Republicanism in Latin America is often, though somewhat mistakenly, associated with movements for independence from Iberian colonial control during the early nineteenth century. Political independence brought few significant changes to the region's social, economic, and cultural structures. Often the new governments were as authoritarian as, if not more so than, the absolute monarchies they replaced. One concrete republican change that did come with independence was the abolition of titles of nobility and *fueros* (privileges extended to members of the church and military). But while a flourishing of liberal ideals brought an end to formal racial discrimination, it did not necessarily end the institution of slavery nor result in an extension of rights to women, Indians, or peasants.

Although women were active participants in the struggles for independence, they still remained legally subjugated to male control. They could not vote or hold public office and could not work or enter into legal contracts without a husband's or father's approval. Without the crown's paternalistic protection, Indians found themselves to be worse off under new republican regimes as creole elites preyed on their communal landholdings, further narrowing the base of landholders. Republicanism witnessed the continued dominance of elite, aristocratic values—with few economic or social advances for subalterns. This resulted in a long struggle by Africans, Indians, women, and other marginalized populations for full and equal participation in affairs of the new republics.

The history of Haiti, Mexico, and Brazil underscores the difference between independence and republicanism in Latin America. In Haiti, Jean Jacques Dessalines and Henri Christophe briefly set themselves up as monarchs after gaining independence from France. In Mexico, Agustín de Iturbide was a royal general who combined forces with creole leaders in a conservative declaration of independence to free Mexico from a liberal-controlled Spanish government. For a brief period of time after independence in 1821, Iturbide ruled Mexico as an emperor (Agustín I) in a constitutional monarchy; it was not

until 1824 that Mexico became a republic. In the 1860s, Mexico once again returned to a monarchy when the French imposed archduke Ferdinand Maximilian of Habsburg as king after occupying the country. In 1867, Mexico once again became a republic after the liberal leader Benito Juárez defeated the French occupying forces and executed Maximilian.

The gap between independence and republicanism is even more dramatic in the case of Brazil. In 1808, Napoleon's occupation of Portugal had driven King João VI's royal court from Lisbon to Rio de Janeiro. In 1821, João returned to Lisbon, leaving his son Dom Pedro as regent of Brazil. When Portugal attempted to curtail Brazilian autonomy, Pedro refused to comply. In his famous September 1822 *fico*, he declared that he would stay in Brazil—bringing a bloodless independence to the colony. Nevertheless, under Pedro I and his successor Pedro II Brazil remained a monarchy, although they ruled in a rather enlightened manner. In 1889, the military overthrew the monarchy, finally bringing a republican form of government to Brazil.

According to Thomas Millington, the persistence of monarchic rule in Brazil undermined a commitment to republicanism in Latin America. Specifically, he argues that Simón Bolívar's refusal to challenge the monarchy in Brazil, something that was within his reach, translated into a wider failure to challenge European influences in the New World—including authoritarianism and elitism. This allowed Bolívar to replicate authoritarian aspects of the Brazilian system, including the goals of order and progress, in the Spanish-American republics. In a sense, Millington contends, the new republics lacked a functioning civil society that provided the consensus necessary for a functioning republican system. Ironically, the Brazilian monarchy implemented a more liberal and "enlightened" system than that existing in the Spanish republics.

Political historians have traditionally portrayed the emergence of republican ideologies at the end of the eighteenth and beginning of the nineteenth centuries as a revolution in political culture. Popular participation in government replaced a hereditary monarchy allied with clergy and military interests. Social historians, however, have demonstrated just how exclusive citizenship rights were, as creole elites consolidated economic and political power in their hands. Economically, independence represented a transfer of wealth from peninsular to creole elites. Politically, the republican constitutions established legal equality but provided for little change in power relations. Without a broadening of suffrage, a very small elite continued to rule over the rest of the population. Even with representative government, there was not more participation in power. Ideologically, republicanism drew on positivist ideologies with its emphasis on liberty, order, and progress. The dissolution of central authority with the elimination of the European crown left nothing in its place, leading to struggles to determine who had the right to rule.

Deep social, economic, and geographic divisions also led to political instability following independence. Large and diverse countries divided physically, culturally, ethnically, and

linguistically, in which people who lived in one area had little to do with those in another area, led to relatively small groups of powerful men using force to assert their will. Small, individual factions with differences in values and ideals fought for control, resulting in rapid changes in power and the appearance of extreme political instability. Stable centralized governments did not emerge until perceived national interests surmounted the economic interests of regional leaders.

Peter Guardino, Mark Thurner, Charles Walker, and others have stressed the importance of examining these transitions to republican forms of government from a peasant perspective. Walker, for example, examines the critical and often unacknowledged role the indigenous peasantry played in battles for independence. Far from employing mindless mob actions, these dissidents engaged in thoughtful political and legal actions and cultivated coalitions with sympathetic outsiders. Rather than being passive or disengaged, Indians were active agents who “imagined” an alternative vision of the nation that conflicted with that of the dominant culture. Walker criticizes historians who “have far too often accepted contemporary views that deemed Indians incapable of political consciousness and indifferent to the battles over the state.” Rather, he sees indigenous peoples as “key to understanding the turbulent transition from colony to republic” (p. 2).

While voicing republican rhetoric, creole elites feared a militant and mobilized indigenous population. Walker argues that despite significant indigenous participation in independence movements, elites intentionally denied them citizenship rights, with the result that republican rule did little to improve their lot in life. Guardino challenges histories of Mexico’s transition to a republican government told from the point of view of the palace, instead stressing the critical role peasants played in this process. Historians are also gaining an increasing appreciation for the previously understudied role that subalterns played in shaping emerging state structures, a role that was significant despite their marginalization within elite conceptualizations of those state structures.

As these examples illustrate, although theoretically informed by liberal ideologies that favored equality under the law, Latin American republicanism did not lead to universal citizenship by any means. Despite variations in constitutions throughout the hemisphere, almost all created exclusionary systems that limited political participation based on literacy, property, gender, and sometimes religious beliefs. Even though property and religious restrictions were generally relaxed during the nineteenth century, it was not until well into the twentieth century that some countries extended suffrage to women and Indians (who had generally been targeted with literacy restrictions). Thurner plays off this imagery in his book *From Two Republics to One Divided*. Colonial administration deliberately divided society into two “republics”: one for Spaniards and another for Indians. Creole elites terminated this bipartite division in the independent republics, but the goal was to abolish separate ethnic identities through assimilation of Indians into a mestizo culture rather than respecting or preserving indigenous peoples’ unique traditions. As Thurner notes, these colonial divisions “were more fictional and juridical than they were actual,” but

“these imagined constructs had real historical consequences” (p. 6). They resulted in wide gaps between the liberal ideals of universal citizenship and the cold reality of highly exclusionary republican governments.

The history of Latin America since independence can be written as a story of subalterns fighting for full citizenship rights that republicanism had promised but never delivered. Women, Africans, Indians, peasants, and others subverted the language of elite rhetoric in order to demand popular sovereignty, political rights, and active citizenship so that they would also have a say in how the government was structured. Theoretically, elections form the base of a republic, as they express the will of the populace. The gap between theory and reality reveals the failure of republican systems in Latin America, but it is a failure slowly being overturned thanks to the efforts of those originally excluded from the political system. Ongoing political activism on the part of Indians, blacks, women, and the poor demonstrates that the republican ideal is still being realized for many.

REPUBLIC

The term *republic* derives from the Latin phrase *res publica* (“matter” or “thing of the people”). Most generally, the word refers to any political regime in which no king or hereditary dynasty rules over subjects in a state of submission or servility. A republic is thus populated by “citizens” who enjoy some manner of political and legal rights to govern themselves through collective political mechanisms and processes. Because citizens are self-governing, liberty is associated with and regarded as emerging from republican regimes. Yet republicanism must also be distinguished from democracy: the idea of a republic entails the imposition of fixed and strict limits on the power of the people. Consequently, a republic involves a constitutional system that provides checks and balances or a mixture of authorizing agents. Stated simply, the liberty of the citizens must be weighed against the maintenance of a common public good that is best identified by leaders who are insulated from the unchecked passions of the people.

Historically, the language of republicanism has been recognized as one of the central modes of political discourse in the European and modern Atlantic worlds. The title of a synoptic collection of essays from 2002 labels republicanism a “shared European heritage,” and many scholars treat it as a European bequest to the New World. Certainly, republicanism seems to be a distinctively Western construction, although a plausible case may be constructed that the pre-kingship system of Judaic government depicted in the Old Testament constituted an embryonic system of “federated republic.” (Indeed, many later thinkers viewed the Israelite polity as an inspiration for their own vision of a self-governing constitution.)

Perhaps the most hotly debated issue in current scholarship is the relationship between the ancient or classical, the medieval, and the modern strains of republican thought. Some have traced the diffusion of classical republicanism from the Renaissance through to the founding of the American republic, arguing for an essential continuity, a “Machiavellian moment,” in the phrase of John Pocock. Others have sternly criticized the view that a uniform revival of classical republicanism may be attributed to the modern world, contending instead that “classical” republicanism must be distinguished from a “modern” variant and that, despite superficial resemblances, different thinkers may be sorted into one or the other category. Paul Rahe represents the outstanding proponent of this view. Still others posit a continuous and developing tradition of republican thought that commenced in the Roman era and persisted (in necessarily transformed fashion) through the Latin Middle Ages into the modern world.

Roman Republicanism

Republicanism in practice predated any attempt to define or articulate it conceptually. Rome became a self-proclaimed republic at the end of the sixth century B.C.E. as a result of a revolt against the Tarquin dynasty of kings who had ruled the region. Thereafter, the Latin word for king, *rex*, was anathema to Romans (even after the rise of the Caesars, who styled themselves *princeps*, “first man,” instead.). The basic constitution of the Roman Republic evolved slowly over the course of the succeeding four centuries, always shaped by a practice of diffusing power among a range of institutions: administrative officers, a body of noblemen (the senate), and various popular citizen assemblies. In the beginning, the concentration of authority rested with the senate and the executive magistrates (chief among whom were the two consuls). Over the course of the republic’s history, however, the lesser citizens demanded and received greater power via the addition of further magistracies and assemblies.

It is perhaps not too great an exaggeration to say that Marcus Tullius Cicero (106–43 B.C.E.) was the most influential republican thinker of the ancient world. Although many other classical authors contributed significantly to the understanding of the theory and practice of the republic—Polybius (c.200–118 B.C.E.), Sallust (86–35 or 34 B.C.E.), and Livy (59 B.C.E.–17 C.E.) were among the most important—Cicero produced the largest body of writings about the topic. Moreover, he enjoyed the widest audience and most loyal following of

any republican author, both in ancient times and later. Drawing on Hellenic and Hellenistic philosophies, as well as on his knowledge of Roman history and his personal experiences with the practical requirements of republican rule, Cicero in many ways represented the pinnacle of republican theory as well as statesmanship. Reflecting the inherent tension within republicanism between populism and elitism, his teachings endorse two distinguishable and potentially competing theoretical defenses of republican government: one highlighting eloquent speech, the other focusing on the faculty of reason.

Populism and public discourse. In Cicero’s writings on rhetoric and oratory, a premium is placed on public discourse—among both citizens and statesmen—as the basis for the republican regime. In writings such as *De inventione* and *De oratore*, Cicero maintains that the eloquent expression of the common welfare binds the republic together. On the one hand, the leaders of the commonwealth are charged with acquiring the oratorical skills necessary to persuade citizens to accept the laws and policies conducive to the well-being of public affairs. On the other hand, all human beings, regardless of their station, are deemed competent (on the basis of their natural faculties) to discern and judge the pronouncements of orators in public assemblies and proceedings.

Cicero grounds this discursive approach to republican rule on the claim that human nature can only be fully realized through articulate and intelligent speech. While his rhetorical writings do not deny the importance of rationality, they are explicitly critical of the philosophical tradition, which glorifies reason to the exclusion or detriment of language. Rather, human beings are both rational and linguistic creatures, simultaneously capable of reasoning and speaking. Speech is, however, accorded primacy in this formulation of human nature. It is not enough to possess reason, for rational powers require the faculty of language in order that their discoveries may be disseminated.

Cicero believes that the realization of the associative potentialities present within human speech may only be achieved with the aid of oratory. The orator discovers what is truly good for his fellow creatures and communicates it to them in the most forceful and convincing manner so that they may put it to use. The combination of eloquence and wisdom characteristic of the orator assures that he will speak on behalf of the interests of the entire community. Cicero invokes a direct contrast between oratory and philosophy. The philosopher may know the good but lack the skill or training to convey it to the multitude. Inherent in the subject matter of oratory, then, is a regard for fellow citizens, which imposes on the orator an overarching duty to act in the service of public welfare. The orator can only achieve this goal, in turn, by expressing himself in the popular idiom. Oratory is concerned in some measure with the common usage, custom, and speech of humankind, so that, whereas in all other arts that which is most excellent is farthest removed from the understanding and mental capacity of the untutored, in oratory the very cardinal sin is to depart from the language of everyday life and the usage approved by the sense of the community.

Cicero's account of the discursive foundations of public life ties the role of political leadership to a clear notion of citizenship and civic intercourse. The man of public affairs is called on to persuade his fellow citizens to follow the wisest course of action in order to achieve the common good. Eloquent speech must, therefore, be cultivated alongside wisdom as a prized asset for political life; the statesman requires these qualities in order to appeal to and convince an audience. Likewise, even though ordinary citizens may lack the talent and skill of the orator, they are deemed to be competent to judge between competing arguments within the public arena and to choose in accordance with the best and most persuasive (that is, the wisest) case that they hear. Thus, citizenship ought to be construed in an active sense: statesmen seek the approval of citizens, who, by virtue of their inherently rational and linguistic faculties, are all qualified to discern the public good. Public life is a kind of recapitulation of the initial entry of human beings into the social and political order. Hence, this discursive approach has overtly participatory implications; it encourages political actors to conceive of their roles in terms of open rational persuasion and debate leading toward the civic recognition of the public good.

Elites and natural reason. Cicero bolsters this view with an account of the foundations of republican government that emphasizes the centrality of reason alone as the source of public welfare, and concomitantly diminishes the active and discursive dimensions of citizenship. In this version of republicanism, natural reason forms the cornerstone of human social relations. The role of reason is to discover those precepts of natural law that maintain and strengthen the bonds of communal order, and to impose such dictates through law and rulership in a manner consonant with the public good. Of course, Cicero acknowledges that reason is unevenly distributed among human beings. While all people may be minimally rational, some exceed their fellows in the exercise of reason, a fact that qualifies the wise to ascend to positions of authority within the civic body. Indeed, in a well-ordered regime, those lacking fully developed powers of reason ought freely to accede to governance by their betters, on the grounds that wise rule is the strongest safeguard of the common good. The rational powers of statesmen guide the republic for the benefit of citizens, and the people are best governed when they defer to magistrates of superior wisdom. Cicero's philosophical writings, in particular, tend to highlight the Stoic-derived view that human beings are inherently rational creatures and that their natural powers of reason constitute the precondition for all social intercourse and political community.

Cicero maintains that society, and hence people's very capacity to conceive of a public welfare, depends on the cultivation of virtue. Virtue is directly dependent, in turn, on the cultivation of the rational faculties. Hence, the mark of a harmonious communal setting is the presence of virtue as an ingrained feature of its organization. Cicero singles out and concentrates on justice, identifying it as the virtue most crucial to the perpetuation of human association. The Ciceronian conception of justice is rooted in the doctrine of natural law. Cicero holds that nature imposes on individuals a

certain code or measure of conduct, constituted in particular by the requirement to promote the ends and interests of human society. In order to prevent perpetual endangerment to the bonds of society, the law of nature is afforded prescriptive force. To know what accords with the law of nature, and hence what behavior is required by justice, one reasons about the common good. One's duty on the basis of natural law is always to act in the general welfare when there exists a conflict between private benefit and the general interests of society. The Ciceronian doctrine of natural law codifies and authorizes the obligation stemming from justice to value social fellowship above all else.

Cicero believes that all human beings share in the faculty of reason, and therefore are equal in their capacity to grasp what is just and lawful. But it is obvious that all people are not equally rational, and therefore virtuous and law-abiding. Whatever equality human beings enjoy by birth is in effect eradicated by differences of circumstance, so that wisdom is ultimately achieved by a very few persons, and the multitude remain in a state of ignorance. The distinction between the wise and the foolish has important implications for the foundations of the republic. Since civil law, properly speaking, has a rational origin in "what is true and just," according to Cicero, only those statutes that are framed and approved by the wise should be counted as valid. Valid legislation, therefore, must be referred to reason in accordance with nature and justice. No enactment of the multitude, regardless of how overwhelming the popular support, deserves to be accorded respect and obedience unless it is consonant with natural law. And only the wise are qualified to make this determination.

Cicero therefore turns to the *optimates* (best men), in whose hands the security of government must reside. The well-ordered republic of Cicero's *De re publica*—the constitution most in conformity with nature—is the creation of individuals who apply wisdom to the art of politics. In turn, the ideal constitution is balanced and harmonious when the *optimates* (embodied by the senate of the republic) enjoy the influence appropriate to their superior learning. *De re publica* commends that stage in the growth of the republican system when "supreme authority was in the senate with the sufferance and obedience of the people"; and Cicero bemoans the popular grasping after power (in the name of liberty) that leads to the decline in the concord afforded by the republic.

Hence, the rational conception of the republic promotes a passive conception of citizenship as well as an exalted idea of statesmanship. While all human beings are deemed minimally rational, Cicero regards the powers of reason of most of them to be insufficient for sharing directly in the judgment of the common good. Rather, it is up to the statesman, with his wisdom and superior virtue, to serve the public welfare by pioneering and preserving just institutions. Given the distinction between the ignorance of the multitude and the wisdom of the virtuous few, a direct appeal by a statesman to the masses would almost certainly be an act of demagoguery or tyranny, an attempt to destabilize the order of the republic. There is a noticeable contrast between this idea of the rational statesman, who governs on behalf, not at the behest, of

citizens, and the oratorical model, in which the statesman can only lead the citizen body by the force of his eloquence and must accede to the popular will.

Medieval Republicanism

The tension between the populist and elitist dimensions in republican thought is recapitulated in later important contributions to republicanism. Italy, in particular, produced a number of exponents of republican doctrines, such as Brunetto Latini (1220–c. 1294) and Ptolemy of Lucca (c. 1236–1327). Perhaps the most famous medieval republican work was the *Defensor pacis* (1324), written by Marsilius of Padua (c. 1280–c. 1343). Marsilius stresses the linguistic foundations of the community, following Cicero's account of the formation of the human community as a consensual process in which the multitude is convinced to join into bonds of social and political cooperation by the "persuasion and exhortation" of oratorically gifted individuals. In turn, Marsilius ascribes to discourse a continuing role in the conduct of public affairs, as a sort of repetition of the original foundation of the community. The framing of legislation, for example, he regards as a function of public speech. He stipulates that draft statutes are to be framed by prudent persons (*prudentes*) who, by virtue of their leisure and superior experience, are best qualified to discover just and useful laws. Yet the wisdom of the few does not entitle them to enact legislation on behalf of the general mass of citizens. Rather, the whole body of citizens (which Marsilius terms the *legislator humanus*) must consent to draft statutes in order to give them the status of laws that the community is obligated to obey.

The *Defensor pacis* ascribes to oratory two pivotal functions in the process of a "bill becoming a law." First, it is assigned to the *prudentes*, when they present their legislative proposals to the citizen body, to "explain" publicly the measures they have recommended; and their fellow citizens are likewise bound to "listen attentively" to the arguments given. The *prudentes* in effect play the role created by the primordial orator: they must attempt to persuade the assembly of citizens that the draft statutes are consistent with justice and contribute to the common good, while it is left to the multitude, whose powers of reason are less well developed, to reflect on the justifications presented to them and to approve (or withhold approval from) laws. Second, Marsilius views the occurrence of legislative authorization as an occasion for general public discussion and debate among the members of the civic body. The whole citizen population must have an opportunity to speak about the matters of communal concern placed before it, and the words of the populace are ultimately binding. Lest "partiality" creep into the legislative process, the entire citizen body is to enjoy a say in the laws by which it will be governed.

Renaissance Italian Republicanism

Scholars often view the Renaissance, especially in Italy, as a decisive period in the development of republican thought. Many important authors of the Renaissance glorified civic-minded virtue—the ethos of sacrifice for the sake of one's fellow citi-

zens and city—shared by members of a community (the so-called civic humanism identified most influentially by Hans Baron). While a simple equation of Renaissance thought with the revival of classical republicanism has come under serious and deserved challenge, some of the greatest humanists of the fifteenth and sixteenth centuries embraced citizenship as the fullest expression of a virtuous human life, taking Cicero as their exemplar. Consequently, republican discourse became one of the primary forms of political expression during the period.

The tension within classical republicanism between discursive and rationalistic conceptions of governance thus also reemerged among Renaissance thinkers, perhaps most strikingly in the works of Niccolò Machiavelli (1469–1527). One of the central themes of Machiavelli's famed treatise on republican government, the *Discourses on the Ten Books of Titus Livy* (1517) is the defense of the view that the popular elements within the community form the best safeguard of civic liberty as well as the most reliable source of decision making about the public good. In particular, Machiavelli contrasts the constancy and trustworthiness of the people, who are often accused of fickleness and ineptitude, with the improbity of the nobility, who are commonly regarded to be the "natural" leaders of a republic. What permitted Rome to avoid public corruption and to extend its empire for so many centuries, Machiavelli believes, was precisely the fact that ordinary citizens demanded and were accorded such a large hand in public determinations. The people thus thwarted the use by patricians of public power to pursue private interests. The apparent "tumults" between the popular and elite segments of the Roman population were in fact the key to Rome's success. Machiavelli's praise for the role of the people in securing the republic is supported by his confidence in the generally illuminating effects of public speech upon the citizen body. Near the beginning of the first *Discourse*, he notes that some may object to the extensive freedom enjoyed by the Roman people to assemble, to protest, and to veto laws and policies. But he replies by referring to Cicero's view that "the people, although they may be ignorant, can grasp the truth, and yield easily when told what is true by a trustworthy man"; that is, the people are competent to respond to and support the words of the gifted orator when he speaks truly about the public welfare.

Machiavelli returns to this theme in a chapter of the *Discourses* intended to demonstrate the superiority of popular over princely government. He argues that the people are well ordered, and hence "prudent, stable and grateful," so long as room is made for public speech and deliberation within the community. Citing the formula *vox populi, vox dei*, Machiavelli insists that the people are competent to discern the best course of action when orators lay out competing plans, and in fact they are better qualified to make decisions, in Machiavelli's view, than are princes. The republic governed by words and persuasion—in sum, ruled by public speech—is almost sure to realize the common good of its citizens; and even should it err, recourse is always open to further discourse. Nonrepublican regimes, because they exclude or limit discursive practices, ultimately rest on coercive domination and can only be corrected by violent means.

English Republicanism

According to many scholars, James Harrington (1611–1677) walks directly in Machiavelli's footsteps, circulating classical republicanism beyond the confines of Italian (especially, Florentine) writers, into the English tradition, and eventually across the Atlantic. Yet Harrington's *The Commonwealth of Oceana* (1656) seems to have detoured around some of the more populist elements of Machiavelli's classical republicanism. In preferring the government of Venice to that of Rome, and to a lesser extent, Sparta to Athens, he manifests overt hostility to public speech. Rome and Athens, he asserts, were both ruined by the "storms" arising from the "debate of the people." Far preferable is Venice, which, like its alleged Lacedaemonian exemplar, Sparta, never sanctions public debate. Indeed, in his own ideal commonwealth of Oceana, popular discussion of political affairs is punishable by no less a penalty than death. Harrington's abhorrence of public speech is tied to the rationalistic side of classical republicanism: namely, that public decision making must be conducted in accordance with a strict principle of right reason, accessible only to the wise few, who therefore take it upon themselves to serve as guardians of the people for the sake of the common benefit.

Harrington expressly distinguishes three concepts of reason—as self-interest, as group interest, and as the interest of the whole—and contends that only the latter should be taken into consideration in the formation of laws and public policies. The problem is how the "common right" may safely be discovered and converted into the law of the land. In Harrington's view, this cannot be achieved by the people as a whole, since he observes that nature itself generates clear differences between human beings and, in particular, produces a "natural aristocracy" of the wise who are clearly more adept in their faculties of understanding. Harrington thinks that the foolish or ignorant will recognize that it is desirable to be led by the "excellent parts" in whom special "virtue or authority" resides.

Harrington institutionalizes this distinction between the wise few and the foolish multitude in his construction of the constitution of Oceana. The natural leaders form the body of the senate, whereas the foolish are represented in a popular assembly (or "prerogative tribe") composed of 1,050 delegates. The functions of these two groups differ markedly. The senate is charged with debating public affairs and with decreeing laws and policies; within its halls, discussion of proposals is to be open and unrestricted, and its members are deemed free to express disparate and conflicting opinions, until some conclusion is achieved. That this will not lead to disorder, Harrington believes, stems from the fact that the procedures of debate will occur strictly in accordance with the precepts of reason. The prerogative tribe, by contrast, performs a completely passive role: strictly enjoined from debating the senate's decrees, its members instead either affirm or reject the proposals presented to them. This has the effect of ensuring that the senators do not attempt to employ their authority to pass measures that reflect either private or group interest. The popular assembly thus has the primary purpose of checking potential abuses of power. But Harrington ascribes to the prerogative tribe no positive or active functions; it cannot air grievances, suggest issues or topics for legislation, make any sorts of

changes in proposals, nor even question the wisdom of the senatorial decrees. Starting with the principle that reason is a special competence of the few, Harrington's republicanism excludes popular speech from the well-ordered constitution.

Modern Republicanism

The modern period witnessed a number of important practical experiments in the implementation of republican ideas, including the Netherlands, France, and the United States. One of the important facets of these experiments was the introduction of novel features into the classical tradition in recognition of the de facto replacement of the city by the territorial state as the central unit of public life. Modern republicans recognized that the process of political debate could not realistically be modeled on a direct interaction between speakers and an audience. Hence, political representation rather than direct governance by the people emerged as a hallmark of republican regimes, even as the principle of popular sovereignty was retained and reinforced. Representation permitted discussion and dispute in an assembly setting that presumably mimicked the views and disagreements that were held by members of society at large. Moreover, republicans such as James Madison (1751–1836) in the United States sought ways to mitigate the consequence of the factionalism that Machiavelli had regarded to be the hallmark of a healthy republic by institutionalizing mixed government by means of a constitutionally designated system of checks and balances. Thus, no faction could entirely impose its will on its opponents.

Another modification to traditional republican conceptions came with the challenge posed by the commercialization of Atlantic economic relations and social values. For classical republicans, the private accumulation of liquid wealth had been widely viewed as incompatible with civic virtue, but early modern authors began to reevaluate this doctrine. Some thinkers contended that citizens should proudly acknowledge industriousness and self-acquired possessions as the foundation of morality and the greatness of their cities. The Dutch-born Bernard Mandeville (1670–1733) proposed in his *Fable of the Bees* (1714) the famous principle that private vices yield public goods, which is to say that the pursuit of personal gain, and indeed the desire for comfort and luxury, leads directly to the enrichment of society as a whole and the consequent benefit of all its members. Republics should thus orient their political institutions in order to promote commercial enterprise.

With the rise of liberalism, capitalism, and democracy during the course of the nineteenth and twentieth centuries, republican ideas entered a period of decline. Only in very recent times has this fortune been reversed. On the one hand, historical scholars such as Gordon S. Wood and John Pocock have offered reminders of how great was the debt of modern political institutions to the language and doctrines of republicanism. On the other hand, political philosophers critical of the excesses of liberalism have turned to the communitarian orientation of classical republicanism for inspiration. Among the best known of these "new republicans" are Hannah Arendt (1906–1975), Alasdair MacIntyre (b. 1929), Michael Sandel (b. 1953), and Philip Pettit (b. 1945). It seems clear that in the early twenty-first century the republican tradition is

enjoying a considerable revival that suggests its continuing vitality and the relevance of its fundamental tenets to modern life.

RESISTANCE. The path of *resistance* has been neither straight nor narrow. First adopted by the political right, and then crossing the aisle to the left, resistance is sometimes considered a means and other times an end. Its modern history traces the evolution of an idea and a transformation in politics.

The English word resistance is a derivation of “resist,” stemming from the Latin—via the French—meaning “to stand.” Resistance has a technical scientific meaning, the opposition offered by one body to the pressure or movement of another, as well as a later psychoanalytic one, the unconscious opposition to repressed memories or desires. But the *Oxford English Dictionary*’s primary definition: “To stop or hinder (a moving body); to succeed in standing against; to prevent (a weapon, etc.) from piercing or penetrating,” has a distinct political bent.

Conservative Roots

Edmund Burke (1729–1797), the great conservative thinker of the modern era, makes the case for resistance in *Reflections on the Revolution in France* (1790). Fondly remembering Marie Antoinette as a “morning star, full of life, and splendour, and joy” (p. 75), Burke criticizes the revolutionary overthrow of birthright authority. Horrified by the thought of the hairdresser who thinks himself the equal of his betters, he rails against the leveling of classes. But what really motivates Burke’s fear and loathing of the French Revolution is his belief that these radical and sudden changes fly in the face of time-tested tradition and are an “usurpation on the prerogatives of nature” (p. 49). Undermining the firm foundations of society, this can only lead to chaos. As such, Burke appeals to his English audience to resist such progress in their own country “with their lives and fortunes” (p. 16).

Nearly a century later, Burke’s countryman Matthew Arnold (1822–1888) takes up the call of conservative resistance. In *Dover Beach* (1867) he describes a faithless land that “Hath really neither joy, nor love, nor light. . . . Swept with confused alarms of struggle and flight/ Where ignorant armies clash by night.” Arnold’s mid-nineteenth century England was a world of storm and strife: urbanization, industrialization, and class warfare. The republican ideals of the French Revolution had triumphed over Burke’s beloved tradition, and “nature,” after Darwin, was harnessed to progress. A new principle of resistance was needed; for Arnold it was culture. As “the best which has been thought and said” (p. 6) as he defines it in *Culture and Anarchy* (1869), culture offered a means with which to rise above the politics, commerce, and machinery of the day and supply a universal standard upon which to base “a principle of authority, to counteract the tendency to anarchy which seems to be threatening us” (p. 82) Culture was a metaphysical realm where “*real* thought and *real* beauty; *real* sweetness and *real* light” (p. 69, author’s emphasis) could safely flourish, eventually returning to terra firma—if at all—in the form of an ideal State to guide society.

Anti-Colonial Resistance

Halfway around the world Mahatma Gandhi (1869–1948) was developing his own ideas of resistance. Arriving at conclusions similar to Burke and Arnold, he stood these conservative

notions on their head in opposing British colonial rule. Central to Gandhi's political philosophy was the idea of *satyagraha*. In Sanskrit this means "insistence on the truth"; Gandhi, however, also used the word to denote "civil resistance." This was a logical translation for him. Insisting on the truth in an India under foreign rule meant resisting the imposition of that rule, for as long as India labored under colonial guns and culture, she would have a false idea of herself. It was this false idea: that English culture comprised the "best that has ever been thought and said," that one needed to be violent like one's oppressors, that needed to be resisted more fiercely than even the British themselves. To be free of European bodies on Indian soil was one thing, to be free of their ideas, their prejudices, and their technology, was another. As Gandhi rhetorically asks in an early pamphlet *Hind Swaraj* (1910), "Why do you forget that our adoption of their civilization makes their presence at all possible?" (p. 75). As with Arnold, insistence on the truth meant cultivating a resistant culture that could rise above the world of the West and act as a guide to a truly home-ruled India. And like Burke, tradition offered a resource for this resistant culture. Gandhi counseled breaking India's economic dependence on Britain by *khaddar*, a return to the hand loomed cloth, and looked to non-Westernized, rural India for political and spiritual models.

Radical resistance, defined in part as the rejection of foreign cultures and the celebration of indigenous traditions, winds its way through the twentieth century, as European colonies in Africa and Asia were swept away by struggles of national liberation. This strain of resistance makes its way back to the metropole in the words of those finding parallels between their own struggles and anticolonialism. A key point of identification was the fight against internalized oppression, what the Algerian writer and activist Albert Memmi (b. 1920) referred to as the colonizer within (1965). In 1970 the American group, Radicalesbians, issued a manifesto calling for "The Woman-Identified Woman." "[W]hat is crucial" they write, "is that women begin disengaging themselves from male defined response patterns. . . . For irrespective of where our love and sexual energies flow, if we are male-identified in our heads, we cannot realize our autonomy as human beings." "Only women," they conclude, "can give to each other a new sense of self."

These final words were picked up and developed by the radical black women of the Combahee River Collective, who asserted in 1977, "We believe that the most profound and potentially radical politics come directly out of our identity," setting the stage for an "identity politics" that argued for resistance based within and upon the unique experiences of a person's ethnicity, gender, or sexual identity (p. 272).

Totality

La Résistance was the name adopted by the French citizens who fought against the Nazi occupation of France. But the specter of oppression didn't disappear with the defeat of Fascism in the postwar West. Instead, totalizing power was identified everywhere and resistance was redefined as an everyday battle with no end in sight.

This total resistance against totality finds its roots in existentialism. Existentialists argued that the fate of humanity is

to choose and to act; indeed, it is only in these actions that one defines who one is. "Man is nothing else but that which he makes of himself," Jean-Paul Sartre (1905–1980) writes in *Existentialism Is a Humanism* (1946; p. 349). If the importance of action (or resistance) was once judged on its efficacy in bringing about (or protecting) an ideal or country, Sartre was now arguing that it was the choice, and the action that follows, which matters. In the *Myth of Sisyphus* (1955), Albert Camus (1913–1960) retells the tale of Sisyphus, condemned for eternity by the gods to roll a rock up a hill only to watch it roll back down again. In this task Camus identifies the human condition as being condemned to an action that brings no certain result, but also finding definition—and happiness—in the absurd and ceaseless labor.

In 1961 Erving Goffman (1922–1982), an American sociologist influenced by the existentialists, wrote *Asylums* (1961), discussing "total institutions." Observing patients in a mental asylum, Goffman argued that the job of total institutions is to create—or recreate—their charge's identity in order to integrate them into the world. Individuals, however, don't always do what they should. The patients Goffman observed elided institutional demands and created an "underlife" where different values reigned. Indeed, it was in resisting the definitions pressed upon them that inmates of institutions developed their own sense of identity. *Asylums* was an implicit critique of the postwar "Free World" of big business and the welfare state, mass media, and compulsory education. But, Goffman argues, this institutionalization and homogenization of thought and behavior need not lead only to despair, for as Goffman's mental patients taught him, "It is *against something* that the self can emerge" (p. 320).

Meanwhile, youth cultures such as the beatniks, and later the hippies, were busy acting out identities of resistance, defining themselves by what they were not as much as what they were ("I'm gonna wave my freak flag high," sang Jimi Hendrix in 1968). The freak, mental patient, artist, native, and resurrecting an old ideal of nineteenth-century anarchism, the criminal, were celebrated (and idealized) in their "otherness"; their resistance—conscious or not—to the world of the white-collared conservative. In 1968 the world seemed to explode. Vietnamese nationalists were defeating the most powerful military in the world, U.S. college campuses and urban ghettos were in upheaval, young people stood up to dictatorships in Mexico City and Prague, and perhaps most dramatic of all, students and workers, together, took to the streets of Paris in May 1968. The world was rocked to its core, yet politically little seemed to change: the ruling powers in these countries continued to rule.

In Paris of the 1960s Michel Foucault (1926–1984), like Goffman, was examining total institutions such as prisons, asylums, and schools, but the French intellectual was interested in institutions of the mind as well, such as disciplinary boundaries and classification systems. The failures of the political resistance in 1968 confirmed what Foucault had already known: that power was not something out there—easy to identify and to overthrow. Instead it was everywhere, "the disciplinary grid of society," which was continuous, anonymous, intimate, and even

pleasurable (1980, p. 111). Whereas previous critics of totalitarianism, from the left and the right, elevated the ideal of the individual subject resisting against totalizing society, Foucault countered that the individual was itself problematic. This Enlightenment creature that made new ideals of personal freedom possible also opened up a new site of oppression: the individual's mind, body, and spirit. Because power is impressed upon and internalized into the subject, it raises the vexing problem of who resists and what exactly are they resisting. Can one resist the very subject thing doing the resisting?

Resistance remains a stated goal for Foucault, but it must be reconceptualized. The ideal of developing the pure subject in opposition to the corrupting object of society must be rejected. "Maybe the target nowadays," he suggests, "is not to discover what we are, but to refuse what we are" (1984, p. 22). Foucault's refusal to provide an answer, to spell out what the resistant subject is for or against, is characteristic, as it is the answer, the category, the truth which constrains us most of all.

In his essay, "The Masses: The Implosion of the Social in the Media" (1985) the playful postmodernist Jean Baudrillard (b. 1929) extends Foucault's ideas to their—perhaps illogical—conclusion. Baudrillard argues that strategies of resistance always change to reflect strategies of control. Against a system that excludes or represses the individual, the natural demand is one of inclusion: to become a subject. This, however, is not the modern world. In twenty-first century Western society people are bombarded with appeals for their participation: "Vote!" and "This Bud's for You," and yet they also know that their choice or vote matters little. Against a system that justifies and sustains its existence by the consent (or consumer purchases) of those it governs, the masses have devised their strategy of resistance: apathy—"a spontaneous, total resistance to the ultimatum of historical and political reason" (p. 588). Popular politics is "no longer a question of revolution but of massive *devolution* . . . a massive desisting from will" (p. 586). It is a resistance to resistance.

Cultural Resistance

While apathy may reign supreme in the voting booth, some scholars and activists have been looking for resistance elsewhere: on the street corner, in the living room, or at the club, that is, in cultural expression. Matthew Arnold first articulated cultural resistance, but the Italian Marxist Antonio Gramsci (1891–1937) framed the contemporary discussion.

Gramsci, writing from a Fascist jail in the 1920s and early 1930s, reflected on why the communist revolutions he labored for in the West had so far failed. Part of the reason, he concluded, was a serious underestimation of culture and civil society. Power does not just reside in institutions, but also in the ways people make sense of their world; hegemony is both a political and cultural process. Armed with culture instead of guns, one fights a different type of battle. Whereas traditional battles were "wars of maneuver," frontal assaults that seized the state, cultural battles were "wars of position," flanking maneuvers, commando raids, and infiltrations, staking out positions from which to attack and then reassemble civil society (pp. 229–239). Thus, part of the revolutionary project was to

create counterhegemonic culture behind enemy lines. But if this culture was to have real power, and communist integrity, it could not—contra Arnold—be imposed from above; it must come out of the experiences and consciousness of people. Thus, the job of the revolutionary is to discover the progressive potentialities that reside within popular consciousness and from this material fashion a culture of resistance.

It was this implicitly politico-cultural mission that guided the Centre for Contemporary Cultural Studies at the University of Birmingham in the 1970s. The CCCS is best known for its subcultural studies, and it was within these mainly working-class subcultures that researchers found an inchoate politics of resistance. Mods one-upped their bosses with their snappy dress. Punks performed the decline of Britain with lyrics that warned: "We're your future, no future." Skinheads recreated a cohesive white, masculine working-class world that no longer existed. And Rastafarians turned the world upside down by rereading Christianity into a condemnation of white Babylon. It was through culture that young people contested and rearranged the ideological constructions—the systems of meaning—handed down to them by the dominant powers of postwar Britain.

For Stuart Hall (the influential director of the CCCS) and his colleagues, cultural resistance was politically ambiguous. Subcultures opened up spaces where dominant ideology was contested and counter hegemonic culture was created, however, these contestations and symbolic victories often remained locked in culture. "There is no 'subcultural solution'" to structural inequality write Hall and his colleagues in *Resistance through Rituals* (1976), "They 'solve,' but in an imaginary way, problems which at the concrete material level remain unresolved" (pp. 47–48). As W. H. Auden (1907–1973) came to lament, "Poetry makes nothing happen"—at least not by itself.

Resistance Refuted and Reimagined

Is cultural resistance, resistance at all? Malcolm Cowley (1898–1989) raised this question in *Exile's Return* (1934), his memoir of Bohemian days in Greenwich Village. He pointed out that while the cultural conservatism of the Victorians may have served an era of capitalism predicated on hard work and savings, by the 1920s a new ethic was needed for what was becoming a mass consumer economy. Within the context of consumer capitalism the bohemian call to be freed from yesterday's conventions translates easily into freedom to buy tomorrow's products. More recently, Thomas Frank has taken up the refrain, writing in his journal *The Baffler* (1993):

Over the years the rebel has naturally become the central image of this culture of consumption, symbolizing endless, directionless change, an eternal restlessness with "the establishment"—or, more correctly, with the stuff "the establishment" convinced him to buy last year. (p. 12)

As a purely political strategy resistance also has its critics. Resistance only exists in relation to the dominant power—"bonds of rejection," are what Richard Sennett calls these in

his discussion of *Authority* (1980)—and without that dominant power, resistance has no coherence or purpose. This is not a difficulty if resistance is a tactic on the road to revolution (and thus the end of resistance), but once this goal is discarded resistance becomes problematic, for what is the point of resistance if the very thing being resisted must be maintained?

In the early twenty-first century, theorists and activists are rethinking and redefining resistance, approaching it less as a stand against the world and more as means with which to actualize a new one. This is a central theme of Michael Hardt and Antonio Negri's *Empire* (2000). Resistance, they argue, has two sides. Yes, it is opposing the current world, "but at the same time it is linked to a new world." This new world, however, unlike the revolutionary utopias of times past, "knows no outside. It knows only an inside, a vital and ineluctable participation in the set of social structures, with no possibility of transcending them" (p. 413). This is a strange resistance. What sort of opposition counsels participation inside the system? What sort of new world cannot transcend the old one? The answers lie in Hardt and Negri's analysis of empire. Within the social structures of the system of global capitalism they discover resistant elements: global interdependence, social networks, systems of communication, affective and immaterial labor, and the formation of cooperative consciousness. These ideas and practices are as useful to a new world as they are necessary to the old one. As such, these experiences lived by the multitude are *both* conformity and resistance, depending upon how one understands and mobilizes them.

Hakim Bey (also known as Peter Lamborn Wilson) shares Hardt and Negri's suspicion of a world "outside," but believes that through resistance one can catch a glimpse of an alternative. His model is the TAZ, or *Temporary Autonomous Zone* (1985), an immediate experience—a happening—that temporarily reverses the rules, laying bare the structures of the present and experimenting with a model for the future. The TAZ is necessarily limited in time and space. "But," Bey argues, "such moments of intensity give shape and meaning to the entirety of a life" (p. 100). Protest groups such as London-born Reclaim the Streets put this philosophy of resistance into practice in the 1990s: throwing large, illegal street parties that literally *demonstrated* to participants what the experience of a participatory public culture feels like. What is being created, through acts of resistance, is a revolutionary imagination. As the rebel-poet Subcommandante Marcos of the Zapatista army in Southern Mexico writes,

In our dreams we have seen another world. A sincere world, a world definitively more just than the one in which we now move. . . . That sincere world was not a dream of the past, it was not something that came from our ancestors. It came from ahead, it was from the next step that we had taken.

RESISTANCE AND ACCOMMODATION. To fight and quite possibly die? Or to acquiesce in one's fate as a slave or conquered person? This has been the classic choice presented by conventional definitions of resistance and accommodation. In Thucydides' (d. c. 401 B.C.E.) *Peloponnesian War*, the people of Melos face the certainty of an invasion by Athens. Two options, both unpalatable, confront their leaders. On one hand, the Melians could acknowledge the superior power of Athens and the coming reality of foreign rule. "And how, pray," they ask, "could it turn out as good for us to serve as for you to rule?" To this the Athenians have a ready answer: "Because you would have the advantage of submitting before suffering the worst, and we should gain by not

destroying you.” On the other hand, the Melians could reject Athenian aggression. “[T]o submit,” they argue, “is to give ourselves over to despair, while action still preserves for us a hope that we may stand erect.” In the end the Melians resist Athenian imperialism, are defeated in battle, and have many grown men put to death and children and women taken as slaves.

Until recently, definitions of accommodation and resistance, particularly in relation to slavery and colonialism, have reproduced the stark decisions that faced the Melians more than two thousand years ago. To accommodate was to agree, however tacitly, with the existing order of things—to compromise, to oblige, to be pliable. Accommodation entailed the avoidance of further conflict, as in a treaty or some other form of agreement that settled a dispute. Compliance with prevailing norms and practices—in short, “accommodation”—contrasted with active contestation of social structures and systems of domination, or “resistance.” Accommodation assumed the absence or ending of conflict, whereas conflict—the throwing up of an obstacle, the establishing of a confrontation—was at the very center of resistance. In some early usages resistance was a physical thing, a type of fortification to slow advancing armies. Accommodation, in contrast, sprang from the mind, and was a strategy by which the less powerful adjusted their lives to the realities of their domination.

Slavery and colonialism represent among the most extreme forms of domination. Slavery centers on “natal alienation”—slaves are divorced from their own community—and property rights, one person owning another human being. Colonialism entails the domination of one society by another that is geographically and culturally distinct from the society that is subjugated. Slavery invariably involves close interaction, even intimacy. A central characteristic of colonialism, on the other hand, is foreignness, rule by a remote society.

Throughout most of the twentieth century perspectives on slavery and colonialism stressed the totality of domination and the apparent passivity of slaves and colonized peoples, or, conversely, dramatic examples of resistance. Influenced by his understanding of Jews in Nazi concentration camps during World War II, the historian Stanley Elkins argued that certain behaviors of slaves showed their near total domination by white masters and the psychological consequences of accommodation. Elkins drew on the work of the German philosopher Georg Wilhelm Friedrich Hegel (1770–1831), particularly on Hegel’s “master-slave dialectic,” according to which the slave becomes an instrument of his master’s will. To the extent that the master’s consciousness and identity come to depend on the slave, so the slave’s capacity for an independent consciousness will decline and he will adopt a “slavish consciousness.” The absence of dramatic resistance such as rebellions seemed to suggest the pervasiveness in American history of accommodation and “slavish consciousness.”

Theorists of colonialism occasionally made similar arguments. The Tunisian Albert Memmi wrote of the entwined identities of colonizer and colonized and of the psychological consequences of accommodation. Frantz Fanon (1925–1961), trained as a psychiatrist, thought colonialism a form of dehu-

**STATEMENT OF FREDERICK LAW
OLMSTED, HAVING VISITED VIRGINIA,
UNITED STATES**

[T]hat everywhere on the plantations, the agrarian notion has become a fixed point of the negro system of ethics: that the result of labor belongs of right to the laborer. . . . They [slaves] almost universally pilfer from the household store when they have a safe opportunity.

SOURCE: Frederick Law Olmstead, *A Journey in the Seaboard Slave States*.

manization; some of the disorders he treated during his time in French Algeria he considered to have originated in the effects of accommodation. Fanon elaborated ideas about resistance and advocated participation in anticolonial violence as a way by which the colonized could cleanse themselves of the stain of subjugation and reassert their basic humanity.

Until the 1970s, writings on accommodation in slave and colonial societies proceeded from a number of assumptions about resistance. Accommodation and resistance were viewed as inversely proportional: the greater the resistance, the less the accommodation, and vice versa. Resistance was clearly identifiable as purposive organized action. In the Americas, the Haitian Revolution (1791–1803), in which slavery was overturned, represented the clearest example of resistance. Scholars looked elsewhere for other examples of slave rebellions and argued that the absence of organized resistance indicated greater levels of domination and accommodation.

Throughout the postcolonial world, discussions of resistance likewise centered on organized actions to resist or to overthrow colonialism. Scholars of South Asia concentrated on revolts such as the 1857 Indian Rebellion or on the nonviolence campaigns of Mahatma Gandhi that led up to the granting of Indian independence in 1947. China specialists analyzed events such as the Boxer Rebellion at the beginning of the twentieth century.

Africanist scholars distinguished “primary resistance” from “secondary resistance.” Active, organized protest against colonial encroachment and conquest, or against early colonial rule, represented primary resistance. The Maji Maji rebellion in German Tanganyika (1905–1906), the Herero rebellion in German South West Africa (1904–1907), and military engagements across the continent in the late nineteenth and early twentieth centuries were representative examples. In contrast, “secondary resistance” looked ahead to the ending of foreign rule and the creation of new nation-states; strikes and demands by trade

**STATEMENT OF HENDRIK WITBOOI (NAMA CHIEF) ON THE GERMAN
ADMINISTRATION, SOUTH WEST AFRICA [NAMIBIA]**

The German himself . . . is just what he described the other nations as . . . he makes no requests according to truth and justice and asks no permission of a chief. He introduces laws into the land . . . [which] are entirely impossible, untenable, unbelievable, unbearable, unmerciful and unfeeling. . . . He personally punishes our people at Windhoek and has already beaten people to death for debt. . . . it is not just and right to beat people to death for that. . . . He flogs people in a shameful and cruel manner. We stupid and unintelligent people, for so he thinks us to be, we have never yet punished a human being in such a cruel and improper way for he stretches people on their backs and flogs them on the stomach and even between the legs, be they male or female, so Your Honour can understand that no one can survive such a punishment.

unions and, especially, the claims and actions of nationalist organizations were the clearest examples. Importantly, whereas primary resistance invariably entailed violence, this was not necessarily so with secondary resistance, which embraced peaceful protests as well as armed movements for national liberation.

The Effects of Culture and Consciousness

Definitions of resistance and accommodation, even in their earliest formulations, inevitably raised issues of culture and consciousness. As early as the 1960s, scholars began widening their definitions and complicating what once appeared to have been clear distinctions between accommodation and resistance. The absence of organized resistance, they said, did not necessarily imply accommodation, and certainly not acquiescence. All forms of critique could be seen to be examples of resistance. In the study of slavery in the Americas, scholars called attention to symbolic rather than directly confrontational forms of resistance. Songs might criticize the planter class. The preservation and reworking of African beliefs and practices pointed to the creation of identities and consciousness independent of the slave master. The accumulation of personal property offered some, albeit often very small, degree of economic autonomy and indicated the success slaves had in mitigating their condition. The existence and preservation of family networks were another way slaves created a world separate from their masters and, in so doing, brought into question the solidity of slavery as a system of domination.

Indeed, in this new way of looking at slavery, masters were discovered to have accommodated to the demands of their slaves in order to protect their economic investment and preserve a modicum of stability. Slavery came to be seen in less stark terms, slave societies as intensely negotiated worlds. At

the same time, as topics such as songs and rituals began being included within the more expansive definitions of resistance, so also did theft, slowdowns, and other actions that did not have as their immediate object the overthrow of slavery itself. Because slaves had access to the master's valuable economic resources, they could steal from planters, damage crops, livestock, and machinery, or simply work slowly or inefficiently. Behaviors that Elkins and others had viewed as examples of moral defeat and acquiescence came to be viewed far differently, as creative expressions of resistance.

In Africa and elsewhere in the colonial world scholars were making similar points, focusing increasingly on symbolic and "hidden" forms of resistance. The older dichotomies of resistance versus accommodation fell out of favor. Historians called attention to social banditry, theft, and myriad activities ranging from tax evasion to migration, whereby the colonized resisted domination. One important concept was "moral economy," the cultural and ideological logic by which people understood social and economic relationships. The dominated—whether slaves or the colonized—expected their superiors to abide by certain codes of conduct that created a kind of consensus about how the community should function. These norms and obligations might range from how hard people should work to the provisioning of food. This logic could at times be articulated in ways that helped to foment active resistance or to force masters or colonizers to somehow accommodate to the demands of slaves or colonized peoples.

Oral histories and the recording of songs and other cultural productions pointed to the elaboration of rich critiques of colonial power. They also revealed the important roles of gender and generation. Women contested colonialism in ways that were often very different than men, and younger adults did so

differently than their elders. In Mozambique, women complained of the burdens of forced cash-crop production of cotton and of sexual abuse by local colonial functionaries. Pounding grain into flour offered women an opportunity to converse and to compose songs about their condition as exploited people. "I suffer, I do," women lament in one song (see White and Vail),

I cultivate my cotton,
I suffer, my heart is weeping,
 Picking, picking a whole basketful,
I suffer, my heart is weeping,
 I've taken it to the Boma [market] there,
I suffer, my heart is weeping,
 They've given me five escudos
I suffer, my heart is weeping.

Other songs the women sang parodied colonial officials, using rich and ribald language; the critique of colonialism remained implicit, so as not to invite retribution.

In the 1980s, the beginning of a cultural turn in studies of accommodation and resistance shifted attention away from collective acts such as rebellions. Increasingly, scholars emphasized culture and what people believed and how they felt. The definition of both words shifted from the physical to the mental to embrace historical conditions that could be political, cultural, even psychological. Scholars demonstrated the ways in which the creation of meaning, the ways people imbued the world around them with significance, could be powerfully constitutive of new identities that stood in opposition to slavery or the colonial order. Compliance therefore did not automatically indicate an absence of resistance. Indeed, some forms of accommodation could mask resistance as long as actions somehow mitigated conditions.

Cultural as opposed to political definitions of resistance have emphasized concepts such as moral economy, ritual, hegemony, and hybridity. Scholars of the subaltern school of South Asian history have been especially important in expanding the definitions of resistance and accommodation. They have, for instance, argued that since colonial domination was never total—that is, hegemonic—the culture of the colonized remained autonomous; their behavior cannot be reduced to so many reactions to colonialism. The emphasis thus shifts from resistance or accommodation to the kinds of engagements people had with those who wielded power. The decision the Melians faced more than two thousand years ago was exceptionally stark. Since most forms of domination—including slavery and colonialism—entail some sort of negotiation, scholars in the early twenty-first century focus on the complex cultural borrowing that typically characterizes slave and colonial societies.

For example, rituals and what some have described as "invented traditions" incorporated parts of the slave master's or the colonizer's world, such as dress, ceremony, or even state procedures such as criminal trials. This mixture of artifacts and other facets, what is called syncretism, can be seen most clearly in religion. Slave religions and religious movements through-

out the colonial world have combined Christianity with earlier conceptions based on local gods and ancestor worship. The new beliefs have frequently critiqued the slave or colonial order as not simply unjust but immoral, even evil. They also have helped shape resistance movements such as the Mau Mau rebellion in Kenya (1954–1956) and the 1915 Chitembo revolt in Nyasaland (Malawi).

Definitions of resistance and accommodation now embrace far more than treaties, formal acceptances of defeat, and in the alternative large-scale organized movements against slavery or colonialism. As Fanon suggested, even looking the colonizer in the eye could be a form of resistance. Extending the definitions beyond formal settlements and organized resistance has not only broadened the range of possible examples but ultimately blurred the lines separating words that once had clearly opposed meanings. Even conventional acts of resistance are becoming seen as more ambiguous, since resistance often entails some sort of recognition of and accommodation to the colonizer's world. But the understanding of culture and consciousness raises thorny questions. Can one resist without consciously doing so? Can resistance include at the same time accommodation? The central challenge now facing scholars of slave and colonial societies is how to understand meaning and action within highly unequal relationships and how to creatively rethink those moments when people actively reassert their humanity in the face of power.

RESPONSIBILITY. The term *responsibility* has several related meanings.

First, there is causal responsibility. To say that the short circuit is responsible for the fire is simply to say that the short circuit caused the fire.

Second, there is personal responsibility. This comes in two forms, prospective and retrospective. To say that the lifeguard is responsible for the swimmers' safety is to say that the lifeguard has a responsibility (a duty or obligation) to see to it that the swimmers remain safe. This is a prospective matter, since it points toward the future. In contrast, to say that the lifeguard is responsible for the swimmers' deaths is to say that the lifeguard bears responsibility for something that has already happened; it is to attribute a sort of blameworthiness to the lifeguard for having failed to fulfill a duty. Attributions of retrospective responsibility need not always be negative, though. To say that the generous donor is responsible for the charity's success is to attribute a sort of praiseworthiness to the donor.

Third, there is collective responsibility. This may also be either prospective or retrospective. Sometimes collections of individuals (such as corporations or nations) are said to have duties or obligations, and on such occasions they may also be held to account for fulfilling or failing to fulfill these duties. It is controversial whether collective responsibility is reducible to personal responsibility (so that all statements about the former can be translated into statements about the latter) or rather constitutes a distinct type of responsibility.

Noncausal responsibility, whether personal or collective and whether prospective or retrospective, may be either moral or nonmoral (as when it is legal or professional) depending on whether the duties in question are moral or nonmoral. Furthermore, retrospective responsibility, whether positive or negative, constitutes a susceptibility to reactions that may vary in kind. The most basic kind of reaction consists simply in an evaluation of the person (or collection of individuals) to whom (or which) the attribution of responsibility is made. Thus, to hold the lifeguard responsible, in this basic way, for the swimmers' deaths is to make a negative evaluation of him or her in light of the deaths. A more robust kind of reaction involves treating the person (or group) in some way—for example, by handing out reward or punishment. It is frequently held that justification for the more robust kind of reaction presupposes justification for the basic kind (so that, for example, punishment is warranted only if the person punished warrants a negative evaluation), but this is not universally accepted.

This article will concentrate on responsibility that is personal, retrospective, moral, and basic. Philosophers have concerned themselves with what is needed and what suffices for

such responsibility. Aristotle (384–322 B.C.E.) suggested two distinct conditions, and his discussion has shaped all subsequent treatment of the matter.

The First Condition: Freedom

A common assumption is that, to be responsible (personally, retrospectively, morally, and basically) for something, one must enjoy freedom of will or action. Just what the relevant sort of freedom consists of is controversial, but the central idea is that one's behavior must be within one's control.

There is a venerable argument to the effect that this condition of responsibility is impossible to satisfy, and hence that responsibility is never incurred. The argument involves the thesis of determinism (roughly, the view that every event has a cause) and may be put as follows:

1. If determinism is true, no one is ever in control of what happens.
2. If determinism is false, no one is ever in control of what happens.
3. Determinism is either true or false.

Hence,

4. No one is ever in control of what happens.
5. One is responsible for what happens only if one is in control of it.

Hence,

6. No one is ever responsible for what happens.

Premise 5 states the precondition for responsibility that is at issue. Premise 3 is taken to be a logical truth. The rationale for premise 1 is this: if something is caused to happen, then it is, under the circumstances, inevitable; and if it is inevitable, then no one is in control of it. The rationale for premise 2 is this: if something occurs uncaused, then it occurs at random and if it occurs at random, then no one is in control of it.

Some philosophers have accepted this argument, but it is surely hard to do so. (Others, such as Immanuel Kant [1724–1804], have insisted that the idea that individuals never act freely is, practically speaking, impossible to accept.) Among those who have rejected the argument, some have done so by explicitly disputing one or another of its premises. So-called compatibilists deny the first premise; their number includes such major historical figures as Thomas Hobbes (1588–1679), John Locke (1632–1704), David Hume (1711–1776), and John Stuart Mill (1806–1873). So-called libertarians deny the second premise; among major historical figures, perhaps the most uncompromising proponent of this view was Thomas Reid (1710–1796), although both Aristotle and Kant also flirted with it at times.

More recently, premise 5 has been challenged. Robert Adams has argued that certain sins, for which one is to blame,

are involuntary and hence such that one is not free with respect to them. Examples include the vices of bigotry, cowardice, cruelty, and so on, where these are understood not as a matter of behaving in a certain way (something that may well be under one's control) but of being a certain way, that is, of having certain inclinations, desires, or beliefs (something that may well not be under one's control). Adams's point is that, whether or not these phenomena are under one's control, one is certainly to blame for them.

One way to resist Adams's conclusion is to deny that the phenomena in question are never under one's control. Aristotle took this tack, claiming that, even if individuals have now reached a point in their lives at which certain of their virtuous or vicious traits are beyond their control (not in terms of acting on them, but in terms of ridding ourselves of them or of acquiring them), still there was a time when they could have acted in such a way as to prevent their having them (if they are vices they now have) or to produce them in themselves (if they are virtues they now lack). Another way to resist Adams's conclusion is to acknowledge that individuals may be to praise or blame in some way for such traits, but to deny that such praise or blame constitutes an attribution of responsibility. (Peter Abelard [1079–1142] at times suggested this position.)

Another challenge to premise 5 involves granting the traditional idea that responsibility requires freedom but denying the traditional idea that freedom requires control. Harry Frankfurt has recently pressed this line of thought, urging that the inability to behave differently does not compromise the freedom required for responsibility when this inability does not serve to explain one's behavior. His discussion of this issue has generated a vigorous, subtle, and often complex debate.

An argument similar to, but also importantly different from, the argument concerning determinism has lately garnered considerable attention. The argument ends, as before, with the inference of 6 from premises 4 and 5. The difference lies in the beginning. Now the claim is that 4 (the proposition that no one is ever in control of what happens) is true, not because of any general considerations concerning determinism, but simply because of the fact that luck cannot be eliminated from people's lives. In support of this contention, cases of the following sort are commonly cited: Alf shoots at Bert and kills him. Charlie shoots in like fashion at Dave but, because a bird happens to get in the way of the bullet, fails even to wound him. This case serves to dramatize the fact that, in all one's actions, what one succeeds in doing is in large measure not up to the individual but, as it is often put, up to nature. Or again, it may be that what saves Dave is not a passing bird that intercepts Charlie's bullet but a sudden sneeze that prevents Charlie from even firing his gun. The more one thinks about it (independently of any question of determinism), the more one sees that luck permeates people's lives, eroding the control over, and thereby the responsibility for, their actions that they like to think they have.

The force of such considerations is keenly debated. In light of them, some philosophers appear willing to forgo attributions of responsibility. Others seek to preserve such attributions by rejecting (once again) the traditional idea that

responsibility requires control. Still others seek to preserve such attributions by pointing out that lack of complete control over what happens need not amount to lack of any control.

Finally, just what sort of freedom or control might be thought necessary for responsibility has been a subject of some controversy. Some philosophers propose a fairly thin account, involving one's being in some sense the source of one's actions. Others propose richer accounts, involving some form of autonomy or of responsiveness to reasons. Whatever the proper account may be, it is important to note a distinction between two types of freedom, each of which may initially appear necessary for responsibility. This distinction can best be drawn by means of a familiar example. Suppose that Emma goes into a bank, points a gun at Fiona, the teller, and orders her to hand over all the money in her till. Fiona complies. Two questions arise: did Fiona freely hand over the money and is she responsible for doing so? One's initial inclination may well be to answer "No" to both. One may be tempted to add that the negative response to the first question is the ground for the negative response to the second. But on reflection this may seem mistaken. Although there certainly seems to be a sense in which Fiona did not act freely (for she was strongly coerced to do what she did), there is also clearly a sense in which it seems she did act freely; she had a choice in the situation (albeit an unpleasant one) and, one may assume, she made the right choice. Indeed, in light of this, it may well be appropriate to praise her for acting as she did, and this would seem to imply that she is responsible for her conduct after all. It thus seems that the sort of freedom necessary for responsibility (if, indeed, any sort of freedom is necessary) is that which Fiona exemplified rather than that which she failed to exemplify.

The Second Condition: Mentality

Control over one's behavior is not all that is necessary for responsibility. Gwen, a young child, may have control over what she does (for example, she may freely choose to yank the tail of the family cat), but that is no reason to hold her morally responsible for her behavior.

What is it that Gwen lacks? The obvious answer is that she fails to understand the moral character of her action and is thus not to blame for it. This suggests that one is blameworthy (in a way that imputes responsibility for one's behavior) only if one is aware that one is doing wrong. At least three reasons may be given for rejecting this view, however.

First, ever since Plato (c. 428–348 or 347 B.C.E.), philosophers have claimed that it is not possible freely to act in the belief that one is doing wrong, since this requires that one willingly do wrong, which is impossible. (Of course, many philosophers have rejected this claim. Indeed some, such as St. Augustine of Hippo [354–430], have gone so far as to suggest that it is possible to have wrongdoing as one's ultimate objective.) Although this claim may seem at odds with common experience, its plausibility may grow on reflection. For example, many apparent instances of willing wrongdoing may reveal themselves on inspection to be better characterized as cases of doing something that one merely believes that others take to be wrong.

Second, to be aware that one is doing wrong implies that one is indeed doing wrong, but some philosophers have claimed that blameworthiness merely requires the belief, and not the fact, that one is doing wrong.

Third, blameworthiness seems often to be incurred through negligence, which in many cases involves the failure to be aware that one is doing wrong; indeed, it is this very failure that seems to ground the attribution of responsibility.

On these arguments, it is doubtful that awareness of wrongdoing is necessary for blameworthiness. Yet, as the case of Gwen indicates, it seems that one must satisfy some rather sophisticated mental condition to be blameworthy; just what this condition is, however, remains unclear. Similarly, presumably some other rather sophisticated mental condition must be satisfied if one is to be praiseworthy (in a way that imputes responsibility for one's behavior). Again, it is controversial just what this condition is. Some philosophers appear to think that simply having good intentions will do; others, such as Kant, insist that one must have doing one's duty as one's ultimate objective.

Finally, there is the question of the relevance of mental disorders to responsibility. It is commonly said that suffering from a mental disorder relieves one of responsibility for one's conduct. But this is far too sweeping. While kleptomania may provide an excuse for theft, it surely provides no excuse for assault; similarly, pyromania may furnish an excuse for arson but not for theft. There must be some close connection between disorder and offense for an excuse to be in the offing. Even then, whether an excuse is indeed available is debatable. Suppose that Holly is a kleptomaniac; why think she therefore has an excuse for theft? One answer is that she literally cannot help stealing. But this seems dubious. More accurate would seem to be the claim that she finds it abnormally difficult, rather than literally impossible, to resist the impulse to steal. But if there is the possibility of resistance, why excuse her for failing to resist? Perhaps she is not to be excused after all, if she recognizes that it is wrong to steal. Or perhaps the unusual strength of the impulse to steal makes it justifiable for her to succumb to it, so that she is indeed not to blame for doing so. Or perhaps she is not justified in succumbing to the impulse but is still not to blame for doing so because of some aspect of her mental state that has yet to be identified; for it is noteworthy that we tend rather to pity people such as Holly than to judge them wicked.

It is safe to say that the grounds for attribution of moral responsibility are complex and that, despite Aristotle's lasting contributions, the discussion that began with him remains unresolved.

REVELATION. See *Religion; Sacred Texts*.

REVOLUTION. It is tempting to give a definition of revolution at the outset of an account such as this. This is a temptation to be resisted. The great sociologist Max Weber (1864–1920) was right to say that “definition can be attempted, if at all, only at the conclusion of the study.” Another great thinker, Friedrich Nietzsche (1844–1900), declared that “only that which has no history can be defined.” Both of these remarks are highly relevant to the concept of revolution. It is best to postpone any attempt to define it until one has inquired into its history. As a humanly made event, revolution cannot be seen as a timeless thing, lacking change and variety. Like all human artifacts it has a history, and that must mean change. Our understandings of revolution must be sensitive to those changes. There cannot be any “essentialist” definition of revolution, any account that assumes some permanent, unvarying meaning, stretching across space and time.

This does not mean, on the other hand, that revolution can mean just anything (except, that is, to advertisers and marketing people who announce every new model of a motor car as a revolution). The various European languages have naturalized the word revolution—*révolution*, *Revolution*, *rivoluzione*, *revolución*—to mean much the same thing. That is because Western societies have shared certain common legacies and certain common experiences. The concept of revolution has reflected that shared tradition. While we should not

therefore expect revolution to carry one unequivocal meaning everywhere, we should at least expect what Ludwig Wittgenstein (1889–1951) called “family resemblances” between the various uses and understandings.

Revolution, finally, is a European invention. The meaning that it has in the world today derives from European use and experience. As a particular species of change it had no equivalent in the non-European world. The theory and practice of revolution was carried, along with other European inventions such as industrialism and nationalism, by traders, missionaries, and colonizers along the paths laid out by the European empires, formal and informal. It was learned and studied by non-Western intellectuals in the cities and academies of the West. If, as is indeed the case, revolution has become a worldwide inheritance, that is because Western principles and patterns of politics have become the norm for much of the world.

That some of the meanings in the non-Western world differ from those in the West is only to be expected from a concept that has always, even in the West, been sensitive to particular contexts and particular histories. The Russian understanding of revolution has been different from that of the French, and that too from the English or American, which have in their turn differed from German or Spanish conceptions. So African, Asian, and Latin American ideas of revolution have shown characteristic variations reflecting their different cultures. Even here, however, it is possible to see the same family resemblances that are observable in the Western cases. The fact that revolution has a tradition of use and meaning explains its variability; but it also points to continuities and similarities. The Western origin of revolution has meant that, as an ideal and a practice, it carries a certain basic stamp that enables us to identify and study it as a coherent phenomenon wherever it appears. Not anything can be called a revolution, whatever the claims of either its adherents or detractors.

Classical and Christian Conceptions

Revolution is an invention of Western modernity. In its generally understood meaning today, it was unknown in the ancient world. Nor was it understood in our sense in the European Middle Ages, or in the early modern period. It was only in the eighteenth century, with the American and French Revolutions, that the word *revolution* acquired its modern connotation of fundamental and far-reaching change.

The ancient Greeks certainly had their fill of violent politics; but they had no word for revolution, nothing that truly corresponds to our modern understanding of it. The commonest terms, used by both Thucydides (d. c. 401 B.C.E.) and Aristotle (384–322 B.C.E.), were *metabole politeias* (“change of constitution”), and *metabole kai stasis* (“change with uprising, change due to factional strife”). Plato in the *Republic* uses plain *metabole* (“change”), or occasionally a phrase such as *neoterizein ten politeian*, usually translated as “to revolutionize (or renew) the state.” But this translation, with its connotation of purpose and novelty, is misleading. Plato (in book 8 of the *Republic*) is discussing the inevitable decline of the ideal state, first into a timocracy then, though a series of successively determined stages, into an oligarchy, a democracy, and so to tyranny.

Political cartoon relating to the execution of Charles I during the English Civil War, c. 1660s. Many historians consider the English Civil War to be the first true large-scale revolution. The war led to substantial change in England’s government, including the execution of the ruling monarch and the establishment of a republic. © CORBIS

In this highly determinist pattern, there is no room for that consciously directed change that we associate with revolution.

The problem indeed is largely one of translation. *Stasis*, for instance, is regularly rendered by modern translators as “revolution.” Thus book 5 of Aristotle’s *Politics* is generally treated as a discussion of causes of revolution, while Thucydides, in various parts of *The Peloponnesian War*, is usually held to have given a brilliant account of the revolutionary condition of the Greek city-states at the time of the war (e.g., book 3, ch. 5: “Practically the whole of the Hellenic world was convulsed. . . . Revolution broke out in city after city.”).

The trouble is that, just as Plato is not speaking of revolution but of the predetermined turns of the political cycle, so Aristotle and Thucydides are not speaking of revolution but of faction or party, and the violent conflicts that spring from them. A condition of stasis is one of party warfare, one, moreover, where though there may be much noise and fury, there is little

The storming of the Bastille during the French Revolution, engraving after a painting by Francois Flamena, 1879–1881. The French Revolution is widely hailed as the epitome of revolutions, the revolution against which all others are measured. Afterwards, the concept of revolution became one of the triumph of human will against an unjust society. © CORBIS-BETTMANN

real change. *Stasis* derived from words meaning “standing still,” “stationariness,” “bring to a standstill,” and in contexts (e.g., Plato’s *Cratylus*) where it is said to be “denial of movement.” When applied to politics, it conjured up a picture of opponents locked in frenzied conflict, preventing, by the very violence and fanaticism of their mutual antagonism, any real change or any genuine resolution of political problems. In so far as revolution is concerned with fundamental change and the starting of new things, where there is *stasis* there cannot be revolution.

Similarly the widespread classical conception of revolution is of the turns of the political cycle, mirroring, or perhaps instancing, the cycles of growth and decay in nature. It excludes all ideas of true novelty, as well as of human agency. Plato had left the cycle incomplete. The degeneration of his ideal state ended with tyranny. It was left to the Greek writer Polybius, drawing explicitly on Plato, to complete the cycle, and to make tyranny pass back into the ideal state, when the cycle would begin all over again. What drove the cycle was Fate or Fortune (*tukhe*). Revolutions were the turns of For-

tune’s impassively revolving wheel—hence inevitable and irresistible, beyond human willing or control. “Such,” wrote Polybius (c. 200–118 B.C.E.), “is the course of political revolution (*politeion anakyklosis*), the course appointed by nature in which constitutions change, disappear, and finally return to the point from which they started.”

The importance of Polybius’s contribution was his influence on Roman writers, such as Cicero (106–43 B.C.E.), and through them the whole later classical and early Christian world. The standard terms—*metabole* and *stasis*—from the Greek political lexicon were glossed in Latin as *novae res, mutatio rerum*, and *commutatio rei publicae*. But when it came to fitting these phenomena into a philosophy of politics Roman writers were apt to fall back on the Platonic idea of the cycle, as amplified by Polybius. For Cicero, for example, the “revolution” whereby Julius Caesar attained power was an instance of the natural cyclical process described by the Greek philosophers. It marked the turn of the circle—*orbis*—that described political change generally.

The palace guards opened fire on the demonstrators, and the uprising of protest that followed eventually resulted in the first Russian Revolution. HULTON/ARCHIVE BY GETTY IMAGES

Christian writers of the Middle Ages were content to follow this respectable example, the more so as its Stoicism fitted in well with a cosmology that was even less inclined to allow freedom to merely human volition. By comparison with the cosmic “revolution” of Christ’s coming, and the end of human history that it portended, all secular changes among humans paled into insignificance. Platonic conceptions, which in any case tended to disparage the things of this world, were highly suited to this view. The political cycles of the earthly city could be seen as the secondary counterpart to the predominant rectilinear pattern of Providential history, which was preparing the way for the consummation in the heavenly city.

It was in fact from the heavens that the word *revolution* descended to enter the earthly domain of politics. Astrology provided the link. The word *revolutio*—from *revolvere*, “to roll back,” “to come back,” “to return in due course”—was a late Latin coinage. St. Augustine of Hippo (354–430) used it to refer to the migration of souls. It then came to be applied to the revolutions of the heavens, to the cyclical rotations of the planets and stars in their fixed orbits. The astronomical usage, as in Nicolaus Copernicus’s *De revolutionibus orbium coelestium* (1543), predominated until the late seventeenth century. But earlier it had already come to be applied to human society, through the widely shared astrological belief in the in-

fluence of the stars on human affairs. The revolutions of the heavens were the direct cause of revolutions among humans.

This confirmed rather than modified in any substantial way the concept of revolution as the turn of Fortune’s wheel. For not only were the movements of the stars as independent of human agency as the dispositions of Fortune (cf. Hamlet’s “Here’s fine Revolution,” as he muses on Yorick’s skull). They operated according to the same laws of motion as the political cycles of the Greeks. Each movement was preordained and predictable, a step or phase in the complete orbital cycle that returned the star or planet to its original starting point. The revolutions of the stars were therefore as bereft of novelty as the revolutions of the seasons. As Hannah Arendt has written of the astronomical *revolutio*, “if used for the affairs of men on earth, it could only signify that the few known forms of government revolve among the mortals in eternal recurrence and with the same irresistible force which makes the stars follow their pre-ordained paths in the skies” (p. 35). The astronomical conception of political change dominated the uses of the term *revolution* from the fourteenth to the sixteenth centuries. The *rivoluzioni* of the North Italian cities of the fourteenth century—when the term first entered the political vocabulary to denote violent political change—were seen in the perspective

Poster celebrating the Red Navy during the Russian Revolution, 1917. Two successive uprisings in 1917 by Russian peasants and the working class led to the overthrow of the monarchy and created the first Communist regime. © BETTMANN/CORBIS

of the cyclical conception derived from classical antiquity. Most commonly *revolution* was used in some sense of restoration, the return to a truer or purer or more original state of things. This was the meaning of its use in relation to the pro- and anti-Medicean revolts in Florence in 1494, 1512, and 1527. Widely called *rivoluzioni* by contemporary observers, the revolts were held by their supporters to bring back the better state of affairs displaced by their rivals. A similar meaning underlay the use of the term *révolution* to describe the conversion to Catholicism of the French king Henry IV in 1593. By so disarming his enemies, the Catholic League, and causing massive defections to his side, Henry was said both to have brought about an irresistible turn of the wheel of Fortune and at the same time to have restored the kingdom to an earlier condition of health (Griewank, p. 145). In this late sixteenth century usage one sees as clearly as anywhere the persistence of a concept of revolution in which the quality of novelty is conspicuously absent.

The Seventeenth Century

It has been common to see the seventeenth century as the source of the modern idea of revolution. Partly this is due to

the fact that seventeenth-century Europe was profoundly shaken by a great wave of rebellions and civil wars. There were revolts in the Netherlands against Spanish rule; major rebellions in France—the Fronde—and in several of the territories of the Spanish monarchy—Catalonia, Portugal, Naples, and Sicily; Scotland and Ireland rose against English domination. Above all there is the English Civil War of 1642–1649, seen by many, such as Karl Marx, as the first of the “great revolutions” of modern history.

Most historians agree that, however bloody the conflicts, most of these rebellions were just that—rebellions, not revolutions. These were traditional uprisings by traditional actors. There was no attempt to create anything new or different. Peasants, townsmen, and disaffected aristocrats appealed to “the ancient and fundamental laws of the kingdom,” to customs, traditions, and the “good old ways”—in other words, to the past—in their struggles with their rulers. The aim was to bring back or to confirm historic institutions—the French parlements and Estates-General, the Spanish Cortes, the Catalan *diputació*, the English Parliament.

The English Civil War, however, has seemed to many a different kind of conflict, one deserving the name *revolution* in the modern sense. Did the English not execute their king, abolish the monarchy and the House of Lords, disestablish the Church of England, and proclaim a republic? In a more far-reaching way, did the English Civil War not clear the way for capitalist development, so launching England on the path that was to take it to the pinnacle of the world economy? Contemporaries called it “the Great Rebellion,” but should we not be prepared to call it, with Lawrence Stone, “the first ‘Great Revolution’ in the history of the world” (p. 147)?

One needs to attend to the language of contemporaries, and to beware of imposing our often anachronistic interpretations on past events. In relation to the events that occurred between 1640 and 1660, and even to those of 1688, contemporaries largely avoided the newly coined political term “revolution.” When they did use it, they gave it the meaning current in early modern political thought. That is, they employed it with the cyclical connotation derived from its astronomical usage. That is why it so often appeared in plural form, as when Robert Sanderson wrote in 1649 of “the confusions and revolutions of government,” or Matthew Wren in 1650 of “those strange revolutions we have seen.”

Most revealingly of all, what we call the “Restoration” of 1660 was widely hailed as a “revolution.” It was so termed by Lord Clarendon, the first historian of what he called, referring to the events of the past twenty years, the “Great Rebellion.” Thomas Hobbes, in his *Behemoth* (1668), was also clear that with the return of Charles II in 1660, a political cycle had been duly completed: “I have seen in this Revolution a circular motion of the Sovereign Power, through two Usurpers, from the late King to his Son.” Nor was it just monarchists and conservatives who remained wedded to the traditional concept of revolution. What was later to be sanctified as the “Glorious” or “Bloodless” Revolution of 1688 was also at the time understood to be a revolution in the tra-

ditional sense of the word. The parliamentary Whigs, taking their cue from John Locke, here turned the tables on Clarendon and the supporters of the Restoration by arguing that not 1660 but 1688 was the true restoration, hence the true, final revolution. Charles II, and even more James II, had flouted the fundamental laws and violated the original constitution of the kingdom every bit as much as Charles I and Oliver Cromwell. All had plunged the country into a cycle of violence and oppressive but unstable regimes. Only with the restoration of a truly constitutional monarchy in 1688 had the cycle run its course.

One is entitled, for certain purposes, to argue that the men and women of the seventeenth century knew not whereof they spoke, that when they spoke of “restoration,” we can quite properly speak of revolution in the modern sense. This claim has been especially made for the radicals of the English Civil War, the Levellers and Diggers, who are said to look forward to the socialist and communist revolutionaries of a later century. But why deny the reality to the radicals of the language that they used to describe their actions? When Levellers protested against “the Norman yoke,” this represented to them a real usurpation of traditional English rights and liberties by an alien ruling class. When the Diggers proclaimed communism, this was because, as their leader Gerard Winstanley said, they wished to restore “the pure law of righteousness before the Fall,” to make the earth “a common treasury again.” Along with such groups as the Fifth Monarchy men, the Diggers believed that Christ’s Second Coming, as foretold in the Book of Revelation, was imminent. With it would come “a new heaven and a new earth,” Christ’s millennial reign on earth. These were all convictions sincerely and powerfully held. On what grounds are we to say that they were deluded, that their actions really meant something else?

Millennial imagery and even doctrine are not foreign to modern concepts of revolution. It is even possible to argue, as Melvin Lasky does, that without this millenarian background, the idea of revolution is inconceivable. But revolution is no more religion than it is restoration—not, at least, in the senses that the term has come to hold for us. At some point revolution was stripped of its religious associations and launched on an independent career as a secular concept. This was the accomplishment of the American and French Revolutions of the eighteenth century. It is to them we must look for the birth of the modern concept of revolution.

Inventing Revolution: American and French Revolutions

The pull of the past is nowhere more evident than in the case of the American and French Revolutions. Repeatedly they made reference to the heroic deeds and figures of the past. Rome, the Rome of the Republic, was an inspiration to both revolutions. The revolutionaries frequently saw themselves in the guise of Gracchus or Brutus, opposing tyranny and striking a blow for the liberty of the people. Their painters and sculptors portrayed them in Roman costume. In their speeches they quoted the great Roman orators. They wished to revive the public spirit and civic virtue of the Roman Republic, to make citizens out of subjects.

The American and French Revolutions did in truth both begin with conservative intentions, or at least pretensions. The Americans wished, they said, to go back to the working arrangement that they had had with the British state since the seventeenth century, an arrangement upset by the “innovations” of the British Parliament; the French wished to restore power to the old institutions of the parlements and the Estates-General, in the face of a reforming and “modernizing” monarchy. In both cases the revolution rapidly went beyond these conservative premises, to the consternation of many who began the revolution. A new concept of revolution emerged in the course of these revolutions. Tom Paine, whose pamphlet *Common Sense* (1776) saluted the American Revolution as “the birth-day of a new world,” went on in *The Rights of Man* (1791–1792) to see the French and American Revolutions as jointly inaugurating a veritable “age of Revolutions, in which everything may be looked for.”

“What were formerly called Revolutions, were little more than a change of persons, or an alteration of local circumstances. They rose and fell like things, of course, and had nothing in their existence or their fate that could influence beyond the spot that produced them. But what we now see in the world, from the Revolutions of America and France, are a renovation of the natural order of things, a system of principles as universal as truth and the existence of man, and combining moral with political happiness and national prosperity.” (Paine, 1984 ed., p. 144)

Americans, increasingly dismayed by what many saw as the excesses of the French Revolution (though Thomas Jefferson was not one of them), progressively downplayed the significance of their own revolution, giving it a conservative interpretation that dominated all discussion until recently. In this they paid unconscious homage to the defining character of the French Revolution. Fairly or not, it is the French, not the American, Revolution that has come to be seen as the inventor of the modern concept of revolution.

The French Revolution is the model revolution, the archetype of all revolutions. It defines what revolution is. This is a matter of fact rather than of conceptual analysis—or rather, it is a matter of the concept being shaped by the historical experience. For not only was it during the French Revolution that the concept of revolution unmistakably acquired its modern meaning. The French Revolution also established the classic pattern of revolution. It named the revolutionary experience, and wrote the script of the revolutionary drama. It showed, by its own example as well as its attempt to export its revolution, by its ideas as well as its armies, what it is a society must do to undergo revolution. In this sense the French Revolution was not simply the first great revolution. It can seriously be argued to be the only revolution. All revolutions subsequently were indebted to it. It was from the French that they borrowed their concept; it was the French Revolution whose practice they attempted to imitate—even when they hoped to go beyond it.

With the French Revolution, the hesitations and ambiguities of earlier revolutions were swept aside. Revolution now acquired its distinctively modern meaning. It came to mean, not the turns of a recurrent cycle or the reversion to some earlier condition, but the creation of something radically new: something never before

seen in the world, a new system of society, a new civilization, a new world. Moreover it lost—though never entirely—its connotation of something natural, inevitable, and irresistible, something occurring beyond the province of human agency or the possibility of human intervention. Revolution was on the contrary now something quintessentially man-made. It was the action of human will and human reason upon an imperfect and unjust world, to bring into being the good society. This was for the philosopher Georg Wilhelm Friedrich Hegel the great discovery of the French Revolution: “Never since the sun had stood in the firmament and the planets revolved around him had it been perceived that man’s existence centres in his head, i.e. in Thought, inspired by which he build up the world of reality. . . . This was accordingly a glorious mental dawn. All thinking beings shared in the jubilation of this epoch” (Hegel, 1956 ed., p. 447).

With the example of the French Revolution before them, it became possible for contemporaries to see earlier events as comparable in several important respects, and retrospectively to baptize them as revolutions—often with a polemical purpose in mind. French revolutionaries such as the Marquis de Lafayette, who had fought with the Americans against the British, were quick to refer to “the American Revolution,” by analogy with what they saw as the similarly heroic enterprise embarked upon by the French in 1789. The French historian and liberal statesman François Guizot, in his *Histoire de la révolution d’Angleterre* (1826), was the first to call the English Civil War a revolution in the modern, that is, French, sense, in his case with the cautionary purpose of championing English moderation against French fanaticism. Dutch historians began to discover in the sixteenth-century “revolt of the Netherlands” rather a “Dutch Revolution.”

Nor did the comparisons remain solely in the political field. The technological and economic developments transforming England in the early nineteenth century were seen in the 1820s as “the industrial revolution.” Later scholars were to speak of “the revolution of the Baroque” and of “the scientific revolution” of the seventeenth century, to refer to the thoroughgoing changes in artistic practice and in scientific thought in that period. They would also speak of “revolutions of humanity,” such as the Paleolithic and Neolithic revolutions, or the “urban” or “agricultural” revolutions. Changes of an epoch-making kind routinely came to be called revolutions, as in “the Roman Revolution,” which produced the principate out of the republic in the first century of the common era.

In all cases what gave the term its meaning was the analogy with what increasingly came to be designated “the Great French Revolution” of 1789. In whatever sphere it was employed, political, economic, or cultural, revolution meant dramatic, fundamental change, change in a radically new direction, a complete change of “paradigm,” to use the term popularized by the philosopher of science Thomas Kuhn. Whether, especially in the political realm, the change had to be accompanied by violence, as in the French case, remained a matter of dispute. “Violence is the midwife of the old society pregnant with the new,” said Marx; but Vladimir Lenin, noting this, penciled in the laconic comment, “some births are difficult, others easy.” What mattered in the end was not so

much violence as the degree and intensity of the change. Revolution was a speeding up of evolution. It was an action by which men changed utterly the way they had traditionally done things. It looked to the future, not to the past.

In this respect, too, the future belonged to the French Revolution, as much as it inspired a renaming and reimagining of past episodes of change. Not the English or the American Revolution but the French Revolution became the inspiration of the revolutionary movement throughout Europe and the rest of the world. Marx called it “the lighthouse of all revolutionary epochs,” and he remained indebted to its example in his conception of the future socialist revolution. In the understanding of revolutionaries and revolutionary theorists everywhere, to undergo revolution was to imitate the French. The French Revolution displayed the universal “logic of revolution,” the stages or phases through which all revolutions must pass. There would be a “rule of the moderates” followed by “the rise of the radicals,” Girondists followed by Jacobins. Terror would give way to Thermidor, the point at which the revolution ceased its radicalization and tried to achieve a period of stability. As in the French case, this would often lead to a military dictatorship that claimed to safeguard the gains of the revolution. The symbolic dates of the French Revolution marked, for generations to come, the successive phases of the revolutionary process: the “Fourteenth of July” (capture of the Bastille and seizure of power), the “Ninth of Thermidor” (fall of Maximilien Robespierre and the beginning of the period of stabilization), the “Eighteenth of Brumaire” (Napoleon’s coup d’état and the inauguration of the dictatorship). If, as was claimed in the nineteenth century, *le nouveau Messie, c’est la Révolution* (“revolution is the new Messiah”), it was the French Revolution that had inspired these apocalyptic hopes.

The Revolutionary Idea in the Modern World

The idea of revolution, once invented by the French—Americans having for the most part disclaimed the patent—rapidly became the possession of the entire world. This was partly because the idea was carried on the bayonets of Napoleon’s armies in the French bid to revolutionize the whole of Europe. But the defeat of Napoleon was no barrier to the further spread of the idea. All attempts to repress it only seemed to lend it strength. It inspired a whole series of later revolutions in France, the land of its birth, in 1830, 1848, and 1871. In 1848 practically the whole of Europe—Britain and Russia were almost the sole exceptions—was convulsed by revolution. The idea had a particular appeal for intellectuals in Central and Eastern Europe, who embraced it with messianic fervor. In Russia in particular it found fertile soil, so much so that revolutionaries in Western Europe began to look to Russia to give the signal that would light the torch of revolution everywhere.

The idea of revolution as expressed by the French Revolution appealed because of its simplicity and universality. “Liberty, Equality, and Fraternity” could inspire populations from Brussels to Beijing, from Poland to Peru. Of course there remained the question of how to interpret and apply its terms. Here the main modification to the original idea consisted in seeking to realize liberty and equality in the social as well as the political realm. This was the contribution of the nineteenth-century socialists, supremely in the thinking of Karl

OLYMPE DE GOUGES (1748–1793)

Olympe de Gouges—the self-invented name of Marie Gouzes—was a playwright and pamphleteer who took an active part in the French Revolution. She agitated for the emancipation of slaves, divorce, and the rights of illegitimate children and unmarried mothers. After her own unhappy marriage she renounced marriage as such, proposing that the marriage contract be replaced by a “social contract” that specified the equal rights of the partners, including the right to end the union. Her best-known work is the *Declaration of the Rights of Woman and Citizen* (1791), a direct riposte and corrective to the more famous *Declaration of the Rights of Man and Citizen* of 1789. In it she strove to reconcile the abstract universality of that document, which she thought unreal and dangerous, with an acknowledgment of difference. Men and women were different, she argued, just as nature was variegated, but both were equally the bearer of rights, equally capable of agency and action. The Jacobins, like nearly all the leading French revolutionaries, were hostile to the claims of equality for women. They denounced Olympe’s activities as “unnatural,” and condemned her to death in 1793 for plastering the walls of Paris with posters opposing Jacobin centralization and in favor of the Girondist program of decentralized federalism.

Marx. For Marx, the French Revolution remained to be completed. It had freed the capitalists, the bourgeoisie, but at the cost of turning the mass of workers into exploited and propertyless proletarians. The liberal gains of the French Revolution—and Marx never denied that they were gains—had to be converted into the emancipation of the people as a whole. This would be accomplished by a socialist or communist revolution that would abolish private property and bring about the “free association of producers.” In the final condition of communism, following the transitional “dictatorship of the proletariat,” the state itself would “wither away,” having no necessary function. In this vision of the future, the Marxist concept of revolution fused with that of the anarchists, who had particularly strong followings, through the teachings of Pierre-Joseph Proudhon (1809–1865) and Mikhail Bakunin (1814–1875), in France, Russia, Spain, and Italy.

It is fair to say that, in one version or another, the Marxist concept of revolution came to dominate not just Europe but the world beyond in the later nineteenth and the twentieth centuries. This was perhaps inevitable, given the massive disruption and distress caused by the relentless march of capitalist industrialization across the globe. The Paris Commune of 1871, which Marx hailed as the first truly proletarian revolution, can perhaps be taken as marking the divide between the older, more purely political, concept of revolution, and the later one that made social and economic transformation the heart of the revolution. Symbolically, the old revolutionary hymn of the *Marseillaise* was replaced by the new socialist anthem, the *Internationale*; the red flag of the socialists replaced

the tricolor of the liberals. Not surprisingly, the Russian Revolutions of 1905 and 1917 gave a massive impetus to this socialist understanding of revolution, as did the later success of socialist revolutions in China (1948) and in Cuba (1958).

The Russian Revolution of 1917 became the type of twentieth century revolutions, especially in the non-Western world. It seemed to solve the difficult question of how to make a socialist revolution in conditions that, in a strictly Marxist understanding, were highly unpromising. Marx had expected the socialist revolution to begin in the advanced industrial societies, such as France, Germany, or Britain, where the industrial working class or proletariat made up the vast majority of society. Russia, like many other non-Western societies, was at the time of its revolution 80–90 percent peasant. It also had a relatively small and weak middle class. But in the main urban centers, such as St. Petersburg (Petrograd), it had a proletariat that, though small, was highly developed, well organized, and politically very conscious.

The Russian revolutionaries, especially Lenin and Trotsky, elaborated a theory of socialist revolution in which, under the guidance of the proletariat, the mass peasant population would be induced to rise in rebellion and to take over the land, at the same time as the proletariat took over the factories. Together the workers and peasants would coordinate the socialist revolution, after suppressing their common enemies among the bourgeoisie and the aristocracy. Throughout a significant role was marked out for the worker’s party—in this case the Bolshevik party—as the theoretical organ and directing force

of the revolution. But it was always stressed that rule by the party was in the nature of a temporary, bridging, operation, mainly concerned with mopping up the remaining pockets of resistance and in preparing the workers for direct rule.

Here then was a new model of revolution, though particularly appropriate for countries, such as Russia, that had not been through a “bourgeois revolution” and had not as a result enjoyed the benefits of liberal or constitutional rule. The proletariat, organized by the party, would in effect carry out a dual or two-fold revolution. It would overthrow autocratic or authoritarian rule, here accomplishing the aim of the classic bourgeois revolutions, such as the English and French revolutions; and it would also push through, in a single, uninterrupted sequence, to the proletarian or socialist revolution. Both political and social emancipation would be achieved by the self-same agency, in the same act of revolution. No wonder that, whatever the misgivings about the course of the revolution in Russia, such a model proved so compelling to those many non-Western countries that saw themselves as standing in the same semi-feudal and backward condition as Russia on the eve of 1917.

But it would be wrong to overstress the differences between the socialist and earlier conceptions of revolution. For Marx the French Revolution of 1789 was always the model revolution, the one that provided the essential terms of revolutionary conflict as a conflict of classes. If the French Revolution was a “bourgeois revolution,” the coming socialist one would be a proletarian revolution. It would differ in that the proletarian revolution would lead to general emancipation instead of the emancipation of only one class. But the form of the revolution, the conditions under which the proletariat would gather its strength and overthrow its oppressors were precisely modeled on the rise of the bourgeoisie in feudal society. Thus both in its form—class struggle—and its intention—liberty and equality, now understood in social and economic as well as political terms—the socialist revolution could plausibly be presented simply as the continuation and completion of the enterprise started by the French Revolution. This was the claim of many prominent socialist revolutionaries. “A Frenchman,” wrote Lenin to a French comrade in 1920, “has nothing to renounce in the Russian Revolution, which in its method and procedures recommences the French Revolution.” Fidel Castro, in his defense speech at the Moncada trial of 1953 (1968), saw the very existence of an independent Cuba as an inheritance of the European revolutionary tradition, and he looked back to the French Revolution to justify his actions and to proclaim the inevitability of revolution in Cuba.

Of course there had to be modifications even to the socialist idea of revolution, especially as it moved beyond its European base and encountered different conditions and different traditions in the non-Western world. The most important amendments were provided by Mao Zedong in China, Vo Nguyen Giap in Vietnam, and Castro and Che Guevara in Cuba—leaders and fighters as well as theoreticians. What especially concerned them was the role of the peasantry in what were overwhelmingly peasant societies. The predominantly urban tradition of revolution had to be rejected. “The city,” observed Castro of the Latin American experience, “is a cemetery of rev-

olutionaries and resources.” In place of the city and the urban workers they looked to the countryside and the organization of the peasants—in their traditional communities, if possible, in the form of mobile guerrilla bands if for whatever reasons this proved strategically dangerous (as for instance it appeared to do so in Cuba and Latin America generally). This was the revolutionary strategy that, often after decades of struggle, led to the success of the Chinese, the Cuban, and the Vietnamese revolutions. These in turn became the inspiration, the “model” revolutions, for other Third World societies. Socialist in form and rhetoric, they quite often—as in many African cases—embodied fundamentally nationalist aspirations in societies seeking to throw off colonial rule.

In the West too, changing conditions brought about modifications to the inherited concept of revolution. Revolution on the barricades began to appear increasingly unreal in societies where sophisticated firepower and counterinsurgency techniques gave states overwhelming power against potential insurgents. The fate of the Hungarian revolution of 1956 gave the clearest indication of this, as did, in a somewhat different way, the failure of the “Prague spring” of 1968. In the face of this, the student revolutionaries in Paris and elsewhere in 1968 turned away from direct confrontation with the state and invented subversive techniques based on ridicule and new forms of cultural opposition. “All power to the imagination”; “Be a realist: demand the impossible”; “I am a Marxist—Groucho style”—such were the slogans on the posters that the students plastered all over Paris in May 1968. Marx was still an influence, but it was Marx the philosopher of alienation rather than Marx the anatomist of the capitalist economy who continued to be an inspiration. In addition, and often taking over, were influences derived from the Dadaists and Surrealists, together with a radical reading of Sigmund Freud.

Revolution has not been a prominent feature of Western societies since World War I—not, that is, revolution as it has traditionally been understood in the libertarian, “left-wing,” versions inherited from the French Revolution. There have been some who have spoken of the Nazi or the fascist revolution, and have tried to offer a “right-wing” concept of revolution. This has to struggle with a whole tradition of meaning derived from the European experience of the past two hundred years. Inequality, authoritarianism, and racism—central elements of fascist ideology—simply have not been part of the revolutionary inheritance, whatever the practices of states, such as the Soviet Union, that claimed the revolutionary mantle. Condorcet’s statement of 1793, that “the word revolutionary can only be applied to revolutions which have liberty as their object,” aptly sums up the predominant and persistent meaning of the concept, as it has been elaborated by successive theorists since the French Revolution.

Nowhere was this demonstrated more forcibly than in the 1989 revolutions, the revolutions that overthrew communist rule throughout Central and Eastern Europe, eventually, in 1991, dissolving the Soviet Union itself. While in the same year the French and other Western Europeans, contemplating with a conspicuous lack of enthusiasm the bicentennial of the French Revolution, appeared disillusioned with the whole idea of rev-

olution, Eastern Europeans embraced it with fervor. Crowds occupied the squares of Prague, Warsaw, Budapest, and Bucharest, forcing, in almost classic demonstration of the power of the people, their rulers to depart. If the West had forgotten its revolutionary heritage, the same had not happened in the East. Moreover, it was not, for obvious reasons, the Marxist or socialist idea of revolution that inspired the East Europeans. In a remarkable reversal, what they looked back to, what was evident in almost every demand they made, was the tradition of the eighteenth-century American and French Revolutions. It was individual rights, a free civil society, and a liberal constitution that were the centerpieces of the programs of 1989.

Do the 1989 revolutions mark the end of revolution in the West, as many have claimed? Are they the final deposit of the revolutionary tradition? This may be too shortsighted a view, even for the West and certainly from the perspective of the world as a whole. In November 2003 the people of Georgia, one of the former republics of the Soviet Union, rose up against a corrupt ruler in a classic display of revolutionary action. Elsewhere in the world—in China, in Latin America, in the Middle East—there are intermittent but persistent revolutionary stirrings. Many of these are now mixed with religion, following the example of the Iranian Revolution of 1979. Revolution has always been a changing and many-sided thing. We can be sure there are many surprises in store for us still.

Overview

Ancient and Medieval

OVERVIEW

Rhetoric governs the effective use of verbal and nonverbal communication designed to influence an audience. Understood in its broadest sense, it is practiced more or less deliberately in all societies. Even the animal world seems to apply some of its principles. But in its original and historical form, rhetoric is associated with the use of human discourse to persuade and can be defined as the art of speaking, of speaking well, or of speaking effectively with the aim of persuading. Rhetoric is at once technical, practical, pedagogical, and analytical. It deals with opinions, rather than truths and certitudes, and as such, it can be abused as a means of manipulation.

Since originating in Sicily in the fifth century B.C.E., rhetoric has reflected a keen awareness of all the conditions that, taken together, influence an audience in one way or another. Rhetoric has established itself as a systematic and exhaustive synthesis of all the human sciences, as they are called, and of all practices from which it can draw a benefit, from philosophy to psychology, linguistics to literary theory, and anthropology to sociology. What is specific to rhetorical synthesis and what gives it its universal validity is its transdisciplinary dimension. Rhetoric is an art of synthesis that controls a series of approaches, which together—and only together—contribute toward bringing about the desired effect.

Universality

Although the most systematic formalization of rhetoric occurred in the West, first in Greece and then in Rome, its key practices and conceptions are universal. Ever since writing was invented in Mesopotamia and Egypt, people have recognized the power of professional writers. Examples of practices and precepts related to eloquence can be found in Egypt beginning with the second millennium B.C.E. and in the Book of Proverbs.

China, like Europe, wanted to separate the persuasive and expressive aspects of rhetoric, to distinguish between the rhetoric of public discourse and what is called literary or ornamental rhetoric. This can be seen throughout China's history in the many compilations of exemplary speeches, in the many treatises with a pedagogical aim, and in the long tradition of poetry and poetic commentary. India, which early on invented an argumentative epic literature, also had rhetorical competitions and later developed a practical and critical method for teaching rhetoric as well as a theory of poetry and drama.

Societies without writing sometimes recognize the authority of those gifted at speaking out. Hence we find the ethos of wisdom among Australian aborigines or that of venerable age and heroic deeds among Native Americans. European Americans recognized and appreciated the eloquence of Native Americans, who used irony or pathos. Thomas Jefferson, for example, com-

pared the Mingo chief Logan to the Roman orator Marcus Tullius Cicero. Specialists have studied the verbal formalism typical of Aztec ceremonies, evidence of which was passed down by the conquistadores. A society without rhetoric is hardly imaginable, since rhetoric is necessary to all communication. And it is impossible to imagine how anyone could utter words without seeking ways to make language more effective.

Fields of application. By definition, any human activity that explicitly or implicitly involves a quest for influence entails rhetoric in its broadest sense, whether or not that activity is grounded in verbal communication. Hence a multiplicity of rhetorics exists. Nothing prevents us from calling any field of interaction rhetoric, since it is precisely the field of interaction that defines the conditions for treating matters discursively, for arguing in one's own defense, or for choosing modes of expression. As a result, it is possible to speak of rhetorics of minorities and of majorities, rhetorics of sexuality, racism, and feminism, rhetorics of drugs, war, peace, exile, and so on. We may also speak of rhetoric in reference to nonverbal activities, assimilating them to one function or another of language to show their influence on the public. Every art form—music, painting, the figurative arts in general, architecture, and cinema—has its rhetoric, although it may lie at least as much in the manipulation of images as in the use of speech. There is, therefore, also a rhetoric of gestures, of mime, of public or religious gatherings, and of military parades, of all activities that are supposed to communicate a message or spread propaganda.

The Art of Persuasion

Because the Western world has offered the most systematic historical, methodological, and theoretical approach to rhetoric, this entry will focus on the Western concept of rhetoric, understood as the art of persuasion, essentially through speech.

Form and content. Rhetoric's persuasive efficacy depends on both thought and expression or style. Thought, which is the domain of philosophy, governs the art of dialectics. Expression, which is concerned with the speech act itself, governs how that thought is put into words and how it is delivered. That division between the philosophical realm of thought and the linguistic field of expression is problematic, and the history of rhetoric is in large part the history of their relationship. The tendency to separate them, to limit rhetoric to expression and reserve the dialectical realm of argument, evidence, and organization to philosophy is always present, as if thought were independent of its expression and, conversely, as if eloquence were independent of thought and truth. In rhetoric properly understood and as Cicero (106–43 B.C.E.) conceived it in *De oratore*, persuasion and expression are interdependent, organically connected. Meaning lies as much in form as in content.

Logos. Rhetoric thus defined deals with the everyday universe and the contingent aspects of human and social reality, which a certain kind of philosophy, practiced by Plato (c. 428–348 or 347 B.C.E.) and later by René Descartes (1596–1650), disdained and considered unworthy of interest. Philosophy in its traditional and classic sense is interested in eternal and universal certainties and truths. It intends to convince

by calling upon unassailable evidence and by invoking arguments that will make its demonstrations irrefutable. Rhetoric's philosophical method is dialectics, which relies on credible arguments, plausible evidence, or circumstantial events. Such arguments appeal to commonplaces and are based on received opinion; they allow for and may even demand refutation, or at least objections that appeal to competing opinions and the same sorts of evidence. Because rhetoric deals with opinions, it argues by applying what is called dialectical reasoning to the probable causes on which the opinion is based. In order to persuade, rhetoric relies on credible arguments, plausible evidence, or circumstantial events. Such arguments appeal to commonplaces and are based on received opinion, but at the same time, they must allow for and may even demand refutation, or at least objections that appeal to competing opinions and the same sorts of evidence.

Pathos and ethos. Although the first measures taken by the rhetoric of persuasion occur in the realm of thought (designated by the term *logos*), the order of verisimilitude to which thought belongs is not sufficient in itself to influence the audience decisively. Rhetoric moves beyond logical argument to consider indirect and circumstantial data (historical, political, social, religious, psychological, moral, and ethical, for example) as a way to increase its effectiveness. It also considers the audience's sensibility, passions, and emotions at least as much as its intellectual faculties. This appeal to the psychology of the audience is what traditional rhetoric calls pathos and it is directed primarily at the senses. Hence images, sounds, odors, and even tactile and gustatory sensations may serve to reinforce the influence sought. That is why the senses (especially sight but also hearing) seem to have become the target par excellence of modern methods of influence, as in advertising. The dominance of the visual in the twenty-first century means that image is often the determining factor; no one who is not at least minimally telegenic can expect to have much public or political success.

The final aspect of any rhetorical approach is ethos, which is linked to the orator's personality. It establishes authority and assures the audience's trust by presenting a view of the orator's character, moral qualities, and sincerity by projecting a moral and physical image. Hence venerable age, experience, social or religious position, or professional or media success may invest an individual with authority.

Description

The Greek philosopher Aristotle (384–322 B.C.E.) and the Roman Cicero provided what has become the standard description of rhetoric. In addition to the series of steps to be followed, they defined types of discourse according to the kind of public each type was meant to address.

Audience and types of discourse. The invention of Western rhetoric in Hellenic Sicily in the fifth century B.C.E. can be attributed to judicial, or forensic, discourse, which was developed to level accusations or mount defenses in the name of justice. In Greece, rhetoricians very quickly came to identify two other types of discourse as functions of the different audiences to which they were addressed. The deliberative, which

is supposed to inform, exhort, advise, or dissuade, coincides with the democratic political discourse and was initially addressed to the Senate to urge it to support the useful against the harmful. The epideictic, also called the demonstrative, whose purpose is to praise or blame, to commemorate or denounce, is addressed to a group of spectators to elicit their admiration or reprobation, often to hold something up as an example or as a value to them. These original distinctions are open to revision in the early twenty-first century, when more and more complex types of discourse seem to exist, ranging from the sciences to advertising, television to the Internet, drama to poetry, including treatises, theses, films, cartoons, and so on, and when these types of discourse seem to be more precisely defined and to have better-delimited audiences. Although the distinction between judicial and deliberative discourse still seems valid, we might have to concede, as some have suggested, that epideictic praise or blame has been reincarnated as advertising. In this new type of discourse, the audience is the consumer, the easily influenced viewer who is the potential customer for the items being extolled.

The parts of rhetoric. Since Aristotle's time, rhetoric has been divided into parts comprising the steps involved in producing a discourse and delivering it in person to the intended public. Each of these parts has in turn been subdivided, resulting in an extremely structured system wherein each phase in the production of a persuasive discourse is systematically and exhaustively represented. Rhetorical treatises are encyclopedias of discursive expertise on how to think, how to write, and how to deliver.

Latin writers, including Cicero in *De oratore*, definitively established the steps involved in elaborating an oral discourse. The first is *inventio* (invention), which consists of seeking and selecting the arguments and other resources necessary to one's cause as a function of the discourse chosen. These may include syllogisms, on which dialectical argument is based, or prototypical examples. Logos, pathos, and ethos are subdivisions of *inventio* and determine the type of argument selected, including the type of evidence, whether extrinsic or intrinsic.

Dispositio (arrangement or composition) defines the order and organization of these arguments. The discourse may have between two and seven parts, but usually has five: the introduction or exordium, the narration (exposition of facts), the confirmation (exposition of evidence), the refutation (denunciation of the opposing argument), and the conclusion or peroration.

Elocutio (elocution) has to do with style: the choice of words and figures and of their formal syntactical combination. These choices are adapted to fit the subject following the rules of decorum. Three styles have been identified. They are known in Latin as *grave* (noble), *tenue* (simple), and *medium* (agreeable); the choice of style is governed by the nature of the subject to be treated, the goal to be achieved, and the target audience. These styles determine the choice of vocabulary (unusual, common, or familiar), the complexity of syntax, and the use of relatively obscure versus transparent figures. A further distinction is made between figures that have to do with the words themselves and those that have to do with ideas. Individual words taken in a sense other than their

usual one are called tropes (metaphor and metonymy, for example). *Scheme* refers to the order in which the words are arranged. Rhetorical figures are often seen as the essence of *elocutio*; indeed, rhetoric as a whole is sometimes reduced to them. Such figures have regularly been seen as markers of a text's literariness.

Memoria (memory) designates the stage of memorizing a discourse and involves a complex mnemonics that places the parts of a discourse in an imaginary physical space such as, for example, a house or a human body. Finally, *actio* (delivery) is the art of public performance, the theatrical effects governing voice, accent, body language, mimicry, and so on. It names the moment when the orator comes into contact with the public, makes an entrance and becomes an actor. *Memoria* and *actio* apply only to oral discourse, whereas *inventio*, *dispositio*, and *elocutio* apply to both the written and the oral.

History

Rhetoric, which was first formalized in Greece, found a practical field for expansion in its service to the republic of Rome. Under the Roman Empire, Quintilian (c. 35–c. 100 C.E.) introduced the most systematic description of rhetoric. As a teacher, he saw the rhetorician as someone whose level of education entailed an ethical responsibility. The art of speaking well implied the art of speaking virtuously.

The Christian Middle Ages was wary of rhetoric, believing that revealed truth did not need the artifices of eloquence. But the Church also recognized its utility, since rhetoric made it possible to defend the new religion against its enemies. A moderate eloquence would soon be enlisted as an instrument of propaganda, a way of spreading the truth. Saint Augustine of Hippo (354–430), a rhetorician by profession, recognized the model for this eloquence in the Bible itself. In addition, medieval hermeneutics applied the rules of rhetorical analysis when it proposed that the books of the Old Testament be read allegorically.

From the twelfth century on, rhetoric survived in law studies, preaching, and poetry. Beginning in the fourteenth century, Francesco Petrarca (1304–1374) and the humanist Renaissance restored rhetoric's gleam, which had been tarnished by medieval suspicion. But this was also the age when the anti-Ciceronianism of Petrus Ramus (1515–1572) once again called into question the integrity of rhetoric, establishing a historical break between the fields of thought and expression that lasted for centuries. Rhetoric was confined to *elocutio*, whereas *inventio* and *dispositio* moved to the logico-philosophical realm of dialectics.

Although that revolution had no major consequences in the short term, Descartes and later John Locke (1632–1704) rejected the legitimacy of dialectics itself, believing that what is only probable and credible has no claim to truth, which lies in the realm of reason or experience. Rhetoric could no longer make use of dialectics but was confined to *elocutio*. That break was not universal: The Counter-Reformation viewed rhetoric as a useful instrument of propaganda, and thus rhetoric would have its moment of glory in Jesuit teachings.

Romanticism dealt rhetoric a nearly lethal blow, reacting to a rigid formalism that had gradually set in toward the end of the *ancien régime*. Johann Wolfgang von Goethe (1749–1832) and those who followed contrasted rhetoric to the freedom of a new sensibility that was in quest of a more personal and more sincere expression.

The art of rhetoric was resurrected many times in the twentieth century but always in the shadow of the Ramusian scission. On one side, philosophers such as Chaïm Perelman, in *The New Rhetoric*, took an interest in questions of argumentative logic and brought about a rhetorical revival in midcentury; on the other side, literary theorists and specialists in poetics confined their interest not just to *elocutio* but to rhetorical figures, and in the end to a few paradigmatic figures such as metaphor and metonymy. As Gérard Genette argued, the development of an increasingly limited rhetoric characterizes modern literary critical discourse.

Rhetoric and literature. Literature is one of the language arts most directly influenced by and dependent on rhetoric. Until the eighteenth century, even poetry, as any other oral or written discourse, was directly concerned with the three divisions of rhetoric applicable to written language (*inventio*, *dispositio*, and *elocutio*). It would be a serious anachronism to ignore this. But beginning in the nineteenth century, poetry considered only *elocutio* and gradually reduced even it to the question of figures, which became the chief subject of poetic treatises. Figures were now what defined the poetic quality of a text. No longer mere ornament and flowery language, they served to shore up a truly cognitive approach and became a privileged way of apprehending the world. Hence the formalist linguist Roman Jakobson defined the poetic function of a text as the display of its materiality, its "palpable" side, and as a figurative quality essential for expressing indirectly what is not accessible through "simple" speech.

Thus every age seems to have an emblematic figure. In the Middle Ages, allegory was conceived of as the tangible manifestation of the abstract and spiritual world through personification. In the nineteenth century, the symbol became an expression of the cosmic and universal correspondences that the romantics saw as the essence of their poetics. In the twentieth century, metaphor and metonymy became the exemplary figures for a conception of the world that was either poetic and founded on analogy, or prosaic and utilitarian and founded on contiguity. This was an extreme moment in the figurative character of literary rhetoric. Ultimately, an essential figurativeness was revealed at the core of all literary expression. The text, at odds with itself, was now seen as fundamentally incapable of representing the world. Only a return to philosophical reflection may be able to temper the rhetoric of figures and subordinate it to metalinguistic reflection.

General Assessment

From its birth in Sicily within the particular context of defending landowners' rights to twenty-first-century media globalization, rhetoric has evolved and adapted. It is interdisciplinary in its essence and has sometimes appropriated knowl-

edge from disciplines close to its own object; at other times, it has been appropriated by disciplines encroaching on its domain. A unique synthesis of philosophical and expressive approaches, rhetoric is constantly being born anew. It has at its disposal a set of prescriptive or analytical practices and theoretical reflections that even in the twenty-first century allows it to master all fields of human expression and communication designed to act on the world.

On the whole, the global conception of rhetoric as it appeared in Aristotle's Greece has changed little. Despite, or may because of, its desire for a somewhat utopian, if not ominous desire for control, its overall theoretical and practical understanding of persuasion is still valid.

What has changed are the resources available. One of the advantages its modern-day practitioners have over their ancestors is that they are able to benefit from advances in technology and from the knowledge acquired through research in the nearby branches of the human sciences. In these fields of research, the modern orator, whether a lawyer, a political candidate, or a car dealer, will find resources to better grasp the social, ideological, psychological, or emotional state characterizing the target audience and thus to better understand it so as to better influence, if not control it.

But what has changed even more deeply are the technological means of communication, which are now able to diffuse farther, more rapidly, and more effectively a larger number of messages to a greater number of targets in a greater number of places. The power of the message is directly affected by that new audience. The electronic revolution itself, which is at least as significant as the invention of the printing press, offers new means for more effective persuasion. It is easier to seduce, and hence to influence, through the use of audiovisual media and virtual reality. Virtual reconstitutions of crime scenes, for example, are admissible in court. Rhetoric can only seek to adapt to these technological media, which constitute the new field of *actio*. The television screen has replaced the forum, the actor has replaced the orator, and teleprompters have replaced memory.

Even more radically, control of the media and access to the means of communication are what now seem to determine the true efficacy of the message, rather than oratorical talent or the intellectual quality of an argument (with perhaps the exception of the lawyer in the courtroom). That revolution has altered the conditions governing access to an audience. The means of communication, when they are not controlled by the state, are increasingly placed in the hands of a few large institutions, which are often controlled by commercial or ideological interests.

The Internet as it exists in the early twenty-first century would seem to offer to each individual access to his or her own means of communication. It ends up, however, providing a virtual "audience" an anarchical plethora of mostly unreliable and inefficient information. Without access to the media, which are the chief if not the exclusive means for diffusing ideas, no opposing power and no perceptible dissension can exist. And dissension is an unavoidable marker for freedom of

speech, which is now reserved and limited to those who control access to the means of diffusion. Some speak of a "dictatorship of the media" linked to the power of the new technology, and of "formal democracy." Competition in the realm of opinion requires equal access to the forum.

Paradoxically, then, although nothing seems to have changed in terms of the general principles that govern the art of persuasion, the means available to rhetoric have shifted the essence of intellectual activity toward expression, whether that refers to *elocutio*, with the emphasis on seduction, or to *actio*, with the idea that the orator cannot be heard. It is somewhat as if the universe of communication were being transformed into an enormous literary fiction designed to entertain more than to inform or argue. This fiction is already embodied on our television screens and in our magazines as a new kind of discourse, the infomercial, whose very name captures its ambiguity.

Any rhetoric has two aspects: vacuity, if not manipulation and lies; and ethics and trust. We must ensure that such trust is not irremediably undermined by the distrust produced by the growing monopolization of increasingly effective means of communication. The public is now a captive audience, increasingly powerless in the face of that monopoly, and the very future of democratic societies is at stake. In addition to the tradition of reliance on the speaker's ethos, access to a multiplicity of opinions is the public's essential safeguard against possible abuse of rhetoric. Rooted in freedom of speech, rhetoric finds its justification in the equal opportunity of access to the means of communication.

ANCIENT AND MEDIEVAL

Despite some recent controversy, *rhetoric* may be seen, from its ancient Greek-language origin, to be the systematic preceptive training that orators or public speakers have sought or received, from the fourth century B.C.E. onward. Signifying less a set of “ideas” than a preceptive practice, the Greek word *rhetoric*, later adopted into Latin (despite the equivalence of the phrase [*artificiosa*] *eloquentia*), always refers to the Graeco-Roman preceptive tradition, which remained foundational from the time of Aristotle (384–22 B.C.E.) to that of Hobbes (1588–1679), Vico (1668–1744) and even Nietzsche (1844–1900). It is only in recent times that the term has come to serve in a pejorative sense as a substitute for “truth.”

Graeco-Roman Origins

This Graeco-Roman tradition had its origins in certain specific situations that required extraordinary and popularized skills in public address. One such tradition of origin is associated with the names of Tisias and Corax (who may be one or two persons, or a figment of later theorizers and historiographers of rhetoric), who are supposed to have “invented” and “published” in now lost manuals, an art of legal pleading upon the fall of the “tyrants” who ruled in Sicily (until 467 B.C.E.) apparently enabling ordinary, propertied people to make court claims for

the restitution of lands confiscated under the preceding tyrannies. True or not, this judicial emphasis became progressively crucial and the earliest extant Latin manuals (Cicero’s *De inventione* and the pseudo-Ciceronian *Rhetorica ad Herennium*, both written in the Roman Republic during the first quarter of the last century B.C.E., have a courtroom context and background, and the training they offered, though apparently popular, was seen by some to be subversive of Roman ways. Although a perceived dependence upon Greek technical manuals stimulated this opposition, it was nevertheless such a dependence that produced the classic shape of Roman rhetoric.

Invention (*inventio*) is the devising of matter, true or plausible, that would make the (legal) case convincing. Arrangement (*dispositio*) is the ordering and distribution of the matter, making clear the place to which everything is to be assigned. Style (*elocutio*) is the adaptation of suitable words and sentences to the matter devised. Memory (*memoria*) is the firm retention in the mind of the matter, words, and arrangement. Delivery (*pronuntiatio*) is the graceful regulation of voice, countenance, and gesture.

The pseudo-Ciceronian *Rhetorica ad Herennium*—from which the above quotation comes, provides instruction in all these divisions of the art, though in a slightly different order to the enumeration here. This training, although it was later to be further adapted to Roman political and court contexts in the last century of the Roman Republic (principally by Marcus Tullius Cicero, 106–43 B.C.E., though others were similarly skilled, went back to the Greek preceptive texts of Aristotle (c. 330 B.C.E., his *On Rhetoric* being the earliest complete rhetorical “manual” to have survived the pseudo-Aristotelian *Rhetoric* [dedicated] to Alexander, the *Rhetorica ad Alexandrum*), Isocrates (436–338 B.C.E.), and above all Hermagoras of Temnos (middle of the second century B.C.E.), whose lost texts much influenced later developments.

Aristotle and His Successors

Aristotle set the tone of later ideas with his concept of the three major audiences (already found in Isocrates as three kinds of oratory, judicial, political / deliberative or “epideictic”—the audience is either a judge dealing with actions in the past [court cases] or the future [deliberative assemblies], or a spectator [listening to a speech in praise or blame of something/someone but not required to make a judgment]). Aristotle’s discussion of emotion and character—analyzing the feelings in an audience and the expectations the audience may have of the speaker (*pathos* and *ethos* respectively) and the strong links with argumentation (dialectic)—all in book II—were decisive for the future of the subject, as was book III on style, arrangement, and the parts of the speech. Thus “rhetoric” began its career by being forced into the straitjacket of the art or skill or preceptive system for finding what may be persuasive in any communications situation, as distinct from the direct “magic” of word power, stressed for example by Gorgias (fifth century B.C.E.), an early member of a group that came to be called “sophists,” that is, professional purveyors of “wisdom” and techniques that might lead to success in the world. A “stylistic” tendency had its outcome in the debate between protagonists of the “Asian” (“ornate”) and “At-

tic” (“restrained,” but originally assuming conscious imitation of Athenian writers of the fifth and fourth centuries B.C.E.) styles in Roman antiquity, in the emphasis upon style in the works of Dionysius of Halicarnassus (who lived at Rome in the last years of the era before Christ), Longinus (possibly Cassius Longinus, a rhetorician of the third century A.D.), and Hermogenes (second century C.E., known as perhaps the most important Greek rhetorician of the Roman Empire). Aristotle himself assumed that the user of rhetoric would be a “good person,” thus linking rhetoric with “virtue,” a link that had its origins, perhaps, in Isocrates’ emphasis upon the orator’s moral qualities and wide-ranging skills and knowledge. It was a link that remained strong, in Cicero, Augustine, and even in Alcuin’s *De rhetorica et virtutibus* (730–804 C.E.) Rhetoric (*copia dicendi ac summum eloquentiae studium*—“abundance of speech and the most elaborate study of eloquence” according to the terms used in Cicero’s *De inventione* 1.1) was capable of good or evil, and although the initial incentive toward civilized modes of living must have been implanted by a uniquely eloquent individual, there came a time when masters of eloquence paid insufficient attention to philosophy with the consequence that the state suffered (all this to be found in the proem to the *De inventione*). In later times the term “rhetores” was often reserved for those who used eloquence for shallow and selfish ends.

Roman Imperial Rhetoric

In the Roman Empire (31 B.C.E. to c. 476 C.E.), rhetoric reached its full development as a technical system useful for lawyers and advocates (most eloquently and grandly put in the twelve-book *Institutes of Oratory* by the Spanish orator Quintilian who lived in the first century C.E.) in court situations, especially the centumviral courts (concerned in the main with civil law, particularly inheritance), which spawned a set of manuals that formed a large part of what has come to be known as “the minor Latin rhetoricians.” Rhetoric was most eloquently and grandly described in the twelve-book *Institutes of Oratory* by the Spanish orator and advocate Quintilian who lived in the first century C.E. The art also served as a civilized code of shared behavior supposed to unite the elite court, curial (that is, related to the town councils of the Roman Empire), civil service, and rural aristocratic class of the empire with their rulers in pursuit of common cultural goals and parameters; as a code of ornate, ceremonial praise and blame in prose for the articulation of official values of the imperial autocracy (panegyric) and the proper celebration of important moments in elite life (see Menander Rhetor for the epideictic writings of Menander of Laodicea c.300 C.E.) and as a code of poetic and prose expression suited to the elaboration of elite perspectives on life, politics, and art. The best surviving late antique rhetor/orator is Libanius of Antioch (314–c.394), for whom some 51 declamations, 96 progymnasmata (see below), 64 orations, and 1600 letters have survived.

Christianity broke into this interlocking, mutually reinforcing complex in the course of the fourth century C.E. by stressing the dichotomy “truth versus ornate expression” and emphasizing new techniques of communication—sermons and homilies, together with a training in argumentation use-

ful for the doctrinal polemics that characterized early Christian history. Although ultimately destined to absorb and make over much of the classical rhetorical and hermeneutic tradition (Copeland), Christianity initially set itself against the elite preceptive communications system and (St.) Augustine himself (354–430) in his celebrated *Confessions* enshrined for later generations the difficult process of transition from this elite classical preceptive tradition to the new language of Christian discourse: “humble speech” (*sermo humilis*). Augustine focused on imitation of the supposed language of Christ speaking to ordinary people, and taking as a universal model biblical passages replete with moral and behavioral worth fitted to Christian doctrines and beliefs, and full of eloquence of an adapted sort.

Medieval Transitions

The Venerable Bede in England (672/73–735) brought this approach to a kind of fruition by pointing out in his treatise *De schematibus et tropibus* (“Concerning figures and tropes”) that the Bible revealed all the stylistic tricks inculcated by the Latin rhetorical preceptive tradition (under the heading of style or *elocution*, see Miller, Prosser, and Benson, pp. 96–122). However, although intellectual life in the western European Middle Ages (c. 500–1500) was committed rather more than that of pre-Christian antiquity to notions of revealed truth, it relied heavily upon the Graeco-Roman rhetorical preceptive tradition to organize its communicative needs and its perceptive grids. The Augustinian, imitative and the Ciceronian preceptive tradition were in balance until the twelfth century, when the habit of lecturing on the *De inventione* and *Ad Herennium* (begun, at least as far as the former treatise was concerned, in at least the third century C.E.) returned to favor and dominated communications systems, even invading theological discourse and ideas, where the distinction between “literal” and “allegorical” interpretations of a text permitted the carriage of multiple meanings, thus pluralizing “truth” in favor of what Abelard called the *multiloquium* (or “omnicompetent multifacetedness”) of language. From the period between c. 1020 and c. 1215 C.E. some twenty-two commentaries on the *De Inventione* and the *Rhetorica ad Herennium* have survived to the present in manuscripts, compiled usually as reportages of lecture series delivered in cities with teaching cathedrals or court and monastic schools. These texts, catering to situations that demanded intensified persuasive discourse (for example the so-called Investitures Controversy of the eleventh century or the intensified study of Roman law or the processes of argumentation in theology and university “arts-faculty” disputations / controversy), produced a series of new departures adapted to expanding government and church administrations and aspirations from c. 1000 onward. It is interesting, for example, that although neither Greek nor Roman antiquity produced any preceptive manuals devoted to letter and document composition, in the later period “formularies” have survived such as the model letter collection of the sixth-century Italian Cassiodorus, the late eleventh, twelfth, and thirteenth centuries spawned an important series of classically influenced treatises (on *dictamen* or “composition”) setting out the modes of address and persuasion between potential

letter writers and receivers in medieval diplomatic, administrative and intellectual contexts—where the letter was the major carrier of news, ideas, information, and polite discourse of a less-than-treatise worthy nature. In England at least these treatises expanded into regular “business courses” (Camargo, 1995), and the treatise-form was eventually adopted by a wide range of communication arts, including the arts of memory and public address.

The same can be said for the pressing need of the revivalist international (Latin-using) church of the thirteenth century felt to communicate its elaborate salvational doctrines against heresy, apostasy, witchcraft (*maleficium*), heathenism, Islam, Judaism, secularism, impiety and various forms of lay piety, particularly that of women. This emphasis produced a vast range of sermons and preaching manuals (the *ars predicandi* or “art of preaching” and the art of “praying” or *ars precandi*), which matched a somewhat smaller profusion of manuals (c.1175–1250) imitating the ancient *ars poetica* of Horace (a text commented upon with interest in the twelfth century) and designed to inculcate a maximum of prose and poetic flexibility in the ornate Latin discourse of the day.

Late Medieval Transformation

These perceptive packages continued to have an impact until the Renaissance of the fifteenth century and were joined from the time of Dante (1265–1321) onward by a less uniform but still extensive set of commentaries and notes on and from the *De Inventione* and *Ad Herennium*, in both Latin and, especially, in Italy, in the vernacular. This complex of texts had a profound influence on the shape of major literary works of the period (Jean de Meung’s *Romance of the Rose*, Dante’s *Divine Comedy*, the works of Chaucer) and on modes of elite historical writing, though the formal instruction of the universities (from the thirteenth century onward) concentrated only on the theoretical structure of the classical rhetorical system (using a text such as the early sixth-century Italian Boethius’s *On the different topics*), and on the provision of a training in *dictamen*, the *ars poetriae*, and the *ars predicandi*. Italian culture from the time of Petrarch on added force and precision to the classical rhetorical inheritance, enriching the texts favored by the Middle Ages with works less in vogue during the former period (the mature rhetorical texts of Cicero, and his letters—which became key texts in Renaissance rhetoric—together with the works of Hermogenes and the full text of Quintilian’s *Institutes of Oratory*), thus inculcating a more thorough-going recovery of classical Latin (and Greek) modes of expression and vocabulary, together with doctrines neglected—or practiced differently—in the Middle Ages (such as *numerus* or the system of prose rhythm discussed in many of Cicero’s mature rhetorical works). In this respect the medieval West finally drew nearer to the Byzantine world of Eastern Europe and western Asia, where classical Greek rhetorical influences maintained their hold and there was less of a parallel to the rupture caused in the west by the so-called fall of the (western) Roman Empire. In Byzantium, the emphasis evident in the “preliminary” compositional exercises or progymnasmata (Greek; in Latin *praexercitamina*) found among the works of

Hermogenes (this portion only translated into Latin and therefore available to the Latin Middle Ages) and Aphthonius of Antioch (fourth century C.E.—remained dominant. Judicial rhetoric was dominated by the classical emphasis upon *stasis*-theory (that is, a classification of the ‘issues’ an advocate might encounter in the law courts), whilst epideictic and deliberative rhetorical theory and practice gradually gained strength. The whole complex of Byzantine rhetoric proved influential even upon the Islamic world of the Arabs during the Middle Ages, and from the ninth-century onward, a commentary tradition emerged, based upon the so-called Athonian-Hermogenic corpus of rhetorical works. As in the West, a tension was evident between a striving for effect that might have struck some as “obscure” and an emphasis upon a simplicity open even to the ill-educated. The wide oral and theoretical range of Byzantine rhetorical studies and practice is illustrated by the works of Michael Psellus (1018–c. 1072). In contrast with the West, Byzantium emphasized rhetoric more than dialectic (argumentation) and made less of rhetorical techniques for scriptural exegesis or interpretation.

In both antique and medieval times, Greek and Latin rhetorical ideas, despite the patriarchal conventions that underlay contemporary gender ideas, spread to select women: in the medieval period (H)rotsvit of Gandersheim (tenth century), Heloise (twelfth century), and Christine de Pisan (writing in the French court vernacular but understanding and using Italian and Latin) made notable contributions to the literary genres of their day. Like the female mystics (for example Marguerite Porete, burnt in Paris for heresy in 1310), they did not contribute to the technographic rhetorical teaching literature, but they did absorb much of the contemporary rhetorical culture. Ancient examples include such figures as Aspasia, the mistress of Pericles of Athens (whose famous “funeral speech” in the later fifth century B.C.E. some suppose she wrote), and Hypatia of Alexandria (fourth century C.E.).

RITUAL.

This entry includes two subentries:

Public Ritual
Religion

PUBLIC RITUAL

The study of ritual performed in communal life encompasses the wealth of world history and cosmology. Yet, few linguistic or conceptual categories of analysis address fully the diversity of ritual as an enactment of belief in the divine, inclusive of the mythologies of magic, associated with the liminal moments of human experience. For modern societies, the historical celebration of ritual as a dramatic enactment of the numinous (sacred) reveals a persistent trait among world communities to transform human existence in order to experience sacred presence. To this end, the stylized adaptation of religion, foremost for the Western world, is predicated on a richly variegated model of ceremonial systems that are centered on the formalized invocation of symbols, discourse, and gestures. Combined, the sensory experience innate in ritual performance extends to the history of communities, institutions, and the rise of the premodern and the modern state. The enactment of ritual, both political and religious, also touches on the history of law and the rise of modern theories of government predicated on precepts of moral obligation and the duty of obedience to ordained rulership that have historically been enjoined on individual members of civic communities.

Since the nineteenth century, the subject of ritual has been the focus of a considerable corpus of historical, philosophical, ecclesiastical, economic, and legal research. In the latter third of the twentieth century, significant contributions were also achieved through the application of models of social and cultural anthropology that link the transmission of oral, written, and visual texts. The discipline of art history, specifically the study of iconology, has further refined the implications of the sacred within the emerging loci of secular, national histories. Among the luminaries who have contributed to twentieth- and

twenty-first-century research on ritual are Émile Durkheim, Victor Turner, Clifford Geertz, Mircea Eliade, Natalie Zemon Davis, Catherine Bell, Michel Foucault, Marshall Sahlins, and Pierre Bourdieu. Each has approached the modern study of ritual with reference to the liminality of human experience; Foucault and Bourdieu have addressed concerns of communities to protect civic interests from nonconformist intrusion. A fourth contribution also informs the modern study of public ritual. The history of ritual violence, a trait of premodern communities, has effected the transformation in theories of resistance to authorized authority as well as the imposition of penal practices that now characterize the modern state. The ritualized forms of violence and murder that have been enacted against minorities in the twentieth century reveals the critical paradox of limning-out a theory of ritual as a codified form of social communication: ritual practices have promoted the consolidation of human resources without supporting a universal model of human rights predicated on notions of diversity and tolerance.

Historical Models in Premodern Europe

Basic to any study of ritual in Western culture is the understanding that its history is qualified through linguistic distinctions between ritual (derived from the study of liturgical rites, *ritus*) and ceremony (derived from the stages of the celebration, *caerimonia*). Thus, the modern etymological basis of ritual is rightly sited within the upheaval of the sixteenth century and the rise of Protestantism, yet its history from classical antiquity through modern culture is posited on the importance of public rituals enacted in early medieval communities. For example, the cultural performance of ritual at the close of the Roman Empire and the rise of the Christian West was predicated on the importance of liturgical rites that were performed by members of monastic communities in order to promote and to maintain the hierarchies of rulership that bound ecclesiastical and lay communities into a “body politic.” The embodied celebration of ritual was, in turn, founded on an ethos celebrating the omnipresence of the sacred. The elaboration of the *adventus novi episcopi* (the ceremonial entry honoring the appointment of new bishops) established the eternal model for the reception of royalty in Western kingdoms. The rituals of Visigothic kingship included the sacral elements of unction, the ecclesiastical ritual of coronation, and the swearing of a royal oath to protect property. By the tenth century, the most frequently enacted rituals were religious processions staged to honor the holy feast days and the solemn celebrations of the Church liturgy, which drew the attendance of dignitaries of the royal and Church courts. A more political use of early ritual enactment soon extended to the reconciliation of communities after a king’s subjects had suffered the trespass of war and violence. Both the frequency of war and the gravity of insurrection in the early Middle Ages influenced the protocol surrounding the presentation of royal regalia. Medieval rituals of lordship that were centered on restoring peace first incorporated the regalia of sword into the enactment of truce. Such ceremonies of peace then influenced the history of royal ritual. The incorporation of the sword of justice, spurs, and the enactment of the kiss of peace into the

royal coronation ritual are testimony that the divine providence of ordained authority that was increasingly celebrated in terms of “natural” realities.

If initially the celebration of royal ritual was performed to burnish regal authority, early commentators on such ceremonial enactments recognized how the symbolic enactment of the sacred promoted an ideology of power that ultimately lasted throughout the Middle Ages. Texts that recorded the liturgy of raising prayers and the celebration of Mass were central features in the corpus of historical scholarship that examined the liturgy of coronation rituals. In general, the records of such rites underscore the intrinsic association of *regnum* and *sacerdotium* based on the exaltation of Judeo-Christian models of kingship within a rapidly changing dynastic basis of medieval territories of power. In general, the multivalent history of the early medieval rituals of royal advent attests to the primacy of symbolic dramatization in the history of world culture. For anthropologist Clifford Geertz and modern scholars, the past dynamics of social order are linked to two sources, charisma and the authority vested in a ruler’s body. To this end, throughout the history of medieval and early modern Europe, religion provided a Christological basis that promoted ritual associations of the sacred and profane.

A parallel corollary, the consolidation of sovereign prerogative over civic resources, also requires the same cultural frame in order to define the rites of constitutive power and the (mystical) ceremonial attributes of bodily actions. Evidence supporting Geertz’s observations extend throughout the Middle Ages, when both royal and Church officials began to shape commentary on Church liturgy into a discourse that promoted the viability of a “political theology” predicated on ritual and the construction of holiness. The writings of men in orders, canon lawyers, and later royal publicists promoted the celebration of royal advent enacted through dramatic parallels drawn between the Majesty of Christological kingship and the *Dignitas* of the king’s body on display, vested with royal regalia and the insignia of spiritual authority. The annual rites commemorating Christ’s Birth and Passion were incorporated into the history of dynastic states. Failures derived from dynastic or territorial ambitions were atoned through recourse to rites of royal penance and the solemn display of relics in public processions. Imagery of coronation ceremonies was recorded in texts that enhanced the parallels of the lives of kings with the lives of the Biblical kings of the Old Testament. As contemporary culture articulated the spiritual basis of royal authority in terms of obligations and prerogatives of office, the resources of community life visualized the extended nature of this kingship with recourse to the sculpture that framed church portals. To summarize, members of civic communities who sought salvation through ritual enactment of Christ’s Majesty increasingly honored the thaumaturgical elements of royal Majesty as they crossed the liminal space of sanctity.

By the twelfth century, the history of royal advent had achieved an element of codification that proved essential to the emerging theory of political theology now associated with the celebration of late-medieval ritual and ceremonial traditions. First, the historical understanding of the sacred rites of

unction and coronation was articulated through the invocation of the *gravitas* of anointing medieval rulers. With recourse to historical texts, commentators grafted the legacy of eleventh- and twelfth-century Capetian ceremonial onto the stemma of the early-medieval royal dynasties of the Merovingian and Carolingian rulership. The transmission of one legend became the impetus of French ritual practice, and ultimately influenced the history of other national rituals of advent. The search for mystical provenance led to a premise of divine communication: the origins of Christian kingship were traced to the conversion of Constantine the Great and the baptism of the Frankish king, Clovis. The royal legend was familiarized in texts and the subsequent performance of the French ritual of consecration with holy oil increasingly celebrated the sacramental basis of political power achieved through hereditary rulership. Thus, the ritual elements of elevation and investiture that had once dramatized the elective principle of monarchy were effaced in the course of the High and Late Middle Ages in order to stress the primacy of royal power in a fully hereditary monarchy. The history of enthronement was addressed with recourse to ceremonial elevation, the display of royal insignia, and the incorporation of heraldic and dynastic emblems in the historical accounts of the Capetian dynasty. Jurists and publicists who wrote extensively on behalf of royal prerogative promoted royal authority over matters of church and state. Artists captured the primacy of such argument by depicting royal enthronement in manuscripts, liturgical texts, and coinage. In each medium, the representation of royalty was achieved through the dramatization of divine presence that extended to new participants, foremost the increasing large cadre of officials who promoted royal interests and the rise of civic communities that were steadily brought under an invigorated model of royal prerogative.

By the late thirteenth century, the articulation of the sacred in rituals enacted to dramatize obedience to ordained authority served to define communal practices inherent in the administration of law and justice. And, to exactly the opposite effect, the celebration of ceremonies and rituals that elevated the doctrine of political theology into a nascent form of constitutional thought were also enacted to manifest the “natural” realities of sacred rites and public ceremonies. Few scholars have influenced modern scholarship on the essence of ritual symbolism in the late medieval and early modern state as fully as Ernst H. Kantorowicz (1895–1963). In his seminal work, *The King’s Two Bodies: A Study in Mediaeval Political Theology*, Kantorowicz schematized the interplay of ritual, symbolism, politics, and law that flourished from the late Middle Ages well into the seventeenth century. Ultimately, Kantorowicz posited an integrated model of power that incorporated the full history of antiquity with that of Byzantium and the Western world. Central to the argument is the history of Roman law precepts addressing questions of majesty and authority; the development of laws of community, *ius commune*, were treated as empirical models of an ethos supporting civic authority within an integral community of divine providence. The model was antique and universal, but its application favored the northern monarchies of France, England, and the comital states of Burgundy.

As charted by Kantorowicz, in the course of the fourteenth century, as the Capetian royal house began to falter and the Valois dynasty was elevated to the throne, the drama of royal bodily metaphor achieved the status of public law pertaining to royal succession and the inalienability of royal domain. One effect of this emerging constitutionalism was to promote anew the fully hereditary title of the Valois to the crown of France. A second was to encourage representational models of kingship. The image of the sovereign as embodiment of both qualities of *Majestas* and *Dignitas* is one of the most striking features of late medieval kingship in both France and England. For France, modern scholars have elucidated how the pictorial traditions of representation were adapted to exceptional effect in the coronation book of Charles V of France and Jeanne of Bourbon. Executed at the king's request in 1364, the fully illuminated manuscript records the image of majesty with the presentation of the king and queen's authority during the royal ceremonial of coronation and their joint enthronement that concluded the ritual.

Although modern historians celebrate the articulation of Majesty through image, the constitutional implications of the subsequent ritual enactments staged during the reigns of Charles VI and Charles VII revived the drama of protecting the sempiternal basis of the crown of France within the context of war and trespass. Neither the French nor English monarchy exhibited the necessary vigor to assert dynastic preeminence and power. Yet, the effect on the French rite of royal coronation was to mark a liminal stage in articulating the abstract legal precepts of the early modern state. On the one hand, the rite of 1364 fully articulates the conscious and voluntary submission to the symbolic presentation of a king's body. Yet, the later inclusion of two oaths of office that bound successive kings to protect the full resources of the Church and the property of the royal domain produced the fictional ritual of royal marriage of the king to the kingdom. From this remarkable articulation of the duty of office, Kantorowicz was one of the first scholars to expand the constitutional meaning of ritual symbolism within the cognitive grammar of symbolic ritual. For both France and England, the subsequent elucidation of the legal fiction of the corporate soul influenced the tenor and protocol of ceremonial festivities, foremost by focusing on the presence of the "royal" body in politico-legal culture.

Following Kantorowicz's research, modern scholars have found considerable evidence attesting to a shared belief among contemporaries of late medieval Europe regarding the sempiternal nature of ordained rulership. The gravities of the Hundred Years War did little to efface belief in the mystical corpus of the realm, the body politic, and did much to promote the understanding of the king's authority as "living law," (*Vivat lex*). Royal piety attested to the sanctity of office and royal prerogative increasingly framed the duties and obligations imposed on subjects. The public display of the king's body was increasingly framed by extensive preparations that bound civic communities and the officials of the royal court who were charged with overseeing the enactment of power that was predicated on ideology and the control of social groups.

The symbols and rites associated with royal authority in the northern monarchies—foremost the crown, rite of unc-

tion, and the presentation of the scepter—were common attributes of other kingdoms. Variations in the rituals, however, reveal an issue innate in the classification of ritual. The development of a "functionalist" approach to celebrations of royal prerogative encourages the association of repetition with the emergence of new models of power. Yet, the English and French models cast a long shadow over the history of ritual celebrations of advent in other communities. Before the reign of Alfonso XI in 1312, Spanish kings rarely resorted to the full ritual of unction, coronation, and investiture. Yet, his dramatic gesture of self-coronation did not inspire subsequent kings who ruled over the regions of Spain and the Netherlands to repeat the gesture. Both Philip II and Philip IV were adamant promoters of royal prerogative and vigilant defenders of the primacy of Catholic ritual, yet the ritual of Habsburg advent is rarely celebrated within the model posited by Kantorowicz. Moreover, the perception that sites of power are defined through repeated enactment of ritual and secular ceremonies honoring the king's authority detracts from a full appreciation of the gravity of imperial authority in the late Middle Ages. For example, Emperor Charles IV of Bohemia established Prague as the center of empire but he remained a pivotal figure in the formation of French dynastic interests in the early fourteenth century. A second imperial figure, Frederick III, promoted a Christological depiction of Habsburg rule that marked the recovery of the vitality of German kingship. His magisterial enthronement in Rome in 1452 has not been studied as an *impresa* of ordained ritual; yet the liturgy, the drama of enactment by the presence of Pope Pius II as officiant and the vision of ordained rule shared with the Empress Eleanor of Portugal touch directly on the character of Renaissance rulership: the coronation accounts emphasize the imposition of a humanistic model of kingship that scholars now associate with the monarchies of Renaissance France and England.

Ritual and State-Building in Europe

Following the research of Kantorowicz, twenty-first-century scholars, foremost scholars of French ritual, have proposed a model of ritual that draws inspiration from antique sources. The effect of the scholarship on ceremonial has invigorated the association of classical and modern use of allegory and mythology in burnishing the royal prerogative of the heirs of Charles V of France. By the late fifteenth century, the history of royal presentations of majesty was predicated on the performance of four rituals associated with the king's advent: celebration of the royal coronation rite; the staging of an elaborate post-coronation entry ceremony into the city of Paris; the sporadic attendance of the kings of France within the chambers of judicial institutions (the *lits de justice*); and the orchestration of emotions associated with a king's death and the drama of the royal funeral ceremony. For each ritual, the medieval origins of the ceremony have been noted. The continuity in ritual enactment reveals a new tenor in kingship expressed through elaborate protocol, processional order, and the hierarchy of rulership; these qualities became defining characteristics of the modern, "absolute" ritual of Louis XIV's court that treated ritual as performance theater. The full resources of the crown of France were evoked through constitutional metaphor of the "king's two bodies," yet ritual performance

underlined the gravitas of the physical presence of a king's body amidst the collected members of the body politic. Both the festivities and participants increasingly eulogized the glory and prowess of hereditary monarchy at the juncture in history when ritual became a pejorative term for many communities who fought the resources of the crown and church in order to defend the Protestant faith.

Although the model of "state" ceremonial is grounded in study of Kantorowicz's seminal work and Geertz's research, the theory introduces critical elements of an antinomialism that limit the empirical and normative elements of ritual study. First, the public presentations of majesty in Renaissance and Reformation Europe also included adventitious ceremonies. For example, both civic and religious processions were staged throughout each realm to honor the presence of members of the royal family or the arrival of royal officials. The celebrations of royal births and marriages, as well as military and diplomatic victories, encouraged the invocation of ceremonial and rituals that paralleled the protocol of "state" ceremonial. The pageantry and orchestration of a processional order predicated on office and privilege reveals a vested interest in ceremonial robes and emblems of office. Yet, while the articulation of "state" ceremonial is defined through the pursuit of order among hierarchies of elites, the records of many of the adventitious celebrations demonstrate considerable dispute among contemporary office-holders regarding the past history of ritual, protocol, the privileges of office; even the history of gift-exchange was rigorously debated. Second, the model of "state" ceremonial is wholly royal and excludes the presence of royal women at critical moments of dynastic change. The result has been a celebration of royal prerogative that has been encoded in legal metaphors of power as a "canon of law" based on the promotion of misogyny. Yet, the full records of state and adventitious celebrations staged to honor the queens of France reveal a profuse culture of affective topoi based on the emotional elements of kinship and community evident in discourse and gesture that both acknowledged and celebrated the queens' authority within communities throughout the realm. Thus, if the model of "state" ceremonial is exclusively royal, the combined study of ritual and ceremonial suggests a fully gendered model that is at odds with social and political history of early modern monarchies and the rise of nation-states. The confluence of religion and political aspirations is especially striking in study of the acts of regicide enacted against Louis XVI of France and Charles I of England. The history of festivals during the French Revolution offers insight into the transformation of state-building based on the incorporation of republican models of citizenship that has transformed the process of government in Western communities.

Rituals Sacred and Profane

The contractual nature of public ritual in Western culture is critical to interpreting the symbolism of political rights within modern communities of world culture. For example, the gesture of gift-exchange is one measure of how rituals revitalize society by shared gestures of affection and devotion. A second example, the ritual invocation of violence touches directly on

the history of power. Feud and vengeance, combined with factional struggles in cities, territorial, and modern-nation states in Renaissance Italy, has supported the belief shared by scholars that the importance of ritual in political systems is its ability to foster the resolution of conflict. For the history of the Protestant Reformation, communities in the monarchies of northern Europe engaged in destructive elements of ritual and violence in order to discredit the authority of ordained rule predicated in the history of Catholic liturgy. The horrors of the Wars of Religion offer full testimony of the brutality inflicted throughout communities based on legitimate and historical practices that supported royal authority. Yet, the crisis of representation posed by a divided polity of Protestant and Catholic adherents ultimately produced rituals of reconciliation. In France, communities petitioned the queen regent of France, Catherine de Médicis (1519–1589), to uphold the sacred basis of royal authority. The shared language of devotion between the widowed queen and her subjects suggests that the sustained perception of transcendental experience ultimately supported the promulgation of the first modern notions of toleration. The subsequent promotion of Henri IV's authority as king in the late sixteenth century was achieved in two stages. First, the award of amnesty and gifts to the king's political rivals that took place in a ceremonial seating that captured the essence of the symbolism of the Last Supper; second, his conversion to Catholicism and the celebration of a royal rite of coronation enacted the drama of mystical revival of the royal body and the body politic. In Switzerland and Imperial German cities, the violence of the Reformation was addressed through the ritual of *stalling* (peace-bidding), which dramatized the connotations of the performance of Penance with the symbolism of the Last Judgment. Finally, in England, ritual use of royal healing, combined with elaborate pageantry and ceremonial associations between king, queen, and nobility, the ruler and the ruled, remained a potent force in royal courts of Sweden, Poland, and Russia in premodern Europe. The adaptation of rites of advent was a potent source of political renovation for Western Europe during the twentieth century. The confluence of ritual, pomp, and power as an ideology is also evident in the articulation of the doctrine of "manifest destiny" that has guided the diplomatic relations of both the United States and Britain.

Study of ritual also offers broader cultural implications throughout world communities. By the seventeenth century, ceremony was adapted by Spanish, English, and French inhabitants of colonial North America to legitimize claim to new lands and political power over native inhabitants. The ceremonial history of African and Caribbean communities, for example in Dahomey and Jamaica, reveals how political elites either created or usurped power over local communities and resources. The myths and symbols of ritual based on precepts of theology were also part of the politico-religious culture of the Incan rulers in premodern communities, Islamic communities in world culture, and the history of imperial authority in Japan and China into the twentieth- and twenty-first centuries. The modern use of ritual extends to the political drama of the Russian Revolution, the rise of ideologies of fascism, nazism, and communism. Rituals and the public display of symbols of authority in modern China underscores how fully aspects of political power based on

representation of human and divine decree have been adapted by communities to invent national and world mythologies of divine providence associated with the social construction of twentieth- and twenty-first century visions of hegemony. Of particular interest is the adaptation of ritual, foremost parades, to include the construction of national identity in Singapore, throughout communities in North America, as well as Sino-Soviet regimes of the late twentieth century. The general significance of parades as models of ritual and cultural anthropology has recently included study of both minority and gay and lesbian culture in world communities.

If the cumulative effect of this cycle of ritual performance was to promote a gradual secularization of society predicated on modern notions of state and conscience, one question remains open for the study of ritual within the political discourse of human rights: to what extent has the modern study of medieval ritual promoted a rebirth of violence associated with the rise of the modern state and the legal construct of racial slavery? Both events are predicated on the dichotomy of embodied rights and powers. Both systems of government have been historically grounded in royal legal fictions based on Christological notions of ordained authority. If, as scholars assert, the life of ritual and religion shifts continually between the two phases of maintaining and regenerating world systems of belief based on sacrifice, the model of cultural anthropology may need to question belief that the dynamic of ceremonial performance can be codified into a search for a universal system of just law necessary for the promulgation of human rights based on a model of theological ethics.

RELIGION

The comparative study of religion has generally focused on doctrine, on canonical texts and their interpretations. But what of religions without writing, much less canonical texts?

Evolutionary Anthropology

As E. B. Tylor noted in his seminal work, *Primitive Culture* (1871), "it is generally easier to obtain accurate accounts of ceremonies by eyewitnesses, than anything like trustworthy and intelligible statements of doctrine; so that very much of our knowledge of religion in the savage and barbaric world consists of acquaintance with its ceremonies" (1958 ed., vol. 2, p. 449). Such a division of religion into "doctrine" and "ceremony," into "belief" and "ritual," reflected an even more fundamental dualism in European thought between "mind" and "body." The unquestionably racist implications of the idea that, among "savages," ritual is more developed than doctrine is that their mental faculties are less developed than their physical ones.

Tylor and Frazer. Tylor was one of the key figures in the institutionalization of the modern discipline of anthropology; indeed, in 1884, he was appointed to the first university post in anthropology in Britain, at Oxford no less. Tylor and his contemporaries looked to so-called primitive societies for insights into the origins of modern institutions, such as marriage, the family, the state, and property. These scholars relied heavily on the accounts of European travelers, few of whom were conversant enough in the languages and cultures of the peoples they described to provide accurate and detailed accounts of religious belief. Consequently, Tylor depended upon descriptions of ritual in his attempt to infer a generalized idea of "primitive religion" that he argued was centered on "animism," the belief that humans, but also animals and even inanimate objects, have souls. To support his theory, he cited legions of examples from around the world of "water worship," of "tree worship," of the sacrifice of objects, animals, and humans at funerals so that their souls might assist the deceased, and other ritual practices. Tylor's ultimate aim was to demonstrate that religion as a whole was a holdover from primitive misconceptions about the world. Thus he also used ritual to demonstrate the existence of primitive "survivals" in contemporary religious practice: "throughout the rituals of Christendom stand an endless array of supplications unaltered in principle from savage times—that the weather may be adjusted to our local needs, that we may have the victory over all our enemies, that life and health and wealth and happiness may be ours" (p. 456).

Sir James Frazer shared Tylor's methods of argumentation as well as his opposition to Christianity. For Frazer, religions emerged from earlier forms of belief in magic, based on principles of analogy and imitation. *The Golden Bough* (1890) cited countless examples of rain-making and wind-making rites as illustrations of such principles of "sympathetic magic." Frazer's analysis revolved around the figure of the divine priest-king responsible for the rites ensuring the fertility and prosperity of the land, who had to be put to death once his powers gave signs of waning. For instance, he drew parallels between instances where divine kings in Japan or Mexico were prohibited from seeing the sun or touching the ground and similar interdictions in girls' puberty rites from around the world: "The uncleanness . . . of girls at puberty and the sanctity of holy men are only different manifestations of the same supernatural energy" (vol. 2, p. 242). For Frazer as well as for Tylor, primitive rituals provided a code with which to decipher imperfectly articulated systems of belief.

Robertson Smith. W. Robertson Smith's *The Religion of the Semites* (1889) aimed, like the work of Tylor and Frazer, to uncover the primitive roots of modern religion. However, he conceived of the relationship between ritual and belief in radically different terms. Premising that "the antique religions had for the most part no creed; they consisted entirely of institutions and practices" (1972 ed., p. 16), he concluded that ritual was prior not only to doctrine, but even to myth. Sacrifice, the most ancient of all rituals, addressed the relationship between the clan, its god, and its totem animal, all of whom were considered kin to one another. The god, as a member of the clan, was particularly concerned with maintaining harmony among fellow members. The original form of sacrifice was a holy meal for which the totem animal, whose flesh was otherwise strictly forbidden, was ritually killed and shared by the assembled clan and its god. The act simultaneously expressed and guaranteed the solidarity of the clan. If the theories of Tylor and Frazer were primarily intellectualist, attempts to use ritual as a key to primitive thought, Robertson Smith pioneered a more thoroughly sociological approach.

From Evolution to Sociology

Émile Durkheim acknowledged the influence of Robertson Smith in his magnum opus, *The Elementary Forms of Religious Life* (1912). However, unlike his evolutionist predecessors, his goals were not to uncover the original form of religion (which he rightly considered an impossible task) but rather the very essence of religion, its universal features. He accepted key evolutionary assumptions, notably that he could rank human societies unambiguously from simpler to more complex, and that the simplest society would have the simplest religion. Scholarly consensus at the time identified native Australian societies as the simplest in existence. Durkheim was able to rely on the work of pioneer Australian ethnographers Baldwin Spencer and F. J. Gillen, whose description of the Arunta in *The Native Tribes of Central Australia* (1899) contained a wealth of detail on religion and especially ritual. Durkheim intended his analysis of this "elementary" case to demonstrate the centrality of religion to human society in all of its forms, including modern Europe. For Durkheim, religion incarnated society's *conscience collective*, a

term that can be translated either as "collective consciousness" or as "collective conscience." If religious beliefs were expressions of this consciousness, then ritual imparted the conscience causing believers to internalize the deep-seated sentiments that made religious and moral ideas compelling. Rituals were, for Durkheim, sites of collective effervescence, moments when the very fact of congregating to perform set actions imparted special energy to the participants. These emotions generated by ritual gave credence to religious beliefs and moral dispositions. For example, mourning rituals were not simply expressions of an individual sense of loss; on the contrary, the rituals conditioned, if they did not create, the very sentiments they expressed. Last but not least, ritual was essential in maintaining the separation between the domains of the "sacred" and the "profane" that, for Durkheim, constituted the defining essence of religion.

Van Gennep. Arnold Van Gennep's *The Rites of Passage* (1909) considered rituals from an entirely different vantage point, neither in terms of the ideas they expressed nor the sentiments they instilled, but rather in terms of shared formal properties of ritual process. Specifically, he argued that a wide variety of rituals from very different types of society effected "passages" in a literal or metaphorical sense from one state to another. Literal passages included leaving or entering a specific territory or passing a threshold when entering or exiting a dwelling. Metaphorically, they denoted the passage from one social state to another, specifically rituals of pregnancy and childbirth, of initiation, of marriage and betrothal, and of death. Such ceremonies, he suggested, all involved the same sequence of phases—rites of separation, of transition, and of incorporation—so that the person or group could be separated from one initial state in order to pass into another. Van Gennep categorized the transitional phase in terms of the metaphor of the threshold (*limen* in Latin), as "liminal." His was undoubtedly the most fully "instrumental" of the early approaches to the study of ritual, an attempt to understand ritual in terms of what it accomplished instead of what it expressed.

From Theory to Ethnography

The development of anthropology as an academic discipline in the first half of the twentieth century effaced the distinction between ethnographic description and theorization that characterized the work of the evolutionists, as well as Durkheim and Van Gennep.

American approaches. In the United States, Franz Boas and his students were especially critical of the speculative nature of their predecessors' theories. Working for the most part among Native Americans, they provided richly detailed accounts of rituals while deliberately avoiding presenting their own interpretations. Paul Radin, in *The Winnebago Tribe* (1923), devoted a large portion of his text to descriptions of ceremonies, translated as literally as possible from informants' accounts. In his discussion of fasting and the vision quest, he juxtaposed a variety of individual accounts in order to demonstrate the importance of distinguishing between "the actions and testimony of the religious man from that of the intermittently religious and the nonreligious man" (1990 ed., p. 229). However, another of Boas's students, Ruth Benedict, was able

to find a means of interpreting ritual that avoided both intellectualist and sociological approaches. In *Patterns of Culture* (1934), she contrasted the Apollonian ethos of Pueblo culture with the Dionysian timbre of their neighbors, using examples largely drawn from ritual contexts. The vision quest and the Sun Dance among Plains cultures exemplified the extent to which they “valued all violent experience, all means by which human beings may break through the usual sensory routine” (p. 80). On the other hand, “There is nothing wild about [Pueblo dances]. It is the cumulative force of the rhythm, the perfection of forty men moving as one, that makes them effective” (p. 93). Rituals were an expression, not of individual ideas, but rather of the overall style of a culture, in the same way that Gothic architecture expressed the style of the later Middle Ages.

French approaches. Unlike their American counterparts, French and British anthropologists were self-conscious heirs to the Durkheimian tradition, though in very different ways. In France, an important school of thought developed around the work of Marcel Griaule among the Dogon in West Africa. In *Conversations with Ogotemelli* (1948), he related a series of interviews with a knowledgeable elder who gradually exposed an intricate, secret cosmology to the anthropologist, providing interpretations of major Dogon rituals in the process. For Griaule and his school, the true, deep meaning of rituals lay in esoteric traditions of exegesis, fully known only to a few initiates, the most knowledgeable of elders. If nineteenth-century theorists had argued that rituals were the key to understanding religious ideas which “natives” were incapable of articulating, Griaule suggested on the contrary that highly articulate native intellectuals held the key to understanding the inner significance of their culture’s rituals.

British approaches. Of the various national traditions, British anthropology was perhaps the most sociologically inclined. No doubt for this reason, early British ethnographic studies tended to focus on institutions—economy, law, politics, and especially kinship. The notable exception was Gregory Bateson’s *Naven* (1936), which centered on a transvestite ritual among the Iatmul of New Guinea; to honor a boy or a young man, his mother’s brother dressed in grotesque female attire and symbolically offered himself to his nephew, while his paternal aunt proudly donned male attire. The book was an extraordinary experiment in analysis, exploring the cogency and limits of four different approaches to explaining the ritual: a “structural” analysis in terms of the cultural logic of different kin relationships; a “sociological” analysis in terms of the contribution of the ritual to maintaining solidarity within the community; an “ethological” analysis examining the emotional component of Iatmul culture, especially in gendered terms; and an “eidological” analysis in terms of patterns of dualistic thought among the Iatmul.

In the 1950s, other British anthropologists turned increasingly to studies on religion and ritual. E. E. Evans-Pritchard’s experience of fieldwork among the Nuer of southern Sudan in the 1930s had led him to convert to Roman Catholicism. Years afterwards, in his study *Nuer Religion* (1956), he suggested that “Those who give assent to the religious beliefs of their own

people feel and think, and therefore also write, differently about the beliefs of other peoples from those who do not give assent to them” (p. vii). This attitude was evident in the rich and complex analysis of Nuer sacrifice that accounted for about one-third of the entire book. Sacrifice was a means of communication between the sacrificer and *kwoth*, “God” or “Spirit,” comprehensible only in terms of the complex Nuer representations of “Spirit” but also of “sin,” especially when the purpose of sacrifice was to restore the moral imbalance in the relationship between Spirit and the believer that the commission of a fault had occasioned. The sacrificer identified himself in the most intimate way with the spear with which he transfixed the victim, but equally with the ox, the victim, itself, so that sacrifice ultimately represented a gift of the self to God—a relationship that Evans-Pritchard refused to reduce to a sociological, psychological, or ideological explanation.

Audrey Richards’s *Chisungu: A Girl’s Initiation Ceremony among the Bemba of Zambia* (1956) was a pioneering study that focused centrally on women’s performance, ideas, and attitudes. She paid special attention to the explanations of different sorts of participants, ritual specialists as well as initiates or their mothers, and showed how the ritual simultaneously expressed dogmatic cultural values—the deference of juniors to elders and of females to males—and unconscious tensions connected with the ambivalent attitudes about sex and marriage.

The 1960s

The 1960s saw the emergence of sharply divergent currents in American anthropology, with some anthropologists focusing on the elaboration of cultural meanings while others stressed the relationship of behavior to ecology, with the interaction of humans with their environment.

Ritual and ecology. Marvin Harris was perhaps the most dogmatic of the latter, advocating a kind of analysis loosely inspired by Marx, which he labeled “cultural materialism.” For Harris, ritual and ideology were epiphenomena of modes of production, a mechanism for adapting to specific environments. His most famous example was the “sacred cow” in India; in his analysis, he maintained that ritual prohibitions on eating beef (which did not in any case apply to the least privileged classes, including Muslims) were not instances of the irrational sway of religious ideology, but rather a highly efficient strategy for managing scarce resources, including manure needed for fuel, milk, and animal traction for plows.

Roy Rappaport’s *Pigs for the Ancestors* (1968) analyzed the *kaiko*, a ritual cycle among the Maring of New Guinea, in terms of cultural ecology. The cycle began with the planting of a *rumbim* tree to signal a truce between warring groups. Some years later, the uprooting of the tree heralded the beginning of a year-long celebration whose climax involved a huge feast where most of the pig herd of the group was slaughtered and consumed, after which hostilities might resume. Rappaport included extensive discussions of the role of pork within the Maring diet, of the carrying capacity of the territory, of the balance between the human and the pig populations, and of warfare as a mechanism for controlling scarce

agricultural resources. He concluded by comparing the *kaiko* cycle to a thermostat, an on/off mechanism for adjusting the relationship between different variables: human and pig populations, but also trade, marriage, and relations of alliance and hostility. Unlike some of his colleagues, Rappaport never dismissed the importance of cultural meanings out of hand, but instead bracketed consideration of meanings for the specific analytical purpose of examining the pragmatic functions of ritual.

Geertz The 1960s also marked the heyday of “symbolic anthropology,” of a renewed interest in religion and symbolism, topics that for a long time, especially in the United States, had been marginalized in anthropology because they seemed intractable to scientific investigation. In an influential paper titled “Religion as a Cultural System” (1966), Clifford Geertz, the leading exponent of this approach, looked back to Durkheim when he postulated that “sacred symbols function to synthesize a people’s ethos—the tone, character, and quality of their life, its moral and aesthetic style and mood—and their actual world view—the picture they have of the way things in sheer actuality are, their most comprehensive ideas of order” (1973, p. 89). Ritual served to integrate ethos to worldview by rendering the ethos intellectually reasonable and the worldview emotionally compelling. In this way it supplied “models of” as well as “models for” reality—compelling representations of the way the world really is and the way it ought to be.

Geertz had already applied this perspective in his monograph on *The Religion of Java* (1960). Though the overwhelming majority of Javanese identified themselves as Muslims, Geertz identified three variants—*abangan*, *santri*, and *prijaji*—associated with three distinct strata of Javanese society: peasants, merchants, and bureaucrats. *Santri* were more preoccupied with doctrine than with ritual, whereas both *abangan* and *prijaji* variants were primarily associated with ritual expression. The core of *abangan* practice was the *slametan*, a communal feast shared with neighbors (not to mention local spirits), which “concentrates, organizes, and summarizes the general *abangan* ideas of order, their ‘design for living’ ” by stating “the values that animate traditional Javanese peasant culture: the mutual adjustment of interdependent wills, the self-restraint of emotional expression, and the careful regulation of outward behavior” (p. 29). Similarly, the mystical *prijaji* ethos and worldview were best expressed in shadow plays. Geertz went on to apply a similar approach to the politico-religious rituals of the Balinese theater state or, more prosaically, to cockfights.

Turner. The study of symbolism in ritual was already an important facet of British anthropology in the 1950s; in the 1960s, the next generation produced a dazzling array of detailed analytical studies of ritual, particularly in African societies, among which Victor Turner’s work with the Ndembu of Zambia stood out as particularly rich and multifaceted. Turner was deeply interested in theater, and used the analogy of “social drama” as an analytical device even before he focused specifically on ritual as a means of presenting case studies of village conflict. The analogy lent itself particularly well to ritual performance, especially healing rit-

uals, which simultaneously expressed and attempted to resolve specific conflicts generated by points of tension in Ndembu society. For the Ndembu, this tension revolved around conflicting principles of matrilineal descent and virilocal residence, whereby women were expected to live with their husbands; unstable communities were constantly being formed around men who would simultaneously strive to hold on to their wives and children while attracting their sisters and their sisters’ children as well. Turner suggested that such conflicting principles were not only acted out in the course of rituals, but also deeply embedded in ritual symbolism. Key symbols in rituals connoted multiple and often contradictory meanings. For example, the milk tree central to *Nkang’a*, the female rite of initiation, “stands for, *inter alia*, women’s breasts, motherhood, a novice at *Nkang’a*, the principle of matriliney, a specific matrilineage, learning, and the unity and persistence of Ndembu society” (1967, p. 28) Such meanings were clustered around two poles: an ideological pole, centered on the importance of group norms and values, such as matriliney; and a sensory pole, focused on emotional reactions to the body and bodily functions and fluids, such as milk. Loosely following Sigmund Freud, Turner suggested that such symbols were “a compromise between the need for social control, and certain innate and universal human drives whose complete gratification would result in a breakdown of that control” (p. 37).

Turner’s concern with process as well as with symbols in ritual led him to explore a specific aspect of Van Gennep’s scheme of rites of passage, the phase of “liminality.” Liminality in rites of initiation was associated with the temporary breakdown of social distinctions among novices, their assumption of a status that was simultaneously lowly and symbolically charged, even potent. Turner associated such a state with “*communitas*,” with the sentiment of common humanness, an antistructure in sharp contrast to the structured social relations before and after the ritual. If, for Turner, the dialectic between the ideological and sensory poles of symbolic meaning replicated the conflict between “self” and “society,” then the dialectic between structure and *communitas* embodied a countervailing conflict between “selflessness” and “society.”

Douglas. Like her colleagues, Mary Douglas was initiated into the ranks of British anthropology through fieldwork in Africa. However, in her most important work on ritual, she turned from the particulars of her field experience to the elaboration of a more general model. In *Purity and Danger* (1966), she focused on ritual concerns with purity and pollution. As a central case, she analyzed Hebrew dietary prohibitions as detailed in Leviticus, pointing out that the logic of the prohibitions rested on a scheme of classification that identified species as in one way or another typical or atypical. Anomalous animals, such as fish without scales, were deemed unclean. She argued that such preoccupations with cleanness (defined ideologically and not hygienically) corresponded with attempts to maintain group boundaries between insiders and outsiders as sharply as possible.

In *Natural Symbols* (1970) she pursued the relationship between ritual, ideology, and social organization. She proposed a two-dimensional scheme for classifying types of societies, with one axis representing “grid” and the other “group.” The “group” dimension referred to the extent of the emphasis placed on “insider” or “outsider” status; “grid” referred to the extent to which interpersonal relations were defined in terms of set, ascribed categories. Societies with high grid and high group had a firm commitment to ritual practice and place a higher priority on the group than the individual; societies that scored low on both counts (modern industrial societies among others) tended to devalue ritual in favor of personal expression. But it was possible to have one without the other. She furnished examples from Central African societies that placed high value on group membership but whose fluid role structure rated low in terms of “grid”; such societies, she suggested, were obsessed with their vulnerability to outside agencies of evil, notably witchcraft, and their ritual observances centered on the identification and expulsion of such threatening forces.

Practice and History

In France during the 1960s, anthropological concerns with symbolism, spearheaded by Claude Lévi-Strauss, were far more centrally concerned with myth than with ritual.

Bourdieu. Pierre Bourdieu’s *Outline of a Theory of Practice* (1972), a critique of French structuralist but also British functionalist approaches, proposed an alternative approach that devoted considerable attention to the analysis of ritual. As the title of the book suggests, Bourdieu stressed the importance of the domain of practical activity, understood in terms of “habitus,” taken-for-granted predispositions that were neither consistently verbalized nor unconscious in any deep sense. Such predispositions included, for example, bodily gestures, modes of interpersonal interaction, and the organization of space and time. “Rites, more than any other type of practice, serve to underline the mistake of enclosing in concept a logic made to dispense with concepts; of treating movements of the body and practical manipulations as purely logical operations; of speaking of analogies and homologies . . . when all that is involved is the practical transference of incorporated, quasi-postural schemes” (p. 116).

Ritual in historical time. In recent years, anthropologists have grown increasingly self-conscious about the historical contexts in which they conduct their research and correspondingly wary of abstracting cultures from particular places and times with specific antecedents. For example, Maurice Bloch’s analysis of circumcision ritual among the Merina of Madagascar paid particular attention to historical accounts to demonstrate how a family ritual was transformed into an expression of the central power of the state in the late eighteenth century and back again, in the twentieth century, into a family performance with increasingly anti-Christian and antielite overtones. While elements of the symbolism may have been invariant and placed constraints on the uses to which the ritual might be put, it was equally clear that the meanings of specific performances were highly subject to the agency of particular actors. Jean Comaroff’s

account of ritual in Zionist churches among the Tshidi of South Africa explicitly integrated a focus on practice with attention to historical context, arguing that the sometimes disjunctive synthesis of precolonial Tswana and of Protestant Christian imagery is a form of resistance to the social and cultural hegemonies that marginalize adherents.

Talal Asad has gone so far as to historicize the very concept of “ritual,” pointing out that in eighteenth and nineteenth century editions of the *Encyclopaedia Britannica* the term specifically referred to instructions for performing the divine service. It was precisely early anthropologists such as Tylor, Frazer, and Robertson Smith who introduced the concept of ritual as symbolic behavior, in other words as a form of practice that called for decoding, for interpretation, especially by an outsider. Using the *Rule* of St. Benedict as a paradigm, Asad advocated a return to the earlier meaning of ritual as a prescription for action: “Ritual is therefore directed at the apt performance of what is prescribed, something that depends on intellectual and practical disciplines but does not itself require decoding” (p. 62). While many anthropologists balk at so far-reaching a critique, contemporary accounts of ritual demonstrate a heightened sensitivity to issues of agency, gender, power, and the capacities of ritual performers to understand and interpret their own actions in modern contexts.

Robert Launay

ROMANTICISM IN LITERATURE AND POLITICS.

Romanticism is perhaps the richest and certainly the most vexed of the "isms." At the most general level, the term denotes a set of common tendencies in European art and thought from about 1797 to 1848. Ultimately those tendencies influenced the arts, especially literature, in virtually every country from Spain to Russia, but their acknowledged origins and centers were Britain, France, and Germany. Until the late twentieth century, there was even wide critical and historical agreement on the canonical names and the succession of Romantic generations in these countries. In literature, criticism, and philosophy, it was standard to regard William Blake (1757–1827), William Wordsworth (1770–1850), and Samuel Taylor Coleridge (1772–1834) in England as constituting the first generation of major Romantic poets and Lord Byron (1788–1824), Percy Bysshe Shelley (1792–1822), and John Keats (1795–1821) the second, with Sir Walter Scott (1771–1832) the lone novelist; Thomas Carlyle (1795–1881) often figured as a later Romantic *sui generis*. In Germany, "early Romanticism" (*Frühromanti*) meant the Jena Circle of Friedrich Schlegel (1772–1829) and August Wilhelm Schlegel (1767–1845), Novalis (pseudonym for Georg Friedrich Philipp von Hardenburg [1772–1801]), and Ludwig Tieck (1773–1853)—the first self-conscious Romantic "movement,"

though without the name—along with Wilhelm Heinrich Wackenroder (1773–1798), Friedrich Hölderlin (1770–1843), the philosopher Friedrich Schelling (1775–1854), and the theologian Friedrich Schleiermacher (1768–1834). The younger writers of the second "War of Liberation" generation included the folklorists and writers Achim von Arnim (1781–1831), Clemens Brentano (1778–1842), the brothers Grimm (Jakob [1785–1863] and Wilhelm [1786–1859]), Jean Paul (1763–1825), and the more problematic Heinrich von Kleist (1777–1811). Romanticism in France arguably lasted longer, though it started a little later, and could be divided into four generations, both chronological and ideological—François René de Chateaubriand (1768–1848), Benjamin Constant (1767–1830), and Germaine de Staël (1766–1817) (the lone woman considered in her own right) in the revolutionary and Napoleonic periods; the *cénacles* around Victor Hugo (1802–1885) and Stendhal (pseudonym of Marie-Henri Beyle [1783–1842]) in the 1820s; the *Jeune France* (Young France) Romantics of the Revolution of 1830 and the following decade, including Théophile Gautier (1811–1872), Alfred Vigny (1811–1872), Alfred de Musset (1810–1857), and Gérard de Nerval (1808–1855); and finally the so-called Social Romantics led by the poet-politician Alphonse de Lamartine (1790–1869), whose ideas triumphed, then foundered in the failed Revolution of 1848, finally taking Romanticism with them.

The sheer number, diversity and chronological spread of these writers suggest the difficulty of generalization, and the list does not include all the putative Romantic writers and critics, let alone painters and composers. Nonetheless literary critics and historians through the 1960s did identify a number of characteristics that, even if not all shared by every Romantic, seemed to capture a distinctive Romantic style, indeed a whole ethos. Central to it was a validation of both unique human particularity or individuality and the human sense for the infinite, as well as the effort to reconcile the two. The Romantic idea of individuality involved a heightened awareness and legitimization of the emotions and the irrational, against what it took to be the arid rationalism and the narrow, destructive analytic spirit of the eighteenth century. The crucial faculty of the expanded Romantic self was the imagination, which through the emotions and the unconscious could grasp and unite with the infinite in its various characterizations, whether a virtually deified Nature, a more abstract Absolute, or a more traditionally theistic divinity. As to the origins of these new concerns, as early as the 1820s contemporaries had identified a number of instigating factors: the revival of ballads and of medieval and Elizabethan "romance," the rise of German Idealist philosophy, and the French Revolution.

M. H. Abrams's *Natural Supernaturalism: Tradition and Revolution in Romantic Literature* (1971) offered an elegant, powerful synthesis of British and German Romanticism whose range went beyond the narrowly literary implications of its title to include Johann Gottlieb Fichte and Georg Wilhelm Friedrich Hegel as well as such later figures as Karl Marx, Friedrich Nietzsche and D. H. Lawrence, whom Abrams also claimed for Romanticism. Abrams saw Romanticism as profoundly philosophical, a "metaphysics of integration" whose

The Death of Sardanapalus (1844) by Eugène Delacroix. Oil on canvas. As with Romanticism in the visual arts, written works in the Romantic style stressed emotions and intuition over rationalism and scientific analysis, and the imagination above all. © PHILADELPHIA MUSEUM OF ART/CORBIS

key was “the ‘reconciliation,’ or synthesis, of whatever is divided, opposed and conflicting.” Its central literary trope was the circuitous journey, in which the visionary writer, as prophetic representative of all humanity, falls from primal unity into individuated and conflicted existence but ultimately returns to a higher unity that restores the original harmony while preserving his fully separate identity. This trope was the secularized and naturalized transformation of Christian Neoplatonism, which posited a three-stage developmental history of Being as paradigmatic also for human development: primal cosmic unity and goodness, subsequent differentiation into multiplicity and particularity, equivalent to a fall into evil and suffering, and then a return to unity and goodness that yet retains individuation and differentiation.

Abrams explained the Romantic secularization of an originally religious metaphysics as the direct result of the French Revolution. The Revolution seemed to bring the prospect of

heaven down to earth, holding out a this-worldly hope for radical individual freedom and complete social harmony, only to betray that hope by its murderous course and ultimate failure. The Romantics, initially caught up in revolutionary fervor, transferred their quest for liberation and reconciliation from political actions and forms to the spheres of aesthetics and philosophy. As Abrams put it, external means for transforming the world were replaced by internal means; the millennial faith in an apocalypse by revolution gave way to faith in an apocalypse by imagination or cognition.

The depth, coherence, and comprehensiveness of Abrams’s synthesis meant that any new approach would inevitably, directly or implicitly, be directed against it. In the ensuing decades the “visionary” interpretation of Romanticism was subjected to three main sorts of criticism.

Even before *Natural Supernaturalism* was published, Geoffrey Hartmann’s groundbreaking work on William

Wordsworth had undermined one of Romanticism's fundamental premises: the idea of a Romantic reconciliation of individuality and infinity. The attack on reconciliation became the main thrust of deconstructionist criticism, drawing on the French philosopher Jacques Derrida and led by the critic Paul de Man, whose first essays also predated Abrams. As he and others argued, Romantic writing consistently "deconstructed" the hoped-for unity of the mind with the objective Absolute through literary tropes and rhetorical disclaimers that unintentionally revealed the supposedly objective Romantic absolute as a wishful linguistic artifact of mind itself. Ultimately there was nothing but the human imagination, looking for, but in the nature of things unable to find, an external cocreator of the human experience of infinite wholeness. Romantic literature, as one critic put it, was a constant "dialogue between illusion and its deconstruction."

A very different kind of criticism of the visionary approach implicated deconstruction as well: Both were radically unhistorical. Abrams's interpretation was ostensibly historically-minded in its claim that Romanticism was a continuation of the project of the French Revolution by other means. In the following decades, however, historicist criticism, partly building on an earlier Marxism but using new techniques of reading derived from the critic Stephen Greenblatt's application of Clifford Geertz's anthropology, the work of Michel Foucault, and deconstruction itself, insisted that this claim obscured the true relationship between politics and Romanticism. By shifting the arena of freedom and reconciliation to the imaginative and aesthetic, the Romantics were in fact either occluding politics or retreating from it altogether. Jerome McGann (1983), for example, asserted that the poetry of Romanticism was everywhere marked by an extreme form of displacement, through which the actual human issues of liberation from hierarchy, oppression, and poverty and the political struggle to achieve a just and egalitarian society were resituated in a variety of idealized locales such as nature, agrarian utopias, or the visionary imagination of art. Only a sociohistorical method of reading even such ostensibly unhistorical poems as Wordsworth's "Tintern Abbey" (1798) could demystify them by revealing the hidden conservative or outright antipolitics of a Romanticism that tried to transform concrete sociopolitical agenda into timeless ontological visions.

German historical criticism took a similar political tack, though it was less debunking in tone because there was never any doubt in the minds of critics that the original German Romantic impulse was inspired by the liberationist goals of the French Revolution or that the early Romantics themselves openly acknowledged this. As Frederick Beiser (1992) pointed out, what separated early from later German Romanticism was the distinction between the former's relatively egalitarian ideal of community and the latter's more authoritarian and paternalistic ideal of the state. The question for critics like him, therefore, was why the original radical thrust of German Romanticism, in which Friedrich Schlegel's demand for a "universal poetry" shaped only by the poet's sovereign will was initially linked with republican politics, not only dissipated but turned into its opposite.

The third line of dissent from the visionary hypothesis argued the limitations of an inherently masculine Romantic vision and its contemporary masculinist interpretation. Both, feminist critics claimed, entailed the ideological subordination of the feminine along with the simultaneous exclusion of real women from their purview. Feminist Romantic criticism undertook three distinct though connected initiatives. One worked at exposing the gendered character of the visionary synthesis. Ann Mellor (1988, 1993), for example, claimed that the Romantic poets endorsed a concept of the self as a power that gains control over and gives significance to nature, represented in their writings as female, thus legitimizing the continued repression of women. A second initiative focused on the women writers of the Romantic movement, both previously acknowledged if underestimated authors like de Staël and Mary Shelley, and those hitherto treated as little more than supernumeraries and handmaidens of the canonical Romantic writers, such as Dorothy Wordsworth, Dorothea Schlegel, and Caroline Schelling. A third approach, the one potentially most disruptive of the previous synthesis, tested the Romantic canon by resurrecting the work of a number of late-eighteenth- and early-nineteenth-century women writers such as Helen Maria Williams, Charlotte Smith, Mary Robinson, Felicia Hemans, and Maria Edgeworth, all well-known and well regarded in their own time but consigned by later critics to oblivion. Many of them could not be easily assimilated into the interpretive categories of visionary Romanticism.

In the face of the new diversity, there might be a temptation to return to Lovejoy's radical nominalism. But a more helpful approach, one faithful to the spirit of the times, revises the earlier synthesis in the light of its challengers, maintaining the meaningfulness of the term Romanticism, while acknowledging that not everything written during the "age of Romanticism"—for example, the novels of Jane Austen—was Romantic. Such revision, furthermore, is able to include more of the conclusions of the new methodologies, and more of the new work they examine, than might initially be expected. The indispensability of the historical context for understanding the emergence and development of Romanticism strongly suggests that synthesis must take the form of a narrative, however necessarily simplified in a short article.

The First Generation in Britain and Germany

Romanticism in Britain and Germany did indeed begin in the late 1790s as the young intellectual generation's response to the great hopes and correspondingly crushing disappointments of the French Revolution. The German Romantic poet Novalis wittily referred to the revolution, meaning his generation's reaction to it, as a puberty crisis. But if it was, the Romantics unwittingly revolutionized Western adolescence by inventing a new ideal of the self, which would become the maturational ideal of truly free and fully self-aware moderns. The first Romantics comprised an actual demographic generation; all were born within a few years of 1770, all came of age around the outbreak of the Revolution in 1789, all were its ardent partisans. They came to it out of personal motives of rebellion against hierarchical societies and paternalistic families on behalf of freedom of vocational choice and sexual self-expression.

Implicitly already political and social, their rebellion found in the Revolution the larger framework of socio-political analysis and universal ideals that enabled them to generalize it into an ideological worldview.

“Bliss was it in that dawn to be alive / But to be young was very heaven,” Wordsworth famously wrote of the Revolution. Heaven did not last long, but while it did, he and others pushed the Revolutionary ideal of freedom beyond anything the revolutionaries themselves had conceived, beyond freedom guided by reason to freedom that accepted no restraints from nature, history or any “general laws,” only the “light of circumstances / flashed / Upon an independent intellect.” In Germany the philosopher Fichte, explicitly generalizing from the political ideals of the Revolution, went beyond Kantian rational freedom to theorize the self as an infinitely striving subjectivity that in principle knows no boundaries except those of its own finitude, which it experiences as a goad to constant transcendence.

This vision of unbounded freedom could not survive either the dilemma of relativism that it generated or the perversions of tyranny and exploitation in both revolutionary politics and personal life that it seemed to produce. The first generation (with the exception of Hölderlin) turned away from radical politics while retaining the idea of infinite freedom in the sphere of the creative imagination. It was at this stage that August Wilhelm Schlegel, in *Athenaeum* Fragment 116, propounded his famous definition of romantic poetry. But even as an aesthetic doctrine, infinite freedom—Keats’s famous “egotistical sublime”—threatened anarchy and isolation. Recoiling from the imperial self, the young rebels created Romanticism by reconnecting the self with that which was greater than it, the infinite, embodied in an entity, whether nature, the beloved, or more abstractly, the Absolute, with which it could unite. As feminist critics noted, this entity was virtually always figured as feminine. But the Romantics’ relationship to the feminine infinite was not simply conquest and subordination, but a complex, and contradictory, mixture. On the one hand, the mind was dependent on the infinite, safely harbored in its sheltering matrix and, as in Wordsworth’s explicit metaphor of infant and mother, connected through its greater power to the rest of the world. On the other hand, nature was but mind’s partner and cocreator of the vision of the unity of all things, in Wordsworth’s words, the “genuine counterpart” of the “glorious faculty / Which higher minds bear with them as their own.” Thus the infinite was at once the mind’s external superior and mind’s own equal capacity; in Coleridge’s famous formulation, the poetic imagination was the repetition in the finite mind of the eternal act of creation in the infinite “I am.” Another version of the Romantic paradox, Schleiermacher’s description of the self’s two basic but opposite urges, presented a different face of contradiction. On the one hand, he wrote in *On Religion* (1799, 1806), the self “longs to expand . . . outwards into the world, and so to permeate everything with itself . . . to penetrate everything and fill everything with reason and freedom.” On the other hand, “the opposing drive is the dread fear of standing as a single individual alone against the whole; it is the longing to surrender and be completely absorbed in it, to feel taken hold of and determined

by it.” The Romantic self was driven at once by the desire for infinite self-assertion and the desire for complete subsumption into the infinite.

Before deconstruction, many Romantics were aware of the impossibility of this conjunction. Schlegel’s central concept of romantic irony was the expression of his insistence that every claim on the part of a Romantic work to totality was necessarily false because of the finitude of the self and of its creations. One strove to create knowing that one had to destroy the thing one loved in order to continue creating. And the German Romantic sense of infinite longing, *Sehnsucht*, epitomized in Novalis’s yearning poems of love *Hymns to the Night* (1800), testified to the awareness that haunted all of Romanticism, that the infinite was beyond human reach and could only be the achievement of wish-fulfilling dreams of eternal love.

The gendered contradictions in Romantic metaphysics between maternal symbiosis and partnership, and between surrender and penetrating mastery, parallel literary depictions of Romantic love as well as real relations among the Romantics. Friedrich Schlegel’s representative, quasi-autobiographical novel *Lucinde* (1799) describes a series of relationships with women that enable the male protagonist to mature into a centered, creative artist. His harmonious wholeness is achieved through the experience of being loved, and his unified personality in turn makes possible the organic form of his artistic work, which does not need to rely on classical rules for its unity. The relationship with Lucinde (a barely disguised if idealized version of the author’s lover and later wife, Dorothea Mendelsohn Veit) is described contradictorily both as reciprocal—“Only in the answer of its ‘you’ can every ‘I’ wholly feel its boundless unity”—and unequal: Lucinde, while an independent woman and an artist, is finally the mirror in which Julius sees his own unity and power reflected, the moon to his sun. Dorothy Wordsworth played an analogous role for William not only in life, but in poems like “Tintern Abbey,” where she serves as the guarantor for the poet’s vision of the unity of all things. While it was necessary for the feminine to be seen as independent, even omnipotent, to make possible the Romantic imagination of the unity of personality, it was precisely the exclusion of women from the public sphere, sparing them the conflicts and imperfections of striving, that made it plausible for the male Romantics to see the feminine as already achieved wholeness. The maternal role best symbolized feminine self-containment and selflessness, even as the male Romantics demanded that women be autonomous, indeed creative, intellectual companions.

The women of that first generation were, consciously at least, mostly content to fill the roles assigned them. Though Dorothy Wordsworth wrote poetry, she refused to think of herself as a poet, even referring to her poems as mere verses or rhymes. Conflicting assessments of her work suggest that it was either thwarted in its effort to follow her brother’s sense of the Romantic self by her felt exclusion from its masculine authority, or that it registered a different relation of self to community from that suggested by the visionary imagination, one in which the self had its place though not the privileged one of the male visionary. Her sense of community, however, was in fact no different from the ideal that William himself suggested in the chastened agrarian republicanism and later

increasingly Burkean traditionalism of his postrevolutionary social vision. Visionary imagination and the celebration of the common life were not mutually exclusive in the poetics of *Lyrical Ballads* (1798, 1800), but were rather in fact mutually entailed. Dorothea Schlegel, unlike Dorothy Wordsworth, published the work she wrote, the novel *Florentin* (1801), but its hero was the questing young male Romantic seeking the ideal woman who could complete him.

There is no critical consensus as yet, however, about the women poets of the time whose work critics are rediscovering in the early twenty-first century. Some critics like Mellor and Marlon Ross (1989) see in it a distinct feminine sensibility that offers a countertradition to that of the egotistical sublime, one that emphasizes local experience and sensibility rather than vision. Yet, as Isobel Armstrong argues, women's poetry shared with male Romantic writing the valorization of emotion and the language of the sense as well as the explicit self-consciousness about both long held to be one of Romanticism's chief characteristics. What does seem clearly to be the case, as Stuart Curran and Gary Kelly point out, is that in the first decade of the nineteenth century at the height of the Napoleonic wars women writers like Hemans and Edgeworth moved like their male counterparts away from radicalism to a celebration of domesticity which entailed the negative representation of "excessive selfhood." In this respect they participated in a consensual "discourse of Romanticism."

The Second Generation in Britain and Germany

Romanticism in Britain and Germany diverged in the second generation as a result of very different political experiences during and after the Napoleonic wars. Freed from the climate of oppressive wartime fear, though not from the continuing repressive policies of the British government, Byron and Shelley felt it was time to revive the original radical impulse of the first generation, and sharply criticized Wordsworth for his frightened apostasy from the cause of liberty. Both, however, understood the legitimate reasons for his fearfulness: Freedom had been perverted during the Revolution, and its champions knew that they had to explore and exorcise the inner temptations that a fledgling radical autonomy bred before it could be safely embraced. In his dramatic poems "Manfred" (1816) and "Cain" (1821), Byron wrestled with the problem of guilt over (possibly sexual) misuse of freedom and of the religious temptations of forgiveness and consolation at the cost of submission to authority, ultimately rejecting them for an affirmation of individual agency and moral responsibility. In *Prometheus Unbound* (1820), Shelley identified the tyrannical Zeus, who had punished the rebellious Prometheus, as an emblem of humanity's own worst potential, the corruption of freedom and love into self-love and the lust for domination. Only when freedom recognized its own temptations to omnipotence and controlled them was it capable of the mutuality on which both true love and a free polity were based. But in the end their Romantic visions were quite different. Shelley celebrated love, earthly and divine, as the symbol of the fusion of the individual and the whole. The relentless satire and irony of the late masterpiece *Don Juan* (1819–1824) have seemed to some later

critics un-Romantic, and certainly very different from the restless questing and world-weariness of the Byronic hero of the earlier *Childe Harold* (1812–1818), but they were in fact the other side of Romanticism, a display of the "mobility" Byron ascribed to his most positive character in the epic, the ability to respond spontaneously to every new stimulus without false sentimentality. In his own time, "Byronism" was second only to the cult of Napoleon—which Byron himself helped promote—in mythifying one Romantic life model: life as an experiment without bounds, the infinite conquest of experience.

The fiction of Scott showed, however, that the Romantic dialectic could produce yet another kind of synthesis. In the *Waverley* novels (first published in 1814) and in medieval romances like *Ivanhoe* (1819), Scott, a modernizer but an anti-Jacobin fearful of the radical effects of revolutionary individualism, in effect extended the ideal of individuality from person to nation. In the increasingly conservative and patriotic vein of the postrevolutionary Wordsworth, he established the genre of the historical novel as a vehicle for the creation of national identity through (mythic) national history. From a very different vantage point Mary Shelley also offered a critique of Romantic—and modern scientific—hubris in her novel *Frankenstein* (1816–1818), which, as she herself wrote in a preface to the third edition, was intended as the story of a "human endeavor to mock the stupendous mechanism of the Creator of the world." Contemporary feminist critics have pointed out that the creation of the "monster" was also a masculine attempt to usurp the feminine role in reproduction. The two interpretations are not mutually exclusive.

The transformation of individualism that Scott worked implicitly, the German Romantics of the second generation advanced programmatically. Most of the Jena Circle had by the late 1790s and early 1800s already become more conservative while striving to retain the forms of political freedom. In *Belief and Love* (1798), Novalis argued that the integration of monarchy and republic was the highest form of liberty. As inherently free egos, all men were in principle worthy of the throne. The legitimacy of the Prussian monarch derived from his being both incarnation of the Fichtean absolute ego—made possible, of course, only by the indispensable love of his queen; the purpose of his rule was to ultimately cancel out his own authority by preparing all men, through his example, for freedom in a polity of self-governing equals. The evolution of Friedrich Schlegel's politics, preceded by his conversion to Catholicism, brought him to an idealization of the Holy Roman Empire's universalism, whose unity under the aegis of the Roman Catholic Church had made safely possible the harmonious flourishing of plural national individualities.

Adding to the chaos produced by the French Revolution, the humiliations inflicted on Germany by Napoleon intensified German Romantic conservatism. Yet even when it seemed to elevate the nation or the state to dominance, it never wholly surrendered individualistic ideals. The second generation devised a putatively unique German version of individuality that displaced that idea from the person onto the collective entity. True individuality was thus not incompatible with social solidarity, as was merely "French" or self-interested individual-

ism; rather it was the salutary effect of identifying with the unique spirit of one's collectivity. Many Romantics embarked on the construction of a unique "personality" for Germany out of its history, language, and folk culture, for example, in the folk songs collected (and composed) by Arnim and Brentano in *The Boys Magic Horn* (1808), or the folk tales assembled (and revised) by the brothers Grimm (1812). These celebrants of folk culture recognized the "higher reality" of magic and the supernatural as vehicles of the collective unconscious, as did the tales of E. T. A. Hoffmann (1814, 1817), and thus as agencies of an expanded national individuality not constrained by the limits of universal rationality.

French Romanticism

Paradoxically, given the role of the Revolution in fostering Romanticism, French Romanticism began a few years later than British and German, in part because French writers could be more directly involved in the politics than their European counterparts. Perhaps for this reason too it took a somewhat different course in the first generation; two of its main protagonists, de Staël and Constant, remained liberal, if chastened, revolutionaries. It was de Staël, in her extraordinarily influential *Of Germany* (1810), who brought German Romanticism to French, and wider European, notice.

But it was the young aristocrat Chateaubriand who first dazzled France with an indigenous version of Romanticism. Initially a supporter of the Revolution, he had left, disillusioned by its violence, for the United States to investigate the pristine republican virtue of the native "noble savages," acclaimed by Jean-Jacques Rousseau and a generation of Enlightenment writers. It was in the wilderness, however, that he became aware of the dangers of *le vague des passions*, the passion for the indeterminate, which he came to believe had derailed revolutionary politics into self-deifying tyranny. In forced exile after a failed military venture in the royalist cause, he experienced a religious epiphany whose first fruits were the short stories "Atala" (1801) and "René," included in the enormously influential *Genius of Christianity* (1802). The stories are cautionary tales about the dangers of the quest of the infinite in its most exalted interpersonal form, sexual love. Only in religious yearning, expressed in such earthly creations as the Gothic cathedral and in the heavenly vision of the fulfillment of Christ's love in the afterlife, did passion have an adequate object that would never disappoint and the quest for which would never be destructive. Chateaubriand's Romantic religiosity, like that of his German Protestant counterpart Schleiermacher, was quite untraditional. The "genius" of religion lay not in its dogmatic claims but in its unique ability to fulfill secular yearnings for ecstasy and to inspire human creativity. The same powerful residue of revolutionary individuality can be found in Chateaubriand's later politics. A royalist out of reason, he said, he remained a republican by taste; only monarchy could preserve liberty because it was limited by divine law.

Unlike Chateaubriand, Constant's revolutionary liberalism weathered the Terror, though it was through it that he understood the dangers both of centralized political power and of "enthusiasm" in politics. But his attitude toward enthusi-

asm was necessarily ambiguous. A defender of the modern liberty of rights against both traditional authority and the classical republican priority of the common good, Constant was also deeply suspicious of self-interest for political as well as existential reasons. The self-interest of the private sphere not only endangered public-mindedness, it was a corrosive sentiment that drained life of meaning by drying up passion, above all the passion for the infinite. It was his onetime mistress and political mentor de Staël who had taught him its importance in politics and life. But, like Chateaubriand, Constant had learned that passion had to be directed at the proper object. Politicized in the abstractions of virtue and the common good, it could put tyrannical power in the hands of any group who claimed superior knowledge of them. It was ultimately in religion and the arts that absolute passion could most fully and safely express itself, though devotion to the transcendent ideal of liberty was its indispensably activist, public dimension.

Like Chateaubriand too, Constant believed that love was not passion's safest outlet, for love ran the same danger as politics of deifying the finite object of devotion. His novel *Adolphe* (1816) documented the insatiable need that continued to drive an erotic attachment that had outlived its initial frenzy, fully aware of the limitations of its object and of its own narcissistic tendency to exploit, yet unable to let go. Contemporaries and some later critics interpreted the novel as a roman à clef charting Constant's tortured relationship with de Staël (and other mistresses), but Germaine, a prolific and established novelist long before Constant, had her own Romantic agenda. More committed than Constant to the expression of enthusiasm as romantic passion, she also knew that passion was particularly problematic for women. Women love men for their individuality, but women's individuality is a hindrance to men's love. In her novels *Delphine* (1802) and *Corinne* (1807) talented women who aspire to creative achievement do not find the succor in men that men find in women; unable to hold a man's love, and no longer nurtured by it, they either die or lose their creativity.

Under Chateaubriand's influence, French Romanticism was predominantly royalist and Catholic during the Restoration, but there was a significant liberal coterie, under the leadership of Stendhal, that in the wake of aristocratic reaction in the late 1820s recruited former royalists like Hugo and Lamartine. In the preface to his play *Hernani* (1830), whose first production inspired an epoch-making riot in the theater between partisans of traditional neoclassical drama and the new Romantic ideas, Hugo called for a "July 14" of art and declared that liberty in art was the offspring of political liberty. Harmony, the goal of all art, could not be achieved by excluding the unique and the idiosyncratic or the ugly and grotesque. Rather the artistic challenge was to achieve formal unity and wholeness by including the infinite variety of life, and to do so not by following rigid rules but through the creative inspiration of the artist whose genius derived from being authentically him or herself. In his novels, particularly *The Red and the Black* (1830), Stendhal wittily explored the formidable obstacles to the Romantic ideals of authenticity and emotional sincerity in the way of an ambitious young man striving

to achieve both in the post-Napoleonic era of restored authoritarian hierarchy in society and church.

The Revolution of 1830 promised at first to realize liberal Romantic hopes for extending political as well as artistic freedom, but the younger generation was severely disappointed by the political and cultural dominance of a commercial oligarchy under the “Bourgeois Monarchy.” The writers of the Young France movement abandoned politics once again for art, now aiming it explicitly against the sordid materialism of bourgeois society. Proclaiming the aesthetic doctrine of “art for art’s sake,” they in fact posed ideals of sensuality and beauty as a counter-culture to the ugliness of everyday bourgeois life. In his novel *Mlle. de Maupin* (1835), Théophile Gautier extended the idea of the boundaryless Romantic personality in the first literary exploration of the realities and potentialities of human bisexuality and the need to integrate it into the personality that would be genuinely whole. Beyond art, Romanticism became a lifestyle whose declared purpose was to “shock the bourgeoisie” by flouting its norms and acting out the infinity of the self in theatrically eccentric and bizarre behavior. The “Bohemia” of the countercultural artist was a reality before it was a novel—though the novel by Henri Murger (1849) that gave it its name was an unsparingly unsentimental view of its less respectable underside.

In the final cycle of French Romanticism, the implicitly political critique of 1830s aestheticism reasserted itself directly in the 1840s as a growing protest against the selfish narrowness of the political class and the social oppression and misery that marked the beginnings of the industrial revolution in France. “Social Romanticism” idealized “the people” as the new Romantic hero, the repository of spontaneity, goodness, and unity, and demanded that their liberty be realized not only in more democratic politics but in providing the poor with the material means that were the prerequisite for full self-realization. The literature of Social Romanticism ranged from the Parisian novels of Georges Sand to the histories of Jules Michelet, the chronicler of the people’s struggle for liberty. But its great moment seemed to come when its most prominent spokesman, the poet-politician Lamartine, became leader of the provisional republican government of France in the Revolution of 1848. Lamartine was by far not the first Romantic politician—a number of his European predecessors had held offices high and low—but for the first time in history, a Romantic literary figure seemed to be in a position to legislate a version of Romanticism into reality. When, however, in the tragic denouement of the June Days, Lamartine found himself directing the army to shoot down “the people” on the barricades of Paris, the vision of Social Romanticism, and with it the era of Romanticism, came to an end. Its legacy nevertheless remained not only in the revived “late Romanticism” of

the fin-de-siècle but as a permanent dimension of contemporary art and of our understanding of the modern self.

S

SACRED AND PROFANE. In order to define and explain the paired concepts of *sacred* and *profane*, it is important to look at these concepts as developed in the influential work of the French sociologist Émile Durkheim (1858–1917).

Durkheim's Definition of Religion

In his last great work, *The Elementary Forms of Religious Life* (1912), Durkheim set out “to study the simplest and most primitive religion that is known at present, to discover its principles and attempt an explanation of it” (p. 1) in order to uncover universal properties of religion. But first he needed to define religion, or else “run the risk of either calling a system of ideas and practices religion that are in no way religious, or of passing by religious phenomena without detecting their true nature” (p. 21). Rather than immediately proposing a definition of his own, he began by rejecting two existing definitions. Religion could not be defined, he argued, in terms of the “supernatural,” a category that made sense only in opposition to a modern European paradigm of scientific explanation for “natural” phenomena; for most of the world’s peoples, including premodern Europeans, religious phenomena were perfectly natural. Nor, he continued, could religion be reduced to ideas of “divinity” or even “spiritual beings.” For instance, salvation in Buddhism was not predicated on divine assistance, and many religious practices—Jewish dietary regulations, for example—were “wholly independent of any idea of gods or spiritual beings” (p. 32).

Instead, Durkheim formulated a radical proposition:

Whether simple or complex, all known religious beliefs display a common feature: They presuppose a classification of the real or ideal things that men conceive of into two classes—two opposite genera—that are widely designated by two distinct terms, which the words profane and sacred translate fairly well. The division of the world into two domains, one containing all that is sacred and the other all this is profane—such is the distinctive trait of religious thought. (p. 34)

Unlike definitions in terms of “supernatural,” “divinities,” or “spiritual beings,” Durkheim’s definition in no way predicated any specific kind of belief, much less belief in any particular kind of being. On the contrary, for Durkheim, the division into “sacred” and “profane” was a necessary precondition for religious beliefs, indeed their very foundation. “Religious beliefs are those representations that express the nature of sacred things and the relations they have with other sacred

things or with profane things . . . rites are rules of conduct that prescribe how man must conduct himself with sacred things” (p. 38).

Sacred versus Holy; Profane versus Secular

It is helpful to contrast Durkheim’s concept of the sacred to that of the holy in the contemporary work of the noted German theologian Rudolf Otto, in *The Idea of the Holy* (1917). The holy, for Otto, derived from a sense of the “numinous” (a word Otto coined): the experience of awe, of the transcendent majesty, energy, and mystery of the wholly other. For Otto, the holy was grounded in individual feeling, the apprehension of something outside the individual and infinitely greater. Durkheim hardly denied the existence, or for that matter the importance, of such an experience but held that it derived from the idea of the sacred rather than constituting its essence. For Durkheim, the concept of sacred was above all intrinsically social, the product of the social classification of all phenomena into the antithetical categories of sacred and profane. Unlike Otto’s “holy,” Durkheim’s sacred was literally unthinkable except in terms of the profane. The content of the category sacred was intrinsically fluid: anything might be classified as sacred. What mattered was the social act of separation from the profane.

At first sight, this dichotomy between sacred and profane seems identical to that between sacred and secular. While Durkheim did not explicitly argue against such assimilation, it is clear that he would have regarded it as analogous to that between natural and supernatural, a historically constituted distinction that made sense only in terms of relatively recent European history, with its emphasis on the separation of church and state. Most important, Durkheim very definitely refused to exempt the secular realm of the state from the domain of the sacred. One of his most powerful images—all the more so when one bears in mind that *The Elementary Forms of Religious Life* appeared only two years before the outbreak of World War I—was that of the flag: “The soldier who fall defending his flag certainly does not believe he has sacrificed himself to a piece of cloth” (p. 229); “A mere scrap of the flag represents the country as much as the flag itself; moreover, it is sacred in the same right and to the same degree” (p. 231).

Totems, Society, and the Sacred

Durkheim’s analysis centered on what he considered to be the simplest and most primitive known religion, namely Australian totemism, and rested on the consideration of what the Australians held sacred: “totemism places figurative representations

of the totem in the first rank of the things it considers sacred; then come the animals or plants whose name the clan bears, and finally the members of the clan" (p. 190). It is important to note that representations of totem animals were far more sacred than the animals themselves. Such designs were placed on ritual objects such as churinga (bullroarers), the very sight of which might be forbidden to profane noninitiates—foreigners, but also women and children—on pain of death. The relatively abstract nature of such representations made them particularly appropriate symbols, concrete manifestations of an abstract idea, just as the flag represented the nation; indeed, Durkheim noted, the "totem is the flag of the clan" (p. 222).

More generally, the totem represented a sacred force of energy that Durkheim (borrowing a term from other Melanesian and Polynesian peoples for lack of an appropriate Australian word) named *mana*. This force, external to the individual but in which he also participated, was nothing else but society itself, Durkheim argued. Ultimately, the sacred was not only social but also the very form in which society represented itself to its members.

The Ambiguity of the Sacred

The sacred was not in any simpleminded way reducible to "the good." Mourning rituals pointed the way to another dimension of the sacred, connected with "[any] misfortune, anything that is ominous, and anything that motivates feelings of disquiet or fear" (p. 392). The domain of the sacred also included "evil and impure powers, bringers of disorder, causes of death and sickness, instigators of sacrilege" (p. 412). Just as the sacred and the profane could be defined only in terms of one another, so the pure and the impure constituted two inextricably linked modalities of sacredness. After all, both holy and polluting things need to be kept separate from the profane realm of everyday reality.

In some cases, Durkheim suggested that the same object could easily pass from one state to another. The impurely sacred, according to Durkheim, was necessary in order to represent inevitable negative facets of social reality. "[The] two poles of religious life correspond to the two opposite states through which all social life passes. There is the same contrast between the lucky and the unlucky sacred as between the states of collective euphoria and dysphoria" (p. 417).

Durkheim's Critics

Despite the profound influence of Durkheim on the structural-functional school of British anthropology, many of its practitioners were highly critical of the pertinence of his antithesis between sacred and profane. E. E. Evans-Pritchard proposed "a test of this sort of formulation . . . : whether it can be broken down into problems which permit testing by observation in field research, or can at least aid in a classification of the observed facts. I have never found that the dichotomy of sacred and profane was of much use for either purpose" (p. 65). Specifically, British anthropologists challenged its applicability to the real-life situations they observed in the course of field research.

Evans-Pritchard argued that among the Azande of central Africa, sacredness might be situational. Shrines erected for the

purposes of ancestor worship in the middle of a compound might serve as a focus of ritual offerings on some occasions but on others, might be a convenient place for resting spears. W. E. H. Stanner found that the distinction was impossible to apply unambiguously in studying Australian religion, the very example on which it was ostensibly based. Jack Goody noted that many societies have no words that translate as sacred or profane and that ultimately, just like the distinction between natural and supernatural, it was very much a product of European religious thought rather than a universally applicable criterion.

Sacred and Profane since Durkheim

The American anthropologist W. Lloyd Warner, after conducting ethnographic research in Australia, turned in the 1930s to field work in a New England town that he called "Yankee City." He published a series of monographs about American life through the lens of a small town, the last of which, *The Living and the Dead* (1959), focused on symbols and symbolism. The central chapter of the book, the one that most closely reflects the title of the book, was an analysis of Memorial Day rites, which "are a modern cult of the dead and conform to Durkheim's definition of sacred collective representations" (p. 278). These rites transcended the division of the community in terms of class, ethnicity, and religion, uniting it around sacred symbols, including the cemetery, and national heroes—Lincoln, Washington, the Unknown Soldier. "The graves of the dead are the most powerful of the visible emblems which unify all the activities of the separate groups of the community," whereas the celebration of the deaths of men who sacrificed their lives for their country "become powerful sacred symbols which organized, direct, and constantly revive the collective ideals of the community and the nation" (p. 279).

The sociologist Robert Bellah explicitly built on Warner's analysis of Memorial Day rites to elaborate a concept of "American civil religion"—"a collection of beliefs, symbols, and rituals with respect to sacred things and institutionalized in a collectivity" (p. 10). Examining various presidential addresses on ceremonial occasions, from the founding father down to Lyndon Johnson, he notes the strategic invocation of "God" and the complete absence of mentions of "Christ," which he argued signaled the transcendent, sacred nature of the nation while acknowledging the separation of church and state by avoiding references to any particular institutionalized religious faith. Ultimately, these analyses of American civil religion developed the analogies that Durkheim had suggested by stressing the identity of "flag" and "totem" and demonstrated the extent to which this conception of the sacred could not be opposed in any straightforward way to the secular.

More than any other contemporary anthropologists, Mary Douglas has made Durkheim's distinction between sacred and profane a central focus of her work. In *Purity and Danger* (1966), she proposed a sweeping cross-cultural analysis of rules concerning purity and pollution that stressed Durkheim's central thesis that religious ideas depended on the active separation of antithetical domains, a separation that in turn implied a system of classification. The central premise of her analysis

ÉMILE DURKHEIM

Émile Durkheim (1858–1917) was the founder of academic sociology in France and a thinker whose contribution to the social sciences, especially sociology and anthropology, continues to be fundamental. Born into a family of rabbis in Lorraine, he studied at the prestigious École Normale Supérieure in Paris, where his fellow students included the future philosopher Henri Bergson and Jean Jaurès, who was to become the leader of the Socialist Party. Philosophy was (and remains) a central focus of the humanities in France; Durkheim's first concern was to establish sociology as a legitimate branch. Consequently, his doctoral thesis and first major work, *The Division of Labor in Society*, published in 1893, sought to establish a "science of ethics."

The idea of looking for morality in the division of labor was startling, especially in light of the Marxist convictions of Durkheim's socialist friends. With equal daring, Durkheim suggested that such moral principles were reflected in the different types of law, repressive (criminal) and restitutive (civil). Repressive law rested on shared social understandings of "crime" morality, a domain Durkheim labeled the "conscience collective," which can be translated either as "collective consciousness" or "collective conscience." The moral underpinnings of such understandings amounted to "mechanical solidarity," the recognition of essential likeness between fellow members of a society. The increasing scope of the division of labor gave rise to a higher form of "organic" solidarity, reflecting complementarity rather than likeness. Ideally, organic solidarity was expressed by restitutive law stipulating reciprocal rights and obligations and redressing imbalances rather than punishing crimes. Durkheim was acutely aware of the gap between law and justice in modern society, a gap that he named "anomie," the absence of rules or norms. In his view, the economic aspects of the division of labor had temporarily outpaced the development of law and morality.

Two years later, in 1895, he published *The Rules of Sociological Method*, in which he insisted that

"social facts," "ways of acting, thinking, and feeling, external to the individuals, and endowed with a power of coercion, by which they control him" (p. 3), could be explained only in social terms and were not reducible to biological or psychological explanations. In 1897 he published *Suicide* as a dramatic demonstration of the power of his methods; after all, the decision to take one's own life seemed a matter of individual psychology. However, he persuasively argued that psychological, biological, or climactic theories could not explain differences in suicide rates. For example, Protestants were more suicide-prone than Catholics, recently widowed men more so than women; suicide rates climbed during economic depressions and dropped in periods of revolutionary upheaval. Different types of suicide could be classified with respect to two axes: one in terms of the individual's commitment to social norms and the other in terms of the extent to which such norms were available to guide the individual in particular situations.

In 1896 Durkheim founded a journal, the *Année Sociologique*, which served as a forum not only for his own ideas but also for those of a growing number of brilliant pupils, including his nephew, Marcel Mauss. In 1912 he published his last book, *The Elementary Forms of Religious Life*; in it, he used Australian totemism as his central case on the grounds that native Australians were the simplest society known to humanity and that their religion was consequently free from confusing accretions. In stark contrast to his predecessors, nineteenth-century theorists of social evolution such as E. B. Tylor, Lewis Henry Morgan, and James Frazer, Durkheim did not use the Australians to demonstrate how far European society had evolved but rather as a means of uncovering universal features of religion and society that we share with them.

As a native of Lorraine, which was annexed by Germany in 1871, Durkheim enthusiastically supported the cause of France in World War I, with tragic consequences. His only son and most of his students died at the front, and he died a broken man in 1917.

was that “dirt is essentially disorder” (p. 12). For this reason, anomalous persons or animals, those that did not fit neatly into preconceived, socially determined categories, were especially powerful or dangerous. Seen in this light, European-American preoccupations with hygiene were not qualitatively different from non-European anxieties about ritual pollution. Such preoccupations with the maintenance of order and the separation of antithetical categories were intimately related to the perpetuation of social boundaries between insiders and outsiders.

Most recently, Durkheim’s concepts have reappeared in a heated debate between anthropologists as to whether Captain James Cook, who arrived in the Hawaiian islands in 1778 and was killed by native Hawaiians in 1779, was really considered by his killers to be an avatar of the god Lono. Marshall Sahlins, in *Islands of History* (1985), asserted that Cook’s murder was a direct outgrowth of his deification. Sahlins’s analysis centered on the opposition between the god Lono, “associated with natural growth and human reproduction who annually returns to the islands with the fertilizing rains of winter” (p. 105) and the god Ku, associated with kingship, warfare, and human sacrifice.

Each year, the Makahiki festival celebrated the arrival of Lono along with the rains, his journey throughout the islands, and his departure/death, marked by the resumption of human sacrifice to the god Ku. The arrival of Cook in Hawaii, his journey around the island, and his departure all coincided with the ritual trajectory of the god Lono, with whom, Sahlins argued, Cook was literally identified, particularly by the priests of Lono. Disaster struck when, after his departure, Cook was obliged to return to Hawaii. The arrival of “Lono” at the wrong time and from the wrong direction was precisely a violation of rules of separation of antithetical categories, a direct threat to the god Ku and the king, who promptly had Cook killed. “Cook was transformed from the divine beneficiary of the sacrifice to its victim—a change never really radical in Polynesian thought, and in their royal combats always possible” (p. 106).

This analysis has been challenged by Gananath Obeyesekere, who has argued that such accounts of the deification of explorers like Cook were part of European imperial mythologizing rather than “native” thought. Advocating an approach derived from the sociology of Max Weber and emphasizing “practical rationality,” he has suggested that Cook’s death be interpreted more prosaically in terms of factional power struggles in Hawaii. Sahlins, it must be noted, carefully avoid the assertion that all Hawaiians accepted that Cook was a god. Rather, his point was that the historical events could be understood only in terms of the framework of Hawaiian ideas about the sacred, ideals that revolved around the classification of the social and the physical world in terms of one another, where the mixture of antithetical categories generated either great power or danger.

The debate shows clearly that Durkheim’s distinction between sacred and profane continues to inform anthropological analyses of religion (as well as of ostensibly secular ideologies) but also that such approaches continue to be challenged and

contested, and that the relevance of such distinctions is far from universally accepted.

SACRED PLACES. Every civilization has its share of sacred places, that is, geographical locations, buildings, monuments, or environmental features, such as mountains, lakes, rocks, waterfalls, and so on, that are believed to be endowed with intense spiritual qualities. Indeed, such places are frequently thought to possess a variety of supernatural powers that can heal, rejuvenate, or otherwise affect the human beings who visit them, often as devout pilgrims. They are also sometimes thought to be the focal points of creation, the places where deities first manifested themselves or performed some fundamental actions, and are thus typically steeped in mythology and theological dogmas.

Stonehenge. Wiltshire England. Constructed over a span of fifteen hundred years, Stonehenge is one of the oldest sacred places on the planet. The exact function of the stone circles remains unknown, although numerous theories exist. © BOB KRIST/CORBIS

In what follows, we shall consider eight well-known sacred places in several parts of the world, all of which have not only had a profound impact on the civilizations that venerate them, but also, in several cases, on a fair share of the human race. They are England's Stonehenge, the Great Pyramid of Egypt, the Greek oracle at Delphi, the Temple Mount and the Church of the Holy Sepulcher in Jerusalem, the Pyramid of the Sun at Teotihuacán, the great Islamic pilgrimage site of Mecca, and the Ise-Jingu, the most sacred of all Japanese Shinto shrines.

Stonehenge

We begin with one of the oldest—and best-known—sacred places on the planet, the great megalithic stone circle known as Stonehenge, the ruins of which still loom majestically above Salisbury Plain in southwestern England. Like Rome, Stonehenge was not built in a day, but rather over a span of about fifteen hundred years, from about 2900 to 1500 B.C.E. The earliest phase in its construction involved the excavation of a circular ditch some 360 feet (110 meters) in diameter and five feet (1.5 meters) deep. Inside the ditch was an embankment, composed of excavated material, and just inside the embankment was a circle of fifty-six holes, or pits, that have come to be known as “Aubrey Holes” after their seventeenth-century discoverer, John Aubrey. These holes may have held posts of some sort.

The second phase in Stonehenge's construction, which lasted from 2900 to about 2500 B.C.E., saw the erection of wooden structures and posts in the center of the site. It was during the third and final phase (2500–1600 B.C.E.), however, that the monument we know today was created. Two concentric circles of approximately eighty huge stone pillars, quarried in southwestern Wales and known as “bluestones,” from their bluish color, were erected in the center of the circle—only to be replaced several centuries later by a row of even bigger “sarsen” stones that were brought from Marlborough Downs,

some twenty-five miles (forty kilometers) to the north. The thirty sarsen stones, each of which stands approximately thirteen feet (four meters) high, form a circle about 108 feet (33 meters) in diameter. Originally, they were topped by a circle of lintels; however, today only a few remain intact, together with seventeen of the original sarsen pillars.

Inside the so-called Sarsen Circle the builders erected a horseshoe-shaped structure composed of five pairs of huge sarsen blocks, weighing approximately forty metric tons each, each topped by an equally massive lintel forming a series of trilithons, or three-stone gateways, the largest of which rises twenty-four feet (seven meters). Within the horseshoe, next to the central trilithon, lies the formerly erect Altar Stone. In addition, four “station stones” are located just inside the embankment, and several more sarsen blocks were originally placed near the entrance to the site. The two that survive are the Slaughter Stone and the Heel Stone, which were placed just outside the ditch. The latter stone appears to have played a crucial part in the rituals that took place (and still take place) during the summer solstice.

In any case, it is the ruins of this final phase in Stonehenge's evolution that impress visitors today. Although there are over one thousand stone circles in Britain, the massive remains on Salisbury Plain are by far the most impressive, despite the collapse of most of the lintels and over half of the original stones. That it was an intensely sacred place dating back into the mists of prehistory is undoubted, despite the fact that the closely related questions of who built Stonehenge and what went on there have long been hotly debated.

The earliest theory, advocated by the aforementioned James Aubrey, was that it was built by the ancient Celtic Druids. However, while these mysterious white-clad priests probably venerated Stonehenge and performed rituals there, it long predated their appearance in Britain around 600 B.C.E. Other theories range from wandering Mycenaean (on one of the sarsen

The Great Pyramid. Giza, Egypt (created c. 2525 B.C.E.; photographed c. 1880). The Great Pyramid, along with all of Egypt's sacred structures, was built on the western bank of the Nile River, facing the setting sun. The Egyptians believed that the land of the dead lay in this direction. © CORBIS

stones there are markings that some scholars have identified as a Mycenaean double-ax) to Egyptians and even ancient astronauts. However the most likely candidates were the Bronze Age (3000–1000 B.C.E.) inhabitants of southern Britain, including the “Wessex people,” whose precise linguistic affiliations are as yet unknown, although we do know that they shared a great many traits in common with the pre-Celtic populations of western Europe, including stone circles (compare Carnac in Brittany).

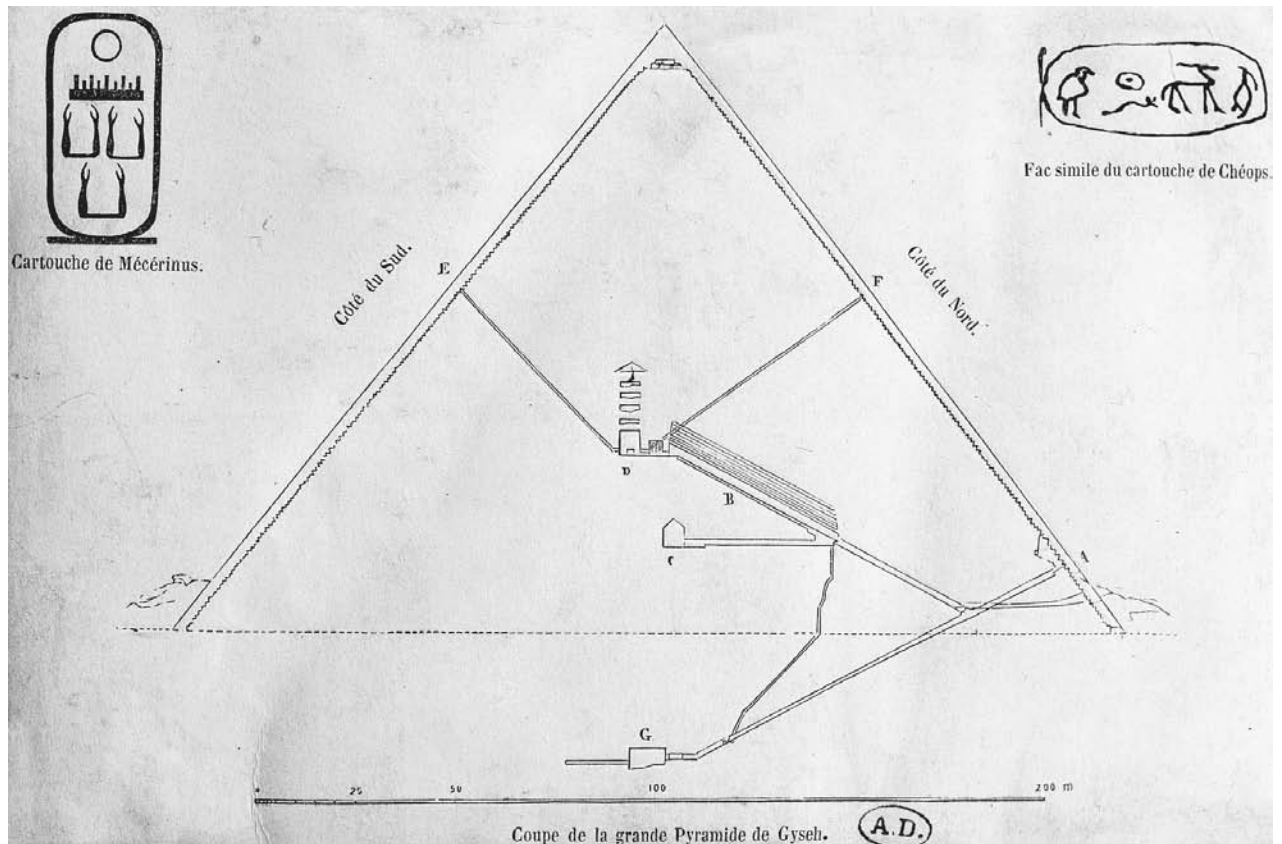

However, the questions of what it was used for can now be tentatively addressed, if not definitively answered. In the mid-1960s American astronomer Gerald S. Hawkins suggested that Stonehenge was an ancient astronomical observatory that was used to calculate a variety of celestial events, including both lunar and solar eclipses, as well as the summer and winter solstices. To this day, the sun rises over the Heel Stone on 21 June, the summer solstice, and thousands of pilgrims, including latter-day “Druids,” flock to Stonehenge every year on that date to watch this occur. If Hawkins is correct, the calendar, as well as the solar and lunar cycles, must have loomed large indeed in the beliefs systems of those who built the monument. However, this hypothesis is by no means universally accepted. Other scholars assert that, while it was clearly

a place where extremely important rituals took place, some of them perhaps involving animal and perhaps human sacrifices (hence the “Slaughter Stone”), it was not a primordial “computer” designed to facilitate the calculation of astronomical events. In short, a definitive interpretation of the fundamental meaning and purpose of this remarkable place remains elusive.

Nevertheless, anyone making the trek to Salisbury Plain for the first time cannot help but be awestruck at the sight of those mighty stones silhouetted against the sky. The enduring sacredness of Stonehenge is underscored by the fact that, unlike the other megalithic monuments of Britain, such as the great stone circle at Avebury, some thirty miles (forty-eight kilometers) to the north, it has never been intruded upon by a town or village.

The Great Pyramid

Our second example of a major sacred place, the Great Pyramid at Giza (near Cairo) in northern Egypt, dates from approximately the same time at which the prehistoric people of southern Britain were beginning the second phase in Stonehenge's construction, that is, c. 2500 B.C.E. In fact, the

Cutaway diagram of the interior of the Great Pyramid at Giza. The incredibly precise geometric measurements of the Great Pyramid, along with the size and weight of the stones used, gave rise to many unusual theories about its construction. THE ART ARCHIVE / BIBLIOTHÈQUE DES ARTS DÉCORATIFS PARIS / DAGLI ORTI

Great Pyramid can be dated far more precisely. It was during the reign of the pharaoh Khufu (Cheops) (2551–2528), which marked the high point of what Egyptologists call the “Old Kingdom.” It was the first of the three major pyramids built at Giza, the other two being the pyramids of the pharaohs Khafre and Menkaure, respectively, Khufu’s son and grandson. However, it also represents the culmination of a long period of development that began in predynastic times with the construction of mastabas, or flat-topped tombs with sloping sides, and continuing through the famous Step Pyramid at Saqqâra (also near Cairo) that was designed by the brilliant Egyptian architect Imhotep for King Djoser (Third Dynasty), who reigned from 2630 to 2611, and the so-called Bent Pyramid built by Khufu’s father Sneferu (2575–2551).

Like those pyramids and mastabas that preceded it, the Great Pyramid, which originally rose 481.4 feet (146.73 meters) and is composed of approximately 2.3 million blocks, each of which weighs, on average, 2.5 metric tons, was a royal tomb. It was located on the west bank of the Nile. Indeed, all of the sacred places in Egypt that played host to the dead, from Giza and Saqqara to the Valley of the Kings opposite ancient Thebes (modern Luxor), were located on the west bank of the river because it was in the direction of the setting sun, that is,

the land of the dead, the place toward which the Sun God Re sailed each day as he navigated the Celestial Nile, which ran at right angles to the Earthly river.

In view of its mammoth proportions, the weight of the stone blocks, and the fact that it is almost perfectly aligned with the points of the compass, some researchers have suggested that the Great Pyramid, as well as the other two Giza pyramids and the Sphinx, traditionally attributed to Khufu’s son Khafre, must have been built by technologically sophisticated extraterrestrials, as no human technology, ancient or modern, could possibly have manipulated stones of this size and weight. However, recent archaeological research at Giza has clearly demonstrated that the pyramids were built by thousands of ordinary human beings, most of whom were peasants, rather than slaves, whose labor was conscripted during the fallow season, and who lived in nearby barracks. Moreover, the architects knew enough geometry to work out the remarkable alignments and, after several earlier failures, to determine the correct angle and slope. It is also clear that by using ramps, rollers, massive sleds, and sheer human muscle power, the builders were in fact able to wrestle the blocks into position without any extraterrestrial help.

Nevertheless, even though they were almost certainly not built by space aliens, from the beginning of Egyptian history,

King's Chamber of the Great Pyramid at Giza, photographed c. 1930. The mummified remains of the Pharaoh were placed in the King's Chamber, along with objects of wealth and a collection of figurines which were believed to serve the Pharaoh in the afterlife. HULTON ARCHIVE/GETTY IMAGES

the pyramids of Giza and Saqqara have had a special religious significance. They were thus fitting final resting places for the Pharaoh's soul—or souls, as the ancient Egyptians believed that each person had two souls: a *ka* and a *ba*. At death, the *ka* left the deceased's mortal remains and went to the afterworld; the *ba*, however, was destined to remain behind in the tomb, which was why pharaohs and other wealthy Egyptians were buried with such a plethora of grave goods: the *ba* needed these things to survive. Both souls needed as close a replica of the former living body as it was possible to produce, which accounts for the practice of mummification.

In any case, although the wealth interred with Khufu in the Great Pyramid has long since been looted, his *ba* must have been surrounded initially with a priceless horde of objects with which it could live in a princely style for what his heirs hoped would be eternity. In addition to physical objects, the needs of a deceased pharaoh were served by a retinue of figures called *ushabtis*, figurines would serve both his *ka* in the afterworld and his *ba* within the pyramid's burial chamber.

The interior of the Great Pyramid has two such chambers, the King's Chamber, which is reached by a steep gallery, and the Queen's Chamber, some distance below it. As just indicated, both chambers are now completely empty, and have been for several millennia. However, the King's Chamber, which is located close to the center of the pyramid, has long been considered to possess extraordinary spiritual power. The author of this article once spent the better part of an hour, between waves of tourists, sitting cross-legged in the center of the chamber in question, doing his best to absorb some of that supposed spiritual energy, or "pyramid power," as it is sometimes called. While he failed to notice any appreciable psychic changes, he did come away from the experience with a

profound sense of awe and wonder. The Great Pyramid is thus by any measure an extremely sacred place, and all who visit it, even casually, cannot help but be impressed not only by its sheer size, but also by its ineffable majesty and intense spiritual aura.

Delphi

Some five hundred-odd miles (805 kilometers) due north of Giza, on the slopes of Mount Parnassus, which looms above the north shore of the Gulf of Corinth in northwestern Greece, is another extremely sacred place: Delphi, site of the famous Oracle of Apollo. Like Stonehenge, the origins of Delphi are lost in the mists of mythology and prehistory; however, we do know that very early on the ancient Greeks came to consider it to be the center of the universe.

The central feature of Delphi is the Temple of Apollo, which commemorates the god's slaying of Python, a terrible she-dragon that lived on the slopes of Parnassus. According to ancient Greek mythology, the goddess Hera sent Python to harm her husband Zeus's paramour, Leto, while Leto was pregnant with Apollo and Artemis. But Leto was saved in the nick of time by Poseidon, who hid her in the waves. In any case, four days after he was born, Apollo set out to find a location where he could establish his sanctuary. When he wandered onto the slopes of Parnassus, he encountered Python, who immediately attempted to kill him, just as she had his mother. Apollo loosed one of the magical arrows the smith-god Hephaestus had forged for him and mortally wounded the monstrous reptile. However, one of Python's tasks had been to guard the region, which had been sacred to her mother, the primordial earth-goddess Gaia, and so Apollo needed to purify himself and placate the slain monster's spirit. He exiled himself to Thessaly, did his penance, and when he returned to what was to become Delphi, he established the oracle that bears his name. In memory of Python, he named the woman who spoke with his voice the Pythia.

The name Delphi comes from *delphin*, the Greek word for "dolphin." When Apollo realized that he needed priests to interpret his words, he changed himself into a dolphin and lured a boatload of Cretan sailors to the shore beneath Mount Parnassus and convinced them to serve him.

From the earliest period in Greek history, Delphi was an extremely sacred place. Both individuals and cities came to Delphi to hear Apollo's oracles. Indeed, each major Greek city maintained a treasury along the Sacred Way that led up to the Temple of Apollo. The region around Delphi was nominally a dependency of the city of Phocis, although the site was in effect international territory and, except on rare occasions, unaffected by the wars that constantly pitted city-state against city-state, the most famous of which was the Peloponnesian War (431–404 B.C.E.).

The mantic, or divinatory ritual, took place in a chamber deep within the temple called the *manteion*. The Pythia, who, in anthropological terms, was a shaman, that is, someone who goes into a trance and is either possessed by a divine being or is able to visit the spirit world, chewed a laurel leaf and then

Tholos of the Sanctuary of Athena at the Oracle at Delphi, Greece. Considered by the ancient Greeks to be the center of the universe and a place of great mystical power, the Oracle of Apollo at Delphi was constructed in the early 4th century B.C.E. and is located on Mount Parnassus. © BETTMANN/CORBIS

mounted a tripod that stood on top of the Omphalos Stone, which was believed to be the world's navel. According to several ancient eyewitnesses, including the second-century C.E. historian Plutarch, "noxious fumes" issued from a hole, about nine inches in diameter, directly beneath the tripod and surrounded the Pythia. Some modern scholars have suggested that the chewed laurel leaves might have been responsible for her altered state of consciousness, and that the fumes came from a natural source beneath the ground. However, we now know that no such source exists and that laurel is not a hallucinogen. The author of this article has suggested that the "noxious fumes" probably came from *Cannabis sativa* leaves burning in a secret furnace directly beneath the *manteion*, and that it was their hallucinogenic effect that put the Pythia into a trance. Unfortunately, all evidence of such a furnace has long since disappeared, and, until further research is done on the charring in the interior of the hole, this must remain a tentative hypothesis.

In any case, after the petitioner posed his question, the Pythia babbled incoherently. Her random utterances were then reshaped by the Delphic priests into coherent, albeit cryptic "responses," which frequently reflected current political

realities or the size of the gift the petitioner or his city had made to the oracle.

In addition to the Temple of Apollo, the surviving ruins of which date from the fourth century B.C.E., when the oracle was at the height of its importance, Delphi includes several other temples, a theater, and the aforementioned treasuries. Although it declined steadily during the Roman period (after 150 B.C.E.), and especially after the spread of Christianity in the fourth century, the oracle remained a sacred place in the eyes of both the Romans and the Greeks, and it survived until 390, when the Temple of Apollo was finally closed by the Roman emperor Theodosius I (347–395), along with other pagan sites in Greece, including the Parthenon.

The Temple Mount

Our next two sacred places, which still possess a profound spiritual aura, are in the city of Jerusalem, a city sacred to three world religions, Judaism, Christianity, and Islam, which, between them, command the devotion of well over two-thirds of the world's population. By the beginning of the Bronze Age (c. 3500 B.C.E.) what was to become Jerusalem had

Jews at the Western Wall of the Temple Mount in Jerusalem. The Western Wall is all that remains of the Second Temple, which was destroyed in 70 B.C.E. It serves as a gathering place for Jews to lament the Temple's loss. AP/WIDE WORLD PHOTOS

been conquered by a Canaanitic people known as the Jebusites. By around 1400 Egyptian records indicate that the site was called *Urusalim* (Heb., *Yerushalayim*). However, the history of Jerusalem as we know it begins with the Hebrew conquest of the region around 1250. Around 1000 King David managed to capture the city from the Jebusites, brought the Ark of the Covenant from *Qiryat Ye'crim*, where it had been kept, and installed it in a tabernacle. He also began construction of a modest temple, which was vastly enlarged and completed by his son and successor, King Solomon.

Although Jerusalem is studded with monuments sacred to the three religious traditions that venerate the city, in what follows we shall focus on two locations that loom above the rest: the first is the Temple Mount, which today includes the Dome of the Rock, the al-Aqsa Mosque, and the Western Wall or "Wailing Wall," the last remnant of the Second Temple; the second is the Church of the Holy Sepulcher.

Church of the Holy Sepulcher, Jerusalem. The most well-known and popular Christian pilgrimage site, the Church of the Holy Sepulcher, was originally constructed in 330, but was destroyed some three hundred years later and rebuilt in the thirteenth century. © CARMEN REDONDO/CORBIS

The Temple Mount, also known as Mount Moriah and, to Muslims, as *Haram-esh-Sherif*, was initially the site of Solomon's Temple, completed in the early tenth century B.C.E., which was totally destroyed by the invading Babylonians in 586. The Second Temple was begun on the same site shortly after 539, when the Persians liberated the Jews from captivity. It was ravaged several times in the ensuing centuries, most notably by the Syrian king Antiochus IV in 168 B.C.E. In 4 B.C.E. the Second Temple was extensively restored by Herod the Great, only to be destroyed permanently by the Romans in 70 C.E. in the wake of the great Jewish Revolt of 69–70.

The dimensions and appearance of both temples were roughly similar. The First Temple reached the zenith of its development under King Hezekiah (c. 715–687 B.C.E.). By that time it had become a prime place of pilgrimage for Jews from both Israel and Judah. The most sacred part of the temple was the "Holy of Holies," where the Ark of the Covenant, a box, traditionally 2.5 cubits (3 feet, 9 inches) in length and 1.5 cubits (2 feet, 3 inches) in height, that contained the Tablets of the Law (the Ten Commandments) which Moses had received atop Mount Sinai, was kept. The Holy of Holies was located deep inside the principal building and could only be approached by the hereditary priests, that is, the descendants of Aaron, the first Jewish high priest and traditional founder of the Hebrew priesthood.

The Second Temple, especially as restored and enlarged by Herod the Great, was even larger and more impressive than Solomon's Temple, although it still served fundamentally to house the Ark and the Tablets of the Law. It was in the Second Temple that Jesus disputed with the Pharisees and later

kicked over the tables of the money changers in the courtyard. However, save for a handful of artifacts looted by the Romans—a menorah, or sacred seven-branched candelabra, a shofar, or ritual horn, and some cups and other vessels, images of which were carved on the Arch of Titus in Rome—most of the Second Temple’s furnishings, including the Ark and its sacred contents, were lost forever when the building was razed in 70 C.E. (According to some legends, the Ark of the Covenant managed to survive the catastrophe, and several sites have been suggested as its ultimate resting place, including one in Ethiopia; this was the theme of the film *Raiders of the Lost Ark*.)

However, the Temple Mount remained, as did the aforementioned Western Wall, better known as the “Wailing Wall,” where Jews still come to pray and lament the temple’s loss. And the Temple Mount also came to occupy an extremely important position in Islam as well. Indeed, it is the third most important pilgrimage site, outranked only by Mecca and Medina. The reason is that when the prophet Muhammad died in 632 C.E. he ascended to heaven astride his horse, but not before stopping briefly at the Haram esh-Sherif, or Temple Mount, more specifically on the rock traditionally believed to be the one on which Abraham offered the sacrifice of his son Isaac to God. Indeed, devout Muslims believe that the imprint of one of Muhammad’s horse’s hooves can still be seen on this rock. A sanctuary, called the Dome of the Rock, was built

between 691 and 692 C.E. by the Umayyad caliph ‘Abd al-Malik to mark this sacred spot. Originally its domed roof was covered with gold leaf, although in 1962 the gold was replaced by gold-colored anodized aluminum. Nearby is the sacred al-Aqsa Mosque, which has also figured importantly in recent disputes between the Israelis and the Palestinians.

The Church of the Holy Sepulcher

The second sacred site in Jerusalem is the Church of the Holy Sepulcher, believed to have been constructed on the site of Jesus’ crucifixion and interment. In some respects, as the historian of religion Jonathan Z. Smith points out, the Church of the Holy Sepulcher, the original version of which was built by Helen, mother of the Roman emperor Constantine, in 330, can be regarded as the successor to the Second Temple. Indeed, it immediately became the single most important Christian pilgrimage site (the second was the equally ancient Church of the Nativity in Bethlehem) and thus carried on the tradition that Jerusalem was a supremely sacred place among adherents of the new religion.

The original church, built in the Byzantine style, was destroyed by the Persians in 614. It was rebuilt in the same style shortly thereafter and, although severely damaged by an earthquake in 808, managed to survive until the Fatimid caliph al-Hakim destroyed the building again in 1009 and along with it the cave that was the presumed tomb of Jesus. In 1244 the

Crusaders rebuilt the church, in the Romanesque style, and it has remained essentially intact ever since, despite several attempts at restoration.

In the interior, the site of Golgotha, the traditional location of Jesus' crucifixion is marked by a Greek Orthodox chapel, and his tomb, or Sepulcher, called in Greek the *Anastasis*, or "Place of Resurrection," is located beneath a rotunda surrounded by columns supporting an ornamented, domed roof. The Sepulcher itself is marked by a structure known as the Edicule, which is believed to be directly above the cave destroyed in 1009.

A unique—and not always happy—feature of the Church of the Holy Sepulcher is that it is jointly owned by three major Christian denominations: the Greek Orthodox, the Armenian Orthodox, and the Roman Catholic Churches. Other communities—the Egyptian Coptic, the Ethiopian Orthodox, and the Syrian Orthodox Churches—also possess certain rights and small properties in or near the building. For example, the Copts share a small area on the roof. The rights and privileges of all of these communities are protected by the Status Quo of the Holy Places (1852), as guaranteed in the Treaty of Berlin (1878), although the several communities jealously guard their spaces and rarely agree on even the smallest matters of basic maintenance. Indeed, at various times the secular authority, as of the early 2000s wielded by the State of Israel, has been

forced to intervene in these disputes and subsidize needed repairs and renovations.

Nevertheless, despite the recent political upheavals in the region and the ongoing squabbles among its owners, the Church of the Holy Sepulcher remains the foremost Christian pilgrimage site in the world and is indeed a worthy successor to its vanished neighbor, the ancient Hebrew Temple.

The Pyramid of the Sun at Teotihuacán

The Pyramid of the Sun at the great pre-Columbian site of Teotihuacán in the Valley of Mexico is an awe-inspiring sight. One of the largest man-made constructions in the Americas—a continent dotted with enormous pre-Columbian pyramids—the Sun Pyramid stands at 489 feet (149 meters) by 551 feet (168 meters) at its base, 148 feet (45 meters) in height. Its graceful volumetric construction echoes the shape of the mountain behind it, encouraging viewers to perceive the man-made shape as a metaphorical echo of the enormous natural form that dominates the valley.

The Pyramid of the Sun is one of a series of impressive pyramids, temples, and plazas that line the Avenue of the Dead, the main north-south axis of the central precinct of Teotihuacán, one of the largest cities of the world during the first millennium C.E., when it boasted a population of 100,000 to 150,000. The city began its rise to prominence around 1 C.E.; the pyramid began to be constructed around 150 C.E., and was repeatedly expanded through multiple construction phases. Abandoned rather suddenly after 600, the enormous ruins of this urban center nonetheless continued to influence Mexican life for centuries thereafter. The conquering Spanish learned of the site from the Aztec ruler Montezuma, who regularly visited there, considering it a holy place. Tourists, both Mexican and international, continue to be moved by its grandeur, and the U.S.-based artist Michael Heizer, son of an archaeologist, has gained international prominence for his abstract earthworks, which echo the majestic form of the pyramid he saw as a child.

The full significance of the Pyramid of the Sun only became clear to archaeologists in the early 1970s, when a tunnel was accidentally discovered at the foot of the main staircase. This tunnel leads directly toward the center of the pyramid's base, where six chambers or caves were discovered. Originally believed to be natural springs, these "caves" are now thought to be completely man-made, and to date back to the earliest date of the pyramid's construction.

In the religions of the ancient Americas, perhaps more so than in the other great religious traditions described here, sacred places loomed especially large in the spiritual imagination. Widespread traditions of ancestor worship invested the tombs of the dead with great power both as the sources of political and social legitimacy for the living, and as sites imbued with religious sanctity and powerful with the sources of life, fecundity, and health not only for human descendants, but for the ecosystem more generally. Features of the natural landscape, such as springs, caves, and mountain peaks, were likewise invested with great sacral significance, and were often

believed to be original places from which the very first ancestors emerged. In Mesoamerica in particular, the idea of a hidden source of water inside a cave was closely associated with the birth of ancestors and with the control of rainfall, the circulation of water, the origins of time, and the source of life. This complex of ideas was one of the oldest and the most pervasive religious concepts, traceable far back in time, and shared across the many language and cultural groups of the region. The six secret caves under the Pyramid of the Sun may make specific reference to the origin myth of ruling lineages, but more importantly, in constructing their largest and most impressive temple-pyramid around a circle of secret caves containing canalized water, the builders of the Pyramid of the Sun tapped into this most primordial of ancient American ideas about sacred space.

Mecca

The most sacred place in Islam is the city of Mecca (or Makkah in Arabic), which is located in the western part of Saudi Arabia about seventy-five miles (121 kilometers) inland from the port city of Jidda in Hejaz province. Although it was clearly a sacred place for centuries before the time of Muhammad (c. 570–632 C.E.), and includes the famous Ka'ba, a cube-shaped building said to have been built by the Hebrew patriarch Abraham and in whose southeastern corner can be found the venerated "Black Stone," supposedly given to Abraham by the Angel Gabriel, the city's sacredness in Islam

derives primarily from the fact that it was the Prophet's birthplace.

Muhammad lived peacefully in Mecca, managing his wife's business affairs, until he was about forty years of age, when he began receiving revelations from God via the Angel Gabriel. He soon began to preach his new faith, supported by his devoted wife Khadijah and a growing number of followers. But after his wife died, he began to struggle against opposition from several quarters and, in the year 622, he was forced to flee to the nearby city of Medina one step ahead of a plot to assassinate him. This retreat, called in Arabic the *Hejira*, or "flight," later became the base-year for the Muslim calendar.

Eventually Muhammad returned to Mecca in triumph, and after his death in 632, his revelations were gathered together into the Muslim holy book, the Koran. These revelations included the "Five Pillars of Islam," one of which asserts that every Muslim should make a pilgrimage, called the hajj, to Mecca at least once in his or her lifetime. Thus the city annually plays host to two million Muslims from all over the world. Wearing a white robe called an *ihram*, the pilgrims are expected to circle the Ka'ba seven times, to run another seven times between two hills, Safa and Marwa, to spend from noon until sunset on a hill in the valley of Arafat, to throw stones at the devil in the valley of Mina, and to sacrifice sheep and goats. The hajj occurs only in the first two

weeks of Dhu al-Hijja, the last month of the Muslim lunar year, and during the time they are in Mecca and its environs the pilgrims are expected to observe some strict taboos, including abstinence from sexual activity. Those who make this pilgrimage are entitled to add the title *hajji* to their names.

Thus, like Jerusalem, Mecca has become a worldwide place of pilgrimage. It is clearly a place apart, a place brimming with spirituality and sacredness, despite the fact that only Muslims are permitted to visit it.

Ise

Our final example of an important sacred place is the Ise-Jingu, the most sacred shrine in Shinto, the indigenous belief system of Japan. Located in the city of Ise in Mie prefecture, about an hour's train ride south of Nagoya, it is dedicated to the Sun-Goddess Amaterasu Omikami, from whom the imperial family is traditionally believed to descend through her grandson, Honinigi, who, according to the *Kojiki* (712 C.E.), the most ancient Japanese mythological text, descended to Earth and extended his grandmother's sovereignty to the "Reed Plain," that is, the mortal realm. Actually, there are two major shrines at Ise. The Outer Shrine is dedicated to Toyouke, the *kami*, or god, of harvests and goods. But it is the Inner

Shrine, or Naiku, that is most important to the Japanese people, as it is there that Amaterasu is enshrined.

Traditionally, the Naiku is said to date from the third century C.E., and the extremely simple architecture reflects the wooden thatched-roof storehouses of the late prehistoric period. However, what sets the Ise complex apart not only from all other Shinto shrines, but from sacred places elsewhere in the world, is that all of the shrine buildings are torn down and rebuilt exactly as they were every twenty years (the most recent rebuilding was in 1993). Thus, the Ise shrines are at once extremely old—the rebuilding cycle began in the eighth century—and very new. And the same holds for Amaterasu and Toyouke, who are ritually rejuvenated with each rebuilding.

Each year, the emperor is expected to make a pilgrimage to Ise to honor his ancestor and report to her about what has happened to him and the realm since his last visit. But he is not the only pilgrim. A great many Japanese from all walks of life visit Ise annually to worship at its shrines and do honor to the Sun Goddess. Indeed, in the mid-nineteenth century, as Japan began to open up to the outside world, several Ise-related cults swept across the country and impelled thousands of Japanese peasants to leave their villages and head for the Ise-Jingu. While the current Ise pilgrimages are far less

frenziered, the shrine remains central not only to Shinto, but to Japanese culture per se.

Conclusion

These, then, are eight of our planet's premier sacred places. While they are very different from one another in a great many respects, all share at least one common quality: an intense spirituality that makes them special. Some paranormal researchers have suggested that they are inherent "power spots," located at the confluence of what have been called "ley lines," that is, energy-charged paths that presumably connect major ancient and prehistoric sites. While most orthodox scientists scoff at this notion, one cannot help but wonder whether these six locations and others like them do have an inherent spiritual power that sets them apart and renders them sacred, not only to those who built them, but to subsequent generations and cultures.

Asia

Koran

According to Buddhist tradition, questions regarding doctrinal authenticity first arose during the lifetime of the historical Buddha (c. fifth century B.C.E.). When asked how his followers should distinguish the true "word of the Buddha" (*buddha-vacana*) from false teachings, he is reported to have said, "whatever is well spoken is the word of the Buddha." Later commentators understood this to mean that if a doctrine or practice accords with the Buddhist goals of liberation from cyclic existence (*samsara*) and the alleviation of suffering (*dukkha*), and if it is concordant with the core doctrines of Buddhism, then it can be adopted and practiced by Buddhists, regardless of who originally taught it.

A more restrictive approach to questions of textual authority was presented in the Great Instruction Discourse (*Mahapadesa-sutta*, attributed to the Buddha but probably written after his death), in which he advises his followers to compare contested teachings with the corpus of discourses known to have been spoken by the Buddha. If a teaching or text accords with the oral instructions (*Pali, sutta*; Sanskrit, *sutra*) and the rules for monastic conduct (*vinaya*), then it can be accepted as authoritative. It should be noted, however, that the text assumes that only well-educated senior monks—not ordinary Buddhists who lack a thorough knowledge of the Buddha's teachings—will be able to make such determinations.

Shortly after the Buddha's death, a group of five hundred of his most advanced disciples convened to definitively settle the limits of Buddhist teaching. All were arhats, men who had eliminated mental afflictions and who would attain nirvana at the end of their lives. It was assumed that such people would not be hampered by faulty memories or sectarian biases. Ananda—who had been the Buddha's personal attendant and had been present at all of his discourses—was responsible for reciting the oral discourses, while Upali recounted the Buddha's instructions on monastic discipline. After the recitation was concluded, the canon was declared closed, and the assembled arhats agreed that no new teachings would be recognized as the "word of the Buddha."

Contemporary Western scholars have questioned the historicity of the “first council,” but the story is accepted as fact by the Theravada school, the dominant Buddhist tradition in Southeast Asia, which views it as an indication of the validity of its canon. This is written in an Indic language called Pali and is believed to have been definitively codified by the five hundred arhats. It is organized into three sections, called “baskets” (*pitaka*): Vinaya *pitaka*, which was concerned with rules for Buddhist monks and nuns; Sutta *pitaka*, the Buddha’s discourses on doctrine and practice; and Abhidhamma *pitaka*, containing scholastic treatises summarizing and explicating Buddhist doctrine.

Later Additions to the Buddhist Canon

Despite the confident pronouncement by the participants at the first council that the canon was closed, several centuries after the passing of the Buddha new texts began to appear in India that carried the title of “sutra,” purportedly spoken by the Buddha during his lifetime. These were part of a new movement that referred to itself as “Mahayana” (Greater vehicle) and that characterized its opponents as “Hinayana” (Lesser vehicle). Proponents of the Mahayana sutras claimed that their texts superseded those of their rivals and were of “definitive meaning” (*nitartha*), while those of the previous canons were relegated to the status of “interpretable meaning” (*neyartha*). The opponents of Mahayana, for their part, categorically rejected these new texts as forgeries, and pointed out that they differed significantly from those of the earlier canon and contained new doctrines and practices that were not attested in the earlier texts. The Mahayanists responded by claiming that their sutras had been taught by the Buddha but were only revealed to his most advanced disciples.

Some Mahayana sutras set out hermeneutical principles that could be used to differentiate which texts are definitive and which are interpretable. According to the Teaching of Aksayamati Sutra (Aksayamati-nirdesa-sutra), which became normative for the Middle Way (Madhyamaka) school, the differentiating factor is doctrinal content: those texts that discuss the final nature of phenomena are definitive, while all others are of interpretable meaning. The final nature of phenomena is said to be their emptiness (*sunyata*) of inherent existence (*svabhava*).

Another hermeneutical schema was propounded by the Sutra Explaining the Thought (Samdhinirmocana-sutra), which became the primary scriptural source for the Yogic Practice (*Yogacara*) school. In this text, the Buddha is presented as claiming that he taught his doctrines in three cycles, or “wheels of doctrine” (*dharmacakra*). The “first wheel” contains basic Buddhist doctrines that are contained in the early canon, which were taught for beginners and were not definitive. In the “second wheel” the literal interpretation of these doctrines was rendered problematic by the declaration that all phenomena—including Buddhist teachings and practices—are empty of inherent existence, and so the doctrines of the early canon lack the privileged truth status that conservative Buddhists had attributed to them. The “third wheel,” represented by the Sutra Explaining the Thought, differentiates interpretable and definitive teachings and provides hermeneutical guidelines by

which Buddhists (or at least those who accept them as normative) can differentiate the two.

The canonical situation of Indian Buddhism became even more confusing in later centuries when a new group of texts began to appear, again claiming to have been spoken by the Buddha. These were called “tantras” and contained significant innovations in doctrine and practice, although the basic path was that of the Mahayana. Like the Mahayana sutras before them, they claimed to supersede previous teachings and to represent the final “word of the Buddha” on doctrine and practice.

Regional Transmission

The profusion of canonical, protocanonical, and deutero-canonical literature in India presented significant difficulties for Buddhists in other Asian countries as the religion spread. Scholars of the tradition commonly identify three primary trajectories in the diffusion of Buddhism: Southeast Asian Buddhism, East Asian Buddhism, and Northern Buddhism.

According to tradition, Buddhism was first established in Southeast Asia by a mission led by Mahinda, a Buddhist monk who was the son of the Indian emperor Aśoka (ruled 272–236 B.C.E.). After arriving in Sri Lanka, Mahinda reportedly converted its king to Buddhism, and the two founded the Mahavihara, the first Buddhist monastery outside of India. It became the seat of Buddhist orthodoxy in Southeast Asia for millennia. The dominant Buddhist tradition in the region is Theravada (Teachings of the Elders), which prides itself on its conservatism and adheres to the Pali canon. According to mainstream Theravada, their canon contains the only true “word of the Buddha,” and all other purported teachings are spurious.

East Asian Buddhism mainly arrived via trade routes linking India to China and the rest of the region. Several of the oasis cities along these routes had established Buddhist centers, and these became a conduit by which texts, doctrines, and practices moved from India to China, and from there to Korea, Japan, and Vietnam.

The first outpost in the transmission process was a translation bureau established in the Chinese capital of Loyang in 148 C.E. by the Central Asian monk An Shigao. Together with a team of other Central Asian monks, he began rendering Indic texts into Chinese. The process of translation intensified in later centuries, and two primary techniques were adopted by Chinese translators: some coined new terminology for Indic technical terms that had no equivalents in Chinese, while others developed a system called “matching meanings” (*ke-yi*), in which they appropriated terms (mainly from Daoism) that approximated Indic originals.

Both of these approaches had inherent problems. Translators who opted for the creation of a new technical vocabulary often ended up with neologisms that sounded odd to Chinese readers and that had little resonance for them. While they might be technically accurate, literate Chinese often perceived them as evidence of the foreign (and inferior) origins of Buddhism and its unsuitability for Chinese. The practice of

Statue of Buddha with offerings, Munsusa Monastery, South Kyoongsang, South Korea. After the Buddha's death, a council of his disciples met to finalize and close the canon of his teachings. Several centuries later, however, new texts began to be presented as doctrines that Buddha had put forth during his lifetime. JOHN POWERS

“matching meanings,” on the other hand, produced texts with terms that were well known to Chinese and that appeared to contain familiar doctrines, but there was considerable slippage between the original Indic terms and their Chinese equivalents. For example, in some texts the Sanskrit term *nirvana*—liberation from the world and from rebirth, which is the result of the elimination of mental afflictions and the cultivation of wisdom and insight—was commonly rendered by the Daoist term “nonaction” (*wu wei*), which is the ideal way of life of the Daoist sage, who lives in accordance with the rhythms of the Dao and avoids micromanaging affairs.

Such terminological ambiguity was compounded by the problems of textual transmission to East Asia. Buddhism only gradually gained adherents, and for centuries texts flowed into China haphazardly, brought mainly by pilgrims or missionary monks. The difficult terrain of the deserts of Central Asia and the vast distances covered by the trade routes limited what individual travelers could carry with them. Missionaries would bring texts that were important to them and seldom attempted to carry a representative sampling of Indian Buddhist literature. As a result, commentaries sometimes arrived in China before the texts on which they commented, and polemical texts arrived before those they were attacking. The Chinese Buddhist canon contains a plethora of texts from

various regions of India, various schools and traditions, and from different periods of time. Many sutras exist in several variants, which are dated in the Chinese canon. These have provided scholars with evidence for when certain doctrines and practices developed in India, because later versions retrospectively added material as it became established in India. In addition, the Chinese canon contains portions of other Indian canons, which have revealed some of the doctrines and practices of schools that were influential at a certain point but later died out.

China was the conduit from which Buddhism was disseminated to the rest of East Asia. It first traveled to Korea, and from there it was exported to Japan and Vietnam. The Korean Buddhist canon is derived from the Chinese canon, and the canonical texts used in Japanese and Vietnamese Buddhism also derive from Chinese translations.

The transmission of Buddhism to Tibet and Mongolia was significantly different from that into East Asia. Like the Chinese, Tibetans adopted Mahayana Buddhism, but tantra was much more influential than in China. Also, while China had an advanced culture at the time when it first encountered Buddhism, Tibet was relatively backward culturally. Despite this, it was an expanding military power, and as it spread outward from the Tibetan plateau it encountered other civilizations that were

far more advanced in science, technology, and culture. One result of this was that the Tibetan kings of the Yarlung dynasty (so called because its headquarters were in the Yarlung Valley of central Tibet) decided to import elements of the civilizations beyond their borders.

Beginning in the seventh century, the Yarlung kings converted to Buddhism and began a process of transforming Tibetan society. According to tradition, the first of the “dharma kings” (*chos rgyal*) was Songtsen Gampo (Srong btan sgam po; c. 618–850), who is said to have been a physical emanation of the Buddha Avalokitesvara, who embodies compassion and is the patron Buddha of Tibet. He married princesses from Nepal and China, both of whom are said by tradition to have been emanations of the Buddha Tara, and the three worked together to convert the Tibetans to Buddhism. Although this is the consensus of histories written centuries later by Buddhist clerics, there is little contemporary evidence that Songtsen Gampo had any real interest in Buddhism.

Some of his successors, however, were clearly devout Buddhists, and they allocated significant resources to the importation of Buddhism. Tibetan students were sent to the great seats of Buddhist learning at monastic universities like Nalanda and Vikramasila, and Indian masters were invited to Tibet to spread the faith. During the early period of transmission (*snga dar*), translation committees were established, often with government funding. Their task was to render the vast corpus of Indian Buddhist literature into Tibetan. Faced with the same translation issues that Chinese Buddhists had encountered earlier, the Tibetans opted for the development of a specialized vocabulary for Indian Buddhist technical terms. Many of these were Tibetan neologisms, such as the rendering of “passed beyond sorrow” (*nya ngan las 'das pa*) for the Sanskrit term *nirvana*.

During this early period, translation equivalents varied considerably, and when the Yarlung dynasty fell in 842, translation activity was largely suspended. It began again during the “second dissemination” (*phyi dar*), which was initiated by the arrival of Atisa (982–1054) in Tibet in 1042. During this period translation bureaus were reconstituted, and standard Sanskrit-Tibetan lexicons were created in order to standardize terminology. In the fourteenth century, the Tibetan scholar Bu-ston (Bu ston rin chen grub; 1290–1364) reportedly codified the Tibetan canon by poring through the various manuscripts of translations of Indian Buddhist texts and selecting those he deemed to be the most accurate. These were arranged into two groupings: Kangyur (bKa' 'gyur, literally “translations of teachings”) and Tengyur (bsTan 'gyur, literally “translations of texts”). The first section contained Indian Mahayana sutras and tantras, as well as texts on monastic discipline. The “Translations of Texts” section includes Indian philosophical texts and commentaries on sutras, along with some indigenous Tibetan works and translations of Chinese treatises. Most of this literature was imported from the libraries of the great monasteries of northern India, but at the same time tantric teachings, both written and oral, came to Tibet, mostly transmitted by Indian masters and their students. These often

achieved a deuterocanonical status within tantric lineages, and many are still widely circulated and discussed.

During the early period of transmission of Buddhism, Tibetans mainly concentrated on translating Indic texts, but as they grew more confident in their understanding of the tradition, a vast corpus of indigenous works was composed. Over time, four main orders formed in Tibet: Nyingma (rNying ma), Kagyü (bKa' rgyud), Sakya (Sa skya), and Geluk (dGe lugs). Each of these in turn produced deuterocanonical texts, and the Nyingma, Kagyu, and Sakya orders have compiled their own canons. The Gelukpa order mainly relies on the works of its founder Tsong Khapa (Tsong kha pa bLo sang grags pa; 1357–1419) and his disciples Kaydrup (mKhas grub rje) and Gyeltsap (rGyal tshab rje). All of these traditions continue to revere the Indic texts contained in the normative Buddhist canon, but in practice they are seldom studied today; instead, Buddhist students and scholars tend to rely on the works of their own traditions, supplemented by oral instructions by their teachers.

Questions regarding authenticity and interpretation remain important in Buddhism today. In most of Asia, the prime criterion for judging the validity of a given text is whether or not there is an Indian original. Given the vast size of the various Buddhist canons, however, this provides little help in deciding which texts or teachings should be regarded as definitive. Most Buddhist traditions base their decisions on what has been handed down to them by their respective lineages. Most of these privilege a particular text (or set of texts) and use it as the criterion for determining authoritativeness. Several East Asian lineages in particular have devised elaborate classification schemes that rank Buddhist teachings hierarchically, with those of their preferred text(s) on the top. It is rare for individual Buddhists to take the time to pore over the voluminous literature in their respective canons, and most interpret texts and doctrines in accordance with the traditions of their lineages.

KORAN

The English word *Koran* comes from the Arabic *qur'an*, most likely meaning “recitation” or “reading,” although some Muslim commentators consider it simply the name of the scripture, while some others trace its etymology to a verb that means “to collect.” The word *qur'an* is probably related to the Syriac word *qaryānā*, which in pre-Islamic Christian usage meant a reading or a recitation from memory in the context of worship and prayer. The Koran is accepted by Muslims as the corpus of revelations given through Muhammad in the Arabian towns of Mecca and Medina between 610 C.E. and his death in 632 C.E. It is the revelations themselves that proclaim the Prophet’s authority. At the same time, the revelations are accepted on the basis of his testimony.

The traditional biography of Muhammad portrays the first encounter of this forty-year-old merchant with God’s messenger Gabriel in a mountain cave as a terrifying experience. He is commanded to recite, yet does not know how or what to recite. Indeed, for Muslims the illiteracy, or at least lack of education, on the part of the Prophet is a guarantee that the revelations were not composed by him, but have a divine origin. Over the ensuing twenty-two years, Gabriel teaches him the revelations that will eventually become the text at the heart of Muslim life and faith. It came initially not as a completed text but piecemeal, as the voice of God addressing the Prophet and his hearers according to the actual situation in which they found themselves.

Although it is common to think of the Koran as an elaborately calligraphed text, and in spite of the fact that it refers to itself as scripture (*kitab*), the name *qur'an* underlines in several senses the centrality of its oral character. It comes to the Prophet orally, dictated by the angel, who assures that it is committed to memory. It is delivered to the people orally as it is revealed piece by piece. Even after the text was transcribed on the basis of oral testimony and given standardized form probably some twenty years after the death of the Prophet, it continued to live principally in oral form, memorized and recited by the community. The oral tradition rather than ancient manuscripts formed the basis of the standard edition made in Egypt in 1924.

The Koran and Previous Scriptures

In its characteristically self-referential way, the Koran tells Muslims that they are to believe not only in what has been revealed through Muhammad, but also, and without distinction, in “what was revealed to Abraham, Ishmael, Isaac, Jacob, and the tribes, and what Moses and Jesus received, and what the prophets received from their Lord” (2:136). The Koran has a very clear idea of its place in the broader pattern of divine revelation: it contains essentially the same message as has been delivered by every prophet sent by God from the beginning of creation. Those who possess the earlier scriptures—the *ahl al-kitab*—recognize in the Koran the same truth (5:83). This was the first time the Arabs had been addressed by God in their own language, and Muslims consider the Koran the definitive and most complete version of the divine message currently available.

Even though in principle the other scriptures are to be believed, it is not clear whether or not the other communities are still in possession of the original message entrusted to them through their prophets. Charges of falsification and corruption of their scriptures, or at least of misinterpreting them, are often leveled against Christians and Jews.

The Koran addresses its hearers as though they are already familiar with the stories of the great biblical figures, commenting on them without retelling the narrative. In this the Koran sees itself acting as a reminder of the perennial revelation. It has often been noted that these figures are presented in the Koran with little of the detail and few of the distinguishing characteristics found in the biblical narratives. Early commentators of the Koran drew on the Bible and on other Jewish and Christian materials (referred to as *isra'iliyyat*) to explicate texts that were otherwise opaque.

History of the Koranic Text

There are several quite distinct senses in which one might speak of the history and prehistory of the text. For the believer, the Koran’s prehistory is its preexistence in the heavenly realm: as God’s speech, as part of the *umm al-kitab*, or “source of the scripture” (43:4) written on the heavenly *lahb mahfuz* (“Preserved Tablet”) (85:22). From the Preserved Tablet it descended as a whole to the lowest heaven on the Night of Destiny (97:1), whence it was transmitted to the Prophet as need and occasion required.

Non-Muslim scholarship, on the other hand, sifts the Koran in search of textual and conceptual parallels with the Bible, the Talmud, Christian apocrypha, and ancient near-eastern religions, hoping to discover there the prehistory of the text now known. However, this search for dependence has yielded little evidence to show that the Koran has relied on those texts, except to presuppose the broad lines of their narratives as background for its own teaching. For the believer, these echoes and similarities pose no difficulty, since the Koran makes no claim to novelty in its content, but rather asserts proudly the divine origin it shares with those earlier scriptures.

Historical setting. Another sense in which one might speak of the history of the text is in the attempt to determine the precise historical context that the text is addressing or, one might say, within which it is a player. Since the Koran itself has no narrative structure, and its chapters (*suras*) and verses (*ayat*, sing, *aa*) contain little or no indication of their historical context, various attempts have been made by Muslims and others to establish a chronological order for the revelations, and a context for each verse or group of verses. The basic division is between the revelations that took place in Mecca and those after the Emigration (*hijra*) to Medina. The Meccan verses are in their turn often divided into three subperiods. All this activity is at best speculative, though there does seem to be gradual development in style and thought that could be taken to mirror the changing circumstances of the Prophet’s career. As the Koran came to be used as a source for the elaboration of law, it became increasingly important to establish context and chronology.

Most non-Muslim scholarship accepts along with Muslims that the Koran, whatever prehistory it might have, dates as a textual corpus to the time of Muhammad in Mecca and Medina. However, the years since the mid-1970s have seen a revisionist movement among historians of early Islam who take a radically critical approach to the historical evidence. These scholars, following the lead of John Wansbrough, suggest a later and more gradual process of canonization, taking place once the Arab conquerors had moved out of the Hejaz region of Arabia and encountered the sectarian milieu of Jewish and Christian Syria and Mesopotamia. Such a situation seems to them a much more probable setting for the Koran's particular range of concerns and styles. There is still considerable controversy over this question.

The written text. The history of the written text is also approached in various ways. Most Muslims would believe that the text currently available in print is precisely what was taught to the Prophet by Gabriel. Unexpectedly, perhaps, it is Muslim tradition itself rather than non-Muslim scholarship that throws most doubt on this simple approach. The tradition preserves accounts that assure the community that every word of the Koran was transcribed on whatever materials were to hand at the time of its revelation. However, it also contains accounts of disagreements about the content and pronunciation of the text even during the lifetime of the Prophet.

The official transcript of the text under the caliph 'Uthman (r. 644–656) seems to have been based on oral testimony. Even so it did not succeed in putting an end to variants, and the Koran has continued to be recited within a certain range of variation that came eventually to be agreed upon as canonically legitimate. The variant oral traditions themselves for the most part represent divergent ways of vowel-ing and so of pronouncing the original transcription, which contained only an incomplete consonantal skeleton. The script used in 'Uthman's transcription did not even distinguish all the consonants; one particular shape, for example, was used to represent five different consonants, a vowel, and a diphthong. Over the first three or four Islamic centuries a more complete script was gradually developed and came to be accepted.

No doubt the publication of the Egyptian standard edition has created the impression of uniformity and unanimity in the transmission of the text. Its wide circulation may indeed contribute to a real uniformity. However, ancient Koran manuscripts and fragments found in Yemen some years ago reveal that even the main written tradition took some centuries to achieve complete uniformity.

Themes and Styles

It comes as no surprise, either to Muslim or non-Muslim, to find that many of the central themes of the Koran are familiar from other scriptures. Prophetic denunciations of injustice and unbelief are characteristic of the revelations usually considered early. Mistreatment of the widow, the orphan, and the female child are condemned, the arrogant atheism of the rich deplored. These censures are accompanied by vivid images of the end-times, and the repeated announcement that all the

living will be raised by God to judgment, reward, and punish according to their deeds. God, who created all living things, can easily resurrect them.

The power, wisdom, and providence of God should be obvious to all who consider the signs (*ayat*) in nature and in human history (for example, 16:10–18; 30:20–25; 80:24–32). Many passages rehearse this theme and repeatedly call people to reflect on their world and on the history of nations that have gone before them. Each nation received prophetic guidance from God and was punished if it did not respond. Increasingly important as time goes on is the affirmation of God's unity, the center of Koranic thought and the basis of much of its polemic, not only against the pagan polytheists, but also against Jews and Christians. These latter groups, although having received the Scripture through Moses and Jesus, are considered to have abandoned the core Abrahamic belief in one God and to have given other figures a role alongside God as intercessors and protectors. The Koran consistently calls its hearers to faith in the one God (*iman, tawhid*), which consists in entrusting oneself to God alone (*islam*), and following the guidance God provides through the prophets.

A recurrent theme is the question of the Koran's own origin and authority, both of which are constantly questioned or denied by its hearers. This self-consciousness is a major feature of the Koran, and no other scripture observes and comments upon the processes of its own revelation and reception in such a sustained way. No other scripture argues with its hearers in order to proclaim and defend its authority and the bona fides of its prophet. The history of prophecy is rehearsed schematically to show that Muhammad's career conforms to a centuries-old pattern of rejection.

Particularly in the revelations of the Medinan period, the Koran provides regulations for the life of the new community of believers: for example, on the religious duties of prayer, fasting, almsgiving, and pilgrimage; on family matters of inheritance, marriage, and divorce; on communal obligations such as defense and propagation of the new faith and relations with other communities. Along with these, there are particular regulations for the Prophet and his family.

The Koran, like the Hebrew Bible, emerges in an environment of sometimes bloody conflict. However, unlike the Bible, it does not contain narratives of such bloodshed. Its regulation of religious conflict, even though sanctioning defensive and retaliatory violence, always carries conditions to provide for a cessation of hostilities (cf., 2:190–193; 9:5, 29).

Controversy over Whether the Koran Was Created

Any religion founded on the belief that God communicates with creatures must eventually consider the relationship between God and God's word or speech. Since Muslims consider God to be the "speaker" of the Koran, the text is therefore defined as God's speech (*kalaam Allah*). However, God's speech cannot be external to God or accidental, but belongs to God's essence. It is, therefore, uncreated and, according to some, eternal.

Beginning in the late eighth century much attention, and for a time an inquisition, came to be focused on the questions of whether, and if so in what sense, the Koran text itself is uncreated. Although one still hears echoes of the Mu'tazilite school of thought that denied the Koran is uncreated, the question of its uncreated nature has been resolved virtually unanimously in the positive. However, the question of in what sense the Koran is the uncreated speech of God was never firmly resolved and remains important even in the early twenty-first century.

There are several reasons for wanting to maintain a distance between the words of the Koran and the eternal speech of God. The first is to safeguard the otherness and immateriality of God and avoid the risk of anthropomorphism. Another is the logical need to recognize the historical particularity of many of the Koran's revelations. A third would be to avoid the idea that in the act of recitation the reciter of the Koran becomes completely identified with God (*hulul*).

At the same time, to distance the Koran too much from God risks undermining its authority and its value as "guidance for the God-fearing" (2:2). It risks reducing it to a merely human document, thus opening too much latitude for interpretation, and diminishing its value as a clear foundation for the law.

The Koran and Law

The Koran itself contains relatively little in the way of specific laws. What little there is, even the five crimes for which it fixes punishments (*hudud*), needs further specification. In one sense the Koran remains the foundation for all Islamic law, yet at the same time it must be read in the context of the Prophet's teaching and example (*sunna*). The intimate connection between Muhammad and the revelation makes it unthinkable that the sunna could conflict with the Koran. If there seems to be a contradiction, it is the sunna that indicates the true meaning of the Koran, makes it more precise, or renews it for changed circumstances. The idea that the Koran must share the place of authority with the sunna was elaborated by al-Shafi'i (d. 820), who argued that the Koran itself commanded obedience to the Prophet along with obedience to God (3:132; 4:180), and further that God had given Muhammad not only the Koran but also another form of revelation, the Wisdom (*al-hikma*, 2:151, 231; 62:2).

Koranic Interpretation

It is widely believed that Muslims cannot or will not interpret the Koran but insist on simple literalism. It is true that there is a strong preference for a plain reading that does not evade the claims the text makes on believer and unbeliever alike. However, the Koran itself says (3:7) that it contains some verses that are straightforward and others that need to be interpreted—either because they are metaphorical or because they can only be fully understood in relation to other verses. That verse itself is open to several interpretations, depending on how one divides the sentences within it, and on how one understands the key words translated here as "straightforward" and "metaphorical." Thus, the Koran itself, while denouncing the

kind of manipulation of the text that divides the community, recognizes the necessity of interpretation.

The tradition of commentary (*tafsir*) and analysis is rich and extensive, and draws on several principles and methods familiar in biblical studies: study of textual variants (*qira'at*); reconstruction of the historical context or "occasions of revelation" (*asbab al-nuzul*); distinguishing different literary forms; recourse to grammatical technicalities; and lexical studies of contemporary literature in order to understand unfamiliar vocabulary.

A major factor in interpretation is the doctrine of abrogation (*naskh*) based on the verses 2:106 and 16:101. It is effectively a recognition of the historicity of the text and of the developments this inevitably involves in the divine teaching and commands. As the situation of the Prophet and the community changes, so too does the guidance offered by God change or become more specific. As the faithful become more established in their religion, so too do the demands made upon them become more challenging: the prohibition of alcohol, for example, is introduced in stages.

The principle of abrogation is used by some Muslims, for example, to deny the continuing validity of verses that encourage patience under persecution, and good relations with Christians. Such counsel is considered appropriate only to the period in which the community is weak and unable to fight back. Others, however, would hold that such verses are still valid even where the community is strong.

Esoteric and mystical interpretations are often referred to as *ta'wil*. They rely on distinguishing between the surface meaning (*zahir*) and the deeper sense (*batin*) that should be developed from it on the basis of the teaching of the Shiite imam or the Sufi master.

Contemporary Controversies over Koranic Criticism

There has long been a distinction, if not a conflict, between interpretation based on traditions of the Prophet and his Companions (*tafsir bi-l-ma'thur*) and interpretation based on reason (*tafsir bi-l-ra'y*). Contemporary conflicts can to some extent be seen as a continuation of that classic dispute. The central question is what role the Prophet had in the process of revelation. Even without denying the divine origin of the Koran, some Muslim authors discuss the human, and therefore conditioned, aspect of the text. Though this has caused great consternation, particularly in the case of the Egyptian author Nasr Hamid Abu Zayd, in many respects it has its roots in classical discussions—about the nature of the prophetic access to the unseen realm, compared to that of poets and seers; and about the nature of the passage from the eternal divine word that has no letters, words, or sounds, to the actual Arabic words of the Koran. It is not new to suggest that what God revealed was the meaning (*ma'na*) and that the Prophet, or perhaps Gabriel, was responsible for the wording (*lafz*) that nonetheless faithfully conveyed that meaning.

Another approach came from the Sudanese author M. M. Taha, who suggested that, contrary to traditional approaches,

the earlier rather than the later revelations are the authoritative heart of the Koran. The Meccan verses contain the eternally valid principles of faith, justice, and equality. The Medinan verses, however, represent an application of the principles to a very particular historical circumstances and cannot respond to the changed circumstances of the early twenty-first century. Taha was executed for heresy in 1985. His approach has found echoes in the work of, among others, feminist writer Fatima Mernissi.

The controversy arises from calling into question the contemporary adequacy not of the Word of God itself, but of some of its traditional interpretations. This is seen to open the way to a reduction of the Koran to the same level as the much analyzed and thus diminished Bible. It is also an attack on the power of the guardians of traditional interpretations. Nonetheless, the quest for a new approach to the Koran continues, based on the confidence that the scripture need not remain locked in the seventh or the tenth century, but that it remains the Word of God valid for and relevant to this century.

Daniel A. Madigan

SAGE PHILOSOPHY. Sage philosophy is a body of knowledge attributed to wise men and women in communities and is regarded to be philosophically significant for both its content and its critical approach to the sustenance and growth of knowledge at the communal level. Although the term came into use rather recently in the course of African philosophers' appraisal of the nature and relation of philosophy to the indigenous traditions of their communities, questions that have emerged from debating the nature of sage philosophy are applicable beyond the postcolonial confines of African scholars' efforts to revise, redefine, and align disciplinary contents and practices to the recovery of their cultural values. For example, because sage philosophy raises such questions as the separation between critical thinking and popular belief, its discussion could resonate with analytical methods that rely on the analysis of popular conceptual assumptions and ideas as expressed either in ordinary language or in the language of professional communities. In these senses, analytic practices appear constantly to seek conceptual clarification by comparing and contrasting specific—and, therefore, sometimes specialized—uses of terms to their appearances in other domains. Discussions of sage philosophy might also be relevant to theories about the social underpinnings of scientific knowledge advanced by the American historian Thomas Kuhn

(1922–1996). He explains that a revolution occurs in scientific theory only when it is determined that a new explanation has made a complete break from a previous paradigm; this is, in a sense, a discussion of how radical critical thinking relates to a more popular—that is, communally held or communalized—mindset or framework from which it becomes disentangled by virtue of a critical engagement with it.

From a historical standpoint, sage philosophy connects with other voices and perspectives in the postcolonial discourse through its claim, however more implicit than it is an open expression, that Africans' creation of knowledge in the present moment of Africa's history cannot ignore those voices that give the present a sense of relevance and validity by bridging it with the past to form a continuum.

Historical Origins

Conceived, defined, advanced, and defended by the late Kenyan philosopher Henry Odera Orika (1944–1995), the idea of sage philosophy has its historical origins in two separate but related colonial factors: first, the general disparaging colonial attitude that Africans were incapable of abstract thinking; and second, a vicious rivalry between different European religious denominations for control over Africans' minds and souls. On the one hand was a Protestant skepticism about Africans' capacity to philosophize, and on the other was the guarded Catholic belief, formed out of long years of training young Africans in ecclesiastic philosophy as part of their priestly education, that Africans could grasp some philosophy if it was appropriately tailored to have some resonance with their indigenous worldviews. Needless to say, Africans pursuing the study of philosophy as a secular and purely academic goal were rare in the colonial education system.

At the University of Nairobi, the Department of Religion and Philosophy (founded in 1970) was headed by Stephen Niell, an ultraconservative retired Anglican bishop. His deputy was Joseph Donders, a younger Catholic priest who doubled as a professor of philosophy at a local National Seminary. Convinced that Africans were not gifted for abstract or logical thinking, Niell had reluctantly offered Orika employment as a special assistant, to ensure Orika did not get a regular appointment despite his possession of a doctoral degree in philosophy from the University of Uppsala in Sweden. Specifically, Niell instructed Donders not to assign Orika any logic classes—as Africans had no idea what that was, let alone being able to explain or teach it.

By the end of the 1960s and the beginning of the 1970s, anglophone Africa was still basking in the positive reception of John Mbiti's *African Religions and Philosophy* (1969) and of the slightly older translations of Marcel Griaule's *Conversations with Ogotemmêli* (1965) and Placide Tempels's *Bantu Philosophy* (1959). But as much as they were popular for a variety of reasons, these texts also clearly stated just what people like Niell would have liked to hear and to show in support of their skepticism regarding Africans' tuning to academic philosophy: that African modes of thought were deeply grounded in their mythical representations of reality. With this background, Orika's project, simultaneously personal and professional, was

defined—to erase the two levels of myth surrounding and possibly even blocking the practice and growth of African philosophy. One level was established by the previously mentioned texts, by virtue of leaving many complex African myths and other representational forms unexamined and unexplained but presenting them intact as philosophical knowledge. The other, made possible by the first and created by people like Niell and their followers (both local and otherwise), was that Africans could not think philosophically.

Relation between Sage Philosophy and Popular Myths

Oruka's 1972 article "Mythologies as African Philosophy" marked the beginning of his project of dismantling the mythological constructs in African philosophy. Although others—such as Franz Crahay, Fabien Eboussi Boulaga, and Paulin Hountondji—shared similar concerns and produced similar arguments, these were veiled from Orika by Africa's linguistic divide. Orika argued that myths could not be substituted for philosophy for their lack of the subject and of the critical method. While Orika recognized the universal presence and usefulness of myths at the cultural level, he claimed, like his contemporaries cited above, that the conflation of the two only in reference to Africa could lead to a harmful confusion. Like Crahay, he at least partially contended that philosophy builds on, even at the same time as it also "takes off" from, the cultural plain that for every thinker constitutes the sourcing field. At the same time, however, Orika insisted that his separation of philosophy from mythology did not amount to the erroneous inference, once made by some critics of the essay, that philosophy was a monopoly of the academy in the narrow sense of a discipline practiced exclusively within the confines of its academic definition and control.

This double separation has not been easy. The key problem has been the contrast between the logical soundness of the argument and what is perceived to be the weakness of the examples accumulated as illustrations of the logical claim. For example, in contrast to Griaule's *Conversations with Ogotemmêli*, which, in Orika's view, presents the commonly shared knowledge of Dogon worldview through the folk sage Ogotemmêli, the protagonists of Orika's sage philosophy think as independent and critical-minded individuals. While folk sages know and teach the common wisdom of their communities as a way of both keeping traditions and group identity and protecting them from breach, philosophic sages, in a Socratic fashion, stir up this quiet in the interest of truth and inquiry. The philosophic sages are guided by their realization and admiration of the view that there are many aspects of culture that are neither rationally acceptable nor practically compelling for every member of the communities where these are operative. Thus, they share with others in the community only some selective customary practices and beliefs or some aspects of them. In the everyday negotiation—that is, explanations and determination of courses of action—over issues in the community, these independent-minded persons were a source of new knowledge and the change that issued therefrom.

According to the philosopher Kwasi Wiredu, such independent and critical thinking was available in varying forms in communities and was the basis of frequently protracted

disputations among elders, for example, in search of a consensus over different matters that required disputative negotiations. Thus, contrary to popular belief regarding knowledge at the communal level, it is precisely in regard to the importance of consensus on matters of common good that disputation and careful navigation through different opinions was crucial. Needless to say, such matters were not adjudicated without the input of those members of community who were well regarded for their excellent independent opinions. Africans often object to suggestions that some specific individual's opinion be sought on an issue under scrutiny: "Why seek so-and-so's opinion when he never has a personal view to anything? He only follows other people like sheep do." At the very least, such an observation about other people's character of mind suggests that independent thinking is not only accepted in African cultures, but it is also encouraged and admired as a virtue. Once in a while such independent-minded wise persons acquired some infamy and notoriety for stubbornness, especially in the eyes of those other persons whose opinions or justifications might have been the subject of the sage's criticism. History illustrates that outstandingly critical individuals in society only rarely enjoy comfort with those—usually in the majority—whose views stand in opposition to their own.

According to Oruka, for a person to be regarded a sage philosopher, one not only will be a catalyst to change within his or her community, one will also have to be a significant contributor to the growth and sustenance of the moral ideals of the community. In this context, the criterion for a moral ideal, according to the sage, is not that it match the historical belief of the community but that it satisfies an acceptable idea of right, fairness, and respectfulness toward all those who are involved or may be affected by its practical application. Imagine the conjunctural case where, for purposes of satisfying a local ritual requirement, custom dictates that a man and his baby son spend a night or two in an improvised structure outside his regular house. While the majority of the family group insists on the performance of the ritual according to custom, mindless of the weather uncertainties in the middle of the wet season, the sage among them steps in to object. According to her, custom provides guidance to desired behavior; it is not an end unto itself. Thus, she advises, calls for the performance of ritual need to take into consideration the view that because rituals are meant to give us a sense of reconciliation between a chain of ideas as we believe they relate to our practices; they are meaningful only if we do not cause harm to people in the course of performing them. In this case, she added, the performance of ritual as called for is likely to expose those involved, especially the baby son, to circumstances detrimental to their health. Hence the performance of the ritual would be counterproductive, and so unreasonable and unallowable. Such would be a circumstance where the sage would endeavor to subject a customary requirement to a rational appraisal and be committed to a view considered by her to be rationally superior to the traditional position. According to Oruka, the sage can sometimes have only a private disagreement with customary principles and that would be sufficient to define her as a person who relies on the dictates of rational appeal. Also, disagreement with commonly held knowledge is neither a condition nor a defining rational

character of the sage. Because she is a member of the community, she probably agrees with and abides by many of her community's maxims and ways. Thus her uniqueness emerges in those circumstances of need for exacting principles or reasons in matters requiring theoretical clarification and understanding. Faced with such a need, the sage can agree with custom but largely on the basis of independently concurring with the view expressed in a customary principle or the justification for one.

Worried that the ethnophilosophical texts of Tempels, Griaule, the Rwandan philosopher Alexis Kagame, and several others who merely baptized the anonymous traditional worldviews as philosophies may have justified the harsh but equally mythical criticisms like that of Niel, Oruka's endeavor was to separate the thoughts of individual thinkers at the traditional level from the collective traditional beliefs. The criterion set by Oruka for the qualification of the individual sages' views as philosophical thinking was not their mere variance from the communal beliefs of the sages' own groups but also a theoretical account provided by the sage as the foundation of his or her own view. Accordance or discordance with a group's views was, for Oruka, a factor that could not by itself satisfy the philosophical character of a sage's knowledge. The sage attends to the rationality of views rather than to the judgment of the group, although the sage always hopes that everyone sees and accepts the grounds that make his or her position the better one. This criterion, in Oruka's view, is precisely what qualifies Socrates (c. 470–399 B.C.E.) as a philosopher. And while the criterion favors the classification of both Socrates and Paul Mbuya as philosophers, for example, it disqualifies Griaule's Ogotemméli from being one (Oruka, 1991, p. 49–50).

In response to the question whether the one-time interviews with the sages was sufficient for the detection of their philosophical groundings, Oruka makes the following observation: "Some of the Greek sages are known and treated as philosophers for having made only one or two utterances. Thales, for example, is known to have said that 'everything is made of water,' and Heraclitus that 'strife is the truth of all life'" (1991, p. 2). Of course this is not correct. The selection of historical textual representation by historians of philosophy may have led to the impression that Oruka holds. But there are large collections of pre-Socratic texts that have been translated into modern languages and that show that there was much more than the specific topics historians have overwhelmingly focused on in order to create the image of a unilinear growth of the discipline generally and of specific topical issues. Hermann Diels's collection, *Fragmente der Vorsokratiker* (1903), is a good example of the contrast between what more there is—and could be if they were recovered in their complete forms—of the pre-Socratic period and what some historians have biasedly used. To be sure, Oruka uses the pre-Socratic example only as an explanatory tool, given that he too, like the ethnophilosophers that he partly wanted to correct, wrote largely for a European audience. As for their relevance to local societies, a case can be made that not only does Oruka's project aim at establishing the claim that the sages are philosophers in their own right, but it also teaches that there are many things to learn from careful consideration of the teachings of different experts in indigenous communities. In

other words, that a local philosophical tradition can ensue out of dialogues with the sages, especially with the sage philosophers, whether directly through dialogical interviews or indirectly by cogitating on the philosophical import of their assertions. This recognition of the philosophical worth of traditional thinkers is the basis of the work of Barry Hallen and John Olubi Sodipo, now in two volumes—one epistemological (*Knowledge, Belief, and Witchcraft: Analytic Experiments in African Philosophy*, 1997, by Hallen and Sodipo), the other ethical and aesthetic (*The Good, the Bad, and the Beautiful: Discourse about Values in Yoruba Culture*, 2000, by Hallen). In both, Hallen and Sodipo bring traditional thinkers, the *onisegun* or medical experts, into the enterprise of expounding and elucidating traditional thought of an African people, the Yoruba, as it relates to the conception or idea of knowledge in both cognitive and moral senses. Oruka counters Hallen and Sodipo that because the *onisegun* only expound and elucidate the traditional thought of the Yoruba, they are certainly very wise, but they are not philosophers. He thinks that the *onisegun*, who are deliberately kept anonymous by Hallen and Sodipo for reasons of privacy, are like Ogotemmêli, whose presentation, however complex and amazing in details, was exactly what every wise and well-trained Dogon person was expected to know (1990, pp. 9–10).

On the issue of literacy, Oruka is quite correct: literacy alone, in and of itself, does not constitute a measurement for philosophizing. Yet this is really not the point. Philosophy is characterized by some form of “tradition”: that is, by a sustained discursive inquiry rather than by just an expression of ideas, however scattered and unrelated among themselves, or however they may be at variance with some societal belief. Those who defend literacy (see, e.g., Goody; Popper; and Bodunrin) make the minimal claim that literacy contributes to the sustainability of a discourse by making it possible for all those who are or wish to be involved to critically engage in it with regard to a specific issue whose point of reference remains accessible. Thus, while the pre-Socratics may have offered little to regard as philosophy, the worth of the little they are alleged to have uttered lies in how reference to them by later thinkers made them the subject matter of wider and growing commentaries, interpretations, and, why not, even reaffirmations and re-elaborations. It is the possibility of a revisit of older texts that, for example, enables Martin Heidegger (1889–1976) to attempt to reestablish what he calls the proper understanding of Being.

As a discipline that aspires so much to clarify concepts and ideas as representations of reality, the task of philosophy includes conceptual analysis as a means to attain clarity and precision in understanding. So, in fact, the reason why the pre-Socratics have lost their worth is precisely that the scattered utterances in themselves do not lead to much, if anything, except via their re-interpretations by later philosophers. Thus reference to them may be crucial, but it is largely indirect.

It turns out, then, that Oruka was right in claiming that literacy per se does not constitute philosophy. Nor, conversely, would orality, in and of itself, be a hindrance to philosophizing. Critics of the attribution of philosophical thought to

Africans who were not formally schooled in the discipline held the generalizing view that oral cultures are incapable of producing or enhancing the growth in their individual members of the virtues of skepticism that these critics considered pivotal to philosophical thinking and inquiry. However, as argued by Oruka, Wiredu, Hallen, and Sodipo, philosophizing requires much more than the mere medium of its expression. For indeed, when considered together with other factors, each can be a medium by which ideas are made known and their defense elaborated. Nor does mere variance of opinion from some popular belief by itself constitute philosophy. But variance becomes an important characteristic of philosophy through a sustained critical inquiry that includes the testing of such an opinion against its real and possible rivals. Traditional palavers, negotiations, and other forums of public debates and deliberations provided the contexts for such testing. Such forums uncovered and enhanced the development of great communal orators as much as they did those individuals with succinct analytic mental skills. Analysis of the procedures of these forums could yield insight not only into how ideas were processed at the traditional level but also into the role and esteem accorded the personal skills of oration and debating.

But the rise of pluralism and the crisis of foundationalism in the late twentieth century introduced and require a fresh reading of sage philosophy. As one takes stock of what has happened in African philosophy from the 1980s through the turn of the twenty-first century through the aid of such compelling titles as Ngugi wa Thiong’o’s *Decolonising the Mind* (1986) and V. Y. Mudimbe’s *The Invention of Africa* (1988), there arises the possibility of reading Oruka’s idea of sage philosophy as part of the wider (postcolonial) critique and rejection of the Eurocentric idea of a comprehensive framework in which philosophical reflection must take place.

Out of the postcolonial discourse Oruka draws two implications. First, the irreducible plurality of values and cultures that issue into a plurality of forms of reflection makes it possible for him to call for an end to the unjustified Western monopoly of philosophy, and especially of the monopoly of the institutional mode of its production. Hence such plurality removes the monopoly of philosophy from the confines of the academy. But while he emphasizes this plurality, Oruka does not draw from it the view that informs the ethnophilosophical texts: that the nature of social organization within which African philosophy is produced distinguishes it from all others by making it a consensual or, as he calls it, a communalized commodity (1991, p. 8). Also, like Wiredu, Oruka did not believe that pluralism opened doors to relativism. Rather, again like Wiredu, he believed in the possibility of recasting the philosophical task as an invitation to a philosophical conversation both across cultures and between the professionals and the solid thinkers of the traditions.

In the wake of the emphasis of the plurality of forms of knowledge, the idea of sage philosophy becomes an interesting and important channel for identifying, understanding, and articulating the philosophical task through a comparative contrast of different epistemic fields. Hallen and Sodipo’s work does this, as does Wiredu in *Philosophy and an African*

Culture (1980) and in *Cultural Universals and Particulars* (1996), in the course of discussing the concepts of mind, the person, truth, democracy, human rights, and other matters pertinent to philosophical thought and practice. But above all, sage philosophy addresses the crucial question of who produces knowledge in the modern hierarchized social formations. In pursuit of the underpinning elements of an African epistemic field, Oruka originally classified Africans' practice of philosophy into four trends, listed as ethnophilosophy, nationalist-ideological philosophy, professional philosophy, and philosophic sagacity. In *Sage Philosophy* (1991), Oruka makes additions to this list to bring the number of the trends to six, including hermeneutic philosophy and artistic or literary philosophy. It is important to note that Oruka did not see these trends as separated in a strong sense. He thought of them as reconcilable by means of a comprehensive account. Such a comprehensive account, he thought, could be offered only by the professional philosophers. "No one thinks in a vacuum" is a tenet that appears to have been central to Oruka's view of this comprehensive account of the trends in African philosophy. The technical work of professional African philosophers, who are themselves also sages at a different level, should find its grounding and discursive context in the frameworks provided by the other three trends (Oruka, 1991, p. 2). He did not think of the trends as differentiated by value on a scale that runs from bad to best. Rather, they complement each other in constituting specific fields of knowledge.

Sometimes the proposed method for identifying a sage reads as problematic, as when Oruka says, for example, that "the best judge [of who qualifies as a sage] must be the community from which the person hails. The researcher [however,] must follow up the guidance of the community and be capable of assessing those alleged to be sages and dismissing others" (1991, p. 3). So, after all, it is the professional practitioner who produces the sage according to his or her institutionalized definitions of the categories of knowledge. Several other critics of the modes of executing the sage philosophy research have adequately covered other methodological problems (see, e.g., Keita; Bodunrin; and Oruka, 1991; several others are also reprinted in Oruka, 1991, and also noted by van Hook).

The significant merit of the idea of philosophic sagacity is to be found, at least in part, in a combination of what Mudimbe has called "the geography of a discourse" and the decentering implications of the Tanzanian politician Julius K. Nyerere's idea of *ujamaa* (the social and moral view that lasting good stems from recognition of the basic interdependency and ultimate unity of all human endeavors and goals). The idea of sage philosophy suggests that professional philosophers ought to take sufficiently into account the problems posed by the sages in the course of their conversations, not just once, but always. This engagement, Oruka believed, would erase the current division of African philosophical discourse into two opposed spaces of tradition and modernity. According to Mudimbe, the view of binary opposition between modernity and tradition can be justified only through the false representation of the latter as static and prehistoric. In his view, however, "tradition (*traditio*) means discontinuities through a dynamic continuation and possible conversion of *traditio*

(legacies). As such, it is part of a history in the making" (p. 189). Like Mudimbe, Oruka too postulates that an African tradition of philosophy will be hard to establish in an influential way "if it ignores the past and traditions. But the continent will equally be handicapped if it abandons science and logic, in the so-called Western sense, as things that are un-African" (1991, p. 26). It would be a tragedy, Oruka argued, as has happened in Great Britain, if the intellectual elite of society were to succeed in imposing its views on the masses.

By proposing to narrow the opposition between the academy as the institutionalized production center and the rest of society as the location of pure consumers at the periphery of the academy, Oruka strips the academy of its colonial definition and status. And he does not limit this stripping to the practice of philosophy. Rather, he sees it as a project to be expanded to all other disciplines and institutions whose processes find their justification and principles of procedure in colonial epistemological formulations and assumptions. His views as expert witness at the now-famous (or, for some, infamous) civil case over the Kenyan lawyer Silvano M. Otieno's body in 1987, and on several other related issues thereafter, clearly define Oruka's opposition to the naïvete with which many people, African and non-African, intellectual professionals and ordinary people, regard the idea and process of "modernization." Particularly relevant was his reply to the presiding judge's question as to whether he, Oruka, as a modern, well-educated (Western-educated) analytic philosopher and professor of philosophy, believed in the (assumedly traditional—by which was apparently implied "primitive") idea of ghosts and their vengeant powers. He responded thus: "there is no reason, your honor, for me to deny [or affirm] the existence of ghosts and their vengeant powers." The statement quickly acquired notoriety more for its perceived arrogance than for the analytic savvy that the judge had unwittingly evoked. In a 1989 article about the case, Oruka gave an analytic appraisal of the naïvete and contradictions of the accusations leveled at him following his testimony regarding belief in spirits.

According to Oruka, one of the most injurious blows colonialism dealt on Africa was to make Africans to think and believe that the label "traditional," applicable to their pre-colonial values, had the negative connotations of evil, brute, irrational, and so on, and hence were to be rejected (1989). Nowhere else, he observed, was "the distinction between tradition and modernity in any given culture [equitable with the] distinction between the *outdated* and the *novel*" (1989, p. 80). Why should Africans judge their participation in or practice of an antiquated European value or practice—such as reading Shakespeare or listening to Mozart's or Beethoven's music—as "modern," and some of their own people's still-valued musical traditions as "outdated"? Or why should Africans regard the reverence of Jesus, who died two millennia ago, as "modern," while tribute to an ancestor who died one year ago as "outmoded"? With these questions and considerations, Oruka appears to ask with surprise the criteria for defining the boundaries of reason with regard to cultural encounters. To be specific, listening to Mozart and reading Shakespeare had been cited in the Otieno case as legitimate indicators of Otieno's avowal of "modernity," and therefore repudiation of his own

local traditions, including the requirement that he be buried in his parents' still-standing homestead. In response to his own questions, Oruka observes: "In the naive sense of the term modern, such a person is [judged] modern just because the cultures associated with Shakespeare or Mozart are *European*. And to be European [or, when you are not one, to mimic anything European by origin], it is naively conceived, is to be civilized and modern" (1989, p. 81).

Conclusion

It is clear from this brief descriptive account of some of the things Oruka stood for that African philosophers are faced with crucial issues and pertinent questions as they critically appraise and define their participation in the wider global philosophical conversation. The influence of Oruka's work is to be seen in both the numbers and research interests of local, regional, and international scholars he inspired to work closely with him, whether or not they agreed with his positions. As a true scholar who believed in the historical spirit of philosophy, Oruka frequently supervised and directed dissertations that sometimes argued strongly against his positions.

SCARCITY AND ABUNDANCE, LATIN AMERICA.

Abundance and scarcity are crucial to Latin America because of the sharp disparities between the wealth produced in this region and the impoverishment of people and environment. Though ideas about causes differ sharply, Latin American social thought has revolved in substantial part around this axis. This entry begins with ideas from before the Spanish conquest, proceeds to key debates among the conquerors, moves then to ideas of progress and modernization, and finishes with recent, critical perspectives.

Pre- and Postconquest Thought

One risks overgeneralization in speaking of "pre-Hispanic" ideas as a unified entity since this covers so many cultures and geographic settings, but two themes stand out: to maintain abundance, communities engage in reciprocal exchanges with deities of particular places, set in broader spatial orders such as the four compass directions; and societies undergo great cycles of creation, destruction, and rebirth. Such visions once characterized official public thought but after conquest were submerged in the rituals of indigenous communities. The Spanish had a different set of concerns. They had conquered, with great self-confidence, a region of biological abundance and human wealth. Was this "natural" richness a sign of the backward state of the Americans compared to the rational, Christian Europeans? Or was it a paradise lost to pillage and enslavement by rapacious conquerors? The 1550 debate between Juan Ginés de Sepúlveda (taking the former position) and Bartolomé de Las Casas (taking the latter) carries into the present, in which the intellectual

descendants of Las Casas posit a romantic ecology and anthropology of profound indigenous cultures in lush but imperiled habitats and the inheritors of Sepúlveda see underutilized natural wealth needing rationality for its proper exploitation.

Modernization and the Ideology of Science

From the mid-nineteenth century until the early twentieth century, a broadly Sepúlvedan position held sway. After independence, political fragmentation and the decline of the colonial economy resulted in Latin America falling visibly behind industrializing western Europe and the United States. Capitalist pioneers from those areas after 1850 began to invest in Latin America in alliance with local landowners and businesspeople. Intellectual spokespeople for this process, the “*científicos*” (advocates of science and progress), saw Latin America as abundant and potentially wealth-producing but constrained by cultural and biological backwardness, especially on the part of darker-skinned lower orders. Scientific racism was in the air, making it easy to blame Latin America’s scarcity on Native Americans, African-Americans, and people of mixed European and non-European ancestry. One example of this kind of thought, though not as biologically racist as some, blamed Mexico’s underdevelopment on the nutritional deficiencies of corn tortillas, the millennia-old food of the Mexican people, and advocated instead the consumption of wheat bread, associated with Europe. There was little support for this seemingly “scientific” theory, and it ignored how inequality in resources led to nutritional shortfalls. But it seemed to explain Mexico’s poverty, offering a suitably progressive path forward.

There were dissenters, however. Two Peruvians, the social theorist José Carlos Mariátegui (1894–1930) and the novelist-anthropologist José María Arguedas (1911–1969), stand out for revaluing indigenous cultures. Mariátegui interpreted the indigenous people of the Andes as a revolutionary class in Marxist terms, while Arguedas deepened attention to highland Peruvian culture per se, noting the continuities of pre-Hispanic thought described above. Generally, though, notions that Latin America should follow external models of progress continued into the 1940s, 1950s, and early 1960s. The models had once been England and France, but in this period the economically and politically overwhelming United States provided the vision of power and abundance. Racist theories declined (though did not disappear), and the key idea was “modernization”: that Latin America could engineer progress by discarding its traditional social structures and cultures. A new nationalism crept in, with the central state and local capitalists seen as modernizers as well as, or in replacement of, foreigners. This opened the door for a major reversal in thought.

The Radical Critique of Modernization

In the 1960s and 1970s “dependency” theorists (including, among others, Teotonio Dos Santos, Fernando Henrique Cardoso, Anibal Quijano, and Andre Gunder Frank) argued that as Latin America entered into relationships with dominant economies like Spain and Portugal, and later Britain and the United States, it became poorer rather than richer. Various enterprises, from sugar plantations and silver mines to automo-

bile assembly plants and pharmaceutical factories, did not advance Latin America but rather removed its wealth and stunted its own, self-determining progress. Furthermore one could identify elite classes and dominant areas within Latin America not as modernizers but as doing the work of extraction and control for outsiders. Backwardness thus was imposed from outside on a potentially self-sufficient, abundant region.

Dependency theory at its most radical called for class revolutions in Latin America. It identified a carrier of change in the peasantry seen as a class (rather than as indigenous cultures) and, to a lesser extent, in the urban poor and workers in new industries. These classes were seen as the creators of abundance but the sufferers of scarcity because the surplus product of their labor was taken away in unequal exchange with the world centers of capitalism (a heterodox Marxism focusing on relations of exchange rather than production). In spite of this radical diagnosis, however, dependency theory overlapped in practice with nationalist-capitalist industrialization and urbanization guided by the central state, which envisioned scarcity and abundance in conventional economic terms.

The Return of Modernization (Neoliberalism) and Its Cultural-Ecological Critics

The nationalist-capitalist project collapsed in the 1980s due to corruption and inequity in which enormous debts to foreign (mostly U.S.) banks resulted in retrenchment, job loss, and impoverishment. Neoliberalism is the intellectual movement that corresponds to the dismal era of economic retrenchment and return of U.S. domination in the period from 1982 to the twenty-first century. As a set of ideas, neoliberalism differs little from those advocated by “*científicos*” and modernizers of past epochs except, perhaps, in its emphasis on the example of U.S. and East Asian business practices, such as private entrepreneurship. Again the assumption is that Latin America is characteristically backward and needs to import models for achieving abundance from more “successful” societies.

There are, however, two alternatives on the intellectual horizon. The Peruvian economist Hernando de Soto propounds the argument that Latin America has been hobbled by monopolies of economic and political power and that enduring prosperity will be created by the acts of millions of tiny entrepreneurs—street vendors, small businesspeople, and the like. This is clearly an idea of its time, related to neoliberalism and reflective of the retreat of the grand projects of the state and the proliferation of microscopic businesses among the unemployed, but it does touch on the persistent problem of stultifying monopolies of power in the region.

Meanwhile, welling up from innumerable social movements are the offshoots of dependency theory but with a new focus on indigenous cultures, women, and ecology. Like dependency theory, these diverse ideas (for which we do not yet have a name) locate abundance inside Latin America, in its forests and waters and in its pre-Hispanic and African-American legacies. They see globalization (economic and cultural) as threatening that abundance and thus form part of the international antiglobalization movement, centered on the World Social Forums held in Porto Alegre, Brazil. Unlike dependency theory, these ideas emphasize an encompassing cul-

tural vision of radical economy and ecology, drawing on 1960s forebears in liberation theology and Paulo Freire's "conscientization" approach to collective self-education. Fragmented as these tendencies are, there is no single intellectual spokesperson, but one might start with the Colombian anthropologist Arturo Escobar. We look hopefully for a synthesis of the penetrating critique of political-economic power characteristic of the 1960s and 1970s and the richer attention to culture and nature characteristic of recent Latin American thought.

SCHOLASTICISM. Scholasticism is best understood not as a set of doctrines, but as a method, or body of intellectual practices. In particular, Scholasticism developed as the method through which Christian thinkers of the patristic and medieval periods gradually transformed the narratives of Scripture into a theological system. Scholastic method, then, has its roots in the earliest Christian times. It reached its fullest development in the schools of the twelfth and thirteenth centuries. The disintegrating Scholasticism of the fourteenth and fifteenth centuries laid the foundations for modern forms of intellectual discourse.

Biblical and Patristic Roots

In Matthew 5:17 Jesus declares, "Do not think that I am come to destroy the law, or the prophets. I am not come to destroy but to fulfill (*plērōsai*)" (Douay-Rheims version). Christianity thus stands in a complex relationship of continuity and discontinuity with regard to its Jewish sources. The Christian faith views itself as preserving the Jewish heritage in its integrity, yet at a higher level. The precise definition of this "fulfillment"—that is to say, of the relationship between the Old and the New Testaments—was one of the central tasks of the first Christian thinkers, the church fathers. In addition, tensions that occur within the narratives and teachings of each of the two Testaments (in the four Gospels, for example) had to be explained and smoothed over as well. Some of the strategies that the church fathers used in order to harmonize the texts of Scripture were themselves scriptural, such as allegorization, which patristic thinkers widely employed to read the Old Testament in light of the New. Other techniques, however, were derived from non-scriptural sources; most importantly, the church fathers borrowed philosophical terminology of Greco-Roman provenance in order to articulate certain elements of the scriptural narrative in a systematic fashion, that is to say, as "doctrine." Thus, for example, occasional references to God the Father, the Son, and the Spirit came to be transformed into the doctrine of the Trinity, which was defined, in the Latin West, by means of the Greco-Roman philosophical terms of substance and person.

Unlike their Greek counterparts, the Latin church fathers did not produce a comprehensive account of the Christian faith in a complete theological system. Rather, they limited themselves to discussions of specific areas of theology, such as the Trinity or the relationship between grace and free will. And although they availed themselves of methods of textual synthesis and system-building, they rarely reflected upon these techniques in a detailed fashion. For many centuries, St. Augustine of Hippo's (354–430) treatise *On Christian Teaching* remained the standard text on Christian methodology.

The Early Middle Ages

The writings of the church fathers were soon subjected to the same synthesizing approach that they themselves had applied to Scripture. From the fifth century onward, Christian thinkers garnered *sententiae*—"sentences" or authoritative quotations—from the writings of their predecessors. The resulting sentence collections gave rise to two challenges that were crucial in honing the emerging Scholastic method: first, the task of reconciling the often divergent teachings of one or several church fathers on a given theological topic, and of doing so in light of the scriptural

texts upon which these teachings were built; and second, the task of arranging the theological topics in a meaningful order.

In subsequent centuries, the textual basis upon which this method was brought to bear became even broader; this increased breadth in turn called for improved strategies of structuring the material. Thus, the Carolingian era saw the introduction of Eastern theology into the Christian West, especially through the writings of John Scottus Eriugena (c. 810–c. 877). But around the same time, Christian thinkers also began an ambitious project of systematically elucidating the whole of Scripture with pertinent quotations lifted from authoritative writers of the tradition. In the *Glossa ordinaria*, or “Standard Gloss,” the text of the Bible was presented with interlinear notes to explain difficult words and phrases, while marginal annotations helped the reader understand the theological content of key passages. The *Glossa ordinaria* constituted a central step in the Scholastic project of translating the “stories” of Scripture into a theological system. It continued to be improved by successive generations of theologians, reaching its definitive shape only in the twelfth century.

The Twelfth and Thirteenth Centuries

In the twelfth century, the sentence collection became the central genre of theological writing, overshadowing the Scripture commentary and the treatise. A theologian now had to prove his competence by presenting a comprehensive synthesis of traditional doctrine. A number of factors flowed together to produce this situation, especially the inherent dynamics of the development of the Christian intellectual tradition and the increasing importance of urban schools as centers of education. In the monasteries—the paradigmatic institutional setting of earlier medieval writers—education and learning served a contemplative goal: the monks saw themselves as pursuing *salutaris scientia*, “salvific knowledge.” In the schools, on the other hand, knowledge came to be conceivable as an end in itself, dissociated from spirituality. The “master” teaching at the school was neither a monk nor a bishop entrusted with the care of souls, but an intellectual. He competed with masters at other schools for students, who judged his performance based not least upon how effectively he presented his subject matter.

The tradition of the sentence collections culminated in Peter Lombard’s (c. 1095–1160) *Sententiarum libri IV* (Book of sentences), which quickly became the standard theological textbook of the medieval schools—to the chagrin of more conservative thinkers, such as the English bishop Robert Grosseteste (c. 1168–1253), who believed that theology should remain centered on the study of Scripture. In the *Sentences*, Peter Lombard divides theology into four books, logically starting with God and the Trinity in book one, then moving on to Creation, the human being, and the Fall in book two, treating Christology in book three, and concluding with the sacraments in book four. The books were further broken down into chapters, with a table of contents placed at the beginning of the work to facilitate its consultation—a remarkable innovation at the time. Moreover, Lombard indicated the internal structure of each chapter by means of red subheadings, so-called rubrics. Within each chapter, a theological question is posed, then answered provisionally by means of scriptural and

patristic quotations that often remain discordant, therefore requiring reconciliation. This harmonization is effected through detailed examination of the texts, determination of each author’s precise meaning, and careful weighing up of arguments. Lombard usually attempts to formulate a consensus position in a short paragraph at the end of the chapter.

From the beginning of the thirteenth century until the early sixteenth, the history of Scholasticism can to a large extent be written as the history of commentaries upon the *Book of Sentences*. In the commentaries of the theologians of the thirteenth century, Scholastic method reached its most developed stage. Under the influence of newly available Aristotelian methodology, theology came to be defined rigorously as *scientia divina*, “divine science.” This *scientia divina* was conceived as being distinct both from philosophy (taught in a separate faculty at the recently founded universities) and from *sacra pagina*, that is to say, “sacred page” or Scripture commentary. Furthermore, in the commentaries upon the *Sentences*, the dialectical structure of Peter Lombard’s analyses was formalized, to yield the schema with which every reader of Thomas Aquinas’s (c. 1225–1274) *Summa theologiae* is familiar (the *Summa* is, in fact, a revised version of Aquinas’s own *Sentences* commentary): question; arguments con; arguments pro; solution by means of a distinction in which both sides are usually shown to have seen parts of the truth; response to the opening arguments. The “divine science” of the *Summa theologiae* leaves the narrative structure of Scripture behind completely, replacing it with a system that articulates all the elements of the Christian faith as parts of a coherent whole—a whole that represents the methodically generated sum total of all the authoritative voices of the tradition.

The Waning of Scholasticism

Already toward the beginning of the fourteenth century, however, the intellectual practices of high Scholasticism—such as the question schema just described—were disintegrating. The problems of Christian thought, together with its textual bases, had reached such a degree of complexity that a method designed to integrate discordant voices into a coherent tradition could no longer succeed. Authors now began to emphasize their originality, choosing a format for their presentation that allowed them greater independence. Thus, the “question” dissolved, and commentators on the *Sentences* used the genre for increasingly autonomous statements of doctrine.

SCIENCE.

This entry includes two subentries:

Overview

East Asia

OVERVIEW

Science is a product, a particular kind of knowledge, as well as a process to obtain such knowledge. It is a social activity primarily aimed at obtaining objective and consensual knowledge about nature and to use this knowledge for socially desirable purposes. Scientists and philosophers disagree about whether scientific knowledge mirrors nature as it really is, or if it merely constitutes an instrument to describe and control natural processes and objects. Irrespective of the stance on this issue, scientists (and most philosophers) agree that objective and consensual knowledge can in fact be obtained, and that to a large extent the success of science derives from following certain rules and methods. Although there is no one scientific method that leads to true knowledge, there are rules and methods that are generally followed and in a loose way demarcate science methodologically from non-science.

General

The methodological foundation of modern science was laid during the scientific revolution of the sixteenth and seventeenth centuries. Whereas one school of thought, going back to Francis Bacon, emphasized induction from particular observations and experiments, the followers of René Descartes favored a more hypothetical-deductivist approach. In the mid-nineteenth century, the two kinds of methodology were refined and developed by, among others, John Stuart Mill and William Whewell. It is commonly recognized that both methods are employed in real science and that they do not constitute two different ways of doing science. Moreover, the favored meth-

ods differ from one science to another. The methods of the astrophysicist are not the same as those of the botanist, yet they are not entirely different either.

Science is organized in a large number of disciplines and subdisciplines, including areas of research of a transdisciplinary nature. Although there have been many attempts to establish hierarchical, more or less natural classifications among the sciences, in the early twenty-first century these have largely been abandoned. All of the particular sciences have a limited area of validity, a domain of nature within which they are relevant and about which they can claim cognitive authority. Nevertheless, there is no one-to-one correspondence between domains and scientific disciplines, and many cases in which science has the “right” to speak about a certain domain is a matter of controversy. According to some positivistically minded thinkers, science as a whole covers all domains of nature, consciousness, and society in the sense that all meaningful questions can be answered scientifically, and they ought to be answered so. This point of view, which expresses a kind of scientific imperialism as it denies the legitimacy of, say, social, metaphysical, and religious explanations, is often referred to as scientism. Although few thinkers have endorsed scientism in a pure form, it is not unusual for scientists to believe that social and ethical questions can in the last resort be reduced to scientific questions. In his book *Consilience* (1998), the biologist Edward O. Wilson holds that the unification of the natural sciences with the social sciences and humanities can be achieved on terms dictated by science. It is a matter of debate how stringently a scientific theory should be restricted to its original domain. Nature does not tell what is the proper domain of a scientific theory or principle. According to “restrictionists” a theory can be legitimately applied only to its scientific context, whereas “expansionists” are willing to extrapolate it to very different areas, for instance by means of analogies. Scientism is typically more appealing to expansionists than to restrictionists.

It is a major aim of history and philosophy of science to establish how science develops over time. Science has been hugely successful, but how is it that scientists know so much more of nature, and so much more reliably, than their predecessors? How is cognitive progress achieved? The traditional view is that new scientific theories build on earlier theories, which are criticized and improved upon, typically because they fail to account for new phenomena. They are modified or rejected in order to give way to new theories, although most of the old experimental data will still be valid and have to form part of the new theories as well. According to this picture, science essentially evolves cumulatively, by adding knowledge to knowledge or replacing obsolete knowledge with better knowledge. Whereas the picture stresses the evolutionary and conservative aspects of science development, it pays little attention to major conceptual restructurings of knowledge.

In his *The Structure of Scientific Revolutions* (1962), Thomas S. Kuhn argued that cumulative progress occurs only in periods of “normal science” when the community of scientists within a given field agree upon the standards of science, its paradigm. During revolutionary changes a new paradigm

replaces the older one, and the two kinds of science are so different that they cannot be compared rationally. They are incommensurable in the sense that there is no neutral, trans-paradigmatic way to define progress across a revolution. According to the strong version of Kuhnian revolutionary changes, paradigms constitute separate worlds between which no communication is possible. Consequently Kuhn's theory opens up for relativism, with all its problems (as discussed further below). The strong Kuhnian picture, however, does not agree very well with the history of science, which includes many examples of scientists who have had no problems in maneuvering between competing paradigms. Although revolutions in the strong sense rarely or never occur, science often experiences major transformations that may involve drastic reinterpretations of past knowledge. Yet even in such cases—quantum mechanics may be an example—new theories are usually designed to account also for the successes of past science.

Recent Developments

In classical sociology of science, such as that developed by Robert K. Merton (1910–2003) in particular, ideological, political, and economic factors form the framework of science development, but they do not affect the epistemic content of science. From the 1970s onward, groups of sociologists and philosophers have gone beyond this position and argued that science is not epistemically privileged compared to other, non-scientific modes of obtaining knowledge. Partly inspired by Kuhn's book, scholars such as Paul Feyerabend, David Bloor, and Barry Barnes claimed that science is essentially ideological in nature and that its knowledge claims can be fully understood in terms of social mechanisms, hence by sociology. According to the so-called strong program of science studies, the distinction between science and nonscience cannot be upheld; furthermore, there is no intrinsic difference between true and false statements in science. A true theory is simply one that happens to be accepted by the relevant community of scientists.

Epistemic sociology of science, sociology of scientific knowledge (SSK), or social constructivism was a strong force in science studies during the last part of the twentieth century. It nevertheless left little mark on the scientists. Common to constructivists, of whatever inclination, is that they share to some degree a relativistic conception of science: A scientific theory is relative to social and cultural contexts, hence its truth value cannot be decided simply by comparing it with nature itself (that is, with observations and experiments, for these, too, are social constructs). Modern constructivists, such as Harry Collins, Andrew Pickering, Bruno Latour, and Karin Knorr Cetina, do not form a homogeneous group, but they all deny that science is a successful truth-seeking activity based upon an interplay between theories and experiments that reveal objective natural phenomena. In their arguments, they tend to emphasize controversies within the scientific communities, the contingent nature of scientific problems, and also the inescapable theory-ladenness of experiments. Naturally, the claim that accepted scientific knowledge is not derived from nature, but rather from local social and cultural contexts within and without the scientific community, has caused a great deal of controversy.

The "science wars" have principally been fought between scientists and academic analysts of science, but there have also been battles among scholars within the fields of sociology, history, and philosophy of science. In *Higher Superstition* (1994), the biologist Paul R. Gross and the mathematician Norman Levitt launched an attack on what they considered to be the antiscientific attitude of the "academic left." It is probably true to say that in the early twenty-first century such battles are no longer as intense as they used to be, and that the radical relativism of the 1980s has only a few advocates left. As far as the scientists are concerned, the large majority continue their work unperturbed by the controversy and in many cases blissfully unaware of it.

Yet the turn toward contextualism and constructivism has clearly left its mark upon science studies and opened the way for a variety of new approaches to the historical, philosophical, and sociological study of science. Thus, with the development of SSK it became natural to investigate the role played by rhetoric in the construction of scientific arguments (whereas, traditionally, science and rhetoric have been seen as antithetical). Most scholars in this area of science studies are content to point out the importance of rhetorical strategies, but according to others, closer in spirit to social constructivism, science itself can be understood as a form of rhetoric. Whatever the differences, after about 1980 rhetorical and literary analysis became a legitimate and popular tool in the examination of science—although a tool unknown to most scientists. Among the rhetorical elements that have attracted much attention are metaphors in science.

Science is international, but of course it depends on national and other local contexts as far as funding, organization, and institutionalization are concerned. Since the late nineteenth century it has been argued that the national stamp also covers "styles" of doing science, which derive from either national characters or cultural traditions specific to a certain country. Although the notion of style is controversial, and that of national style even more so, the topic has been examined by several modern historians and philosophers of science. For example, Jonathan Harwood has used style as a historiographical category in studies of twentieth-century biology, and Alistair Crombie has provided an extensive treatment of style in science in his *Styles of Scientific Thinking in the European Tradition* (1994).

The gender aspect of science, although not a new one, has flourished only since the 1980s when Carolyn Merchant in *The Death of Nature* (1980) discussed the historical gendering of nature as female. Likewise, Evelyn Fox Keller argued in *Reflections on Gender and Science* (1985) that science, in its present form, is inherently masculine. One answer to the historically documented conflict between femininity and traditional science has involved attempts to develop a new "feminist science" that reflects what are supposedly feminine values, such as cooperation, tenderness, organicism, and reflexivity. This has resulted in a considerable amount of scholarship, but not any real changes in the practice and ethos of science. Social constructivists, radical feminists, multiculturalists, and postmodernist critics have been accused of fighting the case of antisience. Nevertheless, although they

oppose established science, they are not against science as such but rather seek to build up alternative modes of science in harmony with the social and cultural values they favor. Their endeavors have not been more successful, though, than the attempts of some Christian fundamentalists to establish an alternative “creationist science.” The norms, contents, and institutions of modern science have a remarkable degree of robustness. If there are alternative sciences, they are marginalized and have, at least so far, been unable to challenge established science.

Theory, and particularly mathematically formulated theory, has traditionally been the focus of philosophy of science, whereas experimental practice has been considered merely an appendix to theory. Experimental results have always been of interest, but only from the 1980s has attention been given to experiment and observation as a process. Experiment has become an important field of inquiry, irrespective of its connection to theory. Indeed, Ian Hacking, Allan Franklin, and others have questioned the notion that observations are always “infected” by the theory under test. They have urged scholars to study experiments and observations in their own right, including how instruments are built and used in measurements. Many constructivist scholars share this interest in the experimental workplace. Bruno Latour and Steve Woolgar’s *Laboratory Life* (1979) initiated a new kind of study, laboratory studies, in which scientists and other “actors” are followed in their daily work, much like anthropologists observe the habits of their subjects. Laboratory studies have in some cases been concerned with laboratories as buildings rather than workplaces of scientists. The architecture and physical arrangement of laboratories, observatories, museums, and botanical gardens is a field of growing concern, among other reasons because they are seen as expressions of the values associated with science at any given time and place.

EAST ASIA

The most familiar characteristics of modern science—rigorously demonstrated relationships based on a combination of experimentation and exact measurement—did not exist anywhere in the world before the seventeenth century. Any definition of science that holds for earlier times or for places other than Europe must be more inclusive. More useful criteria are the attempt to find rational explanations, rather than those based on gods and analogues to human will, and the use of abstraction to generalize from concrete data.

One can speak of East Asian science because the educated elite of China, Japan, Korea, and Vietnam shared a classical written language. To a large extent, literacy in East Asia meant being educated in the same Chinese classics and writing in a language based on them, just as Europeans for centuries learned and communicated in Latin. China, because of its size, wealth, and bookish literati, tended to dominate its neighbors intellectually in science as in other fields, but East Asians elsewhere made notable contributions, some of which are noted below.

The Sciences

A peculiarity of Greek culture was that philosophy informed the basic educations of those who practiced mathematics and the natural sciences, and of many physicians whose writings became textbooks. In the Islamic world, and in the early European universities, curricula continued to put philosophy prior to science and medicine.

This was not the case in China. Information on natural phenomena first appeared in general writings devoted simultaneously to moral philosophy, political theory, and cosmology. Basic physical concepts and frameworks evolved in such works.

Beginning in the first century B.C.E., autonomous sciences separated from philosophy on the one hand and technical practice on the other. Their traditions, like those of earlier non-technical scholarship, were canonical. Confucius claimed that philosophy began with books that had survived from a golden antiquity into the degraded present. Analogously, almost every field of endeavor traced its beginnings to one or more classics revealed by an ancient sage-ruler. Education was based on the ritual transmission of such texts from master to disciple within each tradition.

Early monographic technical writings (many of which used the form and rhetoric of the classics) elaborated on their philosophic predecessors to meet their own needs. Practitioners did not, however, see themselves as supplementing philosophy, or engaged in an overarching intellectual enterprise. Rather, they were engaged in a common exploration of the Way (*dao*), an aim that encompassed aesthetic, literary, and visionary experi-

Some outstanding East Asian scientists

Name	Dates	Accomplishments
Zhang Heng	78-139	Polymath, astronomer, cosmologist, instrument designer
Zhang Ji	c. 160?–after 219	First formulary for febrile diseases
Sun Simo (or Simiao)	alive 673	Alchemist, physician
Yang Yunsong	9th century	Expert on siting, author of important manuals
Zan Ning	919–1002	Author of important sources for resonance studies
Shen Gua (or Kuo)	1031–1095	Polymath, astronomer, critical commentator on science
Guo Shoujing	1231–1316	Designer of astronomical instruments, expert on water control
Li Shizhen	1518–1593	Author of <i>Systematic Materia Medica</i>
Seki Kowa (or Takakazu)	d. 1708	Japanese innovator in calculus and other mathematical fields
Mei Wending	1633–1721	Mathematician, restorer of classic computational and astronomical traditions

ence, in which cognition could play only a part. Because there was no science as a single, distinct activity, it is more accurate to speak of the Chinese sciences.

Scholars in East Asia in the early twenty-first century commonly enumerate the traditional sciences using modern categories (or rather those common in the 1950s). This positivistic approach often leads to a misperception. For instance, because there was no such field as biology in ancient classifications of knowledge, one must gather traditional notions about life and organisms from treatises on materia medica, handbooks for connoisseurs of goldfish and other creatures that people collected, travel accounts, textbooks on veterinary medicine, and so on. The result is inevitably a grab bag of incompatible notions, likely to give rise to the misconception that Asians did biology poorly. Nor was physics a discrete field. The physical disciplines that did exist, such as siting and resonance studies, had no counterpart in the West. This article follows current practice by discussing scientific ideas in the categories that practitioners used. It divides them into quantitative (*shushu*) and qualitative sciences.

Before addressing the individual sciences, it is necessary to discuss certain early concepts of the cosmos and its workings that affected every aspect of culture.

Qi, yin-yang, five phases. In the late Zhou period (722–256 B.C.E.), ritualists manipulated natural and social symbols in sets of costumes, implements, offerings, and so on, specifying the number in each set. As the notion evolved that the order of the good state reflected that of the cosmos, courtly discussions naturally adapted this idea of numbered sets to the social and natural worlds. Certain categories—especially those arising in twos, threes, fives, and sixes—turned out to be especially useful. As philosophers used them to group phenomena and analyze their interrelations, dependence on them grew. After the third century B.C.E. these categories, especially those of yin-yang and the five phases, became the first resort for systematic thought.

At the same time, thinkers trying to account for continuity and change refined the concept of *qi*, the stuff from which everything was formed, to deal with questions analogous to those that

Anaximenes' *aer* addressed. But unlike *aer* or Aristotle's *hyle*, *qi* was also the vitality of an organism' or thing,' responsible for its stability, growth, and change. *Qi* was predominantly a matter of cyclic processes, each a sequence of dynamic phases. It circulated through the body because it circulated through the universe and through the earth as part of the universe.

From the mid third century B.C.E., several philosophers explored the use of yin-yang and the five phases to discuss complementary aspects within temporal processes or spatial configurations. By the end of the first century B.C.E., the *Inner Canon of the Yellow Emperor (Huangdi nei jing)*, a collection of writings on medical doctrine, and *The Canon of Supreme Mystery (Tai xuan jing)*, a cosmological treatise, provided mature syntheses in which these twofold and fivefold concepts became ways of characterizing *qi*. In Chinese thought from then on, yin and yang were not activities or forces but phases of *qi* responsible for form, vitality, and change. This understanding became a foundation not only of philosophy but also of the autonomous sciences as they appeared. Each adapted this set of concepts to its own problems, and supplemented it with additional ones.

Quantitative sciences. The quantitative sciences in traditional China consisted of mathematics, mathematical astronomy, and mathematical harmonics.

Mathematics (*shu*, *suan*). The pattern for mathematics was largely formed by the *Mathematical Canon in Nine Chapters (Jiuzhang suan shu)* of the first century C.E. It brings together 246 problems, of which some reflect the practice of government accountants and surveyors and others the concerns of small private traders. For each it provides a step-by-step numerical solution. It is not concerned with proofs (these appeared at the end of the third century), but rather aims to show how one can solve a wide variety of problems using nine general computational methods. These methods, even for mensuration problems, remained algebraic, depending on computational devices (computing boards until around the fourteenth century, then the abacus).

Unlike earlier manuscripts, the book arranged its materials in standard and rather systematic form. The main mathematical

tradition remained focused on numerically stated practical problems. Over the last millennium even authors who explored more abstract realms—always tentatively until the introduction of European approaches—still stated their problems in concrete (and often impractical) form.

The texts gathered in the other early classic of mathematics, the *Zhou Gnomon* (*Zhou bi*, later called *Zhou bi suan jing*, between 50 B.C.E. and 100 C.E.), use the try square and compass to construct simple numerical models of the universe and its relation to a central earth. These texts apparently aim to demonstrate how one might go about building up a computational astronomy.

Mathematical astronomy (li). Chinese believed that Heaven gave the mandate to rule to the family best able to keep the cosmos and the state in harmony. Unpredicted celestial events were warnings to the current emperor that he was failing to carry out his responsibilities as he should. He therefore needed court astrologers to observe, report, and interpret these portents, and to find out what acts or omissions Heaven was warning him about. He also needed court astronomers to improve methods of prediction, so that there would be fewer omens to worry him. Thus both astrology and astronomy were state enterprises.

The Chinese began the day at midnight, the month at the new moon, and the year at the winter solstice. A system of computational astronomy (*li*) was a set of step-by-step procedures that officials could follow to generate a calendar for the coming year. It forecast actual new moons, solstices, eclipses, planetary phenomena, and much else.

Originators of systems generally claimed that they would yield highly accurate predictions forever. In practice, their slight errors accumulated and lead to failures sooner or later. Because unpredicted phenomena reflected on the emperor's virtue, there was endless pressure to design better systems. Some governments used them ritually to signal the cosmic aegis of a new dynasty or reign period, or even a renewal of virtue within a reign. Rulers over two millennia officially adopted roughly fifty systems. Other East Asian governments, generally relying on hereditary astronomy officials, tended to adopt or minimally adapt Chinese systems, and to use a very few of them for long periods of time.

The methods of computation were numerical, closer to modern computer algorithms than to the Greek geometric approach. Building a calendar was a matter of cycles, as a simple example illustrates.

Astronomers discovered early on that a year was on average 365 days long, and a month, a little over 29 days long. Since the units of a calendar must contain a whole number of days, the Chinese, roughly speaking, alternated months of 29 and 30 days. But 12 such months add up to only 354 or 355 days. It was therefore necessary to add an extra (that is, intercalary) month every so often to reach the correct long-term average. Specialists soon realized that adding 7 extra months at more or less equal intervals over 19 years, creating 7 years each 383 or 384 days long, would make the average year 365 days, so the calendar would roughly predict what people saw in the sky. By the end of the first century B.C.E., they extended

the scope of their systems to eclipses and planetary phenomena by incorporating many additional cycles.

This approach, based on average periods, could carry astronomers only so far. Later astronomy remained mainly cyclic in approach, but (from 223 C.E. on) gradually incorporated the varying, or apparent, motions of heavenly bodies, and (from the eleventh century on) evolved a trigonometric approach to spherical geometry. The high point of predictive power came with the *Season-Granting System* (*Shoushi li*), in use from 1281 to 1644 in China, and even later in Japan and Korea.

Mathematical harmonics (lü, lülü). Chinese thinkers were as fascinated by the quantitative relations between sounds and the physical arrangements that produced them as the Pythagoreans were. Harmonic intervals implied that a quantitative order underlay apparently qualitative and sensuous phenomena. In China such studies were concerned primarily with resonant pipes. These pitch pipes provided the standards for tuning ritual bells and stone chimes. Their lengths and volumes were also the basis—symbolically, at least—for metrological standards of length, volume, and (indirectly) weight. The ceremonial music of the court applied harmonics as an aspect of the imperial charisma.

Qualitative sciences. Among the qualitative sciences were astrology, medicine, materia medica, alchemy, siting, and resonance studies.

Astrology. Astrology (*tianwen*) complemented astronomy by dealing with unpredictable, and therefore ominous, phenomena. Its portents were mainly celestial, but also included freaks of weather and of animal or human birth, palace fires, and so on. These concerns led to assiduous observation and recording, and to archives maintained over many centuries. The second task of the astrologer was to correlate newly observed prodigies with recorded instances, and thus to direct the attention of the ruler and his advisors to what aspect of government needed reform. Practically speaking, such ritual (like economic forecasting in the early 2000s), although flawed as a technique of prediction, enabled a wider range of policy discussion than those in power might otherwise consider.

The registers of phenomena have been boons to modern science. They have provided richer collections of precisely dated observations than those from any other civilization—millennia not only of eclipses (used in studying, for instance, the gradual change in the moon's speed) and comets (used to establish changes in the orbital velocity of, for instance, Halley's comet), but also of earthquakes (which have given China a leading role in research on their prediction).

Medicine. Traditions of medicine (*yi*) based on abstract doctrines developed by elite practitioners and passed down in writing were only a small component of health care in East Asia, as elsewhere.

Those who treated the sick were mostly laymen, illiterate healers, and priests. In other East Asian societies, methods for healing the elite were very different from the culturally embedded practices available to the majority of those populations, and the practice of medicine was affected by different social cir-

A few important East Asian scientific books

Title	Author	Date	Contents
<i>Records of the Grand Historian (Shi ji)</i>	Sima Qian	c. 100 B.C.E.	First history to contain astronomical and astrological treatises
<i>Inner Canon of the Yellow Emperor (Huangdi nei jing)</i>	Anonymous	1st century B.C.E.?	Canonical collection of medical doctrines
<i>Mathematical Canon in Nine Chapters (Jiuzhang suan shu)</i>	Anonymous	1st century C.E.	Worked problems in practical form
<i>Kinship of the Three (Zhouyi cantong qi)</i>	Anonymous	c. 700	Early theoretical text of alchemy
<i>Formulas at the Heart of Medicine (Ishimpō)</i>	Tamba no Yasuyori	982	Compendious Japanese formulary from Chinese sources
<i>Season-Granting System (Shoushi li)</i>	Wang Xun et al.	1281	Most sophisticated system of astronomical computation
<i>Classified Collection of Medical Formulas (Ŭibang yuchwi)</i>	Kim Yemong	1445	Korean collection of over 50,000 formulas
<i>Systematic Materia Medica (Bencao gangmu)</i>	Li Shizhen	1596	Wide range of data about nearly 2000 drug substances

There is no reliable, complete translation of any of these books into English.

cumstances. For instance, classical Chinese medicine reached the Japanese court by the early ninth century, but was almost inaccessible outside aristocratic circles and a few Buddhist institutions. It became a mainstream tradition only between the mid sixteenth and mid seventeenth centuries, when its European counterpart was also first becoming known in Japan.

Materia medica. *Materia medica* (*bencao*) was the study of drugs of mineral, vegetable, and animal origin. But more than that, it was a trove of natural history. The earliest compilation (in the late first or second century C.E.) was as concerned with immortality as with the restoration of health. Later compilations described each medicinal substance in detail, with information ranging from habitat to adulterants to methods of processing. Charles Darwin drew on data from the *Systematic Materia Medica* (*Bencao gangmu*, 1596), the most authoritative treatise on pharmacognosy, in his *Variation of Animals and Plants under Domestication* (1868).

Alchemy. The somewhat more than a hundred surviving treatises on alchemy (*liandan*, *lianjin*, *jindan*) vary greatly in their concepts, content, symbology, and rituals, and their interrelations remain far from clear. Research in the 1990s and 2000s places them tentatively on a spectrum ranging from external alchemy to internal alchemy. Adepts in external alchemy made elixirs much as mineral medicines were made, by treating chemical substances with fire and water. Elixirs, when ingested, could cure illness, restore youth, and bring about immortal life, for the alchemist or anyone who ingested them. Internal alchemists produced elixirs within the body by visualization, contemplation, and other meditative means. These were the same disciplines used in other modes of self-cultivation, but adepts of internal chemistry used the language of the external art—chemical ingredients, crucibles, furnaces, timed application of heat, and so on—to describe their own meditative experiences. On occasion, such experiences amounted to drug hallucinations. Between these two contrasting genres were theoretically inclined writings that explained alchemy (of the laboratory or of the body) as symbolic manipulation of time and space. Whether, in external prac-

tice, adepts were charging the furnace with timed sequences of carefully weighed fuel or, in internal alchemy, they were breathing in cycles regulated by depth and time, the aim was to reproduce on a compressed scale a great cycle of macrocosmic creation, growth, maturity, aging, death, and rebirth.

In this amalgam of theory and practice, witnessing in the laboratory the process that created the elixir of experiencing it within the body perfected the adept spiritually and, as a result, physically. It made him immortal. The chemical product was unimportant by comparison. Alchemy was as much concerned with religious transcendence as with chemical processes, but along the way alchemists accumulated a great deal of practical knowledge, including understanding of quantitative relations.

Siting. Siting (*dili*, *kanyu*, now called *fengshui*) was concerned with the placement of houses and tombs in relation to their environments. It was based on the idea that *qi* circulated regularly through the earth, channeled by high and low places, wet and dry places, and other topographic features. The ideal site was one on which a dynamic balance of *qi* converged. Great effort went into finding the right abode for a family or an ancestor—effort that intellectuals justified cosmically and that the less educated justified as bringing good fortune. Siting is historically interesting because the compass first appears in the early eleventh century in the hands of practitioners, a century before its use for navigation. Siting fascinates landscape architects because its systematic analyses of landforms generate consistently beautiful placements in the landscape.

Resonance studies. All the traditional sciences attempted to find the regularities underlying change. One widespread style of reasoning began with two assumptions. The first was that since things and events observably influence each other, such categories as yin-yang and the five phases can explain their interaction. The second was that things of the same category affect each other by resonance, the same resonance that causes interaction between certain musical strings or pitch pipes. The surviving literature consists of only a few books devoted to resonance studies (*ganying*, *wuli*) and a number of assertions in

the materia medica and other literatures, and these have been little studied. Some of the assertions about how one creature responds to or changes into another echo folklore. Still, the language of resonance made it possible to collect and set in order data on, for instance, a range of biological phenomena, such as grafting of trees.

Scholarship on East Asian Science

Historical studies of East Asian science grew out of two broader traditions: the rigorous philological scholarship (*kaozheng*) that evolved in China, Japan, and Korea, and the chronicling of positive progress (focused mainly on concepts) prevalent in early-twentieth-century Europe and America. The best-known philological scholars are Xi Zezong (b. 1931) in Beijing and Yabuuchi Kiyoshi (1906–2000) in Kyoto. And the best-known Western chronicler is Joseph Needham (1900–1995) in Cambridge, England. From around 1970 on, social history (drawing on sociology and anthropology) filled some of the gaps in the prevalent history of scientific ideas. In the 1980s, as the antagonism between “internalist” intellectual history and “externalist” social history drew to an end in the West, mainstream history of science took up the challenge of exploring phenomena as a whole, using the widest range of disciplinary tools. Nathan Sivin, using “cultural manifolds” that integrate every dimension of the problems investigated, has applied this approach to East Asian science and to cross-cultural comparisons.

New primary sources have led to fundamental reevaluations. From the 1950s on, archeological excavations have disinterred many troves of manuscripts, some earlier than any extant book, others that cast a fresh light on later technical developments. Many of these documents were not published until 1980 or later. And the excavations continue. The result is a quickly changing base of empirical knowledge, especially about the beginnings of science, that makes many earlier generalizations obsolete.

SCIENCE, HISTORY OF. The history of science as an academic discipline grew in the post-1945 era along with the development of higher education and the expansion of science and technology. In the United States, Vannevar Bush's seminal 1945 article, “Science, the Endless Frontier: A Report to the President,” called for a government-supported national research foundation. Bush's influence led to the creation of the National Science Foundation in 1950 and inaugurated an era in which science was a form of “politics by other means” for waging the Cold War. Science came to be combined with technology in ways that often made the two indistinguishable. The program to land men on the moon, the development of intercontinental ballistic missiles with nuclear warheads, the construction of supercomputers, and the war on cancer are just a few examples of technoscience during this era. As the role of science and scientists in society increased, so did the need to understand science and scientists in historical terms.

In the 1970s and 1980s, many universities established history of science programs or related science and technology studies programs, greatly increasing the number of professional scholars in the field. The annual edition of the *Isis Current Bibliography* is a good indicator of growth and decline in the history of science. *Isis* is the academic journal of the History of Science Society, the discipline's largest professional organization. According to the society's preface to the 2000 edition, “The *Isis Current Bibliography* is compiled by the systematic search of approximately 600 journals.” Throughout the 1970s, the *Isis Current Bibliography* typically listed fewer than 3,000 entries comprising books and journal articles. In 1983 the number of entries rose above 3,000, and in 1993 it first surpassed 4,000. After 1999, scholarship in the history of science seemed to decline rapidly in quantitative terms, and since 2000 the number of entries has hovered below 3,000.

Throughout most of the twentieth century, there were two generally opposed schools of thought in the history of science: internalist and externalist. Internalists believe that the history of science should be explained only through the growth and development of science as rational knowledge and methods. For the internalist, social or cultural factors merely hinder or accelerate this growth, but are not intrinsically part of science. Externalists believe that science is a part of culture and society. For the externalist, the explanation of scientific change necessarily must include non-scientific factors. Boris Hessen's book *The Social and Economic Roots of Newton's Principia* (1931) helped establish the boundaries of the externalist camp with its emphasis on the social, economic, and political forces that shaped Newton's science. Alexander Koyré's work *Études Galiléennes* (1939; Galileo studies) helped establish the boundaries of the internalist camp with its emphasis on intellectual content, growth of knowledge, metaphysical assumptions, and rational nature of Galileo's science. In principle this debate between internalist and externalist explanations in the history of science largely ended following the publication of Thomas Kuhn's *The Structure of Scientific Revolutions* in 1962. Though Kuhn had begun historical work as a disciple of Koyré, Kuhn's book emphasized the role of social factors in revolutionary periods when one paradigm replaces another. Subsequently, though non-historians often fall into the internalism versus externalism debate, historians tend to embrace both explanations as complementary ways of understanding scientific change through time. From the internalist versus externalist debates, the sociology of science emerged as a discipline closely allied to the history of science. Because the sociology of science may use a theoretical method that distinguishes it from history qua history, it is sometimes treated as a special subcategory of the history of science.

Most historians of science focus their work around some combination of chronological period, subject category, and cultural area. Chronological periods include classical antiquity (chiefly Greco-Roman to c. 500 C.E.), the Middle Ages (Latin culture and Europe in general from 500 to c. 1450), the Renaissance and Reformation (1450–1600), and century-by-century from the seventeenth to the twentieth. Subject categories include mathematics, earth sciences, biological sciences, social sciences, and medicine and medical sciences. These are further broken down into subcategories—for example, the physical sciences consist of astronomy, physics, and chemistry. Some historians use a biographical focus within the subject approach. Cultural areas include Islamic and related cultures (including Israel, Iran, and the Near East in general; chiefly from c. 500 to c. 1600), India (to c. 1600), and the Far East (to c. 1600). Presumably, global communication and unification in the sciences make these cultural categories unnecessary after 1600. The work of Joseph Needham seems to belie this point, and the history of modern science in non-Western cultures remains a fertile and largely unexplored academic terrain.

The following categories are by no means an exhaustive survey of new themes in the history of science. Rather, they are an effort to identify selected key developments—some in traditional areas such as the scientific revolution, and others in new areas such as feminist history of science—that will help

orient scholars who are new to the discipline. Also, in part because of space limitations, history of technology and history of the social sciences are excluded, and only the history of the natural sciences is covered here.

General Works

Specialization among historians of science and the sheer volume of publications make it difficult for a historian of science to publish a general overview of the field that pleases most colleagues and is sufficiently comprehensive. With this in mind, two generally successful efforts are Anthony Alioto's *A History of Western Science* (1987) and Daniel Boorstin's *The Discoverers* (1983). Alioto's book serves well as a general introduction for undergraduate students. It is broad and inclusive up through the end of the scientific revolution (c. 1700), and it makes some effort to survey developments in science to the late twentieth century. Alioto emphasizes that science is a way of seeing the world and a way of knowing, rather than a compilation of facts. He also acknowledges the role of metaphysics. Much like Koyré, Alioto regards metaphysics as a commitment to the inherent and knowable order of natural phenomena. Boorstin was a general social historian and not a historian of science per se, but his book is a pleasure to read and is an excellent introduction to the subject for lay readers. It portrays science as human discovery on the frontier of nature and as a progressive method for defeating ignorance. Boorstin is generally weak on the effect of the social and cultural milieu on science, but he is strong in explaining the role of instruments such as the printing press, the telescope, and the microscope. In addition to the general works by Alioto and Boorstin, W. W. Norton and Company has published a series of historical surveys of major disciplines such as chemistry, physics, and the human sciences. The volumes in the Norton series are highly recommended for scholars new to the history of science.

To understand the general scope of the history of science since 1970, two other introductory texts are necessary. One is a work about women in science, and the other is about science as socially constructed knowledge. Margaret Alic's *Hypatia's Heritage* (1992) surveys the role of women in science from antiquity through the nineteenth century. Through a series of chapter-length biographies, Alic helps students and general readers appreciate male biases that created both social hurdles to discourage women who wanted to become scientists and historical filters to render invisible those women who did become scientists. David Bloor's *Knowledge and Social Imagery* (1981) helped establish "the strong programme" for the social history of science. Bloor's method hinges on the belief that "knowledge for the sociologist is whatever people take to be knowledge." Thus, according to Bloor's symmetry principle, there should be no inherent difference between the explanations about what some might regard as true beliefs and what some might regard as false beliefs. Furthermore, Bloor is interested in the form and content of science as knowledge, and not in scientists per se. The strong programme is a theory supporting the social constructionist view and is not to be confused with the social history of science, which seeks merely to explain social influences on science. That said, the origins of the strong programme and social constructionist in the his-

tory of science can be traced to “The Merton Thesis.” Robert K. Merton’s *Science, Technology, and Society in Seventeenth Century England* (1938) argued for the linked origin of values in science, the English revolution, and the Anglican religion.

Preclassical Antiquity

Mott Greene’s *Natural Knowledge in Preclassical Antiquity* (1992) displays a time when people lived in an oral culture and were in close contact with their natural surroundings as a daily part of life. Greene argues that this firsthand experience of nature means that mythology should be understood in natural terms as well as through philology. For example, the enigma of the Cyclops might well be explained through the presence of volcanoes—gigantic one-eyed beasts that threatened humans with annihilation.

Ideas such as Greene’s have found their way into standard works of scholarship on human ecology and nature. In *The Idea of Wilderness: From Prehistory to the Age of Ecology* (1991), Max Oelschlaeger begins by trying to understand the worldview of Paleolithic humans. He writes, “Clearly, the mythology of the Great Hunt and totemism are not stupid responses to the world but mirror the same level of intelligence—albeit one directed to an unmistakably different view of the world—as modern science” (p. 15). Furthermore, in seeking to understand the meaning of wilderness for the modern world, Oelschlaeger considers the poetry of Robinson Jeffers or Gary Snyder to be on equal footing with the environmental science of Aldo Leopold. Understanding science as an integral part of culture rather than as an exceptional activity is characteristic of postmodernism, although this way of thinking is still disputed by many historians of science.

Middle Ages

The Middle Ages, from about 500 to about 1600, are in the early twenty-first century recognized as a fertile period marking a transition from the dominance of a handful of ancient authorities to a broad range of theory and experiment. These developments took place throughout Europe, North Africa, the Arabian Peninsula, and Asia. For the eventual rise of science in Renaissance Europe, developments in Islamic nations were especially important. For a comprehensive survey of this cultural transfer, see David Lindberg’s *The Beginnings of Western Science* (1992), which traces the development of ideas within cultures and their transfer from one culture to another as well as the cultural contexts that enframed these developments. As an historian who pioneered studies of the close relationship between science and Christianity in the West, Lindberg is especially good at laying the “religion versus science” myth to rest. He does this in a number of ways, including explanations of support for science and medicine in the medieval church and the transfer of Greek science from Islam to Europe through Christian scholars such as St. Thomas Aquinas.

Scientific Revolution

The “scientific revolution” embraces the period between 1500 and 1700. Major biographical figures such as Francis Bacon (1561–1626), Galileo Galilei (1564–1642), Robert Boyle

(1627–1691), Nicolaus Copernicus (1473–1543), Johannes Kepler (1571–1630), and Isaac Newton (1642–1727) dominate historiography for this period, although historians have done considerable work on figures such as Paracelsus (1493–1541) or Robert Fludd (1574–1637), whose ideas on occult sciences or mysticism influenced major figures, or those such as Marin Mersenne (1588–1648) or Christiaan Huygens (1629–1695), whose ideas on mechanism or metaphysics helped shape the work of others.

Historians of science long acknowledged the importance of published communication and authorship during this period. Yet until Elizabeth Eisenstein’s two-volume *The Printing Press as an Agent of Change: Communications and Cultural Transformation in Early Modern Europe* (1979), the importance of publication and authorship was a largely untested assumption with knowledge about these phenomena scattered throughout the literature. The second volume of Eisenstein’s work is mainly about communication and science and makes a strong case that, whereas print was not *the* agent of change in giving rise to the scientific revolution, it was a crucial one. The social power of scientists as authors and the development of print-based academic culture were seen in the importance of prestige and how it came to be defined as a system of social capital. This reward system did not guarantee that publications would bring acclaim from fellow scientists, but it did ensure that an otherwise original scientist who did not publish would not receive acclaim. As an important independent variable in the history of science, publishing helps explain Galileo’s popularity (and his political troubles with the Catholic Church), the obscurity of the Swedish chemist Carl Scheele (who made major chemical discoveries but did not publish in French or English, and hence was unknown to contemporaries), the importance of the priority dispute between Newton and Gottfried Wilhelm von Leibnitz (1646–1716), and the covert pleas by Charles Darwin’s (1809–1882) friends for him to publish his *On the Origin of Species by Means of Natural Selection* (1859).

Although the occasional social constructionist has doubted whether there was any such thing as the scientific revolution, most historians recognize its usefulness as a heuristic term to characterize this amazing era of change. Indeed, Kuhn’s work made revolution—the overthrow of one paradigm by another—the key event in explaining scientific change.

Instead of merely working with “revolution” as a historical tool, I. Bernard Cohen uses the historical method to investigate the very idea of revolution in science. By placing Kuhn’s work in historical context, Cohen explains how scientists used and shaped the idea of revolution from the early modern period, through the Enlightenment, and on to the late twentieth century. During the Enlightenment, revolution became a rhetorical instrument borrowed from politics and heavily laden with connotations of progress. Like Cohen’s earlier biographical histories, his investigation of revolution in science centered on key figures such as Copernicus and Newton.

Social constructionists have also focused on key biographical figures to explain the scientific revolution. By investigating

the work of the chemist Robert Boyle, Steven Shapin and Simon Schaffer sought to explain how faith in the mechanistic approach came to dominate scientific culture and how the mechanistic view came to be constructed as scientific reality. Although often criticized for its focus on Boyle's having established his legitimacy by emphasizing his own status as a gentleman, Shapin and Schaffer's work is more nuanced than that, and it does help explain Boyle's ascendancy over rival mechanists such as Thomas Hobbes (1588–1679). As a representative of the conservative traditional social order, Hobbes doubted the ability of experiments to yield knowledge and was a critic to be reckoned with. Boyle's ability to tie experimental demonstration to his mechanistic views was crucial in gaining public acceptance over Hobbes's skepticism. Shapin and Schaffer also effectively explain how the English Revolution and Anglican religion shaped the scientific revolution and hence modern science. Just as Hobbes had feared, scientists became the modern priesthood and science a major source of political authority.

In the history of science since the 1970s, Newton has continued to be a key biographical figure. In a series of books published between 1975 and 1995, Betty Jo Teeter Dobbs revealed Newton's passion for alchemy and explained the connections between this passion, Newton's theological beliefs, and his science. According to Dobbs, Newton's alchemical quest revolved around "Hunting the Green Lyon"—searching for the vegetable spirit that brought brute matter to life and revealed the divine origins of the world. Phenomena such as fermentation were examples of this vital spirit, which caused alchemical transformation as compared with mere chemical change. Newton also searched for essences through his religion and physics. Through his Bible studies, Newton sought a pure and uncorrupted reading of the Scriptures, a reading that would reveal the mind of God at work. In his physics research, Newton sought the essence of space, time, and physical matter—a research program that would reveal the "sensorium of God." Dobbs also demonstrated the effect of Newtonian science on industrial developments. Earlier scholars had pointed out Newton's search for ancient wisdom and alchemical investigation, but it was Dobbs who tied this to Newton's science in a convincing synthesis. Like Dobbs, Richard Westfall spent much of his life researching and writing about Newton. A paradigm for biographical studies, Westfall's book is more than 900 pages long, and the reader comes to Newton as a complete person in intellectual, social, and psychological terms. To accomplish this feat, Westfall deciphered Newton's boyhood journals, understood his private devotion to Bible studies, analyzed his private devotion to alchemy, and sympathized with his psychological challenges. Above all, Westfall explained the intellectual basis of Newton's science, with heavy emphasis on his mathematical and logical genius. Newton also emerges as a social force in his own right, from his work as warden and master of the mint to his leadership of the Royal Society (1703–1727).

Biological Sciences

Just as Newton endures as a primary biographical subject for the history of the scientific revolution, Charles Darwin endures

in the history of biology. As a biography, Adrian Desmond and James Moore's *Darwin* stands in stark contrast to Westfall's study of Newton. Desmond and Moore consider Darwin's life and science almost solely on their own terms. The book is about how Darwin comes to be Darwin and not about how Darwin's work comes to influence science. Throughout, the emphasis is on creating a narrative from primary sources, not on evaluating these sources through the lens of a century's worth of historiography. Desmond and Moore do explain the economic, political, and social factors that shaped Darwin, and they discuss the role of Thomas Malthus's (1766–1834) *An Essay on the Principle of Population* (1798) and other contemporary ideas. The leitmotif that binds this biography together is Darwin's frequent illnesses, but even this is treated strictly in terms of how the illnesses were understood by Darwin and his contemporaries with no allusion to the various later historical explanations for it.

As if to demonstrate the importance of Darwin to the history of biology and the attraction of such major figures for historians, Janet Browne's two-volume biography may prove to be the definitive work on Darwin. Both volumes, *Charles Darwin: A Biography: Voyaging* (volume 1, 1995) and *Power of Peace* (volume 2, 2002), successfully integrate the wealth of primary and secondary sources. Browne is especially adept at explaining the social context of Victorian England, where Darwin lived a privileged life as a member of the leisured class. The pivotal member within a network of actors including friends and family, Darwin was both taken care of by others and in a position to manipulate them. Browne's biography is by no means a one-dimensional sociological study, but also explains Darwin's involvement with and interest in the natural world.

Two other works are important for an understanding of Darwin's role in the history of biology: Ernst Mayr's *The Growth of Biological Thought: Diversity, Evolution, and Inheritance* (1982) for the significance of Darwin's work to later science, and Stephen Jan Gould's *Ontogeny and Phylogeny* (1977) for the clash of ideas (and their political significance) in Darwinian biology. The history of twentieth-century biology is of special interest because the discipline has been largely defined by historians who actively participated as scientists in the synthesis of fields such as cytology, genetics, and embryology. Ernst Mayr is a biologist who participated in the evolutionary synthesis and became a well-respected historian, and his 1982 book is a central text for understanding twentieth-century biology.

Like other historians who have written about the evolutionary synthesis, Mayr explains how diverse scientific streams converged to form the river of contemporary biology. He focuses mainly on the streams of taxonomy, evolution, and genetics and traces their origins to sources as diverse as Aristotle's classification, Jean-Baptiste Lamarck's (1744–1829) theory of adaptation, and the cell theory of Theodor Schwann (1810–1882) and Matthias Schleiden (1804–1881). Although Mayr's work is anything but social history, he does emphasize the cultural environment surrounding biologists and their ideas. And the emphasis on the role of individual biologists is so strong that one reviewer called Mayr's book "an intellectual biography in disguise."

Mayr is inclusive in considering the sources of modern evolutionary theory, but he also occasionally plays the role of historical judge in assessing the value of certain ideas to the history of biology. He is especially harsh regarding the “straight jacket of Plato’s essentialism,” which Mayr believes held back the development of biology for more than two thousand years. Mayr’s disdain for Platonism helps explain his appreciation for the Enlightenment-era naturalist Georges-Louis Leclerc de Buffon (1707–1788), who argued that there are no species but only individuals. Mayr also judged more contemporary aspects of history, as with his criticism of Gould’s work regarding punctuated equilibrium as a driving force in evolution and as an alternative to the gradual adaptation favored by Mayr.

Like Mayr, Stephen Jay Gould, in *Ontogeny and Phylogeny*, combines history with arguments regarding contemporary evolutionary theory. Instead of a historiography that looks for the synthesis of diverse ideas through time, Gould focuses more on history of science as a battle of ideas. Gould’s scientific roots were in paleontology as contrasted with Mayr’s roots in the systematics of extant species. Paleontologists must confront the enigma of sudden widespread extinctions and the dramatic rise of newly dominant taxa. Gould’s historiographic and scientific interests led him to examine different sources than those studied by Mayr and to interpret sources in alternate ways. Thus, Gould uses history to argue that an overemphasis on gradualism and “the evolutionary synthesis” unfairly obscured other historical developments such as the alteration of regulatory genes and the role of stochastic cataclysmic events. Moreover, as he did in numerous other publications, Gould critically examines science as a problem when it is taken as an “objective” frame for politics. For Gould, moral and humanistic concerns outweigh any easy tendency to reduce complex social problems to easy scientific solutions.

Historically, Gould’s fears regarding the political misuse of biological science were well founded. Although historians such as Robert Young have pointed out the implicit class prejudice inherent in Darwin’s science, it was not until after Darwin’s death that Darwinian biology began to shape politics in this way. Daniel J. Kevles in his *In the Name of Eugenics: Genetics and the Uses of Human Heredity* (1985) explains the origins of this desire to breed better humans. Starting with the work of Darwin’s cousin Francis Galton in the late nineteenth century, Kevles tracks this program through the twentieth century, explaining the success of eugenics legislation in the United States versus its failure in Britain. In Britain, legislation failed because of a deeper appreciation by politicians of the scientific complexity or heredity, resistance from the Labour party, and arguments for individual reproductive rights. Before World War II, the American genetics program sought to prevent inferior people from reproducing. After the war and the dark image created by the Nazis for human selective breeding, American scientists shifted their program to a “reform eugenics” based on genetic testing and counseling to screen out inherited disabilities. In Kevles’s historiography, science as a process for creating and developing ideas is replaced by a science that shapes law, feeds powerful political coalitions, gets tested in the courts, and becomes an economic commodity.

The American obsession with understanding and controlling genetics through inheritance has, in recent years, turned toward manipulating the genes themselves. Sheldon Krinsky was original in looking at an episode of contemporary history as a narrative about the politics of science and science policy. America’s war on cancer began in the late 1960s and helped generate interest in and funding for research on the viral causes of cancer. This led to the discovery of SV40, a monkey virus that transformed healthy cells into tumor cells and could also be used to insert new genes into cells. As scientists learned more about synthesizing and manipulating SV40, some of them—such as David Baltimore at MIT—raised ethical concerns over the creation of human health hazards. Although scientists tried to control such biohazards through voluntary agreements, their meetings and public communication attracted public scrutiny and political attention. When federal legislation threatened commercial prospects for recombinant DNA, scientists made every effort in their public communications to black box the issue and to emphasize its potential health benefits. As a black box, scientists could sell the public on the attractive applications of recombinant DNA applications without educating the public to understand either the scientific aspects or the potential disbenefits. This rhetorical strategy was largely successful, both in the 1970s and in more recent politics of genetic engineering.

Feminist History of Science

Since 1970, the feminist history of women in science has become an important field within the larger discipline. The term *feminist history* means more than simply the history of women in science. As an explicitly ideological perspective, feminist history seeks to explain the oppression of women and to offer strategies for overcoming that oppression. Unlike historians in other fields, who are frequently loath to consider themselves personally as agents of historical change, feminist historians of science often admit their personal biases and draw practical political implications from their work.

Carolyn Merchant in *The Death of Nature: Women, Ecology, and the Scientific Revolution* (1980) considers mechanistic natural science between 1500 and 1700 as an object of criticism. In defining the harm to women and ecology stemming from the scientific revolution, Merchant examines the controversy between mechanistic and organic views of nature, the social construction of a female-gendered nature, and the struggle of some women against dominant culture. For example, instead of dismissing the persecution of witches as a fundamentally irrational practice, Merchant sees it as an integral part of the mechanistic program of control over nature. Francis Bacon, René Descartes (1596–1650), and other architects of the scientific revolution promoted this program. Merchant’s criticism of the scientific revolution fits closely with the work of other postmodernists such as Albert Borgmann and Max Oelschlaeger, who identify historical developments such as Locke’s political and economic individualism, Descartes’s universal reductivism, and Bacon’s mechanistic control as key features of the modernist period.

Margaret Rossiter takes a very different yet equally original tack in *Women Scientists in America: Struggles and Strategies*

(1982). By collecting biographical information on thousands of women who earned a listing between 1906 and 1938 in the directory *American Men of Science*, Rossiter identified systemic barriers to women's advancement in science and common strategies by which women overcame or sidestepped these barriers. As factors to further explain these barriers and strategies, she examined more than a dozen variables such as education and marital status. Rossiter found clear patterns in the factors that were associated with professional success in science. This work deflated the myth of science as a meritocracy and also helped feminists develop strategies to promote inclusion in contemporary science. Furthermore, Rossiter's work encouraged historians to look more closely at the connections between gender and contemporary social institutions.

An exemplary scientific biography of a woman scientist is Evelyn Fox Keller's 1983 *A Feeling for the Organism: The Life and Work of Barbara McClintock*. McClintock won the Nobel Prize in Physiology or Medicine in 1983 for her research in corn genetics and her discovery of transposable genes. Keller focuses on McClintock's struggle against patriarchy, her perseverance in getting other scientists to examine her unorthodox research, and her way of knowing nature through connection and relationship rather than through abstract analytical power. By identifying particular masculine and feminine gender characteristics, Keller explains McClintock's scientific insight based on her sympathy for and involvement with the objects of her research. Thus Keller criticizes cultural limitations on scientific knowledge and also suggests ways in which those limitations might be transcended.

In identifying barriers to knowledge and imagining ways to overcome them, Donna Haraway is a distinctively original and inspirational thinker. Her *Primate Visions: Gender, Race, and Nature in the World of Modern Science* (1989) is a good example of her ability to build a historical narrative and use critical analysis to shift the reader's point of view. Haraway began this narrative by reading exhibits at the American Museum of Natural History in New York City as primary sources. These exhibits told a story of cultural politics and "a logic of appropriation and domination" by white male European culture in the postcolonial era. The book is in three parts, beginning with the pre-World War II emphasis on the balance of nature and the need for hierarchy, shifting after the war to a "man the Hunter" trope emphasizing cooperation and the integration of individuals into society, and ending with the "Politics of Being Female"—a new feminist primatology rooted in historical conditions. For Haraway, history of science matters because of the way it shapes society, defines our ideology, and limits our imagination. History matters because it can always be contested and revised, taking on a new narrative form to explore ontological possibilities.

Conclusion

In a brief entry such as this, it is necessary to emphasize a few popular themes at the expense of the great diversity comprising the field. Alas, much of the history of science since 1970 has revolved around telling and retelling narratives about the great men of physics and biology. It is a process that Mott Greene once called "toting bones from one graveyard to another." In his 1992 work on preclassical antiquity, Greene shows what interesting bones are yet to be discovered. In

Geology in the Nineteenth Century: Changing Views of a Changing World (1982), Greene demonstrates how a new way of looking at the world—the discovery of plate tectonics in the 1960s—could be a reason to rescue obscure geologists from historical oblivion. It is good history and also a good example of self-reflexivity in the post-Kuhnian age, where the historian becomes a self-conscious shaper of the social fabric, and not a mere narrator of historical truth.

Similarly—although it seems to have been a case of toting bones back and forth—the discovery of the importance of magic and mysticism to Newton, Bacon, and other major biographical figures of the scientific revolution helped open the door to another recovery project—this one centered around "wonders" and how scientists, physicians, and other adherents of natural philosophy experienced them. Lorraine Daston and Katharine Park researched accounts regarding objects of wonder such as monstrous births, extraordinary mushrooms, and urine stones that glowed in the dark. In addition to giving readers a richer sense of ontology from the twelfth to the eighteenth centuries, they also widened historical understanding of how empiricism related to society, morality, and aesthetics. Daston and Park argue that objects of wonder did not fall out of favor because empirical science excluded them as objects of popular fascination, but rather were driven to the pages of X-Men comics and supermarket tabloids by changing social fashions and etiquette.

Considered from a historiographic point of view, Greene, Dalton, and Park might have much to show about the future of the history of science. From Herodotus to Leopold von Ranke (1795–1886) to the postmodernist deconstructionists, the methods of researching, writing, and interpreting history have changed greatly. History is always subject to revision and reinterpretation based upon the questions one asks and how one seeks to answer them.

As a history of historiography, *Telling the Truth about History* by Joyce Appleby, Lynn Hunt, and Margaret Jacob is a comprehensive survey from the scientific revolution to the end of the twentieth century. By tracing history from the hagiography that made Newton into a cultural hero to the "crisis of modernity" that sees truth and objectivity as "dissimulations advanced by those who have power," Appleby et al. seek to fashion a reconstruction project. They argue that history is rooted in the human psychological experience of memory and the personal craving for meaning. This is an optimistic project. Although we must give up naïve notions of truth and objectivity, we may embrace a democratic truth that "celebrates a multiplicity of actors" (p. 283) and encourages "open-ended scholarly inquiry that can trample on cherished illusions" (p. 289).

SCIENCE FICTION. Like a rapacious and relentlessly predatory science fictional entity assimilating all it encounters (the *Star Trek* Borg come to mind), science fiction in the early twenty-first century is an unstoppable expansive force that is certainly not limited to one particular genre. Science fiction literature, once ghettoized and marginalized, is pervasive and ever more rapidly garnering respect.

PMLA, America's most distinguished literary criticism journal, published its first science fiction issue in May 2004. Stephen King received the 2003 National Book Foundation Medal for Distinguished Contribution to American Letters. Philip K. Dick once dismissed as a pulp science fiction writer—because of his works' emphasis upon paranoia regarding government, technology, and personal relationships and its attention to what constitutes reality itself—has been lauded as creating the most emblematic fiction of the turn of the twenty-first century. Jonathan Lethem's *The Fortress of Solitude* was applauded as one of the most important novels published in 2003, and *Star Trek* was recognized as the most enduring cultural mythology of the second half of the twentieth century.

The attention lavished upon King and Dick especially exemplifies why science fiction is pervasive and ever more rapidly gaining respect. The National Book Foundation's decision to recognize King's achievements signaled an end to the discrimination popular genre writers automatically suffered. Dick precisely envisioned the world of the early twenty-first century, a world that did not inherit flying cars, but which endures such Dickian devices and themes as implanted memories, commercialized personalities, dislocation, and disintegrating realities.

Literary theory reflects the newfound status science fiction garners. Carl Freedman, in *Critical Theory and Science Fiction* (2000), proclaims that science fiction, one of the most theoretically informed areas of the literary profession, is a privileged genre for critical theory:

I maintain that science fiction, like critical theory, insists upon historical mutability, material reducibility, and utopian possibility. Of all genres, science fiction is thus the one most devoted to the historical concreteness and rigorous self-reflectiveness of critical theory. The science-fictional world is not only one different in time

or place from our own, but one whose chief interest is precisely the difference that such difference makes. (p. xvi)

In a 1999 essay for the *New York Times* titled “Black to the Future,” Walter Mosley positions science as one of the most exciting emerging directions in contemporary American fiction; he explains that the newly free black imagination joins with science fiction to create a new force to counter racism. N. Katherine Hayles’ *How We Became Post Human: Virtual Bodies in Cybernetics, Literature and Informatics* (1999), in response to science fiction’s aforementioned pervasive presence within reality, declares that people are now more than simply human. Posthumans inhabit a brave new postmodern world in which science fiction infused reality ever more increasingly blurs the old comfortable distinctions between the real and the unreal. Via an overview of the development of science fiction literature and science fiction theory from the 1970s to the start of the twenty-first century, this entry will explore how we and our world became science fictionally post real.

Edward James’s *Science Fiction in the Twentieth Century* (1994) offers one of the best descriptions of science fiction’s historical progression; his ideas form the basis of the historical survey given here. The American New Wave influenced the most innovative science fiction writers of the 1970s (including John Crowley, Joe Haldeman, Ursula Le Guin, James Tiptree/Alice Sheldon, and John Varley). The New Wave can be defined as the 1960s generational shift away from the classic writers who began to write before World War II—such as Isaac Asimov, Alfred Bester, Ray Bradbury, Arthur Clarke, Robert Heinlein, and Theodore Sturgeon. The New Wave, an attempt to bring science fiction into the literary mainstream by emphasizing style rather than scientific accuracy, consisted of experimental works emphasizing psychology and soft sciences. New Wave writers shared the notion that the world is not improving, expressed a distrust of science and technology, and thought humans unworthy of valorization.

American New Wave writers (Robert Silverberg, Joanna Russ, Harlan Ellison, Roger Zelazny, and Samuel Delany, for example) wanted to improve upon rather than reject classic pulp science fiction. The word *pulp* refers to the inexpensive paper used to produce pulp magazines as well as to the characteristics of the fiction the magazines published. Action, romance, heroism, exotic settings, adventures, and positive endings characterize pulp science fiction stories. Pulp science fiction began with *The Argosy* in the 1890s and proliferated until the 1930s in such magazines as *Weird Tales*, *Amazing Stories* (created by Hugo Gernsback, the father of pulp science fiction and namesake of the Hugo Award), and *Astounding*. *Astounding* editor John W. Campbell insisted upon hard science as a basis for story acceptance; hence, classic pulp science fiction can be understood as a juxtaposition of science fiction, monster stories, and hero pulp stories. Such clichéd science fiction tropes as Bug-Eyed-Monsters and little green men emerging from the spaceship that lands on the White House lawn epitomize classic pulp science fiction.

During the 1970s, new subgenres arose from the combination of New Wave ideas engaging with the older traditions

classic pulp science fiction represents. Larry Niven, the exemplary writer of hard science fiction, emphasized technology, physics, and space exploration. Women writers (such as Ursula Le Guin, Joanna Russ, and James Tiptree/Alice Sheldon), in contrast, focused upon such soft sciences as psychology and sociology and produced pure literary experimentation. Much of the soft science fiction written during the 1970s was fantasy, not science fiction. (Critics have generated multitudinous arguments regarding the distinctions between science and fantasy. The rule of thumb is that texts about what can be realized are science fiction and those about what cannot be realized are fantasy. Future generations, for example, might travel in a *Star Trek* starship, which in the early twenty-first century exists only in science fiction; unlike the protagonists of the fantasy *Alice in Wonderland*, they will never experience close encounters with a watch-wearing white rabbit.) The rise of both women’s science fiction and fantasy rooted in the 1970s, two of the most important developments in the history of science fiction, continues into the twenty-first century. Feminist science fiction provides blueprints for social change, which enable us to rethink and reformulate patriarchal social domination.

Joanna Russ, the most important representative of the rise of 1970s feminist science fiction, is best known for *The Female Man* (1975), a startling, brilliant feminist novel which presents four female protagonists who inhabit four alternative worlds. Ursula Le Guin’s equally important *The Dispossessed: An Ambiguous Utopia* (1974) is more inspired by anarchism than by feminism. Delany’s *Triton: An Ambiguous Heterotopia* (1976) echoes Le Guin’s political emphasis and builds upon Russ’s feminist breakthroughs. Tiptree/Sheldon’s feminist short stories (such as “The Women Men Don’t See”—1973) are important contributions to the feminist and soft science fiction surge characterizing the 1970s. In international science fiction, the first English translations of the Polish writer Stanislaw Lem began to appear in the 1970s (for example, *Solaris* [1961, translated 1970] and *The Invincible* [1964, translated 1973]).

The new New Wave called cyberpunk dominated the 1980s. *Cyberpunk* is derived from the words *cybernetics* and the 1970s rock term *punk*. Cyberpunk arose in response to a discrepancy characteristic of the 1980s: the glaring difference between the gleaming pristine future cities traditional science fiction portrays and depressing real-world urban landscapes. Cyberpunk fiction, which portrays people dwarfed by machines in a technological world and alienated from nature, contributes a rethinking of the military-industrial complex’s hegemony. Pat Cadigan, best known for *Synners* (1991), has been called the “Queen of Cyberpunk.” William Gibson’s *Neuromancer* (1984) epitomizes cyberpunk in its portrayal of seedy and dark urban environments in which protagonists literally enter cyberspace.

In 1990, the U.S. president George H. W. Bush announced an intention to place people on Mars by 2019, inspiring some science fiction writers to focus upon Mars; such works as Kim Stanley Robinson’s *Red Mars* (1993), *Green Mars* (1994), *Blue Mars* (1996), and *The Martians* (1999) reflect this focus. Ben Bova’s *Mars* (1992) and Paul J. McAuley’s *Red Dust* (1993) are other noteworthy novels about Mars. In addition to Robinson,

Nicola Griffith and Gwyneth Jones were important writers who debuted during the 1990s. Attention to politics, ecology, feminism, and extraterrestrial soft science fiction dominate the science fiction written during this decade.

The surge in black science fiction, reflected in Walter Mosley's "Black to the Future" and Sheree R. Thomas's anthology *Dark Matter* (2000), was the most important development in science fiction at the beginning of the new millennium. Mosley's *Futureland* and work by Nalo Hopkinson, Tananarive Due, and Stephen Barnes build upon the tradition of black science fiction literature Delany and Octavia Butler pioneered. Darko Suvin's *Metamorphoses of Science Fiction: On the Poetics and History of a Literary Genre* (1979) is the most significant critical work about science fiction published since the 1970s. Suvin famously defines science fiction as

a literary genre whose necessary and sufficient conditions are the presence and interaction of estrangement and cognition, and whose main formal device is an imaginative framework alternative to the author's empirical environment. (pp. 7–8)

In concert with Suvin, Robert Scholes defines fabulation as "fiction that offers us a world clearly and radically discontinuous from the one we know, yet returns to confront that known world in some cognitive way." Marleen S. Barr, in *Feminist Fabulation: Space/Postmodern Fiction* (1992) defines feminist fabulation as feminist fiction that offers a world clearly and radically discontinuous from the patriarchal world we know, yet returns to confront that known patriarchal world in some feminist cognitive way. There is an intergenerational science fiction critical lineage between Suvin's and Scholes's corollary definitions and Barr's "feminist fabulation" that brings their influential definitions to bear upon feminism and postmodernism.

In the manner of their marked influence upon imaginative science fiction, feminism and postmodern are integral to science fiction criticism. Brian McHale in *Postmodernist Fiction* (1987) states that science fiction "is to postmodernism what detective fiction was to modernism: it is the ontological genre *par excellence* (as the detective story is the epistemological genre *par excellence*), and so serves as a source of materials and models for postmodernist writers." While McHale reads postmodernism in terms of science fiction, Larry McCaffery's *Storming the Reality Studio: A Casebook of Cyberpunk and Postmodern Science Fiction* (1991) reads science fiction in terms of postmodernism. Scott Bukatman's *Terminal Identity: The Virtual Subject in Postmodern Science Fiction* (1993), a compendious study of contemporary science fiction, positions techno-culture as the focus of the discussion about the relationship between postmodernism and science fiction. Donna J. Haraway's "A Cyborg Manifesto: Science, Technology, and Socialist Feminism in the Late Twentieth Century" (1985) links postmodernism and technoculture to the feminist analysis of science fiction.

Barr's *Future Females: A Critical Anthology* (1981) was the first essay collection devoted to feminism and science fiction. Sarah Lefanu's *In The Chinks of the World Machine: Feminism and Science Fiction* (1988), which followed Barr's *Alien to Fem-*

inity: Speculative Fiction and Feminist Theory (1987), asserts that

the plasticity of science fiction and its openness to other literary genres allow an apparent contradiction . . . it makes possible, and encourages (despite its colonization by male writers), the inscription of women as subjects free from the constraints of mundane fiction; and it also offers the possibilities of interrogating that very inscription, questioning the basis of gendered subjectivity.

The 1990s saw the appearance of Jenny Wolmark's *Aliens and Others: Science Fiction, Feminism and Postmodernism* (1994), which analyzes the "shared theoretical moments" between feminism and postmodernism; Russ's *To Write Like a Woman: Essays in Feminism and Science Fiction* (1995), which collects her most important essays; and Jane Donawerth's *Frankenstein's Daughters: Women Writing Science Fiction* (1997), which places Frankenstein as integral to science fiction written by women. In 2000, Barr, in *Future Females, the Next Generation: New Voices and Velocities in Feminist Science Fiction Criticism*, collected the work of young feminist science fiction theorists who analyze science fiction's relevance to disenfranchising patriarchal master narratives and social institutions. Brian Attebery's *Decoding Gender in Science Fiction* (2002) carries the torch of feminist science fiction criticism into the new century. Race and queer theory are discussed in Elizabeth Anne Leonard's edited collection *Into Darkness Peering: Race and Color in the Fantastic* (1997), Daniel Leonard Bernardi's *Star Trek and History: Race-ing toward a White Future* (1998), and Samuel Delany's *Shorter Views: Queer Thought and the Politics of the Paraliterary* (2000).

Two aforementioned scholars, Freedman and Hayles, respectively explain that science fiction is crucial to the entire enterprise of producing critical theory and that at the start of the twenty-first century human beings hold being posthuman in common with science fiction protagonists. As both the scholarly works about science fiction and science fiction literature itself indicate, the boundaries between literature and life drawn in terms of fixed definitions of what constitutes the real and the science fictional are becoming increasingly blurred. We might, sooner than we expect, find ourselves on the cusp of telling Scotty to beam us up.

SCIENTIFIC METHOD. See **Science**.

SCIENTIFIC REVOLUTION. As distinct from the centuries-old conception of scientific revolutions (plural), the concept of the one and only Scientific Revolution dates from the 1930s. What meaning, if any, to give the concept over and above its signifying the birth of modern science has been in lively, productive dispute ever since. This entry first outlines the historiographical vagaries of the term, then (from the heading "A Tentative, Synthetic Overview" onward) discusses the event itself in ways meant to do some justice to what historians' ongoing debates have yielded.

Historiographical Developments

The concept of the Scientific Revolution was introduced as part of a major historiographical overhaul that took place between the mid-1920s and the early 1950s. It was then meant to identify a period in European history, roughly between the second half of the sixteenth century and almost the full seventeenth century (that is, between Copernicus and Newton), when a unique, radical conceptual upheaval took place out of which modern science emerged essentially as we still know it. This view of a radical conceptual upheaval, first vaguely sensed in some earlier historiography, quickly began to be articulated in the budding field of the history of science in ways that turned the previously customary listing of one heroic scientific achievement after another into a careful reconstruction of the conceptual knots that those who brought about the Scientific Revolution actually had to disentangle.

A master narrative. Within this emerging concept-focused mode of history writing came a variety of path-breaking narratives minimally sharing a focus on how the once self-evident conception of our Earth at the center of the universe gave way to the core of the modern worldview of the Earth and the other planets placed in a solar system occupying a tiny portion of an infinite universe. What brought about this fundamental conceptual shift to a non-Earth-centered universe, as well as new conceptions of motion and of the creation of space as a void? Historians held that a major contributor was the quickly expanding process of the mathematization of nature, that is, the subjection of increasing ranges of empirical phenomena to mathematical treatment in ways generally suitable to experimental testing. Several people were seen as key figures in this process. Copernicus (1473–1543) computed, down to the required detail, planetary trajectories in a Sun-centered setting. Johannes Kepler (1571–1630) turned Copernicus's formulation into a previously inconceivable "celestial physics," and this led to his discovery of the planets' elliptical paths. Galileo (1564–1642) mathematized a significant terrestrial, as opposed to celestial, phenomenon—falling and projected bodies—in an effort to counter major objections to Copernicus's formulation. René Descartes (1596–1650) mathematically conceived space and particle interactions in space. Sir Isaac Newton (1642–1727) capped these developments by uniting terrestrial and celestial physics in his mathematically exact, empirically supported conception of universal gravitation. This is not to say that historians equated these scientists and their principal accomplishments with the Scientific Revolution. Still, for decades historians were inclined to treat most other noteworthy modern scientific attainments—such as William Harvey's (1578–1657) discovery of the circulation of the blood and others' refinements in chemical analysis—as somehow tangential to the main course of development.

New historiographical perspectives. Starting in the 1960s, historians introduced a range of perspectives to widen (or in some cases to replace) the historiographical master narrative just outlined and some of the insights gained thereby. In fairly random (certainly not chronological) order, these perspectives are listed below.

Historians have ceased identifying the present classification of scientific disciplines with their seventeenth century counterparts.

They are replacing it with a still increasing awareness that what we now call “mechanics,” for instance, scarcely had a counterpart in the early seventeenth century—so different, and differently aligned, was the intellectual context in which problems of motion used to be considered from the ancient Greeks onward. Some historians are even beginning to recognize that what we now call “science” developed at the time in several different modes, each with a distinct intellectual tradition, knowledge structure, mode of approach, and professional identity.

Historians are including in their narratives research subjects and/or people previously omitted or marginalized. Rediscovered research areas include ranges of (at the time) nonmathematical, chiefly descriptive subjects, like magnetism or illness, or subjects neglected because they are scarcely practiced any more today, like musical science, and/or are held under grave suspicion, like alchemy. Rediscovered contributors, though important, fall below the first rank. Examples are hosts of able Jesuit experimenters, numerous practitioners on the European Continent, as well as a small number of women (e.g., Margaret, duchess of Newcastle, who developed a speculative Cartesian yet creative theory of moving particles, or Elisabetha Hevelius, coworker with her better known astronomer-husband).

Perhaps most important of all, historians of science have strived to put the history of scientific ideas in institutional and other sociocultural contexts. Though history writing in the vein of “This thinker brought about this particular conceptual breakthrough; then that thinker that one” is still valuable for revealing the complex way in which conceptual innovation and continuity are intertwined, historians now feel that properly understanding scientific accomplishment requires a deep awareness of how it was situated in time and place. In this way historians have revealed, for example, the at times highly consequential dependence of practitioners on Europe’s patronage market, and the link between the controversy over the validity of instrument-aided experimentation, as articulated in Robert Boyle’s (1627–1691) and Thomas Hobbes’s (1588–1679) early 1660s dispute over the void, and the politics of the Stuart Restoration. As a result, historians have increasingly focused on the local particularity, over the universal validity, of the most seminal developments of the Scientific Revolution. Among genuine accomplishments of this contextualist approach must be counted a heightened concern for the day-to-day practice of experimental research and for the trustworthiness of results thus attained, a heightened sense that the course of discovery is at times fortuitous, and an awareness that discoverers had other motives than sheer backwardness and/or superstition. In the past contextualization has at times focused on this or that piece of pertinent microhistory. We face a wide-open opportunity to extend contextualization by taking the world-historical peculiarities of Europe as the context in which to make proper sense of large-scale scientific developments. Indeed, most writing on the history of science has been confined, if not just to the English speaking world, then at least to the Western tradition held to run from the Greeks, via the purported holding action of the Arabs, to medieval then Renaissance Europe, then to postrevolutionary science as it unfolded principally in the Western heartlands. Despite some inspiring, pioneering efforts in the 1930s to 1950s, a

cross-culturally comparative perspective on why modern science emerged where and when it did is still in its infancy.

Abandonment or new syntheses? The net effect of this plurality of novel viewpoints has been the perhaps predictable one of resignation. What numerous historians of science have given up is not the ongoing production of partly novel interpretations of events in the history of seventeenth-century science, but the very idea that, deeply below the surface of singular events, something identifiable holds so complex an event as the Scientific Revolution together. True, we can no longer accept the once enlightening yet too one-sided formula “Scientific Revolution = mathematization of nature.” But the message that historians’ resignation imparts to nonscholars is that one of the most decisive events in world history, one of the prime motors of our modern world, was due to little more than chance. We have ready to hand a great deal of material and hosts of penetrating yet partial interpretations to answer the question of how modern science emerged in seventeenth-century Europe, rather than in one of the other great pre-modern civilizations at that or some earlier time. Yet there has been no serious effort to come to grips with the question how modern science emerged in seventeenth-century Europe. Below is an inevitably idiosyncratic, highly schematic example of how we might grapple with the question.

A Tentative, Synthetic Overview

Of those civilizations where natural phenomena were subjected to scrutiny of a kind that went beyond their identification with the divine, only two did so against the background of an articulated worldview. In the Chinese tradition, which was uninterrupted until the Jesuits brought modern science along, practitioners were much inclined to an empiricist approach.

In contrast, two distinct Greek traditions—one mathematical, one philosophical—were quick to rationalize the empirically given. The Greeks also experienced a range of potentially fertile transplantations from other civilizations. In one tradition, called “Alexandrian” for short, Archimedes (c. 450–c. 388 B.C.E.), Ptolemy (2d c. C.E.), and others subjected a limited number of empirical phenomena (planetary positions, vibrating strings, and a few others) to mathematical treatment in highly abstract ways that left connections with reality minimal (i.e., the resulting science of music dealt with numbers, not with vibrations). In the other tradition, called “Athenian” for short, natural philosophers posited a limited number of first principles to explain the world at large (e.g., substantial forms in Aristotelianism, or indivisible particles and the void in atomism) and empirically shored up these principles by appeal to selected chunks of observable reality.

By means of three successive large-scale efforts at translation (second-/eighth-century Baghdad, twelfth-century Toledo, fifteenth-century Italy) these two modes of nature knowledge were transplanted, first to Islamic civilization wholesale, then (in a truncated manner) to medieval Europe, then (upon the fall of Byzantium) wholesale once again to Renaissance Europe. In each case the Greek legacy was received, then enriched in often creative ways that left the broad framework unscathed. As a result, the state that knowledge of nature attained in

Europe by 1600 was broadly similar to what it had once been like in Islamic civilization before (in the fifth to eleventh centuries) waves of invasions nipped a possible next stage of radical transformation in the bud. For the second time, in Renaissance Europe, careful reconstruction of the legacy of the Alexandrian geometers gave rise to incidental enrichment, the way Copernicus improved on Ptolemy in trusted Alexandrian fashion. Also, the incessant, inherently irresolvable debate between the four schools of Athenian natural philosophy and their skeptical nemesis raged once again.

Beside these essentially backward-looking modes of nature knowledge, Renaissance Europe also developed a third mode, which, unlike the other two, reflected in its forward-looking dynamism certain peculiarities of the civilization at large. This third mode of nature knowledge, bent upon accurate, magic-tinged description, developed an empiricism different from the Chinese variety in that it was marked by a drive toward domination or at least coercion of the natural environment.

Onset of the revolution. With this much as background, we can now conceptualize the onset of the Scientific Revolution very briefly as the near-simultaneous, revolutionary transformation of three traditions.

First, natural philosophers turned the Alexandrian tradition into the Alexandrian-plus tradition. In astronomy, Kepler and Galileo, in seeking to resolve major tensions in Copernicus's variety of heliocentrism, toned down the highly abstract approach of the Greek geometers with an infusion of physical reality. For terrestrial phenomena, other natural philosophers did this by means of experiments carefully designed to demonstrate the mathematically ideal phenomenon, and these served as an empirical check on theoretical outcomes. Central to such mathematization of nature was a new conception of motion as tending to persist and as relative, in ways tentatively worked out by Galileo and his disciples for a range of cases (like falling bodies and outflowing water).

Second, Isaac Beeckman (1588–1637), Descartes, and Pierre Gassendi (1592–1655) turned the Athenian tradition into the Athenian-plus tradition. Inside the atomist doctrine, which they adopted in its essentials, they shifted emphasis from the shapes and sizes of subvisible particles to their movements, and these movements, they held, were governed by general laws that conceived of motion as persisting and relative. Descartes gave systematic expression to this conception of a world fully explicable through the imagined motions of imagined particles. He found warrant for its truth in allegedly rigorous, pseudo-mathematical derivation from first principles and empirical backing in a wealth of examples taken, without experimental intervention, from real-life phenomena.

Third, in the uniquely European, coercive, and empirical third mode of knowledge of nature, setting up carefully designed fact-finding experiments was central. This contrasts with the Athenian-plus tradition, where experimentation was lacking, and the Alexandrian-plus tradition, where experimentation served as a means of a posteriori empirical support. This transformation occurred at the hands of, notably, Francis Bacon (1561–1626; who preached rather than practiced the

approach), William Gilbert (1544–1603; magnetic and electric phenomena), Jan Baptista van Helmont (1579–1644; the chemical composition of matter/spirit), and William Harvey (the circulation of blood).

Ongoing innovation and remaining continuities. In the hands of those who went along, the approaches of the traditions changed science drastically in each case. Natural philosophers mathematized an ever increasing range of phenomena, whether encountered in nature (like sound) or in contemporary craftsmanship (like gunnery), devised universal explanations through an endless variety of particle movements, and to a vast extent experimentally explored the unknown, whether encountered in nature (like wind) or in contemporary craftsmanship (like textile dyeing). What also changed was that the two first modes of explanation, which jointly defied common sense and conjured up the specter of a clockwork universe devoid of divine concern or human purpose, quickly became entangled in a battle of legitimacy of quite uncertain outcome. Meanwhile, what remained the same, at least up to the mid-seventeenth century, were the respective knowledge structures: in one case thinkers used first principles to attain at one stroke a definitive, comprehensive grasp of the world; in the other two cases, practitioners looked at phenomena to make piecemeal, step-by-step advances. Also, practitioners of each mode as a rule operated in insulation from one another. Even if an individual like Descartes or the English mathematician Thomas Harriot (1560–1621) did work in more than one mode, he made no effort to let results attained in one mode bear upon the other, let alone to reconcile (occasionally) incompatible outcomes (e.g., Descartes's Alexandrian derivation of his sine law of refraction required the assumption that light has finite velocity, whereas in his Athenian-plus philosophy its velocity is necessarily infinite).

A decisive, mid-century change of scenery. Starting in the early 1660s, after the stabilization of princely authority in the wake of the Peace of Westphalia and (in Britain) the Restoration, a mood of reconciliation descended upon Europe. That mood helped overcome the rapidly expanding crisis of legitimacy. Efforts in the 1630s to 1650s to enforce a return to the fold (the trial of Galileo, the tribulations of van Helmont and Descartes) and countless cases of ensuing self-censorship gave way to conditional, religiously sanctioned acceptance. A prerequisite for this transition was the well-known shift of Europe's political, commercial, cultural, and scientific center from the Mediterranean (Italy, Spain, Austria, and Southern Germany) to the Atlantic (France and Britain). The new science was carefully walled off from all that might smack of heresy, and its experimental, and hence philosophy-free, aspects were institutionally emphasized. As a result, its widely perceived material and ideological promise of improvement of daily life and of a decisive edge in warfare earned the new science official sustenance in two major associations that came to dominate ongoing innovation of knowledge of nature in the second half of the seventeenth century and beyond. These were the Royal Society in London and the Académie Royale des Sciences in Paris, both founded in the 1660s. As a result of breakthroughs in, for example, microscopy (Antony van Leeuwenhoek's discovery of bacteria and spermatozoa) and

telescopic measurement (large-scale revision of the size of the universe), the societies of London and Paris and the journals to emanate from both came to serve as rallying centers for intellectuals in Europe to contribute in a major way to ongoing innovation.

Even more revolutionary was a new mood of reconciliation in the sciences. The Dutch mathematician Christiaan Huygens (1629–1695) and the young Newton—in blending their prime allegiance to the Galilean approach with their acceptance of the doctrine of particles in ubiquitous motion not as comprehensive dogma but as a selectively applicable hypothesis—sought to resolve the tension between the Galilean and Cartesian conceptions of motion for a range of principal cases (impact, persisting motion, rotation, oscillation). At about the same time the British physicist and chemist Robert Boyle, the English scientist Robert Hooke (1635–1703), and again the young Newton, in blending their fact-finding experimentalism with the hypothesis of particles in ubiquitous motion, managed to anchor subtly particulate mechanisms in empirical evidence and by the same move to provide their fact finding with some badly needed coherence and direction. In the end, the mature Newton not only became aware of the limitations inherent in the two highly innovative approaches but even transcended these modes in ways codified in a book that rounded off the Scientific Revolution, his *Philosophiæ Naturalis Principia Mathematica* (Mathematical principles of natural philosophy), published in 1687.

The outcome. The major result of all this was that science became a distinct enterprise, placed more prominently in society than at any other time and place. Its prominence was due not only to the promise of practical results widely attributed to it but also to intellectuals' desire to make mathematical-experimental or fact-finding-experimental assertions about natural phenomena clinching rather than at best plausible (as in speculative natural philosophy). Indeed, up against the perennial human inclination to let our bias decide, it is in the capacity of the new science to produce conclusive outcomes that its uniqueness as a mode of knowledge resides. Herein lies the deepest reason for calling the highly conditioned emergence of science and its ensuing staying power a revolution if ever there was one.

SECULAR HUMANISM. See **Humanism.**

SECULARIZATION AND SECULARISM. The terms *secularization* and *secularism* have had a variety of meanings since they were coined; “secularization” in the mid-seventeenth century and “secularism” in the mid-nineteenth, both incorporating the word *secular*. “Secular,” from the Latin “saeculum,” a generation or age, originally referred to secular clergy who were not in a monastic order. It also came to refer to the worldly realm. *Secularism* is used here in two current senses—an emphasis on the this-worldly rather than the other-worldly, and what is called in the United States as the “separation of church and state.” In Latin countries terms based on *laic* imply stronger state controls, based on their history of struggles with the Catholic Church.

Secularization involves both increasing state control of spheres formerly controlled by religious institutions and the expansion and freedom from religious control of nonreligious institutions, both state and private, and comprising education, social welfare, law, publication and the media, and forums for the expression of belief and action. In some areas, notably Turkey and communist countries, there has been state control of religion, rather than separation of church and state, and it is unclear if such countries should be called secular. Every secular country has a different version of secularism, and none of them has an absolute separation of church and state. Secularism involves belief in the priority of this-worldly considerations, and an end to religious doctrinal influence on law, education, and welfare, and the need for equal treatment of various beliefs and believers. To its opponents secularism often implies unbelief, a sense also included in some dictionaries but denied by most secularists, whether or not they are believers.

Secularism has also involved egalitarian political and social treatment of religious minorities and unbelievers, which had not been true of either Protestant or Catholic majorities, while Islam had a place for minorities but an unequal one. The major Asian religions have traditionally been more religiously tolerant and have had fewer struggles over secularism.

Works about secularism and secularization have been scattered over time and region, with the greatest concentration covering the “secularization thesis,” most popular in Great Britain, which posited a steady progress of secularization, which has not since occurred outside Western Europe. India, where secularism is a central political issue, has seen more varied literature on the subject. Many works relevant to secularism and secularization are centered on different concepts.

History and Nature of Secularization and Secularism to 1914

Secularization originally meant the transfer of ecclesiastical property to civil or state ownership, and its first recorded use was apparently after the Thirty Years War in 1648 to mean the transfer of church lands to states. Christian Churches were huge landowners, and religious institutions in non-Christian countries also held or controlled very large properties, which states increasingly secularized. In England Henry VIII's dissolution of monasteries was a secularizing step. Secularization over time came rather to refer primarily to a process in which religious influence over government, institutions, ideas, and behavior is reduced and reliance on this-worldly bases for these spheres grows.

In premodern times religion and religious institutions had far greater power than they did later, though Confucianism, some kinds of Buddhism and Hinduism, and rationalist philosophies in ancient Greece, the Muslim world, and Europe had strong this-worldly elements. Secularization and secularism began in Western Europe, along with the rise of capitalism and stronger states. Other secularizing forces occurring first in the West, included the rise of science and the scientific outlook, over many centuries. The Copernican revolution in astronomy and the Darwinian evolutionary revolution contradicted the creation stories in Jewish, Christian, and Muslim scriptures, and cast doubt on these scriptures' literal infallibility, and the spread of belief in this-worldly causation to ever-greater spheres, including history and social science, undermined ideas of divine intervention. In the eighteenth century, Enlightenment building on earlier science and philosophy, the idea of the Great Watchmaker who created the universe but did not afterward intervene became widespread among intellectuals, and was later refurbished to fit evolutionary theories. The Enlightenment had important proponents in most of Western Europe and the Americas, where Benjamin Franklin (1706–1790) and Thomas Jefferson (1743–1826) are the main names.

Protestantism is often considered a force for secularization, though it initially increased religiosity and religious loyalties, both among Protestants and among reformed and aroused Catholics. Ultimately, the proliferation of sects, including some liberal ones, and exhaustion in religious wars, helped lead to religious toleration by governments and recognition of various religious and irreligious beliefs—all elements of state secularism.

Several intellectuals encouraged secularism with writings advocating religious toleration, like John Locke's *A Letter Concerning Toleration* (1689) and John Stuart Mill's *On Liberty* (1859). Enlightenment writers often stressed anticlericalism and attacked the Catholic Church. Several, including Voltaire (1694–1778), said that religion was a good thing for the lower classes, to keep them honest, diligent, and peaceful, an idea that got support from the anti-church violence during the French Revolution. This idea had wide currency in the Muslim world until the Iranian Revolution (1979) showed again that popular religiosity did not always have such orderly effects.

The rise of nation-states and of nationalism encouraged secularism. Except in countries like Poland, Ireland, and former Yugoslavia where religious and nationalist boundaries coincide,

nationalism and nation-states have tended to undermine organized religion. Religious loyalties and ideologies were supranational, and religion supported hierarchical relations between genders, toward minorities, and in everyday life, which conflicted with the priorities of the nation. Nationalism provided an ideology for nonreligious loyalties. This accompanied socioeconomic modernization and industrialization, requiring similar workers, similar rules for treating people, and national markets. Nationalism was a secular force, and religion could play only a subordinate role in most nations. In many countries nation-states struggled with church control over schools, law, and social institutions, and generally nation-states won and expanded secular institutions.

Industrialization, urbanization, and the rising role of economic class groups helped undermine religious ties and promote secular ideologies, whether nationalist, liberal, or socialist. The rising socialist movement was often antireligious. The atheism of Karl Marx (1818–1883), who saw religion as unnecessary in a communist state, became widespread among workers and their supporters.

In mid-nineteenth century England, the terms *secularist* and *secularism* were coined by George Holyoake (1817–1906), who founded a secularist society that helped end religious discrimination in parliament and elsewhere. In the late nineteenth century elite ideas were increasingly secular and agnostic, including Charles Darwin (1809–1882) and his “bulldog” Thomas Huxley (1825–1895), the radical literary critics of Russia, and the new field of sociology, with Auguste Comte (1798–1857), Émile Durkheim (1858–1917), Max Weber (1864–1920), and others. Bible criticism, with Germans like Richard Strauss (1864–1949) and Frenchmen like Ernest Renan (1823–1892), undermined faith in established religion. Even an ideological trend that most people in the early twenty-first century find repellent—scientific racism—was predominantly secular. Women's rights movements have been secular in their effect, as all major religions endorsed male control of and superiority to women and denied women rights regarding property, work, political participation, and control of their bodies. In much of the world resistance to women's rights has been primarily based on religious, antiseccular, ideas.

Secularism usually endorses the idea found in nationalism, socialism, feminism, and some science, of progress. Darwinism, against the occasional caveats of Darwin, was seen as a story of progress, and was applied to Spencer's “survival of the fittest” in human society. Social Darwinism was intertwined with racism, one of whose offshoots was the eugenics movement, a supposed recipe for race amelioration. Socialism, nationalism, and feminism expected a better future, to be brought by human secular activity. By contrast, religions often saw history as a fall from a golden age, or as a period in which individual salvation was possible only through religion. A better world might only come via a sudden, millennial process. The contrast between traditional Jewish expectations of a messiah and the this-worldly efforts of modern (secular nationalist) Zionists exemplifies this difference.

The period 1848–1914 was the heyday of secularism and of belief in progress in the West, and saw their first rise in the

Global South. Several countries established secular states after major struggles. The papal territories were a major obstacle to Italian unification, which required their conquest and a break with the church, a break not healed until Mussolini's concordat. France experienced many struggles between clericals and anticlericals. French *laïcisme*, more militantly anticlerical than British and American secularism, won out decisively in the 1905 law disestablishing the Catholic Church. In England the Church of England remained established but, partly as a result of struggles by secularist groups, legal restrictions on non-conformists, Jews, and atheists ended, and the established church's power declined. The United States outlawed federal church establishment in the constitution, and the late nineteenth century saw the rise of new secular cultural trends and even the popularity of agnostics like Walt Whitman (1819–1892) and Robert Ingersoll (1833–1899). In all Western countries public education of children and young adults spread rapidly, and it was increasingly a secular education. In several Western countries, the fight against the Catholic Church was often the key issue in politics. Anticlericalism, with secular implications, became central to politics in several countries, partly because nineteenth-century popes ruled against modern socialist and liberal ideas.

Popular belief and state control over education and welfare became increasingly secular. In Eastern Europe and the Global South traditionalist religion remained strong and secularism made fewer inroads in governmental policy than in Western Europe, but secularism was rising, especially among intellectuals and the newly educated classes, and was often a component of nationalism. Many forces favoring secularism were similar in the West and the Global South, except (1) their time span was much shorter in the Global South, and (2) many secularizing forces entered with imperialism in the Global South, and some who resisted imperialism also resisted secularism and incorporated religion in resistance. The Indian National Congress, however, founded in 1885, was ideologically secular, secularism being the only way to unite different Hindu castes, Muslims, Sikhs, Christians, Buddhists, and others in a single national movement. In the Middle East the new ideologies of Turkish, Iranian, and Arab nationalism, which arose in the late nineteenth and early twentieth centuries, emphasized Islam less and secular and nationalist values more. Several Iranian and Turkish nationalists were hostile to Islam and constructed idealized pre-Islamic national pasts full of modern and secular virtues. Even Arab nationalists, who saw Islam as a great Arab achievement, mostly favored a more secular legal system with more equal treatment of minorities. While words like *secular* never became widely popular in Muslim countries, where adherence to Islam by political leaders, and also state churches, continued, there were strong secular trends.

Among Jews secular trends were strong in the West, especially in the middle classes, but less in Eastern Europe and in the Global South. Theodor Herzl (1860–1904) and most founders of political Zionism were secularists, but many Eastern European Zionists were not. Oriental Jewry was essentially untouched by secularism by 1914, while most Jews worldwide were either indifferent or hostile to Zionism until the 1930s. Among Jews secularism and nationalism were not congruent;

many Zionists were not secularists, and many secularists were not Zionists.

Secularism and Its Opponents since 1914

Since World War I there was at first a rise in secularism in the Global South, but then a rise in antiseccularist forces, both in the United States and in the Global South, along with a decline in optimism about the future. The biggest impetus to secular nationalism came after World War I, with Mustafa Kemal Atatürk (1881–1938) in Turkey, whose leaders wanted a strong secular national state to catch up with the West. Atatürk's secularizing measures included Romanization of the script, outlawing the use of Arabic, ending religious education and the *shari'a*, basing personal status law on the Swiss Civil Code, votes for women, and discouragement of veiling. His were the strongest measures outside the communist world, and after World War II, when political parties competed, some of his measures were eased. While in the early twenty-first century Turkey has seen Islamist or partially Islamist parties in power, there has been little change in secular laws and practices, which have been guarded by periodic interventions of the secularist army.

In Iran Reza Shah, (r. 1925–41) imitated Atatürk. He promoted the secular nationalist view of Iran earlier favored by oppositionists, glorifying pre-Islamic Iran and denigrating the Arabs and Islam. He forced men and later women to adopt Western dress, promoted a secular public school system, and so forth. His son, Muhammad Reza Shah (1941–1979), continued secularist measures. With secular opposition cowed, and secular nationalism partly associated with the status quo and subservience to the United States, support grew for a religious opposition that appealed to anti-Western and antityrannical feelings and triumphed in 1979. Since then, however, secular opposition and thought have revived.

In Egypt the secular nationalism of Gamal Abdel-Nasser was undermined by defeats by Israel, and his secular successors followed unpopular economic and political policies. A growing Islamist movement there has influenced policy. Islamism is strong in the Muslim world, though several governments have suppressed it. The association of secularism with Western dominance helps account for this growth of Islamism; even the strict rulers of Saudi Arabia are attacked as infidels dependent on the United States. When Muslims want to be free of Western interference, and associate the West with support for Israel, many do not want to imitate ideologically the secular West.

In Pakistan and Israel religious identity was the *raison d'être* of movements to create nations. The early Zionist leaders were, however, secularists, and much of the population is still secularist. Muhammad Ali Jinnah (1876–1948) of Pakistan was also a secularist. Reactions against secularism, organized into several parties have, however, taken advantage of both states' religious basis, and have grown. Both states incorporate significant bodies of religious law, including religious courts for some matters.

India, where there are several major religions, is more complex. While Hindu, Muslim, and Sikh movements have grown, the secular Indian National Congress represented the main

trend of the national liberation movement. Once the Muslim League adopted and agitated for the creation of Pakistan in the 1940s, communal-religious feelings were aroused, culminating in partition in 1947. A Hindu political party ruled for some years until the secular Congress Party ousted it in 2004. Religiously based political movements have caused a weakening of secularist commitments in the Global South, at the same time as most governments continue to follow secular policies in education, welfare, and economics.

The other major area where secularism has been on the defensive and religious politics on the rise is the United States. Although the United States is very different from the Global South, the rise of religious politics in both since around 1970 is to some degree a reaction to governmental secular measures. The Supreme Court, partly responding to cases brought by the American Civil Liberties Union, began rulings favoring church-state separation in the states only in the 1930s. After World War II there were several secularizing governmental measures, but antisecular opposition has focused on two Supreme Court decisions, the outlawing of school prayer in 1962 and the legalization of abortion in 1973. The earlier concern of the religious right with evolution has also continued, as well as focus on opposition to schools' teaching about homosexuality or even about sex. Many feel that after 2001 the U.S. government under President George W. Bush became less secular, endorsing federal funds for "faith-based" programs and acquiescing to religious objections to stem-cell research and to funding international programs that include mention of abortion.

In Eastern Europe and Central Asia, the end of communism unleashed some backlash and restatement of traditions, though secularism remains strong. Even among secularists, concern over contemporary behavior patterns has been added to antisecularist ideologies. Among worldwide trends decried by antisecularists are the rise of freer sexual habits and of sexually transmitted diseases, a rise in crime rates, and a decline in community action and spirit. Some find in revived religious ties and morality an answer to such problems. Many traditions have come to be romanticized and seen as belonging to religion. The religious right creates a picture of harmony that never existed, generally idealizing the past family situation and social relations. Antisecularists everywhere appeal to the past to create religious roadblocks to the liberation of, and equal rights for, women.

In the past, when secular ideologies like nationalism, socialism, free market capitalism, and others had not been widely tried they could be seen as panaceas, while religion in government existed widely, and its faults were obvious. In the early twenty-first century this situation has reversed, with secular ideologies having been tried and shown problems, and religious groups able to present alternative ideologies and create effective religio-political organizations.

Many of the changes instituted by governmental secularization have been retained or reinstated when religious parties come to power, as seen in Iran. The Islamic Republic adopted a largely secular constitution and its economy and schools are mainly secular, despite a religious overlay, which, as with the

U.S. religious right, concerns mainly questions of gender and sexuality. Secularist ideas are also popular and religious government unpopular.

The backlash to secularism can produce its own backlash, as is happening in the early twenty-first century in Iran and possibly in India. Taking the whole world, secularism is not in dramatic retreat, although antisecular ideologies are stronger than they were. Religious politics are not important in the large, secular Japan and China, nor are they in most of Europe. Secularism seems strongest in countries that are growing in prosperity and in those that have considerable resources devoted to social safety nets, like Western Europe and Canada. The presence of large Muslim populations in Western Europe discriminated against and sometimes following Islamist ideologies and gender practices that disfavor women has created problems for European secularism, however. The most dramatic expression of secularism in the face of such problems has been the controversial French outlawing of wearing religious symbols, including the headscarf, in the schools in 2003.

SEGREGATION. The concept of segregation is usually based on race, gender, class, religion, or ethnicity, depending on the circumstances under which it is practiced. This entry will mainly address racial and ethnic segregation and when appropriate address how it spawned gender and class segregation in the Americas and Africa.

Segregation in the Americas

The concept of segregation in the United States was different from segregation in other parts of the Americas, although all practiced slavery that affected the indigenous population. Segregation, with the exception of the United States, was not codified into law. Throughout the colonial and slavery periods in Latin America, South America, and the Caribbean, people of European descent maintained a hierarchy based on race. They attended separate schools and churches, lived in separate neighborhoods, and used separate recreational facilities. In Brazil after slavery was abolished in 1888, segregation was not by law; however, blacks and the indigenous population were not integrated into society. The government wanted to “whiten” the population by encouraging European immigration and interracial marriages. People who were viewed as white or close to white accrued privileges from their skin color, therefore indigenous Brazilians and people of African descent remained excluded from whites. Under Brazil’s racial democracy project during the nineteenth and twentieth centuries, it was argued that Brazil did not have the same kind of racial problems as the United States because race was of little significance and people achieved social and economic mobility due to individual merit. If people of African descent were at the bottom of the socioeconomic ladder, it was due to poverty and past discrimination. Scholars such as Gilberto Freyre, Carl Degler, and Frank Tannenbaum contended that the Portuguese who colonized Brazil were used to black people because of their experience with the Moors. The Catholic Church encouraged slaveholders to treat the slaves with a certain amount of humanity, and miscegenation was encouraged. Critical race theorists such as Thales de Azevedo began to question the racial democracy myth during the 1970s and argued that blacks and indigenous Brazilians were segregated in society based on race and not class.

Segregation was also practiced in Canada, as illustrated by the experiences of people of African descent who fought on the side of the British during the American Revolutionary War and those who escaped through the Underground Railroad. They believed they would enjoy citizenship rights in Canada, but there were few economic and educational opportunities, and land for farming was scarce. Some blacks therefore opted for resettlement in Sierra Leone.

The concept of segregation in the United States has been defined in distinct ways, based on race and ethnicity. White Anglo-Saxon Protestant immigrants were the privileged group who wielded political, economic, and social power. Other European immigrant groups were excluded from various jobs, universities, residential neighborhoods, and recreational facilities. This segregation was not codified into law and ended as soon as these groups were considered “white” and granted citizenship.

The country was envisioned as a “white man’s” country regardless of the presence of American Indians. Beginning in the early seventeenth century, Africans were brought to work first as indentured servants and then (by the 1660s) as slaves, and thousands of people from Asia emigrated to the United States in search of jobs in the late nineteenth and early twentieth centuries. Residential segregation was evident with the establishment of reservations for American Indians in 1638. People of Mexican descent experienced economic, residential, and educational segregation following the end of the Mexican-American War in 1848. People of Asian descent were encouraged to immigrate to the United States for employment in the late nineteenth and early twentieth centuries. Nonwhite workers were relegated to unskilled jobs in factories and on sugar plantations, farms, and the railroads. They were forced to attend separate schools and live in separate neighborhoods.

Segregation in Africa

The concept of segregation in Africa will be discussed within the context of the colonial period. Segregation was defined as a hierarchy with Europeans on top; Indians, Arabs, other ethnic groups, and mixed-race people (depending on the colony) in the middle; and Africans on the bottom. In settler colonies such as South Africa, Namibia, and Zimbabwe, segregation was not solely defined in racial terms but also in ethnic, religious, and gender terms. Separate schools were maintained along religious and ethnic lines in Eritrea; Saint-Louis, Senegal, had segregated areas for Christians and Muslims; and reserves in South Africa were created along ethnic lines. Throughout southern Africa, rural areas were often disproportionately populated with women after men were forced into the urban labor market to earn wages, which left women segregated in the rural areas.

One of the most important forms of segregation found throughout Africa was residential, especially in urban areas. Cities in settler colonies were designed for Europeans and in some cases Asian and Arab merchants. The more developed parts of the city were designated for Europeans, while Africans (mostly male workers) were forced into reserves, prevented from owning freehold property, denied the franchise, and forced to carry passes. Thousands of Africans, Indians, and mixed-race people were forced out of cities in the 1950s and 1960s in South Africa and Namibia.

Ideas Surrounding Segregation

During the seventeenth century, when Europeans arrived in what later became the United States, the intellectual ideas that supported the segregation of people of European descent from the American Indians was predicated on the belief that Europeans were culturally superior. The idea that education and conversion to Christianity could civilize American Indians was abandoned because they were thought to be biologically different from whites. The segregation of American Indians must be understood in economic terms. The colonists were in competition with the American Indians for arable land in the North, and planters in the South needed large tracts of land to produce cash crops. The segregation of American Indians was justified in religious terms—God ordained whites to have

the land. John Winthrop and John Cotton contended that the diseases that killed many American Indians in New England were sent by God and that this cleared the way for the whites to possess the land. The political architects who ensured the segregation of American Indians were the “founding fathers” (Thomas Jefferson, James Madison, James Monroe). The segregation of American Indians was justified on cultural and legal grounds by the ideology of Thomas Jefferson and Andrew Jackson—both believed that American Indians were children and savages who could not survive in the larger society.

Before slavery was abolished in the United States, ideas among African-American intellectuals about segregation were mixed. Martin Delany and Edward Blyden believed that people of African descent would never be integrated into American society. Frederick Douglass believed that blacks should remain and fight for their full citizenship rights. Booker T. Washington, the most powerful African-American at the beginning of the twentieth century, endorsed social segregation. He argued that African-Americans should forego political and social equality until they achieved economic equality. At the same time, the most influential African-American intellectual, W. E. B. Du Bois, vehemently opposed Washington’s views on segregation. He argued that African-Americans should demand their full economic, political, and social rights and call for an end to all forms of segregation.

The emergence of the Ku Klux Klan following the Civil War illustrated how wedded some whites were to segregation. It was formed in 1866 by Nathan Bedford Forrest, who strongly believed that the South’s way of life was being undermined by the northern Republican government and the former slaves. The idea behind the Klan was to reestablish white rule in the South. The Klan was revived in 1915 by William J. Simmons, who espoused the ideas of patriotism, Protestantism, traditional American values, and American nativism. Simmons’s Klan was revived within the context of large influxes of immigrants who were not Protestant or Anglo-Saxon. The Klan was revived again in 1922 under Hiram Evans, who believed white American values needed to be preserved. Later figures associated with the Klan who espoused the values of nativism and white supremacy included Robert Shelton during the 1950s and David Duke in the 1980s and 1990s.

Ideas Surrounding Segregation in Africa

Africans, Asians, Arabs, and mixed-race people in Africa were viewed through the same cultural lens—Europeans were inherently superior, and Africans were the most inferior. They were uncivilized, lazy, and childlike in their behavior. They were prone to criminal activities and therefore had to be controlled and segregated for the protection of whites. During the nineteenth and twentieth centuries, biology spawned ideas about race that were used to justify racial segregation in the Americas and Africa. The belief developed that there were distinct races with different levels of intelligence, capacities, and abilities guided by the laws of nature. These ideas were given scientific and academic legitimacy through the writings of historians, anthropologists, and geographers. South Africa’s Howard Pim, Maurice S. Evans, Edgar H. Brookes, James Hertzog, Jan Christian Smuts, and Charles Loram advocated

racial segregation. Evans studied South Africa and the United States and concluded that segregation was a good policy because it would help to ensure the survival of European civilization. Loram supported the idea of separate vocational education along the lines of Booker T. Washington’s Tuskegee Institute. Africans and people of color were viewed as unhealthy, diseased, and contaminated, and they had to be segregated from whites. Segregation was also needed for economic reasons: the African communal economy was not compatible with the European capitalist economy, so a dual economy was needed. Finally, it was thought that African and European cultures were too different to coexist. African society was “primitive,” and its customs would not be able to survive contact with Europeans.

When the National Party came to power in South Africa in 1948, the ideas of apartheid, or separate development, were codified into law. The major supporters of these ideas included Daniel Malan, J. G. Strijdom, and Hendrik Verwoerd, whose campaign slogan was “the white man must remain master.” The cultural ideas that espoused a racial hierarchy throughout the Americas and Africa served as the foundation for religious, political, and economic ideas that embraced segregation. Segregation was supported both in the Americas and in Africa by Christian churches, especially in South Africa by the Dutch Reformed Church (until the 1990s) and in the American South by most of the predominantly white Christian denominations (until the 1960s). Religious leaders and church members argued that the Bible upheld segregation and that forced integration was against God’s will because God ordained people to live separately.

Social Movements to End Segregation

The ideas of the 1950s and 1960s that served as the catalyst to end Jim Crow segregation in the United States were not new. Intellectuals such as James Farmer, A. Philip Randolph, and Bayard Rustin supported and used the tactics of civil disobedience and mass resistance to end racial segregation. For example, James Farmer, who founded the Congress of Racial Equality, used Mahatma Gandhi’s philosophy of nonviolent civil disobedience in Chicago in the 1940s before Dr. Martin Luther King Jr. adopted them. King’s ideas of using the Christian faith, moral superiority, and moral persuasion as part of civil disobedience cannot be overlooked. King believed that unjust laws do not coincide with the law of God, therefore segregation laws, which were immoral and unjust, did not have to be obeyed. In addition, if people could not vote and did not have political representation, they were not obligated to obey unjust laws. These laws had to be overturned by just, moral means. In sum, King’s ideas of mass resistance, direct action, and civil disobedience were tied to Christianity, which instructed him to love his sisters and brothers and to have faith that morality and justice would prevail in overthrowing segregation. And through the abolition of segregation, whites could achieve salvation through living up to the American creed of democracy and liberty for all.

Segregation was opposed throughout Africa, but the fight to abolish apartheid in South Africa was waged both domestically and globally. At the turn of the twentieth century

Mahatma Gandhi developed nonviolent strategies to end segregation in South Africa, and he worked closely with the founders of the African National Congress (ANC), especially John Dube. Dube, along with Pixley Seme and Sol Plaatje, believed that African nationalism and unity would restore land and rights lost under European rule. Their beliefs were supported by the strategies of petitioning the British government and sending delegations to London to appeal for constitutional changes that would grant Africans their rights. Later leaders such as Walter Sisulu, Oliver Tambo, and Nelson Mandela committed themselves to the idea of mass resistance and established the ANC Youth League. They believed African nationalism would lead to African self-determination and that equality and the end of apartheid would only come through the efforts of Africans. Therefore, the ideology of the ANC shifted in the 1940s from a conservative to more a radical and militant approach that would involve the masses of people instead of a few educated members of the middle class. Mandela, Sisulu, and Tambo strongly believed in mass civil disobedience, boycotts, peasant revolts, and strikes, manifested in their support of the Campaign for the Defiance of Unjust Laws in 1952, when blacks, Indians, and coloreds refused to obey laws that they found unjust.

The ideas of the ANC's main leadership further shifted in the 1960s from attempting to abolish apartheid by disciplined and nonviolent means to violent forms of resistance with the establishment of a military wing, the Umkhonto we Sizwe (Spear of the Nation). This was established only after the South African state was ruling by force and violence and ANC leaders felt that all forms of peaceful protest had been exhausted. The ideas of black consciousness espoused by Steve Biko in the 1970s were based on building strong grassroots organizations to raise awareness of the plight of black South Africans. It was his belief that only blacks could liberate themselves through a reevaluation of African history, pride, religion, and culture: out of black consciousness, black liberation could be born. In turn blacks would gain respect from other groups in society, and the apartheid system would be abolished.

The abolition of apartheid in the 1990s was based on the political ideas of a multiracial democratic South Africa espoused by Nelson Mandela and F. W. de Klerk. The religious ideas to end apartheid came from church leaders such as Desmond Tutu and Allan Boesak, who both believed apartheid could be abolished through nonviolent means, resulting in a multiracial democratic society that granted full human rights to all citizens.

SEX AND GENDER. See **Gender; Gender Studies; Anthropology.**

SEXUAL HARASSMENT. Unwanted sexual attention was imposed on people in no position to refuse it long before *sexual harassment* was a recognized idea. Sexual harassment seems to be practiced wherever the sexes are materially unequal, which generally they are; its reality in paid work can be traced from the beginnings of industrialization and in unpaid work throughout slavery. Until the mid-1970s, it had no name.

The women's movement of that period brought many obscured and unnamed harms long inflicted on women to social consciousness, stimulating political intervention and legal action. In this context, unwanted sex began to be resisted in the United States within the framework of an analysis of sexual politics, conceptualized by Kate Millett as relations of power on the basis of sex. In this context, Working Women United Institute (first at Cornell University, then in New York City) and others organized against the coercive imposition of sexual demands with impunity on women in workplaces.

Building on this activism, sexual harassment of working women was theorized by Catharine MacKinnon as a form of sex inequality that drew its power from a gendered dominance that was sexual combined with a workplace hierarchy that was economic. Sexual harassment was argued to be a form of discrimination on the basis of sex under federal equal employment laws in the United States. Federal courts initially rejected this legal argument, then accepted it in 1977 in the breakthrough ruling of *Barnes v. Costle*. The Equal Employment Opportunity Commission's 1980 guidelines codified this ruling in an influential formulation of harassment on the basis of sex as a violation of federal antidiscrimination law when "unwelcome sexual advances, requests for sexual favors, and other verbal or physical conduct of a sexual nature [are made] a term or condition of . . . employment [or] submission or rejection of such conduct . . . is used as the basis for employment

decisions . . . [or] such conduct has the purpose or effect of unreasonably interfering with an individual's work performance or creating an intimidating, hostile, or offensive working environment." Sexual harassment became the first accepted legal concept to be defined by women based on their experience of victimization.

Framed as a civil right, the right not to be sexually harassed under United States law was extended from employment to education, from opposite sex patterns to same-sex situations to harassment on other grounds, and came to encompass sex- and race-based harassment combined. Through well-publicized claims against powerful men in public life, sexual harassment became a household word. By the turn of the twentieth century, legal systems around the world and international law had recognized that the human right to equality included not being sexually harassed.

The original debate centered on whether or not unwanted sex imposed under unequal conditions—whether as a *quid pro quo*, meaning in exchange for benefits, or as a hostile environment, meaning as a constant condition requiring tolerance or exit—should be subject to civil suits. What kind of violation was sexual harassment, if it was one at all? Advocates for survivors argued that it was imposed on women because they were women, thus was a form of sex-based discrimination, a status injury based on gender (the social form sex takes) of which unequal undesired sexual practices were a part. Courts that initially rejected this argument thought of sexual harassment as part of sexuality, hence personal, individual rather than gendered in the group-based sense, private, not properly regulable by public means, and biological, not social but natural and inevitable. As sexual, it was imagined inherently free and equal: nonexploitative, incapable of being socially stereotyped or scripted, intrinsically separate from social rank orderings. This sexual essentialism was authoritatively rejected when courts accepted the analysis that sexual harassment is sex-based discrimination: not personal, social; neither biological nor inevitable; the exploitative social imposition of inferiority on the group ground of sex, an injury of status as well as treatment.

The reasons the legal claim for sexual harassment was initially controversial continue, in ever-changing form, to operate as backlash and undertow in social and legal discussions of the subject. The debate over the place of sexuality in gender inequality, although authoritative resolved, has not gone away. It has continued to drive critical commentaries, to underlie public disputes, and to animate legal controversies, often taking the form of opposition to the hostile environment claim. Sexuality as such remains defended by some as inherently a sphere of freedom properly off limits to the law, while being scrutinized by others as a site of sex inequality, specifically of male dominance, propitious to abuse and in need of public exposure and redress.

Entrenched positions on these deeper questions shaped public conflicts and public dialogue through episodes that proved decisive in public consciousness. When Professor Anita Hill accused then-Judge Clarence Thomas in the fall of 1991 of what amounted to sexual harassment in his confirmation hearing for Justice of the Supreme Court of the United States,

many of the attacks on her and on the validity of the inquiry proceedings took the view that sexual goings-on did not belong in a Senate hearing or in a confirmation debate, or were not sufficiently severe to be worthy of concern. When Paula Jones accused then-President Bill Clinton in 1996 of having sexually harassed her when she was employed by the state of which he was governor, much of the hue and cry centered on the appropriateness or not of public airing of what were minimized as his sexual peccadilloes, as well as the fact that the allegations involved a single incident, which was minimized as not severe, although it was alleged to include unwanted sexual touching and indecent exposure. Trivializing sexual attacks because they are sexual remains an ideological feature of the discussion of such incidents. Far less public attention was visited on the U.S. Supreme Court decision in 1998 that public schools need not pay for the sexual injuries teachers inflicted on their students unless the abuse had been properly reported and the school had deliberately been indifferent to it—an exceedingly low standard of requisite institutional responsiveness. The Court's treatment of sexual use of young students by adult teachers reflected an ideology of sexuality as essentially private misbehavior for which public authorities were unaccountable unless put explicitly on notice.

If sexual harassment's conceptual resonance with women worldwide has propelled its acceptance, political organizing and legal acceptance has promoted its legitimacy, and the concept itself has proven adaptable to diverse legal cultures, each aspect of it has produced some debate somewhere. Some countries do not recognize it as sex inequality, as in France, where it is a crime, centering on the *quid pro quo* form. Israel's sexual harassment provision—the most explicit and far-reaching in the world in extending to all spheres of social life and expressly covering harassment based on sexuality and sexual tendencies as well as sex—is premised on values of dignity as well as equality. German law recognizes harassment only if women object to it, which can be problematic where unequal power exists. The European Community's approach has historically emphasized respect and dignity over equality, with European approaches generally tending to individualize the behavior, ignoring group hierarchies and obscuring the function of sexuality in gender-based discrimination.

In Japan, although the legal claim has been recognized, women continue to experience extraordinary difficulty being valued and believed when they claim they were sexually harassed—as, indeed, women do everywhere. Legal and social constraints on the form that the abuse must take that do not reflect the experience of victims is a globally shared problem, as is valuing the careers of perpetrators above the equality of victims. Perhaps the least legal debate has occurred in India, where the Supreme Court of India has embraced the concept and designed imaginative and aggressive relief for companies to institute. And the inclusion of the concept by interpretation under the Convention on the Elimination of All Forms of Discrimination Against Women has solidified its place in international law.

In the United States, some scholars have urged that unwelcomeness be assumed rather than be required to be proven, on

the view that it makes no sense to assume that women at work welcome sexual attention. Some academics have urged courts be more receptive to finding gender-based harassment that is not expressly sexual, a dimension of the legal claim that has always been a part of it, sometimes complaining that too much attention has been devoted to specifically sexual forms of abuse. To reduce controversy in legal decision-making over the hostile environment claim, some jurists have urged that a per se list of acts that constitute hostile environment sexual harassment be devised, typically including sexual assault, sexual threats, and pornography. Other advocates have argued that hostile environment sexual harassment, most of which is verbal or physical expressive behavior should not be legally actionable at all, because it is speech that should be constitutionally protected.

Whether or not the claim for sexual harassment should encompass sexual harassment of gay men and lesbians has produced considerable discussion in the United States. Proponents argue that sexual orientation should not deprive a person of a right from unwanted sexual attention on the basis of sex. Opponents argue that sexual abuse based on sexual orientation is not based on sex. Proponents reply that sexual orientation is itself sex-based, as is abuse based either on the sex or the sexual orientation of the victim, whether same-sex or not. There is also some concern on both sides that harassment claims premised on a same-sex sexual orientation, if permitted, could become a pretext for unfounded or bigoted claims.

Perhaps most significantly, the fact that the idea of sexual harassment is widely recognized as defining a violation does not mean that it no longer happens—far from it. It is also far from actionable wherever it occurs, including on the street and in the home. And for survivors, challenging the behavior is not yet safe or without cost. Although protections against retaliating against them proliferate, studies indicate that women are often better off not resisting the abuse than challenging it, which is no doubt the reason that reporting rates continue to be low. Perpetrators often protect one another. Institutions often elude responsibility. Victims seldom receive effective support and relief. Despite the strides toward eliminating this form of sex-based abuse, the history of the idea of sexual harassment continues to be a short chapter in the longer history of its practice.

SEXUALITY.

This entry includes three subentries:

- Overview*
- Islamic Views*
- Sexual Orientation*

OVERVIEW

When we think of sexuality, we think of many different things. We think of reproduction and the different bodies and reproductive capacities of men and women. We think of pleasure, the pleasures of the body, but also the pains, mental and physical, that can wrack the body. We think of love, and the joys of human involvement, but we might also remember the fear and hate that sexuality can evoke—through discrimination, prejudice, abuse, violence, rape. We think of potential diseases, of which HIV/AIDS has become the most potent symbol, and the possibility of death, which has always dogged sexual activity, from the perils of childbirth to the great artistic traditions that link love, sex, and death. Sexuality is about both pleasures and dangers, and that link gives it its ambiguity and its power.

This multiplicity of meanings can often confuse as much as clarify. At the most basic and popular level, *sexuality* refers to what most regard as one of the most basic features of human life, "our sexuality," the "most natural thing about us," the "truth of our being," in Michel Foucault's well-known phrase. When people say something like "this is my sexuality," they are referring to something that they see as essential to their needs, desire, identity, and social position. Yet even as we agree on its importance to individuals and cultures (at least in their Western, metropolitan forms) the term has become a highly contested one. Even those modern researchers who claim to have put our understanding of the body and its desires on a solidly scientific basis—like the sociobiologists or evolutionary psychologists who claim to be able to trace the roots of human sexuality to the first human steps on the African savannah tens of thousands of years ago—express puzzlement as to why sexuality should have evolved. For historians, anthropologists, and other social scientists alert to the different interpretations given to sexuality at different times in different cultures, the concept is a deeply problematic one.

The concept is so cloaked in historical myths and social ambivalence, and obscured by heterogeneous meanings and elaborate taboos, that sexuality often appears more a product of the mind than of the body. Perhaps, as the social anthropologist Carole Vance once suggested, the most important human sexual organ is located between the ears. Yet, of course, it is through the body that sexual desires are expressed, and the body is the site for marking gender differences, which

continue to shape culturally important differences and sexual beliefs and behaviors. The body, and its biology, cannot simply be ignored. So the safest way of putting it is that *sexuality* as a concept is perilously stretched between the biological, the social, and the psychic. Even Sigmund Freud, usually accused of putting sex into everything, confessed to the difficulty of agreeing on “any generally recognized criterion of the sexual nature of a process” (p. 323). Since then, despite our ever growing knowledge about the varieties of patterns, values, norms, lifestyles, and fantasies around the erotic, a certain ambiguity continues to cloak the meanings of sexuality.

Conceptualizing Sexuality

A brief history of the concept in English shows how meanings of sexuality continue to evolve. The earliest usage of the term *sex* in the sixteenth century referred to the division of humanity into the male section and the female section; and the quality of being male or female. The subsequent meaning, however, and one current since the early eighteenth century, refers to physical relations between the sexes, “to have sex.” What we know as masculinity and femininity, and what came to be labeled from the late nineteenth century as *heterosexuality*, with *homosexuality* as the aberrant “other,” are thus inscribed into the meanings of *sex* from the start. *Sexual*, a word that can be traced back to the mid-seventeenth century, carries similar connotations—pertaining to sex, or the attributes of being male or female, is one given meaning. *Sexuality* as a term meaning “the quality of being sexual” emerged early in the nineteenth century, and it is this meaning that is carried forward and developed by the sexologists, sexual theorists, and researchers who emerged as a distinct category of specialists in the late nineteenth century, and became increasingly influential in the twentieth century. Luminaries included not only Freud, who is now best remembered, but also the Austrian pioneer, Richard von Krafft-Ebing (1840–1902), who can lay claim to being the founding father of sexology; the Briton, Havelock Ellis (1859–1939), and the German, Magnus Hirschfeld (1868–1935), who was also a pioneer of homosexual rights, among many others.

Sexologists sought to discover the “laws of nature,” the true meaning of sexuality, by exploring its various guises and manifestations. They often disagreed with one another; they frequently contradicted themselves. But all concurred that sexuality was in some way a quality or essence that underlay a range of activities and psychic dispensations. Thus Krafft-Ebing became a pioneer in seeing sexuality as something that differentiated different categories of beings—so opening the way to theorizing sexual identities. Dozens of individuals wrote to him with their case histories, and in the process of studying them Krafft-Ebing came to understand that there were many types of sexualities that could not easily be reduced to the traditional assumption of heterosexual, reproductive sex. Freud went further. His *Three Essays on the Theory of Sexuality* (1905) began with a discussion of homosexuality, thus severing the expected connections between sexuality and heterosexual object choice, and continued with a discussion of the perversions, so breaking the expected link between pleasure and genital activity. In the psychoanalytic tradition,

sexuality was seen as central to the workings of the unconscious. More broadly, sexuality was becoming a distinct continent of knowledge, with its own specialist explorers. When people spoke of “my sexuality,” they increasingly meant those desires and behaviors that shaped their sexual (and social) identities, as male or female, heterosexual or homosexual, and so forth.

The result of all this classifying and definitional zeal was startling. The pioneering explorers of sexuality thought they were simply mapping and giving names to what was already there. It is to this generation that we owe concepts and terms such as *homosexuality* and *heterosexuality*, *transvestism* and *sadomasochism*, *coprophilia* and *necrophilia*, and a thousand more terms in the ever growing lexicon of the erotic. Later researchers such as Alfred Kinsey (1894–1956) and his colleagues sought to demonstrate that in biology there was little concept of what was right or wrong, normal and abnormal; and the sexual lives of our fellow citizens (or at least the twenty thousand or so American men and women from whom Kinsey obtained his information in the 1940s) displayed a spectrum of behaviors and desires that was far from the culture’s self-image of respectability. Whole armies, it has been well said, began to march out of the pages of the sexologists’ learned tomes and onto the stage of social history.

However, late-twentieth- and twenty-first-century theorists have questioned the naturalness and inevitability of the sexual categories and assumptions we have inherited. They suggest that the sexologists did not so much discover or map the world of sexuality as help create and constitute it. The concept of *sexuality*, they argue, unifies a host of activities that have no necessary or intrinsic connection: discourses, institutions, laws, regulations, administrative arrangements, scientific theories, medical practices, household organization, subcultural patterns, ethical and moral practices, the arrangements of everyday life. The idea of *sex*, which seems so foundational to the very notion of *sexuality*, is itself a product of the discourses. Nothing is sexual, as Ken Plummer (1975) suggests, but naming makes it so. So sexuality can be seen as a narrative, a complexity of the different stories we tell each other about the body; a series of scripts through which we enact erotic life; or an intricate set of performances through which the sexual is invented, ritualized, and embodied.

In other words, “sexuality” was a social construction, a “fictional unity” that once did not exist and that at some time in the future may cease to exist. John H. Gagnon and William Simon have discussed the need at an unspecified point in human history to *invent* an importance for sexuality. Michel Foucault queried the very category of “sexuality” itself: “It is the name that can be given to a historical construct (p. 105).” Foucault’s work particularly has had a huge impact on our thinking about the sexual. But he was building on new forms of sexual knowledge already in development. These were in turn being heavily influenced by radical social movements including second-wave feminism and the gay liberation movement, which emerged from the late 1960s.

The work of young scholars inspired by these movements began to develop critical social-scientific approaches to sexuality. Already by the mid-1970s feminists were questioning the

basic categories of sexuality, and a number of pioneering lesbian and gay historians were interrogating the fixity of the heterosexual-homosexual dichotomy to show that this apparently fundamental binary divide had a relatively recent history. If the homosexual identities we took for granted were indeed a historical construction, then so could the norm of heterosexuality be seen as something that was invented. In a similar way the sharp distinction that some of the pioneering writers on sexuality had drawn between “civilized” and “uncivilized” patterns of behavior could also be challenged, and instead could be seen as products of Western cultural—and racist—assumptions in the age of empire. In other words, sexuality, far from being the domain of the given, the natural, the biological, was preeminently historical and social, and moreover was shaped in relations of power. This has profound implications.

Questioning the Concept of Sexuality

In the first place, we need to question the concept of sexuality. We can no longer easily see sexuality as a given and constant nexus of instincts, drives, and desires with automatic effects on individual and social lives. Rather, we need to see the erotic as always and necessarily given meaning only through the social. That means inevitably that to find the sexual, we always need to look for its specific local manifestations and the forces that structure it. Instead of seeking the laws of nature that would explain sexuality as a universal phenomenon, we need to understand the social organizations of sexualities in all their diverse forms. We therefore need to speak not of sexuality but of sexualities, not of sex and society but of sexual cultures. To understand sexual cultures we need to understand the diverse contexts in which meanings are attributed to intimacy and eroticism, and the complex social interactions that shape the erotic cultures of different societies.

It is important, further, to recognize that sexualities are hierarchically organized—that is, some forms are dominant while others have been made subordinate and marginalized—and are shaped by complex relations of power. The most familiar of these relate to gender, class, age, race, and ethnicity. There has also been an increasing recognition that sexualities in the West at least have been organized into institutionalized forms of heterosexuality, leading to critiques of “compulsory heterosexuality,” “heterosexism,” the “heterosexual panorama,” the “heterosexual assumption,” and “heteronormativity”—the phrases vary, but the effort put into these concepts underlines the importance many people give to questioning our assumptions.

Gendering Sexualities

Gender is at the heart of our thinking about sexuality, though not necessarily in the ways traditionally believed. The complex ways in which gender is constructed, reinforced, and set in patterns of dominance and subordination through the institutionalization of heterosexuality, has become central to our developing understanding of sexualities and sexual cultures. Some feminist theorists have indeed argued that gender constitutes sexuality, and that female sexuality is shaped and organized through the mechanisms of male domination. Other theorists have argued for a significant distinction between the domains of sexuality and gender, regarding their relationship

as more complex and contingent than is often thought. But there can be little question that gender relations have been shaped asymmetrically, in patterns of domination and subordination.

But of course, the existence of a hierarchy does not determine gender relations in an absolute way. If that were the case, there could be no change. On the contrary, uneven power relations provide the necessary condition for resistance, and for sexual politics. The impact of feminism since the 1960s has simultaneously sharpened our awareness of the arbitrary nature of gender divisions and increased the possibility of changing them. Gender has increasingly been seen not simply as lived, but as “performed” through the constant iteration and reenactment of what are regarded as the essential characteristics of both sex (male and female) and gender. In such theorizations we seem to move ever further from any preexisting essence of femininity or masculinity.

New Subjectivities

We are also moving away from seeking an essence to our subjectivities and identities. The extent to which sexuality is central to people’s sense of self is increasingly seen as historically specific, as the first volume of Michel Foucault’s *History of Sexuality* powerfully suggested. This has been best explored in tracing the evolution of homosexual identities since the nineteenth century. In a culture in which a particular form of sexuality was either denied or punished, it was inevitable that people organized their sense of self around their sexuality in various forms of resistance—through what Foucault described as a “reverse discourse.” Historians have increasingly sought to understand the dynamics of push and pull, definition and self-definition that have shaped the emergence of nonorthodox sexual identities.

Identities have been the object of struggle, often against extremely forceful and imposed norms. The sexual movements of the 1970s were in some ways heirs of the modernist project, in which it was taken for granted that the historical distinction between heterosexuality and homosexuality would be reflected in homogeneous identities, of for example, heterosexuals, lesbians, and gays. This has met a dual challenge. The emergence from the late 1980s of “queer” political movements radically challenged the homogeneous nature of the identities that existed and constituted a self-conscious refusal of identity on the part of many younger people. An even more significant challenge has come from a growing recognition that the meanings developed around sexual identity in the West were of little relevance to many marginalized people from minority ethnic communities within the Western world, or to many people in other cultures.

Globalization

This is closely related to a recognition of the growing importance of globalization in relation to the organization of sexualities. A globalized world is one in which Western categorizations of sexuality increasingly interact and interpenetrate with those operating in other sexual cultures, and in which new categorizations emerging worldwide—whether being universalized or asserted in opposition to one another—are increasingly interconnected across cultures. The spread of the HIV/AIDS

epidemic since the 1980s to become a global pandemic is a vivid and tragic illustration of this. Sexual behavior has of course always been associated with risk: the risk of unwanted pregnancy, of disease, of exploitation, of prejudice and oppression. These risks did not disappear with the emergence of a new discourse of sexual rights over the last thirty years of the twentieth century. But the risks have changed their forms, giving rise to new forms of conflict—over, for example, the rights and roles of women in nonindustrialized societies, and the responsibility of the developed world to the Third World in relation to matters such as the population explosion. These often become central to political differences on a global scale, such as the postulated conflict between Western and Islamic values. Conflicts over sexuality have become integral to the emergence of fundamentalist politics both within Western societies and elsewhere around the world. The work of international campaigns for reproductive rights suggests that there is a double push in this global movement: for bodily integrity and the right of women to control their own body; but also for challenging wider social, economic, and cultural inequalities, without which rights may become meaningless.

This pinpoints the new dilemmas of “global sex.” If sexual cultures are varied and have specific historical formations, how do we distinguish those claims to right that have a universal resonance, and those that are highly culturally specific—and possibly distasteful to large numbers of citizens around the globe? One answer lies in the realization that human rights do not exist in nature. They are not there to be discovered written on tablets of stone. They have to be invented, in complex historical conjunctures and contestations, as part of the making of minimal common values. And in a divided, often violently polarized world, that is not an easy task.

Conflict of Values

This pluralistic, diverse world is subject to an unavoidable conflict of values that can neither be wished away nor easily resolved by a resort to absolute standards, science, history, or tradition. In a world that is simultaneously globalized and challenged by emergent differences and new fundamentalisms, questions of values and ethics inevitably come to the fore. Sexuality may always have been an arena of moral and cultural conflict, but in contemporary societies sexuality is becoming an increasingly central and explicitly debated issue in mainstream cultural conflicts and political debates over values and citizenship. Debates about who and what we are, what we need and desire, how we should live, are to a striking degree also debates about sexuality. It is not surprising therefore that debates over sexuality display anxiety and uncertainty. The fear aroused by the HIV/AIDS epidemic was more than simply concern about a new and possibly incurable disease; it also underlined our uncertainty about contemporary moral stances. The “culture wars” that have been so prominent a feature of United States politics since the 1980s revolve around abortion, sex education, same-sex marriage, and the family—keystone issues on which views seem irreconcilable because they speak of the sort of society we are, and want. As sexuality goes, so goes society.

Advances in science, far from resolving our dilemmas, only serve to compound the general air of uncertainty. How, for

example, should we react to the possibilities opened up by embryological research? What are the implications for sexual values and ethics of the Internet revolution? In a world where traditional sources of authority such as religion and the patriarchal family are under intense pressure, and heightened individualism is increasingly the norm, it is difficult to see how there can ever be agreement on a fixed set of values, or a categorical list of rights and responsibilities to which everyone can readily adhere.

It is perhaps for this reason that the language of human rights and of sexual or intimate citizenship has come to the fore. It provides at least one discursive form through which the necessary debates can be carried on in working out what is and is not possible. It provides an iterative framework through which we can try to agree to the minimum standards we need to attain to recognize simultaneously each other's differences and common humanity. This is a long way from the belief of the pioneering sexologists of the late nineteenth century and the sex researchers of the mid-twentieth century—that the truth of sexuality in nature could be discovered. It remains even further as a position from those prophets of the truth who would like us all to bend a knee to their insights, whether religious or moral. But it is in tune with a recognition that sexuality is a product of negotiation and choice as much as of revealed truth. And that, surely, is the only way forward that accords with the diversity of our sexual world.

ISLAMIC VIEWS

Islam considers sexual pleasure to be a gift from God to humanity that should be enjoyed with gratitude. The religion has also always frowned on celibacy. The Prophet, who is an exemplar for all aspects of Islamic behavior, enjoyed his many wives, including his famous child-bride, 'A'isha. Hence, sexual regulation is concerned not so much with the potential for sexuality to distract the believer from God as with its capacity to disrupt social relations. Specifically, this means control over paternity, being sure that the father is really the father of his children. As a result, those forms of sexual behavior that do not threaten patriarchal transmission are either authorized or socially tolerated, while those behaviors that threaten to create a doubt over paternity are both condemned in Muslim law and aggressively repressed by Muslim societies.

Sexual segregation, rather than preaching, has always been seen as the most (if not the only) effective means to keep sex within licit channels. One of the most oft-repeated sayings of the Prophet is that when a man and a woman are together (alone is implied), the devil is the third. In premodern times one result, especially for the rich and powerful, was the use of eunuchs as guardians of women or domestic spaces generally. Even in the early twenty-first century, in most Muslim societies, women's domain is said to be the home and there is a reluctance, especially among revivalists, to permit women to go out into public nondomestic space more than the minimum necessary. Outside the home, and in the presence of all but a limited circle of male relatives, a Muslim woman should be covered by garments that range from a scarf covering the hair and neck, in the more lenient view, to the all-enveloping shrouds of *niqabs*, chadors, or burkas, for stricter interpretations. The need to avoid stimulating men and women through public contact has led to practices such as separate seating, or entrances, in public transportation, separate seating in public halls, and so on (mosques have separate seating and entrances). After a period when the imperialism of Western mores led to a reduction in segregation and covering, both practices have been on the increase since the late 1970s.

Licit sex includes sexual intercourse (whether genital, oral, or anal) within marriage. (A man may marry up to four wives if he has the means to support them; a woman may only have one husband). But a man may also have licit sex with concubines whose number is not limited. In premodern times there was a vigorous and legal trade in slave-girls for those with the means to own them. Some branches of Islam authorize temporary marriage. Since the period for this marriage may be as short as one hour, and since Islamic marriages are contracts in which property usually figures, the result can resemble prostitution, with the difference that the woman cannot remarry until she has had her menses, thus obviating any doubt over paternity.

Both male and female homosexuality are forbidden in Islamic law (though only male homosexuality is explicitly condemned in the Koran). In premodern Muslim societies homosexuality was widely tolerated, and even celebrated in literature. In discussions of lesbian practices, mutual masturbation (called rubbing) was even considered potentially positive as

it helps to prepare the woman for male sexual penetration. In most respects, attitudes to homosexuality in Muslim societies were a continuation of those that dominated in the ancient classical world in which any shame only attached to the passive partner. Modern revivalist movements, by contrast, have made the repression of homosexuality part of their neo-puritanical agenda.

Literature, both popular and elite, took a very free attitude to the varieties of sexual behavior in premodern Muslim societies. European imperialism, however, brought Victorian values that have been strengthened by the contemporary revivalist movements (at least in their public utterances). Hence, a great classic such as *The Thousand and One Nights* is only available in expurgated editions (or on the black market).

The sacralization of sexuality extends to the rewards promised to the just in Paradise. In addition to spiritual and other sensual pleasures, the elect male is given multiple (the most common figure is seventy) *houris*, beautiful maidens in paradise, for his sexual pleasure. He will also enjoy congress with all his legitimate wives (these last will have the enjoyment of their husbands).

The sacralization of sex coupled with the need to control behavior have historically led Muslim societies to potentially contradictory positions. On the one hand, the rich literature of sexual technique and description celebrates female pleasure. On the other hand, many Muslim societies (principally, though not exclusively, in Africa) continue to practice clitoridectomy, the removal of this part of the female genitalia before puberty in order to dampen female desire. The practice also exists in some non-Muslim African societies. Muslim jurists have labeled the practice as either recommended (hence optional) or permitted, but never required or forbidden.

The Koran specifically grants men authority over their wives, including the right to use corporal punishment on a rebellious wife. A wife's marital duties include the obligation to grant sex to her husband unless she is physically indisposed. However, contemporary revivalist women have argued either that the sexual obligation does not extend to anal sex, or that the husband's right to use corporal punishment does not apply to issues of sexual access. Disputes over anal sex also appear in premodern sources.

Adultery or any sex outside of licit relationships is condemned in Islam, though in practice enforcement has been made difficult, especially for men. A woman accused of sexual impropriety, or even the appearance of such, suffers the full brunt of social disapproval, extending to death by legal or extralegal means. The "honor killing" of females who have escaped the control of their male relatives or guardians is widespread in many Muslim societies. Though such homicide is clearly not consistent with Islamic law, its proponents claim the support of the religion and adduce the Koranic verse permitting corporal chastisement of rebellious women as justification.

SEXUAL ORIENTATION

The phrase *sexual orientation* is used to describe different forms of erotic attraction: toward people of the same gender (homosexual), the opposite gender (heterosexual), or both (bisexual). Like any simplistic categorization, such definitions quickly become mired in contradictions and complications. For instance, is the label “heterosexual” to be reserved for people who only have sexual interactions with members of the other sex, so that those who deviate from this pattern are classed as homosexuals regardless of the number of same-sex relationships they have had, even if the opposite-sex relationships far outnumber them? When can an individual be labeled bisexual, homosexual, or heterosexual?

The influential study of Alfred Kinsey on American males in 1948 and his later study of females first pointed out the difficulties of such classification. To overcome it, he developed a 7-point scale with 0 representing individuals who only had heterosexual intercourse, and 6, those who only had same-sex activities. Unsurprisingly, Kinsey found that 37 percent of the males and 13 percent of the females in their sample had at least one homosexual encounter. The scale, however, did not establish numerical ranges for categorizing sexual orientation. Is a man who has sexual relations with females 70 percent of the time and with males 30 percent of the time a homosexual? Is a woman who has sex with males 30 percent of the time and with other women 70 percent a lesbian? Are they both bisexual? The issue is further complicated by the fact that many people do considerable experimentation before confining themselves to one sex. Others might originally have only partners of the opposite sex, but as they age they have increasing numbers of partners of the same sex and settle down with a same-sex partner. This pattern is even more marked in many non-Western societies, where same-sex sexual experimentation may be expected as a premarital phase; a highly institutionalized version of the age-specific structure was documented by Gil Herdt in parts of Melanesia, where before Christian missionizing changed sexual mores, every male was expected to progress through a series of alternating same-sex and heterosexual phases.

Some Factors to Be Considered

There are other factors to be considered, particularly the relation between actual practice, fantasy, and feelings. Anna Freud, for example, maintained that the crucial determination of homosexuality or heterosexuality was one's thoughts and images when masturbating or becoming sexually aroused. A woman who becomes sexually aroused by same-sex fantasies while having sex with her husband would be classed as homosexual even

though she never engaged in homosexual behavior. The opposite case with males would be equally true. The question of whether erotic attraction or sexual practice is the defining characteristic of sexual orientation continues to be debated by researchers.

Another approach taken by scholars attempting to discover the true “nature” of sexual orientation has been to look at nonhuman species. Frank Beach, for example, held that homosexual activity among animals was usually an expression of the dominant or submissive role of that particular individual animal vis-à-vis another. He cautioned, however, that the existence of homosexual behavior in some animals says little about homosexual relations in humans, that is, it could not prove that homosexuality is “biologically normal.” The empirical evidence from animals, he felt, was irrelevant.

Another knotty question has to do with the relationship between sexual orientation and gender. Whereas stereotypical images of the homosexual associate same-sex desire with male effeminacy and masculine-appearing women, in actuality the relationship between gender and sex is far less predictable.

Cross-cultural data further complicate the picture. Clellan Sterns Ford and Frank A. Beach (1951) examined 190 cultures for information about sexuality using what was then called the Human Relations Area Files, a collection of reports of a variety of cultures. The information was extracted from reports of observers in earlier periods, many of them missionaries or explorers, while later reports were more often made by trained anthropologists. They found that homosexual behavior was not a predominant sexual activity among adults in any of the societies but that in the majority of the seventy-six groups for which information on homosexuality was available, same-sex relations were considered to be normal and socially acceptable, at least for certain members of the society. In about one-third of these societies where homosexuality was reported, it was said to be rare, absent, or carried on only in secrecy. The fact that it was not mentioned in the reports of the majority of societies, however, should not be taken to say it was nonexistent since the observers might well not have been looking for it.

For example, Balinese society was classified by Ford and Beach among the 36 percent minority where homosexual activity was rare, absent, or carried on only in secret. Yet the crossing of sex roles is common among the Balinese, and their religious beliefs place a high valuation on the hermaphroditic figure of Syng Hyan Toengaal, also known as the Solitary or Tjinitja. Tjinitja existed before the division of the sexes and is regarded as both husband and wife. Are the transvestic ceremonies connected with god homosexuality? Other examples of gender and sexual variation in non-Western and tribal societies, such as the Native American *berdache* or “two-spirit person” or Polynesian *mahu*, have all been objects of fascination to European and U.S. homosexuals looking for evidence of sexual freedom, but in reality, it is very difficult to map Western notions about sexual orientation onto non-Western contexts. Even in closely related societies, such as those of Latin America, the United States, and Canada, ideas about male homosexuality have been shown to vary considerably, so that, for

example, the nature of the sexual activity (active versus passive) may be more important than the sex of the partner in determining sexual identity. Furthermore, within complex societies, distinct sexual subcultures with their own notions about sexual orientation flourish within different racial, class, ethnic, and regional groups. For instance, while upper-middle-class lesbians in the United States embraced a model of androgyny and equality between partners in the latter half of the twentieth century, working-class lesbians chose to be either “butch” or “femme,” a pattern that later came to influence their wealthier and better-educated sisters as well.

In the early twenty-first century, although some social and biological scientists continue to pursue other methods of identifying sexual orientation, most observers simply ask the person in question, leaving sexual orientation as a question of self-identity. Such an approach assumes a more tolerant attitude toward homosexuals and bisexuals than in the past, when such an identity was widely regarded as “sick” and their “illness” as illegal. It was not until 1974 that members of the American Psychiatric Association (APA) adopted a resolution that being “homosexual did not imply any impairment in judgment, stability, reliability or general social or vocational capabilities” (Bullough, 1994). Such a conclusion was based on research dating from at least the beginning of the twentieth century, but change in psychiatric opinion was slow and occurred only in response to activists in the gay and lesbian community, who confronted both the American Psychiatric Association and the legal system. Groups such as the American Civil Liberties Union (ACLU) and the American Law Institute began agitating for change in the 1950s and the early 1960s, as did a growing number of people in the gay community, an agitation culminating in the 2003 decision of the U.S. Supreme Court declaring sodomy laws unconstitutional.

Acquiring an Identity

As the barriers fell, increasing numbers of gays and lesbians came out of the closet, proclaiming their sexual orientations. Acquiring a public gay identity is extremely important but not always an easy process even though most gays and lesbians indicate they felt that somehow they were different in childhood and adolescence from others. Only gradually in their teens did they begin to identify themselves as homosexual. Those who do so tend to be culturally defined by society as a single homogeneous class.

In reality, of course, gays and lesbians, either as individuals or in groups, are a very mixed collectivity of individuals with a wide-ranging variety of behaviors, although most seem to be gender atypical in some traits. Attempts to identify the precise relationship between sexual orientation and gender by researchers have led only to contradictory and very tentative results, possibly because such relationships tend to change rapidly in response to changing social conditions.

Most theories fall into one of two categories: psychosocial dynamic or biological dynamic, sometimes simplified as nurture versus nature. Psychosocial dynamic theories attempt to explain development of a person’s sexual orientation in terms of internal mental processes and the interaction of these with

reward and punishment. Examples of these include the psychoanalytic theory of Sigmund Freud or socialization theory such as put forth by Ira Reiss, who held that the greater the rigidity of gender role in male-dominant societies, the higher the likelihood of male homosexual behavior. This was, he said, because the rigidity of the gender role could lead a male child who did not conform to find conformity with other nonconformists, that is, male homosexuals.

In the 1990s biological theories that explain sexual orientation in terms of biological phenomena, such as brain circuitry, hormones, genes, and evolution, became increasingly popular. Researchers have looked at such factors as prenatal hormones as well as other physiological and anatomical features, but all of these theories have limitations, some more serious than others. Since homosexuality is thought to run in families, there has been a search for genetic influence; but while some researchers have found what they think is evidence along these lines, there generally has been a failure to replicate the findings.

So far there are too many variables involved to come up with any definitive answers. At the moment, sexual orientation seems best left up to the individual to define for himself or herself.

SHINTO. *Shinto*, composed of two ideographs, literally means the “way of the *kami*.” Although *kami* can be translated as gods or deities, it also refers more generally to spirit-beings, the supernatural, or to a sacred quality in which an individual can even participate. *Shinto* refers to what has become a

religious tradition indigenous to Japan that recognizes the existence of the *kami* governing various aspects of reality. There is no primary revelatory text from which doctrines emanate. Instead, doctrines have become established over time, with evidence showing conceptual interaction with Daoism, Buddhism, and Confucianism over the centuries.

The sacred as represented by the *kami*, in whom lie the constructive “way” of creation, harmony, and uprightness, plays a central role. These truths can be discerned through faith and ritual. While beneficial and malevolent forces are both recognized, they are not necessarily strictly separated, since good and evil are understood as closely related. In Shinto mythology, for example, it is not unusual for the effects of particular gods to change from one to the other depending on the *kami*’s circumstances.

Central to Shinto is the concept of purity and purification of one’s inner and outer selves. Purification of the inner self involves living before the *kami* in reverence and worship. Shinto recognizes that life lived with such reverence shapes attitudes of heart and mind, leading to *magokoro* (“heart of sincerity”). This, in turn, influences all of man’s relationships to himself, to others, and to the world leading to harmony and peace. In this way, man also partakes in the divine as he lives in accordance to the way of the *kami*. The purification of the outer self involves the observance of various rites—among which are included rites for different stages in an individual’s life, and festivals (*matsuri*) at various times of the year.

Contrary to common perceptions, for most of its past, Shinto did not exist as an independent religion. In this sense, presenting a summary of the “history of Shinto” may misleadingly reify its existence when it was not truly there as a distinctive religious tradition. The term as it is understood today did not become common parlance until the twentieth century. Still, since modern Shinto reflects the broader tendencies of folk religion in Japan’s history, and since the tradition claims historicity, the history of Shinto as it is often presented remains significant.

It is standard to present the origins of Shinto as being historically discernible as far back as the Yayoi period (roughly 300 B.C.E. to 300 C.E.) in which *uji*, or clans, worshipped the *ujigami*, its tutelary deity. While these *kami* were often ancestral, others represented various aspects of nature or ideas. As the Yamato clan, from which the imperial line is said to come, gradually grew powerful, the authority of its tutelary deity also expanded. During the seventh and eighth centuries, Daoist, Confucian, and Buddhist traditions deeply influenced Japanese folk belief. Efforts in the eighth century made Buddhist and Shinto philosophies compatible in a process called *shim-butsu shûgô* (unifying of gods and buddhas). Shinto *kami* became protectors of Buddhism, making it possible to have Shinto shrines within Buddhist temples. Such Buddhist-Shinto accommodation became more explicit during the Kamakura period (1192–1333): Ryobu (Dual) Shinto taught that the two realms of the universe in Shingon Buddhism corresponded with the two *kami* (Amaterasu and Toyouke) of the Ise Shrine; and, Sannô Shinto taught that the fundamental truth of the universe was equivalent to Amaterasu, the sun goddess, who

was the source of the universe. Buddhism, however, generally remained more politically powerful and much of what is referred to as Shinto during this time may, in fact, be more Buddhist.

Shinto as a more distinct religious tradition is said to become more recognizable in reactions to Buddhist dominance that occurred in the thirteenth and fifteenth centuries. In the thirteenth century, Watarai (or Ise) Shinto taught that *kami* were the basis of all beings including buddhas and bodhisattvas. In actuality, however, the Watarai tradition continued to assume compatibility with Buddhism. In the fifteenth century, hints of Shinto as a distinctive religion appear. Yoshida Shinto, established by Yoshida Kanetomo (1435–1511), taught that Buddhism and Confucianism were second-hand versions of Shinto, and that indigenous knowledge of truths had been handed down through generations through his lineage. Although Yoshida Shinto’s influence would be subdued during the Tokugawa period (1603–1867) when Neo-Confucian philosophy legitimized the state, it continued to inform Shinto beliefs leading to the development of Nativist Studies (Kokugaku) and the thinking of Motoori Norinaga (1730–1801). This would eventually coalesce in Fukko (Restoration) Shinto that called for the restoration of imperial rule, resulting in the Meiji Restoration and the start of Japan’s modern history.

Following the Meiji Restoration until the end of World War II, Shinto was made a state religion that taught the national ethic of reverence for and submission to the emperor. Kokka (State) Shinto, as this form is called, was very much a modern creation and was used aggressively by the state to nurture a loyal and nationalistic population. In the postwar period, though some traditionalist conservatives are known to seek revivals of this in some form, due to its disestablishment in the postwar constitution, Shinto no longer has such close connection with the state and is substantially weaker.

Still, Shinto belief and practice continue and exert their shaping influence upon attitudes and values of many Japanese. Shinto weddings, or festivals marking the calendar such as *obon* in the summer, the November festival for children, or New Year’s Day, all remain popular and have become deeply embedded in national life. This has invited a new generation of scholars to move beyond viewing Shinto only in its statist form, to seeing it as a rich and lively tradition that continues to flourish in modern Japanese society. Although its close association in both beliefs and practice with the people and politics of Japan has given Shinto a parochial sensibility not conducive to spreading overseas, its continuing vitality has raised questions regarding the place of folk religion in the modern era and has won scholarly interest.

SKEPTICISM. Skepticism is both a generalized sense of doubt and disbelief as expressed in everyday language and an identifiable school of thought in the history of ideas. In its most general sense it refers to uncertainty, doubt, disbelief, suspension of judgment, and rejection of knowledge. It is characterized by its opposition to dogmatism, which claims to know reality and the truth.

As a philosophical tradition skepticism is best understood as the product of two movements in ancient Greek philosophy. Academic skepticism can be attributed to Socrates and to Plato’s successors at the Academy in Athens (fifth century to second century B.C.E.), and Pyrrhonism can be traced back to Pyrrho of Elis (c. 365–275 B.C.E.). Elements of skepticism can be found in many other schools of ancient Greek philosophy, from Heraclitus to the Cyrenaics and the Cynics. There are also analogies to ancient Greek and Roman skepticism in ancient Chinese, Persian, Arabic, and Indian philosophy, but they did not have the impact on modern thinking that the Mediterranean skepticisms did.

Academic Skepticism

The Roman philosopher and statesman Marcus Tullius Cicero (106–43 B.C.E.) is the chief source for Academic skepticism. His *Academica* (45 B.C.E.) reports on the teachings of Arcesilaus (315–240 B.C.E.) and Carneades (214–129 B.C.E.), both heads of the Academy, and he claims allegiance to the

Academic school. St. Augustine of Hippo’s earliest extant work, *Contra Academicos* (Against the Academics; 386 C.E.), is also an important source of knowledge about Academic skepticism.

Socrates can be placed at the origins of skepticism if it is understood that he only asked questions and did not teach positive doctrines. Plato and Aristotle strayed from his path when they claimed to know the truth. Arcesilaus gave renewed vigor to skepticism, arguing against the opinions of all men, as Cicero put it. But he also showed that skeptics could make choices in accordance with the *eulogon* (the reasonable) in the absence of truth. Carneades, also a master of arguing on both sides of every issue, refined this into the standard of the *pi-thanon* (the credible). Cicero translated this into Latin as *probabile*, setting the stage for the skeptics’ claim to live by the probable in the absence of truth.

Manuscripts of Cicero’s *Academica* were available in the Middle Ages to figures such as John of Salisbury (1115–1180), who used it to underpin defenses of liberty of thought and speech. The text was first printed at Rome in 1471, followed by numerous commentaries and annotations. By 1600 more than 100 editions had been published.

The Dutch humanist Desiderius Erasmus (1466?–1536) admired Academic skepticism in his *Praise of Folly* (1511), which provoked opposition from Christians like Philipp Melancthon (1487–1560). Gianfrancesco Pico della Mirandola’s *Examen Vanitatis* (1520) drew from both Cicero and Sextus Empiricus. Omer Talon emphasized the Academics’ philosophical freedom from dogmatism in his *Academia* of 1547, and Petrus Ramus praised their rhetoric and style in *Ciceronianus* of 1557. Giulio Castellani (1528–1586) defended Aristotelianism against Academic skepticism in *Adversus Marci Tullii Ciceronis* (1558), arguing that disagreement is not as widespread as the skeptics claimed. Johannes Rosa (1532–1571) brought out a substantial early commentary on the *Academica* in German in 1571, and Pedro de Valencia (1555–1620) refashioned Academic skepticism in his own *Academica* of 1596, published in Spain.

Publication of Sextus Empiricus’s works in the 1560s replaced Cicero as the chief source of information about ancient skepticism. After that point most authors drew their inspiration from both sources, so it is hard to speak of purely Academic skeptics from then on. One exception is David Hume (1711–1776), sometimes called an Academic skeptic, among other reasons because a character in his *Dialogues concerning Natural Religion* (1779) takes the role of an Academic. There has also been scholarly debate about whether other individual early modern figures were Academic skeptics or Pyrrhonians, but in this period the two traditions were often run together and few, if any, authors made a clear distinction.

Pyrrhonism

The chief source for ancient Pyrrhonism is the work of the Greek physician Sextus Empiricus (second century C.E.), including *Outlines of Pyrrhonism*, *Against the Dogmatists*, and *Against the Mathematicians*. Once thought of as a mere compiler, many recent studies have found philosophical originality

in his texts. As Sextus explained it, skepticism was not a philosophy but rather a way of life in which one opposed all claims to truth with equal opposite claims (equipollence). Standard tropes or formula arguments could be used against any certainty or truth. He attributed one set of these tropes to the Greek philosopher Aenesidemus and another to Agrippa (both first century B.C.E.). Diogenes Laertius's *Lives of the Philosophers* (early third century C.E.) is also a source for information about ancient skepticism, including the tropes.

In Sextus's account, the basic ten tropes or formula arguments show that the same thing appears differently (1) to different animals, (2) to different individuals, (3) to different senses, (4) to the same sense in different conditions, (5) in different positions or places, (6) in company with different things, (7) in different quantities, (8) in different relations, (9) if common or if rare, and (10) to people with different customs or ways of life. Thus, any claim about a thing could be matched with an equal counterclaim. Other tropes bring out the problem of the criterion (an infinite regress), unresolved disputes, problems with attributing causation, and more. The result of the skeptical tropes was that one would suspend judgment (*epochē*) and then find oneself in *ataraxia*, or tranquility, no longer disturbed by conflicting claims. One would live in accordance with the phenomena or appearances, without taking a stand on the truth or reality behind them. One would follow one's natural impulses as well as local customs and laws.

Even in ancient times, critics of the skeptics accused them of inconsistency, incoherence, immorality, and inability to live their skepticism. These arguments were more and less sophisticated, and ranged widely from the claim that skeptics cannot be fully skeptical because they believe their own positions are true to the claim that skeptics will not make reliable friends. As late as the 1980s, a number of scholars of ancient skepticism continued to maintain these claims, but opinion turned in the 1990s as a consensus emerged that skeptics could indeed live their skepticism, and that they would not necessarily be any more immoral than followers of other philosophies.

Much of Sextus's text consists of refutation of other dogmatic philosophies of the time. Since he quoted their ideas in order to refute them, his text has been an important source of information about ancient Stoicism, Epicureanism, and other philosophies.

Early Reception

Occasional references to the ancient Pyrrhonists can be found throughout the late Roman and early medieval periods. The oldest extant Greek manuscript of Sextus dates from the tenth century, and manuscripts of Latin translations existed in medieval collections by the fourteenth century. More manuscripts came into Italy from Byzantium in the mid-fifteenth century, when the Florentine religious leader Girolamo Savonarola (1452–1498) used Sextus to combat pagan philosophy, and the humanist scholar Pico della Mirandola drew on Sextus to fight other dogmatists. Knowledge of the materials eventually spread into France and other northern countries.

The printing press made for the most influential dissemination of these texts. Published Latin translations by Henri II

Estienne (Stephanus) (1562) and Gentian Hervet (1569) provided the stimulus for a widespread "skeptical crisis." Michel de Montaigne (1533–1592) was the most influential of the early European writers to draw on the writings of Sextus in his *Essais* (Essays; 1580–1595). In his longest essay, "Defense of Raymond Sebond," Montaigne retailed most of the skeptical tropes and all of the skeptical vocabulary from Sextus Empiricus. In this and other essays he demolished pretensions to human knowledge and argued both sides of nearly all issues. He was never pessimistic but showed people how to live a good life in spite of skepticism, which helps explain why his work was so popular.

Later thinkers often started from Montaigne. One who went beyond him in posing questions of skepticism was René Descartes (1596–1650). Without specific precedent in the ancient materials, he set out to answer the skeptical idea that there could be an all-powerful *malin genie* or evil demon that manipulates human perceptions and reasoning, fooling people about the world. His conclusion was that individuals know of their existence because they can think—the famous "I think therefore I am." Explaining why one's perceptions of thinking could not be a deception, Descartes asserts that God would not allow such deception. Religion is invoked to certify truth. Later skeptics would worry about a deceiving God.

Bishop Pierre-Daniel Huet (1630–1721) and the Huguenot refugee Pierre Bayle (1647–1706) have been described as the "master skeptics." Huet invoked Sextus Empiricus in great detail against Descartes and many other dogmatic philosophers in his *Traité philosophique de la faiblesse de l'esprit humaine* (1723; Philosophical tract on the weakness of the human mind). Bayle's massive works attacked all previous philosophy and historical scholarship but upheld moral rigorism.

Reception in and since the Enlightenment

The Scottish philosopher David Hume responded to the skeptical challenge in ways that made him central to philosophical discussion up to the twenty-first century. His *Treatise of Human Nature* (1739–1740) argued for skepticism about both facts and reason. His critique of causation reduces it to little more than a habit based on constant conjunction. And yet in typical skeptical fashion he showed people how to live with skepticism on the basis of probabilities and custom.

The Prussian philosopher Immanuel Kant (1724–1804) was called the "all-destroyer" because of his rejection of many other dogmatic philosophies. He adopted skeptical Greek vocabulary when he argued that one could have no knowledge of the noumena—the reality behind appearances—but only of the phenomena. He saved free will and morality from scientific determinism by reducing human knowledge of them to faith rather than knowledge. Other skeptics writing in German in his time included Salomon Maimon and Gottlob Ernst "Aenesidemus" Schulze. When Carl Friedrich Stäudlin's *Geschichte und Geist des Skepticismus* (History and spirit of skepticism) of 1794 showed Hume facing Kant on the title page, it was clear that these two thinkers had posed the skeptical challenge for the age. Stäudlin denounced unphilosophical skepticism even as he demonstrated that philosophical skepticism could not be refuted.

In the nineteenth century, the German philosopher Georg Wilhelm Friedrich Hegel (1770–1831) believed that ancient skepticism was of great philosophical importance while modern skepticism had little merit. The Danish philosopher Søren Kierkegaard (1813–1855) incorporated skepticism into his theology. One of the prize questions of the Royal Academy in Paris concerned the failure of all answers to skepticism. The Swiss philologist and philosopher Friedrich Nietzsche (1844–1900) made skepticism a significant part of his philosophy. Karl Marx (1818–1883) and Sigmund Freud (1856–1939) followed in a long-established tradition of using various skepticisms against their opponents but then claiming dogmatic truth for their own positions. Their practice reflected the important distinction between partial skepticism (e.g., of claims in one domain, such as religion, or the claims of an opposing political party) and global or universal skepticism, which suspends judgment about everything.

In the twentieth century Jean Grenier (1898–1971) translated Sextus into French. His student Albert Camus (1913–1960) drew on skepticism in his work as one of the founders of existentialism. In Germany, Odo Marquard (1928–) led a self-consciously skeptical charge against the dogmatism of thinkers such as Jürgen Habermas. Also in the same century, some analytical philosophers developed their own ahistorical definitions of skepticism and debated them with little if any reference to the traditions of skepticism. Revisionists such as Stephen Toulmin (1922–) then interpreted one of their heroes, Ludwig Wittgenstein (1889–1951), as following in the footsteps of the ancient skeptics.

Skepticism in Medicine and Science

Of all the fields that in the early twenty-first century are considered sciences, medicine has been especially intertwined with skepticism. Sextus Empiricus was a practicing physician whose work influenced his philosophy. The writings of the Greek physicians Hippocrates (c. 460–c. 377 B.C.E.) and Galen (c. 129–c. 200 C.E.) stressed the importance of skeptical observation and experience and the dangers of dogmatic theory in medicine. Their work was an important part of medical education in early modern Europe, introducing the student to both dogmatic medicine and the skeptical critique.

Several prominent early modern physicians developed the connections between skepticism and medicine. The Toulouse professor Francisco Sanches (c. 1550–1623) called himself “Carneades philosophus,” attacking Aristotelian science in his book *Quod Nihil Scitur* (That nothing is known; 1581). The English physician and philosopher John Locke (1632–1704) borrowed some of the skeptical elements in his philosophy from the skeptical physician Thomas Sydenham (1624–1689). Martín Martínez (1684–1734), royal physician and president of the Royal Medicine Academy of Medicine in Seville, published *Medicina Sceptica* (1722–1724), attacking dogmatic Galenism, and *Philosophia Sceptica* (1730), which introduced Descartes to Spain. The German physician Ernst Platner’s (1744–1818) skeptical writings were influential in Kant’s time.

The early natural scientist Francis Bacon (1561–1626) was convinced that the experimental method would produce

absolute certainty. Skeptics like François de La Mothe Le Vayer (1583–1672) used skeptical tropes to show that science could not produce certain knowledge. Other philosopher-scientists, such as Marin Mersenne (1588–1648) and Pierre Gassendi (1592–1655) in France, rejected the need for certainty and defended experimental science on the ground that it is enough that it produces useful knowledge. This attitude prevailed at the Royal Society in London. Skepticism could sweep away the pretensions of Aristotelians and other dogmatists while leaving scientists free to continue their experiments. In this spirit, Robert Boyle (1627–1691) named his spokesman “Carneades” in *The Sceptical Chymist* (1661), and Joseph Glanvill (1636–1680) titled one of his books *Scep̄sis Scientifica* (1665).

By the twentieth century, natural science had pretty much left the skeptical path, claiming something close to a monopoly on truth and knowledge. But avatars of the skeptical tradition still emerge here and there in connection with the sciences. The philosopher of science Karl Popper (1902–1994) contended that scientific claims could never be absolutely verified, only falsified. Paul Feyerabend (1924–1994) was described as a Pyrrhonian for his generally skeptical attitude toward all scientific claims.

Skepticism in Law, Historiography, and Political Thought

It is no accident that one of the chief sources for Academic skepticism was a lawyer. After all, Cicero spent much of his professional life making cases for clients, regardless of which side truth was on. Montaigne also studied law and served as a magistrate, and concluded both that judges can make the law come out any way they want, and that they are often wrong. Legal realists in the twentieth century endorsed these views, concluding that the law was more an expression of social power than of truth or certainty. Legal education encourages skepticism by teaching lawyers how to argue both sides of any case.

Especially in the seventeenth century, skepticism made its way into historiography, as writers began to question the received accounts of history. La Mothe Le Vayer’s *On the Small Amount of Certainty in History* (1668) and Pierre Bayle’s *Historical and Critical Dictionary* (1697–1702) brought numerous historical errors to public attention. The only lasting solution was to learn to live with the appearances and accept lower standards for practical purposes instead of absolute certainty.

Throughout the early modern era, skepticism was used to justify a wide variety of political stances, from radical reform to quietist conservatism. The implications of many of Montaigne’s political commentaries were quite subversive of the political arrangements of his time. But his contemporary, the Dutch thinker Justus Lipsius (1547–1606), claimed that skepticism justified repression of reformers on the ground that they could not know that they were right. The English political philosopher Thomas Hobbes (1588–1679) accepted much of the skeptical critique of knowledge and concluded that, for the sake of social order, the king should define the truth and punish deviations from it. Hume drew the different political

implication that people should be left alone in commercial society to define their own manners and opinions. Kant concluded that one can know what politics should be like (ethical and republican) but that one could never know if these standards are really instantiated in any concrete political arrangements.

Earlier figures from Montaigne to Kant were often aware of the genealogy of their ideas, but even later writers working in ignorance of the roots of their ideas have come up with a similarly wide range of political conclusions. Without indicating much awareness of the skeptical tradition, the British political philosophers Edmund Burke (1729–1797) and Michael Oakeshott (1901–1990), each in different ways, used skepticism to undermine dogmatic political activism. Post-modernists with generally radical or activist sympathies have also not usually been aware of how close some of their positions are to the skeptical tradition.

Skepticism and Religion

The historical scholarship of Isaac la Peyrère (1596–1676), Benedict de Spinoza (1632–1677), and Richard Simon (1638–1712) contributed to skepticism about the Bible. In response, it has been common to accuse skeptics of atheism, libertinism, and immorality. But skeptics were not necessarily atheists. One of the most common uses of skepticism was by the self-described orthodox against pagan claims to truth; by the Lutherans and Calvinists against Catholic claims to infallibility; and by Catholics against Protestant claims to truth. Many religionists believed that if all claims to truth can be demolished, one should accept traditional religion on faith. This position is known as fideism.

Various versions of fideism were widespread. Thinkers from Montaigne to Huet and Bayle wrote that skepticism cleared the way to faith by removing rationalist objections. Kant famously wrote that he had had to deny knowledge in order to make room for faith. Whether some of these figures were insincere atheists, using fideism as a defense against charges of heresy, has been the subject of debate ever since.

But there is little doubt about the sincerity of many fideists. The sixteenth-century translators of Sextus, Huet and Stephanus, were both Christians who believed that skepticism could help them in apologetics. Blaise Pascal (1623–1662) in France Christianized skepticism by showing that, properly understood, it set the scene for Christianity. Philosophers at the Prussian Academy who translated the Greek, Latin, and British skeptics into French and German, such as Jean-Henri-Samuel Formey (1711–1797), Jean-Bernard Mérian (1723–1807), and Jean de Castillon (1709–1791), tried to draw the teeth of skepticism by adding notes that made it consistent with Christianity. The Germans Johann Georg Hamann (1730–1788) and Friedrich Jacobi (1743–1819) adopted skepticism as a propaedeutic to Christian faith. Kierkegaard claimed that skepticism was the key to proper Christianity, which required a “leap of faith” after dogmatism had been destroyed by skepticism. The Russian theologian Lev Shestov (1866–1938) even rejected mathematics in order to achieve faith. Twentieth-century theologians were also compelled to either use skepticism or refute it.

In the twenty-first century it is safe to say that the challenges of the skeptical tradition to any claims to human truth and knowledge are alive and well. Many and perhaps most modern and postmodern thinkers have internalized much of skepticism, often without full awareness of the genealogy of their ideas. The chief elements of skepticism must be adopted, adapted, or refuted by any thinker. Since no one has succeeded fully at the last of these, variations on the former prevail.

John Christian Laursen

SLAVERY. Slavery is possibly the most ubiquitous of all human institutions. It has existed in most times and most places, and few peoples have not, at various times, been either the enslaved or the enslavers. While slavery has generally been coerced, the result of war capture or kidnapping, in periods of

Slaves cutting sugar cane in Antigua, 1823 painting by William Clark. The majority of slave labor was used in crop production and the handling of livestock, but some slaves were retained as domestic servants and still others as concubines. COURTESY OF THE JOHN CARTER BROWN LIBRARY AT BROWN UNIVERSITY

low and variable levels of agricultural output slavery has been entered into voluntarily, people choosing survival ahead of freedom. Slavery has almost always been a status reserved to those, both males and females, considered outsiders to the enslaving society, but the definition of the outsider has varied over time and place. It has been based on nationality, ethnicity, religion, race, or membership in a different tribal or clan group. Individuals who are considered outsiders have a different legal status and can be subject to different treatment and punishments from those considered members of the enslaving society, who will not become slaves, whatever their treatment in other regards.

Slavery is regarded as one end of a spectrum that includes different forms of coerced labor, including serfdom, indentured labor, debt bondage, and “wage slavery,” in contrast with so-called free labor. Slavery is characterized legally as including the right to buy and sell the enslaved and to have control over where the slave will reside and the nature of his or her labor. As a legal system it is enforced by the government or the elites, and this enforcement is central to its continuity, since it precludes one individual bidding slaves away from their owner as well as ensuring that runaway slaves will be returned to their owners. These legal rights are given slave owners and create an unbalanced power relationship, with psychological

impacts upon the enslaved; these rights do not mean, however, that nominally free labor need be treated better or have a higher material standard of living than do slaves. If there are limited choices of work and residence due to poverty, the dramatic legal difference may seem more limited in its consequences in actuality.

The work performed by slave labor varied among slavery societies, and in several societies slave women served as concubines or objects for the sexual pleasure of the enslavers and not just as agricultural or industrial workers. In the extensive debate about the relative efficiency of free versus slave labor in agriculture, the expected benefits described for free labor included both the greater incentives of free labor compared to a slave system that presumably had no incentives and the greater need for free labor to work hard to avoid starvation, whereas slaves could be supported by their owners.

Abolition

Most religions generally considered that slaves be well treated and that, if possible, manumission into freedom was desirable. This did not mean, however, that the existence of the slave system was placed under attack. The first major attack on slavery as a system originated in England in the late eighteenth century, and this attack spread to other western European nations

and to the United States in the nineteenth century. Although the attack was aimed at slavery on moral or economic grounds, most nations ended the foreign slave trade about a quarter-century before slaves were freed. Western European nations ended slavery in their American possessions at about the same time European nations ended serfdom, often with similar arguments about the nature and morality of coerced labor. In the cases of both slavery and serfdom, compensation was generally paid to slave owners and landowners in cash, bonds, or compelled labor time, with no compensation paid to the freed labor, reflecting the belief in the property rights of owners of labor, not the right of individuals to own themselves.

The antislavery argument stressed the immorality and the economic inefficiency of the slave system and argued that a devastating psychological impact resulted from the status of being a slave. Two arguments for this psychological effect dominated the slavery debates. To some, given the then-racial basis of slavery, it was due to the genetic basis of the African population. To most antislavery advocates, the destructive impact was due to the slave status and reflected environmental factors that would influence anyone, of any race, who had been enslaved. This distinction was not only important in the arguments about slavery but also was central to debates about whether emancipation should be immediate or gradual. Hence emancipation schemes that allowed for periods of apprenticeship were advocated not only because they helped masters obtain a financial return but also because such apprenticeship could serve to provide a necessary education to the freed people to deal with their freedom.

Modern Slavery in the Americas

Although slave societies have taken many different forms in terms of differences in the proportion of the population who

were slaves, in the labor undertaken by slave laborers, and whether they were located in rural or urban areas, most impressions of the meaning of slavery are based upon what Moses Finley (1980) describes as the five major slave societies in world history—Greece and Rome (each with about 30 percent of the population being slaves) and the three New World slave powers—the British and French Caribbean (90 percent slaves), the U.S. South, and Brazil (each with about 30 percent slaves).

The New World slave powers imported slaves purchased in Africa; about 10 million Africans were taken to the Americas from the start of the sixteenth century to the middle of the nineteenth century. Generally the number of males transported was greater than females (a proportion of about 60 to 40), due both to a New World desire for males and an internal African demand for females. There was also a large trade from southern Africa to North Africa and the Middle East, as well as a substantial internal slave trade within Africa. Most slaves in the transatlantic trade went to the Caribbean and to Brazil, with the United States receiving only a small part of this migration. The United States was unusual for a slave society because of its high fertility rate among slaves and rapid rate of natural increase, whereas the other areas suffered from a natural decrease, and the United States came to account for a large part of the New World slave population by the nineteenth century.

Slave labor was generally most important in producing crops, such as sugar, cotton, tobacco, rice, and coffee on plantations, for sale in European markets. Crops were grown on units larger than family farms—often, in the case of sugar, containing up to two hundred laborers—although most of the labor input on these plantations involved the growing of foodstuffs and the handling of livestock. Rising prices paid for slaves in Africa and in the Americas throughout this period are suggestive of the profits obtained from the use of slave labor. A few northern states in the United States ended slavery by the 1780s; with intellectual impetus from England and elsewhere in Europe, in the next century slavery was ended throughout the Americas due to slave rebellion in Haiti, legislated compensated emancipations by the British and French, the Civil War in the United States, and by legislation in Brazil in 1888.

The experience of all ages and nations, I believe, demonstrates that the work done by slaves, although it appears to cost only their maintenance, is in the end the dearest of any. A person who can acquire no property, can have no other interest but to eat as much, and to labour as little as possible.

SOURCE: Adam Smith, *The Wealth of Nations*.

There is no use for slaves, where all disagreeable work can be, and is performed by the weaker sex; Australian and Melanesian women supply the place of slaves. On the other hand, where the women hold a high position, and the men are desirous of relieving them of a part of their task, slavery is likely to arise sooner than otherwise would be the case.

SOURCE: H. J. Nieboer, *Slavery as an Industrial System*.

Despite the ending of slavery in the New World, it continued into the twentieth century in Africa and Asia, with the final legislated ending in the Arabian peninsula in the 1960s, although variant forms of slavery continue to exist in parts of North Africa and sex slaves continue to be held in Asia and Arabia. The term *slavery* remains applied to conditions of low income and of a loss of control by individuals over their own lives, not just to the existence of slaves as a form of legal property, so that it is still argued that slavery persists in the world of the twenty-first century.

Stanley L. Engerman

SOCIABILITY IN AFRICAN THOUGHT. *Sociability* is a descriptive term that refers to the relational or interactive disposition and condition from which persons, as individuals, are said to derive their identity and status. According to this view, humans are regarded as beings whose defining characteristics, like reason, and its manifestation in cognitive, moral, and language

capacities, are said to arise from the social conditioning of human life. Although this communalistic principle underlies African philosophical endeavors as well as African people's practical orientations to social, moral, and political values generally, the concept has received only meager attention and treatment by African intellectuals and remains to be finely articulated and applied openly in metaphysical, epistemological, political, and ethical analyses of Africans' experiences. This lack of a robust presence of the relational view of the world in African theoretical culture is in spite of the vigorous claim by African political leaders like Léopold Sédar Senghor (1906–2001) and Julius Nyerere (1922–1999) in the early 1960s that "African socialism," an idea they claimed was based on traditional African communalism, was the moral flag of a distinctly African ideological framework and the key to a collective African socioeconomic growth. Benefiting from both the political (independence) and religious (post-Vatican II and ecumenical) fervors of the time, emerging African theologians and philosophers, like Vincent Mutilago (1924–) and John S. Mbiti (1931–), defended this view, arguing that the Christian Church had much to learn from the communalistic African cultures in its quest toward self-definition as a community or family of believers. More recently, African philosophers, especially Kwasi Wiredu and Kwame Gyekye, both of Ghanaian origin, have published works that crucially and compellingly place African communalism back at the center of a distinctly African point of view to philosophical visions.

The idea of human sociability is metaphysical, but it is founded on the observation of the biological human dependency of new members of the species on other and older members for their security, growth, and flourishing. The observation of this basic human condition leads to the idea that humans can attain the full development of the characteristics and properties that make them specifically human, or persons, only by depending on each. By education and imitation, humans learn from each other and acquire the capacity to competently function and behave as members of the species. Thus one is born biologically human but only socially does he or she become a person. It can be argued upon this view that although human nature is bestowed upon us by the biological constitution of the species, it is the communicative activity among us that sets in motion the development and flourishing of our cognitive and moral capacities. Thus our capacity to develop our basic human competencies is governed by our disposition to be sociable. It is in this sense that sociability becomes a metaphysical condition, because the distinguishing properties of the species depend on, and grow from, it.

While sociability is recognized in all cultures as a universal condition for the growth and flourishing of human capacities, some cultures go further by making such a condition the basis for advancing the belief that values that promote communal interests are superior to those that promote individual ones. Dominant ideas about individual selves, or persons, and about how they relate to others in society are the basis of vast differences in value systems of different societies and cultures as reflected in their respective sociopolitical and economic organizations, as well as in the principles upon which their moral systems and ethical theories are built. While cultural systems that give prominence to the rights and liberties of the

individual tend to define individuals in terms of their inherent personal attributes and capacities, those that put emphasis on the community tend to prefer relational models of personhood. In the latter, individuals are considered as links in genealogical chains within which they bear responsibility for the furtherance of their respective families and lineages. They are part of larger communal or social subjects that have rights just as individuals do. Cognitively and morally, individuals in relational models of society become part of the social quest toward ideal common goods such as truth and moral good. Because of this communalistic standpoint, one notices in these cultural systems or traditions a signification skepticism toward objectivist epistemological theories, as well as toward the idea, pivotal to the Kantian moral scheme in Western philosophy, of universal moral right that is knowable, directly and independently, by individual minds. By contrast, it is argued from the African communalistic view that epistemological truths and principles of moral right are ideals that we become aware of only in social contexts. Kwasi Wiredu, arguably the most senior and prominent African philosopher of the early twenty-first century, argues (1980, 1996) that epistemological truths are only opinions whereas the principles of moral right, while pursuing the golden rule, are arrived at by way of sympathetic impartiality. In other words, cognitive truths are neither part of the structural condition that makes experience possible nor are they the function of the mechanistic functioning of such structure. Truth is the idea, entailed in the nature of the assertions about our experience of the world, that it indeed be as we claim we perceive it. And it is hard, very hard, and perhaps impossible, for any one person to estimate such truth-value of their own assertions of their experiences without comparing them with those of other people, for every truth is always someone's truth. Truth, according to this view, is opinion. Similarly, as the estimation of the morally obligating nature of certain actions upon us, the idea of duty is not a structural property. Rather, it is a value that we know (become aware of) in social contexts as we attempt to harmonize our individual interests with the interests of others in society. Thus the communalistic view of morals provides the Kantian golden rule with a base, a social base. According to this view the construction of morals requires both the objective rationale and the subjective motivation.

African thought, whether traditional or more recent, does not view the idea of basic selfhood of all individuals as conflictual with what it upholds about community. In its constitution and realization, the self is enhanced and made possible by the communal condition of its flourishing, but it does not become inferior to the community by virtue of this dependency on it. Any view that sharply separates the two as mutually exclusive would be the result of the failure to see the pivotal mutual dependency between the two categories as logically, metaphysically, and practically related. Subjectivity is essentially intersubjective or relational, inasmuch as one can be empirically conscious of oneself only as one individual among many and must thus posit the freedoms and rights of self as commensurate with the freedoms and rights of others. Egoism and other principles of self-centeredness can thus develop only at the point where one loses sight of the superior common good that conditions and informs individual claims thereon, for common goods are, like human rights, those goods that are required equally by all as a means to leading life

worthy of human beings. For example, apart from abuses for which African leaders became notorious over the first four to five decades of Africa's independence from colonialism, traditional virtues are unequivocal on matters of human rights. Every person has a right to life irrespective of their age, gender, or their occupation in the community. Likewise, the traditional political and moral lores taught that every adult person has the right to those basic means, like land and their opinions, by which an adult is not completely one unless they can, respectively, fend for themselves and their dependents, as well as contribute to the growth of the community through the expression of their opinions. Because these rights are considered to be at the very foundation of what it means for everyone to be fully human, every individual has the right to demand these rights from their community as much as the latter has the duty to guarantee them for all its members. It will not escape the notice of many that this is one area in which African governments have made significant deference to traditional systems in matters of communal land use by limiting the jurisdiction of contemporary statutory law over some land tenure procedures. According to this view, the community protects the rights of the individual as much as the individual preserves the common good by respecting the rights of all other individuals with whom she shares basic equality in the eyes of the community.

African thought holds, therefore, that individual freedom must be externally limited if a community of free individuals with equal rights is to be possible, and demonstrates that a just political order is a demand of reason itself, since the principles of political and moral right are functions of generalizations made out of the practical experience of mutuality. The Ghanaian philosopher Kwame Gyekye uses Akan proverbs to illustrate the view that in African thought moral and political principles underscore the centrality of the idea of community while simultaneously upholding a relative status of individuality. According to him, "The view seems to represent a clear attempt to come to terms with the natural sociality as well as the individuality of the human person. It requires recognizing the claims of both communality and individuality and integrating individual desires and social ideals and demands" (1997, p. 41).

In their zeal to chart a sociopolitical path that was commensurate with their understanding of a full sense of post-colonial independence that included the recovery of cultural values deemed useful to the project, the first generation of African political leaders ideologized this communality into what they referred to as African socialism. It is significant to note that different brands of doctrinaire socialism were rife at the time African leaders were campaigning against colonial domination and therefore they may have been influenced in their choice of terminology (like the word *socialism*) to characterize this African virtue. However, the key texts in that generation of political thought, including the works of Léopold Sédar Senghor of Senegal and Julius Nyerere of Tanzania, both now deceased but renowned political and ideological leaders in the continent in their times, seem to indicate that their reference was to the communalism that Gyekye describes. In *On African Socialism*, Senghor says of the centrality of African idea of community: "Negro-African society puts more stress on the group than on the individual, more on solidarity than on the

activity and needs of the individual, more on the communion of persons than on their autonomy. Ours is a community society” (pp. 93–94). For Senghor, this communalistic “attitude” is an axiomatic foundation that clearly distinguishes Negro-Africans in their moral and sociopolitical value-systems from such others, like the European systems, for which society is an “assembly of individuals.” Thus for Senghor, as for the Martinican poet and political leader Aimé Césaire (1913–), with whom he jointly coined the term *negritude*, communalism was a major and distinctive characteristic of “being Negro-African.”

Like Senghor, Nyerere too believed that communalism was such a distinguishing mark of African cultures that it ought to be the guiding ideal of postcolonial politics. Nyerere gave it a new name, *Ujamaa*, a (Swahili) term recovered from the traditional social and moral systems to express the view that lasting good stems from recognition of the basic interdependency and ultimate unity of all human endeavors and goals. The distinguishing marks of *Ujamaa* were that it was communitarian rather than collective, democratic rather than totalitarian, homocentric rather than materialistic, and that it was founded on the primacy of law rather than on the dictatorship of class. In *Ujamaa: The Basis of African Socialism*, Nyerere says, “it is the attitude of mind, not the rigid adherence to a standard political pattern, which is needed to ensure that people care for each other’s welfare” (p. 1).

SOCIAL CAPITAL. The term *social capital* first began to be defined in the 1970s and remained largely restricted to the academic world of the social sciences until the 1990s, when it suddenly emerged as a central element in public discussions and policy debates about the quality of civic culture in Western nations, especially the United States of America. At the same time it also gained a place of prominence in discussions of political and economic “development” in the non-Western world by international agencies such as the World Bank. Despite this rapid ascent—becoming a key analytical concept used by academics (primarily sociologists, political scientists, and economists, but also anthropologists and historians), government policy planners, and international officials in development agencies within less than a generation—a firm definition of the term has not yet emerged, which is not surprising given that what it seeks to describe is largely intangible, diffuse, and elusive. As a result there has been a proliferation of usages, which has weakened the conceptual cogency of the term.

Broadly defined, what most authors mean in the early twenty-first century, when they write of social capital are social networks of cooperation in which people invest and from which they may ultimately derive benefits. According to most contemporary theorists of the concept, the three most important diagnostic features of such networks are social interaction, civic trust, and normative behavior.

Social capital is a theoretical concept rather than a clearly tangible phenomenon. Interaction, trust, and norms are observable and even measurable phenomena, whereas social capital is not itself perceptible, and hence difficult to define. Nevertheless, the first references to the term (as opposed to a defined concept) of social capital were observational rather than theoretical.

Most studies trace the first use of the term to a 1916 academic study by Lyda Judson Hanifan, a school supervisor, on the deterioration of civic culture in rural West Virginia. The next and perhaps most influential use of the idea came with Jane Jacobs’s 1961 study of the decline of American cities, a study that was based on her close observations of the changing nature of urban communities in New York City. Both authors called attention to the features and benefits of close social communities, and hence the need to preserve them.

It was not until the 1970s that the idea began to attract theoretical attention in the academic world; elements of the theory of social capital predate these attempts at definition, having been traced back to the idea of, among others, Jeremy Bentham (1748–1832), James Mill (1773–1836), Alexis de Tocqueville (1805–1859), Karl Marx (1818–1883), Max Weber (1864–1920), Georg Simmel (1858–1918), John Dewey (1859–1952), and Emile Durkheim (1858–1917). It is widely accepted that the three most important proponents of the concept of social capital have been the French social theorist Pierre Bourdieu (1930–2002) and two American social scientists, the sociologist James Coleman and the political scientist David Putnam. Their definitions of the concept, which vary considerably, usefully summarize a range of analytical and definitional perspectives.

Bourdieu's conceptualization of social capital, which owed nothing to the work of Hanifan and Jacobs, came out of his understanding of the workings of cultural capital among the upper classes of French society. He was interested in elucidating disguised or invisible forms of capital that were deployed by elites to maintain social inequality. He saw the nonmaterial exchanges inherent in social relationships as producing resources that members of elites drew upon to maintain their positions within the existing social structure. This view of social capital was very hierarchical and exclusive in its conceptualization, whereas Coleman's understanding of social capital was egalitarian and benign. His interest in social capital came out of his research on the importance of family and community in educational results. He found that familial and community resources, which he defined as social capital, were sufficiently powerful to compensate for economic disadvantages. For Coleman, whose definition of social capital drew on the concept of human capital that had been current in economics for over two decades, not only individuals benefited from social capital, but also society as a whole.

The highly influential definition of the social capital put forward by Putnam in the 1990s originated in his examination of the differences in civic engagement in northern and southern Italy; he used the concept to explain the more successful integration of civil society and the state in the north, which he traced back to medieval guilds. He went on to apply the concept of social capital to his study of civic culture in the United States; in an article published in 1995, which anticipated and summarized the argument of his book *Bowling Alone*, he brought the concept of social capital into the world of political debate and the popular media, first in the United States and then internationally.

Putnam looked at social capital primarily in terms of its benefits to society rather than the individual. He argued that there was a direct correlation between the quality of civic culture and levels of poverty, violence, and democracy. The diagnosis became popular in no small part because it suggested noneconomic solutions to social problems: increase social capital and solve a range of social problems. However, there was at least one major flaw in such reasoning: Putnam had failed to consider the role of economics adequately in the deterioration of civic culture in the first instance. Furthermore, as critics of Putnam, such as Alejandro Portes, have noted, social capital can itself lead to social problems, whether in the form of organized crime associations, prostitution and gambling rings, or youth gangs. These negative forms of social capital are much different than newspaper readership, voluntary associations, and political trust, which were the positive forms Putnam examined.

Social capital has been appealing to both conservatives, who use it to argue for the devolution of former governmental responsibilities onto society, as well as to liberals, who see it as a means for the state to deal directly with the causes of social problems rather than merely their symptoms.

Despite the divergent ideological lessons drawn from it, there is wide agreement about the importance of the concept in both academic and public policy circles today. However,

there is no consensus on how to measure it. Unlike conventional forms of capital, social capital is primarily relational rather than material. Some economists have been skeptical about the cogency of the concept as well as about the ability of proponents of social capital to arrive at quantifiable measures. Measuring social capital has been a particularly important task because of the prominent role the concept has assumed in discourses concerning economic development in the non-Western world, where the emphasis is not on civic culture but directly on amelioration of economic and political conditions.

By bringing the social to the forefront of discussions of economic and political conditions, social capital has had an important impact on the thinking of institutions such as the World Bank about development in the non-Western world. But the application of the concept beyond the West has raised a series of important questions, the central one of which is its relationship between society and the state. Some forms of social capital have been seen as inimical to economic and political development; where states have collapsed or become oppressive and economies deteriorated, and where accordingly survival strategies have heightened the importance of social capital, the symptoms have been read as a cause of continuing economic and political failure. Many forms of social capital that appear to be negative in the context of the West, must be understood within the much different historical origins and more problematic dynamics of the relationship between state and society in many parts of the non-Western world.

Both within the West and for the non-Western world, the idea of social capital offers new ways of thinking about social problems. In particular, it offers the possibility of integrating our understandings of the social and economic; however, if not properly integrated there is a real danger of the latter merely colonizing the former, thereby reducing social interactions to sets of instrumental strategies and rational calculations. Simply because it is a relatively recent concept, it requires further elaboration and refinement, which it is already beginning to attract. Even more nuanced insights will result.

SOCIAL CONTRACT. The "social contract" in the early twenty-first century is associated with the modern school of natural jurisprudence as crystallized in the seventeenth century (although earlier scholastics and humanists had also spoken of contracts, but differently, for example contracts between people and ruler rather than contracts that actually generate sovereignty). Yet there were preceding statements of central elements of social contract theory. The ancient Sophist Lycophron is sometimes credited with originating the idea of the social contract, and there are echoes of it in the teachings of Protagoras (c. 490–c. 421 B.C.E.) as well. The Roman author Cicero (106–43 B.C.E.) stated in his widely read treatise on rhetoric, *De inventione*, that social, legal, and political associations were the result of a primeval agreement to live together on the part of human beings who were previously in a wild and asocial condition. Likewise, St. Augustine (354–430) insisted that any true republic required agreement on the part of its citizens about the object of their love.

Modern Formulations

Modern theorists of the social contract school argued that political authority was artificial and conventional rather than divinely or naturally ordained. To sustain their argument, some—including Thomas Hobbes (1588–1679), John Locke (1632–1704), and Jean-Jacques Rousseau (1712–1778)—appealed to a social contract as a way of explaining the rational basis for and limits on political authority. But for most of these thinkers, the social contract was not the deepest basis of their arguments, which depended rather on new views about natural rights, sociability, passion, and reason. It was David Hume (1711–1776) in his "Of the Original Contract" of 1748, who, although agreeing that political authority was artificial and

conventional, attacked the use of the "social contract" by Locke and his followers and so retrospectively turned this image into the badge of a tradition.

By contrasting the social contract unfavorably with his own view of a duty to obey government grounded in utility, Hume established the debate between the social contract and utilitarianism that continued to structure Anglophone philosophy into the twenty-first century. (John Rawls's *A Theory of Justice*, 1971, is widely credited with reviving contractarianism, though others contributed to this revival before and since.) But Hume's classic criticisms of the contract approach—Were any governments actually founded by contract? When and how could people consent to such a contract, especially one founded before they were born? Why should the duty to keep contracts or promises be more fundamental than the duty to obey political authority?—apply principally to its Lockean interpretation.

Locke, in his *Second Treatise of Government* of 1689 (the year it was published anonymously), interpreted the social contract to require actual consent, whether explicit or "tacit." Most critics concur that he was unable to show convincingly when or how such consent is given, though he did powerfully develop the claim that however given, consent to a government that proves grossly incompetent or malicious can be rescinded. At the opposite extreme, Rousseau, in *Du contrat social* (1762; *On the social contract*), accepted only assemblies actually giving consent to laws as indicative of authentic social contracts. Yet the most interesting treatments of the idea of the social contract are those that treat it as a device for testing the rationality of obedience to political authority. Here, the justificatory force rests on not on visible consent or contract but rather on the rationality (broadly conceived) that such a contract exhibits. In different ways, Hobbes and Rawls both take this approach, as will be discussed below.

Political Authority versus Moral Principles

Hume's sometime-friend Rousseau can be seen as the initiator of a second fundamental question about the contract: that of its scope. Hobbes and Locke had both treated the contract in relation to the justification of political authority, although for Hobbes the contract also turned the precepts of a minimal morality (the "laws of nature") into binding civic law. Rousseau, however, saw the contract as creating simultaneously political legitimacy and genuine moral principles: in transforming asocial or antisocial "men" into civically minded "citizens," his social contract created justice and freedom along with the artifice of political authority. This role of the contract in constructing morality inspired Immanuel Kant (1724–1804), who, in addition to featuring the contract in his political theory, transformed its role in creating moral principles into his idea of the categorical imperative instructing every rational being to act only according to maxims that he or she could will to be a universal law.

Toward the end of the twentieth century, Rawls developed the role of the contract in justifying political authority, while its role in constructing and testing moral principles was developed primarily by David Gauthier, J. C. Harsanyi, and Thomas Scanlon. Scanlon extended a Rawlsian approach from

justice to morality, arguing that “contractualism” identifies principles that no one could reasonably reject. By contrast, Gauthier and Harsanyi both bridged the Humean distinction between contract and utility, using contractarian approaches to argue for utilitarian principles as simultaneously morally right and rational to pursue.

Hobbes and Rawls

This entry returns to the rational-justification approach to the contract’s role. Sometimes this is called the “hypothetical” approach, as it is often framed in terms of a contract to which one could or would agree. But since the question then arises of how a hypothetical contract can be regarded as morally binding, one is forced back upon its rationality. Rationality, however, can be divided (using Rawls’s terms) into a narrow conception of rationality on the one hand, and “reasonableness” on the other. The narrow conception of rationality, which the term bears in the remainder of this entry, is identical with prudence: assessing the best way to pursue one’s own goals and interests. “Reasonableness,” by contrast, involves assessing the fairness of the conditions under which all can pursue their goals and interests.

Using this distinction, it can be said that Hobbes, in his *Leviathan* of 1651, uses the contract to argue that it is rational to act reasonably—that is, it is rational and prudent to obey an effective sovereign and so to act fairly towards all the others who are also obeying rather than to try to evade obedience for personal advantage. Rawls, in contrast, uses the contract to argue that one must first establish reasonable conditions for reflection on what is rational and only then decide what one can rationally pursue. For Rawls, obedience is justified because what is obeyed is just, whereas for Hobbes, what is obeyed is just because this is what it is most prudent to obey.

So for Rawls, what is reasonable both structures the contracting position and shapes the analysis of what would be chosen within it. The role of the contract is to model the reasonable constraints of publicity and reciprocity: any principles of justice chosen must be mutually acknowledged by citizens, even though in the “original position” all are ignorant of their actual identities and so would reason the same way. Rawls insists on this ignorance because, like Kant in his moral theory, he wants to exclude special pleading and unfair existing advantages from the contracting or “original” position. Whereas for Hobbes, people have the same overriding interest in preserving their lives and can be shown that in a “state of nature” without government they will best do so by acting reasonably, for Rawls people should recognize the fairness of starting with the reasonable prior to any particular rational interest they might have.

Feminist Views

Some feminists have criticized the social contract approach as excessively individualistic, arguing that to treat contract as the fundamental moral and/or political relationship is to overlook the dependency on the care of others that characterizes infants, the elderly, the severely disabled, and everyone to the extent that they are vulnerable. Carole Pateman has noted the problematic relationship of women to contract in the seventeenth-century

heyday of natural jurisprudence, when married women could not own property or make contracts in English common law. But others have argued that the social contract approach can be turned to feminist ends. Susan Moller Okin argues that a consistent Rawlsian theory would include the family within the scope of the theory of justice, while Jean Hampton contends that contractarianism can be used to test and prevent the exploitation that may pervade intimate relationships between family and friends.

SOCIAL DARWINISM. Social Darwinism arose in the last quarter of the nineteenth century. It was an intellectual movement associated with the theory of evolution in general but was principally derived from the works of Charles Darwin (1809–1882), especially his *Origin of Species* (1859).

Five major questions are raised by the extension of Darwin’s theories to the human sphere.

1. To what extent was Darwin’s theory simply a reflection of the thinking and prejudices of his day?
2. What does “struggle” actually entail? And what exactly are these “human capacities”?
3. What have been the continuing effects of this movement?
4. What are the differences between the natural and social sciences and how do these disciplines relate to each other?
5. How can Social Darwinism be developed?

Darwinism: A Product of Society?

Darwin argued that biological laws affect all living beings. Population growth takes place within limited resources. This leads to a struggle for survival, with particular physical and mental capacities conferring advantages to some individuals and not others. These traits are selected for, reproduced, and inherited, resulting in new species emerging and others being eliminated.

Darwinism and Social Darwinism need to be placed in context for two reasons. First, many of the ideas that are conventionally linked to Darwinism were well established before *The Origin of Species* (1859). Herbert Spencer (1820–1903) was the dominant British philosopher of the late nineteenth century, and he, more than Darwin, made evolution the dominant discourse of that era. Similarly, Jean Baptiste Lamarck (1744–1829), who explained variation and diversification of life as a product of acquired characteristics, was expounding his ideas in the early decades of the nineteenth century. His views greatly influenced Spencer, and they were developed by Darwin, especially in *The Descent of Man* (1871).

Second, Darwinism as a science was itself influenced by its social context, specifically by British industrial capitalism at the heart of a global empire. The struggle for survival in the context of limited resources, with some organisms or species surviving and others not, mirrored mid-nineteenth-century society back on to the nonhuman world.

However, the fact that Darwinism was a product of its era does not make it useless for understanding how species have evolved. This point was well made by Karl Marx in his correspondence with Friedrich Engels.

Meanwhile, influential propagators of Social Darwinism made highly controversial parallels between the species of the natural world and different groups of humans. Nonwhites, women, and the working class apparently did not have the requisite physical and mental capacities to thrive in the modern world.

Human Nature and the Struggle for Survival

There are three connected issues here. What is human nature? How fixed and transmissible is it? How does human nature relate to modern society?

Commentators imbue “human nature” with the qualities that best fit their philosophical and political predilections. Writing in the early twentieth century, for example, the anarchist Pyotr Kropotkin (1842–1921) argued that all species are collectively oriented. The struggle for existence is actually composed of individuals collaborating. Indeed, the rise of capitalism had wrecked this essential human nature, a circumstance to be reversed by an anarchist society. In contrast, Fabian socialists, such as Sidney Webb (1859–1947) and Beatrice Webb (1858–1943), argued that people can easily be individualistic and competitive. They therefore envisaged a form of social engineering that would override these propensities. Individual actions “must sooner or later be checked by the whole, lest the whole perish through the error of its member” (cited in Hawkins, p. 165). Meanwhile, William Sumner (1840–1910)

MARX ON EVOLUTIONISM AS A SOCIAL CONSTRUCT

In a letter to Friedrich Engels, Karl Marx argued that the theory outlined in *The Origin of Species* is a construction of human society used to understand nature. “It is remarkable how Darwin recognises in beasts and plants his English society with its ‘inventions’ and the Malthusian ‘struggle for existence’” (Dickens, 2000, p. 29). But Marx had a great deal of respect for Darwin. Despite using metaphor, Darwin’s theory referred to real, important processes. It needed incorporating into Marx and Engels’s understanding of human society. “Although developed in the crude English fashion, this is the book which, in the field of natural history, provides the basis for our views.”

and others in the United States celebrated possessive individualism, arguing that “the progress of civilisation . . . depends on the selection process; and that depends upon the workings of unrestricted competition” (quoted in Hofstadter, p. 57).

Social Darwinism has relied heavily on the idea of “traits” or “characteristics” that are seen as determining whether an organism, a “race,” or even a nation survives and satisfactorily breeds. This issue is especially important when considering eugenics, the deliberate selection of people with particular traits and their discouragement from breeding through forms of social control. Darwin’s own writings, especially *The Descent*, express anxiety about biological decline stemming “the weak members of civilised society” not only propagating their kind but, as a result of medical and charitable intervention, leading to “the degeneration of a domestic race” (Darwin, 1901, p. 206).

The issue was to arise forcibly with Darwin’s cousin Francis Galton (1822–1911) and his colleague Karl Pearson (1857–1936). In *Hereditary Genius*, Galton studied family trees over a period of two hundred years and argued that a disproportionately large number of distinguished jurists, politicians, military commanders, scientists, poets, painters, and musicians were blood relatives. He concluded that it would be “quite practical to produce a highly gifted race of men by judicious marriages during several consecutive generations” (quoted in Kevles, p. 4). His young colleague Pearson attempted to measure mental capacities and claimed on a statistical basis, one appealing to scientific method, that these capacities were indeed passed on between generations.

But the influential Herbert Spencer envisaged “human nature” as flexible and transformed over time. “Primitive man”

was immoral, irrational, mendacious, and aggressive. A number of groups (including children, women, inferior social ranks, and tribal cultures) remain arrested in a prehistoric state, although they could be civilized during their individual lives. Social evolution, Spencer argued, is generally progressive. It has consisted of a steady improvement of a primitive state of affairs. Individualism, morality, and voluntary association (qualities Spencer approved of) had developed in modern society, one in which people could start caring for one another.

The idea of inborn characteristics generating success has remained influential since the days of Galton and Pearson. It was made prominent in the late twentieth century with the suggestion by Richard Herrnstein and Charles Murray that success in modern society depends on people's inbuilt ability to handle information. In modern society the successful are those with advanced mental capacities. Meanwhile unsuccessful people with low intelligence are interbreeding to produce a rapidly increasing underclass. Society is again envisaged as "natural," class structure being a product of inborn characteristics. Robert Plomin and others supporting the work of Herrnstein and Murray are searching for a genetic basis to intelligence.

The issue of a fixed, heritable, possibly genetically based human nature remains highly controversial. In contrast, there is a rapidly growing literature showing that early parenting and schooling are especially important in determining both mental and physical "fitness" (Dickens, 2004). Perhaps the most important defining "trait" of human beings is their flexibility, their capacity to adapt to many different circumstances.

As regards the relationship between human nature and modern society, a recurrent theme was established by Graham Wallas (1858–1932), another Fabian socialist. Writing in 1908, he asked, "Why should we expect a social organisation to endure, which has been formed in a moment of time by human beings, whose bodies and minds are the result of age-long selection under far different conditions?" (quoted in Hawkins, p. 64). The implication is that human nature was established during the earliest years of human evolution but is inappropriate for, or even destructive to, modern society.

This is a position developed later by "evolutionary psychology." Again using the idea of a genetically based human nature, the suggestion is that humanity's principle predispositions were established while the species evolved on the savannah. The modern mind remains a "neural computer," one "driven by goal states that served biological fitness in ancestral environments, such as food, sex, safety, parenthood, friendship, status and knowledge" (Pinker, p. 524). Male philandering, female coyness, and even aesthetic predispositions were genetically embedded in humanity during that era. These theories are also proving highly controversial (Rose and Rose).

Social Darwinism, Eugenics, and the Modern Era

Social Darwinism, and particularly its extension to eugenics, has had a continuing, often evil, impact on modern society. The Nazi Holocaust killed over 5 million Jews and sterilized at least 375,000 supposedly "inadequate" people. This was all

KARL PEARSON ON INHERITING OF MENTAL CAPACITIES

"We inherit our parents' tempers, our parents' conscientiousness, shyness and ability, even as we inherit their stature, forearm and span" (quoted in Kevles, p. 32).

in the name of a "science" of eugenics, one deeming Jews and others to be biologically inferior to the Aryan race. These programs were the horrific climax to an extreme eugenic movement that swept through much of the Western world during the first third of the twentieth century.

While Jews were the targets of eugenics in Europe, black people were made victims of this movement in the United States. Intelligence quotient (or IQ) tests purported to show that they were inherently inferior, a conclusion that greatly hindered the extension of educational opportunities beyond the white population. And it has become clear that in Sweden, a society often held up as a model of social democracy, thousands of misfits, deviants, gypsies, and others were sterilized as late as the 1960s. This was an attempt to make a pure, socially responsible breed of human being. Eugenics still finds echoes in the early twenty-first century. Yet eugenics has no serious credibility as a science. Not only are there no proven connections between innate biological characteristics and human behavior, but there is no such thing as a pure race—"Jewish," "black," "white," or otherwise. Migration and intermarriage have meant that biological characteristics have become fully combined.

Problems of Direction, Progress, and Teleology

Social Darwinism has often implied that evolution is developing in a linear and progressive way. Furthermore it may be fulfilling some long-term purpose. These themes have a long history. Georg Wilhelm Friedrich Hegel (1770–1831), writing in the early part of the nineteenth century, remains among the best-known advocates of the argument that history is marching toward a definite end, one in which human beings will finally recognize and fulfill themselves as human beings. A similar argument informed early evolutionary thought. In the mid-nineteenth century Robert Chambers (1802–1871) combined a notion of linearity and progress with one of teleology or underlying purpose. The fossil record shows, he argued, that invertebrates developed into fish, fish developed into reptiles, and the latter evolved into mammals. In due course the process culminated with "man." Furthermore these developments signify "progress," the transition from basic animals to humanity being seen as a generally beneficial development. Finally, Chambers argued that the advance toward humanity was the unfolding of a divine purpose. The law of progress was created by God.

Darwin resisted all three supposed tendencies. He saw evolution as open-ended and capable of diverging or branching

DARWIN AND WALLACE ON GENDER DIFFERENCES

Darwin wrote that “the chief distinction in the intellectual powers of the two sexes is shown by man’s attaining to a higher eminence in whatever he takes up, than can women—whether requiring deep thought, reason, or imagination, merely the use of the senses of the hands” (quoted in Richards, p. 119). Alfred Wallace (1823–1913), the codiscoverer of the theory of evolution, argued that if women were freed from financial dependence on men, their mental potentials would soon become fully realized. They would be “regenerators of the entire race” (quoted in Stack, p. 29).

in any number of directions. How, or whether, a species survives depends on the environment it encounters. Darwin certainly denied that it was directed toward some predetermined, God-given, goal. On the other hand, his understanding of “progress” was also colored by the dominant views of his day. Witness his assertion that the European white race represented a major advance over other “races” or that men are more capable of rational thought than women. Men, he argued, had developed this capacity when they had to hunt and protect their families in the earliest stages of evolution.

T. H. Huxley (1825–1895), Darwin’s contemporary and great publicist, offered a related analysis. He argued that women’s capacities excluded their full involvement in science. Their levels of intelligence rendered them largely unable to handle abstract ideas. Here again a supposed “science” is used to legitimate power relations. Social relations are envisaged as a product of nature, and nature is immutable.

As regards humanity as a whole, Darwin proposed a progressive model of evolution that conferred superiority on humans while remaining consistent with his general theory. In *The Descent of Man* he argued that humanity had separated itself from apes as a wholly unique way of adapting to life in the ancestral forests. Early human beings had adopted an upright posture in this kind of environment. Unlike the apes, who needed their hands for locomotion, early humans’ hands were freed up to hunt and make tools. This freeing up, Darwin argued, led to the development of advanced human intelligence and dominion over nature.

Nevertheless, the views of writers such as Chambers rather than Darwin were those that prevailed in the making of Social Darwinism, the idea of an open-ended, undirected form of evolution finding little or no support. Similarly, the idea of

a linear progression toward some kind of ideal solution was especially influential in evolutionary anthropology.

Notions of “progress” and direction remain important in early-twenty-first-century social and political science, albeit in muted and perhaps less-teleological forms. There often remains, for example, an implicit suggestion that there is just one way in which societies can evolve. It is toward liberal democracy, with individual fulfillment being obtained via democracy and the market. Pursuing such an end remains, for some, a divinely inspired mission. Such arguments are controversial since they do not recognize that societies, their politics, and religions may also branch off in their own, perhaps unique directions.

Evolution and Society: Ways Forward

Social Darwinism therefore has a distinctly checkered history. A “science” that concludes that nonwhites, working-class people, and women are biologically unable to succeed is nowadays likely to encounter ridicule and outright hostility. Sociobiology, the forerunner of evolutionary psychology, has run into similar controversy. It suggested that genes and the reproduction of genes into future generations is the primary mechanism informing the behavior of humans and other animals. Sexuality and gender inequalities are largely governed by genes, and there is little that can be done to change inherited nature (Wilson).

But there remains much potential value in alternative forms of Social Darwinism. One important contemporary application of evolutionary thought to human society is to use evolution primarily as a metaphor or analogy. Jürgen Habermas, for example, envisages society as similar to a natural organism, one with highly differentiated parts, one that is self-maintaining and capable of selecting alternative strategies. This has echoes in the analogies between society and nature made by, for example, Herbert Spencer. But Habermas uses the organic metaphor not as a means of developing laws supposedly applying to both humans and nonhumans. Rather, evolution and biology are being used as heuristic devices. They are deployed as a means of understanding how contemporary society develops and changes.

Evolutionary analogies are used in other fields. “Evolutionary economics,” for example, treats the competition of firms as analogous to the struggle for survival in the nonhuman world. And a popular understanding of technological change also uses evolutionary analogies, some technologies succeeding over others in a competitive process.

Analogies and metaphors of this kind are helpful in developing new insights. But they do not address the main difficulties of early Social Darwinism. Two central questions remain. In what sense is society “natural”? How are the insights of the social and natural sciences to be combined?

A useful first step in developing a modern “Social Darwinism” would be to recognize different levels of generality. Evolutionary processes and tendencies operate at a general level and over immense periods of time. Biological evolution has left human beings with developmental tendencies and needs stemming from their remarkably long periods of infancy. But precisely how these tendencies and needs are realized crucially depends on the contingent circumstances that they encounter.

Early parenting as well as experience at school and work deeply affect cognitive abilities and levels of health, and these are all highly variable over time and between different societies.

A rigorous dualism between “society” and “nature” was maintained by early Social Darwinism, women and nonwhites being allocated to the category of “nature,” for example, and European men being allocated to “culture.” This kind of dichotomy is full of dangerous implications but can be overcome if evolution and biology are envisaged as bequeathing potentials and tendencies that can be realized in different ways by the kinds of society encountered.

Social Darwinism attempted, often in crude, premature, and dangerous ways, to link insights from the social and natural sciences. But there remain exciting possibilities for developing new, more complex, nuanced, and transdisciplinary ways of linking the social and biological sciences. These are likely to throw important new light on the nature and well-being of humans as they interact with one another and their environment.

Peter Dickens

SOCIAL HISTORY, U.S. The “new” social history that emerged in the United States in the 1960s and came to dominate the profession by the 1980s, conjoined two scholarly agendas. The first was a program for reshaping history along the lines of the behavioral sciences—in particular economics, political science, and sociology—and employing quantitative methods and models in historical research. The second was the project of rewriting history from the “bottom up,” and providing a “usable past” for contemporary movements for social change. Although the advocates of social history might differ in their methodological or ideological commitments, they agreed on the need to displace “traditional” narratives of the American past—ones that privileged high politics, diplomacy, or intellectual life—and to replace them with “new” histories that emphasized social and economic processes and phenomena. Their efforts prompted extensive discussions about the means and ends of historical analysis, and produced a major reorientation within the profession.

Among the earliest, and most forceful, proponents of social science history were Lee Benson and Robert Fogel. Benson, and other practitioners of the “new” political history, urged historians to develop systematic methods and generate quantifiable data with which to verify hypotheses. In *The Concept of Jacksonian Democracy: New York as a Test Case* (1961), Benson used electoral returns and census data to suggest that ethnic and religious factors, rather than social class, best accounted for party affiliation and voting behavior. Fogel and his fellow “diometricians” developed a “new” economic history that adopted complex mathematical models and counterfactual questions from economics, and applied them in statistical analyses of serial data. In *Time on the Cross: The Economics of Negro Slavery* (1974), Fogel and Stanley Engerman drew upon a wide variety of sources in order to demonstrate that slavery was a profitable and efficient system of labor, and that in terms of material conditions, the lives of slaves could be compared to those of wage workers. The interdisciplinary interests and the collaborative activities of the new historians led to the establishment of such institutions as the Inter-University Consortium for Political and Social Research (1962), which served as an archive for machine-readable data and as a center for training in quantitative methods; the publication of such periodicals as *Historical Methods Newsletter* (1967), the *Journal of Social History* (1967), and the *Journal of Interdisciplinary History* (1970); and the organization of the Social Science History Association (1974).

For other scholars, the turn to quantitative methods was more a matter of pragmatic choice than professional manifesto. Stephan Thernstrom, in *Poverty and Progress: Social Mobility in a Nineteenth Century City* (1964), sampled city directories, and censuses in order to determine rates of occupational mobility in Newburyport, Massachusetts. Social mobility, he discovered, was a far less common phenomenon than was assumed by scholars or celebrated in popular culture. *Poverty and Progress* came to serve as a model for a number of social mobility studies, and as one of the key texts in the development of a “new” urban history. Thernstrom’s creative use of sources, in particular manuscript census returns, also generated significant interest among historians who wished to

examine the lives of a great majority of Americans, those whose experiences were missing from the pages of histories focusing on elites. Recovering the histories of workers, women, immigrants, and minorities—"anonymous Americans" as Tamara Hareven (1937–2002) characterized them—became a central concern for social historians. So, too, did the need to connect these histories to such contemporary issues as civil rights and feminism. To many aligned with the New Left, writing social history was both a professional and a political activity.

Both the historiographical critiques and the methodological prescriptions of the new social historians became matters of controversy. Scholars interested in such areas as foreign relations, finance, and the presidency rejected characterizations of their work as "top down" or "great man" history. Historians whose works were dismissed as being "impressionistic" rather than "rigorous" replied that not every past event or piece of evidence was suitable for quantification. Whether to count or not should be a matter of choice, not creed. The most extensive, and rancorous, exchanges over the implications of quantitative history came in the wake of the publication of *Time on the Cross*. In such works as Herbert Gutman's *Slavery and the Numbers Game* (1975), critics of Fogel and Engerman pointed to problems in their statistical analyses and the scope of their data sets. They raised moral objections as well. Should the suffering of slaves be reduced to a series of indices and equations? Could the complex system of chattel slavery be adequately represented with the tools of cliometrics?

Among those who identified themselves as social historians, there were also differences in approaches to materials and methods. While social science historians preferred to make their claims on the basis of "objective" sources—city directories, wills, estate inventories—historians of the marginalized and of social movements also continued to rely on "subjective" sources—letters, diaries, and newspapers—for evidence of consciousness or culture. Sean Wilentz and other "new" labor historians questioned the suitability of concepts imported from liberal social theory, such as modernization and social mobility, and the utility of elaborate statistical modeling. They preferred instead the style of social history done by such British Marxists as E. P. Thompson (1924–1993) and Eric Hobsbawm (1917–). In *Chants Democratic: New York City and the Rise of the American Working Class, 1788–1850* (1984), Wilentz examined the interaction of socio-economic transformation and political mobilization, in particular in the era of Andrew Jackson. Where Lee Benson had found cross-class alliances along "ethno-cultural" lines, however, Wilentz discovered class conflict and the development of an oppositional working class culture. Though not all social historians were Marxists, the revival of interest in modes of Marxist analysis, and the return of interpretations, which emphasized conflict instead of consensus, were among the most important changes that were wrought in the profession.

By the mid-1980s, much of what the first behavioralists and "bottom up" historians had envisioned was being realized. Major periods and problems in American history had been

reinterpreted and revised along social history's lines. New fields of study, such as women's history, had been opened up; and others, such as urban and labor history, had been renewed. A once-dominant political and diplomatic grand narrative of national development was being replaced by one that concentrated on questions of race, class, and gender, and that stressed conflict as the engine of social change. Scholars who wrote about members of the elite assumed defensive positions; prominent intellectual historians called for a new social history of ideas.

Yet a number of social historians, including Lee Benson, expressed doubts about the enterprise. The serious critiques of positivism gaining currency among social scientists could be directed toward social history as well. So, too, could questions about agency, and postmodern rejections of the possibility of objectivity. More than a few social historians turned away from the assumptions of behavioral economists and sociologists, and toward an engagement with methods of cultural anthropologists and literary critics. In these moves from statistics to symbols, and from verification to interpretation, the "new" social history began to give way to a "new" cultural history. Quantitative social science history did not disappear, however, and remains important in such areas as demographic history; yet when compared to cultural history, it is no longer as influential a force. To the extent that the new cultural historians employ American history in terms of oppression, resistance, and emancipation, they are carrying on the mission, if not always using the methods, of history "from the bottom up."

Martin J. Burke

SOCIALISM. The difficulty of defining socialism is apparent to anyone who attempts to study this protean doctrine, not least because what socialism is or is not is usually a matter of contentious debate. However, there is a general consensus that the various schools of socialism share some common features that can be summarized as follows. Socialism is above all concerned with the relationship between the individual, state, and society. For the socialist, the individual is never alone and thus must always define himself or herself in relation to others. Socialists believe that a well-ordered society cannot exist without a state apparatus, not least because the state is seen as the most effective vehicle for coordinating and administering to the needs of all.

Socialists' views on human nature distinguish them from their principal political rivals, the liberals and conservatives. While the latter two groups tend to hold that all humans are inherently self-interested and materialistic, socialists contend that these traits are products of social conditioning under capitalism. On this view, individuals act selfishly and competitively, not because it is in their nature to do so, but rather because they are encouraged and rewarded for such behavior. Socialists hold that the values and beliefs promoted in a socialist society would enhance our capacity for acting cooperatively and collectively in pursuit of mutually reinforcing material and spiritual goals.

Because they see material circumstances as being key to the well-being of individuals, socialists stress the importance of the economic system that operates in every society. It was their observations of the deleterious effects of industrial capitalism that caused socialist reformers to call for the development of new economic structures based on a completely different set of moral principles. The question of how the transition from capitalism to socialism would occur has been answered in different ways by different socialist theorists. Robert Owen (1771–1858), Charles Fourier (1772–1837), and other early socialist thinkers saw the need to reform rather than destroy capitalism, while followers of Karl Marx (1818–1883) and Friedrich Engels (1820–1895) insisted that capitalism had to be completely overturned in order for society to advance to a state of socialism. Contemporary socialists do not envisage the transition from capitalism to socialism as a sharp break, but as a process of economic reforms that takes into account the role of market forces.

So far as is known the terms *socialist* and *socialism* first appeared in print in Italian in 1803, but in a sense were entirely unconnected with any of their later meanings. No trace of the word *socialist* appears again until 1827, when it was used in the Owenite *Co-operative Magazine* to designate the followers of Robert Owen's cooperative doctrines. Across the English Channel, *socialisme* was adopted by the Saint-Simonians—followers of the French philosopher and social scientist Claude-Henri de Rouvroy (1760–1825), comte de Saint-Simon—during the 1830s to describe their theory, and thereafter it was increasingly used to refer to those groups aiming at some kind of new social order resting on an economic and social conception of human rights.

In these senses, socialism was used to distinguish the attitudes of those who laid stress on the social elements in human

relations from those who emphasized the claims of the individual. In fact, to be a socialist was to be someone who promoted a social system in direct opposition to the highly individualistic order being advocated by the proponents of *laissez faire* economics.

Industrial Revolution and the Rise of Socialism

As a political ideology, socialism arose largely in response to the economic and social consequences of the Industrial Revolution. There is an abundance of literature that attests to the dramatic way in which the industrialization of Europe affected the daily lives of individuals, particularly the working classes. The reformist trend in British politics during the 1830s brought some of these harsh realities to the public's attention. In 1832, for example, a parliamentary investigation into the conditions in the textile factories—later known as the Sadler Committee's Report—revealed the appalling toll on human life that had resulted from unregulated industrial growth. And, even if we discount certain embellishments or exaggerations, these accounts of the general working conditions in the factories were nonetheless all too illustrative of a social climate in which practices of the most callous inhumanity were accepted as a natural order of events and, most important, were at first not thought to be the general public's concern.

It deserves mention here that, in addition to the horrors wrought by an unregulated factory system, workers were also subjected to the changes brought on by the machine age. The introduction of new technologies in the workplace invariably meant the displacement of laborers. No less important was the fact that many of the changes wrought by rapid technological advances and the consequent restructuring of the workplace (e.g., the factory system) had an alienating effect on the worker. To the minds of some, however, these evils of industrialization were not inevitable outcomes. Such was the case with the so-called Utopian socialists who emerged in England and on the Continent around this time.

Utopian Socialists: Owen, Saint-Simon, Fourier

In the beginning there were basically three groups of socialists, although there were lesser groups representing broadly similar tendencies. The three principal groups were the Fourierists and Saint-Simonians in France and the Owenites in Great Britain. There were obvious similarities between them: (1) they regarded the social question as by far the most important of all; (2) insisted that it was the duty of all good men to promote the general happiness and welfare of everyone in society; (3) regarded this task as incompatible with the continuance of a social order that was maintained strictly on the basis of a competitive struggle between individuals for the means of living; and (4) were deeply distrustful of politics and politicians, believing that the future control of social affairs ought to lie not with parliaments or ministers or kings and queens but with the "producers." They held that, if the economic and social aspects of men's lives could be properly ordered, the traditional forms of government and political organization based on conflict and competitiveness would soon be superseded by a new world order of international peace and collaboration.

On the other hand, there were wide diversities separating these three groups. The Fourierists and Owenites were community-makers. They set out to establish a network of experimental communities based on their ideas that would become the foundation stones of a new social order. The Saint-Simonians differed from these two groups in that they were strong believers in the virtues of large-scale organizations and scientific planning. Their principal aim was to transform nations into great productive corporations dominated by a sort of “technocracy” composed of scientists and technicians. Unlike the Fourierists and Owenites, who eschewed political activity, the Saint-Simonians were not opposed to using the existing political channels as a means to bring about the transformations they were advocating.

Thus, at this juncture in its historical development, socialism meant collective regulation of the affairs of people on a cooperative basis, with the happiness and welfare of all as the ultimate goal, and with the main emphasis not on “politics” per se but on the production and distribution of wealth. Enemies of individualism, the socialists sought to strengthen the socializing influences that brought people together in a harmonious whole. They therefore emphasized education as an instrument for conditioning patterns of behavior, social attitudes, and beliefs.

It deserves mention that in this description of socialism nothing is said about the proletariat or the class struggle between it and the capitalist class. This is because the members of the aforementioned socialist schools did not think in these terms. They did not see capitalists and workers as rival classes, nor did they believe that a revolutionary struggle between the proletariat and bourgeoisie was necessary to put their social plans into effect.

“Scientific Socialism”

In following the historical analysis of socialism offered by Karl Marx and Friedrich Engels, the modern socialist movement dates from the publication of their *Communist Manifesto* in 1848. The term *communism*, which came into common usage in this same period, was often used in connection with the idea of socialism, though the former tended to have a more militant connotation. This is most likely why it was used by the Communist League, the group that commissioned Marx and Engels to write the *Communist Manifesto*. As Engels later explained, the word *communism* carried with it the idea of common ownership, and, above all, it helped to distinguish the ideas of Marx and Engels from those of the so-called utopian socialists in that it lent itself better to association with the idea of the class struggle and with the materialistic conception of history.

The publication of the *Communist Manifesto* coincided with the revolutionary tide that swept through Europe between 1848 and 1849. Marx and Engels were still correcting the proofs of their soon-to-be famous pamphlet when the first barricades of 1848 were being erected in Paris. But while it is true that the *Manifesto* was published during a period of political tumult, it did not have a profound impact on the revolutionaries of the period. Nevertheless, it was an important document in the

history of socialism, above all because it presented in outline form the theoretical basis for modern socialism.

Perhaps the boldest and most probing argument advanced by Marx and Engels was their critique of present and past societies. According to this, society’s political and cultural arrangements (superstructure) are shaped primarily by the forces of material production (base). When the productive modes and relations have developed as far as they can within the existing framework of political and economic structures of society, then the conditions arise for a thoroughgoing social revolution, a process that inevitably brings about a transmutation of these older forms into more progressive ones. In this way, societies are able to advance progressively from more primitive states (e.g., feudalism) to more sophisticated ones (e.g., capitalism).

In their discussion of the relationship between state and class, Marx and Engels identify further dimensions of their “stages” view of history that were to become cornerstones of “scientific” socialism. According to them, the state is essentially a class-based institution, expressing the will and exclusive interests of the dominant political and economic groups in society. The state and its apparatuses are thus seen as essential features of the superstructure that overlays the economic base (which itself corresponds to the stage reached in the development of the powers of production). Under capitalism, the authors go on to say, the bourgeoisie seek both to expand their base—which is too narrow to accommodate the wealth created by them—and to overcome the economic crises caused by the development of productive forces beyond the point compatible with capitalism. By so doing, they begin to dig their own graves, for the scramble for new markets inevitably creates new problems that cannot possibly be resolved within the framework of the one created by the bourgeoisie. At this point, the *Manifesto* explains that it is the ongoing and ceaseless dialectical struggle between the dominant and dominated classes that provides the impetus for breaking down the barriers for further social and economic development. With the advent of revolution, the control of the state and its forms passes into the hands of the new dominant class (the working classes), thus paving the way for the development of new forces of production.

Another distinguishing aspect of the doctrine outlined in the *Manifesto* has to do with the special historical mission that Marx and Engels assigns to the proletariat. Unlike previous insurgent classes, which developed their importance and strength within the preceding social order, Marx and Engels contend that the laboring class under capitalism is driven to revolt through its own increasing misery. Once they have wrested political power from the middle classes, the authors believe that the proletariat will be able to establish their own hegemony (construed more concretely in later writings as a dictatorship). Over time, during which the material conditions are created for the construction of socialism, their class rule would give way to a classless and stateless society, communism.

As regards the relationship between communists and the working classes, Marx and Engels assert that communists were the most advanced and politically resolute segment of the proletariat in every nation, not least because they had the

advantage of seeing more clearly than others the direction in which society is moving. As revolutionaries, their role was to assist the exploited workers in three ways: (1) to raise their class consciousness so that they can realize their role in history; (2) to overthrow the bourgeoisie; and (3) to establish working-class control of the state and its ruling apparatuses (i.e., a dictatorship).

Having said all of this it is important to keep in mind that the *Manifesto* cannot be regarded as a full exposition of Marxist doctrine. And while Marx sketches out many of the basic tenets of his communist viewpoint, at this point in his career he had not worked out his complete system of thought, which was carefully developed over many years, culminating with the publication of his magnum opus, *Das Kapital*, in 1867. Nonetheless, it is significant to note that both Marx and Engels continued to endorse the views of the *Manifesto* even after most of them were rendered irrelevant by the course of events. The continuing relevance of this important document, then, had less to do with its predictive powers than with its potency as a clarion call for revolution. The *Manifesto* is full of memorable and moving phrases such as, “Workers of the World unite. You have nothing to lose but your Chains.” The teleological understanding of history presented in the *Manifesto* was also compelling to successive generations of socialists. In their “scientific” critique of the bourgeois society with which they were acquainted, Marx and Engels managed to invest history with both a dramatic purpose and a desirable destination. History was, according to them, moving toward a higher goal that could only be obtained through class struggle and social revolution. It was thus the moral message embedded in their theory of historical materialism that made the *Communist Manifesto* a landmark publication in the history of modern socialism.

Socialism during its “Mature” Phase

The genesis and development of socialism paralleled the rise of liberalism in Europe. Over the course of the nineteenth century, liberalism had become the predominant ideology in Great Britain and on the Continent. However, from 1889 on, socialism increasingly challenged liberalism’s supremacy in the political arena. In Europe generally there were various schools of socialist thought that came to maturity during the second half of the nineteenth century: reformist socialism, Marxism, anarchism, and syndicalism. Of these currents, Marxism tended to be the dominant socialist theory, partly because of its conceptual cogency and partly because it was embraced by the most powerful and influential social democratic parties affiliated with the Second (Socialist) International, (1889–1914), a confederation of socialist parties and labor organizations that was created in order to continue the work of the First International Workingmen’s Association.

Why did socialism become so important at this time? One of the contributing factors was the growing influence of positivism on the general outlook of European thinkers. Following in the tradition of the French Enlightenment, intellectuals like Auguste Comte (1798–1857) and Herbert Spencer (1820–1903) promoted the idea that an understanding of both the natural and social worlds could be achieved through scientific

knowledge. It was this belief that inspired socialists like Saint-Simon and Marx to develop political cosmologies that they thought could be grounded on a sound empirical basis. Marx in particular asserted in the *Communist Manifesto* and other major writings that his brand of socialism was distinguished from all others by its “scientific” approach to the study of economics and society. This is not to say that Marxists were the only socialists who were convinced of the scientific validity of their theories. Anarchist social views, particularly those espoused by the Russian revolutionary Pyotr Kropotkin (1842–1921), also owed a great deal to the positivist tradition. And, finally, the evolutionary brand of socialism known as Fabianism that developed in Great Britain at the end of the nineteenth century was shaped by the positivist beliefs of its leading theorists.

A general shift in the attitude toward the role of the state in society also contributed to the growth of socialism. The failure of laissez-faire political and economic policies, which had been long favored by liberal governments as a way to respond effectively to the problems created by the periodic crises of capitalism, the second wave of industrialization, and the emergence of a mass society caused many to see the state in a more favorable light. For example, the unexpected and occasionally jolting economic fluctuations of the 1870s and 1880s not only drove a wedge between the workers and their liberal middle-class representatives, but also alarmed industrialists and other members of the economic elite. As a result, an increasing number of all these groups started turning to the government for protection. The growing popularity of imperialism in the closing decades of the century also made the average person less opposed to the growing powers of the state.

Among the many other factors that favored the rise of socialism at this time, the most notable can be summarized as follows. (1) The increase in the number of workers in the industrializing nations was one important factor. The concentration of industries during the so-called second industrial revolution that occurred during the last two decades of the nineteenth century brought together workers in unprecedented numbers. Rapid industrialization also accelerated the tendency of the general population to move from the countryside into urban centers. Cities proved to be favorable environments for socialist organizations—which demanded a fairly sophisticated social/cultural infrastructure in order to thrive. (2) The rise of literacy also redounded to the benefit of the socialists: as more and more workers learned to read they were able to imbibe socialist ideas in the form of pamphlets, books, and the press. (3) The “democratization” of the ballot box also helped the socialists in that the extension of the franchise brought more workers into the political arena thus making it possible to get socialist deputies elected to parliament. All of these factors created the basis for a “proletarian” mentality or consciousness. By the late 1880s workers were joining clubs and trade unions, electing their own representatives, and subscribing to their own publications. And though this is not to say that all workers were necessarily socialist, it did mean that the principal vehicles for propagating and sustaining socialism were now anchored in the framework of modern industrial society.

The Spread of Marxism during 1880s

Of all the varieties of socialism that existed during this period, Marxism proved to be the most popular doctrine among working-class parties that began to emerge in the 1870s in France, Germany, Belgium, and elsewhere where there was a large industrial proletariat. In countries where industrialization had yet to be firmly established, Marxism was a minority tendency. This was particularly evident in Spain, where anarchism was a major force among both the industrial workers and the peasantry. Anarchism also attracted a sizeable following among peasants and workers in Italy, though it never achieved the mass following it did in Spain. In Russia, Marxism became important only after the turn of the century and even then it did not represent the largest segment of the socialist movement as a whole.

Beginning in the 1880s a special effort was made by Friedrich Engels to popularize Marx's theories, particularly among the growing reading public of workers. As far as Marx's general theories were concerned, this was no easy task, for, apart from intellectuals, few people could easily grasp the meanings of his probing analysis of capitalist development. In order to make such views more accessible, Engels set himself the task of defending Marxian theories against Marx's would-be critics. In *Anti-Dühring* and several of his better known works, Engels attempted to expand upon the views of his lifelong collaborator by stressing that Marxism was not just a revolutionary theory but a scientific worldview that lay bare the complexities of society. By arguing in this way, Engels hoped not only to discredit rival views of socialism but also to demonstrate the continuing relevance of Marx's theories. From a doctrinal point of view, Engels's most enduring legacy to socialism, however, was his materialist conception of history. More so than Marx, Engels saw the march of socialism as an inexorable historical process that could be predicted with almost mathematical certainty by correctly reading the "objective laws" that governed the evolution of both the natural world and society. He therefore suggested a view of socialist development that linked it to a general process of change that could be measured and read by means of empirical investigations.

The certitude of the causal explanatory model sketched out in Engels' writings on historical materialism appealed especially to the generation of socialists who came of age during the closing years of the nineteenth century, a period when positivism was at its height. Karl Kautsky (1854–1938), Eduard Bernstein (1850–1932), Georgy Plekhanov (1857–1918), and V. I. Lenin (1870–1924) were all indebted to Engels's elaboration of Marxist doctrine. No less a testament to Engels's impact on the future development of socialism is the fact that his materialist conception of history became an article of faith in all the regimes that declared themselves to be Marxist in the twentieth century.

The Anarchist Alternative

The anarchists represented one of the strongest non-Marxian currents in the socialist movement and it was their ongoing rivalry with the Marxists that kept alive the doctrinal debates and organizational divisions that characterized both the First (1864–1876) and Second Internationals (1889–1914).

Anarchism was never a homogenous ideological movement. At one time or another in the course of the nineteenth and early twentieth centuries anarchists who belonged to the international socialist movement identified themselves as mutualists, collectivists, communists, and syndicalists. Yet, despite their theoretical differences, anarchists of all schools were united in their opposition to Marxism. Above all this was because of their diametrically opposed views of the role of the state. For the Marxists, the state was a necessary vehicle for governing society until full communism had been achieved. Once this stage of history had been reached, the state would, in the words of Engels, cease to be a useful instrument of rule and simply wither away. The anarchists completely rejected the notion that the state could serve any positive function. In sharp contrast to the Marxists, they believed that the working classes would overturn capitalism, not by wresting political power from the middle-classes, but by concentrating their energies in developing and organizing their own social institutions and by engaging continuously in an economic struggle against their oppressors.

Anarchists also opposed Marxism on the grounds that its communist principles were incompatible with the kind of libertarian society they envisaged. The Russian anarchist Mikhail Bakunin (1814–1876) famously declared that he detested communism because, "it is the negation of liberty." He further accused Marx of promoting an authoritarian form of communism that "concentrates and absorbs all the powers of society into the state."

Since the anarchists abstained from politics and thus rejected the ballot box as a means of advancing the workers' cause, they were forced to adopt a revolutionary strategy that also placed them at odds with Marxists and reformist socialists. For this reason there are two main features of the movement that need to be mentioned: direct action tactics and violence. The former included such things as sabotage, strikes, and public demonstrations—May Day celebrations, for example. The anarchists' reliance on a tactic known as "propaganda by the deed" gave rise to the stock image of them—popularized by writers and social scientists like Joseph Conrad (1857–1924), Henry James (1843–1916), and Cesare Lombroso (1835–1909)—as social deviants who were bent on destroying the foundations of civilization. This overblown stereotype was reinforced by several widely publicized anarchist outrages that punctuated the last years of the nineteenth century. Apart from launching small-scale attacks against symbols of class, state, and religious rule, anarchists were responsible for the political assassinations of several heads of state. Within a span of only six years, the presidents of France (1894) and the United States (1901), the empress of Austria (1898), the prime minister of Spain (1897), and the king of Italy (1900) were murdered by anarchists. The stigma that all anarchists were now saddled with obscured the fact that these were isolated acts committed by only a handful of individuals. Most rank-and-file anarchists were strongly opposed to terrorism, and most saw education and trade unions as the main vehicles for conducting their revolutionary activity.

At the turn of the century anarchism, which had nearly died out in most areas of Europe, was revitalized by the

development of yet another brand of socialism known as revolutionary syndicalism. When Arturo Labriola (1873–1959), Émile Pouget (1860–1931), José Prat (d. 1932), and other libertarian thinkers began to marry the new doctrine (which emphasized trade unionism and direct action tactics like the general strike) to old anarchist beliefs the result was anarchosyndicalism, a movement that was particularly important in France, Spain, and Italy. In fact, it was the introduction of syndicalism that brought about the phenomenal growth of anarchism in Spain. Over the course of the next two decades, anarchosyndicalism became a mass movement, with its membership peaking at over 1.5 million members during the Spanish Civil War (1936–1939).

Marxism Challenged

The anarchists were not the only ones to challenge the view that socialism was synonymous with Marxism. Toward the end of the nineteenth century there emerged several strands of “new” socialist thinking that developed outside the Marxist tradition. The most important of these was the brand of socialism known as Fabianism, which became an important movement in Great Britain after 1889. Originally comprised almost exclusively of upper-middle class intellectuals—notably, George Bernard Shaw (1856–1950), Annie Besant (1847–1933), and Beatrice Webb (1858–1943), and Sidney Webb (1859–1947)—the Fabian Society advocated a nonrevolutionary form of socialism that was shaped more by the ideas of Herbert Spencer (1820–1903), Jeremy Bentham (1748–1832), James Mill (1773–1836), and John Stuart Mill (1806–1873) than it was by those inspired by Karl Marx. Unlike the Marxists, who saw historical progress in terms of class conflict, the Fabians conceived of society as an organism that evolved gradually over time. Socialism was, in their eyes, a natural outcome of social development, but one that needed to be guided by enlightened thinkers like themselves. Drawing upon their faith in positivist principles, the Fabians were convinced that a “scientific” approach to the study of social phenomena would produce an effective strategy for constructing incrementally a socialist society. By insisting that socialism could be achieved in a peaceful way, the Fabians set themselves against the Marxian parties of the Second International who conceptualized social change in terms of a dialectical struggle.

Revisionist Controversy on the Continent

The greatest challenge to Marxism at this time, however, came not from without but from within the Marxian current of socialism. Beginning in the late 1890s a diverse group of so-called revisionist thinkers increasingly questioned the validity of a number of fundamental Marxist tenets. They particularly objected to how rigidly Marx’s doctrine was being interpreted by his epigones in the Second International. The foremost theoretical spokesman of the revisionist movement was Eduard Bernstein. Bernstein was a German social democrat whose views on socialism had been influenced by his extended sojourns in Switzerland and particularly in England, where he became familiar with the views of the early Fabian Society. While his own theory of socialism differed from theirs, Bernstein nevertheless shared many of the Fabian beliefs, including the notion that socialism could be achieved by

nonrevolutionary means. In a series of articles that first appeared in *Die Neue Zeit* between 1896 and 1899 and later published in the book *Evolutionary Socialism* (1899), Bernstein laid the foundation for a revisionist challenge to Marxist ideas that had long been regarded as sacrosanct. Above all, Bernstein’s writings were meant as a corrective to some of Marx’s fundamental economic suppositions—his theory of surplus value, for example—as well as to some of his a priori claims, such as his prophecy that, by virtue of its inherent contradictions, the cataclysmic end of capitalism was inevitable. From his own observations of general economic and political conditions at this time, for example, Bernstein concluded that class tensions were easing rather than intensifying. Instead of becoming increasingly poorer, Bernstein asserted that available statistical measures indicated that workers were generally enjoying higher living standards. By further arguing that the state should be used as a vehicle for abolishing all class privileges and promoting democratic rights, not just for workers, but for all groups in society, Bernstein also ran afoul of his colleagues in the Marxist-dominated sections of the German Social Democratic Party (known by the German acronym SPD) who maintained that the working classes alone should benefit from the advent of socialism.

Bernstein’s intellectual assault on the reigning orthodoxy of Marxist thinking set in motion a series of debates and discussions within the Second International that did not die down until the onset of the World War I (1914–1918). Leading the opposition to Bernstein’s revisionism were Karl Kautsky, the foremost interpreter of the writings of Marx and Engels at this time, and Georgy Plekhanov, the principal architect of the Russian Social Democratic movement. Both attempted to defend what they regarded as the core principles of Marxism by contending that Bernstein had failed to grasp Marx’s basic notions about the relationship between economics and politics and that the antirevolutionary policies implied by his revisionism rendered socialism completely unnecessary. In the former case, for example, Kautsky explained that socialism would come about, not as a result of the increasing pauperization of the working classes, but as a result of sharpening class divisions, which were inevitable and therefore unavoidable features of historical development.

In reaffirming their faith in the immutable principles of Marxism, Kautsky and other antirevisionists hoped that they could prevent socialism from deviating from its revolutionary path. Yet despite their commitment to this understanding of socialism, the fact is that the majority of groups affiliated with the Second International at this time were already pursuing reformist policies. In France, Spain, Italy, and even in Germany the social democratic parties preferred the ballot box to confrontational tactics as a means of advancing their cause. In most instances this entailed working in cooperation with rather than against the middle-class parties that dominated political activity in the various Western European countries where socialism had an important following. Thus, Jules Guesde (1845–1922), the leading figure in the Marxist branch of the French socialist movement, was so committed to the idea of achieving socialism through peaceful means that he advocated parliamentary collaborationism. Another key French socialist

in pre-World War I period, Jean Léon Jaurès (1859–1914), was equally convinced that theoretical concerns should be subordinated to the tactical needs of the movement. He therefore thought it possible to retain his commitment to revolutionary Marxism while at the same time promoting a democratic path to socialism.

There were other socialist thinkers around this time who did not necessarily draw reformist conclusions from their critique of Marxism. Georges Sorel (1847–1922) was a French socialist who had come to Marxism late in life. Within a few years of his conversion, however, Sorel was ready to reject the scientific pretensions of Marxist doctrine as well as the reformist policies of the French socialist movement in order to embrace a form of revolutionary syndicalism. In his most famous work, *Reflections on Violence* (1906–1908; English trans., 1912), Sorel set forth a philosophy of syndicalism that stressed the importance of violence (by which he meant rebellion against existing institutions) in the workers' moral and economic struggle against capitalism. According to Sorel, the revolutionary élan of the workers needs to be sustained by the "myth of the general strike" or poetic vision of the coming epic showdown between workers and their oppressors.

While Sorel himself was not directly involved in the working-class movement, his ideas contributed to the growing body of left-wing syndicalist theories that had been developing since the late 1890s in countries like Belgium, Holland, France, Italy, and Spain and that would continue to exercise a profound influence on trade union development in those countries until the outbreak of World War II (1939–1945).

Socialism versus Communism

The two events in the twentieth century that had the greatest impact on the course of international socialism were the World War I and the Russian Revolution (1917). The outbreak of hostilities in Europe in 1914 brought to an abrupt halt the numerous theoretical debates inside the socialist movement that had been raging up to that time. The war also dispelled the notion held by nearly all socialists that, irrespective of doctrinal differences, socialist parties everywhere were united by a common goal (the overthrow of capitalism) as well as by their internationalist outlook.

The Russian Revolution of 1917 that brought the Bolsheviks to power had even more far-reaching consequences for the development of socialism. First and foremost, it signaled an end to Marxism as it was generally understood by most socialists up to 1917. This was not least because the epicenter of Marxism was transferred from Western Europe to the east and would remain there for the greater part of the twentieth century. In its new surroundings, Marxism would be widely referred to as *communism*, a term that was adopted in 1919 by V. I. Lenin (1870–1924) and the Bolsheviks in order to distinguish their movement from the so-called infantile revisionist socialism that had come to characterize the Second International. With the founding of the Soviet Union in 1924, the division between socialism and communism was formalized and made permanent. From this point on, socialism moved along two very distinct paths. One was defined and

largely controlled by the Soviet communists and the other followed a course that was defined by the pluralistic socialist traditions of Western Europe. Because the story of communism occupies a distinct chapter in the history of socialism in the twentieth century, it is not our intention here to summarize the main features of that movement. Instead, we will proceed with our survey of European socialism after the advent of communism.

Socialism in the Interwar Period, 1919–1939

The trauma and physical destruction that resulted from the World War I created widespread political and economic instability in Europe. Established political traditions and practices were the first to be challenged in this uncertain environment, first by the communists who sought to build upon the revolutionary experiences of Russia, and then by radical right-wing factions and fascists, who set themselves against both liberal democrats and left-wing parties. In these circumstances, socialists of the social democratic variety fared poorly. In most countries, socialist parties had barely recovered from their setbacks during the war when they were met with crises caused by the aforementioned groups. On one level, the communists forced socialists to adopt either the Russian Revolution as their standard or the reformist model that still prevailed in most European social democratic movements. The result was disastrous in countries like Italy and Germany, where a divided left made the socialists and communists more vulnerable to their more unified opponents on the right. The fascists were particularly adroit at playing on the weaknesses of the socialists. By the mid-1930s socialists everywhere were either in retreat in the few democratic countries that had survived the aftershocks of the war or driven completely underground by the authoritarian and totalitarian one-party states that had come into existence across Continental Europe.

Socialist participation in the communist-inspired Popular Front was an electoral strategy during the mid-1930s that was meant to check the rapid advance of facism and other antide-mocratic movements that were gaining ground at this time. In both Spain and France, for example, socialists played a pivotal role in forging a political alliance that embraced a wide spectrum of left and liberal factions. However, in Spain the Popular Front government formed in February 1936 was short lived, as civil war broke out in July. In France, Léon Blum's (1872–1950) socialist-led Popular Front coalition also enjoyed only limited success between 1936 and 1938. In this brief period, Blum managed to push through a number of social reform measures, such as the implementation of the forty-hour work week, before his government succumbed to the pressures of its conservative and pro-appeasement rivals.

The outbreak of yet another general war in 1939 marked the beginning of a seven-year hiatus in the development of socialism. When the war ended in 1945, socialist parties found themselves struggling against a number of currents. On the one hand, they were confronted by the spread of communism throughout the greater part of East and Central Europe. The strangle-hold that Joseph Stalin (1879–1953) had secured over the postwar regimes that emerged in this region between 1946 and 1949 effectively smothered the development of any

independent socialist movement for the next few decades. Under immense pressure from Moscow, social democratic parties were forced to disband and amalgamate with the communist parties loyal to the Soviet Union.

Except in Great Britain and the Scandinavian countries—where social democratic parties were in the ascendant—circumstances in much of Western Europe also conspired against a general revival of socialism. The right-wing dictatorships in Portugal (Antonio de Oliveira Salazar) and Spain (Francisco Franco) survived the war and both governments maintained their ban on left-wing parties for the next few decades. The postwar difficulties socialism faced elsewhere in Europe were compounded by the onset of the Cold War. Because the political and economic stability of the pro-capitalist nations remained in doubt in the immediate aftermath of the war, socialism was generally viewed with suspicion by the electorate. This was partly because socialists in Italy and France tended to form alliances with the Moscow-oriented communists, and partly because of the growing dependency of many European nations on the economic and military support of the United States. In fact, the United States made it clear to the newly restored postwar regimes that, because Europe was now divided into mutually hostile ideological blocs, it would not tolerate the idea of socialists and communists forming government coalitions outside the Soviet umbrella.

There were further reasons why socialism failed to make inroads into the political arena at this time. One was connected with the cultural and ideological shifts on the liberal and conservative end of the political spectrum that had taken place in Europe since the Great Depression and World War II. The economic problems thrown up by the Depression had caused many liberals to revise their views regarding the state's role in the economy. The mixed economic model for capitalism promoted by the liberal economist John Maynard Keynes (1883–1946) gained currency at this time, and this trend in economic thinking was generally reinforced during the war, when the collectivist practices of the state were deemed both necessary and desirable by the majority of the population. At war's end, the consensus among liberals and conservatives was, at least for the time being, the state would have to play a major role not only in bringing about the political and economic recovery of war-torn Europe but also in sustaining the social welfare of the general population during this critical period of transition.

While the socialists stood to gain much from this development, they failed to win popular backing at the polls for policies with which they had long been identified. This was due in part to their own miscalculations—such as their insistence on forming alliances with the communists—and in part to the fact that the socialists' general political outlook was woefully out-of-date. With few exceptions, social democratic parties in Europe were reluctant to refashion the theoretical content of their political programs. For example, most still looked to the working classes (trade unions) as their main constituency and most retained a nostalgia and even reverence for the Marxist ideological underpinnings of their movement.

Despite these shortcomings, socialist parties continued to occupy an important place in the political arena. This was

especially true in countries like Sweden, where the social democrats (SAP) dominated politics for the greater part of the twentieth century, and in Great Britain, where the Fabian style of pragmatic reformism of the Labour Party has won out over other forms of socialism.

The cultural ferment associated with the 1960s and early 1970s helped to inject some new life into socialist doctrine. The left-wing radicals who spearheaded protest movements in this period turned a fresh eye to the historical and ideological roots of socialism. In doing so they helped to resurrect themes that had lain dormant for many years but that now appealed to the intellectually diverse postwar generation of leftists. Perhaps the most important of these was the question of women's role in the socialist movement. From its origins, socialist thinking had been concerned with the fate of both men and women. Yet, apart from Charles Fourier, August Bebel, Friedrich Engels, Edward Carpenter (1844–1929), and a handful of other theorists, socialists tended to ignore specific questions relating to sexuality and gender. Indeed, all of the classical socialists who addressed the woman question, such as Engels did in his *Origin of the Family, Private Property and the State* (1884), regarded women as proletarians in the household and thus did not, as twenty-first-century socialist feminists do, view gender as distinct from class. Fewer still thought it necessary to transform socialist practices so that they matched the profeminist rhetoric of their movement. It was against this background that a new generation of socialist thinkers began their campaign to infuse socialism with feminist values and beliefs. The research of socialist feminists like Sheila Rowbotham and other historians of gender revealed that women played a much greater role in the development of socialism than had hitherto been acknowledged. Up until this point, Flora Tristan (1803–1844), Vera Zasulich (1851–1919), Rosa Luxemburg (1871–1919), Alexandra Kollantai (1873–1952), Dolores Ibárruri (1895–1989), Clara Zetkin (1857–1933), Beatrice Webb, and other notable activists had rarely received the kind of historical attention that was commensurate with the contributions they had made to socialist theory and practice. For example, it was not until the late 1960s that the prominent role that Luxemburg played in the key debates and discussions within European socialism during the first decades of the twentieth century became widely recognized by the scholarly community. Beside making her mark as a theorist during the revisionist controversy in *Reform or Revolution* (1899), Luxemburg became famous during World War I for leading the socialist opposition to the war in Germany. By the time of her death in 1919, the year she helped spearhead an ill-fated coup against the provisional Weimar government, Luxemburg had also established a reputation as a critic of the authoritarian policies of the Leninist brand of revolutionary vanguard Marxism. While the theoretical differences between her and Bolsheviks such as Lenin and Trotsky should not be exaggerated, Luxemburg always stood for a more open and democratic interpretation of socialism than did her Russian counterparts. No less important was the light that gender-sensitive research cast on the role that anonymous women in the past and present played not only in building socialism through their participation in grass-roots associations but also in broadening female participation in the public sphere.

Besides seeking to revise the historical record, socialist academics, writers, and activists in the women's liberation movement were also interested in changing the attitudes and perceptions that the majority of socialist men held of women. Socialist feminists pointed out that, while most men endorsed pro-feminist principles, they nevertheless tended to see women in sexist terms. For example, few concerned themselves with issues—child care, birth control, sexual expression, among others—that directly affected their wives, sisters, mothers, and female friends. Nor were they alive to the second-class status to which women were consigned in the workplace, where gendered divisions of labor prevailed, and in society generally, where male dominance was both profound and pervasive. The degree to which socialist feminists were successful in their endeavors is hard to measure. There can be no question that their efforts to place the women's question high on the socialist agenda and their insistence that "the personal is political" contributed in a number of ways to the rejuvenation of the theory and practice of a doctrine that was increasingly out of step with the realities of late twentieth century society. Nonetheless, the legacy of socialist feminism is mixed. Though it failed to bring about the much sought after gender reorientation of a number of socialist parties, socialist feminism can be credited for greatly advancing the ongoing struggle for women's rights. Contemporary feminists are above all indebted to this movement for having raised society's awareness of the multiple ways in which gender relations affect the daily lives of everyone.

Socialism at the End of the Twentieth Century

In the closing years of the twentieth century, socialism experienced further transmutations. On a practical level, socialist parties tended to resemble each other more and more, though this was not necessarily due to a closer collaboration among the various socialist parties. Ever since the demise of the Second International in 1914, socialists had all but abandoned the idea of using an overarching body to coordinate the policies of the various national socialist parties. The largely inert bureau of the Labour and Socialist International (LSI) met for the last time in April 1940, and it was not replaced until 1946. The onset of the Cold War after 1948 forced changes within the LSI that resulted in the creation of a new organization, the Socialist International (SI), in 1951. Echoing the realities of the postwar era, the executive council of the SI made clear to all its members that it would "put an end to the equivocation of parties which want to belong to our socialist group while in fact obeying directives from Moscow." Apart from reaffirming the European socialist parties' commitment to democratic socialism, the SI provided intellectual and moral support to the socialist parties that had been forced underground in antidemocratic regimes of Western Europe or were threatened by communist influence in the non-aligned movement countries. It was particularly successful at assisting the resurrection of socialism in Portugal (1974) and Spain (1975) when democracy returned to those countries in the late 1970s. During the 1980s, the SI continued to expand its influence in Europe and in parts of the Third World, though, in an age when nationalist feelings greatly diminishes the spirit of internationalism, its relevance to the future development of socialism remains an open question.

Partly in response to the electoral successes of their ideological opponents on the right, during the mid-1980s socialists throughout Europe began questioning their longstanding commitment to socialization policies, such as social welfare and public ownership (nationalization). And though a small core of purists refused to abandon the transformative goals of their doctrine, the vast majority of socialists elected to office in this period believed that social justice and equality could best be achieved by adopting the principles and practices of neoliberalism. As a result, the notion of what it meant to be a socialist underwent significant revision, with some critics arguing that the pre-capitalist values of "credit card" socialists made them indistinguishable from their liberal and conservative rivals.

Those who belong to the generation of socialists alluded to here are widely known in the early twenty-first century as *social democrats*, a label that refers to their commitment both to parliamentary democracy as well as to the principles of market socialism. According to this model of a mixed economy, the government should play a role in overseeing the ownership of certain enterprises (e.g., utilities and public transportation) but would allow market forces to determine the allocation of their goods and services. While the social democrats insist that their policies are aimed at implementing the classic socialist ideals of social justice and economic equality for all, they do not subscribe to the age-old socialist belief that holds that the state should function as the sole vehicle for achieving these much-desired goals.

The theoretical and policy shift that were identified with the social democratic movements of the 1980s greatly contributed to a reversal of the political fortunes of socialist parties in several countries. In Spain and France, for example, the socialists dominated national politics throughout the 1980s. The ascendancy of the New Labour Party movement in Great Britain during the late 1990s and early years of the twenty-first century seems to have signaled a further shift of socialist doctrine away from its historic ideological foundations.

The rightward drift of socialism in the last decade of the twentieth century was given even greater emphasis following the collapse of communist regimes in East Central Europe in 1989 and the Soviet Union in 1991. With communist ideas largely discredited the socialists' doctrinal links with Marxism were completely severed. The intellectual preoccupations and foci of the post-Cold War era promise to erode further the core elements of socialist ideology.

It is evident from the foregoing account that socialism has been in a state of flux over the course of the past two centuries. Socialism in the twenty-first century cannot be located on the same ideological map that it occupied as a revolutionary theory in the nineteenth and greater part of the twentieth centuries. Whether it will continue to change or cease to exist as a distinct ideology remains to be seen. But whatever its fate as a doctrine, socialist ideas and values are so integral to Western political traditions that they will no doubt continue to find expression in an ever-changing political landscape.

nineteenth century. African socialisms represent various combinations of African thinkers, politicians, and activists' absorption with and reconfiguring of nineteenth- and twentieth-century European socialist ideas and practice. The sources are multiple, from trades unions and contact with European workers, to affiliations with European political parties, and through contact with Pan-African (West Indian and African-American) radicals. Many African thinkers and movements have identified with various strands of social democratic and Marxian forms of socialism, seeking to indigenize them to Africa.

The rise of African socialisms as a movement coincides with the early phases of nationalism and national development, the high point of which was the non- nonaligned movement and Third Worldism. African socialism as practice began with the first self-proclaimed socialist-nationalist revolution in Africa, Gamal Abdel-Nasser's (1918–1970) 1952 Officers Coup in Egypt; and intended with globalization meeting South Africa's thwarted redistributive social democracy.

All African socialisms shared overlapping features that provided bases for nationalism and approaches to postcolonial development and nation building. First, was a combination of state ownership, an equitable distribution of wealth, and increasing citizen well-being; second, was the urgency of conquering underdevelopment, of "catching up"; third, was creating relevant noncapitalist institutions that would shape economic development; and fourth was creating well-balanced social relationships of citizenship that could establish cohesion between people and the state.

Prior to the 1917 Bolshevik Revolution in Russia, socialist ideas and practices were mooted among sections of the African middle and working classes. The *Sierra Leone Weekly News* in 1913 compared union-based socialism in industrial Europe with the supposed hallmark of an indigenous socialism, African "hospitality," auguring in sentiments (and myths) subsequently invoked by African Socialist-nationalists and political leaders. Striking laborers and clerks in Lagos in 1897 had neither socialist ideas nor organization to mobilize them against low wage labor policy for Africans, yet African socialist movements begin with the development of a modern work force.

Where industrial capitalism had penetrated more deeply in Africa, as in South Africa, Egypt, and Algeria, burgeoning workers and trade union movements would become subjects of communist and socialist ideas. Established primarily by settler, expatriate or European unionists and intellectuals, these movements learned their socialism in metropolitan-based parties. Striking white miners between 1906 and 1907 and from 1913 to 1914 in South Africa would beckon the call of (white) trade unionism and socialist organizing and practice, as would black workers in 1918. Socialism's claim to social justice would uniquely shape South Africa's national experience, where a class divided by race would force the national question to the center of discussions about the nature of socialism and independence in South Africa.

The first communist party in Africa (and in the Arab world) was formed in Egypt in 1921, where textile and transportation workers became the subject of communist attention after

SOCIALISMS, AFRICAN. Socialist ideas have been in Africa before the advent of colonialism at the turn of the

World War I. The general orientation of Egyptian Marxists and socialists was directed to the Arab world, which would persist into Nasserism. Egyptian communism remained small; having a large impact upon intellectual Marxism, debating many important questions about socialism in a backward country; it had little impact upon Egyptian politics and was unable to develop a mass following among a large indigenous working class, a well-developed trade union tradition, and millions of Egyptian peasants, or fellaheen. The party eventually disbanded in 1965 through in-fighting and Nasser's repression.

Until the formation of the 1970s Afro-Marxist regimes, movements espousing revolutionary Marxism were nonexistent. An exception was one the large metropolitan, European dominated, Algerian Communist Party, formed in 1936. By the 1950s it had disgraced itself by constantly placing the French interests above Algerians'. Two other exceptions were Sudan Communist Party and the South Africa Communist Party (SACP). In the early twenty-first century the SACP remains numerically strong, while the large Sudanese Communist movement, founded in 1946 under the influence of Egyptian Marxists, played a role in the nationalist movement, retaining significant influence in Sudanese politics before General Gafur Nimeri's murderous purges in the early 1970s.

Marxist influence would find homes within African socialism. Soviet and Chinese communism were benchmarks of socialism throughout colonialism, nationalism, and the formative years of national development. With few exceptions, like self-management in Algeria (1960–1965), alternative or academic socialisms had little foothold in Africa. If communist party formation was prohibited during colonialism, many independence parties (especially in Francophone Africa) were modelled on communist parties. Many African leaders, even when seeing communism as threatening, were impressed by the rapidity of its modernizing achievements through centralization, planning, and the one-party state. The Cold War also demanded positions on communism; most African states preferred charting unaligned vistas between it and Western capitalism.

North African, "Arab" Socialisms

Nasserite Egypt (1960–1974), Bourguiba's Tunisia (1954–1986), Algeria from Ahmed Ben Bella's and Boumediene's through the reforms of the mid-1980s Qaddafi's Libya (1969/1977–) represented the beginning and end of North African socialisms.

Like the Cold War, the Egyptian Young Officer's coup would prepare a template for much of the continent's independence with its one party, state capitalist socialism; it also demonstrated efficacy in achieving power through armed force. Originally hostile to socialism, Nasser eventually used "Arab" socialism to rationalize confiscating large landed estates, foreign nationalizations, and outlawing political and religious opposition, all identified with holding back national development. A trademark of African socialisms was invoking development in the "people's" name, and populist state capitalist socialism became a practice of legitimation. The imperative of rapid economic and social development through planning was put forward as guaranteeing modernization and equitable

redistribution that only the state could be charged with. Multiparty democracy was viewed as a disruptive extravagance the progress of the "people's" developmental state could ill afford, and trade unions, once a ground of radical support, were expected to have no role other than to support the aims of the state.

One finds similar rationalizations in all other North African socialisms, despite differences over, for instance, the extent to which there was a need for the state to own socialized property, rather than direct the redistribution of wealth. In Habib Bourguiba's modernist appeal to socialism at independence in 1956 through the Tunisian nationalist Neo-Destourisme; in Algeria's attempt to come to terms with the reconstructive aftermath of a brutal war of independence, in the response to the chaos of the early years under Ahmed Ben Bella's (1918–) chaotic self-management; and Houari Boumediene's (1965) coup, auguring in "Real Socialism," the rationalized normalizing of the revolution combing technocratic development through state-led industrialization; as well as Ghadafi's coup and eventual 1977 announcement of Jamahiriya (the "people's" state) socialism for Libya. In their different ways, each sought to balance national identity as Islamic, with the demands of modernizing under the quasi-secularist nationalizing, one-party state. Each feared fragmentation, and each sought centralized political and economic control to overcome it. Each restricted political parties, undertook a more or less centralized state for fear of unfettering dormant interests uniting around religion, class, and ethnicity. All claimed to have modern egalitarian and equitable ends, and all wanted to justify themes consistent with religion, while keeping the ulema and conservative classes allied with them under control, ensuring religion did not interfere with its national cohesion and national development.

Only Ghadafi clung to fictionalizing socialism's name as real; by the early twenty-first century Tunisia had abandoned all simulation, embarking on the most controlled secular march toward modernizing the society and the economy; while Algeria continued to live with the effects unleashed by the (1978–1991) economic and political liberalization, forces repressed by one-partyism. From the breakdown of the state from ethnic loyalties to the violence of Islamist backlash in the face of annulled elections in 1993, the facade of socialism was all but forsaken.

African Socialists

Nkrumah's Ghana (1957–1966), Ahmed Sékou Touré's Guiné (1958–1984), Modibo Keita's Mali (1960–1968), Julius Nyerere's Tanzania (1960–1985) Leopold Sédar Senghor's Senegal (1960–1981), and Kenneth Kaunda's Zambia (1964–1991) are the primary exemplars of "south of the Sahara" African socialisms.

African socialists were nationalist-politicians who believed the anthropologically problematic idea of a long-established ethos within the precolonial community's traditions of extended family networks of social mutualism, social egalitarianism, and a consensus system of political order. This order could be modernized but able to avoid conflicts inherent in European class

societies, as in Tanzania's Julius Nyerere's (1922–1999) vision of a policy of education for self-reliance that would enable a willing peasantry to accept collective decision-making in villages organized by the state. Ghana's Kwame Nkrumah (1909–1972) is often identified as the major figure, not because he was the most original; nor because of his execution of socialism when in power. It lies, rather, in his posthumous stature among Pan-Africanists and because he left a corpus of writing after his overthrow in 1966 that identified his credentials as a reborn radical. While in power, however, his political policies followed a familiar trajectory of one-party socialism—the imprisonment of the opposition, the banning of strikes by the same unions he would demand take up the cause of revolutionary socialism after his overthrow. There is little in his thought or, indeed, in much of his practice that to varying degrees, one cannot find in Mali's Modibo Keita (1915–1977) or in Guiné's Ahmed Sékou Touré (1922–1984), or for that matter much that is different in the North African socialist variants. In the case of Touré, he claimed that because prior to Guiné's independence in 1958, colonialism's inability to create class antagonisms was because extensive private ownership barely existed. The Africanization of Marxism could begin by building upon the supposed solidarity of a precapitalist caste-based society. His early, distinctly radical rule tried to create the cadres for a socialist revolution. As his policies failed, Touré responded with greater centralized rule and fiercer social oppression, which was mirrored in a collapse of the economy and livelihoods in Guiné.

Consistent with notions that the one-party state was best suited to carry out nation-building and development tasks, after independence Modibo Keita promptly moved to declare the Union Soudanaise Independence Party the single party of the Malian state, pursue a socialist policy based on extensive nationalization, and court both the Soviet Union and China. Malians were constructing socialisms through choosing the best from their Islamic past, where duties to the weakest and poorest in society were part of Afro-Islamic egalitarianism. Keita genuinely believed economic and financial decolonization from France and the establishment of socialist structures throughout the country. To this end, from 1961 before his overthrow in 1968, Keita's regime would maintain the necessity of structural sectorial reforms.

In contrast, Leopold Sédar Senghor (1906–2001) was a pragmatist for whom socialism was a cultural vision. Less interested in immediate structural transformations in the economy, he was more interested in an identification of the alleged mores of African societies, which, he claimed, were forms of social humanism. For Senghor, African socialism as culture never translated, except pragmatically, into much more than a cultural disposition that could modify some of the more corrosive values of western individualism. There were never the attempts at the large-scale socialization of production found among the more radical African socialists, in part because of the intimate economic and cultural relations Senegal had with France, and also because of the various conservative members of coalitions that supported the ruling Union Progressiste Sénégalaise (UPS), especially the Islamic Brotherhoods, who maintained some control over much of Senegal's main export commodity, groundnuts.

Political compromise rooted in production and key resources made political commitments appear rationalizations. So, Kenneth Kaunda's (1924–) eclectic African humanistic justification of state nationalization and state welfare through bringing together elements of Christian and Fabian socialisms allied with a selective liberalism was joined to a putative African collectivism. If it appeared well meaning, it could also appear a rationalization of state patronage through Zambia's major industry, copper: accumulation by political elites through nationalization. Profiting from soaring copper prices on world markets for over a decade after independence, many urban Zambians benefited from state subsidies and an expanded welfare system. Less than a decade later, however, these services shrunk under the burden of low world commodity prices and accumulated debt, revealing that the socialization means of production benefited a freeloading bureaucracy that contributed little but their vacancies.

Between 1965 and 1977, Nyerere's *ujamma* (familyhood) socialism was the highest profile African socialism and development. Initially meant to promote an egalitarian ethos, and a way of forestalling the development of classes and inequality, it failed because of a long price depression for its export commodities, costs sustained in removing Idi Amin from power, and the inability for the state to genuinely understand the needs of its peasantry. Peasants, the supposed source of *ujamma* modernization from below became subject to state-sanctioned bureaucratized replacement of traditional rural households with the forced displacement of nine million rural dwellers into planned resettlement “development” villages.

Nyerere said that villagization was not socialism but a technical decision concerned with the concentration of resources in settlements with little input from the peasantry; socialism and its full appreciation would come later. They never did. Very much reliant upon foreign aid for development programs, Tanzania was anything but self-reliant. After a decade of economic failure, and compelled by the demands of international financial institutions (IFIs) to adjust and stabilize its economy, by the time he left office in 1985 there was no more African socialists.

Afro-Marxism

Marxist socialisms grouped under the rubric of Afro-Marxist regimes, which came into and out of existence between 1963 and 1995, primarily coming to power through military coups. They include Congo's Masekela-Debat to Sassou Nguesso (1963–1991), Ethiopia under Mengistu Haile-Miriam (1974–1991), Somalia under Siad Barre (1969–1991), Mathieu Kérékou's Benin (1972–1991), and Didier Ratsiraka's Madagascar 1975–1993, 1997–). Also included is Zimbabwe's Robert Mugabe (1924–), who came to power through armed struggle and subsequent elections, and who also used Marxist-Leninist rhetoric. African “scientific socialisms” only real affinities to Marxism-Leninism and most practicing African socialism were one-partyism, the nationalization of industries, and authoritarianism. There were also Marxists, like the Cap Verdian Amílcar Cabral (1924–1973), the Angolan Augustinho Neto, and the Mozambiquans Eduardo Mondlane and Samora Machel, whose successors came to power inheriting very

unstable states in the violently uneven and unresolved Lusophone national liberation struggles. All regimes accepted some alliance with the Soviet Union. The one actual social revolution, which sought to socialize production and attempt to actually transform society, was the Ethiopian Revolution (1974), which was also the most bloody, killing thousands in its wake. Afro-Marxists also came into existence at a time when there was a revivification of Third Worldism, but also at a time when world markets were contracting, and debt was beginning to grow.

Afro-Marxism's rhetoric and practice were divorced from the realities they enforced themselves upon. Few understood, even cared to understand, both peasant life and the ethnic environments within which they inhabited. The exceptions were the assassinated leaders, Cabral and Eduardo Mondlane (1920–1969). For both Marxism had little utility unless it allowed activists and peasants alike to understand their worlds as ends to participation and well being, and both felt that understanding the materially cultural aspects of the populations that sought liberation was practically and normatively important. Striking about all of Afro-Marxist regimes is how easily they either collapsed or so easily altered themselves from Marxist-Leninist parties to liberalizing recipients of neoliberal adjustment policies. The regimes and leaders that did not collapse transformed themselves into devotees of the advice offered by (IFIs). Often leaving a bloody bequest of failure and death, these regimes' rhetoric was as deep as their commitment to actually revolutionize the relations and forces of production.

Conclusion

Whether Marxist, social democratic, or state-capitalist, African socialisms reflected diverse political economies and politics, covering theoretical intents, ideological perspectives, political movements, cultural and regional orientations, revolutionary struggles, and formerly actually existing socialist states. Over half of Africa's states have celebrated themselves as socialist or social democratic, have identified socialism in the pages of their liberation charters, and/or have retained "socialist," or socialism in their constitutions.

Like most other African political systems, African socialisms failed to meet people's aspirations and needs. They sometimes employed opportunistic and brutal ambition to thwart people's wishes for greater freedoms and choices over the nature and status of their needs. Equally, they frequently had their hopes aborted as casualties of Cold War realpolitik and vacillating economic desires of a world capitalist system.

African socialism's prospects look inauspicious. The wave of post-1970s, liberalization, and the collapse of the regimes, or death of many important leaders associated with African socialism's preeminence and disgrace, also saw many of these socialisms go with them. Increasing constraints of economic deprivation and debt, the imposition of adjustment and stabilization, and the demand, internally and externally, for greater pluralism and political choice, further limit prospects for renewal. African socialism became a consensus metaphor for failure—of the centralization, authoritarianism, and inefficiencies of state malfunction. The history of socialism in

Africa suggests much failure and a history of false promises; it also suggests, however, that those failures arise from development failure, a failure not generic to Africa and not to socialism alone. African socialism was a history of intent; as such it should also be remembered as past optimism for what it promised, even where it couldn't fulfill it.

SOCIETY. The concept of society is in transition due to globalization and the knowledge associated with it. Today's views of society are not altogether new, however. Rather, they are engaged with the rediscovery of the worlds of antiquity. Since the 1970s, scholars have reached to the past to explain mainstay concepts such as society. In this manner, ancient Eastern ideas flood into the current Western perspectives on society. The turn to the archaic East also heightens awareness of the West's own archaic past. Thus the concept of society metamorphoses while it embraces a living past.

Ancient Views of Society: East and West

Until the modern era, China did not have a word for society. The current term *shehui* means an organized assembly. In the ancient world, China utilized the idea of *wenming* (civilization), which literally meant the brightness of culture or the clarity of writing. It also had the idea of *zhongguo* (Middle Kingdom), denoting the middle of the world on a geographical plane and the middle of the universe (between heaven and earth) on a cosmological plane. During the pre-Qin era (third century B.C.E.), Chinese society was a living matrix of ideas and events, of spirituality and materiality. James Sellmann describes this world as "hylozoistic—a living world empowered with *qi* [life force]" (p. 5). As a "foci-field model" or "field cosmology," the pre-Qin society was conceived as an organic complex that changed as the seasons changed.

The Chinese philosophical coupling of yin-yang was an organizing principle that connected the heavens to earth and established all worldly changes. Political decision making relied on proper timing: the right season, the right pitch of the pipes,

the right state of mind. The balance of space and time was the key to harmony in the Chinese dynasties to come.

In highly stratified and patriarchal societies such as the West and Middle East, women might constitute a society within a society. While similar situations existed in the Far East, the harmonizing balance of Chinese philosophy accommodated women throughout history to occupy prominent roles ranging from calligrapher to empress.

In the Roman world, *socius* was a word that meant friend—hence the English word *society* as a modern word related to a community of friends. In the ancient world, one could not get by without friends who shared common values, common work, and common lands. Thus the Roman word *communitas* as applied to society symbolized the collectivity of physical and spiritual relations that bound together a people, as in the slogan *senatus populusque Romanus*—the Senate and the People of Rome. Roman community was bound together by a sense of *civitas* or citizenship as defined by the civil virtues of Rome. The English word *civilization* derives from the Latin and carries the sense of a social, political, cultural, religious, and philosophical whole. The Middle Ages in Europe saw the splintering of Roman civilization into church and state, or into religious and political spheres of influence. As towns began to develop and the world split more visibly into city and country, social philosophers' views on society also bifurcated.

Early Modern Views of Society

When the Jesuits brought knowledge of their explorations into China back to Europe, an organic view of society as a compendium of functioning interdependent parts started to take shape. Although this was a bare shadow of China's sophisticated civilization, it led to a Western idea of a body politic, with the state as the head, the church as the heart, and economy and other social systems as the limbs and organs of society. This organic view had far-reaching implications well into the twentieth century, especially in structural functionalist views of society. Karl Marx (1818–1883), however, regarded these developments as a definitive conflict between the generation of civil society and political community. Civil society developed conflicting classes within it that were regulated by the political community. The contradictions of everyday life were monitored by a state that favored the ruling class, and the state wore a political lion skin for the dominant class. Hence, political relations were often mediated by class relations. Hence, society began to manifest simultaneously both conflictual and consensual components. Society was forever in a state of flux.

With the division of labor, industrialization, and the quest for the development of the nation-state, a new philosophical challenge emerged in the form of one question: What comes first, society or the individual? In the ancient Western world of Greece and Rome, the individual was not so much a factor. Rather, a person made commitments to the virtues of various institutions and traditions such as the family. But with the struggle for the creation of the European nation, especially in France, the concept of the individual greatly challenged definitions of society. On the one hand, the more conservative view of kings retained the idea of society as a given, as a complete whole functioning in accord with the will

of God; individuals would simply obey the laws of society and work to maintain this equilibrium. On the other hand, the more radical views of French revolutionaries saw the individual as the center of the universe with a variety of inalienable rights; society would serve the individual while maintaining the supremacy of that individual through *liberté, égalité, fraternité*—liberty, equality, fraternity—a battle cry of the French Revolution.

Society: Consensus and Conflict

Views of modern Western society tend to fall into two camps: consensus and conflict. Consensus views beginning with the economist Max Weber (1864–1920) and continuing into the structural functionalism of the American sociologist Talcott Parsons (1902–1979) describe society as a complex combination of static and dynamic systems. Weber identified society as a system of potential harmonization, with rational actors choosing the best means to the end of ensuring the smooth operation of society; Parsons discussed the functional and dysfunctional aspects of society as it strives for a dynamic equilibrium through complementary institutional structures.

Marx is still the main proponent of the conflict theory of society, among a plethora of thinkers up to Louis Althusser (1918–1990) and beyond. Marx conceived of society as a kind of shape shifter, culminating in and overcoming moments of conflict through a sequence of class struggles: slavery giving way to feudalism, feudalism giving way to capitalism, capitalism giving way to socialism, socialism giving way to communism. Althusser divided society into repressive and ideological apparatuses. He had a rather pessimistic view of society's transformations because of its ingrained structures of dominance, especially in the overwhelming powers of the modern state.

The philosopher Jürgen Habermas (b. 1929) combined both consensus and conflict theories while exploring a legitimation crisis of modern society struggling for a communicative competence among both institutions and individual actors. These five thinkers—Weber, Parsons, Marx, Althusser, Habermas—still stand as the most prominent models of social scientific thinking regarding society today. What is attractive about their approaches seems to be an ability to connect abstract macro-level ideas about society with more concrete micro-level ideas about individual social actors within the framework of these umbrella systems.

The New Ancient World: Leibniz, Vico, and China

Given the present trend toward global communications, more attention has focused on the origins of concepts of society, especially in the works of pioneering scholars in the relations between East and West. The philosopher Gottfried Wilhelm Leibniz (1646–1716) did not simply rehearse Christian views of Chinese society. Like Giambattista Vico (1668–1744), Leibniz was impressed with the Confucian view of benevolence and the harmonious society that it spawned. Like Vico, he distrusted René Descartes's and Isaac Newton's image of a mechanical universe. Leibniz was indebted to the Jesuit Matteo Ricci (1552–1610), who was similarly open-minded about Chinese philosophical and religious life. Leibniz embraced a Chinese notion of society as a living organism and

popularized this image in Europe. His description of matter applies to society as well: “Thus every portion of matter can be conceived as a garden full of plants or a pond full of fish. But every branch of the plant, every limb of the animal, every drop of its humors, is again such a garden or such a pond” (1965, p. 159). For Leibniz, society was a thoroughly interdependent living entity whose every fiber was connected. Every societal institution was dependent on each other and necessary for a harmonious balance. Since every entity was composed of matter, then matter itself was infinitely interconnected. His idea of monadology was clearly linked to the Confucian idea of *li* (principle, form, pattern) as a primary substance that generated *qi* (primordial vapor or life-energy force), both of which acted upon every aspect of the life-world. He correctly perceived Chinese society as holding to a cosmology that ensured harmonious relations: “Indeed, it is difficult to describe how beautifully all the laws of the Chinese, in contrast to those of other peoples, are directed to the achievement of public tranquility and the establishment of social order” (1994, p. 47). Leibniz so much admired China’s “public morality” and “natural theology” that he referred to it as an “Oriental Europe.”

Whereas Leibniz was influenced by Matteo Ricci, Vico was influenced by another religious friend, Father Matteo Ripa (1692–1746). Ripa had lived for many years at the court of Kangxi, the emperor of China’s Qing dynasty. When Ripa returned to Italy, he brought with him copper engravings of world maps and garden vistas complete with Chinese poetry. Ripa introduced many Chinese scholars along with an abundance of knowledge to Naples, where he established the Collegio dei Cinesi (The Chinese institute). This cross-cultural milieu greatly influenced Vico’s formulation of *Scienza Nuova* (The new science) and his image of society that aimed to give birth to the ancient past in the present.

Vico was interested in myth and language, especially in tracing etymologies of words to their ancient roots and then awakening them in modern contexts. In other words, language was a conduit for the past to become the present. It is language that gives life its poetic character. Hence Vico characterized society in terms of a “poetic cosmography,” a mapping of the world of gods, heroes, and humans. As a humanist, Vico did not believe in the dominance of rationalism through physical and mathematical sciences to the exclusion of the arts of philosophy and history. Through each of these vehicles, humans could attempt to recover the essence of society. This fundamental societal essence is what Vico called “conatus,” a primordial beginning or striving “proper to the human will” (p. 101). Vico endeavored to discover this beginning through various stages of history: the age of gods, the age of heroes, and the age of men. Each held its own nature or birth: divine imagination, heroic nobility, and modest conscience. Likewise, each represented a kind of government: theocratic, aristocratic, and human. Finally, each offered a language: divine poetic, heroic blazoning, and articulate speech. In his linguistic configurations, Vico is clearly indebted to both ancient Chinese and Greco-Roman thought. Divine written characters (hieroglyphs) were used “by all nations in their beginnings” (p. 341). These “poetic universals” were followed by heroic “imaginative universals” that spoke of noble events and then by human words.

The Chinese, for example, retained the number of pictographs in circulation for daily use from the large lexicon of classical and literary characters. Like the Egyptians, the Chinese maintained “the vanity of their imagined remote antiquity” (p. 21). This included the elevated speech of heroic singing reflected in the tones of the Chinese language and the recording of their first histories in verse. In many ways, Vico tried to emulate this style in his own works. He describes the Greek use of the dragon Draco, probably one of Gorgon’s serpents attached to Perseus’s shield (later Athena’s shield) and eventually the writer of Athenian law in blood, as that which “signifies the rule of the laws” (p. 228) in the time of heroic aristocracies. He then compares this with the Chinese dragon used as a royal emblem and a symbol of civil rule, while marveling at the poetic convergence of East and West.

Phenomenology and Society

John O’Neill, who has made a significant impact on social sciences and humanities since the 1970s, develops Vico’s ideas into a new phenomenological view of society. O’Neill recognizes Vico’s call to enter language and thereby “renew” society through every word: “Thus etymology is the music of Vico’s wild sociology inviting us to hear our beginnings in the birth of language” (1974, p. 37). Vico’s Chinese-inspired metaphor of the body politic replaces a mechanical scientific one. In attempting to recreate the “public functions of rhetoric,” O’Neill revises Vico’s project by identifying three levels of body politic in modern society: bio-body, productive body, libidinal body. The first refers to the institution of the family through the discourse of well-being; the second refers to work through the discourse of expression; the third refers to personality through the discourse of happiness. In addition, O’Neill maintains that “on the one hand, we have the bodies we have because they have been inscribed by our mythologies, religions, philosophies, sciences, and ideologies. But, on the other hand, we can also say that we have our philosophies, mythologies, arts, and sciences because we have the body we have—namely, a communicative body” (1989, p. 3). Influenced by Maurice Merleau-Ponty, O’Neill’s idea of society takes shape by way of a communicative body as a reciprocal crossing of experience somewhere between idea and flesh. It is the visceral grounding that is the heart of a society in constant flux. O’Neill is not afraid to cross spatial and temporal borders in his embrace of global thought, both East and West. His influence is wide, reaching into political theory and philosophy.

Building upon a similar understanding, Fred Dallmayr invites scholars to move “beyond orientalism” in discarding the Eurocentric views of society. Dallmayr is concerned with the recognition of non-Western cultures in the current shaping of a “global village.” Phenomenology helps shape “cross-cultural ‘co-being’ in a shared world—where the issue is neither to distance the other into the indifference of externality nor to absorb or appropriate otherness in an imperialist gesture” (p. 52). A strategy for understanding a global society necessitates a comparative political theory. Hwa Yol Jung’s *Comparative Political Culture in the Age of Globalization* (2002) follows Dallmayr and O’Neill in evoking phenomenology to explain a cultural hybridization of East-West views of society. Inspired by Merleau-

Ponty and Martin Heidegger, Jung promotes an idea of “planetary thinking” whereby a “global citizen” (*homo globatus*) engages in a world beyond the nation-state. Jung writes, “For the transversalist, globalization means to decenter Western hegemony and disclaim Western superiority thereby empowering the non-West to participate fully in the new worldmaking as an act of hybridization or imbrication” (Jung, p. 14). The writings of O’Neill, Dallmayr, and Jung go a long way to providing a new global understanding of the concept of society.

SOCRATIC METHOD. See *Dialogue and Dialectics: Socratic.*

SOPHISTS, THE. The word *sophist* (Greek: *ho sophistês*) can be traced as far back as the early fifth century B.C.E. and

means literally someone who engages in or teaches wisdom (*sophia*). Thus Homer, Hesiod, the Seven Sages, Pythagoras, and other preeminent poets, musicians, philosophers, and statesmen are referred to as “sophists” by ancient writers. However, the word acquired a technical meaning by the middle of the fifth century B.C.E. to describe a number of itinerant teacher-intellectuals who, visiting Athens from time to time, displayed their wisdom in virtuosic speeches (*epideixeis*) and claimed to be able to teach human excellence or virtue (*aretê*) for large fees.

The principal source of information about the Sophists is Plato (427?–347 B.C.E.), whose dialogues portray them as occasional interlocutors of Socrates. Since their own works exist only in fragmentary form, there is uncertainty about their philosophical views and the precise impact of their thought on the history of rhetoric, philosophy, political theory, and pedagogy. If we follow Plato, the list of major fifth-century Sophists should include Protagoras of Abdera (c. 490–c. 421 B.C.E.), Prodicus of Ceos (c. 465–after 399 B.C.E.), Hippias of Elis (fl. after 460 B.C.E.), and the brothers Euthydemus and Dionysodorus from Chios (fifth century B.C.E.), all of whom teach virtue for pay. It is customary, however, to include a number of other figures on the list, such as Gorgias (c. 485–c. 380 B.C.E.), Polus (fifth century B.C.E.), and Thrasymachus (fifth century B.C.E.), who appear in Plato’s dialogues as teachers of rhetoric but not of virtue; as well as Xenocrates (fifth century B.C.E.), Lycophron (late fifth or possibly early fourth century B.C.E.), Critias (c. 460–403), and Antiphon (c. 479–411), whom we know of from other sources.

Sophistic Speeches

Sophistic speeches were famous in antiquity for their rhetorical style and their moral and philosophical content. Prodicus’ “Hercules at the Crossroads,” (see Xenophon, *Memorabilia*, II.i.21–34) depicts a young Hercules at the brink of manhood choosing between a life of virtue and one of vice. Though the life of vice appears easy at first and the life of virtue difficult, virtue is said to produce genuine happiness (*eudaimonia*), while vice produces shame and distress.

Another important speech is the “Great Speech” of Protagoras in Plato’s dialogue by that name (302c–328d), which details the process of moral education from childhood through adulthood and celebrates the virtues of justice (*dikê*) and respect for others (*aidôs*) as prerequisites for civil life. In a different vein are the speeches of Gorgias, which showcase the power of certain rhetorical techniques to defend positions of dubious morality and truth. Thus his “Encomium of Helen” and his “Defense of Palamedes” make two classical villains appear blameless, while his speech “On the Non-Existent,” argues that nothing exists, that even if it exists it is inapprehensible to man, and that even if it is apprehensible, it cannot be expressed.

Pedagogy

Surprisingly little is known of the virtues that Sophists taught in private when they took students under their wing for long periods (a pedagogical method referred to as “association,” *suneimi*). Certainly skill in legal and political argument was a

large part of these virtues, since the Sophists were all talented statesmen, and their students were aspiring members of the political class. Evidence suggests that the major Sophists imparted a fairly wide set of moral and intellectual virtues. Not only respect for others and justice, but *euboulia*, or sound political judgment, was evidently part of Protagoras' program; while Hippias taught students advanced arithmetic, astronomy, geometry, and music before arriving at anything immediately political.

An exception to this rule (besides Gorgias and other rhetoricians who eschewed the teaching of virtue) is the nefarious pair of Sophists, Euthydemus and Dionysodorus, who in Plato's dialogue *Euthydemus* present their crash course in "eristic" as a complete schooling in virtue. Eristic, which derives from the Greek word for strife, is a form of rapid verbal combat in which opponents are drawn into well-rehearsed philosophical paradoxes in order to be refuted or confounded. It is doubtful whether these Sophists' spurious arguments were ever taken seriously as "virtue," but they were at least philosophically interesting enough to attract the attention of Aristotle (384–322 B.C.E.), whose *On Sophistical Refutations* responds to them directly.

Doctrines

In addition to their activities as teachers and statesmen, the Sophists wrote treatises on a staggering array of subjects, including rhetoric, debate, poetry, music, natural science, geometry, theology, and government. The surviving fragments of these treatises suggest that the Sophists' philosophical interests and doctrines varied widely. (One of the most common mistakes has been to treat the Sophists as a unified movement or school.) Protagoras is best known for the opening (and only surviving) lines of two works. His book *On Truth* began: "Man is the measure of all things, of things that are that they are, and of things that are not that they are not." Debate has centered on whether this fragment represents some form of secular humanism (i.e., man, as opposed to the gods, measures the truth of all things), or a type of subjectivist relativism (i.e., each man measures what is true *for himself*). The latter interpretation is most plausible, though the former is sometimes supported by reference to the famous fragment from Protagoras's work, *On the Gods*: "Concerning the gods I cannot know either that they exist or that they do not exist, or what form they might have, for there is much to prevent one's knowing: the obscurity of the subject and the shortness of man's life."

The Sophist Prodicus also wrote on the gods, arguing anthropologically that what are called gods are "things useful for human life." Whether his theory was meant to support atheism or rather to bolster belief in the gods by relating them to human needs is not clear. Prodicus was more famous in antiquity for his art of defining words (called "synonymic" by German scholars), which enabled his students to untangle vexing paradoxes by distinguishing precisely between terms and concepts.

The fragments of Hippias of Elis testify to the breath of learning of the Sophists. If his work, *The Collection* (*Synagogê*), was an encyclopedia of some kind, which is likely, it would help explain why he is cited well into the Middle Ages on a

host of diverse topics—from the etymology of particular words, to the biographical details of famous personages, to questions of astronomy and geometry. Perhaps the most familiar Sophistic doctrine today is the one put forth by Thrasymachus in book one of Plato's *Republic*, namely that "justice is the advantage of the stronger." It is not certain that Thrasymachus should be grouped among the Sophists (Plato himself does not do so), but his oft-quoted maxim has been used to give the Sophists a bad name. It is interesting to compare Thrasymachus' views to those of the *Anonymous Iamblich*, a short treatise thought to be composed by a Sophist of the late fifth-century B.C.E., in which laws are similarly understood as merely conventional and yet defended as the source of political stability.

Historiography

The Sophists have always been controversial figures. They were vilified in Aristophanes' play *The Clouds* for teaching students to evade moral responsibility through argument. In Plato they are criticized chiefly for accepting pay when they have failed to think deeply and rigorously about the virtues they teach. Since the nineteenth century, however, the Sophists have been evaluated more favorably, beginning especially with George Grote's *History of Greece* (1850), which casts them as effective teachers of invaluable political skills. Grote's view that the Sophists contributed substantially to democratic theory, practice, and education was developed in the twentieth century by Werner Jaeger, Eric Havelock, Karl Popper, and Cynthia Farrar.

Other scholars, beginning with Hegel, have emphasized the Sophists' importance in the history of philosophy. This is usually described as a rejection of both Ionian and Eleatic accounts of reality for a greater emphasis upon sensory experience, where the Ionians had stressed a single causal substance at work in the universe (for example, fire or air), and the Eleatics (particularly Parmenides) had described being as one, the Sophists are said to have emphasized the phenomenal world with all its variety and contradictions. Though this philosophical-historical approach to the study of the Sophists has led to masterful studies by W. K. C. Guthrie and G. B. Kerferd, it often involves speculation beyond what the fragments can bear, as it did in Hegel's *Philosophy of History* and Mario Untersteiner's *The Sophists*. Most recently, the Sophists have been studied for their seminal role in the history of rhetoric. In this context the so-called "second Sophistic" movement is also important; this was a vast movement of the second century C.E. that attempted to recover and to develop the rhetorical techniques of the classical age.

SOVEREIGNTY. *Sovereignty* refers to the supreme and ultimate source of authority that exists within any political unit or association. A sovereign power is deemed independent of all other authorities and it possesses no rivals within its jurisdiction. Thus, sovereignty has internal and external dimensions. Internally, it connotes the superior and final power to determine who shall rule and how rule shall occur. Externally, it involves an exclusive right to exercise power within fixed geographical boundaries without interference from or intervention by other authorities. Although the terminology of sovereignty is sometimes employed metaphorically, it is fundamentally a concept related to matters of governance. For instance, when the sixteenth-century Protestant Reformer John Calvin (1509–1564) referred to “God’s sovereignty,” he was seeking to explain the relationship between the divine and His worldly creation in a way that characterized the governmental dimension of heavenly rule over the earth and its inhabitants.

Early Concepts

As an intellectual construct, sovereignty has often been assimilated to the rise of the nation-state in Europe during the early modern period. It is true that sovereignty as a theoretical or a practical precept is incompatible with tribal or feudal societies, where power is decentralized or parceled out into the hands of numerous lordlings, all of whom exercise governmental functions in overlapping and semi-autonomous forms. Yet societies that deified their supreme rulers, such as ancient Egypt or Japan, thereby sought at least implicitly to capture a salient el-

ement of sovereignty: that a unitary source existed from which flowed the validity of all lesser forms of command and rule.

Perhaps the political and legal system that most cogently expressed the aspiration to sovereign authority before the rise of the modern state system was the Roman Empire. (Of course, Roman ideas, especially those contained in its civil law, in turn exercised considerable influence on early modern thought.) The Roman doctrine of imperium, meaning the concentration of powers over the territories of the Empire in the hands of its Emperor, conveyed the unrivaled and unchallengeable supremacy invested in the ruler. To affront this imperium by word or deed constituted a grave crime against the Roman majesty, punishable by execution. When imperium is coupled with the legal doctrine that the Emperor is *legibus solutus*—a law unto himself answerable to no one—one arrives at a concept very nearly identical to that of sovereignty.

Although Roman law was widely disseminated in Europe during the postclassical period, and concepts such as imperium and *legibus solutus* were widely discussed, the conjunction of a feudal social structure with religious and ecclesiastical constraints on power rendered sovereignty functionally inapplicable to temporal government. The ecclesiological doctrine of the pope’s “plenitude of power” (*plenitudo potestatis*), according to which the papacy possesses final authority over the determination of matters of orthodox, however, does involve elements of a theory of sovereignty. Yet not even extreme papalists would claim that the pope is beyond error or “infallible” (in the meaning of that term as, in effect, spiritually sovereign, which was eventually proclaimed by the First Vatican Council in the nineteenth century).

Only near the end of the Middle Ages does the word *sovereignty* appear in the major vernacular languages of Europe, and its meaning during this time remains ambiguous. A particularly clear example of this ambiguity is afforded by the French law book *Coutumes de Beauvaisis*, compiled by Philippe de Beaumanoir (c. 1250–1296) during the later thirteenth century. Beaumanoir declared that “the king is sovereign (*souverains*) above all others and by his rights has the general protection of the whole realm, because he can make all statutes for the common benefit and what he decrees must be followed.” The assertion of binding legal authority sounds very familiar to modern ears. Yet Beaumanoir also blunts some of the impact of this sovereignty by insisting that “every baron is sovereign (*souverains*) in his barony,” meaning that each noble prince can do for his immediate territorial subjects precisely what the king does for the entire realm. Hence, an exclusive franchise is lacking from Beaumanoir’s doctrine, which remains consonant with the multiple and overlapping jurisdictions typical of European feudalism. The key idea of “complete” sovereignty stemming from a unitary wellspring is absent.

The Western world was not alone in struggling with the meaning behind sovereignty. In the Persian-language treatise of political advice *Mau'izah-i Jahangiri* (1612–1613), written in Muslim-controlled India by Muhammad Baqir Najm-i Sani (d. 1637), the ruler is counseled to exercise his “sovereignty [*dawlat*] according to the injunctions of Islamic law.” The word *dawlat* has a general meaning of “bliss” or “felicity” in Persian,

as well as the more concrete connotation of supreme political authority. Given the intertwined personal, religious, and political overtones, it becomes difficult to specify with precision whether Baqir intended to conceive of the Emperor as fully sovereign or whether instead the ruler must subject himself to religious precepts that constrain his authority.

Early Modern Views: Absolutism

The real crystallization of the doctrine of sovereignty occurred in sixteenth-century Europe and, like so much else, in the context of the religious turmoil that accompanied the Reformation. In France, Germany, England, and the Low Countries, the salient issue driving affairs of state in external relations with their neighbors and internal dealings with their populations concerned the determination of religious confession. Regardless of whether toleration or establishmentarianism prevailed, it came to be recognized—theoretically as well as practically—that a single authority must be ceded the right to determine how inhabitants might worship. And this ultimate and supreme authority enjoyed sovereignty.

The classic statement of this position is ordinarily ascribed to the *Six livres de la république* (1576) by the French lawyer and humanist Jean Bodin (1530–1596). Bodin proposed a definition of sovereignty as absolute and indivisible, so that the ruling power possessed sole final authority over the legislative, judicial, administrative, and military functions associated with the state. In formulating this conception of sovereignty, Bodin explicitly challenged many of the central tenets of Aristotle's political science, such as the distinction between the governance of the family and the rulership of the state. Moreover, Bodin ridiculed as incoherent the idea that sovereignty could be shared between or mixed among different groups or institutions. The sovereign is answerable to no earthly authority and, while he is cautioned by Bodin to subject himself to divine and natural law, there is no temporal compulsion that he do so. Hence, Bodin's doctrine is generally described as "absolutism," since it posits the absolute and unchecked sovereignty of the monarch.

Another important advocate of absolutism was Thomas Hobbes (1588–1679), especially in his masterpiece, the *Leviathan* (1651). Like Bodin, Hobbes insisted that the only justifiable form of sovereign authority is absolute and indivisible. Hobbes ascribed to human beings natural liberty and equality, which licenses them to undertake any actions necessary in order to preserve themselves and to avoid pain. He believed that the pursuit of self-preservation by free and equal creatures left to their own devices (the "state of nature") logically leads to unceasing conflict and unremitting fear. Frustrated in their realization of their basic desires, human beings voluntarily exchange their chaotic natural freedom for peace and order by means of a social contract, the terms of which call upon the parties to renounce all liberties and rights they possess by nature (with the exception of self-preservation itself). Any contract that permits the retention of some rights, and thus a limitation on the sovereign's absolute authority, will fail to achieve the peace sought and will eventually slip its members back into the state of nature. In contrast with Bodin, Hobbes did not insist that the constitutional form of sovereign rule *must*

be monarchy, although it is evident that he preferred royal government. Rather, Hobbes held that *any* type of regime—aristocracy (rule of the few) and democracy (the rule of the many) as well as kingship (the rule of one)—might meet the standard for sovereign authority so long as it commanded with an undivided and single voice.

Hobbes recognized that religion constituted an especially fertile source of political conflict and thus a particular threat to the maintenance of sovereign authority. To remedy the divisive consequences of religion, he offered a rather extreme solution in the second half of *Leviathan*, of strictly limiting the autonomy of ecclesiastical officials and offices and reinterpreting Christian theology in a manner consonant with his conceptions of human nature and sovereignty. While Hobbes's Erastian proposals were highly unusual, his comments about religion and public order demonstrate clearly how the emergence of the idea of sovereignty reflected deep concern about the corrosive effects of confessional dispute.

A further strand of absolutism may be associated with "patriarchal" ideas, such as were proposed by Sir Robert Filmer (c. 1586–1653). In his *Patriarcha*, Filmer drew a direct analogy between Adam, to whom God had entrusted the whole of the earth, and the kings who followed after him. Since Adam enjoyed unchecked sovereignty over both natural resources and over his family, so should his heir, the king, possess fatherly authority to dispose of his subjects and their goods as he saw fit, without the approval of a superior authority.

Early Modern Views: Popular Sovereignty

Alongside the view that absolute power was vested in a single governor (or group of governors) emerged the competing doctrine that the sole legitimate source of authority sprang from the people as a collectivity or joint body. Intimations of this idea can be discovered in medieval authors such as Marsilius of Padua (c. 1280–c. 1343), for whom all forms of legislative and executive power pertained in the first instance to the whole body of citizens. But Marsilius's theory possessed the same deference to the fragmented condition of authority in the Middle Ages that characterized Beaumanoir. Instead, the modern principle of popular sovereignty arose in response to the perceived excesses of absolutistic theories.

Writing in explicit opposition to Filmer (and perhaps also indirectly against Hobbes), John Locke (1732–1804) insisted that sovereignty is the creation of the people who contract with one another to form civil society and who only entrust executive authority to a government conditionally. In contrast with Filmer, Locke held that the natural condition of mankind was individual freedom, and no person—not even a man's own offspring—was entirely subject to arbitrary rule. Against Hobbes, Locke maintained the impossibility of renouncing one's natural rights of subjects to life, liberty, and estate in the process of creating sovereign power. Instead, a ruler who systematically violates human rights breaches the bond of trust that authorizes his office. Locke thus insists that no one is obligated to obey the commands of an illegitimate government. If the magistrate attempts to coerce their obedience, members of civil society may legitimately use force against him, just as

they would in the case of robbery or assault, since they retain control of their rights individually and together.

Jean-Jacques Rousseau (1712–1778) extended the idea of popular sovereignty by means of an innovative marriage between Lockean and Hobbesian insights. Sovereignty for Rousseau cannot be exercised legitimately by any authority external to the body of citizens. The citizens alone are competent to renounce their natural liberty and bind themselves jointly and individually to laws and rulers. Hence, no matter what constitutional form of government is appointed—and Rousseau contends that kingship, aristocracy, and democracy may each be appropriate, depending on the scale of the territory to be governed—it remains only the executive of the general will of the community. Freedom reposes strictly and exclusively in the communal order in which the moral liberty of each person assumes the equal moral liberty of every person, guaranteed under the terms of the law and protected by the magistrates. Hence, Rousseau’s free state is guided by the collective determinations of the people about how they wish to live—a clear statement of a system of popular sovereignty. Nor can the general will be judged errant or mistaken. Whatever the people decide is right and must be treated as obligatory.

Later Developments

The dispute between absolutistic and popular conceptions of sovereignty might seem highly polarized and irresolvable. Certainly, the violent upheavals of the French Revolution between the ancien régime and the advocates of popular rule seemed to presage a cataclysmic clash between two profoundly opposed visions of the location of supreme authority. But at times, efforts were made to find a common ground or bridge between the apparently incommensurable points of view.

The framers of the United States federal Constitution, ratified in 1789, afforded one strategy for resolving the conflict. The Constitution proclaimed in its preamble the sovereignty of the people as the source of the authorization of government and the execution of public duties. Toward this end, some officials were to be directly elected on the democratic principle of one vote assigned to each citizen. At the same time, other magistrates such as the President and Vice-President and senators were to be selected by intermediary bodies (the Electoral College and state legislatures, respectively, although the ratification of the Seventeenth Amendment in 1913 provided for senators to be directly elected), while still others (such as the judiciary) were appointed by essentially non-democratic means. The result was to create a system of checks and balances to diffuse the potential domination of any portion of the populace—especially, the poor and least educated (but numerically greater) segment of the people. The supporters of this vision articulated a set of theoretical principles supporting the constitutional design in the collection of occasional essays collected together under the title of *The Federalist Papers* (1788).

From a more philosophical perspective, the German thinker Georg Wilhelm Friedrich Hegel (1770–1831) in his *Philosophy of Right* (1821) endorsed a conception of the state that also sought to redress the divide between absolutism and populism. Hegel evinced considerable skepticism concerning the

viability—let alone coherence—of unmitigated popular sovereignty such as that endorsed by Rousseau. Hegel instead posited a realm of civil society the members of which concerned themselves with their own narrow and partial interests. In order to ensure that these interests did not come into conflict, they received representation at the level of a legislative body and enforcement by a professionalized and disinterested civil service. But Hegel also insisted that an independent hereditary monarchy, unencumbered by any external constraints, was necessary to ensure that the laws governing the nation arose from an undivided and unimpeachable act of will. Hence, Hegel’s king lacks constitutional restraints, in the sense that he is not obligated to defer to the popular determinations of the legislature, but his absolute power is limited to the ability to affirm or deny the statutes with which he is presented.

Obsolescence of Sovereignty?

Given the condition of the political map in the aftermath of the Treaty of Westphalia (1648), with its checkerboard of nation-states, sovereignty might seem to be a doctrine with global purchase, taken as universally efficacious and valid. Yet in many places the idea of sovereignty never really took hold, and in many contexts there may be good reason to declare its erosion or increasing irrelevance.

In certain cases, the spread of European political and legal values in the wake of colonialism often was received with indifference, if not hostility. New Zealand’s early colonial history is instructive. When the British arrived to settle Aotearoa in the mid-nineteenth century, they entered into an agreement, the Treaty of Waitangi (1840), with some of the tribal elders of the Polynesian (Maori) population that ceded—or so the colonizers thought—“absolutely and without reservation all the rights and powers of Sovereignty” to the English Crown. The Treaty, set down in both English and Maori languages (of which the latter is the official version), takes as the equivalent for *sovereignty* the word *kwanatanga*, a term that means something like “trusteeship” in Maori. Indeed, it remains unclear whether the Maori had any vocabulary at the time that could plausibly be translated as “sovereignty,” simply because their worldview, not to mention political and legal language, was so differently constituted than that of the Pakeha (Europeans). The consequences of this crucial failure on the part of the British to recognize the cultural specificity of “sovereignty” resonate into the twenty-first century, as the Maori and Pakeha populations of the country struggle to accommodate the tribal social, economic, and legal system that was never actually surrendered in the context of a representative democracy that claims the status of a sovereign state.

Another illustration of the breakdown of sovereignty derives from the appearance, especially since World War II, of transnational regimes in both the public and private spheres. Economic globalization, free trade zones, and the easy flow of capital across national borders obviously threaten the ability of sovereign states to make crucial decisions about the welfare of their citizens. Moreover, quasi-governmental and non-governmental agencies and institutions such as the United Nations, the World Trade Organization, the International Monetary Fund, and the European Union have been granted

(some say, usurped) many of the rights and powers customarily associated with sovereignty, whether in a legal, economic, military, or cultural sense. Little wonder that in a 1999 appraisal of the topic, Stephen Krasner refers to the very idea of sovereignty—in our own times, and perhaps even in the past—as “organized hypocrisy.” The interdependence that ties together the international state system seems increasingly likely to relegate sovereignty to the dustbin of obsolete concepts.

At the same time, sovereignty throughout the world has come under direct challenge from subnational groupings as well. The rise of regional independence movements, often built around ethno-nationalist agendas, sets in question the basic principle that public power must derive from a single autonomous and supreme source. One encounters the demand for autonomy and sometimes secession even in highly developed nation-states with strong traditions of sovereign authority, such as the United Kingdom, Spain, and Canada. It is little wonder that some scholars during the last several decades of the twentieth century spoke about the “re-feudalization” or “re-tribalization” of the political scene globally.

SPORT. “What do they know of cricket who only cricket know?” queried the historian and political reformer C. L. R. James in the preface of *Beyond a Boundary* (1963), his lyrical exploration of political, social, and racial relations in the twentieth-century West Indies and British Empire. He answered throughout the book that those who only know sport really know nothing of value. Sport, he insisted, was an essential part of the fabric of modern cultures, the democratic art of the globe’s common folk, the stage on which a myriad of social issues were contested. Intellectuals who dismissed sport as mere games or mass opiates misunderstood the fundamental power of sport for shaping modern culture, James insisted. James wrapped his arguments for West Indian political independence and the equality of people of color in the British Empire in discourses on cricket and the ideals of fair play. “It isn’t cricket,” James insisted, whether he was decrying poor sportsmanship within the boundaries or denouncing racism on the cricket pitch or in any other human endeavor.

In the course of his meditation on sport, James also claimed that ideas about sport were interwoven with ideas about identity, citizenship, gender, and every other facet of human culture in ancient as well as modern societies. Following the lead of James, scholars since the 1960s have contended that ideas about sport are inextricably linked to ideas about politics, economics, and other facets of culture. The vast majority of investigations about the power of sport in shaping and revealing cultural mentalities have concentrated on modern history, especially on modern Western societies. A smaller contingent has excavated the athletic ideologies of classical Western antiquity. The sporting lives and ideas of non-Western and non-modern peoples remain mostly unexplored. Regardless of the time period or culture studied, however, recent scholarship insists that those who know only the details of sporting practices and nothing about the larger cultures which shape and are shaped by those practices really know nothing of value.

Sport and Traditional Cultures

Modern conceptions of the contrasts between tradition and modernity frame contemporary studies of the history of ideas about sport, physical education, and body culture. Perhaps the most influential work in shaping contemporary paradigms, Allen Guttman’s *From Ritual to Record* (1978), grounds the history of athletic competition firmly in the modernity versus tradition dialectic. While contemporary scholars certainly bring differing theoretical perspectives to the study of ideas about sport, they rarely question the notion that traditional and modern physical cultures are essentially different entities.

Even though a few historians argue that traditional physical activities are so different from modern athletics that sport can only be understood as a product of modernity, a range of evidence indicates an ancient lineage for sport. Sport, in various forms, has been a part of cultural life since the origins of the human species. As most anthropologists contend, the hunters and gatherers of early human history lived in societies with abundant leisure. Their sports played a critical role in teaching the skills and teamwork necessary for hunting and warfare. Athletic contests served as sites for the demonstration of physical prowess—particularly male prowess. Sports were also embedded in the religious rituals of hunters and gatherers, as they are enmeshed today in the sacred practices of the world's few remaining traditional cultures.

The archaeological evidence for sport among hunters and gatherers, or among the early farmers in the new agricultural societies that began to emerge in various places around the world circa 7000 B.C.E., is limited and sketchy. Carvings and inscriptions related to sport appear occasionally in ancient Western, American, and Asian civilizations. The first compelling written evidence regarding ancient ideas about sport appears in Homer's *Iliad* (c. 750 B.C.E.) and *Odyssey* (c. 725 B.C.E.). Homer's work reveals Greek aristocrats who used competitive sport as a vehicle for demonstrating prowess. Significantly the ancient Greeks used the same word, *agon*, to refer to athletic contests and combat. Winning honor and glory in war or sport marked the zenith of Greek masculine achievement.

Ancient Greeks formalized and rationalized competitive athletics, moving from funeral games and irregular contests to well-organized sporting extravaganzas held at a variety of sites, and especially in sacred places to honor Greek gods. The most important Greek athletic festival, celebrated every four years beginning in 776 B.C.E., was the Olympic Games. The Olympics evolved into a vital celebration of pan-Hellenic identity for the balkanized Greek city-states. Greek citizens felt compelled to make a pilgrimage to Olympia at least once in a lifetime. Homages to and exposés of the Olympics appeared frequently in Greek literature, philosophy, and drama. Greek city-states sponsored athletic programs to develop stars to win fame for their hometowns in the games, especially at Olympia.

The Olympics reveal much about Greek culture. Participation and spectatorship were limited to males. Only freeborn Greek citizens could compete in the Olympics. Victors won olive-wreath crowns symbolizing their accomplishments. Early twenty-first century scholarship indicates that the Greeks had no conception of what moderns label amateurism. While Olympic champions received only symbolic garlands from the sponsors of the festival, their city-states subsidized their training and bestowed enormous riches on those who brought glory to their polis.

The Greeks also sponsored sporting contests in which athletes competed directly for lucrative prizes such as the Panathenaic Games. Athletes earned fame and fortune in ancient Greece. Public acclaim translated their athletic prowess into political clout. Male athletes served as icons of physical beauty and objects of erotic desire. The athlete embodied Greek notions of physical perfection and inspired artistic re-creations of

the human form. By the 500s B.C.E., a class of professional athletes appeared in Greece. The time, effort, and attention lavished on athletics earned condemnation from Greek intellectuals such as Socrates, Plato, and Aristotle, who did not object to athletic competition in principle but disparaged the narrow focus on bodily prowess to the exclusion of all other characteristics of good citizenship required of elite athletes. These thinkers argued that athletics should be one of many components in the general training of good citizens. Such arguments sparked a debate about the meaning and purpose of sport that has raged in Western societies ever since, raising issues regarding whether sport should serve the general education of the common citizen or whether sport should serve exclusively to test the extremes of human capability.

Traditionally scholars have argued that, with a few exceptions such as an athletic festival for women hosted at Olympia in honor of the goddess Hera or odes to the athletic prowess of Spartan maidens, Greek athletics were relentlessly patriarchal. In the 1990s, a debate over the level of participation by Greek women in athletics began. Some revisionists posit a much more substantial role for women in Greek sport, noting that female names appear on lists of Olympic victors. In one famous case, a woman who owned a chariot team won an Olympic race. Other revisionists argue that contextual readings of the evidence reinforces rather than revises the patriarchal nature of Greek sport, contending that an accurate interpretation reveals that the Spartan female chariot owner was in fact a surrogate put forward by her male relatives to further embarrass the defeated chariot teams and demonstrate that wealth rather than masculine skill won equestrian competitions.

Greek athletics spread throughout the ancient world during the Hellenistic era. Greek stadia, gymnasia, and hippodromes appeared in cities throughout the ancient West. Even after the conquest of Greece by Rome, Greek athletics remained the normative conception in ancient Western cultures. The Romans, like other cultures influenced by the Greeks, both adopted and resisted Greek ideas. Some Roman patricians patronized the Olympic and other Greek games and propagated Greek notions of the importance of physical education in the general development of the citizenry. Other Roman elites, with the support of many plebeians, rejected Greek athletics as too hedonistic and effete for Roman tastes. The Greek custom of competing in the nude offended Romans such as the philosopher Cicero, who condemned Greek sport as undermining family, duty, and state.

Still, like the Greeks, the Romans promoted chariot racing and built huge monuments for sporting contests. The Romans practiced a different set of spectacles that emerged from a different history. The *ludi Romani* represent the first appearance of mass spectator sport in history. The Roman games comprised three basic disciplines. The circuses, by far the most popular and common of the three spectacles, devoted themselves to chariot racing. The *munera* presented gladiatorial combats to the masses. The *naumachia*, the rarest of the Roman games, were elaborate reconstructions of famous naval battles. Each of the Roman games was deeply intertwined in the political conflicts of Roman society. Chariot teams at

circuses promoted political factions. Gladiators fighting to the death reminded both Roman citizens and barbarians that the empire had been built on violence. Significantly very few of the gladiators were Roman citizens. The vast majority were war captives, criminals, or political or religious dissenters sentenced to the arena for the amusement of the masses. Opposition to gladiatorial games from both Roman and non-Roman sources highlighted the cruelty of the *munera*. Foes of Roman games also condemned them as part of a “bread and circuses” policy practiced by imperial governments to buy the consent of the masses with the dole and sporting delights. These condemnations of sport as an agent of statecraft bent on diverting the people from social problems have remained staples of sporting critiques into the contemporary era.

Greek and Roman sports were exceptional in their imperial reach and sophisticated organization but traditional in most other aspects. Traditional sports were frequently part of sacred rites and were generally martial exercises for training warriors. Traditional sporting practices were almost invariably local and loosely organized. Traditional games varied from place to place and from time to time, and were based on custom rather than formal rules. Traditional sports were incredibly durable, lasting in similar form for thousands of years. Finally traditional sports were, like traditional social relations, structured around social inequalities. Hierarchy, kinship, ethnicity, and gender habitually shaped participation. Women were generally excluded from the sports of traditional societies, especially as participants and sometimes as spectators.

Sport and Modern Cultures

Histories of sport reveal that modern cultures conceptualize physical activity differently than traditional societies. Modern sport tends toward the secular rather than the sacred. A focus on equality, both in the conditions of competition and in opportunities to compete, consumes modern sport. Modern sport replicates modern social structures in other ways as well, manifesting the peculiar modern manias for specialization, bureaucratization, rationalization, and quantification in unique ways. In modern history, sport is embedded in the major trends of modernity itself, industrialization, urbanization, and nationalism. Most significantly, at least from modern perspectives, has been a new conceptualization of sport as a useful tool for solving social problems that has replaced an understanding of sport as part of the steady rhythms of traditional life. The idea of sport as a social utility certainly has roots in older traditions, as Greek and Roman concepts about athletics as training for citizenship testify. However in the modern period the idea of sport as a useful tool grew to grand historic dimensions.

In early modern Europe, sports served the emerging centralized monarchies by symbolizing power and cultivating popular support. Monarchs commandeered the older sporting practices of the aristocracy in order to celebrate regal prowess and wealth. To gain popular support as they moved to usurp the power of the nobility and clergy, European monarchs transformed popular peasant pastimes into political rights to win over the masses. At the same time sport became a central element in the education of European elites. The Renaissance

witnessed the excavation of classical notions of sound minds in sound bodies. Renaissance thinkers insisted that a complete education developed physical as well as intellectual faculties. Utilitarian notions of sport also developed in unexpected places. Early-twenty-first-century scholarship has revealed that Protestant reformers, far from the sport-hating puritans of stereotype, in fact endorsed a variety of athletic endeavors as long as they were undertaken to make people better workers, better citizens, better soldiers, and better Christians.

Purposeful sport that served specific social ends was firmly established in Western societies in the early modern period. During the same epoch, the sports of non-Western cultures moved rapidly toward extinction. The “Columbian Exchange” in sport was initially a one-way street. Indigenous sports, such as the elaborate ritual of the Mesoamerican ball game, were destroyed by Western conquest. Modern sports developed almost exclusively in Western cultures. Western cultures sometimes appropriated pastimes such as lacrosse, a game with heritages in both Europe and the Americas, but they relentlessly modernized them. A survey of sports including the largest global athletic event, the modern Olympic Games, reveals that, with one exception, all developed from Western sources. That one exception, judo, was invented by pro-Western innovators in Japan who sought to modernize their own nation through the introduction of Western-style sports. The global sporting culture that has emerged since the mid-1800s is a product of the West.

The rise of the modern nation-state, beginning in Europe and North America in the eighteenth century, fueled rapid growth of the idea of sport as a useful social tool. In sport many nationalists thought that they had discovered an elemental force for making the French Revolution’s three criteria for modern nationhood—liberty, equality, fraternity—into social realities. Through modern sport they proclaimed the end of the old sporting order of *ancien regimes* and the rise of new national pastimes, from cricket to prize fighting to varieties of football to baseball. They recognized, as C. L. R. James later noted, that when the modern masses had the liberty to choose their leisure they gravitated to sport. Sport also became a testing ground for modern notions of equality. Class, ethnicity, race, and gender boundaries increasingly came under attack on playing fields in the nineteenth and twentieth centuries. The ideal, if not always the reality, of equality, played to mass audiences in sporting dramas through “great experiments” in racial integration such as the tales of Jackie Robinson in U.S. baseball, Edson Arantes do Nascimento (better known as Pelé) in Brazilian soccer, and Learie Constantine in British cricket.

It was, however, the third element of the French Revolution’s prescription for modern nationalism where sport found the most fertile loam. More than any other modern institution with the exception of war, sport provides the necessary conditions for the blossoming of fraternity, the patriotic bonds that bind citizen to citizen. Sport and physical education as agents of fraternal bonding first developed during the 1700s and 1800s in the English-speaking world and in Germany. In Germany, which was occupied by France and not yet unified as a modern state, a powerful national movement known as

the Turners arose. The Turners were devoted explicitly to promoting physical fitness and implicitly to creating a nation of soldier-athletes to win independence for the fatherland. The movement married exercise to patriotism. Turners formed the core of the German revolution against French hegemony and fought for a unified German nation. The Turner movement spread to German communities in Europe and the Americas, and sparked imitations in Denmark and Sweden. The inherent Germanness of the physical education system, however, ultimately prevented global diffusion of the Turners.

At the same time, in the heartland of the industrial revolution, modern competitive sports developed in Great Britain, its colonies, and its former colonies. National games such as cricket, soccer football, and rugby football emerged. Promoters sold these games as the fraternal foundation of Greater British identity. Resistance to British national games from sections of the English-speaking world sparked the modernization of Gaelic football and hurling in Ireland and the invention of baseball and American football in the United States. Through these games, and the massive literature that grew to support them such as the classic English sporting novel, *Tom Brown's Schooldays* (1857), Anglo-American cultures crafted the idea that participation in sport taught modern peoples the basic tenets of citizenship. In Anglo-American ideology sport promoted moral virtue, balanced individual and communal needs, and fostered fair competition in every social endeavor. Sports, as Anglo-American promoters ceaselessly preached, were essential tools in the construction of modern nationhood.

While the gymnastic exercises of German Turners failed to find a receptive global audience, Anglo-American sports soon became a worldwide phenomenon. As the world's major imperial power, Great Britain's games spread throughout the world. As a rising imperial power, the sports of the United States also spread. With the birth of the modern Olympic Games in 1896, an event midwived by the baron Pierre de Coubertin, a French Anglophile who fervently believed in Anglo-American sporting ideology, modern Western sport moved toward global hegemony. During the twentieth century, the Olympic Games and the World Cup soccer tournament—a 1930 spin-off from the Olympics—became the world's most popular spectacles. Soccer football, originally a British pastime, became “the world's game,” spreading from the West to the rest of the world through emulation and diffusion rather than at imperial gunpoint. Non-Western cultures clearly chose to adopt this European import.

Encased in rhetorical claims that sport promoted peaceful internationalism, the global spread of sport during the world's bloodiest century (the 1900s) revealed that most of the world's cultures had converted to the Anglo-American faith that sport was a crucial element for fueling patriotism rather than athletic pacifism. As sport became the common language of global culture, it represented a dialect that forged national rather than global identities and was spoken with equal fluency by dictatorships as well as democracies. Sport represented an essential bonding agent in the “imagined communities” of many modern nations. Initially national sporting cultures embraced men but discouraged or excluded women from serving as patriotic

athletes or fans. As ideas of gender equity altered social relations in modern nations, the homosocial boundaries of sport came under assault. By the end of the nineteenth century, women had begun to participate as both spectators and players in increasing numbers. The emergence of women in sport was frequently equated to women's emancipation and suffrage. When U.S. swimmer Gertrude Ederle became the first woman to conquer the English Channel in 1926, beating the times of all the men who had previously navigated those waters, her feat was hailed as a triumph that rivaled the acquisition of women's voting rights.

In spite of the feats of Ederle and other women, male performances remained normative in modern sport. Women athletes were frequently prized as much for their sexual appeal as for their athletic prowess, a consumer culture trend since the early twentieth century that perhaps explains the early-twenty-first-century global fascination with tennis player Anna Kournikova. Fans in many nations both cheered and leered when women Olympians stoked the fraternal furnaces of athletic nationalism. In cultures where women athletes raised direct challenges to gender orders, such as in some modern Islamic states, female champions such as the Algerian runner Hassiba Boulmerka aroused violent reactions.

Sporting conflicts over ideas about gender reveal that in the early-twenty-first century sport remains a powerful site for debating social concepts and practices. The history of ideas about sport indicates that the question that began C. L. R. James's meditation on cricket and West Indian culture should be expanded. What do they know of sport who only sport know? Insights into human societies develop at the intersection of sport with the myriad other facets of culture, from politics to religion to gender to economic interchange. In the history of ideas, sport represents a popular common pursuit for many societies at many times that can reveal much about the dynamic complexities of human cultures.

STATE, THE.

This entry includes two subentries:

Overview

The Postcolonial State

OVERVIEW

The concept of the state was central to the social sciences until temporarily displaced in the 1950s by a concept of the “political system” that is mainly associated with Talcott Parsons’s (1902–1979) systems analysis. Parsons’s sociology identified the political system with behaviors and institutions that provide a center of integration for all aspects of the social system. David Easton echoed Parsons by declaring that “neither the state nor power is a concept that serves to bring together political research” and instead defined the political system as “those interactions through which values are authoritatively allocated for a society” (p. 106). Systems analysis was tied closely to various theories of decision making, but most notably to pluralist theory, which viewed decision making as the outcome of peaceful bargaining between interest groups in society. Pluralist theory implicitly assumed that key sources of power such as wealth, force, status, and knowledge, if not equally distributed, are at least widely diffused among a plurality of competing groups in society.

Return to the State

A return to the state in political science, sociology, and history was launched by the publication of Nicos Poulantzas’s *Pouvoir politique et classes sociales* (1968; Political power and social classes) and Ralph Miliband’s *The State in Capitalist Society* (1969), which directly challenged pluralist theory and systems analysis. The worldwide political rebellions of 1968 called into question the dominant assumptions of an academic social science that presumed the existence of pluralism and system equilibrium as the basis of the political system. Miliband and Poulantzas both drew on a radical tradition identified with the writings of Karl Marx (1818–1883), Friedrich Engels (1820–1895), V. I. Lenin (Vladimir Ilich Ulyanov; 1870–1924), and Antonio Gramsci (1891–1937) and considered a theory of the state anchored in this tradition to be the main alternative to the dominant social science. Their works were highly

influential. At the height of his popularity in the mid-1970s, Miliband was one of the leading political scientists in the English-speaking world. Nicos Poulantzas was arguably the most influential political theorist in the world, with works that influenced scholars in Europe, North America, and Latin America.

Instrumentalism and Structuralism

Miliband’s writings are most notable for reestablishing an instrumentalist theory of the state, which was subsequently adopted by many scholars conducting research on political institutions and public policy. Prior to Miliband, the instrumentalist theory of the state had been articulated cryptically by Paul Sweezy, who asserted the state is “an instrument in the hands of the ruling class for enforcing and guaranteeing the stability of the class structure itself” (p. 243). Miliband identifies the ruling class of a capitalist society as “that class which owns and controls the means of production and which is able, by virtue of the economic power thus conferred upon it, to use the state as its instrument for the domination of society” (p. 23). Both authors trace this concept of the state to Marx’s famous dictum in *The Communist Manifesto* that “the executive of the modern state is but a committee for managing the affairs of the whole bourgeoisie.” Miliband identified the chief deficiency of Marxist political theory as the fact that nearly all Marxists had been content to assert this general thesis as more or less self-evident, but without proving it. Thus, Miliband’s main objective in renewing state theory was “to confront the question of the state in the light of the concrete socio-economic and political and cultural reality of actual capitalist societies” (p. 6). Miliband suggests that Marx provided a conceptual foundation for the socioeconomic analysis of capitalist societies, Lenin provided guidance for a political analysis, and Gramsci supplied the conceptual apparatus for a cultural and ideological analysis of capitalist societies. Miliband was convinced that the central thesis and conceptual structure of Marxist political theory was effectively in place and therefore what Marxist political theory needed was more empirical and historical analysis to give concrete content to this thesis and its associated concepts.

The state, as Miliband conceives it, does not exist as such, but is a conceptual reference point that “stands for . . . a number of particular institutions which, together, constitute its reality, and which interact as parts of what may be called the state system” (p. 49). This state system is actually composed of five elements that are each identified with a cluster of particular institutions, including:

1. The governmental apparatus, which consists of elected legislative and executive authorities at the national level, which make state policy;
2. The administrative apparatus, consisting of the civil service bureaucracy, public corporations, central banks, and regulatory commissions, which regulate economic, social, cultural, and other activities;
3. The coercive apparatus, consisting of the military, paramilitary, police, and intelligence

agencies, which together are concerned with the deployment and management of violence;

4. The judicial apparatus, which includes courts, the legal profession, jails and prisons, and other components of the criminal justice system;
5. The subcentral governments, such as states, provinces, or departments, counties, municipal governments, and special districts.

One of the most direct indicators of ruling-class domination of the state is the degree to which members of the capitalist class control the state apparatus through interlocking positions in the governmental, administrative, coercive, and other apparatuses. Miliband emphasizes that: "It is these institutions in which 'state power' lies, and it is through them that this power is wielded in its different manifestations by the people who occupy the leading positions in each of these institutions" (p. 54). A similar concept of the state was also adopted by many non-Marxists, such as G. William Domhoff, who proposed a power structure theory of how "the owners and managers of large banks and corporations dominate the United States" (p. xi). Although indebted to Marx's writings, Miliband was also aware that Marx "never attempted a systematic study of the state" (p. 5) comparable to the one conducted by Miliband, but instead left a collection of political writings that are unsystematic, fragmentary, and sometimes self-contradictory.

This ambiguity in Marx's work quickly led to a disagreement with Nicos Poulantzas, who became the leading spokesperson for a structuralist theory of the state. Poulantzas claims that the basic structure of the capitalist mode of production generates contradictory class practices and crisis tendencies that inexorably disrupt the capitalist system at the economic, political, and ideological levels. These crisis tendencies and contradictions necessitate a separate structure to specifically maintain and restore its equilibrium as a system. Although Poulantzas modified systems analysis by introducing class conflict as a disequilibrating mechanism, he was nevertheless clearly indebted to the American functionalists and systems theorists in arguing that the general function of the state in the capitalist mode of production is its function as "the regulating factor of its global equilibrium as a system" (p. 45).

Whereas Miliband articulates an institutionalist conception of power, Poulantzas articulates a functionalist conception of power anchored by the methodological assumptions of structural functionalism. In direct contrast to Miliband, Poulantzas draws a sharp analytic distinction between the concepts of state power and the state apparatus. Poulantzas defines the state apparatus as: "(a) The place of the state in the ensemble of the structures of a social formation," that is, the state's functions and "(b) The personnel of the state, the ranks of the administration, bureaucracy, army, etc." (p. 116). The state apparatus is a unity of the effects of state power (i.e., policies) and the network of institutions and personnel through which the state function is executed. Poulantzas emphasizes the functional unity between state power and the state apparatus with the observation "that structure is not the simple principle of

organization which is exterior to the institution: the structure is present in an allusive and inverted form in the institution itself" (p. 115, fn. 24).

Poulantzas defines state power as the capacity of a social class to realize its objective interests through the state apparatus. Bob Jessop observes that within this framework "state power is capitalist to the extent that it creates, maintains, or restores the conditions required for capital accumulation in a given situation and it is non-capitalist to the extent these conditions are not realised" (p. 221). In structuralist theory, the objective effects of state policies on capital accumulation and the class structure are the main objective indicators of state power.

Poulantzas's well-publicized methodological differences with Miliband were deeply influenced by the French structuralist philosopher Louis Althusser, but like Miliband, he also claims to draw on the work of Marx, Engels, Lenin, and Gramsci and "to provide a systematic political theory by elucidating implicit ideas and axioms in their practical writings" (pp. 1, 42). Yet, while Miliband placed Marx and Engels's *Communist Manifesto* at the center of his political theory, Poulantzas identifies *Capital* as "the major theoretical work of Marxism" (p. 20). The chief difficulty in designating *Capital* as Marx's central theoretical treatise is that it is an unfinished work with no theory of social class and no theory of the state, but a text that is rife with lacunae, omissions, and stated intentions never fulfilled in fact, particularly in its latter volumes.

These disputes were aired in the *New Left Review* in a series of widely heralded polemical exchanges that became known as the Miliband-Poulantzas debate. The debate itself was symptomatic of unresolved epistemological issues within Marxism that had far-reaching methodological repercussions beyond state theory and even beyond Marxism. Their public debate set off a wide-ranging discussion among scholars throughout the world that stimulated renewed interest among social scientists in the nature of the state. The debate mainly revolved around Poulantzas's claim that Miliband's empirical and institutional analysis of the state in capitalist society constantly gives the impression that "social classes or 'groups' are in some way reducible to inter-personal relations . . . and the State is itself reducible to inter-personal relations of 'individuals' composing social groups and 'individuals' composing the State apparatus." Poulantzas insisted that this method of analysis failed to comprehend "social classes and the State as objective structures, and their relations as an objective system of regular connections, a structure and a system whose agents, 'men', are in the words of Marx, 'bearers' of it" (pp. 70–71).

Instrumentalists and structuralists were quickly divided into competing schools of thought symbolized by the fractiousness of the Miliband-Poulantzas debate. As the polemic between them and their supporters became redundant, state theorists began looking for ways to move beyond the methodological stalemate. Moreover, despite the ongoing methodological controversy, both theories of the state shared a common analytical postulate that the state successfully implements the long-term interests of the capitalist class by maintaining the equilibrium of the capitalist mode of production. This postulate was increasingly called into question in the later 1970s as a result of

slow economic growth, high unemployment, high inflation, and the crisis of the welfare state. The growing disequilibrium of the welfare state was dramatically symbolized by the expenditure rollbacks of Prime Minister Margaret Thatcher in Great Britain and President Ronald Reagan in the United States.

Derivationism

The Miliband-Poulantzas stalemate and the crisis of the welfare state defined the intellectual and political context in which the journal *Kapitalistate* first introduced derivationism—also known as the capital logic school—to Anglo-American scholars. Derivationism emerged from the West German student movement in 1969, but it did not have an impact outside Germany until the translation and publication in 1978 of several essays by John Holloway and Sol Picciotto. The central axiom of the derivationist approach is that the analysis of the relation between state and society must be deduced from contradictions inherent in the capitalist mode of production. The rationale for this claim is that if capitalism were in fact a spontaneous and self-regulating economic system as stipulated by neoclassical economics, there would be no logical rationale for state action in relation to capital accumulation. Yet, the state routinely intervenes in economic relations in all capitalist societies. Therefore, derivationists posit the state as a logically necessary instance of capitalist society that must perform for the capitalist class those tasks that it inherently cannot perform for itself. These tasks, whatever their nature at any given historical period, define the general interests of the capitalist class.

Derivationism was viewed briefly as a way to transcend the methodological antinomies of the Miliband-Poulantzas debate because it focused state theory on the limitations imposed on state policies by its relation to the process of capital accumulation. Derivationism seemed to offer a more dynamic approach to the state that would explain the relationship between the state's historical political development and the underlying contradictions of the capitalist mode of production in contrast to the static models proposed by Miliband and Poulantzas. Paradoxically, the major objection to derivationism was that it tended to remain ahistorical and nonempirical in its approach to the state and thus provided little guidance to scholars who were interested in studying the historical political development of actually existing states.

The derivationists' main contribution was to call attention to the possibility that systematic and insurmountable limitations on state policy may be imposed by the developing contradictions of the capital accumulation process. It could no longer be assumed that the state would automatically succeed in maintaining the equilibrium of the capitalist system or resolve the underlying political conflicts generated by that process. Thus, state theorists increasingly searched for a theory of the state that could identify the limits of its policy-making capacities and that could conceptualize, anticipate, and explain the crisis tendencies of late capitalist societies, rather than describe its maintenance and stabilization mechanisms.

Systems Analysis

A new systems-analytic approach sought to identify these limits by identifying specific examples of policy breakdown,

particularly instances where state policy either fails to maintain capital accumulation or to restabilize social order among disaffected subordinate classes. The systems-analytic theory of the state is largely identified with the "post-Marxist" works of Jürgen Habermas and Claus Offe, who were influenced by the derivationists conceptually, but whose methodology draws heavily on the radical systems theory of Niklas Luhmann. Offe is largely credited with advancing state theory beyond instrumentalism and structuralism by introducing the dependency principle. The dependency principle asserts that the decision-making power and policy capabilities of the state in capitalist society are dependent upon the continuity of the capital accumulation process, primarily because of the modern state's dependence on tax revenues. Therefore, state elites in a capitalist economy must adopt policies that enhance business confidence in the short-run and that promote a favorable business climate over the long-run. Where state elites promote a favorable business climate with public policy, they will be rewarded with high rates of private investment, economic growth, and employment stability. Where state policies undermine business confidence, business people will refuse to invest, which generates an investment strike throughout the economy, while many business people may even redeploy their capital toward economies in which they have greater political and economic confidence.

The modern state's dependence on substantial and growing tax revenues means that every interest state personnel have "in their own stability and development can only be pursued if it is in accordance with the imperative of maintaining accumulation" (Offe, p. 126). According to Offe, "this fundamental dependency upon accumulation also functions as a selective principle upon state policies," because violating this logic of accumulation would simultaneously weaken or undermine all state capacities. Thus, a concern for the continuity of private accumulation is "incorporated in the pursuit of interests and policies that, considered by themselves, may have little or nothing to do with accumulation" (p. 126).

However, in a political democracy, the capitalist state must also be legitimate. A capitalist state that sustains an exploitative accumulation process can only achieve legitimacy by deploying concealment and ideological mechanisms. Concealment mechanisms, such as administrative secrecy, facilitate the adoption and implementation of maintenance policies outside the sphere of class struggle and special-interest competition. The state's ideological mechanisms convey the image that its power is organized to pursue the general interests of society as a whole, even though it functions in a specific relationship to capitalist accumulation. Consequently, a capitalist state must sustain and yet conceal a structural disjuncture between its democratic form and its capitalist functions.

The capitalist state must respond to contradictions in the capitalist mode of production with social policies, but an important feature distinguishing post-Marxist systems analysis from similar structuralist analyses is the assertion that welfare states actually fail to function at precisely those moments when most needed and these system failures result in contradictory outcomes that produce a variety of cumulative crisis tendencies

in capitalist societies. Jürgen Habermas and James O'Connor suggest that the political contradictions and policy failures of modern states cumulatively generate an economic crisis, a fiscal crisis, crises of state rationality and legitimation, and a motivation crisis in the underlying population and workforce.

Organizational Realism

During the 1980s and 1990s, state theorists influenced by the new institutionalism in political science and sociology elucidated yet another post-Marxist approach to the state called organizational realism. Organizational realists define the state as an organization that attempts to extend coercive control and political authority over particular territories and the people residing within them. A fundamental thesis of organizational realism is that in pursuing this political objective state elites are self-interested maximizers whose main interest is to enhance their own institutional power, prestige, and wealth. Consequently, Theda Skocpol has suggested that during exceptional periods of domestic or international crisis state elites may be impelled to implement social policies, economic reforms, and institutional changes that concede subordinate class demands while violating the interests of those classes that benefit from the existing economic arrangements within a state's jurisdiction. Under certain circumstances, Skocpol argues that state elites might deploy state power to act against the long-run interests of a dominant class or even act to create a new mode of production. However, Skocpol cautions that the extent to which states actually are autonomous, and to what effect, varies from case to case, which means "the actual extent and consequences of state autonomy can only be analyzed and explained in terms specific to particular types of sociopolitical systems and to particular sets of historical international relations" (p. 30). Therefore, the aim of this research strategy has been to focus on the theoretically limited task of constructing empirical generalizations by using comparative historical case studies of policy formation and state institutional development.

Economics and the State

The new institutionalism in state theory has been embraced by some economists, such as Douglass C. North, who observes that "the whole development of the new institutional economics must be not only a theory of property rights and their evolution but a theory of the political process, a theory of the state, and of the way in which the institutional structure of the state and its individuals specify and enforce property rights" (p. 233). There have been few significant efforts to follow through on this observation. Joseph Stiglitz also suggests that because most state activities involve questions of resource allocation, state theory falls within the purview of the economics discipline, but economists have largely neglected the state despite their agreement that there are only two ways of coordinating the economic activities of large populations: (1) central direction involving the use of coercion (that is, the state) and (2) the voluntary cooperation of individuals (the market).

Economists have devoted little attention to the theory of the state because most assume that markets provide optimal resource allocations in contrast to the state's supposed inefficiency. From this perspective, state intervention in the economy

is only justified in cases of market failure, but since market failures are considered exceptions to the rule that markets optimize resource allocations, the analysis of the state and its role in society is considered marginal to the main focus of neoclassical economics. At its most extreme, libertarian philosophers and economists not only accept this proposition, but draw on well-accepted definitions of the state as a coercive institution to argue that the state is inherently parasitic. Murray Rothbard claims that regardless of its form, the state is inherently illegitimate since it is dependent on "coerced levies" (i.e., taxes) that make it essentially no different from "a criminal band" beyond the fact that it is the "best organized aggressor against the persons and property of the mass of the public" (pp. 46–47). In contrast to Marxist theory, which views the state as a mechanism for subordinating subaltern classes by a dominant class, libertarian theory views the state itself as a political class that exploits the entire society of economic producers.

Stiglitz has proposed an economic model that reverses the main assumption of neoclassical economics with the argument that markets are always imperfect because information is imperfect and this makes all markets incomplete without state intervention. In Stiglitz's model, the issue for economists is not to identify market failures, since "these are pervasive in the economy, but of identifying large market failures where there is scope for welfare-enhancing government interventions" (pp. 38–39). This model incorporates the normative assumption that the state will (or should) pursue welfare-enhancing policies and, therefore, challenges the normative claims raised by most other theories of the state, which view it as an exploitative organization.

Globalization and the State

The main contours of "the state debate" were fixed by the early 1990s, and there were few new developments in state theory as many scholars lost interest in the topic. The proliferation of state theories from 1968 onward resulted in an intellectual stalemate, where scholars retreated into their favored theoretical approach to conduct empirical and institutional research on political development and public policy. Postmodernist and poststructuralist theories of power claimed that power was not centered in the state, but diffused in a variety of everyday relationships and identities such as language, gender, race, ethnicity, mass media, medicine, family, work, and play. Many scholars shifted their attention to the analysis of these diffused forms of "micropower." Finally, the process of economic globalization, which became so evident in the 1990s, led others to conclude that the state was in crisis, retreat, or decline as its sovereign functions were lost or ceded to global markets and transnational corporations.

However, the latter trend also witnessed the emergence of new supranational institutions (for example, the European Union and the World Trade Organization) and the strengthening of preexisting international organizations (for example, the United Nations, the North Atlantic Treaty Organization, the World Bank, and the International Monetary Fund). This development stimulated renewed interest in state theory at the turn of the century, while shifting its analytic focus toward the new forms of global governance and their relation to the

nation-state. A variety of theoretical positions quickly appeared, which are distinguished mainly by their analysis of the American state within this global system and their claims about the role of the nation-state within the world economy.

The proponents of the American superstate thesis argue that the collapse of the Soviet Union has left the United States with no serious rivals in the economic, political, or military realms, and thus economic globalization and its auxiliary institutions are viewed as a projection of the American state's power on a global scale. Thus, globalization is not viewed as a development external to the nation-state, because it is nation-states, particularly the United States and its allies, that have played the leading role in creating a new global economy, while remaining the primary actors within the new supranational institutions.

A major theoretical challenge to this thesis is Martin Shaw's argument that an internationally legitimate "global-Western state" has integrated its member nation-state's functions as an organizer of legitimate violence and authoritative rule maker into larger bloc structures. While the United States played a leading role in constructing the Western state's supranational military and economic organizations, Shaw insists that "the idea of American hegemony is too simple to characterize relations within the Western state." Instead, Shaw claims that the global-Western state is "an integrated authoritative organization of violence" that should be considered "a new type of state, rather than an alliance or a complex set of alliances of states" (pp. 240–242).

Finally, a thesis proposed by Michael Hardt and Antonio Negri seems to mark a new phase in the abandonment of the state concept. Hardt and Negri seek to replace the state with a concept of empire. Their main hypothesis is that globalization is transforming governance to such an extent that "sovereignty has taken a new form, composed of a series of national and supranational organisms united under a single logic of rule" (p. xii). The global form of sovereignty is called empire. Hardt and Negri argue that "Empire establishes no territorial center of power and does not rely on fixed boundaries or barriers. It is a decentered and deterritorializing apparatus of rule that progressively incorporates the entire global realm within its open expanding frontiers" (p. xii). Hardt and Negri concede that the United States enjoys a privileged position in empire, and they attribute the origins of its logic to the United States Constitution, but they view empire as a supranational logic "that effectively encompasses the spatial totality . . . that rules over the entire 'civilized' world." Empire is an "order that effectively suspends history and thereby fixes the existing state of affairs for eternity" and thus marks the end of history or the final phase of world political development (p. xiv).

THE POSTCOLONIAL STATE

The scope of coverage of the term *postcolonial* varies across disciplinary fields and authors, being broader in literary studies, for example, than in political science. Some authors include former settler colonies as referents alongside non-settler colonies. Other analysts, such as Amina Mama, distinguish the term *postcolonial*, used to refer specifically to former colonies, from the term *post-imperial*, preferring this term to refer to former imperial powers. In temporal terms, *postcolonial* does not refer simply to the period after colonialism but assumes continuity, in terms of the continued effects of processes initiated during colonialism, as well as discontinuity, in terms of new processes unfolding subsequently. The term *postcolonial* is used here to refer to the study of the attempted transformation, successful and otherwise, of former colonies in the context of changing imperial conditions.

From Structural Functionalism to Marxist Structuralism

In the early days of independence, the individualistic approach of authors who singled out the performance of those in positions of power earned them the label of “leadership theorists.” Leadership was essentially viewed as a means for achieving “order.” Such writers shared much in common with the “nation-building” school of American structural functionalism, where “nation” was very often equated with “state.” This literature was more concerned with the possibilities of statehood and the development of political institutions in the new states than with the constraints on institutional development, the latter being of greater interest to Marxists. The chief merit of leadership approaches is the emphasis on the created aspects of state formation and the efforts of individuals with a degree of control over their political life and environment. Critics (see Stark) point out, however, that the analysis tends to foster philosophical idealism and does not take enough account of the relationship between ideology and social action.

During the 1960s and 1970s, the underdevelopment paradigm became very influential in efforts to explain the economies and modes of rule that decolonizing nations were constructing. Underdevelopment theorists were concerned with the economic dependency of postcolonial states in the context of international capitalism as well as the relative autonomy of the postcolonial state from social classes. The theoretical model drew on the dichotomy between base and superstructure that characterized Marxist structuralism, but the focus was on trade rather than production. Several authors (see Ollawa) have pointed out that the developmental experiences of decolonizing countries highlight the centrality of the postcolonial state in structuring the necessary conditions for continued capital accumulation and regulating the allocation of surplus among different social categories.

In an influential essay on Pakistan and Bangladesh, “The State in Post-Colonial Societies—Pakistan and Bangladesh” (1972), Hamza Alavi posited that the postcolonial state was “over-developed” due to its foreign creation. It was consequently particularly powerful compared to the leading agrarian and industrial classes, the latter being “under-developed.” The idea of the relative autonomy of the state was proposed because of the independent material base of the bureaucratic-military oligarchy and its relative autonomy from the other propertied classes. Critics of Alavi’s position point to the idea of the state being reduced to a handful of bureaucrats and military officers in his analysis. Understanding the limitations placed on the state’s responses to pressures from hegemonic interests requires a closer examination of the state, in relation to its constituent parts and in relation to the international environment, and a more comprehensive view of classes.

Alavi’s 1972 essay sparked off considerable debate amongst Marxist Africanists. This included John Saul’s emphasis on ideology, which he said was neglected in Alavi’s analysis, but was necessary for the state’s function of holding together the capitalist system. Colin Leys responded by reasserting the importance of class as the basis of analysis of the state, and others responded in a similar vein. Many Marxists are of the view

that patterns of belief can bind the state together and, drawing on the ideas of Antonio Gramsci (1891–1937), have attempted to conceptualize anew the role of elites and their ideologies, in the complex economic relationships of the post-colonial state.

Interweaving History, Politics, and Culture

Jean-Francois Bayart points out that the notion that the state was an external structure does not recognize the ways in which Africans quickly re-appropriated the new state forms and the accompanying colonial political culture. Similar perspectives (e.g., Mbembe) point to the re-appropriation taking place not only in the institutional sphere but also in the material and cultural spheres. State power creates its own world of meanings through administrative and bureaucratic practices. It also attempts to institutionalize this world and turn it into people’s everyday understanding as well as the consciousness of the period.

The historicity of the postcolonial state is at the center of Bayart’s analysis. His focus is on the genesis of the state, the strategies of the actors, the procedures of accumulation and the world of political make-believe, all of which contribute to social inequality. Bayart’s evocative phrase, “the politics of the belly,” refers to desires and practices associated with interrelated themes: poverty and food scarcity; accumulation, corruption, and sexual excess. These are all understood as changing patterns of historical action, that are located in a network of tensions and interdependence, and that act upon one another. Bayart highlights the ways in which authoritarian regimes have managed to retain control over security forces and economic rents whilst maintaining the support of Western powers and international financial institutions. African postcolonial states rested on indigenous social bases whilst simultaneously being connected to the international system. Bayart’s approach counters the conception of African states and societies as lacking history, and of African politics as absent or inexplicable. These prevailed in colonial historiography, in philosophy, and continue today in mainstream Western sociology and political science.

From the 1980s onward, considerable scholarly attention across the social sciences has been paid to the “crisis” of the African state. The literature has also examined the shifting orientations of international financial institutions, from initially increasing the interventionist powers of the state to reversing that position by the mid-1980s. In an ideological climate defined by neoliberalism and marked by structural adjustment programs, scholars of diverse ideological orientations are united in their fierce criticism of international financial institutions, their appropriation of the concept of the “overdeveloped state” and the effects of their policy impositions on diverse categories of people. The literature has characterized the activities of international financial institutions as “rolling back the state” and bypassing the autonomy of the state in several critical ways through policy prescriptions and financing patterns.

Achille Mbembe’s poststructural analysis of the “post-colony” draws attention not just to the historical strength and purpose of the state but also to questions of power—its manifestations and the different techniques of enhancing its value to either ensure abundance or scarcity. Before and after

colonization, state power in Africa magnified its value by establishing specific relations of subjection that were informed by the distribution of wealth and tribute, and that shaped modes of constituting the postcolonial subject. Postcolonial states were strongly influenced by the modalities of their integration into world trade, such as reliance on one or more key resources for export, and whether they were financed through the peasantry, aid, or debt. Their modalities of integration shaped the forms taken by postcolonial states; the ways in which their ruling elites were inserted into international networks; and the structuring of relations among state, market, and society. Mbembe highlights the significance of the links that the postcolonial state in Africa forged among inter-related arenas. These were the production of violence, the allocation of privileges and livelihoods, and systems of transfer, such as the reciprocities and obligations comprising the communal social tie. The state's systems of allocations and transfers were significant in underpinning social and political cohesion and, thereby, the state's legitimacy.

Mbembe also draws attention to the present erosion of state legitimacy since the concentration of the means of coercion by the postcolonial state is difficult to achieve given the acute lack of material resources. Instead, autonomous power centers proliferate within what used to be a system. This is a consequence of the growing indebtedness of local rulers and trading elites, thus leading African polities to lose external power and exposing them to the risk of internal dissolution. The violence and predation required by the new form of integration into the international economy has led not only to the militarization of power and trade, and to increased extortion, but also to serious destabilization of the trade-offs that had previously governed the relationship between holding state power and pursuing private gain. The idea of the state as a general mechanism of rule and as the best instrument for making possible the exercise of citizenship is thus being seriously threatened.

Feminist Analyses of the Postcolonial State

In contrast to the above approaches, a key debate among feminist analysts of the postcolonial state concerns the extent to which the state is able to act as a vehicle for social change aimed at increasing gender equality. For example, in Morocco in the early 1990s, the modernizing state drew women into the public arena through law and education. The other side of the debate concerns the state as a mechanism for male social control and the convergence between the state and patriarchal forces. Where politics becomes deeply communalized, particularly when it is supported by state-sponsored religious fundamentalism, the traditional control over women that rested with particular male individuals—such as fathers, brothers, husbands—soon shifts to all men. Sonia Alvarez argues that there is nothing essential about the state's ability to act in either direction—social change or social control—but that its trajectory is more likely to be determined by political regime and historical conjuncture.

The feminist analyst Shirin Rai conceptualizes the state as a network of power relations that are located in economic, political, legal, and cultural forms interacting with and against each other. This allows her to examine the state in the context

of social relations shaped by systems of power, which are themselves affected by struggles against these systems. Rai points out that the state may take different forms in different historical, social, and economic contexts, as in the case of postcolonial states emerging from struggles against imperialism and colonial rule. The nationalist opposition to colonialism was itself located within the modernizing framework favored by colonialists. The prioritization of goals, first by the nationalist movement and then by the postcolonial state, erased issues that potentially challenged the modernist developmental conceptions of the new nation-state, such as women's interests and rights.

Rai highlights three features of postcolonial states that are significant for women's strategizing for social change. The first concerns the transformative role of the state: most nationalist elites saw themselves as agents for social and economic transformation, and state institutions were also relatively autonomous from dominant social classes. This allows space for institutional and political struggles. Second, the infrastructural capacity of the state is uneven, resulting in the possibility of activists targeting sympathetic institutions and individuals within the state. Third, the existing level of corruption is an important determinant of whether negotiation within the state is possible or not. Rai points out that one of the important implications of the poststructuralist conception of power as dispersed is the recognition that power takes diverse forms and can be used in varied ways. Simply taking an adversarial position against the state may be positively dangerous for women, given the deeply masculinist character of society, including civil society.

The gendered character of state formation, state practices, and militarism are analyzed by Amina Mama. In an earlier paper, Mama had argued that, in an international context highly influenced by women's movements, the military regimes of Generals Ibrahim Babangida (1985–1993) and Sani Abacha (1993–1998) were appropriating Nigerian women and their struggles whilst seeking legitimacy for their continued rule. Later, she refined this position by pointing out that the situation was more complex than this. This complexity included the fact that the politics of transition, and hence its gender politics, was more improvised than planned and took several turns in different and contradictory directions. Moreover, Nigerian women, in diverse and competing ways, were not passive pawns but actively engaged in the political maneuvers involved.

Drawing on Michel Foucault's theorization of power as dispersed, Mama theorizes power as dispersed across micropolitical, existential states of being as well as more macropolitical formations such as the nation-state. This allows her to consider ways in which these different levels of social reality come together to produce resonance and, potentially, dissonance. Mama also draws on the feminist philosopher Judith Butler's development of Foucault's theorization of power, arguing that being implicated or enabled by relations of power does not rule out the possibility of subversion. Mama examines the gender discourses articulated by the Heads of State and their wives in successive regimes, the programs and political practices articulated by these discourses, and the different structural changes made in efforts to institutionalize them. In the process, she highlights the interplay among power, knowledge, and

practice that facilitated the manufacture of consent to the military regimes dominating the workings of the state.

Rajeswari Sunder Rajan delineates the changing, heterogeneous character of the postcolonial state in India in her exploration of the state's contradictory positions toward female citizens. In a feminist analysis of social realities textured by divisions of age, ethnicity, religion, and class, Sunder Rajan examines women's lives, needs, and struggles around issues such as child marriage, compulsory sterilization, female infanticide, and prostitution. She shows how the state is critical to an understanding of women's individual and group identities at the same time as women and their struggles affect the operations of the state.

Conclusion

Three major conceptual fields are identifiable in the above literature. The first is that of structuralism, spanning ideas from structural functionalism to Marxism and with concomitant emphases on individualism and class. This field was in the ascendant in the 1960s and 1970s, its influence waning since then. The second field, emerging in the late 1980s, highlights the agency of actors in and around the state, located in inter-related historical, material, and cultural contexts. Although highly innovative in its syntheses of literature in history, politics, and cultural studies, the ideological orientation of this work in relation to social action is less clear. Finally, there is the field of feminist thought. This field shares common features with that highlighting agency, such as poststructural approaches to the analysis of power and the recognition of nonunitary, contradictory interests surrounding the postcolonial state. Unlike either of the other two fields, feminist scholarship is distinguished by its analysis of gendered state processes, the implications for women, and strategies for realizing gender justice.

STATE OF NATURE. The state of nature is a situation without government, employed in social contract theory in order to justify political authority. The device is most important in the works of the great contract theorists of the seventeenth and eighteenth centuries, mainly Thomas Hobbes (1588–1679), John Locke (1632–1704), and Jean-Jacques Rousseau (1712–1778). But it has a long history and was used by many other theorists. In the latter half of the twentieth century, variants of the state of nature were revived by John Rawls and other theorists who attempted to establish particular moral or political principles on the grounds that they would be selected in artificially constructed choice situations.

Accounts of humanity's purported natural condition differ in important ways, for example, whether circumstances are peaceful or riddled with conflict, whether there is an absence of society as well as the state, and the extent to which the people depicted resemble those in existing societies. These variations and others lead to justifications of different forms of governments—and moral principles.

Early History

Mythical accounts of a pre-social and/or pre-political Golden Age abound in classical literature. Familiar variants are found in Hesiod's *Works and Days* (lines 108–21) and in Plato's *Statesman*. In Plato's *Protagoras*, the title character describes the original human condition as one of isolation and peril from wild beasts and the elements. Divine intervention provided fire and the crafts, which allowed humans to defend themselves, and moral qualities of justice and respect, which allowed them to live together peaceably. A roughly similar account was presented by Cicero, in *De inventione* (On invention, I.2.2), and an especially vivid account in Book V of Lucretius' *De rerum natura* (On the nature of things). A variant of these themes is that people originally enjoyed a condition of peace and plenty, until some intervening event gave rise to conflict, which made

the state necessary. The Stoic Posidonius attributed humankind's fall to the origin of property (Seneca, *Epistle* 90), while according to Ovid, the change occurred as people began to eat meat (*Metamorphoses*, XV.96–111).

Connections between an original condition and the origin of justices are presented in Book II of Plato's *Republic*. Plato's spokesman, Glaucon, argues that justice arose from a general compromise: people agreed not to take advantage of others, in exchange for not being taken advantage of themselves (358e–59b). This was perhaps the first “social contract” argument in the Western tradition.

Classical arguments blended well with Judaeo-Christian accounts of the Garden of Eden and subsequent fall, to support the important medieval notion that the state arose as a remedy for sin. But other theorists, influenced by Aristotle, argued against the state of nature and contract traditions, claiming that the human is naturally a political animal, and so there could not have been a primordial pre-social (or pre-political) condition. St. Thomas Aquinas and subsequent Scholastic theorists argued that even in the Garden of Eden, authority was necessary to coordinate people's activity to achieve the common good.

Hobbes, Locke, and Rousseau

During the late medieval and early modern periods, claims according to which political power originated from a pre-political, natural condition generally supported limitations on political power—which people would have required for renouncing their natural liberty. The great originality of Hobbes was to use a contract argument to establish absolute government. He accomplished this by depicting the state of nature in horrific terms, as a war of all against all, in which life is “solitary, poore, nasty, brutish, and short” (*Leviathan*, chap. 13). Hobbes argued that, in order to escape such horrors, people would consent to absolute political authority—and that only absolute authority could ward off the state of nature.

Although Hobbes employed the device of the state of nature for largely analytical purposes, he also believed in its historical accuracy. Evidence he provided is people's defensive behavior in society, the “savage people” in America, whom he saw as living in a “brutish manner,” and how states confront one another in the international arena, “in the state and posture of Gladiators,” with their “Forts, Garrisons, and Guns” pointed at one another (*Lev.* chap. 13).

In the state of nature described by Locke in his “Second Treatise of Government,” people live under the law of nature, which, in the absence of government, they enforce themselves (Secs. 6–9). People also establish property rights, use money, and have something of a developed economy. But conflict arises because people are self-interested and so not impartial in their own disputes. Recognizing the need for an impartial umpire, Lockean individuals leave the state of nature, in two stages, forming first a community and then government. When government violates the agreement according to which it was established, people revert to a pre-political but not pre-social state. The state of nature returns only with complete destruction of society, through foreign invasion or similar catastrophes (Sec. 211).

In his “Discourse on the Origin of Inequality,” Rousseau criticized other theorists for attributing to natural man qualities they found in their own societies. Influenced by anthropological and zoological discoveries, Rousseau depicted natural man as little different than an ape: solitary, without language, and with limited reasoning capacity. But because his purely physical needs are satisfied relatively easily, he is content and, above all, morally innocent. Man becomes corrupt only through a gradual process of moving into society, and Rousseau depicted the contract through which government originates as a clever fraud perpetrated by the rich upon the poor. Rousseau's political theory aspired to recapture as much primordial natural purity as possible, through the new contract described in *The Social Contract*.

Contemporary Developments

By the end of the eighteenth century, the social contract was widely criticized on historical grounds. The idea fell into general disuse, and with it, the state of nature. Contract theory was revived by John Rawls, in *A Theory of Justice* (1971), although Rawls used his contract to justify moral principles rather than a form of government. Rawls's principles of justice are those that would be agreed upon under appropriately fair conditions. The state of nature reappears in his theory as the “original position.” In order to prevent people from choosing principles that would advantage themselves, they are placed behind a “veil of ignorance” and so deprived of knowledge of their personal attributes, e.g., age, religion, race, and wealth. The two principles selected under these conditions are highly egalitarian, guaranteeing equal liberty and that economic inequalities benefit the least-advantaged members of society. With Rawls, the state of nature (original position) loses all historical pretense. It is simply an analytical device to help identify appropriate moral principles.

Other theorists employ contractual devices to justify moral principles rather than government. In David Gauthier's *Morals by Agreement*, appropriate principles are those that would be agreed upon by parties motivated by self-interest. Gauthier's “initial bargaining position” differs from Rawls's original position in that the parties have full knowledge of their circumstances and interests. The principles agreed upon represent the parties' least possible concession to others' demands, the “maximum relative concession.”

A different, highly influential alternative to Rawls's contract theory is Robert Nozick's “invisible hand” explanation of the origin of the state, in *Anarchy, State, and Utopia*. According to Nozick, individuals situated in a Lockean state of nature join together in “mutual protective associations,” which are then moved by market forces to combine in ever-larger associations, eventually giving rise to an “ultraminimal state,” and finally a minimal state. Nozick argues that a state can arise through such a process without violating anyone's rights, and that only a minimal state can meet this condition.

STOICISM. Stoicism, from its foundation, has been most famous for its ethical ideas. Even now, *stoical* suggests a particular ethical stance, endurance of pain or misfortune without complaint. But in antiquity Stoicism was notable also for its unified view of the scope of philosophy and of the nature of reality.

The Stoic School in Antiquity

Stoicism, alongside Epicureanism, was one of the two most important philosophical movements in ancient Greece in the Hellenistic period (after the transformation of the Greek world by Alexander the Great). Both schools were founded in Athens at the end of the fourth century B.C.E.; both offered a distinctive way of life and an integrated theory and worldview. Ancient philosophical schools were not formal institutions but rather groups of intellectuals and students centered on a leading figure (the head of the school). Stoicism was founded by Zeno of Citium (c. 335–c. 263 B.C.E.), and developed by a series of subsequent heads, particularly Chrysippus (c. 280–c. 206 B.C.E.) in the late third century, who systematized the teachings of Zeno and made special contributions in logic. From the first century B.C.E. onward, the school was not based at Athens or centered on a specific head, but became a more diffuse movement, with Stoic teachers and adherents throughout the Greco-Roman world. Stoic teachings were transmitted by an extensive body of treatises, especially by Chrysippus, supplemented by summaries of doctrines and more popular writings especially in practical ethics. Stoicism was a powerful philosophical force throughout the Hellenistic period (until the late first century B.C.E.) and in the first two centuries C.E. under the Roman Empire. It died out as a creative movement in the third century C.E., though its influence remained important in later antiquity.

Main Doctrines

In ethics, Stoics saw themselves as perpetuating the key ideas of Socrates (c. 470–399 B.C.E.), especially as presented in Plato's (c. 428–348 or 347 B.C.E.) dialogues. These ideas were combined with the view of philosophy as an integrated system of branches of knowledge and a picture of reality as an intelligible and unified whole. For the Stoics, complete wisdom consisted in a synthesis of ethics, physics (study of nature), and logic.

The Stoic ethical ideas drawn from Socrates were that virtue was unified, a type of knowledge, and the only thing that was good in itself. Also Socratic were the ideas that virtue was the sole basis for happiness and that all human beings were capable of achieving full virtue. The Stoics developed these ideas into a systematic theory of value linked with a normative picture of human development. Apart from virtue, the other so-called good things in human life, such as one's own health or prosperity and that of one's family or friends, were "matters of indifference," not goods, though they were naturally "preferable." In a complete process of ethical development, human beings would progress from valuing "preferable" things to recognizing that virtue (conceived as order and rationality) was the only good. Failure to develop an understanding of what was really good produced emotions, such as anger and grief, that were defective and misguided reactions. One of the main objectives of Stoic practical ethics was to cure people of the misconceptions that produced these emotions and to promote the development toward full wisdom that alone brought true peace of mind. Sociability and the desire to benefit others was also seen as a natural instinct in human beings, which should develop toward a sense of kinship with all other human beings as rational animals. The realization of the brotherhood of humankind (which was also seen as the expression of "natural law") was the ultimate ideal and desired objective of Stoic political thinking. Stoics did not favor any specific type of conventional constitution such as democracy or monarchy.

In Stoic physics, the natural universe was seen as unified and coherent. Reality, including god and the human mind, was conceived in wholly material terms. The universe was a total fusion of active and passive principles; the active principle could be understood as fiery air or animate breath (*pneuma*), and also as immanent god, reason, or fate. The universe was also seen as a seamless web of interconnected causes with no random events. This nexus of events, and the universe as a whole, was understood in teleological terms, as expressing underlying providential purpose or rationality and as being, in that sense, good.

For the Stoics the scope of logic included the philosophy of language and epistemology as well as the systematization of arguments. Chrysippus in particular developed formal logic to a very high level, especially the logic of propositions; Stoics also partly anticipated Gottlob Frege's (1848–1925) distinction between sense and reference. In epistemology, they maintained the empiricist claim that certain kinds of sensory "appearances" form the basis of an infallible grasp of reality. However, they also held that complete knowledge, or wisdom, involves a systematic, theoretically based understanding of reality as a whole.

The goal of philosophical enquiry was an integrated grasp of these three areas. For instance, the Stoic theory of determinism embraces a conception of universal causation (derived from physics), a logical analysis of possibility and necessity, and an ethical account of human responsibility, based on the idea of humans as both rational agents and an integral part of the causal chain. The modern stereotype of the stoical person as one who accepts life's vicissitudes as the work of fate derives from this conceptually powerful set of theories. The seemingly idealized

picture of natural human development adopted in Stoic ethics was seen as consistent with the idea, fundamental to Stoic physics, that nature forms an organic and providential whole. The Stoic conception of the good was, in essence, that of structure, order, and rationality, manifested as virtue in the sphere of ethics, as the order of the universe in physics, and as a system of argumentation and knowledge in logic.

The Medieval and Modern Reception of Stoicism

From the third century C.E., Stoicism was eclipsed as a creative force by Neoplatonism and Christianity. Both those movements replaced the Stoic holistic worldview with transcendent ideals, but they also absorbed and transformed key Stoic themes. The Stoic idea of *logos* (reason) as a bridge between the divine and the human, and as a fundamental principle of reality, was embraced in different ways by both Neoplatonists and Christians in late antiquity and the Middle Ages. One possible response was to draw on Stoic writings for their moral rigor but to ignore or revise their larger philosophical framework. This approach was applied to Epictetus's (c. 55–c. 135 C.E.) *Handbook*, a pithy statement of Stoic practical ethics; by the Neoplatonist commentator Simplicius (fl. c. 530 C.E.); and by medieval Christian ascetics, who used the text as a guide for monastic self-scrutiny. Christian philosophers such as St. Thomas Aquinas (1225–1274) and Francisco Suárez (1548–1617) similarly drew on Stoic ideas to define the idea of virtue as a natural property. In the Enlightenment period, engagement with Stoicism was more full-hearted, and the Neo-Stoic Justus Lipsius (1547–1606) argued for the fundamental equivalence of Stoic and Christian ethics and theology. In the nineteenth century, Hellenistic thought was often regarded as an inferior phase of ancient thought by philosophers (notably Georg Wilhelm Friedrich Hegel) and scholars. But in the twentieth century, especially its last thirty years, Stoicism was an object of intensive scholarly study. The modern revival of virtue-ethics and cognitive approaches to emotion, and current interest in nonreligious practical ethics, have given Stoic ideas renewed appeal. In the twenty-first century, we may expect to find Stoicism also valued for its holistic approach to the universe and the mind-body relationship and the attempt to integrate ethics, science, and logic.

STRUCTURALISM AND POSTSTRUCTURALISM.

This entry includes two subentries:

Overview
Anthropology

OVERVIEW

Structuralism was both an intellectual movement with wide ramifications in the twentieth century and an attempt to provide scientific status to the knowledge of language, culture, and society.

Structuralism originated in the work of Ferdinand de Saussure (1857–1913), a Swiss linguist whose lectures, when published by his students in 1916 (*Course in General Linguistics*), launched the new school of thought. Initially, the influence of Saussure's ideas was limited to linguistics and to the linguistics-based study of literature that the Russian formalists carried out in the early decades of the twentieth century. When one of the leaders of the formalist movement, Roman Jakobson, emigrated to the United States during World War II, he met the French anthropologist Claude Lévi-Strauss and introduced him to Saussure's work. When Lévi-Strauss returned to France after the war, he launched structural anthropology and initiated French structuralism. His work in the late 1940s and 1950s inspired congruent and related work in psychoanalysis, sociology, history, and literary and cultural studies that culminated in the mid-1960s in the writings of literary scholars Roland Barthes, Tzvetan Todorov, and Julia Kristeva, historian Michel Foucault, and psychoanalyst Jacques Lacan. Structuralism dominated French thought through the early 1960s. In 1967, a new movement that questioned and extended the insights of structuralism arose. Poststructuralism, as it came to be called, is best known in the work of philosophers Jacques Derrida, Luce Irigaray, and Jean Francois Lyotard; sociologist Jean Baudrillard; and literary critic Hélène Cixous.

Saussure and Structuralism

The Saussurean legacy in structuralism assumes two forms. The first is the study of the latent system that generates surface events such as speech in language. The second is the study of culture, language, and society as systems of signs that facilitate communication and the creation of meaning in human culture.

Saussure revolutionized the study of language. He shifted attention away from surface utterances, the everyday speech practices that make up spoken language, and focused it instead on the underlying system that allows those utterances to come into being. He distinguished between *langue* (language system) and *parole* (speech). Each speech utterance presupposes the simultaneous existence of the entire language system from which it arises, much as a leaf, when cut transversally, to use Saussure's example, reveals its entire invisible structure. Saussure also compared language to a game of chess, in which each move has meaning and is made possible by the rules of the game, all of which are implied in each move. In language, similarly, utterances can function as bearers of ideas or as names of things only if the entire system of language is implied in each utterance.

Saussure's most innovative contention was that words are signs that consist of a palpable sound image (signifier) and a mental concept (signified). All signs exist in chains that connect them to all other signs in the language. Language works through the interrelationship and interaction of linguistic signs, not as the naming of objects by words. The relation between words and things, Saussure contended, is entirely arbitrary. *Cat* names a particular animal not because the sound image or signifier "cat" has a real connection or resemblance to the creature but because the signifier "cat" is different from other adjacent signifiers such as "rat" or "hat" in the particular chain of signifiers in which it exists. The slight difference in sound and spelling creates a difference of meaning. Those signifiers in turn function to name things or have meaning because they sound different and are spelled differently from other words. This is known as the diacritical principle. The identity of signifiers is determined by their differences from other signifiers. In language, according to Saussure, there are no identities, only differences. It is the relation between terms that allows signifiers to appear to possess an identity of their own. Language, in other words, is entirely conventional, a matter of form, not natural substance.

Each signifier has a value, a function within the system of language understood as a set of relations between differentially connected terms. A signifier has value as a noun or a verb or as the designator of a particular thing or as performing a particular grammatical function—that is, as a qualifier or pronoun. Saussure notes, for example, that the French *mouton* functions to name both the animal and the food; it has a double value, while English uses two different words with two different values to carry out this function—*sheep* and *mutton*. Each language assigns different values to signifiers, and it is the relation between signifiers that determines value.

Saussure also distinguished between the syntagmatic and the paradigmatic dimensions of language. The syntagmatic names the linking together of parts of language in temporal chains such as a sentence. The paradigmatic is the spatial dimension of language that comprises the possible options that might fill any one space in a syntagmatic chain. For example, in an utterance requiring a verb in a particular position, the slot for "verb" might be filled by any number of possible actions from that particular paradigmatic set.

Influence of Saussure. Saussure made the study of language more scientific by dividing the field into its component parts. He also specified the linguistic field as being concerned with the way language worked as a sign system with a particular structure and with specific rules of operation.

Two of Saussure's ideas proved of great use to thinkers in other fields such as philosophy, history, and sociology. The first was that language is a self-sufficient system of interconnected terms whose value derives entirely from their functions within the system, not from their relation to objects or ideas outside it. This insight allowed other thinkers to argue that *human knowledge and human consciousness in social life occurs within language or discourse*. Knowledge of reality is frequently more a matter of the interconnections among terms in the particular discourse (of economics, politics, or science, for example) than of the connection between the terms of the discourse and

objects in the extra-discursive world. The second influential idea was that *difference makes identity possible*. There is no substance in language apart from the differential relations among the terms, none of which otherwise have an identity of their "own." All traditional notions of a natural substance in philosophy, social thinking, political theory, and other fields could now be rethought as effects of differential relations.

Saussure's discoveries influenced work in other fields directly and by analogy. In the structural anthropology of Lévi-Strauss, both kinds of influence are evident. Lévi-Strauss noted, for example, that numerous different myths, when studied together, reveal a common structure. Myths are sign systems in which terms have different values in relation to one another. Those values often consist of oppositions between terms such as the *raw* and the *cooked* or *nature* and *culture*. Myths functioned to resolve contradictions in human culture by constructing stories in which opposed and contradictory possibilities are mediated and their opposition resolved in a way that provides a solution to some conceptual problem or conflict of values in that particular culture. The myth of Oedipus, for example, resolves the dilemma of human origins by positing a mediation between the supposed earthly origins of human life and the fact that all humans are the product of human sexual relations. The tale is a version of the opposition between nature and culture.

Many mythic stories revolve around the incest taboo, which forbids marriage between members of the same family. In his famous study of human kinship systems (*The Elementary Structures of Kinship*, 1949), Lévi-Strauss noted that all human societies enjoin incest. If one studies kinship structurally as a system of relations between terms in which one element has meaning through its relation to all the other terms, then the incest taboo must be understood as a function of the larger kinship system. Kinship is like language in two respects. It is a system of communication among different tribal groups, and it is a language, in which value is determined by function. The value of the incest taboo is that it forbids marriage within a clan or family, but as a result, it has the function of obliging marriage between members of different clans, tribes, and family groups. The result is a form of communication through marriage that binds different people together. The larger function of this language-like kinship system is to work to prevent conflict; strife is less likely between groups connected by marriage.

Lévi-Strauss's work had an impact on literary and cultural studies, psychoanalysis, and historiography. Roland Barthes argues in *Mythologies* (1957) that culture (in the form of movies, advertisements, commodities, books of photography, wrestling matches, travel guides, and so on) resembles language in that it operates through signs that create meaning. Barthes distinguishes between signifiers such as the photo of a black French colonial soldier on the cover of a magazine saluting the French flag and the signifieds such an image generates. Such signifieds have several levels, from the elementary—the image signifies the loyalty of the colonial subject—to the more complex and abstract—the idea of imperialism that is sanctioned and communicated by the image. In his later work in literary criticism, Barthes studies literature in a similar manner, noting how

writers operate within systems of meaning that rely on the differences between terms to make signification possible.

The impact of Saussure is also evident in the work of literary critics Julia Kristeva and Tzvetan Todorov. Todorov argues in *The Poetics of Prose* (1971) that fictional narratives can be understood in structuralist terms. A diverse set of short stories by the same writer can be interpreted as having a similar internal structure. The tales of Henry James, for example, all deal with an absence at the center of the tale. Kristeva in *Semanalysis* (1967) uses structural linguistics to argue that works of literature have different levels—the phenotext and the genotext—that resemble Saussure’s distinction between *langue* and *parole*.

Jacques Lacan, Michel Foucault, and Gilles Deleuze

One of the most ingenious and influential uses of structuralism occurred in psychoanalysis. In *Écrits* (1966), Jacques Lacan gathered together three decades worth of work, much of which owed a debt to Lévi-Strauss and to Saussure. For Lacan, the psyche is immersed in signification, and psychic content exists in the form of signifiers. The unconscious, as he famously put it, “is structured as a language.” Symptoms of psychic dysfunction are signifiers, but because the psyche is semiotic in the same way that language is, one never moves from psychic signifiers to a content or a mental object. Instead, signifying reference moves along a chain of signifiers, each of which is linked to other signifiers. All one can do in the process of psychoanalysis, then, is trace the signifying links. One can never reach the “real” that would deliver up a knowable object or thing or reality signified by psychic language.

The other major work of mid-1960s structuralism was Michel Foucault’s *Words and Things* (1966; *Les mots et les choses*, translated 1970 as *The Order of Things*). A historian, Foucault argues that our knowledge of the world is always mediated by signifiers. Over time, systems of signification change, and with each new system, a different picture of the world emerges. Each *episteme*, or system of knowledge, portrays (or signifies) the world differently depending on what kind of signification is used.

Like a number of structuralists, Foucault pointed the way toward poststructuralism’s critique of rationalism. His *Madness and Civilization* (1961; *Folie et déraison*) reflected the influence of the philosopher Martin Heidegger, who shifted attention away from the post-Enlightenment philosophic concern with rational knowledge and focused instead on fundamental metaphysical issues that he felt withstood rationalization. A similar influence came from philosopher Friedrich Nietzsche, whose recently translated work was critical of the idea that one could know the world clearly through reason. Nietzsche noted that knowledge reduces the complexity of the world to false identities. His influence is evident in the work of the French philosopher Gilles Deleuze, especially in his *Nietzsche and Philosophy* (1961). Deleuze, in his work in the 1960s such as *The Logic of Sense* (1969), tries to expose the irrational and allogical elements of human knowledge.

What these thinkers share is a sense, derived from Saussure, that the identities of knowledge arise from and are made

possible by differential relations between terms that have no identities of their own apart from those relations. Reason, inasmuch as it operates through clear distinctions that demarcate separate identities (of categories, of things), cannot, by definition “know” or grasp this realm of difference. Difference makes knowledge possible, yet it is ungraspable using only the categories of knowledge. Difference by definition does not lend itself to identity, but knowledge consists of identification.

Jacques Derrida and Deconstruction

This antirational implication of Saussure’s thinking is most fully exploited beginning in 1967 in the work of Jacques Derrida (*Writing and Difference*, *Of Grammatology*, and *Speech and Phenomenon*, all published that year). Derrida contends that if difference makes knowledge possible, it also renders it impossible on its own terms. If the world is differential in the same way language is, then knowledge of that world which operates according to rationalist imperatives and seeks to identify “what is” will necessarily miss the mark. We have to think more complexly about how we know, and we have to rethink what the known world looks like.

Derrida’s most interesting advance on Saussure consists of formulating a new concept, which he calls *différance*. He argues that philosophy has traditionally based concepts of truth on presence—the presence of the thing or of the idea to the mind. Yet when one examines presence, one finds that it is not a simple identity. Presence must exist both in time and in space. In time, it must be distinguished from past moments and from future moments. In space, the presence of a thing can only be isolated and identified by distinguishing it from other objects. In both a temporal and a spatial sense, then, presence arises out of difference. Derrida combines spatial and temporal difference into one process—difference spelled with an *a*, or *différance*. This neologism is significant because in French one cannot hear the *a* when one pronounces the word. The *a*, in other words, cannot be made present. It thus resembles the way difference in time and space gives rise to presence (of the present moment, of the thing in its presence) without itself assuming the form of presence.

Derrida contends that all being and all thought is made possible by *différance*. In order for difference to be operative in language, there must, he argues, be at work in being a more primordial process that distinguishes one thing from another in time and space. It has no identity of its own, but it makes all identity possible. All things thus bear the mark or trace of other things from which they differ and to which they relate or are connected in their very constitution. Because this primordial process can never assume the form of presence or of identity, one finds its imprint, when one reviews the philosophic tradition, in the very concepts and categories that would seem to deny its priority. Because all philosophic concepts operate through identification and the naming of presence, they obscure the process of *différance*. Yet because it is prior and because it constitutes all presence and all identity, its effects are evident in the text of philosophy.

Derrida’s method of analysis, called “deconstruction,” seeks to locate the fuzzy, anti-identitarian process of *différance* at work

in philosophic and literary texts. He notices places in texts where thinkers lay claim to an ideal of natural substance or of full and self-identical presence that allows them to order their conceptual world. Usually, such ordering consists of a hierarchy in which the ideal of natural substance or of presence is thought to be prior, foundational, or axiomatic, and something else is declared to be derivative, secondary, and lesser in relation to that norm. Such differentiations, Derrida finds, characterize most if not all philosophical thinking. Many thinkers, for example, locate value and truth in what is declared to be more natural in relation to something else that is declared to be artificial, external, additive, or merely supplementary in relation to an internal or prior essence. Even Saussure, Derrida argues, is guilty of this “metaphysical” maneuver. He argues that speech is more central and internal to language because it is more natural, while writing is more artificial, a matter of external notation and convention rather than of natural substance. Yet, Derrida notes, Saussure’s own concept of difference should instruct him that what he calls nature is itself differential. Indeed, in order to delineate the natural as a concept, Saussure must differentiate between an inside and an outside. The supposed natural substance of speech is declared to be inside language, while the technical artifice of writing is declared to be an external addition. Saussure’s description of language never takes this particular distinction into account, but on it his entire argument rests. Saussure merely assumes it is the case that speech is closer to the natural “inside” of language while writing is an “external” form. If he tried to take the initial distinction between “inside” and “outside” into account, he would be obliged to notice that difference must precede and determine what he calls “nature.” And what this means is that nature is not foundational; it derives from and is produced by difference.

What Derrida calls *différance* thus obliges philosophic knowledge to relinquish its traditional concern with identification and to instead adopt a looser style that makes weaker, less absolutist claims. American philosophers like Richard Rorty (*Philosophy and The Mirror of Nature*, 1979) notice that Derrida’s position recalls arguments made by proponents of Pragmatism, which also favored a less absolutist epistemology and an approach to knowledge tailored to circumstances that would be more experimental in character. Knowledge, for Pragmatism, is what works in a particular historical situation, not what is absolutely and unequivocally true in nature.

Poststructuralism

Derrida’s work launched a new intellectual movement called poststructuralism. If structuralism searched for the invariant structures of language and culture, poststructuralism was more concerned with criticizing the rationalist impulse that animated the structuralist undertaking. The impact of his work was immediate and profound. Structuralists like Barthes and Kristeva shifted their focus to the alogical and prerational dimension of literary texts. In *S/Z* (1970), Barthes examines a tale by Honoré de Balzac from the perspective of the multiple codes that go into its making; in *Revolution in Poetic Language* (1974), Kristeva notices the conflict in texts between a symbolic level associated with logic and meaning and a semiological level that is prerational.

Derrida’s contention that the world is itself differential led many thinkers to apply his ideas to such social issues as feminism. The two most noteworthy practitioners of deconstructive feminism were Hélène Cixous and Luce Irigaray.

In *The Newly Born Woman* (1975), Cixous examines the traditional way in which men and women are characterized in Western culture. She suggests that men are associated with reason, identity, truth, and logic and women with unreason, difference, falsity, and hysteria. Cixous argues that this social and philosophical system is deconstructed by certain kinds of avant-garde writers such as James Joyce and Virginia Woolf who write in a way that undermines traditional rationalist assumptions. Their writing is deliberately alogical and semantically generative. It works through horizontal linkages along a differential chain of semiotic connections that obey no rationalist logic. Cixous calls this “feminine writing” because it accords with the traditional negative way of characterizing women. Following Derrida, she argues that a deconstructive strategy in regard to the patriarchal tradition would deliberately inhabit its terms and reveal their subversion from within. If *différance* does inhabit and make possible the categorical identities of patriarchy, then its undoing consists of revealing that *différance* and undermining the authority of those categories.

Luce Irigaray argues in *Speculum of the Other Woman* (1974) and *This Sex Which Is Not One* (1977) that in Western philosophy woman have been portrayed as matter, body, fluidity, boundarylessness, irrationality, artificiality, and the like. Women are the opposite or mirror image (hence *speculum*) of men, who are assigned reason, truth, and authenticity. Male philosophic speculation abstracts from concrete particularity and bodily materiality when it resorts to metaphysical concepts and categories such as “being,” “becoming,” “truth,” and “infinity.” The attempt to transcend matter is quintessentially male. In pursuing such speculative philosophy, men have sought to separate themselves from matter and from *mater*, that is, from their own links through their mothers to physical life and to material fluidity. Men must separate from their bloody origin in the mother’s body and elevate themselves above such matter if they are to attain a psychic identity predicated on masculine principles and ideals. The subordination of women is thus both a psychic and a philosophical necessity and process. Men take matter as an object of speculative knowledge and thereby gain control over physical processes that threaten to overwhelm and overpower male identity. Those processes must remain outside male reason and never accommodate themselves to its categories. Irigaray thus ends up arguing for female separatism.

Jean François Lyotard pursues the poststructuralist argument in books such as *The Postmodern Condition* (1979) and *The Differend* (1983). Lyotard argues that knowledge and discourse are inseparable. The traditional stories or narratives about the world have been transformed in what he calls the postmodern era. The classic narratives of the Enlightenment such as liberal humanism and Marxism no longer provide a convincing or accurate account of the world. They have been replaced by a proliferation of micro-narratives. In a world dominated by corporations, especially, what counts as true is increasingly determined by the

financial and technical requirements of those with economic power. Lyotard sees society as consisting of contending stories about the world, no one of which is in itself more true than another. Each person or group must work rhetorically to convince others of the truth of their own particular discourse. Social life is an ongoing discussion in which people seek to make their perspective and their story dominant. Totalitarianism consists of abolishing this free play of discussion by establishing a consensus that silences further discussion.

One of the most innovative French poststructuralists, Jean Baudrillard, began as a structuralist sociologist interested in the way the semiotic regimes of advertising shape and categorize reality. Baudrillard has since that early work on “consumer society” been preoccupied with the power of cultural representations to become lived reality. Initially, this meant for him the power of advertising images to shape social identities and to impose modes of behavior. By “being a Marlboro man,” one adopted a cultural sign and adapted one’s behavior to the code it implied and imposed. In that code, to become the bearer of certain signs (smoking cigarettes, for example) is tantamount to assuming a particular social identity. The code shapes and determines reality through the operation of both cultural and behavioral signs. Baudrillard’s understanding of this process becomes more pronouncedly pessimistic over time. From *Symbolic Exchange and Death* (1976) to “Simulacra and Simulations” (1981), he argues that the media have become so powerful that simulated realities have now replaced actual reality. This hyperreality is a perfect imitation of reality, much as Disneyland aspires to be a totally enclosed universe of its own, created through the manipulation of signs. At his most provocative, Baudrillard argues that something like the first Gulf War “did not take place.” Its “reality” was so mediated and constructed by images that in effect it occurred in hyperreality. The real, in other words, can be shaped to be whatever those with economic, political, and cultural power want it to be.

While there are significant differences between structuralism and poststructuralism, the two movements share a concern with signs and with the power of sign systems both in the field of human knowledge and in the field of culture and society. The structuralists moved from examining the operations of sign systems to understanding their role in human society. The poststructuralists furthered that undertaking by studying the way signs operate to misrepresent the world and to underwrite social power.

ANTHROPOLOGY

Structuralism in anthropology is inextricably linked with its founder, Claude Lévi-Strauss. His principal contributions have been in the field of kinship and in the analysis of symbolism, particularly of myths. The characteristic approach of structuralist analysis is to categorize systems, not in terms of the composition or content of their component elements, but in terms of the structure of relationships between these elements.

Lévi-Strauss's first major work, *The Elementary Structures of Kinship* (1949), begins with the premise that exogamy, the obligation to marry outside one's own group, is a corollary of the incest taboo, a defining criterion of "culture" as opposed to "nature." If complex kinship structures are characterized by negative rules—prohibitions on marrying certain categories of relatives—then elementary structures are defined by positive rules that indicate marriage with specific kinds of relatives. Bilateral cross-cousin marriage, in which a man marries either a father's sister's or a mother's brother's daughter, can be conceived of as a system of symmetrical exchange of women between two groups. Matrilineal cross-cousin marriage, where a man marries his mother's brother's daughter but never his father's sister's daughter, involves asymmetrical exchange, whereby a man takes a wife from one group and marries off his sister to another.

In 1962, Lévi-Strauss published *The Savage Mind*, a work on symbolism that characterized primitive thought as *bricolage*, a term that translates roughly as "handy work," working with whatever is readily available rather than using a specific tool adapted to a certain task. The primary tool of such thought is metaphor, grounded in analogical reasoning. In other words, if the members of one clan are "bears" and their neighbors "foxes," this has nothing to do with intrinsic resemblances; rather, the difference between human groups is considered to be analogous to the difference between species of animals.

Lévi-Strauss applied this approach in his magnum opus, a four-volume series on mythology: *The Raw and the Cooked* (1964), *From Honey to Ashes* (1966), *The Origin of Table Manners* (1968), and *The Naked Man* (1971). The aim of his analysis is "to show how empirical categories—such as the categories of the raw and the cooked, the fresh and the decayed, the moistened and the burned, etc., which can only be accurately defined by ethnographic observation and, in each instance, by adopting the standpoint of a particular culture—can nonetheless be used as conceptual tools with which to elaborate abstract ideas and combine them in the form of propositions."

Lévi-Strauss begins with a myth from the Bororo culture in Brazil, initially comparing it to other Bororo myths, then to myths from neighboring populations, until by the end of the fourth volume, he discusses no fewer than 813 myths from across North as well as South America. The mythology of the Americas is depicted as a single vast system in which individual myths can be interpreted as transformations of other myths and where relationships between elements from different codes—social categories, animal and plant species, modes of food preparation, parts of the body, celestial and meteorological phenomena, among others—can always be expressed as analogical to other codes.

Followers and Critics

Lévi-Strauss's work on kinship gave rise in Britain to "alliance theory," whose leading practitioners were Edmund Leach and Rodney Needham. They challenged the prevalent classification of kinship systems in terms of matrilineal and patrilineal descent and suggested instead a classification based on patterns of marriage. Needham attempted to distinguish between "preferred" and "prescriptive" cousin, but Lévi-Strauss himself refused to admit the pertinence of such a distinction, and Needham encouraged one of his students, Francis Korn, to publish a case-by-case refutation of *Elementary Structures of Kinship*. The work of Abraham Rosman and Paula Rubel in the United States and of Françoise Héritier in France represents other applications of structuralism to kinship theory.

Lévi-Strauss's influence has been even more pervasive, if more diffuse, in the study of symbolism. Edmund Leach and Dan Sperber have published important general works on the subject. Numerous ethnographies have incorporated structural approaches in their analyses of the symbolic systems of specific cultures, including Stephen Hugh-Jones's discussion of Amazonian cosmology, Sherry Ortner's analyses of Sherpa rituals, Louis Dumont's account of caste and pollution in India, and Luc de Heusch's comparative study of Central African myths of kingship. Although Mary Douglas has remained persistently critical of Lévi-Strauss's work, her work on purity and pollution shows definite affinities with structuralist approaches.

Certain Marxists and materialists such as Claude Meillassoux and Marvin Harris criticized Lévi-Strauss for his radical idealism, his interest in mental structures rather in the material circumstances underpinning them; other Marxists, however, notably Maurice Godelier, sought to reconcile Marxism and structuralism. In addition, critics such as Pierre Bourdieu have pointed out that Lévi-Strauss's concern with abstract thought rather than with the process of thinking leaves no room for human agency.

Poststructuralism and Anthropology: Foucault and his Impact

Poststructuralism is a term loosely applied to members of the next generation of French thinkers after Lévi-Strauss who also concerned themselves with texts and discourses. Of these, Michel Foucault had the greatest impact on anthropology. Foucault's work is specifically concerned with the relationship between knowledge and power. Knowledge, for Foucault, is not primarily a collection of facts or even ideas, but only takes on significance within what he calls an *episteme*, an overarching framework situated in time, within which such ideas emerge as relevant and indeed possible. Though Foucault avoids Marxist terminology, one might characterize his *epistemes* as "modes of thinking" as opposed to "modes of production." In a similar manner, he situates "power" within a framework of possibilities determined by an overall system rather than as a property of individual actors. In *Discipline and Punish* (1975), he uses the modern prison system as a central example of how these two systems, of knowledge and of power, are fused in contemporary society. Discipline is, he argues, a central feature of modern institutions—prison, army, school—inscribing power relations on the bodies of subjects who must

conform but must also be constantly monitored; this monitoring of subjects is the intellectual task of modern “disciplines”—psychology, sociology, anthropology, and others.

Edward Said’s *Orientalism* (1978) argued in a similar vein that European and American expert knowledge of the “Orient” and particularly the Middle East was inextricably connected with the exercise of Western hegemony over the region. Such critiques have made anthropologists much more self-conscious about the implications of their own representations of “other,” non-European peoples. James Clifford and George Marcus have been concerned with the ways in which such representations are constructed through writing, and the rhetorical means by which anthropologists lay claim to “authority.” Talal Asad has suggested that anthropologists’ attempts to arrive at ahistoricized definitions of such phenomena as religion serve to naturalize (that is, make cultural concepts and thought systems appear timeless, natural, and universal) post-Enlightenment systems of European thought while simultaneously problematizing other systems of practice, even in European history. Paul Rabinow has been perhaps the most adamant disciple of Foucault within the discipline, both as an exegete and as an ethnographer of modern France.

Derrida and Deconstruction

At first sight, Jacques Derrida’s *Of Grammatology* (1967), which makes the provocative claim for the logical priority of writing (or at least “archè-writing”) over speech, might not seem a likely candidate for a work that would influence anthropological thinking. Derrida’s point is, first of all, that writing reveals the spaces, silences, and erasures that speech conceals; second, that there is an apparent gap in time and space, a *différance*, between the enunciation and reception of a written text, whereas speech gives the illusion of immediacy. Derrida’s purpose is to radically call into question the relevance of authorial intention and the possibility of any fixed meaning. Texts, written or spoken, must be interpreted not only in terms of what they “say” but of what they keep silent, and with respect to other texts before and after. Derrida’s approach to texts, “deconstruction,” lays bare the internal contradictions of any text, precluding the attribution of definitive meaning, intentional or otherwise.

The term *deconstruction* has been used so loosely by many anthropologists that it has lost any clear referent—an ironic fate for a concept intended to challenge the fixity of meaning. More specifically, Derrida’s skepticism about intentionality in the interpretation of texts has fueled “postmodern” critiques of anthropological representations of the “other.” Derrida’s wordplay and elliptical style have inspired new forms of anthropological writing, best exemplified by the work of Michael Taussig.

Ultimately, both structuralism and poststructuralism have contributed to tendencies on the part of many (but by no means all) anthropologists to call into question the characterization of their discipline as “science” and to reposition themselves more centrally in the humanities—structuralism through its emphasis on the decoding of symbols, a domain often considered antithetical to strictly “scientific” approaches; and

poststructuralism by forcing anthropologists to call into question their own practices of representation. Critics from within the humanist camp, however, have pointed out that both structuralism and poststructuralism are theoretically de-humanizing (that is, ignoring or minimizing the impact and importance of human agency), most obviously in Derrida’s critique of human intentionality but also, at least implicitly, in the work of Lévi-Strauss and Foucault. At best, such theories make any consideration of human agency problematic; at worst, they leave no place for it at all.

Robert Launay

SUBJECTIVISM. *Subjectivism's* natural antonym is *objectivism*, and various species of subjectivism have been developed as alternatives to objectivism of various sorts. One can be a subjectivist about a variety of things—ethics, aesthetics, even science. Many of these topics are covered in related entries, however, and the emphasis here will be on subjectivism with respect to ethics in modern and contemporary thought.

Philosophers often distinguish normative ethics, which deals with specific questions about rights or duties or ideals (e.g., “is infanticide wrong?”) and metaethics, which deals with questions about the status of ordinary moral claims (such as, “can moral judgments be true or false?”). Subjectivism and objectivism are positions in metaethics.

Ethics and Values

The moral or ethical realm is extremely complex. Our moral lives involve practices, principles, convictions, commitments, duties, ideals, and more, and one can be a subjectivist about some of these without being a subjectivist about others.

Many versions of moral subjectivism are motivated by a combination of two views. In the first, different cultures, societies, subcultures, and the like often have strikingly different conceptions of morality; thus, many cultures have practiced human sacrifice, infanticide, and slavery. In the second, we are indelibly shaped by the culture and historical period in which we live; we cannot step outside our modes of evaluation and thought to some neutral Archimedean point from which we can impartially adjudicate the conflicting claims of alternative moral codes. Indeed, many subjectivists go one step further, urging that the notion that there is one true story about morality is empty.

Our moral beliefs and claims exhibit several fundamental features that any viable position in metaethics must either explain

or explain away. First, ethical discourse often appears to describe, quite literally, facts in the moral realm. The theory that endorses the claim to objectivity is known as cognitivism; moral judgments make cognitive or descriptive claims, rather than simply expressing emotions or making recommendations. Second, when we give arguments that something is right or wrong, we often marshal reasons for thinking certain moral claims to be true or false. Third, moral judgments often provide motivation to act in accordance with them. Fourth, morality is a social institution that involves shared practices and beliefs.

Objectivity

According to the metaphors often used to characterize objectivism, the world (or some subdomain of it, like ethics) is “out there,” beyond our language and thought. If we are fortunate, we may discover something about this mind-independent realm, but in no sense do we create or construct it. Thus, to objectivists, there is a fact about whether abortion is ever acceptable that obtains quite independently of anyone’s opinions on the matter.

Varieties of Subjectivism

When people say that morality is subjective, they often mean simply that there really aren’t any objective moral truths. But philosophers who defend versions of subjectivism frequently go on to offer us a new account of the moral dimension to compensate for the loss of objectivity.

Individual subjectivism: existential choice. If alternative moral codes and ideals are possible, can each person simply choose which ones to adopt? According to many existentialists, most notably Jean-Paul Sartre (1905–1980), there are no objective moral values or meanings. Each person, thrown into an indifferent, often cruel world, must create individual values through making choices and living life. Indeed, it is added, no values can be binding unless chosen personally. On this view a person’s claim that abortion is wrong represents a moral judgment, but one that is motivated by (and only by) subjective, existential choices. Views like Sartre’s are subjectivist in the sense that people create their own values for themselves, and different people (even within the same culture) may choose quite different values.

On accounts like Sartre’s, disagreements about very important things (like the death penalty or forced clitoridectomy) boil down to simple differences in the values people have decided (often tacitly, and for no objective moral reasons) to adopt. But people who disagree about things like the morality of abortion rarely feel that their claims are merely expressions of their subjective commitments; indeed, most of them would see this as trivializing their view. Finally, views like Sartre’s fail to do justice to the social nature of morality.

Individual subjectivism: noncognitivist views about ethics. Noncognitivism is the view that moral claims do not (despite appearances) function to describe a moral realm and that they instead play a very different role. The most common versions of noncognitivism are species of expressionism, according to which moral claims serve to express a speaker’s attitudes, feelings, or emotions.

In the 1930s the British philosopher A. J. Ayer (1910–1989) defended one of the earliest and most influential versions of expressionism. In the late twentieth and early twenty-first centuries, thanks to philosophers such as Allan Gibbard and Simon Blackburn, noncognitivism has enjoyed a resurgence, though the current versions are far more nuanced than Ayer's.

Noncognitivism avoids problems that threaten objectivism. It also explains the link between moral judgments and moral motivations, since such judgments are seen to be based on attitudes and feelings, which often have a powerful motivational force. On this view the claim that abortion is wrong serves to express the speaker's disapproval of, or horror at, abortion.

Objective versions of noncognitivism are possible, but noncognitivism has a strong tendency toward subjectivism. Most versions of noncognitivist subjectivism treat moral claims as expressions of a person's (subjective) attitudes or emotions and recognize that people (even within the same culture) may differ about these. Like most forms of individual subjectivism, this view is vulnerable to the difficulties, noted above, that threaten views such as Sartre's.

Group subjectivism. There are several different types of group subjectivism.

Different human groups. Human beings are social animals who acquire most of their values and attitudes in the process of socialization; these acquisitions become part of a shared social heritage. Hence, it is often argued, there can be widespread agreement about right and wrong and what makes for a meaningful life within a group (such as a culture). But groups with different cultures, languages, or religions may share values that are quite alien to other groups.

This view allows a good deal of agreement and intersubjectivity within a culture, and morality does not boil down to simply what any particular individual thinks or feels or decides. Furthermore, it enables us to explain how moral arguments within a culture are possible; the partisans share enough values and beliefs that disagreement here and there is possible, and issues can often be evaluated within a shared framework of values and standards for moral justification. On this view the claim that abortion is wrong amounts to the claim that all or most members of the culture believe that it is or, more plausibly, that they subscribe to more general principles that entail this.

This view is subjectivist in the sense that moral facts and values are not based on any objective moral realm, but instead derive from (shared) attitudes and outlooks that may vary from group to group. Although ethical debate within a relevant group (such as a culture) is possible, there are no non-question begging methods to adjudicate disagreements between different cultures or the like. Moreover, it is extremely difficult to view some moral differences (as about the Holocaust) as mere differences in group opinions.

Species subjectivism. Species subjectivism is the view that ethical matters rest on subjective aspects (like emotions) of human beings. Humans are similar enough, however, that specieswide values are possible. David Hume's (1711–1776)

mid-eighteenth-century account of morality is the prototype for such views.

On Hume's view, morality is a matter of feeling rather than reason and is based on human sentiments that are ultimately grounded in human sympathy. Because Hume believed human nature to be constant, he concluded that many of the basic aspects of morality would be similar for all human beings. Still, in a letter to Francis Hutcheson Hume regretted the limitations of his view, stating that it "regards only human nature and human life." Recent "sensibility theories" are more sophisticated than Hume's but are recognizably inspired by it.

Species subjectivism underwrites a specieswide intersubjectivity that allows genuine moral argument and debate among humans. Hume went on to argue that we often "project" our feelings and attitudes onto the world, so they seem (wrongly) to characterize something objective ("out there"). This enabled Hume to explain the appearance that moral discourse and argument involve literal description.

Different versions of species subjectivism would offer different accounts of the claim that abortion is wrong, but all rest on views about human nature and human sensibility. Views like Hume's are subjective in the sense that, although all human beings have roughly the same moral sentiments, this is a completely contingent fact about us.

Many philosophers have argued that morality is based on things like reason that run deeper than emotions like human sympathy. In fact, as Hume himself lamented, his account may make morality seem uncomfortably contingent, resting on subjective (such as emotional) aspects of human life. Indeed, it is nowadays natural to view these aspects as the product of an evolutionary history shot through with randomness and chance.

Conclusion

In the late twentieth and early twenty-first centuries there has been a great deal of work on objectivism and subjectivism. As such views become more subtle and sophisticated, it becomes more difficult for an outsider to tell them apart. But they remain important, involving as they do very basic questions about the human condition and our place in the world.

SUFISM. Sufism is the English rendering of the Arabic word *tasawwuf*, which derives from *suf*, meaning “wool.” *Tasawwuf* in early Islamic history refers to the attitude of people who used to wear a white woolen garment as a sign of renunciation of worldly possessions. To be properly understood, the emergence of Sufism must be situated in the context of Islamic expansion. During the first and second centuries of Islamic expansion, Muslims conquered vast tracts of land that were part of the Byzantine or Persian Empires. They acquired huge amounts of wealth. Many of them became obsessed with mundane things. At that moment, a few believers, haunted by the Prophet's model of perfection and remembering the description of the hereafter in the Koran and the punishment reserved to those who went astray, did not only content themselves to follow the commandments of God and abandon his prohibitions. They devoted much of their time to praying, fasting, and nightly vigils. These are the first people who practiced what has come to be known as *tasawwuf* or Sufism. Sufism became one of two dominant paradigms in Islamic theology as to how Muslims might interpret the teachings of the prophet Muhammad.

The other paradigm is based on the premise that the prophet Muhammad was sent to deliver the Koranic message to the whole of humanity. In addition to the Koran, the deeds and sayings of the prophet Muhammad (known as the *sunna*) would provide guidance to Muslims who lived during his lifetime as well as to subsequent generations of Muslims until the day of the Last Judgment. But, according to this paradigm, no communication with the Prophet was possible after his death. This understanding led to a perspective labeled legalistic, fundamentalist, or scriptural based on the dual premise of the immediate readability of religious texts, which govern their rights and duties, and of the conceptual equality of all Muslims. This perspective also developed an individual approach to salvation.

Conversely, the Sufi paradigm is based on the belief that, after the passing of the prophet Muhammad, communication with his soul remains possible. As Islam spread and Islamic

theology became more and more elaborated, Sufis developed very complex sets of doctrines and worldviews, some of which bore a similarity to other forms of mysticism. One of the most fundamental Sufi ideas is that the Koran, in addition to an apparent meaning (Ar., *zahir*) that is accessible to all, has a hidden meaning (Ar., *batin*). To have access to the latter, one must follow a path (Ar., *tariqa*; pl., *turuq*) that leads to spiritual fulfillment. This was the justification for the creation of Sufi orders, which quickly became and still remain a dominant form of spirituality in the entire Muslim world.

Another fundamental Sufi idea is that there exists a conceptual inequality among believers, some of whom are closer to God by virtue of enjoying a higher rank in His eyes in relation to others. The Arabic word *wali*, “friend of God,” which suggests the idea of proximity and friendship, renders the notion of proximity to God. It occurs several times in the Koran either in the singular (*wali*) or in the plural (*awliya*) but is interpreted differently within each of the two above-mentioned paradigms. For legalist Muslims, every pious believer is close to God, whereas in the Sufi tradition, the status of *wali* is accorded exclusively by divine grace to certain individuals. Sufis believe that the *awliya* have extraordinary powers, because they are close to God. For example, they have the power to secure happiness in this world and in the next for their disciples and their descendants by blessing them. They have retaliatory powers over their enemies, whom they can curse and punish. They have the mystical power to heal the ill, and so on. These desires for happiness and healing constitute the basis of the veneration of Sufi *awliya* in the Muslim world. Sufis have successfully established themselves as mediators between God and believers throughout the Muslim world.

The commitment to Sufi Islam is marked by a formal introduction in the course of which a disciple is initiated by a master. The master was himself initiated by another master through a chain of initiation (Ar., *silsila*) going back to the founder of a Sufi order, who usually claims to have started his order subsequent to prophetic revelation. Once initiated, the disciple is expected to obey the master. Moreover, on his or her way to spiritual fulfillment, the disciple is believed to be in the hands of the master as a cadaver is in the hands of a mortician. In other words, there is an assumed relationship of utter dependence of the disciple on the master.

Islam in Africa was greatly influenced by Sufi ideas and understanding of salvation. The majority of African Muslims practice Sufi Islam. Historically, the two orders of the Tijaniyya and Qadiriyya spread in the whole Islamized part of the African continent during the nineteenth and twentieth centuries. These orders provided a paradigm of salvation based on the belief that certain persons have supernatural powers. But there are also orders that were founded locally, such as the Muridiyya established by the Senegalese Shaykh Ahmadu Bamba (1853 or 1854–1927).

The book *Rimah hizb al-rahim 'ala nubur hizb al-rajim* (1863), written by 'Umar B. Sa'id Tall (1797–1864), is one of the most elaborate expositions of the doctrine of the Tijaniyya Sufi order. It is a good illustration of the special privileges that God bestows on followers of Sufi orders. According

to the *Rimah*, all disciples of the Tijaniyya will be spared from the agonies of death, they will not be persecuted in their graves by angels, and they will be safe from all tortures in the grave from the day of their death until the day they enter Paradise. God will forgive all their sins and they will not have to account at the Day of Judgment. They will be among the first group of believers to enter Paradise together with the prophet Muhammad and his Companions. They will die as *awliya* (friends of God) because of their love for the founder of the Tijaniyya, Shaykh Ahmad al-Tijani (1737–1815). Finally, because, they are members of the Tijaniyya, not only will they go to Paradise, but members of their family will also go to Paradise.

More than just religious fraternities, Sufi orders have often been vital economic, political, and social organizations that perform many social functions. They are organized around *zawiya* (lodges), which are centers of religious learning, initiation places for disciples in search of spiritual realization, shelters for fugitives, and locations of saintly shrines where disciples go to seek healing and blessing.

In Africa, there were times when some Sufi sanctuaries were virtual states within states, for example the Senusiyya in Cyrenaica (modern Libya) and the Tijaniyya in Algeria, and the Mourides in Senegal. Since the tenth century, Sufi orders have constantly risen, declined, regenerated, and split. Sufi orders exist in all Muslim countries.

Sufism provides ingredients through which many Muslims—educated and uneducated, “modern” and “traditional,” men, women, and children—understand their universe.

SUPPLY AND DEMAND. See *Capitalism*.

SUICIDE. The word *suicide* is a seventeenth-century English invention put together from Latin elements and meaning literally “self-slaughter,” and from English the word spread to other European languages. An isolated scholar around 1130 had in fact coined a Latin word *suicida*, but it had not gained currency, and that fact highlights the question why so ancient an act should have had to wait so long for a name.

Taboo

One reason was taboo. People did not want to talk about suicide and, when they had to, used composite expressions like the medieval lawyers’ “homicide (or felony) of oneself,” or others, tinged with euphemism, like “to hasten death,” “to die by one’s own hand” (to quote from over a dozen expressions in classical Latin). A second reason, linked with the first, was an enduring difficulty in understanding the character of suicide. This is best seen in the history of a much older word, the Greek *biaiothanatos*. It literally meant “violent death” and included suicide along with deaths we would classify as accidents, like falling from a bridge, all of which were thought polluting, and had consequences for burial and for the dead person’s status as a ghost. Although the Latinized successor-word, *biothanatos*, came increasingly to be confined to suicide, it still carried the old ambiguity as late as the twelfth century. The slowness of that discovery is confirmed by early legal texts, where rabbis, Christian canon lawyers, and commentators on the Koran all, in their turn, insist that it is intention that distinguishes suicide—as if people did not know.

So the mere linguistic history of suicide already reveals a lot about how it was conceived. It suggests, further, that the taboo extended beyond the topic to the act of suicide, however vaguely distinguished. Religion absorbed the taboo, and in time gave it force and rationale. Already in Greek antiquity we find indignities attached to the burial of suicides, so understood. Similarly, as ideas of hell became better defined, we find suicides assigned to it, first (this time) in India.

Rationale

As for rationale, it drew on two kinds of source, divine and social. Around the sixth century B.C.E., Pythagoreans taught that we mortals are on sentry duty and bound to stay at our watch until relieved, an image that clearly implied man’s obligation to superior powers, sovereign beyond death. The image would be absorbed by Plato and his innumerable readers, who in the later Roman Empire included Neoplatonists and Christians, both of whom used it, with other borrowings, to fortify their faintly equivocal traditions. For the Christian tradition had until then itself been uncertain. In the Bible, keen eyesight is needed to find suicide expressly forbidden (as perhaps in Gen. 9:5 or Exod. 20:13). And although most suicides in the Bible—Judas the most notorious—are manifest villains, a “suicide guerilla” had slipped in among biblical heroes around the tenth century B.C.E., in the person of Samson (Judg. 16:18–30), and was joined around 70 B.C.E. by another hero, Razias, who had killed himself after military defeat, in the Roman manner (2 Macc. 14:43–46). The early church furthermore revered as saints certain women who had killed themselves to avoid rape. In the fourth century C.E., Christ-

ian opinion formers set about closing these loopholes, notably Pachomius (in respect of burial ritual) and Augustine (in argument). A few centuries later, Muslim commentators would do the same for the Koran, whose deficiencies in this particular were amply supplied by the Hadith (tradition).

A second main source for an antisuicide rationale was social. Aristotle had explained the Athenians' mutilation of suicides' corpses on the ground that a suicide had injured his polis (an argument to be seized on gratefully by Christian theologians in the later Middle Ages, when Aristotle became available in Latin). The Jews, for their part, told sympathetically (in *Tobit*, c. 200 B.C.E.) of a woman restrained from suicide by the thought that it would hurt her father. Even suicide-prone Roman Stoics could be restrained by consideration for their friends. Illiterates meanwhile expressed their social feelings on the subject by ideas about pollution of the community cemetery and bad weather. Finally, social considerations could express themselves on the vertical plane, from master to dependent. A Roman slave who killed himself robbed his owner, who might make him an example by maltreating the corpse. In early medieval Europe—when nearly everyone was someone else's dependent—lords would punish an underling's suicide by confiscating the property. That prerogative gradually passed to monarchs. That suicide was in England classed as a felony until 1961 probably owed its origin to the defiance it had represented, in the early Middle Ages, to the king qua lord.

Justifications of Suicide

Condemnation of suicide, though widespread, has been far from universal. In all kinds of society, including preliterate kinds in Africa and America, communities with a suicide taboo can sometimes be found alongside others without. At least in more advanced cultures, two kinds of milieu have bred acceptance of suicide. One is military. In 1897 Émile Durkheim's classic, *Suicide*, recorded abnormally high rates among military officers. Durkheim ascribed this to the military ethos, on grounds that soldiers are familiar with weapons and death and set a high premium on honor. The same factors have operated throughout history. Greek and Roman warrior-heroes like Ajax or Brutus—not to mention their opposite numbers among Germanic opponents of Rome—were remembered honorably as falling on their swords after defeat. Off the battlefield, in a political climate similarly based on honor, members of the same class might kill themselves to vindicate their honor, as Lucretia and Cato did, winning posthumous glory as martyrs, respectively to chastity and republicanism. In the most intensely militarized cultures, suicide can become an institution, as with the hara-kiri ("belly-cutting") ritualized by samurai in twelfth-century Japan, and the kamikaze of their twentieth-century successors, who piloted torpedoes and bombs. A more complex case is that of warriors fighting for Semitic monotheisms, which frown on suicide. That Jewish warrior-suicide Razias would set a dilemma for Christian commentators, while Muhammad's condemnation of suicide came to sit uneasily with the martial ethos of early Islam, which could at its most extreme produce an offshoot like the Shurat ("sellers of their lives for God"), who plunged into battle against patently overwhelming odds.

The second tolerant milieu has been philosophy. The classical Greek kind of philosophy, still thriving, tends to resist taboos unjustified by reason; and reason alone cannot easily justify the taboo on suicide, as Hamlet found. It may indeed resent it, since, lacking unquestionable evidence of sensation beyond death, reason suggests that an unhappy life with no prospects is best ended. This train of thought was formally inaugurated by the Cynic Diogenes in the fourth century B.C.E. and survived under the capacious blanket of Roman Stoicism, whose philosophers argued that, just as we may quit a banquet if it becomes tedious, so, under the same condition, we may—indeed must, to be rational—quit the banquet of life; what we do is in any case up to us and no cause for disgrace or punishment. Among lasting effects of this view was the systematic erasure from classical Roman law of any stigma on suicide as such. Around the fourth century C.E. came a change of mood, of which Augustine's arguments were less a cause than a symptom. The philosophical current only began reemerging in the Renaissance, and more fully in the eighteenth-century Enlightenment, when it targeted, in particular, ancient rituals that aimed to disgrace a suicide's memory, usually to the prejudice of his family. After a series of skirmishes—including a pan-European scandal at the romanticization of suicide in Goethe's novel *Die Leiden des jungen Werthers* (1774; The sufferings of young Werther)—philosophical tolerance completed its conquest of European law during the twentieth century.

Quite a different philosophical tradition has meanwhile recommended suicide of a very strictly defined type. The same ancient Sanskrit texts that condemned suicide done through passion have allowed those ascetics who have overcome passion to sever its last roots by parting from their bodies, by the least passionate method available (say, by drowning in a sacred river or by starvation). Traces of this view have been present in Mediterranean history, and condemnation of suicide by the Semitic religions may owe some of its force to a defensive reaction, against the doctrine of what one early Koran commentator calls the “Indian fools.”

While suicides form a minute proportion of the population (0.03 percent per annum is a fairly high figure), a study of their circumstances, as Durkheim and his successors have demonstrated, throws otherwise inaccessible light on the lives of everyone else. In the same way, while suicide commands only a small proportion of moral and legal theory, it raises inexhaustible questions, both of the casuistical kind about suicide as such and also, through those, about life itself.

SUPERSTITION. Superstition has had different meanings in different cultures and epochs. One thing binding these meanings together is that they are usually negative—superstition is a concept defined principally by its self-declared opponents. A second is that superstition is defined as the opposite of something praiseworthy—usually true religion or true science.

The ancient Greeks referred to superstition as *deisidaimonia*—fear of the spirits or daimons. This term was originally used positively, in the sense of “God-fearing.” The first known negative use occurred around the fourth century B.C.E. in Theophrastus’s *Characters*. His character of the superstitious man shows a person so obsessed with carrying out rituals to ward off the gods’ anger that he could not lead a normal life. After Theophrastus, negative uses of *deisidaimonia* became much more common, although positive uses never entirely

ceased. Plutarch (c. 46–after 119 C.E.), in his essay on superstition in the *Moralia*, used the Aristotelian doctrine of virtue as a means to distinguish between atheism and *deisidaimonia*, opposite vices in the field of religion. He argued that atheism was in every way superior to superstition, as it was a lesser insult to the gods to assert that they did not exist than to assert that they were cruel. The atheist was insensitive, but the superstitious person lived in constant terror. Plutarch included a wider range of religious behavior in the category of superstition than had Theophrastus, including human sacrifice, Jewish observance of the Sabbath, fear of punishment in the afterlife, and belief in the literal truth of Greek myth. Unlike Theophrastus and many other ancient writers, Plutarch emphasized the grim rather than the comic aspects of superstition. The consequences of superstition could be disastrous not only for the superstitious person but for everyone—Plutarch’s life of the Athenian general Nicias ascribes the Athenian disaster at Syracuse in large part to Nicias’s timorous fear of a lunar eclipse.

The word *superstition* itself originates with the ancient Romans, who used the term *superstitio* mainly as a pejorative for those religions and religious practices they found barbarous, including Judaism and Christianity. Superstition was the opposite of religion, the decorous and pious worship of the gods. The antiquary Varro distinguished between the superstitious man, who feared the gods as his enemies, and the religious man, who was devoted to them as his parents.

Christians countered accusations of superstition by accusing their pagan opponents of both superstition and *deisidaimonia*. Christian polemicists particularly emphasized the superstitious nature of pagan “idolatry.” Saint Augustine (354–430), in a particularly influential passage of *On Christian Doctrine*, explicitly linked idolatry with divination as superstitious practices, essentially reducing all of pagan religion to superstition. The conversion of the Roman Empire to Christianity in the fourth century and the growing Christianization of Roman institutions led by the fifth century to Roman laws referring to all non-Christian religions as “superstition.” Christian authorities for a long time ascribed the superstitious practices of Christians themselves to lingering paganism.

Superstition and the Medieval and Early Modern Catholic Church

Thomas Aquinas (1225–1274) provided a meticulous and influential definition of superstition in the *Summa Theologica*. Aquinas followed Plutarch in claiming that superstition was a vice of excess of religion, as impiety was a vice of deficiency of religion. Varieties of superstition included erroneous worship of the true God (Aquinas gives the example of someone in the Christian era who worships according to the old Law, i.e., a Jew) or unsanctioned by the church. Another variety of superstition was idolatry, worship directed to inappropriate objects—that is, anything other than God. Divination and other magical practices, which Aquinas claimed involved an implicit or explicit agreement with demons, were also superstitious in violating the religious precept that man should learn from and trust in God. Even practices outwardly pious, such as wearing the relic of a saint, were superstitious if they relied

on practices having nothing to do with piety, such as the particular shape of the reliquary.

The Catholic campaign against superstition in the Middle Ages and early modern periods were not merely theoretical. Church reformers preached and campaigned against what they identified as superstitious religious practices, the wearing of charms and talismans and other non-Church sanctioned activities. Catholic authorities defined superstitious practices as those that did not rely either on nature or on divine power for their effectiveness. Superstition was not only a threat to the laity. Parish priests were often seen as tolerating superstition or even practicing it themselves, and many of the leading campaigners against it were friars operating outside the diocesan hierarchy of the church.

Early modern Spain produced a particularly rich literature on superstition from the pens of Catholic priests, ranging from the vernacular works of the sixteenth-century friars Pedro Ciruelo (1470–1548) and Martin de Castanega to the Scholastic Latin writings of the eminent Jesuit theology professor Francisco Suarez (1548–1617). Ciruelo's influential *Treatise Reproving All Superstitions*, aimed at ordinary Spaniards whose souls were threatened by superstition, identified it almost completely with magic. All superstition, Ciruelo claimed, was based either on the desire for illicit knowledge or material gain. Superstitions aimed at gaining knowledge were necromancy and divination; those aimed at gain were enchantment and witchcraft. Like much of the early modern Catholic literature, Ciruelo's work focused on questions of causation, claiming that events could be caused either by direct divine intervention, as in the case of miracles, the actions of good or evil angels, or natural causes. Ascribing outcomes to other causes was superstitious. The general tendency of the Spanish literature on superstition from the sixteenth to the eighteenth century was to circumscribe the area of direct divine action and ascribe more and more events to natural causes.

Superstition and Its Foes in the Islamic World

Campaigns against “superstitious” practices emerged independently in the Islamic world. Muslims who venerated shrines of deceased holy men or celebrated “mawlid”—the birthday of Muhammad—were condemned for practices that were non-Koranic and directed worship to persons other than God, the crime of “shirk” or idolatry. Among the most important medieval Muslim intellectuals to campaign against superstitious practices was the brilliant and uncompromising Syrian jurist of the Hanbali school of Sunni legal interpretation, Taqi al-Din Ibn Taymiyya (1263–1328), and his disciple Ibn Qayyim al-Jawziyya (1292–1350). Ibn Taymiyya and Ibn Jawziyya saw the first three centuries of Islam as free from superstitious practices but the Muslims of their own time as corrupted by them, linking prayer at graves with the practices of pre-Islamic Arab polytheists and contemporary Christians. Despite Ibn Taymiyya's influence, however, his opposition to shrine visits and other “superstitions” did not become the mainstream position in the Sunni ulama.

The Wahhabi movement of Islamic reform, which emerged in eighteenth-century Arabia, recognized Ibn Taymiyya as a

Sixteenth-century woodcut of witches by Hans Baldung Grien (1484–1545). During the medieval period, the Catholic Church labeled several different practices as superstitious, among them idolatry, incorrect worship of God, and magical practices such as witchcraft. PHOTO CREDIT: RÉUNION DES MUSÉES NATIONAUX / ART RESOURCE, NY

precursor and carried on a vigorous struggle against the “superstitious” veneration of tombs and shrines, destroying many of them. Similar Islamic reform movements, such as the Indian movement founded by Sayyid Ahmad Barelwi (1786–1831), would also denounce superstition. Indian Islamic reformers often linked “idolatry” to the influence of Hinduism.

Superstition in the Protestant and Catholic Reformations

The concept of superstition as a religious error was very influential during the Reformation, when Protestants defined many aspects of traditional Catholic worship, including pilgrimages, prayers for the dead, the cult of the saints, and the veneration of the consecrated host, as superstitious. Francis Bacon (1561–1626) in his essay on superstition quoted Plutarch and followed him in believing atheism preferable to superstition, a position he particularly emphasized by placing the essay on superstition immediately after the one on atheism. Bacon listed as superstitions “pleasing and sensual rites

THE *SPECTATOR* ON SUPERSTITION AND ENTHUSIASM

In an issue of the *Spectator* dated 20 October 1711, Joseph Addison distinguished between superstition and enthusiasm, linking superstition with Catholicism, enthusiasm with Protestant Dissent, and “masculine piety” with the group he himself was a member of, the Church of England.

An Enthusiast in Religion is like an obstinate Clown, a Superstitious Man like an insipid Courtier. Enthusiasm has something in it of Madness, Superstition of Folly. Most of the Sects that fall short of the Church of *England* have in them strong Tinctures of Enthusiasm, as the *Roman* Catholick Religion is one huge overgrown Body of childish and idle Superstitions.

The *Roman* Catholick Church seems indeed irrecoverably lost in this Particular. If an absurd Dress or Behaviour be introduced in the World, it will soon be found out and discarded: On the contrary, a Habit or Ceremony, tho’ never so ridiculous, which has taken Sanctuary in the Church, sticks in it for ever. A *Gothic* Bishop perhaps, thought it proper to repeat such a Form in such particular Shoes or Slippers. Another fancied it would be very decent if such a Part of publick Devotions were performed with a Mitre on his Head,

and a Crosier in his Hand. To this a Brother *Vandal*, as wise as the others, adds an antick Dress, which he conceived would allude very aptly to such and such Mysteries, till by Degrees the whole Office has Degenerated Into an empty Show.

Their Successors see the Vanity and Inconvenience of these Ceremonies; but instead of reforming, perhaps add others, which they think more significant, and which take Possession in the same manner, and are never to be driven out after they have been once admitted. I have seen the Pope officiate at St. *Peter’s* where, for two Hours together, he was busied in putting on or off his different Accoutrements, according to the different Parts he was to act in them.

Nothing is so glorious in the Eyes of Mankind, and ornamental to Human Nature, setting aside the infinite Advantages which arise from it, as a strong, steady masculine Piety; but Enthusiasm and Superstition are the Weaknesses of human Reason, that expose us to the Scorn and Derision of Infidels, and sink us even below the Beasts that perish.

SOURCE: Donald F. Bond, ed., *Spectator*, 2:289–290.

and ceremonies; excess of outward and pharisaical holiness; [and] overgreat reverence of traditions,” recapitulating common Protestant anti-Catholic rhetoric. The charge of superstition was also a polemical weapon in intra-Protestant battles. Bacon also hinted that there was a “superstition in avoiding superstition, when men think to do best, if they go furthest from the superstition, formerly received” a veiled thrust at the extreme Protestants of his day (Bacon, p. 40).

Catholic accusations of superstition against Protestants were less common, as the principal charge they made was heresy. Heresy differed from superstition in that it resulted from willful error rather than ignorance. In common usage, superstition also differed from heresy in that it was focused more on practices than beliefs. The early modern period also saw more secular analyses of superstition in Sir Thomas Browne’s (1605–1682) *Pseudodoxia Epidemica* (1646) and the works of other

collectors and denouncers of “vulgar errors” who preceded and followed him. These writers included superstitions among other false beliefs. Although in many places endorsing the theory that superstitions had been handed down from ancient pagans, Browne and his successors had more interest in cataloging and analyzing individual superstitions than did the theologians and religious polemicists. Their work contributed to the later development of the anthropological study of superstition.

Superstition in the Enlightenment and Romantic Periods

Enlightenment thinkers like David Hume (1711–1776) and Joseph Addison (1672–1719) adapted the “virtue of the mean” model of superstition by defining the opposite extreme not as atheism or irreligion but as enthusiasm or fanaticism. Hume considered the different social consequences of the two

extremes. Hume claimed that superstition originated in the fear of the unknown and that people undertook superstitious activities to propitiate unknown forces and thus protect themselves. Superstition sprang from excessive fear, enthusiasm from excessive confidence. However, Hume claimed that superstition was far more dangerous to society than enthusiasm. Superstitious people, afraid to approach the divine directly, handed over authority to priests, whereas enthusiasts refused to admit any intermediary between themselves and God. Superstition encouraged timorousness, and enthusiasm encouraged fearlessness—therefore despotic government and political passivity naturally accompanied superstition. Socially, eighteenth-century thinkers identified superstition with marginalized groups—peoples outside Europe, the European masses, and women, particularly old women.

Some radical Enlightenment philosophers broadened the concept of superstition until it described all organized religions. The entry on superstition in Voltaire's *Philosophical Dictionary* recounted how various Christian and non-Christian sects have accused each other of "superstition." By pointing out that there is no religion that has not been denounced by another as superstition, Voltaire discredited organized religion generally. Both Voltaire and Hume hinted that the inevitable superstition of the masses might not be altogether a bad thing, if it kept them quiescent.

The Romantic era saw a more positive valuation of superstition, part of the reaction against Enlightenment rationalism and the growing interest in "folk" culture. The English poet John Clare (1793–1864) viewed superstition in his country as a remnant of the culture of the Anglo-Saxons and Normans and spoke of it almost rhapsodically. "Superstition lives longer than books; it is engrafted on the human mind till it becomes a part of its existence; and is carried from generation to generation on the stream of eternity, with the proudest of fames, untroubled with the insect encroachments of oblivion which books are infested with" (Clare, p. 301). The human sciences that emerged in the nineteenth century considered superstition and particular superstitions part of their subject matter, and anthropologists and folklorists collected and analyzed them while psychologists sought the root of superstition in the human mind.

Superstition in the Modern World

Superstition in the modern era is less likely to be contrasted with true religion and more likely to be viewed as the opposite of science, reason, or modernity. Campaigns to abolish superstition have continued but have not usually been motivated by interest in purifying religion. The early twentieth-century Chinese government in its efforts to modernize Chinese culture employed a new concept, *mixin*, usually translated as "superstition," to denote many aspects of popular religion previously called *xie*, "heterodoxy." This linguistic change accompanied a shift from the Neo-Confucian strategy of incorporating popular religion as a support for the established order to one of actively suppressing many aspects of it. The Chinese nationalist government's 1928 decree "Standards for Preserving and Abandoning Gods and Shrines," attacked superstition as opposed to science and progress. The decree distinguished between cults, which remained permissible, mostly those of deified humans

such as Confucius and the Buddha, and "superstitious" cults, which were outlawed, mostly those of nature deities such as the god of rain. It was followed by several other antisuperstition edicts attacking divination and other magical practices.

Even when lacking the coercive power of a state or church, rationalist and scientific polemicists continue to describe the beliefs of their opponents as superstitious. Psychologists have investigated the human propensity for superstitious beliefs, attempting to identify those populations most and least likely to adopt superstitions. The causes for superstition they have put forth include the human propensity to ascribe meaning to coincidence or to assert control over uncontrollable events. Much of this work has been placed in a context hostile to superstition, seeing the identification of superstition's causes as essential to fighting it and defending rational thought. The idea of "superstition" has even been broadened beyond human beings; B. F. Skinner (1904–1990), in his 1947 paper on "Superstition in the Pigeon," gave a behaviorist interpretation of superstition. Skinner claimed to have produced in pigeons a tendency to repeat behavior associated with food getting, even when there was no real causal connection between the behavior and the appearance of food. He suggested that superstitious beliefs in humans could originate in the same way.

Anthropologists and folklorists have continued their studies of superstition, producing a myriad of studies of superstitions in particular geographical areas, among particular subcultures such as actors or baseball players, and concerning particular subjects, such as cats or fertility.

SURREALISM. In view of its global impact, as Anna Balakian has persuasively argued, Surrealism constituted the major poetic and artistic current of the twentieth century. Of the dozens of movements that vied for this honor, Surrealism proved to be the most influential and the most persistent. Although abstraction enjoyed a huge success, it was limited almost entirely to art. Surrealism's most serious rival was probably Cubism, since it had an important impact on both literature and painting. Another leading contender was Expressionism, however one chooses to define it, which influenced a broad spectrum of aesthetic creations. Nevertheless, Surrealism was the only movement to span the greater part of the century and to enjoy widespread popularity.

In the Beginning

The term "surrealism" was coined by Guillaume Apollinaire in 1917 to describe Jean Cocteau's ballet *Parade* and his own play *The Mammaries of Tiresias*. After Apollinaire died the following year, André Breton appropriated the term in homage to the fallen poet. In contrast to Apollinaire's surrealism, which was basically analogical, Breton's Surrealism (with a capital S) was preoccupied with the Freudian unconscious. Breton, a former medical student who served as a psychiatric orderly during the war, sought to probe the secret recesses of the mind. In particular, since he was a practicing poet, he wondered what aesthetic discoveries they might hold.

Although Surrealist art and film were destined to achieve greater popular success, Surrealism was originally conceived as a literary movement. The Surrealists proposed exploring the unconscious via the written and/or spoken word. By systematically violating linguistic rules, they attempted to increase our ability to describe irrational experiences and illogical events. By pushing language to the edge of intelligibility—and beyond—the Surrealists created a powerful instrument for exploring the unconscious. Like the Dada movement, from which it originally sprang, Surrealism strove not only to revolutionize language but also to renew its primary function. Surrealist practitioners no longer regarded words as passive objects but rather as autonomous entities. "Words . . . have finished playing silly games," Breton proclaimed; "Words have discovered how to make love" (p. 286).

Surrealism's basic principles were not all promulgated at the same moment nor adopted by everyone with the same measure of enthusiasm. The first *Manifesto of Surrealism* (1924) focused on the role of psychic automatism:

SURREALISM, n. Pure psychic automatism by which we propose to express—either verbally or in writing or

in some other manner—the true functioning of thought. The dictation of thought, in the absence of all control exercised by reason, outside all aesthetic and moral preoccupations.

ENCYCL. Philos. Surrealism rests on a belief in the superior reality of certain forms of association neglected until now, in the omnipotence of dream, in the disinterested play of thought. Ultimately it tends to destroy all other psychic mechanisms and to take their place in resolving the principal problems of life.

Despite the excitement evident in these and similar proclamations, psychic automatism assumed a limited role in Surrealism. Most, if not all, of the Surrealists exercised a certain amount of conscious control over their works. Breton himself distinguished between Surrealist texts, which were entirely automatic, and Surrealist poems, in which unconscious desires were encompassed by a broader design.

Marvelous Encounters

The concept of the marvelous also played a crucial role in Surrealist works. Differing from one era to the next, the marvelous was defined basically as exacerbated beauty. Provoking an involuntary shudder in the reader or viewer, the marvelous mirrored the perpetual anxiety underlying human experience. In Surrealist works, it often assumes the form of eerie images and enigmatic adventures. The concept of objective chance played an equally important role. According to Surrealist theory, the most powerful imagery was that which caused the greatest surprise. In order to create marvelous images, Surrealist poets juxtaposed two terms that appeared to conflict with each other but were secretly related. The power of the resulting imagery was directly proportional to their apparent dissimilarity.

Surrealist artists performed a similar operation by juxtaposing incongruous or contradictory images on the canvas. Psychic automatism provided one means of achieving this goal. Artists and writers also resorted to chance operations like those governing an exercise called "the exquisite cadaver," in which several individuals contributed different words to create a nonsensical utterance. The name derived from their first attempt, which produced the following phrase: "The exquisite cadaver will drink the new wine."

Later Developments

With the publication of the *Second Manifesto* six years later, the Surrealist program acquired additional principles. These principles applied to every official member of the Surrealist movement. One of these, which Breton called "the supreme point" (or sometimes "the sublime point"), attempted to revive the medieval concept of *coincidentia oppositorum*. "According to all indications," he declared, "a certain point exists in the mind where life and death, the real and the imaginary, the past and the future, the communicable and the incommunicable, the high and the low cease to be perceived as contradictions." The Surrealists sought to eliminate traditional binary oppositions, including the distinction between beauty and ugliness, truth and falsehood, and good and evil, because

they appeared to be arbitrary. In their opinion, these and other cultural constructions merely restricted the imagination.

Since the Surrealists strove to revolutionize life as well as art, they also, almost without exception, became ardent Marxists. How could one liberate humanity, they reasoned, without correcting widespread social abuses? Psychological freedom clearly depended on the achievement of political and economic freedom. Although the French Communist Party refused to take Breton and his colleagues seriously, they continued to subscribe to Marxist goals.

A final principle to be enshrined in the Surrealist pantheon was delirious love. Officially adopted in 1937, when Breton published a book of the same name, it was already well established. Hence the *Second Manifesto* (1930) celebrated love as the “only [idea] capable of reconciling every individual, momentarily or not, with the idea of *life*” (Breton, p. 823). In keeping with Surrealism’s objectives, passionate commitment was portrayed as a liberating force.

As much as anything, Breton and his colleagues insisted, Surrealism sought to improve the quality of everyday life. Although the movement’s accomplishments were largely aesthetic, it strove to revolutionize our view of the world around us. Among other things, Surrealism offered potential solutions to a number of problematic situations. One of the problems it addressed was the relation between the individual and his or her unconscious. By inventing strategies to glimpse this hidden realm, it conferred a new significance on the ancient Greek motto “Know thyself.” In addition, Surrealism explored the relation between individuals and the natural world. While the concept of the supreme point stressed the unity of life, the principles of objective chance and the marvelous emphasized its extraordinary beauty. In addition, the Surrealists aimed to redefine the relation between the individual and society and between man and woman. Reflecting the movement’s eclectic origins, they succeeded in reconciling Freud with the alchemist Fulcanelli and Eros with Marx. Ultimately, they attempted to modify the process of seeing, thinking, and feeling in order to achieve total liberation.

The Movement’s Reception

Originating in France, Surrealism soon spread to every corner of the globe. Painters and poets all over the world were attracted to the Surrealist endeavor, especially those living in Spain and Latin America. At least two of the latter artists, Salvador Dalí and Joan Miró, were destined to play a major part in the movement. An analogous role was reserved for Luis Buñuel, who founded the Surrealist cinema. In addition, Surrealism attracted three poets who would eventually receive the Nobel prize for literature: Vicente Aleixandre, Pablo Neruda, and Octavio Paz. In retrospect, Surrealism cast a long, indelible shadow over most of the twentieth century. Artists and writers who were not affiliated with the movement also benefited—and continue to benefit—from the Surrealist enterprise. Surrealism led to the creation of a new language, a new vision, and a vast body of exciting, innovative works. It revolutionized not only the way we perceive ourselves and the world around us but the way in which we translate this perception into words and images.

SYMBIOSIS. *See Environment.*

SYMBOLISM. The symbolist movement began in France in the 1880s as a literary phenomenon. The term *symbolism*, however, quickly came to encompass a range of arts, from painting and sculpture to theater and music. While the movement is often said to have spanned the years 1885–1895, the ideas and aesthetic interests of symbolism are often traced back to the middle of the nineteenth century, and many early twentieth-century artists and writers continued to be influenced by its ideas. Symbolism was first and foremost a movement in French literature centered in Paris, and many of its central participants were French (Stéphane Mallarmé, Paul Verlaine, Arthur Rimbaud). Yet many artists and writers from elsewhere were also central to French symbolism: Maurice Maeterlinck, Émile Verhaeren, and Albrecht Rodenbach were Belgian, Jean Moréas was Greek, Téodor de Wyzewa was Polish, and Stuart Merrill was American. In addition, there were symbolist movements in Germany, Italy, Russia, and Belgium. Many scholars also see mid-nineteenth-century British aestheticism as a form of symbolism.

Each manifestation of symbolism had its own distinct characteristics. For example, most Belgian symbolists were more socially and politically engaged with working-class issues than their French counterparts, while Russian symbolism linked spiritual, social, and national concerns. Many artists and writers who never would have called themselves symbolists are considered under the rubric of symbolism because their work shares at least some of the same interests as that produced by self-proclaimed symbolist artists.

Proponents of symbolist aesthetics rejected the notion that the purpose of the arts is to represent the world as it appears to one's senses. They proposed instead to create works that would use suggestive (and often abstract) forms, images, or sounds to embody transcendent (and sometimes spiritual) ideas and would thus offer their readers, viewers, or listeners an experience of truth, beauty, or the idea beyond the material realm. Symbolism—be it in literature, music, or the visual arts—is thus characterized by a paradox: It relies on an emphasis on material form (decorative patterns in painting, repeated sounds, or arrangements of words on the page in the literary arts) as the vehicle for transcending the material or empirical world. This foregrounding of form links symbolism to the emergence of modernist abstraction in art and literature.

For a long time, scholars saw the symbolist refusal to depict the empirical world as a reaction against naturalistic artistic and literary movements such as realism and Impressionism. Later scholarship suggested that, rather than seeing symbolism mainly as a rejection of naturalist aesthetics, it should be acknowledged that symbolism was embedded in wider cultural and political anxieties of the late nineteenth century. The dominant philosophies of positivism and Darwinism threatened to substitute empirical facts for the traditional religious explanations of the great mysteries of the world. Human activity was increasingly explained in mechanistic psychophysiological terms and human beings appeared to be less and less in control of their thoughts and behaviors. The development of capitalist economies led to an increasing commodification of daily life and an increasingly materialistic culture. Rather than situating symbolism in the rarified world of the aesthetic, scholars came to see the symbolist alternative to materialism—evocative abstraction, suggestion, mysticism, and dreamlike imagery—as an attempt to oppose the effects of materialism and capitalism.

Symbolism in French Literature

The symbolist movement was formally launched in 1886, when the poet Jean Moréas (1856–1910) published a manifesto in the major Parisian newspaper *Le Figaro*. Moréas described symbolism as the

enemy of teaching, of declamation, of false sensitivity, of objective description, Symbolic poetry seeks to clothe the Idea in a perceptible form that nevertheless will not be the ultimate goal in itself, but, which, even as it serves to express the Idea, remains subject to it. The Idea, for its part, must not allow itself to be deprived of the sumptuous robes of external analogies; for the essential character of symbolic art is never to reach the Idea itself. Accordingly, in this art, the depictions of nature, the

actions of human beings, all the concrete phenomena would not manifest themselves; these are but appearances perceptible to the senses destined to represent their esoteric affinities with primordial ideas. (p. 60)

Moréas' version of symbolism rejects all attempts to represent the perceptible world directly or instruct the reader straightforwardly. Instead, Moréas advocates allusive language that will allow the idea to be intuited by readers through a series of analogies. Moréas makes clear that for symbolism the important subject matter lies beyond the perceptible world. In addition, in the manifesto, Moréas advocates new kinds of verse no longer bound by traditional rules of poetic composition.

Moréas' manifesto served many purposes. On one hand, it was a declaration of the direction modern poetry should take and thus part of a wider attempt on the part of young writers to find cultural legitimacy while declaring themselves outside the traditional French academy. This general trend toward establishing an independent literary milieu is perhaps most clearly evidenced in the plethora of literary magazines that emerged in the mid-1880s: *Le Symboliste*, *La vogue*, *Le scapin*, *La Décadence*, and *Le Décadent*. Some, such as *La vogue*, sought legitimacy as serious journals by publishing new work by young poets such as Gustave Kahn, Jean Moréas, René Ghil, and Édouard Dujardin alongside the work of already established symbolist heroes such as Mallarmé and Rimbaud. These small journals also published articles further formulating and often arguing the points of symbolist theory. Many journals founded in the 1880s and early 1890s were short-lived, some lasting less than a year. Some journals, however, such as *La revue indépendante*, *La plume*, and *Les entretiens politiques et littéraires* had more successful runs, and one, *Le mercure de France*, still exists, though its aims have been considerably broadened since the original publication.

While in some sense declaring his independence from tradition, Moréas also wanted to distinguish what he called "Symbolism" from the approach of other nontraditional writers and artists he designated as "Decadent." In 1883, Paul Bourget had expounded a "theory of decadence" when discussing Charles Baudelaire (1821–1867) in his *Essai de psychologie contemporaine* (Essay on contemporary psychology). Baudelaire's figure of the hypersensitive dandy aesthete became the model for the decadent artist, and Joris-Karl Huysmans's novel *À rebours* (1884; *Against nature*) became a veritable handbook: The main character, Des Esseintes, became a fictional cult hero and model for aspiring decadent artists and writers.

There is a great deal of overlap between decadence and symbolism. Both reject the value of empirical descriptions of the natural world and look to the artist's heightened sensitivity and imagination for the source of creativity. The aim of decadence, however, more often seems to be the rejection of bourgeois values and everyday morality in favor of detailed explorations of socially marginal and exotic subject matter: the occult, the femme fatale, sexual debauchery, extreme artifice, and aestheticism.

Conversely, symbolism, while sometimes overlapping in subject matter, is more seriously concerned with the search for a new approach to poetic, literary, or artistic form drawing on

the experimentations of an older generation of writers such as Baudelaire, Edgar Allan Poe, Mallarmé, Rimbaud, and Verlaine. Moréas' description of symbolism refers most directly to Baudelaire's poem "Correspondences" from his volume *Les fleurs du mal* (1857, expanded 1861; The flowers of evil)—a work that became a touchstone for symbolist artists and writers:

La nature est un temple où de vivants pilliers
 Laissent parfois sortir de confuses paroles;
 L'homme passe à travers des forêts de symboles
 Qui l'observent avec des regards familiers.
 Comme de longs échos qui de loin se confondent
 Dans une ténébreuse et profonde unité,
 Vaste comme la nuit et comme la clarté,
 Les parfums, les couleurs et les sons se répondent.
 Nature is a temple whose living pillars
 Sometimes emit confusing messages
 Man passes through forests of symbols
 That observe him with familiar glances.
 Like extended echoes that blend in the distance
 In a shadowy and deep unity,
 Vast as the night and as the light,
 The perfumes, the colors and the sounds are answered.
 (translation author's)

Baudelaire's poem suggests that humans inhabit a world where the mundane can serve as a "forest of symbols" to which the poet is especially attuned. Everyday objects and experiences offer secret correspondences between sounds, scents, and colors in which the poet deciphers a higher meaning. The poem evokes two ideas that will be central to symbolism: first, the role of the artist or poet as a gifted seer capable of identifying connections that point beyond the perceptible world; and second, the importance of formal echoes in sensory data where scents, colors, and sounds "se répondent" (respond to one another) in synesthesia—the connection between different sensory realms.

Baudelaire had been strongly influenced by the work of the U.S. writer Edgar Allan Poe (1809–1849), whose prose writings he had translated in the 1850s. Mallarmé and others were especially influenced by Baudelaire's 1859 translation of Poe's essay "Philosophy of Composition." Whereas Mallarmé was influenced by Poe's allusive figures and economy of means, others looked to Poe's status as *poète maudit* (damned poet), whose subject matter delved into mystery, the occult, and madness. In his work, Arthur Rimbaud (1854–1891) followed this interpretation of Poe, taking on the mantle of damned poet for himself. For Rimbaud poetry was not a controlled process of self-expression in the tradition of romanticism but instead a vehicle for the unraveling and disorganization of self—"a long, boundless, and systematized disorganization of *all the senses*"—that allows the exploration of those elements of human subjectivity associated with madness. As Rimbaud famously put it: "I is an *other*. . . . I am the spectator at the flowering of my thought: I watch it, I listen to it: I draw a bow across a string: a symphony stirs in the depths, or surges onto the stage" (p. 102). Rimbaud published *Un saison en enfer* (A season in hell) in 1873 and abandoned writing before the age of twenty. Other volumes of his work, *Illuminations*

(1886) and *Poésies complètes* (1895), were published at the instigation of others long after they had initially been written.

Whereas Rimbaud's questioning of the boundaries of poetry and of the self ultimately led him to abandon poetry, Stéphane Mallarmé (1842–1898) repeatedly wrote poems about the impossibility of embodying the Idea in poetic form. This is most famously thematized in the poetic symbol of *l'azur*, a term evoking both the color blue and the sky and alluding to the impossible ideal that the poet seeks to grasp and express. In an 1891 response to Jules Huret's *Enquête sur l'évolution littéraire* (Survey of literary development), Mallarmé, attempting to describe his approach to poetry, expanded on Baudelaire's notion of correspondences and turned it into the *modus operandi* of creation. According to Mallarmé,

to name an object is to suppress three quarters of the pleasure of the poem which is meant to be deciphered little by little: suggestion, that is the dream. This is the perfect use of mystery which constitutes the symbol: to evoke an object little by little in order to show a state of the soul or, conversely, to choose an object and glean from it an emotional state by a series of decipherments. (1891 response to Jules Huret, *Enquête sur evolution littéraire*)

As this passage suggests, the purpose of a poem is not to put forth a clearly decipherable message about the exterior world or the intentions of the writer, but to set in motion a process of reading. The word on the page always points beyond itself or its obvious referents to an unknown that cannot be fixed. Mallarmé's works place the emphasis on language's material unfolding through the poem, and the reader's unending act of decipherment is not a sign of the poem's failure but of its success.

Symbolism and Music

Many symbolists share the notion that all art should aspire to the condition of music, which was thought to be the most emotionally direct aesthetic medium. In "Art poétique" (1884), Paul Verlaine (1844–1896) famously instructed poets on the importance of "music before all else." This musicality was achieved in much symbolist poetry through rhyming, alliteration, assonance, and other rhetorical flourishes.

Mallarmé's famous late poem *Un coup de dés* (1897; A die-throw) takes the relationship between poetry and music even further than Verlaine. In this poem, Mallarmé radically experimented with type size and placement, leaving many blank areas, which themselves seem to carry meaning. The poem has been compared to a musical score with blanks that prescribe rests and with phrases that evanesce in much the same way as the music of Mallarmé's contemporary, the composer Claude Debussy. Indeed, Mallarmé's conception of his poems as a kind of music is brought out in an anecdote. When Debussy asked permission to set Mallarmé's "Afternoon of a Faun" (1876) to music, Mallarmé responded: "But I thought I had already done that!" (Sieburth, in Hollier, p. 796).

No composer is more closely aligned with symbolism than Claude Debussy (1862–1918). Debussy is famous for setting

many symbolist writings to music, including several poems by Baudelaire and Mallarmé. Most famously, he wrote “Prelude to the Afternoon of the Faun,” meant to complement and extend Mallarmé’s poem. Perhaps more important, Debussy approached musical composition with aims parallel to those of many symbolists. As Debussy wrote in an article of *La revue blanche* in 1902, music should not be “confined to producing Nature more or less exactly, but rather to producing the mysterious correspondences which link Nature with Imagination” (quoted in Lloyd, p. 266).

Like the symbolists, Debussy experimented radically with the conventions of rhythm, abandoning artificial demarcations within musical time in a move analogous to the symbolists’ rejection of the classic meters of poetry. Debussy compared his desire to minimize symbol and ornament in music to Mallarmé’s carefully wrought economy of language. Debussy also rejected any notion that music should tell an easily decipherable narrative: “There are those who want music to tell base anecdotes! As if the newspapers didn’t perform this task wonderfully well already” (quoted in Lloyd, p. 263). Both Debussy and Mallarmé imagined that their work, because of its rejection of anecdotal references and formulas, required active participation by its audience and asked them to transcend the mundanity of everyday experience. Debussy emphasized not only sound but silence as an element of meaning in his music, and this has been described as analogous to Mallarmé’s emphasis on the pauses and blank areas of the page in his late poem “Dice Thrown.” Finally, both Debussy and Mallarmé composed works that circle around the theme of desire.

Many poets associated with symbolism were extremely interested in the German composer Richard Wagner (1813–1883). The French interest in Wagner went back to the 1860s, when Baudelaire had admired and written about him and Auguste de Villiers de l’Isle-Adam, Judith Gautier, and Catulle Mendès had all visited him. Wagner imagined his music-dramas as *Gesamtkunstwerke* (total works of art) in which all the arts would be combined in a single work to transcend the possibilities of individual media. While some critics emphasized the naturalist tendencies of Wagner’s music, French interpreters of Wagner imagined the orchestrator of the total work of art as a secular priest and the work itself as a means to provide a transcendent experience. Baudelaire described his experience of Wagner’s music-drama *Lohengrin* (1848) as ecstatic, instigating an involuntary dreamlike state. Furthermore, in a transformation of Wagner that would be seized on by the symbolists, Baudelaire relates this experience to the synesthetic ideal he had described in “Correspondences,” saying that music by its very nature suggests synaesthetic analogies. In the aftermath of the Franco-Prussian War of 1870, the performance of Wagner’s operas had been banned in France. Many French literary figures, however, visited the festivals at Bayreuth, and by the mid-1880s there was a veritable cult of Wagner in France. From 1885 to 1888 one of Mallarmé’s disciples, Édouard Dujardin, published a symbolist journal, *La revue wagnérienne*, devoted to Wagnerism.

Les Vingt and Belgian Symbolism

In Belgium, the avant-garde group Les Vingt (The twenty) held exhibitions, musical events, and readings from 1884 to 1893.

Its founders, Edmond Picard and Octave Maus, aimed to promote avant-garde culture using the Wagnerian theory of the unification of the arts. The exhibition galleries of Les Vingt displayed works by avant-garde artists from Belgium and elsewhere. Performances of the work of contemporary composers (including Debussy) were held in the galleries. The elite of the literary world were invited to speak on literature, and readings of avant-garde poetry were regularly held. Belgium had long been fertile ground for the development of literature and the arts and the influence of France had always been strong. As a French-speaking nation close to France’s border, Belgium had hosted many exiled French artists and writers, including Baudelaire, and often works by French writers that could not be published in France were published in Belgium. Journals such as *La jeune Belgique*, *L’élan littéraire*, and *La Wallonie* contributed to the development of Belgian symbolism and also had a great influence in France. Many on the staff of *La Wallonie*, for example, were important players in the French symbolist movement. The Belgian symbolist writers Verhaeren, Maeterlinck, and Rodenbach participated in the literary events of Les Vingt. They were influential in the literary worlds of both Belgium and France. The journal *L’art moderne* championed Les Vingt and published many articles explaining its aesthetic platform, which was broadly antiacademic (and thus embraced Impressionism and Neoimpressionism alongside symbolism). Like the organization itself, the journal was devoted to a range of media—painting, sculpture, engraving, and furniture and costume design were discussed alongside literature and music. Significantly, *L’art moderne* also promoted a socialist political agenda and rejected the bourgeois public, the press, and the official exhibiting space of the Salon as its enemies.

Russian Symbolism

The symbolist movement in Russia is known as the Russian Silver Age (1892–1917). Although it was a widespread cosmopolitan movement encompassing often contradictory elements, certain general outlines can be drawn. In the 1890s a young generation of Russian writers was strongly influenced by Arthur Schopenhauer (1788–1860), Friedrich Nietzsche (1844–1900), Poe, Baudelaire, Mallarmé, Rimbaud, and Verlaine. The writer Valeri Briusov was instrumental in introducing Western work to the Russian audience through his translations of Baudelaire and Poe as well as his editorship of the important symbolist journal *Vesy* (The scales), which was modeled on *Le mercure de France* and published the works of Russian writers alongside European symbolists, including Moréas, Verhaeren, and Rémy de Gourmont. In 1892 three collections of verse were published under the title *The Russian Symbolists*. Rejecting positivism and materialism as well as the classic approach to literature, these writers followed the example of their Western counterparts. Writers such as Briusov, Konstantin Balmont, Fyodor Sologub, Zinaida Gippius, and Dmitry Merezhkovsky experimented with literary form and valued suggestion, intuition, and musicality in their work. The poet, mystic, and theologian Vladimir Solovyev described “life’s reverberating noise” as an “altered echo of transcendent harmonies.” Like their French and Belgian counterparts, Russian symbolists rejected the didactic depiction of the empirical world

and conceived of a truer reality hidden by phenomenal experience. They believed that intuition was more important than objective knowledge. This borrowing of ideas from further west was accompanied by an aesthetics of art for art's sake.

At the turn of the century Russian symbolism began to develop a much stronger character of its own, emphasizing a particularly Russian spiritual content. In 1901 Gippius and Merezhkovsky opened their Saint Petersburg Salon to contributors to Sergey Diaghilev's journal *World of Art* and in 1902 Merezhkovsky founded the Religious Philosophical Society. This led to a cross-fertilization of the literary, visual, and philosophical components of the movement in a forum focused on cosmic consciousness and the particular role of Russia as an intermediary between Eastern and Western spirituality, and on various forms of occult theorizing. The writers Vyacheslav Ivanov, Aleksandr Blok, and Andrey Bely were important participants in this later phase of the symbolist movement. Andrey Bely (1880–1934) described the new Russian poetry as apocalyptic and poets as prophets of the end of European civilization who foreshadow in their work a new, more highly evolved form of human consciousness. Solovyev described the poet as a possessor of secret knowledge. Aleksandr Blok (1880–1921) wrote poems drawn from mystic experiences and based on dreams. Bely is perhaps best known for his symbolist novels, the most famous of which is *Saint Petersburg* (1913). The novel, composed of experimental suggestive prose, combines descriptive narrative with mystical symbolism and can be read on many levels.

British Aestheticism

In Britain a movement known as aestheticism is often seen as part of the wider symbolist movement. From the mid-nineteenth century until the early twentieth century, the artists and writers associated with British aestheticism experimented with the idea that art is a realm separate from the everyday world and the artist's role is to cultivate and express beauty for its own sake. British aestheticists most often used very refined evocations of women from myth and legend as a means for exploring their own highly cultivated sensibilities. They rejected classic approaches to art and literature and disputed the notion that art should educate its audience about moral values. The retreat into the realm of highly refined art and the refusal to address contemporary issues are often regarded as an oblique attack on bourgeois morality and the growing commodity culture of nineteenth-century Britain.

The writers of the aesthetic movement drew on the work of British romantic poets such as William Blake (1757–1827). Some were also influenced by Baudelaire and the French symbolists. One of the precursors to the aesthetic movement was the Pre-Raphaelite Brotherhood, which was formed by a group of young painters and writers in the mid-nineteenth century. This movement rejected the classic aesthetic of the British academy and looked to other sources for its inspiration and subject matter. Many of their early works had Christian subjects. Often they tried to re-create the forms and methods of Gothic art and looked back to stories of knights and ladies. Pre-Raphaelite journals such as *The Germ* combined literary endeavors with explorations of the visual arts. Initially, the Pre-Raphaelite aesthetic involved taking a detailed approach and for this reason

it is often linked to realism. Nevertheless, many of the poems and paintings of artists such as James McNeill Whistler, Edward Burne-Jones, and Dante Gabriel Rossetti are rather vague and suggestive and these are commonly seen as part of the aesthetic movement. Writers associated with the aesthetic movement include John Ruskin, Alfred Lord Tennyson, Christina Rossetti, Charles Swinburne, Walter Pater, and Oscar Wilde. Many participants in British aestheticism embraced the notion of synesthesia and looked for correspondences between poetry, painting, and music. Dante Rossetti often based his paintings on his own poems, especially those evoking stories from the writings of Dante Alighieri (1265–1321), author of the *Divine Comedy*. Claude Debussy set Dante Rossetti's poem "The Blessed Damozel" (1850) to music in 1887–1888. Rossetti had completed his own painting of this poem in 1881, and the painting, which had the poem inscribed on the frame, is thought to have inspired Debussy's composition. James McNeill Whistler (1834–1903) was a close friend of Mallarmé and symbolist critics described him as a "painter-poet." Whistler embraced the connection between art and music by giving his works musical titles such as "symphony" or "nocturne," with subtitles designating colors or subject matter.

Symbolist Theater

Symbolist theater relied on the Wagnerian idea of the total work of art, while also emphasizing the importance of using suggestion to reach metaphysical concepts of "the enigma of life" (Villiers de l'Isle Adam). The symbolists aimed to eliminate all traces of naturalistic or imitative acting, and all romance and melodrama. In theory, the actor was to be a depersonalized symbol pointing to a meaning beyond what was visible on the stage. In France, the Théâtre d'Art and the Théâtre de l'Oeuvre put on plays by symbolist writers and held experimental poetry stagings. In addition to the plays of French writers, they produced adaptations of works by Edgar Allan Poe, which had recently been translated by Mallarmé, and of *Salomé*, the play Oscar Wilde had written in French during his exile from Britain. Plays by the Belgian symbolists Maeterlinck and Rodenbach were also produced. Often the plays featured stage sets created by Paul Sérusier and other artists from the symbolist group the Nabis. In "On the Absolute Lack of Utility of Exact Staging," the playwright and theorist Pierre Quillard wrote that "the set should be a pure ornamental fiction which completes the illusion through analogies of colors and lines with the play. . . . Theater will be what it should be: a pretext for dream" (quoted in Deak, p. 145). Significantly, the sets were meant not to echo the visible shapes or forms of the characters, but, in a kind of synesthesia, to analogize the essence of the play itself.

Plays by the Scandinavian writers Henrik Ibsen (1828–1906) and August Strindberg (1849–1912) also became important parts of the French symbolist repertoire. In a manifesto accompanying the opening of Aurélian-Marie Lugné-Poe's Théâtre de l'Oeuvre, the symbolist critic Camille Mauclair identified Ibsen with the symbolist struggle to express "libertarian ideas or taste for aestheticism" and "modern beauty." Ibsen's plays *Ghosts*, *The Wild Duck*, *Hedda Gabler*, *A Doll's House*, *The Lady from the Sea*, *Rosmersholm*, and *An Enemy of the*

the *People* were all staged in the early 1890s. Part of the reason Ibsen was appropriated as a symbolist had to do with the staging. The Danish actor, director, and novelist Hermann Bang described Lugné-Poe's staging of *Rosmersholm* as "without any firm contours. The actors wander restlessly over the stage, resembling shadows drifting continuously on the wall. They like to move with their arms spread out, . . . like the apostles in old paintings who look as if they've been surprised during worship" (quoted in Deak, p. 189). Bang's description of actors resembling apostles and shadows on a wall gives us a sense of how the staging of the play used vagueness and suggestiveness to reach higher spiritual meanings. As Frantisek Deak points out in his study of symbolist theater, however, Bang saw these initial attempts by Lugné-Poe as a misappropriation of Ibsen and attempted to persuade Lugné-Poe to emphasize psychological elements in his staging. Many Scandinavian critics, who believed Ibsen's play was realist, objected to the staging. Several of August Strindberg's psychological dramas (including *The Father* and *The Creditors*) were also staged at the Théâtre de l'Oeuvre, despite the fact that he too had previously been understood to be a naturalist.

Symbolism in the Visual Arts

In the 1880s and 1890s, many European artists experimented with work that had similarities to symbolist literature. When applied to the visual arts, symbolism designates less a recognizable style than a general approach to art that rejects direct representation of the material world in favor of allusion and suggestion. While artists such as Paul Gauguin and the Nabis or Ferdinand Knopff consciously pursued an aesthetic agenda analogous to the project of literary symbolism, others, such as Pierre Puvis de Chavannes and Gustave Moreau or Auguste Rodin were annexed to the symbolist movement by a younger generation of artists in much the same way that Ibsen and Strindberg had been.

The aim of searching for more authentic ideas than those offered by material reality was in some sense similar to the traditional goal of idealization long pursued by academic art. The technical means by which symbolists pursued the idea was often quite innovative, however. In 1886, the symbolist critic Gustave Kahn offered a description of symbolism that lent itself to translation into visual media. Rather than portraying "the quotidian, the near at hand," as realist and Impressionist artists had done, symbolists "wish to be able to place the development of the symbol in any period whatsoever, and even in outright dreams (the dream being indistinguishable from life)." With this reference to Schopenhauer's theorization of the world as representation, Kahn proposed that symbolist artists or writers look inward for their subject matter: "The essential aim of our art is to objectify the subjective (the externalization of the Idea) instead of subjectifying the objective (nature seen through a temperament)." (*L'Événement*, 28 September 1886). Kahn negated the naturalist writer Émile Zola's championing of the expression of individual temperaments and called for the externalization of the transcendent Idea.

Symbolism and modernism. The symbolist artists imagined that their privileged subjective states were best expressed through allusive, nonnaturalistic arrangements of line and

color. *The Talisman* (1888), a painting by Paul Sérusier (1865–1927), is often said to be the first attempt by French symbolist artists to practice this aesthetic. In a story recounted by Maurice Denis, Sérusier is said to have painted the work following Gauguin's instruction: "How do you see this tree, Gauguin asked in front of a corner of the Bois d'Amour: is it green? Then paint it green, the most beautiful green on your palette; and that shadow, rather blue? Don't be afraid to paint it as blue as possible" (p. 50). In this way, bold and simplified color patterns were extracted from the natural landscape. In 1891 Albert Aurier wrote "Symbolism in Painting: Paul Gauguin," in which he defined the characteristics of symbolist painting and suggested by Gauguin's work embodied them. Like Moréas he emphasized the primacy of "the Idea" and necessity of clothing it in a synthetic form that would work by allusion. He stressed that the work should be *subjective*, because an object would not be considered as an object, but as a sign of an idea perceived by the subject.

Denis's painting *April* (1892) demonstrates his own experimentation with this aesthetic. In 1890, Denis wrote in his manifesto "Definition of Neo-Traditionism": "Before it is a battle horse, a nude woman, or an anecdote, a painting is a flat surface, covered with colors arranged in a certain order" (p. 1). Thus Denis, like the symbolist poets, foregrounded the abstract qualities of his medium and like them explicitly defined symbolism as a kind of modernism. The title of his manifesto points to the paradoxical nature of his symbolist project. Denis wished to turn to tradition in order to found a new (neo) kind of art. He argued that artists should look to aesthetic examples such as the Italian primitives and Pierre Puvis de Chavannes (1824–1898). That artist, who was France's greatest painter of murals on national themes, interested the symbolists because his large, boldly patterned compositions in muted colors, such as *Poor Fisherman* (1881), seemed to suggest rather than define their subjects. His compositions were often described as dreamlike. The critic Téodor de Wyzewa, for example, explained the unanimous praise for the artist as being a result of "a thirst for dream, emotion and poetry."

The artist as prophet. The notion that the artist was a seer or prophet who, in the words of the symbolist critic Camille Mauclair, "painfully saved our sickened souls from the excremental muck of materialism" (quoted in Matthews, p. 15), was explicitly embraced by many artists in France who wished to be associated with symbolism. Paul Gauguin as well as the artists who formed the avant-garde group the Nabis (*Nabis* is the Hebrew word for *prophets*)—Maurice Denis, Paul Sérusier, Paul Ranson, Édouard Vuillard, and Émile Bernard—are good examples of this. Art, they believed, had the potential to offer the kind of salvation that had previously been the terrain of traditional religions. Some, such as Denis, were part of a wider, extremely conservative neo-Catholic movement.

Others were looking for less traditional forms of spiritual meaning beyond everyday existence. Artists such as Paul Gauguin, Paul Ranson, and Odilon Redon in France, the Blue Rose group led by Pavel Kuznetsov as well as Mikhail Vrubel' in Russia, and the Czech artist František Kupka embraced the occult mysticism that was in vogue during the late nineteenth

century. Some artists employed principles of “sacred geometry” according to which basic shapes or harmonic ratios shared by plants, animals, or other natural objects were thought to demonstrate a universal continuum of form understandable to all. Such ideas were derived from the theosophy of Madame Blavatsky and Édouard Schuré and from the study of earlier illustrated treatises on the occult, which aimed to find unifying principles in disparate religions. These theories of the occult also shared an interest in dualistic principles of male-female, heaven-earth, and a three-part godhead of matter-mind-spirit, which were often represented using geometric diagrams. This emphasis on abstract geometry thus links the spiritualist emphasis of some symbolists to the more widespread modernism of the movement.

One of the main international exhibition forums for mystical symbolist art was the Order of the Rose + Cross of the Temple and the Grail, whose Salons were held in Paris from 1892 to 1897. The order had been founded by the self-anointed “Sâr” Joséphin Péladan (1859–1918; *Sâr* was the title designating Assyrian royalty), a prolific art critic, the author of *Androgyne* and *Vice suprême*, and a high priest of the occult. He described the artist as the “supreme priest” who should represent “dreams instead of reality.” The flamboyant Péladan viewed himself and all his public activities as a work of art. He even coined the term *kaloprosopia* to describe this art of personality in which the externalization of an aesthetic idea in dress, gesture, and demeanor would ultimately lead to the internalization of this aesthetic as a personality trait, and visa versa. Péladan himself dressed in archaic silk robes and affected the pose of a quasi-Byzantine mystic.

Péladan and other symbolist artist-prophets expected to be rejected by the mass audience, thought to be incapable of interpreting the truths embodied in their art. Thus symbolism often brought with it a form of elitism that was sometimes used to support a conservative social agenda. The symbolist rejection of a wider bourgeois audience has also been interpreted as a protest against the degraded mass culture that resulted from industrial capitalism and the related effects of capitalism’s materialist values on human subjectivity. However much the symbolists themselves may have understood their elitism as a form of protest, their emphasis on the creative genius unwittingly reinforced the notions of individualism on which the growing art market traded.

Symbolist primitivism: the retreat from Western civilization. Like Kahn, the symbolist art critic Albert Aurier described the artist as a visionary who, by looking inward, achieved access to the absolute. According to Aurier, this ability to communicate more directly with basic truths was shared by others whose “uncivilized” natures brought them closer to an originary state of being in which the senses were not yet dulled by daily exposure to decadent European culture: children, non-Europeans, peasants, madmen, and hysterical women. Symbolist artists who embraced the primitive wished to return their own consciousnesses to equivalent states of innocence and instinctiveness. In France, the symbolist interest in the primitive was related to the opening of markets between East and West, and to the expansion of colonialism that gave

artists exposure to what were viewed as more primitive peoples and their art. Many artists borrowed from non-Western sources. The Dutch artist Vincent van Gogh, Paul Gauguin, and many other late-nineteenth-century artists looked to the bold patterns and lack of traditional Western perspective of Japanese prints for a seemingly primitive source of artistic ideas.

Paul Gauguin (1848–1903) retreated to Brittany in the 1880s in what he imagined was an escape to a more primitive region of France, where he hoped to set up an artists’ colony. There he painted several images of the natives, including the famous *Vision after the Sermon* (1888). This painting used bold patterns and generalized shapes to picture the mystical vision of “primitive” peasants. Vincent van Gogh (1853–1890) moved from Paris to Arles at about the same time and invited Gauguin to join him in a similar attempt to escape the metropolis. Ultimately, seeking a retreat to a primitive paradise, Gauguin fled Paris for Tahiti in the 1890s. He continued to paint boldly patterned works of primitive subjects—especially native women—until his death.

On one hand, many of the symbolists sincerely valued what they believed to be positive characteristics of so-called primitive peoples. On the other, they also believed that though women, children, and savages were closer to the absolute, they lacked the intellectual ability to recognize and identify universal ideas. Neither did such primitives possess the artistic ability to communicate the absolute through art. Only the artist-seer had both access to the absolute and the means to recognize and communicate it. Thus, while symbolism encouraged artists and poets to explore marginalized realms—to “become” momentarily feminine, mad, or primitive in the act of creativity—it also denied the possibility that traditionally “primitive” people could themselves be artists. It therefore shored up the elite status of already privileged European male artists. In addition, in the process of celebrating the people they saw as primitive, these artists reinforced the stereotypes that allowed the wider culture to marginalize them, or, in the case of colonialism, they justified imperial expansion as a needed civilizing force.

Artifice against nature. In Joris-Karl Huysmans’s 1884 novel, *À rebours* (Against the grain, or Against nature), the decadent aesthete Des Esseintes withdraws into an elaborate world of his own construction in an effort fully to control his “reality.” Within the confines of his abode, the differences between nature and artifice, reality and imagination are effaced and the whims of his highly refined sensibility are indulged to such an extent that nothing natural remains. This transformation of the natural world into a product of the Des Esseintes artifice is well illustrated when the protagonist decorates his home with a live turtle encrusted with gold and jewels. (The turtle, not surprisingly, dies.) Des Esseintes’s walls are hung with the works of Odilon Redon and Gustave Moreau. Each artist pictures worlds that work “against nature.” Their works overtly claim status as products of the imagination rather than replications of the real.

Gustave Moreau (1826–1898) belonged to an earlier generation of artists and had little respect for the symbolist movement. He refused to exhibit with them at Sâr Péladan’s Salon

***Vision after the Sermon: Jacob Wrestling with the Angel* (1888) by Paul Gauguin. Oil on canvas.** Gauguin frequently imbued his boldly patterned paintings with spiritual meaning. He believed that art had the same power of salvation as religion. © ARCHIVO ICONOGRAFICO, S.A./CORBIS

of the Rose + Croix and described the “enthusiasm for the invisible . . . exclusive need of dreams, mystery mysticism, Symbolism and the undefined” as so much snobbery and posing (quoted in Cooke, 124). By the time Huysmans wrote about Moreau’s paintings *Salomé* (1874) and *The Apparition* (1876) in his novel, Moreau had been exhibiting scenes from the Old Testament and Ovid’s *Metamorphoses* in the Salon for nearly three decades. Despite this, Moreau did share some aims with the works of artists aligned with symbolism, though his aesthetic approach is quite different from artists such as Gauguin and the Nabis. His works embody the principle that one must move beyond the description of the everyday and against any sense of the replication of nature. Moreau’s paintings combine imagery and symbols from a wide range of sources (including Old Masters, Egyptian art, the Byzantine empire, and Asian culture). All these are incorporated into highly detailed paintings whose disparate symbols are held together by a distinctive painterly style. Elaborate and often minute patterns, sometimes painted, some-

times scratched into the paint, form a unifying armature or screen over the canvas. The effect is a disconcerting jewel-like surface and dreamlike treatment of the familiar that now appears to be wholly a product of the artist’s artifice.

Like Moreau, the printmaker and painter Odilon Redon (1840–1916) was chosen by Huysmans as an artist favored by his fictional decadent hero Des Esseintes. Redon’s small-scale works on paper differ greatly from Moreau’s intricately wrought history paintings. Redon’s imagery, however, like Moreau’s, draws on a range of sources, from ancient myth to Christian subjects to natural imagery to contemporary literature, and often combines sources in impossible and surprising ways that evoke formal or conceptual correspondences between seemingly disparate objects. This combination, reminiscent of dreams in which one thing metamorphoses into another, was sometimes further enhanced by the captions or evocative titles that accompanied the works. Like symbolist poetry, Redon’s prints push the reader into a process of interpretation where

echoes between elements suggest meanings but resist any ultimate decipherment or closure. In Redon's work, as in symbolist poetry, the viewer's engagement with the process of interpretation seems to be the most important element.

In many works, Redon specifically thematizes the transformation of nature into imagination by transmuting natural forms into highly evocative dreamlike visions. In *There Was Perhaps a First Vision Attempted in the Flower*, a plate from the lithograph series *Les origines* (1883; *Origins*), the orb at flower's center becomes an eye and the lashes give it the look of a carnivorous plant. In other works, flowers, spiders, or planetary orbs have human faces. Redon studied anatomy and natural history. His hybrid creatures cross categories of the natural world to become evocatively unnatural. Their hybridity also speaks to the possibility of a primeval continuum tying together different categories of being.

A similar hybridization of natural categories is seen in the works of the Norwegian artist Edvard Munch (1863–1944). In the series of paintings *The Frieze of Life*, the forms in background landscapes seem to be based on contemporary studies of the physiology of the human body. Furthermore, Munch described the landscape itself through physiological metaphors, sometimes of pulsing or breathing. In Munch, as in Redon, the metaphorical correspondences link disparate realms of being to point to basic structures or primeval truths beyond the immediately visible.

Symbolism, Gender, and Sexuality

Woman is a ubiquitous subject in symbolist art and literature. Sometimes, as in Denis's *April* or the early work of Piet Mondrian, she is a positive symbol of innocence and possibility—desexualized and dematerialized. In paintings by D. G. Rossetti or Whistler, woman is a highly aestheticized and unattainable love object. In his early work, the Russian artist Kazimir Malevich (1878–1935) used the motifs of women and embryos to express the notion that woman could be the incarnation of a higher, purer, more spontaneous realm. At other times, woman is turned into a sexualized femme fatale, as in Jean Delville's *Idol of Perversity* or in the works of the Belgian graphic artist Félicien Rops or the German artist Franz von Stuck. Thus, much symbolist visual art reinforces and amplifies a long-standing dichotomy between woman as virgin and woman as whore.

Significantly, each of these stereotypes aligns woman closely with nature. Such images reinforce the idea that woman, imprisoned within her biology—as the innocent vessel of the life-bearing force or as bearer of uncontrollable and instinctive sexual desire—is incapable of transcending her bodily functions and desires. Woman is a subcategory of nature and is linked to the primitivism that was such an important subtext of the symbolist project. The Belgian symbolist Ferdinand Khnopff's *Art (Caresses of the Sphinx)*, 1896) combines many of these elements. The Dutch symbolist Jan Toorop, with his flat linear vision, and Munch painted renditions of woman as femme fatale. Moreau's images of Salomé and other female figures also fit this description.

Significantly, these works were produced at a time when feminist movements were experiencing a resurgence across Eu-

rope and when women were beginning to work in a number of male professions. This imagery may be seen partly as a cultural reaction to the emergence of a well-defined social type—"the New Woman"—a bourgeois woman who sought financial independence, education, and a professional life. To counteract this threat to traditional values, the mainstream definitions of femininity in late-nineteenth-century European culture denied woman the possibility of "genius." And individual women who pursued intellectual or professional activities were described as "masculine." Artistic representations of woman's proximity to nature counteracted women's demands for intellectual pursuits by reinforcing the boundaries between intellectually endowed virile masculinity and body-bound femininity. Patricia Matthews argues that the masculinity of the intuitive artist-seer was ultimately protected by the exclusion of women from the category of genius. Like the primitives, women might experience intuition, spirituality, or a loss of the boundaries of self, but because they lacked genius, they would never be able to transform those experiences into an understanding of higher truths; nor could they communicate those truths through art. One rare exception to this general belief was the sculptor Camille Claudel, whose works were praised by several symbolist critics. Nevertheless, many of them still related the power of Claudel's works to her instinctual femininity. Other successful women artists and writers were said to have lost some of their femininity in expressing their genius.

The relationship between symbolism and sexuality was not always degrading to women. For some Russian symbolists, including the woman writer Zinaida Gippius and the male writers Ivanov and Merezhkovsky, sex was a source of liberation with the potential to unite humanity with God. Furthermore, many male symbolists conceived of their own projects in feminized terms. Intuition, spirituality, emotionalism, loss of intellectual control—all these were characteristics commonly aligned with the feminine. Many symbolists (Sâr Péladan is the most obvious example) enacted the role of feminized aesthete in their public lives, constructing personae that rejected bourgeois norms of masculinity. The British aesthete and writer Oscar Wilde (1854–1900) also assumed the role of the unconventional dandy (though in a less extreme form than Péladan). In the early twentieth century, many lesbians, including Romaine Brooks and Claude Cahun, would take the image of the male dandy as a model for their alternative visions of female sexuality.

Because it challenged normative values and offered alternative cultural forms, symbolism and the aestheticism that often accompanied it opened new avenues for imagining sexuality, which sometimes offered positive ways of conceptualizing the marginal subject position of the homosexual male. Rimbaud is famous for writing in a symbolist vein about his relationship with Verlaine. André Gide, who would openly theorize male homosexuality in dialogue form in *Corydon* (1911–1924), began his literary career in the symbolist milieu. Péladan described the androgyne as a symbol of creative possibility—an innocent creature prior to the corruption of sexuality who still embodied the intuitive possibilities of femininity without its negative aspects.

Laus Veneris (1873–1875) by Edward Burne-Jones. Oil on canvas. British artist Burne-Jones frequently depicted androgynous figures in his works, which certain critics believed to partially symbolize the homosexual subculture in the country. © ARCHIVO ICONOGRAFICO, S.A./CORBIS

Wilde seems to have found something enabling in the images of the femme fatale (his version of Salomé clearly differs from the overtly misogynist versions produced by many late-nineteenth-century artists). Swinburne attacked normative sexual morality in his poems by incorporating perverse sexuality into his images of beauty. British artists such as Aubrey Beardsley, Simeon Solomon, and Edward Burne-Jones, and writers such as Pater and Swinburne, often represented androgynous figures. Richard Dellamora and Thais Morgan connect these androgynous figures to the construction of a homosexual subcultural identity in Britain. Morgan suggests that images of the androgyne and of the hermaphrodite were meant to be read both as symbols of the perfect art object (by the mainstream audience) and as specific objects of homosexual desire.

Symbolism and the Unconscious

Symbolism was part of a wider cultural trend in which the order, clarity, and hierarchy that had long been associated with traditional academic art were replaced by modes of representation that focused instead on experimentation with representational form and an emphasis on individual sensibility. In this sense, symbolism is connected to Impressionism in painting and naturalism in literature. In fact, many symbolist artists

emerged from this naturalist milieu. Unlike naturalism, however, symbolism emphasizes the sensuous suggestiveness of language and form and the tendency of this suggestiveness to solicit individual interpretations from viewers and readers. Because symbolism suggested rather than instructing or describing, and because its subjects were so often themselves dreamlike, it seemed to open the door to a proliferation of fantasies in its audience. Thus the symbolist project was part of broader challenges to the notion of the autonomous human subject—a male subject for whom thought and representation had the potential to be transparent. When the boundaries of this traditional male subject position were opened up, many consequences, both aesthetic and political, followed.

The symbolist movement was one element in a general reconceptualization of human subjectivity that took place just as the existence of the unconscious mind was being imagined by psychologists and sociologists. One salient example of this theorization of the unconscious and the consequent questioning of the nature of subjectivity is to be found in the popular fascination with hysteria, hypnosis, and “suggestion.” The power of suggestion was thought to be especially strong when the subject had a weak or nervous personality (for example, children, primitives, and women). There was much debate over whether “normal” men with strong personalities were also

subject to the suggestion of others. In 1891, Alfred Fouillee summed up the consequences of recent psychological discoveries, saying “contemporary psychology has wrested from us the illusion of a bounded, impenetrable, and absolutely autonomous ego (p. 811). The discovery of the unconscious led to the possibility that human beings were not truly in control of their thoughts and actions. Works of art were deemed to have the potential to open their audiences to a suggestibility analogous to the state of hypnosis. Thus, paradoxically, the symbolist rejection of material reality in favor of the world of dream took shape at approximately the same time empirical science was confirming the importance of fantasy in daily life.

Conservative critics such as Ferdinand Brunetière in France or Max Nordau in Germany worried that symbolist work, with its incantatory echoing sounds and forms and its refusal to point readers or viewers to clear edifying messages, might encourage a loss of control not only in the artists who produced it but in the audiences who experienced it. Brunetière believed the aesthetic experience should serve as an edifying point of focus for the reasoning mind. He charged that the “empty forms” and “hollow rattling words” of symbolism would “dissolve the unity of the self in a diversity of successive states . . . give it over to the wandering voluptuousness of dream,” which would lead to “the glorification of egoism” rather than the betterment of society (Shaw, p. 192). Nordau’s book *Degeneration* described symbolism as a symptom of a general decline in Western civilization. Yet the very qualities that critics such as Nordau abhorred were the things that made symbolism a turning point in the arts. Symbolism opened new aesthetic possibilities of experimentation and abstraction and created space for alternative subject positions. It created the possibility, that is to say, for many of the wide range of avant-garde movements that followed in the early twentieth century.

SYNCRETISM. Syncretism—the process whereby two or more independent cultural systems, or elements thereof, conjoin to form a new and distinct system—is among the most important factors in the evolution of culture in general, but especially in the history of religion. Indeed, *all* of the so-called world religions, that is, Christianity, Judaism, Islam, Hinduism, Buddhism, and Confucianism, are to a fair extent syncretistic. But the process occurs whenever previously independent belief systems come into sustained contact, no matter what their respective levels of sophistication may be. This article briefly surveys examples of syncretism drawn from several traditions, including the aforementioned world religions and Japanese Shinto, as well as three syncretistic belief systems that emerged as a result of Western colonial expansion, slavery, and/or proselytizing: Santeria, Voodoo (or Vodou), and the Ghost Dance, which twice swept across large areas of Native North America in the late nineteenth century.

Syncretism in the World Religions

Of all the world religions, Christianity is probably the most syncretistic. Although rooted in Judaism, Christianity quickly came to absorb elements of Zoroastrianism (the ancient dualistic religion of Iran), some important features of pharaonic Egyptian religion, the religions of ancient Mesopotamia, and a number of Greco-Roman cults, which were themselves highly syncretistic. The Zoroastrian impact, which was already present in postexilic Judaism, was profound indeed. The prime example here is the intense Christian (and late Judaic) emphasis on a constant struggle between good and evil, which was the essence of the religion found by the Iranian prophet Zoroaster (or Zarathustra, c. 630–550 B.C.E.). The fully evolved figure of Satan is a classic example of syncretism: a fusion of the Hebrew concept of Lucifer, the “fallen angel,” and the Zoroastrian figure Angra Mainyu (Ahriman), who is the evil opponent of Ahura Mazda (Ormazd), the “wise lord” and the embodiment of light, truth, and goodness. Moreover, the late Zoroastrian texts tell of a final conflict between Ahura

Mazda and Angra Mainyu, during which a messiah-like figure will appear and lead the forces of Good. This, of course, is dramatically reflected in a number of Judeo-Christian apocalyptic texts, from the Book of Daniel to the Book of Revelation. The important thing here is that neither Angra Mainyu nor Lucifer is identical to Satan. Rather, the Judeo-Christian figure is a syncretism of the two otherwise distinct evil entities.

Precursors to the importance of the resurrection of Jesus for Christianity were the resurrected Egyptian god Osiris, as well as the Mesopotamian deity Dummuzi, who was rescued from the land of the dead by his divine lover Inanna. The Egyptian cult of the goddess Isis, sister-wife of Osiris and mother of the god Horus, who, together with Astarte and other Near Eastern goddesses, influenced the rise of the medieval cult of the Virgin Mary. The Isis cult also affected Christian ritual. The *sistrum*, a tinkling rattle that was shaken during ceremonies honoring the goddess, is the source of the bell that is rung several points in a Roman Catholic mass.

Several Greco-Roman religious cults also impacted the new religion. For example, the dove, a widespread symbol of the goddess Aphrodite and her Roman counterpart, Venus, became a symbol of the Holy Ghost, and the god Apollo was sometimes equated with Christ.

Islam also drew extensively on older religions, including Christianity and Zoroastrianism, especially after the Muslim conquest of Iran in 641 C.E. The chief Muslim demon, Iblis, is markedly similar to Angra Mainyu, and Islam also holds that there will be a final, Armageddon-like battle between the forces of good and evil.

Classical and modern Hinduism can be characterized as a grand syncretism between the indigenous Dravidian belief systems of northern India, as reflected in the artifacts of the Indus Valley civilization, and those carried into India in the middle of the second millennium B.C.E. by the Aryans, whose beliefs were a variant of those carried by Indo-European speakers across Eurasia from India to Western Europe. One of the best examples is the major Hindu god Shiva, the third member of the trinity that includes Brahma and Vishnu. Shiva is often called “the Lord of Beasts,” and an Indus Valley stamp seal found at Mohenjo Daro dating from about 1800 B.C.E. shows a god seated in the lotus position and surrounded by animals. This figure’s connection with the later iconography of Shiva is clear, and thus strongly suggests that the god in question reflects a syncretism of the ancient Dravidian and Aryan religions. Even the fully evolved Hindu caste system involves an amalgamation of the Aryan tripartite social class system, which they shared with other ancient Indo-European-speaking communities, and the indigenous emphasis on occupation groups, which is clearly evident in the physical layout of the chief Indus Valley cities: Mohenjo Daro and Harappa.

Buddhism too has evolved its fair share of syncretistic beliefs and practices, especially as it spread to countries outside of India. In what is now northwest Pakistan (ancient Gandhara), where the Mahayana, or bodhisattva-centered, evangelical form of Buddhism crystallized in the centuries immediately preceding the beginning of the Common Era, the

religion's iconography (sacred images) was heavily influenced by Greek artistic ideals, as the region in question was conquered by Alexander the Great in 326 B.C.E. These Hellenized images of the Buddha and other sacred figures were later carried into China, beginning in the first century C.E., where they blended with the indigenous artistic tradition. Moreover, by the time Buddhism arrived in Korea and Japan in the late fifth to mid-sixth centuries C.E. it had heavily syncretized with Confucianism, a development that is clearly exemplified in Shōtoku Taishi's (574–622 C.E.) famous "Seventeen-Article Constitution" (604 C.E.), which seamlessly blended the idea of filial piety and the other primary Confucian relationships with the Buddhist concept of *dharmā*, which is itself deeply rooted in the Hindu tradition.

Syncretism in Japanese Shinto

Shinto, the indigenous belief system of Japan, has coexisted with Buddhism for the past fifteen hundred years (the traditional date of the first appearance of Buddhism is 552 C.E., when the ruler of the Korean kingdom of Paekche sent a contingent of priests to the court of the Yamato emperor as a goodwill gesture), and Shōtoku Taishi's constitution is by no means the only example of syncretism between the two faiths. The form of Buddhism (Mahayana) that penetrated East Asia places great emphasis on bodhisattvas, or "enlightened," Buddha-like deities that intercede with the divine on behalf of human beings. Many of these figures were syncretized with the myriad Shinto *kami*, or deities. A good example is Hachiman, who became a Shinto war god, but whose origin, as Byron Earhart (p. 44) points out, "may be Chinese, Buddhist, or both."

Indeed, Shinto and Buddhism have become so intertwined in Japan that it is sometimes hard to know where one ends and the other begins. Most large Buddhist temples play host to one or more Shinto shrines, and, like Hachiman, Shinto *kami* are often conceived as guardians of the enshrined *bosatsu* (bodhisattva). Moreover, the latter are often worshiped in the same fashion as the *kami*, that is, he or she will be asked for the same sort of favors: good health, success in business or in passing examinations, and the like. Many Japanese assert that they "live" as Shintoists, but "die" as Buddhists, and this underscores a major distinction between the two faiths: the former emphasizes this world, while the latter tends to focus on the afterlife. But for practical purposes Shinto and Buddhism are, with a few exceptions, what amounts to a single faith in Japan, a complex syncretism that meets the religious needs of most Japanese.

Santeria and Voodoo

Yet another important example of syncretism can be found in the Caribbean. As a result of the slave trade, a host of West African religious beliefs were transplanted to Cuba, Haiti, and other Caribbean islands, as well as to Brazil, in the seventeenth and eighteenth centuries. There, they intermingled with the Roman Catholicism of the slave masters and plantation owners. The result was a set of syncretistic religions, the most important of which are Santeria and Voodoo (or Vodou).

Santeria took shape primarily in Cuba and reflects for the most part the beliefs of the Yoruba people, who live in what is now Nigeria. The focus of the Yoruba (and other West African

belief systems) is upon a pantheon of deities called *orishas*. However, in Santeria, these figures are often identified—that is, syncretized—with Catholic saints. A good example is Changó, a male god of thunder, lightning, and fire, who is nevertheless identified with St. Barbara, a devout young woman who lived in the fourth century C.E. and who was beheaded by her father for refusing to give up her Christian faith and marry according to his wishes. At the moment of her beheading her father was struck by lightning, and this gave rise to a legend that St. Barbara had power over lightning bolts. Although Changó is a masculine *orisha*, the similarities between this legend and the Yoruba traditions about him led to the syncretism in question.

Haitian Voodoo (more properly Vodou or Vodun) is similar to Santeria in a great many ways, both in its African heritage and when it comes to syncretism. Here, the West African deities, primarily from Benin and Dahomey, are called *loa* and are also usually identified with Roman Catholic saints. For example, the serpent *loa*, Damballah, is often identified with St. Patrick, drawing on the legend that the latter drove the snakes out of Ireland. *Houngan*, or Voodoo priests, have long since adopted elements of Roman Catholicism in Voodoo rituals, including the use of candles, bells, crosses, the practices of baptism, and making the sign of the cross. These Christian elements are intertwined with such African religious practices as drumming, dancing, ancestor worship, and spirit possession.

The Ghost Dance

The final example of syncretism involves what anthropologists call a "nativistic movement," that is, a religious reaction to the appearance of a more powerful and hegemonic culture. Although such movements have occurred in areas as diverse as Siberia and Melanesia in the late nineteenth and early twentieth centuries, the most intensely studied nativistic movement is the Ghost Dance, which began in northern Nevada among the Paiutes in 1870. In that year, a shaman named Tavibo had a vision in which he learned that if his people danced in a certain fashion, their ancestors, or "ghosts," would return, and the white men would be swallowed up by a great earthquake. Soon other tribes heard of this dance, and by 1871 it had spread widely among Native American tribes in the Great Basin and parts of California. However, the ghosts never materialized, and the religious fervor soon died down.

A generation later, Tavibo's possible descendant, another Paiute shaman named Wovoka (c. 1856–1932), revived the dance, but this time it was heavily syncretistic. As a youth Wovoka spent several years working for a white family that was extremely religious and gave him the name "Jack Wilson." In 1889, during a severe illness, Wilson had a vision in which God told him that not only would his ancestors return, but that a Native American incarnation of Jesus would return to help them, and that the whites, who were the spawn of Satan, would be swallowed by the earthquake that failed to occur in 1870. By the middle of 1890 the second Ghost Dance had spread widely east of the Rocky Mountains and eventually included among its converts the famous Sioux shaman Sitting Bull. However, on December 29, 1890, the Ghost Dance movement also led to one of the great tragedies in Native American history: the Wounded Knee massacre on the Pine

Ridge Reservation in South Dakota, in which several hundred people—including women, children, and elderly men—were killed simply because they refused to stop performing the Ghost Dance. Afterward, belief in the power of the dance diminished rapidly.

In sum, these are but a few examples of syncretism, a process that has played an enormous role in human religious history, from antiquity to modern times and in almost every corner of the globe.

READER'S GUIDE

This Reader's Guide was compiled by the editors to provide a systematic outline of the contents of the New Dictionary of the History of Ideas, thereby offering teachers, scholars, and the general reader a way to organize their reading according to their preferences. The Reader's Guide is divided into four sections: Communication of Ideas, Geographical Areas, Chronological Periods, and Liberal Arts Disciplines and Professions, as indicated in the outline below.

COMMUNICATION OF IDEAS

Introduction to History of Communication of Ideas

Communication Media

GEOGRAPHICAL AREAS

Global Entries

Africa

Asia

Europe

Middle East

North America

Latin and South America

CHRONOLOGICAL PERIODS

COMMUNICATION OF IDEAS

This category is the newest aspect of the *New Dictionary of the History of Ideas*; cultural studies, communications studies, and cultural history are moving the disciplines in this direction.

Introduction to History of Communication of Ideas

The following entries focus on the media humans have used to communicate with one another.

Absolute Music
Aesthetics: Asia
Architecture: Overview
Architecture: Asia
Arts: Overview
Astronomy, Pre-Columbian and Latin American
Bilingualism and Multilingualism
Borders, Borderlands, and Frontiers, Global
Calendar

Communication Media

This is a listing of the types of historical evidence the author used in writing the entry. While entries in the original Dictionary of the History of Ideas were to a great extent the history of texts, the entries in the New Dictionary of the History of Ideas are generally the cultural history of ideas, making use of the records of oral communication, visual communication, and communication through practices, as well as the history of texts, in order to show the impact of the idea on a wide variety of people.

ORAL

The selective list below contains the entries that give the most coverage to historical examples of the oral transmission and transformation of ideas.

Civil Disobedience
Civil Society: Europe and the United States
Communication of Ideas: Orality and Advent of Writing
Cosmopolitanism
Cultural Capital
Determinism
Dialogue and Dialectics: Socratic
Dialogue and Dialectics: Talmudic
Dream
Emotions
Empire and Imperialism: Europe
Equality: Overview

TEXTUAL

Every entry in the *New Dictionary of the History of Ideas* used texts. The following is a list of entries that focused mainly on the history of a succession of texts. Each academic discipline has a succession of major authors with whom later practitioners of the discipline build upon and respond to creatively. The historian of a discipline—such as the history of political philosophy, literary history, or the history of science—considers the responses of thinkers and practitioners of a discipline to the major earlier texts in the discipline. In tracing the origin, development, and transformation of an idea, the historian of ideas considers thinkers' responses to texts from a variety of disciplines.

LIBERAL ARTS DISCIPLINES AND PROFESSIONS

This section is in accord with the university divisions of the Liberal Arts into Fine Arts, Humanities, Social Sciences, and Sciences and the graduate programs of the professions of Law, Medicine, and Engineering. The sample of Interdisciplinary Programs are listed under their most common university grouping. For example, Fine Arts includes Performance Arts; Social Sciences includes Women's Studies and Gender Studies, as well as Ethnic Studies; Sciences includes Ecology and Geology, as well as Computer Sciences; Humanities includes programs of Communication, Language, and Linguistics. Meanwhile, the growth of interdisciplinary programs reflects the increasing overlap between studies listed under the labels of Fine Arts, Humanities, Social Sciences, and Sciences. A discipline or interdisciplinary program only appears once, but an entry may appear under the several disciplines and interdisciplinary programs that influenced the scholarship of the article. Titles that appear in bold indicate entries that are especially suited as an introduction to the discipline.

Under the category Multidisciplinary Practices, there are entries on the many methods, techniques, theories, and approaches that have spread across the disciplines. The Multidisciplinary Practices help explain the contemporary trend of interdisciplinarity for which the history of ideas has long been known. At the end of this Reader's Guide is a listing of a number of entries that overlap three of the four divisions and a listing of entries that overlap all four divisions.

Especially Interdisciplinary Entries

The most interdisciplinary entries synthesized knowledge by using the methods and focusing on the topics of practitioners of several disciplines. Very few entries listed below are in only one division. Common pairs for the history of ideas are social sciences and humanities, social sciences and sciences, and humanities and sciences. In the early twenty-first century there is generally a recognition of the common overlap of the social sciences with the humanities; social scientists may take ethical and literary factors into consideration and humanists may incorporate societal contexts into their work. The presence of psychology in the sciences, as well as the quantitative nature of some social sciences work, creates an overlap of social sciences with sciences. Another interesting overlap is between humanities and sciences—topics that in antiquity were treated as philosophy or religion are now investigated by those following scientific methods.

T

TASTE. We tend to use the word *taste* in two different ways. First, to refer to the ability to judge a thing correctly, usually (but not always) a work of art from an aesthetic point of view. Second, we use the word to refer to a particular set of aesthetic preferences, and given the most popular sense of this second usage, we understand that one person's set of preferences may differ from another person's set. In this article, *taste* refers to taste in the first sense, and *personal taste* refers to it in the second. "Personal taste" does not imply that one person's set of aesthetic preferences cannot be shared by others.

Taste

Taste in this first sense, by which we mean the ability to correctly judge aesthetic objects and events, has a long history, but happily that history is fairly easy to trace and fairly easy to contextualize. We will start in ancient Greece. In those philosophic traditions that begin with Greece, Aristotle (384–322 B.C.E.) is the first person who offers us a formula for beauty. If a thing possesses a certain set of properties—objective properties that anyone with working senses and a passing familiarity with those properties can easily pick out—then that thing is beautiful. Aristotle said that an object is beautiful if it is ordered, symmetrical, and definite, and if it demonstrates each of these virtues to a high degree. This analysis we call "formal," because it focuses on the presence in the object of certain aesthetic properties that have to do with the form (as distinguished from the content) of the object. If a set of criteria can be discovered, the presence of which will ensure that an object is beautiful, and the absence of which will ensure that it is not, then through this the correctness of aesthetic judgments can be established.

Formalism, as an objective approach to aesthetic judgment, has been very popular. We find in St. Augustine of Hippo (354–430) a formalist account of beauty: for an object to be beautiful is for it to exhibit unity, number, equality, proportion, and order, with unity as the most basic notion. And in the work of St. Thomas Aquinas (1224–1274), we find a formal account of beauty, which rests on three conditions: integrity or perfection, due proportion or harmony, and brightness or clarity. We find examples of formalists in eighteenth-century Britain. The third earl of Shaftesbury (Anthony Ashley Cooper, 1671–1713) believed that so long as one was disinterested in attitude, one's judgment that an object was beautiful was correct as long as the object exhibits "unity in multiplicity." Francis Hutcheson (1694–1746) believed that, given a disinterested attitude, if an object exhibits "uniformity amongst variety," that object is beautiful. The essayist and statesman Joseph Addison (1672–1719) believed that an

object was worthy of positive aesthetic judgment if it exhibited greatness and uncommonness. And jumping to the twentieth century, we find formalist accounts of aesthetic merit (though not explicitly about beauty per se) in the work of G. E. Moore (1873–1958) ("organic unity") and Clive Bell (1881–1964) ("significant form").

While theorists such as Shaftesbury and Hutcheson include clear formalist elements in their theories of aesthetic merit, they also stand at the beginning of a tradition of philosophers of aesthetics sometimes referred to as "taste theorists." The taste theorists are found, generally, in eighteenth-century Britain, and they begin as a bridge between objective formalist and subjective accounts of beauty. Although individual subjectivity now begins to appear in accounts of aesthetic judgment, it is important to note that these accounts were not antirealist (antirealism being the position that judgments about aesthetic objects are neither true nor false). Quite to the contrary, theorists like Shaftesbury and Hutcheson were still aesthetic realists (realism being the position that there are real answers to questions of aesthetic merit, that judgments about aesthetic objects really are true or false). In order to access the formal conditions of beauty, Shaftesbury and Hutcheson said that the attender must put himself or herself into a proper frame of mind. From this proper perspective—from the proper exercise of one's faculty of taste—one could judge correctly whether a thing is beautiful or not. The inclusion in their theories of the formal elements of "unity in multiplicity" and "uniformity amongst variety" were meant as explanations for why the exercise of one's taste would result in aesthetic enjoyment and correct judgment, but it is the exercise of taste that, in their theories, is logically prior: one exercises taste; one enjoys and judges positively; and notes subsequently that this enjoyment and positive judgment are occasioned by the presence of certain objective, formal features. Shaftesbury and Hutcheson are joined in their theories—which mix objective features of objects with subjective features of judgment—by others, most notably Joseph Addison (1672–1719), Archibald Alison (1757–1839), Lord Kames (Henry Home, 1696–1782), and Alexander Gerard (1728–1795).

The eighteenth-century British taste theorists are, in some sense, a product of their times. There are three items that motivate them. First, they rejected as insufficient pure formalist, objectivist theories of beauty. Second, they were inspired by empiricism, and they sought to connect knowledge with the focus on the senses as the medium through which reality was taken in. In aesthetic theory, this can be seen in the move from the Platonism apparent in theories like Shaftesbury's to

Les Femmes d'Alger (1907) by Pablo Picasso. Oil on canvas. Theories of taste have had a long history. In ancient Greece Aristotle claimed that order and proportion contributed to beauty. Twentieth-century theorists found distinctly asymmetrical works such as those of Picasso to have visual merit as well. AP/WIDE WORLD PHOTOS

the almost physiological tone of theories such as those of Hutcheson and Edmund Burke (1729–1797). Third, with political theorists in Britain like Thomas Hobbes (1588–1679) and John Locke (1632–1704) came a new focus on the authority and autonomy of the individual. This celebration of the individual, his rights, and the dominion and prerogative of his judgments, can be seen in the fundamental premises

upon which David Hume (1711–1776) and Immanuel Kant (1724–1804) build their theories of aesthetic judgment.

Although formalist accounts persist into the twentieth century, they reach a point of diminished popularity at the end of the eighteenth century when mixed objective-subjective accounts, such as those offered by Shaftesbury and Hutcheson,

are replaced in popularity by more purely subjective accounts offered by, to name the two most influential, Hume and Kant. Instead of focusing on the aesthetic object, both of these theorists focus on the aesthetic attender. Instead of offering objective-criteria formulae for what makes an object aesthetically good or beautiful, they focus exclusively on the qualities of the attender that make him or her a good judge.

Hume believed in the indisputability of particular taste and the sovereignty of the individual judge, but he also believed that “amidst all the variety and caprice of tastes, there are certain general principles of approbation and blame.” For Hume, an object is beautiful if and only if it provokes aesthetic sentiment in appropriately disposed competent critics, which he calls “true judges.” True judges have the following traits: (1) serenity of mind (mentioned earlier than the other five), (2) delicacy of taste, (3) they are well practiced, (4) they are versed in comparison between objects, (5) they are free from prejudice, and (6) they have good sense (i.e., their senses work very well).

Kant’s focus was similar, although the theoretical details are rather different. Kant’s means of establishing the worthiness of aesthetic judgment focuses somewhat less on the individual than Hume’s, and more on what is common about judgment. It is from the dual vantage point of the authority of the subject’s judgment and the call to universality of judgment—that we expect and even demand commonality in judgment—that Kant develops his view. Kant thought that the key to securing this universality was twofold: first, we recognize that each person has basically the same “common sense” for recognizing beauty in objects, and that aesthetic judgment is not merely a matter of sentiment but a matter of free play between the understanding and the imagination. Second, it is important for the judge to be properly disposed to making a correct judgment, and the proper disposition is for the judge to be disinterested—to consider the object/event for its own sake alone, without regard for any relation it bears to anything else, including personal interests. Given disinterest on the part of the judge, and given that we all have similar faculties for understanding the world—particularly, the formal structures and purposefulness of the phenomenal world—we would all judge similarly, at least with regard to individual, particular aesthetic judgments.

Hume and Kant opened the door for other subjective accounts of aesthetic goodness, but the real investment in subjective accounts came in the twentieth century and was provided by an assortment of aestheticians, Frank Sibley (1923–1996) being perhaps the most famous, who argue that reductions of evaluative aesthetic claims will never result in arrangements of objective properties. Sibley first identified aesthetic concepts and aesthetic terms as ones that necessarily include taste in their application. In justifying the use of aesthetic terms, however, we naturally seek out a basis that does not refer to taste. We look for the objective basis for our use of such terms, and we commonly expect to find such bases. Unfortunately, this only flows in one direction. While we may naturally look to non-aesthetic features to ground our ascriptions of aesthetic ones,

we cannot, no matter how full an account we offer, ever say that, due to the presence of given nonaesthetic features an aesthetic feature must certainly be present. We would, says Sibley, be suspicious of anyone who says that we can create a rule that states that a certain aesthetic feature can be created by inserting certain nonaesthetic ones. We would say that such a person is not exercising taste and, moreover, did not really understand the aesthetic term at issue unless he could correctly apply it in instances where citing the rule was not an option.

This movement, first begun in the latter eighteenth century, but really brought to bloom in the twentieth—twentieth-century formalists notwithstanding—through the work of Sibley and others, is a movement from objective accounts of beauty to subjective ones. The subjective accounts focus on taste, on the attenders or audience members (1) exercising their ability to judge correctly from an aesthetic point of view and (2) finding enjoyment in attending to those aesthetic qualities that properly should ground such enjoyment.

Personal Taste

The second sense in which the word *taste* is used, what we are calling “personal taste,” focuses on particular sets of aesthetic preferences. There is certainly a relationship between taste and personal taste, and we want to explore that a bit later on. For now, consider the nature of the preference that one may exhibit for vanilla ice cream over chocolate, for chicken over fish, for saturated colors over muted ones, and for action-adventure films over romantic comedies. In these matters, it is the rare observer who will assert that there is clearly a correct decision to be made, that one of each pair is clearly to be preferred over the other. Most observers are content to say that these are all simply matters of personal preference. Moreover, there are now many who say that all aesthetic judgments are on a continuum with such exemplars of personal preference. As mentioned earlier, antirealism is the position that there is nothing right or wrong about an aesthetic judgment that refers to anything beyond that judge’s preference—that all aesthetic judgment is a matter of personal preference. If one takes such phrases as “beauty is in the eye of the beholder” and “there’s no disputing individual taste” out of the realist contexts that the taste theorists had originally envisioned for them, one may understand taste as merely a set of personal preferences, over which external adjudication—or perhaps any adjudication—is inappropriate.

One challenge to this move toward antirealism as a theoretical platform for talking about personal taste is the widespread agreement in judgment forthcoming from certain aesthetic comparisons. Almost no one, on a “blind hearing,” prefers Salieri to Mozart, and it is easy to develop a list of such comparisons, each instance of agreement serving as one more bit of inductive evidence in support of aesthetic realism. There is an explanation for this, and it turns on the fact that there are purposes to our aesthetic choices. We mean to invest our attention in those aesthetic experiences that we predict we will find more enjoyable, satisfying, rich, and rewarding. There are few museum or gallery patrons who will spend minutes upon minutes staring at Andy Warhol’s *Campbell’s Soup Can*

or a Marcel Duchamp ready-made. These conceptual works can be taken in quickly, and perhaps fully so. But it is not uncommon to see patrons spend a good deal of time in front of a mature Joseph Mallord William Turner, Paul Cézanne, or Henri Matisse. If the experience one seeks is deep visual satisfaction, one will tend to invest attention in objects that most likely will provide this.

One's personal taste can be understood, then, as a series of past choices and resulting experiences that provide a basis upon which one will make future investment predictions and choices. If one has a rewarding experience listening to a Billie Holiday song, one will most likely seek out more Billie Holiday songs, and it is likely that one will also seek out blues in general. If one has a less than rewarding experience looking at a Jackson Pollock work, then one will probably avoid Pollock in the future, and it may be expected that one may avoid modern art altogether. If one has a good experience with works by Mark Rothko, one may reasonably expect to enjoy the work of Agnes Martin. All of this is based on induction. We find patterns in the world that serve us, that promote survival, flourishing, or simple enjoyment. It is only reasonable that we will follow those patterns and that, to some degree, groups of people who are similar will find similar patterns.

A second challenge, perhaps more intriguing than the first, is the regular phenomenon that with exposure, time, and information, aesthetic preferences tend to grow and develop in fairly predictable ways. The film preferences of freshman students tend to be for very recent works that provide immediate, easy reward. The preferences of students who have taken a few film courses tend to be informed by a much broader temporal span of the film world and tend to focus on films that require some subject-initiated investment of attention, both cognitive and psychological. The preferences of senior level film studies majors (and perhaps their professors) may be seen as bizarre by the aforementioned freshmen, as such preferences may well include silent films, nonnarrative films, and directors like Sergei Eisenstein, Ingmar Bergman, and Federico Fellini. College students commonly move in their musical preferences from rock to jazz and classical, if not giving up the former, at least adding to it the latter. The best explanation for this is that taste grows in regular ways, and once these regularities are identified, taste can be educated: personal taste can grow in sophistication.

We need to be careful here to distinguish between the effects of education as a tool for social or cultural indoctrination and education as a means of facilitating experience, furthering horizons, and encouraging genuine aesthetic enjoyment. It would be a shame and a loss to move a student, through the education of taste, to less aesthetic enjoyment, and there is a danger in declaring that a person's aesthetic preferences are wrong if they do not match some standard or other. This returns us to the authority and autonomy of individual judgment with which the taste theorists wrestled.

One bit of support for the appropriate plurality of personal taste comes from the diversity of aesthetic preferences that follows geographical, ethnic, and even gender identities. The patterns of bright, colorful dress that one may see in the Maya,

the Masai, and the Mongolians are very different from the patterns one sees in mainstream Europe and mainstream North America. Visually, traditional Asian artwork is easily separated from mainstream European and American artwork. One can take this to an even more basic level: the traditional Asian conception (or definition) of the aesthetic property of balance appears to be different from the mainstream European or American definition. If our very definitions of aesthetic properties diverge, yet in both contexts there is a general valuing of, in this case, balance, then the preferences that follow from this will diverge, as well.

Similar sorts of cases of diversity will manifest themselves in comparisons among ethnicities even within a geographical region. Public-space ambient music tends to follow these preferences; the music one hears in shopping centers in one part of the country may differ radically from the music one hears in another part. This is most likely more than simply the management's preferences. The choice in ambient music more likely follows the management's best judgments concerning the sort of music that the likely clientele will enjoy and that will keep them shopping. This is partly a geographical phenomenon, but in many places, can involve ethnic and subcultural considerations, as well.

The Relationship between Taste and Personal Taste

The recent understanding of taste (as closer to personal taste and away from the more traditional, realist sense of the word) can still be seen as pointing toward greater authority of the judgment of the individual that was one of the motivators of the original taste theorists. If there is ultimately no way to reasonably, authoritatively, or meaningfully adjudicate among divergent particular judgments or among divergent personal tastes as sets of matters of choice, then the eighteenth-century move toward a fuller respect for individual autonomy in aesthetic judgment has brought us to a point where taste gives way to personal taste. If one believes that Hume failed in his attempt to render consistent the authority of the individual with the call to commonality in judgment, and if one rejects Kant's attempt to solve the antinomy of taste ("taste is at the same time subjective and individual yet also universal") and save aesthetic realism where perhaps Hume was unable to, one may believe that, in these failures, the realist version of a singular, correct definition of taste is rightly abandoned. We may see as continuous with the decision between vanilla and chocolate ice cream a preference for Pink Floyd over Beethoven, Albee over Shakespeare, and Pollock over Rembrandt. Still, the recognition of this continuity is not a cause for surrender to the philosophy of "anything goes." As individuals may reasonably be expected to pursue those experiences that they find rewarding, and to make their investments of aesthetic attention based on predictions derived from patterns of past reward, we will continue to see some degree of commonality in personal judgment. The degree to which we see this—however modestly or subtly—will continue to advance culture positively.

TECHNOLOGY. Introduced in the first decades of the nineteenth century, the word *technology* signified the pursuit of a science to encompass all the *industrial arts*. *Mechanical arts*, a term used in medieval and early modern Europe, indicated something different because it included, for example, painting and sculpture. The introduction of the term *technology* corresponded somewhat contemporaneously with the introduction of other key terms for modernity, including *scientist*, *class*, *capitalism*, and *socialism*. They all come from a time troubled by the "machinery question," a fundamental topic for both political economists and Romantic authors during the same period. This question was posed as a response to the installation of an endless series of novel machines in newly built textile factories, which seemed to have nurtured a class differentiation between those who were amassing fortunes by owning the machines and those who were barely paid at subsistence level to work in them. Having won a decisive battle against those who defended the old order by crediting land rather than labor as being the source of value, classical political economists were unprepared to challenge the popular assumption of machinery being the source of value. The dramatic change similarly confused the best of the future critics of these economists. A young Karl Marx (1818–1883) assumed that the new machinery, despite the hardships that it imposed on many, inevitably paved the way to a better future society.

The denaturalization of the landscape ensuing from the spread of steam engines overwhelmed the Romantics, who lamented the loss of a better (past) society. Despite their unheard objections, for decades England had used previous "atmospheric" engines for draining mines, with pistons that moved up by the pressure of the steam and down by the

pressure of the atmosphere, in the pattern of the engine that Thomas Newcomen introduced early in the eighteenth century. By the last two decades of the same century, following James Watt's series of modifications, there were also engines with pistons moving in both directions only by the pressure of the steam. Like the electronic computer of the last decades of the twentieth century and the electric generator of the last decades of the nineteenth, Watt's steam engine was heralded as a universal (global, general purpose) machine, that is, a machine that could be automatically used in all places and at all times.

A technological progressive in comparison to Newcomen, Watt turned out to be conservative next to those who configured the successor models to his engine, namely, high-pressure steam engines versus his low-pressure model. A myriad of local reconfigurations were needed before the supposedly global steam engine could produce mechanical motion, first, strong enough to pull a train or propel a ship, and second, uniform enough to spin a fine textile or generate electricity. The need for reconfiguring a universal machine was repeated in the history of the supposedly universal electric generator and, more recently, regarding the supposedly universal electronic computer. The safety of low-pressure versus the efficiency of high-pressure engines has also been a perpetual issue, reproduced in the "battle of the currents" (direct versus alternating) between Thomas Edison and George Westinghouse during the 1880s and 1890s and the analog versus digital battle between engineers and mathematicians during the 1950s and 1960s. A symbol of progress in the 1880s, Edison in more recent times is viewed as exhibiting a puzzling conservatism. Biographers of the Massachusetts Institute of Technology electrical engineering professor Vannevar Bush are equally puzzled by how the preferences of this champion of mechanized analysis of the interwar period appear to be so incompatible with the prevalent post-World War II computing orientation.

Technocracy

The work of a generation of historians sensitive to the symmetrical study of technological success and failure suggests that animated debates concerning choice between competing technologies have been the rule, not the exception. In the case of the automobile—another technology assumed to be globally preeminent—early-twentieth-century battery-run and internal-combustion-powered vehicles competed hard in various local contexts against each other (as well as against those moved by steam pressure). Now a technical hope of the future, the electric car did not lose in the past because of an internal technical inferiority; the gasoline-driven internal combustion engine prevailed because of an abstracted over a socially situated conception of technical efficiency. Unsurprisingly, the term *technology* became widely used only after the early-twentieth-century rise of "technocracy," a movement that promoted an abstracted conception of technical superiority by seeking to replace the acknowledged subjectivity of politics by the assumed objectivity of engineering.

The technocracy movement was propelled by the establishment of Fordism, a mode of mass production of automobiles with internal combustion engines. The technical

efficiency of the automobile assembly line of the factories of Henry Ford was unquestionable in the 1910s. Things changed in the following decade when competitors chose production flexibility over efficiency by challenging the Fordist reliance on a combination of increasingly specialized machines and degraded skills; rather than producing a more affordable car but one offered only in a single model—the infamous black Model T—Ford’s competitors elected the option of producing a variety of car models.

Taylorism was the other side of Fordism because it started from changes in labor efficiency that were to match changes in machine efficiency. Interested in increasing the efficiency of low-skill work and then returning a portion of the extra value to be produced to the workers in the form of better wages, Frederick W. Taylor, through what became known as “scientific management,” proposed a scheme for a decisive advance in industrialization regardless of the availability and the wills of skilled workers, by relying on the unskilled labor of destitute urbanite and/or peasant masses. Varying mixes of the Taylorist-Fordist combination appealed to societies as different as that of Germany and the USSR of the interwar period. Organic components of Stalinism, Taylorism, and Fordism also puzzled the most critical spirits of interwar Europe, including Antonio Gramsci, the imprisoned leader of the Italian Communist Party. In the pursuit of a worker who ought to abandon all preindustrial attitudes that were incompatible with the uniformity expected by the Taylorist-Fordist mode of production, Gramsci saw the potential for moral and material improvement of the working class, which he considered prerequisite to its emancipation.

Ford was not the only one concerned with creating a massive demand for his product to match its mass supply by his factories. Samuel Insull—who had started as Edison’s secretary before he controlled, through dubious financial schemes, an empire of electrical utilities—had clearly realized the need for around-the-clock demand for electricity to take advantage of mass-production-capacity installations. Whatever technology might have been, it has been shaped both in production and in consumption, by invention and in use. The study of the history of the experience of technology vis-à-vis consumption, such as in a First World household or a Third World farmstead, has managed a decisive blow for the commonplace assumption of technology’s universalism. It has shown that technology’s easy mix with time-honored ideologies such as sexism or racism has increased the household work of a First World woman and decreased the resources of a Third World habitant.

Unregulated overproduction across the whole of industry accumulated the forces that were unleashed with the 1929 stock market crash. Herbert Hoover, the engineer-president was replaced by the iron politics of Franklin D. Roosevelt. The state-driven civilian rural electrification of the 1930s, which matched demand to supply, the Manhattan Project, and the rest of the state-driven military-technological projects of World War II shaped the emergence of “technology policy” as a key issue for the post-World War II state. Success in what is now called technology policy has in fact been a prerequisite for the

constitution of the modern state as such on both sides of the Atlantic. The end of the *ancien régime* in France and of the democracy of artisans, farmers, and merchants in the United States was marked by the state’s pursuit of a technology for the mass manufacturing of guns with as uniform (or “interchangeable”) parts as possible. The transfer of this technology to the rest of U.S. manufacturing over the course of the nineteenth century resulted in the so-called American system of manufactures, which took the millions visiting the world’s fairs by surprise.

Technological Determinism

A visit to a world’s fair after the mid-nineteenth century proved that the “machinery question” had been practically answered by the tremendous increase in the number and kinds of new machines. With the interconnection of machines into networks (of transportation, energy, communication, and so on), the term *technology* started to obtain a new meaning. In doubt by then about machinery inexorably dictating a better society, Marx liked the new term enough to correct his earlier editions of *Das Kapital* by carefully distinguishing between the “technical” and the “technological,” according to whether the same process was experienced as an objective, product-making process or a subjective, value-forming one, respectively. Unlike the technical, the technological was subjective in that the revelation of the surplus value produced depended on political prerequisites. Technology, like surplus value, was a concept that pointed to an unspecified agency. Technology has since been recognized by its effects, whereas the issue of agency has remained conveniently abstract. In surveying the subsequent history of the use of the concept, Leo Marx, a distinguished historian of technology, finds that its abstractness has sustained the hegemony of the ideology of “technological determinism,” the assumption that technology is autonomous from society.

Technological determinism matches well with the canonical presentation of the archetypal engine of Watt as being self-regulated because of the inclusion of a mechanism known as the “governor” (the foundational circuit of “cybernetics”). It was this ideological canon that was displayed at world’s fairs, not, for instance, a diorama of the lethal steam boiler explosions that killed thousands. Historians have found that the dominance of technological determinism explains the many waves of technological utopianism and technological enthusiasm of the recent centuries. It explains why the late-nineteenth-century crash of the utopian hope that the telegraph would bring world peace was not taken into account in the enthusiasm that surrounded the initial emergence of the telephone, the radio, the television, and, more recently, the Internet. It also explains why the dramatic revelation of the destructive power of the atomic energy in Hiroshima was quickly followed by the hope that a nuclear reactor to run everybody’s automobile was just around the corner. It finally explains why Leo Marx finds that technology has emerged as a “hazardous concept.”

TEMPERANCE. In classical and medieval thought, temperance, or *sōphrosynē*, could signify one or more of a congeries of traits, such as moderation, self-knowledge, self-restraint, or independence. These virtues were to be cultivated by the individual. In modern history, however, the meaning of temperance has become narrowed to refer only to limits on the consumption of alcoholic beverages, whether those restrictions are placed by an individual upon his or her personal consumption or by the state upon the habits of those subject to its jurisdiction. The principal agency in accomplishing this change in meaning has been a set of social movements whose origins lie in the sixteenth-century Protestant Reformation, but whose full flowering occurred in the nineteenth and twentieth centuries. Temperance movements have appeared in many societies, drawn upon diverse sources of support, pursued a variety of goals, and enjoyed widely varying degrees of success. In general, however, the temperance impulse in the modern world has been successful, whether its progress is measured by average levels of consumption or by preferences for less intoxicating forms of alcohol.

Temperance as Ideal and Issue

Most of the world's religions embrace temperance from alcoholic beverages as a virtue. For Hindu Brahmins, Buddhists,

Jews, Roman Catholic Christians, and especially for Muslims and Protestant Christians, temperance and, for some, abstinence is valued. Tantra Hinduism, Daoism, and Roman Catholicism incorporate alcohol into ritual, among others, but only a few mystical sects, such as Islamic Sufism, celebrate intoxication. As a result, the worth of temperance itself has rarely been at issue in any society, even when social conflict over drinking has been most bitter. Nearly all drinkers regard their own behavior as temperate. Rather, discord over temperance typically arises when one segment of society attempts to impose restrictions upon another's drinking—that is, when interpretations of the meaning of temperance clash. Temperance can also become involved in a struggle over other issues.

Colonial regimes, for example, have often imposed controls on the drinking of indigenous peoples, even when the introduction of alcohol into native cultures has undermined traditional ways and left native societies vulnerable to imperial domination. The European colonial powers in central Africa sought to compartmentalize the drinking of native laborers in space and time so as to safeguard productivity, and mine owners in South Africa went even further in the same direction when they forced prohibition on their workforces.

As early as the dawn of the nineteenth century, the United States federal government mandated prohibition for Native Americans. But embattled indigenous peoples have also sought to use temperance for their own purposes, as a buttress of anticolonial resistance, as was the case for South African kings, leaders of Native American revitalization movements such as the Seneca Handsome Lake and the Shawnee Tenskwatawa (1775–1836), and the Indian nationalist movement led by M. K. Gandhi (1869–1948). In such cases, the hypocrisy of colonial authorities in preaching temperance while allowing, or even fostering, alcohol consumption has given a weapon to those seeking to overthrow or reject their dominion.

In industrial societies, employers have often found it expedient to support controls on workers' alcohol consumption in the hope of habituating their workforce to the discipline of machine production. But militant workers' movements, such as the English Chartists, the Knights of Labor in the United States and Canada, Austrian Socialists, and Spanish anarchists, have realized the value of temperance in mobilizing sober opposition to capital or to capitalist governments. Furthermore, successful revolutionary movements have sometimes included liquor control among their tools for reshaping society, as was the case for the Mexican government in the 1930s and the early Soviet regime.

Temperance has been a subtler instrument in inter-group struggles when classes or professions have deployed it as a means of self-definition or as a vehicle for claims of expertise. In many industrializing English-speaking societies, middle classes have adopted sobriety as a badge of respectability, distinguishing themselves at least rhetorically from allegedly profligate elites on one hand and from purportedly dissolute workers on the other. Among professionalizing groups, physicians in particular have often taken leadership roles in temperance advocacy in societies as diverse as the United States,

Britain, Denmark, France, Australia, Imperial Russia, and the Soviet Union. In such cases, as sociologist Joseph Gusfield shows, temperance serves both as a badge of personal rectitude and as an assertion of the fitness of a class or profession to set society's direction.

Temperance Movements

The first temperance campaign in modern history was mounted by Martin Luther (1483–1546) and his followers as part of the Protestant Reformation, and was directed at the episodic drunkenness of traditional German drinking bouts. It failed, however, and German intellectuals instead came to view unconstrained drinking as a positive, indeed defining, Germanic trait.

Organized temperance societies next appeared in Britain and the United States in the early nineteenth century. Although the appearance of such societies derived critical impetus from evangelical Protestantism in both countries, temperance advocacy was by no means limited to evangelicals or to Protestants. By the 1870s, the Church of England had created its own temperance society, and during the same decade in the United States the founding of the Catholic Total Abstinence Union (CTAU) demonstrated Roman Catholic concern with the issue. The CTAU's definition of "temperance" as total abstinence also indicated how far temperance reform had traveled during its first half-century, since early American temperance reformers had first defined only moderation in the use of alcoholic beverages and later abstinence only from distilled spirits as their goal. Many reformers, however, soon moved to appeals for abstinence from all intoxicating beverages and then to a demand for state action to stop liquor sales, or prohibition. By the early twentieth century, movements for prohibition had appeared as well in Britain, in other British settler societies—Canada, Australia, and New Zealand—and in Nordic countries. The prohibition cause peaked during the 1910s and 1920s, when various forms of large-scale prohibition were adopted in Iceland (1915–1922), Finland (1919–1932), Norway (1916–1927), Russia and the Soviet Union (1914–1925), Canadian provinces (varying periods between 1901 and 1948) and by the Canadian federal government (1918–1919), and in the United States (1918–1933). In addition, a majority of voters in New Zealand twice supported prohibition (in 1911 and 1919), but the measure was never enacted. For those nations involved, World War I furnished a crucial stimulus for new restrictions on alcohol sales, such as the Carlisle system, a British scheme for government ownership and management of the liquor industry, and the French government's ban on absinthe.

Although temperance reform is commonly thought to have declined following the death of prohibition, new movements have simply taken on novel guises. American National Prohibition had been repealed only two years when a new self-help movement for habitual drunkards, Alcoholics Anonymous (AA), grew from the chance meeting of two drunks in Akron, Ohio. AA has since become a worldwide movement, with popular manifestations or imitations in countries such as Mexico and Japan, and its twelve-step method has found application to a variety of habits and afflictions. Since the 1940s,

academics following in the footsteps of E. M. Jellinek at the former Yale (University) Center of Alcohol Studies have taken a leading part in alcohol research and policy advice. Employers have continued to offer intervention in their workers' personal habits through "employee assistance programs." Both government policies and new organizations such as Mothers against Drunk Driving and Students against Destructive Decisions have focused on preventing or punishing drunken driving.

Women have often played key roles in temperance reform. In the United States, although women made up a large proportion of the membership of early temperance societies, they generally worked under male leadership. This began to change during the 1850s with the founding of the Independent Order of Good Templars, which soon became an international organization in which women in theory, and sometimes in practice, held equal status with male members. Women definitely seized the initiative in American temperance reform, however, in 1873–1874, when tens of thousands of women undertook nonviolent direct action against retail liquor dealers, using mass marches and public prayer and song. In the aftermath of the Women's Temperance Crusade, the national Woman's Christian Temperance Union (WCTU) was founded, and it soon became the largest organization of American women. Through the visit of an American activist from the Crusade the British Women's Temperance Association, Britain's first national women's temperance society, was established in 1876.

American and British women temperance activists soon began to extend their movement across the world, leading to the establishment in 1884 of the World's Woman's Christian Temperance Union (WWCTU). Although it was always controlled by American and British women, the WWCTU made temperance for the first time an international movement. Through this vehicle advocacy of other issues, such as peace and women's enfranchisement, was also spread.

Despite the common belief that failure of the various national prohibition schemes ended its impact, in fact temperance reform has exerted far-reaching influence upon consumption patterns, in large part because of its protean character and ability to adapt to diverse national cultures. Examples of its adaptability include AA in Roman Catholic Mexico, which in 1997 held the world's second largest number of local chapters; the Pioneer Total Abstinence Association of the Sacred Heart, an Irish Catholic society that at its peak in 1960 enrolled one-sixth of the Irish population and also attracted members in other countries; and the Danshukai societies in Japan, which have altered AA practices to fit Japanese culture. In the older industrialized countries at the outset of the twenty-first century, overall per capita consumption of alcohol was declining from peaks reached during the late twentieth century, and spirits and sometimes wine were being replaced in public preference by less potent beers, even in societies with long traditions of wine drinking. Nevertheless, rising consumption in the developing world, especially in China and India, presents new challenges to one of the world's historically most influential social movements.

TERROR. An apprehension of danger or impending violence, terror is akin to fear in an accentuated or distilled form and is often accompanied by trembling. It underpins many aspects of existence, especially the cut-and-thrust of the evolutionary drive and the predatory nature of the food chain. Lacking the “blood and sawdust” element associated with “horror,” it has nevertheless become allied with atrocities and outrages, from the emperors of Rome down to the massacring armies of Genghis Khan, Attila the Hun, and the later purges of dictators such as Stalin, Hitler, and Pol Pot.

The Politics of Oppression

In Europe, terror was employed as a tool by the church and state, often to suppress dissent and maintain the status quo. Campaigns like the Albigensian Crusade, in which the soldiers of Pope Innocent tortured, burned, and butchered the heretical sect of the Cathars, are examples of the extremes to which a religious body was prepared to go in order to maintain its authority, and the same might be said of the witch trials and the Spanish Inquisition. Many philosophers and statesmen have viewed such brutalities in terms of the degeneration of a cause. The German philosopher Georg Wilhelm Friedrich Hegel (1770–1794) considered the “Reign of Terror” of the French Revolution (April 1793 to July 1794) as a crisis of the human spirit: a vast abstract notion of freedom had arisen that annulled all moral and humanitarian considerations. Others saw it as a brutal mob avenging themselves on their enemies. During this period around seventeen thousand people were put to death, and the republican leader Maximilien de Robespierre (1758–1794) observed “in times of peace the springs

of popular government are in virtue, but in times of revolution, they are both in virtue and terror.”

Under ruthless regimes, people tend to adopt a docile attitude toward those in authority. It is not uncommon for families, neighbors, and friends to betray each other. Trust and the communal patterns of daily life inevitably suffer—during Stalin’s pogroms, for instance, hundreds of thousands of children were orphaned and left to roam the country, living rough, often starving, and many of these eventually became soldiers who were notably brutal and insensitive. In order to pursue his policies—particularly the collectivization of Soviet agriculture and the removal of all rival left-wing factions—Stalin institutionalized terror, creating government mechanisms that were extensions of his will, oiled by bureaucrats and fueled by propaganda. So many thousands were put to death on a daily basis that the appalling became indistinguishable from the ordinary.

From a despot’s point of view, the advantage gained from terror tactics is that he has under him a cowed, servile population; the disadvantage is that, having dispatched so many to camps or firing squads, he may start to anticipate revenge from every quarter and extend his field of killing until his situation becomes more isolated and absurd.

The Culture of Terror

But terror need not imply persecution or a life-threatening situation. It has another strand, a religious, aesthetic aspect that implies awe or reverence before a universe whose many mysteries—including those of religion—have never been fully grasped. William Wordsworth (1770–1850), in his poem *The Prelude* (published 1850), spoke of the “ministry of fear” and evoked the brooding silence of a huge mountain peak hemming him in as he rowed across Esthwaite Lake. The British

The Nightmare, engraving after 1790 painting by Henry Fuseli. The popularity of horror-themed books, films, and works of art suggests that on some level people are drawn to the concept of terror—or at least that of fabricated terror that can be easily banished. © HENRY FUSELI/FORTEAN PICTURE LIBRARY

GODS OF TERROR

The black Hindu goddess Kali was depicted with three eyes and four arms, bloated with the blood of her victims; Seth, the dark god of Egypt, as a monster or crocodile; and Satan, the adversary of Jehovah, as a scaly dragon devouring the souls of the dead. The Russians envisaged a figure of legendary dread in the “Pest Maiden,” whose billowing skirts unloosed plague and famine.

In ancient Greece, Pan the goat-god was associated with surges of panic and terror, such as a flocks bursting into a stampede or men overcome with fear and trembling in the depths of the forest. Apart from being a musician and flock-keeper, Pan was a god of the hunt. Undoubtedly a primal terror is that of the hunted creature pursued by an avenging pack. The phrase “thrill of the chase” may be counterbalanced by “terror of the quarry.” Frightened cries or pleas for clemency may have featured in the early articulation of speech.

NICCOLÒ MACHIAVELLI

Niccolò Machiavelli’s (1469–1527) manual of Renaissance statesmanship, *The Prince*, is a classic treatise on leadership utilizing terror or fear. It urges the ideal prince not to put “the reproach of cruelty” before such overwhelming issues as political unity and that “it is much safer to be feared than to be loved when one of the two must be lacking.” While seldom quoting or approving Machiavelli—unjustly his name became synonymous with conspiracy and deceit—many subsequent leaders and dictators have taken his strictures to heart.

politician and thinker Edmund Burke (1729–1797), in his *Philosophical Enquiry into the Origin of Our Ideas of the Sublime and Beautiful* (1757), saw terror as an elevating, thrilling sensation deriving from the “sublime” and accompanying the observation of soaring, stupendous scenery. In the *Duino Elegies* (1923), the Austrian poet Rainer Maria Rilke (1875–1926) perceived “beauty” as “nothing but the beginning of terror,” implying that, in the act of emotional surrender or identification, man lays himself open to a force over which he can exercise little control. Buildings, too, can produce such an effect. There are churches whose massive, solemn architecture, like those of the London architect Nicholas Hawksmoor (c. 1661–1736), induce a dread concomitant with an all-powerful deity.

Contemporary evangelists emphasize the “love of God,” but men like Martin Luther feared God just as much. The latter

was literally a “terrible” power capable of visiting plague, famine, and earthquake. During the Middle Ages and the early modern period, numerous “panic” and “God-fearing” cults sprang up—from the flagellants to the Anabaptists—that exploited mass credulity, drawing upon the end of the world or “day of judgment” theme and the glorious, terrifying visions of the Book of Revelation—a favorite text, significantly, of the deranged, self-appointed messiah David Koresh (1959–1993), who died amid the blood and flames of his apocalyptic vision at Waco, Texas, taking his followers with him.

During the early Romantic period, the classic terror image *The Nightmare* (1782) was painted by Henry Fuseli (1741–1825), showing a young woman sprawled out sleeping and the head of a phantom horse rising above the bed. Perched on the woman’s breast is a small hairy incubus. The popularity of such works gives rise to the question: Do people enjoy being terrified? The answer is that, in comfortable surroundings, they may enjoy the vicarious thrill of a mental journey through terrains littered with ruined castles, skulls, vampires, and apparitions: hence the enduring appeal of Gothic novels like *The Castle of Otranto*, *Dracula*, *Frankenstein*, and, more recently, the horror film and works of popular authors like Stephen King. Furthermore, the terrors banished at the climaxes of books and films are reassuring compared with the spectacular diseases and potential nuclear catastrophes filling much contemporary reality. Ghosts and ghouls, for all their menacing antics, hint at a startling extension of existence rather than the terminal facts of modern warfare. The effect of such works is to reassure more than terrify, for usually the fears are objectified and framed in the neutral environment of the page or screen.

The Amygdala

Since the 1990s, terror has been localized in tiny pathways between nerve cells in a small, almond-shaped clump of tissue called the amygdala. Joseph LeDoux—an authority on

the emotional brain—observed, “We have shown that the amygdala is like the hub in the centre of a wheel of fear. If we understand the pathways of fear, it will ultimately lead to better control.” Part of the primitive brain, the amygdala seems to have developed early, steering organisms away from poisons and predators. Some researchers associate it with conditions like depression and autism. Specific fears can be “burned” into it and stimulate a trigger reaction or recurrent terror. Through research into the amygdala and neurocircuitry, some hope that terror, man’s oldest adversary, will be conquered, provoking the question: Will there be such a thing as a hero in the future?

TERRORISM, MIDDLE EAST. While terrorism has arisen in a variety of cultures and historical periods, much of the world’s attention on this phenomenon in the late twentieth and early twenty-first centuries has centered on the Middle East. Middle Eastern terrorism emerged in Western consciousness during the 1970s, primarily through the rise of secular leftist and nationalist groups among Palestinian exiles, which targeted Israelis and their supporters both within and outside of Israel. Some (such as Yasir Arafat’s Fatah movement and George Habash’s Popular Front for the Liberation of Palestine) were part of broader political movements within the umbrella of the Palestine Liberation Organization, while others (such as Abu Nidal’s Fatah faction) operated outside the

PLO. Palestinian nationalists were inspired in part by the success of the Algerian revolution, which used terror as a tactic to free that North African nation from French colonialism in 1962, and by the case of Israel, which won independence from Britain in 1948 in part through the efforts of terrorist groups led by future prime ministers Menachem Begin and Yitzhak Shamir. Without a recognized government or territory, terrorism appeared to many Palestinians to be a more realistic option than conventional or guerrilla warfare.

The rise of Palestinian terrorism was concomitant with the rise of Palestinian nationalism, where successive betrayals and defeats by Arab governments had led Palestinians to take leadership in their own national struggle. The use of such high-profile tactics as airline hijackings and embassy takeovers helped call attention to the plight of the Palestinian people, most of whom were living under Israeli military occupation or in forced exile in refugee camps in neighboring Arab states. Though such tactics led the West to belatedly recognize the Palestinians as a distinct people with national aspirations, it also gave Israel and the United States the excuse to thwart these goals on the grounds that the nationalist movement was led by terrorists.

The fratricidal Lebanese civil war (1975–1990) brought to the fore a number of ethnic-based militias that utilized terror, including the right-wing Phalangists, based in the Maronite Christian community, and—following the 1982 Israeli invasion and subsequent U.S. intervention—Shiite Islamic groups, some of which coalesced into the Hizbollah movement.

Turkey has been subjected to widespread terrorism by extreme leftist and extreme rightist groups, particularly during the late 1970s and early 1980s. Also during this period, Armenian terrorists would periodically assassinate Turkish diplomats in retaliation for the 1915 genocide and the refusal of Turkey’s government to acknowledge their culpability. Kurdish nationalists, under the leadership of the Kurdish Workers Party (PKK), engaged in a series of terrorist attacks in Turkey through the 1990s in an effort to secure greater autonomy.

Leftist and Islamic groups used terror on a limited scale against the shah’s repressive regime in Iran during the 1970s. During the early 1980s, following the shah’s ouster in a largely nonviolent revolution and the subsequent consolidation of power by hardline Islamists, there was an upswing in terrorism that included assassinations of top officials of the revolutionary government.

In recent decades, the failure of secular nationalist and leftist movements in the Middle East has given rise to Islamic groupings, some of which have engaged in terrorism. Many were Arab veterans of U.S.- and Pakistani-backed mujahideen groups fighting the Communist Afghan government and its Soviet backers during the 1980s. This period saw the beginning of a tactic (which had previously been utilized primarily by Hindu Sri Lankan Tamils) where assailants, carrying explosives in a vehicle or strapped to themselves, would blow themselves up along with their targets, a phenomenon that became known as suicide bombings.

Several autocratic Arab regimes, long accused of corruption and abandonment of Islamic values, have become targets of Islamic radicals. Egypt was a hotbed of such movements throughout the 1980s and into the 1990s, with terrorists targeting government officials (including President Anwar Sadat), wealthy Egyptian elites, and foreign tourists. Conservative monarchies in Saudi Arabia, Kuwait, and Bahrain, along with their Western supporters, became targets of radical Islamists during this period as well. Algeria became the site of the most deadly acts of terrorism in the region beginning in the early 1990s, when the radical Armed Islamic Group (GIA) arose following a military coup that short-circuited scheduled national elections. During the 1990s, when the PLO's renunciation of terrorism and peace talks with Israel failed to end the occupation, Palestinian Islamic groups such as Hamas and Islamic Jihad, later joined by a renegade Fatah faction known as the Al-Aqsa Martyrs Brigade, commenced a suicide bombing campaign against Israel.

The ouster of Saddam Hussein's regime by invading U.S. forces in 2003 has resulted in Iraq's becoming a major center of terrorism. Though most of the Iraqi resistance to the U.S. occupation has targeted occupation forces, there has also been a series of bombings against civilians by both Iraqi and foreign terrorists.

The late 1990s saw the emergence of the Islamist Al Qaeda network, led primarily by Saudi exiles such as Osama bin Laden, who have targeted a number of Arab and Western targets, particularly the United States. Chief among their grievances have been U.S. support for Arab dictatorships; the American-led sanctions, bombings, and invasion of Iraq; U.S. support for Israel; and the ongoing U.S. military presence in the heart of the Islamic world. Al Qaeda's financial resources and sophisticated organization has taken terrorism to unprecedented levels, most dramatically illustrated by the devastating September 11, 2001, terrorist attacks on the United States that killed over three thousand people.

State-Sponsored Terrorism

Most governments and peoples of the Middle East categorically oppose terrorism. The taking of innocent human life is proscribed under Islam just as it is under Christianity and Judaism. However, a number of radical Middle Eastern states—such as the Islamist military government in Sudan, the Libyan regime of Muammar Qaddafi, the Baathist government of Syria, the former Taliban regime in Afghanistan, the Islamic Republic of Iran, and Saddam Hussein's former regime in Iraq—have provided or continue to provide funding and logistical support for terrorist groups.

Such activities have contributed to these governments' international isolation, although the United States has at times exaggerated the extent of support these regimes have provided terrorists in order to further advance other policy goals. U.S. forces bombed Libya in 1985, Iraq in 1993, and Sudan and Afghanistan in 1998 because of their governments' alleged support for terrorism, although some of these air strikes resulted in widespread civilian casualties themselves. In 2001, the U.S.-led air strikes played a decisive role in the ouster of the Taliban

Poster celebrating Palestinian suicide bomber, Jenin, 2002. Palestinian desire for Israeli withdrawal from occupied territories such as the West Bank has led to the formation of several terrorist organizations who utilize violent methods of coercion such as kidnapping, hijackings, and bombings. AP/WIDE WORLD PHOTOS

government in Afghanistan, which had provided sanctuary for Al Qaeda. Some intelligence and military officers and other officials in Saudi Arabia and Pakistan are believed to have quietly supported Islamist terrorists, although top government leaders largely support antiterrorism efforts.

Far more consequential, however, both politically and in terms of civilian lives, have been acts of state terror stemming directly from armed forces of governments themselves. For example, the Kurdish minorities in Iraq (particularly during the 1980s) and in Turkey (particularly during the 1990s) were subjected to widespread massacres, destruction of villages, and forced relocation, with civilian death tolls in the tens of thousands. In the former case, the United Nations Security Council set up a safe haven for Kurds in the northern part of Iraq following a devastating 1991 Iraqi offensive, the first time the UN had restricted the right of the armed forces of a sovereign country to operate within its internationally recognized borders on human rights grounds. During the Turkish invasion of Cyprus in 1974, hundreds of ethnic Greek civilians were killed, and ethnic cleansing uprooted the majority of the population in the northern one-third of the island; killings and forced relocations on a lesser scale occurred in other parts of Cyprus during this period against ethnic Turks. Successive Arab-dominated Sudanese governments contributed to the deaths of hundreds of thousands of Christian and animist blacks in the southern part of the country through massacre and forced starvation, more recently targeting black Muslims in the Dafur region in the west. Algerian forces killed thousands of civilians in counterinsurgency operations in the early to mid-1990s. In southern Iraq, Saddam Hussein's armed forces were responsible for the deaths of thousands of civilians following an uprising by Shiite Arabs in 1991. In Iran, too, under both the U.S.-backed shah and the Islamic regime that replaced it, thousands of Iranians have been killed by secret police and other government forces. The U.S. bombing of Afghanistan during the fall of 2001 ap-

pears to have killed more civilians than the September 11, 2001, attacks against the United States that prompted it.

Decades of Israeli bombing and shelling of civilian areas in Lebanon are believed to have resulted in the deaths of more than twenty thousand people. The number of Palestinian civilians killed in Israeli assaults in the occupied West Bank and Gaza Strip far surpasses the number of Israeli deaths from Palestinian terrorists. Israeli maltreatment of Palestinians under occupation, which has included widespread violations of the Fourth Geneva Convention, has been the subject of a series of UN Security Council resolutions demanding that such practices be halted, although the United States has blocked their enforcement and vetoed dozens of similar resolutions. Reports from reputable human rights organizations have also accused Moroccan occupation forces in Western Sahara of widespread abuses, particularly during the initial conquest of the former Spanish colony in 1975.

The Function of Terrorist Groups

In general, terrorism by non-state actors arises from those who are too weak to engage in more conventional forms of armed struggle or are motivated by the sheer frustration of their situation. Some individuals who enlist with radical Islamist groups may also be promoted in part by the perceived glory of martyrdom. Supporters of such terrorism justify such actions as a means of inflicting damage on political entities and societies as a whole that are seen as carrying out mass violence through government forces too strong to confront directly.

For example, Israel's occupation and colonization of Palestinian territory seized in the Six-Day War in 1967, the ongoing repression, and rejection of demands for a full withdrawal in return for security guarantees—combined with Israel's overwhelming military power and the large-scale military, financial, and diplomatic support from the world's only remaining superpower—have led some Palestinians to support suicide bombing as a means of convincing Israel that the costs of holding on to the occupied West Bank and Gaza Strip are higher than withdrawal. Such violence has actually hardened the attitudes of Israelis and their American backers, as it appears to reinforce their assumption that the Palestinians' actual goal is not just ending the Israeli occupation of the West Bank and Gaza Strip, but the destruction of Israel itself.

The terrorism of previous decades in the Middle East, like terrorism practiced by leftist and nationalist movements elsewhere, was based upon the idea of “propaganda of the deed”—inspiring popular struggle and demoralizing their opponents. In this regard, it was almost uniformly unsuccessful, particularly as enhanced security measures made successful terrorist operations more difficult.

Suicide bombing not only was easier to carry out, since the terrorists were willing to kill themselves in the process, but Islamist groups were able—despite Islamic prohibitions against suicide and killing innocent people—to take advantage of the exalted role of martyrdom among Muslims to gain recruits and popular support. Such terrorist operations, with their poten-

tial for inflicting enormous casualties, appear to also be designed to provoke a disproportionate reaction from governments with superior armed forces, resulting in large-scale civilian casualties and thereby increasing support for their extreme anti-Western ideology. A number of strategic analysts have argued that the U.S. response to September 11, particularly the invasion of Iraq, have actually strengthened Al Qaeda by leading increasing numbers of alienated young Muslims to adopt bin Laden's view of a holy war between Islam and the West.

Some groups, such as Al Qaeda, function primarily to promote their causes through terrorism. Others, like Hamas, carry out civilian functions—such as running health clinics and schools and providing social services—as well as supporting an armed wing involved in terrorism. Some have evolved into political parties: for example, since the mid-1990s, Hizbollah has refrained from attacks against civilians, has largely restricted its armed activities to Israeli occupation forces, and has competed in Lebanese parliamentary elections.

Most contemporary Middle Eastern terrorist groups have emerged out of situations where there has been widespread social dislocation through war or uneven economic development. Virtually all have emerged in situations where legal nonviolent means of political change have been suppressed. The disproportionate level of terrorism in the Middle East appears to be less a result of anything inherent within Arab culture or within Islam than a consequence of the systematic denial by governments to allow for the manifestation of basic rights, including the right of self-determination. Given that the primary supporters and arms providers of most of these repressive Middle Eastern governments are Western powers such as the United States, the threat from terrorism is unlikely to be suppressed through military means alone.

TEXT/TEXTUALITY. This is not a definition. Well, of course it is—after all, it is appearing in a dictionary—and yet, in a certain and actually rather important way, it is not. Or, put differently, precisely to the extent that the text is not an

idea, this is not a definition. Of course, the text can be treated as an idea, perhaps even one whose time has come, but doing so misses something important about what the text is. In fact, what one misses in treating the text as an idea is its resistance to both idealism and the history of ideas, a resistance marked—however obliquely—by the necessarily digressive form of this definition that is not one.

Etymology

Text derives from the Latin *textus* (a tissue), which is in turn derived from *texere* (to weave). It belongs to a field of associated linguistic values that includes weaving, that which is woven, spinning, and that which is spun, indeed even web and webbing. *Textus* entered European vernaculars through Old French, where it appears as *texte* and where it assumes its important relation with *tissu* (a tissue or fabric) and *tisser* (to weave). All of these resonant associations are relevant to understanding how “the text” is used in contemporary scholarship, especially the interplay between its nominal and verbal forms, an interplay that registers the quality of what Julia Kristeva has called the text’s “productivity,” that is, its capacity to enable and exceed the producing, the materialization, of products.

The emergence of the text as an important concept in humanistic scholarship has taken many twists and turns. When Walter Benjamin, in his essay “The Image in Proust,” described Proust’s writing as a *textum*, a weaving not unlike the raveling and unraveling carried out by Penelope in the *Odyssey*, he was bringing to closure a tradition that dates back at least to Quintilian (c. 35–100 C.E.), a tradition of associating the literary work with a tissue woven of many threads. If it makes sense to associate Benjamin with the closure of this tradition, it is because in his insistence on the dialectic of raveling and unraveling, he foregrounds a key preoccupation of what came to be known as textual criticism. Textual criticism—a distinctive fusion of the practices of biblical exegesis, paleography, and philology linked now with the figure of the German philologist Karl Lachmann (1793–1851)—was an institutionally and largely theologically organized emphasis on the text as an empirical object. This expressed itself during the fourteenth century in the works of William Langland, Geoffrey Chaucer, and John Wycliffe (among others) as a concern for the original and therefore true words contained in any writing—in effect, what God actually said. The text was defined either in opposition to commentary and annotation or in opposition to all that is supplemental: introductions, appendices, etc. This was a text understood as a thing, as a specific and precise configuration of words toward which one was then authorized to turn his or her hermeneutical attentions.

Text and Semiological Text

When in 1972 Oswald Ducrot and Tzvetan Todorov published *The Encyclopedic Dictionary of the Sciences of Language*, it was the text as thing, the text of textual criticism, that oriented the first of their two entries on “the text,” which focused on the way the text fills a gap in linguistics, rhetoric, and stylistics by providing them with a concept of the autonomous and closed unit that arises through the individuated use of a language sys-

tem. In effect, “the text” answers the question: what thing is produced when a linguistic code is used to generate a message? In this it substitutes for either discourse or speech act. Significantly, though the *Encyclopedic Dictionary* contains a second entry on the text, it appears in an appendix, the very sort of supplementary material typically distinguished from the text of textual criticism. This text is dubbed “semiological” by the authors, a characterization meant to note the rather different way this second text engages the traditions and practices of humanistic scholarship.

In his contribution to the *Encyclopaedia Universalis* of the following year, Roland Barthes repeats this division of the concept of the text, suggesting that—despite the centrality of his contribution to the theorization of the semiological text—he found the division, if not compelling, then certainly useful. Framing his discussion in terms of the “crisis of the sign,” Barthes reminds us that the second text has a rather different genealogy than the text of textual criticism. For one thing, its emergence is considerably more recent. Although many of the writers who mattered to the theorists of the semiological text—Stéphane Mallarmé, Honoré de Balzac, Edgar Allan Poe, the Comte de Lautréamont, and others—wrote during the nineteenth century, the theorization of the text their work enabled unfolded during the postwar period in France. Nineteen-sixty is the date typically given for the emergence of the second text, and this is because it was in 1960 that the first issue of the influential journal *Tel Quel* appeared. While it is certainly the case that the text and *Tel Quel* are intimately related, the intellectual insights that converged in the concept of the text are discernible already in the 1940s. This becomes evident if one compares Maurice Blanchot’s 1948 essay “Literature and the Right to Death” with his “Reflections on Nihilism” from part two of *The Infinite Conversation* (1969). In “Reflections” Blanchot makes explicit how his earlier meditation on literature, the book, the work, and death—framed largely in terms of the Hegelian principle of negativity—converts almost effortlessly into the properly textual concerns of Barthes and Jacques Derrida. Indeed, Blanchot appears to trace here precisely the movement from work to text that was to be thematized so fruitfully by Barthes in 1971. Perhaps because Derrida has made his debt to Blanchot explicit, it is difficult not to read in the title of the opening section of *Of Grammatology* (1966), “The End of the Book and the Beginning of Writing,” the palimpsestic presence of Blanchot’s conception of the disappearance of literature and the absence of the book. While it is true that Blanchot holds the very term “text” in abeyance (systematically preferring “work”), it is clear that his profoundly philosophical engagement with the literary object opened what Barthes was later to call the “methodological field” of the semiological text.

Tel Quel

While it might be argued that the appearance of Michel Foucault’s “Language to Infinity” (an essay openly in dialogue with Blanchot) in an early issue of *Tel Quel* is what destined the encounter between the journal and the concept of the text, this presupposes rather than establishes the relevance of Blanchot. What clearly makes *Tel Quel* so pertinent to the

emergence of the text is the fact that its longtime senior editor, Philippe Sollers, sought explicitly to devote the resources of the journal to the dissemination of the concept. Indeed, it is largely through the intellectual debates stirred by the journal that the text and textuality came to belong together. Although it ceased publication in the 1980s (morphing into *L'infini* in 1982), the journal not only brought together all of the major theorists of the text—Barthes, Derrida, Kristeva, and Sollers—but, by virtue of its role in the French institutions of intellectual power, it allowed the text both to materialize and to do so in a manner that left it marked by the conditions of its emergence. Despite its heady and deeply theoretical character, the text was always in some ways a “pop” phenomenon. With the creation of the *Tel Quel* series at Editions du Seuil in 1962 (which eventually included major works by Barthes, Derrida, and Kristeva), not only was the text being widely disseminated (many titles in the series were translated), it became the topic of discussion at seminars, colloquia, and, thanks to Bernard Pivot’s *Apostrophes*, nationally televised debates. Those eager to dismiss the importance of the text typically point to this as evidence of its degraded character, but in thereby hiding the commodity character of virtually all academic concepts they overlook the distinctly textual character of the text. The heterogeneous threads woven into the concept always included unruly, indeed compromising, material elements; indeed, this was part of its purchase on the concept of materialism, a purchase that might be said to culminate in the displacement of context (whether social or historical) by contextuality.

Jacques Derrida: Writing

Philosophically, the semiological or second text was given its earliest and perhaps most enduring formulation in the work of Jacques Derrida. Although it is true that Barthes had a longer, much more intimate, affiliation with *Tel Quel* (first publishing there in 1961), he would have been the first to admit that most of the heavy theoretical lifting was done by those around him, certainly by Derrida (and earlier Roman Jakobson, Claude Lévi-Strauss, and Jacques Lacan), but also by his protégée, and later master, Julia Kristeva. Certainly, *Tel Quel*’s tenacious defense of the politics of writing (both phonetic and grammatological or *arché*) is unthinkable in the absence of Derrida. Indeed, Derrida’s attack on idealism provided Sollers and others affiliated with the journal with rigorous means by which to link their early commitment to literature with a post-engagement leftism. Derrida’s first sustained presentation of the concept of the text appears in *Of Grammatology*, although one finds important strands of the insight it crystallizes in his earlier reading of Edmund Husserl. There, the text is used in a way consistent with its use in textual criticism, except that it is linked to a meditation on the relation between what makes science scientific and writing, a link forged by making consistent appeal to Maurice Merleau-Ponty’s use of the Husserlian concept of “interweaving” in the former’s lectures on “The Origins of Geometry” from the 1950s. Invoked both by Husserl and by Merleau-Ponty to designate the encounter between language and thought, interweaving is taken up by Derrida as a way to introduce the rhetoric of textuality within a theorization of writing and its place in the dispute between science and philosophy. For example, in “Form and Meaning”

(another early essay on Husserl) Derrida explicitly translates interweaving (given in German as *Verwebung*) as the Latin *texere*, and does so in anticipation of a formulation in which linguistic and prelinguistic strata are shown to interact in accord with “the controlled system of a sort of text.” “Sort of” here marks the advent of the semiological text—that is, the concept through which Derrida seeks to challenge phenomenology’s account of the being of meaning.

The Text as Philosophical Paradigm

Of Grammatology draws out the relation between this text and a critique of the philosophical ethnocentrism expressed in the subordination of writing to speech. Although Derrida frames the issue in terms of a critique of Ferdinand de Saussure’s account of the linguistic sign, it is clear that the problems raised regarding Husserl’s figure of interweaving are not far away. Indeed, Saussure’s subordination of writing to speech is read as an expression of his tacit agreement with Husserl’s phenomenological construal of language. To challenge this subordination and the ethnocentrism sustaining it, Derrida uses the logic of the text, that is, the argument that the interweaving that confounds the distinction between different levels of consciousness and dimensions of reality also confounds not just the distinction between speech and writing but the distinction between thought and signs. Here, the semiological text comes to designate the unstable process whereby experience and representation (whether linguistic or not) engage one another in a radically undecidable manner. The oft-cited formulation “there is nothing outside the text,” which appears in the discussion of Jean-Jacques Rousseau, thus asks, at one level, to be taken this way: there is no experience that can be absolutely separated from the systems of representations developed for its expression. The text then is less a thing than a philosophical paradigm, that is, a way of representing—within the protocols and procedures of a certain discourse—the undecidable limits and procedures of representation. It is not that there is nothing but representation. Rather, if there is nothing outside the text, it is because there is nothing but the enduring missed encounter between experience and representation.

Because of the intimacy that defines the relation between *Of Grammatology* and *Writing and Difference* (from the same year), it is important here to acknowledge the way Derrida mobilizes Sigmund Freud to extend his critique of experience, a critique that might otherwise appear to leave both the personal and the ineffable unthematized. In “Freud and the Scene of Writing” Derrida, by tracing Freud’s ambivalent relation to the metaphors of writing as they appear in various discourses, shows how a textual logic is at work both in Freud’s account of neurophysiology (the thematics of *Bahnung*, “pathmaking”) and in his account of the psychical interaction of memory and perception, whether in waking life or in the dream. Thus, the semiological text, by representing the undecidable interweaving at work in the different operations of the psychical apparatus, is shown to have yet another relation to the systemic mediation of experience. If, as Derrida argues, the signifier and the signified are interwoven—in effect, structured by the differing deferral of *différance* (Derrida’s well-known neologism)—then, strictly speaking, there are no ideas. Idealism is then thrown into cri-

sis, and while Derrida's materialism has consistently defied philosophical categorization, it is clear that the text paradigm, in foregrounding the interminable labor of differentiation, exhibits an unmistakable materiality.

Julia Kristeva: Textual Productivity and Intertextuality

Perhaps because Julia Kristeva's earliest articulations of the theory of textuality are framed within the context of a more intimate dialogue with Marxism than Derrida's, the text's materiality receives more direct attention. Specifically, in several of the essays that comprise *Séméiotiké* (1969) Kristeva links the text with the concept of productivity. This term derives from her effort to rethink Marx's concept of the "mode of production" from the vantage points of linguistics and psychoanalysis, with the aim of capturing both how values (economic, linguistic, etc.) are effects of a system of relations, and how this system is defined by a heterogeneity of relations (social, psychic, etc.) that sustain themselves in a permanent state of crisis. In the essay "The Productivity Called the Text," Kristeva shows how the text, again as paradigm rather than as thing, allows one to think about how language is deployed in ways that undercut its communicative function, at once revealing and confounding the codes that organize the production of linguistic messages. Although it is impossible to designate the product of the productivity called the text, it is clear that what is at stake here is the subject in process/on trial (Kristeva's original formulation invites both). The text provides one with the conceptual means by which to theorize and thus analyze the formation and deformation of the human being that takes place in the circuits of symbolic exchange.

Crucial to her point about the systemic articulation of heterogeneous relations is the conceptual innovation of intertextuality. Derived from the semiological concept of substance (used by Louis Hjelmslev to track the plane of content from one sign system to another), intertextuality describes the transpositions that allow different semiological registers to engage one another. Kristeva's earliest characterizations of intertextuality—for example, "in the space of a text several utterances, taken from other texts, intersect and neutralize each other"—associate it with the process of literary allusion. In *Revolution of Poetic Language* (1974), however, a much stronger accent falls on the dynamics of transposition—that is, the unstable process whereby differently realized texts collide in, say, a novel—and she goes out of her way to disassociate intertextuality from the "study of sources." Because intertextuality is identified in *Revolution* as a third primary process (primary processes were Freud's list of psychic activities that effect the form and content of dreams), it is equally clear that transposition is designed to give the analyst access to the permutation of subject positions undergone in the production of a work. Kristeva's emphasis on textual interactivity underscores the interdisciplinary character of the text paradigm. No doubt because her mentor, Barthes, drew heavily on Hjelmslev's substance in his influential studies of fashion, where clothing is photographed, written about, and worn, Kristeva's use of intertextuality deliberately engages the forms of textuality that arise both in different sign systems and in different disciplines. Not

surprisingly, therefore, music and painting have mattered deeply to Kristeva's thinking about literature.

A final conceptual innovation must be mentioned. Throughout the late 1960s and early 1970s Kristeva appealed to a distinction between the "pheno-text" and the "geno-text." Obviously modeled on the discourse of genetics (such as phenotype and genotype), this distinction was not about restoring the work's "organic" character. Instead, it sought to stress the continuum of effects that passed between the formation of the speaking subject and the works produced by him or her. In *Revolution*, this distinction is tied to one between the semiotic and the symbolic, and Kristeva uses it to analyze how the subject's relation to the maternal body and the social order manifests itself in the form and content of a poem. In designating different levels of the text, the pheno-text and geno-text serve to give the textual paradigm access to a field of literary production that reaches well beyond the poem without, however, renouncing any claim on its formal detail. In providing the analyst with the conceptual means by which to track the transposition of the semiotic into the symbolic, the pheno-text/geno-text distinction gives intertextuality its deep structure. In doing so it makes the process of transposition central to Kristeva's theory of the text, a theory that, among other things, calls the concept of the literary tradition deeply into question.

Roland Barthes: Pleasure of the Text

As *Tel Quel's* "spiritual advisor," Roland Barthes (1915–1980) had enormous influence on the fate of the text. Although he often deferred to the theoretical rigor of others, he was unquestionably the text's most articulate and tenacious cultural ambassador. Like Kristeva he was keen to extrapolate the literary implications of the semiological text, and for this reason—not to mention the largely literary cast of the American reception of textuality—his studies *S/Z* and *The Pleasure of the Text* still define for many in the Anglophone world what the second text is. This reputation is by no means undeserved. It does, however, tend to obscure the permutations undergone by Barthes's text. In *S/Z* (a textual analysis of Balzac's *Sarrazine* [1830]), for example, Barthes deploys a straightforwardly etymological notion of the text by identifying five codes that, in his account of the story, are "woven together" in its narration. Although the strong suggestion made by the study is that this approach is warranted by its pedagogical value (and Barthes's skills here are legendary), it is clear that Barthes is reading the narrative in a deliberately textual manner. That is, he is constructing the means by which the story produces the possibility of its meanings, including, it should be added, the intensely queer motif of the sexual undecidability around which the narration winds and unwinds. This approach, also exemplified in numerous essays of the period, does at a certain point succumb to the affective charge it channels, resulting in the publication of *The Pleasure of the Text* (1973), where the figure of weaving, while not giving way entirely, recedes in importance. In its place appears a theme first programmatically identified in his groundbreaking essay from 1971, "From Work to Text": the theme of pleasure, later set off against its more strictly Lacanian double, *jouissance*.

As part of Barthes's professional trajectory from semiotics to semioclassicism ("sign breaking" or the defiling of the sacred status of signs), this shift clearly registers the impact of Kristeva (and to a lesser extent, Derrida) on his writing. Indeed, in engaging the theme of pleasure Barthes openly weaves into his text the problem of the body and its drives. Although struck by Kristeva's semiotics, Barthes rechannels pleasure toward the practice of the reader, that is, the highly mediated encounter between the absent body of the writer and the present, indeed attentive, body of the critic/theorist. Drawing on Blanchot's neutered account of literary space, Barthes reframes this encounter in the distinctly queer mood of promiscuous anonymity, making the textual paradigm accommodate a distinctly sexual, indeed homo-textual, relationality.

This attention to the reader's body and its practices (what the body does when it reads) finds perhaps its highest expression in Barthes's critique of the literary object, the work. Not content to stress the existential aspect of one's practice, Barthes links such practice to the social reproduction of the literary institution, arguing that its organizing conceit, the concept of a commodity laden with values deposited there by a genius, in short the literary work, is not only an ideological confection of that institution, but one being deployed in a rear-guard action against challenges being mounted against it from within a heterogeneous field of writings. Here, the methodological field of the text serves both to frame the literary institution, to account for its reproductivity, while also establishing how one might read from the inside out, that is, with an eye toward grasping how reading is also always an engagement with its social and psychic conditions. In thus calling for a paradigm shift from the work to the text, Barthes is not only echoing Derrida's call for the end of the book in historical terms, but is situating the text itself as the context for a transformation of intellectual power in the West, one that in demythologizing some of its most cherished ideas, challenges the West's ability to define and thereby legitimate its cultural values. In this sense the text is not itself an idea.

Textual Analysis outside Literary Studies

The specific terms in which the integrity of the literary object was questioned by the semiological text helped to catalyze discussion about objects in other disciplines. Kristeva's interest in painting and music has already been remarked. The most concerted effort to make the textual paradigm matter outside literary studies, however, was in cinema studies, where in the course of the 1970s "textual analysis" came to be synonymous with a rigorous psychoanalytically and/or philosophically inflected neo-formalism. This development had strong immediate repercussions outside France, notably in Britain, where many of the writers affiliated with the journal *Screen* saw themselves as contributing to the "textual analysis" initiative. In France, the figures typically associated with elaborating the cinematic text would include Christian Metz, Marie-Claire Ropars-Wuilleumier, Raymond Bellour, Michel Marie, and Thierry Kuntzel. That each is quite distinctive does not deny that, taken as a whole, they represent a concerted effort to displace the filmographic or humanistic object of cinema studies by bringing to bear upon the institutional consensus sustaining it all the questions animated in the works of Derrida, Kristeva, and Barthes.

Because the sound track figured centrally as one of the "codes" to weave into the textual analysis of film, music (one of several components of the sound track), and more specifically musicology, also became a site for the elaboration of the semiological text. Pitched against musicological structuralism (of the sort embodied in the work of Jean-Jacques Nattiez), the textual analysis of music sought to push away from the concerns of compositional syntax, and toward music's performativity, especially its interaction with the array of practices legitimated by post-Cagean aesthetics, notably of course dance and experimental theater. While it is certainly true that the textual analysis of music has never had the sort of impact enjoyed by cinema studies, the writings of Daniel Charles and Ivanka Stoianova have had influence. Moreover, precisely because of its emergence in musicology the textual paradigm has in significant ways secured its status as a uniquely powerful model of interdisciplinary and inter-media critical analysis. Indeed, textuality as a quality attributable to a wide variety of cultural practices derives its analytical force from the disciplinary dissemination both latent within the paradigm and materialized in its historical development.

The Global Social Text

Derrida, Kristeva, and Sollers were all still writing. Barthes died in 1980. Of the "textual survivors," none has assumed Barthes's ambassadorial responsibilities. In that sense the hour of the text may have passed. However, precisely because the semiological text posed the question of the literary, indeed the cultural, institution, thereby challenging the very logic of disciplinary reason and the ethnocentrism supporting it, the text retains what Benjamin called a "weak Messianic charge." This utopian and necessarily metacritical residue is nowhere more evident than in Gayatri Spivak's concept of "text-ility." Deftly picking up the etymological thread of the semiological text as a weaving, Spivak, in the controversial *A Critique of Post-Colonial Reason* (1999), deploys "text-ility" as the conceptual means by which to think the making and unmaking of the global social text. Specifically, she attempts to articulate the geopolitics of textile production in "the South," the multicultural fashion system supported in sectors of postcolonialism, and the "traveling theories" (a term derived from Edward Said's essay by that name) of largely Western academic intellectuals. Unashamed of her debts to Barthes and especially Derrida, Spivak makes it clear that in important ways the theory of the text, especially as it supplements itself, remains unfinished. At the very least she reminds us emphatically of what the text has always asked that we make of it: the theoretical and practical loom of the not there, the not yet—perhaps even the undefinable.

TEXTILES AND FIBER ARTS AS CATALYSTS FOR IDEAS. Working with fiber has generated many seminal ideas in the course of human history, including the first notions of rotary motion, machines, and computers. The fiber arts also have provided an important means of expression of the human condition.

String

At some unknown time before 25,000 B.C.E. (when we get our first direct evidence), humans figured out that you could make long, strong flexible strings by twisting together thin, easily bro-

Figure 1. Earliest weaves: (a) twining with paired wefts; (b) warp-wrap twining; (c) plain-weave. COURTESY OF THE AUTHOR

ken plant fibers. Twist adds great strength, as one learns by twisting together a handful of fibers from a dead vine after the winter weather has rotted away (retted) the woody parts. The resulting string can be used in numerous ways to make life easier and more convenient: for tying things together (increasing one's power to carry, to store, and to make compound tools) or tying things down, and for crafting snares and nets (making hunting and fishing far more efficient). String is probably the special tool—almost unseen in the material record—that allowed the human race to move, during the Upper Paleolithic, into many ecological niches they otherwise could not have handled. All human cultures have string. Actual impressions of twisted plant fiber string and twined netting were found at Pavlov, Czech Republic, from 25,000 B.C.E., the middle of the Upper Paleolithic (Fig. 1a). These remains are already so sophisticated that string- and net-making must have been practiced for some time, possibly since the start of the era of cave art, c. 40,000 B.C.E. Other evidence of Paleolithic string and its uses has been found across Europe from 20,000 B.C.E., including increasing numbers of bone needles and fine-holed beads.

Once the domestication of plants and animals began in the Near East at the beginning of the Neolithic, c. 9000 B.C.E., evidence for fiber arts increases dramatically (partly because the newly permanent settlements make it easier to find human artifacts at all), allowing us to see new ideas in fiber and string technology.

Flax, still today an important fiber plant, was one of the first plants domesticated, and one of the first animals domesticated was the sheep (specifically *Ovis orientalis*). But sheep were domesticated for meat, not wool, as most people assume. Their coats were not soft and woolly, but coarse and bristly like a deer's, and it evidently took some four thousand years of inbreeding and selection to develop useably woolly sheep. Before that, domestic sheep and cattle were raised to be killed for food, but around 4000 B.C.E. people conceived the radical idea that they did better by keeping the sheep alive. Instead of providing one feast and one hide, each animal could provide a continuing supply of wool for clothing and of milk for food (preservable as yogurt and cheese). This change, as revolutionary as domestication itself, came to be known as the "secondary products revolution." Wool, from ever woollier sheep, is still one of the most important fibers worldwide.

Figure 2. Women weighing and preparing wool, spinning with drop-spindle, weaving on warp-weighted loom. From Greek wedding vase, 560 B.C.E. THE METROPOLITAN MUSEUM OF ART, FLETCHER FUND, 1931 (31.11.10) PHOTOGRAPH, ALL RIGHTS RESERVED, THE METROPOLITAN MUSEUM OF ART

Another key Neolithic invention was the spindle. Plant fibers are often long, making them easy to twist by hand into a single length of string. But for longer pieces, or if the fibers are short, one encounters a problem, for the string, once twisted, becomes quite ornery the moment you let go of one end to add more fiber to the other. It either untwists or gnarls up in a tangle, both effects being counterproductive. The solution is to wind it up on something, say a stick, which both stores it and keeps it from tangling or untwisting. But then the easiest way to twist more fiber onto the free end is to turn the stick itself. That's what a spindle is: a rod for holding the finished thread while adding twist to the newly forming part. The spindle can be twirled in the hand (hand-held), or with one end in a dish (supported), or hanging in the air from the newly forming thread (dropped) (Figs. 2 and 10). The speed and steady inertia of its spin can be increased by adding a little flywheel to the rod: an apple or potato will do, but we start finding small clay disks or wheels for the purpose, called spindle whorls, early in the Neolithic, by 6000 B.C.E. Spinning with a whorl-weighted spindle is many times faster (and easier) than twisting without a spindle.

So from the notion of twist to the notion of twirling a stick to the addition of the spindle whorl, humans came up with their first ideas of rotary motion, translated only much later, c. 3000 B.C.E., to the idea of the load-bearing wheel—a key idea that seems now to have been thought up only once, and in the area where spindles were invented.

Spindle technology was so easy, efficient, and portable that it remained essentially unchanged for seven thousand years, until the invention of the foot-powered spinning wheel in the Middle Ages, a design that quadrupled the speed of spinning and that was apparently jump-started by ideas from China, and finally, the spinning jenny—a hand-powered multiple spinning machine—during the industrial revolution. Hand spindles are still used in rural areas, however, where women make thread from fiber while doing other chores.

Textiles

Toward the end of the Paleolithic, people developed the idea of interlacing string or other long thin elements in a regular way to form a broad fabric: impressions of twined net or cloth

were found at Pavlov (see above) from 25,000 B.C.E., and fragments of mats and baskets are often found in the Near East from 7000 B.C.E. onwards. In a sense, the idea of interlacing is far older, since other large primates, such as chimps, will loosely “weave” together a few branches in a treetop to make a comfortable place to nap. (One can still see pleached [plaited] fences woven of the live branches of hedge plants in rural Wales [Fig. 3], and house walls woven of dead branches [wattle] were common in earlier times.) But interlacing in a *regular* way to make a *portable* object was a much newer idea.

Cloth differs from mats and baskets in one important respect. Mats and baskets, which hold their shape, are made principally from stiff materials, whereas cloth (whose prime quality is floppiness) is made entirely from pliable string or thread. A little experimentation will convince the reader that one cannot compactly interlace several pieces of string that are simply lying about: one set of string must be held under tension—a substitute for stiffness. This “foundation” set of threads is called the warp, and the frame that holds it is the loom (Fig. 4). Then it's easy to lace in crossways a second set—the weft or woof (both from the same ancient linguistic root as *weave*). There are also ways of holding several sets of material taut, as in braiding and other forms of plaiting and netting; but tension is basic to all of these.

Heddles

Most cloth today is true weave, in which the weft simply goes over and under successive warp threads (Fig. 1c; possibly in a pattern) rather than twisting around the warp or around other weft (twining; Fig. 1a–b). Because of the twist, twined fabrics are inherently more stable than those in true weave (consider how easily a torn edge of modern cloth frays out). Early cloth-like fabrics were therefore twined, as at Pavlov and in the earliest known cloth in the Western Hemisphere (from at least 8000 B.C.E.). The only advantage to true weave is that, unlike twining, the weaving process is mechanizable, making the production of true-weave cloth many times faster than that of twined cloth. When you can make so much so fast, the problem of unraveling becomes less important (and one can prevent raveling by binding the raw edges). Our first proof of true weaving occurs at Çatal Höyük, in central Turkey, around 6000 B.C.E., where we find a large amount of plain-weave

Figure 3. Freshly “pleached” hedge: thin, live branches have been bent obliquely to the right and woven across upright stakes. Powys, Wales, 1989. E. J. W. BARBER

Figure 4. Earliest extant depiction of loom. At bottom: horizontal ground loom with warp stretched between two beams pegged to the ground. At top: either weft-preparation or a mat loom. Painted dish, Badari, Egypt, c. 4200 B.C.E. © PETRIE MUSEUM OF ARCHAEOLOGY, UNIVERSITY COLLEGE LONDON

linen—coarse and fine; tight and open; hemmed, fringed, and with reinforced woven selvages of three sorts—and a very small amount of twined linen. The sheer statistics, as well as the fine and even weaving, tell us that these people knew and used the heddle—the invention that mechanized the loom.

Heddles are difficult to explain abstractly (although easy to use) and must have been very difficult to think up. The evidence suggests that the heddle was invented only once in human history and spread across the world from there. In 1900,

when extensive ethnographic work was being done in remote parts of the earth, it was clear that many human cultures had never got the idea of weaving with heddles, or even, in a few cases, of any kind of weaving.

Let’s imagine a loom in which the warp lies horizontally. The problem is to separate the warp threads so that one half—every second thread—is lifted. When the weft passes through the resulting “tunnel” (called the shed, from an old word for “divide”), it leaves its trail under one (lifted) thread, over the next (unlifted) thread, under the next, and so on. This can be accomplished easily by shoving a rod, called a shed bar, through the warp in exactly this way: then lift the rod, and you open the shed.

But the problem of lifting the other half of the warp, for what is called the countershed, is not so easy. You could stick a second rod into the opposite shed, but you will find your two rods interfere with each other hopelessly: one prevents the other from being raised. What you need is a discontinuous rod. Impossible.

The solution is to lay the second rod on *top* of the warp (not the obvious place), where it won’t interfere with the shed rod, then make a series of string nooses (heddles), each of which is attached to this rod (the heddle bar) and to one warp thread. Among them, they catch up all the intervening warp threads that still need to be raised. Now raise the heddle bar, and you open the countershed.

The solution of this difficult three-dimensional problem produced the world’s first complex machine, one with multiple moving parts, before 7000 B.C.E., more than a millennium

before the invention of fired pottery and nearly four thousand years before the hot-working of metals.

Looms

Once heddles were invented, loom weaving spread rapidly, spawning different types of looms. Narrow band-looms must have come first, then wider ones, with the warp stretched horizontally (as in Mesopotamia, Egypt, China, and Southeast Asia), vertically (Syria), or aslant (Europe and Central and South America), and tensioned with twin beams (Mesopotamia, Egypt, and Syria), weights (Europe), or the body (China, Southeast Asia, and Central and South America) (see Figs. 2, 4, 5, and 10). On all these early looms, the heddle bars—of which there might be several, for patterning—had to be shifted by hand to change the sheds.

The next conceptual development was to rig up pulley-linked treadles to use the feet for changing sheds, thereby freeing the hands to manipulate the weft more efficiently. Our first evidence for treadled looms comes in a manuscript of 1200. It shows the weft carried in a true shuttle (Fig. 6) rather than on a simple stick bobbin (as in Figs. 2 and 10). With the flick of one hand, this boat-shaped device can be shot rapidly through the wide-open shed—lightly supported on the horizontal warp as it passes across—and caught with the other hand, ready for the return shot a moment later when the stomp of one foot changes the shed. Again the new ideas, possibly inspired by information about Chinese practices, helped speed the work enormously.

To produce the elaborate silk brocades Chinese customers wanted, weavers eventually developed a system of pulling (“drawing”) the pattern heddles up by means of strings attached to special heddle bars that caught up the requisite threads for each row of the pattern. Called the draw-loom, this extremely complicated

Figure 5. Woman weaving on a foot-tensioned backstrap loom. From a figurine on top of bronze Chinese vessel, Han Dynasty (206 B.C.E.–220 C.E.).

device required both a weaver to insert the variously colored wefts and a “draw-boy” (or -girl) perched above the loom to pull the strings. At the beginning of the nineteenth century, with fancy brocades in high demand in Europe, a French inventor from Lyon (center of the European silk industry), J. M. Jacquard, figured out how to mechanize the draw-loom process by punching onto cards the information about which heddles to raise for each successive row of the pattern (Fig. 7). The information was picked up mechanically, since the needles that slid through holes in a given card caused iron bars to lift hooks attached to the heddles. This idea of punch-hole patterns to encode and store information, already used in Lyon for simpler textile mechanization by 1730, facilitated the development of data storage and control mechanisms in the later nineteenth century, leading ultimately to the twentieth-century computer.

Clothing

Why was textile production such a catalyst for new ideas? Presumably because textiles had such important uses that people were pushed hard to improve the technology. But what were these uses, and how did we become so dependent on them?

Cloth is so perishable that until the advent of writing we have very little direct evidence of how textiles were used in early eras. (Writing began in the Near East shortly before 3000 B.C.E., by which time humans had been speaking for more than 100,000 years.) But we have a few interesting hints.

As already discussed, string alone enabled people to catch and hold more; nets did likewise. But cloth enabled people to cover and wrap things, and especially, because of its extreme flexibility, things of odd or lumpy shape—like the human body.

Already at 20,000 B.C.E., still in the Upper Paleolithic, we have a few representations of people wearing clothing clearly made from twisted fiber string. For example, a carved “Venus” (or fertility) figure from Lespugue, France, depicts a plump

Figure 7. Jacquard loom. © BETTMANN/CORBIS

woman wearing a so-called string skirt, a belt-band supporting a row of strings that hang down like a skirt or apron (Fig. 8b). (The carver marked not only the twists on the strings but even how the strings are coming untwisted at the bottom.) Other Venuses of the same era from Russia (Figs. 8a and c) are shown wearing string skirts or twisted bands worn across the chest, while the Venus of Willendorf (Austria) wears a spirally worked cap on her head.

All this clothing, clearly, was fashioned from string. Yet none is of any use for either warmth or what we would call modesty. So why did Paleolithic people trouble to make such clothing?

Apparently to communicate messages. String skirts continue to appear on European figurines through the Neolithic and Bronze Ages, by which time we begin to find actual string skirts preserved on buried women (in Denmark, where woolen garments often survive), and we see them occasionally in Iron Age Greece (in literature, and on figurines and vases). These women—both those buried and those represented and talked about—are clearly not children, but full-grown. In recent centuries such skirts still turn up as a key part of women’s folk costumes (rural dress) throughout eastern Europe, from the Adriatic to the Urals and from southern Greece to Latvia.

Wherever we find representations or physical remains, the woman has reached child-bearing age; wherever we find direct information about the skirt’s meaning, from Homer to the

Figure 8. Paleolithic “Venus” figures of c. 20,000 B.C.E. wearing string clothing: (a) cords across chest (Kostenki, Russia); (b) string skirt in rear (Lespugue, France); (c) string skirt in front (Gagarino, Russia). The string skirt apparently signaled child-bearing status. COURTESY OF THE AUTHOR

modern ethnographers, it invariably indicates something about the ability or willingness to bear children. In eastern Europe, in fact, we learn that girls are not *allowed* to wear them until they reach puberty, at which point they *must* do so. In short, the string skirt (or its surrogate) gives the viewer crucial biosocial information about both the females who wear it and those who do not.

A quite different piece of clothing, in these societies, signals that the woman is also married and therefore no longer available: a headdress completely covering the hair. (It was, and in some places still is, widely believed that a woman’s fertility resides in her hair.) In modern Western societies, this message is conveyed by a piece of jewelry, the wedding ring.

What we see, then, is that humans started to devise clothing as a means of communication, and not, as is generally supposed, for warmth. We tend to forget that prolonged exposure to less-than-extreme cold inures the body to frigid weather (and, in fact, the humans in most depictions prior to the Bronze Age, which begins about 3000 B.C.E. in the Near East, are naked). Although not so flexible as language, clothing signals have the advantage that they do not die away instantly, but rather persist over time. If a woman wears a wedding ring, she doesn’t have to keep saying “I’m taken” every time a man looks at her. The earliest signals sent by clothing that we can detect thus concern marital status. Such signals gradually formed a vital communication system parallel to but independent of language.

Although harder to pin down, early uses also include marking special events, particularly religious rites, and along with this, marking people central to those events. For instance, Upper Paleolithic cave art includes a depiction of what appears to be a dancing man clad in what look like a deerskin and antlers (Trois Frères, France), presumably involved in a ritual.

One of the earliest clear depictions we have of a religious scene is on a tall alabaster vase from the great Mesopotamian

Figure 9. Naked workers (middle) and clothed elite (above) involved in agricultural ritual. Adapted from stone vase, Uruk (Warka), c. 3200 B.C.E.

city of Uruk, shortly before 3000 B.C.E. (Fig. 9). The bottom registers depict the key domestic plants and animals (wheat and sheep); above them, lines of naked workmen carry baskets laden with agricultural produce. In the top register we see people wearing kilts or long robes presenting some of this produce to a long-robed woman who, judging from the banners hung next to her, is either the goddess Inanna or her priestess. So people already “dressed up” for religious ceremonies, and the textiles sometimes marked the religious space itself.

We still tend to dress more specially for church, synagogue, mosque, or temple; special shawls, robes, or hats usually mark key participants; and the place of worship is generally set off or “dressed” with special textiles, from altar cloths to prayer rugs to screens and pavilions. In fact, in many cultures (for example, Indonesia or classical Greece), the laying out or hanging of special textiles serves to make that space sacred for the moment, in order to carry out a wedding, funeral, judgment, or other rite. Anyone of that culture, seeing that textile, recognizes its significance, although others probably will not.

The Uruk vase shows us something beyond religious status, however. While the peasants are naked, the elite are coming to be distinguished by their clothing. This idea of social status as economic and political, rather than solely marital or religious, seems to begin with the concentration of masses of people into cities in the fourth millennium B.C.E. and to spread with the quest for metals that ensued.

Metals were the first important commodity that people could neither grow nor find in their backyards; obtaining them required organizing resources to support expeditions to mine ore or to trade for finished metal. This meant increasingly permanent stratification into leaders and followers (instead of temporary stratification for local warfare) and quickly led to the differentiation between those who had power—and easy access to imported goods—and those who did not. The ancient

monuments show us that soon everyone in “civilized” areas took up clothing. Wearing clothes even came to be viewed as a mark of being civilized, to the Chinese and to many other cultures.

Clothing Design

Belts, cloaks, kilts—the earliest garments depicted—are mere wraparounds. The Egyptians are the first on record to think of sewing up cloth into a permanently formed dress, in their case a tube for the torso, held up by a strap over one or both shoulders and forming a sort of jumper (Figs. 10 and 11a). The earliest preserved body garment we possess is a First Dynasty linen shirt (c. 3100 B.C.E.) in which the idea of tubes has already been taken further to include sleeves (Figs. 11b and 12). Where one would expect the narrow supporting straps, two long rectangles of cloth were added, sewn up along the edges to form tube sleeves.

In the Near East, on the other hand, people seem to have worked from the concept of a garment hung from the shoulders. When they began sewing up clothes, rather than draping them anew with each wearing, they cut a neck hole in the middle of the cloth and sewed up the sides, eventually adding two tubes for sleeves (Fig. 11c). Our first extant example of this garment type was found in Tutankhamen’s (c. 1370–1352 B.C.E.) tomb (though details show it to be a Syrian import). This general design, improved by opening the front for easy donning (Fig. 11d), was destined to survive till today as our basic upper garment. Our oldest examples of this construction occur on magnificently preserved Caucasoid mummies from the deserts of central Asia from 1000 B.C.E.

These same immigrants also preserve our first examples of another clever use of cloth tubes: trousers, invented shortly before 1000 B.C.E. by Eurasian horsemen for protection while riding horseback (Fig. 13). Again, this clothing design has come down to us as one of our basic garments.

As textile technology progressed, who wore what often became strictly codified. In Egypt, only the pharaoh folded his kilt with the left lappet on top; in Rome, only the emperor could wear a garment entirely of purple, and only noble citizens a purple stripe. This meant the viewer could read rank and station from another’s costume, even, in some cases, down to the last degree. In China, for example, officials of all types sewed onto their robes fair-sized rectangular emblem-patches, known as rank badges, that specified their exact rank and position in the governmental hierarchy. (The highest emblem was the dragon, which only the emperor could wear.) Aztec warriors, for their part, displayed their degree of prowess in battle as special emblems on their cloaks. Less formally, but just as rigidly, European folk dress evolved in such a way that the knowledgeable viewer could look at a village woman’s garb and determine that, for example, the wearer had reached puberty, was a Christian rather than Muslim or Jewish, was not particularly wealthy, came from a certain village or locality, and was a skilled and diligent worker. The elements that conveyed this information accrued one by one over twenty thousand years, to the point that the costume represents multiple layers of walking history.

Figure 10. Egyptian textile workers (right to left: spinner, flax-splicer, overseer, two weavers squatting beside horizontal ground loom). Although much of this kind of information could be read from nineteenth-century traditional dress throughout Eurasia, the same could not be said in England, for an interesting reason. There the nobility habitually gave its cast-off clothing to the servants and tenant farmers, a practice that increasingly obscured an observer's ability to determine someone's standing by clothing alone, although poor fit, fraying edges, and outmoded fashion would give clues. Consequently there is no English "peasant costume" as in other parts of Europe. In this way, although court dress at the top of the scale was highly controlled, dress in the lower classes became more democratic, a trait that, to some extent, moved to North America with the colonists. In the early twenty-first century, the farther west you go across the United States, the less dress and its potential signals of status matter to many people. On West Coast college campuses it can be hard to tell students from professors, and at the Los Angeles Opera you may see everything from tuxedos and jeweled evening gowns to blue jeans—and running shoes on both sexes. For the middle class, at least, what you wear during leisure time is more a function of how you feel that day than of how you wish others to perceive you. If anything, the Bronze Age idea of telling people your social rank through dress has been emphatically rejected, and westerners will complain about easterners' "class consciousness."

The same people, however, still send messages through the textiles they choose to wear by selecting them according to

their personalities—within, of course, the general mores of their culture. Pluck them out of Los Angeles and drop them into, say, Ankara or Turfan, and their clothing readily signals their cultural origin.

Handmade textiles, too, have always had a personal element. Those who wove, embroidered, or knotted pile for home use are repeatedly documented as taking the attitude, "If I'm going to put this much work in, and use it all my life, I want it to look the way *I* want it to look." Hence no two rugs or aprons or blouses looked alike: the traditional was simultaneously personal.

Furnishings

Since about the third millennium, messages similar to those given by clothing have been transmitted by the textiles we use to dress our surroundings. We mentioned using cloth to set apart and adorn religious or sacred space, but textiles also adorned the home, as bedcovers, curtains, cushions, and so forth. Evidence from Çatal Höyük, Turkey, whence some of our earliest textile fragments (6000 B.C.E.), indicates that people slept and sat on low clay platforms covered with padding (dried grass? rushes?) topped with mats or textiles. The ancient Egyptians manufactured only plain white linen for normal household use—sheets, bedspreads, towels, and clothing—but from at least 2000 B.C.E., they were importing fancily patterned woolen cloth from the Aegean to make into

Figure 11. Construction of early clothing types: (a) Egyptian dress made of tube with shoulder strap; (b) Egyptian shirt, in which shoulder-straps were elongated into sleeves; (c) Syrian shirt with neck-hole in cloth hung from shoulders; (d) Eurasian nomad shirt, hung from shoulders but with front opening. COURTESY OF THE AUTHOR

ostentatiously colorful canopies, apparently to advertise their social status. Around 1370 B.C.E. we also glimpse colorful rugs and cushions, again probably of imported fabric.

We read in classical Greek literature that cloth tents were set up temporarily on temple grounds for celebrations. These pavilions were constructed from textiles decorated with elaborately woven scenes—rare and expensive textiles dedicated to the deities as votive gifts and stored in temple storehouses. Temples served as the treasuries, and indeed, museums, of the ancient world, just as cathedrals did in medieval times, and the rarer the gift, the higher the giver in people’s estimation.

Among nomadic peoples of Eurasia, cloth furnishings were even more important than among their sedentary neighbors, since cloth was highly utilitarian yet portable. They made their houses out of collapsible wicker frames covered with felt (densely matted wool) and fastened with colorful woven straps that signaled to visitors whose yurt (felt tent) it was (Fig. 14). Their possessions were stored in chests covered with brightly patterned felt padding, and their precious china teacups were carried in padded felt pouches. Pile carpets formed the (movable) floors, and colorful interior hangings further insulated and adorned the walls. Even the plates for dry foods were often made of felt. Because textiles were so central, they were an

important form of gift exchange: in frozen burial sites of the fourth century B.C.E., in the Altai Mountains, excavators found saddle cloths of Chinese embroidered silk from far to the east, and of Persian woolen tapestry from far to the west, as well as of local polychrome felt cutwork.

As the world became more interconnected, trade in textiles became increasingly important. We hear of such trade already between Mesopotamia and Syria before 2000 B.C.E. and between Assyria and Anatolia (roughly modern Turkey) in 1800 B.C.E.; between China and India in the second century B.C.E., and between China and Rome in the early centuries C.E. (along the newly opened, so-called Silk Road). Long voyages of discovery were undertaken by Europeans in the fifteenth and sixteenth centuries to open up more trade with the Orient in textiles, as well as in spices and other commodities, leading to the accidental opening of routes to the New World. As such trade became serious international business, textile wars also broke out—the struggles among the Spanish, British, and Dutch over the wool trade among them—for, as the middle class rose after the breakdown of feudalism, more and more people wanted to display their status by means of elegant textiles for the furnishings of their parlors as well as their clothing. Imported fabrics spelled luxury, and their display announced those ever-crucial social messages.

THEATER AND PERFORMANCE. "Performance" is an influential theoretical paradigm in the arts and humanities, with adherents in disciplines as diverse as anthropology, linguistic philosophy, and theater. Since the early 1980s, thinking about performance has been fostered in "performance studies" programs, disciplinary hybrids with widely variant intellectual genealogies, united by their commitment to performance as their central object and method of research.

Performance Studies' Interdisciplinary Genealogy

Histories of performance studies most frequently cite its formation in the convergence of experimental theater and structuralist anthropology in the late 1960s. Avant-garde theater practitioners in the United States such as Richard Schechner were exploring cultural traditions of performance that fell outside entrenched disciplinary traditions of Western theatrical practice and theater studies. Their work drew on research into archaic ritual and non-Western performance forms, unsettling representational conventions of illusionism and distinctions between artistic disciplines, exploring the significance of neglected parts of the performance process, such as audience response, rehearsal, and training, and blurring the boundaries between art and everyday life. Their investigations coincided with the structural anthropologist Victor Turner's interest in ritual, festival, and other forms of symbolic, collective action. Turner's dramatically inflected analysis of public culture and social events saw performance as the site of a given culture's fullest and most self-conscious expression of its unique values and categories, and the engine of its perpetuation and transformation. Schechner and Turner's research collaboration spurred the formation of New York University's Performance Studies Department in 1980.

The contemporary field of performance studies as a whole owes its genesis to a still broader range of disciplinary interests.

The Department of Performance Studies at Northwestern University, for example, grew from the tradition of oral interpretation of literature dating back to the late nineteenth century. Attuned to the rhetorical power of acts of verbal and embodied performance, the Northwestern school's interest is still primarily in performance as a mode of human communication that is "creative, constructed, collaborative, and contingent." Influential currents in the sociology and psychology of the 1960s and 1970s also informed the development of performance studies. These included the theorization of play, social dramaturgy, and the presentation of self in everyday life developed in the work of Johan Huizinga, Roger Caillois, Erving Goffman, and others, and the interpretive or symbolic anthropology of Clifford Geertz. At its broadest level, performance studies probably owes most to the linguistic turn in the arts and humanities, and its development has been closely aligned with poststructuralist or postmodernist innovation in philosophy, linguistics, anthropology, feminism, area studies, cultural studies, folklore, postcolonial studies, and queer studies.

Performance as Object

As an "interdiscipline," performance studies prides itself on its open, multivocal, and fluid character, refusing to dictate either a core methodology or canonical body of knowledge and resisting a fixed or exclusive definition of performance itself. That said, scholarship that goes under the banner of performance studies has in common a focus on process, action, events, and behaviors, be they physical, verbal, artistic, or technological, and claims performance—the execution or carrying out of things—as both its object and its method of study. This focus entails abandoning static, object-oriented, or textual approaches to cultural analysis, inclining instead toward processual, interactional, and experiential perspectives. An art historian or archaeologist working in performance studies, for example, might examine how a given object has functioned or been understood over time and in particular material and social contexts; a performance historian might concentrate on situating a historical document in the contexts and moments of its enunciation; an idea or political principle would not be approached in the abstract but through an analysis of its embodied enactment in ceremony, debate, or communal events. In the words of one of its more famous exponents, Dwight Conquergood, performance studies means understanding "culture" as a verb rather than a noun.

Among the basic premises shared by scholars in performance studies is the conviction that performance is one of the most powerful means that humans have for constructing reality, forging and sustaining collectivities, social relationships, and individual identities, and for questioning or imagining them otherwise. Performance is also a means for accomplishing agendas and forwarding arguments, for learning and persuading through the agency of narrative, semiotic communication, corporeal style and training, pleasure, and participation. While performance studies retains close ties to the study of Western theatrical practice, it regards illusionistic, representational theater as but one category in a broad spectrum of performance

Outdoor performance of Euripides' *Iphigenia in Taurus*, Bradfield College, Berkshire, England, 1912. The field of performance studies has its roots in the mid-nineteenth century, when experimental and avant-garde theater met structuralist anthropology. Performance was seen as a means to build new realities and stimulate the mind. © HULTON-DEUTSCH COLLECTION/CORBIS

practices, the majority of which are more concerned with *poesis* than mimesis, with making (of realities and meanings) rather than faking. Performance studies resists drawing hard and fast lines between aesthetic modes of performance and deliberative or habitual forms of action, arguing instead that analytical models used for either can be productively applied to both. However, the bulk of performance studies scholarship is still drawn to those actions along what Richard Schechner has called the “performance continuum” between everyday enactments and the performing arts, actions that are framed or designated in specific social contexts as performance.

Performance as Method

While performance studies scholars espouse a range of often innovative methodologies, the ephemeral, subjective nature of performance as its subject matter poses unique challenges. For a majority of those in the field, understanding performance as a way of knowing entails a commitment to participant-observer ethnography as the principal research methodology. Dwight Conquergood, who has written extensively on this issue, sees the performance ethnographer and her “informant” (or the teacher and student, performer and audience) as engaged in reciprocal, collaborative performances. Studying performance in this way foregrounds cultural knowledge as contingent, socially located, embodied, and contested, and implies that the ethnographer is directly implicated in and responsible to the community in which he or she studies. Following from this assumption, performance studies scholars frequently vaunt an open, politicized commitment to a position within their field and understand their performance scholarship as a mode of advocacy as much as analysis. Furthermore, they are frequently practitioners or artists themselves, confusing traditional anthropological distinctions between the subject and object of research.

Performance, Performativity, and Theatricality

The performance concept has since the late 1980s enjoyed a reach beyond this interdisciplinary constellation of performance studies through the elaboration of theories of performativity. Judith Butler's famous formulation draws on continental philosophy and the work of the linguist J. L. Austin to argue that, through processes of forcible iteration, discourse has the power to enact or materialize (to “perform”) that which it names. Adherents of performativity use these theories, in the place of earlier theories of “representation,” to explain the ways in which norms of gender and sexuality are produced, reproduced, and modulated in cultural production. Thanks to this work, the performance concept has a life throughout the arts and humanities, even as current debates in performance studies seek to reconcile their field's orientation around acts of performance (the tactical and interpretive agency of the performer and audience, and the subversive or deconstructive nature of theatrical traditions) with performativity's emphasis on the power of textual systems.

The State of the Field

Performance studies has been most notable for work that examines the politics and poetics of identity (gender, race, ethnicity, and sexuality) in ways that are both responsive to the claims of human creativity and criticality and cognizant of the normative forces that constrain such expressions. This work avoids the Enlightenment distinctions between mind and body that have proved an obstacle to similar critique from other disciplines. Significant areas of interest in the field in the early twenty-first century include tourism, urban festivity, historical ethnography, pedagogy, and the performance of space and place. True to the origins of performance studies, much work examines contemporary performance art and experimental theater from a perspective that provocatively mixes criticism and practice. In a field that has historically privileged the localized study of live, embodied action and interaction, interest in globalization, diaspora, cyber-communities, and virtual, technological, and “mediatized” performance has proved theoretically fertile. Some prominent scholars have made broad claims that performance is the predominant paradigm of a globalized age, comparable to the colonial era's orientation around models of “discipline.”

Performance studies is flourishing both within and outside the United States. Its flagship journals, *The Drama Review* (TDR) and *Text and Performance Quarterly* have been joined by publications such as *Performance Research*; performance research centers have been established in Cardiff, Wales, and Christchurch, New Zealand; and conferences have been held in Japan, Germany, and Singapore. The doctoral programs at New York University and Northwestern University, and the performance studies focus areas of numerous communications programs, have been joined by a world theater and dance program at UCLA, and formerly traditional theater programs (at the University of California at Berkeley, for example) are adopting the performance studies moniker as they increasingly embrace research interests and theoretical paradigms from outside the bounds of Western institutionalized theater.

Whether performance studies can sustain itself as an “interdisciplinary” formation, given the claims made on the performance concept by a range of disciplinary competitors, has been a matter for debate since the earliest inception of performance studies institutions. As a powerful tool for thinking about cultural process from the point of view of human action and expression, however, the performance concept will doubtless be a significant feature in the landscape of cultural criticism for some time to come.

Margaret Werry

THEODICY. Gottfried Wilhelm Leibniz’s (1646–1716) neologism *théodicée* (from Greek *theos*, God + *dike*, justice) means divine justice, but the term has long been conflated with John Milton’s (1608–1674) promise to “justify the ways of God to men.” In 1791 Immanuel Kant (1724–1804) defined theodicy as “the defense of the highest wisdom of the creator against the charge which reason brings against it for whatever is counterpurposive in the world” (p. 24).

Many intellectual historians see theodicy as a specifically modern, perhaps even a more specifically eighteenth-century phenomenon, but the term has come to have broader meanings. Auguste Comte (1798–1857) described all natural and philosophical theology as theodicy. Scholars of religion call all efforts to answer a problem of evil thought to be universal theodicies. The Book of Job, the Indian doctrine of karma, and even capitalist faith in the market have all been seen as theodicies.

There is good reason to restrict the meaning of the term, however, if not to post-Leibnizian thought then at least to philosophical discussions of a certain sort. Works like the Book of Job do not offer philosophical justifications of God, or even accounts of his justice; slamming the door in the face of human demands for intelligibility simply cuts the knot. Much can be learned from examining the presuppositions that make the door-slam inadmissible in the modern age.

Early Modern Theodicy

Pierre Bayle (1647–1706) forced the problem of evil in his 1697 *Dictionnaire historique et critique*. He may have been inspired by Nicolas de Malebranche’s (1638–1715) insistence on the world’s imperfections—albeit in the context of an argument for the supremacy of God. For Malebranche, evils prove that God sought not to create the best of all possible worlds but only the most perfect in relation to God’s ways. He could have created a better world, but this world, the work of “general” rather than “particular volition,” better expresses his nature.

Leibniz’s *Essais de théodicée* (1710) responded to Bayle’s challenge, but offers little that was really new. Leibniz himself traced its most famous claim—that this is “the best of all possible worlds”—back to Plato. The related idea that a perfect world is not possible because not all possible things are “compossible” with each other has a Stoic pedigree. Both claims had come close to the surface of Martin Luther’s polemic with Desiderius Erasmus and were explicitly made by Spanish Jesuits and by the Cambridge Platonists.

While Leibniz thought that we would do well to be more attentive to the good in our lives, his argument was a priori. A God infinite in goodness, power, and wisdom would not create a world unless it were good, and, if several worlds were possible, would create none but the best. “It is true that one may imagine possible worlds without sin and without unhappiness,” Leibniz conceded. Yet, “these same worlds again would be very inferior to ours in goodness. I cannot show you this in detail. For can I know and can I present infinities to you and compare them together? But you must judge with me *ab effectu*, since God has chosen this world as it is” (*Theodicy* §10).

Optimism. Christian Freiherr von Wolff (1679–1754), Leibniz’s most influential disciple, thought that Leibniz had unnecessarily abandoned the best argument against atheism—the argument from design, known in Germany as teleology or physico-theology. Much early-eighteenth-century thought offered teleological arguments that this was the best possible world. The word *optimism* (from *optimum*, the best), coined in the 1730s, lumped together decidedly different arguments. Wolff’s Leibnizian arguments are quite different from Alexander Pope’s assertion, in his best-selling *Essay on Man* (1733), that “Whatever IS, is RIGHT.”

The hollowness of optimistic claims was shown by Samuel Johnson’s *Rasselas* (1759), Voltaire’s *Candide* (1759), and most decisively by David Hume’s posthumously published *Dialogues Concerning Natural Religion* (1779). Hume’s character Philo declares “Epicurus’ old questions” concerning the compatibility of belief in God with evil “yet unanswered.” Immanuel Kant tried to show that they could never be answered.

Kant. Although he was originally a defender of optimism and remained impressed by the evidences of physico-theology, Kant pulled the rug out from under the project of theodicy. As an endeavor fusing theoretical and practical reason, philosophical theodicy for Kant represented a particularly dangerous form of pretension: it threatened to blunt the sense that

THEODICIES OF SUFFERING AND GOOD FORTUNE

Max Weber thought that the problem of theodicy was the stimulus for the “rationalization of religious ideas” in all—not just monotheistic—religious traditions. Alongside “theodicies of suffering,” accounts of the nature and distribution of misfortune in the world that console those who suffer, Weber discerned another kind of view that reassures those who do not suffer that it is just and right that they be spared. He deems this the “theodicy of good fortune” (ch. 6).

The idea seems to have roots in Marx, but Weber adds the idea that those theodicies that last are those that speak both to the fortunate and to the unfortunate. He thought only three have ever done so: Zoroastrian dualism, the Calvinist understanding of the hidden God (*deus absconditus*), and the Indian doctrine of karma, “the most complete formal solution of the problem of theodicy (ch. 8).

Weber’s is the most impressive effort to expand the meaning of theodicy beyond its monotheistic origins. No longer a problem only for theists, theodicy arises in response to the general problem of the “the incongruity between destiny and merit” (a Kantian problematic), which challenges all human efforts at making theoretical and practical sense of the world. Weber’s understanding of theodicy as a species of the problem of meaning has shaped important theories of religion by Clifford Geertz and Peter Berger.

defined the human ethical vocation—that the world of our experience is not as it ought to be. In his mature philosophy of religion, Kant was particularly attentive to insincerity and saw philosophical theodicies as a key example.

In his essay “On the Failure of All Philosophical Efforts in Theodicy” (1791), Kant likened theodacists to Job’s comforters. By contrast, Job, whose faith in God was firmly rooted in the moral law rather than in the claim to be able to understand God’s ways, was able to stand fast in his piety despite his “counterpurposive” experiences. In the place of the hypocrisy of “doctrinal” theodicy Kant recommended Job’s “authentic theodicy”: “honesty in openly admitting one’s doubts; repugnance to pretending conviction where one feels none” (p. 33).

Progress and Pessimism

Theodicy was not yet dead, however. Georg Wilhelm Friedrich Hegel (1770–1831) thought philosophical efforts at theodicy had failed only because they did not see history philosophically. Properly understood, history is “the true theodicy.” Like other nineteenth-century accounts of necessary progress, he did not deny the reality of evil. Evil qua evil is a necessary moment in the unfolding of spirit. For Karl Marx (1818–1883) and Friedrich Engels (1820–1895) feudalism was a necessary stage in human history. For Herbert Spencer (1820–1903) the competition that led to the “survival of the fittest” was the best promise for a bright future.

In response, Arthur Schopenhauer (1788–1860) developed his philosophical “pessimism,” a deliberate reversal of optimism. This is not the best of all possible worlds, but the worst, a mindless machine of self-inflicted suffering, among whose cleverest devices are precisely the philosophical theories of teleology and progress. All efforts to make life bearable only make things worse. The only hope is to deny the will to live. Schopenhauer claimed that his pessimism made it like Buddhism, a mistaken equation that persists to this day.

In turn, thinkers as varied as Friedrich Nietzsche, William James, and Karl Barth argued for views that acknowledged the impossibility of canceling out the evils of the world and yet affirmed the world. But these views are no longer theodicies—or at least do not claim to be. What makes it possible for us to resist pessimism is not reflection on the experienced order of the world but will (Nietzsche), temperament (James), or grace (Barth).

Contemporary debates. Debate on theodicy has come to be dominated by two very different tendencies. There has been a revival of philosophical theodicy among analytic philosophers of religion, who have moved from attention to the “logical problem of evil” to the “evidential problem of evil.” Alvin Plantinga has revived the important distinction between the “defense” of a view against objections and the far more demanding philosophical establishment of that view, which he calls “theodicy,” and which he thinks we can do without. On

the other hand, the very desire to do theodicy has been condemned as irreligious or ideological. “The disproportion between suffering and every theodicy was shown at Auschwitz with a glaring, obvious clarity,” wrote Emmanuel Levinas (p. 162).

THEOLOGY. See *Religion*.

THIRD CINEMA. “The anti-imperialist struggle of the peoples of the Third World and of their equivalents inside the imperialist countries constitutes today the axis of the world revolution. Third cinema is, in our opinion, the cinema that recognizes in that struggle the most gigantic cultural, scientific and artistic manifestation of our time, the great possibility of constructing a liberated personality with each people as the starting point—in a word, the decolonization of culture.” These sentences were penned in 1969 by the revolutionary Argentine filmmakers Fernando Solanas and Octavio Getino in an essay titled “Towards a Third Cinema: Notes and Experiences for the Development of a Cinema of Liberation in the Third World.”

This essay, along with several other manifestos, including the Brazilian Glauber Rocha’s “Aesthetics of Hunger” and the Cuban Julio Garcia Espinosa’s “For an Imperfect Cinema,” placed questions regarding the interpenetration of political struggle, cultural struggle, and mass media squarely at the center of a global struggle against the intensification of Western imperialism. Other such proclamations, including Fernando

Birri’s “Cinema and Underdevelopment” and Tomás Gutierrez Alea’s “The Viewer’s Dialectic,” underscored and elaborated the concerns of Latin American revolutionaries with media and mass movements. What Solanas and Getino called “third cinema” was imagined, in short, as a cinema of liberation. Third cinema was to be filmmaking that would aid nationalist movements in creating a new sociocultural solidarity in the struggle against Western imperialism and for national self-determination.

Third Cinema and the Third World

Roy Armes, in his important work *Third World Film Making and the West*, suggests that during the 1960s “the steady development of industrialization combined with growing national awareness led almost imperceptibly to a belief, which came to be widely held, that an era of socialist revolution was dawning throughout the Third World.” This belief was based in part upon Cuban resistance during an invasion orchestrated by the U.S. Central Intelligence Agency at the Bay of Pigs in 1961, and the success of Algerian nationalists after eight years of armed struggle against French rule in 1962. Armes notes that there gradually emerged what Gérard Chaliand called “a sort of third world euphoria” over the potential for genuine political change. This euphoria was connected to a host of factors including widespread “anti-colonial struggle, opposition to the Vietnam war, student revolt, a new consciousness on the part of American blacks, the emergence of armed guerilla groups in Latin America,” and a reconceptualization of revolutionary strategies from the ferment of China and the Soviet Union. From so many uprisings and changes of consciousness there emerged the distinct possibility of what was to be a tri-continental revolution imagined via figures such as Frantz Fanon, Che Guevara, and Ho Chi Minh.

This possibility of a tricontinental revolution informed the work of many third world revolutionaries and filmmakers. The people aided by their leaders and artists would reinvent the terms of a new social order free from domination by outsiders, or indeed by anyone. To put an end to the systematic, violent, and continuous exploitation of the third world by first world economies, militaries, and persons, it was necessary to invent revolutionary strategy on several levels and, moreover, revolutionary culture. Filmmakers from Africa, Asia, Latin America, and even Europe bent themselves to this task. The ideas of strategy and culture are important here because the category of “thirdness,” as it turns out for many theorists of third cinema, was to be assigned *according to a film’s aesthetic and political strategy* as much as by either its geographical provenance or its thematic content. In many cases, the operative question both for film commentators and filmmakers was, What can a cinema of liberation accomplish in bringing about the overthrow of Western imperialist domination and creating revolutionary culture? Given the ways in which colonized nations are dominated by their colonizers at economic, geographical, cultural, intellectual, and psychological levels, this cinema of liberation was understood to be, necessarily then, a cinema of subversion. Revolutionary cultural politics needed to subvert the dominant paradigms of social organization and interpersonal relations. As the filmmaker Glauber Rocha, whose

masterfully subversive works including *Deus e o diabo na terra do sol* (1963; *Black God, White Devil*) and *Antonio das Mortes* (1969) remain staples of film-history courses, put it, “When one talks of cinema, one talks of American cinema. The influence of the cinema is the influence of *American cinema*, which is the most aggressive and widespread aspect of American culture throughout the world. . . . For this reason, every discussion of cinema made outside Hollywood must begin with Hollywood” (cited in Armes, p. 35).

Formal Dimensions

The inception of third cinema brought together participants in a variety of anticolonial revolutions during a period in which the world was understood to be fundamentally polarized along lines of nation and class. Beginning in the late 1950s and early 1960s, many third world writers and filmmakers saw themselves working in their own national contexts but connected intimately to a global uprising against worldwide racist and capitalist colonization. These uprisings extended from the Cuban and Algerian revolutions to political upheavals in Brazil, Argentina, Chile, Senegal, and Vietnam. Many of these films appear crude and characterized by low production values but revolutionary filmmakers found it necessary to work on very small budgets with whatever materials were available. Most of the films are black and white and made with few takes. However, Espinosa’s idea of “imperfect cinema” is central here because the practical and economic challenges to film production have formal consequences that speak to and of the problems faced by emergent nations.

Third cinema often uses a realistic style associated with cinema verité or sometimes with Italian neorealism. At times it uses nonprofessional actors or even workers and ordinary people doing their everyday tasks (as in the Chilean director Patricio Guzmán’s three-part documentary *The Battle of Chile* [1975–1978]). Some of the films are forms of social realism that take a typical figure or situation and create an archetypal narrative that shows how the prevailing social order limits and often destroys individual possibilities. Filmmakers such as Lino Brocka (Philippines), Hector Babenco (Brazil), and Dariush Mehrjui (Iran) have worked in this manner. At the same time, figures such as Rocha, Djibril Diop Mambety (Senegal), and Gutierrez Alea (Cuba) use mythic elements and modernist devices of fragmentation. In almost every case, films that are considered to be part of the third cinema corpus make difficult demands on their viewers, who are addressed such that they must not only understand the films’ nontraditional portrayals of the world but act upon that portrayal in order to change the world.

Periodizing Third Cinema

The third cinema movement, which emerged as a corollary to the worldwide decolonization movement, exploded in the late 1960s and thereafter went through several incarnations. In particular, one could discern three breaks. The inaugural moment of third cinema, which carried the movement through the 1970s, was followed by an academic and institutional revitalization during the mid-1980s that focused on reception and interpretation as well as the practice of filmmaking. This

mid-1980s resurgence of interest in third cinema occurred in part because it was felt that both national and perhaps more pointedly festival audiences did not easily fit into a standard differentiation between colonizer and colonized.

The uneasy fit of spectators into opposing first and third worlds, colonizers and colonized, which were formerly imagined as polar opposites, was exacerbated by the relative failure of revolutionary uprisings in the colonies to bring about the liberation of colonized peoples despite the fact that the colonies themselves had achieved nominal independence. It was further complicated by the growing numbers of third-world diasporic populations who faced difficult and vexing questions of existence and identity in the Western metropolises. Claiming that the unequal economic exchange between the first and the third world had its analogue in the unequal symbolic exchange between the first and the third world, Teshome Gabriel suggested that one of the effects of third cinema was to displace the Western(ized) viewer from his accustomed position of the privileged interpreter of the image. In assigning the category of thirdness to cinema, the spectators’ reception became part of that assignment and Gabriel proposed that it was also possible to read “first” or “second” cinema (cinema which registered the malaise or alienation of third world subjects but was not in itself revolutionary) in a third cinema way. However, despite the blurring of some polar distinctions between oppressive colonizer and oppressed colonial subject, many if not most of the intellectuals, organizers, and filmmakers involved with what was still, if with some reservations, called third cinema, worked in solidarity with ongoing revolutionary activity in places like Nicaragua, El Salvador, and the Philippines. Finally, in the opening years of the twenty-first century, there was a growing reassessment of third cinema practices, which took account of postcolonial theories, globalization, and the emergence of what might be called a world media system.

Ideology: Racism and Identification

Third cinema set out to destroy various aspects of what has been called the colonial mentality and to replace it with various forms of cultural affirmation. Summing up the situation of the third world and its peoples in 1969, Solanas and Getino wrote, “Just as they are not masters of the land upon which they walk, the neo-colonized people are not masters of the ideas in their heads” (p. 48). In a situation in which colonial control was maintained not only by economic and police violence but by mind control, third cinema was given the status of a weapon in a war that was not only for land and for laboring bodies, but also for minds. Quoting from their landmark film *La Hora de los Hornos* (*The Hour of the Furnaces*, 1968), a scathing analysis of the structure of Argentine society that sought to at once explain the violence foisted upon Argentina by Western capitalism and to offer a revolutionary solution, Solanas and Getino write, “In order to impose itself, neo-colonialism needs to convince the people of a dependent country of their own inferiority. Sooner or later the inferior man recognizes Man with a capital M; this recognition meant the destruction of his defenses. If you want to be a man, says the oppressor, you have to be like me, speak my language, deny your own being, transform yourself into me.”

The situation of colonial identification with the oppressor was forcefully formulated fifteen years earlier by one of the clear influences on this manifesto, Frantz Fanon, the philosopher, psychoanalyst, and expositor of negritude from Martinique. Fanon, after completing his education in Paris and painfully discovering that in spite of his colonial French education he was not seen to be French by the French colonizers of Martinique, lived and worked in Algeria. In *Black Skin, White Masks* (1952), Fanon wrote, "To speak a language is to take on a world, a culture. The Antilles Negro who wants to be white will be the whiter as he gains greater mastery of the cultural tool that language is. . . . Historically, it must be remembered that the Negro wants to speak French because it is the key that can open doors which were still barred to him fifty years ago." Thus in a film like *La noire de . . .* (*Black Girl*, 1966) by the Senegalese writer and director Ousmane Sembene, an impoverished Senegalese woman who works as a maid for a white expatriate French couple is persuaded to return with them to France to work in their home. Audiences see how her need to leave a life with no promising future in a Senegal recoiling under the destruction of colonization is coupled to her aspiration for the wealth and power of the Western metropole. Her desire for a better life in France becomes part of her oppression and eventual destruction. Although motivated by dreams of a better life in the colonial center, she finds instead utter isolation and virtual enslavement. Her tragedy, which Sembene handles with a devastating economy of means that requires from audiences an intense engagement with the experience of the Senegalese protagonist, is, at the end of the film, shown as reported by a French newspaper in two column inches. The contrast between what she has undergone in the house of the French and the official story told in the "objective" language of the press raises her tragedy to the level of outrage while showing how inadequate dominant media are to understand the colonial condition.

Mass Communications as Weaponry

What Fanon identified as the cultural and psychological dimensions of a racist—that is, white supremacist, imperialistic—capitalism, Solanas and Getino saw as being extended and intensified through mass communications:

As early as the 17th Century, Jesuit missionaries proclaimed the aptitude of the [South American] native for copying European works of art. Copyists, translator, interpreter, at best a spectator, the neocolonized intellectual will always be encouraged to refuse to assume his creative possibilities. Inhibitions, uprootedness, escapism, cultural cosmopolitanism, artistic imitation, metaphysical exhaustion, betrayal of country all find fertile soil in which to grow. (p. 47)

In seeking an alternative to mass communication's co-optation and colonization of spectators, all of the cultural conditions noted above become themes for various third cinema filmmakers: The culture, politics, psychology, and metaphysics of colonialism are analyzed at great length. For example,

another of Sembene's films, *Xala* (1973), depicts a postcolonial high government official of Senegal replicating the same patterns of domination practiced by the colonial masters: he steals the people's rice and fills the radiator of his Mercedes Benz with imported Evian water—but eventually he pays the price for his betrayal. In Gutierrez Alea's *Memories of Underdevelopment* (1968), the bourgeois protagonist, unable to identify with the project of the Cuban revolution despite his nationalist inclinations, cannot tap his creative powers and wastes away into "metaphysical exhaustion" and irrelevance. In Filipino filmmaker Lino Brocka's great *Manila in the Claws of Light* (1975), a provincial couple is lured by the glitz of Manila to the metropole in search of a better life, only to meet with betrayal and destruction.

The three films mentioned above along with myriad others foreground the pitfalls of what has been referred to in shorthand as a colonial mentality. Solanas and Getino bring the question of colonial culture to the question of neocolonial media as follows: "Mass communications tend to complete the destruction of a national awareness and of a collective subjectivity on the way to enlightenment, a destruction which begins as soon as the child has access to these media, the educational culture of the ruling classes. . . . Mass communications are more effective for neocolonialism than napalm" (pp. 48–49). They are more effective than napalm, for Solanas and Getino, because first world, capitalist mass communication's industries structure the imagination and organize the desire of viewers in terms or patterns that run counter to their own individual and collective/nationalist best interests. In this view, aside from seducing viewing subjects away from the immediate materiality of their own problems and the potential, collective solutions that may be at hand, "mass communications" as they stand under capitalism effect the ongoing normalization of, in Solanas and Getino's words, "Violence, Crime and Destruction . . . [as] Peace, Order and Normality." For this reason, "*Truth then amounts to subversion. Any form of expression or communication that tries to show national reality is subversion*" (p. 49).

First, Second, and Third Cinema and the Lie of Neutrality

To equate the "showing of reality" with "subversion" does not necessarily lead to a naive theory about a medium that can transparently represent reality. Rather, what passes for reality is inexorably tied to the forms by which it is rendered. It was understood that representational forms, from news formats to standard Hollywood narratives of individual heroism, were and are part of the functioning of institutions, as well as the functioning of cultural and economic power. Therefore, it was also understood that control of the spectator is central to the maintenance of power. Opposed to such hegemonic functionality, third cinema creates an activist relation to knowledge making; third cinema makers work with "a camera in one hand and a rock in the other." They tried to show that because all representation is shot through with power relations, the most pernicious representations are generally those in which the process—that is, the mode of representing—is naturalized and/ or made invisible. If representation appears larger than

I make the revolution; therefore I exist. This is the starting point for the disappearance of fantasy and phantom to make way for living human beings. The cinema of the revolution is at the same time one of destruction and construction: destruction of the image that neocolonialism has created of itself and of us, and construction of a throbbing, living reality which recaptures truth in any of its expressions.

SOURCE: Fernando Solanas and Octavio Getino, "Towards a Third Cinema."

life, as something like a second nature, human beings are simultaneously persuaded of their powerlessness. Third cinema endeavors, in one way or another, to show the world as being constructed in and through social relations.

In bourgeois cinema, write Solanas and Getino, "Man is accepted only as a passive and consuming object; rather than having his ability to make history recognized, he is only permitted to read history, contemplate it, listen to it, undergo it" (p. 51). This leads to another important set of distinctions impacting the term *third cinema*, for "thirdness" is to be distinguished from a "firstness" and "secondness" in the cinema. First cinema is the dominant Hollywood product, a "spectacle aimed at a digesting object." "The world, experience and historic process are enclosed within the frame of a painting, the same stage of a theater, and the movie screen; man is viewed as a consumer of ideology, not as the creator of ideology" (p. 51). Auteurist cinema, including the French new wave and Brazilian Cinema Novo, constitute second cinema. Here the filmmaker seeks a new film language and endeavors to challenge social constraints, but ultimately finds him or herself "trapped inside the fortress" as [Jean Luc] Godard put it (Solanas and Getino, p. 52). The second cinema often thematizes the situation of disaffected colonial subjects but can neither posit nor effect a social basis of transformation, caught up as it is in the ideology of bourgeois individualism. It thus remains closer to forms of existentialism but is not yet revolutionary. Third cinema sets out to fight "the system," and sees itself as a weapon in a collective struggle against racist, capitalist domination. It is defined as a cinema of liberation. It understands the collective character not only of history making but of historically individuated subjects.

Significance of Art

It is important to draw out the implications of third cinema as a practical critique of third world populations within the first and second worlds. Third cinema is put forward by Solanas and Getino as "above all, a new conception of filmmaking and the significance of art in our times" (p. 54).

Their phrase "*I make the revolution; therefore I exist*," echoes Rocha's important formulation in his essay from the same period, "The Aesthetics of Hunger": "The moment of violence is the moment when the colonizer becomes aware of the colonized." In other words, within the regime of institutionalized violence, any claim to existence, any assertion of will by the colonized, is taken as an act of violence or revolution by the colonial regime—for it is the working conceit of colonial regimes that colonial populations do not have will, do not suffer pain, humiliation, starvation, torture, and death, have no legitimate claims on the placid, beneficent world of colonial domination; and indeed, do not exist.

From such claims regarding revolution and violence emerges a theory of knowledge: "There is no knowledge of a reality as long as that reality is not acted upon, as long as its transformation is not begun on all fronts of struggle." To emphasize this point, Solanas and Getino invoke Marx's eleventh thesis on Ludwig Feuerbach: "The philosophers have only *interpreted* the world in various ways; the point, however, is to *change* it." Connecting third cinema to Marxism indicates that the historical development of class consciousness must be linked to developments of race consciousness and nationalist consciousness in the process of knowledge making. The world is not given merely in its representations. Representations present an interested picture of the world; in short, a worldview. This point connects the decolonization movements with the history and theory of Marxist revolution, and these thematics as well as those that arose with the negritude movement inform to varying degrees the work of many third cinema filmmakers.

Authors of History

According to Solanas and Getino, the connection of third cinema to revolutionary practice led to the discovery of "a new facet of cinema: the participation of people who . . . were [formerly] considered spectators" (p. 61). Thus, unlike in first and second cinema, film is seen not as a spectacle but as a "detonator or a pre-text." Third cinema is experimental, and impels its audience toward social change: spectators become actors, the authors of history. "The film act means an open-ended film; it is essentially a way of learning" (p. 62). Thus, as opposed to traditional cinema, third cinema is "*cinema fit for a new kind of human being, for what each one of us has the possibility of becoming*" (p. 63). The third cinema movement therefore represents a consciousness of the history-making and knowledge-making aspects of film and understands the historical role of cinema as creating a liberated society. The function of third cinema, while centrally concerned with the objective transformation of society, is not only extrinsic to viewing subjects but intrinsic as well. For all of the debates that have occurred over the tenability and fate of third cinema, the urgent call of Solanas and Getino may yet be heard: "The decolonization of the filmmaker and of films will be simultaneous acts to the extent that each contributes to collective decolonization. The battle begins without, against the enemy who attacks us, but also within, *against the ideas and models of the enemy to be found inside each one of us*" (p. 63).

Jonathan Beller

THIRD WORLD. The term *Third World* has long served to describe countries of Africa, Asia, and Latin America that have been seen to share relatively low per-capita incomes, high rates of illiteracy, limited development of industry, agriculture-based economies, short life expectancies, low degrees of social mobility, and unstable political structures. The 120 countries of the Third World also share a history of unequal encounters with the West, mostly through colonialism and globalization.

During the Cold War (1945–1991), *Third World* referred to countries that were relatively minor players on the international stage, strategic though they sometimes were to the United States and the Soviet Union as these superpowers sought to maintain their balance of terror. The tendency was to essentialize, oversimplify, and homogenize complex identities and diversities in the political systems of the Third World

by focusing too narrowly on the politics of bipolarity. Yet the so-called Third World countries always had many more divergences than similarities in their histories, cultures, demographics, climates, and geographies, and a great variation in capacities, attitudes, customs, living standards, and levels of underdevelopment or modernization.

Unilinear assumptions of modernization also encouraged pejorative connotations of the Third World as cultures and peoples trapped in tradition and custom, with a progressive few desperately seeking a "civilizing mission" in order to graduate into the rights and freedoms that capitalism and its modernity promise individuals and communities. Deaf to the diversities in the history, politics, and economics of the countries in question, and to the cultural and intersubjective rationalities that give contextual meanings to development, the concept has failed to inspire a meaningful comparative analysis of development.

Origins

The term *Third World* is European in origin, but analysts have yet to agree on its genesis. Some believe it came about through the search for an explanatory "third way" to the dualism of capitalism and socialism as analytical frameworks among European political scientists in the 1920s. This challenge became even more urgent in the 1950s as colonies increasingly gained independence and sought legitimacy as states and international actors in their own right. Others situate its birth with the classification of the world by the industrialized West into First (Western Europe and Japan), Second (the Soviet Bloc and its satellites), and Third (the rest) worlds. Still others have traced the term to 1940s and 1950s France, linking it with the "Third Estate" in French politics—the rising but underrepresented bourgeoisie in the French Revolution of 1789—who capitalized on the quarrel between nobility and clergy. Similarly, the Cold War provided the political opportunity for the "third way" in international politics, under the guidance of the newly independent developing countries. Whatever its origin, the idea of the Third World rapidly became embedded in the discourse and diplomacy of international relations, and those claiming or claimed by it were able to make the concept synonymous with radical agendas in liberation struggles and the clamor for more participatory and just international relations through new world orders.

Historical, intellectual, and ideological context. Despite various appropriations or attempts at domesticating the concept, Third World has always been an uneasy, controversial, and polemical concept, especially to the increasingly sensitive, critical, and rights-hungry intellectuals and elites of the post-colonies. Over the years, there have been efforts to coin new terms to replace "Third World." From a communist revolutionary perspective, Mao Zedong formulated a theory of three worlds in which the First World consisted of the then-superpowers (Soviet Union and United States), whose imperialistic policies, as he felt, posed the greatest threat to world peace. Mao placed the middle powers (Japan, Canada, and Europe) in the Second World. Africa, Latin America, and Asia (including China) formed the Third World. Others have dismissed the notion of three worlds as inadequate, and have asked

for four or more worlds. To some, the Fourth World should comprise currently underrecognized and underrepresented minorities, especially the indigenous “first” peoples of various states and continents. Still to others, only bipolar divisions along lines of physical geography and locality make sense, regardless of the differences and inequalities that may unite people across physical boundaries or divide those within the same borders.

To others, the whole notion of worlds is misleading for various reasons. First, it implies an essential degree of separation between different parts of the globe that is simply not realistic in a globalizing world marked by multiple encounters and influences. Second, despite the efforts to stimulate and sustain Third World unity in the struggles against various forms of subjection, current obsession with belonging and boundaries have fueled the conflicts undermining Third World solidarity and action. Third, the increased degree of polarization within a global economic geography, along with the collapse of state socialism, and the insertion of capitalist social relations even among the communist giants of the world (Russia and China), suggest not a reduction but a multiplication of worlds, including the production of material conditions characteristic of the Third World even within First World societies. Fourth, the emergence of newly industrializing countries represents a form of dependent development and a further differentiation of the global economic geography. If globalization is producing Third World realities in First World contexts, it is at the same time producing First World consumers in Third World societies. In certain contexts, globalization has generated levels of poverty and victimhood that best justify the qualification as Fourth World.

Movements associated with the Third World. During the Cold War, the term *Third World* or *Thirdism* inspired what came to be known as the “non-aligned movement” (NAM) a counterweight to the two rival Cold War blocs, and a kind of international pressure group for the Third World. NAM was founded on five basic principles—peace and disarmament; self-determination, particularly for colonial peoples; economic equality; cultural equality; and multilateralism exercised through a strong support for the United Nations. From the 1960s through the 1980s the movement used its majority voting power within the United Nations to redirect the global political agenda away from East-West wrangles over the needs of the Third World. However, in practice, with the exception of NAM’s anticolonialism, about which there could be strong agreement, the aim of creating an independent force in world politics quickly succumbed to the pressure of Cold War alliances. By the 1970s, NAM had largely become an advocate of Third World demands for a New International Economic Order (NIEO), a role it shared with the Group of 77, the caucusing group of Third World states within the United Nations. Through NIEO, the Third World argued in favor of a complete restructuring of the prevailing world order, which they perceived to be unjust, as the only enduring solution to the economic problems facing them. At the level of UNESCO, Third World scholars waged a war against unequal cultural exchange through calls for a New World Information and Communication Order (NWICO). In general, the Third World wanted a new order based on equity, sovereignty,

interdependence, common interest, and cooperation among all states. Given the economic weakness of the Soviet Union, these demands were essentially directed at the West.

Theories of “Third World” Development

In their quest for a new world order, Third World governments found measured support among radical academics who elaborated and drew from dependency and center-periphery frameworks to critique the basic tenets of modernization paradigms of development and underdevelopment. To these scholars, largely inspired by Marxism, the price of the development of the First World was the subjection to exploitation and dependency (or underdevelopment) that First World states and actors had brought to bear on the Third World through imperialism, colonialism, and globalization. Under the global capitalist system, the Third World can only play second fiddle to the real global decision-makers. This perspective explains both Third World economic underdevelopment and stalling democracy essentially in terms of the assimilation and exclusion logic of global capitalism, according to which only the handful of powerful economic elites in the Third World stand to benefit from its internalization and reproduction.

The Future of the Third World

Because the idea of the Third World was partly created and largely sustained by the logic of bipolarity that governed the Cold War era, some argue that in a unipolar world, in which the United States is the only global gendarme, to claim the same degree of existence for the Third World as in the past would be tantamount to a “fantasy” with little conceptual and analytical utility. Still, some factors persist to make the Third World still relevant as a concept. In analytical terms, the Third World idea identifies a group of states whose common history of colonialism has left them in a position of economic and political weakness in the global system. In this sense, the recent alignment in global politics neither undermines the coherence of the idea nor justifies its abandonment. The Third World may continue to exist in this sense, but the changing context confronts it with new challenges and opportunities.

Francis B. Nyamnjoh

THIRD WORLD LITERATURE. As a term of standard usage, though still minus "literature," *Third World* dates from the 1950s. (The *Oxford English Dictionary's* first listing for it—still in its French form of *Tiers Monde*—is dated 1956.) Supposedly coined by the French sociologist Alfred Sauvy (1898–1990) in 1952, it initially referred to the independent and soon-to-be-independent nations of Africa and Asia that claimed to maintain a militarily nonaligned stance vis-à-vis both "First" and "Second" worlds—for instance, respectively, the United States, and its allies in NATO and SEATO, and the Soviet Union together with the nations of the Warsaw Pact, with the People's Republic of China a kind of wild card. But as this exact historical point of origin fades more and more into an unremembered past, *Third World* nevertheless continues to evoke the defining moments of a still iridescent lineage of the present: the era of anticolonial and national liberation mass movements and wars, from India to Algeria to Vietnam, that produced the contemporary grid of national boundaries in most of Africa and in large parts of Asia. Hence, the unmistakably radical overtone that is still audible in the term itself. And hence, given the eventual disappointment of that radical aspiration to become a "third"—that is, still another *new world*—there often appears an impulse to shrug it off in favor of more neutral-sounding terms such as "postcolonial."

Following Aijaz Ahmad, this "pre-history of the present" can be more precisely identified as the "Bandung Era," stretching from the meeting of nonaligned heads of Asian and African states in Bandung, Indonesia, in 1955—with statesmen such as Jawaharlal Nehru (1918–1970), Gamel Abdel Nasser (1889–1964), and Chou En-lai (1898–1976) presiding—to

the Iranian Revolution of 1979 and its embrace of an openly antisecularist path to national emancipation. Though events in the world since the attacks of September 11, 2001, and the launching of a second war in the Persian Gulf in 2003 may at times seem to have set the historical clock back to a "Third World" moment—prospective or real Vietnam-style defeat for the United States in Iraq—the sense of repetition is finally possible only from the perspective of a newly humbled U.S. imperial hubris. Outside the metropolitan world, the struggles to resist or even just simply withstand what is now—relative to, say, 1968—the enormously worsened global crisis of capital seem to evoke only the terrible suffering and martyrdom of the successful war of national liberation eventually won, on the ground, by Vietnam in 1975. Long past is the historical conjuncture that saw in Vietnam the emblem, along with Cuba, of what Robert J. C. Young rechristens, in 2001, as "tri-continentalism": the uniting, within a "third" world forcibly triangulated by Cold War dualisms, of Asia and Africa, joined now by a Latin America obliged by modern imperialism to accept that, like the former regions, but unlike the settler colony to its north, it was also far "south" of the West.

For these reasons, "Third World literature" is not the name for a well-defined literary corpus—the way, say, "South African" literature, or even "Southern African" or "Latin American" can or could be. This is not just because, as Ahmad has noted, "it is in the metropolitan country . . . that a literary text is first designated a Third World text" (p. 44). It is also because Third World literature names a historical aspiration to objectivity, rather than an object per se. *Cahiers du retour au pays natal* could not belong to a Third World literature had its author, Aimé Césaire (b. 1913), not been Martinican, and probably had he not been a black Martinican. But just being Martinican does not itself make this work Third World in any meaningful sense either. It sounds more plausible to call *Martín Fierro*, the best known of the Argentina's nineteenth-century gaucho sagas, Third World than it does to call Argentine Jorge Luis Borges's (1899–1986) short story collection *Ficciones* by that name, even though only the latter (first published in 1944) falls within the appropriate, historically demarcated zone.

One might define Third World literature as composing the literatures of Asia, Africa, and Latin America—perhaps together with their respective metropolitan diasporas. But this could only work if the category was effectively restricted to works written after the end of World War II. And that still leaves the question of whether Third World literature continues to be written, or whether in fact it extends only as far as the various ideological slippage points for embattled national-liberationist energies: as early as the 1970s in West and South Asia and as late as the 1980s and 1990s in South Africa and Central America. Perhaps even so severely qualified a categorization remains technically defensible, since it does, after all, provide a means, however contentious, to refer collectively to the literature of a transnational but sub-global entity. As recently as the shutting down of the World Trade Organization meetings in Cancún in 2003 by an Indian-Chinese-Brazilian-led "Third World" alliance, this entity, in its political form, made its real presence known.

But, of course, what the notion of a third conveys—especially after the disappearance of a second—is essentially the fact that it is *not* first. Third World literature is that literature that is most emphatically *not* of the First—that is, *not* of the European, the Europeanized American, and perhaps simply *not* of the white man's world. In this sense it is Third World literature that inherited, if anything can be said to have done so, the revolutionary, utopian aspiration once claimed by a class, rather than a racial or ethnic "other": Third World literature appears, at times, to replace but also to act as a kind of relay for the lost promise of a "proletarian" literature. It is the non- or antibourgeois literature of a world for which literature itself has seemed to become irredeemably bourgeois. So, for example, not only in the militancy of a Ngugi wa Thiong'o or the epic gravity of a Pramoedya Anta Toer but even in the largely parodic structure of Latin American "magical realism," the direct mediation of class by "oppressed nation," theorized by Fanon, is arguably at work.

It is, ironically, just this absence of any positive, precisely determined empirical reference, this aspiration to "other" worldliness, however mystified, that has made of Third World literature what is still a key, if somewhat devalued, term in literary and cultural theory. Although it cannot refer to just any literary work, when it does refer to actually existing literature there is always embedded in the term itself a reference to the falsely claimed universality of the "Western canon." Thus whatever it is that, say, Tomás Gutiérrez Alea's film *Memorias del subdesarrollo* (Memories of underdevelopment, 1968), means on a literary and narrative plane, its meaning, as "Third World literature," is understood to be one that could not have been produced "in" the "First World."

In this register, one critical work above all has stamped our way of speaking and thinking of Third World literature: Fredric Jameson's 1986 essay "Third World Literature in the Era of Multi-national Capitalism." "As western readers, whose tastes (and much else) have been formed by our own modernisms," wrote Jameson, "a popular or socially realistic third-world novel tends to come before us, not immediately, but as though already-read. We sense, between ourselves and this alien text, the presence of another reader, of the Other reader, for whom a narrative, which strikes us as conventional or naïve, has a freshness of information and a social interest we cannot share" (p. 66). Jameson's reference to a habitual impression of the "conventional or naïve" in Third World literature has now itself come to seem naïve, and the sense of the "already-read" may now be replaced by a sense of an (always already) "unread." But the relation that Jameson captures here of reader to "Other reader" in and through Third World literature could not be more actual.

The tendency, since about 1990, to substitute the term *post-colonial* for Third World, reflects, of course, the rise of post-colonial theory in the metropolitan academy, and, if nothing else, the sense of embarrassment, within that academy, at making even the most remotely uncritical allusion to supposedly obsolete doctrines of national liberation. But, *mutatis mutandis*, the strange logical slippages bequeathed by history to Third World literature resurface in the newer jargon. Meanwhile, to

be sure, the literature itself—Third World, postcolonial, or however it is to be framed—occupies a central position in the metropolitan canons that once excluded it even as the presence of its Other reader, in ethical as much as in literary form, is felt just as strongly, if not more urgently than ever before.

TIME.

This entry includes three subentries:

China
India
Traditional and Utilitarian

CHINA

As in other civilizations, China has delved into both the sensible and the abstract, analytical aspects of time. Social-political time traditionally used sixty-day and sixty-year cycles, and a ten-day "week" framed plans, or divinations, about the near future (these schemata are seen in 1200 B.C.E. oracle records and remained ubiquitous). Usually, Chinese days were broken into twelve "hours" and 100 subunits ("minutes"). Archaeology provides examples of early imperial (c. 250–100 B.C.E.) clocks used by officialdom: one type was a gnomon chronometer—a small disk notched for diurnal shadows, in one case with sixty-nine subunits. Cosmic boards of the Han period (206 B.C.E. to 220 C.E.) mechanically aligned an inner wheel indicating segmented slices of time (seasons and hours) with cosmological categories and ecliptic constellations appearing on a square background. Third-century B.C.E. texts preserved in the western deserts refer to regulations for local functionaries in assigning times for signaling, delivering documents, and scheduling projects. Finally, in all time periods court experts performed time-related functions: calendar ritualists assigned dates for sacrifices and ceremonies; astrologers interpreted astral and meteorological portents, often drawing on computations for eclipses; and scholar-officials not only interpreted and debated the findings of such experts but also worked on genealogies and on philological research to correct primordial calendars, both of which played a role in political legitimacy.

Chinese thinkers did not devise philosophies, pedagogies, or keys of the sort developed in the West concerning time, and the context was chiefly driven by the state's need for cosmological and ritual correctness, and in some cases by cosmological and apocalyptic notions conveyed in Buddhist and Daoist scriptures. Yet China also produced its own sophisticated metaphysics of time—more accurately, sociocosmic “timing.” The 3,000-year tradition known as “the Changes,” or *Yi jing* (Book of changes), employed a set of arrayed lines, classically three or six per set, which was called a *gua*. The lines were associated with numbers; they could change in character (yin and yang) and concomitantly in numeric value; and they moved in and through other, associated, *gua* by means of permutations. Like dates and times of birth in Western astrology, they were used to predict career and health and to establish an individual's place in a local social or political network. The *Yi jing* achieved a high place in China's pedagogical, scholarly, and even political life, as influential in its way as the West's Bible. We should approach the *gua* system as an essential part of Chinese natural philosophy, a locus of scholarly work that linked broad areas of inquiry like cosmic patterns and regularity, divination, alchemy, chronology, medicine, and numerical principles.

Gua Time

China's most ancient, and deeply imprinted, conceptions of time developed through divination. Beginning around 1400 B.C.E., diviners at the Shang courts made auguries based on linelike cracks created by heating plastrons and bones, a practice that involved complex skills in recording and tracking time by means of astral, calendric, and proto-*gua* devices. *Yi jing* provided a way to examine individual and cosmic time frames, as well as the metaphysics of time. Its oldest textual layers (the *gua* line matrices and various divination formulas), which stemmed in some ways from the line cracking of the Shang era, date to 800–700 B.C.E.; the “Judgment” and “Images” commentaries date from about 500–350 B.C.E. Later commentaries (“Great Treatise” and “Words”; roughly 350–200 B.C.E.) connected these time matrices with unifying metaphysical concepts. The “Judgment” and “Image” layers refer often to time (*shi*) in the sense of “timeliness within a development,” or “season(s).” A strong metaphysical sense is found, for example, in the Judgment commentary's section on “Gen” (*Yi jing* hexagram no. 52): “Gen means stopping. When the timeliness [of this specific *gua*] comes to a stop, then one stops; when it goes, then one goes.” This is not about duration of motion or transitional states of being, but one's own “timeliness” in being part of the *gua*'s field of influence.

The “Great Treatise” expanded the notional sense of time. Several words there, taken as a set, explicate “change” and, indirectly, “time”: *bian* (“alternation,” movement from state to state in a matrix); *hua* (“transformation” as growth, maturation, influence); *tong* (“projection, development,” inferring an entire system from one of its aspects); *fan* (“reversion,” a deduced return point, or node, in a cycle).

By about 100 B.C.E., the most concrete sense of time (qua timing) in *Yi jing* was the notion carried in the fourth term, *fan*: astronomic reversal and return of solstices and diurnal and sidereal cycles. But, like all other concepts of time and change, this

Page showing the *Yi jing* system, from a Qing-era printing of the works of Jiao Xun. Conceived some three thousand years ago, the *Yi jing* is a sociocosmic system of lines with numeric values. The interactions of the lines were studied by the Chinese in order to predict the future.

is analogized as yin-yang dualism; even in twelfth-century B.C.E. inscriptions, diviners had used the interplay of even and odd numbers in a *gua* and observed the way one *gua* reached out to a “changed” correspondent and functioned to bridge time in situations of prediction. During the Han dynasty, brilliant metaphysician-ritualists like Jing Fang and Yang Xiong worked to unify mathematics, musical theory, calendrics, and *gua* systematics. Beginning around 300 C.E., diviners increasingly used astral position timing and integrated various numerate techniques, spurring technical elaborations in personal astrology (death and important career-date predictions). The culture at large became attuned to the numerate and mechanized aspects of time as they sought to establish personal “timing.”

Finally in the *Yi jing* system, “position” is a key component of time. The term *wei* refers not only to the situation surrounding a specific one of the six stacked lines of a *gua* but also to the line's interrelations. For example, a *gua*'s *wei* at the second line, traditionally a time of deference in a career, takes cues from its concurrent, yet future, partner *wei* at line five (career apogee, or seat of power). *Gua* time developed around the social appropriateness of one's *wei*, how much help one received from all entities acting in the matrix (the *wan-wu*), and, hermetically, the correctness of one's own union with the *gua* system.

Manipulable Time and Social Time: Progress, Alchemy, Salvation

Some observers of China have thought that Chinese time was entirely cyclical. It is true that political life traditionally was based on dynastic rise and fall and the attendant appeals to astral cycles, and religious ideas and movements frequently were founded upon era cycles. But China was not much different from other civilizations. Linear chronology, unique cosmic moment, and social progress can be seen in various, albeit not always culturally dominant, contexts concerning time.

The pathbreaking historian Sima Qian (d. c. 90 B.C.E.), for example, honed the use of tables (time-linear in concept) to demonstrate the role of genealogies and blood lines in political history. Moreover, his remarks often suggest that a dynasty should not be a passive recipient of judgments derived from divination but should also be headed toward something—a socio-cosmic correctness and unity. Joseph Needham considered, perhaps too emphatically, that the technical and intellectual work of court experts to achieve that unity was scientific “progress,” a way to understand linearity in Chinese time. But his observation prompts fruitful speculation. Chinese scholarship and bureaucratic institutions always recognized previous toilers and their goals. Scholar-officials occasionally sought to restore antique knowledge, in order to explain via commentaries rather technical matters or confront the influence of outside (foreign, in the case of Muslim and then Jesuit) court-appointed experts. Modern historians of Chinese sciences have fleshed out particular cases, and in them we see that “progress” often was ad hoc and piecemeal, or thwarted politically. Moreover, such “progress” was actually quite backward-looking, like sixteenth- and seventeenth-century European humanists who sought truths lodged in the biblical past—terms and keys to natural knowledge whose meanings had become obscured.

Another way to view Chinese ideas of time is through the cosmologies implied in computational astronomy. Early astronomers recognized what we term Metonic periods and Saros cycles, yet they were also attempting to reconcile the regularities of such cycles with all-important numerological constants. Unwieldy greatest common denominators resulted from factoring lunar, solar, and sidereal conjunctions, and such large numbers would represent a primordial cycle that could evidence new, or reformed, dynasties. Concomitantly, predictive astronomy often failed because of the need to fudge aesthetically desirable numerologies with data from incomplete, ad hoc observations of solstitial moments and tropical year lengths. Besides dyadic, “five phases,” and other cycles, Chinese experts undertook to grasp enormous reaches of cosmic time and the way human society and politics fit into it.

Daoist cult scriptures applied similar sorts of calculated eras to their propaganda during dynastic strife—for instance, calculations that claimed when a judgment of the corrupt by the sage-god Laozi or the Dao itself would occur. One example is the fourth-century C.E. *Purple Texts Inscribed by the Spirits*, which influenced ideas of dynastic and millennial time, affecting legitimization ideologies as late as the reunification of China in the sixth and seventh centuries. Scriptures of this sort

utilized calendrical arts to provide yet other numerological bases for arguing the existence of ending-nodes in the large conjunction cycles. Daoist scriptural time-concepts frequently meshed with Buddhist ones. In the Buddhō-Daoist mélange of scriptures and cult aims, tantric materials offered protection against apocalypse, as in the spells carried in the *Lotus Sutra*, which reached broad popular consumption from about 400 to 800 C.E. Such theologies reflect the cyclical nature of Chinese time but also furnish extremely important examples of unique (nonlinear, noncyclical) divine intervention into social time. Daoist scriptures speak of “seed people” planted by the Dao in order to renew the postapocalyptic world.

Chinese alchemy engaged in measurement and analysis. Although that in itself might imply notions of time, alchemy focused not on time but on the effort to “construct a model of the *Tao*, to reproduce in a limited space on a shortened time scale the cyclical energetics of the cosmos” (Sivin, 1976, p. 523). The early alchemical tradition known as *Zhouyi can tong qi* (originating in the second century and elaborated in Tang and Song times) was concerned with the progress of cosmogonic time and for that purpose used Han-era *gua* calendars. Ultimately, such approaches to “timing” and “timeliness” carry with them elements of the timeless, namely, the Dao principle of numero-cosmogony as found in *Laozi*, *Huainanzi*, and *Zhuangzi*, and as made precise by the *Yi jing* system. Time as quantifiable durations of states and qualifiable modes of change was not a primary concern.

Metaphysical Time: Terms and Philosophies

From about 500 to 200 B.C.E. several Chinese thinkers conceived time abstractly and without reference to *gua* systematics. Passages in *Zhuangzi*, *Huainanzi*, and *Shuowen jiezi* (a second-century C.E. lexicon) drew upon extant terms connoting “time,” linking them with categories for space and motion: these terms included *shi* (season, historical moment), *yu* (spatial expanse, first delineated as the area of a roof’s perimeter, later “the four directions plus up,” and, for *Zhuangzi*, “reality without anything in it [the void-expanse]”), and *zhou* (the cyclic, expected return of any moving thing; for *Zhuangzi*, “what goes on extensively but has no beginning or end”); hence the binome *yuzhou*—limitless expanse conjoined with cyclical return. The oldest terms were not intentionally abstract, but pointed to social time, timeliness of action, and spatiality as products of motion and change.

When the oldest *Zhuangzi* passages were created (probably c. 300 B.C.E.), logico-analytic debates were popular, and we find statements of a certain Hui Shi, who states the paradox, “One sets out for Yue today, but arrives in the past.” The authorial voice, *Zhuangzi*, ridicules Hui Shi’s mode of knowledge, yet the much later (fourth century C.E.) commentary takes it seriously, arguing that the “setting out” and the “arriving” (abstractly analogized as “knowing” and its known “entity”) are like facing mirrors, which make a continuum of reflection: thus the “knowing” about “setting out for Yue” engages simultaneously with its dyadic partner, the “arriving.”

Equally striking was the Mohists’ approach to time. Early Mohists (roughly 400–350 B.C.E.) were an influential

community dedicated to knowledge, ethics, and supplying political-military services to regional courts. Their writings were poorly transmitted and taken up only rarely by later Chinese scholars. The brilliant reconstruction of the jumbled extant version of the Mohist *Canon* by A. C. Graham has shown that time was articulated with brief declarations of such notions as light, weight, speed, and geometric axioms. One logical premise concerns “Duration: what fills out different times. Extension: what fills different locations.” The later Mohists (about 300 B.C.E.) blended their own thoughts into the *Canon* and distinguished between times with and without duration: “Of times in a movement some have duration, others do not have duration. The beginning does not have duration.”

Demands of Ritual Precision and the Impact of Western Learning

Since at least about 150 B.C.E. Chinese scholars, in the relatively rarefied contexts of court rites and projects, had perceived that space and time were quantifiable through measurement and notation of positions. But with the impact of Western learning after 1600, not only did the royal court become increasingly chronometric, so did urban and mercantile culture. In 1644 an important Jesuit, Adam Schall von Bell, proposed to the court that the one hundred minutes of the day be changed to ninety-six for purposes of meshing with the European twenty-four-hour clock. Gear-driven clocks introduced by Jesuits and other westerners made an enormous impact, and through much of the 1700s the court employed Jesuit clock technicians. Throughout urban China clock makers found a niche, and we even have writings on their arts that contain thoughts about time in a new, ontologically self-contained way, not part of traditional, relatively indirect, approaches to “time.”

Many Chinese, familiar with Jesuit ideas, consciously isolated Western challenges to Chinese notions of time from the accompanying cosmological and theological arguments. Some, however, engaged the new theology. Zhuang Qiyuan (1559–1633), who was influenced by Jesuits, pondered integrating the Christian “god” into Confucianism: “People of our age all know there is a Heaven, but they do not all know the reason why Heaven is Heaven. If Heaven had no ruler, then there would only be the present moment, motionless and stagnant, dreamlike without the mysterious spirit.” His descendant Zhuang Cunyu (1719–1788), not Jesuit-influenced in the same way, wrote that the “Great Ultimate” (an *Yi jing* schema for cosmic unity) is “Heaven. Nothing is prior to the beginning of Heaven.” The latter Zhuang was arguing that Confucian (*Yi jing*) cosmology was temporally prior to all things, implicitly positing the Chinese view as favorable to a Christian heaven. The Zhuangs were influential in fostering the Han Learning movement. From about 1600 to 1825 quite a few leading scholars reconstructed Han-era masters of *Yi jing* systematics (like the aforementioned Jing Fang), purged their product of any Buddhist and Daoist taint, and reexamined China’s own early mathematics. The movement developed tools for potentially taking astronomy and math back from the Jesuit grip. Yet the Western worldview would dominate, and after the 1949 Communist revolution, with its assaults on intellectual culture,

Chinese tradition—which had once accommodated a fine variety, including hermetic *gua* time, Daoist eschatology, and ad hoc technical progress in time-related arts like math, computational astronomy, and music—was replaced by modern science and physics and by reductionist interpretations of Western philosophy.

False dichotomies like “China the cyclical” versus “the West as progressive” do not work. Arnaldo Momigliano once demolished such caricatures about Jewish versus Greek “time,” noting that even within one culture we must not automatically compare a historian’s ideas about time with a philosopher’s (given the latter’s unbounded room for natural and metaphysical speculation). The same caveat applies to Chinese ideas of time. Educated officials, who wrote history, had to address the demands of political cycles, yet their classicist work could be “regressive”—seeking a perfect, primordial age of unity. Court ritualists perceived a certain progress in their arts, and alchemical writers and metaphysical philosophers used time-related ideas to pursue ontology and epistemology. The *gua* time presented here is just one possible, if important, way to approach a Chinese “concept” of time. The history of Chinese alchemy and medicine will in the future present other models, as will studies of scholar-ritualists.

INDIA

In general, the conceptualization of time in Indian religious and philosophical thought is framed by a dichotomy between the phenomenal world and absolute transcendence—that is, the realms of time and the timeless. The former, the sphere of contingent temporality, is usually understood to be the world of suffering, of change and impermanence, of what is known in Sanskrit as *samsara*. The latter is the realm of God or the divine, the transcendental realm of changelessness and release from suffering (*moksha* or *nirvana*). While the Indian tradition does not, as was once thought by Westerners, entirely devalue the this-worldly (concerned with things in this world, as opposed to a future existence after death), the ultimate goal of all of the religious traditions that have sprung forth in India is indeed to overcome and transcend time and the death it entails.

As opposed to modern notions of the progressive nature of time, traditionally in Indian texts time is envisioned as degenerative and entropic. Such a viewpoint on the nature of cosmic time goes all the way back to the early Vedic cosmogonies where the universe is said to have been created by a god (Purusha, the Cosmic Man, or Prajapati, the "Lord of Creatures"). The work of creation, however, was defective. The creator "emits" from himself the creation, but in this cosmogonic move from primordial unity to multiplicity and diversity the product is characterized by disconnection, confusion, and disarray. The very parts of time are, in their original state, created in a "disjointed" manner: "When Prajapati had emitted the creatures, his joints became disjointed. Now Prajapati is the year, and his joints are the two junctures of day and night, of the waxing and waning lunar half-months, and of the beginnings of the seasons. He was unable to rise with his joints disjointed" (Shatapatha Brahmana 1.6.3.35).

The "natural state" of time is here mythically represented as discontinuous and chaotic. The point of such Vedic myths of origins is to represent God's cosmogonic activity as faulty—creation here is not cosmos. The universe, as it was in the beginning, is in need of repair. Vedic ritual activity was performed to continually "heal" a world that was created defective and perpetually tends toward its natural state of disjuncture. The ritual was conceived as a connective, reparative activity.

With the Agnihotra [the twice-daily sacrifice performed at dawn and dusk] they healed that joint [which is] the two junctures of night and day, and joined it together. With the new and full moon sacrifices, they healed that joint [which is] between the waxing and waning lunar half-months, and joined it together. And with the Caturmasyas [performed quarterly at the beginning of the seasons] they healed that joint [which is] the beginning of the seasons, and joined it together. (Shatapatha Brahmana 1.6.3.36)

Such is the power of human ritual activity, but the natural tendency to entropy, to return to the "natural" state of discontinuity, requires that human's continually reinvigorate time through ritual.

This vision of time as perpetually degenerating, encoded in the earliest texts of the Indian tradition, continues in one form or another to the present. By more or less the turn of the Common Era, Hindu, Buddhist, and Jain traditions had all accepted the notion that time, now measured in incomprehensibly long cycles, is constantly replicating, at the macrocosmic level, the process of birth, aging, and death that characterize the life of humans. Furthermore, time (and everything in it) was also seen as indefinitely recycled. The conceptualization of the cyclical nature of time, together with the idea of entropy, characterizes the basic understanding of temporality in the Indian context.

The assumption of transmigration and rebirth, already appearing in the middle centuries of the first millennium B.C.E., had both micro- and macrocosmic applications. Just as souls were perpetually reborn, so was the universe and time itself. The Sanskrit name for this theory is *samsara*, a word that literally means, "to wander or pass through a series of states or conditions." *Samsara* describes the beginningless and endless cycle of cosmic or universal death and rebirth; all of phenomenal existence is thought to be transient, ever changing, and cyclical.

Cosmological time in the classical texts of Hinduism is measured in units ranging from the infinitesimally short (the "particle" or atom of time called the *truti*, the "moment" or *kshana*, and the "eye blink" or *nimesha*) to the unimaginably long (the life span of the god Brahma, reckoned at 4,320,000,000 human years, according to one method of calculation). Within this framework are large units of time called the "eons" or *yugas* (which further combined into even greater periods called "great eons" or *mahayugas*). The first of these is the "Golden Age" or *krita-yuga*, which lasts for about 4,000 divine years (each divine year is the equivalent of 360 human years), a period of happiness and great virtue. The next two eons, the *trreta* and *dvapara*, are both shorter (3,000 and 2,000 divine years, respectively) and increasingly worse as all things, including life spans and the human's capacity for spirituality, decrease. The process culminates in the last and "dark" or *kali yuga*, which is identified always in these texts as the present age of utter degeneration. At the end of this final eon (which lasts 1,000 divine years), the world will end in a cataclysmic apocalypse. After a period of dormancy, the universe will be recreated and the process will begin again . . . endlessly.

In mythological terms, the cycle is said to involve the fall from a Golden Age of happiness and righteousness. Such a fall is sometimes attributed to the arising of greed and desire, which, together with hatred and ignorance, form the fundamental roots of negative karma, which keeps souls entrapped, and constantly circling in *samsara*. But it is, according to some theories, the simple "power of time" itself that results in the fall from grace in the "Golden Age":

In the beginning, people lived in perfect happiness, without class distinctions or property; all their needs were

supplied by magic wishing-trees. Then because of the great power of time and the changes it wrought upon them, they were overcome by passion and greed. It was from the influence of time, and no other cause, that their perfection vanished. Because of their greed, the wishing-trees disappeared; the people suffered from heat and cold, built houses and wore clothes. (*Vayu Purana* 1.8.77)

The cyclical nature of time entails not just an inevitable degeneration of time, with the resulting decrepitude of moral sensibility and the increase in evil and suffering; it also implies an equally inevitable return to the Golden Age as the wheel of time turns once again. The righteous will survive as the seeds for a new and better cosmic era:

In the Kali Age, men will be afflicted by old age, disease, and hunger and from sorrow there will arise depression, indifference, deep thought, enlightenment, and virtuous behavior. Then the Age will change, deluding their minds like a dream, by the force of fate, and when the Golden Age begins, those left over from the Kali Age will be the progenitors of the Golden Age. All four classes will survive as a seed, together with those born in the Golden Age, and the seven sages will teach them all dharma. Thus there is eternal continuity from Age to Age. (*Linga Purana* 1.40.72–83)

It is here the simple “force of fate” that impels the ever-changing world of samsara, characterized by an “eternal continuity” that links the circle of time. Evil and suffering are, from this point of view, the inexorable consequences of the eternal processes that guide the phenomenal universe.

Within this very large framework of ever-declining and infinitely repeated eons is found the divisions of calendrical time: the day (and its parts), fortnight, month, season, and year. The lunar calendar is divided into 360 days, each day divided into 30 units of 48 minutes called the *muhurtas*. The next unit traditionally was the fortnights of the waxing and waning moon. Together the two fortnights formed a month. The lunar year consists of twelve months divided into three four-month periods (the *caturmasyas*) or six seasons: spring, summer or the hot season, the rainy season, autumn, winter, and the cool season. The new year was reckoned to begin either with the full moon in the month of Tapasya (February–March) or with that of the month of Caitra (a.k.a. Madhu, March–April).

Also introduced already by the middle centuries B.C.E. in India and henceforth continuing in all Hindu, Buddhist, and Jain traditions was the notion that the world of *samsara* was fundamentally illusory. This doctrine, known as *maya* (“illusion”), held that it is because of our own ignorance that we perceive a world of differentiation and change; and it is through our own ignorance that we suffer and produce karma and thus circle through the cycle of perpetual rebirth. *Samsara* is contrasted to an unconditioned, eternal, and transcendent state that is equated with “freedom” or “liberation” from such transience, suffering, and rebirth, and the ultimate goal of all Indian religions is to attain such a state.

Whereas the monastic strains of Buddhism and Jainism tended to emphasize renunciation from the world of ordinary, worldly time and the suffering that accompanies it as soon as one had the inclination, in Hinduism a system of gradual withdrawal was recommended. At the level of the individual, a “life-time” is ideally divided according to the Hindu theory of *ashramas* or “stages of life,” each with its own set of necessary and important religious duties. The first of these is the stage of the student who is charged with learning the sacred texts and rituals and serving the teacher. This is followed by the stage of life of the married householder who is to pursue worldly life (including pleasure and material gain) within the boundaries of proper religion or *dharma*. When the householder “sees his son’s son,” he should begin the process of retiring from worldly concerns and take up the life of the “forest-dweller.” The final stage of life is that of the world-renouncer, the *sannyasi* who has given up worldly duties altogether and seeks the mystical knowledge whereby temporality itself is transcended and the eternal dimension of reality is fully realized. Such a person—and there are Buddhist and Jain equivalents—is thought to be permanently “released” from the bonds of time and forever is identified with the Absolute.

TRADITIONAL AND UTILITARIAN

A primary distinction separates sequential (or utilitarian) time, which has to do with the relations of before and after, from traditional time, which has to do with the relation of the present to both the past and the future. For Émile Durkheim (1858–1917), traditional societies were based on solidarities in traditional time, and they relegated to the margins of social life practical concerns emanating from sequential time, such as whether to do A before doing B. These latter (utilitarian) concerns typify, in Durkheim’s view, magic on the peripheries of traditional societies and utilitarian thinking about means and ends, or causes and effects, central to the ordering of modern societies. For Max Weber (1864–1920), charismatic leaders introduced radical disruptions in social orders based on

traditional times, but in order to survive, these movements had to become preoccupied with sequential or utilitarian time, with lines of success, and with logical or practical forms of thinking and action. Thus for Weber, charismatic authority, which is initially disdainful of practical concerns, defeats itself by its own successes, which dictate concern with means and ends, and causes and effects. Durkheim remains critical of such utilitarian concerns, even when they dominate the social order, because they are inadequate as bases for authority and social control. Thus in the disagreements between Weber and Durkheim one can find the roots of contemporary conflict in the field over whether utilitarian time is derived from, a side effect of, or opposed to traditional time and whether utilitarianism in various forms is typical of all social orders or primarily of modernity alone.

The Origins of Utilitarian Modernity

Various attempts have been made to explain how the sense of time in modern societies has come to be dominated by the concerns of rationality, which relegates to the peripheries of social life such other sources of social order and allegiance as loyalty to kinship and ethnic groups, or commitment to mythical versions of the past and of the future. The move toward utilitarian time in Europe may be due to the marginalization of traditional time, in which the present is both embedded in the past and mortgaged to the future, from the social life of the nation. The causes of this development have been variously attributed to a number of sources, notably: the legacy of the church as a source of rational social control; the tendency of the Protestant Reformation to displace traditional time, in which the departed were still intimately linked with the ongoing life of the community and were a source of authority for kinship and ethnic groups; and the early dissolution of the feudal system and the resultant ordering of production and of relationships between employers and employees, even in late medieval agricultural communities, along rational lines.

Some scholars have focused on the monastic, highly rational ordering of temporal sequences as the source and model for the increasing regulation of the temporal sequences of public life in the Western city from the twelfth century onward. Others, following this line of argument, have traced the concern for the rational ordering of everyday life and the self-perfection of the individual to the attempt to turn Purgatory into a this-worldly state of mind, in which individuals have to take on a rational self-discipline in their use of time for the purpose of spiritual perfection. Max Weber credited the church in the Western city with breaking open the communities based on familial or ethnic ties and replacing them with the more inclusive ties among coreligionists. It is also widely understood that utilitarian time was advanced by the administrative rationality and control of the Christian Church in Europe as it took on a wide range of functions after the collapse of the Roman Empire from the fifth century onward.

When Latin was replaced, the newer vernaculars took on the function of providing the extended present for nations and a sense of sharing in a common time as well as space. They provided a common language that was exclusive of the dialects and other traditional sources of loyalty and solidarity. The

vernacular, carried by the media and especially by the broadsheets, established a present and defined "the times" in which people were living, while relegating Latin to the past, to an old world that was passing away.

This strategy for relativizing and marginalizing is easily seen as utilitarian when it occurs under the auspices of the modern nation-state, as in the case of England under Henry VIII and Elizabeth, who replaced traditional religion with a more abstract or generalized form of ascetic belief and practice: from Scholasticism and systematic theology to science and public affairs. Here again, the broadsheet became the sacrament of a secular society.

If utilitarianism relegates traditional sources of solidarity, which rely on traditional time and its mediation of the past and the future to the present, utilitarian time construes an extended present, in which the various pasts of ethnic and kinship, racial or national groups are irrelevant to a discourse on precedents, conditions, and consequences of effective and legitimate action. Social processes are thus ordered in terms of sequences that link means to ends, causes to effects, and precedents to procedures: not in terms of priorities based on a wide range of collective memories and aspirations for the future. A major gulf thus opens up between discussions of social policy and the unsatisfied longings of minority or subordinate groups and communities, along with their aspirations for a redress of grievances in the future.

Modern Societies

In modern societies, however, those who control public discourse have arrogated to themselves the kind of time that Durkheim regards as merely utilitarian, "temporal," and thus lacking in the bases of traditional solidarity that would have been available in more primitive societies, where temporal sequence was a matter of peripheral concern for individuals and those practicing magic: not for those on whom the duration of the society itself depended.

Thus, for Durkheim, modern societies represent an inversion of the traditional: a change in which type of time dominates public discourse, and a change in the sort of elites that control public discourse. Because of his antipathy to utilitarianism, Durkheim took as his preferred model traditional social systems that considered themselves to be part of time that runs from the past through the present into the future; thus the sort of time that is concerned with the logical and practical relation of means to ends and of causes to effects was relegated, in his view, to the social periphery. In modern societies, however, these oppositions were reversed, with the utilitarian engagement with time preoccupying the political and cultural center, and communities with their own traditional bases of solidarity (and their views of the present as being linked with the past and the future) being relegated to the periphery.

Sociologists and historians remain divided as to whether the new elites and their utilitarian view of time can provide the bases for solidarity and for personal identity, which had been mediated by powerful myths and rituals linking the self to the duration of the society from the past into the present and the future. Some regard this conflict as a contest for the

“soul” of a nation such as America, while others regard the contest in more comparative terms as a problem faced by a wide variety of nations coping with indigenous and external sources of both threats and opportunities. Whether or not Durkheim is right about the inversion of time-sense between modern and traditional societies, a question remains as to whether any society, by its very formation, divides the flow of time into two separate streams, the one sequential or utilitarian, temporal and temporary, the other concerned with the long duration of peoples over many generations, and with the impact of both the past and the future upon the social present.

The question also remains whether, as Talal Asad argues, what is needed is an alternative to utilitarianism: a view of the world that “is not divided into significant binary features” (p. 15). In modern societies, of course, those opposites have been, at least since the Enlightenment, the modern and the premodern, and sometimes these oppositions have been arrayed in ideological discourse along lines separating the West from the East, or within the West between Europe and the United States. Other forms of binary opposition have arrayed the relatively educated, who have adapted well to living in a complex, highly differentiated society, in opposition to those who are looking for simpler formulations and more primitive forms of solidarity. For modern commentators working from within Weberian assumptions, utilitarianism has been accompanied by the emergence of a self with political rights and the freedom to make a variety of choices in the economy and the political system, as well as in the more intimate spheres of the family and local community. This freedom comes from the individuating consequences of complex societies, which keep individuals from being embedded in particular and highly limiting social contexts.

Conclusion

It may well be that, as Durkheim argued, the division of the world into binary opposites begins with the formation of any social system, which pits its own times against those of other forms of social solidarity. Thus the tendency to divide time between the utilitarian and the traditional, between concern with means-ends or cause-effect relationships and the long extension of the present into the past and the future is typical of any social system. Pierre Bourdieu argues in this vein, and separates the two kinds of time into “field” and “habitus,” their differences providing a potential source of tension within any social system.

Others, however, like Niklas Luhmann, argue that a binary opposition is typical of any social system. Luhmann uses the cybernetic model as an analogy for understanding the fluidity and complexity of relationships and practices in modern societies. On this view, the utilitarian tendency to divide time into two separate streams is not restricted to modern societies but is endemic to the formation of any social system.

Richard K. Fenn

TOLERATION. Toleration is a policy or attitude toward something that is not approved and yet is not actively rejected. The word comes from the Latin *tolerare* (to bear or endure), suggesting a root meaning of putting up with something. There is no single and widely accepted definition of the term, and it is hardly an exaggeration to say that every author uses it in his or her own way. Therefore it may be best to understand the many uses of the word in terms of family resemblances.

It should be clear that each of the languages that uses a variant of the Latin term (German, *Toleranz*; Dutch, *tolerantie*; French, *tolérance*; Spanish, *tolerancia*; Italian, *tolleranza*; etc.) adds its own slightly different connotations to the word, based on historical experiences. Languages that do not derive the word from Latin have synonyms, each with some overlap and some difference in usage.

Throughout much of the history of the concept, *toleration* referred largely to a policy or attitude toward different religions. Intolerance could mean burning at the stake of heretics or apostates and forced conversions of adherents to different religions, and tolerance could mean anything short of that. By the late twentieth century, demands for toleration could also refer to other disputed behaviors such as sexual orientations, clothing and dress, drug use, vegetarianism versus meat-eating, and more (although religion was often not far behind these disputes). Ethnic and cultural behaviors and language usage

could be the subject of tolerance and intolerance as well. In medicine, toleration refers to an organism's capacity to absorb or endure something without untoward consequences.

Conceptual Nuances

Most uses of the word understand it as referring to a middle ground on a spectrum between rejection, intolerance, hate, and persecution on one end, and acceptance, approval, love, and respect on the other. They distinguish it from indifference because it only comes into play when something is disliked or disapproved and matters.

Who is doing the tolerating, who or what is being tolerated, and exactly what such toleration entails can vary enormously. Individuals can be said to tolerate their own personal foibles, not to tolerate fools, or to tolerate whole groups. Groups can be said to tolerate individuals within or without, or other groups. States and other political authorities can be said to tolerate individuals, groups, or other states. That which is tolerated can range from the very existence to the appearance, ideas, or activities of the tolerated entity. Toleration can range from providing only limited encouragement, to doing nothing, to applying limited sanctions short of persecution.

Some authors have tried to distinguish "toleration" from "tolerance," with the former referring to official policies and the latter to a personal attribute, but ordinary language does not seem to distinguish the two. For example, we can say that the behavior of tolerant persons shows that they tolerate others, or that all we are asking for from another person is toleration. We can also say that a government policy reflects tolerance of some activity.

Some authors have thought that toleration is only a second-best, half-way measure, and that we ought to go beyond toleration to embrace and respect others. This is certainly the right thing to do where whatever is being tolerated actually deserves to be embraced. But one can wonder if all human beings really are always doing things that deserve respect. What would the world be like if all people and all of their activities were worthy of embrace? Certainly unlike anything we have seen so far. Then, perhaps, there would be no need for a concept like toleration. But until that moment arrives, this is the term for the response to things that merit neither active persecution nor full acceptance.

Toleration may look weak and thin from the perspective of a possible acceptance and embrace, but it can look very good from the perspective of someone who is undergoing persecution. Many a victim of intolerance would just like to be left alone, and that is one of the modes of toleration. One of the paradoxes of toleration is that if one is tolerant of everything, then one is also tolerant of the intolerant. This may mean complicity with persecution, or at least failure to prevent it.

Related Concepts

A large vocabulary of related concepts has been used to define and promote toleration. If, as mentioned above, religion created many of the disputes that lead to persecution, it also produced many concepts that can lead toward toleration. Irenicism

(the seeking of peace), the pursuit of concord, comprehension, latitudinarianism, and basic agreement on fundamentals have been policies of many theologians and churchmen. Where these policies recognize that we may never approve of everything the other thinks or does, they promote toleration. Where they imply that someday we will all agree, they go beyond it.

Other terms that have both religious and secular meanings are relevant. Mercy and charity may inspire one to tolerate. Patience is close to the root meaning of the Latin word, helping one endure what one disapproves. Humility, modesty, and skepticism about one's own knowledge of what is right may incline one to tolerate others even when one disagrees with them. Indulgence can mean allowing something that one could prevent. Compromise may mean conceding some points in order to gain others, tolerating the loss of the conceded points.

High-minded philosophical principles can lead toward toleration. Belief in the autonomy and independence of other people can justify leaving them alone even when one does not like what they are doing. Principles of impartiality and neutrality may make a state stay out of religious or other quarrels. Of course, not just any principle will do: most persecution is justified by principle as well.

Toleration has not always been the result of principle. It can come about for purely practical reasons because of exhaustion, impotence, or impasse. It can be the result of political calculation that hostility does not pay. Swiss physician and theologian Thomas Erastus (1524–1583) gave his name to Erastianism, a term for state supremacy and policies that enforce toleration in order to maintain political stability and prevent religious fighting. Gag orders and decrees prohibiting further debate have often been used to silence contending parties in the hopes of reaching a modicum of mutual toleration.

Liberty of conscience and freedom of religion are policies that sometimes overlap with toleration and sometimes go beyond it. Liberty of conscience usually means that everyone may think what they like, and no one will inquire into what they think. But this is compatible with suppressing public expression of what one thinks. On the one hand, this may be better than regimes in which "thought police" are constantly monitoring people's ideas; on the other, it is not as free as forms of toleration that permit expression. Freedom of religion often means that one can choose among two or more established religions, but it sometimes also implies that one must choose one of the available religions. It may not tolerate rejection of all religion.

Valence

In modern times and in liberal ideology, toleration has a positive valence, associated with open-mindedness and egalitarianism. It can be a valued character trait or a beneficial attribute of a group or state.

But toleration has also been considered a negative trait or attribute. It can be associated with laziness, carelessness, and slacking. While many moderns do not consider it lazy or careless to tolerate other religions, we can capture some of the force that this charge once had if we consider that doing nothing

about cruelty or murder could be characterized as tolerating it. Then the tolerators would be tolerating something they should not, perhaps out of cowardice or carelessness.

Another negative valence of toleration can be found in the Marxist tradition, where tolerating something can be considered part of an oppressive regime. “Repressive tolerance” can include tolerating evil and oppressive people or activities. It can also mean tolerating a protesting group and thus depriving it of the importance it would have if it were taken seriously. In effect, this theory holds that in conditions of class inequality, both tolerance and intolerance are repressive.

Other modern groups have considered toleration condescending and ultimately affirmative of conditions of injustice. For example, T. S. Eliot (1888–1965) wrote that in the conditions of modern secularism “The Christian does not want to be tolerated” (Cranston, p. 101); rather, she wants to be respected. Similarly, spokespeople for ethnic groups, women, gays, and others have objected that simply being in a position of having to be tolerated is already unfair, reflecting power inequalities.

Perhaps because of its middle-way position, toleration is rarely likely to be stable over a long period. Rather, persons or states can become more or less tolerant or more or less tolerated as time goes by and opinions or conditions change. Since intolerance is often a response to a perceived threat, when the perception of threat increases or decreases, toleration may become less or more of an option. Individuals or groups that were once persecuted out of fear but are now perceived as harmless can become tolerated and eventually embraced. Vice versa, if people who were once considered innocuous become perceived as more of a threat, intolerance of them may increase.

Toleration in the Ancient World

Cyrus the Great of Persia (r. c. 558–529 B.C.E.) is a key figure at the foundation of two traditions of toleration. He is praised in the Hebrew Bible for allowing the Jews to return to Jerusalem after Babylonian captivity. And Xenophon (c. 431–c. 352 B.C.E.) lauded him in *The Education of Cyrus* (after 394 B.C.E.) for his policy of religious toleration, placing him in the Greek tradition. Scholars have speculated that his toleration of Medes, Hyrcanians, and other religious and ethnic groups was largely an imperial political strategy. He needed to draw on the manpower of conquered kingdoms and knew it would be easier to defeat kings whose peoples believed they could thrive under his rule.

Aspects of Buddhist religious thought, which originated in India, also justified peacefulness and toleration. Ashoka (r. c. 273–232 B.C.E.), the last emperor of the Mauryan dynasty in India, renounced war and promoted Buddhism while remaining tolerant of other religions.

Throughout much of history, the ancient Chinese were tolerant of a variety of religions ranging from Confucianism to Buddhism and Taoism to animism. Manichaeans and Jews thrived at times. Scholars have speculated that it was precisely because they were tolerated and not persecuted that Jews in ancient China seem to have shed their identity and blended into the rest of the population.

The Koran contains passages about living in peace with peoples of other religions, especially “peoples of the book” (Jews and Christians). Therefore, Islamic cultures such as medieval Spain tolerated flourishing Christian and Jewish communities in what was known as *convivencia*, or living together in peace. The Ottoman Empire developed regimes of toleration of those religions that included the “millet” system, in which each religion had its own legal system and paid its own tax rate, even though only Muslims could hold higher offices.

The ancient Romans were generally tolerant of the existence of many cults because of polytheism, which implied that every hearth, city, and people could have its own gods. When they became an imperial power, they tolerated any religion that would also show signs of respect for Roman deities. They conceived of the Jewish War not as wars against that religion but against a rebellious subject people. Christians were persecuted for their refusal to take part in the imperial cult and for their disrespect for Roman rule, not merely for their religion.

The Rise of Christian Persecution

Throughout world history, local practices of toleration have been interspersed with pogroms and persecution. Sometimes practices of toleration have come before ideas about it, and sometimes ideas have come before practices. Wherever toleration is practiced as a norm, there is not much need to think or write about it. By far the most elaborate discussion of the issue took place in the Christian West in the period from 1500 to 1800, precisely because a great deal of persecution was going on. To fully understand it, we must go back to the origins of Christian persecution.

The situation in the Roman Empire changed when the emperor Constantine (r. 306–337) legalized Christianity in 313 and promoted it as the public religion. Now it was implicated in state power and had to decide whether to tolerate or persecute others. In the following millennium there were wars against Muslims and persecution of pagans and Jews, as well as contentions within Christianity. With respect to the latter, one could justify intolerance if the people one disagreed with could be labeled as heretics or blasphemers.

The word *heresy* originally meant “choice,” as in a choice of beliefs or sects, with no negative connotations. But various passages in the New Testament used it to mean sinful divisiveness. Early church fathers such as St. Irenaeus (c. 120 to 140–c. 200 to 203), Tertullian (c. 155 or 160–after 220), and Eusebius of Caesaria (c. 260–c. 339) refuted the chief early heresies. In 325 Constantine convened the Council of Nicaea to settle church doctrine and then issued an edict banning heresies. In 385 a Spanish bishop, Priscillian (c. 340–385), became the first person to be executed for heresy.

St. Augustine of Hippo (354–430) was the most influential theorist of persecution. After belonging to the Manichaean heresy in his youth, he joined the Catholic Church in 387 and eventually became a bishop. Facing Manichaean, Pelagian, and Donatist heresies, at first he advocated peaceful methods but by about 400 he began to endorse coercion. He interpreted the parable of the tares (Matt. 13:24–30) and the parable of

the feast (Luke 14:21–23) to justify coercion of heretics. The latter was a particularly long stretch, because the parable merely has a rich man prepare a banquet and send his servant out into the streets to find people and “compel them to come in.” Later, both Catholics and Protestants justified forced conversions on the basis of this invitation to a feast.

Further developments in the justification of persecution include the definitions of heresy in Gratian of Bologna’s (d. before 1159) *Decretum* (c. 1140) and many further decrees. The persecution of heretics became the object of armed warfare in the bloody Albigensian Crusade (1209–1229). In 1233 Pope Gregory IX (ruled 1227–1241) assigned the persecution of heresy to the Dominican order, establishing the Inquisition.

Medieval voices for tolerance. However, not everyone went along with the violent treatment of religious difference. The *Dialogue of a Philosopher with a Jew and a Christian* of Peter Abelard (1079–?1144) demonstrated that the pursuit of knowledge could not be detached from the inclusion of diverse standpoints. John of Salisbury (c. 1115–1180) and Marsilius of Padua (c. 1280–c. 1343) combined defenses of personal liberty with functionalist accounts of the organic unity of the political community to maintain that the health of the body politic requires freedom of thought, speech, and even action. John Wycliffe (1330–1384) developed a theory of toleration that derived from his theology of grace and his political theory of the king’s responsibility to protect the welfare of both the graced and the ungraced.

Medieval times also included voices for toleration from the disempowered. Menachem Ha-Me’iri (1249–1316) developed a uniquely Jewish theory of toleration to justify cooperation with gentiles. Christine de Pisan (1364–1430) stressed the interdependence of the various parts of the body politic to justify tolerant treatment of differences of gender, class, and nationality.

In the late medieval or early Renaissance period, Nicholas of Cusa’s *The Peace of the Faith* (1453) recognized that mankind was inherently and inescapably diverse in language, culture, and politics. If there will always be different customs and rites, toleration is justified because persecution is futile. Giovanni Pico della Mirandola (1463–1494) and others from this period also developed toleration for non-Christians from their interests in the Jewish Kabbalah and pagan philosophy.

Early Modern Period

The Protestant Reformation created the most serious challenge to toleration in early modern Europe. Martin Luther (1483–1546), John Calvin (1509–1564), and Huldrych Zwingli (1484–1531) were the three most influential leaders of this movement, which permanently divided Christian Europe. Each demanded toleration for their own movement, but could be intolerant of other religions. Early Catholic responses included violent repression of the Protestants, but Humanists like Desiderius Erasmus (1466?–1536) called for a more irenic response of continuing dialogue and peaceful admonition.

Early Protestants soon justified being left alone based on their interpretations of the Bible. Spiritualists like Hans Denck

(c. 1495–1527) and Sebastian Franck (c. 1499–c. 1542) and mystics like Jakob Böhme (1575–1624) felt that God is within every man, and religious individualism is God’s purpose. Persecuted Anabaptists from Balthasar Hubmaier (1485–1528) and David Joris (c. 1501–1556) to Thomas Helwys (c. 1550–c. 1616) and Leonard Busher (dates unknown) argued that religious persecution is against the spirit of Jesus Christ and that judgment about matters of faith should be left to God. Menno Simons (1496–1561), founder of the Mennonites, argued for Christian pacifism, and Italian Protestants like Bernardino Ochino (1487–1564) and Celio Secondo Curione (1503–1569) defended their right to religious toleration on such grounds as faith is a gift from God, it is tyranny to punish an error of the soul, and God’s church has room for great variety.

At first the Protestants could claim the high moral ground because they did not use violence like their Catholic opponents. Then, in 1553, Michael Servetus (1511–1553) was burned for antitrinitarian heresy in Calvin’s Geneva. This provoked Sébastien Castellio (1515–1563) to write some of the first sustained defenses of toleration. *De haereticis* (1554; Concerning heretics) collected the irenic opinions of several writers and essays by the author under false names. “Heretic” is just the word we use to describe those with whom we disagree, he asserts. The suffering of persecution is actually the sign of a true Christian, and persecution of people who are acting in accord with their consciences promotes hypocrisy and is harmful to everybody. In later works Castellio drew on the ancient skeptics for their rejection of pretended certainty and argued for the separation of church and state. Other writers including Jacobus Acontius (1492–1566) and Mino Celsi (d. c. 1575) followed up on Castellio’s thinking. Among these, Dutchman Dirck Coornhert (1522–1590) insisted that civil unity was more important than religious unity; he was one of the first to argue in favor of tolerating atheists.

Throughout the early modern period, the ideal of the primitive church as voluntary and nonviolent appealed to many people. It could be carried to the point where Pietist Gottfried Arnold’s *Impartial History of Churches and Heretics* (1699–1700) redescribed most alleged heretics as pious, and most of the orthodox as the real heretics.

Catholic toleration. In the Anglophone world there has long been a tendency to claim that most theories of toleration came from the Protestant side. But Father Joseph Lecler found a Catholic writer in favor of toleration for almost every Protestant toleration theorist. For example, Cardinal Reginald Pole (1500–1558) developed the thought that “Heretics be not in all Things Heretics” into a defense of toleration. In the France of the religious civil wars of the sixteenth century, Chancellor Michel de l’Hôpital (1505–1573) strove for compromise and toleration between the Calvinists and Catholics, partly on the basis of his own Catholic religious convictions. The great author Michel de Montaigne (1533–1592) never renounced Catholicism even as his *Essays* (1580–1595) contained many reasons for toleration drawn from individualism, skepticism, and a deep sense of the bodily nature of human beings. Such thinkers were sometimes called “politiques” because of their arguments for toleration on practical political grounds.

Jean Bodin (1530–1596) is an intriguing figure, ostensibly Catholic, but he could have been a Judaizer. In several works including *Colloquium of the Seven about the Secrets of the Sublime* (c. 1588) he argued for nonviolence, neutrality, and mutual agreement not to discuss differences that might lead to fighting.

The Spanish conquest of Latin America led to much abuse of the natives, partly on the ground that they were not good Christians. Writers like the bishop of Chiapas, Bartolomé de Las Casas (1474–1566), wrote in their defense. Half-Spanish half-natives like Felipe Guaman Poma (1532–1614) wrote to reconcile the two cultures, to little effect. Garcilaso de la Vega, known as “the Inca” (1539–1616), also spoke up for tolerance from the native side.

By the mid-eighteenth century active persecution of Protestants in France had died down, but in 1762 Jean Calas, a Protestant, was the victim of a judicial murder. The famous writer Voltaire (1694–1778) took up the cause, publishing *A Treatise on Toleration* (1763), which received European-wide circulation and discredited such persecution in public opinion. It may have been the last major *cri de coeur* against religious violence, because even contemporary and later Catholic treatments of heresy such as François Adrien Pluquet’s *Dictionary of Heresies* of 1762 and Nicolas-Sylvestre Bergier’s *Methodical Encyclopedia* of 1788–1832 took for granted that heresy did not justify violence.

Antitrinitarianism (Socinianism). Antitrinitarianism or unitarianism—the theory that Jesus and the Holy Spirit did not share God’s nature—was a heresy considered as bad as atheism and persecuted all over Europe. But conditions close to anarchy have often been good for toleration. The absence of centralized power in Poland in the later sixteenth century meant that it became a haven for Lelio (1525–1562) and Fausto (1539–1604) Sozzini, founders of the antitrinitarian Socinians, and followers such as Samuel Przytkowski (1592–1670). They developed a battery of reasons why they should not be persecuted, most of them rooted in Scripture. Their much-anathematized writings were published in the Netherlands, which had one of the freest presses of the day. Later, many thinkers such as Isaac Newton (1642–1727) were clandestine sympathizers with antitrinitarianism under another of its variants, Arianism.

The Netherlands out front. The Dutch published a great deal of toleration theory and practiced toleration to a substantial degree from the later sixteenth to the eighteenth centuries. During early decades of the Revolt of the Netherlands (1568–1648) almost anything could be published because of the exhaustion of the political authorities, the myriad of decentralized jurisdictions, and appreciation of the economic value of the book market. William the Silent (1533–1584), leader of the Dutch Revolt, wrote that repression of worship leads to hypocrisy and that no false religion would last.

In the early seventeenth century a theological dispute in the Netherlands between Gomarists and Arminians led to suppression of the Arminians, but also to many writings against that suppression. Simon Episcopius (1583–1643) and Jan Uytenbogaert (1557–1644) wrote that Christian charity and reciprocity requires

freedom of conscience, even for Catholics. Hugo Grotius (Huigh de Groot; 1583–1645) defended a limited tolerance as part of his theory of natural law, which was developed by later natural-law theorists like the German Samuel von Pufendorf (1632–1694). Pufendorf’s *Of the Nature and Qualification of Religion* (1687) claimed that the genius of the Christian religion was nonviolence, that people’s thoughts were not punishable, and that the civil authorities should control religion.

Benedict Baruch Spinoza (1632–1677), an excommunicated Jew, wrote one of the most robust defenses of freedom of thought while living in the Netherlands. In his *Theological-Political Treatise* (1670) he argued for arming the state for security against the mob, and then for reining in the state in matters of religion. Pierre Bayle (1647–1706), a Huguenot refugee in the Netherlands, developed the most sophisticated and most tolerant theory of the century. In *Letters on the Comet* (1682) he showed how atheists could indeed live in civil peace, and in *Philosophical Commentary on the Words “Compel Them to Come In”* (1685) he developed a wide-ranging theory of toleration based on the rights of conscience, even erring conscience, that would protect not only Protestant sects, but Catholics and virtually all others as well. In his last writings, he asserted that he would rather live under an atheist king because that king would have one less reason to persecute.

The English Civil War and its aftermath. The anarchy of the English Civil War was also fertile ground for toleration writings. John Dury (1595–1680), Samuel Hartlib (c. 1600–1662), and Johann Comenius (1592–1670) drew on millenarian hopes to justify reunion and peace among Protestants. Merchant and Leveller William Walwyn (1600–1680) wrote in favor of complete religious toleration on religious grounds. Leveller Richard Overton (fl. 1642–1663) argued for toleration of Jews and Catholics and made free use of humor to take down over-serious persecuting pride, a method recommended in Anthony Ashley Cooper, Third Earl of Shaftesbury’s *Characteristics* (1711). John Milton (1608–1674) made an impassioned case for toleration of divorce in several pamphlets, and then wrote the first major defense of that aspect of toleration known as freedom of the press in *Areopagitica* (1644). His work was followed up in the first substantial French and German defenses of freedom of the press by Elie Luzac (1749) and Karl Friedrich Bahrtdt (1787).

Roger Williams (1603?–1683) founded the English colony of Rhode Island as a haven of freedom of religion, and published *The Bloody Tenent of Persecution* (1644) in favor of separation of church and state and freedom of religion on Christian grounds. William Penn (1644–1718) founded the colony of Pennsylvania as a haven for persecuted Quakers and published *The Great Case of Liberty of Conscience* (1671).

Thomas Hobbes (1588–1679) wrote *Leviathan* (1651), one of the most influential theories of absolute power in the history of political philosophy, but he has also been credited with a theory of toleration in the ruler’s own self-interest. Trying to control people’s thoughts may provoke too much opposition and squanders power that can best be used elsewhere.

The English philosopher John Locke’s (1632–1704) first work on toleration opposed it (1667). But after living for some

years in the Netherlands, becoming friends with Dutch toleration theorist Philip van Limborch (1633–1712), and reading Pierre Bayle and Adriaan Paets (1631–1686) he developed a theory of toleration, which he published in *A Letter Concerning Toleration* (1689). He relied on the Calvinist point that everyone is responsible for his own salvation, skepticism about who really knew the truth, and the political benefits of toleration. Like Milton, however, he was unable to conceive of toleration of Catholics and atheists because of their alleged political unreliability, but later wrote for legal endenization of Muslims and against licensing of the press.

Economic interests, travel writings, and belles lettres. Beyond religious and philosophical ideas, one source of toleration in theory and practice was economics. The Dutch found that wide toleration paid off in economic growth and provided a demonstration effect for the rest of Europe. Henry Robinson's (c. 1605–c. 1664) pamphlets of the 1640s and Daniel Defoe's (1660–1731) many writings of the beginning of the eighteenth century pointed out the commercial benefits of toleration of merchants and customers of differing religions.

Another source of tolerationist ideas was travel literature, which introduced Europeans to different customs and religions from around the world. This could include actual travel accounts; somewhat fanciful travel literature such as Fernão Mendes Pinto's *Travels* (1614); and imaginative works like Denis Veiras's *History of the Sevarites* (1675–1679), Defoe's *Robinson Crusoe* (1719), and Jonathan Swift's *Gulliver's Travels* (1726).

Other genres of literature could be important, too. Aphra Behn's play *Oroonoko* (1688) taught English audiences to tolerate Africans, Gotthold Ephraim Lessing's *Nathan the Wise* (1779) expressed the values of toleration for late-eighteenth-century Germany, and Karl Friedrich Bahrdt's play *The Edict of Religion* (1787) ridiculed Frederick William II's attempt to legislate religious conformity.

Despite all of the foregoing defenses of toleration, open admission of Socinianism or atheism remained dangerous throughout the early modern period. One recourse for Socinians, atheists, and libertines was the circulation of manuscripts and even clandestine printed works in the large underground literature of the time. Much of this literature, which included many pleas for toleration, has been explored in the French annual *La lettre clandestine* (1992–).

Toleration of Jews. Jews and heretics were often subjects of popular and clerical intolerance in medieval and early modern Europe, but writers could counteract some of that sentiment. Millenarians favored toleration of Judaism because they believed that the Jews must voluntarily convert before the restoration of Christ. Histories such as Jacques Basnage's *History of the Jews* (1707–1716) and Ludvig Holberg's *History of the Jews* (1742) helped place this much-maligned people in a more favorable light. The Jewish writer Moses Mendelssohn's *Jerusalem* (1783) was an eloquent plea for religious tolerance.

Nineteenth and Twentieth Centuries

It seems safe to say that although toleration of differing religions remains a political issue even into the twenty-first

century, there have been few or no substantial novelties concerning the idea of toleration since the eighteenth century. Wilhelm von Humboldt's *The Limits of State Action* of 1852, his follower John Stuart Mill's *On Liberty* of 1859, and twentieth-century pleas for tolerance have largely debated, restated, and updated the theoretical ideas already in place from earlier times.

Legal Acts and Declarations

In addition to political pamphlets and philosophical arguments, from the sixteenth century on toleration can be tracked by study of the legal provisions that were decreed to grant it. One form of toleration was settled by the Peace of Augsburg of 1555, which ended some of the wars between Lutherans and Catholics. Under the formula *cuius regio eius religio* (the ruler determines the religion) it held that each prince could decide which of the two religions would be established in his territories and permitted adherents to the other religion to emigrate. Although not much, this was an entering wedge for wider forms of toleration. The principle was reaffirmed, this time including Catholicism, Lutheranism, and Calvinism, in the Peace of Westphalia of 1648.

The Revolt of the Netherlands against Spain after 1560 eventually gave the once-persecuted victorious Protestants the dilemma of deciding how to deal with the large number of Catholics in their territories. Pacts of tolerance were published as early as the 1570s, and in some localities Catholics were forbidden to proselytize or engage in public processions but were allowed to worship in private homes.

In 1568 the Diet of Torda in Transylvania consolidated religious enactments of the previous decades into a decree that “no one should be abused by anyone for his religion” and further similar provisions. In the following decades Anabaptists, Unitarians, Jews, and Orthodox Christians were protected by various laws and patents. In 1573 the king of Poland was forced to accede to the Confederation of Warsaw, which granted Catholics, Lutherans, Calvinists, and even antitrinitarians some protection from persecution, leading to a golden age for Socinians there that lasted for several decades until Catholicism regained the ascendancy.

After decades of civil war between Calvinist Huguenots and Catholics in France, Henry IV enacted the Edict of Nantes in 1598, which guaranteed Protestant rights to worship in their churches and even to certain fortified cities. Several other edicts of the sixteenth century attempted to settle continuing religious rivalry, but Louis XIV ended efforts to make coexistence possible by his Revocation of the Edict of Nantes in 1685. As many as a hundred thousand Calvinists fled France.

Taking advantage of the outflow of these talented and hard-working Huguenots, Frederick William I, the Calvinist great elector of Lutheran Brandenburg, issued the Decree of Potsdam in 1685, announcing that he would provide refuge to them and respect their religion. Many came and settled in Berlin, helping the city prosper.

The Toleration Act of 1689 demonstrates what the word could mean in England in that period. It suspended penal laws

against Protestants who refused to conform to the Church of England. It did not lift penalties against antitrinitarians and Catholics, who were only given equal rights in 1813 and 1829, respectively. It maintained privileges such as exclusive qualification for political office for members of the Church of England. Nevertheless, this could be considered toleration because it allowed some dissenting sects that had not previously been permitted to worship in public to do so. Its perhaps unintended consequence was to keep alive the idea that other sects could eventually be tolerated, too.

Many who emigrated to the English colonies in North America did so in pursuit of religious freedom. Maryland's Act Concerning Religion of 1649 was the first to spell out religious freedom. As mentioned above, Roger Williams founded the colony of Rhode Island in order to institute religious liberty. By the later eighteenth century, the ideal of religious toleration was often institutionalized by declarations of rights. The Virginia Declaration of Rights of 1776, several other state declarations, and the First Amendment to the United States Constitution (1791) provided for religious freedom. In France, the "Declaration of the Rights of Man and of the Citizen" of the National Assembly in 1789 provided that "No one shall be disquieted on account of his opinions, including his religious views, provided their manifestation does not disturb the public order established by law" (Article 10). The United States and France served as models for such ideals and declarations in many countries throughout the next century.

Twentieth-century declarations. In the twentieth century, the United Nations internationalized the tradition of declarations of rights to toleration. In 1948 the General Assembly adopted the Universal Declaration of Human Rights, providing that "everyone has the right to freedom of thought, conscience and religion; this right includes freedom to change his religion or belief, and freedom, either alone or in community with others and in public or private, to manifest his religion or belief in teaching, practice, worship and observance" (Article 18).

In 1996 the United Nations Educational, Social, and Cultural Organization (UNESCO) issued a "Declaration of Principles of Tolerance." Ignoring the ordinary usage of *tolerance* as referring to the middle of the spectrum between persecution and warm embrace, UNESCO redefined it by fiat as "respect, acceptance and appreciation of the rich diversity of our world's cultures" (Article 1.1). This was surely well-intended as an effort to move people who are unjustifiably opposed to diversity toward more open-mindedness. But if warm embrace becomes the exclusive meaning of *toleration*, we will surely need another term for our attitude or policy toward the things we may justifiably not respect, accept, or appreciate, but also do not persecute.

John Christian Laursen

TOTALITARIANISM. Totalitarianism is a concept rooted in the horror of modern war, revolution, terror, genocide, and, since 1945, the threat of nuclear annihilation. It is also among the most versatile and contested terms in the political lexicon. At its simplest, the idea suggests that despite Fascist/Nazi “particularism” (the centrality of the nation or the master race) and Bolshevik “universalism” (the aspiration toward a classless, international brotherhood of man), both regimes were basically alike—which, as Carl Friedrich noted early on, is not to claim that they were wholly alike. Extreme in its denial of liberty, totalitarianism conveys a regime type with truly radical ambitions. Its chief objectives are to rule unimpeded by legal restraint, civic pluralism, and party competition, and to refashion human nature itself.

Coined in May 1923 by Giovanni Amendola, *totalitarianism* began life as a condemnation of Fascist ambitions to monopolize power and to transform Italian society through the creation of a new political religion. The word then quickly mutated to encompass National Socialism, especially after the Nazi “seizure of power” in 1933. By the mid-1930s, invidious comparisons among the German, Italian, and Soviet systems as totalitarian were becoming common; they increased considerably once the Nazi-Soviet pact was signed in 1939. Meanwhile, recipients of the totalitarian label took different views of it. Although, in the mid 1920s, Benito Mussolini and his ideologues briefly embraced the expression as an apt characterization of their revolutionary élan, Nazi politicians and propagandists saw a disconcerting implication. Granted, Adolf Hitler and Joseph Goebbels, during the early 1930s, had a penchant for cognate expressions such as “total state”; so, too, did sympathetic writers such as Ernst Forsthoff and Carl Schmitt. At around the same time, Ernst Jünger was busy expounding his idea of “total mobilization.” But “totalitarianism” was treated with greater circumspection. The *Volksgemeinschaft* (national community), Nazi spokesmen insisted, was unique: the vehicle of an inimitable German destiny based on a national, racially based, rebirth. *Totalitarianism* suggested that German aspirations were a mere variant on a theme; worse, a theme that current usage extrapolated to the Bolshevik foe.

Once Fascism and Nazism were defeated, a new global conflict soon emerged, and with it a reinvigorated role for “totalitarianism.” Anxiety over Soviet ambitions in Europe prompted Churchill’s use of the term twice in his “Iron Curtain” speech on March 5, 1946, at Fulton, Missouri. A year later, the Truman Doctrine entrenched the word in American foreign policy and security jargon. Then the Cold War took its course, punctuated by the Berlin Airlift, the building of the Berlin Wall, the Sino-Soviet treaties, the Korean War, the Cuban

Missile Crisis, and the Hungarian, Czech, and Polish uprisings. At each turn, the language of totalitarianism received a further boost, though there were significant national variations in the credence it received. In the United States, the language of totalitarianism, despite dissenting voices, had wide appeal across the political spectrum. In France, by contrast, it had practically none until the decay of existentialism and the appearance of Solzhenitsyn’s work on the Soviet Gulag triggered a major attitudinal shift. Postwar Germany represents an intermediate case: officially sanctioned by the Federal Republic, *totalitarianism* became the focus of major intellectual controversy from the late 1960s onward.

Even periods of engagement with the Soviet Union— notably détente and the Ronald Reagan–Mikhail Gorbachev dialogue—stimulated debate over totalitarianism. Some commentators optimistically announced its softening and demise, while others deplored collaborating with the totalitarian enemy. During the Soviet Union’s last decade, Western academics and foreign policy experts argued over the distinction between two kinds of regime. Authoritarian regimes (sometimes also called “traditional” or “autocratic”) typified the apartheid state in South Africa, Iran under the Pahlavis, and the South American military juntas. Though hierarchical, vicious, and unjust, they had limited goals, and they left large parts of society (religious practice, family, and work relations) untouched. Conceivably, they were capable of reformist evolution toward representative government. In contrast, totalitarian regimes were depicted as utopian, inherently expansionist, and indelibly tyrannical, an evil empire. Treating them as normal states was folly. Meanwhile, in central Europe, embattled oppositionists during the late 1970s and 1980s were coining terms that suggested novel permutations on the classical model. “Posttotalitarian” regimes, suggested Václav Havel in *The Power of the Powerless* (1978), retained a brutal apparatus of coercion but were no longer able to enthuse their populations with faith. Resistance required puncturing a hollow, mechanically recited ideology by everyday acts of noncompliance and by “living in truth” (that is, by speaking and acting honestly).

Following the collapse of the Soviet Union, twenty-first-century Islamism and the “war against terror” continued to keep the idea of totalitarianism salient. Yet if all these experiences are inseparable from the discourse of totalitarianism, its longevity has also been promoted by three rather different factors. One factor is the term’s elasticity. It can be applied either to institutions or to ideologies, to governments or to movements, or to some combination of all of these. Additionally, it can be invoked to delineate an extant reality or a desire, myth, aim, tendency, experiment, and project. *Total* and its cognates (*totality*, *total war*, etc.) are commonplaces of the current age, so it is unsurprising that *totalitarianism* is also one. A second factor, more important still, is the role played by journalists, novelists, poets, playwrights, and filmmakers in publicly disseminating the images of totalitarian domination. Their role was to ensure that totalitarianism never became a recondite, academic term but one central to the vernacular of educated people. Totalitarianism was a buzzword of political journalism before it received, in the late 1940s and 1950s, searching treatment by social science and political theory. Its

first literary masterpiece was Arthur Koestler's *Darkness at Noon* (1941) with its sinister portrayal of the Communist confessional. Many great works on a similar theme followed, making totalitarianism vivid and unforgettable to readers electrified by the pathos and terror such writing evoked.

Still, no novelist is more responsible for the notion that totalitarianism penetrates the entire human personality, dominating it from within, than George Orwell (Eric Arthur Blair, 1903–1950). That view appeared nothing less than prescient when stories later circulated in the 1950s about “brainwashing” of captured prisoners of war (POWs) during the Korean War. Orwell deserves a special place in any historical audit of totalitarianism for another reason. *Nineteen Eighty Four* (1949) introduced terms—“Thought Police,” “Big Brother,” “Doublethink”—that have since entered the English language as unobtrusively as those of Shakespeare and the King James Bible. So long as his work appears in the secondary school and university curricula, totalitarianism as an idea will survive. In a similar way, no one is more responsible for informing a general public about the Soviet Gulag than Aleksandr Solzhenitsyn (b. 1918). To his extraordinary novels, memoirs, and what he called “experiments in literary investigation,” one may add the work of Osip Mandelstam, Nadezhda Mandelstam, Anna Akhmatova, Boris Souvarine, and Boris Pasternak. Each bequeathed a searing portrait of the depravity and recklessness of “totalitarian” systems.

Finally, totalitarianism's endurance as a term owes much to its capacity for provocative and counterintuitive application. It was not only heterodox Marxists such as Herbert Marcuse who indicted modern pluralist regimes for a systemically imbecilic, one-dimensional, and totalitarian mass culture. Liberals such as Friedrich Hayek also warned in 1944 of totalitarian developmental tendencies—particularly the fetish with state planning and intervention—that were paving the “road to serfdom.” Many critics of the New Deal took a similar view; Herbert Hoover notoriously called Franklin Delano Roosevelt a “totalitarian liberal.” Also disquieting was the sociologist Erving Goffman's contention in *Asylums* (1961) that Nazi death camps were broadly comparable to widely accepted “total institutions” such as the asylum, prison, barracks, and orphanage. The implication was that totalitarianism was not an exotic species of regime “over there” but a legitimized institution or trend deeply embedded within modernity as a whole.

Origins, Trajectory, Causation

Theorists of totalitarianism take very different views of its origins. For some, Hannah Arendt foremost among them, totalitarianism is radically new, an unprecedented development that attended Europe's economic, political, and moral ruination during and after World War I. From this perspective, attempts to locate a long-established lineage of totalitarianism are fundamentally mistaken. So, too, are analogies of totalitarianism with Caesarist, Bonapartist, and other dictatorial regimes. Totalitarianism is conjunctural or unique, not an extreme version of something previously known. The point of using the term is precisely to show the novelty of the regime type and the crisis it denotes. Other writers, conversely, believe that totalitarianism has deeper roots. Hence it might be said that totalitarianism is

a perverted outgrowth of the Martin Luther–sanctioned authoritarian state, or an exaggerated legacy of tsarist intolerance. Or it might be argued that “totalitarian dictatorship” is ancient, prefigured in the Spartan state or the Roman imperial regime of Diocletian (r. 284–305). That was the judgment of Franz Neumann, who in addition claimed that National Socialism had revived the “fascist dictatorship” methods of the fourteenth-century Roman demagogue Cola di Rienzo. Nor, according to still others, should totalitarianism be understood as an exclusively occidental institution. Karl Wittfogel in *Oriental Despotism* (1957) found “total power” in the hydraulic governance of ancient China. And while sinologists have major reservations about describing Maoism as totalitarian, victims such as Harry Wu, imprisoned for nineteen years in the Chinese Laogai, exhibit no such compunction. Totalitarianism has also been located in Africa, for instance, in the rule of Shaka Zulu, while the Soviet Union itself was often depicted as a hybrid entity, more “Asian” than Western.

The search for the roots of totalitarian ideas, as distinct from institutions, has generated yet another fertile literature. Karl Popper found protototalitarianism in Plato. Max Horkheimer and Theodor Adorno spied a totalitarian dialectic evolving out of an “Enlightenment” fixation on mathematical formalization, instrumental reason, and the love of the machine. J. L. Talmon discovered a creedal, “totalitarian democracy” arising from one tendency among eighteenth-century philosophies. Enunciated by Jean-Jacques Rousseau (1712–1778), Morelly (fl. mid-eighteenth century), and Gabriel Bonnot de Mably (1709–1785); radicalized by the French Revolution, especially during its Jacobin phase; reincarnated in the Babouvist conspiracy, “totalitarian democracy” amounted to a leftist “political messianism” that preached the arrival of a new order: homogenous, egalitarian, yet supervised by a virtuous revolutionary vanguard able to divine the general will. This reminds one of Alexis de Tocqueville's observation, in *The Ancien Regime and the French Revolution* (1856), that the Revolution's “ideal” was nothing less than “a regeneration of the whole human race. It created an atmosphere of missionary fervor and, indeed, assumed all the aspects of a religious revival.” That “strange religion,” he continued, “has, like Islam, overrun the whole world with its apostles, militants, and martyrs” (p. 44).

Tocqueville's reference to Islam was deliberately discomfiting. It reminded his audience of what a modern “enlightened” European revolution shared with a declining Oriental civilization. Less than a century later, Bertrand Russell augmented that idea when he suggested that Bolshevism was like Islam, while John Maynard Keynes, in lapidary mood, remarked that “Lenin [was] a Mahomet, and not a Bismarck.” Yet since Al Qaeda's suicide attack on the World Trade Center and the Pentagon on September 11, 2001, a growing number of commentators have contended that it is *modern* Islam, or at least the current of Islamism associated with the legacy of the Egyptian Muslim Brotherhood and the Saudi Wahabite movement, with which previous European revolutions are best compared. On this account, twenty-first century Islamist (and perhaps Ba'athi) ideology, practice, and organization bear many disquieting parallels with National Socialism and Bolshevism.

Modern Islamism is a radical movement in which pluralism is anathema, and in which politics itself is derided as a sphere of venality. To that extent it mirrors Islamic doctrine more generally since the suras of the Koran make no categorical or principled distinction between public and private spheres: every duty emanates from God alone. The state has no independent authority. Among Islamist militants, the substitute for political institutions is, above all, the fellow-feeling and camaraderie bestowed by membership of a secret society and the existential tests that confront the believer. “Muslim totalitarianism” reconfigures the capillary, decentralized organization of its Western precursors. Islamist militants combine the conspiratorial anti-Semitism of the Nazis (for whom they entertain a nostalgic admiration) with the pan-territorial ambitions of Bolshevik universalism. Islamist language is also replete with millenarian images of struggle, merciless destruction, and “sacred terror.” Bent on purifying the world of Zionism, liberalism, feminism, and Crusader (U.S.) hegemony, Islamist ideology articulates a mausoleum culture of submission, nihilism, suicidal martyrdom for the cause, and mythological appeal to a world about to be reborn. That archaic demands for the reestablishment of the hallowed caliphate are pursued with all the means modern technology affords is consistent with the “reactionary modernism” of earlier totalitarian movements.

Such totalitarian parallels or intellectual lineages do not satisfy those who insist that family resemblance is no substitute for attributable historical causation. And since the early 1950s it has frequently been acknowledged that theorists of totalitarianism are much more adept at constructing morphologies than they are at establishing the precise relationship of totalitarian regimes to one another. François Furet argued this point eloquently, claiming too that Arendt’s hodgepodge reconstruction of totalitarianism’s career had failed to explain the “very different origins” of fascism and communism. Like Ernst Nolte, Furet was convinced that a “historico-genetic” approach to these movements was required to supplement the standard typological one. Like Nolte, as well, he believed that Bolshevism and National Socialism were historically linked, still a taboo contention among many leftists. Yet Furet disagreed with Nolte’s contention that, essentially, National Socialism was a reaction to Bolshevism, a defensive if evil posture that gained credibility owing to the disproportionate influence of Jews in Marxist and socialist parties. According to Furet, the genealogical relationship between Bolshevism and National Socialism was not principally cause and effect. Each had its own endogenous history. The two movements’ affinity derived instead from the fact that both of them (and Italian Fascism too—Mussolini was once a revolutionary socialist) emerged from the same “cultural” atmosphere: a late-nineteenth-, early-twentieth-century milieu suffused with “hatred of the bourgeois world.” Deep and bitter loathing of that world was well established before World War I and thus also before the October Revolution. Equally, German anti-Semitism did not require Jews to be major spokesmen and leaders of the left to be an object of detestation. Anti-Semitism was already firmly established before Bolshevism erupted, because Jews were seen as a vanguard of democracy itself. Bourgeois democracy was the common enemy of totalitarian movements: the “communist sees it as the

breeding ground of fascism, while the fascist sees it as the antechamber of Bolshevism (Furet and Nolte, p. 33).”

Totalitarian Characteristics

A conventional way of describing totalitarianism is to present a list of characteristics common to Italian Fascism, German National Socialism, and Soviet Bolshevism. (Other regimes may also be included—notably, Chinese Communism under the rule of Mao, the Democratic People’s Republic of Korea (North Korea), and Pol Pot’s “Democratic Cambodia.”) But how capacious should that portmanteau be? In *Totalitarianism*, published in 1954, Carl Friedrich itemized five elements, which, in a subsequent collaboration with Zbigniew Brzezinski, he increased to six. Yet, before that, Arthur M. Hill concocted fifteen points that Norman Davies, in *Europe: A History* (1997), expanded to seventeen. Recurrently mentioned features of totalitarianism include the following:

- A revolutionary, exclusive, and apocalyptic ideology that announces the destruction of the old order—corrupt and compromised—and the birth of a radically new, purified, and muscular age. Antiliberal, anticonservative, and antipluralist, totalitarian ideology creates myths, catechisms, cults, festivities, and rituals designed to commemorate the destiny of the elect.
- A cellular, fluid, and hydra-like political party structure that, particularly before the conquest of state power, devolves authority to local militants. As it gains recruits and fellow believers, the party takes on a mass character with a charismatic leader at its head claiming omniscience and infallibility, and demanding the unconditional personal devotion of the people.
- A regime in which offices are deliberately duplicated and personnel are continually shuffled, so as to ensure chronic collegial rivalry and dependence on the adjudication of the one true leader. To the extent that legal instruments function at all, they do so as a legitimizing sham rather than a real brake on the untrammled use of executive power. Indeed, the very notion of “the executive” is redundant since it presupposes a separation of powers anathema to a totalitarian regime.
- Economic-bureaucratic collectivism (capitalist or state socialist) intended to orchestrate productive forces to the regime’s predatory, autarchic, and militaristic goals.
- Monopolistic control of the mass media, “professional” organizations, and public art, and with it the formulation of a cliché-ridden language whose formulaic utterances are designed to impede ambivalence, nuance, and complexity.
- A culture of martial solidarity in which violence and danger (of the trenches, the street fight, etc.) are ritually celebrated in party uniforms, metaphors

(“storm troopers,” “labor brigades”), and modes of address (“comrade”). Youth are a special audience for such a culture, but are expected to admire and emulate the “old fighters” of the revolution.

- The pursuit and elimination not simply of active oppositionists but, and more distinctively, “objective enemies” or “enemies of the people”—that is, categories of people deemed guilty of wickedness in virtue of some ascribed quality such as race or descent. Crimes against the state need not have actually been committed by the person accused of them. Hence the “hereditary principle” in North Korea where punishment is extended to three generations (the original miscreants, their children, and their grandchildren). Under totalitarianism, it is what people are, more than what they do that marks them for punishment. As Stéphane Courtois observes, “the techniques of segregation and exclusion employed in a ‘class-based’ totalitarianism closely resemble the techniques of ‘race-based’ totalitarianism” (p. 16). Soviet and Chinese Marxism may have claimed to represent humanity as a whole, but only a humanity divested first of millions—classes, categories—who were beyond the pale of Marxist doctrine. Its universalism was thus always, like National Socialism, an exclusive affair.
- Continual mobilization of the whole population through war, ceaseless campaigns, “struggles,” or purges. Moreover, and notwithstanding ideological obeisance to ineluctable laws of history and race, totalitarian domination insists on febrile activity. The mercurial will of the leader and the people as a whole must constantly be exercised to produce miracles, combat backsliding, and accelerate the direction of the world toward its cataclysmic culmination.
- The pervasive use of terror to isolate, intimidate, and regiment all whom the regime deems menacing. Charged with this task are the secret police rather than the army, which typically possesses significantly fewer powers and less status than it does under a non-totalitarian dictatorship or “authoritarian” regime.
- The laboratory of totalitarian domination is the concentration camp. The experiment it conducts aims to discover the conditions under which human subjects become fully docile and pliable. In addition, a slave labor system exists side by side with a racial and/or class-oriented policy of genocide. In Nazi Germany, Jews were the principal objective enemy—over six million were murdered—but there were others such as Slavs and Gypsies. In the Soviet Union, key targets of annihilation or mass deportation were Cossacks (from 1920), kulaks (especially between 1930–1932), Crimean Tartars (1943), Chechens, and Ingush (both in 1944). The Great Purge of 1937–1938 is estimated to have killed close to 690,000 people, but this is dwarfed by the systematically induced famine in Ukraine in 1932–1933,

thought to have killed around six million. Pol Pot’s Cambodian Communist Party had a similar penchant for mass extermination, as did the Chinese Communist Party (CCP) under Mao: the Chairman boasted that 700,000 perished in the 1950–1952 campaign against “counterrevolutionaries.” The CCP targeted landlords and intellectuals, and through a policy of accelerated modernization created the famine of the Great Leap Forward that claimed around 30 million victims.

It should be noted that there is widespread disagreement among commentators about whether Italian Fascism is properly classified as a totalitarian system. Hannah Arendt and George Kennan thought otherwise. Mussolini’s regime, on such accounts, is best comprehended as an extreme form of dictatorship or, according to Juan Linz, a species of “authoritarianism.” Though preeminent, it shared power with other collective actors such as the monarchy, the military, and the Catholic Church in a way that was utterly alien to National Socialism and Bolshevism. Official anti-Semitism was less intense and less vigorously policed. And Mussolini was domestically ousted in a way that indicates a far more precarious grip on power than either Hitler or Stalin evinced.

The Coherence of Totalitarianism

Since the 1950s, the majority of academic commentators who favor the term have acknowledged that totalitarianism was never fully successful in its quest for complete domination. (Critics of the concept of totalitarianism are considered in the final section of this entry.) This was the key intuition of David Riesman in his correspondence with Hannah Arendt (he read in manuscript the last part of *The Origins of Totalitarianism* [1951]). It was also a theme of the Harvard Project on the Soviet Social System and its literary offspring—notably, Alex Inkeles and Raymond Bauer’s *The Soviet Citizen: Daily Life in a Totalitarian Society* (1961). To that extent, as Daniel Bell remarked, totalitarianism was always a concept in search of reality. Unlike political philosophers, moreover, social scientists tend to see totalitarianism as an ideal-type, a one-sided model constructed for research purposes, which also suggests that totalitarianism in the flesh can be of greater or lesser virulence. Studies of inmate camp “culture” lend further credence to the oxymoronic concession that totalitarianism had its limits. Tsvetan Todorov and Anne Applebaum show that even under conditions expressly designed to expunge all traces of solidarity, acts of “ordinary virtue” persisted. Hence there were always people who maintained their dignity (by keeping as clean as they could), who cared for others (sharing food, tending the sick), and who exercised the life of the mind (by reciting poetry, playing music, or committing to memory camp life so as to allow the possibility of its being fully documented later). Michel Mazor’s luminous, yet astonishingly objective, autobiographical account of the Warsaw Ghetto (*The Vanished City*, 1955) expresses a similar message of hope. Survivors of death camps and Gulags have typically conveyed a different message, however. Crushed by a merciless regime determined to exterminate not only an individual’s life, but the concept of humanity itself, inmates endured a vertiginous “gray zone” of collaboration and compromise.

Any list of totalitarian features, such as the one itemized above, raises an obvious question: What gives the typology its coherence? Or, to put the matter differently, is there some property that furnishes the whole with its master logic or integral animation? Two frequently rehearsed, and related, answers are discernible. The first takes up the pronounced totalitarian attachment to the will, dynamism, and movement. As early as 1925, Amendola was struck by the “wild radicalism” and “possessed will” of the Italian Fascists. Mussolini himself spoke proudly of “la nostra feroce volonta totalitaria” (“our fierce totalitarian will”). And the virtue of “fanaticism,” “will,” and “the movement” for the nation’s well-being was tirelessly rehearsed by Hitler and Goebbels, as it was later by Mao. *Yundong* (movement, campaign) was among the most salient ideas of the Chairman, who specifically emphasized the importance of chaos. Sinologist Michael Schoenhals observes that in its original Maoist sense (since disavowed by Deng Xiaoping and his successors, who prefer to speak of an incremental *fazhan* or “development”), *yundong* entails the deliberate “shattering of all regular standards,” the suspension of all stabilizing rules, norms, and standards that may apply in ordinary times. The goals of this regularized suspension—there were sixteen major national “movements” between 1950 and 1976—were to orchestrate hatred against the Party’s latest enemy (often previously hallowed figures within the Party), to arouse superhuman efforts in support of economic targets, and incessantly to combat “revisionism” and the emergence of new elites. The Soviet Union during the heyday of Stalinism exhibited similar characteristics, as Boris Pasternak’s Dr. Zhivago explains:

The point is, Larissa Fyodorovna, that there are limits to everything. In all this time something definite should have been achieved. But it turns out that those who inspired the revolution aren’t at home in anything except change and turmoil: that’s their native element; they aren’t happy with anything that’s less than on a world scale. For them, transitional periods, worlds in the making, are an end in themselves.

The centrality of flux and activism to the idea of totalitarianism is integral to classical academic accounts of the phenomenon. It prompted Franz Neumann, in *Behemoth: The Structure and Practice of National Socialism* (1942), to call the Third Reich a “movement state,” and Ernst Fraenkel to describe it as a “dual state” in which the “normal” functions of the legal and administrative apparatus were constantly undermined by Party “prerogative”—Fraenkel’s term for the maelstrom of feverish Nazi initiatives that unleashed bedlam without respite. Similarly, Sigmund Neumann entitled his comparative study of the Nazi, Fascist, and Bolshevik hurricanes *Permanent Revolution: The Total State in a World at War* (1942).

Still, the most influential account along these lines was that proffered by Hannah Arendt. Totalitarianism, she argued, was a mode of domination characterized far less by centralized coordination than by unceasing turbulence. To confuse totalitarianism with dictatorship or to see it as a type of dictatorship (or even state) was to miss a fundamental distinction. Once consolidated, dictatorships—for instance, military juntas—typically

become routinized and predictable, domesticating and detaching themselves from the movements that were their original social basis. Totalitarian regimes, in contrast, rise to power on movements that, once installed in office, employ motion as their constitutive “principle” of domination. The volcanic will of the leader whose next decision could nullify all previous ones; rule by decree rather than law; the continual manufacture of new enemies; police institutions, Gulags, and death camps whose only purposes are to transform citizens into foes and transform individuals into an identical species and then into corpses: All these features characterize a regime-type of eternal transgression. “Terror,” remarks Arendt, is itself “the realization of the law of movement; its chief aim is to make it possible for the force of nature or of history to race freely through mankind, unhindered by any spontaneous human action” (p. 465). Indeed, it is the grotesque destructiveness and futility of totalitarian systems, their attack on every norm that might anchor human life in something stable, that makes them so resistant to methodical analysis.

A second thread that runs through discussions about totalitarianism is the pagan ardor that Fascism, National Socialism, and Bolshevism were capable of generating. Once more, Amendola was a pioneer in this line of interpretation, calling Fascism a “war of religion” that demands total devotion. More sympathetically, the philosopher Giovanni Gentile, ghost-writer of Mussolini’s “The Doctrine of Fascism” (1932), stressed the new movement’s penetrative spirit. Of special significance was the myth of rebirth: the creation of a new nation or a world without classes, and the formation of a selfless New Man or Woman, untainted by decrepit habits. Fascism, Mussolini avowed, was the author of the Third Italian Civilization (the previous two being the Roman Empire and the Renaissance). Nazi ideology was also replete with notions of national redemption, the spirit of a rejuvenated people, and even the divine mission of the SS. World War I, and the community of front-line soldiers (*Frontgemeinschaft*) or “trenchocracy” it witnessed, was typically identified as the crucible of this steely resurrection. Coup d’état strategizing, the battles to defeat the Whites during the civil war, and the perennial trumpeting of the class struggle, promoted a similar mentality among the Bolshevik leaders.

Commentators who stress the mythological component of totalitarianism—writing of “ersatz religions,” “political religions,” the “myth of the state,” the “sacralization of politics,” and “palingenesis”—include Raymond Aron, Albert Camus, Ernst Cassirer, Norman Cohn, Waldemar Gurian, Jacob Talmon, and Eric Voegelin. Worthy successors are Michael Burleigh, Roger Griffin, and Emilio Gentile. Gentile, while desisting from the view that political religion is the most important element of totalitarianism, nonetheless affirms that it is “the most dangerous and deadly weapon” in its ideological arsenal (p. 49). Civic religions, such as those found in the United States and France, are different from political religions because they celebrate a republican concept of freedom and law. Church and state are separated, but each has its legitimate sphere of activity. In contrast, the sacralization of politics under totalitarian rule, together with its liturgies, festivals, and cults, is marked by the deification of the leader; idolatrous worship of the state,

which arrogates to itself the exclusive right to determine Good and Evil; marginalization or destruction of traditional religion; orgiastic mass rallies; immortalization of the party fallen; the appeal to sacrifice; and the cult of death. Interpretations of totalitarianism that emphasize political religion have one notable implication. They suggest that totalitarianism is best understood not as a singular event, or a unique set of institutions, but as a recurrent possibility of the modern world shorn of its customary restraints.

Criticisms and Responses

At the risk of simplification, criticisms of the concept of totalitarianism may be divided into two main, though overlapping, types: moral-political and scientific. The first type of criticism takes different forms but often hinges on the argument that *totalitarianism* was employed during the Cold War as an ideological weapon of a particularly Manichean, self-serving, and self-righteous kind. Starkly dividing the world into liberal democratic white-hats and communist black-hats, Abbott Gleason remarks, conveniently omitted the extent to which Western governments supported military and other regimes with bleak and bloody human-rights records. Describing military juntas as authoritarian rather than totalitarian made no difference to the people they murdered. A twist on this criticism, found among American disciples of the Frankfurt School, is that liberal democracy itself is not in principle the antithesis of totalitarianism, because both are disastrous permutations of “Enlightenment modernity.” A rather different objection is that totalitarianism is an opportune way for former collaborators of Nazism, Bolshevism, and so forth, to dodge responsibility for their actions. Its exculpatory value turns on the claim that “resistance was impossible” or that “we were all brainwashed.” Yet the charge of double standards is also made by those, such as Martin Malia, who vehemently defend the pertinence of *totalitarianism* as a label. Disavowing that term all too often means denying the evil symmetry of Nazism and Bolshevism. By recapitulating earlier leftist dogmas—that genuine antifascism required support for the Soviet Union, that comparisons with Nazi Germany are unacceptable because they play into the hands of U.S. imperialism—such denials can become an expedient means of rescuing Marxism from its real, sanguinary history. In a similar way, loose talk of the “dialectic of Enlightenment” is less a challenge to common sense than it is a meretricious affront to its very existence. In any case, the term *totalitarianism* preceded the Cold War by more than two decades.

Scientific objections to totalitarianism as an idea typically focus on a diverse set of issues. Critics argue that the notion is mistaken because:

- Totalitarianism is a fictive Orwellian dystopia instead of an empirical reality. The Soviet system, for instance, “did not exercise effective ‘thought control,’ let alone ensure ‘thought conversion,’ but in fact depoliticized the citizenry to an astonishing degree” (Hobsbawm, p. 394). Official Marxism was unspeakably dull and irrelevant to the lives of most people.
- *Totalitarianism* is a misnomer because in neither the Soviet Union nor Nazi Germany was terror total.

Instead it was always focused on particular groups. In the Soviet Union, terror formed a radius in which danger was greatest the nearer one was to power and purge. In Germany, once active domestic opposition to the Nazis was defeated, and Jews were deported to the camps, most citizens existed at peace with a regime they deemed legitimate. The majority would never have considered themselves as terrorized by it. Distinguishing between seasoned adversaries and pesky grumblers, the undermanned Gestapo rarely intruded into normal life. Denunciation by citizens of one another was a more effective means of garnering information than the prying eye of the security state.

- The theory of totalitarianism fails to specify a mechanism to explain the internal transition of the Soviet Union and China to nontotalitarian phases. Indeed, the very evolution of such regimes toward humdrum routinization flies in the face of the idea that totalitarianism is above all a movement that cannot be pacified, and is the antithesis of all forms of political normality.
- Totalitarian regimes are too heterogeneous for them to be classified under a single rubric. Under Mao, for instance, the People’s Liberation Army was a more powerful organ of control than the security forces, while Mao’s prestige was periodically checked, and occasionally deflated, by other CCP leaders. The contrasts between Hitler and Joseph Stalin are, Ian Kershaw suggests, even more telling. While Stalin was a committee man who ascended to rule within a recently established system, Hitler was a rank outsider, strongly averse to bureaucratic work of all kinds. Similarly, while Stalin was an interventionist micromanager, Hitler had little to do with the actual functioning of government. People did not so much directly follow his detailed orders, of which there were few, as second guess what he wanted them to achieve, thereby “working toward the Führer.” Then again, Hitler was a spectacular and mesmerizing orator; Stalin’s words were leaden by comparison. Mass party purges characterize one system, but not the other (the liquidation of the Röhm faction in 1934 was a singular event). And finally the systems over which the men prevailed had a different impetus. Stalin’s goal of rapid modernization was, some say, a humanly understandable, if cruelly executed, objective; that the end justifies the means is a standard belief of all tyrants. Conversely, the mass slaughter of the Jews and others was, for Hitler, an end in itself, unquestionably irrational if not insane.

All these objections are themselves the targets of rebuttal. Modernization at the expense of the nation it is intended to benefit seems hardly rational. Its victims rarely thought so. And did not Hitler, too, think in terms of instrumental means and ends? The goal was a purified Aryan civilization, regenerate,

marital, manly, and beautiful. To achieve it, putative nonhumans had to vanish from the face of the earth. Moreover, the transitions that Soviet and Chinese Communism witnessed by no means nullify the totalitarian model. They only appear to do so, Victor Zaslavsky argues, because of failure to distinguish between “system building” and “system maintenance” phases; the latter represents a more stable development, but one still mired in the militarization of society and mass surveillance. Where previous thinkers have erred is in identifying the “system building” stage with totalitarianism *tout court*. Finally, critics of the totalitarian model often object to it on spurious grounds. For to argue that totalitarianism was never systematic in its rule, never fully synchronized, but rather “chaotic,” “wasteful,” and “anarchic” is hardly a criticism of those such as Arendt who made such attributes pivotal to their theory. In good measure, her emphasis on movement is vindicated even by those who employ a different terminology. Examples include “regimes of continuous revolution” (enunciated by Michael Mann) and “cumulative radicalization” (preferred by Hans Mommsen).

Conclusion

As a vehicle for condemnation as well as analysis, *totalitarianism* is likely to remain a vibrant idea long into the twenty-first century. Its extension to radical Islam is already evident. And as a potent reminder of the terrible deeds of which humans are capable, the concept has few conceptual rivals. Principled disagreements as well as polemics about its value continue to mark its career. Present dangers, and anxious debates about how they should best be characterized, suggest that the age of totalitarianism is not yet over.

TOTEMS. The word *totem* is an anglicized rendering of the Ojibwa word *ninto:tem*. It refers to an animal or plant species emblematic of a specific group, notably a clan. While the term was originally applied only to practices of natives of northeastern North America, it was soon extended to refer to superficially similar phenomena around the globe, whose observances came to be known as “totemism.”

Evolutionary Theories

The concept of *totemism* as a form of religion was first formulated by John McLennan, one of the most prominent Victorian anthropologists, in an article entitled “The Worship of Animals and Plants” (1869–1870). McLennan based his concept on similarities between the beliefs and practices of native Australians on one hand, and native North Americans, especially from the northeastern United States, on the other. McLennan summarized his conclusions:

There are tribes of men (called primitive) now existing on the earth in the totem stage, each named after some animal or plant, which is its symbol or ensign, and which by the tribesmen is religiously regarded; having kinship through mothers only, and exogamy as their marriage law. In several cases, we have seen, the tribesmen believe themselves to be descended from the totem, and in every case to be, nominally at least, of its breed or species. We have seen a relation existing between the tribesmen and their totem . . . that might well grow into that of worshipper and god, leading to the establishment of religious ceremonials to allay the totem’s just anger, or secure his continued protection. (p. 518)

McLennan had earlier theorized that the earliest stages of human kinship and marriage, once humanity had evolved out of primeval hordes, were characterized by matrilineal descent and by exogamy—a term he coined and that was arguably his most lasting contribution to anthropology—the rule that states that one must marry outside one’s own kin group. Totemism, he suggested, was the earliest stage of religion, the logical companion to matrilineal descent and exogamy. The rest of his essay attempted to demonstrate that the Greek and Roman deities were anthropomorphized versions of earlier totemic animal and plant spirits.

The thesis that the worship of animals and plants was the earliest form of religion was not original to McLennan. It had been formulated over one hundred years earlier in 1760 by the French Enlightenment thinker Charles de Brosses, in a book entitled *Du culte des dieux fétiches* (Of the cult of the fetish gods), in which he attempted to establish parallels between ancient Egyptian religion and the contemporary religious practices of sub-Saharan Africans. However, McLennan considered fetishism to be a more general concept than totemism, which he argued was its most primitive form.

From Robertson Smith to Spencer and Gillen. In 1889 William Robertson Smith constructed a more elaborate scenario for the origin of religion around the idea of totemism. In *The Religion of the Semites*, he theorized that the original

form of Semitic religion (and by implication all religions) revolved around the notion of kinship between a human community, its totem species, and its god. Under normal circumstances, precisely because of such conceptions of kinship, men were forbidden to eat their totems. However, on specific ritual occasions, the totem animals were sacrificed and shared among members of the community and with their god, in an act where commensality—eating together—was literally a form of communion.

Robertson Smith’s theories were a direct inspiration to those of Émile Durkheim and Sigmund Freud, but they were based on no concrete evidence and were entirely speculative. However, ten years later, the detailed ethnographic research of Baldwin Spencer and F. J. Gillen in *The Native Tribes of Central Australia* appeared to lend credence to his hypothesis. Spencer and Gillen described important ceremonies called *Intichiuma*, which members of the clan performed in order to ensure the natural increase of particular species of animal or plant. At the end of the ceremony, initiates (women and children were rigorously excluded) consumed small portions of the sacred species. Spencer and Gillen’s work also included elaborate descriptions of initiation ceremonies and of the *churinga*—the sacred paraphernalia of totemic groups. They also contradicted McLennan’s hypothesis that totems were associated with matrilineal descent. In fact, a child did not derive his totem directly from either his mother or father, but from the spot where his mother believed him to have been conceived.

Frazer. Sir James Frazer’s *Totemism and Exogamy* (1910) was a massive, four-volume compendium of instances of totemism throughout the world. Frazer rejected McLennan’s contention that totemism was the earliest form of religion: “If religion implies, as it seems to do, an acknowledgment of the part of the worshipper that the object of his worship is superior to himself, then pure totemism cannot properly be called a religion at all, since a man looks upon his totem as his equal and friend, not at all as his superior, still less as his god” (vol. 4, p. 5). Rather, he considered totemic practices to be a form of magic, historically prior to the emergence of religion *per se*. The title of his book notwithstanding, Frazer also disagreed with McLennan’s contention that totemism was necessarily associated with exogamy. Although Frazer conceded that this was frequently the case, he correctly noted that later ethnographers had amassed ample cases of cultures where totemism existed without exogamy, or vice versa, and he provided different speculative explanations for the origins of both phenomena.

Durkheim and Freud

Émile Durkheim, in *The Elementary Forms of Religious Life* (1912), emphatically rejected Frazer’s claim that totemism did not constitute a religion. On the contrary, he used totemism as a case of “the simplest and most primitive religion that observation can make known to us” (1995 ed., p. 21), basing his assertion on Australian ethnography (especially Spencer and Gillen) but resorting to examples from North America and elsewhere at critical junctures of his argument. Durkheim used his analysis of totemism to demonstrate the social origins of knowledge and the underlying unity of religious, philosophical, and

scientific thought. Australian social organization was quite complicated, with tribes divided and subdivided into exogamous moieties (“halves”), classes, and clans, each associated with different species, in a system that incorporated all natural phenomena. “[These] facts illuminate the manner in which the idea of genus or class took form among humans. . . . It was the phratries [i.e., moieties] that served as genera and the clans as species. It is because men formed groups that they were able to group things” (p. 145).

Totemism was not just a way of thinking but also of acting and feeling, organized around the separation of the domains of “sacred” and “profane” that, for Durkheim, constituted the essence of religion itself. More sacred than the totem animals themselves were the *churinga*, bull roarers of wood or stone with schematic representations of the totemic ancestors painted upon them. Uninitiated women and children were forbidden to see them on pain of death, and loss or destruction of one of them was considered catastrophic. But totemism was no more the literal worship of *churinga* than of animals and plants; rather, these were merely the symbolic representations of a force, which Durkheim called *mana*, that was simultaneously external and internal to the worshiper. For Durkheim, the totem was the flag of the clan, a concrete object on which the individual’s allegiance was projected: ultimately, it was nothing other than society’s representation of itself to its members. In this sense, religion in general and totemism in particular did not “rest upon error and falsehood” but was indeed “grounded in and express[ed] the real” (p. 2). Unlike his predecessors, Durkheim stressed the fundamental comparability of “primitive” and “modern” religious thought rather than their essential dissimilarity.

Totem and Taboo. A year later, Sigmund Freud was to suggest in *Totem and Taboo* (1913) that totemism was the expression of a psychological, rather than social, reality. His theory was predicated on the link between totemism and exogamy, which Freud took to be a manifestation of the horror of incest. He was also profoundly inspired by Robertson Smith’s hypothesis of the ritual sacrifice and consumption of the totem animal. However, he incorporated these ideas into an original scenario of his own. Humanity, he suggested, once lived in primal hordes where the father monopolized all the women and exerted tyrannical authority over his children. His sons eventually conspired to kill him, eat him, and take his place. However, the guilt that they experienced not only prevented them from mating with their mother and sisters but ultimately caused them to institute a prohibition on incest.

Psychoanalysis has revealed to us that the totem animal is really a substitute for the father, and this really explains the contradiction that it is usually forbidden to kill the totem animal, that the killing of it results in a holiday and that the animal is killed and yet mourned. The ambivalent emotional attitude which to-day still marks the father complex in our children and so often continues into adult life also extended to the father substitute of the totem animal. (p. 182)

For Freud, parallels between the behavior of “primitives” and “neurotics” led him to seek explanations of both phenomena in

terms of his understanding of universal unconscious emotional processes.

Critique and Elaboration

By the time Durkheim and Freud were writing, the very concept of totemism had already come under attack in a long article by American anthropologist A. A. Goldenweiser, "Totemism: An Analytical Study" (1910). Goldenweiser began by listing the main features believed to be symptomatic of totemism:

1. An exogamous clan.
2. A clan name derived from the totem.
3. A religious attitude towards the totem; as a "friend," "brother," "protector," etc.
4. Taboos, or restrictions against the killing, eating (sometimes touching and seeing), of the totem.
5. A belief in descent from the totem (pp. 182–183).

In a comparison of cases from around the world, he arrived at the devastating conclusion that "Each of these traits . . . displays more or less striking independence in its distribution; and most of them can be shown to be widely-spread ethnic phenomena, diverse in origin, not necessarily coordinated in development, and displaying a rich variability of psychological make-up" (p. 266). Goldenweiser was not quite prepared to give up the concept altogether and proposed a definition of the phenomenon in terms of the association between "definite social units" and "objects and symbols of emotional value" (p. 275). Arguably, such a definition was far too vague and general to be of any use. A few years later, in a highly influential synthesis of cultural anthropology, Robert Lowie was to summarize Goldenweiser's findings and draw an even more radical conclusion: "Why not abandon the vain effort to thrust into one Procrustean bed a system of naming, a system of heraldry, and a system of religious or magical observances?" (p. 143). In other words, he suggested that there was no such thing as totemism, that it was for all intents and purposes an invention of anthropologists.

British functionalism and structural-functionalism.

British anthropologists were less ready to give up the concept of totemism than their American colleagues. Bronislaw Malinowski is often credited with an excessively utilitarian explanation of totemism: "The road from the wilderness to the savage's belly and consequently to his mind is very short, and for him the world is an indiscriminate background against which there stand out the useful, primarily the edible, species of animals or plants" (p. 44). Actually, Malinowski's position was slightly more complex, and he conceded that the "primitive" interest in nature, selective as it might be, was not limited to the edible, but included sentiments of admiration or fear. One way or the other, "the desire to control the species, dangerous, useful, or edible . . . must lead to a belief in special power over the species, affinity with it, a common essence between man and beast or plant" (p. 45).

A. R. Radcliffe-Brown, Malinowski's rival and contemporary, had a more sophisticated approach to the problem,

seeing it as part of "a much wider group of phenomena, namely the general relation between man and natural species in mythology and ritual. It may well be asked if 'totemism' as a technical term has not outlived its usefulness" (p. 117). More specifically, he suggested that totemism was a product of segmentary forms of social organization, the division of society into moieties, clans, or other similar institutions. He proposed a tentative analogy with sainthood in Roman Catholicism: saints are, at one level, universally recognized within the church, but also have particular relationships with specific congregations. In a similar manner, totem species do not simply stand for the clan, as Durkheim suggested, but also for the clan's place in a broader social scheme that includes all totemic species.

The students of Malinowski and Radcliffe-Brown tended to eschew general pronouncements on the nature of totemism. Instead, Raymond Firth, Meyer Fortes, and E. E. Evans-Pritchard, among others, wrote sophisticated ethnographic analyses of religion and social organization in specific societies, discussing totemism among the Tikopia, the Tallensi, or the Nuer in terms that could not readily be generalized. For example, Evans-Pritchard sought to understand totemism in terms of broader Nuer beliefs about *kwoth*, "God" or "Spirit." There were both higher and lower manifestations of "spirit," with totemic spirits definitely belonging to the realm of "spirits of the below." Nuer totems, he noted, were not symbols of lineages, since some lineages had none and other lineages shared the same totem but did not otherwise acknowledge kinship with one another. Nor did totems symbolize Spirit as such, but rather the relationship between God and a particular lineage. In short, such an analysis embedded totemism within the religious beliefs and practices of a particular society.

The Structural Study of Totemism

Paradoxically, Claude Lévi-Strauss began his short book *Totemism* (1962) with the contention that totemism as such did not really exist, comparing it to the concept of hysteria that emerged in psychology at about the same period: "once we are persuaded to doubt that it is possible arbitrarily to isolate certain phenomena and to group them together as diagnostic signs of an illness, or of an objective institution, the symptoms themselves vanish or appear refractory to any unifying interpretation" (1963 ed., p. 1). Even more damning than Goldenweiser, he suggested that the very concept of "totemism" served as a mechanism for establishing a gulf between "primitive" and "civilized" humanity. Ostensibly, totemistic primitives were those who confused the boundaries between "nature" and "culture," if not worshiping animals and plants at least positing bonds of kinship between humans and nonhuman species.

In one sense, the book was an obituary, the history of an illusion. However, it ironically recouped the value of the very concept it pretended to dismiss, as can be seen in the book's most oft-cited phrase, a rejoinder to functionalist approaches: "natural species are chosen [as "totems"] not because they are 'good to eat' but because they are 'good to think'" (p. 89). Examples of so-called totemism were really instances of universal features of human thought, a theme to which Lévi-Strauss returned in *The Savage Mind* (1962), several chapters of which were also devoted to totems and totemism. Seen in this light,

“totemism” was simply a variety of metaphorical thought—with the proviso that metaphor was an indispensable feature of human thought in general. What is more, the metaphor rested, not on the perception of intrinsic similarities, but rather on the recognition of systematic differences. In other words, if there were a Kangaroo clan and an Emu clan, this was not because members of the first clan considered themselves like kangaroos and the second clan like emus. Rather, the difference between species served as a metaphor for the difference between human groups, Nature as a metaphor for Culture.

Animal symbolism and classificatory schemes. In a radical way, Lévi-Strauss changed the terms in which problems were phrased. (To the extent that his book sealed the death knell of the concept of “totemism,” there ceased to be a single problem.) Whereas Lévi-Strauss’s particular concerns were with uncovering the abstract properties of human thought lurking behind concrete instances of its application, British anthropologists were able to combine his approach with an enduring preoccupation with the dynamics of specific societies. In particular, they examined the social implications of the ways in which different cultures classified animals.

Undoubtedly the best-known example is Mary Douglas’s analysis of the dietary prohibitions detailed in Leviticus. Robertson Smith had suggested that the pig, along with the dog, the horse, the mouse, the dove, and some varieties of fish were offered as totemic sacrifices in early Semitic religion. Douglas suggested instead that the distinction between clean and unclean (and forbidden) animals was an artifact of a system of classification made very clear in the text, and that distinguished between the normal and the anomalous. Mammals that had cloven hooves and that chewed their cud were the typical food of pastoralists like the ancient Hebrews, a criterion that excluded the pig, just as the notion that creatures who live in the water should typically possess scales and fins excluded eels, sharks, or shrimp. But such concerns with alimentary purity accompanied a preoccupation with social purity, and especially with the maintenance of a clear boundary between Jews and Gentiles, expressed in terms of separation of the clean from the unclean.

Ralph Bulmer’s analysis of the classification of the cassowary by the Karam of New Guinea took a similar approach. The cassowary, a relative of the ostrich and the emu, was not classed as a bird by the Karam. There were special rules for hunting cassowaries, who could not be shot with spear or arrow but had to be snared and bludgeoned. Live cassowaries had to be kept away from the village and fields, and usually they were cooked and eaten in the forest. Indeed, a person who killed a cassowary was ritually dangerous, and had to avoid the taro crops for a month. This attitude toward the cassowary simultaneously assimilated cassowaries to quasi-human status while highlighting the symbolic separation of the domains of the forest and the cultivated fields, a separation that in turn paralleled ambivalent relations between brother and sister. Sisters left the home village at marriage, but their children held residual rights in land; however, the brother’s sons tended to view these rights ambivalently at best. This attitude was captured by the symbolism of the cassowary, which was equated with the father’s sister’s children.

Other work along similar lines included S. J. Tambiah’s analysis of food prohibitions in Thailand and Edmund Leach’s comparison of the sexual commutations of animal names in English and in highland Burma. Ultimately, such analyses represent the very antithesis of the aims of the early writing on totemism, which sought to demonstrate the illogical nature of “primitive” as opposed to modern European thought. Instead, modern anthropologists have insisted, not only on the logical nature of non-European thought, but on its deep affinities with our own modes of thinking and speaking.

Robert Launay

TRADE. Trade is one of the basic processes that link individuals and groups. Trade binds people to one another through the expectations of reciprocal giving, through the formal calculus of wages and markets, and through the desires or needs to obtain items not locally available. In this way, trade is a fundamental element of human culture.

Trade and exchange are often used synonymously, but there is a basic difference. Trade refers to the movement of goods between individuals or groups where there is a general expectation of reciprocity and where the purpose is basically utilitarian. Exchange has a broader meaning, encompassing all movements of goods. The general expectation of reciprocity need not be a part of exchange, nor does exchange have to be utilitarian in nature. In contrast, both are central to trade.

Approaches to the Study of Trade

Various perspectives can be applied to understanding trade. Here it is discussed as reciprocity, exploitation, and adaptation, and in the context of globalization.

Trade as reciprocity. The earliest anthropological approaches to trade focused on reciprocity and how the expectations of reciprocity shaped social relations. In the classic ethnography *Argonauts of the Western Pacific* (1922), for example, Bronislaw Malinowski described and interpreted a complex system of reciprocal trade in the Trobriand Islands known as the *kula*. The items traded in the *kula* were of two kinds: shell beads and armbands. The value of these items was determined by their age and renown—some were heirloom pieces and even had names. The goal of participants in the *kula* was to gain prestige by obtaining, and then giving away, large amounts of *kula* goods and particularly highly valued heirloom pieces. Participants could lose prestige if they gave away valued items but did not receive equivalents in return. Malinowski described individuals carefully planning *kula* expeditions to other islands and scheming ways to bring particular *kula* goods into their possession. In this way, *kula* was a system of reciprocal trade through which the Trobrianders created and maintained social status.

But what about less formal systems of reciprocal trade, like the giving of Christmas presents? If we give a Christmas present to our neighbors, we generally expect one in return. And, if we give a nice present, we expect a similarly nice one in return. There is no formal system like the *kula* in place, so how is reciprocity maintained? These more sophisticated questions about trade were asked by anthropologists after Malinowski, and many significant contributions were made. Among the most influential was the work of Marcel Mauss, whose essay *The Gift* (1954) posited a universal reciprocal structure for gift giving. Mauss argued that gifts symbolize the giver, and the act of giving symbolizes the relationship between the giver and the receiver. The act of giving a gift necessitates a reciprocal gift if a social relationship is to be maintained. If a reciprocal gift is not given, it signals the end of the relationship. Gift giving, then, often takes on a cyclical form (as is the case with Christmas presents) and is a fundamental way that humans maintain social relationships.

Anthropological work on trade as reciprocity was pulled together in a concise form by Marshall Sahlins. In *Stone Age*

Economics (1972), Sahlins defined three forms of reciprocal trade: balanced reciprocity, generalized reciprocity, and negative reciprocity. Balanced reciprocity describes the forms of trade examined by Malinowski and Mauss, where there is an expected balance between what is given and what is received through trade. Generalized reciprocity is a less structured form of trade and takes place mainly within families and kin groups. For example, families often share an evening meal. Parents provide and prepare the food, and both parents and children share it. Children are expected to reciprocate by clearing the dishes, taking out the garbage, and loving and obeying their parents. Through these actions children maintain a general balance in the trade between family members, but no formal accounting is kept and no expectation of formal balance is ever made. This is the basic nature of generalized reciprocity. Negative reciprocity essentially refers to forms of cheating or stealing. Negative reciprocity occurs when one party in a trade relationship receives less than they give. Sahlins posited that negative reciprocity is most common when dealing with people from other societies for, as both Malinowski and Mauss imply, negative reciprocity within one's own society would seriously disrupt social relationships.

Trade as exploitation. Sahlins's definition of negative reciprocity illustrates the idea that not all trade takes place on an even footing. Some forms of trade are unequal, even exploitive. In the 1970s and 1980s a number of anthropologists began examining trade as an element of larger systems of production and consumption, often employing Marxist modes of production models. Eric Wolf's *Europe and the People without History* (1982) is illustrative of this type of research. Wolf explored three "modes of production": kin-based, which is characterized by generalized and balanced reciprocity; tributary, where tribute or taxes are provided to a centralized political authority that manages and maintains the society; and capitalist. For Wolf (and many others), the capitalist mode of production is rooted in exploitation. Workers sell their labor for wages but they must, by the very nature of capitalism, be paid less than their labor is actually worth—if not, then no profit would be possible. Wolf explains that capitalists in Europe were able to find a way around this problem by obtaining raw materials (and even labor in the form of slaves) for next to nothing by taking them from colonial areas. In the process, they actively exploited and essentially dehumanized the people living in those regions by creating a formal structure of negative reciprocity—one in which social relations cannot be maintained.

Trade as adaptation. The idea that trade is generally utilitarian in nature was seemingly ignored by anthropologists until the 1960s. At this time, theories of human behavior based on ecology began to be employed by anthropologists, and trade came to be seen as fundamental to the creation and maintenance of an ecosystem. Trade provided a mechanism through which matter, energy, and information moved through human-dominated ecosystems. For example, Stuart Piddocke (1965) argued that a reciprocal trade system known as the potlatch (and similar in nature to the *kula*) was essential to the survival of the Kwakiutl peoples of British Columbia. Piddocke demonstrated that the environment in which the Kwakiutl lived was subject to fluctuations that, in the same year, would

THE FORMALIST/SUBSTANTIVIST DEBATE

In the 1950s a group of social scientists, the most prominent among them being Karl Polanyi, proposed that trade was a social construction like the rest of culture and could not be usefully examined outside of its unique social setting. This perspective came to be known as “substantivism.” The substantivists argued that economic analyses of noncapitalist trade employing concepts like supply and demand, rational choice, profit, and other ideas linked to capitalist market economics was misguided, because these concepts were either meaningless or had different meanings in noncapitalist social settings. Other scholars, and archaeologists in particular, countered that markets and market-like economies were present for millennia before capitalism, and that many noncapitalist economies appear to be usefully analyzed with concepts and methods drawn from the study of capitalism. This perspective came to be known as “formalism.” The “formalist/substantivist” debate consumed economic anthropology throughout much of the 1960s, with no clear winner emerging. In the early twenty-first century, most anthropologists see the benefits of both perspectives in understanding trade.

cause some populations to lack resources while others had excess resources. The potlatch, Piddocke argued, was a formal system in which populations redistributed resources from areas with excess to areas of scarcity. For the Kwakiutl, then, trade was part of their adaptation to a highly variable and unstable environment.

Trade, globalization, and meaning. With increasingly global markets and the introduction of Western capitalism into all corners of the world, anthropologists have become increasingly concerned with the effects of trade on the cultures they study. As Wolf pointed out, initial trade relations in many of these areas were highly exploitive, and they essentially prevented the formation of social relationships between indigenous populations and Western capitalists. In most ways, the situation did not change much in the twentieth century, and many anthropologists are working at the turn of the twenty-first with indigenous populations to help them gain equity in trade relationships.

As Western products enter non-Western cultures, anthropologists have also become increasingly interested in the meanings people attach to things. How are new products integrated into society? What is the effect of the loss of indigenous products? Arjun Appadurai (1986) suggested that objects themselves are socially created, that their circulation through a society gives them meaning and purpose, and that they are recontextualized as they move through different social contexts. In this sense, the distinction between foreign and local goods becomes blurred, as “foreignness” and “localness” are attributes that are socially assigned and that can change as the context of their use changes, just as attributes such as “desirability,” “utility,” and “value” change in different contexts.

Trade not only brings Western products into non-Western cultures, but also many aspects of Western culture. Many anthropologists think that the adoption of capitalist modes of trade also promotes Western ideas such as profit, modernization, and individualism, pushing aside indigenous ideas of tradition and responsibility for the care of social relations. This process of Western ideas pushing out non-Western ones is called “Westernization,” and is seen by many anthropologists as a major problem facing the non-Western cultures of the world. In a larger sense, Westernization is part of “globalization,” the process through which international trade is increasingly binding the nations of the world together into a single, global economy. Again, many anthropologists view globalization as a major force acting to eliminate non-Western ideas and cultures from the global economy.

While Westernization and globalization may be forcing contemporary non-Western cultures to become more Western and global in their orientation, capitalist trade has had a much more profound effect on many historic non-Western cultures. In North America, for example, colonization by Europeans and the introduction of the fur trade in the 1600s led to competition between local groups, an increase in warfare, and dramatic population movements that transformed the social landscape of the Great Lakes and Plains regions. Trade brought with it not only Western goods (including guns, one of the items that fostered increased warfare), but also Western biota. European diseases such as smallpox and measles may have killed 80 percent of the indigenous peoples of North America. European plants and animals have dramatically changed ecosystems throughout the Americas. The point here is that trade brings with it many things in addition to the items

WORLD SYSTEMS THEORY

Immanuel Wallerstein developed world systems theory in the early 1970s as a new way of looking at the rapid expansion of capitalism. Wallerstein posited that in capitalism a clear geographical hierarchy of trade evolved. Europe was the core, the area where raw materials were converted into finished products. The rest of the world was the periphery, the area where raw materials were obtained and finished products consumed. Capitalism expanded rapidly because it needed raw materials to create goods and markets to consume them. Nineteenth-century colonialism was the political actualization of these capitalist needs. However, finished products always cost more than the value of the raw materials needed to make them, so the periphery, in providing raw materials and consuming finished products, was actively exploited by the core, a process world systems theorists came to refer to as “underdevelopment.” World systems theory provided social scientists a means to understand why and how the “developing” world was never able to actually “develop” despite many attempts to aid them in doing so—because they were being actively “underdeveloped” by the capitalist core. World systems theory continues to be one of the primary means that anthropologists and other social scientists use to examine and understand trade relations and their effects.

being traded—ideas, diseases, plants and animals—and all these have an effect on the people involved in trade.

Trade and the Development of Civilization

With trade being such an important concept for anthropologists and other social scientists attempting to understand the historic and contemporary cultures of the world, it is not surprising that trade has been an important concept to scholars attempting to understand the evolution of cultures and, in particular, the development of civilization.

Trade as redistribution. Elman Service (1962) saw trade as a basic element in the evolution of chiefdoms out of tribal societies. Chiefs, Service argued, functioned as the operators of centralized redistribution networks, which took in surplus goods from all populations in a society and redistributed them back to those populations, but spread them evenly so that no single population lacked goods they needed, and no single population could acquire an ongoing surplus. This system of redistribution only evolved among sedentary agriculturalists, because it was among these societies that redistribution was needed. Redistribution allowed regional fluctuations in agricultural production (due to variation in rainfall, for example) to be evened out. More importantly, however, Service argued that redistribution both required and fostered the centralization of political authority, and thus was essential to the evolution of chiefs. It was only with the creation of a formal position of redistributor—a chief—that the smooth functioning of a system of redistribution could be ensured. And once the position had evolved, chiefs quickly learned to use their authority to provide or withhold goods to increase their authority in other areas of social life.

Trade as legitimation. But there are problems with Service’s ideas. Not all chiefs function as redistributors, and not all societies with chiefs have resource bases that vary significantly. It is clear, however, that trade seems to be important in the evolution of many chiefdoms, and Mary Helms (1979) suggested that one reason might be that trade can serve as a mechanism for legitimating power. Helms studied the late prehistoric and early historic chiefdoms of Panama, where chiefs actively participated in and controlled trade in exotic goods such as gold ornaments, but had little to do with trade in basic, utilitarian goods of daily life. Helms argued that Panamanian chiefs used trade as a symbol of their ties to distant people and places and, through those ties, to exotic and even supernatural knowledge. Trade was not used as a means of controlling resources, but rather, of controlling knowledge and, through that control, of legitimating the chief’s authority. The chief was the legitimate leader because, through trade, he had formed social relationships with neighboring and distant chiefs. He also gained knowledge of distant people and things through these relationships, and, in some cases, even knowledge of supernatural powers unknown to the society he governed but well understood by distant people with whom he was in contact through trade.

Trade as finance. One of the key aspects of the evolution of civilization is the creation of surpluses to finance the support of individuals who are removed from production to become political leaders, priests, artisans, soldiers, and the like. Elizabeth Brumfiel and Timothy Earle (1987) suggested that trade, in the form of mobilization of surpluses, is a process through which this key aspect of civilization is played out.

They argue that political leaders evolve as individuals who are able to mobilize surpluses in order to finance their own support and, later, support for other political personnel. Over time, mobilization increases, and political leaders are able to finance support for larger numbers of people. Brumfiel and Earle suggest that this form of “staple finance” is often transformed into “wealth finance” as politics become larger and more complex. Political leaders employing wealth finance use trade to mobilize wealth, often in the form of exotic goods from distant locales, to finance support for political personnel. Wealth finance is less cumbersome than staple finance, as bulk goods such as food are not involved, and often provides political leaders with new avenues for social control. For example, complex administrative structures may be needed to maintain access to and control over trade in wealth items, and a market system may be required in order to provide political personnel a means to transform wealth items into staples. In this way, the mobilization of wealth through trade is seen as a driving force in the evolution of civilization.

Conclusions

Trade is the movement of goods between individuals or groups where there is a general expectation of reciprocity and where the purpose is basically utilitarian. Anthropologists have long been interested in trade because it is an important factor in shaping social relations. The earliest anthropological approaches to trade focused on reciprocity and how the expectations of reciprocity shaped social relations. But it was soon recognized that many forms of trade are unequal, even exploitive. Capitalism seems particularly exploitive, and with increasingly global markets and the introduction of Western capitalism into all corners of the world, anthropologists have become more and more concerned with the effects of trade on the cultures they study. Trade not only introduces Western products but also many aspects of Western culture, both good and bad, as well as Western plants, animals, and diseases. These have had a devastating effect on non-Western cultures and have profoundly impacted world history. Trade has also been important prehistorically and is an important concept to scholars attempting to understand the evolution of civilization. Trade has been seen as essential to the evolution of centralized polities, as trade provides means to both legitimate and finance positions of authority. With trade being such an important concept for understanding both contemporary and past cultures of the world, it is likely that research on trade will remain a central concern in anthropology and the other social sciences.

TRADITION. The basic sense of the term *tradition* remains quite close to its etymological roots. The Latin noun *traditio* describes the handing over of an item or an idea, while the English *tradition* refers to a social or cultural institution that is handed down from the past. This much seems straightforward. Sacrificing cattle, singing at graduation, celebrating the New Year with fireworks: all these appear quite plainly to be traditions for their practitioners. For all its seeming simplicity, though, *tradition* is indeed the “particularly difficult word” that Raymond Williams called it in his account of its changing meanings over the centuries. Its intellectual usage is especially fraught with argument, and since the 1970s, the term has been subjected to so many debates and revisions that few scholars use it nowadays with any confidence in its transparency.

Let us first consider how tradition has acquired its specific ideological and academic meanings. Often these formal uses have expanded on, intensified, and arguably distorted the minimal sense of traditions as institutions passed on through historical eras.

For a start, the idea that tradition derives from the past has often involved a subtle shift in emphasis, from the process of

transmission to the fact of repetition. In this view, deeming a cultural form a tradition implies that all its instances are identical, that it does not change over time. This is not necessarily the case, however. Think of how we refer to traditions like Greco-Roman sculpture or Renaissance painting. No one assumes these styles remained the same throughout the time they endured, only that their later manifestations were in some way shaped by precedents. Nor does derivation from the past exclude the idea that traditions embody active historical processes. A dynamic view of traditions as developing and changing continuities is intrinsic to the way we trace, say, a line from the Romanesque to the Gothic in the tradition of medieval European architecture. Nonetheless, the trend is to equate tradition with replication, to judge institutions traditions insofar as they reiterate past performance. Consider how we tend to think inauthentic any tradition that has been altered by contemporary practice. In this view we cannot adapt or reinvigorate real traditions, let alone create them. At best, we preserve them.

A closely related extension of the idea of tradition opposes it to modernity. If modernity is a state of ceaseless change, tradition, as unchanging repetition, is its antithesis. This notion is so well established it seems self-evident now, but it also subtly inflates the basic sense of the term. Its origins lie in the ideological conflicts surrounding the intellectual, political, and economic revolutions, starting in eighteenth-century Europe, that shaped what we now regard as modern society. On the one hand, the proponents of Enlightenment and their heirs have called for a world based on reason, not on what they regard as baseless custom. On the other hand, various strands of conservative and Romantic thought have celebrated tradition as the treasure chest of accumulated experience, collective cultural genius, and authentic human sentiment, all threatened by the totalitarian visions of social reformers. But the most important point here is that both camps see modern developments, like democracy or mechanization, as absolute departures from the past. The premodern or traditional past is not just what precedes these particular changes, then; instead, it becomes the opposite of historical change itself.

Once tradition acquires this extended sense as the opposite of modernity, it assumes quite a curious temporality too. It comes to be identified with the past from which it is passively handed down and not with the expanse of time through which it is transmitted, up to and including the present. But even while we insist that traditions are part of the past, we also thereby deny that they have real historical lives (except insofar as history has diluted them) precisely because we think they are unchanging. We think traditions persist across the passing of time, but we only think they are *in* it when we talk about their destruction. Modernity, on the other hand, exists in time inasmuch as it is constant change but precisely because it is change it has no past.

Another important effect of turning tradition into the opposite of modernity is that these problems with the concept seem to intensify the farther its objects lie from what we take to be modernity. Within societies felt to be mainly modern, for instance, an emphasis on static rather than changing continuity is much more pronounced in talk about folk art and

custom than it is in high cultural criticism. An electronic composer can move the classical chamber music tradition forward, but a hip-hop artist who samples the blues is untrue to its authentic agrarian roots. Elite traditions can change and still be traditions, but folk traditions cannot.

The greatest confusions come, though, from describing non-Western peoples and their societies as traditional in contrast to a West conceived as modern. This idea has global reach now, and non-Western intellectuals use it if anything more often than their Western peers at present. But it first appeared in the West, and it found its strongest expression there in the theories of specialist anthropological disciplines and discourses (Kuper; Stocking, 1968, 1996).

Anthropology began life as the study of non-Western peoples, and it kept this orientation until the late twentieth century because of the idea that these peoples' communities somehow embodied the human past. In the nineteenth through to the early twentieth centuries, this idea informed evolutionary theories that pictured human communities climbing a ladder of cultural progress. Topmost was the industrial West, with its bureaucratic states, nuclear families, and monotheistic faiths; at the bottom were stateless foragers with extensive notions of kinship and beliefs in natural spirits. Anthropology was tasked, then, with discovering where in this evolutionary hierarchy to place the many communities known to the ethnological record. But it was largely taken for granted that all peoples evolved in one and the same direction. And if some were less advanced at present than others, this had to be because they had developed more slowly. Some communities ambled along the course of human historical development, whereas others raced ahead. Traditional peoples were still living in the same evolutionary past that modern societies had already left behind them.

The catastrophes of the first half of the twentieth century made it hard to sustain such sanguine faith that Western history represented the course of progress for all humanity. Also, by the 1940s, the claim that Western societies were more advanced than others suffered the taint of associations with discredited racist and fascist thought. Anthropology turned away from evolutionary comparisons in this period, instead cultivating a relativist attention to the differences among cultural systems in terms of their *internal* patterns. This did not weaken the tendency to contrast types of societies as traditional or modern, however. If anything, ironically, it strengthened it. This is because the idea that some communities changed more slowly than others was now understood as a function, not of their place on the ladder of progress, but of their own internal resistance to change. Instead of being considered still traditional inasmuch as they were not yet modern, communities like these were now imagined to be traditional by nature. The structuralists of the 1960s thus distinguished "hot" from "cold" societies: those that changed dynamically from those that tried to conserve old institutions. While some peoples therefore had histories proper, others experienced change as an entropic force in the face of which traditions only survived if they imposed their older structures on new events. Insofar as they succeeded at this, traditions actually swallowed up all trace of the fact that change had ever happened (Levi-Strauss).

In other words, anthropology gave a cultural cast to the schisms of time already implied in the contrast of tradition with modernity. Traditional peoples derived their ways from the past but had no histories. They lived across time but not in it. Modern people had histories, but the burden of the past was far behind them. They lived in time but did not straddle its passing.

Despite this confusion, the notion that some communities are traditional, and therefore the antithesis of the dynamic, changing West, has proven very resilient and influential. Advocates of modernization often assert how peoples need to leave traditional ways behind them—not just because traditions are part of the past in this view but also because they are held to be antithetical to change. The model of a contrast between the West and the Rest is also used quite widely to explain social inequalities and differences *within* the so-called developing nations that used to be grouped as the Third World. In this view developing nations have both modern and traditional sectors inside them, as if time ran on unrelated tracks not just for the world as a whole but even within some societies. Nor are such beliefs only held by self-described opponents of tradition. Multiculturalists and cultural conservatives often cherish traditions because they see them as islands of stability, in a modern world they judge to be unmoored and inauthentic. These sentiments usually add a mid-twentieth century anthropological perspective to the doubts about modernity and nostalgia for the past derived from older forms of anti-Enlightenment thinking.

Ironically, however, anthropology itself has mostly abandoned these ideas. In part this shift is due to a growing awareness of the conceptual problems presented by older anthropological usages. But the impetus to question older usage in the academy has itself arisen from broader intellectual and political developments in the decades after World War II.

By far the most important of these developments is the wave of European decolonization that took place in the 1950s and 1960s, creating a host of new independent nations out of the formerly colonized territories of Africa and Asia. Once these nations' political representatives took their places on the international stage, it became increasingly difficult to describe them in terms that made them seem less modern or developed than their peers from the states of the West. And even amidst the divisions of the Cold War era, the rise of a set of global institutions like the United Nations fostered a new sense of planetary civilization. The notion of a shared human fate, demanding respectful dialogue, became more widespread than ever during these decades.

In this changed political climate, many intellectuals became concerned with what it meant to call non-Western peoples traditional. Since tradition was so strongly imbued with the sense of being the antithesis of modernity, it seemed less and less appropriate to apply the idea to societies that now had the very same sets of institutions and ambitions that were identified with modernity in the West. In fact, as many thinkers came to insist, the use of terms like *tradition* did much more than impose anachronistic mistakes about the contemporary social lives and institutions of peoples outside the West. For in so doing it also demeaned and diminished them. In the first place it belittled their modern achievements, such as their struggles for liberation

and their quests to achieve economic and political equality with European and other Western nations. In this way it, if anything, distorted these societies' actual histories. This seemed all the more discordant in the context of the 1960s and 1970s, when the former colonies witnessed new waves of social and cultural dynamism while Western nations mostly seemed to stagnate. But secondly and even more insidiously, to call these peoples traditional seemed to deny that they possessed even the capacities to have such histories at all. The strong distinction this usage drew between those who were tradition-bound on the one hand and the dynamic West on the other now seemed offensive to the new international ethos of equality among peoples. Most important, it also echoed the sorts of colonial stereotypes about non-Western peoples that anticolonial movements had resisted in their struggles for freedom from Western domination. To say that people were ruled by the past began to sound suspiciously like an excuse for ruling over them in the present.

In the postcolonial era, therefore, many politically minded intellectuals found ideas about tradition versus modernity inseparable from the history of colonial rule over non-European societies. By the early 1970s, this judgment had also penetrated critical discussions within universities. Inspired by the radical social movements of the 1960s, a young generation of scholars had already started questioning the idea that the academy and its products were politically disinterested. Instead, they argued, the mainstream human or social sciences had tended toward complicity in modern structures of power (Foucault and Gordon). In the case of anthropology, its relationship with European colonialism was the form of guilt provoking most critiques it faced (Asad; Mafeje). In their harshest forms, these discussions even saw anthropology mocked for having been the willing "handmaiden" of colonialism. And if anthropology found itself accused of being the intellectual servant of the West's colonial projects, this criticism was largely due to the images of non-Western peoples the discipline had developed under the rubric of tradition.

To critical scholars who sympathized with anticolonial movements, then, the use of the term *tradition* became problematic. Influenced by critiques of colonial discourse in the humanities, such as Edward Said's *Orientalism* (1979), some began to see anthropology's emphasis on traditions as part of a broader set of misrepresentations of non-Western peoples in Western thought. In this view, the portrayal of people in terms of their traditions made them appear to be mysterious, accepting of authority, immersed in collective cultural and spiritual life—in other words, not at all like the rational, pragmatic individuals who had earned the rights and freedoms of modernity. In one such commentary, Johannes Fabian (1983) showed how many anthropologists had exoticized the peoples whom they studied. Even though they shared so much time with their subjects during field research, he pointed out, their writing tended to represent these people as if they lived in other epochs. Not only did this make them look as if they lived in the past, but it also made it possible to overlook the conditions of colonial domination they faced in the present.

Critiques like these are widely accepted by scholars now, and few would think it tenable to assert today that some

peoples have traditions while others have histories. But this was not the only effect of the conversations that took place in this vein in the 1970s. By showing that there was a politics to the concept of tradition, these commentaries also opened up another kind of critical discussion about tradition in the 1980s and afterward. This second wave of studies has focused less on the ideological meanings implicit in the idea of tradition and more on the contested social contexts in which various parties refer to traditions in order to advance their own agendas.

The most important step in this direction was Eric Hobsbawm and Terence Ranger's collection of historical essays that showed how several institutions generally thought traditional, from chieftaincy in Africa to tartan-wearing in Scotland, were actually of recent historical vintage. In each case, these historians argued, an institution was made to seem as if it came from the age-old past, in order to grant legitimacy to a social group and its projects in the present. The real task of scholarship, then, was to study not the transmission or replication but the *invention* of traditions.

This argument is radically unsettling, of course. Traditions are supposed to be the stable, enduring antitheses of invention, not its new, ephemeral products. So the claim that they are the latter has inspired an enormous body of literature by way of response in the late twentieth and early twenty-first centuries.

Some have used this concept of invented traditions in order to revisit the relationship of ideas about tradition to colonialism. Instead of seeing tradition as a figment of the Western colonial mind alone, this kind of work examines the use of terms like *tradition* or *custom* by a range of social actors in colonial and postcolonial settings: by colonizers and colonized, urban elites and peasant villagers, nationalists and compradors, conservatives and modernizers, and even the scholars who study them all (Briggs; Foster; Jolly and Thomas; Keesing; Keesing and Tonkinson; Spiegel and Boonzaier). As these studies show, while Westerners may have used the idea of tradition to make non-Western peoples appear exotic and backward, non-Western peoples have used this concept to portray themselves as special communities, worthy of distinctive rights, entitlements, and identities. From this perspective tradition is less like an argument, true or false, about the lack of change in society and more like a language or idiom in which ever-changing arguments about social life are conducted. This treatment mitigates some of the most odious associations that critics of colonial discourse attached to the concept. It does not rescue the term itself for renewed academic use, however. Instead it demotes tradition to the status of a folk category—an excellent object of study just like any idea one finds in such wide social circulation, but hardly a viable tool of social analysis.

The convergence of the postcolonial moment with the critical turn in scholarship has thus made it very difficult for scholars to speak of traditions without embarrassment. One quite common response to this situation is to use the term as if in its naive sense, while hedging it in heavy layers of irony. While true to the uncertainties that now surround the label, this is a less than helpful strategy for conceptual clarification. Another more considered and productive response is to bite the bullet and try to understand the relations among society, culture, and

history with more rigor, self-reflection, and complexity than contrasts between tradition and modernity allow (Axel; Bauman and Briggs; Comaroff and Comaroff; Sahlins; Trouillot). But here there is also an irony of sorts. Although it may not use the term *tradition* with any innocence, what all such work affirms is that there are few more worthy tasks for the humanities and social sciences than helping us appreciate and understand the changing continuities in our social lives: the institutions that all of us keep handing down through time.

TRAGEDY AND COMEDY. Various ideas have been associated with the term *tragedy* and the term *comedy* over the centuries, including tragedy that is not tragic, in the sense of “sad” or “disastrous,” and comedy that is not comic, in the modern prevalent meaning of “amusing.” The modern English meaning of comedy as a synonym for *humor* is largely a twentieth-century development.

Greek Origins

Tragedies are first heard of, as stage plays, in the Dionysiac celebrations in Athens at the turn of the fifth century B.C.E., and comedies appear as a contrasting type of play a century later. Aristotle (384–322 B.C.E.) said that tragedies dealt with *spoudaia* (serious matters) and comedies with *phaulika* (trivial subjects). Tragedies aimed at arousing and then purging emotions such as pity and fear. Effective tragedies need not end in disaster; he gives highest praise to the happily resolved *Iphigenia among the Taurians* of Sophocles, and, among narrative poems (since staging is not essential to tragedy), he considers the *Odyssey* to have a tragic story as well as the *Iliad*, though he notes at one point that the effects of such a double-plotted story (good end for the good, bad for the bad) are more appropriate to comedy.

Aristotle’s treatment of comedy has not survived, and his analysis of tragedy was not cited in antiquity. His chief disciple, Theophrastus (c. 372–c. 287 B.C.E.) also dealt with tragedy and comedy, and his definitions were cited by the Latin grammarian Diomedes (4th century C.E.). They can be rendered as follows: “Tragedy deals with the fortunes of heroes in adversity,” and “Comedy treats of private deeds with no threat to life.” Diomedes adds that tragedies usually move from joy to sadness, comedies the opposite.

Meanwhile, Horace (65–8 B.C.E.) had discussed the genres in his *Ars poetica*. He explains the meaning of “tragedy” as “goat-song,” so called because the winning players were rewarded with a cheap goat. He does not define the forms and deals mainly with questions of style, that is, tone and diction. The complaints of tragedy should not readily be mixed with the *privata carmina* (domestic verse) of comedy. Ovid (43 B.C.E.–17 C.E.), too, has style in mind when he says that tragedy is the gravest form of writing (*Tristia* 2.381). It consists of sublime verse, as opposed to the lighter forms of elegy (used for love poems) (*Amores* 3.1.39–42).

Another influential grammarian of the fourth century, Aelius Donatus, considers Homer the father of tragedy in the *Iliad* and the father of comedy in the *Odyssey*. He attributes

Scene from *Electra* by Sophocles, 1908. Sophocles was one of the three most important authors of tragedies in ancient Greece. He wrote more than one hundred plays, but only seven have survived in their entirety. © HULTON-DEUTSCH COLLECTION/CORBIS

to Cicero (106–43 B.C.E.) a definition of comedy as “the imitation of life, the mirror of custom, the image of truth,” which is later reflected in Hamlet’s discourse to the players.

The chief Greek authors of tragedies were Aeschylus (525–456 B.C.E.), Sophocles (c. 496–406 B.C.E.), and Euripides (c. 484–406 B.C.E.). Comedy was divided into old, middle, and new. Aristophanes (c. 450–c. 388 B.C.E.) straddled the old and the middle periods, while Menander (342–292 B.C.E.) represented the new. The Latin playwrights Plautus (c. 254–184 B.C.E.) and Terence (186 or 185–?159 B.C.E.) specialized in adapting Greek comedies from Menander’s period. As for tragedy, Lucius Annaeus Seneca (c. 4 B.C.E.–65 C.E.) is the only known playwright whose works are extant. Plautus claimed that one of his plays, the *Amphitruo*, was a combination of comedy and tragedy, not because it used an elevated style, but rather because it introduced characters proper to both genres, kings and gods on the one hand and slaves on the other.

The Latin World

By Seneca’s time, plays may have largely or entirely ceased to be performed by actors and, at most, been presented only by public recitations. The term *tragedy* was also used for pantomime productions, *tragoediae saltatae*, and also for *citharoediae*, in which a tragic protagonist sang and accompanied himself on the lyre.

The most important treatment of tragedy and comedy in the early Middle Ages was that of St. Isidore of Seville (c. 560–636).

In book 8 of his *Etymologies*, he cites Horace's etymology for tragedy, taking it to mean that the poets were originally held in low esteem, but that later they became highly regarded for the skill of their very realistic stories. Tragic poets deal with public affairs, the histories of kings, and sorrowful matters, whereas comic poets recite the deeds of private persons and emphasize joyful things. However, the new comic poets, like Persius (34–62 C.E.) and Juvenal (c. 55 or 60—in or after 127 C.E.), are called satirists, and they expose vice. Both tragic and comic poems consist entirely of the dialogue of characters.

In book 18 of his encyclopedia, Isidore takes up tragedy and comedy again, this time as theatrical pieces. Comic and tragic (or comedic and tragic) poets sang their poems on the stage, while actors and mines danced and made gestures. Thanks largely to this account, classical dramas were regarded in the Middle Ages and early Renaissance as having been recited by the poet himself, that is, Seneca, Plautus, or Terence (except that in Terence's case a stand-in was used); while he declaimed the lines of all of the characters himself, actors would mime their words and actions.

In addition to "theatricizing" tragedy and comedy in book 18, Isidore now gives a darker account of the subject matter of the two forms (there was some hint of this with regard to comedies in the account of the satirists in book 8). Here he says that the comedians sang not only of private men, but specifically of "the defilements of virgins and the loves of whores," and tragedians sang of the "sorrowful crimes of wicked kings" (18.45–46).

Just as influential as Isidore's accounts was a passage written a century before him by Boethius (c. 480–c. 524). In the *Consolation of Philosophy*, he portrays Lady Philosophy as inviting Lady Fortune to give an account of herself, and at one point she says, "What does the cry of tragedies bewail but Fortune's overthrow of happy kingdoms with a sudden blow?" (2 pr. 2). Subsequent commentators on the *Consolation* offered definitions of both tragedy and comedy. Notably, William of Conches, writing around the year 1125, says that tragedy begins in prosperity and ends in adversity, whereas in comedy the situations are reversed.

Medieval Contributions

The most important medieval writer of comedy was Dante (1265–1321), and Geoffrey Chaucer (c. 1342–1400) was the most important author of tragedy. Dante does not seem to have known either the comedies of Terence and Plautus or the tragedies of Seneca. The latter had recently been discovered and were being studied in Padua during Dante's time, notably by Albertino Mussato, who considered tragedy to be a genre of elevated subject matter, consisting of two subgenres: those dealing with disasters (like Seneca's works and his own *Ecerinis*) used iambic verse, and those dealing with triumphs, like the works of Virgil (70–19 B.C.E.) and Publius Papinius Statius (c. 45–96 C.E.), used dactylic hexameters.

Dante's own definitions of comedy and tragedy in *De vulgari eloquentia* are not connected to ideas of misery or felicity. He agrees with Mussato in considering tragedy to use elevated subjects. It also uses the best syntax, verse forms, and diction.

Comedy on the other hand is a style inferior to that of tragedy, using both middling and humble forms. He cites lyric poems, including some of his own, as examples of tragedy. In *Inferno* (20.113) he has Virgil refer to the *Aeneid* as "my high tragedy." He may have based his ideas on Papias's definition of comedy in his *Elementarium* (c. 1045), repeated in the *Catholicon* of John Balbus of Genoa (1286): comedy deals with the affairs of common and humble men, not in the high style of tragedy, but rather in a middling and sweet style, and it also often deals with historical facts and important persons.

Dante's commentators did not know of the *De vulgari eloquentia*, and most of them, including Guido da Pisa and the author of the *Epistle to Cangrande* (which purports to be by Dante himself), follow definitions similar to those of the Boethian commentators; thus they explain Dante's choice of title by the fact that the work begins in misery (hell) and ends in felicity (heaven). They hold that Terence's comedies follow the same pattern, and that Seneca's tragedies trace the reverse movement (hardly true in either case). Some readers, like Dante's son Piero, followed the rubrical tradition that designated *Inferno*, *Purgatorio*, and *Paradiso* as three comedies, and found an upbeat conclusion to all of them: each ends with a reference to the stars.

Chaucer, for his part, like Dante's commentators, was influenced by the Boethian tradition. He translated the *Consolation* and used glosses derived from the commentary of Nicholas Trivet (1258?–?1328). But whereas Trivet repeated Conches's definition of tragedy and added to its iniquitous subject by repeating Isidore's statement about the crimes of the wicked kings, the gloss that Chaucer received and translated removed all such reference: "Tragedy is to say a dite [literary composition] of a prosperity for a time that endeth in wretchedness" (pp. 409–410). He thus restored the concept to its Boethian context by removing the suggestion that all tragic falls are deserved and punitive. Chaucer wrote tragedies of this sort himself, on the model of the narratives of Giovanni Boccaccio's (1313–1375) *De casibus virorum illustrium* (Boccaccio himself did not consider these stories to be tragedies) and later assigned them to the Monk in the *Canterbury Tales*. In the meantime, he wrote an extended tragedy, *Troilus and Criseyde*. John Lydgate (c. 1370–c. 1450) subsequently applied Chaucer's idea of tragedy to *The Fall of Princes*, his translation of the *De casibus*, and it was adopted in its sixteenth-century continuation, *A Mirror for Magistrates*. Thus Chaucerian tragedy was transmitted to the age of Shakespeare.

The Renaissance

Shakespeare (1564–1616) himself does not say what he means by comedy and tragedy, but one can deduce from his characters that comedy has the general meaning of a pleasant or mirthful play, and that tragedy more often refers to an event than to a play, and more often concerns the downfall of an innocent than a guilty person. This is in contrast to formal discussions—like Sir Philip Sidney's (1554–1586) *Apology for Poetry*—that tend to restrict the subject of tragedy to bad men coming to bad ends, thereby "making kings fear to be tyrants." This is a kind of plot that received very low marks from Aristotle.

Shakespeare, arguably the most famous dramatist in history, wrote numerous comedic plays, although he did not specifically explain what his criteria was for a play to be considered a comedy. © JOHN SPRINGER COLLECTION/CORBIS

By Sidney's time, Aristotle's *Poetics* was available in an accurate form (before the sixteenth century it was chiefly known from the commentary of Averroës [1126–1198], who understood comedy to refer to poems reprehending vice and tragedy to poems praising virtue). But it was mainly cited on minor points, or distorted through assimilation to Horatian concerns. Aristotle's insistence on unity of action was made equal to the newly invented unities of time and space.

Tragedy became an elite genre, in which only the best tragedies were thought worthy of the name of tragedy. In England this concept can be seen in Thomas Rymer's *Short View of Tragedy* (1692), when he speaks of "the sacred name of tragedy." Such an understanding is widely accepted and practiced in modern times, allegedly with the backing of Aristotle: the criterion that Aristotle gives for the most effective tragedy (the fall of a good man through a flaw) has been smuggled into the definition of and made a sine qua non for tragedy. Now there is no such thing as a bad or mediocre tragedy. For Aristotle, on the contrary, everything that was called a tragedy

or fitted general criteria was a tragedy, but some were better than others.

Problems of Definition

There have been dozens of attempts to define tragedy, understood as supreme tragedy, radical tragedy, pure tragedy, and the like. Most of these understandings are intuitive and personal to the definers and are based on a favorite example of tragedy (or a small cluster of favorite tragedies). To give a recent example, George Steiner defines tragedy as "the dramatic testing of a view of reality in which man is taken to be an unwelcome guest in the world"; and the plays that communicate "this metaphysic of desperation" are very few, "and would include *The Seven against Thebes*, *King Oedipus*, *Antigone*, the *Hippolytus*, and, supremely, the *Bacchae*" (1980 Foreword to *The Death of Tragedy*, 1961).

Because of the elevated status of the idea of tragedy, actual tragedies have become a thing of the past, represented by the classical plays, Shakespeare and his contemporary English

dramatists and, in France, Jean Racine and Pierre Corneille sometimes extending to Lope de Vega in Spain. The only more recent work that is named a tragedy by its author and acknowledged to be a great work is Johann Wolfgang von Goethe's (1749–1832) *Faust: A Tragedy* (1808), but it is not usually considered to be a great tragedy or even a tragedy at all. (Whether Goethe himself meant to call Part 2 a tragedy is not clear; but it was published as such, posthumously, in 1832.)

Comedy, in contrast to tragedy, remained a general and amorphous genre, encompassing ineffective as well as effective examples. No comic masterpieces have been singled out as supreme comedies (though Shakespeare's plays are given high ranking), and plays that do not measure up to some classical standard have not in general been drummed out of the genre, though occasionally this sort of qualifying spirit can be seen when a dud is denigrated as "mere farce."

In England in Shakespeare's time, when the action of a play was not amusing but simply avoided the usual final disasters of tragedy, it was given the name of "tragicomedy," which Sidney referred to as a mongrel form. When Plautus invented the term to describe his *Amphitruo*, it was for a different reason: because it had the characters proper to tragedy (kings and gods) as well as those proper to comedy (slaves, etc.). The term was revived in Spain for yet another reason, by what might well be called a comedy of errors. When Fernando de Rojas (c. 1465–1541) adapted the twelfth-century Latin "comedy" *Pamphilus* and published it under the title of *The Comedy of Calisto and Melibea* (1500), readers complained that its action was not that of comedy but rather of tragedy, and he thought to satisfy them by calling it a tragicomedy. This work, usually called *Celestina*, gave rise to several sequels, among them *Segunda Comedia de Celestina* (1534), *Tragicomedia de Lisandro y Roselia* (1542), *Tragedia Policiana* (1547), *Comedia Florinea* (1554), and *Comedia Selvagia* (1554). During this time, *comedy* came to mean "any stage play," and the most celebrated adaptation of the *Celestina* was Lope de Vega's (1562–1635) great tragedy, *El Caballero de Olmedo*, which appeared in Part 24 of Vega's *Comedias* (1641). *Comedia* also became the general name for theater, a practice found in France, as in the *Comédie Française* in Paris.

In Italy in the sixteenth century, Dante's *Comedy* was given the title of *The Divine Comedy*, seemingly to make the point that it has nothing to do with any of the usual senses of comedy. In France in the 1840s Honoré de Balzac (1799–1850) gave to his collected works the retrospective title of *The Human Comedy*, not because of any theory of comedy, but to contrast the mundane world of his novels with the otherworldly actions and interests of Dante's work. The designation of "art comedy," *commedia dell'arte*, was given to plays performed by professional actors on stereotyped plots with much improvisation. In the eighteenth century in both France and Italy sentimental or "tearful" comedy and "musical" comedy came into vogue.

In the late twentieth century "musical comedy" was shortened to "musical," which was contrasted with "comedy," both being contrasted with "drama" (as in the Golden Globe Awards). The latter category includes all revived tragedies and also modern plays or films that are perceived to have a sense of the tragic.

TRANSLATION. What may summarily be called *translation* has been practiced in many parts of the world for centuries and even millennia. The rendering of Buddhist texts into literary Chinese and the Latinization of the Bible in the first millennium are two instances of celebrated achievements in the long history of translation. There are countless cases where translations are known to have played a decisive role in the development of literary cultures, pedagogical institutions, ecclesiastic reformations, and the global spread of the nation-state and capitalism, particularly since the Renaissance and the European conquest of the Americas. Yet, until the 1970s or 1980s, translation did not attract much academic attention and consequently had not been studied systematically, though such diverse writers as John Dryden (1631–1700), Motoori Norinaga (1730–1801), and Walter Benjamin (1892–1940) offered insightful speculations on their own practice of translation.

In the early twenty-first century a number of scholars became aware of both the conceptual complexity and the politico-ethical significance of translation. Simultaneously, they came to realize that translations not only in the fields of literature and religion must be problematized but also those in the spheres of commercial advertisement, popular entertainment, public administration, international diplomacy, scientific research and publication, judiciary procedure, immigration, education, and family livelihood.

The conceptual complexity of the term *translation* and the difficulty in any attempt to define it make it necessary to historicize the particular ways translation has been understood and practiced in modern societies. The politico-ethical significance of translation is always complicit with the construction, transformation, or disruption of power relations. Translation involves moral imperatives on the part of both the addresser and the addressee and can always be viewed, to a greater or lesser degree, as a political maneuver of social antagonism. In addition, the representation of translation produces sociopolitical effects and serves as a technology by which individuals imagine their relation to the national or ethnic community.

The particular way translation is represented is conditioned by the essentially “modern” *schema of co-figuration*—most typically, the communication model according to which translation is represented as a transfer of signification between two clearly demarcated unities of ethnic or national languages—by means of which one comprehends natural language as an ethno-linguistic unity. In other words, the commonsensical notion of translation is delimited by the schematism of the world (that is, by the act of representing the world according to the schema of co-figuration). Conversely, the modern image of the world as “inter-national” (that is, as consisting of basic units called *nations*) is prescribed by a representation of translation as a communicative and international transfer of a message between a pair of ethno-linguistic unities.

The Concept of Translation and Its Complexity

The network of connotations associated with the term *translation* leads to notions of transferring, conveying, or moving from one place to another, of linking one word, phrase, or text to another. These connotations are shared among the words for translation in many modern languages: *fanyi* in Chinese, *translation* in English, *traduction* in French, *honyaku* in Japanese, *Übersetzung* in German, and so forth. It may therefore appear justified to postulate the following definition: “Translation is a transfer of the message from one language to another.” Even before one specifies what sort of transfer this may be, it is hard to refrain from asking about the message. Is not the message in this definition a product or consequence of the transfer called translation rather than an entity that precedes the action of transfer, something that remains invariant in the process of translation? Is the message supposedly transferred in this process determinable in and of itself before it has been operated on? And what is the status of the language from which or into which the message is transferred? Is it justifiable to assume that the source language in which the original text makes sense is different and distinct from the target language into which the translator renders the text as faithfully as possible?

Are these languages countable? In other words, is it possible to isolate and juxtapose them as individual units, such as apples, for example, and unlike water? By what measures is it possible to distinguish one from the other and endow each with a unity? But for the sake of facilitating the representation of translation, however, is it not necessary to posit the organic unity of language rather than see it as a random assemblage of words, phrases, and utterances if one is to speak of translation in accordance with the definition?

Accordingly, the presumed invariance of the message transmitted through translation is confirmed only retroactively, after it has been translated. What kind of definition is it, then, that includes the term in need of explanation in the definition itself? Is it not a circular definition? Similarly, the unity of the source language and of the target language is also a supposition in whose absence the definition would make little sense. What might translation be if it were supposed that a language is not countable or that one language cannot be easily distinguished from another?

It is difficult to evade this problem when attempting to comprehend the terms *meaning* and *language*. At the least, it may be said that, logically, translation is not derivative or secondary to meaning or language; it is just as fundamental or foundational in any attempt to elucidate those concepts. Translation suggests contact with the incomprehensible, the unknowable, or the unfamiliar—that is, with the foreign—and there is no awareness of language until the foreign is encountered. The problematic of translation is concerned in the first place with the allocation of the foreign.

If the foreign is unambiguously incomprehensible, unknowable, and unfamiliar, then translation simply cannot be done. If, conversely, the foreign is comprehensible, knowable, and familiar, translation is unnecessary. Thus, the status of the foreign is ambiguous in translation. The foreign is incomprehensible and comprehensible, unknowable and knowable, unfamiliar and familiar at the same time. This foundational ambiguity of translation is derived from the position occupied by the translator. The translator is summoned only when two kinds of audiences are postulated with regard to the source text, one for whom the text is comprehensible at least to some degree, and the other for whom it is incomprehensible. The translator’s work consists in dealing with difference between the two audiences. The translator encroaches on both and stands in the midst of this difference. In other words, for the first audience the source language is comprehensible while for the second it is incomprehensible. It is important to note that the term *language* in this instance is figurative: it need not refer to the natural language of an ethnic or national community—German or Tagalog, for example. It is equally possible to have two kinds of audiences when the source text is a technical document or an avant-garde work of art. In such cases *language* may well refer to a vocabulary or set of expressions associated with a professional field or discipline—for example, law; it may imply a style of graphic inscription or an unusual setting in which an artwork is displayed. This loose use of the term *language* invariably renders the task of determining the meaning of the term *translation* difficult, because all the acts of projecting, exchanging, linking, matching, and mapping could then be

considered kinds of translation, even if not a single word is involved. Here the discernability of the linguistic and the nonlinguistic is at stake.

Roman Jakobson's famous taxonomy of translation attempts to restrict the instability inherent in the figurative use of the word *language*. Jakobson divides translation into three classes: "1) Intralingual translation or *rewording* is an interpretation of verbal signs by means of other signs of the same language. 2) Interlingual translation or *translation proper* is an interpretation of verbal signs by means of some other language. 3) Intersemiotic translation or *transmutation* is an interpretation of verbal signs by means of signs of nonverbal sign systems" (p. 261). According to the Jakobsonian taxonomy, one who translates "legal language" into common parlance would be performing an intralingual translation, while one who offers a commentary on an obscure artwork would be engaged in an intersemiotic translation. Neither can be said to be a translator strictly speaking. Only someone who translates a text from one language to another would be doing translation proper.

Jakobson's taxonomy neither elucidates nor responds to the supposition concerning the countability and organic unity of the source and target languages. It does not empirically validate the supposition; it merely repeats and confirms it. Nevertheless, it discloses that "translation proper" depends on a supposed discernibility between the interlingual and the intralingual, between a translation from one language to another and a rewording within the same language. It thereby prescribes and demarcates the locus of difference between two presumably ethnic or national language communities by virtue of the fact that Jakobson presupposes that translation proper can take place only between two unequivocally circumscribed languages. It therefore eradicates the various differences within such a linguistic community and locates the foreign exclusively outside the unity of a language.

No doubt this conception of translation is a schematization of the globally shared and abstractly idealized commonsensical vision of the *international* world as basic units—nations—segmented by national borders into territories. It is not simply Jakobson's idiosyncratic view. In this schematization, "translation proper" not only claims to be a description or representation of what happens in the process of translation; that description also prescribes and directs how to represent and apprehend what one does when one translates. In this respect, "translation proper" is a *discursive* construct: it is part of what may be called the regime of translation, an institutionalized assemblage of protocols, rules of conduct, canons of accuracy, and ways of viewing. The *discursive* regime of translation is *poietic*, or productive, in that it foregrounds what speech acts theorists call the "perlocutionary" effect. Just as a perlocutionary act of persuading might well happen in a speech act of arguing but persuasion does not always result from argument, "translation proper" need not be postulated whenever one acts to translate. Yet, in the regime of translation, it is as if there were a casual relationship between the co-figurative schematization of translation and the process of translation. Collapsing the process of translation onto its co-figurative schematization, the representation of translation repeatedly discerns the domestic language co-figuratively—one unity is

figured out, represented, and comprehended as a spatial figure, in contrast to another—as if the two unities were already present in actuality.

As long as one remains captive to the regime of translation, one can construe the ambiguity inherent in the translator's positionality only as the dual position a translator occupies between a native language and a foreign tongue. Hence the presumption persists that one either speaks one's mother tongue or a foreigner's. The translator's task would be to discern the differences between the two languages. And the difference one deals with in translation is always determined as that between two linguistic communities. Despite countless potential differences within one linguistic community, the regime of translation obliges one to speak from within a binary opposition, either to the same or to the other. Thus, in the regime of translation the translator becomes invisible. This attitude in which one is constantly solicited to identify oneself may be called "monolingual address," whereby the addresser adopts the position representative of a putatively homogeneous language community and enunciates to addressees who are also representative of a homogeneous language community. The term *monolingual address*, however, does not imply a social situation in which both the addresser and the addressee in a conversation belong to the same language; they believe they belong to different languages yet can still address each other monolingually.

Translator: The Subject in Transit

Is it possible to understand the act of translation outside monolingual address? To respond to this question, it may be helpful to consider the translator's position of address. When engaged in the task of translation, can she perform a speech act such as making a promise? Is the translator responsible for what she says while translating? Because of the translator's unavoidably ambiguous position, the answer too is ambiguous. Yes, she can make a promise, but only on behalf of someone else. She "herself" cannot make a promise. The translator is responsible for her translation but she cannot be held responsible for the pledges expressed in it, because she is not allowed to say what she means; she is required to say what she says without meaning it. In essence, the translator is someone who cannot say "I." Here the problem of the invariant message returns as the question of meaning, of what the translator "means" to say.

In relation to the source text, the translator seems to occupy the position of the addressee. She listens or reads what the original addresser enunciates. At the same time, however, there is no supposition that the addresser is speaking or writing to her. The addressee of the enunciation is not located where the translator is; in translation, the addressee is always located elsewhere. Here again the translator's positionality is inherently ambiguous: she is both an addressee and not an addressee. She cannot be the "you" to whom the addresser refers.

A similar disjunction can be observed in the enunciation of the target text—that is, in the translation. In relation to the audience of the target text, the translator seems to occupy the position of the addresser. The translator speaks or writes to the audience. But it is seemingly not the translator herself who speaks or writes to the addressee. The *I* uttered by the

translator does not designate the translator herself but rather the subject of the original enunciation. And if the translator does indicate the subject of the translated enunciation by saying *I*—in a “translator’s note,” for example—she will then have to designate the original addresser as *he* or *she*.

In other words, in translation, the subject of the enunciation and the subject of the enunciated—the speaking *I* and the *I* that is signified—are not expected to coincide. The translator’s desire is at least displaced, if not entirely dissipated, in the translated enunciation, if by *desire* one understands that what is signified by *I* in “my” utterance, ought to coincide with the supposedly concrete and unique—but imagined—existence of “me” (the desire expressed as “I want to be myself”). This is why the translator cannot be designated straightforwardly either as *I* or *you*: she disrupts the attempt to appropriate the relation of addresser and addressee as a *personal* relation between the first person and the second person. According to Émile Benveniste, only those directly addressing and those directly addressed can be called persons, whereas *he*, *she*, and *they* cannot be so designated (Benveniste, p. 224). Hence, the addresser, the translator, and the addressee cannot be persons simultaneously. The translator cannot be the first or second person, or even the third “person” undisruptively. Ineluctably, translation introduces an instability into the putatively *personal* relations among the agents of speech, writing, listening, and reading. The translator is internally split and multiple, devoid of a stable position. At best, she is *a subject in transit*.

In the first place, this is because the translator cannot be an “individual” in the sense of *individuum*, the undividable unit. In the second, it is because she is a *singular* that marks an elusive point of discontinuity in the social, even though translation is the practice of creating continuity from discontinuity. Translation is a *poietic* social practice that institutes a relation at the site of incommensurability. This is why the discontinuity inherent in translation would be completely repressed if one were to determine translation as the communication of information; the *ambiguity inherent in the translator’s positionality* would have to be entirely overlooked as translation is grasped as the transfer of information.

The internal split within the translator demonstrates how the subject constitutes itself. In a sense, this internal split is homologous to what is known as the “fractured *I*.” The temporality of “I speak” necessarily introduces an irreparable distance between the speaking *I* and the *I* signified, between the subject of the enunciation and the subject of the enunciated. The subject in the sense that *I* am here and now speaking designates the subject of the enunciation, but it does not signify it because every signifier of the subject of the enunciation may be lacking in the enunciated or the statement. In the case of translation, however, an ambiguity in the translator’s personality marks the instability of the *we* as subject rather than the *I*, since the translator cannot be a unified and coherent personality in translation. This suggests a different attitude of address, namely, “heterolingual address” (Sakai, pp. i–xii)—that is, a situation in which one addresses oneself as a foreigner to another foreigner. Held captive in the regime of translation, however, the translator is supposed to assume the role of the

transcendent arbitrator, not only between the addresser and the addressee but also between their linguistic communities. As monolingual address, translation, as a process of creating continuity in discontinuity, is often replaced by the representation of translation in which translation is schematized according to the co-figurative communication model.

Modernity and the Schema of Co-Figuration: A Genealogy of the Modern

Consider how translation is displaced by its representation and how collective subjectivity, such as national and ethnic subjectivity, is constituted in the representation of translation. Through the translator’s labor, the incommensurable differences that call for the translator’s service in the first place are negotiated. In other words, the work of translation is a practice by which the initial discontinuity between the addresser and the addressee is made continuous. In this respect translation is like other social practices; translation makes something representable out of an unrepresentable difference. Only retrospectively, therefore, can one recognize the initial incommensurability as a gap, crevice, or border between fully constituted entities, spheres, or domains. But when so represented, it is no longer an incommensurability. It is mapped onto a striated space, which may be segmented by national borders and other markers of collective (national, ethnic, racial, or “cultural”) identification.

Incommensurable difference is more like a feeling prior to the explanation of how incommensurability occurred, and cannot be represented as a specific difference (in schemas of genera and species, for example) between two terms or entities. What makes it possible to represent the initial difference between one language unity and another as already determined is the work of translation itself. Hence the untranslatable, or what appears to be so, cannot exist prior to the enunciation of translation. It is translation that gives birth to the untranslatable. The untranslatable is as much a testimony to the sociality of the translator, whose elusive positionality reveals the presence of an aggregate community of foreigners between the addresser and the addressee, as the translatable itself. We fail to communicate because we are in common with one another. Community itself does not mean we share common ground. On the contrary, we are in community precisely because we are exposed to a forum where our differences and failure in communication can be manifest. Nevertheless, the translator’s essential sociality with respect to the untranslatable is disregarded in monolingual address, and with the repression of this insight, monolingual address equates translation with the representation of translation.

When the temporality of translation by which the translator’s disjunctive positionality manifests itself is erased, translation is displaced by the representation of translation. Because the disruptive and dynamic processes of translation are leveled out, the representation of translation makes possible the representation of ethnic or national subjects and, despite the presence of the translator, who is always ambiguous and disjunctive, translation as representation posits one language unity against another and one “cultural” unity against another. In this sense, the representation of translation transforms *difference in repetition* (Deleuze) into a *specific difference* between two particularities and serves to constitute the putative unities

of national languages, thereby reinscribing the initial difference and incommensurability as a specific, or commensurate and conceptual, difference between two particular languages within the continuity of languages. As a result of this displacement, translation is represented as a form of communication between two fully circumscribed, different but comparable, language communities in which social antagonism and the various loci of difference are expunged.

The particular representation of translation as communication between two particular languages is no doubt a historical construct. Given the politico-social significance of translation, it is no accident that, historically, the regime of translation became widely accepted in many regions of the world, after the feudal order and its passive vassal subject gave way to the disciplinary order of the active citizen subject in the modern nation-state, to an order consisting of disciplinary regiments that Michel Foucault describes brilliantly. The regime of translation serves to reify national sovereignty. As Michael Hardt and Antonio Negri have argued, it makes “the *relation* of sovereignty into a *thing* (often by naturalizing it) and thus weed out every residue of social antagonism. The nation is a kind of ideological shortcut that attempts to free the concepts of sovereignty and modernity from the antagonism and crisis that define them” (Hardt and Negri, p. 95, italics in the original).

Kant thought of the schema as a “third thing” heterogeneous to either sensibility or understanding, in which an intuition (in sensibility) is subsumed under a concept (in understanding), and attributed it to the general faculty of imagination, a faculty to give a concept its figure or *Bild*. He called this operation of schema *schematism*. Following the Kantian schematism, the *poietic* technology embedded in the regime of translation that renders translation representable may be called “the schema of co-figuration.” Since the practice of translation remains radically heterogeneous to the representation of translation, translation cannot always be represented as a communication between two clearly delineated ethno-linguistic unities. Rather, it was this particular representation of translation that gave rise to the possibility of figuring out the unity of ethnic or national language together with another language unity. Thanks to this co-figurative schematism, there emerges an ethno-linguistic unity as if it were a sensuous and unified thing hidden and dormant behind the surface of extensive variety. In other words, the schema of co-figuration is a technology by means of which an ethno-linguistic community is rendered representable, thereby constituting itself as a substratum upon which national sovereignty can be built. “People” is nothing but an idealization of this substratum.

This self-constitution of the nation does not proceed unitarily, but on the contrary, its figure constitutes itself only by making visible the figure of an other with which it engages in a relationship of translation. Precisely because the two nations are represented as equivalent and alike, however, it is possible to determine them as *conceptually different*, and their difference is construed as a *specific difference* (*daiphora*) between separate identities. Nevertheless, cultural difference, which calls for the work of a translator, is not a conceptual difference but an incommensurability. The relationship of the two terms as

equivalent and alike gives rise to the possibility of extracting an infinite number of distinctions between the two. Just as in the co-figuration of “the West and the Rest” by which the West represents itself, constituting itself by positing everything else as “the Rest,” conceptual difference allows one term to be evaluated as superior to the other. This co-figurative comparison enables typical binary oppositions—such as the presence of scientific rationality versus its absence, the future-oriented spirit of progress versus the tradition-bound sense of social obligation, and internalization of religious faith and its accompanying secularism versus the inseparableness of the private and the public—to characterize the West and the Rest.

The “modern” is marked by the introduction of the schema of co-figuration, without which it is difficult to imagine a nation or ethnicity as a homogeneous sphere. The economy of the foreign—that is, how the foreign must be allocated in the production of the domestic and non-universal language—has played a decisive role in the *poietic*—and poetic—identification of national languages (Berman). Most conspicuously in eighteenth-century movements such as Romanticism in western Europe and *Kokugaku* (National Studies) in Japan, intellectual and literary maneuvers to invent, mythically and poetically, a national language were closely associated with a spiritual construction of a new identity that later naturalized national sovereignty. This substratum for the legitimization of national and popular sovereignty was put forward as a “natural” language specific to the “people,” supposedly spoken by them in their everyday lives. Literary historians generally call this historical development “the emergence of the vernacular.” With the irruption of the sphere of nearness—extensive obsessions with things of everydayness and experimental immediacy—in which the ordinary and the colloquial were celebrated, the status of “universal” languages such as Latin, literary Chinese, and Sanskrit was drastically and decisively altered. In their stead, languages emerged whose markers were ethnic and national—English, German, Japanese, Spanish and so forth—and the ancient canons were translated into these languages. For this reason, Martin Luther’s German translation of the Bible and Motoori’s Japanese phonetic translation of the *Kojiki* (Records of ancient matters) can be said to mark crucial steps in modernity. This emphasis on ordinary and colloquial languages was correlated with the reconception of translation and the schema of co-figuration.

Historically, how one represents translation does not only prescribe how we collectively imagine national communities and ethnic identities and how we relate individually to national sovereignty. It is also complicit with the discourse of the West and the Rest through which the colonial power relationship is continually fantasized and reproduced.

TRANSNATIONALISM. See Globalization.

TRAVEL FROM EUROPE AND THE MIDDLE EAST. Travel, as a human activity, predates language. It should be no surprise, then, that some of the first ancient literary expressions from the European and African continents should use travel as a motif. Certainly the ancient Hebrew biblical narratives of Abraham, Isaac, Jacob, and Moses structure the lives of their subjects through travel. Greek and Roman epics—*The Odyssey* and *The Aeneid*—as well as the history of Thucydides, use travel as an important thematic element, connecting it with various aspects of conflict. Similarly, Herodotus (c. 484–c. 424 B.C.E.), in his historical, ethnographic, and geographic compendium, uses travel in part as his method of research. The Islamic tradition begins with epic travel—flight and return—continuing with pilgrimage, educational, and diplomatic travel. In the millennium and a half since, the motif of travel has attracted a number of images that structure our view of this basic human activity, images that appear in both fiction and nonfiction.

Ancient and Medieval Travel: Epic Heroes, Pilgrims, and Merchants

The genre of epic structures the oldest European travel narratives extant, from the voyages of Ulysses to that of Beowulf. The epic as a form connects travel to conflict and cultural threat, as well as to the landscape of fantasy and to the epic hero. Just as the epic hero is larger and more marvelous than

life, so the epic landscape is both marvelous and dangerous. The epic hero and those who accompany him are often engaged in activities that either preserve or extend the culture of which he is the ideal. Such an image of travel has little room for reflection or satiric treatment; the mood is one of high seriousness. The epic form is modified in the oldest Hebrew writings; there, the culture-creating protagonists become sometimes the focal point of narrative but always the recipients of divine directives regarding travel. Biblical travel is conceived in three ways: first, as travel toward a land of divine promise; second, as wandering to or in the land; and third, as exodus or flight. In the Islamic tradition, the travel of the prophet Muhammad contains the same elements of divine directive, flight, and return.

The rise of Christianity and Islam activates a second image associated with travel, that of pilgrimage. One could classify the ancient Hebrew narratives as pilgrimage, but the concept, which gains importance in the period from 800 to 1400 C.E. in Europe and Africa, involves other elements. Pilgrimage is conceived as reenactment; the pilgrim undertakes a sacred journey, the significance of which is primarily spiritual, as he or she visits sites important to sacred history. In the Christian and Islamic traditions, this sacred journey is conditioned by devotion and obedience. Medieval Christian tradition adds the element of veneration and indulgence: the idea that acts of veneration for holy relics and places could provide spiritual benefit can be traced back to the late classical period. But the explicit linking of acts of devotion with the remission of temporal punishment for sin only began with the First Crusade in 1095, when Pope Urban II announced the granting of indulgences to those who fought to regain the Christian holy shrines. Such a view, conditioned by conflict, both renders ambiguous the spiritual aspects of the journey and historically allows the symbolizing of acts of devotion. The act of pilgrimage also allows travelers to escape being accused of the sin of curiosity; travel for sightseeing is problematic in the Middle Ages, but travel for at least ostensibly spiritual reasons can sometimes escape this censure.

In medieval Europe, a mode of pilgrimage writing develops, in which certain items of information and structures of narration become standardized. This tradition approaches landscape and the journey in the following ways: first, the journey is conceived as outgoing; narratives focus on the hardships of the journey out and the travels between the holy places, instead of on the journey out and back. Second, the journey within the holy destination is organized in terms of "stations" or stopping places, often connected with specifically significant sites. These significant sites usually become connected allegorically with a variety of biblical significances. The twelfth-century pilgrimage guide writer Fetellus, for example, localizes a number of biblical references in one spot. When he describes the traditional hill of Christ's crucifixion in his narrative, he names this spot as the site on which Abraham sacrificed Isaac and as the place where Adam was buried (and resurrected by Christ's blood falling upon him). Furthermore, this site has significance for the future, being the place upon which Christ will return at the end of history. Specific physical characteristics of the site are used to bolster these allegorical accretions: the crack running through the rocks

of the crucifixion hill is there because of the earth-rending strain of holding the cross. Other sites, from the city of Hebron to the Dead Sea, gain a number of allegorical significances based on their associations with the biblical narrative.

The third important type of travel, for the purposes of trade, had almost certainly been occurring concurrently with other forms of travel since the earliest human cultures. In Europe, commercial travel was seldom documented until well into the Middle Ages. By far the most important Continental writing about commercial travel was the narrative of Marco Polo, a Venetian who traveled to China and back during a twenty-four-year period, between 1271 and 1295. His writings were both widely publicized and widely ridiculed, as his European readers refused to believe the apparently miraculous accounts of the wealth, geographical wonders, and population of the Far East, as well as his account of offices he had held while in China. His ultimate nickname, *Il Milione* (The million), reflected the European public's sense that he had exaggerated the information that he brought back. The reaction to Marco Polo's narrative also points to the general reaction that hearers and readers in the Middle Ages expected from information derived through travel: generally they wanted to react with a sense of wonder and calculated disbelief to the tales brought back by far-flung narrators. This appetite for wonders can also be seen by the popularity of the information in the compendia of geographical and other lore compiled by such people as Vincent of Beauvais, the medieval encyclopedist (c. 1190–c. 1264).

Renaissance Travel: Exploration and Empire

With the beginning of the early modern period, the primary image of travel gradually transforms from the traditional images of epic and pilgrimage into something new—exploration. There is a sense in which exploration retains the heroic character of epic travel: it often highlights conflict, whether conflict with the elements and a hostile landscape or conflict with the other cultures encountered. But explorers, while at some level imperialists, are, during the early period of exploration at least, not really larger-than-life figures. The curiosity about geographic features and other cultures ceases to be a minor sin and becomes the animating reason for travel. The explorer travels expressly to find new lands and peoples, desiring to trade with other cultures or to exploit the riches of new lands. In the initial European encounter with America, Christopher Columbus was very much the medieval man, looking during his voyage for the lost earthly paradise, said to be located in the west. The Spanish conquistadors saw themselves as feudal overlords of subject peoples, and conducted their conquests accordingly. Narrators of their voyages over the ocean and over land contributed to a perspective on the native civilizations they found there, a perspective that inherited the sense of wonder found in medieval travel narratives but also a less benign questioning of the humanity of the others who were encountered. Seeing the native civilizations as strange and wondrous tended to dehumanize the people encountered. But the New World yielded another, more tangible, reward to the explorers—the gold and silver of the Americas. Ultimately all the European exploratory ventures took part in a quest for resources, either precious metals or the natural resources of the lands discovered.

Exploration narratives were writings in search of a genre. It was important, for the first time, that each explorer “answer for himself, justify his own reports, and stand accountable for his own doings,” according to England's greatest Renaissance collector and travel narrative editor, Richard Hakluyt, because these reports were becoming the guidebooks for colonists and pioneers. Curiosity about people, languages, and geography became a virtue, and truthfulness became important.

Fact and Fiction in Travel Narratives

Travel narratives allowed ancient and medieval audiences to escape through literary fantasy and compare their culture to different ones. But the wondrous living denizens of these narratives—people whose heads grew beneath their shoulders, people who lived on odors, tribes of Amazon women—would be proven nonexistent. In their place, exploration narratives would put the actual wonders of spices, gold, silver, canoes, and differing customs. Before the early modern period, the veracity of travel narratives was not a serious issue because travel was a rare event and large-scale cross-cultural contacts relatively few. The few medieval narratives that realistically recounted diplomatic missions to the invading Mongol hordes during the thirteenth and fourteenth centuries were not widely known.

Thus, though medieval travelers were not generally believed, veracity was trivial. The situation changed in the fifteenth century with the first seaborne expeditions around the African continent and to the Americas. Though the earliest sea voyagers carried medieval descriptions of the places for which they searched, it soon became apparent that these descriptions were untrustworthy. Columbus carried on his first American voyage a copy of the fourteenth-century *Travels of Sir John Mandeville*, one of the most popular pilgrimage and travel narratives of the time, hoping to use its description to find the scriptural earthly paradise. Richard Hakluyt reprinted a Latin version of Mandeville's *Travels* in the first edition of his collection *The Principall Navigations* (1589). He most probably dropped it from the second edition of the collection because of its falsehoods.

Travel as exploration demanded a different set of criteria; instead of wonder and the imaginative, the requirements of the new travel narratives involved reliability and exactness of detail. This demand for descriptive exactness contributed to an extension of the exploratory image in travel writing into the twentieth century. Though exploration as an image of travel connotes objectivity and exactness, it is clear that this image is affected by the historical concomitants of conquest and imperialism. Certainly the information the explorers recount is conditioned by their Eurocentric perspective.

As representatives of the ascendant European culture and its political hegemony spread out across the globe, the amount of travel writing greatly expanded. Women undertook journeys in support of spouses or independently and related their experiences exploring and encountering other cultures, often in epistolary form. Lady Mary Wortley Montagu traveled to Turkey with her husband, a diplomat, between 1716 and 1718. Her letters closely observe the cultures through which she passed. It is clear, as well, that she is familiar with the male

ISLAMIC TRAVELERS

Islamic travelers voyaged through Africa and into the Far East using established overland and sea routes from northern Africa and the Mideast. Routes were established in the Mediterranean to Spain and indirectly to the rest of Europe; overland, the great Silk Road reached into China; by sea, Arab traders reached India.

Of two important early Muslim travelers, Ibn Fadlan (Ahmad ibn Fadlan ibn al-'Abbas ibn Rashid ibn Hammad) and Ibn Jubayr (Abu al-Husayn Muhammad ibn Ahmad Jubayr), little is known. Ibn Fadlan includes little description of himself in his *risala*, or epistle, describing a diplomatic mission from the caliph of Baghdad in 921 to the Bulgarians of the Volga. Ibn Jubayr, a Spanish Arab traveler during the twelfth century, voyaged around the Mediterranean basin and through Mecca and Medina on a journey that he recorded in *rihla* form; it is the only journey for which he wrote a narrative of three that he made. What is known of his second journey is that he composed a poem celebrating Saladin's victory at Hittin.

The *rihla*, a genre of travel description in Arabic developed by various Islamic authors, encompassed various sorts of journey: pilgrimage, travel for learning, or travel for discovery. One of the greatest of the travelers of the Middle Ages, Shams al-Din ibn Battuta (1304–c. 1368), composed a *rihla* called *Tuhfat al-nuzzar fi ghara'ib al-amsar wa 'aja'ib al-asfar* (A feast for the eyes [presenting] exotic places and marvelous travels). This work so epitomized the genre of *rihla* that Ibn Battuta's work is often simply known by that name—the *Rihla*. Like Marco Polo, Ibn Battuta

and his account were greeted with skepticism by his contemporaries, including the great Islamic historian Ibn Khaldun. Also like Marco Polo, contemporary scholarship indicates that he was essentially truthful in most of his account. All in all, Ibn Battuta's account is a compendious store of information about the Muslim world of his day.

Leo Africanus (al-Hasan ibn Muhammad al-Wassan az-Zayyati), born in Islamic Spain, is one of the most important European writers about Africa between 1500 and 1800. His description of sub-Saharan and northern Africa, *Descrittione dell'Africa* (Description of Africa), was completed in 1529, after he had been captured by pirates and had converted to Christianity. His writing falls into the Arabic tradition of geography rather than into the tradition of the *rihla* account. Since, as a stranger in a different culture, he had no access to the traditional works of Arabic geography, he needed primarily to rely upon his memory to write his work. This necessity has led many readers to identify his *Description* more with genres of travel writing than geography.

One of the masters of *rihla* writing was the seventeenth-century Sufi scholar and poet Abu Salim Abd Allah ibn Muhammad al-Ayyashi, who left a detailed account of a journey that includes elements of pilgrimage and exploration. After a journey overland from his native Morocco to Cairo, al-Ayyashi continued his pilgrimage to Mecca and Medina. He was as interested in the people and customs that he saw as he was in the holy sites that he visited. His narrative makes clear the interconnected world of North African Islam and that of the Mideast.

tradition of travel writing, because she often provides a contrasting female perspective on her travel experiences, as do many female travel authors of the fifteenth through the eighteenth centuries. Mary Wollstonecraft's epistolary journal of her travels to Scandinavia in 1795, in the company of only her maid and infant daughter, was influenced (like Lady Wortley Montagu's) by the earlier letters of the French Madame de Sévigné. In general, the specifically female mode of travel writing has much in common with the parallel tradition of women's autobiography.

Men, meanwhile, continued the exploratory movement, this time under the aegis of scientific and sociological investigation. The narrative of David Livingstone in Africa in the mid-nineteenth century was constructed as an exploratory and imperialistic epic, while Mungo Park's narratives of Africa in the 1790s and Alexander von Humboldt's narratives of scientific discovery on the American continent from 1799 to 1804 combine both epic hardships and reports of important scientific investigations. Sir Richard Burton, one of the Victorian era's most intrepid travelers, hazarded his life in journeys

EARLY MODERN EUROPEAN TRAVEL COLLECTIONS

The early modern period in Europe (roughly 1450–1700) was not only a time of intense exploratory activity but also a time in which a number of editors and collectors strove to collect, organize, and distribute overviews of nonfictional writing about travel. Nationalistic impulses as well as the need for information drove a number of editors between 1550 and 1650 to collect narratives.

Giovanni Ramusio (1485–1557) collected and translated the works in *Delle navigationi et viaggi* (On navigations and travels) between 1550 and 1559. In this work, he intended to produce a new kind of compendium, an overall survey of important geographical treatises, organized by global region. It contains writing by Leo Africanus, Antonio Pigafetta (who took part in Magellan's circumnavigation), and Amerigo Vespucci, among others.

Richard Hakluyt (c. 1552–1616) compiled, edited, and translated *The Principal Navigations, Voyages, Traffiques, and Discoveries of the English Nation* in two editions: 1589 and 1598–1600. Though both editions concentrated on English discoveries, the second edition especially had a larger scope, to provide information for English

explorers and traders about all the areas in which they might have interest. Organized both chronologically and regionally, the collection provides a comprehensive look at the history of exploration and trade to the point of publication, insofar as Hakluyt was able to obtain information.

Samuel Purchas, a clergyman originally interested in a universal history of religions told through travel narratives, purchased Richard Hakluyt's literary effects around 1620. From it and his own collecting, Purchas compiled a collection called *Hakluytus Posthumous, or Purchas his Pilgrimes*, in 1625. Though organized in much the same way as Hakluyt's collection, Purchas's editorial methods and aims are quite different. He is interested as much in the edification and educational benefits of travel as he is in accurate information about exotic locations.

The *Collectiones peregrinationum in Indiam orientalem et Indiam occidentalem*, produced by the de Bry family at Frankfurt (begun by Théodor de Bry, but brought to conclusion by his sons; 1590–1634), enhanced narratives of travel with high-quality engravings.

through the Islamic world, including making a disguised pilgrimage to Mecca, bringing back the first eyewitness European description of that great journey (*Personal Narrative of a Pilgrimage to El-Medinah and Meccah*; 1855–1856). Travel writing of the exploratory type thus takes on a more personal and literary character as time goes on.

Modern Images of Travel: Tourist or Ironist

Tourism began in the early modern period as travel for education. At this time, travel was seen as an important pedagogical capstone. In England, such important social and literary figures as Sir Philip Sidney (1554–1586) took the “grand tour” (an extended visit to important cities and courts of continental Europe) as an appropriate way to conclude their education in the arts of politics and culture. Ideally, the grand tour introduced its practitioner to the languages and polite societies of the Continent; practically, a number of English critics of this type of travel complained that it led to students coming back with French affectations and fashions, German manners, and Italian diseases. The playwright Thomas Nashe penned an ingenious satiric journey for his picaresque traveler Jack Wilton in *The Unfortunate Traveller* (1594). In the realm of nonfiction, the Oxford-educated

eccentric Thomas Coryate penned his voluminous *Crudities* (1611), in which he paints himself as the innocent abroad, coming into contact with various kinds of picaresque adventures while undertaking a perhaps not-so-grand tour through the Continent. That Coryate had elements of the explorer in himself as well is evident from his death in India while on a more far-flung journey. George Sandys's *Relation of a Journey Begun Anno Domini 1610* combines the structures of pilgrimage narrative with the motivations of the practitioner of the grand tour.

During the eighteenth and early nineteenth centuries, travel became more consciously literary. Such figures as Samuel Johnson and James Boswell melded the tour of the countryside with autobiography, biography, and the essay, while Romantic period authors in Britain and on the Continent celebrated the imaginative potential of journeys through the natural world. This sort of travel often allied itself to the emerging genre of the novel, in which the physical journeys of various protagonists were paralleled by their interior development, sometimes with comic results.

However, travel could never fully become tourism until the level of danger inherent in the activity had diminished. One

could say that tourism was born in Europe with the guides of Baedeker during the Victorian period and in America with the closing of the frontier in the late 1800s. But there had always been a sense of conflict between the “true” traveler and the mob of others; as early as the fourteenth century, Margery Kempe, the English mystic and pilgrim, lamented the motivations (curiosity and good fellowship) of her fellow pilgrims, to the point that her traveling companions attempted to strand her in Rome because of her constant moral hectoring. But with the advent of technology, one of the cachets of travel, its attendant dangers, had been removed. Thus, with the rise of tourism, a new tension arose in the image of travel: that between the true traveler and the tourist. While tourists stick to the instructions of Baedeker and travel in herds, the true traveler takes the road untraveled (at least by Europeans).

For literary travelers, this tension between tourism and other forms of travel produced much fruit. It would probably be a mistake to count various tourist guides as literary productions, but traveling authors have gained much ironic material by their appropriation of and resistance to the activities and material of tourism. During the early to mid-twentieth century, as well, there were still substantial portions of the globe generally off limits to tourists for political or other reasons. Modern authors tended to seek out just those sorts of marginal journeys.

Between the world wars, literary travelers often took the pose of ironists or reporters, sometimes espousing specific ideological points of view and sometimes using the profits gained by writing travel volumes to finance more “serious” literary pursuits. The English authors Graham Greene and Evelyn Waugh traveled extensively: Waugh used his journeys in the Mediterranean and South America as well as his stint as a reporter in Africa to provide material for some of his satiric novels. André Gide’s travels in Africa and the Mideast animated his sense of the ideal artistic life: to construct a careful equilibrium between the exotic and the familiar.

The contemporary literary traveler becomes a complexly folded narrator, taking an ironic stance, not just toward other cultures but often toward other travelers and even to him- or herself. Contemporary travel writing partakes of many genres and modes: novelistic, picaresque, satiric, and contemplative. Even the ancient motif of flight and return is explored as a means of self-discovery. For postmodernity, travel becomes a means of self-discovery or self-exploration.

TREATY. In modern diplomatic practice, a treaty is a formal written agreement between states (though recently also designating agreements with and between international organizations), which is legally binding under international law. Treaties differ from a variety of other international agreements like declarations, memorandums of understanding, and gentlemen’s agreements, which only create moral and political obligations, nonbinding commitments, or what has been branded as “soft law.” The Helsinki Final Act of the Conference on Security and Cooperation in Europe (1975) is an example of an important international agreement that was deliberately drafted in a way that was legally nonbinding to the parties at the time, circulated at the United Nations but deliberately not registered with the Secretariat. In legal jargon, and as codified in the preamble as well as Article 26 of the Vienna Convention on the Law of Treaties (1969), a treaty, unlike other international agreements, comes under “the fundamental principle” of *pacta sunt servanda*. This Latin phrase means that “agreements must be observed,” unless forced upon or concluded in bad faith. *Pacta sunt servanda* is a Ciceronian principle that has been selectively and problematically appropriated by modern treaty law. In *De officiis* (3.24), Cicero (106–43 B.C.E.) speaks extensively of ethical conduct and makes no distinction between agreements and promises (*pacta et promissa*) in his meditation on the matter. By contrast, international legal discourse allows for agreements that do not

follow the *pacta sunt servanta* rule, in turn providing for diplomatic flexibility and a bypassing of ethics. This makes it possible to daily exchange agreements and promises that have shades of legality, publicly simulating commitment, but in practice retaining opt-outs and remaining legally unenforceable.

Linguistic Issues

Although the word *treaty* can be etymologically traced back to the Latin *tractus*, meaning treatment, handling, discussion, and management, there was no Latin word with that root having the notion of an (international) agreement. If anything, *tractus* sometimes had the sense of a disagreement, of a violent handling of affairs, such as the dragging by the hair of the priestess of Apollo. A common Latin word for treaty is *foedus*—interestingly a word that also meant the unseemly, horrible, and detestable, probably depicting in the mind of the users the forced circumstances and unholy power deals that led to the conclusion of some. Another Latin word for treaty is *conventio*, from which the English word *convention* derives, a term currently used as a synonym for *treaty*, especially when following long multilateral negotiations. *Conventio* has in addition the meaning of an assembly and is a word that literally translates *sumbais*, an ancient Greek word for treaty. *Sumbainō* had the meaning of coming to an agreement but also of walking together, just like in the Latin *convenio*. Walking together along the same path or in the same direction is a good metaphor for agreement, though in practice it was also meant literally, like the walking together of comrades to the assembly, battlefield, or exile. There were other words for treaty in ancient Greek, such as *sumphōnia*, the harmony of speaking with a “common voice” about an issue, depicting people in great solidarity and symphony, or *sunthēkē*, which meant literally the composition of words, emphasizing the textual or synthetic sense of an agreement. But the most formal and solemn treaty was called *spondē*, meaning literally “libation,” which included the calling of the gods to witness the treaty and the taking of the oaths that sanctified it. Unlike other agreements, the breaking of a *spondē* was not just an illegal or immoral act, but a sacrilege.

The move to the term *treaty* signifies a change from the usual metaphors of agreement but also a turn toward secularization in international relations and law. In the sense of a contract between states the first recorded use of *treete* is in 1430. But as a technical term of international law the word is commonly employed from the end of the seventeenth century onward (*Oxford English Dictionary*). Interestingly, the introduction of the term follows the end of the Thirty Years’ War and the conclusion of the Treaty of Westphalia (1648), which is supposed to have secularized international norms and practice and provided the foundation of the modern (European) interstate system.

Typically, the only state that made and still makes the point of not using the name *treaty* for its legally binding international agreements is the Holy See. In diplomatic practice, bilateral treaties signed with the Vatican are called *concordats*, and canonists have gone to great pains to show that the “nature of concordats” bears practical similarities—but is not identical—to

that of treaties. A concordat refers to a cordial agreement, a union of wills, the successful meeting of hearts and minds in Christian harmony. The concordat is supposed to pass its provisions spiritually, requires no diplomatic “handling,” and its conclusion is avoided by the Holy See if it foresees complications in the ratification process from the other side. It is a euphemism through which papal treaty practice is rendered sui generis, supposed always to operate in concord, thus rhetorically separating itself from the worldly bargaining and crude pursuit of national interest associated with conventional treaty-making. Note also that in concordat practice, the Holy See emulates the discourse of the new covenant, which in Christian cosmology constitutes “the treaty of treaties,” rendering all other sacred or secular agreements false or insignificant by comparison. It was the messianic advent of Jesus Christ that brought forth the “new covenant,” bypassing and superceding the collective oath of the faithful to keep the “old covenant.” As taken up in the Epistle to the Hebrews—which is precisely a call to reject the old and accept the new covenant—the old covenant requires command ethics and rabbinic enforcement, whereas the new one inscribes the divine laws in the minds and hearts of the people in concordat style (see sidebar).

The story of rendering the old covenant obsolete following the declaration of a momentous happening or new revelation has ironically established a pattern in secular treaty law, and specifically in the employment of the principle of *clausula rebus sic stantibus*, the “clause of things standing thus.” This clause renders a treaty obsolete if there is a significant change in the conditions under which it was first concluded. The principle is a late-sixteenth-century invention coined by Alberico Gentili (1552–1608), a Protestant theologian and international jurist, in *De iure belli libri tres*. By mixing religious and legal discourse, oath-taking and treaty (*foedus*) ratification, Gentili suggests that there is in every treaty a silent assumption, an understanding (*intelligitur*) or mental reservation (*subintelligi*) of a *clausula rebus sic stantibus* (pp. 244–245, 599). This is only the case among Christian rulers, for Gentili doubts the legal durability of treaties concluded with untrustworthy infidel rulers (*nec fidere infidelibus potes*) on scriptural moral grounds: “For although the impious oath of an infidel may be accepted, yet what trust can be put in an unbeliever” (p. 660). That a tacit understanding of termination exists when circumstances fundamentally change reinforces the privilege of “mortal gods,” but highly complicates the binding status of treaties between them. Not surprisingly, in actual diplomatic practice, statesmen from Otto von Bismarck (1815–1898) to Woodrow Wilson (1856–1924) considered the denouncement of or abrogation from a treaty as the solemn and inalienable right of state sovereignty. Taken to its logical conclusion, *clausula rebus sic stantibus* poses a fundamental challenge to the principle of *pacta sunt servanta*, the treaty’s defining characteristic. Still, the *rebus sic stantibus* principle became part of customary international law and was codified—albeit in a more restrictive form because of its common abuse—in the Vienna Convention on the Law of Treaties (Article 62).

Contexts

Examining how the concept of treaty developed as a basic form of inter- and cross-cultural handling requires consideration of

COVENANTS OLD AND NEW

Had that first covenant been faultless, there would have been no occasion to look for a second to replace it. But God finds fault with his people when he says, "The time is coming, says the Lord, when I shall conclude a new covenant with the house of Israel and the house of Judah. It will not be like the covenant I made with their forefathers when I took them by the hand to lead them out of Egypt; because they did not abide by the terms of that covenant, and so I abandoned them, says the Lord. For this is the covenant I shall make with Israel after those days, says the Lord: I shall set my laws in their understanding and write them on their hearts; I shall be their God, and they will be my people. They will not teach one another, each saying to his fellow-citizen and his brother, "Know the Lord!" For all of them will know me, high and low alike; I shall pardon their wicked deeds, and their sins I shall remember no more." By speaking of a new covenant, he has pronounced the first one obsolete; and anything that is becoming obsolete and growing old will shortly disappear.

SOURCE: Hebrews 8:7–13, in *The Revised English Bible with the Apocrypha*.

its ideological affinities to the concept of trade. These affinities are lexically quite striking, more so in the French words for treaty and trade, *traité* and *traite*, respectively. This is not surprising when one recalls how the conclusion of treaties was an important means through which Western trade expanded, initially in the East and then globally. During this period we saw the development of the terms "treaty port" and "treaty national." Treaty ports were established all over the coasts of East Asia and along navigable waterways too, through treaties between Western nations and the rulers of China, Japan, Korea, and Siam. The treaty ports regime allowed for the establishment of self-administered foreign settlements for the purposes of trade, settlements that enjoyed varying degrees of autonomy. The main provision was that foreign or treaty nationals enjoyed extraterritoriality and were therefore deemed to be outside the jurisdiction of the country they actually resided in, thus being legally accountable only to their respective consular courts. Though treaty ports and nationals were not limited to the east coast of Asia, and could be found also in the Ottoman Empire and Morocco, it was in China that they reached unparalleled proportions to the bitterness of the local elite that was forced to capitulate. There was a time that up to eighteen countries, not only Western powers but also Mexico, Brazil, and Peru, signed such treaties with China, in the first instance for the promotion of trade, but in the longer term infiltrating the region culturally and politically through missionaries and consuls.

In the sense of "worldly handling," treaties were also used as an instrument for colonial expansion. Note, parenthetically, that formal treaties were not always employed, especially with regard to the colonization of Africa, or the Spanish conquests

of America, which were "legalized" through the Papal Bull *Inter caetera* (1493). The latter gave the "illustrious sovereigns" of Castile the exclusive right to acquire all the land they had discovered or might discover in the future one hundred leagues west of the Azores and Cape Verde islands. In terms of local instruments, the Spanish morally and practically dispossessed indigenous peoples through a legal caricature, the *Requerimiento*, a Eurocentric and Christocentric document on the history and state of the world, read to the natives and asking them to accept it by submitting to Spanish sovereignty or be made to submit. Nonetheless, treaties with the natives were often employed by colonial powers when commercial, political, or military interests so demanded. Such treaties were textually very basic, written in paternalistic discourse, and indirectly legitimated colonial occupation and governance in exchange for vague promises of protection of native life, possession, and culture. Their current "anomalous" status in terms of legal claims and retrospective enforcement has become a hotly contested issue in, among other places, North America, Australia, and New Zealand.

Perhaps a paradigmatic treaty between a colonial power and an indigenous community is the Treaty of Waitangi (1840), concluded between Britain and the Maori chiefs of New Zealand (see sidebar). This treaty is interesting because it has been retrospectively enforced, albeit reluctantly and selectively, through a 1975 New Zealand Act of Parliament and currently forms the basis of a number of claims by Maori groups for partial restitution and nondiscrimination. Still, the treaty's terms and processes expose the catachrestic political environment within which colonial treaty-making was taking place. For a start, there are significant differences between the English and

THE TREATY OF WAITANGI, 1840

Victoria, the Queen of England, in her concern to protect the chiefs and subtribes of New Zealand and in her desire to preserve their chieftainship and their lands to them and to maintain peace and good order considers it just to appoint an administrator one who will negotiate with the people of New Zealand to the end that their chiefs will agree to the Queen's Government being established over all parts of this land and (adjoining) islands and also because there are many of her subjects already living on this land and others yet to come. So the Queen desires to establish a government so that no evil will come to Maori and European living in a state of lawlessness. So the Queen has appointed me, William Hobson, a captain in the Royal Navy to be Governor for all parts of New Zealand (both those) shortly to be received by the Queen and (those) to be received hereafter and presents to the chiefs of the Confederation chiefs of the subtribes of New Zealand and other chiefs these laws set out here.

The First

The chiefs of the Confederation and all the chiefs who have not joined that Confederation give absolutely to the Queen of England for ever the complete government over their land.

The Second

The Queen of England agrees to protect the chiefs, the subtribes and all the people of New

Zealand in the unqualified exercise of their chieftainship over their lands, villages and all their treasures. But on the other hand the Chiefs of the Confederation and all the Chiefs will sell land to the Queen at a price agreed to by the person owning it and by the person buying it (the latter being) appointed by the Queen as her purchase agent.

The Third

For this agreed arrangement therefore concerning the Government of the Queen, the Queen of England will protect all the ordinary people of New Zealand and will give them the same rights and duties of citizenship as the people of England.

(Signed) W. HOBSON

Consul and Lieutenant-Governor

So we, the chiefs of the Confederation and of the subtribes of New Zealand meeting here at Waitangi having seen the shape of these words which we accept and agree to record our names and our marks thus.

Was done at Waitangi on the sixth of February in the year of our Lord 1840.

SOURCE: Literal translation of the Maori text of the Treaty as proposed by Sir Hugh Kawharu; quoted from Ian Brownlie, *Treaties and Indigenous Peoples*, pp. 6–7.

the Maori texts of the treaty as well as differences in the understanding of the concepts used within. The English text included a provision that the Maori chiefs were “claiming authority over the Tribes and Territories which are specified after our respective names,” a passage that is missing from the Maori text. The Maori translations for “government” (*kawanatanga*) did not have the Western conception of the exercise of sovereignty, nor did “rights and duties” (*tikanga*) have the notion of the pursuit of individual claims and obligations outside the remit of local custom (see www.archives.govt.nz/holdings/treaty_frame.html). There are also variations between the original Maori text and the eight copies in Maori opened for signature. The more than five hundred signatures to the treaty were a “cumulative process,” added by different chiefs on different copies at different locations in New Zealand. In

addition, not all copies bear a government seal. Some chiefs signed on unknown dates and without any witnesses. Some signatories have not been identified. Others signed without any clarification on the text of what representative authority they had, if any. The “Confederation of the Chiefs” referred to in the treaty was instigated by the British Resident in 1835 and only covered the north of the country. What is more, some important chiefs and tribes rejected the treaty and refused to sign, yet found themselves bound by it. As a leading legal authority implies, even using the most “generous” and “creative” interpretation of the provisions of the treaty, the Maori people cannot overcome the biases of the initial colonial policy through which they were “legally” dispossessed of their lands and polities (Brownlie). Ironically, recent human rights treaties of which they are not a party may provide a better basis for recognition

of their claims than the treaty they signed as “independent” and “sovereign” people. In practice, of course, indigenous groups use a combination of the original bilateral and recent multilateral treaties to support their claims.

Jurisprudence

Such cases illustrate that the modern idea of treaty developed within but also beyond the parameters of international legal history. In global practice, and from a non-Western perspective, treaties of particular historical periods could be seen as instruments for the aggressive promotion of commercial and imperial interests. In this sense, their primary aim was less the creation of legally binding commitments and more the economic and political infiltration of territories whose population status was legally defined through the treaty in ways that made this possible. As unequal devices and cover-ups through which Western global hierarchy was legitimated and reinforced, such historical treaties provide an antinomy to their conventional legal purpose as currently understood. Yet there are specific conceptual and practical limitations that need to—and perhaps cannot—be overcome in transforming a treaty into a politically neutral instrument. For example, as the Vienna Convention on the Law of Treaties (Article 2.1a) and treaty specialists outline, the designation of an agreement as a “treaty” does not in itself render it into a treaty, if written in contrary spirit and terminology. Similarly, the designation of an agreement by a nontreaty name (including memorandum of understanding) does not mean that it is automatically not a treaty, if parties textually display intention to be bound, yet decide not to go through the usual legal motions. In short, almost anything is technically possible given that the status of international agreements, in the final analysis, always depends on the definition whims of sovereign agents. That is why legal attempts to progressively develop the concept of treaty by extending it to all kinds of agreements that create binding obligations, and thus challenging the devious uses of “soft law,” may be important but can only go so far. Soft law is an expedient diplomatic practice that is likely to continue, exploiting the space between the “hard” obligations of treaty making and the dubious legality of nontreaty commitments, “creatively” mixing the two when politically necessary, establishing concomitant duties of varying degrees. This is not to belittle the usefulness and importance of treaties in creating contractual obligations that can be recognized if parties to a treaty agree (a current prerequisite under international law) to take disputes over validity and interpretation before an international tribunal or the International Court of Justice. It should be remembered, however, that treaties, like the one done in Waitangi, have also been an instrument to obliterate an international legal personality and deny an international *locus standi*, by creating internal rather than external treaty obligations, which can always be bypassed by new domestic law. From this perspective, as a means of both constituting and erasing international legal subjectivity, treaties have been essential in reproducing state sovereignty, through which humans invariably benefit or suffer.

TRIBALISM, MIDDLE EAST. The term *tribe*, derived from the Latin *tribus*, refers to a group of persons forming a community and claiming descent from a common ancestor. In the Middle East and North Africa, unlike many other parts of the world, claiming tribal affiliation often positively affirms community, identity, and belonging. In the mid- to late twentieth century, nationalist leaders in some regions rejected claims to tribal identity as “primitive” or potentially divisive to national unity. In the early twenty-first century in Morocco, Yemen, and Jordan, tribal affiliations figure implicitly in electoral politics in many regions, although other aspects of personal and collective identity also come into play. In the Iraq ruled by Saddam Hussein (1979–2003), the mention in public of one’s tribal identity, outlawed in the 1980s in an effort to forge national identity, crept back into common usage and regime practice by the mid-1990s. Tribal identities remain important in many regions of the Middle East. They provide the basis for many forms of communal and political solidarity, although never exclusive ones, in many parts of the Arabian peninsula, Iraq, Jordan, Syria, among Arabs in Israel, and in the Palestinian areas.

Tribes in Seventh-Century Arabia

Tribal identities in the Middle East are best seen in the context of the wider social and economic networks in which they have played a part, from ancient empires to the present. Tribal, kinship, and genealogical identities also profoundly influenced

religious and political formations in earlier periods of the Middle East. For example, studies of ancient Judaism now also take tribal relations more into account than did earlier accounts that relied primarily on textual exegesis. In all these cases, however, alternative forms of social and political identity were never entirely absent.

For example, in the Arabian peninsula at the time of the advent of Islam in 622 C.E., social position in both oasis towns and their hinterlands depended foremost on overlapping ties of family, kinship, and tribe. In this context, Islam offered a new form of belonging, the “firmest tie” in the language of the Koran (2: 256), binding believers to God and giving them a sense of individual responsibility. The Koran morally sanctions ties to family, kin, and tribe but the community of Muslims (Ar., *umma*), united in submission to the one God, takes precedence.

The sense of belonging as individuals to the community of Muslims as the principal social and religious identity broke with the primary loyalties of the pre-Islamic era, but in practice tribal structure and claimed descent remained essential to understanding political, social, and economic action from later historical periods to the present. Thus there are many early references to the prophet Muhammad as an arbitrator among feuding tribes, a role traditionally played by members of his descent group, the Quraysh, prior to the advent of Islam. Many tribal groups decided that their adherence to the community of Muslims ceased with Muhammad’s death in 632 C.E., leaving them open to forge new alliances.

Tribal Identity and Political Metaphor

Tribal genealogies and identities often employ metaphors such as the parts of the human body and the branches of a tree to symbolize stability, obligation, and belonging, but tribal and lineage identities in the Middle East are social constructs that change and are manipulated with shifting political and economic circumstances. Ibn Khaldun (1332–1406), the medieval North African historian and advisor to kings, recognized the flexible shape of tribal identities.

For Ibn Khaldun, “group feeling” (Ar., *‘asabiyya*) exists when groups act cohesively, as if compelling ties of obligation hold them together to achieve common interests over extended periods of time. Thus belonging to a tribe does not depend on kinship or descent alone. In certain circumstances, individuals can change tribal, lineage, and clan affiliations. Dynasties and political domination were hard to sustain without such cohesiveness, especially present in tribal contexts. Group feeling is expressed in terms of presumed “blood” relationships, but in tribal contexts these are strong and compelling social metaphors for bonds of solidarity that take precedence over all other bonds of association. In Jordan, Iraq, Egypt, and elsewhere, tribal codes of responsibility and justice based on such cohesion often parallel the civil and criminal codes of state justice, and those of Islamic law, the *shari‘a*.

The Multiple Meanings of *Tribe*

The fact that one word, *tribe*, describes a range of ideas about society and social forms throughout the Middle East, as

elsewhere in the world, does not make these meanings intrinsically related. For example, take the notion of tribe, still prevalent in many archaeological discussions, as an organizational level between “band” and “state.” This formulation implies that tribes are on an evolutionary ladder and independent of states. Yet in earlier historical periods and in the present, tribes and states coexist and overlap. The problem of misrecognizing tribal identities is further compounded by the views of some Middle Eastern urban intellectuals who have adopted nineteenth-century evolutionary views and assume that tribes exist only at the fringes of states or are residues of pre-state formations. Both now and in the past, however, ideas of tribe share “family resemblances,” possessing partial and overlapping similarities and a shared cultural logic. Far from being a relic of the past, “tribe” in the Arabian peninsula and the modern Middle East can even sustain modern national identity.

Tribal identity, like other bases of social cohesion, including kinship, citizenship, and nationalism, is something that people (and sometimes ethnographers and state officials) create, and it changes with historical and political context. The first form that the notion of tribe can take is the elaboration and use of explicit ethnopolitical ideologies by people themselves to explain their social and political organization. These locally held ideologies of tribal belonging in the Middle East are generally based on a concept of political identity formed through common patrilineal descent. A major exception is the Tuareg of the Sahara, where tribal identity is based on matrilineal descent—descent traced through the mother.

People in such tribes sometimes hold that how groups align themselves in time of dispute is explained by tribal and lineage identities alone, but other grounds for political action coexist and overlap. In precolonial Morocco as elsewhere, coalitions did not necessarily occur along the lines of tribe or lineage. This is demonstrated by the patterns of resistance in which people from various sections and tribes aligned themselves against the French in the early twentieth century. Precolonial accounts of disputes in western Morocco also suggest that alliances followed more flexible lines than those predicted by formal classification.

In general, tribal names and chains of patrilineal genealogies provide a range of potential identities rather than a basis for sustained collective action in itself. Often there is strong resistance to efforts to write down genealogies or claims to tribal descent because writing, by fixing the relationships among groups, distorts the ongoing process by which groups rework alliances and obligations and “re-imagine” the past in order to legitimate actions in the present.

For example, when Moroccan tribespeople discuss *tribe* (Ar., *qabila*), they elaborate the notion in different ways depending on their generation and social status. Socially and politically dominant individuals use ideas of tribe and lineage to fix political alliances with members of other tribal groups and to enhance their own position vis-à-vis state authorities and their followers. Ethnographers working in tribal societies have frequently based their accounts of kinship relations and tribal organization on information provided by such socially and

politically dominant individuals. In contrast, the notions of tribal identity maintained by ordinary tribesmen, not to mention tribeswomen, often differ significantly from such formal ideologies of politically dominant tribal leaders.

A second notion of *tribe* is based on its use as an administrative device in contexts as varied as the Ottoman Empire, Morocco, Iran, and other countries prior to, during, and after colonial rule. Administrative assumptions concerning the nature of tribes are generally based, to some degree, on locally maintained conceptions modified for political purposes. Thus administrative concepts of tribe frequently assume a corporate identity and fixed territorial boundaries that many “tribes” do not possess and give privileges and authority to tribal leaders that are dependent on the existence of a state organization and not derived from leadership as understood by tribal people themselves. In cases such as Morocco and the Sudan, colonial authorities formally promoted “tribal” identities and developed tribal administration to a fine art in an attempt to retard nationalist movements. In reaction, the postcolonial governments of these and other countries signaled an ideological break with the colonial past by formally abolishing tribes as an administrative device, although such identities remain politically significant.

A third meaning of *tribe* refers to the practical notions that tribal people implicitly hold as a guide to everyday conduct in relating to their own and other social groups. These notions emerge primarily through social action. Tribal people do not always articulate such notions in ordinary situations because they are so taken for granted and because the social alignments based on these notions frequently shift. Practical notions of tribe and related concepts of social identity implicitly govern crucial areas of activity, including factional alignments over land rights, pastures, and other political claims, marriage strategies (themselves a form of political activity), and many aspects of patronage. In Jordan and among Palestinians in the occupied West Bank and in Israel, for example, Arabic newspapers are filled with announcements indicating the settlement of disputes among lineage and tribal groups precipitated by disputes or even automobile accidents resulting in personal injury in which tribal leaders mediate a settlement that is then publicly announced.

A fourth meaning of *tribe* relates to the analytical conceptions of the term held by anthropologists. Anthropological conceptions are intended primarily to make sociological sense of tribal social relations and often parallel those held by tribal people themselves. They are not more real than tribal people’s conceptions of tribe or superior to them; they are a more explicit form of knowledge intended to explain how societies work. The anthropologist’s objective is to achieve as adequate an understanding as possible of how people in a given society conceive of social forms, use this knowledge as a basis for social action, and modify these conceptions in practice and over time.

TROPE. The trope concept, which is used increasingly in the social sciences to conceptualize the dynamics of definitions (and redefinitions) of social situations involved in communicative interaction, is derived from the Greek *tropos* (a turning), *tropē* (a turn), or *trepein* (to turn). It has long been used as a technical term in rhetoric to designate the use of a word or expression in a different sense than that which properly belongs to it in order to give liveliness, emphasis, perspective, coloration, or some other quality to an idea. The figures of speech (metaphor, metonym, synecdoche, and irony) are the four main categories of tropes, although tropes have been multitudinously identified in treatises on rhetoric.

The Tropes in Classical Rhetoric

At issue here is the very human tendency when thinking about some difficult, banal, or obscure subject to think about something else that can enliven, offer perspective on, or cast light on the subject. Although a tropologist is anyone interested in the role figures of speech play in discourse, in the social sciences tropology is an interest in how such figurative expression can be used persuasively to affect the understanding of social situations and consequently effect social interaction. A basic question is what role figures of speech play in the figuring out and playing out of human life in society as, mainly, a playing out of categories of social belonging and social differentiation. As can be seen in the Greek root of the word, the use of tropes, these turnings of thought, raises the question of mutability in society and its susceptibility to persuasion and change of direction. Contemporary tropologists are particularly interested in the plotting of this dynamic.

The trope concept, and the rhetorical disciplines in general, have long been opposed by the exponents of clearly reasoned argument and of explicit syllogistic logic whose truth can be ascertained. These exponents dislike the volatility and obscurity that figures of speech bring into any argument. They have misgivings about the enthymemic quality—that is, the truncated syllogisms of rhetorical argument—caused by the use of the tropes. These objections were first raised by Plato

(c. 428–348 or 347 B.C.E.) in various dialogues with the Sophists, the professional rhetoricians of his time. Socrates (c. 470–399 B.C.E.) questioned the Sophists' practice of the arts of persuasion, in which belief and opinion were manipulated but what he considered true knowledge, obtained through the dialectic, was neglected. Nevertheless, Aristotle (384–322 B.C.E.), in both the *Poetics* and the *Rhetoric*, considers rhetoric the counterpart of logic and an offshoot of the dialectic, although he focuses on metaphor and not on the overarching concept of the trope as a whole. He holds rhetoric to be worthy of attention and study, particularly in the education of the young. Indeed, in the classical world, training in the rhetorical arts of speaking, persuading, and debating was the hallmark of elite education. This is seen both in Marcus Tullius Cicero (106–43 B.C.E.; *De Oratore*) and in the massive rhetorical treatise (essentially a schoolbook) *De Institutione Oratoria* or *On the Education of the Orator*, by Marcus Fabius Quintilian (c. 35–c. 100 C.E.). By “the orator,” Quintilian meant scions of the patrician classes destined by birth to become persuasive in public affairs and naturally endowed to give shape and order to society. Important sections of this massive work are devoted to the various tropes and to the associated figures of speech that lie at the heart of rhetorical power and persuasion.

The idea of the trope and of studying the trope as affective and effective in public argument—that is, the idea of a science of tropology—was both appreciated and disliked by the ancients. The negative view of employing tropes in argument, which is that they confuse more than they enlighten, continues into the early modern period and is found in René Descartes (1596–1650), Thomas Hobbes (1588–1679), and John Locke (1632–1704), and can still be found in the present. Whereas the Cartesian, Hobbesian, and Lockian views first articulate early modern misgivings about the obfuscating role of the tropes and figures of speech in reasoned argument, other early moderns, such as Giambattista Vico (1668–1744) in the *New Science* (1725), argued that it was the tropes that enabled human understanding, or at least the escape from misunderstanding. Vico argued that a poetic logic existed in the creation and conduct of human life as it has evolved through the stages of civilization, and that studying the use and effect of the various tropes in discourse was central to understanding that logic and that evolution.

Vico devised an etymological method for discovering the tropes that were the source of our understanding of the world and of ourselves and whose evolutionary dynamic accounted for the cycle of civilization. His method is similar to the “genealogical method” developed by Friedrich Nietzsche (1844–1900) in *The Genealogy of Morals* (1897), through which he sought to discover the metaphors that lie behind the mummified concepts that we take as objective and direct representations of the world. For Nietzsche, all conceptualizing is willfully metaphoric, and it would follow that tropology is the only method through which to understand the springs of our thinking and its dynamic of power in human relations over time. His stark observations on the metaphoric basis of any supposedly secure metaphysical belief have become classics:

What then is truth? A movable host of metaphors, metonymies, and anthropomorphisms: in short, a sum

of human relations which have been poetically and rhetorically intensified, transferred, and embellished, and which, after long usage, seem to a people to be fixed, canonical, and binding. (1979, p. 23)

The Tropes in Contemporary Thought

Nietzsche's tropological approach to human understanding is echoed in subsequent thought, and especially in such postmodern thinkers as Jacques Derrida and Michel Foucault and in postmodern deconstructionism. This late-twentieth-century work is co-occurrent with the revival of interest in Vico and his tropology in the 1960s and 1970s. The tropological theories of the historian Hayden White are notable here. White echoes Nietzsche's assertion in *The Use and Abuse of History* (1957) that historical writing is not a window enabling us to directly perceive historical reality but rather a perspectival screen always obstructing our view of the past in its particular way, according to the persona and preferences of the historian. In *Metahistory* (1973), White examines the great historians of the eighteenth and nineteenth centuries, Edward Gibbon (1737–1794), Alexis de Tocqueville (1805–1859), Thomas Babington Macaulay (1800–1859), Jules Michelet (1798–1874), Jacob Burckhardt (1818–1897), and Leopold von Ranke (1795–1886), showing how each had a particularly powerful poetic grasp of the part of the past that interested him and how this grasp was a function of the particular poetic tropes that he found evocative and helpful in organizing his thoughts. These tropological screens, or “governing metaphors,” of historical writing acted in the particular historian to more or less self-consciously include or eliminate data from consideration. Historical understanding is thus anchored in the constraints exercised by the tropes the historian chooses.

White's work was accompanied in the seventies and eighties by tropological approaches to both anthropology and cognitive linguistics. Beginning in the collection *The Social Use of Metaphor* (1977) edited by David Sapir and Christopher Crocker, anthropologists gradually worked toward analyzing the role of the various tropes as they played off or interacted with each other in social life and culture. This interactive tropology, the authors in this collection argued, was useful in developing a more sensitive anthropological ethnography—that is, the study of the dynamics of “communicative interaction” in society and culture. Cognitive linguists, working over a twenty-year period that began in 1980, developed a linguistic theory of the logic behind the figuration of human understanding as anchored in bodily experience and projected out on the world. This is a theory sharply contesting the objectivist and rationalist paradigms in philosophy and in its way an actualization in cognitivist terms of Vico's efforts to identify the poetic logic of life in civilization. Cognitivists pay particular attention to the effect this logic has on the categorization processes in cognition, an emphasis that is congenial to anthropologists interested in the social categorization processes in culture and social relations.

The trope concept is an integral part of an enduring debate about the role of the figurative both in human communication and in bringing about social and cultural change. Cultures may vary in their stability over time, but all cultures are dynamic to one degree or another and can be persuaded

to change the structure of their social relationships and turn in a new direction. The degree to which the tropes—themselves micro-turnings of thought—are influential in these macro-level social turnings has been a central question of tropology.

TRUTH. The concept of truth is central to Western philosophical thought, especially to such branches of philosophy as metaphysics, epistemology, and the philosophy of language. In particular, the correspondence theory of truth has long been associated with a realist metaphysics, according to which objects exist independently of cognition by the human mind. Alternatives to the correspondence theory have, by contrast, been associated with antirealist metaphysics.

The Correspondence Theory: Ancient and Modern

The correspondence theory of truth holds that a belief or proposition is true when it corresponds to the way the world is. The theory originated with Plato (c. 428–348 or 347 B.C.E.) and held the stage in Western theories of truth through the eighteenth century. At *Theaetetus* 188c–189b, Plato considered what is sometimes called the "existence" theory of truth: true opinion is thinking what is, while false opinion is thinking what is not (pp. 893–895). Plato dismissed this view of false opinion on the ground that to think what is not is to think nothing, and this is no more possible than to see nothing. At *Sophist* 240d–241a and 260c–263d, Plato proposed an alternative theory of truth designed to circumvent this difficulty: a thought resembles a sentence in consisting of a noun and a verb, and one's thought can be about something even though it is false because the noun refers to an object while the verb misdescribes this object (pp. 984, 1007–1011). This is a correspondence theory in the sense that truth requires that the truth bearer concatenate a noun and verb just as the object to which the noun refers has the property expressed by the verb.

At *De Interpretatione* 16a10–19, Aristotle (384–322 B.C.E.) endorsed Plato's *Sophist* point against the existence theory when he proposed that truth and falsity require names and verbs in combination or separation (p. 25). His definition of truth at *Metaphysics* Γ 7, 1011b26ff is committed to complex truth bearers: "To say of what is that it is not, or of what is not that it is, is false, while to say of what is that it is, and of what is not that it is not, is true . . ." (pp. 1597–1598).

The Stoics also offered a correspondence theory: "They [the Stoics] say that a true proposition [*axioma*] is that which is and is contradictory to something" (Sextus Empiricus, p. 203). However, the Stoics parted with Aristotle in defending the principle of bivalence, that there are only two truth values, true and false. St. Thomas Aquinas (c. 1224–1274) said that "truth is primarily in intellect; and secondarily in things, by virtue of a relation to intellect as to their origin" (p. 63).

Philosophers of the seventeenth and eighteenth centuries also accepted the correspondence definition of truth, but they differed from their ancient and medieval predecessors in emphasizing that the definition has no utility as a criterion of truth, that is, as a means to judge whether given propositions are true. René Descartes (1596–1650) conceded that "the word *truth*, in the strict sense, denotes the conformity of thought with its object" (p. 65). But he denied that this definition is useful for clarifying or explaining the concept: "it seems a notion so transcendently clear that nobody can be ignorant of it" (p. 65); a definition can only cause confusion. He offered clear and distinct perception as a criterion of truth.

Baruch Spinoza (1632–1677) expressly applied *true* to ideas in *Ethics*: "A true idea must agree with its object" (p. 410). The axiom is used to show that reason regards things as necessary.

John Locke (1632–1704) endorsed the Platonic-Aristotelian view that *true* applies strictly to truth bearers of subject-predicate form—to propositions, in particular. He did not, however, formulate a correspondence definition of true proposition. Instead, he offered an account of the conditions in

which truth is ascribed to ideas. Though ideas do not have a subject-predicate form and are thus not strictly true, one nevertheless ascribes truth to them in a manner that derives from one's "tacit supposition of their conformity to" their object (p. 514). When I ascribe truth to an idea belonging to another individual, I say that the idea is true when I suppose it conforms to my idea; and when I ascribe truth to my own idea, I suppose it is "conformable to some real existence" (Locke, p. 515). David Hume (1711–1776) loosely follows Locke in his account of the kinds of truth in the *Treatise*. "Truth is of two kinds, consisting either in the discovery of the proportions of ideas, consider'd as such, or in the conformity of our ideas of objects to their real existence" (p. 448). The second kind of truth, concerning matters of fact, echoes Locke's account of the ascription of truth to my own ideas and defines truth for matters of fact as conformity to the real existence of objects. Note that Hume endorses a correspondence theory only for matters of fact, not for matters of reason (or the discovery of proportions of ideas).

In the *Critique of Pure Reason*, Immanuel Kant (1724–1804) defined truth as correspondence: "The nominal definition of truth, namely that it is the agreement of cognition with its object, is here granted and presupposed; but one demands to know what is the general and certain criterion of the truth of any cognition" (p. 197). However, Kant denied that there is a universal material criterion of truth and observed that a universal formal criterion of truth, being nothing but logic, is sufficient only for consistency, not truth. Georg Wilhelm Friedrich Hegel (1770–1831) too accepted a correspondence definition of truth in his *Science of Logic*: "Objective truth is no doubt the Idea itself as the reality that corresponds to the Notion" (p. 784). But he did not see this as helping us with subjective truth.

Pragmatist and Coherence Theories

In *Logic*, Kant noted that to judge whether a cognition is true, one must compare it with its object, and this requires another cognition of the object, which may be fallible—hence the judgment of truth is not sufficient for truth. Kant took this to show that the correspondence definition is useless as a criterion of truth. By contrast, followers of Kant took it to show that correspondence truth is unknowable or even unthinkable, since it requires comparing a cognition with its uncognized object, which is uncognizable. One can compare a cognition only with other cognitions. Moreover, a cognition cannot copy or resemble an object. This difficulty led many philosophers in the nineteenth century to seek an alternative to the correspondence definition, and they naturally sought to define truth in terms of the criterion of truth.

In "How to Make Our Ideas Clear," the American pragmatist Charles Sanders Peirce (1839–1914) proposed a method of clarifying our everyday conceptions: a conception is to be identified with the conception of the practical effects of its object. For example, "To say that a body is heavy means simply that, in the absence of opposing force, it will fall" (1992b, p. 48). Applying this to truth, to say that a belief is true is to say that it would permanently survive sustained inquiry conducted in a proper way. This is an epistemic definition of truth, since it

defines truth in terms of proper inquiry. An epistemic definition runs into circularity if proper inquiry is in turn defined in terms of the aim of true belief. In "The Fixation of Belief," Peirce answered this threat of circularity by characterizing proper inquiry without employing the notion of truth—as inquiry that fixes belief by eliminating doubt.

Like Peirce, William James (1842–1910) applied a pragmatist theory of meaning to *true* and identified the notion of true belief with that of the consequences for experience of the belief's being true—"truth's cash-value in experiential terms" (p. 200). James differed from Peirce in characterizing a true belief as one that is eventually verifiable, rather than one that would be permanently fixed in sustained inquiry. This allows the possibility that a true belief will be permanently retracted after its eventual verification in sustained inquiry. James was more pragmatist than Peirce in attempting to use his pragmatist theory of true belief to explain the practical, and not merely cognitive, utility of true belief. A true belief is one that would fit my experience in a counterfactual circumstance. Because my true belief that the cowpath leads to a house would fit my experience were I to go down the path, it enables me to select the more useful course of action—going down the path that leads to food, as opposed to one that does not. Moreover, James, unlike Peirce, was guided in his choice of a definition of truth by the aim of finding a definition that explains the practical utility of true belief.

British idealists developed coherence theories of truth in the late nineteenth century. One motivation for these theories was epistemological: knowledge of whether a given judgment is true cannot result from comparing the target judgment with its object, as the correspondence theory requires; it must result from comparing judgments with other judgments. The available criterion here is coherence of the judgments with one another. This motivation for the coherence theory received its most extensive expression in the twentieth century in the American idealist Brand Blanshard (1892–1987) (pp. 225–237, 268). An alternative metaphysical motivation, to be found in the work of Francis Herbert Bradley (1846–1924) and Harold H. Joachim (1868–1938), appeals to the doctrine of internal relations. According to this doctrine, every relation is grounded in the natures of the relata. This is said by Bertrand Russell (1872–1970) to be equivalent to the monistic theory of truth, that judgments are not true one by one, but only abstracted from a concrete known whole (1906–1907, p. 37). From monism, it is supposed to follow that the truth of a judgment consists in its coherence with the whole, rather than in correspondence. Russell objects to the coherence theory on the ground that it does not rule out contrary propositions both being true: "coherence as the definition of truth fails because there is no proof that there can be only one coherent system" (1912, p. 122).

The Correspondence Theory: Twentieth Century

The correspondence theory was revived at the beginning of the twentieth century by the founders of analytic philosophy, G. E. Moore (1873–1958) and Russell, in reaction to James, Bradley, and Joachim. The new correspondence theories addressed the worries of idealists and pragmatists about just what the correspondence relation is, if not the discredited copying relation, and what the terms of the relation are.

In lectures delivered in 1910 and 1911, Moore posed a problem like the one Plato urged against the existence theory of truth. On the one hand, if one believes that God exists, and this is true, one believes a fact (that God exists), and this fact is. On the other hand, one believes the same thing whether the belief is true or false; so there must be a fact even if one believes falsely that God exists; yet in this case there is no such fact (pp. 250–251). In “Beliefs and Propositions,” Moore resolved this dilemma by denying that what one believes in a true or false belief is a fact. The clause “that p ” in the description “the belief that p ” does not name any fact or indeed anything at all. A belief, whether true or false, is not a relation between a believer and a fact, or even between a believer and a proposition. So one can believe the same thing in a false belief as in a true belief, even though for the false belief there is no fact. Moore nevertheless found it convenient to speak of beliefs as referring to facts: “To say that a belief is true is to say that the *fact to which it refers is* or has being; while to say that a belief is false is to say that the fact to which it refers is not—that there is no such fact” (p. 267). Moore was unable to analyze what is involved in referring (which amounts to correspondence when the fact referred to has being), but he was quite clear that, although “the belief that p is true” is equivalent to “ p ” on the assumption that the belief p exists, this is not a definition of truth precisely because “ p ” says nothing about the belief p or a correspondence relation.

Russell tried to say what correspondence is in his work between 1906 and 1912. Othello’s belief that Desdemona loves Cassio is a four-term relation between Othello, Desdemona, the relation of loving, and Cassio, while the corresponding fact (if there is one) is a two-term relation of loving between Desdemona and Cassio. Correspondence is then a certain match between the terms in the belief relation and the fact (1912, pp. 124–130). Later, Russell abandoned the idea that a false proposition is one that does not correspond to a fact, in favor of the view that it is one that bears a different correspondence relation to a pertinent fact (1956, p. 187). The latter view avoids a commitment to the idea that the clause “that p ” in the description of a false belief names a fact, but it is encumbered with the burden of defining the two correspondence relations so that they cannot both obtain, on pain of allowing a proposition to be both true and false.

The British ordinary language philosopher John Langshaw Austin (1911–1960) proposed a correspondence theory in his article “Truth” (1950). His theory takes statements as truth bearers and states of affairs as truth makers, and it defines correspondence as a correlation that relies on conventions of two kinds: “demonstrative” conventions relating token states of affairs to statements, and “descriptive” conventions relating types of states of affairs to sentence types expressing those statements. A statement is true when the state of affairs to which it is correlated by demonstrative conventions is of a type with which the sentence used in making the statement is correlated by descriptive conventions. The British philosopher P. F. Strawson (b.1919) attacked Austin’s theory, and correspondence theories more generally, on the ground that there are no bearers of truth values, there are no entities in the world amounting to facts, and there is no relation of correspondence (1950). Strawson

endorsed the opposing view that an assertion made by uttering “It is true that p ” makes no assertion beyond one made by uttering “ p ,” although it may be used to do things other than make this assertion (for example, confirm or grant the assertion that p).

The Polish-American logician Alfred Tarski (c. 1902–1983) offered a “semantic” conception of the truth of sentences in a given interpreted and unambiguous formalized language L . His account was intended to capture an Aristotelian notion of truth. Tarski set as a material adequacy condition on a theory of truth-in- L what is called Convention T: that the theory entails all sentences of the form “ X is a true sentence if and only if p ,” where X is a name of some sentence of L , and p is the translation of this sentence into the metalanguage of the theory. Tarski then demonstrated that a recursive truth definition satisfies Convention T.

The basic idea of the truth definition is that a sentence such as “ a is F ” (for a name “ a ” and a predicate “ F ”) is true just in case F applies to the object denoted by a , where application is defined case by case for each name in the language L . Now let us give a Tarski-like truth definition for a simple language L with two names, “ a ” and “ b ,” and one predicate “ F .” We may begin by defining truth separately for each atomic sentence of L in semantic terms like “applies” and “denotes.” (Tarski made central a notion of satisfaction related to application.) The basis clause is: “ a is F ” is true just in case “ F ” applies to the object denoted by “ a ”; and similarly for “ b is F .” We then define “denotes” for each name: “ a ” denotes x just in case $x = a$; and similarly for “ b .” We define “applies”: “ F ” applies to y just in case ($y = a$ and a is F) or ($y = b$ and b is F). This has been called a disquotational definition of the semantic terms. Finally, we define truth for nonatomic sentences by exploiting the truth-functional properties of logical connectives like “or” and “not.” Treating truth as involving subject-predicate form is mandated by the need to satisfy Convention T.

Tarski’s theory formulated in terms of “denotes” and “applies” is plausibly regarded as a correspondence theory. However, Harry H. Field (b. 1946) charged that Tarski’s definition of truth does not reduce truth to a physicalistically acceptable property, as Tarski desired (1972). For Tarski’s disquotational definitions of semantic terms do not provide an explanatory reduction of those terms to any general physical properties. This is shown by the fact that if we augment L by adding a new name or predicate to form a language L' , the definition of truth-in- L gives no hint of what truth-in- L' amounts to. Field proposed that we remedy such difficulties by fitting Tarski’s theory in terms of semantic concepts with a physicalistically acceptable causal theory of denotation and application, rather than a disquotational definition of these concepts.

Deflationary Theories

Deflationary theories treat the truth predicate as having only a logical or grammatical function, rather than as ascribing a property or relation to a truth bearer, as on correspondence, pragmatist, and coherence theories. Frank Plumpton Ramsey (1903–1930) proposed, contrary to Moore, that *true* generally makes no substantive contribution to what is asserted in a

statement: “‘it is true that Caesar was murdered’ means no more than that Caesar was murdered” (p. 157). “Whatever he says is true” comes out “For all p , if he says that p , then p .” This is called the redundancy theory of truth. It is deflationary in denying that *true* expresses a property of truth bearers or a relation of correspondence between truth bearers and the way the world is.

In *Philosophical Investigations* (1958), Ludwig Wittgenstein (1889–1951) rejected his idea presented in the *Tractatus* (1961, originally published in 1922) that “This is how things are” expresses the general form of a proposition. This form of words does express a proposition, but “To say that this proposition agrees or does not agree with reality would be obvious nonsense.” Rather, it is a propositional variable the value of which is fixed by an earlier statement, in the way the referent of a pronoun is fixed by an earlier use of a name. This proposal, known as the “prosentential” theory of truth because it treats “That is true” as a “prosentence,” was subsequently developed by Dorothy Grover, Joseph L. Camp, Jr., and Nuel D. Belnap, Jr. (1975).

Willard Van Orman Quine (1908–2000) proposed that the truth predicate is used for semantic ascent, which in certain cases is indispensable for expressive purposes: “If we want to affirm some infinite lot of sentences that we can demarcate only by talking about sentences, then the truth predicate has its use” (p. 11). If we wish to say only that Tom is mortal, we can say “‘Tom is mortal’ is true,” but we need not do so. But if we wish to affirm each of the sentences of Euclidean geometry, we have no option but to say “All the sentences of Euclidean geometry are true.” We are saying no more than we would say by uttering each of the sentences, but since there are infinitely many of them, we cannot utter them all. For this reason, the truth predicate is practically indispensable. This suggests a disquotational theory of truth on which the content of *true* for a language is given by all the equivalences: “ p ” is true just in case p (for all sentences “ p ” of the language). Presumably, occurrences of *true* in contexts like “What he said is true” or “That is true” would be either spelled out in the manner of Ramsey or implicitly defined by the T-equivalences in virtue of the fact that the subject of the sentence refers to a particular sentence. Paul Horwich developed a related minimalist theory of truth by taking as the axioms of the theory all the equivalences: the proposition that p is true if and only if p (1990). These deflationary theories have, in common with Moore’s and Russell’s correspondence theories, the disadvantage of entailing the principle of bivalence, which prohibits “truth-value gaps,” as in borderline vague sentences or sentences with presuppositions that fail. A correspondence theory such as Field’s can be formulated in a way that avoids bivalence (1972). Deflationary theories also differ from correspondence theories in making it impossible to ascribe truth to sentences in a language we can’t understand. Field argued in a 1986 article that a deflationary notion of truth cannot be employed to account for how our tendency to believe truths explains our practical success in action.

Some have denied that truth is definable. Gottlob Frege (1848–1925) argued that if truth is definable as a property, then any judgment of whether an idea is true would involve judging whether the idea has the property, and the question

would then arise whether it is true that the idea has the property, generating a circle (1956). The early Moore (1953, p. 262) and Donald Davidson (1917–2003) also denied that truth is definable. Since 1980, philosophers (e.g., Huw Price) have shown an interest in functionalist accounts of truth, which characterize truth in terms of its cognitive or social function, rather than define the concept in other terms.

U

UNIVERSALISM. Since the late nineteenth century, the debate around issues concerning universalism and universalizability has intensified. Against the claims to universal knowledge made on behalf of Christianity, the West, rationality, and mankind, feminist, critical race, and postcolonial scholars and activists have shown that the issues are more complicated. Notwithstanding the validity of their criticism, universalism is not only compatible with the approaches that have condemned it, but is importantly in a sense presupposed by them.

First, we need to distinguish between different kinds of universalism. Universalism, in its most sophisticated form as it appears in the philosophy of science, defends the idea that thinking about any problem in science always leads to reasoning and that this reasoning will always seek the outermost limits through attempts to be universally valid, and to discover nonrelative truth. There are two forms of this simple and elegant idea about reason. One argues that this submission to an order of reason is a demand of reason itself. The other disagrees with the idea that we are ultimately submitting ourselves to an order of reason that is there for us to discover. Following Charles Peirce, this view argues that even as we try to think of this order of nature and of rationality, we are always doing so through a community of inquirers, so that this convergence of opinion about universally valid scientific laws always retains its ideal aspect. Here, Peirce sought to update Immanuel Kant's transcendental idealism, and show its relevance to the philosophy of science. For Kant, our scientific laws are valid for rational creatures such as us, and we can show their validity through transcendental deduction. But we cannot ultimately reach beyond the synthetic imagination and the categories of space and time that shape our world to reach into the world of things themselves. Convergence, for Peirce, means that divergent opinions can actually come to agreement on specific scientific laws and that unless there is a significant challenge to that agreement it will remain valid as true. But it is precisely because it is an agreement of a community of inquirers that also makes it open-ended, since such agreements can, at least in principle, always be challenged or re-elaborated by new paradigms of scientific truth. In some sense then, we are creating the order of reasons through the articulation of scientific laws. Simply put, there is always more to know, and as we know more, scientific laws that we previously thought of as unshakeable can either be criticized, extended, or in some cases, downright rejected. Peirce further argues that how well we think is ultimately dependent on the ethics of the scientific community to which we belong. Ethics then, as critiques of a community of knowledge, including scientific knowledge, can be foregrounded without necessarily losing the appeal to scientific laws as justifiable and as universally valid.

Feminists writing in the philosophy of science, such as Evelyn Fox Keller and Sandra Harding, have made important contributions in critiquing claims of universality for scientific law from at least two vantage points. The first and most important is that the community of knowledge is corrupt at the deepest level. It has adopted an ethics of scientific inquiry that, for the most part, has excluded women. Moreover, by so excluding women, it has in fact adopted notions of instrumental rationality that fail to achieve true objectivity because they relate to nature from a masculine or patriarchal viewpoint in which nature is reduced to something only valuable for its use to us. There is a rich and important literature in feminist epistemology and it is obviously impossible for me to be fair to the extent of the varieties of critique offered there. But even when such a feminist critique is allied with the searing analysis of the destructiveness of instrumental rationality as it takes over what we can even think of as reason—an analysis put forth by thinkers of the Frankfurt school such as Theodor Adorno and Max Horkheimer—it does not in itself necessarily lead to the rejection of a universality understood as always taking reason to its limit. This is true even if one allows, following Peirce, that that limit might always recede under the changing principles of scientific knowledge. Again, for Peirce, as for many feminists and other critical theorists, convergence remains always and still an ideal.

Indeed, we could argue that Peirce, following Kant, offers us a powerful critique of the pretensions of reason. This critique forces us to see how a thoroughgoing rationalism always is thrown back on the finitude of any actually given community of inquirers, humbled before their own historical position, even as they aspire to the scientific grandeur of ultimately trying to grasp the meaning of the universe. If Kant is right, we will never be able to think God's thoughts. But if Albert Einstein is also right, and the basic argument about reason is compelling, then any given community of inquirers will never stop trying.

Another central question in the debates surrounding universalism has been raised in ethics; precisely, the question is whether we need to rationalize ethical reasons into something more than a circular procedure for moral reasoning. In the famous case of John Rawls's proceduralism, he defends the hypothetical experiment of putting ourselves behind the veil of ignorance to imagine what Kant would have called our noumenal selves unbounded at least as imagined by the contingencies of our own history. Unlike Jürgen Habermas, Rawls does not want to defend his theory of justice or his own political liberalism through an overarching philosophical conception of reason and history that explains ethical and moral principles by an appeal to something outside of them.

Famously, Habermas argued against his predecessors, and indeed Kant himself, by trying to show us that reason can ground itself in universal principles of communicative action when combined with an empirically validated notion of evolutionary learning processes. This attempt to rationalize moral reason has been criticized extensively by theorists of language and of communication who have argued that first of all, no presuppositions can be found. Further, even if they could be found, they would not be strong enough to ground a normative theory, let alone an overarching normative conception of modernity and of human moral learning leading to the one-way street of modern Europe. Habermas is adding an empirical dimension to the general and comprehensive worldview of strong universalism advocated by Hegel. For Hegel, the universal ideal of humanity unfolds in all its greatness and, despite its floundering, finally culminates in a grand unity of our particular historical expression and our universal moral selves in what some may have seen as a rather limited embodiment, i.e. the German state. Habermas, in other words, attempts a general and comprehensive theory, to use John Rawls's expression that justifies universalism through a connection of reason and an overarching concept of rationality. But, as mentioned earlier, Rawls himself rejects this as the basis of the universalizable ideals of what he calls political liberalism. Rawls, one of the greatest voices of this vision, argued that at least hypothetically, we should be able to imagine ourselves as noumenal beings that could idealize themselves so as to articulate and defend as reasonable certain universal principles of justice. Rawls certainly defends the universality of the principles of justice. But he refuses universalism understood as the attempt to ground moral reason in an order of reason outside of the procedure, such as in the case of Habermas, who seeks to ground morality and ethics in the presuppositions of language.

In her own work in moral philosophy, Martha Nussbaum has tried to defend universalism in the sense of defending an Aristotelian notion of a moral view of human nature. Her view too should be considered universalism in the sense that she argues that we can know what our nature is and derive from that knowledge a strong commitment to values, universalizable because they are true to the substance of our human nature. By universalizable, I mean to indicate ideals that purport to include all of humanity and therefore can be accepted by all of us. This way of thinking about what is universalizable emphasizes the idea of the scope of who should be included in the ideal of humanity, and the rights that are accorded to those so included. But universalism as defended by either Nussbaum or Habermas ultimately denies the central importance of the insight of the Kantian proceduralism of Rawls. That insight is for a norm to be truly universalizable, it cannot be based on a notion of the human that generalizes out of a particular experience. Again, the feminist critiques of man were not arguing against the aspiration to universalizability of the rights of man, but claiming instead that those rights were indeed only for men, in many instances being granted to men only, and thus fail the test of universalizability that they purported to meet. Feminists, of course, have been joined by postcolonial theorists who have reminded us that the identification of humanity as an ideal, including as a moral ideal, with European modernity, not only risks reducing the universal to the particular, but has also justified the worst forms of colonial cruelty.

A critique then, of European modernity as other than a particular form of history is crucial for the unmooring of the ideal of universality and even the ideal of humanity itself from its implications in a brutal imperialist history. Universalizable norms, in this sense, carry with them a specific kind of self-reflexivity in which universality as an ideal must always lead to critical analysis. The danger is not only of confusing generality with universality, but also of proclaiming a particular form of being human as if this were the last word on who and what we could be. Universality, in other words, as a claim to cover the scope even of rights to be protected is always open to the moral contest it protects.

When Hegel is removed from his presumptuous philosophy of history, the lingering truth of Hegel's insight is that the re-articulation of universality and universalizable norms always takes place through a struggle. Karl Marx saw that struggle, or at least the struggle that could ultimately bring us to our truest humanity, as the battle between classes. History in other words, had not stopped with the bourgeois German state, but would only reach its culmination when humanity realized itself in communism. The lingering importance of German idealism is that it teaches us that at the end of the day we are left with a struggle—the struggle to see that taking reason to its limit also takes us back to the limit of reason itself, as Kant so powerfully taught us. Therefore, Kant's critique itself is integral to what is understood as an ideal in which the procedures by which we seek to universalize a norm or an ideal are always themselves open to question and re-articulation.

This notion of universality, as an ideal whose meaning can be reinterpreted in order for it to be able to live up to its own claims, should not be confused with relativism. Relativism, which argues that norms, values, and ideals are always relative to culture, actually turns on a strong substantive claim about the nature of moral reality. Relativists have to become the strongest kinds of rationalists in order to defend their position. To defend relativism as a substantive truth about moral reality clearly has to appeal to a form of universal knowledge. After all, if the claim is that principles are always inevitably relative to culture, then that claim is one that must defend itself as a universal truth. In our globalized world, the remembrance and the commitment to universality demands nothing less of us than a commitment to the critique and the corresponding imaginative openness to the re-articulations of the ideal.

UNIVERSITY.

This entry includes two subentries:

Overview
Postcolonial

OVERVIEW

The university is a legal corporation empowered by civil or ecclesiastical authorities to award degrees certifying that the recipients have achieved significant levels of expertise in various disciplines. Teachers instruct students of various ages and preparation in higher learning in several subjects. Many, but not all, teachers are scholars who carry on original research in order to add to the body of knowledge available to all. The world outside the university expects it to contribute to society by creating new knowledge, by training learned professionals at an advanced level, and helping all students to develop intellectually and culturally. This is the idea of the university. It has not changed in substance in nine hundred years, even though ideas about how universities should fulfill their missions have changed and expanded.

Precedents in the Ancient World and Islam

The ancient world did not have universities. But it did have several centers for research and study at an advanced level that provided the opportunity for a limited amount of informal education. Plato (427–348 B.C.E.) after 388 B.C.E. founded an Academy in Athens in which men gathered to discuss broad philosophical issues through interrogation and dialogue. The Academy lasted until 529 C.E., albeit with many changes. Aristotle (384–322 B.C.E.) had a circle of friends and pupils who gathered just outside Athens. After his death, Theophrastus (c. 372–c. 287 B.C.E. made it into a center, usually known as the Peripatetic School, for the study of the subjects that interested Aristotle, which meant practically everything from natural science to poetry, but especially philosophy. Neither the Academy nor the Peripatetic School, which lasted until the third century C.E., offered structured education or awarded degrees.

The museum and its library in Alexandria, Egypt, was the most important center for advanced learning in the Greco-Roman world. *Museum* meant a place where learned men cultivated the muses, not a collection of artifacts. Founded in

A student consults with Plato. Mural painting by Puvis de Chavannes. While the ancient world did not have accredited universities, it did offer informal centers for education, such as the one founded in Athens, Greece, by Plato in the third century B.C.E. © BETTMANN/CORBIS

the third century B.C.E. by Ptolemy I Soter (r. 305–283 B.C.E.), the museum provided support for writers but soon attracted scholars in many other fields, especially astronomy, mathematics, and philosophy. Ptolemy I added a library that attempted to obtain, or make copies of, the works of all known Greek authors. Scholars corrected and edited the texts, an important form of advanced academic scholarship. The museum of Alexandria had numerous scholars, some of whom attracted followers, but it did not offer formal education or confer degrees. The persecutions of Ptolemy VIII (r. 145–116 B.C.E.) drove some scholars away and ended the museum's greatest days, although it lasted until 651. The idea motivating Plato's Academy, Aristotle's Peripatetic School, and the museum and library of Alexandria was the advancement of high-level scholarship in many fields through the gathering of scholars and texts.

Between the eighth and eleventh centuries the Islamic world created the college, called *masjid khan* and later *madrasa*, a place where mature scholars taught law based on the Koran to younger men. Teachers, advanced students who assisted the master in teaching, and beginning students lived together for several years in inns attached to important mosques. But Islamic law colleges did not develop the corporate structure and legal identity of the

university, and they did not influence the Christian West. Nor did Islam have organized institutions for medical and philosophical higher education. Distinguished Islamic scholars such as the medical scholar Ibn Sina (or Avicenna, 980–1037) and the philosopher and commentator on Aristotle, Ibn Rusd (Averroës, 1126–1198), did not hold teaching positions but were court physicians most of their adult lives. In similar fashion, Jewish students came to learn from eminent Jewish interpreters of the Talmud, the basic source for Jewish law, in German and northern French towns, especially in the twelfth century. But the Talmudic schools did not evolve into universities.

The Creation of the University

The Western European Middle Ages created the university, its most significant and enduring achievement after the Roman Catholic Church. No clear idea or plan lay behind the beginning of the university. Rather, the two original universities of Bologna and Paris arose spontaneously as practical responses to circumstances, desires, and needs. In the late eleventh century, law students began to gather in Bologna at the feet of senior jurists who looked to ancient Roman law as the guide for creating legal principles to sort out the conflicting claims

Engraving of Bologna University, c. 1790. Bologna University, established in the early thirteenth century, is considered one of the first two official universities. An important advancement in the history of the university occurred in Bologna in the 1220s when the government began taking responsibility for the teacher's salaries. HULTON GETTY/LIAISON AGENCY

and rights of empire, church, kingdoms, princedoms, towns, and individuals. In similar fashion students came to Paris to study arts, philosophy, and especially theology. In both cities enough teaching and organization regulating the teaching and the rights and obligations of teachers and students was in place by about 1150 that it could be said that universities were born.

Recognition that universities were new and unique institutions came after the fact. In the twelfth century *universitas* meant a group of people legally recognized as a collectivity. The corporation of masters and students at Paris first called itself a *universitas* in 1221. Hence, universities came into existence when society recognized that teachers and students as a collectivity had certain legal rights. Another term was *studium generale* (universal school), meaning an institution of higher learning that attracted students from a wide area and had the right to grant degrees authorizing the holder to teach anywhere in the world. A key event occurred in Bologna in the 1220s when the city government began to pay the salaries of teachers. This meant that professors would stay in one place and guaranteed the stability and continuity of the university. While pope and emperor played no role in their creation, civil governments, teachers, and students accepted that it was useful and orderly that popes and emperors should issue charters authorizing universities to award degrees recognized throughout Christendom.

These and other measures gave the university the basic shape that continues in the twenty-first century. The medieval university consisted of a corps of professors teaching arts (including logic, Latin literature, and mathematics), philosophy, medicine, surgery, science, canon law, civil law, and theology at an advanced level. Students of varying ages, from the early teens through men in their mid-twenties, heard lectures, studied texts required by university statutes, and participated in academic exercises for several years, sometimes for more than a decade. They submitted themselves to examinations for bachelor's, master's, and doctoral degrees. Upon obtaining degrees, they practiced or taught the disciplines that they had mastered. While sharing a basic structure, universities in northern and southern Europe differed. Many northern universities, including Paris and Oxford, taught mostly arts and theology to students studying for bachelor's degrees. Bologna and other Italian universities concentrated on law and medicine and awarded doctoral degrees.

European monarchs, princes, and towns founded and staffed at considerable expense a very large number of universities in the fourteenth, fifteenth, and sixteenth centuries. Historians frequently state that monarchs and cities founded universities in order to train civil servants to fill the expanding ranks of government offices, and certainly many law graduates did so. But contemporary documents do not mention this rationale for founding universities. Instead, university foundation charters offered as reasons the universal thirst for knowledge and the benefits to society of men learned in different subjects and full of mature counsel. There is no reason to doubt the sincerity of these lofty concepts. And reference to mature advice meant that university training would give those who later served ruler or town the scholarly perspective with which to approach complex issues.

The University in the Renaissance and Reformation

In the Middle Ages and the Renaissance, universities enjoyed a nearly complete monopoly as educators of Europe's scholarly, civic, and ecclesiastical elites. Although no author or treatise articulated the idea that universities should train the intellectual and sometimes the political and ecclesiastical leaders of Europe, they did. In the sixteenth century European universities probably exerted the greatest influence on learning and society in their history. Professors at Italian universities made extraordinary, original, scholarly contributions in medicine, philosophy, mathematics, and astronomy. The original anatomical research of Andreas Vesalius (1514–1564) while at the University of Padua from 1537 to 1543 and the mathematical and scientific research of Galileo Galilei (1564–1642), who taught at the University of Pisa from 1589 to 1592 and the University of Padua from 1592 to 1610, were just the best known of many examples of innovative research with enduring consequences. Martin Luther (1483–1546) created a new theology while teaching at the University of Wittenberg from 1513 on. He and many other professors of theology led the Protestant Reformation through their teaching, writing, and advice to princes. The Reformation, in turn, changed Europe religiously, politically, and culturally.

As a result of the Protestant and Catholic Reformations, many European universities became closely allied with religious groups in ways that they never had been in the past. The Society of Jesus in particular dominated some older universities or played major roles in newly founded ones from the middle of the sixteenth century onward. On the other side of the religious divide, some universities became closely identified with Protestant churches, such as the University of Wittenberg with the Lutheran Church and several universities with Calvinism, especially in the Netherlands. The University of Leiden (founded in 1575) was the most important among the latter.

Universities beyond Europe

When Europeans took their civilization to new continents, they quickly founded universities modeled on those of Europe. Catholic religious orders and Protestant churches founded most of the overseas universities, which trained indigenous clergy and produce educated lay leaders. The first universities founded in the New World were Santo Domingo (after 1538), Mexico (1551), and Lima (1571). A Catholic bishop of the Dominican Order founded the University of Santo Tomas in Manila, the Philippines, in 1611. The Congregational Church founded Harvard College in Cambridge, Massachusetts, in 1636 and named it for a minister who bestowed a considerable gift on the new college. These and many other universities across the world were based on European models. They were small in enrollment, faculty, and instruction at first, but grew over the centuries.

Universities in Decline

By 1600 European universities were beginning a period of decline in accomplishments and influence that lasted about 250 years. Many new schools arose in both Catholic and Protestant Europe to take students away from universities and to offer employment for scholars. In the Catholic world the Society of Jesus or Jesuits and other new religious orders developed schools that taught part of the university curriculum. The Je-

suits began by teaching Latin grammar, humanities, and rhetoric to boys aged ten to sixteen, then added a three-year program of logic, natural philosophy, and metaphysics at a higher level, as well as mathematics and occasionally other subjects. These were university subjects. The Jesuits had 578 schools, many with university-level instruction, across Europe in 1679. In Protestant Europe academies competed with universities. These were small schools offering higher instruction in a limited number of disciplines, especially arts and theology, without necessarily conferring degrees. The prototype was the Geneva Academy, founded by John Calvin in 1559. Academies hired excellent teachers and took students away from universities.

Learned societies, such as the Royal Society of London for the Advancement of Natural Knowledge, founded in 1662, offered more competition to universities by supporting scholars without requiring them to teach. Most learned societies on the Continent received funding from governments, which enabled them to offer salaries to members who carried on research in mathematics, astronomy, chemistry, and other subjects without teaching.

Enlightenment philosophes of the eighteenth century strongly criticized universities for not being useful to society because they held on to a traditional curriculum, a criticism often repeated in the next two centuries. The philosophes persuaded rulers to create nonuniversity institutions of higher learning to teach specialized practical subjects, such as agricultural technology, engineering, military science, surgery, even painting. They thought that such institutions would produce citizens capable of contributing useful knowledge to society and the state. Napoléon Bonaparte (who ruled France and much of Europe from 1799 to 1815) agreed. He abolished many universities in France and Germany and created technical schools in their place.

The Nineteenth and Twentieth Centuries

Nineteenth-century German educational reformers revived and gave new meaning to the idea of the university. Karl Wilhelm, baron von Humboldt (1767–1835), minister for education in Prussia, believed that universities should support *Wissenschaft*, faculty research and discovery in all fields, and should foster *Bildung*, or cultivation, meaning broad intellectual development and humanistic culture, in students. The new University of Berlin, founded in 1810, embodied Humboldt's vision. The renewed emphasis on research echoed the importance of innovative scholarship in theology, philosophy, law, and medicine by professors at medieval and Renaissance universities. The German research university of the second half of the nineteenth century realized the first goal and was widely copied by North American universities in the twentieth century. Many universities, especially those focusing on undergraduate education, in England, North America, and parts of the world influenced by England, emphasized a version of *Bildung* and called it *liberal education* in English and *culture générale* in French.

Beginning in the nineteenth century, governments assumed a greater role in higher education in Western Europe and the

United States. National governments in France, Germany, Italy, and elsewhere founded new state universities and closed or took control of church-sponsored institutions. Governments provided funding for universities, but also brought them under the control of ministries of education and made professors into civil servants. This process continued in the twentieth century, especially in the former Soviet Union (1917–1991). In the United States, state governments founded land-grant colleges in the nineteenth century that often became the largest and most important universities in the state. Although the United States still has a large number of colleges and universities affiliated with religious denominations, the ties between churches and universities have weakened and sometimes been dissolved. Church-affiliated universities have become less insistent that professors be members of the affiliated church, and they increasingly attract students of many faiths or none at all.

Since World War II (1939–1945) the dominant ideas shaping the university are that it should create new learning, teach skills in all fields and especially science and medicine, help the economy create wealth, and support a knowledge-driven society. While not ignored, humanistic research and teaching are less central. The multi-university, as it is sometimes called, offers an astonishing range of institutes, centers, and schools to teach all manner of knowledge, much of it practical. Emblematic of the new conception of the university is the addition of business schools preparing students to be successful in the many areas of national and international commerce and finance.

The idea that universities should provide higher education for a much larger proportion of the population has also won wide support from the public and governments. Hence, beginning in the 1960s governments increased the number and enrollments of universities and eased or broadened admission requirements. In addition, many more older students attended universities than in the past. As a result, the number of university students in Europe, North America, and other parts of the world greatly increased in the last thirty years of the twentieth century. One or two percent, at most, of the university-age population (eighteen through twenty-four) attended European universities in the first half of the twentieth century. By contrast, about half of the university-age population received some university education in the United States at the end of the twentieth century. In Europe as well, an increasing number of young people are attending university. Also, the European Union is slowly moving toward cooperation between universities in different countries and greater mobility of professors and students.

Women Students and Professors

Women were neither students nor professors in universities for many centuries. This was probably not the result of a conscious decision to exclude them, but the logical consequence of the view that universities prepared students for public careers and professions that women traditionally did not enter or from which they were barred. The path toward acceptance of women in universities was long and slow. The first woman to obtain a university degree was Elena Lucrezia Cornaro Piscopia (1646–1684), a Venetian noblewoman, who received a doctorate of philosophy from the University of Padua on 25 June 1678.

She did not attend lectures but obtained the degree through examination, an accepted practice in Italian universities. The second was Laura Bassi (1711–1778), a highborn Bolognese woman who obtained a doctorate of philosophy, again through examination, from the University of Bologna on 12 May 1732. She was the first female professor, as she taught experimental science at the University of Bologna from 1732 to 1738. The third was Maria Pellegrina Amoretti, who earned a doctorate in law from the University of Pavia on 25 June 1777.

From 1800 through 1945 more women, although still a small minority, attended university and earned degrees. Because many universities did not accept women as students, undergraduate colleges for women were founded, as well as new colleges and universities that admitted both men and women, especially in the United States. This changed greatly in the last thirty years of the twentieth century. Nearly all male-only colleges and universities in the United States accepted women as students, and a majority of women-only institutions enrolled men. But except for traditional female-dominated professions, such as nursing, only a few women were university professors in Europe and North America as late as the 1960s. Then, in response to larger societal moves to provide equal rights and opportunities for women, the barriers became lower or disappeared. By the twenty-first century women constituted the majority of undergraduates in American universities and about half of the students in law and medical schools. The number of women professors has increased greatly, although their distribution by fields varies. European universities also saw an expansion in the number of female students and professors, although the number of female faculty members varies considerably from country to country.

The idea of a university that offers education to students and supports advanced research by professors has proven to be one of the most enduring and influential ideas in Western civilization.

Paul F. Grendler

POSTCOLONIAL

The late twentieth century saw a renewed interest in the postcolonial development of higher education systems within broader literature on globalization and education policies. Particularly, efforts by international institutions, such as the World Bank, to prevent the global and local effects of the so-called knowledge divide, led to a number of policy documents and initiatives aimed at leveling the pace of changes and development in higher-education landscapes of rich and poor countries. Policy in this domain seemed largely influenced by studies that presented the gradual domination of managerialism in the organization of both teaching and research, the commercialization of research, and the outsourcing of many services to create leaner structures as inevitable consequences of globalization and the “knowledge explosion.” As a result, most developing countries were restructuring their already inherited systems of higher education along similar patterns to those observed in the West and the Pacific Rim. How this process—sometimes described as the “recolonization” of education—translates into actual higher education landscapes around the world seems to depend on a number of contextual variables.

A Contrasted Picture

A closer look at local and regional situations reveals persistent differences, in terms of institutional management, relations to the state, enrollments, and patterns of participation and academic careers. Beyond similar policy agendas, these realities signal contrasted histories and unequal states of development of higher education.

The fortune of universities and university education in countries that regained independence from waning European

INDIAN HIGHER EDUCATION SYSTEM: THE CRIPPLED GIANT

When India achieved independence in 1947, only a few thousand students were enrolled in higher education. In 2004, with 250 universities and approximately 8 million students, India had the world's second-largest system of higher education and produced more Ph.D.s per capita than anywhere in the world. However, the gross enrollment ratio in tertiary education stagnated at 11 percent. This figure, although higher than the average of 4 percent in Africa, remained low as compared to the countries of North America (60 to 70 percent) and Europe (40 to 60 percent), or the recently developed Asian Tigers (33 to 55 percent).

colonial "empires" (e.g., France, Britain) in the mid-twentieth century have differed, following routes largely influenced by their regional environment. If university education in Jamaica, Malaysia, Nigeria, and India still bears the mark of a common colonial origin, the universities of the West Indies in Mona, of Ibadan, of Malaya, and the Jawaharlal Nehru University of Delhi have, by will or by happenstance, been permeable and responsive to the realities and needs of postcolonial societies they had, to a large extent, not been designed to serve.

With a few exceptions, these countries are located in low-income regions where university education was reluctantly established in the agonizing days of the colonial era. As part of the colonial educational edifice, universities contributed to the spreading of a knowledge base rooted in the Western episteme. But as training centers of a mid-ranked indigenous bureaucracy, they also turned out to be the breeding ground of two generations of postcolonial political elite who led their countries as politicians, public servants, professionals, and businessmen. Following independence, the mission of universities established under colonial rule or with Western universities as their models was everywhere challenged and replaced by much more ambitious agendas for the development of genuine post-colonial university education systems.

At the beginning of the twenty-first century, universities throughout the postcolonial world were still criticized for underachievement. The criticisms remained the same: it was said that the universities produced graduates who were unemployable; they inculcated alien values; they failed to serve the interests of the vast majority of the population through appropriate courses and research dealing with the problems of the common man; they engaged in pure research that adds little value to the economy; they lacked in innovation and perpetually copied in-

novations in the developed world that may not be suitable for local circumstances. Despite these criticisms, enrollment in higher education grew steadily over the period, and universities gradually emerged as protected spaces, promoting a unique gender- and minority-inclusive culture. From the 1980s, female enrollment grew considerably in the poorest countries while it remained fairly flat in Europe and America. However, in the case of sub-Saharan Africa, while significant progress was made, the troubles of history since the mid-twentieth century (unstable governments, supra- and international pressures, civil strife, pandemics) made it extremely difficult for universities to develop appropriate curricula or to adjust their research agendas to local needs and realities. Once the euphoria of the 1960s waned, universities fell victim to distrust from growing authoritarian regimes and were among the first victims in the 1980s of the structural

THE EUPHORIA OF THE 1960s: UNIVERSITIES AND POSTCOLONIAL DEVELOPMENT IN AFRICA

In 1962, UNESCO and the Economic Commission for Africa organized a conference on the Development of Higher Education in Africa in Tananarive, Madagascar, which highlighted many of the challenges of the African universities. The conference focused on problems related to staffing, financing, and content of higher education, with particular attention to the Africanization of staff and curriculum. The participants at Tananarive concluded that in addition to the role of teaching and of research, higher education was to contribute to the social, cultural, and economic development of Africa. Higher education was to do so by promoting national unity, prioritizing teaching and research on African concerns, and training human resources to meet “manpower” demand, while simultaneously maintaining international standards of academic quality. This focus on the role of universities in national development, marked the rise of the notion of the “developmental university.”

adjustment policies imposed by the International Monetary Fund (IMF) and the World Bank on almost all African countries that qualified for loans.

Drastic cutbacks in research and infrastructure grants, along with the withdrawal of state support to student services and the rapid downfall of the standard of living of staff threw most developing world universities into a state of dereliction. The situation was condemned in the following terms by a task force convened by the World Bank in cooperation with UNESCO in 1999:

Since the 1980s, many national governments and international donors have assigned higher education a relatively low priority. Narrow—and, in our view, misleading—economic analysis has contributed to the view that public investment in universities and colleges brings meager returns compared to investment in primary and secondary schools, and that higher education magnifies income inequality. As a result, higher education systems in developing countries are under great strain. They are chronically under-funded, but face escalating demand. (The Task Force on Higher Education and Society, 2000, p. 10)

A Peripheral World of Learning

The dilemma facing higher education worsened through the 1980s and 1990s due to a massive south-north intellectual migration flow. The movement illustrates in itself the role higher education plays in keeping up the tight and imbalanced links initiated in the colonial era.

Alongside the development of local elitist systems of higher education, and in reaction to the growing attractiveness of North American institutions among local “educated elites,” colonial powers were keen to encourage the most promising graduates of secondary schools to further develop their training in the home institutions. This fact, added to the flow of students migrating as

a result of the higher education Malthusianism applied in the colonies, constituted the basis of a steady south-north study migration flow, which in many cases resulted in a “brain drain.” Leaning on family networks or supported by external donors, and fostered by the ever-increasing economic gap between industrialized and developing countries, the flow was barely affected by the development of university education in newly independent countries. On the contrary, with local curricula largely untouched, postcolonial higher education offered excellent basic training to candidates for postgraduate programs in the developed world. This diversion of funding opportunities affected in return the quality of higher education in the developing countries. The earlier perspective of encouraging students from abroad to study in the United Kingdom or France as a form of colonial or postcolonial aid and encouragement of trade (in goods or ideas) was transformed; education came to be seen more as a directly saleable commodity. The concomitant abandonment of scholarship policies, which primarily affected students from low-income countries, impacted markedly on the origin of international students in host countries. However, as shown in Table 2, postcolonial study migration routes continued to reflect strong economic, cultural, and linguistic ties with the former home institutions, except where the United States and Australia (notably in Asia) took over leadership in the provision of higher education services.

Mediating the Global and the Local

The postcolonial era is marked in most countries by attempts to combine the quality of teaching inherited from highly elitist higher education systems and the necessity to widen access to higher education to “bridge the development gap” and to strengthen democratic institutions. However, political developments since the 1960s, economic choices, and global pressures show that higher education cannot be developed to the exclusion of broader policy initiatives, leaving out the sociocultural context. The unequal distribution of colonial universities generated con-

trasting expectations from populations. National policies on education then endured enormous tensions from the multiple pressures of ever more exigent demands from an educated minority; of ever more dramatic educational, social, and regional discrepancies; and of ever more restrictive recommendations and conditions set by international organizations. The landscape of higher education that emerged from these contradictory tensions reflected both the peculiarities of national trajectories and the inequalities of the postcolonial world order.

UNTOUCHABILITY.

This entry includes three subentries:

- Overview*
- Menstrual Taboos*
- Taboos*

OVERVIEW

A basic idea of social grouping emerged in one of the late poems in the earliest of the Hindu scriptures, the Rig Veda. In this mythic account, probably composed about three thousand years ago, the primeval man was sacrificed to make the *varnas* (castes): the Brahmans emerged from his head, the Kshatriyas from his arms, the Vaishyas from his thighs, and the Shudras

from his feet. It is clear there is some ranking here, but the full-scale hierarchy based on degrees of purity and pollution emerged later, and untouchable castes became a category as *avarnas*, without *varna*, probably sometime after the fourth century C.E.

We find a development of this idea in the law books called *Dharmashastras* (300 B.C.E. to 500 C.E.). The first three *varnas* are known as the twice-born and are composed of Brahman priests and advisers, warriors and rulers, and merchants, all of whom undergo a ceremony in their youth admitting them into high status. Shudras, generally any caste that did manual work, were denied the privilege of studying the Vedas and were cast into a servant position. Untouchables were and are below the Shudras in any ranking, considered polluting to all and generally given the work in society that is filthy or demeaning.

In both law books and the epics, we find references to burning ghat workers, individuals who generally worked in the burning ghats with corpses and are considered unclean. A play from around the fifth century C.E., *Mrichcha katika* (The little clay cart) by Shudraka, includes two executioners who are actually quite intelligent and humorous but nevertheless untouchable. Burning ghat workers and executioners are two of the occupations still considered most polluting. The idea of persons who pollute was present early on, but the phenomenon of polluting castes developed later.

Parallel to the *varnas* and outside scripture were *jatis*, meaning “by birth” and also translated as *castes*. A *jati* is an endogamous group, sharing many customs and often an occupation, usually based in one language area. There were hundreds of *jatis* within each *varna*, and while untouchables were *avarna*, without *varna*, they were members of specific *jatis*.

The Origin of Untouchability

There are many theories about the origin of caste and, subsequent to that, the origin of untouchable castes. The untouchable leader B. R. Ambedkar (1891–1956) held theories on both. He wrote that the caste system originated from the Brahman requirement of endogamy to preserve its purity and from that was spread to lower castes. Untouchables, he held, had been Buddhists isolated and despised when Brahmanism became dominant about the fourth century. His theory is important both because it led to his conversion to Buddhism and because it represents the need of all untouchables to explain their status. Most untouchable castes have a myth of origin usually relating to a cosmic mistake; almost none assume that a past karma of bad deeds has resulted in an untouchable status in this life. On the other hand, most caste Hindus think that sins or good deeds or the careful fulfillment of duty in a previous life produce the karma that determines the caste into which one is born.

Vivekananda Jha agrees on the time period of Ambedkar but disagrees with the idea of untouchables’ Buddhist past, as do most caste Hindu writers. An influential book by Louis Dumont (1970) focuses exclusively on the concept of purity and pollution as determinants of the entire Hindu hierarchy. For Dumont, untouchables are necessary for the purity of Brahmins: “It is clear that the impurity of the Untouchable is conceptually inseparable from the purity of the Brahman. . . . In particular, untouchability will not truly disappear until the

purity of the Brahman is itself radically devalued” (p. 54). Other theorists limit the role of purity and pollution, holding chiefly that the purity needed for ritual spread to other occasions in life. A Marxist approach presumes tribal groups coming into the caste system found a ranking dependent on their economic opportunities. Many inside and outside of India hold that race is behind caste distinctions, especially that of Brahman and untouchable, and this belief is reflected in many untouchable belief systems, such as the supposition that untouchables were indigenous people ruling the land, forced to submit to invading Aryans (people speaking an Indo-European language and coming from outside India). Whatever their beginnings, untouchable groups were clearly delineated by the seventh century, when the Chinese traveler Xuanzang listed butchers, fishermen, public performers, executioners, and scavengers as marked castes living outside the city.

The Voices of Untouchables

In the medieval period a few voices of untouchables emerged. In the fourteenth century in Maharashtra, Cokhamela and his family of the untouchable Mahar caste were part of a religious movement generally called *bhakti* devotional religion. Intensely personal, the movement included all castes, and their songs have come down through the ages. Cokhamela complained bitterly about the concept of purity, and one of his poems calls out, “We are born in impurity, we die in impurity, O God, who is pure?” (unpublished translation by Anne Murphy). He is saddened by his inability to enter the temple of his god. According to legend, he was born to a mother and father whose duty as Mahars was to take the village produce to the ruler, and he died while mending the village wall. Eknath, a Brahman *bhakta*, wrote two centuries later as if he were a Mahar, and more duties can be noted: caring for the horses of government officials, sweeping the village streets and hauling out the dead cattle, getting firewood for the village headman, and guarding the village.

Another poet-saint’s voice is that of the Ravidas in the sixteenth century, who refers to his caste as an untouchable Chamar and his duties as working with leather: “O, people of the city! My notorious caste is Chamar! In my heart is the essence of all good qualities. . . . I carry cattle-hides all around Benaras.” He believed in purity beyond caste: “Whether one’s heart is Brahmin or Vashiya, Shudra or Kshatriya, Dom, Chandala, or Malech (a foreigner), through the worship of the Lord, one becomes pure” (unpublished translations by Anne Murphy). Ravidas is honored by both Sikhs and Hindus. Untouchables who convert to Sikhism from Chamar castes often take the name Ravidasi. It should be noted that anything to do with a dead cow or its hide is the work only of untouchables. A caste of drummers in the south known as the Parayan contributed the word *pariah* (outcaste) to English. In this case, the drumhead made of hide is polluting.

We do not hear from untouchables again until the nineteenth century. Then there are again direct voices: a plea from Mahars to be allowed to reenter the British army, closed to them after a century of employment; an adi-Hindu (first or pre-Hindu) movement in the north, an adi-Dravida (original Dravidians) movement in the south; a movement among toddy

tappers to secure their economic base, become educated, and be considered no longer untouchable. Toward the end of the nineteenth century, the British began recording and codifying caste, and more untouchable castes based usually on occupation emerged: Bhangis or removers of human waste in the north; Doms, the caretakers of the extensive burning grounds in the holy city of Benaras (Varanasi); Dhobis, laundrymen who handle polluted clothing.

The Beginnings of “Affirmative Action”

The British government had allowed separate electorates for “depressed classes” in the 1932 announcement of future government in India made after the Round Table Conferences in England. This provision was made at the insistence of the untouchable representatives, B. R. Ambedkar from the province of Bombay and Rao Bahadur Rettamalle Srinivasan of Madras—the two most active areas of reform—who felt, in the face of demands for separate constituencies from all other minorities, that proper elected representatives could only be elected by untouchables themselves. Mohandas K. Gandhi, then in prison for activities against the government in the interests of independence, thought separate electorates were too divisive and began a “fast unto death.” Ambedkar gave in but bargained for reserved seats for untouchables in all elected bodies to be elected by the general electorate. Gandhi then began the Harijan Sevak Sangh (Organization for the Service of the People of God), which was intended to bring the issue of untouchability as an evil to the public mind and to bring change to the hearts of caste Hindus. *Harijan* became the most popular word for the general public, replacing *depressed classes*, *exterior castes*, *outcastes*, and *untouchables*, terms previously used. Ambedkar and other politically awakened untouchables rejected the word as patronizing and meaningless. The basic disagreement was between belief in a change of heart and belief in legal and political means of securing human rights.

By 1935 it had become clear that untouchable castes must be listed to determine who exactly would be eligible for the reserved seats and for educational and economic benefits. The criteria for listing stipulated specific castes in specific areas that were denied religious rights of entry into temples and civil rights of entry to public places and the use of wells. The word *specific* was necessary because the ways of identifying who is an untouchable can vary. Occupation is not always a reliable guide. Laundrymen (Dhobis) and barbers may be untouchables in certain areas of the north but not in the state of Maharashtra. The new term *scheduled castes*, those on a list or schedule, was applied to 429 castes. (By 1993 the number was given in a survey conducted by K. S. Singh as 4,635, using the same criteria but noting subcastes and small castes not previously identified.)

The background for these concessions, probably the first “affirmative action” in the world, was from movements among untouchables themselves, which were especially important in Madras and Bombay, provinces that in the early decades of the twentieth century decreed that “depressed classes” should be represented in government bodies and, in the case of Bombay, that public places should be open to all. There were a number of leaders in various movements for dignity and human rights in many areas, but the dominant figure since the

late 1920s was B. R. Ambedkar, who continued to be important in the early twenty-first century.

Ambedkar was born to a Mahar army schoolteacher and was urged to secure education both by his father and by caste Hindus interested in reform. He graduated from Elphinston College in Bombay, one of very few untouchables in western India to do so, and with the help of the reform-minded non-Brahman princes of the princely states of Baroda and Kolhapur was given a chance to secure an M.A. and a Ph.D. in economics from Columbia University in New York and a D.Sc. from the University of London. He also became a barrister in the course of his two periods overseas. He returned to India as one of the most highly educated men in western India and an instant source of pride to untouchables. From then on, Ambedkar tried to convince the British to give attention to untouchable needs and to awaken all untouchables to progress through conferences, newspapers (although the literacy rate was very low), and an occasional public demonstration for rights. He founded political parties as well as social organizations and an educational system, and in 1947 he was asked to serve as law minister in newly independent India’s first cabinet. In that capacity, he was chair of the drafting committee of the Indian constitution.

The Contemporary Period

Five phenomena mark the contemporary period: the reservation policy’s results and disputes; the increased violence against untouchables; the growth of Dalit literature; the presence of a new and effective political party; and the image of Ambedkar all over India as a symbol of achievement and a claimant to all human rights. The reservation policy that provided a quota system for scheduled castes in all governmental political bodies and services and in educational institutions aided by the state was extended to “backward castes” in 1991 and produced a backlash from Brahman students who feared they would not be employed. Since that time higher castes have also claimed the right for reservation on economic grounds, but with the privatization of much government enterprise, the possibility of government positions for any caste is greatly lessened. Meanwhile, the years of reservation have created a large middle class among untouchables.

Increased violence, usually in the rural areas, when untouchables claim economic, religious, or social rights disputed by higher castes, is reported from all parts of India. The practice of untouchability was prohibited by law in the constitution, and there are many court cases, but much injustice is still handed out by police and higher castes, as detailed in the Human Rights Watch’s publication *Broken People*.

A flowering of Dalit literature, “the literature of the oppressed,” began in Marathi in the early 1970s with the poetry of the Dalit Panthers in Bombay and has now spread to almost every language area in India. *Dalit* means “ground down, broken up,” as in the title *Broken People*. But like the African-American use of the word *black*, it is not a term indicative of victimization but a proud term indicating that an untouchable is not polluting but oppressed by others and that even a middle-class untouchable should identify with those still oppressed. The organization of young men who called themselves Dalit Panthers in imitation of the Black Panthers in the United States is

no longer active, but *Dalit* has replaced the words *untouchable* and *harijan* in most public pronouncements and the press.

The name of the Bahujan Samaj Party (BSP) means the party of the majority, and in its founding by Kanshi Ram, an untouchable Sikh, in 1984 it was intended to include all nonelite groups, the majority in India. It has been very successful in the northern state of Uttar Pradesh, where Mayawati, a Chamar woman, served three terms as chief minister. Mayawati stressed the importance of Ambedkar and his liberal political philosophy but joined with the Bharatiya Janata Party (BJP), a conservative party led by Brahmins, in order to secure power to make changes in the state.

It is impossible to ignore the role of B. R. Ambedkar in any discussion of untouchables or Dalits in the early twenty-first century. His image is in every town and many villages, often represented by a statue of a man in suit and tie, the dress of most of the educated, holding a book that represents the constitution. He is a symbol of pride and revolt, an inspiration for continuing progress.

Untouchability outside Hinduism

The caste system has permeated other religions in India, and untouchables exist in Christianity, Islam, and Sikhism, although without scriptural legitimacy. A movement among Dalit Christians for equal rights within the church is especially strong.

Many Dalits attended the 2001 United Nations conference on racism in Durban, contending that “descent-based” groups suffer the same discrimination as racial groups, a concept opposed by the government of India. Caste-like discrimination has been found in some other countries, with the Burakumin of Japan suffering in much the same way as Indian untouchables, although the rest of the caste hierarchy was not present.

MENSTRUAL TABOOS

Menstruation is a physiological process often imbued with powerful cultural and religious symbols. For men, it is a mysterious and sometimes frightening phenomenon—the shedding of blood without visible injury. For women, it has been a double-edged sword. Far too often, it has been used in misogynist ideologies as evidence of the defiling and ungodly nature of the female body, leading many societies to subject menstruating women to taboos that limit their autonomy and agency. However, not all societies have interpreted menstruation in the same way: in some cultures it has been perceived as relatively unimportant, subject to neither stigma nor taboo; in others, menstruation has been a sign of the magical power of the female body, in all its mysterious fecundity. Indeed many societies exhibit profound ambivalence where menstruation is concerned, imbuing it with both positive and negative meanings, making it difficult to arrive at a single interpretation of menstrual taboos.

Menstrual Taboos in Tribal and Band Societies

The more positive or neutral associations of menstruation typically are found in small-scale, relatively egalitarian societies, where misogyny is in general less well developed. In many such societies, the menstruating woman was perceived as emitting a supernatural power, or mana; as anthropologists such as Mary Douglas have found, this sacred power is neither inherently good nor inherently bad. It is, however, extremely powerful, with a potential to be creative and energetic or destructive and even deadly. Thus menstruating women, like women who have recently given birth, had to observe strict taboos and to remain segregated from ordinary society, especially from men, who could be inadvertently hurt by a menstruating woman's mana. (It is noteworthy that males who had shed blood in war typically suffered similar proscriptions.)

Foragers such as the Eskimo feared the perceived danger of menstruating women on men's ability to hunt. The attitudes of Australian Aborigines, in contrast, are more complex and not altogether negative. Agricultural peoples too exhibit a variety of attitudes, with some making positive connections between agricultural fertility, the moon, and women's cycles, whereas others constructed symbolic oppositions between breast milk and menstrual blood as representations of birth and death and so found menstruating women to be a danger

to crops and animals, and still others, such as Andean peoples, attached little significance to menstrual blood.

Menstrual taboos also serve to underline the gender segregation characteristic of many tribal societies, such as the Maori of New Zealand or the Arapesh of New Guinea. Sexual intercourse, in the case of the Mae Enga of the Central Highlands, was strictly limited in order to preserve male vitality, with menstrual blood, according to Mervyn Meggitt, perceived as especially corrupting to men's "vital juices."

Menstruating women, for the Lele of Africa, were prohibited from poking the fire or cooking for their husbands due to their polluting presence, while Bemba women feared pollution from the adulterous actions of men. These often rigid demarcations of sexual roles were thought to be necessary in upholding the foundation of community and preventing "sex pollution" from outside intermingling; the result, however, especially in the rigidly segregated societies of highland New Guinea, reflected and perpetuated a view that men and women belonged to two mutually distinct, hostile, and antagonistic spheres, both of which constituted a danger to the other.

Many such societies feature a special enclosed space, referred to in the anthropological literature as a "menstrual hut"—a nomenclature that reveals the unconscious biases of earlier scholars, who routinely referred to male ritual spaces as "men's houses," even when the "huts and "houses" were of similar size and construction. The retreat into sacred space protected the women themselves—as vulnerable carriers of a divine power—as well as other members of their society, who could be injured by a glance alone. Not all retreats to the hut constituted a punishment, however; for the Mbuti of Zaire, seclusion among women in the hut, or *elima*, gave rise to a spirit of community as younger and older women sang special songs to one another, sometimes to be joined by the musical replies of men who stood outside. Menstruation and isolation were also connected in rites of passage for young girls. Existing in a marginal state between childhood and adulthood, such girls could undergo seclusion followed by a ritual deflowerment, mortification, and beatings (as with the Uaupes of Brazil) or, in the case of the Deshast Brahmins of India, joyous celebrations, feasts, and the exchange of presents.

Menstruation and Civilization

In general, however, the greater social inequalities and restrictions that accompany the rise of civilization brought with them an increase in negative attitudes toward women and their bodies and a greater attention to controlling female agency and reproductive powers. This can be seen in many of the great religions of the world and in the cultural traditions of the West. Among the ancient Greeks, for example, Pliny wrote that menstrual blood could "[turn] new wine sour," render crops barren, dull the "gleam of ivory," drive dogs mad, and even cause "very tiny creatures" such as ants to turn away in disgust from a grain of corn that had suffered contact with the offending woman. But what was an affliction—a curse—could also constitute a sacred gift or what the Romans called *sacra*; enclosed within male boundaries, woman were graced as well as burdened by the cyclical days of blood they had to bear.

The great religions that developed with the rise of civilization tended to further these ideas in religious texts and doctrines, especially when it came to delineating rules of sacred and ritual cleanliness and pollution. Zoroastrianism placed purity as one of the most important tenets in the upholding of the faith, with those deemed impure—including women during their menses but also priests with bleeding sores—prohibited from entering the fire temple. In Hinduism, where rules of un-touchability could be vast and complex, bleeding women were expected to avoid worship, cooking, and members of their own family through restrictions that were precisely proscribed; according to the *Vendidad* (16.4), a woman in her menses "should keep fifteen paces from fire, fifteen from water . . . and three paces from a holy man." Visiting a consecrated holy place during menses was highly contaminating and therefore forbidden, as were women's involvement in ritualistic worship practices in general. Such a stigma was explained in part by the *Bhagavata Purana*, which described the menstrual cycle as constituting a partial karmic reaction to Indra's inadvertent killing of a brahmana; according to the text, after Indra killed the brahmana, he proceeded to negotiate with four groups who agreed to absorb one-quarter of the karmic reaction in exchange for a blessing. Women received the blessing of engaging in sex during pregnancy without endangering the embryo in exchange for accepting the monthly menstrual cycle.

In the Judeo-Christian tradition, the biblical Book of Leviticus was the most central and influential text in postulating rules having to do with cleanliness and uncleanness or what the anthropologist Mary Douglas called purity and danger. Leviticus stated that while menstruating, a woman would be considered unclean for seven days and anyone who touched her would also be unclean. The taboo continued to be recognized by Orthodox Jews, who relegated bleeding women to their own secluded sphere or enjoined them to abstain from sexual intercourse for seven days, followed by immersion in the *mikveh*, or ritual bath. Such isolation accorded with what was thought to be women's special burdens—or Eve's multiplying sorrows—as the prophet Micah enjoined them to "Be in pain, and labour to bring forth, O daughter of Zion, like a woman in travail" (Mic. 4:10). Such rites were also, however, continuous with other treatments in the Old Testament concerning the mundane and symbolic use of blood, which was seen as life-giving as well as defiling and all-important in the preparation of food or the act of sacrifice.

In the New Testament, Jesus encounters and cures a "woman with issue" who has been menstruating continuously for twelve years when she touches the hem of his garment—not his body—and is told, "Thy faith hath made thee whole" (Matt. 9:20–22). But Levitical notions of cleanliness and uncleanness, isolation and contamination, continued to pervade the early Christian world in such debates as the acceptability of menstruating women entering churches or receiving communion. In early Syrian Christian texts as well as the writing of Origen, women undergoing menses were prohibited, like their Jewish counterparts, from entering church or "mixing" reproductive blood with the sacrificial blood at the altar; it would therefore become a notable development when Pope Gregory I (590–604) informed Augustine, the monk and

bishop of Canterbury, that menstruating women should not be forbidden from entering church or receiving communion, though “if [she] out of a sense of deep reverence does not presume to receive communion, she must be praised” (Bede, 1:27). Despite such leniency, penitential texts as well as a later archbishop of Canterbury, Theodore, chose to uphold the prohibition, which continued well into the Middle Ages.

Medical Variations and Modern Interpretations

Ancient medical writers onward believed menstrual blood constituted a toxic substance that needed to purge itself from the body, with Hippocrates arguing that that fermentation in the blood precipitated menstruation because women were unable to rid themselves of their impurities in the blood through sweat alone. Aristotle for his part assumed that menstruation represented the excess blood not incorporated into the fetus, while Galen believed it to originate in part from residual blood in food that women were unable to digest. During the Middle Ages, menstruation continued to be regarded as malignant and unclean, emanating from the “imperfection” of women, though by the end of the sixteenth century, according to Ian Maclean, there was far less stress on the noxious nature of menses, and the majority of texts “stress their harmless excremental nature” (Maclean, p. 40). Still, sexual intercourse during the menstruation cycle, for example, continued to be a particularly charged subject for theologians and medical writers, with Thomas Aquinas in the thirteenth century rendering the deed a mortal sin, unless the woman’s cycle was unusually prolonged and consummation was absolutely necessary. Such medical and theological ideas would decline only slightly in the early modern period, when Cardinal Cajetan demoted intercourse during menstruation to a “minor sin,” though it remained, in Thomas Sanchez’s words, “unseemly.” Seventeenth-century writers continued to perpetuate the stigma that attached itself around the menstrual cycle, with the Englishman Helkiah Crooke questioning, “What pleasure of contentment could any man finde in a wife so lothsomely defiled, and that perpetually.” The notion that a woman had to remain sexually unapproachable, for her own sake as well as for her partner’s, became especially pronounced in the nineteenth century, for example, when it was believed that gonorrhoea could be transmitted to men through menstrual blood or that such emissions in general constituted a physiological as well as psychological threat. The new preoccupation with women’s hysteria, and the frequent recommendation that such women be isolated in bed rest or asylum, was inexorably attached to the menstrual cycle, while a minority of physicians as late as 1920 could describe menstrual blood as containing highly toxic substances.

In the twentieth century anthropologists and psychoanalysts recognized the opportunity of examining culture through the prism of such a powerful taboo, which reflected a society’s cosmological, symbolic, and social attitudes toward women, sex, blood, hygiene, and power. For Freud, the segregation of a woman during her menses might have served a hygienic purpose, though it above all reflected ambivalent notions and phobic fears about women as a whole; in the 1960s William Stephens continued the psychoanalytic treatment of the taboo, arguing that castration anxiety, from the sight of bleeding

genitals, resided behind the imposition of unapproachability onto menstruating women across cultures. Bruno Bettelheim, on the other hand, argued that male envy had originally attached itself to the biologically powerful act of menstruation, with quarantine an attempt to level the playing field between the sexes. Feminist and matriarchalist theories would advance Bettelheim’s relatively positive treatment of the powers inherent in menstruation, arguing for a more subtle approach in which the “forbidden” and the “holy” are conjoined and the very terms *taboo* and *defilement* contain more complex associations than those that cohere around *oppression* alone. Such ideas also harkened back to the interpretations of Émile Durkheim and Sir James Frazer, who argued that society’s repulsion actually reflected the positive, or at least formidable and respected, “sacred,” or “priestly,” power inherent in menstruation, with women segregated not for their inferior status but rather their power. Still, negative vestiges of the taboo linger in euphemisms or “red humor” jokes, in the politicization and stigmatization of premenstrual syndrome, or even in continuing claims over menstruation’s “toxicity”—evidence of the continuation of the myth of the bleeding woman who bears “Eve’s curse” in silence and sorrow.

TABOOS

The notion of *taboo* has a peculiar history: it was originally a Polynesian term referring to a ritual prohibition against contact with a thing, an animal, or a person. The term eventually

became a widely discussed anthropological concept, and finally, in its last avatar, has been adopted by most languages to refer to something that is strictly and collectively forbidden. This wide recognition stems from the fact that every culture has things that are forbidden for religious reasons. Certain beings or objects are thought to possess a kind of substance that renders them untouchable or unapproachable. In some cases, they may be thought of as particularly pure; in other cases, on the contrary, it is their extreme impurity that entails the obligation to keep them apart. The violation of a taboo has different consequences: sometimes it leads only to some temporary defilement but, in other cases, it can be considered a crime. Finally, as far as people are concerned, the notion of *taboo* applies to persons at both ends of the social ladder: kings as well as untouchables, priests as well as hermits. But in some ritual circumstances, nearly everyone can be the object of some kind of taboo: in transitory states, for instance during the liminal stages of rites of passage, ordinary people are also considered to be taboo.

The word *taboo* was first used in the English language by Captain James Cook, who, as early as 1777, reported that some chiefs in Tonga were not allowed to behave like common people: they were *taboo*, Cook explained. The first European observers were not quite sure whether *taboo* meant “sacred” or “defiled.” This uncertainty is probably due to the fact that the concept is ambivalent, and can mean both, depending on the case. Later scholars often pointed out this paradox: in his major study on the subject, Franz Steiner insisted that the Brahman was just as taboo as the untouchable. In the Polynesian context, the word *taboo* has largely been thought to be inseparable from the idea of *mana*, a term that refers to the religious power or force attached to some people or objects. A chief is said to possess *mana*, and is considered to be taboo by virtue of this power. The idea of *mana* was once given great importance in some anthropological writings: Marcel Mauss (1872–1950), for example, devotes a great deal of attention to the idea of *mana* in his studies of the gift and magic. Yet later observers noticed that *mana* was finally an empty concept that meant hardly more than a “thing” or a “thingamajig”: and as it means nothing, it can be taken to mean anything.

The concept of *taboo* soon became part of the English language, but even before then it was widely discussed by early anthropologists. While it had fallen out of fashion by the end of the twentieth century and was hardly considered an essential anthropological concept, this was not the case in the nineteenth century, when it was seen as something that had to be explained by anthropologists. The “primitives,” it was then thought, lived in a world dominated by taboo. James Frazer, for instance, regarded taboo as a symptom of irrationality: primitive man, he argued, believed he lived in a world full of supernatural dangers, and he protected himself by maintaining a distance between himself and those threats. Frazer’s description of numerous cases of taboo and his interpretation of it were deeply influential and permeated Sigmund Freud’s views on “primitive” societies. According to Freud (1856–1939), society derived from psychology, and this was particularly clear in “primitive” societies. In *Totem and Taboo* (1913),

Freud assimilates the primitive human to a neurotic, and the concept of *taboo* plays a significant role in supporting this equation. According to the father of psychoanalysis, the multitude of fears and prohibitions in which the “savage” lives parallels the world of the neurotic. Furthermore, people forbid only what they desire and are therefore always ambivalent toward their prohibitions. This is particularly true of the incest prohibition, which Freud labeled the *incest taboo*: the mother is a forbidden sexual partner because she is the object of an intense desire. All other taboos, such as food taboos, are only extensions of the fundamental incest taboo.

Like his contemporaries, Freud considerably exaggerated the importance of fear and prohibition in preindustrial societies. Modern anthropologists soon realized that the people they studied did not live in a world dominated by prohibitions of all kinds. It is interesting to note that Captain Cook had seen the Polynesians’ taboos as more funny than frightening, and later, modernist anthropologists such as Bronislaw Malinowski (1884–1942) and native authors from tribal societies alike commented on the variability of attitudes toward taboos. At one extreme is the strict adherence of the religious to dietary restrictions, an attitude as likely to be found among urban sophisticates as isolated tribesmen, and at the other the relaxed and humorous attention noted by Cook. In the early 2000s anthropologists no longer considered *taboo* to be a unitary category. Malinowski opined that taboos are most strictly observed in arenas where technical competence is least likely to yield predictable results, an observation later extended to the study of contemporary professional athletes, who often observe personal rituals and taboos with great rigor before major games.

The term itself remains useful, as there is no other word to refer to what is both dangerous and forbidden. It resurfaced in the mid-twentieth century in the work of the anthropologist Marvin Harris, who considered that all prohibitions, and food taboos in particular, are not arbitrary but result from the material conditions in which people live: the taboo on eating cow or pig was dictated by the economic conditions in which Hindus and Arabs lived. On the whole, Harris’s explanations are rather unconvincing and certainly fail to establish a true determination. In another vein, Mary Douglas notes that purity taboos cannot be explained by considerations of cleanliness. Dirtiness, she maintains, has first of all to be understood within a system of symbols and cannot be taken as an isolated phenomenon: what is pure exists only as the contrary of what is impure. Thus, taboos belong to a category or a system of classification.

As a general category, the concept of *taboo* illustrates the differences that divide contemporary anthropologists: those who seek a general understanding of humanity find some usefulness in broad concepts such as this. Others argue that it can be useful only at the cost of a serious impoverishment of social realities. Yet the fact remains that we have no other concept to describe socioreligious prohibitions.

UTILITARIANISM. *Utilitarianism* is the name of a group of ethical theories that judges the rightness of acts, choices, decisions, and policies by their consequences for human (and possibly animal) welfare. These theories have been widely influential among philosophers, economists, and political and social scientists, and, in the early twenty-first century, in the general area of applied or practical ethics. It would not be too much to say that utilitarian thinking undergirds one of the contending positions on virtually each of the issues in debate, whether to do with animal rights, euthanasia and physician-assisted suicide, health care coverage, or punishment. This is so, moreover, even as critics of utilitarianism as a normative ethical theory have become more numerous.

Classically, utilitarianism is the view that acts are right or wrong if they produce best consequences—that is, consequences with regard to human welfare that are at least as good as those of any alternative. This is the view normally associated with Jeremy Bentham (1748–1832), James Mill (1773–1836), and John Stuart Mill (1806–1873); with Henry Sidgwick (1838–1900) and G. E. (George Edward) Moore (1873–1958); more recently, with J. J. C. Smart (b. 1920) and Richard Mervyn Hare (1919–2002); and, more recently still, Peter Singer (b. 1946). It began, thus, in the nineteenth century in Britain, though traces of it can be found in earlier thinkers there, such as Francis Hutcheson (1694–1746), David Hume (1711–1776), and William Godwin (1756–1836). This classical version of the theory is also the view that contemporary critics, such as Amartya Sen (b. 1933), Bernard Williams (1929–2003), and Samuel Scheffler, attack. In fact, different versions of utilitarianism have been distinguished from classical- or act-utilitarianism, such as rule-utilitarianism, utilitarian generalization, motive utilitarianism, and so on, though it remains hotly debated how far these versions are ultimately distinct from the utilitarianism (and, to critics, from the objections directed against it).

Act-utilitarianism as it has come down to the present has three main components, and each has generated discussion in

its own right. These are the consequence component, the value component, and the range component.

The consequence component maintains that rightness is tied to the production of good consequences (specifically, to consequences better than those of any alternative or best consequences). It may be argued that something in addition to consequences helps to determine an act's rightness, but consequentialism is the view that consequences alone determine this; act-utilitarians are consequentialists. Consequentialism in the early 2000s is the object of a good deal of criticism, though even in the nineteenth century it was sometimes controversial, as in the debates between Cardinal Newman (1801–1890) and Charles Kingsley (1801–1890). To some it is self-defeating, in that an effort to produce best consequences on each occasion may fail to produce best consequences overall. To others it seems inherently evil because it cannot exclude certain acts as intrinsically wrong or wrong independently of consequences (for example, lying). More recent criticisms have been equally strong. To John Rawls (b. 1921) impersonal accounts of rightness, such as best consequences, fail to take seriously the separateness of persons and so fail to treat people as autonomous individuals with their own individuality, plans, and worth. To Bernard Williams impersonal accounts of rightness run the risk of severing one from one's integrity, in the sense that pursuit of best consequences may not be compatible with pursuit of one's own projects, commitments, and relationships. Of course, some act-utilitarians, such as R. M. Hare (1919–2002), have resisted the Rawls-Williams objections, but others influenced by the theory, such as L. Wayne Sumner, have responded by trying to build a scheme of individual moral rights into the theory on the ground that doing so gives one the best chance of producing best consequences. (See indirect utilitarianism below.) Still more recent criticisms move in an epistemological direction. One cannot know at the time of acting, it is said, what (all) the consequences of one's proposed act will be. Some have seen this as demanding a role for rules as a guide; others, such as Peter Railton, have viewed it as a reason for not trying to act upon consequentialism in the first place and so for not using this account of rightness as if it were a decision procedure. He suggests a role for the concept of (good) character in determining how individuals shall act.

The value component has from Bentham onward spurred debate. It maintains that consequences are to be assessed by some standard of intrinsic goodness, the presence of which in the world is to be maximized. In the early twenty-first century this good in the case of act-utilitarianism is construed to be human welfare, but how "welfare" is to be understood is contentious. Thus, Bentham is a hedonist, maintaining that all and only pleasure (which his felicific calculus was supposed to be able to calculate) is intrinsically good; not surprisingly, Friedrich Nietzsche (1844–1900) referred to utilitarianism as a pig philosophy. John Stuart Mill spoke of happiness and pleasure and tried to introduce a distinction between higher and lower pleasures, and the mentor of the Bloomsbury Group, G. E. Moore, maintained that other things, such as beauty and friendship, as well as pleasure and/or happiness, were good in themselves. Most act-utilitarians have followed Moore in moving away from hedonism and from the emphasis upon happiness.

Three types of issues have dominated recent critical discussion of the value component. First, there has been a movement away from the old mental-state accounts of goodness (e.g., pleasure) to desire- or preference-satisfaction accounts. Economists have helped spur this development. It is unclear, however, upon which desires one is to focus. Problems to do with present or future desires have led theorists to an emphasis upon informed desires—that is, those desires one would have if one were fully informed, detached, free from bias and pressure, and so on. The thought seems to be that, in the appropriate circumstances, informed desires become actual, and so those desires upon which one (rightly) acts. (This thought, so construed, can then be wedded, in economics, to “revealed preference” accounts of goodness, which are widespread.) Second, there has been a movement away from agent-neutral values toward agent-relative ones. Values, it is said, are subjective, in the sense of being agent-relative; they are the values of agents. Utilitarianism, however, requires that desires be aggregated, weighed, and balanced in terms of, for example, agent-neutral concerns to do with the amount of desire-satisfaction produced, irrespective of which individual agents obtain that satisfaction. The question then arises whether any particular agent has reason to value pursuit of overall desire-satisfaction, in addition to or in place of his or her own. Third, if one focuses upon desires, then a question about moral filtering devices obviously arises. If one takes into account the desires of all those party to a situation, does one filter out the desires of evildoers? This seems contrary to the spirit of utilitarianism and its emphasis upon agent-neutral values. But if one does not filter out the desires of evildoers, does this mean that the utilitarian weighs and balances their desires, according to strength, with the desires of those against whom evildoers act?

The range component maintains that all those affected by the act are to have their desires taken into account. This has led notoriously, from the nineteenth century onward, to the problem of interpersonal comparisons of (pains and pleasures) or desire-satisfaction. One can only maximize desire-satisfaction across all those affected by the act if one can compare the effect of the act upon the desire sets of each individual involved, judge the strength and extent of that effect, and then compare the different results. How one does this, what measures or scales of comparison are used, is not obvious. Another problem with the range component that stirs debate in the early twenty-first century has been whether to include animals within the scope of utilitarianism. Bentham did, on the grounds that animals could suffer. But if informed desires are the focus of the value component, can animals have informed desires? The point is not obvious (just as it is not obvious that all humans can have informed desires). Some utilitarians want to keep a pain/pleasure standard of goodness for animals, but endorse desire-satisfaction accounts for humans. Still another problem for the range component has to do with the emphasis in utilitarianism upon maximization of what is deemed to be intrinsically good. Something short of this, of increasing the amount of good to some extent less than the greatest extent possible, is both possible and less problematic, at least if one treats Derek Parfit’s “repugnant conclusion”—that one can increase the greatest total happiness (or desire-satisfaction) in the world by eliminating those at the bottom of the happiness

ladder—as tied to the general thrust of maximization of the good.

To a large extent, discussion of utilitarianism in the late twentieth to early twenty-first century has moved away from earlier concerns. It has centered around three developments. First, R. M. Hare and others have urged a kind of indirect utilitarianism, wherein one does not employ consequentialism at the level of practice, in order to decide what it would be right to do. Hare urges a two-level account of moral thinking, which is rule-utilitarian at the level of practice but act-utilitarian at the level of theory or rule/institutional design. In his hands, act-utilitarian thinking at the critical level will select as guides at the intuitive or practical level those rules whose general acceptance will give one the best chance of producing best consequences. In this way, it is only in exceptional circumstances that one’s practical guides are exposed to consequentialist thinking. Thus, Hare hopes to avoid many of the problems that are held to beset the act-utilitarian, through the employment of consequentialism as a way of deciding what it would be right to do. Hare’s two-level account of moral thinking can seem, then, a way of developing a further case for act-utilitarianism; other two-level theorists, it should be noted, do not see the split-level innovation as furthering this particular case. In fact, on Hare’s account, since the focus of his theory is no longer acts, on a case-by-case basis, the name *act-utilitarianism* is something of a misnomer.

Second, because so many of the objections to act-utilitarianism (and consequentialism) have always centered around clashes with “ordinary moral convictions” or “commonsense morality,” the question has arisen of whether our ordinary moral intuitions have probative force in ethics. To those who feel that they do have probative force, the problem has been to make it appear that certain of one’s intuitions are more secure than others, so that they are believed to be more “true” or “correct” than the dictates of any normative ethical theory. Accordingly, one needs to identify which these crucial intuitions are. Different ways of doing this have been suggested, including Rawls’s reflective equilibrium method. But it is clear, even in Rawls, that some intuitions survive intact, such as the wrongness of slavery. This intuition of his needs no revision. Other theorists privilege other of their intuitions about particular acts or classes of acts. Over privileging in this way, serious doubts can arise, no matter how secure one feels one’s intuitions to be. Yet, it is from this very privileging that condemnations of act-utilitarianism typically begin. It is wrong to lie, and the act-utilitarian mounts a case for lying on this occasion; it is wrong to kill, but the act-utilitarian mounts a case in favor of active euthanasia or abortion or suicide. In this way, arguments about the probative force of certain of one’s intuitions have taken on a life of their own and are often used in moral debate in the early twenty-first century. This is especially true in medical ethics, where some want to draw a distinction between killing and letting die and where act-utilitarians on the whole deny that such a distinction is morally significant or where some want to distinguish, say, between giving someone a pill which, if they take it, will kill them and giving someone an injection of a sufficiently large dose of morphine to hasten their death while intending only to relieve their pain.

Third, the enormous growth of applied or practical ethics, especially medical ethics, has brought act-utilitarianism and consequentialism into the public domain. Almost without exception, virtually every issue, whether to do with killing, the allocation of resources, or the case for animal experimentation, features a utilitarian line of argument, and this line of argument is also, typically, act-utilitarian in character. This in a way is odd: while theorists are developing more and different types of indirect utilitarianisms, most of the examples of applied ethics feature the direct application of consequentialism on a case-by-case basis, with, it is held, morally shocking results. To be sure, not everyone will be shocked any longer by a case in support of a doctor assisting a competent patient who voluntarily requests assistance in dying, but the case can be discussed from the level of rule or institutional design, as well as from the consequentialist realities of the situation in question. Moreover, there are more general questions that arise in the various areas of applied ethics, where act-utilitarians are taken to adopt a particular kind of stand. Thus, one can intentionally kill a patient or one can knowingly bring about or cause a patient's death: are these morally different? One can directly bring about a person's death or one can indirectly bring it about: are these morally different? One can bring about a person's death by action or one can bring it about by omission: are these morally different? One can bring about a person's death actively or passively: are these morally different? If the consequences appear the same or very similar, the act-utilitarian will be held to think there is no difference among these things. Because Hare and others favor an indirect form of utilitarianism, it is not uncommon in the early 2000s to treat these practical issues as if they involved direct consequentialists and leave until another occasion whether these consequentialists are also act-utilitarians. In this way, applied ethics has helped consequentialism to come to dwarf the other components of act-utilitarianism.

For Hare, moral education plays an important role in one's moral thinking. He rejects the employment of consequentialism on a case-by-case basis for deciding what to do and rejects as well the thought that consequentialism indicates the kind of thinking one should do at the intuitive or practical level. Instead, he emphasizes the role of character and character development: by education, individuals turn themselves into people whose actions flow from their character, in which the traits and dispositions that comprise character are inculcated in them overseen by the utilitarian goal of maximizing human welfare. This further reduces clashes with certain privileged moral intuitions, but it does not require that one treat those intuitions as having probative force. In this way, the moral thinking for Hare is much more intimately connected with one making one's self into the sort of creature who behaves out of certain dispositions than into the sort of creature who acts only out of consequentialist concerns.

Utilitarianism, then, has in latter years undergone a significant transformation at the hands of theorists. It is no longer the relatively simple, straightforward rubric that Bentham and John Stuart Mill took it to be; its statement, even by those who remain sympathetic to it, such as Hare and those influenced by him, is complicated and layered. An account of its

historical development in terms of ideas, as can be seen here, shows that it has become sufficiently encumbered with distinctions and technicalities that it no longer really resembles the earlier view. Yet, in the twenty-first century, it is still common to find thinkers objecting to some particular view in moral, political, or social policy as "utilitarian," where the view they have in mind is the direct application of consequentialist thinking to decisions on how to behave. Thus, in modern medical ethics, there is little concern to get right the niceties of utilitarian theory; rather, the point is to protest about the "shocking" results that the direct application of consequentialist thinking can appear to produce in some instances.

UTOPIA. The word *utopia* was coined by Thomas More (1478–1535) as the name of the island described in his *Libellus vere aureus nec minus salutaris quam festivus de optimo reip[ublicae] statu, deq[ue] noua Insula Vtopia* (1516). While More wrote in Latin, he based his new word on Greek. More combined *topos* (place or where) with *u* or *ou* (no or not) to create *nowhere*, but in "Six Lines on the Island of Utopia,"

1518 woodcut by Ambrosius Holbein from Thomas More's *Utopia*. Although the concept of utopia has existed in many different religions and societies since ancient times, the term itself was originated by Thomas More in his early-sixteenth-century work.

part of the larger work, he suggests that the word *eutopia*, or good place, is a better descriptor. Thus, from the time of More's original coinage, the word *utopia* has been conflated with *eutopia* to mean a nonexistent good place.

The word *utopia* entered Western languages quickly—the book was translated into German in 1524, Italian in 1548, French in 1550, English in 1551, and Dutch in 1553, and the word itself often entered these languages before the book was translated. In the eighteenth century, the word *dystopia* was first used to characterize a nonexistent bad place, but the word did not become standard usage until the mid-twentieth century.

While More coined the word and invented the genre of literature that grew from the book, he was not the first to imagine the possibility of a society better than the one currently existing and to describe such a society. Examples of such imaginings can be found in ancient Sumer, classical Greek, and Latin literature, the Old Testament, Buddhism, Confucianism, and Hinduism, among other predecessors.

While it is no longer possible to see utopia as a product of the Christian West, the role of utopia in Christianity has long been an area of dispute. Eden, the millennium, and heaven all have clear utopian elements, but the extent to which they can be achieved through human action is open to dispute. The Fall and the resultant emphasis on sinful human nature has led some commentators to view utopia as anti-Christian and heretical. Human beings are simply not capable of a utopia in this life. But other commentators, like the theologian Paul Tillich (1886–1965) and the founders of Liberation Theology, have argued that utopia is central to any understanding of the social message of Christianity.

Expressions of Utopianism

Today dreaming of or imagining better societies is usually called “utopianism,” and utopianism can be expressed in a variety of ways. Utopian literature, the creation of intentional communities or communes, formerly called utopian experiments, and utopian social theory are the most commonly noted forms in which utopianism is expressed, but there are other means of expressing utopianism, such as the design of ideal cities.

Utopian literature. Utopian literature is most common in the English-speaking world, with particularly strong traditions in England, the United States, and New Zealand. Brazil, France, Germany, Greece, Italy, Russia, and Spanish America also have strong utopian traditions, and we now know that there are substantial utopian traditions in other European countries and in the non-Western world. The strongest non-Western utopian tradition is found in China, but such traditions exist throughout the Middle East and in India and Southeast Asia; there are also developing utopian traditions in various African countries. Even Japan, which was once thought to have no such tradition, has recently been shown by young Japanese scholars to have one.

Although early scholarship in the field treated utopias from all times and places as if they were alike, these utopian literatures differ from each other in significant ways, and national

and cultural differences are now recognized. Also, as a direct result of the influence of feminist scholarship, we are now more aware of both the similarities and differences found in utopias written by men and woman, and recently such awareness has been extended to differences and similarities based on ethnicity, race, religion, and other such characteristics.

From its earliest expression to the present, a basic human utopia is found in which everyone has adequate food, shelter, and clothing gained without debilitating labor and in which people lead secure lives without fear of, in early versions, wild animals, and in later versions, other human beings. But these basic elements are expressed in different ways in different times and places and also reflect individual concerns; as a result, the range of utopias present throughout history is immense.

Much utopian literature, particularly the dystopian, has been marketed as science fiction, and one minor scholarly controversy had some arguing that utopias were a subgenre of science fiction and others arguing that historically it was the other way around. In the late twentieth and early twenty-first century, there was clearly an intellectual as well as a marketing overlap with the most prolific writers of utopias, like Ursula K. Le Guin (b. 1929) and Mack (Dallas McCord) Reynolds (1917–1983), using science fictional motifs and tropes. In *Scraps of the Untainted Sky* (2000), Tom Moylan carefully considers the relationships between utopia, dystopia, and science fiction.

Scholarship on utopian literature increased in both quantity and quality in the 1970s and 1980s with the publication of definitional essays by Lyman Tower Sargent and Darko Suvin that helped clarify the conceptual muddle; bibliographies by Arthur O. Lewis, Glenn Negley, and Sargent that transformed the understanding of the subject; and important books by Krishan Kumar, Frank E. and Fritzie P. Manuel, Tom Moylan, and Kenneth M. Roemer that rewrote the history of utopian literature. At the same time, there was a major revival of utopian writing, the most important works being Le Guin's *The Dispossessed* (1974), significantly subtitled *An Ambiguous Utopia*, and *The Left Hand of Darkness* (1969); Joanna Russ's (b. 1937) *Female Man* (1975); Marge Piercy's (b. 1936) *Woman on the Edge of Time* (1976); Samuel R. Delany's (b. 1942) *Dhalgren* (1975) and *Triton* (1976); and Margaret Atwood's (b. 1939) *The Handmaid's Tale* (1985).

A major contribution to our understanding of the changes utopias were undergoing was Moylan's development in *Demand the Impossible* (1986) of the “critical utopia.” Moylan wrote:

A central concern in the critical utopia is the awareness of the limitations of the utopian tradition, so that these texts reject utopia as a blueprint while preserving it as a dream. Furthermore, the novels dwell on the conflict between the originary world and the utopian society opposed to it so that the process of social change is more directly articulated. Finally, the novels focus on the continuing presence of difference and imperfection within the utopian society itself and thus render more recognizable and dynamic alternatives. (pp. 10–11)

Even though positive utopias were published in every year of the twentieth century, the dystopia has been the most frequently published form of utopian literature from World War I to the early twenty-first century. The dystopia uses the depiction of a usually extrapolated negative future as a means of warning the present to change its behavior. The message of the dystopia is that if the human race continues in the direction it is now heading, this is what will happen. The dystopia, thus, has a positive element in that it suggests the possibility of change. In this, the dystopia is in the tradition of the *Jeremiad*, or a work modeled on the Book of Jeremiah, in which a condemnation of contemporary behavior and a warning of retribution also holds out hope of improvement if the warning is heeded.

Although there were precursors, the dystopia came to prominence through four works: *We* (1924), by Yevgeny Zamyatin (1884–1937); *Brave New World* (1932), by Aldous Huxley (1894–1963); and *Animal Farm* (1945) and *Nineteen Eighty-Four* (1949), by George Orwell (Eric Arthur Blair; 1903–1950). They were concerned with the effects of the dominant ideologies of the twentieth century and each raised the question of the potential danger of a utopia based on one of these ideologies being imposed on some country. Such works continued to be written, albeit rarely as well, throughout the rest of the century. Later the dystopia was applied to other areas. Two works by John Brunner (1934–1995) are outstanding examples: *Stand on Zanzibar* (1968), focusing on the effects of overpopulation, and *The Sheep Look Up* (1972), focusing on the effects of pollution.

Some authors, such as Fredric Jameson and Sargent, have made a distinction between dystopia and anti-utopia. Sargent reserves the latter for works written against positive utopias or utopianism. Jameson does the same, but in doing so makes a political point by arguing that anti-utopianism has dominated the late twentieth century.

The most important twentieth-century theme of positive utopias has been feminism. The discovery of *Herland* (published serially in 1915) by Charlotte Perkins Gilman (1860–1935) with its first book publication in 1979 led to the discovery or rediscovery of many early feminist utopias, particularly *The Description of a New World, Called the Blazing World* (1666), by Margaret Cavendish, duchess of Newcastle (1623?–1674); *A Serious Proposal to the Ladies* (1694), by Mary Astell (1668–1731); and *A Description of Millenium Hall* (1762), by Sarah Scott (1723–1795).

Such feminist utopias are found throughout the history of utopian literature, but the greatest number were published from the mid-1970s through the end of the twentieth century, with the most important being those by Le Guin, Piercy, and Russ. Small feminist presses published many of these novels, and the many lesbian utopias were published almost exclusively by lesbian presses. Such lesbian utopias included *Retreat: As It Was!* (1979), by Donna J. Young; *Daughters of a Coral Dawn* (1984), by Katherine Forrest (b. 1939); and *Womankind: A Vision* (1986), by Sunlight.

The other major theme of the late twentieth century was environmentalism. *Ecotopia* (1975), by Ernest Callenbach

(b. 1929), the most influential of the environmental utopias, was initially published by a small press and then reissued by a mass-market publisher. Later, environmentalism and feminism combined in ecofeminism, and most utopias that are feminist or reflect environmentalism include the other perspective.

Intentional communities. The aspect of turn-of-the-twenty-first-century utopian studies that might appear least connected to the tradition of utopianism is intentional communities, but most such communities had a clear vision of how they hoped to live, which was in many cases explicitly utopian. In most cases, the actuality of the communities had little to do with the visions. Still, the visions were there, and they attracted and continue to attract people who choose to try to live the vision, even if they regularly fail to do so.

Many intentional communities were founded in the late 1960s through the 1970s, and while most were short-lived, there are a substantial number of such communities, like Twin Oaks in Virginia and The Farm in Tennessee, that are well past their thirtieth anniversary. And there are individual communities in various countries that are past fifty or seventy-five years. The phenomenon continues to grow, with more communities planned and some founded each year, and although members now downplay the utopian aspects, they are still there.

Utopian social theory. The first major theorist to use utopia as an aspect of social theory was Karl Mannheim (1893–1947). Mannheim's sociology of knowledge is concerned with the social origins of thought systems, and to understand them he contrasts ideology and utopia. Ideology characterizes dominant social groupings who unconsciously obscure the fragility of their position. Utopia characterizes subordinate social positions; it reflects the desire to escape from reality. The utopian mentality is at the base of all serious social change.

Karl R. Popper (1902–1994) objected to utopianism in his *The Open Society and Its Enemies* (1945). Popper argued that utopianism leads to violence and totalitarianism, saying, “the Utopian approach can be saved only by the Platonic belief in one absolute and unchanging ideal, together with two further assumptions, namely (a) that there are rational methods to determine once and for all what this ideal is, and (b) what the best means of its realization are” (vol. 1, p. 161). Popper's position came to dominate discussions of utopianism.

Those opposing Popper and supporting utopianism, like Ernst Bloch (1885–1977) and Frederik L. Polak (1907–1985), argued that utopianism was an essential element of all positive social theory. Polak argues that it is fundamental to the continuance of civilization, saying:

if Western man now stops thinking and dreaming the materials of new images of the future and attempts to shut himself up in the present, out of longing for security and for fear of the future, his civilization will come to an end. He has no choice but to dream or to die, condemning the whole of Western society to die with him. (vol. 1, p. 53)

Others have argued that while some people may be willing to impose their vision on others if they have the power to do so, this is not a problem with utopianism but with people misusing power.

Karl Marx (1818–1883) and his followers argued that their version of socialism was scientific, in contrast to the socialism of the so-called utopian socialists. This position was most famously expressed by Friedrich Engels (1820–1895) in his *Socialism: Utopian and Scientific* (1882), but Marxists have always been more ambivalent about utopianism than this simple division suggests, and while many Marxists were anti-utopian, others were clearly utopian themselves.

Thus, while Bloch was a Marxist, he did not have the negative attitude to utopias of many Marxists because his philosophy stressed the end or goal of human life. He saw utopia as an aspect of present reality, saying, in his *Principle of Hope* (1955–1959):

So far does utopia extend, so vigorously does this raw material spread to all human activities, so essentially must every anthropology and science of the world contain it. *There is no realism worthy of the name if it abstracts from this strongest element in reality, as an unfinished reality.* (p. 624; emphasis in the original)

Bloch makes a key distinction between “abstract” and “concrete” utopia. “Abstract utopia” includes the wishful thinking or fanciful elements found in the utopian tradition, such as the golden ages, earthly paradises, and cockaignes that occur early in most utopian traditions but also continue throughout their histories. “Concrete utopia” anticipates and affects the future, something like Polak’s idea that our images of the future are part of the creation of our actual future. But for Bloch, as a Marxist, utopia must be part of praxis, it must grow out of present reality and influence actual political activity. Utopia, for Bloch, is a mechanism that has the potential of being reached. As Oscar Wilde famously put it, “A map of the world that does not include Utopia is not worth even glancing at, for it leaves out the one country at which Humanity is always landing. And when Humanity lands there, it looks out, and, seeing a better country, sets sail. Progress is the realization of utopias (p. 27).”

Bloch’s approach is based on the joined concepts of “hope” and “desire,” in which desire can become an active agent of change. In *The Concept of Utopia* (1990), Ruth Levitas uses Bloch’s approach to develop an understanding of utopia as a politically important tool whose essence is desire.

Postmodernism

The coming of postmodernism, with its rejection of universals, posed a problem for those utopians who see utopias as generalizable solutions. But as Moylan points out in *Demand the Impossible*, writers of utopias had begun to change their approach even as postmodernism became influential. Le Guin’s subtitle, *An Ambiguous Utopia*, signaled an explicit rejection of perfection and the recognition that utopias will face problems and will change over time.

Fredric Jameson, one of the most important theorists of postmodernism, has written extensively on utopianism. Jameson, like Bloch, argues that the literary utopia is a form of praxis rather than representation. But for Jameson, utopias are not goals, as they are for Bloch, but critiques of the present that help reeducate us regarding the present.

Both positive and negative utopias continue to be published. Intentional communities continue to be founded, and while most will fail, some will last for many years, fulfilling at least some of the expectations of their members. And attempts to understand the roles played by utopianism in human thought continue. Utopias have always expressed both the hopes and fears of humanity, the highest aspirations for human life and the deep-seated fear that we may not be capable of our own aspirations.

Non-Western Utopianism

While some well-regarded scholars argue that utopianism is a Western phenomenon and that utopias do not appear outside the West until the influence of More’s *Utopia* was felt, others have argued that utopianism developed independently in non-Western cultures. Thomas More invented a literary genre, but there are texts in the West and outside it that predate More’s *Utopia* that describe a nonexistent society that is identifiably better than the existing society. Probably the best-known early non-Western utopia is “The Peach Blossom Spring,” a poem of T’ao Yüan Ming (also known as T’ao Ch’ien) (365–427), that describes a peaceful peasant society, but there are golden ages, earthly paradises, and other forms of utopianism found in Sumerian clay tablets and within Buddhism, Confucianism, Hinduism, Islam, and Daoism.

Once it is established that there are utopian traditions that are certainly non-Western, there are problems that confront a scholar approaching the subject at the beginning of the twenty-first century. One is the issue of what is non-Western. Scholars disagree profoundly over what constitutes non-Western and Western. Some would limit Western to Europe, North America, Australia, and New Zealand and thereby exclude the substantial Portuguese and Spanish literatures published in Central and South America, which contain many utopias. Others would include these literatures. A second problem is that there are no good bibliographies of any non-Western utopianism not written in English. A related problem is that there are debates in a number of countries, even in countries such as India, where English is an official language, over the status of works written in English, particularly those written by authors who choose to live outside the country.

In ancient China, Moist and Legalist thought had utopian elements, and the same can be said for neo-Confucianism and Daoism. In twentieth-century China, Mao Zedong (1893–1976) was clearly utopian in his desire to transform Chinese society along the lines of his vision for it, and it can be argued that Mao’s Communism was both Marxist and rooted in Confucianism.

There have been a number of twentieth-century political movements with utopian dimensions. In India, Mohandas K. Gandhi (1869–1948) was a utopian and used the Hindu

notion of Ramaraja (the rule of the Rama), the golden age, as a means of communicating his ideas. The vision of the Islamic republic developed by Ayatollah Ruhollah Khomeini (1900?–1989) and by the Taliban for Afghanistan were also clearly utopian and fit Popper's analysis of the dangers of utopianism.

There are oral utopian traditions among the aborigines in Australia, the first nations in Canada, the Maori in New Zealand, and the Native American Indians in the United States. The struggle against colonialism produced millennial movements with strong utopian elements, such as the Taiping Rebellion (1851–1864) in China and the Ghost Dance movement in the United States. There were dozens of such movements in South America and movements among the Maori in New Zealand, some of whose successors still exist in the early twenty-first century, such as the Maori's Ratana Church.

Also, there is a strong communitarian tradition in both Buddhism and Hinduism, and there is a traditional communitarianism among various indigenous peoples that has redeveloped since around 1980 as chosen, better ways of living, particularly among the Maori in New Zealand.

Most non-Western utopianism is post-More and clearly connected with the genre of literature he invented, and as a result are deeply influenced by the West. Since China had the strongest pre-More utopian tradition, it is not surprising that it has the strongest post-More tradition. The Chinese utopias that are best-known in the West are Li Ju-Chen's (c. 1760–c. 1830) *Flowers in the Mirror* (1828), which favors the rights of women, and Kang Youwei's (1858–1929) *Da Tung Shu* (1935), which is concerned with world unity.

Works that most nearly fit the genre of utopian literature appear to be most common in former colonies, and aspects of Chinese utopianism fit this model. There are utopias in English in various African countries, including South Africa, where utopias are in Afrikaans, English, and indigenous languages. In addition, there are utopias (because of limited research, how many is not known) in various indigenous languages in other African countries and in India.

African utopias in English are the works most widely read in the West. They come from many different countries and have a strong dystopian flavor. But as with many contemporary Western utopias, they often hold out hope of positive change. Ali A. Mazrui (1933–), who was born in Kenya, wrote *The Trial of Christopher Okigbo* (1971), which is mostly dystopian but still holds out hope. Authors born in Nigeria include Buchi Emechta (1944–), whose *The Rape of Shavi* (1983) shows the destruction of traditional utopia by colonialism; Wole Soyinka (1934–), whose *Seasons of Anomy* (1973) is primarily dystopian but includes the possibility of a better life; and Ben Okri (1959–), whose *Astonishing the Gods* (1995) presents the search for utopia. Bessie Head (1937–1986) was born in South Africa and lived in Botswana; her *When Rain Clouds Gather* (1969) presents a village that is both described as a utopia and is the location of an attempt to create a utopia.

The best-known Indian utopia in English is probably Salman Rushdie's (1947–) *Grimus* (1975), which includes a society that is described in the text as "utopian" because it functions on a basis of rough equality and with no money. Other Indian utopias do not appear to have gained much of an audience outside India.

Comparative studies on Western and non-Western utopianism are only just beginning. (An early-twenty-first-century example is Zhang Longxi's "The Utopian Vision, East and West" in the journal *Utopian Studies* [2002].)

VICTORIANISM. Even seemingly unshakeable axioms are prone to reassessment by historians, and Victorianism is no exception. Even the very period of Victorianism itself stands challenged: historians no longer refer unquestioningly to the

“Victorian Age” as the precise years associated with the monarch but instead concentrate on a shorter period—a “high age”—from about 1830 to 1880. Yet critics shadowed the entire period in question, and the negative connotations were fired dramatically forward soon after the period ended, notably with Lytton Strachey’s (1880–1932) mocking attack *Eminent Victorians* (1918). Moralizing, prudish, repressed (and repressive), and old-fashioned (rather than traditional)—each of these notions captures what Victorianism has meant to later generations.

North-West Passage (1874) by John Everett Millais. Oil on canvas. A strong patriarchal influence and the importance of family were prominent values in the Victorian Age, possibly, some say, because there were so many societal obstacles for families to overcome. © THE ART ARCHIVE/TATE GALLERY LONDON/EILEEN TWEEDY

Early Victorianism

The early Victorian years witnessed the emergence of a cluster of values and beliefs that represented the central ideas of Victorianism. These years are associated with developments in governance, economic and social life, science, and learning that capture the essential features of Victorianism. In governance, one can look to the reforms which, if not immediately democratic, changed the structure of parliament, ushering in a tradition of evolutionary change (with major Reforms Acts in 1832, 1867, 1884) and the expansion of local, middle-class political power with the Municipal Corporations Act (1835). In economic life, the hard-nosed essentials of political economy and utilitarianism reached a high point prior to the 1850s. Associated with such notable names as Jeremy Bentham (1748–1832), James Mill (1773–1836), and David Ricardo (1772–1823), and later refined and developed by luminaries such as John Stuart Mill (1806–1873), political economy helped to shape the policy conditions for the reform of the Elizabethan Poor Law (in the form of the Poor Law Amendment Act, 1834), and the ideology of self-help which, for a while, attained the status of mantra. By the time Samuel Smiles (1812–1904) penned the popularized guide to the joys of this creed (*Self Help*, 1859), the concept had already begun to be pushed to one side by a creeping state and the tendency of the working class to collectivize in the face of demands for Smilesian individualism: hence, the staggering rise of friendly societies, trade unions, the co-operative movement, and countless other examples of collective identification by the people.

Values and Beliefs

In religion, Victorianism balanced the ancient regime Anglicanism of the Church of England with a growing pluralism through alternative Christianities, new faiths, and the toleration of unbelief. The backdrop to this was a crisis of faith for Anglicans, dating to the early Victorian years, when the Church of England was rocked by fierce debates about Tractarianism, “Romish” rituals, and the intellectual contribution of the Oxford movement. At a more prosaic level, the Religious Census of 1851 revealed a general weakening of popular interest in the established church and many dissenting faiths, whilst Roman Catholicism prospered through Irish migration. Victorianism may be equated with spiritual piety and Christian morality, but alternative and opposite forces also had some importance. Agnosticism, advocated most notably by Thomas H. Huxley (1825–1895), offered, by the 1870s, an alternative to faith in the attempt to answer profound questions about the nature of being.

Victorianism came to be associated with patriarchal social values, stressing the importance of family and an image of motherhood captured well in Alfred Lord Tennyson’s (1809–1892) poem, *The Princess* (1847):

Man for the field and woman for the hearth;
for the sword, and for the needle she;
Man with the head, and women with the heart;
Man to command, and woman to obey;
All else is confusion.

Thus, poetry, as well as prose, painting, and music, reflected hegemonic notions. Yet, the stereotype of the Victorian family perhaps assumed its importance precisely because there were so many challenges to it. In the cities, drink and crime denied many children the full influence of parental guidance, and the critics of industrialism saw in female and child labor a collection of evils that had to be addressed. But economic conditions placed women and children in this position. Poverty, drunkenness, and alcoholism were sometimes causes of prostitution. Charles Dickens’s (1812–1870) portrayal of Nancy, the pathetic, doomed heroine of *Oliver Twist* (1837–1839), obliquely, and somewhat coyly, suggested how easy it was for a woman to fall prey to professional gangs. In *Mary Barton* (1848), Elizabeth Gaskell (1810–1901) captured the horror that Victorian society felt at the sight of a “fallen woman” in her portrayal of the stunted relationship of the widower John Barton and his sister-in-law, the fallen woman. Social reportage also emphasized this aspect of Victorianism: Bracebridge Hemyng’s (1809–1898) study of prostitution suggested that, in 1857, London had 8,600 who plied this trade.

Anti-Victorianism

Behind the facade of staidness there was another sort of Victorianism—a kind of anti-Victorianism. Here, stifling mores were replaced by more adventurous and plural sexualities. Liaisons outside marriage, such as Dickens’s longstanding affair with the actress Nelly Ternan, were common. William Gladstone’s (1809–1898) self-flagellation—a habit the four-time prime minister shared with the bohemian Algernon Swinburne (1837–1909)—was his punishment for the sexual feelings (though there are no known sexual acts) aroused by his attempts to rescue London’s prostitutes. Pornographic pictures and texts were readily available in the nineteenth century. Peep shows were commonplace and provided titillation to a broad spectrum of male society. As Simon Winchester’s *The Surgeon of Crowthorne* (1999) demonstrates, William Chester Minor (1834–1920), the American military doctor, murderer, and prolific contributor to the *Oxford English Dictionary*, aggressively pursued a sex life that utterly contradicted the conventional image of his age. Obsessed with sex and a regular user of prostitutes—prior to his incarceration in 1872 in the new Broadmoor Criminal Lunatic Asylum for murdering a man in London—Minor harbored such a strong sense of self-loathing that he cut off his own penis. Homosexuality may have scandalized Victorian sensibilities, but it was not invisible. Literary works with a homosexual theme, such as *Teleny* (1883), were produced; Oscar Wilde’s (1854–1900) trial and imprisonment reminded Victorians that homosexuality and pedophilia were part of their worlds; while the artist and aesthete Aubrey Beardsley (1872–1898) helped to create a self-image of sexual radicalism, including an unfinished pornographic novel, *Under the Hill* (1894). Not long after, in 1899, Lord Longford was recorded for posterity in *Hansard* with a telling contribution to a parliamentary debate: “Of course I have seen people recover from homosexuality. A boy at Eton assaulted my elder brother in the bath there and was later expelled for repeating the offence on another boy. Later he became a pillar of society and captained the county cricket team” (Sweet, p. 190).

The period saw the creation of several new religions, a branching out of Christianity, and a growing rise of agnosticism. © HULTON-DEUTSCH COLLECTION/CORBIS

Victorianism and Progress

No other age was quite so strongly associated with a faith in the progress of technologies. Victorianism is correctly and inextricably intertwined with inventions and the rise of the machine. Steam locomotion, iron, and then steel ships, telegraphy, and many other developments receive attention from historians, for the Victorians triumphed over so many challenges of distance and power that had held up such progress in earlier times. Justifiably, Victorianism remains associated with industrialism, urbanization, transport, technologies, travel, and communication. The essential character of Victorian technological determinism was that science and the practical men could change the world through invention and implementation.

Leaps in technology were matched by developments in social thought. Prophets of progress and the enemies of industrial modernity competed for space, and both groups contributed to the sense of what Victorianism was about. From the 1830s, the critics of Victorianism grew. Modernity was feared by many and loathed by some. Tories, such as the “Young England” group (which included Benjamin Disraeli [1804–1881]) looked back to a bygone age of preindustrial harmony, where deference, social equilibrium, and a more agreeable life was once thought to exist. Disraeli’s classic, *Sybil; or the Two Nations* (1845), captured these sentiments brilliantly. Another stern early critic, the Scot Thomas Carlyle (1795–1881), shared the “Young England” aversion to modernity but

looked forward, not back. He abhorred the Victorian tendency to seek mechanical solutions to human problems and sought, instead, a reinvention of an earlier morality, but in a future setting. This style of criticism connected many early nineteenth-century thinkers, such as Carlyle and Robert Owen (1771–1858), to later socialists, such as William Morris (1834–1896). By the 1880s the critique of Victorianism was powerful indeed. Unlike on the continent, where Marxism was much more influential and where anarchism and communism posed a seemingly greater challenge, most British socialism sought accommodation with capitalism and was reformist in character. The Fabian, Sidney Webb (1859–1947), represented an administrative type of socialism, based upon efficiency and organization. William Morris’s utopian socialism was characterized by a more fundamental attack upon capitalism and a pursuit of an alternative moral and spiritual way of life. Socialist criticism of modernity also had echoes in the growing feminist challenge to Victorianism. Although suffragism achieved its ends beyond the Victorian period, its seeds were sprouting long before Victoria’s end.

Traditional interpretations of society as a static entity were undermined as the period progressed. Charles Darwin’s (1809–1882) theories of evolution and Herbert Spencer’s (1820–1903) considerations upon human development were to have a startling impact, radically altering classic Victorian notions of society and how to manage it. A social science, borrowed from evolutionary theory, that downplayed contractual in favor of organic ideas of society emerged. Social Darwinism and other evolutionary theories played some part in the development of a philosophy of state interventionism, which marked later Victorian, and particularly twentieth-century, thought (though recent studies, for example, H. S. Jones’s *Victorian Political Thought* [2000], sound more cautious and complicated notes). The search for perfectibility in society, which echoed nature’s selection of the fittest, could be set up for *or* against the collectivization of social welfare.

Victorianism Beyond Britain

Victorianism—in architecture, science, governance, and culture—impacted heavily upon the wider world. Britain’s short-lived preeminence as an imperial power bequeathed a rather hardier cultural imprint on the world. After the globalization of the English language, the most striking effect was in the character of civic culture in the English-speaking colonies and dominions: Canada, Australia, and New Zealand. In these places, political systems, bureaucracies, and education took on a clearly Victorian character. Victorianism also affected street design and civic building programs—in India, parts of Africa, and the Far East, as well as in the Dominions. Urbanism marked the Victorian world outside of Britain, as well as within. So great was the growth in Sydney, for example, that in 1901 that city (not Liverpool or Glasgow) boasted “it now stands as the second city of the British Empire, as estimated by the annual value of its rateable property” (Briggs, p. 310).

Even when it stood at the leading edge of world culture, exercising a hegemonic power over large swaths of the globe, Victorianism had its critics. In politics, social thought, and economics, interventionism and a demand for action pushed

Victorian-style house at Longwood, Natchez, Mississippi (1860–1862). In the mid-to-late-nineteenth century, buildings—especially in the United States—became elaborate and complex in design and decoration, with architects drawing upon several different styles, from Italianate to Queen Anne. © G. E. KIDDER SMITH/CORBIS

classical *laissez-faire* ideologies to one side. Sexual repressiveness was challenged; many on the left of politics rejected capitalism; and an imperial rot set in after the arduous struggles of the Boer War (1899–1902). The challenge to Victorianism often came in the shape of a wholesale anti-Victorianism from a disparate array of groups: workers, women, socialists, bohemians, and from anticolonialists beyond the metropolitan stage.

VIRTUAL REALITY. *Virtual reality*, a term that became popularized in the late 1980s with the advent of critical research and new technologies developed by Scott Fisher at NASA-Ames Research Center, has its roots in a broad and colorful evolution of art, technology, and communications. The creation of virtual reality is essentially concerned with the quality and experience of immersion, whether real or simulated. The idea of immersion in this sense is related to the artistic concept of “representation,” in which the world is translated into visual form. Virtual reality often extends this notion of representation by engaging other senses as well, such as sound and touch, to bring about multisensory experience.

The first part of this essay is an overview of the leading pioneers in the arts and sciences who introduced new technologies, concepts, and artistic innovation that led to the contemporary definition of virtual reality. The second part focuses on artists and theorists who have chronicled new media and virtual reality and its impact on the social condition, revealing transformations in cultural norms and the psychological effects of extending our reach into virtual space.

Historical Overview

By 15,000 B.C.E. Cro-Magnon had evolved with a brain capable of modern intelligence. With this new intelligence, artistic renderings were installed deep in subterranean grottos in the Dordogne region of southern France, in caves such as the well-known Lascaux. This birth of drawing and painting was among the first attempts at representation, in the modern sense of the word, in which animal figures (bison, reindeer, horses) and coded shamanist scrawls and motifs were brought to life on the walls of the caves. This recreation of both the external world of nature and the inner world of magic in the immersive space and controlled atmospheric conditions of the underground cavern was an early attempt at artistic expression for the purpose of the preservation of culture. Here, in the prehistoric caves, the human concept of virtual reality began with the multisensory, totalizing experience that engaged sight, sound, smell, and touch—the first conscious virtualization of the physical world.

The Gothic Cathedral of Notre Dame in Chartres, one of the greatest of the European Gothic cathedrals, was built in central France beginning in the late twelfth century. With its magnificent rose windows and stained glass, resonant chambers,

vaulted ceilings, and sacred labyrinth, the sanctuary transposed the virtues of the church by transporting the individual through the experience of immersion. The cathedral served as an architectural canvas for the depiction of the scriptures, figures from the Old Testament, and the narrative of the Crucifixion, as told through the elements of light, sculpture, glass, sound, and stone. The enigmatic labyrinth inlaid on the floor of Chartres invites the viewer to navigate its complex pattern as a spiritual exercise. From the interior of the space, the great height of the cathedral evokes the ascent of heaven. The immersive and totalizing depiction of religious life invites the visitor to consider virtual reality as a mystical realization and transformation from the material to the immateriality of human existence.

German composer Richard Wagner's (1813–1883) *Gesamtkunstwerk* (total artwork), as implemented at the Festpielhaus in Bayreuth, Germany, in 1876, illuminates our understanding of the artistic impulse behind the creation of virtual worlds as it corresponds to the theatrical environment. Wagner understood the power of virtualization through music theater, and he mastered techniques of sensory immersion in order to heighten the audience experience of the “suspension of disbelief.” The composer employed a powerful articulation of this age-old theatrical device to render stage action “believable,” which has been used as long as humanity has employed the

San Francisco Opera rehearses a 1990 performance of Wagner's *Siegfried*. When staging his compositions, Richard Wagner sought to use various theatrical devices, such as placing the orchestra out of sight, to immerse the audience completely in the world depicted in his works. © IRA NOWINSKI/CORBIS

artifice of live performance to represent, recreate, and transform reality—transcending the notion of the sole possibility of the things that “are,” replacing them with what “might be.” Wagner used the mechanisms of the theater, as the computer would be used in the early twenty-first century, to transport the viewer’s mind, emotion, and senses to an otherworldly virtualization where reality is reconfigured. As he stated in his essay “Artwork of the Future,” “the spectator transplants himself upon the stage, by means of all his visual and aural faculties.” This illustrates Wagner’s desire to construct a totalizing experience through the narrative of music drama, one that fully engages the viewer’s consciousness. The composer’s invention of such theatrical devices as darkening the house, hiding the musicians in the orchestra pit, and reintroducing Greek amphitheatrical seating to orient audience perspective directly to the stage all contributed to the powerful illusion that takes place within the frame or “interface” of the proscenium arch—the portal to the imaginary space of the theatrical stage.

In the late 1940s, MIT scientist Norbert Wiener founded the field of cybernetics (derived from the Greek word for “steersman,” or “governor”) to explore the sociological impact of communications between human and machine. This research is critical to an understanding of the impact of virtual

reality, as Wiener opened the door to the study of human relationship to technology and the cyberborgian (cybernetic organism) nature of the symbiosis of the two. Wiener describes an increasingly technological society reliant on machines, and he explains how the nature of those interactions affects the quality of life. The design of virtual reality technologies that extend our reach, such as tele-robotic devices (the control of robots at a distance), is informed by Wiener’s research in cybernetics and his concern with the nature of sending messages and the reciprocal feedback inherent in those systems.

The virtualization of reality and the simulation of human consciousness by engaging the full range of the viewer’s sensory mechanisms is illustrated by cinematographer Morton Heilig’s claim in the 1950s that the cinema of the future—a medium already transformed by such innovations as the panoramic perspective of Cinerama—would “no longer be a ‘visual art,’ but an art of consciousness . . . [a] simulation so lifelike that it gives the spectator the sensation of being *physically* in the scene” (p. 250; emphasis in original). The experience of “being there” has since been a paramount quest in the development of virtual reality. Heilig’s Sensorama, for example, a nickelodeon-style arcade prototyped in the 1960s, immersed the viewer in a multisensory excursion through the

streets of Brooklyn that engaged all the senses through the synchronization of media using the technology of film.

In the mid-1960s, the engineer Douglas Engelbart conducted critical research at the Augmentation Research Center at Stanford Research Institute, which resulted in the invention of the computer mouse, hypertext, and other interactive information technologies. For the first time, one could virtually navigate information space as an alternative to the linear methods of earlier forms of computing. The mouse pointer (cursor) and keyboard in conjunction with the visual display extended the intellectual reach of the individual. Engelbart believed that this intuitive and cybernetic approach to information processing would lead to the “augmentation of human intellect,” by engaging the individual in new methodologies of complex problem solving, far beyond the scope of previous tools.

Computer graphics specialist Ivan Sutherland, the first scientist to bring real-time graphics simulation to the computer screen, advanced the possibilities of reality construction, claiming, “the ultimate display would, of course, be a room

within which the computer can control the existence of matter . . . a bullet displayed in such a room would be fatal” (p. 256). At the University of Utah in 1970, Sutherland introduced the first head-mounted display (miniaturized graphics display) that enabled the superimposition of low-resolution computer graphics in the physical environment. Expressing the

spirit of Lewis Carroll’s *Alice in Wonderland*, Sutherland believed in a new mathematical wonderland that transformed the abstract nature of mathematical constructions into virtual objects and imaginary worlds.

The defining development in virtual reality was carried out in the late 1980s at the NASA-Ames Research Center in northern California by the artist and scientist Scott Fisher, who sought to render virtual worlds even more closely coupled to our sensory mechanisms. Fisher oversaw the creation of the VIEW system (Virtual Interactive Environment Workstation), the first virtual reality (VR) system that integrated the head-mounted display, dataglove (sensing device worn as a glove), voice recognition, and three-dimensional (3-D) audio, which enables the listener to experience the location and movement of specific sounds more realistically than the two-dimensional stereo field of left to right. As a result of this research, Fisher established the field of telepresence, in which one could virtually transport oneself to another place, real or imaginary, experiencing remote spaces and controlling objects at a distance. According to Fisher, virtual reality’s potential was now as limitless as reality itself.

In the early 1990s, Daniel Sandin, along with his colleagues Thomas DeFanti and Carolina Cruz-Neira, developed the CAVE System (Cave Automatic Virtual Environment) to project interactive, computer-generated 3-D imagery and audio into a physical space defined by multiple projection screens and a surround-sound system. The immersive nature of CAVE was intended as an allusion to Plato’s Cave, evoking the shadowy presence of the representation of reality. The CAVE System also returns full circle to the earliest attempts at virtualization and multisensory experience, as practiced in the prehistoric caves of Lascaux, seventeen thousand years earlier.

Cultural Implications

While a graduate student at MIT in 1979, the artist Michael Naimark collaborated on the *Aspen Movie Map*, the navigable

laserdisc tour through Aspen, Colorado. Using a touch screen monitor and interactive display, the viewer navigates the streets of Aspen, exploring the environment virtually by controlling the direction and speed of the video. The *Aspen Movie Map* was Naimark's first exploration into what he refers to as "surrogate travel," in which the viewer is transported virtually to another place. Naimark's research opened up new interest in virtual forms of navigation in real or imagined places, in which the possibilities for nonlinear storytelling and interactive experience might alter our perception of time and space.

The video artist Bill Viola has been concerned with the idea of "dataspace" since the 1980s as a means to record cultural history in electronic or virtual space, inspired by the "memory palaces" of Greek temples and Gothic cathedrals. Viola compared these ancient architectural vessels of knowledge to the contemporary personal computer with its capacity for storage and instant-access retrieval of information. According to Viola, the symbolic ornamentation, paintings, and stained-glass windows of the European cathedrals might serve as a model for the branching pathways and hypermediated environments of computer-controlled video works, resulting in what he refers to as "idea space"—the conceptual basis for

recent virtual reality applications that employ 3-D simulation of information space.

William Gibson coined the term *cyberspace* in his 1984 science fiction novel *Neuromancer*. By adding this term to contemporary vocabulary, Gibson gave literary meaning to the wires, hubs, networks, and computers that constitute the material manifestation of the more abstract virtual information space. Gibson foresaw a habitable, immersive terrain that would become a new environment for the staging of narratives concerned with the far-reaching possibilities of cyber activity. This reconstruction of the material world through the emerging information technologies would, in Gibson's terms, spark an age of the "posthuman," in which utopian dreams and dystopian nightmares are imagined and realized in digital form.

The computer scientist Pavel Curtis developed one of the first multiuser environments at Xerox PARC (Palo Alto Research Center) in the early 1990s, entitled LambdaMOO, and designed as a text-based virtual reality. The purpose of his research was to explore social phenomena in real-time virtual space—the forerunner of the chat room. Curtis's observation of social behavior in cyberspace is fundamental to our understanding of the

Performance artist Laurie Anderson. Anderson's performances frequently utilize varied forms of media such as dance, music, and computer technology. Often the pieces are interactive and audience members are invited to participate. AP/WIDE WORLD PHOTOS

sociological implications of communications in virtual reality. His research also explored the new paradigms of anonymity, the fluidity of multiple identity creation, and the extensibility of world building in digital spaces, and how they might come to transform social interaction.

Marcos Novak, a digital architect, describes his 3-D designs as "liquid architectures," digital spaces that are composed to virtually situate the viewer into complex "fourth-dimensional" environments. He has conceived of these immersive spaces as "navigable music" and "habitable cinema," with their allusion to musical and narrative forms. Novak poetically describes his research: "liquid architectures . . . is an architecture without doors and hallways, where the next room is always where I need it to be and what I need it to be" (p. 259). In Novak's renderings, architecture need no longer be experienced as a fixed or finite space, but rather engages the viewer in the interactive, fluid, and transformational properties of digital media. He has created a vocabulary and set of paradigms for future architects who will no longer work within the physical constraints of solid materials.

In 1993, *Virtual Reality: An Emerging Medium* opened at the SOHO Guggenheim Museum in New York City, one of the first exhibitions to investigate new artistic directions in virtual reality. The show featured two virtual worlds by Jenny Holzer. The first, *The Lost Ones*, was inspired by one of Samuel Beckett's short stories. The second, *Bosnia*, offered a response to the violence against women in the Bosnian war. The observer enters and discovers a vast patterned desert of striking color: bright orange earth and deep blue sky. As one travels across the landscape, one reaches villages with block huts. Each hut harbors a different voice, and each village has a different story to tell. *Bosnia* points to a form of interactive storytelling in which the viewer virtually enters into and inhabits the "narrative space," where the narrative unfolds according to viewer's interactions.

The multimedia artist Laurie Anderson created large-scale theatrical works during the 1980s that integrated dance, music, performance art, and technology. In 1995 she explored the interactive medium, creating the CD-ROM *Puppet Motel* as a nonlinear sequence of scenes and vignettes based on previous theater pieces. *Puppet Motel* is a new form of performance art that takes place on the virtual stage of the computer desktop; the audience becomes the performer, controlling the flow of time and the movement of the narrative. Anderson's experimentation with interactive multimedia can be viewed as a new form of "digital *Gesamtkunstwerk*," in which the theatrical "fourth wall" dissolves; the fourth wall is the mechanism that traditionally separates the audience from the stage to preserve the illusion of the stage. Here the viewer enters into, inhabits, and interacts with objects in an illusionary world conceived as theater in digital space.

The artist Char Davies has explored new ways to interface with the technologies of virtual reality: the apparatus worn by an "immersant" in her work *Osmose* (1995), which includes a head-mounted display and harness, incorporates breath and movement as a means for navigating a sequence of virtual environments. The viewer uses body motion similar to the scuba diver to negotiate the floating, meditative worlds of the artwork—the contemplation of self, space, nature, and sound, has a powerful effect in the evocation of otherworldly conditions. As Davies describes her work, "The medium of 'immersive virtual space' or virtual reality . . . has intriguing potential as an arena for constructing metaphors about our existential being-in-the-world and for exploring consciousness as it is experienced subjectively, as it is felt" (p. 295). *Osmose* reveals the potential for virtual reality to transform the inner being, similar to the effects of drugs or meditation to induce mind-altering or "out-of-body" experience.

In viewing virtual reality's historical evolution and cultural impact, we see the timelessness and cyclical nature of human expression—from the dreams and representations as depicted in the prehistoric caves of Lascaux; to the totalizing experience of the *Gesamtkunstwerk*; to recent digital forms of immersive experience and altered states of consciousness. The Japanese curator Toshiharu Ito, describing *conFiguring the CAVE*, an immersive artwork created in 1997 by Jeffrey Shaw, Agnes Hegedues, Bernd Linterman, and Leslie Stück for the CAVE

System at the InterCommunication Center (ICC) in Tokyo, Japan, refers to a fourth dimension that exists between the work and the viewer, a space in which the viewer's awareness and bodily experiences can be restructured and recreated.

In describing immersive forms, "we cannot," according to Margaret Morse, "fully anticipate what it means to experience that realm until we are inside." Virtual reality is experiential and sensory—one does not simply observe the object, one is the object. One is not merely a detached observer—one enters into and becomes part of the landscape. The medium of virtual reality functions as an extension of the self, a reconfiguration of identity, intellect, dreams, and memories—ultimately blurring the boundary between self and exterior, between the real and the imaginary.

VIRTUE ETHICS. Virtue ethics is one of the three major ethical approaches in modern moral philosophy, the other two being utilitarianism and deontology. Unlike the latter two, it focuses on the virtues. In the Western tradition of philosophy, virtue ethics begins with the ethical writings of Plato and Aristotle, but in the Eastern tradition its origins are even earlier. Confucius discussed in detail what might be regarded from a Western perspective as the virtuous character traits of charity, righteousness (the virtue pertaining to public affairs), propriety, wisdom, and sincerity and subscribed to something like Aristotle's doctrine of the mean regarding virtue. Siddhartha Gautama, the Buddha, recognized such virtues—perfections of character—as patience, self-restraint, contentment, sympathy, mildness, courage, meditation, and knowledge. All the ancient ethical writers, from East and West, shared the view that there is an answer to the question "How should a human being live?" and that the answer is "virtuously."

The later Greek and Christian writers continued to emphasize the central importance of the virtues in human life, Augustine being the first Christian writer to place the theological virtues of the New Testament—faith, hope, and charity (*caritas*, or love)—beside Plato's four "cardinal" virtues—courage, temperance, justice, and wisdom. Aquinas took more from Aristotle than from Plato, in particular Aristotle's view that our emotions and appetites can, through habituation, be brought into harmony with our reason. The striking consequence of this view is that, if perfect virtue is acquired, the agent does what is right, as reason directs, without inner conflict.

In Aquinas, and in later Christian writers, discussion of the virtues ran alongside discussions of God's, or "natural," law, but the rise of natural law jurisprudence in the seventeenth century saw this increasingly replaced by discussion of rules or principles intended to identify right—and in particular, just—acts, regardless of the motive or character from which they sprang. This trend was rejected by Hume, who insisted that all right actions derive their merit only from virtuous motives and devoted most of his second *Enquiry* to a discussion of the virtues.

The real break with the virtue ethics tradition came with the emergence of the theoretical alternatives, deontology and utilitarianism, offered by Immanuel Kant and then John Stuart Mill. Although the tradition continued to some extent among Continental philosophers, it disappeared from Anglo-American moral philosophy for about a hundred years.

The Rise of Modern Virtue Ethics

Modern virtue ethics is generally assumed to have been launched by G. E. M. Anscombe's 1958 article "Modern Moral Philosophy," in which she roundly criticized utilitarian and Kantian ethics, briefly indicated "how Plato and Aristotle talk" about ethics, and startlingly claimed that we should give up doing moral philosophy until we had "an adequate philosophy of psychology." The latter turns out to involve, particularly, "an account of what *type of characteristic* a virtue is . . . and how it relates to the actions in which it is instanced."

Fortunately, Anscombe's article did not deter moral philosophers from sticking to their subject. In the 1970s and

1980s Philippa Foot, Iris Murdoch, Alasdair MacIntyre, Bernard Williams, John McDowell, and Julia Annas followed her in criticizing contemporary moral philosophy from the perspective of their reading of the ancient Greeks (and in some cases Aquinas), in which talk about the virtues and vices naturally occurred.

They were not alone in finding the prevailing ethical literature unsatisfactory. By the 1970s, it had become respectable for moral philosophers to do applied ethics. (In the first half of the century they had concentrated almost exclusively on the methodology of ethical theory, metaethics, and the language of moral discourse.) But, despite the fact that articles on contemporary moral issues had become common, moral philosophy seemed to some almost as abstract and removed from everyday life as what had been done in the first half of the century. If “real life” was what was being discussed, why was there no mention of friendship and family relationships, of the morality of the emotions, of motives and moral character, or of moral education? Why did no one ever address the questions of what sort of people we should be and how we should live? Why was the concept of happiness, when it was employed, so unrealistically shallow? The writings of Anscombe’s early followers alerted the dissatisfied to the exciting fact that all of these topics were discussed in Aristotle in connection with the topic of virtue.

By the early 1980s, a flood of books and articles had been published, enough to justify a survey article, Gregory Pence’s 1984 “Recent Work on Virtues.” Its title, however, was significant. The work surveyed was mostly on the virtues themselves, often on a single virtue such as courage or integrity, or on a group such as the virtues involving sympathy, or on the virtues’ relation to knowledge or the emotions. Most of the writings discussed were not explicitly on what we would now call “virtue ethics,” an approach that could replace the traditional deontological or utilitarian theories—though, as Pence notes, many of them made “grand claims” about this possibility. Nevertheless, they frequently contained passing and sometimes sustained criticism of the prevailing orthodoxy and illustrated, albeit perhaps in relation to only one virtue, how “a return to the virtues” avoided the problem identified.

Virtue Ethics’s Criticisms of Prevailing Orthodoxy

A constant target of this criticism of the contemporary forms of deontology and utilitarianism was their shared conception of the task of ethical theory—that it was to come up with a set (possibly one-membered in the case of act-utilitarianism) of general rules or principles that, applied to particular cases, would provide a decision procedure for determining what the right action was. The theory would reveal what was right about the actions everyone already agreed were right, by showing them to be grounded, or justified, by the rules in question. Even more importantly, it would resolve any moral disagreements about what it would be right to do in problematic situations. The virtue ethicists’ attack on the idea that moral dilemmas were best resolved by finding general principles received unexpected support from Carol Gilligan’s 1982 book attacking the principles-based view of moral development espoused by the educational psychologist Lawrence Kohlberg.

Closely related to the criticism of deontology and utilitarianism as obsessed with the formulation of general rules that would deliver cut-and-dried answers were trenchant objections to their use in ideal moral decision making. According to a prevailing view, a truly moral motive involved acting for the sake of duty, but in an influential 1976 paper, Michael Stocker highlighted the oddity of supposing that ideally your friend should visit you in the hospital because it was his duty rather than simply because you were his friend. Similar objections were pressed against the prevailing assumption that taking up “the moral point of view” involved being impartial—according all rational autonomous agents, or the interests of all sentient beings, equal value. The virtue ethicists stressed that impartiality or justice was but one virtue among many and that how one should act in relation to one’s own children, partners, parents, friends, students, patients, and so on was a central aspect of morality that was being ignored.

Before the reemergence of virtue ethics, Anglo-American moral philosophy had accepted as gospel John Rawls’s claim (in *A Theory of Justice*, 1971) that there are just two “main” or “basic” concepts in ethics, “the right” and “the good.” It is a mark of the extent to which virtue ethics has prevailed that it is now widely (though by no means universally) accepted that the concept of virtue is as important as the other two. This has had a beneficial effect on the other two approaches. Now that the significance of virtue has been recognized, deontologists and utilitarians are seeking ways to incorporate it into their theories, to the extent that it has become necessary to distinguish between virtue theory—an account of virtue or the virtues within the framework of any ethical approach—and virtue ethics. There is thus revived interest in Kant’s *Doctrine of Virtue* and in the new wave of character-based versions of consequentialism.

Another way in which virtue ethics has made its mark can be seen in the extent to which moral philosophers have retreated from their earlier position that a normative theory must come up with a decision procedure that will provide specific practical guidance in difficult situations. The virtue ethicists’ stress on the importance of *phronesis* (practical or moral wisdom) eventually brought recognition that such wisdom is needed to apply rules or principles correctly (since we all know that the Devil can quote Scripture to his own purposes), and that they cannot be usefully applied in difficult situations by people who lack experience, insight, and moral sensitivity.

Current Debates about Virtue Ethics

Notwithstanding this concession, the claim that virtue ethics, unlike the other two approaches, cannot provide adequate guidance on actions persists as the most common objection to it. This is reflected in what is increasingly becoming the new commonplace among moderate anti-virtue ethicists, namely that “what we need” (for a complete ethical theory) is “an ethics of virtue AND an ethics of rules.”

In the earlier days of modern virtue ethics, this was a plausible objection. It was based on the premise that the only guidance virtue ethics could come up with was that you should do what the virtuous agent would do in the circumstances. It is

true that the earlier virtue ethics literature offered little more. But then it was pointed out by Rosalind Hursthouse (1991) that every virtue generates a prescription (Do what is honest, Do what is charitable/benevolent) and every vice a prohibition (Do not do what is dishonest, uncharitable/malevolent). The existence of these “v-rules,” expressed in the vocabulary of the virtues and vices and hence part of “an ethics of virtue,” refutes (literally) the premise on which the objection was based; what plausibility, if any, is retained by the claim that an ethics of virtue needs to be supplemented by an ethics of rules or principles is now the central debate.

In some instances, the claim seems no more than a verbal flourish; the v-rules must be “supplemented” by a principle of benevolence, a principle of nonmalevolence, and so on. Why so, one might ask, but why not indeed if people think it sounds more authoritative? Many criticisms of the v-rules fall foul of an obvious *tu quoque* (this applies to you, too) response. Of course, the requirements of the different virtues may, at least apparently, conflict. Honesty points to telling the hurtful truth, kindness or compassion to remaining silent or even lying. But so too do the related deontologists’ and rule-utilitarians’ rules, rightly reflecting the fact (ignored by the old act-utilitarians) that life does present us with dilemmas whose resolution, even if correct, should leave us with a remainder of regret. Like the other two approaches, virtue ethics seeks resolutions of such conflicts in a more refined or nuanced understanding or application of the rules involved; and as with the other approaches, its proponents may disagree about the correct resolution.

Perhaps overimpressed by Alasdair MacIntyre’s early work, critics of virtue ethics have commonly asserted that the v-rules are inherently culturally specific and conservative because they are developed within existing traditions and societies. Virtue ethicists are amused by the implicit assumption that what their rivals find “reasonable” or “rationally acceptable” is not shaped by modern Western culture and (predominantly) American society, and are more than willing to admit that they have no reason to suppose that their own lists of rules are complete.

However, they do point out that their lists of rules—particularly perhaps the list of vice-rules—is remarkably long in comparison with any that their rivals have produced, and grows naturally (albeit within our own culture) as people’s experience of modern life contributes new terms. And they appeal to their list to rebut the charge that the guidance they offer is less specific than that provided by others. “Tell the truth,” even if filled out to provide plausible answers to “All of it? Always? To anyone?” is still much less specific than what is yielded by “Do what is honest,” “Do not do what is disingenuous, rude, insensitive, spiteful, hypocritical, untrustworthy, treacherous, manipulative, phony, sneaky,” and so on. The issue is still hotly contested.

VISUAL CULTURE. While visual culture has certainly been around as long as culture itself, the phrase *visual culture* used to denote a specific component of culture in general, a set of visual practices, or an academic discipline is quite recent. James Elkins, one of this emerging field’s leading scholars, dates the term from 1972, saying that it “was used—perhaps for the first time . . . —in Michael Baxandall’s *Painting and Experience in Fifteenth Century Italy*” (p. 2). The recent provenance of the term *visual culture* is important because it indexes a historical shift in the importance of vision itself that has led to an ongoing reconceptualization of the visual and what has been called, in another neologism, *visuality*. Elkins locates the origins of visual culture as an emerging academic discipline in the cultural studies movement that started in England during the late 1950s, and sees visual culture as an American (U.S.) extension of that project (with an emphasis on the visual that did not really get off the ground until the 1990s). What is visible, how it appears, and how it affects nearly every other aspect of social life is suddenly of paramount concern.

The emergence of an idea called *visual culture* surely implies the emergence of a set of urgent problems for which the idea should enable some kind of answers. At a certain moment in the late twentieth century, a new consideration of the role of the visual, of perception, of images, and of the technologies and subjectivities that are embroiled in these relations became an urgent matter for scholars. This moment, which may be identified with what has been called from various corners and with differing emphasis as poststructuralism, the information

age, media society, postindustrial society, postmodernism, postcolonialism, and/or globalization, is marked above all else by a new degree of saturation of social space by visual technologies, and, one must assume, a related shift in their social function and significance.

The Visual Turn

While it is arguable that this visual turn is indeed the meta-event that might show the deep interrelationships and common logic of the other periodizing categories mentioned above, it is true that the conditions of possibility for the emergence of the idea of visual culture were a long time in the making. As noted, culture always and necessarily has had a visual component. However, the shift in emphasis toward an increasing importance of the visible (and its manipulation) is due principally to two related factors: the organization of economies and societies with and by images and the related hyperdevelopment and intensification of visual technologies. Of course, this claim raises more questions than it answers. Image technologies from photography to cinema, television, and computerization are more and more deeply woven into the very fabric of reality. Such interweaving is imbricated to the point where the function of images has become inseparable from any consideration of what might be called the contemporary human condition, including the situation of other categories of analysis central to the humanities including race, class, nation, gender, and sexuality. What might be thought of as an industrialization of the visible is not, strictly speaking, a natural emergence, any more than it is natural that there be skyscrapers or music television. Rather, the visual turn is the contingent result of a matrix of historical and economic forces. In particular (and this is an argument, not a mere statement of fact), the rise of visual culture is a response to the need to efficiently organize and manage huge populations composed of disparate cultures and/or races, in multiple locations and with varying degrees of economic power in what has become the capitalist world-system. The emergence of visual culture is the historical answer to a complex set of organization questions posed at the scale of the human species.

Visuality

Many scholars locate the emergence of visual culture in relationship to the development of visual technologies, the history of pictorial art, and the emerging recognition of the priority of the visual as the king of the senses. Most, if not all, see this new field as being connected to the streams of images and information that continuously assault spectators from all corners of their environments. No one seems to doubt that, from an experiential standpoint, that which is visible—its intensity, its demands, its possibilities, as these come to us via television, cinema, video, DVD, Internet, electronic billboard, or Mars rover—is something qualitatively new. Yet a smaller number of scholars (Arjun Appadurai, Jonathan Crary, Nicholas Mirzoeff, Sean Cubitt, and a few others) see the emergence of the visual as part of a necessary and practical reconfiguration of subjectivity. The cutting edge of visual cultural studies, however, understands that visuality and the visual technologies that mediate it are part of a larger social project in which the interiority of concrete individuals is being reconfigured. As the

British art historian Norman Bryson writes, “Between subject and the world is inserted the entire sum of discourses which make up visuality, *that cultural construct*, and make visuality different from vision, the notion of unmediated visual experience” (pp. 90–91, italics added). We should add here that visuality is constructed via the interweaving of the discourses that would capture vision and the technologies that utilize it.

Stated dramatically, the social project being undertaken by ostensibly external visual technologies and the economics thereof is not only a reorganization of social macro-structures on a planetary scale but also a total reconfiguration of the interiority of persons. This reconfiguration, which enables and indeed necessitates persons to effectively retool themselves as media for the reception and transmission of social vectors of force—to become mediators among the mediations, implies a new modality of what used to be thought of as human being. It is around these questions that the debates regarding visual culture are perhaps most interesting and fruitful. As nearly all persons, from U.S. presidents, to Hollywood directors, to international consumers, to middle-class workers, to television viewers, to war victims, to dollar-a-day sweatshop chip manufacturers are locked into an economy that passes through the visual, and as the visual is mediated by new technologies, financial institutions, and the military industrial complex, it is fair to say that humanity, if one can still call it that, has become at once more profoundly collective and more inexorably cybernetic than ever before.

Historical Emergence of the Field of Vision as a Site of Power and Social Control

In Nicholas Mirzoeff’s “The Subject of Visual Culture,” an essay that serves as an introduction to his important edited volume *The Visual Culture Reader*, he writes that “By the visual subject I mean a person who is both constituted as an agent of sight and as the effect of a series of categories of visual subjectivity” (p. 10). Sketching the emergence of some of these categories, Mirzoeff traces an arc from René Descartes (1596–1650) to roughly Jean-Paul Sartre (1905–1980) and Jacques Lacan (1901–1981). This arc spans the early modern Cartesian notion of “I think, therefore I am” to what Mirzoeff calls “a new mantra of visual subjectivity: ‘I am seen and I see that I am seen’” (p. 10). Notably, the modern subject who first emerges through the negation of the visual field (Descartes begins his meditations by doubting the veracity of vision itself, specifically whether it is his hand he sees before his face), and after being subject to a variety of disciplinary regimes of surveillance (in the work of Michel Foucault [1926–1984]), is later constituted in and through the visual (Lacan’s “I see myself seeing myself”). The Lacanian analysis of the visual field derives a great proportion of the algebra of subjectivity from scopic relations. Marking a shift in the development and organization of a subject who was effectively located at the (0,0) Cartesian coordinate point in a visible universe of axonometric space developed by Leon Battista Alberti (1404–1472) and point perspective and formalized by Descartes, Mirzoeff astutely sites the utilitarian philosopher Jeremy Bentham’s (1748–1832) prison design known as the Panopticon (1786) as emblematic of the utilization of visual surveillance for

disciplinary purposes. Brilliantly analyzed by Foucault in “The Eye of Power,” Bentham’s prison design created a circular array of fully transparent prison cells forming a perimeter around a central hub—a guard tower of smoked glass. The genius of the panopticon was in its economy: the prisoners knew that they could always be seen by the guard in the tower wherever they were in their cells; because they could not tell whether the guard tower was occupied (guards were changed via an underground tunnel), the prisoners effectively watched themselves, that is, policed themselves. Foucault called this form of self-surveillance the “internalization of the gaze of power.” While Foucault notes the efficient advance in disciplinary technology marked by the panopticon (it is much cheaper to have people police themselves than to have to continuously beat them into submission), what is at least as important here is that the visual is explicitly grasped as a medium of organization and social control, and that the visual field can be structured via architecture and therefore via design and technology.

The fact that vision and the gaze become the media for the orchestration of social control is in no way confined to technologies of surveillance. As suggested above, the organization of the visual is for many thinkers constitutive of subjectivity, of modern psychology, and therefore of conceptualization of self and other. The fact that Freudian psychoanalysis and the origins of cinema (developed by the Lumiere brothers) share 1895 as an inaugural date might therefore be viewed as more than mere coincidence. Although the majority of psychoanalytic work during the twentieth century believed itself to be embarking on a description and analysis of the deep and therefore ontological structures of human desire and the psyche, it has been argued that the psychic structures available for analysis by the new discipline of psychoanalysis are in fact instantiated and developed by visual technologies themselves (Beller, 2002). Film theory includes extensive work on cinema’s modulation of the gaze and its skilled and satisfying manipulation of visual pleasure, but it is at least as likely as not that the structures of perception capable of deriving the pleasures that cinema offers emerge in dialectical relation to cinematic technologies themselves, rather than having always already been there, lying in wait.

Historicity of the Senses

As early as 1844, Karl Marx in his *Economic and Philosophic Manuscripts* of that year argued from a historical-materialist perspective that the senses themselves developed in dialectical relationships to society’s objects. New modes of perception, sensibility, and appropriation were developed for the objects and processes of industrialization.

It is only when the objective world becomes everywhere for man in society the world of man’s essential powers—human reality, and for that reason the reality of his own essential powers—that all objects become for him the objectification of himself. . . . The manner in which they become *his* depends upon the *nature of the objects* and on the nature of the *essential power* corresponding *to it*; for it is precisely the *determinateness* of this relationship which shapes the particular, *real* mode of affirmation. To the eye an object comes to be other than

it is to the ear, and the object of the eye is another object than the object of the ear. The peculiarity of each essential power is precisely its *peculiar essence*, and therefore also the peculiar mode of its objectification, of it objectively *actual* living *being*. Thus man is affirmed in the objective world not only in the act of thinking, but with *all* his senses.

On the other hand, looking at this in its subjective aspect: just as music alone awakens in man the sense of music, and just as the most beautiful music has *no* sense for the unmusical ear—is no object for it because my object can only be the confirmation of one of my essential powers and can therefore only be so for me as my essential power is present for itself as a subjective capacity, because the sense of an object for me goes only so far as *my* senses go (has only sense for a sense corresponding to that object)—for this reason the *senses* of the social man are other senses than those of the non-social man. . . . The *forming* of the five senses is a labor of the entire history of the world down to the present (pp. 74–75).

Marx writes here both of the historical disarticulation (separation) of the senses and of the historico-social elaboration of their capacities. If the forming of the five senses is indeed a labor of the entire history of the world down to the present, then it is also true that “the psychic structures which are then derived from this organization of the senses by the objective conditions of production” are also preeminently historical. The theorist Hal Foster, in his landmark essay “Scopic Regimes of Modernity,” sketches some of the varied scopic regimes (the organization of subjects and objects by differing visual systems of representation) in early modern Europe and discusses their historical basis. His work provides concrete examples of varied scopic regimes embedded in different cultural and historical moments.

Although it may not seem like much to show that the organization and development of the senses (and therefore the structures of the psyche) are historical rather than ontologically hard-wired, this insight is of great import for an understanding of the historicity of the idea of visual culture. For the idea of visual culture emerges when and only when social production itself has entered definitively into the visual realm and the site of the visual becomes indeed the privileged realm of social production.

Race and Photo-Graphics

It is essential here to see that the processes of industrialization and then computerization that produced the new objects and eventually machines for the development of the visual do not occur in some spatio-temporal vacuum occupied by abstract individual bodies all subjected to regimes of visibility in precisely the same manner. Rather, industrialization developed on the laboring backs of specific bodies in tandem with the entire European and American projects of colonization and imperialism. If industrialization was linked to the development of capitalism, the development of capitalism was linked to the conquest

of regions formerly on the periphery of capitalism: Africa, Asia, the Americas—in short, the world. Thus one must observe that the development of the various racisms (which are themselves relatively new and certainly not transhistorical) are nothing less than a complementary technology of exploitation—a process of othering that enabled and legitimated the violence done unto populations subject to conquest, genocide, enslavement, and the twenty-first century's continued neocolonialism.

That this racism has a visual component is an understatement. It is indeed ironic that the French critic Roland Barthes (1915–1980), in his celebrated work *Camera Lucida*, locates what he considers “the essence of photography” in a discussion of a lost photograph of a slave auction. That photograph would indicate the “this-has-beeness” of the abhorrent reality of slavery, and yet Barthes displaces slavery itself in order to talk about photography. The technology, finally, is for Barthes more significant than the social conditions of its emergence. However, one might also think that photography emerges alongside the social need to graph people onto a social hierarchy vis-à-vis their appearance—that slavery haunts photography. Such a graphing via the skin, a process of capture, objectification, classification, and control, defines both slavery and photography. Photography partakes of and intensifies many of the logics of racialization and the violence that is inseparable from it. There are other works, such as Vicente Rafael's work in *White Love* on census photography in the Philippines, that would support such a line of analysis.

Many black writers have commented on the visual aspects of racism directly or indirectly. Harriet Jacobs's slave narrative, *Incidents in the Life of a Slave Girl: Written by Herself* (1870?), details Jacobs's effective incarceration hidden in the attic of a shed where, for seven years as an immobilized prisoner of plantation society and invisible to everyone, she watches her own children play just below her while being unable to tell them that she loves them, is okay or even alive. This autobiographical passage creates an extraordinary image of the violence of the black/white divide imposed by white supremacist society in which black subjects were rendered invisible in their subjectivity to white subjects. Not only did slave labor produce the wealth necessary to sustain and develop plantation society (its lands, its culture, its wealth, and its dominant subjects), but the objectification of slaves as property, as Other, by whites was essential in order that they *not see* the consequences of who and what slaveholders and other whites were for slaves.

The consciousness produced by the violence of racism and the mapping of subjects via their appearance is a topic of long-standing critique, lament, and rage. W. E. B. Du Bois (1868–1963) wrote in *The Souls of Black Folk* (1903) of “a world which yields him no true self-consciousness, but only lets him see himself through the revelation of the other world. It is a peculiar sensation, this double-consciousness, this sense of always looking at one's self through the eyes of others. . . .” In the 1950s, the author Ralph Ellison declared the American black an invisible man. And in France, the political theorist Frantz Fanon, who was born and first educated in colonial Martinique, wrote in a chapter in *Black Skin, White Masks* (1952), entitled “The Fact of Blackness,” of his existential

crises of being perceived as black in a French context. What emerges in Fanon's writing is not only the crisis of being perceived to be black and thus other, but the constitutive and universalist racism of France. In response to his experiences, he recalls a moment of being othered while on a train by a child who says, “Look, a negro!” Fanon writes:

I was responsible at the same time for my body, my race, for my ancestors. I subjected myself to objective examination, I discovered my blackness, my ethnic characteristics; and I was battered down by tom-toms, cannibalism, intellectual deficiency, fetishism, racial defects, slave-ships, and above all else, above all: “Sho' good eatin'.”

On that day, completely dislocated, unable to be abroad with the other, the white man, who unmercifully imprisoned me, I took myself far off from my own presence, far indeed, and made myself an object. What else could it be for me but an amputation, an excision, a hemorrhage that spattered my whole body with black blood? (p. 112)

The violent structuring of the visual field along racial lines, which led to violent critique of this violence by many cultural producers and revolutionaries, remains subject to an ongoing critique by subjects who identify as or with numerous races and/or ethnicities. One of the most important aspects of the study of visual culture in the early twenty-first century is the analysis and unpacking of visibility in terms of race and the allied histories of colonization and imperialism. For the structuring of visibility is tied to the production and reproduction of representations (and erasures) of racialized subjects, and these images, whether through the stimulation of fantasy or the production of perceptions of what is ostensibly reality, in turn enable much of the ongoing violence of contemporary society.

Gender, Sexuality, and the Image

In addition to race-based critiques of dominant visual representation and its profound connection both to dominant modalities of the visual and to socio-subjective organization, scholars—particularly film theorists—have also examined the visual field in terms of its implantation in the organization of gender and sexuality. Most famously here, perhaps, is Laura Mulvey's work “Visual Pleasure and Narrative Cinema” (1975). Undertaking an analysis of Hollywood's development of scopophilia or “pleasure in looking,” Mulvey understood Hollywood narrative cinema to be developing and narrativizing a particular image of woman: “Woman . . . stands in patriarchal culture as signifier for the male other, bound by a symbolic order in which man can live out his fantasies and obsessions through linguistic command by imposing them on the silent image of woman still tied to her place as bearer of meaning, not maker of meaning” (p. 199). She further comments, “As an advanced representation system, the cinema poses questions of the ways the unconscious (formed by the dominant order) structures ways of seeing and pleasure in looking” (p. 199). Though it has already been suggested here that cinema itself may be considered to be part of the dominant order that forms the unconscious itself, this dialectic for Mulvey results in the effective evacuation of the subjectivity of woman as representation,

and perhaps (this has been debated in terms of the question of female spectatorship) as a concrete individual person. Without rehearsing the entire argument, suffice it to say that Mulvey sets out to attack the film industry's "satisfaction and reinforcement of the [male] ego," and understands the film industry to be effectively maintaining if not producing and intensifying patriarchal society and its domination/exploitation of women. In writing, "It is said that analyzing pleasure, or beauty, destroys it. That is the intention of this article" (p. 200), Mulvey crystallized a central point of her analysis: the link between pleasure, the production of subjectivity, and domination in patriarchal society.

While other theorists of cinema and of the visual, including Mary Ann Doane, Judith Butler, Judith Halberstam, Kaja Silverman, Linda Williams, and many others, offer differing and sometimes conflicting analysis of the organization and function of the visual in contemporary society, nearly all agree that what takes place in cinematic, televisual, and later digital media regarding the organization of gender and sexuality is not to be understood as a collection of unique instances but rather as at once symptomatic of social life and often productive of aspects of social life. Taken as a whole, mass media exert tremendous pressure on the organization of the psyche and the patterning of social performance. The critique of mass media's function has the power to alter its reception and therefore to transform its function. The possibility of such an analysis of images, and of an understanding of their processes, has been put forward under various nomenclatures, from semiotics to visual literacy to media theory.

Alternative Media

Many people seeking social justice share the perception that the dominant media—from the Hollywood studio system to the formation of television and later cable networks—exercised a tremendous, often racist, sexist, and anti-democratic power, leading to the emergence of a variety of visual forms of resistance. These included the Third Cinema movement of the late 1960s and following, which encouraged Third World revolutionary filmmakers and fellow travelers to work "with the camera in one hand and a rock in the other," in order to enable the decolonization of spectators. Additionally, a tremendous number of experimental film and alternative video production projects took root. In the realm of film, endeavors from the French New Wave to experimental sixteen-millimeter filmmaking (especially the work of the American filmmaker Stan Brakhage) tried to investigate the materiality of the medium and its conventions for creating the most persuasive of illusions. Filmmakers such as Yvonne Rainer and Marlene Gorris, among many others, also worked on creating a feminist film corpus. Additionally, with the rise of the video portapak and the general dissemination of inexpensive video technology in the early 1970s, a whole generation of alternative video and video art began to make inroads not only in the field of what could be represented on television, but at least as importantly into the ways in which images were perceived, processed, and understood. The artists Nam June Paik, Lynda Benglis, and Linda Montano in the 1970s and 1980s and Bill Viola in the 1990s and 2000s, among many others, created video artworks, while organizations such as New York's Downtown

Community Television Center, with Jon Alpert and Keiko Tsuno, covered topics like access to healthcare and minority experiences in a documentary style. These U.S. efforts at alternative video and video art had their counterparts in Latin America, Southeast Asia, and elsewhere.

Advertising, Attention, and Society of the Spectacle

French situationist Guy Debord began his enduring work *Society of the Spectacle* (1967) with, "The spectacle is not a collection of images; rather, it is a social relationship between people that is mediated by images" (p. 12). While this thesis is true of the spectacle in general, it is perhaps most readily intelligible from a study of advertising. Theorists from Marshall McLuhan to Robin Andersen and Sut Jhally chart the extension and penetration of advertising into both the format of media productions—particularly television, but also with product placement, the cinema—and simultaneously into the psychology and fantasy of consumers. Up until the 1920s, advertisements in print venues were principally informational (e.g., if your dentures are falling out, we make this denture cream). By the 1950s, advertisers were not selling products but a whole way of life in which consumption itself would begin to solve life's ailments. The purpose of advertising became to produce consumers. Advertising's messages overall are designed to produce feelings of lack and inadequacy that might then be treated by the consumption of a product, or more particularly, the image of that product. In the twenty-first century, these campaigns are mounted by specialized agencies that employ PhDs in psychology and use statistical techniques and brainstorming sessions (called "the theater of the mind") to elicit unconscious associations from consumers. Advertising operates through what this author calls a "calculus of affect" in order to continuously refine the efficiency by which spectators are manipulated not by rational arguments but by emotional and visceral appeals to their unconscious and sometimes conscious fantasy. Without a doubt, many of these fantasies are shot through with variants of the racism and sexism discussed above. Since corporate media exist principally for profit and their profits come from paid advertisements, it is easy to see how, structurally at least, these very media serve first and foremost as vehicles for advertisers.

The American critic Jonathan Beller's work on visual culture and media extends the idea that mass media sell eyeballs to advertisers and elaborates "the attention theory of value." In brief, this theory is a development of Marx's labor theory of value in which the production of all value for capital has its basis in human labor. It argues that attention is the superset of labor (and thus labor is a subset of attention). Just as workers labor in the factory, spectators labor in the social mechanisms known as media, building value for capital and oftentimes disenfranchising themselves. Television functions like a deterritorialized factory for the production and reproduction of consumer-citizen-subjects. The theory proposes a cybernetic model of production in which the image is the paradigmatic interface between bodies and the social armature. The logistics of media society, its modalities of operation, its affects, and its production of history, space, time, and fantasy are fully integrated into spectatorial consciousness. Imagination itself is engaged as an engine of production: attending bodies validate

media pathways and simultaneously transform themselves. Indeed, as spectators are posited as nodes on media circuits that are fundamental to the production and reproduction of the global, it becomes increasingly difficult to say where mediation ends and personhood begins. As noted above, humanity itself is increasingly cybernetic.

Visuality, Mediation, Simulation, and Cybernetics

The integration of the machinery of media circuits, the imagination of spectators, financial markets, and the military-industrial complex—all on a global scale—compose what Beller calls the world-media system. This idea of a world-media system that endeavors to fully integrate modes of perception and the requisites of social production and reproduction is connected to several critical ideas. One such idea is the German philosophers Theodor Adorno and Max Horkheimer's idea of "the culture industry," in which commercial cultural products were understood "as an after-image of the work process" and in effect designed to reconcile workers to their own powerlessness and exploitation by giving them compensatory images of satisfactions that were denied to them in life. Debord begins *Society of the Spectacle* with the idea that "The whole life of those societies in which modern conditions of production prevail presents itself as an immense accumulation of spectacles. All that was once directly lived has become mere representation" (p. 12). The political theorist Paul Virilio has shown the intimate developmental relationships between war machines and the cinematic apparatus, as well as the role of visual technologies in surveillance and the rendering of targets abstract, virtual, and therefore more easily destroyable, both practically and in terms of the conscience of the killers. Murder becomes technologized and as easy as the touch of a button. The French sociologist Jean Baudrillard has written about the connections between mass media and what he calls *simulation*, a process that creates copies without originals. Images for Baudrillard are "hyperreal," that is more real than real, and have, for him at least, effectively rendered reality impossible and consequently short circuited genuine thought. What is clear from the work of these thinkers and others whom they have inspired is that the media environment has radically altered the very fabric of reality, the character of the human sensorium, and the nature of the consciousness that might mediate between the two.

Along these lines, the French intellectual Régis Debray, in his important work *Media Manifestos* (1996), has argued that the word *communication* is a radical misconception of what transpires in the messaging process and should thus be replaced by the word *mediation*, because messages don't just travel from A to B. Rather, "sender and receiver are modified from the inside by the message they exchange, and the message itself modified by its circulation" (p. 44). Instead of looking at particular cultural products or texts, Debray's analysis is more interested in "change[s] in the system of manufacture/circulation/storage of signs" (p. 19) and charts a historical, planetary shift from what he dubs the *logosphere* to the *graphosphere* to the *videosphere*—that is, regimes of the written word, the printed word, and the image respectively. His study of "the ways and means of symbolic efficacy" (p. 7) is more interested in the

effects of mediations rather than their meanings or contents, and points toward the techno-cultural apparatuses that manage the circulation of signs as something like the unthought of human historical process. The visual, and what is now called visual culture, is the latest and most powerful development in the management and organization of human society.

The Future of Visual Culture and Visual Studies

It seems clear that visual culture is not about to disappear but, rather, with the growing perception that visuality is one of the profound operators of our times and therefore a site of the twenty-first century's most important questions, we may expect critical approaches to visual culture to develop quite rapidly and with tremendous diversity. The American theorist Lisa Cartwright has written about medical imaging and its sociocultural implications in *Screening the Body: Tracing Medicine's Visual Culture*. The legal scholars Kimberle Williams Crenshaw and Garry Peller have written on the evidentiary character of amateur video and the way in which racist, state, and aesthetic ideologies overcode the image. Writers from Raymond Williams to Lynn Spigel have analyzed television's reorganization of social space. Linda Williams considers pornography to be of central importance. Political scientist Armand Mattelart and sociologist Manuel Castells discuss the manner in which media and information flows are linked to the movement of capital and the restructuring of imaginary and built environments. Still others (such as the philosopher Douglas Kellner) have written on the connections between commercial television, ideology, and the waging of war. The theorist and artist Lev Manovich has written on the possibilities and implications of digital cinema, and Cubitt has broached the questions of digital aesthetics with tremendous insight and erudition. The media theorist Lisa Parks has written on "satellite and cyber visualities."

Looking toward the future and toward possible forms of the institutionalization of what he pointedly calls visual studies, the art historian James Elkins suggests that visual literacy courses should include history of Western art and mass media, but also an understanding and analysis of multicultural as well as multidisciplinary image making processes, including non-Western aesthetic productions, and scientific and satellite imaging. This author's view is that visual studies will amount to little more than an accommodation to shifting conditions of domination and the intensification of global inequality unless it is also imbued with the commitment to demonstrate both the preconditions for the production of images as well as the consequences of different modes of reception of these images.

Jonathan Beller

VISUAL ORDER TO ORGANIZING COLLECTIONS.

A generation trained to select icons on a desktop computer is able to take a fresh approach to the visual cues within early rooms of collection. Visual cues often preceded catalogs and inventories, helping users to situate themselves in the room and to locate items of the collection. In searching out the modes of conceptualizing, mapping, and classifying of collections, we shall see that the distinctive details of ceilings, walls, cabinets, or furniture of a collection room may be functional elements organizing manuscripts or other valuable objects in the room. Scholars Alain Besson, André Masson, Eric Garberson, and Maryanne Cline Horowitz have examined visual classification schemes, especially in libraries and studies, but a plethora of extant as well as defunct rooms of collections might similarly be examined. The *Journal of the History of Collections* (founded 1989) might be the appropriate venue.

Each section of this entry features a distinctive type of iconography for rooms of collection: hunting, horticulture, cabinets of curiosity, author portraits, imperial busts, the

disciplines of knowledge, the circle of knowledge, secular temples, and towers of knowledge.

Hunting for Precious Objects

Excavations in the basement of the Louvre reveal the circular fortress of the Tour de la Fauconnerie (Tower of Falconry), where medieval French kings sent birds out tower windows and stored their hunting gear. In 1367, imitating the three floors of manuscripts of the Tour de la Garde-Robe (Tower of the Vestments) of the papal palace in Avignon, King Charles V (r. 1364–1380) moved the royal collection of books to this tower, renaming it the Tour de la Librairie. Christine de Pisan in her 1405 book about wise King Charles V of France notes the orderly arrangement of his library. The reference to “hunting” for manuscripts is most evident in the frescos completed about 1345 on the four walls of the Chambre du Cerf (Room of the Deer) in the Tour de la Garde-Robe, Avignon. The frescos of hunting with birds, hunting with dogs, fowling in trees, and fishing in ponds would help a cleric to locate a handwritten animal-skin manuscript on one of the tables in the room (Horowitz, 1998, pp. 123–128). By ancient rhetorical theory, a trained student is a huntsman finding the locations of hidden knowledge, and from Petrarch onward humanists were praised as manuscript-hunters.

Isabella d’Este (1474–1539), in setting up her second suite of rooms in the ducal palace of Mantua, transformed the *scalcheria* (the room where meat, vegetables, and other delicacies were previously prepared for banquets) into a room for sorting and arranging her collection of antiquities. With good humor, she commissioned Lorenzo Leonbruno to paint on the upper walls female hunters hunting for deer; seen from below, the Amazons appear to be pointing their arrows down toward the objects in the room. Isabella d’Este—who to acquire desired antiquities wrote both the duke of Milan and Andrea

Caesar Travelling Library constructed for Sir Julius Caesar (1558–1636). Throughout the centuries, some collections have been mobile, allowing for their display in multiple locations. BY PERMISSION OF THE BRITISH LIBRARY, C.20.F.15–58

Mantegna on their deathbeds—with Amazonian imagery likened hunting to collecting.

The Boston Public Library in Boston, Massachusetts, opened in 1896, was noted for its large card-catalog room with a decorative frieze of the search for the Holy Grail; the published dissertation on the topic (Ferris Greenslet, *The Quest of the Holy Grail*, 1902) misses the humor of the implied analogy between the adventures within medieval legends of seeking the cup from which Jesus drank and the often time-consuming, circuitous paths between card-catalog entries and

Studiolo of Isabella d'Este, Palazzo Ducale, Mantua, Italy. D'Este's elaborately detailed grotto in Corte Vecchia is one example of a cabinet of curiosity, a type of collection popular in the sixteenth and seventeenth centuries. PHOTO CREDIT: ALINARI/ART RESOURCE, NY

shelves to finding the ideal cup of knowledge (or book) for which one longs.

Horticulture and Culture

Thirteenth-century Richard de Fournival discusses his "garden" of manuscripts in *La biblionomia*. This catalog shows the rows of his plantings: about three hundred manuscripts entered the founding collection of the Sorbonne of which forty of Fournival's have survived. The duke of Berry, most famous for his manuscript of the calendar months, utilized the insignia of vegetative "roots" to designate his manuscripts. Piero de' Medici, father of Lorenzo the Magnificent, created a *studiolo* (a study) in the Medici Palace, Via Larga, Florence. The twelve calendar months by Luca della Robbia on the ceiling are a visual cataloging system pointing out the twelve categories of Piero's classical and Christian books below, color-coded in the written catalogs of 1456 and 1464–1465 (Horowitz, 2003).

Isabella d'Este's second suite of *schalera*, *studiolo*, grotto, and garden created an atmosphere of a garden of virtues, as in the Mantegna painting *Pallas Expelling the Vices from the Garden of Virtue* (1499–1502) which hung in the *studiolo* (now in the Louvre). Hovering in a cloud on the right are the three cardinal virtues; below in the distance, a pleasant landscape seen through the tree-lined archways reveals vices fleeing and new growth

growing from old roots; in the foreground on the left is the Mother of Virtue imprisoned in a tree; and in the center, vices pollute the pond. Minerva (Pallas Athene) and two goddesses enter and seek to bring about a return to a garden of virtue.

The analogy of "culture" and horti"culture" is evident in many languages. The tree catalog of the library of Saint-Lambrecht, a painted panel by Michel Boeckyn (1688–1742), utilizes the common image of a tree of knowledge, with the various branches of knowledge rising from a trunk (fig. 4, Masson, 1981). One might plant a collection of books or other valuables, many might labor in the fields of scholarship and the arts, and a society devoted to cultivating the arts might create an abundant culture. French King Francis I (r. 1515–1547) was praised by his courtiers for his cultivation of the humanist virtues, which are equally evident in his manuscript collection, in the flowery ephemeral art of his royal entries, and in the flowers and fruit ornamenting the wall paintings in the Galerie Francis I, Fontainebleau. The analogy of writing to agricultural productivity, like the analogy of collecting to hunting, also helped make these cultural activities appropriately aristocratic.

Agricultural abundance ornamenting cultural institutions was so prevalent in the eighteenth century that it barely receives comment; note especially the decoration of the rotunda library of the Radcliffe Camera, Oxford, and of the stucco ceiling at the entrance to the Ashmolean Museum, Oxford. In the mid-nineteenth century, the upper walls of the main reading room of the Bibliothèque nationale were painted with illusionistic windows revealing sky and treetops. The implication that natural vegetative growth encourages the growth of the mind was expressed in the medieval tradition of drawings of a scholar in a study with an open cupboard showing fruit. (John Clark, in *The Care of Books* [1901], asks why the fruit are there [p. 313].)

Cabinets of Curiosity

In the sixteenth and seventeenth centuries, collectors arranged a diversity of natural and crafted objects within decorative furniture cabinets, as well as within rooms that served as cabinets of curiosity. When one enters Isabella d'Este's grotto in Corte Vecchia, one feels that one is inside an elaborate jewelry box. Ornate marquetry woodwork decorates the doors to the cabinets that once contained her valuables; the distinctive perspective pictures would remind her of the exact location of her antiquities protected in this room.

At the corner of the Hall of the Five Hundred in the Palazzo Vecchio, Florence, is the restored study of Francesco I, the work of Giorgio Vasari in 1570–1575. Under the vaulted ceiling, there are numerous paintings. A door behind the sixth painting, Alessandro Allori's *Cleopatra's Feast*, with his *Pearl-fishing* above, opens to a staircase leading to the *tesoretto*, a small treasure room with eleven cupboards, one of which leads to a further room below. In the context of Francesco I's collecting, Allori's *Cleopatra's Feast* is his *Pearl-fishing*, a playful allusion to the hunting for treasure below.

The *studiolo* in the ducal palace of Urbino plays with this genre by appearing to show the contents of cabinets in its

Pallas Expelling the Vices from the Garden of Virtue (1499–1502) by Andrea Mantegna. Oil on canvas. Some early collectors drew a parallel between culture and horticulture, a view reflected in Mantegna’s painting, in which order is restored in a garden setting. RÉUNION DES MUSÉES NATIONAUX / ART RESOURCE

elaborate marquetry. While the open door at the front of the protruding central panel of squirrel and flower bowl is not in fact a door, a door on the right side of that panel does in fact open. Duke Federigo da Montelfeltro kept treasures in two cubicles below his *studiolo*: a temple to the muses for antiquities and a chapel to God for his relics. Also, his library contained several hundred manuscripts; some of those authors are featured in the portraits on the upper walls above the marquetry of his *studiolo*.

“Portraits” of Authors

Providing a portrait, even if fictional, of the key authors of one’s set of manuscripts helped individualize the books and encouraged the illusion that those select guests invited to the room were conversing amid the authorities. The pairs of portraits on the upper walls of the duke’s *studiolo* in the Palazzo Ducale, Urbino—somewhat representative as in Petrarch, Dante, and contemporary churchmen, and fictive as in Moses (right corner) and Solomon—relate to valued manuscripts in the library a floor below.

In Julius II’s (r. 1503–1513) study in the Vatican, the Stanza della Segnatura, bookcases were attached to the walls under the now famous paintings *School of Athens*, *Parnassus*, *Dispute over the Sacrament*, and *Jurisprudence*. Plato, Aristotle, Homer, and others are portrayed with their books, which would have been in the room for Julius’s usage. Two hundred eighteen of Julius’s books were in this room, known in his lifetime as “the upper library.” As André Masson pointed out, the *Dispute over the Sacrament* and the *School of Athens* were imitated later in the library of Jesuits of Valenciennes (1740–1742) to distinguish the collecting of classical works from the collecting of Christian disputations.

The frieze of over two hundred authors in the Bodleian Library, Oxford University, depicted in 1616–1618 in the three-sided gallery (now the Upper Reading Room), have numerical references in each author’s portrayal to the shelf location of the author’s respective books in the neighboring Duke Humphrey’s Library, where the books remain chained today. The Bodleian Gallery displays the innovative wall shelves with heroes above (except for one heroine, Sappho) of the respective faculties of

Reading Room at the Bibliothèque Nationale, Paris, France. Decorative motifs involving vegetation as an allegory for learning were prevalent during the eighteenth century, such as the trees painted in the reading room of the Bibliothèque Nationale. © PAUL ALMASY

theology, arts, medicine, and law. First one walks between the theologians seeming to vie with each other across the room, then one peruses the classical authors of the liberal arts, and then one walks between the teachers of medicine and the teachers of law. The visual cues of the arts section lead one to the referenced manuscripts of classical and “modern” authors in Duke Humphrey’s Library.

David Rogers has suggested that the frieze portrait imitates and enlivens the manuscript image of Roger Bacon. Further research might be done on the respective pictorial examples,

seeking sources for the particular image, gesture, sayings, and symbols, as in André Thevet’s *Portraits des hommes illustres*, 1584, and in Théodore de Bèze’s (Beza; 1519–1605) *Icones vivorum illustrium*, 1580. The author frieze, the 1604 catalog, and the 1620 catalog are alternative Renaissance innovations in the area of indexing an exclusive collection for members of Oxford University, government dignitaries, and foreigners (either university students or graduates).

An alternative type of frieze is not of authors but of dignitary patrons or users of a local library. Sixty-seven portraits of

Portraits on walls of Federico da Montefeltro's Studiolo (study), c. 1472–1476, Palazzo Ducale, Urbino, Italy. The use of author portraits in libraries gave the collections an air of legitimacy. Da Montefeltro's study featured several such portraits of prominent writers. SCALA/ART RESOURCE, NY

fathers of the Abbaye de Saint-Victor adorn their library in Paris (1684); the architectural construction of the frieze high above the wall bookshelves is modeled on the Ambrosiana Library in Milan, designed by Federigo Borromeo, 1603–1609 (Masson, 1972, pp. 107, 117, fig. 58).

Imperial Busts

To collect imperial coins or busts and to organize one's objects in the categories of Suetonius's twelve emperors suggests an appearance of imperial activity. Many Renaissance collections of ancient Roman imperial coins are displayed in room two of the Archaeological Museum, Venice, and busts of the emperors are displayed in the Room of the Emperors in the Palazzo Borghese. A common pastime among Italian humanists and antiquarians was the collection of coins with heads of the twelve Caesars discussed in Suetonius's *Lives of the Caesars*. Most influential, Petrarch collected such coins of the emperors and utilized both image and inscription to corroborate

information. Furthermore, applying such numismatics to challenging church history and policy, Lorenza Valla wrote in 1440 the *Declamation Concerning the False Donation of Constantine*. Filarete, in discussing the collection in Piero de' Medici's *studiolo* of the 1450s to 1460s, mentioned intaglios of Caesar, Octavian, Vespasian, Tiberius, Hadrian, Trajan, Domitian, Nero, and Antonius Pius, as well as Faustina, and viewed them as a more accurate record than writing. Humanists learned from Pliny, *Natural History* 35.2.9–10, that portraits and busts inspired readers in ancient libraries, and some humanists and collectors, such as Piero's brother, Giovanni de' Medici (d. 1463), organized a *studiolo* by busts of emperors.

The culmination of organizing via busts of emperors is the continuing use of imperial names as the cataloging system of the Cotton collection of the British Library, a collection visually central to the new British Library. Colin C. Tite has argued that in the 1620s the Cotton House displayed busts of the twelve emperors and of Cleopatra and Faustina

above the presses containing the books labeled by that imperial name.

Cotton's many coins gave him full examples of Roman images of the emperors. The British Library manuscript room contains the first catalog of Cotton manuscripts arranged in accordance with the emperor system, Additional MS 36682, fols. 14v–15 (approximately 1638). It places the books marked Cleopatra and Faustina after the books marked Julius and Augustus, and then continues the line of emperors; on the other hand, the Thomas Smith *Catalogue*, 1696 (reprint, 1984) lists the books marked Cleopatra and the books marked Faustina after the books of the twelve emperors. An imagined reconstruction focuses on the noncontroversial location of the presses of the first two emperors Julius and Augustus. Books and objects were arranged by size within the fourteen categories.

Disciplines of Knowledge

Classification of books by disciplines occurs in the Chinese, Islamic, and European traditions. Starting in the third century, the imperial library of China classified books into four disciplines: canonical and classical, historical, philosophical, and literary, and there was a corresponding color-coding scheme. Chinese encyclopedism, which began in the fourth century B.C.E., reached a culmination under Emperor Quianlong, whose reign extended from 1736 to 1795. A devotee of

arts and letters who personally painted and did calligraphy according to the great masters, Quianlong in 1772 launched a copying project for over ten thousand books and manuscripts. The project—involving 16 directors, 361 scholars, and 4,000 assistants or copyists—resulted in an extensive collection of over ten thousand books and manuscripts. Likewise, Quianlong commissioned the covers of the books in the traditional color scheme: green for classics, red for history, blue for philosophy, gray for literature. The catalog of 10,254 entries follows the four-part scheme; three original copies have survived (Schaer, pp. 350–367).

Piero de' Medici, father of Lorenzo the Magnificent, used color-coding in his catalog of books and in his book bindings in his *studiolo* in the Medici Palace, Florence. Many of these hand-illuminated works are in good condition in the Biblioteca Laurenziana, Florence. The main room designed by Michelangelo opened in 1571; the subject names still survive on the sides of the lecterns where the books were then chained. Likewise, the Latin words for “Grammar books” and “Medical books” appear on window inscriptions of the library of the cathedral chapter of Bayeux (c. 1464) and correspond in location to that indicated in the catalog of 1480.

In the Escorial Library of Philip II of Spain, designed by Juan de Herrera and constructed 1575–1792, as a great hall 212 feet by 35 feet with a barrel vault 35 feet from the floor, paintings of personifications of the liberal arts rise from above the wall bookcases. These are Philosophy, Grammar, Rhetoric, Dialectics, Arithmetic, Music, Geometry, Astrology, and Theology. The figure of Grammar thus rose above the shelves designated for grammar in the Escorial Library (fig. 31, Masson, 1972). While decorating a library with muses or personifications of the liberal arts was not new, lining a rectangular room with wood bookcases was a new innovation, allowing those entering to see and grasp the unity of the open-spaced room and

Interior view of San Lorenzo dell'Escorial library, near Madrid, Spain. The Escorial library, built for Phillip II of Spain, introduced the concept of wall bookcases, an innovation that quickly became a standard fixture of Italian libraries and collection houses. THE ART ARCHIVE/DAGLI ORTI (A)

to use the books stacked horizontally on the shelves (Frey Jose de Siguenza, *Fundacion del Monasterio de El Escorial*, 1595 (reprint, 1963), pp. 279–280). The Ambrosian Library, Milan, 1603–1609, established wall bookcases as the norm for Italy.

Until about 1700, earlier in Italy, upper wall and ceiling figures of muses might correlate with the matching books inspired by that muse. The books in lecterns, cases, or shelves would correlate with the appropriate decor of that classification. For example, Garberson has studied a transition library, the Austrian Bibliotheca Windhagiana, built 1650–1673, which gave more decorative space to theology to match the extensive collection in that field on the shelves below. Allowing for a unified decor despite continuing purchase of books in varying fields, later libraries allowed the architectural space to designate a balanced distribution of design illustrating the overall purposes of the library. Nevertheless, in the 1764 first printing of *Descripcion del Real Monasterio de San Lorenzo del Escorial*, Andres Ximenez classified his partial list of four thousand volumes by the muses in Pellegrino Tibaldi's paintings decorating the ceiling and archway of the main floor of the library.

Through the nineteenth century, the muses remained a popular decorative scheme in libraries, as well as in opera houses, where they are often dancing in a circle. Above the

Outline of the Salone Sistino of Pope Sixtus, Vatican Library.

The Vatican Library took a strong interest in preserving previous cultures, as is shown in this depiction of the libraries of various civilizations throughout history. ADAPTED FROM FIGURE 18 IN *THE CARE OF BOOKS* BY JOHN WILLIS CLARK, 1901.

entry hall staircase of the Boston Public Library, Pierre-Cécile Puvis de Chavannes painted the muse of history viewing ancient ruins, as well as a new iconography for physics, represented by figures of good and bad news holding the telegraph pole.

Extensive collections required division not simply by a section of a room, but by multiple rooms. Avicenna (Ibn Sina), awed by the size of the Islamic library at Bukhara at the end of the tenth century, reported that each room was designated

for a particular discipline of knowledge and contained trunks of books: poetry and Arabic philology, jurisprudence, and others. Sorting knowledge into “rooms” is a theme in the Roman Quintillian’s (c. 35–c. 100) *Art of Rhetoric*. In the Institute of Research in History in the Senate House of the University of London, there is virtually a house of history with, for example, rooms for specific national histories in specific centuries. On a smaller scale, in his influential 1885 design for a history seminar room on German precedent at Johns Hopkins University, Herbert Baxter Adams planned the room to house alcoves of histories, of related disciplines such as political science and economics, and of primary sources such as laws and public documents; nearby rooms were designated for ancillary tools such as maps and statistics (Smith, p. 1159, illustration).

Succession of Collections

Great book collections, as well as large museums, have absorbed within them previous collections. The Vatican Library took pride in its role as a preserver of and successor to previous cultures. Sixtus V (r. 1585–1590) commemorated that tradition by commissioning fictive fresco images of some of the libraries contained within his collecting project. The graphical design shows the arrangement of images of great libraries of diverse peoples and the great council meetings that set church doctrine. Works that in private hands might cause an accusation of heresy

against their owner were safely stored in the closed cabinets five feet high on the perimeter wall and around the columns of this rectangular great hall, 184 by 57 feet.

The neo-Gothic library of the London Guild House also has visual renditions of earlier libraries. Starting with the Louvre in the late eighteenth century, great museums sought to collect works from a succession of great civilizations: the Egyptian, the Greek, the Roman, the Christian, the Italian Renaissance, the French Classical, and so forth. With changing tastes in the nineteenth century, curators added additional works of medieval art and of Northern Renaissance art.

Circles of Knowledge

In the Renaissance, the sphere and the circle were viewed as perfect forms. The medical school in Padua, in initiating one of the earliest and most famous botanical gardens, chose a circular arrangement. Plants from the Americas were transplanted there.

Reading rooms imitating the ancient Roman Pantheon dome became an engineering feat and architectural possibility in the mid-nineteenth century.

In 1857 Sidney Smirke worked with Anthony Panizzi to construct the reading room within the courtyard of the British Museum. Ten years later in 1867, Henri Labrousse, having

Floor plan of the British Museum reading room (1857). Commissioned in 1857, the main reading room at the British Museum was designed by Sidney Smirke and built in the Great Court of the museum. © CORBIS

studied the London feat and applying the analogy of culture to horticulture, which he already had applied in the tree decoration of the bibliothèque Sainte-Geneviève, created the main reading room of the Bibliothèque nationale, Richelieu.

Readers in either room were encircled by topically organized reference books; they literally might walk around the circle of knowledge. This central wheel of essential knowledge has spokes leading out to the stacks of more detailed books retrieved by librarians at the reader's request desk.

The United States imitated both great circular reading rooms in the 1886–1897 construction of the Main Reading Room of the Jefferson Building of the Library of Congress. The figures painted on the dome depict a chronological sequence of civilizations contributing to the collection: Egypt, Judea, Greece, Rome, Islam, Middle Ages, Italy, Germany, Spain, England, France, America. Statues of eight personifications of disciplines and of two great male achievers for each discipline encircle readers seeking knowledge of Philosophy, Art, History, Commerce, Religion, Science, Law, and Poetry.

Awe-Inspiring Temples

Some of the earliest rooms of collection of Chinese Buddhist art are in Toshodaiji near Nara, Japan. In the Kondo (main hall) at Toshodaiji, 759 C.E., one sees an arrangement reminiscent of an emperor with courtiers in the rendition of a large seated Buddha with Bodhisattvas on either side. The entire complex of buildings at Toshodaiji is symmetrical, the great Buddha hall as the center with twin pagodas on either side. Museum goers may thus study ancient Chinese culture within Japanese temples.

During the Italian Renaissance, Venice was a good location for studying ancient Greek culture. La Libreria Sansoviniana in the Biblioteca Nazionale Marciana is on the second floor of a columned building across from the ducal palace and basilica of Venice. Built by architect Jacopo Sansovino in 1591, it is especially famous for its ceiling painting by Titian of

New York's Metropolitan Museum of Art. Some institutions that house artistic collections feature large-scale, impressive architectural components which reflect the importance of that which is housed within. © BOB KRIST/CORBIS

Wisdom. Nicola Ivanoff has elaborated on the Neoplatonic iconography of the ceiling and wall decoration of the room containing the rare manuscripts. The scheme involves personifications for virtues and for the disciplines (Ricciardi, pp. 33–44 with illustrations). Slanted desks housed the valuable possessions of Greek manuscripts collected by Cardinal Bessarion and donated to the city of Venice in 1468.

Considering this special room in the context of the path to it, one finds large caryatids by Alessandro Vittoria (1553–1555) guarding the original entrance, which leads up a winding vaulted staircase to a vestibule heavily decorated with classical sculpture donated in 1587 by the cardinal and patriarch of Aquileia, Giovanni Grimani.

In ancient Greek temple sites, as in Athens, one walked up a holy path to the hilltop temple and then stood outside the temple housing the statue of the god or goddess. To reach the collection of Greek manuscripts, one walks up a holy way and stands in a vestibule of ancient sculpture. The holy of holies in La Libreria Sansoviniana is not the effigies of gods but the Greek manuscripts.

Bibliothèque Nationale, Paris, France. France's new national library is a complex consisting of a garden surrounding four towers—shaped like open books—that house the institution's collections. AP/WIDE WORLD PHOTOS

Monumental staircases, grandiose like ancient Egyptian or Aztec step pyramids, became the pathway to grandiose collections, such as the Louvre, the Widener Library, the Columbia University Library, and the Metropolitan Art Museum. The winged victory goddess, which has become the insignia of Niketown, marks the turn in the grand internal staircase of

the Louvre, Paris; the Chicago Art Institute imitated the design. At the end of the twentieth century, a glass pyramid entrance downward displaced the grand staircase as the main entryway to the Louvre. The crowds of diverse population line the outdoor staircase to the Metropolitan Museum of Art, New York.

Escher–influenced medieval tower is featured in the scene of manuscripts burning in the film *The Name of the Rose*, therein one sees Richard de Fournival portrayed rescuing manuscripts that will later enter into the library of the Sorbonne. In the upper story tower study of Château de Montaigne, Michel de Montaigne in the 1570s, 1580s, and early 1590s utilized the book collections of his father and of his friend Étienne de La Boétie to nourish his own thoughts on numerous important social concerns of his day in his *Essais*. Imagining his mind as an infertile field and as a galloping horse, he recommends as a remedy proper

VISUAL CUES TO A COLLECTION

This British Library miniature library for the traveler is related to three others extant. It has clear visual cues to its collection. Books of theology and philosophy are on the top shelf and listed in the left column, books of history are on the middle shelf and listed in the middle column, and books of poetry are on the bottom shelf and listed on the right column. The theology and philosophy books have a floral ornament on the

spine and originally had blue ties, the history books have a flaming heart on the spine and red ties, and the poetry books have either a six-pointed star or a rosette on the spine and have green ties. While the history and poetry texts are primarily from ancient Greece and Rome, theology includes Old and New Testament and Christian texts, and philosophy emphasizes Stoic philosophers to Justus Lipsius.

sowing and careful reining (*Essais* 1.8 on idleness, “De l’oisiveté”). With self-discipline, he inscribed on the beams of his ceiling his favorite literary and philosophical sayings. After his death in 1592, Marie de Gournay worked in the book-lined tower study to prepare the 1595 posthumous edition of his essays and to track down the original sources of Montaigne’s Greek and Latin classical quotes.

The newest Bibliothèque nationale, at François-Mitterrand/Tolbiac in Paris, rises in four towers of books from the rectangular garden of trees. The Tower of Time, the Tower of Letters, the Tower of Numbers, and the Tower of Law appear to grow from the arboretum. The “Haut-de-Jardin,” the upper garden, serves to cultivate the general public while the “Rez-de-Jardin” encourages the deeper cultivation of the research scholar.

While the new library in Paris stores the books in towers, the new British Library in the St. Pancras Building, opened by the queen in June 1998, stores the books underground. Both great national and international collections utilize the latest technology for online reader requests as well as automated, mechanical means for book retrieval. Nevertheless, the British especially value the books extant from John Cotton’s Library as well as the rest of King George III’s books, which King George IV gave to the nation in 1823. These books rise in a six-story bronze and glass tower in the center of the new British Library.

VOLKSGEIST. *Volksgeist* (folk or national spirit) is perhaps the best known of a family of terms referring to sets of mental, intellectual, moral, and cultural traits that define particular human groups represented as being “nations” or “peoples.” Additional related words include *Volksseele* (“folk soul”),

“national character,” *esprit de la nation* (“spirit of the nation”), and a host of others. These terms have never had narrowly fixed meanings, either individually or in comparison with each other. Sometimes they have been used to denote irreducible, irrational spiritual forces that lie close to the foundations of perception and behavior and explain why people of one nation must differ radically from those of another. More often, they have served as platforms for arraying ranges of cultural characteristics in such a way that distinctions between nationalities can be identified, the moral and political implications of the distinctions can be developed, and the cultural similarities among people of the same nationality can be used to construct a conscious national community. Regardless of their stated intentions, writers employing these terms have tended to apply them both descriptively and judgmentally and seldom have avoided tautology. *Volksgeist* (which will stand here for the entire family) has not been a popular word among intellectuals since the middle of the twentieth century, but concepts closely related to it are far from uncommon in contemporary public discourse.

Benedict Anderson has argued that nations are “imagined communities.” *Volksgeist* originated mainly in the efforts of early modern Europeans to imagine communities that corresponded either to the extensive, politically centralized territorial states emerging around them (France, for instance) or to groups of people of similar language who were not experiencing such political developments but might do so in the near future (Germans and Italians). Its relationship to actual states in the eighteenth century was quite complex. *Volksgeist* was created as much by the critics of the major nation-states as by their apologists. Charles-Louis de Secondat, baron de Montesquieu (1689–1755), one of the originators of the concept, argued that the cultural identities—the “spirits”—of peoples derived mainly from their interactions with their environments over time, which suggested that the efforts of the French state to establish cultural uniformity among the various nations of which France was composed was as illegitimate as its attempts to extend its imperial control over nations beyond its borders and to impose a single, authoritarian political hegemony over the diverse orders of French society. Johann Gottfried Herder (1744–1803), generally acknowledged as the person who first brought most of the conventional elements of *Volksgeist* together into a coherent whole, represented nations as embodiments of unique sets of cultural characteristics in explicit opposition to attempts to define nations politically.

Herder bears the reputation of being the father both of *Volksgeist* and of modern nationalism. In each case the reputation is only partly deserved, but his contribution was profound nonetheless. Herder used extended expressions such as *Geist des Volkes* rather than *Volksgeist*, but in representing peoples (*Völker*) as actual humans with individual differences, sharing cultural traits shaped by their ancestors’ history and experience of a particular physical environment and mentally constructing their world through language and law inherited from earlier generations, he expressed the essence of the concept and laid the groundwork for what would later be called ethnology. Herder’s presentation shows that there was more to the creation of *Volksgeist* than simply engagement with the implications of the nation-state. It was also a reaction to the

inadequacies of the model of the abstract rational individual that underpinned the Lockean interpretation of society. With regard to nationalism, Herder did not call for a unified state defined by the German *Volksgeist*, even though he argued against imposing French political and cultural hegemony on Germans. He did, however, claim that the only effective and legitimate governments were ones that developed naturally among particular nations and that reflected, in their differences from other polities, the cultures of the peoples they governed. Whether such a relationship was possible between nations defined as natural cultural entities and governments that ruled very extensive areas was, to Herder, at best questionable. He did not foresee the massive efforts of nineteenth-century nation-states to create common nationalities among their diverse citizens by such means as public education.

The word *Volksgeist* itself was coined by Georg Wilhelm Friedrich Hegel (1770–1831) to denote the separate spiritual essences of the diverse nations that characterized the present stage of human history and that would, through a dialectical process, produce the uniform “world-spirit” which spelled history’s end. Hegel’s formulation had some resonance later in the nineteenth century, but the most important versions of the idea followed more directly the line established by Herder. Early nineteenth-century Romantic philologists such as Jacob and Wilhelm Grimm (1785–1863, 1786–1859) focused on the centrality of language in framing the distinctive ways in which particular peoples interpret the world, on the history of languages as the key to the real history of nations, and on the study of folk tales as a means of comprehending the spiritual realities of peoples that lay hidden beneath layers of sophistication and cultural borrowing. These intellectual concerns were often bound up with political ones, as national character was commonly cited as a justification for claiming political autonomy within imperial states or asserting independence (Hungarians and Czechs in the Austrian Empire, for example, or the Irish with respect to Great Britain) or for insisting on the union of peoples of similar language (as in Germany). *Volksgeist* was also frequently connected with democratic, or at least anti-hierarchical, political tendencies. If the core of a genuine nation lay not in the power or civilization of its elite, but rather in the language and folk heritage of its common people, it followed that in some manifest way those people should participate in the political life of the national state.

Apart from its political implications, the most important consequence of the formulation of *Volksgeist* was its influence on the formulation of the concept of *culture* in the middle years of the nineteenth century. The idea that “peoples” identified by particular, but wide, arrays of traits could be taken as the fundamental units of social and historical study was basic to the establishment of ethnology as a science. The comparative ethnology of both the diffusionist and the functionalist schools was predicated on this assumption, which dominated cultural science until past the middle of the twentieth century. Comparative studies of folk culture, pioneered in Germany by Wilhelm Heinrich Riehl (1823–1897), were also strongly affected by the concept of *Volksgeist*. Such studies found echoes in many countries. Another human science that incorporated *Volksgeist* was *Völkerpsychologie* (folk psychology), which aimed at distinguishing psychological charac-

teristics and mental operations that were common to all people from those derived from their varied cultures. The broad complex of cultural studies affected by the idea of *Volksgeist* provided discursive and conceptual frameworks to intellectuals throughout the world—to George Eliot (1819–1880), for example, and to W. E. B. DuBois (1868–1963), whose book, *The Souls of Black Folk* (1903), examines in great depth the relationship between a people, the larger political nation to which it belongs, and the distinctive forms of perception that it derives from its history and culture.

In the late nineteenth and early twentieth centuries, *Volksgeist* came to be associated with the fashion for biological racialism that swept through social thought in Europe and America, helping to produce what has been called “*völkisch*” ideology. It was this association that, perhaps more than anything else, caused the sudden decline of *Volksgeist* as a respectable term in intellectual discourse after World War II.

Woodruff D. Smith

VOLUNTEERISM, U.S. The meaning of volunteerism is contingent on the nature of government, particularly the extent and ways in which it enables individuals to make uncompensated donations of money and labor to some form of collective activity or shared purpose.

Over the course of the five centuries since European colonists first occupied North America, the meaning and practice of volunteerism has changed as part of the broader evolution of legal and government structures.

Volunteerism first appeared within the framework of state action in the form of donations of land, money, and labor to public purposes. Some of these are outlined in the Statute of Charitable Uses, a 1601 act of Parliament intended to regulate charitable abuses. They include assisting the poor, sick, and injured, education, caring for orphans, tax relief, ransoming captives, helping young tradesmen, and constructing public works. To these ends charitable gifts were given to municipal corporations, the church, and other public bodies. Privately funded schools, hospitals, and other institutions required the sanction of the state, either through the granting of corporate charters or court approval.

Early voluntary giving in England was strictly regulated by the state, which not only limited the purposes for which funds could be donated (a donor could not, for example, support any other religion but the Church of England), but also placed the authority with the Lord Chancellor and the chancery courts.

Eamon Duffy’s studies of English religious life before the Protestant Reformation depict a rich culture of what appears to be voluntary activity (1992, 2001). But like most early volunteerism, failure to serve was punishable by fines—suggesting that it was viewed as a public obligation, much like paying taxes, rather than a genuinely voluntary act. Duffy suggests that the English Reformation ruthlessly eliminated broad-based lay participation in congregational life, centralizing sacramental and administrative functions in the hands of clergy and community leaders. Their service on vestries and other parochial boards may have been voluntary to the extent that such notables were not compelled to serve. But to the extent that it constituted one of the central functions of the aristocracy and gentry as governing classes, it could hardly be considered private in the modern sense.

Old World traditions of public volunteerism were carried to the colonies. Colonists were compelled to attend and support churches. Colonial government required all men of military age to serve in the militia. Townships levied on citizens’ labor to maintain roads and other public works (McKinney, 1995).

Private volunteerism emerged from the complex politics of English Protestantism. Henry VIII’s break with Rome was not intended to radically alter English religious life. But at a time when mechanical printing made the wide circulation of ideas possible, England could not be insulated from the religious ferment of the Protestant Reformation, then unfolding on the Continent. England became a battleground between religious factions, some favoring traditional Catholic conceptions of religious authority, others favoring Lutheran, Calvinist, and Anabaptist ideas that emphasized the spiritual sovereignty of believers (Dickens, 1964; Marsh, 1998).

For much of the period before 1689, the Church of England was a broad tent, permitting wide ranges of practices. This gave encouragement to a kind of spiritual volunteerism under which worshipers gravitated to preachers with whose views they sympathized, rather than being constrained by the geographical boundaries of the parishes to which the law assigned them. This practice of “gadding sermons” helped to produce the national subculture of religious individualism that gave rise first to efforts by the British state to enforce religious uniformity under the Stuarts and, ultimately, to the Puritan Revolution of 1640–1665. “Liberty of conscience” became a byword not only for religious toleration but for more encompassing conceptions of political freedom.

Volunteerism in Colonial America

The early migrations to New England exemplify the coexistence and common roots of public and private volunteerism. The Pilgrims who settled in Plymouth in 1620 were adherents

of a Protestantism that rejected the idea of a state church in favor of a church as a voluntary gathering of believers (Ahlstrom, 1972). Rejecting ecclesiastical hierarchy and the authority of the priesthood, these “separatists” established independent self-governing congregations in which members covenanted with one another to live under a common religious discipline and accept responsibility for maintaining the church and its ministry. Though an important step toward modern forms of private volunteerism, the separatists nonetheless rejected religious toleration—the existence of competing congregations—and their congregations maintained many of the characteristics of state churches.

By contrast, the settlers of the Massachusetts Bay Colony, while embracing many of the theological positions and ecclesiastical practices of their Plymouth neighbors, saw themselves as operating within the Church of England and sustained the hope that their mode of worship would set an example for the reform of the church in the old country. Because the Massachusetts Bay Colony drew on a far broader range of the spectrum of Puritan belief and practice, the first decade of settlement was fraught with intense conflict between factions on a number of issues, including the civil role of the church. Though ultimately embracing a state church model—intolerant of religious diversity and depending on taxation for its support—the Massachusetts Bay churches nonetheless regarded themselves as covenanted bodies of believers and, to this extent, embodied important characteristics of modern volunteerism.

Conflicts over theology and church polity in the 1630s resulted in the fracturing of Puritan unity. A number of Massachusetts groups, including most notably the antinomian followers of Roger Williams, were expelled from the colony. The new colony they established on Narragansett Bay (Rhode Island) permitted complete religious tolerance, requiring all churches to be supported by their members and rejecting state support. The Baptist and other congregations of Rhode Island offer the first examples of completely private volunteerism.

Ironically, the new colony’s religious diversity stood in the way of any large-scale voluntarily supported enterprises. As the Massachusetts colonists moved to define and enforce religious orthodoxy, they were able to allocate public funds and to encourage private philanthropy to found Harvard College in 1636. Harvard was in no sense a private institution: most of its revenues came from government rather than from private donations; the members of its governing boards were *ex officio* ministers and magistrates. Nonetheless, to the extent that it solicited gifts and bequests from individuals, it did embody elements that would become basic elements of private institutions when they ultimately emerged. Colonies with religious establishments—Massachusetts, Connecticut, and Virginia—all established colleges by the first decade of the eighteenth century. In contrast, the colleges that embraced religious tolerance—Rhode Island, New York, New Jersey, and Pennsylvania—would not do so until decades later.

Even in Massachusetts, where the precursors of modern volunteerism would first take root, authorities were not entirely comfortable with the idea of voluntary activity outside the

purview of the state. In 1638, when a group of Boston merchants petitioned the Massachusetts General Court requesting a charter for a private artillery company, worried legislators pondered “how dangerous it might be to erect a standing authority of military men, which might easily, in time, overthrow the civil power” (quoted in Bremer, p. 309). The Ancient and Honorable Artillery Company was allowed to organize, but was denied corporate status.

In the later years of the seventeenth century, a variety of kinds of secular volunteerism began to flourish in England (Jordan, 1959, 1960, 1962). The most important of these were mutual benefit organizations—fraternal societies like the Freemasons, friendly societies, and social clubs—membership associations that enabled participants to assist one another in times of illness and death, to share resources like books, and to provide places of entertainment and relaxation. By the first decades of the eighteenth century, variants of these types of voluntary associations began to appear in North America. As early as 1710, Boston’s preeminent religious leader, Reverend Cotton Mather (1663–1728), urged readers of his pamphlet *Bonifacius* to organize neighborhood “societies” to worship privately and to identify and care for residents in need. He also encouraged people to create associations to suppress disorders, to visit the sick and needy, and to enable young artisans to help one another.

Mather’s writings had a profound influence on Benjamin Franklin, who, during his apprenticeship in London in the 1730s, had an opportunity to see firsthand the potent possibilities of voluntary association. On his return to America, he helped to introduce Freemasonry (which soon became one of the most important translocal organizations in the colonies) and, later, was instrumental in organizing young men’s associations (the Junto), voluntary fire companies, an academy, and a hospital (Franklin, 1993).

Volunteerism in the Early Republic

Volunteerism, both public and private, played an important part in the American Revolution (Fischer, 1994; Bullock, 1996). Freemasonry, which embraced Enlightenment political and religious ideals, helped to consolidate the emergent revolutionary elite, while at the same time serving as a model for such radical organizations as the Sons of Liberty (Hammill, 1998). The voluntary religious activity that grew out of the Great Awakening of the 1730s and 1740s helped to create political, social, and economic networks friendly to the cause of independence. Together these facilitated a loosening of ties between volunteerism and government. Early in the revolutionary struggle, many militias—military bodies nominally subject to the authority of civil government—were persuaded to volunteer their services to fight the British. After the battles at Lexington and Concord, local militias throughout New England defied local authorities and marched to Boston to join the revolutionary forces gathering in and around the city.

The centrality of volunteerism to the success of the American Revolution helped to kindle hostility toward it once independence was achieved. When veteran officers of the Continental Army organized the Society of the Cincinnati in 1783, its

enemies viewed it as a covert effort to overthrow republican institutions and replace them with a hereditary aristocracy (Burke, 1784). In *Federalist* no.10, James Madison warned of the hazards that factions—by which he meant private political groups—posed to republican institutions. In the mid-1790s, when opponents of the new Federalist regime began organizing “democratic societies”—precursors of modern party organizations—President Washington warned against “self-created societies” intended to “subvert the Power of the People, and to usurp for themselves the reins of Government; destroying afterwards the very engines which have lifted them to unjust domination” (Washington, 1948).

The U.S. Constitution established conditions that made the growth of volunteerism inevitable. By mandating majoritarian decision-making while at the same time guaranteeing individual rights of expression, worship, and assembly, the Constitution posed an unresolvable tension between political equality and individual voice. Groups that did not prevail at the ballot box would be drawn to extragovernmental instruments—the press and voluntary associations—to advance their views and to work for victory in future elections.

Citizens of the early republic found themselves compelled to use voluntary associations, despite the uneasiness that they engendered. Because Americans feared government power, states and municipalities strictly limited the range of services they provided citizens. At the same time, the dismantling of religious establishments in the decades following the Revolution made volunteerism the central organizing principle of religious life throughout the nation. Like it or not, if Americans wanted to be educated, healed, entertained, politically represented, or provided with places of worship, they had to be willing to join with like-minded private citizens to pursue these ends.

The rise of voluntary action preceded the articulation of coherent ideas about the practice. The evangelical preacher Lyman Beecher (1775–1863), one of the first Americans to attempt to understand the role of volunteerism in institutional and political life, describes his plunge into promoting voluntary activity—in connection with early temperance efforts—as impulsive rather than deliberate. Only later, when he saw how powerful voluntary activity could be, did he begin to understand that the “voluntary system” could be used to organize all sorts of enterprises, from political reform movements, through schools, colleges, and religious crusades (Beecher, 1961). In the course of building his reputation as one of the nation’s most influential evangelists, Beecher made the promotion of volunteerism one of the central themes of his efforts. For Beecher and his coreligionists, uncoerced voluntary action became an important source of moral and spiritual development for individuals and communities (Bacon, 1832; Mathews, 1969).

Beecher played a particularly important role in the development of American volunteerism. Concerned about growing numbers of unchurched and uneducated citizens, Beecher came to recognize that voluntary activity, literacy, and broadly shared public values were the precondition for religious conversion. Accordingly, he and his colleagues devoted their

energies to secular reforms that could attract broad coalitions of citizens and citizen organizations such as temperance, anti-slavery, education, and the relief of poverty. Appealing to a broad rather than a sectarian public, Beecher not only helped teach countless numbers of Americans the skills of volunteerism, but also to overcome attitudes that had equated volunteerism with destructive factionalism.

By the time Alexis de Tocqueville visited the United States in the late 1820s, private volunteerism was well on the way to becoming one of the most distinctive expressions of American democracy. Taking note of the temperance movement, he was quick to draw comparisons between European and American styles of civic action. “The first time I heard in the United States that a hundred thousand men had bound themselves publicly to abstain from spirituous liquors,” he wrote,

it appeared to me more like a joke than a serious engagement, and I did not at once perceive why these temperate citizens did not content themselves with drinking water by their own firesides. I at last understood that these hundred thousand Americans, alarmed by the progress of drunkenness around them, had made up their minds to patronize temperance. They acted in just the same way as a man of high rank who should dress very plainly in order to inspire the humbler orders with a contempt of luxury. It is probable that if these hundred thousand men had lived in France, each of them would singly have memorialized the government to watch the public houses all over the kingdom. (vol. 1, pp. 109–110)

Although he observed the importance of voluntary association as a counterpoise to the potential for majoritarian tyranny in democracies and to the hazards of overly powerful government, Tocqueville undoubtedly exaggerated the ubiquity of private volunteerism in the United States. Many states adopted laws that discouraged private philanthropy (in Mississippi, for example, it was illegal to establish charitable trusts until well into the twentieth century) and kept voluntary organizations under strict regulatory scrutiny (i.e., New York’s Regents of the University of the State of New York, which oversaw the activities of all educational, charitable, cultural, and professional organizations) (Zollmann, 1924). Only in New England and the upper Midwest was private volunteerism allowed to flourish relatively unimpeded—and even there, prominent leaders like Unitarian theologian William Ellery Channing and Baptist political economist Francis Wayland wrote widely circulated critiques of voluntary associations as posing dangers to republican government (Channing, 1900; Wayland, 1838).

In the antebellum era, voluntary associations began to play crucial roles in empowering Americans who, because of gender, race, or ethnicity, were disenfranchised. By the late eighteenth century, as whites began excluding free blacks from their congregations, black religious leaders organized their own churches. Women, generally barred from full economic and political participation, carved out a “separate sphere” of civic activism, using voluntary associations to expand their traditional

domestic helping and caring roles to the dependent, disabled, unchurched, and uneducated (Scott, 1991). Immigrant associations helped those newly arrived from Europe to find economic opportunities, show their political muscle, and meet their needs in times of distress.

Volunteerism during and after the Civil War

The Civil War helped Americans to overcome whatever qualms they may have had about volunteerism. Though the war gave rise to a strong national government, it also strengthened the voluntary impulse. Armies on both sides—at least in the first years of the war—depended on volunteer soldiers. In the North, caring for the wounded and attending to the public health needs of the armed forces depended on national voluntary associations, the United States Sanitary Commission and the United States Christian Commission. These national bodies used local chapters to raise funds, produce medical supplies, and raise morale (Brockett, 1864; Frederickson, 1965).

After the war, voluntary associations flourished on an unprecedented scale (Skocpol, 2003). Fraternal and sororal organizations proliferated in countryside and city alike. Veterans' organizations with chapters in every city and village advocated for the interests of those who had served in the armed forces. The growth of cities and the increasing corruption of the political system encouraged the growth of associations advocating civil service, sanitary, and education reform. The growth of industry gave rise not only to national trade associations to advance the interests of merchants and manufacturers, but to labor organizations to defend the rights of working people. As demands for specialized expertise grew, professionals of every sort—physicians, lawyers, clergy, architects, engineers, and educators—organized membership associations to set professional standards and advance their collective legislative interests.

The rapid growth of voluntary associations among a people that, on the whole, had little experience with them led inevitably to considerable organizational disorder. Union army officer Henry M. Robert (1837–1923), assigned to posts in Washington State, California, Massachusetts, and Wisconsin, encountered what he described as “virtual parliamentary anarchy” in voluntary organizations (Doyle, 1980). This moved him to write his famous *Rules of Order*—which became the national standard for Americans swept up in the tidal wave of association building in the closing decades of the nineteenth century.

By the beginning of the twentieth century, two parallel traditions of volunteerism, one public, the other private, were firmly in place. On the public side, most municipalities depended on the voluntary energies of citizens, who served on boards and commissions and ran key municipal services (such as fire protection) on a voluntary basis. On the private side, many public services, such as social welfare and health care, had become largely dependent on voluntary donations of money and labor. But even when formally private, volunteerism sought not merely to serve members in their private capacities—it was almost always linked to government, seeking to sway public opinion on civic issues or to elicit government commitment. During the 1920s, Herbert Hoover sought to create an “associative state”

based on partnerships between voluntary associations and government agencies (Hoover, 1922; Hawley, 1977).

Volunteerism served both democratic and undemocratic purposes. Organizations like the American Protective Association and the Ku Klux Klan—both voluntary associations—sought to disempower and terrorize racial, ethnic, and religious minorities. Elite art museums, symphony orchestras, and universities sought both to enlighten the public and to shape its values in ways favorable to the interests of monied elites (DiMaggio, 1986). Professional associations often used efforts to elevate professional standards as ways of excluding Catholics and Jews (Auerbach, 1976). At the same time, voluntary associations were vehicles for national and international efforts to oppose lynching, promote economic and social justice, and advance women's suffrage (see, for example, Dray, 2002).

Inevitably, as the twentieth century advanced, hitherto voluntary activity began to be affected by professionalization. As the revenue needs of educational, health, and social welfare institutions grew, they were increasingly likely to turn to professional fundraising firms instead of depending on the efforts of volunteers (Cutlip, 1990). As medical and social work practice increasingly required higher levels of expertise, professionals and managers began to replace volunteers as key decision makers in health and welfare agencies (Starr, 1982; Perrow, 1963). By the late 1920s, the establishment training programs for volunteer trustees and directors in schools, libraries, and social agencies suggest that even volunteering itself began to require trained expertise (Hall, 2000). Inevitably, professionals pushed volunteers to the margins in most large nonprofit organizations.

Volunteerism and the Rise and Fall of the Welfare State

As the World War II ended, American policymakers began to take the full measure of the domestic and international responsibilities the nation had taken on as leader of the free world. International leadership would require the development of capacities to manage the domestic economy, to maintain internal political stability, and to sustain military preparedness. This would require a vast expansion of government.

The realities of the U.S. federal system, with its divided and subordinated responsibilities, combined with continuing popular distrust of big government prevented the creation of a European-style centralized bureaucratic state. The American welfare/warfare state, as it emerged, concentrated revenue gathering and policy powers in the national government while allocating most of the tasks of implementing national policies to states, localities, and private sector actors (Webber and Wildavsky, 1986; Donahue, 1989).

Tax policy became one of the most important instruments of the welfare state. The universalization of income taxation and steeply progressive individual and corporate taxes provided a powerful tool for influencing the activities of citizens and citizen organizations. Although the federal government used grants and contracts to influence private sector activity, the deductibility of donations and bequests and exemption from

corporate income and other forms of taxation became effective ways of encouraging transfers of funds between private sector actors. Implementing this system required a revolution in the tax treatment of charitable enterprises. Between 1947 and 1954, Congress rewrote the tax code, creating powerful incentives for charitable, educational, and religious organizations to incorporate and seek certification of charitable status from the federal government.

Depriving many voluntary membership organizations of tax exemptions that they had historically enjoyed, in combination with the establishment of federal social insurance programs, eliminated the *raison d'être* for the mutual benefit organizations that comprised the majority of secular voluntary associations in the United States. By the 1960s, traditional voluntary membership associations were dying out and, as Robert Putnam has noted, volunteerism of every sort was declining (Putnam, 2000; Skocpol, 2003).

The place of voluntary membership associations was being taken by charitable tax-exempt “nonprofit organizations” that were increasingly likely to be run by professional managers and funded by a mix of donations, commercial revenues, and foundation and government grants and contracts. Though volunteers still played a role in the nonprofit sector, they were increasingly likely to be involved with start-up organizations (which, if successful, quickly became professionalized) and religious bodies. There were exceptions to this pattern: religious organizations continued to command nearly two-thirds of the volunteer labor in the nonprofit sector; self-help groups, like Alcoholics Anonymous, explicitly rejected professionalism and depended entirely on the voluntary support of their members (Wuthnow, 1994); character building organizations like the Girl Scouts and Boy Scouts also continued to depend almost entirely on volunteers.

The last decades of the twentieth century witnessed a revival of public volunteerism. The Peace Corps, established in the early 1960s, sent American volunteers to developing countries. During the War on Poverty of the late 1960s, VISTA (Volunteers in Service to America) drew volunteers to impoverished urban and rural areas within the United States. The conservative revolution, which began in earnest with the election of President Ronald Reagan in 1980, advocated voluntary community efforts as a substitute for big government programs that, conservatives argued, perpetuated a culture of poverty. Some of these efforts, like Americorps, were government-sponsored. Others, like Habitat for Humanity, enlisted private citizens to help address public problems, such as poor housing. Colleges and universities became enthusiastic promoters of student voluntarism and community service as forms of experiential learning.

Dismantling big government through devolution (shifting burdens from the national government to states and localities) and privatization (shifting government responsibilities to private sector actors) was the central project of the conservative revolution. George H. W. Bush's speeches following his nomination as Republican candidate for the presidency in 1988 were not only high-profile official endorsements of volunteerism, but also suggested a peculiar blurring of public and private conceptions of volunteerism at the end of the

twentieth century. In his 1989 inaugural speech, the president declared

I have spoken of a thousand points of light, of all the community organizations that are spread like stars throughout the Nation, doing good. We will work hand in hand, encouraging, sometimes leading, sometimes being led, rewarding. We will work on this in the White House, in the Cabinet agencies. I will go to the people and the programs that are the brighter points of light, and I will ask every member of my government to become involved. The old ideas are new again because they are not old, they are timeless: duty, sacrifice, commitment, and a patriotism that finds its expression in taking part and pitching in.

At the end of the twentieth century, the traditions of public and private volunteerism that had diverged two centuries earlier were evidently converging as institutions—government, business, and universities—promoted volunteering as ways of fulfilling their responsibilities to the public. Such institutionally sponsored efforts—which often contain coercive elements (such as being requisites for graduation or promotion)—raise questions about the voluntariness of contemporary volunteerism.

W

WAR. How does one define a war? How can one distinguish between the war on drugs, the war on terrorism, jihad, anarchy, and wars between states? Definitions are relevant as they provide the rationale for considering a war legitimate and just and contribute to decisions about international interventions, aid, and protocol. This has become particularly important in contemporary international affairs, when the most prevalent conflicts have been nationalist and or ethnic in character and international terrorism has escalated. War has been defined in a number of ways: as “organized violence carried out by political units against each other” (Bull, p. 184); as “the legal condition which equally permits two or more hostile groups to carry on a conflict by armed force” (Wright, p. 698); and as “an act of force to compel our enemy to do our will” (Clausewitz, p. 75). These definitions encapsulate the notion of war as political, as organized violence carried out by a collective, and as ordered in that it has rules and customs of behavior. An underlying assumption is that war is a regular occurrence in the international arena and is an inevitable outcome of organized human societies.

This latter idea has been critiqued by Margaret Mead, who sees warfare as one of many inventions constructed to order our lives, in the same realm as “writing, marriage, cooking” and so on. War, like culture, takes on the veneer of an ancient tradition, something having historical depth, and has prevailed since early organized human societies. Mead suggests that war is an invented and learned activity and is not inherent to human behavior. The contending opinion emphasizes the “innateness” of human aggression, the consequences of which are sometimes violence and war. Without denying the complex interplay between genetic and environmental variables, these theories see human aggression as biologically driven. Humans fight over land, resources, and personal relationships in much the same way as other primates do, hence war in this perspective is not a social or cultural invention.

John Vasquez sees war as learned but also includes the notion that war comes out of a long-term process, is a product of interaction, is a way of making decisions, and is multicausal, and he recognizes that there are many different types of wars. Although this is a more comprehensive list of defining characteristics of war, the emphasis is on “interstate” wars and international peace and security.

Defining States as Warring Units

Should we assume states to be the main contending parties in war? Many influential definitions of war place states as a key variable. They assume that states are rational actors made up

of coherent territorial units with recognized leaders, governmental institutions, and discernable civil societies. However, in many of the major conflicts in the 1980s and 1990s, transnational activity reduced the significance of states as key actors. Post–Cold War central Africa and eastern Europe exemplify instances where intra- and interethnic conflicts within states sparked violent confrontations between states. Should these conflicts be classified as wars even though individual states did not declare war against other states? In some instances, belligerent ethnic groups within one state declared war on ethnic groups in another state, as in the Serbian Serb-Bosnian Muslim conflict in the former Yugoslavia from 1992 to 1995. In an attempt to answer the question of the types of nationalism that are most likely to cause war, Stephen Van Evera isolates four attributes: the movement’s political status with respect to statehood, its relationships with its national diaspora, its stance toward other nations, and its treatment of its own minorities. Using this scheme, it might be possible to evaluate the potential of a nationalist (or ethnic) conflict to escalate into a war. Theorists such as Van Evera have attempted to shift attention from states to nationalist movements as indicators showing the potential for war.

In other cases, there was no legitimate and overarching ruling authority within the state, as in Somalia from 1992 to 1994, when political anarchy prevailed and rival clan leaders battled each other. There refugees, guerrilla groups, and targeted factions fled across borders, initiating conflicts and instability in these regions. How should these conflicts be classified? If such conflicts are considered “domestic,” falling under the purview of sovereign states, then international interventions become extremely difficult. Given the regional instability that such conflicts produce, the devastation that follows, and the gross human rights violations that are committed, defining this as a national issue has many negative repercussions.

The havoc wrought by terrorists also challenges definitions of war. Highly skilled, trained, motivated, and ordered like soldiers in conventional armies, international terrorists have instigated some of our most intense wars. The U.S. invasion of Afghanistan in 2002 and Iraq in 2003 are good examples of the repercussions terrorists can invoke, in this case, the 9/11/2001 attack on the World Trade Center and the Pentagon. In pursuit of the masterminds behind the attacks, the United States believed that Osama Bin Laden (thought to be residing in Afghanistan) and Saddam Hussein (of Iraq) were key players, hence prompting the invasions. Should the citizenship of terrorists determine the belligerent state? Must we assume that all states are able to control all their citizens and

For the Common Grave, an etching by Francisco José de Goya y Lucientes from his *Disasters of War* series (1810–1820). The consequences of a war, whether it is considered justified or not, are often terrible, testing the humanity and mores of the participating combatants. © ARCHIVO ICONOGRAFICO

must take responsibility for their actions? How do we determine the target state when some terrorists have multiple citizenships and divided loyalties? Can we isolate a particular state as belligerent when some terrorists fight for political ideals and religious doctrines that transcend national state borders? Can we classify an attack by terrorists as an act of war? These questions challenge the assumption that states are the key units in war and challenge ideas of the causes and rules of war.

Jus ad bellum

Can war be morally justified? Most war doctrines include two considerations: first, the conditions under which one may have recourse to war (*jus ad bellum*); second, the rules and codes by which war may be conducted (*jus in bello*). The act of war, a license to kill, tests our adherence to morality, our acceptance of what we assume are human and civilized codes of behavior, our notion of the distinctions between the divine and the profane, our understanding of authority and legitimacy, and our sense of self- and moral consciousness. There are two main discourses dealing with *jus ad bellum*. The first makes a distinction between just and unjust wars, and the second makes distinctions between offensive and defensive wars.

St. Augustine of Hippo (354–430 C.E.) first grappled with the Christian ideal of love that prohibited killing and wounding in one's own defense but also obliged Christians to aid others, thus justifying the use of force on the aggressors. Yet Augustine did not provide a theory that isolated causes for a just war, nor did he suggest that a Christian cause was most just. Instead, he proposed that Christian ethics gave people and their leaders a capacity to know the moral limits of armed action but did not provide them with the attributes to "compare unerringly the over-all justice of regimes and nations" (Ramsey, p. 32). For Augustine, as all parties in war are engaging in wrongdoing, the warring parties cannot be divided into good versus bad, but rather Christian ethics provide guidance and the parameters for conduct in war of all parties involved.

St. Thomas Aquinas (1225–1274) expanded the idea of a just war and also initiated a shift from "voluntarism" to "rationalism" in understanding the nature of the political community, emphasizing a natural-law notion of justice (Ramsey, p. 32). According to Aquinas, a just war had three necessary requirements: declaration by a legitimate constitutional authority, a just cause, and the right intention. Francisco de Vitoria

(1486?–1546) and Francisco Suárez (1548–1617) added further conditions: the means of war should be proportional to the injustices being prevented or remedied by war, all peaceful means to remedy injustices should be exhausted, and the war should have a reasonable hope of success.

The recognized rules of *jus ad bellum*, as outlined by Aquinas and others, are often used to determine whether or not a war is justifiable. Some of the objections to these criteria are that they are overly subjective, leaving ample space for self-interested rationalization; that they rest on normative criteria about the nature of good and evil; that these categories were designed for evaluating the causes of war in the Middle Ages; and that in the nuclear age, with its emphasis on deterrence, they provide little guidance as to how to evaluate the “moral significance of different levels of threat and of risk” (Adeney, p. 97).

There are also those who question the very notion of war as having moral legitimacy. Reinhold Niebuhr, for example, argues that “Christianity should recognize that all historic struggles are struggles between sinful men.” Given this, he adds that “it is just as important to save what relative decency and justice the western world still has, against the most demonic tyranny of history” (Niebuhr, p. 35). Niebuhr recognizes that

JUS AD BELLUM: UNITED NATIONS CHARTER OF 1945

Chapter 1, Article 2(4)

All Members shall refrain in their international relations from the threat or use of force against the territorial integrity or political independence of any state, or in any other manner inconsistent with the Purposes of the United Nations.

Chapter 7, Article 51

Nothing in the present Charter shall impair the inherent right of individual or collective self-defence if an armed attack occurs.

Chapter 7, Article 42

Should the Security Council consider that measures provided for in Article 41 would be inadequate . . . it may take such action by air, sea, or land forces as may be necessary to maintain or restore international peace and security. Such action may include demonstrations, blockade, and other operation by air, sea, or land forces of Members of the United Nations.

while war can never be morally justified, it might be the only way to safeguard liberal democratic values.

In reflecting on the morality of the Gulf War, several authors came up with different conclusions. George Weigel argues that opposing the aggression of Saddam Hussein's invasion of Kuwait was justified in both intention and execution according to the criteria set out by just-war theory. Jean Bethke Elshtain, on the other hand, argues that war cannot be justified merely by checking off the list of criteria associated with the just-war theory. Instead, she suggests that the theory begs us to pause, to think about the ramifications of war, and to show some skepticism and queasiness about war. Above all, she asks that in drawing the balance sheet for the Gulf War, we evaluate technological accuracy and military might alongside the devastation and long-term effects of war on Iraqi children and society.

The just-war mode of reasoning attempts to reconcile the requirements of national defense with the moral obligations of protecting the innocent. In the age of modern warfare, where nuclear deterrence is the most significant element in preventing wars, the ideas behind just-war theory require a lot of tweaking before it begins to make any sense at all. In evaluating the justifiability of a contemporary war, some of the rules pertaining to *jus ad bellum*, particularly the rules of proportionality and reasonable hope of success, are seriously challenged. With the capacity and probability of killing large numbers of innocent people in warfare, the tensions inherent between *jus ad bellum* and *jus in bello* become sharper.

When looking specifically at modern warfare, Bernard T. Adeney sees deterrence as an “embarrassment and a puzzle” with respect to just-war theory. In terms of the criteria laid out under *jus ad bellum*, deterrence appears to be the “only

possible means of resisting unjust aggression” (Adeney, p. 112). Yet deterrence has the inherent ability to violate the basis of *jus in bello*. The Catholic Church responded to the Gulf War in a statement that put the very idea of just war in peril. The theory of just war, they said, was “indefensible and has been abandoned. In reality—with the sole exception of a purely defensive war against acts of aggression—we can say that there are no ‘just wars,’ and there is no ‘right’ to wage war” (La civiltà cattolica, p. 118). For many pacifists, who recognize the existence of political conflict, war is an unjustifiable means of resolution.

Jus in bello

Can war be controlled? Carl von Clausewitz says war is an act of force, and “there is no logical limit to the application” of force (Clausewitz, p. 77). However, others see war as a social activity that demands social organization and control, requiring a military that uses violence with deliberation for political objectives. As instruments of the state, the military employs violence (or uses force) in a purposeful, deliberate, and legitimate manner. Two criteria that maintain order and military discipline in war are the general value system of culture and the presupposition that the cost of war should not outweigh its benefits.

Focusing on the notion that language reflects “the moral world and gives us access to it” and that “our understanding of moral vocabulary is sufficiently common and stable so that shared judgments are possible,” Michael Walzer makes an argument for moments when the rules of *jus in bello* can be overridden (Walzer, p. 52). In a “supreme emergency,” determined by the “imminence of danger” and the “nature” of the threat, one might be “required to override the rights of innocent people and shatter the war convention” (Walzer, p. 259). Nazism,

JUS IN BELLO

Hague Convention IV of 1907

Governs methods and means of warfare, such as weapons that are restricted and tactical battlefield restraints.

Geneva Conventions of 1949

Concerned with the protection of victims of armed conflict—defined as the wounded, sick and/or shipwrecked, prisoners of war and civilians.

1977 Protocol I Additional to the 1949 Geneva Conventions (Article 1[4])

Armed conflicts in which peoples are fighting against colonial domination and alien occupation and against racist regimes in the exercise of their rights of national self-determination, as enshrined in the Charter of the United Nations.

1977 Protocol II Additional to the 1949 Geneva Conventions (Article 1[1])

Covers conflicts that take place in the territory of a High Contracting Party between its armed forces and dissident armed forces or other organized armed groups which, under responsible command, exercise such control over part of its territory as to enable them to carry out sustained and concerted military operations and to implement this Protocol.

which represented the “ultimate threat to everything decent in our lives,” constituted a supreme emergency, and Walzer sees the decision by Winston Churchill to bomb German cities in 1940 as a legitimate and justifiable decision. Although the initial decision qualified as a supreme emergency, according to Walzer, the decision to continue bombing cities after 1942, when the Russians and Americans had entered the war, was not justified, and Churchill ought to have asked his army to resort to attacking legitimate military targets.

A justified war is not necessarily a just war, as we also need to be concerned about justifiable moral means of behaving in war. Most theorists argue that the ends justify or structure the means, in that if the cause is justified, the use of all necessary and appropriate means is also justified. But some see an independent standard for judging *jus in bello*, especially in prohibiting all intentional killing of innocent people. However, it is difficult to know exactly what the appropriate means are until the war ends. For example, because the U.S. military has not found the weapons of mass destruction purportedly manufactured in Iraq for use by terrorists and the Hussein regime, it is difficult to evaluate whether the destruction of property and deaths of civilians and soldiers was indeed justified in the U.S. invasion of Iraq in 2003. Justice in the waging of war (that is, the justifiability of the violence and killing that is intrinsic to warfare) is a necessary condition for *jus ad bellum* and *jus in bello*.

Contention over the parameters of *jus in bello* during the nuclear arms race invigorated the debate between realists and idealists in international relations. The characteristics of

human nature lay at the basis of contention. Drawing on Thucydides (d. c. 401 B.C.E.), Niccolò Machiavelli (1469–1527), and Thomas Hobbes (1588–1679), realists start with the premise that human nature is inherently bad, self-serving, evil, and desirous of power. States in the international system also reflect these characteristics and exist in a state of anarchy where war is constant and insecurity is the norm. In this perspective deterrence is one of the ways in which states can prevent wars, in that their military capabilities act as a deterrent against possible attack. For idealists, human nature is essentially good, and bad behavior is due mainly to evil institutions that encourage people to act selfishly. For example, Mahatma Gandhi (1869–1948) maintained that the means justified the ends, and in this perspective nonviolence and *Satyagraha* (soul-force) were the appropriate ways in which to achieve equality and a just system. Idealists believe that war is an international problem that requires collective, multilateral cooperation and diplomacy.

The notion of the appropriate means necessary to fulfill desired ends became particularly pertinent in the nuclear age. Some argued that if nuclear weapons were used in an all-out war scenario, it would be a “monstrously disproportionate response to aggression on the part of any nation” (U.S. Catholic Bishops, p. 103). The bishops argued that good ends could not justify “immoral means” and urged the superpowers to invest in diplomacy, peacemaking, and disarmament.

Other theorists have argued that nuclear deterrence is necessary if we are to defend our freedom and fundamental rights, that deterrence in fact works to prevent war and destruction.

Nuclear deterrence in this perspective is necessary to prevent war and to enable peace and security. John J. Mearsheimer adds that the Cold War period was largely peaceful because of the bipolar distribution of power, the “rough equality of military power between the two polar states,” and the presence of nuclear weapons that made deterrence “far more robust” (Mearsheimer, p. 9). Proponents of this view add that while we have to be judicious in the decisions to engage in war to preserve our values, we also have to develop military capabilities suited to our moral commitments. Although increasing military capacity might increase tensions, they act as a deterrent to possible attacks, but most importantly, they will be adequate means to defend our values if we are forced to do so.

International organizations that attempt to create a forum for international diplomacy and peacemaking have less significance in the realist perspective. John Gerard Ruggie argues that realism has failed to grasp the integral role of international institutions like the United Nations in promoting cooperative and multilateral ways of maintaining peace and preventing wars. Criticisms against the notion that nuclear deterrence is one of the strongest means of preventing wars are prolific. Although quite varied, many of them see world politics as socially constructed, that is, that international politics are social rather than material and that structures shape identities interests and behavior. Structures are considered “discourses” made up of shared knowledge, material resources, and practices. Here the emphasis is not on human nature but rather on the social relationships that are forged and the complex interplay between leaders, state structures, and civil society. Feminists critique the realist paradigm by questioning the “denial of female images and female-linked imperatives” in the foundational assumptions about human nature, the character of states, and the international system (Elshtain, “Just War as Politics,” p. 261). Even in just-war theory, men are considered the soldiers or just Christian warriors, while women are relegated to the private sphere, the “beautiful soul” who is peaceful, frugal, and self-sacrificing. A reevaluation of war and peace from a feminist perspective energizes the debate on the causes of war and appropriate and acceptable behavior during war. The use of rape as a weapon of war, used in Italy in 1943 and in Bosnia in the early 1990s, has become part of the international human rights agenda but is also crucial to determining the parameters of *jus in bello* and to the idea that with constantly changing “means” of war, the war conventions must be open to change as well.

WAR AND PEACE IN THE ARTS. Depictions of violence have been part of human culture for millennia. What began as an effort of early humans to come to terms with the awe-inspiring power of weapons to kill their prey, and thus sustain human life, or ward off danger (for example, the cave paintings of Altamira, Spain) has evolved into a complex social code to help us try to make sense of total war, which industrialization and the modern nation-state made possible during the twentieth century.

The Military Leader

The most common image of war is that of the military leader, typically depicted on horseback or in a chariot, leading his troops into battle, and vanquishing the enemy. Before the late

nineteenth and twentieth centuries, a king or an emperor had to be a skilled military leader in order to seek, obtain, and maintain political power. Thus, depictions of his military successes were an important means of demonstrating to his subjects and would-be challengers the king's legitimacy as a ruler. These images were displayed on the bas reliefs of public buildings and temples, and as statuary in public places where as many people as possible could see and admire their achievements. Such images were also created for private viewing, usually to remind the ruling elite of the king's power and legitimacy. Paintings commissioned by the king or emperor would show the leader in various idealized poses as brilliant battlefield commander or god-anointed ruler.

The Heroic Soldier

The second most commonly depicted individual in war art is the heroic soldier. In the Western world the characteristics of the archetypal hero were defined in Homer's ninth-century epic poems about the Trojan War, the *Iliad* and the *Odyssey*. The Homeric hero, as personified by Achilles, was courageous in battle, loyal to his friends and comrades, and quick to anger. He suffered grievous loss, sometimes even death, and was curiously attracted to the thrill of battle but was equally appalled by its horrifying consequences. In the visual arts the Homeric heroes were repeatedly depicted in the red and black figures of painted Ancient Greek pottery. The image of Ajax carrying the body of Achilles is particularly poignant as it reminds the viewer that death often accompanies heroic actions on the battlefield.

More commonly the hero has been depicted as the protector of society who symbolically defeats the enemy as snake or dragon, as demonstrated by the innumerable depictions of Saint George, who was adopted as the patron saint of England in the fourteenth century. Or the hero is depicted, often on horseback, leading his troops into battle with firm conviction of the high moral purpose of the battle about to be fought, as when William the Conqueror leads his troops into the Battle of Hastings (1066) in an early piece of war propaganda, the Bayeux Tapestry.

It was sometimes acknowledged that to be a hero one had to be a little bit mad. To willingly face physical harm or death and to be able to urge one's fellows to do likewise and to lead them into battle required a sense of commitment that might appear to verge on madness. Albrecht Dürer caught this in his copper engraving *Knight, Death, and the Devil* (1513), where the steadfast knight, accompanied by his loyal dog, looks intently forward, trying to avoid the distractions of Death, who brandishes his hourglass, and of the Devil, who leers at him.

Two countertypes stand in contrast to the model of the heroic soldier: the heroic female soldier, or "warrior queen," and the antihero. Many warrior queens who led nations but not armies into battle wished to show themselves the equal of their male counterparts, at least in works of art. A coronation painting of Empress Catherine II of Russia (r. 1762–1796) shows her on horseback, in uniform, holding a sword but with armed troops almost hidden in the background; Maria Theresa of Austria also wanted to be painted on horseback but, although

she brandishes a sword, she wears robes, not a military uniform, and sits side-saddle.

Actual warrior heroines like the ancient Briton, Boadicea, are depicted riding a chariot (a bronze statue by Thomas Thornycroft, 1902) or standing on a slight rise above her troops exhorting them to battle; Amazons were depicted on an equal footing with Greeks in art; Joan of Arc is often depicted wearing full armor but kneeling in prayer or standing with a battle standard, and less frequently on horseback. In India, the Rani of Jhansi, who led men into battle against the British in 1858, is depicted on horseback and brandishing a sword.

The Robin Hood of legend was the classic antihero—an aristocrat who donned the garb of ordinary peasants and took up their cause of opposing taxation and other feudal obligations while an absentee king fought in foreign wars. Courage and resistance are among the hallmarks of the antihero. John Simpson Kirkpatrick, an Australian soldier who served in the Gallipoli front (Turkey, 1915) in World War I, demonstrated his courage not by killing the enemy but by rescuing the injured, often under fire, and bringing them back to the first aid stations on the back of his donkey. The image of "Simpson and his donkey" became a potent one in photographs, posters, and, later, statues. It was used both as propaganda for Australian recruitment and as an antiwar statement of how one man turned his back on the killing and sought to save life.

Civilian Casualties in War

Jacques Callot's series of etchings *The Miseries of War* (mid-seventeenth century) was the first attempt to depict the impact of war on civilians. Callot's finely detailed etchings of war-ravaged Lorraine during the Thirty Years' War (1618–1648) show pillaged farm houses, burning churches, and the raping and killing of peasants by marauding soldiers and deserters. But this is not a thoroughgoing antiwar perspective; rather, it shows what happens when legitimate authority temporarily breaks down and soldiers become an ill-disciplined rabble as a result. A good Catholic and monarchist, Callot concludes his series with the just punishment and rewards meted out by the absolute monarch according to God's will, no doubt—the wicked soldiers are hung en masse and the well-disciplined officers get their monetary rewards and promotions.

Francisco Goya (1746–1828) achieves a more consistent antiwar perspective in his graphic depiction of the horrors of guerrilla warfare in Spain under the occupation of Napoleon's troops (1808–1813). His adoption of enlightened ideas of reason and the natural rights of man meant that Goya regarded as a crime and a disaster what others had accepted previously as inevitable, namely the killing of civilians. The particular circumstances of the guerrilla war in Spain brought this aspect of war into particularly sharp focus. His series of eighty-three etchings, *The Disasters of War* (1810–1814; published posthumously because of their radical perspective and graphic depiction of atrocities), documents the horrors committed by both sides—the Spanish people fighting a foreign occupying army and the French rooting out "terrorists" in order to bring the ideals of the French Revolution to an apparently unwilling populace.

THE WORLD WARS IN FILM

From the earliest years of moving pictures the topic of war provided exciting and attractive material. At first, directors “restaged” current events such as the Spanish-American War, the Boxer Rebellion in China, or the Boer War in South Africa in order to entertain and “inform” movie-goers. During World War I all sides rushed propaganda movies into production in order to show the enemy in the worst possible light and to bolster popular support for the war. The need of the modern military for intelligence and training required people skilled in photography, so it is ironic that many individuals who would go on to make war movies in the 1920s and 1930s (sometimes anti-war movies) got their training during World War I serving in military intelligence. One such individual was the American Lewis Milestone who went on to make the classic antiwar movie *All Quiet on the Western Front* (1930).

Important films about World War I include William Wellman’s *Wings* (1927) with its spectacular and thrilling aerial combat sequences; Milestone’s *All Quiet on the Western Front*, which defined the genre of the anti-war film for decades to come; Jean Renoir’s *The Grand Illusion* (1937), a subtle French film about how class, race, and language divide men even more than nationality; Stanley Kubrick’s *Paths of Glory* (1957), which shows how ambitious generals use war to promote their own careers at the expense of the enlisted men; Joseph Losey’s *King and Country* (1964), a grim film that questions the British policy of executing soldiers for suffering mental breakdown under extreme combat stress or “shell shock”; and Peter Weir’s *Gallipoli* (1981), which forces Australians to question the wisdom of fighting for the concept of “Empire” so far from home.

During World War II Hollywood threw its whole-hearted support behind the war effort and produced a large number of “combat films” designed to boost recruitment into the armed forces and morale on the home front. The formula for these movies was to take a diverse group of “typical Americans” (e.g., an Italian from New York,

a Texan, a midwesterner, a Californian, a Jew, an Hispanic, and so on) and show how they overcame their differences to become a coherent fighting unit dedicated to achieving the government’s war aims. Typical of this genre is *Bataan* (1943), directed by Tay Garnett, and *Guadalcanal Diary* (1943), directed by Lewis Seiler.

Only rarely toward the end of the war and occasionally afterwards did more critical and thoughtful films emerge that looked beyond the established stereotypes. John Ford’s *They Were Expendable* (1945) hints at the futility of what some men were asked to do, while Sam Fuller’s autobiographical film *The Big Red One* (1980) suggests that personal survival and loyalty to the platoon is what motivated men, not grandiose schemes dreamed up by politicians; Keith Gordon’s *A Midnight Clear* (1992), based upon William Wharton’s autobiographical novel set during the Battle of the Bulge in December 1944, suggests that fear, chaos, and incompetence determined the outcome of battle.

Hollywood continued to produce blockbuster movies about World War II well into the 1960s, until the Vietnam War began to sour the taste for celebratory war movies. *The Longest Day* (1962), directed by a committee of Andrew Marton, Ken Annakin, and Bernhard Wicki, based on the book by Cornelius Ryan about the Normandy invasion in June 1944, and *The Battle of the Bulge* (1965), also directed by Ken Annakin about the last counterattack by the Germans in December 1944, were the last gasp of this type of World War II movie.

The European and Japanese perspective on World War II was quite different, as one might expect. Societies that either had done the conquering and occupying (like Germany and Japan), or had been conquered, occupied, and then divided into resisters and collaborators (like the French, Italians, Poles, Russians, and so on) would be expected to see the war in a different light than the Americans, Britons, and Australians who had not been conquered and occupied.

(continued on the next page)

THE WORLD WARS IN FILM

(continued from previous page)

German war films about World War II have been understandably few and far between. In the last months of the Nazi regime, enormous resources were expended in the making of “historical films” like *Kolberg* (1945), directed by Veit Harlan; these were designed to rally the German people to one last stand against the “invading” allied armies by reminding them of successful heroic last stands put up by German Baltic towns like Kolberg as Napoleon was marching toward Moscow. But generally Germans preferred to forget the war years as they rebuilt their lives and enjoyed the benefits of the post-war economic miracle. Low budget films like Bernhard Wicki’s *Die Brücke* (*The Bridge*; 1959) sometimes appeared but they were rare. Wicki shows a group of conscript teenage boys forced to pointlessly defend a minor bridge against advancing American tanks as the Nazi regime crumbles. Death for all naturally ensues. Higher production values were used to make *Die Blechtrommel* (*The Tin Drum*; 1979), directed by Volcker Schlöndorff and based on the novel by Günter Grass, but the point it may have been trying to make is lost in the bravura performances of the cast. A major international success came with the submarine drama *Das Boot* (*The Boat*; 1981), directed by Wolfgang Petersen, which brilliantly shows the claustrophobic nature of submarine warfare in the Atlantic, but which completely clouds the issue of why men fought so desperately for the Nazi regime. It took an American director, Sam Peckinpah, notorious for his violent westerns, to take a German autobiographical novel about the appalling conflict on the Eastern Front and turn it into a film designed to debunk comfortable Hollywood films about World War II—*Cross of Iron* (1977). Its depiction of the brutal fighting on this front is only equaled by the Russian director Elem Klimov’s *Idi i smotri* (*Come and See*; 1985).

The French were also reluctant to confront the painful issues raised by defeat, collaboration, and

resistance. An early film by René Clément, *La Bataille du Rail* (1946), depicts French railway workers as resistance fighters, and thus by extension all French people as heroic, thereby glossing over the issue of collaboration or apathy. A later film by Clément, *Jeux interdits* (*Forbidden Games*; 1952), follows parentless children traumatized by the 1940 invasion of France as they retreat into parodies of Catholic death and the burial rituals, their subjects deceased farm animals.

The very few Japanese films about World War II did not appear until the late 1950s as the Japanese people, like the German people, either strove to forget the war or were prevented by the censorship laws of the occupying Americans, which forbade patriotic war films or films that were critical of the United States. Kon Ichikawa made a pair of disturbing films, *Biruma no tategoto* (*The Harp of Burma*; 1956), about a Japanese soldier in Burma who refuses to be repatriated with his unit at the end of the war until he has made amends by dressing as a Buddhist monk, searching out the unburied corpses of the war dead and burying them himself; and *Nobi* (*Fires on the Plain*; 1962), about a soldier who is trapped in the jungle by the advancing American forces in the Philippines, in February 1945, and is forced to endure hunger and disease rather than surrender. At the same time, Masaki Kobayashi made a nine-hour trilogy, *Ningen no joken* (*The Human Condition*; 1959–62), about a young man who worked as a manager in a mine in Manchuria that uses Chinese slave labor; he is conscripted to fight in the Imperial Japanese Army in China and endures the brutality of Japanese army discipline, and then, after the Japanese army collapses, is forced to walk back to his homeland to escape the advancing Red Army. After this very promising start, Japanese treatment of war in film virtually disappears as the “economic miracle” of the 1960s preoccupies everyone’s mind. So when distribution in 1990 is sought for *Blood Oath* (directed by Stephen Wallace, it is also known as *Prisoners of the Sun*), an Australian film about the

(continued on the next page)

THE WORLD WARS IN FILM

(continued from previous page)

brutal treatment of POWs on the island of Ambon in Indonesia, few Japanese people have ever heard of these events (Japanese school textbooks carry no mention of them) and no mainstream cinemas are willing to show the film.

After having dropped out of fashion due to the traumas resulting from the Vietnam War, the

World War II movie made a come-back in the late 1990s with Steven Spielberg's *Saving Private Ryan* (1998). This film cleverly combines many elements of the traditional World War II combat movie with just a hint of the criticism that had emerged previously in films like Fuller's *The Big Red One*, namely that men fight more for their immediate comrades and in order to survive, rather than for abstract, lofty ideals.

In the twentieth century the widespread use of the camera made possible the depiction of the impact of war, especially total war, on civilian populations in much greater detail: whole cities reduced to rubble by "carpet bombing" during World War II; a naked Vietnamese girl running toward the camera with her napalm wounds exposed; a room full of human skulls in Cambodia. In the early twenty-first century the small and cheap digital camera made possible the graphic depiction of the treatment of Iraqi prisoners in Abu Ghraib prison camp. Among the outright pornographic is the iconic image of a hooded and cloaked Iraqi with arms outstretched, Christlike, with wires from his extremities hooked up to some source of electricity. The camera is able to capture and reveal two extremes of war's impact—the personal and individual suffering that war causes, and the panorama of mass destruction—but the middle ground seems to be missing.

Photographic images that have become closely associated with the Holocaust are pictures of rooms full of victim's shorn hair, spectacles, shoes, empty suitcases, and boxes of gold fillings extracted from inmates' teeth—the by-products of the industrialized process of killing human beings and recycling their property. In camps like Theresienstadt, art work by inmates was sometimes officially commissioned or tolerated by the Nazis as a useful diversion. In other camps, making sketches or drawing was strictly forbidden, and inmates were severely punished if they were caught. Yet, many did make a visual record of their experience in the camps, and some returned to the topic in paintings they made after the war ended. The themes dealt with by camp artists include portraits, images of daily hardships, images of death and dying, and gallows or black humor. The art produced in the Nazi camps is extraordinary testimony to the will to survive of human beings and to the deeply felt need to document human experience.

The atomic bombing of Hiroshima and Nagasaki, Japan, by the United States in World War II also gave rise to new images of war. The image of the mushroom-shaped cloud produced by the explosion of an atomic bomb is now universally recognized. What is less well known is the art produced by the people on the ground who lived through the explosion. In 1976 the Japanese Broadcasting Corporation, NHK, collected images drawn by survivors of the atomic bomb blast. The

pictures (published in *Unforgettable Fire*), all drawn by amateur artists, provide a moving and very different set of images of atomic warfare. A number of images that appear repeatedly in their work include bloodshot and bleeding eyes; people walking about naked; and people walking about with what appear to be rags or cloth draped over their bodies but which are in fact sheets of burnt skin that have peeled away. Many walked with their arms outstretched, held away from their body in order to prevent the burnt flesh from rubbing. In Japanese culture, this is the way ghosts walk. The atomic bomb victims had been transformed into living ghosts.

In spite of the camera's success in capturing the experience of war in the twentieth century, perhaps the most powerful and best-known depiction of innocent civilians in war is Pablo Picasso's mural *Guernica* (1937), inspired by the bombing of a Basque town by German fighter bombers serving with the Nationalists during the Spanish Civil War. In a complex, triangular structured painting Picasso depicts burning houses surrounding a square, a woman calling out a warning to others, a mother holding her dead baby, a woman running from the mayhem, a fallen and broken statue of a warrior, a stabbed and screaming horse. In spite of the fact that much worse atrocities against civilians were perpetrated and depicted in the second half of the twentieth century (or perhaps because of it), the power of this painting still shocks nearly seventy years after its creation.

The Ordinary Soldier in Battle

Like civilians, the ordinary soldier was largely invisible in war art until the nineteenth century. Only when mass conscript armies of citizens took to the field after the French Revolution and the Napoleonic Wars had revolutionized the nature of warfare did artists and photographers begin to take notice. The emergence of mass circulation newspapers, the technology to cheaply reproduce sketches and photos, a reading public interested in the fate of their fathers and sons on the battlefield, and a growing liberal concern for the welfare of the ordinary soldier, were also contributing factors.

During the American Civil War, artists like Winslow Homer (1836–1910) produced a steady stream of illustrations of battles (usually not personally witnessed but reconstructed

afterward) and of the life of the ordinary soldiers in their camps. Many of these camp illustrations show the boredom of soldiers with nothing to do while they wait for the next bloody battle. Photographers like Matthew Brady, Alexander Gardner, and Timothy H. O'Sullivan revolutionized the depiction of war with their images of the dead littering the battlefield, or of the execution of rebels by hanging.

World War I produced a number of gifted war artists whose visual record of the war is significant. Among these is the German graphic artist Otto Dix, who served from 1914 to 1918 and saw action on the Western Front. His most interesting work consists of a set of fifty etchings simply called *Der Krieg* (1924; *The war*) and some oil paintings, especially the disturbing *War Triptych* (1929–1932). Iconic images of World War I include the desolation of the landscape caused by the incessant shelling and the digging of trenches along the Western Front. In *Der Krieg* Dix shows how ordinary soldiers dealt with these appalling conditions—they became one with the earth in both death and life. In death their bodies were literally consumed by the soil and the worms (the worm-riddled *Skull*); in life they spent their lives covered in dirt and living in holes and trenches dug in the earth (*Feeding-Time in the Trench*). The only hope for life seems to be the flowers and worms that grow out of the craters and skulls of men. In the *War Triptych* Dix takes the traditional Christian image used to portray the life, death, and resurrection of Christ and applies it to the front-line soldier in the trenches.

The experience of ordinary soldiers who were captured by the enemy was largely hidden from public view during World War II and did not surface until well after their release. Cameras were forbidden, of course, and those prisoners who were caught keeping diaries or making sketches were severely punished. Nevertheless, some prisoners of war (POWs) were able to keep their diaries and sketches and publish them after the war. British soldier-artists such as Ronald Searle and Jack Chalker, captured after the fall of Singapore in 1942, were sent to work building the Thai-Burma railways as slave workers for the Imperial Japanese Army. In their art they document the brutal treatment the POWs received as many of their comrades were worked to death. They produced images that have a number of similarities to those produced by European victims of the Nazi Holocaust—emaciated, sick bodies lying on flimsy beds and brutal captors with batons and rifle butts ready to beat them. Of the 60,000 POWs who worked on the railway nearly one third died. Not surprisingly, their anger at their treatment tinges their art with racist depictions of their oppressors.

Bringing War to an End

The formal ending of a state of war is commonly achieved by means of a surrender, armistice, or peace treaty. For the losing party there is no pleasant way to accept defeat. For the victor, there is an opportunity for propaganda, as a number of works of art demonstrate. The seventeenth-century Spanish painter Diego Velasquez was commissioned by the Spanish court to contribute to a series of victory paintings during the Thirty Years' War. His *Surrender of Breda* (1634–1635) shows Justin of Nassau handing the keys of the besieged Dutch city of Breda to the marchese Spinola in 1625 after the city had

endured a terrible ten-month siege. Both men have their hats off, as equals might greet each other, and the Spaniard has his arm on the Dutchman's shoulder in a conciliatory gesture. Given the impact of a siege on a civilian city such a gesture might seem somewhat inadequate, but it was how the Spaniard wished to be seen in victory.

A less generous depiction of a surrender, but no less propagandistic, is a popular Japanese woodcut that shows the Russian surrender of the fortress of Port Arthur to the Japanese in 1905, also after a long siege. The Japanese officers stand with their hats on under the shelter of a tent that flies the Japanese flag. The Russian officers stand humiliated in the snow outside the tent with their hats off submissively, waiting to sign the surrender papers. The battle is significant because it was the first time an Asian military power had defeated one of the great powers of Europe. Thus the Europeans had to be humiliated as well as defeated.

The humiliation was returned forty years later, when the Japanese formally signed surrender documents on the deck of the U.S. battleship *Missouri* on 2 September 1945. The official American military photograph shows the Japanese party literally surrounded by Allied personnel as they approach the signing table. Immediately above them and to the side, dozens of American enlisted men sit on the ship's giant guns with their feet dangling over the side. They will not show any respect by standing for the Japanese delegation. Directly overhead, at the moment of the signing, 400 B-29 bombers and 1,500 naval fighters flew past, drowning out all words. The surrender was total, unconditional, and utterly humiliating.

The American painter Winslow Homer took a different approach to the end of war. In *The Veteran in a New Field* (1865), a Northern veteran has taken off his jacket and canteen and put them to one side. He has taken up a scythe and begins to harvest a field of wheat. We can imagine that, like the Roman leader Cincinnatus (b. c. 519 B.C.E.), who left his farm to assume the dictatorship of Rome and defend it from its enemies only to relinquish that power and return to his farm, this veteran has turned his back on war and taken up peaceful and productive agricultural labor. The image brings to mind the biblical verse: "And they shall beat their swords into ploughshares, and their spears into pruning hooks; nations shall not lift up sword against nation, neither shall they learn war any more" (Isaiah 2:4).

David M. Hart

WEALTH. Wealth has been viewed as a blessing and as a curse; as a prerequisite of virtue and an embodiment of vice; as an expression of merit and of fault. This nonexhaustive list illustrates that not only is the history of wealth a history of contention, it is also intimately bound up with moral evaluations. These differing evaluations themselves indicate a range of divergent cultural judgments. “Wealth,” however, is not simply an item of moral discourse. It has a central place in political and economic vocabularies. While there is, perhaps, a core linkage with the notion of “resources,” that itself is an elastic category, referring to “goods” both tangible and immaterial (such as clean air, a healthy environment, and general quality of life). Wealth with all its cultural and ethical connotations is applied descriptively to an individual (the “rich man”), to a group or class of individuals (“the wealthy”), and to a country or, as in the title of Adam Smith’s famous book, to nations.

With this range of reference it is unsurprising that most of the established “great thinkers” in what is unreflectively labeled the “Western tradition,” from Aristotle to St. Thomas Aquinas to Jean-Jacques Rousseau to Karl Marx to Thorstein Veblen, have had something to say on the topic. But the issues and debates are neither exclusively Western nor intellectual. Most of the great religions include in their teaching some reference to wealth, though not without manifesting the idea’s contentiousness. In addition, wealth plays a ubiquitous role in social and cultural life from grave goods to potlatch ceremonies. An attempt will be made in this entry to represent this range of concern, though its major focus will be on the place of wealth in Western intellectual debates.

The entry is organized along two axes—thematic and chronological. Thematically, the discussion is organized in

terms of two basic associations—wealth and virtue, and wealth and power. Each theme is explored in rough chronological order—charting the history of wealth’s interactions with virtue and with power. Throughout these explorations three questions will implicitly recur: What is wealth? that is, what is supposed, in different times, with respect to virtue and power, to constitute it; Who has it? that is, what is supposed similarly about its distribution; and, closely related, Why or on what grounds does X rather than Y have that item of wealth? that is, what is supposed to justify or legitimate the distribution.

Wealth and Virtue

Historically the association between wealth and virtue has been viewed both positively and negatively. These will be examined in turn.

Positive. Aristotle (384–322 B.C.E.) identifies “liberality” as a virtue that is the mean between prodigality and illiberality. The context is money or wealth. The liberal man (the gender is not incidental) will “give with a fine end in view, and in the right way; because he will give to the right people, and the right amounts, and at the right time” (Aristotle [1976] p. 143:1120a25). When acting liberally, it is the disposition that matters, not the sum or sort of resources. Though giving is more virtuous than receiving, nonetheless, the “liberal” will accept wealth under similar constraints. The most important source of wealth is the ownership of property, especially landed property. This ownership is associated with other estimable traits such as responsibility, prudence, and steadfastness. By exercising these virtues, wealth qua landed property is sustained so that, accordingly, there are resources available with which to act liberally. Importantly, wealth thus understood imposes obligations; it does not reflect an acquisitive mentality and it is not valued for its own sake.

Although worked up theoretically by Aristotle, this link between wealth and obligation and the stress on the use made of wealth is pervasive. The early Christian theologian St. Clement of Alexandria (c. 150–between 211 and 215) does not subscribe to the asceticism prescribed by many of the church fathers but, nonetheless, instructs that wealth is to be used for charitable purposes and not retained possessively. This is echoed in the Koran, and, somewhat similarly, in Hindu teaching wealth (*artha*) needs to be cultivated but by virtuous means so that the wherewithal is possessed that goodness may be exercised. This is an attribute of many cultures. The form this often takes is of hospitality. The Israelites in the Old Testament are enjoined to give succor to the improvident, while for Kalahari bushmen, and many others, wealth exists to be shared. In these latter examples it is less that wealth calls forth individual virtue than it manifests a cultural norm of reciprocity. In both cases, however, wealth is justified as a means to further good ends.

This understanding of the importance of wealth, and its justification, has endured beyond its presence in Aristotelian theory and cultural practice. Only if one is wealthy can generosity or charity—whether by the Good Samaritan or by millionaires—be exercised and only if a society is wealthy can it support extensive welfare programs. In a just society, according to

John Rawls (1921–2002), the wealth enjoyed by the more fortunate, as a consequence of arbitrarily distributed natural talents, could be viewed as a “collective asset” to be used, once freedom has been accorded priority, to further the interests of the worse-off (p. 179). However, supporting welfare need not mean collective provision. F. A. Hayek (1899–1992) justified retaining wealth within families as an expression of freedom, which includes making responsible welfare decisions. This was also an essential means to prevent the concentration of wealth in the hands of the state.

Hayek is here making a consequentialist case for inheritance. This pays little attention to the source of wealth, but a positive case for wealth is that its possession is the deserved outcome of the virtue of industry or hard work. The Protestant ethic, as articulated by Max Weber (1864–1920) in his *Die protestantische Ethik und der Geist des Kapitalismus* (1920; *Protestant Ethic and the Spirit of Capitalism*), psychologically compelled the “elect” (those chosen for salvation by God) to seek proof of their election. This took the form of diligence and industriousness, which led to success in worldly activity, but since waste was also proscribed, and frugality prescribed, it meant that wealth was accumulated. In a historically important argument, John Locke (1632–1704) developed a version of this. He argued that God enjoined everyone to be industrious and that through mixing their labor (as he termed it) to natural resources they were entitled to the fruits of that labor as their private property. Provided they did not accrue wastefully all the resources to themselves, the inequality of holdings derived from greater industry was justified. Nonetheless, true to his own Nonconformist (Calvinist) background, Locke also held that if people lived providently without the desire for luxuries then wealth would be increased even more. Locke here broaches the negative link between wealth and virtue.

Negative. While Aristotle does link wealth with virtue positively, his more sustained and influential argument (in the *Politics*) is that the former can lead to a corruption of the latter. Wealth and its maintenance is properly an attribute of household management (of economics, *oikonomikē*), its purpose being to give the male head of the household the freedom to act virtuously—not only via liberality but also via participation in the affairs of the community (the polis), an activity that is natural since man is by nature a political animal. Wealth is limited to this instrumental function. However, it is liable to transgress those limits. Some exchange is permissible, when it serves to meet the naturally limited consumption needs of the household, but once it is undertaken for its own sake, and not as a means to an end of consumption, then it becomes money-making (*chrēmastikē*). This activity can be engaged upon without limit. There is a natural limit, for example, to how much food can be consumed but not to how much money is possessed. A transgression of the proper purpose or end of activity represents a corruption, a perversion of virtue.

This moral critique of wealth has been enormously influential. One particularly potent occurrence was its linkage with the fall of the Roman republic. Originally austere virtuous, the republic became corrupted once riches were imported from abroad (“Asia”). This wealth-induced corruption in the form

People look for a different kind of wealth and wealth acquisition and rightly so for natural wealth and wealth acquisition are different. Natural wealth acquisition is a part of household management, whereas commerce has to do with the production of goods, not in the full sense, but through their exchange. . . . The wealth that derives from this kind of wealth is without limit.

of avarice and luxury was condemned by Stoic moralists such as Seneca (4 B.C.E.–65 C.E.) or Epictetus (c. 55–c. 135 C.E.) and was illustrated through the normatively loaded narrative of historians of Rome like Sallust (86–35 or 34 B.C.E.) and Livy (59 B.C.E.–17 C.E.). The latter, for example, opened his *History of Rome* by contrasting Rome’s virtuous beginnings with the ruin that the influx of wealth or riches (*divitiae*) had wrought. The undermining of Roman virtues by the spread of wealth and luxury also became the object of satirical poets like Horace (65–8 B.C.E.) and Juvenal (c. 55 or 60–in or after 127 C.E.). Due to the importance that a “classical education” had in the pedagogy of Europe from the Renaissance onward, the “fall of Rome,” and the role of wealth therein, became a clichéd commonplace.

This culturally received wisdom was abetted by the appropriation, for their own end of demonstrating the transience and superficiality of worldly goods, by Christians. The early Christians, such as Saints Ambrose (339–397), Augustine of Hippo (354–430), and John Chrysostom (c. 347–407), took up this moral critique of wealth. It was an important source of their advocacy of asceticism but it built also upon Paul’s (who was himself influenced by the Stoics) pronouncement in his Epistle to Timothy that the love of money was the root of all evil. The message was reiterated by Thomas Aquinas (1225–1274) and by other Christian philosophers upon the rediscovery of Aristotle’s works. It received a significant boost in the republican tradition that was reenergized by Niccolò Machiavelli (1469–1527), though here the “political” rather than the moral dimension (see below) is dominant. Much the same can be said of Jean-Jacques Rousseau (1712–1778), perhaps the last great exemplar of this tradition.

This critique was responsible for significant ripostes. David Hume (1711–1776)—followed by his fellow Scot, Adam Smith (1723–1790)—turned the tables. Hume, in his essay *Of Luxury* (1752), linked virtue with wealth, and not with ascetic poverty, and identified this linkage as the definitive characteristic of ages of refinement or commerce. He stressed both the intrinsic benefit of the pleasure that accrued from being

The natural effort of every individual to better his own condition, when suffered to exert itself with freedom and security, is so powerful a principle, that it is alone, and without any assistance, not only capable of carrying on the society to wealth and prosperity, but of surmounting a hundred impertinent obstructions with which the folly of human laws too often incumbers its operations.

able to enjoy goods that gratified the senses and the great instrumental benefits that came from the industry that was undertaken to obtain the wealth that permitted such goods to be enjoyed. The commercialism that Hume and others defended has not been without critics. In the twentieth century it expressed itself in the critique of consumerism. In an effective rerun of Aristotle, the acquisition of goods, the accumulation of wealth, or what C. B. Macpherson (1911–1987) labeled the legitimization of possessive individualism, has been subject to condemnation. A culture committed to consumerism is judged deleterious to the individual who, lacking a proper instrumental perspective, is at the mercy of the fads of fashion and the interests of those who benefit from the manufacture of demand. It is also bad for society because it embodies a misdirection of resources away from societally advantageous investment and entrenches the gap between wealthy and poor economies. The celebration of consumption and the desire to emulate the supposed spending power of the rich also led, in the latter decades of the twentieth century, to the development of “Green” thought, which argues that this entire emphasis on gratification is practically disastrous for the environment and symptomatic of a hubristic arrogance toward Nature. E. F. Schumacher (1911–1977), for example, advocated, in his popular essay *Small Is Beautiful* (1973), what he termed Buddhist economics as a way to halt this degradation.

Wealth and Power

In all stratified societies (which includes virtually all societies for which records exist) the hierarchy is significantly determined by differential access to, and possession of, wealth. To be wealthy enables one to exercise economic and political power. This exercise is frequently related to the question of virtue. Hence the resources at the disposal of Aristotle’s “liberal man” stemmed from what was under his control. Sociologically this man was the head of the household whose position rested upon his command of his wife and slaves as they created the “leisure” time for him to pursue intrinsically

worthwhile ends. True wealth for Aristotle consisted in a store of goods that were sufficient for life and useful for the good life. This wealth had to be secure and it was best obtained through land ownership in marked contrast to the insecure foundation of commerce and money.

This secure source of wealth sustained political independence. This association between landed wealth and political activity has been one of the most historically enduring linkages. The crux of the corruption of Rome was held to be the replacement of a commitment to the public good, which was sustained by relative equality and independence, by a devotion to private satisfaction, which followed from the emergence of the rich, who used their wealth to advance their own personal ambition. Machiavelli drew an evocative picture of this pattern as it appeared in Renaissance Italy. He depicted the gentry (*gentiluomini*) as “a pest” because they use their wealth to hire others to work for them. Crucially these hired hands, being dependent on their masters for their livelihood, could be used to support their selfish ambitions. The only way to end this corrupting dependency is to (re)establish equality through fostering a sense of civic virtue. To further this objective, Machiavelli advocated, drawing on Roman precedents, an Agrarian law that precluded the accumulation of large estates. Other republicans took a similar line. James Harrington (1611–1677) went into minute detail in his imagined constitutional republic of *Oceana* (1656). In Rousseau’s legitimate polity there should be a level of equality such that no one is wealthy enough to be able to create dependents and no one poor enough to become dependent on others. With the economic structure in this way forestalling the emergence of dependency—creating differential wealth, there is more chance, he believed, that acting for the common good (or willing “the general will”), rather than out of private self-interest, will occur.

In Rousseau’s republican vision political power was possessed by equal citizens, but that meant it was restricted to those who were independent. On that criterion Aristotle excluded from citizenship slaves, manual laborers, and women (also excluded by Rousseau) and, when it came to the franchise, the exclusion of the latter two categories lasted into the twentieth century. It was a received commonplace that the privilege of political citizenship (the right to vote for a representative as well as to be a representative) required sufficient wealth to ensure economic independence. It followed that those economically dependent were without a direct political voice. In the eighteenth century Edmund Burke (1729–1797) defended the restricted franchise on the grounds that only those individuals with a direct stake in the country could be entrusted with its well-being. Thanks to their economic status they were able to exhibit the crucial political virtues of “constancy, gravity, magnanimity, fortitude, fidelity and firmness” (p. 427). Burke explicitly called these masculine virtues, but their possession meant that the interests of women, as well as the bulk of the disenfranchised population, would be properly looked after. Certainly the schemes for greater equality that were fomented by the Revolution in France would be disastrous. Much of the political history of the nineteenth century concerned the continual redefinitions of what constituted economic independence (and later how women were to be accommodated).

This history, and the surrounding debates, not only saw the increasing articulation of a modern idea of democracy but also the growth of socialism. Of course, the effect of the possession of wealth on sustaining dependency was not a uniquely Western phenomenon. The *jajmani* caste system in southern India (especially) operated in such a way that the lowest caste, in exchange for the lease of land owned by members of the high caste, had to provide the latter with labor service and a portion of their crop output. The fact that the caste system was integral to the belief systems of Hindus did not make it immune to criticism. Some of these criticisms were internal (as by Dayananda Sarasvati [1824–1883] or Mahatma Gandhi [1869–1948]), but the challenges to such inequality that the Western ideas of democracy and socialism articulated were also influential.

The socialist critique. The most powerful Western voice was Karl Marx (1818–1883). Marx saw the key to history in the association between wealth and power. The source of wealth for Marx lay in ownership of what he called the forces of production. These had developed over time from slaves (human labor) to land to capital. Those who owned the forces—slave owners, landlords, capitalists, or bourgeoisie—were able because of that control to rule over nonowners—slaves, serfs, the proletariat. Ownership appears to be legal title, but law for Marx is part of society’s “superstructure,” which is determined by the economic base. Political power, which is used to enforce legal title, also upholds the interests of the dominant economic power; in a celebrated phrase, “the executive of the modern State is but a committee for managing the common affairs of the whole bourgeoisie” (Marx and Engels, p. 475). These interests are for Marx obviously opposed to the interests of those without economic power, and history reveals a struggle between the class of the owners of wealth and the class of nonowners.

Marx devoted most attention to the contemporary struggle within capitalism. His major work, *Das Kapital* (1867; *Capital*), identified the particular form that wealth took under that mode of production. The rationale of capitalism was accumulation. For Marx, the only source for this was the “surplus value” extracted from the worker in the process of production. The exchange-value received in the form of wages by the worker for “his” labor-power is less than the exchange-value received by the capitalist for the commodity made by that power. This exploitative extraction was disguised because the level of wages appeared to be the consequence of a free contract between employer and employee. While Marx saw the initial source of the wealth in the blatant form of expropriation, forcing the landless into factories, the capitalists’ ongoing accumulation of wealth was derived from this exploitation inherent to the system. However, he argued this was an unsustainable and self-defeating process that resulted in the immiserization of the workers whose labor-power was the source of accumulation. That misery, he predicted, would generate a proletarian revolution and the ushering in of a communist society. Here (though Marx was not very forthcoming) there would be equality and sufficient wealth to be shared since production would be geared to meeting needs, not accumulation.

Although Marx’s predicted revolutionary trajectory did not transpire, revolutions did occur in his name. These inspired a

The greater the social wealth, the functioning capital, the extent and energy of its growth, and, therefore, also the absolute mass of the proletariat and the productiveness of its labor, the greater is the industrial reserve army. The same causes which develop the expansive power of capital, develop also the labor-power at its disposal. The relative mass of the industrial reserve army increases therefore with the potential energy of wealth. . . . This is the absolute law of capital accumulation. . . . Accumulation of wealth at one pole is, therefore, at the same time the accumulation of misery, agony of toil, slavery, ignorance, brutality, mental degradation, at the opposite pole.

SOURCE: Karl Marx, *Capital*, trans. S. Moore and S. Aveling. In *Marx Engels Reader*, 2nd ed., ed. R. Tucker (New York: Norton, 1978), 429–431.

vast literature both in lands like Russia (in the form of Leninism) and China (Maoism), where these revolutions were sited, as well as in the West, where Marx’s ideas were the dominant source of criticism of capitalism. Increasingly these critiques paid less attention to Marx’s economic analysis and more to his early philosophical writings, with their focus on alienation. While the issue of wealth correspondingly lost some of its salience, the association between the economic and the political was resilient. The universalizing power of capitalism, which Marx did predict, seems to have been reinforced since 1989 and the fall of the Soviet Union. One prominent expression of this has been debate on the meaning and morality of “globalization.” The focus has been on the relative impotence of national governments when confronted by worldwide markets and the power of the institutions of global finance like the World Bank and the International Monetary Fund. The least powerful are the least wealthy (the most indebted), effectively the non-Western world.

Mercantilism and its critique. Marx was not original in seeing historically a development between wealth and economic-political power. Adam Smith had argued that societies (though not universally and unexceptionally) went through four stages—hunting/herding, herding, farming, and commercial. In each case there was a system of subordination, which, although based on personal qualities in the first stage, in the next two rested on control of the dominant means of wealth, that is, of herds and land. He was explicit that government was instituted to protect the propertied (the owner of the herds and of the land) against those without property. The fourth commercial stage saw a difference because the impartial rule of law was established to

In order to gain and to hold the esteem of men it is not sufficient merely to possess wealth or power. The wealth or power must be put in evidence, for esteem is awarded only on evidence. And not only does the evidence of wealth serve to impress one's importance on others and to keep their sense of importance alive and alert but it is scarcely less use in building up and preserving one's self-complacency. . . . Abstention from labor is the conventional evidence of wealth and is therefore the conventional mark of social standing; and this insistence on the meritoriousness of wealth leads to a more strenuous insistence on leisure. . . . According to well-established laws of human nature, prescription presently seizes upon this conventional evidence of wealth and fixes it in men's habits of thoughts as something that is itself substantially meritorious and ennobling.

SOURCE: Thorstein Veblen, *The Theory of the Leisure Class* (New York: Dover, 1994), 42, 44–45.

provide a formal equality. In his *Wealth of Nations* (1776) he analyzes the basis of wealth in the modern world. Part of his task was to assault the then dominant understanding of the linkage between wealth and economic-political power.

According to this prevalent view (usually labeled “mercantilism”), as expressed by Thomas Mun (1571–1641), the way to increase wealth is “to sell more to strangers yearly than we consume of theirs in value” (p. 125). Mun distinguished between natural wealth, essentially minerals and direct agricultural products, and artificial wealth, which was the manufacture of materials (clothing rather than wool or flax). He thought more profit (exports) could be earned from the latter source. To achieve this it was necessary—and this is central to the mercantilist view—to maintain a favorable balance of trade. This maintenance needed to be managed or regulated and, as such, had to be an item of policy, the ultimate objective of which was the promotion of the wealth, and thence of the power and security, of the state. Indeed, the very idea of the “state” as an impersonal entity emerged at this time.

Whether mercantilism ever constituted a coherent theoretical position, as opposed to practical responses, has been contested, but Smith gave it an identity. Smith judged the mercantilist method of acquiring and maintaining wealth/power as theoretically misconceived. For Smith the real wealth of a nation lay in the annual produce of the land and labor of the society. The way to increase this wealth is through what

he called the system of natural liberty. This entailed removing the panoply of regulations and restrictions characteristic of mercantilism, such as those on employment, like guild-sponsored apprenticeships; on the mobility of property, like entails; on consumption, like sumptuary laws; and on trade, like tariffs. Without these obstacles, a free economy would produce a growth in wealth that would benefit the entire population (the “trickle-down” effect).

Smith, although he has become by far the most famous, was not alone in reevaluating the meaning of wealth. One significant dimension had always been population. The wealthier a country, the more people it could sustain, and that in turn would provide both economic and political-cum-military clout. In the Aristotelian tradition, one of the attacks made on commerce was that it enfeebled nations because its citizens were too busily engaged in their private tasks of money-making to devote themselves to their civic responsibilities, which included fighting. For Machiavelli and his intellectual heirs, a citizen militia was the appropriate martial institution, and professional standing armies were not only a threat to civic liberty but also less effective as fighting machines. Smith rejected this. He countered that the wealthier a country was, the more resources were at its disposal to provide sophisticated weaponry and to train soldiers effectively. It was one consequence of this that population by the nineteenth century ceased to have the same value as a marker of national strength; indeed the worries were rather that industrialization was producing too many people to be provided for adequately.

Status

The link between wealth and power can also be expressed indirectly. Thorstein Veblen (1857–1929) in his *Theory of the Leisure Class* (1899) articulated this through his notion of conspicuous consumption. He argued that to enjoy esteem it was not sufficient merely to be wealthy, others had to be made aware of that fact (it had to be conspicuous). In its purest form, consuming conspicuously is consumption of the totally useless, but (less perfectly) it is the consumption of “high maintenance” goods like white clothes in a dirty industrial environment. While there were predecessors (including Adam Smith), Veblen's analysis was free of the moralizing that often appeared in economists. The leading contemporary economist of Veblen's time, Alfred Marshall (1842–1924) in his *Principles of Economics* (1890), declared the desire for wealth as a means of display to be unwholesome. Marshall was here following his most distinguished predecessor, John Stuart Mill (1806–1873), who had declared that the subject of political economy itself was wealth, which he defined (after a critique of the mercantilist version) as “all useful or agreeable things that possess exchangeable value” (p. 15). However, he proceeded to maintain that the English needed instruction in the use of wealth and how to appreciate those objects of desire that wealth cannot purchase. Mill here implied a distinction between the pursuit of wealth (the art of “getting on” as he put it) and the worthwhileness of what is being pursued (the art of living).

This implicit distinction is made explicit and its moralism exposed by Veblen. He distinctively drew attention to the divergence between the drive to accumulate wealth, as a symbol

of reward for industry, and the desire, once it has been accumulated, to look upon its possession as intrinsically worthy. Since social status is attributed to the possession of wealth, the imperative is to exhibit leisure (the nonproductive consumption of time) and dissociate thereby the actual possession of the wealth from the effort expended to attain it. Later economists have developed his ideas in their analysis of consumption in the form of the “demonstration effect” and what they call nonfunctional demand. A “Veblen effect” has been identified where, in an exact reversal of the assumed practice of the rational consumer, the demand increases when the price rises. Only the “truly” wealthy can afford to flout that rationality.

Of course, at another level there is a rationality at work—namely that of demonstrating one’s wealth and impressing others by its possession. Under that guise this indirect linkage between wealth and power is a recurrent feature. One of its most striking manifestations is the practice of “potlatch.” The status system of the tribes of northwest America is maintained by display, as exhibited in the hosting of great feasts. In the Nootka tribe the chief is presented with the first catch of the salmon traps, the first pickings of ripe fruit, and so on, but having received these, he then holds a feast where the gifts are communally consumed. This pattern is also characteristic of the so-called big man systems of the Pacific. Among the Kaoka of Guadalcanal, reputation is enhanced not by accumulating wealth but by giving it away. The more one can bestow upon others, the greater one’s social standing. Hence every significant event such as a birth or wedding is celebrated by a feast, and the more feasts, and the more lavish the fare, that can be “afforded,” the greater the prestige. The social leaders (the holders of political power) in all such systems are those whose wealth is manifest by being able to give away most.

The Dangers of Wealth

That the possession of wealth conveys political power has long been a source of suspicion. For both Plato (428–348 or 347 B.C.E.), in *The Republic*, and Aristotle an oligarchic constitution was associated with rule by the wealthy “few.” In both cases this was a negative association. The wealthy used their economic power to rule politically in their own interest, as opposed to the interests of all. In the idea of a “cycle of constitutions” propounded by Polybius (c. 200–118 B.C.E.), in his *Histories* [of Rome] (and reiterated many times over during the succeeding centuries), oligarchy represented a corrupt falling away from good rule by the few (aristocracy) but that was itself displaced in reaction to its self-serving rule by the initially virtuous rule of the many (what became called democracy).

Contemporary (liberal) democracies all have practices and policies that in some way aim to forestall any pernicious effects that might follow from concentration of wealth in a few hands. Some of these are direct. The buying of votes is universally made illegal but frequently, in addition, there are restrictions on the use of money in political campaigns. Other prescriptions are indirect, for example, wealth taxes, and other redistributive fiscal mechanisms. One of the intentions behind such policies is to enhance the possibility of the equality of opportunity. If jobs are “open to the talents,” if individuals are provided with the educational resources (in particular) to enable

them to compete, then the differing amount of wealth subsequently earned is justified. However, for that differential to pass down to the next generation undiluted is, it is argued, to undermine that equality. It remains, however, one of the longest running disputes in modern political philosophy the extent to which policies designed to neutralize the inequalities associated with wealth infringe upon the value of liberty and autonomy. A libertarian thinker like Robert Nozick (1938–2002), in his *Anarchy, State, and Utopia* (1974), argues that attempts to impose a preferred distribution of assets illicitly infringe on the rights of individuals. More egalitarian writers, like Michael Walzer (b. 1937) in his *Spheres of Justice* (1983) or, from very different premises, Jürgen Habermas (b. 1929) in a range of writings, seek to keep the political or civic sphere free of the baneful effects of the economic power and reach of wealth.

Conclusion

Wealth continues to be a subject of debate. Its distribution and effects on social and public policy and welfare are a matter of both practical and academic concern. Its generation and allocation is a central topic in economics; its justification similarly is a major issue in moral and political philosophy. These current disputes without much distortion carry with them the weight of millennia of speculation and in so doing demonstrate that the history of the idea of wealth encapsulates a wealth of ideas.

WESTERNIZATION.

This entry includes three subentries:

Africa
Middle East
Southeast Asia

AFRICA

As applied to non-Western societies, the term *Westernization* is almost always equated with modernization. It is important, however, to distinguish between the two, for modernization, considered as an overhauling of African societies, predates the incursion of the West on the continent. Before the Europeans, the most important agents of modernization in Africa were the Arabs, who, after their settlement in North Africa, introduced Islam into West Africa and thus set in motion a profound transformation of societies and cultures in the region. Similarly, the coastal peoples of East Africa were in touch with external civilizations long before the arrival of Europeans; the influence of the Arabs in this area has been as deep and durable as in West Africa. Internally, the Zulu leader Chaka's (1786–1828) conquests of and his creation of the Zulu nation out of diverse ethnicities over an extensive area in South Africa entailed a restructuring of their societies; the same can be said of Ashanti hegemony exercised over neighboring societies and peoples drawn into its sphere of imperial authority and cultural influ-

ence. In all these cases, what is involved is not merely a process of adjustment consequent upon conquest, but an extensive re-fashioning of the institutions and cultural practices of the societies affected in conformity with a new model of the world.

There is, however, a fundamental difference between these earlier processes of change and modernization as it is understood in the twenty-first century: that is, as the transition from an agrarian to an industrial-technological civilization. The origins of this process in the West and its global character constitute this civilization as a universal paradigm. It is in this sense that Westernization can be said to be synonymous with modernization in relation to the impact of the West on Africa.

The historical context of Westernization in Africa is the encounter with Europe, under the specific conditions of the Atlantic slave trade and the European colonial adventure, which was its logical extension. The forced acculturation of the black populations in the New World, already in full swing by the mid-eighteenth century, represents the first sustained assimilation of Western culture by Africans. It is significant to note the contribution that diaspora blacks were later to make to the process of Westernization in Africa, notably through their role in Christian evangelization and education.

The colonial factor was essential to the process of Westernization in Africa itself. The comprehensive reorganization of African societies in every sphere of life signaled a new dispensation that functioned as the comprehensive framework of the African experience under colonialism. The boundaries that resulted from the nineteenth century partition of Africa were determined without regard to antecedent institutions and cultures; the entities that emerged from partition represented a patchwork of administrative territories that in the twenty-first century have evolved into "modular states," each encompassing a diversity of languages and ethnicities. The colonial powers, especially the French and the Portuguese, undertook a systematic dismantling of indigenous institutions in order to establish colonial rule as the primary source of legitimacy in the territories they controlled. Moreover, they imposed new legal systems based upon European concepts of law, often at variance with indigenous legal systems and almost always with serious implications for such questions as property and inheritance.

A major effect of European colonialism was the progressive integration of Africa into the world capitalist system, within which Africa functioned primarily as a source of raw materials for Western industrial production. This required a total reorganization of African economic life, beginning with the introduction of the cash nexus and the imposition of taxation, which forced Africans into wage labor, a more intense and problematic variant of which was the migrant labor created by the mining industry in Southern Africa. Colonial economy also caused agriculture to be diverted toward the production of primary products and cash crops: cocoa, groundnut, palm oil, sisal, and so on. In the settler colonies—notably in Kenya and Rhodesia—the alienation of native land complicated the economic situation of the indigenous populations. The infrastructure undertaken by the colonial administrations was minimal, developed strictly as a function of the requirements of the new economy, which saw the rise of the colonial cities such as

Dakar, Lagos, Nairobi, and Luanda. Urbanization led to rural exodus and the displacement of large segments of the population.

It is against this background of the disaggregation of African societies and the destabilization of African life that the impact of Christianity has to be considered, for this has been the most important single factor in the process of Westernization in Africa. Western education, involving literacy and the mastery of a European language, became the condition for entry into the modern sector. For most of the colonial period, education was in the hands of the Christian missions, who sought not only to convert Africans but also to inculcate Western values. In West Africa, the assimilation of Western lifestyles was mediated by returnees from the diaspora—the West Indians, Brazilians, and Sierra Leoneans—whose education and skills enabled them to play an effective role in Christian evangelization and the nascent colonial civil service; their relatively privileged status enabled them to serve as a major reference group for indigenous Africans.

Christianity challenged traditional belief systems and promoted the diffusion of new ideas and modes of life; in particular, it sought to impose monogamy and the nuclear family as the norm. Romantic love and new conceptions of the self emerged, a development that was reinforced in the postwar period by the influence of the cinema and popular literature from the West. All over the continent throughout the colonial period, Africans were adopting new habits and acquiring new tastes derived from Western culture, often considered progressive in relation to traditional culture. This cultural revolution came to be associated with the new elite that was spawned by Christian education, an elite developed from an initial body of clerks, interpreters, and later, of teachers and lay preachers, expanding with time to include professionals, especially lawyers and doctors.

The ranks of the elite swelled with the establishment of the universities after World War II. Because they were linked at first with the metropolitan universities and staffed by Europeans, and the structure and content of the education they dispensed, they functioned essentially as outposts of Western culture, which thus proved a determining factor of modern cultural expression. This is attested by the dominance of Western-educated Africans, products of the new universities, in the genesis and evolution of a new literature written in the European languages, for which the forms and conventions of the metropolitan literatures have served as reference. Western cultural forms also provided expressive channels in other areas of aesthetic manifestation. This was most notable in music, where Western instruments such as the piano, the trumpet, and the guitar have been adopted by African artists to fashion a new musical idiom fusing indigenous and foreign modes, a creative syncretism that is forcefully demonstrated in African popular music, and that can be observed in other areas such as the visual arts.

The transformations provoked by the pressures of colonial rule in all spheres of life are sufficiently extensive and pervasive to qualify as the signs of a new modernity in Africa. In no area is the association of Westernization with modernization clearer than in the impact of science and technology on

African experience and consciousness. Modern medicine has largely taken precedence over traditional methods in matters of health; ironically, the drastic reduction of infant mortality it has made possible has also complicated the demographic issues in Africa, with consequences for agriculture and social services. Although no major effort of industrialization took place during the colonial period, and there has been no significant development since, Western technology has long entered the lives of Africans through familiarity with manufactured products imported from the West.

As with other societies and cultures in the so-called Third World, the impact of Western civilization on Africa has occasioned a discontinuity in forms of life throughout the continent. This has led to a cultural dualism that often presents itself as a real dilemma in concrete, real-life situations. In other words, the African experience of modernity is fraught with tensions at every level of the communal and individual apprehension. African nationalism was predicated on the conjugation of nation-building and economic development as a means for the improvement in standards of living. Beyond these immediate objectives, it was concerned more fundamentally with the establishment of a new order informed by modern concepts of political life and behavior and by a rationality in conformity with a modern world outlook. The upheavals of the postindependence era have derived from the stresses arising from the quest for this ideal. It is thus fair to observe that the fundamental issue with which the contemporary societies of Africa are confronted is that of their full and orderly accession to modernity, that is, to a mode of collective organization based on the model of the liberal and democratic nation-state and of the industrial-technological civilization, a model that is associated with the West.

This is not to restrict Africans to a single model, nor to deny the capacity for adaptation manifested by African societies. There is an undeniable energy in the movement toward a new integration evident in the original forms of life and expression that have been evolved on the continent since the encounter with Europe. As Melville Herskovits and William Bascom have observed, "There is no African culture which has not been affected in some way by European contact, and there is none which has entirely given way before it" (p. 3).

Indeed, the significant fact about African cultural history is the convergence upon the indigenous tradition of the two external influences—the Arab-Islamic and the European-Christian—to which the continent has been exposed for well over a millennium. The values and lifestyles associated with these traditions have been assimilated and to a large extent indigenized on the continent. This observation provides a broader perspective on the phenomenon of Westernization in Africa, an observation made as early as the late nineteenth century by the great African cultural theorist Edward Wilmot Blyden and summed up in the late twentieth century by Ali Mazrui as "the triple heritage."

MIDDLE EAST

The notion of Westernization in the Middle East raises a number of interrelated issues. First, it refers to a period (nineteenth to twentieth centuries) in which Middle Eastern intellectuals engaged Western political philosophy in a self-conscious search for modernity. Albert Hourani, in his groundbreaking *Arabic Thought in the Liberal Age, 1798–1939* (1983), dates this engagement from Napoleon Bonaparte's invasion of Egypt in 1798. This defeat revealed the weaknesses of Ottoman government and sent shockwaves throughout the Ottoman Empire. How had the Europeans gained such superiority, and how could the Muslims catch up? Selim III (1761–1808), the Ottoman sultan in Istanbul, and Muhammad Ali (1769?–1849), the Ottoman governor of Egypt, enlisted European advisors to implement military and governmental reforms on the Western model (*tanzimat*). A generation of "new men," many graduates of these European-style schools, began a period of intense reflection and critique. They studied Rousseau, the Manchester textile mills, and parliamentary government for clues to European power. They also criticized traditional Islamic institutions and advocated reform of education, government, and the Arabic language.

These two avenues of reform raise a second issue: did the reform movement mark "Westernization" or a local modernity forged by traditional intellectuals? Many historians have defined Westernization narrowly as the "all-out adoption of the Western model," which they contrast to "modernization," an Islamic response to political, economic, and social pressures from the West. Modernity and Westernization cannot be separated, however. Islamic modernist thought was formulated as a specific response to the European challenge. Thinkers from Muhammad Abduh (1849–1905) to Ali Shari'ati (1933–1977) had to explain European superiority and propose specific solutions for Muslim decline. Even when Western models were not adopted, the West provided the terms of the debate: industrialization, women's rights, secular law, the bureaucratic state, and popular sovereignty. Finally, modernism itself, a self-conscious effort to organize and govern society according to rational principles, was invented in the West. Islamic modernizers embraced the centrality of reason, which led them back to a classical question: "What is the relationship of reason to revelation?"

Yet the Muslim modernizers posed the question in a new way. How could reason and religion be reconciled to reform

Islam, and how could this purified Islam be applied to society? Thus, our subject is actually the reform of Islam and its new transformative role, a program formulated in engagement with the West. The relationship between the Middle East and the West occurred at a number of levels. First, the reforms on the Western model (*tanzimat*) centralized the states in Egypt and Anatolia, disciplined their populations, and laid the social foundations of modern Egyptian and Turkish nationalisms. Second, the modernizers adapted Western ideologies (liberalism, socialism, nationalism) to create cultural hybrids. Colonial industrialization was part of this process, for changes in labor and production produced new classes and new consciousness. Finally, even those intellectuals who rejected the West unwittingly adopted Western approaches to knowledge. Islamic modernizers rejected Gnostic knowledge and mysticism (Sufism), much as Western positivists tried to fit all knowledge into a rational framework. This helps to explain a central puzzle in Islamic history: the secularists and the Islamic fundamentalists (one branch of the *Salafyya*) spring from the same intellectual root.

At first contact, Egyptians were not impressed with liberalism and the French Republic. Consider the Egyptian chronicler Abd al-Rahman al-Jabarti's reaction to the French and their political ideas:

[Napoléon] saying "[all people] are equal in the eyes of God the Almighty," this is a lie and stupidity. How can this be when God has made some superior to others as is testified by the dwellers in the Heavens and on the Earth . . . those people are opposed to both Christians and Muslims, and do not hold fast to any religion. You see that they are materialists, who deny all God's attributes. . . . (p. 31).

Yet as Ottoman rulers adopted European institutions, a new generation of intellectuals adopted French political ideas. The Egyptian Rifa'a Rafi'a al-Tahtawi (1801–1873) tried to reconcile the republic with the *umma* (community of believers), secular law with the *shari'a* (Islamic law), the *ulema* (religious scholars) with the republican legislator. Tahtawi argued that Muslims had failed to develop theories of government; they saw the executive only as a guardian of Islamic law and spiritual guidance. However, government also gave order to society and should thus be used to promote the public welfare. Creating the just society and upholding the will of God were thus compatible if not identical projects. Drawing on the thought of al-Farabi, Ibn Sina, and the Mu'tazili school of the Middle Ages, al-Tahtawi argued that reason and philosophy were two paths to the same ultimate reality and thus must be reconcilable. Al-Tahtawi was the first to articulate the notion of an Egyptian nation, a historical community of the Muslim and Christian occupants of Egypt, and a brotherhood "over and above the brotherhood in religion." He attributed Egyptian decadence to foreign rule, specifically that of the Turkish overlords (Mamluks and later Ottomans) who ruled Egypt from the thirteenth century.

Yet Tahtawi's project failed to address a basic tension between secular and religious law. In a republic, the people are sovereign and the social contract defines the members of the

political body. The law is the expression of the general will and thus utilitarian and subject to change. In the *umma*, the community is defined in relation to God; the Muslims are those who submit to God's will, (a Muslim is "he who submits [to God]"). Since God is sovereign and the law is the expression of his will, many Muslim jurists argued that once the Koran and hadith had been elaborated into a legal code (*shar'ia*), by the fourteenth century, it was universally valid and permanent, and so "the gates of *ijtihad* [independent legal reasoning] are closed." A second question arose: if Islamic law is divine, what checks, if any, should there be on the executive? Finally, Muslim scholars feared that Western institutions might be inseparable from a secular worldview. Indeed, historians of the scientific revolution have argued that elements of Western modernity could not be conceived before the "paradigm shift," the replacement of religious worldviews by a Newtonian universe. Finally, Muslims had to answer Orientalists like Ernest Renan, who claimed that Islam was antithetical to science.

In response to all of this, Muhammad Abduh and Jamal al-Din al-Afghani (1839–1897) presented a synthesis that "rationalized" Islam and opened the door to both secularism and Islamic fundamentalism. Abduh argued that the true Islam of the Companions (*al-salaf*) of the prophet Muhammad was the tool for social modernity. Islam must be freed of antiquated scholarship; he demanded that the traditional Islamic institutions like Al-Azhar in Egypt replace rote memorization with a new *ijtihad* and teach the modern sciences. Islam must be unified into a single creed: Shiism was a "heresy" and Shiites must be brought into the fold. Abduh suggested unifying the four Sunni schools of Islamic law (Hanafi, Hanbali, Shaf'ā'i, Maliki) into a single school. Islam was to be purified of heterodoxy and foreign elements; thus the modernizers condemned Sufism (mystical Islam), visitation of the graves of the *awliya'* (holy men), and other popular practices (amulet-writing, healing) as *shirk*, or worship of things other than God.

Abduh collapsed the divide between the secular and the religious in *The Sociological Laws of the Qur'an*. He argued that Islam and Western civilization were of the same order of knowledge and that a purified Islam held the answers to all modern social problems. Parliaments, railroads, and space travel were anticipated in the Koran and fully compatible with its message. He translated legal conceptions of the medieval period to the "modern day": *ijma'* (consensus of the jurists) was "public opinion," *shura'* (consultation, especially in the selection of the caliph) was "parliamentary democracy." Among his disciples, this synthesis split into two strands.

One strand was secular nationalism (1900–1939), and nationalists in Egypt, Lebanon, Syria, Turkey, Morocco, Algeria, Tunisia, Iraq, and Iran embraced the institutions of political liberalism under French and British "protection." Secularists dropped the project of "Islamic government" because, as they argued, the Koran contained or prefigured (or so they believed) Western institutions. Religious minorities—Copts, Druze, Maronites, Jews—welcomed the opportunity for full participation in political life. The Egyptian Qasim Amin advocated women's emancipation as a national project. However, as liberals failed to address growing labor and social

problems or bring an end to colonial rule, liberal constitutionalism lost popular support.

Other secularists turned to Marxist socialism. Lenin's *Imperialism: The Highest Stage of Capitalism* provided an economic critique of colonialism and a plan of revolutionary action. The 1952 "Arab Socialist" revolution of Jamal 'Abd al-Nasser (1918–1970) proposed social equality for all citizens through state capitalism. Nationalism in Algeria and Tunisia grew from the trade unionism of migrant labor in France (Étoile Nord-Africaine). However, the materialism of Marx was difficult to reconcile with Islam, and the Iranian Islamist intellectual Ali Shari'ati rejected Marxism as a solution to social ills.

Finally, the second group of Abduh's successors, led by Muhammad Rashid Rida (1865–1935), focused on the rationalization of Islam to create a "true Islamic state." Rida believed that Sufism (mystical Islam) had created division in the Islamic community and that westernizers undermined its moral foundation; only a strict adherence to *shari'a* and the Islam of the *salaf* would rejuvenate the *umma*. This strain of thought found various expressions in the work of Islamists such as Sayyid Qutb, the premier theoretician of the Egyptian Muslim Brotherhood, and Shii form in the work of Ayatollah Ruholla Khomeini (1900–1989), leader of the 1978–1979 Islamic Revolution in Iran. Thus, even the ideas of the contemporary Islamist radicals were formulated in dialogue with the West.

Ellen Amster

SOUTHEAST ASIA

Westernization in world history can refer to the transmission and reception of European ideas, technology, lifestyles, and institutions throughout the globe. Much of the scholarly attention has tended to concentrate on the intensity and nature of that transmission during the era of European colonialism and its attempts to transform the very consciousness of the peoples it encountered. Although the modes of transfer, the locales of interaction, and the intellectual capital are no longer the sole domain of Europe, the nature of Westernization continues to be relevant as local traditions become more integrated (or subsumed) within supposed “universal” values. Societies that are unable to cope with the blistering pace of technological change, the fluctuations of an interdependent world economy, or the insensitivity of an “international” community often find fault with “Westernization,” which is associated with these uncontrollable and unfamiliar pressures on local societies. As a result, the idea of Westernization continues to be a part of twenty-first-century historical discourse, framing the ways in which scholars examine the interactions among cultures, regions, and nations.

Approaching Westernization in Eurasian History

Contemporary ideas of what constitutes “Western culture” reflect its postcolonial origins and twentieth-century politics, just as the idea of the “West” may have had slightly different meanings between the fifteenth and nineteenth centuries. In the history of Southeast Asia, Europeans had competing ideas about the cultural values they represented and were attempting to infuse into the societies they encountered. Spanish policy in the Philippines was exceptionally different from Dutch policy in Indonesia, and the Spaniards and the Dutch certainly did not see each other as representing a single, unified, cultural domain. These motivations were often couched in religious or political agendas that many times reveal tensions between empires as much as they disclose the tensions within. Scholars gazing toward the past sometimes project “Westernization” into the histories of exploration, trade, and colonialism, despite the fact that those participating in these global exchanges probably saw and articulated their missions in slightly different ways. Caution must be employed when considering Westernization as a process because it was often much more disparate in nature than coherent. Nonetheless, using Westernization as a category of analysis can provide a useful lens into the history of global interactions with Europe.

In the history of colonialism, the term *Westernization* reveals the geographic context and self-referential perspective that would inform the ways in which peoples of Asia would be categorized and understood, though elites within these societies would also adopt the term to represent their notion of “modernity.” This association can be attributed partly to the rhetoric of colonialism, which blended Europe’s cultural forms with theories of human development in order to organize and tabulate the communities and societies that came under colonial authority. Colonized elites would appropriate these conceptions of modernity and apply them to their own societies, fundamentally changing their own identity in relation to the world. Within these discourses, the “East” or the “Orient” was

seen as something homogenous, unified, and fundamentally opposite to that which was European, even though the idea of a coherent “West” encountering a coherent “East” tended to overstate the complexity, nature, and composition of these societies. In addition to Asia, this process of European interaction also occurred in Africa and the Americas, producing very similar narratives of exchange, acculturation, and domination. Whatever the context, early European scholars, traders, soldiers, and missionaries viewed themselves and the people they encountered as coming from very different worlds. In some instances, Europeans would view Westernization as the process of making others more like themselves, though they probably did not consider this transformation as “Westernization” *per se*. Throughout history, Westernization would come to have different meanings, effects, and forms, but in essence it refers to one of many global processes that have characterized the interaction of human societies.

From a regional perspective, the history of Westernization in Southeast Asia can be seen in much the same way: It is but one of many continuing processes that have contributed to the region’s character. For a millennium, Southeast Asia has benefited from its unique geographic location of being both a mainland and maritime crossroad between the Indian and Chinese cultural zones. This vital location has given it exposure to three great religions (Buddhism, Islam, and Christianity), global trade, and the movement of peoples from all over the world. Many scholars have chosen to consider the dynamics of regional change in the context of Islamization, Indianization, and Sinicization (modification under Chinese influence), to which Westernization might be compared. While these regionally specific processes may be associated with particular times in Southeast Asia’s deep past, closer readings of how these exchanges occurred in specific cases reveal that all four processes continue to interact, intersect, and overlap, thereby illustrating the complexity of these ideas and their interrelatedness in the Southeast Asian context.

The Structure of Westernization in Southeast Asian History

Most scholars have approached the structure of Westernization in Southeast Asia as a process that has developed over stages and varying intensities according to location, internal receptiveness, and the circumstances in which the encounter took place. One of the most important mechanisms contributing to the transmission of Western culture to the region was trade. In this context, trade consists of the movement, over the centuries, of peoples, goods, and ideas between the Mediterranean, Bengal, and Southeast Asian waters. With this in mind, Western interaction with Southeast Asia can be organized chronologically into four stages.

In the first stage, labeled Early Maritime Influence (1511–1670), initial contacts were made through the agency of European and Southeast Asian traders. The nature of interaction here could be described as minimal in terms of cultural penetration, but certain important technological exchanges did occur. During this period the Portuguese and the Spanish began to make headway into the region, securing the regional port of Malacca in the case of the former and Cebu in the case of

the latter. The Dutch also began to initiate activity in the Southeast Asian waters, but powerful Muslim states and trading networks still continued to thrive, producing minor levels of exchange. Although Portuguese firearms would contribute to the reintegration of the Burmese kingdom in the 1550s, European influence was marginal on the Southeast Asian mainland.

By 1670, Dutch penetration of the regional trade networks intensified as they slowly began to involve themselves in internal political issues of succession and power relations. Under this second stage of Accelerated Influence (1670–1820), the main Muslim kingdoms disintegrated and regional trading networks fragmented as the Dutch (in particular) increased their influence in the island interiors. Similarly it is during this period that the Spanish increased their role in the Philippines, inserting the religious-political structures that would become the foundation of their strong presence among the local communities there. While the islands of Southeast Asia were beginning to be exposed to Western technology, religion, and economic pressures, the mainland on the other hand was left on its own, as the spices and other natural resources of the island world continued to draw Europe's attention.

By the early nineteenth century, however, the mainland was to bear the brunt of new European initiatives in the form of Full Scale Conquest (1820–1870). Because of European political maneuvering and competition, and the promise of the Chinese market, mainland Southeast Asia was conquered during this period by the British (Burma) and the French (Indochina). With the establishment of colonial governments, mainland Southeast Asian communities were slowly integrated into new economic, political, and ideological shadows of empire. For the most part, because of the limitations of military operations, coastal sections of the mainland were more intensely affected than the interior, leaving the people in the latter area and their ways of life somewhat unaffected.

With the opening of the Suez Canal, the improvements in steam technology, and the development of the telegraph, Southeast Asian societies experienced an intensification of Western influence under High Imperialism (1870–1942). Because of changing world demands for natural resources, the potential for capital from the taxing of local populations, and the influence of new theories of European cultural superiority, Europeans began to actively pursue and initiate programs designed to colonize the consciousness of ordinary Southeast Asian people. Colonial bureaucracies, churches, schools, and other institutions produced a consolidated view of the world that placed European civilization at the peak of humanity's development, self-justifying the role and influence Europeans had on indigenous peoples of Southeast Asia. New standards of language, authority, health, and knowledge were produced, professed, and dictated that fundamentally questioned the role and place of indigenous values and beliefs. Throughout the region, colonialism would change the character of Westernization by restructuring the nature of this global exchange through the reduction of local autonomy.

Yet the contribution by Southeast Asians to the shape of Westernization was not minimal in any regard. Southeast Asians adapted, modified, and reshaped colonial influences to

fit their needs and concerns—just as they had done for centuries through Indianization, Sinicization, and Islamization. Colonialism produced a particular body of knowledge and symbols that were consciously (and at times unintentionally) adopted by indigenous elites in order to improve local power and prestige. The idea of nationalism in Southeast Asia developed in just this manner, through local innovation and appropriation of ideas either introduced in schools or through the mechanics of the civil service. Southeast Asians contributed to the construction of what was Western and especially what was not—by identifying and constructing elements of “traditional” Southeast Asian culture (using Western modes of knowledge production) that might stand independent of Western influence. In the case of Thailand, the monarchy actively engaged European education, nation-building, and popular culture in order to transform itself into a modern country based on European definitions. Though not formally colonized, it initiated reforms that paralleled colonial legislation in British Burma, French Indochina, and Dutch Indonesia. In short, Westernization was as much a part of Southeast Asian regional processes as it was an encounter between cultures.

In postcolonial Southeast Asia, the nature of engagement continued in much the same way, though the colonial powers were no longer formally (except in the case of Vietnam) dictating the nature of this exchange. Southeast Asians continued to view Western technological and economic influences with interest in some cases and distrust in others. Burma withdrew into itself and limited interaction with what it viewed as the colonial “West,” though it continued to adopt certain principles of European economic planning in order to craft a locally sensitive state policy called the “Burmese Way to Socialism.” Because of its history of direct colonialism and the disruption of its most important cultural institutions, Burma's postcolonial history has viewed Western influences with considerable hesitation. Understandably, measures to “de-Westernize” or decolonize itself have even included changing the nation's name back to its precolonial form, Myanmar. In contrast, Thailand's autonomy throughout the age of High Imperialism has left it more culturally secure, with its institutions intact, and less wary of Western influences. While sharing a similar historical and cultural trajectory as its Western neighbor, it has chosen a completely different path from Burma, choosing to adopt Western forms and ideas at a ferocious pace while at the same time applying adjustments along the way. In short, the intensity of colonialism has affected the intensity of the response to colonialism and its cultural features.

Shaping Westernization in Southeast Asian Studies

Scholarship has addressed the concept of Westernization in Southeast Asia indirectly through alternative themes and interests. That the early histories of Southeast Asia by colonial officials were actually the history of Westerners in Asia and their perspective on the region's culture reveals something about the idea of Westernization. As many early accounts describing this process were involved in the spreading of ideas, technology, or goods, their assessments tended to reflect their interests and their unfamiliarity with the region as a whole. One aspect of this approach was to view Southeast Asian

history within the chronological and narrative framework of the West's own history, leading to judgments proclaiming the region's political, social, and technological levels to be inherently backward. It was believed that through colonial policies, Southeast Asia under European tutelage would be emancipated from itself, joining the civilized world by emulating it. Thus, early assessments by colonial officials saw the process of Westernization as the process through which traditional cultures could be made modern.

This view was shared to some degree by Southeast Asian observers as well. The emerging class of indigenous elites who were trained in Western schools began considering the idea that European culture had something to offer and could improve their situation. These groups began to speak in European languages, adopt European modes of dress, and evaluate the world through European conceptions of it. For many scholars following World War II, Westernization became viewed in terms of nationalism and its specific role in the process of constructing the nation-state. Histories were produced that de-emphasized pre-European elements and themes in favor of more "modern" narratives that embraced the structures, ideas, and values of "Western" historical writing. As a result, nationalist histories supported the idea that Westernization and the formation of the nation were inevitable and inextricably linked. Ironically, colonial and nationalist historians envisioned Westernization and its role in history in much the same way.

In response to colonial and nationalist histories, attempts were made toward writing histories that promoted "Southeast Asian" perspectives, with the emphasis placed on alternative, locally defined categories upon which new narratives of regional history could be written. Scholars began to question the role and place of European influence on the superstructure of Southeast Asian beliefs. Many began to see Westernization as a "thin and flaking glaze" over more enduring ideas and institutions that had defined the region for centuries. With this shift in perspective, Westernization was perceived as having far less of an impact in Southeast Asia than previously held before, swinging the pendulum to the other side. Studies of anticolonial movements, economic systems, nationalism, rituals, and identity deemphasized the impact of Westernization in order to accentuate Southeast Asia's cultural integrity more clearly. As a result, the reappraisal of colonialism led to a different reading of Southeast Asia's Westernization. Where the colonial period might have previously represented a significant conjuncture in the region's long history, scholars now viewed more continuity with the precolonial past and its traditions.

With changes in the world of the early twenty-first century, and most notably in postcolonial scholarship, the shape of Westernization has once again taken a more prominent place in Southeast Asian studies. The realization that many of the categories once thought "Southeast Asian" were actually colonial constructions led to important reappraisals of European and U.S. influence in the region. This shift has thus reinserted the importance of European culture back into the mix that is Southeast Asian culture. Scholarship since the late 1990s has also shown that, in the last two centuries of the colonial encounter, the distinctions between "West" and "East" were

much more ambiguous than once held; that identities of race, ethnicity, gender, and religion were openly contested; and that the nature of Westernization in relation to the idea of modernity has not only changed in terms of its receptiveness, but that it was also losing its distinctiveness as being derived from Europe. Popular culture from Japan, technological innovation from India, and cultural tourism have redefined the relationship between what is perceived as Western influence and what is not, while growing economic, political, and technological integration has moved the region much closer to its neighbors around the world.

WILDLIFE. Prehistory makes clear that our ancestors continuously conceptualized their relations with the myriad forms of plants and animals with whom their existence was interwoven. These ancient musings, more mythological than scientific, were the first sustained efforts to comprehend the order of nature. The noun *wildlife* has been in use no more than 125 years. But the swirl of ideas around wildlife, however inchoate, is nearly as old as the human species.

Reconstructions of the conceptual dimensions of wildlife prior to the advent of agriculture are based on carvings, paintings, burial, and other material artifacts as well as the study of contemporaneous indigenous cultures living outside the cocoon of industrial civilization. While generalization remains provisional, the Paleolithic era of hunting and gathering has

marked by notions of plants and especially animals as totems and dual presences. As totems the other species taught their two-legged kin the ways of the world: survival more than anything else. As dual presences the others encouraged the notion that all creatures were shape-shifters, bound up in the ongoing cyclical process of life in relationships based on reciprocity rather than dominion. The “economy of nature” (itself a modern term) was conceptualized as sacramental, based on the myth of the eternal return.

The New Stone Age (c. 15,000–10,000 B.P.) slowly but inexorably overturned the established notion of one creation binding all creatures together. The cultivation of cereal grasses and domestication of animals led to a binary categorization of the wild and tame. The wild encompassed the plants and animals not under human control. Unwanted plants intruding upon fields became weeds. Population blooms of insects that ravaged the fields became plagues. Animals that preyed on livestock became predators.

The tame included the lands and domesticated species under the control of civilization. Domestication entails selection for characteristics that, however desirable for human purposes, would in many cases be lethal in a natural environment. Cereal grasses were valued because their seeds were retained in the head so that they could be harvested. Domesticated cattle were valued because they were docile and amenable to herding.

As permanent settlement spread, lingering memories of a time before agriculture when humans were intimately entwined with the others were expressed in sources such as the *Gilgamesh* epic and the Old Testament. Psalm 104 praises the glory of a creator god and the intricacy of the living creation. Even as the psalmist sang, there was a dawning realization that humankind was not a good steward: “I brought you into a fruitful land, to enjoy its fruit and the goodness of it; but when you entered upon it you defiled my land, and made the home I gave you an abomination” (Jeremiah 2:7).

Changing Conceptions of Wildlife in Darwin’s Century

Nineteenth-century evolutionary theory and the discovery of Paleolithic archeological materials established three fundamental ideas. First, that biophysical evolution existed on a temporal scale far beyond conventional schemes of history and culture. Second, the human species itself had a natural history that, however poorly understood, clearly linked the “Descent of Man,” as Charles Darwin put it, with an ancient and continuing evolutionary stream. And third, evolutionary theory made clear that the domestication of plants and animals was little more than tinkering with natural history for human purposes, especially economic ones.

While the nineteenth century did not overturn the modern notion that humankind was the master and possessor of nature, a somewhat chastened estimate of our place in nature emerged. Henry David Thoreau (1817–1862) observed in 1838 that hunting and trapping had eliminated the mountain lion and black bear from most of New England. He challenged his coevals to reconsider the fate of a culture that was losing

connection with wild places and creatures. Near the end of the century, John Muir (1838–1914) argued for the creation of national parks as refugia for wildlife and as places to nourish the human spirit. While protective legislation dates to the early 1600s (e.g., Bermuda’s protection of the cahow and the green turtle), the late nineteenth and early twentieth centuries marked the beginnings of systematic approach to the conservation of wildlife. Yellowstone (1872) was the first national park in America. Created primarily to protect unique geological features, Yellowstone’s value for wildlife preservation soon became apparent. President Theodore Roosevelt’s (1858–1919) and Gifford Pinchot’s (1865–1946) efforts around the turn of the century were instrumental in legislative efforts to create a system of public lands that offered protection for wildlife. Progressive resource conservation found many allies, such as sport hunters, who reacted vigorously to the depredations of market hunting on wildlife. (Predators did not enjoy legislative protection until passage of the Endangered Species Act near the end of the twentieth century).

Wildlife in the Twentieth Century

The early- to mid-twentieth century was marked by an increased scientific understanding of wildlife and an increased willingness on the part of nations to protect it. The International Union for the Protection of Nature (now the World Conservation Union) was established in 1948 and gave birth shortly thereafter to the World Wildlife Fund. These and other global organizations, such as the United Nations, and conventions, such as the Convention Concerning the Protection of World Cultural and Natural Heritage (1972), were dedicated to protecting wildlife through a variety of strategies. These included moratoriums on trade in endangered species and the creation of reserves, such as those designated as World Natural Heritage Sites.

Despite such efforts, the continuing humanization of the planet made the long-term survival prospects for wildlife increasingly uncertain. As the twentieth century ended, the biological sciences conclusively established the reality of an anthropogenic mass extinction of terrestrial flora and fauna. Estimates of human-caused extinction rates ranged from a low of one hundred to a high of one thousand times greater than natural rates. Humankind’s increasing population and subsequent levels of economic demand led to rapid development of the few remaining areas, such as Amazonia, that were primary habitats for wildlife. Patterns of human settlement in developed nations, including sprawl, urbanization, and the fragmentation of habitat, increasingly impacted remnant populations of wild plants and animals. Less direct impacts on wildlife were the consequence of the increase in global temperature, predicted by the Intergovernmental Panel on Climate Change to increase by 5 to 10 degrees Fahrenheit over the twenty-first century. Given such dramatic increase, the possibility of retreat by heat sensitive species appeared doubtful.

Progress in scientific understanding was paralleled by ethical advance. The pioneering work of Thoreau and Muir was followed in the twentieth century by a variety of ecological ethics that charged humanity with obligations to conserve wild places and things, and to restore those species, such as the wolf,

that had been thoughtlessly endangered. These ranged from the secular, such as Aldo Leopold's (1887–1948) land ethic, *A Sand County Almanac* (1949), to the religious caring for creation movement that followed Lynn White, Jr.'s charge in a 1967 issue of *Science* magazine that Jews and Christians were to blame for ecological crisis.

Rachel Carson's *Silent Spring* (1961), which focused on the consequences for avian species of the toxic chemicals used in a war against nature, marked the point where the environmental movement became a mass phenomenon. Membership in organizations dedicated to the conservation, preservation, and restoration of wildlife soared. As public interest increased in America, legislative action, such as the passage of the Wilderness Act (1964), the National Environmental Policy Act (1969), and the Endangered Species Act (1973), followed. Such laws, and similar ones passed in other nations, are the cornerstone of wildlife protection.

Wildlife in the New Millennium

As the twenty-first century begins, our ideas of wildlife are being transformed through the advance of the natural and human sciences. Humankind has engendered a mass extinction event and caused "the death of birth" (i.e., disrupted the processes of speciation), thus creating uncertain prospects for plants and animals, and ourselves, over the millennium. Three pivotal themes stand out.

Economically considered, the value of nature, including the plant and animal species (the total number of which are unknown to the nearest order of magnitude), has been calculated to exceed the value of the artifice of the human economy by two to one. Potential uses of great significance in medicine and agriculture alone give ample reason to work toward international solutions for the biodiversity crisis.

Humanistically considered, interdisciplinary inquiry has established a close connection between the extinction of experience and the extinction of wildlife. Cultural diversity goes hand in hand with biodiversity. The almost unchecked processes of globalization, legitimated under the banner of progress, and euphemistically termed cultural homogenization and assimilation, are rushing literally thousands of indigenous cultures, their languages, and the associated wild places and things to extinction.

Finally, humankind vitally needs the others in ways that we barely comprehend. Our natural history reveals that continual close interactions with the plants and animals are the norm. The small interval of time beginning with the Neolithic revolution and continuing to the present is a mere moment in that long history. There is increasing agreement across a variety of scientific communities that we ignore our continued need for and value of the others at great peril.

WISDOM, HUMAN. Wisdom is irretrievably linked with age and experience in human societies. If wisdom comes mainly through age and experience, it also requires "sense" to achieve. It is associated with the capacity to deal with experience in a constructive manner. If someone acts in a way that seems sensible, we may use the phrase "he has sense." Sense is the internal quality that promotes the learning process.

The question of the knowledge of creative activity, of intellectuals, of originality, even if this is viewed in a more limited way as only having a better memory, has little directly to do with the notion of wisdom but it has some overlap. A wise individual is definitely someone who knows about human affairs, or at least some segment of these affairs such as midwifery (*sage femme*, wise woman in French). Equally, the three kings in the story of the magi at the birth of Christ were wise men, not only in realizing the importance of that event, but also perhaps in the way they carried out their ritual and religious roles. Wisdom, knowledge, and common sense are all interrelated in complex ways.

Oral Cultures

Unwritten languages do not lack abstraction, as has sometimes been suggested; language use itself depends on that very process. But in purely oral cultures words do tend to be more concrete in their reference, established as they are by face-to-face interaction. There seem to be relatively few nouns for qualities such as *wisdom* (nouns in any case being more common in written languages).

In an oral culture, one acquires wisdom and more generally knowledge through the aging process. The young can hardly be wiser or more knowledgeable than the old since they have had less experience, on which wisdom is based, and have acquired less knowledge, which in any case comes from the elders. There are no books that the young can read to acquire wisdom and learning independently of their seniors, who are largely members of the same family.

The discussion of wisdom ties up with the question of whether we find "intellectuals" in oral cultures. Clearly there are not only different levels of knowledge about cultural

affairs, but also differences in the ability to create that knowledge. In his work on the cosmology of the Dogon of Mali, Marcel Griaule offers his *Conversations with Ogotemméli* (1948) as if they presented a picture of the people's worldview. It is not altogether clear how much of this account comes from the actor's mouth and how much from the interpreter and the anthropologist. But what is apparent is that Ogotemméli was an exceptional man who was capable of shaping his own view of the world. Exceptional, but not all that rare. In nonliterate societies, in the absence of a written text to which they can refer, many elaborate their own version in areas of what is often thought to be "common knowledge."

Bagre. The Bagre is an association found in various groups in northern Ghana to which the majority of the inhabitants belong in order to ward off disease. It consists of a series of initiatory performances over six months at which elders repeat a recitation in two parts, the White and the Black, that comprises an account of the ceremony itself and, in the Black, a version of how the people came to have the culture they do and the problems they face as humans. The extensive Bagre recitations of the LoDagaa, which display some features of later philosophic discourse (for example, an awareness of "the problem of evil"), do not refer to anything that has been translated as "wisdom." On the other hand, "wise" as an adjective is something used in the translations.

In the Bagre, the notion of *wisdom* is closely connected with age. In the Black Bagre, the "deepest" of the two parts, a repeated phrase has been translated as "little old woman"; in the other, White Bagre, a similar phrase has been translated as "wise old woman." The shift could be an error of transcription, but it is not all that important, since the notion of aged already implies *wisdom*. While you may find foolish old men or women, generally age proclaims wisdom.

For the LoDagaa, the capacity to act in a wise manner is helped by learning from one's elders, who are more experienced in the ways of the world. But it also comes from one's knowledge of "oral literature," with having a wide range of reference to common culture, starting with proverbs, running to folk tales (mainly told to children, often with a "moral" ending, though not of the Rudyard Kipling sort), but more thoroughly with the knowledge of the Bagre recitation. Not everyone belongs to the association whose members have this "myth" repeatedly recited to them, but the majority of men are initiated and so too are women, at least as far as the lower White Bagre, as a result of which restriction they lack some ritual knowledge, though they acquire this after menopause, when they count "as men." In this recitation, especially in the Black, many matters concerning the human experience are discussed, including the problem of evil. But the role of God as Creator and as Supreme Being is also frequently referred to, especially in what has elsewhere been called the First Bagre (Goody, 1972).

In the Bagre a great deal of attention is paid to learning and to knowledge that brings wisdom. In a way, the whole of the recitation is about how humans *learned* to do what they do, who taught them, who deceived them. The knowledge comes from supernatural agencies, ultimately from the creator god,

more immediately from the beings of the wild who can deceive. It was they who instructed our ancestor(s), who in turn passed the knowledge on to us, often in the course of recitals such as the Bagre. We have to *understand* (hear) this knowledge with the aid of our *sense* (*yen*). Wisdom consists in the judicious application of knowledge and experience to actual situations; it is based on a knowledge not so much of the supernatural as of the natural world, the world of man. While there is no general quality translatable as "wisdom," the wise application of knowledge both religious and secular does seem to be recognized by the actors. And part of the knowledge on which it is based does emerge from the recitation of the Bagre, which could be seen as a kind of "schooling" process—that is, it aims to transfer knowledge to the initiates. However, it is possible for elders of either sex to be perceived as wise without actually being a member. There are other ways of becoming a sound counselor and solving disputes in the course of ordinary life.

While wisdom is a feature of human relationships, sense is also an internal quality that can manifest itself in the young. In the Bagre, God's child is said to have

had much sense
in his head (Goody, 1972, First Black Bagre, l. 1480–1481)

At one point in the recitation, he has just been told by his father, who claims possession, that a woman passing by was not his mother:

"You have no mother."
The boy
laughed softly
and asked his father,
"Have you seen anyone
who has no mother
and yet has a father?" (l. 1438–1444)

While this child has sense, mainly it is the old who are wise. When the father and mother of God's child are quarrelling about the ownership, "the wise old woman"

laughed loudly
and said
that one child
is causing two people
to quarrel. (l. 864–868)

She takes the case before God himself (a bearded old man sitting on a cow's hide), who asks them to keep calm and "resolve" the problem by asking the mother and the father to urinate down a hollow stalk. This arbitrary task hardly matches the wisdom of Solomon in similar circumstances and in fact resolves nothing. The quarrel continues, but the problem of the duality of parenthood has been made explicit. This situation seems not atypical of oral cultures.

As is shown by the various published versions of the LoDagaa recitation of the Bagre, memory is rarely verbatim, and the performers are therefore "forced to be free," obliged to fill

in the gaps and in many cases wanting to make their own contribution. Changes, often creative changes, are frequent. And there is considerable difference in that creative ability, which is recognized in the recitation itself in the injunction to new initiates to learn to recite. In the recorded versions, the First Bagre, both Black and White, is considerably more sophisticated, partly because the speaker was more of an “intellectual,” a person who gave more thought to the nature of things, which is how later philosophers like to think of themselves.

Written Cultures

In written cultures, wisdom is often associated with the elders and their experience. But it is largely expressed in their writings, in the wisdom literature of the ancient world, in Proverbs and the wisdom of Solomon in the Bible, the wisdom books of ancient Egypt, of the *Baghavat Gita* in Hinduism, and of the equivalents in Buddhist writings. Once again these texts are concerned with relations between humans rather than about relations of humans with gods. There are right and wrong ways of conducting the latter, but in general wisdom is not a notable feature. Wisdom literature, however, is concerned not with the more abstract questions of the ethical philosopher, whose activities are involved with general principles, but with the immediate problems of daily life.

Priests may be knowledgeable, even wise, about the ways of the gods, but there is no special wisdom automatically attached to being a priest, although they are often expected to conduct themselves in a restrained manner. Wisdom is more likely to be seen as the result of reading the works of secular authors, especially philosophers, interested in morality and the daily conduct of human affairs.

Societies with writing were heavily divided, until very recently, into those who could read and those who could not. The latter are sometimes spoken of as belonging to an oral culture; some would rather see them as attached to an oral tradition, one that has been significantly affected by the “high culture” of the written. An oral tradition, when combined with a written culture such as the biblical, has its own characteristics. The written culture may incorporate and transform earlier oral culture and myth and produce a “folk wisdom” that enters into oral repetition. That may consist in the appropriate reference to proverbs, such as “a stitch in time,” but it also produces a kind of wisdom, more often associated with the country rather than the town, that draws on a wider experience not of books but of life as it is lived in the round. The paradigmatic example of such unlettered wisdom is provided by the peasant Karataev in Leo Tolstoy’s *War and Peace*, whose “wisdom” is contrasted with the anxious cleverness of the aristocratic, cosmopolitan Pierre, a great reader.

The unlettered still had a wisdom to offer in a society many of whose activities were dominated by the written text. By contrast, in mixed societies too much reading is sometimes seen as leading to the loss of wits, of “sense,” of contact with the real world. The text is distanced from human affairs and may prevent the profound contact that encourages wisdom, at least folk wisdom, and that comes from an unmediated experience of human affairs.

WITCHCRAFT. The word *witchcraft* is used in many different ways. The word *witch* is derived from Old English *wicca* (masc., “wizard”) and *wicce* (fem., “witch”). The term *wiccan* (“witchcraft”) referred to human acts intended to influence nature, usually through the use of power unavailable to all human beings. This use of the word *witchcraft* is synonymous with the more general word *magic*. The acts associated with witchcraft were sometimes called spells (Old English “talk, tale”). The person could conduct these acts for his or her benefit, or for others who did not have access to the necessary power. In contemporary academic work and in popular culture, however, it is still generally assumed that the influence or change resulting from the act is harmful. With these negative associations, *witchcraft* is also used for diabolism, acts performed with the assistance of the devil. Other acts, those that attempt to influence nature in a beneficial way, are usually not considered. *Witchcraft* also refers to ideas and practices believed to influence nature that emerged in the twentieth century, largely in Europe and North America, sometimes referred to as neo-paganism. This use of *witchcraft* is similar to the one derived from the Old English *wiccan*.

Witchcraft is the term most commonly used in the social science literature, and the practices it refers to can be found in all societies. Over the years there has been some debate about the similarities and differences between the practices of witchcraft and sorcery, and in the social sciences there are several traditions. Studies conducted in Asia tend to use the term *sorcery* for the practices referred to by *magic*, while studies in South America use *shamanism* in a similar way. Studies in Africa use both *sorcery* and *witchcraft*, and the use of both terms usually assumes that the magical acts are intended to be harmful.

In the twentieth century, there were debates about whether different terms should be applied to rituals that were conducted with and without the assistance of spirits. There were also discussions about distinguishing between practitioners whose power was innate and those who learned the knowledge and skills from existing practitioners. In the social sciences, it is generally assumed that both *witchcraft* and *sorcery* can be used interchangeably, but it is important for the scholar to explain the particular way each term is being used, as well as its relationship to local terms.

The Social and Political History of Witchcraft in Europe

The ancient Greeks made distinctions among forms of magic, although they differ from the categories found in contemporary thought. The Greeks considered all magic to be performed with the assistance of spirit entities called *diamones* (“demons”) that could be either harmful or helpful. During the Hellenistic period, a new belief emerged that developed the notion that evil spirits were led by Satan. Christians then began to divide the *diamones* into good angels and harmful demons. People involved in magic were thought to use the power of demons. During the Renaissance, this idea expanded into a full-fledged belief in diabolical witchcraft. The idea of the devil in Christianity overshadowed all other ideas concerning magic, and the fear of witchcraft took a central place in the religious imagination.

During the period of the European witch craze (1450–1700), many beliefs and practices rooted in paganism and folklore came to be associated with influences from the devil. The idea of diabolical witchcraft also came to be applied to medieval heretics, who were imagined to be involved in a pact with witches and with Satan himself. In Spain and its colonies, the Inquisition, which provided a legal forum for persecuting those identified as witches and heretics, further collapsed the concepts of magic and diabolical witchcraft. Gradually, any form of magic came to be viewed in Europe as diabolical witchcraft.

During the witch craze, patterns in accusation show that the accused generally had a low social status, already had been faulted for other transgressions, and exhibited difficult personality traits. Many were practitioners of medicine, and a disproportionately large number were women, as discussed below. Although there were no witch hunts in Europe during the eighteenth and nineteenth centuries, many colonial societies developed new versions of witchcraft laws that were used to stigmatize the religious ideas and practices of colonized peoples.

The Functions of Witchcraft

In the 1940s and 1950s sociologists and anthropologists explored the many positive functions of witchcraft and illustrated them with detailed studies. As E. E. Evans-Pritchard (1902–1973) observed in his classic study of the belief in witches in an African society, the Azande, witchcraft can be understood as an explanation for unfortunate events. That explanation enabled people to maintain a sense of control over their lives and feel that they understood their world. Understandings about witchcraft could also help to define values and moral standards in a society.

The ideas that a society creates about witches can be seen to support norms and values in that society, and, when analyzed along with a structural model of the society, can also provide insights into the organization of the culture and society. Ideas about the negative characteristics of the witch can be a way to guide behavior, as functionalist anthropologists argued in a series of studies showing that the belief in witchcraft served as a social control mechanism. In his work on the Navajo, Clyde Kluckhohn found that the fear of becoming the victim of witchcraft encouraged them to cooperate, share resources, and minimize public displays of anger. The socially permitted

form of aggression toward the witch allowed other hostilities to be displaced onto an individual, a useful outlet in situations where in-group hostilities could threaten the survival of the group or damage people’s abilities to act collectively.

The central problem with studies that assumed a cohesive function for witchcraft was that, like other functional analyses, the theory could not be proved or falsified. Some sociologists and anthropologists such as Max Marwick were more interested in analyzing the social basis of witchcraft accusations and the life conditions that placed particular strain on these relationships. Against the dominant functionalist trend, Robert Murphy proposed that beliefs about witchcraft and accusations could have disruptive effects. Working with the Mundurucú in Brazil, he found that witchcraft accusations, combined with a rubber economic boom, created group divisions and family migration, which eventually supported a more dispersed settlement pattern. From her comparative analysis of African Studies, Mary Douglas (1963) came to a similar conclusion.

It has been observed that people in relatively marginal positions in society might be able to use witchcraft, or the threat of witchcraft, as a form of social power. The relatively weak could then influence people with more power or wealth to redistribute it and minimize some of the inequalities in the society. In his study of the Maka in Cameroon, Peter Geschiere shows that witchcraft can work both to promote accumulation and leveling.

Symbolic and Ideological Aspects of Witchcraft

Largely through the influence of Claude Lévi-Strauss’s structuralist approach, anthropologists have placed great emphasis on the position of witches in symbolic systems. In ethnographic studies, it has often been observed that witches are associated with the left hand and with wild or nondomestic realms, and are placed in opposition to the moral standards of a society. Actors’ understandings of witchcraft are extremely important, although most anthropologists are cautious in interpreting these exegeses, placing them within more comprehensive analyses that also examine symbolic meanings more generally, as well as their relationship to the social, political, and economic processes in the society. This approach is best shown in the work of Bruce Knauft in New Guinea.

Scholarship has also explored the role of witchcraft beliefs in diverting people’s attention from economic and political explanations for untoward events. This kind of argument, similar to Karl Marx’s (1818–1883) understanding of ideology, claims that witchcraft as a form of explanation functions to maintain the existing sociopolitical structure of a society. According to George Bond, witchcraft explanations in Muyombe, Zambia, work to obfuscate the changing labor and property relationships among villagers. While their participation in accusations emphasizes their common membership in the community, it deemphasizes their increasingly unequal economic status.

Witchcraft and Gender Relations

Scholarly works from many different societies and time periods have shown that witch-finding rituals, popularly called witch hunts, are used by more powerful segments of a society

to persecute people who are opponents or who present a threat to established power. Christina Lerner shows that in sixteenth- and seventeenth-century England the church and state entered new forms of cooperation and identification that especially targeted women as witches. Her explanation is that men identified themselves as the proper professional group to offer healing services, and women were persecuted because their healing traditions competed with this new system.

It is important to understand that the disproportionate number of women targeted by European and American witchcraft accusations should not be taken to mean that this focus is a universal. In some societies, men are more commonly accused of witchcraft and represent that society's ideal witch. Diane Ciekawy (1999) shows that among Mijikenda in Kenya witchcraft accusations are primarily directed toward men. In her analysis of the witchcraft accusation process, women collect evidence and shape ideas about culpability in the homestead, thereby wielding a great deal of power. The work of Rosalind Shaw with Temne women in Sierra Leone illustrates the ways that women are active agents in diviner consultations. She shows how women can select from diviner consultations the explanations for their problems that they most favor. These chosen explanations can resist patriarchal explanations that disadvantage them or create less favorable power relations.

Witchcraft: Questions of Translation and Meaning

Scholars continue to debate the question of how well scholarly concepts like witchcraft convey the meanings of local terms, and how much a term like *witchcraft* can reduce the diversity and complexity of ideas and actions to which it is applied. Regarding the history of scholarship around the terms *magic*, *sorcery*, and *witchcraft*, we see that, although magic can be indigenously conceived as having both harmful and helpful potentials, the latter can be deemphasized by scholars who are more interested in its harmful potential. While these questions are not entirely new—both Victor Turner and Malcolm Crick encouraged anthropologists to use local terms and their specific meanings as much as possible in their work—current scholarship is more sensitive to the possibility of misrepresenting the cultures it attempts to describe. In view of the political history of witch hunts in Europe, and the ways non-Christian religious ideas and practices were demonized, it is possible to ask if a similar process continues in the structure of contemporary academic discourse.

Some scholars regard witchcraft as a discourse of power that requires knowledge about the historical and ethnographic conditions that shape understandings about it. This might entail a more careful analysis of the semantic range of terms for magic and harmful magic, with an attempt to separate local discourses from wider regional or national ones. Ciekawy (1998) does this in her analysis of the application of the Witchcraft Act in colonial and postcolonial coastal Kenya. She describes different words that Mijikenda people use for harmful magic: *utsai* is a Kimijikenda term, the kiSwahili words are *uchawi* and *ulozi*, and some people use *witchcraft*. Mijikenda employ these terms in different contexts. She concludes that, for conceptual and analytical purposes, the terms must be distinguished because *utsai* refers to a discourse on harmful magic that is

created and operates within local social and political settings largely under the control of Mijikenda who use them, while *witchcraft* is best understood as a technology of power that emerged under European colonialism, supported largely through discourses of mission Christianity and colonial law and administration.

Witchcraft as a Discourse of Power

Jeanne Favret-Saada's study of witchcraft in the Bocage of western France examines the power of words used by people to talk about witchcraft. She distinguishes this approach to witchcraft as power from its more conventional use in anthropology as knowledge or information, pointing out that in the Bocage there is no neutral position that a person can have when it concerns such socially and politically powerful speech. She also questions the way academics have viewed witchcraft as the backward and untrue beliefs of people who do not use academic forms of reasoning. This is consistent with the general approach used to study many forms of magic offered by Arens and Karp. Rather than use the words *magic* and *witchcraft*, they advocate the use of the terms *transformational capacity* and *power*.

The Modernity of Witchcraft

Contemporary scholarly work indicates that the study of witchcraft is as relevant today as it has been in the past. Ideas about witchcraft address new circumstances and are very much a part of people's understanding of how their lives are connected to events and processes both near and far. It is common for witchcraft discourses to relate to the countryside, town, state, and world. Few current studies see witchcraft only as a social construction; it is also understood to be a concept that meaningfully provides people with a representation of the complexity of the order in which they live, including power and inequality, individual and collective interests, and resources and their allocation. Witchcraft addresses issues of globalization and transformations within the state, and continues to explain events and the mechanics of their integration into daily life. It is also important to remember that the constructions of witchcraft can be powerful realities, and have the ability to maintain or transform social relationships.

WITCHCRAFT, AFRICAN STUDIES OF. In contemporary scholarly and popular discourse, the term *witchcraft* refers to a wide variety of ideas, practices, and institutions. Among most social science scholars of Africa, particularly anthropologists, *witchcraft* is defined as an act of magic that results in harming a person or aspects of the material world on which he or she depends. In this context, *witchcraft* and *magic* are used interchangeably; it is assumed that magic used

for harm and magic used for healing, or enhancement, can be distinguished, either conceptually or in practice.

The work of anthropologists from the 1930s on made the greatest contributions to the study of social and political institutions in African societies, as well as their systems of belief and logic. Their methodological and theoretical achievements influenced many disciplines in Western scholarship, notably history and philosophy. During the past forty years, witchcraft has occupied a controversial place in African Studies scholarship. As a general term that describes the harmful use of magic, *witchcraft* is not specific with respect to the societies or peoples who use it. Witchcraft and magic exist in all societies, but, as many scholars have shown, in the history of Western thought and popular culture, and in much of contemporary European-American scholarship, witchcraft has been positioned as a backward or erroneous system of thought. In the study of African religions, it is also interesting to note that Western scholarship has given it great prominence. As noted by John Mbiti in *African Religions and Philosophies*, Western scholarship has often presented witchcraft ideas out of context and emphasized their association with harm, which has resulted in a fundamental misrepresentation of African religions.

One of the central achievements of E. E. Evans-Pritchard's (1902–1973) work was to show that witchcraft among the Azande provided explanations for everyday events and presented a theory of causality. From a contemporary critical perspective, however, it can be faulted for making the assumption that it did not have the same explanatory power as scientific modes of thought and reasoning. African philosophy has been at the forefront of critical assessment of the biases of Western scholarship and the quest to develop discourses and ways of re-representing African religious life.

The study of witchcraft now involves a broader range of scholars who have extended debates and included in their studies many new areas of interest. Some of these concern questions of representation and meaning and new questions about the ability of disciplinary concepts to address local knowledge and experience.

Early Anthropological Contributions

Witchcraft serves many different social functions. In ethnographic studies of peoples around the world, anthropologists have detailed many of the positive social functions of witchcraft. As popularized in Evans-Pritchard's work, witchcraft can be understood as an explanation for misfortune, which might function to provide people with a sense of control over their own lives and the ability to understand forces in their world. These could be called empowering functions of witchcraft. Understandings about witchcraft can be used to define values and moral standards in a society, thus contributing to a society's definition of itself or distinction from other groups. Also, people who are in relatively weak and marginal positions in society might be able to use witchcraft, or the threat of witchcraft, as a form of power. In this way, the ideas and practices of witchcraft could work to mediate social, political, or economic inequalities.

Witchcraft also serves more overtly political functions. The complex of ideas associated with witchcraft can involve rituals

that identify people responsible for practicing witchcraft. Early anthropological works on African societies noted the existence of movements against witchcraft, sometimes known as anti-witchcraft movements or witchcraft eradication movements, that borrowed from these cultural institutions. Audry Richards's important essay on a witch-finding movement in Zambia shows how the movement drew from responses to the influences of colonialism, yet also drew from rituals that are part of a common complex in central African societies.

Politics of Witchcraft: Local and Global

Building on anthropological methods for studying the politics of witchcraft, several important works demonstrate relationships between local and global worlds in the construction of witchcraft ideas and practices. Peter Geschiere's *The Modernity of Witchcraft* shows how the many different fields of everyday experience that shape witchcraft for the Maka in Cameroon are influenced by regional, national, and global forces. In her study of legal and administrative institutions in Kenya, Diane Ciekawy (1998) shows how local religious practice is both constrained and encouraged to develop in ways that further strengthen the power of state institutions. Scholars also acknowledge the challenge of segregating local discourses concerning magical harm from wider regional or national ones, particularly when the English term *witchcraft* is used in African communities.

Philosophical Approaches to the Study of Witchcraft

African philosophy has provided some of the most critical assessments of Western scholarly traditions. In *The Invention of Africa*, V. Y. Mudimbe shows how concepts and terms used in the study of African religion, including witchcraft, developed through colonial practices and Western prejudices about African peoples and their cultures. African philosophy has also engaged in discussion about the importance of acknowledging the role of individual philosophers in the creation of knowledge (Hallen and Sodipo; Karp and Masolo).

Moral and Ethical Relevance

Scholars are now more interested in exploring the moral and ethical questions that witchcraft presents. Elias Bongmba is also attentive to the ways that witchcraft discourse contributes to problems within African societies. Bongmba, himself from Wimbun society, uses his experience as well as fieldwork. Drawing on notions of intersubjectivity from philosophy, he examines notions of *tfu*, used by Wimbun in Cameroon. He shows that it is part of a discourse of power that includes both helpful and harmful aspects, and concludes that it gives people an opportunity to engage in face-to-face encounters. In a similar way, Ciekawy examines Mijikenda interpretations of the magical practice of *utsai*. She argues that it is a way for people to conceptualize inequality and the exploitation of one human being by another, which makes it particularly useful for comprehending the world and considering the ethical choices available to human beings.

Modernity

Contemporary ideas of witchcraft provide an idiom for expressing individualism, innovation, and human agency that are

much a part of modern life. During this period of rapid globalization and incorporation within the postcolonial state, ideas of witchcraft have been used by African peoples as frameworks of interpretation. As interpretive constructs, they also help to shape the political world, and they are, therefore, powerful forces that can both help to maintain or transform social and political worlds.

Conclusions

In the study of witchcraft in African societies, the concern with systems of logic and thought that has long engaged anthropology and philosophy continues. More recently, there has been a focus on indigenous systems of knowledge and hermeneutical traditions. More contemporary scholars are interested in forms of interpretation, skepticism, and cultural critique that come from within local thought traditions. Scholarship is now, more than ever before, poised to counter the academic practice of maintaining distinctions in forms of thought from Western and African societies.

Diane Ciekawy

WOMANISM. The term *womanist* first appeared in Alice Walker's *In Search of Our Mothers' Gardens: Womanist Prose* (1983), in which the author attributed the word's origin to

the black folk expression of mothers to female children, 'You acting womanish,' i.e. like a woman . . . usually referring to outrageous, audacious, courageous, or *willful* behavior. Wanting to know more and in greater depth than is considered 'good' for one . . . [A womanist is also] a woman who loves other women sexually and/or nonsexually. Appreciates and prefers women's culture . . . and women's strength . . . committed to survival and wholeness of entire people, male and female. Not a separatist . . . Womanist is to feminist as purple is to lavender. (pp. xi–xii)

Although Walker states that a womanist is a black feminist or feminist of color, she insists that a black feminist as womanist talks back to feminism, brings new demands and different perspectives to feminism, and compels the expansion of feminist horizons in theory and practice.

The introduction of "womanism" in the feminist lexicon in the early 1980s marks a historic moment in feminist engagement in the United States. The late 1970s and the 1980s witnessed an internal insurgency in feminism led by women of color who participated in fighting vigorously against sexual politics of the previous decade only to be confronted by the feminist politics of exclusion a decade later. Excluded from and alienated by feminist theorizing and thinking, women of color insisted that feminism must account for different subjectivities and locations in its analysis of women, thus bringing into focus the issue of difference, particularly with regard to race and class.

If feminism were not able to fully account for the experiences of black women, it would be necessary, then, to find other terminologies that could carry the weight of those experiences. It is in this regard that Alice Walker's "womanism" intervenes to make an important contribution. As Walker noted in the *New York Times Magazine* in 1984, "I don't choose womanism because it is 'better' than feminism . . . I choose it because I prefer the sound, the feel, the fit of it; because I cherish the spirit of the women (like Sojourner) the word calls to mind, and because I share the old ethnic-American habit of offering society a new word when the old word it is using fails to describe behavior and change that only a new word can help it more fully see" (p. 94). In other words, feminism needed a new word that would capture its complexity and fullness. Despite Walker's claims to the contrary, she suggests in her definitions of womanism (e.g., "womanist is to feminism as purple is to lavender") that the womanist/black woman is stronger and superior to the feminist/white woman.

Walker's construction of womanism and the different meanings she invests in it is an attempt to situate the black woman in history and culture and at the same time rescue her from the negative and inaccurate stereotypes that mask her in American society. First, Walker inscribes the black woman as a knowing/thinking subject who is always in pursuit of knowledge, "wanting to know more and in greater depth than is considered 'good' for one," thus, interrogating the epistemological exclusions she endures in intellectual life in general and feminist scholarship in particular. Second, she highlights the black woman's agency, strength, capability, and independence. Opposed to the gender separatism that bedevils feminism, womanism presents an alternative for black women by framing their survival in the context of the survival of their community where the fate of women and that of men are inextricably linked. As Patricia Hill Collins aptly notes, "many black women view feminism as a movement that at best, is exclusively for women, and, at worst, dedicated to attacking or eliminating men . . . Womanism seemingly supplies a way for black women to address gender-oppression without attacking black men" (p. 11).

In 1993 the word *womanism* with the meanings Alice Walker bestowed on it was added to *The American Heritage*

Dictionary. The concept has had a profound influence in the formulation of theories and analytical frameworks in women/gender studies, religious studies, black studies, and literary studies. Because of the linking of black women and spirituality in Walker's project, many African-American female theologians have incorporated womanist perspectives in their work. Drawing on African-American history in general and the black church in particular, black womanist theologians interrogate the subordination of women and assume a leadership role in reconstructing knowledge about women. Prominent black womanist theologians and scholars of religion—such as Cheryl Townsend Gilkes, Katie Geneva Cannon, Delores S. Williams, Emilie Maureen Townes, and Marcia Y. Riggs—bring womanist perspectives to bear on their black church, canon formation, social equality, black women's club movement of the nineteenth century, race, gender, class, and social justice. The impact of womanism goes beyond the United States to Africa where many women scholars and literary critics (Chikwenye Okonjo Ogunyemi, Tuzylina Jita Allan, and Mary Modupe Kolawole, in particular) have embraced it as an analytical tool.

Alice Walker's womanism has also generated debates and controversies. Prominent among those who challenge the terminology's appropriateness for framing and explaining the lives of women of African descent is Clenora Hudson-Weems, who proposes an alternative terminology—*Africana womanism*—that is different from Black feminism, African feminism, and Walker's womanism. Many of the debates and controversies about womanism focus on the differences and tension between womanism and black feminism. Patricia Hill Collins offers an excellent critique of both womanism and black feminism. Hill Collins notes that the debate about whether to label black women's standpoint womanist or black feminist is indicative of the diversity among black women. According to Hill Collins, "Walker's definition thus manages to invoke three important yet contradictory philosophies that frame black social and political thought, namely, black nationalism via her claims of black women's moral and epistemological superiority via suffering under racial and gender oppression, pluralism via cultural integrity provided by the metaphor of the garden, and integration/assimilation via her claims that black women are 'traditionally universalist'" (p. 11). While weaving the separatism and black moral superiority of the black nationalist philosophy, the pluralism of the black empowerment variant, and the interrogation of white feminism, womanism seeks to give a voice, a standpoint to black women but fails to adequately take into account the heterogeneity of women of African descent with their different histories and realities.

WOMEN AND FEMININITY IN U.S. POPULAR CULTURE.

Before the women's movement and deconstruction, the term *femininity* was understood as the opposite of the more obvious *masculinity*. Femininity represented those traits, characteristics, behaviors, or thought patterns not associated with a given society's expectations of men. Until the cultural upheaval of the late 1960s in the United States and elsewhere, the sweetly patient "angel of the house" persisted as the womanly ideal. Women learned to be feminine "in the image that suited the masculine desires" (quoted in Costa, p. 222), an image that included deference, respect, and obedience to males. In compensation, the woman held the passive power of the dispossessed. Submissive, soft-voiced, empathic, and maternal, the feminine woman would be willing to subordinate her own needs in order to better please others.

Femininity as a principle or "exquisite esthetic," as Susan Brownmiller puts it in *Femininity* (1984), "pleases men because it makes them appear more masculine by contrast . . . conferring an extra portion of unearned gender distinction on men, an unchallenged space in which to breathe freely and feel stronger, wiser, more competent, is femininity's special

gift” (p. 16). This gift, however, costs the giver. Girls and young women learn they must adhere to standards of comportment, physical presentation, and appearance according to the demands and currency of their respective cultures and classes or face disapproval, even social failure, ostracism, rejection.

In a postbinary world, however, definitions of femininity as well as masculinity have blurred. Definitions of femininity are no longer standardized and are therefore seemingly open, writes Maggie Mulqueen in *On Our Own Terms*. They arise “only from the culture, not from theory. . . . In reality, though, the cultural prescriptions about femininity (and masculinity) are very narrow and influential” (p. 13). These influential prescriptions consist of social expectations and the pressure to conform, particularly in adolescence. A girl’s sexual awakening and turbulent maturation eventually steer her toward pleasing boys and winning admiration, envy, and acceptance from her peers.

Beauty and Class

In addition, the reigning elements of femininity and their effect on women resonate according to one’s class and race, criteria that can locate a woman along the continuum of behavior and attractiveness. Class is a fluid or changeable category; race is generally not, though beauty treatments can “standardize” ethnic features like hair color and texture (see below) or influence acceptable limits of body size.

Related to class are the awareness of and access to proper nutrition as well as the availability of leisure time for exercise, factors associated with the maintenance of lean body mass. The proportion of lean mass to body fat contributes to the impression of overall girth and therefore health. Few men, young or old, strive to be gaunt, and fewer men than women are dissatisfied with their bodies even if they are somewhat overweight. Instead, they value size especially if the bulk is muscle rather than fat. Men’s “perceptions serve to keep them satisfied with their bodies, whereas women’s serve to keep them dissatisfied,” writes Sarah Grogan (pp. 144–145). American women of any age, however, find thinness the only tolerable size, despite evidence that men prefer somewhat rounder female bodies than women think they do.

Preferred body size and proportion reflect class-related tastes or expectations. Researchers have suggested that different social classes have distinct ideas of attractiveness, and magazines gear to these readers. The fleshiness of magazine models varies according to the social class of the targeted audience, be it male or female. Magazines for upwardly mobile homemakers have trim but not skinny models. Family-oriented magazines present more modest images typical of pleasant-looking housewives. So-called pulp magazines feature curvier bodies: “the lower the social class ranking of the magazine the bigger the chest and hip measurements of the models,” observes Nora Scott Kinzer (p. 165). Magazine models are rarely if ever overweight; in fact, compared with their counterparts from the 1950s, they generally weigh less and have smaller measurements.

Viewing and Being Seen

Because she frequently feels on display, a woman monitors her physical appearance in mirrors, in store windows, and in the

eyes and expressions of people who see her. Self-criticism originates not only in the woman herself but also from the internalized voice of male culture and the parents who teach her how to dress and present herself. John Berger’s *Ways of Seeing* (1972) articulates the concepts of viewer and viewed by noting that the observer is generally male and the object observed, female. Though intended as an assessment of the subject in Western European painting, Berger’s remarks apply equally to contemporary representations of women in the media: “Women watch themselves being looked at. . . . The surveyor of woman in herself is male: the surveyed female” (p. 47).

Women internalize femininity’s burden of self-monitoring along with this same male gaze as they compare themselves, usually unfavorably, with the ideal face and body that they imagine the male conjures up in his mind’s eye. In her article “The Persistence of Vision,” Donna Haraway rejects the power that the male gaze assumes as it “mythically inscribes all the marked [e.g., female] bodies, that makes the unmarked category claim the power to see and not be seen, to represent while escaping representation. This gaze signifies the unmarked positions of Man and White” (quoted in Conboy, Medina, and Stanbury, p. 282). White males, the cliché goes, see a generic human being when they view themselves in the mirror; everyone else sees the markings of gender, race, or both.

Femininity, Attractiveness, and Science

Scientifically measurable differences in male and female prenatal hormone levels and in brain development, among other areas, have rekindled questions of the origins of, tendencies toward, and social reinforcements of masculinity and femininity as well as gender identity. Because the data lend themselves to different conclusions as to whether or not physical attractiveness has a scientific basis beyond its aesthetic component, studies from social theorists could lead to one set of interpretations; studies by sociobiologists and evolutionary psychologists to quite another.

Genetic survival, or maximizing the number of genes passed on in successive generations, is consistent with the latter’s viewpoint regarding physical attractiveness. Sociobiologists and evolutionary psychologists would associate good looks with reproductive fitness and health. Traits like waist-to-hip ratio (WHR) and signs of overall health (luster of hair, vigor) attract attention from the opposite sex presumably because they indicate reproductive vigor. This paradigm, though, does not explain popular culture’s preference for thin women rather than voluptuous or even overweight bodies with the optimal WHR; nor the preference for larger breasts, despite the irrelevance of breast size to milk production.

Moreover, while a wide pelvis should indicate a desirable mate for childbearing capacity, such was not the case in the last quarter of the twentieth century. Since the exaggerated thinness of the English model Twiggy, the ideal female figure of international supermodels resembles more the body of a twelve-year-old boy with long, slim limbs and small hips— androgynous rather than womanly. This preferred body type, however, seems unconnected to carrying and suckling an infant. The trend for a flat torso and stomach has replaced the

breast as the focus of the female body. So prevalent are breast implants that one no longer can assume that a generous bra size is natural. A flat, well-muscled abdomen, on the other hand, indicates controlled food intake and a fitness routine. One anthropologist terms it “a modern-day virginity symbol” that suggests “a woman who has never borne children and thus has all of her years of fertility in front of her” (quoted in Bellafante, p. 9).

The American author Kim Chernin has discussed the relationship of female slimness to the power of the mother over infant sons, a power which a more robust-sized woman would recall unconsciously in men and which would threaten them. In fact, potential mothers are expected to be physically smaller and more delicate than men—thinner and less well-muscled than their protectors—but at the same time tall enough and long enough of bone to indicate good childhood nutrition and thus reproductive vitality. Today, particularly in puritanical America, slimness suggests self-control and mastery of sensuality in a society when fattening food is readily available and sex as much a sport as an erotic or intimate experience. Yet historically, a well-padded body was considered ideal as it indicated health and prosperity in centuries when starvation and illness were a constant threat.

Sociobiologists and evolutionary psychologists would identify reproduction as the main source of aggression and display in males and females. Despite social variations in these areas, reproductive rivalry, assertive courtship behaviors, and conflicts seem universal among males as they compete for potential mates. Feminine behavior appears to confer a further advantage in public by not threatening strangers. Women displaying such qualities as compliance, warmth, receptivity, and responsiveness can disarm interpersonal tension. The Norwegian social scientist Tore Bjerke notes that “the woman who looks and acts the most feminine (stereotypically speaking) is least likely to provoke an aggressive response after intruding on others” (Van der Dennen, p. 118).

Social constructionists could argue, however, that these trends become exaggerated by class, race, status, and any given society’s standards of a pleasing physical appearance—what one could label an attractiveness quotient. This quotient differs for males and females according to their biological imperatives: for men, the need to inseminate as much as possible; for women, the need to choose the male who promises the greatest stability and capacity to provide materially for offspring.

Bionic Beauty and Distorted Views of the Self

In a culture saturated with idealized and retouched photos of models, comparisons of “ideal” and ordinary bodies seem inescapable, whether by others or by oneself. The American sociologist Leon Festinger’s Social Comparison Theory of self-evaluation based on external models “would predict that people might use images projected by the media as standards for comparison” (Grogan, p. 100). Constant bombardment with an unattainable ideal of “models’ bodies (slim and carefully arranged in the most flattering poses) would be expected to lead to unfavorable evaluation of the body of the perceiver” (Grogan, pp. 100–101). Some women do indeed report greater

dissatisfaction with their own appearance than before exposure, others “no change,” and some even report increased satisfaction. Grogan cites another study that correlates exposure and more negative body image to pre-test attitudes about the body. Clearly, studies of women exposed to media images have yielded mixed results.

In any case, such comparisons increase a young woman’s sense that her appearance is substandard and urgently in need of repair. Forgotten is the reality that hair and makeup artists spend hours preparing models for these photos. Even then, the images can be airbrushed and pasted together. One actress (Julia Roberts) found magazine photos of herself to be a composite of different shots. Another (Kate Winslet) was displeased to find that her thighs had been slimmed in a picture airbrushed without her permission.

In their real lives, not even models or media stars resemble their carefully staged professional photos. How, then, can any woman without such resources escape disappointment with her appearance? Media images are partly to blame for the wounding and deflation so many feel in our narcissistic culture. Psychologists “argue that a failure to match the ideal leads to self-criticism, guilt and lowered self-worth”; this effect is stronger for women than for men because of more frequent exposure to photographs and the “cultural pressures on women to conform to an idealized body shape are more powerful and more widespread than those on men,” says Grogan (p. 100).

In addition to this psychological need to repair perceived flaws, consumerism creates appetites for products that respond to the newly-awakened need to improve one’s appearance. If not born beautiful, one can own the paraphernalia of beauty. Thus marketing in tandem with industry and the media motivate women to try to remedy their disappointment in their looks. Sandra Lee Bartky refers to this in *Femininity and Domination* as the “fashion-beauty complex” (p. 42), parallel to the “military-industrial complex” in that both are “major articulation[s] of capitalist patriarchy . . . a vast system of corporations—some of which manufacture products, others services and still others information, images, and ideologies” (p. 39). The fashion-beauty complex, argues Bartky, has replaced the family as the regulator of femininity.

The American feminist Naomi Wolf addresses the conflict between social and biological requirements for attractiveness in *The Beauty Myth*. The Professional Beauty Qualification, or PBQ as she terms it, reflects the demands of a capitalist economy and the exploitation of sex and fantasy as incentives to consume and as criteria for hiring in the job market. The connection between publicity and success, status, sex appeal, and the admiration of others has long directed print and other forms of media.

Real-life achievements, based on talent, discipline, frustration, and hard work as much as on luck, seem disconnected from these images. Competency does not always help to secure or keep employment, according to widely publicized lawsuits of wrongful job termination for reasons other than weak performance. Some women have been fired because they were neither pretty enough nor slim enough to sell products in

department stores, to read the news as television anchors, to work as flight attendants, or even to sing in the opera—an art form traditionally dependent on talent rather than appearance. The internationally respected soprano Deborah Voigt was dropped from a scheduled production of Richard Strauss's *Ariadne auf Naxos* because her weight strained both the costume and her credibility in the role. “Tenorissimo” Luciano Pavarotti, in contrast, was not fired for his enormous body. Rather, he chose to retire because he no longer could move on stage.

Of particular concern is the early-twenty-first century phenomenon of “makeover” programs (*What Not to Wear*, *How Do I Look*, *Date Patrol*, *Style Court*, and *Extreme Makeover*). The last is the most serious challenge to women’s (and men’s) health and well-being, fostering the fantasy that with enough money and cosmetic surgery or other procedures, anyone can have Hollywood-style glamour and, in fact, should. The program features multiple surgical procedures over a period of many hours and with good results. No information emerges about how the potential candidate’s health history, suitability for extreme surgery, or physical condition are evaluated before selection is made. Minimal attention is spent on pain or complications of recovery. Television programs on stomach stapling (gastric bypass surgery) provide more information on the potential dangers of this last-chance solution to morbid obesity. Indeed, either way the patient is at serious risk. The problems with silicone breast implants are better publicized, but still women of all ages continue to desire large breasts that change the proportions of their bodies. Younger and younger adolescents ask for cosmetic surgery, a phenomenon that should not surprise a society with ever-growing numbers of young women suffering from eating disorders and body dysmorphic disorder.

“How healthy is the Surgical Age?” asks Wolf (p. 229), citing deaths caused by smoking, fasting, and other extreme methods of weight control and cosmetic surgery known as “body sculpting.” She correctly aligns such practices with an intense stress that, she suggests, can contribute to mental instability. “Narcissists feel that what happens to their bodies does not happen to them” (p. 230). In other words, paying attention to various body parts or facial features contributes to a fragmented and fragmenting view of the self, a distorted sense of the body as abnormal or diseased. “The Surgical Age’s definition of female ‘health’ is not healthy” (p. 231).

Wolf’s Surgical Age goes hand-in-hand with “body dysmorphic disorder” (formerly “dysmorphophobia”), a somatoform disorder described in the *Diagnostic and Statistical Manual (DSM-IV)* (number 300.7 in the *International Classification of Diseases*). Intense preoccupation with minor flaws, real or imagined, in facial or body features can lead to excessive, almost compulsive grooming rituals to try to undo or control one’s “deformity.” Symptoms range from both avoiding and seeking out one’s reflection in mirrors or windows to “significant distress or impairment in social, occupational, or other areas of functioning . . . [and] may be underrecognized in settings in which cosmetic procedures are performed” (*DSM-IV*, p. 467). Short of calling the Surgical Age pathological, this statement infers that genuine psychological disorders may be

masked in a society that promotes an exaggerated level of self-scrutiny.

A woman who chooses to submit to multiple plastic surgeries over a period of years in order to achieve a “Barbie-doll” look for her face and body may be determined to enjoy the attention, success, and glamorous social life she thinks beauty will bring. There may be a relationship between good looks and social success, in that attractiveness increases self-confidence, an appealing trait that draws people’s attention. Self-confidence can be learned, however, and does not result from physical appearance alone.

Beauty and Race

Variations of the elements of female attractiveness have entered the beauty discourse through the popular media over the last decades. Audiences are exposed to a more inclusive standard of good looks represented by models, actresses, or contestants in international beauty pageants from various ethnic origins. Young women of color have seen more fashion icons, celebrities, and video artists of their own ethnic backgrounds in mainstream media, particularly in rap and hip-hop culture and, in some North American cities, in soap operas and talk-shows on Spanish-language television. Some of these figures—Lil’ Kim, Foxy Brown, Queen Latifah—present images of beauty and sexuality different from the dominant culture’s version of attractiveness or “vanilla” sex appeal. Others, like Tyra Banks, Salma Hayek, and Halle Berry, blend anglicized and ethnic features. These contrasting aesthetics bespeak an ongoing conflict between the preference for the silky blond hair and light skin or skin darkened only with a tan and of traditional Western culture with the “exotic” appearance of women of color. A mixed message underlies these images: on the one hand, a superficial acceptance of a broader range of beauty and sexual desirability; on the other, a limit to the degree of identifiable ethnicity that impinges upon the Anglo norm. Thus, in order to be considered beautiful, the faces and bodies of multiracial women must display only minor departures from the standard white Western European look.

This fusion of facial features has long been the subject of psychological studies of female appearance. German researchers at the Universities of Regensburg and Rostock have tested various theories of female facial attractiveness, including the “attractiveness is averageness” hypothesis; the “facial symmetry” hypothesis; and the theory of “multidimensional beauty perception,” which suggests that faces combining child-like characteristics with more mature features are judged most attractive. Their results partially confirm the averageness hypothesis: computer-generated composite faces are considered most beautiful, but only if the features to be morphed are not unattractive to begin with.

The question of hair resonates in particular for women of color. Madame C. J. Walker (1867–1919), born into slavery, invented and marketed her hair-straightening method in the early twentieth century. Ironically, African-American women have seen curls, Afros, corn rows, and dreadlocks appropriated by white women while they themselves still turn to chemical treatments, hot irons, hair weaving, and extensions to recreate

the impossible and unforgiving image of the “good hair” of the dominant culture.

The very concept of “good hair” represents another battle in the beauty wars. Kasey West, in an article about hair and identity titled “Nappy Hair: A Marker of Identity and Difference” (for the Web site *Beauty Worlds*), writes:

A return to African-based hairstyling practices by many black women in the 1960s . . . marked an assertion of national identity and heritage in the face of oppressive Western ideals of beauty and continuing disenfranchisement. Although the popular Afro was achieved by blowing hair out to straighten the curls, it was representative as an expression of beauty ideals centered on an African identity. In other words, hairstyling became a political statement of connection to the black community. . . . [B]lack hairstyles retained a cultural and political significance.

Noting the “political complexities of African-American hair and beauty culture,” West quotes the sociologist Ingrid Banks, who interviewed more than fifty black girls and women between 1996 and 1998 for her book *Hair Matters* (2000) and who concluded that “hair shapes black women’s ideas about race, gender, class, sexuality, images of beauty and power.”

Other African-American women writers address the issue in fiction and nonfiction. Toni Morrison’s novel *The Bluest Eye* exposes these conflicts through the young heroine’s poignant resentment and despair as she realizes she never will attain her dream of waking up blond and blue-eyed. bell hooks’ article “Selling Hot Pussy” continues the examination of bodies and race. Black women still find themselves represented as savage, primitive sex machines and are objectified and dehumanized by this image. The “black female body gains attention only when it is synonymous with accessibility, availability, when it is sexually deviant” (in Conboy, Medina, and Stanbury, p. 117; see also Gilman). In this context, beauty and racism conflate to doubly oppress women, whatever their background.

Some American women of color, Latinas among them, trace their ethnic heritage to cultures whose ideal female body differs noticeably from the bony fashion icons of today’s dominant white culture. A Mexican-American woman prized by her relatives for her rounded womanly body might be judged overweight in fitness-conscious California, for example. African-American culture embraces as beautiful a range of body sizes and shapes that would fall in the “full-figured” category in fashion advertising, despite the fact that models of color featured in the edgy, glamorous photos of high fashion publications possess the characteristic tall and ultraslim body. Kathryn Zerbe notes, “In comparison to white girls, fewer African-American girls report trying to lose weight. In cultures where plumpness is valued, eating disorders are rare” (p. 160). Additionally, curvy hips and ample bust lines, the hallmarks of a female figure, can fuel racist views of hypersexuality in people of color. In *Face Value: The Politics of Beauty* (1984), by Robin Tolmach Lakoff and Raquel Scherr, Scherr recalls her adolescence filled with taunts for resembling her Mexican-Indian mother rather than

her white father. At first outraged, later she agreed with a friend’s remark that “discrimination based on beauty is more prevalent than discrimination based on race” (p. 7).

At the other extreme is the very thin African-American model Gerren Taylor, who was twelve years old in April 2003 when the *Los Angeles Times* profiled her nascent modeling career: Taylor had the prepubescent and scrawny silhouette that dominates the catwalk and fashion shoots and becomes the standard to which girls and women aspire. “The debate over the sexualization of girls at younger and younger ages waxes and wanes; Gerren’s mother understands that sexuality is a part of fashion and believes she can protect her child from exploitation,” writes Booth Moore (p. E9).

Immigrant women of color cannot escape their adopted culture’s view of body size. In order to be appealing and noticed, American women “are supposed to be thin—and if they are not, the culture assumes they are unhappy, dissatisfied, lazy, slovenly, and ugly” (Zerbe, p. 159). Zerbe cites a study of African immigrants to Great Britain. Those “who have resided in Britain for only four years will have adopted the British viewpoint with respect to size and shape. These immigrants tend to desire a smaller physique than their African peers,” who “in general enjoy their fuller figures” (p. 101). Zerbe offers examples suggesting that as immigrant women acculturate in a society that places a high value on thinness, they are likely to adopt “the more stringent eating attitudes of the prevailing culture” (p. 101).

Beyond Questions of Science

The body, writes the American feminist Susan Bordo, is a “culturally mediated form” (in Conboy, Medina, and Stanbury, p. 103), in that its appearance reflects the discourse of its society and the state of women’s power or lack thereof in that society. Beyond aesthetics, the ideal appearance and female body exist in relation to the bondage of dependency, racism, and social roles. The body, in other words, is territory conquered by masculine spectatorship, the site of a struggle over ownership of resources.

Women’s beauty rituals comprise part of this cultural mediation. Rituals are the repeated acts of grooming beyond basic hygiene that serve to embellish according to the tastes and standards she has internalized from her peer group, magazines, and other media. Rituals can be as innocent as preteen makeup parties, as painful as piercing or tattoos, and as life-threatening as eating disorders for weight control. Some girls choose rituals to feel good about what is asked of them; some to bind the anxiety they feel as they dodge threats to their still-formulating sense of self; and some to overcome perceived shortcomings of which they are constantly reminded by advertising.

Successful advertising seeks to address a consumer’s pleasure-seeking tendencies before the reality principal dampens her impulse to buy. Along with products, companies sell fantasies of pleasure, excitement, or well-being that will arise from the act of buying and using advertised items. Scenes of arousal need not include a partner. Pampering oneself with soothing lotions satisfies the need for attention without the risks involved in a relationship. Contemporary television and print commercials

feature women experiencing what looks like self-stimulation and sexual arousal from shampoo and soap use in the shower.

In addition to bath and skin treatments, creamy foods like yogurts are advertised as sensual indulgences enjoyed by oneself. But for women, eating is already overdetermined. Intentionally or not, advertising can contribute to “emotionally induced compensatory eating,” says Suzanne Z. Grunert (quoted in Costa, p. 68), and thus heighten the dilemma between the immediate comfort of eating and the potential for weight gain. Perhaps in compensation, shades of lipstick, eye shadow, and nail polish often are named after food. Instead of ingesting chocolate or cinnamon, one can wear them.

Ads for beauty and grooming aids fuel self-consciousness and vulnerability by making women aware of flaws they did not know they had. They stimulate an often-panicky desire to improve and, not surprisingly, create markets for products that promise to remedy imperfections from acne to wrinkles. Magazine articles, infomercials, and niche-marketed television programs bombard young women with images and messages they ignore at their own peril. Well-socialized girls change their hairstyles and adopt fashion trends in part to conform to the standards of their peer groups—actions that indicate how well they understand and respond to peer influences as seen in their shopping patterns. Product boycotts or grassroots truth-in-advertising campaigns fight to expose the “marketization” of cultural expression, but cannot fully counteract the impact of advertising and mass marketing and their by-product, peer pressure.

Women at times can resist the expectation of prettiness by refusing to dress for the pleasure of the beholder. In renouncing what Bartky calls “institutionalized heterosexuality,” lesbians, for example, can disengage from the “panoptical male connoisseur” who “resides within the consciousness of most women” (p. 72). Some remove themselves from the beauty game altogether and thus dislocate and interrupt the male gaze whether external or internalized. Comfort, serious athleticism, modesty, indifference to attention-seeking, and rejection of so-called female vanity lead others to free themselves from adornment. Young adolescents often respond to their own ambivalence about their developing bodies by dressing in shapeless t-shirts and baggy pants. This camouflage enables them to feel they can escape the judgmental stares of peers as well as surprised looks from family members unused to their daughters’ emerging secondary sex characteristics.

Lesbian dressing evolved through the last decades of the twentieth century from a hard-core butch style to the appearance known as “lipstick lesbianism” and a greater repertory of looks, writes Barbara Creed in a 1999 essay titled “Lesbian Bodies.” From the 1970s, when “the true lesbian” was expected to “reject all forms of clothing that might associate her image with that of the heterosexual woman and ultimately with patriarchal capitalism,” to the “butch-femme renaissance of the 1980s,” to the so-called heterosexual lesbians of 1990s queer culture, lesbians have renounced the “lesbian uniform” as well as “the patriarchal stereotypes of feminine dress and appearance” (pp. 122–123). In so doing they reveal the

sacrifice required of women who conform to feminine attractiveness.

The cult of beauty in women represents an attempt to counteract an externally imposed sense of inadequacy. Feelings of failure arise from “a context where body image is subjective and socially determined. . . . A person’s body image is not determined by the actual shape and size of that body, but by that person’s subjective evaluation of what it means to have that kind of body within their particular culture,” writes Grogan (p. 166). For women of any race, class, or gender identification, femininity becomes an investment of resources and discipline in order to gain fleeting attention “and some admiration but little real respect and rarely any social power” (Bartky, p. 73). Late-twentieth-century studies cited in Grogan (pp. 180–192) suggest that positive body image is linked to self-esteem and a sense of personal control over one’s environment, both of which are problematic for women in a capitalist patriarchy. As long as societies teach women to evaluate themselves principally in terms of their femininity and attractiveness, self-assurance will belong more often to those who successfully conform to the cultural ideal. If instead girls and young women learn to appreciate their bodies as healthy, well-functioning instruments that enable them to lead productive lives, they will be closer to changing the conditions that relegate them to objectification.

WOMEN'S HISTORY.

This entry includes two subentries:

Africa
Asia

AFRICA

Since 1970 the history of African women has developed into a vital and steadily expanding area of research and study, motivated, as with other areas of women's history, by the development of the international feminist movement. African women's history also paralleled the expansion of African history following World War II, as scholars inside and outside of Africa began to focus on historical transformations on the African continent.

Before the 1970s there was little available research on African women's history per se, though information on women in Africa was found in anthropological and ethnographic studies. This focus has continued in the preponderance of research on African women appearing in development studies. The first publications in the 1970s dealt with women and economic change and with women as political activists. By the mid-1980s there were a number of important extended studies, but only in the 1990s did a substantial number of monographs on specific topics begin to appear, although the bulk of new research is still found in journal and anthology articles.

Earlier historical eras were initially neglected, in part as a result of the difficulty in obtaining historical sources that dealt with women before the nineteenth century. Written materials on earlier eras, especially from an African woman's perspective, were scarce because many African communities were decentralized and nonliterate. Topics that have archival source

materials included elite women such as Queen Nzinga, a seventeenth-century ruler in what became Angola, and market women along the West African coast who interacted with European traders. Eva, a seventeenth-century African woman who settled in the early Dutch community on the Cape in South Africa and married a European colonist, is also found in archival documentation. Egypt was exceptionally strong in sources concerning women in earlier centuries.

Source availability influenced the large number of studies on slave women in the nineteenth century, which is an important issue but did not represent the experience of most women. Slaves within Africa were more likely to be women, a reflection of their productive and reproductive contributions to their communities. Scholars have retrieved information on other aspects of the lives of women in the nineteenth century, as exemplified in research that detailed women's work in Lesotho, elite women in Buganda, women's vulnerability in Central Africa, Swahili women's spirit possession cults, Asante queen mothers' political influence, religious Muslim women in West Africa, and numerous other specific areas of women's activity.

Reexamining familiar issues from a woman's perspective has altered African history more generally. For example, many of the initial studies of women's work during the colonial period showed how they had lost power and economic autonomy with the arrival of cash crops and their exclusion from the global marketplace, in contrast to men, who were more likely to benefit from these economic changes. The emphasis on the formal sector of the economy in African labor history eclipsed women's actual economic activity, which centered on agricultural work. Studying women's economic contributions meant paying attention to rural agricultural work as well as the urban efforts of market vendors, both sectors previously neglected in African labor history. Female agricultural innovations were described as essential to community survival. Women's changing position in arenas formerly seen as only male has been shown in research on mining compounds in Zambia, railway communities in Nigeria, and other urban studies.

Research on women's involvement in political activism changed previously accepted ideas of women's passivity in the face of such changes. In some areas, such as southern Nigeria in the 1920s, women drew on precolonial practices to express their displeasure with the colonial powers. New information about the leadership role of illiterate Muslim women in Dar es Salaam in the nationalist movement of the 1950s fundamentally changed the view that the Tanzanian anticolonial movement was led solely by men who were products of Christian mission education. Research on more recent years has found a proliferation of African women's organizations concerned with bringing peace to conflict-ridden areas, ending female genital cutting or mutilation (erroneously called female circumcision), and training women to get involved in national politics. Women's studies programs have been established at most African universities.

Scholars of women and religion have investigated female spiritual power in local religions and the role of women in developing local churches that were often offshoots of larger

denominations. Research in the 1990s also included a focus on women and missions, with researchers demonstrating that the introduction of European ideas about marriage and family simultaneously brought new oppressions and new opportunities for women. Research on women and Islam has also grown, with new information on women and Koranic education in West Africa and on Muslim women's involvement in nationalist struggles in North Africa.

The earliest publications tended to be descriptive as scholars worked to prove that African women had made an impact on their societies. More recent studies have provided much more nuanced descriptions of the complexities of women's lives, of the changes over time, and of local and outsider ideologies about women in Africa. Helen Bradford's reanalysis of the role of the adolescent girl Nongqawuse in the Xhosa cattle killing of the 1850s has demonstrated that taking women's testimony seriously and focusing on women's experience and expression of history can fundamentally change the explanation of an event. She convincingly suggests that issues of changing sexuality and possibly abuse or incest were of central importance in understanding people's motivations, and conventional reliance on broader economic and political reasons for the upheaval is not completely satisfactory.

Among the issues continuing to appear in writings on African women's history are those of representation (who is writing this history and for what audience), sources and methodology, and periodization, as well as the usual areas of productive work, family life, and public activities such as politics and religion. Tiyambe Zeleza has described the enduring marginalization of African women's history, as the information that has been recovered is omitted from textbooks or included in very limited ways. The absence of African women historians is frequently commented on, as there are regrettably few who publish regularly. The history of women in precolonial Africa continues to be a weak point, while the history of the colonial era (from around 1880 to the 1960s for most of the continent) has shifted from examining the impact of colonialism on women (assessed as mostly negative) to investigating African communities and history from their own perspectives. This approach includes an emphasis on African women's agency and efforts to present African women's own voices. A notable effort in this regard is the Women Writing Africa Project sponsored by Feminist Press, which presents extensive materials written and recorded by African women. A single volume on English-speaking southern Africa has been published and the editors, Tuzyline Jita Allan and Abena Busia, plan several more regional collections. New research reexamines territory already covered and opens new topics while incorporating the voices of African women as both subjects and scholars, indicating the direction African women's history will take in the near future.

ASIA

The prominent roles occupied by women in the legends and myths of that complex and diverse part of the world called Asia suggest that "histories" of women in Asia have existed for a very long time. That these legends have been shaped, written, and sometimes performed by men operating in androcentric cultural contexts does not negate the impression of power and consequence their narratives convey. From Japan's sun goddess, the original ancestress of the imperial line, to Korean shamans, to the powerful and transgressive women of South and Southeast Asian myth, or China's Hua Mulan, the stories of these legendary women suggest that women in early Asian societies did "make history." Perhaps only in China does the written record present, dynasty after dynasty, legendary women whose experience is embedded in the historicity of China's changing social, political, and economic institutions.

In various parts of Asia, these myths generated questions about matriarchal societies that were reinforced by the nineteenth-century work of Friedrich Engels (1820–1895) and Garrett A. Morgan (1877–1963). This theoretical framework may have encouraged one of Japan's first historians of women, Takamura Itsue (1894–1964), to do research on family registers; that research, parts of which have been reinforced by twentieth-century scholarship, strongly suggests that families in eighth-century Japan were predominantly matrilineal. For other women in Asia, myths and legends provided models for resistance and revolution in the twentieth century (China and Vietnam) and left some, like Hiratsuka Raicho (1886–1971), wondering why and how women had lost the power and authority they once had in Japanese history.

The Confucian Pattern

Few intellectual traditions have had a greater impact on women in Asia than Confucianism, in part because Confucian

traditions were central not only to China but also to other parts of Asia (Japan, Korea, and Southeast Asia) influenced by Chinese culture. The study of women in these cultures has dismantled basic assumptions about Confucianism: its universality, monolithic nature, and immutability. The study of women has shown many different Confucianisms and has made it clear that the continuity of these traditions is the result of accommodation to social change, not stasis.

Scholars of Chinese women's history have, in recent years, moved far beyond an earlier scholarship that focused on Confucianism's role in conceptualizing and rationalizing a patriarchal, patrilineal family in which women were marginalized, victimized, and seemingly left with little opportunity to develop or exercise a sense of their own agency. Overcoming and supplanting this view has come only through the continuing research of historians who, reading against the grain of the Confucian record, have provided a much more complex picture of women's lives and of Chinese culture. Margery Wolf's work on women in Taiwan represents a rare early glimpse of women developing strategies to increase their power in the family; Susan Mann, Patricia Ebrey, and Dorothy Ko have since demonstrated, in a number of different settings, how important women were as contributors to "Chinese civilization" and how effectively they circumvented the institutional barriers ranged against them.

Elsewhere in Asia, Confucian patterns had less continuity as well as less influence. In the Japanese case, Confucian ideas about the family and statecraft were heavily moderated by existing cultural patterns, even in the two periods when Confucianism is thought to have had greatest influence—the eighth and ninth centuries when the Japanese state was being organized, and the seventeenth and eighteenth centuries of the Tokugawa period. Korea, although thoroughly conversant with Confucianism, was really not dominated by these ideas until well after the fourteenth century, and Southeast Asia, particularly Vietnam, encountered the greatest levels of Confucian influence between the fourteenth and sixteenth centuries. Recent scholarship makes it clear how difficult it is to walk the tightrope between establishing a history of women in Asia that speaks to their strengths *and* acknowledges the reality of the constraints they faced. Although historians continue to investigate stereotypical symbols of women's oppression in Asia (sati, footbinding), they do so with a heightened sense of the possibility that Western scholarship "orientalizes" women when it fails to present them as active participants in their own culture, able to find nuanced and effective ways to challenge those constraints.

The Modern Period

There has always been a women's version of the Western civilizing narrative in Asia; in many times and places, Western colonizers sought to use the "oppression of women" in Asian cultures as a rationale for their self-proclaimed civilizing mission. The treatment of women, they often said, was the standard by which civilizations could be judged, and on that basis it was clear that Asia "needed civilizing." The history of women in Asia has convincingly demonstrated that the "Western impact" on Asia not only complicated women's ability to improve

their lives but also generated an anticolonial, nationalist engagement that did not aid, but typically subverted, feminist agendas.

Growing recognition of the intellectual significance of feminism since the late nineteenth century has been coupled with the assumption that feminism's natural competitors—nationalism and socialism—have eclipsed feminism's impact in the modern period. Women have been critical to the development of nationalism and socialism in China, India, Korea, and Southeast Asia: as symbols of "tradition," workers, educators, and soldiers. Women were asked to postpone their agendas in China's great twentieth-century revolution, where leaders pursued a "backward to revolution" strategy, and in India, where connections with nationalism and anti-imperialist movements were complicated by geography, ethnicity, caste, class, and religious diversity. While South Asia may present the greatest challenges for historians of women, it is also true that, in the 1990s, scholars there such as Kumkum Sangari and Sudesh Vaid pointedly demonstrated how much a feminist standpoint adds to our understanding of nationalism, colonialism, and anticolonial movements. Independence may have brought an improvement in the legal status of women, but the partition that created the new states of India and Pakistan ushered in a long period of conflict in which large numbers of women were abducted, raped, and/or killed as part of a continuing political, ethnic, and religious struggle. Until 1990, women were an invisible part of historical analysis of this conflict; since then, historians of women, such as Urvashi Butalia in South Asia, have made clear how important women and gender are to any understanding of these conflicts.

WOMEN'S STUDIES. In its short history (from the late 1960s in the United States) women's studies has moved around the world as an idea, a concept, a practice, and finally a field or *Fach* (German for specialty or field). As late as 1982 in Germany *Frauenstudium* was not considered a *Fach* and therefore could not be studied in the university but only in special or summer courses. By the early twentieth century women's studies was recognized in higher education from India to Indonesia, from the United States to Uganda, China to Canada, Austria to Australia, England to Egypt, South Africa to South Korea.

Definitions

Women's studies is the study of women and gender in every field. Its basic premise is that traditional education is based on a study of men—usually upper-class, Caucasian, educated men—while other groups of men and all different groups of women are erroneously subsumed under the category "mankind." Early on courses drew especially on history, literature, and sociology, but they quickly expanded to the other humanities (philosophy, religious studies, comparative literature, art, music) and the social sciences (anthropology, political science, economics, psychology, geography). Science and technology have been slower to embrace women's studies, but biology, math, technology, computer science, chemistry, physics, and medicine have all begun to examine their assumptions for sexist bias, and courses in "gender and physics," "women geologists," or "sexism and science" are de rigueur in most programs.

Over the years the term itself and the naming of the enterprise have been contested and changing. The first name was "female studies," but "women's studies" quickly found more adherents. The name "women's studies" has been criticized for its ambiguous apostrophe (the study of or by women?), for its (supposed) assumption that all women can be studied together, and for its "hegemonic narrowness" that does not take into

account transgendered or lesbian identities. Some programs have changed their names to "gender studies," "women and gender studies," or "feminist studies." And of course in the exporting of "women's studies" around the world, various languages are unable to translate "gender" or "women's studies" in satisfactory ways. It is safe to say, however, that all permutations share some commonalities—that women matter and that their own assessment of their experiences is the starting point for description and analysis; that the history of women's subordination is differently experienced but commonly shared; that the elimination of that subordination is a common goal. The concept of gender as a social construction that reflects and determines differences in power and opportunity is employed as the primary analytic category.

Origins

Women's studies, as a concept and a site of learning, really began with the second wave of the women's movement in the late 1960s. But generations of work and information gathering preceded that time, particularly in the nineteenth-century penchant for writing stories of "great women" and gathering them in collections of "women worthies." A later, more democratic strain of the study of women was begun by the historian Mary Beard, who in her 1946 volume *Woman as Force in History* took a different tack. If one looks at "long history," one finds not "great women" only but everyday women, not women as victims but women who influenced their worlds, women who had agency, even within the confines of a limited sphere, within the private realm. Simone de Beauvoir wrote of women as "other" in *The Second Sex* (1953), while Betty Friedan analyzed "the problem that has no name," the malaise and victimization of middle-class women, in *The Feminine Mystique* (1963), and Helen Hacker compared women's position to that of minorities (1951). Yet all these important precursors did not initiate women's studies.

It took a combination of the civil rights movement, the New Left, the peace movement (especially the protests against the war in Vietnam), and the various open university movements in the 1960s to help women coalesce and organize themselves into the women's liberation movement. Many more women were attending colleges and universities, many women were participating in the radical youth movements of the 1960s, and many women students and faculty were leaders in the civil rights and antiwar movements. It was thus almost inevitable that women would begin to question their role in those movements if they always had to make the coffee, do the typing, and be available as sex objects. Stokely Carmichael of the Student Non-Violent Coordinating Committee (SNCC) famously said, "The only position of women in the movement is prone," infuriating many young women. The second wave of the women's movement began with hundreds of small consciousness-raising (CR) groups in many cities and towns; as women collectively started to understand and then study their situation, they initiated courses and classes on women's history, literature, and culture, first on a community, ad hoc basis but quickly moving to the college classroom. There were hundreds of women's studies courses offered at colleges and universities in the United States in the late 1960s, and by 1970 formal women's studies programs were launched, first at San Diego State University in

California and then at Cornell University in New York. Every year after that saw an increase, from 276 programs in 1976 to 680 in 1999. Most of these programs offered minors, certificates, concentrations, or majors. A *Campus Trends* report for the American Council on Education in 1984 found that women's studies courses were offered at a majority of four-year colleges and universities and at 25 percent of community colleges; there are more now. Women's studies at the beginning of the twenty-first century enrolled the largest number of students of any interdisciplinary field. The Department of Education estimates that 12 percent of all undergraduate students in the United States have received credit for a women's studies course. But the growth in formal programs does not tell the whole story; many more students enroll in separate courses than choose to major or minor in the field.

Growth and Institutionalization

Because American educational institutions, especially newer, less-traditional ones, are very flexible in curricular change, women's studies grew and expanded in the United States more quickly than anywhere else. But very soon there were women's studies programs in Japan, Australia, New Zealand, Finland, Sweden, India, South Korea, Taiwan, and the Philippines. By the 1980s there were programs in all countries in Western Europe, plus Thailand, South Africa, China, the Caribbean, and Uganda. Finally, after the change from communism in Eastern Europe, programs were instituted in Slovakia, the Czech Republic, Russia, Ukraine, and others, in addition to Malaysia, Vietnam, and other African nations. Two series of international conferences gave impetus to the growth of women's studies, both within universities and in community-based organizations worldwide. The International Interdisciplinary Congress on Women began in Haifa, Israel, in 1981 and has met every three years since—in the Netherlands (1984), in Ireland (1987), in New York (1990), in Costa Rica (1993), in Australia (1996), in Norway (1999), in Uganda (2002), and in South Korea (2005). Two to three thousand delegates, mostly women, both academics and community organizers, attend to present their work. Each conference draws especially on that continent's practitioners. Thus the Costa Rica conference brought together many indigenous women from Central America as well as Latin American delegates. Languages that year were Spanish, English, and a variety of Indian languages. That this congress continues to meet, without governmental or formal organizational support, is testimony to the personal importance to women all over the world of global scholarship on women.

The United Nations has sponsored four international conferences as a part of its "Decade for Women," in Mexico City (1975), Copenhagen (1980), Nairobi (1985), and Beijing (1995). The nongovernmental organizations (NGO) forums held in conjunction with each conference brought together thousands of activists and women's studies groups from all over the world, thus reminding those from the developed world of the connections between education and broader social justice issues.

Research and Publication

Scholarly journals in women's studies were begun in the United States early on (1972 for *Feminist Studies*; 1975 for

Signs: A Journal of Women in Culture and Society; but not until 1988 for the *National Women's Studies Association Journal*), and soon there were journals published around the world. In 1999 an informal International Network of Women's Studies Journals (now the Feminist Journals Network) was formed, meeting first in Tromsø, Norway, then in Halifax, Canada, in 2001 and in Kampala, Uganda, in 2002. Thirty editors from twenty-seven journals in twenty-one countries were represented in the membership in the early twenty-first century. Joint publishing projects, including a book series by Zed Press, reprinting of articles from journals in the "economic south" (developing nations) by journals in the "economic north" (industrialized nations, mostly in the north but including Australia), a Web site, and a listserv to make members aware of current issues are all part of their work.

Ellen Messer-Davidow surveyed the number of books and scholarly monographs available in English between 1980 and 1998 and estimated that 10,200 feminist books were published during that period. As she says, the print knowledge is so voluminous that scholars cannot keep track, much less read it all. And the topics are superabundant: "everything and anything is gendered, . . . gendering is narrated, quantified, or modeled, . . . and 'gender' as an analytical category is interrogated" (Messer-Davidow, p. 167).

Theories and Assumptions

Even though some practitioners of women's studies disavow any attempt to theorize universally about women or women's studies, most others will subscribe to a discussion of the following kinds of theories. Women's studies course material depends largely on various feminist theories, although these assumptions may not always be made explicit. Most feminist theories can be divided into two basic kinds, based on the answer to the question: How important is the physiological or biological difference between males and females? Put another way: What should one make of the sex-gender difference? Should this difference be noted and positively valued for its unique perspective? Or should it be downplayed in a system that recognizes the common humanity of men and women and attempts to unite women with institutions from which they have historically been excluded? These two basic strains of feminist theory have been variously called equality feminism and difference feminism, minimizer feminism and maximizer feminism, or individualist feminism and relational feminism. In each case, the first term includes those who seek to deemphasize difference and press for the integration of women into masculine institutions, usually emphasizing the individual; the second term includes those who seek to stress and value difference, to transform or abandon masculine systems, often emphasizing the relational qualities of women, especially in regard to children and extended families.

The term *sex-gender* is used here to refer to the biological and social difference between males and females. In the early days, the two words were used separately and distinctly. *Sex* meant the physiological difference between male and female, while *gender* meant the social overlay of education and socialization, constructed differently in different eras and societies. The two terms have become conflated in everyday speech, and

GERDA LERNER

Gerda Lerner could be called “the mother of us all,” that phrase used by Gertrude Stein in her opera about Susan B. Anthony. An American historian by training, Gerda Lerner’s biography exhibits the uniqueness of her life and work. Born and educated through secondary school in Austria, she came to the United States as a part of the Jewish exodus after the 1938 *Anschluss* that brought Nazi power to Austria, first as a part of a nearly phony marriage that enabled her to gain a visa. As a young wife and mother in Los Angeles and then in New York through the war years and the early days of the Cold War, Lerner organized for such groups as the Congress of American Women. Her (second) husband, Carl Lerner, was a screenwriter, editor, and filmmaker. Both were involved in various leftist activities for years. After the war she began writing fiction and taking courses at the New School for Social Research in New York in 1948. Gerda Lerner quickly earned first her B.A. at the New School

and then her M.A. and Ph.D. at Columbia University, using her biography of the Grimké sisters of South Carolina as her Ph.D. dissertation. As a “returning student” in the years before that was a recognized category, Lerner had to persuade the authorities at Columbia to let her study women’s history, not an acceptable field in the early 1960s. Beginning the women’s studies program at Sarah Lawrence College (and one of the first graduate programs in women’s history), Lerner proceeded to teach, write, and lecture around the country, penning several classic volumes in women’s studies: *Black Women in White America* (1972), *The Majority Finds Its Past* (1979), and her two-volume magnum opus, *The Creation of Patriarchy* (1986) and *The Creation of Feminist Consciousness* (1993). In 1982, after the death of her husband, she moved to the University of Wisconsin to found the Ph.D. program in women’s history. Her autobiography of her early years, *Fireweed: A Political Autobiography*, was published in 2002.

many use *gender* where *sex* would have been used earlier. For many theorists, both terms are constructed—that is, the particular culture gives its own meaning to sex and gender. Additionally, we now have much more research and experience with transgendered individuals, such that the binary of male-female is problematic at best. Any particular “sex-gender system” is of course an artifact of a particular historical time and place. Still, the two major types continue to be a useful way of understanding the various forms of the theories that underlie women’s studies.

Each one of the two major types of feminist theories includes several subtypes, from conservative to radical, from positions that imply few changes in the status quo to ones in which the whole society is altered by the shift in women’s status and conceptualization. It is useful to envision the positions—minimizers and maximizers of difference—on two lines that move from the more conservative to the more radical, from right to left. The most conservative feminist position on both continua is that view of women that offers a rationale for the present structure of society. The most radical position offers a call for a future society totally transformed either by the extreme of making males and females no longer different physiologically (for example, by the abolition of female reproductive capacities) or, for the maximizers, the extreme of totally separating the two sexes—physically, geographically, and socially. Beyond the conservative feminist pole, one finds reactionary positions: for the maximizers,

various sociobiologist positions; for the minimizers, the position that fails to recognize that human rights may be an issue. This latter view is based on an unstated assumption that might be expressed thus: “We are all alike; we all stand in the position of white privileged males; we all have equal rights.”

The minimizers. Along the “minimizers” continuum, one moves first from the “human rights” position to “women’s rights,” the stance of various reformist groups and theorists that advocate granting equal rights to women in all areas by working within existing political systems. This nineteenth-century egalitarian position of the first women’s rights activists, such as Elizabeth Cady Stanton and Susan B. Anthony, is also known as liberal feminism. It is the point of view of John Stuart Mill in his important work *The Subjection of Women* (1869) and that of Mary Wollstonecraft in *A Vindication of the Rights of Woman* (1792). The stance is found most conspicuously in the early twenty-first century in views of the U.S. National Organization for Women (NOW).

Next along the continuum are various types of socialist feminists: those who advocate the primacy of socialist revolution, those who advocate wages for housework and other solutions to equate being a housewife (or a househusband) with working outside the home, and others who attempt to make new syntheses of feminist questions and socialist or Marxist answers that begin with an economic analysis. Historically the socialist position on women is stated most dogmatically by Friedrich

Women have been left out of history not because of the evil conspiracies of men in general or male historians in particular, but because we have considered history only in male-centered terms. We have missed women and their activities, because we have asked questions of history which are inappropriate to women. To rectify this and to light up areas of historical darkness we must, for a time, focus on a *woman-centered* inquiry, considering the possibility of the existence of a female culture *within* the general culture shared by men and women. History must include an account of the female experience over time and should include the development of feminist consciousness as an essential aspect of women's past. This is the primary task of women's history. The central question it raises is: What would history be like if it were seen through the eyes of women and ordered by values they define?

What is needed is a new universal history, a holistic history which will be a synthesis of traditional history and women's history. It will be based on close comparative study of given periods in which the historical experiences of men are compared with those of women, their interactions being as much the subject of study as their differences and tensions. Only after a series of such detailed studies has been done and their concepts have entered into the general culture can we hope to find the parameters by which to define the new universal history. But this much can be said already: Only a history based on the recognition that women have always been essential to the making of history and that *men and women* are the measure of significance, will be truly a universal history.

SOURCE: Gerda Lerner, *The Majority Finds Its Past*, pp. 178, 180.

Engels in *The Origin of the Family, Private Property, and the State* (1884), but many other theorists have used economics and class as a starting point. This approach is illustrated by Sheila Rowbotham's influential *Women, Resistance, and Revolution* (1972); Juliet Mitchell's four interlocking female structures (production, the reproduction of children, sexuality, and the socialization of children) in *Woman's Estate* (1971); and Zillah Eisenstein's grid pattern for understanding sex and class in concert in *Capitalist Patriarchy and the Case for Socialist Feminism* (1979). What has come to be called "state feminism" in Europe, especially in the Nordic countries, fits into this position. A women's or equality minister is a part of the government, and socialist solutions to women's traditional inequality are made a part of the law.

The next position on the minimizer continuum is one that advocates the sharing of traditional gender characteristics. In order to remedy the psychosocial tyranny that oppresses both men and women, exclusive female parenting that produced "momism" (as well as the fear and hatred of women) must be ended, these feminists argue. This gender difference is a cultural product, not an inherent biological distinction. The psychologists Nancy Chodorow, in *The Reproduction of Mothering* (1978), and Dorothy Dinnerstein, in *The Mermaid and the Minotaur* (1976), both weigh in with this view, although in different ways. Charlotte Perkins Gilman's *Women and Economics* (1898) is an early work with this perspective. Traditional masculine (and valued) characteristics had been mistakenly monopolized by one sex, she believed, while the "feminine" virtues also needed to be shared.

Those who want to abolish gender distinctions completely, creating a gender-free (but not sexless) society, are next on the continuum. Males and females are more similar to each other

than either is to any other species, these theorists claim. The anthropologist Gayle Rubin proposed this view in her influential article "The Traffic in Women: Notes on the Political Economy of Sex" (1975). Simone de Beauvoir's renowned *Le deuxième sexe* (1949; *The Second Sex*, 1953) can be read as arguing this point as well. Her goal is for women to become the independent, "transcendent" human beings that men have always had the choice of becoming. Ursula Le Guin's fictional *The Left Hand of Darkness* (1977) posits an androgynous society in which people belong to a particular sex for only a few days a month; for most of the time they function androgynously in both physical and psychological ways.

The extreme pole of the minimizer position is represented by those intensely controversial thinkers who want to abolish not only gender and sex roles but also female reproduction (including conception, pregnancy, and birth) or at least their exclusive ownership by women. Gilman wrote one of the first explorations of such a society. Her fictional *Herland* (1915) envisioned a female-only culture where women conceive by parthenogenesis (without male sperm). In the more recent past, both theorists, such as Shulamith Firestone in *The Dialectic of Sex* (1970), and feminist science-fiction writers, such as Marge Piercy in *Woman on the Edge of Time* (1976), have advocated the abolition of exclusive female reproduction. Many believe that reproductive technology, with its artificial fertilization and implantation of a fertilized egg, is close to making this a reality. The film *Junior* (1994), in which Arnold Schwarzenegger's character becomes pregnant, explores this fantasy in a humorous manner.

The maximizers. All feminists on the maximizer continuum are interested in seeking out, recognizing, and valuing sex-gender difference, especially as it relates to women. Women's specific

**PREAMBLE TO THE CONSTITUTION OF THE NATIONAL WOMEN'S STUDIES ASSOCIATION,
ADOPTED 1977, REVISED AND RATIFIED 1982.**

The National Women's Studies Association was formed in 1977 to further the social, political, and professional development of Women's Studies throughout the country and the world, at every educational level and in every educational setting. To this end, this organization is committed to being a forum conducive to dialogue and collective action among women dedicated to feminist education and change.

Women's Studies owes its existence to the movement for the liberation of women; the feminist movement exists because women are oppressed. Women's Studies, diverse as its components are, has at its best shared a vision of a world free from sexism and racism. Freedom from sexism by necessity must include a commitment to freedom from national chauvinism, class and ethnic bias, anti-Semitism, as directed against both Arabs and Jews; ageism; heterosexual bias—from all the ideologies and institutions that have consciously or unconsciously oppressed

and exploited some for the advantage of others. The development of Women's Studies in the past decade, the remarkable proliferation of programs that necessitated this Association, is a history of creative struggle to evolve knowledge, theory, pedagogy, and organizational models appropriate to that vision.

Women's Studies is the educational strategy of a breakthrough in consciousness and knowledge. The uniqueness of Women's Studies has been and remains its refusal to accept sterile divisions between academy and community, between the growth of the mind and the health of the body, between intellect and passion, between the individual and society.

Women's Studies, then, is equipping women not only to enter society as whole, as productive human beings, but to transform the world to one that will be free of all oppression. This constitution reaffirms that commitment.

talents and unique ways of contributing plead for their having a larger role in society. A bumper sticker reading "A Woman's Place is in the House—and in the Senate" uses this maximizer or difference argument, as does one that says "Clean Up Politics—Elect Women."

One notes first the historical "separate spheres" position—that women and men inhabit different physical places in society (private and public) and have different roles, virtues, aptitudes, sensibilities, and "ways of knowing." The nineteenth century saw the first clear use of the separate-spheres philosophy to help ameliorate women's position, in such thinkers as Catharine Beecher and Frances Willard. Later Jane Addams, in *Newer Ideals of Peace* (1907), enunciated the "municipal housekeeping" argument for giving women the vote: women should manage the household, but if they were to do this well, they must be concerned with clean water, pure milk, garbage disposal, and safe streets and parks for their children. They must therefore participate in municipal government by voting and standing for office. People promoting separate spheres in the twenty-first century include conservative women on the New Right and fundamentalist Christians.

The next group on the continuum wants to glorify the "feminine," wherever it may be found, often in writings of male poets. Sometimes identified as postmodern feminists, many of these thinkers are French or influenced by Jacques

Derrida, Jacques Lacan, and other French deconstructionists. Opposed to binary oppositions such as male-female, these feminists wish to assert multiple modes of being and gender. Hélène Cixous, Luce Irigaray, and Julia Kristeva are important writers here, as are Jane Gallop, Joan Scott, and Teresa de Lauretis in the United States and Toril Moi and Gayatri Spivak internationally. Additionally these thinkers would be opposed to the very idea of the two continua, since they often assert that neither "woman" nor "man" can be defined.

Cultural feminists and maternalists occupy a middle position on the maximizer continuum. Cultural feminists celebrate women's spirituality, art, music, and writing, especially in women's bookstores, cafés, theater groups, galleries, holiday centers, and support groups. Both the feminist art movement and the women's music movement, with its annual festivals, have been important in articulating these viewpoints. The maternalists cherish motherhood as the source of woman's difference and superiority. Both practical groups—lesbian parenting, natural and home-birth groups, and the women's health movement—and theorists such as Adrienne Rich in *Of Woman Born: Motherhood as Experience and Institution* (1976) and Sara Ruddick in *Maternal Thinking* (1989) are connected to the maternalist position.

The "woman-as-force" position rejects "woman-as-victim" stances and argues that because of women's close connection

to nature—historically, biologically, mythologically, and psychologically—women can save humanity from the destructive path that men have begun. The historian Mary Beard enunciated the woman-as-force position in 1946, while Carol Gilligan's argument that young women take different ethical stances than young men, articulated in her *In a Different Voice* (1982), has influenced psychological and learning theories on gender differences. Another important work in this vein is Mary Field Belenky and her colleagues' *Women's Ways of Knowing* (1986).

Ecofeminism is an important subcategory of the woman-as-force position; the views of various theorists, such as Ynestra King, Susan Griffin, and Karen Warren, have been influential. The Indian nuclear physicist Vandana Shiva's work, especially *Staying Alive: Women, Ecology, and Development* (1988), explores ecofeminism on the global stage and makes connections with postcolonial and development concerns.

The female supremacists occupy the most radical position on the maximizer continuum. Either lesbian or celibate, these most extreme of the separatists advocate a complete partition of the sexes, believing that only with their own institutions can women find freedom. How far separatism is taken depends on the individual, but some advocates call for separate geographical areas for women, attempting self-sufficiency in various communal living situations. Most influential in this argument are Mary Daly, in *Gyn/Ecology: The Metaethics of Radical Feminism* (1978) and *Websters' First New Intergalactic Wickedary of the English Language* (1987); Sonia Johnson, in *Wildfire: Igniting the Shell Revolution* (1989); Marilyn Frye, in *Some Reflections on Separatism and Power* (1981); and various science-fiction proposals, such as Joanna Russ's *The Female Man* (1975). It should be noted, however, that lesbians are found in all categories of feminism.

Problems with the model; or, mediating the dichotomy.

The dichotomy of equality-difference or minimizers-maximizers is difficult to maintain and often false, asserts the German critic Gisela Bock, since dichotomies are often hierarchies in disguise. Arguing strongly on the side of difference can lead to the dangerous "difference dilemma" because it can confirm women's inferiority. Yet strong arguments from the equality stance produce the "equality dilemma," in which gender differences are completely erased and everyone is presumed to be the same.

The most fruitful way to deal with the two kinds of arguments is to mediate between them, as some contemporary thinkers have done. There is a suggestive link made by African-American and multicultural feminists who argue the need for forms of socialism (a minimizer strategy) while identifying and celebrating the unique assets supplied to the struggle by strong women of color (a maximizer strategy). "The Combahee River Collective Statement," in *Home Girls* (1983), edited by Barbara Smith, and *This Bridge Called My Back: Writings by Radical Women of Color* (1983), edited by Cherríe Moraga and Gloria Anzaldúa, are essential works in this vein. Likewise the historian Gerda Lerner's conceptualization of "woman as majority" in *The Majority Finds Its Past* (1979) connects maximizer arguments about women's different strengths and special institutions with the minimizer insistence on the necessity of abolishing the sex-gender system and sharing gender.

Other creative thinkers have written of "difference in unity" or "equality in difference." Virginia Woolf, in *Three Guineas* (1938), proposes that women need to belong to a society of outsiders who have the same goals as men but must work in their own way on the borders of the patriarchal system, both inside and outside. In a spoof on the religious vows of monks and nuns, she says that women who belong to this society must take vows of poverty, chastity (of the brain), derision of honors, and freedom from the "unreal loyalties" of nation, class, sex, family, or religion. Members of the Society of Outsiders would agree to earn their own livings "expertly," not engage in any profession that promotes war, and criticize the institutions of education and religion. Only in this way can women help prevent war. Contemporary thinkers, especially Latinas and other bicultural women, such as Gloria Anzaldúa in *Borderlands: The New Mestiza = La Frontera* (1987), or African-American women, such as bell hooks in *Feminist Theory: From Margin to Center* (1984), also explore this "border" position. So-called Third or Developing World feminists (also known as postcolonial feminists) clearly mediate the two strands of theory, with their call for support for nationalist struggles ("all issues are women's issues" and "if it's appropriate technology, it's appropriate for women") and their recognition of women's continuing "double day" work (housework, child care, and productive or economic activities) at every level of society around the world.

Controversies

As "the most powerful force affecting women in higher education today," according to Mariam Chamberlain of the Ford Foundation, women's studies stands at the cusp of several controversies. Many of the criticisms of the early days (the standard retort from men in power was "When are we going to have men's studies?") have disappeared into internal controversies among practitioners: Should women's studies attempt to integrate into the regular curriculum or remain an autonomous outsider? Should women's studies opt for discourse theory, forsaking political action on which women's studies was built? Can you teach what you have not experienced? Can a white woman teach multiculturalism? Should people give priority to transgendered and other sexual concerns over against the concerns of postcolonial and developing nations?

The dangers of identity politics and the threatening allegation of essentialism have fractured the unity of women's studies programs. But disciplinary identities can be as dangerous, such that the feminist literary critic or the feminist sociologist hearkens back to her disciplinary language and methodology, even as she is opposed to those disciplines' contents. What often happens now in women's studies programs is that the senior faculty continue their disciplinary identity, leaving the junior faculty to be the "identity reps" of Chicana, Asian, or African-American ethnicity and prey to the charge of essentialism.

Another difficulty is the ubiquitous presentism that is now everywhere in women's studies. Although women's history was one of the earliest and strongest supporters of women's studies, women's and gender history have moved largely into their own field, with dedicated journals and conferences. Few sessions on

history are to be found now at National Women's Studies Association conferences or at the International Interdisciplinary Congress on Women. Both the history of the discipline and women's history itself therefore stand to be marginalized or ghettoized from women's studies. Worse, the disciplines have so embraced women's studies that "translation" is now necessary in moving a course from women's studies to, say, literature or sociology.

There is often a conflict between those faculty who "privilege gender or gender and sexuality, as analytical frameworks, and those who also incorporate race, colonialism, and class," say Laura Donaldson, Anne Donadey, and Jael Silliman, in their article in Robyn Wiegman's edited collection, *Women's Studies on its Own* (Donaldson, Donadey, and Silliman, p. 439). And often in the United States, globalization is little more than "a Cold War production of knowledge," which compares other areas to the United States to their detriment, continuing a dangerous U.S.-centrism.

Still, with all the fragmentation, the "center holds." Women's studies as a concept and a practice is here to stay. It has been so institutionalized, there is so much new knowledge and new scholarship, there have been so many hearts and minds changed through this study that the various splits and positions can only help to proliferate the ideas.

Margaret H. McFadden

WORK. Work as a unitary experience, set off in time and place from the rest of life, is a concept bound in the culture of wage labor (see especially Thompson, 1967, on disciplined promptness and time regulation accompanying factory work). Only when effort—physical and mental—is turned into a commodity sold to an employer who then monitors and controls it can we discern an abstract concept of "work." Other concepts stand outside of that context, such as "a work" being a finished product of a craftsman or artist, or work divided into concrete activities of particular people—warrior, farmer, smith, and so on. The situation where productive activities blend into the overall flow of daily life especially challenges our commonsense notion of work. In the recent past of the Dobe Ju/'hoansi of Botswana, women, men, and children sporadically gathered plant foods and hunted small animals, interspersed with visiting, eating, and relaxing. Hunting large animals, performed by men, stood out from the rest of life because meat was desired and was the basis for much social

interchange. But although the ethnographer Richard Lee could designate specific activities as “work” in his own cultural terms, and count the hours and minutes spent in them (surprisingly little time was needed to produce quite satisfactory subsistence), no clear concept equivalent to abstract work emerged from the Ju/hoansi themselves.

Many cultures do distinguish activities requiring disciplined effort and focus to produce a concrete result, however. Among farmer-fishermen living by Lake Titicaca, Benjamin Orlove found that the general word *work* (Spanish *trabajo* or Quechua *llank'ay*) was used only in conjunction with a specific activity. This demanded concentrated effort, often physical but sometimes mental, and produced a tangible product, so that fishing was “work” while repairing nets while sitting, chatting, and relaxing was not. The richest study of work embedded in culture is Bronislaw Malinowski’s ethnographic classic, *Coral Gardens and Their Magic* (1935), which focuses on the rituals of birth, growth, and death and the magical control over chance that envelop South Pacific farming and fishing. Although there is a long tradition of considering labor to be the defining human characteristic (e.g., Karl Marx, discussed below), when looking across cultures we see instead a pattern of alternation between disciplined routine and vibrant, expressive release. Both qualities, then, must be part of our understanding of humanity.

Another methodological concern in studying work is that upper-class intellectuals have produced most of the texts. There are two serious problems with writing a history of the idea of work based solely on these authors, who may or may not have personally experienced or carefully observed nonintellectual labor. First, they represent the interests, perspectives, and biases of their social origin and position. Second, they often take the articulate words of intellectuals to be the sole or characteristic voice of their era or place. But these authoritative sources do not necessarily represent the full range of ideas within a complex and unequal society, even if they do influence the notions of others. Thus in a society dominated by men, we often hear little about women’s ideas of work; in a society of landowners, artisans, and slaves, we often hear little from the latter two groups. How are we to rectify this? We should locate and listen to working people’s voices as directly as possible, through novels and diaries (e.g., Levi), or at least such voices mediated by careful and sympathetic observers (e.g., Mintz; Nash). And we should be imaginative in uncovering evidence about the conceptual lives of nonintellectuals, paying attention to folklore, jokes, inscriptions on products, and so on.

Pre-Capitalist Civilizations: The Incas, India, and Classical Greece and Rome

Getting beyond the articulate voices of intellectuals is especially a problem for understanding civilizations before the era of widespread printing and literacy. However, cross-cultural comparison allows us to highlight similarities and differences. This article compares concepts of work from three widely separated world regions: the Inca empire of the Andes before the Spanish conquest, the Indian subcontinent (South Asia) before British colonialism, and the Greek and Roman world before the Christian era. In the Andes, archaeological evidence

from the epoch before the Incas shows that large public works (walls, temples, canals) were constructed by multiple communities each working on its own small, essentially equivalent segment. There was no division of labor by task, but rather by community. Similarly, in the Inca period, people paid the principal taxes to the state not in the form of money or goods but as collective labor service, as communities or segments of communities (e.g., all young men of an area would serve as imperial message runners). Conceptually, this labor service took the form of reciprocity between unequal social ranks, from village to regional lord to emperor; for example, harvesting the lands of the emperor and his official religion, the cult of the sun, was reciprocated by extensive gifts of cloth and corn beer. In the late empire, however, what had started as a system of independent agricultural communities giving tribute to the state was radically transformed with new forms of labor that were disarticulated from the local community, and turned into permanent labor forces at the service of the Inca aristocracy.

In South Asia, we see a similar pattern of unequal reciprocity. Under the *jajmani* system, local caste groups owed a variety of work services and products to each other, from tanning to weaving to conducting rituals. Indeed, it is plausibly speculated that castes originated as hereditary occupations. At the level of ideas, work was not thought of as a unitary subject performed by a free (if socially grounded) individual; instead, group productive roles existed, marked by highly unequal but also reciprocal qualities of ritual purity, such as the work of tanners—conceived as polluting—which interlocked with the putatively pure work of Brahmin priests. Clearly, this was an ideology that explains and endorses inequality, though it also allowed space for change (as local castes maneuvered for changed work roles with improved ritual rank) and resistance (as groups dropped out of the system by conversion to egalitarian religions like Buddhism or Islam).

We notice a pattern in these precapitalist class societies in which the idea of work was differentiated into concrete products or tasks associated with specific collective groups, in turn synthesized into a functioning economy through unequal exchanges, mystified as mutual and reciprocal in nature. Though group membership was envisioned in various ways, cultural, linguistic, religious, and so forth, it was often the case that groups consisted of or were identified with a specific kind of work, and that such work carried denigrating or exalting qualities.

With this in mind, we can better situate Greek and Roman ideas about work, which constitute in part the roots of the Western intellectual tradition. The early Greek oral traditions of Homer and Hesiod idealize the work of the farmer, as do early Roman stories about Cincinnatus, the patriotic farmer-general. These “farmers,” however, were owners of large estates and masters of extensive households in which women, slaves, and other subordinates labored, so these ideals highlight not hard work in general but the hands-on management of rural production. By contrast, classical Greek thought turned against work, especially for others (self-sufficient farming was still esteemed). The ideal in Plato (c. 428–348 or 347 B.C.E.) and Aristotle (384–322 B.C.E.) was the man free of necessity, with leisure to engage in politics and contemplation.

There was particular disdain for merchants, who made money by trade rather than production from the land, and for artisans, who crafted goods with their hands. The productive and reproductive work of women was largely ignored. The classic Roman authors, such as Cicero (106–43 B.C.E.), held roughly the same views. This constitutes a characteristic inversion of the social reality surrounding such authors: they lived in commercially vibrant cities whose wealth came from extensive long-distance trade in farm and handcraft products. The idle rich, with time for political and natural theory, drew income from this economy, while distinguishing themselves by denigrating its key actors: slaves, foreigners, and craftsmen.

Unlike the Inca and South Asian examples cited above, in the Greco-Roman case there seems to be no specific mandate to reciprocity (however unequal) between direct laborers and intellectual elites. Perhaps this difference is the result of the greater division of labor and differentiation of roles in the rich commercial Mediterranean, creating more conceptual separation between urban authors and direct producers. The brief glimpses we have of the idea-worlds of artisans differ significantly from the famous classical writers; numerous inscriptions on pottery express pride and status in well-made handcrafts. Also, there were in Rome *collegia*, large clubs of craftsmen, with a rich mythological and ceremonial life. Though inarticulate in the sense of bequeathing to us extended texts, these represent alternative views of work from the famous disdain of Plato or Aristotle.

European Ideas from the Late Roman Era to the Industrial Revolution

Early Christianity turned away from Roman and Greek elite arrogance toward work. Jesus and the Apostles were peasant-craftsmen, and though early Christianity spread among wealthier urban populaces, there was in its communalism little room for denigration of merchants, slaves, and workers. St. Paul, a tentmaker, used the expression, “my fellow workers.” St. Augustine (354–430) extolled work as a means of moral perfection and saw it as an expression of human genius, thereby glorifying God. This line of thought found practical expression in Christian monasticism, which prized hard, focused work—forest clearing, agriculture, manuscript illumination, and so forth. Monks did not value labor in itself, but insofar as it offered dedication and discipline to God, and supported the more important role of prayer. The church viewed non-monastic human work as being in the image of God’s work, a generally favorable attitude to labor that would continue in Catholic thought to the present.

The medieval concept of “estates,” much like the castes of India, organized society by collective work functions, duties, and rights—nobility, church, and peasantry/laborers—but relegated the direct producers of society to the lowest order. However, towns were different. They had merchants and moneylenders, the antecedents of capitalism, and also the craft guilds. Guilds embodied an ideal of gradually accumulated knowledge and dexterity, culminating in personal mastery of the entire production process, including control of the materials, tools, and markets for finished goods. This concept of control and mastery was manifested in group rules and rituals that marked guild members off from nonmembers.

The rise of Protestantism, in conjunction with growing commercialization in cities, transformed Western ideas about work. Martin Luther’s (1483–1546) concepts reflected medieval social orders, in which everyone worked according to the trade in which they were born. However, he rejected the Catholic doctrine of higher and lower “callings” in favor of a singular, individualistic notion of “calling,” a strong incentive to action. More importantly, John Calvin (1509–1564) forged a radically new vision of work. He saw success in life as a sign of God’s predestined favor to the person. In a curious, but profound way, this doctrine that denied free will ended up strongly motivating labor and profit-making, since the individual cherished hard work and success as signs of heavenly election. Consistent with its roots in rising commercial centers, Calvinism also considered trade, profits, and finance as of equal value with direct production. This represents a distinct break with a long previous tradition of disdain for money-making in favor of farming.

Surveying this history, the great German sociologist Max Weber (1864–1920) argued that Protestantism stimulated the rise of European capitalism during the sixteenth to eighteenth centuries, but significant criticisms have emerged. First, Weber overstated the asceticism of early capitalists and underestimated the role of consumption as a stimulus to work and economic growth. Second, mercantile capitalism arose first in Catholic regions of northern Italy and southern Germany. Weber focused on a somewhat later period in its development. Likewise, a distinctive east Asian form of capitalism has taken hold in the twentieth century in a world region without deep Christian traditions (Japan, China, and Korea). It is debatably linked to Confucian and other east Asian worldviews that emphasize group orientation and profound feelings of duty (as opposed to Western individualism). Weber did, however, seem to catch a broadly applicable aspect of the thinking of rising capitalists, their breaking with agrarian traditionalism concerned with protecting inherited class privileges and old-fashioned luxuries. For intellectual history more generally, his work pioneered the exploration of ideas as causes and not just reflections of social change.

The concept that labor was the singular source of value in goods, the ultimate basis of wealth, now emerged in a context of rising landowner-capitalists dedicated to transforming traditional means of production. Unlike in later eras when this “labor theory of value” would serve to highlight conflict between workers and capitalists, the early version emphasized the new landlord’s role, taking private property out of the shared state of nature by adding the specific element of organized effort. This also conformed to the European expropriation of world resources after Columbus—putting the assumed “state of nature” to work, including human populations in the slave trade, land in the plantation colonies, and silver and gold in the mines of the Americas. John Locke’s (1632–1704) *Two Treatises on Government* epitomize this line of argument. It offered a truly radical turn of thought by finding value in secular human action rather than, as in the Middle Ages, from fixed social rank combined with God’s awesome majesty. Instead, the image of God became like that of man: God the maker. This fascination with making was the inspiration of

eighteenth-century French and British Enlightenment attention to mechanisms of all kinds, natural and artificial. Denis Diderot (1713–1784), the son of a prosperous knifemaker, included the mechanical arts in his encyclopedia of natural and philosophical knowledge and insisted on the worth of artisans and artisanry. With these ideas, and with the concurrent rise of global trade, putting out manufacturing of cloth, improved agriculture, and the like, we have set the stage for modern wage labor and capitalism.

The Capitalist Era

Beginning in the late eighteenth century, new theories of work under capitalism emerged.

Smith and Ricardo. In 1776 the United States declared independence and Adam Smith (1723–1790) published *The Wealth of Nations*. Within the history of ideas, this is the year best suited to mark the full birth of capitalism, though as we saw above, the change had been long coming; and it was still to be a few decades before artificially powered factories began to diffuse outward from northern England and Scotland. Smith's view of work must be understood within his wider understanding of markets, since he saw markets as leading to the division of labor in detail, breaking production into a series of discrete operations, performed repetitively and with a focused perfection by different kinds and grades of workers. This concept, which was to become pervasive in capitalist practice, is exactly the opposite of the medieval notion of the unity of all stages of work in a craft. Smith was ambivalent about his vision of the trajectory of work, however, since he feared that this division of labor would dull the mind of the worker. (This worry is characteristic of Smith, who both forecast the power of markets and capitalism and explored moral sentiments that bind otherwise materialistic and competitive people.)

Smith accepted the labor theory of value, but it was propounded most emphatically by David Ricardo (1772–1823) around 1810. In the mid-nineteenth century, it was adopted by Karl Marx (1818–1883) and has been a mainstay of orthodox Marxism since then. The labor theory of value holds that as people make and reshape the raw materials of nature and transform them into objects of use (“use value”), their market values (“exchange value”) come from the physical and mental effort in that work. It is, in part, a theory of price, but more widely it is a theory of the commonality in the values that each individual idiosyncratically attributes to objects. Clearly, a labor theory of value exalts work as a fundamental theme of human life. In Ricardo's hand, it highlighted the producing classes, capital and labor together, against the dead hand of rent-collecting landlords—in other words, it announced the birth of capitalism out of feudalism. In Marx's subsequent version, however, it valued workers against capitalists, the direct producers against the surplus-collecting owners of tools and resources (“means of production”), which are the congealed results of labors past. To Marx, this announced the future birth of communism out of capitalism. Neoclassical economists of the late nineteenth and twentieth centuries avoided the question of intersubjective value and transfer of value between classes altogether, narrowing their concern to how prices are set in particular markets. Other radical perspectives have looked to nonlabor theories of value,

especially energy and other ecological-physical value sources. Flawed as it may be, however, the labor theory of value captures something of the relationship of past work (capital) to present work (laborers), which is both an existential necessity and the basis for unequal and exploitative power relations.

Karl Marx. Marx offered a comprehensive, radical theory of work. In his labor-based worldview, human activity is central to making and transforming all aspects of life, including the concepts we use to understand it. It is important that we recognize that this is not a purely economic perspective, which is often assumed about Marx, but a much wider emphasis on the practice of life rather than the play of unworldly ideas. Likewise, his view of labor is wider than physical effort in factories, though Marx himself focused on this (then new) feature of capitalism. Rather, the term *labor* captures the full range of human capacities, as much mental and creative as physical and forceful.

This understood, we turn to alienation, Marx's central concern about work. At times we labor for ourselves, and though the product may be outside our bodies (e.g., my cleaned desk), we are not highly alienated from it. It is part of our being. At other times, we labor directly for others (e.g., a garden I plant for my wife), rendering a product that someone else will possess, use, and enjoy. But though the product is separated from us, it becomes part of a social bond, a nonalienated relation to another human being. However, under the condition of commodity production (making a good for anonymous sale), and even more importantly in wage labor under capitalism (working on a good that is owned by someone else, in a manner controlled by someone else), the result of our labors has no connection or relation to us. It is alienated. To take, for example, the division of labor in a bank, we will see that one worker will collect data, another sum it up, and a third give it a credit score, based on research by a fourth, fifth, and so on. No one worker has an organic relationship to the owner of the labor (the bank), the final product of labor (the mortgage), or the person who receives the product (the potential homeowner). Alienation is, in Marx, a matter of objective relationships, but it has subjective, felt implications—a sense that the product or the customer or the firm does not matter, that the individual has no control or commitment to work, that the whole goal of labor is vague or even unimaginable.

Within this broad framework, Marx launched a critical analysis of work under capitalism. If capitalists want to profit, labor has to render enough value to cover two funds. One is to pay workers enough to live, that is, to “reproduce” labor power. The other is for capitalists to hold the “surplus value.” Marx thus saw unequal reward for work at the heart of capitalism; assuming the labor theory of value, work activity produces all the value, but the workers receive only part of it. The rest is captured by the owners of past labor, the means of production. If total value can be conceptually divided into the necessary payment to workers and surplus value, then capitalists who seek constantly to add to their invested capital (to “accumulate capital”) have two basic strategies. One is to increase the total length of the working day, so that workers are paid for ten hours, say, enough to survive, but have to work

for two hours beyond that. Marx called this absolute surplus value. The other is to make the workers' efforts during a given period of time more productive. More could be paid to workers, possibly, but the total product would increase even more quickly, rendering yet more surplus value. Obtaining this "relative surplus value" is, according to Marx, the main logic governing work under capitalism: not that work becomes more and more brutal, though sometimes it does, but that it becomes more and more dominated by the efficiency of production, especially via technology, the dead labor of the past used to speed up the live labor of the present.

Marx thus foresaw the ultimate polarization of capital and labor, leading to a revolution by the workers. Capital would accumulate more and more means of production, pushing relative surplus value ever more extremely, and workers would have more and more in common, as each would experience the same alienated and fractured labor. Both classes would become clearer in self-definition and self-understanding, and more openly in struggle between them, until a fundamental historical transformation (a "revolution") would usher in a new state of communism. Marx failed to think clearly about this future, being always focused on the immediate task of criticism and hostile to utopias, but he hints at a life of holistic, undivided labor, producing goods that were directly shared or exchanged in webs of immediate social relations. This recital indicates two major flaws in Marx's thought. Neither workers nor capitalists have become clearly defined and self-recognized classes across national or ethnic lines, though capitalists have come closer than Marx's preferred workers. And actual communism formed a series of dystopias, dedicated to the mass production of commodities in alienating factories with worker's labor unions and other self-expressions (e.g., religion) severely controlled or repressed by domineering political-economic masters: the worst of capitalism without the leavening of democracy and civil liberties. However, no worker, student, or activist in the modern world can ignore Marx's analysis of work, whether one seeks to defend or to transform capitalism.

Non-Marxist and Neo-Marxist Views of Work under Capitalism

Marx looked to the future, embracing the development of work under capitalism as the necessary stage before communism. Other critics looked backward, drawing on (sometimes quite unrealistic) visions of medieval craft guilds or the mutualistic cooperation of the village community. Utopian socialists in the early nineteenth century, such as Charles Fourier (1772–1837) and the Scottish industrialist-turned-radical Robert Owen (1771–1858), sought the productivity of capitalism without alienation and inequality through communal mass production and the equal exchange of products between specialized craftspeople. The late-nineteenth-century artist, designer, and philosopher William Morris put forth an ideal of craft mastery against the division of labor and of creativity rooted in knowledge of the past. The gaffly economist Thorstein Veblen (1857–1929) explored related ideals about productive creativity and disciplined work, but instead of archaic crafts guilds, he envisioned as social carriers the combined figures of industrial engineers and workers. He turned a critical gaze

against financiers, the accumulators and manipulators of money, who he regarded as the parasites (the "leisure class") of otherwise productive capitalism.

Émile Durkheim (1858–1917), a French sociologist-anthropologist who worked at the beginning of the twentieth century, offered perhaps the most perceptive defense of work under capitalism in *The Division of Labor in Society*. In traditional societies, people did pretty much the same work, so they bonded with each other from their sameness ("mechanical solidarity"). But with the advance of the detailed division of labor, people no longer do the same work. Instead, their mutual interdependence creates a new, "organic" solidarity—unity from difference. This denied Marx's postulate of ultimately polarized classes. Durkheim's work is especially important in that he recognizes and confronts some of capitalism's most troubling developments, such as division and inequality (he was, we should note, a vigorous reformer who favored socialism). But his solution represents a mystical hope. Why should the division of labor result in solidarity and not worsening alienation and increasing fractionation of work?

The troubling qualities of contemporary, alienating work sparked two important mid- to late-twentieth-century statements affirming its underlying value. Catholic social teaching, as expressed in Pope John Paul II's *Laborem exercens* (*On Human Work*), views work as a distinguishing feature of humankind. Through work, people come to understand their role in and obligation to a society, and to humanity as a whole. Likewise, work is a crucial source of self-respect and identity. This both establishes ideals of what work can be and provides a basis for critical evaluation of work in capitalism and socialism, where people become the objects rather than the subjects of work. *Laborem exercens* values labor over capital, though it accepts a subordinated role for capitalism. Hannah Arendt also sees work as crucial to the human condition, but she distinguishes between labor and work in an interesting fashion. Labor is the instrumental use of the body to make things that will be consumed and will not last long; work is the use of the mind and the hands to create things that will endure, the world of art and artifacts that surround and enrich human lives. She criticizes contemporary economics for blurring these two categories, for sacrificing the enduring monuments of work in favor of impermanent, mass-produced consumer goods. Insightful as this temporal perspective is, it seems biased toward artists and intellectuals and dismisses the creativity and necessity of daily chores, particularly those associated with women.

In 1974 Harry Braverman refocused the debate over work around the perspective of Marx. He argued that capitalists do not just buy labor power but seek to control the performance of work itself. Work may be considered to have two components, mental and physical (often called manual). To capture control over work is to take its mental side, the skills, knowledge, and initiative, away from the worker and put it in the hands of the employer. This is done through observation and redesign of physical motions (time-motion engineering), by building work skills into technologies and production layouts, and by bureaucratically controlled reward systems. Debate has raged over his reading of work history; for example, some

technologies remove existing skills but introduce new skills. Nor are workers ever completely deskilled; even highly controlled and designed workplaces require subtle tricks and informal group cooperation. But after Braverman, we can no longer view new technology or management reform as simply neutral, as always means of greater efficiency and saving of effort; the forces behind such changes bear critical scrutiny.

In summary, writers of the last two centuries have viewed capitalist work with great ambivalence. From Smith, through Marx, to Arendt and Braverman, there is a sense that capitalism provides us a bounty of goods, but at the cost of controlled, subdivided, unchallenging, and unimaginative labors that do not tap the richness of human creative capacity. Ethnographers of workplaces generally agree with these views, but note that workers often find a sense of play and accomplishment in their jobs. Some bit of humanity peeks through.

The Social Sciences and Work: Key Ideas

Feminism has contributed the social sciences' most important insight about work: that is, work often performed by males, wage work or work outside the household, has been assumed to be the only kind of work, while work often performed by women, such as childcare or gardening, is left invisible or dismissed as mere chores and hobbies (this can be extended to activities of many men, such as tinkering with cars). To think of women's labor as work means to think not only of producing objects but also reproducing (renewing) the conditions of daily life. It means widening our ideas about what work is, for example in Arlie Hochschild's studies of emotional and nurturing care as work. And it challenges everyday language, such as "going out to work" and identifying a person by their paid occupation.

We thus need to keep open minds about what sorts of activities constitute work. The world of work is more diverse than stereotypical images of factories or heavy physical labor. Bureaucrats, for example, engage in "thought-work," the partly rationalized mass production of mental and verbal operations required to classify and regulate other people. Work thus involves tremendously varied experiences and ideas about those experiences, even within wage labor. Different workplaces and occupations have their own subcultural norms and symbols; the so-called "informal" workplace organization of friendship, collaboration, and factionalism often differs from the official organizational chart of power and authority. Participant-observation in workplaces has shown that informal organization surrounding minutely differentiated tasks and pay rates interdigitates with inequalities brought from the wider world, including gender, race, and ethnic background. Workplace friction, then, both reflects and exacerbates wider societal conflicts. The concept of "segmentation" aims to summarize such patterns of inequality of work and employment conditions. It highlights, in particular, the differences between jobs with specific entry requirements (e.g., educational credentials), relative stability, ascending careers, generous fringe benefits, and so on, and jobs that come and go, with few entry requirements, little future, low pay, and poor or no benefits. Working people holding the latter jobs are much more vulnerable to recurrent unemployment, giving rise to patterns of persistent rural and inner-city poverty that we perceive as "social problems."

Social scientists have also debated whether and how work has changed in recent history. Three key phases emerge from this literature. In Taylorism, named after management consultant Frederick Taylor (most active in the 1890s), management controls virtually every motion of workers through a combination of minute subdivision of tasks, detailed instructions, and monetary incentives for rapid and efficient performance. In Fordism, named after automobile manufacturer Henry Ford (most active in the 1910s and 1920s), relatively high rates of pay joined high-speed, high-pressure jobs; its broader social effect was a high-production, high-consumption, joint corporate/labor union economy characteristic of privileged segments of the Western economy from the 1940s to the 1970s. Post-Fordism, also termed flexible production, or Japanese-style management, has emerged since the 1980s. This is a contradictory concept. On the one hand, hierarchies of control are supposedly flattened and cooperative groups promoted. On the other hand, unions are dismissed as old-fashioned, even attacked and broken, workers are treated as "flexible," that is, easy to hire and fire, and corporate culture and human relations are deftly manipulated by management.

A debate has emerged in the literature about post-Fordism over whether, with computers and other advanced technologies, the tedious, Taylorist and Fordist jobs of the past will disappear. The social theorist André Gorz argues that the immense productive capacity of the modern economy makes possible vastly reduced effort, a life of leisure, self-cultivation, or voluntary and avocational work. In abstract terms, Gorz's argument makes sense and is an appealing ideal. Yet in post-Fordist conditions, the demands of work (both in terms of sheer time spent at work and people's tendency to take work "home" via computer, cell phone, etc.) have actually increased (Schor). This debate poses the question of whether the modernist image of labor as factory work and analyses, such as Marx's, that apply to it, are relevant to contemporary (flexible or postmodern) capitalism. Contemporary capitalism involves corporate and governmental entities of enormous size, complexly distributed working processes, rapidity of movement and information transfer, and finely tuned systems of psychological control. Some authors feel that this constitutes a networked capitalism characterized by loose, relaxed relationships, flexibility, and constant change. Others portray systems of power in which external surveillance becomes included as part of the individual's own watchful self. There is a strange mixture of giddy futurism and hopeless surrender in postmodern perspectives. Though often presented as arguments against Marx, these visions extend his notion of alienated labor to the point where the commoditization of the person as worker and consumer has completely colonized the self. The main difference is that they abandon his hope of a revolutionary break with alienation. Yet we should question whether such corporate forms really have eliminated all competing notions of human creativity and self-directed discipline. Likewise, the predicted end of the factory is incorrect and Western-centric; the mind-numbing mass production of everyday goods has shifted to newly developing countries such as China, South Korea, Malaysia, Mexico, Brazil, and others. Though not simply replicas of the past, such places do in their own way re-create the "dark Satanic mills" of William Blake's early industrial Britain.

WORLD SYSTEMS THEORY, LATIN AMERICA.

The term *world systems analysis* was coined in 1974 by Immanuel Wallerstein to refer to a broad set of ideas about the global political economy, and especially the relationship between Latin America and the dominant economies of Europe and the United States, which were then gaining currency. The phrase *world system* is explored in detail in Wallerstein's famous book *The Modern World-System: Capitalist Agriculture and the Origins of the European World Economy in the Sixteenth Century* (1976). The form of critical inquiry advanced in this legendary study was then used in varying ways around the globe by such other scholars as Samir Amin of Senegal, Giovanni Arrighi of Italy, and André Gunder Frank of Germany, all of whom collaborated with Wallerstein on a notable book published through Monthly Review Press in 1982 entitled *Dynamics of Global Crisis*.

Landmark theories often emerge when the concrete events of history demand a new politics, and with it a new explanatory framework. Such was the case with world systems theory, and the preceding dependency theory of the 1960s and 1970s. As anthropologist Eric Wolf would later write, these intellectual movements tried to synthesize theoretically informed history with historically informed theory in response to the pressing problem, expressed most acutely during the political upheavals of 1968, "to discover history, a history that would account for the ways in which the social system of the modern world came into being," since "only in this way could we come to comprehend the forces that impel societies and cultures here and now" (p. ix). As this statement—and Wolf's own political activism in the United States during the 1960s—makes clear, world systems theory and its antecedent movements were not merely intellectual exercises; the scholars involved in them were also activists, many of whom risked their lives and suffered political repression, imprisonment, and exile in their efforts to transform the unequal system they abhorred.

The Age of Decolonization and the Failings of Modernization Theory

The period after World War II marked the epoch when the age of colonialism finally crashed, as one national liberation movement after another in Asia and Africa won legal independence (from Asian nations such as India in 1947, China in 1949, and Vietnam in 1974 to African countries such as Egypt in 1951, Ghana in 1957, Nigeria in 1960, Guinea-Bissau in

1974, and Angola in 1975, among many others). Above all, there was also the historic defeat of U.S.-enforced neocolonialism in Latin America by the Cuban Revolution of 1 January 1959—an event that had a tremendous impact on the entire hemisphere at a time when corporate capitalism reigned almost unchallenged in the Americas.

But as Western modernization replaced Western colonialism in former colonies, scholars and activists alike realized that the struggle was far from over, as it became increasingly apparent throughout the “Third World” (as it came to be called in the late 1950s and early 1960s) that Western modernization meant one thing to Western countries and quite another to non-Western countries. One and the same economic project, in the act of producing “modern nations” around the globe, generated unprecedented wealth for the West and abject poverty for the majority of citizens in non-Western countries.

World systems theory was developed by scholars on the left in response to the failures of modernization theory, which had predicted growing prosperity and development in the Third World, rather than the immiserization that befell so many new nations. Few could disagree on the facts about the stark inequalities that divided the former colonial powers from their former colonies, given the grim statistics on such social indicators as infant mortality, average life span, access to health care, and level of literacy. But explanations diverged sharply. Western apologists for mainstream modernization theory, such as W. W. Rostow in *The Stages of Economic Growth: A Non-Communist Manifesto* (1960), made a straightforward three-fold argument about the “universal” superiority of capitalist modernization. First, they maintained that the main countries comprising the West had modern economies, while most other nations simply had traditional economies characterized by low levels of industrialization, a small middle class, and hardly any advanced technology. Second, they argued that Western nations had a citizenry who possessed a modern psychology and modern cultures, which together were linked to an understanding of the need for hard work, a habit of punctuality, and a commitment to save money for investment. Conversely, the citizens of non-Western nations supposedly lacked this modern attitude and worldview to varying degrees and their economies suffered accordingly. Third, the Western apologist contended that the countries in the West were governed by modern institutions, such as parliamentary democracy, a multiparty system, an independent judiciary, and excellent public education systems. On the other hand, the “traditional societies” from outside the West were governed instead by “premodern” institutions, often with dictatorial leaders or paternalistic regimes, and no real commitment to public literacy. So, the answer, the modernization theorists maintained, was simple: the rest of the world should learn to behave like the West and to adapt its system of corporate capitalism.

By the late 1950s and early 1960s, however, something else was becoming clear, namely, the precise opposite of what modernization theorists had predicted was in fact occurring. Moreover, this development process often happened in ways that were devastating for the majority of the populations in every

Latin American nation, whether it was more or less “modern.” As Western capital modernized Latin American economies—from the copper mines of Chile, the oil fields of Venezuela, and the agribusinesses of Central America to the bauxite production of Jamaica—they became more contradictory and imbalanced on the national level to the degree that they were modernized by the West. Far from creating a large middle class, for example, corporate capitalism did exactly the opposite. Moreover, it soon became well documented that U.S. multinational corporations in fact preferred to do business with repressive military dictatorships and other premodern, as well as antidemocratic, political formations, in order to support a modernization that generated huge profits for the West, even as it led to very modest infrastructural gains for the host nation. In addition, it was not lost on the popular classes themselves that modernization theory was inaccurate on another count as well, that is, the relation of hard work and high productivity to remuneration. In Latin America, the members of the labor force who worked hardest within corporate capitalism were paid the least.

At this point, the issue simply was no longer one of explaining social injustice as a consequence of European-American-based modernization—these injustices had become patently, even painfully, clear to the Third World intelligentsia and progressive intellectuals in the West—but rather one of disclosing why and how the two phenomena, social injustice and capitalist modernization, were deeply interrelated. Were they incidentally connected through the misapplication of capitalist modernization by corrupt local leaders? Or were they linked through the coercive designs of imperial political policies emanating squarely from the West?

To an increasing number of critics, neither of these types of explanation were sufficient, since they did not begin with a structural economic analysis of what Karl Marx, almost a century earlier, had named the “uneven development” of modern capitalism. What was needed was a theory that began, not with individual examples of corruption or inefficiency, but with the inherent structural logic of corporate capitalism that, based as it is on an unequal “international division of labor,” is unfairly organized by its very nature at the site of production, not just as a result of distribution. In an outpouring of intellectual energy beginning in the late 1950s, a new cohort of intellectuals, many from Third World countries themselves, began to develop such a theory.

Precursors to World Systems Theory

In developing his theory, Wallerstein built upon the nineteenth-century critiques by Marx of capitalism’s structural contradictions and those by the subsequent school of dependency theory that first emerged in the 1950s and 1960s throughout the Americas about the “development of underdevelopment.” The latter school of thought, devoted to analyzing the structural logic of monopoly capitalism, was put forth first by such scholars as Paul Baran, Harry Magdoff, and Paul Sweezy of *Monthly Review*, then developed in interrelated books throughout Latin America by Fernando Henrique Cardoso, Theotonio dos Santos, Jaime Wheelock Román, Fidel Castro, and Orlando Núñez Soto, among several others. World systems theory also

owes an intellectual and political debt to the anticolonial critiques from the Caribbean of C. L. R. James or Frantz Fanon; the celebrated *Annales* school of material history from France exemplified by Fernand Braudel, Marc Bloch, or Georges Duby; and the radical historical analysis in England of Christopher Hill, E. P. Thompson, or E. J. Hobsbawm.

Anticolonialism. In 1952, Frantz Fanon of the Caribbean island of Martinique launched a stirring anticolonial analysis of the ideologically charged ethnocentrism hidden behind European efforts at “modernization” in Africa, entitled *Peau noire, masques blancs* (*Black Skin, White Masks*, 1967). (This work was also very much in the tradition of C. L. R. James’s *sui generis* anticolonial study *The Black Jacobins* [1939] about revolutionary movements in Haiti and the Dominican Republic.)

Development of underdevelopment. In 1957, Paul Baran published a watershed study entitled *The Political Economy of Growth*, which became one of the most popular books about political economy in the history of Latin America. (A Spanish edition of this study had gone through more than twenty different editions, since being published by the National Autonomous University of Mexico.) In it, Baran demonstrated how Western development via modernization unavoidably produced underdevelopment in Latin America, and that it was necessarily based on “uneven development” owing to its peculiar structural logic. Indeed, without major structural adjustments, Western modernization would continually lead to the development of underdevelopment in Latin America and the Third World. Far from being the solution to poverty in Latin America, Western modernization was a primary cause of it. As the formative “core” of a hemispheric system, capital in the United States (and Europe) would thus continue to siphon crucial resources from “peripheral” Latin American countries through hyper-profits generated by the international division of labor.

Latin American dependency theorists. Baran’s book helped to galvanize the position of an entire generation of Latin American intellectuals. They answered the call to document his abstract claims about the deforming effects of Western modernization for the Americas through concrete studies of specific instances of the effects of corporate capitalism, with a series of studies that were extensive, provocative, and often brilliant. One particularly well-known example is Brazilian scholar Fernando Henrique Cardoso’s (with Enzo Faletto) *Dependencia y desarrollo en América Latina* (1969). The context of its publication reveals the increasingly fierce battle between left and right that shaped twentieth-century Latin American politics: it was authored in Chile (on the eve of the Salvadore Allende years) where Cardoso was then in exile, because of a U.S.-backed military coup in Brazil during 1964. The latter opened the way to what Western capital would celebrate as an “economic miracle” (an annual growth rate of 10% for a decade). Yet, as one Brazilian leader of the period admitted: “In my country, the economy is doing fine, but the people aren’t.”

Cardoso’s study, based on what he terms an “*análisis global*” (global analysis), provides a structural analysis of this contradictory process. In 1950 there were at least five large nations from Latin America that, according to the standards of modernization theory, were virtually guaranteed success as modern nations who

would be major players on the world economic stage: Argentina, Brazil, Chile, Columbia, and Mexico. Each of them possessed the following: (1) sufficient internal markets to propel growth; (2) a formidable industrial base; (3) abundant reserves of raw materials; (4) powerful stimuli to grow nationally; and (5) satisfactory formations of domestic capital. Yet despite their enormous structural promise and hardworking labor forces, these five countries ended up being trapped by the West in a type of *desarrollo dependiente* (dependent development) that caused a profound depression of the living standards and welfare of the vast majority of their citizenry. The result was a disadvantageous interdependency with a Western-led modernization that did not make them modern nations by the standards of the West, even as the West itself profited handsomely from this foreign labor force and the region’s raw materials.

An even more extreme case of underdevelopment as a consequence of Western modernization occurred in the seven largely rural countries of Central America, which were far less prepared to succeed in the world system than were the five Latin American nations singled out by Cardoso. Few have encapsulated better in a short aphorism than did Nicaraguan author Sergio Ramírez, how the economy of a Third World region is deformed by capitalist-based underdevelopment simply to serve the consumer patterns of the West. As Ramírez noted, people in Central America figured out fairly soon what their assigned role in the world system would be: cheap desserts for the West, such as coffee, sugar, and fruit. It was another Nicaraguan intellectual and guerrilla leader, Jaime Wheelock Román, who documented extensively and explicated deftly the historical process whereby Central America’s fate would be determined by the international division of labor of corporate capitalism. The latter set of relationships rigidly presupposes the preparation of raw materials on the periphery of the world system and the production of finished industrial goods primarily in the core area. Written in the 1970s, Román’s *Nicaragua: Imperialismo y Dictadura* was an underground classic during the insurrection against Nicaragua’s de facto leader Antonio Somoza Debayle and a guiding text for revolutionary policies by the Sandinistas after their victory over Somoza in 1979.

Even more so than Cardoso, Wheelock Román’s book exemplifies the increasingly high stakes in which Latin American dependency and world systems theorists worked as an underground labor leader during a period of intense political depression. Despite these dangers, he produced one of the most important books on dependency theory ever to come out of Central America. Román carefully traces how the Nicaraguan *economía agroexportadora* based on coffee (and to a lesser extent on bananas, sugar, and cotton) was set up to provide cheap goods for the West, and produced low prices for European-American consumers through the systematic maltreatment of underfed, underpaid, and terrorized workers denied basic human rights. Moreover, the unquestioned accompaniment to this success story of corporate capitalism and its modernization project in Nicaragua was the brutal, U.S.-backed dictatorship of the Somoza family (r. 1934–1979), two of whose members even graduated from West Point. This regime insured that labor discontent in Nicaragua would not be allowed to upset the project of modernization in Central America.

The author whose career epitomizes the mix of politics and scholarship that characterized Caribbean dependency theory is Fidel Castro, who produced a monumental tour de force of dependency theory, *The World Economic and Social Crisis*, together with two teams of researchers at the University of Havana. This analytical report, presented in 1983 by Cuban president Castro to the Seventh Summit Conference of Non-Aligned Countries, compiled evidence from a massive number of nonpartisan scholarly sources to document a world division of labor that is structurally enforced at every stage of development by the forces of corporate capital and the Western militaries that back them. Criticizing the claim by modernization theorists that Third World countries were gradually industrializing and could someday rise to the level of the industrialized West, Castro and his coauthors emphasized that “in spite of some affirmations to the effect that world industry is producing a so-called restructuring . . . the really impressive thing is that 69.2% of the world’s industrial work force is found in the Third World and it generates less than 9% of the world industrial production” (p. 127).

This global division of labor was the main target of Castro’s critique: his book calls for a rejection of the effort to “divide the world into an industrialized area with advanced technology and a primary-commodity-producing area” (p. 67). As examples, he pointed to mining, where “the underdeveloped countries contribute 25.6% of the mining of metals, they produce only 4.1% of the metal manufacture in the world” (p. 123), and textiles, where the manufacture of yarn—“high-labor and low capital intensive” in the Third World increased from “19% in 1950 to almost 40%,” while weaving “which is more capital-intensive and require high automation and concentration, is still controlled by developed countries, and based there” (p. 67). Textiles were then returned back to the Third World to be made into garments, because this industry still demands a high degree of hand labor. But critically, the most important phase of all—the manufacturing and sale of textile machinery—“requires advanced technology and a complex design, on which the future of the entire sector largely reveals the power relationship in the textile sector.” Third World industries produced less than 5 percent of such machinery, and saw few possibilities for increasing their share. It is from this control of the making of machinery, according to Castro and other dependency theorists, that the so-called captive trade system arises, turning international trade into a caricature of itself (pp. 67–68).

It is this control of the machines that make all other machines, that is, the export of machines, but not the technology that reproduces these machines, that is the guiding thread of all Western modernization policy. This is a key locus of power and a primary way of maintaining Western hegemony in the world system.

Wallerstein and World Systems Theory

Inspired by dependency theorists, Wallerstein developed the concept of world systems analysis in the 1970s as a response to the methodological impasse, or *Methodenstreit*, within the social sciences over how to explain the existence of stark inequities among three different worlds within the modern global

economic order: those of societies in the core (the West and Japan), those on the semiperiphery (Eastern Europe and much of Asia), and those on the periphery (most of Africa, Latin America, along with the Middle East, except for Israel, plus some parts of Asia). Wallerstein opposed, on the one hand, what he deemed the “universalizers” in mainstream economics, sociology, and political science, who defend Western modernization theory as an international standard, and, on the other, the “particularizers” in anthropology, history, art history, and other disciplines in the humanities, for whom all economic developments are merely relative to the peculiar regions in which they occur. The latter assertion amounts to a fetishism, or universalization, of relative difference. According to Wallerstein,

Both groups . . . tend to share one premise in common: the unit of analysis was politico-cultural structure . . . whether the term they used for this unit was the state, or the people, or the nation. . . . This book makes a radically different assumption. It assumes that the unit of analysis is an economic entity, the one that is measured by the existence of an effective division of labor, and that the relationship of such economic boundaries to political and cultural boundaries is variable. . . . Once we assume that the unit of analysis is such a “world-system” and not the “state” or the “nation” or the “people,” then much changes in the outcome of the analysis. Most specifically we shift from concern with the attributive characteristics of states to concern with the relational characteristics of states. We shift from seeing classes (and status-groups) as groups within a state to seeing them as groups within a world-economy. (pp. xi–xii)

A critical example of this approach, with its emphasis on underlying economic causes for political and cultural events, was his analysis of the advent of modern society, a process that for Wallerstein begins with the novel emergence of mercantile capitalism in late fifteenth-century Europe, which ultimately produced for the first time an entire world system. Wallerstein divided his analysis of the “determining elements” of the modern world system into four major epochs: the formation of the European world economy from 1450 to 1640; the consolidation of the system between 1640 and 1815; the technological transformation of industrialization from 1815 to 1917; and the “consolidation of this capitalist world-economy from 1917 to the present, and the particular revolutionary tensions this consolidation has provoked” (pp. 10–11).

The breadth of vision and sense of political urgency that underlay this new theoretical approach is evident in the introduction to *Dynamics of Global Crisis*, a manifesto on behalf of world systems theory that included a joint statement by coauthors Wallerstein, Amin, Gunder Frank, and Arrighi in which the following shared premises were declared:

1. We believe that there is a social whole that may be called a capitalist world economy . . . [that emerged] in the sixteenth century, and that is expanded historically from its European origins. . . .

2. We believe that we cannot make an intelligent analysis of the various states taken separately without placing their so-called internal life in the context of the world division of labor, located in the world-economy. . . .
3. We believe that, throughout the history of this capitalist world-economy, there has been increasing organization of oppressed groups within the world-system and increasing opposition to its continuance. . . .
4. After World War II, the United States was the hegemonic power, having commanding power in the economic, political, and military arenas, and able to impose relative order on the world system—a fact which correlated with the world's unprecedented economic system. . . .
5. We do not believe that the struggle between capitalist and socialist forces can be reduced to, or even symbolized by, a struggle between the United States and the USSR, however much the propaganda machines of both assert otherwise. . . .

These premises laid out, it remains only to indicate our prejudices and our visions. We are all on the left. That is, we all believe in the desirability and possibility of a world that is politically democratic and socially and economically egalitarian. We do not think the capitalist world-economy has done very well on any of these accounts. We believe that capitalism, as a historical system, will come to an end. (pp. 9–10)

Developments and Critiques of World Systems Theory since 1980

World systems theory was enormously influential throughout the world for several decades, although its influence was more profound in Third World regions such as Latin America, and in Europe, than in the United States. Even in the United States, however, major works such as Eric Wolf's study of *Peasant Wars of the Twentieth Century* (1969) or Sidney Mintz's magisterial study of the relationship between slavery and capitalism, Europe, and the Caribbean, *Sweetness and Power: The Place of Sugar in Modern History* (1985), took their inspiration directly from world systems theory.

There were always critics on the right, of course, and over time other criticisms arose, and intellectual trends that began as part of world systems theory gradually moved away from it. Conservative development theory gained new ground among politicians and development experts in the 1980s with the popularity of neoliberal reforms; within academic circles, post-modernism has both been influenced by world systems theory, and profoundly suspicious of it. The current emphasis on transnationalism clearly looks back to Wallerstein's insistence that in the face of a global economy, nation-states and local cultures cannot be analyzed in isolation from one another; at the same time, however, a distaste for "master narratives" marked the death knell for the mono-causal insistence on looking for

a single underlying structure with vast explanatory reach. Yet, as postcolonial theorists have shown, a multicausal conception of master narrative, such as colonialism, avoids the problem of any single overarching explanation that homogenizes history.

Thus by 1996, statements such as those made by York Bradshaw and Michael Wallace, two sociologists from the United States, in their book *Global Inequalities*, that despite its historical importance "world-systems analysis" is simply "out of touch with current realities," have become commonplace. Two of their criticisms are especially revealing. First, they say that "just as modernization theory places too much blame on poor countries for their own underdevelopment, [so] world-system theory errs in the other extreme: It places almost total blame for Third World poverty on core countries" (p. 51). This point has been taken up by many activists in Third World countries, who see their own leaders and educated elites using criticism of the First World to evade responsibility for their own failures. Political positions, such as cultural policies, and artistic production are all marked by a "relative autonomy" from the world system that must be acknowledged before much needed local self-criticism is possible and democratic accountability can occur.

Second, Bradshaw and Wallace observe that sometimes "world-system theory had exaggerated the harmful effects" of multinational corporations. They and others point to the relative success story of China and the four "Little Dragons" in Asia (South Korea, Taiwan, Singapore, and Hong Kong) on the advanced semiperiphery of the world system as an instance of how "underdevelopment" is less in evidence as a result of Western-style modernization. This point is related to one made by intellectuals from within the world systems tradition, who in the late 1980s and 1990s began to move from a simple view of world history in which European domination was the single, central fact to a more complex vision of history. New studies of the past looked at the emergence of previous core-and-periphery systems, before the rise of Europe, in which the core might be found in Asian empires, or in the Middle East. In a similar vein, studies of the contemporary world have emphasized a multicentric vision, in which Japanese capitalist expansion in Southeast Asia, Australian neocolonial influence in the Pacific, and the rise of India's technology centers create multiple centers of economic power, while still perpetuating an underlying capitalist system in which the drive for profit overrides all other motives, and drastic inequality is continually reproduced and exacerbated.

Indeed, critics who dismiss world systems theory as irrelevant may be both losing sight of its most critical insights and overlooking current political trends. The much-vaunted neoliberal reforms of the 1990s, modernization theory's successors, seem to have produced a series of economic crises; overall, most Latin Americans lost considerable economic ground during that dismal decade. Enlarging the definition of the core to include the bourgeoisie of Third World nations, and the periphery to include the disenfranchised poor of First World nations such as Britain or the United States, is entirely in keeping with the original vision of unequal development; nor has the brunt of poverty and political repression ceased to fall on the world's

nonwhite population, whether they live in Paris, London, or the Caribbean. Furthermore, presidents elected in some Latin American nations in the early 2000s, including Lula da Silva of Brazil and Hugo Chávez of Venezuela, as well as the rise of powerful new popular movements such as the indigenous movements of Ecuador and Bolivia, or the landless movement of Brazil, and the international antiglobalization movement, may indicate a new wave of political activism on behalf of the poor, which in turn may produce a new intellectual movement that will take off where world systems theory left off.

The underlying global inequalities that motivated world systems theory are still evident: in the early twenty-first century 5 percent of the population (the percentage of the population that resides in the United States) continues to control more than half of the world's resources. Unlike modernization theory, world systems theory not only highlights this grave situation, but also gives compelling reasons for how the world could be more justly organized otherwise.

YZ

YIN AND YANG. In Chinese cosmology, yin and yang are two opposite but complementary principles that regulate the functioning of the cosmos. Their repeated alternation provides the energy necessary for the cosmos to sustain itself, and their continuous joining and separation is at the origin of the rise and the disappearance of the entities and phenomena that exist within the world of the “ten thousand things” (*wanwu*).

According to a celebrated statement, which is found in one of the appendixes to the *Book of Changes (Yijing)*, “one yin and one yang, this is the Dao.” This sentence refers to the Dao that first determines itself as the One (or Oneness) and then through the One gives birth to the two complementary principles. As each of these stages generates the next one, yin and yang are ultimately contained within the Dao itself. At the same time, the phrase “one yin and one yang, this is the Dao” refers to the continuous alternation of yin and yang within the cosmos. When one of the two principles prevails, the other yields, but once one of them has reached the height of its development, it begins to recede; in that very moment, the other principle begins its ascent. This mode of operation is especially visible in the time cycles of the day (alternation of daytime and nighttime) and of the year (alternation of the four seasons).

The origins of these notions are impossible to ascertain. Scholars generally deem that the terms *yin* and *yang* originally denoted the shaded and sunny sides of a hill and later began to be used in an abstract sense as cosmological categories. The earliest extant text that contains a list of items arranged according to their yin and yang qualities is a manuscript found in Mawangdui entitled *Designations (Cheng)*, likely dating from the third century B.C.E. Examples of yang and yin items, respectively, mentioned in this text include heaven and earth; above and below; day and night; summer and winter; spring and autumn; man and woman; father and child; elder brother and younger brother; ruler and minister; soldiers and laborers; speech and silence; giving and receiving; action and nonaction.

Between the third and the second centuries B.C.E., the notion of yin and yang became one of the main pillars of correlative cosmology, a feature of which is the coordination of several preexistent patterns of emblems, including, besides yin and yang, the five agents (*wuxing*) and the eight trigrams and sixty-four hexagrams of the *Book of Changes*. Each of these patterns represents a particular way of explicating the features and functioning of the cosmos. In the system of correlative cosmology, for instance, yin is related to the agents Metal (west/autumn) and Water (north/winter), while yang is related

to Wood (east/spring) and Fire (south/summer), and the balance between them is represented by the central agent Soil. The association with the five agents is likely at the origin of the view that yin and yang are further subdivided into two states each: “minor yang” (Wood), “great yang” (Fire), “minor yin” (Metal), and “great yin” (Water).

The relations among the different cosmological configurations that intervene between the Dao and the “ten thousand things” are illustrated in the well-known *Diagram of the Great Ultimate (Taiji tu)*, which was discussed at length by both Daoist and Neo-Confucian authors. This chart depicts on top the Absolute (*wuji*) as an empty circle. Below it is another circle that represents the Great Ultimate (*taiji*) as harboring the Two, or yin and yang, shown as two semicircles that mirror each other. Each of them is made of black (yin) and white (yang) lines that enclose each other to depict yin containing yang and yang containing yin. The empty circle within these lines corresponds to the empty circle on top; this alludes to the notion that yin and yang are the “function” or “operation” (*yong*) of Emptiness, which in turn is their “substance” or “core” (*ti*). Following this are the five agents, which constitute a further stage in the progressive differentiation of Oneness into multiplicity. The lines that connect them to each other show the sequence in which they are generated, namely Wood, Fire, Soil, Metal, and Water. In this cosmological configuration, the Great Ultimate is represented by the central Soil (which is said to have a “male” and a “female” aspect) and reappears as the small empty circle below, which represents the conjunction of Water and Fire (“great yin” and “great yang”) and of Wood and Metal (“minor yang” and “minor yin”). The circle below the five agents represents heaven and earth or the active and passive principles that respectively give birth to and support the existence of the “ten thousand things,” represented by the circle at the base of the diagram.

The notions of yin and yang have deeply affected Chinese culture as a whole. Representations of these notions are found in religion, art, and several other contexts; as part of the system of correlative cosmology, moreover, yin and yang have played a central role in traditional sciences and techniques, such as divination, medicine, and alchemy. Beyond this, the search for the balance and harmony of yin and yang has had, and continues to have, a pervasive influence on the everyday lives of Chinese people.

He asked: What is the Dao?

I replied: The Dao is Ancestral Pneuma prior to Heaven that generates the creatures. If you want to look at it, you do not see it, if you want to listen to it, you do not hear it, if you want to grasp it, you do not get it. It envelops and enwraps Heaven and Earth and gives life and nourishment to the ten thousand things. It is so great that there is nothing outside it, so small that there is nothing inside it. Confucians call it Great Ultimate, Daoists call it Golden Elixir, and Buddhists call it Complete Awareness. Fundamentally it has no name, but forced to give it a name it is called the Dao. If it is determined, one is in error, and if it is discussed, one loses it. It has no body and no image, it is not form and not emptiness, it is not Being and not Non-being. If it is attributed the images of form and emptiness, of Being and Non-being, it is not the Dao. [That is, if one uses the notions of form and emptiness, Being and Non-being in relation to the Dao, then one is not talking about the Dao, because the Dao is beyond these notions.]

He asked: If the Dao is without body and without image and if it is the One inchoate pneuma, why then does the *Book of Changes* say: “One yin and one yang, this is the Dao”?

I replied: “One yin and one yang, this is the Dao” are words used to express the function (or operation) of the Dao. “Without body and without image” are words used to express the substance (or core) of the Dao. When the Great Ultimate has not yet divided itself [into yin and yang], the Dao envelops yin and yang. After the Great One has divided itself, it is yin and yang that give life to the Dao. If yin and yang were not there, the pneuma of the Dao would not be visible. It is only in the alternation of yin and yang that the pneuma of the Dao can grow and maintain itself for innumerable eons without being damaged. In the state prior to Heaven [this pneuma], it is the Dao; in the state posterior to Heaven, it is yin and yang. The Dao is the foundation of yin and yang; yin and yang are the outgrowth of the Dao. This is what is meant when one says that the Great Ultimate divides itself and becomes yin and yang and that yin and yang joined to each other form the Great Ultimate. It is One but they are Two, they are Two but it is One.

YOGA. The word *yoga* comes from a Sanskrit verbal root meaning “to yoke, harness” and in general refers to one or another of the many psycho-physical techniques in Indian religions designed to obtain discipline and control over the body and mind. In its classical contexts, yoga could refer to any one of a whole variety of such self-disciplinary practices. In India, yoga transcended sectarian boundaries. There are, for example, both Hindu and Buddhist forms of yoga and within each of these religious traditions many different kinds of spiritual methods and practices are designated by this term. None of these “yogic” methods is solely physical. All entail some form of mental discipline, which can be labeled meditation; in In-

dian religions yoga and meditation almost always went hand in hand. The physical practices of yoga were usually seen at best to be only preliminary to the more spiritual forms of yoga that utilize various kinds of meditation techniques.

It is possible that yoga goes back to the earliest period of Indian history. Figurines and seals found at sites of the Indus Valley civilization, dating back to the second millennium B.C.E., have sometimes been interpreted to indicate the practice of yoga there. In particular, one seal depicts what appears to be a deity sitting in a posture typical of later yoga. In the earliest Sanskrit texts of the Vedic period (c. 1500–1200 B.C.E.) there are references to ascetics and ecstasies called *munis* (“silent sages”) who are depicted with long hair, are said to be “girdled by the wind” (meaning, possibly, naked), and are described as having some of the superhuman powers later associated with advanced yoga practice. The Atharva Veda mentions a group called the *vratyas* who practice asceticism (they are said to be able to stand for a year) and assume other physical postures as part of their disciplinary regimen. They also seemed to have practiced some kind of breath control and envisioned correlations between their bodies and the cosmos.

Also already in the Vedic texts we encounter the theory and practice of *tapas* or “ascetic heat” which, when obtained by the practitioner through various methods of physical and mental asceticism, was said to impart similar powers and spiritual purity. *Tapas* was in later texts to come to the forefront of the essential disciplinary practices that were involved in yoga.

By the time of the later texts of the Vedic period, the Upanishads of the third or fourth centuries B.C.E., the word and conceptualizations of *yoga* are encountered frequently. In these texts, *yoga* means primarily the control of the mind and the senses. The senses are likened to horses which must be “yoked” or “disciplined” by the yogin (yogi) whose “mind is constantly held firm” and whose “senses are under control like the good horses of a charioteer. . . . They consider yoga to be the firm restraint of the senses. Then one becomes undistracted” (Katha Upanishad 3.6; 6.11). In these texts some of the physical practices of yoga are also described. The practitioner is advised to retreat to a pleasant place in the wilderness where he should assume a particular physical posture (or *asana*) and “breathe through his nostrils with diminished breath” (the practice of breath-control called in later yogic texts by the name of *pranayama*). Yoga is defined in one such Upanishad as “the unity [another possible translation of the word “yoga”] of the breath, mind, and senses, and the relinquishment of all conditions of existence” (Maitri Upanishad 6.25). As the yogin progresses in his practice his body and mind are said to change: “Lightness, healthiness, freedom from desires, clearness of countenance and pleasantness of speech, sweetness of odor and scanty exertions—these, they say, are the first stage in the progress of yoga” (Shvetashvatara Upanishad 2.13). The final stage of the practice, the goal of yoga, is also depicted in the Upanishads—and will become standard in later yogic texts. It is nothing less than the state of deathlessness or eternal life, often imagined in a body of light that never degenerates or grows old.

Yoga was systematized in different ways in two foundational texts dating to around the turn of the Common Era. In the first of these classical treatises, the Bhagavad Gita or “Song of the Lord,” yoga is used to describe three apparently distinct but practically interrelated “paths” or spiritual methods. The first of these is called *jnana yoga* or the “yoga of wisdom.” This path consists of deep contemplation on the nature of reality and recognizing the difference between the phenomenal world of change and the unchanging self. Through such meditation, the yogin penetrates the illusory nature of appearances and realizes the ultimate unity of all things and beings. As the Gita is also a theistic (or pantheistic) text, *jnana yoga* also entails recognizing God or Krishna in all things.

The second kind of yoga in this syncretistic work is *karma yoga*, the yoga of action. This method is one of “doing one’s duty” as it is laid out by the strictures of caste and stage of life (and not renouncing action in the world as seemed to be required by the earlier Upanishadic treatises). Such worldly activity must, however, be performed in a “yogic” and self-disciplined way. While one cannot avoid action, the yogin should act not out of desire for the fruits of action but rather in a desireless and self-sacrificial way. Renouncing the ends or goals, the practitioner of *karma yoga* was to perform

desireless action dedicated to God. The third yoga outlined in the Bhagavad Gita was termed *bhakti*, “devotion,” and was nothing other than the “yoking” or “union” of the self and God. It is depicted as the easiest of the three methods but also the most efficacious.

The other text of this period to synthesize yoga was the Yoga Sutra of Patanjali. Patanjali defines yoga as the “cessation of the turnings of thought,” that is, the purification and calming of the mind and the correlative attainment of higher states of consciousness. Yoga for Patanjali involves eight “limbs” or parts (*ashtanga*), each one leading to the next and culminating in release from suffering and rebirth.

The first two limbs provide the ethical foundation thought to be necessary for any further progress in yoga. The first consists of the five “moral restraints” (*yamas*): nonviolence, truthfulness, not stealing, chastity, and the avoidance of greed. The second limb, the internal “observances” (*niyamas*), provides a second set of five virtues the practitioner should perfect. These are mental and physical purity, contentment, *tapas* or the practice of austerities and asceticism, the study of sacred texts, and devotion to the “Lord” (God or the guru).

The third part of Patanjali’s eightfold path consists of the physical postures or *asanas*. When the yogin has disciplined his or her moral life, the next step is to discipline the physical body. The later traditions of yoga have greatly expanded this dimension of the yogic path. The physical practices are sometimes referred to as *hatha yoga* (the “yoga of exertion”) and are conceived of in terms of a rigorous program of physical exercise and digestive constraint thought to be preparatory to the more advanced and subtle forms of yoga. Some texts claim there are 840,000 yogic physical postures; a standard list gives 84 including, most famously, the “lotus position” (*padma asana*). Such postures are designed to make the practitioner’s body supple and healthy and help in the general training of self-discipline. Patanjali, however, devotes a mere three verses to the purely physical dimension of yoga, saying only that one should take a position that is “steady and comfortable,” for then one is ready to pursue the true goal of yoga, the state of mind wherein one is “unconstrained by opposing dualities.”

More subtle than the physical body is the breath, and it is the “restraining of the breath” (*pranayama*) that forms the fourth limb of the practice. Here again, later yogic texts go into much greater detail about the various practices of breath awareness and control, including methods for retention of the breath over long periods of time. The breath is regarded as the fundamental life force in yoga, and control and manipulation of it is essential for rejuvenating and immortalizing the body. Its power is such that some texts warn about the dangers entailed in the *pranayama* practices and, as always, insist that the yogin should only practice under the watchful guidance of a master. Patanjali has little to say about it, restricting his observations to the fact that it basically refers to the control of inhalation, exhalation, and retention of breath and that it has as its purpose the making of a “mind fit for concentration.”

The next stage of Patanjali’s system is named the “withdrawal of the senses” (*pratyahara*) by which is meant the kind

of “yoking” of the sense organs that was likened to the reining in of horses. Another very common image for this portion of the yogic training is that of a tortoise who withdraws its limbs into its shell. So too should the yogin disengage the sense organs from the objects of senses and, by means of such detachment, gain mastery over them. The ability to turn away from the distractions of the object of senses and to increasingly turn attention to the mind itself in a concentrated fashion is, of course, crucial for the meditative pursuits that describe the highest and most subtle forms of yoga.

The sixth, seventh, and eighth limbs of Patanjali’s yogic system are progressively higher states of meditative ability and attainment. The sixth is called “concentration” (*dharana*), defined as the ability to “bind thought in one place” for long periods of time; it is the essence of what is sometimes known as “one-pointedness” of mind. The mastery of concentration leads the yogin to the next the stage of the path, which is called “meditation” per se (*dhyana*), the unwavering attention of the concentrated mind on the meditative object. The culmination of yoga is the attainment of the eighth limb, pure contemplation accompanied by ecstasy or, otherwise described, the trance-like state of pure “enstasis,” which is termed *samadhi*. The end of the yogic path is defined by Patanjali as “meditation that illumines the object alone, as if the subject were devoid of intrinsic form.” The “yogin yoked in *samadhi*” is, according to a later text in this tradition, completed liberated—free from the “pairs of opposites” or all duality, not bound by the forces of karma, unconquerable, “without inhalation and exhalation,” invulnerable to all weapons, and immortal (Hatha Yoga Pradipika 4.108ff.).

Indeed, much of the third chapter of Patanjali’s classic text is given over to the extraordinary powers (the “accomplishments” or *siddhis*) that are claimed to come along with advanced practice of yoga. These include the ability to know the past and future, the languages of animals, one’s previous lives, the thoughts of others, and so on. It is, in fact, said that the perfected yogin becomes omniscient. He or she also attains the power to become invisible, gets the “strength of an elephant,” and wins the capability to grow larger or smaller at will. In later texts, abilities such as these are summarized as the eight “great powers” (*mahasiddhis*): miniaturization, magnification, levitation, extension, irresistible will, mastery, lordship over the universe, and fulfillment of all desires.

The yoga systematized in Patanjali’s Yoga Sutras is sometimes referred to as “classical” or “royal” yoga (*raja yoga*), especially in contrast to the *hatha yoga*, which is envisioned as preparatory to the higher spiritual practices of Patanjali’s later limbs. It also came to be the charter text of the school of Hindu philosophy (*darshana*) called “Yoga,” which in turn was closely related to the dualistic philosophical school known as “Samkhya” (the main difference being the atheistic quality of the latter, although the “Lord” of the Yoga Sutras is more of a Divine Yogin than a creator god). In these philosophical traditions, the purpose of yoga was understood to be the “distinction” or “discrimination” between material nature and the eternal spirit. The spirit or pure consciousness (*purusha*) is to be “isolated” from both matter and from ordinary awareness

and its afflicted mental experiences. When the *purusha* becomes thus disentangled, its pure nature can shine forth and the yogin becomes liberated.

The term *yoga*, as has already been shown, can be applied to a variety of practices and disciplines. Another important use of the term is in the phrase *mantra yoga*, the “yoga of sacred, efficacious sound.” Here yoga refers to the concentration on and repetition of sacred sounds, utterances, syllables, or prayers composed from the Sanskrit language and thought to have inherent transformative power. Such mantras are transmitted from teacher to pupil in an initiatory setting, and it is indeed thought to be primarily the power of the guru that gives the mantra its efficacy. The most famous of such mantras is the sound “*om*” (sometimes written as “*aum*” to emphasize the three verbal parts of the utterance) which is regarded as the aural essence of the universe itself. While the texts do claim that *mantra yoga* will also lead to liberation, it is usually said to be suitable mainly for the practitioner of inferior intellectual capabilities.

Yoga also plays a major role in both Hindu and Buddhist “tantric” or esoteric traditions, which arose around the middle of the first millennium C.E. In Buddhism, tantric practice is divided into four classes, each one regarded higher than the other: action tantras, performance tantras, yoga tantras, and highest yoga tantras. In all forms of tantra, the goal is to transmute the physical body into a body of light, a “rainbow body,” through the manipulation of the subtle energies, channels, and power centers (*cakras*) of the mystical inner body. This is done through the practices known as *guru yoga*, the “yoking” of oneself to a tutelary deity or *yidam*, and the carrying out of a series of visualizations in which one assumes the being of that deity and meditates in that way. There is also a form of “Taoist yoga” in China that bears comparison to the Indian yogas.

Yoga has entered the West mostly as physical exercise and often not as the holistic worldview it was in its original contexts. Increasingly, however, Westerners are aware of the ethical and meditative dimensions to yoga and these elements are finding their way into the practice of yoga outside of India.

ZEN. One of the most important scholars of Zen Buddhism, Daisetz Suzuki, cogently explained the origins of Zen Buddhism in 1959:

Zen is one of the products of the Chinese mind after its contact with Indian thought, which was introduced into China in the first century C.E. through the medium of Buddhist teachings. There were some aspects of Buddhism in the form in which it came to China that the people of the Middle Kingdom did not quite cherish: for instance, its advocacy of a homeless life, its transcendentalism or world-fleeing and life-denying tendency, and so on. At the same time, its profound philosophy, its subtle dialectics and penetrating analyses and speculations, stirred Chinese thinkers, especially Taoists. (p. 3)

For several centuries in China, it was thought that Buddhism was a form of Daoism returning from India along the Silk Roads. Bernard Faure relates: “At the end of his life Laozi, in the guise of the Buddha, was said to have departed to the west to convert the barbarians. To punish them for their initial lack of faith, he condemned them to celibacy” (p. 39). Conversely, the Buddhists claimed that Laozi and Confucius were sent to China to pave the way for Buddhism. In any event, many forms of Buddhism arrived in China from India.

Between the sixth and tenth centuries, Buddhism reached its apex in China with the appearance of four schools: *Tiantai* (Celestial Platform), *Huayan* (Flower Garland), *Jingtu* (Pure Land), and *Chan* (Meditation). The Sanskrit word *dhyana* is transcribed as *Chan* in Chinese and *Zen* in Japanese, meaning “collectiveness of mind or meditative absorption in which all dualistic distinctions like *I/you*, *subject/object*, and *true/false* are eliminated” (Schuhmacher and Woerner, p. 441). Chan is a melding of Dhyana Buddhism with its emphasis on the stillness of meditation toward enlightenment or awakening (*wu*, *satori*) and Daoism with its emphasis on nonaction (*wuwei*) as the way of the water. Bodhidharma (470–543), the twenty-eighth patriarch after Shakyamuni Buddha, arrived from India at the Shaolin temple in China, where he practiced seated meditation (*zuo chan*, *zazen*) for nine years in front of a wall. This meditation aimed to clear the mind of daily desires while allowing the sitter to connect his or her true nature with the universe through the achieving of *śūnyata* (*kong*, *ku*, emptiness). Ninian Smart states that Bodhidharma, the first patriarch, is reputed to have summarized his teaching as follows: “A special transmission outside the scriptures; No basis in words or writing; Direct pointing to the mind of people; Insight into one’s nature and attainment of Buddhahood” (p. 126).

The sixth patriarch, Huineng (638–713), refined Bodhidharma’s teachings by emphasizing master-student relationships in monasteries and meditation upon what later would become “public documents” (*gongan*, koan) or unsolvable riddles. One day Huineng encountered two monks arguing about a flag waving in the breeze. One monk said that the flag was inanimate and that only the wind made it flutter. The other monk

said there was no flapping at all because only the wind moved. Huineng intervened. He said that neither the flag nor the wind moved, only their minds.

Huineng debated with Shenxiu (606–706) regarding immediate or gradual enlightenment. He relates:

“Good friends, in the Dharma there is no sudden or gradual, but among people some are keen and others dull. The deluded commend the gradual method; the enlightened practice the sudden teaching. To understand the original mind of yourself is to see into your own original nature. Once enlightened, there is from the outset no distinction between these two methods; those who are not enlightened will for long kalpas be caught in the cycle of transmigration” (Yampolsky, p. 137).

Shenxiu’s northern school of gradual enlightenment soon gave way to Huineng’s southern school of immediate enlightenment. Willard Oxtoby observes that Huineng’s school “became known for freedom of expression and respect for the natural. Similar characteristics are associated with Daoism” (p. 270). At this time, China was ripe for Chan Buddhism. Kenneth Ch’en writes: “For over one hundred and thirty years, from 625 to 755, the T’ang Dynasty had enjoyed tranquility, security, and prosperity without any internal rebellion or external invasion to mar the orderly march of events. During this era all phases of Chinese culture, religion, art, and literature enjoyed a long period of free growth and development” (p. 360).

In the ninth century, the *Caodong zong* (Caodong school) and *Linji zong* (Linji school) sects of Chan Buddhism carried on the rivalry of gradual and sudden enlightenment. Caodong favored gradual, silent enlightenment through seated meditation. The gradual stillness of mind is like “the bird hatching the egg” (Oxtoby, p. 272). Linji favored immediate awakening through the practice of shouting, beating, and paradoxical sayings that were later compiled as *gongan*. Unanticipated shouting and blows between master and pupil could result in enlightenment. Similarly, reflection on riddles could end in a sudden awakening, like “the blossoming of a lotus or the sun emerging from behind the clouds” (Oxtoby, p. 272). The Linji master might answer a student’s query “Who is the Buddha?” with the quip “three pounds of flax.” Alternatively, the master might propose the riddle “What is the sound of one hand clapping?” The purpose was to encourage the student to abandon all logic and reasoning while searching for peace in the quietude of meditation.

During the Southern Song dynasty of the twelfth century, the interaction of Chinese and Japanese monks stimulated the migration to Japan of Linji (Rinzai Zen) and Caodong (Soto Zen). Eisai (1141–1215) brought Rinzai and Dogen (1200–1253) brought Soto. The Kamakura period (1185–1333) was a watershed for Zen Buddhism. Rinzai’s emphasis on the controlled discipline of seated meditation and the contemplation of koan became popular among the ruling samurai clans at Kamakura. Soto’s more exclusive focus on seated meditation

appealed to the peasantry. Zen's influence in the arts included painting, literature, and calligraphy and carried on well into the modern era. Zen and the sword, Zen and archery, Zen and tea were intimately connected to samurai culture.

The juxtaposition of Zen's humanity and samurai warfare is difficult for Westerners to understand. At Shaolin, the Chan monks practiced martial arts (*gongfu*) to keep themselves physically fit while defeating their worst enemy: their own desire. In a world of suffering, desire is the root of misery. To do away with desire is to clear a way to the "extinction" of suffering (nirvana). In Japan the samurai were intimately linked to Zen. If Buddhism is the pure negation of the will as the extinguishing of desire, then Bushido (the warrior's way) is the pure will as the negation of the negation or the annihilation of nirvana. The juxtaposition of Zen and the warrior spirit is the essence of samurai culture. This alluring paradox is one reason that Suzuki's style of Rinzai Zen became popular in the Western world after World War II.

ZIONISM. The historians of nationalism have reached a consensus that modern nationalism began as a secular movement, but almost all its varieties were affected by an undertow of older religious sentiments and loyalties. In many of the nationalisms (for example, in the battles between Greeks and Turks in the second decade of the nineteenth century or in the quarrel between Catholics and Protestants in Northern Ireland) the religious dimension of the quarreling nationalisms was clear and avowed. In the case of Zionism the reverse seemed to be true. When modern Zionism appeared in the nineteenth century, it defined itself in secular terms. It did not come into the world to bring about the age of the messiah that had been foretold in many of the classic texts of the Jewish religion. Zionism offered to answer two major problems that faced contemporary Jews. They were victims of large-scale persecution, most overtly in Eastern Europe, and the Jewish intelligentsia were being all too attracted to the promise of

equality in society—which was apparently only being offered to those who were willing to abandon their separateness and assimilate into the non-Jewish majority. The modern Zionist movement suggested that a Jewish national home would help solve the problems of persecution and assimilation (the Zionists really meant that they wanted a state of their own). Jews would have a homeland that would always gladly receive them, and Jews who were conflicted about their identity would be able to deal with this question in the safe and nurturing environment of a Jewish community in which they were an autonomous majority.

The question of religion did, inevitably, arise at the very beginning of modern Zionism. In the 1830s two rabbis from Central Europe, Yehudah Hai Alkalai and Zvi Hirsch Kalischer, each proposed that with nationalism burgeoning all around them—the Greeks had just won their revolt against the Turks, and other European nationalities were arising to fight for their independence—it was time for the Jews, who could trace their national existence back to biblical times, to assert their own unique identity. Surely, so Alkalai and Kalischer argued, as the oldest of all nationalities, the Jews had the right and even the duty to lead the contemporary parade of nations who were asserting their rebirths. But Alkalai and Kalischer, both of whom were not only rabbis learned in the Talmud but scholars of the Kabbalah (Jewish esoteric mystical teaching), were very careful to deny that they were announcing the beginning of a messianic movement. They held fast to the inherited doctrine that the messiah could come not as the result of human action, but as a free gift from God. The nationalism that Alkalai and Kalischer were suggesting might have some connection to messianic hopes: kabbalistic teaching had allowed that "stirrings down below" might act to remind heaven of the longing of the Jewish people for the messiah, but no political program could be built on this hope. In the nineteenth century peoples were defining themselves by their history and group identity; the Jews should therefore cease to think of themselves as a persecuted minority and begin to assert themselves as a people among the peoples of the earth.

Thus, it is inaccurate to label even the "religious Zionists" as the ancestors of contemporary Zionist messianism. This element in present-day Zionism descends from two sources; the first is the confusion that existed in the minds and hearts of some of the most seemingly secular of the Zionist leaders and thinkers. For example, Chaim Weizmann (1874–1952), the long-time leader of the World Zionist Organization and the first president of Israel, made no secret of the total secularity of his way of life. Nonetheless, at every crucial moment in the debate over the rights of Zionists to a Jewish national home and, ultimately, to a state in the Holy Land, Weizmann invoked sacred Scripture. He kept saying that "the Bible is our charter." The Zionist contemporary who was second only to Weizmann, David Ben Gurion (1886–1973), the first prime minister of Israel and the man who led the country to win its independence, was an even more avowed secularist than Weizmann. After years of studying his work, the author of this entry reached the conclusion that he was best defined by a paradox: there is no God, but he chose the Jewish people and gave them the land of Israel. So, at the time of Israel's as-

ounding victory in June 1967, when it conquered the large territories all the way to the Jordan River and the Suez Canal, the pervasive mood in Israel and among the Jewish people as a whole was that a miracle had happened. Never mind whether it was God or the inherent “spirit of the Jewish people” that had performed the miracle. Most Jews were sure that they were living in a version of messianic times; they were free to carve out their own destiny, at least in much of the land that was now under their control.

The second source of the new messianism was in a change in the theology of the Orthodox Zionists. In the first years of the twentieth century a young and universally respected rabbinic scholar and Kabbalist, Rabbi Abraham Isaac Kook (1865–1935), arrived in Jaffa to assume the post of chief rabbi of its growing Jewish community. Kook insisted that the Jews were indeed living in messianic times. He asserted that the new Zionist movement, despite its pronounced bias against religion, was despite itself an instrument of God’s hands. Modern Zionism was reviving the sacred language, Hebrew. Kook insisted that the religious character of the tongue of the Bible was so deeply ingrained that the revival of Hebrew would inevitably act to bring contemporary Zionists closer to their roots. The secular Zionists, so Kook continued, might think that they were engaged in regaining the soil of the Holy Land for a contemporary Jewish state, but this soil was inherently holy; the labor to regain it and to dwell in it would soon transform the self-avowed secular people who were devoting their lives to this task. When World War I broke out in 1914, Rabbi Kook interpreted this enormous bloodletting as the war of Gog and Magog, the ultimate destructive war that had been foretold as the last preamble to the messianic age. The gentile world was destroying itself, and the moral credit of its achievements was now worthless. So it went after each major turning point in the course of the Zionist revival. Kook saw every event as part of the immediate drama of messianism.

Kook was clearly a holy man, but his teaching contained a unexploded bomb. If the Jewish people were living in the immediate preamble to the messianic age, as he maintained, then what was to be done with the disappointments and the blockages that would occur on the path to redemption? Kook died in 1935, so these questions were left to a lesser figure, his son, Rabbi Zvi Yehudah Kook (1891–1981), to contemplate. He ultimately succeeded his father as the head of the *Mercaz Harav* (“the rabbi’s center”), the *Yeshiva*, the School of Talmudic Learning and Theological Thought, which the father had established. This school taught its students not only the conventional studies in Talmudic literature that were the staples of the other *yeshivot*. At this unique school the students were taught to enter the army and to prepare themselves to be elite combat troops. These young people were imbued by Zvi Yehudah Kook with an activist faith that it was their privilege and duty to help bring the messiah soon, in their own day—and Zvi Yehudah Kook never gave up the dream that all of the land that the Jews had possessed in biblical times, including especially the West Bank, would and must be returned to the Jewish people. The enormous and heady victories of the Six-Day War in 1967 were hailed in this religious circle as proof of their ideology. Yes, the messianic miracle had occurred, and

the whole of the land of biblical Israel must now be possessed and never returned. Jewish settlement on the West Bank was a religious commandment, and those who opposed such settlements or hindered them or threatened to make them impossible were never to be forgiven. The most extreme thinking among this element was expressed by some younger people, especially among the rabbis who ministered to the new communities in the West Bank. Several of them were accused of encouraging Yigal Amir, the assassin who murdered Israel’s prime minister, Yitzhak Rabin, in 1995. Rabin’s “sin” was that he had signed the agreement that Israel and the Palestinians had made secretly in Oslo in 1992. On behalf of Israel, Rabin had agreed to allow the Palestinians ultimately to establish a state of their own on the West Bank. He was therefore regarded by the hard-line believers in the “undivided land of Israel” as leaning toward religious and national treason.

At the start of the twenty-first century the shock of this murder had not abated because the activist minority—probably 20 percent of Israel’s population—made no secret that it would engage in civil, and some even in armed, disobedience against any Israeli government that intends to allow the Palestinians a state of their own on most, or almost all, of the West Bank. This embitterment had the most profound effect on the question of the very nature of the Zionist enterprise. When modern Zionism was created, there was an existing consensus among all its factions that the highest authority within the Zionist movement would be the civil government of the national home that was being established. To be sure, from the very beginning a certain amount of respect was extended to the religious elements within the Jewish community. There was no question that the kitchens of the Israeli army would be kosher everywhere and that the Orthodox rabbinate would be given the ultimate authority on such matters as marriage and divorce among Jews. Through the years some elements in Israel have chafed under these controls, but the majority have made peace with the amount of religious coloration that exists in Israel’s public life, but these issues were essentially peripheral. They did not involve religious judgments on the foreign policy of Israel or the questions of relations with the Arab world. In the aftermath of the Six-Day War of June 1967, the newly awakened messianic believers reframed their Zionist aims as politically maximalist. The new messianists proposed to enact their program in the name of God’s will.

More recently, in the first years of the twenty-first century, modern Zionism is under attack from two other perspectives. The ultraright Zionists are ever more forthright in insisting that if the messiah does not come soon, they will at least solve the problem of keeping a Jewish state Jewish even as it controls a population that, between the Mediterranean and the Jordan River, is already half Arab, either by denying the Arabs full political rights or by creating the conditions for the large-scale “transfer” of Arabs from the land of Israel. Such thinking used to be anathema to the Israeli mainstream, but it has become more thinkable as the armed conflict between Jews and Palestinians has become ever more embittered. By the end of 2003, there were well over two thousand dead among the Palestinians, but there had been nearly a thousand casualties

among the Israelis since the outbreak of the “second intifada” in 2000. These deaths occurred in guerrilla warfare, including suicide bombings by the Palestinians, and in reprisals by the Israelis. In the current struggle, Israel’s moderates have diminished after each suicide bombing, and no new moderates have appeared among the Palestinians. It seems ever less likely that Israelis and Palestinians will find a way to put their hurts behind them and make peace across the table. They will need strong leadership and pressure from the United States and from some of the rest of the international community.

By April 2004 Sharon made the first step toward accepting a notion that no one had ever expected he would accept: the demographic balance in “the undivided land of Israel” was shifting toward an Arab majority. He, therefore, proposed that the Israelis begin by evacuating all 7500 settlers from the Gaza Strip and leaving that to Arab rule. Despite opposition from his own Likud party, Sharon insisted ever more openly that demography commands Israel to cease ruling an unwilling and hostile Arab majority. Sharon’s policies make an Arab state living beside Israel an inevitability, but one that will take much military and political turmoil to work.

On the side of the Palestinians and their sympathizers, especially in the Arab world, there is equally strong awareness that demographic trends are producing an Arab majority in the supposedly “undivided land of Israel.” The basic Arab policy seems to have moved in the direction of waiting out the next few years and then demanding that only one state should exist in this land but that this state should be ruled by the principle of “one man, one vote.” This notion is often dressed up as the realization of the great democratic dream, a binational state of Jews and Arabs, in which Jews can be assured that a growing Arab majority will not treat them harshly. Most of those who argue this view, however, do not manage to hide their indifference, or even glee, at the thought that the Zionist venture would then be over. The Jewish state would be gone; it would be replaced by a state with an Arab majority. All the claims that the Jews have made concerning their need and their right for a state of their own in which they could make their own destiny by their own rights would end in failure. These Jewish notions seemed plausible—so the argument goes—only late in the nineteenth century and early in the twentieth when nationalism and even colonialism still had some credit in the world.

But modern Zionism will not die so easily and certainly not in the pages of left-wing journals in the Western world or in the pronouncements by Islamic nationalists in their own media in the Arab world. The Jews who founded Zionism and their followers who began to come to Palestine more than a century ago to establish the modern Zionist presence did not suffer and die so that, as Chaim Weizmann once said, they might become “Hebrew nationals in a Palestinian State.” Zionists will not allow the state of Israel to pack up and leave but are determined to stay put despite the bitter quarrels. Devotion to Israel’s survival as a Jewish state does, and will, force it to fight. By the same token, the Palestinians are not going to leave. The Arab states in the Middle East have no desire to absorb any substantial number of Palestinian Arabs, and the

world as a whole, especially the West, is not overly hospitable to those who would enter it as part of a new mass migration.

These considerations already existed many decades ago when it became clear that Jews and Palestinian Arabs were, despite themselves, having to find ways of living in some tolerable peace. The reigning suggestion was defined in 1937 by the Peel Commission, the highest-level investigation into the conflict in the Holy Land that the British authorities ever empowered. This body knew very well that there was no happy answer to the conflict between Jews and Arabs, but they ruled that the least obnoxious and most likely mode of making some tolerable peace would be the partition of the land between Jews and Arabs. Ten years later in 1947, the nascent United Nations reiterated the conclusions of the Peel Commission and voted to divide the land between a Jewish and an Arab state. On neither of these two occasions was the recommended solution enacted peacefully because the bulk of the Palestinians and their Arab confederates refused to recognize the legitimacy of giving the Jews even one ell of the land of Palestine for a state of their own.

The most interesting new development lies not in Palestinian and Arab opinion, but in a substantial shift among many political liberals who had traditionally supported the Zionist vision and program. This change in opinion began in some circles in 1967 when parts of the liberal intelligentsia shifted allegiance during and after the Six-Day War. They found reason to be annoyed with the Jews for concentrating on so parochial a purpose as the survival of the Jewish state and not on such wider concerns as America’s misdeeds in the Vietnam War and, more immediately, on the pains and needs of the Palestinians. By 1967 the memory of the Holocaust, the murder of six million defenseless Jews in Europe, had begun to fade, and the Jewish people as a whole were becoming for many in the liberal left an annoying reminder of past deaths and past guilts. Israel was now a going concern—an increasingly powerful one—and thus the Palestinians became the new “victims” of choice. The undertow of this change in political faction was an increasing impatience with the unique demands that the Zionist state was making for special consideration for the Jewish people.

Why, indeed, should the Jews need a state of their own? The main charge that the Arab states have kept raising against the state of Israel is that it is a “rabbinic theocracy” but no one has challenged almost all of the Arab states to not conduct themselves as “Muslim theocracies” with scant concern for the right of minorities. On the contrary, left-liberal doctrine insisted that Jewish nationalism should disappear even as most other nationalisms in the world have an unquestioned right to continue. The most interesting part of this phenomenon is that some of its theories are being advanced by Jews. The older assimilationist doctrines, which stated that the Jews should meld into the majority among whom they lived, are being applied even to the Zionist community in the Middle East: it should accept and gladly welcome absorption among the many million of Arabs in the region.

In the early twenty-first century it is being argued by various spokesmen of the liberal left—many Arabs and some

Jews—that the Zionist state should be dismantled. Let one state be established in which the inevitable Arab majority could supposedly be trusted to treat the Jewish minority fairly according to democratic principles. Anyone who knows the history of the region and has any reasonable assessment of the present tensions knows that this vision is a pipe dream. It is advanced by people who might wring their hands when a supposed democracy of Jews and Arabs in one state does not live up to its promises, but then these thinkers will have lost interest in the problem. Of all the visions that are being held out to the warring Israelis and Palestinians, the one-state solution is by far the least likely because neither side to the conflict can trust the other to rein in its maximalists.

The most sober assessment has to be that the problems will continue and that the conflict will not be easily resolved, but modern Zionism and its creation, the state of Israel, are here to stay. Its future is not guaranteed by the coming of the messiah soon, but Israel is not ultimately threatened even by the intifada and the suicide bombers. It exists and will continue to exist by the will of its own people. Jews will not surrender their claim to a home of their own to which those who need to come may come freely, nor their claim to a national center of their own in which Jewish energies may continue to define what the long past of this people means in the present and what it can be understood to mean in the future.
