*Dedicated to all  
past and present contributors  
and  
supporters of Toronto Notes  
who have made the production of the 2017 edition possible!*

The *Toronto Notes* is dedicated to helping fund many charitable endeavours and medical student initiatives at the University of Toronto's Faculty of Medicine. Programs that have received *Toronto Notes* funding include:

**Community Affairs Projects**

- Saturday Program for Inner City High School and Grade 8 students
- St. Felix Mentorship Program for Inner City children
- Parkdale Mentorship Program for Grade 10-12 students
- WoodGreen Community Centre
- Let's Talk Science
- Growing Up Healthy

**Annual Faculty Showcase Events**

- Bruce Tovee Lecture Series
- Daffydil, in support of the Canadian Cancer Society
- Earthtones Benefit Concert
- Convocation and Ceremonies

**Medical School Clubs**

- Books with Wings
- Women in Medicine
- University of Toronto International Health Program
- Complementary and Alternative Medicine
- Peer Support for Students
- History of Medicine Society
- Faculty of Medicine Yearbook

**Scholarships and Bursaries**

- Nishant Fozdar Memorial Award
- Graduating Medical Class Scholarships and Bursaries

**NOTE:**

Many of you have wondered about the *Toronto Notes* logo, which is based on the rod of Asclepius, the Greek god of medicine. The rod of Asclepius consists of a single serpent entwined around a staff. This icon symbolizes both rebirth, by way of a snake shedding its skin, and also authority, by way of the staff.

In ancient Greek mythology, Asclepius was the son of Apollo and a skilled practitioner of medicine who learned the medical arts from the centaur Chiron. Asclepius' healing abilities were so great that he was said to be able to bring back people from the dead. These powers displeased the gods, who punished Asclepius by placing him in the sky as the constellation Orphiuchus.

The rod of Asclepius is at times confused with the caduceus, or wand, of Hermes, a staff entwined with two serpents and often depicted with wings. The caduceus is often used as a symbol of medicine or medical professionals, but there is little historical basis for this symbolism.

As you may have guessed, our logo uses the rod of Asclepius that is modified to also resemble the CN Tower – our way of recognizing the university and community in which we have been privileged to learn the art and science of medicine.

Thomas O'Brien, MD  
Class of 2009  
M.D. Program, University of Toronto

# Preface – From the Editors

Dear Readers,

As the Editors-in-Chief of *Toronto Notes 2017*, we are proud to present this updated edition.

Toronto Notes began humbly in 1985 from a set of student notes circulated among medical students at the University of Toronto. Over time, Toronto Notes has grown into one of the premier study resources for generations of Canadian medical trainees. This rich history solidified our commitment to publish a comprehensive study resource for medical students engaged in clinical rotations and studying for both the Canadian MCCQE Part 1 and USMLE Step 2.

For the past 32 years we have remained committed to our original vision. The 2017 edition of *Toronto Notes* contains significant improvements including:

1. A new emphasis on 'Approaches to Common Clinical Presentations' in addition to traditional content organized by disease.
2. A completely revised Psychiatry chapter incorporating the DSM-V in a quick-to-reference and readable format.
3. The Toronto Notes Quiz App, which is available for free on iTunes and Google Play. This app contains hundreds of questions allowing users to test themselves on the content contained within *Toronto Notes*.
4. A significantly improved interactive eBook with many new high-quality colour images.
5. A brand-new Clinical Handbook that is more concise, has numerous new figures, and features approaches to hundreds of common clinical situations.

*Toronto Notes 2017* is produced by Toronto Notes for Medical Students Inc., which is a non-for-profit organization supporting various charity organizations in the city of Toronto. This year Toronto Notes for Medical Students has supported organizations including medical school clubs, community outreach groups, student bursaries and scholarships, and the Canadian Cancer Society. Your purchase of *Toronto Notes 2017* is much appreciated by these well-deserving groups.

We would like to highlight the exceptional work of our team, composed of over 150 medical students, medical illustrators/artists, and faculty members at the University of Toronto Faculty of Medicine. Without the tireless effort expended by these individuals the production of *Toronto Notes 2017* would not have been possible. In particular, we would like to highlight the work of the executive team, all of whom made personal sacrifices in balancing their clinical and academic duties with the responsibilities asked of them: our production managers, Tina Binesh Marvasti and Sydney McQueen, our associate editors, Narayan Chattergoon, Desmond She, Claudia Frankfurter, Inna Gong, Dhruvin Hirpara, and Sneha Raju, and our EBM editors, Arnav Agarwal, Quynh Huynh, Robert Vanner, Brittany Prevost, Simran Mundi, and Valerie Lemieux. We also want to highlight the work of Rajkumari Chatterjee from University of Toronto Bookstore, who has contributed to the production of *Toronto Notes* for the past ten years, and has been instrumental in the annual launch of the *Toronto Notes Ebook*. Lastly, we would like to thank our partners at Type & Graphics Inc., particularly Enrica Aguilera, for their assistance during the production of *Toronto Notes 2017*.

We hope that *Toronto Notes 2017* enhances your medical knowledge and allows you to perform better on both your clinical rotations and licensing exams. We continue to encourage feedback – this year, we have read and incorporated every piece of feedback we received regarding the previous edition of *Toronto Notes*. On behalf of the *Toronto Notes 2017* team, we wish you success in your studies and academic endeavours.

Sincerely,

**Jieun Kim**, MSc, MD/PhD Candidate and  
**Ilya Mukovozov**, MSc, PhD, MD Candidate  
Editors-in-Chief, *Toronto Notes 2017*  
MD Program, University of Toronto

# Acknowledgements

We would like to acknowledge the exceptional work of all previous Toronto Notes (formerly MCCQE Notes) Editors-in-Chief and their editorial teams. The 33rd edition of this text was made possible with their contributions.

# How to Use This Book

This book has been designed to remain as one book or to be taken apart into smaller booklets. Identify the beginning and end of a particular section, then carefully bend the pages along the perforated line next to the spine of the book. Then tear the pages out along the perforation.

The layout of *Toronto Notes* allows easy identification of important information. These items are indicated by icons interspersed throughout the text:

Icon	Icon Name	Significance
	Key Objectives	This icon is found next to headings in the text. It identifies key objectives and conditions as determined by the Medical Council of Canada or the National Board of Medical Examiners in the USA. If it appears beside a dark title bar, all subsequent subheadings should be considered key topics.
	Clinical Pearl	This icon is found in sidebars of the text. It identifies concise, important information which will aid in the diagnosis or management of conditions discussed in the accompanying text.
	Memory Aid	This icon is found in sidebars of the text. It identifies helpful mnemonic devices and other memory aids.
	Clinical Flag	This icon is found in sidebars of the text. It indicates information or findings that require urgent management or specialist referral.
	Cross-Reference	This icon is found in sidebars of the text. It indicates a cross-reference for information that is discussed in a separate chapter.
	Evidence Based Medicine	This icon is found in sidebars of the text. It identifies key research studies for evidence-based clinical decision making related to topics discussed in the accompanying text.
	Colour Photo Atlas	This icon is found next to headings in the text. It indicates topics that correspond with images found in the Colour Photo Atlas available online ( <a href="http://www.torontonotes.ca">www.torontonotes.ca</a> ).
	Radiology Atlas	This icon is found next to headings in the text. It indicates topics that correspond to images found in the Radiology Atlas available online ( <a href="http://www.torontonotes.ca">www.torontonotes.ca</a> ).
	Online Resources	This icon is found next to headings in the text. It indicates topics that correspond with electronic resources such as Functional Neuroanatomy or ECGs Made Simple, available online ( <a href="http://www.torontonotes.ca">www.torontonotes.ca</a> ).

## Chapter Divisions

To aid in studying and finding relevant material quickly, each chapter is organized in the following general framework:

### Basic Anatomy/Physiology Review

- features the high-yield, salient background information students are often assumed to have remembered from their early medical school education

### Common Differential Diagnoses

- aims to outline a clinically useful framework to tackle the common presentations and problems faced in the area of expertise

### Diagnoses

- the bulk of the book
- etiology, epidemiology, pathophysiology, clinical features, investigations, management, complications, and prognosis

### Common Medications

- a quick reference section for review of medications commonly prescribed

# Common Unit Conversions

To convert from the conventional unit to the SI unit, **multiply** by conversion factor

To convert from the SI unit to the conventional unit, **divide** by conversion factor

	<b>Conventional Unit</b>	<b>Conversion Factor</b>	<b>SI Unit</b>
ACTH	pg/mL	0.22	pmol/L
Albumin	g/dL	10	g/L
Bilirubin	mg/dL	17.1	µmol/L
Calcium	mg/dL	0.25	mmol/L
Cholesterol	mg/dL	0.0259	mmol/L
Cortisol	µg/dL	27.59	nmol/L
Creatinine	mg/dL	88.4	µmol/L
Creatinine clearance	mL/min	0.0167	mL/s
Ethanol	mg/dL	0.217	mmol/L
Ferritin	ng/mL	2.247	pmol/L
Glucose	mg/dL	0.0555	mmol/L
HbA1c	%	0.01	proportion of 1.0
Hemoglobin	g/dL	10	g/L
HDL cholesterol	mg/dL	0.0259	mmol/L

Canadian law applicable to medical practice varies between jurisdictions and changes over time. Criminal law is nationwide, but non-criminal (civil) law varies between provinces. This section is meant to serve only as a guide. Students and physicians should ensure that their practices conform to local and current laws.

# Acronyms

AE	adverse event	FMEQ	Fédération médicale étudiante du Québec	OMA	Ontario Medical Association

# The Canadian Health Care System

## Overview of Canadian Health Care System

- one federal, three territorial, and ten provincial systems
- major complexities involved in establishment of Canadian health policy include geographical diversity, socioeconomic divisions, and international pressures
- financed by both the public (70%) and private (30%) sectors
- each provincial plan must cover all medically necessary health services delivered in hospitals and by physicians; may choose to cover services such as home care and prescription drugs
- non-insured health services and fees are either covered by private insurance or by the individual
- workers' compensation funds cover treatment for work-related injuries and diseases

**Table 1. Division of Government Responsibilities in Health Care**

Federal Government	Provincial Government
Marine hospitals and quarantine (Constitution Act, 1867)	Establishment, maintenance and management of hospitals, asylums, charities, and charitable institutions ( <i>Constitution Act</i> , 1867)
Health care services for Aboriginal people, federal government employees (RCMP and armed forces), immigrants, and civil aviation personnel	Licensing of physicians, nurses and other health professionals
Investigations into public health	Determining the standards for licensing all hospitals
Regulation of food and drugs	Administering provincial medical insurance plans
Inspection of medical devices	Financing health care facilities
Administration of health care insurance	Delivery of certain public health services
General information services related to health conditions and practices	
Role in health derived from government's constitutional powers over criminal law (basis for legislation such as <i>Food and Drugs Act</i> and <i>Controlled Substances Act</i> ), spending, and 'peace, order, and good government'	

- Principles of the Canada Health Act**
1. Public Administration: provincial health insurance programs must be administered by public authorities
  2. Comprehensiveness: provincial health insurance programs must cover all necessary diagnostic, physician, and hospital services
  3. Universality: all eligible residents must be entitled to health care services
  4. Portability: emergency health services must be available to Canadians who are outside their home province, paid for by the home province
  5. Accessibility: user fees, charges, or other obstructions to insured health care services are not permitted

## Legal Foundation

- the legal foundation of the Canadian health system is based on two constitutional documents:
  1. **Constitution Act** (1867): deals primarily with the jurisdictional power between federal and provincial governments
  2. **The Canadian Charter of Rights and Freedoms** (1982): does not guarantee a right to health care but, given government's decision to finance health care, they are constitutionally obliged to do so consistently with the rights and freedoms outlined in the Charter (including the right to equality, physicians' mobility rights, etc.)
- and two statutes:
  1. **Canada Health Act** (1984): outlines the national terms and conditions that provincial health systems must meet in order to receive federal transfer payments
  2. **Canada Health and Social Transfer Act** (1996): federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces' discretion

The federal government can reduce its contributions to provinces that violate the key principles of the Canada Health Act

## History of the Canadian Health Care System

- 1867 British North America Act (now Constitution Act) establishes Canada as a confederacy
  - "establishment, maintenance, and management of hospitals" under provincial jurisdiction
- 1965 *Royal Commission on Health Services* (Hall Commission) recommends federal leadership and financial support with provincial government operation

- 1984 *Canada Health Act* passed by federal government
- replaces Medical Care Act (1966) and Hospital Insurance and Diagnostic Services Act (1957)
  - provides federal funds to provinces with universal hospital insurance
  - maintains federal government contribution at 50% on average, with poorer provinces receiving more funds
  - medical insurance must be 'comprehensive, portable, universal, and publicly administered'
  - bans extra-billing by new fifth criterion: accessibility
- 1996 *Canada Health and Social Transfer Act* passed by federal government
- federal government gives provinces a single grant for health care, social programs, and post-secondary education; division of resources at provinces' discretion
- 2001 *Kirby and Romanow Commissions* appointed
- Kirby Commission* (final report, October 2002)
- examines history of health care system in Canada, pressures and constraints of current health care system, role of federal government, and health care systems in foreign jurisdictions
- Romanow Commission* (final report, November 2002)
- dialogue with Canadians on the future of Canada's public health care system
- 2004 *First Ministers' Meeting on the Future of Health Care* produces a 10 year plan
- priorities include reductions in waiting times, development of a national pharmacare plan, and primary care reform
- 2005 *Chaoulli v. Québec*, Supreme Court of Canada decision
- rules that Québec's banning of private insurance is unconstitutional under the Québec Charter of Rights, given that patients do not have access to those services under the public system in a timely way
- 2011 First progress report by the Health Council reviews progress (2004 First Ministers' 10 year plan)
- significant reductions in wait times for specific areas (such as cancer, joint replacement and sight restoration), but may have inadvertently caused increases in wait times of other services
  - despite large investments into EMRs, Canada continues to have very low uptake, ranking last in the Commonwealth Fund International Health Policy survey, with only 37% use among primary care physicians
  - little progress in creating a national strategy for equitable access to pharmaceuticals; however, there has been some success in increasing pharmacists' scope of practice, reducing generic drugs costs, and implementing drug info systems
  - increases in funding to provinces at 6% per annum until the 2016-2017 fiscal year; from then onwards, increases tied to nominal GDP at a minimum of 3% per annum
- 2012 Second progress report by the Health Council reviews progress towards 2004 First Ministers' 10 year plan
- funding is sufficient; however, more innovation is needed including incentivizing through models of remuneration
  - 46 recommendations made to address the lack of progress
- 2014 Expiry of current *10 Year Health Care Funding Agreement* between federal and provincial governments
- 2015 Negotiations underway for a new Health Accord with a \$3 billion investment over four years to homecare and mental health services by the elected Liberal government

## Health Care Expenditure and Delivery in Canada

- projected total health care expenditure in 2014 was \$214.9 billion, 11% of the GDP, approximately \$6,045 CDN per person

### Sources of Health Care Funding

- 71% of total health expenditure in 2015 came from public-sector funding with 66% coming from the provincial and territorial governments and 5% from other parts of the public sector: federal direct government, municipal, and social security funds. 29% is from private sources including out of pocket (14%), private insurance (12%) and other (3%)
- public sector covers services offered on either a fee for service, capitation, or alternate payment plan in physicians' offices and in hospitals
- public sector does not cover services provided by privately practicing health professionals (e.g. dentists, chiropractors, optometrists, massage therapists, osteopaths, physiotherapists, podiatrists, psychologists, private duty nurses, and naturopaths), prescription drugs, OTC drugs, personal health supplies, and use of residential care facilities

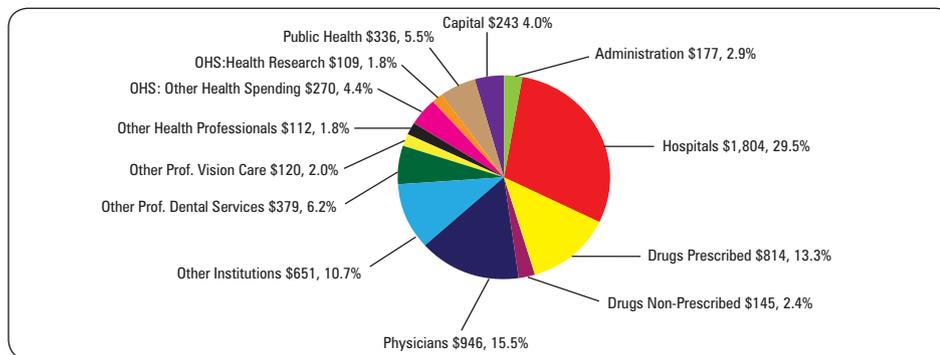

Figure 1. Total health expenditure by use of funds, Canada, 2015 (percentage share and billions of dollars)

Source: [https://secure.cihi.ca/free\\_products/nhex\\_trends\\_narrative\\_report\\_2015\\_en.pdf](https://secure.cihi.ca/free_products/nhex_trends_narrative_report_2015_en.pdf)

### Delivery of Health Care

- hospital services in Canada are publicly funded but delivered through private, not-for-profit institutions owned and operated by communities, religious organizations, and regional health authorities
- other countries, such as the United States (a mix of public and private funding, as well as private for-profit and private not-for-profit delivery) and the United Kingdom (primarily public funding and delivery) have different systems of delivery

## Physician Licensure and Certification

- physician certification is governed nationally, while the medical profession in Canada self-regulates under the authority of provincial legislation
- self-regulation is based on the premise that the licensing authority must act first and foremost in the interest of the public

Table 2. Key Physician Certification and Licensing Bodies in Canada

Certifying Body	Description
<b>MCC</b>	Certifies physicians with the LMCC The LMCC is acquired by passing the MCC Qualifying Examination Parts I and II
<b>RCPSC</b>	Certifies specialists who complete an accredited residency program and pass the appropriate exam Voluntary membership of the RCPSC is designated FRCPC or FRCSC
<b>CFPC</b>	Certifies family physicians who complete an accredited residency program and pass the Certification Examination in Family Medicine
Licensing Body	Description
<b>CPSO</b>	Membership to the provincial licensing authority is mandatory Licensing authority functions include: Provide non-transferable licensure to physicians Maintaining ethical, legal, and competency standards and developing policies to guide doctors Investigating complaints against doctors Disciplining doctors guilty of professional misconduct or incompetence At times of license investiture and renewal, physicians must disclose if they have a condition (such as HIV positivity, drug addiction, or other illnesses that may impact their ability to practice safely)

- the RCPSC and CFPC are responsible for monitoring ongoing CME and professional development
- certification by the LMCC plus either the RCPSC or CFPC is a minimum requirement for licensure by most provincial licensing authorities

## Role of Professional Associations

Table 3. Key Professional Associations

Association	Description
<b>CMA</b>	Provides leadership to doctors and advocates for access to high quality care in Canada Represents physician and population concerns at the national level Membership is voluntary
<b>OMA and Other PTMAs</b>	Negotiates fee and benefit schedules with provincial governments Represents the economic and professional interests of doctors Membership is voluntary
<b>CMPPA</b>	Physician-run organization that protects the integrity of member physicians Provides legal defence against allegations of malpractice or negligence Provides risk management and educational programs Membership is voluntary
<b>RDoC and PHO</b>	Upholds economic and professional interests of residents across Canada Facilitates discussion amongst PHOs regarding policy and advocacy items
<b>CMFS and FMÉQ</b>	Medical students are represented at their universities by student bodies, which collectively form the CFMS or FMÉQ The FMÉQ membership includes that of francophone medical schools

# Ethical and Legal Issues in Canadian Medicine

## Introduction to the Principles of Ethics

- ethics addresses
  - principles and values that help define what is morally right and wrong
  - rights, duties and obligations of individuals and groups
- the practice of medicine assumes there is one code of professional ethics for all doctors and that they will be held accountable by that code and its implications
- the doctor-patient relationship is formed on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
- a fiduciary duty is a legal duty to act solely in another party's interest; one may not profit from the relationship with principals unless he/she has the principal's express consent

**Table 4. The Four Principles Approach to Medical Ethics**

Principle	Definition
<b>Autonomy</b>	Recognizes an individual's right and ability to decide for himself/herself according to his/her beliefs and values Not applicable in situations where informed consent and choice are not possible or may not be appropriate
<b>Beneficence</b>	The patient-based 'best interests' standard that combines doing good, avoiding harm, taking into account the patient's values, beliefs, and preferences, so far as these are known Autonomy should be integrated with the physician's conception of a patient's medically-defined best interests The aim is to minimize harmful outcomes and maximize beneficial ones Paramount in situations where consent/choice is not possible or may not be appropriate
<b>Non-Maleficence</b>	Obligation to avoid causing harm; <i>primum non nocere</i> ("First, do no harm") A limit condition of the Beneficence principle
<b>Justice</b>	Fair distribution of benefits and harms within a community, regardless of geography or privilege Concept of fairness: Is the patient receiving what he/she deserves – his/her fair share? Is he/she treated the same as equally situated patients? How does one set of treatment decisions impact others? Basic human rights, such as freedom from persecution and the right to have one's interests considered and respected

**Autonomy vs. Competence**  
**Autonomy:** the right that patients have to make decisions according to their beliefs and preferences  
**Competence:** the ability or capacity to make a specific decision for oneself

### CMA Code of Ethics

- The CMA developed a Code of Ethics that acts as a common ethical framework for Canadian physicians. The Code of Ethics is:
  - prepared by physicians for physicians and applies to physicians, residents, and medical students
  - based on the fundamental ethical principles of medicine
  - sources include the Hippocratic Oath, developments in human rights, recent bioethical discussion
  - CMA policy statements address specific ethical issues not mentioned by the code (e.g. abortion, transplantation, and euthanasia)

The CMA Code of Ethics is a quasi-legal standard for physicians; if the law sets a minimal moral standard for doctors, the Code augments these standards

## Confidentiality

### Overview of Confidentiality

- a full and open exchange of information between patient and physician is central to a therapeutic relationship
- privacy is the right of patients (which they may forego) while confidentiality is the duty of doctors (which they must respect barring patient consent or the requirements of the law)
- if inappropriately breached by a doctor, he/she can be sanctioned by the hospital, court, or regulatory authority
- based on the ethical principle of patient autonomy, patients have the right to the following:
  - control of their own information
  - the expectation that information concerning them will receive proper protection from unauthorized access by others (*see Privacy of Medical Records, ELOM6*)
- confidentiality may be ethically and legally breached in certain circumstances (e.g. the threat of harm to others)
- unlike the solicitor-client privilege, there is no 'physician-patient privilege' by which a physician, even a psychiatrist, can promise the patient absolute confidentiality
- physicians should seek advice from their local health authority or the CMPA before disclosing HIV status of a patient to someone else
  - many jurisdictions make mandatory not only the reporting of serious communicable diseases (e.g. HIV), but also the reporting of those who harbour the agent of the communicable disease
  - physicians failing to abide by such regulations could be subject to professional or civil actions
- the legal duty to maintain patient confidentiality is imposed by provincial health information legislation and precedent-setting cases in the common law

**Legal Aspects of Confidentiality**  
 Advice should always be sought from provincial licensing authorities and/or legal counsel when in doubt

**CMA Code of Ethics**  
 "Disclose your patients' personal health information to third parties only with their consent, or as provided for by law, such as when the maintenance of confidentiality would result in a significant risk of substantial harm to others or, in the case of incompetent patients, to the patients themselves. In such cases take all reasonable steps to inform the patients that the usual requirements for confidentiality will be breached"

## Statutory Reporting Obligations

- legislation has defined specific instances where public interest overrides the patient's right to confidentiality; varies by province, but may include
  - suspected child abuse or neglect – report to local child welfare authorities (e.g. Children's Aid Society)
  - fitness to drive a vehicle or fly an airplane – report to provincial Ministry of Transportation (see [Geriatric Medicine, GM11](#))
  - communicable diseases – report to local public health authority (see [Population Health and Epidemiology, PH24](#))
  - improper conduct of other physicians or health professionals – report to College or regulatory body of the health professional (sexual impropriety by physicians is required reporting in some provinces)
  - vital statistics must be reported; reporting varies by province (e.g. in Ontario, births are required to be reported within 30 days to Office of Registrar General or local municipality; death certificates must be completed by a MD then forwarded to municipal authorities)
  - reporting to coroners (see [Physician Responsibilities Regarding Death, ELOM14](#))
- physicians who fail to report in these situations are subject to prosecution and penalty, and may be liable if a third party has been harmed

## Duty to Protect/Warn

- the physician has a duty to protect the public from a known dangerous patient; this may involve taking appropriate clinical action (e.g. involuntary detention of violent patients for clinical assessment), informing the police, or warning the potential victim(s) if a patient expresses an intent to harm
- first established by a Supreme Court of California decision in 1976 (*Tarasoff v. Regents of the University of California*); supported by Canadian courts
- obliged by the CMA Code of Ethics and recognized by some provincial/territorial regulatory authorities
- concerns of breaching confidentiality should not prevent the MD from exercising the duty to protect; however, the disclosed information should not exceed that required to protect others
- applies in a situation where
  - there is a clear risk to identifiable person(s);
  - there is a risk of serious bodily harm or death; and
  - the danger is imminent (i.e. more likely to occur than not)

## Disclosure for Legal Proceedings

- disclosure of health records can be compelled by a court order, warrant, or subpoena

## Privacy of Medical Records

- privacy of health information is protected by professional codes of ethics, provincial and federal legislation, the *Canadian Charter of Rights and Freedoms*, and the physician's fiduciary duty
- the federal government created the PIPEDA in 2000 which established principles for the collection, use, and disclosure of information that is part of commercial activity (e.g. physician practices, pharmacies, private labs)
- PIPEDA has been superseded by provincial legislation in many provinces, such as the *Ontario Personal Health Information Protection Act*, which applies more specifically to health information

## Duties of Physicians with Regard to the Privacy of Health Information

- inform patients of information-handling practices through various means (e.g. posting notices, brochures and pamphlets, and/or through discussions with patients)
- obtain the patient's expressed consent to disclose information to third parties
  - under Ontario privacy legislation, the patient's expressed consent need not be obtained to share information between health care team members involved in the "circle of care." However, the patient may withdraw consent for this sharing of information and may put parts of the chart in a "lock box"
- provide the patient with access to their entire medical record; exceptions include instances where there is potential for serious harm to the patient or a third party
- provide secure storage of information and implement measures to limit access to patient records
- ensure proper destruction of information that is no longer necessary
- regarding taking pictures or videos of patients, findings, or procedures, in addition to patient consent and privacy laws, trespassing laws apply in some provinces

### Reasons to Breach Confidentiality

- Child abuse
- Fitness to drive
- Communicable disease
- Coroner report
- Duty to inform/warn

### Ontario's Medical Expert Panel on Duty to Warn

- Ferris et al., 1998
- There should be a duty to inform when a patient reveals that he/she intends to do serious harm to another person(s) and it is more likely than not that the threat will be carried out.
  - Where a threat is directed at a person or group and there is a specific plan that is concrete and capable of commission and the method for carrying it out is available to the threatener, the physician should immediately notify the police and, in appropriate circumstances, the potential victim. The report should include the threat, the situation, the physician's opinion and the information upon which it is based.

### CMA Code of Ethics

- Protect the health information of your patients
- Provide information reasonable in the circumstances to patients about the reasons for the collection, use and disclosure of their health information
- Be aware of your patients' rights with respect to the collection, use, disclosure and access to their health information; ensure that such information is recorded accurately

### Lock Boxes

The term "lock boxes" applies to situations where the patient has expressly restricted his or her physician from disclosing specific aspects of their health information to others, even those involved in the patient's circle of care. Note that PHIPA provisions denote that patients may not prevent physician from disclosing personal health information permitted/required by the law.

### CPSO Policy Consent

Obtaining valid consent before carrying out medical, therapeutic and diagnostic procedures has long been recognized as an elementary step in fulfilling the doctor's obligations to the patient

# Consent and Capacity

## Ethical Principles Underlying Consent and Capacity

- consent is the autonomous authorization of a medical intervention by a patient
- usually the principle of respect for patient autonomy overrides the principle of beneficence
- where a patient cannot make an autonomous decision (i.e. incapable), it is the duty of the SDM (or the physician in an emergency) to act on the patient's known prior wishes or, failing that, to act in the patient's best interests
- there is a duty to discover, if possible, what the patient would have wanted when capable
- central to determining best interests is understanding the patient's values, beliefs, and cultural or religious background
- more recently expressed wishes take priority over remote ones

- patient wishes may be verbal or written
- patients found incapable to make a specific decision should still be involved in that decision as much as possible
- agreement or disagreement with medical advice does not determine findings of capacity/incapacity
- however, patients opting for care that puts them at risk of serious harm that most people would want to avoid should have their capacity carefully assessed

**Four Basic Requirements of Valid Consent**

**1. Voluntary**

- consent must be given free of coercion or pressure (e.g. from parents or other family members who might exert ‘undue influence’)
- the physician must not deliberately mislead the patient about the proposed treatment

**2. Capable**

- the patient must be able to understand and appreciate the nature and effect of the proposed treatment

**3. Specific**

- the consent provided is specific to the procedure being proposed and to the provider who will carry out the procedure (e.g. the patient must be informed if students will be involved in providing the treatment)

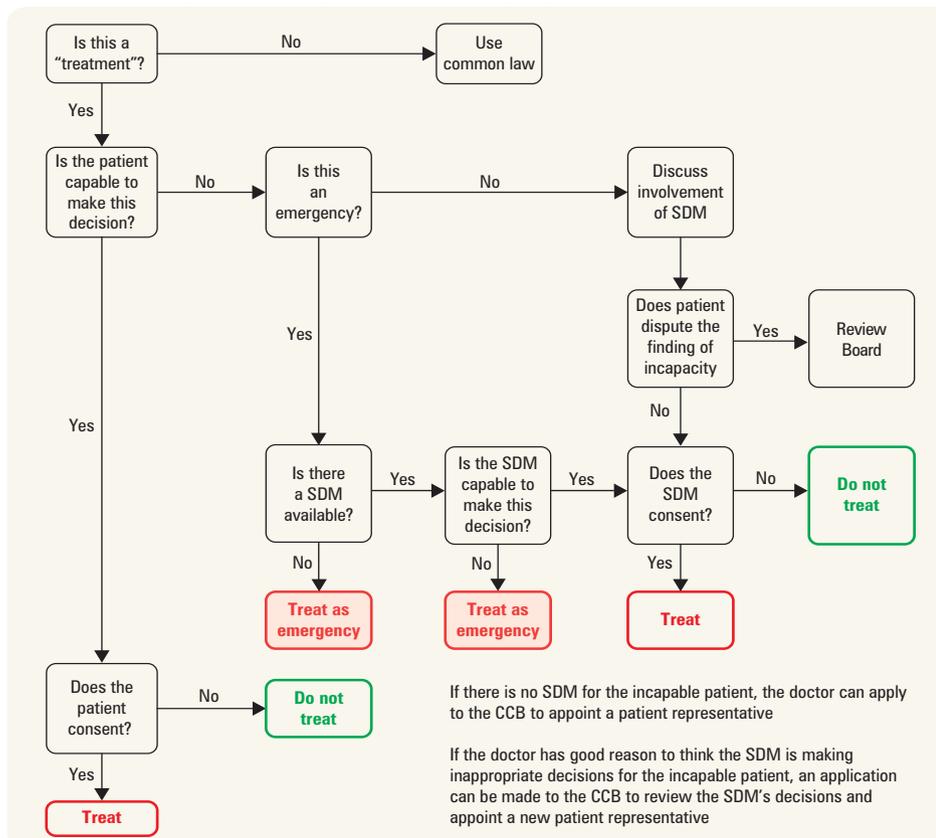

**4. Informed**

- sufficient information and time must be provided to allow the patient to make choices in accordance with his/her wishes, including
  - ◆ the nature of the treatment or investigation proposed and its expected effects
  - ◆ all significant risks and special or unusual risks
  - ◆ alternative treatments or investigations and their anticipated effects and significant risks
  - ◆ the consequences of declining treatment
  - ◆ risks that are common sense need not be disclosed (i.e. bruising after venipuncture)
  - ◆ answers to any questions the patient may have
- the reasonable person test – the physician must provide all information that would be needed “by a reasonable person in the patient’s position” to be able to make a decision
- disclose common adverse events (>1/200 chance of occurrence) and serious risks (e.g. death), even if remote
- it is the physician’s responsibility to make reasonable attempts to ensure that the patient understands the information
- physicians should not withhold information about a legitimate therapeutic option based on personal conscience (e.g. not discussing the option of emergency contraception)

**4 Basic Elements of Consent**

- Voluntary
- Capable
- Specific
- Informed

Administration of treatment for an incapable patient in an emergency situation is applicable if the patient is:

- Experiencing extreme suffering
- At risk of sustaining serious bodily harm if treatment is not administered promptly

Patients may also ask to waive the right to choice (e.g. “You know what’s best for me, doctor”) or delegate their right to choose to someone else (e.g. a family member)

**Figure 2. Ontario consent flowchart**

CCB = consent and capacity board; SDM = substitute decision-maker

Adapted by Hébert P from Sunnybrook Health Sciences Centre Consent Guidelines

## Obtaining Legal Consent

- consent of the patient must be obtained before any medical intervention is provided; consent can be
  - verbal or written, although written is usually preferred
    - ♦ a signed consent form is only evidence of consent – it does not replace the process for obtaining valid consent
    - ♦ what matters is what the patient understands and appreciates, not what the signed consent form states
  - implied (e.g. a patient holding out their arm for an immunization) or expressed
- consent is an ongoing process and can be withdrawn or changed after it is given, unless stopping a procedure would put the patient at risk of serious harm
- *HCAA of Ontario* (1996) covers consent to treatment, admission to a facility, and personal assistance services (e.g. home care)

## Exceptions to Consent

### 1. Emergencies

- treatment can be provided without consent where a patient is experiencing severe suffering, or where a delay in treatment would lead to serious harm or death and consent cannot be obtained from the patient or their SDM
- emergency treatment should not violate a prior expressed wish of the patient (e.g. a signed Jehovah's Witness card)
- if patient is incapable, MD must document reasons for incapacity and why situation is emergent
- patients have a right to challenge a finding of incapacity as it removes their decision-making ability
- if a SDM is not available, MD can treat without consent until the SDM is available or the situation is no longer emergent

### 2. Legislation

- Mental Health legislation allows for:
  - ♦ the detention of patients without their consent
  - ♦ psychiatric outpatients may be required to adhere to a care plan in accordance with Community Treatment Orders (see [Psychiatry, PS51](#))
  - ♦ Public Health legislation allows medical officers of health to detain, examine, and treat patients without their consent (e.g. a patient with TB refusing to take medication) to prevent transmission of communicable diseases

### 3. Special Situations

- public health emergencies (e.g. an epidemic or communicable disease treatment)
- warrant for information by police

## Consequences of Failure to Obtain Valid Consent

- treatment without consent is battery (an offense in tort), even if the treatment is life-saving (excluding situations outlined in exceptions section above)
- treatment of a patient on the basis of poorly informed consent may constitute negligence, also an offense in tort
- the onus of proof that valid consent was not obtained rests with the plaintiff (usually the patient)

## Overview of Capacity

- capacity is the ability to
  - understand information relevant to a treatment decision
  - appreciate the reasonably foreseeable consequences of a decision or lack of a decision
- capacity is specific for each decision (e.g. a person may be capable to consent to having a chest x-ray, but not for a bronchoscopy)
- capacity can change over time (e.g. temporary incapacity secondary to delirium)
- most Canadian jurisdictions distinguish capacity to make healthcare decisions from capacity to make financial decisions; a patient may be deemed capable of one, but not the other
- a person is presumed capable unless there is good evidence to the contrary
- capable patients are entitled to make their own decisions
- capable patients can refuse treatment even if it leads to serious harm or death; however, decisions that put patients at risk of serious harm or death require careful scrutiny

## Assessment of Capacity

- capacity assessments must be conducted by a physician and, if appropriate, in consultation with other healthcare professionals (e.g. another physician, a mental health nurse)
- clinical capacity assessment may include
  - specific capacity assessment (i.e. capacity specific to the decision at hand)
    1. effective disclosure of information and evaluation of patient's reason for decision
    2. understanding of
      - his/her condition
      - the nature of the proposed treatment
      - alternatives to the treatment
      - the consequences of accepting and rejecting the treatment
      - the risks and benefits of the various options

The Supreme Court of Canada expects physicians to disclose the risks that a "reasonable" person would want to know. In practice, this means disclosing minor risks that are common as well as serious risks that happen infrequently, especially those risks that are particularly relevant to a particular patient (e.g. hearing loss for a musician)

### Major Exceptions to Consent

- Emergencies
- Public and Mental Health Legislation
- Communicable diseases

### Consent

- Treatment without consent = battery, including if NO consent or if WRONG procedure
- Treatment with poor or invalid consent = negligence

### CPSO Policy on Capacity

Capacity is an essential component of valid consent, and obtaining valid consent is a policy of the CMA and other professional bodies

### Capacity Assessment

Test for understanding: can the patient recite what you have disclosed?  
 Test for appreciation: are his/her beliefs responsive to evidence?  
 Refer to: *JAMA* The Rational Clinical Examination "Does This Patient Have Medical Decision-Making Capacity?"

3. for the appreciation needed for decision making capacity, a person must
  - acknowledge the condition that affects him/herself
  - be able to assess how the various options would affect him or her
  - be able to reach a decision and adhere to it, and make a choice, not based primarily upon delusional belief
    - general impressions
    - input from psychiatrists, neurologists, etc.
- employ “Aid to Capacity Evaluation”
- a decision of incapacity may warrant further assessment by psychiatrist(s), legal review boards (e.g. in Ontario, the Consent and Capacity Review Board), or the courts
- judicial review is open to patients if found incapable

### Treatment of the Incapable Patient in a Non-Emergent Situation

- obtain informed consent from SDM
- an incapable patient can only be detained against his/her will to receive treatment if he/she meets criteria for certification under the Mental Health Act (see [Psychiatry, PS51](#)); in such a situation:
  - document assessment in chart
  - notify patient of assessment using appropriate Mental Health Form(s) (Form 42 in Ontario)
  - notify Rights Advisor

### Substitute Decision-Makers

- SDMs must follow the following principles when giving informed consent:
  - act in accordance with wishes previously expressed by the patient while capable
  - if wishes unknown, act in the patient's best interest, taking the following into account
    1. values and beliefs held by the patient while capable
    2. whether well-being is likely to improve with vs. without treatment
    3. whether the expected benefit outweighs the risk of harm
    4. whether a less intrusive treatment would be as beneficial as the one proposed
  - the final decision of the SDM may and should be challenged by the MD if the MD believes the SDM is not abiding by the above principles

### Instructional Advance Directives

- allow patients to exert control over his/her care once they are no longer capable
- the patient sets out his/her decisions about future health care, including who he/she would allow to make treatment decisions on his/her behalf and what types of interventions he/she would want
- takes effect once the patient is incapable with respect to treatment decisions
- in Ontario, a person can appoint a power of attorney for personal care to carry out his/her advance directives
- patients should be encouraged to review these documents with their family and physicians and to reevaluate them often to ensure they are current with their wishes

### POWERS OF ATTORNEY

- all Guardians and Attorneys have fiduciary duties for the dependent person

### Definitions

- **Power of Attorney for Personal Care**
  - a legal document in which one person gives another the authority to make personal care decisions (health care, nutrition, shelter, clothing, hygiene, and safety) on their behalf if they become mentally incapable
- **Guardian of the Person**
  - someone who is appointed by the Court to make decisions on behalf of an incapable person in some or all areas of personal care, in the absence of a POA for personal care
- **Continuing Power of Attorney for Property**
  - a legal document in which a person gives another the legal authority to make decisions about their finances if they become unable to make those decisions
- **Guardian of Property**
  - someone who is appointed by the Public Guardian and Trustee or the Courts to look after an incapable person's property or finances
- **Public Guardian and Trustee**
  - acts as a SDM of last resort on behalf of mentally incapable people who do not have another individual to act on their behalf
- **Pediatric Aspects of Capacity Covered**
  - no age of consent in all provinces and territories except Québec; consent depends on patient's decision-making capacity
  - Québec has a specific age of consent, but common law and case law deem underage legal minors capable, allowing them to make their own choices
  - infants and children are assumed to lack mature decision-making capacity for consent but they should still be involved (i.e. be provided with information appropriate to their comprehension level)

#### Aid to Capacity Evaluation

- Ability to understand the medical problem
- Ability to understand the proposed treatment
- Ability to understand the alternatives (if any) to the proposed treatment
- Ability to understand the option of refusing treatment or of it being withheld or withdrawn
- Ability to appreciate the reasonably foreseeable consequences of accepting the proposed treatment
- Ability to appreciate the reasonably foreseeable consequences of refusing the proposed treatment
- Ability to make a decision that is not substantially based on delusions or depression

Adapted from Etchells et al. 1996

Most provinces have legislated hierarchies for SDMs; the hierarchy in Ontario is:

- Legally appointed guardian
- Appointed attorney for personal care, if a power of attorney confers authority for treatment consent (see *Powers of Attorney*)
- Representative appointed by the Consent and Capacity Board
- Spouse or partner
- Child (age 16 or older) or parent (unless the parent has only a right of access)
- Parent with only a right of access
- Sibling
- Other relative(s)
- Public guardian and trustee

There is no age of consent in Ontario  
Capacity is assessed on an individual basis

#### Other Types of Capacity Not Covered by the HCCA

- Testamentary (ability to make a will)
- Fitness (ability to stand trial)
- Financial (ability to manage property – Form 21 of the Mental Health Act)
- Personal (ability to care for oneself on a daily basis)

- adolescents are usually treated as adults
- preferably, assent should still be obtained from patient, even if not capable of giving consent
- in the event that the physician believes the SDM is not acting in the child's best interests, an appeal must be made to the local child welfare authorities
- under normal circumstances, parents have right of access to the child's medical record

## Negligence

### Ethical Basis

- the doctor-patient relationship is formed on trust, which is recognized in the concept of fiduciary duty/responsibility of physician towards patient
- negligence or malpractice is a form of failure on the part of the physician in fulfilling his/her fiduciary duty in providing appropriate care and leading to harm of the patient (and/or abuse of patient's trust)

### Legal Basis

- physicians are legally liable to their patients for causing harm (tort) through a failure to meet the standard of care applicable under the circumstances
- standard/duty of care is defined as one that would reasonably be expected under similar circumstances of an ordinary, prudent physician of the same training, experience, specialization, and standing
- liability arises from physician's common law duty of care to his/her patients in the doctor/patient relationship (or, in Québec, from the Civil Code provisions regarding general civil liability)
- action(s) in negligence (or civil liability) against a physician must be launched by a patient within a specific prescribed period required by the respective province in which the actions occurred

Errors of care are compatible with non-negligent care if they are ones that a reasonably cautious and skilled MD could make (i.e. mistakes can be made due to 'honest error')

Four basic elements for action against a physician to succeed in negligence:

1. A duty of care owed to the patient (i.e. doctor/patient relationship must be established)
2. A breach of the standard of care
3. Some harm or injury to the patient
4. The harm or injury must have been caused by the breach of the duty of care

## Truth-Telling

### Ethical Basis

- helps to promote and maintain a trusting physician-patient relationship
- patients have a right to be told important information that physicians have regarding their care
- enables patients to make informed decisions about health care and their lives

### Legal Basis

- required for valid patient consent (see *Consent and Capacity*, ELOM6)
  - goal is to disclose information that a reasonable person in the patient's position would need in order to make an informed decision ("standard of disclosure")
- withholding information can be a breach of fiduciary duty and duty of care
- obtaining consent on the basis of misleading information can be seen as negligent

### Evidence about Truth-Telling

- most patients want to know what is wrong with them
- although many patients want to protect family members from bad news, they themselves would want to be informed in the same situation
- truth-telling improves adherence and health outcomes
- informed patients are more satisfied with their care
- negative consequences of truth-telling can include decreased emotional well-being, anxiety, worry, social stigmatization, and loss of insurability

### Challenges in Truth-Telling

#### Medical Error

- medical error may be defined as 'preventable adverse events (AEs)' caused by the patient's medical care and not the patient's underlying illness; some errors may be identified before they harm the patient, so not all error is truly 'adverse'
- many jurisdictions and professional associations expect and require physicians to disclose medical error; that is, any event that harms or threatens to harm patients must be disclosed to the patient or the patient's family and reported to the appropriate health authorities
- physicians should disclose to patients the occurrence of AEs or errors caused by medical management, but should not suggest that they resulted from negligence because:
  - negligence is a legal determination
  - error is not equal to negligence (see *Negligence*)
- disclosure allows the injured patient to seek appropriate corrective treatment promptly
  - physicians should avoid simple attributions as to cause and sole responsibility of others or oneself
  - physicians should offer apologies or empathic expressions of regret (e.g. "I wish things had turned out differently") as these can increase trust and are not admissions of guilt or liability
  - *Apology Acts* across Canada protect apologies, both as expressions of regret and admissions of responsibility, from being used as evidence of liability and negligence

#### CPSO Policy on Truth-Telling

Physicians should provide patients with whatever information that will, from the patient's perspective, have a bearing on medical decision-making and communicate that information in a way that is comprehensible to the patient

#### Adverse Event

An unintended injury or complication from health care management resulting in disability, death, or prolonged hospital stay

#### Open Disclosure of AEs: Transparency and Safety in Health Care

*Surg Clin North Am* 2012;92(1):163-177  
Health care providers have a fiduciary duty to disclose AEs to their patients. Professional societies codify medical providers' ethical requirement to disclose AEs to patients in accordance with the four principles of biomedical ethics. Transparency and honesty in relationships with patients create opportunities for learning that lead to systems improvements in health care organizations. Disclosure invariably becomes a component of broad systems improvement and is closely linked to improving patient safety.

#### Examples of Warning of Impending Bad News

"I have something difficult to tell you..."  
"This may come as a shock to you, but the tests indicate..."  
"There is no easy way for me to tell you this, so I will tell you straight away that you have a serious problem..."

### Breaking Bad News

- 'bad news' may be any information that reveals conditions or illnesses threatening the patient's sense of well-being
- caution patients in advance of serious tests about possible bad findings
- give warnings of impending bad news and make sure you provide time for the patient
- poorly done disclosure may be as harmful as non-disclosure
- truth-telling may be a process requiring multiple visits
- adequate support should be provided along with the disclosure of difficult news
- SPIKES protocol was developed to facilitate "breaking bad news"

### Arguments Against Truth-Telling

- may go against certain cultural norms and expectations
- may lead to patient harm and increased anxiety
- 10-20% of patients prefer not to be informed
- medical uncertainty may result in the disclosure of uncertain or inaccurate information

### Exceptions to Truth-Telling

- a patient may waive his/her right to know the truth about their situation (i.e. decline information that would normally be disclosed) when
  - the patient clearly declines to be informed
  - a strong cultural component exists that should be respected and acknowledged
  - the patient may wish others to be informed and make the medical decisions for him/her
- the more weighty the consequences for the patient from non-disclosure, the more carefully one must consider the right to ignorance
- 'emergencies': an urgent need to treat may legitimately delay full disclosure; the presumption is that most people would want such treatment and the appropriate SDM cannot be found
- 'therapeutic privilege'
  - withholding of information by the clinician in the belief that disclosure of the information would itself lead to severe anxiety, psychological distress or physical harm to the patient
  - clinicians should avoid invoking therapeutic privilege due to its paternalistic overtones and is a defence of non-disclosure that is rarely accepted anymore
  - it is often not the truth that is unpalatable; it is how it is conveyed that can harm the patient

#### Protocol to Break Bad News: SPIKES

**S** Setting the scene and listening skills

**P** Patient's perception of condition and seriousness

**I** Invitation from patient to give information

**K** Knowledge – giving medical facts

**E** Explore emotions and empathize

**S** Strategy and summary

Source: Baile WF, Buckman R. 2000

#### Truth-Telling in Discussing Prognosis in Advanced Life-Limiting Illnesses

*Palliat Med* 2007;21(6):507-517

Many physicians express discomfort at having to broach the topic of prognosis, including limited life expectancy, and may withhold information or not disclose prognosis.

A systematic review of 46 studies relating to truth-telling in discussing prognosis with patients with progressive, advanced life-limiting illnesses and their caregivers showed that although the majority of physicians believed that patients and caregivers should be told the truth about the prognosis, in practice, many either avoid discussing the topic or withhold information. Reasons include perceived lack of training, stress, no time to attend to the patient's emotional needs, fear of a negative impact on the patient, uncertainty about prognostication, requests from family members to withhold information and a feeling of inadequacy or hopelessness regarding the unavailability of further curative treatment.

Evidence suggests that patients can discuss the topic without it having a negative impact on them.

## Ethical Issues in Health Care

### Managing Controversial and Ethical Issues in Practice

- discuss in a non-judgmental manner
- ensure patients have full access to relevant and necessary information
- identify if certain options lie outside of your moral boundaries and refer to another physician if appropriate
- consult with appropriate ethics committees or boards
- protect freedom of moral choice for students or trainees

Source: MCC-CLEO Objectives 1998

## Reproductive Technologies

### Overview of the Maternal-Fetal Relationship

- in general, maternal and fetal interests align
- in some situations, a conflict between maternal autonomy and the best interests of the fetus may arise

### Ethical Issues and Arguments

- principle of reproductive freedom: women have the right to make their own reproductive choices
- coercion of a woman to accept efforts to promote fetal well-being is an unacceptable infringement of her personal autonomy

### Legal Issues and Arguments

- the law upholds a woman's right to life, liberty, and security of person, and does not recognize fetal rights; key aspects of the mother's rights include
  - if a woman is competent and refuses medical advice, her decision must be respected even if the fetus will suffer
  - the fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman

Royal Commission on New Reproductive Technologies (1993) recommendations:

1. medical treatment must never be imposed upon a competent pregnant woman against her wishes
2. no law should be used to confine a pregnant woman in the interest of her fetus
3. the conduct of a pregnant woman in relation to her fetus should not be criminalized
4. child welfare should never be used to control a woman's behaviour during pregnancy
5. civil liability should never be imposed upon a woman for harm done to her fetus during pregnancy

Payment of gamete donors is currently illegal in Canada. The ART Act is, however, not being enforced currently as it does not clarify whether ART falls under the jurisdiction of the federal or provincial government

The fetus does not have legal rights until it is born alive and with complete delivery from the body of the woman

Once outside the mother's body, the neonate becomes a member of society with all the rights and protections other vulnerable persons receive.

- Non-treatment of a neonate born alive is only acceptable if <22 wk GA
- 23-25 wk GA: treatment should be a consensual decision between physician and parents
- 25 wk GA and more: neonate should receive full treatment unless major anomalies or conditions incompatible with life are present

Source: *Paed Child Health* 2012:443

Examples involving the use of established guidelines

- a woman is permitted to refuse HIV testing during pregnancy, even if vertical transmission to fetus results
- a woman is permitted to refuse Caesarean section in labour that is not progressing, despite evidence of fetal distress

### Advanced Reproductive Therapies

- includes non-coital insemination, hormonal ovarian stimulation, and IVF
- topics with ethical concerns
  - donor anonymity vs. child-centred reproduction (i.e. knowledge about genetic medical history)
  - preimplantation genetic testing for diagnosis before pregnancy
  - use of new techniques without patients appreciating their experimental nature
  - embryo status – the Supreme Court of Canada maintains that fetuses are “unique” but not persons under law; this view would likely apply to embryos as well
  - access to ART
  - private vs. public funding of ART
  - social factors limiting access to ART (e.g. same-sex couples)
  - the ‘commercialization’ of reproduction

### Fetal Tissue

- pluripotent stem cells can currently be derived from human embryonic and fetal tissue
- potential uses of stem cells in research
  - studying human development and factors that direct cell specialization
  - evaluating drugs for efficacy and safety in human models
  - cell therapy: using stem cells grown *in vitro* to repair or replace degenerated/destroyed/malignant tissues (e.g. Parkinson’s disease)
  - genetic treatment aimed at altering somatic cells (e.g. myocardial or immunological cells) is acceptable and ongoing

### Induced Abortion

- CMA definition of induced abortion: the active termination of a pregnancy before fetal viability (fetus >500 g or >20 wk GA)
- CMA policy on induced abortion
  1. induced abortion should not be used as an alternative to contraception
  2. counselling on contraception must be readily available
  3. full and immediate counselling services must be provided in the event of unwanted pregnancy
  4. there should be no delay in the provision of abortion services
  5. no patient should be compelled to have a pregnancy terminated
  6. physicians should not be compelled to participate in abortion – if morally opposed, the physician should inform the patient so she may consult another physician
  7. no discrimination should be directed towards either physicians who do not perform or assist at induced abortions or physicians who do
  8. induced abortion should be uniformly available to all women in Canada and health care insurance should cover all the costs (note: the upper limit of GA for which coverage is provided varies between provinces)
  9. elective termination of pregnancy after fetal viability may be indicated under exceptional circumstances

### Ethical and Legal Concerns and Arguments

- no law currently regulates abortion in Canada
- it is a woman’s medical decision to be made in consultation with whom she wishes; there is no mandatory role for spouse/family
- 2nd and even 3rd trimester abortions are not illegal in Canada, but are usually only carried out when there are serious risks to the woman’s health, or if the fetus has died *in utero* or has major malformations (e.g. anencephaly)

### Prenatal/Antenatal Genetic Testing

- uses
  1. to confirm a clinical diagnosis
  2. to detect genetic predisposition to a disease
  3. allows preventative steps to be taken and helps patient prepare for the future
  4. gives parents the option to terminate a pregnancy or begin early treatment
- ethical dilemmas arise because of the sensitive nature of genetic information; important considerations of genetic testing include:
  - the individual and familial implications
  - its pertinence to future disease
  - its ability to identify disorders for which there are no effective treatments or preventive steps
  - its ability to identify the sex of the fetus
- ethical issues and arguments regarding the use of prenatal/antenatal genetic testing include:
  - obtaining informed consent is difficult due to the complexity of genetic information
  - doctor’s duty to maintain confidentiality vs. duty to warn family members
  - risk of social discrimination (e.g. insurance) and psychological harm

#### Advanced Reproductive Technologies: Ethically Appropriate Actions

- Educate patients and address contributors to infertility (e.g. stress, alcohol, medications, etc.)
- Investigate and treat underlying health problems causing infertility
- Wait at least 1 yr before initiating treatment with ART (exceptions – advanced age or specific indicators of infertility)
- Educate and prepare patients for potential negative outcomes of ART

#### The Tri-Council Policy Statement

1. Genetic treatment aimed at altering germ cells is prohibited in Canada and elsewhere
2. Embryo research is permitted up to 14 d post-fertilization
3. Embryos created for reproductive purposes that are no longer required may be used
4. Gamete providers must give free and informed consent for research use
5. No commercial transactions in the creation and use of the embryos are permitted
6. Creation of embryos solely for research purposes is prohibited
8. Human cloning is strictly prohibited
8. Risks of coercion must be minimized (i.e. the fertility treatment team may not be pressured to generate more embryos than necessary)
9. One may only discuss the option of using fetal tissue for research after free and informed choice to have a therapeutic abortion has been made by the patient
10. Physicians responsible for fertility treatment may not be part of a stem cell research team

### Legal Aspects

- no current specific legislation exists
- testing requires informed consent
- no standard of care exists for clinical genetics, but physicians are legally obligated to inform patients that prenatal testing exists and is available
- a physician can breach confidentiality terms in order to warn family members about a condition if harm can possibly be prevented via treatment or prevention (e.g. familial adenomatous polyposis, Gastroenterology, G34)

### Genetic Testing: Ethically Appropriate Actions

- thorough discussion and realistic planning with patient before testing is done
- genetic counselling for delivery of complex information

Surrogate mothers cannot be paid or offered compensation beyond a reimbursement of their expenses  
Source: Assisted Human Reproduction Act, 2004

No one under age 18 can donate sperm or eggs, except for the purpose of creating a child that the donor plans to raise himself/herself (e.g. young patients receiving radiation therapy for cancer that may cause infertility)  
Source: Semen Regulations of the Food and Drug Act, 1996

#### Know the Difference

Palliative care assists patients who are dying, but unlike euthanasia or physician-assisted suicide, it does not aim directly at or intend to end the person's life

#### Euthanasia: Ethically Appropriate Actions

- Respect competent decisions to forgo treatment
- Provide appropriate palliative measures
- Decline requests for euthanasia and assisted suicide
- Try to assess reasons for such requests from patients to see if there are 'reversible factors' (such as depression, pain, loneliness, anxiety) that can be treated

#### Mental Health Outcomes of Family Members of Patients Who Request Physician Aid in Dying

*J Pain Symptom Manage* 2009;38(6):807-815  
Surveyed 95 family members of patients who had explicitly requested aid in dying, including 59 whose loved one received a lethal prescription and 36 whose loved one died by lethal ingestion. For comparison purposes, family members of patients who died of cancer or amyotrophic lateral sclerosis also were surveyed.  
Among those whose family member requested aid in dying, whether or not the patient accessed a lethal prescription had no influence on subsequent depression, grief, or mental health services use; however, family members of patients who received a lethal prescription were more likely to believe that their loved one's choices were honored and less likely to have regrets about how the loved one died. Comparing family members of those who requested aid in dying to those who did not revealed no differences in primary mental health outcomes of depression, grief, or mental health services use. Family members of patients who requested aid in dying felt more prepared and accepting of the death than comparison family members. Pursuit of aid in dying does not have negative effects on surviving family members and may be associated with greater preparation and acceptance of death.

## End-of-Life Care

### Overview of Palliative and End-of-Life Care

- focus of care is comfort and respect for person nearing death and maximizing quality of life for patient, family, and loved ones
- appropriate for any patient at any stage of a serious or life-limiting illness
- may occur in a hospital, hospice, in the community, or at home
- often involves an interdisciplinary team of caregivers
- addresses the medical, psychosocial, and spiritual dimensions of care

### Euthanasia and Physician-Assisted Suicide

- **euthanasia:** a deliberate act undertaken by one person with the intention of ending the life of another person to relieve that person's suffering, where the act is the cause of death
- **physician-assisted suicide:** the act of intentionally killing oneself with the assistance of a physician who deliberately provides the knowledge and/or the means

### Common Ethical Arguments/Opinions

- patient has the right to make autonomous choices about the time and manner of their own death
- belief that there is no ethical difference between the acts of euthanasia/assisted suicide and forgoing life-sustaining treatments
- belief that these acts benefit terminally ill patients by relieving suffering
- patient autonomy has limits
- death should be the consequence of the morally justified withdrawal of life-sustaining treatments only in cases where there is a fatal underlying condition, and it is the condition (not the withdrawal of treatment) that causes death

### Legal Aspect

- in Canada, euthanasia is no longer a punishable offence under the Criminal Code of Canada
- in the *Carter v. Canada* decision of February 2015, physician-assisted suicide ruled to be not criminal, with the decision taking effect in 2016, now postponed to June 2016
- until June 2016, applicants for assistance in dying (MAID - 'Medical Aid in Dying') must obtain court sanction (as an exemption to the Criminal Code)

### Criteria for MAID

- grievously and irreversibly ill / injured
- suffering intolerable to the patient
- not treatable by means acceptable to the patient
- adult, competent patient, clear and freely given consent

### Acceptable Use of Palliative and End-of-Life Care

- the use of palliative sedation with opioids in end-of-life care, knowing that death may occur as an unintended consequence (principle of double effect) is distinguished from euthanasia and assisted suicide where death is the primary intent
- the appropriate withdrawal of life-support is distinguished from euthanasia and assisted suicide as it is seen as allowing the underlying disease to take its 'natural course' but this distinction may be more theoretical than real
- consent for withdrawal of life-support must be sought from SDMs, as ruled in *Cuthbertson v. Rasouli* in 2013, as palliative care would be instituted and consent for that would require SDM consent
- refusals of care by the patient that may lead to death as well as requests for a hastened death, ought to be carefully explored by the physician to rule out any 'reversible factors' (e.g. poor palliation, depression, poverty, ill-education, isolation) that may be hindering authentic choice

### Physician Responsibilities Regarding Death

- physicians are required by law to complete a medical certificate of death unless the coroner needs notification; failure to report death is a criminal offence
- *Coroner's Act*, 1990 (specific to Ontario, similar in other provinces) requires physicians to notify a coroner or police officer if death occurs
  - due to violence, negligence, misconduct, misadventure, or malpractice
  - during pregnancy or is attributable to pregnancy
  - suddenly and unexpectedly
  - from disease which was not treated by a legally qualified medical practitioner
  - from any cause other than disease
  - under suspicious circumstances
- coroner investigates these deaths, as well as deaths that occur in psychiatric institutions, jails, foster homes, nursing homes, hospitals to which a person was transferred from a facility, institution or home, etc.
- in consultation with forensic pathologists and other specialists, the coroner establishes:
  - the identity of the deceased
  - where and when the death occurred
  - the medical cause of death
  - the means of death (i.e. natural, accidental, suicide, homicide, or undetermined)
- coroners do not make decisions regarding criminality or legal responsibility  
unclear as yet whether physicians who object to MAID on grounds of conscience will have to refer to willing physicians and also unclear what patients seeking MAID in religious affiliated hospitals will do

#### Notify Coroner if Death Occurs due to:

- Violence, negligence, misconduct
- Pregnancy
- Sudden or unexpected causes
- Disease not treated
- Cause other than disease
- Suspicious circumstances

## Physician Competence and Professional Conduct

### CanMEDS Competencies (Ethical/Policy Statement)

- a framework of professional competencies established by the MCC as objectives for the MCC Qualifying Exam
- further information on MCC objectives can be found at [www.mcc.ca](http://www.mcc.ca)

### Legal Considerations

- physicians' conduct and competence are legally regulated to protect patients and society via mandatory membership to provincial governing bodies (e.g. the CPSO)
- physicians are legally required to maintain a license with the appropriate authority, and are thus legally bound to outlined policies on matters of conduct within his/her medical practice
- the ultimate constraint on MD behaviour as regards to unprofessionalism is 'conduct unbecoming a physician', such as inappropriate behaviour with colleagues, conflicts of interest, untruthfulness, unethical billing practices, and sexual impropriety with patients

### Common Policies on Physician Conduct

- physicians must ensure that patients have access to continuous on-call coverage and are never abandoned
- sexual conduct with patients, even when consented to by the patient, is a serious matter that can lead to accusations of battery by the patient and provincial governing body. Important notes on this topic include:
  - inappropriate sexual conduct includes intercourse, undue touching, references to sexual matters, sexual jokes, and physician presence when capable patients undress or dress
  - in specified situations, physicians may have a personal relationship with a patient provided a year has passed since the last therapeutic contact
  - physicians are permanently prohibited from personal relationships with patients whom they saw for psychotherapy
  - in Ontario, physicians must report any colleagues of whom they have information regarding sexual impropriety (as per CPSO Code of Ethics)
- physicians must maintain adequate records for each patient, which include:
  - demonstration that care has been continuous and comprehensive
  - minimal standards for record-keeping, including readability, diagnosis, differential diagnosis, appropriate tests and referrals, and a coherent patient record, including drugs, a Cumulative Patient profile, all aspects of charting that are required for safe patient care (full standards available at [www.cpso.on.ca](http://www.cpso.on.ca)). Another physician should be able to take over the safe care of the patient based on the record
  - records stored for 10 years in most jurisdictions
  - although the medical record is the property of the physician or an institution, the patient or the patient's delegate must be allowed full access to information in the medical record in a reasonable period of time, and can charge a reasonable fee, upon (usually written) request
- in the hospital, physicians must ensure their own competence, respect hospital by-laws and regulations, practice only within the limits of granted privileges, cooperate with other hospital personnel, and maintain adequate hospital records

#### CanMeds Competencies

- Communicator
- Collaborator
- Health Advocate
- Leader
- Professional
- Scholar
- Medical Expert

#### CPSO Policy: Treating Self and Family Members

Physicians will not diagnose or treat themselves or family members except for minor conditions or in emergencies and then only if no other physician is readily available

#### CPSO Policy: Ending the Physician-Patient Relationship

Discontinuing services that are needed is an act of professional misconduct unless done by patient request, alternative services are arranged, or adequate notice has been given

#### CMA Code of Ethics

Report any unprofessional conduct by colleagues to the appropriate authority

## Research Ethics

- involves the systematic analysis of ethical dilemmas arising during research involving human subjects to ensure that:
  - study participants are protected
  - clinical research is conducted to serve the interests of the participants and/or society as a whole
- major ethical dilemmas arise when a physician's obligation to the patient comes into conflict with other obligations and incentives
- any exceptions to disclosure for therapeutic consent do not apply in an experimental situation
- important ethical principles to consider when conducting research on human subjects were laid out in the *Declaration of Helsinki*, the *Belmont Report*, and the *Tri-Council Policy Statement: Ethical Conduct on Research Involving Human Subjects*

**Table 5. Ethical Principles for Research Involving Human Subjects**

Patient's participation in research should not put him/her at a known or probable disadvantage with respect to medical care (i.e. cannot deny participants in research 'known effective care', such as randomizing some depressed patients to a placebo arm with no treatment)

Participant's voluntary and informed choice is usually required, except in special circumstances (i.e. chart reviews without patient contact, or emergency situations for which there is no accepted or helpful standard of care and the proposed intervention is not likely to cause more harm than such patients already face)

Access to the treatment that is considered standard (i.e. placebo-controlled trials are generally acceptable where patients all receive still receive the standard of care, or, if not, are informed about the placebo arm and what that entails)

Must employ a scientifically valid design to answer the research question (ensured via peer review, expert opinion)

Must demonstrate sufficient value to justify any risk posed to participants

Must be conducted honestly (i.e. carried out as stated in the approved protocol)

Findings must be reported promptly and accurately without exaggeration, to allow practicing clinicians to draw reasonable conclusions

Patients must not be enticed into risky research by the lure of money and investigators must not trade the interests of patients for disproportionate recompense by a sponsor; both participants and investigators are due fair recompense for their time and efforts

Any significant interventional trial ought to have a data safety monitoring board that is independent of the sponsor and can ensure safety of the ongoing trial

### Guiding Principles for Research Ethics

- Respect for persons: informed consent
- Beneficence: harm vs. benefit
- Justice: avoid exploitation/unjustified exclusion

### Informed Consent for Research

- Purpose of study
- Sum of funding
- Name and probability of harm and benefits
- Nature of physician's participation including compensation
- Proposals for research must be submitted to a research ethics board

Randomization is allowed even if there is an efficacious standard if, for example, there are drawbacks to it (such as it doesn't work for all, has side effects, and is not wanted by all patients). In such cases, there must be a good safety net established to make sure subjects in the placebo arm do not deteriorate (i.e. there must be a safety monitoring plan for such studies)

### CMA and CPSO Guidelines for Ethically Appropriate Physician-Industry Relations

- The primary goal should be the advancement of the health of Canadians
- Relationships should be guided by the CMA Code of Ethics
- The physician's primary obligation is to the patient
- Physicians should avoid any self-interest in their prescribing and referral practices
- Physicians should always maintain professional autonomy, independence, and commitment to the scientific method

### Professional Considerations

#### Elderly Patient

- Identify their resuscitation options (CPR or DNR), if applicable
- Check for documentation of advance directives and POA where applicable
- For further details, see *Geriatric Medicine, GM12*

#### Pediatric Patient

- Identify the primary decision-maker (parents, guardian, wards-of-state, emancipated)
- Regarding capacity assessment see *Pediatric Aspects of Capacity Covered by the HCCA, ELOM9*

- Be wary of custody issues if applicable

#### Terminally Ill or Palliative Patient

- Consider the SPIKES approach to breaking bad news
- What are his/her goals of care (i.e. disease vs. symptom management)?
- Identify advance directives, POA, or SDM, if applicable (see *ELOM9*)
- Check for documentation of resuscitation options (CPR or DNR) and likelihood of success
- For further details, see *Geriatric Medicine, GM12*

#### Incapable Patient

- If not already present, perform a formal capacity assessment
- Identify if the patient has a SDM or who has their POA
- Check the patient's chart for any Mental Health Forms (e.g. Form 1) or any forms they may have on their person (e.g. Form 42)

## Physician-Industry Relations

- health care delivery in Canada involves collaboration between physicians and the pharmaceutical and health supply industries in the areas of research, education, and clinical evaluation packages (i.e. product samples)
- physicians have a responsibility to ensure that their participation in such collaborative efforts is in keeping with their duties to their patients and society
- gifts or free products from the pharmaceutical industry are usually inappropriate
  - sponsorship for travel and fees for conference attendance may be accepted only where the physician is a conference presenter and not just in attendance
  - physicians receiving such sponsorship must disclose this at presentations and/or in written articles

## Resource Allocation

- definition: the distribution of goods and services to programs and people
- physicians have the duty to inform patients about therapeutic options even if they are not available
- physicians must make health care resources available to patients in a manner which is fair and equitable, without bias or discrimination
  - need and benefit are morally relevant criteria for resource allocation
  - gender, sexual orientation, religion, level of education, or age alone are morally irrelevant criteria
- ethical dilemmas that arise when deciding how best to allocate resources
  - fair chances versus best outcome: favouring best outcome vs. giving all patients fair access to limited resources (e.g. transplant list prioritization)
  - priorities problem: how much priority should the sickest patients receive?
  - aggregation problem: modest benefits to many vs. significant benefits to few
  - democracy problem: when to rely on a fair democratic process to arrive at a decision

### Guidelines for Appropriately Allocating Resources

- the physician's primary obligation is to:
  - protect and promote the welfare and best interests of his/her patients
  - choose interventions known to be beneficial on the basis of evidence of effectiveness
  - seek the tests or treatments that will accomplish the diagnostic or therapeutic goal for the least cost
  - advocate for one's patients, but avoid manipulating the system to gain unfair advantage for them
  - resolve conflicting claims for scarce resources justly, on the basis of morally relevant criteria such as need and benefit, using fair and publicly defensible procedures
  - inform patients of the impact of cost constraints on care, but in a sensitive way
  - seek resolution of unacceptable shortages at the level of hospital management or government

## Conscientious Objection

### Patients Refusing Treatment

- in accordance with the principle of autonomy, it is generally acceptable for competent patients to refuse medical interventions for themselves or others, although exceptions may occur
- if parents or SDMs make decisions that are clearly not in the “best interests” of an incapable child, physicians may have ethical grounds for administering treatment, depending on the acuity of the clinical situation
  - in high-acuity scenarios (e.g. refusing blood transfusion based on religious grounds for a child in hemorrhagic shock), physicians have a stronger obligation to act in the child’s best interests
  - in lower acuity scenarios (e.g. refusing childhood immunization in a developed nation) there is a stronger obligation to respect the autonomy of the decision-makers
  - pursuing traditional First Nations healing (in conjunction or in the place of standard biomedical therapy) is legally considered a constitutionally protected right, which can be made by a SDM, as ruled in *Hamilton Health Sciences v. DH* in 2014

### Physicians Refusing to Provide Treatment

- physicians may refuse to provide treatment or discontinue relationships with patients, but must ensure these patients can access services elsewhere (e.g. a pediatrician who refuses to treat an unvaccinated child should refer the family to another practice)

ETT	endotracheal tube	LOC	level of consciousness				

## Overview of Anesthesia

- anesthesia: lack of sensation/perception
  - **approach to anesthesia**
    1. pre-operative assessment
    2. patient optimization
    3. plan anesthetic
      - various types of anesthesia
      - pre-medication
      - airway management
      - monitors
      - induction
      - maintenance
      - emergence
      - extubation
    4. post-operative care

### 6 As of General Anesthesia

**Anesthesia**  
**Anxiolysis**  
**Amnesia**  
**Areflexia** (muscle relaxation - not always required)  
**Autonomic stability**  
**Analgesia**

## Types of Anesthesia

- **general**
  - general anesthesia (GA)
  - total IV anesthesia (TIVA)
- **regional**
  - spinal, epidural
  - peripheral nerve block
  - IV regional
- **local**
  - local infiltration
  - topical

Note that different types of anesthesia can be combined (general + regional)

## Pre-Operative Assessment

### Purpose

- identify concerns for medical and surgical management of patient
- allow for questions to help allay any fears or concerns patient and/or family may have
- arrange further investigations, consultations and treatments for patients not yet optimized
- plan and consent for anesthetic techniques

## History and Physical

### History

- age, gender
- indication for surgery
- surgical/anesthetic Hx: previous anesthetics, any complications, previous intubations, medications, drug allergies, post-operative N/V
- FHx: abnormal anesthetic reactions, malignant hyperthermia, pseudocholinesterase deficiency (see *Uncommon Complications, A28*)

- PMHx
  - CNS: seizures, TIA/strokes, raised ICP, spinal disease, aneurysm
  - CVS: angina/CAD, MI, CHF, HTN, valvular disease, dysrhythmias, peripheral vascular disease (PVD), conditions requiring endocarditis prophylaxis, exercise tolerance, CCS/NYHA class ([Cardiology and Cardiac Surgery, C35 sidebar for NYHA Classification](#))
  - respiratory: smoking, asthma, COPD, recent upper respiratory tract infection, sleep apnea
  - GI: GERD, liver disease, NPO status
  - renal: insufficiency, dialysis, chronic kidney disease
  - hematologic: anemia, coagulopathies, blood dyscrasias
  - MSK: conditions associated with difficult intubations – arthritides (e.g. rheumatoid arthritis), cervical tumours, cervical infections/abscesses, trauma to cervical spine, previous cervical spine surgery, Trisomy 21, scleroderma, conditions affecting neuromuscular junction (e.g. myasthenia gravis)
  - endocrine: DM, thyroid disorders, adrenal disorders
  - other: morbid obesity, pregnancy, ethanol/other drug use

**Physical Exam**

- weight, height, BP, pulse, respiratory rate, oxygen saturation
- focused physical exam of the CNS, CVS, and respiratory systems
- general assessment of nutrition, hydration, and mental status
- airway assessment is done to determine intubation difficulty (no single test is specific or sensitive) and ventilation difficulty
  - cervical spine stability and neck movement – upper cervical spine extension, lower cervical spine flexion (“sniffing position”)
  - Mallampati classification
  - “3-2-1 rule”
    - ◆ thyromental distance (distance of lower mandible in midline from the mentum to the thyroid notch); <3 finger breadths (<6 cm) is associated with difficult intubation
    - ◆ mouth opening (<2 finger breadths is associated with difficult intubation)
    - ◆ anterior jaw subluxation (<1 finger breadth is associated with difficult intubation)
  - tongue size
  - dentition, dental appliances/prosthetic caps, existing chipped/loose teeth – pose aspiration risk if dislodged and must inform patients of rare possibility of damage
  - nasal passage patency (if planning nasotracheal intubation)
  - assess potential for difficult ventilation
- examination of anatomical sites relevant to lines and blocks
  - bony landmarks and suitability of anatomy for regional anesthesia (if relevant)
  - sites for IV, central venous pressure (CVP), and pulmonary artery (PA) catheters

**Evaluation of Difficult Airway**

**LEMON**

Look – obesity, beard, dental/facial abnormalities, neck, facial/neck trauma  
 Evaluate – 3-2-1 rule  
 Mallampati score  
 Obstruction – stridor, foreign bodies  
 Neck mobility

**To Assess for Ventilation Difficulty**

**BONES**

Beard  
 Obesity (BMI > 26)  
 No teeth  
 Elderly (age > 55)  
 Snoring Hx (sleep apnea)

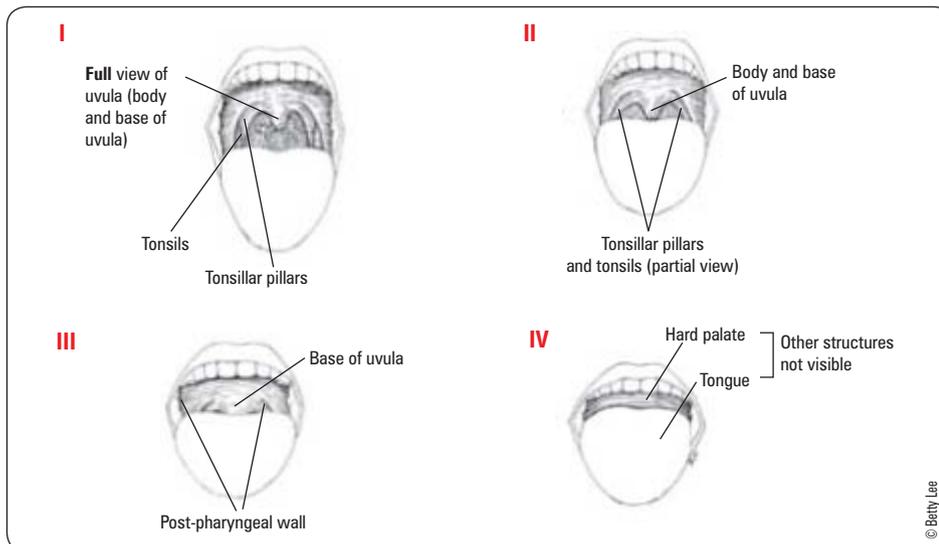

Figure 1. Mallampati classification of oral opening

© Betty Lee

## Pre-Operative Investigations

- routine pre-operative investigations are only necessary if there are comorbidities or certain indications

**Table 1. Suggested Indications for Specific Investigations in the Pre-Operative Period**

Test	Indications
<b>CBC</b>	Major surgery requiring group and screen or cross and match; chronic cardiovascular, pulmonary, renal, or hepatic disease; malignancy; known or suspected anemia; bleeding diathesis or myelosuppression; patient > 1 yr of age
<b>Sickle Cell Screen</b>	Patients from geographic areas with high prevalence of sickle cell disease and/or genetically predisposed patients (hemoglobin electrophoresis if screen is positive)
<b>INR, aPTT</b>	Anticoagulant therapy, bleeding diathesis, liver disease
<b>Electrolytes and Creatinine</b>	Hypertension, renal disease, DM, pituitary or adrenal disease; vascular disease, digoxin, diuretic, or other drug therapies affecting electrolytes
<b>Fasting Glucose Level</b>	DM (repeat on day of surgery)
<b>Pregnancy (β-hCG)</b>	Women of reproductive age
<b>ECG</b>	Heart disease, DM, other risk factors for cardiac disease; subarachnoid or intracranial hemorrhage, cerebrovascular accident, head trauma
<b>Chest Radiograph</b>	Patients with new or worsening respiratory symptoms/signs

Guidelines to the Practice of Anesthesia Revised Edition 2013. Supplement to the *Canadian Journal of Anesthesia*, Vol 60, Dec. 2013. Reproduced with permission © Canadian Anesthesiologists' Society

## American Society of Anesthesiology Classification

- common classification of physical status at the time of surgery
- a gross predictor of overall outcome, NOT used as stratification for anesthetic risk (mortality rates)
- **ASA 1:** a healthy, fit patient
- **ASA 2:** a patient with mild systemic disease
  - e.g. controlled Type 2 DM, controlled essential HTN, obesity, smoker
- **ASA 3:** a patient with severe systemic disease that limits activity
  - e.g. stable CAD, COPD, DM, obesity
- **ASA 4:** a patient with incapacitating disease that is a constant threat to life
  - e.g. unstable CAD, renal failure, acute respiratory failure
- **ASA 5:** a moribund patient not expected to survive 24 h without surgery
  - e.g. ruptured abdominal aortic aneurysm (AAA), head trauma with increased ICP
- **ASA 6:** declared brain dead, a patient whose organs are being removed for donation purposes
- for emergency operations, add the letter E after classification (e.g. ASA 3E)

## Pre-Operative Optimization

- in general, prior to elective surgery
  - any fluid and/or electrolyte imbalance should be corrected
  - extent of existing comorbidities should be understood and these conditions should be optimized prior to surgery
  - medications may need adjustment

## Medications

- pay particular attention to cardiac and respiratory medications, opioids and drugs with many side effects and interactions
- **pre-operative medications to consider**
  - prophylaxis
    - ♦ risk of GE reflux: sodium citrate and/or ranitidine and/or metoclopramide 30 min-1 h prior to surgery
    - ♦ risk of infective endocarditis, GI/GU interventions: antibiotics
    - ♦ risk of adrenal suppression: steroid coverage
    - ♦ anxiety: consider benzodiazepines
    - ♦ COPD, asthma: bronchodilators
    - ♦ CAD risk factors: nitroglycerin and β-blockers
- **pre-operative medications to stop**
  - oral antihyperglycemics: stop on morning of surgery
  - ACE inhibitors and angiotension receptor blockers: may stop on morning of surgery (controversial)

### Impact of Anesthesia Management Characteristics on Severe Morbidity and Mortality

*Anesth* 2005;102:257-268

**Study:** Case-control study of patients undergoing anesthesia.

**Patients:** 807 cases and 883 controls were analyzed among a cohort of 869,483 patients undergoing anesthesia between 1995-1997. Cases were defined as patients who either remained comatose or died within 24 h of receiving anesthesia. Controls were defined as patients who neither remained comatose nor died within 24 h of receiving anesthesia.

**Intervention:** General, regional, or combined anesthesia to patients undergoing a surgical procedure.

**Main Outcome:** Coma or death within 24 h of receiving anesthesia.

**Results:** The incidence of 24 h post-operative death was 8.8 per 10,000 anesthetics (95% CI 8.2-9.5) and the incidence of coma was 0.5 (95% CI 0.3-0.6). Anesthesia management risk factors that were associated with a decreased risk of morbidity and mortality were equipment check with protocol and documentation, directly available anesthesiologist with no change during anesthesia, 2 persons present at emergence of anesthesia, reversal of muscle relaxation, and post-operative pain medication.

### Aspirin® in Patients undergoing Non-Cardiac Surgery

*NEJM* 2014;370:1494-1503

**Purpose:** This study evaluated the effect of low-dose ASA on the risk of death or non-fatal MI in 10,010 patients undergoing non-cardiac surgery. Patients were randomized into two groups in a double-blind process.

**Methods:** RCT in which ASA or placebo to be taken shortly before surgery and in the early post-operative period. The primary outcome was a composite of death or non-fatal MI.

**Results:** Death or non-fatal MI occurred in 7.0% in the ASA group and 7.1% in the placebo group. Major bleeding was more common in the ASA group than the placebo group.

**Conclusion:** Administration of ASA before surgery and throughout the early post-surgical period had no significant effect on the incidence of death or MI but increased the risk of major bleeding.

- warfarin (consider bridging with heparin), anti-platelet agents (e.g. clopidogrel)
  - ◆ discuss perioperative use of ASA, NSAIDs with surgeon ( $\pm$  patient's cardiologist/internist)
  - ◆ in patients undergoing non-cardiac surgery, starting or continuing low-dose aspirin in the perioperative period does not appear to protect against post-operative MI or death, but increases the risk of major bleeding
    - note: this does not apply to patients with bare metal stents or drug-eluting coronary stents
- **pre-operative medications to adjust**
  - insulin (consider insulin/dextrose infusion or holding dose), prednisone, bronchodilators

#### Effects of Extended-Release Metoprolol Succinate in Patients undergoing Non-Cardiac Surgery (POISE Trial): A Randomized Controlled Trial

*Lancet* 2008;371:1839-1847

**Purpose:** To investigate the role of  $\beta$ -blockers (metoprolol) perioperatively in patients with known vascular disease undergoing non-cardiac surgery.  
**Methods:** Patients from 190 centres in 23 countries were eligible if they were age  $>45$ , undergoing non-cardiac surgery, and were known to have significant vascular disease. Patients were randomized to either the metoprolol group or placebo. Participants received metoprolol (or placebo) 100 mg 2-4 h prior to surgery, 6 h after surgery, and then 20 mg daily for 30 d. The primary endpoint was a composite of cardiovascular death, non-fatal myocardial infarction, and non-fatal cardiac arrest. Analysis was by intention to treat.

**Results:** 8,351 patients were recruited into the study, with 8,331 completing the 30 d course. Use of metoprolol was found to significantly reduce the risk of cardiovascular death, non-fatal MI, or non-fatal cardiac arrest vs. placebo (hazard ratio 0.84,  $p<0.05$ ) but significantly increased the rate of stroke (hazard ratio 2.17,  $p<0.01$ ) and overall risk of death (hazard ratio 1.33,  $p<0.05$ ).

**Conclusion:** Use of perioperative  $\beta$ -blockers (metoprolol) in patients with known vascular disease provides both risks and benefits, and these must be considered for each patient individually.

#### $\beta$ -blockers

- $\beta_1$ -receptors are located primarily in the heart and kidneys
- $\beta_2$ -receptors are located in the lungs
- Non-selective  $\beta$ -blockers block  $\beta_1$  and  $\beta_2$ -receptors (labetalol, carvedilol, nadolol). Caution is required with non-selective  $\beta$ -blockers, particularly in patients with respiratory conditions where  $\beta_2$  blockade can result in airway reactivity

## Hypertension

- BP  $<180/110$  is not an independent risk factor for perioperative cardiovascular complications
- target SBP  $<180$  mmHg, DBP  $<110$  mmHg
- assess for end-organ damage and treat accordingly

## Coronary Artery Disease

- ACC/AHA Guidelines (2014) recommend that at least 60 days should elapse after a MI before a non-cardiac surgery in the absence of a coronary intervention
  - this period carries an increased risk of re-infarction/death
  - if operative procedure is essential and cannot be delayed then invasive intra- and post-operative ICU monitoring is required to reduce the above risk
- mortality with perioperative MI is 20-50%
- perioperative  $\beta$ -blockers
  - may decrease cardiac events and mortality (controversial, as recent data suggests stroke risk)
  - continue  $\beta$ -blocker if patient is routinely taking it prior to surgery
  - consider initiation of  $\beta$ -blocker in
    - ◆ patients with CAD or indication for  $\beta$ -blocker
    - ◆ intermediate or high risk surgery, especially vascular surgery

## Respiratory Diseases

- smoking
  - adverse effects: altered mucus secretion and clearance, decreased small airway calibre, and altered immune response
  - abstain at least 8 wk pre-operatively if possible
  - if unable, abstaining even 24 h pre-operatively has been shown to increase oxygen availability to tissues
- asthma
  - pre-operative management depends on degree of baseline asthma control
  - increased risk of bronchospasm from intubation
    - ◆ administration of short course (up to 1 wk) pre-operative corticosteroids and inhaled  $\beta_2$ -agonists decreases the risk of bronchospasm and does not increase the risk of infection or delay wound healing
  - avoid non-selective  $\beta$ -blockers due to risk of bronchospasm
  - cardioselective  $\beta$ -blockers (metoprolol, atenolol) do not increase risk of bronchospasm in the short-term
  - delay elective surgery for poorly controlled asthma (increased cough or sputum production, active wheezing)
  - delay elective surgery by a minimum of 6 wk if patient develops URTI
- COPD
  - anesthesia, surgery (especially abdominal surgery, in particular upper abdominal surgery) and pain predispose the patient to atelectasis, bronchospasm, pneumonia, prolonged need for mechanical ventilation, and respiratory failure
  - pre-operative ABG is needed for all COPD stage II and III patients to assess baseline respiratory acidosis and plan post-operative management of hypercapnea
  - cancel/delay elective surgery for acute exacerbation

## Aspiration

- increased risk of aspiration with
  - decreased LOC
  - trauma
  - meals within 8 h
  - suspected sphincter incompetence (GERD, hiatus hernia, nasogastric tube)
  - increased abdominal pressure (pregnancy, obesity, bowel obstruction, acute abdomen)
  - laryngeal mask vs. endotracheal tube (ETT)

- management
  - reduce gastric volume and acidity
  - delay inhibiting airway reflexes with muscular relaxants
  - employ rapid sequence induction (see *Rapid Sequence Induction*, A15)

## Fasting Guidelines

### Fasting Guidelines Prior to Surgery (Canadian Anesthesiologists' Society)

- 8 h after a meal that includes meat, fried or fatty foods
- 6 h after a light meal (such as toast or crackers) or after ingestion of infant formula or non-human milk
- 4 h after ingestion of breast milk
- 2 h after clear fluids (water, black coffee, tea, carbonated beverages, juice without pulp)

## Hematological Disorders

- history of congenital or acquired conditions (sickle cell anemia, factor VIII deficiency, ITP, liver disease)
- evaluate hemoglobin, hematocrit and coagulation profiles when indicated (Table 1)
- anemia
  - pre-operative treatments to increase hemoglobin (erythropoietin or pre-admission blood collection in certain populations)
- coagulopathies
  - discontinue or modify anticoagulation therapies (warfarin, clopidogrel, ASA) in advance of elective surgeries
  - administration of reversal agents if necessary: vitamin K, FFP, prothrombin complex concentrate, recombinant activated factor VII

## Endocrine Disorders

- diabetes mellitus
  - clarify type 1 vs. type 2
  - clarify treatment – oral anti-hyperglycemics and/or insulin
  - assess glucose control with history and HbA1c; well controlled diabetics have more stable glucose levels intraoperatively
  - end organ damage: be aware of damage to cardiovascular, renal, and nervous systems, including autonomic neuropathy
  - formulate intraoperative glucose management plan based on type (1 vs. 2), glucose control, and extent of end organ damage
- hyperthyroidism
  - can experience sudden release of thyroid hormone (thyroid storm) if not treated or well-controlled preoperatively
  - treatment:  $\beta$ -blockers and pre-operative prophylaxis
- adrenocortical insufficiency (Addison's, exogenous steroid use)
  - consider intraoperative steroid supplementation

## Obesity and Obstructive Sleep Apnea

- assess for co-morbid conditions in obese patient (independent risk factor for CVD, DM, OSA, cholelithiasis, HTN)
- previously undiagnosed conditions may require additional testing to characterize severity
- both obesity and OSA increase risk of difficult ventilation, intubation and post-operative respiratory complications
  - risk may be magnified with both diseases present

## Monitoring

### Canadian Guidelines to the Practice of Anesthesia and Patient Monitoring

- an anesthetist present: "the only indispensable monitor"
- a completed pre-anesthetic checklist: including ASA class, NPO policy, Hx and investigations
- a perioperative anesthetic record: HR and BP every 5 min, O<sub>2</sub> saturation, End Tidal CO<sub>2</sub>, dose and route of drugs and fluids
- continuous monitoring: see *Routine Monitors for All Cases*

### Routine Monitors for All Cases

- pulse oximeter, BP monitor, electrocardiography and capnography are required for general anesthesia and sedation (Ramsey Sedation Scale 4-6), agent-specific anesthetic gas monitor when inhalational anesthetic agents are used
- the following must also be available: temperature probe, peripheral nerve stimulator, stethoscope, appropriate lighting, spirometer

### Pre-Anesthetic Checklist

#### SAMMM

**S**uction: connected and working  
**A**irways: laryngoscope and blades, ETT, syringe, stylet, oral and nasal airways, tape, bag, and mask

**M**achine: connected, pressures okay, all meters functioning, vaporizers full

**M**onitors: available, connected, and working

**M**edications: IV fluids and kit ready, emergency medicines in correct location and accessible

### Elements to Monitor

- anesthetic depth
  - inadequate: blink reflex present when eyelashes lightly touched, HTN, tachycardia, tearing or sweating
  - excessive: hypotension, bradycardia
- oxygenation: pulse oximetry, fraction of inspired O<sub>2</sub> (FiO<sub>2</sub>)
- ventilation: verify correct position of ETT, chest excursions, breath sounds, ETCO<sub>2</sub> analysis, end tidal inhaled anesthesia analysis
- circulation: pulse, rhythm, BP, telemetry, oximetry, CVP, pulmonary capillary wedge pressure
- temperature
- hourly urine output

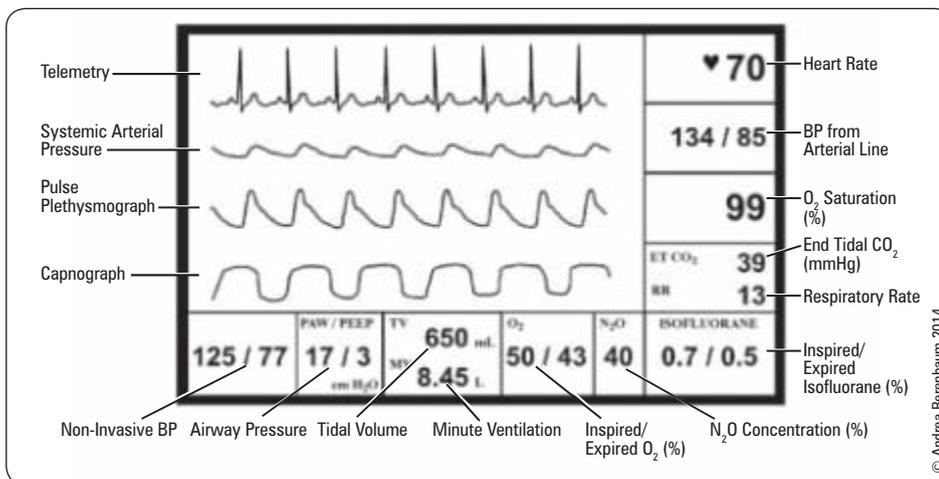

Figure 2. Typical anesthesia monitor

## Airway Management

### Airway Anatomy

- resistance to airflow through nasal passages accounts for approximately 2/3 of total airway resistance
- pharyngeal airway extends from posterior aspect of the nose to cricoid cartilage
- glottic opening (triangular space formed between the true vocal cords) is the narrowest segment of the laryngeal opening in adults
- the glottic opening is the space through which one visualizes proper placement of the ETT
- the trachea begins at the level of the thyroid cartilage, C6, and bifurcates into the right and left main bronchi at T4-T5 (approximately the sternal angle)

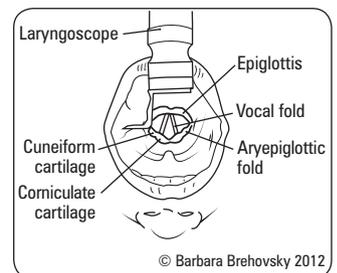

Figure 3. Landmarks for intubation

### Methods of Supporting Airways

1. non-definitive airway (patent airway)
  - jaw thrust/chin lift
  - oropharyngeal and nasopharyngeal airway
  - bag mask ventilation
  - LMA
2. definitive airway (patent and protected airway)
  - ETT
  - surgical airway (cricothyrotomy or tracheostomy)

**Table 2. Methods of Supporting the Airway**

	Bag and Mask	Laryngeal Mask Airway (LMA)	Endotracheal Tube (ETT)
<b>Advantages/Indications</b>	Basic Non-invasive Readily available	Easy to insert Less airway trauma/irritation than ETT Frees up hands (vs. face mask) Primarily used in spontaneously ventilating patient	Indications for intubation ( <b>5 Ps</b> ) <b>P</b> atent airway <b>P</b> rotects against aspiration <b>P</b> ositive pressure ventilation <b>P</b> ulmonary toilet (suction) <b>P</b> harmacologic administration also hemodynamic instability
<b>Disadvantages/Contraindications</b>	Risk of aspiration if decreased LOC Cannot ensure airway patency Inability to deliver precise tidal volume Operator fatigue	Risk of gastric aspiration PPV < 20 cm H <sub>2</sub> O needed Oropharyngeal/retropharyngeal pathology or foreign body Does not protect against laryngospasm or gastric aspiration	Insertion can be difficult Muscle relaxant usually needed Most invasive – <i>see Complications During Laryngoscopy and Intubation, A9</i>
<b>Other</b>	Facilitate airway patency with jaw thrust and chin lift Can use oropharyngeal/nasopharyngeal airway	Sizing by body weight (approx) 40-50 kg: 3 50-70 kg: 4 70-100 kg: 5	Auscultate to avoid endobronchial intubation Sizing (approx): Male: 8.0-9.0 mm Female: 7.0-8.0 mm Pediatric Uncuffed (> age 2): (age/4) + 4 mm

**Equipment for Intubation**

**MDSOLES**

- Monitors
- Drugs
- Suction
- Oxygen source and self-inflating bag with oropharyngeal and nasopharyngeal airways
- Laryngoscope
- Endotracheal tubes (appropriate size and one size smaller)
- Stylet, Syringe for tube cuff inflation

**Medications that can be Given Through the ETT**

**NAVEL**

- Naloxone
- Atropine
- Ventolin
- Epinephrine
- Lidocaine

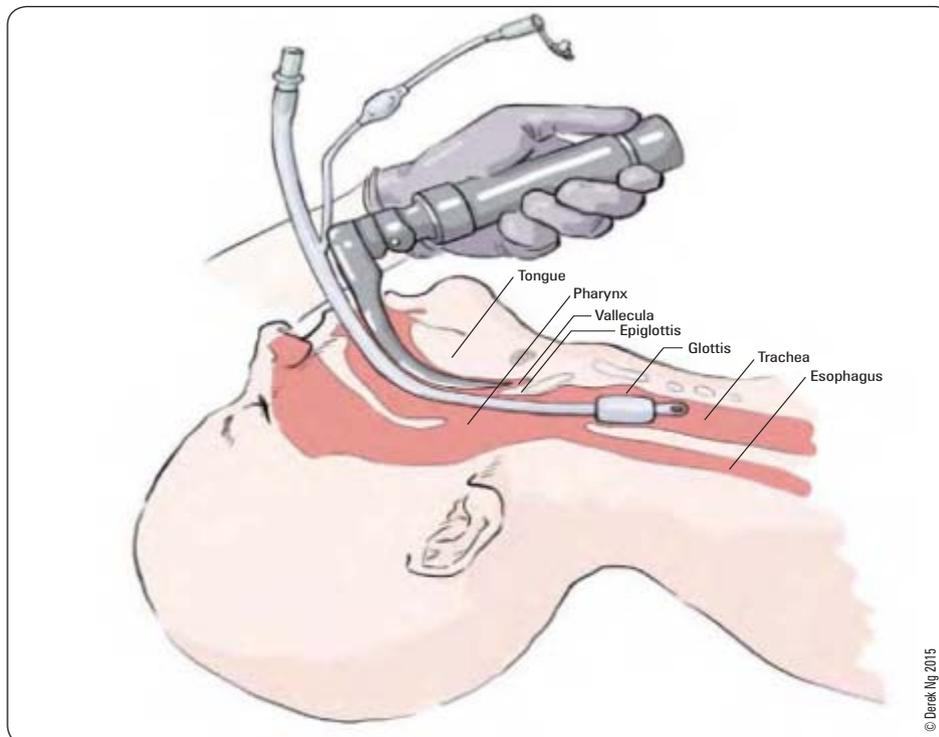

## Tracheal Intubation

### Preparing for Intubation

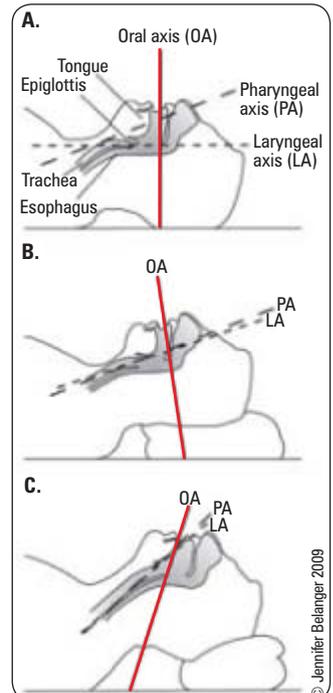

- failed attempts at intubation can make further attempts more difficult due to tissue trauma
- plan, prepare, and assess for potential difficulties (*see Pre-Operative Assessment, A2*)
- ensure equipment is available and working (test ETT cuff, check laryngoscope light and suction, machine check)
- pre-oxygenate/denitrogenate: patient breathes 100% O<sub>2</sub> for 3-5 min or for 4-8 vital capacity breaths
- may need to suction mouth and pharynx first

### Proper Positioning for Intubation

- align the three axes (mouth, pharynx, and larynx) to allow visualization from oral cavity to glottis
  - “sniffing position”: flexion of lower C-spine (C5-C6), bow head forward, and extension of upper C-spine at atlanto-occipital joint (C1), nose in the air
  - contraindicated in known/suspected C-spine fracture/instability
- laryngoscope tip placed in the epiglottic vallecula in order to visualize cord

**Figure 4. Sagittal view of airway with laryngoscope in vallecula**

**Figure 5. Anatomic considerations in laryngoscopy**  
 A. Neutral position  
 B. C-spine flexion  
 C. C-spine flexion with atlanto-occipital extension

© Derek Ng 2015

© Jennifer Belanger 2009

### Tube Insertion

- laryngoscopy and ETT insertion can incite a significant sympathetic response via stimulation of cranial nerves 9 and 10 due to a "foreign body reflex" in the trachea, including tachycardia, dysrhythmias, myocardial ischemia, increased BP, and coughing
- a malpositioned ETT is a potential hazard for the intubated patient
  - if too deep, may result in right endobronchial intubation, which is associated with left-sided atelectasis and right-sided tension pneumothorax
  - if too shallow, may lead to accidental extubation, vocal cord trauma, or laryngeal paralysis as a result of pressure injury by the ETT cuff
- the tip of ETT should be located at the midpoint of the trachea at least 2 cm above the carina and the proximal end of the cuff should be placed at least 2 cm below the vocal cords
  - approximately 20-23 cm mark at the right corner of the mouth for men and 19-21 cm for women

### Confirmation of Tracheal Placement of ETT

- direct
  - visualization of ETT passing through cords
  - bronchoscopic visualization of ETT in trachea
- indirect
  - ET<sub>CO</sub><sub>2</sub> in exhaled gas measured by capnography – a mandatory method for confirming the ETT is in the airway
  - auscultate for equal breath sounds bilaterally and absent breath sounds over epigastrium
  - bilateral chest movement, condensation of water vapour in ETT visible during exhalation and no abdominal distention
  - refilling of reservoir bag during exhalation
  - CXR (rarely done): only confirms position of the tip of ETT and not that ETT is in the trachea
- esophageal intubation suspected when
  - ET<sub>CO</sub><sub>2</sub> zero or near zero on capnograph
  - abnormal sounds during assisted ventilation
  - impairment of chest excursion
  - hypoxia/cyanosis
  - presence of gastric contents in ETT
  - breath sounds heard when auscultating over epigastrium/LUQ
  - distention of stomach/epigastrium with ventilation

### Complications During Laryngoscopy and Intubation

- dental damage
- laceration (lips, gums, tongue, pharynx, vallecula, esophagus)
- laryngeal trauma
- esophageal or endobronchial intubation
- accidental extubation
- insufficient cuff inflation or cuff laceration: results in leaking and aspiration
- laryngospasm (see *Extubation, A20 for definition*)
- bronchospasm

## Difficult Airway

- difficulties with bag-mask ventilation, supraglottic airway, laryngoscopy, passage of ETT through the cords, infraglottic airway or surgical airway
- algorithms exist for difficult airways (*Can J Anesth* 2013;60:1119-1138; *Anesthesiology* 2003;98:3273; *Anesthesiology* 2013;118:251-270), see *ACLS Guidelines (Figures 14, A29 and 15, A30)*
- pre-operative assessment (history of previous difficult airway, airway examination) and pre-oxygenation are important preventative measures
- if difficult airway expected, consider
  - awake intubation
  - intubating with bronchoscope, trachlight (lighted stylet), fibre optic laryngoscope, glidescope, etc.
- if intubation unsuccessful after induction
  1. CALL FOR HELP
  2. ventilate with 100% O<sub>2</sub> via bag and mask
  3. consider returning to spontaneous ventilation and/or waking patient
- if bag and mask ventilation inadequate
  1. CALL FOR HELP
  2. attempt ventilation with oral airway
  3. consider/attempt LMA
  4. emergency invasive airway access (e.g. rigid bronchoscope, cricothyrotomy, or tracheostomy)

#### Differential Diagnosis of Poor Bilateral Breath Sounds after Intubation

##### DOPE

- Displaced ETT
- Obstruction
- Pneumothorax
- Esophageal intubation

#### Predicting Difficult Intubation in Apparently Normal Patients

*Anesth* 2005;103:429-437

**Purpose:** To assess widely available bedside tests and widely used laryngoscopic techniques in the prediction of difficult intubations.

**Study:** Meta-analysis.

**Patients:** 35 studies encompassing 50,760 patients.

**Definitions:** Difficult intubation was defined usually as Cormack-Lehane grade of 3 or greater, but some authors reported the requirement of a special technique, multiple unsuccessful attempts, or a combination of these as the accepted standard for difficult intubation.

**Results:** The overall incidence of difficult intubation was 5.8% (95% CI 4.5-7.5%) for the overall patient population, 6.2% (95% CI 4.6-8.3%) for normal patients excluding obstetric and obese patients, 3.1% (95% CI 1.7-5.5%) for obstetric patients, and 15.8% (95% CI 14.3-17.5%) for obese patients  
Mallampati score: SN:49% SP:86% PLR:3.7 NLR:0.5; thyromental distance: SN:20% SP:94% PLR:3.4 NLR:0.8; sternalmental distance: SN:62% SP:82% PLR:5.7 NLR:0.5; mouth opening: SN:22% SP:97% PLR: 4.0 NLR:0.8; Wilson risk-sum: SN:46% SP:89% PLR:5.8 NLR:0.6; combination Mallampati and thyromental distance: SN:36% SP:87% PLR:9.9 NLR:0.6.

**Conclusions:** A combination of the Mallampati score and thyromental distance is the most accurate at predicting difficult intubation. The PLR (9.9) is supportive of the test as a good predictor of difficult intubation.

**PLR: positive likelihood ratio; NLR: negative likelihood ratio; SN: sensitivity; SP: specificity**

## Oxygen Therapy

- in general, the goal of oxygen therapy is to maintain arterial oxygen saturation ( $\text{SaO}_2$ ) > at a minimum, 90%
- small decrease in saturation below  $\text{SaO}_2$  of 90% corresponds to a large drop in arterial partial pressure of oxygen ( $\text{PaO}_2$ )
- in intubated patients, oxygen is delivered via the ETT
- in patients not intubated, there are many oxygen delivery systems available; the choice depends on oxygen requirements ( $\text{FiO}_2$ ) and the degree to which precise control of delivery is needed
- cyanosis can be detected at  $\text{SaO}_2 < 85\%$ , frank cyanosis at  $\text{SaO}_2 = 67\%$

### Low Flow Systems

- provide  $\text{O}_2$  at flows between 0-10 L/min
- acceptable if tidal volume 300-700 mL, respiratory rate (RR) <25, consistent ventilation pattern
- dilution of oxygen with room air results in a decrease in  $\text{FiO}_2$
- an increase in minute ventilation (tidal volume x RR) results in a decrease in  $\text{FiO}_2$
- e.g. nasal cannula (prongs)
  - well tolerated if flow rates <5-6 L/min; drying of nasal mucosa at higher flows
  - nasopharynx acts as an anatomic reservoir that collects  $\text{O}_2$
  - delivered oxygen concentration ( $\text{FiO}_2$ ) can be estimated by adding 4% for every additional litre of  $\text{O}_2$  delivered
  - provides  $\text{FiO}_2$  of 24-44% at  $\text{O}_2$  flow rates of 1-6 L/min

### Reservoir Systems

- use a volume reservoir to accumulate oxygen during exhalation thus increasing the amount of oxygen available for the next breath
- simple face mask
  - covers patient's nose and mouth and provides an additional reservoir beyond nasopharynx
  - fed by small bore  $\text{O}_2$  tubing at a rate of at least 6 L/min to ensure that exhaled  $\text{CO}_2$  is flushed through the exhalation ports and not rebreathed
  - provides  $\text{FiO}_2$  of 55% at  $\text{O}_2$  flow rates of 10 L/min
- non-rebreather mask
  - a reservoir bag and a series of one-way valves prevent expired gases from re-entering the bag
  - during the exhalation phase, the bag accumulates with oxygen
  - provides  $\text{FiO}_2$  of 80% at  $\text{O}_2$  flow rates of 10-15 L/min

### High Flow Systems

- generate flows of up to 50-60 L/min
- meet/exceed patient's inspiratory flow requirement
- deliver consistent and predictable concentration of  $\text{O}_2$
- Venturi mask
  - delivers specific  $\text{FiO}_2$  by varying the size of air entrainment
  - oxygen concentration determined by mask's port and NOT the wall flow rate
  - enables control of gas humidity
  - $\text{FiO}_2$  ranges from 24-50%

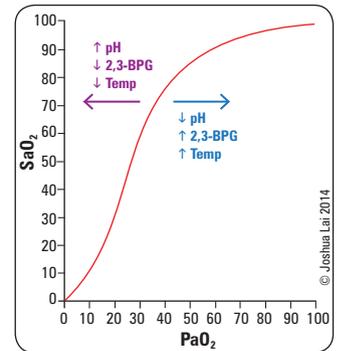

Figure 6.  $\text{HbO}_2$  saturation curve

**Composition of Air**  
 78.1% nitrogen  
 20.9% oxygen  
 0.9% argon  
 0.04% carbon dioxide

## Ventilation

- ventilation is maintained with PPV in patients given muscle relaxants
- assisted or controlled ventilation can also be used to assist spontaneous respirations in patients not given muscle relaxants as an artificial means of supporting ventilation and oxygenation

### Mechanical Ventilation

- indications for mechanical ventilation
  - apnea
  - hypoventilation/acute respiratory acidosis
  - intraoperative positioning limiting respiratory excursion (e.g. prone, Trendelenburg)
  - required hyperventilation (to lower ICP)
  - deliver positive end expiratory pressure (PEEP)
  - increased intrathoracic pressure (e.g. laparoscopic procedure)
- complications of mechanical ventilation
  - airway complications
    - ◆ tracheal stenosis, laryngeal edema
    - ◆ alveolar complications
    - ◆ ventilator-induced lung injury (barotrauma, volutrauma, atelectrauma), ventilator-associated pneumonia (nosocomial pneumonia), inflammation, auto-PEEP, patient-ventilator asynchrony
    - ◆ cardiovascular complications
    - ◆ reduced venous return (secondary to increased intrathoracic pressure), reduced cardiac output, hypotension

Changes in peak pressures in ACV and tidal volumes in PCV may reflect changes in lung compliance and/or airway resistance – patient may be getting better or worse

**Positive End Expiratory Pressure (PEEP)**

- Positive pressure applied at the end of ventilation that helps to keep alveoli open, decreasing V/Q mismatch
- Used with all invasive modes of ventilation

**Tracheostomy**

- Tracheostomy should be considered in patients who require ventilator support for extended periods of time
- Shown to improve patient comfort and give patients a better ability to participate in rehabilitation activities

- neuromuscular complications
  - ◆ muscle atrophy
  - ◆ increased intracranial pressure
- metabolic
  - ◆ decreased CO<sub>2</sub> due to hyperventilation
  - ◆ alkalemia with over correction of chronic hypercarbia

**Ventilator Strategies**

- mode and settings are determined based on patient factors (e.g. ideal body weight, compliance, resistance) and underlying reason for mechanical ventilation
- hypoxemic respiratory failure: ventilator provides supplemental oxygen, recruits atelectatic lung segments, helps improve V/Q mismatch, and decreases intrapulmonary shunt
- hypercapnic respiratory failure: ventilator augments alveolar ventilation; may decrease the work of breathing, allowing respiratory muscles to rest

**Modes of Ventilation**

- assist-control ventilation (ACV) or volume control (VC)
  - every breath is delivered with a pre-set tidal volume and rate or minute ventilation
  - extra controlled breaths may be triggered by patient effort; if no effort is detected within a specified amount of time the ventilator will initiate the breath
- pressure control ventilation (PCV)
  - a minimum frequency is set and patient may trigger additional breaths above the ventilator
  - all breaths delivered at a preset constant inspiratory pressure
- synchronous intermittent mandatory ventilation (SIMV)
  - ventilator provides controlled breaths (either at a set volume or pressure depending on whether in VC or PCV, respectively)
  - patient can breathe spontaneously (these breaths may be pressure supported) between controlled breaths
- pressure support ventilation (PSV)
  - patient initiates all breaths and the ventilator supports each breath with a pre-set inspiratory pressure
  - useful for weaning off ventilator
- high-frequency oscillatory ventilation (HFOV)
  - high breathing rate (up to 900 breaths/min in an adult), very low tidal volumes
  - used commonly in neonatal and pediatric respiratory failure
  - occasionally used in adults when conventional mechanical ventilation is failing
- non-invasive positive pressure ventilation (NPPV)
  - achieved without intubation by using a nasal or face mask
  - BiPAP: increased pressure (like PSV) on inspiration and lower constant pressure on expiration (i.e. PEEP)
  - CPAP: delivers constant pressure on both inspiration and expiration

**Table 3. Causes of Abnormal End Tidal CO<sub>2</sub> Levels**

Hypocapnea (Decreased CO <sub>2</sub> )	Hypercapnea (Increased CO <sub>2</sub> )
Hyperventilation	Hypoventilation
Hypothermia (decreased metabolic rate)	Hyperthermia and other hypermetabolic states
Decreased pulmonary blood flow (decreased cardiac output)	Improved pulmonary blood flow after resuscitation or hypotension
Technical issues Incorrect placement of sampling catheter Inadequate sampling volume	Technical issues Water in capnography device Anesthetic breathing circuit error Inadequate fresh gas flow Rebreathing Exhausted soda lime Faulty circuit absorber valves
V/Q mismatch Pulmonary thromboembolism Incipient pulmonary edema Air embolism	Low bicarbonate

**Monitoring Ventilatory Therapy**

- Pulse oximetry, end-tidal CO<sub>2</sub> concentration
- Regular arterial blood gases
- Assess tolerance regularly

Patients who develop a pneumothorax while on mechanical ventilation require a chest tube

**Causes of Intraoperative Hypoxemia**

**Inadequate oxygen supply**  
e.g. breathing system disconnection, obstructed or malpositioned ETT, leaks in the anesthetic machine, loss of oxygen supply

**Hypoventilation**

**Ventilation-perfusion inequalities** e.g. atelectasis, pneumonia, pulmonary edema, pneumothorax

**Reduction in oxygen carrying capacity**  
e.g. anemia, carbon monoxide poisoning, methemoglobinemia, hemoglobinopathy

**Leftward shift of the hemoglobin-oxygen saturation curve**

e.g. hypothermia, decreased 2,3-BPG, alkalosis, hypocarbia, carbon monoxide poisoning

**Right-to-left cardiac shunt**

**A Comparison of Four Methods of Weaning Patients from Mechanical Ventilation**

*NEJM* 1995;332:345-350

**Study:** Prospective, randomized, multicentre trial.

**Participants:** 130 of 546 patients who received mechanical ventilation and were considered ready for weaning but had respiratory distress during a 2 h trial of spontaneous breathing.

**Intervention:** One of four weaning techniques following standardized protocol.

**Outcome:** Median duration of weaning.

**Results:** The median duration of weaning for intermittent mandatory ventilation, pressure-support ventilation, intermittent (multiple) trials of spontaneous breathing, and once-daily trial of spontaneous breathing was 5 d, 4 d, and 3 d, respectively. The rate of successful weaning was higher with once-daily trial of spontaneous breathing than with intermittent mandatory ventilation (rate ratio 2.83; 95% CI 1.36-5.89; p<0.006) or pressure-support ventilation (ratio 2.05; 95% CI 1.04-4.04; p<0.04). There was no significant difference in the rate of success between once-daily trials and multiple trials of spontaneous breathing.

**Conclusions:** Once-daily or multiple trials of spontaneous breathing led to extubation more quickly than intermittent mandatory or pressure-support ventilation.

# Intraoperative Management

## Temperature

### Causes of Hypothermia (<36.0°C)

- intraoperative temperature losses are common (e.g. 90% of intraoperative heat loss is transcutaneous), due to
  - OR environment (cold room, IV fluids, instruments)
  - open wound
- prevent with forced air warming blanket and warmed IV fluids

### Causes of Hyperthermia (>37.5-38.3°C)

- drugs (e.g. atropine)
- blood transfusion reaction
- infection/sepsis
- medical disorder (e.g. thyrotoxicosis)
- malignant hyperthermia (see *Uncommon Complications, A28*)
- over-zealous warming efforts

### Impact of Hypothermia (<36°C)

- Increased risk of wound infections due to impaired immune function
- Increases the period of hospitalization by delaying healing
- Reduces platelet function and impairs activation of coagulation cascade increasing blood loss and transfusion requirements
- Triples the incidence of VT and morbid cardiac events
- Decreases the metabolism of anesthetic agents prolonging post-operative recovery

## Heart Rate

### Cardiac Arrest

- pulseless arrest occurs due to 4 cardiac rhythms divided into shockable and non-shockable rhythms
  - shockable: ventricular fibrillation (VF) and ventricular tachycardia (VT)
  - non-shockable: asystole and pulseless electrical activity (PEA)
- for VF/VT, key to survival is good early CPR and defibrillation
- for asystole/PEA, key to survival is good early CPR and exclusion of all reversible causes
- reversible causes of PEA arrest (5 Hs and 5 Ts)
  - 5 Hs: hypothermia, hypovolemia, hypoxia, hydrogen ions (acidosis), hypo/hyperkalemia
  - 5 Ts: tamponade (cardiac), thrombosis (pulmonary), thrombosis (coronary), tension pneumothorax, toxins (overdose/poisoning)
  - when a patient sustains a cardiac arrest during anesthesia, it is important to remember that there are other causes on top the Hs and Ts to consider (i.e. local anesthetic systemic toxicity (LAST), excessive anesthetic dosing and others)
- for management of cardiac arrest, see *ACLS Guidelines (Figure 16), A31*

### Intraoperative Tachycardia

- tachycardia = HR >150 bpm; divided into narrow complex supraventricular tachycardias (SVT) or wide complex tachycardias
- SVT: sinus tachycardia, atrial fibrillation/flutter, accessory pathway mediated tachycardia, paroxysmal atrial tachycardia
- wide complex tachycardia: VT, SVT with aberrant conduction
- causes of sinus tachycardia
  - shock/hypovolemia/blood loss
  - anxiety/pain/light anesthesia
  - full bladder
  - anemia
  - febrile illness/sepsis
  - drugs (e.g. atropine, cocaine, dopamine, epinephrine, ephedrine, isoflurane, isoproterenol, pancuronium) and withdrawal
  - Addisonian crisis, hypoglycemia, transfusion reaction, malignant hyperthermia
- for management of tachycardia, see *ACLS Guidelines (Figure 17), A32*

### Intraoperative Bradycardia

- bradycardia = HR <50 bpm; most concerning are 2nd degree (Mobitz type II) and 3rd degree heart block, which can both degenerate into asystole
- causes of sinus bradycardia
  - increased parasympathetic tone vs. decreased sympathetic tone
  - must rule out hypoxemia
  - arrhythmias (see *Cardiology and Cardiac Surgery, C16*)
  - baroreceptor reflex due to increased ICP or increased BP
  - vagal reflex (oculocardiac reflex, carotid sinus reflex, airway manipulation)
  - drugs (e.g. SCh, opioids, edrophonium, neostigmine, halothane, digoxin,  $\beta$ -blockers)
  - high spinal/epidural anesthesia
- for management of bradycardia, see *ACLS Guidelines (Figure 18), A32*

## Blood Pressure

### Causes of Intraoperative Hypotension/Shock

- shock: condition characterized by inability of cardiovascular system to maintain adequate end-organ perfusion and delivery of oxygen to tissues
- a) hypovolemic/hemorrhagic shock
  - most common form of shock, due to decrease in intravascular volume
- b) obstructive shock
  - obstruction of blood into or out of the heart
  - increased JVP, distended neck veins, increased systemic vascular resistance, insufficient cardiac output (CO)
  - e.g. tension pneumothorax, cardiac tamponade, pulmonary embolism (and other emboli – i.e. fat, air)
- c) cardiogenic shock
  - increased JVP, distended neck veins, increased systemic vascular resistance, decreased CO
  - e.g. myocardial dysfunction, dysrhythmias, ischemia/infarct, cardiomyopathy, acute valvular dysfunction
- d) septic shock
  - see [Infectious Diseases, ID21](#)
- e) spinal/neurogenic shock
  - decreased sympathetic tone
  - hypotension without tachycardia or peripheral vasoconstriction (warm skin)
- f) anaphylactic shock
  - see [Emergency Medicine, ER38](#)
- g) drugs
  - vasodilators, high spinal anesthetic interfering with sympathetic outflow
- h) other
  - transfusion reaction, Addisonian crisis, thyrotoxicosis, hypothyroid, aortocaval syndrome
  - see [Hematology, H52](#) and [Endocrinology, E33](#)

### Causes of Intraoperative Hypertension

- inadequate anesthesia causing pain and anxiety
- pre-existing HTN, coarctation, or preeclampsia
- hypoxemia/hypercarbia
- hypervolemia
- increased intracranial pressure
- full bladder
- drugs (e.g. ephedrine, epinephrine, cocaine, phenylephrine, ketamine) and withdrawal
- allergic/anaphylactic reaction
- hypermetabolic states: malignant hyperthermia, neuroleptic malignant syndrome, serotonin syndrome (see [Psychiatry, PS44](#)), thyroid storm, pheochromocytoma (see [Endocrinology, E25](#))

#### Intraoperative Shock

##### SHOCKED

Sepsis or Spinal shock  
Hypovolemic/Hemorrhagic  
Obstructive  
Cardiogenic  
anaphylactic  
Extra/other  
Drugs

$BP = CO \times SVR$ , where  $CO = SV \times HR$   
SV is a function of preload, afterload, and contractility

## Fluid Balance and Resuscitation

- total requirement = maintenance + deficit + ongoing loss
- in surgical settings this formula must take into account multiple factors including pre-operative fasting/ decreased fluid intake, increased losses during or before surgery, fluid shifting during surgery, fluids given with blood products and medications

### What is the Maintenance?

- average healthy adult requires approximately 2500 mL water/d
  - 200 mL/d GI losses
  - 800 mL/d insensible losses (respiration, perspiration)
  - 1500 mL/d urine (beware of renal failure)
- 4:2:1 rule to calculate maintenance requirements (applies to crystalloids only)
  - 4 mL/kg/h first 10 kg
  - 2 mL/kg/h second 10 kg
  - 1 mL/kg/h for remaining weight >20 kg
- increased requirements with fever, sweating, GI losses (vomiting, diarrhea, NG suction), adrenal insufficiency, hyperventilation, and polyuric renal disease
- decreased requirements with anuria/oliguria, SIADH, highly humidified atmospheres, and CHF
- maintenance electrolytes
  - $Na^+$ : 3 mEq/kg/d
  - $K^+$ : 1 mEq/kg/d
- 50 kg patient maintenance requirements
  - fluid =  $40 + 20 + 30 = 90$  mL/h = 2160 mL/d = 2.16 L/d
  - $Na^+$  = 150 mEq/d (therefore 150 mEq / 2.16 L/d  $\approx$  69 mEq/L)
  - $K^+$  = 50 mEq/d (therefore 50 mEq / 2.16 L/d  $\approx$  23 mEq/L)
- above patient's requirements roughly met with 2/3 D5W, 1/3 NS
  - 2/3 + 1/3 at 100 mL/h with 20 mEq KCl per litre

### What is the Deficit?

- patients should be adequately hydrated prior to anesthesia
- total body water (TBW) = 60% or 50% of total body weight for an adult male or female, respectively (e.g. for a 70 kg adult male TBW = 70 x 0.6 = 42 L)
- total Na<sup>+</sup> content determines ECF volume; [Na<sup>+</sup>] determines ICF volume
- hypovolemia due to volume contraction
  - extra-renal Na<sup>+</sup> loss
    - ♦ GI: vomiting, NG suction, drainage, fistulae, diarrhea
    - ♦ skin/resp: insensible losses (fever), sweating, burns
    - ♦ vascular: hemorrhage
  - renal Na<sup>+</sup> and H<sub>2</sub>O loss
    - ♦ diuretics
    - ♦ osmotic diuresis
    - ♦ hypoaldosteronism
    - ♦ salt-wasting nephropathies
  - renal H<sub>2</sub>O loss
    - ♦ diabetes insipidus (central or nephrogenic)
  - hypovolemia with normal or expanded ECF volume
    - ♦ decreased CO
    - ♦ redistribution
      - hypoalbuminemia: cirrhosis, nephrotic syndrome
      - capillary leakage: acute pancreatitis, rhabdomyolysis, ischemic bowel, sepsis, anaphylaxis
- replace water and electrolytes as determined by patient's needs
- with chronic hyponatremia, correction must be done gradually over >48 h to avoid central pontine myelinolysis

**Table 4. Signs and Symptoms of Dehydration**

Percentage of Body Water Loss	Severity	Signs and Symptoms
3%	Mild	Decreased skin turgor, sunken eyes, dry mucous membranes, dry tongue, reduced sweating
6%	Moderate	Oliguria, orthostatic hypotension, tachycardia, low volume pulse, cool extremities, reduced filling of peripheral veins and CVP, hemoconcentration, apathy
9%	Severe	Profound oliguria or anuria and compromised CNS function with or without altered sensorium

### What are the Ongoing Losses?

- losses from Foley catheter, NG, surgical drains
- third-spacing (other than ECF, ICF)
  - pleura, GI, retroperitoneal, peritoneal
  - evaporation via exposed viscera, burns
- blood loss
- ongoing loss due to surgical exposure and evaporative losses

## IV Fluids

- replacement fluids include crystalloid and colloid solutions
- IV fluids improve perfusion but NOT O<sub>2</sub> carrying capacity of blood

### Initial Distribution of IV Fluids

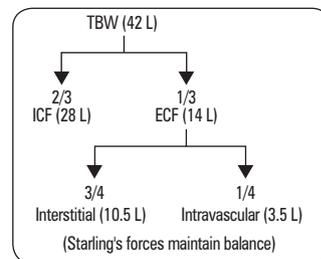

- H<sub>2</sub>O follows ions/molecules to their respective compartments

### Crystalloid Infusion

- salt-containing solutions that distribute only within ECF
- maintain euolemia in patient with blood loss: 3 mL crystalloid infusion per 1 mL of blood loss for volume replacement (i.e. 3:1 replacement)
- if large volumes are to be given, use balanced fluids such as Ringer's lactate or Plasmalyte<sup>®</sup>, as too much normal saline (NS) may lead to hyperchloremic metabolic acidosis

### Colloid Infusion (see *Blood Products*, A15)

- includes protein colloids (albumin and gelatin solutions) and non-protein colloids (dextrans and starches e.g. hydroxyethyl starch [HES])
- distributes within intravascular volume
- 1:1 ratio (infusion: blood loss) only in terms of replacing intravascular volume
- HES colloids remain in intravascular space (metabolized by plasma serum amylase and renally excreted); two available in Canada: Voluven<sup>®</sup> and Pentaspan<sup>®</sup>
- the use of HES solutions is controversial because of recent RCTs and meta-analyses highlighting their renal (especially in septic patients) and coagulopathic side effects, as well as a lack of specific indications for their use
  - colloids are being used based on mechanistic and experimental evidence but there is a paucity of definitive studies investigating their safety and efficacy; routine use of colloids should be avoided

**Figure 7. Total body water division in a 70 kg adult**

### Colloids vs. Crystalloids for Fluid Resuscitation in Critically Ill Patients

*Cochrane DB Syst Rev* 2012;6:CD000567

**Purpose:** To evaluate the effects of colloids compared to crystalloids for fluid resuscitation, specifically when used in critically ill patients.

**Methods:** A meta-analysis was performed looking at randomized controlled trials comparing colloid vs. crystalloid use in patients requiring volume replacement. Pregnant women and neonates were excluded. Primary outcome was overall mortality.

**Results:** Results were broken down based on specific colloid. For albumin (or plasma protein fraction) the relative risk (RR) was 1.01 (95% CI 0.93-1.10) as compared to crystalloid. For hydroxyethyl starch the RR was 1.10 (95% CI 0.91-1.32). Modified gelatin had a RR of 0.91 (95% CI 0.49-1.72) and Dextran had a RR of 1.24 (95% CI 0.94-1.65). For colloids mixed in a hypertonic crystalloid as compared to isotonic crystalloid the RR was 0.88 (91% CI 0.71-1.06).

**Conclusions:** There is no evidence that use of colloids improves survival in trauma patients, burn patients, or post-operative patients when compared to crystalloid solutions. Given the increased cost of colloids as compared to crystalloids, it is recommended that crystalloids be the fluid of choice in these patients.

Table 5. IV Fluid Solutions

	ECF	Ringer's Lactate	0.9% NS	0.45% NS in D5W	D5W	2/3 D5W + 1/3 NS	Plasmalyte
<b>mEq/L</b>							
<b>Na<sup>+</sup></b>	142	130	154	77	-	51	140
<b>K<sup>+</sup></b>	4	4	-	-	-	-	5
<b>Ca<sup>2+</sup></b>	4	3	-	-	-	-	-
<b>Mg<sup>2+</sup></b>	3	-	-	-	-	-	3
<b>Cl<sup>-</sup></b>	103	109	154	77	-	51	98
<b>HCO<sub>3</sub><sup>-</sup></b>	27	28*	-	-	-	-	27
<b>mOsm/L</b>	280-310	273	308	154	252	269	294
<b>pH</b>	7.4	6.5	5.0	4.5	4.0	4.3	7.4

\*Converted from lactate

Table 6. Colloid HES Solutions

	Concentration	Plasma Volume Expansion	Duration (h)	Maximum Daily Dose (mL/kg)
<b>Voluven<sup>®</sup></b>	6%	1:1	4-6	33-50
<b>Pentaspas<sup>®</sup></b>	10%	1:1.2-1.5	18-24	28

## Calculating Acceptable Blood Losses (ABL)

- Blood volume
  - term infant 80 mL/kg
  - adult male 70 mL/kg
  - adult female 60 mL/kg
- Calculate estimated blood volume (EBV) (e.g. in a 70 kg male, approx. 70 mL/kg)
  - EBV = 70 kg x 70 mL/kg = 4900 mL
- Decide on a transfusion trigger, i.e. the Hb level at which you would begin transfusion, (e.g. 70 g/L for a person with Hb(i) = 150 g/L)
  - Hb(f) = 70 g/L
- Calculate
  - ABL =  $\frac{Hb(Hi) - Hb(Hf)}{Hb(Hi)} \times EBV$
  - =  $\frac{150 - 70}{150} \times 4900$
  - = 2613 mL
- Therefore in order to keep the Hb level above 70 g/L, RBCs would have to be given after approximately 2.6 L of blood has been lost

## Transfusion Infection Risks

Virus	Risk per 1 unit pRBCs
HIV	1 in 21 million
Hepatitis C virus	1 in 13 million
Hepatitis B virus	1 in 7.5 million
HTLV	1 in 1-1.3 million
Symptomatic Bacterial Sepsis	1 in 40,000 from platelets and 1 in 250,000 from RBC
West Nile virus	No cases since 2003

Source: Callum JL, Pinkerton PH. *Bloody Easy*. Fourth Edition ed. Toronto: Sunnybrook and Women's College Health Science Centre; 2016

## Blood Products

- see [Hematology, H52](#)

## Induction

### Routine Induction vs. Rapid Sequence Induction

- routine induction is the standard in general anesthesia, however a RSI is indicated in patients at risk of regurgitation/aspiration (see [Aspiration, A5](#))
- RSI uses pre-determined doses of induction drugs given in rapid succession to minimize the time patient is at risk for aspiration (i.e. from the time when they are asleep without an ETT until the time when the ETT is in and the cuff inflated)

Table 7. Comparison of Routine Induction vs. RSI

Steps	Routine Induction	RSI
<b>1. Equipment Preparation</b>	Check equipment, drugs, suction, and monitors; prepare an alternative laryngoscope blade and a second ETT tube one size smaller	Check equipment, drugs, suction, and monitors; prepare an alternative laryngoscope blade and a second ETT tube one size smaller; suction on
<b>2. Pre-Oxygenation/Denitrogenation</b>	100% O <sub>2</sub> for 3 min or 4-8 vital capacity breaths	100% O <sub>2</sub> for 3 min or 4-8 vital capacity breaths
<b>3. Pre-Treatment Agents</b>	Use agent of choice to blunt physiologic responses to airway manipulation 3 min prior to laryngoscopy	Use agent of choice to blunt physiologic responses to airway manipulation; if possible, give 3 min prior to laryngoscopy, but can skip this step in an emergent situation
<b>4. Induction Agents</b>	Use IV or inhalation induction agent of choice	Use pre-determined dose of fast acting induction agent of choice
<b>5. Muscle Relaxants</b>	Muscle relaxant of choice given after the onset of the induction agent	Pre-determined dose of fast acting muscle relaxant (e.g. SCh) given IMMEDIATELY after induction agent
<b>6. Ventilation</b>	Bag-mask ventilation	DO NOT bag ventilate – can increase risk of aspiration
<b>7. Cricoid Pressure</b>	Backwards upwards rightwards pressure (BURP) on thyroid cartilage to assist visualization if indicated	Sellick maneuver, also known as cricoid pressure, to prevent regurgitation and assist in visualization (2 kg pressure with drowsiness, 3 kg with loss of consciousness)
<b>8. Intubation</b>	Intubate, inflate cuff, confirm ETT position	Intubate once paralyzed (~45 s after SCh given), inflate cuff, confirm ETT position; cricoid pressure maintained until ETT cuff inflated and placement confirmed
<b>9. Secure Machines</b>	Secure ETT, and begin manual/machine ventilation	Secure ETT, and begin manual/machine ventilation

## Induction Agents

- induction in general anesthesia may be achieved with intravenous agents, volatile inhalation agents, or both

### Intravenous Agents

- see Table 8
- IV induction agents are non-opioid drugs used to provide hypnosis, amnesia and blunt reflexes
- these are initially used to draw the patient into the maintenance phase of general anesthesia rapidly, smoothly and with minimal adverse effects
  - examples include propofol, sodium thiopental (not available in North America), or ketamine
  - a continuous propofol infusion may also be used for the maintenance phase of GA

#### Solubility of Volatile Anesthetics in Blood Least Soluble to Most Soluble

Nitrous oxide < desflurane < sevoflurane < isoflurane < halothane

**Table 8. Intravenous Induction Agents**

	<b>Propofol (Diprivan®)</b>	<b>Thiopental (sodium thiopental, sodium thiopentone)</b>	<b>Ketamine (Ketalar®, Ketaject®)</b>	<b>Benzodiazepines (midazolam [Versed®], diazepam [Valium®], lorazepam [Ativan®])</b>	<b>Etomidate</b>
<b>Class</b>	Alkylphenol – hypnotic	Ultra-short acting thiobarbiturate – hypnotic	Phencyclidine (PCP) derivative – dissociative	Benzodiazepines – anxiolytic	Imidazole derivative - hypnotic
<b>Action</b>	Inhibitory at GABA synapse Decreased cerebral metabolic rate and blood flow, decreased ICP, decreased SVR, decreased BP, and decreased SV	Decreased time Cl <sup>-</sup> channels open, facilitating GABA and suppressing glutamic acid Decreased cerebral metabolism and blood flow, decreased CPP, decreased CO, decreased BP, decreased reflex tachycardia, decreased respiration	May act on NMDA, opiate, and other receptors Increased HR, increased BP, increased SVR, increased coronary flow, increased myocardial O <sub>2</sub> uptake CNS and respiratory depression, bronchial smooth muscle relaxation	Causes increased glycine inhibitory neurotransmitter, facilitates GABA Produces antianxiety and skeletal muscle relaxant effects Minimal cardiac depression	Decreases concentration of GABA required to activate receptor CNS depression Minimal cardiac or respiratory depression
<b>Indications</b>	Induction Maintenance Total intravenous anesthesia (TIVA)	Induction Control of convulsive states, obstetric patients	Major trauma, hypovolemia, obstetric bleeding, severe asthma because sympathomimetic	Used for sedation, amnesia, and anxiolysis	Induction Poor cardiac function, severe valve lesions, uncontrolled hypertension
<b>Caution</b>	Patients who cannot tolerate sudden decreased BP (e.g fixed cardiac output or shock)	Allergy to barbiturates Uncontrolled hypotension, shock, cardiac failure Porphyria, liver disease, status asthmaticus, myxedema	Ketamine allergy TCA medication (interaction causes HTN and dysrhythmias) History of psychosis Patients who cannot tolerate HTN (e.g. CHF, increased ICP, aneurysm)	Marked respiratory depression	Post-operative nausea and vomiting Venous irritation
<b>Dosing</b>	IV induction: 2.5-3.0 mg/kg (less with opioids) Unconscious < 1 min Lasts 4-6 min t <sub>1/2</sub> = 55 min Decreased post-operative sedation, recovery time, N/V	IV induction: 3-5 mg/kg Unconscious about 30 s Lasts 5 min Accumulation with repeat dosing – not for maintenance t <sub>1/2</sub> = 5-10 h Post-operative sedation lasts hours	IV induction 1-2 mg/kg Dissociation in 15 s, analgesia, amnesia, and unconsciousness in 45-60 s Unconscious for 10-15 min, analgesia for 40 min, amnesia for 1-2 h t <sub>1/2</sub> = ~3 h	Onset less than 5 min if given IV Duration of action long but variable/somewhat unpredictable	IV induction 0.3 mg/kg Onset 30-60 seconds Lasts 4-8 minutes
<b>Special Considerations</b>	0-30% decreased BP due to vasodilation Reduce burning at IV site by mixing with lidocaine	Combining with rocuronium causes precipitates to form	High incidence of emergence reactions (vivid dreaming, out-of-body sensation, illusions) Pretreat with glycopyrrolate to decrease salivation	Antagonist: flumazenil (Anexate®) competitive inhibitor, 0.2 mg IV over 15 s, repeat with 0.1 mg/min (max of 2 mg), t <sub>1/2</sub> of 60 min Midazolam also has amnestic (antegrade) effect and decreased risk of thrombophlebitis	Adrenal suppression after first dose, cannot repeat dose or use as infusion Myoclonic movements during induction

### Volatile Inhalational Agents

- examples include sevoflurane, desflurane, isoflurane, enflurane, halothane, and nitrous oxide
- see Table 9

**Table 9. Volatile Inhalational Agents**

	Sevoflurane	Desflurane	Isoflurane	Enflurane	Halothane	Nitrous oxide (N <sub>2</sub> O)*
<b>MAC</b> (% gas in O <sub>2</sub> )	2.0	6.0	1.2	1.7	0.8	104
<b>CNS</b>	Increased ICP	Increased ICP	Decreased cerebral metabolic rate Increased ICP	ECG seizure-like activity Increased ICP	Increased ICP and cerebral blood flow	—
<b>Resp</b>	Respiratory depression (severely decreased TV, increased RR), decreased response to respiratory CO <sub>2</sub> reflexes, bronchodilation					—
<b>CVS</b>	Less decrease of contractility, stable HR	Tachycardia with rapid increase in concentration	Decreased BP and CO, increased HR, theoretical chance of coronary steal**	Stable HR, decreased contractility	Decreased BP, CO, HR, and conduction Sensitizes myocardium to epinephrine-induced arrhythmias	Can cause decreased HR in pediatric patients with existing heart disease

**MSK** Muscle relaxation, potentiation of other muscle relaxants, uterine relaxation

\*Properties and Adverse Effects of N<sub>2</sub>O

Due to its high MAC, nitrous oxide is combined with other anesthetic gases to attain surgical anesthesia. A MAC of 104% is possible in a pressurized chamber only  
Second Gas Effect

Expansion of closed spaces: closed spaces such as a pneumothorax, the middle ear, bowel lumen and ETT cuff will markedly enlarge if N<sub>2</sub>O is administered

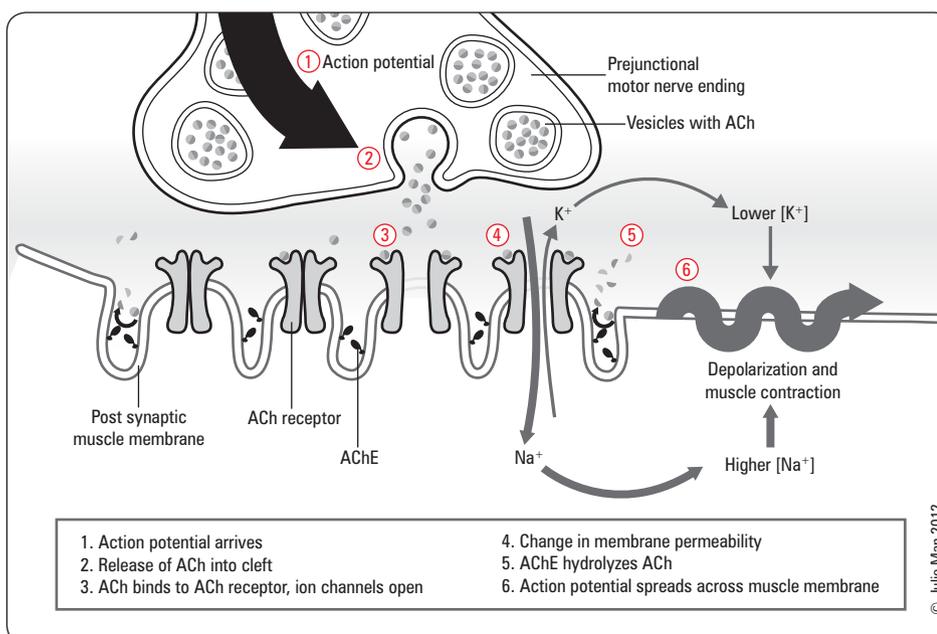

Diffusion hypoxia: during anesthesia, the washout of N<sub>2</sub>O from body stores into alveoli can dilute the alveolar [O<sub>2</sub>], creating a hypoxic mixture if the original [O<sub>2</sub>] is low

\*\*Coronary steal: isoflurane causes small vessel dilation which may compromise blood flow to areas of the heart with fixed perfusion (e.g. stents, atherosclerosis)

### MAC (Minimum Alveolar Concentration)

- the alveolar concentration of a volatile anesthetic at one atmosphere (atm) of pressure that will prevent movement in 50% of patients in response to a surgical stimulus (e.g. abdominal incision)
- potency of inhalational agents is compared using MAC
- 1.2-1.3 times MAC will often ablate response to stimuli in the general population
- MAC values are roughly additive when mixing N<sub>2</sub>O with another volatile agent; however, this only applies to movement, not other effects such as BP changes (e.g. 0.5 MAC of a potent agent + 0.5 MAC of N<sub>2</sub>O = 1 MAC of potent agent)
- MAC-intubation: the MAC of anesthetic that will inhibit movement and coughing during endotracheal intubation, generally 1.3 MAC
- MAC-block adrenergic response (MAC-BAR): the MAC necessary to blunt the sympathetic response to noxious stimuli, generally 1.5 MAC
- MAC-awake: the MAC of a given volatile anesthetic at which a patient will open their eyes to command, generally 0.3-0.4 of the usual MAC

## Muscle Relaxants and Reversing Agents

**Figure 8. Review of anatomy and physiology of the neuromuscular junction (NMJ)**

## Muscle Relaxants

- two types of muscle relaxants
  - depolarizing muscle relaxants: succinylcholine (SCh)
  - non-depolarizing muscle relaxants: rocuronium, mivacurium, vecuronium, cisatracurium, pancuronium
- block nicotinic cholinergic receptors in NMJ
- provides skeletal muscle paralysis, including the diaphragm, but spares involuntary muscles such as the heart and smooth muscle
- never use muscle relaxants without adequate preparation and equipment to maintain airway and ventilation
- muscle relaxation produces the following desired effects
  - facilitates intubation
  - assists with mechanical ventilation
  - prevents muscle stretch reflex and decreases muscle tone
  - allows access to the surgical field (intracavitary surgery)
- nerve stimulator (i.e. train of four) is used intraoperatively to assess the degree of nerve block; no twitch response seen with complete neuromuscular blockade
- see Tables 10 and 11, for more details including mechanism of action

### Plasma Cholinesterase

Plasma cholinesterase is produced by the liver and metabolizes SCh, ester local anesthetics, and mivacurium. A prolonged duration of blockade by SCh occurs with:

- decreased quantity of plasma cholinesterase, e.g. liver disease, pregnancy, malignancy, malnutrition, collagen vascular disease, hypothyroidism
- abnormal quality of plasma cholinesterase, e.g. normal levels but impaired activity of enzymes, genetically inherited

**Table 10. Depolarizing Muscle Relaxants (Non-Competitive): Succinylcholine (SCh)**

<b>Mechanism of Action</b>	Mimics ACh and binds to ACh receptors causing prolonged depolarization; initial fasciculation may be seen, followed by temporary paralysis secondary to blocked ACh receptors by SCh
<b>Intubating Dose (mg/kg)</b>	1-1.5
<b>Onset</b>	30-60 s – rapid (fastest of all muscle relaxants)
<b>Duration</b>	3-5 min – short (no reversing agent for SCh)
<b>Metabolism</b>	SCh is hydrolyzed by plasma cholinesterase (pseudocholinesterase), found only in plasma and not at the NMJ
<b>Indications</b>	Assist intubation Increased risk of aspiration (need rapid paralysis and airway control (e.g. full stomach), hiatus hernia, obesity, pregnancy, trauma) Short procedures Electroconvulsive therapy (ECT) Laryngospasm
<b>Side Effects</b>	<ol style="list-style-type: none"> <li>SCh also stimulates muscarinic cholinergic autonomic receptors (in addition to nicotinic receptors; may cause bradycardia, dysrhythmias, sinus arrest, increased secretions of salivary glands (especially in children))</li> <li>Hyperkalemia Disruption of motor nerve activity causes proliferation of extrajunctional (outside NMJ) cholinergic receptors Depolarization of an increased number of receptors by SCh may lead to massive release of potassium out of muscle cells Patients at risk 3rd degree burns 24 h-6 mo after injury Traumatic paralysis or neuromuscular diseases (e.g. muscular dystrophy) Severe intra-abdominal infections Severe closed head injury Upper motor neuron lesions</li> <li>Can trigger MH (see <b>Malignant Hyperthermia, A28</b>)</li> <li>Increased ICP/intraocular pressure/intragastric pressure (no increased risk of aspiration if competent lower esophageal sphincter)</li> <li>Fasciculations, post-operative myalgia – may be minimized if small dose of non-depolarizing agent given before SCh administration</li> </ol>
<b>Contraindications</b>	
<b>Absolute</b>	Known hypersensitivity or allergy, positive history of malignant hyperthermia, myotonia (m. congenita, m. dystrophica, paramyotonia congenita), high risk for hyperkalemic response
<b>Relative</b>	Known history of plasma cholinesterase deficiency, myasthenia gravis, myasthenic syndrome, familial periodic paralysis, open eye injury

**Table 11. Non-Depolarizing Muscle Relaxants (Competitive)**

Mechanism of Action	Competitive blockade of postsynaptic ACh receptors preventing depolarization					
Classification	Short	Intermediate			Long	
	Mivacuronium	Rocuronium	Vecuronium	Cisatracurium	Pancuronium	
Intubating Dose (mg/kg)	0.2	0.6-1.0	0.1	0.2	0.1	
Onset (min)	2-3	1.5	2-3	3	3-5	
Duration (min)	15-25	30-45	45-60	40-60	90-120	
Metabolism	Plasma cholinesterase	Liver (major) Renal (minor)	Liver	Hofmann Eliminations	Renal (major)	Liver (minor)
Indications	Assist intubation, assist mechanical ventilation in some ICU patients, reduce fasciculations and post-operative myalgias secondary to SCh					
Side Effects						
Histamine Release	Yes	No	No	No	No	
Other	—	—	—	—	Tachycardia	
Considerations	Increased duration of action in renal or liver failure	Quick onset of rocuronium allows its use in rapid sequence induction Cisatracurium is good for patients with renal or hepatic insufficiency			Pancuronium if increased HR and BP desired	

**Reversing Agents**

- neostigmine, pyridostigmine, edrophonium
- reversal agents are acetylcholinesterase inhibitors
  - inhibits enzymatic degradation of ACh; increases amount of ACh at nicotinic and muscarinic receptors, displacing non-depolarizing muscle relaxant
  - administer reversal agents when there has been some recovery of blockade (i.e. muscle twitch)
  - can only reverse the effect of non-depolarizing muscle relaxants
- anticholinergic agents (e.g. atropine, glycopyrrolate) are simultaneously administered to minimize muscarinic effect of reversal agents (i.e. bradycardia, salivation and increased bowel peristalsis)

**Table 12. Reversal Agents for Non-Depolarizing Relaxants**

Cholinesterase Inhibitor	Neostigmine	Pyridostigmine	Edrophonium
Onset and Duration	Intermediate	Longest	Shortest
Mechanism of Action	Inhibits enzymatic degradation of ACh, increases ACh at nicotinic and muscarinic receptors, displaces non-depolarizing muscle relaxants Muscarinic effects of reversing agents include unwanted bradycardia, salivation, and increased bowel peristalsis*		
Dose	0.04-0.08 mg/kg	0.1-0.4 mg/kg	0.5-1 mg/kg
Recommended Anticholinergic	Glycopyrrolate	Glycopyrrolate	Atropine
Dose of Anticholinergic (per mg)	0.2 mg	0.05 mg	0.014 mg

\*Atropine and glycopyrrolate are anticholinergic agents administered during the administration of reversal agents to minimize muscarinic effects

**Analgesia**

- options include opioids (e.g. morphine, fentanyl, hydromorphone), NSAIDs, acetaminophen, ketamine, gabapentin, local, and regional anesthetic (see Table 15, A25)

**Maintenance**

- general anesthesia is maintained using volatile inhalation agents and/or IV agents (i.e. propofol infusion)
- analgesia (usually IV opioids) and muscle relaxants are also given as needed

## Extubation

- criteria: patient must no longer have intubation requirements (see Table 2, A8)
  - patency: airway must be patent
  - protection: airway reflexes intact
  - patient must be oxygenating and ventilating spontaneously
- general guidelines
  - ensure patient has normal neuromuscular function (peripheral nerve stimulator monitoring) and hemodynamic status
  - ensure patient is breathing spontaneously with adequate rate and tidal volume
  - allow ventilation (spontaneous or controlled) with 100% O<sub>2</sub> for 3-5 min
  - suction secretions from pharynx, deflate cuff, remove ETT on inspiration (vocal cords abducted)
  - ensure patient is breathing adequately after extubation
  - ensure face mask for O<sub>2</sub> delivery available
  - proper positioning of patient during transfer to recovery room (supine, head elevated)

## Complications of Extubation

- early extubation: aspiration, laryngospasm
- late extubation: transient vocal cord incompetence, edema (glottic, subglottic), pharyngitis, tracheitis

### Laryngospasm

- defined as forceful involuntary spasm of laryngeal muscles caused by stimulation of superior laryngeal nerve (by oropharyngeal secretions, blood, extubation)
- causes partial or total airway obstruction
- more likely to occur in semi-conscious patients
- prevention: extubate while patient is still deeply under anesthesia or fully awake
- treatment: apply sustained positive pressure with bag-mask ventilation with 100% oxygen, low-dose propofol (0.5-1.0 mg/kg) optional, low-dose succinylcholine (approximately 0.25 mg/kg) and reintubation if hypoxia develops

## Regional Anesthesia

- local anesthetic agent (LA) applied around a peripheral nerve at any point along the length of the nerve (from spinal cord up to, but not including, the nerve endings) for the purpose of reducing or preventing impulse transmission
- no CNS depression (unless overdose of local anesthetic); patient remains conscious
- regional anesthetic techniques categorized as follows:
  - epidural and spinal anesthesia (neuraxial anesthesia)
  - peripheral nerve blocks
  - IV regional anesthesia (e.g. Bier block)

### Patient Preparation

- sedation may be indicated before block
- monitoring should be as extensive as for general anesthesia

## Epidural and Spinal Anesthesia

- most useful for surgeries performed below level of umbilicus

### Anatomy of Spinal/Epidural Area

- spinal cord extends to L2, dural sac to S2 in adults
- nerve roots (cauda equina) from L2 to S2
- needle inserted below L2 should not encounter cord, thus L3-L4, L4-L5 interspace commonly used
- structures penetrated (outside to inside)
  - skin
  - subcutaneous fat
  - supraspinous ligament
  - interspinous ligament
  - ligamentum flavum (last layer before epidural space)
  - dura + arachnoid for spinal anesthesia

### Benefits of Regional Anesthesia

- Reduced perioperative pulmonary complications
- Reduced perioperative analgesia requirements
- Decreased PONV
- Reduced perioperative blood loss
- Ability to monitor CNS status during procedure
- Improved perfusion
- Lower incidence of VTE
- Shorter recovery and improved rehabilitation
- Pain blockade with preserved motor function

### Landmarking Epidural/Spinal Anesthesia

Spinous processes should be maximally flexed  
L4 spinous processes found between iliac crests  
Common sites of insertion are L3-L4 and L4-L5

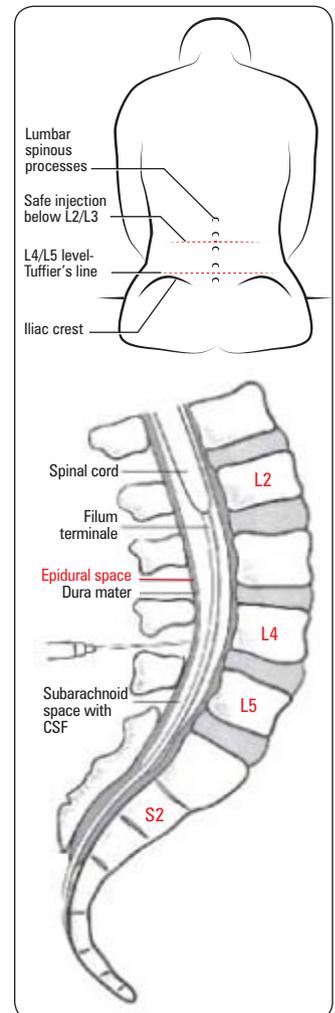

### Classic Presentation of Dural Puncture Headache

- Onset 6 h-3 d after dural puncture
- Postural component (worse when sitting)
- Occipital or frontal localization
- ± tinnitus, diplopia

**Table 13. Epidural vs. Spinal Anesthesia**

	Epidural	Spinal
<b>Deposition Site</b>	LA injected in epidural space (space between ligamentum flavum and dura) Initial blockade is at the spinal roots followed by some degree of spinal cord anesthesia as LA diffuses into the subarachnoid space through the dura	LA injected into subarachnoid space in the dural sac surrounding the spinal cord and nerve roots
<b>Onset</b>	Significant blockade requires 10-15 min Slower onset of side effects	Rapid blockade (onset in 2-5 min)
<b>Effectiveness</b>	Effectiveness of blockade can be variable	Very effective blockade
<b>Difficulty</b>	Technically more difficult; greater failure rate	Easier to perform due to visual confirmation of CSF flow
<b>Patient Positioning</b>	Position of patient not as important; specific gravity not an issue	Hyperbaric LA solution – position of patient important
<b>Specific Gravity/Spread</b>	Epidural injections spread throughout the potential space; specific gravity of solution does not affect spread	LA solution may be made hyperbaric (of greater specific gravity than the cerebrospinal fluid by mixing with 10% dextrose, thus increasing spread of LA to the dependent (low) areas of the subarachnoid space)
<b>Dosage</b>	Larger volume/dose of LA (usually > toxic IV dose)	Smaller dose of LA required (usually < toxic IV dose)
<b>Continuous Infusion</b>	Use of catheter allows for continuous infusion or repeat injections	None
<b>Complications</b>	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. "high spinal" Epidural or subarachnoid hematoma Accidental subarachnoid injection can produce spinal anesthesia (and any of the above complications) Systemic toxicity of LA (accidental intravenous) Catheter complications (shearing, kinking, vascular or subarachnoid placement) Infection Dural puncture	Failure of technique Hypotension Bradycardia if cardiac sympathetics blocked (only if ~T2-4 block), e.g. "high spinal" Epidural or subarachnoid hematoma Post-spinal headache (CSF leak) Transient paresthesias Spinal cord trauma, infection
<b>Combined Spinal-Epidural</b>	Combines the benefits of rapid, reliable, intense blockade of spinal anesthesia together with the flexibility of an epidural catheter	

**Figure 9. Landmarks for placement of epidural/spinal****Contraindications to Spinal/Epidural Anesthesia**

- absolute contraindications
  - lack of resuscitative drugs/equipment
  - patient refusal
  - allergy to local anesthetic
  - infection at puncture site or underlying tissues
  - coagulopathies/bleeding diathesis
  - raised ICP
  - sepsis/bacteremia
  - severe hypovolemia
  - cardiac lesion with fixed output states (severe mitral/aortic stenosis)
  - lack of IV access
- relative contraindications
  - pre-existing neurological disease (demyelinating lesions)
  - previous spinal surgery, severe spinal deformity
  - prolonged surgery
  - major blood loss or maneuvers that can compromise reaction

## Peripheral Nerve Blocks

- deposition of LA around the target nerve or plexus
- ultrasound guidance and peripheral nerve stimulation (needle will stimulate target nerve/plexus) may be used to guide needle to target nerve while avoiding neural trauma or intraneural injection
- most major nerves or nerve plexi can be targeted (brachial plexus block, femoral nerve block, sciatic nerve block, etc.)
- performed with standard monitors
- approximately 2-4 per 10,000 risk of late neurologic injury
- resuscitation equipment must be available

### Contraindications to Peripheral Nerve Blockade

- absolute contraindications
  - allergy to LA
  - patient refusal
- relative contraindications
  - certain types of pre-existing neurological dysfunction (e.g. ALS, MS, diabetic neuropathy)
  - local infection at block site
  - bleeding disorder

## Local Anesthesia

### Local Anesthetic Agents

- see Table 14, for list of LA agents

#### Definition and Mode of Action

- LA are drugs that block the generation and propagation of impulses in excitable tissues: nerves, skeletal muscle, cardiac muscle, brain
- LA bind to receptors on the cytosolic side of the Na<sup>+</sup> channel, inhibiting Na<sup>+</sup> flux and thus blocking impulse conduction
- different types of nerve fibres undergo blockade at different rates

#### Absorption, Distribution, Metabolism

- LA readily crosses the blood-brain barrier (BBB) once absorbed into the bloodstream
- ester-type LA (procaine, tetracaine) are broken down by plasma and hepatic esterases; metabolites excreted via kidneys
- amide-type LA (lidocaine, bupivacaine) are broken down by hepatic mixed-function oxidases (P450 system); metabolites excreted via kidneys

#### Selection of LA

- choice of LA depends on
  - onset of action: influenced by pKa (the lower the pKa, the higher the concentration of the base form of the LA, and the faster the onset of action)
  - duration of desired effects: influenced by protein binding (longer duration of action when protein binding of LA is strong)
  - potency: influenced by lipid solubility (agents with high lipid solubility penetrate the nerve membrane more easily)
  - unique needs (e.g. sensory blockade with relative preservation of motor function by bupivacaine at low doses)
  - potential for toxicity

Table 14. Local Anesthetic Agents

	Maximum Dose	Maximum Dose with Epinephrine	Potency	Duration
chlorprocaine	11 mg/kg	14 mg/kg	Low	15-30 min
lidocaine	5 mg/kg	7 mg/kg	Medium	1-2 h
bupivacaine	2.5 mg/kg	3 mg/kg	High	3-8 h
ropivacaine	2.5 mg/kg	3 mg/kg	High	2-8 h

#### Reduction of Post-Operative Mortality and Morbidity with Epidural or Spinal Anaesthesia: Results from Overview of Randomized Trials

*BMJ* 2000;321:1-12

**Purpose:** To obtain reliable estimates of the effects of neuraxial blockade with epidural or spinal anesthesia on post-operative morbidity and mortality after various surgeries with or without general anesthesia.

**Study:** Systematic review of all trials with randomization to intraoperative neuraxial blockade vs. control group.

**Patients:** 141 trials including 9,559 patients.

**Main Outcomes:** All cause mortality, MI, PE, DVT, transfusion requirements, pneumonia, other infections, respiratory depression, and renal failure

**Results:** With neuraxial blockade, overall mortality was reduced by about one third. Neuraxial blockade reduced the risk of PE by 55%, DVT by 44%, transfusion requirements by 50%, pneumonia by 39%, and respiratory depression by 59%. There were also reductions in MI and renal failure. These mortality reductions are irrespective of surgical group, type of blockade (epidural or spinal), or whether neuraxial blocker was combined with general anesthetic.

**Conclusions:** Neuraxial blockade reduces post-operative mortality and other serious complications.

## Systemic Toxicity

- see Table 16, A25 for maximum doses, potency, and duration of action for common LA agents
- occurs by accidental intravascular injection, LA overdose, or unexpectedly rapid absorption

### CNS Effects

- CNS effects first appear to be excitatory due to initial block of inhibitory fibres, then subsequent block of excitatory fibres
- effects in order of appearance
  - numbness of tongue, perioral tingling, metallic taste
  - disorientation, drowsiness
  - tinnitus
  - visual disturbances
  - muscle twitching, tremors
  - unconsciousness
  - convulsions, seizures
  - generalized CNS depression, coma, respiratory arrest

### CVS Effects

- vasodilation, hypotension
- decreased myocardial contractility
- dose-dependent delay in cardiac impulse transmission
  - prolonged PR, QRS intervals
  - sinus bradycardia
- CVS collapse

### Treatment of Systemic Toxicity

- early recognition of signs, get help
- 100% O<sub>2</sub>, manage ABCs
- diazepam or sodium thiopental may be used to increase seizure threshold
- manage arrhythmias (see *ACLS Guidelines*, A31-32)
- Intralipid® 20% to bind local anesthetic in circulation

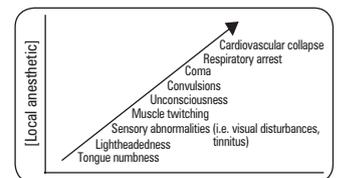

Figure 10. Local anesthetic systemic toxicity

## Local Infiltration and Hematoma Blocks

### Local Infiltration

- injection of tissue with LA, producing a lack of sensation in the infiltrated area due to LA acting on nerves
- suitable for small incisions, suturing, excising small lesions
- can use fairly large volumes of dilute LA to infiltrate a large area
- low concentrations of epinephrine (1:100,000-1:200,000) cause vasoconstriction, thus reducing bleeding and prolonging the effects of LA by reducing systemic absorption

### Fracture Hematoma Block

- special type of local infiltration for pain control during manipulation of certain fractures
- hematoma created by fracture is infiltrated with LA to anesthetize surrounding tissues
- sensory blockade may only be partial
- no muscle relaxation

Where Not to Use LA with Epinephrine  
"Ears, Fingers, Toes, Penis, Nose"

## Topical Anesthetics

- various preparations of local anesthetics available for topical use, may be a mixture of agents (EMLA cream is a combination of 2.5% lidocaine and prilocaine)
- must be able to penetrate the skin or mucous membrane

## Post-Operative Care

- pain management should be continuous from OR to post-anesthetic care unit (PACU) to hospital ward and home

## Common Post-Operative Anesthetic Complications

### Nausea and Vomiting

- hypotension and bradycardia must be ruled out
- pain and surgical manipulation also cause nausea
- often treated with dimenhydrinate (Gravol®), metoclopramide (Maxeran®; not with bowel obstruction), prochlorperazine (Stemetil®), ondansetron (Zofran®), granisetron (Kytril®)

**Confusion and Agitation**

- ABCs first – confusion or agitation can be caused by airway obstruction, hypercapnea, hypoxemia
- neurologic status (Glasgow Coma Scale, pupils), residual paralysis from anesthetic
- pain, distended bowel/bladder
- fear/anxiety/separation from caregivers, language barriers
- metabolic disturbance (hypoglycemia, hypercalcemia, hyponatremia – especially post-TURP)
- intracranial cause (stroke, raised intracranial pressure)
- drug effect (ketamine, anticholinergics, serotonin)
- elderly patients are more susceptible to post-operative delirium

**Respiratory Complications**

- susceptible to aspiration of gastric contents due to PONV and unreliable airway reflexes
- airway obstruction (secondary to reduced muscle tone from residual anesthetic, soft tissue trauma and edema, or pooled secretions) may lead to inadequate ventilation, hypoxemia, and hypercapnia
- airway obstruction can often be relieved with head tilt, jaw elevation, and anterior displacement of the mandible. If the obstruction is not reversible, a nasal or oral airway may be used

**Hypotension**

- must be identified and treated quickly to prevent inadequate perfusion and ischemic damage
- reduced cardiac output (hypovolemia, most common cause) and/or peripheral vasodilation (residual anesthetic agent)
- first step in treatment is usually the administration of fluids ± inotropic agents

**Hypertension**

- pain, hypercapnia, hypoxemia, increased intravascular fluid volume, and sympathomimetic drugs can cause hypertension
- sodium nitroprusside or β-blocking drugs (e.g. esmolol and metoprolol) can be used to treat hypertension

**Pain Management**

**Definitions**

- pain: perception of nociception, which occurs in the brain
- nociception: detection, transduction, and transmission of noxious stimuli

**Pain Classifications**

- temporal: acute vs. chronic
- mechanism: nociceptive vs. neuropathic

**Acute Pain**

- pain of short duration (<6 wk) usually associated with surgery, trauma, or acute illness; often associated with inflammation
- usually limited to the area of damage/trauma and resolves with healing

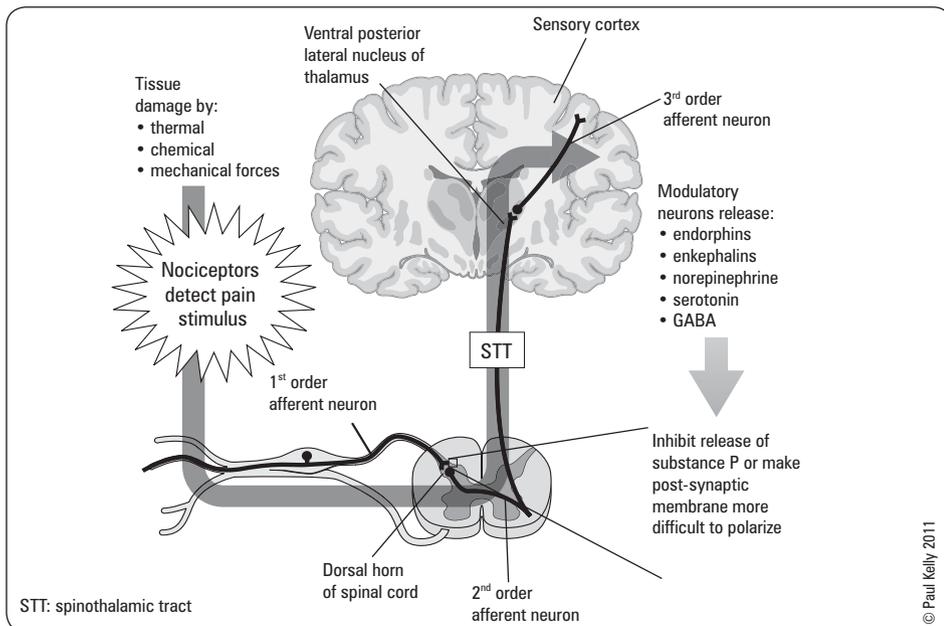

Figure 11. Acute pain mechanism

**Risk Factors for Post-Operative Nausea and Vomiting (PONV)**

- Young age
- Female
- History of PONV
- Non-smoker
- Type of surgery: ophtho, ENT, abdo/pelvic, plastics
- Type of anesthetic: N<sub>2</sub>O, opioids, volatile agents

**Drugs for Preventing Post-Operative Nausea and Vomiting**

Cochrane DB Syst Rev 2006;3:CD004125

**Purpose:** To evaluate the efficacy of antiemetics in preventing PONV.

**Methods:** A meta-analysis was performed looking at randomized controlled trials comparing an antiemetic to either a second antiemetic or placebo. Trials looking at dosing and/or timing of medication administration were also included. PONV was used as the primary outcome.

**Results:** 737 studies involving 103,237 patients. Eight drugs significantly reduced the occurrence of PONV, namely: droperidol, metoclopramide, ondansetron, tropisetron, dolasetron, dexamethasone, cyclizine, and granisetron. Relative risk (RR) versus placebo varied between 0.60, and 0.80. Side effects included a significant increase in drowsiness for droperidol (RR 1.32) and headache for ondansetron (RR 1.16). The cumulative number needed to treat was 3.57.

**Conclusion:** Antiemetic medication is effective for reducing the occurrence of PONV. However, further investigation needs to be done to determine whether antiemetics can cause more severe (and likely rare) side effects, which could alter how liberally they are used.

**Opioid Conversion**

	Parenteral (IV)	Equivalent Oral Dose
Morphine	10 mg	30 mg
Hydromorphone	2 mg	4 mg
Codeine	120 mg	200 mg
Oxycodone	N/A	20 mg
Fentanyl IV	100 µg	N/A

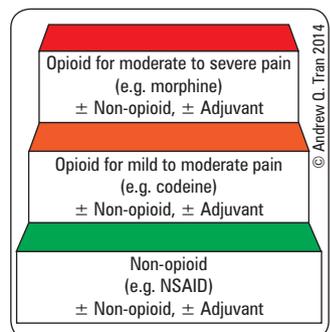

Figure 12. WHO analgesia ladder

**Pharmacological Management of Acute Pain**

- ask the patient to rate the pain out of 10, or use visual analog scale, to determine severity
- pharmacological treatment guided by WHO analgesia ladder
- patient controlled analgesia (PCA)
  - involves the use of computerized pumps that can deliver a constant infusion and bolus breakthrough doses of parenterally-administered opioid analgesics
  - limited by lockout intervals
  - most commonly used agents: morphine and hydromorphone
  - see Table 17, A26 for suggested infusion rate, PCA dose and lockout intervals

**Table 15. Commonly Used Analgesics**

	Acetaminophen	NSAIDs	Opioids
<b>Examples</b>	Tylenol®	Aspirin®, ibuprofen, naproxen, ketorolac (IV)	Oral: codeine, oxycodone, morphine, hydromorphone Parenteral: morphine, hydromorphone, fentanyl
<b>Indications</b>	First-line for mild acute pain	Mild-moderate pain	Oral: moderate acute pain Parenteral: moderate-severe acute pain
<b>Mechanism of Action</b>	Unclear, hypothesized cyclooxygenase-2 (COX-2) inhibition Unclear, hypothesized modulation of endogenous cannabinoid system	Non-selective COX-1 and 2 inhibition reducing proinflammatory prostaglandin synthesis	Dampens nociceptive transmission between 1st and 2nd order neurons in the dorsal horn Activates ascending modulatory pathways resulting in release of inhibitory neurotransmitters Inhibits peripheral inflammatory response and hyperalgesia Affects mood and anxiety – alleviates the affective component of perceived pain
<b>Dosing/Administration</b>	Limited by analgesic ceiling beyond which there is no additional analgesia Opioid-sparing Max dose of 4 g/24 h	Limited by analgesic ceiling beyond which there is no additional analgesia Opioid-sparing Significant inter-individual variation in efficacy	No analgesic ceiling (except for codeine) Can be administered intrathecally (spinal block) or by continuous infusion
<b>Side Effects/Toxicity</b>	Considered relatively safe Liver toxicity in elevated doses	Gastric ulceration/bleeding Decreased renal perfusion Photosensitivity Premature closure of the ductus arteriosus in pregnancy	Respiratory depression Constipation and abdominal pain Sedation N/V Pruritus Confusion (particularly in the elderly) Dependence

**Table 16. Opioids**

Agent	Relative Dose to 10 mg Morphine IV	Moderate Dose	Onset	Duration	Special Considerations
Codeine	200 mg PO	15-30 mg PO	Late (30-60 min)	Moderate (4-6 h)	Primarily post-operative use, not for IV use
Meperidine (Demerol®)	75 mg IV	2-3 mg/kg IV	Moderate (10 min)	Moderate (2-4 h)	Anticholinergic, hallucinations, less pupillary constriction than morphine, metabolite build up may cause seizures
Morphine	10 mg IV 20 mg PO	0.2-0.3 mg/kg IV 0.4-0.6 mg/kg PO	Moderate (5-10 min)	Moderate (4-5 h)	Histamine release leading to decrease in BP
Oxycodone Controlled Release (Oxyneo®)	15 mg PO	10-20 mg PO (no IV)	Late (30-45 min)	Long (8-12 h)	Do not split, crush, or chew tablet
Oxycodone Regular Tablet (Oxy IR®)	15 mg PO (no IV)	5-15 mg PO	Moderate (15 min)	Moderate (3-6 h)	Percocet® = oxycodone 5 mg + acetaminophen 325 mg
Hydromorphone (Dilaudid®)	2 mg IV 10 mg PO	40-60 µg/kg IV 2-4 mg PO	Moderate (15 min)	Moderate (4-5 h)	
Fentanyl	100 µg IV	2-3 µg/kg IV	Rapid (<5 min)	Short (0.5-1 h)	Transient muscle rigidity in very high doses
Remifentanyl	100 µg IV	0.5-1.5 µg/kg IV	Rapid (1-3 min)	Ultra short (<10 min)	Only use during induction and maintenance of anesthesia

In general, parenteral route is 2-3x more potent than oral

**Cautionary Use of NSAIDs in Patients with**

- Asthma
- Coagulopathy
- GI ulcers
- Renal insufficiency
- Pregnancy, 3rd trimester

**Common Side Effects of Opioids**

- N/V
  - Constipation
  - Sedation
  - Pruritus
  - Abdominal pain
  - Urinary retention
  - Respiratory depression
- When prescribing opioids, consider:
- Breakthrough dose
  - Anti-emetics
  - Laxative

**PCA Parameters**

- Loading dose
- Bolus dose
- Lockout interval
- Continuous infusion (optional)
- Maximum 4 h dose (limit)

**Advantages of PCA**

- Improved patient satisfaction
- Fewer side effects
- Accommodates patient variability
- Accommodates changes in opioid requirements

**Patient Controlled Opioid Analgesia vs. Conventional Opioid Analgesia for Post-Operative Pain**

*Cochrane DB Syst Rev* 2006;4:CD003348

**Purpose:** To evaluate the efficacy of patient controlled analgesia (PCA) as compared to conventional 'as-needed' analgesia administration providing pain relief in post-operative patients.  
**Methods:** Meta-analyses of randomized controlled trials comparing PCA vs. conventional administration of opioid analgesia. Assessment employed a visual analog scale (VAS) for pain intensity along with overall analgesic consumption, patient satisfaction, length of stay, and adverse side effects.

**Results:** 55 studies with a total of 2,023 patients receiving PCA and 1,838 patients with standard as-needed opioid administration. PCA provided significantly better pain control through 72 h post-operatively, but patients consumed significantly more opioids (>7 mg morphine/24 h, p<0.05). Significantly more patients reported pruritus in the PCA group compared to control with a number needed to harm of 13. No significant difference in overall length of stay in hospital, sedation level, N/V, or urinary retention.

**Conclusions:** PCA is more effective than standard as-needed administration for reducing post-operative pain. However, patients using PCA consume more opioids overall and have more pruritus.

Table 17. Opioid PCA Doses

Agent	PCA Dose	PCA Lockout Interval	PCA 4 h Maximum
Morphine	1 mg	5 min	30 mg
Hydromorphone	0.2 mg	5 min	6 mg
Fentanyl	25-50 µg	5 min	400 µg

### Opioid Antagonists (naloxone, naltrexone)

- indication: opioid overdose (manifests primarily at CNS, e.g. respiratory depression)
- mechanism of action: competitively inhibit opioid receptors, predominantly  $\mu$  receptors
  - naloxone is short-acting ( $t_{1/2} = 1$  h); effects of narcotic may return when naloxone wears off; therefore, the patient must be observed closely following its administration
  - naltrexone is longer-acting ( $t_{1/2} = 10$  h); less likely to see return of opioid effects
- side effects: relative overdose of naloxone may cause nausea, agitation, sweating, tachycardia, hypertension, re-emergence of pain, pulmonary edema, seizures (essentially opioid withdrawal)

## Neuropathic Pain

- see [Neurology, N41](#)

## Chronic Pain

- chronic pain: greater than 3 mo, or recurrent pain that occurs at least 3 times throughout three month period
- pain of duration or intensity that persists beyond normal tissue healing and adversely affects functioning
- may have nociceptive and neuropathic components; dysregulation of analgesic pathways implicated
- in the perioperative period, consider continuing regular long-acting analgesics and augmenting with regional techniques, adjuvants, additional opioid analgesia and non-pharmacological techniques

## Obstetrical Anesthesia

### Anesthesia Considerations in Pregnancy

- airway
  - possible difficult airway as tissues becomes edematous and friable especially in labour
- respiratory
  - decreased FRC and increased  $O_2$  consumption cause more rapid desaturation during apnea
- cardiovascular system
  - increased blood volume > increased RBC mass results in mild anemia
  - decreased SVR proportionately greater than increased CO results in decreased BP
  - prone to decreased BP due to aortocaval compression – therefore for surgery, a pregnant patient is positioned in left uterine displacement using a wedge under her right flank
- central nervous system
  - decreased MAC due to hormonal effects
  - increased block height due to engorged epidural veins
- gastrointestinal system
  - delayed gastric emptying
  - increased volume and acidity of gastric fluid
  - decreased LES tone
  - increased abdominal pressure
  - combined, these lead to an increased risk of aspiration – therefore for surgery, a pregnant patient is given sodium citrate 30 cc PO immediately before surgery to neutralize gastric acidity

### Options for Analgesia during Labour

- psychoprophylaxis – Lamaze method
  - patterns of breathing and focused attention on fixed object
- systemic medication
  - easy to administer, but risk of maternal or neonatal respiratory depression
  - opioids most commonly used if delivery is not expected within 4 h
- inhalational analgesia
  - easy to administer, makes uterine contractions more tolerable, but does not relieve pain completely
  - 50% nitrous oxide
- neuraxial anesthesia
  - provides excellent analgesia with minimal depressant effects
  - hypotension is the most common complication
  - maternal BP monitored q2-5 min for 15-20 min after initiation and regularly thereafter
  - epidural usually given as it preferentially blocks sensation, leaving motor function intact

#### The Effect of Epidural Analgesia on Labour, Maternal, and Neonatal Outcomes: A Systematic Review

*Am J Obstet Gynecol* 2002;186:S69-77

**Study:** Meta-analysis of 14 studies with 4,324 women.

**Selection Criteria:** RCTs and prospective cohort studies between 1980-2001 comparing epidural analgesia to parenteral opioid administration during labour.

**Types of Participants:** Healthy women with uneventful pregnancies.

**Intervention:** Participants were randomized to either epidural analgesia or parenteral opioid administration during labour.

**Outcomes and Results:** Maternal – there were no differences between the 2 groups in first-stage labour length, incidence of Cesarean delivery, incidence of instrumented vaginal delivery for dystocia, nausea, or mid-to-low back pain post-partum. However, second-stage labour length was longer (mean = 15 min) and there were greater reports of fever and hypotension in the epidural group. Also, lower pain scores and greater satisfaction with analgesia were reported among the epidural group. There was no difference in lactation success at 6 wk and urinary incontinence was more frequent in the epidural group immediately post-partum, but not at 3 mo or 1 yr (evidence from PC studies only)  
Neonatal – there were no differences between the 2 groups for incidence of fetal heart rate abnormalities, intrapartum meconium, poor 5-min Apgar score, or low umbilical artery pH. However, the incidence of poor 1-min Apgar scores and need for neonatal naloxone were higher in the parenteral opioid group.

**Conclusions:** Epidural analgesia is a safe intrapartum method for labour pain relief and women should not avoid epidural analgesia for fear of neonatal harm, Cesarean delivery, breastfeeding difficulties, long-term back pain, or long-term urinary incontinence.

#### Nociceptive Pathways in Labour and Delivery

**Labour**

- Cervical dilation and effacement stimulates visceral nerve fibres entering the spinal cord at T10-L1

**Delivery**

- Distention of lower vagina and perineum causes somatic nociceptive impulses via the pudendal nerve entering the spinal cord at S2-S4

### Options for Caesarean Section

- neuraxial: spinal or epidural
- general: used if contraindications or time precludes regional blockade

## Pediatric Anesthesia

### Respiratory System

- in comparison to adults, anatomical differences in infants include:
  - large head, short trachea/neck, large tongue, adenoids, and tonsils
  - narrow nasal passages (obligate nasal breathers until 5 mo)
  - narrowest part of airway at the level of the cricoid vs. glottis in adults
  - epiglottis is longer, U shaped and angled at 45°; carina is wider and is at the level of T2 (T4 in adults)
- physiologic differences include
  - faster RR, immature respiratory centres which are depressed by hypoxia/hypercapnea (airway closure occurs in the neonate at the end of expiration)
  - less oxygen reserve during apnea – decreased total lung volume, vital and functional reserve capacity together with higher metabolic needs
  - greater V/Q mismatch – lower lung compliance due to immature alveoli (mature at 8 yr)
  - greater work of breathing – greater chest wall compliance, weaker intercostals/diaphragm, and higher resistance to airflow

### Cardiovascular System

- blood volume at birth is approximately 80 mL/kg; transfusion should be started if >10% of blood volume lost
- children have a high HR and low BP
- CO is dependent on HR, not stroke volume because of low heart wall compliance; therefore, bradycardia severe compromise in CO

### Temperature Regulation

- vulnerable to hypothermia
- minimize heat loss by use of warming blankets, covering the infant's head, humidification of inspired gases, and warming of infused solutions

### Central Nervous System

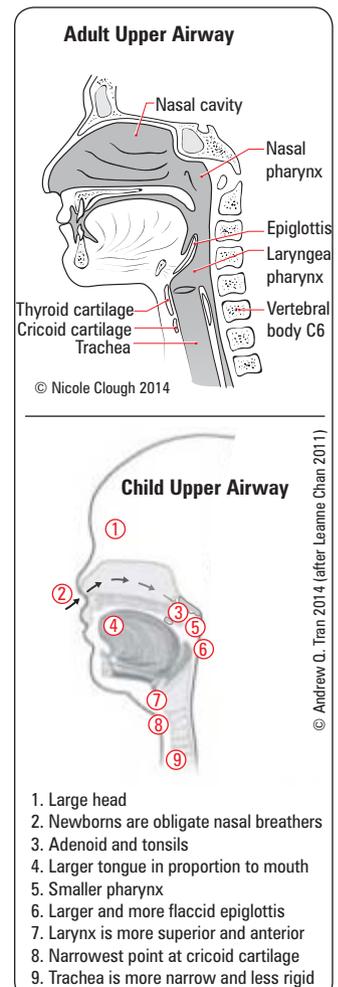

- MAC of halothane is increased compared to the adult (0.75% adult, 1.2% infant, 0.87% neonate)
- NMJ is immature for the first 4 wk of life and thus there is an increased sensitivity to non-depolarizing relaxants
- parasympathetics mature at birth, sympathetics mature at 4-6 mo thus autonomic imbalance
- infant brain is 12% of body weight and receives 34% of CO (adult: 2% body weight and 14% CO)

### Glucose Maintenance

- infants less than 1 yr old can become seriously hypoglycemic during pre-operative fasting and post-operatively if feeding is not recommenced as soon as possible
- after 1 yr, children are able to maintain normal glucose homeostasis in excess of 8 h

### Pharmacology

- higher dose requirements because of higher TBW (75% vs. 60% in adults) and greater volume of distribution
- barbiturates/opioids more potent due to greater permeability of BBB
- muscle relaxants
  - non-depolarizing
    - ♦ immature NMJ, variable response
  - depolarizing
    - ♦ must pre-treat with atropine or may experience profound bradycardia and/or sinus node arrest due to PNS > SNS (also dries oral secretions)
    - ♦ more susceptible to arrhythmias, hyperkalemia, rhabdomyolysis, myoglobinemia, masseter spasm and malignant hyperthermia

**Figure 13. Comparison of pediatric vs. adult airway**

**To increase alveolar minute ventilation in neonates, increase respiratory rate, not tidal volume.**

Neonate: 30-40 breaths/min

Age 1-13:  $(24 - [age/2])$  breaths/min

**ETT Sizing in Pediatrics**

Diameter (mm) of tracheal tube in children after 1 year =  $(age/4) + 4$

Length (cm) of tracheal tube =  $(age/2) + 12$

# Uncommon Complications

## Malignant Hyperthermia

- hypermetabolic disorder of skeletal muscle
- due to an uncontrolled increase in intracellular  $\text{Ca}^{2+}$  (because of an anomaly of the ryanodine receptor which regulates  $\text{Ca}^{2+}$  channel in the sarcoplasmic reticulum of skeletal muscle)
- autosomal dominant inheritance
- incidence of 1-5 in 100,000, may be associated with skeletal muscle abnormalities such as dystrophy or myopathy
- anesthetic drugs triggering MH include
  - all inhalational agents except nitrous oxide
  - depolarizing muscle relaxants: SCh

### Clinical Picture

- onset: immediate or hours after contact with trigger agent
  - increased oxygen consumption
  - increased  $\text{ET}_{\text{CO}_2}$  on capnograph
  - tachycardia/dysrhythmia
  - tachypnea/cyanosis
  - diaphoresis
  - hypertension
  - increased temperature (late sign)
- muscular symptoms
  - trismus (masseter spasm) common but not specific for MH (occurs in 1% of children given SCh with halothane anesthesia)
  - tender, swollen muscles due to rhabdomyolysis
  - trunk or total body rigidity

### Complications

- coma
- DIC
- rhabdomyolysis
- myoglobinuric renal failure/hepatic dysfunction
- electrolyte abnormalities (e.g. hyperkalemia) and secondary arrhythmias
- ARDS
- pulmonary edema
- can be fatal if untreated

### Prevention

- suspect MH in patients with a family history of problems/death with anesthetic
- avoid all trigger medications, use vapour free equipment, use regional anesthesia if possible
- central body temp and  $\text{ET}_{\text{CO}_2}$  monitoring

### Malignant Hyperthermia Management (Based on Malignant Hyperthermia Association of the U.S. [MHAUS] Guidelines, 2008)

1. notify surgeon, discontinue volatile agents and succinylcholine, hyperventilate with 100% oxygen at flows of 10 L/min or more, halt the procedure as soon as possible
2. dantrolene 2.5 mg/kg IV, through large-bore IV if possible
  - repeat until there is control of signs of MH; up to 30 mg/kg as necessary
3. bicarbonate 1-2 mEq/kg if blood gas values are not available for metabolic acidosis
4. cool patients with core temperature  $>39^\circ\text{C}$ 
  - lavage open body cavities, stomach, bladder, rectum; apply ice to surface; infuse cold saline IV
  - stop cooling if temperature is  $<38^\circ\text{C}$  to prevent drift to  $<36^\circ\text{C}$
5. dysrhythmias usually respond to treatment of acidosis and hyperkalemia
  - use standard drug therapy except  $\text{Ca}^{2+}$  channel blockers as they may cause hyperkalemia and cardiac arrest in presence of dantrolene
6. hyperkalemia
  - treat with hyperventilation, bicarbonate, glucose/insulin, calcium
  - bicarbonate 1-2 mEq/kg IV, calcium chloride 10 mg/kg or calcium gluconate 10-50 mg/kg for life-threatening hyperkalemia and check glucose levels hourly
7. follow  $\text{ET}_{\text{CO}_2}$ , electrolytes, blood gases, creatine kinase (CK), core temperature, urine output/colour with Foley catheter, coagulation studies
  - if CK and/or potassium rises persistently or urine output falls to  $<0.5$  mL/kg/h, induce diuresis to  $>1$  mL/kg/h urine to avoid myoglobinuric renal failure
8. maintain anesthesia with benzodiazepines, opioids, and propofol
9. transfer to ICU bed

#### Signs of Malignant Hyperthermia

- Unexplained rise in  $\text{ET}_{\text{CO}_2}$
- Increase in minute ventilation
- Tachycardia
- Rigidity
- Hyperthermia (late sign)

#### Basic Principles of MH Management

##### "Some Hot Dude Better Get Iced Fluids Fast"

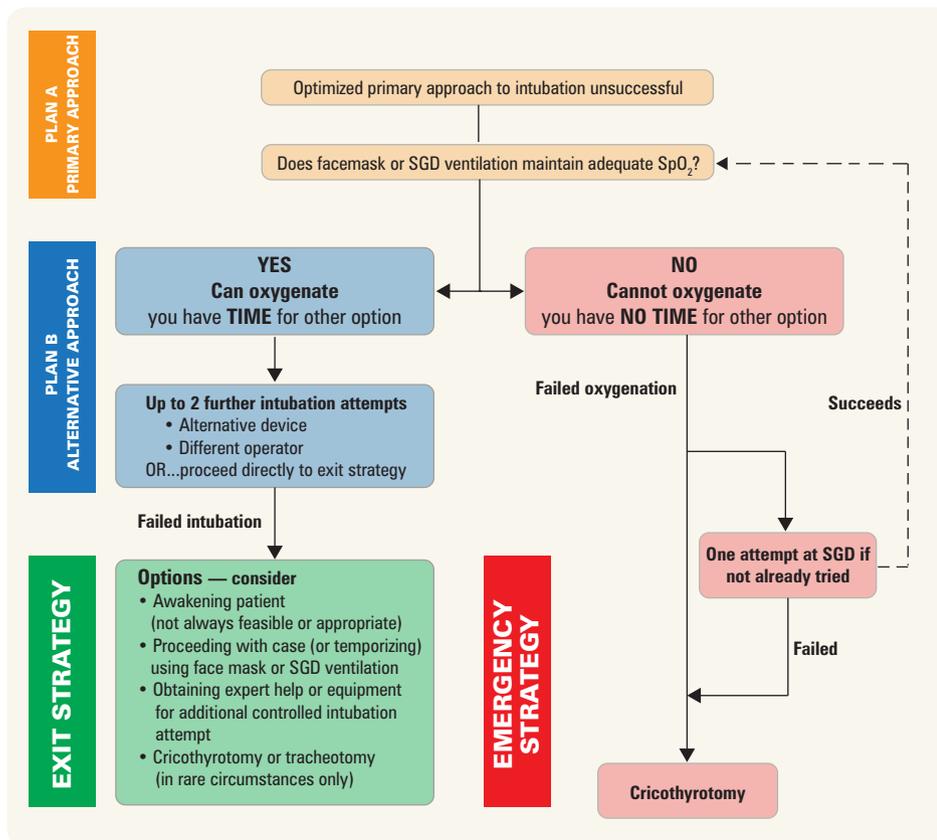

- Stop all triggering agents, give 100%  $\text{O}_2$
- Hyperventilate
- Dantrolene 2.5 mg/kg every 5 min
- Bicarbonate
- Glucose and insulin
- IV fluids; cool patient to  $38^\circ\text{C}$
- Fluid output; consider furosemide
- Tachycardia: be prepared to treat VT

## Abnormal Pseudocholinesterase

- pseudocholinesterase hydrolyzes SCh and mivacurium
- individuals with abnormal pseudocholinesterase will have prolonged muscular blockade
- SCh and mivacurium are contraindicated in those with abnormal pseudocholinesterase
- if SCh or mivacurium are given accidentally, treat with mechanical ventilation until function returns to normal (do not use cholinesterase inhibitors rebound neuromuscular blockade once drug effect is terminated)

## Appendices

### Difficult Tracheal Intubation in Unconscious Patient

CI	cardiac index	LBB	left bundle branch	PUD	peptic ulcer disease	VAD	ventricular assist device
CO	cardiac output	LBBB	left bundle branch block	PVC	premature ventricular contraction	VFib	ventricular fibrillation
COPD	chronic obstructive pulmonary disease	LICS	left intercostal space	PVD	peripheral vascular disease	VT	ventricular tachycardia
CTA	CT angiography	LLSB	left lower sternal border	RA	right atrium	VTE	venous thromboembolism
				RAE	right atrial enlargement	WPW	Wolff-Parkinson-White

## Basic Anatomy Review

### Coronary Circulation

- conventional arterial supply to the heart arises from the right and left coronary arteries, which originate from the root of the aorta
  - right coronary artery (RCA)
    - acute marginal branches
    - atrioventricular (AV) nodal artery
    - posterior interventricular artery (PIV) = posterior descending artery (PD)
  - left main coronary artery (LCA):
    - left anterior descending artery (LAD)
      - septal branches
      - diagonal branches
    - left circumflex artery (LC)
      - obtuse marginal branches
- dominance of circulation
  - right-dominant circulation: PIV and at least one posterolateral branch arise from RCA (80%)
  - left-dominant circulation: PIV and at least one posterolateral branch arise from LC (15%)
  - balanced circulation: dual supply of posteroinferior LV from RCA and LC (5%)
- the sinoatrial (SA) node is supplied by the SA nodal artery, which may arise from the RCA (60%) or LCA (40%)
- most venous blood from the heart drains into the RA through the coronary sinus, although a small amount drains through Thebesian veins into all four chambers, contributing to the physiologic R-L shunt

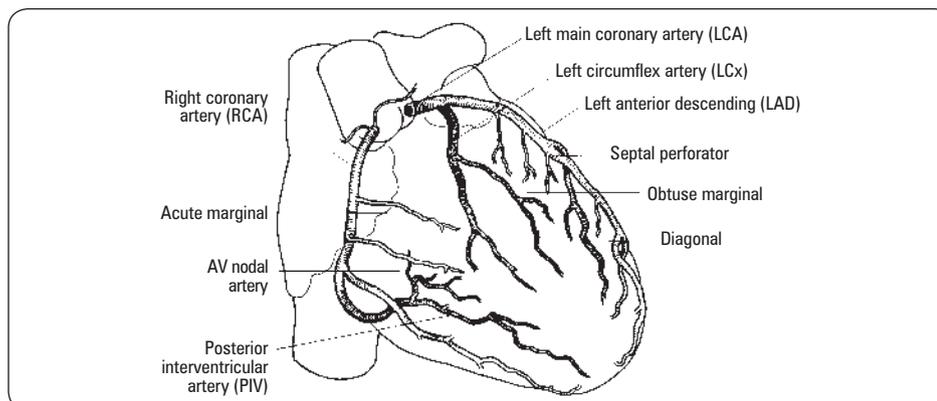

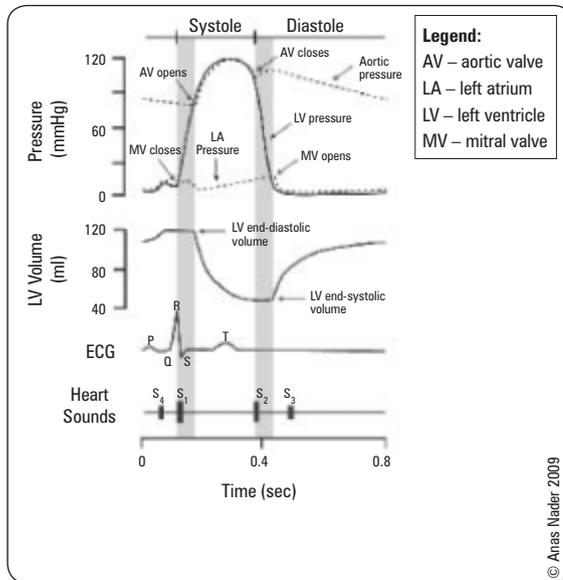

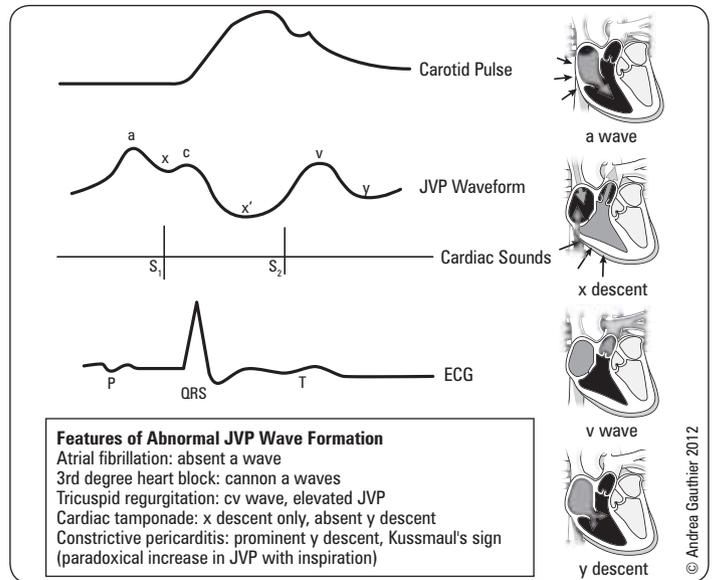

Figure 1. Anatomy of the coronary arteries (right anterior oblique projection)

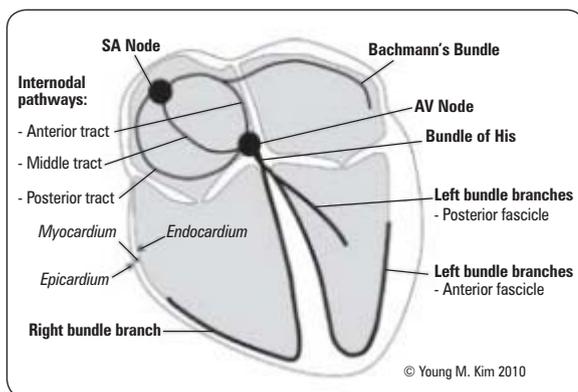

**Figure 2a. Cardiac cycle**  
 Grey shaded bars indicate isovolumic contraction (left) and isovolumic relaxation (right)

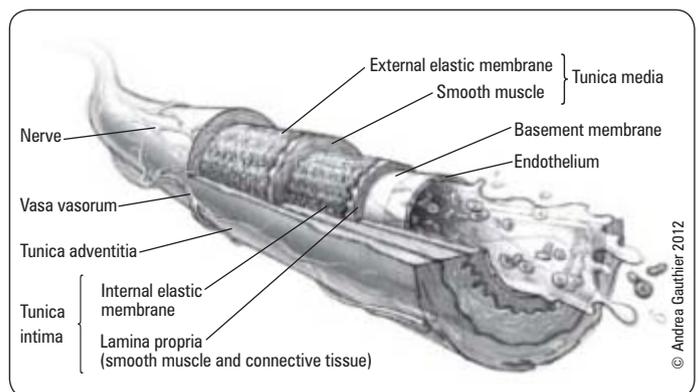

**Figure 2b. JVP waveform**

## Cardiac Anatomy

- **layers of the heart**
  - endocardium, myocardium, epicardium, visceral pericardium, pericardial cavity, parietal pericardium
- **valves**
  - semilunar valves:
    - ♦ aortic valve, 3 valve leaflets: separates LV and ascending aorta
    - ♦ pulmonic valve, 3 valve leaflets: separates RV and main pulmonary artery (PA)
  - atrioventricular valves: subvalvular apparatus present in the form of chordae tendinae and papillary muscles
    - ♦ tricuspid valve, 3 valve leaflets: separates RA and RV
    - ♦ mitral/bicuspid valve, 2 valve leaflets: separates LA and LV
- **conduction system**
  - SA node governs pacemaking control
  - anterior-, middle-, and posterior-internal nodal tracts carry impulses in the right atrium and along Bachmann's bundle in the left atrium
  - atrial impulses converge at the AV node
    - ♦ the AV node is the only conducting tract from the atria to the ventricles because of electrical isolation by the annulus fibrosus (except when accessory pathways are present)
  - the bundle of His bifurcates into left and right bundle branches (LBB and RBB)
  - LBB further splits into anterior and posterior fascicles
  - RBB and fascicles of LBB give off Purkinje fibres which conduct impulses into the ventricular myocardium

**Figure 3. Conduction system of the heart**

**Figure 4. Blood vessel structure**

- **cardiovascular innervation**
  - sympathetic nerves
    - ♦ innervate the SA node, AV node, ventricular myocardium and vasculature
    - ♦ SA node ( $\beta_1$ ) fibres increase pacemaking activity (chronotropy - HR)
    - ♦ cardiac muscle ( $\beta_1$ ) fibres increase contractility (inotropy - SV)
    - ♦ stimulation of  $\beta_1$ - and  $\beta_2$ -receptors in the skeletal and coronary circulation causes vasodilatation
  - parasympathetic nerves
    - ♦ innervate the SA node, AV node, atrial myocardium but few vascular beds
    - ♦ basal vagal tone dominates the tonic sympathetic stimulation of the SA node and AV node resulting in slowing of pacemaker activity and conduction (i.e. reduced chronotropy – if only affecting AV node conduction)
    - ♦ parasympathetics have very little impact on total peripheral vascular resistance

## Differential Diagnoses of Common Presentations

Note: **bold** text indicates most common, underlined text indicates life threatening condition

### Chest Pain

- cardiac
  - MI/angina, myocarditis, pericarditis/Dressler's syndrome
- pulmonary
  - PE, pneumothorax/hemothorax, tension pneumothorax, pneumonia, empyema, pulmonary neoplasm, bronchiectasis, TB
- gastrointestinal
  - esophageal: **GERD**, esophageal rupture, spasm, esophagitis, ulceration, achalasia, neoplasm, Mallory-Weiss syndrome
  - other structures: PUD, gastritis, pancreatitis, biliary colic
- mediastinal
  - lymphoma, thymoma
- vascular
  - dissecting aortic aneurysm, aortic rupture
- surface structures
- costochondritis
- rib fracture
- skin (bruising, herpes zoster)
- breast
- anxiety/psychosomatic

### Loss of Consciousness

- **hypovolemia**
- **vasovagal**
- cardiac
  - structural or obstructive causes
    - ♦ ACS, AS, HCM, cardiac tamponade, constrictive pericarditis
  - arrhythmias (*see Arrhythmias, C16*)
- respiratory
  - massive pulmonary embolism, pulmonary hypertension, hypoxia, hypercapnia
- neurologic
  - stroke/TIA (esp. vertebrobasilar insufficiency), migraine, seizure
- metabolic
  - anemia, hypoglycemia
- drugs
  - antihypertensives, antiarrhythmics, diuretics
- autonomic dysfunction
  - diabetic neuropathy
- psychiatric
  - panic attack

### Local Edema

- inflammation/infection
- venous or lymphatic obstruction
  - thrombophlebitis/deep vein thrombosis, venous insufficiency, chronic lymphangitis, lymphatic tumour infiltration, filariasis

## Generalized Edema

- increased hydrostatic pressure/fluid overload
  - heart failure, pregnancy, drugs (e.g. CCBs), iatrogenic (e.g. IV fluids)
- decreased oncotic pressure/hypoalbuminemia
  - **liver cirrhosis**, nephrotic syndrome, malnutrition
- increased capillary permeability
  - severe sepsis
- hormonal
  - hypothyroidism, exogenous steroids, pregnancy, estrogens

## Palpitations

- cardiac
  - **arrhythmias** (PAC, PVC, SVT, VT), **valvular heart disease**, HCM
- endocrine
  - thyrotoxicosis, pheochromocytoma, hypoglycemia
- systemic
  - **anemia**, fever
- drugs
  - stimulants and anticholinergics
- psychiatric
  - panic attack

## Dyspnea

- cardiovascular
  - acute MI, CHF/LV failure, aortic/mitral stenosis, aortic/mitral regurgitation, arrhythmia, cardiac tamponade, constrictive pericarditis, left-sided obstructive lesions (e.g. left atrial myxoma), elevated pulmonary venous pressure
- respiratory
  - airway disease
    - ♦ asthma, COPD exacerbation, upper airway obstruction (anaphylaxis, foreign body, mucus plugging)
  - parenchymal lung disease
    - ♦ ARDS, pneumonia, interstitial lung disease
  - pulmonary vascular disease
    - ♦ PE, pulmonary HTN, pulmonary vasculitis
  - pleural disease
    - ♦ pneumothorax, pleural effusion
- neuromuscular and chest wall disorders
  - C-spine injury
    - ♦ polymyositis, myasthenia gravis, Guillain-Barré syndrome, kyphoscoliosis
- anxiety/psychosomatic
- hematological/metabolic
  - anemia, acidosis, hypercapnia

## Cardiac Diagnostic Tests

### Electrocardiography Basics

#### Description

- a graphical representation (time versus amplitude of electrical vector projection) of the electrical activity of the heart
- on the ECG graph
  - the horizontal axis represents time (at usual paper speed 25 mm/s)
    - ♦ 1 mm (1 small square) = 40 msec
    - ♦ 5 mm (1 large square) = 200 msec
  - the vertical axis represents voltage (at usual standard gain setting 10 mm/mV)
    - ♦ 1 mm (1 small square) = 0.1 mV
    - ♦ 10 mm (2 large squares) = 1 mV
- leads
  - standard 12-lead ECG
    - ♦ limb leads: I, II, III, aVL, aVR, aVF
    - ♦ precordial leads: V1-V6 (V1-V2 septal, V3-V4 anterior, V5-V6 lateral)
  - additional leads
    - ♦ right-sided leads: V3R-V6R (useful in RV infarction and dextrocardia)
  - lateral = I, aVL, V5, V6; inferior = II, III, aVF; anterior = V1-V4

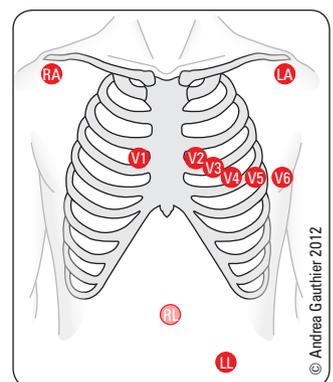

Figure 5. ECG lead placement

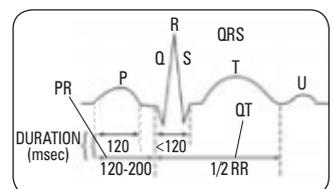

Figure 6. ECG waveforms and normal values

## Indications

- detect myocardial injury, ischemia, and the presence of prior infarction
- palpitations, syncope, antiarrhythmic drug monitoring
- arrhythmia surveillance in patients with documented or potentially abnormal rhythms
- surveillance of non-sustained arrhythmias that can lead to prophylactic intervention

## Contraindications

- no absolute contraindications except patient refusal or electrode latex adhesive allergy

# Approach to ECGs

## Introduction

Below, we are presenting both the Classical Approach and the newer PQRSTU Approach to provide students with different ways to view the ECG. Despite methodological differences, the rigor and final result is the same. These two approaches should help you better understand the concepts of ECG interpretation and equip you with the necessary skills to interpret ECGs in exam scenarios and clinical practice

## Classical Approach to ECGs

### RATE

- normal = 60-100 bpm (atrial rate: 150-250 bpm = paroxysmal tachycardia, 250-350 bpm = atrial flutter, >350 bpm = AFib)
- regular rhythm
  - to calculate the rate, divide 300 by number of large squares between 2 QRS complexes (there are 300 large squares in 1 min:  $300 \times 200 \text{ msec} = 60 \text{ sec}$ )
  - or remember 300-150-100-75-60-50-43 (rate falls in this sequence with the number of large squares between 2 QRS complexes)
- irregular rhythm
  - rate =  $6 \times$  number of R-R intervals in 10 s (the "rhythm strips" are 10 sec recordings)
- atrial escape rhythm = 60-80 bpm; junctional escape rhythm = 40-60 bpm; ventricular escape rhythm = 20-40 bpm

### RHYTHM

- regular: R-R interval is the same across the tracing
- irregular: R-R interval varies across the tracing
- regularly irregular: repeating pattern of varying R-R intervals e.g. A. Flutter
- irregularly irregular: R-R intervals vary erratically e.g. A. Fib, V. Fib
- normal sinus rhythm (NSR)
  - P wave precedes each QRS; QRS follows each P wave
  - P wave axis is normal (positive in 2 out of the 3 following leads I, II, aVF)
  - rate between 60-100 bpm

### AXIS

- mean axis indicates the direction of the mean vector
- can be determined for any waveform (P, QRS, T)
- the standard ECG reported QRS axis usually refers to the mean axis of the frontal plane – it indicates the mean direction of ventricular depolarization forces
- QRS axis in the frontal plane
  - normal axis:  $-30^\circ$  to  $90^\circ$  (i.e. positive QRS in leads I and II)
  - left axis deviation (LAD): axis  $< -30^\circ$
  - right axis deviation (RAD): axis  $> 90^\circ$
- QRS axis in the horizontal plane is not routinely calculated
  - transition from negative to positive is usually in lead V3

#### Rate Calculations

- Examples, practice

For more examples and practice visit [www.ecgmadesimple.com](http://www.ecgmadesimple.com)

#### Classical Approach to ECG

- Rate
- Rhythm
- Axis
- Conduction abnormalities
- Hypertrophy/chamber enlargement
- Ischemia/infarction
- Miscellaneous ECG changes

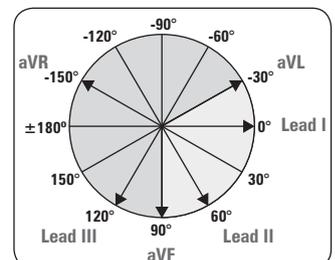

#### Differential Diagnosis for Left Axis Deviation (LAD)

- Left anterior hemiblock
- Inferior MI
- WPW
- RV pacing
- Normal variant
- Elevated diaphragm
- Lead misplacement
- Endocardial cushion defect

#### Differential Diagnosis for Right Axis Deviation (RAD)

- RVH
- Left posterior hemiblock
- Pulmonary embolism
- COPD
- Lateral MI
- WPW
- Dextrocardia
- Septal defects

**Figure 7. Axial reference system**

Each lead contains a (+) area displayed by the bold arrows. Impulses traveling toward the positive region of the lead results in an upward deflection in that lead. Normal QRS axis is between  $-30^\circ$  and  $+90^\circ$

**Table 1. Conduction Abnormalities**

Left Bundle Branch Block (LBBB)		Right Bundle Branch Block (RBBB)
<b>Complete LBBB</b> QRS duration >120 msec Broad notched R waves in leads V4, and V5, and usually I, aVL Deep broad S waves in leads V1-2 Secondary ST-T changes (-ve in leads with broad notched R waves, +ve in V1-2) are usually present LBBB can mask ECG signs of MI		<b>Complete RBBB</b> QRS duration >120 msec Positive QRS in lead V1 (rSR' or occasionally broad R wave) Broad S waves in leads I, V5-6 (>40 msec) Usually secondary T wave inversion in leads V1-2 Frontal axis determination using only the first 60 msec
Left Anterior Fascicular Block (LAFB) (Left Anterior Hemiblock)	Left Posterior Fascicular Block (LPFB) (Left Posterior Hemiblock)	Bifascicular Block
<b>Left Axis Deviation (-30° to -90°)</b> Small q and prominent R in leads I and aVL Small r and prominent S in leads II, III, and aVF	<b>Right Axis Deviation (110° to 180°)</b> Small r and prominent S in leads I and aVL Small q and prominent R in leads II, III, and aVF	RBBB pattern Small q and prominent R The first 60 msec (1.5 small squares) of the QRS shows the pattern of LAFB or LPFB Bifascicular block refers to impaired conduction in two of the three fascicles, most commonly a RBBB and left anterior hemiblock; the appearance on an ECG meets the criteria for both types of blocks

**Nonspecific Intraventricular Block**

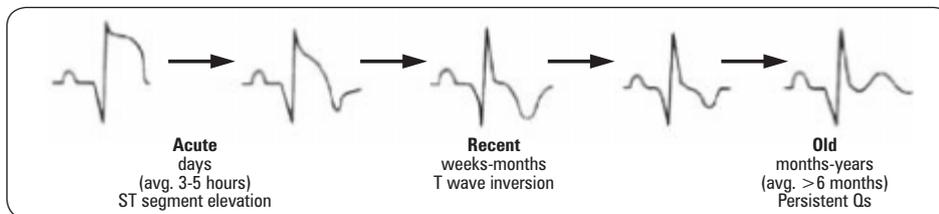

- QRS duration >120 msec
- absence of definitive criteria for LBBB or RBBB

**Table 2. Hypertrophy/Chamber Enlargement**

Left Ventricular Hypertrophy (LVH)	Right Ventricular Hypertrophy (RVH)
S in V1 + R in V5 or V6 >35 mm above age 40, (>40 mm for age 31-40, >45 mm for age 21-30) R in aVL >11 mm R in I + S in III >25 mm Additional criteria LV strain pattern (asymmetric ST depression and T wave inversion in leads I, aVL, V4-V6) Left atrial enlargement N.B. The more criteria present, the more likely LVH is present. If only one voltage criteria present, it is called minimal voltage criteria for LVH which could be a normal variant	Right axis deviation R/S ratio >1 or qR in lead V1 RV strain pattern: ST segment depression and T wave inversion in leads V1-2
Left Atrial Enlargement (LAE)	Right Atrial Enlargement (RAE)
Biphasic P wave with the negative terminal component of the P wave in lead V1 ≥1 mm wide and ≥1 mm deep P wave >100 msec, could be notched in lead II ("P mitrale")	P wave >2.5 mm in height in leads II, III, or aVF ("P pulmonale")

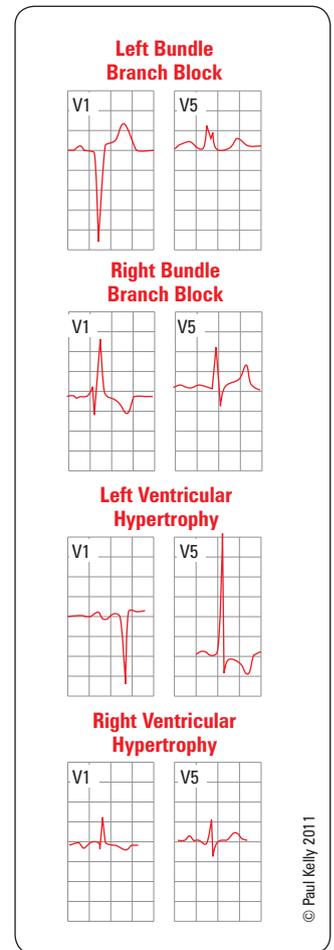

**ISCHEMIA/INFARCTION**

- look for the anatomic distribution of the following ECG abnormalities (see Table 3, C8)
- ischemia
  - ST segment depression
  - T wave inversion (most commonly in V1-V6)
- injury/infarct
  - transmural (involving the epicardium)
  - ST elevation in the leads facing the area injured/infarcted
  - subendocardial
  - marked ST depression in the leads facing the affected area
  - may be accompanied by enzyme changes and other signs of MI

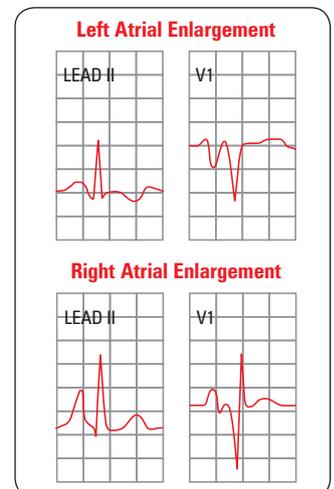

**Figure 10. Typical ECG changes with infarction**

- ST elevation: at least 1 mm in 2 adjacent limb leads or at least 1-2 mm in adjacent precordial leads in STEMI (signifies complete occlusion and transmural ischemic injury) vs. diffuse pattern in early pericarditis vs. transient ST elevation in patients with coronary artery spasm (e.g. Prinzmetal angina) which can be slight or prominent (>10 mm)

**Figure 8. Complete LBBB, RBBB, LVH, and RVH** (please see online examples for the full range of waveforms and the text for additional characteristics)

**Figure 9. LAE, RAE** (please see online examples and the text for characteristics)

- “typical” sequential changes of evolving MI
  1. hyperacute T waves (tall, symmetric T waves) in the leads facing the infarcted area, with or without ST elevation
  2. ST elevation (injury pattern) in the leads facing the infarcted area
    - ♦ usually in the first hours post infarct
    - ♦ in acute posterior MI, there is ST depression in V1-V3 (reciprocal to ST elevation in the posterior leads, that are not recorded in the standard 12-lead ECG) - get a 15-lead ECG
  3. significant Q waves: >40 msec or >1/3 of the total QRS and present in at least 2 consecutive leads in the same territory (hours to days post-infarct)
    - ♦ Q waves of infarction may appear in the very early stages, with or without ST changes
    - ♦ non-Q wave infarction: there may be only ST or T changes despite clinical evidence of infarction
  4. inverted T waves (one day to weeks after infarction)
- completed infarction
  - ♦ abnormal Q waves (Q waves may be present in leads III and aVL in normal individuals due to initial septal depolarization)
  - ♦ duration >40 msec (>30 msec in aVF for inferior infarction)
  - ♦ Q/QRS voltage ratio is >33%
  - ♦ present in at least 2 consecutive leads in the same territory
  - ♦ abnormal R waves (R/S ratio >1, duration >40 msec) in V1 and occasionally in V2 are found in posterior infarction (usually in association with signs of inferior and/or lateral infarction)

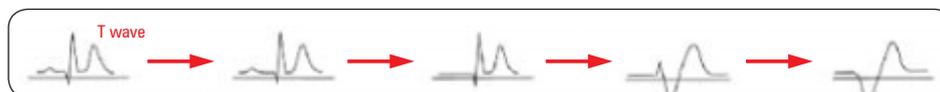

**Table 3. Areas of Infarction/Ischemia (right dominant anatomy)**

Vessel Usually Involved	Infarct Area (LAD and LC)	Leads (LAD and LC)
Left anterior descending (LAD)	Anteroseptal	V1, V2
	Anterior	V3, V4
	Anterolateral	I, aVL, V3-6
	Extensive anterior	I, aVL, V1-6
Right coronary artery (RCA)	Inferior	II, III, aVF
	Right ventricle	V3R, V4R (right sided chest leads)
	Posterior MI (assoc. with inf. MI)	V1, V2 (prominent R waves)
Left circumflex (LCX)	Lateral	I, aVL, V5-6
	Isolated posterior MI	V1, V2 (prominent R waves)

## MISCELLANEOUS ECG CHANGES

### Electrolyte Disturbances

- hyperkalemia
  - mild to moderate ( $K^+$  5-7 mmol/L): tall peaked T waves
  - severe ( $K^+$  >7 mmol/L): progressive changes whereby P waves flatten and disappear, QRS widens and may show bizarre patterns, axis shifts left or right, ST shift with tall T waves, eventually becomes a “sine wave” pattern
- hypokalemia
  - ST segment depression, prolonged QT interval, low T waves, prominent U waves (U>T)
  - enhances the toxic effects of digitalis
- hypercalcemia
  - shortened QT interval (more extracellular  $Ca^{2+}$  means shorter plateau in cardiac action potential)
- hypocalcemia
  - prolonged QT interval (less extracellular  $Ca^{2+}$  means longer plateau in cardiac action potential)

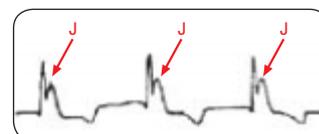

**Figure 11. Hyperkalemia****Figure 12. Hypokalemia**

### Hypothermia

- sinus bradycardia
- when severe, prolonged QRS and QT intervals
- AFib with slow ventricular response and other atrial/ventricular dysrhythmias
- Osborne J waves: “hump-like” waves at the junction of the J point and the ST segment

### Pericarditis

- early: diffuse ST segment elevation ± PR segment depression, upright T waves
- later: isoelectric ST segment, flat or inverted T waves
- ± tachycardia

**Figure 13. Osborne J waves of a hypothermic patient**

### Pacemakers

- Demand pacemaker has discharge (narrow vertical spike on ECG strip) prior to widened QRS
- Atrial pacemaker has discharge prior to P wave
- Triggered pacemaker has discharge following the P wave but prior to the widened QRS
- Atrial and ventricular pacing have discharge before the P wave and widened QRS wave

**Drug Effects**

- digitalis
  - therapeutic levels may be associated with “digitalis effect”
    - ◆ ST downsloping or “scooping”
    - ◆ T wave depression or inversion
    - ◆ QT shortening ± U waves
    - ◆ slowing of ventricular rate in AFib
    - ◆ toxic levels associated with
    - ◆ arrhythmias: paroxysmal atrial tachycardia (PAT) with conduction block, severe bradycardia in AFib, accelerated junctional rhythms, PVCs, ventricular tachycardia (see *Arrhythmias, C16*)
    - ◆ “regularization” of ventricular rate in AFib due to a junctional rhythm and AV dissociation
- amiodarone, quinidine, phenothiazines, tricyclic antidepressants, antipsychotics, some antihistamines, some antibiotics: prolonged QT interval, U waves

**Digitalis Side Effects**

Palpitations, fatigue, visual changes (yellow vision), decreased appetite, hallucinations, confusion, and depression

Figure 14. Atrial fibrillation, ST change due to digitalis (“digitalis effect”)

**Pulmonary Disorders**

- *cor pulmonale* (often secondary to COPD)
  - low voltage, right axis deviation (RAD), poor R wave progression in precordial leads
  - RAE and RVH with strain
  - multifocal atrial tachycardia (MAT)
- massive pulmonary embolism (PE)
  - sinus tachycardia and A. Fib/atrial flutter are the most common arrhythmias
  - RAD, RVH with strain
  - most specific sign is S1Q3T3 (S in I, Q and inverted T wave in III) but rather uncommon

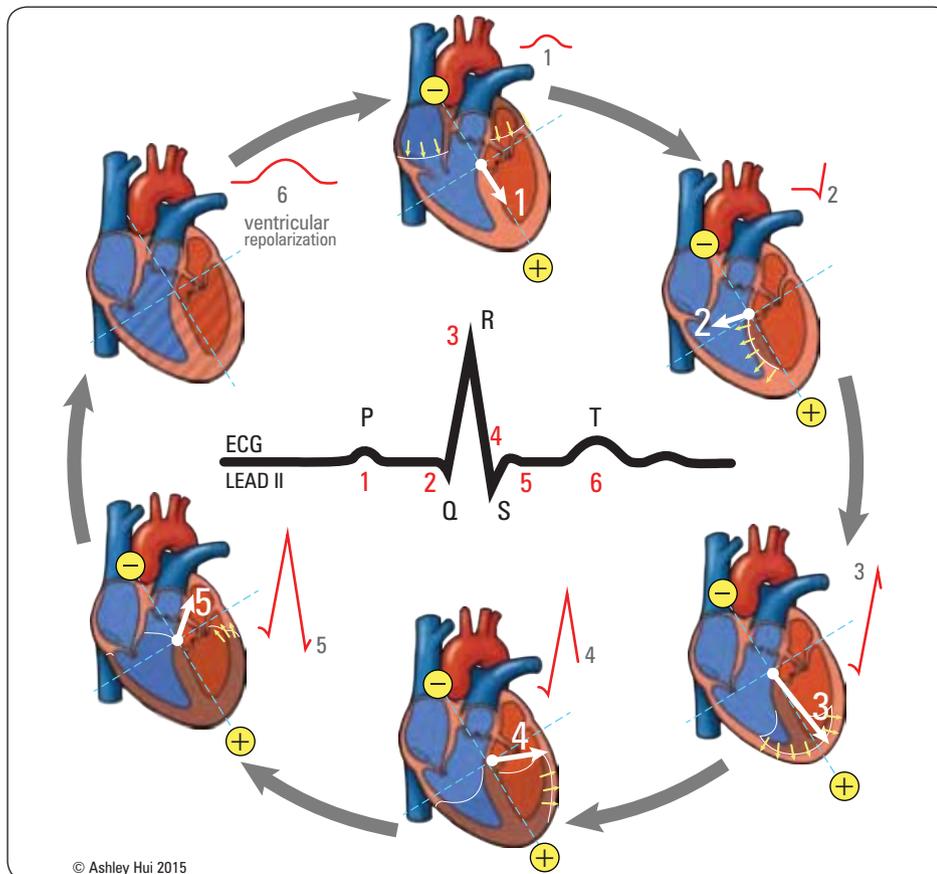

**Alternative PQRSTU Approach to ECGs**

Note: the information seen in this alternative approach – the PQRSTU Approach – is the same as the information in the Classical Approach; it is just organized in a different way based on the anatomy of the ECG

**PQRSTU approach to ECGs**

- P wave
- P-R interval
- QRS complex
- ST segment
- T wave
- Q-T interval
- U wave

© Ashley Hui 2015

Figure 15. ECG correlations with heart activity

## P WAVE

- the P wave represents atrial contraction; best leads: II, VI
  - lead II: the P wave should be rounded, <120 msec and <2.5 mm in height
  - lead VI: the P wave is biphasic with a negative phase slightly greater than the positive phase
- atrial flutter: sawtooth P wave (Hint: flip the ECG upside-down to see it better if unclear)
- atrial fibrillation: absent P wave, may have fibrillatory wave, irregular rhythm
- right atrial enlargement: tall P wave (>2.5 mm) in II or V1 (P pulmonale)
- left atrial enlargement: negative deflection >1 mm deep or >1 mm wide in V1, wide (>100 msec) notched P wave in II may be present (P mitrale)

## P-R INTERVAL

- the P-R interval shows the delay between atrial and ventricular contraction that is mediated by the AV node; the magnitude of the delay is referred to as “dromotropy”
- positive dromotropy increases conduction velocity (e.g. epinephrine stimulation), negative dromotropy decreases velocity (e.g. vagal stimulation)
- P-R interval should be 120-200 msec
- long P-R interval (>200 msec)
  - heart block
    - first degree: fixed, prolonged P-R interval
    - second degree Mobitz I/Wenckebach: steadily prolonging P-R interval to eventual dropped beat
    - second degree Mobitz II/Hay: fixed P-R interval with ratio of beat to dropped beat (e.g. for every 3 beats, there is one dropped beat [3:1])
    - third degree/complete: variable P-R intervals, P-P and R-R intervals individually constant but not in sync
  - atrial flutter
  - sinus bradycardia (normal to have long P-R if heart rate slow)
  - hypokalemia
  - “trifascicular” block -1st degree AV block with LAHF and complete RBBB
- short P-R interval (<120 msec)
  - pre-excitation syndrome (delta wave: upswinging of the P-R segment into the QRS complex indicating pre-excitation)
    - accessory pathways
    - WPW
  - low atrial rhythm

## QRS COMPLEX

- the QRS is where ventricular contraction is visualized
- rate: check the R-R interval to see if it matches the P-P interval
- amplitude: check for hypertrophy (see Table 2, C7)
- narrow width (<120 msec) QRS means that the His-Purkinje system is being used
- wide width (>120 msec) QRS means that the His-Purkinje system is being bypassed or is diseased
  - BBB, VT, ventricular hypertrophy, cardiomyopathy, WPW, ectopic ventricular beat, hyperkalemia, drugs (e.g. TCAs, antiarrhythmics)
- Q wave: the first downward deflection of the QRS complex
  - significant Q wave: >40 msec or >33% of total QRS amplitude; indicate myocardial necrosis (new or historical)
- R and S wave abnormalities typically show pathology in terms of BBB or intraventricular abnormalities

## ST SEGMENT

- located between QRS complex and the beginning of T wave
  - corresponds to the completion of ventricular depolarization
- normally at the same level as “baseline/TP segment”
- ST elevation: please see the infarct section above
- ST depression: ischemia
  - ischemia which causes ST depression can result in myocardial damage (NSTEMI)
  - lateral ST depression (leads I, aVL, V5, V6) may actually indicate a STEMI in the right heart

## T WAVE

- this is the repolarization phase of the ventricles (repolarization of the atria are obscured by the QRS complex)
- typically positive (except in aVR and V1) on ECG but normal isolated negative T waves may be present (esp. in V1 and V2)
- pathology when T wave variation occur in consecutive leads
  - inversion: BBB, ischemia, hypertrophy, drugs (e.g. digitalis), pulmonary embolism (lead III as part of S1Q3T3 sign)
  - elevation: infarction (STEMI, Prinzmetal, hyperacute), hyperkalemia (wider, peaked)
  - flattened: hypokalemia, pericarditis, drugs (e.g. digitalis), pericardial effusion
  - variations: T wave alternans; beat-to-beat variations due to PVC overlap (R on T phenomenon which may precipitate VT or VFib)
- appropriate T wave discordance: in BBB, T wave deflection should be opposite to that of the terminal QRS deflection (i.e. T wave negative if ends with R or R'; positive if ends with S)
  - inappropriate T wave concordance suggests ischemia or infarction

### Significant ECG Changes

- Look for ST changes starting at 60 msec from J point
- J point = the junction between the QRS complex and the ST segment
- ST elevation: at least 1 mm in 2 adjacent limb leads, or at least 1-2 mm in adjacent precordial leads
- ST depression: downsloping or horizontal
- Q Wave: pathological if Q wave  $\geq$  1 small square ( $\geq$ 40 msec) or >33% of the total QRS

### Insignificant Q Wave

- Septal depolarization by the left bundle
- Seen in leads I, II, III, aVL, V5, V6
- <40 msec

### Q-T INTERVAL

- this represents the duration of ventricular depolarization and repolarization and is often difficult to interpret
- corrected QT (QTc) is often used instead in practice to correct for the repolarization duration;  $QTc = QT \div \sqrt{RR}$
- normal QTc is 360-450 msec for males and 360-460 for females
  - increased (>450 msec for males and >460 for females): risk of Torsades de Pointes (a lethal tachyarrhythmia)
    - ♦ genetic Long QT Syndrome (often a channelopathy)
    - ♦ drugs: antibiotics, SSRIs, antipsychotics, antiarrhythmics
    - ♦ electrolytes: low  $Ca^{2+}$ , low  $Mg^{2+}$ , low  $K^+$
    - ♦ others: hypothyroidism, hypothermia, cardiomyopathy
  - decreased (<360 msec): risk of VFib
    - ♦ electrolytes: high  $Ca^{++}$
    - ♦ drugs: digoxin
    - ♦ others: hyperthyroidism

### U WAVE

- origin unclear but may be repolarization of Purkinje fibres or delayed/prolonged repolarization of the myocardium
- more visible at slower heart rates
- deflection follows T wave with <25% of the amplitude
- variations from norm could indicate pathologic conditions:
  - prominent (>25% of T wave): electrolyte (low  $K^+$ ), drugs (digoxin, antiarrhythmics)
  - inverted (from T wave): ischemia, volume overload

#### Differential Diagnosis of ST Segment Changes

##### ST Elevation I HELP A PAL

Ischemia with reciprocal changes  
 Hypothermia (Osborne waves)  
 Early repolarization (normal variant, need old ECGs to confirm)  
 LBBB  
 Post-MI  
 Acute STEMI  
 Prinzmetal's (Vasospastic) angina  
 Acute pericarditis (diffuse changes)  
 Left/right ventricular aneurysm

##### ST Depression WAR SHIP

WPW syndrome  
 Acute NSTEMI  
 RBBB/LBBB  
 STEMI with reciprocal changes  
 Hypertrophy (LVH or RVH) with strain  
 Ischemia  
 Post-MI

## Cardiac Biomarkers

- provide diagnostic and prognostic information in acute coronary syndromes and in heart failure

Table 4. Cardiac Enzymes

Enzyme	Peak	Duration Elevated	DDx of Elevation
Troponin I, Troponin T	1-2 d	Up to 2 wk	MI, CHF, AFib, acute PE, myocarditis, chronic renal insufficiency, sepsis, hypovolemia
CK-MB	1 d	3 d	MI, myocarditis, pericarditis, muscular dystrophy, cardiac defibrillation, chronic renal insufficiency, etc.

- check troponin I at presentation and 8 h later  $\pm$  creatine kinase-MB (CK-MB; depends on local laboratory protocol)
- new CK-MB elevation can be used to diagnose re-infarction
- other biomarkers of cardiac disease
  - AST and LDH also increased in MI (low specificity)
  - BNP and NT-proBNP: secreted by ventricles in response to increased end-diastolic pressure and volume
    - ♦ DDx of elevated BNP: CHF, AFib, PE, COPD exacerbation, pulmonary HTN

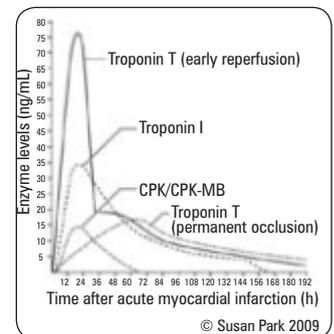

Figure 16. Cardiac enzymes

## Ambulatory ECG

- **description**
  - extended ambulatory ECG of 24 or 48 h or 14 or 30 d duration
  - provides a view of only two or three leads of electrocardiographic data over an extended period of time
  - permits evaluation of changing dynamic cardiac electrical phenomena that are often transient and of brief duration
  - **continuous loop:** a small, lightweight, battery operated recorder that records two or three channels of electrocardiographic data
    - ♦ patient activated event markers
    - ♦ minimum of 24-48 h
  - **implantable device:** subcutaneous monitoring device for the detection of cardiac arrhythmias
    - ♦ typically implanted in the left pectoral region and stores events when the device is activated automatically according to programmed criteria or manually with magnet application
    - ♦ can be used for months to years
- **indications**
  - evaluation of cardiac rhythm abnormalities
  - has also been used for assessing pacemaker and implantable cardioverter-defibrillator function, evidence of myocardial ischemia, late potentials, and heart rate variability
- **contraindications**
  - no absolute contraindications
  - patient refusal
  - allergies (sensitivities to latex adhesive)
- **risks:** no absolute risks

#### Use of B-Type Natriuretic Peptide in the Evaluation and Management of Acute Dyspnea (BASEL)

NEJM 2004;350:647-54

Study: Prospective, RCT.

**Population:** 452 patients (mean age 71 yr 58% male) with acute dyspnea; patients with severe renal disease or cardiogenic shock were excluded. Intervention: Assessment including measurement of B-type natriuretic peptide or standard assessment. **Outcome:** Time to discharge and total cost of treatment.

**Results:** Median time to discharge was significantly shorter in the intervention group when compared with the control group (8.0 vs. 11.0 d,  $p=0.001$ ). Total cost was also significantly lower in the intervention group (\$5410 vs. \$7264,  $p=0.006$ ). In addition, the measurement of B-type natriuretic peptide significantly reduced the need for admission to hospital and intensive care. The 30-d mortality rates were similar (10% vs. 12%,  $p=0.45$ ).

**Conclusions:** In patients with acute dyspnea, measurement of B-type natriuretic peptide improves clinical outcomes (need for hospitalization or intensive care) and reduces time to discharge and total cost of treatment.

## Echocardiography

### Transthoracic Echocardiography (TTE)

- **description:** ultrasound beams are directed across the chest wall to obtain images of the heart
- **indications**
  - evaluation of LVEF, wall motion abnormalities, myocardial ischemia and complications of MI
  - evaluation of chamber size, wall thickness, valve morphology, proximal great vessel morphology, pericardial effusion
  - evaluation of unexplained hypotension, murmurs, syncope, congenital heart disease

### Transoesophageal Echocardiography (TEE)

- **description:** invasive procedure used to complement transthoracic echocardiography
  - ultrasound probe inserted into the esophagus to allow for better resolution of the heart and structures
  - better visualization of posterior structures, including left atrium, mitral and aortic valves, inter-atrial septum
- **indications**
  - should be performed as the initial test in certain life-threatening situations, (e.g. aortic dissection) when other tests contraindicated (e.g. CT angiography in patient with renal failure)
  - intracardiac thrombi, tumours, valvular vegetations (infective endocarditis), aortic dissection, aortic atheromas, prosthetic valve function, shunt, technically inadequate transthoracic study
  - evaluation for left atrial/left atrial appendage thrombus in a patient with atrial fibrillation/atrial flutter to facilitate clinical decision making regarding electrical cardioversion or ablation
- **risks**
  - serious complications are extremely rare (<1 in 5,000)
  - esophageal perforation
  - gastrointestinal bleeding
  - pharyngeal hematoma

### Stress Echocardiography (SE)

- **description:** echocardiography using either exercise (treadmill or bicycle) or pharmacologic agents (dobutamine) as the stress mechanism
- **indications**
  - useful alternative to other stress imaging modalities
  - when ECG cannot be interpreted appropriately
  - intermediate pre-test probability with normal/equivocal exercise ECG
  - post-ACS when used to decide on potential efficacy of revascularization
  - to evaluate the clinical significance of valvular heart disease
  - evaluation of myocardial viability, dyspnea of possible cardiac origin, mitral valve disease, aortic stenosis, mitral regurgitation, pulmonary hypertension, patients with hypertrophic cardiomyopathy (for LVOT obstruction)
  - dobutamine
    - ♦ pharmacologic stress for patients who are physically unable to exercise; same indications as exercise stress echo
    - ♦ low dose dobutamine stress echo can be used to assess myocardial viability and for assessing aortic stenosis with LV systolic dysfunction
- **contraindications**
  - contraindications to exercise testing
  - contraindications to dobutamine stress echocardiography: tachyarrhythmias and systemic hypertension
  - AAA has been considered as a relative contraindication to exercise testing or dobutamine stress echocardiography

### Contrast Echocardiography with Agitated Saline Contrast

- **description:** improves resolution and provides real-time assessment of intracardiac blood flow
  - conventional agent is agitated saline (contains microbubbles of air)
  - allows visualization of right heart and intracardiac shunts, most commonly patent foramen ovale (PFO) and intrapulmonary shunt

### Contrast Echocardiography with Transpulmonary Contrast Agents

- **description:** newer contrast agents are capable of crossing the pulmonary bed and achieving left heart opacification following intravenous injection; these contrast agents improve visualization of endocardial borders and enhance evaluation of LV ejection fraction and wall motion abnormalities (in patients with technically inadequate echocardiograms), and intracardiac mass
- **risks**
  - risk of non-fatal MI and death are rare
  - ultrasound contrast agents may cause back pain, headache, urticaria, and anaphylaxis

## Stress Testing

### EXERCISE TESTING

- **description:** cardiovascular stress test that uses treadmill or bicycle exercise with electrocardiographic and blood pressure monitoring
- **indications**
- patients with intermediate (10-90%) pretest probability of CAD based on age, gender, and symptoms
- ST depression <1 mm at rest, no left bundle branch block, no digoxin or estrogen use
- exercise test results stratify patients into risk groups
  1. low risk patients can be treated medically without invasive testing
  2. intermediate risk patients may need additional testing in the form of exercise imaging studies or cardiac catheterization
  3. high risk patients should be referred for cardiac catheterization
- **contraindications**
  - acute myocardial infarction (within two days)
  - unstable angina pectoris
  - uncontrolled arrhythmias causing symptoms of hemodynamic compromise
  - symptomatic severe valvular stenosis
  - uncontrolled symptomatic heart failure
  - active endocarditis or acute myocarditis or pericarditis
  - acute aortic dissection
  - acute pulmonary or systemic embolism
  - acute non-cardiac disorders that may affect exercise performance or may be aggravated by exercise
  - termination of exercise testing
    - ◆ patient's desire to stop
    - ◆ drop in systolic blood pressure of >10 mmHg from baseline despite an increase in workload, when accompanied by other evidence of ischemia
    - ◆ moderate to severe angina
    - ◆ ST elevation (>1 mm) in leads without diagnostic Q-waves (other than V1 or aVR)
    - ◆ increasing nervous system symptoms (e.g. ataxia, dizziness, or near syncope)
    - ◆ signs of poor perfusion (cyanosis or pallor)
    - ◆ technical difficulties in monitoring ECG or systolic blood pressure
    - ◆ sustained ventricular tachycardia
- **risks:** death, myocardial infarction, arrhythmia, hemodynamic instability, and orthopedic injury (<1-5/10,000 supervised tests)

### NUCLEAR CARDIOLOGY

- **description**
  - myocardial perfusion imaging (MPI) with ECG-gated single photon emission computed tomography (SPECT), using radiolabelled tracer
  - evaluates myocardial viability, detects ischemia, and assesses perfusion and LV function simultaneously
  - predicts the likelihood of further cardiac event rates independent of the patient's history, examination, resting ECG, and stress ECG
  - often denoted as MIBI scan with reference to radiolabelled tracer (sestamibi)
  - stress with either treadmill or IV vasodilator stress (dipyridamole, adenosine, regadenoson)
  - images of the heart obtained during stress and at rest 3-4 h later
  - tracers
    - ◆ Thallium-201 ( $^{201}\text{Tl}$ , a  $\text{K}^+$  analogue)
    - ◆ Technetium-99 ( $^{99}\text{Tc}$ )-labeled tracer (sestamibi/Cardiolite® or hexamibi/Myoview®)
- **indications**
  - exercise MPI
    - ◆ when ECG cannot be interpreted appropriately
    - ◆ intermediate pre-test probability with normal/equivocal exercise ECG
    - ◆ in patients with previous imaging whose symptoms have changed
    - ◆ to diagnose ischemia
  - dipyridamole/adenosine MPI
  - to diagnose CAD in possible ACS patients with non-diagnostic ECG and negative serum biomarkers
  - when ECG is cannot be interpreted appropriately due to LBBB or V-paced rhythm among patients unable to exercise, with the same indications as exercise MPI
- **contraindications**
  - contraindications to exercise testing
  - vasodilators (i.e. adenosine, regadenoson, and dipyridamole) are contraindicated in patients with hypotension, sick sinus syndrome, high-degree AV block (in the absence of backup pacemaker capability), and reactive airways disease
  - pregnancy
- **risks:** radiation exposure

### STRESS ECHOCARDIOGRAPHY

- see *Echocardiography*, C12

#### Most Commonly Used Treadmill Stress Test Protocols

- The Bruce Protocol: 7 stage test with each stage lasting 3 min. With each successive stage, the treadmill increases in both speed (2.7 km/h to 9.6 km/h) and grade (10% with a 2% increase per stage up to 22%)
- The Modified Bruce, Modified Naughton Protocol: for older individuals or those with limited exercise capacity

#### Important Contraindications to Exercise Testing

- Acute MI, aortic dissection, pericarditis, myocarditis, PE
- Severe AS, arterial HTN
- Inability to exercise adequately

#### Important Prognostic Factor

Duke Treadmill Score (DTS)

Weighted Index Score

- Treadmill exercise time using standard Bruce protocol
- Maximum net ST segment deviation (depression or elevation)
- Exercise-induced angina provides diagnostic and prognostic information (such as 1 yr mortality)

DTS = exercise time – (5 x MaxST) – (4 x angina index)

Angina index: 0 (no angina), 1 (angina but not exercise-limiting), 2 (exercise-limiting angina)

DTS ≥5: 0.25% 1 yr mortality

DTS 4 to -10: 1.25% 1 yr mortality

DTS ≤ -11: 5.25% 1 yr mortality

Ann Intern Med 1987;106:793-800

Patients with normal imaging (nuclear perfusion or stress echo) studies at peak stress have a <1%/yr incidence of death or nonfatal MI and are thus often spared further invasive evaluation

## Cardiac Catheterization and Angiography

### Right Heart Catheterization (Swan-Ganz Catheter)

- **description:** also known as pulmonary artery catheterization
  - obtain direct measurements of central venous, right-sided intracardiac, pulmonary artery, and pulmonary artery occlusion pressures
  - can estimate cardiac output, systemic and pulmonary vascular resistance as well as mixed venous oxyhemoglobin saturation, oxygen delivery, and oxygen uptake
  - right atrial, right ventricular, and pulmonary artery pressures are recorded
  - can also be used to measure the Cardiac Index (CI)
    - ♦  $CI = CO/\text{body surface area}$
    - ♦ cardiac index is a measure of cardiac function
    - ♦  $<1.8 \text{ L/min/m}^2$  usually means cardiogenic shock
    - ♦  $2.6\text{--}4.2 \text{ L/min/m}^2$  is considered normal
  - pulmonary capillary wedge pressure (PCWP)
    - ♦ obtained by advancing the catheter to wedge in the distal pulmonary artery
    - ♦ records pressure measured from the pulmonary venous system
    - ♦ in the absence of pulmonary venous disease reflects left atrial pressure
- **indications**
  - unexplained or unknown volume status in shock
  - severe cardiogenic shock (e.g. acute valvular disease, suspected pericardial tamponade)
  - suspected or known pulmonary artery hypertension
  - severe underlying cardiopulmonary disease (e.g. congenital heart disease, left-to-right shunt, severe valvular disease, pulmonary hypertension) and undergoing corrective or other surgery
- **contraindications**
  - lack of consent
  - infection at the insertion site
  - the presence of a right ventricular assist device
  - insertion during cardiopulmonary bypass
- **risks**
  - complications for diagnostic catheterization  $<1\%$
  - inadequate diagnostic procedures occur in  $<1\%$  of cases
  - complications of insertion: atrial and/or ventricular arrhythmias ( $\sim 3\%$  of patients)
  - catheter misplacement or knotting (uncommon)
  - perforation of a cardiac chamber and rupture of a cardiac valve or the pulmonary artery (rare)
  - complications of catheterization: pulmonary artery rupture, pulmonary infarction, thromboembolic events, infection, and data misinterpretation
  - within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

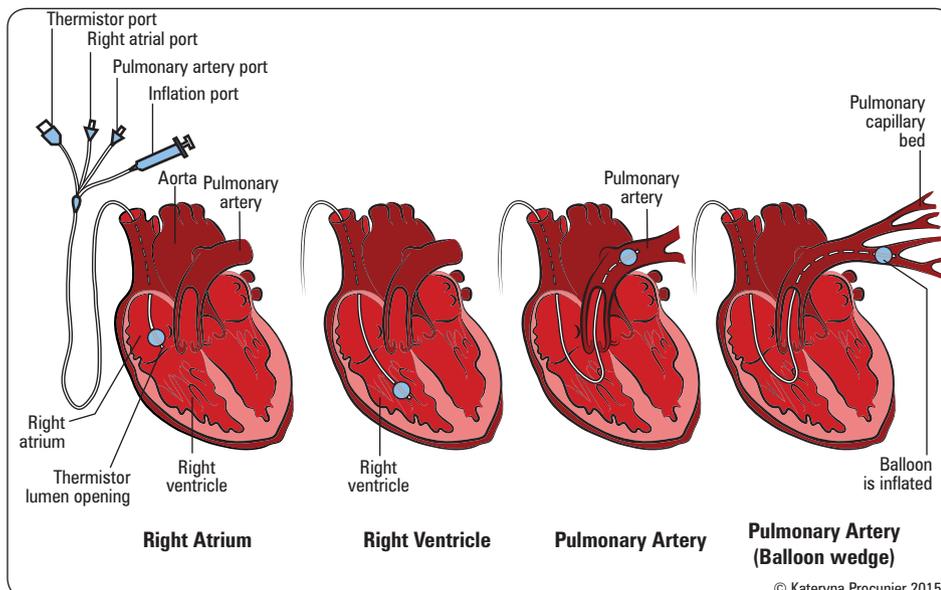

Figure 17. Swan-Ganz catheter placement

## Left Heart Catheterization

### • description

- accomplished by introducing a catheter into the brachial or femoral artery and advancing it through the aorta, across the aortic valve, and into the left ventricle
- evaluates mitral and aortic valvular defects and myocardial disease
- systolic and end-diastolic pressure tracings recorded
- LV size, wall motion and ejection fraction can be assessed by injecting contrast into the LV (left ventriculography) via femoral/radial artery catheterization
- cardiac output (measured by the Fick oxygen method or the indicator dilution method)

### • indications

- identification of the extent and severity of CAD and evaluation of left ventricular function
- assessment of the severity of valvular or myocardial disorders (e.g. aortic stenosis or insufficiency, mitral stenosis or insufficiency, and various cardiomyopathies) to determine the need for surgical correction
- collection of data to confirm and complement noninvasive studies
- determination of the presence of CAD in patients with confusing clinical presentations or chest pain of uncertain origin

### • contraindications

- severe uncontrolled hypertension
- ventricular arrhythmias
- acute stroke
- severe anemia
- active gastrointestinal bleeding
- allergy to radiographic contrast
- acute renal failure
- uncompensated congestive failure (so that the patient cannot lie flat)
- unexplained febrile illness or untreated active infection
- electrolyte abnormalities (e.g. hypokalemia)
- severe coagulopathy

### • risks

- complications for diagnostic catheterization <1%
- inadequate diagnostic procedures occur in <1% of cases
- within 24 h of catheterization: death, MI, or stroke (0.2% to 0.3% of patients)

Chambers	Pressure (systolic; mmHg)
Right atrium/central venous	1-8
Right ventricle	1-8 (15-30)
Pulmonary artery	4-12 (15-30)
Left atrium/ pulmonary capillary wedge	4-12
Left ventricle end diastolic	4-12

## Coronary Angiography

### • description

- radiographic visualization of the coronary vessels after injection of radiopaque contrast media
- coronary vasculature accessed via the coronary ostia

### • indications

- to define the coronary anatomy and the degree of luminal obstruction of the coronary arteries
- to determine the presence and extent of obstructive CAD
- to assess the feasibility and appropriateness of various forms of therapy, such as revascularization by percutaneous or surgical interventions
- can also be used when the diagnosis of CAD is uncertain and CAD cannot be reasonably excluded by noninvasive techniques

### • contraindications: severe renal failure (due to contrast agent toxicity – must check patient's renal status)

### • risks: major complications <2%, but increased in patients with pre-existing renal failure (especially in diabetic patients)

### ACC/AHA 2011 Recommended Indications for Coronary Angiography

- Disabling (CCS classes III and IV) chronic stable angina despite medical therapy
- High-risk criteria on clinical assessment or non-invasive testing
- Serious ventricular arrhythmia or CHF
- Uncertain diagnosis or prognosis after non-invasive testing
- Inability to undergo non-invasive testing

### Coronary Angiography

Gold standard for localizing and quantifying CAD

Hemodynamically significant stenosis is defined as 70% or more narrowing of the luminal diameter

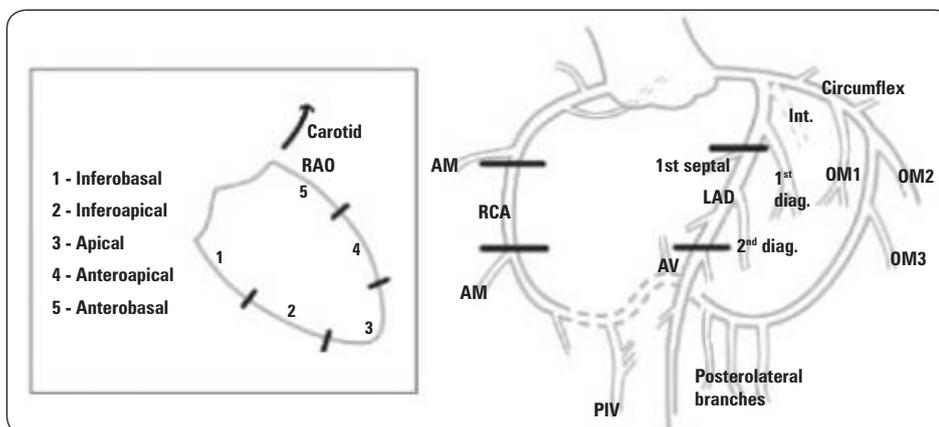

Figure 18. Coronary angiogram schematic

AM = acute marginal; LAD = left anterior descending; OM = obtuse marginal; RCA = right coronary artery

### Diagnostic Catheterization

- complications for diagnostic catheterization <1%
- inadequate diagnostic procedures occur in fewer than 1% of cases
- provocative pharmacological agents can be used to unmask pathology
  - fluid loading may unmask latent pericardial constriction
  - afterload reduction or inotropic stimulation may be used to increase the outflow tract gradient in HCM
  - coronary vasoreactive agents (e.g. methylergonovine, acetylcholine)
  - a variety of pulmonary vasoreactive agents in primary pulmonary HTN (e.g. oxygen, calcium channel blockers, adenosine, nitric oxide, or prostacyclin)

## Contrast-Enhanced CT Coronary Angiography

- **description:** fast ECG-synchronized multi-slice CT image acquisition in the heart to enable non-invasive imaging of the coronary arterial tree
- **indications:** often used to assess coronary artery and previous graft stenosis/viability that could not be seen during coronary angiography
- sensitivity = 85%, specificity = 90% for the diagnosis of obstructive coronary disease with >50% stenosis
- **contraindications:** allergy to contrast dye; severe renal dysfunction
- **risks:** radiation exposure

## Magnetic Resonance Imaging

- **description:** offers high spatial resolution, eliminates the need for iodinated contrast, and does not involve exposure to ionizing radiation
- **indications:** valuable in assessment of congenital cardiac anomalies, abnormalities of the aorta, assessment of viable myocardium, and assessment of cardiomyopathies
- **contraindications:** metallic foreign bodies/implants
- **risks:** hazards posed by certain metallic devices inside patients

# CARDIAC DISEASE

## Arrhythmias

### Mechanisms of Arrhythmias

#### Alterations in Impulse Formation

##### A. Abnormal Automaticity

- automaticity is a property of certain cardiomyocytes to spontaneously depolarize to their threshold voltage to generate action potentials in a rhythmic fashion
- under normal circumstances only cells in the specialized conduction system (SA node, AV node, and ventricular conduction system) exhibit natural automaticity. These cells are pacemaking cells. The automaticity of these cells can become abnormally increased or decreased
- in disease (e.g. post-MI ventricular ischemia) cells in the myocardium outside the conduction system may inappropriately acquire the property of automaticity and contribute to abnormal depolarization. If these ectopic generators depolarize at a rate greater than the SA node, they assume pacemaking control and become the source of abnormal rhythm
- automaticity can be influenced by:
  - ◆ neurohormonal tone (sympathetic and parasympathetic stimulation)
  - ◆ abnormal metabolic conditions (hypoxia, acidosis, hypothermia)
  - ◆ electrolyte abnormalities
  - ◆ drugs (e.g. digitalis)
  - ◆ local ischemia/infarction
  - ◆ other cardiac pathology
- this mechanism is responsible for the accelerated idioventricular rhythm and ventricular tachycardia that often occurs 24-72 h post MI

##### B. Triggered Activity due to Afterdepolarizations

###### 1. Early Afterdepolarizations

- occur in the context of action potential prolongation
- consequence of the membrane potential becoming more positive during repolarization (e.g. not returning to baseline)
- result in self-maintaining depolarizing oscillations of action potential, generating a tachyarrhythmia (e.g. new baseline voltage is greater than threshold, which automatically triggers a new action potential after the refractory period ends)
- basis for the degeneration of QT prolongation, either congenital or acquired, into Torsades de Pointes

##### Sinus Arrhythmia (SA)

- Normal P waves, with variation of the P-P interval by > 120 msec due to varying rate of SA node

##### Respiratory SA

- Seen more often in young adults (<30 yr old)
- Normal, results from changes in autonomic tone during respiratory cycle
- Rate increases with inspiration, slows with expiration

##### Non-Respiratory SA

- Seen more often in the elderly
- Can occur in the normal heart; if marked may be due to sinus node dysfunction (e.g. in heart disease, or after digitalis toxicity)
- Usually does not require treatment

## 2. Delayed Afterdepolarizations

- occur after the action potential has fully repolarized, but before the next usual action potential, thus called a delayed afterdepolarization
- commonly occurs in situations of high intracellular calcium (e.g. digitalis intoxication, ischemia) or during enhanced catecholamine stimulation (e.g. "twitchy" pacemaker cells)

## Alterations in Impulse Conduction

### A. Re-Entry Circuits

- the presence of self-sustaining re-entry circuit causes rapid repeated depolarizations in a region of myocardium (see Figure 26, C20, for an example in the context of AV nodal re-entrant tachycardia)
  - e.g. myocardium that is infarcted/ischemic will consist of non-excitabile and partially excitabile zones which will promote the formation of re-entry circuits

### B. Conduction Block

- ischemia, fibrosis, trauma, and drugs can cause transient, permanent, unidirectional or bidirectional block
- most common cause of block is due to refractory myocardium (cardiomyocytes are in refractory period or zone of myocardium unexcitable due to fibrosis)
- if block occurs along the specialized conduction system distal zones of the conduction system can assume pacemaking control
- conduction block can lead to bradycardia or tachycardia when impaired conduction leads to re-entry phenomenon

### C. Bypass Tracts

- normally the only conducting tract from the atria to the ventricles is the AV node into the His-Purkinje system
- congenital/acquired accessory conducting tracts bypass the AV node and facilitate premature ventricular activation before normal AV node conduction
- see *Pre-Excitation Syndromes, C21*

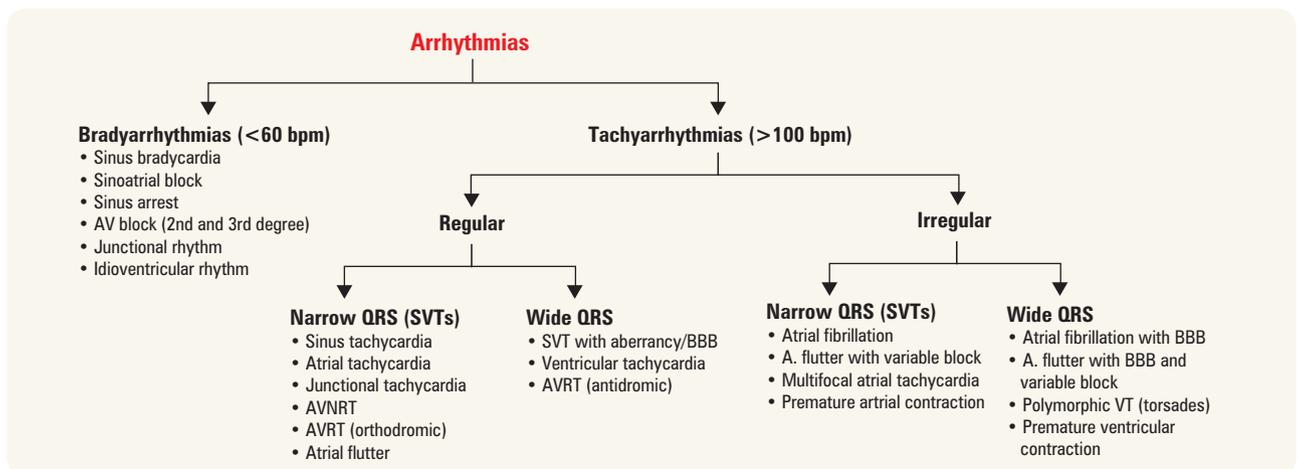

Figure 19. Clinical approach to arrhythmias

Bradyarrhythmias  
• Examples

## Bradyarrhythmias

### 1. SA NODAL DYSFUNCTION

#### A. Sinus Bradycardia

P axis normal (P waves positive in I and aVF)  
Rate <60 bpm ; marked sinus bradycardia (<50 bpm)  
May be seen in normal adults, particularly athletes, and in elderly individuals  
Increased vagal tone or vagal stimulation; drugs ( $\beta$ -blockers, calcium channel blockers, etc.); ischemia/infarction

Atropine; pacing for sick sinus syndrome

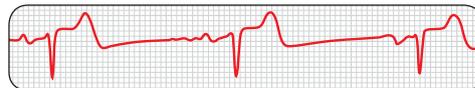

Figure 20. Sinus bradycardia

### 2. AV CONDUCTION BLOCKS

#### A. First Degree AV Block

Prolonged PR interval (>200 msec)  
Frequently found among otherwise healthy adults

No treatment required

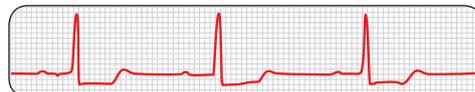

Figure 21. First degree AV block

#### B. Second Degree AV Block: Type I (Mobitz I)

A gradual prolongation of the PR interval precedes the failure of conduction of a P wave (Wenckebach phenomenon)  
AV block is usually in AV node (proximal) triggers (usually reversible): increased vagal tone (e.g. following surgery), RCA-mediated ischemia

Figure 22. Second degree AV block with Wenckebach phenomenon (Mobitz I) (4:3 conduction) (lead V1)

#### B. Second Degree AV Block: Type II (Mobitz II)

The PR interval is constant; there is an abrupt failure of conduction of a P wave  
AV block is usually distal to the AV node (i.e. bundle of His); increased risk of high grade or 3rd degree AV block

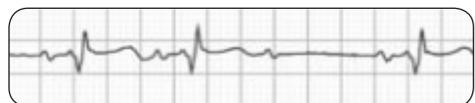

Figure 23. Second degree AV block (Mobitz II) (3:2 conduction) (lead V1)

#### B. Third Degree AV Block

Complete failure of conduction of the supraventricular impulses to the ventricles; ventricular depolarization initiated by an escape pacemaker distal to the block  
Wide or narrow QRS, P-P and R-R intervals are constant, variable PR intervals; no relationship between P waves and QRS complexes (P waves "marching through")

Management (see [Electrical Pacing, C24](#))

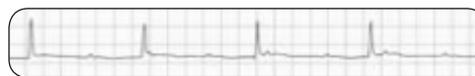

Figure 24. Third degree AV block (complete heart block) (lead II)

## Supraventricular Tachyarrhythmias

Tachyarrhythmias  
• Examples

### Presentation for SVT (and Pre-Excitation Syndromes)

- presentation can include: palpitations, dizziness, dyspnea, chest discomfort, presyncope/syncope
- may precipitate CHF, hypotension, or ischemia in patients with underlying disease
- untreated tachycardias can cause cardiomyopathy (rare, potentially reversible with treatment of SVTs)
- includes supraventricular and ventricular rhythms

### Supraventricular Tachyarrhythmias

- tachyarrhythmias that originate in the atria or AV junction
- this term is used when a more specific diagnosis of mechanism and site of origin cannot be made
- characterized by narrow QRS, unless there is pre-existing bundle branch block or aberrant ventricular conduction (abnormal conduction due to a change in cycle length)

#### 1. Sinus Tachycardia

- sinus rhythm with rate >100 bpm
- occurs in normal subjects with increased sympathetic tone (e.g. exercise, emotions, pain), alcohol use, caffeinated beverages, drugs (e.g.  $\beta$ -adrenergic agonists, anticholinergic drugs, etc.)
- etiology: fever, hypotension, hypovolemia, anemia, thyrotoxicosis, CHF, MI, shock, PE, etc.
- treatment: treat underlying disease; consider  $\beta$ -blocker if symptomatic, calcium channel blocker if  $\beta$ -blockers contraindicated

## 2. Premature Beats

- premature atrial contraction
  - ectopic supraventricular beat originating in the atria
  - P wave morphology of the PAC usually differs from that of a normal sinus beat
- junctional premature beat
  - ectopic supraventricular beat that originates in the vicinity of the AV node
  - P wave is usually not seen or an inverted P wave is seen and may be before or closely follow the QRS complex (referred to as a retrograde, or “traveling backward” P wave)
- treatment usually not required

## 3. Atrial Flutter

- rapid, regular atrial depolarization from a macro re-entry circuit within the atrium (most commonly the right atrium)
- atrial rate 250-350 bpm, usually 300 bpm
- AV block usually occurs; it may be fixed (2:1, 3:1, 4:1, etc.) or variable
- etiology: CAD, thyrotoxicosis, mitral valve disease, cardiac surgery, COPD, PE, pericarditis
- ECG: sawtooth flutter waves (most common type of flutter) in inferior leads (II, III, aVF); narrow QRS (unless aberrancy); commonly see HR of 150
- in atrial flutter with 2:1 block, carotid sinus massage (first check for bruits), Valsalva maneuver, or adenosine may decrease AV conduction and bring out flutter waves
- treatment of acute atrial flutter
  - acute and if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if unstable (e.g. hypotension, CHF, angina): electrical cardioversion
  - if stable
    - rate control:  $\beta$ -blocker, diltiazem, verapamil, or digoxin
    - chemical cardioversion: sotalol, amiodarone, type I antiarrhythmics, or electrical cardioversion
  - anticoagulation guidelines same as for patients with AFib
- treatment of long-term atrial flutter: antiarrhythmics, catheter radiofrequency (RF) ablation (success rate dependent on site of origin of atrial flutter – i.e. whether right-sided isthmus-dependent or left-sided origin)

## 4. Multifocal Atrial Tachycardia (MAT)

- irregular rhythm caused by presence of 3 or more atrial foci (may mimic AFib)
- atrial rate 100-200 bpm – 3 or more distinct P wave morphologies and PR intervals vary, some P waves may not be conducted
- occurs more commonly in patients with COPD, and hypoxemia; less commonly in patients with hypokalemia, hypomagnesemia, sepsis, theophylline, or digitalis toxicity
- treatment: treat the underlying cause; calcium channel blockers may be used (e.g. diltiazem, verapamil),  $\beta$ -blockers may be contraindicated because of severe pulmonary disease
- no role for electrical cardioversion, antiarrhythmics, or ablation

## 5. Atrial Fibrillation

- see *CCS Atrial Fibrillation Guidelines 2014* for details (free mobile app – iCCS available on iOS and Android)
- most common sustained arrhythmia
- incidence increases with age (10% of population >80 yr old)
- symptoms: palpitations, fatigue, syncope, may precipitate or worsen heart failure
- classification**
  - lone: occurs in persons younger than 60 yr and in whom no clinical or echocardiographic causes are found
  - nonvalvular: not caused by valvular disease, prosthetic heart valves, or valve repair
  - paroxysmal: episodes that terminate spontaneously
  - persistent: AFib sustained for more than 7 d or AFib that terminates only with cardioversion
  - permanent/chronic: continuous AFib that is unresponsive to cardioversion or in which clinical judgement has led to a decision not to pursue cardioversion
  - recurrent: two or more episodes of AFib
  - secondary: caused by a separate underlying condition or event (e.g. myocardial infarction, cardiac surgery, pulmonary disease, hyperthyroidism)
  - may be associated with thromboembolic events (stroke risk can be assessed by CHADS2 score in nonvalvular AFib; CHA2DS2-VASc if the former gives a score of 0 or 1)
- initiation**
  - single circuit re-entry and/or ectopic foci act as aberrant generators producing atrial tachycardia (350-600 bpm)
  - impulses conduct irregularly across the atrial myocardium to give rise to fibrillation
  - in some cases, ectopic foci have also been mapped to the pulmonary vein ostia and can be ablated
- maintenance**
  - the tachycardia causes atrial structural and electrophysiological remodelling changes that further promote AFib; the longer the patient is in AFib the more difficult it is to convert back to sinus rhythm
- consequences**
  - the AV node irregularly filters incoming atrial impulses producing an irregular ventricular response of <200 bpm and the tachycardia leads to suboptimal cardiac output
  - fibrillatory conduction of the atria promotes blood stasis increasing the risk of thrombus formation – AFib is an important risk factor for stroke

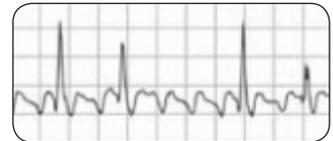

Figure 25. Atrial flutter with variable block

### Atrial Fibrillation – AFFIRM Trial

*NEJM* 2002;347:1825-1833

**Study:** Randomized, multicentre trial with mean follow-up of 3.5 yr.

**Population:** 4,060 patients (mean age 70 yr, 61% male, 89% white) with AF and a high risk of stroke or death.

**Intervention:** Rate control ( $\beta$ -blockers, calcium channel blockers, or digoxin alone or in combination) vs. rhythm control (antiarrhythmic drug chosen by the treating physician).

**Primary Outcome:** All cause mortality.

**Results:** There was no difference in mortality or disabling stroke, anoxic encephalopathy, major bleeding, and cardiac arrest between the two groups. There were more incidents of hospitalizations (80.1% vs. 73%,  $p < 0.001$ ) and adverse events (Torsades de Pointes (12 vs. 2,  $p = 0.007$ ), pulseless or bradycardic arrest (9 vs. 1,  $p = 0.01$ ), pulmonary event (108 vs. 24,  $p < 0.001$ ), gastrointestinal event (127 vs. 35,  $p < 0.001$ ), prolonged QT interval (31 vs. 4,  $p < 0.001$ ), bradycardia (105 vs. 64,  $p = 0.001$ ) in the rhythm-control group.

**Conclusion:** Rate-control was as effective as rhythm-control in AF and was better tolerated. There were more hospitalization incidents in the rhythm-control group.

**Table 5. CHADS2 Risk Prediction for Non-Valvular AFib and Refer to AHA/ACC/HRS AFib Guidelines 2014 for more details**

Risk Factor	Points	CHADS2 Score	Stroke Risk (%/Yr)
Congestive Heart Failure	1	0	1.9 (low)
Hypertension	1	1	2.8 (low-mod)
Age >75	1	2-3	4.0-5.9 (mod)
Diabetes	1	4-6	8.5-18.2 (high)
Stroke/TIA (prior)	2		

JAMA 2001;285:2864-70 and Can J Cardiol 2014 Oct;30(10):1114-30.

### • ECG findings

- no organized P waves due to rapid atrial activity (350-600 bpm) causing a chaotic fibrillatory baseline
- irregularly irregular ventricular response (typically 100-180 bpm), narrow QRS (unless aberrancy or previous BBB)
- wide QRS complexes due to aberrancy may occur following a long-short cycle sequence ("Ashman phenomenon")
- loss of atrial contraction, thus no "a" wave seen in JVP, no S4 on auscultation

Figure 26. Atrial fibrillation (lead II)

### • management (adapted from CCS Atrial Fibrillation Guidelines 2012 & 2014)

- major objectives (RACE):** all patients with AF (paroxysmal, persistent, or permanent), should be stratified using a predictive index for stroke risk and for the risk of bleeding, and most patients should receive either an oral anticoagulant or ASA (see below)
  - Rate control:  $\beta$ -blockers, diltiazem, verapamil (in patients with heart failure: digoxin, amiodarone)
  - Anticoagulation: use either warfarin or direct oral anticoagulant (DOACs) e.g. apixaban, dabigatran, rivaroxaban to prevent thromboembolism
    - for patients with non-valvular AF (NVAf): oral anticoagulant (OAC) is recommended for most patients aged > 65 years or CHADS2  $\geq$  1. ASA 81 mg is recommended only for patients with none of the risk outlined in the CCS algorithm (age <65 and no CHADS2 risk factors) who have arterial disease (coronary, aortic, or peripheral). Novel oral anticoagulant (NOAC) is to be used in preference to warfarin
  - Cardioversion (electrical)
    - if AFib <24-48 h, can usually cardiovert without anticoagulation
    - if AFib >24-48 h, anticoagulate for 3 wk prior and 4 wk after cardioversion due to risk of unstable intra-atrial thrombus
    - if patient unstable (hypotensive, active angina due to tachycardia, uncontrolled heart failure) should cardiovert immediately
  - Etiology
    - HTN, CAD, valvular disease, pericarditis, cardiomyopathy, myocarditis, ASD, post-operative, PE, COPD, thyrotoxicosis, sick sinus syndrome, alcohol ("holiday heart")
    - may present in young patients without demonstrable disease ("lone AFib") and in the elderly without underlying heart disease
- studies of patients with AFib suggest that there is no difference in long-term survival when treating patients with a rhythm-control versus rate-control strategy
- however, many patients with a significant underlying structural heart lesion (e.g. valve disease, cardiomyopathy) will not tolerate AFib well (since may be dependent on atrial kick) and these patients should be cardioverted (chemical or electrical) as soon as possible
- newly discovered AFib**
  - anticoagulants may be beneficial if high risk for stroke
  - if the episode is self-limited and not associated with severe symptoms, no need for antiarrhythmic drugs
  - if AFib persists, 2 options
    - rate control and anticoagulation (as indicated above)
    - cardioversion (as above)
- recurrent or permanent AFib
  - if episodes are brief or minimally symptomatic, antiarrhythmic drugs may be avoided; rate control and anticoagulation are appropriate
  - patients who have undergone at least one attempt to restore sinus rhythm may remain in AFib after recurrence; permanent AFib may be accepted (with rate control and antithrombotics as indicated by CHADS2 score) in certain clinical situations
  - if symptoms are bothersome or episodes are prolonged, antiarrhythmic drugs should be used
    - no or minimal heart disease: flecainide, propafenone, or sotalol
    - LV dysfunction: amiodarone
    - CAD:  $\beta$ -blockers, amiodarone

### Lenient versus Strict Rate Control in Patients with Atrial Fibrillation

NEJM 362:1363-1373

**Study:** Randomized, multi-centre Netherlands prospective study, follow up for at least 2 yr  
**Population:** 614 patients with permanent atrial fibrillation.

**Intervention:** Lenient control (resting HR <110 bpm) or strict control (resting HR <80 bpm)

**Primary Outcomes:** Death from cardiovascular causes, hospitalization for heart failure, and stroke, systemic embolism, bleeding, and life-threatening arrhythmic events.

**Results:** Goal of the study was to establish whether lenient control was equivalent to strict control for prevention of primary outcomes. Resulting hazard ratios were not significantly different between the treatment groups ( $P = 0.001$ ). Frequencies of hospitalization and adverse effects were also similar. More patients were able to maintain lenient targets (97.7%) compared to strict targets (67%).

**Conclusion:** Lenient control was equivalent to strict control for prevention of primary outcomes in patients with atrial fibrillation. Furthermore, lenient control was more easily achieved.

### Rivaroxaban for Stroke Prevention in AFib – ROCKET-AF Trial

NEJM 2011;365:883-891

**Study:** Prospective, non-inferiority, double blind, RCT, median follow-up of 1.9 yr.

**Population:** 14,264 patients with AFib (mean CHADS2=3.5). Patients either had previous thromboembolism or  $\geq$ 3 risk factors.

**Intervention:** Patients were randomized to receiving rivaroxaban or warfarin.

**Outcome:** Composite of strokes and systemic thromboembolic event (STE).

**Results:** The hazard ratio of the primary outcome for rivaroxaban compared to warfarin was 0.88; 95% CI 0.74-1.03;  $p < 0.001$  for noninferiority;  $p = 0.12$  for superiority. Furthermore, the hazard ratio for major and non-major, but clinically relevant, bleeding was 1.03; 95% CI 0.96-1.11;  $p = 0.44$ . There were also significant reductions in intracranial hemorrhage (0.5% vs. 0.7%,  $p = 0.02$ ) and fatal bleeding (0.2% vs. 0.5%,  $p = 0.003$ ) for rivaroxaban.

**Conclusions:** In patients with AFib, rivaroxaban is non-inferior to warfarin for stroke prevention and major and non-major bleeding.

### Rivaroxaban for Stroke Prevention in AFib – ROCKET-AF Trial

NEJM 2011;365:883-891

**Study:** Prospective, non-inferiority, double blind, RCT, median follow-up of 1.9 yr.

**Population:** 14,264 patients with AFib (mean CHADS2=3.5). Patients either had previous thromboembolism or  $\geq$ 3 risk factors.

**Intervention:** Patients were randomized to receiving rivaroxaban or warfarin.

**Outcome:** Composite of strokes and systemic thromboembolic event (STE).

**Results:** The hazard ratio of the primary outcome for rivaroxaban compared to warfarin was 0.88; 95% CI 0.74-1.03;  $p < 0.001$  for noninferiority;  $p = 0.12$  for superiority. Furthermore, the hazard ratio for major and non-major, but clinically relevant, bleeding was 1.03; 95% CI 0.96-1.11;  $p = 0.44$ . There were also significant reductions in intracranial hemorrhage (0.5% vs. 0.7%,  $p = 0.02$ ) and fatal bleeding (0.2% vs. 0.5%,  $p = 0.003$ ) for rivaroxaban.

**Conclusions:** In patients with AFib, rivaroxaban is non-inferior to warfarin for stroke prevention and major and non-major bleeding.

## 6. AV NODAL RE-ENTRANT TACHYCARDIA (AVNRT)

- re-entrant circuit using dual pathways (fast conducting  $\beta$ -fibres and slow conducting  $\alpha$ -fibres) within or near the AV node; often found in the absence of structural heart disease – cause is commonly idiopathic, although familial AVNRT has been reported
- sudden onset and offset
- fast regular rhythm: rate 150-250 bpm
- usually initiated by a supraventricular or ventricular premature beat
- AVNRT accounts for 60-70% of all paroxysmal SVTs
- retrograde P waves may be seen but are usually lost in the QRS complex (see Figure 27)
- treatment
  - acute: Valsalva maneuver or carotid sinus pressure technique, adenosine is first choice if unresponsive to vagal maneuvers; if no response, try metoprolol, digoxin, diltiazem, electrical cardioversion if patient hemodynamically unstable (hypotension, angina, or CHF)
  - long-term: 1st line –  $\beta$ -blocker, diltiazem, digoxin; 2nd line – flecainide, propafenone; 3rd line – catheter ablation

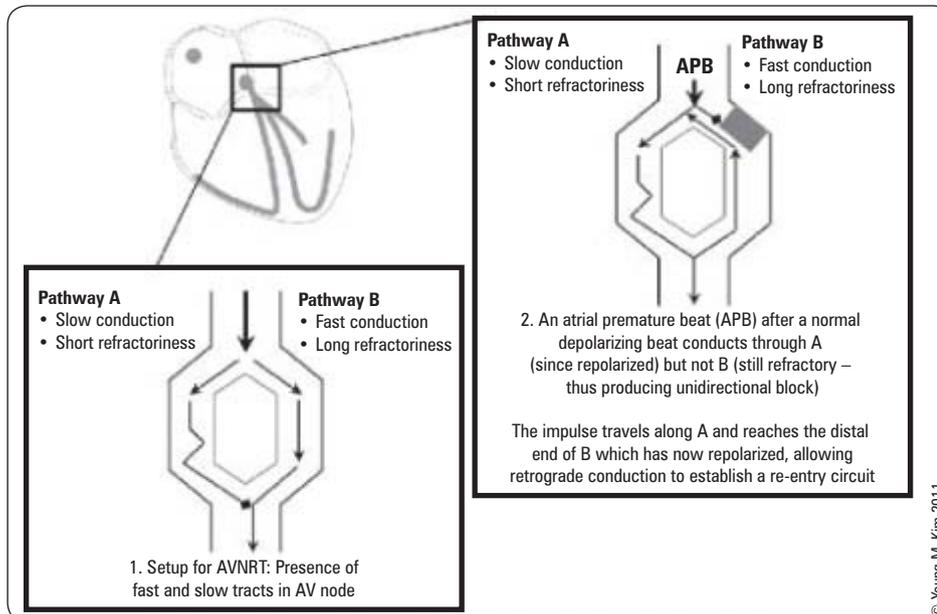

Figure 28. Mechanism for AVNRT

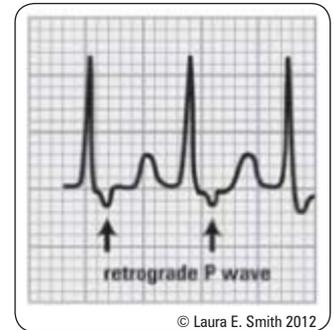

Figure 27. AVNRT

N.B. Refer to ECG Made Simple for further discussion and an animation of the mechanism ([www.ecgmadesimple.com](http://www.ecgmadesimple.com))

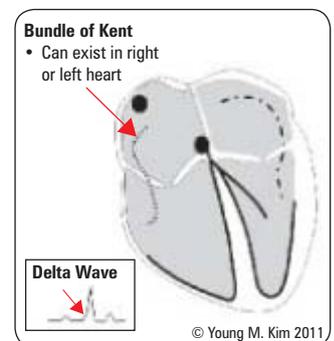

Figure 29. Accessory pathway conduction in WPW. Early ventricular activation leads to the appearance of a delta wave (slurred upstroke of the QRS) on the ECG before usual conduction across the AV node

## Pre-Excitation Syndromes

- refers to a subset of SVTs mediated by an accessory pathway which can lead to ventricular pre-excitation

### Wolff-Parkinson-White Syndrome

- congenital defect present in 1.5-2/1,000 of the general population
- an accessory conduction tract (Bundle of Kent; can be in right or left atrium) abnormally allows early electrical activation of part of one ventricle
- impulses travel at a greater conduction velocity across the Bundle of Kent thereby effectively 'bypassing' AV node
- since the ventricles are activated earlier, the ECG shows early ventricular depolarization in the form of initial slurring of the QRS complex – the so-called "delta wave"
- atrial impulses that conduct to the ventricles through both the Bundle of Kent and the normal AV node/His-Purkinje system generate a broad "fusion complex"
- ECG features of WPW
  - PR interval <120 msec
  - delta wave: slurred upstroke of the QRS (the leads with the delta wave vary with site of bypass)
  - widening of the QRS complex due to premature activation
  - secondary ST segment and T wave changes
  - tachyarrhythmias may occur – most often AVRT and AFib

### AFib in WPW Patients

- AFib is the index arrhythmia in up to 20% of patients with WPW syndrome
  - it is usually intermittent rather than persistent or permanent
- rapid atrial depolarizations in AFib are conducted through the bypass tract which is not able to filter impulses like the AV node can
- consequently the ventricular rate becomes extremely rapid (>200 bpm) and the QRS complex widens
- treatment: electrical cardioversion, IV procainamide, or IV amiodarone
  - do not use drugs that slow AV node conduction (digoxin,  $\beta$ -blockers) as this may cause preferential conduction through the bypass tract and precipitate VF
  - long-term: ablation of bypass tract if possible

### AV Re-Entrant Tachycardia

- re-entrant loop via accessory pathway and normal conduction system
- initiated by a premature atrial or ventricular complex
- **orthodromic AVRT**: stimulus from a premature complex travels up the bypass tract (V to A) and down the AV node (A to V) with narrow QRS complex (no delta wave because stimulus travels through normal conduction system)
- comprises 95% of the reentrant tachycardias associated with WPW syndrome
- **antidromic AVRT**: more rarely the stimulus goes up the AV node (V to A) and down the bypass tract (A to V); wide and abnormal QRS as ventricular activation is only via the bypass tract
- treatment
  - acute: similar to AVNRT except avoid long-acting AV nodal blockers (e.g. digoxin and verapamil)
  - long-term: for recurrent arrhythmias ablation of the bypass tract is recommended
  - drugs such as flecainide and procainamide can be used

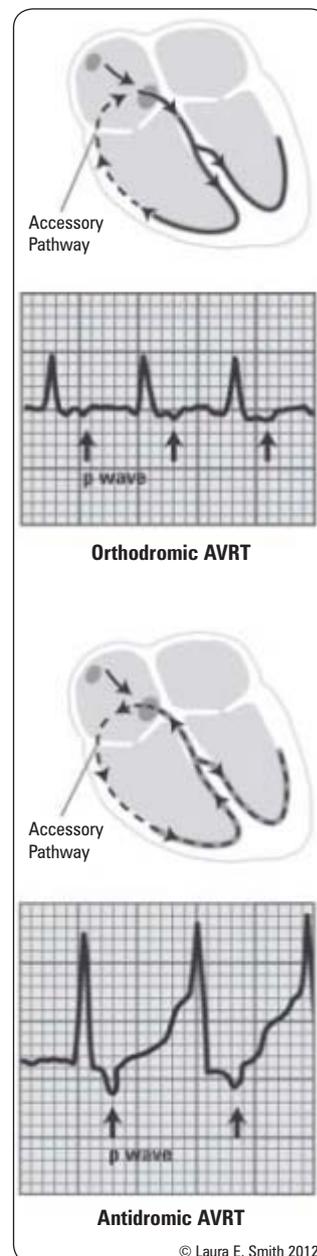

Figure 30. Orthodromic vs. antidromic AVRT

## Ventricular Tachyarrhythmias

### Premature Ventricular Contraction (PVC) or Ventricular Premature Beat (VPB)

- QRS width >120 msec, no preceding P wave, bizarre QRS morphology
- origin: LBBB morphology of VT = RV origin; RBBB morphology of VT = LV origin
- PVCs may be benign but are usually significant in the following situations
  - consecutive ( $\geq 3$  = VT) or multiform (varied origin)
  - PVC falling on the T wave of the previous beat ("R on T phenomenon"): may precipitate ventricular tachycardia or VF

### Accelerated Idioventricular Rhythm

- ectopic ventricular rhythm with rate 50-100 bpm
- more frequently occurs in the presence of sinus bradycardia and is easily overdriven by a faster supraventricular rhythm
- frequently occurs in patients with acute MI or other types of heart disease (cardiomyopathy, hypertensive, valvular) but it does not affect prognosis and does not usually require treatment

### Ventricular Tachycardia (VT)

- 3 or more consecutive ectopic ventricular complexes
  - rate >100 bpm (usually 140-200)
  - ventricular flutter: if rate >200 bpm and complexes resemble a sinusoidal pattern
  - "sustained VT" if it lasts longer than 30 s
  - ECG characteristics: wide regular QRS tachycardia (QRS usually >140 msec)
  - AV dissociation; bizarre QRS pattern
  - also favour Dx of VT: left axis or right axis deviation, nonspecific intraventricular block pattern, monophasic or biphasic QRS in V1 with RBBB, QRS concordance in V1-V6
  - occasionally during VT supraventricular impulses may be conducted to the ventricles generating QRS complexes with normal or aberrant supraventricular morphology ("ventricular capture") or summation pattern ("fusion complexes")
- **monomorphic VT**
  - identical complexes with uniform morphology
  - more common than polymorphic VT
  - typically result from intraventricular re-entry circuit
  - potential causes: chronic infarct scarring, acute MI/ischemia, cardiomyopathies, myocarditis, arrhythmogenic right ventricular dysplasia, idiopathic, drugs (e.g. cocaine), electrolyte disturbances
- **polymorphic VT**
  - complexes with constantly changing morphology, amplitude, and polarity
  - more frequently associated with hemodynamic instability due to faster rates (typically 200-250 bpm) vs. monomorphic VT
  - potential causes: acute MI, severe or silent ischemia, and predisposing factors for QT prolongation
- treatment
  - sustained VT (>30 s) is an emergency, requiring immediate treatment
  - hemodynamic compromise: electrical cardioversion
  - no hemodynamic compromise: electrical cardioversion, lidocaine, amiodarone, type Ia agents (procainamide, quinidine)

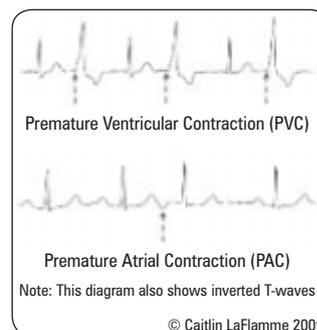

Figure 31. PVC (with bigeminy pattern) and PAC. Note the difference between the normal QRS/T wave and the PVC-generated QRS/T wave

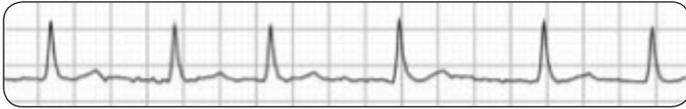

Figure 32. Ventricular tachycardia (monomorphic)

Table 6. Wide Complex Tachycardia: Clues for Differentiating VT vs. SVT with Aberrancy\*

Clinical Clues		ECG Clues	
Presenting symptoms	Not helpful	AV dissociation	VT
History of CAD and previous MI	VT	Capture or fusion beats	VT
Physical exam		QRS width > 140 msec	VT
Cannon "a" waves Variable S1	VT	Extreme axis deviation (left or right superior axis)	VT
Carotid sinus massage/adenosine terminates arrhythmia	SVT**	Positive QRS concordance (R wave across chest leads)	VT
		Negative QRS concordance (S wave across chest leads)	May suggest VT
		Axial shift during arrhythmia	VT (polymorphic)

\*If patient &gt; 65 yr and previous MI or structural heart disease, then chance of VT &gt; 95%

\*\*May terminate VT in some patients with no structural heart disease

### Torsades de Pointes

- a variant of polymorphic VT that occurs in patients with baseline QT prolongation – “twisting of the points”
- looks like usual VT except that QRS complexes “rotate around the baseline” changing their axis and amplitude
- ventricular rate > 100 bpm, usually 150-300 bpm
- etiology: predisposition in patients with prolonged QT intervals
  - congenital long QT syndromes
  - drugs: e.g. class IA (quinidine), class III (sotalol), phenothiazines (TCAs), erythromycin, quinolones, antihistamines
  - electrolyte disturbances: hypokalemia, hypomagnesemia
  - nutritional deficiencies causing above electrolyte abnormalities
- treatment: IV magnesium, temporary pacing, isoproterenol and correct underlying cause of prolonged QT, electrical cardioversion if hemodynamic compromise

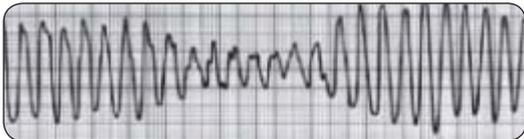

Figure 33. Torsades de pointes

### Ventricular Fibrillation (VFib)

- chaotic ventricular arrhythmia, with very rapid irregular ventricular fibrillatory waves of varying morphology
- terminal event, unless advanced cardiac life-support (ACLS) procedures are promptly initiated to maintain ventilation and cardiac output, and electrical defibrillation is carried out
- most frequent cause of sudden death
- refer to ACLS algorithm for complete therapeutic guidelines

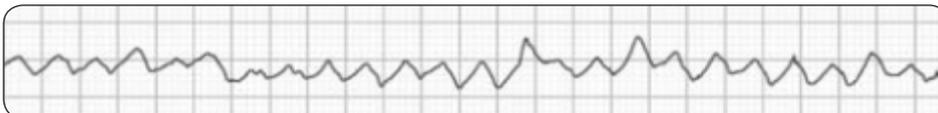

Figure 34. Ventricular fibrillation

#### Arrhythmias that May Present as a Wide QRS Tachycardia

- VT
- SVT with aberrant conduction (rate related)
- SVT with preexisting BBB or nonspecific intraventricular conduction defect
- AV conduction through a bypass tract in WPW patients during an atrial tachyarrhythmia (e.g. atrial flutter, atrial tachycardia)
- Antidromic AVRT in WPW patients (see [Pre-Excitation Syndromes, C21](#))

## Sudden Cardiac Arrest

### Definition

- unanticipated, non-traumatic cardiac death in a stable patient which occurs within 1 h of symptom onset; VFib is most common cause

### Etiology

- primary cardiac pathology
  - ischemia/MI
  - LV dysfunction
  - severe ventricular hypertrophy
  - HCM
  - AS
  - congenital heart disease e.g. arrhythmogenic right ventricular dysplasia
  - mutations in cardiac ion channels e.g. long QT syndrome, Brugada syndrome

### Management

- acute: resuscitate with prompt CPR and defibrillation
- investigate underlying cause (cardiac catheterization, electrophysiologic studies, echo)
- treat underlying cause
- antiarrhythmic drug therapy: amiodarone,  $\beta$ -blockers
- implantable cardioverter defibrillator (ICD)
- refer to ACLS guidelines (see [Anesthesia and Perioperative Medicine, A31](#))

## Electrophysiology Studies

- invasive test for the investigation and treatment of cardiac rhythm disorders using intracardiac catheters
- provide detailed analysis of the arrhythmia mechanism and precise site of origin when ECG data are nondiagnostic or unobtainable
- bradyarrhythmias: define the mechanisms of SA node dysfunction and localize site of AV conduction block
- tachyarrhythmias: map for possible ablation or to assess inducibility of VT

## Electrical Pacing

- the decision to implant a pacemaker usually is based on symptoms of a bradyarrhythmia or tachyarrhythmia in the setting of heart disease

### Pacemaker Indications

- SA node dysfunction (most common): symptomatic bradycardia  $\pm$  hemodynamic instability
- common manifestations include: syncope, presyncope, or severe fatigue
- SA node dysfunction is commonly caused by: intrinsic disease within the SA node (e.g. idiopathic degeneration, fibrosis, ischemia, or surgical trauma), abnormalities in autonomic nervous system function, and drug effects
- AV nodal-infranodal block: Mobitz II, complete heart block

### Pacemaker Complications

- complications related to surgical implantation include venous access (pneumothorax, hemothorax, air embolism), pacemaker leads (perforation, malposition), pocket hematomas and infection
- complications specific to the pacemaker include a failure to pace, failure to sense, pulse generator failure, pacemaker syndrome and pacemaker mediated tachycardia

### Pacing Techniques

- temporary: transvenous (jugular, subclavian, femoral) or external (transcutaneous) pacing
- permanent: transvenous into RA, apex of RV, or both
- can sense and pace atrium, ventricle, or both
- new generation: rate responsive, able to respond to physiologic demand
- biventricular

## Implantable Cardioverter Defibrillators

- sudden cardiac death (SCD) usually results from ventricular fibrillation (VFib), sometimes preceded by monomorphic or polymorphic ventricular tachycardia (VT)
- ICDs detect ventricular tachyarrhythmias and are highly effective in terminating VT/VFib and in aborting SCD
- mortality benefit vs. antiarrhythmics in secondary prevention
- benefit seen in patients with ischemic and non-ischemic cardiomyopathy, depressed left ventricular ejection fraction (LVEF), prolonged QRS
- see [Heart Failure, C34](#) for current treatment recommendations

### CCS Consensus Conference 2003: Assessment of the Cardiac Patient for Fitness to Drive and Fly – Executive Summary

*Can J Cardiol* 2004;20:1313-1323

In both primary and secondary prevention ICD patients with private driving licenses, no restrictions to drive directly following implantation or an inappropriate shock are warranted. However, following an appropriate shock these patients are at an increased risk to cause harm to other road users and therefore should be restricted to drive for a period of 2 and 4 mo, respectively. In addition, all ICD patients with commercial driving licenses have a substantial elevated risk to cause harm to other road users during the complete follow-up after both implantation and shock and should therefore be restricted to drive permanently.

(A complete set of easy to access CCS Drive and Fly guidelines is available in the iCCS App available for iOS and Android platforms)

### Systematic Review: Implantable Cardioverter Defibrillators for Adults with Left Ventricular Systolic Dysfunction

*Ann Intern Med* 2007;147:251-262

**Study:** Meta-review of 12 RCTs used for ICD efficacy, 5 RCTs and 48 observational studies for effectiveness, and 21 RCTs and 43 observational studies for safety review.

**Population:** 8,516 patients for ICD efficacy, 26,840 patients for effectiveness, and 86,809 patients for safety review with left ventricular ejection fraction  $\leq 0.35$ .

**Intervention:** ICD implantation.

**Outcomes:** All-cause mortality and adverse events.

**Results:** ICDs reduced all-cause mortality by 20% (95% CI, 10%-29%;  $I^2=44.4\%$ ) with greatest reduction (54%) in sudden cardiac death (CI 37%-63%;  $I^2=0\%$ ). Observational studies had a reduced relative risk of 0.54 for all-cause mortality versus RCTs (CI 0.43-0.58,  $I^2=60.4\%$ ). Rates of success of ICD implantation were 99% (CI 98.8%-99.3%) with a 1.2% (CI 0.9%-1.5%) chance of peri-implantation death. Post-implantation complications (per 100 patient yr) were: 1.4 (CI 1.2-1.6) device malfunctions; 1.5 (CI 1.3-1.8) lead problems; 0.6 (CI 0.5-0.8) implant site infection and 19.1 (CI 16.5-22.0) inappropriate discharges in RCTs versus a rate of 4.9 (CI 4.5-5.3) inappropriate discharges in observational studies.

**Conclusion:** ICDs are safe and effective in reducing mortality in adult patients with LV systolic dysfunction but carry significant risks of inappropriate discharges. Differences between RCTs and observational studies show that improved risk stratification of patients may further improve outcomes and reduce adverse events.

## Catheter Ablation

### Techniques

- radiofrequency (RF) ablation: a low-voltage high-frequency form of electrical energy (similar to cautery); RF ablation produces small, homogeneous, necrotic lesions approximately 5-7 mm in diameter and 3-5 mm in depth
- cryoablation: new technology which uses a probe with a tip that can decrease in temperature to -20°C and -70°C. Produces small, necrotic lesions similar to RF ablation; when brought to -20°C, the catheter tip reversibly freezes the area; bringing the tip down to -70°C for 5 min permanently scars the tissue
  - advantage: can “test” areas before committing to an ablation
  - disadvantage: takes much longer than RF (5 min per cryoablation vs. 1 min per RF ablation)

### Indications

- paroxysmal SVT
  - AVNRT: accounts for more than half of all cases
- accessory pathway (orthodromic reciprocating tachycardia): 30% of SVT
  - re-entrant rhythm, with an accessory AV connection as the retrograde limb
  - corrected by targeting the accessory pathway
- atrial flutter: reentry pathway in right atrium
- AFib: potential role for pulmonary vein ablation
- ventricular tachycardia: focus arises from the right ventricular outflow tract and less commonly originates in the inferoseptal left ventricle near the apex (note: majority of cases of VT are due to scarring from previous MI and cannot be ablated)

### Major Complications

- 1% of patients
- death: 0.1-0.2%
- cardiac: high grade AV block requiring permanent pacemaker (less risk with cryoablation), tamponade, pericarditis
- vascular: hematoma, vascular injury, thromboembolism, TIA/stroke
- pulmonary: PE

## Ischemic Heart Disease

### Epidemiology

- most common cause of cardiovascular morbidity and mortality
- Canadian-led INTERHEART study showed that 9 modifiable risk factors accounted for >90% of MI
- atherosclerosis and thrombosis are the most important pathogenetic mechanisms
- M:F = 2:1 with all age groups included (Framingham study), 8:1 for age <40, 1:1 for age >70
  - according to the Framingham Heart Study, men develop coronary heart disease at a rate double that of women for age <60; incidence in women triples shortly after menopause
- peak incidence of symptomatic IHD is age 50-60 (men) and 60-70 (women)
- for primary prevention of ischemic heart disease see [Family Medicine, FM7](#)

**Table 7. Risk Factors and Markers for Atherosclerotic Heart Disease**

Non-Modifiable Risk Factors	Modifiable Risk Factors	Markers of Disease
Age	Hyperlipidemia*	Elevated lipoprotein(a)
Male, postmenopausal female	HTN*	Hyperhomocysteinemia
Family history (FHx) of MI*	DM*	Elevated high-sensitivity C-reactive protein (hsCRP)
First degree male relative <55	Cigarette smoking*	Coronary artery calcification
First degree female relative <65	Psychosocial stress	Carotid IMT/plaque
	Obesity	Ankle-brachial index
	Sedentary lifestyle	
	Heavy alcohol intake	

\* Major risk factor

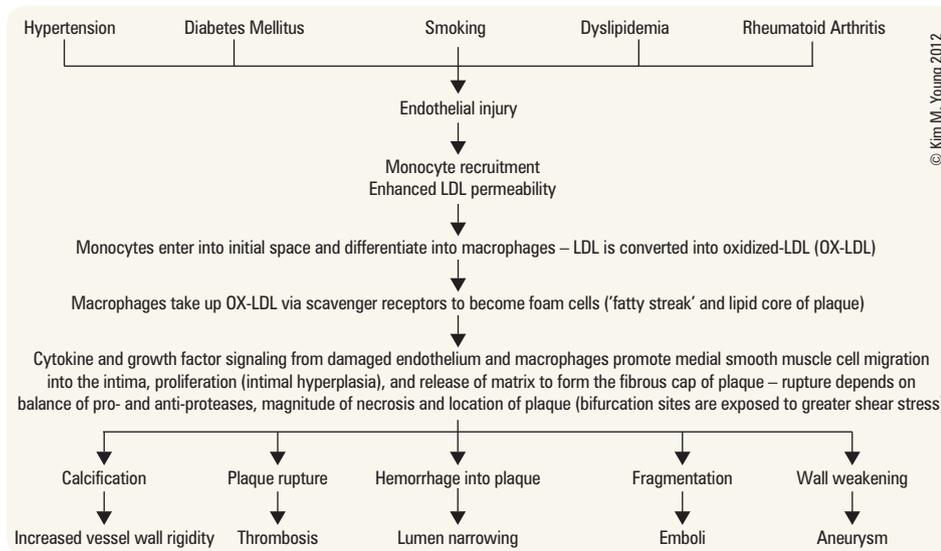

Figure 35. Pathophysiology of atherosclerosis

## Chronic Stable Angina

### Definition

- symptom complex resulting from an imbalance between oxygen supply and demand in the myocardium

### Etiology and Pathophysiology

- factors that decrease myocardial oxygen supply
  - decreased luminal diameter: atherosclerosis, vasospasm
  - decreased duration of diastole: tachycardia (decreased duration of diastolic coronary perfusion)
  - decreased hemoglobin: anemia
  - decreased  $\text{SaO}_2$ : hypoxemia
  - congenital anomalies
- factors that increase myocardial oxygen demand
  - increased heart rate: hyperthyroidism
  - increased contractility: hyperthyroidism
  - increased wall stress: myocardial hypertrophy, aortic stenosis

### Signs and Symptoms

- typical: (1) retrosternal chest pain, tightness or discomfort radiating to left ( $\pm$  right) shoulder/arm/neck/jaw, associated with diaphoresis, nausea, anxiety; (2) predictably precipitated by the “3 Es”: exertion, emotion, eating; (3) brief duration, lasting <10-15 min and typically relieved by rest and nitrates
- atypical/probable angina (meets 2 of the above); non-cardiac chest pain (meets <1 of the above)
- Levine’s sign: clutching fist over sternum when describing chest pain
- anginal equivalents: dyspnea, acute LV failure, flash pulmonary edema

### Clinical Assessment

- history including directed risk factor assessment and physical exam
- labs: Hb, fasting glucose, fasting lipid profile
- ECG (at rest and during episode of chest pain if possible)
- CXR (suspected heart failure, valvular disease, pericardial disease, aortic dissection/aneurysm, or signs or symptoms of pulmonary disease)
- stress testing (see *Stress Testing*, C13) or angiography
- echo
  - to assess systolic murmur suggestive of aortic stenosis, mitral regurgitation, and/or HCM
  - to assess LV function in patients with Hx of prior MI, pathological Q waves, signs or symptoms of CHF

### Differential Diagnosis

- see *Differential Diagnosis of Common Presentations*, CA

Chronic stable angina is most often due to a fixed stenosis caused by an atheroma. Acute coronary syndromes are the result of plaque rupture.

#### Canadian Cardiovascular Society (CCS) Functional Classification of Angina

- **Class I:** ordinary physical activity (walking, climbing stairs) does not cause angina; angina with strenuous, rapid, or prolonged activity
- **Class II:** slight limitation of ordinary activity; angina brought on at >2 blocks on level or climbing >1 flight of stairs or by emotional stress
- **Class III:** marked limitation of ordinary activity; angina brought on at <2 blocks on level or climbing <1 flight of stairs
- **Class IV:** inability to carry out any physical activity without discomfort; angina may be present at rest

## Treatment of Chronic Stable Angina

### 1. General Measures

- goals: to reduce myocardial oxygen demand and/or increase oxygen supply
- lifestyle modification (diet, exercise)
- treatment of risk factors: statins (see [Endocrinology, E5](#), [Family Medicine, FM9](#) for target lipid guidelines), antihypertensives, etc
- pharmacological therapy to stabilize the coronary plaque to prevent rupture and thrombosis

### 2. Antiplatelet Therapy (first-line therapy)

- ASA
- clopidogrel when ASA absolutely contraindicated

### 3. $\beta$ -blockers (first-line therapy – improve survival in patients with hypertension)

- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- cardioselective agents preferred (e.g. metoprolol, atenolol) to avoid peripheral effects (inhibition of vasodilation and bronchodilation via  $\beta_2$  receptors)
- avoid intrinsic sympathomimetics (e.g. acebutolol) which increase demand

### 4. Nitrates (symptomatic control, no clear impact on survival)

- decrease preload (venous dilatation) and afterload (arteriolar dilatation), and increase coronary perfusion
- maintain daily nitrate-free intervals to prevent tolerance (tachyphylaxis)

### 5. Calcium Channel Blockers (CCBs, second-line or combination)

- increase coronary perfusion and decrease demand (HR, contractility) and BP (afterload)
- caution: verapamil/diltiazem combined with  $\beta$ -blockers may cause symptomatic sinus bradycardia or AV block

### 6. ACE Inhibitors (ACEI, not used to treat symptomatic angina)

- angina patients tend to have risk factors for CV disease which warrant use of an ACEI (e.g. HTN, DM, proteinuric renal disease, previous MI with LV dysfunction)
- benefit in all patients at high risk for CV disease (concomitant DM, renal dysfunction, or LV systolic dysfunction)
- angiotensin II receptor blockers (ARBs) can be used when ACEI contraindicated

### 7. Invasive Strategies

- revascularization (see [Coronary Revascularization, C31](#) and COURAGE trial sidebar)

## VARIANT ANGINA (PRINZMETAL'S ANGINA)

- myocardial ischemia secondary to coronary artery vasospasm, with or without atherosclerosis
- uncommonly associated with infarction or LV dysfunction
- typically occurs between midnight and 8 am, unrelated to exercise, relieved by nitrates
- typically ST elevation on ECG
- diagnosed by provocative testing with ergot vasoconstrictors (rarely done)
- treat with nitrates and CCBs

## SYNDROME X

- typical symptoms of angina but normal angiogram
- may show definite signs of ischemia with exercise testing
- thought to be due to inadequate vasodilator reserve of coronary resistance vessels
- better prognosis than overt epicardial atherosclerosis

### Optimal Medical Therapy with or without PCI for Stable Coronary Disease. COURAGE Trial *NEJM* 2007;356:1503-1516

**Study:** Randomized, controlled trial with median follow-up of 4.6 yr.

**Population:** 2,287 patients who had objective evidence of myocardial ischemia and significant stable coronary artery disease.

**Intervention:** Patients were randomized to receive intensive pharmacologic therapy and lifestyle intervention with or without percutaneous coronary intervention (PCI).

**Outcome:** Primary outcome was all-cause mortality and nonfatal myocardial infarction (MI). Secondary outcome had additional events of stroke, all MI, and hospitalization for unstable angina with negative biomarkers.

**Results:** There was no significant difference in primary (unadjusted hazard ratio: 1.05;  $p=0.62$ ) or secondary outcomes (hazard ratio: 1.05;  $p=0.62$ ) between the PCI and non-PCI intervention groups. The PCI group had significantly lower rates of subsequent revascularization at 4.6 yr of follow-up (hazard ratio 0.60,  $p<0.001$ ) and was more angina-free in the first 4 yr of follow-up.

**Conclusions:** PCI as an adjunct in initial management in patients with significant stable coronary artery disease does not reduce mortality, MI, stroke, or hospitalization for ACS, but does provide angina relief and reduced risk of revascularization.

## Acute Coronary Syndromes

### Definition

- ACS includes the spectrum of UA, NSTEMI, and STEMI; this distinction aids in providing the appropriate therapeutic intervention
  - MI is defined by evidence of myocardial necrosis. It is diagnosed by a rise/fall of serum markers plus any one of
    - symptoms of ischemia (chest/upper extremity/mandibular/epigastric discomfort; dyspnea)
    - ECG changes (ST-T changes, new BBB or pathological Q waves)
    - imaging evidence (myocardial loss of viability, wall motion abnormality, or intracoronary thrombus)
  - if biomarker changes are unattainable, cardiac symptoms combined with new ECG changes is sufficient
  - NSTEMI meets criteria for myocardial infarction without ST elevation or BBB
  - STEMI meets criteria for myocardial infarction characterized by ST elevation or new BBB

- UA is clinically defined by any of the following
  - accelerating pattern of pain: increased frequency, increased duration, decreased threshold of exertion, decreased response to treatment
  - angina at rest
  - new-onset angina
  - angina post-MI or post-procedure (e.g. percutaneous coronary intervention [PCI], coronary artery bypass grafting [CABG])

### Investigations

- history and physical
  - note that up to 30% of MIs are unrecognized or “silent” due to atypical symptoms – more common in women, DM, elderly, post-heart transplant (because of denervation)
- ECG
- CXR
- labs
  - serum cardiac biomarkers for myocardial damage (repeat 8 h later) (see *Cardiac Biomarkers, C11*)
  - CBC, INR/PTT, electrolytes and magnesium, creatinine, urea, glucose, serum lipids
  - draw serum lipids within 24-48 h because values are unreliable from 2-48 d post-MI

## MANAGEMENT OF ACUTE CORONARY SYNDROMES

### 1. General Measures

- ABCs: assess and correct hemodynamic status first
- bed rest, cardiac monitoring, oxygen
- nitroglycerin SL followed by IV
- morphine IV

### 2. Anti-Platelet and Anticoagulation Therapy

- see also *CCS Antiplatelet Guidelines 2012* for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
- ASA chewed
- NSTEMI
  - ♦ ticagrelor in addition to ASA or if ASA contraindicated, subcutaneous low molecular weight heparin or IV unfractionated heparin (UFH) (LMWH preferable, except in renal failure or if CABG is planned within 24 h)
  - ♦ clopidogrel used if patient ineligible for ticagrelor
- if PCI is planned: ticagrelor or prasugrel and consider IV GP IIb/IIIa inhibitor (e.g. abciximab)
  - ♦ clopidogrel used if patient ineligible for ticagrelor and prasugrel
  - ♦ prasugrel contraindicated in those with a history of stroke/TIA, and avoidance of or lower dose is recommended for those >75 yr old or weighing under 60 kg (TRITON-TIMI 38)
- anticoagulation options depend on reperfusion strategy:
  - ♦ primary PCI: UFH during procedure; bivalirudin is a possible alternative
  - ♦ thrombolysis: LMWH (enoxaparin) until discharge from hospital; can use UFH as alternative because of possible rescue PCI
  - ♦ no reperfusion: LMWH (enoxaparin) until discharge from hospital
- continue LMWH or UFH followed by oral anticoagulation at discharge if at high risk for thromboembolic event (large anterior MI, AFib, severe LV dysfunction, CHF, previous DVT or PE, or echo evidence of mural thrombus)

### 3. $\beta$ -blockers

- STEMI: contraindications include signs of heart failure, low output states, risk of cardiogenic shock, heart block, asthma or airway disease; initiate orally within 24 h of diagnosis when indicated
- if  $\beta$ -blockers are contraindicated or if  $\beta$ -blockers/nitrates fail to relieve ischemia, non-dihydropyridine calcium channel blockers (e.g. diltiazem, verapamil) may be used as second-line therapy in the absence of severe LV dysfunction or pulmonary vascular congestion (calcium channel blockers do not prevent MI or decrease mortality)

### 4. Invasive Strategies and Reperfusion Options

- UA/NSTEMI: early coronary angiography  $\pm$  revascularization if possible is recommended with any of the following high-risk indicators:
  - ♦ recurrent angina/ischemia at rest despite intensive anti-ischemic therapy
  - ♦ CHF or LV dysfunction
  - ♦ hemodynamic instability
  - ♦ high ( $\geq 3$ ) TIMI risk score (tool used to estimate mortality following an ACS)
  - ♦ sustained ventricular tachycardia
  - ♦ dynamic ECG changes
  - ♦ high-risk findings on non-invasive stress testing
  - ♦ PCI within the previous 6 mo
  - ♦ repeated presentations for ACS despite treatment and without evidence of ongoing ischemia or high risk features
  - ♦ note: thrombolysis is NOT administered for UA/NSTEMI

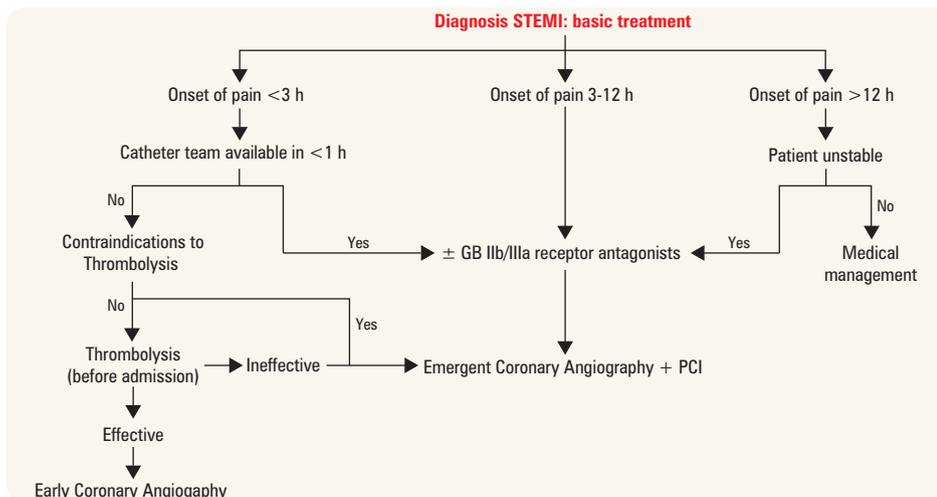

#### TIMI Risk Score for UA/NSTEMI

Characteristics	Points
<b>Historical</b>	
Age $\geq 65$ yr	1
$\geq 3$ risk factors for CAD	1
Known CAD (stenosis $\geq 50\%$ )	1
Aspirin <sup>®</sup> use in past 7 d	1
<b>Presentation</b>	
Recent ( $\leq 24$ h) severe angina	1
ST-segment deviation $\geq 0.5$ mm	1
Increased cardiac markers	1

Risk Score = Total Points  
 If TIMI risk score  $\geq 3$ , consider early LMWH and angiography  
 TIMI = thrombolysis in myocardial infarction  
 UA = unstable angina  
 JAMA 2000;284:835-842

- STEMI
  - ♦ after diagnosis of STEMI is made, do not wait for results of further investigations before implementing reperfusion therapy
  - ♦ goal is to re-perfuse artery: thrombolysis (“EMS-to-needle”) within 30 min or primary PCI (“EMS-to-balloon”) within 90 min (depending on capabilities of hospital and access to hospital with PCI facility)
  - ♦ thrombolysis
    - preferred if patient presents  $\leq 12$  h of symptom onset, and  $< 30$  min after presentation to hospital, has contraindications to PCI, or PCI cannot be administered within 90 min
  - ♦ PCI
    - early PCI ( $\leq 12$  h after symptom onset and  $< 90$  min after presentation) improves mortality vs. thrombolysis with fewer intra-cranial hemorrhages and recurrent MIs
    - primary PCI: without prior thrombolytic therapy – method of choice for reperfusion in experienced centres (*JAMA* 2004;291:736-739)
    - rescue PCI: following failed thrombolytic therapy (diagnosed when following thrombolysis, ST segment elevation fails to resolve below half its initial magnitude and patient still having chest pain)

**Figure 36. Reperfusion strategy in STEMI**

**Table 8. Contraindications for Thrombolysis in STEMI**

Absolute	Relative
Prior intracranial hemorrhage	Chronic, severe, poorly controlled HTN
Known structural cerebral vascular lesion	Uncontrolled HTN (sBP > 180, dBP > 110)
Known malignant intracranial neoplasm	Current anticoagulation
Significant closed-head or facial trauma ( $\leq 3$ mo)	Noncompressible vascular punctures
Ischemic stroke ( $\leq 3$ mo)	Ischemic stroke ( $\geq 3$ mo)
Active bleeding	Recent internal bleeding ( $\leq 2-4$ wk)
Suspected aortic dissection	Prolonged CPR or major surgery ( $\leq 3$ wk)
	Pregnancy
	Active peptic ulcer disease

## Long-Term Management of ACS

- risk of progression to MI or recurrence of MI or death is highest within 1 mo
- at 1-3 mo after the acute phase, most patients resume a clinical course similar to that in patients with chronic stable coronary disease
- pre-discharge workup: ECG and echo to assess residual LV systolic function
- drugs required in hospital to control ischemia should be continued after discharge in all patients
- other medications for long-term management of ACS are summarized below

### 1. General Measures

- education
- risk factor modification

### 2. Antiplatelet and Anticoagulation Therapy

- see also *CCS Antiplatelet Guidelines 2012* for details (free mobile apps available on iOS and Android platforms in the CCS app stores)
- ECASA 81 mg daily
- ticagrelor 90 mg twice daily or prasugrel 10 mg daily (at least 1 mo, up to 9-12 mo, if stent placed at least 12 mo)
- clopidogrel 75 mg daily can be used as alternatives to ticagrelor and prasugrel when indicated
- $\pm$  warfarin x 3 mo if high risk (large anterior MI, LV thrombus, LVEF  $< 30\%$ , history of VTE, chronic AFib)

3. **β-Blockers** (e.g. metoprolol 25-50 mg bid or atenolol 50-100 mg daily)

4. **Nitrates**

- alleviate ischemia but do not improve outcome
- use with caution in right-sided MI patients who have become preload dependent

5. **Calcium Channel Blockers** (NOT recommended as first line treatment, consider as alternative to β-blockers)

6. **Angiotensin-Converting Enzyme Inhibitors**

- prevent adverse ventricular remodelling
- recommended for asymptomatic high-risk patients (e.g. diabetics), even if LVEF >40%
- recommended for symptomatic CHF; reduced LVEF (<40%), anterior MI
- use ARBs in patients who are intolerant of ACEI; avoid combining ACE and ARB

7. **± Aldosterone Antagonists**

- if on ACEI and β-blockers and LVEF <40% and CHF or DM
- significant mortality benefit shown with eplerenone by 30 d

8. **Statins** (early, intensive, irrespective of cholesterol level; e.g. atorvastatin 80 mg daily)

9. **Invasive Cardiac Catheterization if indicated** (risk stratification)

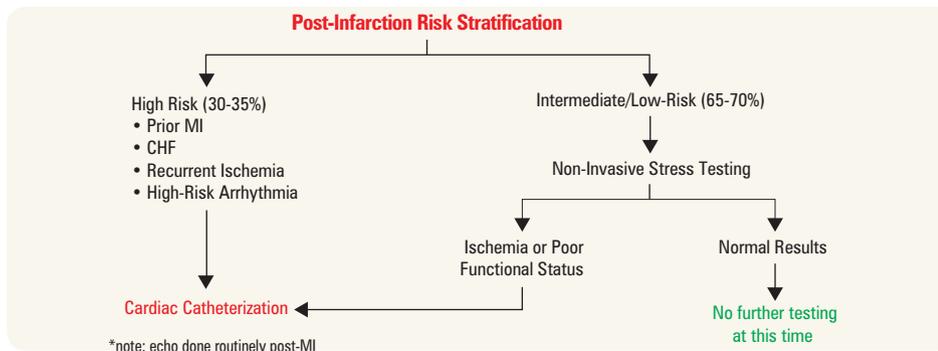

Figure 37. Post-MI risk stratification

Prognosis following STEMI

- 5-15% of hospitalized patients will die
  - risk factors
    - ◆ infarct size/severity
    - ◆ age
    - ◆ comorbid conditions
    - ◆ development of heart failure or hypotension
- post-discharge mortality rates
  - 6-8% within first year, half of these within first 3 mo
  - 4% per year following first yr
  - risk factors
    - ◆ LV dysfunction
    - ◆ residual myocardial ischemia
    - ◆ ventricular arrhythmias
    - ◆ history of prior MI

Table 9. Complications of Myocardial Infarction

Complication	Etiology	Presentation	Therapy
<b>Arrhythmia</b>			
1. Tachycardia	Sinus, AFib, VT, VFib	First 48 h	See Arrhythmias, C16
2. Bradycardia	Sinus, AV block	First 48 h	
<b>Myocardial Rupture</b>			
1. LV free wall	Transmural infarction	1-7 d	Surgery
2. Papillary muscle (→ MR)	Inferior infarction	1-7 d	Surgery
3. Ventricular septum (→ VSD)	Septal infarction	1-7 d	Surgery
<b>Shock/CHF</b>	Infarction or aneurysm	Within 48 h	Inotropes, intra-aortic balloon pump
<b>Post-Infarct Angina</b>	Persistent coronary stenosis Multivessel disease	Anytime	Aggressive medical therapy PCI or CABG
<b>Recurrent MI</b>	Reocclusion	Anytime	Aggressive medical therapy PCI or CABG
<b>Thromboembolism</b>	Mural/apical thrombus DVT	7-10 d, up to 6 mo	Anticoagulation
<b>Pericarditis</b>	Inflammatory	1-7 d	ASA
<b>Dressler's Syndrome</b>	Autoimmune	2-8 wk	

Is this Patient Having a Myocardial Infarction? From The Rational Clinical Examination

JAMA 2009; http://www.jamaevidence.com/content/3484335

**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of an acute myocardial infarction.

**Results:** In patients with normal or non-diagnostic ECG, no established CAD, and prolonged or recurrent chest pain typical of their usual discomfort, radiation of pain to the shoulder OR both arms had the highest positive likelihood ratio (+LR) of 4.1 (95% CI 2.5-6.5) and a negative likelihood ratio (-LR) of 0.68 (95% CI 0.52-0.89). Radiation to right arm had a +LR of 3.8 (95% CI 2.2-6.6) and -LR of 0.86 (95% CI 0.77-0.96), vomiting had a +LR of 3.5 (95% CI 2.0-6.2) and -LR of 0.87 (95% CI 0.79-0.97), while radiation to left arm only had a +LR of 1.3 (95% CI 0.93-1.8) and a -LR of 0.9 (95% CI 0.76-1.1).

**Conclusions:** The most compelling features that increase likelihood of an MI are ST-segment and cardiac enzyme elevation, new Q-wave, and presence of an S3 heart sound. In patients where the diagnosis of MI is uncertain, radiation of pain to the shoulder OR both arms, radiation to the right arm, and vomiting had the best predictive values, while radiation to the left arm is relatively non-diagnostic.

Complications of MI

- CRASH PAD**
- Cardiac Rupture
- Arrhythmia
- Shock
- Hypertension/Heart failure
- Pericarditis/Pulmonary emboli
- Aneurysm
- DVT

Resting LVEF is a useful prognostic factor

Enoxaparin vs. Unfractionated Heparin with Fibrinolysis for ST-elevation Myocardial Infarction

NEJM 2006;354:1477-1488

**Study:** Prospective multicentre RCT.

**Patients:** 20,479 patients (median age 60 yr, 77% male) with STEMI who were scheduled to undergo fibrinolysis.

**Intervention:** Patients were randomized to receive either enoxaparin or weight based unfractionated heparin in addition to thrombolysis and standard therapies.

**Primary Outcome:** Death or recurrent nonfatal MI 30 d post-event.

**Results:** The composite primary outcome occurred less often in the enoxaparin group compared with those who received unfractionated heparin (9.9% vs. 12.0%, p<0.001, NNT=47). Taken separately, there was a trend toward reduced mortality (6.9% vs. 7.5%, p=0.11) and a significant reduction in nonfatal reinfarction (3.0% vs. 4.5%, p<0.001) in the enoxaparin group. The risk of major bleeding was significantly increased in the enoxaparin group (2.1% vs. 1.4%, p<0.001, NNH=142).

**Conclusion:** In patients with STEMI receiving thrombolysis, enoxaparin is superior to unfractionated heparin in preventing recurrent nonfatal MI and may lead to a small reduction in mortality.

## Treatment Algorithm for Chest Pain

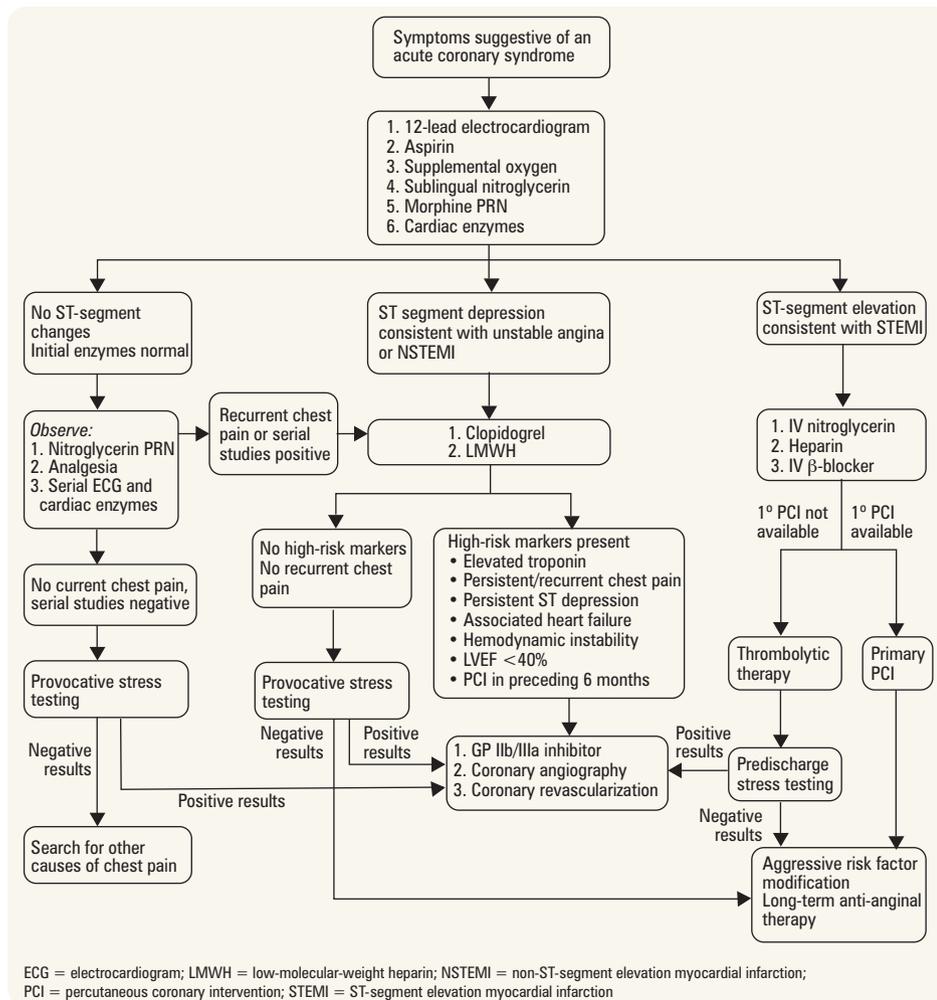

Figure 38. Treatment algorithm for patients with symptoms suggestive of an acute coronary syndrome

Adapted from: Andreoli TE, et al. Cecil Essentials of Medicine, 8th ed. 2011. Elsevier. With permission from Elsevier

**Intensive vs. Moderate Lipid Lowering with Statins after Acute Coronary Syndromes**  
*NEJM* 2004;350:1495-1504  
**Study:** Prospective, double blind, RCT; mean follow-up of 2 yr.  
**Population:** 4,162 patients who had been hospitalized for an ACS within the preceding 10 d.  
**Intervention:** Patients were randomized to receiving pravastatin 40 mg or atorvastatin 80 mg daily.  
**Primary Outcome:** Composite of death from any cause, myocardial infarction, documented unstable angina requiring rehospitalization, revascularization (performed at least 30 d after randomization), and stroke.  
**Results:** High dose atorvastatin was associated with a 16% hazard ratio reduction ( $p=0.005$ ; 95% CI 5-26%) in the primary outcome compared to standard dose pravastatin.  
**Conclusions:** In patients who recently experienced an ACS, high dose statin therapy provides greater protection against death and major cardiovascular events than standard dose therapy.

## Coronary Revascularization

### PERCUTANEOUS CORONARY INTERVENTION

- interventional cardiology technique aimed at relieving significant coronary stenosis
- main techniques: balloon angioplasty, stenting
- less common techniques: rotational/directional/extraction atherectomy

### Indications

- medically refractory angina
- NSTEMI/UA with high risk features (e.g. high TIMI risk score, see sidebar C28)
- primary/rescue PCI for STEMI

### Balloon Angioplasty and Intracoronary Stenting

- coronary lesions dilated with balloon inflation
- major complication is restenosis (approximately 15% at 6 mo), felt to be due to elastic recoil and neointimal hyperplasia
- majority of patients receive intracoronary stent(s) to prevent restenosis
  - bare metal stent (BMS) versus drug-eluting stents: PRAMI trial demonstrated stenting non-culprit lesions results in 14% absolute risk reduction of cardiac death, nonfatal MI, or refractory angina
  - coated with antiproliferative drugs (sirolimus, paclitaxel, everolimus)
  - reduced rate of neointimal hyperplasia and restenosis compared to BMS (5% vs. 20%)
  - complication: late stent thrombosis (5 events per 1,000 stents implanted)

### Treatment of NSTEMI

**BEMOAN**  
 $\beta$ -blocker  
 Enoxaparin  
 Morphine  
 O<sub>2</sub>  
 ASA  
 Nitrates

### Adjunctive Therapies

- ASA and heparin decrease post-procedural complications
- further reduction in ischemic complications has been demonstrated using GPIIb/IIIa inhibitors (abciximab, eptifibatid, tirofiban) in coronary angiography and stenting
- following stent implantation
  - dual antiplatelet therapy (ASA and clopidogrel) for 1 mo with BMS or  $\geq 12$  mo with DES
  - DAPT study showed benefit of dual antiplatelet therapy beyond 12 mo
  - ASA and prasugrel can be considered for those at increased risk of stent thrombosis

### Procedural Complications

- mortality and emergency bypass rates  $< 1\%$
- nonfatal MI: approximately 2-3%

### CORONARY ARTERY BYPASS GRAFT SURGERY

- objective of CABG is complete reperfusion of the myocardium

### Indications

- CABG
  - $\geq 50\%$  diameter stenosis in the left main coronary artery
  - $\geq 70\%$  diameter stenosis in three major coronary arteries
  - $\geq 70\%$  diameter stenosis in the proximal LAD artery plus one other major coronary artery
  - survivors of sudden cardiac arrest with presumed ischemia-mediated VT caused by significant ( $\geq 70\%$  diameter) stenosis in a major coronary artery
- other
  - $\geq 70\%$  diameter stenosis in two major coronary arteries (without proximal LAD disease) and evidence of extensive ischemia
  - $\geq 70\%$  diameter stenosis in the proximal LAD artery and evidence of extensive ischemia
  - multivessel CAD in patients with diabetes
  - LV systolic dysfunction (LVEF 35% to 50%) and significant multivessel CAD or proximal LAD stenosis where viable myocardium is present in the region of intended revascularization
- PCI
  - UA/NSTEMI if not a CABG candidate
  - STEMI when PCI can be performed more rapidly and safely than CABG
- CABG or PCI
  - one or more significant ( $\geq 70\%$  diameter) coronary artery stenosis amenable to revascularization and unacceptable angina despite medical therapy

**Table 10. Choice of Revascularization Procedure**

	PCI	CABG
<b>Advantages</b>	Less invasive technique Decreased perioperative morbidity and mortality Shorter perioperative hospitalization	Greater ability to achieve complete revascularization Decreased need for repeated revascularization procedures
<b>Indications</b>	Single or double-vessel disease Inability to tolerate surgery	Triple-vessel or left main disease DM Plaque morphology unfavourable for PCI

**Table 11. Conduits for CABG**

Graft	Occlusion/Patency Rate	Considerations
<b>Saphenous Vein Grafts (SVG)</b>	At 10 yr, 50% occluded, 25% stenotic, 25% angiographically normal	Used when arterial grafts are not available or many grafts are required, such as triple or quadruple bypass
<b>Left Internal Thoracic/Mammary Artery (LITA/LIMA) (LIMA to LAD)</b>	90-95% patency at 15 yr	Most preferred option because of excellent patency Improved event-free survival (angina, MI) Decreased late cardiac events No increase in operative risk
<b>Right Internal Thoracic/Mammary Artery (RITA/RIMA)</b>	Pedicled RIMA patency comparable to LIMA Free RIMA patency less	Used in bilateral ITA/IMA grafting Patients receiving bilateral ITAs/IMAs have less risk of recurrent angina, late MI, angioplasty
<b>Radial Artery (free graft)</b>	85-90% patency at 5 yr	Prone to severe vasospasm post-operatively due to muscular wall
<b>Right Gastroepiploic Artery</b>	80-90% patency at 5 yr	Primarily used as an in situ graft to bypass the RCA Use limited because of the fragile quality of the artery, other technical issues, increased operative time (laparotomy incision), and incisional discomfort with associated ileus
<b>Complete Arterial Revascularization</b>		For younger patients ( $< 60$ yr of age) Is preferred due to longer term graft patency
<b>Redo Bypass Grafting</b>		Operative mortality 2-3x higher than first operation 10% perioperative MI rate Reoperation undertaken only in symptomatic patients who have failed medical therapy and in whom angiography has documented progression of the disease Increased risk with redo-sternotomy secondary to adhesions which may result in laceration to aorta, RV, IMA/ITA, and other bypass grafts

#### Percutaneous Coronary Intervention vs. Coronary-Artery Bypass Grafting for Severe Coronary Artery Disease: The SYNTAX Trial

*NEJM* 2009;360:961-972

**Study:** Prospective RCT.

**Population:** 1,800 patients with untreated three-vessel or left main coronary artery disease and anatomically equivalent for both Percutaneous Intervention (PCI) and Coronary Artery Bypass Graft (CABG).

**Intervention:** PCI vs. CABG.

**Outcome:** Composite of death from any cause, stroke, MI, or repeat revascularization in 12 mo post-intervention.

**Results:** Incidence of primary outcome was lower in the CABG intervention vs. PCI (12.4% vs. 17.8%,  $p=0.002$ , NNT=19). PCI was associated with significantly higher rates of repeat revascularization (13.5% vs. 5.9%,  $p<0.001$ ) and cardiac death (3.7% vs. 2.1%,  $p=0.05$ ), while CABG had higher rates of stroke (2.2% vs. 0.6%,  $p=0.03$ ).

**Conclusions:** In patients with three-vessel or left main coronary artery disease CABG is superior to PCI in preventing major adverse cardiovascular and cerebrovascular events within 12 mo of intervention.

### Operative Issues

- left ventricular (LV) function is an important determinant of outcome of all heart diseases
- patients with severe LV dysfunction usually have poor prognosis, but surgery can sometimes dramatically improve LV function
- assess viability of non-functioning myocardial segments in patients with significant LV dysfunction using delayed thallium myocardial imaging, stress echocardiography, PET scanning, or MRI

### CABG and Antiplatelet Regimens

- please refer to CCS guidelines – 2012 update on antiplatelet therapy – for more information if possible
- prior to CABG, clopidogrel and ticagrelor should be discontinued for 5 d and prasugrel for 7 d before surgery
- dual antiplatelet therapy should be continued for 12 mo in patients with ACS within 48–72 h after CABG
- ASA (81 mg) continued indefinitely (can be started 6 h after surgery)
- patients requiring CABG after PCI should continue their dual antiplatelet therapy as recommended in the post-PCI guidelines

**Table 12. Risk Factors for CABG Mortality and Morbidity (decreasing order of significance)**

Risk Factors for CABG Mortality	Risk Factors for CABG Post-Operative Morbidity or Increased Length of Stay
Urgency of surgery (emergent or urgent)	Reoperation
Reoperation	Emergent procedure
Older age	Pre-operative intra-aortic balloon pump (IABP)
Poor left ventricular function (see below)	CHF
Female gender	CABG + valve surgery
Left main disease	Older age
Others include catastrophic conditions (cardiogenic shock, ventricular septal rupture, ongoing CPR), dialysis-dependent renal failure, end-stage COPD, DM, cerebrovascular disease, and peripheral vascular disease	Renal dysfunction
	COPD
	DM
	Cerebrovascular disease

### Procedural Complications

- CABG using cardiopulmonary bypass (CPB)
  - stroke and neurocognitive defects (microembolization of gaseous and particulate matter)
  - immunosuppression
  - systemic inflammatory response leading to
    - ◆ myocardial dysfunction
    - ◆ renal dysfunction
    - ◆ neurological injury
    - ◆ respiratory dysfunction
    - ◆ coagulopathies

### OFF-PUMP CORONARY ARTERY BYPASS SURGERY

#### Procedure

- avoids the use of CPB by allowing surgeons to operate on a beating heart
  - stabilization devices (e.g. Genzyme Immobilizer<sup>®</sup>) hold heart in place allowing operation while positioning devices (Medtronic Octopus<sup>®</sup> and Starfish<sup>®</sup> system) allow the surgeon to lift the beating heart to access the lateral and posterior vessels
  - procedure is safe and well tolerated by most patients; however, this surgery remains technically more demanding

#### Indications

- used in poor candidates for CPB who have: calcified aorta, poor LVEF, severe peripheral vascular disease (PVD), severe COPD, chronic renal failure, coagulopathy, transfusion objections (e.g. Jehovah's Witness), good target vessels, anterior/lateral wall revascularization, target revascularization in older, sicker patients
- **absolute contraindications:** hemodynamic instability, poor quality target vessels including intramyocardial vessels, diffusely diseased vessels, and calcified coronary vessels
- **relative contraindications:** cardiomegaly/CHF, critical left main disease, small distal targets, recent or current acute MI, cardiogenic shock, LVEF <35%

#### Outcomes

- OPCAB decreases in-hospital morbidity (decreased incidence of chest infection, inotropic requirement, supraventricular arrhythmia), blood product transfusion, ICU stay, length of hospitalization, and CK-MB and troponin I levels
- no significant difference in terms of survival at 2 yr, frequency of cardiac events (MI, PCI, CHF, recurrent angina, redo CABG), or medication usage compared to on-pump CABG

#### Safety and Efficacy of Drug-Eluting and Bare Metal Stents

*Circulation* 2009;119:3198-3206

**Study:** Meta-analysis of RCTs and observational studies. 22 RCTs and 34 observational studies.

**Population:** 9,470 and 182,901 patients in RCTs and observational studies respectively who underwent percutaneous coronary intervention.

**Intervention:** Drug-Eluting Stents (DES) versus Bare Metal Stents (BMS).

**Outcome:** All-cause mortality, myocardial infarction (MI), and target vessel revascularization (TVR).

**Results:** No difference in mortality was found between DES vs. BMS by RCTs, while observational studies showed significantly lower mortality rates in DES-treated patients (hazard ratio (HR) 0.78,  $p < 0.001$ ). No difference in MI incidence was found in RCTs, while lower incidences of MI were found in observational studies (HR 0.87,  $p = 0.014$ ). DES has a significantly lower TVR rate in both RCT (HR 0.45,  $p < 0.001$ ) and observational studies (HR 0.46,  $p < 0.001$ ).

**Conclusions:** DES significantly reduces rates of TVR compared to BMS. Although there is no difference in mortality or MI incidence as found by RCTs, observational studies suggest lowered mortality and MI rates in patients with DES over BMS.

# Heart Failure

- see also *CCS Heart Failure Guidelines 2012* for details (free mobile apps available on iOS and Android platforms in the CCS app stores) as well as the *CCS Heart Failure Guidelines Compendium* available at [CCS.ca](http://CCS.ca)

## Congestive Heart Failure

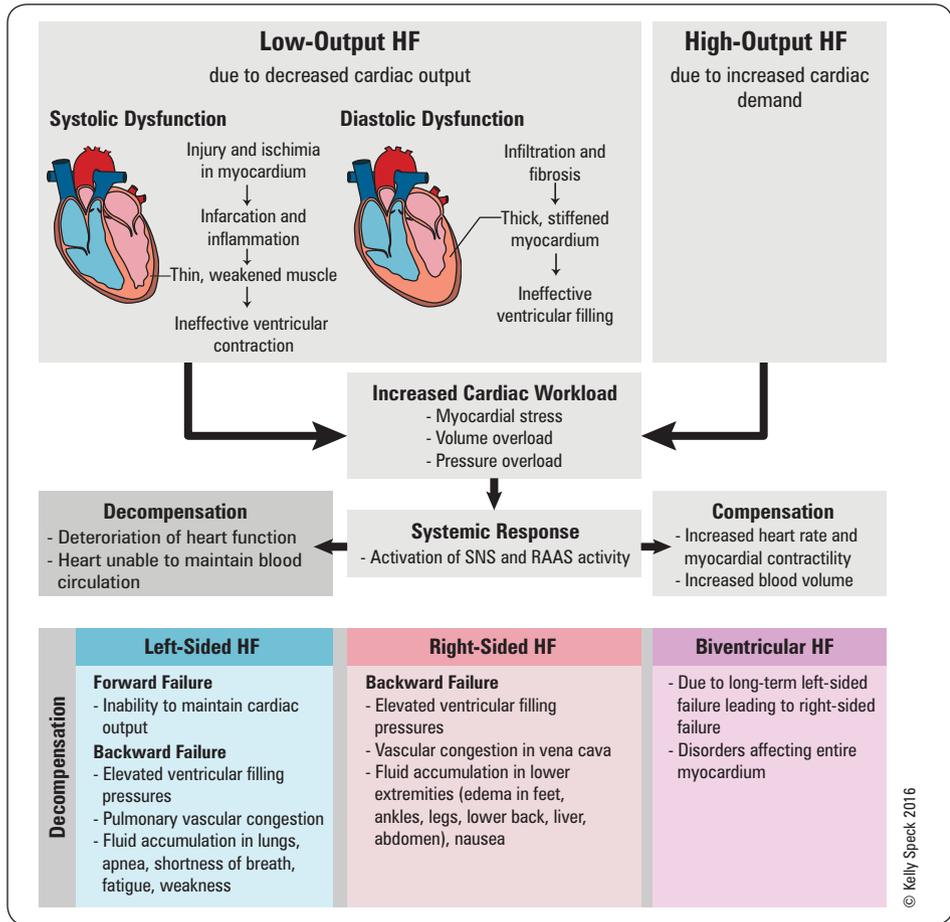

Figure 39. Congestive Heart Failure

Table 13. Signs and Symptoms of Left vs. Right Heart Failure

	Left Failure	Right Failure
<b>Low Cardiac Output</b> (Forward)	Fatigue Syncope Systemic hypotension Cool extremities Slow capillary refill Peripheral cyanosis Pulsus alternans Mitral regurgitation S3	Left failure symptoms if decreased RV output leads to LV underfilling Tricuspid regurgitation S3 (right-sided)
<b>Venous Congestion</b> (Backward)	Dyspnea, orthopnea, PND Cough Crackles	Peripheral edema Elevated JVP with abdominojugular reflux, and Kussmaul's sign Hepatomegaly Pulsatile liver

**Does this Dyspneic Patient in the Emergency Department have Congestive Heart Failure?**  
*JAMA* 2005;294:1944-1956

	LR + (95% CI)	LR - (95% CI)
Initial clinical judgment	4.4 (1.8-10.0)	0.45 (0.28-0.73)
<b>Past Medical History</b>		
Heart failure	5.8 (4.1-8.0)	0.45 (0.38-0.53)
Myocardial infarction	3.1 (2.0-4.9)	0.69 (0.58-0.82)

Atrial fibrillation	3.8 (1.7-8.8)	0.79 (0.65-0.96)
Any abnormal finding	2.2 (1.6-3.1)	0.64 (0.47-0.88)

**Dichotomies of Heart Failure**

- Forward vs. backward
- Left-sided vs. right-sided
- Systolic vs. diastolic dysfunction
- Low output vs. high output

**Use Ejection Fraction to Grade LV Dysfunction**

- Grade I (EF >60%) (Normal)
- Grade II (EF = 40-59%)
- Grade III (EF = 21-39%)
- Grade IV (EF ≤20%)

© Kelly Speck 2016

## Pathophysiology

- most common causes are ischemic heart disease, hypertension and valvular heart disease
- myocardial insult causes pump dysfunction/impaired filling leading to myocardial remodelling
  - pressure overload (e.g. AS or HTN) leads to compensatory hypertrophy (concentric remodelling) and eventually interstitial fibrosis
  - volume overload (e.g. AI) leads to dilatation (eccentric remodelling)
  - both processes lead to maladaptive changes contributing to disease process
- results in decreased volume cardiac output resulting in activation of the SNS and RAAS
- Na<sup>+</sup> and water retention, increasing preload and afterload, tachycardia
  - perpetuates cycle of increasing cardiac demand and decompensation

## Heart Failure with Reduced Ejection Fraction

- impaired myocardial contractile function → decreased LVEF and SV → decreased CO

## Volume Overload and Eccentric Remodelling is the Typical Phenotype

- findings: apex beat displaced, S3, cardiothoracic ratio >0.5, decreased LVEF, LV dilatation
- causes
  - ischemic (e.g. extensive CAD, previous MI)
  - non-ischemic
    - ◆ HTN
    - ◆ DM
    - ◆ alcohol (and other toxins)
    - ◆ myocarditis
    - ◆ dilated cardiomyopathy (multiple causes – see *Dilated Cardiomyopathy, C40*)

## Heart Failure with Preserved Ejection Fraction

- previously known as “diastolic heart failure”
- concentric remodelling with a “stiff” left ventricle is the typical phenotype
- 1/2 of patients with heart failure have preserved EF; confers similar prognosis to HRF; more common in the elderly and females
- reduced LV compliance causes increased LV filling pressures, increased LA pressure/volume, and pulmonary congestion
- findings: HTN, apex beat sustained, S4, normal-sized heart on CXR, LVH on ECG/echo, normal EF
- causes
  - transient: ischemia (relaxation of myocardium is active and requires ATP)
  - permanent
    - ◆ severe hypertrophy (HTN, aortic stenosis, HCM)
    - ◆ restrictive cardiomyopathy (e.g. amyloid)
    - ◆ MI

## High-Output Heart Failure

- caused by demand for increased cardiac output
- often exacerbates existing heart failure or decompensates a patient with other cardiac pathology
- differential diagnosis: anemia, thiamine deficiency (beriberi), hyperthyroidism, A-V fistula or L-R shunting, Paget's disease, renal disease, hepatic disease

## Precipitants of Symptomatic Exacerbations

- consider natural progression of disease vs. new precipitant
- always search for reversible cause
- differential diagnosis can also be organized as follows:
  - new cardiac insult/disease: MI, arrhythmia, valvular disease
  - new demand on CV system: HTN, anemia, thyrotoxicosis, infection, etc.
  - medication non-compliance
  - dietary indiscretion e.g. salt intake
  - obstructive sleep apnea

## Investigations

- identify and assess precipitating factors and treatable causes of CHF
- blood work: CBC, electrolytes (including calcium and magnesium), BUN, creatinine, fasting blood glucose, HbA1c, lipid profile, liver function tests, serum TSH ± ferritin, BNP, uric acid
- ECG: look for chamber enlargement, arrhythmia, ischemia/infarction
- CXR: cardiomegaly, pleural effusion, redistribution, Kerley B lines, bronchiolar-alveolar cuffing
- echo: systolic function (LVEF), diastolic function (E/A ratio, E/e'), cardiac dimensions, wall motion abnormalities, RVSP (from TR jet), valvular disease, pericardial effusion
- radionuclide angiography: LVEF
- myocardial perfusion scintigraphy (thallium or sestamibi SPECT)

**A Validated Clinical and Biochemical Score for the Diagnosis of Acute Heart Failure: the ProBNP Investigation of Dyspnea in the Emergency Department (PRIDE) Acute Heart Failure Score**  
*Am Heart J* 2006;151:48-54

Predictor	Possible Score
Age >75 yr	1
Orthopnea present	2
Lack of cough	1
Current loop diuretic use (before presentation)	1
Rales on lung exam	1
Lack of fever	2
Elevated NT-proBNP (>450 pg/mL if <50 yr, >900 pg/mL if >50 yr)	4
Interstitial edema on chest x-ray	2
<b>Total</b>	<b>/14</b>
Likelihood of heart failure	
Low = 0-5	
Intermediate = 6-8	
High = 9-14	

Brain natriuretic peptide (BNP) is secreted by ventricles due to LV stretch and wall tension. Cardiomyocytes secrete BNP precursor that is cleaved into proBNP. After secretion into ventricles, proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP. The above scoring algorithm developed by Baggish et al. is commonly used. A score of <6 has a negative predictive value of 98%, while scores ≥6 had a sensitivity of 96% and specificity of 84% (p<0.001) for the diagnosis of acute heart failure.

## New York Heart Association (NYHA) Functional Classification of Heart Failure

- **Class I:** ordinary physical activity does not cause symptoms of HF
- **Class II:** comfortable at rest, ordinary physical activity results in symptoms
- **Class III:** marked limitation of ordinary activity; less than ordinary physical activity results in symptoms
- **Class IV:** inability to carry out any physical activity without discomfort; symptoms may be present at rest

## Five Most Common Causes of CHF

- CAD (60-70%)
- HTN
- Idiopathic (often dilated cardiomyopathy)
- Valvular (e.g. AS, AR, and MR)
- Alcohol (dilated cardiomyopathy)

## Precipitants of Heart Failure

### HEART FAILED

- Hypertension (common)
- Endocarditis/environment (e.g. heat wave)
- Anemia
- Rheumatic heart disease and other valvular disease
- Thyrotoxicosis
- Failure to take meds (very common)
- Arrhythmia (common)
- Infection/Ischemia/Infarction (common)
- Lung problems (PE, pneumonia, COPD)
- Endocrine (pheochromocytoma, hyperaldosteronism)
- Dietary indiscretions (common)

### Acute Treatment of Pulmonary Edema

- treat acute precipitating factors (e.g. ischemia, arrhythmias)
- **L** – Lasix® (furosemide) 40-500 mg IV
- **M** – morphine 2-4 mg IV: decreases anxiety and preload (venodilation)
- **N** – nitroglycerin: topical/IV/SL - use with caution in preload-dependent patients (e.g. right HF or RV infarction) as it may precipitate CV collapse
- **O** – oxygen: in hypoxemic patients
- **P** – positive airway pressure (CPAP/BiPAP): decreases preload and need for ventilation when appropriate
- **P** – position: sit patient up with legs hanging down unless patient is hypotensive
- in ICU setting or failure of LMNOPP, other interventions may be necessary
  - nitroprusside IV
  - hydralazine PO
  - sympathomimetics
    - ♦ dopamine
      - low dose: selective renal vasodilation (high potency D1 agonist)
      - medium dose: inotropic support (medium potency  $\beta$ 1 agonist)
      - high dose: increases SVR (low potency  $\beta$ 1 agonist), which is undesirable
    - ♦ dobutamine
      - $\beta$ 1-selective agonist causing inotropy, tachycardia, hypotension (low dose) or hypertension (high dose); most serious side effect is arrhythmia, especially AF
    - ♦ phosphodiesterase inhibitors (milrinone)
      - inotropic effect and vascular smooth muscle relaxation (decreased SVR), similar to dobutamine
- consider pulmonary artery catheter to monitor pulmonary capillary wedge pressure (PCWP) if patient is unstable or a cardiac etiology is uncertain (PCWP >18 indicates likely cardiac etiology)
- mechanical ventilation as needed
- rarely used, but potentially life-saving measures:
  - intra-aortic balloon pump (IABP) - reduces afterload via systolic unloading and improves coronary perfusion via diastolic augmentation
  - left or right ventricular assist device (LVAD/RVAD)
  - cardiac transplant

### Long-Term Management

- overwhelming majority of evidence-based management applies to HFREF
- currently no proven pharmacologic therapies shown to reduce mortality in HFPEF; control risk factors (e.g. hypertension)

### Conservative Measures

- symptomatic measures: oxygen in hospital, bedrest, elevate the head of bed
- lifestyle measures: diet, exercise, DM control, smoking cessation, decrease alcohol consumption, patient education, sodium and fluid restriction
- multidisciplinary heart failure clinics: for management of individuals at higher risk, or with recent hospitalization

### Non-Pharmacological Management

- from CCS guidelines (2013 update)
- cardiac rehabilitation: participation in a structured exercise program for NYHA class I-III after clinical status assessment to improve quality of life (HF-ACTION trial)

### Pharmacological Therapy

#### 1. Renin-angiotensin-aldosterone blockade

- ACEI: standard of care – slows progression of LV dysfunction and improves survival
  - ♦ all symptomatic patients functional class II-IV
  - ♦ all asymptomatic patients with LVEF <40%
  - ♦ post-MI
- angiotensin II receptor blockers
  - ♦ second-line to ACEI if not tolerated, or as adjunct to ACEI if  $\beta$ -blockers not tolerated
    - combination with ACEI is not routinely recommended and should be used with caution as it may precipitate hyperkalemia, renal failure, the need for dialysis and increase (CHARM, ONTARGET)
  - ♦ combination angiotensin II receptor blockers with neprilysin inhibitors (ARNI) is a new class of medication that has morbidity and mortality benefit over ACEI alone; it has been recommended to replace ACEI or ARBs for patients who have persistent symptoms (PARADIGM HF)

#### 2. $\beta$ -blockers: slow progression and improve survival

- class I-III with LVEF <40%
- stable class IV patients
- carvedilol improves survival in class IV HF (COMET)
- note: should be used cautiously, titrate slowly because may initially worsen CHF

The most common cause of right heart failure is left heart failure

#### Measuring NT-Pro BNP

BNP is secreted by ventricles due to LV stretch and wall tension

Cardiomyocytes secrete BNP precursor that is cleaved into proBNP

After secretion into ventricles proBNP is cleaved into the active C-terminal portion and the inactive NT-proBNP portion

#### NT-proBNP levels (pg/mL)

Age	HF very likely
<50	>450
50-75	>900
>75	>1800

Limitations: Age, body habitus, renal function, pulmonary embolism

#### Features of Heart Failure on CXR

##### HERB-B

Heart enlargement (cardiothoracic ratio >0.50)

Pleural Effusion

Re-distribution (alveolar edema)

Kerley B lines

Bronchiolar-alveolar cuffing

Patients on  $\beta$ -blocker therapy who have acute decompensated heart failure should continue  $\beta$ -blockers where possible (provided they are not in cardiogenic shock or in severe pulmonary edema)

#### Can the Clinical Examination Diagnose Left-Sided Heart Failure in Adults?

##### From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3478992>

**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of CHF.

**Results:** The diagnosis of left ventricular dysfunction in patient after an MI based on the presence of radiographic pulmonary venous congestion with edema, rales one-third up the lung fields in the absence of a chronic pulmonary disease, or a 3rd heart sound had a positive likelihood ratio (+LR) of 3.1 (95% CI 1.7-5.8) and a negative likelihood ratio (-LR) of 0.62 (95% CI 0.46-0.83). In inpatients the combination of clinical findings, ECG, and CXR had a +LR of 2.0 (95% CI 1.6-2.5) and a -LR of 0.41 (95% CI 0.30-0.56). Female sex (+LR, 1.6 [95% CI 1.2-2.2]) and sBP  $\geq$ 160 mmHg (+LR, 1.8 [95% CI 1.3-2.6]) were most indicative for diastolic dysfunction. Heart rate  $\geq$ 100/min (+LR 0.43 [95% CI 0.28-0.65]) and left atrial ECG abnormality (+LR 0.42 [95% CI 0.26-0.63]) were most indicative for systolic dysfunction.

**Conclusions:** Patients with signs, symptoms, and risk factors for systolic dysfunction should receive an ECG and CXR. Female sex and sBP  $\geq$ 160 mmHg are suggestive of diastolic dysfunction; heart rate  $\geq$ 100/min and left atrial ECG abnormality suggest systolic dysfunction.

3. **Mineralocorticoid receptor (aldosterone) antagonists:** mortality benefit in symptomatic heart failure and severely depressed ejection fraction
  - spironolactone or eplerenone symptomatic heart failure in patients already on ACEI, beta blocker and loop diuretic
  - note: potential for life threatening hyperkalemia
    - ◆ monitor  $K^+$  after initiation and avoid if  $Cr > 220 \mu\text{mol/L}$  or  $K^+ > 5.2 \text{ mmol/L}$
4. **Diuretics:** symptom control, management of fluid overload
  - furosemide (40-500 mg daily) for potent diuresis
  - metolazone may be used with furosemide to increase diuresis
  - furosemide, metolazone, and thiazides oppose the hyperkalemia that can be induced by  $\beta$ -blockers, ACEI, ARBs, and aldosterone antagonists
5. **Digoxin and cardiac glycosides:** digoxin improves symptoms and decreases hospitalizations, no effect on mortality
  - indications: patient in sinus rhythm and symptomatic on ACEI, or CHF and AFib
  - patients on digitalis glycosides may worsen if these are withdrawn
6. **Antiarrhythmic drugs:** for use in CHF with arrhythmia
  - can use amiodarone,  $\beta$ -blocker, or digoxin
7. **Anticoagulants:** warfarin for prevention of thromboembolic events
  - prior thromboembolic event or AFib, presence of LV thrombus on echo

**Procedural Interventions**

- resynchronization therapy: symptomatic improvement with biventricular pacemaker
- consider if QRS  $> 130$  msec, LVEF  $< 35\%$ , and persistent symptoms despite optimal therapy
- greatest benefit likely with marked LV enlargement, mitral regurgitation, QRS  $> 150$  msec,
- ICD: mortality benefit in 1° prevention of sudden cardiac death
  - prior MI, optimal medical therapy, LVEF  $< 30\%$ , clinically stable
  - prior MI, non-sustained VT, LVEF 30-40%, EPS inducible VT
- LVAD/RVAD (see *Ventricular Assist Devices, C38*)
- cardiac transplantation (see *Cardiac Transplantation, C38*)
- valve repair if patient is surgical candidate and has significant valve disease contributing to CHF (see *Valvular Heart Disease, C43*)

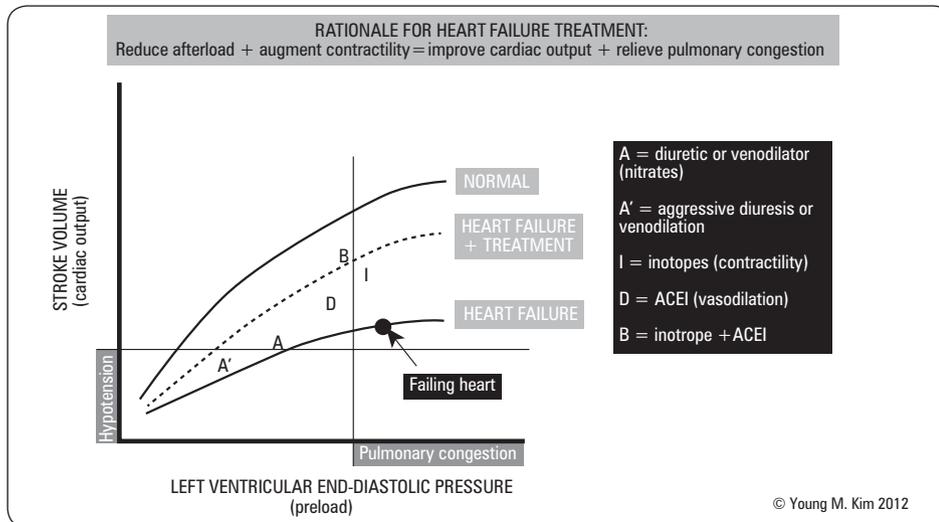

Figure 40. Effect of heart failure treatment on the Frank-Starling curve

**Chronic Treatment of CHF**

- ACEI\*
- $\beta$ -blockers\*
- $\pm$  Mineralocorticoid receptor antagonists\*
- Diuretic
- $\pm$  Inotrope
- $\pm$  Antiarrhythmic
- $\pm$  Anticoagulant
- \*Mortality benefit

**Influence of Ejection Fraction on Cardiovascular Outcomes in a Broad Spectrum of Heart Failure Patients**

*Circulation* 2005;112:3738-3744

**Purpose:** Understand the relationship between ejection fractions and cardiovascular risk in patients with heart failure.

**Methods:** 7,599 patients from the CHARM study (Candesartan in Heart failure: Assessment of Reduction in Mortality and morbidity; RCT comparing placebo vs. candesartan in patients with NYHA class II to IV). Compared LVEF to cardiovascular outcomes and causes of death.

**Results:** All-cause mortality increased by 39% per 10% reduction in LVEF below 45% (Hazard ratio 1.39, 95% CI 1.32-1.46). For LVEF  $> 45\%$ , ejection fraction does not further contribute to assessment of cardiovascular risk in HF patients.

**Conclusions:** At LVEF  $< 45\%$ , lower ejection fractions were associated with poorer cardiovascular outcomes.

LVEF	CHF Hospitalization	All-Cause Mortality
$\leq 22\%$	14.9%	15.4%
23-32%	10.9%	10.8%
33-42%	7.2%	7.4%
43-52%	5.7%	5.2%
$> 52\%$	6.9%	5.7%

**Higher New York Heart Association Classes and Increased Mortality and Hospitalization in Patients with Heart Failure and Preserved Left Ventricular Function**

*Am Heart J* 2006;151:444-450

**Purpose:** To establish the association between NYHA class and outcomes with heart failure and preserved systolic function.

**Methods:** Retrospective follow-up study (median 38.5 mo) of 988 patients with heart failure with ejection fraction  $> 45\%$ . Estimated risks of various outcomes using Cox proportional hazard models.

**Results:** Adjusted hazard ratio for all-cause mortality for NYHA class II, III, IV patients was 1.54, 2.56, and 8.46, respectively. Adjusted hazard ratio for all-cause hospitalization for NYHA class II, III, IV patients was 1.23, 1.71, and 3.4, respectively.

**Conclusions:** Higher NYHA classes were associated with poorer outcomes in patients with heart failure and preserved systolic function. Proportions of NYHA I, II, III, and IV patients who died of all causes during the study were 14.3%.

NYHA	Proportion of All-Cause Hospitalization	Proportion of All-Cause Mortality
I	60.7%	14.3%
II	65.2%	21.3%
III	77.7%	35.9%
IV	75.0%	58.3%

**Sleep-Disordered Breathing**

- 45-55% of patients with CHF have sleep disturbances, including Cheyne-Stokes breathing and sleep apnea (central or obstructive)
- associated with a worse prognosis and greater LV dysfunction
- nasal continuous positive airway pressure (CPAP) is effective in treating symptoms of sleep apnea with secondary beneficial effects in cardiac function and symptoms

## Cardiac Transplantation

- treatment for end-stage heart disease; due to ischemic or non-ischemic cardiomyopathy
- worldwide 1 yr survival is 85-90%, 5 yr survival about 60%, annual mortality rate of 4%
- matching is according to blood type, body size and weight (should be within 25%), and HLA tissue matching (if time allows)

### Indications for Surgery

- severe cardiac disability despite maximal medical therapy (e.g. recurrent hospitalizations for CHF, NYHA III or IV, peak metabolic oxygen consumption <14 mL/kg/min in absence of  $\beta$ -blocker)
- symptomatic cardiac ischemia refractory to conventional treatment (e.g. unstable angina not amenable to CABG or PCI with LVEF <30%; recurrent, symptomatic ventricular arrhythmias)
- exclusion of all surgical alternatives to cardiac transplantation

### Prerequisites

- psychosocial stability
- medically compliant and motivated
- relative contraindications: incurable malignancy, major systemic illness, irreversible major organ disease, active systemic infection, obesity, irreversible pulmonary HTN (pulmonary vascular resistance [PVR] >6 Wood units), severe COPD (FEV1 <1 L) or active drug addiction or alcoholism

### Complications

- rejection
  - common, <5% have serious hemodynamic compromise
  - gold standard to detect rejection: endomyocardial biopsy
  - risk of acute rejection is greatest during the first 3 mo after transplant
- infection
  - leading cause of morbidity and mortality after cardiac transplantation
  - risk peaks early during the first few months after transplantation and then declines to a low persistent rate
- allograft CAD
  - approximately 50% develop graft CAD within 5 yr of transplantation
  - most common cause of late death following transplantation
- malignancy
  - develops in 15% of cardiac transplant recipients due to immunosuppressive medication
  - second most common cause of late death following transplantation
  - cutaneous neoplasms most common, followed by non-Hodgkin's lymphoma and lung cancer
- immunosuppressive medication side effects (prednisone, cyclosporine, tacrolimus, sirolimus)

## Ventricular Assist Devices

- work to unload the ventricle while maintaining output; also results in decreased myocardial oxygen consumption permitting recovery of the myocardium that is not irreversibly injured
- can support the left (LVAD), right (RVAD), or both ventricles (BiVAD)
- indications
  - bridge to transplantation, bridge to decision (for transplant), or long term permanent therapy ("destination therapy")
  - post-operative mechanical support when unable to separate from cardiopulmonary bypass despite inotropic and intra-aortic balloon pump (IABP) support
  - IABP is a catheter based device inserted into the femoral artery and advanced to the descending aorta that decreases myocardial O<sub>2</sub> demand and increases blood flow to coronary arteries
  - inflation of the balloon occurs during diastole to increase ascending aorta and coronary artery perfusion pressure; deflation occurs at systole to reduce intra-aortic pressure thus reducing afterload
- post-operative cardiogenic shock

#### Effects of Donor Pre-Treatment with Dopamine on Survival After Heart Transplantation: A Cohort Study of Heart Transplant Recipients Nested in a Randomized Controlled Multicentre Trial

*J Am Coll Cardiol* 2010;58:1768-1777

Treatment of brain-dead donors with dopamine of 4  $\mu$ g/kg/min will not harm cardiac allografts but appears to improve the clinical course of the heart allograft recipient.

#### REMATCH Trial

*NEJM* 2001;345:1435-1443

Increased survival of 23% vs. 8% with LVAD vs. medical management of heart failure after 2 yr. Heartmate VAD has a biologic surface therefore does not require long-term anticoagulation but higher risk of infection

#### Canadian Cardiovascular Society Focused Position Statement Update on Assessment of the Cardiac Patient for Fitness to Drive: Fitness following Left Ventricular Assist Device Implantation

*Can J Cardiol* 2012;28:137-140

Patients with a continuous flow, NYHA class I-III, LVAD that are stable 2 mo post LVAD implantation qualify for private driving only and are disqualified from commercial driving.

# Myocardial Disease

## Definition of Cardiomyopathy

- intrinsic or primary myocardial disease not secondary to congenital, hypertensive, coronary, valvular, or pericardial disease
- functional classification: dilated, hypertrophic, or restrictive
- LV dysfunction 2° to MI often termed “ischemic cardiomyopathy”, is not a true cardiomyopathy (i.e. primary myocardial disorder) since the primary pathology is obstructive CAD

Table 14. Summary Table for CHF and Myocardial Disease

Heart Failure Reduced Ejection Fraction		Heart Failure Preserved Ejection Fraction		
<b>Dilated Cardiomyopathy</b>	<b>Secondary Causes</b>	<b>Hypertrophic Cardiomyopathy</b>	<b>Restrictive Cardiomyopathy</b>	<b>Secondary Causes</b>
Idiopathic, infectious (e.g. myocarditis), alcohol, familial, collagen vascular disease, etc.	CAD, MI, DM, valvular (e.g. AR, MR)	Genetic disorder affecting cardiac sarcomeres (most common cause of sudden cardiac death in young athletes)	Amyloidosis, sarcoidosis, scleroderma, hemochromatosis, Fabry's, Pompe's Disease, Loeffler's, etc.	HTN, DM, valvular (e.g. AS), post-MI, transiently by ischemia, etc.

### Cardiomyopathy

#### HARD

Hypertrophic cardiomyopathy  
Arrhythmogenic right ventricular cardiomyopathy  
Restrictive cardiomyopathy  
Dilated cardiomyopathy

## Myocarditis

### Definition

- inflammatory process involving the myocardium ranging from acute to chronic; an important cause of dilated cardiomyopathy

### Etiology

- idiopathic
- infectious
  - viral (most common): parvovirus B19, influenza, coxsackie B, echovirus, poliovirus, HIV, mumps
  - bacterial: *S. aureus*, *C. perfringens*, *C. diphtheriae*, *Mycoplasma*, *Rickettsia*
  - fungi
  - spirochetal (Lyme disease – *Borrelia burgdorferi*)
  - Chagas disease (*Trypanosoma cruzi*), toxoplasmosis
- toxic: catecholamines, chemotherapy, cocaine
- hypersensitivity/eosinophilic: drugs (antibiotics, diuretics, lithium, clozapine), insect/snake bites
- systemic diseases: collagen vascular diseases (SLE, rheumatoid arthritis, others), sarcoidosis, autoimmune
- other: giant cell myocarditis, acute rheumatic fever

### Signs and Symptoms

- constitutional symptoms
- acute CHF - dyspnea, tachycardia, elevated JVP
- chest pain – due to pericarditis or cardiac ischemia
- arrhythmias
- systemic or pulmonary emboli
- pre-syncope/syncope/sudden death

### Investigations

- ECG: non-specific ST-T changes ± conduction defects
- blood work
  - increased CK, troponin, LDH, and AST with acute myocardial necrosis ± increased WBC, ESR, ANA, rheumatoid factor, complement levels
  - blood culture, viral titres and cold agglutinins for *Mycoplasma*
- CXR: enlarged cardiac silhouette
- echo: dilated, hypokinetic chambers, segmental wall motion abnormalities
- cardiovascular magnetic resonance: functional and morphological abnormalities as well as tissue pathology (gadolinium enhancement)
- myocardial biopsy

### Management

- supportive care
- restrict physical activity
- treat CHF
- treat arrhythmias
- anticoagulation
- treat underlying cause if possible

**Prognosis**

- often unrecognized, and may be self-limited
- myocarditis treatment trial showed 5 yr mortality between 25-50%
- giant cell myocarditis, although rare can present with fulminant CHF and be rapidly fatal, with 5 yr mortality >80%
- sudden death in young adults
- may progress to dilated cardiomyopathy

**Dilated Cardiomyopathy****Definition**

- unexplained dilation and impaired systolic function of one or both ventricles

**Etiology**

- idiopathic (presumed viral or idiopathic) ~50% of DCM
- alcohol
- familial/genetic
- uncontrolled tachycardia (e.g. persistent rapid AFib)
- collagen vascular disease: SLE, polyarteritis nodosa, dermatomyositis, progressive systemic sclerosis
- infectious: viral (coxsackie B, HIV), Chagas disease, Lyme disease, Rickettsial diseases, acute rheumatic fever, toxoplasmosis
- neuromuscular disease: Duchenne muscular dystrophy, myotonic dystrophy, Friedreich's ataxia
- metabolic: uremia, nutritional deficiency (thiamine, selenium, carnitine)
- endocrine: hyper/hypothyroidism, DM, pheochromocytoma
- peripartum
- toxic: cocaine, heroin, organic solvents
- drugs: chemotherapies (doxorubicin, cyclophosphamide), anti-retrovirals, chloroquine, clozapine, TCA
- radiation

**Signs and Symptoms**

- may present as
  - CHF
  - systemic or pulmonary emboli
  - arrhythmias
  - sudden death (major cause of mortality due to fatal arrhythmia)

**Investigations**

- blood work: CBC, electrolytes, Cr, bicarbonate, BNP, CK, troponin, LFTs, TSH, TIBC
- ECG: variable ST-T wave abnormalities, poor R wave progression, conduction defects (e.g. BBB), arrhythmias (non-sustained VT)
- CXR: global cardiomegaly (globular heart), signs of CHF, pleural effusion
- echo: chamber enlargement, global hypokinesis, depressed LVEF, MR and TR, mural thrombi
- endomyocardial biopsy: not routine, used to rule out a treatable cause
- coronary angiography: in selected patients to exclude ischemic heart disease

**Management**

- treat underlying disease: e.g. abstinence from alcohol
- treat CHF: *see Heart Failure, C34*
- thromboembolism prophylaxis: anticoagulation with warfarin
  - indicated for: AFib, history of thromboembolism or documented thrombus
- treat symptomatic or serious arrhythmias
- immunize against influenza and *S. pneumoniae*
- consider surgical options (e.g. LVAD, transplant, volume reduction surgery) in appropriate candidates with severe, drug refractory disease
- consider ICD among patients with a LVEF <30%

**Prognosis**

- depends on etiology
- better with reversible underlying cause, worst with infiltrative diseases, HIV, drug-induced
- cause of death usually CHF (due to pump failure) or sudden death 2° to ventricular arrhythmias
- systemic emboli are significant source of morbidity
- 20% mortality in 1st yr, 10% per year after

Major Risks Factors for DCM  
Alcohol, cocaine, family history

Abnormal Labs in DCM

- High BNP
- High Cr
- High LFTs
- Low bicarbonate
- Low Na<sup>+</sup>

## Hypertrophic Cardiomyopathy

- see 2011 ACCF/AHA Guideline for the Diagnosis and Treatment of Hypertrophic Cardiomyopathy for details

### Definition

- defined as unexplained ventricular hypertrophy
- various patterns of HCM are classified, but most causes involve pattern of septal hypertrophy

### Etiology and Pathophysiology

- histopathologic features include myocyte disarray, myocyte hypertrophy, and interstitial fibrosis
- cause is felt to be a genetic defect involving one of the cardiac sarcomeric proteins (>400 mutations associated with autosomal dominant inheritance, incomplete penetrance)
- prevalence of 1/500-1/1,000 in general population
- generally presents in early adulthood

### Hemodynamic Classification

- hypertrophic obstructive cardiomyopathy (HOCM): dynamic LV outflow tract (LVOT) obstruction, either at rest or with provocation, defined as LVOT gradient of at least 30 mmHg
  - dynamic i.e. obstruction (and the murmur) is reduced with maneuvers that increase preload, and augmented with maneuvers that reduce preload
- non-obstructive HCM: no LVOT obstruction
- many patients have diastolic dysfunction (impaired ventricular filling secondary to LV hypertrophy which decreases compliance)

### Signs and Symptoms

- clinical manifestations: asymptomatic (common, therefore screening is important), SOB on exertion, angina, presyncope/syncope (due to LV outflow obstruction or arrhythmia), CHF, arrhythmias, SCD
- pulses: rapid upstroke, "spike and dome" pattern in carotid pulse (in HCM with outflow tract obstruction)
- precordial palpation: PMI localized, sustained, double impulse, 'triple ripple' (triple apical impulse in HOCM), LV lift
- precordial auscultation: normal or paradoxically split S2, S4, harsh systolic diamond-shaped murmur at LLSB or apex, enhanced by squat standing or Valsalva (murmur secondary to LVOT obstruction as compared to AS); often with pansystolic murmur due to mitral regurgitation

### Investigations

- ECG/Holter monitor: LVH, high voltages across precordium, prominent Q waves (lead I, aVL, V5, V6), tall R wave in V1, P wave abnormalities
- transthoracic echocardiography and echo-Doppler study: asymmetric septal hypertrophy (less commonly apical), systolic anterior motion (SAM) of mitral valve and MR; LVOT gradient can be estimated by Doppler measurement
- genetic studies ( $\pm$  magnetic resonance imaging) can be helpful when echocardiography is inconclusive for diagnosis
- cardiac catheterization (only when patient being considered for invasive therapy)

### Management

- avoid factors which increase obstruction (e.g. volume depletion)
  - avoidance of all competitive sports
- treatment of obstructive HCM
  - medical agents:  $\beta$ -blockers, disopyramide, verapamil (started only in monitored setting), phenylephrine (in setting of cardiogenic shock)
  - avoid nitrates, diuretics, and ACEI as they increase LVOT gradient and worsen symptoms
- patients with obstructive HCM and drug-refractory symptoms
  - surgical myectomy
  - alcohol septal ablation - percutaneous Intervention that ablates the hypertrophic septum with 100% ethanol via the septal artery
  - dual chamber pacing (rarely done)
- treatment of patients at high risk of sudden death : ICD
- first-degree relatives (children, siblings, parents) of patients with HCM should be screened (physical, ECG, 2D echo) every 12-18 mo during during adolescence, then serially every 5 yr during adulthood

### Prognosis

- potential complications: AFib, VT, CHF, sudden cardiac death (1% risk/yr; most common cause of SCD in young athletes)
  - major risk factors for sudden death (consider ICD placement)
  - history of survived cardiac arrest/sustained VT
  - family history of multiple premature sudden deaths
  - other factors associated with increased risk of sudden cardiac death
    - ◆ syncope (presumed to be arrhythmic in origin)
    - ◆ non-sustained VT on ambulatory monitoring
    - ◆ marked ventricular hypertrophy (maximum wall thickness  $\geq 30$  mm)
    - ◆ abnormal BP in response to exercise (in patients <40 yr old with HCM)

**RCM vs. Constrictive Pericarditis (CP)**  
Present similarly but CP is treatable with surgery

## Restrictive Cardiomyopathy

### Definition

- impaired ventricular filling with preserved systolic function in a non-dilated, non-hypertrophied ventricle secondary to factors that decrease myocardial compliance (fibrosis and/or infiltration)

### Etiology

- infiltrative: amyloidosis, sarcoidosis
- non-infiltrative: scleroderma, idiopathic myocardial fibrosis
- storage diseases: hemochromatosis, Fabry's disease, Gaucher's disease, glycogen storage diseases
- endomyocardial
  - endomyocardial fibrosis, Loeffler's endocarditis, or eosinophilic endomyocardial disease
  - radiation heart disease
  - carcinoid syndrome (may have associated tricuspid valve or pulmonary valve dysfunction)

### Clinical Manifestations

- CHF (usually with preserved LV systolic function), arrhythmias
- elevated JVP with prominent x and y descents, Kussmaul's sign
- S3, S4, MR, TR
- thromboembolic events

### Investigations

- ECG: low voltage, non-specific, diffuse ST-T wave changes  $\pm$  non-ischemic Q waves
- CXR: mild cardiac enlargement
- Echo: LAE, RAE; specific Doppler findings with no significant respiratory variation
- cardiac catheterization: increased end-diastolic ventricular pressures
- endomyocardial biopsy: to determine etiology (especially for infiltrative RCM)

### Management

- exclude constrictive pericarditis
- treat underlying disease: control HR, anticoagulate if AFib
- supportive care and treatment for CHF, arrhythmias
- heart transplant: might be considered for CHF refractory to medical therapy

### Prognosis

- depends on etiology

#### Key Investigations

- Echo: may show respiratory variation in blood flow in CP
- CT: may show very thickened pericardium and calcification in CP
- MRI: best modality to directly visualize pericardium and myocardium

## Valvular Heart Disease

- see *Guidelines on the Management of Valvular Heart Disease*. JACC Jun 10;63(22):2438-88 for details

### Infective Endocarditis

- see [Infectious Diseases, ID16](#)
- American Heart Association (AHA) 2007 guidelines recommend IE prophylaxis
  - only for patients with
    - ♦ prosthetic valve material
    - ♦ past history of IE
    - ♦ certain types of congenital heart disease
    - ♦ cardiac transplant recipients who develop valvulopathy
  - only for the following procedures
    - ♦ dental
    - ♦ respiratory tract
    - ♦ procedures on infected skin/skin structures/MSK structures
    - ♦ not GI/GU procedures specifically

## Rheumatic Fever

- see [Pediatrics, P58](#)

### Prognosis

- acute complications: myocarditis (DCM/CHF), conduction abnormalities (sinus tachycardia, AFib), valvulitis (acute MR), acute pericarditis (not constrictive pericarditis)
- chronic complications: rheumatic valvular heart disease – fibrous thickening, adhesion, calcification of valve leaflets resulting in stenosis/regurgitation, increased risk of IE ± thromboembolism
- onset of symptoms usually after 10-20 yr latency from acute carditis of rheumatic fever
- mitral valve most commonly affected

### Mitral Valve Repair vs. Replacement for Severe Ischemic Mitral Regurgitation

*NEJM* 2014;370:23-32

**Purpose:** Ischemic mitral regurgitation is associated with significant mortality risk. The purpose of this study was to compare the effectiveness and safety of repairing versus replacing the mitral valve in patients with severe chronic ischemic mitral regurgitation.

**Study Design:** RCT with 251 patients with severe ischemic mitral regurgitation were randomly assigned to mitral valve repair or chordal-sparing replacement. The primary endpoint was the left ventricular end-systolic volume index (LVESVI) at 12 mo.

**Results:** There were no significant between-group differences in LVESVI, in the rate of major adverse cardiac or cerebrovascular events, in functional status, or in quality of life at 12 mo. The rate of moderate or severe mitral regurgitation recurrence at 12 mo was significantly higher in the repair group than in the replacement group (32.6% vs. 2.3%, respectively).

**Conclusions:** No significant difference in left ventricular reverse remodelling or survival at 12 mo between patients who underwent mitral valve repair or replacement. Replacement provided more durable correction of mitral regurgitation, but there were no significant differences in clinical outcomes.

## Valve Repair and Valve Replacement

- indication for valve repair or replacement depends on the severity of the pathology; typically recommended when medical management has failed to adequately improve the symptoms or reduce the risk of morbidity and mortality
- pathologies that may require surgical intervention include congenital defects, infections, rheumatic heart disease as well as a variety of valve diseases associated with aging
- valve repair: balloon valvuloplasty, surgical valvuloplasty (commissurotomy, annuloplasty), chordae tendineae shortening, tissue patch
- valve replacement: typically for aortic or mitral valves only; mitral valve repair is favoured in younger individuals; percutaneous techniques being established

## Choice of Valve Prosthesis

**Table 15. Mechanical Valve vs. Bioprosthetic Valve**

Mechanical Valve	Bioprosthetic Valve
Good durability	Limited long-term durability (mitral < aortic)
Less preferred in small aortic root sizes	Good flow in small aortic root sizes
Increased risk of thromboembolism (1-3%/yr); requires long-term anticoagulation with coumadin	Decreased risk of thromboembolism: long-term anticoagulation not needed for aortic valves
Target INR Aortic valves: 2.0-3.0 (mean 2.5) Mitral valves: 2.5-3.5 (mean 3.0)	Some recommendation for limited anticoagulation for mitral valves
Increased risk of hemorrhage: 1-2%/yr	Decreased risk of hemorrhage

## Summary of Valvular Disease

Table 16. Valvular Heart Disease

### Aortic Stenosis (AS)

#### Etiology

Congenital (bicuspid, unicuspid valve), calcification (wear and tear), rheumatic disease

#### Definition

Normal aortic valve area = 3–4 cm<sup>2</sup>  
Mild AS 1.5 to 3 cm<sup>2</sup>  
Moderate AS 1.0 to 1.5 cm<sup>2</sup>  
Severe AS <1.0 cm<sup>2</sup>  
Critical AS <0.5 cm<sup>2</sup>

#### Pathophysiology

Outflow obstruction → increased EDP → concentric LVH → LV failure → CHF, subendocardial ischemia

#### Symptoms

Exertional angina, syncope, dyspnea, PND, orthopnea, peripheral edema

#### Physical Exam

Narrow pulse pressure, brachial-radial delay, pulsus parvus et tardus, sustained PMI  
Auscultation: crescendo-decrescendo SEM radiating to R clavicle and carotid, musical quality at apex (Gallavardin phenomenon), S<sub>4</sub>, soft S<sub>2</sub> with paradoxical splitting, S<sub>3</sub> (late)

#### Investigations

ECG: LVH and strain, LBBB, LAE, AFib  
CXR: post-stenotic aortic root dilatation, calcified valve, LVH, LAE, CHF  
Echo: reduced valve area, pressure gradient, LVH, reduced LV function

#### Treatment

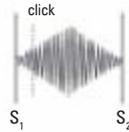

Asymptomatic: serial echos, avoid exertion  
Symptomatic: avoid nitrates/arterial dilators and ACEI in severe AS  
Surgery if: symptomatic or LV dysfunction

#### Surgical Options

Valve replacement: aortic rheumatic valve disease and trileaflet valve  
– prior to pregnancy (if AS significant)  
– balloon valvuloplasty (in very young)

#### Interventional Options

Percutaneous valve replacement (transfemoral or transapical approach) is an option in selected patients who are not considered good candidates for surgery

© Anas Nader 2011

### Aortic Regurgitation (AR)

#### Etiology

Supravalvular: aortic root disease (Marfan's, atherosclerosis and dissecting aneurysm, connective tissue disease)  
Valvular: congenital (bicuspid aortic valve, large VSD), IE  
Acute Onset: IE, aortic dissection, trauma, failed prosthetic valve

#### Pathophysiology

Volume overload → LV dilatation → increased SV, high sBP and low DBP → increased wall tension → pressure overload → LVH (low DBP → decreased coronary perfusion)

#### Symptoms

Usually only becomes symptomatic late in disease when LV failure develops  
Dyspnea, orthopnea, PND, syncope, angina

#### Physical Exam

Waterhammer pulse, bisferiens pulse, femoral-brachial sBP >20 (Hill's test wide pulse pressure), hyperdynamic apex, displaced PMI, heaving apex  
Auscultation: early decrescendo diastolic murmur at LLSB (cusp pathology) or RLSB (aortic root pathology), best heard sitting, leaning forward, on full expiration, soft S<sub>1</sub>, absent S<sub>2</sub>, S<sub>3</sub> (late)

#### Investigations

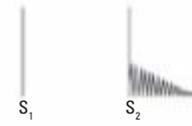

ECG: LVH, LAE  
CXR: LVH, LAE, aortic root dilatation  
Echo/TTE: quantify AR, leaflet or aortic root anomalies  
Cath: if >40 yr and surgical candidate – to assess for ischemic heart disease  
Exercise testing: hypotension with exercise

#### Treatment

Asymptomatic: serial echos, afterload reduction (e.g. ACEI, nifedipine, hydralazine)  
Symptomatic: avoid exertion, treat CHF  
Surgery if: NYHA class III-IV CHF; LV dilatation and/or LVEF <50% with/without symptoms

#### Surgical Options

Valve replacement: most patients  
Valve repair: very limited role  
Aortic root replacement (Bentall procedure):  
– when ascending aortic aneurysm present, valved conduit used

© Anas Nader 2011

### Mitral Stenosis (MS)

#### Etiology

Rheumatic disease most common cause, congenital (rare)

#### Definition

Severe MS is mitral valve area (MVA) <1.5 cm<sup>2</sup>

#### Pathophysiology

MS → fixed CO and LAE → increased LA pressure → pulmonary vascular resistance and CHF; worse with AFib (no atrial kick), tachycardia (decreased atrial emptying time) and pregnancy (increased preload)

#### Symptoms

SOB on exertion, orthopnea, fatigue, palpitations, peripheral edema, malar flush, pinched and blue facies (severe MS)

#### Physical Exam

AFib, no "a" wave on JVP, left parasternal lift, palpable diastolic thrill at apex  
Auscultation: mid-diastolic rumble at apex, best heard with bell in left lateral decubitus position following exertion, loud S<sub>1</sub>, OS following loud P<sub>2</sub> (heard best during expiration), long diastolic murmur and short A2-OS interval correlate with worse MS

#### Investigations

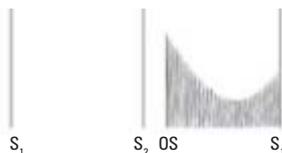

ECG: NSR/AFib, LAE (P mitrale), RVH, RAD  
CXR: LAE, CHF, mitral valve calcification  
Echo/TTE: shows restricted opening of mitral valve  
Cath: indicated in concurrent CAD if >40 yr (male) or >50 yr (female)

#### Treatment

Avoid exertion, fever (increased LA pressure), treat AFib and CHF, increase diastolic filling time (β-blockers, digitalis)  
Surgery if: NYHA class III-IV CHF and failure of medical therapy

#### Invasive Options

Percutaneous balloon valvuloplasty: young rheumatic pts and good leaflet morphology (can be determined by echo), asymptomatic pts with moderate-severe MS, pulmonary HTN  
Contraindication: left atrial thrombus, moderate MR  
Open Mitral Commissurotomy: if mild calcification + leaflet/chordal thickening  
– restenosis in 50% pts in 8 yr  
Valve replacement: indicated in moderate-severe calcification and severely scarred leaflets

© Anas Nader 2011

### Mitral Regurgitation (MR)

#### Etiology

Mitral valve prolapse, congenital cleft leaflets, LV dilatation/aneurysm (CHF, DCM, myocarditis), IE abscess, Marfan's syndrome, HOCM, acute MI, myxoma, mitral valve annulus calcification, chordae/papillary muscle trauma/ischemia/rupture (acute), rheumatic disease

#### Pathophysiology

Reduced CO → increased LV and LA pressure → LV and LA dilatation → CHF and pulmonary HTN

#### Symptoms

Dyspnea, PND, orthopnea, palpitations, peripheral edema

#### Physical Exam

Displaced hyperdynamic apex, left parasternal lift, apical thrill  
Auscultation: holosystolic murmur at apex, radiating to axilla ± mid-diastolic rumble, loud S<sub>2</sub> (if pulmonary HTN), S<sub>3</sub>

#### Investigations

ECG: LAE, left atrial delay (bifid P waves), ± LVH  
CXR: LVH, LAE, pulmonary venous HTN  
Echo: etiology and severity of MR, LV function, leaflets  
Swan-Ganz Catheter: prominent LA "v" wave

#### Treatment

Asymptomatic: serial echos  
Symptomatic: decrease preload (diuretics), decrease afterload (ACEI) for severe MR and poor surgical candidates; stabilize acute MR with vasodilators before surgery  
Surgery if: acute MR with CHF, papillary muscle rupture, NYHA class III-IV CHF, AF, increasing LV size or worsening LV function, earlier surgery if valve repairable (>90% likelihood) and patient is low-risk for surgery

#### Surgical Options

Valve repair: >75% of pts with MR and myxomatous mitral valve prolapse – annuloplasty rings, leaflet repair, chordae transfers/shorten/replacement  
Valve replacement: failure of repair, heavily calcified annulus  
Advantage of repair: low rate of endocarditis, no anticoagulation, less chance of re-operation

© Anas Nader 2011

**Table 16. Valvular Heart Disease (continued)****Tricuspid Stenosis (TS)****Etiology**

Rheumatic disease, congenital, carcinoid syndrome, fibroelastosis; usually accompanied by MS

**Pathophysiology**

Increased RA pressure → right heart failure → decreased CO and fixed on exertion

**Symptoms**

Peripheral edema, fatigue, palpitations

**Physical Exam**

Prominent "a" waves in JVP, +ve abdominojugular reflux, Kussmaul's sign, diastolic rumble 4th left intercostal space

**Investigations**

ECG: RAE

CXR: dilatation of RA without pulmonary artery enlargement

Echo: diagnostic

**Treatment**

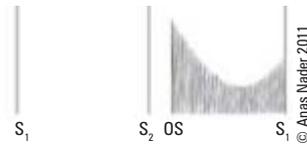

Preload reduction (diuretics), slow HR

Surgery if: only if other surgery required (e.g. mitral valve replacement)

**Surgical Options**

Valve Replacement:

- if severely diseased valve
- bioprosthesis preferred

© Anas Nader 2011

**Tricuspid Regurgitation (TR)****Etiology**

RV dilatation, IE (particularly due to IV drug use), rheumatic disease, congenital (Ebstein anomaly), carcinoid

**Pathophysiology**

RV dilatation → TR further RV dilatation → right heart failure

**Symptoms**

Peripheral edema, fatigue, palpitations

**Physical Exam**

"cv" waves in JVP, +ve abdominojugular reflux, Kussmaul's sign, holosystolic murmur at LLSB accentuated by inspiration, left parasternal lift

**Investigations**

ECG: RAE, RVH, AFib

CXR: RAE, RV enlargement

Echo: diagnostic

**Treatment**

Preload reduction (diuretics)

Surgery if: only if other surgery required (e.g. mitral valve replacement)

**Surgical Options**

Annuloplasty (i.e. repair, rarely replacement)

© Anas Nader 2011

**Pulmonary Stenosis (PS)****Etiology**

Usually congenital, rheumatic disease (rare), carcinoid syndrome

**Pathophysiology**

Increased RV pressure →

RV hypertrophy → right heart failure

**Symptoms**

Chest pain, syncope, fatigue, peripheral edema

**Physical Exam**

Systolic murmur at 2nd left intercostal space accentuated by inspiration, pulmonary ejection click, right-sided S4

**Investigations**

ECG: RVH

CXR: prominent pulmonary arteries enlarged RV

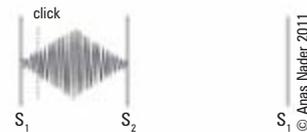

Echo: diagnostic

**Treatment**

Balloon valvuloplasty if severe symptoms

**Surgical Options**

Percutaneous or open balloon valvuloplasty

© Anas Nader 2011

**Pulmonary Regurgitation (PR)****Etiology**

Pulmonary HTN, IE, rheumatic disease, tetralogy of Fallot (post-repair)

**Pathophysiology**

Increased RV volume → increased wall

tension → RV hypertrophy →

right heart failure

**Symptoms**

Chest pain, syncope, fatigue, peripheral edema

**Physical Exam**

Early diastolic murmur at LLSB, Graham Steell (diastolic) murmur 2nd and 3rd left intercostal space increasing with inspiration

**Investigations**

ECG: RVH

CXR: prominent pulmonary arteries if pulmonary HTN; enlarged RV

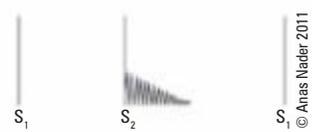

Echo: diagnostic

**Treatment**

Rarely requires treatment; valve replacement (rarely done)

**Surgical Options**

Pulmonary valve replacement

© Anas Nader 2011

**Mitral Valve Prolapse (MVP)****Etiology**

Myxomatous degeneration of chordae, thick, bulky leaflets that crowd orifice, associated with Marfan's syndrome, pectus excavatum, straight back syndrome, other MSK abnormalities; <3% of population

**Pathophysiology**

Mitral valve displaced into LA during systole; no causal mechanisms found for symptoms

**Symptoms**

Prolonged, stabbing chest pain, dyspnea, anxiety/panic, palpitations, fatigue, presyncope

**Physical Exam**

Auscultation: mid-systolic click (due to billowing of mitral leaflet into LA; tensing of redundant valve tissue); mid to late systolic murmur at apex, accentuated by Valsalva or squat-to-stand maneuvers

**Investigations**

ECG: non-specific ST-T wave changes, paroxysmal SVT, ventricular ectopy

Echo: systolic displacement of thickened mitral valve leaflets into LA

**Treatment**

Asymptomatic: no treatment; reassurance

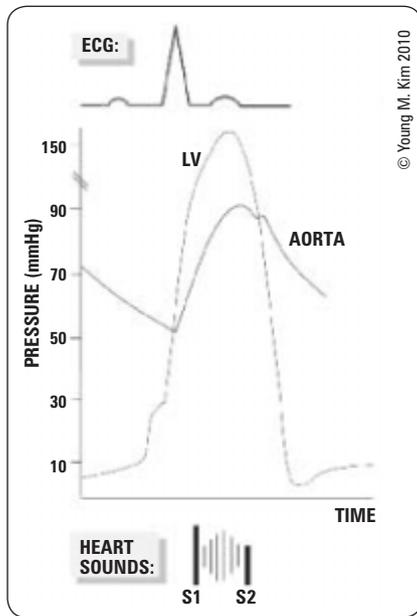

Symptomatic: β-blockers and avoidance of stimulants (caffeine) for significant palpitations, anticoagulation if AFib

**Surgical Options**

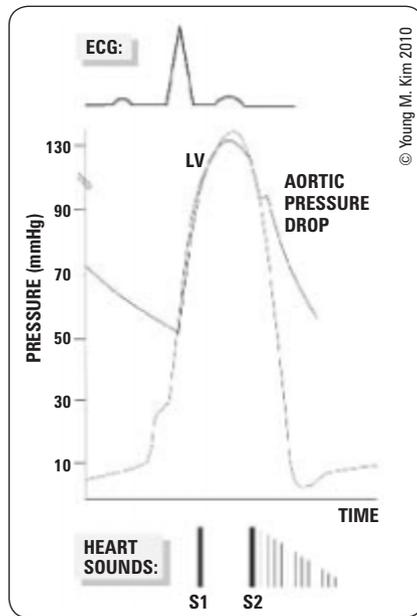

Mitral valve surgery (repair favoured over replacement) if symptomatic and significant MR

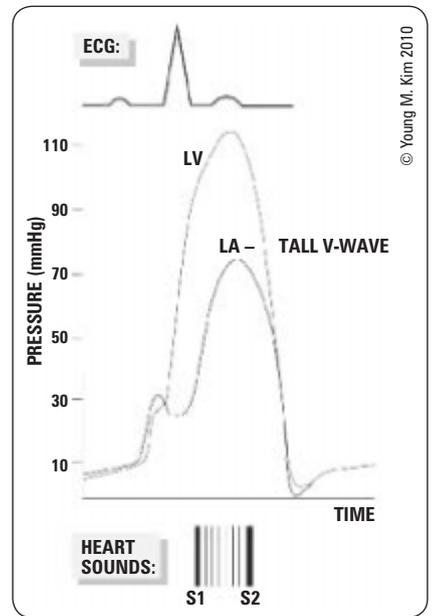

© Colleen Parker 2012

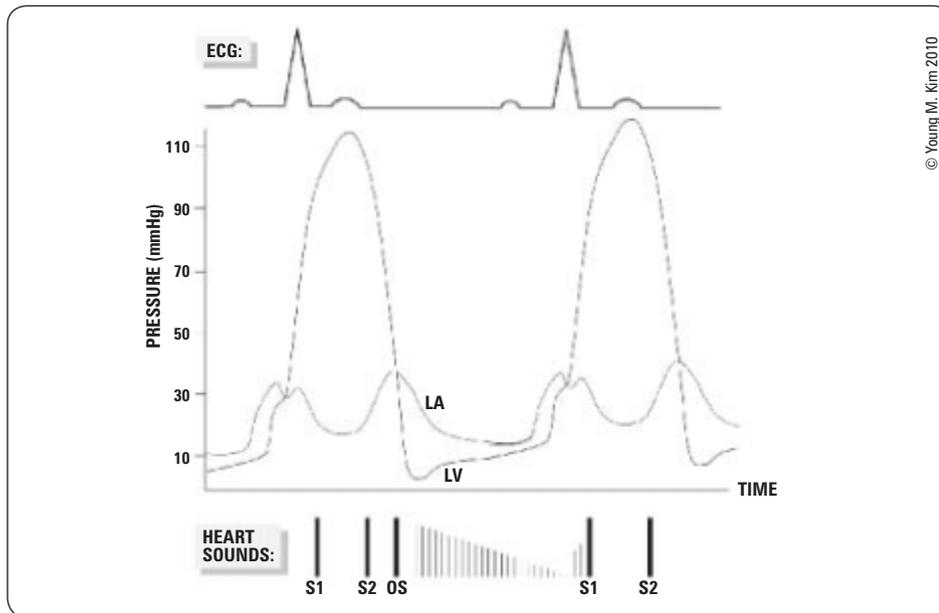

**Figure 41. Hemodynamics of aortic stenosis**  
Stenosis across the aortic valve results in the generation of a significant pressure gradient between the left ventricle and the aorta and a crescendo-decrescendo murmur during systolic contraction. The stenosis decreases the intensity of aortic valve closure hence diminishing S2

**Figure 42. Hemodynamics of aortic regurgitation**  
Regurgitation across the aortic valve during diastole causes the aortic pressure to rapidly decrease and a decrescendo murmur can be heard at the onset of diastole (after S2 is audible). The presence of regurgitant blood from the aorta increases left-ventricular end-diastolic volume

**Figure 43. Hemodynamics of acute mitral regurgitation**  
During systolic contraction, blood regurgitates from the left ventricle into the left atrium across the incompetent mitral valve resulting in an audible holosystolic murmur between S1 and S2. The portion of left ventricular end diastolic volume that regurgitates into the left atrial myocardium increases left atrial pressures resulting in a tall V-wave (in the JVP)

**Figure 44. Hemodynamics of mitral stenosis**  
First note that the left atrial pressure exceeds the left ventricular pressure during diastole due to mitral stenosis and the consequent generation of a pressure gradient across the left atrium and left ventricle. In diastole the stenotic mitral valve opens which corresponds to the opening snap (OS) and the passage of blood across the mitral stenosis results in an audible decrescendo murmur. Left atrial contraction prior to S1 increases the pressure gradient resulting in accentuation of the murmur before S1 is audible

# Pericardial Disease

## Acute Pericarditis

### Etiology of Pericarditis/Pericardial Effusion

- idiopathic is most common: presumed to be viral
- infectious
  - viral: Coxsackie virus A, B (most common), echovirus
  - bacterial: *S. pneumoniae*, *S. aureus*
  - TB
- fungal: histoplasmosis, blastomycosis
- post-MI: acute (direct extension of myocardial inflammation, 1-7 d post-MI), Dressler's syndrome (autoimmune reaction, 2-8 wk post-MI)
- post-cardiac surgery (e.g. CABG), other trauma
- metabolic: uremia (common), hypothyroidism
- neoplasm: Hodgkin's, breast, lung, renal cell carcinoma, melanoma
- collagen vascular disease: SLE, polyarteritis, rheumatoid arthritis, scleroderma
- vascular: dissecting aneurysm
- other: drugs (e.g. hydralazine), radiation, infiltrative disease (sarcoid)

### Signs and Symptoms

- diagnostic triad: chest pain, friction rub and ECG changes (diffuse ST elevation and PR depression with reciprocal changes in aVR)
- pleuritic chest pain: alleviated by sitting up and leaning forward
- pericardial friction rub: may be uni-, bi-, or triphasic; evanescent and rare
- $\pm$  fever, malaise

### Investigations

- ECG: initially diffuse elevated ST segments  $\pm$  depressed PR segment, the elevation in the ST segment is concave upwards  $\rightarrow$  2-5 d later ST isoelectric with T wave flattening and inversion
- CXR: normal heart size, pulmonary infiltrates
- Echo: performed to assess for pericardial effusion

### Treatment

- treat the underlying disease
- anti-inflammatory agents (high dose NSAIDs/ASA, steroids use controversial), analgesics
- colchicine reduces the rate of incessant/recurrent pericarditis (ICAP *N Engl J Med* 2013; 369:1522-1528)

### Complications

- recurrent episodes of pericarditis, atrial arrhythmia, pericardial effusion, tamponade, constrictive pericarditis

#### Acute Pericarditis Triad

- Chest pain
- Friction rub
- ECG changes

## Pericardial Effusion

### Etiology

- transudative (serous)
- CHF, hypoalbuminemia/hypoproteinemia, hypothyroidism
- exudative (serosanguinous or bloody)
  - causes similar to the causes of acute pericarditis
  - may develop acute effusion secondary to hemopericardium (trauma, post-MI myocardial rupture, aortic dissection)
- physiologic consequences depend on type and volume of effusion, rate of effusion development, and underlying cardiac disease

### Signs and Symptoms

- may be asymptomatic or similar to acute pericarditis
- dyspnea, cough
- extra-cardiac (esophageal/recurrent laryngeal nerve/tracheo-bronchial/phrenic nerve irritation)
- JVP increased with dominant "x" descent
- arterial pulse normal to decreased volume, decreased pulse pressure
- auscultation: distant heart sounds  $\pm$  rub
- Ewart's sign

### Investigations

- ECG: low voltage, flat T waves, electrical alternans (classic, but not sensitive to exclude effusion)
  - be cautious in diagnosing STEMI in a patient with pericarditis and an effusion - antiplatelets may precipitate hemorrhagic effusion
- CXR: cardiomegaly, rounded cardiac contour
- ER: bedside ultrasound with subxiphoid view showing fluid in pericardial sac
- Echo (procedure of choice): fluid in pericardial sac
- pericardiocentesis: definitive method of determining transudate vs. exudate, identify infectious agents, neoplastic involvement

#### Ewart's Sign

Bronchial breathing and dullness to percussion at the lower angle of the left scapula in pericardial effusion due to effusion compressing left lower lobe of lung

**Treatment**

- mild: frequent observation with serial echos, treat underlying cause, anti-inflammatory agents
- severe: treat as in tamponade (see *Cardiac Tamponade*)

## Cardiac Tamponade

**Etiology**

- major complication of rapidly accumulating pericardial effusion
- cardiac tamponade is a clinical diagnosis
- any cause of pericarditis but especially trauma, malignancy, uremia, proximal aortic dissection with rupture

**Pathophysiology**

- high intra-pericardial pressure → decreased venous return → decreased diastolic ventricular filling → decreased CO → hypotension and venous congestion

**Signs and Symptoms**

- tachypnea, dyspnea, shock, muffled heart sounds
- pulsus paradoxus (inspiratory fall in systolic BP >10 mmHg during quiet breathing)
- JVP “x” descent only, blunted “y” descent
- hepatic congestion/peripheral edema

**Investigations**

- ECG: electrical alternans (pathognomonic variation in R wave amplitude), low voltage
- echo: pericardial effusion, compression of cardiac chambers (RA and RV) in diastole
- cardiac catheterization

**Treatment**

- pericardiocentesis: Echo-guided
- pericardiectomy
- avoid diuretics and vasodilators (these decrease venous return to already under-filled RV → decrease LV preload → decrease CO)
- IV fluid may increase CO
- treat underlying cause

**Classic Quartet of Tamponade**

- Hypotension
- Increased JVP
- Tachycardia
- Pulsus paradoxus

**Beck's Triad**

- Hypotension
- Increased JVP
- Muffled heart sounds

## Constrictive Pericarditis

**Etiology**

- chronic pericarditis resulting in fibrosed, thickened, adherent, and/or calcified pericardium
- any cause of acute pericarditis may result in chronic pericarditis
- major causes are idiopathic, post-infectious (viral, TB), radiation, post-cardiac surgery, uremia, MI, collagen vascular disease

**Signs and Symptoms**

- dyspnea, fatigue, palpitations
- abdominal pain
- may mimic CHF (especially right-sided HF)
  - ascites, hepatosplenomegaly, edema
- increased JVP, Kussmaul's sign (paradoxical increase in JVP with inspiration), Friedreich's sign (prominent “y” descent)
- BP usually normal (and usually no pulsus paradoxus)
- precordial examination: ± pericardial knock (early diastolic sound)
- see [Table 17](#) for differentiation from cardiac tamponade

**Investigations**

- ECG: non-specific – low voltage, flat T wave, ± AFib
- CXR: pericardial calcification, effusions
- echo/CT/MRI: pericardial thickening, ± characteristic echo-Doppler findings
- cardiac catheterization: equalization of end-diastolic chamber pressures (diagnostic)

**Treatment**

- medical: diuretics, salt restriction
- surgical: pericardiectomy (only if refractory to medical therapy)
- prognosis best with idiopathic or infectious cause and worst in post-radiation; death may result from heart failure

**DDx Pulsus Paradoxus**

- Constrictive pericarditis (rarely)
- Severe obstructive pulmonary disease (e.g. asthma)
- Tension pneumothorax
- PE
- Cardiogenic shock
- Cardiac tamponade

**Table 17. Differentiation of Constrictive Pericarditis vs. Cardiac Tamponade**

Characteristic	Constrictive Pericarditis	Cardiac Tamponade
JVP	"y" > "x"	"x" > "y"
Kussmaul's sign	Present	Absent
Pulsus paradoxus	Uncommon	Always
Pericardial knock	Present	Absent
Hypotension	Variable	Severe

## Common Medications

**Table 18. Commonly Used Cardiac Therapeutics**

Drug Class	Examples	Mechanism of Action	Indications	Side Effects	Contraindications
<b>ANGIOTENSIN CONVERTING ENZYME INHIBITORS (ACEI)</b>					
	enalapril (Vasotec®), perindopril (Coversyl®), ramipril (Altace®), lisinopril (Zestril®)	Inhibit ACE-mediated conversion of angiotensin I to angiotensin II (AT II), causing peripheral vasodilation and decreased aldosterone synthesis	HTN, CAD, CHF, post-MI, DM	Dry cough, 10% hypotension, fatigue, hyperkalemia, renal insufficiency, angioedema	Bilateral renal artery stenosis, pregnancy, caution in decreased GFR
<b>ANGIOTENSIN II RECEPTOR BLOCKERS (ARBs)</b>					
	candesartan, irbesartan, valsartan	Block AT II receptors, causing similar effects to ACEI	Same as ACEI, although evidence is generally less for ARBs; often used when ACEI are not tolerated	Similar to ACEI, but do not cause dry cough	Same as ACEI
<b>DIRECT RENIN INHIBITORS (DRIs)</b>					
	aliskiren	Directly blocks renin thus inhibiting the conversion of angiotensinogen to angiotensin I; this also causes a decrease in AT II	HTN (exact role of this drug remains unclear)	Diarrhea, hyperkalemia (higher risk if used with an ACEI), rash, cough, angioedema, reflux, hypotension, rhabdomyolysis, seizure	Pregnancy, severe renal impairment
<b>β-BLOCKERS</b>					
β1 antagonists	atenolol, metoprolol, bisoprolol	Block β-adrenergic receptors, decreasing HR, BP, contractility, and myocardial oxygen demand, slow conduction through the AV node	HTN, CAD, acute MI, post-MI, CHF (start low and go slow), AFib, SVT	Hypotension, fatigue, light-headedness, depression, bradycardia, hyperkalemia, bronchospasm, impotence, depression of counterregulatory response to hypoglycemia, exacerbation of Raynaud's phenomenon, and claudication	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW. Caution in asthma, claudication, Raynaud's phenomenon, and decompensated CHF
β1/β2 antagonists	propranolol				
α1/β1/β2 antagonists	labetalol, carvedilol				
β1 antagonists with intrinsic sympathomimetic activity	acebutalol				
<b>CALCIUM CHANNEL BLOCKERS (CCBs)</b>					
Benzothiazepines Phenylalkylamines (non-dihydropyridines)	diltiazem verapamil	Block smooth muscle and myocardial calcium channels causing effects similar to β-blockers. Also vasodilate	HTN, CAD, SVT, diastolic dysfunction	Hypotension, bradycardia, edema Negative inotrope	Sinus bradycardia, 2nd or 3rd degree heart block, hypotension, WPW, CHF
Dihydropyridines	amlodipine (Norvasc®), nifedipine (Adalat®), felodipine (Plendil®)	Block smooth muscle calcium channels causing peripheral vasodilation	HTN, CAD	Hypotension, edema, flushing, headache, light-headedness	Severe aortic stenosis and liver failure
<b>DIURETICS</b>					
Thiazides	hydrochlorothiazide, chlorthalidone, metolazone	Reduce Na <sup>+</sup> reabsorption in the distal convoluted tubule (DCT)	HTN (drugs of choice for uncomplicated HTN)	Hypotension, hypokalemia, polyuria	Sulfa allergy, pregnancy
Loop diuretics	furosemide (Lasix®)	Blocks Na <sup>+</sup> /K <sup>+</sup> -ATPase in thick ascending limb of the loop of Henle	CHF, pulmonary or peripheral edema	Hypovolemia, hypokalemic metabolic alkalosis	Hypovolemia, hypokalemia
Aldosterone receptor antagonists	spironolactone, eplerenone	Antagonize aldosterone receptors	HTN, CHF, hypokalemia	Edema, hyperkalemia, gynecomastia	Renal insufficiency, hyperkalemia, pregnancy
<b>INOTROPES</b>					
	digoxin (Lanoxin®)	Inhibit Na <sup>+</sup> /K <sup>+</sup> -ATPase, leading to increased intracellular Na <sup>+</sup> and Ca <sup>2+</sup> concentration and increased myocardial contractility. Also slows conduction through the AV node	CHF, AFib	AV block, tachyarrhythmias, bradyarrhythmias, blurred or yellow vision (van Gogh syndrome), anorexia, N/V	2nd or 3rd degree AV block, hypokalemia, WPW

**Table 18. Commonly Used Cardiac Therapeutics (continued)**

Drug Class	Examples	Mechanism of Action	Indications	Side Effects	Contraindications
<b>ANTICOAGULANTS</b>					
Coumarins	warfarin (Coumadin®)	Antagonizes vitamin K, leading to decreased synthesis of clotting factors II, VII, IX, and X	AFib, LV dysfunction, prosthetic valves	Bleeding (by far the most important side effect), paradoxical thrombosis, skin necrosis	Recent surgery or bleeding, bleeding diathesis, pregnancy
Heparins	Unfractionated heparin LMWHs: dalteparin, enoxaparin, tinzaparin	Antithrombin III agonist, leading to decreased clotting factor activity	Acute MI/ACS; when immediate anticoagulant effect needed	Bleeding, osteoporosis, heparin-induced thrombocytopenia (less in LMWHs)	Recent surgery or bleeding, bleeding diathesis, thrombocytopenia, renal insufficiency (for LMWHs)
Direct thrombin inhibitors	dabigatran, melagatran	Competitive, direct thrombin inhibitor; thrombin enables fibrinogen conversion to fibrin during the coagulation cascade, thereby preventing thrombus development	AFib	Bleeding, GI upset	Severe renal impairment, recent surgery, active bleeding
Direct Factor Xa inhibitors	rivaroxaban apixaban edoxaban	Direct, selective and reversible inhibition of factor Xa in both the intrinsic and extrinsic coagulation pathways	AFib	Bleeding, GI upset, elevated liver enzymes	Hepatic disease, active bleeding, bleeding diathesis, pregnancy, lactation
<b>ANTIPLATELETS</b>					
Salicylates	ASA (Aspirin®)	Irreversibly acetylates platelet COX-1, preventing thromboxane A2-mediated platelet aggregation	CAD, acute MI, post-MI, post-PCI, CABG	Bleeding, GI upset, GI ulceration, impaired renal perfusion	Active bleeding or PUD
Thienopyridines	clopidogrel (Plavix®), ticlopidine (Ticlid®), prasugrel (Effient®)	P2Y12 antagonist (block platelet ADP receptors)	Acute MI, post-MI, post-PCI, CABG	Bleeding, thrombotic thrombocytopenic purpura, neutropenia (ticlopidine)	Active bleeding or PUD
Nucleoside analogues	ticagrelor (Brillinta®)	P2Y12 antagonist (but different binding site than thienopyridines)			
GP1Ib/IIIa inhibitors	eptifibatid, tirofiban, abciximab	Block binding of fibrinogen to Gp IIb/IIIa	Acute MI, particularly if PCI is planned	Bleeding	Recent surgery or bleeding, bleeding diathesis
<b>THROMBOLYTICS</b>					
	alteplase, reteplase, tenecteplase, streptokinase	Convert circulating plasminogen to plasmin, which lyses cross-linked fibrin	Acute STEMI	Bleeding	See Table 8, C29
<b>NITRATES</b>					
	nitroglycerin	Relax vascular smooth muscle, producing venous and arteriolar dilation	CAD, MI, CHF (isosorbide dinitrate plus hydralazine)	Headache, dizziness, weakness, postural hypotension	Concurrent use of cGMP phosphodiesterase inhibitors, angle closure glaucoma, increased intracranial pressure
<b>LIPID LOWERING AGENTS</b>					
Statins	atorvastatin (Lipitor®), pravastatin (Pravachol®), rosuvastatin (Crestor®), simvastatin (Zocor®), lovastatin (Meracor®)	Inhibit HMG-CoA reductase, which catalyzes the rate-limiting step in cholesterol synthesis	Dyslipidemia (1° prevention of CAD), CAD, post-MI (2° prevention of CV events)	Myalgia, rhabdomyolysis, abdominal pain	Liver or muscle disease
Cholesterol absorption inhibitor	ezetimibe (Ezetrol®)	inhibits gut absorption of cholesterol	Decreases LDL but does not reduce mortality	Myalgia, rhabdomyolysis, abdominal pain	Liver or renal impairment
Miscellaneous	fibrates, bile acid sequestrates, nicotinic acid		Primarily in familial hypercholesterolemia	GI side effects common	
Investigational	PCSK9 inhibitor	monoclonal antibody	hypercholesterolemia		

# Antiarrhythmics

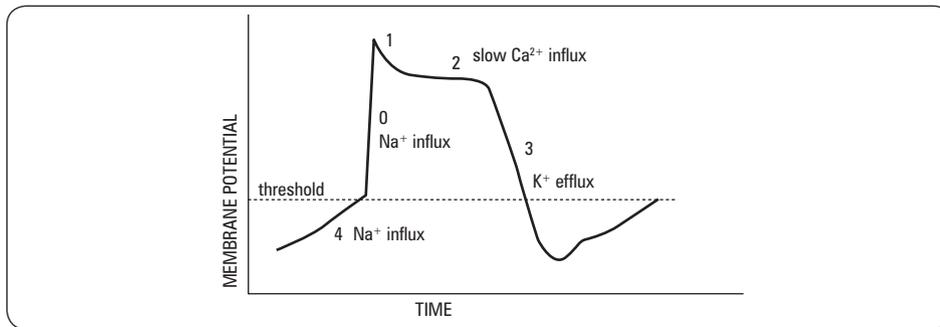

Figure 45. Representative cardiac action potential

Table 19. Antiarrhythmic\* Drugs (Vaughan-Williams Classification)

Class	Agent	Indications	Side Effects	Mechanism of Action
Ia	quinidine procainamide disopyramide	SVT, VT	Torsades de Pointes (all Ia), diarrhea Lupus-like syndrome Anticholinergic effects	Moderate Na <sup>+</sup> channel blockade Slows phase 0 upstroke Prolongs repolarization, slowing conduction
Ib	lidocaine mexiletine	VT	Confusion, stupor, seizures GI upset, tremor	Mild Na <sup>+</sup> channel blockade Shortens phase 3 repolarization
Ic	propafenone flecainide encainide	SVT, VT AFib	Exacerbation of VT (all Ic) Negative inotropy (all Ic) Bradycardia and heart block (all Ic)	Marked Na <sup>+</sup> channel blockade Markedly slows phase 0 upstroke
II	propranolol metoprolol, etc.	SVT, AFib	Bronchospasm, negative inotropy, bradycardia, AV block, impotence, fatigue	β-blocker Decreases phase 4 depolarization
III	amiodarone** sotalol	SVT, VT AFib SVT, VT, AFib	Amiodarone: Photosensitivity, pulmonary toxicity, hepatotoxicity, thyroid disease, increased INR Amiodarone and Sotalol: Torsades de Pointes, bradycardia, heart block, β-blocker side effects	Blocks K <sup>+</sup> channel Prolongs phase 3 repolarization, which prolongs refractory period
IV	verapamil diltiazem	SVT AFib	Bradycardia, AV block Hypotension	Calcium channel blocker Slows phase 4 spontaneous depolarization, slowing AV node conduction

\*All antiarrhythmics have potential to be proarrhythmic

\*\*Amiodarone has class I, II, III, and IV properties

Table 20. Actions of α and β Adrenergic Receptors

	α RECEPTORS		β RECEPTORS	
Target System	α1	α2	β1	β2
<b>Cardiovascular</b>	Constriction of vascular smooth muscle Constriction of skin, skeletal muscle, and splanchnic vessels  Increased myocardial contractility Decreased heart rate	Same as α1  Peripherally act to modulate vessel tone Vasoconstrict and dilate; oppose α1 vasoconstrictor activity	Increased myocardial contractility Accelerate SA node Accelerate ectopic pacemakers	Decreased vascular smooth muscle tone
<b>Respiratory</b>				Bronchodilation
<b>Dermal</b>	Pilomotor smooth muscle contraction Apocrine constriction			
<b>Ocular</b>	Radial muscle contraction		Ciliary muscle relaxation	
<b>Gastrointestinal</b>	Inhibition of myenteric plexus Anal sphincter contraction			
<b>Genitourinary</b>	Pregnant uterine contraction Penile and seminal vesicle ejaculation Urinary bladder contraction	Smooth muscle wall relaxation	Stimulation of renal renin release	Bladder wall relaxation Uterine relaxation
<b>Metabolic</b>	Stimulate liver gluconeogenesis and glycogenolysis at the liver	Same as α1 Fat cell lipolysis	Fat cell lipolysis Glycogenolysis	Gluconeogenesis Fat cell lipolysis

Adapted from the Family Practice Notebook (www.fpnotebook.com/NEU194.htm)

**Table 21. Commonly Used Drugs that Act on  $\alpha$  and  $\beta$  Adrenergic Receptors**

Mechanism of Action	$\alpha$ RECEPTORS			$\beta$ RECEPTORS		
	$\alpha 1$	$\alpha 1$ and $\alpha 2$	$\alpha 2$	$\beta 1$	$\beta 1$ and $\beta 2$	$\beta 2$
<b>Agonist</b>	Phenylephrine Methoxamine	Epinephrine Norepinephrine	Clonidine Methyldopa	Norepinephrine Dobutamine	Isoproterenol Epinephrine	Albuterol Terbutaline
<b>Antagonist</b>	Prazosin Phenoxybenzamine	Phentolamine	Yohimbine Mirtazipine	Metoprolol Acebutolol Alprenolol Atenolol Esmolol	Propranolol Timolol Nadolol Pindolol Carvedilol	Butoxamine

Adapted from the Family Practice Notebook (<http://www.fpnotebook.com/NEU194.htm>)

## Landmark Cardiac Trials

Trial	Reference	Results
<b>ISCHEMIC HEART DISEASE</b>		
ASCOT-LLA	<i>Lancet</i> 2003; 361:1149-58	In hypertensive patients with risk factors for CHD and average or below-average cholesterol, atorvastatin reduced nonfatal MI, fatal CHD, fatal/nonfatal stroke, coronary events but not all-cause mortality
CAPRIE	<i>Lancet</i> 1996; 348:1329-39	In atherosclerotic vascular disease clopidogrel reduced the primary combined endpoint of stroke, MI, or vascular death and improved PAD compared to ASA
CARE	<i>NEJM</i> 1996; 335:1001-9	Pravastatin reduced MI and stroke in patients with previous MI and average cholesterol
COURAGE	<i>NEJM</i> 2007; 356:1503-16	Compared with optimal medical therapy alone PCI + medical therapy did not reduce all-cause mortality and non fatal MI, and it did not reduce the incidence of major cardiovascular events
CURE	<i>NEJM</i> 2001; 345:494-502	Clopidogrel plus ASA reduced death from CV causes, non fatal MI, or stroke but increased bleeding complications
EUROPA	<i>Lancet</i> 2003; 362:782-88	With stable CAD and no CHF perindopril reduced cardiovascular death, MI, and total mortality
HOPE	<i>NEJM</i> 2000; 342:154-60	In high-risk patients without low LVEF or CHF ramipril reduced rates of death, MI, stroke, revascularization, new diagnosis of DM and complications due to DM; vitamin E had no effect on outcomes
HPS	<i>Lancet</i> 2002; 360:7-22	In high-risk patients with various cholesterol values simvastatin reduced all-cause mortality, coronary deaths, and major vascular events
INTERHEART	<i>Lancet</i> 2004; 364:937-52	Nine modifiable risk factors account for 90% of myocardial infarction
IMPROVE-IT	<i>N Engl J Med</i> 2015 Jun 3. [Epub ahead of print]	Ezetimibe added to statin reduces mortality in ACS patients
JUPITER	<i>NEJM</i> 2008; 359:2195-2207	With low to normal LDL-C and elevated hsCRP treatment with rosuvastatin significantly reduced major cardiovascular events; NNT with rosuvastatin for 2 yr to prevent one primary endpoint = 95
SYNTAX	<i>NEJM</i> 2009; 360:961-972	CABG has lower rate of major cardiac or cerebrovascular events; the rate of stroke was increased with CABG, whereas the rate of repeat revascularization was increased with PCI
TNT	<i>NEJM</i> 2005; 352:1425-35	Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d
WHI	<i>JAMA</i> 2002; 288:321-333	Estrogen plus progestin therapy is associated with increased risks of cardiovascular disease and breast cancer but decreased risks of hip fracture and colorectal cancer in postmenopausal women
<b>MYOCARDIAL INFARCTION</b>		
BHAT	<i>JAMA</i> 1982; 247:1707-14	In acute MI propranolol reduced all-cause mortality, cardiovascular death, and sudden death from atherosclerotic heart disease
COURAGE	<i>NEJM</i> 2007; 356:1503-16	Compared with optimal medical therapy alone PCI + medical therapy did not reduce all-cause mortality and non fatal MI, and it did not reduce the incidence of major cardiovascular events
DAPT	<i>NEJM</i> 2014; 371: 2155-66	Dual antiplatelet therapy beyond one year confers additional benefit

Trial	Reference	Results
<b>MYOCARDIAL INFARCTION</b>		
ISIS-2	<i>Lancet</i> 1988; 2:349-60	Early therapy with streptokinase and ASA in patients with MI individually and in combination significantly reduced all-cause mortality and in combination demonstrated additive effect
ISIS-4	<i>Lancet</i> 1995; 345:669-85	In patients with suspected or definite acute MI early treatment with captopril reduced all-cause mortality at 35 d and during long-term follow up
OASIS-5	<i>NEJM</i> 2006; 354:1464-76	Compared to enoxaparin, fondaparinux reduced mortality rates, major bleeds at 9 and MI at 30 and 180 d
PEGASUS-TIMI 54	<i>NEJM</i> 2015 EPUB	Ticagrelor on top of ASA reduces CV events and in patients with a history of MI
PLATO	<i>NEJM</i> 2009; 361:1045-57	ACS patients with either STEMI or NSTEMI, regardless of reperfusion strategy, ticagrelor reduced mortality, MI and stroke without increased bleeding compared to clopidogrel
PROVE IT – TIMI 22	<i>NEJM</i> 2004; 350:1495-1504	In patients hospitalized for ACS high-dose atorvastatin reduced all-cause mortality, MI, unstable angina, revascularization, and stroke compared with pravastatin
TRITON-TIMI 38	<i>NEJM</i> 2007; 357:2001-15	In ACS patients scheduled for PCI, prasugrel reduced ischemic events but increased major bleeding compared to clopidogrel; no change in mortality
<b>HEART FAILURE</b>		
AIRE	<i>Lancet</i> 1993; 342:821-8	Ramipril commenced 3-10 d after MI and continued for a mean 15-month period significantly reduced all-cause mortality in patients with non-severe CHF
CHARM	<i>Lancet</i> 2003; 362:759-66	Candesartan reduced overall mortality, cardiovascular death, and CHF hospitalizations
CIBIS II	<i>Lancet</i> 1999; 353:9-13	Bisoprolol reduced all-cause mortality, cardiovascular death, all-cause hospitalization, and CHF hospitalization
COMET	<i>Lancet</i> 2003; 362:7-13	Carvedilol was associated with a reduction in all cause mortality compared with metoprolol
CONSENSUS	<i>NEJM</i> 1987; 316:1429-35	Enalapril reduced all-cause mortality, death due to progression of heart failure
COPERNICUS	<i>NEJM</i> 2001; 344:1651-8	Carvedilol in addition to standard treatment significantly reduced the risk of death or hospitalization in patients with severe CHF
I-PRESERVE	<i>NEJM</i> 2008; 359:2456-2467	In patients with CHF and normal LVEF treatment with ARB (irbesartan) did not improve mortality or cardiovascular morbidity compared to placebo
MERIT-HF	<i>Lancet</i> 1999; 353:2001-7	Metoprolol CR/XL daily in addition to optimum standard therapy improved survival in clinically stable patients equating to prevention of 1 death per 27 patients treated per year
PARADIGM-HF	<i>NEJM</i> 2014; 371:993-1004	Novel drug (LCZ696 containing valsartan and a neprilysin inhibitor (prevents degradation of natriuretic peptides) reduces hospitalization and mortality
RALES	<i>NEJM</i> 1999; 341:709-17	In severe CHF (class III/IV) and LVEF <35% spironolactone reduced all-cause mortality, sudden death, and death due to progression of heart failure
SAVE	<i>NEJM</i> 1992; 327:669-77	Patients with LV dysfunction post-MI long-term captopril over 3.5 yr reduced the risk of death due to cardiovascular causes, recurrent MI, development of severe CHF, and CHF hospitalization
SCD-HeFT	<i>NEJM</i> 2005; 352:225-237	In mild-to-moderate CHF shock-only ICD significantly reduces risk of death; amiodarone had no benefit compared with placebo in treating patients with mild-to-moderate CHF
SOLVD	<i>NEJM</i> 1991; 325:293-302	In stable chronic CHF with decreased LVEF (<0.35) long-term enalapril reduced death due to all causes and death or hospitalization due to CHF
TRACE	<i>NEJM</i> 1995; 333:1670-6	In patients with LV dysfunction post-MI long-term trandolapril reduced the risk of death or progression to severe CHF and reduced risk of sudden death
V-HeFT II	<i>NEJM</i> 1991; 325:303-10	In chronic CHF enalapril reduced mortality more than hydralazine-isosorbide for at least 2 yr; treatment with either enalapril or hydralazine-isosorbide increased LVEF
<b>DIABETES</b>		
CARDS	<i>Lancet</i> 2004; 264:685-96	Atorvastatin reduces the risk of cardiovascular events in patients with type 2 DM
ONTARGET	<i>NEJM</i> 2008; 358:1547-59	In patients with vascular disease or DM without CHF telmisartan is equally as effective as ramipril, with telmisartan causing a reduced risk of cough and angioedema, and an increased risk of hypotensive symptoms; combination therapy offers no advantage

<b>Trial</b>	<b>Reference</b>	<b>Results</b>
<b>ARRHYTHMIA</b>		
AFFIRM	<i>NEJM</i> 2002; 347:1825-33	No significant difference in mortality rates between rate or rhythm control of AFib
AF-CHF	<i>NEJM</i> 2008; 358:2667-77	In patients with AFib and CHF there is no significant difference in mortality rates from cardiovascular causes between rate and rhythm control
ARISTOTLE	<i>NEJM</i> 2011; 365:981-92	AF patients treated with apixaban had a lower incidence of stroke, major bleeding and mortality compared to warfarin
ENGAGE AF-TIMI48	<i>NEJM</i> 2013; 369:2093-2104	AF patients treated with edoxaban had similar rates of stroke and lower rates of major bleeding compared to warfarin
RE-LY	<i>NEJM</i> 2009; 361:1139-51	AF patients treated with dabigatran had a lower incidence of stroke compared to warfarin, with similar rates of major bleeding
ROCKET-AF	<i>NEJM</i> 2011; 365:883-891	In patients with AFib rivoxaban is non-inferior to warfarin for stroke prevention, and major and non-major bleeding
<b>HYPERTENSION</b>		
HYVET	<i>NEJM</i> 2008; 358:1887-98	In hypertensive patients >80 yr treatment with indapamide, with or without perindopril, showed a trend towards reduced relative risk of fatal or non-fatal stroke
SIPPLICITY-HTN 3	<i>NEJM</i> 2014; 370:1393-1401	Renal denervation does not reduce blood pressure in patients with resistant hypertension compared to sham procedure
SPRINT	<i>NEJM</i> 2015; 373:2103-2116	In patients with high risk of cardiovascular events excluding diabetes, strict systolic BP control (<120 mmHg) is associated with fewer cardiovascular events and lower all-cause mortality
UKHDS (UKPDS)	<i>BMJ</i> 1998; 317:703-13	Hypertensive patients with DM and tight BP control at <150/85 mmHg by use of ACEI or $\beta$ -blocker reduced risk of diabetic complications and death related to DM and reduced risk of end-organ damage
VALUE	<i>Lancet</i> 2004; 363:2022-2031	Valsartan group had higher incidence of MI than amlodipine group, whereas amlodipine had a higher incidence of new-onset DM

## Acronyms

ACE	angiotensin converting enzyme	CSF	cerebrospinal fluid	NDC	National Drug Code	RCT	randomized controlled trial
ACh	acetylcholine	CSFa	certain safety factor	NE	norepinephrine	TBW	total body water
ADR	adverse drug reaction	CYP	cytochrome P450 protein	Po/w	partition coefficient of a drug	TDM	therapeutic drug monitoring
ARB	angiotensin receptor blocker	DIN	drug identification number	PD	pharmacodynamics	TI	therapeutic index
BBB	blood brain barrier	F	bioavailability	PDE	phosphodiesterase	Vd	volume of distribution
Cl	clearance	GFR	glomerular filtration rate	Pgp	p-glycoprotein		
Cr	creatinine	HH	Henderson Hasselbalch	PK	pharmacokinetics		

## General Principles

### Drug Nomenclature

- **chemical name:** describes chemical structure; consistent in all countries (e.g. N-(4-hydroxyphenyl) acetamide is acetaminophen)
- **DIN or NDC:** DIN assigned by Health Canada; NDC assigned by FDA (US)
- **non-proprietary name:** approved name (post-phase III trial), official name (listed in pharmacopoeia), or generic name (off-patent) such as acetaminophen
- **proprietary (trade) name:** the brand name or registered trademark (e.g. Tylenol®)

### Phases of Clinical Drug Testing

- **pre-clinical:** testing a drug in a controlled environment (lab) on animal or human cells before human testing to discern the PK and toxicological profile
- **phase I:** first administration to healthy human volunteers, following animal studies; to determine PK and PD
- **phase II:** first administration to patients, small sample sizes; to determine initial safety and efficacy, dose range, PK, and PD
- **phase III:** large sample sizes, often double-blinded RCT; comparative (new drug vs. placebo or standard of care) to establish safety and efficacy
- **phase IV:** post-marketing surveillance, wide distribution; to determine effects of long-term use, rare ADRs, ideal dosing, and effects in real-world practice

At the time of drug launch, only data from phases I-III are available; thus, effectiveness and safety may be unknown because real-world patients and usage patterns often differ from those in premarket phases

### Drug Administration

- choice of route of administration depends on: drug properties, local and systemic effects, desired onset and/or duration of action, and patient characteristics

Table 1. Routes of Drug Administration

Route	Advantage	Disadvantage
<b>Oral (PO)</b>	Convenient, easy to administer Large surface area for absorption Inexpensive relative to parenteral administration	Incomplete absorption Hepatic first-pass effect Potential GI irritation
<b>Buccal/Sublingual (SL)</b>	Rapid onset of action No hepatic first-pass effect	Must be lipid-soluble, non-irritating Short duration of action
<b>Rectal (PR)</b>	Almost no hepatic first-pass effect Use when NPO, vomiting, or unconscious	Inconvenient, irritation at site of application Erratic absorption
<b>Intravenous (IV)</b>	No hepatic first-pass effect Slow infusion or rapid onset of action Easy to titrate dose	Hard to remove once administered Risk of infection, bleeding, vascular injury extravasation Expensive
<b>Intramuscular (IM)</b>	Depot storage if oil-based = slow release of drug Aqueous solution = rapid onset of action	Pain/hematoma at site of injection
<b>Subcutaneous (SC)</b>	Non-irritating drugs, small volumes Constant, even absorption Alternative to IV	Pain at site of injection Smaller volumes than IM May have tissue damage from multiple injections
<b>Intrathecal</b>	Direct into CSF Bypass BBB and blood-CSF barrier	Risk of infection
<b>Inhalation</b>	Immediate action in lungs Rapid delivery to blood No hepatic first-pass effect	Must be gas, vapour, or aerosol
<b>Topical</b>	Easy to administer Localized (limited systemic absorption)	Effects are mainly limited to site of application
<b>Transdermal</b>	Drug absorption through intact skin No hepatic first-pass effect	Irritation at site of application Delayed onset of action Hydrophilic drugs not easily absorbed
<b>Others (intraperitoneal, intra-articular)</b>	Local effect	Risk of infection

#### Common Latin Abbreviations

q	each, every
OD/bid/tid/qid	once/twice/three/four times a day
hs	at bedtime
ac/pc/cc	before/after/with meals
prn	as necessary
gtt	drops
ung	ointment
ud	as directed
od/os/ou	right/left/each eye
ad/as/au	right/left/each ear

# Pharmacokinetics

- study of “what the body does to a drug”
- **definition:** relationship between drug administration, time-course/rate of absorption and distribution, concentration changes in the body compartments, and the drug’s removal from the body

## Absorption

- **definition:** movement of the drug from the site of administration into plasma

### Mechanisms of Drug Absorption

- most drugs are absorbed into the systemic circulation via passive diffusion
- other mechanisms include active transport, facilitated diffusion, and pinocytosis/phagocytosis

### Factors Affecting the Rate and Extent of Drug Absorption

- $P_{o/w}$
- **local blood flow** at the site of administration (e.g. sublingual vessels facilitate rapid absorption of sublingual medications)
- **molecular size** (e.g. drugs with smaller molecular weight absorb faster)
- **pH and drug ionization**
  - drugs are usually weak acids (e.g. ASA) or weak bases (e.g. ketoconazole) and thus exist in ionized and non-ionized forms
  - non-ionized forms cross cell membranes much faster than ionized (charged) forms
  - the ratio of ionized to non-ionized forms is determined by body compartment pH and drug pKa (HH equation)
- **total surface area for absorption**
  - small intestinal villi are the primary site of absorption for most oral drugs

### Bioavailability (F)

- **definition:** proportion of dose that reaches systemic circulation in an unchanged state
- decreased by limited drug absorption or first-pass effect
- IV dose has 100% bioavailability ( $F = 1$ )

### First-Pass Effect

- **definition:** drug metabolism by the liver and/or the gut before it reaches systemic circulation, resulting in reduced F
- occurs with PO administration of a drug: GI tract (absorption) → portal vein to liver (first-pass metabolism) → systemic circulation
- occurs less with PR administration because drug absorbed in colon bypasses the portal system

### Efflux Pump

- Pgp is a protein found in various parts of the body that acts as a multidrug efflux pump involved in the transport of drugs out of cells
- for example, opposes intestinal absorption (e.g. dabigatran etexilate) and also enhances renal elimination of certain drugs (e.g. digoxin, etoposide, paclitaxel, tacrolimus, cyclosporine)
- some drugs (e.g. macrolide antibiotics) inhibit Pgp function, leading to increased serum levels of drugs transported by Pgp; Pgp inducers (e.g. St. John’s wort) do the opposite
- some tumours overexpress Pgp leading to multidrug resistance to chemotherapeutic agents

## Distribution

- **definition:** movement of drugs between different body compartments and to the site of action
- major body fluid compartments include plasma, interstitial fluid, intracellular fluid, transcellular fluid (e.g. CSF, peritoneal, pleural)
- tissue compartments include fat, brain

### Factors Affecting the Rate and Extent of Drug Distribution

- physiochemical properties of the drug (e.g.  $P_{o/w}$  and  $pK_a$ )
- pH of fluid
- plasma protein binding
- binding within compartments (i.e. depots)
- regional blood flow

$P_{o/w}$

- Ratio of a drug’s solubility in oil/lipid (e.g. cell membrane) as compared to water (e.g. extracellular fluid)
- A large  $P_{o/w}$  (e.g. anesthetics) means that a drug is highly soluble in lipid and will cross cell membranes easily

#### Examples of Drugs with High First-Pass Effect

- Levodopa
- Morphine
- Propranolol
- Lidocaine
- Organic nitrates

#### Examples of Drugs with Low First-Pass Effect

- Diazepam
- Digoxin
- Phenytoin
- Warfarin

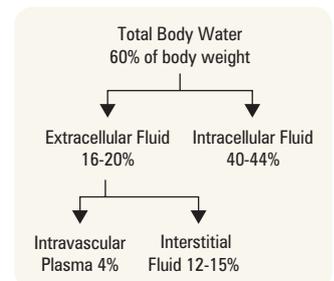

Figure 1. Distribution of total body water (TBW)

## Volume of Distribution

- $V_d$ : the apparent volume of fluid into which a drug distributes
- maximum actual  $V_d$  (anatomic fluid volume accessible to drug) = TBW (TBW ~40 L for average adult)
  - a calculated value ( $V_d$ ) = amount of drug in body  $\div$  plasma drug concentration
  - a theoretical value that does not correspond to an anatomical space (i.e. can exceed TBW)
  - small  $V_d$  corresponds to a drug that concentrates in plasma and/or binds plasma proteins to a high degree
  - large  $V_d$  corresponds to a drug that distributes into tissues (fat, muscle, etc.); most is not in blood (measured) space, and it therefore “appears” to distribute in a large volume
  - $V_d$  of plasma protein bound drugs can be altered by liver and kidney disease
- example: amiodarone distributes into TBW (actual  $V_d$  = 40 L), but it also concentrates in fat tissues giving instead an apparent  $V_d$  of 400 L; therefore, to achieve a given plasma concentration of amiodarone, we dose as though the drug distributes into 400 L of body fluid

## Plasma Protein Binding

- drug molecules in the blood exist in an equilibrium of two forms:
  1. bound to plasma protein: acidic drugs bind to albumin, basic drugs bind to  $\alpha$ 1-acid glycoprotein
  2. free or unbound: can leave the circulation to distribute into tissues and exert an effect, subject to metabolism and elimination
- bound fraction is determined by drug concentration, binding affinity, and plasma protein concentration (number of binding sites)
- reduced number of binding sites (e.g. hypoalbuminemia) or saturation of binding sites (e.g. competition/displacement) may result in increased concentration of free drug, which is often metabolized with no harmful effects, although toxicity is possible

## Depots

- a body compartment in which drug molecules tend to be stored and released slowly over a long period of time
- fat is a depot for very lipid soluble drugs (e.g. diazepam)
- some oil-based medications are injected IM for slow release (e.g. depot medroxyprogesterone acetate q3mo; depot risperidone q2wk)

## Barriers (relative)

- body structures that limit or prevent diffusion of drug molecules, such as the placenta or BBB (a barrier composed of tight junctions between capillary endothelial cells and astrocytes)
- many of these barriers result, in part, from the activity of multidrug efflux pumps (e.g. Pgp), which serve as a natural defense mechanism against drugs and xenobiotics
- need to consider dosing route if drugs are meant to cross these barriers

Multiple drugs and endogenous substances can compete for the same protein binding sites. For example, ASA displaces highly protein-bound acidic drugs such as phenytoin, thus increasing risk of toxicity, and sulfonamide displaces bilirubin, which could potentially lead to jaundice and kernicterus in neonates

Special consideration must be given in dosing patients in hypoalbuminemic states (e.g. liver failure or nephrotic syndrome) to prevent drug toxicity. Highly protein-bound drugs (e.g. warfarin, digoxin, diazepam, furosemide, amitriptyline) will exert a greater effect in these patients than in healthy individuals because of higher levels of free drug

### Main Factors Governing Penetration of BBB

- Small molecular size (<500 Da)
- High lipid solubility
- Active transport mechanisms (e.g. Pgp efflux pump)

# Metabolism (Biotransformation)

- **definition:** chemical transformation of a drug *in vivo* to enhance elimination
- sites of biotransformation include liver (main), GI tract, lung, plasma, kidney
- as a result of the process of biotransformation:
  - an inactive prodrug may be **activated** (e.g. tamoxifen to endoxifen; codeine to morphine)
  - a drug may be **changed** to another active metabolite (e.g. diazepam to oxazepam)
  - a drug may be **changed** to a toxic metabolite (e.g. meperidine to normeperidine)
  - a drug may be **inactivated** (most drugs)

## Drug Metabolizing Pathways

- **phase I (P450) reactions**
  - minor molecular changes introduce or unmask polar groups on a parent compound to increase water solubility (e.g. oxidation-reduction, hydrolysis, hydroxylation); the change in  $P_{o/w}$  is typically minimal compared to phase II, and often phase I places a polar ‘handle’ on a lipophilic drug to allow for phase II
  - mediated by CYPs found in the endoplasmic reticulum
  - product of the reaction can be excreted or undergo further phase II reactions
- **phase II (conjugation) reactions**
  - conjugation with large polar endogenous substrates (e.g. glucuronidation, glutathione conjugation, sulfation)
  - dramatically increases water solubility and renal elimination
  - can result in biologically active metabolites (e.g. glucuronides of morphine)
  - can occur independently of phase I reactions

## Factors Affecting Drug Biotransformation

- **genetic polymorphisms** of metabolizing enzymes
  - individual genotypes may determine rate of drug metabolism (e.g. poor, intermediate, extensive, or ultrarapid metabolizers)
  - may lead to toxicity or ineffectiveness of a drug at a normal dose
    - ♦ tamoxifen and codeine are prodrugs activated by CYP2D6 (nonfunctional alleles reduce effectiveness, whereas overactive/duplicated alleles impart “ultrarapid metabolizer” phenotype)
    - ♦ warfarin is metabolized by CYP2C9 (nonfunctional alleles lead to greater effect and lower dose requirements)
- **enzyme inhibition** may sometimes be due to other drugs
  - CYP inhibition leads to an increased concentration and bioavailability of the substrate drug (e.g. erythromycin [CYP3A4 inhibitor] can predispose patients to simvastatin toxicity [metabolized by CYP3A4])
- **enzyme induction**
  - certain medications enhance gene transcription leading to an increase in the activity of a metabolizing enzyme
  - a drug may induce its own metabolism (e.g. carbamazepine) or that of other drugs (e.g. phenobarbital can induce the metabolism of OCPs) by inducing the CYP system
- **liver dysfunction** (e.g. hepatitis, alcoholic liver, biliary cirrhosis, or hepatocellular carcinoma) may decrease drug metabolism but this may not be clinically significant due to the liver's reserve capacity
- **renal disease** often results in decreased drug clearance
- **extremes of age** (neonates or elderly) have reduced biotransformation capacity, and doses should be adjusted accordingly
- **nutrition:** insufficient protein and fatty acid intake decreases CYP biotransformation, and vitamin/mineral deficiencies may also impact other metabolizing enzymes
- **alcohol:** while acute alcohol ingestion inhibits CYP2E1, chronic consumption can induce CYP2E1 and increase risk of hepatocellular damage from acetaminophen by increasing the generation of acetaminophen's toxic metabolite
- **smoking** can induce CYP1A2, thus increasing the metabolism of some drugs (e.g. theophylline, antipsychotic)

### Cytochrome P450 System

The CYPs are a superfamily of heme proteins that are grouped into families and subfamilies according to their amino acid sequence. These proteins are responsible for the metabolism of drugs, chemicals, and other substances

Nomenclature: CYP3A4

“CYP” = cytochrome P450 protein

1st number = family

letter = subfamily

2nd number = isoform

The CYP1, CYP2, and CYP3 families metabolize most drugs in humans. The most important isoforms are CYP3A4 and CYP2D6; therefore, anticipate drug interactions if prescribing drugs using these enzymes

### Examples of CYP Substrates, Inhibitors and Inducers

<http://www.medicines.iupui.edu/CLINPHARM/ddis/main-table>

### The Cockcroft-Gault Equation can Estimate CrCl in Adults 20 yr of Age and Older

- For males

$$\text{CrCl (mL/min)} = \frac{[(140 - \text{age in yr}) \times \text{Weight (kg)}] \times 1.2}{\text{serum Cr } (\mu\text{mol/L})}$$

- For females, multiply above equation x 0.85

\*\*\*Only applies when renal function is at steady state

Avoid toxicity from drug or metabolite accumulation by adjusting a drug's dosage according to the elimination characteristics of the patient

## Elimination

- **definition:** removal of drug from the body

### Routes of Drug Elimination

- **kidney** (main organ of elimination): two mechanisms
  1. **glomerular filtration**
    - a passive process, so that only the free drug fraction can be eliminated
    - drug filtration rate depends on GFR, degree of protein binding of drug, and size of drug
  2. **tubular secretion**
    - an active process that is saturable allowing both protein-bound and free drug fractions to be excreted
    - distinct transport mechanisms for weak acids (e.g. penicillin, salicylic acid, probenecid, chlorothiazide) and weak bases (e.g. quinine, quaternary ammonium compounds such as choline)
    - drugs may competitively block mutual secretion if both use the same secretion system (e.g. probenecid can reduce the excretion of penicillin)
- **tubular reabsorption:** drugs can be passively reabsorbed back to the systemic circulation, countering elimination mechanisms
- **renal function** (assessed using serum Cr levels) decreases with age and is affected by many disease states such as diabetes
- **stool:** some drugs and metabolites are actively excreted in the bile or directly into the GI tract
  - enterohepatic reabsorption counteracts stool elimination, and can prolong the drug's duration in the body
  - some glucuronic acid conjugates that are excreted in bile may be hydrolyzed in the intestines by bacteria back to their original form and can be systemically reabsorbed
- **lungs:** elimination of anesthetic gases and vapours by exhalation
- **saliva:** saliva concentrations of some drugs parallel their plasma levels (e.g. rifampin)

# Pharmacokinetic Calculation

- definition:** the quantitative description of the rates of the various steps of drug disposition (i.e. how drugs move through the body)
- the pharmacokinetic principles of ADME (absorption, distribution, metabolism, and elimination) can be graphically represented on a concentration vs. time graph

## Time Course of Drug Action

- many kinetic parameters are measured using IV dosing, such that absorption is immediate and distribution for most drugs is rapid; thus elimination is the main process being measured
- the concentration axis is converted to a log<sub>10</sub> concentration to allow for easier mathematical calculations
- drugs such as warfarin can exhibit hysteresis (for a single drug concentration, there may be two different response levels)

## Half-Life

- definition:** time taken for the serum drug level to fall 50% during elimination
- drugs with first order kinetics require five half-lives to reach steady state with repeated dosing or for complete drug elimination once dosing is stopped

# of Half-Lives	1	2	3	3.3	4	5
% of Steady State Concentration	50	75	87.5	90	93.8	96.9

## Steady State

- drug concentration remains constant when amount of drug entering the system is eliminated from the system
- drug levels in therapeutic drug monitoring are of greatest utility when the steady state has been reached
- special situations
  - use a loading dose for drugs with a long half-life and when there is clinical need to rapidly achieve therapeutic levels (e.g. amiodarone, digoxin, phenytoin)
  - use continuous infusion for drugs with a very short half-life and when there is need for a long-term effect and multiple or frequently repeated doses are too inconvenient (e.g. nitroprusside, insulin, unfractionated heparin)

## Clearance

- a quantitative measurement of the body fluid volume from which a substance is removed per unit time
- Cl = rate of elimination of drug ÷ plasma drug concentration
- must consider Cl from a specific part of the body and total body Cl

## Elimination Kinetics

- first-order kinetics (most common type)
  - constant fraction of drug eliminated per unit time
  - some drugs can follow first-order kinetics until elimination is saturated (usually at large doses) at which point the Cl decreases
  - becomes linear relationship when plotted on a log (concentration) vs. time graph
- zero-order kinetics (less common, associated with overdose, e.g. alcohol)
  - drug is eliminated at a constant rate regardless of concentration; concept of half-life does not apply
  - the concentration axis is converted to a log (concentration) to allow for easier mathematical calculations

**Table 2. Loading vs. Maintenance Dosing**

Loading Dose	Maintenance Dose
Use when you need an IMMEDIATE effect	After a loading dose OR beginning with maintenance doses
Often parenteral medication	Steady-state levels achieved after ~5 half-lives
Rationale: give large dose of medication to "fill up" the volume of distribution	Can be given as either a continuous infusion (relatively rare, short half-life drug) OR much more commonly as intermittent doses

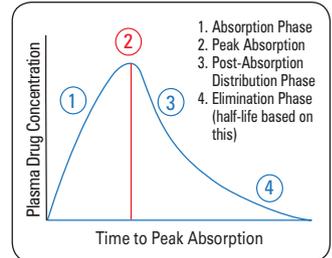

### Principles of Pharmacokinetics

$V_d$  = amount of drug in the body/ plasma drug concentration

Cl = rate of elimination of drug/plasma drug concentration

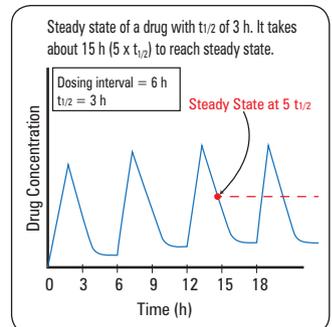

Half-life ( $t_{1/2}$ ) =  $0.7 \times V_d / Cl$

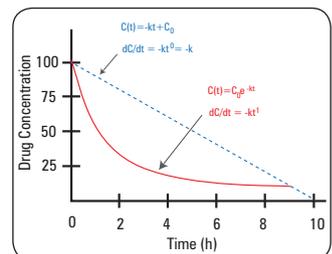

**Figure 2. Time course of drug action**

For most drugs it takes 5 half-lives to reach steady state with repeated dosing or to eliminate a drug once dosing is stopped

**Figure 3. Steady state of a drug displaying first-order kinetics**

**Figure 4. First and zero order kinetics**  
In first order kinetics (solid line), a constant fraction of the drug is eliminated per unit time; in zero order kinetics (dashed line), a constant amount of the drug is eliminated per unit time

# Pharmacodynamics

- study of “what the drug does to the body”

## Dose-Response Relationship

- graded dose-response relationships: relates dose to intensity of effect

### Efficacy

- the maximum biological response produced by a drug
- measured by  $E_{max}$  (the maximal response that a drug can elicit in a RCT or under optimal circumstances)

### Potency

- measured by  $EC_{50}$  (the concentration of a drug needed to produce 50% of  $E_{max}$ )
- a drug that reaches its  $EC_{50}$  at a lower dose is more potent

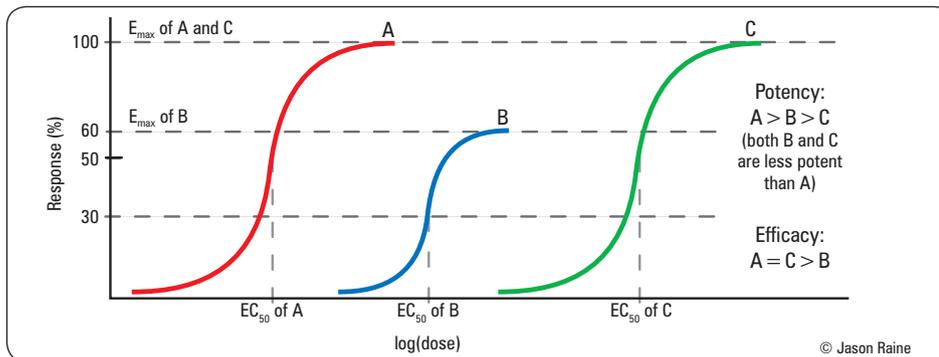

Figure 5. Log(dose)-response curve illustrating efficacy and potency

### Efficacy vs. Potency

- Efficacy measures the maximal effect of a drug
- Potency measures the concentration of a drug needed to produce a certain effect

## Effects of Drugs on Receptors

### Agonists

- drugs that mimic the effects of the endogenous ligand and evoke a response when bound to the receptor
  - **affinity:** the ability of the agonist to bind to the receptor (e.g. the  $\beta_2$ -agonist salbutamol has greater affinity for  $\beta_2$ -receptors than  $\beta_1$ -receptors)
  - **efficacy:** the ability to recapitulate endogenous response via the receptor interaction (e.g. binding of salbutamol to  $\beta_2$ -receptors results in smooth muscle relaxation)
- **full agonists:** can elicit a maximal effect at a receptor
- **partial agonists:** can only elicit a partial effect, no matter the concentration at the receptor (i.e. reduced efficacy compared to full agonists)

### Antagonists

- drugs that block the action of an agonist or of an endogenous ligand
- **chemical antagonism:** direct chemical interaction between agonist and antagonist prevents agonist-receptor binding (e.g. chelating agents for removal of heavy metals)
- **functional antagonism:** two agonists that act independently at different receptors and have opposite physiological effects (e.g. acetylcholine at the muscarinic receptor compared to epinephrine at the adrenergic receptor)
- **reversible and irreversible competitive antagonism**
  - drugs that exert no direct effect upon binding to a given receptor
  - reversible competitive antagonists reversibly bind to the same receptor as the agonist, thus displacing it (e.g. naloxone is an antagonist to morphine or heroin)
  - irreversible antagonists form a covalent bond with the receptor, thus irreversibly blocking substrates from binding (e.g. phenoxybenzamine forms a covalent bond with adrenergic receptors preventing adrenaline and NE from binding)
- **non-competitive antagonism**
  - antagonist binds to an alternate site near the agonist site, producing allosteric effects that change the ability of the agonist to bind (e.g. organophosphates irreversibly bind acetylcholinesterase)

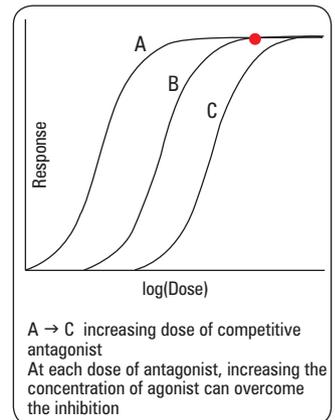

Figure 6. The log(dose)-response curve for competitive reversible antagonism

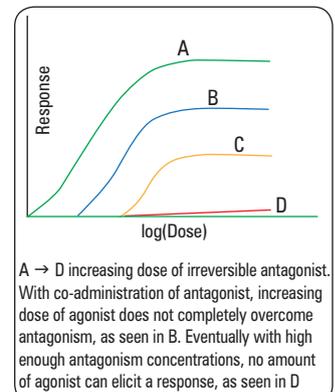

Figure 7. The log(dose)-response curve for irreversible antagonism

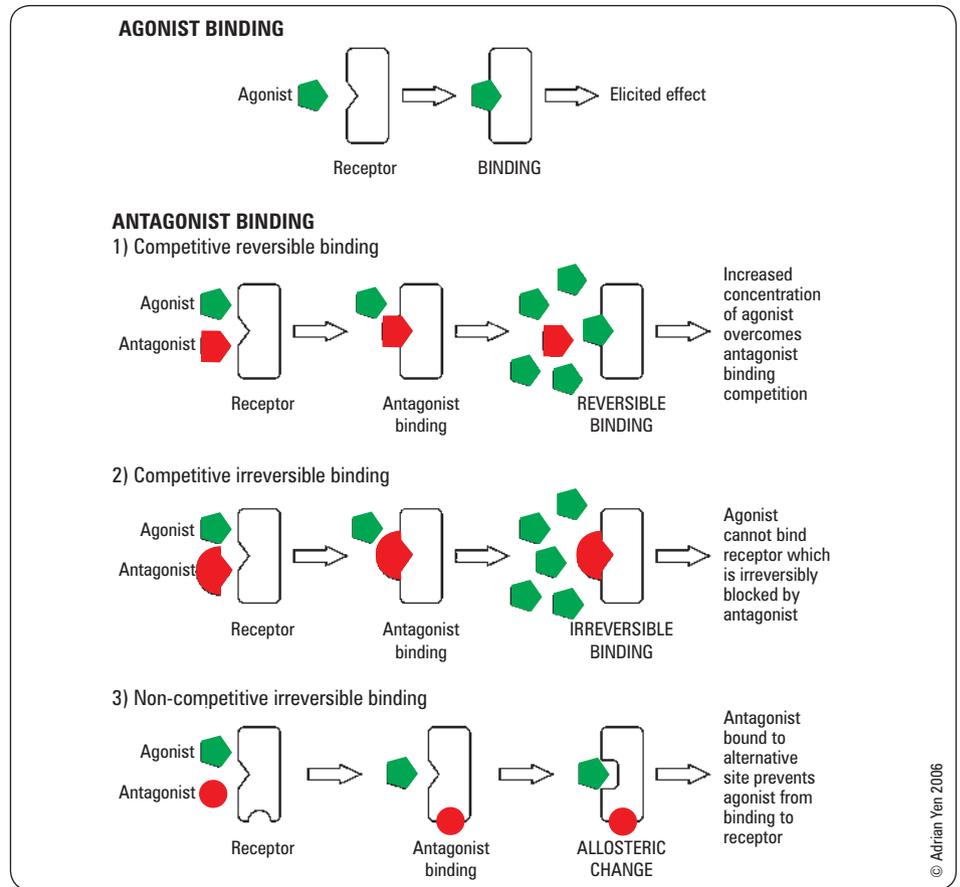

Figure 8. Mechanism of agonists and antagonists

## Effectiveness and Safety

### Effectiveness

- ED<sub>50</sub> (effective dose): the dose of a drug needed to cause a therapeutic effect in 50% of a test population of subjects

### Safety

- LD<sub>50</sub> (lethal dose): the dose of a drug needed to cause death in 50% of a test population of subjects
- TD<sub>50</sub> (toxic dose): the dose needed to cause a harmful effect in 50% of a test population of subjects

## Therapeutic Indices

### Therapeutic Index: TD<sub>50</sub>/ED<sub>50</sub>

- reflects the “margin of safety” for a drug – the likelihood of a therapeutic dose to cause serious toxicity or death
- the larger the TI, the safer a drug (e.g. warfarin has a narrow TI and requires drug monitoring)
- factors that can change the TI
  - presence of interacting drugs
  - changes in drug ADME

### Certain Safety Factor: TD<sub>1</sub>/ED<sub>99</sub>

- >1 translates to a dose effective in at least 99% of the population and toxic in less than 1% of the population

The two most clinically relevant properties of any drug are effectiveness and safety

Drugs with a narrow TI have a high likelihood of causing toxicity and need close therapeutic monitoring

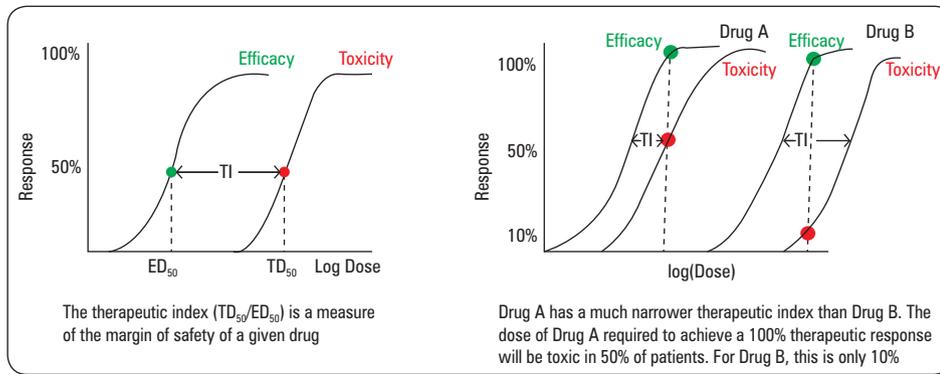

Figure 9.  $ED_{50}$ ,  $TD_{50}$ , and the therapeutic index

## Therapeutic Drug Monitoring

- **definition:** using serum drug concentration data to optimize drug therapy (e.g. dose adjustment, monitor compliance)
  - serum drug samples are usually taken when the drug has reached steady state (after approximately 5 half-lives)
- TDM is often used for drugs that have: narrow TIs, unpredictable dose-response relationships, significant consequences associated with therapeutic failure or toxicity, and wide inter-patient PK variability

## Adverse Drug Reactions

Table 3. Characteristics of Type A-E Adverse Drug Reactions

Classification	Definition	Characteristics
<b>A (Augmented)</b>	Dose related	Predictable extension of drug's pharmacologic effect (e.g. $\beta$ -blockers causing bradycardia) > 80% of all ADRs
<b>B (Bizarre)</b>	Non-dose related	Reactions unrelated to the known pharmacological actions of the drug Examples include: drug hypersensitivity syndromes, immunologic reactions (penicillin hypersensitivity), and idiosyncratic reactions (malignant hyperthermia)
<b>C (Chronic)</b>	Dose and time related	Related to cumulative doses Effects are well-known and can be anticipated (e.g. atypical femoral fracture from bisphosphonates)
<b>D (Delayed)</b>	Time related	Occurs some time after use of drug (e.g. carcinogen) May also be dose-related
<b>E (End of use)</b>	Withdrawal	Occurs after cessation of drug use (e.g. opiate withdrawal)

## Approach to Suspected Adverse Drug Reactions

- history and physical exam: signs and symptoms of reaction (e.g. rash, fever, hepatitis, anaphylaxis), timing, risk factors, detailed medication history including all drugs and timing, de-challenge (response when drug is removed), and re-challenge (response when drug is given again)
- differentiate between drug therapy vs. disease pathophysiology
- treatment: stop the drug, supportive care, symptomatic relief
- resources: check recent literature, Health Canada, and FDA; contact the pharmaceutical company; call Poison Control (1-888-268-9017) if overdose or poisoning suspected; check with Motherisk ([www.motherisk.org](http://www.motherisk.org)) in cases involving pregnant or breastfeeding women
- report all suspected ADRs that are: 1) unexpected, 2) serious, or 3) reactions to recently marketed drugs (on the market <5 yr) regardless of nature or severity
  - Canadian Adverse Drug Reaction Monitoring Program available for online reporting

Examples of drugs whose levels need to be monitored include warfarin (via INR levels), digoxin, lithium, anti-epileptics (e.g. phenytoin, carbamazepine)

Sample of Clinically Relevant Adverse Drug Reactions

Classification	Drug(s)	ADR
A	$\beta$ -blockers	Bradycardia
A	ACEIs	Cough
A	NSAIDs	GI bleeding
A	Opiates	GI upset, constipation, urinary retention, respiratory depression
A	Acetaminophen	Hepatotoxicity
A	Vancomycin	Red Man syndrome
A	Aminoglycosides	Ototoxicity and nephrotoxicity
B	Sulfa Drugs	Stevens-Johnson syndrome Toxic epidermal necrolysis
B	Penicillins	Rash
B	Valproic acid, Chinese herbs	Hepatotoxicity

## Variability in Drug Response

- recommended patient dosing is based on clinical research and represents mean values for a select population, but each person may be unique in their dosing requirements
- possible causes of individual variability in drug response include problems with:
  - intake: patient adherence
  - PK
    - absorption: vomiting, diarrhea, or steatorrhea; first pass effect increased due to enzyme induction or decreased due to liver disease
    - drug interactions (e.g. calcium carbonate complexes with iron, thyroxine, and fluoroquinolones)
    - distribution: very high or low percentage body fat; intact or disrupted BBB; patient is elderly or a neonate, or has liver dysfunction
    - biotransformation and elimination: certain genetic polymorphisms or enzyme deficiencies related to drug metabolism (e.g. acetylcholinesterase deficiency, CYP polymorphism); kidney or liver dysfunction
  - PD: genetic variability in drug response (e.g. immune-mediated reactions); diseases that affect drug PD; drug tolerance or cross-tolerance

### Examples of Clinically Relevant Drug Interactions

Interaction	Potential Effect
Warfarin plus ciprofloxacin, clarithromycin, erythromycin, metronidazole or trimethoprim-sulfamethoxazole	Increased effect of warfarin
Oral contraceptive pills plus rifampin, antibiotics	Decreased effectiveness of oral contraception
Sildenafil plus nitrates	Hypotension
SSRI plus St. John's wort, naratriptan, rizatriptan, sumatriptan, zolmitriptan	Serotonin syndrome
SSRI plus selegiline or non-selective MAO-I	Serotonin syndrome
Some HMG-CoA reductase inhibitors plus niacin, gemfibrozil, erythromycin or itraconazole	Possible rhabdomyolysis

## Drug Interactions

- concomitant prescriptions: one drug alters the effect of another by changing its PK and/or PD
- PK interactions involve changes in drug concentration
  - absorption: alterations in gastrointestinal pH, gastric emptying, intestinal motility, gut mucosal function
  - biotransformation: alterations in drug metabolizing enzymes
  - excretion: alterations in renal elimination
- PD interactions are due to two drugs that exert similar effects (additive) or opposing effects (subtractive)
- drug interactions can also involve herbal medications (e.g. St. John's wort) and food (e.g. grapefruit)

## Autonomic Pharmacology

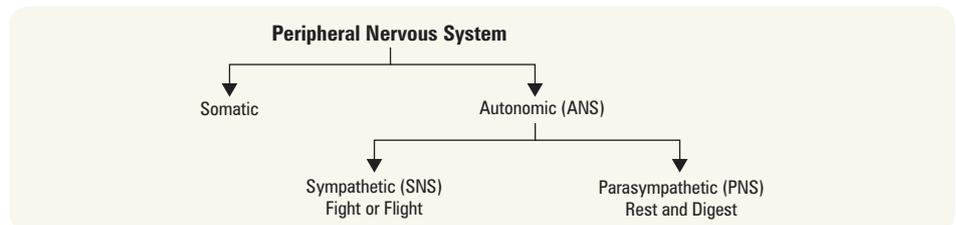

Figure 10. Subdivisions of the peripheral nervous system

- most organs are innervated by both sympathetic and parasympathetic nerves, which have opposing effects (see [Neurology, N8](#))
- ACh and NE are the main neurotransmitters of the autonomic NS
- ACh binds to cholinergic receptors, which include nicotinic and muscarinic receptors
- NE binds to adrenergic receptors, which principally include  $\beta_1$ ,  $\beta_2$ ,  $\alpha_1$ , and  $\alpha_2$
- ACh action is terminated by metabolism in the synaptic cleft by acetylcholinesterase and in the plasma by pseudocholinesterase
- acetylcholinesterase inhibitors (pyridostigmine, donepezil, galantamine, rivastigmine) can be used to increase ACh levels in conditions such as myasthenia gravis or Alzheimer's disease
- NE action is terminated by reuptake at the presynaptic membrane, diffusion from the synaptic cleft, and degradation at monoamine oxidase (MAO) and catechol-O-methyl transferase (COMT)

## Parasympathetic Nervous System

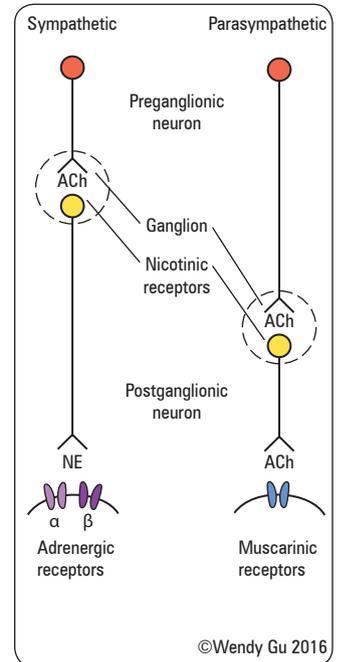

- blood vessels, adrenals, sweat glands, spleen capsule, and adrenal medulla do NOT have parasympathetic innervation
- parasympathetic pre-ganglionic fibres originate in the lower brainstem from cranial nerves III, VII, IX, X, and in the sacral spinal cord at levels S2-S4 and connect with post-ganglionic fibres via nicotinic receptors in ganglionic cells located near or within the target organ
- post-ganglionic fibres connect with effector tissues via:
  - $M_1$  muscarinic receptors located in the CNS
  - $M_2$  muscarinic receptors located in smooth muscle, cardiac muscle, and glandular epithelium

## Sympathetic Nervous System

- sympathetic pre-ganglionic fibres originate in the spinal cord at spinal levels T1-L2/L3
- pre-ganglionic fibres connect with post-ganglionic fibres via nicotinic receptors located in one of two groups of ganglia
  1. paravertebral ganglia (i.e. the sympathetic trunk) that lie in a chain close to the vertebral column
  2. pre-vertebral ganglia (i.e. celiac and mesenteric ganglia) that lie within the abdomen
- post-ganglionic fibres connect with effector tissues via:
  - $\beta_1$  receptors in cardiac tissue
  - $\beta_2$  receptors in smooth muscle of bronchi and GI tract
  - $\alpha_1$  receptors in vascular smooth muscle
  - $\alpha_2$  receptors in vascular smooth muscle
  - M3 muscarinic receptors located in sweat glands

**Table 4. Direct Effects of Autonomic Innervation on the Cardiorespiratory System**

Organ	Sympathetic NS		Parasympathetic NS	
	Receptor	Action	Receptor	Action
<b>Heart</b>				
1. Sinoatrial	$\beta_1$	Increased HR	M	Decreased conduction
2. Atrioventricular node	$\beta_1$	Increased conduction	M	Decreased conduction
3. Atria	$\beta_1$	Increased contractility	M	Decreased conduction
4. Ventricles	$\beta_1$	Increased contractility	M	Decreased HR
<b>Blood Vessels</b>				
1. Skin, splanchnic	$\alpha_1, \beta_2$	Constriction	M	Dilatation
2. Skeletal muscle	$\alpha$	Constriction	M	Dilatation
3. Coronary	$\beta_2$ (large muscles)	Dilatation	M	Dilatation
	$\alpha_1, \beta_2$	Constriction	M	Dilatation
	$\beta_2$	Dilatation	M	Dilatation
<b>Lungs</b>				
1. Bronchiolar smooth muscle	$\beta_2$	Relaxation	M	Constriction
2. Bronchiolar glands	$\alpha_1, \beta_2$	Increased secretion	M	Stimulation

**Figure 11. Autonomic nervous system efferent tracts**

## Common Drug Endings

**Table 5. Common Drug Endings**

Ending	Category	Example
-afil	5-PDE inhibitor	sildenafil
-ane	Inhaled general anesthetic	halothane
-azepam	Benzodiazepine	lorazepam
-azole	Antifungal	ketoconazole
-caine	Local anesthetic	lidocaine
-olol	$\beta$ -blocker	propranolol
-prazole	Proton pump inhibitor	omeprazole
-pril	ACE inhibitor	captopril
-sartan	ARB	candesartan
-statin	HMG-CoA inhibitor	atorvastatin
-terol	$\beta_2$ agonist	albuterol
-tidine	H2 antagonist	cimetidine
-tropin	Pituitary hormone	somatotropin
-vir	Antiviral	acyclovir
-zosin	$\alpha_1$ antagonist	prazosin

Note: Some medications are exceptions to the rule, e.g. methimazole (antithyroid)

$\beta$ -hCG	$\beta$ -human chorionic gonadotropin	Fe	iron	MTP	metatarsal phalangeal	SLE	systemic lupus erythematosus
AAFP	American Academy of Family Physicians	FTA-ABS	fluorescent treponemal antibody-absorption	NB-UVB	narrow band ultraviolet wavelength B	SPF	sun protection factor
AD	atopic dermatitis	GAS	group A $\beta$ -hemolytic <i>Streptococcus</i>	NCN	neocellular nevus	SSRI	selective serotonin reuptake inhibitor
AK	actinic keratosis	GVHD	graft-versus-host disease	Nd: Yag	neodymium-doped yttrium aluminum garnet	SSSS	staphylococcal scalded skin syndrome
ASO	anti-streptolysin O	HHV	human herpes virus	NMN	nevomelanocytic nevus	STI	sexually transmitted infection
BCC	basal cell carcinoma	HPA	hypothalamic-pituitary-adrenal	NMSC	nonmelanoma skin cancers	TB	tuberculosis
BSA	body surface area	HPV	human papillomavirus	NSAID	nonsteroidal anti-inflammatory drug	TEN	toxic epidermal necrolysis
BUN	blood urea nitrogen	HRT	hormone replacement therapy	OC	oral contraceptive pill	TMP/SMX	trimethoprim-sulfamethoxazole
CBC	complete blood count	HSV	herpes simplex virus	OTC	over-the-counter	UC	ulcerative colitis
CMV	cytomegalovirus	HZV	herpes zoster virus	PABA	para-aminobenzoic acid	URTI	upper respiratory tract infection
CNS	central nervous system	IFN	interferon	PASI	Psoriasis Area and Severity Index	UV	ultraviolet
Cr	creatinine	IVg	intravenous immunoglobulin	PPD	purified protein derivative	UVA	ultraviolet A
CXR	chest x-ray	LFT	liver function test	PUVA	psoralens and UVA	UVB	ultraviolet B
DLE	discoid lupus erythematosus	MAOI	monoamine oxidase inhibitor	RA	rheumatoid arthritis	UVC	ultraviolet C
DM	diabetes mellitus	MM	malignant melanoma	SCC	squamous cell carcinoma	VDRL	venereal disease research laboratory
DVT	deep vein thrombosis	MMR	measles/mumps/rubella	SHBG	sex hormone-binding globulin	VZV	varicella zoster virus
EM	erythema multiforme	MRSA	methicillin-resistant <i>Staphylococcus aureus</i>	SJS	Stevens-Johnson syndrome		

# Introduction to Skin

## Skin Anatomy

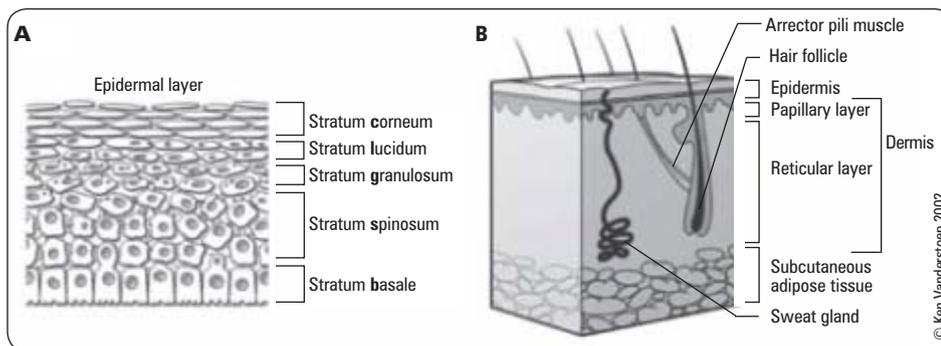

Figure 1. Histologic layers of the skin. Epidermal layer is detailed in A

### Skin

- divided anatomically into epidermis, dermis, and subcutaneous tissue
- epidermis**
  - avascular: receives its nutrition from the dermal capillaries
  - derived from keratinocytes with the youngest presenting at the stratum basale
  - cells progress from stratum basale to stratum corneum in about 4 wk
    - stratum basale (germinativum): mitotic figures that give rise to keratinocytes
    - stratum spinosum (prickle cells): junctions in this layer (tonofilaments) give the epidermis its strength
    - stratum granulosum: flat cells containing basophilic granules which characterize skin
    - stratum lucidum: transparent layers of packed dead cells
    - stratum corneum: flat scales of the water-resistant protein keratin
  - cells of the epidermis
    - keratinocytes: located in all layers of the epidermis, except the stratum corneum; connected to each other by desmosomes
    - melanocytes: located in the stratum basale; keratinocyte to melanocyte ratio in the basal layer is 10:1; melanocyte number is equal among races; produce melanosomes containing melanin, which are transferred to keratinocytes
    - Langerhans cells: dendritic cells which are important for immune surveillance
    - Merkel cells: located in the basal layer; involved in touch sensation
- dermis**: comprised of connective tissue divided into two regions
  - papillary: contains numerous capillaries that supply nutrients to the dermis and epidermis
  - reticular: provides a strong structure for skin; consists of collagen bundles woven together along with elastic fibres, fibroblasts, and macrophages
  - cells of dermis
    - fibroblasts: produces collagen, elastin, and ground substance
    - mast cells: releases histamines which mediate type I hypersensitivity
  - other components of dermis include: blood vessels, nerves, pilosebaceous units, and sweat glands
- subcutaneous tissue (hypodermis)**
  - consists primarily of adipose cells, larger calibre vessels, nerves and fascia

**Layers of the Epidermis**  
 "Californians Like Getting Sun Burns"  
 OR  
 "Canadians Like Good Sushi Boxes"

### Epidermal Appendages

- epidermal in origin, can extend into the dermis; includes hair, nails, and cutaneous glands
- pilosebaceous unit = hair + hair follicle + sebaceous gland + arrector pili muscle

### Cutaneous Glands

- sebaceous gland:** part of pilosebaceous unit, produces sebum which is secreted into the hair follicle via the sebaceous duct, where it covers the skin surface (protective function)
  - sebum has some antifungal properties
  - these glands cover entire skin surface and are absent only in non-hair bearing areas (e.g. palms, soles, lips)
- apocrine sweat gland:** apocrine duct empties into hair follicle above sebaceous gland
  - found in axillae and perineum
  - likely a vestigial structure, functions in other species to produce scent (e.g. pheromones)
- eccrine sweat gland:** not part of pilosebaceous unit
  - found over entire skin surface except lips, nail beds, and glans penis
  - important in temperature regulation via secretion of sweat to cool skin surface

## Skin Function

- protection**
  - due to continuous recycling and avascularity of epidermis
  - barrier to UV radiation (melanin), mechanical/chemical insults (sensory/mechanoreceptors), pathogens (immune cells), and dehydration (lipid rich barrier)
- thermal regulation**
  - insulation to maintain body temperature in cool environments via peripheral vasoconstriction, hair, and subcutaneous adipose tissue
  - dissipation of heat in warm environments via increased activity of sweat glands and increased blood flow within dermal vascular networks
- sensation**
  - touch, pain, and temperature sensation
- metabolic function**
  - vitamin D synthesis
  - energy storage (mainly in the form of triglycerides)

## Definitions

### Primary Morphological Lesions

#### Definition

- an initial lesion that has not been altered by trauma or manipulation, and has not regressed

**Table 1. Types of Primary Morphological Lesions**

Profile	<1 cm Diameter	≥1 cm Diameter
Flat lesion	Macule (e.g. freckle)	Patch (e.g. vitiligo)
Raised superficial lesion	Papule (e.g. wart)	Plaque (e.g. psoriasis)
Deep palpable (dermal or subcutaneous)	Nodule (e.g. dermatofibroma)	Tumour (e.g. lipoma)
Elevated fluid-filled lesions	Vesicle (e.g. HSV)	Bulla (e.g. bullous pemphigoid)

#### Describe a Lesion with SCALDA

**Size and Surface area**  
**Colour** (e.g. hyperpigmented, hypopigmented, erythematous)  
**Arrangement** (e.g. solitary, linear, reticulated, grouped, herpetiform)  
**Lesion morphology**  
**Distribution** (e.g. dermatomal, intertriginous, symmetrical/asymmetrical, follicular)  
**Always check hair, nails, mucous membranes and intertriginous areas**

### Secondary Morphological Lesions

#### Definition

- develop during the evolutionary process of skin disease, or created by manipulation, or due to complication of primary lesion (e.g. rubbing, scratching, infection)
- crust:** dried fluid (serum, blood, or purulent exudate) originating from a lesion (e.g. impetigo)
- scale:** excess keratin (e.g. seborrheic dermatitis)
- lichenification:** thickening of the skin and accentuation of normal skin markings (e.g. chronic atopic dermatitis)
- fissure:** a linear slit-like cleavage of the skin
- excoriation:** a scratch mark
- erosion:** a disruption of the skin involving the epidermis alone; heals without scarring
- ulcer:** a disruption of the skin that extends into the dermis or deeper; may heal with scarring
- xerosis:** pathologic dryness of skin (xeroderma), conjunctiva (xerophthalmia), or mucous membranes (xerostomia)
- atrophy:** histological decrease in size or number of cells or tissues, resulting in thinning or depression of the skin

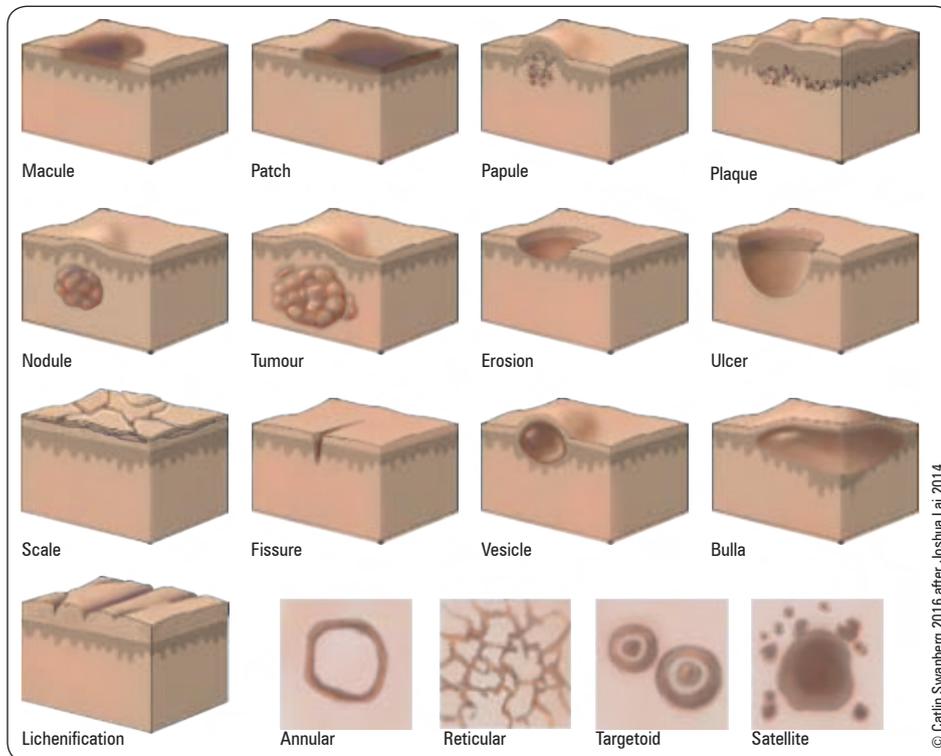

Figure 2. Examples of primary and secondary morphology

## Other Morphological Lesions

- **cyst**: an epithelial-lined collection containing semi-solid or fluid material
- **pustule**: an elevated lesion containing purulent fluid (white, grey, yellow, green)
- **scar**: replacement fibrosis of dermis and subcutaneous tissue (hypertrophic or atrophic)
- **wheel**: a special form of papule or plaque that is transient (<24 h) and blanchable often with a halo and central clearing, formed by edema in the dermis (e.g. urticaria)
- **comedone**: a special collection of sebum and keratin
  - open comedo (blackhead)
  - closed comedo (not a pustule; rather a minute dome-shaped, skin-coloured papule)
- **petechiae**: pinpoint extravasation of blood into dermis resulting in hemorrhagic lesions; non-blanchable, <3 mm in size
- **purpura**: larger than petechia, 3 mm-1 cm in size
- **ecchymosis**: larger than purpura, >1 cm in size (i.e. a "bruise")
- **telangiectasia**: dilated superficial blood vessels; often blanchable, reticulated, and of small calibre, can be associated with benign or malignant entities

## Patterns and Distribution

- **acral**: relating to the hands and feet (e.g. perniosis, secondary syphilis)
- **annular**: ring-shaped (e.g. granuloma annulare)
- **follicular**: involving hair follicles (e.g. folliculitis)
- **guttate**: lesions following a "drop-like" pattern (e.g. guttate psoriasis)
- **Koebner phenomenon**: i.e. isomorphic response, appearance of lesions at an injury site (e.g. lichen planus, psoriasis, vitiligo)
- **morbilliform**: literally means "measles-like", an eruption composed of macules and papules with truncal predominance
- **reticular**: lesions following a net-like pattern (e.g. livedo reticularis)
- **satellite**: small lesions scattered around the periphery of a larger lesion (e.g. candida diaper dermatitis)
- **serpiginous**: lesions following a snake-like pattern (e.g. cutaneous larva migrans)
- **target/targetoid**: concentric ring lesions, like a dartboard (e.g. erythema multiforme)
- **other descriptive terms**: discrete, clustered, linear, confluent, dermatitic, indurated (i.e. hard or firm)

# Differential Diagnoses of Common Presentations

**Table 2. Differential Diagnosis of Common Presenting Problems**

Lesion	Infectious	Inflammatory	Drug/Toxin	Miscellaneous
<b>Brown Macule</b>		Post-inflammatory hyper-pigmentation	UV radiation, actinic/solar lentigo, freckle (ephelide)	Congenital: café-au-lait spots, congenital nevus, epidermal/junctional nevus Neoplasia: lentigo maligna, MM, pigmented BCC Other: melasma/chloasma ("mask of pregnancy")
<b>Discrete Red Papule</b>	Folliculitis Furuncle Scabies	Acne vulgaris Rosacea Psoriasis Urticaria	Bites/stings	Autoimmune: lichen planus; <i>see Papulosquamous Diseases, D16</i> Vascular: hemangioma, pyogenic granuloma Other: dermatofibroma, miliaria rubra
<b>Red Scales</b>	Pityriasis rosea Secondary syphilis Tinea	Dermatitis (atopic, contact, nummular, seborrheic) Discoid lupus Psoriasis	Gold	Autoimmune: lichen planus; <i>see Papulosquamous Diseases, D16</i> Neoplastic: mycosis fungoides
<b>Vesicle</b>	Cat scratch disease Impetigo Viral: HSV, HZV, VZV, Molluscum, Coxsackie Scabies	Acute contact dermatitis Dyshidrotic eczema		Other: dermatitis herpetiformis, porphyria cutanea tarda
<b>Bulla</b>	Bullous impetigo	Acute dermatitis EM, SJS, TEN, SLE	Fixed drug eruption	Autoimmune: bullous pemphigoid, pemphigus vulgaris Other: dermatitis herpetiformis, porphyria cutanea tarda
<b>Pustule</b>	Candida Dermatophyte Impetigo Sepsis Varicella	Acne vulgaris Rosacea Dyshidrotic dermatitis Pustular folliculitis Pustular psoriasis Hidradenitis suppurativa	Acute generalized exanthematous pustulosis (usually secondary to drug reaction)	
<b>Oral Ulcer</b>	Aspergillosis CMV Coxsackie Cryptococcosis HSV/HZV HIV, TB, Syphilis	Allergic stomatitis EM/SJS/TEN Lichen planus Seronegative arthropathies, SLE Recurrent aphthous stomatitis Behçet's disease	Chemotherapy Radiation therapy	Autoimmune: pemphigus vulgaris Congenital: XXY Hematologic: sickle cell disease Neoplasia: BCC, SCC
<b>Skin Ulcer</b>	Plague Syphilis TB Tularemia	RA, SLE, vasculitis UC (pyoderma gangrenosum)		Autoimmune: necrobiosis lipoidica diabetorum (e.g. DM) Congenital: XXY Hematologic: sickle cell disease Neoplasia: SCC Vascular: arterial, neurotrophic, pressure, venous, aphthous, leukoplakia, traumatic

## Common Skin Lesions

### Cysts

**Table 3. Cysts**

	Clinical Presentation	Pathophysiology	Epidemiology	Clinical Course	Management
<b>Epidermal Cyst</b>	Round, yellow/flesh-coloured, slow growing, mobile, firm, fluctuant, nodule or tumour	Epithelial cells displaced into dermis, epidermal lining becomes filled with keratin and lipid-rich debris May be post-traumatic, rarely syndromic	Most common cutaneous cyst in youth – middle age	Central punctum may rupture (foul, cheesy odour, creamy colour) and produce inflammatory reaction Increase in size and number over time, especially in pregnancy	Excise completely before it becomes infected
<b>Pilar Cyst (Trichilemmal)</b>	Multiple, hard, variable sized nodules under the scalp, lacks central punctum	Thick-walled cyst lined with stratified squamous epithelium and filled with dense keratin Idiopathic Post-trauma, often familial	2nd most common cutaneous cyst F > M	Rupture causes pain and inflammation	Excision
<b>Dermoid Cyst</b>	Firm nodule most commonly found at lateral third of eyebrow or midline under nose	Rare, congenital hamartomas, which arise from inclusion of epidermis along embryonal cleft closure lines, creating a thick-walled cyst filled with dense keratin	Rare	If nasal midline, risk of extension into CNS	Excision
<b>Ganglion Cyst</b>	Usually solitary, rubbery, translucent; a clear gelatinous viscous fluid may be extruded	Cystic lesion that originates from joint or tendon sheath, called a digital mucous cyst when found on fingertip Associated with osteoarthritis	Older age	Stable	Incision and expression of contents Laser ablation and electrodesiccation
<b>Milium</b>	1-2 mm superficial, white to yellow subepidermal papules occurring on eyelids, cheeks, and forehead	Small epidermoid cyst, primarily arising from pluripotential cells in epidermal or adnexal epithelium Can be secondary to blistering, ulceration, trauma, topical corticosteroid atrophy, or cosmetic procedures	Any age 40-50% of infants	In newborns, spontaneously resolves in first 4 wk of life	Incision and expression of contents Laser ablation and electrodesiccation Multiple facial milia respond to topical retinoid therapy

## Fibrous Lesions

### DERMATOFIBROMA

#### Clinical Presentation

- button-like, firm dermal papule or nodule, skin-coloured to red-brown colouring
- majority are asymptomatic but may be pruritic and/or tender
- site: legs > arms > trunk
- dimple sign (Fitzpatrick's sign): lateral compression causes dimpling of the lesion

#### Pathophysiology

- benign tumour due to fibroblast proliferation in the dermis

#### Etiology

- unknown; may be associated with history of minor trauma (e.g. shaving or insect bites)
- eruptive dermatofibromata can be associated with SLE

#### Epidemiology

- adults, F>M

#### Differential Diagnosis

- dermatofibrosarcoma protuberans, malignant melanoma, Kaposi's sarcoma, blue nevus

#### Investigations

- biopsy if diagnosis is uncertain

#### Management

- no treatment required
- excision or cryosurgery if bothersome

### SKIN TAGS

#### Clinical Presentation

- small (1-10 mm), soft, skin-coloured or darker pedunculated papule, often polypoid
- sites: eyelids, neck, axillae, inframammary, and groin

#### Pathophysiology

- benign outgrowth of skin

#### Epidemiology

- middle-aged and elderly, F>M, obese, can increase in size and number during pregnancy

#### Differential Diagnosis

- pedunculated seborrheic keratosis, compound or dermal melanocytic nevus, neurofibroma, fibroepithelioma of Pinkus (rare variant of BCC)

#### Management

- excision, electrodesiccation, cryosurgery

#### Skin Phototypes (Fitzpatrick)

Phototype	Colour of Skin	Skin's Response to Sun Exposure (without SPF protection)
I	White	Always burns, never tans
II	White	Always burns, little tan
III	White	Slight burn, slow tan
IV	Pale brown	Slight burn, faster tan
V	Brown	Rarely burns, dark tan
VI	Dark brown or black	Never burns, dark tan

#### Skin tags are also known as...

- Acrochordons
- Fibroepithelial polyps
- Soft fibromas
- Pedunculated lipofibromas
- Cutaneous papillomas

## Hyperkeratotic Lesions

### SEBORRHEIC KERATOSIS

#### Clinical Presentation

- known as 'wisdom spots,' 'age spots,' or 'barnacles of life'
- well-demarcated waxy papule/plaque with classic "stuck on" appearance
- rarely pruritic
- over time lesions appear more warty, greasy and pigmented
- sites: face, trunk, upper extremities (may occur at any site except palms or soles)

#### Pathophysiology

- very common benign epithelial tumour due to proliferation of keratinocytes and melanocytes

#### Epidemiology

- unusual <30 yr old
- M>F
- autosomal dominant inheritance
- Leser-Trelat: sudden appearance of SK that can be associated with malignancy, commonly gastric adenocarcinomas

**Differential Diagnosis**

- malignant melanoma (lentigo maligna, nodular melanoma), melanocytic nevi, pigmented BCC, solar lentigo, spreading pigmented AK

**Investigations**

- biopsy only if diagnosis uncertain

**Management**

- none required, for cosmetic purposes only
- cryotherapy, curettage

**ACTINIC KERATOSIS (SOLAR KERATOSIS)**

- *see Pre-Malignant Skin Conditions, D33*

**KERATOACANTHOMA**

- *see Malignant Skin Tumours, D35*

**CORNS (HELOMATA)****Clinical Presentation**

- firm papule with a central, translucent, cone-shaped, hard keratin core
- painful with direct pressure
- sites: most commonly on dorsolateral fifth toe and dorsal aspects of other toes

**Pathophysiology**

- localized hyperkeratosis induced by pressure on hands and feet

**Epidemiology**

- F>M, can be caused by chronic microtrauma

**Differential Diagnosis**

- tinea pedis, plantar warts

**Management**

- relieve pressure with padding or alternate footwear, orthotics
- paring, curettage

**Corns vs. Warts vs. Calluses**

- **Corns** have a whitish yellow central translucent keratinous core; painful with direct pressure
- **Warts** bleed with paring and have a black speckled central appearance due to thrombosed capillaries; plantar warts destroy dermatoglyphics (epidermal ridges)
- **Calluses** have layers of yellowish keratin revealed with paring; there are no thrombosed capillaries or interruption of epidermal ridges

**Keloids vs. Hypertrophic Scars**

- **Keloids**: extend beyond margins of original injury with claw-like extensions
- **Hypertrophic scars**: confined to original margins of injury

**Keloids****Clinical Presentation**

- firm, shiny, skin-coloured or red-bluish papules/nodules that most often arise from cutaneous injury (e.g. piercing, surgical scar, acne), but may appear spontaneously
- extends beyond the margins of the original injury, and may continue to expand in size for years with claw-like extensions
- can be pruritic and painful
- sites: earlobes, shoulders, sternum, scapular area, angle of mandible

**Pathophysiology**

- excessive deposition of randomly organized collagen fibres following trauma to skin

**Epidemiology**

- most common in black patients, followed by those of Asian descent (predilection for darker skin)
- M=F, all age groups

**Management**

- intralesional corticosteroid injections
- cryotherapy
- silicone compression

## Pigmented Lesions

### CONGENITAL NEVOMELANOCYTIC NEVI (CNMN)

#### Clinical Presentation

- sharply demarcated pigmented papule or plaque with regular borders ± coarse hairs
- classified by size: small (<1.5 cm), medium (M1: 1.5-10 cm, M2: >10-20 cm), large (L1: >20-30 cm, L2: >30-40 cm), giant (G1: >40-60 cm, G2: >60 cm)
- may be surrounded by smaller satellite nevi

#### Pathophysiology

- nevomelanocytes in epidermis (clusters) and dermis (strands)

#### Epidemiology

- present at birth or develops in early infancy to childhood
- malignant transformation is rare (1-5%) and more correlated with size of the lesion
- neurocutaneous melanosis can occur in giant CNMN (melanocytes in the central nervous system)

#### Management

- surgical excision if suspicious, due to increased risk of melanoma
- MRI if suspicious for neurological involvement

### OTHER CONGENITAL PIGMENTED LESIONS

Table 4. Comparison of Other Congenital Pigmented Lesions

	Clinical Presentation	Pathophysiology	Epidemiology	Differential Diagnosis	Clinical Course and Management
<b>Café-au-lait macule</b>	Flat light brown lesions with smooth or jagged borders	Areas of increased melanogenesis	6 or more is suggestive of neurofibromatosis type I. Also associated with McCune-Albright syndrome	Flat congenital melanocytic nevus, speckled lentiginous nevus	Enlarge in proportion to the child. Laser can be used to treat for cosmesis
<b>Speckled lentiginous nevus (nevus spilus)</b>	Brown pigmented macular background (café-au-lait macule-like) with dark macular or papular speckles	Increased melanocyte concentration	Risk of melanoma similar to that of a CNMN of the same size	Café-au-lait macule, agminated lentiginous, Becker's nevus	Usually the light macular background is present at birth and speckles develop over time. Management is similar to that of CNMNs
<b>Dermal Melanocytosis</b> (historically known as Mongolian Spot)	Congenital grey-blue solitary or grouped macules commonly on lumbosacral area	Ectopic melanocytes in dermis	99% occurs in Asian and Aboriginal infants	Ecchymosis	Usually fades in early childhood but may persist into adulthood

### ACQUIRED NEVOMELANOCYTIC NEVI

#### Clinical Presentation

- common mole: well circumscribed, round, uniformly pigmented macules/papules <1.5 cm
- average number of moles per person: 18-40
- 3 stages of evolution: junctional NMN, compound NMN, and dermal NMN

Table 5. Evolution of Acquired Nevomelanocytic Nevi

Type	Age of Onset	Clinical Presentation	Histology
<b>Junctional</b>	Childhood Majority progress to compound nevus	Flat, irregularly bordered, uniformly tan-dark brown, sharply demarcated smooth macule	Melanocytes at dermal-epidermal junction above basement membrane
<b>Compound</b>	Any age	Domed, regularly bordered, smooth, round, tan-dark brown papule Face, trunk, extremities, scalp NOT found on palms or soles	Melanocytes at dermal-epidermal junction; migration into dermis
<b>Dermal</b>	Adults	Soft, dome-shaped, skin-coloured to tan/brown papules or nodules, often with telangiectasia Sites: face, neck	Melanocytes exclusively in dermis

#### DDx of Hyperpigmented Macules

- Purpura (e.g. solar, ASA, anti-coagulants, steroids, hemosiderin stain)
- Post-inflammatory
- Melasma
- Melanoma
- Fixed drug eruption

#### Other Nevi

- Halo nevus:** often a typical appearing nevus surrounded by a ring of depigmentation; not rare in children; uncommonly associated with vitiligo; no treatment required unless irregular colour or borders
- Blue nevus:** round to oval macule/papule with homogenous blue to blue-black colour; often appears in childhood and late adolescence; no treatment required unless atypical features are noted

## Management

- new or changing pigmented lesions should be evaluated for atypical features which could indicate a melanoma
- excisional biopsy can be considered if the lesion demonstrates asymmetry, varied colours, irregular borders, pruritus or persistent bleeding

## OTHER ACQUIRED PIGMENTED LESIONS

**Table 6. Comparison of Other Acquired Pigmented Lesions**

	Clinical Presentation	Pathophysiology	Epidemiology	Differential Diagnosis	Clinical Course and Management
<b>Atypical nevus</b> (Dysplastic Nevus)	Variiegated macule/papule with irregular distinct melanocytes in the basal layer Risk factors: family history	Hyperplasia and proliferation of melanocytes extending beyond dermal compartment of the nevus Often with region of adjacent nests	>5 atypical nevi increases risk for melanoma Numerous dysplastic nevi may be part of Familial Atypical Mole and Melanoma syndrome	Melanoma	Follow with colour photographs for changes Excisional biopsy if lesion changing or highly atypical
<b>Ephelides</b> (Freckles)	Small (<5 mm) well-demarcated light brown macules Sites: sun-exposed skin	Increased melanin within basal layer keratinocytes secondary to sun exposure	Skin phototypes I-II	Junctional nevi Juvenile lentiginos	Multiply and darken with sun exposure, fade in winter No treatment required Sunscreen may prevent the appearance of new freckles
<b>Solar Lentigo</b> (Liver Spot)	Well-demarcated brown/black irregular macules Sites: sun-exposed skin	Benign melanocytic proliferation in dermal-epidermal junction due to chronic sun exposure	Most common in Caucasians >40 yr Skin phototypes I-III	Lentigo maligna, seborrheic keratosis, pigmented solar keratosis	Laser therapy, shave excisions, cryotherapy
<b>Becker's Nevus</b>	Hairy, light brown macule/patch with a papular verrucous surface Sites: trunk and shoulders, onset in teen years	Pigmented hamartoma with increased melanin in basal cells	M>F Often becomes noticeable at puberty	Hairy congenital melanocytic nevus	Hair growth follows onset of pigmentation Cosmetic management (usually too large to remove)
<b>Melasma</b>	Dark, usually symmetrical, skin discolouration on sun-exposed areas of face (forehead, upper lip, cheeks, chin)	Increase in number and activity of melanocytes Associated with estrogen and progesterone	F>M Common in pregnancy and women taking OCP or HRT Risk factors: sun exposure, dark skin tone Can occur with mild endocrine disturbances, antiepileptic medications and other photosensitizing drugs	Post-inflammatory hyperpigmentation, Riehl melanosis	Often fades over several months after stopping hormone treatment or delivering baby Treatment: hydroquinone, azelaic acid, retinoic acid, topical steroid, combination creams, destructive modalities (chemical peels, laser treatment), camouflage make-up, sunscreen, sun avoidance

## Vascular Lesions

**Table 7. Vascular Tumours Compared to Vascular Malformations**

	Vascular Tumours	Vascular Malformations
<b>Definition</b>	Endothelial hyperplasia	Congenital malformation with normal endothelial turnover
<b>Presence at Birth</b>	Usually postnatal	100% at birth (not always obvious)
<b>M:F</b>	1:3-5	1:1
<b>Natural History</b>	Phases Proliferating Involuting Involved	Proportionate growth (can expand)

## HEMANGIOMAS

### Clinical Presentation

- red or blue subcutaneous mass that is soft/compressible, blanches with pressure; feels like a “bag of worms” when palpated

### Pathophysiology

- benign vascular tumour
- includes: cavernous hemangioma, capillary/infantile hemangioma, spider hemangioma

A spider angioma will blanch when the tip of a paperclip is applied to the centre of the lesion

Table 8. Vascular Tumours

	Clinical Presentation	Pathophysiology	Epidemiology	Clinical Course	Management
<b>Hemangioma of infancy</b>	Hot, firm red to blue plaques or tumours	Benign vascular proliferation of endothelial lining	Appears shortly after birth; rarely may be congenital	Appears shortly after birth, increases in size over months, then regresses 50% of lesions resolve spontaneously by 5 yr	10% require treatment due to functional impairment (visual compromise, airway obstruction, high output cardiac failure) or cosmesis Consider treatment if not gone by school age; propranolol; systemic corticosteroids; laser treatment; surgery
<b>Spider Angioma (Campbell Telangiectasia)</b>	Central red arteriole with slender branches, faintly pulsatile, blanchable	Can be associated with hyperestrogenic state (e.g. in hepatocellular disease, pregnancy, OCP) but often is not		Increase in number over time	Reassurance Electrodesiccation or laser surgery if patient wishes
<b>Cherry Angioma (Campbell De Morgan Spot)</b>	Bright red to deep maroon, dome-shaped vascular papules, 1-5 mm Site: trunk Less friable compared to pyogenic granulomas	Benign vascular neoplasm	>30 yr old	Lesions do not fade in time Lesions bleed infrequently	Usually no treatment needed Laser or electrocautery for small lesions Excision of large lesions if necessary
<b>Pyogenic Granuloma</b>	Bright red, dome-shaped sessile or pedunculated friable nodule Sites: fingers, lips, mouth, trunk, toes DDx: glomus tumour, nodular MM, SCC, nodular BCC	Rapidly developing hemangioma Proliferation of capillaries with erosion of epidermis and neutrophilia	<30 yr old		Surgical excision with histologic examination Electrocautery; laser; cryotherapy

## VASCULAR MALFORMATIONS

Table 9. Vascular Malformations

Type	Clinical Presentation	Pathophysiology	Management
<b>Nevus Flammeus (Port-wine stain)</b>	Red to blue macule present at birth that follows a dermatomal distribution, rarely crosses midline Most common site: nape of neck Never spontaneously regresses but grows in proportion to the child	Congenital vascular malformation of dermal capillaries; rarely associated with Sturge-Weber syndrome (V1, V2 distribution)	Laser or make-up
<b>Nevus Simplex (salmon patch)</b>	Pink-red irregular patches Midline macule on glabella known as "Angel Kiss"; on nuchal region known as "Stork Bites" Present in 1/3 of newborns Majority regress spontaneously	Congenital dilation of dermal capillaries	No treatment required

Pyogenic granuloma is a misnomer: it is neither pyogenic nor granulomatous

**Venous Lake:** benign blue or violaceous papular lesion occurring on the face, lips, and ears due to dilation of a venule. Distinguished from malignant pigmented lesions through diascopy, as compression blanches the lesion

## Lipoma

### Clinical Presentation

- single or multiple non-tender subcutaneous tumours that are soft and mobile
- occurs most frequently on the trunk, and extremities but can be anywhere on the body

### Pathophysiology

- adipocytes enclosed in a fibrous capsule

### Epidemiology

- often solitary or few in number, if multiple can be associated with rare syndromes

### Differential Diagnosis

- angiolipoma, liposarcoma

### Investigations

- biopsy only if atypical features (painful, rapid growth, firm)

### Management

- reassurance
- excision or liposuction only if desired for cosmetic purposes

# Acneiform Eruptions

## Acne Vulgaris/Common Acne

### Clinical Presentation

- a common inflammatory pilosebaceous disease categorized with respect to severity
  - Type I: comedonal, sparse, no scarring
  - Type II: comedonal, papular, moderate  $\pm$  little scarring
  - Type III: comedonal, papular, and pustular, with scarring
  - Type IV: nodulocystic acne, risk of severe scarring
- sites of predilection: face, neck, upper chest, and back

### Pathophysiology

- hyperkeratinization at the follicular ostia (opening) blocks the secretion of sebum leading to the formation of microcomedones
- androgens promote excess sebum production
- Propionibacterium acnes* metabolize sebum to free fatty acids and produces pro-inflammatory mediators

### Epidemiology

- age of onset in puberty (10-17 yr in females, 14-19 yr in males)
- in prepubertal children consider underlying hormonal abnormality (e.g. late onset congenital adrenal hyperplasia)
- more severe in males than in females
- incidence decreases in adulthood
- genetic predisposition: majority of individuals with cystic acne have parent(s) with history of severe acne

### Differential Diagnosis

- folliculitis, keratosis pilaris (upper arms, face, thighs), perioral dermatitis, rosacea

**Table 10. Management of Acne**

Compound/Drug Class	Product Names	Notes
<b>MILD ACNE: Topical Therapies OTC</b>		
Benzoyl peroxide (BPO)	Solugel, Benzac, Desquam, Fostex	Helps prevent <i>P. acnes</i> resistance, is a bactericidal agent (targets <i>P. acnes</i> ) and is comedolytic
Salicylic acid	Akurza <sup>®</sup> Cream, DermalZone	Used when patients cannot tolerate a topical retinoid due to skin irritation
<b>MILD ACNE: Prescription Topical Therapies</b>		
Antimicrobials	Clindamycin (Dalacin T), Erythromycin	High rate of resistance when used as monotherapy
Retinoids	Vitamin A Acid (Tretinoin, Stieva-A, Retin A) Adapalene (Differin)	Backbone of topical acne therapy All regimens should include a retinoid unless patient cannot tolerate
Combination products	Clindoxyl (Clindamycin and BPO) Benzacilin (Clindamycin and BPO) Tactuo (Adapalene and BPO) Stievamycine (Tretinoin and Erythromycin) Benzamycin (BPO and Erythromycin)	Allows for greater adherence and efficacy Combines different mechanisms of action to increase efficacy and maximize tolerability
<b>MODERATE ACNE</b>		
Tetracycline/Minocycline/Doxycycline	Sumycin/Minocin/Vibramycin	Use caution with regard to drug interactions: do not use with isotretinoin Sun sensitivity Antibiotics require 3 mo of use before assessing efficacy
Cyproterone acetate-ethinyl estradiol	Diane-35 <sup>®</sup>	After 35 yr of age, estrogen/progesterone should only be considered in exceptional circumstances, carefully weighing the risk/benefit ratio with physician guidance
Spirolactone (source ADA)	Aldactone	May cause hyperkalemia at higher doses Black box warning for breast cancer
<b>SEVERE ACNE</b>		
Isotretinoin	Accutane <sup>®</sup> , Clarus <sup>®</sup> , Epuris <sup>®</sup>	<b>See Table 27</b> for full side effect profile Most adverse effects are temporary and will resolve when the drug is discontinued Baseline lipid profile (risk of hypertriglyceridemia), LFTs and $\beta$ -hCG before treatment May transiently exacerbate acne before patient sees improvement Refractory cases may require multiple courses of isotretinoin

### Treatment of Acne Scars

- Tretinoin creams
- Microdermabrasion for superficial scars
- Injectable fillers (collagen, hyaluronic acid)
- Fraxel laser

### Acne Myths Debunked

- Eating greasy food and chocolate does not cause or worsen acne
- Blackheads (comedones) are black because of oxidized fatty acids, not dirt
- Acne is not caused by poor hygiene; on the contrary, excessive washing of face can be an aggravator

Antibiotics are used in inflammatory skin conditions since they also have anti-inflammatory properties (e.g. macrolides in acne). Topical antibiotics may also be used to treat secondary bacterial superinfections (e.g. impetigo)

### Acne Exacerbating Factors

- Systemic medications: lithium, phenytoin, steroids, halogens, androgens, iodides, bromides, danazol
- Topical agents: steroids, tars, ointments, oily cosmetics
- Mechanical pressure or occlusion, such as leaning face on hands
- Emotional stress

A combination of topical retinoids and topical erythromycin or clindamycin is more effective than either agent used alone

### Intralesional Injections

Intralesional corticosteroid injections are effective in the treatment of individual acne nodules

### Isotretinoin and Pregnancy

- Use of Isotretinoin during pregnancy is associated with spontaneous abortion and major birth defects such as facial dysmorphism and cognitive impairment
- Pregnancy should be ruled out before starting isotretinoin
- Ideally, patients should use 2 forms of contraception while on isotretinoin

## Perioral Dermatitis

### Clinical Presentation

- discrete erythematous micropapules that often become confluent, forming inflammatory plaques on perioral, perinasal, and periorbital skin
- commonly symmetrical, rim of sparing around vermillion border of lips

### Epidemiology

- 15-40 yr old, occasionally in younger children
- predominantly females

### Differential Diagnosis

- contact dermatitis, rosacea, acne vulgaris

### Management

- avoid all topical steroids
- topical: metronidazole 0.75% gel or 0.75-1% cream to affected area bid
- systemic: tetracycline family antibiotic (utilized for its anti-inflammatory properties)
- occasional use of a non-steroidal anti-inflammatory cream (i.e. tacrolimus or pimecrolimus)

#### Important Controversies Associated with Isotretinoin Therapy for Acne

*Am J Clin Dermatol* 2013;14:71-76

**Study:** Review on isotretinoin and (1) depression and suicide, (2) inflammatory bowel disease (IBD), (3) pregnancy prevention programs.

#### Conclusions

1. The evidence on whether isotretinoin causes depression and suicide is inconsistent; however, numerous controlled studies have shown an improvement in anxiety and depression scores in those taking isotretinoin.
2. There is no association between IBD and isotretinoin use. Only one study showed a significantly increased risk of UC. When considering using isotretinoin in a patient with IBD or with a strong family history, consider involving a gastroenterologist.

## Rosacea

### Clinical Presentation

- dome-shaped inflammatory papules ± pustules
- flushing, non-transient erythema, and telangiectasia
- distribution: typically on central face including forehead, nose, cheeks, and chin; rarely on scalp, neck, and upper body
- characterized by remissions and exacerbations
- exacerbating factors: heat, cold, wind, sun, stress, drinking hot liquids, alcohol, caffeine, spices
- all forms of rosacea can progress from mild to moderate to severe
- rarely in longstanding rosacea, signs of thickening, induration and lymphedema in the skin can develop
- phyma: a distinct swelling caused by lymphedema and hypertrophy of subcutaneous tissue, particularly affecting the nose (rhinophyma)
- ocular manifestations: blepharconjunctivitis, keratitis, iritis

### Pathophysiology

- unknown

### Epidemiology

- although found in all skin types, highest prevalence in fair-skinned people
- 30-50 yr old; F>M

### Differential Diagnosis

- acne vulgaris, seborrheic dermatitis, perioral dermatitis, contact dermatitis

### Management

- trigger avoidance and daily sunscreen use for long-term management
- avoid topical corticosteroids
- telangiectasia: treated by physical ablation; electrical hyfrecators, vascular lasers, and intense pulsed light therapies
- phymas: treated by physical ablation or removal; paring, electrosurgery, cryotherapy, laser therapy (CO<sub>2</sub>, argon, Nd:YAG)

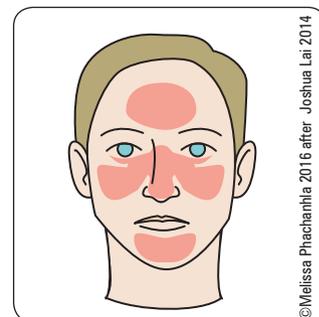

Figure 3. Rosacea distribution

Rosacea can be differentiated from acne by the absence of comedones, a predilection for the central face and symptoms of flushing

#### Guidelines for the Diagnosis of Rosacea

*J Drugs Dermatol* 2012;11(6):725-730

Presence of one or more of the following primary features:

- Flushing (transient erythema)
- Nontransient erythema
- Papules and pustules
- Telangiectasia

May include one or more of the following secondary features:

- Burning or stinging
- Dry appearance
- Edema
- Phymatous changes
- Ocular manifestations
- Peripheral location

Table 11. Specific Rosacea Treatments

1st Line	2nd Line	3rd Line
Oral tetracyclines (250-500 mg PO bid)	Topical clindamycin	Oral retinoids
Topical metronidazole	Topical erythromycin 2% solution	Topical sulfur
Oral erythromycin (250-500 mg PO bid)	Topical benzoyl peroxide	
Topical azelaic acid	Oral metronidazole	
	Ampicillin	

# Dermatitis (Eczema)

## Definition

- inflammation of the skin

## Clinical Presentation

- poorly demarcated erythematous patches or plaques
- symptoms include pruritus and pain
- acute dermatitis: papules, vesicles
- subacute dermatitis: scaling, crusting, excoriations
- chronic dermatitis: lichenification, xerosis, fissuring

## Asteatotic Dermatitis

### Clinical Presentation

- diffuse, mild pruritic dermatitis secondary to dry skin
- very common in elderly, especially in the winter (i.e. "winter itch") but starts in the fall
- shins predominate, looks like a "dried river bed"

### Management

- skin rehydration with moisturizing routine  $\pm$  mild corticosteroid creams

## Atopic Dermatitis

### Clinical Presentation

- subacute and chronic eczematous reaction associated with prolonged severe pruritus
- distribution depends on age
- inflammation, lichenification, excoriations are secondary to relentless scratching
- atopic palms: hyperlinearity of the palms (associated with ichthyosis vulgaris)
- associated with: keratosis pilaris (hyperkeratosis of hair follicles, "chicken skin"), xerosis, occupational hand dryness

### Epidemiology

- frequently affects infants, children, and young adults
- almost 15% of children in developed countries under the age of 5 are affected
- associated with personal or family history of atopy (asthma, hay fever), anaphylaxis, eosinophilia
- polygenic inheritance: one parent >60% chance for child; two parents >80% chance for child
- the earlier the onset, the more severe and persistent the disease
- long-term condition with 1/3 of patients continuing to show signs of AD into adulthood

### Pathophysiology

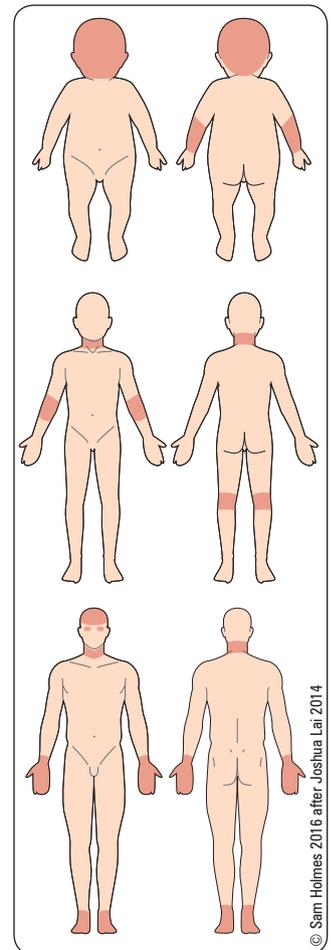

- a T-cell driven process with epidermal barrier dysfunction

### Investigations

- clinical diagnosis
- consider: skin biopsy, immunoglobulin serum levels (often elevated serum IgE level), patch testing, and skin prick tests

### Management

- goal: reduce signs and symptoms, prevent or reduce recurrences/flares
- better outcome (e.g. less flare-ups, modified course of disease) if diagnosis made early and treatment plan individualized
- avoid triggers of AD
- non-pharmacologic therapy**
  - moisturizers
    - apply liberally and reapply frequently with goal of minimizing xerosis
    - include in treatment of mild to severe disease as well as in maintenance therapy
  - bathing practices
    - bathe in plain warm water for a short period of time once daily followed by lightly but not completely drying the skin with a towel; immediately apply topical agents or moisturizers after this
    - use fragrance-free hypoallergenic non-soap cleansers
- pharmacologic therapy**
  - topical corticosteroids
    - effective in reducing acute and chronic symptoms as well as prevention of flares
    - choice of steroid potency depends on age, body site, short vs. long-term use
    - apply 1 adult fingertip unit (0.5 g) to an area the size of 2 adult palms bid for acute flares, and 1-2x/wk for maintenance therapy
    - local side effects: skin atrophy, purpura, telangiectasia, striae, hypertrichosis, and acneiform eruption are all very rarely seen

**Figure 4. Atopic dermatitis distribution**  
The typical distribution of atopic dermatitis in infants <6 mo (top), children >18 mo (middle) and adults (bottom)

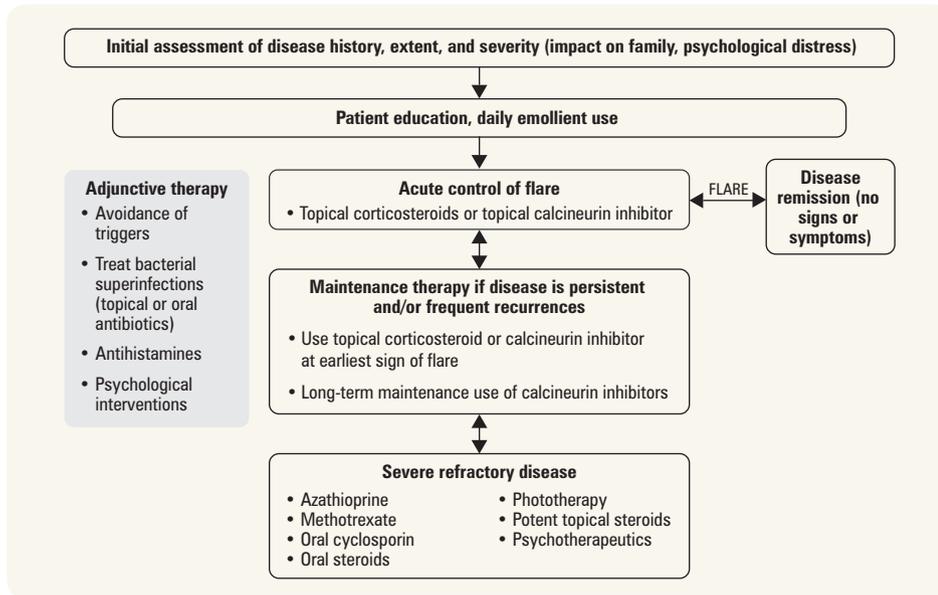

#### Triggers for Atopic Dermatitis

- Irritants (detergents, solvents, clothing, water hardness)
- Contact allergens
- Environmental aeroallergens (e.g. dust mites)
- Inappropriate bathing habits (e.g. long hot showers)
- Sweating
- Microbes (e.g. *S. aureus*)
- Stress

- topical calcineurin inhibitors
  - ◆ tacrolimus 0.03%, 0.1% (Protopic®) and pimecrolimus 1% (Elidel®)
  - ◆ use as steroid-sparing agents in the long-term
  - ◆ advantages over long-term corticosteroid use: rapid, sustained effect in controlling pruritus; no skin atrophy; safe for the face and neck
  - ◆ apply 2x/d for acute flares, and 2-3x/wk to recurrent sites to prevent relapses
  - ◆ local side effects: stinging, burning, allergic contact dermatitis
  - ◆ U.S. black box warning of malignancy risk: rare cases of skin cancer and lymphoma reported; no causal relationship established

**Complications**

- infections
  - treatment of infections
    - ◆ topical mupirocin or fusidic acid (Canada only, not available in US)
    - ◆ oral antibiotics (e.g. cloxacillin, cephalexin) for widespread *S. aureus* infections

**Figure 5. Atopic dermatitis treatment algorithm**

Adapted from: Ellis C, et al. ICCAD II Faculty. International Consensus Conference on Atopic Dermatitis II (ICCAD II): clinical update and current treatment strategies. *Br J Dermatol* 2003;149(Suppl 63):3-10

**The Diagnostic Value of Atopy Patch Testing and Prick Testing in Atopic Dermatitis: Facts and Controversies**

*Clin Dermatol* 2010;28:38-44  
 Study: Systematic review.

**Conclusions**

- Use of the atopy patch test (APT) is controversial
- There is no gold standard for aeroallergen provocation, so APT is used without comparison to another method.
  - APT findings are not consistent among children with atopic dermatitis.

APT may be valuable

- May provide diagnostic information and may aid clinical decision making regarding the use of IgE-mediated sensitizations.

Future research is needed

- Need standardized provocation and avoidance testing to determine the clinical relevance of obtaining a positive APT result.

**Contact Dermatitis**

**Clinical Presentation**

- cutaneous inflammation caused by an external agent(s)

**Table 12. Contact Dermatitis**

	<b>Irritant Contact Dermatitis</b>	<b>Allergic Contact Dermatitis</b>
<b>Mechanism of Reaction</b>	Toxic injury to skin; non-immune mechanism	Cell-mediated delayed (Type IV) hypersensitivity reaction (see <b>Rheumatology, RH2</b> )
<b>Type of Reaction</b>	Erythema, dryness, fine scale, burning Acute: quick reaction, sharp margins (e.g. from acid/alkali exposure) Cumulative insult: slow to appear, poorly defined margins (e.g. from soap), more common	Erythema with a papulovesicular eruption, swelling, pruritus
<b>Frequency</b>	Majority; will occur in anyone given sufficient concentration of irritants	Minority; patient acquires susceptibility to allergen that persists indefinitely
<b>Distribution</b>	Hands are the most common site	Areas exposed to allergen
<b>Examples</b>	Soaps, weak alkali, detergents, organic solvents, alcohol, oils	Many allergens are irritants, so may coincide with irritant dermatitis
<b>Management</b>	Avoidance of irritants Wet compresses with Burow's solution Barrier moisturizers Topical/oral steroids	Patch testing to determine specific allergen Avoid allergen and its cross-reactants Wet compresses soaked in Burow's solution (drying agent) Steroid cream (e.g. hydrocortisone 1%, betamethasone valerate 0.05% or 0.1% cream; bid) Systemic steroids prn (prednisone 1 mg/kg, taper over 2 wk)

## Dyshidrotic Dermatitis

### Clinical Presentation

- “tapioca pudding” papulovesicular dermatitis of hands and feet that coalesce into plaques, followed by painful fissuring
- acute stage often very pruritic
- secondary infections common
- lesions heal with desquamation and may lead to chronic lichenification
- sites: palms and soles ± dorsal surfaces of hands and feet

### Pathophysiology

- NOT caused by hyperhidrosis (excessive sweating)
- emotional stress may precipitate flares

### Management

- topical: high potency corticosteroid with plastic cling wrap occlusion to increase penetration
- intralesional triamcinolone injection
- systemic:
  - prednisone in severe cases
  - antibiotics for secondary *S. aureus* infection

## Nummular Dermatitis

### Clinical Presentation

- annular, coin-shaped, pruritic, dry, scaly, erythematous plaques, can become lichenified
- often associated with atopic and dyshidrotic dermatitis
- secondary infection common

### Pathophysiology

- little is known, but it is often accompanied by xerosis, which results from a dysfunction of the epidermal lipid barrier; this in turn can allow permeation of environmental agents, which can induce an allergic or irritant response

### Management

- moisturization
- mid to high potency corticosteroid ointment bid

## Seborrheic Dermatitis

### Clinical Presentation

- greasy, erythematous, yellow, scaling, minimally elevated papules and plaques in areas rich in sebaceous glands, can look moist and superficially eroded in flexural regions
- infants: “cradle cap”
- children: may be generalized with flexural and scalp involvement
- adults: diffuse involvement of scalp margin with yellow to white flakes, pruritus, and underlying erythema
- sites: scalp, eyebrows, eyelashes, beard, glabella, post-auricular, over sternum, trunk, body folds, genitalia

### Pathophysiology

- possible etiologic association with *Malassezia* spp. (yeast)

### Epidemiology

- common in infants and adolescents
- increased incidence and severity in immunocompromised patients
- in adults, can cause dandruff (pityriasis sicca)

### Management

- face: ketoconazole (Nizoral®) cream daily or bid + mild steroid cream daily or bid
- scalp: salicylic acid in olive oil or Derma-Smoother FS® lotion (peanut oil, mineral oil, fluocinolone acetonide 0.01%) to remove dense scales, 2% ketoconazole shampoo (Nizoral®), ciclopirox (Stieprox®) shampoo, selenium sulfide (e.g. Selsun®) or zinc pyrithione (e.g. Head and Shoulders®) shampoo, steroid lotion (e.g. betamethasone valerate 0.1% lotion bid)

## Stasis Dermatitis

### Clinical Presentation

- erythematous, scaly, pruritic plaques in lower legs, particularly the medial ankle
- brown hemosiderin deposition, woody fibrosis, atrophy blanche, and lipodermatosclerosis in late stages
- usually bilateral, accompanied by swelling, oozing, crusting, may have accompanying varicosities

### Pathophysiology

- chronic venous insufficiency leads to venous stasis
- surrounding soft tissue inflammation and fibrosis results

### Investigations

- Doppler and colour-coded Duplex sonography if suspicious for DVT
- culture for MRSA if there is crusting

### Management

- compression stockings
- rest and elevate legs (above the level of the heart)
- moisturizer to treat xerosis
- mid-high potency topical corticosteroids to control inflammation

### Complications

- ulceration (common at medial malleolus), secondary bacterial infections

## Lichen Simplex Chronicus

### Clinical Presentation

- well-defined plaque(s) of lichenified skin with increased skin markings ± excoriations
- common sites: neck, scalp, lower extremities, urogenital area
- often seen in patients with atopy

### Pathophysiology

- skin hyperexcitable to itch, continued rubbing/scratching of skin results
- eventually lichenification occurs

### Investigations

- if patient has generalized pruritus, rule out systemic cause: CBC with differential count, transaminases, bilirubin, renal and thyroid function tests
- CXR if lymphoma suspected

### Management

- antipruritics (e.g. antihistamines, topical or intralesional glucocorticoids, Unna boot)

## Papulosquamous Diseases

### Lichen Planus

#### Clinical Presentation

- acute or chronic inflammation of mucous membranes or skin, especially on flexural surfaces
- morphology: pruritic, well-demarcated, violaceous, polygonal, flat-topped papules
- common sites: wrists, ankles, mucous membranes in 60% (mouth, vulva, glans), nails, scalp
- distribution: symmetrical and bilateral
- Wickham's striae: reticulate white-grey lines over surface; pathognomonic but may not be present
- mucous membrane lesions: lacy, whitish reticular network, milky-white plaques/papules; increased risk of SCC in erosions and ulcers
- nails: longitudinal ridging; dystrophic; pterygium formation
- scalp: scarring alopecia with perifollicular hyperkeratosis
- spontaneously resolves but may last for weeks, months or years (mouth and skin lesions)
- rarely associated with hepatitis C
- Koebner phenomenon

#### Pathophysiology

- autoimmune, antigen unknown
- lymphocyte activation leads to keratinocyte apoptosis

#### Epidemiology

- 1%
- 30-60 yr old, F>M

#### The 6 Ps of Lichen Planus

- Purple
- Pruritic
- Polygonal
- Peripheral
- Papules
- Penis (i.e. mucosa)

**Investigations**

- biopsy
- hepatitis C serology if patient has risk factors

**Management**

- topical or intralesional corticosteroids
- short courses of oral prednisone (rarely)
- phototherapy for generalized or resistant cases
- oral retinoids for erosive lichen planus in mouth
- systemic immunosuppressants (e.g. azathioprine, methotrexate, cyclosporine)

## Pityriasis Rosea

**Clinical Presentation**

- acute, self-limiting eruption characterized by red, oval plaques/patches with central scale that does not extend to edge of lesion
- long axis of lesions follows skin tension lines (i.e. Langer's Lines) parallel to ribs producing "Christmas tree" pattern on back
- varied degree of pruritus
- most start with a "herald" patch which precedes other lesions by 1-2 wk
- common sites: trunk, proximal aspects of arms and legs

**Etiology**

- suspected HHV-7 or HHV-6 reactivation

**Investigations**

- none required

**Management**

- none required; clears spontaneously in 6-12 wk
- symptomatic: topical glucocorticoids if pruritic, cool compresses, emollients

## Psoriasis

**Classification**

1. plaque psoriasis
2. guttate psoriasis
3. erythrodermic psoriasis
4. pustular psoriasis
5. inverse psoriasis

**Pathophysiology**

- not fully understood, genetic and immunologic factors
- shortened keratinocyte cell cycle leads to Th1- and Th17-mediated inflammatory response

**Epidemiology**

- 1.5-2%, M=F
- all ages: peaks of onset: 20-30 and 50-60
- polygenic inheritance: 8% with 1 affected parent, 41% with both parents affected
- risk factors: smoking, obesity, alcohol, drugs, infections

**Differential Diagnosis**

- AD, mycosis fungoides (cutaneous T-cell lymphoma), seborrheic dermatitis, tinea, nummular dermatitis, lichen planus

**Investigations**

- biopsy (if atypical presentation, rarely needed)

### 1. PLAQUE PSORIASIS

**Clinical Presentation**

- chronic and recurrent disease characterized by well-circumscribed erythematous papules/plaques with silvery-white scales
- often worse in winter (lack of sun and humidity)
- Auspitz sign: bleeds from minute points when scale is removed
- common sites: scalp, extensor surfaces of elbows and knees, trunk (especially buttocks), nails, pressure areas

**PSORIASIS: Presentation and Pathophysiology**

Pink papules/Plaques/Pinpoint bleeding (Auspitz sign)/Physical injury (Koebner phenomenon)  
Silver scale/Sharp margins  
Nail findings: pitting/onycholysis/Oil spots/subungual hyperkeratosis/red lunula/Itching (sometimes)  
Immunologic with Th 1 and Th 17 helper cells being actively involved in the pathogenesis

**PSORIASIS: Triggers**

- Physical trauma (Koebner phenomenon)
- Infections (acute streptococcal infection precipitates guttate psoriasis)
- Stress (can be a major factor in flares)
- Drugs (rebound from stopping systemic glucocorticoids, lithium, antimalarial drugs, interferon)
- Smoking and heavy alcohol consumption

**Mechanism of Biologics**

"-mab" = monoclonal antibody  
"-cept" = receptor

**Topical Treatments for Chronic Plaque Psoriasis**  
*Cochrane DB Syst Rev 2013;3:CD005028*

**Study:** Systematic review of randomised trials comparing active topical treatments against placebo or against vitamin D analogues (used alone or in combination) in people with chronic plaque psoriasis.

**Patients:** 34,808 participants, including 26 trials of scalp psoriasis and 6 trials of inverse psoriasis, facial psoriasis, or both.

**Intervention:** Vitamin D analogues, corticosteroids, dithranol, tazarotene, coal tar.

**Primary Outcomes:** Investigator assessment of overall global improvement. Total severity scores. Psoriasis area and severity index. Patient assessment of overall global improvement.

**Results:** Corticosteroids perform at least as well as vitamin D analogues, and they are associated with a lower incidence of local adverse events. A combination of corticosteroids and vitamin D were better than either vitamin D or corticosteroids alone.

**Management**

- principles of management depends on severity of disease, as defined by BSA affected or less commonly Psoriasis Area and Severity Index (PASI)
- mild (<5% BSA)
  - topical steroids, topical vitamin D3 analogues, or a combinations of the two are first line
  - topical retinoid ± topical steroid combination, anthralin, and tar are also effective but tend to have more side effects than first line therapies
  - emollients potentiate the effect of topical therapies
  - phototherapy or systemic treatment may be necessary if the lesions are scattered or if it involves sites that are difficult to treat such as palms, soles, scalp, genitals
- moderate (5-10% BSA) to severe (>10% BSA)
  - goal of treatment is to attain symptom control that is adequate from patient's perspective
  - phototherapy if accessible
  - systemic or biological therapy based on patient's treatment history and comorbidities
  - topical steroid ± topical vitamin D3 analogue as adjunct therapy

**Calcipotriol is a Vitamin D Derivative**  
**Dovobet®** = calcipotriene combined with betamethasone dipropionate and is considered to be one of the most potent topical psoriatic therapies

**Table 13. Topical Treatment of Psoriasis**

Treatment	Mechanism	Comments
Emollients	Reduce fissure formation	Petrolatum is effective
Salicylic acid 1-12%	Remove scales	
Tar (LCD: liquor carbonis detergens)	Inhibits DNA synthesis, increases cell turnover	Poor long-term compliance
Topical Corticosteroids	Reduce scaling and thickness	Use appropriate potency steroid in different areas for degree of psoriasis
Vitamin D3 analogues: Calcipotriene / calcipotriol (Dovonex®, Silkis®)	Binds to skin 1,25-dihydroxyvitamin D3 to inhibit keratinocyte proliferation	Can be used on face and skin folds
Betamethasone + calcipotriene (Dovobet®)	Combined corticosteroid and vitamin D3 analogue. See above mechanisms	Not to be used on face and folds
Tazarotene (Tazorac®) (gel/cream)	Retinoid derivative, decreased scaling	Use on nails

**Table 14. Systemic Treatment of Psoriasis**

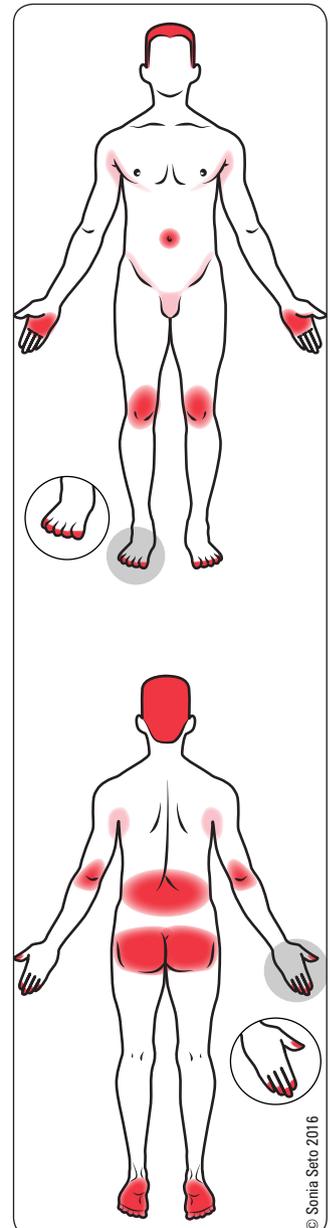

Treatment	Considerations	Adverse Effects
Acitretin	More effective when used in combination with phototherapy	Alopecia, cheilitis, teratogenicity, hepatotoxicity, photosensitivity, epistaxis, xerosis, hypertriglyceridemia
Cyclosporine	Used for intermittent control rather than continuously Avoid using for > 1 yr	Renal toxicity, hypertension, hypertriglyceridemia, immunosuppression, lymphoma
Methotrexate	Has been used for over 50 yr	Bone marrow toxicity, hepatic cirrhosis, teratogenicity
Apremilast (Otezla®)	Extremely safe	GI upset, headache, weight loss
PUVA	Highly effective in achieving remission Avoid >200 sessions in lifetime	Pruritus, burning, cataracts, skin cancer
UVB and "Narrow band" UVB (311-312 nm)	Much less carcinogenic than PUVA	Rare burning

**Table 15. Biologics Approved in Canada**

Treatment	Route	Dosing Schedule	Effectiveness	Action
Etanercept (Enbrel®)*	SC	50 mg twice weekly for 3 mo, then 50 mg weekly	+++	Anti-TNF
Adalimumab (Humira®)*	SC	80 mg x 1, then 40 mg at wk 1 and every 2 wk thereafter	++++	Anti-TNF
Infliximab (Remicade®)*	IV	5 mg/kg at wk 0, 2, 6 and every 8 wk thereafter	+++++	Anti-TNF
Ustekinumab (Stelara®)	SC	45 mg or 90 mg at wk 0, 4 and every 12 wk thereafter	++++	Anti-IL 12/23
Secukinumab (Cosentyx®)	SC	300 mg at week 0, 1, 2, 3, 4 and every 4 wk thereafter	+++++	Anti-IL 17A

\*Can also be used to treat psoriatic arthritis

- biologics under study for treatment of psoriasis: secukinumab, brodalumab, ixekizumab, tildrakizumab, guselkumab

**Figure 6. Psoriasis distribution**

© Sonia Seto 2016

## 2. GUTTATE PSORIASIS ("DROP-LIKE")

### Clinical Presentation

- discrete, scattered salmon-pink small scaling papules
- sites: diffuse, usually on trunk and legs, sparing palms and soles
- often antecedent streptococcal pharyngitis

### Management

- UVB phototherapy, sunlight, lubricants
- penicillin V or erythromycin if Group A  $\beta$ -hemolytic *Streptococcus* on throat culture

## 3. ERYTHRODERMIC PSORIASIS

### Clinical Presentation

- generalized erythema (> 90% of body surface area) with fine desquamative scale on surface
- associated signs and symptoms: arthralgia, pruritus, dehydration, electrolyte imbalance
- aggravating factors: lithium,  $\beta$ -blockers, NSAIDs, antimalarials, phototoxic reaction, infection

### Management

- IV fluids, monitor fluids and electrolytes, may require hospitalization
- treat underlying aggravating condition, sun avoidance
- cyclosporine, acitretin, UV, biologics

## 4. PUSTULAR PSORIASIS

### Clinical Presentation

- sudden onset of erythematous macules and papules which evolve rapidly into pustules, can be painful
- may be generalized or localized to palms/soles
- patient usually has a history of psoriasis; may occur with sudden withdrawal from steroid therapy

### Management

- methotrexate, cyclosporine, acitretin, biologics

## 5. INVERSE PSORIASIS

### Clinical Presentation

- erythematous plaques on flexural surfaces such as axillae, inframammary folds, gluteal fold, inguinal folds
- lesions may be macerated

### Management

- low potency topical corticosteroids
- topical vitamin D derivatives such as calcipotriene or calcitriol
- topical calcineurin inhibitors such as tacrolimus or pimecrolimus

## 6. PSORIATIC ARTHRITIS

- 5-30% of patients with psoriasis can also be suffering from psoriatic arthritis
- psoriatic patients with nail or scalp involvement are at a higher risk for developing psoriatic arthritis
- see [Rheumatology, RH23](#)

# Vesiculobullous Diseases

## Bullous Pemphigoid

### Clinical Presentation

- chronic autoimmune bullous eruption characterized by pruritis, pruritic, tense, subepidermal bullae on an erythematous or normal skin base
- can present as urticarial plaques without bullae
- common sites: flexor aspect of forearms, axillae, medial thighs, groin, abdomen, mouth in 33%

### Pathophysiology

- IgG produced against dermal-epidermal basement membrane proteins (hemidesmosomes) leads to subepidermal bullae

### Epidemiology

- mean age of onset: 60-80 yr old, F=M

### Investigations

- immunofluorescence shows linear deposition of IgG and C3 along the basement membrane
- anti-basement membrane antibody (IgG) (pemphigoid antibody detectable in serum)

### Prognosis

- heals without scarring, usually chronic
- rarely fatal

### Management

- prednisone 0.5-1 mg/kg/day until clear, then taper ± steroid-sparing agents (e.g. azathioprine, methotrexate)
- topical potent steroids (clobetasol) may be as effective as systemic steroids in limited disease
- tetracycline ± nicotinamide is effective for some cases
- immunosuppressants such as azathioprine, mycophenolate mofetil, cyclosporine
- IVIg and plasmapheresis for refractory cases

## Pemphigus Vulgaris

### Clinical Presentation

- autoimmune blistering disease characterized by flaccid, non-pruritic intraepidermal bullae/vesicles on an erythematous or normal skin base
- may present with erosions and secondary bacterial infection
- sites: mouth (90%), scalp, face, chest, axillae, groin, umbilicus
- Nikolsky's sign: epidermal detachment with shear stress
- Asboe-Hansen sign: pressure applied to bulla causes it to extend laterally

### Pathophysiology

- IgG against epidermal desmoglein-1 and -3 lead to loss of intercellular adhesion in the epidermis

### Epidemiology

- 40-60 yr old, M=F, higher prevalence in Jewish, Mediterranean, Asian populations
- paraneoplastic pemphigus may be associated with thymoma, myasthenia gravis, malignancy, and use of D-penicillamine

### Investigations

- immunofluorescence: shows IgG and C3 deposition intraepidermally
- circulating serum anti-desmoglein IgG antibodies

### Prognosis

- lesions heal with hyperpigmentation but do not scar
- may be fatal unless treated with immunosuppressive agents

### Management

- prednisone 1-2 mg/kg until no new blisters, then 1-1.5 mg/kg until clear, then taper ± steroid-sparing agents (e.g. azathioprine, methotrexate, gold, cyclophosphamide, cyclosporine, IVIg, mycophenolate mofetil, rituximab)

**Pemphigus Vulgaris vs. Bullous Pemphigoid**  
 Vulgaris = Superficial, intraepidermal, flaccid lesions  
 Pemphigoid = Deeper, tense lesions at the dermal-epidermal junction

**Pemphigus Foliaceus**  
 An autoimmune intraepidermal blistering disease that is more superficial than pemphigus vulgaris due to antibodies against desmoglein-1, a transmembrane adhesion molecule. Appears as crusted patches, erosions and/or flaccid bullae that usually start on the trunk. Localized disease can be managed with topical steroids. Active widespread disease is treated like pemphigus vulgaris

## Dermatitis Herpetiformis

### Clinical Presentation

- grouped papules/vesicles/urticarial wheals on an erythematous base, associated with intense pruritus, burning, stinging, excoriations
- lesions grouped, bilaterally symmetrical
- common sites: extensor surfaces of elbows/knees, sacrum, buttocks, scalp

### Pathophysiology

- transglutaminase IgA deposits in the skin alone or in immune complexes leading to eosinophil and neutrophil infiltration
- 90% have HLA B8, DR3, DQWZ
- 90-100% associated with an often subclinical gluten-sensitive enteropathy (i.e. celiac disease)
- 30% have thyroid disease; increased risk of intestinal lymphoma in untreated comorbid celiac disease; iron/folate deficiency is common

### Epidemiology

- 20-60 yr old, M:F = 2:1

### Investigations

- biopsy
- immunofluorescence shows IgA deposits in perilesional skin

**Management**

- dapsone (sulfapyridine if contraindicated or poorly tolerated)
- gluten-free diet for life – this can reduce risk of lymphoma

**Porphyria Cutanea Tarda****Clinical Presentation**

- skin fragility followed by formation of tense vesicles/bullae and erosions on photoexposed skin
- gradual healing to scars, milia
- periorbital violaceous discolouration, diffuse hypermelanosis, facial hypertrichosis
- common sites: light-exposed areas subjected to trauma, dorsum of hands and feet, nose, and upper trunk

**Pathophysiology**

- uroporphyrinogen decarboxylase deficiency leads to excess heme precursors
- can be associated with hemochromatosis, alcohol abuse, DM, drugs (estrogen therapy, NSAIDs), HIV, hepatitis C, increased iron indices

**Epidemiology**

- 30-40 yr old, M>F

**Investigations**

- urine + 5% HCl shows orange-red fluorescence under Wood's lamp (UV rays)
- 24 h urine for uroporphyrins (elevated)
- stool contains elevated coproporphyrins
- immunofluorescence shows IgE at dermal-epidermal junctions

**Management**

- discontinue aggravating substances (alcohol, estrogen therapy)
- phlebotomy to decrease body iron load
- low dose hydroxychloroquine

**Drug Eruptions****Exanthematous****EXANTHEMATOUS DRUG REACTION****Clinical Presentation**

- morphology: erythematous macules and papules ± scale
- spread: symmetrical, trunk to extremities
- time course: 7-14 d after drug initiation, fades 7-14 d after withdrawal

**Epidemiology**

- most common cutaneous drug reaction; increased in presence of infections
- common causative agents: penicillin, sulfonamides, phenytoin

**Management**

- weigh risks and benefits of drug discontinuation
- antihistamines, emollients, topical steroids

**DRUG INDUCED HYPERSENSITIVITY SYNDROME (DIHS) / DRUG REACTION WITH EOSINOPHILIA AND SYSTEMIC SYMPTOMS (DRESS)****Clinical Presentation**

- morphology: morbilliform rash involving face, trunk, arms; can have facial edema
- systemic features: fever, malaise, cervical lymphadenopathy, internal organ involvement (e.g. hepatitis, arthralgia, nephritis, pneumonitis, lymphadenopathy, hematologic abnormalities, thyroid abnormalities)
- spread: starts with face or periorbitally and spreads caudally; no mucosal involvement
- time course: onset 1-6 weeks after first exposure to drug, persists weeks after withdrawal of drug

**Epidemiology**

- rare: incidence varies considerably depending on drug
- common causative agents: anticonvulsants (e.g. phenytoin, phenobarbital, carbamazepine, lamotrigine), sulfonamides, and allopurinol
- 10% mortality if severe, undiagnosed, and untreated

**Management**

- discontinue offending drug ± prednisone 0.5mg/kg per day, consider cyclosporine in severe cases
- may progress to generalized exfoliative dermatitis/erythroderma if drug is not discontinued

**Diagnosis of a Drug Reaction**

Classification by Naranjo et. al has 4 criteria:

1. Temporal relationship between drug exposure and reaction
2. Recognized response to suspected drug
3. Improvement after drug withdrawal
4. Recurrence of reaction on re-challenge with the drug

Definite drug reaction requires all 4 criteria to be met

Probable drug reaction requires #1-3 to be met

Possible drug reaction requires only #1

**Drug Hypersensitivity Syndrome Triad**

- Fever
- Exanthematous eruption
- Internal organ involvement

## Urticarial

### DRUG INDUCED URTICARIA AND ANGIOEDEMA

#### Clinical Presentation

- morphology: wheals lasting <24hrs, angioedema (face and mucous membranes)
- systemic features: may be associated with systemic anaphylaxis (bronchospasm, laryngeal edema, shock)
- time course: hours to days after exposure depending on the mechanism

#### Epidemiology

- second most common cutaneous drug reaction
- common causative agents: penicillins, ACEI, analgesics/anti-inflammatories, radiographic contrast media

#### Management

- discontinue offending drug, antihistamines, steroids, epinephrine if anaphylactic

### SERUM SICKNESS-LIKE REACTION

#### Clinical Presentation

- morphology: symmetrical cutaneous eruption (usually urticarial)
- systemic features: malaise, low grade fever, arthralgia, lymphadenopathy
- time course: appears 1-3 wks after drug initiation, resolve 2-3 wks after withdrawal

#### Epidemiology

- more prevalent in kids 0.02-0.2%
- common causative agents: cefaclor in kids; bupropion in adults

#### Management

- discontinue offending drug ± topical/oral corticosteroids

## Pustular

### ACUTE GENERALIZED EXANTHEMATOUS PUSTULOSIS (AGEP)

#### Clinical Presentation

- morphology: erythematous edema and sterile pustules prominent in intertriginous areas
- systemic features: high fever, leukocytosis with neutrophilia
- spread: starts in face and intertriginous areas and spread to trunk and extremities
- time course: appears 1 wk after drug initiation, resolve 2 wks after withdrawal

#### Epidemiology

- rare: 1-5/million
- common causative agents: aminopenicillins, cephalosporins, clindamycin, calcium channel blockers

#### Management

- discontinue offending drug and systemic corticosteroids

## Bullous

### STEVEN-JOHNSON SYNDROME (SJS)/TOXIC EPIDERMAL NECROLYSIS (TEN)

#### Clinical Presentation

- morphology: prodromal rash (morbilliform/targetoid lesions ± purpura, or diffuse erythema), confluence of flaccid blisters, positive Nikolsky sign (epidermal detachment with shear stress), full thickness epidermal loss; dusky tender skin, bullae, desquamation/skin sloughing, atypical targets
- classification: BSA with epidermal detachment: <10% in SJS, 10-30% in SJS/TEN overlap, and >30% in TEN
- spread: face and extremities; may generalize; scalp, palms, soles relatively spared; erosion of mucous membranes (lips, oral mucosa, conjunctiva, GU mucosa)
- systemic features: fever (higher in TEN), cytopenias, renal tubular necrosis/AKI, tracheal erosion, infection, contractures, corneal scarring, phimosis, vaginal synechiae
- time course: appears 1-3 wk after drug initiation; progression <4 d; epidermal regrowth in 3 wk
- can have constitutional symptoms: malaise, fever, hypotension, tachycardia

#### Epidemiology

- SJS: 1.2-6/million; TEN: 0.4-1.2/million
- risk factors: SLE, HIV/AIDS, HLA-B1502 (associated with carbamazepine), HLA-B5801 (associated with allopurinol)
- common causative agents: drugs (allopurinol, anti-epileptics, sulfonamides, NSAIDs, cephalosporins) responsible in 50% of SJS and 80% of TEN; viral or mycoplasma infections;
- prognosis: 5% mortality in SJS, 30% in TEN due to fluid loss and infection

#### SCORTEN Score for TEN Prognosis

One point for each of: age ≥40, malignancy, body surface area detached ≥10%, tachycardia ≥120 bpm, serum urea >10 mmol/L, serum glucose >14 mmol/L, serum bicarbonate <20 mmol/L

Used to determine appropriate clinical setting: score 0-1 can be treated in non-specialized wards; score ≥2 should be transferred to intensive care or burn unit

Score at admission is predictive of survival: 94% for 0-1, 87% for 2, 53% for 3, 25% for 4, and 17% for ≥5

## Differential Diagnosis

- Scarlet fever, phototoxic eruption, GVHD, SSSS, exfoliative dermatitis, AGEP, paraneoplastic pemphigus

## Management

- discontinue offending drug
- admit to intermediate/intensive care/burn unit
- supportive care: IV fluids, electrolyte replacement, nutritional support, pain control, wound care, sterile handling, monitor for and treat infection
- IVIg or cyclosporine

### Intravenous Immunoglobulin in the Treatment of Stevens-Johnson Syndrome and Toxic Epidermal Necrolysis: A Meta-Analysis with Meta-Regression of Observational Studies

*Int J Dermatol* 2015;54(1):108-15

**Study:** Systematic review of 17 articles

(retrospective cohort studies were most common, no RCTs).

**Patients:** Individuals with a diagnosis of SJS/TEN treated with IVIg.

**Intervention:** Various doses and regimens of IVIg.

**Outcomes:** Time to disease cessation, time to healing.

**Results:** Eleven of 14 TEN studies reported positive results, while three studies did not observe a statistically significant improvement. Two of three SJS studies reported positive results, with one study observing no significant difference in mortality, or speed of healing.

**Conclusion:** IVIg appears to have a positive impact on TEN/SJS but results cannot be statistically analyzed as a whole due to variability and inconsistency in data presented from each study. However, it is considered the gold standard treatment.

## Other

### FIXED DRUG ERUPTION

#### Clinical Presentation

- morphology: sharply demarcated erythematous oval patches on the skin or mucous membranes
- spread: commonly face, mucosa, genitalia, acral; recurs in same location upon subsequent exposure to the drug (fixed location)

#### Epidemiology

- common causative agents: antimicrobials (tetracycline, sulfonamides), anti-inflammatories, psychoactive agents (barbiturates), phenolphthalein

#### Management

- discontinue offending drug ± prednisone 1mg/kg/d x 2 wk for generalized lesions ± potent topical corticosteroids for non-eroded lesions or antimicrobial ointment for eroded lesions

### PHOTOSENSITIVITY REACTION

#### Clinical Presentation

- phototoxic reaction: “exaggerated sunburn” (erythema, edema, vesicles, bullae) confined to sun-exposed areas
- photoallergic reaction: pruritic eczematous eruption with papules, vesicles, scaling, and crusting that may spread to areas not exposed to light

#### Pathophysiology

- phototoxic reaction: direct tissue injury
- photoallergic reaction: type IV delayed hypersensitivity

#### Epidemiology

- common causative agents: chlorpromazine, doxycycline, thiazide diuretics, procainamide

#### Management

- sun protection ± topical/oral corticosteroids

## Heritable Disorders

### Ichthyosis Vulgaris

#### Clinical Presentation

- xerosis with fine scaling as well as large adherent scales (“fish-scales”)
- affects arms, legs, palms, soles, back, forehead, and cheeks; spares flexural creases
- improves in summer, with humidity, and as the child grows into adulthood

#### Pathophysiology

- genetic deficiency in filaggrin protein leads to abnormal retention of keratinocytes (hyperkeratosis)
- scaling without inflammation

#### Epidemiology

- 1:300 incidence
- autosomal dominant inheritance
- associated with AD and keratosis pilaris

#### Investigations

- electron microscopy: keratohyalin granules

#### Management

- immersion in bath and oils followed by an emollient cream, humectant cream, or creams/oil containing urea or  $\alpha$ - or  $\beta$ -hydroxy acids
- intermittent systemic retinoids for severe cases

## Neurofibromatosis (Type I; von Recklinghausen's Disease)

### Clinical Presentation

- diagnostic criteria includes 2 or more of the following
  - more than 5 café-au-lait patches >1.5 cm in an adult or more than 5 café-au-lait macules >0.5 cm in a child under 5 yr
  - axillary or inguinal freckling
  - iris hamartomas (Lisch nodules)
  - optic gliomas
  - neurofibromas
  - distinctive bony lesion (sphenoid wing dysplasia or thinning of long bone cortex)
  - first degree relative with neurofibromatosis type I
- associated with pheochromocytoma, astrocytoma, bilateral acoustic neuromas, bone cysts, scoliosis, precocious puberty, developmental delay, and renal artery stenosis
- skin lesions less prominent in neurofibromatosis Type II (see [Pediatrics, P84](#))

### Pathophysiology

- autosomal dominant disorder with excessive and abnormal proliferation of neural crest elements (Schwann cells, melanocytes), high incidence of spontaneous mutation
- linked to absence of neurofibromin (a tumour suppressor gene)

### Epidemiology

- incidence 1:3,000

### Investigations

- Wood's lamp examination to detect café-au-lait macules in patients with pale skin

### Management

- refer to orthopedics, ophthalmology, plastics, and psychology for relevant management
- follow-up annually for brain tumours such as astrocytoma
- excise suspicious or painful lesions
- see [Pediatrics, P84](#)

## Vitiligo

### Clinical Presentation

- primary pigmentary disorder characterized by depigmentation
- acquired destruction of melanocytes characterized by sharply marginated white patches
- associated with streaks of depigmented hair, chorioretinitis
- sites: extensor surfaces and periorificial areas (mouth, eyes, anus, genitalia)
- Koebner phenomenon, may be precipitated by trauma

### Pathophysiology

- acquired autoimmune destruction of melanocytes

### Epidemiology

- 1% incidence, polygenic
- 30% with positive family history

### Investigations

- rule out associated autoimmune diseases: thyroid disease, pernicious anemia, Addison's disease, Type I DM
- Wood's lamp to detect lesions: illuminates UV light onto skin to detect amelanosis (porcelain white discoloration)

### Management

- sun avoidance and protection
- topical calcineurin inhibitor (e.g. tacrolimus, pimecrolimus) or topical corticosteroids
- PVA or Narrow band UVB
- make-up
- "bleaching" normal pigmented areas (i.e. monobenzyl ether of hydroquinone 20%) if widespread loss of pigmentation

#### Interventions for Vitiligo

*Cochrane Database Syst Rev.* 2015;2:CD003263.

**Study:** Systematic review of 96 randomized controlled trials with 4,512 participants with vitiligo.

**Intervention:** Topical treatments, light therapies, oral treatments, surgical methods.

**Outcome Measures:** Quality of life, >75% repigmentation, adverse effects

**Results:** Some evidence of therapies for vitiligo but further research required due to differences in design and outcome measures. Evidence exists to support use of combination therapies to be more effective than single agent. Narrowband UVB light, alone or in combination, show better results. Use of topical corticosteroids reported most adverse effects.

# Infections

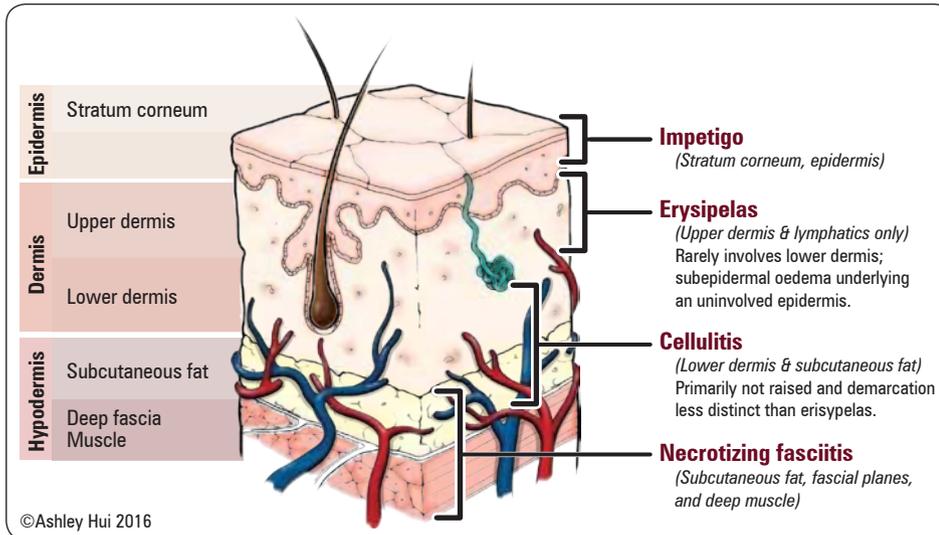

Figure 7. Layers of skin affected by bacterial infections

### Location Matters!

#### e.g. Group A Strep Infections

- Impetigo → just below stratum corneum
- Erysipelas → epidermis and upper dermis only
- Cellulitis → primarily lower dermis and subcutis (primarily not raised, and demarcation less distinct than erysipelas)
- Necrotizing fasciitis → deep fascia and muscle

## Bacterial Infections

### EPIDERMIS

#### IMPETIGO

##### Clinical Presentation

- acute purulent infection which appears vesicular; progresses to golden yellow “honey-crusted” lesions surrounded by erythema
- can present with bullae
- common sites: face, arms, legs, and buttocks

##### Etiology

- GAS, *S.aureus*, or both

##### Epidemiology

- preschool and young adults living in crowded conditions, poor hygiene, neglected minor trauma

##### Differential Diagnosis

- infected eczema, HSV, VZV

##### Investigations

- Gram stain and culture of lesion fluid or biopsy

##### Management

- remove crusts, use saline compresses, and topical antiseptic soaks bid
- topical antibacterials such as 2% mupirocin or fusidic acid (Canada only) tid; continue for 7-10 d after resolution
- systemic antibiotics such as cloxacillin or cephalexin for 7-10 d

## DERMIS

Table 16. Comparison of Erysipelas and Cellulitis

	Clinical Presentation	Etiology	Complications	Differential Diagnosis	Investigations	Management
<b>Erysipelas</b>	Involves upper dermis Confluent, erythematous, sharp raised edge, warm plaque, well demarcated Very painful ("St. Anthony's fire") Sites: face and legs Systemic symptoms: fever, chills, headache, weakness (if present, sign of more serious infection)	GAS	Scarlet fever, streptococcal gangrene, fat necrosis, coagulopathy Spreads via lymphatics	DVT (less red, less hot, smoother), superficial phlebitis, contact dermatitis, photosensitivity reaction, stasis dermatitis, panniculitis, vasculitis	Clinical diagnosis: rarely do skin/blood culture If suspect necrotizing fasciitis: do immediate biopsy and frozen section, histopathology	1st line: penicillin, cloxacillin or cefazolin 2nd line: clindamycin or cephalixin If allergic to penicillin, use erythromycin
<b>Cellulitis</b>	Involves lower dermis/subcutaneous fat Unilateral erythematous flat lesion, often with vesicles poorly demarcated, not uniformly raised Tender Sites: commonly on legs Systemic symptoms (uncommon): fever, leukocytosis, lymphadenopathy	GAS, <i>S. aureus</i> (large sized wounds), <i>H. influenzae</i> (periocular), <i>Pasteurella multocida</i> (dog/cat bite)	Uncommon	Same as erysipelas	Same as erysipelas	1st line: cloxacillin or cefazolin/cephalexin 2nd line: erythromycin or clindamycin Children: cefuroxime If DM (foot infections): TMP/SMX and metronidazole

## COMMON HAIR FOLLICLE INFECTIONS

Table 17. Comparison of Superficial Folliculitis, Furuncles, and Carbuncles

	Clinical Presentation	Etiology	Management
<b>Superficial Folliculitis</b>	Superficial infection of the hair follicle (versus pseudofolliculitis: inflammation of follicle due to friction, irritation, or occlusion) Acute lesion consists of a dome-shaped pustule at the mouth of hair follicle Pustule ruptures to form a small crust Sites: primarily scalp, shoulders, anterior chest, upper back, other hair-bearing areas	Normal non-pathogenic bacteria ( <i>Staphylococcus</i> – most common; <i>Pseudomonas</i> – hot tub) <i>Pityrosporum</i>	Antiseptic (Hibiclens®) Topical antibacterial (fusidic acid, mupirocin, erythromycin or clindamycin) Oral cloxacillin for 7-10 d
<b>Furuncles (Boils)</b>	Red, hot, tender, inflammatory nodules with central yellowish point, which forms over summit and ruptures Involves subcutaneous tissue that arises from a hair follicle Sites: hair-bearing skin (thigh, neck, face, axillae, perineum, buttocks)	<i>S. aureus</i>	Incise and drain large furuncles to relieve pressure and pain If afebrile: hot wet packs, topical antibiotic If febrile/cellulitis: culture blood and aspirate pustules (Gram stain and C&S) Cloxacillin for 1-2 wk (especially for lesions near external auditory canal/nose, with surrounding cellulitis, and not responsive to topical therapy)
<b>Carbuncles</b>	Deep-seated abscess formed by multiple coalescing furuncles Usually in areas of thicker skin Occasionally ulcerates Lesions drain through multiple openings to the surface Systemic symptoms may be associated	<i>S. aureus</i>	Same as for furuncles

## Dermatophytoses

## Clinical Presentation

- infection of skin, hair, and nails caused by dermatophytes (fungi that live within the epidermal keratin or hair follicle and do not penetrate into deeper structures)

## Pathophysiology

- digestion of keratin by dermatophytes results in scaly skin, broken hairs, crumbling nails/onycholysis

## Etiology

- Trichophyton*, *Microsporum*, *Epidermophyton* species (*Pityrosporum* is a superficial yeast and not a dermatophyte)

## Investigations

- skin scrapings, hair, and/or nail clippings analyzed with potassium hydroxide (KOH) prep to look for hyphae and mycelia

## Management

- topicals as first line agents for tinea corporis/cruris and tinea pedis (interdigital type): clotrimazole, or terbinafine or ciclopirox olamine cream applied bid
- oral therapy is indicated for onychomycosis or tinea capitis: terbinafine (Lamisil® – liver toxicity, CYP2D6 inhibitor) or itraconazole (Sporanox® – CYP3A4 inhibitor, liver toxicity)

**Table 18. Different Manifestations of Dermatophyte Infection**

	Clinical Presentation	Differential Diagnosis	Investigations	Management
<b>Tinea Capitis</b>	Round, scaly patches of alopecia, possibly with broken off hairs; pruritic Sites: scalp, eyelashes, and eyebrows; involving hair shafts and follicles Kerion (boggy, elevated, purulent inflamed nodule/plaque) may form secondary to infection by bacteria and result in scarring May have occipital lymphadenopathy Affects children (mainly black), immunocompromised adults Very contagious and may be transmitted from barber, hats, theatre seats, pets	Alopecia areata, psoriasis, seborrheic dermatitis, trichotillomania	Wood's light examination of hair: green fluorescence only for <i>Microsporum</i> infection Culture of scales/hair shaft Microscopic examination of KOH preparation of scales or hair shafts	Terbinafine (Lamisil®) x 4 wk NB: oral agents are required to penetrate the hair root where dermatophyte resides Adjunctive antifungal shampoos or lotions may be helpful, and may prevent spread (e.g. selenium sulfide, ketoconazole, ciclopirox)
<b>Tinea Corporis (Ringworm)</b>	Pruritic, scaly, round/oval plaque with active erythematous margin, and central clearing Site: trunk, limbs, face	Granuloma annulare, pityriasis rosea, psoriasis, seborrheic dermatitis	Microscopic examinations of KOH prep of scales shows hyphae Culture of scales	Topicals: 1% clotrimazole, 2% ketoconazole 2% miconazole, terbinafine or ciclopirox olamine cream bid for 2-4 wk Oral terbinafine, or itraconazole, or fluconazole, or ketoconazole if extensive
<b>Tinea Cruris ("Jock Itch")</b>	Scaly patch/plaque with a well-defined, curved border and central clearing Pruritic, erythematous, dry/macerated Site: medial thigh	Candidiasis (involvement of scrotum and satellite lesions), contact dermatitis, erythrasma	Same as for tinea corporis	Same as for tinea corporis
<b>Tinea Pedis (Athlete's Foot)</b>	Pruritic scaling and/or maceration of the web spaces, and powdery scaling of soles Acute infection: interdigital (esp. 4th web space) red/white scales, vesicles, bullae, often with maceration Secondary bacterial infection may occur Chronic: non-pruritic, pink, scaling keratosis on soles and sides of feet May present as flare-up of chronic tinea pedis Predisposing factors: heat, humidity, occlusive footwear	AD, contact dermatitis, dyshidrotic dermatitis, erythrasma, intertrigo, inverse psoriasis	Same as for tinea corporis	Same as for tinea corporis
<b>Tinea Manuum</b>	Primary fungal infection of the hand is rare; usually associated with tinea pedis Acute: blisters at edge of red areas on hands Chronic: single dry scaly patch	AD, contact dermatitis, granuloma annulare, psoriasis	Same as for tinea corporis	Same as for tinea corporis
<b>Tinea Unguium (Onychomycosis)</b>	Crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris Toenail infections usually precede fingernail infections <i>T. rubrum</i> (90% of all toenail infections)	Psoriasis, lichen planus, contact dermatitis, traumatic onychodystrophies, bacterial infections	Microscopic examinations of KOH prep of scales from subungual scraping shows hyphae Culture of subungual scraping or nail clippings on Sabouraud's agar PAS stain of nail clipping by pathology	Terbinafine (Lamisil®) (6 wk for fingernails, 12 wk for toenails) Itraconazole (Sporanox®) 7 d on, 3 wk off (2 pulses for fingernails, 3 pulses for toenails) Topical: ciclopirox (Penlac®); nail lacquer (often ineffective), Eflinaconazole (Jublia®) (48 weeks)

## Parasitic Infections

### SCABIES

#### Clinical Presentation

- characterized by superficial burrows, intense pruritus (especially nocturnal), and secondary infection
- primary lesion: superficial linear burrows; inflammatory papules and nodules in the axilla and groin
- secondary lesion: small urticarial crusted papules, eczematous plaques, excoriations
- common sites: axillae, groin, buttocks, hands/feet (especially web spaces), sparing of head and neck (except in infants)

#### Pathophysiology

- scabies mite remains alive 2-3 d on clothing/sheets
- incubation of 1 mo, then pruritus begins
- re-infection followed by hypersensitivity in 24 h

#### Etiology

- *Sarcoptes scabiei* (a mite)
- risk factors: sexual promiscuity, crowding, poverty, nosocomial, immunocompromised

**Differential Diagnosis**

- asteatotic eczema, dermatitis herpetiformis, lichen simplex chronicus (neurodermatitis)

**Investigations**

- microscopic examination of root and content of burrow and mineral oil mount for mite, eggs, feces
- skin biopsy may sometimes show scabies mite

**Management**

- bathe, then apply permethrin 5% cream (i.e. Nix®) from neck down to soles of feet (must be left on for 8-14 h and requires second treatment 7 d after first treatment)
- change underwear and linens; wash twice with detergent in hot water cycle then machine dry
- treat family and close contacts
- pruritus may persist for 2-3 wk after effective treatment due to prolonged hypersensitivity reaction
- mid potency topical steroids and antihistamines for symptom management

**LICE (PEDICULOSIS)****Clinical Presentation**

- intensely pruritic, red excoriations, morbilliform rash, caused by louse (a parasite)
- scalp lice: nits (i.e. louse eggs) on hairs; red, excoriated skin with secondary bacterial infection, lymphadenopathy
- pubic lice: nits on hairs; excoriations
- body lice: nits and lice in seams of clothing; excoriations and secondary infection mainly on shoulders, belt-line and buttocks

**Etiology**

- *Phthirus pubis* (pubic), *Pediculus humanus capitis* (scalp), *Pediculus humanus humanus* (body): attaches to body hair and feeds
- can transmit infectious agents such as *Bartonella quintana* and *Rickettsia prowazekii*

**Differential Diagnosis**

- bacterial infection of scalp, seborrheic dermatitis

**Diagnosis**

- lice visible on inspection of affected area or clothing seams

**Management**

- permethrin 1% (Nix® cream rinse) (ovicidal) or permethrin 1% (RC & Cor®, Kwellada-P® shampoo)
- comb hair with fine-toothed comb using dilute vinegar solution to remove nits
- repeat in 7 d after first treatment
- shave hair if feasible, change clothing and linens; wash with detergent in hot water cycle then machine dry

**BED BUGS (HEMIPTERA)****Clinical Presentation**

- burning wheals, turning to firm papules, often in groups of three – “breakfast, lunch and dinner” – in areas with easy access (face, neck, arms, legs, hands)

**Etiology**

- caused by *Cimex lectularius*, a small insect that feeds mainly at night (hide in crevices in walls and furniture during the day)

**Differential Diagnosis**

- dermatitis herpetiformis, drug eruptions, ecthyma, other insect bites, scabies

**Investigations**

- none required, but lesional biopsy can confirm insect bite reaction

**Management**

- professional fumigation
- topical steroids and oral H1-antagonists for symptomatic relief
- definitive treatment is removal of clutter in home and application of insecticides to walls and furniture

## Viral Infections

### HERPES SIMPLEX

#### Clinical Presentation

- herpetiform (i.e. grouped) vesicles on an erythematous base on skin or mucous membranes
- transmitted via contact with erupted vesicles or via asymptomatic viral shedding
- **primary**
  - children and young adults
  - usually asymptomatic; may have high fever, regional lymphadenopathy, malaise
  - followed by antibody formation and latency of virus in dorsal nerve root ganglion
- **secondary**
  - recurrent form seen in adults; much more common than primary
  - prodrome: tingling, pruritus, pain
  - triggers for recurrence: fever, excess sun exposure, physical trauma, menstruation, emotional stress, URTI
- **complications:** dendritic corneal ulcer, EM, herpes simplex encephalitis (infants at risk), HSV infection on AD causing Kaposi's varicelliform eruption (eczema herpeticum)
- two biologically and immunologically different subtypes: HSV-1 and HSV-2
  - HSV-1
    - ◆ typically "cold sores" (grouped vesicles at the mucocutaneous junction which quickly burst)
    - ◆ recurrent on face, lips and hard palate, but NOT on soft, non-keratinized mucous membranes (unlike aphthous ulcers)
  - HSV-2
    - ◆ usually sexually transmitted; incubation 2-20 d
    - ◆ gingivostomatitis: entire buccal mucosa involved with erythema and edema of gingiva
    - ◆ vulvovaginitis: edematous, erythematous, extremely tender, profuse vaginal discharge
    - ◆ urethritis: watery discharge in males
    - ◆ recurrent on vulva, vagina, penis for 5-7 d
    - ◆ differential diagnosis of genital ulcers: *Candida balanitis*, chancroid, syphilitic chancres

Both HSV-1 and HSV-2 can occur on face or genitalia

#### Investigations

- Tzanck smear with Giemsa stain shows multinucleated giant epithelial cells
- viral culture, electron microscopy, and direct fluorescence antibody test of specimen taken from the base of a relatively new lesion
- serologic testing for antibody for current or past infection if necessary

#### Management

- HSV-1
  - treat during prodrome to prevent vesicle formation
  - topical antiviral (Zovirax®/Xerese®) cream, apply 5-6x/d x 4-7 d for facial/genital lesions
  - oral antivirals (e.g. acyclovir, famciclovir, valacyclovir) are far more effective and have an easier dosing schedule than topicals
- HSV-2
  - rupture vesicle with sterile needle if you wish to culture it
  - wet dressing with aluminum subacetate solution, Burow's compression, or betadine solution
  - 1st episode: acyclovir 200 mg PO 5x/d x 10 d
    - ◆ maintenance: acyclovir 400 mg PO bid
  - famciclovir and valacyclovir may be substituted and have better enteric absorption and less frequent dosing
  - in case of herpes genitalis, look for and treat any other sexually-transmitted infections STIs
  - for active lesions in pregnancy, see [Obstetrics](#), OB29

#### Erythema Multiforme

Etiology: most often HSV or mycoplasma pneumoniae, rarely drugs  
 Morphology: macules/papules with central vesicles; classic bull's-eye pattern of concentric light and dark rings (typical target lesions)  
 Management: symptomatic treatment (oral antihistamines, oral antacids); corticosteroids in severely ill (controversial); prophylactic oral acyclovir for 6-12 mo for HSV-associated EM with frequent recurrences

### HERPES ZOSTER (SHINGLES)

#### Clinical Presentation

- unilateral dermatomal eruption occurring 3-5 d after pain and paresthesia of that dermatome
- vesicles, bullae, and pustules on an erythematous, edematous base
- lesions may become eroded/ulcerated and last days to weeks
- pain can be pre-herpetic, synchronous with rash, or post-herpetic
- severe post-herpetic neuralgia often occurs in elderly
- Hutchinson's sign: shingles on the tip of the nose signifies ocular involvement. Shingles in this area involves the nasociliary branch of the ophthalmic branch of the trigeminal nerve (V1)
- distribution: thoracic (50%), trigeminal (10-20%), cervical (10-20%); disseminated in HIV

#### Etiology

- caused by reactivation of VZV
- risk factors: immunosuppression, old age, occasionally associated with hematologic malignancy

Herpes zoster typically involves a single dermatome; lesions rarely cross the midline

### Differential Diagnosis

- before thoracic skin lesions occur, must consider other causes of chest pain
- contact dermatitis, localized bacterial infection, zosteriform HSV (more pathogenic for the eyes than VZV)

### Investigations

- none required, but can do Tzanck test, direct fluorescence antibody test, or viral culture to rule out HSV

### Management

- compress with normal saline, Burow's, or betadine solution
- analgesics (NSAIDs, amitriptyline)
- famciclovir, valacyclovir, or acyclovir for 7 d; must initiate within 72 h to be of benefit
- gabapentin 300-600 mg PO tid for post-herpetic neuralgia

## MOLLUSCUM CONTAGIOSUM

### Clinical Presentation

- discrete dome-shaped and umbilicated pearly, white papules caused by DNA Pox virus (Molluscum contagiosum virus)
- common sites: eyelids, beard (likely spread by shaving), neck, axillae, trunk, perineum, buttocks

### Etiology

- virus is spread via direct contact, auto-inoculation, sexual contact
- common in children and sexually active young adults (giant molluscum and severe cases can be seen in the setting of HIV)
- virus is self-limited and can take 1-2 yr to resolve

### Investigations

- none required, however can biopsy to confirm diagnosis

### Management

- topical cantharidin (a vesicant)
- cryotherapy
- curettage
- topical retinoids
- Aldara® (imiquimod): immune modulator that produces a cytokine inflammation

## WARTS (VERRUCA VULGARIS) (HUMAN PAPILLOMAVIRUS INFECTIONS)

**Table 19. Different Manifestations of HPV Infection**

	Definition and Clinical Features	Differential Diagnosis	Distribution	HPV Type
<b>Verruca Vulgaris</b> (Common Warts)	Hyperkeratotic, elevated discrete epithelial growths with papillated surface caused by HPV Paring of surface reveals punctate, red-brown specks (thrombosed capillaries)	Molluscum contagiosum, seborrheic keratosis	Located at trauma sites: fingers, hands, knees of children and teens	At least 80 types are known
<b>Verruca Plantaris</b> (Plantar Warts) and <b>Verruca Palmaris</b> (Palmar Warts)	Hyperkeratotic, shiny, sharply margined growths Paring of surface reveals red-brown specks (capillaries), interruption of epidermal ridges	May need to scrape ("pare") lesions to differentiate wart from callus and corn	Located at pressure sites: metatarsal heads, heels, toes	Commonly HPV 1, 2, 4, 10
<b>Verruca Planae</b> (Flat Warts)	Multiple discrete, skin coloured, flat topped papules grouped or in linear configuration Common in children	Syringoma, seborrheic keratosis, molluscum contagiosum, lichen planus	Sites: face, dorsa of hands, shins, knees	Commonly HPV 3, 10
<b>Condyloma Acuminata</b> (Genital Warts)	Skin-coloured pinhead papules to soft cauliflower like masses in clusters Often occurs in young adults, infants, children Can be asymptomatic, lasting months to years Highly contagious, transmitted sexually and non-sexually (e.g. Koebner phenomenon via scratching, shaving), and can spread without clinically apparent lesions Investigations: acetowhiting (subclinical lesions seen with 5% acetic acid x 5 min and hand lens) Complications: fairy-ring warts (satellite warts at periphery of treated area of original warts)	Condyloma lata (secondary syphilitic lesion, dark field strongly +ve), molluscum contagiosum	Sites: genitalia and perianal areas	Commonly HPV 6 and 11 HPV 16, 18, 31, 33 cause cervical dysplasia, SCC and invasive cancer

### Treatment for Warts

- **first line therapies**
  - salicylic acid preparations (patches, solutions, creams, ointments), cryotherapy, topical cantharone
- **second line therapies**
  - topical imiquimod, topical 5-fluorouracil, topical tretinoin, podophyllotoxin
- **third line therapies**
  - curettage, cautery, surgery for non plantar warts, CO<sub>2</sub> laser, oral cimetidine (particularly children), intralesional bleomycin (plantar warts), trichloroacetic acid, diphencyprone
- other viruses associated with skin changes, such as measles, roseola, fifth disease, etc.
- see [Pediatrics, Pediatric Exanthems, P55](#)

## Yeast Infections

### CANDIDIASIS

#### Etiology

- many species of *Candida* (70-80% of infections are from *Candida albicans*)
- opportunistic infection in those with predisposing factors (e.g. trauma, malnutrition, immunodeficiency)

#### Candidal Paronychia

- clinical presentation: painful red swellings of periungual skin
- management: topical agents not as effective; oral antifungals recommended

#### Candidal Intertrigo

- clinical presentation
  - macerated/eroded erythematous patches that may be covered with papules and pustules, located in intertriginous areas often under breast, groin, or interdigitally
  - peripheral “satellite” pustules
  - starts as non-infectious maceration from heat, moisture, and friction
- predisposing factors: obesity, DM, systemic antibiotics, immunosuppression, malignancy
- management: keep area dry, terbinafine, ciclopirox olamine, ketoconazole/clotrimazole cream bid until rash clears

Oral Terbinafine (Lamisil®) is not effective because it is not secreted by sweat glands

### PITYRIASIS (TINEA) VERSICOLOR

#### Clinical Presentation

- asymptomatic superficial fungal infection with brown/white scaling macules
- affected skin darker than surrounding skin in winter, lighter in summer (does not tan)
- common sites: upper chest and back

#### Pathophysiology

- microbe produces azelaic acid → inflammatory reaction inhibiting melanin synthesis yielding variable pigmentation
- affinity for sebaceous glands; require fatty acids to survive

#### Etiology

- *Pityrosporum ovale* (*Malassezia furfur*)
- also associated with folliculitis and seborrheic dermatitis
- predisposing factors: summer, tropical climates, excessive sweating, Cushing's syndrome, prolonged corticosteroid use

#### Investigations

- clinical diagnosis but can perform microscopic examination, KOH prep of scales for hyphae and spores

#### Management

- ketoconazole shampoo or cream daily
- topical terbinafine or ciclopirox olamine bid
- systemic fluconazole or itraconazole for 7 d if extensive

## Sexually Transmitted Infections

### SYPHILIS

#### Clinical Presentation

- characterized initially by a painless ulcer (chancre)
- following inoculation, systemic infection with secondary and tertiary stages

#### Etiology

- *Treponema pallidum*
- transmitted sexually, congenitally, or rarely by transfusion

Table 20. Stages of Syphilis

	Clinical Presentation	Investigations	Management
<b>Primary Syphilis</b>	Single red, indurated, painless chancre, that develops into painless ulcer with raised border and scanty serous exudate Chancre develops at site of inoculation after 3 wk of incubation and heals in 4-6 wk; chancre may also develop on lips or anus Regional non-tender lymphadenopathy appears < 1 wk after onset of chancre DDx: chancroid (painful), HSV (multiple lesions)	CANNOT be based on clinical presentation alone VDRL negative – repeat weekly for 1 mo Fluorescent treponemal antibody-syphilis (FTA-ABS) test has greater sensitivity and may detect disease earlier in course Dark field examination – spirochete in chancre fluid or lymph node aspirate	Penicillin G, 2.4 million units IM, single dose
<b>Secondary Syphilis</b>	Presents 2-6 mo after primary infection (patient may not recall presence of primary chancre) Associated with generalized lymphadenopathy, splenomegaly, headache, chills, fever, arthralgias, myalgias, malaise, photophobia Lesions heal in 1-5 wk and may recur for 1 yr 3 types of lesions: 1. Macules and papules: flat top, scaling, non-pruritic, sharply defined, circular/annular rash (DDx: pityriasis rosea, tinea corporis, drug eruptions, lichen planus) 2. Condyloma lata: wart-like moist papules around genital/perianal region 3. Mucous patches: macerated patches mainly found in oral mucosa	VDRL positive FTA-ABS +ve; –ve after 1 yr following appearance of chancre Dark field +ve in all secondary	As for primary syphilis
<b>Tertiary Syphilis</b>	Extremely rare 3-7 yr after secondary Main skin lesion: 'Gumma' – a granulomatous non-tender nodule	As in primary syphilis, VDRL can be falsely negative	Treatment: penicillin G, 2.4 million units IM weekly x 3 wk

**Natural History of Untreated Syphilis**

- Inoculation
- Primary syphilis (10-90 d after infection)
- Secondary syphilis (simultaneous to primary syphilis or up to 6 mo after healing of primary lesion)
- Latent syphilis
- Tertiary syphilis (2-20 yr)

**Latent Syphilis**

70% of untreated patients will remain in this stage for the rest of their lives and are immune to new primary infection

**GONOCOCCEMIA****Clinical Presentation**

- disseminated gonococcal infection
- hemorrhagic, tender, pustules on a purpuric/petechial background
- common sites: distal aspects of extremities
- associated with fever, arthritis, urethritis, proctitis, pharyngitis, and tenosynovitis
- neonatal conjunctivitis if infected via birth canal

**Etiology**

- *Neisseria gonorrhoeae*

**Investigations**

- requires high index of clinical suspicion plays because tests are often negative
- bacterial culture of blood, joint fluid, and skin lesions
- joint fluid cell count and Gram stain

**Management**

- notify Public Health authorities
- screen for other STIs
- cefixime 400 mg PO (drug of choice) or ceftriaxone 1 g IM

**HSV**

- see *Viral Infections, D29*

**HPV**

- see *Viral Infections, D30*

# Pre-Malignant Skin Conditions

## Actinic Keratosis (Solar Keratosis)

### Clinical Presentation

- ill-defined, scaly erythematous papules or plaques on a background of sun-damaged skin (solar heliosis)
- sandpaper-like, gritty sensation felt on palpation, often easier to appreciate on palpation rather than inspection
- sites: areas of sun exposure (face, ears, scalp if bald, neck, sun-exposed limbs)

### Pathophysiology

- UV radiation damage to keratinocytes from repeated sun exposure (especially UVB)
- risk of transformation of AK to SCC (~1/1,000), but higher likelihood if AK is persistent
- UV-induced p53 gene mutation
- risk factors: increased age, light skin/eyes/hair, immunosuppression, syndromes such as albinism or xeroderma pigmentosum
- risk factors for malignancy: immunosuppression, history of skin cancer, persistence of the AK

### Epidemiology

- common with increasing age, outdoor occupation, M>F
- skin phototypes I-III, rare in darker skin as melanin is protective

### Differential Diagnosis

- SCC *in situ*, superficial BCC, seborrheic keratosis, cutaneous lupus erythematosus

### Investigations

- biopsy lesions that are refractory to treatment

### Management

- destructive: cryotherapy, electrodesiccation, and curettage
- topical pharmacotherapy (mechanism: destruction of rapidly growing cells or immune system modulation)
  - topical 5-Fluorouracil cream (for 2-4 wk), Imiquimod 5% (2 times per wk for 16 wk), Imiquimod 3.75% (daily for 2 wk then none for 2 wk then daily for 2 wk), Ingenol Mebutate gel 0.015% (daily for 3 d on the head and neck), Ingenol mebutate 0.05% gel (daily for 2 d on the body)
- photodynamic therapy
- excision

### Types of AK

- Erythematous: typical AK lesion
- Hypertrophic: thicker, rough papule/plaque
- Cutaneous horn: firm hyperkeratotic outgrowth
- Actinic cheilitis: confluent AKs on the lip
- Pigmented: flat, tan-brown, scaly plaque
- Spreading pigmented
- Proliferative
- Conjunctival: pinguecula, pterygium

## Leukoplakia

### Clinical Presentation

- a morphologic term describing homogenous or speckled white plaques with sharply demarcated borders
- sites: oropharynx, most often floor of the mouth, soft palate, and ventral/lateral surfaces of the tongue

### Pathophysiology

- precancerous or premalignant condition
- oral form is strongly associated with tobacco use and alcohol consumption

### Epidemiology

- 1-5% prevalence in adult population after 30 yr of age; peak at age 50
- M>F, fair-skinned
- most common oral mucosal premalignant lesion

### Differential Diagnosis

- lichen planus, oral hairy leukoplakia

### Investigations

- biopsy is mandatory because it is premalignant

### Management

- low risk sites on buccal/labial mucosal or hard palate: eliminate carcinogenic habits, follow-up
- moderate/dysplastic lesions: excision, cryotherapy

# Malignant Skin Tumours

## Non-Melanoma Skin Cancers

### BASAL CELL CARCINOMA

#### Subtypes

- noduloulcerative (typical)
  - skin-coloured papule/nodule with rolled, translucent (“pearly”) telangiectatic border, and depressed/eroded/ulcerated centre
- pigmented variant
  - flecks of pigment in translucent lesion with surface telangiectasia
  - may mimic malignant melanoma
- superficial variant
  - flat, tan to red-brown plaque, often with scaly, pearly border and fine telangiectasia at margin
  - least aggressive subtype
- sclerosing (morpheaform) variant
  - flesh/yellowish-coloured, shiny papule/plaque with indistinct borders, indurated

#### Pathophysiology

- malignant proliferation of basal keratinocytes of the epidermis
  - low grade cutaneous malignancy, locally aggressive (primarily tangential growth), rarely metastatic
  - usually due to UVB light exposure, therefore >80% on face
  - may also occur in previous scars, radiation, trauma, arsenic exposure, or genetic predisposition (Gorlin syndrome)

#### Epidemiology

- most common malignancy in humans
- 75% of all malignant skin tumours >40 yr, increased prevalence in the elderly
- M>F skin phototypes I and II, chronic cumulative sun exposure, ionizing radiation, immunosuppression, arsenic exposure

#### Differential Diagnosis

- benign: sebaceous hyperplasia, intradermal melanocytic nevus, dermatofibroma
- malignant: nodular malignant melanoma, SCC

#### Management

- imiquimod 5% cream (Aldara®) or cryotherapy is indicated for superficial BCCs on the trunk
- fluorouracil and photodynamic therapy can also be used for superficial BCC
- shave excision + electrodesiccation and curettage for most types of BCCs, not including morpheaform
- Mohs surgery: microscopically controlled, minimally invasive, stepwise excision for lesions on the face or in areas that are difficult to reconstruct
- radiotherapy used in advanced cases of BCC where surgical intervention is not an option
- vismodegib is approved for metastatic BCC
- life-long follow up every 6 mo to 1 yr
- 95% cure rate if lesion <2 cm in diameter or if treated early

### SQUAMOUS CELL CARCINOMA

#### Clinical Presentation

- indurated, pink/red/skin-coloured papule/plaque/nodule with surface scale/crust ± ulceration
- more rapid enlargement than BCC
- exophytic (grows outward), may present as a cutaneous horn
- sites: face, ears, scalp, forearms, dorsum of hands

#### Pathophysiology

- malignant neoplasm of keratinocytes (primarily vertical growth)
- predisposing factors include: UV radiation, PUVA, ionizing radiation therapy/exposure, chemical carcinogens (such as arsenic, tar, and nitrogen mustards), HPV 16, 18, immunosuppression
- may occur in previous scar (SCC more commonly than BCC)

#### Epidemiology

- second most common type of cutaneous neoplasm
- primarily on sun-exposed skin in the elderly, M>F, skin phototypes I and II, chronic sun exposure
- in organ transplant recipients SCC is most common cutaneous malignancy, with increased mortality as compared to non-immunocompromised population

#### Differential Diagnosis

- benign: nummular eczema, psoriasis, irritated seborrheic keratosis
- malignant: keratoacanthoma, Bowen’s disease, BCC

#### Workup/Investigations of BCC and other NMSCs

- **History:** duration, growth rate, family/personal Hx of skin cancer, prior therapy to the particular lesion
- **Physical:** location, size, whether circumscribed, tethering to deep structures, full skin exam, lymph node exam
- **Biopsy:** if shallow lesion, can do shave biopsy; otherwise punch or excisional biopsy may be more appropriate

#### Surgical Margins

- **Smaller lesions:** electrodesiccation and curettage with 2-3 mm margin of normal skin
- **Deep infiltrative lesions:** surgical excision with 3-5 mm margins beyond visible and palpable tumour border, which may require skin graft or flap; or Mohs surgery, which conserves tissue and does not require margin control

**Management**

- surgical excision with primary closure, skin flaps or grafting
- Mohs surgery
- lifelong follow-up (more aggressive treatment than BCC)

**Prognosis**

- good prognostic factors: early treatment, negative margins, and small size of lesion
- SCCs that arise from AK metastasize less frequently (~1%) than other SCCs arising de novo in old burns (2-5% of cases)
- overall control is 75% over 5 yr, 5-10% metastasize
- metastasis rates are higher if diameter > 2 cm, depth > 4 mm, recurrent, involvement of bone/muscle/nerve, location on scalp/ears/nose/lips, immunosuppressed, caused by arsenic ingestion, or tumour arose from scar/chronic ulcer/burn/genital tract/sinus tract

**BOWEN'S DISEASE (SQUAMOUS CELL CARCINOMA *IN SITU*)****Clinical Presentation**

- sharply demarcated erythematous patch/thin plaque with scale and/or crusting
- often 1-3 cm in diameter and found on the skin and mucous membranes
- evolves to SCC in 10-20% of cutaneous lesions and >20% of mucosal lesions

**Management**

- same as for BCC
- biopsy required for diagnosis
- topical 5-fluorouracil (Efudex®) or imiquimod (Aldara®) used if extensive and as a tool to identify margins of poorly defined tumours
- cryosurgery
- shave excision with electrodesiccation and curettage

**KERATOACANTHOMA****Clinical Presentation**

- rapidly growing, firm, dome-shaped, erythematous or skin-coloured nodule with central keratin-filled crater, resembling an erupting volcano
- may spontaneously regress within a year, leaving a scar
- sites: sun-exposed skin

**Pathophysiology**

- epithelial neoplasm with atypical keratinocytes in epidermis
- low grade variant of SCC

**Etiology**

- HPV, UV radiation, chemical carcinogens (tar, mineral oil)

**Epidemiology**

- >50 yr, rare <20 yr

**Differential Diagnosis**

- treat as SCC until proven otherwise
- hypertrophic solar keratosis, verruca vulgaris

**Management**

- surgical excision or saucerization (shave biopsy) followed by electrodesiccation of the base, treated similarly to SCC

**Does this Patient have a Mole or Melanoma?**

**ABCDE checklist**

- Asymmetry
- Border (irregular and/or indistinct)
- Colour (varied)
- Diameter (increasing or > 6 mm)
- Enlargement, elevation, evolution (i.e. change in colour, size, or shape)

Sensitivity 92% (CI 82-96%)  
Specificity 100% (CI 54-100%)

JAMA 1998;279:696-701

**Malignant Melanoma****Clinical Presentation**

- malignant characteristics of a mole: "ABCDE" mnemonic
- sites: skin, mucous membranes, eyes, CNS

**Clinical Subtypes of Malignant Melanoma**

- **lentigo maligna**
  - malignant melanoma in situ (normal and malignant melanocytes confined to the epidermis)
  - 2-6 cm, tan/brown/black uniformly flat macule or patch with irregular borders
  - lesion grows radially and produces complex colours
  - often seen in the elderly
  - 10% evolve to lentigo maligna melanoma

- **lentigo maligna melanoma** (15% of all melanomas)
  - malignant melanocytes invading into the dermis
  - associated with pre-existing solar lentigo, not pre-existing nevi
  - flat, brown, stain-like, gradually enlarging with loss of skin surface markings
  - with time, colour changes from uniform brown to dark brown with black and blue
  - found on all skin surfaces, especially those often exposed to sun, such as the face and hands
- **superficial spreading melanoma** (60-70% of all melanomas)
  - atypical melanocytes initially spread laterally in epidermis then invade the dermis
  - irregular, indurated, enlarging plaques with red/white/blue discolouration, focal papules or nodules
  - ulcerate and bleed with growth
- **nodular melanoma** (30% of all melanomas)
  - atypical melanocytes that initially grow vertically with little lateral spread
  - uniformly ulcerated, blue-black, and sharply delineated plaque or nodule
  - rapidly fatal
  - may be pink or have no colour at all, this is called an amelanotic melanoma
  - “EFG” Elevated, Firm, Growing
- **acrolentiginous melanoma** (5% of all melanomas)
  - ill-defined dark brown, blue-black macule
  - palmar, plantar, subungual skin
  - melanomas on mucous membranes have poor prognosis

### Pathophysiology

- malignant neoplasm of pigment forming cells (melanocytes and nevus cells)

### Epidemiology

- incidence 1/75 (Canada) 1/50 (US)
- risk factors: numerous moles, fair skin, red hair, positive personal/family history, 1 large congenital nevus (>20 cm), familial dysplastic nevus syndrome, any dysplastic nevi, immunosuppression, > 50 common nevi, and sun exposure with sunburns, tanning beds
- most common sites: back (M), calves (F)
- worse prognosis if: male, on scalp, hands, feet, late lesion, no pre-existing nevus present

### Differential Diagnosis

- benign: nevi, solar lentigo, seborrheic keratosis
- malignant: pigmented BCC

### Management

- excisional biopsy preferable, otherwise incisional biopsy
- remove full depth of dermis and extend beyond edges of lesion only after histologic diagnosis
- beware of lesions that regress – tumour is usually deeper than anticipated
- high dose IFN for stage II (regional), chemotherapy (cis-platinum, BCG) and high dose IFN for stage III (distant) disease
- newer chemotherapeutic, gene therapies, and vaccines starting to be used in metastatic melanoma
- radiotherapy may be used as adjunctive treatment

**Table 21. American Joint Committee on Cancer Staging System Based on Breslow's Thickness of Invasion**

Tumour Depth	Stage	Approximate 5 Yr Survival
T1 <1.0 mm	Stage I T1a – T2a	5-yr survival 90%
T2 1.01-2.0 mm	Stage II T2b – T4b	5-yr survival 70%
T3 2.01-4.0 mm	Stage III any nodes	5-yr survival 45%
T4 >4.0 mm	Stage IV any mets	5-yr survival 10%

a = no ulceration; b = ulceration

#### Risk Factors for Melanoma

##### no SPF is a SIN

Sun exposure  
 Pigment traits (blue eyes, fair/red hair, pale complexion)  
 Freckling  
 Skin reaction to sunlight (increased incidence of sunburn)  
 Immunosuppressive states (e.g. renal transplantation)  
 Nevi (dysplastic nevi; increased number of benign melanocytic nevi)

#### Node Dissection for Lesions

>1 mm thick OR <1 mm and ulcerated  
 OR >1 mitoses/mm<sup>2</sup> (Stage IB or higher melanoma patients should be offered a sentinel lymph node biopsy)

- Assess sentinel node at time of wide excision

## Other Cutaneous Cancers

### CUTANEOUS T-CELL LYMPHOMA

#### Clinical Presentation

- **Mycosis fungoides** (limited superficial type)
  - characterized by erythematous patches/plaques/nodules/tumours, which may be pruritic and poikilodermic (atrophy, telangiectasia, hyperpigmentation, hypopigmentation)
  - common sites include: trunk, buttocks, proximal limbs
  - mildly symptomatic, usually excellent prognosis for early disease
- **Sézary syndrome** (widespread systemic type)
  - rare variant characterized by erythroderma, lymphadenopathy, WBC >20 x 10<sup>9</sup>/L with Sézary cells
  - associated with intense pruritus, alopecia, palmoplantar hyperkeratosis, and systemic symptoms (fatigue, fever)
  - often fatal

**Pathophysiology**

- clonal proliferation of skin-homing CD4 T-cells

**Epidemiology**

- >50 yr old, M:F 2:1

**Differential Diagnosis**

- tinea corporis, nummular dermatitis, psoriasis, DLE, Bowen's disease

**Investigations**

- skin biopsy (histology, "lymphocyte antigen cell" markers, TcR gene arrangement)
- blood smear looking for Sézary cells or flow cytometry (e.g. CD4:CD8 >10 is Sézary)
- imaging (for systemic involvement)

**Management**

- **Mycosis fungoides**
  - depends on stage of disease
  - topical steroids and/or PUVA, narrow band UVB (NBUVB, 311-313nm)
- **Sézary syndrome**
  - oral retinoids and IFN
  - extra-corporeal photopheresis
  - may need radiotherapy for total skin electron beam radiation
  - may maintain on UV therapy
  - other chemotherapy agents

## Diseases of Hair Density

### Hair Growth

- hair grows in a cyclic pattern that is defined in 3 stages (most scalp hairs are in anagen phase)
  1. growth stage = anagen phase
  2. transitional stage = catagen stage
  3. resting stage = telogen phase
- total duration of the growth stage reflects the type and location of hair: eyebrow, eyelash, and axillary hairs have a short growth stage in relation to the resting stage
- growth of the hair follicles is also based on the hormonal response to testosterone and DHT; this response is genetically controlled

**Hair Loss****TOP HAT**

Telogen effluvium, tinea capitis

Out of Fe, Zn

Physical: trichotillomania, "corn-row" braiding

Hormonal: hypothyroidism, androgenic

Autoimmune: SLE, alopecia areata

Toxins: heavy metals, anticoagulants, chemotherapy, vitamin A, SSRIs

### Non-Scarring (Non-Cicatricial) Alopecia

**ANDROGENETIC ALOPECIA****Clinical Presentation**

- male- or female-pattern alopecia
- males: fronto-temporal areas progressing to vertex, entire scalp may be bald
- females: widening of central part, "Christmas tree" pattern

**Pathophysiology**

- action of testosterone on hair follicles

**Epidemiology**

- males: early 20s-30s
- females: 40s-50s

**Management**

- minoxidil (Rogaine®) solution or foam to reduce rate of loss/partial restoration
- females: spironolactone (anti-androgenic effects), cyproterone acetate (Diane-35®)
- males: finasteride (Propecia®) (5- $\alpha$ -reductase inhibitor) 1 mg/d
- hair transplant

**PHYSICAL**

- trichotillomania: impulse-control disorder characterized by compulsive hair pulling with irregular patches of hair loss, and with remaining hairs broken at varying lengths
- traumatic (e.g. tight "corn-row" braiding of hair, wearing tight pony tails, tight tying of turbans)

**DDx of Non-Scarring (Non-Cicatricial) Alopecia**

- **Autoimmune**
  - Alopecia areata
- **Endocrine**
  - Hypothyroidism
  - Androgens
- **Micronutrient deficiencies**
  - Iron
  - Zinc
- **Toxins**
  - Heavy metals
  - Anticoagulants
  - Chemotherapy
  - Vitamin A
- **Trauma to the hair follicle**
  - Trichotillomania
  - 'Corn-row' braiding
- **Other**
  - Syphilis
  - Severe illness
  - Childbirth

## TELOGEN EFFLUVIUM

### Clinical Presentation

- uniform decrease in hair density secondary to hairs leaving the growth (anagen) stage and entering the resting (telogen) stage of the cycle

### Pathophysiology

- variety of precipitating factors
- hair loss typically occurs 2-4 mo after exposure to precipitant
- regrowth occurs within a few months but may not be complete

## ANAGEN EFFLUVIUM

### Clinical Presentation

- hair loss due to insult to hair follicle impairing its mitotic activity (growth stage)

### Pathophysiology

- precipitated by chemotherapeutic agents (most common), other meds (bismuth, levodopa, colchicine, cyclosporine), exposure to chemicals (thallium, boron, arsenic)
- dose-dependent effect
- hair loss 7-14 d after single pulse of chemotherapy; most clinically apparent after 1-2 mo
- reversible effect; follicles resume normal mitotic activity few weeks after agent stopped

## ALOPECIA AREATA

### Clinical Presentation

- autoimmune disorder characterized by patches of complete hair loss often localized to scalp but can affect eyebrows, beard, eyelashes, etc.
- may be associated with dystrophic nail changes – fine stippling, pitting
- “exclamation mark” pattern (hairs fractured and have tapered shafts, i.e. looks like “!”)
- may be associated with pernicious anemia, vitiligo, thyroid disease, Addison’s disease
- spontaneous regrowth may occur within months of first attack (worse prognosis if young at age of onset and extensive loss)
- frequent recurrence often precipitated by emotional distress

### Management

- generally unsatisfactory
- intralesional triamcinolone acetonide (corticosteroids) can be used for isolated patches
- UV or PUVA therapy
- immunomodulatory (diphencyprone)

#### Precipitants of Telogen Effluvium

“SEND” hair follicles out of anagen and into telogen

**S**tress and **S**calp disease (surgery)

**E**ndocrine (hypothyroidism, post-partum)

**N**utritional (iron and protein deficiency)

**D**rugs (citraetin, heparin, lithium, IFN,  $\beta$ -blockers, valproic acid, SSRIs)

**Non-scarring alopecia:** intact hair follicles on exam → biopsy not required (but may be helpful)

**Scarring alopecia:** absent hair follicles on exam → biopsy required

#### Alopecia Areata Subtypes

Alopecia totalis: loss of all scalp hair and eyebrows

Alopecia universalis: loss of all body hair

#### DDx of Scarring (Cicatricial) Alopecia

##### Developmental/Hereditary Disorders

- Aplasia cutis congenita
- Epidermal nevi
- Romberg’s syndrome
- Generalized follicular hamartoma

##### Primary Causes

- Group 1: Lymphocytic
  - DLE
  - Lichen planopilaris
  - Central centrifugal cicatricial alopecia
  - Classic pseudopelade
- Group 2: Neutrophilic
  - Folliculitis decalvans
  - Dissecting scalp cellulitis
- Group 3: Mixed
  - Acne keloidalis nuchae

##### Secondary Causes

- Infectious agents
  - Bacterial (e.g. post-cellulitis)
  - Fungal (e.g. kerion tinea capitis)
- Neoplasms (e.g. BCC, SCC, lymphomas, and metastatic tumours)
- Physical agents
  - Mechanical trauma
  - Burns
  - Radiotherapy
  - Caustic chemicals

## Scarring (Cicatricial) Alopecia

### Clinical Presentation

- irreversible loss of hair follicles with fibrosis

### Etiology

- physical: radiation, burns
- infections: fungal, bacterial, TB, leprosy, viral (HZV)
- inflammatory
  - lichen planus (lichen planopilaris)
  - DLE (note that SLE can cause an alopecia unrelated to DLE lesions which are non-scarring)
  - morphea: “coup de sabre” with involvement of centre of scalp
  - central centrifugal cicatricial alopecia (CCCA): seen in up to 40% of black women, starting at central scalp; one of most commonly diagnosed scarring alopecias, may be associated with hair care practices in this population

### Investigations

- biopsy from active border

### Management

- infections: treat underlying infection
- inflammatory: topical/intralesional steroids, anti-inflammatory antibiotics, antimalarials

# Nails and Disorders of the Nail Apparatus

**Table 22. Nail Changes in Systemic and Dermatological Conditions**

Nail Abnormality	Definition/Etiology	Associated Disease
<b>NAIL PLATE CHANGES</b>		
Clubbing	Proximal nail plate has greater than 180° angle to nail fold, watch-glass nails, bulbous digits	Cyanotic heart disease, bacterial endocarditis, pulmonary disorders, GI disorders, etc.
Koilonychia	Spoon shaped nails	Iron deficiency, malnutrition, DM
Onycholysis	Separation of nail plate from nail bed	Psoriasis, dermatophytes, thyroid disease
Onychogryphosis	Hypertrophy of the nail plate producing a curved, clawlike deformity	Poor circulation, chronic inflammation, tinea
Onychohemilia	Subungual hematoma	Trauma to nail bed
Onychomycosis	Fungal infection of nail (e.g. dermatophyte, yeast, mould)	HIV, DM, peripheral arterial disease
Onychocryptosis	Ingrown toenail often hallux with congenital malalignment, painful inflammation, granulation tissue	Tight fitting shoes, excessive nail clipping
<b>SURFACE CHANGES</b>		
V-shaped nicking	Distal margin has v-shaped loss of the nail plate	Darier's disease (keratosis follicularis)
Pterygium inversus unguium	Distal nail plate does not separate from underlying nail bed	Scleroderma
Pitting	Punctate depressions that migrate distally with growth	Psoriasis (random pattern), alopecia areata (geometric, gridshaped arrangement), eczema
Transverse ridging	Transverse depressions often more in central portion of nail plate	Serious acute illness slows nail growth (when present in all nails = Beau's lines), eczema, chronic paronychia, trauma
Transverse white lines	Bands of white discolouration	Poisons, hypoalbuminemia (Muehrcke's lines)
<b>COLOUR CHANGES</b>		
Yellow		Tinea, jaundice, tetracycline, pityriasis rubra pilaris, yellow nail syndrome, psoriasis, tobacco use
Green		<i>Pseudomonas</i>
Black		Melanoma, hematoma
Brown		Nicotine use, psoriasis, poisons, longitudinal melanonychia (ethnic)
Splinter hemorrhages	Extravasation of blood from longitudinal vessels of nail bed, blood attaches to overlying nail plate and moves distally as it grows	Trauma, bacterial endocarditis, blood dyscrasias, psoriasis
Oil spots	Brown-yellow discolouration	Psoriasis
<b>NAIL FOLD CHANGES</b>		
Herpetic whitlow	HSV infection of distal phalanx	HSV infection
Paronychia	Local inflammation of the nail fold around the nail bed	Acute: painful infection Chronic: constant wetting (e.g. dishwashing, thumbsucking)
Nail fold telangiectasias	Cuticular hemorrhages, roughness, capillary changes	Scleroderma, SLE, dermatomyositis

# Skin Manifestations of Systemic Disease

**Table 23. Skin Manifestations of Internal Conditions**

Disease	Related Dermatoses
<b>AUTOIMMUNE DISORDERS</b>	
Behçet's disease	Painful aphthous ulcers in oral cavity ± genital mucous membranes, erythema nodosum, acneiform papules
Buerger's disease	Superficial migratory thrombophlebitis, pallor, cyanosis, gangrene, ulcerations, digital resorptions
Dermatomyositis	Periorbital and extensor violaceous erythema, heliotrope with edema, Gottron's papules (violaceous flat-topped papules with atrophy), periungual erythema, telangiectasia, calcinosis cutis
Polyarteritis nodosa	Subcutaneous nodules, stellate purpura, erythema, gangrene, splinter hemorrhages, livedo reticularis, ulceration
Reactive arthritis	Keratoderma blennorrhagica (on feet), balanitis circinata (on male penis)
Rheumatic fever	Petechiae, urticaria, erythema nodosum, rheumatic nodules, evanescent rash
Scleroderma	Raynaud's, nonpitting edema, waxy/shiny/tense atrophic skin (morphea), ulcers, cutaneous calcification, periungual telangiectasia, acrosclerosis, salt-and-pepper pigmentation
SLE	Malar erythema, discoid rash (erythematous papules or plaques with keratotic scale, follicular plugging, atrophic scarring on face, hands, and arms), hemorrhagic bullae, palpable purpura, urticarial purpura, patchy/diffuse alopecia, mucosal ulcers, photosensitivity
Crohn's disease/UC	Pyoderma gangrenosum, erythema nodosum, Sweet's syndrome
<b>ENDOCRINE DISORDERS</b>	
Addison's disease	Generalized hyperpigmentation or limited to skin folds, buccal mucosa, and scars
Cushing's syndrome	Moon facies, purple striae, acne, hyperpigmentation, hirsutism, atrophic skin with telangiectasia
DM	Infections (e.g. boils, carbuncles, <i>Candidiasis</i> , <i>S. aureus</i> , dermatophytoses, tinea pedis and cruris, infectious eczematoid dermatitis), pruritus, eruptive xanthomas, necrobiosis lipoidica diabetorum, granuloma annulare, diabetic foot, diabetic bullae, acanthosis nigricans, calciphylaxis
Hyperthyroidism	Moist, warm skin, seborrhea, acne, nail atrophy, hyperpigmentation, toxic alopecia, pretibial myxedema, acropachy, onycholysis
Hypothyroidism	Cool, dry, scaly, thickened, hyperpigmented skin; toxic alopecia with dry, coarse hair, brittle nails, myxedema, loss of lateral 1/3 eyebrows
<b>HIV-RELATED</b>	
Infections	Viral (e.g. HSV, HZV, HPV, CMV, molluscum contagiosum, oral hairy leukoplakia), bacterial (impetigo, acneiform folliculitis, dental caries, cellulitis, bacillary epithelioid angiomatosis, syphilis), fungal (candidiasis, histoplasmosis, cryptococcus, blastomycosis)
Inflammatory dermatoses	Seborrhea, psoriasis, pityriasis rosea, vasculitis
Malignancies	Kaposi's sarcoma, lymphoma, BCC, SCC, MM
<b>MALIGNANCY</b>	
Adenocarcinoma	
Gastrointestinal	Peutz-Jeghers: pigmented macules on lips/oral mucosa
Cervix/anus/rectum	Paget's disease: eroding scaling plaques of perineum
Carcinoma	
Breast	Paget's disease, eczematous and crusting lesions of the skin of the nipple and usually areola of the breast
GI	Palmoplantar keratoderma: thickened skin of palms/soles
Thyroid	Sipple's syndrome: multiple mucosal neuromas
Breast/lung/ovary	Dermatomyositis: heliotrope erythema of eyelids and violaceous plaques over knuckles
Lymphoma/leukemia	
Hodgkin's	Ataxia Telangiectasia: telangiectasia on pinna, bulbar conjunctiva
Acute leukemia	Ichthyosis: generalized scaling especially on extremities, Sweet's syndrome Bloom's syndrome: butterfly erythema on face, associated with short stature
Multiple myeloma	Amyloidosis: large, smooth tongue with waxy papules on eyelids, nasolabial folds and lips, as well as facial petechiae
<b>OTHERS</b>	
Liver disease	Pruritus, hyperpigmentation, spider nevi, palmar erythema, white nails (Terry's nails), porphyria cutanea tarda, xanthomas, hair loss, jaundice
Renal disease	Pruritus, pigmentation, half and half nails, perforating dermatosis, calciphylaxis
Pruritic urticarial papules and plaques of pregnancy	Erythematous papules or urticarial plaques in distribution of striae distensae: buttocks, thighs, upper inner arms and lower back
Cryoglobulinemia	Palpable purpura in cold-exposed areas, Raynaud's, cold urticaria, acral hemorrhagic necrosis, bleeding disorders, associated with hepatitis C infection

## Raynaud's Phenomenon DDx

### COLD HAND

Cryoglobulins/Cryofibrinogens  
Obstruction/Occupational  
Lupus erythematosus, other connective tissue disease  
DM/Drugs  
Hematologic problems (polycythemia, leukemia, etc)  
Arterial problems (atherosclerosis)  
Neurologic problems (vascular tone)  
Disease of unknown origin (idiopathic)

## Acanthosis Nigricans

An asymptomatic dark thickened velvety hyperpigmentation of flexural skin most commonly around the neck. Associated with DM, obesity, and other endocrine disorders and malignancy. It is a cutaneous marker of tissue insulin resistance

# Pediatric Exanthems

- see [Pediatrics, P55](#)

## Miscellaneous Lesions

### Angioedema and Urticaria

#### Angioedema

- deeper swelling of the skin involving subcutaneous tissues; often involves the eyes, lips, and tongue
- may or may not accompany urticaria
- hereditary or acquired forms
- hereditary angioedema (does not occur with urticaria)
  - onset in childhood; 80% have positive family history
  - recurrent attacks; 25% die from laryngeal edema
  - triggers: minor trauma, emotional upset, temperature changes
- types of acquired angioedema
  - acute allergic angioedema (allergens include food, drugs, contrast media, insect venom, latex)
  - non-allergic drug reaction (drugs include ACEI)
  - acquired C1 inhibitor deficiency
- treatment
  - prophylaxis with danazol or stanozolol for hereditary angioedema
  - epinephrine pen to temporize until patient reaches hospital in acute attack

#### Urticaria

- also known as “hives”
- transient, red, pruritic well-demarcated wheals
- each individual lesion lasts less than 24 h
- second most common type of drug reaction
- results from release of histamine from mast cells in dermis
- can also result after physical contact with allergen

**Table 24. Classification of Urticaria**

Type	Etiology
<b>Acute Urticaria</b> >2/3 of cases Attacks last <6 wk Individual lesions last <24 h	Drugs: especially ASA, NSAIDs Foods: nuts, shellfish, eggs, fruit Idiopathic (vast majority) Infection Insect stings (bees, wasps, hornets) Percutaneous absorption: cosmetics, work exposures Stress Systemic diseases: SLE, endocrinopathy, neoplasm
<b>Chronic Urticaria</b> <1/3 of cases Attacks last >6 wk Individual lesion lasts <24 h	IgE-dependent: trigger associated Idiopathic (90% of chronic urticaria patients) Aeroallergens Drugs (antibiotics, hormones, local anesthetics) Foods and additives Insect stings Parasitic infections Physical contact (animal saliva, plant resins, latex, metals, lotions, soap) Direct mast cell release Opiates, muscle relaxants, radio-contrast agents Complement-mediated Serum sickness, transfusion reactions Infections, viral/bacterial (>80% of urticaria in pediatric patients) Urticarial vasculitis Arachidonic acid metabolism ASA, NSAIDs Physical Dermatographism (friction, rubbing skin), cold (ice cube, cold water), cholinergic (hot shower, exercise), solar, pressure (shoulder strap, buttocks), aquagenic (exposure to water), adrenergic (stress), heat Other Mastocytosis, urticaria pigmentosa
<b>Urticarial Vasculitis</b> Individual lesions last >24 h Often painful, less likely pruritic, heals with bruise type lesions Requires biopsy	Idiopathic Infections Hepatitis Autoimmune diseases SLE Drug hypersensitivity Cimetidine and diltiazem

#### DDx for Urticaria

##### DAM HIVES

Drugs and foods

Allergic

Malignancy

Hereditary

Infection

Vasculitis

Emotions

Stings

#### Approach to Urticaria

- Thorough Hx and P/E
- **Acute:** no immediate investigations needed; consider referral for allergy testing
- **Chronic:** further investigations required: CBC and differential, urinalysis, ESR, TSH, LFTs to help identify underlying cause
- **Vasculitic:** biopsy of lesion and referral to dermatology

#### Wheal

- Typically erythematous flat-topped, palpable lesions varying in size with circumscribed dermal edema
- Individual lesion lasts <24 h
- Associated with mast cell release of histamine
- May be pruritic

#### Mastocytosis (Urticaria Pigmentosa)

Rare disease due to excessive infiltration of the skin by mast cells. It manifests as many reddish-brown elevated plaques and macules. Friction to a lesion produces a wheal surrounded by intense erythema (Darier's sign), due to mast cell degranulation; this occurs within minutes

## Erythema Nodosum

### Clinical Presentation

- acute or chronic inflammation of subcutaneous fat (panniculitis)
- round, red, tender, poorly demarcated nodules
- sites: asymmetrically arranged on extensor lower legs, knees, arms, (typically shins)
- associated with arthralgia, fever, malaise

### Etiology

- 40% are idiopathic
- drugs: sulfonamides, OCPs (also pregnancy), analgesics, trans retinoic acid
- infections: GAS, TB, histoplasmosis, *Yersinia*
- inflammation: sarcoidosis, Crohn's > UC
- malignancy: acute leukemia, Hodgkin's lymphoma

### Epidemiology

- 15-30 yr old, F:M = 3:1
- lesions last for days and spontaneously resolve in 6 wk

### Investigations

- chest x-ray (to rule out chest infection and sarcoidosis)
- throat culture, ASO titre, PPD skin test

### Management

- symptomatic: bed rest, compressive bandages, wet dressings
- NSAIDs, intralesional steroids
- treat underlying cause

#### DDx of Erythema Nodosum

##### NODOSUMM

NO cause (idiopathic) in 40%

Drugs (sulfonamides, OCP, etc.)

Other infections (GAS+)

Sarcoidosis

UC and Crohn's

Malignancy (leukemia, Hodgkin's lymphoma)

Many Infections

## Pruritus

### Clinical Presentation

- a sensation provoking a desire to scratch, with or without skin lesions
- lesions may arise from the underlying disease, or from excoriation causing crusts, lichenified plaques, or wheals

### Etiology

- dermatologic – generalized
  - asteatotic dermatitis ("winter itch" due to dry skin)
  - pruritus of senescent skin (may not have dry skin, any time of year)
  - infestations: scabies, lice
  - drug eruptions: ASA, antidepressants, opiates
  - psychogenic states
- dermatologic – local
  - atopic and contact dermatitis, lichen planus, urticaria, insect bites, dermatitis herpetiformis
  - infection: varicella, candidiasis
  - lichen simplex chronicus
  - prurigo nodularis
- systemic disease – usually generalized
  - hepatic: obstructive biliary disease, cholestatic liver disease of pregnancy
  - renal: chronic renal failure, uremia secondary to hemodialysis
  - hematologic: Hodgkin's lymphoma, multiple myeloma, leukemia, polycythemia vera, hemochromatosis, Fe deficiency anemia, cutaneous T-cell lymphoma
  - neoplastic: lung, breast, gastric (internal solid tumours), non-Hodgkin's lymphoma
  - endocrine: carcinoid, DM, hypothyroid/thyrotoxicosis
  - infectious: HIV, trichinosis, echinococcosis, hepatitis C
  - psychiatric: depression, psychosis
  - neurologic: post-herpetic neuralgia, multiple sclerosis

#### DDx of Pruritus

##### SCRATCHED

Scabies

Cholestasis

Renal

Autoimmune

Tumours

Crazies (psychiatric)

Hematology (polycythemia, lymphoma)

Endocrine (thyroid, parathyroid, Fe)

Drugs, Dry skin

Consider biopsy of any nonhealing wound to rule out cancer

### Investigations

- blood work: CBC, ESR, Cr/BUN, LFT, TSH, fasting blood sugar, stool culture and serology for parasites

### Management

- treat underlying cause
- cool water compresses to relieve pruritus
- bath oil and emollient ointment (especially if xerosis is present)
- topical corticosteroid and antipruritics (e.g. menthol, camphor, phenol, mirtazapine, capsaicin)
- systemic antihistamines: H1 blockers are most effective, most useful for urticaria
- phototherapy with UVB or PUVA
- doxepin, amitriptyline
- immunosuppressive agents if severe: steroids and steroid-sparing

## Wounds and Ulcers

- see [Plastic Surgery, PL8, PL15](#)

## Sunscreens and Preventative Therapy

### Sunburn

- erythema 2-6 h post UV exposure often associated with edema, pain and blistering with subsequent desquamation of the dermis, and hyperpigmentation
- chronic UVA and UVB exposure leads to photoaging, immunosuppression, photocarcinogenesis
- prevention: avoid peak UVR (10 am-4 pm), wear appropriate clothing, wide-brimmed hat, sunglasses, and broad-spectrum sunscreen
- clothing with UV protection expressed as UV protection factor (UPF) is analogous to SPF of sunscreen

### Sunscreens

- under ideal conditions an SPF of 10 means that a person who normally burns in 20 min will burn in 200 min following the application of the sunscreen
- topical chemical: absorbs UV light
  - requires application at least 15-30 min prior to exposure, should be reapplied every 2 h (more often if sweating, swimming)
  - UVB absorbers: PABA, salicylates, cinnamates, benzylidene camphor derivatives
  - UVA absorbers: benzophenones, anthranilates, dibenzoylmethanes, benzylidene camphor derivatives
- topical physical: reflects and scatters UV light
  - titanium dioxide, zinc oxide, kaolin, talc, ferric chloride, and melanin
    - ♦ all are effective against the UVA and UVB spectrum
  - less risk of sensitization than chemical sunscreens and waterproof, but may cause folliculitis or miliaria
- some sunscreen ingredients may cause contact or photocontact allergic reactions, but are uncommon

### Management

- sunburn: if significant blistering present, consider treatment in hospital; otherwise, symptomatic treatment (cool wet compresses, oral anti-inflammatory, topical corticosteroids)
- antioxidants, both oral and topical are being studied for their abilities to protect the skin; topical agents are limited by their ability to penetrate the skin

## Topical Steroids

Table 25. Potency Ranking of Topical Steroids

Relative Potency	Relative Strength	Generic Names	Trade Names	Usage
Weak	x1	hydrocortisone – 2.5% (1% available over-the-counter)	Emo Cort®	Intertriginous areas, children, face, thin skin
Moderate	x3	hydrocortisone 17-valerate – 0.2% desonide mometasone furoate	Westcort® Tridesilon® Elocom®	Arm, leg, trunk
Potent	x6	betamethasone – 0.1% 17-valerate – 0.1% amcinonide	Betnovate® Celestoderm – V® Cyclocort®	Body
Very Potent	x9	betamethasone dipropionate – 0.05% fluocinonide – 0.05% halcinonide	Diprosone® Lidex, Topsyn gel® Lyderm® Halog®	Palms and soles
Extremely Potent	x12	clobetasol propionate – 0.05% (most potent) betamethasone dipropionate ointment halobetasol propionate – 0.05%	Dermovate® Diprolene® Ultravate®	Palms and soles

**SPF** = burn time with cream/burn time without cream

### UV Radiation

#### UVA (320-400 nm): Aging

- Penetrates skin more effectively than UVB or UVC
- Responsible for tanning, burning, wrinkling, photoallergy and premature skin aging
- Penetrates clouds, glass and is reflected off water, snow and cement

#### UVB (290-320 nm): Burning

- Absorbed by the outer dermis
- Is mainly responsible for burning and premature skin aging
- Primarily responsible for BCC, SCC
- Does not penetrate glass and is substantially absorbed by ozone

#### UVC (200-290 nm)

- Is filtered by ozone layer

### Body Site:

#### Relative Percutaneous Absorption

Forearm	1.0
Plantar foot	0.14
Palm	0.83
Back	1.7
Scalp	3.7
Forehead	6.0
Cheeks	13.0
Scrotum	42.0

Calculation of strength of steroid compared to hydrocortisone on forearm: relative strength of steroid x relative percutaneous absorption

### Surface Area

30 g covers full adult body once. Children have a greater surface area/volume ratio and there are consequently greater side effects

### Side Effects of Topical Steroids

- Local: atrophy, perioral dermatitis, steroid acne, rosacea, contact dermatitis, tachyphylaxis (tolerance), telangiectasis, striae, hypertrichosis, hypopigmentation
- Systemic: suppression of HPA axis

## Dermatologic Therapies

**Table 26. Common Topical Therapies**

Drug Name	Dosing Schedule	Indications	Comments
<b>Calcipotriol</b> (Dovonex®)	0.005% cream, ointment, scalp solution, apply bid For maintenance therapy apply OD	Psoriasis	Burning, itching, skin irritation, worsening of psoriasis Avoid face, mucous membranes, eyes; wash hands after application Maximum weekly dosage of cream by age: 2-5 yr – 25 g/wk 6-10 yr – 50 g/wk 11-14 yr – 75 g/wk >14 yr – 100 g/wk Inactivated by light (do not apply before phototherapy)
<b>Imiquimod</b> (Aldara®)	5% cream applied 3x/wk Apply at bedtime, leave on 6-10 h, then wash off with mild soap and water Max duration 16 wk	Genital warts Cutaneous warts AK Superficial BCC	Avoid natural/artificial UV exposure Local skin and application site reactions Erythema, ulceration, edema, flu-like symptoms Works best for warts on mucosal surfaces May induce inflammation and erosion
<b>Permethrin</b> (Kwellada® P Lotion and Nix® Dermal Cream)	1% or 5% cream, applied once overnight to all skin areas from neck down, repeated one week later	Scabies (Kwellada-P Lotion, Nix® Dermal Cream) Pediculosis (Kwellada-P Crème Rinse®, Nix Crème Rinse®)	Do not use in children <2 yr Hypersensitivity to drug, or known sensitivity to chrysanthemums Local reactions only (resolve rapidly); including burning, pruritus Low toxicity, excellent results Consider second application after 7 d
<b>Pimecrolimus</b> (Elidel®)	1% cream bid Use for as long as lesions persist and discontinue upon resolution of symptoms	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive
<b>Tacrolimus Topical</b> (Protopic®)	0.03% (children) or 0.1% (adults) ointment bid Continue for duration of disease PLUS 1 wk after clearing	AD (mild to moderate)	Burning Lacks adverse effects of steroids May be used on all skin surfaces including head, neck, and intertriginous areas Expensive

### Topical Vehicles

- Ointment (water in oil): hydrate, greasy
- Cream (oil in water): hydrate, variable
- Lotion (powder in water): drying, cosmesis
- Solutions (water, alcohol, propylene glycol)
- Gel (solution that melts on contact with skin, alcohol): drying

**Table 27. Common Oral Therapies**

Drug Name	Dosing Schedule	Indications	Comments
<b>Acitretin</b> (Soriatane®)	25-50 mg PO OD; maximum 75 mg/d	Severe psoriasis Other disorders of hyperkeratinization (ichthyosis, Darier's disease)	<u>Monitoring strategies</u> Monitor lipids, LFTs at baseline and q1-2wk until stable <u>Contraindications</u> Women of childbearing potential unless strict contraceptive requirements are met <u>Drug interactions</u> Other systemic retinoids, methotrexate, tetracyclines, certain contraceptives May be combined with PUVA phototherapy (known as re-PUVA)
<b>Antivirals</b>	famciclovir (Famvir®) 250 mg PO tid x 7-10 d (for 1st episode of genital herpes) 125 mg PO bid x 5 d (for recurrent genital herpes)  valacyclovir (Valtrex®) 1000 mg PO bid x 7-10 d (for 1st episode of genital herpes) 500 mg PO bid x 5 d (for recurrent genital herpes)	Chickenpox Herpes zoster Genital herpes Acute and prophylactic to reduce transmission in infected patients Herpes labialis	<u>Side effects</u> Headache, nausea, diarrhea, abdominal pain Reduce dose if impaired renal function  <u>Side effects</u> Dizziness, depression, abdominal pain Reduce dose if impaired renal function <u>Drug interactions</u> cimetidine
<b>Cyclosporine</b> (Neoral®)	2.5-4 mg/kg/d PO divided bid Max 4 mg/kg/d After 4 wk may increase by 0.5 mg/kg/d q2wks Concomitant dose of magnesium may protect the kidneys	Psoriasis May also be effective in: Lichen planus EM Recalcitrant urticaria Recalcitrant AD	<u>Monitoring strategies</u> Blood pressure, renal function <u>Contraindications</u> Abnormal renal function, uncontrolled hypertension, malignancy (except NMSC), uncontrolled infection, immunodeficiency (excluding autoimmune disease), hypersensitivity to drug Long-term effects preclude use of cyclosporine for >2 yr; discontinue earlier if possible May consider rotating therapy with other drugs to minimize adverse effects of each drug
<b>Dapsone</b>	50-100-150 mg PO OD tapering to 25-50 mg PO OD to as low as 50 mg 2x/wk	Dermatitis herpetiformis, neutrophilic dermatoses	<u>Monitoring strategies</u> Obtain G6PD levels before initiating; in the initial two wk obtain methemoglobin levels and follow the blood counts carefully for the first few months <u>Side effects</u> Neuropathy Hemolysis (Vitamin C and E supplementation can help prevent this) <u>Drug interactions</u> Substrate of CYP2C8/9 (minor), 2C19 (minor), 2E1 (minor), 3A4 (major) Often a dramatic response within hours

**Table 27. Common Oral Therapies** (continued)

Drug Name	Dosing Schedule	Indications	Comments
<b>Isotretinoin</b> (Accutane®)	0.5-1 mg/kg/d given OD, to achieve a total dose of 120 mg/kg (20-24 wk)	Severe nodular and/or inflammatory acne Acne conglobata Recalcitrant acne Widespread comedonal acne	<u>Monitoring strategies</u> Baseline lipid profile and LFTs before treatment, $\beta$ -hCG <u>Contraindications</u> Teratogenic – in sexually active females, 2 forms of reliable contraception necessary Generally regarded as unsafe in lactation <u>Side effects</u> Night blindness, decreased tolerance to contact lenses, dry mucous membranes May transiently exacerbate acne, dry skin Depression, myalgia <u>Drug interactions</u> Do not use at the same time as tetracycline or minocycline – both may cause pseudotumour cerebri Discontinue vitamin A supplements Drug may be discontinued at 16-20 wk when nodule count has dropped by >70%; a second course may be initiated after 2 mo prn Refractory cases may require >3 courses
<b>Itraconazole</b> (Sporanox®)	100-400 mg PO OD, depending on infection Tinea corporis/cruris/versicolor: 200 mg PO OD x 7 d Tinea pedis: 200 mg PO bid x 7 d Toenails: 200 mg PO bid x 7 d once per month, repeated 3x Fingernail involvement only: 200 mg bid PO x 7 d once per month, repeated 2x	Onychomycosis Tinea corporis, cruris, pedis, versicolor, capitis	<u>Contraindications</u> CHF <u>Side effects</u> Serious hepatotoxicity <u>Drug Interactions</u> Inhibits CYP3A4 Increases concentration of some drugs metabolized by this enzyme (i.e. statins, diabetic drugs) Give capsules with food, capsules must be swallowed whole
<b>Ivermectin</b> (Mectizan®, Stromectol®)	200-250 $\mu$ g/kg PO qweekly x 2 Take once as directed; repeat one wk later	Onchocerciasis (USA only) Not licensed for use in Canada Also effective for: scabies	No significant serious side effects Efficacious
<b>Methotrexate</b> (Trexall®)	10-25 mg qwk, PO, IM, or IV Max: 30 mg/wk To minimize side effects, administer with folic acid supplementation: 1-5 mg OD	Psoriasis AD Lymphomatoid papulosis May also be effective in: cutaneous sarcoidosis	<u>Monitoring strategies</u> Baseline renal, liver, and hematological studies <u>Contraindications</u> Pregnancy, lactation, alcohol abuse, liver dysfunction, immunodeficiency syndrome, blood dyscrasias, hypersensitivity to drug Restricted to severe, recalcitrant or disabling psoriasis not adequately responsive to other forms of therapy May be combined with cyclosporine to allow lower doses of both drugs
<b>Minocycline</b> (Minocin®)	50-100 mg PO bid Taper to 50 mg PO OD as acne lessens	Acne vulgaris Rosacea	<u>Contraindications</u> Caution if impaired renal or liver function <u>Drug interactions</u> Do not use with isotretinoin (Accutane®) <u>Side effects</u> Extensive; affects multiple organ systems including CNS, teeth, eyes, bones, renal, and skin (photosensitivity and blue pigmentation) Drug-induced lupus (check p-ANCA) Alternative to tetracycline
<b>OCPs</b> (TriCyclen®, Diane 35®, Alesse®)	1 pill PO once daily	Hormonal acne (chin, jawline) Acne associated with polycystic ovarian syndrome or other endocrine abnormalities	All combined OCPs are helpful in acne but those listed on the left have undergone RCTs <u>Contraindications</u> Pregnancy, HTN, migraines with aura, pregnancy Routine gynecological health maintenance should be up to date
<b>Spirolactone</b>	50-100 mg PO OD alone or with OCPs	Hormonal acne (chin, jawline) Acne with endocrine abnormality	<u>Contraindications</u> Pregnancy <u>Side effects</u> Menstrual irregularities at higher doses if not on OCPs Breast tenderness, mild diuresis common Risk of hyperkalemia – counsel patients to reduce intake of potassium rich foods such as bananas
<b>Terbinafine</b> (Lamisil®)	250 mg PO OD x 2 wk Fingernails x 6 wk Toenails x 12 wk Confirm diagnosis prior to treatment	Onychomycosis Tinea corporis, cruris, pedis, capitis	<u>Contraindications</u> Pregnancy, chronic or active liver disease <u>Drug interactions</u> Potent inhibitor of CYP2D6; use with caution when also taking $\beta$ -blockers, certain anti-arrhythmic agents, MAOI type B, and/or antipsychotics Drug concentrates rapidly in skin, hair, and nails at levels associated with fungicidal activity
<b>Tetracycline</b>	250-500 mg PO bid to tid Taken 1 h before or 2 h after a meal	Acne vulgaris Rosacea Bullous pemphigoid	<u>Contraindications</u> Severe renal or hepatic dysfunction

## Acronyms

AAA	abdominal aortic aneurysm	DIC	disseminated intravascular coagulation	LBBB	left bundle branch block	SAH	subarachnoid hemorrhage
ABG	arterial blood gas	DKA	diabetic ketoacidosis	LOC	level of consciousness	SCI	spinal cord injury
ACS	acute coronary syndrome	DRE	digital rectal exam	LP	lumbar puncture	SJS	Stevens-Johnson syndrome
AED	automatic external defibrillator	DT	delirium tremens	LVH	left ventricular hypertrophy	SNS	sympathetic nervous system
AFib	atrial fibrillation	DVT	deep vein thrombosis	MAP	mean arterial pressure	SOB	shortness of breath
AG	anion gap	ED	emergency department	MDI	metered dose inhaler	SSSS	staphylococcal scalded skin syndrome
ARDS	acute respiratory distress syndrome	EM	erythema multiforme	MVC	motor vehicle collision	STEMI	ST elevation myocardial infarction
AVN	avascular necrosis	ETT	endotracheal tube	NG	nasogastric	TBI	traumatic brain injury
AVPU	alert, voice, pain, unresponsive	FAST	focused abdominal sonogram for trauma	NS	normal saline	TCA	tricyclic antidepressant
AXR	abdominal X-ray	FFP	fresh frozen plasma	OD	once daily	TEN	toxic epidermal necrolysis
Bi-PAP	bilevel positive airway pressure	GERD	gastroesophageal reflux disease	PE	pulmonary embolism	TSS	toxic shock syndrome
BSA	body surface area	GCS	Glasgow Coma Scale	PID	pelvic inflammatory disease	U/A	urinalysis
CAS	Children's Aid Society	HI	head injury	PNS	parasympathetic nervous system	U/S	ultrasound
CPAP	continuous positive airway pressure	IBD	inflammatory bowel disease	POG	plasma osmolar gap	UTox	urine toxicology screen
CPP	cerebral perfusion pressure	IBS	irritable bowel syndrome	pRBC	packed red blood cells	VBG	venous blood gas
CSF	cerebrospinal fluid	ICP	intracranial pressure	RBBC	right bundle branch block	VFib	ventricular fibrillation
CVA	costovertebral angle	ICS	intercostal space	ROM	range of motion	Vtach	ventricular tachycardia
CXR	chest X-ray	JVP	jugular venous pressure	RPS	rapid primary survey	VTE	venous thromboembolism
D&C	dilatation and curettage			RSI	rapid sequence induction		
DGI	disseminated gonococcal infection			rt-PA	recombinant tissue plasminogen activator		

## Patient Assessment/Management

### 1. Rapid Primary Survey

- Airway maintenance with C-spine control
- Breathing and ventilation
- Circulation (pulses, hemorrhage control)
- Disability (neurological status)
- Exposure (complete) and Environment (temperature control)
  - continually reassessed during secondary survey
  - changes in hemodynamic and/or neurological status necessitates a return to the primary survey beginning with airway assessment
- **IMPORTANT:** Always watch for signs of shock while doing primary survey

#### A. AIRWAY

- first priority is to secure airway
- assume a cervical injury in every trauma patient and immobilize with collar
- assess ability to breathe and speak
- can change rapidly, therefore reassess frequently
- assess for facial fractures/edema/burns (impending airway collapse)

#### Airway Management

- anatomic optimization to allow for oxygenation and ventilation

#### 1. Basic Airway Management

- protect the C-spine
- head-tilt (if C-spine injury not suspected) or jaw thrust to open the airway
- sweep and suction to clear mouth of foreign material

#### 2. Temporizing Measures

- nasopharyngeal airway (if gag reflex present, i.e. conscious)
- oropharyngeal airway (if gag reflex absent, i.e. unconscious)
- “rescue” airway devices (e.g. laryngeal mask airway, Combitube®)
- transtracheal jet ventilation through cricothyroid membrane (last resort)

#### 3. Definitive Airway Management

- ETT intubation with in-line stabilization of C-spine
  - orotracheal ± RSI preferred
  - nasotracheal may be better tolerated in conscious patient
    - ♦ relatively contraindicated with basal skull fracture
  - does not provide 100% protection against aspiration
- surgical airway (if unable to intubate using oral/nasal route and unable to ventilate)
- cricothyroidotomy

#### Contraindications to Intubation

- supraglottic/glottic pathology that would preclude successful intubation

#### Approach to the Critically Ill Patient

1. Rapid Primary Survey (RPS)
2. Resuscitation (often concurrent with RPS)
3. Detailed Secondary Survey
4. Definitive Care

#### Signs of Airway Obstruction

- Agitation, confusion, “universal choking sign”
- Respiratory distress
- Failure to speak, dysphonia, stridor
- Cyanosis

#### Medications that can be Delivered via ETT

**NAVEL**  
 Naloxone (Narcan®)  
 Atropine  
 Ventolin® (salbutamol)  
 Epinephrine  
 Lidocaine

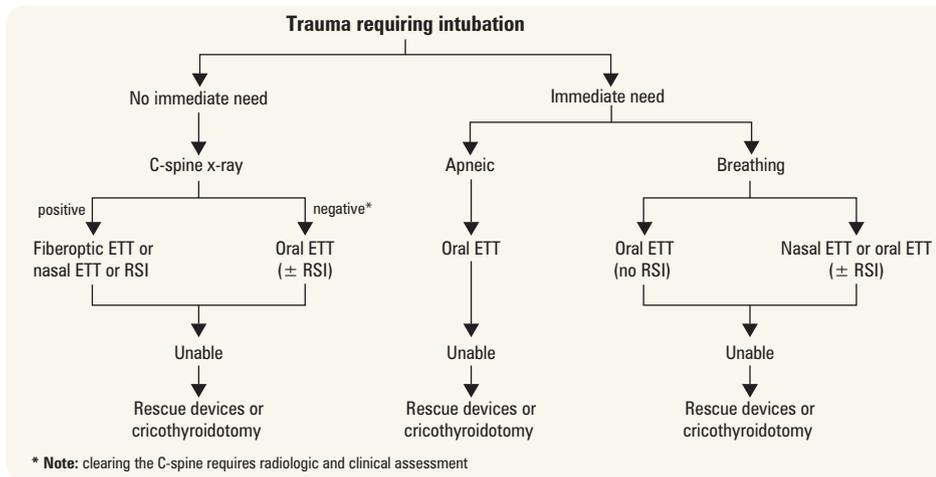

Figure 1. Approach to endotracheal intubation in an injured patient

**B. BREATHING**

- **Look**
  - mental status (anxiety, agitation, decreased LOC), colour, chest movement (bilateral vs. asymmetrical), respiratory rate/effort, nasal flaring
- **Listen**
  - auscultate for signs of obstruction (e.g. stridor), breath sounds, symmetry of air entry, air escaping
- **Feel**
  - tracheal shift, chest wall for crepitus, flail segments, sucking chest wounds, subcutaneous emphysema

**Breathing Assessment**

- objective measures of respiratory function: rate, oximetry, ABG, A-a gradient

**Management of Breathing**

- nasal prongs → simple face mask → non-rebreather mask → CPAP/BiPAP (in order of increasing FiO<sub>2</sub>)
- Bag-Valve mask and CPAP to supplement inadequate ventilation

**C. CIRCULATION**

**Definition of Shock**

- inadequate organ and tissue perfusion with oxygenated blood (brain, kidney, extremities)

Table 1. Major Types of Shock

Hypovolemic	Cardiogenic	Distributive (vasodilation)	Obstructive
Hemorrhage (external and internal)	Myocardial ischemia	Septic	Cardiac tamponade
Severe burns	Dysrhythmias	Anaphylactic	Tension pneumothorax
High output fistulas	CHF	Neurogenic (spinal cord injury)	PE
Dehydration (diarrhea, DKA)	Cardiomyopathies		Aortic stenosis
	Cardiac valve problems		Constrictive pericarditis

**Clinical Evaluation**

- early: tachypnea, tachycardia, narrow pulse pressure, reduced capillary refill, cool extremities, and reduced central venous pressure
- late: hypotension and altered mental status, reduced urine output

Table 2. Estimation of Degree of Hemorrhagic Shock

Class	I	II	III	IV
<b>Blood loss</b>	<750 cc	750-1,500 cc	1,500-2,000 cc	>2,000 cc
<b>% of blood volume</b>	<15%	15-30%	30-40%	>40%
<b>Pulse</b>	<100	>100	>120	>140
<b>Blood pressure</b>	Normal	Normal	Decreased	Decreased
<b>Respiratory rate</b>	20	30	35	>45
<b>Capillary refill</b>	Normal	Decreased	Decreased	Decreased
<b>Urinary output</b>	30 cc/h	20 cc/h	10 cc/h	None
<b>Fluid replacement</b>	Crystalloid	Crystalloid	Crystalloid + blood	Crystalloid + blood

**Indications for Intubation**

- Unable to protect airway (e.g. GCS <8; airway trauma)
- Inadequate oxygenation with spontaneous respiration (O<sub>2</sub> saturation <90% with 100% O<sub>2</sub> or rising pCO<sub>2</sub>)
- Anticipatory: in trauma, overdose, CHF, asthma, COPD, and smoke inhalation injury
- Anticipated transfer of critically ill patients

**Rescue Techniques in Intubation**

- Bougie (used like a guidewire)
- Glidescope®
- Lighted stylet (use light through skin to determine if ETT in correct place)
- Fiberoptic intubation – indirect visualization using fiberoptic cable

Noisy breathing is obstructed breathing until proven otherwise

Shock in a trauma patient is hemorrhagic until proven otherwise

**Medications that can be Delivered via ETT**

**NAVEL**

- Naloxone (Narcan®)
  - Atropine
- Causes of Shock**

**SHOCKED**

- Septic, spinal/neurogenic, Hemorrhagic
- Obstructive (e.g. tension pneumothorax, cardiac tamponade, PE)
- Cardiogenic (e.g. blunt myocardial injury, dysrhythmia, MI)
- anaphylactic
- Endocrine (e.g. Addison's, myxedema, coma)
- Drugs
- Ventolin® (salbutamol)
- Epinephrine
- Lidocaine

**Estimated Systolic Blood Pressure Based on Position of Most Distal Palpable Pulse**

	sBP (mmHg)
Radial	>80
Femoral	>70
Carotid	>60

### Management of Hemorrhagic Shock

- clear airway and breathing either first or simultaneously
- apply direct pressure on external wounds while elevating extremities. Do not remove impaled objects in the emergency room setting as they may tamponade bleeds
- start TWO LARGE BORE (14-16G) IVs in the brachial/cephalic vein of each arm
- run 1-2 L bolus of IV Normal Saline/Ringer's Lactate (warmed, if possible)
- if continual bleeding or no response to crystalloids, consider pRBC transfusion, ideally crossmatched. If crossmatched blood is unavailable, consider O- for women of childbearing age and O+ for men. Use FFP, platelets or tranexamic acid in early bleeding
- consider common sites of internal bleeding (abdomen, chest, pelvis, long bones) where surgical intervention may be necessary

### D. DISABILITY

- assess LOC using GCS
- pupils
  - assess equality, size, symmetry, reactivity to light
    - ♦ inequality/sluggish suggests local eye problem or lateralizing CNS lesion
    - ♦ relative afferent pupillary defect (swinging light test) – optic nerve damage
  - extraocular movements and nystagmus
  - fundoscopy (papilledema, hemorrhages)
  - reactive pupils + decreased LOC: metabolic or structural cause
  - non-reactive pupils + decreased LOC: structural cause (especially if asymmetric)

### Glasgow Coma Scale

- for use in trauma patients with decreased LOC; good indicator of severity of injury and neurosurgical prognosis
- most useful if repeated; change in GCS with time is more relevant than the absolute number
- less meaningful for metabolic coma
- patient with deteriorating GCS needs immediate attention
- prognosis based on best post-resuscitation GCS
- reported as a 3 part score: Eyes + Verbal + Motor = Total
- if patient intubated, GCS score reported out of 10 + T (T = tubed, i.e. no verbal component)

Table 3. Glasgow Coma Scale

Eyes Open		Best Verbal Response		Best Motor Response	
Spontaneously	4	Answers questions appropriately	5	Obeys commands	6
To voice	3	Confused, disoriented	4	Localizes to pain	5
To pain	2	Inappropriate words	3	Withdraws from pain	4
No response	1	Incomprehensible sounds	2	Decorticate (flexion)	3
		No verbal response	1	Decerebrate (extension)	2
				No response	1

13-15 = mild injury, 9-12 = moderate injury,  $\leq 8$  = severe injury

See Table 36, ER57 for modified GCS for infants and children

### E. EXPOSURE/ENVIRONMENT

- expose patient completely and assess entire body for injury; log roll to examine back
- DRE
- keep patient warm with a blanket  $\pm$  radiant heaters; avoid hypothermia
- warm IV fluids/blood
- keep providers safe (contamination, combative patient)

#### 3:1 Rule

Since only 30% of infused isotonic crystalloids remains in intravascular space, you must give 3x estimated blood loss

#### Fluid Resuscitation

- Give bolus until HR decreases, urine output increases, and patient stabilizes
- Maintenance: 4:2:1 rule
  - 0-10 kg: 4 cc/kg/h
  - 10-20 kg: 2 cc/kg/h
  - Remaining weight: 1 cc/kg/h
- Replace ongoing losses and deficits (assume 10% of body weight)

#### Unilateral, Dilated, Non-Reactive Pupil, Think

- Focal mass lesion
- Epidural hematoma
- Subdural hematoma

#### Contraindications to

##### Foley Insertion

- Blood at urethral meatus
- Scrotal hematoma
- High-riding prostate on DRE

#### NG Tube Contraindications

- Significant mid-face trauma
- Basal skull fracture

## 2. Resuscitation

- done concurrently with primary survey
- attend to ABCs
- manage life-threatening problems as they are identified
- vital signs q5-15 min
- ECG, BP, and O<sub>2</sub> monitors
- Foley catheter and NG tube if indicated
- tests and investigations: CBC, electrolytes, BUN, Cr, glucose, amylase, INR/PTT,  $\beta$ -hCG, toxicology screen, cross and type

**Table 4. 2010 AHA CPR Guidelines**

Step/Action	Adult: >8 yr	Child: 1-8 yr	Infant: <1 yr
<b>Airway</b>	Head tilt-chin lift		
<b>Breaths</b>	2 breaths at 1 second/breath – stop once see chest rise		
<b>Foreign-Body Airway Obstruction</b>	Abdominal thrust		Back slaps and chest thrusts
<b>Compressions</b>			
Compression landmarks	In the centre of the chest, between nipples		Just below nipple line
Compression method: push hard and fast, and allow for complete recoil	2 hands: heel of 1 hand with second hand on top	2 hands: heel of 1 hand with second on top, or 1 hand: heel of 1 hand only	2 fingers, or thumbs
Compression depth	2-2.4 inches	About 1/3 to 1/2 the depth of the chest	
Compression rate	100-120/min with complete chest wall recoil between compressions		
Compression-ventilation ratio	30 compressions to 2 ventilations		
Compression-only CPR	Hands-only CPR is preferred if the bystander is not trained or does not feel confident in their ability to provide conventional CPR or if the bystander is trained but chooses to use compressions only		
<b>Defibrillation</b>	Immediate defibrillation for all rescuers responding to a sudden witnessed collapse Compressions (5 cycles/2 min) before AED is considered if unwitnessed arrest Manual defibrillators are preferred for children and infants but can use adult dose AED if a manual defibrillator is not available		

See [Anesthesia and Perioperative Medicine, A31](#) for 2012 ACLS Guidelines

### 3. Secondary Survey

- done after primary survey once patient is hemodynamically and neurologically stabilized
- identifies major injuries or areas of concern
- full physical exam and x-rays (C-spine, chest, pelvis – required in blunt trauma, consider T-spine and L-spine)

#### HISTORY

- “SAMPLE”: Signs and symptoms, Allergies, Medications, Past medical history, Last meal, Events related to injury

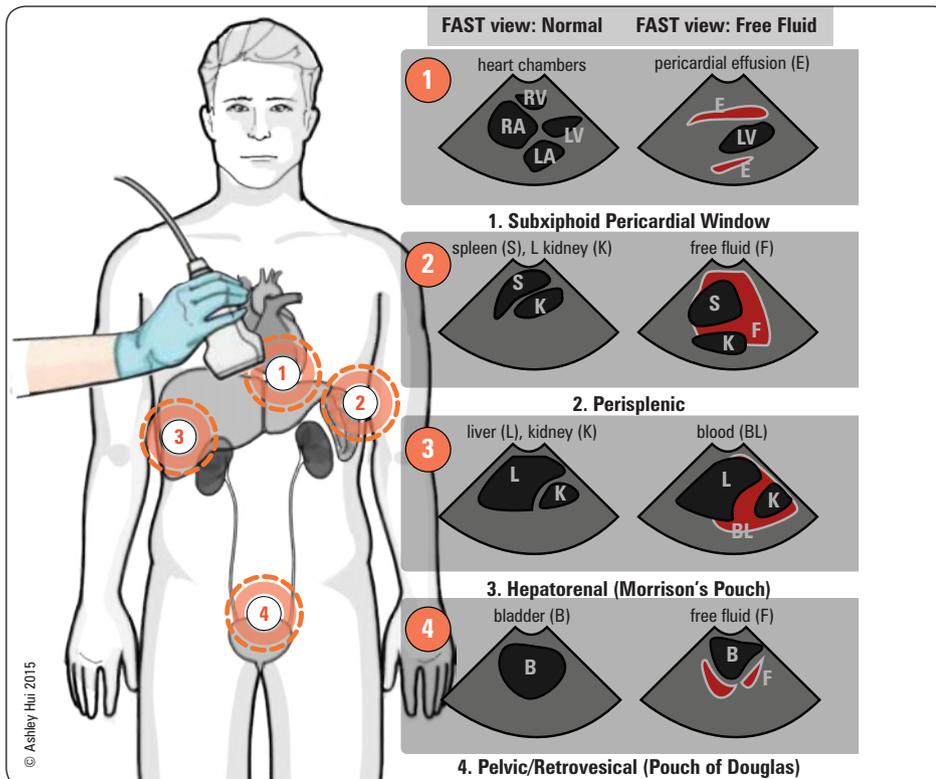

Figure 2. Four areas of a FAST

## PHYSICAL EXAM

### Head and Neck

- palpation of facial bones, scalp

### Chest

- inspect for: 1. midline trachea and 2. flail segment:  $\geq 2$  rib fractures in  $\geq 2$  places; if present look for associated hemothorax, pneumothorax, and contusions
- auscultate lung fields
- palpate for subcutaneous emphysema

### Abdomen

- assess for peritonitis, abdominal distention, and evidence of intra-abdominal bleeding
- DRE for GI bleed, high riding prostate and anal tone

### Musculoskeletal

- examine all extremities for swelling, deformity, contusions, tenderness, ROM
- check for pulses (using Doppler probe) and sensation in all injured limbs
- log roll and palpate thoracic and lumbar spines
- palpate iliac crests and pubic symphysis and assess pelvic stability (lateral, AP, vertical)

### Neurological

- GCS
- full cranial nerve exam
- alterations of rate and rhythm of breathing are signs of structural or metabolic abnormalities with progressive deterioration in breathing indicating a failing CNS
- assess spinal cord integrity
- conscious patient: assess distal sensation and motor function
- unconscious patient: response to painful or noxious stimulus applied to extremities

### INITIAL IMAGING

- non-contrast CT head/face/C-spine (rule out fractures and bleeds)
- chest x-ray
- FAST (see Figure 2) or CT abdomen/pelvis (if stable)
- pelvis x-ray

#### Signs of Increased ICP

- Deteriorating LOC (hallmark)
- Deteriorating respiratory pattern
- Cushing reflex (high BP, low heart rate, irregular respirations)
- Lateralizing CNS signs (e.g. cranial nerve palsies, hemiparesis)
- Seizures
- Papilledema (occurs late)
- N/V and headache

Non-contrast head CT is the best imaging modality for intracranial injury

#### Jehovah's Witnesses

- Capable adults have the right to refuse medical treatment
- May refuse whole blood, pRBCs, platelets, and plasma even if life-saving
- Should be questioned directly about the use of albumin, immunoglobulins, hemophilic preparations
- Do not allow autologous transfusion unless there is uninterrupted extra corporeal circulation
- Usually ask for the highest possible quality of care without the use of the above interventions (e.g. crystalloids for volume expansion, attempts at bloodless surgery)
- Patient will generally sign hospital forms releasing medical staff from liability
- Most legal cases involve children of Jehovah's Witnesses; if life-saving treatment is refused, contact CAS

## Ethical Considerations

### Consent to Treatment: Adults

- see [Ethical, Legal, and Organizational Medicine, ELOM6](#)
- Emergency Rule: consent is not needed when a patient is at imminent risk from a serious injury AND obtaining consent is either: a) not possible, OR b) would increase risk to the patient
  - assumes that most people would want to be saved in an emergency
- any capable and informed patient can refuse treatment or part of treatment, even if it is life-saving
- exceptions to the Emergency Rule - treatment cannot be initiated if
  - a competent patient has previously refused the same or similar treatment and there is no evidence to suggest the patient's wishes have changed
  - an advanced directive is available (e.g. do not resuscitate order)
  - NOTE: refusal of help in a suicide situation is NOT an exception; care must be given
- if in doubt, initiate treatment
- care can be withdrawn if necessary at a later time or if wishes are clarified by family

### Consent to Treatment: Children

- treat immediately if patient is at imminent risk
- parents/guardians have the right to make treatment decisions
- if parents refuse treatment that is life-saving or will potentially alter the child's quality of life, CAS must be contacted – consent of CAS is needed to treat

### Other Issues of Consent

- need consent for HIV testing, as well as for administration of blood products
- however, if delay in substitute consent for blood transfusions puts patient at risk, transfusions can be given

### Duty to Report

- law may vary depending on province and/or state
- examples: gunshot wounds, suspected child abuse, various communicable diseases, medical unsuitability to drive, risk of substantial harm to others

# Traumatology

- epidemiology
  - leading cause of death in patients <45 yr
  - 4th highest cause of death in North America
  - causes more deaths in children/adolescents than all diseases combined
- trimodal distribution of death
  - minutes: lethal injuries, death usually at the scene
  - early: death within 4-6 h – “golden hour” (decreased mortality with trauma care)
  - days-weeks: death from multiple organ dysfunction, sepsis, etc.
- injuries fall into two categories
  - blunt (most common): MVC, pedestrian-automobile impact, motorcycle collision, fall, assault, sports
  - penetrating (increasing in incidence): gunshot wound, stabbing, impalement

Always completely expose and count the number of wounds

## Considerations for Traumatic Injury

- important to know the mechanism of injury in order to anticipate traumatic injuries
- always look for an underlying cause (alcohol, medications, illicit substances, seizure, suicide attempt, medical problem)
- always inquire about HI, loss of consciousness, amnesia, vomiting, headache, and seizure activity

**Cardiac Box:** sternal notch, nipples, and xiphoid process; injuries inside this area should increase suspicion of cardiac injury

**Table 5. Mechanisms and Considerations of Traumatic Injuries**

Mechanism of Injury	Special Considerations	Associated Injuries
<b>MVC</b>	Vehicle(s) involved: weight, size, speed, damage Location of patient in vehicle Use and type of seatbelt Ejection of patient from vehicle Entrapment of patient under vehicle Airbag deployment Helmet use in motorcycle collision	Head-on collision: head/facial, thoracic (aortic), lower extremity Lateral/T-bone collision: head, C-spine, thoracic, abdominal, pelvic, and lower extremity Rear-end collision: hyper-extension of C-spine (whiplash injury) Rollover
<b>Pedestrian-Automobile Impact</b>	High morbidity and mortality Vehicle speed is an important factor Site of impact on car	Children at increased risk of being run over (multisystem injuries) Adults tend to be struck in lower legs (lower extremity injuries), impacted against car (truncal injuries), and thrown to ground (HI)
<b>Falls</b>	1 storey = 12 ft = 3.6 m Distance of fall: 50% mortality at 4 storeys and 95% mortality at 7 storeys Landing position (vertical vs. horizontal)	Vertical: lower extremity, pelvic, and spine fractures; HI Horizontal: facial, upper extremity, and rib fractures; abdominal, thoracic, and HI

**High Risk Injuries**

- MVC at high speed, resulting in ejection from vehicle
- Motorcycle collisions
- Vehicle vs. pedestrian crashes
- Fall from height > 12 ft (3.6 m)

**Vehicle vs. Pedestrian Crash**  
In adults look for triad of injuries (Waddle's triad)

- Tibia-fibula or femur fracture
- Truncal injury
- Craniofacial injury

## Head Trauma

- see [Neurosurgery, NS29](#)
- 60% of MVC-related deaths are due to HI

### Specific Injuries

- fractures
  - Dx: non-contrast head CT and physical exam
- A. skull fractures
  - vault fractures
    - linear, non-depressed
      - most common
      - typically occur over temporal bone, in area of middle meningeal artery (commonest cause of epidural hematoma)
    - depressed
      - open (associated overlying scalp laceration and torn dura, skull fracture disrupting paranasal sinuses or middle ear) vs. closed
  - basal skull
    - typically occur through floor of anterior cranial fossa (longitudinal more common than transverse)
    - clinical diagnosis superior as poorly visualized on CT
- B. facial fractures (see [Plastic Surgery, PL29](#))
  - neuronal injury
  - beware of open fracture or sinus fractures (risk of infection)
  - severe facial fractures may pose risk to airway from profuse bleeding

**Signs of Basal Skull Fracture**

- Battle's sign (bruised mastoid process)
- Hemotympanum
- Raccoon eyes (periorbital bruising)
- CSF rhinorrhea/otorrhea

- **scalp laceration**
  - can be a source of significant bleeding
  - achieve hemostasis, inspect and palpate for skull bone defects ± CT head (rule-out skull fracture)
- **neuronal injury**
  - A. diffuse
    - mild TBI = concussion
      - ♦ transient alteration in mental status that may involve loss of consciousness
        - hallmarks of concussion: confusion and amnesia, which may occur immediately after the trauma or minutes later
        - loss of consciousness (if present) must be less than 30 min, initial GCS must be between 13-15, and post-traumatic amnesia must be less than 24 h
    - diffuse axonal injury
      - ♦ mild: coma 6-24 h, possibly lasting deficit
      - ♦ moderate: coma >24 h, little or no signs of brainstem dysfunction
      - ♦ severe: coma >24 h, frequent signs of brainstem dysfunction
  - B. focal injuries
    - contusions
    - intracranial hemorrhage (epidural, subdural, intracerebral)

## ASSESSMENT OF BRAIN INJURY

### History

- pre-hospital status
- mechanism of injury

### Physical Exam

- assume C-spine injury until ruled out
- vital signs
  - shock (not likely due to isolated brain injury, except in infants)
  - Cushing's response to increasing ICP (bradycardia, HTN, irregular respirations)
- severity of injury determined by
  1. LOC
    - ♦ GCS ≤8 intubate, any change in score of 3 or more = serious injury
    - ♦ mild TBI = 13-15, moderate = 9-12, severe = 3-8
  2. pupils: size, anisocoria >1 mm (in patient with altered LOC), response to light
  3. lateralizing signs (motor/sensory)
    - ♦ may become more subtle with increasing severity of injury
- reassess frequently

### Investigations

- labs: CBC, electrolytes, PT/PTT or INR/PTT, glucose, toxicology screen
- CT scan (non-contrast) to exclude intracranial hemorrhage/hematoma
- C-spine imaging, often with CT head and neck to exclude intracranial hemorrhage/hematoma

### Management

- goal in ED: reduce secondary injury by avoiding hypoxia, ischemia, decreased CPP, seizure
- general
  - ABCs
  - ensure oxygen delivery to brain through intubation and prevent hypercarbia
  - maintain BP (sBP >90)
  - treat other injuries
- early neurosurgical consultation for acute and subsequent patient management
  - medical management
    - ♦ seizure treatment/prophylaxis
      - benzodiazepines, phenytoin, phenobarbital
      - steroids are of no proven value
    - ♦ treat suspected raised ICP, consider if HI with signs of increased ICP:
      - intubate
      - calm (sedate) if risk for high airway pressures or agitation
      - paralyze if agitated
      - hyperventilate (100% O<sub>2</sub>) to a pCO<sub>2</sub> of 30-35 mmHg
      - elevate head of bed to 20°
      - adequate BP to ensure good cerebral perfusion
      - diurese with mannitol 1g/kg infused rapidly (contraindicated in shock/renal failure)

### Disposition

- neurosurgical ICU admission for severe HI
- in hemodynamically unstable patient with other injuries, prioritize most life-threatening injuries and maintain cerebral perfusion
- for minor HI not requiring admission, provide 24 h HI protocol to competent caregiver, follow-up with neurology as even seemingly minor HI may cause lasting deficits

#### Warning Signs of Severe Head Injury

- GCS <8
  - Deteriorating GCS
  - Unequal pupils
  - Lateralizing signs
- N.B.** Altered LOC is a hallmark of brain injury

#### Canadian CT Head Rule

*Lancet* 2001;357:1391-1396

**CT Head is only required for patients with minor HI with any one of the following High Risk** (for neurological intervention)

- GCS score <15 at 2 h after injury.
- Suspected open or depressed skull fracture.
- Any sign of basal skull fracture (hemotympanum, "raccoon" eyes, CSF otorrhea/rhinorrhea, Battle's sign).
- Vomiting ≥2 episodes.
- Age ≥65 yr.

#### Medium Risk

- Amnesia before impact >30 min (i.e. cannot recall events just before impact).
- Dangerous mechanism (pedestrian struck by MVC, occupant ejected from motor vehicle, fall from height >3 ft or five stairs).

**Minor HI** is defined as witnessed loss of consciousness, definite amnesia, or witnessed disorientation in a patient with a GCS score of 13-15.

**NB:** Canadian CT Head Rule does not apply for non-trauma cases, for GCS <13, age <16, for patients on Coumadin® and/or having a bleeding disorder, or having an obvious open skull fracture.

## Mild Traumatic Brain Injury

### Epidemiology

- TBI results in 1.7 million deaths, hospitalizations, and ED visits each year (US)
- 75% are estimated to be mild TBI; remainder are moderate or severe (see [Neurosurgery, NS29](#))
- highest rates in children 0-4 yr, adolescents 15-19 yr, and elderly >65 yr

### Clinical Features

- somatic: headache, sleep disturbance, N/V, blurred vision
- cognitive dysfunction: attentional impairment, reduced processing speed, drowsiness, amnesia
- emotion and behaviour: impulsivity, irritability, depression
- severe concussion: may precipitate seizure, bradycardia, hypotension, sluggish pupils

### Etiology

- falls, MVC, struck by an object, assault, sports

### Investigations

- neurological exam
- concussion recognition tool (see [thinkfirst.ca](#))
- imaging – CT as per Canadian CT Head Rules, or MRI if worsening symptoms despite normal CT

### Treatment

- close observation and follow-up; for patients at risk of intracranial complications, give appropriate discharge instructions to patient and family; watch for changes to clinical features above, and if change, return to ED
- hospitalization with normal CT (GCS <15, seizures, bleeding diathesis), or with abnormal CT
- early rehabilitation to maximize outcomes
- pharmacological management of pain, depression, headache
- follow Return to Play guidelines

### Prognosis

- most recover with minimal treatment
  - athletes with previous concussion are at increased risk of cumulative brain injury
- repeat TBI can lead to life-threatening cerebral edema or permanent impairment

Extent of retrograde amnesia correlates with severity of injury

**Every Patient with One or More of the Following Signs or Symptoms should be Placed in a C-Spine Collar**

- Midline tenderness
- Neurological symptoms or signs
- Significant distracting injuries
- HI
- Intoxication
- Dangerous mechanism
- History of altered LOC

Of the investigations, the lateral C-spine x-ray is the single most important film; 95% of radiologically visible abnormalities are found on this film

Cauda Equina Syndrome can occur with any spinal cord injury below T10 vertebrae. Look for incontinence, anterior thigh pain, quadriceps weakness, abnormal sacral sensation, decreased rectal tone, and variable reflexes

**The Canadian C-Spine Rule vs. the NEXUS Low-Risk Criteria in Patients with Trauma**  
*NEJM* 2003;349:2510-2518

**Purpose:** To compare the clinical performance of the Canadian C-Spine Rule (CCR) and the National Emergency X-Radiography Utilization Study (NEXUS) Low-Risk Criteria (NLC).

**Study:** Trauma patients (n=8,283) in stable condition were prospectively evaluated by both the CCR and NLC by 394 physicians before radiography. 2% of these patients had a C-spine injury.

**Results:** Compared to the NLC, the CCR was more sensitive (99.4 vs. 90.7%) and more specific (45.1 vs. 36.8%) after exclusion of indeterminate cases. The number of missed patients would be 1 for the CCR and 16 for the NLC. The ROM was not evaluated in some CCR cases likely because physicians were not comfortable with the procedure and this may slightly lower the sensitivity or specificity of the CCR in practice.

**Summary:** The CCR is superior to the NLC in alert and stable patients with trauma. The use of the CCR can result in lower radiography rates.

## Spine and Spinal Cord Trauma

- assume cord injury with significant falls (>12 ft), deceleration injuries, blunt trauma to head, neck, or back
- spinal immobilization (cervical collar, spine board during patient transport only) must be maintained until spinal injury has been ruled out (Figure 3)
- vertebral injuries may be present without spinal cord injury; normal neurologic exam does not exclude spinal injury
- cord may be injured despite normal C-spine x-ray (SCIWORA = spinal cord injury without radiologic abnormality)
- injuries can include: complete/incomplete transection, cord edema, spinal shock

### History

- mechanism of injury, previous deficits, SAMPLE
- neck pain, paralysis/weakness, paresthesia

### Physical Exam

- ABCs
- abdominal: ecchymosis, tenderness
- neurological: complete exam, including mental status
- spine: maintain neutral position, palpate C-spine; log roll, then palpate T-spine and L-spine, assess rectal tone
  - when palpating, assess for tenderness, muscle spasm, bony deformities, step-off, and spinous process malalignment
- extremities: check capillary refill, suspect thoracolumbar injury with calcaneal fractures

### Investigations

- bloodwork: CBC, electrolytes, Cr, glucose, coagulation profile, cross and type, toxicology screen
- imaging
  - full C-spine x-ray series for trauma (AP, lateral, odontoid)
- thoracolumbar x-rays
  - AP and lateral views

- indications
  - patients with C-spine injury
  - unconscious patients (with appropriate mechanism of injury)
  - patients with neurological symptoms or findings
  - patients with deformities that are palpable when patient is log rolled
  - patients with back pain
  - patients with bilateral calcaneal fractures (due to fall from height)
    - concurrent burst fractures of the lumbar or thoracic spine in 10% (T11-L2)
  - consider CT (for subtle bony injuries), MRI (for soft tissue injuries) if appropriate

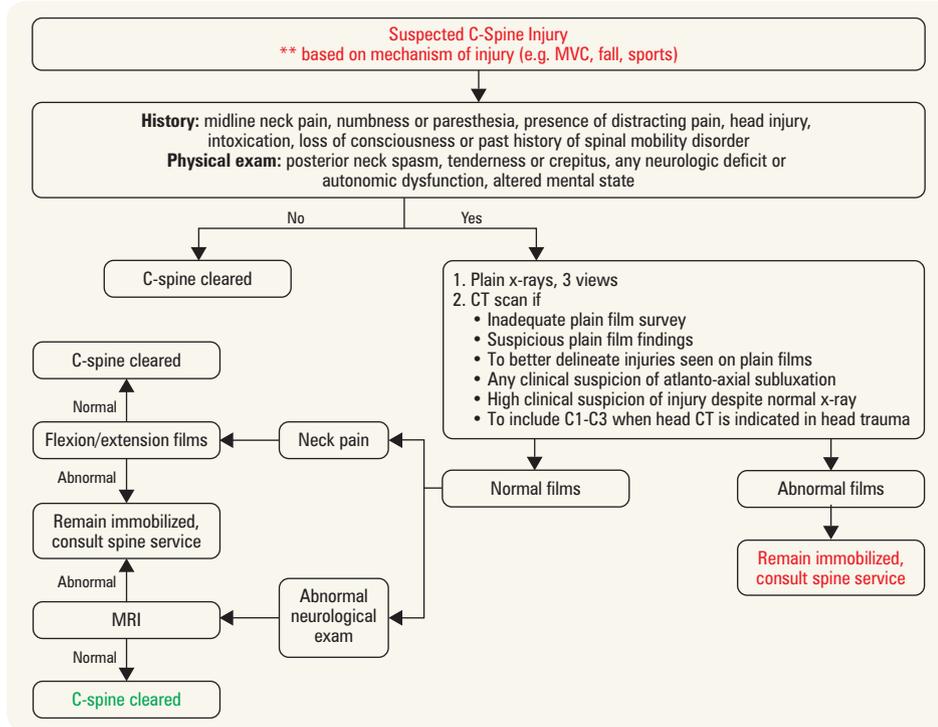

Figure 3. Approach to clearing the C-spine

**Can Clear C-Spine if**

- oriented to person, place, time, and event
- no evidence of intoxication
- no posterior midline cervical tenderness
- no focal neurological deficits
- no painful distracting injuries (e.g. long bone fracture)

**Management of Cord Injury**

- immobilize
- evaluate ABCs
- treat neurogenic shock (maintain sBP >100 mmHg)
- insert NG and Foley catheter
- high dose steroids: methylprednisolone 30 mg/kg bolus, then 5.4 mg/kg/h drip, start within 6-8 h of injury (controversial and recently has less support)
- complete imaging of spine and consult spine service if available
- continually reassess high cord injuries as edema can travel up cord
- if cervical cord lesion, watch for respiratory insufficiency
  - low cervical transection (C5-T1) produces abdominal breathing (phrenic innervation of diaphragm still intact but loss of innervation of intercostals and other accessory muscles of breathing)
  - high cervical cord injury (above C4) may require intubation and ventilation
- treatment: warm blanket, Trendelenburg position (occasionally), volume infusion, consider vasopressors

**Approach to C-Spine X-Rays**

- 3-view C-spine series is the screening modality of choice
  - lateral C1-T1 ± swimmer's view
    - lateral view is best, identifies 90-95% of injuries
  - odontoid view (open mouth or oblique submental view)
    - examine the dens for fractures
      - if unable to rule out fracture, repeat view or consider CT or plain film tomography
    - examine lateral aspects of C1 and spacing relative to C2

**The Canadian C-Spine Rule**

JAMA 2001;286:1841-1848

For Alert (GCS Score = 15) and Stable Trauma Patients where C-Spine Injury is a Concern

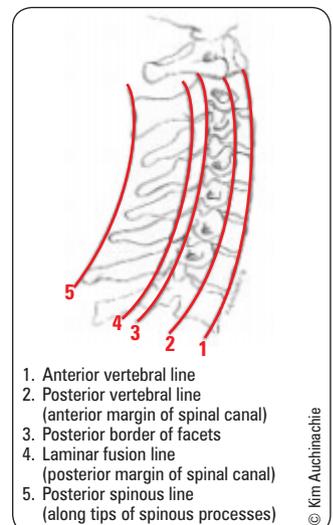

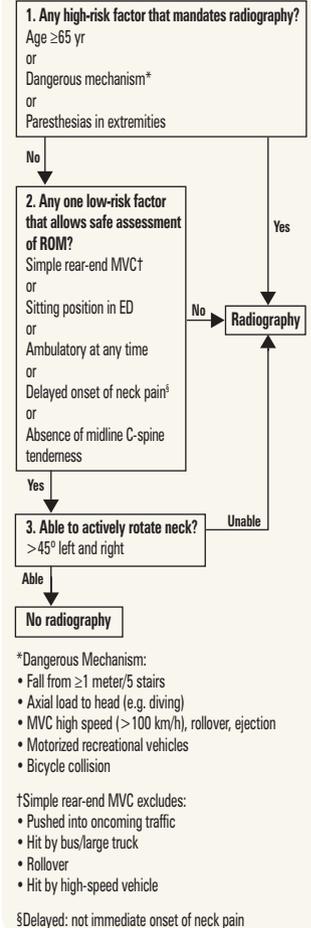

Figure 4. Lines of contour on a lateral C-spine x-ray

Prevertebral soft tissue swelling is only 49% sensitive for injury

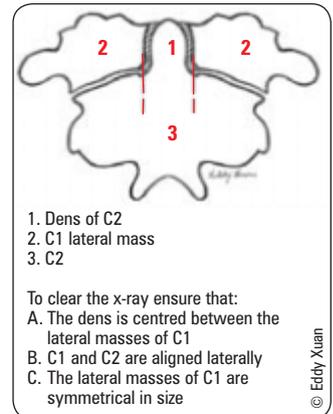

© Kim Auchincloss

3. AP view

- ◆ alignment of spinous processes in the midline
- ◆ spacing of spinous processes should be equal
- ◆ check vertebral bodies and facet dislocations

**Table 6. Interpretation of Lateral View: The ABCS**

<b>A Adequacy and Alignment</b>	Must see C1 to C7-T1 junction; if not, downward traction of shoulders, swimmer’s view, bilateral supine obliques, or CT scan needed Lines of contour in children <8 yr of age, can see physiologic subluxation of C2 on C3, and C3 on C4, but the spino-laminal line is maintained Fanning of spinous processes suggests posterior ligamentous disruption Widening of facet joints Check atlanto-occipital joint Line extending inferiorly from clivus should transect odontoid Atlanto-axial articulation, widening of predental space (normal: <3 mm in adults, <5 mm in children) indicates injury of C1 or C2
<b>B Bones</b>	Height, width, and shape of each vertebral body Pedicles, facets, and laminae should appear as one – doubling suggests rotation
<b>C Cartilage</b>	Intervertebral disc spaces – wedging anteriorly or posteriorly suggests vertebral compression
<b>S Soft Tissues</b>	Widening of retropharyngeal (normal: <7 mm at C1-4, may be wide in children <2 yr on expiration) or retrotracheal spaces (normal: <22 mm at C6-T1, <14 mm in children <5 yr)

**Figure 5. C-spine x-ray; odontoid view**

**Sequelae of C-Spine Fractures**

- see [Neurosurgery, NS32](#)
- acute phase of SCI
  - spinal shock: absence of all voluntary and reflex activity below level of injury
    - ◆ decreased reflexes, no sensation, flaccid paralysis below level of injury, lasting days to months
  - neurogenic shock: loss of vasomotor tone, SNS tone
    - ◆ watch for: hypotension (lacking SNS), bradycardia (unopposed PNS), poikilothermia (lacking SNS so no shunting of blood from extremities to core)
    - ◆ occurs within 30 min of SCI at level T6 or above, lasting up to 6 wk
    - ◆ provide airway support, fluids, atropine (for bradycardia), vasopressors for BP support
- chronic phase of SCI
  - autonomic dysreflexia: in patients with an SCI at level T6 or above
    - ◆ signs and symptoms: pounding headache, nasal congestion, feeling of apprehension or anxiety, visual changes, dangerously increased sBP and dBP
    - ◆ common triggers
      - GU causes: bladder distention, urinary tract infection, and kidney stones
      - GI causes: fecal impaction or bowel distension
    - ◆ treatment: monitoring and controlling BP, prior to addressing causative issue

**Supine Oblique Views**

- Rarely used
- Better visualization of posterior element fractures (lamina, pedicle, facet joint)
- Good to assess patency of neural foramina
- Can be used to visualize the C7-T1 junction

20% of C-spine fractures are accompanied by other spinal fractures, so ensure thoracic and lumbar spine x-rays are normal before proceeding to OR

Trauma to the chest accounts for 50% of trauma deaths

80% of all chest injuries can be managed non-surgically with simple measures such as intubation, chest tubes, and pain control

**Chest Trauma**

- two types: those found and managed in 1° survey and those found and managed in 2° survey

**Table 7. Life-Threatening Chest Injuries Found in 1° Survey**

	Physical Exam	Investigations	Management
<b>Airway Obstruction</b>	Anxiety, stridor, hoarseness, altered mental status Apnea, cyanosis	Do not wait for ABG to intubate	Definitive airway management Intubate early Remove foreign body if visible with laryngoscope prior to intubation
<b>Tension Pneumothorax</b> Clinical diagnosis One-way valve causing accumulation of air in pleural space	Respiratory distress, tachycardia, distended neck veins, cyanosis, asymmetry of chest wall motion Tracheal deviation away from pneumothorax Percussion hyperresonance Unilateral absence of breath sounds	Non-radiographic diagnosis	Needle thoracostomy – large bore needle, 2nd ICS mid clavicular line, followed by chest tube in 5th ICS, anterior axillary line

**Table 7. Life-Threatening Chest Injuries Found in 1<sup>o</sup> Survey (continued)**

	Physical Exam	Investigations	Management
<b>Open Pneumothorax</b> Air entering chest from wound rather than trachea	Gunshot or other wound (hole >2/3 tracheal diameter) ± exit wound Unequal breath sounds	ABG: decreased pO <sub>2</sub>	Air-tight dressing sealed on 3 sides Chest tube Surgery
<b>Massive Hemothorax</b> >1,500 cc blood loss in chest cavity	Pallor, flat neck veins, shock Unilateral dullness Absent breath sounds, hypotension	Usually only able to do supine CXR – entire lung appears radioopaque as blood spreads out over posterior thoracic cavity	Restore blood volume Chest tube Thoracotomy if: >1,500 cc total blood loss ≥200 cc/h continued drainage
<b>Flail Chest</b> Free-floating segment of chest wall due to >2 rib fractures, each at 2 sites Underlying lung contusion (cause of morbidity and mortality)	Paradoxical movement of flail segment Palpable crepitus of ribs Decreased air entry on affected side	ABG: decreased pO <sub>2</sub> , increased pCO <sub>2</sub> CXR: rib fractures, lung contusion	O <sub>2</sub> + fluid therapy + pain control Judicious fluid therapy in absence of systemic hypotension Positive pressure ventilation ± intubation and ventilation
<b>Cardiac Tamponade</b> Clinical diagnosis Pericardial fluid accumulation impairing ventricular function	Penetrating wound (usually) Beck's triad: hypotension, distended neck veins, muffled heart sounds Tachycardia, tachypnea Pulsus paradoxus Kussmaul's sign (increased JVP with inspiration)	Echocardiogram FAST	IV fluids Pericardiocentesis Open thoracotomy

**Table 8. Potentially Life-Threatening Chest Injuries Found in 2<sup>o</sup> Survey**

	Physical Exam	Investigations	Management
<b>Pulmonary Contusion</b>	Blunt trauma to chest Interstitial edema impairs compliance and gas exchange	CXR: areas of opacification of lung within 6 h of trauma	Maintain adequate ventilation Monitor with ABG, pulse oximeter, and ECG Chest physiotherapy Positive pressure ventilation if severe
<b>Ruptured Diaphragm</b>	Blunt trauma to chest or abdomen (e.g. high lap belt in MVC)	CXR: abnormality of diaphragm/lower lung fields/ NG tube placement CT scan and endoscopy: sometimes helpful for diagnosis	Laparotomy for diaphragm repair and associated intra-abdominal injuries
<b>Esophageal Injury</b>	Usually penetrating trauma (pain out of proportion to degree of injury)	CXR: mediastinal air (not always) Esophagram (Gastrografin®) Flexible esophagoscopy	Early repair (within 24 h) improves outcome but all require repair
<b>Aortic Tear</b> 90% tear at subclavian (near ligamentum arteriosum), most die at scene Salvageable if diagnosis made rapidly	Sudden high speed deceleration (e.g. MVC, fall, airplane crash), complaints of chest pain, dyspnea, hoarseness (frequently absent) Decreased femoral pulses, differential arm BP (arch tear)	CXR, CT scan, transesophageal echo, aortography (gold standard)	Thoracotomy (may treat other severe injuries first)
<b>Blunt Myocardial Injury (rare)</b>	Blunt trauma to chest (usually in setting of multi-system trauma and therefore difficult to diagnose) Physical exam: overlying injury, e.g. fractures, chest wall contusion	ECG: dysrhythmias, ST changes Patients with a normal ECG and normal hemodynamics never get dysrhythmias	O <sub>2</sub> Antidysrhythmic agents Analgesia

**Other Potentially Life-Threatening Injuries Related to the Chest****Penetrating Neck Trauma**

- includes all penetrating trauma to the three zones of the neck
- management: injuries deep to platysma require further evaluation by angiography, contrast CT, or surgery
- do not explore penetrating neck wounds except in the OR

**3-way Seal for Open Pneumothorax (i.e. sucking chest wound)**

Allows air to escape during the expiratory phase (so that you do not get a tension pneumothorax) but seals itself to allow adequate breaths during the inspiratory phase

**Pulsus Paradoxus:** a drop in BP of >10 mmHg with inspiration. Recall that BP normally drops with inspiration, but what's "paradoxical" about this is that it drops more than it should

Ruptured diaphragm is more often diagnosed on the left side, as liver conceals right side defect

**Aortic Tear****ABC WHITE**

X-ray features of **Aortic** tear  
Depressed left mainstem **Bronchus**  
pleural **Cap**  
**Wide** mediastinum (most consistent)  
**Hemothorax**  
Indistinct aortic knuckle  
Tracheal deviation to right side  
**Esophagus** (NG tube) deviated to right  
(Note: present in 85% of cases, but cannot rule out)

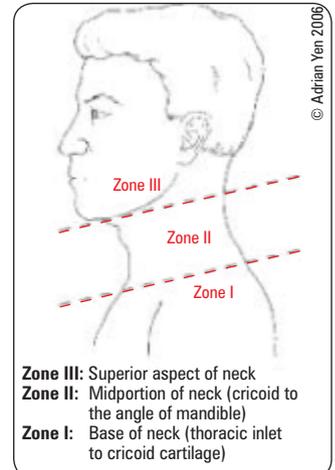

**Airway Injuries**

- always maintain a high index of suspicion
- larynx
  - history: strangulation, direct blow, blunt trauma, any penetrating injury involving platysma
  - triad: hoarseness, subcutaneous emphysema, palpable fracture
  - other symptoms: hemoptysis, dyspnea, dysphonia
  - investigations: CXR, CT scan, arteriography (if penetrating)
  - management
    - ♦ airway: manage early because of edema
    - ♦ C-spine may also be injured, consider mechanism of injury
    - ♦ surgical: tracheotomy vs. repair
- trachea/bronchus
  - frequently missed
  - history: deceleration, penetration, increased intra-thoracic pressure, complaints of dyspnea, hemoptysis
  - examination: subcutaneous air, Hamman's sign (crunching sound synchronous with heart beat)
  - CXR: mediastinal air, persistent pneumothorax or persistent air leak after chest tube inserted for pneumothorax
  - management: surgical repair if >1/3 circumference

**If Penetrating Neck Trauma Present, DON'T:**

- Clamp structures (can damage nerves)
- Probe
- Insert NG tube (leads to bleeding)
- Remove weapon/impaled object

**Zone III:** Superior aspect of neck  
**Zone II:** Midportion of neck (cricoid to the angle of mandible)  
**Zone I:** Base of neck (thoracic inlet to cricoid cartilage)

**Figure 6. Zones of the neck in trauma**

**Seatbelt Injuries May Cause**

- Retroperitoneal duodenal trauma
- Intraperitoneal bowel transection
- Mesenteric injury
- L-spine injury

**Indications for Foley and NG Tube in Abdominal Trauma**

Foley catheter: unconscious or patient with multiple injuries who cannot void spontaneously

NG tube: used to decompress the stomach and proximal small bowel

Contraindications: facial fractures or basal skull fractures suspected

**Criteria for Positive Lavage**

- >10 cc gross blood
- Bile, bacteria, foreign material
- RBC count > 100,000 x 10<sup>9</sup>/L
- WBC > 500 x 10<sup>9</sup>/L,
- Amylase > 175 IU

**Abdominal Trauma**

- two mechanisms
  - blunt: usually causes solid organ injury (spleen = most common, liver = 2nd)
  - penetrating: usually causes hollow organ injury or liver injury (most common)

**BLUNT TRAUMA**

- results in two types of hemorrhage: intra-abdominal and retroperitoneal
- adopt high clinical suspicion of bleeding in multi-system trauma

**History**

- mechanism of injury, SAMPLE history

**Physical Exam**

- often unreliable in multi-system trauma, wide spectrum of presentations
  - slow blood loss not immediately apparent
  - tachycardia, tachypnea, oliguria, febrile, hypotension
  - other injuries may mask symptoms
  - serial examinations are required
- abdomen
  - inspect: contusions, abrasions, seat-belt sign, distention
  - auscultate: bruits, bowel sounds
  - palpate: tenderness, rebound tenderness, rigidity, guarding
  - DRE: rectal tone, blood, bone fragments, prostate location
  - placement of NG, Foley catheter should be considered part of the abdominal exam
- other systems to assess: cardiovascular, respiratory (possibility of diaphragm rupture), genitourinary, pelvis, back/neurological

**Investigations**

- labs: CBC, electrolytes, coagulation, cross and type, glucose, Cr, CK, lipase, amylase, liver enzymes, ABG, blood EtOH, β-hCG, U/A, toxicology screen

**Table 9. Imaging in Abdominal Trauma**

Imaging	Strengths	Limitations
X-Ray	Chest (looking for free air under diaphragm, diaphragmatic hernia, air-fluid levels), pelvis, cervical, thoracic, lumbar spines	Soft tissue not well visualized
CT Scan	Most specific test	Radiation exposure 20x more than x-ray Cannot use if hemodynamic instability
Diagnostic Peritoneal Lavage (rarely used)	Most sensitive test Tests for intra-peritoneal bleed	Cannot test for retroperitoneal bleed or diaphragmatic rupture Cannot distinguish lethal from trivial bleed Results can take up to 1 h
Ultrasound: FAST	Identifies presence/absence of free fluid in peritoneal cavity RAPID exam: less than 5 min Can also examine pericardium and pleural cavities	NOT used to identify specific organ injuries If patient has ascites, FAST will be falsely positive

- imaging must be done if
  - equivocal abdominal examination, altered sensorium, or distracting injuries (e.g. head trauma, spinal cord injury resulting in abdominal anesthesia)
  - unexplained shock/hypotension
  - patients have multiple traumas and must undergo general anesthesia for orthopedic, neurosurgical, or other injuries
  - fractures of lower ribs, pelvis, spine
  - positive FAST

### Management

- general: ABCs, fluid resuscitation, and stabilization
- surgical: watchful waiting vs. laparotomy
- solid organ injuries: decision based on hemodynamic stability, not the specific injuries
- hemodynamically unstable or persistently high transfusion requirements: laparotomy
- hollow organ injuries: laparotomy
- even if low suspicion of injury: admit and observe for 24 h

### PENETRATING TRAUMA

- high risk of gastrointestinal perforation and sepsis
- history: size of blade, calibre/distance from gun, route of entry
- local wound exploration under direct vision may determine lack of peritoneal penetration (not reliable in inexperienced hands) with the following exceptions:
  - thoracoabdominal region (may cause pneumothorax)
  - back or flanks (muscles too thick)

### Management

- general: ABCs, fluid resuscitation, and stabilization
- gunshot wounds always require laparotomy

#### Laparotomy is Mandatory if Penetrating Trauma and:

- Shock
- Peritonitis
- Evisceration
- Free air in abdomen
- Blood in NG tube, Foley catheter, or on DRE

#### "Rule of Thirds" for Stab Wounds

- 1/3 do not penetrate peritoneal cavity
- 1/3 penetrate but are harmless
- 1/3 cause injury requiring surgery

## Genitourinary Tract Injuries

- see [Urology, U32](#)

### Etiology

- blunt trauma: often associated with pelvic fractures
  - upper tract
    - ◆ renal
      - contusions (minor injury – parenchymal ecchymoses with intact renal capsule)
      - parenchymal tears/laceration: non-communicating (hematoma) vs. communicating (urine extravasation, hematuria)
    - ◆ ureter: rare, at uretero-pelvic junction
  - lower tract
    - ◆ bladder
      - extraperitoneal rupture of bladder from pelvic fracture fragments
      - intraperitoneal rupture of bladder from trauma and full bladder
    - ◆ urethra
      - posterior urethral injuries: MVCs, falls, pelvic fractures
      - anterior urethral injuries: blunt trauma to perineum, straddle injuries/direct strikes
  - external genitalia
- penetrating trauma
  - damage to: kidney, bladder, ureter (rare), external genitalia
- acceleration/deceleration injury
  - renal pedicle injury: high mortality rate (laceration and thrombosis of renal artery, renal vein, and their branches)
- iatrogenic
  - ureter and urethra (from instrumentation)

### History

- mechanism of injury
- hematuria (microscopic or gross), blood on underwear
- dysuria, urinary retention
- history of hypotension

### Physical Exam

- abdominal pain, flank pain, CVA tenderness, upper quadrant mass, perineal lacerations
- DRE: sphincter tone, position of prostate, presence of blood
- scrotum: ecchymoses, lacerations, testicular disruption, hematomas
- bimanual exam, speculum exam
- extraperitoneal bladder rupture: pelvic instability, suprapubic tenderness from mass of urine or extravasated blood
- intraperitoneal bladder rupture: acute abdomen
- urethral injury: perineal ecchymosis, scrotal hematoma, blood at penile meatus, high riding prostate, pelvic fractures

Gross hematuria suggests bladder injury

**Investigations**

- urethra: retrograde urethrography
- bladder: U/A, CT scan, urethrogram ± retrograde cystoscopy ± cystogram (distended bladder + post-void)
- ureter: retrograde ureterogram
- renal: CT scan (best, if hemodynamically stable), intravenous pyelogram

**Management**

- urology consult
- renal
  - minor injuries: conservative management
    - ◆ bedrest, hydration, analgesia, antibiotics
  - major injuries: admit
    - ◆ conservative management with frequent reassessments, serial U/A ± re-imaging
    - ◆ surgical repair (exploration, nephrectomy): hemodynamically unstable or continuing to bleed >48 h, major urine extravasation, renal pedicle injury, all penetrating wounds and major lacerations, infections, renal artery thrombosis
- ureter
  - ureterostomy
- bladder
  - extraperitoneal
    - ◆ minor rupture: Foley drainage x 10-14 d
    - ◆ major rupture: surgical repair
  - intraperitoneal
    - ◆ drain abdomen and surgical repair
- urethra
  - anterior: conservative, if cannot void, Foley or suprapubic cystostomy and antibiotics
  - posterior: suprapubic cystostomy (avoid catheterization) ± surgical repair

In the case of gross hematuria, the GU system is investigated from distal to proximal (i.e. urethrogram, cystogram, etc.)

**Orthopedic Injuries**

- see [Orthopedics](#) (see *Shoulder OR10, Knee OR31, Wrist OR20, Ankle OR27*)

**Goals of ED Treatment**

- diagnose potentially life/limb threatening injuries
- reduce and immobilize fractures (cast/splint) as appropriate
- provide adequate pain relief
- arrange proper follow-up if necessary

**History**

- use SAMPLE
- mechanism of injury may be very important

**Physical Exam**

- look (inspection): “SEADS” swelling, erythema, atrophy, deformity, and skin changes (e.g. bruises)
- feel (palpation): all joints/bones for local tenderness, swelling, warmth, crepitus, joint effusions, and subtle deformity
- move: joints affected plus those above and below injury – active ROM preferred to passive
- neurovascular status: distal to injury (before and after reduction)

**LIFE- AND LIMB-THREATENING INJURIES**

**Table 10. Life- and Limb-Threatening Orthopedic Injuries**

Life-Threatening Injuries (usually blood loss)	Limb-Threatening Injuries (usually interruption of blood supply)
Major pelvic fractures	Fracture/dislocation of ankle (talar AVN)
Traumatic amputations	Crush injuries
Massive long bone injuries and associated fat emboli syndrome	Compartment syndrome
Vascular injury proximal to knee/elbow	Open fractures
	Dislocations of knee/hip
	Fractures above knee/elbow

**Open Fractures**

- communication between fracture site and external surface of skin – increased risk of osteomyelitis
- remove gross debris, irrigate, cover with sterile dressing – formal irrigation and debridement often done in the OR
- control bleeding with pressure (no clamping)
- splint
- antibiotics (1st generation cephalosporin and aminoglycoside) and tetanus prophylaxis
- standard of care is to secure definitive surgical management within 6 h, time to surgery may vary from case-to-case

**Description of Fractures**

**SOLARTAT**

- Site
- Open vs. closed
- Length
- Articular
- Rotation
- Translation
- Alignment/Angulation
- Type e.g. Salter-Harris, etc.

**When Dealing with an Open Fracture, Remember “STAND”**

- Splint
- Tetanus prophylaxis
- Antibiotics
- Neurovascular status (before and after)
- Dressings (to cover wound)

## Vascular Injuries

- realign limb/apply longitudinal traction and reassess pulses (e.g. Doppler probe)
- surgical consult
- direct pressure if external bleeding

## Compartment Syndrome

- when the intracompartmental pressure within an anatomical area (e.g. forearm or lower leg) exceeds the capillary perfusion pressure, eventually leading to muscle/nerve necrosis
- clinical diagnosis: maintain a high index of suspicion
  - pain out of proportion to the injury
  - pain worse with passive stretch
  - tense compartment
  - look for "the 6 Ps" (note: radial pulse pressure is 120/80 mmHg while capillary perfusion pressure is 30 mmHg, seeing any of the 6ps indicates advanced compartment syndrome, therefore do not wait for these signs to diagnose and treat)
- requires prompt decompression: remove constrictive casts, dressings; emergent fasciotomy may be needed

Vascular injury/compartment syndrome is suggested by "The 6 Ps"

**P**ulse discrepancies

**P**allor

**P**aresthesia/hypoesthesia

**P**aralysis

**P**ain (especially when refractory to usual analgesics)

**P**olar (cold)

## UPPER EXTREMITY INJURIES

- anterior shoulder dislocation
  - axillary nerve (lateral aspect of shoulder) and musculocutaneous nerve (extensor aspect of forearm) at risk
  - seen on lateral view: humeral head anterior to glenoid
  - reduce (traction, scapular manipulation), immobilize in internal rotation, repeat x-ray, out-patient follow-up with orthopedics
  - with forceful injury, look for fracture
- Colles' fracture
  - distal radius fracture with dorsal displacement from "Fall on Outstretched Hand" (FOOSH)
  - AP film: shortening, radial deviation, radial displacement
  - lateral film: dorsal displacement, volar angulation
  - reduce, immobilize with splint, out-patient follow-up with orthopedics or immediate orthopedic referral if complicated fracture
  - if involvement of articular surface, emergent orthopedic referral
- scaphoid fracture
  - tenderness in anatomical snuff box, pain on scaphoid tubercle, pain on axial loading of thumb
  - negative x-ray: thumb spica splint, repeat x-ray in 1 wk ± CT scan/bone scan
  - positive x-ray: thumb spica splint x 6-8 wk, repeat x-ray in 2 wk
  - risk of AVN of scaphoid if not immobilized
  - outpatient orthopedics follow-up

## LOWER EXTREMITY INJURIES

- ankle and foot fractures
  - see Ottawa Ankle and Foot Rules
- knee injuries
  - see Ottawa Knee Rules
- avulsion of the base of 5th metatarsal
  - occurs with inversion injury
  - supportive tensor or below knee walking cast for 3 wk
- calcaneal fracture
  - associated with fall from height
  - associated injuries may involve ankles, knees, hips, pelvis, lumbar spine

### A knee x-ray examination is required only for acute injury patients with one or more of:

- Age 55 yr or older
- Tenderness at head of fibula
- Isolated tenderness of patella
- Inability to flex to 90°
- Inability to bear weight both immediately and in the ED (four steps)

### Figure 9. Ottawa knee rules

Adapted from: Stiell IG, et al. *JAMA* 1997;278:2075-2079

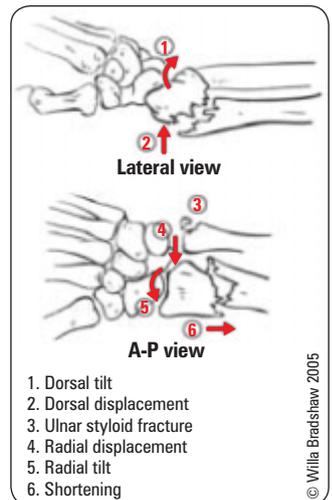

Figure 7. Colles' fracture

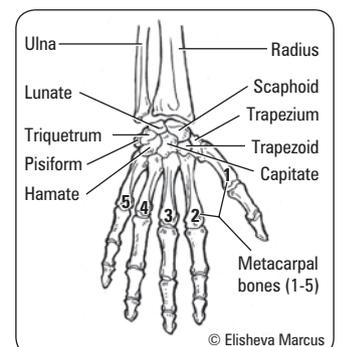

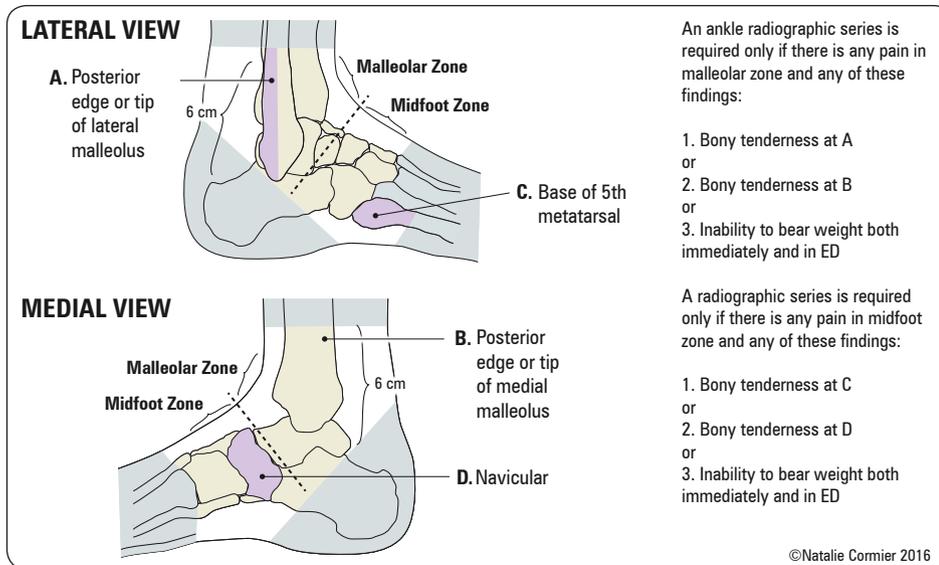

Figure 8. Carpal bones

**Figure 10. Ottawa ankle and foot rules**  
Adapted from: Stiell IG, et al. *JAMA* 1994;271:827-832

## Wound Management

### Goals of ED Treatment

- identify injuries and stop any active bleeding – direct pressure
- manage pain
- wound examination and exploration (history and physical)
- cleansing ± antibiotic and tetanus prophylaxis
- closure and dressing

### Tetanus Prophylaxis

- both tetanus toxoid (Td) and immunoglobulin (TIG) are safe in pregnancy

**Table 11. Guidelines for Tetanus Prophylaxis for Wounds**

	Clean, minor wounds		All other wounds*	
<b>Vaccination History</b>	Tdap or Td <sup>†</sup>	TIG	Tdap or Td <sup>†</sup>	TIG
<b>Unknown or fewer than 3 doses</b>	Yes	No	Yes	Yes
<b>3 or more doses</b>	No <sup>§</sup>	No	No <sup>¶</sup>	No

\*Such as, but not limited to, wounds contaminated with dirt, feces, soil, and saliva; puncture wounds; avulsions; and wounds resulting from missiles, crushing, burns, and frostbite.

<sup>†</sup>Tdap is preferred to Td for adults who have never received Tdap. Single antigen tetanus toxoid (TT) is no longer available in the United States.

<sup>§</sup>Yes, if more than ten years since the last tetanus toxoid-containing vaccine dose.

<sup>¶</sup>Yes, if more than five years since the last tetanus toxoid-containing vaccine dose.

Source: *MMWR* 1991;40(No. RR-10):1-28.

### Bruises

- non-palpable = ecchymosis
- palpable collection (not swelling) = hematoma following blunt trauma
- assess for coagulopathy (e.g. liver disease), anticoagulant use

### Abrasions

- partial to full thickness break in skin
- management
  - clean thoroughly with brush to prevent foreign body impregnation ± local anesthetic antiseptic ointment (Polysporin® or Vaseline®) for 7 d for facial and complex abrasions
  - tetanus prophylaxis

### Lacerations

- see **Plastic Surgery, PL8**
- consider every structure deep to a laceration injured until proven otherwise
- in hand injury patients, include the following in history: handedness, occupation, mechanism of injury, previous history of injury

### Acute Treatment of Contusions

#### RICE

- Rest
- Ice
- Compression
- Elevation

### High Risk Factors for Infection Wound Factors

- Puncture wounds
- Crush injuries
- Wounds >12 h old
- Hand or foot wounds
- Immunocompromised

#### Patient Factors

- Age >50 yr
- Prosthetic joints or valves (risk of endocarditis)

### Suture Use and Duration

Suture to:	Close with Nylon or Other Non-absorbable Suture	Approx. Duration (days)
Face	6-0	5
Not Joint	4-0	7
Joint	3-0	10
Scalp	4-0	7
Mucous Membrane	absorbable (vicryl)/N/A	

N.B. Patients on steroid therapy may need sutures for longer periods of time

- physical exam
  - think about underlying anatomy
  - examine tendon function actively against resistance and neurovascular status distally
  - clean and explore under local anesthetic; look for partial tendon injuries
  - x-ray or U/S wounds if a foreign body is suspected (e.g. shattered glass) and not found when exploring wound (remember: not all foreign bodies are radioopaque), or if suspect intra-articular involvement
- management
  - disinfect skin/use sterile techniques
  - irrigate copiously with normal saline
  - analgesia ± anesthesia
  - maximum dose of lidocaine
    - ♦ 7 mg/kg with epinephrine
    - ♦ 5 mg/kg without epinephrine
- in children, topical anesthetics such as LET (lidocaine, epinephrine, and tetracaine), and in selected cases a short-acting benzodiazepine (midazolam or other agents) for sedation and amnesia are useful
- secure hemostasis
- evacuate hematomas, debride non-viable tissue, remove hair and foreign bodies
- ± prophylactic antibiotics (consider for animal/human bites, intra-oral lesion, or puncture wounds to the foot)
- suture unless: delayed presentation (>6-8 h), puncture wound, mammalian bite, crush injury, or retained foreign body
- take into account patient and wound factors when considering suturing
- advise patient when to have sutures removed
- cellulitis and necrotizing fasciitis (see [Plastic Surgery, PL15](#))

Early wound irrigation and debridement are the most important factors in decreasing infection risk

Where **NOT** to use local anesthetic with epinephrine:  
**Ears, Nose, Fingers, Toes, and Penis**

**Alternatives to Sutures**

- Tissue glue
- Steristrips®
- Staples

# Approach to Common ED Presentations

## Abdominal Pain

Table 12. Selected Differential Diagnosis of Abdominal Pain

	Emergent	Usually Less Emergent
<b>GI</b>	Perforated viscus, bowel obstruction, ischemic bowel, appendicitis, strangulated hernia, IBD flare, esophageal rupture, peptic ulcer disease	Diverticulitis, gastroenteritis, GERD, esophagitis, gastritis, IBS
<b>Hepatobiliary</b>	Hepatic/splenic injury, pancreatitis, cholangitis, spontaneous bacterial peritonitis	Biliary colic, cholecystitis, hepatitis
<b>Genital</b>	Female: Ovarian torsion, PID, ectopic pregnancy Male: Testicular torsion	Female: tubo-ovarian abscess, ovarian cyst, salpingitis, endometriosis Male: epididymitis, prostatitis
<b>Urinary</b>	Pyelonephritis	Renal colic, cystitis
<b>CVS</b>	MI, aortic dissection, AAA	Pericarditis
<b>Respirology</b>	PE, empyema	Pneumonia
<b>Metabolic</b>	DKA, sickle cell crisis, toxin, Addisonian crisis	Lead poisoning, porphyria
<b>Other</b>	Significant trauma, acute angle closure glaucoma	Abdominal wall injury, herpes zoster, psychiatric, abscess, hernia, mesenteric adenitis

Be vigilant: very young, elderly, alcoholics, immunosuppressed patients often present atypically  
Old age, pregnancy (T3), and chronic corticosteroid use can blunt peritoneal findings, so have an increased level of suspicion for an intra-abdominal process in these individuals

Unstable patients should not be sent for imaging

- differential can be focused anatomically by location of pain: RUQ, LUQ, RLQ, LLQ, epigastric, periumbilical, diffuse

### History

- pain: OPQRST
- review symptoms from GU, gynecological, GI, respiratory, and CV systems
- abdominal trauma/surgeries most recent colonoscopy

### Physical Exam

- vitals, abdominal (including DRE, CVA tenderness), pelvic/genital, respiratory, and cardiac exams as indicated by history

### Investigations

- ABCs, do not delay management and consultation if patient unstable
- CBC, electrolytes, glucose, BUN/Cr, U/A ± liver enzymes, LFTs, lipase, β-hCG, ECG, troponins, ± VBG/lactate
- AXR: look for calcifications, free air, gas pattern, air fluid levels
- CXR upright: look for pneumoperitoneum (free air under diaphragm), lung disease
- U/S: biliary tract, ectopic pregnancy, AAA, free fluid
- CT: trauma, AAA, pancreatitis, nephro-/urolithiasis, appendicitis, and diverticulitis

**If elevated AST and ALT**  
Think hepatocellular injury  
AST > ALT: alcohol-related  
ALT > AST: viral, drug, toxin

**If elevated ALP and GGT**  
Think biliary tree obstruction

## Management

- NPO, IV, NG tube, analgesics, consider antibiotics and anti-emetics
- growing evidence that small amounts of opioid analgesics improve diagnostic accuracy of physical exam of surgical abdomen
- consult as necessary: general surgery, vascular surgery, gynecology, etc.

## Disposition

- admission: surgical abdomen, workup of significant abnormal findings, need for IV antibiotics or pain control
- discharge: patients with a negative lab and imaging workup who improve clinically during their stay; instruct the patient to return if severe pain, fever, or persistent vomiting develops

## Acute Pelvic Pain

### Etiology

- gynecological
  - second most common gynecological complaint (after vaginal bleeding)
  - ovaries: ruptured ovarian cysts (most common cause of pelvic pain), ovarian abscess, ovarian torsion (rare, 50% will have ovarian mass)
  - fallopian tubes: salpingitis, tubal abscess, hydrosalpinx
  - uterus: leiomyomas (uterine fibroids) – especially with torsion of a pedunculated fibroid or in a pregnant patient (degeneration), PID, endometriosis
  - other: ectopic pregnancy (ruptured/expanding/leaking), spontaneous abortion (threatened or incomplete), endometriosis and dysmenorrhea, sexual or physical abuse
- non-gynecological (see causes of lower abdominal pain above)

### History and Physical Exam

- pain: OPQRST
- associated symptoms: vaginal bleeding, discharge, dyspareunia, bowel or bladder symptoms
- pregnancy and sexual history
- vitals
- gynecological exam: assess for cervical motion tenderness/“chandelier sign” (suggests PID)
- abdominal exam

### Investigations

- $\beta$ -hCG for all women of childbearing age
- CBC and differential, electrolytes, glucose, Cr, BUN, G&S, PTT/INR
- vaginal and cervical swabs for C&S during physical exam
- pelvic and abdominal U/S: evaluate adnexa, thickness of endometrium, pregnancy, free fluid or masses in the pelvis
- Doppler flow studies for ovarian torsion

### Management

- general: analgesia, determine if admission and consults are needed
- specific
  - ovarian cysts
    - ◆ unruptured or ruptured and hemodynamically stable: analgesia and follow-up
    - ◆ ruptured with significant hemoperitoneum: may require surgery
  - ovarian torsion: surgical detorsion or removal of ovary
  - uncomplicated leiomyomas, endometriosis, and secondary dysmenorrhea can usually be treated on an outpatient basis, discharge with gynecology follow-up
  - PID: requires broad spectrum antibiotics

### Disposition

- referral: gynecological or obstetrical causes requiring surgical intervention, requiring admission, or oncological in nature
- admission: patients requiring surgery, IV antibiotics/pain management
- discharge: negative workup and resolving symptoms; give clear instructions for appropriate follow-up

## Altered Level of Consciousness

### Definitions

- altered mental status: collective, non-specific term referring to change in cognitive function, behaviour, or attentiveness, including:
  - delirium (see [Psychiatry, PS19](#))
  - dementia (see [Psychiatry, PS20](#))
  - lethargy: state of decreased awareness and alertness (patient may appear wakeful)
  - stupor: unresponsiveness but rousable
  - coma: a sleep-like state, not rousable to consciousness

#### Analgesia in Patients with Acute Abdominal Pain

*Cochrane DB Syst Rev 2011;1:CD005660*

**Study:** systematic review of all RCTs of adult patients with acute abdominal pain (AAP) comparing use of opioid analgesia during initial evaluation with placebo. Included in the review: 8 RCTs.

**Population:** patients age >14 with non traumatic AAP <1 week duration.

**Intervention:** six trials used morphine, one trial used Tramadol, one study Papaveretum as analgesia.

**Main Outcome Measure:** diagnostic accuracy.

**Results:** there were no significant differences in the physical examination among the groups or when comparing by drug. There were no significant differences in rate of ‘incorrect diagnosis’ among the groups.

**Conclusion:** the use of analgesia for acute abdominal pain does not increase risk of diagnostic error and does not mask clinical findings.

#### Gynecological Causes of Pelvic Pain

- Ovarian cyst
- Dysmenorrhea
- Mittelschmerz
- Endometriosis
- Ovarian torsion
- Uterine fibroids/neoplasm
- Adnexal neoplasm
- PID + cervicitis

U/S is the preferred imaging modality in the assessment of acute pelvic pain

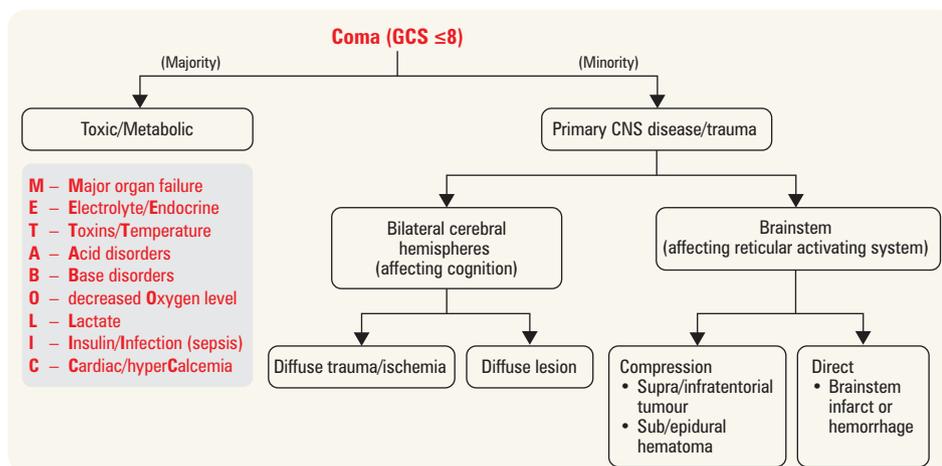

Figure 11. Etiology of coma

## MANAGEMENT OF ALTERED LOC

### History

- obtain collateral from family, friends, police, paramedics, old chart, MedicAlert® bracelet, etc.
- onset and progression
  - antecedent trauma, seizure activity, fever
  - abrupt onset suggests CNS hemorrhage/ischemia or cardiac cause
  - progression over hours to days suggests progressive CNS lesion or toxic/metabolic cause
- determine patient's baseline LOC
- past medical history (e.g. similar episode, depression, overdose)

### Physical Exam

- ABCs, vitals including temperature; cardiac, respiratory, abdominal exams
- complete neurological exam; in particular, examination of the eyes ("PEARL" pupils equal and reactive to light)
  - use the GCS to evaluate LOC (see *Initial Patient Assessment/Management, ER2*)

### Investigations

- blood work
  - rapid blood sugar, CBC, electrolytes, Cr, BUN, LFTs, glucose, serum osmolality, VBG, PT/PTT/INR, troponins
  - serum EtOH, acetaminophen, and salicylate levels
- imaging
  - CXR, CT head
- other tests
  - ECG, U/A, UTox

### Diagnosis

- administer appropriate universal antidotes
  - thiamine 100 mg IV if history of EtOH or patient looks malnourished
  - one ampule D50W IV if low blood sugar on finger-prick
  - naloxone 0.4-2 mg IV or IM if opiate overdose suspected
- distinguish between structural and toxic-metabolic coma
  - structural coma
    - ♦ pupils, extraocular movements, and motor findings, if present, are usually asymmetric
    - ♦ look for focal or lateralizing abnormalities
  - toxic-metabolic coma
    - ♦ dysfunction at lower levels of the brainstem (e.g. caloric unresponsiveness)
    - ♦ respiratory depression in association with an intact upper brainstem (e.g. equal and reactive pupils; see exceptions in Table 13)
    - ♦ extraocular movements and motor findings are symmetric or absent
- essential to re-examine frequently because status can change rapidly
- diagnosis may become apparent only with the passage of time
  - delayed deficit after head trauma suggestive of epidural hematoma (characteristic "lucid interval")

### Possible Causes of Coma

#### AEIOU TIPS

**A**cidosis/**A**lcohol  
**E**pilepsy  
**I**nfection  
**O**xxygen (hypoxia)/**O**piates  
**U**remia  
**T**emperature/**T**rauma (especially head)  
**I**nsulin (too little or too much)  
**P**sychogenic/**P**oisoning  
**S**troke

In general, intubate if GCS < 8; but ability to protect airway is primary consideration

**Table 13. Toxic-Metabolic Causes of Fixed Pupils**

Dilated	Dilated to Normal	Constricted
Anoxia	Hypothermia	Cholinergic agents (e.g. organophosphates)
Anticholinergic agents (e.g. atropine, TCAs)	Barbiturates	Opiates (e.g. heroin), except meperidine
Methanol (rare)	Antipsychotics	
Cocaine		
Opioid withdrawal		
Amphetamines		
Hallucinogens		

**Disposition**

- admission: if ongoing decreased LOC, admit to service based on tentative diagnosis, or transfer patient if appropriate level of care not available
- discharge: readily reversible alteration of LOC; ensure adequate follow-up care available

## Chest Pain

**Table 14. Differential Diagnosis for Chest Pain**

	Emergent	Usually Less Emergent
<b>CVS</b>	MI, unstable angina, aortic dissection, cardiac tamponade, arrhythmia	Stable angina, pericarditis, myocarditis
<b>Respirology</b>	PE, pneumothorax	Pneumonia, pleural effusion, malignancy
<b>GI</b>	Esophageal rupture, pneumomediastinum	Peptic ulcer disease, esophagitis, GERD, esophageal spasm, pancreatitis, cholecystitis
<b>MSK</b>		Rib fracture, costochondritis
<b>Other</b>		Herpes zoster, psychiatric/panic attack

**History and Physical Exam**

- OPQRST, previous episodes and change in pattern
- cardiac risk factors (HTN, DM, dyslipidemia, smoking, FHx)
- vitals, cardiac, respiratory, peripheral vascular, abdominal exams

**Investigations**

- CBC, electrolytes, Cr, BUN, glucose, PTT/INR
- ECG: always compare with previous; may be normal in up to 50% of PE and acute MI
- CXR: compare with previous

**Management and Disposition**

- ABCs, O<sub>2</sub>, cardiac monitors, IV access
- treat underlying cause and involve consultants as necessary
- consider further observation/monitoring if unclear diagnosis or risk of dysrhythmia
- discharge: patients with a low probability of life-threatening illness due to resolving symptoms and negative workup; arrange follow-up and instruct to return if SOB or increased chest pain develops

**Life-Threatening Causes of Chest Pain****PET MAP**

PE  
Esophageal rupture  
Tamponade  
MI/angina  
Aortic dissection  
Pneumothorax

Imaging is necessary for all suspected aortic dissections, regardless of BP

**Angina Characteristics**

1. Retrosternal location
2. Provoked by exertion
3. Relieved by rest or nitroglycerin

**Risk for CAD**

3/3 = "typical angina" - high risk  
2/3 = intermediate risk for women >50 yr, all men  
1/3 = Intermediate risk in men >40 yr, women >60 yr

Table 15. Comparison of Chest Pain Diagnoses

	Classic History	Classic Findings	Diagnostic Investigations	Management and Disposition
<b>Acute Coronary Syndrome</b>	New or worsening pattern of retrosternal squeezing/pressure pain, radiation to arm/neck, dyspnea, worsened by exercise, relieved by rest N/V; syncope	New or worsened murmur, hypotension, diaphoresis, pulmonary edema	ECG: ischemia (15-lead if hypotensive, AV node involvement or inferior MI), serial troponin I (sensitive 6-8 h after onset), CK-MB, CXR	ABCs, aspirin, anticoagulation and emergent cardiology consult to consider percutaneous intervention or thrombolytic
<b>Pulmonary Embolism</b>	Pleuritic chest pain (75%), dyspnea; risk factors for venous thromboembolism	Tachycardia, hypoxemia; evidence of DVT	Wells' criteria: D-dimer, CT pulmonary angiogram*, V/Q scan; leg Doppler, CXR	ABCs, anticoagulation; consider airway management and thrombolysis if respiratory failure
<b>Acute Pericarditis</b>	Viral prodrome, anterior precordial pain, pleuritic, relieved by sitting up and leaning forward	Triphasic friction rub	ECG: sinus tachycardia, diffuse ST elevation, PR depression in II, III, aVF and V4-6; reciprocal PR elevation and ST depression in aVR ±V1; echocardiography	ABCs, rule out MI, high dose NSAIDs +/- colchicine; consult if chronic/recurrent or non-viral cause (e.g. SLE, renal failure, requires surgery)
<b>Pneumothorax</b>	Trauma or spontaneous pleuritic chest pain often in tall, thin, young male athlete	Hemothorax with decreased/absent breath sounds, hyper-resonance; deviated trachea and hemodynamic compromise	Clinical diagnosis CXR: PA, lateral, expiratory views – lung edge, loss of lung markings, tracheal shift; deep sulcus sign on supine view	ABCs, if unstable, needle to 2nd ICS at MCL; urgent surgical consult / thoracostomy 4th ICS and chest tube
<b>Aortic Dissection</b>	Sudden severe tearing retrosternal or midscapular pain ± focal pain/neurologic loss in extremities in context of HTN	HTN; systolic BP difference > 20 mmHg or pulse deficit between arms; aortic regurgitant murmur	CT angio; CXR - wide mediastinum, left pleural effusion, indistinct aortic knob, >4 mm separation of intimal calcification from aortic shadow, 20% normal	ABCs, reduce BP and HR; classify type A (ascending aorta, urgent surgery) vs. B (not ascending aorta, medical) on CT angio and urgent consult
<b>Cardiac Tamponade</b>	Dyspnea, cold extremities, ± chest pain; often a recent cardiac intervention or symptoms of malignancy, connective tissue disease	Beck's triad - hypotension, elevated JVP, muffled heart sounds; tachycardia, pulsus paradoxus >10 mmHg	Clinical diagnosis CXR: may show cardiomegaly, evidence of trauma	ABCs, cardiac surgery or cardiology consult, pericardiocentesis if unstable, treat underlying cause
<b>Esophageal Rupture</b>	Sudden onset severe pain after endoscopy, forceful vomiting, labour, or convulsion, or in context of corrosive injury or cancer	Subcutaneous emphysema, findings consistent with sepsis	CXR: pleural effusion (75%), pneumomediastinum; CT or water soluble contrast esophagogram	ABCs, early antibiotics, resuscitation, thoracics consult, NPO, consider chest tube
<b>Esophagitis or GERD</b>	Frequent heartburn, acid reflux, dysphagia, relief with antacids	Oral thrush or ulcers (rare)	None acutely	ABCs, PPI, avoid EtOH, tobacco, trigger foods
<b>Herpes Zoster</b>	Abnormal skin sensation – itching/tingling/pain – preceding rash by 1-5 d	None if early; maculopapular rash developing into vesicles and pustules that crust	Clinical diagnosis; direct immunofluorescence assay	ABCs, anti-virals, analgesia ± steroids, dressing; r/o ocular involvement/refer if necessary
<b>MSK</b>	History of injury	Reproduction of symptoms with movement or palpation (not specific – present in 25% of MI)	MSK injury or fracture on X-rays	ABCs, NSAIDs, rest, orthopedics consultation for fractures
<b>Anxiety</b>	Symptoms of anxiety, depression, history of psychiatric disorder; may coexist with physical disease	Tachycardia, diaphoresis, tremor	Diagnosis of exclusion	ABCs, arrange social supports, rule out suicidality and consider psychiatry consult

ACS more likely to be atypical in females, diabetics, and >80 yr. Anginal equivalents include dyspnea, diaphoresis, fatigue, non-retrosternal pain

#### Signs of PE on CXR

**Westermark's sign:** abrupt tapering of a vessel on chest film

**Hampton's hump:** a wedge-shaped infiltrate that abuts the pleura

Effusion, atelectasis, or infiltrates 50% normal

It is important to look for reciprocal changes in STEMI in order to differentiate from pericarditis (diffuse elevations)

Tracheal deviation is away from tension or towards non-tension pneumothorax

#### Addition of Clopidogrel to Aspirin® and Fibrinolytic Therapy for Myocardial Infarction with ST-Segment Elevation

*NEJM* 2005;352:1179-1191

**Purpose:** To assess the benefit of adding clopidogrel to Aspirin® and fibrinolytic therapy in ST-elevation MI.

**Study Characteristics:** Double-blind, RCT, following intention-to-treat analysis, with 3,491 patients and clinical follow-up at 30 d.

**Participants:** Individuals presenting within 12 h of onset of ST-elevation MI (mean age 57, 80.3% male, 50.3% smokers, 9.1% previous MI). Those presenting after 12 h, age >75, or with previous CABG, were excluded.

**Intervention:** Clopidogrel (300 mg loading dose followed by 75 mg OD until day of angiogram) or placebo, in addition to Aspirin®, a fibrinolytic agent, and heparin when appropriate.

**Primary Outcome:** Composite of occluded infarct-related artery on angiography (thrombosis in MI flow grade 0 or 1), or death or recurrent MI prior to angiography.

**Results:** Rates of primary end point were 21.7% in the placebo group and 15.0% in the clopidogrel group (95% CI 24-47%). Among the individual components of the primary end point, clopidogrel had a significant effect on the rate of an occluded infarct-related artery and the rate of recurrent MI, but no effect on the rate of death from any cause. At 30 d clinical follow-up, there was no difference in rate of death from cardiovascular causes, a significant reduction in the odds of recurrent MI, and a non-significant reduction in recurrent ischemia with need for urgent revascularization. The rates of major bleeding and intracranial hemorrhage were similar between the two groups.

**Conclusion:** Addition of clopidogrel improves the patency rate of infarct-related arteries and reduces ischemic complications, both of which are associated with improved long-term survival after MI. The trial was not powered to detect a survival benefit, and none was seen.

**Table 16. Common Life-Threatening ECG Changes**

Pathology	ECG Findings
<b>Dysrhythmia</b>	
a) Torsades de pointes	Ventricular complexes in upward-pointing and downward-pointing continuum (250-350 bpm)
b) Ventricular tachycardia	6 or more consecutive premature ventricular beats (150-250 bpm)
c) Ventricular flutter	Smooth sine wave pattern of similar amplitude (250-350 bpm)
d) Ventricular fibrillation	Erratic ECG tracing, no identifiable waves
<b>Conduction</b>	
a) 2nd degree heart block (Mobitz Type II)	PR interval stable, some QRSs dropped Total AV dissociation, but stable P-P and R-R intervals Prolonged QRS complex (>0.12 s)
b) 3rd degree heart block	RSR' in V5 or V6 Monophasic I and V6
c) Left bundle branch block	May see ST elevation Difficult to interpret, new LBBB is considered STEMI equivalent
<b>Ischemia</b>	
a) STEMI	ST elevation in leads associated with injured area of heart and reciprocal lead changes (depression)
<b>Metabolic</b>	
a) Hyperkalemia	Tall T waves
b) Hypokalemia	P wave flattening QRS complex widening and flattening U waves appear Flattened T waves
<b>Digitalis Toxicity</b>	Gradual downward curve of ST At risk for AV blocks and ventricular irritability
<b>Syndromes</b>	
a) Brugada	RBBB with ST elevation in V1, V2, and V3 Susceptible to deadly dysrhythmias, including VFib
b) Wellens	Marked T wave inversion in V2 and V3 Left anterior descending coronary stenosis
c) Long QT syndrome	QT interval longer than 1/2 of cardiac cycle Predisposed to ventricular dysrhythmias

**Immediate Treatment of Acute MI****BEMOAN**

β-blocker  
Enoxaparin  
Morphine  
Oxygen  
ASA  
Nitroglycerin

## Headache

- see [Neurology, N44](#)

**Etiology**

- the common
  - common migraine (without aura)/classic migraine (with aura)
    - ◆ common: unilateral, throbbing, aggravated by activity, moderate/severe, N/V, photo-/phonophobia
    - ◆ classic: varied aura symptoms, e.g. flashing lights, pins and needles (paresthesia), loss of vision, dysarthria
    - ◆ abortive treatment: fluids, NSAIDs, antiemetics, antiepileptic drugs, vasoactive medications
    - ◆ family doctor to consider prophylactic treatment
  - tension/muscular headache
    - ◆ mild-moderate headache with gradual onset lasting minutes to days
    - ◆ bilateral-frontal or nuchal-occipital
    - ◆ increased with stress, sleep deprivation
    - ◆ treatment: modify stressor(s), local measures, NSAIDs, tricyclic antidepressants
- the deadly
  - subarachnoid hemorrhage (SAH) (see [Neurosurgery, NS17](#))
    - ◆ sudden onset, “worst headache of life” maximum intensity within minutes
    - ◆ increased pain with exertion, N/V, meningeal signs
    - ◆ diagnosis
      - new generation CT 100% sensitive within 6h of onset (hyperattenuating signal around Circle of Willis)
      - LP if suspected SAH and normal CT after 6h
    - ◆ management: urgent neurosurgery consult
  - increased ICP
    - ◆ worse in morning, when supine or bending down, with cough or valsalva
    - ◆ physical exam: neurological deficits, cranial nerve palsies, papilledema
    - ◆ diagnosis: CT head
    - ◆ management: consult neurosurgery

**Common Therapeutic Approach to Severe Migraine**

- 1L bolus of NS
- prochlorperazine 10 mg IV
- diphenhydramine 25 mg IV
- ketorolac 30 mg IV
- dexamethasone 10 mg IV
- Other options include haloperidol, metoclopramide, ergotamine, sumatriptan, analgesics

**Ottawa SAH Rule**

JAMA 2013;310(12): 1248-1255

- Use for alert patients older than 15 yr with new severe non-traumatic headache reaching maximum intensity within 1 h
  - Not for patients with new neurologic deficits, previous aneurysms, SAH, brain tumours, or history of recurrent headaches (≥3 episodes over the course of ≥6 mo)
  - Investigate if ≥1 high-risk variables present:
    - Age ≥40 yr
    - Neck pain or stiffness
    - Witnessed loss of consciousness
    - Onset during exertion
    - Thunderclap headache (instantly peaking pain)
    - Limited neck flexion on examination
- Subarachnoid hemorrhage can be predicted with 100% sensitivity using this rule.

- meningitis (see [Infectious Diseases, ID18](#))
  - flu-like symptoms (fever, N/V, malaise), meningeal signs, petechial rash
  - altered LOC and confusion
  - rule out increased ICP; if CT head or normal mental status, no neurological signs and no papilledema, then do LP for diagnosis
  - treatment: early empiric antibiotics ± acyclovir, steroid therapy
- temporal arteritis (causes significant morbidity, blindness) (see [Ophthalmology, OP35](#))
  - vasculitis of large and mid-sized arteries, gender 3:1 F:M, most commonly age >70 yr
  - headache, scalp tenderness, jaw claudication, arthralgia, myalgia, fever, malaise or weight loss
  - temporal artery tender on palpation, relative afferent pupillary defect (RAPD), optic disc edema on fundoscopy
  - labs: elevated ESR, CRP
  - temporal artery biopsy is gold standard for diagnosis
  - associated with polymyalgia rheumatica
  - treatment: high-dose steroids immediately if suspected, no need to hold treatment until pathology results

### Disposition

- admission: if underlying diagnosis is critical or emergent, if there are abnormal neurological findings, if patient is elderly or immunocompromised (atypical presentation), or if pain is refractory to oral medications
- discharge: assess for risk of narcotic misuse; most patients can be discharged with appropriate analgesia and follow-up with their family physician; instruct patients to return for fever, vomiting, neurologic changes, or increasing pain

## Joint and Back Pain

### JOINT PAIN (see [Rheumatology, RH3](#))

- rule out life threatening causes: septic joint (see [Orthopedics, OR10](#))

### History and Physical Exam

- associated symptoms: fever, constitutional symptoms, skin lesions, conjunctivitis, urethritis
- patterns of joint involvement: polyarticular vs. monoarticular, symmetric vs. asymmetric
- inflammatory symptoms: prolonged morning stiffness, stiffness and pain ease through the day, mid-day fatigue, soft tissue swelling
- non-inflammatory symptoms: stiffness short lived after inactivity, short duration stiffness in the morning, pain increases with activity
- assess ROM, presence of joint effusion, warmth
- assess for localized joint pain, erythema, warmth, swelling with pain on active ROM, inability to bear weight, fever; may indicate presence of septic joint

### Investigations

- blood work: CBC, ESR, CRP, WBC, INR/PTT, blood cultures, urate
- joint x-ray ± contralateral joint for comparison
- bedside U/S to identify effusion
- test joint aspirate for: WBC, protein, glucose, Gram stain, crystals

### Management

- septic joint: IV antibiotics ± joint decompression and drainage
  - antibiotics can be started empirically if septic arthritis cannot be ruled out
- crystalline synovitis: NSAIDs at high dose, colchicine within first 24 h, corticosteroids
  - do not use allopurinol, as it may worsen acute attack
- acute polyarthritis: NSAIDs, analgesics (acetaminophen ± opioids), local or systemic corticosteroids
- osteoarthritis: NSAIDs, acetaminophen
- soft tissue pain: allow healing with enforced rest ± immobilization
  - non-pharmacologic treatment: local heat or cold, electrical stimulation, massage
  - pharmacologic: oral analgesics, NSAIDs, muscle relaxants, corticosteroid injections, topical agents

### BACK PAIN (see [Family Medicine, FM38](#))

- rule out vascular emergencies: aortic dissection, AAA, PE, MI, retroperitoneal bleed
- rule out spinal emergencies using red flags (see sidebar): osteomyelitis, cauda equina, epidural abscess or hematoma
- evaluate risk for fracture (osteoporosis, age), infection (IV drug user, recent spinal intervention, immunosuppression), cancer, vascular causes (cardiac risk factors)
- typical benign back pain is moderate, dull, aching, worse with movement or cough
- palpate spine for bony tenderness; precordial, respiratory, abdominal and neurological exams guided by history
- reserve imaging for suspicion of emergencies, metastases, and patients at high risk of fracture, infection, cancer, or vascular causes

### Meningitis

- Do not delay IV antibiotics for LP
- Deliver first dose of dexamethasone with or before first dose of antibiotic therapy

### Which Patients can Safely Undergo Lumbar Puncture Without Screening CT?

*Arch Intern Med* 1999;159(22):2681-2685

**Study:** a prospective study to identify patients who can safely undergo LP without CT.

**Population:** 113 patients, age >18 yr, needing urgent LP as determined by ED physician.

**Intervention:** all patients were examined before CT by staff physicians. Physician examiners involved in the study then recorded the presence or absence of 10 clinical findings and answered 8 questions regarding the patient's past medical history and recorded their perceived likelihood that LP would be contraindicated.

**Main Outcome Measure:** results of non-contrast CTs interpreted by staff radiologist.

**Results:** 2.7% of patients had lesions on CT that contra-indicated LP. Overall, clinical impression had the highest predictive value in identifying patients with contraindications to LP (+LR 18.8). When used in aggregate - altered mentation, focal neurological examination and papilledema were three statistically significant identified predictors of new intracranial lesions (-LR 0). When used alone these predictors were inadequate.

**Conclusion:** given the low prevalence of lesions that contraindicate LP, screening CT solely to establish the safety of LP provides minimal extra information. Physicians can rely on their clinical judgement and the three predictors.

### Parenteral Dexamethasone for Preventing Recurrence of Acute Severe Migraine Headache

*BMJ* 2008;336(7657):1359

A meta-analysis of 7 RCTs examined the effectiveness of parenteral corticosteroids use after administration of standard abortive therapy. The primary outcome was recurrence of migraine within 72 hours of treatment. All trials compared single dose parenteral dexamethasone with placebo. Results showed dexamethasone and placebo provided similar acute pain reduction (weighted mean difference 0.37, 95 CI -0.2, 0.94). Dexamethasone was, however, more effective than placebo in reducing recurrence rates (RR 0.74, 95 CI 0.6-0.9). Conclusion: when added to standard abortive therapy for migraine headaches, single dose of parenteral dexamethasone is associated with 26% RRR in recurrent headaches (NNT=9).

### CT Head within 6 h is 100% Sensitive for Diagnosis of Subarachnoid Hemorrhage (SAH)

*BMJ* 2012;343(d4277)

**Study:** a prospective multicentre cohort study was conducted in 11 tertiary care emergency departments across Canada to measure the sensitivity of CT head in the evaluation of ED patients for SAH.

**Population:** neurologically intact adults who presented with new onset non-traumatic headache reaching maximum intensity in less than one hour who had head CT as part of their diagnostic workup to rule out SAH.

**Design:** patients were deemed positive for SAH if there was subarachnoid blood on CT, xanthochromia in the CSF or red blood cells in the final tube of CSF collected. Some patients with normal results on CT received LPs at the discretion of the treating physician. Unless patients had a negative result on LP or a definitive cause for the headache identified through neuroimaging patients were followed for six months to ascertain their outcome.

**Main Outcome Measure:** Results of CT interpreted by staff radiologist.

**Results:** Overall sensitivity of CT for detecting subarachnoid hemorrhage was 92.9%, specificity 100%. Subgroup analysis revealed 100% sensitivity for patients scanned within 6 h of headache onset.

**Conclusion:** CT is extremely sensitive in identifying subarachnoid hemorrhage when it is carried out within 6 h of headache.

## Management

- treat underlying cause
- lumbosacral strain and disc herniation: analgesia and continue daily activities as much as tolerated; discuss red flags and organize follow-up
- spinal infection: early IV antibiotics and ID consultation
- cauda equina: dexamethasone, early neurosurgical consultation

### Hospitalization is required for joint pain in the presence of

- Significant, concomitant internal organ involvement
- Signs of bacteremia, including vesiculopustular skin lesions, Roth spots, shaking chills, or splinter hemorrhages
- Systemic vasculitis
- Severe pain
- Severe constitutional symptoms
- Purulent synovial fluid in one or more joints
- Immunosuppression

### Red Flags for Back Pain

Bowel or bladder dysfunction

Anesthesia (saddle)

Constitutional symptoms

K - Chronic disease, Constant pain

Paresthesia

Age >50 and mild trauma

IV drug use/infection

Neuromotor deficits

## Seizures

- see [Neurology, N18](#)

### Definition

- paroxysmal alteration of behaviour and/or EEG changes resulting from abnormal, excessive activity of neurons
- status epilepticus: continuous or intermittent seizure activity for greater than 5 min without regaining consciousness (life threatening)

### Categories

- generalized seizure (consciousness always lost): tonic/clonic, absence, myoclonic, atonic
- partial seizure (focal): simple partial, complex partial
- causes: primary seizure disorder, structural (trauma, intracranial hemorrhage, infection, increased ICP), metabolic disturbance (hypo-/hyperglycemia, hypo-/hypernatremia, hypocalcemia, hypomagnesemia, toxins/drugs)
- differential diagnosis: syncope, pseudoseizures, migraines, movement disorders, narcolepsy/cataplexy, myoclonus

### History

- from patient and bystander: flaccid and unconscious, often with deep rapid breathing
- preceding aura, rapid onset, loss of bladder/bowel control, tongue-biting (sides of the tongue)
- length of seizure and post-ictal symptoms

### Physical Exam

- injuries to head and spine and bony prominences (e.g. elbows), tongue laceration, aspiration, urinary incontinence

**Table 17. Concurrent Investigation and Management of Status Epilepticus**

Timing	Steps
<b>Immediate</b>	Protect airway with positioning; intubate if airway compromised or elevated ICP Monitor: vital signs, ECG, oximetry; bedside blood glucose Establish IV access Benzodiazepine - IV lorazepam 0.1 mg/kg up to 4 mg/dose at 2 mg/min preferred over IV diazepam 0.15 mg/kg up to 10 mg/dose at 5 mg/min; repeat at 5 min if ineffective Fluid resuscitation Give 50 mL 50% glucose (preceded by thiamine 100 mg IM in adults) Obtain blood samples for glucose, CBC, electrolytes, Ca <sup>2+</sup> , Mg <sup>2+</sup> , toxins, and antiepileptic drug levels; consider prolactin, β-hCG Vasopressor support if sBP <90 or MAP <70 mmHg
<b>Urgent</b>	Establish second IV line, urinary catheter If status persists, phenytoin 20 mg/kg IV at 25-50 mg/min in adults; may give additional 10 mg/kg IV 10 minutes after loading infusion If seizure resolves, antiepileptic drug still required to prevent recurrence EEG monitoring to evaluate for non-convulsive status epilepticus
<b>Refractory</b>	If status persists after maximum doses above, consult ICU and start one or more of: Phenobarbital 20 mg/kg IV at 50 mg/min Midazolam 0.2 mg/kg IV loading dose and 0.05-0.5 mg/kg/h Propofol 2-5 mg/kg IV loading dose then 2-10 mg/kg/h
<b>Post-Seizure</b>	Investigate underlying cause: consider CT, LP, MRI, intracranial pressure monitoring

Note: All interventions should be done as soon as possible

Adapted from Brophy et al. Guidelines for the Evaluation and Management of Status Epilepticus. *Neurocrit Care* 2012;17:3-23

### Disposition

- decision to admit or discharge should be based on the underlying disease process identified
  - if a patient has returned to baseline function and is neurologically intact, then consider discharge with outpatient follow-up
- first-time seizure patients being discharged should be referred to a neurologist for follow-up
- admitted patients should generally have a neurology consult
- patient should not drive until medically cleared (local regulations vary)
  - complete notification form to appropriate authority regarding ability to drive
- warn regarding other safety concerns (e.g. no swimming, bathing children alone, etc.)

### Minimum Workup in an Adult with 1st Time Seizure

CBC and differential

Electrolytes including Ca<sup>2+</sup>, Mg<sup>2+</sup>, PO<sub>4</sub><sup>3-</sup>

Head CT

If administering phenytoin, patient must be on a cardiac monitor as dysrhythmias and/or hypotension may occur

If IV access is not feasible, midazolam 0.2 mg/kg IM up to 10 mg can be used for initial control of seizure in adults

## Shortness of Breath

- see [Respirology, R3](#) and [Cardiology and Cardiac Surgery, C5](#)

**Table 18. Differential Diagnosis for Dyspnea**

	High Mortality/Morbidity	Usually Less Emergent
<b>Respiratory</b>	Airway obstruction (Foreign body, epiglottitis, abscess, anaphylaxis) Pneumo/hemothorax Gas exchange –Pulmonary edema, PE, pneumonia, AECOPD	Chronic obstructive, interstitial or restrictive lung disease Pleural effusion
<b>Cardiac</b>	CHF, MI, valvular disease, tamponade, arrhythmia	Chronic CHF, Angina
<b>Metabolic</b>	Metabolic acidosis NYD, carbon monoxide inhalation	Anemia, Hemoglobinopathy
<b>Neuromuscular</b>	Myasthenia gravis, diaphragmatic paralysis	CNS lesion, primary muscle weakness
<b>Other</b>		Anxiety, deconditioning

### History and Physical Exam

- acute SOB is often due to a relatively limited number of conditions; associated symptoms and signs are key to the appropriate diagnosis
  - substernal chest pain with cardiac ischemia
  - fever, cough, and sputum with respiratory infections
  - urticaria with anaphylaxis
  - wheezing with acute bronchospasm
  - environmental or occupational exposures
- dyspnea may be the sole complaint and the physical exam may reveal few abnormalities (e.g. PE, pneumothorax)
- vitals including pulse oximetry
  - wheeze and stridor (airway) vs. crackles (parenchymal), JVP, and murmurs

### Investigations

- blood work
  - CBC and differential (hematocrit to exclude anemia), electrolytes, consider VBG
  - serial cardiac enzymes and ECG if considering cardiac source
  - Wells scores to consider appropriateness of d-dimer
- imaging
  - CXR (hyperinflation and bullous disease suggestive of obstructive lung disease, or changes in interstitial markings consistent with inflammation, infection, or interstitial fluid)
  - CT chest usually is not indicated in the initial evaluation of patients with dyspnea, but can be valuable in patients with interstitial lung disease, occult emphysema, or chronic thromboembolic disease (i.e. PE)

### Management of Life-Threatening Dyspnea NYD

- see [Primary and Secondary Surveys, ER2-3](#)
- treat underlying cause

### Disposition

- the history and physical exam lead to accurate diagnoses in patients with dyspnea in approximately two-thirds of cases; the decision to admit or discharge should be based on the underlying disease process identified
  - consider intubation in CO<sub>2</sub> retainers (e.g. COPD)
- if discharging, organize follow-up and educate regarding signs to return to hospital

## Syncopal

### Definition

- sudden, transient loss of consciousness and postural tone with spontaneous recovery
- usually caused by generalized cerebral or reticular activating system hypoperfusion

### Etiology

- cardiogenic: dysrhythmia, outflow obstruction (e.g. PE, pulmonary HTN), MI, valvular disease
- non-cardiogenic: peripheral vascular (hypovolemia), vasovagal, cerebrovascular disorders, CNS, metabolic disturbances (e.g. EtOH intoxication)

#### 5 Types of Syncope

- Vasomotor
- Cardiac
- CNS
- Metabolic
- Psychogenic

## History

- gather details from witnesses, and clarify patient's experience (e.g. dizziness, ataxia, or true syncope)
  - two key historical features: prodrome and situation
- distinguish between syncope and seizure (see [Neurology, N19](#))
  - some patients may have myoclonic jerks with syncope – NOT a seizure
    - signs and symptoms during presyncope, syncope, and postsyncope
    - past medical history, drugs
    - think anatomically in differential; pump (heart), blood, vessels, brain
- syncope is cardiogenic until proven otherwise if
  - there is sudden loss of consciousness with no warning or prodrome
  - syncope is accompanied by chest pain

## Physical Exam

- postural BP and HR
- cardiovascular, respiratory, and neurological exam
- examine for signs of trauma caused by syncopal episode

## Investigations

- ECG (tachycardia, bradycardia, blocks, Wolff-Parkinson White, long QT interval, Brugada Syndrome, RV strain), bedside glucose
- blood work: CBC, electrolytes, BUN/Cr, ABGs, troponin, Ca<sup>2+</sup>, Mg<sup>2+</sup>, β-hCG, D-dimer
- consider toxicology screen

## Management

- ABCs, IV, O<sub>2</sub>, monitor
- cardiogenic syncope: admit to medicine/cardiology
- low risk syncope: discharge with follow-up as indicated by cause (non-cardiogenic syncope may still be admitted)

## Disposition

- decision to admit is based on etiology
- most patients will be discharged
- on discharge, instruct patient to follow up with family physician
  - educate about avoiding orthostatic or situational syncope
  - evaluate the patient for fitness to drive or work
  - patients with recurrent syncope should avoid high-risk activities (e.g. driving)

### Causes of Syncope by System

#### HEAD, HEART, VeSSELS

Hypoxia/Hypoglycemia  
 Epilepsy  
 Anxiety  
 Dysfunctional brainstem  
 Heart attack  
 Embolism (PE)  
 Aortic obstruction  
 Rhythm disturbance  
 Tachycardia  
 Vasovagal  
 Situational  
 Subclavian steal  
 ENT (glossopharyngeal neuralgia)  
 Low systemic vascular resistance  
 Sensitive carotid sinus

### San Francisco Syncope Rule: High risk of adverse outcomes in syncope patients if:

#### CHESS

CHF: Hx of CHF  
 Hct: Low  
 ECG: Abnormal  
 SOB: Hx of dyspnea  
 SBP: sBP <90 at triage

# Sexual Assault

## Epidemiology

- 1 in 4 women and 1 in 10 men will be sexually assaulted in their lifetime; only 7% are reported

## General Approach

- ABCs, treat acute, serious injuries; physician priority is to treat medical issues and provide clearance
- ensure patient is not left alone and provide ongoing emotional support
- obtain consent for medical exam and treatment, collection of evidence, disclosure to police (notify police as soon as consent obtained)
- Sexual Assault Kit (document injuries, collect evidence) if <72 h since assault
- label samples immediately and pass directly to police
- offer community crisis resources (e.g. shelter, hotline)
- do not report unless victim requests or if <16 yr old (legally required)

## History

- ensure privacy for the patient – others should be asked to leave
- questions to ask: who, when, where did penetration occur, what happened, any weapons, or physical assault?
- post-assault activities (urination, defecation, change of clothes, shower, douche, etc.)
- gynecologic history
  - gravidity, parity, last menstrual period
  - contraception use
  - last voluntary intercourse (sperm motile 6-12 h in vagina, 5 d in cervix)
- medical history: acute injury/illness, chronic diseases, psychiatric history, medications, allergies, etc.

## Physical Exam

- never re-traumatize a patient with the examination
- general examination
  - mental status
  - sexual maturity
  - patient should remove clothes and place in paper bag
  - document abrasions, bruises, lacerations, torn frenulum/broken teeth (indicates oral penetration)

Interprofessional teams are key; many centres or regions have sexual assault teams who specialize in the assessment and treatment of sexual assault victims, leaving emergency physicians responsible only for significant injuries and medical clearance

- pelvic exam and specimen collection
  - ideally before urination or defecation
  - examine for seminal stains, hymen, signs of trauma
  - collect moistened swabs of dried seminal stains
  - pubic hair combings and cuttings
  - speculum exam
    - ♦ lubricate with water only
    - ♦ vaginal lacerations, foreign bodies
    - ♦ Pap smear, oral/cervical/rectal culture for gonorrhea and chlamydia
    - ♦ posterior fornix secretions if present or aspiration of saline irrigation
    - ♦ immediate wet smear for motile sperm
    - ♦ air-dried slides for immotile sperm, acid phosphatase, ABO group
- fingernail scrapings and saliva sample from victim

### Investigations

- VDRL: repeat in 3 mo if negative
- serum  $\beta$ -hCG
- blood for ABO group, Rh type, baseline serology (e.g. hepatitis, HIV)

### Management

- involve local/regional sexual assault team
- medical
  - suture lacerations, tetanus prophylaxis
  - gynecology consult for foreign body, complex lacerations
  - assumed positive for gonorrhea and chlamydia
    - ♦ management: azithromycin 1 g PO x 1 dose (alt: doxycycline 100 mg PO bid x 7 d) and cefixime 800 mg PO x 1 dose (alt: ceftriaxone 250 mg IM x 1 dose)
  - may start prophylaxis for hepatitis B and HIV
  - pre and post counselling for HIV testing
  - pregnancy prophylaxis offered
    - ♦ levonorgestrel 0.75 mg PO STAT, repeat within 12 h (Plan B\*)
- psychological
  - high incidence of psychological sequelae
  - have victim change and shower after exam completed

### Disposition

- discharge if injuries/social situation permit
- follow-up with physician in rape crisis centre within 24 h
- best if patient does not leave ED alone

### DOMESTIC VIOLENCE

- women are usually the victims, but male victimization also occurs
- identify the problem (need high index of suspicion)
  - suggestive injuries (bruises, sprains, abrasions, occasionally fractures, burns, or other injuries; often inconsistent with history provided)
  - somatic symptoms (chronic and vague complaints)
  - psychosocial symptoms
  - clinician impression (your 'gut feeling', e.g. overbearing partner that won't leave patient's side)
- if disclosed, be supportive and assess danger
- patient must consent to follow-up investigation/reporting (unless for children)

### Management

- treat injuries and document findings
- ask about sexual assault and children at home (encourage notification of police)
- safety plan with good follow-up with family doctor/social worker

#### Risk of Sexually Transmitted Disease after Sexual Assault

- Gonorrhea: 6-18%
- Chlamydia: 4-17%
- Syphilis: 0.5-3%
- HIV: <1%

How do you get a patient who is accompanied by her partner alone without arousing suspicion?

Order an x-ray

#### Most Common Triggers for Anaphylaxis

- Foods (nuts, shellfish, etc.)
- Stings
- Drugs (penicillin, NSAIDs, ACEI)
- Radiographic contrast media
- Blood products
- Latex

## Medical Emergencies

### Anaphylaxis and Allergic Reactions

#### Etiology

- anaphylaxis is an exaggerated immune mediated hypersensitivity reaction that leads to systemic histamine release, increased vascular permeability, and vasodilation; regardless of the etiology, the presentation and management of anaphylactic reactions are the same
- allergic (re-exposure to allergen)
- non-allergic (e.g. exercise induced)

## Diagnostic Criteria

- anaphylaxis is highly likely with any of
  1. acute onset of an illness (min to hrs) with involvement of the skin, mucosal tissue and at least one of
    - respiratory compromise (e.g. dyspnea, wheeze, stridor, hypoxemia)
    - hypotension/end-organ dysfunction (e.g. hypotonia, collapse, syncope, incontinence)
  2. two or more of the following after exposure to a LIKELY allergen for that patient (min to hrs)
    - involvement of the skin-mucosal tissue
    - respiratory compromise
    - hypotension or associated symptoms
    - persistent gastrointestinal symptoms (e.g. crampy abdominal pain, vomiting)
  3. hypotension after exposure to a KNOWN allergen for that patient (min to hrs)
    - management is also appropriate in cases which do not fulfill criteria, but who have had previous episodes of anaphylaxis
    - life-threatening differentials for anaphylaxis include asthma and septic shock
    - angioedema may mimic anaphylaxis but tends not to improve with standard anaphylaxis treatment

## Management

- moderate reaction: generalized urticaria, angioedema, wheezing, tachycardia
  - epinephrine (1:1000) 0.3-0.5 mg IM
  - antihistamines: diphenhydramine (Benadryl®) 25-50 mg IM
  - salbutamol (Ventolin®) 1 cc via MDI
- severe reaction/evolution: severe wheezing, laryngeal/pulmonary edema, shock
  - -ABCs, may need ETT due to airway edema
  - epinephrine (1:1000) 0.1-0.3 mg IV (or via ETT if no IV access) to start, repeat as needed
  - antihistamines: diphenhydramine (Benadryl®) 50 mg IV (~1 mg/kg)
  - steroids: hydrocortisone (Solu-cortef®) 100 mg IV (~1.5 mg/kg) or methylprednisolone (Solumedrol®) 1 mg/kg IV q6h x 24 h
  - large volumes of crystalloid may be required

## Disposition

- monitor for 4-6 h in ED (minimum) and arrange follow-up with family physician in 24-48 h
- can have second phase (biphasic) reaction up to 48 h later, patient may need to be supervised
- educate patient on avoidance of allergens
- medications
  - H<sub>1</sub> antagonist (cetirizine 10 mg PO OD or Benadryl® 50 mg PO q4-6h x3d)
  - H<sub>2</sub> antagonist (ranitidine 150 mg PO OD x3d)
  - corticosteroid (prednisone 50 mg PO OD) x5d to prevent secondary reaction

Anaphylaxis should be suspected if airway, breathing, or especially circulation compromise is present after exposure to a known allergen

Hypotension is defined as systolic BP >30% decrease from baseline or

- Adults: <90 mmHg
- ≥11 yr: <90 mmHg
- 1-10 yr: <70 mmHg + 2 x age
- 1 mo-1 yr: <70 mmHg

Early epinephrine is lifesaving and there are no absolute contraindications

### Pediatric Dosing

- Epinephrine: 0.01 mg/kg IM up to 0.5mg q5-15min
- Initial crystalloid bolus: 20 mL/kg, reassess
- Epinephrine infusion: 0.1-1 µg/kg/min up to 10 µg/min
- Diphenhydramine: 1 mg/kg up to 50 mg IM/IV q4-6h
- Ranitidine: 1 mg/kg up to 50 mg PO/IV
- Methylprednisolone: 1 mg/kg up to 125 mg IV

Beware of the silent chest in asthma exacerbations. This is a medical emergency and may require emergency intubation

## Asthma

- see [Respirology, R7](#)
- chronic inflammatory airway disease with episodes of bronchospasm and inflammation resulting in reversible airflow obstruction

## History and Physical

- find cause of asthma exacerbation (viral, environmental, etc.)
- history of asthma control; severity of exacerbations (ICU, intubation history)
- signs of respiratory distress
- vitals, specifically O<sub>2</sub>

## Investigations

- peak flow meter
- ± ABG if in severe respiratory distress
- CXR if diagnosis in doubt to rule out pneumonia, pneumothorax, etc.

**Table 19. Asthma Assessment and Management**

Classifications	History and Physical Exam	Management
<b>Respiratory Arrest Imminent</b>	Exhausted, confused, diaphoretic, cyanotic Silent chest, ineffective respiratory effort Decreased HR, RR > 30, pCO <sub>2</sub> > 45 mmHg O <sub>2</sub> sat < 90% despite supplemental O <sub>2</sub>	100% O <sub>2</sub> , cardiac monitor, IV access Intubate (consider induction with ketamine) Short acting β-agonist (Ventolin): nebulizer 5 mg continually Short-acting Anticholinergic (Atrovent): nebulizer 0.5 mg x 3 IV steroids: methylprednisolone 125 mg
<b>Severe Asthma</b>	Agitated, diaphoretic, laboured respirations Speaking in words No relief from β-agonist O <sub>2</sub> sat < 90%, FEV <sub>1</sub> < 50%	Anticipate need for intubation Similar to above management Magnesium sulphate 2 g IV O <sub>2</sub> to achieve O <sub>2</sub> sat > 92%
<b>Moderate Asthma</b>	SOB at rest, cough, congestion, chest tightness Speaking in phrases Inadequate relief from β-agonist FEV <sub>1</sub> 50-80%	O <sub>2</sub> to achieve O <sub>2</sub> sat > 92% Short-acting β-agonist (Ventolin): MDI or nebulizer q5min Short-acting Anticholinergic (Atrovent): MDI or nebs x 3 Steroids: prednisone 40-60 mg PO
<b>Mild Asthma</b>	Exertional SOB/cough with some nocturnal symptoms Difficulty finishing sentences FEV <sub>1</sub> > 80%	β-agonist Monitor FEV <sub>1</sub> Consider steroids (MDI or PO)

**Disposition**

- discharge safe in patients with FEV<sub>1</sub> or PEF > 60% predicted, and may be safe if FEV<sub>1</sub> or PEF 40-60% predicted based on patient's risk factors for recurrence of severe attack
  - risk factors for recurrence: frequent ED visits, frequent hospitalizations, recent steroid use, recent exacerbation, poor medication compliance, prolonged use of high dose beta-agonists
- β-agonist MDI with aerochamber 2-4 puffs q2-4h until symptoms controlled, then prn
- initiate inhaled corticosteroids with aerochamber if not already prescribed
- if moderate to severe attack, administer prednisone 30-60 mg/d for 7 d with no taper
- counsel on medication adherence and educate on use of aerochamber
  - follow-up with primary care physician or asthma specialist

**Elements of Well-Controlled Asthma**

- Can Respir J* 2010;17(1):15-24
- Daytime symptoms < 4x/wk
  - Nocturnal symptoms < 1x/wk
  - No limitation in activity
  - No absence from work/school
  - Rescue inhaler use < 4x/wk
  - FEV<sub>1</sub> < 90% personal best
  - PEF < 10-15% diurnal variation
  - Mild infrequent exacerbations

## Cardiac Dysrhythmias

- see [Cardiology and Cardiac Surgery, C16](#)

**Bradycardias and AV Conduction Blocks**

- AV conduction blocks
  - 1st degree: prolonged PR interval (>200 msec), no treatment required
  - 2nd degree
    - ♦ Mobitz I: gradual prolongation of PR interval then dropped QRS complex, usually benign
    - ♦ Mobitz II: PR interval constant with dropped QRS complex, can progress to 3rd degree AV block
  - 3rd degree: P wave unrelated to QRS complex, PP and RR intervals constant
    - ♦ atropine and transcutaneous pacemaker (atropine with caution)
    - ♦ if transcutaneous pacemaker fails consider dopamine, epinephrine IV
  - long-term treatment for Mobitz II and 3rd degree block – internal pacemaker
- sinus bradycardia (rate < 60 bpm)
  - can be normal (especially in athletes)
  - causes: vagal stimulation, vomiting, myocardial infarction/ischemia, increased ICP, sick sinus node, hypothyroidism, drugs (e.g. β-blockers, CCBs)
  - treat if symptomatic (hypotension, chest pain)
    - ♦ acute: atropine ± transcutaneous pacing
    - ♦ sick sinus: transcutaneous pacing
    - ♦ drug induced: discontinue/reduce offending drug, consider antidotes

**Supraventricular Tachydysrhythmias (narrow QRS)**

- sinus tachycardia (rate > 100 bpm)
  - causes: increased sympathetic tone, drugs, fever, hypotension, anemia, thyrotoxicosis, MI, PE, emotional, pain, etc.
  - search for and treat underlying cause, consider β-blocker if symptomatic
- regular rhythm (i.e. not sinus tachycardia)
  - vagal maneuvers (carotid massage, Valsalva), adenosine 6 mg IV push, if no conversion give 12 mg, can repeat 12 mg dose once
  - rhythm converts: probable re-entry tachycardia (AVNRT more common than AVRT)
    - ♦ monitor for recurrence
    - ♦ treat recurrence with adenosine or longer acting medications

If the patient with tachydysrhythmia is unstable, perform immediate synchronized cardioversion

- rhythm does not convert: atrial flutter, ectopic atrial tachycardia, junctional tachycardia
  - ♦ rate control (diltiazem,  $\beta$ -blockers) and consult cardiology
- irregular rhythm
  - probable AFib, atrial flutter, or multifocal atrial tachycardia
  - rate control (diltiazem,  $\beta$ -blockers)

### Atrial Fibrillation

- most common sustained dysrhythmia; no organized P waves (atrial rate >300/min), irregularly irregular heart rate, narrow QRS (typically)
- etiology: HTN, CAD, thyrotoxicosis, EtOH (holiday heart), valvular disease, pericarditis, cardiomyopathy, sick sinus syndrome
- treatment principles: stroke prevention, treat symptoms, identify/treat underlying cause
- decreases cardiac output by 20-30% (due to loss of organized atrial contractions)
- acute management
  - if unstable: immediate synchronized cardioversion
  - if onset of AFib is >48 h: rate control, anticoagulate 3 wk prior to and 4 wk after cardioversion, or do transesophageal echocardiogram to rule out clot
  - if onset <48 h or already anticoagulated: may cardiovert
    - ♦ electrical cardioversion: synchronized direct current (DC) cardioversion
    - ♦ chemical cardioversion: procainamide, flecainide, propafenone
- long-term management: rate or rhythm control, consider anticoagulation (**CHADS2 score**, see [Cardiology and Cardiac Surgery, C20](#))

### Ventricular Tachydysrhythmias (wide QRS)

- VTach (rate usually 140-200 bpm)
  - definition: 3 or more consecutive ventricular beats at >100 bpm
  - etiology: CAD with MI is most common cause
  - treatment: sustained VTach (>30 s) is an emergency
    - ♦ hemodynamic compromise: synchronized DC cardioversion
    - ♦ no hemodynamic compromise: synchronized DC cardioversion, amiodarone, procainamide
- VFib: call a code blue, follow ACLS for pulseless arrest
- Torsades de pointes
  - looks like VTach but QRS 'rotates around baseline' with changing axis and amplitude (twisted ribbon)
  - etiology: prolonged QT due to drugs (e.g. quinidine, TCAs, erythromycin, quinolones), electrolyte imbalance (hypokalemia, hypomagnesemia), congenital
  - treatment
    - ♦ IV  $Mg^{2+}$ , temporary overdrive pacing, isoproterenol
    - ♦ correct cause of prolonged QT

If patient has Wolff-Parkinson-White and is in AFib use amiodarone or procainamide; avoid AV nodal blocking agents (adenosine, digoxin, diltiazem, verapamil,  $\beta$ -blockers), as this can increase conduction through bypass tract, leading to cardiac arrest

#### Causes of Atrial Fibrillation

##### C ("sea") PIRATES

CHF, Cardiomyopathy  
Pulmonary embolism  
Ischemic heart disease  
Rheumatic or valvular disease  
Anemia  
Thyroid  
EtOH, Elevated blood pressure  
Sick Sinus, Stress - surgery, sepsis

## Acute Exacerbation of COPD (AECOPD)

- for chronic management of COPD see [Respirology, R9](#)
- progressive development of irreversible airway obstruction, typically caused by smoking

### History and Physical Exam

- cardinal symptoms of AECOPD: increased dyspnea, increased coughing frequency or severity, increased sputum volume or purulence
- triggers: virus, pneumonia, urinary tract infection, PE, CHF, MI, drugs
- characterize previous episodes and hospitalizations, smoking history
- vital signs, level of consciousness, signs of respiratory distress, respiratory exam

### Investigations

- CBC, electrolytes, ABG, CXR, ECG
- PFTs are NOT useful in managing acute exacerbations

### Management

- oxygen: keep  $O_2$  sat 88-92% (be aware when giving  $O_2$  to chronic hypercapnic/ $CO_2$  retainers but do not withhold  $O_2$  if hypoxic)
- bronchodilators: short-acting  $\beta$ -agonist (Salbutamol 4-8 puffs via MDI with spacer q15min x3 prn)  $\pm$  short-acting anticholinergic (Ipratropium 4-8 puffs via MDI q15min x3 prn)
- steroids: prednisone 40-60 mg PO for 7-14 d, or methylprednisolone 125 mg IV bid-qid if severe exacerbation, or unable to take PO
- antibiotics: TMP-SMX, cephalosporins, respiratory quinolones (given if all 3 cardinal symptoms present or 2 cardinal symptoms with increased sputum purulence or mechanical ventilation)
- ventilation: apply NIPPV (CPAP or BiPAP) if severe distress or signs of fatigue, arterial pH <7.35, or hypercapnic
- if life-threatening, ICU admission for intubation and ventilation (chance of ventilation dependency)

### Disposition

- no guidelines for admission - based on clinical judgement and comorbidities
- lower threshold to admit if comorbid illness (diabetes, CHF, CAD, alcohol abuse)
- if discharging, use antibiotics, tapering steroids, up to 4-6 puffs qid of ipratropium and salbutamol and organize follow-up

#### Physical Exam Findings in COPD

- Wheeze
- Maximum laryngeal height  $\leq$ 4 cm
- Forced expiratory time  $\geq$ 6 s
- Decreased breath sounds
- Decreased cardiac dullness

#### Need to Rule Out with COPD Exacerbation

- Pneumothorax
- CHF exacerbation
- Acute MI
- Pneumonia and other infectious causes
- PE

## Acute Decompensated Heart Failure (ADHF)

- for chronic management of CHF see [Cardiology and Cardiac Surgery, C36](#)

### Etiology

- Causes of CHF: decreased myocardial contractility (ischemia, infarction, cardiomyopathy, myocarditis), pressure overload states (HTN, valve abnormalities, congenital heart disease), restricted cardiac output (myocardial infiltrative disease, cardiac tamponade)
- Precipitants of acute decompensation of CHF
  - cardiac (ischemia, infarction, arrhythmia - Afib)
  - medications (beta-blockers, CCBs, NSAIDs, steroids, non-compliance)
  - dietary (increased sodium and/or water intake)
  - high output (anemia, infection, pregnancy, hyperthyroid)
  - other (renal failure, hypertensive crisis, iatrogenic fluid overload - blood transfusions or IV fluids)

### Presentation

- left-sided heart failure
  - dyspnea, SOBOE, orthopnea, PND, nocturia, fatigue, altered mental status, presyncope/syncope, angina, systemic hypotension
  - hypoxia, decreased air entry to lungs, crackles, S3 or S4, pulmonary edema (on CXR), pleural effusion (usually right-sided)
- right-sided heart failure
  - dependent bilateral pitting edema, JVP elevation and positive AJR, ascites, hepatomegaly
- patients often present with a combination of right-sided and left-sided symptoms

### Investigations

- blood work: CBC, electrolytes, AST, ALT, bilirubin, Cr, BUN, cardiac enzymes, brain natriuretic peptide
- CXR: most useful test (see sidebar)
- ECG: look for MI, ischemia (ST elevation/depression, T-wave inversion), LVH, atrial enlargement, conduction abnormalities
- ABG: if severe or refractory to treatment
  - hypoxemia, hypercapnia and acidosis are signs of severe CHF
- echocardiogram: not usually used in emergency evaluation, previous results may aid in diagnosis
- rule out serious differentials such as PE, pneumothorax, pneumonia/empyema, AECOPD

### Management

- ABCs, may require intubation if severe hypoxia
- sit upright, cardiac monitoring, and continuous pulse oximetry
- saline lock IV, Foley catheter (to follow effectiveness of diuresis)
- 100% O<sub>2</sub> by mask
  - if poor response, may require BiPAP or intubation
- drugs
  - diuretic (if volume overloaded): Furosemide 40-80 mg IV
  - vasodilators (if sBP > 100): Nitroglycerin 0.3 mg SL q5min prn ± topical Nitroderm patch (0.4-0.8 mg/h)
    - if not responding or signs of ischemia (angina): Nitroglycerine 10-20 µg/min IV, titrate to response
    - if severe or refractory hypertension: Nitroprusside 0.5 µg/kg/min, titrate to response
  - inotropes/vasopressors (if sBP < 90)
    - without signs of shock: Dobutamine 2.5 µg/kg/min IV, titrate up to sBP > 90 mmHg
    - with signs of shock: Dopamine 5-10 µg/kg/min IV, titrate up to sBP > 90 mmHg
- treat precipitating factor - e.g. rate control (beta-blocker, CCB) or rhythm-control (electrical or chemical cardioversion) if new Afib
- cardiology or medicine consult

## Venous Thromboembolism (VTE)

- see [Respirology, R20](#)

### Risk Factors

- Virchow's triad: alterations in blood flow (venous stasis), injury to endothelium, hypercoagulable state (including pregnancy, use of OCP, malignancy)
- clinical risk factors (see sidebar)

### DEEP VEIN THROMBOSIS (DVT)

#### Presentation

- calf pain, unilateral leg swelling/erythema/edema, palpable cord along the deep venous system on exam; can be asymptomatic
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT; investigation often needed

#### Precipitants of CHF Exacerbation

##### FAILURE

Forgot medication  
 Arrhythmia (Dysrhythmia)/Anemia  
 Ischemia/Infarction/Infection  
 Lifestyle (e.g. high salt intake)  
 Upregulation of cardiac output (pregnancy, hyperthyroidism)  
 Renal failure  
 Embolism (pulmonary)

#### CHF on CXR

- Pulmonary vascular redistribution
- Perihilar infiltrates
- Interstitial edema, Kerley B lines
- Alveolar edema, bilateral infiltrates
- May see cardiomegaly, pleural effusions
- Peribronchial cuffing
- Fissural thickening (fluid in fissure)

#### Acute Treatment of CHF

##### LMNOP

Lasix (furosemide)  
 Morphine  
 Nitroglycerin  
 Oxygen  
 Position (sit upright), Pressure (BiPAP)

#### Hospital Management Required if

- Acute MI
- Pulmonary edema or severe respiratory distress
- Severe complicating medical illness (e.g. pneumonia)
- Anasarca
- Symptomatic hypotension or syncope
- Refractory to outpatient therapy
- Thromboembolic complications requiring interventions
- Clinically significant dysrhythmias
- Inadequate social support for safe outpatient management
- Persistent hypoxia requiring supplemental oxygen

#### Risk Factors for VTE

##### THROMBOSIS

Trauma, travel  
 Hypercoagulable, HRT  
 Recreational drugs (IVDU)  
 Old (age > 60 yr)  
 Malignancy  
 Birth control pill  
 Obesity, obstetrics  
 Surgery, smoking  
 Immobilization  
 Sickness (CHF, MI, nephrotic syndrome, vasculitis)

## Investigations

- use Wells' criteria for DVT to guide investigations (Figure 12)
- D-dimer is only useful at ruling out a DVT if it is negative in low to moderate risk patients (highly sensitive)
  - high risk of false positives in: elderly, infection, recent surgery, trauma, hemorrhage, late in pregnancy, liver disease, cancer
- U/S has high sensitivity & specificity for proximal clot but only 73% sensitivity for calf DVT (may need to repeat in 1 wk)
  - if positive – treat for DVT regardless of risk
  - if negative and low risk – rule out DVT
  - if negative and moderate to high risk – repeat U/S in 5-7 days to rule out DVT

## Management

- LMWH unless patient also has renal failure
  - dalteparin 200 IU/kg SC q24h or enoxaparin 1.5 mg/kg SC q24h
- warfarin started at same time as LMWH (5 mg PO OD initially followed by dosing based on INR)
- LMWH discontinued when INR has been therapeutic (2-3) for 2 consecutive days
- rivaroxaban can be used in acute management of symptomatic DVT
  - 15 mg PO bid for first 21 d; 20 mg PO daily for remaining treatment (taken with food at approximately the same time each day)
- consider thrombolysis if extensive DVT causing limb compromise
- IVC filter or surgical thrombectomy considered if anticoagulation is contraindicated
- duration of anticoagulation: 3 months if transient coagulopathy; 6 months if unprovoked DVT; life-long if ongoing coagulopathy

## PULMONARY EMBOLISM (PE)

### Presentation

- dyspnea, pleuritic chest pain, hemoptysis, tachypnea, cyanosis, hypoxia, fever
- clinical signs/symptoms are unreliable for diagnosis and exclusion of DVT; investigation often needed

### Investigations

- use Wells' criteria for PE to guide investigations (Figures 13-14)
- PERC score alone can rule out PE in low risk patients (as determined by Wells' criteria) unless patient is pregnant
- ECG and CXR are useful to rule out other causes (e.g. ACS, pneumonia, pericarditis) or to support diagnosis of PE
  - ECG changes in PE: sinus tachycardia, right ventricular strain (S1Q3T3), T wave inversions in anterior and inferior leads
  - CXR findings in PE: Hampton's hump (triangular density extending from pleura) or Westermark's sign
- D-dimer is only useful at ruling out a PE if it is negative in low to moderate risk patients (highly sensitive)
  - if positive D-dimer or high-probability patient, then pursue CT angiography or V/Q scan
- CT angiography has high sensitivity and specificity for PE, may also suggest other etiology
- V/Q scan useful in pregnancy, when CT angiography not available, or IV contrast contraindicated

### Management of PE

- treatment of PE with anticoagulation and duration of treatment is the same as for DVT (see above)
- consider thrombolysis if extensive PE causing hemodynamic compromise or cardiogenic shock
- catheter-directed thrombolysis or surgical thrombectomy rarely considered in massive PE or contraindication to anticoagulation
- often can be treated as outpatient, may require analgesia for chest pain (narcotic or NSAID)
- admit if hemodynamically unstable, require supplemental O<sub>2</sub>, major comorbidities, lack of sufficient social supports, unable to ambulate, need invasive therapy
  - referral to medicine for coagulopathy and malignancy workup

### Wells' Criteria for DVT

Active cancer	+1
Paralysis, paresis or recent immobilization of leg	+1
Recently bedridden x 3 d or major surgery within 4 wks	+1
Local tenderness	+1
Entire leg swollen	+1
Calf swelling 3cm > asymptomatic leg	+1
Unilateral pitting edema	+1
Collateral superficial veins	+1
Alternative dx more likely	-2

0: Low probability  
1-2: Moderate probability  
>3: High probability

### Wells' Criteria for PE

Previous Hx of DVT/PE	+1.5
HR >100	+1.5
Recent immobility or surgery	+1.5
Clinical signs of DVT	+3
Alternate Dx less likely than PE	+3
Hemoptysis	+1
Cancer	+1

< 2: Low probability  
2-6: Intermediate probability  
> 6: High probability

### PERC Score

- Age >50 yr
- HR >100 bpm
- O<sub>2</sub> sat on RA <94%
- Prior history DVT/PE
- Recent trauma or surgery
- Hemoptysis
- Exogenous estrogen
- Clinical signs suggesting DVT

Score 1 for each question; a score 0/8 means patient has <1.6% chance having a PE and avoids further investigation. Caution using the PERC score in pregnant women as the original study excluded pregnant women

D-dimer is only useful if it is negative; negative predictive value >99%

50% of patients with symptomatic proximal DVT will develop PE, often within days to weeks of the event

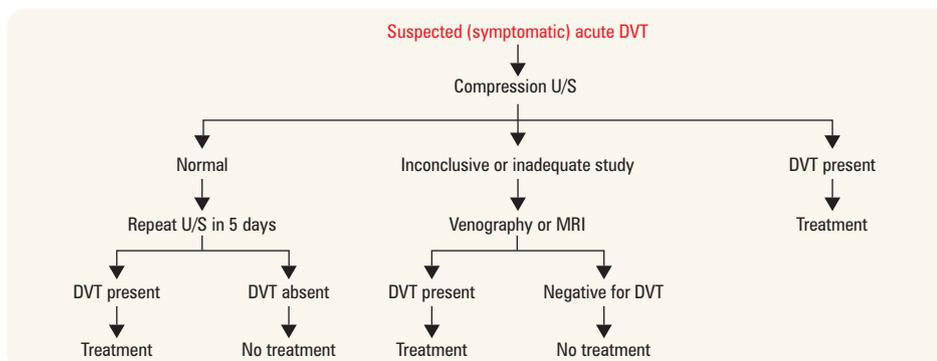

Figure 12. Approach to suspected DVT

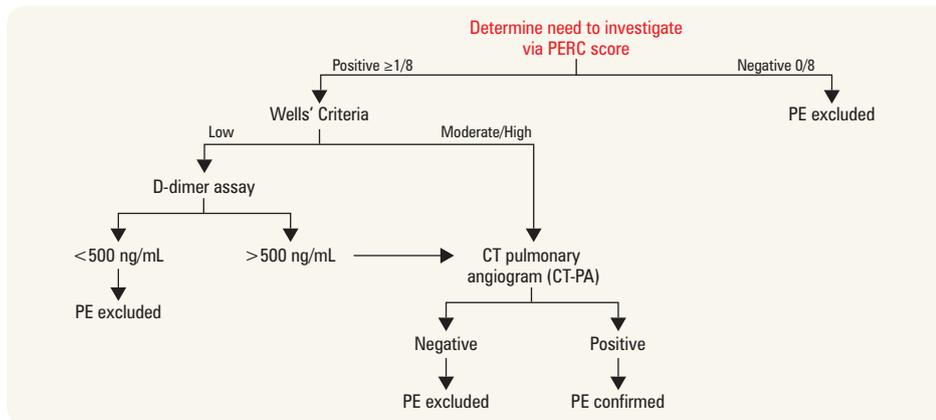

Figure 13. Approach to suspected PE

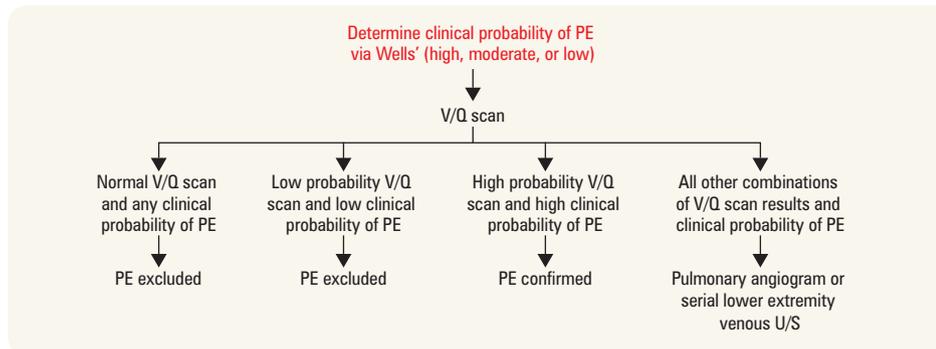

Figure 14. V/Q-based algorithm for suspected PE

## Diabetic Emergencies

- see [Endocrinology, E11](#)

### Diabetic Ketoacidosis

- triad of hyperglycemia, ketosis, and acidosis due to severe insulin deficiency and counter-regulatory hormone excess
- clinical presentation
  - ♦ often young, Type 1 DM patients, (may rarely be first presentation of undiagnosed Type 2 DM) with symptoms evolving within a day
  - early signs and symptoms: polyuria, polydipsia, malaise, nocturia, weight loss
  - late signs and symptoms
    - ♦ GI: anorexia, nausea, vomiting, abdominal pain
    - ♦ neurological: fatigue, drowsiness, stupor, coma
    - ♦ respiratory: Kussmaul's respiration, dyspnea (often due to acidosis), fruity ketotic breath
- investigations
  - blood work: CBC, electrolytes,  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ ,  $\text{PO}_4^{3-}$ , Cr, BUN, glucose, ketones, osmolality, AST/ALT/ALP, amylase, troponin
  - urine: glucose and ketones
  - ABG
  - ECG (MI is possible precipitant; electrolyte disturbances may predispose to dysrhythmia)
- management
  - rehydration
    - ♦ bolus of NS, then high rate NS infusion (beware of overhydration and cerebral edema, especially in pediatric patients)
    - ♦ beware of a pseudohyponatremia due to hyperglycemia (add 3  $\text{Na}^+$  per 10 glucose over 5.5 mmol/L)
  - potassium
    - ♦ essential to avoid hypokalemia: replace KCl (20 mEq/L if adequate renal function and initial  $\text{K}^+ < 5.5$  mmol/L)
    - ♦ use cardiac monitoring if potassium levels normal or low

### Clinical Criteria to Prevent Unnecessary Diagnostic Testing in Emergency Department Patients with Suspected Pulmonary Embolism

**Purpose:** To develop PE rule-out criteria (PERC) that can be used at the bedside, and prevents overtesting for PE, which includes the D-dimer test that frequently results in false positives.

**Study:** 21 variables were collected prospectively from 3,148 ER patients evaluated for possible PE to develop rule-out criteria. The application of the developed rules was investigated in 1,427 low-risk patients and 382 very low-risk patients.

**Results:** Eight variables were included in a block rule (age <50 yr, pulse <100 bpm,  $\text{SaO}_2 > 94\%$ , no unilateral leg swelling, no hemoptysis, no recent trauma or surgery, no prior PE or DVT, no hormone use) and a negative score was used to rule-out PE. In low-risk and very low-risk patients, the rule had a sensitivity of 96 and 100%, respectively and a specificity of 27 and 15%, respectively.

**Summary:** D-dimer testing for PE may not be favourable if all eight factors in the PERC are negative.

### Oral Rivaroxaban for the Treatment of Symptomatic Pulmonary Embolism

*NEJM* 2012;366:1287-1297

**Background:** Evidence supporting rivaroxaban as effective therapy in DVT may also apply to simplify treatment of PE.

**Methods:** A randomized, open-label, event-driven, non-inferiority trial involving 4,832 patients with acute symptomatic PE with or without DVT, was undertaken to compare rivaroxaban (15 mg twice daily for 3 wk, followed by 20 mg once daily) with standard therapy of enoxaparin followed by an adjusted-dose vitamin K antagonist.

**Results:** Rivaroxaban was non-inferior to standard therapy (non-inferiority margin, 2.0;  $p=0.003$ ) for preventing recurrent VTE (HR: 1.12; 95% CI 0.75-1.68). Major bleeding occurred less in the rivaroxaban group (hazard ratio, 0.49; 95% CI 0.31-0.79;  $p=0.003$ ). Rates of other adverse events were similar in the two groups.

**Conclusions:** A fixed-dose regimen of rivaroxaban alone was non-inferior to standard therapy for the initial and long-term treatment of PE.

### Oral Rivaroxaban for the Treatment of Symptomatic Venous Thromboembolism

*NEJM* 2010;363:2499-2510

**Background:** Rivaroxaban, an oral factor Xa inhibitor, hypothesized to provide a simple, fixed-dose regimen for treating acute DVT and for continued treatment, without the need for laboratory monitoring.

**Methods:** An open-label, randomized, event-driven, non-inferiority study compared oral rivaroxaban alone (15 mg twice daily for 3 wk, followed by 20 mg once daily) with subcutaneous enoxaparin followed by vitamin K antagonist in patients with acute, symptomatic DVT (sample size: 3,449 patients). In parallel, a double-blind, randomized, event-driven superiority study was conducted to compare rivaroxaban alone (20 mg once daily) versus placebo in patients who had received treatment for VTE (sample size: 602 patients in intervention vs 594 in placebo group).

**Results:** Rivaroxaban had non-inferior efficacy with respect to recurrent VTE (HR: 0.68 95%CI: 0.44-1.04). Similar bleeding prevalence were reported in each group. In the parallel continued-treatment study, rivaroxaban had superior efficacy with respect to preventing VTE (HR: 0.18 95%CI 0.09-0.39). Four patients in the rivaroxaban group had nonfatal major bleeding vs. none in the placebo group ( $p=0.11$ ).

**Conclusions:** Rivaroxaban offers a single-drug approach to treatment of VTE that may improve the benefit-to-risk profile of anticoagulation.

- insulin
  - ♦ critical, as this is the only way to turn off gluconeogenesis/ketosis
  - ♦ do not give insulin if  $K^+ < 3.3$  mmol/L
  - ♦ initial bolus of 5-10 U short-acting/regular insulin (or 0.2 U/kg) IV in adults (controversial – may just start with infusion)
  - ♦ followed by continuous infusion at 5-10 U (or 0.1 U/kg) per hour
  - ♦ once the blood glucose  $< 14$  mmol/L, patient should receive their regular insulin SC injection and the infusion stopped in 1 hour
  - ♦ add D5W to IV fluids when blood glucose  $< 15$  mmol/L to prevent hypoglycemia
- bicarbonate is not given unless patient is at risk of death or shock (typically pH  $< 7.0$ )

### Hyperosmolar Hyperglycemic State

- state of extreme hyperglycemia (44-133.2 mmol/L) due to relative insulin deficiency, counter-regulatory hormones excess, gluconeogenesis, and dehydration (due to osmotic diuresis)
- clinical presentation
  - often older, Type 2 DM patients with more co-morbid illnesses and larger fluid losses with symptoms evolving over days to weeks, less GI symptoms and more neurological deficits than DKA including: mental disturbances, coma, delirium, seizures
  - polyuria, N/V
- investigations
  - blood work: CBC, electrolytes,  $Ca^{2+}$ ,  $Mg^{2+}$ ,  $PO_4^{3-}$ , Cr, BUN, glucose, ketones, osmolality
  - urine: glucose and ketones
  - ABG
  - find underlying cause: ECG, CXR, blood and urine C&S
- management
  - rehydration with IV NS (total water deficit estimated at average 100 cc/kg body weight)
  - $O_2$  and cardiac monitoring, frequent electrolyte and glucose monitoring
  - insulin is controversial
  - identify and treat precipitant if present (the 5 Is)

### Hypoglycemia

- characterized by Whipple's triad: low plasma glucose, symptoms suggestive of hypoglycemia, prompt resolution of symptoms with glucose
- clinical presentation
  - neuroglycopenic symptoms: headaches, confusion, seizures, coma
  - autonomic symptoms: diaphoresis, nausea, hunger, tachycardia, palpitations
- history and physical exam
  - last meal, known DM, prior similar episodes, drug therapy, and compliance
  - liver/renal/endocrine/neoplastic disease
  - depression, alcohol or drug use
- management
  - IV access and rapid blood glucose measurement
  - D50W 50 mL IV push, glucose PO if mental status permits
  - if IV access not possible, glucagon 1-2 mg IM, repeat x 1 in 10-20 min
  - $O_2$ , cardiac, frequent blood glucose monitoring
  - thiamine 100 mg IM
  - full meal as soon as mental status permits
  - if episode due to long-acting insulin, or sulfonylureas, watch for prolonged hypoglycemia due to long  $t_{1/2}$  (may require admission for monitoring)
  - search for cause (most often due to exogenous insulin, alcohol, or sulfonylureas)

#### 4 Criteria for DKA Dx

- Hyperglycemia
- Metabolic acidosis
- Hyperketonemia
- Ketonuria

#### Signs and Symptoms of DKA

- D: Diuresis, dehydration, drowsy, delirium, dizziness
- K: Kussmaul's breathing, ketotic breath
- A: Abdominal pain, anorexia

#### Precipitating Factors in DKA

##### The 5 Is

- Infection
- Ischemia
- Infarction
- Intoxication
- Insulin missed

#### Causes of Hypoglycemia

- Most common: excessive insulin use in setting of poor PO intake
- Common: alcohol intoxication, sepsis, liver disease, oral anti-hyperglycemics
- Rare: insulinomas, hypopituitarism, adrenal insufficiency, med side effects

Cerebral edema may occur if hyperosmolality is treated too aggressively

## Electrolyte Disturbances

- see [Nephrology, NP7](#) and [Endocrinology, E36](#)

Table 20. Electrolyte Disturbances

Electrolyte Disturbance	Common Causes	Symptoms	Treatment	Special Considerations
<b>Hypernatremia</b> Inadequate H <sub>2</sub> O intake (elderly/disabled) or inappropriate excretion of H <sub>2</sub> O (diuretics, Li, and DI)		Lethargy, weakness, irritability, and edema; seizures and coma occur with severe elevations of Na <sup>+</sup> levels (> 158 mmol/L)	Salt restrict and give free water	No more than 12 mmol/L in 24 h drop in Na <sup>+</sup> (0.5 mmol/L/h) due to risk of cerebral edema, seizures, death
<b>Hyponatremia</b>	Hypovolemic (GI, renal, skin, blood fluid loss), euvolemic (SIADH/stress, adrenal insufficiency, hypothyroid, diet/intake), hypervolemic (CHF, cirrhosis, nephrotic syndrome)	Neurologic symptoms 2° to cerebral edema, headache, decreased LOC, depressed reflexes; chronic milder than acute	Water restrict/NPO; Seizure/Coma: 100cc 3% NaCl; Treat hypovolemia with RL and hypervolemia with furosemide	Limit total rise to 8 mmol/L in 24 h (0.5 mmol/L/h maximum) as patients are at risk of central pontine myelinolysis
<b>Hyperkalemia</b>	Rhabdomyolysis, insulin deficiency, metabolic acidosis (e.g. acute renal failure, missed dialysis)	Nausea, palpitations, muscle stiffness, areflexia	Protect heart: calcium gluconate Shift K <sup>+</sup> into cells: D50W + Insulin, NaHCO <sub>3</sub> , salbutamol Remove K <sup>+</sup> : Fluids + furosemide, dialysis	High risk of dysrhythmia - ECG: peaked/narrow T wave, decreased P wave, prolonged PR interval, widening of QRS, AV block, VFib
<b>Hypokalemia</b>	Metabolic alkalosis (e.g. diarrhea), insulin, diuretics, anorexia, salbutamol	N/V, fatigue, muscle cramps, constipation	K-Dur®, K <sup>+</sup> sparing diuretics, IV solutions with 20-40 mEq/L KCl over 3-4 h	ECG: U waves most important, flattened/inverted T waves, prolonged QT, depressed ST May need to restore Mg <sup>2+</sup>
<b>Hypercalcemia</b>	Hyper-PTH and malignancy account for ~90% of cases	Multisystem including CVS, GI (groans), renal (stones), rheumatological, MSK (bones), psychiatric (moans)	Isotonic saline (+ furosemide if hypervolemic) Bisphosphonates, dialysis, chelation (EDTA or oral PO. <sup>3</sup> )	Patients with more severe or symptomatic hypercalcemia are usually dehydrated and require saline hydration as initial therapy
<b>Hypocalcemia</b>	Iatrogenic, low Mg <sup>2+</sup> , liver dysfunction, 1° hypo-PTH	Laryngospasm, hyperreflexia, paresthesia, tetany, Chvostek's and Trousseau's sign	Acute (ionized Ca <sup>2+</sup> <0.7 mM) requires immediate treatment: IV calcium gluconate 1-2 g in 10-20 min followed by slow infusion	Prolonged QT interval can arise, leading to dysrhythmia as can upper airway obstruction

## Hypertensive Emergencies

### Hypertensive Emergency (Hypertensive Crisis)

- definition: severe elevation of BP with evidence of end-organ damage (CNS, retinal, CVS, renal, GI)
- etiology
  - essential HTN, emotional exertion, pain, use of sympathomimetic drugs (cocaine, amphetamine, etc.), MAOI use with ingestion of tyramine-containing food (cheese, red wine, etc.), pheochromocytoma, pregnancy
- clinical presentation

**HELLP Syndrome** (seen only in preeclampsia/eclampsia)  
Hemolytic anemia  
Elevated Liver enzymes  
Low Platelet count

Table 21. Signs and Symptoms of Hypertensive Emergencies

	CNS	Retinal	Renal	Cardiovascular	Gastrointestinal
<b>Complication</b>	Stroke/TIA, headache, altered mental status, seizures, hemorrhage	Vision change, hemorrhage, exudates, papilledema	Nocturia, elevated Cr, proteinuria, hematuria, oliguria	Ischemia/angina, infarction, dissection (back pain), CHF	N/V, abdominal pain, elevated liver enzymes

- investigations
  - blood work: CBC, electrolytes, BUN, Cr
  - urinalysis
  - peripheral blood smear: to detect microangiopathic hemolytic anemia
  - CXR: if SOB or chest pain
  - ECG, troponins, CK: if chest pain
  - CT head: if neurological findings or severe headache
  - toxicology screen if sympathomimetic overdose suspected
- management
  - in general, the strategy for management is to gradually and progressively reduce BP in 24-48 h
  - lower BP by 25% over the initial 60 min by initiating antihypertensive therapy (usually nitroprusside and labetalol)
  - if preeclampsia, immediately consult OB/GYN (see [Obstetrics, OB24](#))
  - establish arterial line; transfer to ICU for further reduction in BP under monitored setting
  - in case of ischemic stroke: do not rapidly reduce BP, maintain BP > 150/100 for 5 d
  - in case of aortic dissection: rapid reduction of sBP to 110-120 STAT (do not resuscitate with IV fluids)
  - in case of excessive catecholamines: avoid β-blockers (except labetalol)
  - in case of ACS: address ischemia initially, then BP

### Catecholamine-Induced Hypertensive Emergencies

Avoid use of non-selective β-blockers as they inhibit β-mediated vasodilation and leave α-adrenergic vasoconstriction unopposed

## Hypertensive Urgency

- definition: severely elevated BP (usually sBP >180, dBP >110) with no evidence of end-organ damage
- most commonly due to non-adherence with medications
- treatment: initiate/adjust antihypertensive therapy, monitor in ED (up to 6 h) and discharge with follow up for 48-72 h
- goal: differentiate hypertensive emergencies from hypertensive urgencies

With CNS manifestations of severe HTN, it is often difficult to differentiate causal relationships (i.e. HTN could be secondary to a cerebral event with an associated Cushing reflex)

**Table 22. Commonly Used Agents for the Treatment of Hypertensive Crisis**

Drug	Dosage	Onset of Action	Duration of Action	Adverse Effects*	Special Indications
<b>VASODILATORS</b>					
Sodium Nitroprusside (vascular smooth muscle dilator) 1st line	0.25-10 µg/kg/min	Immediate	3-5 min	N/V, muscle twitching, sweating, cyanide intoxication, coronary steal syndrome	Most hypertensive emergencies (especially CHF, aortic dissection) Use in combination with β-blockers (e.g. esmolol) in aortic dissection Caution with high ICP and azotemia
Nicardipine (CCB)	2 mg IV bolus, then 4 mg/kg/h IV	15-30 min	40 min	Tachycardia, headache, flushing, local phlebitis (e.g. encephalopathy, RF, eclampsia, sympathetic crisis)	Most hypertensive emergencies Caution with acute CHF
Fenoldopam Mesylate (dopamine receptor antagonist)	0.05-0.1 µm/kg/min IV	<5 min	8-10 min	Tachycardia, headache, nausea, flushing (e.g. acute RF)	Most hypertensive emergencies Caution with glaucoma
Enalapril (ACEI)	0.625-1.25 mg IV q6h	15-30 min	12-24 h	Theoretical fall in pressure in high renin states not seen in studies	Acute LV failure Avoid in acute MI, pregnancy, acute RF
Nitroglycerin	5-20 µg/min IV	1-2 min	3-5 min	Hypotension, bradycardia, headache, lightheadedness, dizziness	MI/pulmonary edema
Hydralazine	5-10 mg IV/IM q20min (max 20 mg)	5-20 min	2-6 h	Dizziness, drowsiness, headache, tachycardia, Na <sup>+</sup> retention	Eclampsia
<b>ADRENERGIC INHIBITORS</b>					
Labetalol	20 mg IV bolus q10min or 0.5-2 mg/min	5-10 min	3-6 h	Vomiting, scalp tingling, burning in throat, dizziness, nausea, heart block, orthostatic hypotension	Most hypertensive emergencies (especially eclampsia) Avoid in acute CHF, heart block > 1st degree
Esmolol	250-500 µg/kg/min 1 min, then 50 µg/kg/min for 4 min; repeat	1-2 min	10-20 min	Hypotension, nausea, bronchospasm	Aortic dissection, acute MI SVT dysrhythmias, perioperative HTN Avoid in acute CHF, heart block > 1st degree
Phentolamine	5-15 mg q5-15min	1-2 min	3-10 min	Tachycardia, headache, flushing	Catecholamine excess (e.g. pheochromocytoma)

\*Hypotension may occur with all of these agents

## Acute Coronary Syndrome

- see [Cardiology and Cardiac Surgery, C27](#)
- definition: new onset of chest pain, or acute worsening of previous chest pain, or chest pain at rest with:
  - negative cardiac biomarkers and no ECG changes = Unstable angina (UA)
  - positive cardiac biomarkers (elevated troponin) and no ECG changes = NSTEMI
  - positive cardiac biomarkers (elevated troponin) and ST segment elevation on ECG = STEMI
- investigations
  - ECG STAT (as soon as ACS is suspected on history), troponin (2-6 hours after symptom onset), CXR (to rule out other causes)
- management
  - stabilize: ABCs, oxygen, IV access, cardiac monitors, oximetry
  - ASA 162-325 mg chewed and swallowed
  - nitroglycerin 0.3 mg SL q5min x 3; IV only if persistent pain, CHF, or hypertensive
    - ♦ contraindications: hypotension, phosphodiesterase inhibitor use, right ventricular infarctions (1/3 of all inferior MIs)

- anticoagulation: choice of anticoagulation (unfractionated heparin, LMWH, or fondaparinux) and additional antiplatelet therapy (clopidogrel, ticagrelor, or prasugrel) depends on STEMI vs. NSTEMI and reperfusion strategy
- early cardiology consult for reperfusion therapy
  - ◆ UA/NSTEMI: early coronary angiography recommended if high TIMI risk score
  - ◆ STEMI: primary percutaneous coronary intervention (within 90 min) preferred; thrombolytics if unavailable within 120 min of medical contact, symptoms <12 hr and no contraindications
- atorvastatin 80 mg to stabilize plaques
- β-blocker if no signs of CHF, hemodynamic compromise, bradycardia or severe reactive airway disease
- ACEI initiated within 24 hours

## Sepsis

- see [Infectious Diseases, ID21](#) and [Respirology, R33](#)
- definitions
  - SIRS: Two or more of: 1) T < 36 or > 38; 2) Pulse > 90 bpm; 3) RR > 20 breaths per min (or PaCO<sub>2</sub> < 30 mmHg); 4) WBC > 12 x 10 cells/L<sup>9</sup>, or < 4 x 10 cells/L<sup>9</sup>, or > 10% bands
  - sepsis: SIRS in response to infection
  - severe sepsis: sepsis and signs of organ dysfunction (altered mental status, lung injury, renal failure, coagulopathy, decreased urine output, lactic acidosis, liver failure)
  - septic shock: severe sepsis and hypotension (sBP <90) unresponsive to IV crystalloid fluid bolus
- management
  - early recognition of sepsis and investigations to locate source of infection
  - identify severe sepsis with lactate or evidence of tissue hypoperfusion
  - treatment priorities
    - ◆ ABCs, monitors, lines
    - ◆ aggressive fluid resuscitation; consider ventilatory and inotropic support
    - ◆ cultures, then early empiric appropriate antibiotics - consider broad spectrum and atypical coverage
    - ◆ source control - e.g. remove infected Foley or surgery for ischemic gut
    - ◆ monitor adequate resuscitation with vital signs, inferior vena cava on U/S, and serial lactates

## Stroke and TIA

- see [Neurology, N48](#)
- definitions
  - stroke: sudden loss of brain function due to ischemia (80%) or hemorrhage (20%) with persistence of symptoms >24 hr or neuroimaging evidence
  - TIA: transient episode of neurologic dysfunction from focal ischemia without acute infarction typically lasting <1 h, but defined as <24 h
- clinical presentation

**Table 23. Signs and Symptoms of Stroke**

	General	Language/ Throat	Vision	Coordination	Motor	Sensation	Reflex
<b>Signs/ Symptoms</b>	Decreased LOC, changed mental status, confusion, neglect	Dysarthria, aphasia, swallowing difficulty	Diplopia, eye deviation, asymmetric pupils, visual field defect	Ataxia, intention tremor, lack of coordination	Increased tone, loss of power, spasticity	Loss of sensation	Hyper-reflexia, clonus

- patients with hemorrhagic stroke can present with sudden onset thunderclap headache that is usually described as “worst headache of life”
- stroke mimics: seizure, migraine, hypoglycemia, Todd’s paresis, peripheral nerve injury, Bell’s palsy, tumour, syncope

**Table 24. Stroke Syndromes**

Region of Stroke	Stroke Syndrome
<b>Anterior Cerebral Artery</b>	Primarily frontal lobe function affected Altered mental status, impaired judgment, contralateral lower extremity weakness and hypoaesthesia, gait apraxia
<b>Middle Cerebral Artery</b>	Contralateral hemiparesis (arm and face weakness > leg weakness) and hypoaesthesia, ipsilateral hemianopsia, gaze preference to side of lesion ± agnosia, receptive/expressive aphasia
<b>Posterior Cerebral Artery</b>	Affects vision and thought Homonymous hemianopsia, cortical blindness, visual agnosia, altered mental status, impaired memory
<b>Vertebrobasilar Artery</b>	Wide variety of cranial nerve, cerebellar, and brainstem deficits: vertigo, nystagmus, diplopia, visual field deficits, dysphagia, dysarthria, facial hypoaesthesia, syncope, ataxia Loss of pain and temperature sensation in ipsilateral face and contralateral body

### 7 Causes of Emboli from the Heart

- AFib
- MI
- Endocarditis
- Valvular disease
- Dilated cardiomyopathy
- Left heart myxoma
- Prosthetic valves

### Differentiation of UMN Disease vs. LMN Disease

Category	UMN Disease	LMN Disease
Muscular deficit	Muscle groups	Individual muscles
Reflexes	Increased	Decreased/absent
Tone	Increased	absent
Fasciculations	Absent	Decreased
Atrophy	Absent/minimal	Present
Babinski	Upgoing	Downgoing

### Investigations

- CBC, electrolytes, blood glucose, coagulation studies ± cardiac biomarkers ± toxicology screen
- non-contrast CT head: look for hemorrhage, ischemia
- ECG ± echocardiogram: rule out AFib, acute MI as source of emboli
- other imaging: carotid Dopplers, CTA, MRA as appropriate

### Management

- ABCs; intubation with RSI if GCS ≤8, rapidly decreasing GCS, or inadequate airway protection reflexes
- thrombolysis: immediate assessment for eligibility; need acute onset, <4.5 h from drug administration time AND compatible physical findings AND normal CT with no bleed
- elevating head of bed if risk of elevated ICP, aspiration, or worsening cardiopulmonary status
- NPO, IV ± cardiac monitoring
  - judge fluid rate carefully to avoid overhydration (cerebral edema) as well as underhydration (underperfusion of the ischemic penumbra)
- BP control: only treat severe HTN (sBP >200, dBP >120, mean arterial BP >140) or HTN associated with hemorrhagic stroke transformation, cardiac ischemia, aortic dissection, or renal damage; use IV nitroprusside or labetalol
- glycemic control: keep fasting glucose <6.5 in acute phase (5 d)
- cerebral edema control: hyperventilation, mannitol to decrease ICP if necessary
- consult neurosurgery, neurology, medicine as indicated

### Medications

- acute ischemic stroke: thrombolytics (rt-PA, e.g. alteplase) if within 4.5 h of symptom onset with no evidence of hemorrhage on CT scan
- antiplatelet agents: prevent recurrent stroke or stroke after TIAs, e.g. Aspirin® (1st line); clopidogrel, Aggrenox® (2nd line)
- anticoagulation: DVT prophylaxis if immobile; treat AFib if present
- follow-up for consideration of carotid endarterectomy, cardiovascular risk optimization

If patient presents within 4.5 h of onset of disabling neurological deficits greater than 60 min with no signs of resolution, they may be a candidate for thrombolysis. Do brief assessment and order stat CT head

#### Absolute Exclusion Criteria for tPA

- Suspected subarachnoid hemorrhage
- Previous intracranial hemorrhage
- Cerebral infarct or severe HI within the past 3 mo
- Recent LP or arterial puncture at non-compressible site
- Brain tumour
- Metastatic cancer diagnosis
- BP >185 mmHg systolic, or >110 mmHg diastolic
- Bleeding diathesis
- Prolonged PT > 15 s or INR >1.7
- Platelet count <100,000
- Blood glucose <2.8 or >22 mmol/L
- Intracranial hemorrhage on CT or large volume infarct
- Previously ADL dependent (clinical judgment)
- Seizure at onset causing postictal impairments

#### Relative Exclusion Criteria for tPA

- Only minor or rapidly improving symptoms
- Very severe symptoms (NIHSS > 22) or coma
- Major surgery within the past 14 d
- GI or urinary hemorrhage within the past 21 d

## Otolaryngological Presentations and Emergencies

- see [Otolaryngology, OT6](#)
- ear associated symptoms: otalgia, aural fullness, otorrhea, hearing loss, tinnitus, vertigo, pruritis, fever
- risk factors: Q-tip use, hearing aids, headphones, occupational noise exposure

### Dizziness and Vertigo

- distinguish four types of dizziness: vertigo (“room spinning”), lightheadedness (“disconnected from environment”), presyncope (“almost blacking out”), dysequilibrium (“unstable, off-balance”)
- broad differential and diverse management (see [Family Medicine, FM25](#); [Otolaryngology, OT6](#))
- consider medication adverse effects

### Otalgia (see [Otolaryngology, OT6](#))

- differential diagnosis
  - infections: acute otitis externa, acute otitis media, otitis media with effusion, mastoiditis, myringitis, malignant otitis in diabetics, herpes simplex/zoster, auricular cellulitis, external canal abscess, dental disease
  - others: trauma, temporomandibular joint dysfunction, neoplasm, foreign body, cerumen impactions, trigeminal neuralgia, granulomatosis with polyangiitis
- observe for otorrhea, palpation of outer ear/mastoid, otoscope to see bulging erythematous tympanic membrane, perforation
- C&S of ear canal discharge, if present
- CT head if suspicion of mastoiditis, malignant otitis externa
- antibiotics/antifungals/antivirals for respective infections

### Hearing Loss (see [Otolaryngology, OT7](#))

- differentiate conductive versus sensorineural hearing loss
- rule out sudden sensorineural hearing loss (SNHL), a medical emergency requiring high dose steroids and urgent referral
- in elderly, unilateral tinnitus or SNHL is acoustic neuroma until proven otherwise
- consider audiogram and referral or follow-up with family physician

## Epistaxis

- see [Otolaryngology, OT26](#)
- 90% of nosebleeds stem from the anterior nasal septum (at Kiesselbach's plexus located in Little's area)
- can be life-threatening

### Etiology

- most commonly caused by trauma (digital, blunt, foreign bodies)
- other causes: barometric changes, nasal dryness, chemicals (cocaine, Otrivin\*), or systemic disease (coagulopathies, HTN, etc.)

### Investigations

- blood work: CBC, PT/PTT (as indicated)
- imaging: X-ray, CT as needed

### Treatment

- aim is to localize bleeding and achieve hemostasis
- first-aid: ABCs, clear clots by blowing nose or suctioning, lean forward, pinch cartilaginous portion of nose for 20 min twice
- assess blood loss: vitals, IV NS, cross match 2 units pRBC if significant
- if first aid measures fail twice, proceed to packing
- apply an anterior pack
  - clear nose of any clots
  - apply topical anesthesia/vasoconstrictors (lidocaine with epinephrine, cocaine, or soaked pledgets)
  - insert either a traditional Vaseline® gauze pack or a commercial nasal tampon or balloon
  - if bleeding stops, arrange follow-up in 48-72 h for reassessment and pack removal
  - if packing both nares, prophylactic anti-staphylococcal antibiotics to prevent sinusitis or toxic shock syndrome
  - if bleeding is controlled with anterior pressure, cautery with silver nitrate can be performed if the site of bleeding is identified (one side of septum only because if both are cauterized this can lead to septal perforation)
- if suspect posterior bleed or anterior packing does not provide hemostasis, consult ENT for posterior packing and further evaluation
  - posterior packing requires monitoring because can cause significant vagal response and posterior bleeding source can lead to significant blood loss, therefore usually requires admission

### Disposition

- discharge: discharged upon stabilization and appropriate follow-up; educate patients about prevention (e.g. humidifiers, saline spray, topical ointments, avoiding irritants, managing HTN)
- admission: severe cases of refractory bleeding, and most cases of posterior packing

Thrombocytopenic patients – use resorbable packs to avoid risk of re-bleeding caused by pulling out the removable pack

#### Complications of Nasal Packing

- Hypoxemia
- Toxic-shock syndrome
- Aspiration
- Pharyngeal fibrosis/stenosis
- Alar/septal necrosis

## Gynecologic/Urologic Emergencies

### Vaginal Bleeding

- see [Gynecology, GY10](#) and [Obstetrics, OB13](#)

### Etiology

- pregnant patient
  - 1st/2nd trimester pregnancy: ectopic pregnancy, abortion (threatened, incomplete, complete, missed, inevitable, septic), molar pregnancy, implantation bleeding, friable cervix (most common cause)
  - 2nd/3rd trimester pregnancy: placenta previa, placental abruption, premature rupture of membranes, preterm labour
  - other: trauma, bleeding cervical polyp, passing of mucous plug
- postpartum
  - postpartum hemorrhage, uterine inversion, retained placental tissue, endometritis
- non-pregnant patients
  - dysfunctional uterine bleeding, uterine fibroids, pelvic tumours, trauma, endometriosis, PID, exogenous hormones

### History

- characterize bleeding (frequency, duration, number of pads/tampons, cyclicity)
- pain, if present (OPQRSTU)
- menstrual history, sexual history, STI history, syncope/pre-syncope
- details of pregnancy, including gush of fluid and fetal movement (>20 wk)

### Physical Exam

- ABC (especially noting postural BP/HR and mucous membrane)
- abdominal examination (peritoneal signs, tenderness, distension, mass)
- speculum examination (NOT IF 2nd/3rd trimester bleeding; perform only when placenta previa is ruled out with U/S)
  - look for active bleeding, trauma/anomaly, and cervical dilatation
  - use sterile speculum if pregnant
- bimanual examination (cervical tenderness, size of uterus, cervical length/dilatation)
- sterile gloves if pregnant

Vaginal bleeding can be life-threatening  
Always start with ABCs and ensure your patient is stable

### Investigations

- $\beta$ -hCG test for all patients with childbearing potential
- CBC, blood and Rh type, quantitative  $\beta$ -hCG, PTT, INR
- type and cross if significant blood loss
- transvaginal U/S (rule out ectopic pregnancy and spontaneous abortion)
- abdominal U/S (rule out placenta previa and fetal demise)
- postpartum
  - U/S for retained products
  - $\beta$ -hCG if concerned about retained tissue

### Management

- ABCs
- pulse oximeter and cardiac monitors if unstable
- Rh immune globulin (Rhogam<sup>®</sup>) for vaginal bleeding in pregnancy and Rh-negative mother
- 1st/2nd trimester pregnancy
  - ectopic pregnancy: definitive treatment with surgery or methotrexate
  - intrauterine pregnancy, no concerns of coexistent ectopic: discharge patient with obstetrics follow-up
  - U/S indeterminate or  $\beta$ -hCG >1,000-2,000 IU: further workup and/or gynecology consult
  - abortions: if complete, discharge if stable; for all others, acquire gynecology consult
- 2nd/3rd trimester pregnancy
  - placenta previa or placental abruption: obstetrics consult for possible admission
- postpartum
  - manage ABCs: start 2 large bore IV rapid infusion, type and cross 4 units of blood, consult OB/GYN immediately
- non-pregnant
  - dysfunctional uterine bleeding (prolonged or heavy flow  $\pm$  breakthrough bleeding and without ovulation, a diagnosis of exclusion)
    - ◆ <35-40 yr of age: Provera<sup>®</sup> 10 mg PO OD x 10 d, warn patient of a withdrawal bleed, discharge if stable
    - ◆ if unstable, admit for IV hormonal therapy, possible D&C
    - ◆ >35-40 yr of age: uterine sampling necessary prior to initiation of hormonal treatment to rule out endometrial cancer, U/S for any masses felt on exam
    - ◆ tranexamic acid (Cyklokapron<sup>®</sup>) to stabilize clots
  - structural abnormalities: fibroids or uterine tumours may require excision for diagnosis/treatment, U/S for workup of other pelvic masses, Pap smear/biopsy for cervical lesions

### Disposition

- decision to admit or discharge should be based on the stability of the patient, as well as the nature of the underlying cause; consult gynecology for admitted patients
- if patient can be safely discharged, ensure follow-up with family physician or gynecologist
- instruct patient to return to ED for increased bleeding, presyncope

Need  $\beta$ -hCG  $\geq 1,200$  to see intrauterine changes on transvaginal U/S

An ectopic pregnancy can be ruled out by confirming an intrauterine pregnancy by bedside U/S unless the patient is using IVF due to the high risk of heterotopic pregnancy

Vaginal bleeding (and its underlying causes) can be a very distressing event for patients; ensure appropriate support is provided

## Pregnant Patient in the ED

Table 25. Complications of Pregnancy

Trimester	Fetal	Maternal
<b>First</b> 1-12 wk	Pregnancy failure Spontaneous abortion Fetal demise Gestational trophoblastic disease	Ectopic pregnancy Anemia Hyperemesis gravidarum UTI/pyelonephritis
<b>Second</b> 13-27 wk	Disorders of fetal growth IUGR Oligo/polyhydramnios	Gestational DM Rh incompatibility UTI/pyelonephritis
<b>Third</b> 28-41 wk	Vasa previa	Preterm labour/PPROM Preeclampsia/eclampsia Placenta previa Placental abruption Uterine rupture DVT

## Nephrolithiasis (Renal Colic)

- see [Urology, U17](#)

### Epidemiology and Risk Factors

- 10% of population (twice as common in males)
- recurrence 50% at 5 yr
- peak incidence 30-50 yr of age
- 75% of stones <5 mm pass spontaneously within 2 wk, larger stones may require consultation

### Clinical Features

- urinary obstruction → upstream distention of ureter or collecting system → severe colicky pain
- may complain of pain at flank, groin, testes, or tip of penis
- writhing, never comfortable, N/V, hematuria (90% microscopic), diaphoresis, tachycardia, tachypnea
- occasionally symptoms of trigonal irritation (frequency, urgency)
- fever, chills, rigors in secondary pyelonephritis
- peritoneal findings/anterior abdominal tenderness usually absent

### Differential Diagnosis of Renal Colic

- acute ureteric obstruction
- acute abdomen: biliary, bowel, pancreas, AAA
- urogynecological: ectopic pregnancy, torsion/rupture of ovarian cyst, testicular torsion
- pyelonephritis (fever, chills, pyuria, vomiting)
- radiculitis (L1): herpes zoster, nerve root compression

### Investigations

- screening
- CBC: elevated WBC in presence of fever suggests infection
- electrolytes, Cr, BUN to assess renal function
- U/A: R&M (WBCs, RBCs, crystals), C&S
- imaging
- non-contrast spiral CT is the study of choice
- abdominal U/S may demonstrate stone or hydronephrosis (consider in females of childbearing age)
- AXR will identify large radioopaque stones (calcium, struvite, and cystine stones) but may miss smaller stones, uric acid stones, or stones overlying bony structures; consider as an initial investigation in patients who have a history of radioopaque stones and similar episodes of acute flank pain (CT necessary if film is negative)
- strain all urine stone analysis

### Management

- analgesics: NSAIDs (usually ketorolac [Toradol\*], preferable over opioids), antiemetics, IV fluids
- urology consult may be indicated, especially if stone >5 mm, or if patient has signs of obstruction or infection
- α-blocker (e.g. tamsulosin) may be helpful to increase stone passage in select cases

### Disposition

- most patients can be discharged
- ensure patient is stable, has adequate analgesia, and is able to tolerate oral medications
- may advise hydration and limitation of protein, sodium, oxalate, and alcohol intake

#### Kidney Stones

- 80% Calcium oxalate
- 10% Struvite
- 10% Uric acid

#### Obstruction + Infection

- = Urological Emergency
- Urgent urology consult

#### Indications for Admission to Hospital

- Intractable pain
- Fever (suggests infection) or other evidence of pyelonephritis
- Single kidney with ureteral obstruction
- Bilateral obstructing stones
- Intractable vomiting
- Compromised renal function

## Ophthalmologic Emergencies

- see [Ophthalmology, OP5](#)

### History and Physical Exam

- patient may complain of pain, tearing, itching, redness, photophobia, foreign body sensation, trauma
- mechanism of foreign body insertion – if high velocity injury suspected (welding, metal grinding, metal striking metal), must obtain orbital X-rays, U/S, or CT scan to exclude presence of intraocular metallic foreign body
- visual acuity in both eyes, pupils, extraocular structures, funduscopy, tonometry, slit lamp exam

### Management of Ophthalmologic Foreign Body

- copious irrigation with saline for any foreign body
- remove foreign body under slit lamp exam with cotton swab or sterile needle
- antibiotic drops qid until healed
- patching may not improve healing or comfort – do not patch contact lens wearers
- limit use of topical anesthetic to examination only
- consider tetanus prophylaxis
- ophthalmology consult if globe penetration suspected

Visual acuity is the "vital sign" of the eyes and should ALWAYS be assessed and documented in both eyes when a patient presents to the ER with an ophthalmologic complaint

**Table 26. Differential Diagnosis of Red Eye in the Emergency Department**

Symptom	Possible Serious Etiology
Light sensitivity	Iritis, keratitis, abrasion, ulcer
Unilateral	Above + herpes simplex, acute angle closure glaucoma
Significant pain	Above + scleritis
White spot on cornea	Corneal ulcer
Non-reactive pupil	Acute glaucoma, iritis
Copious discharge	Gonococcal conjunctivitis
Blurred vision	All of the above

**Table 27. Select Ophthalmologic Emergencies**

Condition	Signs and Symptoms	Management
<b>Acute Angle Closure Glaucoma</b>	Unilateral red, painful eye Decreased visual acuity, halos around lights Fixed, mid-dilated pupil N/V Marked increase in IOP (>40 mmHg) Shallow anterior chamber ± cells	Ophthalmology consult for laser iridotomy Topical β-blockers, adrenergics, and cholinergics Systemic carbonic anhydrase inhibitors and hyperosmotic agents
<b>Chemical Burn</b>	Known exposure to acids or alkali (worse) Pain, decreased visual acuity Vascularization or defects of cornea Iris and lens damage	Irrigate at site of accident IV NS drip in ED with eyelid retracted Swab fornices Cycloplegic drops Topical antibiotics and patching
<b>Orbital Cellulitis</b>	Red, painful eye, decreased visual acuity Headache, fever Lid erythema, edema, and difficulty opening eye Conjunctival injection and chemosis Proptosis, ophthalmoplegia ± RAPD	Admission, ophthalmology consult Blood cultures, orbital CT IV antibiotics (ceftriaxone + vancomycin) Drainage of abscess
<b>Retinal Artery Occlusion</b>	Sudden, painless, monocular vision loss RAPD Cherry red spot and retinal pallor on fundoscopy	Restore blood flow <2 h Massage globe Decrease IOP (topical β-blockers, inhaled O <sub>2</sub> /CO <sub>2</sub> mix, IV Diamox®, IV mannitol, drain aqueous fluid)
<b>Retinal Detachment</b>	Flashes of light, floaters, and curtains of blackness/ peripheral vision loss Painless Loss of red reflex, decreased IOP Detached areas are grey ± RAPD	Ophthalmology consult for scleral buckle/ pneumatic retinoplexy

**Contraindications to Pupil Dilation**

- Shallow anterior chamber
- Iris-supported lens implant
- Potential neurological abnormality requiring pupillary evaluation
- Caution with CV disease – mydriatics can cause tachycardia

**Other Ophthalmologic Emergencies**

**Infectious:** Red eye, endophthalmitis, hypopyon

**Trauma:** Globe rupture, orbital blow-out fractures, corneal injuries, eyelid laceration, hyphema, lens dislocation, retrobulbar hemorrhage

**Painful vision loss:** Acute iritis, corneal abrasion, globe rupture, lens dislocation, retrobulbar hemorrhage, optic neuritis, temporal arteritis, endophthalmitis, keratitis

**Painless vision loss:** Central retinal vein occlusion, amaurosis fugax, occipital stroke

## Dermatologic Emergencies

### Rash Characteristics

#### A. Diffuse Rashes

- Staphylococcal Scalded Skin Syndrome (SSSS)
  - ♦ caused by an exotoxin from infecting strain of coagulase-positive *S. aureus*
  - ♦ mostly occurs in children
  - ♦ prodrome: fever, irritability, malaise, and skin tenderness
  - ♦ sudden onset of diffuse erythema: skin is red, warm, and very tender
  - ♦ flaccid bullae that are difficult to see, then desquamate in large sheets
  - ♦ Nikolsky's sign: gentle lateral stroking of skin causes epidermis to separate
- Toxic Epidermal Necrolysis (TEN): >30% of BSA
  - ♦ see **Dermatology, D22**
  - ♦ caused by drugs (e.g. phenytoin, sulfas, penicillins, and NSAIDs), bone marrow transplantation, and blood product transfusions
  - ♦ usually occurs in adults
  - ♦ diffuse erythema followed by necrosis
  - ♦ severe mucous membrane blistering
  - ♦ entire epidermis desquamation
  - ♦ high mortality (>50%)
- Toxic Shock Syndrome (TSS)
  - ♦ see **Infectious Diseases, ID23**
  - ♦ caused by superantigen from *S. aureus* or GAS activating T-cell and cytokines
  - ♦ patient often presents with onset of shock and multi-organ failure, fever
  - ♦ diffuse erythematous macular rash
  - ♦ at least 3 organ systems involved: CNS, respiratory, GI, muscular, mucous membranes, renal, liver, hematologic, and skin (necrotizing fasciitis, gangrene)

- vesicobullous lesions
- Erythema Multiforme (EM)
  - ◆ see [Dermatology, D29](#)
  - ◆ immunologic reaction to herpes simplex
  - ◆ viral prodrome 1-14 d before rash
  - ◆ “target lesion”: central grey bulla or wheal surrounded by concentric rings of erythema and normal skin
- Stevens-Johnson Syndrome (SJS): <10% of BSA
  - ◆ see [Dermatology, D22](#)
  - ◆ related to drugs such as antiepileptics and biologic agents (e.g. infliximab)
  - ◆ EM with constitutional symptoms and mucous membrane involvement (milder mucous membrane involvement than TEN)

### B. Discrete Lesions

- pyoderma gangrenosum
  - ◆ often associated with immunocompromised patients (HIV, leukemia, or lymphoma) with Gram-negative sepsis
  - ◆ often occurs in arms, hands, feet, or perineal region
  - ◆ usually begins as painless macule/vesicle pustule/bulla on red/blue base sloughing, leaving a gangrenous ulcer
- disseminated gonococcal infection
  - ◆ see [Dermatology, D32](#)
  - ◆ fever, skin lesions (pustules/vesicles on erythematous base ~5 mm in diameter), arthritis (joint swelling and tenderness), and septic arthritis (in larger joints, such as knees, ankles, and elbows)
  - ◆ most commonly in gonococcus positive women during menstruation or pregnancy
  - ◆ skin lesions usually appear in extremities and resolve quickly (<7 d)
- meningococemia
  - ◆ flu-like symptoms of headache, myalgia, N/V
  - ◆ petechial, macular, or maculopapular lesions with grey vesicular centres
  - ◆ usually a few millimeters in size, but may become confluent and hemorrhagic
  - ◆ usually appear in extremities, but may appear anywhere
  - ◆ look for signs of meningeal irritation: Brudzinski, Kernig, nuchal rigidity, jolt accentuation

### History and Physical Exam

- determine onset, course, and location of skin lesions
- fever, joint pain
- associated symptoms: CNS, respiratory, GU, GI, renal, liver, mucous membranes
- medication history
- vitals

Thorough dermatologic examinations are required; examination of asymptomatic skin may identify more lesions; ensure adequate draping during dermatologic examinations

### Investigations

- immediate consultation if patient unstable
- CBC, electrolytes, Cr, AST, ALT, ALP, blood culture, skin biopsy, serum immunoglobulin levels (serum IgE)

### Management

- general: judicious IV fluids and electrolyte control, consider vasopressors if hypotensive, prevention of infection
- determine if admission and consult needed: dermatology or infectious diseases
- specific management is determined by etiology
  - SSSS, TSS, DGI, and meningococemia
    - ◆ IV antibiotics
  - EM, SJS, and TEN
    - ◆ stop precipitating medication
    - ◆ fluids
    - ◆ symptomatic treatment: antihistamines, antacids, topical corticosteroids, systemic corticosteroids (controversial), prophylactic oral acyclovir, consider IVIG
    - ◆ TEN: debride necrotic tissue

### Disposition

- most cases will require urgent care and hospitalization
- TEN: early transfer to burn centre improves outcome

# Environmental Injuries

## Heat Exhaustion and Heat Stroke

- predisposing factors: young persons who overexert themselves, older adults who cannot dissipate heat at rest (e.g. using anticholinergic drugs such as antihistamines or TCAs), and patients with schizophrenia who are using anticholinergic or antiepileptic medications

### Heat Exhaustion

- clinical features relate to loss of circulating volume caused by exposure to heat stress
- “water depletion”: heat exhaustion occurs if lost fluid not adequately replaced
- “salt depletion”: heat exhaustion occurs when losses replaced with hypotonic fluid

### Heat Stroke

- life-threatening emergency resulting from failure of normal compensatory heat-shedding mechanisms
- divided into classical and exertional subtypes
- if patient does not respond relatively quickly to cooling treatments, consider other possible etiologies of hyperpyrexia (e.g. meningitis, thyroid storm, anticholinergic poisoning, delirium tremens, other infections)

Table 28. Heat Exhaustion vs. Heat Stroke

	Heat Exhaustion	Classical Heat Stroke	Exertional Heat Stroke
<b>Clinical Features</b>	Non-specific malaise, headache, fatigue Body temp <40.5°C (usually normal) No coma or seizures Dehydration (HR, orthostatic hypotension)	Occurs in setting of high ambient temperatures (e.g. heat wave, poor ventilation) Often patients are older, poor, and sedentary or immobile Dry, hot skin Temp usually >40.5°C Altered mental status, seizures, delirium, or coma May have elevated AST, ALT	Occurs with high endogenous heat production (e.g. exercise) that overwhelms homeostatic mechanisms Patients often younger, more active Skin often diaphoretic Other features as for classical heat stroke, but may also have DIC, acute renal failure, rhabdomyolysis, marked lactic acidosis
<b>Treatment</b>	Rest in a cool environment IV NS if orthostatic hypotension; otherwise replace losses slowly PO	Cool body temperature with water mist (e.g. spray bottle) and standing fans Ice water immersion also effective; monitor body temperature closely to avoid hypothermic overshoot Secure airway because of seizure and aspiration risk Give fluid resuscitation if still hypotensive after above therapy Avoid $\beta$ -agonists (e.g. epinephrine), peripheral vasoconstriction, and antipyretics (e.g. ASA)	

Heat exhaustion may closely resemble heat stroke; heat exhaustion may eventually progress to heat stroke, so if diagnosis is uncertain treat as heat stroke

## Hypothermia and Cold Injuries

### HYPOTHERMIA

- predisposing factors: extremes of age, lack of housing, drug overdose, EtOH ingestion, trauma (incapacitating), cold water immersion, outdoor sports
- treatment based on re-warming and supporting cardiorespiratory function
- complications: coagulopathy, acidosis, ventricular dysrhythmias (VFib), asystole, volume and electrolyte depletion
- labs: CBC, electrolytes, ABG, serum glucose, Cr/BUN,  $Mg^{2+}$ ,  $Ca^{2+}$ , amylase, coagulation profile
- imaging: CXR (aspiration pneumonia, pulmonary edema are common)
- monitors: ECG, rectal thermometer, Foley catheter, NG tube, monitor metabolic status frequently

Table 29. Classification of Hypothermia

Class	Temp	Symptoms/Signs
Mild	32-34.9°C	Tachypnea, tachycardia, ataxia, dysarthria, shivering
Moderate	28-31.9°C	Loss of shivering, dysrhythmias, Osborne (J) waves on ECG, decreased LOC, combative behaviour, muscle rigidity, dilated pupils
Severe	<28°C	Coma, hypotension, acidemia, VFib, asystole, flaccidity, apnea

### Re-warming Options

- gentle fluid and electrolyte replacement in all (due to cold diuresis)
- **passive external re-warming**
  - suitable for most stable patients with core temperature >32.2°C
  - involves covering patient with insulating blanket; body generates heat and re-warms through metabolic process, shivering

#### Afterdrop Phenomenon

Warming of extremities causes vasodilation and movement of cool pooled blood from extremities to core, resulting in a drop in core temperature leading to cardiac arrest

- **active external re-warming**
  - involves use of warming blankets
  - beware of “afterdrop” phenomenon
  - safer when done in conjunction with active core re-warming
- **active core re-warming**
  - generally for patients with core temperature  $<32.2^{\circ}\text{C}$ , and/or with cardiovascular instability
  - avoids “afterdrop” seen with AER alone
  - re-warm core by using
    - ◆ warmed humidified oxygen, IV fluids
    - ◆ peritoneal dialysis with warm fluids
    - ◆ stric/colonic/pleural irrigation with warm fluids
    - ◆ external circulation (cardiopulmonary bypass machine) is most effective and fastest

### Approach to Cardiac Arrest in the Hypothermic Patient

- do all procedures gently or may precipitate VFib
- check pulse and rhythm for at least 1 min; may have profound bradycardia
- **if any pulse at all (even very slow) do NOT do CPR**
- if in VFib try to defibrillate up to maximum 3 shocks if core temperature  $<30^{\circ}\text{C}$
- intubate if required, ventilate with warmed, humidified  $\text{O}_2$
- medications (vasopressors, antidysrhythmics) may not be effective at low temperatures
  - controversial; may try one dose
- focus of treatment is re-warming

### FROSTBITE

#### Classification

- ice crystals form between cells
- classified according to depth – similar to burns (1st to 3rd degree)
- 1st degree
  - symptoms: initial paresthesia, pruritus
  - signs: erythema, edema, hyperemia, no blisters
- 2nd degree
  - symptoms: numbness
  - signs: blistering (clear), erythema, edema
- 3rd degree
  - symptoms: pain, burning, throbbing (on thawing); may be painless if severe
  - signs: hemorrhagic blisters, skin necrosis, edema, no movement

#### Management

- treat for hypothermia:  $\text{O}_2$ , IV fluids, maintenance of body warmth
- remove wet and constrictive clothing
- immerse in  $40\text{--}42^{\circ}\text{C}$  agitated water for 10-30 min (very painful; administer adequate analgesia)
- clean injured area and leave it open to air
- consider aspiration/debridement of blisters (controversial)
- debride skin
- tetanus prophylaxis
- consider penicillin G as frost bite injury has high risk of infection
- surgical intervention may be required to release restrictive eschars
- never allow a thawed area to re-chill/freeze

## Burns

- see [Plastic Surgery, PL17](#)

### Clinical Presentation/Physical Exam Findings

- burn size
  - rule of nines; does not include 1st degree burns
- burn depth
  - superficial (1st degree): epidermis only (e.g. sunburn), painful and tender to palpation
  - superficial partial thickness (2nd degree): extends to epidermis and superficial dermis, blister formation occurs, very painful
  - deep partial thickness (2nd degree): involves hair follicles, sebaceous glands; skin is blistered, exposed dermis is white to yellow, absent sensation
  - full thickness (3rd degree): epidermis and all dermal layers; skin is pale, insensate, and charred or leathery
  - deep (4th degree): involvement of fat, muscle, even bone

### Management

- remove noxious agent/stop burning process
- establish airway if needed (indicated with burns  $>40\%$  BSA or smoke inhalation injury)
- resuscitation for 2nd and 3rd degree burns (after initiation of 2 large bore IVs)

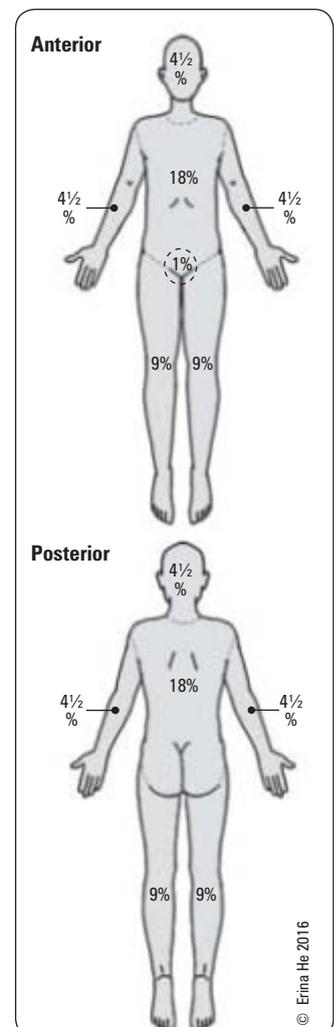

Figure 15. Rule of 9s for total BSA

- fluid boluses if unstable
  - Parkland Formula: Ringer's lactate 4 cc/kg/%BSA burned; give half in first 8 h, half in next 16 h; maintenance fluids are also required if patient cannot tolerate PO hydration
  - urine output is best measure of resuscitation, should be 40-50 cc/h or 0.5 cc/kg/h; avoid diuretics
- pain relief: continuous morphine infusion with breakthrough bolus
- investigations: CBC, electrolytes, U/A, CXR, ECG, ABG, carboxyhemoglobin
- burn wound care: prevent infection, clean/debride with mild soap and water, sterile dressings
- escharotomy or fasciotomy for circumferential burns (chest, extremities)
- topical antibiotics, systemic antibiotics infrequently indicated
- tetanus prophylaxis if burn is deeper than superficial dermis

### Disposition

- admit
  - 2nd degree burns >10% BSA, or any significant 3rd degree burns
  - 2nd degree burns on face, hands, feet, perineum, or across major joints
  - electrical, chemical burns, and inhalation injury
  - burn victims with underlying medical problems or immunosuppressed patients

Use palm of the patient's hand to estimate 1% of BSA affected

#### Burn Causes

- Thermal (flame, scald)
- Chemical
- Radiation (UV, medical/therapeutic)
- Electrical

## Inhalation Injury

### Etiology

- CO or cyanide poisoning
- direct thermal injury: limited to upper airway
- smoke causes bronchospasm and edema from particulate matter and toxic inhalants (tissue asphyxiates, pulmonary irritants, systemic toxins)

### History and Physical Exam

- risk factors: closed space fires, period of unconsciousness, noxious chemicals involved
- cherry red skin (unreliable, usually post-mortem finding)
- singed nasal hairs, soot on oral/nasal membranes, sooty sputum
- hoarseness, stridor, dyspnea
- decreased LOC, confusion
- PO<sub>2</sub> normal but O<sub>2</sub> saturation low suggests CO poisoning

### Investigations

- measure carboxyhemoglobin levels, co-oximetry
- ABG
- CXR ± bronchoscopy

### Management

- CO poisoning: 100% O<sub>2</sub> ± hyperbaric O<sub>2</sub> (controversial)
- direct thermal injury: humidified oxygen, early intubation, pulmonary toilet, bronchodilators, and mucolytics (N-acetylcysteine)

Intubate early if you suspect inhalation injury, as airway can become obstructed due to edema

## Bites

### MAMMALIAN BITES

- see [Plastic Surgery, PL10](#)

### History

- time and circumstances of bite, symptoms, allergies, tetanus immunization status, comorbid conditions, rabies risks, HIV/hepatitis risk (human bite)
- high morbidity associated with clenched fist injuries, "fight bites"

### Physical Exam

- assess type of wound: abrasion, laceration, puncture, crush injury
- assess for direct tissue damage: skin, bone, tendon, neurovascular status

### Investigations

- if bony injury or infection suspected, check for fracture and gas in tissue with x-rays
- get skull films in children with scalp bite wounds ± CT to rule out cranial perforation
- ultrasound may be helpful for identifying abscess formation as well as locating radiolucent foreign bodies in infected wounds

### Initial Management

- wound cleansing and copious irrigation as soon as possible
- irrigate/debride puncture wounds if feasible, but not if sealed or very small openings; avoid hydrodissection along tissue planes
- debridement is important in crush injuries to reduce infection and optimize cosmetic and functional repair

- culture wound if signs of infection (erythema, necrosis, or pus); obtain anaerobic cultures if wound foul smelling, necrotizing, or abscess; notify lab that sample is from bite wound
- suturing
  - vascular structures (i.e. face and scalp) are less likely to become infected, therefore consider suturing
  - allow avascular structures (i.e. pretibial regions, hands, and feet) to heal by secondary intention
  - tetanus immunization if >10 yr or incomplete primary series

### Prophylactic Antibiotics

- types of infections resulting from bites: cellulitis, lymphangitis, abscesses, tenosynovitis, osteomyelitis, septic arthritis, sepsis, endocarditis, meningitis
- a 3-5 d course of antibiotics is recommended for all bite wounds to the hand and should be considered in other bites if any high-risk factors present (efficacy not proven)
- dog and cat bites (pathogens: *Pasteurella multocida*, *S. aureus*, *S. viridans*)
  - 10-50% of cat bites, 5% of dog bites become infected
  - 1st line: amoxicillin + clavulanic acid
- human bites (pathogens: *Eikenella corrodens*, *S. aureus*, *S. viridans*, oral anaerobes)
  - 1st line: amoxicillin + clavulanic acid
- rabies (see [Infectious Diseases, ID20](#))
  - reservoirs: warm-blooded animals except rodents, lagomorphs (e.g. rabbits)
  - post-exposure vaccine is effective; treatment depends on local prevalence

### INSECT BITES

- bee stings
  - 5 types of reactions to stings (local, large local, systemic, toxic, unusual)
  - history and physical exam key to diagnosis; no lab test will confirm
  - investigations: CBC, electrolytes, BUN, Cr, glucose, ABGs, ECG
  - ABC management, epinephrine 0.1 mg IV over 5 min if shock, antihistamines, cimetidine 300 mg IV/IM/PO, steroids,  $\beta$ -agonists for SOB/wheezing 3 mg in 5 mL NS via nebulizer, local site management
- West Nile virus (see [Infectious Diseases, ID24](#))

#### Consider Admission if

- Moderate to severe infections
- Infections in immunocompromised patients
- Not responding to oral therapy
- Penetrating injuries to tendons, joints, CNS
- Open fractures

## Near Drowning

- most common in children <4 yr and teenagers
- causes lung damage, hypoxemia, and may lead to hypoxic encephalopathy
- must also assess for shock, C-spine injuries, hypothermia, and scuba-related injuries (barotrauma, air emboli, lung re-expansion injury)
- complications: volume shifts, electrolyte abnormalities, hemolysis, rhabdomyolysis, renal, DIC

### Physical Exam

- ABCs, vitals: watch closely for hypotension
- respiratory: rales (ARDS, pulmonary edema), decreased breath sounds (pneumothorax)
- CVS: murmurs, dysrhythmias, JVP (CHF, pneumothorax)
- H&N: assess for C-spine injuries
- neurological: GCS or AVPU, pupils, focal deficits

### Investigations

- labs: CBC, electrolytes, ABGs, Cr, BUN, INR, PTT, U/A (drug screen, myoglobin)
- imaging: CXR (pulmonary edema, pneumothorax)  $\pm$  C-spine imaging
- ECG

### Management

- ABCs, treat for trauma, shock, hypothermia
- cardiac and O<sub>2</sub> monitors, IV access
- intensive respiratory care
  - ventilator assistance if decreased respirations, pCO<sub>2</sub> >50 mmHg, or pO<sub>2</sub> <60 mmHg on maximum O<sub>2</sub>
  - may require intubation for airway protection, ventilation, pulmonary toilet
  - high flow O<sub>2</sub>/CPAP/BiPAP may be adequate but some may need mechanical ventilation with positive end-expiratory pressure
- dysrhythmias: usually respond to corrections of hypoxemia, hypothermia, and acidosis
- vomiting: very common, NG suction to avoid aspiration
- convulsions: usually respond to O<sub>2</sub>; if not, diazepam 5-10 mg IV slowly
- bronchospasm: bronchodilators
- bacterial pneumonia: prophylactic antibiotics not necessary unless contaminated water or hot tub (*Pseudomonas*)
- always initiate CPR in drowning-induced cardiac arrest even if patient hypothermic; continue CPR until patient is fully rewarmed

**Disposition**

- non-significant submersion: discharge after short observation
- significant submersion (even if asymptomatic): long period of observation (24 h) as pulmonary edema may appear late
- CNS symptoms or hypoxemia: admit
- severe hypoxemia, decreased LOC: ICU

"Secondary drowning" where the onset of symptoms, as a result of pulmonary edema or infection, can be insidious, developing over hours, or possibly even days, must be anticipated in the near drowning patient

## Toxicology

### "ABCD<sub>3</sub>EFG" of Toxicology

- basic axiom of care is symptomatic and supportive treatment
  - address underlying problem only once patient is stable
- |           |   |
|-----------|---|
| <b>A</b>  | <b>A</b> irway (consider stabilizing the C-spine)   |
| <b>B</b>  | <b>B</b> reathing   |
| <b>C</b>  | <b>C</b> irculation   |
| <b>D1</b> | <b>D</b> rugs <ul style="list-style-type: none"> <li>▪ ACLS as necessary to resuscitate the patient</li> <li>▪ universal antidotes</li> </ul> |
| <b>D2</b> | <b>D</b> raw bloods   |
| <b>D3</b> | <b>D</b> econtamination (decrease absorption)   |
| <b>E</b>  | <b>E</b> xpose (look for specific toxidromes)/Examine the patient   |
| <b>F</b>  | <b>F</b> ull vitals, ECG monitor, Foley, X-rays   |
| <b>G</b>  | <b>G</b> ive specific antidotes and treatments  |

- reassess
- call Poison Information Centre
- obtain corroborative history from family, bystanders

**Principles of Toxicology**

4 principles to consider with all ingestions:

- Resuscitation (ABCD<sub>3</sub>EFG)
- Screening (toxidrome? clinical clues?)
- Decrease absorption of drug
- Increase elimination of drug

### D1 – Universal Antidotes

- treatments that will not harm patients and may be essential

**Dextrose (glucose)**

- give to any patient presenting with altered LOC
- measure blood glucose prior to glucose administration if possible
- adults: 0.5-1.0 g/kg (1-2 mL/kg) IV of D50W
- children: 0.25 g/kg (2-4 mL/kg) IV of D25W

**Oxygen**

- do not deprive a hypoxic patient of oxygen no matter what the antecedent medical history (i.e. even COPD with CO<sub>2</sub> retention)
- if depression of hypoxic drive, intubate and ventilate
- exception: paraquat or diquat (herbicides) inhalation or ingestion (oxygen radicals increase morbidity)

**Naloxone (central  $\mu$ -receptor competitive antagonist, shorter t<sub>1/2</sub> than naltrexone)**

- antidote for opioids: administration is both diagnostic and therapeutic (1 min onset of action)
- used for the undifferentiated comatose patient
- loading dose
  - adults
    - ♦ response to naloxone can be drastic, so stepwise delivery of initial 2 mg bolus is recommended
    - ♦ draw up 2 mg to deliver IV/IM/SL/SC or via ETT (ETT dose = 2-2.5x IV dose)
      - 1st dose 0.4 mg
      - if no response, deliver second dose 0.6 mg
      - if still no response, deliver remaining 1 mg
  - child
    - ♦ 0.01 mg/kg initial bolus IV/IO/ETT
    - ♦ 0.1 mg/kg if no response and opioid still suspected to max of 10 mg
  - maintenance dose
    - ♦ may be required because half-life of naloxone (30-80 min) is much shorter than many opioids
    - ♦ hourly infusion rate at 2/3 of initial dose that allowed patient to be roused

**Thiamine (Vitamin B1)**

- 100 mg IV/IM with IV/PO glucose to all patients
- given to prevent/treat Wernicke's encephalopathy
- a necessary cofactor for glucose metabolism (may worsen Wernicke's encephalopathy if glucose given before thiamine), but do not delay glucose if thiamine unavailable
- must assume all undifferentiated comatose patients are at risk

**Universal Antidotes****DONT**

- Dextrose
- Oxygen
- Naloxone
- Thiamine (must give BEFORE dextrose)

Administration of naloxone can cause opioid withdrawal in chronic users:

**Minor** withdrawal may present as lacrimation, rhinorrhea, diaphoresis, yawning, piloerection, HTN, and tachycardia

**Severe** withdrawal may present as hot and cold flashes, arthralgias, myalgias, N/V, and abdominal cramps

**Populations at Risk for Thiamine Deficiency**

- Alcoholics
- Anorexics
- Hyperemesis of pregnancy
- Malnutrition states

## D2 – Draw Bloods

- essential tests
  - CBC, electrolytes, BUN/Cr, glucose, INR/PTT, osmolality
  - ABGs, measure O<sub>2</sub> sat
  - ASA, acetaminophen, EtOH levels
- potentially useful tests
  - drug levels – this is NOT a serum drug screen
  - Ca<sup>2+</sup>, Mg<sup>2+</sup>, PO<sub>4</sub><sup>3-</sup>
  - protein, albumin, lactate, ketones, liver enzymes, CK – depending on drug and clinical presentation

### Serum Drug Levels

- treat the patient, not the drug level
- negative toxicology screen does not rule out a toxic ingestion – signifies only that the specific drugs tested were not detectable in the specimen
- specific drugs available on general screen vary by institution; check before ordering
- urine screens also available (qualitative only)

**Table 30. Toxic Gaps (see Nephrology, NP16)**

#### METABOLIC ACIDOSIS

**Increased AG:** “MUDPILES CAT” (\* = toxic)

Methanol\*

Uremia

Diabetic ketoacidosis/Starvation ketoacidosis

Phenformin\*/Paraldehyde\*

Isoniazid, Iron, Ibuprofen

Lactate (anything that causes seizures or shock)

Ethylene glycol\*

Salicylates\*

Cyanide, CO\*

Alcoholic ketoacidosis

Toluene, theophylline\*

**Increased POG:** “MAE DIE” (if it ends in “-ol”, it will likely increase the POG)

Methanol

Acetone

Ethanol

Diuretics (glycerol, mannitol, sorbitol)

Isopropanol

Ethylene glycol

Note: normal POG does not rule out toxic alcohol; only an elevated gap is helpful

#### Decreased AG

Electrolyte imbalance (increased Na<sup>+</sup>/K<sup>+</sup>/Mg<sup>2+</sup>)

Hypoalbuminemia (50% fall in albumin ~5.5 mmol/L)

decrease in the AG)

Lithium, bromine elevation

Paraproteins (multiple myeloma)

#### Increased O<sub>2</sub> saturation gap

Carboxyhemoglobin

Methemoglobin

Sulfmethemoglobin

#### Normal AG

High K<sup>+</sup>: pyelonephritis, obstructive nephropathy, renal tubular acidosis IV, TPN

Low K<sup>+</sup>: small bowel losses, acetazolamide, renal tubular acidosis I, II

**Table 31. Use of the Clinical Laboratory in the Initial Diagnosis of Poisoning**

Test	Finding	Selected Causes
ABG	Hypoventilation ( pCO <sub>2</sub> ) Hyperventilation ( pCO <sub>2</sub> )	CNS depressants (opioids, sedative-hypnotic agents, phenothiazines, EtOH) Salicylates, CO, other asphyxiants
Electrolytes	AG metabolic acidosis Hyperkalemia Hypokalemia	“MUDPILES CAT”: see Table 30 Digitalis glycosides, fluoride, potassium Theophylline, caffeine, β-adrenergic agents, soluble barium salts, diuretics, insulin
Glucose	Hypoglycemia	Oral hypoglycemic agents, insulin, EtOH, ASA
Osmolality and Osmolar Gap	Elevated osmolar gap	“MAE DIE”: see Table 30
ECG	Wide QRS complex Prolonged QT interval Atrioventricular block	TCAs, quinidine, other class Ia and Ic antidysrhythmic agents Terfenadine, astemizole, antipsychotics Ca <sup>2+</sup> antagonists, digitalis glycosides, phenylpropanolamine
Abdominal X-Ray	Radioopaque pills or objects	“CHIPES”: Calcium, Chloral hydrate, CCl <sub>4</sub> , Heavy metals, Iron, Potassium, Enteric coated Salicylates, and some foreign bodies
Serum Acetaminophen	Elevated level (> 140 mg/L or 1,000 μmol/L 4 h after ingestion)	May be only sign of acetaminophen poisoning

Urine drug screen is costly and generally not helpful in the ED management of the poisoned patient

**Anion Gap**  
= Na<sup>+</sup> – Cl<sup>-</sup> – HCO<sub>3</sub><sup>-</sup>  
Normal AG ≤ 12 mM/L

## D3 – Decontamination and Enhanced Elimination

### Ocular Decontamination

- saline irrigation to neutralize pH; alkali exposure requires ophthalmology consult

### Dermal Decontamination (Wear Protective Gear)

- remove clothing, brush off toxic agents, irrigate all external surfaces

### Gastrointestinal Decontamination

- single dose activated charcoal
  - adsorption of drug/toxin to activated charcoal prevents availability
  - contraindications: caustics, small bowel obstruction, perforation
  - dose: 10 g/g drug ingested or 1g/kg body weight
  - odourless, tasteless, prepared as slurry with H<sub>2</sub>O
- whole bowel irrigation
  - 500 mL/h (child) to 2,000 mL/h (adult) of polyethylene glycol solution by mouth until clear effluent per rectum
  - start slow (500 mL in an adult) and aim to increase rate hourly as tolerated
  - indications
    - ◆ awake, alert, can be nursed upright OR intubated and airway protected
    - ◆ delayed release product
    - ◆ drug/toxin not bound to charcoal
    - ◆ drug packages (if any evidence of breakage emergency surgery)
    - ◆ recent toxin ingestion
- contraindications
  - evidence of ileus, perforation, or obstruction
- surgical removal in extreme cases
  - indicated for drugs that are toxic, form concretions, or cannot be removed by conventional means
- no evidence for the routine use of cathartics (i.e. ipecac)

### Urine Alkalinization

- may be used for: ASA, methotrexate, phenobarbital, chlorpropamide
- weakly acidic substances can be trapped in alkali urine (pH >7.5) to increase elimination

### Multidose Activated Charcoal

- may be used for: carbamazepine, phenobarbital, quinine, theophylline
- for toxins which undergo enterohepatic recirculation
- removes drug that has already been absorbed by drawing it back into GI tract
- various regimens: 12.5 g (1/4 bottle) PO q1h or 25 g (1/2 bottle) PO q2h until non-toxic

### Hemodialysis

- indications/criteria for hemodialysis
  - toxins that have high water solubility, low protein binding, low molecular weight, adequate concentration gradient, small volume of distribution, or rapid plasma equilibration
  - removal of toxin will lead to clinical improvement
  - advantage is shown over other modes of therapy
  - predicted that drug or metabolite will have toxic effects
  - impairment of normal routes of elimination (cardiac, renal, or hepatic)
  - clinical deterioration despite maximal medical support
- useful for the following toxins
 

<ul style="list-style-type: none"> <li>• methanol</li> <li>• ethylene glycol</li> <li>• salicylates</li> </ul>	<ul style="list-style-type: none"> <li>• lithium</li> <li>• phenobarbital</li> <li>• chloral hydrate ( trichloroethanol)</li> </ul>
--	---
- others include theophylline, carbamazepine, valproate, methotrexate

## E – Expose and Examine the Patient

- vital signs (including temperature), skin (needle tracks, colour), mucous membranes, pupils, odours, and CNS
- head-to-toe survey including
  - C-spine
  - signs of trauma, seizures (incontinence, “tongue biting”, etc.), infection (meningismus), or chronic alcohol/drug abuse (track marks, nasal septum erosion)
- mental status

Table 32. Specific Toxidromes

Toxidrome	Overdose Signs and Symptoms	Examples of Drugs	
<b>Anticholinergic</b>	Hyperthermia Dilated pupils Dry skin Vasodilation Agitation/hallucinations Ileus Urinary retention Tachycardia	“Hot as a hare” “Blind as a bat” “Dry as a bone” “Red as a beet” “Mad as a hatter” “The bowel and bladder lose their tone and the heart goes on alone”	Antidepressants (e.g. TCAs) Cyclobenzaprine (Flexeril®) Carbamazepine Antihistamines (e.g. diphenhydramine) Antiparkinsonians Antipsychotics Antispasmodics Belladonna alkaloids (e.g. atropine)
<b>Cholinergic</b>	“DUMBELS” Diaphoresis, Diarrhea, Decreased BP Urination Miosis Bronchospasm, Bronchorrhea, Bradycardia Emesis, Excitation of skeletal muscle Lacrimation Salivation, Seizures		Natural plants: mushrooms, trumpet flower Anticholinesterases: physostigmine Insecticides (organophosphates, carbamates) Nerve gases
<b>Extrapyramidal</b>	Dysphonia, dysphagia Rigidity and tremor Motor restlessness, crawling sensation (akathisia) Constant movements (dyskinesia) Dystonia (muscle spasms, laryngospasm, trismus, oculogyric crisis, torticollis)		Major tranquilizers Antipsychotics
<b>Hemoglobin Derangements</b>	Increased respiratory rate Decreased LOC Seizures Cyanosis unresponsive to O <sub>2</sub> Lactic acidosis		CO poisoning (carboxyhemoglobin) Drug ingestion (methemoglobin, sulfmethemoglobin)
<b>Opioid, Sedative/Hypnotic, EtOH</b>	Hypothermia Hypotension Respiratory depression Dilated or constricted pupils (pinpoint in opioid) CNS depression		EtOH Benzodiazepines Opioids (morphine, heroin, fentanyl, etc.) Barbiturates Gamma hydroxybutyrate
<b>Sympathomimetic</b>	Increased temperature CNS excitation (including seizures) Tachycardia, HTN N/V Diaphoresis Dilated pupils		Amphetamines, caffeine, cocaine, LSD, phencyclidine Ephedrine and other decongestants Thyroid hormone Sedative or EtOH withdrawal
<b>Serotonin Syndrome</b>	Mental status changes, autonomic hyperactivity, neuromuscular abnormalities, hyperthermia, diarrhea, HTN		MAOI, TCA, SSRI, opiate analgesics Cough medicine, weight reduction medications

Note: ASA poisoning and hypoglycemia mimic sympathomimetic toxidrome

## F – Full Vitals, ECG Monitor, Foley, X-Rays

## G – Give Specific Antidotes and Treatments

### Urine Alkalinization Treatment for ASA Overdose

- urine pH >7.5
- fluid resuscitate first, then 3 amps NaHCO<sub>3</sub>/L of D5W at 1.5x maintenance
- add 20-40 mEq/L KCl if patient is able to urinate

Table 33. Protocol for Warfarin Overdose

INR	Management: Consider Prothrombin Complex Concentrate (Octaplex®, Beriplex®) for any elevated INR, AND either life-threatening bleeding, or a plan for the patient to undergo a surgical procedure within the next 6 h
<5.0	Cessation of warfarin administration, observation, serial INR/PT
5.1–9.0	If no risk factors for bleeding, hold warfarin x 1-2 d and reduce maintenance dose OR Vitamin K 1-2 mg PO if patient at increased risk of bleeding
9.1–20.0	Hold warfarin, vitamin K 2-4 mg PO, serial INR/PT, additional vitamin K if necessary
>20.0	Hold warfarin, vitamin K 10 mg IV over 10 min, increase vitamin K dosing (q4h) if needed

**Table 34. Specific Antidotes and Treatments for Common Toxins\***

Toxin	Treatment	Considerations
<b>Acetaminophen</b>	Decontaminate (activated charcoal) N-acetylcysteine	Often clinically silent; evidence of liver/renal damage delayed >24 h Toxic dose >200 mg/kg (>7.5 g adult) Monitor drug level 4 h post-ingestion; also liver enzymes, INR, PTT, BUN, Cr Hypoglycemia, metabolic acidosis, encephalopathy poor prognosis
<b>Acute Dystonic Reaction</b>	Benzotropine: 1-2 mg IM/IV then 2 mg PO x 3 d OR Diphenhydramine 1-2 mg/kg IV, then 25 mg PO qid x 3 d	Benzotropine (Cogentin®) has euphoric effect and potential for abuse
<b>Anticholinergics</b>	Decontaminate (activated charcoal) Supportive care	Special antidotes available; consult Poison Information Centre
<b>ASA</b>	Decontaminate (activated charcoal) Alkalinize urine; want urine pH >7.5	Monitor serum pH and drug levels closely Monitor K <sup>+</sup> level; may require supplement for urine alkalinization Hemodialysis may be needed if intractable metabolic acidosis, very high levels, or end-organ damage (i.e. unable to diurese)
<b>Benzodiazepines</b>	Decontaminate (activated charcoal) Flumazenil Supportive care	
<b>β-blockers</b>	Decontaminate (activated charcoal) Consider high dose insulin euglycemia therapy Some dialyzable, some use intralipids	Consult Poison Information Centre
<b>Calcium Channel Blockers</b>	Decontaminate (activated charcoal) CaCl <sub>2</sub> 1-4 g of 10% solution IV if hypotensive Other: high dose insulin euglycemia inotropes or intralipids	Order ECG, electrolytes (especially Ca <sup>2+</sup> , Mg <sup>2+</sup> , Na <sup>+</sup> , K <sup>+</sup> )
<b>Cocaine</b>	Decontaminate (activated charcoal) if oral Aggressive supportive care	Beta-blockers are contraindicated in acute cocaine toxicity Intralipid for life-threatening symptoms
<b>CO Poisoning</b>	<i>See Inhalation Injury, ER47</i> Supportive care 100% O <sub>2</sub>	
<b>Cyanide</b>	Hydroxocobalamin	
<b>Digoxin</b>	Decontaminate (activated charcoal) Digoxin-specific Ab fragments 10-20 vials IV if acute; 3-6 if chronic 1 vial (40 mg) neutralizes 0.5 mg of toxin	Use for life-threatening dysrhythmias unresponsive to conventional therapy, 6 h serum digoxin >12 nmol/L, initial K <sup>+</sup> >5 mmol/L, ingestion >10 mg (adult)/>4 mg (child) Common dysrhythmias include VFib, VTach, and conduction blocks
<b>Ethanol</b>	Thiamine 100 mg IM/IV Manage airway and circulatory support	Hypoglycemia very common in children Mouthwash = 70% EtOH; perfumes and colognes = 40-60% EtOH Order serum EtOH level and glucose level; treat glucose level appropriately
<b>Ethylene Glycol/Methanol</b>	Fomepizole (4-methylpyrazole) 15 mg/kg IV load over 30 min, then 10 mg/kg q12h OR Ethanol (10%) 10 mL/kg over 30 min, then 1.5 mL/h	CBC, electrolytes, glucose, ethanol level Consider hemodialysis
<b>Heparin</b>	Protamine sulfate 25-50 mg IV	For unfractionated heparin overdose only
<b>Insulin IM/SC/ Oral Hypoglycemic</b>	Glucose IV/PO/NG tube Glucagon: 1-2 mg IM (if no access to glucose)	Glyburide carries highest risk of hypoglycemia among oral agents Consider octreotide for oral hypoglycemics (50-100 µg SC q6h) in these cases; consult local Poison Information Centre
<b>MDMA</b>	Decontaminate (activated charcoal), supportive care	Monitor CK; treat rhabdomyolysis with high flow fluids: aggressive external cooling for hyperthermia
<b>Opioids</b>	<i>See Universal Antidotes, ER49</i>	
<b>TCA's</b>	Decontaminate (activated charcoal) Aggressive supportive care NaHCO <sub>3</sub> bolus for wide QRS/seizures	Flumazenil antidote contraindicated in combined TCA and benzodiazepine overdose Also consider cardiac and hypotension support, seizure control Intralipid therapy (consult local Poison Information Centre)

\* Call local Poison Information Centre for specific doses and treatment recommendations

## Alcohol Related Emergencies

- see [Psychiatry, PS23](#)

### Acute Intoxication

- slurred speech, CNS depression, disinhibition, lack of coordination
- nystagmus, diplopia, dysarthria, ataxia may progress to coma
- hypotension (peripheral vasodilation)
- if obtunded, rule out
  - head trauma/intracranial hemorrhage
  - associated depressants/street drugs, toxic alcohols
    - ◆ may also contribute to respiratory/cardiac depression
  - hypoglycemia (screen with bedside glucometer)
  - hepatic encephalopathy: confusion, altered LOC, coma
    - ◆ precipitating factors: GI bleed, infection, sedation, electrolyte abnormalities, protein meal
  - Wernicke's encephalopathy (ataxia, ophthalmoplegia, delirium)
  - post-ictal state, basilar stroke

### Withdrawal

- beware of withdrawal signs
- treatment
  - diazepam 10-20 mg IV/PO or lorazepam 2-4 mg IV/PO q1h until calm
    - ◆ frequency of dosing may have to be increased depending on clinical response
  - may use CIWA protocol and give benzodiazepines as above until CIWA <10
  - thiamine 100 mg IM/IV then 50-100 mg/d
  - magnesium sulfate 4 g IV over 1-2 h (if hypomagnesemic)
  - admit patients with DT or multiple seizures

**Table 35. Alcohol Withdrawal Signs**

Time Since Last Drink	Syndrome	Description
6-8 h	Mild withdrawal	Generalized tremor, anxiety, agitation, but no delirium Autonomic hyperactivity (sinus tachycardia), insomnia, N/V
1-2 d	Alcoholic hallucinations	Visual (most common), auditory, and tactile hallucinations Vitals often normal
8 h-2 d	Withdrawal seizures	Typically brief generalized tonic-clonic seizures May have several within a few hours CT head if focal seizures have occurred
3-5 d	DT	5% of untreated withdrawal patients Severely confused state, fluctuating LOC Agitation, insomnia, hallucinations/delusions, tremor Tachycardia, hyperpyrexia, diaphoresis High mortality rate

### Cardiovascular Complications

- HTN
- cardiomyopathy: SOB, edema
- dysrhythmias ("holiday heart")
- AFib (most common), atrial flutter, SVT, VTach (especially Torsades if hypomagnesemic/hypokalemic)

### Metabolic Abnormalities

- alcoholic ketoacidosis
  - AG metabolic acidosis, urine ketones, low glucose, and normal osmolality
  - history of chronic alcohol intake with abrupt decrease/cessation
  - malnourished, abdominal pain with N/V
  - treatment: dextrose, thiamine (100 mg IM/IV prior to dextrose), volume repletion (with NS)
  - generally resolves in 12-24 h
- other alcohols
  - ethylene glycol CNS, CVS, renal findings
  - methanol
    - ◆ early: lethargy, confusion
    - ◆ late: headache, visual changes, N/V, abdominal pain, tachypnea
  - both ethylene glycol and methanol produce severe metabolic acidosis with anion gap (as the alcohol is metabolized) and osmolar gap (initially after ingestion but before metabolism)
  - EtOH co-ingestion is protective

Alcohol levels correlate poorly with intoxication

Alcohol intoxication may invalidate informed consent

#### Common Deficiencies

- Thiamine
- Niacin
- Folate
- Glycogen
- Magnesium
- Potassium

#### CIWA Withdrawal Symptoms

- N/V
  - Tremor
  - Paroxysmal sweats
  - Anxiety
  - Agitation
  - Visual disturbances
  - Tactile disturbances
  - Auditory disturbances
  - Headache
  - Disorientation
- 10 symptoms each scored out of 7 except orientation is out of 4

- treatment
  - ◆ urgent hemodialysis required
  - ◆ fomepizole 15 mg/kg IV bolus OR EtOH 10% IV bolus and infusion to achieve blood level of 22 mmol/L (EtOH loading may be done PO)
  - ◆ consider folic acid for methanol, and pyridoxine and thiamine for ethylene glycol – both help reduce conversion to active metabolites
- other abnormalities associated with alcohol: hypomagnesemia, hypophosphatemia, hypocalcemia, hypoglycemia, hypokalemia

### Gastrointestinal Abnormalities

- gastritis
  - common cause of abdominal pain and GI bleed in chronic alcohol users
- pancreatitis
  - serum amylase very unreliable in patients with chronic pancreatitis, may need serum lipase
  - hemorrhagic form (15%) associated with increased mortality
  - fluid resuscitation very important
- hepatitis
  - AST/ALT ratio >2 suggests alcohol as the cause as well as elevated GGT with acute ingestion
- peritonitis/spontaneous bacterial peritonitis
  - leukocytosis, fever, generalized abdominal pain/tenderness
  - occasionally accompanies cirrhosis
  - paracentesis for diagnosis (common pathogens: *E. coli*, *Klebsiella*, *Streptococcus*)
- GI bleeds
  - most commonly gastritis or ulcers, even if patient known to have varices
  - consider Mallory-Weiss tear secondary to retching
  - often complicated by underlying coagulopathies
  - minor: treat with antacids
  - severe or recurrent: endoscopy

### Disposition

- before patient leaves ED ensure stable vital signs, can walk unassisted, and fully oriented
- offer social services to find shelter or detox program
- ensure patient can obtain any medications prescribed and can complete any necessary follow-up

## Approach to the Overdose Patient

### History

- age, weight, underlying medical problems, medications
- substance and how much
- time and symptoms since exposure determines prognosis and need for decontamination
- route
- intention, suicidality

### Physical Exam

- focus on: ABCs, LOC/GCS, vitals, pupils

#### Suspect Overdose when

- Altered LOC/coma
- Young patient with life-threatening dysrhythmia
- Trauma patient
- Bizarre or puzzling clinical presentation

## Disposition from the Emergency Department

- methanol, ethylene glycol
  - delayed onset, admit and watch clinical and biochemical markers
- TCAs
  - prolonged/delayed cardiotoxicity warrants admission to monitored (ICU) bed
  - if asymptomatic and no clinical signs of intoxication: 6 h ED observation adequate with proper decontamination and no ECG abnormalities
  - sinus tachycardia alone (most common finding) with history of overdose warrants observation in ED
- hydrocarbons/smoke inhalation
  - pneumonitis may lag 6-8 h
  - consider observation for repeated clinical and radiographic examination
- ASA, acetaminophen
  - if borderline level, get second level 2-4 h after first
  - for ASA, must have at least 2 levels going down before discharge (3 levels minimum)
- oral hypoglycemics
  - admit all patients for minimum 24 h if hypoglycemic and 12 h after last octreotide dose
  - observe asymptomatic patient for at least 8 h

### Psychiatric Consultation

- once patient medically cleared, arrange psychiatric intervention if required
- beware – suicidal ideation may not be expressed

# Psychiatric Emergencies

## Approach to Common Psychiatric Presentations

- see [Psychiatry, PS4](#)
- before seeing patient, ensure your own safety; have security/police available if necessary

### History

- safety
  - assess suicidality: suicidal ideation (SI), intent, plan, lethal means, and past attempts
  - assess homicidality: homicidal ideation (HI), access to weapons, intended victim, and history of violence
  - driving and children
  - command hallucinations
- identify current stressors and coping strategies
- mood symptoms: manic, depressive
- anxiety: panic attacks, generalized anxiety, phobias, obsessive-compulsive disorder, post-traumatic stress disorder
- psychotic symptoms: delusions, hallucinations, disorganized speech, disorganized or catatonic behaviour, negative symptoms (affective flattening, alogia, avolition)
- substance use history: most recent use, amount, previous withdrawal reactions
- past psychiatric history, medications, adherence with medications
- medical history: obtain collateral if available

### Physical Exam

- complete physical exam focusing on: vitals, neurological exam, signs of head trauma, signs of drug toxicity, signs of metabolic disorder
- mental status exam: general appearance, behaviour, cooperation, speech, mood and affect, thought content and form, perceptual disturbances, cognition (including MMSE if indicated), judgment, insight, reliability

### Investigations

- investigations vary with age, established psychiatric diagnosis vs. first presentation, history and physical suggestive of organic cause
- as indicated: blood glucose, urine and serum toxicology screen, pregnancy test, electrolytes, TSH, AST/ALT, bilirubin, serum Cr, BUN, and osmolality
- blood levels of psychiatric medications
- CT head if suspect neurological etiology
- LP if indicated

#### Key Functions of Emergency Psychiatric Assessment

- Is the patient medically stable?
- Rule out medical cause
- Is psychiatric consult needed?
- Are there safety issues (SI, HI)?
- Is patient certifiable? (must demonstrate risk [present/past test] and apparent mental illness [future test])

#### Psychiatric Review of Systems

**MOAPS**  
 Mood  
 Organic  
 Anxiety  
 Psychosis  
 Safety  
 intoxication

## Acute Psychosis

### Differential Diagnosis

- primary psychotic disorder (e.g. schizophrenia)
- secondary to medical condition (e.g. delirium)
- drugs: substance intoxication or withdrawal, medications (e.g. steroids, anticholinergics)
- infectious (CNS)
- metabolic (hypoglycemic, hepatic, renal, thyroid)
- structural (hemorrhage, neoplasm)

### Management

- violence prevention
  - remain calm, empathic, and reassuring
  - ensure safety of staff and patients, have extra staff and/or security on hand
  - patients demonstrating escalating agitation or overt violent behaviour may require physical restraint and/or chemical tranquilization
- treat agitation: whenever possible, offer medication to patients as opposed to administering with force (helps calm and engage patient)
  - benzodiazepines: lorazepam 2 mg PO/IM/SL
  - antipsychotics: olanzapine 5 mg PO, haloperidol 5 mg PO/IM
- treat underlying medical condition
- psychiatry or Crisis Intervention Team consult

## Suicidal Patient

### Epidemiology

- attempted suicide F>M, completed suicide M>F
- second leading cause of death in people <24 yr

### Management

- ensure patient safety: close observation, remove potentially dangerous objects from person and room
- assess thoughts (ideation), means, action (preparatory, practice attempts), previous attempts
- admit if there is evidence of intent and organized plan, access to lethal means, psychiatric disorder, intoxication (suicidal ideation may resolve with few days of abstinence)
- patient may require certification if unwilling to stay voluntarily
- do not start long-term medications in the ED
- psychiatry or Crisis Intervention Team consult

See [Psychiatry, Common Forms, PS50](#) for certification (involuntary assessment/admission) considerations

### High Risk Patients

**SAD PERSONS**  
 Sex = male  
 Age >45 yr old  
 Depression  
 Previous attempts  
 Ethanol use  
 Rational thinking loss  
 Suicide in family  
 Organized plan  
 No spouse, no support system  
 Serious illness

Any trauma or suspected trauma patient <1 yr of age with a large, boggy scalp hematoma requires U/S or CT

## Common Pediatric ED Presentations

### Modified Glasgow Coma Score

Table 36. Modified GCS

Modified GCS for Infants		
Eye Opening	Verbal Response	Motor Response
4 – spontaneously	5 – coos, babbles	6 – normal, spontaneous movement
3 – to speech	4 – irritable cry	5 – withdraws to touch
2 – to pain	3 – cries to pain	4 – withdraws to pain
1 – no response	2 – moans to pain	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response

Modified GCS for Children <4 years		
Eye Opening	Verbal Response	Motor Response
4 – spontaneously	5 – oriented, social, speaks, interacts	6 – normal, spontaneous movement
3 – to speech	4 – confused speech, disoriented, consolable	5 – localizes to pain
2 – to pain	3 – inappropriate words, not consolable/aware	4 – withdraws to pain
1 – no response	2 – incomprehensible, agitated, restless, not aware	3 – decorticate flexion
	1 – no response	2 – decerebrate extension
		1 – no response

## Respiratory Distress

- see [Pediatrics, P84](#)

### History and Physical Exam

- infants not able to feed, older children not able to speak in full sentences
- anxious, irritable, lethargic – may indicate hypoxia
- tachypnea >60 (>40 if preschool age, >30 if school age), retractions, tracheal tug
  - see [Pediatrics, P3](#) for age specific vital signs
- pulsus paradoxus
- wheezing, grunting, vomiting

Table 37. Stridorous Upper Airway Diseases: Diagnosis

Feature	Croup	Bacterial Tracheitis	Epiglottitis <sup>1</sup>
Age Range (yr)	0.5-4	5-10	2-8
Prodrome	Days	Hours to days	Minutes to hours
Temperature	Low grade	High	High
Radiography	Steeple sign	Exudates in trachea	Thumb sign
Etiology	Parainfluenza	<i>S. aureus</i> /GAS	<i>H. influenzae</i> type b
Barky Cough	Yes	Yes	No
Drooling	Yes	No	Yes
Appear Toxic	No	Yes	Yes
Intubation/ICU	No	Yes	Yes
Antibiotics	No	Yes	Yes
NOTE	Oral exam	Oral exam	No oral exam, consult ENT

<sup>1</sup>Now rare with Hib vaccine in common use

## Management

- croup (usually laryngotracheitis caused by parainfluenza viruses)
  - humidified O<sub>2</sub> should not be given (no evidence for efficacy)
  - racemic epinephrine q1h x 3 doses, observe for 'rebound effects'
  - nebulized 1:1000 epinephrine (racemic has limited availability)
  - dexamethasone x 1 dose
  - consider bacterial tracheitis/epiglottitis if unresponsive to croup therapy
- bacterial tracheitis
  - start croup therapy, but may have poor response
  - usually require intubation, ENT consult, ICU
  - start antibiotics (e.g. cloxacillin), pending C&S
- epiglottitis
  - 4 D's: drooling, dyspnea, dysphagia, dysphonia + tripod sitting
  - do not examine oropharynx or agitate patient
  - immediate anesthesia, ENT call – intubate
  - then IV fluids, antibiotics, blood cultures
- asthma
  - supplemental O<sub>2</sub> if saturation <90% or PaO<sub>2</sub> <60%
  - bronchodilator therapy: salbutamol (Ventolin®) 0.15 mg/kg by masks q20min x 3
  - add 250-500 µg ipratropium (Atrovent®) to first 3 doses salbutamol
  - give corticosteroid therapy as soon as possible after arrival (prednisolone 2 mg/kg, dexamethasone 0.3 mg/kg)
  - if critically ill, not responding to inhaled bronchodilators or steroids: give IV bolus, then infusion of MgSO<sub>4</sub>
  - IV β<sub>2</sub>-agonists if critically ill and not responding to above

## Febrile Infant and Febrile Seizures

### FEBRILE INFANT

- see [Pediatrics, P51](#)
- for fever >38°C without obvious focus
  - <28 d
    - ♦ admit
    - ♦ full septic workup (CBC and differential, blood C&S, urine C&S, LP ± stool C&S, CXR if indicated)
    - ♦ treat empirically with broad spectrum IV antibiotics
  - 28-90 d
    - ♦ as above unless infant meets Rochester criteria, investigate as indicated by history and physical
  - >90 d
    - ♦ toxic: admit, treat, full septic workup
    - ♦ non-toxic and no focus: investigate as indicated by history and physical

#### Rochester Criteria for Febrile Infants Age 28-90 Days Old

- Non-toxic looking
- Previously well (>37 wk gestational age, home with mother, no hyperbilirubinemia, no prior antibiotics or hospitalizations, no chronic/underlying illness)
- No skin, soft tissue, bone, joint, or ear infection on physical exam
- WBC 5,000-15,000, bands <1,500, urine <10 WBC/HPF, stool <5 WBC/HPF

### FEBRILE SEIZURES

- see [Pediatrics, P82](#)

#### Etiology

- children aged 6 mo-6 yr with fever or history of recent fever
- typical vs. atypical febrile seizures
- normal neurological exam afterward
- no evidence of intracranial infection or history of previous non-febrile seizures
- often positive family history of febrile seizures
- relatively well-looking after seizure

#### Investigations and Management

- if it is a febrile seizure: treat fever and look for source of fever
- if not a febrile seizure: treat seizure and look for source of seizure
  - note: may also have fever but may not meet criteria for febrile seizure
- ± EEG (especially if first seizure), head U/S (if fontanelle open)

**Table 38. Typical vs. Atypical Febrile Seizures**

Characteristic	Typical	Atypical
Duration	<15 min	>15 min
Type of Seizure	Generalized	Focal features
Frequency	1 in 24 h	>1 in 24 h

## Abdominal Pain

- see [Pediatrics, P37](#)

### History

- nature of pain, associated fever
- associated GI, GU symptoms
- anorexia, decreased fluid intake

### Physical Exam

- HEENT, respiratory, abdominal exam including DRE, testicular/genital exam

**Table 39. Differential Diagnosis of Abdominal Pain in Infants/Children/Adolescents**

Medical	Surgical
Colic	Malrotation with volvulus
UTI	Hirschsprung's disease
Constipation	Necrotizing enterocolitis
Gastroenteritis	Incarcerated hernia
Sepsis	Intussusception
Henoch-Schönlein purpura	Duodenal atresia
IBD	Appendicitis
Hemolytic uremic syndrome	Cholecystitis
Pneumonia	Pancreatitis
Strep throat	Testicular torsion
Sickle cell disease crisis	Ectopic pregnancy
DKA	Trauma
Functional	Pyloric stenosis

\*Remember to keep an index of suspicion for child abuse

### Red Flags for Abdominal Pain

- Significant weight loss or growth retardation (need growth chart)
- Fever
- Joint pain with objective physical findings
- Rash
- Rectal bleeding
- Rebound tenderness and radiation of pain to back, shoulders, or legs
- Pain wakes from sleep
- Severe diarrhea and encopresis
- Trauma or suspected trauma patient < 1 yr of age with a large, boggy scalp hematoma requires U/S or CT

## Common Infections

- see [Pediatrics, P51](#)

**Table 40. Antibiotic Treatment of Pediatric Bacterial Infections**

Infection	Pathogens	Treatment
<b>MENINGITIS SEPSIS</b>		
Neonatal	GBS, <i>E. coli</i> , <i>Listeria</i> , Gram-negative bacilli	ampicillin + cefotaxime
1-3 mo	Same pathogens as above and below	ampicillin + cefotaxime + vancomycin
>3 mo	<i>S. pneumoniae</i> , <i>H. influenzae</i> type b (>5 yr), meningococcus	ceftriaxone + vancomycin
<b>OTITIS MEDIA</b>		
1st line	<i>S. pneumoniae</i> , <i>H. influenzae</i> type b, <i>M. catarrhalis</i>	amoxicillin 80-90 mg/kg per day
2nd line		clarithromycin 15 mg/kg/d bid (for penicillin allergy)
Treatment failure		90 mg/kg/d amoxicillin and 6.4 mg/kg/d clavulanate divided into bid dosage
<b>STREP PHARYNGITIS</b>		
	Group A $\beta$ -hemolytic <i>Streptococcus</i>	penicillin/amoxicillin or erythromycin (penicillin allergy)
<b>UTI</b>		
	<i>E. coli</i> , <i>Proteus</i> , <i>H. influenzae</i> , <i>Pseudomonas</i> , <i>S. saprophyticus</i> , <i>Enterococcus</i> , GBS	Oral: cephalexin (older children) IV: ampicillin and aminoglycoside
<b>PNEUMONIA</b>		
1-3 mo	Viral, <i>S. pneumoniae</i> , <i>C. trachomatis</i> , <i>B. pertussis</i> , <i>S. aureus</i> , <i>H. influenzae</i>	cefuroxime $\pm$ macrolide (erythromycin) OR ampicillin $\pm$ macrolide
3 mo-5 yr	Viral, <i>S. pneumoniae</i> , <i>S. aureus</i> , <i>H. influenzae</i> , <i>Mycoplasma pneumoniae</i>	ampicillin/amoxicillin or cefuroxime
>5 yr	As above	ampicillin/amoxicillin + macrolide or cefuroxime + macrolide

## Child Abuse and Neglect

- see [Pediatrics, P14](#)
- obligation to report any suspected/known case of child abuse or neglect to CAS yourself (do not delegate)
- document injuries
- consider skeletal survey x-rays (especially in non-ambulatory child), ophthalmology consult, CT head
- injury patterns associated with child abuse
  - HI: torn frenulum, dental injuries, bilateral black eyes, traumatic hair loss, diffuse severe CNS injury, retinal hemorrhage
  - Shaken Baby Syndrome: diffuse brain injury, subdural/SAH, retinal hemorrhage, minimal/no evidence of external trauma, associated bony fractures
  - skin injuries: bites, bruises/burns in shape of an object, glove/stocking distribution of burns, bruises of various ages, bruises in protected areas
  - bone injuries: rib fractures without major trauma, femur fractures age <1 yr, spiral fractures of long bones in non-ambulatory children, metaphyseal fractures in infants, multiple fractures of various ages, complex/multiple skull fractures
  - GU/GI injuries: chronic abdominal/perineal pain, injury to genitals/rectum, STI/pregnancy, recurrent vomiting or diarrhea

### Presentation of Neglect

- Failure to thrive, developmental delay
- Inadequate or dirty clothing, poor hygiene
- Child exhibits poor attachment to parents

### Procedures that may Require Sedation

- Setting fractures
- Reducing dislocations
- Draining abscesses
- Exploring wounds/ulcers/superficial infections
- Endoscopic examination
- Reduce patient anxiety/agitation for imaging/procedures

## Common Medications

Table 41. Commonly Used Medications

Drug	Dosing Schedule	Indications	Comments
Acetaminophen	325-650 mg PO q4-6h prn	Pain control	Max 4 g daily
Activated charcoal	30-100 g PO in 250 mL H <sub>2</sub> O	Poisoning/overdose	
ASA	325-650 mg PO q4h max 4g/d stroke/MI risk: 81-325 mg PO OD 160 mg chewed	Pain control Cardiac prevention ACS	
β-blockers (metoprolol)	5 mg slow IV q5min x 3 if no contraindications	Acute MI	
Diazepam	anxiety: 2-10 mg PO tid/qid alcohol withdrawal: 10-20 mg PO/IV q1h titrated to signs/symptoms	Anxiety Alcohol withdrawal	
Enoxaparin	1 mg/kg SC bid	Acute MI	
Epinephrine	anaphylaxis: 0.1-0.5 mg IM; can repeat q10-15min	Anaphylaxis	Max 1 mg/dose
Fentanyl	0.5-1.0 μg/kg IV	Procedural sedation	Very short acting narcotic (complication=apnea)
Flumazenil	0.3 mg IV bolus q5min x 3 doses	Reversal of procedural sedation	Benzodiazepine antagonist Can cause seizures/status epilepticus in chronic benzodiazepine users
Furosemide (Lasix®)	CHF: 40-80 mg IV HTN: 10-40 mg PO bid	CHF HTN	Monitor for electrolyte imbalances
Glucose	0.5-1.0 g/kg (1-2 mL/kg) IV of D50W	Hypoglycemia/DKA	
Haloperidol	2.5-5.0 mg PO/IM initial effective dose 6-20 mg/d	Psychosis	Monitor with Parkinson's; results in CNS depression
Ibuprofen	200-800 mg PO tid prn max 1,200 mg/d	Mild to moderate acute pain Analgesic and anti-inflammatory properties	
Insulin	bolus 5-10 U (0.2 U/kg) then 5-10 U (0.1 U/kg) per h	Hyperglycemia	Monitor blood glucose levels Consider K <sup>+</sup> replacement, also measure blood glucose levels before administration
Ipratropium bromide	2-3 puffs inhaled tid-qid, max 12 puffs/d	Asthma	Contraindicated with peanut/soy allergy Caution with narrow-angle glaucoma
Lidocaine with epi	max 7 mg/kg SC	Local anesthetic	Not to be used in fingers, nose, toes, penis, ears
Lidocaine w/o epi	max 5 mg/kg SC	Local anesthetic	
Lorazepam	anxiety: 0.5-2 mg PO/IM/IV q6-8h status epilepticus: 4 mg IV repeat up to q5min	Anxiety Status epilepticus	
Midazolam	50 μg/kg IV	Procedural sedation	Short acting benzodiazepine (complication=apnea when used with narcotic) Fentanyl and midazolam often used together for procedural sedation

**Table 41. Commonly Used Medications (continued)**

Drug	Dosing Schedule	Indications	Comments
Morphine	15-30 mg PO q8-12h 0.1-0.2 mg/kg max 15 mg IV q4h	Mild to moderate acute/chronic pain Prescribed in combination with NSAIDs or acetaminophen	GI and constipation side effects DO NOT CRUSH, CUT, or CHEW
Naloxone	0.5-2 mg or 0.01-0.02 mg/kg initial bolus IV/IM/SL/SC or via ETT (2-2.5x IV dose), increase dose by 2 mg until response/max 10 mg	Comatose patient Opioid overdose Reversal in procedural sedation	
Nitroglycerin	acute angina: 0.3-0.6 mg SL q5min, OR 5 µg/min IV increasing by 5-20 µg/min q3-5min	Angina Acute MI	Not to be used with other antihypertensives Not in right ventricular MI
Percocet 10/325®	1-2 tabs PO q6h prn	Moderate pain control	Oxycodone + acetaminophen Max 4 g acetaminophen daily
Phenytoin	Status epilepticus: <a href="#">see Table 17</a>	Status epilepticus	Begin maintenance dose 12 h after loading dose Continuous ECG, BP monitoring mandatory
Polysporin®	Apply to affected area bid-tid	Superficial infections	
Propofol	0.25-1 mg/kg IV	Procedural sedation	Short acting Anesthetic/sedative (complication=apnea, decreased BP)
Salbutamol	2 puffs inhaled q4-6h max 12 puffs/d	Asthma	Caution with cardiac abnormalities
Thiamine	100 mg IV/IM initially, then 50-100 mg IM/IV/PO OD x 3d	To treat/prevent Wernicke's encephalopathy	Caution use in pregnancy
Tylenol #3®	1-2 tabs PO q4-6h prn	Pain control	Max 4 g acetaminophen daily

## Acronyms

[ ]	concentration	DI	diabetes insipidus	HPA	hypothalamic pituitary adrenal	PTU	propylthiouracil
Ab	antibody	DKA	diabetic ketoacidosis	hs-CRP	highly sensitive C-reactive protein	RAIU	radioactive iodine uptake
ACR	albumin-creatinine ratio	DM	diabetes mellitus	HVA	homovanillic acid	RAAS	renin-angiotensin-aldosterone system
ACTH	adrenocorticotropic hormone	DXM	dexamethasone	ICF	intracellular fluid	RH	releasing hormone
ADH	antidiuretic hormone	ECF	extracellular fluid	IDL	intermediate density lipoprotein	SHBG	sex hormone binding globulin
AG	anion gap	EtOH	ethanol	IFG	impaired fasting glucose	TZDM	type 2 diabetes mellitus
AVP	arginine vasopressin	FFA	free fatty acids	IGT	impaired glucose tolerance	T <sub>3</sub>	triiodothyronine
BG	blood glucose	FNA	fine needle aspiration	LCAT	lecithin-cholesterol acyltransferase	T <sub>4</sub>	thyroxine
BMD	bone mineral density	FPG	fasting plasma glucose	LDL	low density lipoprotein	TBG	thyroid binding globulin
BMI	body mass index	FSH	follicle stimulating hormone	LH	luteinizing hormone	TC	total cholesterol
CAD	coronary artery disease	GFR	glomerular filtration rate	LP	lipoprotein	TG	triglycerides
CAH	congenital adrenal hyperplasia	GH	growth hormone	MEN	multiple endocrine neoplasia	TgAb	thyroglobulin antibodies
CHO	carbohydrates	GHRH	growth hormone releasing hormone	MMI	methimazole	TPOAb	anti-thyroid peroxidase antibodies
CK	creatinine kinase	GnRH	gonadotropin releasing hormone	MTC	medullary thyroid cancer	TRAb	TSH receptor antibodies
CMV	cytomegalovirus	Hb	hemoglobin	NS	normal saline	TRH	thyrotropin releasing hormone
CrCl	creatinine clearance	hCG	human chorionic gonadotropin	OGTT	oral glucose tolerance test	TSH	thyroid stimulating hormone
CRH	corticotropin releasing hormone	HDL	high density lipoprotein	PAD	peripheral arterial disease	TSI	thyroid stimulating immunoglobulin
CVD	cardiovascular disease	HHS	hyperosmolar hyperglycemic state	PCOS	polycystic ovarian syndrome	VLDL	very low density lipoprotein
DDAVP	desmopressin (1-deamino-8-D-arginine vasopressin)	HLA	human leukocyte antigen	POMC	pro-opiomelanocorticotropin	VMA	vanillylmandelic acid
DHEA	dehydroepiandrosterone	HMG-CoA	3-hydroxy-3-methylglutaryl-coenzyme A	PRL	prolactin	WC	waist circumference
				PTH	parathyroid hormone		

## Basic Anatomy Review

### Major Endocrine Organs

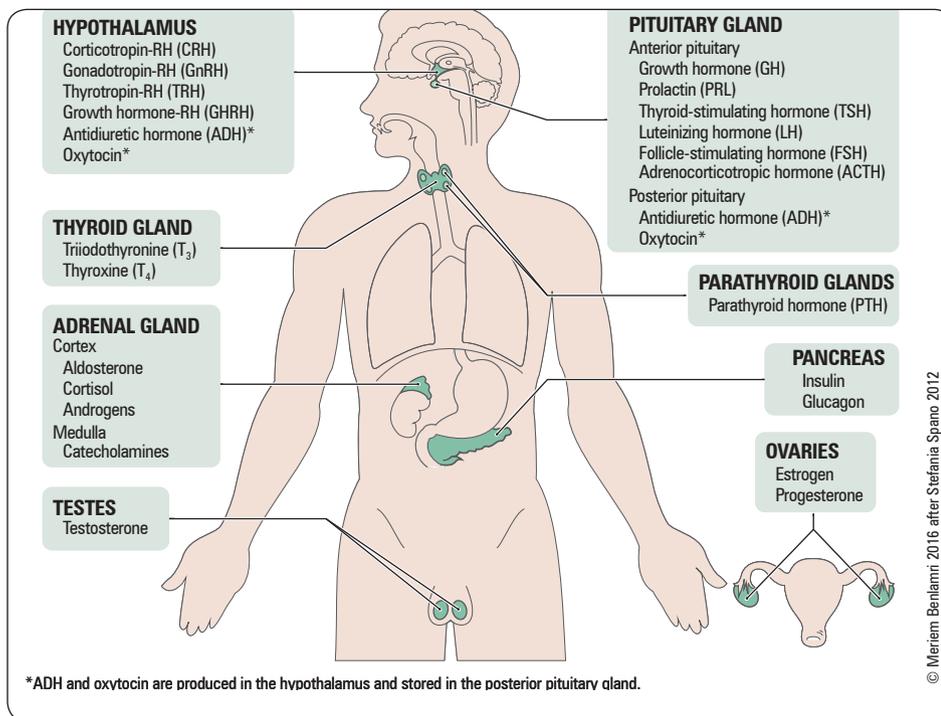

Figure 1. Endocrine system

## Dyslipidemias

### Definition

- metabolic disorders characterized by elevations of fasting plasma LDL-cholesterol, and/or triglycerides (TG), and/or low HDL-cholesterol

### Overview of Lipid Transport

- lipoproteins are spherical complexes that consist of a lipid core surrounded by a shell of water-soluble cholesterol, apoproteins, and phospholipids
- lipoproteins transport lipids within the body
- apolipoproteins serve as enzyme co-factors, promote clearance of the particle by interacting with cellular receptors, and stabilize the lipoprotein micelle

### GENERAL FUNCTION OF ORGANS

#### The Hypothalamic-Pituitary Axis

Information about cortical inputs, automatic function, environmental cues (light, temperature) and peripheral hormonal feedback is synthesized at the coordinating centre of the endocrine system, the hypothalamus. The hypothalamus then sends signals to the pituitary to release hormones that affect the thyroid, adrenals, gonads, growth, milk production, and water balance

#### Anatomy ↔ Function

Hypothalamic hormones: small peptides, non-binding protein → rapid degradation  
High [ ] in pituitary-portal blood system  
Low [ ] in peripheral circulation  
Proximity of axis preserves the pulsatile output signals from the hypothalamic neurons

#### Thyroid

Thyroid hormone is critical to 1) brain and somatic development in fetus and infants, 2) metabolic activity in adults, and 3) function of virtually every organ system

#### Adrenal

Each gland (6-8 g) has 1) a cortex with 3 layers that act like independent organs (zona glomerulosa → aldosterone, fasciculata → cortisol, reticularis → androgen and estrogen precursors), and 2) a medulla that acts like a sympathetic ganglion to store/synthesize adrenaline and noradrenaline

#### Gonads

Bifunctional: sex steroid synthesis and gamete production  
Sex steroids control sexuality and affect metabolic and brain functions

#### Parathyroid

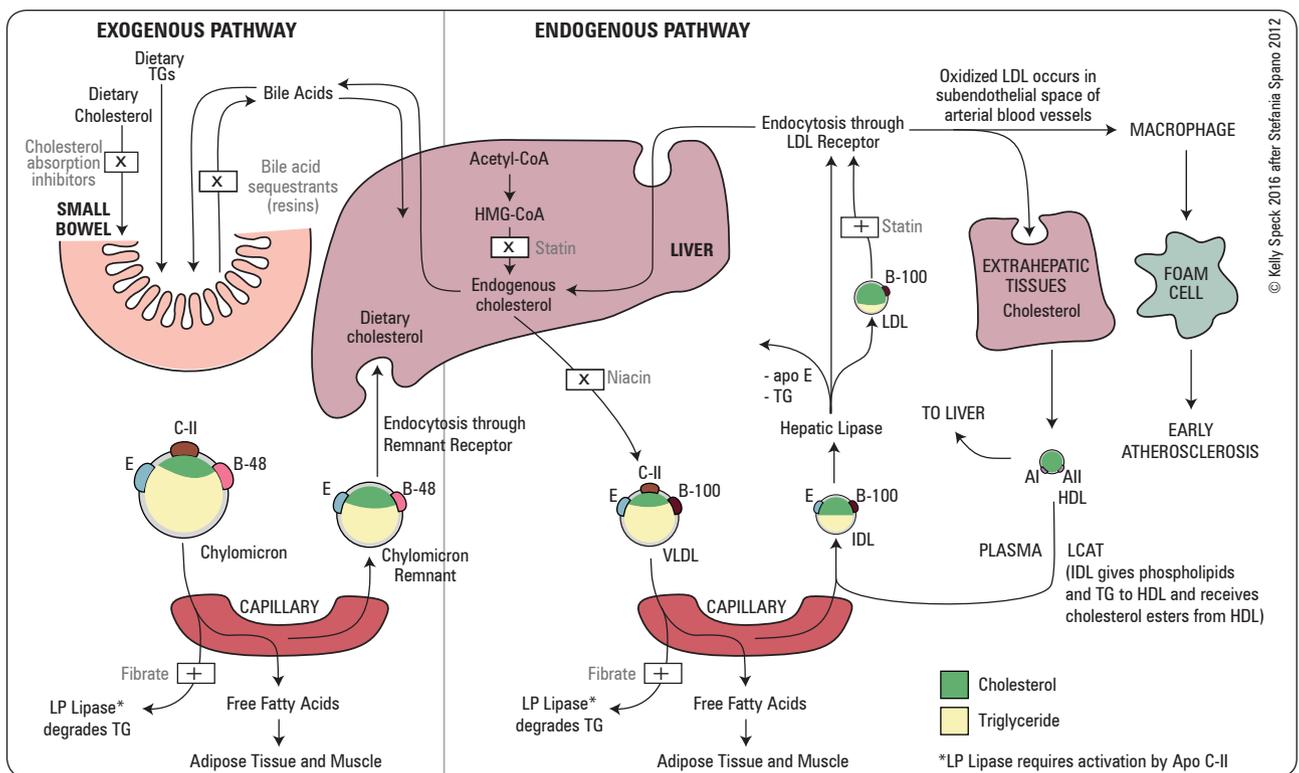

Synthesize and secrete PTH, a principle regulator of ECF Ca<sup>2+</sup>, regulated by [Ca<sup>2+</sup>], [Mg<sup>2+</sup>], 1,25(OH)<sub>2</sub>D (active metabolite of vit D), and phosphate

#### Pancreas

Endocrine islet β-cells produce insulin: oppose glucose production (glycogenolysis, gluconeogenesis), increase glucose uptake into muscle and fat. Glucagon, epinephrine, cortisol, and GH are the counterregulatory hormones

**Table 1. Lipoproteins**

Lipoprotein	Apolipoproteins	Function
<b>Exogenous Pathway</b>		
Chylomicron	B-48, C, E, A-I, A-II, A-IV	Transports dietary TG from gut to adipose tissue and muscle
<b>Endogenous Pathway</b>		
VLDL	B-100, C, E	Transports hepatic synthesized TG from liver to adipose tissue and muscle
IDL	B-100, E	Product of hydrolysis of TG in VLDL by lipoprotein lipase resulting in depletion of TG core Enriched in cholesterol esters
LDL	B-100	Formed by further removal of residual TG from IDL core by hepatic lipase resulting in greater enriched particles with cholesterol esters Transports cholesterol from liver to peripheral tissues (gonads, adrenals)
HDL	A-I, A-II, C, E	Transports cholesterol from peripheral tissues to liver Acts as a reservoir for apolipoproteins

**Figure 2. Exogenous and endogenous biosynthetic lipid pathways**

## Hypertriglyceridemia (Elevated Triglycerides)

### PRIMARY HYPERTRIGLYCERIDEMIA

**Table 2. Primary Hypertriglyceridemias**

Hypertriglyceridemia	Etiology/ Pathophysiology	Labs	Clinical Presentation	Treatment
Familial Lipoprotein Lipase Deficiency	Autosomal recessive deficiency of lipoprotein lipase or its cofactor	↑ TG ↑ Chylomicrons Moderate ↑ in VLDL	Presents at infancy Recurrent abdominal pain Hepatosplenomegaly Splenic infarct Anemia, granulocytopenia, thrombocytopenia 2° to hypersplenism Pancreatitis Lipemia retinalis Eruptive xanthomata	Decrease dietary fat intake to <10% of total calories Decrease dietary simple carbohydrates Cook with medium chain fatty acids Abstain from EtOH Gene therapy (Glybera)
Familial Hypertriglyceridemia	Autosomal dominant for inactivating mutations of the LP lipase gene Several genetic defects resulting in ↑ hepatic VLDL synthesis or ↓ removal of VLDL	↑ TG ↑ VLDL	Possible premature CAD Develop syndrome of obesity, hypertriglyceridemia, hyperinsulinemia, and hyperuricemia in early adulthood	Decrease dietary simple carbohydrates and fat intake Abstain from EtOH Fibrates or niacin

## SECONDARY HYPERTRIGLYCERIDEMIA

### Etiology

- endocrine: obesity/metabolic syndrome, hypothyroidism (more for high LDL, not TG), acromegaly, Cushing's syndrome, DM
- renal: chronic renal failure, polyclonal and monoclonal hypergammaglobulinemia
- hepatic: chronic liver disease, hepatitis, glycogen storage disease
- drugs: alcohol, corticosteroids, estrogen, hydrochlorothiazide, retinoic acid,  $\beta$ -blockers without intrinsic sympathomimetic action (ISA), anti-retroviral drugs, atypical antipsychotics, oral contraceptive pills
- other: pregnancy

**Hypertriglyceridemia and Pancreatitis**  
Serum triglyceride levels >10 mmol/L increases the risk of developing pancreatitis (even some reports of TG >5 mmol/L)

## Hypercholesterolemia

### PRIMARY HYPERCHOLESTEROLEMIA

**Table 3. Primary Hypercholesterolemias**

Hypercholesterolemia	Etiology/Pathophysiology	Labs	Clinical Presentation	Treatment
Familial Hypercholesterolemia	1/500 in U.S. population Autosomal codominant with high penetrance More prevalent in French Canadian, Dutch Afrikaner, Christian Lebanese populations Most commonly due to defects in the normal LDL receptor on cell membranes	$\uparrow$ LDL $\uparrow$ TC	Tendinous xanthomatosis (Achilles, patellar, and extensor tendons of hand) Arcus cornealis Xanthelasmata Heterozygotes: premature CAD, 50% risk of MI in men by age 30 Homozygotes: manifest CAD and other vascular disease early in childhood and can be fatal (<20 yr) if untreated	Heterozygotes: improvement of LDL with statins, often in combination with ezetimibe or bile acid sequestrants or PCSK9 inhibitor Homozygotes: partial control with portacaval shunt or LDL apheresis in conjunction with niacin; large dose statin is modestly effective; potential liver transplant; consider lomitapide (inhibitor of the microsomal TG transfer protein) and mipomersen (inhibits ApoB gene)
Polygenic Hypercholesterolemia	Most common Few mild inherited defects in cholesterol metabolism	$\uparrow$ TC $\uparrow$ LDL	Asymptomatic until vascular disease develops No xanthomata	Statins, ezetimibe, niacin, bile acid sequesterant, PCSK9 inhibitor
Familial Combined Hyperlipidemia	In many cases, over-population of VLDL and associated $\uparrow$ LDL 2 <sup>o</sup> to excess hepatic synthesis of apolipoprotein B Autosomal dominant	$\uparrow$ TC + G $\uparrow$ VLDL $\uparrow$ LDL	Xanthelasma CAD and other vascular disease	Weight reduction Decrease simple carbohydrates, fat, cholesterol, and EtOH in diet Statins Niacin, fibrates, ezetimibe, PCSK9 inhibitor

**FH and Cardiovascular Risk Calculators**

- Risk calculators such as Framingham and SCORE do not apply to patients with familial hypercholesterolemia
- Consider all adults with FH as "high risk"

**Familial Combined Hyperlipidemia**

- A common disorder (1-2% of the population)
- Contributes to 1/3 to 1/2 of familial coronary artery disease

### SECONDARY HYPERCHOLESTEROLEMIA

### Etiology

- endocrine: hypothyroidism
- renal: nephrotic syndrome
- immunologic: monoclonal gammopathy
- hepatic: cholestatic liver disease (e.g. primary biliary cirrhosis)
- nutritional: diet, anorexia nervosa
- drugs: cyclosporin, anabolic steroids, carbamazepine

## Low High-Density Lipoprotein

### PRIMARY CAUSES

**Table 4. Primary Low HDL Cholesterol Levels**

Disorder	Etiology/Pathophysiology	Clinical Presentation	Treatment
Familial Hypoalphalipoproteinemia or Familial HDL Deficiency	Autosomal dominant inheritance of a mutation in the ABCA1 or the APOA1 gene	Premature atherosclerosis Cerebrovascular disease Premature atherosclerosis Xanthomas	Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present
Tangier Disease	Autosomal recessive inheritance of mutations in the ABCA1 gene Impaired HDL-mediated cholesterol efflux from macrophages and impaired intracellular lipid trafficking	Mild hypertriglyceridemia Neuropathy Enlarged, orange-coloured tonsils Premature atherosclerosis Splenomegaly Hepatomegaly Corneal clouding Type 2 DM	Reduce the risk of atherosclerosis with lifestyle changes, management of concomitant hypercholesterolemia, hypertriglyceridemia, and metabolic syndrome if present

## SECONDARY CAUSES

### Etiology

- endocrine: obesity/metabolic syndrome, DM
- drugs:  $\beta$ -blockers, benzodiazepines, anabolic steroids
- other: acute infections, inflammatory conditions

#### Treatment Effect

Each 1.0 mmol/L decrease in LDL corresponds to 20-25% relative risk reduction in cardiovascular disease

#### 6% Rule

If the dose of a statin is doubled there is approximately a 6% increase in the LDL lowering efficacy

#### For Statin Follow-Up

- Liver enzymes and lipid profile: liver enzymes measured at the beginning of treatment then once after therapy initiated. Lipids (once stabilized) measured annually. Order both if patient complains of jaundice, RUQ pain, dark urine
- CK at baseline and if patient complains of myalgia
- D/C statin if CK  $>10\times$  upper limit of normal or patient has persistent myalgia

#### A Report of the American College of Cardiology/ American Heart Association Task Force on Practice Guidelines

*Circulation* 2013;00:000-000.

**Purpose:** To examine the evidence supporting specific end-point LDL targets in statin therapy  
**Study:** Systematic review, searching 1995-2009 inclusive identified 19 RCTs.

**Results:** None of the trials examined demonstrated better cardiovascular outcomes for a particular target LDL. Moreover, many trials showed best outcomes from maximum tolerated dose of statin, irrespective of the treated LDL level.

**Conclusion:** Based on systematic review, the ACC/AHA is no longer recommending a "Treat to Target" approach for statin therapy. Primary prevention in patients with increased risk should be treated with moderate to high intensity statin therapy without tracking LDL targets. Similarly, patients needing secondary prevention should receive high intensity statin therapy without attention to LDL targets.

#### Simvastatin to Lower CAD Risk - The Heart Protection Study (HPS)

*Lancet* 2002;360:7-22

**Study:** Randomized, double-blind, placebo-controlled trial (median follow-up 5.0 yr). Patients: 20,536 patients with coronary disease, other occlusive arterial disease or DM (aged 40-80 yr) who had a total cholesterol level of  $\geq 3.5$  mmol/L.

**Intervention:** Simvastatin 40 mg/d or placebo.

**Main Outcomes:** Mortality, fatal or non-fatal vascular events.

**Results:** The use of simvastatin significantly decreased total mortality (12.9 vs. 14.7,  $p=0.0003$ ) and the first event rate of any cardiovascular event by 25% ( $p<0.0001$ ).

**Conclusion:** Treatment with simvastatin improved survival and cardiovascular outcomes in high-risk CAD patients.

## Dyslipidemia and the Risk for Coronary Artery Disease

- increased LDL is a major risk factor for atherosclerosis and CAD as LDL is the major atherogenic lipid particle
- increased HDL is associated with decreased cardiovascular disease and mortality
- moderate hypertriglyceridemia (triglyceride level 2.3-9 mmol/L) is an independent risk factor for CAD, especially in people with DM and in post-menopausal women
- treatment of hypertriglyceridemia has not been shown to reduce CAD risk

### Screening

- screen men over age 40, women over age 50 or post-menopausal
- if following risk factors present, screen at any age
  - DM
  - current cigarette smoking or COPD
  - HTN (sBP  $>140$ , dBP  $>90$ )
  - obesity (BMI  $>27$  kg/m<sup>2</sup>)
  - family history of premature CAD
  - clinical signs of hyperlipidemia (xanthelasma, xanthoma, arcus cornealis)
  - evidence of atherosclerosis
  - inflammatory disease (rheumatoid arthritis, SLE, psoriatic arthritis, ankylosing spondylitis, inflammatory bowel disease)
  - HIV infection on highly active anti-retroviral therapy (HAART)
  - chronic kidney disease (estimated GFR  $<60$  mL/min/1.73 m<sup>2</sup>)
  - erectile dysfunction
- screen children with a family history of hypercholesterolemia or chylomicronemia

### Factors Affecting Risk Assessment

- metabolic syndrome
- apolipoprotein B (apo B)
  - each atherogenic particle (VLDL, IDL, LDL, and lipoprotein A) contains one molecule of apo B
  - serum [apo B] reflects the total number of particles and may be useful in assessing cardiovascular risk and adequacy of treatment in high risk patients and those with metabolic syndrome
- C-reactive protein (hs-CRP) levels
  - highly sensitive acute phase reactant
  - may be clinically useful in identifying those at a higher risk of cardiovascular disease than predicted by the global risk assessment

## Treatment of Dyslipidemias

### Approach to Treatment

For clinical guidelines see *Can J Cardiol* 2012;29:151-167

- estimate 10 yr risk of CAD using Framingham model
- establish treatment targets according to level of risk

**Table 5. Target Lipids by Risk Group**

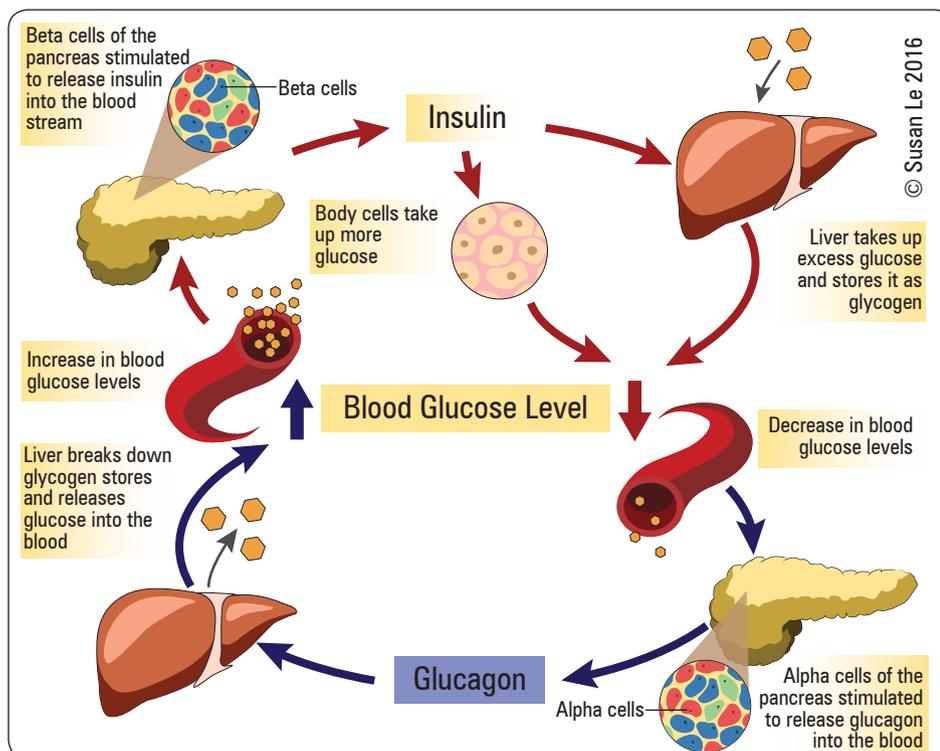

Level of Risk	Definition (10 Yr Risk of CAD)	Initiate Treatment if:	Primary Target LDL-C	Alternate
High	Risk $\geq 20\%$ , or Clinical atherosclerosis Abdominal aortic aneurysm DM $>15$ yr duration and age older than 30 yr DM with age older than 40 yr Microvascular disease High risk kidney disease High risk HTN	Consider treatment in all patients	$\leq 2$ mmol/L or $\geq 50\%$ $\downarrow$ in LDL	apo B $\leq 0.80$ g/L or non-HDL-C $\leq 2.6$ mmol/L
Moderate	Risk 10 - 19%	LDL $> 3.5$ mmol/L For LDL-C $< 3.5$ consider if: apo B $\geq 1.2$ g/L or non-HDL-C $\geq 4.3$ mmol/L	$\leq 2$ mmol/L or $\geq 50\%$ $\downarrow$ in LDL	apo B $< 0.80$ g/L or non-HDL-C $\leq 2.6$ mmol/L
Low	Risk $< 10\%$	LDL $\geq 5.0$ mmol/L Familial hypercholesterolemia	$\geq 50\%$ $\downarrow$ in LDL	

**Table 6. Treatment of Hypercholesterolemia and Hypertriglyceridemia**

Treatment of Hypercholesterolemia	Treatment of Hypertriglyceridemia
<p><b>Conservative:</b> 4-6 mo trial unless high risk group, in which case medical treatment should start immediately</p> <p>Diet</p> <ul style="list-style-type: none"> <li>Decrease fat: &lt;30% calories</li> <li>Decrease saturated fat: &lt;10% calories</li> <li>Decrease cholesterol: &lt;200 mg/d</li> <li>Increase fibre: &gt;30 g/d</li> </ul> <p>Decrease alcohol intake to ≤1-2 drinks/d</p> <p>Smoking cessation</p> <p>Aerobic exercise: ≥150 min/wk in bouts of ≥10 min</p> <p>Weight loss: target BMI &lt;25</p> <p><b>Medical</b></p> <p>HMG-CoA reductase inhibitors, ezetimibe, bile acid sequestrants, niacin (see <i>Common Medications, E49</i>)</p>	<p><b>Conservative:</b> 4-6 mo trial</p> <p>Diet</p> <ul style="list-style-type: none"> <li>Decrease fat and simple carbohydrates</li> <li>Increase omega-3 polyunsaturated fatty acid</li> </ul> <p>Control blood sugars</p> <p>Decrease alcohol intake to ≤1-2 drinks/d</p> <p>Smoking cessation</p> <p>Aerobic exercise: ≥150 min/wk in bouts of ≥10 min</p> <p>Weight loss: target BMI &lt;25</p> <p><b>Medical:</b> fibrates, niacin (see <i>Common Medications, E49</i>)</p> <p>Indications:</p> <ul style="list-style-type: none"> <li>Failed conservative measures</li> <li>TG &gt;10 mmol/L (885 mg/dL) to prevent pancreatitis</li> <li>Combined hyperlipidemia</li> </ul>

## Disorders of Glucose Metabolism

### Overview of Glucose Regulation

**Figure 3. Blood glucose regulation**

### Pre-Diabetes (Impaired Glucose Tolerance/ Impaired Fasting Glucose)

- 1-5% per yr go on to develop DM
- 50-80% revert to normal glucose tolerance
- weight loss may improve glucose tolerance
- increased risk of developing macrovascular complications (IGT >IFG)
- lifestyle modifications decrease progression to DM by 58%

#### Diagnostic Criteria (CDA Guidelines)

- impaired fasting glucose (IFG): fasting plasma glucose (FPG) 6.1-6.9 mmol/L
- impaired glucose tolerance (IGT): 2h 75 g oral glucose tolerance test (OGTT) 7.8-11.0 mmol/L
- HbA1c: 6.0-6.4%

#### Glucose Related Emergencies

- DKA
- HHS
- Hypoglycemia

#### Three Year Efficacy of Complex Insulin Regimens in Type 2 DM: 4T Trial

*NEJM* 2009;361:1736-1747

**Study:** Randomized unblinded trial with 3 yr of follow-up.

**Population:** 708 patients with type 2 DM, not on insulin or thiazolidinedione therapy on maximal metformin and sulfonylurea therapy.

**Intervention:** Thrice-daily prandial insulin aspart, versus twice-daily biphasic insulin aspart, versus once-daily basal insulin detemir. Sulfonylurea therapy was replaced with a secondary insulin regime specific to each arm if there was persistent hyperglycemia.

**Primary Outcome:** Three yr hemoglobin HbA1c.

**Results:** Significant difference in rates of patient withdrawal from the study: 5.1% biphasic, 11.7% prandial, 8.5% basal regimens ( $p=0.04$ ). There were no significant differences in median HbA1c levels between all three arms from yr 1-3. A smaller proportion of patients reached HbA1c <6.5% or <7.0% in the biphasic arm. The basal arm had least weight gain and least weight circumference increase, but highest rate of secondary insulin requirement. The basal arm had fewest severe hypoglycemic events per patient yr, while the biphasic had the most serious adverse effects.

**Conclusion:** Basal insulin regime provides the best glycemic control over a 3 yr study; with better HbA1c control, fewer hypoglycemic events, and less weight gain.

# Diabetes Mellitus

## Definition

- syndrome of disordered metabolism and inappropriate hyperglycemia secondary to an absolute/relative deficiency of insulin, or a reduction in biological effectiveness of insulin, or both

## Diagnostic Criteria (CDA Guidelines)

- any one of the following is diagnostic
- FPG  $\geq 7.0$  mmol/L (fasting = no caloric intake for at least 8 h) OR
- 2h 75 g OGTT  $\geq 11.1$  mmol/L OR
- random PG  $\geq 11.1$  mmol/L OR
- HbA1c  $\geq 6.5\%$  (not for diagnosis of suspected Type 1 DM, children, adolescents, or pregnant women)
- in the presence of hyperglycemia symptoms (polyuria, polydipsia, polyphagia, weight loss, blurry vision, etc.), a confirmatory test is not required
- in the absence of hyperglycemic symptoms, a repeat confirmatory test is required to make the diagnosis of diabetes

## Etiology and Pathophysiology

**Table 7. Etiologic Classification of Diabetes Mellitus**

<b>I. Type 1 DM</b> (immune-mediated $\beta$ cell destruction, usually leading to absolute insulin deficiency)
<b>II. Type 2 DM</b> (ranges from predominantly insulin resistance with relative insulin deficiency to a predominantly insulin secretory defect with insulin resistance 2 $\alpha$ to $\beta$ cell dysfunction)
<b>III. Other Specific Causes of DM</b>
a. Genetic defects of $\beta$ cell function (e.g. MODY – Maturity-Onset Diabetes of the Young) or insulin action
b. Diseases of the exocrine pancreas: Pancreatitis, pancreatotomy, neoplasia, cystic fibrosis, hemochromatosis (“bronze diabetes”)
c. Endocrinopathies: Acromegaly, Cushing’s syndrome, glucagonoma, pheochromocytoma, hyperthyroidism
d. Drug-induced: Glucocorticoids, thyroid hormone, $\beta$ -adrenergic agonists, thiazides, phenytoin, clozapine
e. Infections: Congenital rubella, CMV, coxsackie
f. Genetic syndromes associated with DM: Down’s syndrome, Klinefelter’s syndrome, Turner’s syndrome
<b>IV. Gestational Diabetes Mellitus</b> (see <a href="#">Obstetrics, OB26</a> )

**Table 8. Comparison of Type 1 and Type 2 Diabetes Mellitus**

	Type 1	Type 2
<b>Onset</b>	Usually <30 yr of age	Usually >40 yr of age Increasing incidence in pediatric population 2 $^\circ$ to obesity
<b>Epidemiology</b>	More common in Caucasians Less common in Asians, Hispanics, Aborigines, and Blacks Accounts for 5-10% of all DM	More common in Blacks, Hispanics, Aborigines, and Asians Accounts for >90% of all DM
<b>Etiology</b>	Autoimmune	Complex and multifactorial
<b>Genetics</b>	Monozygotic twin concordance is 30-40% Associated with HLA class II DR3 and DR4, with either allele present in up to 95% of type 1 DM Certain DQ alleles also confer a risk	Greater heritability than type 1 DM Monozygotic twin concordance is 70-90% Polygenic Non-HLA associated
<b>Pathophysiology</b>	Synergistic effects of genetic, immune, and environmental factors that cause $\beta$ cell destruction resulting in impaired insulin secretion Autoimmune process is believed to be triggered by environmental factors (e.g. viruses, bovine milk protein, urea compounds) Pancreatic cells are infiltrated with lymphocytes resulting in islet cell destruction 80% of $\beta$ cell mass is destroyed before features of DM present	Impaired insulin secretion, peripheral insulin resistance (likely due to receptor and post receptor abnormality), and excess hepatic glucose production

### Effects of Intensive Treatment of Type 1 DM on the Development and Progression of Long-Term Complications: The DCCT Study

*NEJM* 1993;329:977-986.

**Study:** Multicentre RCT, with 6.5 yr of mean follow-up

**Patients:** 1,441 patients (aged 13-39 yr) with type 1 DM with no cardiovascular history or severe diabetic complications

**Intervention:** Intensive therapy (3 or more daily insulin injections or treatment with an insulin pump with dose adjustments as needed, BG monitoring minimum qid, monthly visits, strict BG targets) vs. Conventional therapy (1 or 2 insulin injections per day with no dose adjustments, daily BG monitoring, visits q3 months).

**Outcomes:** Primary outcome was development or progression of retinopathy. Secondary outcomes were development or progression of renal, neurological, cardiovascular, and neuropsychological outcomes

**Results:** Intensive treatment of Type 1 DM significantly reduced the risk for the development and progression of retinopathy in the primary- and secondary-intervention cohorts, respectively. Intensive therapy also reduced the occurrence of microalbuminuria, albuminuria, and clinical neuropathy. The chief adverse event associated with intensive therapy was an increase in the occurrence of severe hypoglycemia.

**Conclusions:** Intensive treatment of Type 1 DM significantly reduces the development and progression of diabetic retinopathy, nephropathy, and neuropathy in patients with Type 1 DM.

### Blood Glucose Control in Type 2 DM – UKPDS 33

*Lancet* 1998;352:837-853

**Study:** RCT (mean follow-up 10 yr).

**Patients:** 3,867 patients with newly diagnosed type 2 DM (mean age 53 yr, 61% men, 81% white, mean fasting plasma glucose [FPG] 6.1-15.0 mmol/L).

Exclusions included severe cardiovascular disease, renal disease, retinopathy, and others.

**Intervention:** Intensive treatment with a sulfonylurea or insulin (target FPG <6 mmol/L) vs. conventional treatment with diet alone (target FPG <15 mmol/L without hyperglycemic symptoms).

**Main Outcomes:** DM-related endpoints (MI, angina, heart failure, stroke, renal failure, amputation, retinopathy, blindness, death from hyperglycemia or hypoglycemia), DM-related death, and all-cause mortality.

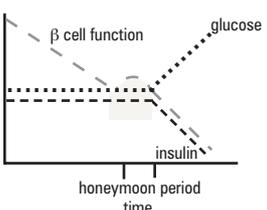

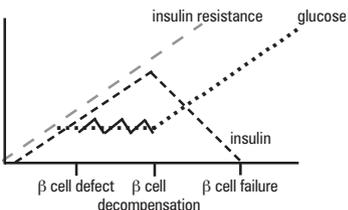

**Results:** Patients allocated to intensive treatment had lower median HbA1c levels ( $p < 0.001$ ).

Outcome	RRR % (p value)
DM-related endpoint	12 (0.029)
DM-related death	10 (0.34)
All-cause mortality	6 (0.44)

Patients allocated to intensive therapy had more hypoglycemic episodes and greater weight gain.

**Conclusion:** Intensive blood glucose control reduces microvascular, but not macrovascular complications in type 2 DM.

**Table 8. Comparison of Type 1 and Type 2 Diabetes Mellitus (continued)**

	Type 1	Type 2
<b>Natural History</b>	 <p>After initial presentation, honeymoon period often occurs where glycemic control can be achieved with little or no insulin treatment as residual cells are still able to produce insulin. Once these cells are destroyed, there is complete insulin deficiency.</p>	 <p>Early on, glucose tolerance remains normal despite insulin resistance as <math>\beta</math> cells compensate with increased insulin production. As insulin resistance and compensatory hyperinsulinism continue, the <math>\beta</math> cells are unable to maintain the hyperinsulinemic state which results in glucose intolerance and DM.</p>
<b>Circulating Autoantibodies</b>	Islet cell Ab present in up to 60-85%. Most common islet cell Ab is against glutamic acid decarboxylase (GAD). Up to 60% have Ab against insulin.	<10%
<b>Risk Factors</b>	Personal history of other autoimmune diseases including Graves', myasthenia gravis, autoimmune thyroid disease, celiac disease, and pernicious anemia. Family history of autoimmune diseases.	Age >40 yr Schizophrenia Abdominal obesity/overweight Fatty liver First-degree relative with DM Hyperuricemia Race/ethnicity (Black, Aboriginal, Hispanic, Asian-American, Pacific Islander) Hx of IGT or IFG HTN Dyslipidemia Medications e.g. 2nd generation antipsychotics PCOS Hx of gestational DM or macrosomic baby (>9 lb or 4 kg)
<b>Body Habitus</b>	Normal to thin	Typically overweight with increased central obesity
<b>Treatment</b>	Insulin	Lifestyle modification Non-insulin antihyperglycemic agents - unless contraindicated, metformin should be the initial antihyperglycemic agent of choice. Additional agents to be selected on the basis of clinically relevant issues, such as glucose lowering effectiveness, risk of hypoglycemia, and effect on body weight Insulin therapy
<b>Acute Complication</b>	Diabetic ketoacidosis (DKA) in severe cases	Hyperosmolar hyperglycemic state (HHS) DKA in severe cases
<b>Screening</b>	Subclinical prodrome can be detected in first and second-degree relatives of those with type 1 DM by the presence of pancreatic islet autoantibodies	Screen individuals with risk factors

#### Targeting Intensive Glycemic Control vs. Targeting Conventional Glycemic Control for Type 2 DM

*Cochrane DB Syst Rev* 2011;6:CD008143

**Study:** Systematic review of randomized clinical trials of glycemic control in adults with type 2 DM.  
**Patients:** Twenty trials randomized 16,106 patients with type 2 DM to intensive control and 13,880 patients with type 2 DM to conventional glycemic control.

**Intervention:** Intensive glycemic control (HbA1c  $\leq 6.5\%$ ) versus conventional glycemic control (determined by local guidelines).

**Primary Outcomes:** All-cause mortality, composite macrovascular (death from cardiovascular cause, nonfatal MI, nonfatal stroke) and microvascular events (nephropathy, retinopathy).

**Results:** There was no significant difference between targeting intensive and conventional glycemic control for all-cause mortality or cardiovascular mortality. Targeting intensive glycemic control reduced the risk of amputation, the composite risk of microvascular disease, retinopathy, retinal photocoagulation, and nephropathy. The risks of both mild and severe hypoglycemia were increased with targeting intensive glycemic control.

**Conclusions:** Intensive glycemic control did not reduce all-cause mortality and cardiovascular mortality compared to conventional glycemic control. Intensive glycemic control reduced the risk of microvascular complications while increasing the risk of hypoglycemia. Intensive glycemic control may also reduce the risk of non-fatal MI in trials exclusively dealing with glycemic control in usual care settings.

#### Canadian Diabetes Guidelines 2013

	Target
HbA1c	<7.0%
Fasting plasma glucose	4-7 mmol/L (72-126 mg/dL)
2h post-prandial glucose	5-10 mmol/L (90-180 mg/dL) 5-8 mmol/L (90-144 mg/dL) if not meeting target A1c and can be safely achieved
Lipids	As per high risk group if age >40 or age >30 if DM duration >15 yr
Blood pressure	<130/80

#### Cardiovascular Effects of Intensive Lifestyle Intervention in Type 2 DM: The Look AHEAD Trial

*NEJM* 2013;369:145-154

**Study:** RCT, with 9.6 yr of median follow-up.

**Population:** 5,145 overweight or obese patients with type 2 DM.

**Intervention:** Intensive lifestyle intervention promoting weight loss through decreased caloric intake and increased physical activity (intervention) or DM support and education (control).

**Primary Outcome:** First occurrence of death from cardiovascular (CV) causes, non-fatal MI, non-fatal stroke, or hospitalization for angina.

**Results:** Although the intensive lifestyle intervention produced greater weight loss and reductions in glycated hemoglobin, the intervention did not significantly reduce the risk of CV morbidity or mortality.

**Conclusions:** An intensive lifestyle intervention focusing on weight loss did not significantly reduce the rate of cardiovascular events in overweight or obese adults with type 2 DM.

## Treatment of Diabetes

### Glycemic Targets

- HbA1c reflects glycemic control over 3 mo and is a measure of patient's long-term glycemic control
- therapy in most individuals with type 1 or type 2 DM (especially younger patients) should be targeted to achieve a HbA1c  $\leq 7.0\%$  in order to reduce the risk of microvascular and if implemented early in the course of disease, macrovascular complications
- more intensive glucose control, HbA1c <6.5%, may be targeted in type 2 DM in patients with a shorter duration of DM with no evidence of significant CVD and longer life expectancy, to further reduce risk of nephropathy and retinopathy, provided this does not result in a significant increase in hypoglycemia
- less stringent HbA1c targets (7.1-8.5%) may be more appropriate in type 1 and type 2 patients with limited life expectancy, higher level of functional dependency, a history of recurrent severe hypoglycemia, multiple comorbidities, extensive CAD, or a failure to attain HbA1c <7.0% despite intensified basal and bolus insulin therapy
- there may be harm associated with strategy to target HbA1c <6.0% (see *ACCORD trial*, E9)

### Diet

- daily carbohydrate intake 45-60% of energy, protein 15-20% of energy, and fat <35% of energy
- intake of saturated fats <7% and polyunsaturated fats <10% of total calories each
- limit sodium, alcohol, and caffeine intake
- type 1: carbohydrate counting is used to titrate insulin regimen
- type 2: weight reduction

**Lifestyle**

- regular physical exercise to improve insulin sensitivity, lower lipid concentrations and control blood pressure
- smoking cessation

**Medical Treatment: Non-insulin Antihyperglycemic Agents (Type 2 DM)**

- initiate non-insulin antihyperglycemic therapy within 2-3 mo if lifestyle management does not result in glycemic control
- if initial HbA1c >8.5% at the time of diagnosis, initiate pharmacologic therapy with metformin immediately and consider combination of therapies or insulin immediately
- continue to add additional pharmacologic therapy in a timely fashion to achieve target HbA1C within 3-6 months of diagnosis
- see *Common Medications, E49* for details on antihyperglycemic agents

**Medical Treatment: Insulin** (Figure 5)

- used for type 1 DM at onset, may be used in type 2 DM at any point in treatment
- routes of administration: subcutaneous injections, continuous subcutaneous insulin infusion pump, IV infusion (regular insulin only)
- bolus insulins: short-acting (Insulin regular), rapid-acting analogue (Insulin aspart, Insulin glulisine, Insulin lispro)
- basal insulins: intermediate-acting (Insulin NPH), long-acting analogue (Insulin detemir, glargine)
- premixed insulins (combination of basal and bolus insulins) available but not used regularly
- estimated total daily insulin requirement: 0.5-0.7 units/kg (often start with 0.3-0.5 units/kg/d)

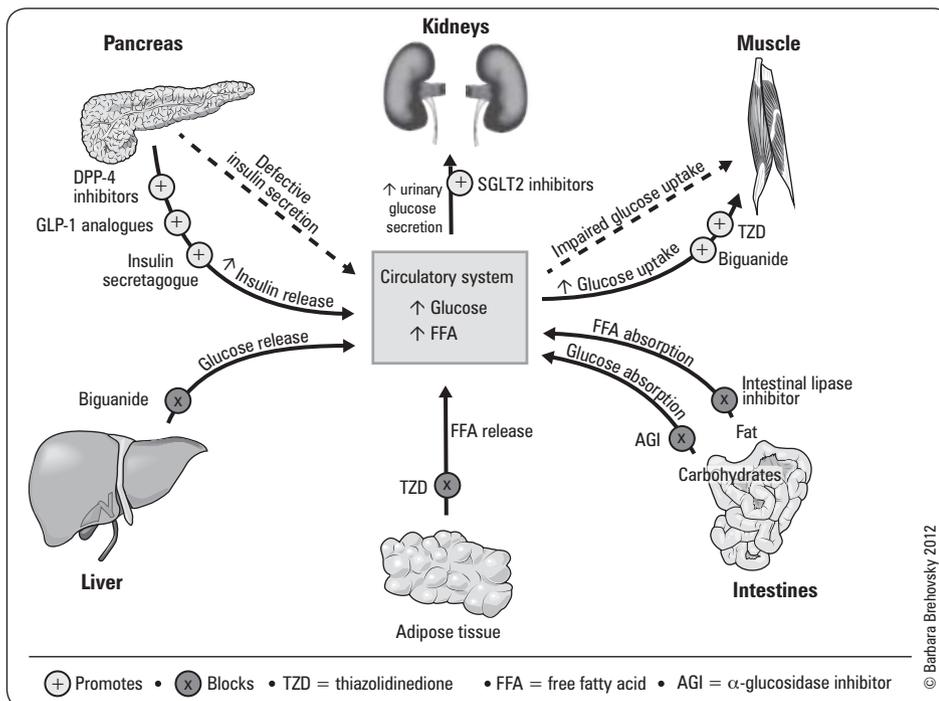

Figure 4. Antihyperglycemic agents

Table 9. Available Insulin Formulations

Insulin Type (trade name)	Onset	Peak	Duration
<b>PRANDIAL (BOLUS) INSULINS</b>			
Rapid-acting insulin analogues			
Insulin aspart (NovoRapid®)	10-15 min	1-1.5 h	3-5 h
Insulin lispro (Humalog®, Humalog 200 units/mL)	10-15 min	1-2 h	3.5-4.75 h
Insulin glulisine (Apidra®)	10-15 min	1-1.5 h	3-5 h
Short-acting insulins			
Humulin R®	30 min	2-3 h	6.5 h
Novolin Toronto®			
<b>BASAL INSULINS</b>			
Intermediate-acting			
Humulin N®	1-3 h	5-8 h	Up to 18 h
Novolin NPH®			
Long-acting basal insulin analogues			
Insulin detemir (Levemir®)	90 min	Not applicable	Up to 24 h (glargine 24 h, detemir 16-24 h)
Insulin glargine 100 units/mL (Lantus®)			
Insulin glargine 300 units/mL (Toujeo)			

**DPP-IV Inhibitors**

- Antihyperglycemic agents (e.g. sitagliptin, saxagliptin, linagliptin) that inhibit DPP-IV, which is an enzyme that degrades endogenous incretin hormones like GLP-1
- Incretin hormones stimulate glucose-dependent insulin secretion and inhibit glucagon release from the pancreas

**GLP-1 Analogues (Incretins)**

- Human glucagon-like peptide-1 analogues: exenatide, liraglutide
- These activate GLP-1 causing increased insulin secretion, decreased inappropriate glucagon secretion, increased B-cell growth/replication, slowed gastric emptying, and decreased food intake
- Associated with weight loss
- Subcutaneous formulation

**Effects of Intensive Glucose Lowering in Type 2 DM: The ACCORD Trial**

*NEJM* 2008;358:2545-2559  
**Study:** Multicentre RCT.  
**Patients:** 10,251 patients (mean age 62.2) with type 2 DM, and cardiovascular risk factors.  
**Intervention:** Intensive therapy targeting a HbA1c level of less than 6.0% or standard therapy targeting 7.0-7.9%.  
**Outcomes:** First occurrence of nonfatal MI, nonfatal stroke, or death from CV causes.  
**Results:** The intensive therapy arm was stopped early (3.5 yr vs. 5.6 yr planned) due to evidence of increased mortality. There was no difference in primary outcome for either study arm. There was a significant increase in all-cause mortality, CV mortality, nonfatal MI, and CHF in the intensive therapy group. There were increased rates of all hyperglycemic events, any nonhyperglycemic serious adverse events, fluid retention, and weight gain >10 kg, but lower systolic and diastolic blood pressure in the intensive therapy group. There was an increased incidence of elevated ALT (>3x upper limit) and ACE drug use in the standard therapy group.  
**Conclusions:** Intensive glucose lowering therapy in type 2 DM does not improve clinic outcomes and actually increases the risk of mortality with more adverse events compared to standard therapy. Additional research is required to discern the cause.

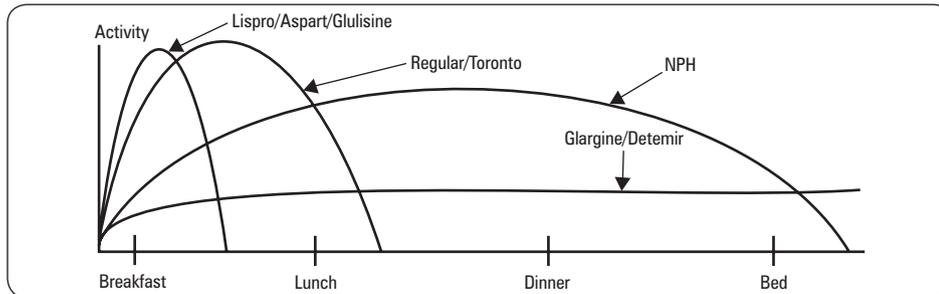

**Effects of Intensive Blood Pressure Control in Type 2 DM: The ACCORD Trial**

*NEJM* 2010;362:1575-1585  
**Study:** RCT, unblinded with 4.7 yr of mean follow-up.  
**Population:** 4,733 patients with type 2 DM, risk factors for cardiovascular (CV) disease, systolic blood pressure (sBP) between 130-180 mmHg.  
**Intervention:** sBP control less than 120 mmHg (intensive) or 140 mmHg (standard).  
**Primary Outcomes:** Major CV event (composite nonfatal MI, nonfatal stroke, or CV-related death).  
**Results:** Mean number of medications at 1 yr for intensive therapy was 3.4 (95% CI 3.4-3.5) versus 2.1 (95% CI 2.1-2.2) for standard therapy. There was a significant increase in all serious adverse events in the intensive treatment arm (3.3% vs. 1.27%, p=<0.001); especially bradycardia or arrhythmia (0.5% vs. 0.13%, p=0.02) and hyperkalemia (0.4% vs. 0.04%, p=0.01). There was no significant difference in primary outcomes in the two study arms, or all-cause mortality. There was a significant reduction in any stroke (0.32%/yr vs. 0.53%/yr, p=0.01) and nonfatal stroke incidences (0.30%/yr vs. 0.47%/yr, p=0.03) in the intensive therapy arm.  
**Conclusions:** Intensive BP lowering to less than 120 mmHg vs. 140 mmHg in patients with type 2 DM and CV risk factors does not reduce major CV event risk reduction except for stroke events.

**Table 9. Available Insulin Formulations (continued)**

Insulin Type (trade name)	Onset	Peak	Duration
<b>PRE-MIXED INSULINS</b>			
Premixed regular insulin – NPH Humulin 30/70® Novolin 30/70®			
Premixed insulin analogues Biphasic insulin aspart (NovoMix 30®) Insulin lispro/lispro protamine (Humalog Mix25® and Mix50®)		A single vial or cartridge contains a fixed ratio of insulin (% of rapid acting or short-acting insulin to % of intermediate-acting insulin)	

**Figure 5. Duration of activity of different insulins**

## Insulin Regimens

**Table 10. Insulin Regimens for Type 2 DM and Type 1 DM**

Regimen	Administration
Type 2 DM Non-insulin antihyperglycemic agent + basal insulin	Start with 10 units of basal insulin at bedtime Titrate up by 1 unit until FPG < 7.0 mmol/L
Type 1 DM Basal-bolus (multiple daily injections (MDI))	Estimated total insulin requirement is 0.5-0.7 U/kg 40% is given as basal insulin at bedtime 20% is given as bolus insulin before breakfast, lunch, and dinner Continue metformin but discontinue secretagogue
Premixed	Estimated total insulin requirement is 0.5-0.7 U/kg 2/3 dose is given as pre-mixed insulin before breakfast 1/3 dose is given as pre-mixed insulin before dinner Continue metformin but discontinue secretagogue

\*Bolus insulin: Aspart, Glulisine, Lispro; \*Basal insulin: Gargine, Detemir, NPH; \*Pre-mixed insulin: Humulin 30/70, Novolin 30/70, Novomix 30, Humalog Mix25, Humalog Mix50

**Table 11. Titrating Insulin Doses**

Hyperglycemic Reading	Insulin Correction
High AM sugar	Increase bedtime basal insulin
High lunch sugar	Increase AM rapid/regular insulin
High supper sugar	Increase lunch rapid/regular insulin, or Increase AM basal insulin
High bedtime sugar	Increase supper rapid/regular insulin

## Variable Insulin Dose Schedule (“Supplemental/Correction Scale”)

- for patients on Basal-Bolus regimen: patient takes usual doses of basal insulin but varies doses of bolus insulin based on BG reading at time of dose
- use baseline bolus insulin dose when within BG target range; add or subtract units when above or below target
- when used in hospital (including perioperative management of DM), patient should also receive basal insulin to prevent fluctuations in blood sugar levels or long periods of hyperglycemia
- construction of a supplemental sliding scale for a patient on anti-hyperglycemics
- Correction Factor (CF) = 100/Total Daily Dose of insulin (TDD)
  - BG < 4: call MD and give 15 g carbohydrates
  - BG between 4 to 8: no additional insulin
  - BG between 8 to (8 + CF): give one additional unit
  - BG between (8 + CF) to (8 + 2CF): give two additional units
  - BG between (8 + 2CF) to (8 + 3CF): give three additional units

## Insulin Pump Therapy: Continuous Subcutaneous Insulin Infusion (CSII)

- external battery-operated device provides continuous basal dose of rapid-acting insulin analogue (aspart, glulisine, or lispro) through small subcutaneous catheter
- at meals, patient programs pump to deliver insulin bolus
- provides improved quality of life and flexibility
- risk of DKA if pump is inadvertently disconnected
- coverage available for insulin pumps for individuals with Type 1 DM varies by province

### Effects of Combination Lipid Therapy in Type 2 DM: the ACCORD Trial

NEJM 2010;362:1563-1574

**Study:** RCT, double-blinded trial with 4.7 yr of mean follow-up.

**Population:** 5,518 patients with type 2 DM.

**Intervention:** Statin with or without fibrate therapy.

**Primary Outcome:** Major cardiovascular (CV) event (composite nonfatal MI, nonfatal stroke, or CV-related death).

**Results:** No significant differences in primary outcome between the two arms. No difference in all MI, all stroke, or all-cause mortality between study arms.

**Conclusions:** The addition of fibrate therapy to statin therapy in patients with type 2 DM does not reduce major CV event risk.

### Effects of a Mediterranean Diet in Preventing Cardiovascular Events in Type 2 DM: The PREDIMED Trial

NEJM 2013;368:1279-1290

**Study:** RCT, with 4.8 yr of median follow-up.

**Population:** 7,447 patients with type 2 DM or other high cardiovascular risk factors.

**Intervention:** Mediterranean diet supplemented with extra-virgin olive oil, Mediterranean diet supplemented with mixed nuts, or control diet with advice to reduce dietary fat.

**Primary Outcome:** Major cardiovascular (CV) event (MI, stroke, or death from CV causes).

**Results:** Both Mediterranean diets were associated with a reduced incidence of major CV events compared to the control diet.

**Conclusions:** A Mediterranean diet with extra-virgin olive oil or nuts reduces rates of MI, stroke, and CV death in those at high risk for CV disease.

### Treatment of DKA/HHS

- Fluids
- Insulin
- Potassium
- Search for and treat precipitant

### Conversion Chart for Percentage HbA1c to Average Blood Sugar Control

Average blood sugar level (mmol/L)	Hemoglobin A1c (% HbA1c)
17	12%
16	11%
14	10%
12	9%
10	8%
8	7%
6	6%

Conversion chart adapted from Nathan DM, et al. The clinical information value of a glycosylated hemoglobin assay. *NEJM* 1984;310:341-346

### The 8 Is Precipitating DKA

- Infection
- Ischemia or Infarction
- Iatrogenic (glucocorticoids)
- Intoxication
- Insulin missed
- Initial presentation
- Intra-abdominal process (e.g. pancreatitis, cholecystitis)
- Intraoperative/perioperative stress

All Ketonemia is not DKA  
Consider starvation or alcohol ketosis

## Acute Complications

**Table 12. Acute Complications of Diabetes Mellitus: Hyperglycemic Comatose States**

	Diabetic Ketoacidosis (DKA)	Hyperosmolar Hyperglycemic State (HHS)
<b>Pathophysiology</b>	<ul style="list-style-type: none"> <li>Usually occurs in type 1 DM</li> <li>Insulin deficiency with ↑ counterregulatory hormones (glucagon, cortisol, catecholamines, GH)</li> <li>Can occur with lack of insulin (non-adherence, inadequate dosage, 1st presentation) or increased stress (surgery, infection, exercise)</li> <li>Unopposed hepatic glucose production → hyperglycemia → osmotic diuresis → dehydration and electrolyte disturbance → ↓ Na<sup>+</sup> (water shift to ECF causing pseudohyponatremia)</li> <li>Fat mobilization → ↑ FFA → ketoacids → metabolic acidosis</li> <li>Severe hyperglycemia exceeds the renal threshold for glucose and ketone reabsorption → glucosuria and ketonuria</li> <li>Total body K<sup>+</sup> depletion but serum K<sup>+</sup> may be normal or elevated, 2° to shift from ICF to ECF due to lack of insulin, ↑ plasma osmolality</li> <li>Total body PO<sub>4</sub><sup>3-</sup> depletion</li> </ul>	<ul style="list-style-type: none"> <li>Occurs in type 2 DM</li> <li>Often precipitated by sepsis, stroke, MI, CHF, renal failure, trauma, drugs (glucocorticoids, immunosuppressants, phenytoin, diuretics), dialysis, recent surgery, burns</li> <li>Partial or relative insulin deficiency decreases glucose utilization in muscle, fat, and liver while inducing hyperglucagonemia and hepatic glucose production</li> <li>Presence of a small amount of insulin prevents the development of ketosis by inhibiting lipolysis</li> <li>Characterized by hyperglycemia, hyperosmolality, and dehydration without ketosis</li> <li>More severe dehydration compared to DKA due to more gradual onset and ↑ duration of metabolic decompensation plus impaired fluid intake which is common in bedridden or elderly</li> <li>Volume contraction → renal insufficiency → ↑ hyperglycemia, ↑ osmolality → shift of fluid from neurons to ECF → mental obtundation and coma</li> </ul>
<b>Clinical Features</b>	<ul style="list-style-type: none"> <li>Polyuria, polydipsia, polyphagia with marked fatigue, N/V</li> <li>Dehydration (orthostatic changes)</li> <li>LOC may be ↓ with ketoacidosis or with high serum osmolality (osm &gt;330 mmol/L)</li> <li>Abdominal pain</li> <li>Fruity smelling breath</li> <li>Kussmaul's respiration</li> </ul>	<ul style="list-style-type: none"> <li>Onset is insidious → preceded by weakness, polyuria, polydipsia</li> <li>History of decreased fluid intake</li> <li>History of ingesting large amounts of glucose containing fluids</li> <li>Dehydration (orthostatic changes)</li> <li>↓ LOC → lethargy, confusion, comatose due to high serum osmolality</li> <li>Kussmaul's respiration is absent unless the underlying precipitant has also caused a metabolic acidosis</li> </ul>
<b>Serum</b>	<ul style="list-style-type: none"> <li>↑ BG (typically 11-55 mmol/L, ↓ Na<sup>+</sup> (2° to hyperglycemia → for every ↑ in BG by 10 mmol/L there is a ↓ in Na<sup>+</sup> by 3 mmol/L)</li> <li>Normal or ↑ K<sup>+</sup>, ↓ HCO<sub>3</sub><sup>-</sup>, ↑ BUN, ↑ Cr, ketonemia, ↓ PO<sub>4</sub><sup>3-</sup></li> <li>↑ osmolality</li> </ul>	<ul style="list-style-type: none"> <li>↑ BG (typically 44.4-133.2 mmol/L)</li> <li>In mild dehydration, may have hyponatremia (spurious 2° to hyperglycemia → for every ↑ in BG by 10 mmol/L there is a ↓ in Na<sup>+</sup> by 3 mmol/L) <ul style="list-style-type: none"> <li>if dehydration progresses, may get hypernatremia</li> </ul> </li> <li>Ketosis usually absent or mild if starvation occurs</li> <li>↑ osmolality</li> </ul>
<b>ABG</b>	<ul style="list-style-type: none"> <li>Metabolic acidosis with ↑ AG, possible 2° respiratory alkalosis</li> <li>If severe vomiting/dehydration there may be a metabolic alkalosis</li> </ul>	<ul style="list-style-type: none"> <li>Metabolic acidosis absent unless underlying precipitant leads to acidosis (e.g. lactic acidosis in MI)</li> </ul>
<b>Urine</b>	<ul style="list-style-type: none"> <li>+ve for glucose and ketones</li> </ul>	<ul style="list-style-type: none"> <li>-ve for ketones unless there is starvation ketosis</li> <li>Glycosuria</li> </ul>
<b>Treatment</b>	<ul style="list-style-type: none"> <li>ABCs are first priority</li> <li>Monitor degree of ketoacidosis with AG, not BG or serum ketone level</li> <li>Rehydration <ul style="list-style-type: none"> <li>1 L/h NS in first 2 h</li> <li>after 1st 2 L, 300-400 mL/h NS. Switch to 0.45% NaCl once euvolemic (continue NS if corrected sodium is falling faster than 3 mosm/kg water/h)</li> <li>once BG reaches 13.9 mmol/L then switch to D5W to maintain BG in the range of 12-14 mmol/L</li> </ul> </li> <li>Insulin therapy <ul style="list-style-type: none"> <li>critical to resolve acidosis, not hyperglycemia</li> <li>do not use with hypokalemia (see below), until serum K<sup>+</sup> is corrected to &gt;3.3 mmol/L</li> <li>use only regular insulin (R)</li> <li>maintain on 0.1 U/kg/h insulin R infusion</li> <li>check serum glucose hourly</li> </ul> </li> <li>K<sup>+</sup> replacement <ul style="list-style-type: none"> <li>with insulin administration, hypokalemia may develop</li> <li>if serum K<sup>+</sup> &lt;3.3 mmol/L, hold insulin and give 40 mEq/L K<sup>+</sup> replacement</li> <li>when K<sup>+</sup> 3.5-5.0 mmol/L add KCl 20-40 mEq/L IV fluid to keep K<sup>+</sup> in the range of 3.5-5 mEq/L</li> </ul> </li> <li>HCO<sub>3</sub><sup>-</sup> <ul style="list-style-type: none"> <li>if pH &lt;7.0 or if hypotension, arrhythmia, or coma is present with a pH of &lt;7.1 give HCO<sub>3</sub><sup>-</sup> in 0.45% NaCl</li> <li>do not give if pH &gt;7.1 (risk of metabolic alkalosis)</li> <li>can give in case of life-threatening hyperkalemia</li> </ul> </li> <li>± mannitol (for cerebral edema)</li> </ul>	<ul style="list-style-type: none"> <li>Same resuscitation and emergency measures as DKA</li> <li>Rehydration <ul style="list-style-type: none"> <li>IV fluids: 1 L/h NS initially</li> <li>evaluate corrected serum Na<sup>+</sup></li> <li>if corrected serum Na<sup>+</sup> high or normal, switch to 0.45% NaCl (4-14 mL/kg/h)</li> <li>if corrected serum Na<sup>+</sup> low, maintain NS (4-14 mL/kg/h)</li> <li>when serum BG reaches 13.9 mmol/L switch to D5W</li> </ul> </li> <li>K<sup>+</sup> replacement <ul style="list-style-type: none"> <li>less severe K<sup>+</sup> depletion compared to DKA</li> <li>if serum K<sup>+</sup> &lt;3.3 mmol/L, hold insulin and give 40 mEq/L K<sup>+</sup> replacement</li> <li>if K<sup>+</sup> is 3.3-5.0, give KCl 20-30 mEq/L IV fluid</li> <li>if serum K<sup>+</sup> ≥5.5 mmol/L, check K<sup>+</sup> every 2 h</li> </ul> </li> <li>Search for precipitating event</li> <li>Insulin therapy <ul style="list-style-type: none"> <li>use only regular insulin (R)</li> <li>initially load 0.1 U/kg body weight insulin R bolus</li> <li>maintenance 0.1 U/kg/h insulin R infusion or IM</li> <li>check serum glucose hourly</li> <li>in general lower insulin requirement compared to DKA</li> </ul> </li> </ul>
<b>Prognosis</b>	<ul style="list-style-type: none"> <li>2-5% mortality in developed countries</li> <li>Serious morbidity from sepsis, hypokalemia, respiratory complications, thromboembolic complications, and cerebral edema (the latter in children)</li> </ul>	<ul style="list-style-type: none"> <li>Overall mortality approaches 50% primarily because of the older patient population and underlying etiology/precipitant</li> </ul>

## Macrovascular Complications

- increased risk of CAD, ischemic stroke, and peripheral arterial disease secondary to accelerated atherosclerosis
- CAD (see [Cardiology and Cardiac Surgery, C32](#))
  - risk of MI is 3-5x higher in those with DM compared to age-matched controls
  - CAD is the leading cause of death in type 2 DM
  - most patients with DM are considered “high risk” under the risk stratification for CAD (see [Dyslipidemias, E5](#))
- ischemic stroke (see [Neurology, N50](#))
  - risk of stroke is approximately 2.5x higher in those with DM
  - level of glycemia is both a risk factor for stroke and a predictor of a poorer outcome in patients who suffer a stroke
  - HbA1c level is a significant and independent predictor of the risk of stroke
- peripheral arterial disease (see [Vascular Surgery, VS2](#))
  - manifested by intermittent claudication in lower extremities, intestinal angina, foot ulceration
  - risk of foot gangrene is 30x higher in those with DM compared to age-matched controls
  - risk of lower extremity amputation is 15x higher in those with DM
- treatment
  - tight blood pressure control (<130/80 mmHg); especially for stroke prevention
  - tight glycemic control in early DM without established CVD (refer to ACCORD, VADT, ADVANCE, DCCT, EDIC, UKPDS extension studies)
  - tight low density lipoprotein (LDL) cholesterol control (LDL  $\leq$ 2.0 mmol/L)
  - ACEI or angiotensin receptor blocker in high-risk patients
  - smoking cessation

Average fluid loss runs at 3-6 L in DKA, and 8-10 L in HHS

### Laboratory Testing: Ketones

The nitroprusside test for ketones identifies acetone and acetoacetate but does NOT detect  $\beta$ -hydroxybutyrate (BHB), the ketone most frequently in excess. This has two clinical consequences:

- Be wary of a patient with a clinical picture of DKA but negative serum or urinary ketones. These could be false negatives because of the presence of BHB
- As DKA is treated, BHB is converted to acetone and acetoacetate. Serum or urinary ketones may therefore rise, falsely suggesting that the patient is worsening when in fact they are improving

### Empagliflozin, Cardiovascular Outcomes, and Mortality in Type 2 Diabetes

*NEJM* 2015;373:2117-2128

**Purpose:** To examine whether Empagliflozin (an SGLT2 inhibitor) has any effect on cardiovascular risk in patients with Type 2 DM.

**Study:** Multi-centre RCT comparing Empagliflozin to placebo control; 7020 patients (test N=4687, placebo N=2333), median observation 3.1 yr.

**Outcome:** Death from cardiovascular causes, nonfatal MI, or nonfatal stroke.

**Results:** Both groups concurrently received the standard treatment for T2 DM. The Empagliflozin group had significantly lower rates of death from cardiovascular causes than control (3.7%, vs. 5.9%; 38% decreased relative risk). The test group also had lower all-cause mortality (5.7% and 8.3%, respectively; 32% decreased relative risk).

**Conclusion:** Adding Empagliflozin to standard treatment for Type 2 DM reduced death from macrovascular complications and all-cause mortality when compared to placebo.

### Management of Diabetic Retinopathy: A

#### Systematic Review

*JAMA* 2007;298:902-916

**Purpose:** To review the best evidence for primary and secondary interventions in the management of diabetic retinopathy (DR), including diabetic macular edema.

**Study Selection:** English-language RCTs with more than 12 mo of follow-up and meta-analyses were included.

**Results:** Forty-four studies (including 3 meta-analyses) met the inclusion criteria. Tight glycemic and blood pressure control reduces the incidence and progression of DR. Pan-retinal laser photocoagulation reduces the risk of moderate and severe visual loss by 50% in patients with severe nonproliferative and proliferative retinopathy. Focal laser photocoagulation reduces the risk of moderate visual loss by 50-70% in eyes with macular edema. Early vitrectomy improves visual recovery in patients with proliferative retinopathy and severe vitreous hemorrhage. Intravitreal injections of steroids may be considered in eyes with persistent loss of vision when conventional treatment has failed.

**Conclusions:** Tight glycemic and blood pressure control remains the cornerstone in the primary prevention of DR. Pan-retinal and focal retinal laser photocoagulation reduces the risk of visual loss in patients with severe DR and macular edema, respectively. There is currently insufficient evidence to recommend routine use of other treatments.

## Microvascular Complications

**DIABETIC RETINOPATHY** (see [Ophthalmology, OP33](#) for a more detailed description)

### Epidemiology

- type 1 DM: 25% affected at 5 yr, 100% at 20 yr
- type 2 DM: 25% affected at diagnosis, 60% at 20 yr
- leading cause of blindness in North America between the ages of 20-74
- most important factor is disease duration

### Clinical Features

- nonproliferative
- preproliferative
- proliferative

### Treatment and Prevention

- tight glycemic control (delays onset, decreases progression), tight lipid control, manage HTN, smoking cessation
- ophthalmological treatments available – see [Ophthalmology, OP33](#) for more details
- annual follow-up visits with an optometrist or ophthalmologist examination through dilated pupils whether symptomatic or not (immediate referral after diagnosis of type 2 DM; 5 yr after diagnosis of type 1 DM)
- interval for follow-up should be tailored to severity of retinopathy

**DIABETIC NEPHROPATHY** (see [Nephrology, NP31](#) for a more detailed description)

### Epidemiology

- DM-induced renal failure is the most common cause of renal failure in North America
- 20-40% of persons with type 1 DM (after 5-10 yr) and 4-20% with type 2 DM have progressive nephropathy

### Screening

- serum creatinine
- random urine test for albumin to creatinine ratio (ACR) plus urine dipstick test for all type 2 DM patients at diagnosis, then annually, and for postpubertal type 1 DM patients with  $\geq$ 5yr duration of DM

### Treatment and Prevention

- appropriate glycemic control
- appropriate blood pressure control (<130/80 mmHg)
- use either ACEI or ARB (often used first line for their CVD protection)
- limit use of nephrotoxic drugs and dyes

## DIABETIC NEUROPATHY

### Epidemiology

- approximately 50% of patients within 10 yr of onset of type 1 DM and type 2 DM

### Pathophysiology

- can have peripheral sensory neuropathy, motor neuropathy, or autonomic neuropathy
- mechanism poorly understood
- acute cranial nerve palsies and diabetic amyotrophy are thought to be due to ischemic infarction of peripheral nerve
- the more common motor and sensory neuropathies are thought to be related to metabolic or osmotic toxicity secondary to increased sorbitol and/or decreased myoinositol (possible mechanisms include accumulation of advanced glycation endproducts [AGE], oxidative stress, protein kinase C, nerve growth factor deficiency)

### Screening

- 128 Hz tuning fork or 10 g monofilament at diagnosis and annually in people with type 2 DM and after 5 yr duration of type 1 DM

### Clinical Features

**Table 13. Clinical Presentation of Diabetic Neuropathies**

Peripheral Sensory Neuropathy	Motor Neuropathy	Autonomic Neuropathy
Paresthesias (tingling, itching), neuropathic pain, radicular pain, numbness, decreased tactile sensation	Less common than sensory neuropathy Delayed motor nerve conduction and muscle weakness/atrophy	Postural hypotension, tachycardia, decreased cardiovascular response to Valsalva maneuver
Bilateral and symmetric with decreased perception of vibration and pain/temperature; especially true in the lower extremities but may also be present in the hands	May involve one nerve trunk (mononeuropathy) or more (mononeuritis multiplex)	Gastroparesis and alternating diarrhea and constipation
Decreased ankle reflex	Some of the motor neuropathies spontaneously resolve after 6-8 wk	Urinary retention and erectile dysfunction
Symptoms may first occur in entrapment syndromes e.g. carpal tunnel	Reversible CN palsies: III (ptosis/ophthalmoplegia, pupil sparing), VI (inability to laterally deviate eye), and VII (Bell's palsy)	
May result in neuropathic ulceration of foot	Diabetic amyotrophy: refers to pain, weakness, and wasting of hip flexors or extensors	

### Treatment and Management

- tight glycemic control
- for neuropathic pain syndromes: tricyclic antidepressants (e.g. amitriptyline), pregabalin, duloxetine, anti-epileptics (e.g. carbamazepine, gabapentin), and capsaicin
- foot care education
- Jobst® fitted stocking and tilting of head of bed may decrease symptoms of orthostatic hypotension
- treat gastroparesis with domperidone and/or metoclopramide (dopamine antagonists), erythromycin (stimulates motilin receptors)
- medical, mechanical, and surgical treatment for erectile dysfunction (see [Urology, U30](#))

#### Effect of a Multifactorial Intervention on Mortality in Type 2 DM: The Steno-2 Study

NEJM 2008;358:580-591

Study: Single centre RCT.

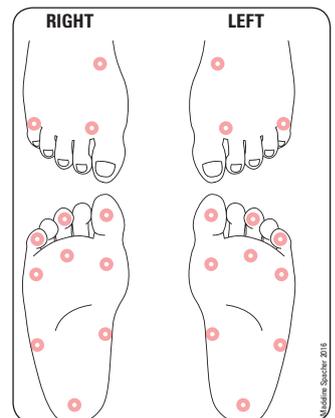

Patients: People (n=160) with type 2 DM and persistent microalbuminuria.

Intervention: Random assignment to receive either conventional multifactorial treatment or intensified, target-driven therapy involving a combination of medications and focused behaviour modification. Targets included an HbA1c level of <6.5%, a fasting serum total cholesterol level of <4.5 mmol/L, a fasting serum triglyceride level of <1.7 mmol/L, a sBP of <130 mmHg, and a dBP of <80 mmHg. Patients were treated with blockers of the renin-angiotensin system because of their microalbuminuria, regardless of blood pressure, and received low-dose Aspirin® as primary prevention.

Outcomes: The primary end point was the time to death from any cause. Other endpoints examined were death from CV causes and various CV events along with diabetic neuropathy, nephropathy, and retinopathy.

Results: Twenty-four patients in the intensive-therapy group died, as compared with 40 in the conventional-therapy group (hazard ratio, 0.54; 95% confidence interval [CI] 0.32-0.89; p=0.02). Intensive therapy was associated with a lower risk of death from CV causes (hazard ratio, 0.43; 95% CI 0.19-0.94; p=0.04) and of CV events (hazard ratio, 0.41; 95% CI 0.25-0.67; p<0.001). One patient in the intensive-therapy group had progression to end-stage renal disease, as compared with six patients in the conventional-therapy group (p=0.04). Fewer patients in the intensive-therapy group required retinal photocoagulation (relative risk, 0.45; 95% CI 0.23-0.86; p=0.02).

Conclusions: In at-risk patients with type 2 DM, intensive intervention with multiple drug combinations and behaviour modification had sustained beneficial effects with respect to vascular complications and on rates of death from any cause and from CV causes.

**Figure 6. Monofilament testing for diabetic neuropathy**

#### Effects of Treatments for Symptoms of Painful Diabetic Neuropathy: Systematic Review

BMJ 2007;335:87

Purpose: To evaluate the effects of treatments for the symptoms of painful diabetic neuropathy.

Study Selection: RCTs comparing topically applied and orally administered drugs with a placebo in adults with painful diabetic neuropathy.

Results: 25 included reports compared anticonvulsants (n=1,270), antidepressants (94), opioids (329), ion channel blockers (173), NMDA antagonist (14), duloxetine (805), capsaicin (277), and isosorbide dinitrate spray (22) with placebo. The odds ratios in terms of 50% pain relief were 5.33 (95% CI 1.77-16.02) for traditional anticonvulsants, 3.25 (95% CI 2.27-4.66) for newer generation anticonvulsants, and 22.24 (95% CI 5.83-84.75) for tricyclic antidepressants. The odds ratios in terms of withdrawals related to adverse events were 1.51 (95% CI 0.33-6.96) for traditional anticonvulsants, 2.98 (95% CI 1.75-5.07) for newer generation anticonvulsants, and 2.32 (95% CI 0.59-9.69) for tricyclic antidepressants.

Conclusion: Anticonvulsants and antidepressants are still the most commonly used options to manage diabetic neuropathy. Tricyclic antidepressants and traditional anticonvulsants are better for short-term pain relief than newer anticonvulsants. Evidence of the long-term effects of antidepressants and anticonvulsants is lacking. Further studies are needed on opioids, NMDA antagonists, and ion channel blockers.

## Other Complications

### Dermatologic

- diabetic dermopathy: atrophic brown spots commonly in pretibial region known as “shin spots”, secondary to increased glycosylation of tissue proteins or vasculopathy
- eruptive xanthomas secondary to increased triglycerides
- necrobiosis lipoidica diabetorum: rare complication characterized by thinning skin over the shins allowing visualization of subcutaneous vessels

### Bone and Joint Disease

- juvenile cheiroarthropathy: chronic stiffness of hand caused by contracture of skin over joints secondary to glycosylated collagen and other connective tissue proteins
- Dupuytren's contracture
- bone demineralization: bone density 10-20% below normal
- adhesive capsulitis (“frozen shoulder”)

### Cataracts

- subcapsular and senile cataracts secondary to glycosylated lens protein or increased sorbitol causing osmotic change and fibrosis

### Infections

- see [Infectious Diseases, ID15](#)

## Hypoglycemia (BG <4.0 mmol/L or 72 mg/dL)

### Etiology and Pathophysiology

- hypoglycemia occurs most frequently in people with DM receiving insulin or certain antihyperglycemic therapies (insulin secretagogues)
- in people without DM, care must be taken to distinguish fasting from post-prandial hypoglycemia as each invokes separate differential diagnoses

**Table 14. Common Causes of Hypoglycemia**

Fasting		Post-Prandial (Nonfasting, Reactive)
Hyperinsulinism	Without Hyperinsulinism	
Exogenous insulin	Severe hepatic dysfunction	Alimentary
Sulfonylurea or meglitinide reaction	Chronic renal insufficiency	Functional
Autoimmune hypoglycemia (autoantibodies to insulin or insulin receptor)	Hypocortisolism	Noninsulinoma pancreatogenous hypoglycemic syndrome
Pentamidine	Alcohol use	Occult DM
Pancreatic $\beta$ cell tumour – insulinoma	Non-pancreatic tumours	Leucine sensitivity
	Inborn error of carbohydrate metabolism, glycogen storage disease, gluconeogenic enzyme deficiency	Hereditary fructose intolerance
		Galactosemia
		Newborn infant of diabetic mother

### Clinical Features

- Whipple's triad
  - serum glucose <2.5 mmol/L in males and <2.2 mmol/L in females
  - neuroglycopenic symptoms
  - rapid relief provided by administration of glucose
- adrenergic symptoms (typically occur first; caused by autonomic nervous system activity)
  - palpitations, sweating, anxiety, tremor, tachycardia
- neuroglycopenic symptoms (caused by decreased activity of CNS)
  - dizziness, headache, clouding of vision, mental dullness, fatigue, confusion, seizures, coma

### Investigations

- electrolytes, creatinine, LFTs, drugs/toxins, cortisol
- if concerned about possible insulinoma
  - blood work to be drawn when patient is hypoglycemic (e.g. during hospitalized 72-h fast) for glucose, serum ketones, insulin, pro-insulin, C-peptide, insulin antibodies

### Treatment

- for fasting hypoglycemia, must treat underlying cause
- for post-prandial (reactive) hypoglycemia, frequent small feeds
- see [Emergency Medicine, ER35](#)
- treatment of hypoglycemic episode in the unconscious patient or patient NPO
  - D50W 50 mL (1 ampule) IV or 1 mg glucagon SC (if no IV available)
  - may need ongoing glucose infusion once BG >5 mmol/L

## Metabolic Syndrome

- several definitions exist
- postulated syndrome related to insulin resistance associated with hyperglycemia, hyperinsulinemia, HTN, central obesity, and dyslipidemia
- obesity aggravates extent of insulin resistance
- complications include DM, atherosclerosis, CAD, MI, and stroke
- women with PCOS are at increased risk for developing insulin resistance, hyperlipidemia, and metabolic syndrome
- not to be confused with syndrome X related to angina pectoris with normal coronary arteries (Prinzmetal angina)

## Obesity

- see [Family Medicine, FM7](#)

### Other Players in Glucose Homeostasis

These hormones act to increase blood glucose levels

- Glucagon
- Epinephrine
- Cortisol
- Growth hormone

### C-Peptide

A short peptide released into the circulation when proinsulin is cleaved to insulin

### Use C-peptide Levels to Distinguish between Exogenous and Endogenous Source of Hyperinsulinemia

Increased = endogenous

Decreased or normal = exogenous

### Treatment of Acute Hypoglycemic Episode (Blood Glucose <4.0 mmol/L) in the Awake Patient (e.g. able to self-treat)

- Eat 15 g of carbohydrates (CHO) (e.g. 3 packets sugar dissolved in water; 3/4 cup of juice)
- Wait 15 min
- Retest Blood Glucose (BG)
- Repeat steps 1-3 until BG >5 mmol/L
- Eat next scheduled meal. If next meal is >1 h away, eat snack including 15 g of CHO and protein

### Hypoglycemia Unawareness (Type 1 DM >>> Type 2 DM)

Patient remains asymptomatic until severely hypoglycemic levels are reached

#### Causes:

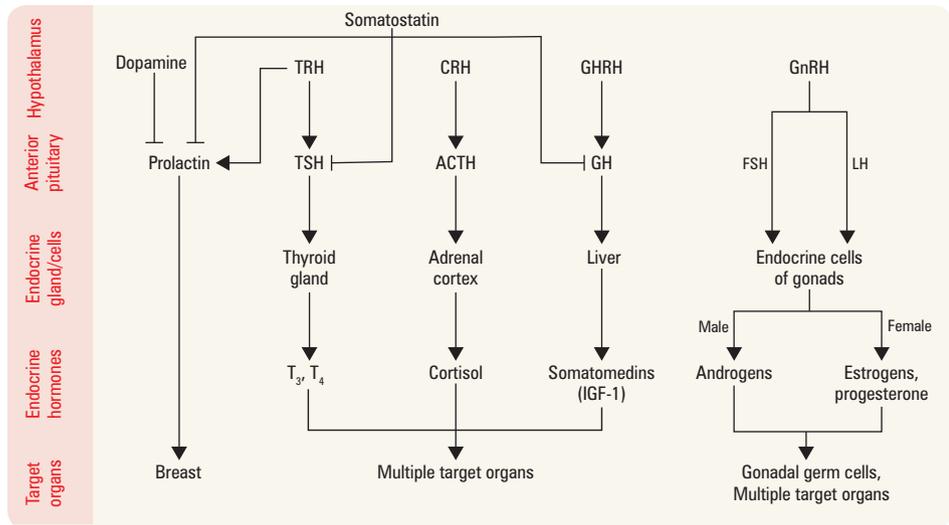

- Decreased glucagon/epinephrine response
- History of repeated hypoglycemia or low HbA1c
- Autonomic neuropathy
- Not safe to drive

Suggest that patient obtain a Medic-Alert bracelet if at risk for hypoglycemia, especially with hypoglycemia unawareness

# Pituitary Gland

## Pituitary Hormones

**Figure 7. Hypothalamic-pituitary hormonal axes**

CRH = corticotropin-releasing hormone; GHRH = growth hormone-releasing hormone; GnRH = gonadotropin-releasing hormone; PRH = prolactin-releasing hormone; TRH = thyrotropin-releasing hormone

### Hypothalamic Control of Pituitary

- trophic and inhibitory factors control the release of pituitary hormones
- most hormones are primarily under trophic stimulation except prolactin which is primarily under inhibitory control by dopamine, as well as GH and TSH which are inhibited by somatostatin
- transection of the pituitary stalk (i.e. dissociation of hypothalamus and pituitary) leads to pituitary hypersecretion of prolactin and hyposecretion of all remaining hormones

### Anterior Pituitary Hormones

- growth hormone (GH), luteinizing hormone (LH), follicle stimulating hormone (FSH), thyroid stimulating hormone (TSH), adrenocorticotrophic hormone (ACTH), and prolactin (PRL)

### Posterior Pituitary (Hypothalamic) Hormones

- antidiuretic hormone (ADH) and oxytocin
- peptides synthesized in the supraoptic and paraventricular nuclei of the hypothalamus
- although ADH and oxytocin are produced in the hypothalamus these hormones are stored and released from the posterior pituitary

**Table 15. The Physiology and Action of Pituitary Hormones**

Hormone	Function	Physiology	Inhibitory Stimulus	Secretory Stimulus
<b>ACTH</b>	Stimulates growth of adrenal cortex and secretion of its hormones	Polypeptide Pulsatile and diurnal variation (highest in AM, lowest at midnight)	Dexamethasone Cortisol	CRH Metyrapone Insulin-induced hypoglycemia Vasopressin Fever, pain, stress
<b>GH</b>	Needed for linear growth IGF-1 stimulates growth of bone and cartilage	Polypeptide Acts indirectly through serum factors synthesized in the liver: IGF-1 (somatomedin-C) Serum GH undetectable for most of the day and suppressed after meals high in glucose Sustained rise during sleep	Glucose challenge Glucocorticoids Hypothyroidism Somatostatin Dopamine D2 receptor agonists IGF-1 (long-loop) Tonically by dopamine	GHRH Insulin-induced hypoglycemia Exercise REM sleep Arginine, clonidine, propranolol, L-dopa

### Features of Metabolic Syndrome (≥ 3 measures to make a Dx)

Measure	Men	Women
Abdominal Obesity (Elevated Waist Circumference)		
Canada, USA	≥102 cm (40 inches)	≥88 cm (35 inches)
Europid, Middle Eastern, Sub-Saharan Africa, Mediterranean	≥94 cm (37 inches)	≥80 cm (31.5 inches)
Asian, Japanese, South & Central America	≥90 cm (35 inches)	≥80 cm (31.5 inches)
Triglyceride Level	≥1.7 mmol/L (150 mg/dL)	
HDL-C Level	<1.0 mmol/L (<40 mg/dL)	<1.3 mmol/L (<50 mg/dL)
Blood Pressure	≥130/85 mmHg	
Fasting Glucose Level	≥5.6 mmol/L (>100 mg/dL)	
Drug treatment for any elevated marker is an alternate indicator		

**Table 15. The Physiology and Action of Pituitary Hormones (continued)**

Hormone	Function	Physiology	Inhibitory Stimulus	Secretory Stimulus
LH/FSH	Stimulate gonads via cAMP Ovary: LH: production of androgens (thecal cells) which are converted to estrogens (granulosa cells); induces luteinization in follicles FSH: growth of granulosa cells in ovarian follicle; controls estrogen production Testes: LH: production of testosterone (Leydig cells) FSH: production of spermatozoa (Sertoli cells)	Polypeptide Glycoproteins (similar $\alpha$ subunit as TSH and hCG) Secreted in pulsatile fashion	Estrogen Progesterone Testosterone Inhibin Continuous (i.e. non-pulsatile) GnRH infusion	Pulsatile GnRH
Prolactin	Promotes milk production Inhibits GnRH secretion	Polypeptide Episodic secretion	Dopamine	Sleep Stress, hypoglycemia Pregnancy, breastfeeding Mid-menstrual cycle Sexual activity TRH Drugs: psychotropics, antihypertensives, dopamine antagonists, opiates, high dose estrogen
TSH	Stimulates growth of thyroid and secretion of T <sub>3</sub> and T <sub>4</sub> via cAMP	Glycoprotein	Circulating thyroid hormones (T <sub>3</sub> , T <sub>4</sub> ) Opiates, dopamine	TRH Epinephrine Prostaglandins
ADH	Acts at renal collecting ducts on V2 receptors to cause insertion of aquaporin channels and increases water reabsorption thereby concentrating urine	Octapeptide Secreted by posterior pituitary Osmoreceptors in hypothalamus detect serum osmolality Contracted plasma volume detected by baroreceptors is a more potent stimulus than $\uparrow$ osmolality	$\downarrow$ serum osmolality	Hypovolemia or $\downarrow$ effective circulatory volume $\uparrow$ serum osmolality Stress, pain, fever, paraneoplastic Lung or brain pathology
Oxytocin	Causes uterine contraction Breast milk secretion	Nonapeptide Secreted by posterior pituitary	EtOH	Suckling Distention of female genital tract during labour via stretch receptors

## Growth Hormone

### GH DEFICIENCY

- cause of short stature in children (see [Pediatrics, P26](#))
- controversial significance in adults; often not clinically apparent, may present as fatigue

### GH EXCESS

#### Etiology

- GH secreting pituitary adenoma, carcinoid or pancreatic islet tumours secreting ectopic GHRH resulting in excess GH

#### Pathophysiology

- normally GH is a catabolic hormone that acts to increase blood glucose levels
- in growth hormone excess states, secretion remains pulsatile but there is loss of hypoglycemic stimulation, glucose suppression, and the nocturnal surge
- proliferation of bone, cartilage, soft tissues, organomegaly
- insulin resistance and IGT

#### Clinical Features

- in children (before epiphyseal fusion) leads to gigantism
- in adults (after epiphyseal fusion) leads to acromegaly
- enlargement of hands and feet, coarsening of facial features, thickening of calvarium, prognathism, thickening of skin, increased sebum production, sweating, acne, sebaceous cysts, fibromata mollusca, acanthosis nigricans, arthralgia, carpal tunnel syndrome, degenerative osteoarthritis, barrel chest, thyromegaly, renal calculi, HTN, cardiomyopathy, obstructive sleep apnea, colonic polyps, erectile dysfunction, menstrual irregularities, and DM

#### Risks Associated with GH Excess

- Cardiac disease (e.g. CAD, cardiomegaly, cardiomyopathy) in 1/3 of patients, with a doubling of risk of death from cardiac disease
- HTN in 1/3 of patients
- Risk of cancer (particularly GI) increased 2-fold to 3-fold

### Investigations

- elevated serum insulin-like growth factor-1 (IGF-1) is usually the first line diagnostic test
- glucose suppression test is the most specific test (75 g of glucose PO suppresses GH levels in healthy individuals but not in patients with acromegaly)
- CT, MRI, or skull x-rays may show cortical thickening, enlargement of the frontal sinuses, and enlargement and erosion of the sella turcica
- MRI of the sella turcica is needed to look for a tumour

### Treatment

- surgery, octreotide (somatostatin analogue), dopamine agonist (bromocriptine/cabergoline), growth hormone receptor antagonist (pegvisomant), radiation

## Prolactin

### HYPERPROLACTINEMIA

#### Etiology

- pregnancy and breastfeeding
- prolactinoma: most common pituitary adenoma (prolactin-secreting tumours may be induced by estrogens and grow during pregnancy)
- pituitary masses with pituitary stalk compression causing reduced dopamine inhibition of prolactin release
- primary hypothyroidism (increased TRH)
- decreased clearance due to chronic renal failure or severe liver disease (prolactin is metabolized by both the kidney and liver)
- medications with anti-dopaminergic properties are a common cause of high prolactin levels: antipsychotics (common), antidepressants, antihypertensives, anti-migraine agents (triptans/ergotamines), bowel motility agents (metoclopramide/domperidone), H<sub>2</sub>-blockers (ranitidine)
- macroprolactinemia (high molecular weight prolactin also known as big big prolactin)

#### Clinical Features

- galactorrhea (secretion of breast milk in women and, in rare cases, men), infertility, hypogonadism, amenorrhea, erectile dysfunction

#### Investigations

- serum PRL, TSH, liver enzyme tests, creatinine, macroprolactin level in select cases
- MRI of the sella turcica in select cases

#### Treatment

- long-acting dopamine agonist: bromocriptine, cabergoline, or quinagolide
- surgery ± radiation (rare)
- prolactin-secreting tumours are often slow-growing and sometimes require no treatment
- if medication-induced, consider stopping medication if possible
- in certain cases if microprolactinoma and not planning on becoming pregnant, may consider OCP

#### Approach to Nipple Discharge

- Differentiate between galactorrhea (fat droplets present) versus breast discharge (usually unilateral, may be bloody or serous)
- If galactorrhea, determine if physiologic (e.g. pregnancy, lactation, stress) versus pathologic
- If abnormal breast discharge, must rule out a breast malignancy

## Thyroid Stimulating Hormone

- see *Thyroid, E20*

## Adrenocorticotrophic Hormone

- see *Adrenal Cortex, E29*

## Luteinizing Hormone and Follicle Stimulating Hormone

### HYPOGONADOTROPIC HYPOGONADISM

#### Etiology

- primary/congenital: Kallmann syndrome, CHARGE syndrome, GnRH insensitivity
- secondary: CNS or pituitary tumours, pituitary apoplexy, brain/pituitary radiation, drugs (GnRH agonists/antagonists, glucocorticoids, narcotics, chemotherapy, drugs causing hyperprolactinemia), functional deficiency due to another cause (hyperprolactinemia, chronic systemic illnesses, eating disorders, hypothyroidism, DM, Cushing's disease), systemic diseases (hemochromatosis, sarcoidosis, histiocytosis)

**Clinical Features**

- hypogonadism, amenorrhea, erectile dysfunction (see [Urology, U30](#)), loss of body hair, fine skin, testicular atrophy, failure of pubertal development

**Treatment**

- combined FSH/LH hormone therapy, hCG, rFSH, or pulsatile GnRH analogue if fertility desired
- symptomatic treatment with estrogen/testosterone

**HYPERGONADOTROPIC HYPOGONADISM**

- hypogonadism due to impaired response of the gonads to FSH and LH

**Etiology**

- congenital:
  - chromosomal abnormalities (Turner's syndrome, Klinefelter syndrome, XX gonadal dysgenesis)
  - enzyme defects (17 $\alpha$ -hydroxylase deficiency, 17, 20-lyase deficiency)
  - gonadotropin resistance (Leydig cell hypoplasia, FSH Insensitivity, pseudohypoparathyroidism type 1A)
- acquired:
  - gonadal toxins (chemotherapy, radiation)
  - drugs (glucocorticoids, antiandrogens, opioids, alcohol)
  - infections (STIs, Mumps)
  - gonadal failure in adults (androgen decline and testicular failure in men, premature ovarian failure and menopause in women)

**Clinical Features**

- hypogonadism, amenorrhea, erectile dysfunction (see [Urology, U30](#)), loss of body hair, fine skin, testicular atrophy, failure of pubertal development, low libido, infertility

**Treatment**

- hormone replacement therapy consisting of androgen (for males) and estrogen (for females) administration

## Antidiuretic Hormone

**DIABETES INSIPIDUS****Definition**

- disorder of ineffective ADH (decreased production or peripheral resistance) resulting in passage of large volumes of dilute urine

**Etiology and Pathophysiology**

- central DI: insufficient ADH due to pituitary surgery, tumours, idiopathic/autoimmune, stalk lesion, hydrocephalus, histiocytosis X, trauma, familial central DI
- nephrogenic DI: collecting tubules in kidneys resistant to ADH due to drugs (e.g. lithium), hypercalcemia, hypokalemia, chronic renal disease, hereditary nephrogenic DI
- psychogenic polydipsia and osmotic diuresis must be ruled out

**Clinical Features**

- passage of large volumes of dilute urine, polydipsia, and dehydration; hyponatremia can develop with inadequate water consumption or secondary to an impaired thirst mechanism

**Diagnostic Criteria**

- fluid deprivation will differentiate true DI (high urine output persists, urine osmolality < plasma osmolality) from psychogenic DI (psychogenic polydipsia)
- response to exogenous ADH (DDAVP) will distinguish central from nephrogenic DI

**Treatment**

- DDAVP/vasopressin for central DI
- chlorpropamide, clofibrate, thiazides, NSAIDs, or carbamazepine as second line or for partial DI
- nephrogenic DI treated with solute restriction NSAIDs and thiazide diuretics; DDAVP (if partial)

**Diagnosing Subtypes of DI with DDAVP Response**

Concentrated urine = Central  
No effect = Nephrogenic

**SYNDROME OF INAPPROPRIATE ADH SECRETION****Diagnostic Criteria**

- hyponatremia with corresponding plasma hypo-osmolality, urine sodium concentration above 40 mEq/L, urine less than maximally diluted (>100 mOsm/kg), euolemia (edema absent), and absence of adrenal, renal, or thyroid insufficiency

## Etiology and Pathophysiology

- stress (pain, nausea, post-surgical)
- malignancy (lung, pancreas, lymphoma)
- CNS disease (inflammatory, hemorrhage, tumour, Guillain-Barré syndrome)
- respiratory disease (TB, pneumonia, empyema)
- drugs (SSRIs, vincristine, chlorpropamide, cyclophosphamide, carbamazepine, nicotine, morphine, DDAVP, oxytocin)

## Clinical Features

- symptoms of hyponatremia: headaches, nausea, vomiting, muscle cramps, tremors, cerebral edema If severe (confusion, mood swings, hallucinations, seizures, coma)

## Treatment

- treat underlying cause, fluid restriction (800-1000 mL/day), vasopressin receptor antagonists (e.g. tolvaptan, conivaptan), and demeclocycline (antibiotic with anti-ADH properties, rarely-used) fludrocortisone, furosemide

**SIADH vs. Cerebral Salt Wasting (CSW)**  
CSW can occur in cases of subarachnoid hemorrhage. Na<sup>+</sup> is excreted by malfunctioning renal tubules, mimicking findings of SIADH; hallmark is hypovolemia

**Presentations of Pituitary Lesions**

- Mass effect (visual field deficits, diplopia, ptosis, headaches, CSF leak)
- Hyperfunction
- Hypofunction

# Pituitary Pathology

## PITUITARY ADENOMA (see [Neurosurgery, NS13](#))

### Clinical Features

- local mass effects
  - visual field defects (bitemporal hemianopsia due to compression of the optic chiasm), diplopia (due to oculomotor nerve palsies), headaches; increased ICP is rare
- hypofunction
  - hypopituitarism
- hyperfunction
  - PRL (galactorrhea), GH (acromegaly in adults, gigantism in children), ACTH (Cushing's disease = Cushing's syndrome caused by a pituitary tumour)
  - tumours secreting LH, FSH, and TSH are rare

### Investigations

- radiological evaluation (MRI is imaging procedure of choice)
- formal visual field testing
- hypothalamic-pituitary hormonal function

## HYPOPITUITARISM

### Etiology (The Eight Is)

- Invasive
  - pituitary tumours, craniopharyngioma, cysts (Rathke's cleft, arachnoid, or dermoid), metastases
- Infarction/hemorrhage
  - Sheehan's syndrome (pituitary infarction due to excessive post-partum blood loss and hypovolemic shock)
  - pituitary apoplexy (acute hemorrhage/infarction of a pituitary tumour; presents with sudden loss of pituitary hormones, severe headache, and altered level of consciousness; can be fatal if not recognized and treated early)
- Infiltrative/inflammatory
  - sarcoidosis, hemochromatosis, histiocytosis
- Infectious
  - syphilis, TB, fungal (histoplasmosis), parasitic (toxoplasmosis)
- Injury
  - severe head trauma
- Immunologic
  - autoimmune destruction
- Iatrogenic
  - following surgery or radiation
- Idiopathic
  - familial forms, congenital midline defects

### Clinical Features

- symptoms depend on which hormone is deficient:
  - ACTH: fatigue, weight loss, hypoglycemia, anemia, hyponatremia, failure to thrive and delayed puberty in children
  - GH: short stature in children
  - TSH: tiredness, cold intolerance, constipation, weight gain, hair loss
  - LH and FSH: oligo- or amenorrhea, infertility, decreased facial/body hair and muscle mass in men, delayed puberty
  - Prolactin: inability to breastfeed
  - ADH: symptoms of diabetes insipidus (extreme thirst, polydipsia, hypernatremia)
  - Oxytocin: usually asymptomatic- only needed during labour and breastfeeding

**Important Deficiencies to Recognize are:**

- Adrenal insufficiency
- Hypothyroidism

Concurrent adrenal insufficiency and hypothyroidism should be treated with glucocorticoids first and then with thyroid hormone to avoid adrenal crisis

**The Pituitary Hormones**  
Order they are usually lost with compression by a mass:  
"Go Look For The Adenoma Please"  
GH, LH, FSH, TSH, ACTH, PRL + posterior pituitary hormones: ADH and oxytocin

## Investigations

- triple bolus test
  - stimulates release of all anterior pituitary hormones in normal individuals
  - rapid sequence of IV infusion of insulin, GnRH, and TRH
  - insulin (usual dose 0.1 unit/kg of human regular insulin) → hypoglycemia → increased GH and ACTH/cortisol
  - GnRH (100 µg IV push) → increased LH and FSH
  - TRH (200 µg IV push over 120 s) → increased TSH and PRL (no longer available in Canada)
  - GnRH and TRH stimulation tests are very limited in their utility; the insulin tolerance test is the only truly useful test in the triple bolus assessment

# Thyroid

## Thyroid Hormones

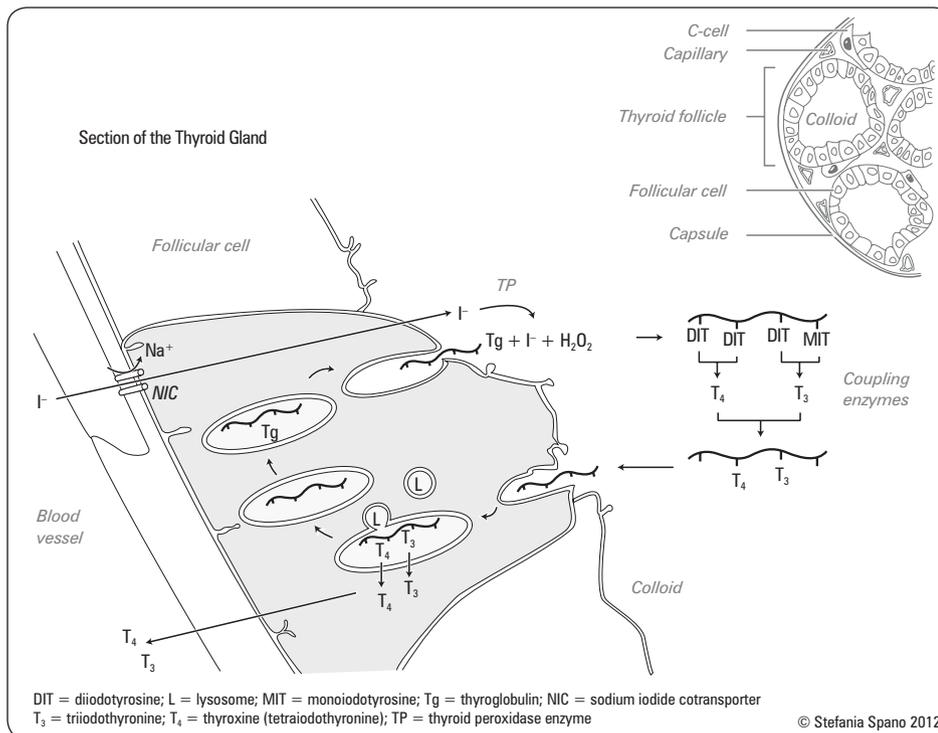

Figure 8. Thyroid hormone synthesis

### Synthetic Function of Thyroid Gland

- the synthesis of thyroid hormones T<sub>4</sub> (thyroxine) and T<sub>3</sub> (triiodothyronine) by the thyroid gland involves trapping and oxidation of iodide, iodination of thyroglobulin, digestion of thyroglobulin, and release of T<sub>3</sub> and T<sub>4</sub>
- free T<sub>4</sub> (0.03%) and free T<sub>3</sub> (0.3%) represent the hormonally active fraction of thyroid hormones
  - the remaining fraction is bound to thyroxine binding globulin (TBG) and albumin and is biologically inactive
- T<sub>3</sub> is more biologically active (3-8x more potent), but T<sub>4</sub> has a longer half-life
- 85% of T<sub>4</sub> is converted to T<sub>3</sub> or reverse T<sub>3</sub> (RT3) in the periphery by deiodinases
- RT3 is metabolically inactive but produced in times of stress to decrease metabolic activity
- most of the plasma T<sub>3</sub> pool is derived from the peripheral conversion of T<sub>4</sub>
- calcitonin, a peptide hormone, is also produced in the thyroid, by the parafollicular cells or C cells
  - it functions by inhibiting osteoclast activity and increasing renal calcium excretion

### Role of Thyroid Hormones

- thyroid hormones act primarily through modifying gene transcription by binding to nuclear receptors
- action of these hormones is diffuse, affecting nearly every organ system
- they increase the basal metabolic rate including: increased Na<sup>+</sup>/K<sup>+</sup>ATPase activity, increased O<sub>2</sub> consumption, increased respiration, heat generation, and increased cardiovascular activity
- also play crucial role during fetal life in both neurological and somatic development

#### Patterns of Hormone Levels

	TSH	T <sub>3</sub> , T <sub>4</sub>
1° Hyper	↓	↑
2° Hyper	↑	↑
1° Hypo	↑	↓
2° Hypo	↓	↓

## Regulation of Thyroid Function

- extrathyroid
  - stimulation of thyroid by TSH, epinephrine, prostaglandins (cAMP stimulators)
  - T<sub>3</sub> negatively feeds back on anterior pituitary to inhibit TSH and on hypothalamus to inhibit TRH
- intrathyroid (autoregulation)
  - synthesis (Wolff-Chaikoff effect, Jod-Basedow effect)
  - there is varying thyroid sensitivity to TSH in response to iodide availability
  - increased ratio of T<sub>3</sub> to T<sub>4</sub> in iodide deficiency
  - increased activity of peripheral 5' deiodinase in hypothyroidism increases T<sub>3</sub> production despite low T<sub>4</sub> levels

### Thyroid Assessment

- Serum thyroid hormones (TSH, T<sub>3</sub>, T<sub>4</sub>)
- Antibodies (TRAb, TgAb and TPOAb)
- Thyroglobulin (to monitor thyroid cancer)
- Thyroid ultrasound
- Nuclear uptake and scan (for hyperthyroidism)
- Biopsy (FNA)

## Tests of Thyroid Function and Structure

### TSH

- sensitive TSH (sTSH) is the best test for assessing thyroid function
- hyperthyroidism
  - primary: TSH is low because of negative feedback from increased levels of circulating T<sub>3</sub> and T<sub>4</sub>
  - secondary: increased TSH results in increased T<sub>3</sub> and T<sub>4</sub>
- hypothyroidism
  - primary: increased TSH (most sensitive test) because of less negative feedback from T<sub>3</sub> and T<sub>4</sub>
  - secondary: TSH is low or normal with variable response to TRH depending on the site of the lesion (pituitary or hypothalamic)

### Free T<sub>3</sub> and Free T<sub>4</sub>

- standard assessment of thyroid function measures TSH and if necessary free T<sub>4</sub>. Free T<sub>3</sub> should only be measured in the small subset of patients with hyperthyroidism and suspected T<sub>3</sub> toxicosis. TSH would be suppressed, free T<sub>4</sub> normal, and free T<sub>3</sub> elevated

### Thyroid Autoantibodies

- thyroglobulin antibodies (TgAb), anti-thyroid peroxidase antibodies (TPOAb), and TSH receptor antibodies (TRAb) of the blocking variety are increased in Hashimoto's disease; normal variant in 10-20% of individuals
- TRAb of the stimulating variety are also referred to as thyroid stimulating immunoglobulins (TSI) and cause Graves' disease. However, both TRAb receptor blocking and stimulating antibodies are seen in patients with Graves' disease

### Plasma Thyroglobulin

- used to monitor for residual thyroid tissue post-thyroidectomy, e.g. tumour marker for thyroid cancer recurrence
- normal or elevated levels may suggest persistent, recurrent, or metastatic disease

### Serum Calcitonin

- not routinely done to investigate thyroid nodules
- ordered if suspicion of medullary thyroid carcinoma or family history of MEN IIa or IIb syndromes
  - used to monitor for residual or recurrent medullary thyroid cancer

### Thyroid Imaging/Scans

- normal gland size 15-20 g (estimated by palpation)
- thyroid U/S
  - to measure size of gland, solid vs. cystic nodule, facilitate fine needle aspirate biopsy (FNAB)
- radioisotope thyroid scan (Technetium-99)
  - test of structure: order if there is a thyroid nodule and patient is hyperthyroid with low TSH
    - differentiates between hot (functioning → excess thyroid hormone production) and cold (non-functioning) nodules
      - hot nodule → very low chance malignancy; treat hyperthyroidism
      - cold nodule → ~5% chance malignancy; further workup required (U/S and FNAB)
- radioactive iodine uptake (RAIU)
  - test of function: order if patient is thyrotoxic
  - RAIU measures the turnover of iodine by thyroid gland *in vivo*
  - if ↑ uptake (i.e. incorporated), gland is overactive (hyperthyroid)
  - if ↓ uptake (i.e. not incorporated), gland is leaking thyroid hormone (e.g. thyroiditis), exogenous thyroid hormone use, or excess iodine intake (e.g. amiodarone or contrast dye, which has high iodine content)
- see Figure 9, *Approach to the Evaluation of a Thyroid Nodule*, E28 for further information regarding the utility of these scans

### Thyroid Biopsy

- fine needle aspiration (FNA) for cytology
  - differentiates between benign and malignant disease
  - best done under U/S guidance
  - accuracy decreased if nodule is greater than 50% cystic, or if nodule located posteriorly in the gland

### Does this Patient have a Goitre?

#### From The Rational Clinical Examination

JAMA 2009; <http://www.jamaevidence.com/content/3480618>

**Study:** Systematic review of articles assessing the accuracy and precision of the clinical exam in the diagnosis of a goitre.

**Results:** Clinical diagnosis was based on degree of lateral prominence, visibility, and palpability of the thyroid gland. No evidence exists to support the superiority of any one method.

The combined results of 4 studies detail the predictive utility of assessing grades of thyroid gland weight:

Weight	Reference	LR+	95% CI
0-20 g	normal	0.15	(0.10-0.21)
20-40 g	1-2x	1.9	(1.1-3.0)
>40 g	>2x	25.0	(2.6-175)

Alternatively, defining a goitre as mass larger than the distal phalanx of the thumb has been shown to have an LR+ of 3.0 (95% CI 2.5-3.5) and LR- of 0.30 (95% CI 0.24-0.37) in children, and an LR+ of 4.7 (95% CI 3.6-6.0) and LR- of 0.08 (95% CI 0.02-0.27) for the presence of a goitre.

**Conclusions:** Use of weight of thyroid tissue is an appropriate method of diagnosing a goitre, while comparing the size of thyroid mass to the distal phalanx of the thumb may be a useful alternative.

**Table 16. Summary of Diagnostic Testing in Hyperthyroidism and Hypothyroidism**

	Hyperthyroidism	Hypothyroidism
<b>TSH</b>	Decreased in 1° hyperthyroidism Increased in 2° hyperthyroidism	Increased in 1° hypothyroidism Decreased in 2° hypothyroidism
<b>Free T4</b>	Increased in 1° hyperthyroidism Increased in 2° hyperthyroidism	Decreased in 1° hypothyroidism Decreased in 2° hypothyroidism
<b>Antibodies</b>	Graves': thyroid stimulating Ig (TSI)	Hashimoto's: antithyroid peroxidase (TPOAb, TgAb)
<b>RAIU</b>	Increased uptake Graves' Toxic multinodular goitre Toxic adenoma	Decreased uptake Subacute thyroiditis Recent iodine load Exogenous thyroid hormone
<b>Radioisotope Thyroid Scan</b>	Graves': homogenous diffuse uptake Multinodular goitre: heterogeneous uptake Toxic adenoma: single intense area of uptake with suppression elsewhere	

**Caution with Amiodarone**

**Amiodarone-Induced Hypothyroidism (AIH):** AIH occurs more often in iodine-sufficient areas, and is more common in populations with a higher prevalence of autoimmune thyroid disease, such as women and the elderly. AIH can also occur in patients without pre-existing thyroid dysfunction.

**Amiodarone-Induced Thyrotoxicosis (AIT):** AIT occurs more often in iodine-deficient areas. It may occur in patients with pre-existing thyroid deficiencies, as an iodine load on an already dysfunctional thyroid may result in excessive thyroid hormone synthesis and release. AIT may also occur in patients without thyroid abnormalities through a cytotoxic mechanism that results in leakage of thyroid hormone into the systemic circulation.

**Signs and Symptoms of HYPERthyroidism**

Tremor  
Heart rate up  
Yawning (fatigued)  
Restlessness  
Oligomenorrhea/amenorrhea  
Intolerance to heat  
Diarrhea  
Irritability  
Sweating  
Muscle wasting/weight loss

**Common Etiologies**

Thyrotoxicosis	Hypothyroidism
Graves' Disease	Hashimoto's
Toxic Nodular Goitre	Congenital
Toxic Nodule	Iatrogenic (thionamides, radioactive iodine, or surgery)
Thyroiditis	Hypothyroid phase of thyroiditis

## Thyrotoxicosis

**Definition**

- clinical, physiological, and biochemical findings in response to elevated thyroid hormone

**Epidemiology**

- 1% of general population have hyperthyroidism
- F:M = 5:1

**Etiology and Pathophysiology****Table 17. Differential Diagnosis of Thyrotoxicosis**

Disorder	TSH	Free T <sub>4</sub> /T <sub>3</sub>	Thyroid Antibodies	RAIU	Other
<b>HYPERTHYROIDISM</b>					
Graves' Disease	Decreased	Increased	TSI	Increased	Homogenous uptake on scan
Toxic Nodular Goitre	Decreased	Increased	None	Increased	Heterogeneous uptake on scan
Toxic Nodule	Decreased	Increased	None	Increased	Intense uptake in hot nodule on scan with no uptake in the rest of the gland
<b>THYROIDITIS</b>					
Subacute, Silent, Postpartum	Decreased	Increased	Up to 50% of cases	Decreased (increases once entering hypothyroid phase, when TSH rises)	In classical subacute painful thyroiditis, ESR increased
<b>EXTRATHYROIDAL SOURCES OF THYROID HORMONE</b>					
Endogenous (struma ovariae, ovarian teratoma, metastatic follicular carcinoma)	Decreased	Increased	None	Decreased	
Exogenous (drugs)	Decreased	Increased (T <sub>4</sub> would be decreased if taking T <sub>3</sub> )	None	Decreased	
<b>EXCESSIVE THYROID STIMULATION</b>					
Pituitary thyrotrophoma	Increased	Increased	None	Increased	
Pituitary thyroid hormone receptor resistance	Increased	Increased	None	Increased	
Increased hCG (e.g. pregnancy)	Decreased	Increased	None	Increased	DO NOT DO THIS TEST IN PREGNANCY

## Clinical Features

**Table 18. Clinical Features of Thyrotoxicosis**

General	Fatigue, heat intolerance, irritability, fine tremor
CVS	Tachycardia, atrial fibrillation, palpitations Elderly patients may have only cardiovascular symptoms, commonly new onset atrial fibrillation
GI	Weight loss with increased appetite, thirst, increased frequency of bowel movements (hyperdefecation)
Neurology	Proximal muscle weakness, hypokalemic periodic paralysis (more common in Asians)
GU	Oligomenorrhea, amenorrhea, decreased fertility
Dermatology	Fine hair, skin moist and warm, vitiligo, soft nails with onycholysis (Plummer's nails), palmar erythema, pruritis Graves' disease: clubbing (acropachy), pretibial myxedema (rare)
MSK	Decreased bone mass, proximal muscle weakness
Hematology	Graves' disease: leukopenia, lymphocytosis, splenomegaly, lymphadenopathy (occasionally)
Eye	Graves' disease: lid lag, retraction, proptosis, diplopia, decreased acuity, puffiness, conjunctival injection

### Treatment

- thionamides: propylthiouracil (PTU) or methimazole (MMI); MMI recommended (except in first trimester pregnancy)
- $\beta$ -blockers for symptom control
- radioactive iodine thyroid ablation for Graves' disease
- surgery in the form of hemi, sub-total, or complete thyroidectomy

## Graves' Disease

### Definition

- an autoimmune disorder characterized by autoantibodies to the TSH receptor that leads to hyperthyroidism

### Epidemiology

- most common cause of thyrotoxicosis
- occurs at any age with peak in 3rd and 4th decade
- F:M = 7:1, 1.5-2% of U.S. women
- familial predisposition: 15% of patients have a close family member with Graves' disease and 50% have family members with positive circulating antibodies
- association with HLA B8 and DR3
- may be associated with other inherited autoimmune disorders (e.g. pernicious anemia, Hashimoto's disease)

### Etiology and Pathophysiology

- autoimmune disorder due to a defect in T-suppressor cells
- B lymphocytes produce TSI that binds and stimulates the TSH receptor and stimulates the thyroid gland
- immune response can be triggered by postpartum state, iodine excess, lithium therapy, viral or bacterial infections, glucocorticoid withdrawal
- ophthalmopathy (thyroid associated orbitopathy) is a result of increased tissue volume due to inflammation and accumulation of glycosaminoglycans, stimulated by TSI, that increase osmotic pressure within the orbit; this leads to fluid accumulation and displacement of the eyeball forward
- dermatopathy may be related to cutaneous glycosaminoglycan deposition

### Clinical Features

- signs and symptoms of thyrotoxicosis
- diffuse thyroid goitre  $\pm$  thyroid bruit secondary to increased blood flow through the gland
- ophthalmopathy: proptosis, diplopia, conjunctival injection, corneal abrasions, periorbital puffiness, lid lag, decreased visual acuity (plus signs of hyperthyroidism: lid retraction, characteristic stare)
- dermatopathy (rare): pretibial myxedema (thickening of dermis that manifests as *non-pitting* edema)
- acropachy: clubbing and thickening of distal phalanges

### Investigations

- low TSH
- increased free T<sub>4</sub> (and/or increased T<sub>3</sub>)
- positive for TSI (specific but not sensitive for Graves' disease)
- increased radioactive iodine (I-131) uptake
- homogeneous uptake on thyroid scan (only do this test in the presence of nodule)

#### Graves' Ophthalmopathy

##### NO SPECS (in order of changes usually)

No signs

Only signs: lid lag, lid retraction

Soft tissue: periorbital puffiness, conjunctival injection, chemosis

Proptosis/exophthalmos

Extraocular (diplopia)

Corneal abrasions (since unable to close eyes)

Sight loss

## Treatment

- thionamides: propylthiouracil (PTU) or methimazole (MMI)
  - PTU and MMI inhibit thyroid hormone synthesis by inhibiting peroxidase-catalyzed reactions, thereby inhibiting organification of iodide, blocking the coupling of iodotyrosines
  - PTU also inhibits peripheral deiodination of T<sub>4</sub> to T<sub>3</sub>
  - continue treatment until remission occurs (20-40% of patients achieve spontaneous remission at 6-18 mo of treatment)
  - small goitre and recent onset are good indicators for long-term remission with medical therapy
  - major side effects: hepatitis, agranulocytosis, and fever/arthritis
  - minor side effects: rash
  - iodinated contrast agents: sodium ipodate and iopanoic acid can inhibit conversion of T<sub>4</sub> to T<sub>3</sub> and are especially effective in combination with MMI
  - MMI preferred vs. PTU due to longer duration of action (once daily for most), more rapid efficacy, and lower incidence of side effects
  - in pregnancy: use PTU during first trimester and MMI during second and third trimester. MMI is contraindicated in the first trimester due to risk of aplasia cutis; MMI is preferred in the second and third trimester due to the potential risk of hepatotoxicity with PTU in the second and third trimesters
- symptomatic treatment with β-blockers
- thyroid ablation with radioactive <sup>131</sup>I if PTU or MMI trial does not produce disease remission
  - high incidence of hypothyroidism after <sup>131</sup>I requiring lifelong thyroid hormone replacement
  - contraindicated in pregnancy
  - may worsen ophthalmopathy
- subtotal or total thyroidectomy (indicated for large goitres, suspicious nodule for Ca, if patient is intolerant to thionamides and refusing RAI ablation)
  - risks include hypoparathyroidism and vocal cord palsy
- ophthalmopathy/orbitopathy
  - smoking cessation is important
  - prevent drying of eyes
  - high dose prednisone in severe cases
  - orbital radiation, surgical decompression

## Prognosis

- course involves remission and exacerbation unless gland is destroyed by radioactive iodine or surgery
- lifetime follow-up needed
- risk of relapse is 37%, 21%, 6% in thionamides, radioiodine ablation, and surgery groups, respectively

## Subacute Thyroiditis (Thyrotoxic Phase)

### Definition

- acute inflammatory disorder of the thyroid gland characterized by an initial thyrotoxic state followed by hypothyroidism eventually followed by euthyroidism in most cases
- two subtypes: painful (“De Quervain’s”) and painless (“Silent”)

### Etiology and Pathophysiology

- acute inflammation of the thyroid gland characterized by giant cells and lymphocytes
- disruption of thyroid follicles by inflammatory process results in the release of stored hormone rather than excessive production of new thyroid hormone
- painful = viral (usually preceded by URTI), De Quervain’s (granulomatous thyroiditis)
- painless = postpartum, auto-immune, lymphocytic
  - occurs in 5-10% of postpartum mothers and is symptomatic in 1/3 of patients

### Clinical Features

- painful (thyroid, ears, jaw, and occiput) or painless
- fever and malaise may be present, especially in De Quervain’s
- postpartum: thyrotoxicosis 2-3 mo postpartum with a subsequent hypothyroid phase at 4-8 mo postpartum
- may be mistakenly diagnosed as postpartum depression

### Laboratory Investigations

- initial elevated free T<sub>4</sub>, T<sub>3</sub>, low TSH, RAIU markedly reduced
- marked elevation of ESR in painful variety only
- as disease progresses values consistent with hypothyroidism may appear

### Treatment

- painful – high dose NSAIDs, prednisone may be required for severe pain, fever, or malaise
- iodinated contrast agents (e.g. iopanoic acid, ipodate) to inhibit peripheral conversion of T<sub>4</sub> to T<sub>3</sub>
- β-adrenergic blockade is usually effective in reversing most of the hypermetabolic and cardiac symptoms in both subtypes
- if symptomatically hypothyroid, may treat short-term with thyroxine

### Prognosis

- full recovery in most cases, but permanent hypothyroidism in 10% of painless thyroiditis
- postpartum: most resolve spontaneously without need for supplementation, however may recur with subsequent pregnancies

#### Other Medications Used in the Treatment of Graves’

**Glucocorticoids** have been useful in the treatment of severe Graves’ hyperthyroidism and thyroid storm, by inhibiting the conversion of peripheral T<sub>4</sub> to T<sub>3</sub>

**Lithium** is also used to treat Graves’ hyperthyroidism. It acts by blocking thyroid hormone release, but its toxicity has limited its use in practice

#### Caution with Thionamides

These drugs are effective in controlling hyperthyroidism and induce permanent remission in 20-30% of patients with Graves’ disease. They inhibit thyroid hormone synthesis. They are most often employed to achieve a euthyroid state before definitive treatment. Adverse effects include teratogenicity, agranulocytosis, hepatotoxicity, and ANCA-positive vasculitis

#### Radioiodine Therapy for Graves’ Disease and the Effect on Ophthalmopathy: A Systematic Review

*Clin Endocrinol* 2008;69:943-950

**Purpose:** To assess whether radioiodine therapy (RAI) for Graves’ disease (GD) is associated with increased risk of ophthalmopathy compared with antithyroid drugs (ATDs) or surgery. To assess the efficacy of glucocorticoid prophylaxis in the prevention of occurrence or progression of Graves’ ophthalmopathy (GO), when used with RAI.

**Study Selection:** RTCs regardless of language or publication status.

**Results:** RAI was associated with an increased risk of GO compared with ATD (Relative Risk (RR) 4.23, 95% confidence interval (CI) 2.04-8.77) but compared with thyroidectomy, there was no statistically significant increased risk (RR 1.59, 95% CI 0.89-2.81). The risk of severe GO was also increased with RAI compared with ATD (RR 4.35, 95% CI 1.28-14.73). Prednisolone prophylaxis for RAI was highly effective in preventing the progression of GO in patients with pre-existing GO (RR 0.03; 95% CI 0.00-0.24). The use of adjunctive ATD with RAI was not associated with any significant benefit on the course of GO.

**Conclusions:** RAI therapy for GD is associated with a small but definite increased risk of development or worsening of GO compared with ATDs. Steroid prophylaxis is beneficial for patients with pre-existing GO.

## Toxic Adenoma/Toxic Multinodular Goitre

### Etiology and Pathophysiology

- autonomous thyroid hormone production from a functioning adenoma that is hypersecreting T<sub>3</sub> and T<sub>4</sub>
- may be singular (toxic adenoma) or multiple (toxic multinodular goitre [Plummer's disease])

### Clinical Features

- goitre with adenomatous changes
- tachycardia, heart failure, arrhythmia, weight loss, nervousness, weakness, tremor, and sweats
- seen most frequently in elderly people, often with presentation of atrial fibrillation

### Investigations

- low TSH, high T<sub>3</sub> and T<sub>4</sub>
- thyroid scan with increased RAIU in nodule(s) and suppression of the remainder of the gland

### Treatment

- initiate therapy with PTU or MMI to attain euthyroid state
- use high dose radioactive iodine (I-131) to ablate hyperfunctioning nodules
- $\beta$ -blockers often necessary for symptomatic treatment prior to definitive therapy
- surgical excision may also be used as 1st line treatment

## Thyrotoxic Crisis/Thyroid Storm

### Definition

- acute exacerbation of all of the symptoms of thyrotoxicosis presenting in a life-threatening state secondary to uncontrolled hyperthyroidism – medical emergency!
- rare, but serious with mortality rate between 10-30%

### Etiology and Pathophysiology

- often precipitated by infection, trauma, or surgery in a hyperthyroid patient

### Differential Diagnosis

- sepsis, pheochromocytoma, malignant hyperthermia, drug overdose, neuroleptic malignant syndrome

### Clinical Features

- hyperthyroidism
- extreme hyperthermia ( $\geq 40^\circ\text{C}$ ), tachycardia, vomiting, diarrhea, vascular collapse, hepatic failure with jaundice, and confusion
- tachyarrhythmia, CHF, shock
- mental status changes ranging from delirium to coma

### Laboratory Investigations

- increased free T<sub>3</sub> and T<sub>4</sub>, undetectable TSH
- $\pm$  anemia, leukocytosis, hyperglycemia, hypercalcemia, elevated LFTs

### General Measures

- fluids, electrolytes, and vasopressor agents should be used as indicated
- a cooling blanket and acetaminophen can be used to treat the pyrexia
- propranolol or other  $\beta$ -blockers that additionally decrease peripheral conversion of T<sub>3</sub>  $\rightarrow$  T<sub>4</sub> can be used, but should be used with caution in CHF patients as it may worsen condition

### Specific Measures

- PTU is the anti-thyroid drug of choice and is used in high doses
- Give iodide, which acutely inhibits the release of thyroid hormone, one hour after the first dose of PTU is given
  - Sodium iodide 1 g IV drip over 12h q12h
  - OR
  - Lugol's solution 2-3 drops q8h
  - OR
  - Potassium iodide (SSKI) 5 drops q8h
- dexamethasone 2-4 mg IV q6h for the first 24-48 hours lowers body temperature and inhibits peripheral conversion of T<sub>3</sub>  $\rightarrow$  T<sub>4</sub>

### Prognosis

- probably <20% mortality rate if rapidly recognized and treated

## Hypothyroidism

### Definition

- clinical syndrome caused by cellular responses to insufficient thyroid hormone production

### Epidemiology

- 2-3% of general population
- F:M = 10:1
- 10-20% of women over age 50 have subclinical hypothyroidism (normal T<sub>4</sub>, TSH mildly elevated)
- iodine deficiency most common cause worldwide, but not in North America

### Etiology and Pathophysiology

- primary hypothyroidism (90%)
  - inadequate thyroid hormone production secondary to intrinsic thyroid defect
    - iatrogenic: post-ablative (<sup>131</sup>I or surgical thyroidectomy)
    - autoimmune: Hashimoto's thyroiditis, chronic thyroiditis, idiopathic, burnt out Graves'
    - hypothyroid phase of subacute thyroiditis
    - drugs: goitrogens (iodine), PTU, MMI, lithium
    - infiltrative disease (progressive systemic sclerosis, amyloid)
    - iodine deficiency
    - congenital (1/4,000 births)
      - neoplasia
  - secondary hypothyroidism: pituitary hypothyroidism
    - insufficiency of pituitary TSH
  - tertiary hypothyroidism: hypothalamic hypothyroidism
    - decreased TRH from hypothalamus (rare)
  - peripheral tissue resistance to thyroid hormone (Refetoff syndrome)

**Table 19. Interpretation of Serum TSH and Free T<sub>4</sub> in Hypothyroidism**

	Serum TSH	Free T <sub>4</sub>
Overt Primary Hypothyroidism	Increased	Decreased
Subclinical Primary Hypothyroidism	Increased	Normal
Secondary Hypothyroidism	Decreased or not appropriately elevated	Decreased

### Clinical Features

**Table 20. Clinical Features of Hypothyroidism**

<b>General</b>	Fatigue, cold intolerance, slowing of mental and physical performance, hoarseness, macroglossia
<b>CVS</b>	Pericardial effusion, bradycardia, hypotension, worsening CHF + angina, hypercholesterolemia, hyperhomocysteinemia, myxedema heart
<b>Respiratory</b>	Decreased exercise capacity, hypoventilation secondary to weak muscles, decreased pulmonary responses to hypoxia, sleep apnea due to macroglossia
<b>GI</b>	Weight gain despite poor appetite, constipation
<b>Neurology</b>	Paresthesia, slow speech, muscle cramps, delay in relaxation phase of deep tendon reflexes ("hung reflexes"), carpal tunnel syndrome, asymptomatic increase in CK, seizures
<b>GU</b>	Menorrhagia, amenorrhea, impotence
<b>Dermatology</b>	Puffiness of face, periorbital edema, cool and pale, dry and rough skin, hair dry and coarse, eyebrows thinned (lateral 1/3), discolouration (carotenemia)
<b>Hematology</b>	Anemia: 10% pernicious due to presence of anti-parietal cell antibodies with Hashimoto's thyroiditis

### Treatment

- L-thyroxine (dose range: 0.05-0.2 mg PO OD ~1.6 µg/kg/d)
- elderly patients and those with CAD: start at 0.025 mg daily and increase gradually every 6 wk (start low, go slow)
- after initiating L-thyroxine, TSH needs to be evaluated in 6 wk; dose is adjusted until TSH returns to normal reference range
- once maintenance dose achieved, follow-up TSH with patient annually
- secondary/tertiary hypothyroidism
  - monitor via measurement of free T<sub>4</sub> (TSH is unreliable in this setting)

### CONGENITAL HYPOTHYROIDISM

- see **Pediatrics, P28**

#### Thyroid Hormone Replacement for Subclinical Hypothyroidism

*Cochrane DB Syst Rev* 2007;3:CD003419

**Purpose:** To assess the effects of thyroid hormone replacement for subclinical hypothyroidism.

**Study Selection:** RCTs comparing thyroid hormone replacement with placebo in adults with subclinical hypothyroidism. Minimum duration of follow-up was one month.

**Results:** No trial assessed (cardiovascular) mortality or morbidity. Seven studies evaluated symptoms, mood, and quality of life with no statistically significant improvement. One study showed a statistically significant improvement in cognitive function. Six studies assessed serum lipids, there was a trend for reduction in some parameters following levothyroxine replacement. Some echocardiographic parameters improved after levothyroxine replacement therapy, like myocardial relaxation. Only four studies reported adverse events with no statistically significant differences between groups.

**Conclusions:** In current RCTs, levothyroxine replacement therapy for subclinical hypothyroidism did not result in improved survival or decreased cardiovascular morbidity. Data on health-related quality of life and symptoms did not demonstrate significant differences between intervention groups. Some evidence indicates that levothyroxine replacement improves some parameters of lipid profiles and left ventricular function.

#### Signs and Symptoms of Hypothyroidism

##### HIS FIRM CAP

Hypoventilation  
Intolerance to cold  
Slow HR  
Fatigue  
Impotence  
Renal impairment  
Menorrhagia/amenorrhea  
Constipation  
Anemia  
Paresthesia

## Hashimoto's Thyroiditis

- most common form of primary hypothyroidism in North America
- chronic autoimmune thyroiditis characterized by both cellular and humoral factors in the destruction of thyroid tissue
- two major forms: goitrous and atrophic; both forms share same pathophysiology but differ in the extent of lymphocytic infiltration, fibrosis, and thyroid follicular cell hyperplasia
- goitrous variant usually presents with a rubbery goitre and euthyroidism, then hypothyroidism becomes evident
  - associated with fibrosis
- atrophic variant patients are hypothyroid from the start
  - associated with thyroid lymphoma

### Etiology and Pathophysiology

- defect in clone of T-suppressors leads to cell-mediated destruction of thyroid follicles
- B lymphocytes produce antibodies against thyroid components including thyroglobulin, thyroid peroxidase, TSH receptor, Na<sup>+</sup>/I<sup>-</sup> symporter

### Risk Factors

- female gender (F:M = 7:1)
- genetic susceptibility: increased frequency in patients with Down's syndrome, Turner's syndrome, certain HLA alleles, cytotoxic T-lymphocyte-associated protein 4 (CTLA-4)
- family Hx or personal Hx of other autoimmune diseases
- cigarette smoking
- high iodine intake
- stress and infection

### Investigations

- high TSH, low T<sub>4</sub> (not necessary to measure T<sub>3</sub> as it will be low as well)
- presence of anti-thyroid peroxidase (TPOAb) and thyroglobulin antibodies (TgAb) in serum

### Treatment

- if hypothyroid, replace with L-thyroxine (analog of T<sub>4</sub>)

## Myxedema Coma

### Definition

- severe hypothyroidism complicated by trauma, sepsis, cold exposure, MI, inadvertent administration of hypnotics or narcotics, and other stressful events – medical emergency!
- rare, high level of mortality when it occurs (up to 40%, despite therapy)

### Clinical Features

- hallmark symptoms of decreased mental status and hypothermia; hyponatremia, hypotension, hypoglycemia, bradycardia, hypoventilation, and generalized edema often present

### Investigations

- decreased T<sub>4</sub>, increased TSH, decreased glucose
- check ACTH and cortisol for evidence of adrenal insufficiency

### Treatment

- aggressive treatment required
- ABCs: ICU admission
- corticosteroids (for risk of concomitant adrenal insufficiency): hydrocortisone 100 mg q8h
- L-thyroxine 0.2-0.5 mg IV loading dose, then 0.1 mg IV OD until oral therapy tolerated; also consider T<sub>3</sub> therapy
- supportive measures: mechanical ventilation, vasopressor drugs, passive rewarming, IV dextrose, fluids if necessary (risk of overload)
- monitor for arrhythmia

## Sick Euthyroid Syndrome

### Definition

- changes in circulating thyroid hormones amongst patients with serious illness, trauma, or stress
- not due to intrinsic thyroid or pituitary disease
- initially low free T<sub>3</sub> may be followed by low TSH and if severe illness low free T<sub>4</sub>
- with recovery of illness, TSH may overshoot and become transiently high

**Pathophysiology**

- abnormalities include alterations in
  - peripheral transport and metabolism of thyroid hormone
  - regulation of TSH secretion
  - thyroid function itself
- may be protective during illness by reducing tissue catabolism

**Labs**

- initially decreased free T<sub>3</sub> followed by decreased TSH and finally decreased free T<sub>4</sub>

**Treatment**

- treat the underlying disease; thyroid hormone replacement worsens outcomes
- thyroid function tests normalize once patient is well (initially with a transient increase in TSH)

## Non-Toxic Goitre

**Definition**

- generalized enlargement of the thyroid gland in a euthyroid individual that does not result from inflammatory or neoplastic processes

**Pathophysiology**

- the appearance of a goitre is more likely during adolescence, pregnancy, and lactation because of increased thyroid hormone requirements
  - early stages: goitre is usually diffuse
  - later stages: multinodular non-toxic goitre with nodule, cyst formation and areas of ischemia, hemorrhage, and fibrosis

**Etiology**

- iodine deficiency or excess
- goitrogens: brassica vegetables (e.g. turnip, cassava)
- drugs: iodine, lithium, para-aminosalicylic acid
- any disorder of hormone synthesis with compensatory growth
- peripheral resistance to thyroid hormone

**Treatment**

- remove goitrogens
- radioiodine therapy (need very high doses given low iodine uptake, used as last resort)
- suppression with L-thyroxine (rarely done)
- surgery may be necessary for severe compressive symptoms

**Complications**

- compression of neck structures causing stridor, dysphagia, pain, and hoarseness
- multinodular goitre may become autonomous leading to toxic multinodular goitre and hyperthyroidism

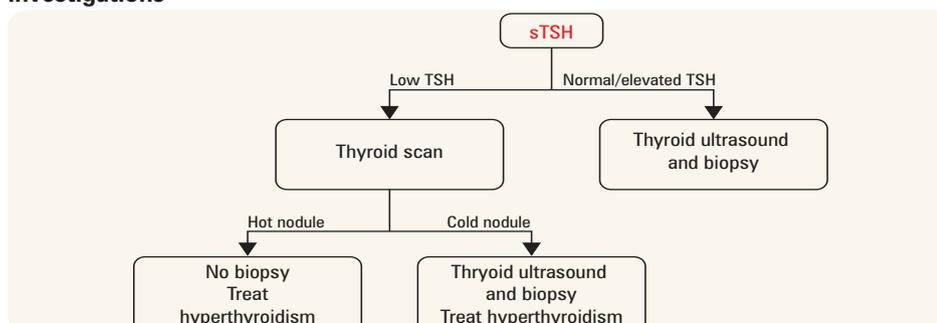

## Thyroid Nodules

**Definition**

- clearly defined discrete mass, separated from the thyroid parenchyma
- palpable nodules are found in approximately 5% of women and 1% of men

**Etiology**

- benign tumours (e.g. colloid nodule, follicular adenoma)
- thyroid malignancy
- hyperplastic area in a multinodular goitre
- cyst: true thyroid cyst, area of cystic degeneration in a multinodular goitre

**Investigations**

**Figure 9. Approach to the evaluation of a thyroid nodule**

Adapted from Dr. J Goguen, University of Toronto, MMMD 2013

# Thyroid Malignancies

- see [Otolaryngology, OT34](#)

# Adrenal Cortex

## Adrenocorticotrophic Hormone

- a polypeptide (cleaved from prohormone POMC), secreted in a pulsatile fashion from the anterior pituitary with diurnal variability (peak: 0200-0400; trough: 1800-2400)
- secretion regulated by corticotropin-releasing hormone (CRH) and arginine vasopressin (AVP)
- stimulates growth of adrenal cortex and release of glucocorticoids, androgens and, to a limited extent, mineralocorticoids
- some melanocyte stimulating activity

## Adrenocortical Hormones

### Aldosterone

- a mineralocorticoid which regulates extracellular fluid (ECF) volume through Na<sup>+</sup> (and Cl<sup>-</sup>) retention and K<sup>+</sup> (and H<sup>+</sup>) excretion (stimulates distal tubule Na<sup>+</sup>/K<sup>+</sup> ATPase)
- regulated by the renin-angiotensin-aldosterone system (Figure 12)
- negative feedback to juxtaglomerular apparatus (JGA) by long loop (aldosterone ↑ volume expansion) and short loop (angiotensin II ↑ peripheral vasoconstriction)

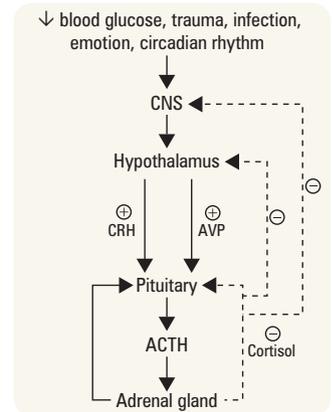

Figure 10. Regulation of CRH-ACTH-adrenal gland axis

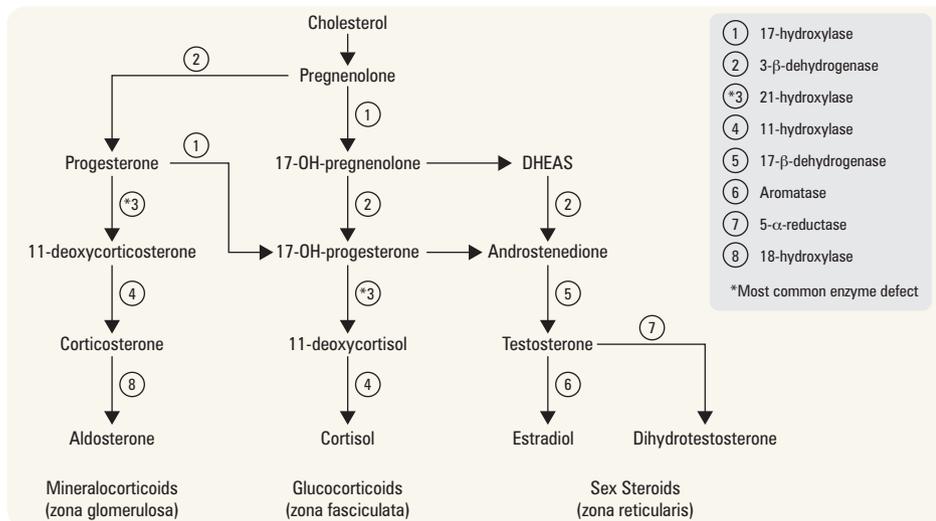

Figure 11. Pathways of major steroid synthesis in the adrenal gland and their enzymes

### Layers of the Adrenal Cortex

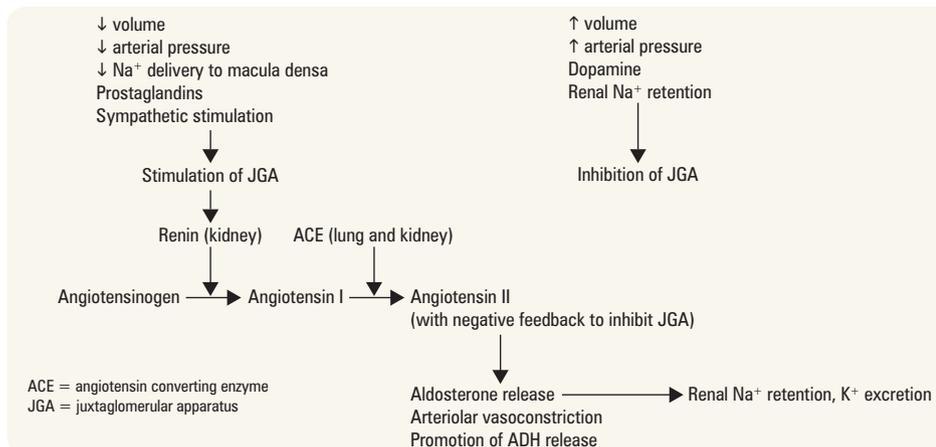

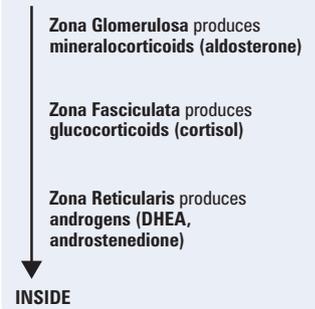

Figure 12. Renin-angiotensin-aldosterone axis (see [Nephrology, NP4](#))

## Cortisol

- a glucocorticoid, regulated by the HPA axis
- involved in regulation of metabolism; counteracts the effects of insulin
- support blood pressure, vasomotor tone
- also involved in regulation of behaviour and immunosuppression

**Table 21. Physiological Effects of Glucocorticoids**

Stimulatory Effects	Inhibitory Effects
Stimulate hepatic glucose production (gluconeogenesis)	Inhibit bone formation; stimulate bone resorption
Increase insulin resistance in peripheral tissues	Inhibit fibroblasts, causing collagen and connective tissue loss
Increase protein catabolism	Suppress inflammation; impair cell-mediated immunity
Stimulate leukocytosis and lymphopenia	Inhibit growth hormone axis
Increase cardiac output, vascular tone, Na <sup>+</sup> retention	Inhibit reproductive axis
Increase PTH release, urine calcium excretion	Inhibit vitamin D3 and inhibit calcium uptake

## Androgens

- sex steroids regulated by ACTH; primarily responsible for adrenarche (growth of axillary and pubic hair)
- principal adrenal androgens are dihydroepiandrosterone (DHEA), androstenedione, and 11-hydroxyandrostenedione
- proportion of total androgens (adrenal to gonadal) increases in old age

# Adrenocortical Functional Workup

## STIMULATION TEST

- purpose: diagnosis of hormone deficiencies
- method: measure target hormone after stimulation with tropic (pituitary) hormone

### 1. Tests of Glucocorticoid Reserve

- Cosyntropin (ACTH analogue) Stimulation Test
  - give 1 µg or 250 µg cosyntropin IV, then measure plasma cortisol levels at time 0, 30, and 60 min
  - physiologic response: stimulated plasma cortisol of >500 nmol/L
  - inappropriate response: inability to stimulate increased plasma cortisol
- insulin tolerance is the gold standard test used to diagnose adrenal insufficiency (see *Pituitary Gland, E15*)

## SUPPRESSION TESTS

- purpose: diagnosis of hormone hypersecretion
- method: measure target hormone after suppression of its tropic (pituitary) hormone

### 1. Tests of Pituitary-Adrenal Suppressibility

- Dexamethasone (DXM) Suppression Test
  - principle: DXM suppresses pituitary ACTH, plasma cortisol should be lowered if HPA axis is normal
  - **Screening Test: Overnight DXM Suppression Test**
    - ♦ oral administration of 1 mg DXM at midnight measure plasma cortisol levels the following day at 8 am
    - ♦ physiologic response: plasma cortisol <50 nmol/L, with 50-140 nmol/L being a “grey zone” (cannot be certain if normal or not)
    - ♦ inappropriate response: failure to suppress plasma cortisol
    - ♦ <20% false positive results due to obesity, depression, alcohol, other medications
  - **Confirmatory Test:** Other testing is used to confirm the diagnosis, such as:
    - ♦ 24 h urine free cortisol (shows overproduction of cortisol)
    - ♦ midnight salivary cortisol (if available), shows lack of diurnal variation
      - inappropriate response: remains high (normally will be low at midnight)

### 2. Tests of Mineralocorticoid Suppressibility

- principle: expansion of extracellular fluid volume (ECFV); plasma aldosterone should be lowered if HPA axis is normal
- ECFV Expansion with Normal Saline (NS)
  - IV infusion of 500 mL/h of NS for 4 h, then measure plasma aldosterone levels
  - plasma aldosterone >277 pmol/L is consistent with primary hyperaldosteronism, <140 pmol/L is normal
  - inappropriate response: failure to suppress plasma aldosterone

## Mineralocorticoid Excess Syndromes

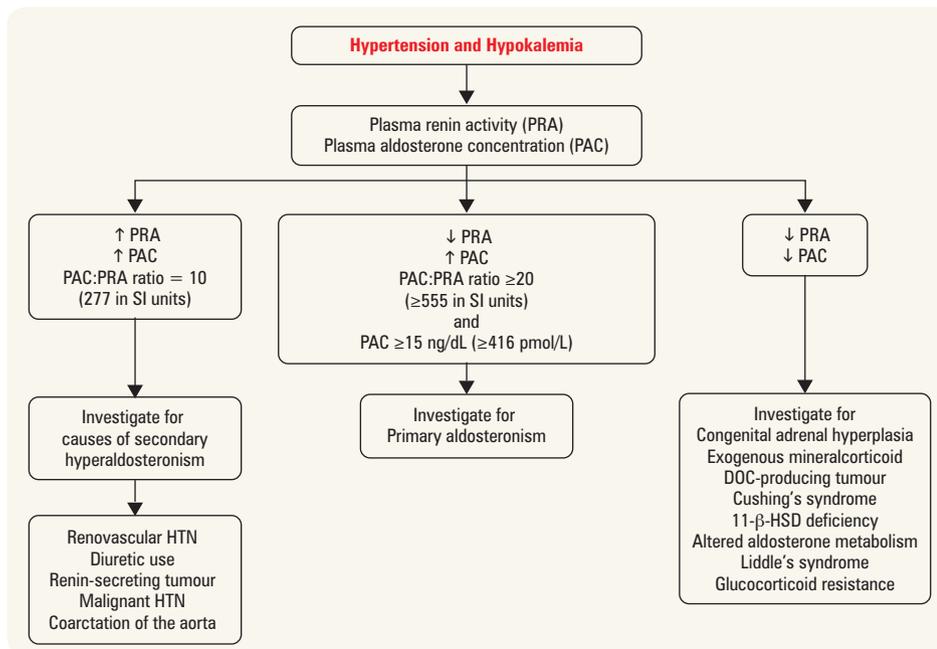

Figure 13. Approach to mineralocorticoid excess syndromes

### Definition

- primary hyperaldosteronism (PH): excess aldosterone production (intra-adrenal cause)
- secondary hyperaldosteronism (SH): aldosterone production in response to excess RAAS (extra-adrenal cause)

### Etiology

- primary hyperaldosteronism
  - aldosterone-producing adrenal adenoma (Conn's syndrome)
  - bilateral or idiopathic adrenal hyperplasia
  - glucocorticoid-remediable aldosteronism
  - aldosterone-producing adrenocortical carcinoma
  - unilateral adrenal hyperplasia
- secondary hyperaldosteronism

### Clinical Features

- HTN
- hypokalemia (may have mild hyponatremia), metabolic alkalosis
- normal  $K^+$ , low  $Na^+$  in SH (low effective circulating volume leads to ADH release) edema
- increased cardiovascular risk: LV hypertrophy, atrial fibrillation, stroke, MI
- fatigue, weakness, paresthesia, headache; severe cases with tetany, intermittent paralysis

### Diagnosis

- investigate plasma aldosterone to renin ratio in patients with HTN and hypokalemia
- confirmatory testing for PH: aldosterone suppression test (demonstrate inappropriate aldosterone secretion with ECF volume expansion)
- imaging: CT adrenal glands

Table 22. Diagnostic Tests in Hyperaldosteronism

Test	Primary Hyperaldosteronism	Secondary Hyperaldosteronism
Plasma aldosterone to renin ratio (PAC/PRA)	Elevated (↑ aldo, ↓ renin)	Normal (↑ aldo, ↑ renin)
Salt loading test	↑ urine aldosterone	Not performed if normal PAC/PRA
A) Oral test	↑ plasma aldosterone	
B) IV saline test		

### Treatment

- inhibit action of aldosterone: spironolactone, eplerenone, triamterene, amiloride (act on sodium channels)
- surgical excision of adrenal adenoma
- secondary hyperaldosteronism: treat underlying cause

## Cushing's Syndrome

### Definition

- results from chronic glucocorticoid excess (endogenous or exogenous sources)

### Etiology

- ACTH-dependent (85%) – bilateral adrenal hyperplasia and hypersecretion due to:
  - ACTH-secreting pituitary adenoma (Cushing's disease; 80% of ACTH-dependent)
  - ectopic ACTH-secreting tumour (e.g. small cell lung carcinoma, bronchial, carcinoid, pancreatic islet cell, pheochromocytoma, or medullary thyroid tumours)
- ACTH-independent (15%)
  - long-term use of exogenous glucocorticoids
  - primary adrenocortical tumours: adenoma and carcinoma (uncommon)
  - bilateral adrenal nodular hyperplasia

### Clinical Features

- symptoms: weakness, insomnia, mood disorders, impaired cognition, easy bruising, oligo-/amenorrhea, hirsutism, and acne (ACTH dependent)
- signs: central obesity, round face, supraclavicular and dorsal fat pads, facial plethora, proximal muscle wasting, purple abdominal striae, skin atrophy, acanthosis nigricans, HTN, hyperglycemia, osteoporosis, pathologic fractures, hyperpigmentation, hyperandrogenism if ACTH-dependent

### Diagnosis

- complete a drug history to exclude iatrogenic Cushing's
- perform one of: 1) 24 h urine free cortisol, 2) dexamethasone suppression test, or 3) late night salivary cortisol
- consider reasons for a false positive (e.g. pregnancy, depression, alcoholism, morbid obesity, poorly controlled DM)
- confirm with one of the remaining tests if necessary (do not rely on random cortisol, insulin tolerance, loperamide, or urinary 17-ketosteroid tests)

### Treatment

- adrenal
  - adenoma: unilateral adrenalectomy (curative) with glucocorticoid supplementation post-operatively
  - carcinoma: adjunctive chemotherapy often not useful (frequent metastases, poor prognosis)
  - medical treatment: mitotane, ketoconazole to reduce cortisol
- pituitary
  - trans-sphenoidal resection, with glucocorticoid supplement post-operatively
- ectopic ACTH tumour (paraneoplastic syndrome): usually bronchogenic cancer (poor prognosis)
  - surgical resection, if possible; chemotherapy/radiation for primary tumour
  - medical treatment with mitotane or ketoconazole to reduce cortisol synthesis. Often required when surgery is delayed, contraindicated, or unsuccessful

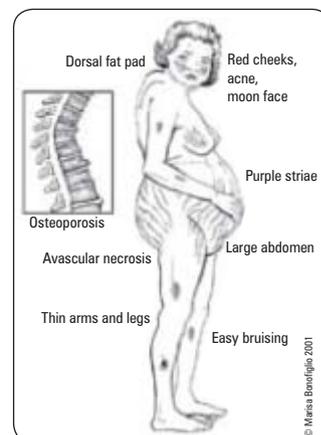

Figure 14. Clinical features of Cushing's syndrome

## Congenital Adrenal Hyperplasia

- see [Pediatrics, P29](#)

## Hyperandrogenism

### Definition

- state of having excessive secretion of androgens (DHEA, DHEA sulfate, testosterone)

### Etiology and Pathophysiology

Table 23. Etiology of Hyperandrogenism

Constitutional/Familial	Family history, predisposing ethnic background Premature adrenarche
Medications Androgen-Mediated	Anabolic steroids, ACTH, androgens, progestational agents
Ovarian	PCOS Ovarian hyperthecosis Theca cell tumours Pregnancy: placental sulfatase/aromatase deficiency
Adrenal	Congenital adrenal hyperplasia (CAH, late-onset CAH) Tumours (adenoma, carcinoma)
Pituitary	Cushing's disease – high ACTH Hyperprolactinemia

## Clinical Features

### Females

- hirsutism
  - male pattern growth of androgen-dependent terminal body hair in women: back, chest, upper abdomen, face, linea alba
  - Ferriman-Gallwey scoring system is used to quantify severity of hirsutism
- virilization
  - masculinization: hirsutism, temporal balding, clitoral enlargement, deepening of voice, acne
  - increase in musculature
- defeminization
  - loss of female secondary sex characteristics (i.e. amenorrhea, ↓ breast size, infertility)

### Males

- minimal effects on hair, muscle mass, etc.
- inhibition of gonadotropin secretion may cause reduction in: testicular size, testicular testosterone production, and spermatogenesis

## Investigations

- testosterone, DHEA-S as a measure of adrenal androgen production
- LH/FSH (commonly in PCOS >2.5)
- 17-OH progesterone, elevated in CAH due to 21-OH deficiency; check on day 3 of menstrual cycle with a progesterone level
- for virilization: CT/MRI of adrenals and ovaries (identify tumours)
- if PCOS, check blood glucose, lipids, 75 g OGTT

## Treatment

- discontinue causative medications
- antiandrogens, e.g. spironolactone
- oral contraceptives (increase sex hormone binding globulin, which binds androgens>estrogens; reduce ovarian production of androgens)
- surgical resection of tumour
- low dose glucocorticoid ± mineralocorticoid if CAH suspected
- treat specific causative disorders, e.g. tumours, Cushing's, etc.
- cosmetic therapy (laser, electrolysis)

### Conditions that do NOT Represent True Hirsutism

- Androgen-independent hair (e.g. lanugo hair)
- Drug-induced hypertrichosis (e.g. phenytoin, diazoxide, cyclosporine, minoxidil)
- Topical steroid use

# Adrenocortical Insufficiency

## Definition

- state of inadequate cortisol and/or aldosterone production by the adrenal glands

## Etiology

### PRIMARY (ADDISON'S DISEASE)

**Table 24. Etiology of Primary Adrenocortical Insufficiency**

<b>Autoimmune (70-90%)</b>	Isolated adrenal insufficiency Polyglandular autoimmune syndrome type I and II Antibodies often directed against adrenal enzymes and 3 cortical zones
<b>Infection</b>	TB (7-20%) (most common in developing world) Fungal: histoplasmosis, paracoccidioidomycosis HIV, CMV Syphilis African trypanosomiasis
<b>Infiltrative</b>	Metastatic cancer (lung>stomach>esophagus>colon>breast); lymphoma Sarcoidosis, amyloidosis, hemochromatosis
<b>Vascular</b>	Bilateral adrenal hemorrhage (risk increased by heparin and warfarin) Sepsis (meningococcal, <i>Pseudomonas</i> ) Coagulopathy in adults or Waterhouse-Friderichsen syndrome in children Thrombosis, embolism, adrenal infarction
<b>Drugs</b>	Inhibit cortisol: ketoconazole, etomidate, megestrol acetate Increase cortisol metabolism: rifampin, phenytoin, barbiturates
<b>Others</b>	Adrenoleukodystrophy Congenital adrenal hypoplasia (impaired steroidogenesis) Familial glucocorticoid deficiency or resistance

## SECONDARY ADRENOCORTICAL INSUFFICIENCY

- inadequate pituitary ACTH secretion
- multiple etiologies (see *Hypopituitarism, E19*), including withdrawal of exogenous steroids

### Clinical Features

**Table 25. Clinical Features of Primary and Secondary Adrenal Insufficiency (AI)**

	Primary AI (Addison's or Acute AI)	Secondary AI
<b>Skin and Mucosa</b>	Dark (palmar crease, extensor surface)	Pale
<b>Potassium</b>	High	Normal
<b>Sodium</b>	Low	Normal or Low
<b>Metabolic Acidosis</b>	Present	Absent
<b>Associated Diseases</b>	Primary hypothyroidism, type 1 DM, vitiligo, neurological deficits	Central hypogonadism or hypothyroidism, growth hormone deficiency, DI, headaches, visual abnormalities
<b>Associated Symptoms</b>	Weakness, fatigue, weight loss, hypotension, salt craving, postural dizziness, myalgia, arthralgia GI: N/V, abdominal pain, diarrhea	Same except: No salt craving GI less common
<b>Diagnostic Test</b>	Insulin tolerance test Cosyntropin Stimulation Test High morning plasma ACTH	Insulin tolerance test Cosyntropin Stimulation Test Low morning plasma ACTH

Adapted from: Salvatori R. *JAMA* 2005;294:2481-2488

### Treatment

- acute condition – can be life-threatening
  - IV NS in large volumes (2-3 L); add D5W if hypoglycemic from adrenal insufficiency
  - hydrocortisone 50-100 mg IV q6-8h for 24h, then gradual tapering
  - identify and correct precipitating factors
- maintenance
  - hydrocortisone 15-20 mg total daily dose, in 2-3 divided doses, highest dose in the AM
  - Florinef® (fludrocortisone, synthetic mineralocorticoid) 0.05-0.2 mg PO daily if mineralocorticoid deficient increase dose of steroids 2-3 fold for a few days during moderate-severe illness (e.g. with vomiting, fever)
  - major stress (e.g. surgery, trauma) requires 150-300 hydrocortisone IV daily divided into 3 doses
  - medical alert bracelet and instructions for emergency hydrocortisone/dexamethasone IM/SC injection

## Adrenal Medulla

### Catecholamine Metabolism

- catecholamines are synthesized from tyrosine in postganglionic sympathetic nerves (norepinephrine) and chromaffin cells of adrenal medulla (epinephrine)
- broken down into metanephrines and other metabolites (VMA, HVA) and excreted in urine

### Pheochromocytoma

#### Definition

- rare catecholamine secreting tumour derived from chromaffin cells of the sympathetic system

#### Epidemiology

- most commonly a single tumour of adrenal medulla
- rare cause of HTN (<0.2% of all hypertensives)

#### Etiology and Pathophysiology

- most cases sporadic (80%)
- familial: associated with multiple endocrine neoplasia II (MEN IIA and IIB) (50% penetrance; i.e. 50% of people with the mutation get pheochromocytoma), von Hippel-Lindau (10-20% penetrance), paraganglioma (20% penetrance), or neurofibromatosis type 1 (0.1-5.7% penetrance)
- tumours, via unknown mechanism, able to synthesize and release excessive catecholamines

#### ABC of Adrenaline

Adrenaline activates  $\beta$ -receptors, increasing Cyclic AMP

### Clinical Features

- 50% suffer from paroxysmal HTN; the rest have sustained HTN
- classic triad (not found in most patients): episodic “pounding” headache, palpitations/tachycardia, diaphoresis
- other symptoms: tremor, anxiety, chest or abdominal pain, N/V, visual blurring, weight loss, polyuria, polydipsia
- other signs: orthostatic hypotension, papilledema, hyperglycemia, dilated cardiomyopathy
- symptoms may be triggered by stress, exertion, anesthesia, abdominal pressure, certain foods (especially tyramine containing foods)

### Investigations

- urine catecholamines
  - increased catecholamine metabolites (metanephrines) and free catecholamines
  - plasma metanephrines if available (most sensitive)
    - ◆ cut-off values will depend on assay used
- CT abdomen
  - if negative, whole body CT and meta-iodo-benzguanidine (MIBG) scintigraphy, Octreoscan, or MRI

### Treatment

- surgical removal of tumour (curative) with careful pre- and post-operative ICU monitoring
- adequate pre-operative preparation
  - $\alpha$ -blockade for BP control: doxazosin or calcium channel blockers (10-21 d pre-operative), IV phentolamine (perioperative, if required)
  - $\beta$ -blockade for HR control once  $\alpha$  blocked for a few days
  - metyrosine (catecholamine synthesis inhibitor) + phenoxybenzamine or prazosin
  - volume restoration with vigorous salt-loading and fluids
- rescreen urine 1-3 mo post-operatively
- screen urine in first degree relatives; genetic testing in patients <50 yr old

## Disorders of Multiple Endocrine Glands

### Multiple Endocrine Neoplasm

- neoplastic syndromes involving multiple endocrine glands
- tumours of neuroectodermal origin
- autosomal dominant inheritance with variable penetrance
- genetic screening for RET proto-oncogene on chromosome 10 has long-term benefit in MEN II
  - early cure and prevention of medullary thyroid cancer

Table 26. MEN Classification

Type	Tissues Involved	Clinical Manifestations
<b>MEN I</b> (chromosome 11)		
<b>Wermer's Syndrome</b>	Pituitary (15-42%) Anterior pituitary adenoma	Headache, visual field defects, often non-secreting but may secrete GH (acromegaly) and PRL (galactorrhea, erectile dysfunction, decreased libido, amenorrhea)
	Parathyroid ( $\geq 95\%$ ) Primary hyperparathyroidism from hyperplasia	Nephrolithiasis, bone abnormalities, MSK complaints, symptoms of hypercalcemia
	Entero-pancreatic endocrine (30-80%) Pancreatic islet cell tumours	Epigastric pain (peptic ulcers and esophagitis)
	Gastrinoma	Hypoglycemia
	Insulinomas	Secretory diarrhea
	Vasoactive intestinal peptide (VIP)-omas	
	Glucagonoma	Rash, anorexia, anemia, diarrhea, glossitis
Carcinoid syndrome	Flushing, diarrhea, bronchospasm	
<b>MEN II</b> (chromosome 10)		
1. Ila Sipple's Syndrome	Thyroid (>90%) Medullary thyroid cancer (MTC)	Physical signs are variable and often subtle
	Adrenal medulla (40-50%) Pheochromocytoma (40-50%)	Neck mass or thyroid nodule; non-tender, anterior lymph nodes
	Parathyroid (10-20%) 1° parathyroid hyperplasia	HTN, palpitations, headache, sweating
	Skin	Symptoms of hypercalcemia
	Cutaneous lichen amyloidosis	Scaly skin rash

**MEN I – Wermer's Syndrome Affects the 3 Ps**

Pituitary  
Parathyroid  
Pancreas

Table 26. MEN Classification (continued)

Type	Tissues Involved	Clinical Manifestations
2. Familial Medullary Thyroid Ca (a variant of IIa)	Thyroid MTC ( $\geq 95\%$ )	MTC without other clinical manifestations of MEN IIa or IIb
3. IIb	Thyroid MTC Adrenal medulla Pheochromocytoma ( $\geq 50\%$ ) Neurons Mucosal neuroma, intestinal ganglioneuromas (100%) MSK (100%)	MTC: most common component, more aggressive and earlier onset than MEN IIa HTN, palpitations, headache, sweating  Chronic constipation; megacolon  Marfanoid habitus (no aortic abnormalities)

## Investigations

- MEN I
  - laboratory
    - ♦ may consider genetic screening for MEN-1 mutation in index patients
      - if a mutation is identified, screen family members who are at risk
    - ♦ gastrinoma: elevated serum gastrin level ( $>200$  ng/mL) after IV injection of secretin
    - ♦ insulinoma: reduced fasting blood glucose (hypoglycemia) with elevated insulin and C-peptide levels
    - ♦ glucagonoma: elevated blood glucose and glucagon levels
    - ♦ pituitary tumours: assess GH, IGF-1, and prolactin levels (for over-production), TSH, free T<sub>4</sub>, 8 AM cortisol, LH, FSH, bioavailable testosterone or estradiol (for underproduction due to mass effect of tumour)
    - ♦ hyperparathyroidism: serum Ca<sup>2+</sup> and albumin, PTH levels; bone density scan (DEXA)
  - imaging
    - ♦ MRI for pituitary tumours, gastrinoma, insulinoma
- MEN II
  - laboratory
    - ♦ genetic screening for RET mutations in all index patients
      - if a mutation is identified screen family members who are at risk
    - ♦ calcitonin levels (MTC); urine catecholamines and metanephrines (pheochromocytoma); serum Ca<sup>2+</sup>, albumin, and PTH levels (hyperparathyroidism)
    - ♦ pentagastrin  $\pm$  calcium stimulation test if calcitonin level is within reference range
    - ♦ FNA for thyroid nodules-cytology
  - imaging
    - ♦ CT or MRI of adrenal glands, metaiodobenzylguanidine (MIBG) scan for pheochromocytoma
    - ♦ octreoscan and/or radionuclide scanning for determining the extent of metastasis

## Treatment

- MEN I
  - medical
    - ♦ proton pump inhibitor (PPI) for acid hypersecretion in gastrinoma
    - ♦ cabergoline or other dopamine agonists to suppress prolactin secretion
    - ♦ somatostatin for symptomatic carcinoid tumours
  - surgery for hyperparathyroidism, insulinoma, glucagonoma, pituitary tumours (if medical treatment fails for the latter)
    - ♦ trans-sphenoidal approach with prn external radiation
- MEN II
  - surgery for MEN IIa with pre-operative medical therapy
    - ♦ prostaglandin inhibitors to alleviate diarrhea associated with thyroid cancer
    - ♦  $\alpha$ -blocker for at least 10-21 d for pheochromocytoma pre-operatively
    - ♦ hydration, calcitonin, IV bisphosphonates for hypercalcemia

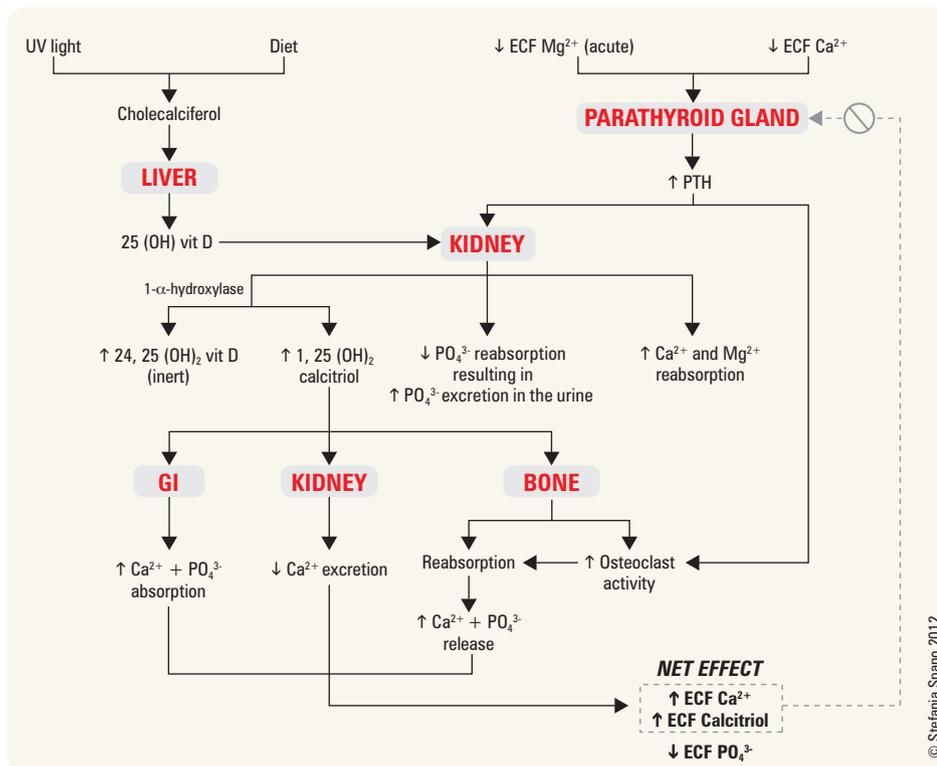

# Calcium Homeostasis

- normal total serum Ca<sup>2+</sup>: 2.2-2.6 mmol/L
- ionic/free Ca<sup>2+</sup> levels: 1.15-1.31 mmol/L
- serum Ca<sup>2+</sup> is about 40% protein bound (mostly albumin), 50% ionized, and 10% complexed with PO<sub>4</sub><sup>3-</sup> and citrate
- regulated mainly by two factors: parathyroid hormone (PTH) and vitamin D
- actions mainly on three organs: GI tract, bone, and kidney

**Table 27. Major Regulators in Calcium Homeostasis**

Major Regulators	Source	Regulation	Net Effect
<b>PTH</b>	Parathyroid glands	Stimulated by low serum $\text{Ca}^{2+}$ and high serum $\text{PO}_4^{3-}$ ; inhibited by chronic low serum $\text{Mg}^{2+}$ , high serum $\text{Ca}^{2+}$ , and calcitriol	$\uparrow \text{Ca}^{2+}$ $\uparrow \text{Calcitriol}$ $\downarrow \text{PO}_4^{3-}$
<b>Calcitriol (1,25-(OH)<math>_2</math>D<math>_3</math>)</b>	Dietary intake Synthesized from cholesterol: UV on skin makes cholecalciferol (vitD3) liver makes calcidiol (25-(OH)D $_3$ ) kidneys make calcitriol	Renal calcitriol production is stimulated by low serum $\text{PO}_4^{3-}$ and PTH; inhibited by high serum $\text{PO}_4^{3-}$ and calcitriol in negative feedback	$\uparrow \text{Ca}^{2+}$ $\uparrow \text{PO}_4^{3-}$
<b>Calcitonin</b>	Thyroid C cells	Stimulated by pentagastrin (GI hormone) and high serum $\text{Ca}^{2+}$ ; inhibited by low serum $\text{Ca}^{2+}$	$\downarrow \text{Ca}^{2+}$ (in pharmacologic doses) $\downarrow \text{PO}_4^{3-}$
<b>Mg<math>^{2+}</math></b>	Major intracellular divalent cation	<b>See Magnesium, NP15</b>	Cofactor for PTH secretion
<b>PO<math>_4^{3-}</math></b>	Intracellular anion found in all tissues	<b>See Phosphate, NP14</b>	$\downarrow \text{Ca}^{2+}$

**Figure 15. Parathyroid hormone (PTH) regulation**

**Primary Hyperparathyroidism** Increased PTH secretion commonly due to parathyroid adenoma, lithium therapy; less often parathyroid carcinoma or parathyroid hyperplasia

**Secondary Hyperparathyroidism** Partial resistance to PTH action leads to parathyroid gland hyperplasia and increased PTH secretion, often in patients with renal failure and osteomalacia (due to low or low normal serum calcium levels)

**Tertiary Hyperparathyroidism** Irreversible clonal outgrowth of parathyroid glands, usually in long-standing inadequately treated chronic renal failure on dialysis

**Primary Hyperparathyroidism** is the most common cause of hypercalcemia in healthy outpatients. Most commonly related to a solitary adenoma or less commonly multiple gland hyperplasia. Surgical excision acts as definitive treatment and is recommended for patients who are symptomatic. For mild asymptomatic disease medical surveillance may be appropriate with annual serum calcium, creatinine, and bone mineral density (BMD)

**For asymptomatic patients surgery is recommended for those who meet  $\geq 1$  of the following criteria:**

- Serum calcium concentration more than 0.25 mmol/L (1.0 mg/dL) above the upper limit of normal
- Creatinine clearance  $< 60$  mL/min
- BMD T-score  $< -2.5$  at hip, spine, or distal radius, and/or previous fragility fracture
- Age  $< 50$  yr

**Pseudohypercalcemia:** increased protein binding leading to an elevation in serum total  $\text{Ca}^{2+}$  without a rise in the ionized/free form, e.g. hyperalbuminemia from severe dehydration

## Hypercalcemia

### Definition

- total corrected serum  $\text{Ca}^{2+} > 2.6$  mmol/L OR ionized  $\text{Ca}^{2+} > 1.35$  mmol/L

### Approach to Hypercalcemia

1. Is the patient hypercalcemic? (correct for albumin – see sidebar)
2. Is the PTH high/normal or low?
3. If PTH is low, is phosphate high/normal or low? If phosphate is high/normal is the level of vitamin D metabolites high or low?

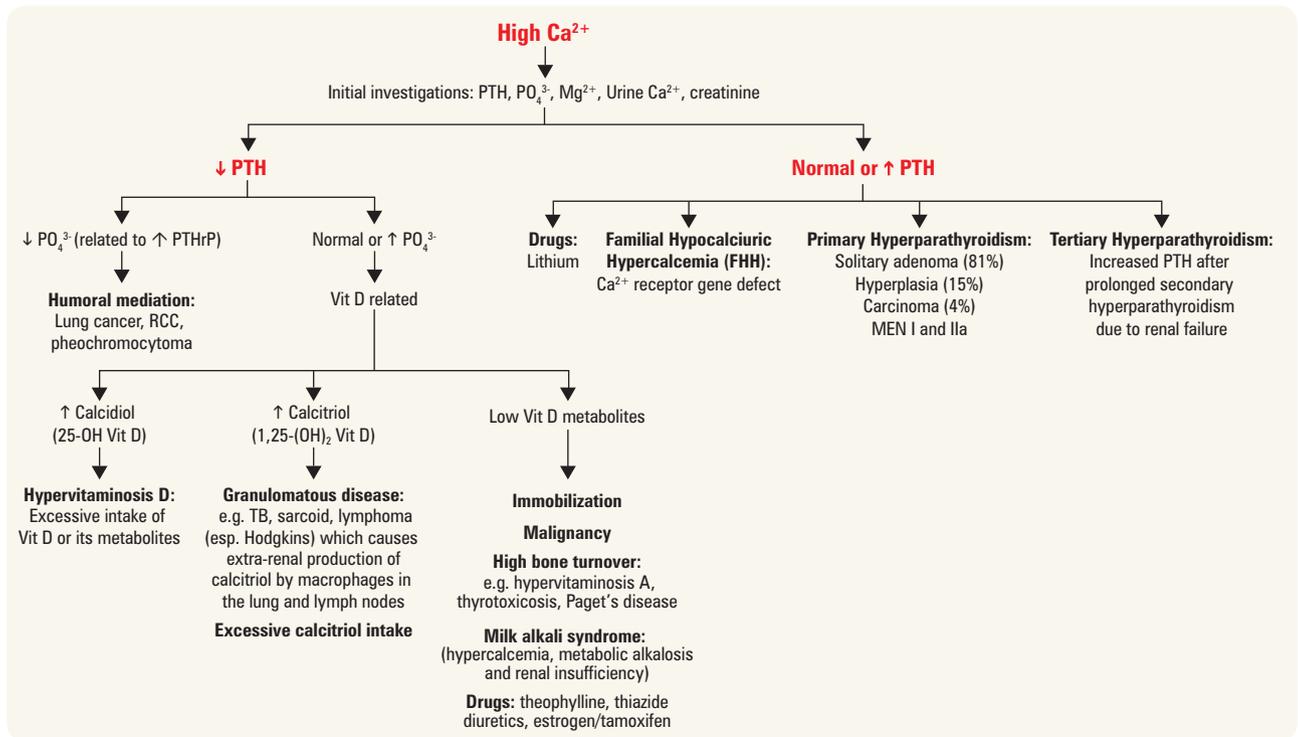

Figure 16. Differential diagnosis of hypercalcemia

**Clinical Features**

- symptoms depend on the absolute Ca<sup>2+</sup> value and the rate of its rise (may be asymptomatic)

Table 28. Symptoms of Hypercalcemia

Cardiovascular	GI	Renal	Rheumatological	MSK	Psychiatric	Neurologic
HTN Arrhythmia Short QT Deposition of Ca <sup>2+</sup> on valves, coronary arteries, myocardial fibres	Constipation Anorexia Nausea Vomiting (groans) PUD pancreatitis	Polyuria (Nephrogenic DI) Polydipsia <b>Nephrolithiasis (stones)</b> Renal failure (irreversible) Dehydration	Gout Pseudogout Chondrocalcinosis	Weakness Bone pain (bones)	>3 mmol/L (12 mg/dL) Increased alertness Anxiety Depression Cognitive dysfunction Organic brain syndromes >4 mmol/L (16 mg/dL) <b>Psychosis (moans)</b>	Hypotonia Hyporeflexia Myopathy Paresis

\*\* **Hypercalcemic crisis** (usually >4 mmol/L or 16 mg/dL): primary symptoms include oliguria/anuria and mental status changes including somnolence and eventually coma → this is a medical emergency and should be treated immediately!

**Treatment**

- treatment depends on the Ca<sup>2+</sup> level and the symptoms
- treat acute, symptomatic hypercalcemia aggressively
- treat the underlying cause of the hypercalcemia

Corrected Ca<sup>2+</sup> (mmol/L) = measured Ca<sup>2+</sup> + 0.02 (40 – albumin)

For every decrease in albumin by 10, increase in Ca<sup>2+</sup> by 0.2

Benign (less likely malignant): Ca<sup>2+</sup> <2.75 mmol/L

Pathologic (more likely malignant): Ca<sup>2+</sup> >3.25 mmol/L

The symptoms and signs of hypercalcemia include:

**"Bones, stones, groans, and psychiatric overtones"**

The most common cause of hypercalcemia in hospital is malignancy-associated hypercalcemia

- Usually occurs in the later stages of disease
- Most commonly seen in lung, renal, breast, ovarian, and squamous tumours, as well as lymphoma and multiple myeloma

**Mechanisms:**

- Secretion of parathyroid hormone-related protein (PTHrP) which mimics PTH action by preventing renal calcium excretion and activating osteoclast-induced bone resorption
- Cytokines in multiple myeloma
- Calcitriol production by lymphoma
- Osteolytic bone metastases direct effect
- Excess PTH in parathyroid cancer

**Table 29. Treatment of Acute Hypercalcemia/Hypercalcemic Crisis**

<b>Increase Urinary Ca<sup>2+</sup> Excretion</b>	Isotonic saline (4-5 L) over 24 h ± loop diuretic (e.g. furosemide) but only if hypervolemic (urine output >200mL/h) Calcitonin: 4 IU/kg IM/SC q12h 8 IU/kg IM/SC q6h Only works for 48 h Rapid onset within 4-6 h
<b>Diminish Bone Resorption</b>	Bisphosphonates (treatment of choice) Inhibits osteoclastic bone resorption and promotes renal excretion of calcium Acts rapidly but often transient response (decreased by 0.3-0.5 mmol/L beginning within 4-6 h) max effect usually in 7 d Combination of calcitonin and steroids may prolong reduction in calcium Tachyphylaxis may occur Indicated in malignancy-related hypercalcemia (IV pamidronate or zoledronic acid used) Mithramycin (rarely used) – effective when patient cannot tolerate large fluid load Dangerous – hematotoxic and hepatotoxic
<b>Decrease GI Ca<sup>2+</sup> Absorption</b>	Corticosteroids in hypervitaminosis D and hematologic malignancies Anti-tumour effects → decreased calcitriol production by the activated mononuclear cells in lung and lymph node Slow to act (5-10 d); need high dose
<b>Dialysis</b>	Treatment of last resort Indication: severe malignancy-associated hypercalcemia and renal insufficiency or heart failure

**Differential Diagnosis of Hypercalcemia**

- Primary hyperparathyroidism
- Malignancy: hematologic, humoral, skeletal metastases (> 90% from 1 or 2)
- Renal disease: tertiary hyperparathyroidism
- Drugs: calcium carbonate, milk alkali syndrome, thiazide, lithium, theophylline, vitamin A/D intoxication
- Familial hypocalciuric hypercalcemia
- Granulomatous disease: sarcoidosis, TB, Hodgkin's lymphoma
- Thyroid disease: thyrotoxicosis
- Adrenal disease: adrenal insufficiency, pheochromocytoma
- Immobilization

**Watch Out for:**

- Volume depletion via diuresis
- Arrhythmias

**Acute Management of Hypercalcemia/Hypercalcemic Crisis**

- Volume expansion (e.g. NS IV 300-500 cc/h): initial therapy
- Calcitonin: transient, partial response
- Bisphosphonate: treatment of choice
- Corticosteroid: most useful in vitamin D toxicity, granulomatous disease, some malignancies
- Saline diuresis + loop diuretic (for volume overload): temporary measure

Hypomagnesemia can impair PTH secretion and action

**Differential Diagnosis of Tetany**

- Hypocalcemia
- Metabolic alkalosis (with hyperventilation)
- Hypokalemia
- Hypomagnesemia

**Signs and Symptoms of Acute Hypocalcemia**

- Paresthesias: perioral, hands, and feet
- Chvostek's sign: percussion of the facial nerve just anterior to the external auditory meatus elicits ipsilateral spasm of the orbicularis oculi or orbicularis oris muscles
- Trousseau's sign: inflation of a blood pressure cuff above systolic pressure for 3 min elicits carpal spasm and paresthesia

Transient hypoparathyroidism (resulting in hypocalcemia) common after subtotal thyroidectomy (permanent in <3% of surgeries)

## Hypocalcemia

**Definition**

- total corrected serum Ca<sup>2+</sup> <2.2 mmol/L

**Table 30. Clinical Features of Hypocalcemia**

Acute Hypocalcemia	Chronic Hypocalcemia
Paresthesia Laryngospasm (with stridor) Hyperreflexia Tetany Chvostek's sign (tap CN VII) Trousseau's sign (carpal spasm) ECG changes Delirium Psychiatric Sx: emotional instability, anxiety, and depression	CNS: lethargy, seizures, psychosis, basal ganglia calcification, Parkinson's, dystonia, hemiballismus, papilledema, pseudotumour cerebri CVS: prolonged QT interval → Torsades de pointes (ventricular tachycardia) GI: steatorrhea ENDD: impaired insulin release SKIN: dry, scaling, alopecia, brittle and transversely fissured nails, candidiasis, abnormal dentition OCULAR: cataracts MSK: generalized muscle weakness and wasting

**Approach to Hypocalcemia**

1. Is the patient hypocalcemic?
2. Is the PTH high or low?
3. If PTH is high, is phosphate low or normal?
4. Is the Mg<sup>2+</sup> level low?

**Approach to Treatment**

- correct underlying disorder
- mild/asymptomatic (ionized Ca<sup>2+</sup> >0.8 mmol/L)
  - treat by increasing dietary Ca<sup>2+</sup> by 1000 mg/d
  - calcitriol 0.25 µg/d (especially in renal failure)
- acute/symptomatic hypocalcemia (ionized Ca<sup>2+</sup> <0.7 mmol/L)
  - immediate treatment required
  - IV calcium gluconate 1-2 g over 10-20 min followed by slow infusion if necessary
  - goal is to raise Ca<sup>2+</sup> to low normal range (2.0-2.1 mmol/L) to prevent symptoms but allow maximum stimulation of PTH secretion
- if PTH recovery not expected, requires long-term therapy with calcitriol and calcium
- **do not correct hypocalcemia if asymptomatic and suspected to be transient**

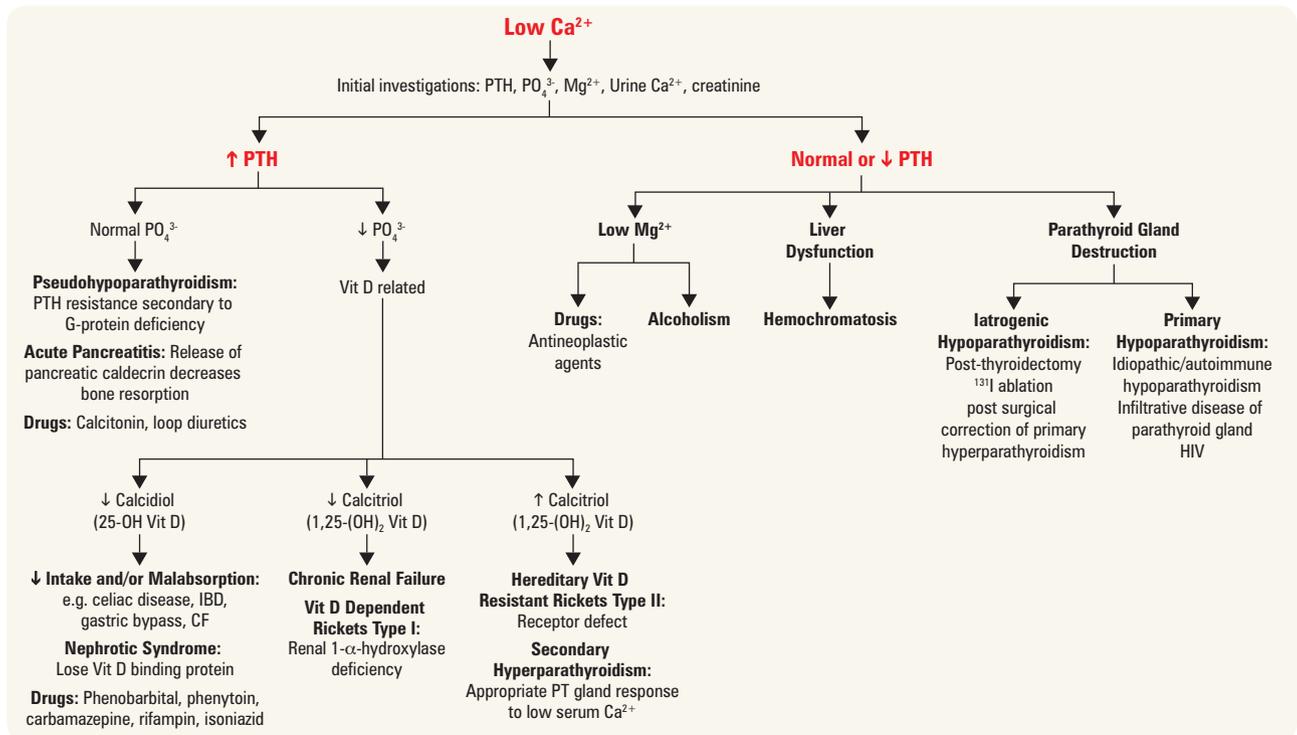

Figure 17. Etiology and clinical approach to hypocalcemia

## Metabolic Bone Disease

### Osteoporosis

#### Definition

- a condition characterized by decreased bone mass and microarchitectural deterioration of bone tissue with a consequent increase in bone fragility and susceptibility to fracture
- bone mineral density (BMD)  $\geq 2.5$  standard deviations below the peak bone mass for young adults (i.e. T-score  $\leq -2.5$ )
- osteopenia: BMD with T-score between -1.0 and -2.5

#### ETIOLOGY AND PATHOPHYSIOLOGY

##### Primary Osteoporosis (95% of osteoporosis in women and 80% in men)

- primary type 1: most common in post-menopausal women, due to decline in estrogen, worsens with age
- primary type 2: occurs after age 75, seen in females and males at 2:1 ratio, possibly due to zinc deficiency

##### Secondary Osteoporosis

- gastrointestinal diseases
  - gastrectomy
  - malabsorption (e.g. celiac disease)
  - chronic liver disease
- bone marrow disorders
  - multiple myeloma
  - lymphoma
  - leukemia
- endocrinopathies
  - Cushing's syndrome
  - hyperparathyroidism
  - hyperthyroidism
  - premature menopause
  - DM
  - hypogonadism
- malignancy
  - secondary to chemotherapy
  - myeloma
- drugs
  - corticosteroid therapy
  - phenytoin
  - chronic heparin therapy
  - androgen deprivation therapy
  - aromatase inhibitors
- other
  - rheumatologic disorders
    - rheumatoid arthritis
    - SLE
    - ankylosing spondylitis
  - renal disease
  - poor nutrition
  - immobilization
- COPD (due to disease, tobacco, and glucocorticoid use)

#### Online Clinical Tools

##### CAROC

[www.osteoporosis.ca/multimedia/pdf/CAROC.pdf](http://www.osteoporosis.ca/multimedia/pdf/CAROC.pdf)

##### FRAX

[www.shef.ac.uk/FRAX/tool.aspx](http://www.shef.ac.uk/FRAX/tool.aspx)

#### Corticosteroid Therapy is a Common Cause of Secondary Osteoporosis

Individuals receiving  $\geq 7.5$  mg of prednisone daily for over 3 mo should be assessed for bone-sparing therapy

Mechanism: increased resorption + decreased formation + increased urinary calcium loss + decreased intestinal calcium absorption + decreased sex steroid production

### Clinical Features

- commonly asymptomatic
- height loss due to collapsed vertebrae
- fractures: most commonly in hip, vertebrae, humerus, and wrist
  - fragility fractures: fracture with fall from standing height
  - Dowager's hump: collapse fracture of vertebral bodies in mid-dorsal region
  - x-ray: vertebral compression and crush fractures, wedge fractures, "codfishing" sign (weakening of subchondral plates and expansion of intervertebral discs)
- pain, especially backache, associated with fractures

### Approach to Osteoporosis

1. assess risk factors for osteoporosis on history and physical
2. decide if patient requires BMD testing with dual-energy x-ray absorptiometry (DEXA): men and women  $\geq 65$  yr or younger if presence of risk factors
3. Initial investigations
  - all patients with osteoporosis: calcium corrected for albumin, CBC, creatinine, ALP, TSH
  - also consider serum and urine protein electrophoresis, celiac workup, and 24 h urinary  $\text{Ca}^{2+}$  excretion to rule out additional secondary causes
  - **25-OH-Vitamin D level should only be measured after 3-4 mo of adequate supplementation and should not be repeated if an optimal level  $\geq 75$  nmol/L is achieved**
  - lateral thoracic and lumbar x-ray if clinical evidence of vertebral fracture
4. Assess 10-yr fracture risk by combining BMD result and risk factors (only if  $\geq 50$  yr)
  - 1) WHO Fracture Risk Assessment Tool (FRAX)
  - 2) Canadian Association of Radiologists and Osteoporosis Canada Risk Assessment Tool (CAROC)
    - ♦ approach to management guided by 10-yr risk stratification into low, medium, high risk
5. For all patients being assessed for osteoporosis, encourage appropriate lifestyle changes (see Table 33)

**Table 31. Indications for BMD Testing**

Older Adults (age $\geq 50$ yr)	Younger Adults (age $< 50$ yr)
All women and men age $\geq 65$ yr	Fragility fracture
Menopausal women, and men aged 50-64 yr with clinical risk factors for fracture:	Prolonged use of glucocorticoids
Fragility fracture after age 40	Use of other high-risk medications (aromatase inhibitors, androgen deprivation therapy, anticonvulsants)
Prolonged glucocorticoid use	Hypogonadism or premature menopause
Other high-risk medication use (aromatase inhibitors, androgen deprivation therapy)	Malabsorption syndrome
Parental hip fracture	Primary hyperparathyroidism
Vertebral fracture or osteopenia identified on x-ray	Other disorders strongly associated with rapid bone loss and/or fracture
Current smoking	
High alcohol intake	
Low body weight ( $< 60$ kg) or major weight loss ( $> 10\%$ of weight at age 25 yr)	
Rheumatoid arthritis	
Other disorders strongly associated with osteoporosis: primary hyperparathyroidism, type 1 DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause ( $< 45$ yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD and chronic inflammatory conditions (e.g. inflammatory bowel disease)	

**Table 32. Osteoporosis Risk Stratification**

<b>Low Risk</b> 10-yr fracture risk $< 10\%$	Unlikely to benefit from pharmacotherapy; encourage lifestyle changes Reassess risk in 5 yr
<b>Medium Risk</b> 10-yr fracture risk 10-20%	Discuss patient preference for management and consider additional risk factors Factors that warrant consideration for pharmacological therapy: Additional vertebral fracture(s) identified on vertebral fracture assessment (VFA) or lateral spine x-ray Previous wrist fracture in individuals $\geq 65$ or with T-score $\leq -2.5$ Lumbar spine T-score much lower than femoral neck T-score Rapid bone loss Men receiving androgen-deprivation therapy for prostate cancer Women receiving aromatase-inhibitor therapy for breast cancer Long-term or repeated systemic glucocorticoid use (oral or parenteral) that does not meet the conventional criteria for recent prolonged systemic glucocorticoid use Recurrent falls (defined as falling 2 or more times in the past 12 mo) Other disorders strongly associated with osteoporosis  Repeat BMD and reassess risk every 1-3 yr initially
<b>High Risk</b> 10-yr fracture risk $> 20\%$ ; OR Prior fragility fracture of hip or spine; OR More than one fragility fracture	Start pharmacotherapy

#### Calcium Plus Vitamin D Supplementation and Risk of Fractures. Osteoporosis

*Int* 2015;27:367-376

**Purpose:** To review trials of Vitamin D and Calcium therapy for reducing fracture risk in osteoporosis.  
**Study:** Systematic review searching 2011-2015, inclusive, identified 8 RCTs totalling 30,970 participants. RCTs reviewed included healthy adults and ambulatory older adults with medical conditions (excluding cancer). Vitamin D and Calcium combination therapy was compared to placebo.

**Results:** Analysis of RCT data revealed that calcium plus vitamin D supplementation produced a statistically significant reduction in risk of total fractures (0.85; CI:0.73-0.98) and in hip fractures (0.70; CI:0.56-0.87). Subgroup analysis was significant for community dwelling or institutionalized patients.

**Conclusions:** Systematic analysis suggests that Vitamin D and Calcium therapy significantly decreases fracture risk. This study did not specifically look at individuals with osteoporosis. However, it still supports that Vitamin D and Calcium should continue to be used as preventative treatment for individuals at increased risk of fractures.

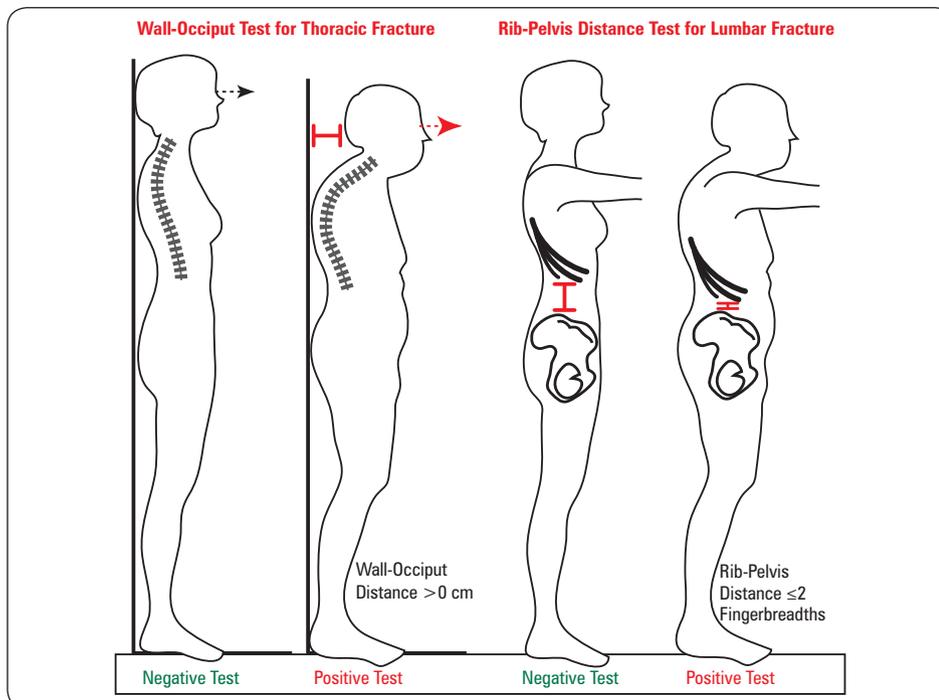

#### Clinical Signs of Fractures or Osteoporosis

- Height loss  $> 3$  cm (Sn 92%)
- Weight  $< 51$  kg
- Kyphosis (Sp 92%)
- Tooth count  $< 20$  (Sp 92%)
- Grip strength
- Armspan-height difference  $> 5$  cm (Sp 76%)
- Wall-occpit distance  $> 0$  cm (Sp 87%)
- Rib-pelvis distance  $\leq 2$  finger breadth (Sn 88%)

## Treatment of Osteoporosis

**Table 33. Treatment of Osteoporosis in Women and Men**

Treatment for Both Men and Women	
<b>Lifestyle</b>	Diet: Elemental calcium 1000-1200 mg/d; Vit D 1000 IU/d Exercise: 3x30 min weight-bearing exercises/wk Cessation of smoking, reduce caffeine intake Stop/avoid osteoporosis-inducing medications
Drug Therapy	
<b>Bisphosphonate:</b> inhibitors of osteoclast binding	1st line in prevention of hip, nonvertebral, and vertebral # (Grade A): alendronate, risedronate, zoledronic acid 2nd line (Grade B): etidronate
<b>RANKL Inhibitors</b>	Denosumab: 1st line in prevention of hip, nonvertebral, vertebral # (Grade A)
<b>Parathyroid Hormone</b>	YES fragility #: 18-24 mo duration
<b>Calcitonin (2nd line)</b> osteoclast receptor binding	YES fragility #: Calcitonin 200 IU nasally OD with Calcitriol 0.25 µg bid
Treatment Specific to Post-Menopausal Women	
<b>SERM (selective estrogen-receptor modulator):</b> agonistic effect on bone but antagonistic effect on uterus and breast	Raloxifene: 1st line in prevention of vertebral # (Grade A) +ve: prevents osteoporotic # (Grade A to B evidence), improves lipid profile, decreased breast ca risk -ve: increased risk of DVT/PE, stroke mortality, hot flashes, leg cramps
<b>HRT:</b> combined estrogen + progesterone (see <a href="#">Gynecology, GY34</a> )	1st line in prevention of hip, nonvertebral, and vertebral # (Grade A) For most women, risks > benefits Combined estrogen/progestin prevents hip, vertebral, total # Increased risks of breast cancer, cardiovascular events, and DVT/PE

**Figure 18. Physical examination test**

## Osteomalacia and Rickets

- **rickets:** osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue prior to epiphyseal closure (in childhood)
- **osteomalacia:** osteopenia with disordered calcification leading to a higher proportion of osteoid (unmineralized) tissue after epiphyseal closure (in adulthood)

### Etiology and Pathophysiology

#### Vitamin D Deficiency

- deficient uptake or absorption
  - nutritional deficiency
  - malabsorption: post-gastrectomy, small bowel disease (e.g. Celiac sprue), pancreatic insufficiency

#### Alendronate for the Primary and Secondary Prevention of Osteoporotic Fractures in Postmenopausal Women

*Cochrane DB Syst Rev* 2008;1:CD001155

#### Etidronate for the Primary and Secondary Prevention of Osteoporotic Fractures in Postmenopausal Women

*Cochrane Database Syst Rev* 2008;(1):CD003376

#### Risedronate for the Primary and Secondary Prevention of Osteoporotic Fractures in Postmenopausal Women

*Cochrane Database Syst Rev* 2008;(1):CD004523

**Purpose:** To assess the efficacy of three bisphosphonates in the primary and secondary prevention of osteoporotic fractures in postmenopausal women.

**Study Selection:** Women receiving at least one yr of bisphosphonates for postmenopausal osteoporosis were compared to those receiving placebo or concurrent calcium/vitamin D or both. The outcome was fracture incidence.

**Results:** Levels of evidence: <http://www.cochranemsk.org/review/writing/> %RRR and %ARR for 5 yr fracture incidence reduction.

#### Alendronate (10 mg/d)

1° Prevention – Vertebral 45% RRR, 2% ARR (Gold)

1° Prevention – Hip Not significant

1° Prevention – Wrist Not significant

2° Prevention – Vertebral 45% RRR, 6% ARR (Gold)

2° Prevention – Hip 53% RRR, 1% ARR (Gold)

2° Prevention – Wrist 50% RRR, 2% ARR (Gold)

#### Etidronate (400 mg/d)

1° Prevention – Vertebral Not significant

1° Prevention – Hip Not significant

1° Prevention – Wrist Not significant

2° Prevention – Vertebral 47% RRR, 5% ARR (Silver)

2° Prevention – Hip No benefit

2° Prevention – Wrist No benefit

#### Risedronate (5 mg/d)

1° Prevention – Vertebral Not significant

1° Prevention – Hip Not significant

1° Prevention – Wrist Not significant

2° Prevention – Vertebral 39% RRR, 5% ARR (Gold)

2° Prevention – Hip 26% RRR, 1% ARR (Silver)

2° Prevention – Wrist Not significant

Before prescribing Calcitonin, remember to ask about fish allergies

#### Factors Necessary for Mineralization

- Quantitatively and qualitatively normal osteoid formation
- Normal concentration of calcium and phosphate in ECF
- Adequate bioactivity of ALP
- Normal pH at site of calcification
- Absence of inhibitors of calcification

- defective 25-hydroxylation
  - liver disease
  - anticonvulsant therapy (phenytoin, carbamazepine, phenobarbital)
- loss of vitamin D binding protein
  - nephrotic syndrome
- defective 1- $\alpha$ -25 hydroxylation
  - hypoparathyroidism
- renal failure
- pathophysiology: leads to secondary hyperparathyroidism and hypophosphatemia

### Mineralization Defect

- abnormal matrix
  - osteogenesis imperfecta
  - fibrogenesis imperfecta
  - axial osteomalacia
- enzyme deficiency
  - hypophosphatasia (inadequate ALP bioactivity)
- presence of calcification inhibitors
  - bisphosphonates, aluminum, high dose fluoride, anticonvulsants

**Table 34. Clinical Presentations of Rickets and Osteomalacia**

Rickets	Osteomalacia
Skeletal pain and deformities, bow legged	Not as dramatic
Fracture susceptibility	Diffuse skeletal pain
Weakness and hypotonia	Bone tenderness
Disturbed growth	Fractures
Ricketic rosary (prominent costochondral junctions)	Gait disturbances (waddling)
Harrison's groove (indentation of lower ribs)	Proximal muscle weakness
Hypocalcemia	Hypotonia

### Investigations

**Table 35. Laboratory Findings in Osteomalacia and Rickets**

Disorder	Serum Phosphate	Serum Calcium	Serum ALP	Other Features
Vitamin D deficiency	Decreased	Decreased to normal	Increased	Decreased calcitriol
Hypophosphatemia	Decreased	Normal	Decreased to normal	
Proximal RTA	Decreased	Normal	Normal	Associated with hyperchloremic metabolic acidosis
Conditions associated with abnormal matrix formation	Normal	Normal	Normal	

- radiologic findings
  - pseudofractures, fissures, narrow radiolucent lines – thought to be healed stress fractures or the result of erosion by arterial pulsation
  - loss of distinctness of vertebral body trabeculae; concavity of the vertebral bodies
  - changes due to secondary hyperparathyroidism: subperiosteal resorption of the phalanges, bone cysts, resorption of the distal ends of long bones
  - others: bowing of tibia, coxa profundus hip deformity
- bone biopsy: usually not necessary but considered the gold standard for diagnosis

### Treatment

- definitive treatment depends on the underlying cause
- vitamin D supplementation
- $\text{PO}_4^{3-}$  supplements if low serum  $\text{PO}_4^{3-}$ ,  $\text{Ca}^{2+}$  supplements for isolated calcium deficiency
- bicarbonate if chronic metabolic acidosis

## Renal Osteodystrophy

- changes to mineral metabolism and bone structure secondary to chronic kidney disease
- represents a mixture of four types of bone disease:
  - osteomalacia: low bone turnover combined with increased unmineralized bone (osteoid)
  - adynamic bone disease: low bone turnover due to excessive suppression of parathyroid gland
  - osteitis fibrosa cystica: increased bone turnover due to secondary hyperparathyroidism
  - mixed uremic osteodystrophy: both high and low bone turnover, characterized by marrow fibrosis and increased osteoid
- metastatic calcification secondary to hyperphosphatemia may occur

### Pathophysiology

- metabolic bone disease secondary to chronic renal failure
- combination of hyperphosphatemia (inhibits 1,25(OH) $_2$ -Vit D synthesis) and loss of renal mass (reduced 1- $\alpha$ -hydroxylase)

**KDIGO 2012 Clinical Practice Guideline for the Evaluation and Management of Chronic Kidney Disease**  
*Kidney Inter Suppl* 2013;3:1-150

#### Recommendations for Metabolic Bone Disease in CKD

##### Screening

- Regular bone mineral density screening of patients with eGFR < 45 is not recommended
- No consensus regarding optimal intervals for screening  $\text{PO}_4^{3-}$  and  $\text{Ca}^{2+}$  levels
- Screening Vitamin D and PTH is not recommended

##### Management

- Best fracture prevention strategy is fall risk assessment and fall prevention measures (see [Geriatric Medicine, GM5](#))
- No clear evidence that manipulation of  $\text{Ca}^{2+}$ , Vitamin D,  $\text{PO}_4^{3-}$ , or PTH results in improved outcomes

### Clinical Features

- soft tissue calcifications, necrotic skin lesions if vessels involved
- osteodystrophy, generalized bone pain and fractures
- pruritus
- neuromuscular irritability and tetany may occur
- radiologic features of osteitis fibrosa cystica, osteomalacia, osteosclerosis, osteoporosis

### Investigations

- serum  $\text{Ca}^{2+}$  corrected for albumin,  $\text{PO}_4^{3-}$ , PTH, ALP,  $\pm$  imaging (x-ray, BMD),  $\pm$  bone biopsy

### Treatment

- prevention
- maintenance of normal serum  $\text{Ca}^{2+}$  and  $\text{PO}_4^{3-}$  by restricting  $\text{PO}_4^{3-}$  intake to 1 g OD
- $\text{Ca}^{2+}$  supplements;  $\text{PO}_4^{3-}$  binding agents (calcium carbonate, aluminum hydroxide)
- vitamin D with close monitoring to avoid hypercalcemia and metastatic calcification

## Paget's Disease of Bone

### Definition

- a metabolic disease characterized by excessive bone destruction and repair

### Epidemiology

- a common disease: 5% of the population, 10% of population >80 yr old
- consider Paget's disease of bone in older adults with  $\uparrow$  ALP but normal GGT

### Etiology and Pathophysiology

- postulated to be related to a slowly progressing viral infection of osteoclasts, possibly paramyxovirus
- strong familial incidence
- initiated by increased osteoclastic activity leading to increased bone resorption; osteoblastic activity increases in response to produce new bone that is structurally abnormal and fragile

### Differential Diagnosis

- primary bone lesions
  - osteogenic sarcoma
  - multiple myeloma
  - fibrous dysplasia
- secondary bone lesions
  - osteitis fibrosa cystica
  - metastases

### Clinical Features

- usually asymptomatic (routine x-ray finding or elevated ALP)
- severe bone pain (e.g. pelvis, femur, tibia) is often the presenting complaint
- skeletal deformities: bowed tibias, kyphosis, frequent fractures
- skull involvement: headaches, increased hat size, deafness
- increased warmth over involved bones due to increased vascularity
- high output CHF
- hypercalcemia with immobilization
- osteosarcoma

### Investigations

- laboratory
  - $\uparrow\uparrow$  serum ALP (unless burnt out),  $\text{Ca}^{2+}$  normal or  $\uparrow$ ,  $\text{PO}_4^{3-}$  normal
  - urinary hydroxyproline  $\uparrow$  (indicates resorption)
- imaging
  - bone scan to evaluate the extent of disease
  - confirmation on x-ray required to establish the diagnosis
  - skeletal survey: involved bones are denser and expanded with cortical thickening
    - ◆ initial lesion may be destructive and radiolucent
    - ◆ multiple fissure fractures in long bones

### Complications

- local
  - fractures; osteoarthritis
  - cranial nerve compression and palsies (e.g. deafness), spinal cord compression
  - osteosarcoma/sarcomatous change in 1-3%
    - ◆ indicated by marked bone pain, new lytic lesions and suddenly increased ALP
- systemic
  - hypercalcemia and nephrolithiasis
  - high output CHF due to increased vascularity

#### Bones Most Often Affected in Paget's Disease (in decreasing order)

- Pelvis
- Femur
- Skull
- Tibia
- Vertebrae
- Clavicle
- Humerus

#### Comparison of a Single Infusion of Zoledronic Acid with Risedronate for Paget's Disease

*NEJM* 2005;353:898-908

**Study:** Two identical, randomized, double-blind, actively controlled trials (combined for analysis).  
**Patients:** 357 men and women who were older than 30 yr of age and had radiologically confirmed Paget's disease. All but 4 patients had alkaline phosphatase levels that were more than twice the upper limit of normal.

**Intervention:** One 15-min infusion of 5 mg of zoledronic acid compared with 60 d of oral risedronate (30 mg/d) with follow up at 6 mo.  
**Primary Outcome:** Rate of therapeutic response at 6 mo, defined as a normalization of alkaline phosphatase levels or a reduction of at least 75% in the total alkaline phosphatase excess.

**Results:** At 6 mo, 96% of patients receiving zoledronic acid had a therapeutic response (169 of 176), as compared with 74.3% of patients receiving risedronate (127 of 171,  $p < 0.001$ ). Alkaline phosphatase levels normalized in 88.6% of patients in the zoledronic acid group and 57.9% of patients in the risedronate group ( $p < 0.001$ ). Zoledronic acid was associated with a shorter median time to a first therapeutic response (64 vs. 89 d,  $p < 0.001$ ). Quality of life increased significantly from baseline at both 3 and 6 mo in the zoledronic acid group and differed significantly from those in the risedronate group at 3 mo. Pain scores improved in both groups. During post-trial follow-up (median, 190 d), 21 of 82 patients in the risedronate group had a loss of therapeutic response, as compared with 1 of 113 patients in the zoledronic acid group ( $p < 0.001$ ).

**Conclusions:** A single infusion of zoledronic acid produces more rapid, more complete, and more sustained responses in Paget's disease than does daily treatment with risedronate.

**Treatment**

- symptomatic therapy (pain management)
- weight-bearing exercise
- adequate calcium and vitamin D intake to prevent development of secondary hyperparathyroidism
- treat medically if ALP >3x normal
  - bisphosphonates, e.g. alendronate 40 mg PO OD x 6 mo OR risedronate 30 mg PO OD x 3 mo OR zoledronic acid 5 mg IV per yr
  - calcitonin 50-100 U/d SC
- surgery for fractures, deformity, degenerative changes

# Male Reproductive Endocrinology

## Androgen Regulation

- negative feedback may occur by androgens directly or after conversion to estrogen
- testosterone (from Leydig cells) primarily involved in negative feedback on LH and GnRH, whereas inhibin (from Sertoli cells) suppresses FSH secretion

## Tests of Testicular Function

- testicular size (lower limit = 4 cm x 2.5 cm)
- LH, FSH, total, bioavailable, and/or free testosterone
- human chorionic gonadotropin (hCG) stimulation test
  - assesses ability of Leydig cell to respond to gonadotropin
- semen analysis
  - semen volume, sperm concentration, morphology, and motility are the most commonly used parameters
- testicular biopsy
  - indicated with normal FSH and azoospermia/oligospermia

## Hypogonadism and Infertility

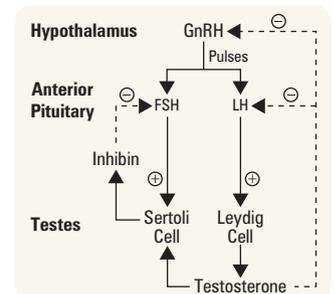

- see [Urology, U34](#)
- deficiency in gametogenesis or testosterone production

**Etiology**

- causes include primary (testicular failure), secondary (hypothalamic-pituitary failure), and idiopathic
- primary hypogonadism is more common than secondary

**Table 36. Classification and Features of Hypogonadism**

	<b>Hypergonadotropic Hypogonadism (Primary Hypogonadism)</b>	<b>Hypogonadotropic Hypogonadism (Secondary Hypogonadism)</b>
<b>Definition</b>	Primary testicular failure ↑ LH and FSH, ↑ FSH:LH ratio ↓ testosterone and sperm count	Hypothalamic-pituitary axis failure ↓ LH + FSH (LH sometimes inappropriately normal) ↓ testosterone and sperm count
<b>Etiology</b>	Congenital Chromosomal defects (Klinefelter’s, Noonan) Cryptorchidism Disorders of sexual development (DSD) Bilateral anorchia (vanishing testicle syndrome) Myotonic dystrophy Mutation of FSH or LH receptor gene Disorders of androgen synthesis Germ cell defects Sertoli cell only syndrome Leydig cell aplasia/failure Infection/Inflammation Orchitis – TB, lymphoma, mumps, leprosy Genital tract infection Physical factors Trauma, heat, irradiation, testicular torsion, varicocele Drugs Marijuana, alcohol, chemotherapy, ketoconazole, glucocorticoid, spironolactone	Congenital Kallman’s syndrome Prader-Willi syndrome Abnormal subunit of LH or FSH Infection Tuberculosis, meningitis Endocrine Adrenal androgen excess Cushing’s syndrome Hypo or hyperthyroidism Hypothalamic-pituitary disease (tumour, hyperprolactinemia, hypopituitarism) Drugs Alcohol, marijuana, spironolactone, ketoconazole, GnRH agonists, androgen/estrogen/progestin use, chronic narcotic use Chronic illness Cirrhosis, chronic renal failure, AIDS Sarcoidosis, Langerhan’s cell histiocytosis hemochromatosis Critical illness Surgery, MI, head trauma Obesity Idiopathic
<b>Diagnosis</b>	<b>Testicular size and consistency (soft/firm)</b> Sperm count LH, FSH, total, and/or bioavailable testosterone hCG stimulation (mainly used in pediatrics) Karyotype	<b>Testicular size and consistency (soft/firm)</b> Sperm count LH, FSH, total, and/or bioavailable testosterone Prolactin levels MRI of hypothalamic-pituitary region

**Figure 19. Hypothalamo-pituitary-gonadal axis**

**Two Distinct Features of Primary Hypogonadism**

- The decrease in sperm count is affected to a greater extent than the decrease in serum testosterone level
- Likely to be associated with gynecomastia

**Two Features of Secondary Hypogonadism**

- Associated with an equivalent decrease in sperm count and serum testosterone
- Less likely to be associated with gynecomastia

## Treatment

- testosterone replacement (improve libido, muscle mass, strength, body hair growth, bone mass)
  - IM injection, transdermal testosterone patch/gel, oral
  - side effects: acne, fluid retention, erythrocytosis, sleep apnea, benign prostatic hypertrophy, uncertain effects on cardiac events/mortality in older men
  - contraindicated if history of metastatic prostate cancer, breast cancer, severe LUTS associated with BPH, uncontrolled or poorly controlled CHF, PSA>4, hematocrit >50%
- GnRH agonist to restore fertility, if hypothalamic dysfunction with intact pituitary
  - administered SC in pulsatile fashion using an external pump
- hCG ± recombinant follicular stimulating hormone (rFSH) can be used to restore fertility in cases of either hypothalamic or pituitary lesions
- testicular sperm extraction (TESE) or microscopic sperm extraction (MICROTESE) – only if testicular tissues are not functioning

## Other Causes of Male Infertility

- hereditary disorders: Kartagener syndrome (primary ciliary dyskinesia), cystic fibrosis
- anatomy: hypospadias, retrograde ejaculation
- obstruction: vasal occlusion, vasal aplasia, vasectomy, seminal vesicle disease
- sexual dysfunction: erectile dysfunction, premature ejaculation, infrequent coitus
- surgery: TURP, radical prostatectomy, orchiectomy

## DEFECTS IN ANDROGEN ACTION

### Etiology

- complete androgen insensitivity (CAIS)
- partial androgen insensitivity (PAIS)
- 5- $\alpha$ -reductase deficiency
- mixed gonadal dysgenesis
- defects in testosterone synthesis
- infertile male syndrome
- undervirilized fertile male syndrome

### Clinical Features

- depends on age of onset

**Table 37. Effects of Testosterone Deficiency**

<b>First Trimester <i>in utero</i></b>	Incomplete virilization of external genitalia (ambiguous genitalia) Incomplete development of Wolffian ducts to form male internal genitalia (male pseudohermaphroditism)
<b>Third Trimester <i>in utero</i></b>	Micropenis Cryptorchidism (failure of normal testicular descent)
<b>Prepuberty</b>	Incomplete pubertal maturation (high pitch voice, sparse pubic + axillary hair, absence of facial hair) Eunuchoidal body habitus (greater growth of extremity long bones relative to axial bones) Poor muscle development, reduced peak bone mass
<b>Postpuberty</b>	Decrease in energy, mood, and libido Fine wrinkles in corners of mouth and eyes Decrease in pubic/axillary hair, hematocrit, muscle mass, strength, and BMD

Adapted from: UpToDate, 2010; Cecil's Essentials of Medicine

## Treatment

- appropriate gender assignment in the newborn
- hormone replacement or supplementation
- psychological support
- gonadectomy for cryptorchidism (due to increased risk for testicular cancer)
- reduction mammoplasty for gynecomastia

### Approach to Male Infertility

Infertility: failure of a couple to conceive after 12 mo of regular intercourse without use of contraception in women <35 yr of age; after 6 mo of regular intercourse without use of contraception in women  $\geq$ 35 yr

#### History

- Partner status re: infertility
- Length of time for attempt to conceive
- Prior successes with other partners
- Ejaculation problems
- Frequency of intercourse
- Prev Surg, Med Hx, STI Hx
- Hx orchitis? Cryptorchidism?
- Hx toxic exposure?
- Medications
- Alcohol and illicit drug use
- Heat exposure: bath, sauna, whirlpool
- Smoking

#### P/E

- General (height, weight, gynecomastia, masculine)
- Testicular size and consistency
- Varicocele?
- Pituitary disease?
- Thyroid disease?

#### Investigations

- Should be considered for couples unable to conceive after 12 mo of unprotected and frequent intercourse. Consider earlier evaluation if suggestive medical Hx and physical, and in women  $\geq$ 35 yr of age
- Semen analysis x 2 (sperm count, morphology, motility)
- Scrotal/testicular U/S (look for varicocele)
- Blood work: LH, FSH, testosterone, prolactin, thyroid function tests, DNA fragmentation of sperm, karyotype, Y chromosome deletion
- Test female partner (see **Gynecology, GY23**)

#### Treatment

- No specific therapy for majority of cases
- Treat specific causes
- Consider: intrauterine insemination, IVF, therapeutic donor insemination, testicular aspiration of sperm, adoption

## Erectile Dysfunction

- see **Urology, U30**

## Gynecomastia

### Definition

- true gynecomastia refers to benign proliferation of the glandular component of the male breast, resulting in the formation of a concentric, rubbery, firm mass extending from the nipple(s)
- pseudogynecomastia or lipomastia refers to enlargement of soft adipose tissue, especially seen in obese individuals

### Etiology

#### Physiologic

- puberty
- elderly (involutional)
- neonatal (maternal hormone)

#### Pathologic

- endocrinopathies: primary or secondary hypogonadism, hyperthyroidism, extreme hyperprolactinemia, adrenal disease
- tumours: pituitary, adrenal, testicular, breast, ectopic production of hCG
- chronic diseases: cirrhosis, renal, malnutrition (with refeeding)
- drugs: estrogens and estrogen agonists, spironolactone, ketoconazole, cimetidine, digoxin, chemotherapy, marijuana, alcohol
- congenital/genetic: Klinefelter's syndrome, androgen insensitivity
- other: idiopathic (majority of gynecomastia is classified as idiopathic), familial

#### Pathophysiology

- hormonal imbalance due to increased estrogen activity (increased production, or increased availability of estrogen precursors for peripheral conversion to estrogen) or decreased androgen activity (decreased androgen production, binding of androgen to sex hormone binding globulin (SHBG), or androgen receptor blockage)

### History

- recent change in breast characteristics
- trauma to testicles
- mumps
- alcohol and/or drug use
- FHx
- sexual dysfunction

### Physical Exam

- signs of feminization
- breast
  - rule out red flags suggesting breast cancer: unilateral, eccentric, hard or fixed mass, skin dimpling or retraction, and nipple discharge or crusting
  - gynecomastia occurs concentrically around nipple, is not fixed to underlying tissue
- genito-urinary exam
- stigmata of liver or thyroid disease

### Investigations

- laboratory: serum TSH, PRL, LH, FSH, testosterone, estradiol, LFTs, creatinine, hCG (if hCG is elevated need to locate the primary tumour)
- CXR and CT of chest/abdomen/pelvis (to locate neoplasm)
- testicular U/S to rule out testicular mass
- MRI of hypothalamic-pituitary region if pituitary adenoma suspected

### Treatment

- initial observation for most men with gynecomastia
- medical
  - correct the underlying disorder, discontinue responsible drug
  - androgens for hypogonadism
  - anti-estrogens: tamoxifen has most evidence for benefit
  - aromatase inhibitors: less evidence of benefit as compared to anti-estrogens
- surgical
  - usually required for macromastia, gynecomastia present for >1 yr (fibrosis is unresponsive to medication), or failed medical treatment and for cosmetic purposes

#### Pubertal Gynecomastia

- This benign condition peaks between 13-14 years of age and spontaneously regresses in 90% of cases within 2yr
- Waiting is often the best approach

#### Causes of Gynecomastia

##### DOC TECH

**D**rugs  
**O**ther  
**C**ongenital  
**T**umour  
**E**ndocrine  
**C**hronic disease

#### Occurrence of Gynecomastia

3 Peaks	% Affected
Infancy	60-90
Puberty	4-69
Ages 50-80	24-65

## Female Reproductive Endocrinology

- see [Gynecology, GY23](#)

## Paraneoplastic Syndrome

- clinical syndromes involving non-metastatic systemic effects that accompany malignant disease
- triggered by antibodies against neoplasm cross-reacting with normal tissue or by production of a physiologically active substance by the neoplasm
- commonly present with cancers of lung, breast, ovaries, or lymphatic system

**Table 38. Clinical Presentation**

Syndrome Class	Symptoms/Syndrome	Associated Malignancies	Mechanism
<b>Endocrine</b>	Cushing's syndrome	Small-cell lung cancer Pancreatic carcinoma Neural tumours Thymoma	Ectopic ACTH and ACTH-like substance secretion
	SIADH	Small-cell lung cancer CNS malignancies	Antidiuretic hormone secretion
	Hypercalcemia	Lung cancer Breast carcinoma Renal cell carcinoma Multiple myeloma Ovarian carcinoma	PTH-related protein, TGF- $\alpha$ , TNF secretion
	Hypoglycemia	Hepatocellular carcinoma Fibrosarcoma	Insulin or insulin-like substance secretion
	Carcinoid	Pancreatic carcinoma Gastric carcinoma	Serotonin, bradykinin secretion
<b>Neurologic</b>	Lambert-Eaton myasthenic syndrome (LEMS) Muscle weakness in limbs	Small-cell lung cancer	Ab interferes with ACh release
	Myasthenia gravis Fluctuating muscle weakness and fatigability	Thymoma	Ab interferes with ACh release
	Paraneoplastic limbic encephalitis Depression, seizures, short-term memory loss	Small-cell lung cancer	Unknown
<b>Renal</b>	Hypokalemic nephropathy	Small-cell lung cancer	Ectopic ACTH and ACTH-like substance secretion
	Nephrotic syndrome	Lymphoma Melanomas	Immunocomplex sedimentation in nephrons
<b>GI</b>	Watery diarrhea	Medullary thyroid carcinomas	Prostaglandin secretion
<b>Hematologic</b>	Erythrocytosis	Renal cell carcinoma Hepatocellular carcinoma	EPO production
<b>Rheumatologic</b>	SLE	Lymphomas Lung cancer Breast carcinoma Gonadal carcinoma	Anti-nuclear Ab production
	Scleroderma	Breast carcinoma Lung cancer Uterine cancer	Anti-nuclear Ab production

### Investigations

- CBC, electrolytes, creatinine, LFTs, ALP, ESR, CRP, serum/urine electrophoresis
- serum autoantibodies, lumbar puncture
- imaging: skeletal survey, CT, MRI, PET scan
- $\pm$  endoscopy

### Treatment

- treat underlying tumour: surgery, radiation, chemotherapy
- treat immune-mediated disorder: IVIg, steroids, immunosuppressive drugs, plasmapheresis (reserved for patients with identifiable antibodies in serum)

## Common Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects	Comments	
Biguanide	Sensitizes peripheral tissues to insulin → increases glucose uptake Decreases hepatic glucose production by stimulation of hepatic AMP-activated protein kinase (AMPK)	metformin	Glucophage® Glumetza®		500 mg OD titrated to 2000 mg/d maximum	Useful in obese type 2 DM Improves both fasting and postprandial hyperglycemia Also ↓ TG	ABSOLUTE: Moderate to severe liver dysfunction Moderate renal dysfunction GFR <30 mL/min Cardiac dysfunction	GI upset (abdo discomfort, bloating, diarrhea) Lactic acidosis Anorexia	↓ HbA1c 1.0-1.5%  Weight neutral	
Insulin Secretagogue	Stimulates insulin release from β cells by causing K <sup>+</sup> channel closure → depolarization → Ca <sup>2+</sup> mediated insulin release Use in nonobese type 2 DM	sulfonylureas: glyburide	Diabeta® Euglucon®	Micronase® Glynase PreTab®	2.5-5.0 mg/d titrated to >5 mg bid Max: 20 mg/d		ABSOLUTE: Moderate to severe liver dysfunction RELATIVE (glyburide and glimepiride): Adjust dose in mild to moderate kidney dysfunction and avoid in severe kidney dysfunction Avoid glyburide in the elderly INTERACTIONS: Do not combine with a non-sulfonylurea insulin secretagogue or preprandial insulin	Hypoglycemia Weight gain	↓ HbA1c 0.8%  Gliclazide lowest incidence of hypoglycemia	
		gliclazide	Diamicon® Diamicon® MR		40-160 mg bid 30-120 mg OD					
		glimepiride	Amaryl®		1-8 mg OD					
		non-sulfonylureas: repaglinide	GlucosNorm®		0.5-4 mg tid	Short t <sub>1/2</sub> of 1 h causes brief but rapid ↑ in insulin, therefore effective for post-prandial control	ABSOLUTE: Severe liver dysfunction INTERACTIONS: Do not combine with a non-sulfonylurea or pre- prandial insulin	Hypoglycemia Weight gain	↓ HbA1c 0.7% for repaglinide and 0.5-1.0% for nateglinide	
		nateglinide	Starlix®		60-120 mg tid					
Insulin Sensitizers (thiazolidinedione)	Sensitizes peripheral tissues to insulin → increases glucose uptake Decreases FFA release from adipose Binds to nuclear receptor PPAR-γ	rosiglitazone	Avandia®		2-8 mg OD	Rosiglitazone – indicated only in patients with type 2 DM for whom all other oral antidiabetic agents, in monotherapy or in combination, do not result in adequate glycemic control or are inappropriate due to contraindications or intolerance	ABSOLUTE: NYHA > class II CHF INTERACTIONS: Do not combine with insulin	Peripheral edema CHF Anemia Fluid retention and CHF Increased risk of cardiac events with rosiglitazone (requires written informed consent when prescribing) Increased risk of bladder cancer with pioglitazone Fractures	↓ HbA1c 0.8%	
		pioglitazone	Actos®		15-45 mg OD					
α-Glucosidase Inhibitor	↓ carbohydrate GI absorption by inhibiting brush border α-glucosidase	acarbose	Glucobay®		25 mg OD titrated to 100 mg tid	↓ postprandial hyperglycemia	ABSOLUTE: Inflammatory bowel disease Severe liver dysfunction	Flatulence Abdominal cramps Diarrhea	↓ HbA1c 0.6% Not recommended as initial therapy in patients with A1c > 8.5%	
Dipeptidyl Peptidase-IV (DPP-IV) Inhibitor	Inhibits degradation of endogenous antihyperglycemic incretin hormones Incretin hormones stimulate insulin secretion, inhibit glucagon release, and delay gastric emptying	sitagliptin	Januvia®		100 mg OD		ABSOLUTE (sitagliptin): Type 1 DM DKA	Nasopharyngitis URTI	↓ HbA1c 0.7%	
		saxagliptin	Onglyza™		2.5-5 mg OD			Headache Pancreatitis	Weight neutral	
		linagliptin	Trajenta®		5 mg OD		RELATIVE (sitagliptin and saxagliptin): Use with dose reduction in kidney dysfunction	Stevens Johnson syndrome		

## Diabetes Medications (continued)

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects	Comments
Glucagon-Like Peptide (GLP)-1 Analogue	Binds to GLP-1 receptor to promote insulin release Insulinotropic effect suppressed as plasma glucose <4 mmol/L Slows gastric emptying, suppresses inappropriately elevated glucagon levels Causes $\beta$ -cell regeneration and differentiation <i>in vitro</i>	Exenatide		Byetta®	5-10 $\mu$ g SC bid 1 h before meals		ABSOLUTE: Type 1 DM DKA Acute pancreatitis Hx	N/V, diarrhea Dizziness, headache Muscle weakness Anti-exentide antibodies Pancreatitis	↓ HbA1c 1.0%
		Liraglutide		Victoza®	0.6-1.8 mg OD SC		RELATIVE: Gastroparesis ESRD Personal or family history of medullary thyroid cancer (MTC)		
Sodium- glucose linked transporter 2 (SGLT2) Inhibitor	Enhances urinary glucose excretion by inhibiting glucose reabsorption in the proximal renal tubule	Canagliflozin	Invokana®		100 mg OD before first meal of the day		ABSOLUTE: Severe renal impairment ESRD	UTI, genital infections Hypotension caution with concomitant loop diuretic use Caution with renal dysfunction Hyperlipidemia (raises LDL and HDL) Dapagliflozin not to be used in patients with active or history of bladder cancer Rare diabetic ketoacidosis (may occur with no hyperglycemia)	↓ HbA1c 0.7-1.0%
		Dapagliflozin	Forxiga®		5 mg OD in the morning with or without food		Patients on dialysis		Negligible risk of hypoglycemia as monotherapy
		Empagliflozin	Jardiance®		10 mg OD in the morning with or without food				Cause weight loss

For insulin formulations see Table 9, E9

## Dyslipidemia Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
HMG-CoA Reductase Inhibitor (statins)	Inhibits cholesterol biosynthesis, ↓ LDL synthesis, ↑ LDL clearance, modest ↑ HDL, limited ↓ VLDL	atorvastatin	Lipitor®		10-80 mg/d	1st line monotherapy Used for ↑ LDL, ↑ TG	Active liver disease Persistent ↑ in AST, ALT unexplained	GI symptoms Rash, pruritus ↑ liver enzymes Myositis (↑ risk if combined with fibrates) Rhabdomyolysis
		fluvastatin	Lescol®		20-80 mg/d			
		lovastatin	Mevacor®		20-80 mg/d			
		pravastatin	Pravachol®		10-40 mg/d			
		rosuvastatin	Crestor®		5-40 mg/d			
		simvastatin	Zocor®		10-80 mg/d			
Fibrates	Upregulate lipoprotein lipase + apo A1, ↓ VLDL, ↓ TG, modest ↓ LDL, modest ↑ HDL	bezafibrate fenofibrate gemfibrozil	Bezalip® Lipidil® Lopid®		400 mg/d 48-200 mg/d 600-1200 mg/d	Used for ↑ TG, hyperchylomicronemia	Hepatic disease Renal disease	GI upset Skin rashes ↑ risk of gallstone formation ↑ risk of rhabdomyolysis when combined with statins
Niacin	Inhibits secretion of hepatic VLDL via lipoprotein lipase (LPL) pathway → decreased VLDL and LDL; decreased clearance of HDL	nicotinic acid	Niaspan® generic niacin	Niacor®	0.5-2 g/d 1-3 g/d	Used for ↑ LDL, ↑ VLDL	Hypersensitivity Hepatic dysfunction Active PUD Hyperuricemia	Generalized flushing Abnormal liver enzymes Pruritus IGT Watch glucose control with overt DM
Bile Acid Sequestrants	Resins that bind bile acids in intestinal lumen and prevent absorption thereby ↓ LDL	cholestyramine	Questran®		2-24 g/d	Used for ↑ LDL Use as adjunct with statins or fibrates	Complete biliary obstruction Pregnancy, lactation TG >3.5 mmol/L GI motility disorder	Constipation Nausea Flatulence Bloating Rise in TG
		colestipol	Colestid®		5-30 g/d			
Cholesterol Absorption Inhibitors	Inhibits cholesterol absorption at the small intestine brush border	ezetimibe	Ezetrol®	Zetia®	10 mg/d	Used for ↑ LDL, apo B	Hypersensitivity Hepatic dysfunction Do not combine with fibrates or bile acid resins	Fatigue Pharyngitis Sinusitis Abdominal pain Diarrhea Arthralgia

## Thyroid Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Antithyroid Agent (thionamides)	Decreases thyroid hormone production by inhibiting iodine and peroxidase from interacting with thyroglobulin to form T <sub>4</sub> and T <sub>3</sub> PTU also interferes with conversion of T <sub>4</sub> to T <sub>3</sub>	propylthiouracil (PTU)	Propyl-Thyracil®		Start 100 mg PO tid, then adjust accordingly Thyroid storm: start 200-300 PO qid, then adjust accordingly	Hyperthyroidism	Hypersensitivity Relative: renal failure, liver disease PTU recommended in 1st trimester, MMI during 2nd and 3rd trimester Lactation: safe with PTU <300 mg/day and MMI <20-30 mg/d	N/V Rash Drug-induced hepatitis Agranulocytosis Hepatitis with PTU Cholestasis with MMI
		methimazole (MMI)	Tapazole®		Start 5-20 mg PO OD, then adjust accordingly Up to 60 mg OD may be required			
Thyroid Hormone	Synthetic form of thyroxine (T <sub>4</sub> )	levothyroxine l-thyroxine	Synthroid® Eltroxin®	Levoxyl®	0.05-2.0 mg/d, usually 1.6x weight (kg) is dose in micrograms In elderly patients start at 0.025 mg/d	Hypothyroidism	Recent MI, thyrotoxicosis	If wrong dosing: symptoms of hypothyroidism or hyperthyroidism Skin rash from dye in pill
Antithyroid Agent Radiopharmaceutical	Radioactive isotope of iodine that is incorporated into the thyroid gland irradiating the area and destroying local glandular tissue	sodium iodide I-131	Iodotope®		Dose corrected for 24 h radioactive iodine uptake Hyperthyroidism 4-12 mCi Thyroid Ca 50-150 mCi	Hyperthyroidism Thyroid malignancy	Hypersensitivity Concurrent antithyroid medication Pregnancy, lactation	N/V Bone marrow suppression Sialadenitis Thyroiditis

## Metabolic Bone Disease Medications

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Bisphosphonates	Inhibits osteoclast-mediated bone resorption	alendronate	Fosamax®		Osteoporosis: 5-10 mg OD 70 mg once weekly Paget's: 40 mg OD for 6 mo	Prevention of postmenopausal osteoporosis Treatment of osteoporosis Glucocorticoid-induced osteoporosis Paget's disease	Esophageal stricture or achalasia (oral) Unable to stand or sit upright for >30 min (oral) Hypersensitivity Hypocalcemia Renal insufficiency	GI MSK pain Headache Osteonecrosis of the jaw
		risedronate	Actonel®		Osteoporosis: 5 mg OD 35 mg once weekly 150 mg once monthly Paget's: 30 mg OD for 2 mo	Treatment and prevention of postmenopausal osteoporosis Treatment and prevention of glucocorticoid-induced osteoporosis Paget's disease		
		etidronate	Didronel®		Paget's: 5-10 mg/kg OD x 6 mo	Symptomatic Paget's disease Prevention and treatment of heterotopic ossification after total hip replacement or spinal cord injury		
		ibandronate	Boniva®		2.5 mg OD or 150 mg once monthly	Treatment and prevention of postmenopausal osteoporosis (US only)		
		pamidronate	Aredia®		Hypercalcemia of malignancy 60-90 mg IV over 2-24 h Wait at least 7 d before considering retreatment	Hypercalcemia of malignancy Paget's disease Osteolytic bone metastases of breast cancer Osteolytic lesions of multiple myeloma		
		zoledronate	Zometa® Aclasta®		5 mg IV once yearly IV	Treatment of osteoporosis Hypercalcemia of malignancy Treatment and prevention of skeletal complications related to cancer		

## Metabolic Bone Disease Medications (continued)

Drug Class	Mechanism of Action	Generic Drug Name	Canada Name	US Name (if different)	Dosing	Indications	Contraindications	Side Effects
Selective Estrogen Receptor Modulators	Decreases resorption of bone through binding to estrogen receptors	raloxifene	Evista®		60 mg OD	Treatment and prevention of postmenopausal osteoporosis (2nd line)	Lactation Pregnancy Active or past history of DVT, PE, or retinal vein thrombosis	Hot flashes Leg cramps Increased risk of fatal stroke, venous thromboembolism
Calcitonin	Inhibits osteoclast-mediated bone resorption	calcitonin	Miacalcin®		One spray (200 IU) per d, alternating nostrils	Treatment of postmenopausal osteoporosis, greater than 5 yr postmenopause	Clinical allergy to salmon-calcitonin	Rhinitis Epistaxis Sinusitis Nasal dryness
Anti-RANKL Monoclonal Ab	Inhibits RANKL (osteoclast differentiating factor) → inhibits osteoclast formation and decreases bone resorption	denosumab	Prolia™	Xgeva™	60 mg SC q6mo	Treatment of postmenopausal women at high risk of fracture Prevent skeletal-related events in patients with bone metastasis from solid tumours	Hypocalcemia	Fatigue/headache Dermatitis/rash Hypophosphatemia/Hypocalcemia Hypercholesterolemia GI discomfort
PTH	Stimulates new bone formation by preferential stimulation of osteoblastic activity over osteoclastic activity	teriparatide	Forteo®		20 µg SC OD x 18-24 mo	Treatment of postmenopausal women with osteoporosis who are at high risk for fracture Treatment of men with primary or hypogonadal osteoporosis who are at high risk for fracture	Paget's disease Prior external beam or implant radiation therapy involving the skeleton Bone metastases Metabolic bone diseases other than osteoporosis	Orthostatic hypotension Hypercalcemia Dizziness Leg cramps
Calcium	Inhibits PTH secretion				1200 mg/d (including diet) Divided in 3 doses	Osteopenia Osteoporosis Prevention of metabolic bone disease	Caution with renal stones	Vomiting Constipation Dry mouth
Vitamin D	Regulation of calcium and phosphate homeostasis	cholecalciferol (vitamin D3)			800 -2000 IU/d	Osteopenia Osteoporosis Prevention of metabolic bone disease	Caution in patients on digoxin (risk of hypercalcemia which may precipitate arrhythmia)	Hypercalcemia Headache N/V Constipation
		ergocalciferol (vitamin D2)	Drisdol® Erdol®		50,000 IU/wk	Osteoporosis in patients with liver dysfunction, refractory rickets, hypoparathyroidism	Hypercalcemia Malabsorption syndrome Decreased renal function	
		calcitriol (1,25(OH) <sub>2</sub> -D)	Rocaltrol®		Start 0.25 µg/d Titrate up by 0.25 µg/d at 4-8 wk intervals to 0.5-1 µg/d	Hypocalcemia and osteodystrophy in patients with chronic renal failure on dialysis	Hypercalcemia Vitamin D toxicity	
					Start 0.25 µg/d Titrate up by 0.25 µg/d at 2-4 wk intervals to 0.5-2 µg/d	Hypoparathyroidism		
			Calcijex®					

## Adrenal Medications

Drug Class	Mineralocorticoid Activity	Generic Drug Name	Potency Relative to Cortisol	Equivalent Dose (mg)	Duration of Action (t <sub>1/2</sub> in h)	Dosing	Comments
Hydrocortisone	Yes	Cortef Solu-Cortef	1.0	20	8	<u>Adrenal Crisis:</u> 50-100 mg IV bolus, then 50-100 mg q8h (continuous infusion x 24-48 h) PO once stable (50 mg q8h x 48 h, then taper over 14 d) <u>Chronic AI:</u> 15-20 mg PO OD (2/3 AM, 1/3 PM)	In high doses, mineralocorticoid side effects may emerge (salt + water retention, ECF volume expansion, HTN, low K <sup>+</sup> metabolic alkalosis)
Cortisone Acetate	Yes	Cortisone Acetate	0.8	25	oral = 8 IM = 18+	<u>Adrenal Crisis:</u> 75-300 mg/d PO/IM divided q12-24h <u>Chronic AI:</u> 25 mg/d	Pro-drug which is converted to active form as hydrocortisone High doses can result in mineralocorticoid side effects (see above)
Prednisone	No	Prednisone	4	5	16-36	<u>Adrenal Crisis:</u> 15-60 mg/d PO qd or divided bid/qid <u>Chronic AI:</u> 5 mg daily	Pro-drug which is converted to active form as prednisolone
Dexamethasone	No	Dexamethasone	30	0.7	36-54	<u>Adrenal Crisis:</u> 4 mg IV; repeat q2-6h if necessary	Used for undiagnosed adrenal insufficiency (does not interfere with measurement of serum cortisol levels)

## Landmark Endocrinology Trials

Trial	Reference	Results
<b>DIABETES</b>		
ACCORD	<i>NEJM</i> 2008; 358:2560-72	Compared with standard therapy the use of intensive therapy to target normal HbA1c levels (<6%) for 3.5 yr increased mortality and did not significantly reduce major cardiovascular events
ADVANCE	<i>NEJM</i> 2008; 358:2545-59	Intensive glucose control that lowered the HbA1c value to 6.5% reduced the incidence of nephropathy but did not significantly reduce major macrovascular events, death from cardiovascular events, or death from any cause; hypoglycemia was more common in the intensive control group
BARI-2D	<i>NEJM</i> 2009; 360:2503-15	In patients with both type 2 DM and CAD no significant difference was found in the rates of death and major cardiovascular events in patients undergoing prompt revascularization and those undergoing medical therapy or between strategies of insulin sensitization and insulin
DCCT	<i>NEJM</i> 1993; 329:977-86	Intensive blood glucose control delayed the onset and reduced the progression of microvascular complications (retinopathy, nephropathy, and neuropathy) in type 1 DM
EDIC	<i>NEJM</i> 2005; 353:2644-53	Compared with conventional therapy intensive DM therapy early on without macrovascular disease (goal HbA1c <6.05%) has long-term beneficial effects on the risk of cardiovascular disease in patients with type 1 DM
Look AHEAD	<i>NEJM</i> 2013; 369:145-54	Moderate weight loss (<7% BW) and increased exercise are not associated with reduction in CVD and its complications among overweight or obese patients with type 2 DM
NAVIGATOR	<i>NEJM</i> 2010; 362:1463-90	In patients with impaired glucose tolerance, nateglinide did not reduce progression to DM or risk of cardiovascular events while valsartan only reduced progression to DM
PREDIMED	<i>NEJM</i> 2013; 368:1279-90	A Mediterranean diet with extra-virgin olive oil or nuts reduces rates of MI, CVA, or CV death in those at high risk for CV disease (outcome was driven by reduction in rates of CVA)
Steno-2	<i>NEJM</i> 2008; 358:580-91	In at-risk patients with type 2 DM intensive intervention with multiple drug combinations and behaviour modification had sustained significant beneficial effects with respect to vascular complications and mortality; multifactorial intervention is critical in the management of type 2 DM
UKPDS	<i>Lancet</i> 1998; 352:837-53	Intensive blood glucose control reduces microvascular but not macrovascular complications in type 2 DM
UKPDS Extension	<i>NEJM</i> 2008; 359:1577-89	Continued risk reduction in microvascular risk and emergent risk reductions for MI and death from any cause 10 yr post UKPDS trial follow up in type 2 DM
VADT	<i>NEJM</i> 2009; 360:1-11	In patients with longstanding poorly controlled type 2 DM intensive glucose control had no significant effect on the rates of major cardiovascular events, death, or microvascular complications; adverse events, predominantly hypoglycemia, were more common in the intensive control group
<b>LIPIDS</b>		
4S	<i>Lancet</i> 1994; 344:1383-89	In patients with angina or previous MI and high total cholesterol simvastatin reduced: all-cause mortality, fatal and nonfatal coronary events, and need for coronary artery bypass surgery or angioplasty
FIELD	<i>Lancet</i> 2005; 366:1849-61	In patients with type 2 DM not previously on statin therapy fenofibrate did not significantly reduce the risk of the primary outcome of coronary events; it did reduce non-fatal MI and revascularizations
HPS	<i>Lancet</i> 2002; 360:7-22	In high-risk patients with various cholesterol values simvastatin reduced all-cause mortality, coronary deaths, and major vascular events
Jupiter	<i>NEJM</i> 2008; 359:2195-207	Rosuvastatin significantly reduced the incidence of major cardiovascular events in patients with elevated high-sensitivity CRP levels and no hyperlipidemia
TNT	<i>NEJM</i> 2005; 352:1425-35	Lipid-lowering therapy with atorvastatin 80 mg/d in patients with stable CHD provides clinical benefit beyond atorvastatin 10 mg/d

## Acronyms

AAA	abdominal aortic aneurysm	FBG	fasting blood glucose	MAOI	monoamine oxidase inhibitor	PUFA	polyunsaturated fatty acids
ACR	albumin:creatinine ratio	FOBT	fecal occult blood test	MMSE	mini mental status examination	PVD	peripheral vascular disease
AIN	anal intraepithelial neoplasia	FRS	Framingham Risk Score	MOCA	Montreal cognitive assessment	RA	rheumatoid arthritis
AMC	another medical condition	GAD	generalized anxiety disorder	MSM	men who have sex with men	RCT	randomized controlled trial
AKI	acute kidney injury	GERD	gastroesophageal reflux disease	MUFA	monounsaturated fatty acids	SAH	subarachnoid hemorrhage
BMI	body mass index	GTT	drops	NPH	human insulin isophane	SDRI	serotonin dopamine reuptake inhibitor
ABG	arterial blood gas	HAART	highly active anti-retroviral therapy	NTD	neural tube defects	SERM	selective estrogen receptor modulator
AR	absolute reduction	HDL-C	high density lipoprotein cholesterol	NTG	nitroglycerin	SIDS	sudden infant death syndrome
BPPV	benign paroxysmal positional vertigo	HNPCC	hereditary non polyposis colon cancer	O&P	ova and parasites	SLE	systemic lupus erythematosus
CA	cancer	HSIL	high-grade squamous intraepithelial lesion	OA	osteoarthritis	SNRI	serotonin norepinephrine reuptake inhibitor
CABG	coronary artery bypass graft	HPV	human papillomavirus	OCB	obsessive compulsive disorder	SOB	shortness of breath
CAD	coronary artery disease	HRT	hormone replacement therapy	OCB	oral contraceptive pill	SSRI	selective serotonin reuptake inhibitor
CHEP	Canadian Hypertension Education Program	IBD	inflammatory bowel disease	OD	once a day	TIA	transient ischemic attack
CVD	cardiovascular disease	IBS	irritable bowel syndrome	OGCT	oral glucose challenge test	TC	total cholesterol
CBT	cognitive behavioural therapy	ICS	inhaled corticosteroids	OGTT	oral glucose tolerance test	TCA	tricyclic antidepressant
CF	cystic fibrosis	IFG	impaired fasting glucose	OTC	over the counter	TG	triglyceride
CHF	congestive heart failure	IGT	impaired glucose tolerance	PCOS	polycystic ovarian syndrome	TM	tympanic membrane
CPAP	continuous positive airway pressure	IHD	ischemic heart disease	PFT	pulmonary function test	TMJ	temporomandibular joint
CRC	colorectal cancer	INH	isoniazid	PHE	periodic health examination	TUIP	transurethral incision of the prostate
DHP	dihydropyridine	IPT	interpersonal therapy	PID	pelvic inflammatory disease	TURP	transurethral resection of the prostate
DMPA	depot medroxyprogesterone	IVP	intravenous pyelogram	PMS	premenstrual syndrome	UC	ulcerative colitis
DRE	digital rectal exam	KUB	kidneys, ureter, bladder x-ray	PND	paroxysmal nocturnal dyspnea	URTI	upper respiratory tract infection
DS	double strength	LDL-C	low density lipoprotein cholesterol	PPI	proton pump inhibitor	UTI	urinary tract infection
ED	emergency department	LSIL	low-grade squamous intraepithelial lesion	PPD	purified protein derivative	VAIN	vaginal intraepithelial neoplasia
ER	extended release	LV	left ventricle	PSA	prostate specific antigen	VIN	vulvar intraepithelial neoplasia
F/U	follow-up	LVH	left ventricle hypertrophy	PTSD	post-traumatic stress disorder	VBI	vertebrobasilar insufficiency
FAP	familial adenomatous polyposis	MDI	metered dose inhaler	PUD	peptic ulcer disease	WSIB	Workplace Safety and Insurance Board

## Four Principles of Family Medicine

### College of Family Physicians of Canada Guidelines

- The family physician is a skilled clinician**
  - diagnoses and manages diseases common to the population served
  - recognizes importance of early diagnosis of serious life-threatening illnesses
- Family medicine is a community-based discipline**
  - provides information and access to community services
  - responds/adapts to changing needs and circumstances of the community
- The family physician is a resource to a defined practice population**
  - serves as a health resource
  - advocates for public policy to promote health
- The patient-physician relationship is central to the role of the family physician**
  - commits to the person, not just the disease
  - promotes continuity of patient care

## Periodic Health Examination

- Canadian Task Force on Preventive Health Care established in 1976, first published in 1979
- mandate: to develop and disseminate clinical practice guidelines for primary and preventive care
- recommendations are based on systematic analysis of scientific evidence
  - most notable recommendation is the abolition of the annual physical exam; replaced by the PHE

### Adult Periodic Health Exam

Male and female evidence-based preventive care checklist forms are available online at <http://www.cfpc.ca>

## Purpose of the Periodic Health Examination

- primary prevention:** identify risk factors for common diseases; counsel patients to promote healthy behaviour
- secondary prevention:** presymptomatic detection of disease to allow early treatment and to prevent disease progression
- update clinical data
- enhance patient-physician relationship

## Classification of Recommendations (GRADE, 2011)

### Strength of Recommendation

- strong:** high level of confidence that desirable effects outweigh undesirable effects (strong recommendation for an intervention) or that the undesirable effects outweigh desirable effects (strong recommendation against an intervention)
  - implies that most individuals will be best served by the recommended course of action

- **weak:** desirable effects probably outweigh the undesirable effects (weak recommendation for an intervention) or undesirable effects probably outweigh the desirable effects (weak recommendation against an intervention); uncertainty exists
  - implies that most people would want the recommended course of action but that many would not
  - different choices will be appropriate for different individuals, patients require support in reaching a management decision consistent with his/her values and preferences

**Quality of Evidence**

- high: high level of confidence that true effect lies close to the estimate of the effect
- moderate: true effect likely to be close to the estimate of the effect, but there is a possibility that it is substantially different
- low or very low: true effect may be substantially different from the estimate of the effect

**Table 1. Periodic Health Exam**

	General Population	Special Population
<b>DISCUSSION</b>	Dental hygiene (community fluoridation, brushing, flossing) (A) Noise control and hearing protection (A) Screen for poverty Smokers: counsel on smoking cessation, provide: Nicotine replacement therapy (A) Referral to smoking cessation program (B) Dietary advice on leafy green vegetables and fruits (B) Seat belt use (B) Injury prevention (bicycle helmets, smoke detectors) (B) Moderate physical activity (B) Avoid sun exposure and wear protective clothing (B) Problem drinking screening and counselling (B) Counselling to protect against STIs (B) Nutritional counselling and dietary advice on fat and cholesterol (B) Dietary advice on calcium and vitamin D requirements (B)	<b>Pediatrics:</b> Home visits for high risk families (A), Inquiry into developmental milestones (B) <b>Adolescents:</b> Counsel on sexual activity and contraceptive methods (B), Counsel to prevent smoking initiation (B) <b>Perimenopausal Women (&gt;50):</b> Assess for risk factors for: osteoporosis and fracture (A), Counsel on osteoporosis, Counsel on risks/benefits of hormone replacement therapy (B) <b>Adults &gt;65:</b> Follow-up on caregiver concern of cognitive impairment (A), Multidisciplinary post-fall assessment (A)
<b>PHYSICAL</b>	Blood pressure measurement, using techniques described in CHEP guidelines (strong recommendation; moderate quality evidence) BMI measurement in obese adults (B)	<b>Pediatrics:</b> Repeated examinations of hips, eyes and hearing (especially in first year of life) (A), Serial height, weight and head circumference (B), Visual acuity testing after age 2 (B) <b>Adults &gt;65:</b> Visual acuity (Snellen sight chart) (B), Hearing impairment (inquiry, whispered voice test, audioscope) (B) <b>First-Degree Relative with Melanoma:</b> Full body skin exam (B)
<b>TESTS</b>	See recommendations below for age and gender specific screening for diabetes, dyslipidemia, hypertension and cancer screening (colon, prostate, cervical, lung, and breast)	<b>Pediatrics:</b> Routine hemoglobin for high risk infants (B), Blood lead screening of high risk infants (B) <b>TB High Risk Groups:</b> Mantoux skin testing (A) <b>STI High Risk Groups:</b> Voluntary HIV antibody screening (A) Gonorrhea screening (A) Chlamydia screening in women (B) Syphilis screen (A) <b>Syphilis Risk Group:</b> VDRL test (A)
<b>THERAPY</b>	Folic acid supplementation to women of child-bearing age (A) Pharmacologic treatment of HTN (Refer to CHEP Guidelines) (A) Varicella vaccine for children age 1-12 and susceptible adolescents/adults (A) Rubella vaccine for all non-pregnant women of child-bearing age unless there is proof of immunity via immunization records or serology (B) Tetanus vaccine: routine booster q10yr if had 1° series (A) Pertussis vaccine: adults <65 should receive one booster given as Tdap- Adacel® or Boostrix® (A) Herpes zoster vaccine for adults ≥60	<b>Pediatrics:</b> Routine immunizations (A), Hepatitis B, HPV and Meningococcal immunizations are offered in schools in most Canadian provinces <b>Influenza High Risk Groups:</b> Outreach strategies for vaccination (A), annual immunization (B), now recommended for all <b>TB High Risk Groups</b> INH prophylaxis for household contacts or skin test converters (B) INH prophylaxis for high risk sub-groups (B) <b>Immunocompromised/Age≥65/COPD/Asthma/CHF/Asplenia/Liver Disease/Renal Failure/DM:</b> Pneumococcalvaccine (Pneumovax®) (A)

Classification of recommendation in brackets. See sidebar on FM2 for classification details. See www.canadiantaskforce.ca – for up-to-date guidelines  
Reference: Canadian Task Force on Preventive Health Care, 2014

**Choosing Wisely Canada**  
<http://www.choosingwiselycanada.org/>  
A campaign to help clinicians and patients engage in conversations about unnecessary tests and treatments and make smart and effective choices to ensure high quality care

**Folic Acid Supplementation in Pregnancy (Joint SOGC-Motherisk Clinical Guideline)**

- To prevent neural tube defects in all women capable of becoming pregnant
- Low risk women (no personal health risks, planned pregnancy): 0.4-1.0 mg daily folic acid supplementation for at least 2-3 mo before conception and throughout pregnancy and postpartum period
- High risk women (health risks including epilepsy, insulin dependent diabetes, BMI >35, family history of NTD, high risk ethnic group): at least 3 mo prior to conception until 10-12 wk post conception: daily supplementation with multivitamins with 5 mg folic acid
- From wk 12 post-conception until postpartum period (4-6 wks or as long as breastfeeding continues): 0.4-1.0 mg of folic acid supplementation is sufficient
- Women with additional lifestyle issues (poor compliance with medications, no consistent birth control, taking possible teratogenic substances): higher folic acid dose of 5 mg and counselling about prevention of birth defects

## Breast Cancer Screening Guidelines

### 2011 Recommendations on Screening for Breast Cancer in Average-Risk Women (The Canadian Task Force on Preventive Health Care)

- average-risk women: women age 40-74 with no personal history of breast cancer, history of breast cancer in 1st degree relatives, known mutations of the BRCA1/BRCA2 genes or previous exposures of the chest wall to radiation

### Mammography

- age 40-49: routine screening with mammography not recommended (weak recommendation - moderate quality evidence)
- age 50-74: routine screening q2-3yr (age 50-69: weak recommendation; moderate quality evidence, age 70-74: weak recommendation; low quality evidence)
- age 75+: screen if benefits outweigh harm, must take overall health into account

### Magnetic Resonance Imaging

- no routine screening with MRI scans (weak recommendation - low quality evidence)

### Clinical Breast Examination

- no routine CBE alone or in conjunction with mammography to screen for breast cancer (weak recommendation - low quality evidence)

### Breast Self-Examination

- recommend not advising women to routinely practice breast self-examination
- for more information on benign breast lesions and breast cancer, see [General Surgery, GS55](#)

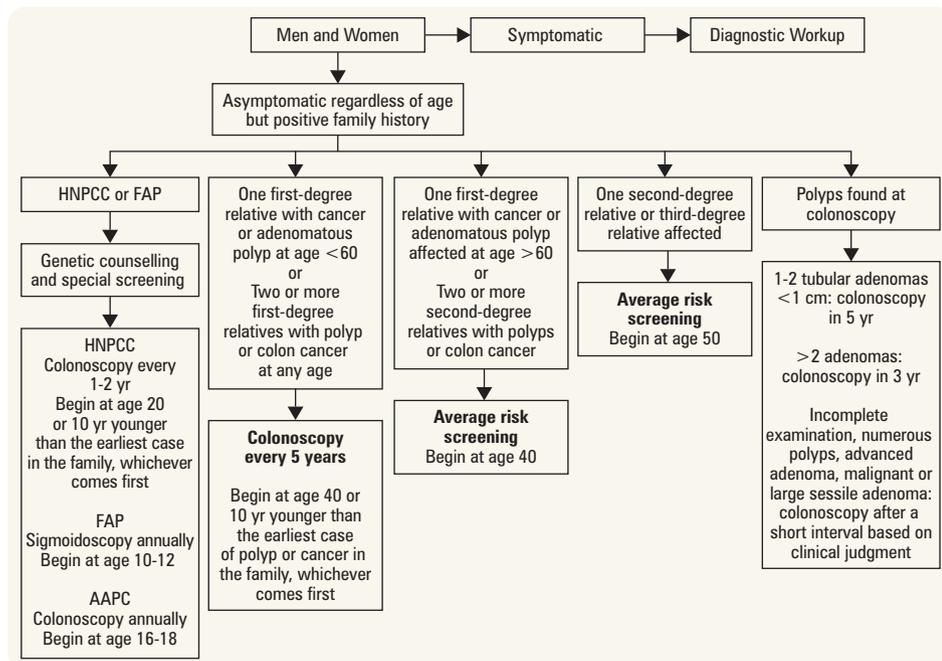

## Lung Cancer Screening Guidelines

### 2016 Canadian Task Force on Preventative Health Care

- apply to adults aged 18 and older who are not suspected of having lung cancer
- annual screening with low dose CT for adults aged 55-74 with at least a 30 pack-year smoking history who currently smoke or quit less than 15 years ago, up to three consecutive times

## Colorectal Cancer Screening Guidelines

- recommendations for average risk individuals (asymptomatic, no family history of UC, polyps, or CRC)
- average risk testing should begin at age 50, but assessment for risk factors should begin earlier to identify high-risk individuals
  - Canadian Task Force on Preventative Health Care (2016)
    - ♦ FOBT (either high sensitivity FOBT or FIT - fecal immunochemical testing) q2yr OR flexible sigmoidoscopy q10yr
    - ♦ no colonoscopy as a screening test
    - ♦ no screening after age 75 is recommended for average risk patients, but it may be assessed on an individual basis for ages 76-85
- for more information on colorectal neoplasms, see [General Surgery, GS33](#)

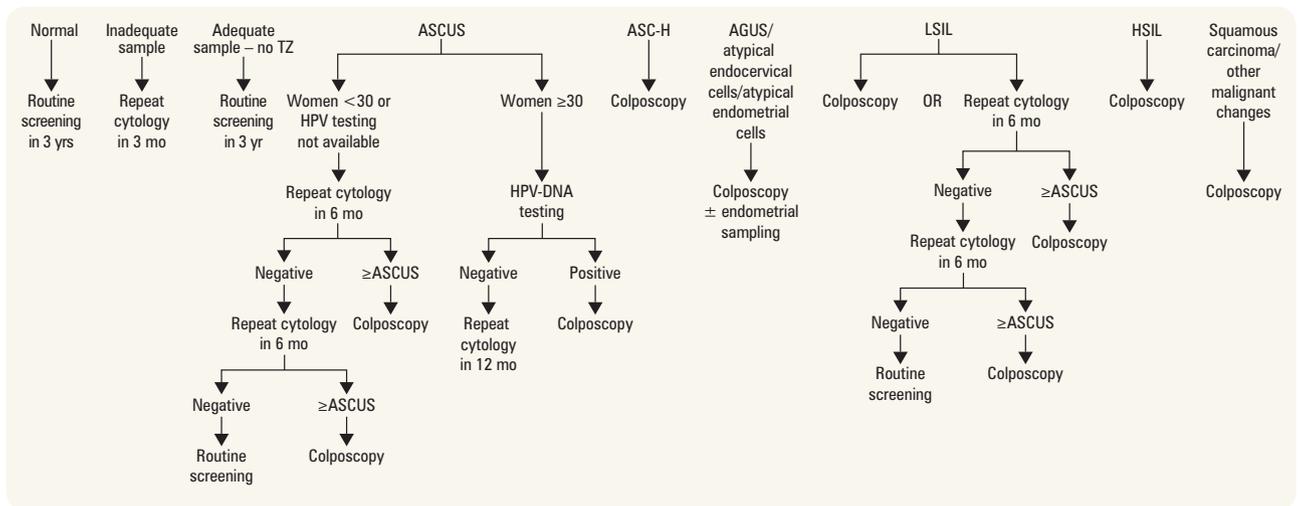

**Figure 1. Approach to higher risk screening**

AAPC = attenuated adenomatous polyposis; FAP = familial adenomatous polyposis; HNPCC = hereditary nonpolyposis colorectal cancer; 1st degree relatives: parents, siblings, children; 2nd degree relatives: grandparents, aunts, uncles; 3rd degree relatives: great grandparents or cousins. Figure printed with permission from *Can J Gastroenterol* 2004;18:93-99. Also see: Colorectal Screening for Cancer Prevention in Asymptomatic Patients, March 2013. Available from [http://www.bcguidelines.ca/pdf/colorectal\\_screening.pdf](http://www.bcguidelines.ca/pdf/colorectal_screening.pdf)

## Cervical Cancer Screening

- either conventional Papanicolaou (Pap) smear or liquid based cytology testing
- endocervical and exocervical cell sampling (aim is to sample the transitional zone)
- best identifies squamous cell abnormalities, less reliable for glandular abnormalities
  - false positives 5-10%, false negatives 10-40% (for single test)
  - false negative rate 50% for existing cervical cancer
- cervical cancer screening guidelines differ by provincial jurisdiction (see The Society of Obstetricians and Gynaecologists of Canada guidelines)
- **Canadian Task Force for Preventative Care Guidelines**
  - screen all women age  $\geq 25$  q3yr (age 25-29: weak recommendation; moderate quality evidence, age 30-69: strong recommendation; high quality evidence)
  - women age  $\geq 70$ : if 3 normal tests in a row and no abnormal tests in last 10 yr, can discontinue screening (weak recommendation; low quality evidence)
- **Ontario guidelines**
  - screen all women age  $\geq 21$  who are or have ever been sexually active (includes intercourse or digital/oral activity with partner of either gender)
  - if cytology is normal, can screen every 3 yr
  - women age  $\geq 70$ : if 3 successive negative Pap tests in last 10 yr, can discontinue screening
  - women who are not sexually active by age 21 should delay cervical cancer screening until sexually active
- pregnant women and women who have sex with women should follow the routine cervical screening regimen
- women who have had a hysterectomy
  - total: discontinue screening if hysterectomy was for benign disease and no history of cervical dysplasia or HPV infection, continue to swab vaginal vault if history of uterine malignancy/dysplasia
  - subtotal: continue screening according to guidelines
- exceptions to guidelines
  - immunocompromised (transplant, steroids, diethylstilbestrol exposure, HIV)
  - previously unscreened patients
- for more information on cervical cancer (see [Gynecology, GY43](#))

**Figure 2. Decision making chart for cervical cancer screening (not applicable for adolescents)**

AGUS = atypical glandular cells of unknown significance; ASCUS = abnormal squamous cells of unknown significance; ASC-H = abnormal squamous cells cannot rule out HSIL; HSIL = high grade squamous intraepithelial lesion; LSIL = low grade squamous intraepithelial lesion; TZ = transitional zone  
 Adapted from: Ontario Cervical Screening Cytology Guidelines. May 2012

## Prostate Cancer Screening

- Canadian Task Force for Preventative Care Guidelines
  - screening for prostate cancer with the prostate specific antigen test is not recommended for any age group (age <55: strong recommendation; low quality evidence, age 55-69: weak recommendation; moderate quality evidence, age >70: strong recommendation; low quality evidence)

### Prostate Cancer Mortality at 11 Years of Follow-Up

*NEJM* 2012;366:981-990

**Study:** Updated "ERSPC" study – multicentre randomized trial of screening for prostate cancer using PSA.

**Patients:** 162,388 men, ages 55-69 from 8 different European countries.

**Intervention:** PSA-based screening.

**Main Outcome:** Mortality from prostate cancer.

**Results:** After median follow up of 11 yr, the RRR of death from prostate cancer was 21%. The ARR was 1.07 deaths/1,000 men. NNT=1,055 – therefore to prevent one death from prostate cancer at 11 yr follow up, 1,055 men would need to be screened.

# Health Promotion and Counselling

- health promotion is the most effective preventive strategy
- there are several effective ways to promote healthy behavioural change, such as discussions appropriate to a patient's present stage of change
- for more information about motivational interviewing, see [www.motivationalinterviewing.org](http://www.motivationalinterviewing.org)

## Motivational Strategies for Behavioural Change

**Table 2. Motivational Strategies for Behavioural Change**

Patient's Stage of Change	Physician's Aim	Physician's Plan
<b>Pre-Contemplation</b>	Encourage patient to consider the possibility of change Assess readiness for change Increase patient's awareness of the problem and its risks	Raise issue in a sensitive manner Offer (not impose) a neutral exchange of information to avoid resistance
<b>Contemplation</b>	Understand patient's ambivalence and encourage change Build confidence and gain commitment to change	Offer opportunity to discuss pros and cons of change using reflective listening
<b>Preparation</b>	Explore options and choose course most appropriate to patient Identify high-risk situations and develop strategies to prevent relapse Continue to strengthen confidence and commitment	Offer realistic options for change and opportunity to discuss inevitable difficulties
<b>Action</b>	Help patients design rewards for success Develop strategies to prevent relapse Support and reinforce convictions towards long-term change	Offer positive reinforcement and explore ways of coping with obstacles Encourage self-rewards to positively reinforce change
<b>Maintenance</b>	Help patient maintain motivation Review identified high-risk situations and strategies for preventing relapse	Discuss progress and signs of impending relapse
<b>Relapse</b>	Help patient view relapse as a learning experience Provide support appropriate to present level of readiness post-relapse	Offer a non-judgmental discussion about circumstances surrounding relapse and how to avoid relapse in the future Reassess patient's readiness to change

Adapted from: Hunt P. Motivating Change. *Nursing Standard* 2001;16:45-52, 54-55

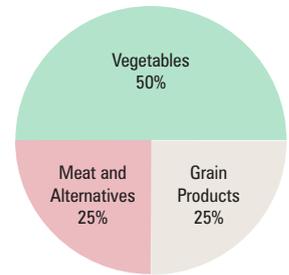

## Nutrition

### General Population

- Canada's Food Guide is appropriate for individuals age ≥2
- counsel on variety, portion size, and plate layout
- vitamins and minerals: see CDC-Vitamins and Minerals, available from <http://www.cdc.gov/nutrition/everyone/basics/vitamins/>

**Table 3. Canada's Food Guide 2011 Recommendations for Children >2 and Adults (# of servings/d)**

	Children		Teens	Adults		Choose More From	
Age in Years	2-3	4-8	9-13	14-18	19-50	51+	
<b>Grain Products</b>	3	4	6	F:6 M:7	F:6-7 M:8	F:6 M:7	Whole grain and enriched grain products
<b>Vegetables and Fruit</b>	4	5	6	F:7 M:8	F:7-8 M:8-10	F:7 M:7	Dark green vegetables, orange vegetables and fruit
<b>Milk and Alternatives</b>	2	2	3-4	F:3-4 M:3-4	F:2 M:2	F:3 M:3	Lower-fat dairy products
<b>Meat and Alternatives</b>	1	1	1-2	F:2 M:3	F:2 M:3	F:2 M:3	Lean meat, poultry, fish, peas, beans, lentils

**Figure 3. Plate layout**

### Handy Serving Size Comparisons

- 3 oz meat, fish, poultry → palm of hand
- 1 cup dairy (milk/yogurt) → size of fist
- Bread/grains → one slice, palm of hand
- ½ cup rice/pasta → one hand cupped
- 1 cup of fruit/vegetables → two cupped hands
- 1 oz cheese → full length of thumb
- 1 tsp oil/butter → tip of thumb
- Nuts/chips/snacks → palm covered

### Energy Content of Food

- Carbohydrates 4 kcal/g
- Protein 4 kcal/g
- Fat 9 kcal/g
- Ethanol 7 kcal/g

### Calculating Total Daily Energy Expenditure (TDEE)

- Roughly 35 kcal/kg/d
- Varies by age, weight, sex, and activity level
- Average 2000-2100 kcal/d for women, 2700-2900 kcal/d for men

### Canadian Cancer Society (CCS)

#### Recommendations for Vitamin D Use

- Based on CCS research on Vitamin D and the prevention of colorectal, breast and prostate cancer
- In consultation with their healthcare provider, the Society is recommending that:
  - Adults living in Canada should consider taking Vitamin D supplementation of 1,000 international units (IU) a day during the fall and winter
  - Adults at higher risk of having lower Vitamin D levels should consider taking Vitamin D supplementation of 1,000 IU/d all year round. This includes people: who are older, with dark skin, who do not go outside often, and who wear clothing that covers most of their skin
  - Babies who are exclusively breast-fed: 400 IU/d

## Cardiovascular Disease Prevention

**Table 4. Dietary Guidelines for Reducing Risk of Cardiovascular Disease**

	Recommendations	Effects
<b>Fat, Carbohydrates, Protein</b>	Overall fat intake: 26-27% of total energy Saturated fat: 5-6% of total energy Trans fat: reduce intake, replace with MUFA or PUFA Carbohydrates: 55-59% of total energy Protein: 15-18% of total energy	Lower LDL
<b>Omega-3 Fatty Acid Rich Foods</b>	≥2 servings/wk of fish (especially oily fish like salmon)	Decreased sudden death, death from CAD Lower TG
<b>Salt</b>	≤2,400 mg/d	Lower BP Combining decreased sodium intake with the DASH diet (see below) achieves even greater BP-lowering effects
<b>Alcohol</b>	≤3 drinks/d for men, max 15/wk ≤2 drink/d for women, max 10/wk	Decreased risk of hypertriglyceridemia, HTN, osteoporosis, certain cancers
<b>Dietary Approaches</b>	DASH diet (Dietary Approaches to Stop Hypertension), recommended by the American Heart Association (AHA)  Diet: high in vegetables/fruits, low-fat dairy, whole grains, poultry, fish, and nuts; Low in sweets, sugar-sweetened beverages, red meats Macronutrients: low in saturated/total fat and cholesterol; high in potassium, magnesium, calcium, protein, and fibre  Mediterranean diet (fruits, vegetables, whole grains, legumes, nuts, olive oil, and herbs)	Lower BP, lower LDL

MUFA = monounsaturated fatty acids; PUFA = polyunsaturated fatty acids  
Eckel RH, et al. 2013 AHA/ACC Guideline on Lifestyle Management to Reduce Cardiovascular Risk: A Report of the American College of Cardiology/American Heart Association Task Force on Practice Guidelines. *Circulation* 2013.  
Dietary approaches to stop hypertension (DASH), available from: [http://www.nhlbi.nih.gov/health/public/heart/hbp/dash/dash\\_brief.pdf](http://www.nhlbi.nih.gov/health/public/heart/hbp/dash/dash_brief.pdf)  
Lichtenstein AH, et al. Diet and lifestyle recommendations revision 2006: a scientific statement from the American Heart Association Nutrition Committee. *Circulation* 2006;114:82-96

**Osteoporosis Canada Recommendations for Calcium and Vitamin D Daily Requirements**

- Vitamin D: 800-1,000 IU for individuals age <50 yr, 800-2,000 IU for individuals ≥50 yr
- Calcium: 1,000 mg daily from all sources for individuals 19-50 yr and pregnant/lactating women; 1,200 mg daily for individuals >50 yr (recommended to obtain calcium from nutrition whenever possible vs. supplementation)

**Effectiveness of behavioural and pharmacologic treatment for overweight and obesity in adults.**  
*CMAJ* Open 2014;2:E306-17.  
**Study:** Review of 68 RCTs comparing the interventions: diet, exercise, diet and exercise, lifestyle, orlistat or metformin to control groups: no intervention, usual care, placebo or minimal interventions (e.g. newsletter or single information session on healthy living).  
**Population:** overweight and obese adults > 18 yr.  
**Outcome measure:** weight 12 mo post intervention and secondary health outcomes: total cholesterol, LDL, fasting blood glucose, incidence of DM-2, systolic and diastolic BP.  
**Results:**

- Intervention participants had a greater mean weight loss, greater reduction in waist circumference and greater reduction in BMI. There was no significant difference between behavioural and pharmacologic intervention for any weight outcome.
- For cholesterol and fasting glucose- the reduction was greater for participants in pharmacologic plus behavioural intervention as opposed to those using behavioural interventions alone.
- A diagnosis of new onset type 2 DM was less likely to occur in intervention participants compared with the control group.

**Conclusion:** Behavioural and pharmacological interventions for overweight and obesity in adults leads to clinically significant results.

**Losing Weight**

- Aim for caloric intake 500-1000 kcal/d less than total daily energy expenditure (TDEE)
- 3500 kcal energy expended/ lb of fat burned
- Results in 1-2 lb (0.5-1 kg) weight loss per wk
- Achieved by combination of increased activity and/or decreased caloric intake

**Low BMI Associations**

- Osteoporosis
- Eating disorders
- Under-nutrition
- Pregnancy complications

**Adverse Medical Consequences of Obesity**

- Type 2 DM
- CAD
- Stroke
- HTN
- Gallbladder disease
- Non-alcoholic steatohepatitis
- Complications of pregnancy
- Dyslipidemia
- Osteoarthritis
- Sleep apnea
- Certain cancers
- CHF
- Low back pain
- Increased total mortality

## Obesity

- see Canadian Task force on Preventive Health Care recommendations (*CMAJ* February 2015) at: [canadiantaskforce.ca/ctfphc-guidelines/2015-obesity-adults/](http://canadiantaskforce.ca/ctfphc-guidelines/2015-obesity-adults/)
- body mass index (BMI) = weight (kg)/height (m)<sup>2</sup> = weight (lbs)/height (in)<sup>2</sup> x 703; BMI is a poor predictor of obesity
- waist circumference (WC) = flexible tape placed on horizontal plane at iliac crest, normal depends on ethnic background
- increased WC for BMI 25-35 increases the risk of cardiovascular disease and type 2 diabetes

**Table 5. Classification of Weight by BMI, Waist Circumference, and Associated Disease Risks in Adults**

	BMI (kg/m <sup>2</sup> )	Obesity Class	Men ≤102 cm (40 in) Women ≤88 cm (35 in)	Men >102 cm (40 in) Women >88 cm (35 in)
<b>Underweight</b>	<18.5			
<b>Normal</b>	18.5-24.9			
<b>Overweight</b>	25.0-29.9		Increased	High
<b>Obesity Class I</b>	30.0-34.9	I	High	Very High
<b>Obesity Class II</b>	35.0-39.9	II	Very High	Very High
<b>Obesity Class III (Extreme Obesity)</b>	40.0 +	III	Extremely High	Extremely High

From: Classification of Overweight and Obesity by BMI, Waist Circumference, and Associated Disease Risks, National Institute of Health, National Heart Lung and Blood Institute, Obesity Education Initiative, [http://www.nhlbi.nih.gov/health/public/heart/obesity/lose\\_wt/bmi\\_dis.htm](http://www.nhlbi.nih.gov/health/public/heart/obesity/lose_wt/bmi_dis.htm)

### Epidemiology

- 16% (4 million) of people ≥18 yr old are obese, 32% (8 million) are overweight in Canada, according to StatsCan (2007)
- obesity rate in people of **Aboriginal origin is 1.6 times higher than the national average**
- proportion of children aged 6-11 who are overweight has more than doubled in the last 25 yr; percentage of overweight adolescents has tripled
- overweight and obesity rates in children are directly proportional to screen time (*see Exercise, FM10*)
- only 10-15% of population consume <30% fat daily
- obese persons generally consume more energy-dense food which tends to be highly processed, micronutrient poor, and high in fats, sugars, or starch

**Screening Recommendations**

- the CANRISK or FINRISC scores can be used to assess the risk for type 2 diabetes in overweight and obese patients
- BMI risk assessment should be done every 3-5 yr in people at high risk of developing diabetes within 10 yr

**Management**

**Behavioural/ Lifestyle**

- weight loss of >5% is clinically significant for reducing many cardiovascular risk factors (e.g. elevated blood pressure, glucose and lipids)
- efficacious behavioural interventions are greater than 12 months duration, include diet and/or exercise and/or lifestyle components, and include group and individual sessions
- structured behavioural and lifestyle interventions should be offered or arranged for overweight individuals BMI >25
- strong recommendation for those with increased risk of Type 2 DM
- BMI >35 + risk factors or BMI >40 are candidates for bariatric surgery failing behavioural modification

**Pharmacologic**

- the task force recommends against pharmacologic intervention to manage patients who are overweight and obese, although some patients may prefer medications and be good candidates for pharmacologic treatment
- high benefit of behavioural modification alone, NNH (number needed to harm) 10 (mostly GI side effects) for pharmacotherapy

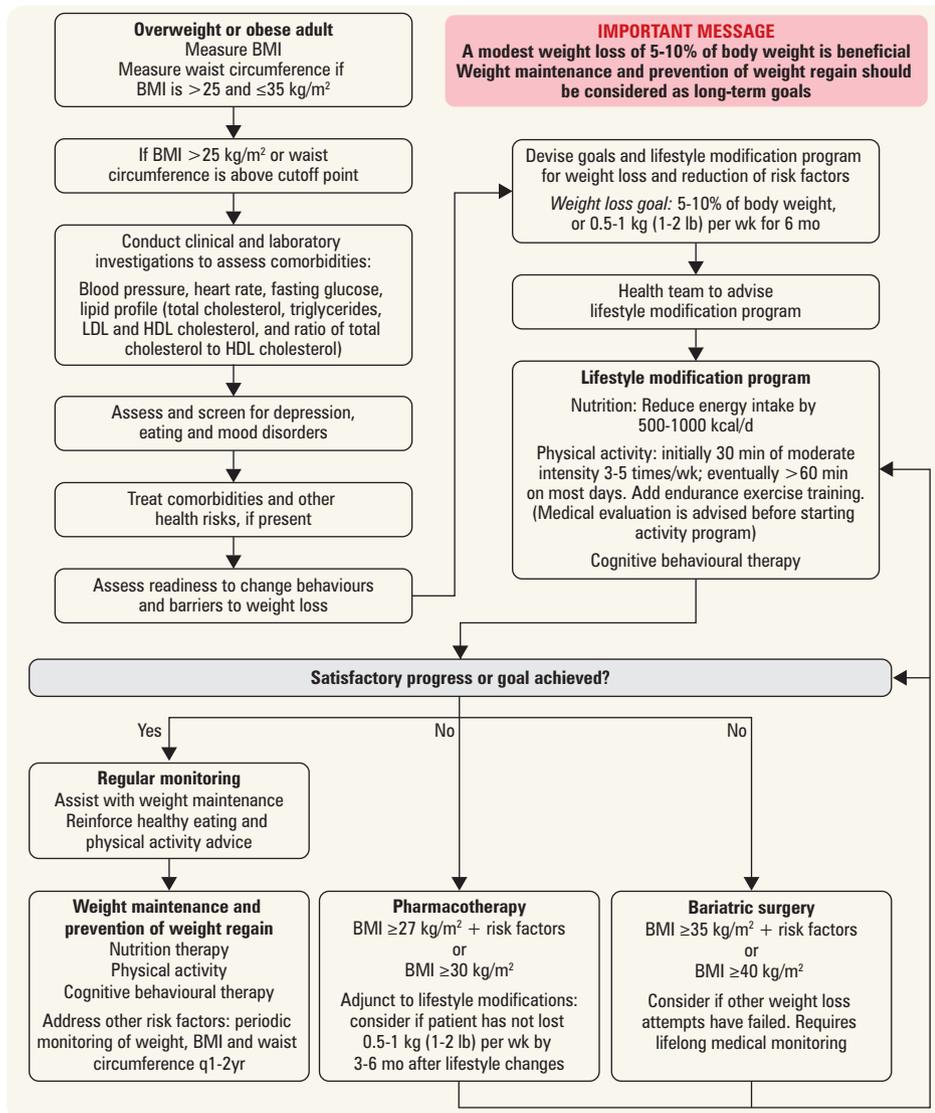

**Pharmacotherapy for Obesity**

- Orlistat: gastrointestinal lipase inhibitor, reduces fat absorption by 30% by inhibition of pancreatic lipase
- Orlistat is associated with several adverse effects and not approved for clinical use longer than 2 yr
- Orlistat should be avoided in people with inflammatory or chronic bowel disease

**"The Latest Evidence on Fad Diets..." Comparison of the Atkins, Ornish, Weight Watchers, and Zone Diets for Weight Loss and Heart Disease Risk Reduction**

*JAMA* 2005;293:43-53  
**Purpose:** To assess the effectiveness and adherence rates of four popular diets for weight loss and reduction of cardiac risk factors.  
**Study Characteristics:** Single centre RCT at academic medical centre in Boston, MA; 160 participants were randomized to either Atkins (carbohydrate restriction), Zone (macronutrient balanced and low glycemic load), Weight Watchers (low calorie/portion size), or Ornish (fat restriction) diet groups for a period of 18 mo.  
**Participants:** Adults age 22-72 with known HTN, dyslipidemia, or fasting hyperglycemia.  
**Results:** Assuming that participants who discontinued the study remained at baseline, the mean weight loss at 1 yr (and self selected dietary adherence rates per self report) were 2.1 kg for Atkins (53% of participants completed, p=0.009), 3.2 kg for the Zone (65% of participants completed, p=0.002), 3.0 kg for Weight Watchers (65% completed, p<0.001), 3.3 kg for Ornish (50% completed, p=0.007). Each diet significantly reduced the LDL/HDL ratio by ~10% (p<0.05), with no significant effects on blood pressure or glucose. Amount of weight loss was associated with adherence level (r = 0.60; p<0.001) but not with diet type (r = 0.07; p=0.40). Weight loss for each diet was significantly associated with reduction in levels of total/HDL cholesterol (r=0.36), C-reactive protein (r=0.37), and insulin (r=0.39), with no significant difference between diets.  
**Conclusion:** Each popular diet was associated with modest weight loss and reduction of several cardiac risk factors. Adherence level, and not diet type, was the most important predictor of weight loss and cardiac risk factor reduction.

**Hyperlipidemia Signs**

- Atheromata: plaques in blood vessel walls
- Xanthelasmata: a sharply demarcated yellowish deposit of cholesterol underneath the skin, usually on or around the eyelid
- Tendinous xanthoma: lipid deposit in tendon (especially Achilles)
- Eruptive xanthoma: hypertriglyceridemia induced reddish yellow, pruritic, and painful papular or nodular rash
- Lipemia retinalis: thin atheromata seen in the retinal blood vessels
- Corneal arcus (arcus senilis): lipid deposit in cornea

Figure 4. 2006 Canadian clinical practice guidelines on the management and prevention of obesity in adults and children (summary)  
 Adapted from: *CMAJ* 2007;176:S1-S13

# Dyslipidemia

- see [Endocrinology, E2](#)
- defined as abnormal elevation of plasma cholesterol or triglyceride levels

## Assessment

- measure fasting serum TC, LDL-C, HDL-C, and TG
- screen with full fasting lipid profile q1-3yr in males >40 yr and females >50 yr or who are menopausal, or at any age for adults with additional dyslipidemia risk factors (see sidebar)
- screen for secondary causes: hypothyroidism, chronic kidney disease, DM, nephrotic syndrome, liver disease
- risk category
  - estimate using the model for 10 yr CAD risk developed from the Framingham data (Framingham Risk Score – FRS)
    - ♦ FRS calculated based on the following factors: gender, age, HDL-C, total cholesterol, sBP, smoking, DM
    - ♦ family history of CVD <55 male relative or <65 in female relative doubles FRS
    - ♦ to be completed for men age 40-75, and women age 50-75 q3-5yr
    - ♦ cardiovascular age calculated as patient’s age ± the difference between his or her estimated remaining life expectancy
      - used to increase adherence to therapy and reaffirm positive effect of following therapy
  - treatment decisions focus on LDL-C level and/or FRS risk; the alternate primary targets are apolipoprotein B (apo B) and non-HDL-C (not used widely yet)
  - if moderate risk and LDL-C <3.5, treatment decision thresholds shifted to apo B >1.2g/L or non-HDL C >4.3 mmol/L
  - other targets include: TC:HDL-C ratio, apo B:apo AI ratio, hs-CRP (used more for risk stratification of CAD), non-HDL-C, and serum TG levels

**Table 6. Target Lipid Values for Primary Prevention of CAD (2012 Canadian Cholesterol Guidelines)**

Risk Category	Initiate Treatment if	Primary Targets	
		LDL-C	Alternate
High (FRS ≥20%) Also: AAA, history of DM (>40 yrs, DM for 15 yr and age >30, microvascular complications), CAD, PVD, atherosclerosis, CKD, or Male with HTN plus one of: smoking, EKG abnormality, LVH, Fam hx of premature death, age >55 yr, TC/ HDL-C >6, microalbuminuria	Consider treatment in all patients	≤2 mmol/L or ≥50% decrease in LDL-C	apo B <0.80 g/L non HDL-C ≤2.6mmol/L
Moderate (FRS 10-19%)	LDL-C ≥3.5 mmol/L For LDL-C <3.5 consider if: apo B ≥1.2 g/L or non-HDL-C ≥4.3 mmol/L	≤2 mmol/L or ≥50% decrease in LDL-C	apo B ≤ 0.80 g/L non HDL-C ≤2.6mmol/L
Low (FRS <10%)	LDL-C ≥5.0 mmol/L Familial hypercholesterolemia	≥50% decrease in LDL-C	

Anderson TJ, et al. 2012 Update of the Canadian Cardiovascular Society Guidelines for the Diagnosis and Treatment of Dyslipidemia and Prevention of Cardiovascular Disease in the Adult. *Can J Cardiol* 2013; 29:151-167

## Management

- intensity and type of treatment is guided by “risk category” assigned (see Table 6)
- 1. health behaviours (can decrease LDL-C by up to 10%)
  - smoking cessation: probably the most important for preventing CAD
  - dietary modification: reduce saturated fat, red meat, refined sugar, alcohol; consume nuts, fruits/vegetables, poultry, fish
  - physical activity: at least 150 min of moderate to vigorous intensity aerobic exercise per wk
  - employ consistent lifestyle modifications for at least 3 mo before considering drug therapy; high risk patients should start treatment immediately with concurrent health behaviour interventions
- 2. pharmacologic therapy (can decrease LDL-C by up to 40%)
  - for a comparison of dyslipidemia medications, see [Endocrinology, E50](#)
  - 1st line monotherapy: statins (HMG-CoA reductase inhibitors)
    - ♦ risks: myopathy and hepatotoxicity
    - ♦ if severe side effects: ezetimibe (cholesterol absorption inhibitor) can be used for 19% reduction in LDL-C
    - ♦ post-ACS, cholesterol absorption inhibitors (e.g. ezetimibe) in addition to simvastatin reduced mortality, attained lipid targets <1.8, and improved outcomes in high risk individuals
    - ♦ lower evidence for other agents: bile acid sequestrants, nicotinic acid, fibrates, psyllium
  - monitoring
    - ♦ ALT, CK, Cr at baseline then 6 wk later for signs of transaminitis or myositis; tolerate rise in CK up to 10 times upper limit of normal vs. 2-3 times if symptomatic, or serum creatinine rise of ≤25%
    - ♦ no routine repeated measures of ALT and CK necessary in asymptomatic patients using statin therapy
    - ♦ if adequate response is achieved, evaluate fasting lipids q6-12mo

To calculate Framingham Risk Score, go to <http://www.framinghamheartstudy.org/risk-functions/cardiovascular-disease/10-year-risk.php#>

### Risk Factors for Screening for Dyslipidemia

- First Nations or of South Asian ancestry
- Current cigarette smoking
- Diabetes
- Arterial Hypertension
- Family history of premature CVD
- Family history of hyperlipidemia
- Erectile dysfunction
- Chronic kidney disease
- Inflammatory disease (lupus, rheumatoid arthritis, psoriatic arthritis, IBD)
- HIV infection
- Chronic obstructive pulmonary disease
- Clinical evidence of atherosclerosis or abdominal aneurysm
- Clinical manifestation of hyperlipidemia
- Obesity (BMI >27)

### Non-fasting Lipids vs. Fasting Lipids

Non-fasting (TC and non-HDL cholesterol) can be used for Framingham Risk Assessment and hold same prognostic value as fasting lipids. In fasted vs. non-fasted samples, Non-HDL and TC varies by 2%, LDL-C by 10% and TG by 20%.  
Recently, non- fasting LDL-C has the same prognostic value as fasting LDL-C.  
Ontario Association of Medical Laboratories Guidelines for Lipid Testing in Adults (2013): [http://www.oaml.com/documents/eineforAdultLipidTestingFinal2013\\_000.pdf](http://www.oaml.com/documents/eineforAdultLipidTestingFinal2013_000.pdf)

LDL cannot be calculated when TG ≥4.5 mmol/L

### Safety of Statins: An Update

*Therapeutic Advances in Drug Safety* 2012;3:133-144  
Trials have shown that statin therapy slightly increases the incidence of diabetes; however, the absolute risk is small. Relative to the reduction in coronary events, the clinical significance is not great enough to recommend against their use.

Use with caution when prescribing combined statin and fibrate therapy as there has been concern regarding the safety of certain combinations (potential increased risk of myopathy and rhabdomyolysis)

### Isolated Hypertriglyceridemia

- does not increase your cardiovascular risk
- normal HDL-C and TC, elevated TG
- mild  $\geq 2.2$  mmol/L ( $\geq 200$  mg/dL); marked  $\geq 5.6$  mmol/L ( $\geq 500$  mg/dL)
- principal therapy is lifestyle modification
  - weight loss, exercise, avoidance of smoking and alcohol, effective blood glucose control in diabetics, increased omega-3 fatty acid intake
  - severe hypertriglyceridemia (typically  $>10$  mmol/L) is associated with an increased risk of acute pancreatitis
- drug therapy (used to prevent pancreatitis, NOT cardiovascular disease!)
  - nicotinic acid
  - fibrates

#### Clinical Definition of Metabolic Syndrome

- Central obesity
  - Men – waist circumference  $\geq 94$  cm
  - Women – waist circumference  $\geq 80$  cm
- Plus any TWO of the following four factors

Risk Factor	Defining Level
TG level	$\geq 1.7$ mmol/L (150 mg/dL)
HDL-C level:	
Men	$< 1.0$ mmol/L (40 mg/dL)
Women	$< 1.3$ mmol/L (50 mg/dL)
Blood pressure	$\geq 130/85$ mmHg
Fasting glucose level	$\geq 5.6$ mmol/L (100 mg/dL)

#### Statin-Related Adverse Events: A Meta-Analysis

*Clin Ther* 2006;28:26-35  
**Study:** Meta-analysis of 18 RCTs (N=71,108) focused on adverse effects of statins.  
**Patients:** Those taking statin monotherapy for primary or secondary prevention of CVD.  
**Intervention:** Statin vs. placebo.  
**Main Outcome:** Adverse events (AE) including elevated liver enzymes or myopathy (myalgias, elevated CK, rhabdomyolysis).  
**Results:** Statin therapy increased the risk of any AE by 39% (OR 1.4; 95% CI 1.09-1.80;  $p=0.008$ ) compared with placebo. Treating 1,000 patients with a statin would cause 5 AE. Serious events (CK  $>10$  times the upper limit of normal or rhabdomyolysis) are infrequent (NNH 3,400) and rhabdomyolysis, although serious, is rare (NNH 7,428).  
**Conclusion:** Statin therapy was associated with greater odds of AEs compared with placebo but with substantial clinical benefit. Similar rates of serious AEs were observed between statin and placebo.

## Exercise

### Epidemiology

- 25% of the population exercises regularly, 50% occasionally, 25% are sedentary

### Management

- assess current level of fitness, motivation, and access to exercise
- encourage warm up and cool down periods to allow transition between rest and activity and to avoid injuries
- exercise with caution for patients with CAD, DM (risk of hypoglycemia), exercise-induced asthma
- patients with known CAD should have cardiac assessment prior to commencing exercise
- benefits of exercise
  - reduces risk of premature death, heart disease, stroke, HTN, certain types of cancer, type 2 DM, osteoporosis, and overweight/obesity
  - leads to improved fitness, strength, and mental health (morale and self-esteem)

**Table 7. Canadian Physical Activity and Sedentary Behaviour Guidelines (2012 CSEP Guidelines)**

Age Category	Physical Activity Guidelines	Example Activities	Sedentary Behaviour Guidelines
Infant (<1y)	Active several times daily	Interactive floor-based play including tummy time, reaching for toys, crawling	Minimize time spent sedentary, including sitting and being restrained (stroller, etc.) Screen time not recommended for infants <1y, limit to <1h/d ages 2-4
Toddler (1-2)	Accumulate 180 min of physical activity at any intensity spread throughout the day	Moving around the home Climbing stairs Exploring environment Brisk walking, running Dancing	apo B $< 0.80$ g/L non HDL-C $\leq 2.6$ mmol/L
Preschool (2-4)			apo B $\leq 0.80$ g/L non HDL-C $\leq 2.6$ mmol/L
Children (5-11)	Accumulate 60 min of moderate to vigorous intensity physical activity daily	Moderate: bike riding, playground Vigorous: running, swimming	Minimize time spent being sedentary Limited recreational screen time no more than 2 h per day Limit sedentary (motorized) transport, sitting, and time spent indoors
Youth (12-17)	Accumulate 60 min of moderate to vigorous intensity physical activity daily Vigorous intensity activities at least 3 d per wk Activities that strengthen muscle and bone at least 3 d per wk	Moderate: skating, bike riding Vigorous: running, roller blading	
Adults (18-64)	Accumulate 150 min of moderate to vigorous intensity aerobic physical activity per wk, in bouts of 10 m or more. It is beneficial to add muscle and bone strengthening activities using major muscle groups, at least 2 d per wk	Moderate: brisk walking, bike riding Vigorous: jogging, cross country skiing	No specific guidelines
Older Adults (65 and older)		Moderate: brisk walking, bike riding Vigorous: cross country skiing, swimming Those with poor mobility should perform physical activities to enhance balance and prevent falls	

# Smoking Cessation

## Epidemiology

- smoking is the single most preventable cause of premature illness and death
- 70% of smokers see a physician each year
- 2012 Canadian data from the Canadian Tobacco Use Monitoring Survey (CTUMS) on population age ≥15
  - 16% are current smokers (lowest since 1965)
  - highest prevalence in age group 20-24 (20%)
  - 11% of youth age 15-19 smoke (decreased from 25% in 2000): more males smoke than females; number of cigarettes consumed per day also decreasing

## Management

- general approach
  - identify tobacco users; elicit smoking habits, previous quit attempts and results
  - CAN-ADAPTT 2012 guidelines
    - ♦ tobacco use status should be updated for all patients regularly (Grade 1A)
    - ♦ health care providers should clearly advise patients to quit (Grade 1C)
    - ♦ health care providers should also monitor the patient's mental health status/other addictions while quitting smoking. Medication dosage should be monitored and adjusted as necessary (Grade 1A)
  - every smoker should be offered treatment
    - ♦ combining counselling and smoking cessation medication is more effective than either alone (Grade 1A)
  - make patient aware of withdrawal symptoms
    - ♦ low mood, insomnia, irritability, anxiety, difficulty concentrating, restlessness, decreased heart rate, increased appetite
  - ≥4 counselling sessions >10 min each with 6-12 mo follow-up yields better results
  - 14% abstinent with counselling vs. 10% without counselling
  - approach depends on patient's stage of change (see *Motivational Strategies for Behavioural Change, FM6*)
- willing to quit
  - provision of social support, community resources (self-help, group, helpline, web-based strategies)
  - pregnant patients: counselling is recommended as 1st line treatment (Grade 1A). Nicotine replacement therapy (NRT) should be made available to pregnant women who are unable to quit using non-pharmacologic methods; intermittent NRT use (lozenges, gum) is preferred over continuous dosing of the patch (Grade 1C). Use bupropion (no evidence of fetal or reproductive harm) only if benefits > risks; consult Motherisk. Varenicline has not been studied in pregnancy and should not be used in pregnant women
- pharmacologic therapy
  1. Nicotine Replacement Therapy
    - ♦ 19.7% abstinent at 12 mo with NRT vs. 11.5% for placebo
    - ♦ no difference in achieving abstinence for different forms of NRT
    - ♦ reduces cravings and withdrawal symptoms without other harmful substances that are contained in cigarettes
    - ♦ use with caution: immediately post-MI, serious/worsening angina, serious arrhythmia
    - ♦ advise NO smoking while using NRT
  2. Antidepressants (note: mode of action appears to be independent of antidepressant effect)
    - ♦ Bupropion SR (Zyban®)
    - ♦ 21% abstinent at 12 mo vs. 8% for placebo
    - ♦ no advantage for NRT vs. bupropion (similarly effective)
  3. Varenicline (Champix®)
    - ♦ partial nicotinic receptor agonist (to reduce cravings) and partial competitive nicotinic receptor antagonist (to reduce the response to smoked nicotine)
    - ♦ more effective than bupropion (23% abstinent from 9-52 wk with varenicline vs. 16% for bupropion vs. 9% with placebo)
    - ♦ significant side effects may lower patient compliance

**Physician Advice for Smoking Cessation**  
*Cochrane DB Syst Rev* 2013;5:CD000165  
 This systematic review of 17 trials compared brief advice by the physician versus no advice.  
**Conclusions:** Simple advice can increase cessation rates by 1-3%. More intensive advice and providing follow-up support may further increase the quit rates.

**The 5 A's for Patients Willing to Quit**  
 Ask if the patient smokes  
 Advise patients to quit  
 Assess willingness to quit  
 Assist in quit attempt  
 Arrange follow-up

**The 2-3 Pattern of Smoking Cessation**

- Onset of withdrawal is 2-3 h after last cigarette
- Peak withdrawal is at 2-3 d
- Expect improvement of withdrawal symptoms at 2-3 wk
- Resolution of withdrawal at 2-3 mo
- Highest relapse rate within 2-3 mo

**Assist Patient in Developing Quit Plan**

**STAR**

- Set quit date
- Tell family and friends (for support)
- Anticipate challenges (e.g. withdrawal)
- Remove tobacco-related products (e.g. ashtrays/lighters)

**Antidepressants for Smoking Cessation**  
*Cochrane DB Syst Rev* 2014;1:CD000031  
 This systematic review of 90 randomized trials compared antidepressant medication to placebo or alternative pharmacotherapy for smoking cessation and where follow-up was longer than 6 mo.  
**Conclusions:** The antidepressants bupropion and nortriptyline can aid smoking cessation and have a similar efficacy to NRT. Bupropion is less effective than varenicline. Neither SSRIs (e.g. fluoxetine) nor MAOIs aid smoking cessation.

**Nicotine Replacement Therapy for Smoking Cessation**  
*Cochrane DB Syst Rev* 2012;11:CD000146  
 This systematic review of 132 randomized trials compared NRT to placebo or no treatment or compared different NRT doses.  
**Conclusions:** All commercially available forms of NRT (gum, transdermal patch, nasal spray, inhaler, and sublingual tablets/lozenges) are effective as part of a strategy to promote smoking cessation. They increase the rate of quitting by 50-70% regardless of setting and independent on the level of additional support provided to the smoker. Compared to a single form of NRT, combining a nicotine patch with a rapid delivery form of NRT may be more effective.

**Table 8. Types of Nicotine Replacement Therapy**

Type	Dosage	Comment	Side Effects
<b>Nicotine Gum (OTC)</b>	2 mg if <25 cig/d 4 mg if >25 cig/d 1 piece q1-2h for 1-3 mo (max 24 pieces/d)	Chew until "peppery" taste then "park" between gum and cheek to facilitate absorption Continue to chew-park intermittently for 30 min	Mouth soreness Hiccups Dyspepsia Jaw ache Most are transient
<b>Nicotine Patch (OTC)</b>	Use for 8 wk 21 mg/d x 4 wk 14 mg/d x 2 wk 7 mg/d x 2 wk	Start with lower dose if <10 cig/d Change patch q24h and alternate sides	Skin irritation Insomnia Palpitations Anxiety
<b>Nicotine Inhaler (OTC)</b>	6-16 cartridges/d for up to 12 wk	Nicotine inhaled through mouth, absorbed in mouth and throat not in lungs	Local irritation Coughing
<b>Nicotine Nasal Spray (Rx)</b>		Newer form of NRT	Local irritation, coughing

**Table 9. Pharmacologic Treatments for Smoking Cessation**

Drug	Mechanism	Dosage	Prescribing*	Contraindications
<b>Bupropion</b>	Inhibits re-uptake of dopamine and/or norepinephrine Side effects: insomnia, dry mouth	1. 150 mg qAM x 3 d 2. Then 150 mg bid x 7-12 wk 3. For maintenance consider 150 mg bid for up to 6 mo	1. Decide on a quit date 2. Continue to smoke for first 1-2 wk of treatment and then completely stop (therapeutic levels reached in 1 wk)	Seizure disorder Eating disorder MAOI use in past 14 d Simultaneous use of bupropion (Wellbutrin®) for depression
<b>Varenicline</b>	Partial nicotinic receptor agonist, and partial nicotinic receptor competitive antagonist Side effects: N/V, constipation, headache, dream disorder, insomnia, increased risk of psychosis, depression, suicidal ideation	1. 0.5 mg qAM x 3 d 2. Then 0.5 mg bid x 4 d 3. Continue 1 mg bid x 12 wk ± additional 12 wk as maintenance	1. Decide on a quit date 2. Continue to smoke for first wk of treatment and then completely stop	Caution with pre-existing psychiatric condition

\*Bupropion and Varenicline may be used in combination with nicotine replacement therapy

- unwilling to quit
  - motivational intervention (5 Rs)
  - 1. Relevance to patient
    - ♦ relevant to patient's disease status or risk, family or social situation (e.g. having children in the home), health concerns, age, gender
  - 2. Risks of smoking
    - ♦ short-term: SOB, asthma exacerbation, impotence, infertility, pregnancy complications, heartburn, URTI
    - ♦ long-term: MI, stroke, COPD, lung CA, other cancers
    - ♦ environmental: higher risk in spouse/children for lung CA, SIDS, asthma, respiratory infections
  - 3. Rewards: benefits
    - ♦ improved health, save money, food tastes better, good example to children
  - 4. Roadblocks: obstacles
    - ♦ fear of withdrawal, weight gain, failure, lack of support
  - 5. Repetition
    - ♦ reassure unsuccessful patients that most people try many times before successfully quitting (average number of attempts before success is 7)
- recent quitter
  - highest relapse rate within 3 mo of quitting
    - ♦ minimal practice: congratulate on success, encourage ongoing abstinence, review benefits and problems
    - ♦ prescriptive interventions: address problem of weight gain, negative mood, withdrawal, lack of support

**Nicotine Partial Receptor Agonists for Smoking Cessation**

*Cochrane DB Syst Rev* 2012;4:CD006103

**Conclusions:** Cytisine increases the chances of quitting, although absolute quit rates were modest in two recent trials. Varenicline at standard dose increased the chances of successful long-term smoking cessation between two- and threefold compared with pharmacologically unassisted quit attempts. Lower dose regimens also conferred benefits for cessation, while reducing the incidence of adverse events. More participants quit successfully with varenicline than with bupropion.

## Alcohol

- see [Psychiatry, PS23](#)

### Definition

- diagnostic categories occur along a continuum

### Epidemiology

- 10-15% of patients in family practice are problem drinkers
- 20-50% of hospital admissions, 10% of premature deaths, 30% of suicides, and 50% of fatal traffic accidents in Canada are alcohol-related
- more likely to miss diagnosis in women or elderly, patients with high socioeconomic status

### Assessment

- screen for alcohol dependence with CAGE questionnaire
  - if CAGE positive, explore with further questions for alcohol abuse/dependence
- assess drinking profile
  - setting, time, place, occasion, with whom
  - impact on: family, work, social
  - quantity-frequency history
    - ♦ how many drinks per day?
    - ♦ how many days per week?
    - ♦ maximum number of drinks on any one day in the past month?

**Standard Drink Equivalents**

One standard drink = 14 g of pure alcohol

- Beer (5% alcohol) = 12 oz
- Wine (12-17% alcohol) = 5 oz
- Fortified wine = 3 oz
- Hard liquor (40%) = 1.5 oz

**CAGE Questionnaire**

**C** Have you ever felt the need to **CUT** down on your drinking?

**A** Have you ever felt **ANNOYED** at criticism of your drinking?

**G** Have you ever felt **GUILTY** about your drinking?

**E** Have you ever had a drink first thing in the morning to steady your nerves or get rid of a hangover?

**(EYE OPENER)**

≥2 for men or ≥1 for women suggests possibility of problem drinking (sensitivity 85%, specificity 89%)

- if identified positive for alcohol problem
  - screen for other drug use
  - identify medical/psychiatric complications
  - ask about drinking and driving
  - ask about past recovery attempts and current readiness for change

**Investigations**

- GGT and MCV for baseline and follow-up monitoring
- AST, ALT (usually AST:ALT approaches 2:1 in an alcoholic)
- CBC (anemia, thrombocytopenia), INR (decreased clotting factor production by liver)

**Management**

- intervention should be consistent with patient’s motivation for change
- individualized counselling and regular follow-up is crucial
- 10% of patients in alcohol withdrawal will have seizures or delirium tremens
- Alcoholics Anonymous/12-step program
  - outpatient/day programs for those with chronic, resistant problems
  - family treatment (Al-Anon, Alateen, screen for spouse/child abuse)
- in-patient program if
  - dangerous or highly unstable home environment
  - severe medical/psychiatric problem
  - addiction to drug that may require in-patient detoxification
  - refractory to other treatment programs
- pharmacologic
  - diazepam for withdrawal
  - disulfiram (Antabuse®): impairs metabolism of alcohol by blocking conversion of acetaldehyde to acetic acid, leading to flushing, headache, N/V, hypotension if alcohol is ingested (available in U.S., but no longer available in Canada)
  - naltrexone: competitive opioid antagonist that reduces cravings and pleasurable effects of drinking
  - may trigger withdrawal in opioid-dependent patients
  - acamprosate: glutamate receptor modulator that also reduces craving
- see [Psychiatry, PS23](#)

**Prognosis**

- relapse is common and should not be viewed as failure
- monitor regularly for signs of relapse
- 25-30% of abusers exhibit spontaneous improvement over 1 yr
- 60-70% of individuals with jobs and families have an improved quality of life 1 yr post-treatment

**Some Adverse Medical Consequences of Problem Drinking**

- GI: gastritis, dyspepsia, pancreatitis, liver disease, bleeds, diarrhea, oral/esophageal cancer
- Cardiac: HTN, alcoholic cardiomyopathy
- Neurologic: Wernicke-Korsakoff syndrome, peripheral neuropathy
- Hematologic: anemia, coagulopathies
- Other: trauma, insomnia, family violence, anxiety/depression, social/family dysfunction, sexual dysfunction, fetal damage

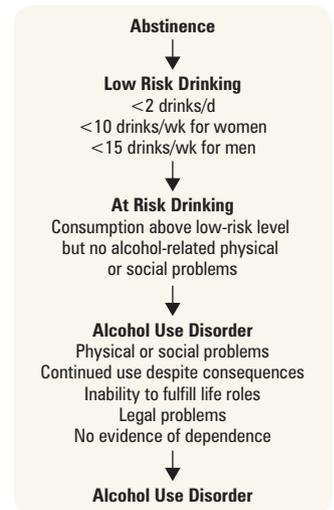

Figure 5. Continuum of alcohol use

# Common Presenting Problems

## Abdominal Pain

- see [Gastroenterology, G11](#) and [General Surgery, GS4](#)

**Epidemiology**

- 20% of individuals have experienced abdominal pain within the last 6-12 mo
- 90% resolve in 2-3 wk
- only 10% are referred to specialists, of those <10% admitted to hospital

**Etiology**

- most common diagnosis in family medicine at 28% is “nonspecific abdominal pain,” which has no identifiable cause and is usually self-limited
- GI disorders (e.g. PUD, pancreatitis, IBD, appendicitis, gastroenteritis, IBS, diverticular disease, biliary tract disease)
- urinary tract disorders (e.g. UTI, renal calculi)
- gynecological disorders (e.g. PID, ectopic pregnancy, endometriosis)
- cardiovascular disorders (e.g. CAD, AAA, ischemic bowel)
- other: DKA, porphyria, hypercalcemia, medications (e.g. NSAIDs), alcohol, toxic ingestion, foreign body, psychogenic

If pain precedes nausea/vomiting, cause of abdominal pain is more likely to be surgical

## Pathophysiology

- type of pain
  - somatic pain: sharp, localized pain
  - visceral pain: dull, generalized pain
- location of pain
  - epigastric (foregut): distal esophagus, stomach, proximal duodenum, biliary tree, pancreas, liver
    - ♦ RUQ: biliary, hepatic, colonic, pulmonary, renal
    - ♦ LUQ: cardiac, gastric, pancreatic, renal, vascular
  - periumbilical (midgut): distal duodenum to proximal 2/3 of transverse colon,
  - hypogastric (hindgut): distal 1/3 of transverse colon to rectosigmoid region,
    - ♦ RLQ: colonic, appendix, gynecologic, renal
    - ♦ LLQ: colonic, gynecologic, renal
  - any location: aneurysm, dissection, ischemia, zoster, muscle strain, hernia, bowel obstruction, ischemia, peritonitis, porphyria, DKA

## Investigations

- guided by findings on history and physical
- possible blood work: CBC, electrolytes, BUN, Cr, amylase, lipase, AST, ALT, ALP, bilirubin, glucose, INR/PTT, tox screen,  $\beta$ -hCG
- imaging
  - CXR (for free air under the diaphragm) in setting of perforation in surgical abdomen
  - abdominal x-ray, KUB (consider: gas pattern, free air, kidney stones, constipation)
  - ultrasound (renal stones, gallbladder disease, gynecological problems, liver disease, pancreatitis, diverticular disease, appendicitis)
  - CT scan (AAA, appendicitis), non-contrast helical CT-Scan (first choice for renal stones)
- other tests
  - urinalysis
  - endoscopy (for peptic ulcers, gastritis, tumours, etc.)
  - *H. pylori* testing (urea breath test, serology, biopsy)

### Abdominal Pain Red Flags

- Severe pain
- Signs of shock
- Peritoneal signs
- Abdominal distention
- Pain out of proportion to clinical findings
- New onset pain, change in pain, or altered bowel habits in elderly
- Weight loss
- Blood per rectum/melena
- Anemia
- Supraclavicular nodes
- Family history of serious bowel disease

In patient age >50, keep a high index of suspicion for AAA – its presentation may mimic renal colic or diverticulitis

## Allergic Rhinitis

- see [Otolaryngology, OT23](#)

### Definition

- inflammation of the nasal mucosa that is triggered by an allergic reaction
- classification
  - seasonal
    - ♦ symptoms during a specific time of the year
    - ♦ common allergens: trees, grass and weed pollens, airborne moulds
  - perennial
    - ♦ symptoms throughout the year with variation in severity
    - ♦ common allergens: dust mites, animal dander, moulds
- persistent allergic rhinitis may lead to chronic rhinosinusitis

### Etiology

- increased IgE levels to certain allergens → excessive degranulation of mast cells → release of inflammatory mediators (e.g. histamine) and cytokines → local inflammatory reaction

### Epidemiology

- affects approximately 40% of children and 20-30% of adults
- prevalence has increased in developed countries, particularly in the past two decades
- associated with asthma, eczema, sinusitis, and otitis media

### Assessment

- identify allergens
- take an environmental/occupational history
- ask about related conditions (e.g. atopic dermatitis, asthma, sinusitis, and family history)

### Management

- conservative
  - minimize exposure to allergens
    - ♦ most important aspect of management, often sufficient (may take months)
  - maintain hygiene, saline nasal rinses
- pharmacologic agents
  - oral antihistamines – first line therapy for mild symptoms
    - ♦ e.g. cetirizine (Reactine®), fexofenadine (Allegra®), loratadine (Claritin®)
  - intranasal corticosteroids for moderate/severe or persistent symptoms (>1 mo of consistent use to see results)
  - intranasal decongestants (use must be limited to <5 d to avoid rhinitis medicamentosa)

### Differential Diagnosis

- Acute viral infection
- Vasomotor rhinitis
- Deviated septum
- Nasal polyps
- Acute/chronic sinusitis
- Drug-induced rhinitis

### Rhinitis Medicamentosa

Rebound nasal congestion. Occurs with prolonged use (>5-7 d) of vasoconstrictive intranasal medications. Patient may become dependent, requiring more frequent dosing to achieve the same decongestant effect

- allergy skin testing
  - for patients with chronic rhinitis
  - symptoms not controlled by allergen avoidance, pharmacological therapy
  - may identify allergens to include in immunotherapy treatment
- immunotherapy (allergy shots)
  - reserved for severe cases unresponsive to pharmacologic agents
  - consists of periodic (usually weekly) subcutaneous injections of custom prepared solutions of one or more antigens to which the patient is allergic

**Symptoms of GAD**

**AND I C REST**  
 Anxious, nervous, or worried  
 No control over the worry  
 Duration >6 mo  
 Irritability  
 Concentration impairment  
 Restlessness  
 Energy decreased  
 Sleep impairment  
 Tension in muscles  
*Can Fam Physician 2005;51:1340-1342*

**Differential Diagnosis of Anxiety Disorders**

- Panic disorder
- GAD
- Social Anxiety Disorder (previously Social Phobia)
- Agoraphobia
- Specific phobia
- Selective Mutism
- Separation Anxiety Disorder
- Other: GMC, AMC, mood disorder, psychotic disorder, OCD, PTSD

**Rule Out**

- Cardiac (post MI, arrhythmias)
- Endocrine (hyperthyroidism, diabetes, pheochromocytoma)
- Respiratory (asthma, COPD)
- Somatoform disorders
- Psychotic disorders
- Mood disorders (depression, bipolar)
- Personality disorder (OCPD)
- Drugs (amphetamines, thyroid preparations, caffeine, OTC for colds/decongestants, alcohol/benzodiazepine withdrawal)

## Amenorrhea

- see [Gynecology, GY10](#)

## Anxiety

- see [Psychiatry, PS13](#)

### Epidemiology

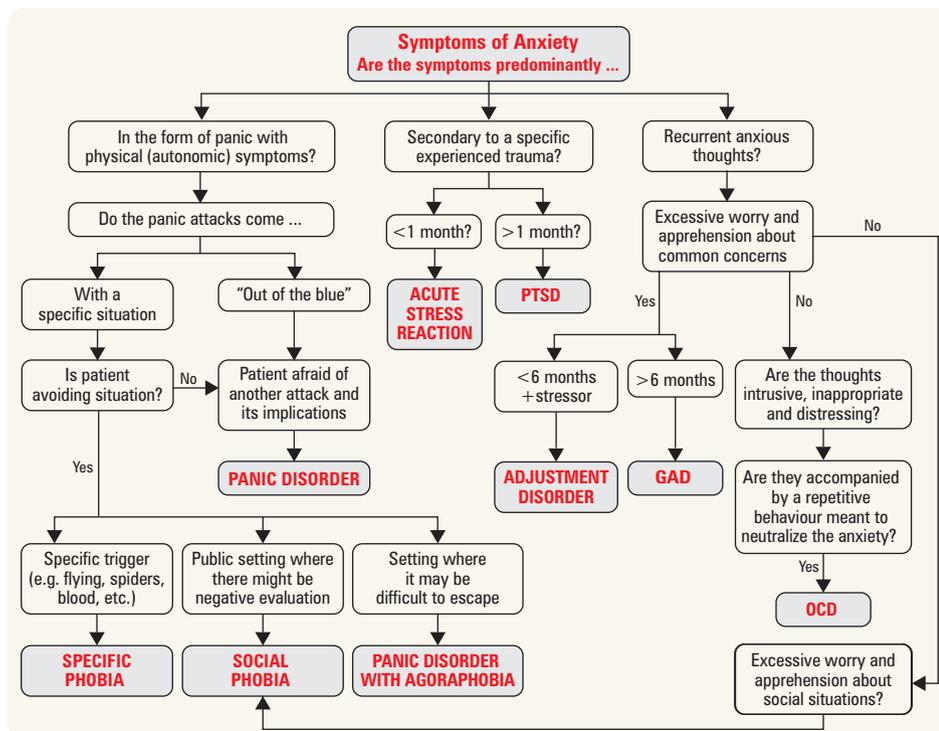

- 25-30% of patients in primary care settings have psychiatric disorders
- many are undiagnosed or untreated; hence the need for good screening
- high rate of coexistence of anxiety disorders and depression

### Screening

- screening tools such as the GAD-7 tool
- screening questions
  - Do you tend to be an anxious or nervous person?
  - Have you felt unusually worried about things recently?
  - Has this worrying affected your life? How?

### Assessment

- associated symptoms
- risk factors
  - family history of anxiety or depression, past history of anxiety, stressful life event, social isolation, female, comorbid psychiatric diagnosis (e.g. depression)
- assess substance abuse, comorbid depression, stressful life events, trauma, suicidal ideation/self-harm
- to differentiate anxiety disorders, consider symptoms (panic attacks, specific situations/stressors, excessive worry about common concerns, repetitive thoughts and/or behaviours to neutralize the anxiety) and their duration
- Generalized Anxiety Disorder 7-item (GAD - 7) scale to assess level of anxiety

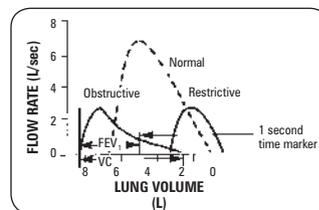

**Figure 6. Differentiating anxiety disorders**

Adapted from: Evans M, Bradwejn J, Dunn L. Anxiety Review Panel. Guidelines for the treatment of anxiety disorders in primary care. Toronto: Queen's Printer of Ontario, 2000.41

**Management**

- patient education: emphasize prevalence, good recovery rate of anxiety conditions
- lifestyle advice: decrease caffeine and alcohol intake, exercise, relaxation techniques, mindfulness strategies
- self-help materials, community resources (e.g. support groups)
- CBT: cognitive interventions, exposure therapy, etc.
- treat any underlying medical and/or comorbid conditions
- provide support to family and caregivers
- for pharmacotherapy, see [Psychiatry, PS48](#)

**Figure 7. Expiratory flow volume curves (obstructive, normal, and restrictive disease)**

See [Respirology, R8](#) Adapted from: Weinberger SE. Principles of pulmonary medicine, 5th ed. With permission from Elsevier. ©2008

**Signs of Poorly Controlled Asthma**

- $\beta_2$  agonist use >4x/wk
- Asthma-related absence from work/school
- Exercise induced asthma
- Night-time symptoms >1x/wk

**What Colour is Your Inhaler?**

Name	Body/Cap Colour
<b><math>\beta_2</math>-Agonists</b>	
Salbutamol – Ventolin®	light blue/navy
Salmeterol – Serevent®	teal/light teal
Terbutaline – Bricanyl®	blue/white
<b>ICS</b>	
Fluticasone – Flovent®	orange/peach
Budesonide – Pulmicort®	white/brown
<b>Combined Long-Acting <math>\beta_2</math>-Agonist + ICS</b>	
Fluticasone/Salmeterol – Advair®	purple discus
Budesonide/Formoterol – Symbicort®	red/white
Ipratropium/Albuterol – Combivent®	clear/orange
<b>Anticholinergics</b>	
Ipratropium – Atrovent®	clear/green
Tiotropium – Spiriva®	white/turquoise

**More About Inhalers**

- Aerosols (puffers=MDI, MDI + spacer)  
MDIs should be used with spacers to:
  - Reduce side effects
  - Improve amount inhaled
  - Increase efficiency of use
- Dry Powder Inhalers (discus, turbuhaler, and diskhaler) require deep and fast breathing (may not be ideal for children)
- Nebulizers can be used to convert liquid medications into a fine mist: recommended for use if contraindications to MDIs

**Differential Diagnosis of Wheezing**

- Allergies, anaphylaxis
- Asthma, reactive airway disease
- GERD
- Infections (bronchitis, pneumonia)
- Obstructive Sleep Apnea
- COPD
- Less common: congestive heart disease, foreign body, malignancy, cystic fibrosis, vocal cord dysfunction

When prescribing salbutamol, watch out for signs of **hypokalemia**: lethargy, irritability, paresthesias, myalgias, weakness, palpitations, N/V, polyuria

**Asthma/COPD**

- see [Respirology, R7](#)

**Definition**

- asthma
  - chronic, reversible airway inflammation characterized by periodic attacks of wheezing, SOB, chest tightness, and coughing
  - airways hyper-responsive to triggers/antigens leading to acute obstructive symptoms by bronchoconstriction, mucous plugs and increased inflammation
  - cannot be diagnosed at first presentation; called reactive airway disease until recurrent presentations
  - pulmonary function tests (PFTs) can be done from age 6 or when child able to follow instructions to do PFTs
  - peak flow meters are useful in the office and at home for monitoring
- chronic obstructive pulmonary disease (COPD)
  - group of chronic, progressive, non-reversible lung diseases characterized by limited airflow with variable degrees of air sac enlargement and lung tissue destruction
  - emphysema and chronic bronchitis are the most common forms

**Table 10. Differentiating COPD from Asthma**

	<b>COPD</b>	<b>Asthma</b>
<b>Age of Onset</b>	Usually in 6th decade	Any age (but 50% of cases diagnosed in children age <10)
<b>Role of Smoking</b>	>10 pack yr	Not causal, known trigger
<b>Reversibility of Airflow Obstruction</b>	Airflow obstruction is chronic and persistent	Airflow obstruction is episodic and usually reversible with therapy
<b>Evolution</b>	Slow, progressive worsening (with periodic exacerbations)	Stable, episodic, less than 50% will outgrow
<b>History of Allergy</b>	Infrequent	Over 50% patients
<b>Precipitators</b>	Environmental irritants (air pollution), cigarette smoking, $\alpha$ -1 antitrypsin deficiency, viral infection, occupational exposure (firefighters, dusty jobs)	Environmental irritants (dust, pollen), animal fur, cold air, exercise, URTIs, cigarette smoke, use of $\beta$ -blockers/ASA
<b>Symptoms/Signs</b>	Chronic cough, sputum, and/or dyspnea	Wheeze (hallmark symptom), dyspnea, chest tightness, cough which is worse in cold, at night, and in early AM, prolonged expiration
<b>Diffusion Capacity</b>	Decreased (more so in pure emphysema)	Normal (for pure asthma)
<b>Hypoxemia</b>	Chronic in advanced stages	Not usually present Episodic with severe attacks
<b>Spirometry</b>	May have improvement with bronchodilators but not universally seen	Marked improvement with bronchodilators or steroids
<b>Chest X-Ray</b>	Often normal Increased bronchial markings (chronic bronchitis) and chronic hyperinflation (emphysema) often co-exist, bullae	Often normal or episodic hyperinflation Hyperinflation during asthma attack
<b>Management</b>	<p><b>Mild</b> Step 1: SABA pm (salbutamol) Step 2: SABA pm + LAAC (i.e. tiotropium) or + LABA (e.g. salmeterol)</p> <p><b>Moderate</b> Step 3: SABA pm + LAAC + low-dose combined ICS/LABA; consider inhaled vs. oral steroids</p> <p><b>Severe</b> Step 4: <math>\pm</math> theophylline Pneumococcal vaccination, annual influenza immunization</p>	<p>Ongoing patient education, and environmental control SABA taken pm as rescue medication + maintenance meds</p> <p>Maintenance medications Step 1: Low-dose ICS Step 2: Medium/high-dose ICS or low-dose ICS plus either LABA, LT modifier, or long-acting theophylline Step 3: Medium/high-dose ICS plus either LABA, LT modifier, or long-acting theophylline Step 4: As above plus immunotherapy <math>\pm</math> oral glucocorticosteroids + pneumococcal vaccination, annual influenza immunization</p>

ICS = inhaled corticosteroids; LAAC = long-acting anticholinergic; LABA = long-acting  $\beta$ -agonist; LT modifier = leukotriene modifier; SABA = short-acting  $\beta$ -agonist

# Benign Prostatic Hyperplasia

- see [Urology, U7](#)

## Definition

- hyperplasia of the stroma and epithelium in the periurethral transition zone

## History and Physical

- include current/past health, surgeries, trauma, current and OTC meds
- specific urinary symptoms
- physical exam must include DRE for size, symmetry, nodularity, and texture of prostate (prostate is symmetrically enlarged, smooth, and rubbery in BPH)

## Investigations

- urinalysis to exclude UTI and for microscopic hematuria (common sign)
- serum PSA: protein produced by prostatic tissue
  - values
    - ◆ <4.0 ng/mL: normal, but must take into account patient's age and velocity of PSA increase
    - ◆ 4-10 ng/mL: consider measuring free/total PSA
    - ◆ >10 ng/mL: high likelihood of prostate pathology
  - PSA testing is inappropriate in men with a life expectancy less than 10 yr or patients with prostatitis, UTI
  - increased PSA in a younger man is more often due to cancer than other causes
  - abnormal DRE or PSA should trigger further assessment
  - discuss test with men at increased risk of prostate cancer (FHx, African ancestry) or who are concerned about development of prostate cancer
  - decision to test PSA in an asymptomatic man should involve discussion about the risks and possible benefits
- other tests
  - Cr, BUN
  - post-void residual volume by ultrasound
  - urodynamic studies, renal ultrasound
  - patient voiding diary
- tests NOT recommended as part of routine initial evaluation include:
  - cystoscopy
  - cytology
  - prostate ultrasound or biopsy
  - IVP
  - urodynamic studies

**Table 11. Symptoms and Complications of BPH**

Obstructive Symptoms	Irritative Symptoms	Late Complications
Hesitancy (difficulty starting urine flow)	Urgency	Hydronephrosis
Diminution in size and force of urinary stream	Frequency	Loss of renal concentrating ability
Stream interruption (double voiding)	Nocturia	Systemic acidosis
Urinary retention (bladder does not feel completely empty)	Urge incontinence	Renal failure
Post-void dribbling	Dysuria	
Overflow incontinence		
Nocturia		

## Management

- referral to urologist if moderate/severe symptoms
- conservative: for patients with mild symptoms or moderate/severe symptoms considered by the patient to be non-bothersome
  - fluid restriction (avoid alcohol and caffeine)
  - avoidance/monitoring of certain medications (e.g. antihistamines, diuretics, antidepressants, decongestants)
  - pelvic floor/Kegel exercises
  - bladder retraining (scheduled voiding)
- pharmacological: for moderate/severe symptoms
  - α-receptor antagonists (e.g. terazosin [Hytrin<sup>®</sup>], doxazosin [Cardura<sup>®</sup>], tamsulosin [Flomax<sup>®</sup>], alfuzosin [Xatral<sup>®</sup>])
  - relaxation of smooth muscle around the prostate and bladder neck
  - 5-α reductase inhibitor (e.g. finasteride [Proscar<sup>®</sup>])
  - only for patients with demonstrated prostatic enlargement due to BPH
  - inhibits enzyme responsible for conversion of testosterone into dihydrotestosterone (DHT) thus reducing growth of prostate
  - phytotherapy (e.g. saw palmetto berry extract, *Pygeum africanum*)
  - more studies required before this can be recommended as standard therapy
  - considered safe

**Self-Management Asthma and COPD Education and Written Action Plan**

- Education is a key component in management of asthma and COPD
- Guided self-management combining education, regular medical review, self-assessment, and written action plan have been shown to reduce hospitalizations, ER visits, and missed days at work or school.
- Sample action plans available online: <http://www.respiratoryguidelines.ca>

**Differential Diagnosis**

- Prostate cancer
- Urethral obstruction
- Bladder neck obstruction
- Neurogenic bladder
- Overactive bladder
- Cystitis
- Prostatitis

- surgical
  - TURP (transurethral resection of the prostate), TUIP (transurethral incision of the prostate, for prostates <30 g)
  - absolute indications: failed medical therapy, intractable urinary retention, benign prostatic obstruction leading to renal insufficiency
  - complications: impotence, incontinence, ejaculatory difficulties (retrograde ejaculation), decreased libido

**Differential Diagnosis of Bronchitis**

- URTI
- Asthma
- Acute exacerbation of chronic bronchitis
- Sinusitis
- Pneumonia
- Bronchiolitis
- Pertussis
- Environmental/occupational exposures
- Post-nasal drip
- Others: GERD, CHF, cancer, aspiration syndromes, CF, foreign body

**How to Tell if Viral or Bacterial?**

Bacterial infections tend to give a higher fever, excessive amounts of purulent sputum production, and may be associated with concomitant COPD

**Risk Factors for CAD**

**Major**

- Smoking
- Diabetes
- HTN
- Hyperlipidemia
- Family history of early CAD in first degree relative (males <55 yr, females <65 yr)
- Untreated obstructive sleep apnea
- Chronic kidney disease

**Minor**

- Obesity
- Sedentary lifestyle
- Age

**Red Flags**

- Severe pain
- Pain for >20 min
- New onset pain at rest
- Severe SOB
- Loss of consciousness
- Hypotension
- Tachycardia
- Bradycardia
- Cyanosis

**Ruling out Coronary Artery Disease in Primary Care**

CMAJ 2010;182(12):1295-1300

Components of the prediction rule used to determine the presence or absence of CAD in patients with chest pain in primary care:

- Age/sex (female ≥65, male ≥55): 1 pt
- Known clinical vascular disease (coronary artery disease, occlusive vascular disease, or cerebrovascular disease): 1 pt
- Pain worse during exercise: 1 pt
- Pain not reproducible by palpation: 1 pt
- Patient assumes pain is of cardiac origin: 1 pt

**Positive result:** 3-5 pts; **negative result:** ≤2 pts (sensitivity: 87.1%, specificity: 80%)

## Bronchitis (Acute)

**Definition**

- acute infection of the tracheobronchial tree causing inflammation leading to bronchial edema and mucus formation

**Epidemiology**

- 5th most common diagnosis in family medicine, most common is URTI

**Etiology**

- 80% viral: rhinovirus, coronavirus, adenovirus, influenza, parainfluenza, respiratory syncytial virus (RSV)
- 20% bacterial: *M. pneumoniae*, *C. pneumoniae*, *S. pneumoniae*

**Investigations**

- acute bronchitis is typically a clinical diagnosis
- sputum culture/Gram stain is not useful
- CXR if suspect pneumonia (cough >3 wk, abnormal vital signs, localized chest findings) or CHF
- PFT with methacholine challenge if suspect asthma

**Management**

- primary prevention: frequent hand washing, smoking cessation, avoid irritant exposure
- symptomatic relief: rest, fluids (3-4 L/d when febrile), humidity, analgesics and antitussives as required
- bronchodilators may offer improvement of symptoms (e.g. salbutamol)
- current literature does not support routine antibiotic treatment for the management of acute bronchitis because it is most likely to be caused by a viral infection
  - antibiotics may be useful if elderly, comorbidities, suspected pneumonia, or if the patient is toxic (see *Antimicrobial Quick Reference, FM49*)
  - antibiotics in children show no benefit

## Chest Pain

- see [Cardiology and Cardiac Surgery, C4 and Emergency Medicine, ER21](#)

**Differential Diagnosis**

**Table 12. Differential Diagnosis of Chest Pain**

Cardiac	Pulmonary	GI	MSK/Neuro	Psychologic
Angina*	Hemothorax*	Cholecystitis	Arthritis	Anxiety
Aortic dissection*	Lung CA	Esophageal spasm	Costochondritis	Depression
Endocarditis	PE*	GERD	Herpes zoster	Panic
MI*	Pneumonia	Hepatitis	Intercostal strain	
Myocarditis	Pneumothorax*	Perforated viscus*	Rib fractures	
Pericarditis*	Pulmonary HTN	PUD	Trauma	

\*Emergent

**Investigations**

- ECG, CXR, and others if indicated (cardiac enzymes, d-dimers, liver function tests [LFTs], etc.)
- refer to ED if suspect serious etiology (e.g. aortic dissection, MI)

**Management of Common Causes of Chest Pain**

- angina/ischemic heart disease
  - nitroglycerin (NTG): wait 5 min between sprays and if no effect after 3 sprays, send to ED
- myocardial infarction
  - ASA (160-325 mg, chewed stat), clopidogrel (Plavix®), LMWH (enoxaparin), morphine, oxygen, NTG
  - ± reperfusion therapy with fibrinolytics (e.g. tPA, RPA, TNK, or SK) if within 12h (ideally <30 min) or percutaneous intervention (cath lab) if <90 min
  - start β-blocker (e.g. metoprolol starting dose 25 mg PO q6h or bid, titrating to HR goal of 55-60 bpm)
- endocarditis: antibiotic choice is based on whether patient has a native or prosthetic heart valve as well as culture and sensitivity results
- GERD: antacids, H<sub>2</sub>-blockers, PPIs, patient education
- costochondritis: NSAIDs

**Treatment of Stable Ischemic Heart Disease**

- see [Cardiology and Cardiac Surgery, C27](#)

## Common Cold (Acute Rhinitis)

- see [Infectious Diseases, Pneumonia and Influenza, ID7](#)

### Definition

- viral URTI with inflammation

### Epidemiology

- most common diagnosis in family medicine, peaks in winter months
- incidence: adults = 2-4/yr, children = 6-10/yr
- organisms
  - mainly rhinoviruses (30-35% of all colds)
  - others: coronavirus, adenovirus, RSV, influenza, parainfluenza, coxsackie virus
- incubation: 1-5 d
- transmission: person-person contact via secretions on skin/objects and by aerosol droplets

### Risk Factors

- psychological stress, excessive fatigue, allergic nasopharyngeal disorders, smoking, sick contacts

### Clinical Features

- symptoms
  - local: nasal congestion, clear to mucopurulent secretions, sneezing, sore throat, conjunctivitis, cough
  - general: malaise, headache, myalgias, mild fever
- signs
  - erythematous nasal/oropharyngeal mucosa, enlarged lymph nodes
  - normal chest exam
- complications
  - secondary bacterial infection: otitis media, sinusitis, bronchitis, pneumonia
  - asthma/COPD exacerbation

### Differential Diagnosis

- allergic rhinitis, pharyngitis, influenza, laryngitis, croup, sinusitis, bacterial infections

### Management

- patient education
  - symptoms peak at 1-3 d and usually subside within 1 wk
  - cough may persist for days to weeks after other symptoms disappear
  - no antibiotics indicated because of viral etiology
  - secondary bacterial infection can present within 3-10 d after onset of cold symptoms
- prevention
  - frequent hand washing, avoidance of hand to mucous membrane contact, use of surface disinfectant
  - yearly influenza vaccination
- symptomatic relief
  - rest, hydration, gargling warm salt water, steam, nasal irrigation (spray/pot)
  - analgesics and antipyretics: acetaminophen, ASA (not in children because risk of Reye's syndrome)
  - cough suppression: dextromethorphan or codeine if necessary (children under 6 yr of age should not use any cough/cold medications)
  - decongestants, antihistamines
- patients with reactive airway disease will require increased use of bronchodilators and inhaled steroids

### MI in Elderly Women

Elderly women can often present with dizziness, back pain, lightheadedness, or weakness, in the absence of chest pain

### MI in Diabetics

May present with dyspnea, syncope, and fatigue in the absence of chest pain

### Influenza vs. Colds: A Guide to Symptoms

Features	Flu	Cold
Onset of illness	Sudden	Slow
Fever	High fever	None
Exhaustion level	Severe	Mild
Cough	Dry severe or hacking	±
Throat	Fine	Sore
Nose	Dry and clear	Runny
Head	Achy	Headache-free
Appetite	Decreased	Normal
Muscles	Achy	Fine
Chills	Yes	No

### Echinacea for Preventing and Treating the Common Cold

*Cochrane DB Syst Rev* 2014;2:CD000530

This systematic review of 24 trials assessed the effect of Echinacea in preventing and treating common colds. Trials compared preparations containing Echinacea with placebo, no treatment, or an alternative common cold treatment.

**Conclusions:** Echinacea products have not been shown to provide benefits for treating colds, although, it is possible there is a weak benefit from some Echinacea products. Individual prophylaxis trials consistently show positive (if non-significant) trends, although potential effects are of questionable clinical relevance.

- see [Neurosurgery, NS29, and Emergency Medicine, ER9](#)

- a useful tool for the assessment of individuals and athletes with concussion is the Sport Concussion Assessment Tool, 3rd edition (SCAT3), *Br J Sports Med* 2013 47: 259

## Contraception

- see [Gynecology, GY16](#)

### EMERGENCY CONTRACEPTION

- hormonal EC (Yuzpe® or Plan B®, usually 2 doses taken 12 h apart) or post-coital copper IUD insertion
- hormonal EC is effective if taken within 72 h of unprotected intercourse (reduces chance of pregnancy by 75-85%), most effective if taken within 24 h, does not affect an established pregnancy
- copper IUDs inserted within 5 d of unprotected intercourse are significantly more effective than hormonal EC (reduces chance of pregnancy by ~99%)
- pregnancy test should be performed if no menstrual bleeding within 21 d of either treatment
- advance provision of hormonal EC increases the use of EC without decreasing the use of regular contraception
- pharmacists across Canada can dispense Plan B® OTC

## Cough

### History and Physical

- duration (chronic - 8 wk), onset, frequency, quality (dry vs. productive), sputum characteristics, provoking/relieving factors, recent changes
- associated symptoms: fever, dyspnea, hemoptysis, wheezing, chest pain, orthopnea, PND, rhinitis, reflux, post-nasal drip
- constitutional symptoms: fever, chills, fatigue, night sweats
- risk factors: smoking, occupation, exposure, family history of lung CA or other CA, TB status, recent travel
- medications (e.g. ACEI,  $\beta$ -blockers), allergies
- PMH: lung (asthma, COPD, CF), heart (CHF, MI, arrhythmias), chronic illness, GI (reflux)
- vitals including O<sub>2</sub> saturation, respiratory exam, HEENT and precordial exam

### Investigations

- guided by findings on history and physical
  - consider throat swab, CXR, PFTs, upper GI series, sputum culture test for acid-fast bacilli (if TB is suspected)

### Differential Diagnosis

#### Common Causes

- Upper airway cough syndrome (post-nasal drip)
- Asthma/COPD
- GERD
- Non-asthmatic eosinophilic bronchitis

#### Other Causes

- ACEI
- Aspiration
- Bronchiectasis
- Cystic fibrosis
- Chronic interstitial lung disease
- CHF
- Lung/laryngeal cancer
- Pertussis
- Psychogenic
- Restrictive lung disease
- TB, atypical mycobacterium, and other chronic lung infections

## Dementia (Major Neurocognitive Disorder)

- see [Psychiatry, PS20](#)

### Epidemiology

- 15% of Canadians 65 and older are living with dementia; risk for dementia doubles every 5 years after age 65
- prevalence of depression in dementia is 20-60%; major depression decreases as dementia severity increases; vascular and mixed dementias have a higher prevalence of depression
- differential diagnosis: Alzheimer's dementia, vascular dementia, Lewy-Body dementia, frontotemporal dementia

### Investigations

- history, physical exam, MMSE, MOCA (best screening test), dementia quick screen (see sidebar)
- investigations are completed to exclude reversible causes of dementia and should be selected based on the clinical circumstances
- CBC, liver enzymes, TSH, renal function tests, serum electrolytes, serum calcium, serum glucose, vitamin B<sub>12</sub>, folate, VDRL, HIV, head CT

### Management

- treat and prevent reversible causes
- provide orientation cues (e.g. calendars, clocks) and optimize vision and hearing
- family education, counselling, and support (respite programs, group homes)
- pharmacologic therapy: NMDA receptor antagonists and cholinesterase inhibitors slow rate of cognitive decline; low-dose neuroleptics and antidepressants can be used to treat behavioural and emotional symptoms
- 20% of patients develop clinical depression, most commonly seen in vascular dementia

### Dementia Quick Screen = Mini Cog + Animal naming

- 3 simple tests, takes about 2 min
- Use when suspect mild cognitive impairment or when patient is at high risk
- Mini Cog = 3-word recall + clock drawing
  - Clock Drawing – including numbers and hands so time shows 10 min past 11 (normal = correct number/hand placing, or only minor spacing problems)
  - 0 word recall = impairment, 1-2 words and clock drawing abnormal = impairment, 3- word recall = normal.
- Naming animals in 1 min (normal = >15 in one min)
- Interpretation: If all 3 results within normal range, cognitive impairment unlikely
- Return for further evaluation if:
  - <15 animals named
  - 0-1 words recalled
  - Clock Drawing Abnormal

## Depression

- see [Psychiatry, PS10](#)

### Etiology

- often presents as non-specific complaints (e.g. sleep disturbance, chronic fatigue, pain)
- depression is a clinical diagnosis and tests are done in order to rule out other causes of symptoms
- 2/3 of patients may not receive appropriate treatment for their depression
- early diagnosis and treatment improve outcomes

### Screening Questions

- Canadian Task Force on Preventive Health Care (2103) recommends not routinely screening for depression
- high-yield screening questions are:
  - “Are you depressed?” (high specificity and sensitivity)
  - “Have you lost interest or pleasure in the things you usually like to do?” (anhedonia)
  - “Do you have problems sleeping?”
- PHQ9 tool is useful to screen, diagnose and monitor depression; use Geriatric Depression Scale (GDS) for the geriatric population

**Assessment**

- risk factors: see **Psychiatry, PS10**
- personal or family history of depression
- medications and potential substance abuse problems
- high risk for suicide/homicide
  - fill out Form 1 (in Ontario): application by physician to hospitalize a patient against his/her will for psychiatric assessment (up to 72 h)
- functional impairment (e.g. work, relationships)
- at least 5 out of 9 criteria including at least one of anhedonia or depressed mood  $\geq 2$  wk for actual diagnosis to be met (see sidebar)
- validated depression rating scales: Beck's depression inventory, Zung's self-rating depression scale, Children's depression inventory, Geriatric Depression Scale, Personal Health Questionnaire Depression Scale (PHQ-9)
- routine medical workup (physical exam, CBC, TSH, ferritin, folate, B<sub>12</sub>, electrolytes, urinalysis, glucose, etc.)

**Treatment**

- goal: full remission of symptoms and return to baseline psychosocial function
- phases of treatment
  - acute phase (8-12 wk): relieve symptoms and improve quality of life
  - maintenance phase (6-12 mo after symptom resolution): prevent relapse/recurrence, must stress importance of continuing medication treatment for full duration to patients
- treatment options are pharmacotherapy psychotherapy, or a combination of both
- combination therapy is synergistic and most effective
- treatment of youth (age 10-21)
  - for mild depression, a period of active support and monitoring before initiating treatment is recommended
  - fluoxetine is first line among SSRIs (most evidence)
    - ♦ monitor closely for adverse effects such as suicidal ideation and behaviour
  - psychotherapy
    - ♦ CBT or interpersonal therapy (IPT) alone can be used for mild depression
    - ♦ psychotherapy plus medication is recommended for moderate to severe depression
  - treatment should continue for at least 6 months
    - ♦ ongoing management should include assessment in key domains (school, home, social setting)
    - ♦ reassessment and referral recommended if no improvement after 6-8 wk of treatment
- for adolescents with moderate/severe depression and coexisting psychosis and/or substance abuse, consider referral

**Table 13. Common Medications**

Class	Examples	Action	Side Effects	Notes
<b>SSRI</b>	paroxetine (Paxil®) fluoxetine (Prozac®) sertraline (Zoloft®) citalopram (Celexa®) fluvoxamine (Luvox®) escitalopram (Ciprallex®)	Block serotonin reuptake	Sexual dysfunction (impotence, decreased libido, delayed ejaculation, anorgasmia), headache, GI upset, weight loss, tremors, insomnia, fatigue, increase QT interval (baseline ECG is suggested)	First line therapy for youth is fluoxetine; paroxetine is not recommended for youth (controversial)
<b>SNRI</b>	venlafaxine (Effexor®) duloxetine (Cymbalta®)	Block serotonin and NE reuptake	Insomnia, tremors, tachycardia, sweating	
<b>SDRI</b>	bupropion (Wellbutrin®)	Block dopamine and NE reuptake	Headache, insomnia, nightmares, seizures, less sexual dysfunction than SSRIs	Often chosen for lack of sexual side effects, can be used for augmentation of anti-depressant effects with other classes of medication
<b>TCA</b>	amitriptyline (Elavil®)	Block serotonin and NE reuptake	Sexual dysfunction, weight gain, tremors, tachycardia, sweating	Narrow therapeutic window, lethal in overdose

**Prognosis**

- up to 40% resolve spontaneously within 6-12 mo
- risks of recurrence: 50% after 1 episode; 70% after 2 episodes; 90% after 3 episodes

**Must Ask About/Rule Out**

- Suicidal/homicidal ideation
- Psychosis
- Substance use/abuse/withdrawal
- Anxiety
- Bipolar/manic/hypomanic episodes
- Bereavement
- Intimate partner violence
- Post-partum depression
- Organic cause

**Differential Diagnosis**

- Other psychiatric disorders (e.g. anxiety, personality, bipolar, adjustment disorder, schizoaffective, seasonal affective disorder, substance abuse/withdrawal)
- Cancer (50% of patients with tumours, especially of brain, lung, and pancreas, develop symptoms of depression before the diagnosis of cancer is made)
- Chronic fatigue syndrome
- Early dementia
- Endocrine (e.g. hyper/hypothyroidism, DM, adrenal disorders)
- Infections (mononucleosis)
- Liver failure, renal failure
- Medication side effects ( $\beta$ -blockers, benzodiazepines, glucocorticoids, interferon)
- Menopause
- Neurological (Parkinson's, MS)
- Vitamin deficiency (pernicious anemia, pellagra)

**Criteria for Depression ( $\geq 5/9$  with at least one of anhedonia or depressed mood for  $\geq 2$  wk)**

**M-SIGECAPS**

- M** Depressed Mood
- S** Increased/decreased Sleep
- I** Decreased Interest
- G** Guilt
- E** Decreased Energy
- C** Decreased Concentration
- A** Increased/decreased Appetite and weight
- P** Psychomotor agitation/retardation
- S** Suicidal ideation

**Combined Pharmacotherapy and Psychological Treatment for Depression: A Systematic Review**  
*Arch Gen Psychiatry* 2004;61:714-719

**Study:** Systematic review of randomized clinical trials.

**Patients:** 16 trials comprising 1,842 patients.

**Intervention:** Antidepressant treatment alone vs. combination of psychological intervention and antidepressant therapy.

**Main Outcomes:** Efficacy of and adherence to therapy.

**Results:** Overall, combined therapy was significantly more effective than antidepressant therapy alone (OR 1.86; 95% CI 1.38-2.52), however there was no difference in the rate of dropouts and non-responders in either treatment arm. In studies lasting  $> 12$  wk, combined therapy showed a reduction in dropouts compared to non-responders (OR 0.59; 95% CI 0.39-0.88).

**Diabetes Mellitus**

- see **Endocrinology, E7**
- see 2013 Clinical Practice Guidelines from Canadian Diabetes Association (updated in 2016), available from: <http://guidelines.diabetes.ca/fullguidelines>

**Definition**

- metabolic disorder characterized by the presence of hyperglycemia due to deflection insulin secretion, defective insulin action or both

**Classification**

- type 1: primarily a result of pancreatic β-cell destruction
- type 2: characterized by insulin resistance
- GDM: glucose intolerance with onset or first recognition during pregnancy

**Epidemiology**

- major health concern, affecting up to 10% of Canadians
- incidence of type 2 DM is rising due to increasing obesity, sedentary lifestyle, and age of the population
- leading cause of new-onset blindness and renal dysfunction
- Canadian adults with DM are twice as likely to die prematurely, compared to persons without DM

**Risk Factors**

- type 1 DM
  - personal or family history of autoimmune disease
- type 2 DM
  - first degree relative with DM
  - age ≥40 yr
  - obesity (especially abdominal), HTN, hyperlipidemia, CAD, vascular disease
  - prior GDM, macrosomic baby (>4 kg)
  - PCOS
  - history of IGT or IFG
  - presence of complications associated with DM
  - presence of associated diseases: PCOS, acanthosis nigricans, psychiatric disorders, HIV
  - medications: glucocorticoids, atypical antipsychotics, HAART
- both
  - member of a high risk population (e.g. Aboriginal, Hispanic, Asian, or African descent)

**Diagnosis**

- persistent hyperglycemia is the hallmark of all forms of DM

**Table 14. Diagnosis of Prediabetes and Diabetes**

Condition	Diagnostic Criteria
DM	One of the following on 2 occasions: Random BG ≥11.1 mmol/L (200 mg/dL) with symptoms of DM (fatigue, polyuria, polydipsia, unexplained weight loss) OR Fasting BG ≥7.0 mmol/L (126 mg/dL) OR BG 2 h post 75 g OGTT ≥11.1 mmol/L (200 mg/dL) OR HbA1c ≥6.5% (in adults) **If asymptomatic (and meet any of the above criteria) a repeat test must be done to confirm the diagnosis. If symptomatic (fatigue, polyuria, polydipsia, unexplained weight loss), the diagnosis is made with one test.
Impaired Fasting Glucose (IFG)	Fasting BG = 6.1-6.9 mmol/L (110-124 mg/dL)
Impaired Glucose Tolerance (IGT)	BG 2 h post 75 g OGTT = 7.8-11.0 mmol/L (141-198 mg/dL)
Prediabetes	HbA1C = 6.0-6.4%

**Screening**

- type 2 DM
  - FBG in everyone ≥40 q3yr, or at high risk using the CANRISK calculator
  - more frequent and/or earlier testing if presence of ≥1 risk factor (see above)
- GDM (see [Obstetrics, OB26](#))
  - all pregnant women between 24-28 wk gestation

**Goals of Therapy**

**Table 15. Goals of Therapy in Diabetes**

General	Avoid complications (e.g. ketoacidosis, hyperglycemia, infection) Prevent long-term complications (microvascular and macrovascular) Minimize negative sequelae associated with therapies (e.g. hypoglycemia, weight gain)
Fasting or Preprandial BG	Ideal: 4-7 mmol/L (72-126 mg/dL) Suboptimal: 7.1-10 mmol/L (128-180 mg/dL); action may be required Inadequate: >10.0 mmol/L (180 mg/dL); action required Frail Elderly: target is 5-12 mmol/L
HbA1c	≤7% or ≤6.5% in some type 2 DM patients at risk for nephropathy Suboptimal: 7-8.4% Inadequate: >8.4% Frail elderly, advanced co-morbidities, recurrent severe hypoglycemia or hypoglycemia unawareness: target is 7.1-8.5%
2 h Postprandial BG	5-10 mmol/L (90-180 mg/dL) if HbA1c target met 5-8 mmol/L (90-144 mg/dL) if HbA1c target not met Frail elderly: use clinical judgment
Blood Pressure	<130/80 in adults (DM and HTN guidelines)
Lipids	LDL <2.0 mmol/L (36 mg/dL)

**Long-Term Complications of DM**

- Microvascular: nephropathy, retinopathy, neuropathy
- Macrovascular: CAD, CVD, PVD

**DM Related Symptoms**

- Hyperglycemia:** polyphagia, polydipsia, polyuria, weight change, blurry vision, yeast infections
- Diabetic Ketoacidosis (DKA):** fruity breath, anorexia, N/V, fatigue, abdominal pain, Kussmaul breathing, dehydration
- Hypoglycemia:** hunger, anxiety, tremors, palpitations, sweating, headache, fatigue, confusion, seizures, coma

## Assessment and Monitoring

**Table 16. Assessment and Monitoring**

	Initial Assessment	q2-4mo	Annually
<b>History</b>	Symptoms of hyperglycemia, ketoacidosis, hypoglycemia Past medical history Functional inquiry Family history Risk factors Medications Sexual function Lifestyle	DM-directed history Screen for awareness and frequency of hypoglycemia and DKA Glucose monitoring Use of insulin and oral agents Smoking cessation	DM-directed history Screen for awareness and frequency of hypoglycemia and DKA Glucose monitoring Use of insulin and oral agents Sexual function Lifestyle counselling Screen for depression
<b>Physical Exam</b>	General: Ht, Wt, BMI, BP, WC Head and neck: funduscopy, thyroid exam Cardiovascular exam: signs of PVD, pulses, bruits Abdominal exam (e.g. for organomegaly) Hand/foot/skin exam Neurological exam	Wt, BP, BMI, WC	Foot exam for sensation (using a 10 g monofilament), ulcers or infection Remainder of exam as per PHE
<b>Investigations</b>	FBG, HbA1c, fasting lipids, Cr, microalbumin:creatinine ratio Baseline ECG; repeat testing q2yrs for those at high risk	HbA1c q3mo FBG as needed	Fasting lipid profile Annual random ACR and eGFR
<b>Management</b>	Nutritional and physical education Consider referral to DM education program if available Monitoring BG: explain methods and frequency Medication counselling: oral hypoglycemics and/or insulin, method of administration, dosage adjustments Pneumococcal vaccination Ophthalmology consult type 1 DM within 5 yr type 2 DM at diagnosis	Assess progress towards long-term complications Adjust treatment plan if necessary	Calibrate home glucose monitor Arrange retinopathy screening Influenza vaccination annually

**Calculate Total Insulin Required**  
type 1 DM: 0.5-0.7 units/kg/d  
type 2 DM: 0.3 units/kg/d

### Dietary Advice for Treatment of Type 2 DM in Adults

*Cochrane DB Syst Rev 2007;3:CD004097*  
A meta-analysis of 36 RCTs in which dietary advice was the main intervention for adults with T2DM demonstrated no data available for efficacy of dietary changes. Exercise improved HbA1c at 6 and 12-mo timepoints.

## Nonpharmacologic Management

- diet
  - all diabetics should see a registered dietician for nutrition counselling
  - can reduce HbA1c by 1-2%
  - moderate weight loss (5%) improves glycemic control and CVD risk factors
  - decrease combined saturated fats and trans-fatty acids to <10% of calories
  - avoid simple sugars, choose low glycemic-index foods, ensure regularity in timing and spacing of meals
- physical activity and exercise
  - at least 150 min of aerobic exercise per wk, plus 2 sessions per wk of resistance exercise is recommended
  - encourage 30-45 min of moderate exercise 4-7 d/wk
  - promote cardiovascular fitness: increases insulin sensitivity, lowers BP, and improves lipid profile
  - if insulin treated, may require alterations of diet, insulin regimen, injection sites, and self-monitoring

## Self-Monitoring of Blood Glucose

- type 1 DM: 3 or more self-tests/d is associated with a 1% reduction in HbA1c
- type 2 DM: recommendations vary based on treatment regimen (e.g. insulin dependent requires more frequent monitoring – refer to 2013 Canadian Practice Guidelines)
- if FBG >14 mmol/L, perform ketone testing to rule out DKA
- if bedtime level is <7 mmol/L, have bedtime snack to reduce risk of nocturnal hypoglycemia

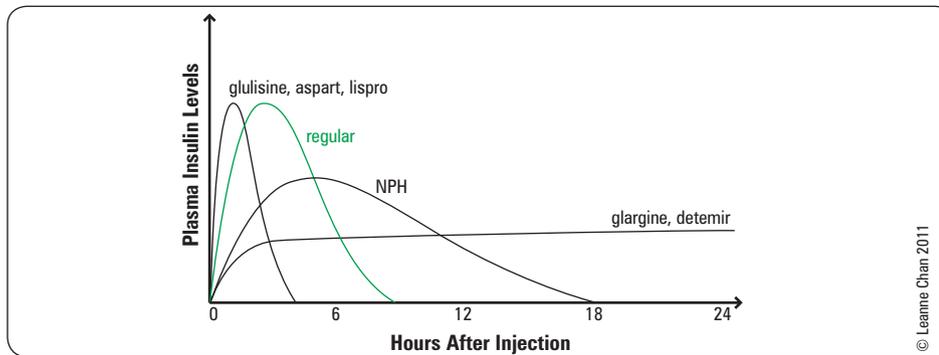

Figure 8. Types of insulin preparation

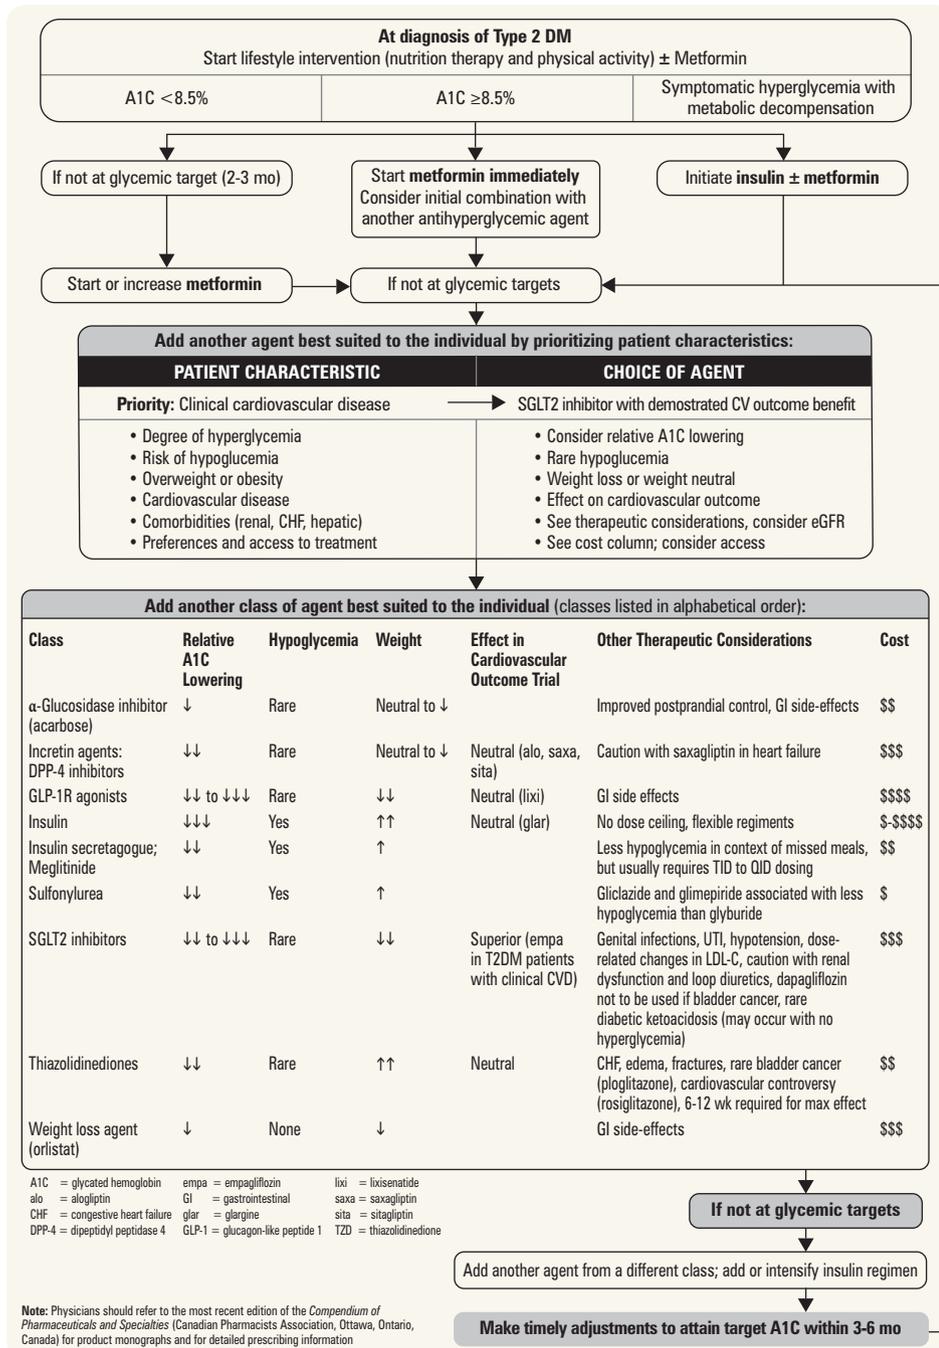

Figure 9. Management of hyperglycemia in type 2 diabetes

With permission of: Canadian Diabetes Association Clinical Practice Guidelines Expert Committee. Pharmacologic Management of Type 2 Diabetes. *Can J Diabetes* 2013;37:S61-S68

### Hypoglycemic Agents (Type 2 DM)

- oral
  - biguanide: metformin (Glucophage®)
  - thiazolidinedione: troglitazone (Rezulin®), rosiglitazone (Avandia®)
  - α-glucosidase inhibitor: acarbose (Precose®)
  - nonsulfonylureas: nateglinide (Starlix®), repaglinide (Gluconorm®)
  - sulfonylureas: glyburide (DiaBeta®), glimepiride (Amaryl®), gliclazide (Diamicron®)
  - DPP-4 inhibitor: sitagliptin (Januvia®)
- injectable
  - GLP-1 analogue: liraglutide (Victoza®)

### Other Medications Used in DM

- ACEI or ARB in those with any of
  - clinical macrovascular disease
  - age ≥55 years
  - age <55 and microvascular complications
- statin in those with any of
  - clinical macrovascular disease
  - age ≥40 years
  - age <40 and any of the following:
    - diabetes duration >15 years and age >30 years
    - microvascular complications
    - other cardiovascular risk factors
- low dose ASA (81-325 mg)
  - for secondary prevention in people with established CVD (NOT to be used routinely for primary prevention)

**Rosiglitazone Revisited: An Updated Meta-Analysis of Risk for Myocardial Infarction and Cardiovascular Mortality**  
*Arch Intern Med* 2010;170:1191-1201  
 Eleven years after the introduction of rosiglitazone, the totality of randomized clinical trials continue to demonstrate increased risk for MI although not for CV or all-cause mortality. The current findings suggest an unfavourable benefit to risk ratio for rosiglitazone.

**DDx of Vertigo**

	BPPV	Labyrinthitis	Menière's	Acoustic Neuroma
Onset	sudden	sudden	gradual	insidious
Duration	seconds	days	min-hours	chronic
Hearing Loss	—	+	+	+
Tinnitus	—	+	+	+
Neuro Sx	—	—	—	+

## Dizziness

- see [Otolaryngology, OT6](#)

### Epidemiology

- 70% see general practitioners initially; 4% referred to specialists
- frequency proportional to age; commonest complaint of ambulatory patients age >75

### Differential Diagnosis

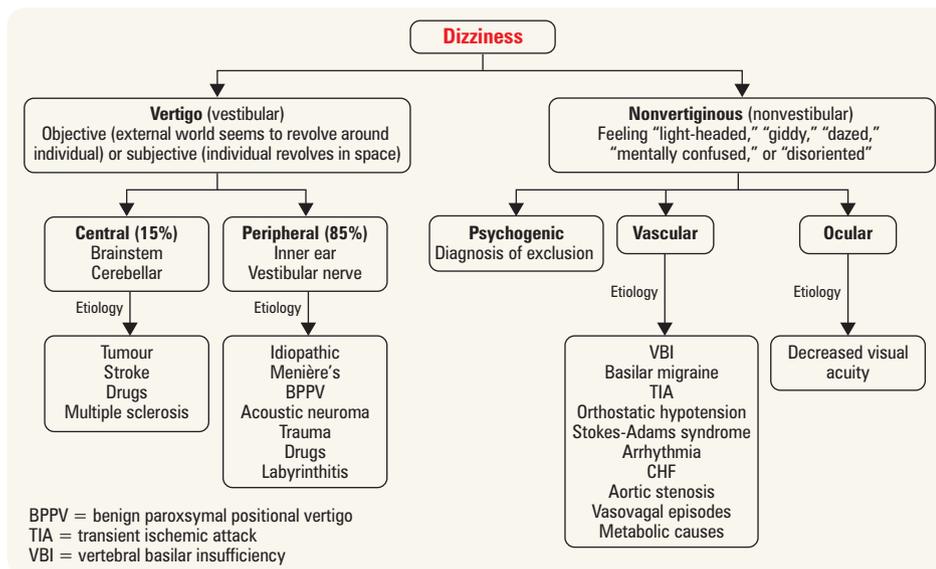

Figure 10. Differential diagnosis of dizziness

### History

- clarify type of dizziness: vertigo, pre-syncope, disequilibrium, light-headedness
- duration
- exacerbations
  - worse with head movement or eye closure (vestibular)
  - no change with head movement and eye closure (nonvestibular)
  - worse with exercise (cardiac/pulmonary causes)

- associated symptoms
  - neurologic (central)
    - ♦ transient diplopia, dysphagia, dysarthria, ataxia (TIA, VBI, migraine)
    - ♦ persistent headache, alterations in level of consciousness, sensory and/or motor deficits (CNS)
  - audiologic (peripheral)
    - ♦ hearing loss, tinnitus, otalgia, aural fullness
  - others
    - ♦ N/V (peripheral vestibular disorders)
    - ♦ SOB, palpitations (hyperventilation, cardiac problem)
- general medical history
  - HTN, DM, heart disease, fainting spells, seizures, cerebrovascular disease, migraines
  - ototoxic drugs: aminoglycosides (gentamicin, streptomycin, tobramycin), erythromycin, ASA, antimalarials
  - hypotension (secondary to diuresis): furosemide, caffeine, alcohol
  - depression/anxiety: can present with light-headedness

### Physical Exam/Investigations

- syncopal
  - cardiac (orthostatic changes in vitals), peripheral vascular, and neurologic exams
  - blood work, ECG, 24 h Holter, treadmill stress test, loop ECG, tilt table testing, carotid, and vertebral doppler, EEG
- vertiginous
  - ENT and neurologic exams
  - Dix-Hallpike, consider audiometry and MRI if indicated
- non-syncopal, non-vertiginous
  - assess gait, vision and test for neuropathy
  - cardiac and neurologic exams
  - 3-min hyperventilation trial (patient is coached to hyperventilate until patient becomes dizzy to identify if symptoms are reproducible and confirm that hyperventilation is the etiology of the symptoms), ECG, EEG
  - Romberg test: test for disequilibrium (patient sways towards the side of vestibular dysfunction)

### Treatment

- guided by history, physical exam, and investigations
- include education, lifestyle modification, physical maneuvers (e.g. Epley for BPPV), symptomatic management (e.g. antiemetics), pharmacotherapy, and surgery
- refer when significant central disease is suspected, when vertigo of peripheral origin is persistent (lasting >2-4 wk), or if atypical presentation

#### Dix-Hallpike Test

- Have the patient seated with legs extended and head at 45° rotation
- Rapidly shift patient to supine position with head fully supported in slight extension (for 45 s)
- Observe for rotatory nystagmus and ask about sensation of vertigo

## Domestic Violence/Elder Abuse

### INTIMATE PARTNER VIOLENCE

#### Definition

- includes physical, sexual, emotional, psychological, and financial abuse (see [Emergency Medicine, ER28](#))

#### Epidemiology

- lifetime prevalence of intimate partner violence against women is between 25-30%
- women who experience abuse have increased rates of injury, death, and health consequences including 50-70% increase in gynecological, central nervous system, stress-related problems
- occurs in all socioeconomic, educational, and cultural groups with increased incidence in pregnancy, disabled women, and 18-24 age group
- 25-50% chance of child abuse or neglect in families where partner abuse occurs
- physician recognition rates as low as 5%

#### Presentation

- multiple visits with vague, ill-defined complaints such as: headaches, gastrointestinal symptoms, insomnia, chronic pain, hyperventilation
- may also present with injuries inconsistent with history

#### Management

- screen ALL patients
  - always have a high index of suspicion
  - asking about abuse is the strongest predictor of disclosure
  - several screening tools (see sidebar) exist to identify victims of partner violence
  - make sure to determine the victim's level of immediate and long-term danger and ask if there are weapons in the house
- ensure patient safety
  - victim most at risk for homicide when attempting to leave home or following separation

#### Screening Instruments for Domestic Violence

##### A) Woman Abuse Screening Tool (WAST)-SHORT

1. In general how would you describe your relationship?
  - a. A lot of tension
  - b. Some tension
  - c. No tension
2. Do you and your partner work out arguments with . . . ?
  - a. Great difficulty
  - b. Some difficulty
  - c. No difficulty

Endorsing either question 1 ("a lot of tension") or question 2 ("great difficulty") makes intimate partner violence exposure likely

##### B) HITS

- How often does your partner:
1. Physically hurt you?
  2. Insult you?
  3. Threaten you with harm?
  4. Scream or curse at you?

Each question on HITS to be answered on a 5 point scale ranging from 1 (= never) to 5 (= frequently)  
A total score of 10.5 is significant

- provide community resources
  - safety planning includes ensuring that there is access to an exit in the home, establishing a safe place to go and having money, clothes, keys, medications, important documents, and other emergency items prepared should the patient need to leave quickly
  - shelter or helpline number with legal advocacy and counselling services
  - involve social workers or domestic violence advocates
- appointment for follow-up to assess whether condition is better or worse
- reassure patient she/he is not to blame and that the assault is a crime
  - goal is to convey the message that “As your doctor, I am concerned for your safety” and “Your partner has a problem that he/she needs help with” and “I want to help you”
  - reporting suspected or known child abuse is mandatory
  - spousal abuse is a criminal act, but not reportable without the woman’s/man’s permission
- DOCUMENT all evidence of abuse-related visits for medico-legal purposes

## ELDER ABUSE

- see [Geriatric Medicine, GM4](#)

### How to Document Abuse

- Take photographs (with permission) of known or suspected injuries
- Use an injury location chart or “body map” when documenting physical findings
- Document any investigations ordered (e.g. x-ray)
- Write legibly or use a computer
- Record the patient’s own words in quotation marks
- Avoid phrases that imply doubt about the patient’s reliability (e.g. “patient claims that...”)
- Record the patient’s demeanor (e.g. upset, agitated)
- Record the time of day the patient is examined and how much time has elapsed since the abuse occurred

## Dyspepsia

- see [Gastroenterology, G10](#)

### Definition and Clinical Features

- defined as epigastric pain or discomfort
- can be associated with fullness, belching, bloating, heartburn, food intolerance, N/V

### Epidemiology

- annual incidence 1-2%, prevalence 20-40%

### Etiology

- common: functional, PUD, GERD, gastritis
- others: cholelithiasis, irritable bowel syndrome, esophageal or gastric cancer, pancreatitis, pancreatic cancer, Zollinger-Ellison syndrome, and abdominal angina

### History

- symptoms may not be useful in finding cause
- associated with eating, anorexia, N/V, alcohol, NSAID use
- red flags: vomiting, bleeding/ anemia, abdominal mass, dysphagia (VBAD)

### Investigations and Management

- for new onset dyspepsia, test for *H. pylori* using the urea breath test or serology
- upper endoscopy (preferred), upper GI series (not in patients with alarm symptoms)
- lifestyle modifications: decreased caffeine and alcohol intake, avoid citrus food, avoid supine position right after meals, smoking cessation
- pharmacologic treatment
- gastric acid suppression: H<sub>2</sub> blockers, PPIs; both are effective for PUD and GERD
- prokinetics: e.g. Metoclopramide; effective for functional dyspepsia
- *H. pylori* eradication
- do not keep patients on PPI without at least 1 trial off the medication per year (<http://www.choosingwiselycanada.org/in-action/toolkits/bye-bye-ppi/>)
- for non-responders, gastroscopy should be considered

### Dyspepsia Red Flags

- Weight Loss
- Dysphagia
- Persistent vomiting
- GI bleeding (hematemesis, hematochezia, melena)
- Onset age >50

### *H. pylori* Eradication

#### Take the following 10 day treatment

- 1) PPI 1 tablet 2x/d for 10 d and
  - 2) Amoxicillin 1 g twice a day for 5 d (day 1-5)
- Followed by
- 3) Clarithromycin 500 mg 2x/d (day 6-10) and
  - 4) Metronidazole 500 mg 2x/d (day 6-10)

### DDx of Dyspnea

#### Pulmonary

- COPD
- Asthma
- Restrictive lung disease
- Pneumothorax
- Congenital lung disease
- PE

#### Cardiac

- CHF
- CAD
- MI (recent or past)
- Cardiomyopathy
- Valve dysfunction
- Pericarditis
- Arrhythmia
- Hypertrophy

#### Mixed/Other

- Deconditioning
- Trauma
- Pain
- Neuromuscular
- Metabolic condition
- Functional: anxiety, panic attack, hyperventilation

## Dyspnea

- see [Respirology, R3](#) and [Emergency Medicine, ER26](#)

### Definition

- uncomfortable, abnormal awareness of breathing

### History and Physical Exam

- history
  - cough, sputum, hemoptysis, wheezing, chest pain, palpitations, dizziness, edema, SOB
  - asthma, allergy, eczema, ASA/NSAID sensitivity, nasal polyps
  - constitutional symptoms
  - smoking, recreational drugs, medications
  - occupational exposure, environmental exposure (e.g. pets, allergens, smoke)
  - travel and birth place
  - FHx of atopy
  - previous CXR or PFTs
- physical exam: vitals, respiratory, precordial, HEENT, signs of anemia/liver failure/heart failure

**Investigations**

- CXR, ECG
- PFTs, ABG acutely if indicated

**Management**

- ABCs: send to ED if in severe respiratory distress
- depends on cause

**UTI Clinical Decision Aid**

- Dysuria
- + Leukocytes
- + Nitrites

If 2 or more criteria MET, then treat without culture, otherwise culture required prior to treatment

*Arch Intern Med* 2007;67:2201-2206

**Risk Factors for Complicated UTI**

- Male
- Pregnancy
- Recent urinary tract instrumentation
- Functional or anatomic abnormality of the urinary tract
- Chronic renal disease
- DM
- Immunosuppression
- Indwelling catheter

**Cranberries for Preventing Urinary Tract Infections**

*Cochrane DB Syst Rev* 2008;1:CD001321

**Study:** Meta-analysis of 10 RCTs (n=1,049).

**Patients:** All populations.

**Intervention:** Cranberry juice vs. placebo, juice or water was evaluated in seven studies, and cranberry tablets vs. placebo in four studies.

**Main Outcome:** UTIs – symptomatic and asymptomatic.

**Results:** Cranberry products significantly reduced the incidence of UTIs at 12 mo (RR 0.65, 95% CI 0.46-0.90) compared with placebo/control.

**Conclusion:** There is some evidence that cranberry products may decrease the number of symptomatic UTIs over a 12 mo period, particularly for women with recurrent UTIs.

**Prevention of UTIs**

- Maintain good hydration (especially with cranberry juice) (recommendation level I)
- Wipe urethra from front to back to avoid contamination of the urethra with feces from the rectum
- Avoid feminine hygiene sprays and scented douches
- Empty bladder immediately before and after intercourse

**Dysuria**

- see [Urology, U10](#)

**Definition**

- the sensation of pain, burning, or discomfort on urination

**Epidemiology**

- in adulthood, more common in women than men
- approximately 25% of women report one episode of acute dysuria per year
- most common in women age 25-54 and in those who are sexually active
- in men, dysuria becomes more prevalent with increasing age

**Etiology**

- infectious
  - most common cause
  - presents as cystitis, urethritis, pyelonephritis, vaginitis, cervicitis, epididymo-orchitis, or prostatitis
- non-infectious
  - hormonal conditions (hypoestrogenism), obstruction (BPH, urethral strictures), allergic reactions, radiation, drugs/chemicals, foreign bodies, trauma, neoplasm, kidney stones, inflammatory diseases, endometriosis, psychogenic

**Table 17. Etiology, Signs and Symptoms of Common Causes of Dysuria**

Infection	Etiology	Signs and Symptoms
UTI/Cystitis	KEEPS bacteria ( <i>Klebsiella</i> , <i>E. coli</i> , <i>Enterobacter</i> , <i>Proteus mirabilis</i> , <i>Pseudomonas</i> , <i>S. saprophyticus</i> )	Internal dysuria throughout micturition, frequency, urgency, incontinence, hematuria, nocturia, back pain, suprapubic discomfort, low grade fever (rare)
Urethritis	<i>C. trachomatis</i> , <i>N. gonorrhoeae</i> , <i>Trichomonas</i> , <i>Candida</i> , herpes	Initial dysuria, urethral/vaginal discharge, history of STI
Vaginitis	<i>Candida</i> , <i>Gardnerella</i> , <i>Trichomonas</i> , <i>C. trachomatis</i> , atrophic, herpes, lichen sclerosis	External dysuria/pain, vaginal discharge, irritation, dyspareunia, abnormal vaginal bleeding
Prostatitis	<i>E. coli</i> , <i>C. trachomatis</i> , <i>S. saprophyticus</i> , <i>Proteus mirabilis</i> , <i>Enterobacter</i> , <i>Klebsiella</i> , <i>Pseudomonas</i>	Dysuria, fever, chills, urgency, frequency, tender prostate, rectal pain
Pyelonephritis	<i>E. coli</i> , <i>S. saprophyticus</i> , <i>Proteus mirabilis</i> , <i>Enterobacter</i> , <i>Klebsiella</i> , <i>Pseudomonas</i>	Internal dysuria, fever, chills, flank pain radiating to groin, CVA tenderness, N/V

**Investigations**

- no investigations necessary when history and physical consistent with uncomplicated UTI – treat empirically (urinalysis can be performed when indicated by dipstick or microscopy)
- urinalysis/dipstick: positive for nitrites and leukocytes
- urine R&M: pyuria, bacteriuria, hematuria
- urine C&S
- CBC and differential if suspecting pyelonephritis
- if vaginal/urethral discharge present: wet mount, Gram stain, KOH test, vaginal pH, culture for yeast and trichomonas, endocervical/urethral swab or urine PCR for *N. gonorrhoeae* and *C. trachomatis*
- radiologic studies and other diagnostic tests if atypical presentation
- see [Pediatrics, P62](#) for UTI in children

**Management**

- UTI/cystitis
  - pregnant women with bacteriuria (2-7%) must be treated even if asymptomatic, due to increased risk of pyelonephritis, preterm labour, low birth weight and perinatal mortality; need to follow with monthly urine cultures and retreat if still infected
  - patients with recurrent UTIs (>3/yr) should be considered for prophylactic antibiotics
  - if complicated UTI, patients require longer courses of broader spectrum antibiotics
- urethritis
  - when swab or PCR is positive for chlamydia or gonorrhea must report to Public Health
  - all patients should return 4-7 d after completion of therapy for clinical evaluation

## Epistaxis

- see [Otolaryngology, OT26](#)

## Erectile Dysfunction

- see [Urology, U30](#)

### Definition

- consistent or recurrent inability to attain and/or maintain penile erection sufficient for sexual performance of  $\geq 3$  mo duration

### Epidemiology

- ~20% of men age 40; ~50% of men age 70

### Etiology

- organic: vascular (90%) (arterial insufficiency, atherosclerosis), endocrine (low testosterone, DM), anatomic (structural abnormality, e.g. Peyronie's), neurologic (post-operative, DM), medications (clonidine, antihypertensives, psychotropics)
- psychogenic (10%)

**Table 18. Differentiation Between Organic and Psychogenic ED**

Characteristic	Organic	Psychogenic
Onset	Gradual	Acute
Circumstances	Global	Situational
Course	Constant	Varying
Non-Coital Erection	Poor	Rigid
Morning Erection	Absent	Present
Psychosexual Problem	Secondary	Long history
Partner Problem	Secondary	At onset
Anxiety and Fear	Secondary	Primary

Walsh: Campbell's Urology, 8th ed. Table 46-4

### History

- comprehensive sexual, medical, and psychosocial history
- time course
  - last satisfactory erection
  - gradual or sudden onset
  - attempts at sexual activity
- quantify
  - presence of morning or night time erections
  - stiffness (scale of 1-10)
  - ability to initiate and maintain an erection with sexual stimulation
  - erection stiffness during sex (scale of 1-10)
- qualify
  - partner or situation specific
  - loss of erection before penetration or climax
  - degree of concentration required to maintain an erection
  - percentage of sexual attempts satisfactory to patient and/or his partner
  - significant bends in penis or pain with erection
  - difficulty with specific positions
  - impact on quality of life and relationship

### Investigations

- hypothalamic-pituitary-gonadal axis evaluation: testosterone (free + total), prolactin, LH
- risk factor evaluation: fasting glucose, HbA1c, lipid profile
- others: TSH, CBC, urinalysis
- specialized testing
  - psychological and/or psychiatric consultation
  - in-depth psychosexual and relationship evaluation
  - nocturnal penile tumescence and rigidity (NPTR) assessment
  - vascular diagnostics (e.g. doppler studies, angiography)

### DDx of Erectile Dysfunction

#### PENIS

- Psychogenic
- Endocrine (type 2 DM, testosterone)
- Neurogenic (type 2 DM, post-operative)
- Insufficiency of blood (atherosclerosis)
- Substances

### The Effect of Lifestyle Modification and Cardiovascular Risk Factor Reduction on Erectile Dysfunction

*Arch Intern Med* 2011;171:1797-1803

**Study:** Meta-analysis of 6 RCTs.

**Population:** 740 male participants.

**Intervention:** Lifestyle modification and pharmacotherapy targeting CAD risk factors.

**Main Outcome Measure:** International Index of Erectile Dysfunction (IIEF-5) score.

**Results:** Lifestyle modifications and pharmacotherapy for cardiovascular risk factors had a statistically significant association with improved sexual function (weighted mean difference 2.66; 95% CI 1.86-3.47). Lifestyle modification without use of statins was also statistically significantly associated with improved sexual function (weighted mean difference 2.40; 95% CI 1.19-3.61).

**Conclusion:** Lifestyle modification alone or combined with pharmacotherapy can improve sexual function.

### Reasons for Referral to Urology

- Significant penile anatomic disease
- Younger patient with a history of pelvic or perineal trauma
- Cases requiring vascular or neuro- surgical intervention
- Complicated endocrinopathies
- Complicated psychiatric or psychosocial problems
- Patient or physician desire for further evaluation

## Management

**Table 19. Management of Erectile Dysfunction**

Nonpharmacologic	Pharmacologic	Surgical
Lifestyle changes (alcohol, smoking, exercise) Relationship/sexual counselling Vacuum devices	Oral agents Suppository Male urethral suppository for erection (MUSE) Injections	Implants Vascular repair Realignment

- pharmacologic treatment
  - phosphodiesterase type 5 inhibitors
  - α-adrenergic blockers (e.g. yohimbine)
  - serotonin antagonist and reuptake inhibitor (e.g. trazodone)
  - testosterone – currently only indicated in patients presenting with hypogonadism and testosterone deficiency (note: breast/prostate cancer are absolute contraindications)

**Table 20. Phosphodiesterase Type 5 Inhibitors**

Examples	Dosing (1 dose/d)	Specifics	Side Effects	Contraindications
sildenafil (Viagra®)	25-100 mg/dose	Take 0.5-4 h prior to intercourse May last 24 h	Flushing, headache, indigestion	Not to be used in patients taking nitrates
tadalafil (Cialis®)	5-20 mg/dose	Effects may last 36 h	As above	As above
vardefafil (Levitra®)	2.5-20 mg/dose	Take 1 h prior to intercourse	As above	As above

## Fatigue

### Epidemiology

- 25% of office visits to family physicians
  - peaks in ages 20-40
  - F:M = 3-4:1
- 50% have associated psychological complaints/problems, especially if <6 mo duration

### Differential Diagnosis

**Table 21. Differential Diagnosis of Fatigue: PS VINDICATE**

<b>P</b>	<b>Psychogenic</b>	<b>Depression, life stresses,</b> anxiety disorder, chronic fatigue syndrome, fibromyalgia
	Physiologic	<b>Pregnancy, caregiving demands (young children, elderly)</b>
<b>S</b>	Sleep disturbance	<b>Obstructive sleep apnea, sleep disorder,</b> poor sleep hygiene, BPH, shift work, pain
	Sedentary	Unhealthy/sedentary lifestyle
<b>V</b>	Vascular	Stroke
<b>I</b>	<b>Infectious</b>	Viral (e.g. mononucleosis, hepatitis, HIV), bacterial (e.g. TB), fungal, parasitic
<b>N</b>	<b>Neoplastic</b>	Any malignancy
	Nutrition	<b>Anemia</b> (Fe <sup>2+</sup> deficiency, B <sub>12</sub> deficiency)
	Neurogenic	Myasthenia gravis, multiple sclerosis, Parkinson’s disease
<b>D</b>	<b>Drugs</b>	β-blockers, antihistamines, anticholinergics, benzodiazepines, antiepileptics, antidepressants
<b>I</b>	Idiopathic	
<b>C</b>	Chronic illnesses	CHF, lung diseases (e.g. COPD, sarcoidosis), renal failure, chronic liver disease
<b>A</b>	Autoimmune	SLE, RA, mixed connective tissue disease, polymyalgia rheumatica
<b>T</b>	Toxin	<b>Substance abuse</b> (e.g. alcohol), heavy metal
<b>E</b>	Endocrine	<b>Hypothyroidism, DM,</b> Cushing’s syndrome, adrenal insufficiency, pregnancy

Common causes are in **bold**

### Investigations

- psychosocial causes are common, so usually minimal investigation is warranted
- physical causes of fatigue usually have associated symptoms/signs that can be elicited from a focused history and physical exam
- investigations should be guided by history and physical exam and may include
  - CBC and differential, electrolytes, BUN, Cr, ESR, glucose, TSH, ferritin, vitamin B<sub>12</sub>, serum protein electrophoresis, Bence-Jones protein, albumin, AST, ALT, ALP, bilirubin, calcium, phosphate, ANA, β-hCG
  - urinalysis, CXR, ECG
  - additional tests: serologies (Lyme disease, hepatitis B and C screen, HIV, ANA) and Mantoux skin tests

#### Fatigue Red Flags

- Fever
- Weight loss
- Night sweats
- Neurological deficits
- Ill-appearing

**Treatment**

- treat underlying cause
- if etiology cannot be identified (1/3 of patients)
  - reassurance and follow-up, especially with fatigue of psychogenic etiology
  - quick follow-up for reassurance
  - supportive counselling, behavioural, or group therapy
  - encourage patient to stay physically active to maximize function
  - review all medications, OTC, and herbal remedies for drug-drug interactions and side effects
  - prognosis: after 1 yr, 40% are no longer fatigued

**CHRONIC FATIGUE SYNDROME**

**Definition (CDC 2006)** – must meet both criteria

1. new or definite onset of unexplained, clinically evaluated, persistent or relapsing chronic fatigue, not relieved by rest, which results in occupational, educational, social, or personal dysfunction
  2. concurrent presence of ≥4 of the following symptoms for a minimum of 6 mo
    - impairment of short-term memory or concentration, severe enough to cause significant decline in function
    - sore throat
    - tender cervical or axillary lymph nodes
    - muscle pain
    - multi-joint pain with no swelling or redness
    - new headache
    - unrefreshing sleep
    - post-exertion malaise lasting >24 h
- exclusion criteria: medical conditions that may explain the fatigue, certain psychiatric disorders (depression with psychotic or melancholic features, schizophrenia, eating disorders), substance abuse, severe obesity (BMI >45)

**Epidemiology**

- F>M, Caucasians > other groups, majority in their 30s
- found in <5% of patients presenting with fatigue

**Etiology**

- unknown, likely multifactorial
- may include infectious agents, immunological factors, neurohormonal factors, and/or nutritional deficiency

**Investigations**

- no specific diagnostic laboratory tests

**Treatment**

- promote sleep hygiene
- provide support and reassurance that most patients improve over time
- non-pharmacological
  - regular physical activity, optimal diet, psychotherapy (e.g. CBT), family therapy, support groups
- pharmacological
  - to relieve symptoms: e.g. antidepressants, anxiolytics, NSAIDs, antimicrobials, antiallergy therapy, antihypertensive therapy

**Exercise Therapy for Chronic Fatigue**

Cochrane Depression, Anxiety, and Neurosis Group  
*Cochrane DB Syst Rev* 2004; Issue 3

**Purpose:** To determine the effectiveness of exercise therapy for Chronic Fatigue Syndrome (CFS).

**Methods:** Systematic review of 5 RCTs with 336 patients of all ages with a clinical diagnosis of CFS.

**Interventions:** Exercise therapy alone was compared with treatment as usual (or relaxation and flexibility), pharmacotherapy (fluoxetine), or exercise therapy combined with either pharmacotherapy or patient education.

**Results:** At 12 wk, patients undergoing exercise therapy were less fatigued than controls (SMD -0.77; 95% CI -1.26 to -0.28). Physical functioning was also significantly improved, but there were more dropouts with exercise therapy. Compared with fluoxetine, patients receiving exercise therapy were less fatigued (WMD -1.24; 95% CI -5.3-2.83). Patients receiving combination therapy with exercise therapy and either fluoxetine or patient education, did better than those on monotherapy.

**Conclusions:** Patients may benefit from exercise therapy. Combination therapy with either fluoxetine or education may offer additional benefit. Further high quality trials are needed.

**Fever**

- see [Pediatrics, P51](#)

**Definition**

- oral temperature >37.2°C (AM), 37.7°C (PM)
- fever in children under 2 must be a rectal temperature for accuracy
- TM not accurate for measurement until child is >5 yr

**Table 22. Differential Diagnosis of Fever**

Infection	Cancer	Medications	Other
Bacterial	Leukemia	Allopurinol	Irritable Bowel Syndrome
Viral	Lymphoma	Captopril	Collagen Vascular Disease
TB	Other Malignancies	Cimetidine	DVT
		Heparin	
		INH	
		Meperidine	
		Nifedipine	
		Phenytoin	
		Diuretics	
		Barbiturates	
		Antihistamines	

**History**

- fever
  - peak temperature, thermometer, route, duration
  - time of day
  - response to antipyretics
- systemic symptoms
  - weight loss, fatigue, rash, arthralgia, night sweats
- symptoms of possible source
  - UTI/pyelonephritis: dysuria, foul-smelling urine, incontinence, frequency, hematuria, flank pain
  - pneumonia: cough, pleuritic chest pain
  - URTI: cough, coryza, ear pain
  - meningitis: headache, confusion, stiff neck, rash
  - osteomyelitis: bone pain
  - skin: purulent discharge
  - PID: discharge, dyspareunia, lower abdominal pain
  - gastroenteritis: abdominal pain, diarrhea, blood per rectum, vomit
  - medications
  - PE/DVT: swollen legs, pain in calf, SOB, pleuritic chest pain
  - history of cancer/family history of cancer
- infectious contacts
  - travel history, camping, day care, contact with TB, foodborne, animals

**Possible Investigations**

- CBC and differential, blood culture, urine culture, urinalysis
- stool O&P, Gram stain, culture
- CXR, Mantoux skin test, sputum culture
- LP

**Management**

- increase fluid intake
- general: sponge bath, light clothing
- acetaminophen/ibuprofen as needed
- treat underlying cause

**Headache**

- see [Neurology, N44](#)

**Primary Headaches**

**Table 23. Primary Headaches**

	Migraine	Tension-Type	Cluster	Caffeine Withdrawal
<b>Epidemiology</b>	12% of adults F>M 20% with aura 80% without aura	38% of adults, can be episodic or chronic	<0.1% of adults, M>>F	~50% of people drinking >2.5 cups/d
<b>Duration</b>	5-72 h	May occur as isolated incident or daily, duration is variable	<3 h at same time of day	Begins 12-24 h after last caffeine intake, can last ~1 wk
<b>Pain</b>	Classically unilateral and pulsatile, but 40% are bilateral, moderate-severe intensity, N/V, photo-/phonophobia	Mild to moderate pain, bilateral, fronto-occipital or generalized pain, band-like pain, ± contracted neck/scalp muscles, associated with little disability	Sudden, unilateral, severe, usually centred around eye, frequently awakens patient Associated conjunctival injection and tearing "Suicide" headache	Severe, throbbing, associated with drowsiness, anxiety, muscle stiffness, nausea, waves of hot or cold sensations
<b>Triggers</b>	Numerous (e.g. food, sleep disturbance, stress, hormonal, fatigue, weather, high altitude) Aggravated by physical activity	Stressful events, NOT aggravated by physical activity	Often alcohol	Discontinuing caffeine
<b>Treatment of Acute Headache</b>	1st line: acetaminophen, NSAIDs, ASA ± caffeine 2nd line: NSAIDs 3rd line: 5-HT agonists ± antiemetic	Rest and relaxation NSAIDs or acetaminophen	Sumatriptan Dihydroergotamine High-flow O <sub>2</sub> Intranasal lidocaine	Caffeine Acetaminophen or ASA ± caffeine
<b>Prophylactic Therapy</b>	1st line: β-blockers 2nd line: TCAs 3rd line: anticonvulsants	Rest and relaxation, physical activity, biofeedback	Lithium carbonate, prednisone, methysergide	Cut down on caffeine

**Migraine Screen**

**POUND**  
 Pulsatile quality  
 Over 4-72 h  
 Unilateral  
 Nausea and vomiting  
 Disabling intensity  
 if ≥4 present then a diagnosis is likely  
 (+LR = 24)

**Secondary Headaches**

- caused by underlying organic disease
- account for <10% of all headaches, may be life-threatening

## Etiology

- aneurysm
- medication overuse headache
- space-occupying lesion
- systemic infection (meningitis, encephalitis)
- stroke
- subarachnoid hemorrhage
- systemic disorders (thyroid disease, HTN, pheochromocytoma, etc.)
- temporal arteritis
- traumatic head injuries
- TMJ or C-spine pathology
- serious ophthalmological and otolaryngological causes of headache

## Investigations

- indicated only when red flags are present and may include:
  - CBC for suspected systemic or intracranial infection
  - ESR for suspected temporal arteritis
  - neuroimaging (CT or MRI) to rule out intracranial pathology
  - CSF analysis for suspected intracranial hemorrhage, infection

## Management

- based on underlying disorder
- analgesics may provide symptomatic relief

### Headache Red Flags

#### SNOOP

Systemic symptoms of illness

- fever
- anticoagulation
- pregnancy
- cancer

Neurologic signs/symptoms

- impaired mental status
- neck stiffness
- seizures
- focal neurological deficits

Onset

- sudden and severe
- new headache after age 50

Other associated conditions

- following head trauma
- awakens patient from sleep
- jaw claudication
- scalp tenderness
- worse with exercise, sexual activity or Valsalva

Prior headache history

- different pattern
- rapidly progressing in severity/frequency

### Acupuncture for Migraine Prophylaxis

*Cochrane DB Syst Rev* 2009;4:CD001218

**Study:** Meta-analysis of 22 RCTs.

**Population:** 4,419 participants with diagnosed migraine.

**Intervention:** Preventive treatment with acupuncture, sham acupuncture, no prophylactic treatment/routine care only, other interventions.

**Main Outcome Measure:** Proportion of responders in 3-4 mo.

**Other Outcomes:** Frequency of migraine attacks, number of migraine days, headache frequency.

**Results:** Patients receiving acupuncture had higher response rates and fewer headaches after 3-4 mo than those with no prophylactic treatment or routine care only. There was no statistically significant difference between "true" vs. "sham" acupuncture.

**Conclusion:** Acupuncture is a viable prophylactic treatment option for migraine attacks. Selecting specific points for acupuncture is not as important as believed by practitioners.

### Does this Patient have Hearing Impairment?

*JAMA* 2006;295:416-428

**Purpose:** To evaluate bedside clinical maneuvers used to evaluate the presence of hearing impairment.

**Study:** Evidence-based review of studies examining the accuracy or precision of screening questions and tests. 24 studies were included in this analysis.

**Conclusions:** Elderly patients who admit to having hearing impairment should be offered audiometry, while those who do not should undergo a whispered-voice test. Those who hear the whispered voice require no further testing, while those who do not require audiometry. The Weber and Rinne tests are not useful in screening for hearing impairment.

## Hearing Impairment

- see [Otolaryngology, OT7](#)

### Definition

- hearing impairment: a raised hearing threshold measured as decibels of hearing loss relative to the normal population at specific frequencies
- hearing disability: hearing impairment that interferes with performing daily tasks

### Epidemiology

- prevalence increases with age (6% of 35-44 yr old, 43% of 65-84 yr old)
- 90% of age-related hearing loss (presbycusis) is sensorineural
- hearing loss detectable by audiology is present in greater than 1/3 of people >65 yr
- associated with significant physical, functional, and mental health consequences

### Classification

- conductive (external sound does not reach the middle ear)
- sensorineural involving the inner ear, cochlea, or auditory nerve
- mixed

### Assessment

- infants
  - universal newborn hearing screening program
- elderly
  - presbycusis is characterized by the progressive, symmetric loss of high-frequency hearing
    - ◆ tinnitus, vertigo, and disequilibrium may be present
    - ◆ can cause low self-esteem, isolation, and depression
  - whispered-voice test
    - ◆ whisper 6 test words 6 in-2 ft away from the patient's ear out of the visual field, ask patient to repeat the words (with non-test ear distraction)
  - tuning fork test (to distinguish conductive from sensorineural hearing loss)
    - ◆ Rinne and Weber (not for general screening)
  - formal audiologic assessment
    - ◆ pure tone, air, and bone conduction testing
    - ◆ speech audiometry
    - ◆ impedance audiometry

### Management

- counsel about noise control and hearing protection programs (Grade A evidence)
- investigations in patients with unexplained sensorineural hearing loss
  - blood sugar, CBC+ differential, TSH, syphilis testing
- referral
  - refer patients with hearing loss for a complete audiological examination
  - unclear etiology of hearing loss: referral to ENT
  - **sudden hearing loss: urgent referral** as treatment success is related to early treatment
- patients with progressive asymmetric sensorineural hearing loss should have an MRI/CT scan to exclude vestibular schwannoma (acoustic neuroma)
- hearing amplification (e.g. hearing aids), assistive listening devices, and cochlear implants can dramatically improve quality of life

# Hypertension

Hypertension Guidelines are reviewed and updated annually, for up-to-date recommendations, please see [www.hypertension.ca/chep](http://www.hypertension.ca/chep)

## Epidemiology

- 22% of Canadian adults suffer from HTN (prevalence is 52% in the 60-70 age group)
- lifetime risk of developing hypertension is approximately 90%
- 64% of Canadians who have HTN are treated and controlled, while 17% are unaware that they have HTN
- 3rd leading risk factor associated with death
  - risk factor for CAD, CHF, cerebrovascular disease, renal failure, peripheral vascular disease

## Definitions

- HTN
  - BP  $\geq 140/90$  mmHg, unless DM ( $\geq 130/80$  mmHg), or age  $\geq 80$  yr ( $\geq 150/90$  mmHg)
- isolated systolic HTN
  - sBP  $\geq 140$  and dBP  $< 90$
  - associated with progressive reduction in vascular compliance
  - usually begins in 5th decade
- hypertensive urgency
  - sBP  $> 210$  or dBP  $> 120$  with minimal or no target-organ damage
- hypertensive emergency
  - severe HTN + acute target-organ damage
  - accelerated HTN
    - ♦ significant recent increase in BP over previous hypertensive levels associated with evidence of vascular damage on funduscopy, but without papilledema
  - malignant HTN
    - ♦ sufficient elevation in BP to cause papilledema and other manifestations of vascular damage (retinal hemorrhages, bulging discs, mental status changes, increasing creatinine)
- white coat hypertension
  - high clinic BP with normal home BP and 24 ambulatory BP, caused by anxiety in clinic
- masked hypertension
  - normal clinic BP with high BP in home and/or ambulatory setting, often provoked by anxiety, job stress, exercise

## Etiology

- essential (primary) HTN ( $> 90\%$ )
  - undetermined cause
- secondary HTN (10%)

## Predisposing Factors

- family history
- obesity (especially abdominal)
- alcohol consumption
- stress
- sedentary lifestyle
- smoking
- male
- age  $> 30$
- excessive salt intake/fatty diet
- African American ancestry
- dyslipidemia

**Table 24. Causes of Secondary HTN**

	Common Cause		
<b>Renal</b>	Renovascular HTN Renal parenchymal disease, glomerulonephritis, pyelonephritis, polycystic kidney		
<b>Endocrine</b>	1° hyperaldosteronism Pheochromocytoma Cushing's syndrome Hyperthyroidism/hyperparathyroidism Hypercalcemia of any cause		
<b>Vascular</b>	Coarctation of the aorta Renal artery stenosis		
<b>Drug-Induced</b>	Estrogens/OCP MAOIs Cocaine	Steroids Lithium Amphetamines	NSAIDs Decongestants Alcohol

## Investigations

- for all patients with HTN
  - electrolytes, Cr, fasting glucose and/or HbA1c, lipid profile, 12-lead ECG, urinalysis
  - self-measurement of BP at home is encouraged (recommended devices listed at [www.hypertension.ca](http://www.hypertension.ca))
- for specific patient subgroups
  - DM or chronic kidney disease: urinary protein excretion
  - if suspected renovascular HTN: renal ultrasound, captopril renal scan (if GFR  $> 60$  mL/min), MRA/CTA (if normal renal function)

Symptoms of HTN are usually NOT PRESENT (this is why it is called the "silent killer")  
May have occipital headache upon awakening or organ-specific complaints if advanced disease

**Renovascular HTN Suspected if Patient Presenting with 2 or more of:**

- Sudden onset or worsening of HTN and age  $> 55$  or  $< 30$  yr
- Presence of abdominal bruit
- HTN resistant to 3 or more drugs
- Rise in Cr of 30% or more associated with use of an ACEI or ARB
- Other atherosclerotic vascular disease, particularly in patients who smoke or have dyslipidemia
- Recurrent pulmonary edema associated with hypertensive surges

**Suspect Hyperaldosteronism when**

- HTN refractory to treatment with 3 or more drugs
- Spontaneous hypokalemia
- Profound diuretic-induced hypokalemia ( $< 3.0$  mmol/L)
- Incidental adrenal adenomas

**Hypertensive Emergencies**

- **Malignant HTN**
- **Cerebrovascular**  
Hypertensive encephalopathy  
CVA  
Intracerebral hemorrhage  
SAH
- **Cardiac**  
Acute aortic dissection  
Acute refractory LV failure  
Myocardial infarction/ischemia  
Acute pulmonary edema
- **Renal Failure**

- if suspected endocrine cause: plasma aldosterone, plasma renin
  - ◆ measured from morning samples taken from patients in sitting position after resting 15 min
  - ◆ discontinue aldosterone antagonists, ARBs,  $\beta$ -blockers, and clonidine prior to testing
- if suspected pheochromocytoma: 24 h urine for metanephrines and creatinine
- echocardiography for left ventricular dysfunction assessment if indicated

**Diagnosis**

- all Canadian adults should have BP assessed at all appropriate clinical visits, oscillometric preferred to manual

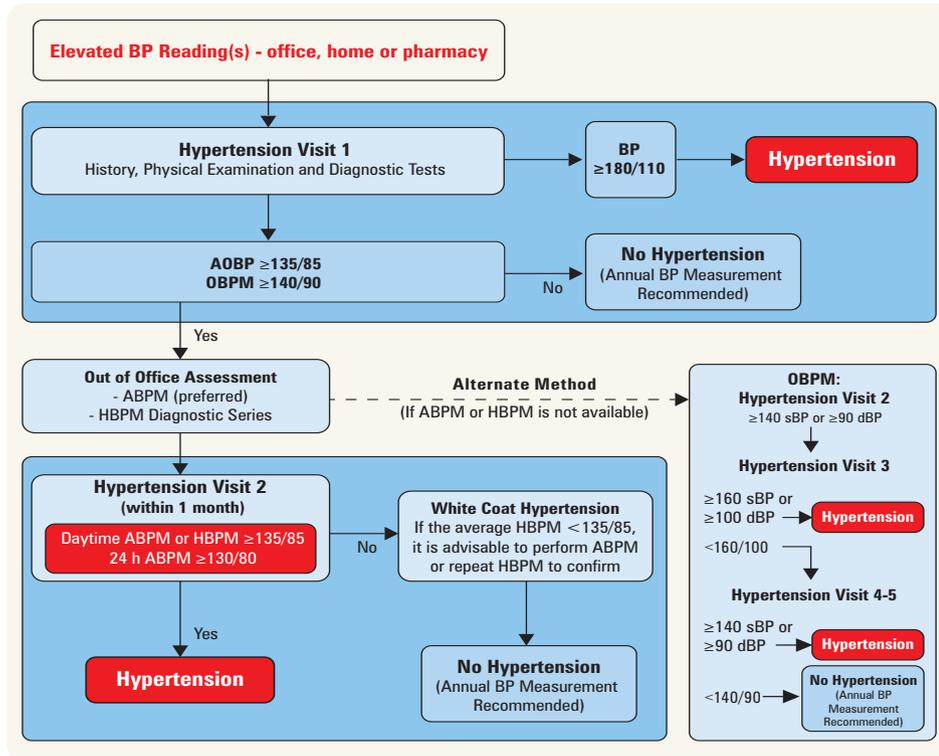

Figure 11. Assessment of patients with hypertension Adapted from: CHEP 2015 Guidelines

**Treatment**

- treat to target BP: <140/90 mmHg, <130/80 mmHg if DM, sBP<150 in very elderly (>80 yrs)
- optimum management of hypertension requires assessment of overall cardiac risk
- lifestyle modification (in all HTN patients)
  - may be sufficient in patients with stage 1 HTN (140-159/90-99)
  - diet
    - ◆ follow Canada's Guide to Healthy Eating (see Nutrition, FM6) and Dietary Approaches to Stop Hypertension (DASH) (reduced cholesterol and saturated fats)
    - ◆ limit daily sodium intake to 65-100 mmol (1.5-2.3 g)
    - ◆ potassium/magnesium/calcium supplementations are NOT recommended for HTN
  - moderate intensity dynamic exercise: 30-60 min, 4-7 x/wk; higher intensity exercise is no more effective
  - smoking cessation
  - stress management
  - low-risk alcohol consumption (see Alcohol, FM12)
  - achieve and maintain a healthy BMI (18.5-24.9 kg/m<sup>2</sup>) and waist circumference (<102 cm for men, <88 cm for women); use multidisciplinary approach to weight loss
  - individualized cognitive behavioural interventions for stress management
- pharmacological
  - indications regardless of age (caution with elderly patients)
    - ◆ dBP ≥90 mmHg with target organ damage or independent cardiovascular risk factors
    - ◆ dBP ≥100 mmHg or sBP ≥160 mmHg without target organ damage or cardiovascular risk factors
    - ◆ sBP ≥140 with target organ damage
  - first line antihypertensives: thiazide/thiazide-like diuretic, ACEI (for non-African patients), ARB, long-acting CCB,  $\beta$ -blocker (if age <60)
  - if partial response to standard dose monotherapy, add another first-line drug
  - caution with combination of non-DHP CCB and  $\beta$ -blocker
  - combination of ACEI and ARB is not recommended
  - be cautious of hypokalemia in patients treated with thiazide/thiazide-like diuretic monotherapy
  - if still not controlled or adverse effects, can add other classes of anti-hypertensives
- focus on adherence to health behaviour modification and pharmacotherapy; should be assessed at each visit

**Impact of Health Behaviour on Blood Pressure**

Intervention	Systolic BP (mmHg)	Diastolic BP (mmHg)
Diet and weight control	-6.0	-4.8
Reduced salt/sodium intake	-5.4	-2.8
Reduced alcohol intake (heavy drinkers)	-3.4	-3.4
DASH diet	-11.4	-5.5
Physical activity	-3.1	-1.8
Relaxation therapies	-3.7	-3.5

CHEP (Canadian Hypertension Education Program) Guidelines 2014. Available from: <http://www.hypertension.ca/en/chep>

**$\beta$ -blocker**  
Not recommended as first line for patients of age  $\geq 60$

**ACEI**  
Not recommended as monotherapy in people of African descent

**Table 25. Pharmacologic Treatment of Hypertension in Patients with Unique Conditions**

Condition or Risk Factor	Recommended Drugs	Alternative Drugs	Not Recommended/Notes
<b>Isolated Diastolic HTN</b>	Thiazide diuretic, $\beta$ -blocker, ACEI, ARB, or long-acting CCB (consider ASA and statin in select patients)	Combinations of first-line drugs	$\beta$ -blocker monotherapy (age > 60) or combination of ACEI with an ARB
<b>Isolated Systolic HTN</b>	Thiazide diuretic, ARB, or long acting dihydropyridine CCB	Combinations of first-line drugs	Same as above
<b>CAD</b>	ACEI or ARB; $\beta$ -blocker for patients with stable angina	Long acting CCB, when combination therapy for high risk patients, ACEI/DHP CCB is preferred	Short-acting CCB (nifedipine) or ACEI + ARB is not recommended dBP 60 mmHg may exacerbate MI
<b>Prior MI</b>	$\beta$ -blocker + ACEI (ARB if cannot tolerate ACEI)	Long-acting CCB	ACEI + ARB combination is not recommended
<b>Left Ventricular Hypertrophy</b>	ACEI, ARB, thiazide, or long-acting CCB	Combination of additional agents	Hydralazine and minoxidil can increase LVH, thus not recommended
<b>Cerebrovascular Disease (stroke/TIA)</b>	ACEI + diuretic	Combination of additional agents	ACEI + ARB combination after a stroke is not recommended
<b>Heart Failure</b>	ACEI (ARB if ACEI intolerant) and $\beta$ -blocker Spironolactone in patients with NYHA class II-IV	ARB in addition to ACEI Hydralazine/isosorbide dinitrate combination if ARB or ACEI not tolerated/contraindicated Thiazide or loop diuretic is recommended as additive therapy DHP CCB can also be used	Non-DHP CCB not recommended Carefully monitor for side effects if using ACEI + ARB
<b>Dyslipidemias</b>	Does not affect initial treatment recommendations	Combination of additional agents	
<b>DM with Albuminuria (ACR &gt; 2.0 mg/mmol in men and &gt; 2.8 mg/mmol in women)</b>	ACEI or ARB (DHP CCB > HCTZ for combination therapy with ACEI)	Add thiazide diuretic, cardioselective $\beta$ -blocker, long acting CCB	If serum Cr > 150 $\mu$ mol/L, a loop diuretic should be considered instead of low-dose thiazide diuretic
<b>DM without Albuminuria (criteria listed above)</b>	ACEI, ARB, DHP CCB, or thiazide diuretic	Combination of first-line drugs or, first-line agents not tolerated, cardioselective $\beta$ -blocker or non-DHP CCB	ACEI + ARB combination not recommended
<b>Non-Diabetic Chronic Kidney Disease with Proteinuria (urinary protein &gt; 500 mg/24 h or ACR &gt; 30 mg/mmol)</b>	ACEI (ARB if ACEI intolerant), diuretic as additive therapy	Thiazide for additive antihypertensive therapy, loop diuretic for volume overload	ACEI + ARB combination is not recommended
<b>Renovascular Disease</b>	Same as HTN without other indications		Caution in using ACEI or ARB – monitor for AKI Renal angioplasty and stenting offer no benefits over optimal medical therapy alone
<b>Asthma</b>	K <sup>+</sup> -sparing + thiazide diuretic for patients on salbutamol		$\beta$ -blocker, unless specific indications like angina or post-MI
<b>Gout</b>			Thiazide, but asymptomatic hyperuricemia is not a contraindication
<b>Smoking</b>	Low dose thiazide ACEI		$\beta$ -blocker
<b>Pregnancy</b>	Methyldopa Hydralazine	Labetolol Nifedipine	ACEI
<b>Elderly (&gt; 60 yr)</b>	As for uncomplicated isolated diastolic HTN, except for use of $\beta$ -blocker		$\beta$ -blocker not recommended as first line treatment
<b>Emergency</b>	BP > 169/90 = labetalol, nifedipine		
<b>If &gt; 3 Cardiovascular Risk Factors or Established Atherosclerotic Disease</b>	Statin (age > 40), low-dose ASA (age > 50)		Caution with use of ASA in patients with uncontrolled BP

**Calcium Channel Blockers**

Dihydropyridine CCBs

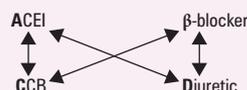

- amlodipine
- nifedipine
- felodipine

Non-Dihydropyridine CCBs

- diltiazem
- verapamil

**How to Combine Antihypertensive Medications (in general)**

**Thiazides as First-Line Antihypertensive Therapy – ALLHAT**

JAMA 2002;288:2981-2997

**Study:** Randomized, double-blind, active-controlled clinical trial with mean follow-up of 4.9 yr.

**Patients:** 33,357 participants (mean age 67 yr, 53% male, 47% white) with stage 1 or 2 HTN and at least one other CHD risk factor.

**Intervention:** Participants were randomly assigned to receive chlorthalidone (12.5-25 mg/d), amlodipine (2.5-10mg/d), or lisinopril (10-40 mg/d). Target BP was < 140/90 mmHg, achieved by titrating the assigned study drug, and adding open-label agents when necessary.

**Outcomes:** The primary outcome was combined fatal CHD or non-fatal MI. Secondary outcomes were all-cause mortality, stroke, combined CHD, and combined CVD.

**Results:** There were no significant differences in either the primary outcome or all-cause mortality between treatment groups. For amlodipine vs. chlorthalidone, secondary outcomes were similar except for a higher 6 yr rate of heart failure with amlodipine (10.2% vs. 7.7%; p<0.001). For lisinopril vs. chlorthalidone, lisinopril had higher 6 yr rates of combined CVD (33.3% vs. 30.9%; p<0.001), stroke (6.3% vs. 5.6%; p=0.02) and heart failure (8.7% vs. 7.7%; p<0.001).

**Conclusion:** Thiazide-type diuretics are superior to CCB and ACEI for preventing one or more major forms of CVD, with similar risks of death and non-fatal MI.

Adapted from: McAlister FA, Zamke KB, Campbell NRC, et al. The 2001 Canadian recommendations for the management of hypertension: Part two – Therapy. Can J Cardiol 2002;18:625-641 and The 2012 Canadian Hypertension Education Program Recommendations

**Follow-Up**

- assess and encourage adherence to pharmacological and non-pharmacological therapy at every visit
- lifestyle modification q3-6mo
- pharmacological
  - q1-2mo until BP under target for 2 consecutive visits
  - more often for symptomatic HTN, severe HTN, antihypertensive drug intolerance, target organ damage
  - q3-6mo once at target BP
- referral is indicated for cases of refractory HTN, suspected secondary cause or worsening renal failure
- hospitalization is indicated for malignant HTN

**Joint Pain**

• see [Rheumatology, RH3](#)

**Table 26. Differential Diagnosis of Joint Pain**

Non-Articular		Articular		
Localized	Generalized	Inflammatory	Degenerative	Other
Bursitis Tendonitis Capsulitis	Fibromyalgia Polymyalgia rheumatica Myofascial pain syndrome	Seropositive RA Systemic lupus erythematosus Scleroderma Polymyositis/Dermatomyositis Sjögren's syndrome  Seronegative Ankylosing spondylitis Inflammatory bowel disease Psoriatic arthritis Reactive arthritis  Crystal Gout Pseudogout Hydroxyapatite  Infectious/septic Gonococcal Non-gonococcal  Systemic vasculitis disease	Primary Familial Heberden's node Osteoarthritis Regional hip or knee  Secondary Metabolic Hemophilic Neuropathic Traumatic	Neoplastic Drug-induced Endocrine (hyperthyroid, hypothyroid, hyperparathyroid)

**History**

- number of joints involved: monoarticular, oligoarticular, polyarticular
- pattern of joints involved: symmetrical vs. asymmetrical, large vs. small joints, axial skeleton
- onset: acute vs. chronic (>6 wk)
- trauma, infection, medications (steroids, diuretics)
- morning stiffness (duration) vs. worse at end of day
- FHx of arthritis
- comorbidities: DM (carpal tunnel syndrome), renal insufficiency (gout), psoriasis (psoriatic arthritis), myeloma (low back pain), osteoporosis (fracture), obesity (OA)
- constitutional symptoms (neoplasm)

**Physical Exam**

- vitals
- specific joint exams
- systemic features (skin, nails, eyes, hands)

**Investigations (Guided by the History and Physical Exam)**

- general: CBC and differential, electrolytes, Cr
- acute phase reactants: ESR, CRP, ferritin, albumin, fibrinogen
- complement (C3, C4)
- urinalysis to detect disease complications (proteinuria, active sediment)
- serology (ANA, anti-dsDNA, HLA-B27, anti-Jo-1, anti-Sm, anti-La, anti-Ro, RhF, and anti-CCP, etc.)
- synovial fluid analysis (cell count + differential, culture, Gram stain, microscopy)
- tissue cultures
- radiology (plain film, CT, MRI, U/S, bone densitometry, angiography, bone scan)

**Treatment**

- patient education including lifestyle modifications
- physiotherapy, occupational therapy
- manage pain (acetaminophen, NSAIDs)
- treat specific causes (e.g. antibiotics, DMARDs etc., see [Rheumatology, RH26](#))

**Signs and Symptoms of Inflammatory Arthritis**

**WARM(S) Joints**

- Worse with rest, better with activity
- Awakening in the latter half of the night
- Redness around joint
- Morning stiffness (>30 min)
- Soft tissue swelling, erythema

**Systemic Features**

- Fever (SLE, infection)
- Rash (SLE, psoriatic arthritis)
- Nail abnormalities (psoriatic, reactive arthritis)
- Uveitis (psoriatic, reactive arthritis, ankylosing spondylitis)
- Myalgias (fibromyalgia, myopathy)
- Weakness (polymyositis, neuropathy)
- GI symptoms (scleroderma, IBD)
- GU symptoms (reactive arthritis, gonococemia)

## Low Back Pain

- see [Orthopedics, OR25](#)

### Definition

- acute: <6 wk
- subacute: 6-12 wk
- chronic: >12 wk

### Epidemiology

- 5th most common reason for visiting a physician
- lifetime prevalence: 90%
- peak prevalence: age 45-60
- largest WSIB category
- most common cause of chronic disability for individuals <45 yr old
- 90% resolve in 6 wk, <5% become chronic

### Etiology

- source of pain can be local, radicular, referred, or related to a psychiatric illness
- 98% are mechanical causes
  - pain is worse with movement, better with rest
  - sprain (ligament), strain (muscle), facet joint degeneration, disc degeneration/herniation, spinal stenosis (e.g. spondylosis), spondylolisthesis, compression fracture, pregnancy
- 2% are non-mechanical causes
  - surgical emergencies
    - ♦ cauda equina syndrome (areflexia, lower extremity weakness, decreased anal tone, saddle anesthesia, fecal incontinence, urinary retention), AAA (pulsatile abdominal mass)
  - medical conditions
    - ♦ neoplastic (primary, metastatic, multiple myeloma)
    - ♦ infectious (osteomyelitis, TB)
    - ♦ metabolic (osteoporosis, osteomalacia, Paget's disease)
    - ♦ rheumatologic (ankylosing spondylitis, polymyalgia rheumatica)
    - ♦ referred pain (perforated ulcer, pancreatitis, pyelonephritis, ectopic pregnancy, herpes zoster)

### Physical Exam

- inspection: curvature, posture, gait
- palpation: bony deformities/tenderness, paraspinal muscle bulk/tenderness, trigger points
  - percussion of spine to elicit pain due to fracture or infection
- ROM and peripheral pulses
- neurologic exam for L4/L5/S1 helps determine level of spinal involvement (power, reflexes, sensation)
- special tests
  - straight leg raise (positive if pain at <70 degrees and aggravated by ankle dorsiflexion), positive test is indicative of sciatica
  - crossed straight leg raise (raising of uninvolved leg elicits pain in leg with sciatica), more specific than straight leg raise
  - femoral stretch test (patient prone, knee flexed, examiner extends hip) to diagnose L4 radiculopathy

### Investigations

- plain films not recommended in initial evaluation
- if infection/cancer suspected: CBC, ESR
- if neurologic deficits worsening or infection/cancer suspected: consider CT or MRI

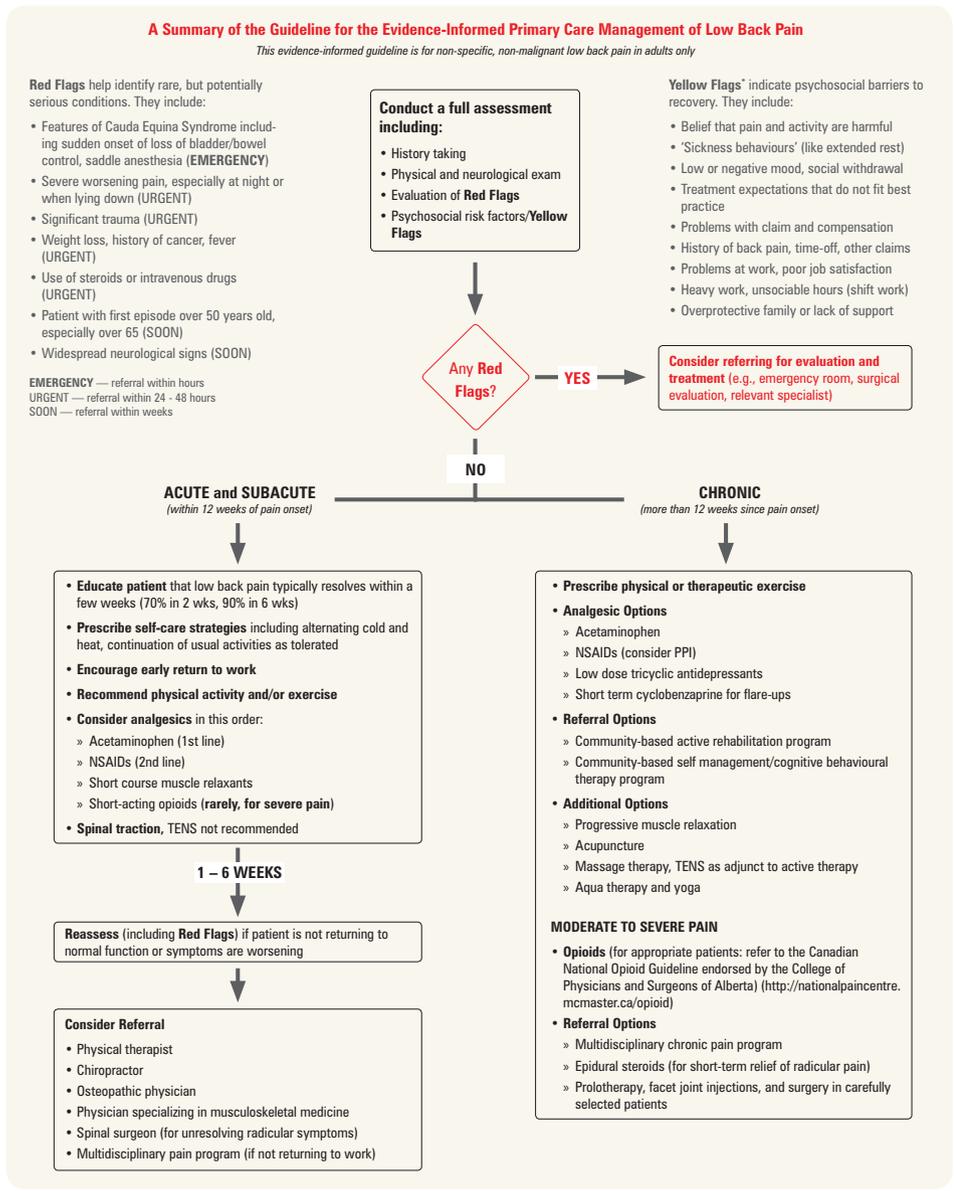

#### Red Flags

Bowel or bladder dysfunction  
 Anesthesia (saddle)  
 Constitutional symptoms/malignancy  
 Chronic disease  
 Paresthesias  
 Age >50 and mild trauma  
 IV drug use/Infection  
 Neuromotor deficits

#### Indications for Lumbar Spine X-Ray

- No improvement after 6 wk
- Fever >38°C
- Unexplained weight loss
- Prolonged corticosteroid use
- Significant trauma
- Progressive neurological deficit
- Suspicion of ankylosing spondylitis
- History of cancer (rule out metastases)
- Alcohol/drug abuse (increased risk of osteomyelitis, trauma, fracture)

**Message for Low Back Pain**  
*Cochrane DB Syst Rev 2008;4:CD001929*  
This meta-analysis of 13 randomized trials assessed the use of massage therapy for non-specific low back pain compared to other active or sham treatments.  
**Conclusions:** For some patients with subacute or chronic non-specific low back pain, massage may be beneficial, especially with education and exercises. Some evidence suggests that acupuncture massage may be more effective than classic massage but more studies are required to confirm these results.

**Spinal Manipulative Therapy (SMT) for Acute Low-Back Pain**  
*Cochrane DB Syst Rev 2012;9:CD008880*  
**Conclusions:** SMT is no more effective in participants with acute low-back pain than inert interventions, sham SMT, or when added to another intervention. SMT also appears to be no better than other recommended therapies.

**Figure 12. Low back pain treatment**

Reprinted with permission from: Kendall NAS, et al. Guide to Assessing Psycho-Social Yellow Flags in Acute Low Back Pain. ACC & NZGG, Wellington, NZ. (2004 ed.); Toward Optimized Practice. Guideline for the evidence-informed primary care management of low back pain, 2nd ed. 2007. Available from: [www.topalbertadoctors.org](http://www.topalbertadoctors.org)

**Table 27. Approach to Non-Traumatic Low Back Pain**

	Back Dominant (Pain greatest above gluteal fold)		Leg Dominant (Pain greatest below gluteal fold)	
<b>History</b>	<b>Pattern 1</b> Worse with flexion Constant/intermittent	<b>Pattern 2</b> Worse with extension Never worse with flexion Always intermittent	<b>Pattern 3</b> Pain changes with back movement/ position Currently/previously constant	<b>Pattern 4</b> Worse with activity Improves with rest and posture change Intermittent/short duration
<b>Physical Exam</b>	Normal neuro exam <u>Fast responder</u> Improves with extension <u>Slow responder</u> No change or worsens with extension	Normal neuro exam ± improves with flexion Worse with extension	Leg pain can improve but not disappear Positive straight leg raise ± conduction loss <u>Fast responder</u> Improves with specific back position <u>Slow responder</u> Not better with position changes	No irritative findings ± conduction loss
<b>Likely Pathology</b>	Arising from intervertebral discs or adjacent ligaments	Posterior joint complex (associated ligaments and capsular structures)	Sciatica	Neurogenic claudication
<b>Initial Management</b>	Scheduled extension Lumbar roll Night lumbar roll Medication as required	Scheduled flexion Limited extension Night lumbar roll Medication as required	Prone extension Supine "Z" lie Lumbar roll Night lumbar roll Medication as required	Abdominal exercises Night lumbar roll Sustained flexion Pelvic tilt Medication as required

## Menopause/Hormone Replacement Therapy

- see [Gynecology, GY34](#)

### Epidemiology

- mean age of menopause = 51.4 yr

### Clinical Features

- associated with estrogen deprivation
- urogenital tract: atrophy, vaginal dryness/itching, urinary frequency/urgency/incontinence, bleeding
- blood vessels and heart: vasomotor instability (e.g. hot flashes), increased risk of heart disease
- bones: bone loss, joint/muscle/back pain, fractures, loss of height
- brain: depression, irritability, mood swings, memory loss

### Management

- encourage physical exercise, smoking cessation, and a balanced diet with adequate intake/ supplementation of calcium (1,200-1,500 mg/d) and vitamin D (800-2,000 IU/d)
- hormone replacement therapy (HRT)
  - prescribe for moderate to severe symptoms for no longer than 5 yr; routine use is not recommended
  - regimens: cyclic estrogen-progestin, continuous estrogen-progestin, estrogen only (if no uterus), estrogen patch/gel/cream/ring/vaginal tablet
  - decreases risk of osteoporotic fractures, colorectal cancer
  - increases risk of breast cancer, coronary heart disease, stroke, DVT, and PE
  - initiation of HRT requires a thorough discussion of short- and long-term benefits and risks
- consider venlafaxine, SSRIs, or gabapentin to ease vasomotor instability

## Osteoarthritis

- see [Rheumatology, RH5](#)

### Epidemiology

- most common form of arthritis seen in primary care
- prevalence is 10-12% and increases with age
- results in long-term disability in 2-3% of patients with OA
- almost everyone over the age of 65 shows signs of OA on x-ray, but only 33% of these individuals will be symptomatic

### Clinical Features

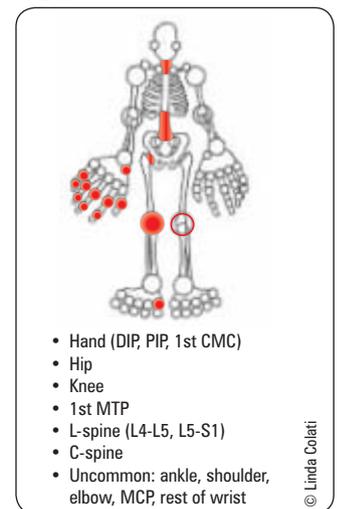

- joint pain with activity, improved with rest, morning stiffness or gelling <30 min
- deformity, bony enlargement, crepitus, limitation of movement, peri-articular muscle atrophy
- usually affects distal joints of hands, spine, hips, and knees

### Investigations

- no laboratory tests for the diagnosis of OA
- hallmark radiographic features: joint space narrowing, subchondral sclerosis, subchondral cysts, osteophytes

### Management

- goals: relieve pain, preserve joint motion and function, prevent further injury
- conservative
  - patient education, weight loss, low-impact exercise (OT/PT), assistive devices (e.g. canes, orthotics, raised toilet seats)
- pharmacological
  - consider comorbidities such as PUD, HTN, IHD, hepatic disease, and renal disease
  - medications do not alter natural course of OA
  - 1st line: acetaminophen up to 4 g/d (OA is not an inflammatory disorder)
  - 2nd line: NSAIDs in the lowest effective dose for the shortest duration of time, along with gastroprotection; COX-2 selective inhibitors (celecoxib/Celebrex®, Meloxicam/Mobicox®) are recommended if long-term treatment or if high risk for serious GI problems
  - combination analgesics (e.g. acetaminophen and codeine)
  - intra-articular hyaluronic acid injections
  - intra-articular corticosteroid injections (no more than 3-4x/yr) may be helpful in acute flares (benefits last 4-6 wk, can be up to 6 mo)
  - topical NSAID (diclofenac/Pennsaid®)
  - capsaicin cream (Zostrix®)
  - oral glucosamine
- surgery
  - consider if persistent significant pain and functional impairment despite optimal pharmacotherapy (e.g. debridement, osteotomy, total joint arthroplasty)

**Figure 13. Common sites of involvement in OA**

**Glucosamine Therapy for Treating Osteoarthritis**  
*Cochrane DB Syst Rev* 2005;2:CD002946  
 This meta-analysis of 25 single- and double-blinded randomized controlled trials with 4,963 patients compared glucosamine treatment, administered by any route, against placebo or another treatment.  
**Conclusions:** Glucosamine can decrease pain and functional impairment resulting from OA and is not associated with any side effects compared to placebo. Differences in the effectiveness of Rotta and non-Rotta preparations highlight variability between glucosamine preparations and patients should be made aware of this.

# Osteoporosis

- see [Endocrinology, E40](#)
- for current guidelines and tools see [www.osteoporosis.ca](http://www.osteoporosis.ca)
- age-related disease characterized by decreased bone mass and increased susceptibility to fractures
- affects 1 in 4 Canadian women and 1 in 8 Canadian men

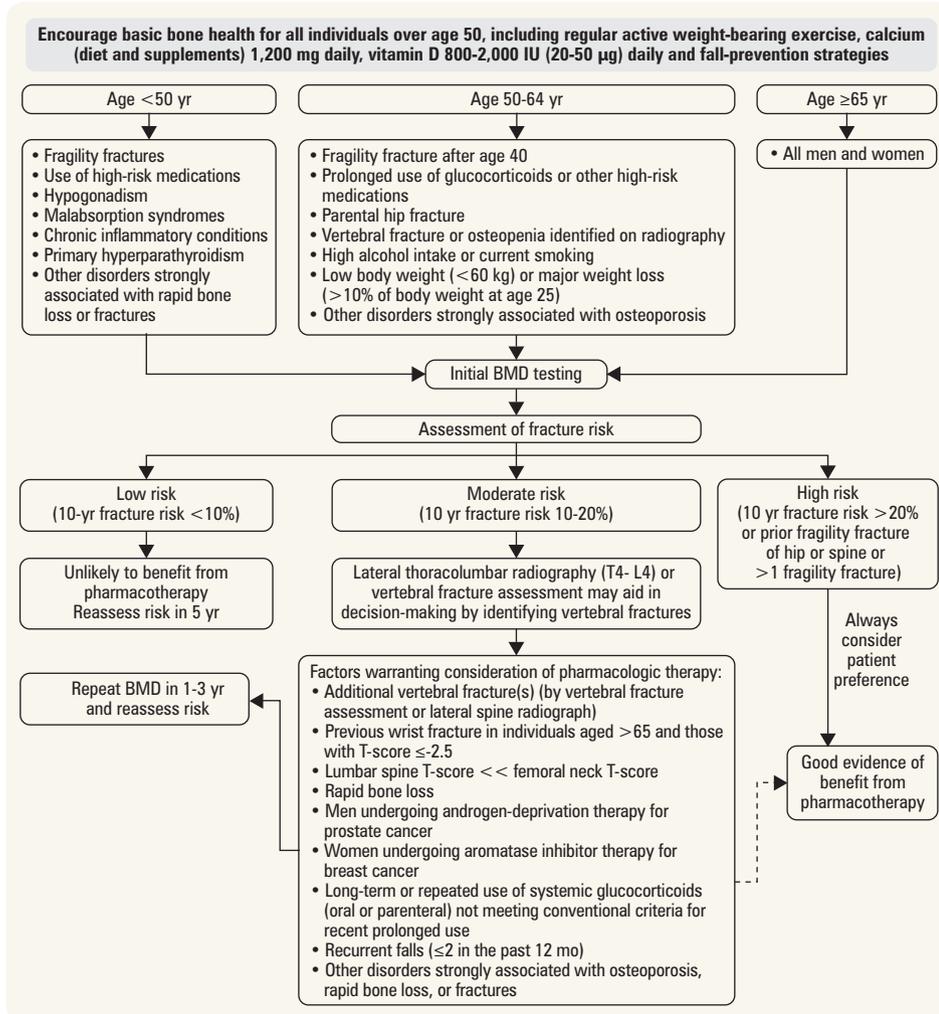

Figure 14. 2010 Clinical practice guidelines for the diagnosis and management of osteoporosis in Canada (integrated management model). Adapted from: *CMAJ* 2010;182:1864-1873

## Management

- see [Endocrinology, E42](#)

# Palliative and End-of-Life Care

- see [Geriatric Medicine, GM12](#)

# Rash

## ATOPIC DERMATITIS

- **clinical features**
  - affects all ages but is more common in children
  - pruritus is the most common symptom; scratching worsens the rash creating a vicious cycle
- **treatment**
  - goals: limit itching, repair skin
  - moisturizers, emollients, topical corticosteroids; oral corticosteroids and topical calcineurin inhibitors may be used

### Disorders Strongly Associated with Osteoporosis Include

Primary hyperparathyroidism, type 1 DM, osteogenesis imperfecta, uncontrolled hyperthyroidism, hypogonadism or premature menopause (<45 yr), Cushing's disease, chronic malnutrition or malabsorption, chronic liver disease, COPD, and chronic inflammatory conditions (e.g. IBD)

### 10 Yr Fracture Risk Assessment

FRAX (WHO Fracture Risk Assessment Tool) and CAROC (Canadian Association of Radiologists and Osteoporosis Canada) have been validated in the Canadian Population. FRAX and CAROC are available online from: <https://www.osteoporosis.ca/health-care-professionals/clinical-tools-and-resources/>

### How much Calcium do we Need?

Age	Calcium (mg)
4-8	1,000 mg
9-18	1,300 mg
19-50	1,200 mg
>50	1,200 mg
Pregnant and lactating women 19-50	1,000 mg

### Calcium Content of Common Foods

- 1 cup milk = 300 mg
- ¾ cup yogurt = 332 mg
- ½ can salmon with bones = 240 mg
- ½ cup cooked broccoli = 33 mg
- 1 medium orange = 50 mg

### Vitamin D Content in Food

- Milk fortified with vitamin D<sub>3</sub> contains 100 IUs per 250 mL glass
- Foods such as margarine, eggs, chicken livers, salmon, sardines, herring, mackerel, swordfish, and fish oils (halibut and cod liver oils) all contain small amounts; supplementation is necessary to obtain adequate levels as dietary intake has minimal impact
- Most multivitamins provide 400 IUs of vitamin D<sub>3</sub>

## SEBORRHEIC DERMATITIS

- **clinical features**
  - affects all ages but is most common in infants within the first 3 mo of life (e.g. pityriasis capitis or “cradle cap”) and adults age 30-60 yr
  - affects the scalp, central face, and anterior chest; often presents as scalp scaling (dandruff) in adolescents and adults
  - may cause mild to marked erythema of the nasolabial fold, often with greasy scaling
- **treatment**
  - topical antifungals, topical low-potency steroids; topical calcineurin inhibitors may be used

## ROSACEA

- **clinical features**
  - stages: (1) facial flushing, (2) erythema and/or edema and ocular symptoms, (3) papules and pustules, (4) rhinophyma
- **treatment**
  - topical or oral antibiotics, oral retinoids
  - laser treatment may be an option for progressive telangiectasias or rhinophyma
  - referral may be required to manage rhinophyma, ocular complications, or severe disease

## ACNE VULGARIS

- **clinical features**
  - types: (I) comedonal, (II) papular, (III) pustular, (IV) nodulocystic
  - predilection for the face, neck, upper chest, and back
- **treatment**
  - mild acne: topical treatments (antibiotics, benzoyl peroxide, retinoids)
  - moderate acne: after topical treatments have failed, add oral antibiotics and consider hormonal therapy
  - severe acne: consider systemic retinoids

## ONYCHOMYCOSIS (TINEA UNGUIUM)

- **definition:** fungal infection of the nail bed, matrix, or plate
- **clinical features**
  - occurs primarily in adults, most commonly after age 60
  - crumbling, distally dystrophic nails; yellowish, opaque with subungual hyperkeratotic debris
  - toenails are affected more often than fingernails
- **investigations**
  - microscopy of subungual scrapings under KOH preparation, culture
- **treatment**
  - oral antifungals (terbinafine/Lamisil®, itraconazole/Sporanox®), topical antifungals (ciclopirox/Loprox®) are less effective

# Sexually Transmitted Infections

- see [Gynecology, GY27](#)

## Definition

- diverse group of infections caused by multiple microbial pathogens
- transmitted by either secretions or fluids from mucosal surfaces

## Epidemiology

- high incidence rates worldwide
- Canadian prevalence in clinical practice
  - common: chlamydia (most common), gonorrhea (2nd most common), HPV, genital herpes (increasing incidence of chlamydia and gonorrhea)
  - less common: hepatitis B, HIV, and syphilis (increasing in incidence), trichomoniasis
  - rare: chancroid, granuloma inguinale, lymphogranuloma venereum
- non-sexually transmitted genital tract infections: vulvovaginal candidiasis (VVC), bacterial vaginosis (BV)
- three most common infections associated with vaginal discharge in adult women are BV, VVC, and trichomoniasis

## History

- sexual history
  - age of first intercourse, sexual orientation, sexual activity (oral, anal, and/or vaginal intercourse), sexual activity during travel
  - total number of partners in the past year/month/week and duration of involvement with each
- STI history
  - STI awareness, contraception, previous STIs and testing (including Pap tests), partner communication regarding STIs
  - local symptoms such as burning, itching, discharge, sores, vesicles, testicular pain, dysuria, abdominal pain
  - systemic symptoms such as fever, lymphadenopathy, arthralgia

When an STI is detected in a child, evaluation for sexual abuse is mandatory

### STI Risk Factors

- Sexually active males and females <25 yr old
- Unprotected sex, sexual contact with a known case of STI, previous STI
- New sexual partner or >2 sexual partners in the past 12 mo
- Street involved, homeless, and/or substance abuse

### Sexual History 5 P's

- Partners (numbers, gender)
- Practices (vaginal, oral, anal insertive/receptive)
- Protection
- Past history of STIs
- Pregnancy prevention

**Investigations/Screening**

- individuals at increased risk, even those who are asymptomatic, should be screened for chlamydia, gonorrhoea, hepatitis B, HIV, and syphilis
- Pap test if none performed in the preceding 12 mo

**Management**

- primary prevention is vastly more effective than treating STIs and their sequelae
- offer hepatitis B vaccine if not immune
- offer Gardasil® to women over 9 years of age (can be offered to men as well but not covered by OHIP)
- discuss STI risk factors (e.g. decreasing the number of sexual partners)
- direct advice to ALWAYS use condoms or to abstain from intercourse
- condoms are not 100% effective against HPV or HSV
- an STI patient is not considered treated until the management of his/her partner(s) is ensured (contact tracing by Public Health)
- patients diagnosed with bacterial STI or trichomonal infection should abstain from sexual activity until treatment completion and for 7 d after treatment for both partners, or until test of cure completed
- mandatory reporting: chlamydia, gonorrhoea, hepatitis B, HIV, syphilis

**Efficacy of Human Papillomavirus Vaccines – A Systematic Quantitative Review**  
*Int J Gynecol Cancer* 2009;19:1166-1176  
**Study:** Systematic review of 6 randomized placebo-controlled double-blind trials.  
**Patients:** 47,236 women between ages 9-26.  
**Intervention:** Vaccination with HPV L1 virus-like particle in either quadrivalent (HPV 6, 11, 16, 18), bivalent (HPV 16, 18), or univalent (HPV 16) form vs. placebo.  
**Main Outcome:** Prevention of cytologically and/or histologically proven lesions (including LSIL, HSIL, VIN, VAIN, AIN, adenocarcinoma in situ of the cervix, or cancer of the cervix associated with HPV infection).  
**Results:** Bivalent and quadrivalent vaccines reduced the rate of lesions in the cervix, vulva, vagina, and anogenital region with efficacy of 93% and 62%, respectively.

**Table 28. Diagnosis and Treatment of Common STIs**

	Signs and Symptoms	Investigations	Treatment	Complications
<b>Gonococcal Urethritis/Cervicitis</b> ( <i>Neisseria gonorrhoeae</i> )	M: urethral discharge, unexplained pyuria, dysuria, irritation, testicular swelling, Sx of epididymitis  F: mucopurulent endocervical discharge, vaginal bleeding, dysuria, pelvic pain, dyspareunia  M and F: often asymptomatic, can involve rectal symptoms in cases of unprotected anal sex	M: urethral swab for Gram stain and culture  F: urine PCR, endocervical swab for Gram stain and culture, vaginal swab for wet mount (to rule out trichomonas)  M and F: urine PCR, rectal/pharyngeal swabs if indicated	Ceftriaxone 250 mg IM single dose* If risk factors for treatment failure (e.g. pregnancy, pharyngeal/rectal infection, potentially reduced susceptibility) Test of cure: culture 4 d post-treatment (preferred) or urine PCR 2 wk post treatment (alternative) If no risk factors, rescreen 6-12 months post treatment	M: urethral strictures, epididymitis, infertility  F: PID, infertility, ectopic pregnancy, perinatal infection, chronic pelvic pain  M and F: Arthritis, increased risk of acquiring and transmitting HIV
<b>Non-Gonococcal Urethritis/Cervicitis</b> (Usually <i>Chlamydia trachomatis</i> **)	~70% asymptomatic If symptoms appear (usually 2-6 wk after infection) then similar to gonococcal symptoms (see above)	Same as above	Azithromycin 1 g PO single dose + gonococcal urethritis/cervicitis Rx* Same follow-up as above	Same as above
<b>Human Papillomavirus</b> (genital warts, cervical dysplasia)	Most are asymptomatic M: cauliflower lesions (condylomata acuminata) on skin/mucosa of penile or anal area  F: cauliflower lesions and/or pre-neoplastic/neoplastic lesions on cervix/vagina/vulva	None needed if simple condylomata Potential biopsy of suspicious lesions F: screening for cervical dysplasia through regular Pap smears	For condylomata: cryotherapy, electrocautery, laser excision, topical therapy (patient-applied or office-based) For cervical dysplasia: colposcopy and possible excision, dependent on grade of lesion	M and F: anal cancer MSM and F who have receptive anal sex: rectal cancer  F: cervical/vaginal/vulvar cancer
<b>Genital Herpes</b> (HSV-1 and -2)	1° episode: painful vesiculoculcerative genital lesions ± fever, tender lymphadenopathy, protracted course Recurrent episodes: less extensive lesions, shorter course may have "trigger factors"	Swab of vesicular content for culture, type-specific serologic testing for HSV-1 vs. HSV-2 antibodies and to determine 1° vs. recurrent episode	<b>1° Episode</b> Acyclovir 200 mg PO 5x/d x 5-10 d or Famciclovir 250 mg PO tid x 5 d or Valacyclovir 1,000 mg PO bid x 10 d  <b>Recurrent Episode</b> Acyclovir 200 mg PO 5x/d x 5d or 800 mg PO tid x 2 d or Famciclovir 125 mg PO bid x 5 d or Valacyclovir 500 mg PO bid x 3 d or 1,000 mg PO OD x 3 d	Genital pain, urethritis, cervicitis, aseptic meningitis, increased risk of acquiring and transmitting HIV
<b>Infectious Syphilis</b> ( <i>Treponema pallidum</i> )	1°: chancre (painless sore), regional lymphadenopathy 2°: rash and flu-like symptoms, meningitis, H/A, uveitis, retinitis, condyloma lata, mucus lesions, alopecia Latent Phase: asymptomatic 3°: neurologic, cardiovascular, and tissue complications	Specimen collection from 1° and 2° lesions, screen high risk individuals with serologic syphilis testing (VDRL), universal screening of pregnant women	Benzathine penicillin G IM (dose depends on stage and patient population. Check Public Health Canada guidelines ) Notify partners (last 3-12 mo) Continuous follow-up and testing until patients are seronegative	Chronic neurologic and cardiovascular sequelae, increased risk of acquiring and transmitting HIV

F = females; M = males

\*N.B. if urethritis/cervicitis is suspected, always treat for both gonococcal and non-gonococcal types (i.e. ceftriaxone AND azithromycin)

\*\*Most common reportable STI in Canada

# Sinusitis

- see [Otolaryngology, OT24](#)

## Etiology

- viral etiology is more common
- viral: rhinovirus, influenza, parainfluenza
- bacterial: *S. pneumoniae*, *H. influenzae*, *M. catarrhalis*

## Management of Acute Sinusitis

- may provide symptom relief: oral analgesics (acetaminophen, NSAIDs), nasal saline rinse, short-term use of topical or oral decongestants
- do not prescribe antihistamines
- intra-nasal corticosteroids if diagnosed with mild to moderate acute bacterial sinusitis
- antibiotics and intra-nasal corticosteroids if diagnosed with severe acute bacterial sinusitis
- ENT referral if: anatomic defect (e.g. deviated septum, polyp, adenoid hypertrophy), failure of second-line therapy, ≥4 episodes/yr, development of complications (e.g. mucocele, orbital extension, meningitis, intra-cranial abscess, venous sinus thrombosis)

### Red Flags for Urgent Referral

- Altered mental status
- Headache
- Systemic toxicity
- Swelling of the orbit or change in visual acuity or EOM
- Hard neurological findings
- Signs of meningeal irritation
- Suspected intra-cranial complications (meningitis, intra-cranial abscess, cavernous sinus thrombosis)
- Involvement of associated structures (periorbital cellulitis, Pott's puffy tumour)

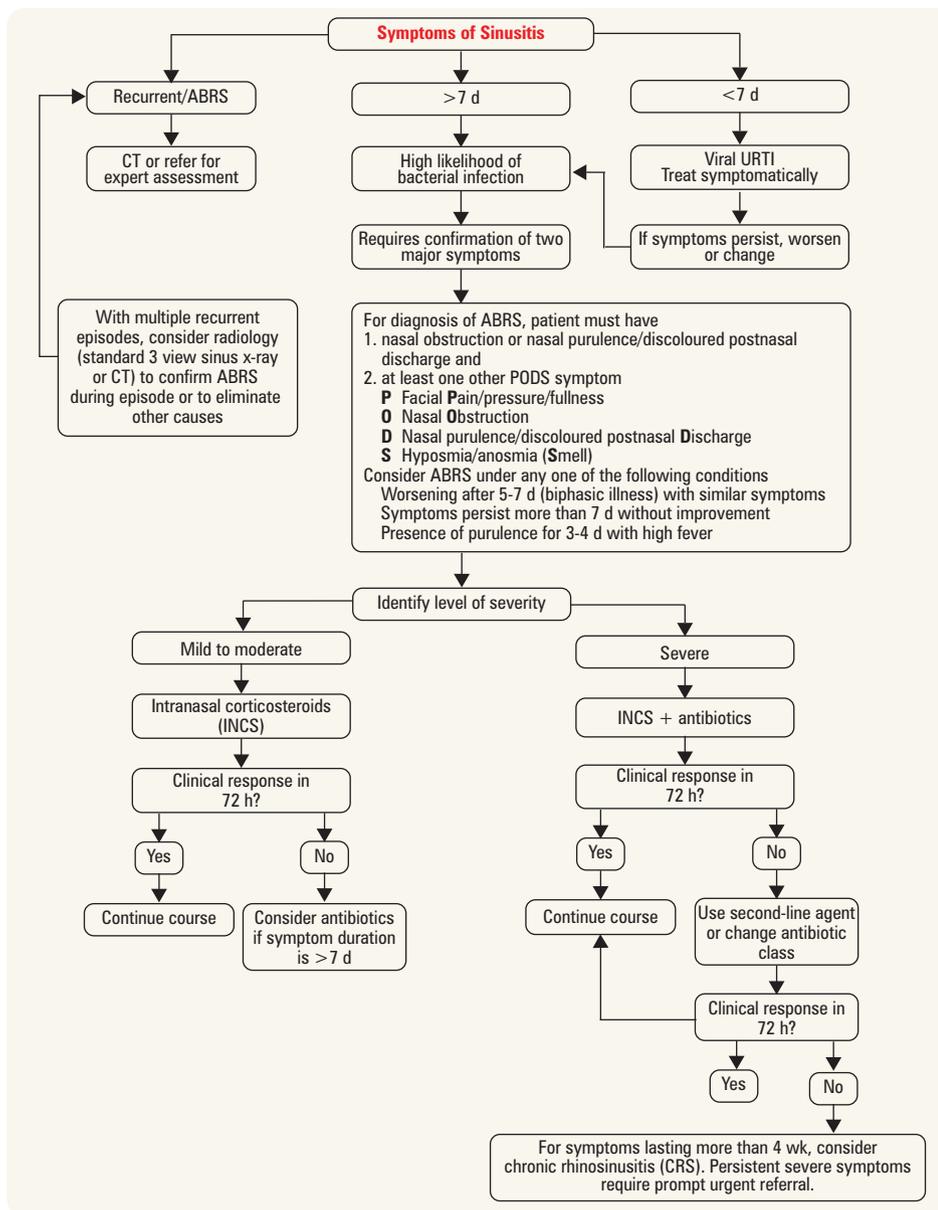

Figure 15. Diagnosis and management of sinusitis

ABRS = acute bacterial rhinosinusitis

Adapted from: Desrosiers M, et al. *Allergy Asthma Clin Immunol* 2011;7:doi:10.1186/1710-1492-7-2

## Sleep Disorders

- see [Respirology, R31](#) and [Neurology, N46](#)

### Definition

- most often characterized by one of three complaints
  - insomnia
    - ♦ difficulty falling asleep, difficulty maintaining sleep, early-morning waking, non-refreshing sleep
  - parasomnias
    - ♦ night terrors, nightmares, restless leg syndrome, somnambulism (performing complex behaviour during sleep with eyes open but without memory of event)
  - excessive daytime sleepiness

### Epidemiology

- 1/3 of patients in primary care setting have occasional sleep problems, 10% have chronic sleep problems

### Etiology

- primary sleep disorders
  - primary insomnia, narcolepsy, obstructive sleep apnea, restless leg syndrome, periodic limb movements of sleep
- secondary causes
  - medical: COPD, asthma, CHF, hyperthyroidism, chronic pain, BPH, menopause, GERD, PUD, pregnancy, neurological disorders
  - drugs: alcohol, caffeine, nicotine, nicotine replacement therapy,  $\beta$ -agonists, antidepressants, steroids
  - psychiatric: mood and anxiety disorders
  - lifestyle factors: shift work, jet-lag

### Investigations

- complete sleep diary every morning for 1-2 wk
  - record bedtime, sleep latency, total sleep time, awakenings, quality of sleep
- rule out specific medical problems (e.g. CBC and differential, TSH)
- refer for sleep study, nocturnal polysomnogram, or daytime multiple sleep latency test if suspicion of sleep apnea or periodic leg movements of sleep

### Treatment of Specific Problems

- **Primary insomnia**
  - majority of cases
  - person reacts to insomnia with fear or anxiety around bedtime or with a change in sleep hygiene, which can progress to a chronic disorder (psychophysiological insomnia)
  - treat any suspected medical or psychiatric cause
  - behaviour-based treatment
  - sleep hygiene: avoid alcohol, caffeine, nicotine; comfortable sleep environment; regular sleep schedule; no napping
  - exercise regularly, avoid heavy exercise within 3 h of bedtime
  - relaxation therapy: deep breathing, meditation, biofeedback
  - stimulus control therapy: re-association of bed/bedroom with sleep, re-establishment of a consistent sleep-wake schedule, reduce activities that cue staying awake
    - ♦ sleep restriction therapy: total time in bed should closely match the total sleep time of the patient (improves sleep efficacy)
    - ♦ CBT: address inappropriate beliefs and attitudes that perpetuate dysfunctional sleep
  - pharmacologic treatment
    - ♦ short-acting benzodiazepines (e.g. lorazepam, oxazepam, temazepam) at the lowest effective dose should be used <7 consecutive nights to break cycle of chronic insomnia or to manage an exacerbation of previously controlled primary insomnia
    - ♦ non-benzodiazepines: zopiclone (Imovane<sup>®</sup>), zolpidem (Sublinox<sup>®</sup>), melatonin, low dose antidepressants with sedating properties (amitriptyline, trazadone, mirtazapine)
    - ♦ follow-up every 2-4 wk initially (to reinforce behavioural interventions and renew/consider pharmacotherapy) then every 3 mo; if no progress or limited improvement, consider referral to sleep medicine program
- **Snoring**
  - results from soft tissue vibration at the back of the nose and throat due to turbulent airflow through narrowed air passages
  - physical exam: obesity, nasal polyps, septal deviation, hypertrophy of the nasal turbinates, enlarged uvula and tonsils
  - investigations (only if severely symptomatic): nocturnal polysomnography and airway assessment (CT/MRI)
  - treatment
    - ♦ sleep on side (position therapy), weight loss
    - ♦ nasal dilators (noninvasive external dilator made with elastic adhesive backing applied over nasal bridge), tongue-retaining devices, mandibular advancement devices
  - at risk of developing obstructive sleep apnea

### • Obstructive Sleep Apnea (OSA)

- apnea (no breathing for  $\geq 10$  s) resulting from upper airway obstruction due to collapse of the base of the tongue, soft palate with uvula, and epiglottis; respiratory effort is present
- leads to a distinctive snoring, choking, awakening type pattern as the body rouses itself to open the airway (resuscitative breath)
- apneic episodes can last from 20 s-3 min and occur 100-600 episodes/night
- diagnosis is based on nocturnal polysomnography:  $>15$  apneic/hypopneic episodes per hour of sleep with arousal recorded
- consequences
  - ◆ daytime somnolence, non-restorative sleep
  - ◆ poor social and work performance
  - ◆ mood changes: anxiety, irritability, depression
  - ◆ sexual dysfunction: poor libido, impotence
  - ◆ morning headache (due to hypercapnia)
  - ◆ HTN (2x increased risk), CAD (3x increased risk), stroke (4x increased risk), arrhythmias
  - ◆ OSA is an independent risk factor for CAD
  - ◆ pulmonary HTN, right ventricular dysfunction, cor pulmonale (due to chronic hypoxemia)
  - ◆ memory loss, decreased concentration, confusion
- investigations
  - ◆ evaluate BP, inspect nose and oropharynx (enlarged adenoids or tonsils)
  - ◆ blood gas not helpful, TSH if clinically indicated
  - ◆ nocturnal polysomnography
- treatment
  - ◆ modifiable factors: avoid sleeping supine; weight loss; avoid alcohol, sedatives, opioids; inhaled steroids if nasal swelling present; dental appliances to modify mandibular position
  - ◆ primary treatment of OSA is CPAP: maintains patent airway in 95% of OSA cases
  - ◆ surgery: somnoplasty, uvulopalatopharyngoplasty (UPPP), tonsillectomy, and adenoidectomy (in children)
  - ◆ report patient to Ministry of Transportation if OSA is not controlled by CPAP

#### Risk Factors for Obstructive Sleep Apnea

- 2% of women, 4% of men between ages 30-60
- Obesity (due to upper airway narrowing). BMI  $>28$  kg/m<sup>2</sup> present in 60-90% of cases
- Children (commonly due to large tonsils and adenoids)
- Aging (due to decreased muscle tone)
- Persistent URTIs, allergies, nasal tumours, hypothyroidism (due to macroglossia), neuromuscular disease
- Family history

## Sore Throat (Pharyngitis)

### Definition

- inflammation of the oropharynx
- may be caused by a wide range of infectious organisms, most of which produce a self-limited infection with no significant sequelae

### Etiology

- viral: adenovirus, rhinovirus, influenza virus, RSV, EBV, coxsackie virus, herpes simplex virus, CMV, HIV
- bacterial: Group A  $\beta$ -Hemolytic *Streptococcus* (GABHS), Group C and Group  $\beta$ -Hemolytic *Streptococcus*, *Neisseria gonorrhoeae*, *Chlamydia pneumoniae*, *Mycoplasma pneumoniae*, *Corynebacterium diphtheriae*

### Epidemiology

- viral
  - most common cause (90% in adults is viral), occurs year round
- bacterial
  - GABHS (Group A  $\beta$ -Hemolytic Streptococcal Infections)
    - ◆ most common bacterial cause
    - ◆ occurs most often in winter months
    - ◆ 5-15% of adult cases and up to 50% of all pediatric cases of acute pharyngitis
    - ◆ most prevalent between 5-17 yr old

### Clinical Features

- viral
  - pharyngitis, conjunctivitis, rhinorrhea, hoarseness, cough
  - nonspecific flu-like symptoms such as fever, malaise, and myalgia
  - often mimics bacterial infection
  - common viral infections
    - ◆ EBV (infectious mononucleosis)
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash
    - ◆ coxsackie virus (hand, foot, and mouth disease)
      - primarily late summer, early fall
      - sudden onset of fever, pharyngitis, headache, abdominal pain, and vomiting
      - appearance of small vesicles that rupture and ulcerate on soft palate, tonsils, pharynx
      - ulcers are pale grey and several mm in diameter, have surrounding erythema, and may appear on hands and feet
    - ◆ herpes simplex virus
      - like coxsackie virus but ulcers are fewer and larger
      - pharyngitis, tonsillar exudate, fever, lymphadenopathy, fatigue, rash

#### Red Flags in Patients with "Sore Throat"

- Persistence of symptoms longer than 1 wk without improvement
- Respiratory difficulty (particularly stridor, croup, etc.)
- Difficulty in handling secretions (peritonsillar abscess)
- Difficulty in swallowing (Ludwig's angina)
- Severe pain in the absence of erythema (supraglottitis/epiglottitis)
- Palpable mass (neoplasm)
- Blood in the pharynx or ear (trauma)

- bacterial
  - symptoms: pharyngitis, fever, malaise, headache, abdominal pain, absence of cough
  - signs: fever, tonsillar or pharyngeal erythema/exudate, swollen/tender anterior cervical nodes, halitosis
  - complications: rheumatic fever, glomerulonephritis, suppurative complications (abscess, sinusitis, otitis media, cervical adenitis, pneumonia), meningitis, impetigo

### Investigations

- suspected GABHS
  - see Table 29 for approach to diagnosis and management of GABHS
  - gold standard for diagnosis is throat culture
  - rapid test for streptococcal antigen: high specificity (95%) but low sensitivity (50-90%)
  - suspected EBV (infectious mononucleosis)
    - ♦ peripheral blood smear, heterophile antibody test (i.e. the latex agglutination assay or “monospot”)

**Table 29. Modified Centor Score: Approach to Diagnosis and Management of GABHS**

	POINTS				
Cough absent?	1				
History of fever >38°C?	1				
Tonsillar exudate?	1				
Swollen, tender anterior nodes?	1				
Age 3-14	1				
Age 15-44	0				
Age >45	-1				
In communities with moderate levels of strep infection (10-20% of sore throats):					
Score	0	1	2	3	4 or more
Chance patient has strep	1-2.5%	5-10%	11-17%	28-35%	51-53%
Suggested action	NO culture or antibiotic		Culture all, treat with antibiotics only if culture is positive	Culture all, treat with antibiotics on clinical grounds <sup>1</sup> , discontinue antibiotics if culture comes back negative	

<sup>1</sup>Clinical grounds include a high fever or other indicators that the patient is clinically unwell and is presenting early in the course of the illness

Limitations: \*This score is not applicable to patients <3 yr of age

\*If an outbreak or epidemic of illness caused by GABHS is occurring in any community, the score is invalid and should not be used

Adapted from: Centor RM, et al. Med Decis Making 1981;1:239-46; McIsaac WJ, et al. CMAJ 1998;158:75-83

### Management

- viral pharyngitis
  - antibiotics not indicated
  - symptomatic therapy: acetaminophen/NSAIDs for fever and muscle aches, decongestants
- GABHS
  - antibiotic treatment decreases severity and duration of symptoms, risk of transmission (after 24 h of treatment), and risk of rheumatic fever and suppurative complications
  - incidence of glomerulonephritis is not decreased with antibiotic treatment
  - no increased incidence of rheumatic fever with 48 h delay in antibiotic treatment; if possible, delay antibiotic treatment until culture confirms diagnosis
  - routine F/U and/or post-treatment throat cultures are not required for most patients
  - F/U throat culture only recommended for: patients with history of rheumatic fever, patients of family member(s) with history of acute rheumatic fever, suspected streptococcal carrier
- infectious mononucleosis (EBV)
  - self-limiting course; antibiotics are not indicated
  - symptomatic treatment: acetaminophen/NSAIDs for fever, pharyngitis, malaise
  - avoid heavy physical activity and contact sports for at least one month or until splenomegaly resolves because of risk of splenic rupture
  - if acute airway obstruction, give corticosteroids and consult ENT

# Complementary and Alternative Medicine

## Epidemiology

- 50-75% of Canadians report some use of CAM over their lifetime, and only half will disclose this use to their physician
- use is highest in Western provinces and lowest in Atlantic provinces
- more likely to be used by younger patients and those with higher education and income
- examples: chiropractic, acupuncture, massage, naturopathy, homeopathy, traditional Chinese medicine, craniosacral therapy, osteopathy

## Herbal Products

- over 50% of Canadians use natural health products (NHPs)
- most commonly used include echinacea, ginseng, ginkgo, garlic, St. John's wort, and soy
- relatively few herbal products have been shown to be effective in clinical trials
- many patients believe herbal products are inherently safe and are unaware of potential side effects and interactions with conventional medicines
- all NHPs must be regulated under The Natural Health Products Regulations as of January 1, 2004, including herbal remedies, homeopathic medicines, vitamins, minerals, traditional medicines, probiotics, amino acids, and essential fatty acids (e.g. omega-3)
- always ask patients whether they are taking any herbal product, herbal supplement, or other natural remedy. Further questions may include:
  - Are you taking any prescription or non-prescription medications for the same purpose as the herbal product?
  - Are you allergic to any plant products?
  - Are you pregnant or breastfeeding?
- information resources: National Center for CAM ([www.nccam.nih.gov](http://www.nccam.nih.gov)), Health Canada website

### Most Common Uses of CAM

- Back/neck problems
- Gynecological problems
- Anxiety
- Headaches
- Digestive problems
- Chronic fatigue syndromes

**Table 30. Common Herbal Products**

Common Name	Reported Uses	Possible Adverse Effects	Possible Drug Interactions
<b>Black Cohosh</b>	Menopausal symptoms, PMS, labour induction, arthritis	Hepatitis, liver failure, headaches, GI discomfort, heaviness in legs, weight problems	None reported
<b>Chamomile</b>	Mild sedative, anxiolytic, GI complaints, common cold	Allergic/contact dermatitis, anaphylaxis	Anxiolytics, sedatives
<b>Echinacea</b>	Common cold, flu, wound treatment, UTI, cancer	Hypersensitivity, hepatotoxicity with prolonged use, avoid use if immunosuppressed	Potentiates warfarin
<b>Evening Primrose</b>	Dysmenorrhea, menopausal sx, inflammation, allergies, eczema, arthritis, MS	Headache, restlessness, nausea, diarrhea, may decrease seizure threshold	Anticoagulants, antiplatelets
<b>Feverfew</b>	Migraine prevention, RA, anti-inflammatory	Anxiety, upset stomach, skin rash, miscarriage	Anticoagulants, antiplatelets
<b>Flaxseed Oil</b>	Laxative, menopausal symptoms, source of omega-3 fatty acids	Diarrhea	Do not take with other medications as fibre content can bind drugs
<b>Garlic</b>	Elevated lipids, HTN, hyperglycemia, antimicrobial	GI irritation, contact dermatitis, may increase post-operative bleeding	Anticoagulants, potentiates antihypertensives
<b>Ginger</b>	Nausea, motion sickness, dyspepsia, anti-inflammatory	Heartburn, not to be used for morning sickness	None known
<b>Ginkgo Biloba</b>	Increases peripheral circulation (AD, dementia, intermittent claudication), premenstrual syndrome, vertigo	Headache, cramping, bleeding, mild digestive problems; reports of intracranial hemorrhage	Anticoagulants, thiazide diuretics, MAO inhibitors
<b>Ginseng</b>	Energy enhancer, decreases stress, adjunct support for chemotherapy/radiation	HTN, nervousness, insomnia, breakthrough bleeding, palpitations	Stimulant medications, antihypertensives, hormonal therapies
<b>Glucosamine (Chondroitin)</b>	Osteoarthritis	GI distress, headache, drowsiness, palpitations	Caution if shellfish allergy
<b>Saw Palmetto</b>	BPH, adjunct to finasteride	Mild GI distress	α-adrenergics, finasteride
<b>St. John's Wort</b>	Mild to moderate depression	Photosensitivity, increased liver enzymes, drowsiness, dizziness, nausea, headache	CNS depressants, contraindicated with indinavir
<b>Valerian Root</b>	Sedative, anxiolytic, muscle relaxant, PMS	Drowsiness, headache, digestive problems, paradoxical insomnia	CNS depressants, antihistamines

Zink T, Chaffin J. Herbal "health" products: What family physicians need to know. *American Family Physician* 1998;58:1133-1140; NIH National Center for Complementary and Alternative Medicine website (<http://nccam.nih.gov/>)

## Primary Care Models

Table 31. Primary Care Models (Adapted from [www.healthforceontario.ca](http://www.healthforceontario.ca))

	Characteristics
<b>Comprehensive Care Model</b>	FPs/GPs in solo practice with limited after-hours availability Payment model: fee-for-service
<b>Family Health Team</b>	Groups of health care professionals (e.g. FPs, GPs, RNs, NPs, dietitians, social workers) Wider range of services (e.g. rehabilitation, palliative care), with increased after-hours availability Receives provincial funding for allied health Patient enrolment is strongly encouraged Payment model: paid annually per patient rostered depending on demographic category (blended capitation model)
<b>Family Health Group</b>	Group of ≥3 FPs, can utilize nurse-staffed, telephone health advisory services to provide around the clock primary care coverage Physicians commit to enroll patients Payment model: blended capitation model i.e. age- and sex-adjusted base rate remuneration plus bonuses and incentives
<b>Family Health Network</b>	Group of ≥3 FPs, can utilize nurse practitioners, with telephone health advisory services to provide around the clock primary care coverage Payment model: salary-based
<b>Family Health Organization</b>	Same as FHT but usually larger in scale in terms of personnel Physicians commit to enrol patients Must sign governance and Family Health Organization agreements to join Payment model: blended capitation model i.e. age- and sex-adjusted base rate remuneration plus bonuses and incentives

## Antimicrobial Quick Reference

## Anatomy Review

### Overview of Gastrointestinal Tract

- the gastrointestinal tract runs from mouth to anus ("gum to bum")

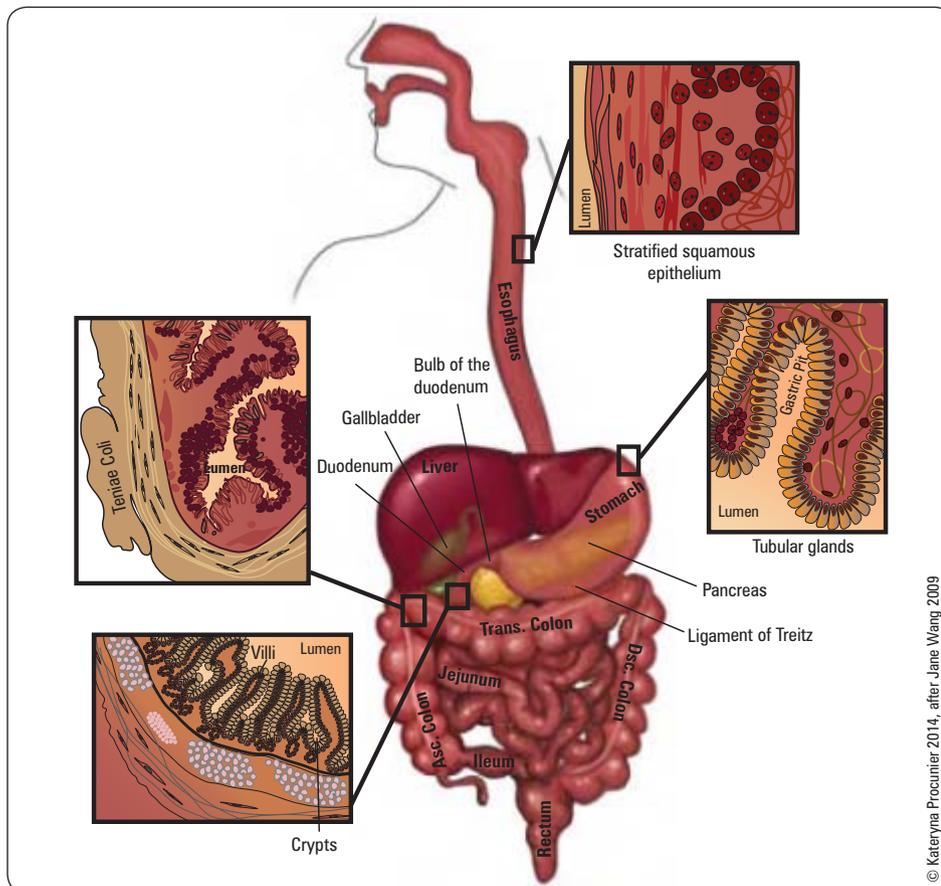

Figure 1. Overview of gastrointestinal tract

**Table 1. Summary of Gastrointestinal Tract Structure and Function**

Organ	Function	Blood Supply	Innervation	Histology and Structural Features
<b>Esophagus</b>	Muscular tube approximately 25 cm long with a diameter of 2 cm Extends from pharynx to the stomach	Arterial: left gastric artery and left inferior phrenic artery Venous: Left gastric vein → portal venous system Esophageal veins → azygos vein → IVC (systemic)	Parasympathetic innervation via anterior and posterior gastric nerves (vagal trunks) Sympathetic innervation via thoracic trunks of the greater splanchnic nerves	Mucosa: stratified squamous epithelium Submucosa: connective tissue, lymphocytes, plasma cells, nerve cells Muscularis propria (muscularis externa): inner circular, outer longitudinal muscle Upper 1/3: striated muscle Middle 1/3: transition zone Lower 1/3: smooth muscle
<b>Stomach</b>	Delivers food to intestine for digestion and absorption Secretes acid, probably to reduce enteric infections/pneumonia; facilitate digestion of protein/iron/B12 Secretes intrinsic factor to facilitate B12 absorption Minor contribution to initial protein digestion via pepsin	Lesser curvature Right and left gastric arteries (from celiac trunk) Greater curvature Right and left gastro-omental (gastroepiploic) arteries (from gastroduodenal and splenic arteries respectively) Fundus: short and posterior gastric arteries (from the splenic artery)	Parasympathetic innervation via vagus nerve Sympathetic innervation via celiac plexus (from T6-T9)	5 parts Cardia Fundus Body Antrum Pylorus
<b>Duodenum</b>	Modulates enteral pH via secretin → decreased gastric acid secretion, increased bicarbonate secretion Secretes CCK to stimulate bile secretion Site of iron absorption	Branches of celiac artery and superior mesenteric artery	Parasympathetic innervation via vagus nerve Sympathetic innervation via greater and lesser splanchnic nerves	4 parts Superior (5 cm) Descending (7-10 cm) Horizontal (6-8 cm) Ascending (5 cm) 1st part is intraperitoneal; rest is retroperitoneal
<b>Jejunum</b>	Absorption of sodium, water, and nutrients (protein, carbohydrates, fat, folic acid, and vitamin A, B, C, D, E, K)	Superior mesenteric artery	Parasympathetic innervation via fibres of the posterior vagal trunk Sympathetic innervation via fibres of T8-T10	Deep red colour 2-4 cm in thickness Thick and heavy wall Plicae circulares are large, tall, and closely packed Has long vasa recta Scant fat in mesentery Scant Peyer's patches
<b>Ileum</b>	Absorption of sodium, water, nutrients, soluble vitamins (only site of vitamin B12 absorption), and bile salts (entero-hepatic circulation)	Superior mesenteric artery	Same as jejunum	When compared to jejunum Paler pink colour 2-3 cm in thickness Thin and light walls Plicae circulares are small and sparse Contains more mesenteric fat Many Peyer's patches
<b>Large Bowel</b>	Absorption of water (5-10% of total water) Bacteria: further digestion of chyme and metabolism of undigested CHO to short chain fatty acids Formation and storage of feces	Branches of superior and inferior mesenteric arteries Rectal blood supply: sigmoid, right pudendal, and rectal arteries	Parasympathetic innervation via vagus nerve Sympathetic innervation via greater and lesser splanchnic nerves	Consists of cecum, colon (ascending, transverse, descending, and sigmoid), rectum and anal canal Features include teniae coli, haustra, and omental appendices
<b>Liver</b>	Glucose homeostasis Plasma protein synthesis Lipid and lipoprotein synthesis Bile acid synthesis and secretion Vitamin A, D, E, K, B12 storage Biotransformation, detoxification Excretion of compounds	2 sources Portal vein (75-80%) Hepatic artery (20-25%)	Parasympathetic innervation via fibres of the anterior and posterior vagal trunks Sympathetic innervation via fibres of the celiac plexus	Largest internal organ Composed of 4 lobes (left, right, caudate, quadrate), and divided into 8 segments
<b>Biliary Tract</b>	Gallbladder functions to store and release bile that is produced in the liver Bile is used to emulsify fat and is composed of cholesterol, lecithin, bile acids, and bilirubin CCK stimulates gallbladder emptying while trypsin and chymotrypsin inhibit bile release	Cystic artery	Parasympathetic innervation via vagus nerve Sympathetic and visceral innervation via celiac nerve plexus Somatic afferent fibres via right phrenic nerve	Consists of the hepatic ducts (intrahepatic, left, right and common), gallbladder, cystic duct, common bile duct, and ampulla of Vater
<b>Pancreas</b>	Endocrine function: islets of Langerhans produce glucagon, insulin, and somatostatin (from the $\alpha$ , $\beta$ , and $\delta$ cells, respectively) Exocrine function: digestive enzymes are produced including amylase, lipase, trypsin, chymotrypsin, and carboxypeptidase	Anterior superior pancreaticoduodenal artery (from the celiac trunk) Anterior inferior pancreaticoduodenal artery (from the superior mesenteric artery) Dorsal pancreatic artery (from the splenic artery) Pancreatic veins drain into the portal, splenic, and superior mesenteric veins	Parasympathetic innervation via vagus nerve Sympathetic innervation via abdominopelvic splanchnic nerves	4 parts of pancreas: head (includes uncinata process), neck, body, and tail (Major) pancreatic duct connecting to common bile duct prior to ampulla of Vater Accessory pancreatic duct connected directly to duodenum

# Visualizing the GI Tract

• see [Medical Imaging, MI15](#)

## Esophagus, Stomach, Duodenum

- OGD: best visualization of mucosa; also allows for therapeutic intervention (e.g. banding varices, thermal therapy/clipping/injecting bleeding ulcers, and dilatation e.g. treatment of esophageal strictures)
  - consider barium swallow first if dysphagia, decreased level of consciousness (increases risk of aspiration), inability to cooperate (increases risk of pharyngeal trauma during intubation), possibility of fistulas
  - endotracheal intubation first if massive upper GI bleed, acidemia, or inability to protect airway

## Small Bowel

- most difficult to visualize, especially if mucosal detail is needed
- CT enterography more accurate than small bowel follow through, but both have low sensitivity
- MRI small bowel imaging increasingly available, especially useful if radiation exposure is an issue (e.g. young patient, multiple radiological images already done)
  - note: MRI enteroclysis: luminal contrast administered by nasojejunal tube to dilate the small bowel – disliked by both radiologist and patient, but may improve sensitivity
- “double balloon” enteroscopy (enteroscope with proximal and distal balloons to propel endoscope into jejunum from mouth or into jejunum/ileum or into ileus from anus) may be most sensitive but currently available only in selected centres; technically demanding
- wireless endoscopy capsule (26 x 11 mm capsule is swallowed, transmits images to a computer; contraindicated in bowel obstruction) is also accurate in diagnosis but unable to provide any therapeutic intervention

## Colon and Terminal Ileum

- colonoscopy, with biopsy if required; contraindicated in perforation, acute diverticulitis, and severe colitis (increased risk of perforation)
- CT colonography (“virtual colonoscopy”) more accurate in diagnosing diverticulosis, extrinsic pressure on colon (e.g. ovarian cancer compressing sigmoid colon), and fistulae; increasing evidence for use in colorectal cancer screening, especially for assessment of right side of colon in cases where colonoscopy is less sensitive. Most often used when optical endoscopic colonoscopy is a risk (e.g. frail elderly) or unsuccessful (e.g. stricture).
- most often used when optical endoscopic colonoscopy is a risk (e.g. frail elderly) or unsuccessful (e.g. stricture)

## Pancreatic/Biliary Duct

- MRCP almost as sensitive as ERCP in determining if bile duct obstruction present, but less accurate in determining cause of obstruction (tumour, stone, stricture)
- ERCP if therapeutic intervention likely to be required: strong suspicion of stone, obstruction requiring stenting, or if tissue sampling required

**Retroperitoneal Structures**  
 Suprarenal glands (adrenal glands)  
 Aorta/IVC  
 Duodenum (second to fourth segments)  
 Pancreas (tail is intraperitoneal)  
 Ureters  
 Colon (only the ascending and descending branches)  
 Kidneys  
 Esophagus  
 Rectum

Only the ileum (not jejunum) can absorb vitamin B12 and bile acids

# Differential Diagnosis of Common Complaints

• see [General Surgery, Acute Abdominal Pain, GS4](#)

Table 2. Differential Diagnosis of Common Presenting Complaints

CHRONIC/ RECURRENT ABDOMINAL PAIN	Inflammatory	Neoplastic/ Vascular	Toxin	Other
	PUD Biliary colic IBD Chronic pancreatitis	Recurrent bowel obstruction Mesenteric ischemia Sickle cell anemia	Lead poisoning	Mittelschmerz Endometriosis Porphyria IBS Radiculopathy Abdominal wall pain syndrome
ACUTE DIARRHEA	Inflammatory	Non-Inflammatory		
*Causes of bloody diarrhea	<b>Bacterial</b> <i>Shigella</i> * <i>Salmonella</i> * <i>Campylobacter</i> * <i>Yersinia</i> * <i>E. coli</i> (EHEC 0157:H7)*	<b>Protozoal</b> <i>E. histolytica</i> * (amoebiasis) Strongyloides  <b>Others</b> NSAIDs IBD* Ischemic*	<b>Bacterial</b> <i>S. aureus</i> <i>C. perfringens</i> <i>B. cereus</i> <i>E. coli</i> (ETEC, EPEC) <i>Salmonella enteritidis</i> <i>Vibrio cholera</i> <b>Protozoal</b> <i>Giardia lamblia</i>	<b>Viral</b> Rotavirus Norwalk CMV <b>Drugs</b> Antibiotics Colchicine Laxatives Antacids (magnesium)

**Acute Upper Abdominal Pain**  
 Remember to rule out thoracic sources, e.g. myocardial infarction, pneumonia, dissecting aneurysm

**Obscure But Treatable Causes of Abdominal Pain**

- Acute Intermittent Porphyria
- Hereditary Angioedema
- Familial Mediterranean Fever
- Vasculitis (e.g. polyarteritis nodosa)

**Inflammatory Diarrhea:** Occurs when there is damage to the mucosal lining or brush border, which leads to a passive loss of protein-rich fluids and a decreased ability to absorb these lost fluids. Diarrhea may be profuse or very small in volume. Often associated with abdominal pain ± fever and chills  
**Non-Inflammatory Diarrhea:** No damage to the mucosal lining. N/V may be present. Fever, chills, blood in the stool, severe abdominal pain or tenderness are not present

**Table 2. Differential Diagnosis of Common Presenting Complaints (continued)**

CHRONIC DIARRHEA		Organic			Functional
*Causes of bloody diarrhea	<b>Inflammatory</b>	<b>Secretory</b>	<b>Steatorrhea</b>	<b>Osmotic</b>	
	IBD* Infectious (TB, CMV, HSV) Ischemic* bowel Radiation colitis Neoplasia  <i>C. difficile</i> rarely causes bleeding	Stimulant laxatives Post-ileal resection/cholecystectomy (bile salts) Bacterial toxins Vasculitis Neoplasia* (colon ca, carcinoid, VIPoma) Addison's disease Congenital syndromes	<i>Giardia lamblia</i> Celiac sprue Chronic pancreatitis Chronic cholestasis	Osmotic laxatives Lactose intolerance Chewing gum (sorbitol, mannitol)	IBS Constipation (overflow diarrhea) Anal sphincter dysfunction
<b>CONSTIPATION: if no associated rectal bleeding/weight loss, etc., usually no cause found (and dysmotility assumed)</b>					
	Colorectal cancer Stricture Extrinsic compression Anal disease Rectocele	Medications (narcotics, antidepressants, calcium channel blockers) Metabolic (DM, thyroid, hypercalcemia)	Neurologic (Parkinson's, MS, stroke) Collagen vascular disease (scleroderma, dermatomyositis)		
<b>NAUSEA/VOMITING</b>		<b>With Abdominal Pain</b>		<b>Without Abdominal Pain</b>	
	<b>Relieved by Vomiting</b>	<b>Not Relieved by Vomiting</b>	<b>Headache/Dizziness</b>	<b>No Other Symptoms</b>	
	Gastric outlet obstruction Small bowel obstruction GERD (regurgitation more common)	Gallbladder disease Pancreatitis Myocardial infarction Hepatitis Infectious Gastroenteritis	Cerebral tumour Migraine Vestibular disease Increased ICP	Drugs Uremia Pregnancy Metabolic (e.g. hypercalcemia) Gastroparesis (e.g. DM) Ketoacidosis	
<b>DYSPEPSIA</b>		<b>Common</b>		<b>Uncommon</b>	<b>Rare</b>
	Functional dyspepsia Drug side effect Peptic ulcer GERD (esophagitis)		Angina Crohn's disease Cancer (stomach, pancreas, liver) Gallstones Aerophagia	Giardia lamblia Malabsorption (celiac sprue) Pancreatitis	
<b>UPPER GI BLEED</b>		<b>Common</b>		<b>Uncommon</b>	<b>Rare</b>
	Ulcers ( <i>H. pylori</i> , ASA, NSAIDs) Esophageal varices Mallory-Weiss tears Erosive esophagitis Erosive gastritis		Tumours Arteriovenous malformation Dieulafoy's lesion (arterial) Gastric antral vascular ectasia (GAVE) Portal hypertensive gastropathy	Aorto-enteric fistulas Hemobilia	
<b>LOWER GI BLEED</b>		<b>Common</b>		<b>Uncommon</b>	<b>Rare</b>
	Diverticulosis Ischemia Angiodysplasia (elderly) Infectious Anorectal (hemorrhoids, fissure, ulcer)		Upper GI bleed (brisk) Post-polypectomy Radiation colitis IBD	Intussusception Vasculitides Stercoral ulcer Coagulopathies	
<b>DYSPHAGIA</b>		<b>Mechanical (Solids)</b>		<b>Motility (Solids and Liquids)</b>	<b>Other</b>
	Peptic stricture/cancer Eosinophilic esophagitis Extrinsic compression Schatzki ring/esophageal web Zenker's diverticulum		Achalasia Diffuse esophageal spasm Scleroderma	Foreign body Eosinophilic esophagitis	
<b>ODYNOPHAGIA</b>		<b>Infection</b>	<b>Inflammation/Ulceration</b>	<b>Drugs</b>	<b>Other</b>
	Candida Herpes CMV (common in those who are immunosuppressed)	Caustic damage Eosinophilic esophagitis	Quinidine Iron Vitamin C Antibiotics (e.g. tetracycline) Bisphosphonates	Radiation	
<b>ABDOMINAL DISTENTION</b>		<b>Fluid (Ascites)</b>	<b>Flatulence</b>	<b>Feces</b>	<b>Other</b>
	<b>Portal HTN</b> Cirrhosis Cardiac failure Hepatic vein thrombosis	<b>Normal Portal Pressure</b> Cancer (especially ovarian) Pancreatitis TB	Functional bowel disease (e.g. IBS) Fibre Lactose intolerance Chewing gum (e.g. sorbitol, mannitol)	Constipation Colonic obstruction Dysmotility	Pregnancy (fetus) Obesity (fat) Blood Large tumours (fatal growth)

IBD is a common cause of bloody diarrhea but can be diagnosed only if mimickers are excluded. Chiefly, infection, ischemia and medication side-effects

#### Commonly Forgotten Causes of Vomiting

- Drugs
- Uremia
- CNS Disease
- Pregnancy
- Marijuana (cannabinoid hyperemesis)

#### Difference Between Dysphagia and Odynophagia

- **Dysphagia:** Difficulty swallowing due to mechanical obstruction or dysmotility of the esophagus or pharynx
- **Odynophagia:** Pain when swallowing due to ulceration or inflammation (e.g. eosinophilic esophagitis) in the esophagus pharynx

#### Differential Diagnosis of Abdominal Distention

- 6 Fs**
- Fat
  - Feces
  - Fetus
  - Flatus
  - Fluid
  - Fatal Growth

**Table 2. Differential Diagnosis of Common Presenting Complaints (continued)**

JAUNDICE (UNCONJUGATED BILIRUBIN)	Overproduction	Decreased Hepatic Intake	Decreased Conjugation
	Hemolysis Ineffective erythropoiesis (e.g. megaloblastic anemias)	Gilbert's syndrome Drugs (e.g. rifampin)	Drug inhibition (e.g. chloramphenicol) Crigler-Najjar syndromes type I and II Gilbert's syndrome Neonatal jaundice
JAUNDICE (CONJUGATED BILIRUBIN)	Common	Uncommon	
	Hepatocellular disease Drugs Cirrhosis (any cause) Inflammation (hepatitis, any cause) Infiltrative (e.g. hemochromatosis) Familial disorders (e.g. Rotor syndrome, Dubin-Johnson syndrome, cholestasis of pregnancy) PBC PSC Sepsis Post-operative/TPN	<b>Intraductal obstruction</b> Gallstones Biliary stricture Parasites Malignancy (cholangiocarcinoma) Sclerosing cholangitis <b>Extraductal obstruction</b> Malignancy (e.g. pancreatic cancer, lymphoma) Metastases in peri-portal nodes <b>Inflammation (e.g. pancreatitis)</b>	

**Bowel Ischemia**

The splenic flexure and rectosigmoid junction are watershed areas and are susceptible to ischemia. History and symptoms include acute onset crampy left abdominal pain, absence of abdominal tenderness on exam, rectal bleeding, and risk factors for embolization, atherosclerosis and atrial fibrillation

**Dyspepsia** = postprandial fullness, early satiety, epigastric pain, or burning

**Foods/Substances that Aggravate GERD Symptoms (but not the underlying disease)**

- EtOH
- Caffeine
- Tobacco
- Fatty/fried foods
- Chocolate
- Peppermint
- Spicy foods
- Citrus fruit juices

# Esophagus

## Gastroesophageal Reflux Disease

**Definition**

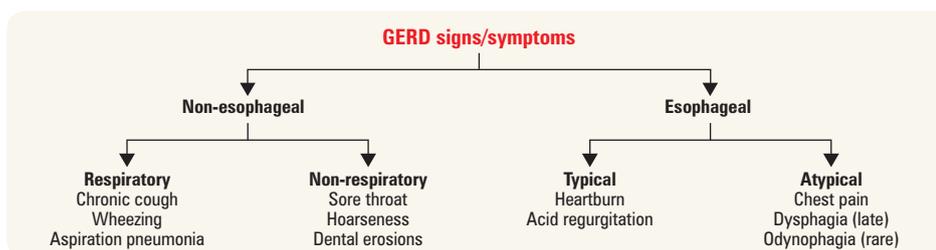

- condition in which the stomach contents (most characteristically acid) moves backwards from the stomach into the esophagus

**Etiology**

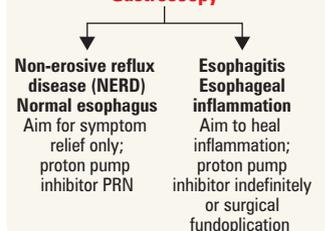

- inappropriate transient relaxations of LES – most common cause
- low basal LES tone (especially in scleroderma)
- contributing factors include: delayed esophageal clearance, delayed gastric emptying, obesity, pregnancy, acid hypersecretion (rare) from Zollinger-Ellison syndrome (gastrin-secreting tumour)
- hiatus hernia worsens reflux, does not cause it (see [General Surgery, GS13](#))

**Clinical Features**

- “heartburn” (pyrosis) and acid regurgitation (together are 80% sensitive and specific for reflux) ± sour regurgitation; less sensitive and less specific: water brash, sensation of a lump in the throat (globus sensation), and frequent belching
- non-esophageal symptoms are increasingly recognized of being poor predictors of reflux

**Figure 2. Signs and symptoms of GERD****Investigations**

- usually, a clinical diagnosis is sufficient based on symptom history and relief following a trial of pharmacotherapy (PPI: symptom relief 80% sensitive for reflux)
- gastroscopy indications (*Ann Intern Med* 2012;157:808-816)
  - absolute indications
    - ♦ heartburn accompanied by red-flags (bleeding, weight loss, etc.)
    - ♦ persistent reflux symptoms or prior severe erosive esophagitis after therapeutic trial of 4-8 wk of PPI 2x daily
    - ♦ history suggests esophageal stricture especially dysphagia
    - ♦ high risk for Barrett's (male, age >50, obese, white, tobacco use, long history of symptoms)
- repeat endoscopy after 6-8 wks of PPI therapy indicated if: severe esophagitis because it can mask Barrett's esophagus or symptoms
- esophageal manometry (study of esophageal motility)
  - done to diagnose abnormal peristalsis and/or decreased LES tone, but cannot detect presence of reflux; indicated before surgical fundoplication to ensure intact esophageal function

**Gastroesophageal Reflux Disease****Gastroscopy****Figure 3. Classification and gastroscopic findings of GERD**

- surgical fundoplication (wrapping of gastric fundus around the lower end of the esophagus) more likely to alleviate symptoms if lower esophageal pressure is diminished; less likely to be successful if abnormal peristalsis
- 24 h pH monitoring: most accurate test for reflux, but not required or performed in most cases
  - most useful if PPIs do not improve symptoms

### Treatment

- PPIs are the most effective therapy and usually need to be continued as maintenance therapy
- on-demand: antacids ( $\text{Mg}(\text{OH})_2$ ,  $\text{Al}(\text{OH})_3$ , alginate),  $\text{H}_2$ -blockers, or PPIs can be used for NERD
- diet helps symptoms, not the disease; avoid alcohol, coffee, spices, tomatoes, and citrus juices
- only beneficial lifestyle changes are weight loss (if obese) and elevating the head of bed (if nocturnal symptoms)
- symptoms may recur if therapy is discontinued

### Complications

- esophageal stricture disease – scarring can lead to dysphagia (solids)
- ulcer
- bleeding
- Barrett's esophagus and esophageal adenocarcinoma – gastroscopy is recommended for patients with chronic GERD or symptoms suggestive of complicated disease (e.g. anorexia, weight loss, bleeding, dysphagia)

Esophageal damage from reflux is most severe at first gastroscopy, therefore gastroscopy is necessary only once for patients with NERD

Up to 25% of patients with Barrett's esophagus do not report symptoms of GERD

**Should Patients with Barrett's Esophagus Undergo Periodic Upper GI Endoscopy for Esophageal Cancer Screening? Impact of Endoscopic Surveillance on Mortality From Barrett's Esophagus - Associated Esophageal Adenocarcinomas**  
*Gastroenterology* 2013;145:312-319

There is no question that Barrett's esophagus (BE) increases the incidence of esophageal adenocarcinoma, which can be recognized early on with a safe procedure, endoscopy. Indeed, because early cancer is often asymptomatic and curable, most clinicians recommend period upper endoscopy. Yet Corley et al. found no difference in endoscopy rates in BE patients who died of esophageal adenocarcinoma compared to BE patients who died of other diseases. Perhaps this result is due to statistics, but as the accompanying editorial emphasizes (*Gastroenterology* 2013; 145:273-6) at the very least this finding should question the value of a screening program. In fact, there are multiple other lines of evidence indicating that endoscopic surveillance is of marginal benefit at most. Possible explanations for this disappointing finding include: most esophageal adenocarcinomas may not arise from BE, esophageal carcinoma is too rare a cause of death in BE, morbidity from esophageal cancer treatments, or that endoscopic screening is just not that effective in the real world. The situation is analogous to the disappointing value of serum PSA screening for prostate cancer. Therefore, adoption of screening programs require more than theoretical calculations.

## Barrett's Esophagus

### Definition

- metaplasia of normal squamous esophageal epithelium to abnormal columnar epithelium containing-type intestinal mucosa (intestinal metaplasia)

### Etiology

- thought to be acquired via long-standing GERD and consequent damage to squamous epithelium

### Epidemiology

- in North America and Western Europe, 0.5-2.0% of adults are thought to have Barrett's esophagus
- up to 10% of GERD patients will have already developed BE by the time they seek medical attention
- more common in males, age >50, Caucasians, smokers, overweight, hiatus hernia, and long history of reflux symptoms

### Pathophysiology

- endoscopy shows erythematous epithelium in distal esophagus; diagnosis of BE relies on biopsy demonstrating the presence of specialized intestinal epithelium of any length within the esophagus
- BE predisposes first to premalignant changes characterized as low or high-grade dysplasia, which then progresses to adenocarcinoma

### Significance

- rate of malignant transformation is approximately 0.12% per yr for all BE patients prior to dysplasia
- risk of malignant transformation in high-grade dysplasia is significantly higher; studies have reported a 32-59% transformation rate over 5-8 yr of surveillance
- increased gastric acid secretion is more frequently associated with Barrett's esophagus as opposed to reflux alone

### Treatment

- acid suppressive therapy with high-dose PPI indefinitely (or surgical fundoplication)
- endoscopy every 3 yr if no dysplasia
- high grade dysplasia: regular and frequent surveillance with intensive biopsy, endoscopic ablation/resection, or esophagectomy produce similar outcomes; however, evidence increasingly favouring endoscopic ablation with mucosal resection or radiofrequency ablation
- if low grade dysplasia, both surveillance and endoscopic ablation/resection are satisfactory options

**Remember:**  
**Dysphagia** = Difficulty in swallowing  
**Odynophagia** = Pain on swallowing

**Key Questions in Dysphagia**

- Difficulty in starting swallowing?
- Associated symptoms? (regurgitation, change in voice pitch, weight loss)
- Solids, liquids, or both?
- Intermittent or progressive?
- History of heartburn?
- Change in eating habits/diet?

# Dysphagia

## Definition

- difficulty swallowing

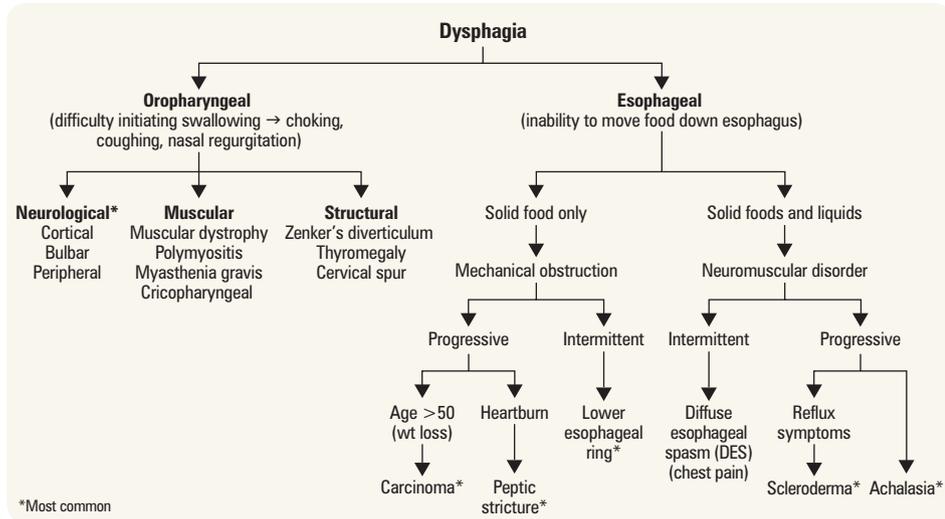

Figure 4. Approach to dysphagia (eosinophilic esophagitis omitted)

# Esophageal Motor Disorders

## Clinical Features

- dysphagia with solids and liquids
- chest pain (in some disorders)

## Diagnosis

- motility study (esophageal manometry)
- barium swallow sometimes helpful

## Causes

- idiopathic
- achalasia (painless)
- scleroderma (painless)
- DM
- DES: rare and can be difficult to diagnose due to intermittent presentation

Table 3. Esophageal Motor Disorders

Disorder	Achalasia	Scleroderma	Diffuse Esophageal Spasm
<b>Definition</b>	Failure of smooth muscle relaxation at LES Increased LES pressure Progressive loss of peristaltic function	See <b>Rheumatology, RH13</b> Systemic disease characterized by vasculopathy and tissue fibrosis (especially skin thickening)	Normal peristalsis interspersed with frequent, repetitive, spontaneous, high pressure, non-peristaltic waves (tertiary peristalsis)
<b>Etiology</b>	Usually idiopathic 2° or pseudo-achalasia: e.g. malignancy, Chagas disease ( <i>Trypanosoma cruzi</i> )	Involves autoimmune, genetic, hormonal, and environmental factors Dysphagia: caused by reflux, dysmotility, or both	Idiopathic
<b>Pathophysiology</b>	Inflammatory degeneration of Auerbach's plexus → increase in LES pressure, incomplete relaxation of LES with swallowing, aperistalsis	Blood vessel damage → intramural neuronal dysfunction → distal esophageal muscle weakening → aperistalsis and loss of LES tone → reflux → stricture → dysphagia	Potential mechanisms include impaired inhibitory innervation to esophageal body, malfunction in endogenous nitric oxide synthesis
<b>Diagnosis</b>	CXR: no air in stomach, dilated esophagus Barium studies: esophagus terminates in narrowing at LES ("bird's beak") Endoscopy: normal mucosa Manometry: definitive diagnosis (signs listed above)	Clinical features of scleroderma Manometry: decreased pressure in LES, decreased peristalsis in body of esophagus	Barium x-ray: "Corkscrew pattern" Manometry: >30% (but <100%) of esophageal contractions are aperistaltic Endoscopy: normal mucosa
<b>Treatment</b>	Dilatation of LES with balloon, ± GERD prophylaxis, 50% good response, can repeat, risk of perforation (5%) Injection of botulinum toxin into LES (temporary) POEM (peroral endoscopic myotomy)	Medical: aggressive GERD therapy (PPIs bid) Surgery: anti-reflux surgery (gastroplasty, last resort)	Reassurance not cardiac pain Medical: nitrates, calcium channel blockers, anticholinergics have variable benefit Surgical: long esophageal myotomy if unresponsive to above treatment (rarely helpful); balloon dilatation

## Esophageal Diverticula

### Definition

- outpouchings of one or more layers of the esophageal tract

### Clinical Features

- commonly associated with motility disorders
- dysphagia, regurgitation, retrosternal pain, intermittent vomiting, may be asymptomatic

### Classification

- classified according to location
  - pharyngoesophageal (Zenker's) diverticulum
    - ♦ most frequent form of esophageal diverticulum
    - ♦ posterior pharyngeal outpouching most often on the left side, above cricopharyngeal muscle and below the inferior pharyngeal constrictor muscle
    - ♦ symptoms: dysphagia, regurgitation of undigested food, halitosis
    - ♦ treatment: endoscopic or surgical myotomy of cricopharyngeal muscle ± surgical excision of sac
  - mid-esophageal diverticulum
    - ♦ secondary to mediastinal inflammation ("traction" diverticulae), motor disorders
    - ♦ usually asymptomatic; no treatment required
  - just proximal to LES (pulsatile type)
    - ♦ usually associated with motor disorders
    - ♦ usually asymptomatic, no treatment required

## Peptic Stricture (from Esophagitis)

- presents as dysphagia alongside a long history of reflux symptoms, but reflux symptoms may disappear as stricture develops
- diagnosed with endoscopy or barium study if endoscopy contraindicated or unavailable

### Treatment

- endoscopic dilatation and indefinite PPI

## Esophageal Carcinoma

- see [General Surgery, GS15](#)

## Webs and Rings

- web = partial occlusion (upper esophagus)
- ring = circumferential narrowing (lower esophagus)

### Clinical Features

- asymptomatic with lumen diameter >12 mm, provided peristalsis is normal
- dysphagia with large food boluses
- Schatzki ring
  - mucosal ring at squamo-columnar junction above a hiatus hernia
  - causes intermittent dysphagia with solids
  - treatment involves disrupting ring with endoscopic bougie

### Plummer-Vinson Syndrome Triad

- Iron deficiency anemia
  - Dysphagia
  - Esophageal webs
- \* rare (prevalence < 1 in 1,000,000) but good prognosis when treated with iron and esophageal dilatation

### Eosinophilic Esophagitis

- Eosinophils infiltrate the epithelium of the esophagus
- Causes odynophagia, dysphagia, common cause of bolus food impaction
- Usually primary, but can be part of the spectrum of eosinophilic gastroenteritis, secondary to drugs, parasites etc.
- Often associated with allergies
- Most characteristically occurs in young men
- Diagnosis established by endoscopic biopsy, suggested by mucosal rings seen in the esophageal mucosa at endoscopy
- Treatment: (a)diet, (b)swallow corticosteroid nasal spray (fluticasone), (c)swallow viscous corticosteroid (budesonide mixed with sucralose)

## Infectious Esophagitis

### Definition

- severe mucosal inflammation and ulceration as a result of a viral or a fungal infection

### Risk Factors

- DM
- chemotherapeutic agents
- immunocompromised states

### Clinical Features

- characteristically odynophagia, less often dysphagia
- diagnosis is via endoscopic visualization and biopsy

### Appearance

- Candida (most common): whitish-yellow plaques without visible ulceration or inflammation
- Herpes (second most common), CMV: focal ulcers

**Investigations**

- diagnosis via endoscopic visualization and biopsy

**Treatment**

- Candida: nystatin swish and swallow, ketoconazole, fluconazole
- Herpes: often self-limiting; acyclovir, valacyclovir, famciclovir
- CMV: IV gancyclovir, famciclovir, or oral valganciclovir

# Stomach and Duodenum

## Dyspepsia

**Definition**

- one or more of the following symptoms: postprandial fullness, early satiation, epigastric pain or burning (Rome III criteria)
- multiple causes: esophagitis, GERD, peptic ulcer, stomach cancer, drugs, but overall functional disease is most common

The most common cause of dyspepsia is functional (idiopathic) dyspepsia

**History and Physical Exam**

- history: most important are age, associated symptoms (such as weight loss and vomiting), and drugs (especially NSAIDs)
- physical exam: adenopathy, abdominal mass/organomegaly, Carnett's sign (if pain is due to abdominal wall muscle problem then the pain will increase during muscle contraction, such as during a sit-up)

**Red Flags of Dyspepsia**  
(raise suspicion of gastric malignancy):

- Unintended weight loss
- Persistent vomiting
- Progressive dysphagia
- Odynophagia
- Unexplained anemia or iron deficiency
- Hematemesis
- Jaundice
- Palpable abdominal mass or lymphadenopathy
- Family history of upper GI cancer
- Previous gastric surgery

**Investigations**

- laboratory: usual (CBC, liver enzymes, glucose, Cr, etc.), amylase, albumin, calcium, protein electrophoresis, TSH, *H. pylori* serology
- consider trial of empiric anti-secretory drug therapy, non-invasive testing for *H. pylori* infection, endoscopy; barium radiography is outdated

## Stomach

Table 4. Cells of the Gastric Mucosa

Cell Type	Secretory Product	Important Notes
Parietal Cells	Gastric acid (HCl)	
Intrinsic Factor	Stimulated by histamine, ACh, gastrin	
Chief Cells	Pepsinogen	Stimulated by vagal input and local acid
G-Cells	Gastrin	Stimulates H <sup>+</sup> production from parietal cells
Superficial Epithelial Cells	Mucus, HCO <sub>3</sub> <sup>-</sup>	Protect gastric mucosa
Neuroendocrine Cells	Multiple (e.g. somatostatin, inhibits cell secretion)	Involved in neural, hormonal, and paracrine pathways

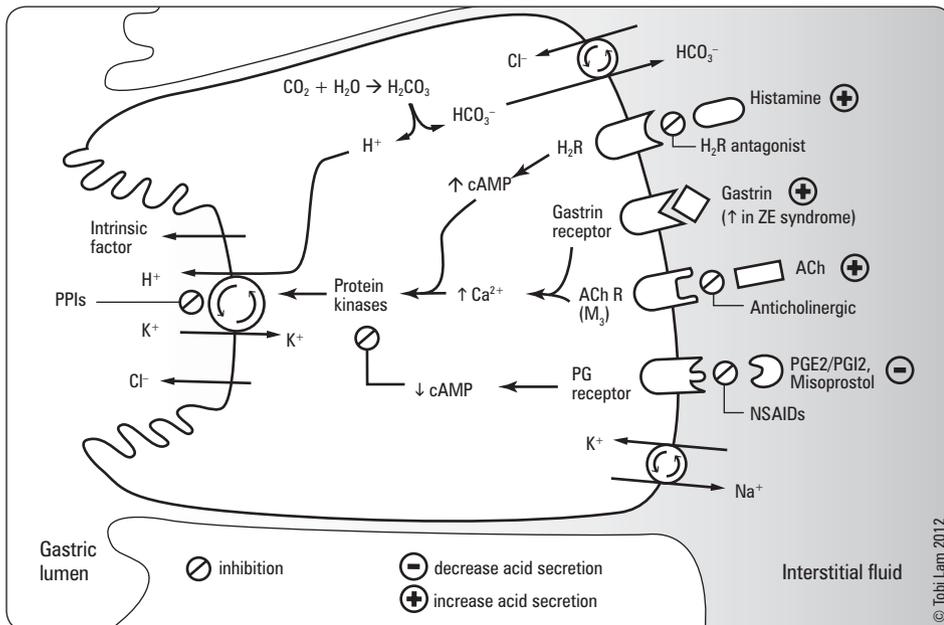

Figure 5. Stimulation of H<sup>+</sup> secretion from the parietal cell

© Tobin Lam 2012

## Gastritis

### Definition

- defined histologically: inflammation of the stomach mucosa

### Etiology

- some causative agents may play a role in more than one type of gastritis and an individual patient may have histopathological evidence of more than one type of gastritis

**Table 5. Updated Sydney Classification of Gastritis**

Type	Common Etiology
<b>Acute Gastritis</b>	
Hemorrhagic/erosive gastritis	Alcohol, Aspirin®/NSAID, shock/physiological stress (seen in ICU patients)
Helicobacter gastritis	<i>H. pylori</i> *
<b>Chronic Gastritis</b>	
Non-atrophic	<i>H. pylori</i>
Atrophic	<i>H. pylori</i> , dietary, environmental factors (multi-focal), autoimmunity
Chemical	NSAID, bile
Radiation	Radiation injury
Lymphocytic	Celiac disease, drug
Eosinophilic	Food allergies
Non-infectious granulomatous	Crohn's disease, sarcoidosis
Other infectious gastritides	Bacteria, viruses, fungi, parasite, TB, syphilis

### Clinical Features

- non-erosive gastritis is asymptomatic (except in certain rare causes like Crohn's disease), does not cause pain; difficult to diagnose clinically or endoscopically – requires biopsy for diagnosis
- erosive gastritis can cause bleeding (pain only if progresses to ulcers – rare); can be seen endoscopically

### Treatment

- determined by etiology (see *H. pylori*, G13, NSAID, G13 and Stress-Induced Ulceration, G14)
- non-pharmacological: avoidance of mucosal irritants such as alcohol, NSAIDs, and foods that trigger symptoms

## Peptic Ulcer Disease

### Definition

- focal defects in the mucosa that penetrate the muscularis mucosal layer results in scarring (defects superficial to the muscularis mucosa are erosions and do not cause scarring)
- peptic ulcer disease includes defects located in the stomach (gastric ulcers) and duodenum (duodenal ulcers)

### Etiology

**Table 6. Etiology of Peptic Ulcer Disease**

	Duodenal	Gastric
<i>H. pylori</i> Infection	90%	60%
NSAIDs	7%	35%
Physiologic Stress-Induced	<3%	<5%
Zollinger-Ellison Syndrome	<1%	<1%
Idiopathic	15%	10%

- NSAID negative, *H. pylori* negative ulcers becoming more commonly recognized
- others: CMV, ischemic, idiopathic
- alcohol: damages gastric mucosa but rarely causes ulcers
- peptic ulcer associated with cigarette smoking, cirrhosis of liver, COPD, and chronic renal failure

### Clinical Features

- dyspepsia: most common presenting symptom
  - only 5% of patients with dyspepsia have ulcers, while most have functional disease
- may present with complications
  - bleeding 10% (severe if from gastroduodenal artery), perforation 2% (usually anterior ulcers), gastric outlet obstruction 2%
  - posterior inflammation (penetration) 2%; may also cause pancreatitis

#### Cigarette Smoking and PUD

- Increased risk of ulcer
- Increased risk of complications
- Increased chance of death from ulcer
- Impairs healing

- duodenal ulcers: 6 classical features, but history alone cannot distinguish from functional dyspepsia
  - epigastric pain; may localize to tip of xiphoid
  - burning
  - develops 1-3 h after meals
  - relieved by eating and antacids
  - interrupts sleep
  - periodicity (tends to occur in clusters over wk with subsequent periods of remission)
- gastric ulcers: more atypical symptoms; a biopsy is necessary to exclude malignancy

### Investigations

- endoscopy (most accurate)
- upper GI series
- *H. pylori* tests (see Table 7)
- fasting serum gastrin measurement if Zollinger-Ellison syndrome suspected (but most common cause of elevated serum gastrin level is atrophic gastritis)

### Treatment

- specific management depends on etiology; (see *H. pylori*, G13, *NSAID-Induced Ulceration*, G13 and *Stress-Induced Ulceration*, G14)
- eradicate *H. pylori* if present; chief advantage of triple therapy over PPI is to lower ulcer recurrence rate
- stop NSAIDs if possible
- start PPI: inhibits parietal cell  $H^+/K^+$ -ATPase pump which secretes acid
- heals most ulcers, even if NSAIDs are continued
- other medications (e.g. histamine H<sub>2</sub>-antagonists) less effective
- discontinue cigarette smoking
- no diet modifications required but some people have fewer symptoms if they avoid caffeine, alcohol, and spices

### Management of Bleeding Peptic Ulcers

- OGD to explore upper GI tract
- IV pantoprazole continuous drip
- establish risk of rebleeding/continuous bleed (since most ulcers stop bleeding spontaneously)
  - clinical risk factors: increased age (>60), bleeding diathesis, history of PUD, comorbid disease, hemodynamically unstable
  - endoscopic signs of recurrent bleeding (active bleeding, visible vessel, clot, red spot) more predictive than clinical risk factors
    - ♦ if high risk, consider ICU admission

#### Gastric vs. Duodenal Ulcers

Gastric ulcers must always be biopsied to rule out malignancies; duodenal ulcers are rarely malignant

#### Approach to PUD

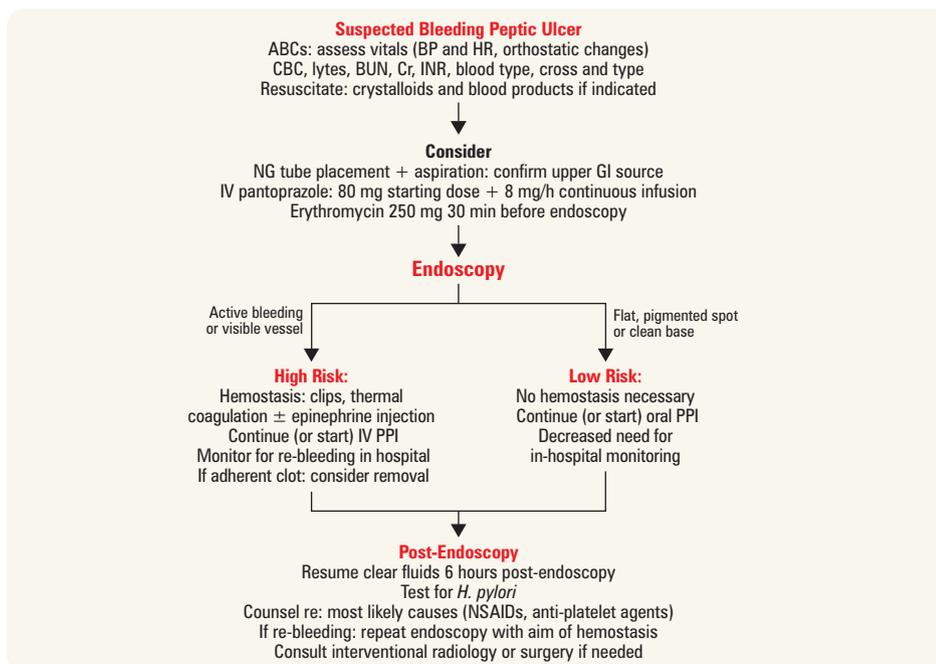

- Stop NSAIDs
- Acid neutralization
- *H. pylori* eradication
- Quit smoking

#### Bleeding Peptic Ulcers

##### Risk Factors for Increased Mortality

- Co-existent illness
- Hemodynamic instability
- Age >60 yr
- Transfusion required

**Figure 6. Approach to management of suspected bleeding peptic ulcer**

Adapted from: Gralnek I, Barkun A, Bardou M. Management of acute bleeding from a peptic ulcer. *NEJM* 2008;359:928-937

## H. pylori-Induced Peptic Ulceration

### Pathophysiology

- *H. pylori*: Gram-negative flagellated rod that resides within the gastric mucosa, causing persistent infection and inflammation
- acid secreted by parietal cells (stimulated by vagal acetylcholine, gastrin, histamine) necessary for most ulcers
- theories of how *H. pylori* causes ulcers: none satisfactory, but pattern of colonization correlates with outcome
- gastritis only in antrum (15% of patients), high gastric acid, associated with duodenal ulcer, may progress to gastric metaplasia of duodenum where ulcer forms
- gastritis throughout stomach ("pangastritis" – 85% of patients), low gastric acid, associated with stomach ulcer and cancer

### Epidemiology

- *H. pylori* is found in about 20% of all Canadians
- highest prevalence in those raised during 1930s
- infection most commonly acquired in childhood, presumably by fecal-oral route
- high prevalence in developing countries, low socioeconomic status (poor sanitation and overcrowding)

### Outcome

- gastritis (non-erosive) in 100% of patients but asymptomatic
- peptic ulcer in 15% of patients
- gastric carcinoma and mucosal associated lymphomatous tissue [MALT] lymphoma in 0.5% of patients
- most are asymptomatic but still worthwhile eradicating to lower future risk of peptic ulcer/gastric malignancy and prevent spread to others (mostly children <5 yr of age)

### Diagnosis

Table 7. Diagnosis of *H. pylori* Infection

Test	Sensitivity	Specificity	Comments
<b>Non-invasive Tests</b>			
Urea breath test	90-100%	89-100%	Affected by PPI therapy (false negatives)
Serology	88-99%	89-95%	Can remain positive after treatment
<b>Invasive Tests (require endoscopy)</b>			
Histology	93-99%	95-99%	Gold standard; affected by PPI therapy (false negatives)
Rapid urease test (on biopsy)	89-98%	93-100%	Rapid
Microbiology culture	98%	95-100%	Research only

### Treatment: *H. pylori* Eradication

- triple therapy for 7-14 d (Hp-Pac®): PPI bid (e.g. lansoprazole 30 mg bid) + amoxicillin 1 g bid + clarithromycin 500 mg bid
- becoming less successful as prevalence of *H. pylori* clarithromycin-resistance increases
- quadruple therapy for 10-14 d now recommended: PPI bid + bismuth 525 mg qid + tetracycline 500 mg qid + metronidazole 250 mg qid
- levofloxacin can replace metronidazole or tetracycline
- sequential therapy
- days 1-5: PPI bid + amoxicillin 1 g bid
- days 6-10: PPI bid + clarithromycin 500 mg bid + tinidazole (generally substitute with metronidazole as tinidazole not available in Canada) 500 mg bid
- 5-15% of cases are resistant to all known therapies

## NSAID-Induced Ulceration

- NSAID use causes gastric mucosal petechiae in virtually all, erosions in most, ulcers in some (25%)
- erosions bleed, but usually only ulcers cause significant clinical problems
- most NSAID ulcers are clinically silent: dyspepsia is as common in patients with ulcers as in patients without ulcers; NSAID-induced ulcers characteristically present with complications (bleeding, perforation, obstruction)
- NSAIDs more commonly cause gastric ulcers than duodenal ulcers
- may exacerbate underlying duodenal ulcer disease

### Pathophysiology

- direct: erosions/petechiae – are due to local (direct) effect of drug on gastric mucosa
- indirect: systemic NSAID effect (intravenous NSAID causes ulcers, but not erosions), inhibits mucosal cyclooxygenase, leading to decreased synthesis of protective prostaglandins, thus leading to ulcers

### Risk Factors for NSAID-induced Peptic Ulcer

- previous peptic ulcers/UGIB
- age ( $\geq 65$  yr)
- high dose of NSAID/multiple NSAIDs being taken
- concomitant corticosteroid use
- concomitant cardiovascular disease/other significant diseases

### Treatment

- prophylactic cytoprotective therapy with a PPI is recommended if any of the above risk factors exist concomitantly with ASA/NSAID use
- lower NSAID dose or stop all together and replace with acetaminophen
- combine NSAID with PPI or misoprostol (less effective) in one tablet
- enteric coating of Aspirin® (ECASA) provides minor benefit since this decreases incidence of erosion, not incidence of ulceration

If at high risk for development of ulcers, prophylaxis with PPI indicated

## Stress-Induced Ulceration

### Definition

- ulceration or erosion in the upper GI tract of ill patients, usually in ICU (stress is physiological, not psychiatric)
- lesions most commonly in fundus of stomach

### Pathophysiology

- unclear: likely involves ischemia; may be caused by CNS disease, acid hypersecretion, Cushing ulcers
- mechanical ventilation is the most important risk factor

### Risk Factors

- mechanical ventilation
- anti-coagulation
- multi-organ failure
- septicemia
- severe surgery/trauma
- CNS injury (“Cushing’s ulcers”)
- burns involving more than 35% of body surface

### Clinical Features

- UGIB (*see Upper Gastrointestinal Bleeding, G25*)
- painless

### Treatment

- prophylaxis with gastric acid suppressants decreases risk of UGIB; PPI most potent but may increase risk of pneumonia; H2 blockers less potent but less likely to cause pneumonia
- treatment same as for bleeding peptic ulcer but often less successful

### Curling’s and Cushing’s Ulcers

- **Curling’s ulcer:** acute peptic ulcer of the duodenum resulting as a complication from severe burns when reduced plasma volume leads to ischemia and cell necrosis (sloughing) of the gastric mucosa (think BURN from a CURLing iron)
- **Cushing’s ulcer:** peptic ulcer produced by elevated intracranial pressure (may be due to stimulation of vagal nuclei secondary to elevated ICP which leads to increased secretion of gastric acid)

## Gastric Carcinoma

- *see General Surgery, GS19*

## Small and Large Bowel

### Classification of Diarrhea

### Definition

- clinically: diarrhea defined as stools that are looser and/or more frequent than normal (i.e.  $\geq 3x$  per day); physiologically: 24 h stool weight  $>200$  g (less useful clinically)

### Classification

- acute vs. chronic
- small volume (tablespoons of stool; typical of colonic diseases) vs. large volume ( $>1/2$  cup stool; typical of small bowel diseases)
- watery: secretory (diarrhea persists with fasting) vs. osmotic (diarrhea stops with fasting)
- steatorrhea
- inflammatory
- functional

### Stool Osmotic Gap

Stool osmolality is normally about 290 mOsm/kg and can be approximated by the calculated stool osmolality

$$2 \times [\text{Na}^+]_{\text{stool}} + [\text{K}^+]_{\text{stool}}$$

In osmotic diarrhea, measured stool osmolality  $>$  calculated stool osmolality  
 In secretory diarrhea measured stool osmolality = calculated stool osmolality  
 Stool osmolality is always the same as serum

## Acute Diarrhea

### Definition

- passage of frequent unformed stools for <14 d

### Etiology

- most commonly due to infections
- most infections are self-limiting and resolve within 7 d

### Risk Factors

- food (seafood, chicken, turkey, eggs, beef)
- medications: antibiotics, laxatives
- others: high risk sexual activity, infectious outbreaks, family history (IBD)

**Table 8. Classification of Acute Diarrhea**

	Inflammatory	Non-inflammatory
<b>Definition</b>	Disruption of intestinal mucosa	Intestinal mucosa intact
<b>Site</b>	Usually colon	Usually small intestine
<b>Mechanism</b>	Organisms and cytotoxins invade mucosa, killing mucosal cells, and further perpetuating the diarrhea	Stimulation of intestinal water secretion and inhibition of water absorption (i.e. secretory problem)
<b>Sigmoidoscopy</b>	Usually abnormal mucosa seen	Usually normal
<b>Symptoms</b>	Bloody (not always) Small volume, high frequency Often lower abdominal cramping with urgency $\pm$ tenesmus May have fever $\pm$ shock	Watery, little or no blood Large volume Upper/periumbilical pain/cramp $\pm$ shock
<b>Investigations</b>	Fecal WBC and RBC positive	Fecal WBC negative
<b>Etiology</b>	See <i>Differential Diagnosis of Presenting Complaints, G4</i>	See <i>Differential Diagnosis of Presenting Complaints, G4</i>
<b>Differential Diagnosis</b>	Acute presentation of idiopathic inflammatory bowel disease	Acute presentation of non-inflammatory chronic diarrhea (e.g. celiac disease)
<b>Significance</b>	Higher yield with stool C&S Can progress to life-threatening megacolon, perforation, hemorrhage Antibiotics may benefit	Lower yield with stool C&S Chief life-threatening problem is electrolyte disturbances/ fluid depletion Antibiotics unlikely to be helpful

### Investigations

- stool cultures/microscopy (C&S/O&P) are required only if diarrhea is inflammatory, severe, or for epidemiological purposes (day care worker, nursing home resident, community outbreaks, e.g. Walkerton, etc.)
  - C&S only tests *Campylobacter*, *Salmonella*, *Shigella*, *E. coli*
    - ♦ other organisms must be ordered separately
- flexible sigmoidoscopy (without bowel preparation): useful if inflammatory diarrhea suspected
  - biopsies are the most useful method of distinguishing idiopathic IBD (Crohn's disease and ulcerative colitis) from infectious colitis or acute self-limited colitis
- *C. difficile* toxin: indicated when recent/remote antibiotic use, hospitalization, nursing home, or recent chemotherapy

### Treatment

- fluid and electrolyte replacement orally in most cases, intravenous if severe extremes of age/coma
- anti-diarrheals
  - antimotility agents: diphenoxylate, loperamide (Imodium®); contraindicated in mucosal inflammation
    - ♦ side effects: abdominal cramps, toxic megacolon
  - absorbants: kaolin/pectin (Kaopectate®), methylcellulose, activated attapulgite
    - ♦ act by absorbing intestinal toxins/micro-organisms, or by coating intestinal mucosa
    - ♦ much less effective than antimotility agents
  - modifiers of fluid transport: bismuth subsalicylate (Pepto-Bismol®) may be helpful (but should not be used in the presence of bloody diarrhea or fever)
- antibiotics: rarely indicated
  - risks
    - ♦ prolonged excretion of enteric pathogen (especially *Salmonella*)
    - ♦ drug side effects (including *C. difficile* infection)
    - ♦ development of resistant strains
    - ♦ renal failure/hemolysis (enterohemorrhagic *E. coli* O157:H7)

#### Useful Questions in Acute Diarrhea

**Those Fads Wilt**  
 Travel  
 Homosexual contacts  
 Outbreaks  
 Seafood  
 Extra-intestinal signs of IBD  
 Family history  
 Antibiotics  
 Diet  
 Steatorrhea  
 Weight loss  
 Immunosuppressed  
 Laxatives  
 Tumour history

#### Infectious Causes of Inflammatory Diarrhea

**Your Stool Smells Extremely Crappy**  
*Yersinia*  
*Shigella*  
*Salmonella*  
*E. coli* (EHEC O157:H7), *E. histolytica*  
*Campylobacter*, *C. difficile*

#### Finally: A Role for Bacteriotherapy Duodenal Infusion of Donor Feces for Recurrent *Clostridium difficile*

*NEJM* 2013; 368:407-15

For centuries, out-of-the-box thinkers have speculated that the colonic bacteria all of us have, but which differs among individuals, play a role in disease. More recently, the colonic microbiome has become the hottest area of research in gastroenterology. The best documented medical indication for manipulating the colonic bacteria is recurrent *C. difficile* infection. In this randomized study of this disease, infusion of donor feces via a nasoduodenal tube resolved diarrhea in 81% of patients, without side-effects, compared to 31% given the standard treatment of oral vancomycin, and 23% of patients given oral vancomycin plus bowel lavage. It takes little prescience to predict an onslaught of future studies investigating the therapeutic potential of altering the human microbiome.

- indications for antimicrobial agents in acute diarrhea
  - ◆ septicemia
  - ◆ prolonged fever with fecal blood or leukocytes
  - ◆ clearly indicated: *Shigella*, *V. cholerae*, *C. difficile*, traveller's diarrhea (enterotoxigenic *E. coli* [ETEC]), *Giardia*, *Entamoeba histolytica*, *Cyclospora*
  - ◆ situational: *Salmonella*, *Campylobacter*, *Yersinia*, non-enterotoxigenic *E. coli*
  - ◆ *Salmonella*: always treat *Salmonella typhi* (typhoid or enteric fever); treat other *Salmonella* only if there is underlying immunodeficiency, hemolytic anemia, extremes of age, aneurysms, prosthetic valve grafts/joints, sickle cell disease

*S. typhi* has a rose spot rash (transient maculopapular rash on anterior thorax, upper abdomen), and a prodrome of high fever, bradycardia, headache, and abdominal pain. Diarrhea is not the initial presentation

## Traveller's Diarrhea

- see [Infectious Diseases, ID13](#)

## Chronic Diarrhea

### Definition

- passage of frequent unformed stool for >4 wk (persistent diarrhea as 14-30 d)
- approach is similar to that of acute diarrhea except that the majority of cases are non-infectious

### Etiology/Classification

- see [Differential Diagnosis of Common Presenting Complaints, G4](#)

### Investigations

- guided by history
- stool analysis for: *C. difficile* toxin, C&S, O&P ± fecal fat, WBC
- blood for: CBC, electrolytes, CRP, TSH, celiac serology (IgA anti-tTG; ask for serum protein electrophoresis or immunoglobulin quantitation to rule out IgA deficiency which has an increased frequency in celiac disease)
- colonoscopy and ileoscopy with biopsy
- upper GI endoscopy with duodenal biopsy
- wireless small bowel endoscopy capsule (low yield)
- trial of lactose free diet
  - caveat: may delay diagnosis of IBD and celiac disease

## Maldigestion and Malabsorption

### Definition

- maldigestion: inability to break down large molecules in the lumen of the intestine into their component small molecules
- malabsorption: inability to transport molecules across the intestinal mucosa into circulation
- malassimilation: encompasses both maldigestion and malabsorption

### Etiology

- maldigestion
  - inadequate mixing of food with enzymes (e.g. post-gastrectomy)
  - pancreatic exocrine deficiency
  - primary diseases of the pancreas (e.g. cystic fibrosis, pancreatitis, cancer)
  - bile salt deficiency
    - ◆ terminal ileal disease (impaired recycling), bacterial overgrowth (deconjugation of bile salts), rarely liver disease (cholestatic, e.g. primary biliary cirrhosis)
  - specific enzyme deficiencies (e.g. lactase)
- malabsorption
  - inadequate absorptive surface
    - ◆ infections/infestations (e.g. Whipple's disease, *Giardia*)
    - ◆ immunologic or allergic injury (e.g. celiac disease)
    - ◆ infiltration (e.g. lymphoma, amyloidosis)
    - ◆ fibrosis (e.g. systemic sclerosis, radiation enteritis)
    - ◆ bowel resection (length, site, location, presence/absence of ileocecal valve are important)
    - ◆ extensive ileal Crohn's disease
  - drug-induced
    - ◆ cholestyramine, ethanol, neomycin, tetracycline, and other antibiotics
  - endocrine
    - ◆ DM (complex pathogenesis)

### Clinical Features

- symptoms usually vague unless disease is severe
- weight loss, diarrhea, steatorrhea, weakness, fatigue
- manifestations of malabsorption/deficiency

**Fat Soluble Vitamins: ADEK**  
vitamin A, vitamin D, vitamin E, vitamin K

**Table 9. Absorption of Nutrients and Fat Soluble Vitamins**

Deficiency	Absorption	Clinical Disease and/or Features	Investigations
<b>Iron</b>	Duodenum, upper jejunum	Hypochromic, microcytic anemia, glossitis, koilonychia (spoon nails), pica	↓ Hb, ↓ serum Fe, ↓ serum ferritin
<b>Calcium</b>	Duodenum, upper jejunum (binds to Ca <sup>2+</sup> binding-protein in cells; levels increased by Vit D)	Metabolic bone disease, may get tetany and paresthesias if serum calcium falls (see <a href="#">Endocrinology, E36</a> )	↓ serum Ca <sup>2+</sup> , ↓ serum Mg <sup>2+</sup> , and ↑ ALP Evaluate for ↓ bone mineralization radiographically (DEXA)
<b>Folic Acid</b>	Jejunum	Megaloblastic anemia, glossitis, ↓ red cell folate (may see ↑ folic acid with bacterial overgrowth)	↓ serum folic acid
<b>Vitamin B<sub>12</sub></b>	B <sub>12</sub> ingested and bound to R proteins mainly from salivary glands; stomach secretes intrinsic factor (IF) in acidic medium; in basic medium, proteases from the pancreas cleave R protein and B <sub>12</sub> -IF complex forms, protecting B <sub>12</sub> from further protease attack; B <sub>12</sub> absorbed in ileum and binds to transcobalamin (TC)	Subacute combined degeneration of the spinal cord, peripheral/optic neuropathy, dementia, megaloblastic anemia, glossitis	Differentiate causes by nuclear Schilling test (when available) Positive anti-intrinsic factor antibodies and atrophic gastritis point toward pernicious anemia (see <a href="#">Hematology, H24</a> )
<b>Carbohydrate</b>	Complex polysaccharides hydrolyzed to oligosaccharides, and disaccharides by salivary and pancreatic enzymes Monosaccharides absorbed in duodenum/jejunum	Generalized malnutrition, weight loss, flatus, and diarrhea	Hydrogen breath test Trial of carbohydrate-restricted diet D-xylose test
<b>Protein</b>	Digestion at stomach, brush border, and inside cell Absorption occurs primarily in the jejunum	General malnutrition and weight loss, amenorrhea, and ↓ libido if severe	↓ serum albumin (low sensitivity)
<b>Fat</b>	Lipase, colipase, phospholipase A (pancreatic enzymes), and bile salts needed for digestion Products of lipolysis form micelles which solubilize fat and aid in absorption Fatty acids diffuse into cell cytoplasm	Generalized malnutrition, weight loss, and diarrhea Foul-smelling feces + gas Steatorrhea	Small bowel biopsy MRCP, ERCP, pancreatic function tests (not routinely available) Quantitative stool fat test (72 h) May start with qualitative stool fat test (Sudan stain of stool) C-triolein breath test (not routinely available)
<b>Vitamin A</b>	Dietary sources (e.g. milk, eggs, liver, carrots, sweet potatoes)	Night blindness Dry skin Keratomalacia	
<b>Vitamin D</b>	Skin (via UV light) or diet (e.g. eggs, fish oil, fortified milk)	Osteomalacia in adults Rickets in children	
<b>Vitamin E</b>	Dietary sources (e.g. vegetable oils, nuts, leafy green vegetables)	Retinopathy, neurological problems	
<b>Vitamin K</b>	Synthesized by intestinal flora ↑ risk of deficiency after prolonged use of broad spectrum antibiotics and/or starvation	Prolonged INR may cause bleeding	

\* Calcium malabsorption more commonly causes decreased bone density rather than hypocalcemia because serum calcium levels are protected by leaching calcium from the bone

### Investigations

- transglutaminase (tTG) antibody serology/immunoglobulin quantitation and abdominal imaging are most useful because celiac disease and chronic pancreatitis are the two most common causes of steatorrhea
- 72 h stool collection (weight, fat content) documents steatorrhea (gold standard)
- fecal elastase (not routinely available) to screen for pancreatic insufficiency and/or consider empiric trial of pancreatic enzymes based on clinical context
- serum carotene (precursor to vitamin A), folate, Ca<sup>2+</sup>, Mg<sup>2+</sup>, vitamin B<sub>12</sub>, albumin, ferritin, serum iron solution, INR/PTT
- stool fat globules on fecal smear stained with Sudan (rarely used)
- other tests specific for etiology (e.g. CT scan/MRI to visualize pancreas)

### Treatment

- dependent on underlying etiology

## Celiac Disease (Gluten Enteropathy/Sprue)

### Definition

- abnormal small intestine mucosa due to intestinal reaction to gluten, a protein found in cereal grains

### Etiology

- only autoimmune disease in which antigen (various gliadin peptides) is recognized
- associated with other autoimmune diseases, especially Sjögren's, thyroid disease
- gluten, a protein in cereal grains, is broken down to gliadin, which is the toxic factor
- HLA-DQ2 (chromosome 6) found in 80-90% of patients compared with 20% in general population; celiac also associated with HLA-DQ8 (note: up to 40% of Caucasians carry the HLA alleles, but will never develop celiac disease)

### Epidemiology

- more common in women
- family history: 10-15% of first-degree relatives
- may present any time from infancy (when cereals introduced) to elderly
- peak presentation in infancy

### Clinical Features

- classic presentation: diarrhea, weight loss, anemia, symptoms of vitamin/mineral deficiency, failure to thrive; more common current presentation: bloating, gas, iron deficiency
- improves with gluten-free diet, deteriorates when gluten reintroduced
- disease is usually most severe in proximal bowel
  - thus iron, calcium, and folic acid deficiency (proximal absorption) more common than vitamin B<sub>12</sub> deficiency (absorbed in ileum)
- gluten enteropathy may be associated with dermatitis herpetiformis skin eruption, epilepsy, myopathy, depression, paranoia, infertility, bone fractures/metabolic bone disease

### Investigations

- serological tests
  - serum anti-tTG antibody, IgA, is 90-98% sensitive, 94-97% specific
  - IgA deficient patients have false-negative anti-tTG
    - therefore, measure serum IgA concomitantly (via serum quantitative protein electrophoresis)
    - incorporate serum testing tTG and/or DGP IgG in IgA deficiencies
- small bowel mucosal biopsy (usually duodenum) is diagnostic with increased intraepithelial lymphocytes (earliest pathologic finding)
  - crypt hyperplasia
  - villous atrophy
  - note: villous atrophy also seen in small bowel overgrowth, Crohn's, lymphoma, Giardia, HIV
- improvement with a gluten-free diet, but should not be started before serological tests and biopsy
- consider CT enterography to visualize small bowel to rule out lymphoma
- evidence of malabsorption (localized or generalized)
  - steatorrhea
  - low levels of ferritin/iron saturation, Ca<sup>2+</sup>, Fe, albumin, cholesterol, carotene, B<sub>12</sub> absorption
- fecal fat >7%

### Treatment

- dietary counselling
  - gluten free diet; avoid barley, rye, wheat (as these grains are related and also have toxic factor, similar to gliadin)
  - oats allowed if not contaminated by other grains (grown in soil without cross-contamination)
  - rice and corn flour are acceptable
  - iron, folate supplementation (with supplementation of other vitamins as needed)
- if poor response to diet change, consider
  - alternate diagnosis
  - non-adherence to gluten-free diet
  - concurrent disease (e.g. microscopic colitis, pancreatic insufficiency)
  - development of intestinal (enteropathy-associated T-cell) lymphoma (abdominal pain, weight loss, palpable mass)
  - development of diffuse intestinal ulceration, characterized by aberrant intraepithelial T-cell population (precursor to lymphoma)

### Prognosis

- associated with increased risk of lymphoma, carcinoma (e.g. small bowel and colon; slight increase compared with general population), autoimmune diseases
- risk of lymphoma may be lowered by dietary gluten restriction

#### Gluten Found in BROW

Barley  
Rye  
Oats (controversial)  
Wheat

## Inflammatory Bowel Disease

### Definition

- Crohn's disease (CD), ulcerative colitis (UC), indeterminate colitis or IBD-unclassified (IBDU)

### Pathophysiology

- poorly understood
- most likely a sustained response of the immune system, perhaps to enteric flora
- lack of appropriate down-regulation of immune responsiveness after an infection in a genetically predisposed individual

### Genetics

- increased risk of both UC and CD in relatives of patients with either disease, especially siblings, early onset disease
  - familial risk greater if proband has CD rather than UC
- likely polygenomic pattern: 9 gene loci are associated
- CARD15/NOD2 gene mutation associated with CD (relative risk in heterozygote is 3, in homozygote is 40), especially Ashkenazi Jews, early onset disease, ileal involvement, fistulizing and stenotic disease
  - CARD15 gene product modulates NFκB, which is required for the innate immune response to microbial pathogens, best expressed in monocytes-macrophages

### Clinical Features

**Table 10. Clinical Differentiation of Ulcerative Colitis from Crohn's Disease**

	Crohn's Disease	Ulcerative Colitis
<b>Location</b>	Any part of GI tract Small bowel + colon: 50% Small bowel only: 30% Colon only: 20%	Isolated to large bowel Always involves rectum, may progress proximally
<b>Rectal Bleeding</b>	Uncommon	Very common (90%)
<b>Diarrhea</b>	Less prevalent, non-bloody	Frequent, mucous, bloody, small volume stools
<b>Abdominal Pain</b>	Post-prandial/colicky	Less common
<b>Fever</b>	Common	Uncommon
<b>Urgency/Tenesmus</b>	Uncommon (unless rectum involved)	Common
<b>Palpable Mass</b>	Frequent (25%), RLQ	Rare (if present, often related to cecum full of stool)
<b>Recurrence After Surgery</b>	Common	None post-colectomy
<b>Endoscopic Features</b>	Ulcers (aphthous, stellate, linear), patchy lesions, pseudopolyps, cobblestoning	Continuous diffuse inflammation, erythema, friability, loss of normal vascular pattern, pseudopolyps
<b>Histologic Features</b>	Transmural distribution with skip lesions Focal inflammation ± noncaseating granulomas, deep fissuring + aphthous ulcerations, strictures Glands intact	Mucosal distribution, continuous disease (no skip lesions) Architectural distortion, gland disruption, crypt abscess Granulomas absent
<b>Radiologic Features</b>	Cobblestone mucosa Frequent strictures and fistulae AXR: bowel wall thickening "string sign"	Lack of haustra Strictures rare; need to rule out complicating cancer
<b>Complications</b>	Strictures, fistulae, perianal disease	Toxic megacolon
<b>Colon Cancer Risk</b>	Increased if >30% of colon involved	Increased except in proctitis

**Table 11. Extraintestinal Manifestations (EIM) of IBD**

System	Crohn's Disease	Ulcerative Colitis
<b>Dermatologic</b>		
Erythema nodosum	15%	10%
Pyoderma gangrenosum	10%	Less common
Perianal skin tags	75-80%	Rare
Oral mucosal lesions	Common	Rare
Psoriasis	Statistically associated in 5-10% of those with IBD but not an EIM	
Stomatitis		
<b>Rheumatologic</b>		
Peripheral arthritis	15-20% of those with IBD (CD>UC)	
Ankylosing spondylitis	10% of those with IBD (CD>UC)	
Sacroiliitis	Occurs equally in CD and UC	
<b>Ocular (~10% of IBD)</b>		
Uveitis (vision threatening)		
Episcleritis (benign)	3-4% of IBD patients (CD>UC)	
<b>Hepatobiliary</b>		
Cholelithiasis	15-35% of patients with ileal Crohn's	
PSC	1-5% of IBD cases involving colon	
Fatty liver		
Gallstones		
<b>Urologic</b>		
Calculi	Most common in CD, especially following ileal resection	
Ureteric obstruction		
Fistulae	Characteristic of Crohn's	
<b>Others</b>		
Thromboembolism		
Vasculitis		
Osteoporosis		
Vitamin deficiencies (B12, Vit ADEK)		
Cardiopulmonary disorders		
Pancreatitis (rare)		
Phlebitis		

## Crohn's Disease

### Definition

- chronic transmural inflammatory disorder potentially affecting the entire gut from mouth to perianal region (“gum to bum”)

### Epidemiology

- incidence 1-6/100,000; prevalence 10-100/100,000
- bimodal: onset before 30 yr, second smaller peak age 60; M=F
- incidence of Crohn's increasing (relative to UC) especially in young females
- more common in Caucasians, Ashkenazi Jews
  - risk in Asians increases with move to Western countries
- smoking incidence in Crohn's patients is higher than general population

### Pathology

- most common location: ileum + ascending colon
- linear ulcers leading to mucosal islands and “cobblestone” appearance
- granulomas are found in 50% of surgical specimens, 15% of mucosal biopsies

### Clinical Features

- natural history unpredictable; young age, perianal disease, and need for corticosteroids have been associated with poor prognosis, but associations are not strong enough to guide clinical decisions
- most often presents as recurrent episodes of abdominal cramps, non-bloody diarrhea, and weight loss
- ileitis may present with post-prandial pain, vomiting, RLQ mass; mimics acute appendicitis
- extra-intestinal manifestations are more common with colonic involvement
- fistulae, fissures, abscesses are common
- deep fissures with risk of perforation into contiguous viscera (leads to fistulae and abscesses)
- enteric fistulae may communicate with skin, bladder, vagina, and other parts of bowel

### Investigations

- colonoscopy with biopsy to visualize (less often gastroscopy)
- CT/MR enterography to visualize small bowel
- CRP elevated in most new cases, useful to monitor treatment response (especially acutely in UC)
- bacterial cultures, O&P, *C. difficile* toxin to exclude other causes of inflammatory diarrhea

## Management (see Figure 7)

**Table 12. Management of Crohn's Disease**

Management	Notes
<b>Lifestyle/Diet</b>	Smoking cessation Fluids only during acute exacerbation Enteral diets may aid in remission only for Crohn's ileitis, not colitis No evidence for any non-enteral diet changing the natural history of Crohn's disease, but may affect symptoms Those with extensive small bowel involvement or extensive resection require electrolyte, mineral, and vitamin supplements (vit D, Ca <sup>2+</sup> , Mg <sup>2+</sup> , zinc, Fe, B <sub>12</sub> )
<b>Antidiarrheal Agents*</b>	Loperamide (Imodium®) > diphenoxylate (Lomotil®) > codeine (cheap but addictive) All work by decreasing small bowel motility, used only for symptom relief CAUTION if colitis is severe (risk of precipitating toxic megacolon), therefore avoid during flare-ups
<b>5-ASA**</b>	Efficacy controversial: Is currently used for mild ileitis Sulfasalazine (Salazopyrin®): 5-ASA bound to sulfapyridine Hydrolysis by intestinal bacteria releases 5-ASA (active component) Dose-dependent efficacy Mesalamine (Pentasa®): coated 5-ASA releases 5-ASA in the ileum and colon when inflammation is mild
<b>Antibiotics</b>	e.g. metronidazole (20 mg/kg/d, bid or tid dosing) or ciprofloxacin Best described for perianal Crohn's, although characteristically relapse when discontinued
<b>Corticosteroids</b>	Prednisone: starting dose 40 mg OD for acute exacerbations; IV methylprednisolone if severe No proven role for steroids in maintaining remissions; masks intra-abdominal sepsis
<b>Immunosuppressives</b>	6-mercaptopurine (6-MP), azathioprine (Imuran®); methotrexate (used less often) More often used to maintain remission than to treat active inflammation Most commonly used as steroid-sparing agents i.e. to lower risk of relapse as corticosteroids are withdrawn May require >3 mo to have beneficial effect; usually continued for several years May help to heal fistulae, decrease disease activity Increases efficacy of biologics plus lowers chances of biological dosing efficacy (tolerance) so often given in combination with biologics Side effects: vomiting, pancreatitis, bone marrow suppression, increased risk of malignancy (i.e. lymphoma)
<b>Biologics</b>	Infliximab IV (Remicade®) or adalimumab SC (Humira®): both = antibody to TNF-α Proven effective for treatment of fistulae and patients with medically refractory CD First-line immunosuppressive therapy with infliximab + azathioprine more effective than using either alone
<b>Surgical/ Experimental</b>	Surgical treatment (see <a href="#">General Surgery, GS28</a> ) Surgery generally reserved for complications such as fistulae, obstruction, abscess, perforation, bleeding, and for medically refractory disease If <50% or <200 cm of functional small intestine, risk of short bowel syndrome At least 50% clinical recurrence within 5 yr; 85% within 15 yr; endoscopic recurrence rate even higher 40% likelihood of second bowel resection, 30% likelihood of third bowel resection Complications of ileal resection <100 cm resected → watery diarrhea or cholorrhea (impaired bile salt absorption) Treatment: cholestyramine or anti-diarrheals e.g. loperamide >100 cm resected → steatorrhea (reduced mucosal surface area, bile salt deficiency) Treatment: fat restriction, medium chain triglycerides

\*Cholestyramine: a bile-salt binding resin; for watery diarrhea with <100 cm of terminal ileum diseased or resected; however, non-specific anti-diarrheals are more convenient and often more potent

\*\* 5-ASA use in Crohn's is controversial; however, initial trial for mild ileitis only is warranted (induction and maintenance if clinical response)

## Prognosis

- highly variable course
- 10% disabled by the disease eventually, spontaneous remission also described
- increased mortality, especially with more proximal disease, greatest in the first 4-5 yr
- complications include
  - intestinal obstruction/perforation
  - fistula formation
  - malignancy (lower risk compared to UC)
- surveillance colonoscopy same as ulcerative colitis (see [Ulcerative Colitis](#)) if more than 1/3 of colon involved

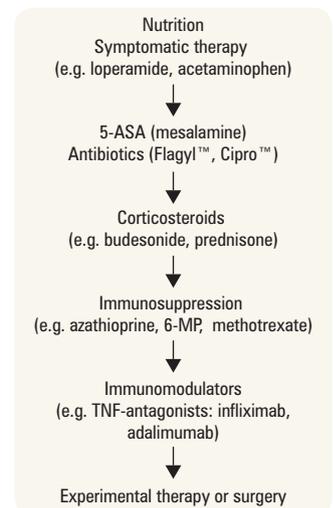

### Traditional Medical Management of Crohn's

	Induction of Remission	Maintenance
5-ASA*	?	?
Steroids	+	
Immunosuppressive	+	+
Antibiotics	+	
MTX	+	+
Infliximab	+	+

\*5-ASA use in Crohn's is controversial. However, initial trial for mild ileitis only is warranted (induction and maintenance if clinical response)

**Note:** Starting with immunosuppressives plus immunomodulators ("bottom-up approach") increasingly being used (*Lancet* 2008;371:660-667). Combination of azathioprine and infliximab has the highest remission rate yet described with medical treatment (*NEJM* 2010;362:1383-1395). Characteristically more than 1 yr between onset of symptoms and diagnosis of Crohn's disease.

**Figure 7. Traditional graded approach to induction therapy in Crohn's disease**

Note: immunosuppressants and immunomodulators are increasingly used initially ("top-down management strategy")

## Ulcerative Colitis

### Definition

- inflammatory disease affecting colonic mucosa anywhere from rectum (always involved) to cecum

### Epidemiology

- incidence 2-10/100,000; prevalence 35-100/100,000 (more common than Crohn's)
- 2/3 onset by age 30 (with second peak after 50); M=F
- small hereditary contribution (15% of cases have 1st degree relative with disease)
- risk is less in smokers
- inflammation limited to rectum or left colon is more common than pancolitis

## Pathology

- disease can involve any portion of lower bowel ranging from rectum only (proctitis) to entire colon (pancolitis)
- inflammation is diffuse, continuous and confined to mucosa

## Clinical Features

- rectal bleeding is the hallmark feature; diarrhea present if more than the rectum is involved
  - can also have abdominal cramps/pain, especially with defecation
- severity of colonic inflammation correlates with symptoms (stool volume, amount of blood in stool)
- tenesmus, urgency, incontinence
- systemic symptoms: fever, anorexia, weight loss, fatigue in severe cases
- extra-intestinal manifestations (see Table 11)
- characteristic exacerbations and remissions; 5% of cases are fulminant

## Investigations

- sigmoidoscopy with mucosal biopsy (to exclude self-limited colitis) without bowel prep often sufficient for diagnosis
- colonoscopy helpful to determine extent of disease; contraindicated in severe exacerbation
- CT colonography (formerly barium enema) if colonoscopy cannot be done; contraindicated in severe disease
- stool culture, microscopy, *C. difficile* toxin assay necessary to exclude infection
- no single confirmatory test

## Treatment

- mainstays of treatment: 5-ASA (mesalamine) derivatives (only in mild to moderate disease) and corticosteroids, with azathioprine used in steroid-dependent or resistant cases
- diet of little value in decreasing inflammation but may alleviate symptoms
- anti-diarrheal medications generally not indicated in UC
  - 5-ASA
    - topical (suppository or enema): effective for distal disease (rectum to splenic flexure) if inflammation is mild, preferable to corticosteroids
    - oral: effective for mild to moderate, but not severe colitis (e.g. sulfasalazine 3-4 g/d, mesalamine 4 g/d)
    - commonly used in maintaining remission (decreases yearly relapse rate from 60% to 15%)
    - may decrease rate of colorectal cancer
- corticosteroids
  - to remit acute disease, especially if severe or first attack; may need maximum dose IV steroids initially (e.g. methylprednisolone 30 mg IV q12h)
  - limited role as maintenance therapy for mild to moderate disease
  - use suppositories for proctitis
  - use enemas and topical steroids (e.g. hydrocortisone foam, budesonide enemas) for inflammation distal to splenic flexure
- immunosuppressants (steroid-sparing)
  - in hospitalized patients with severe UC – add IV infliximab if no response to IV methylprednisolone within 3 days; then colectomy if inadequate response
  - biologics (infliximab, adalimumab, golimumab, vedolizumab) can also be used for outpatients with moderate-severe disease, particularly those that are steroid-unresponsive or steroid-dependent
  - azathioprine and 6-mercaptopurine: too slow to rapidly resolve acute relapse
    - most commonly used to maintain remission as corticosteroids withdrawn
    - given with biologics: increase efficacy of biologics and decrease likelihood of tolerance to biologics (~ 10% chance/yr)
- surgical treatment curative
  - aim for cure with colectomy; bowel continuity can be restored with ileal pouch-anal anastomosis (IPAA)
  - indications: failure of adequate medical therapy, toxic megacolon, uncontrollable bleeding, pre-cancerous changes detected either by endoscopy or endoscopic biopsies (dysplasia), inability to taper corticosteroids, overt malignancy

## Complications

- similar to CD, except
  - more liver problems (especially PSC in men)
  - greater risk of colorectal cancer
    - risk increases with duration and extent of disease (5% at 10 yr, 15% at 20 yr for pancolitis; overall relative risk is 8%)
    - risk also increases with active mucosal inflammation and sclerosing cholangitis
    - thus, regular colonoscopy and biopsy in pancolitis of  $\geq 8$  yr is indicated
  - toxic megacolon (transverse colon diameter  $>6$  cm on abdominal x-ray) with immediate danger of perforation (see [General Surgery, GS37](#))

In UC, non-bloody diarrhea is frequently the initial presentation; eventually progressing to bloody diarrhea

### Medical Management of Ulcerative Colitis

	Induction of Remission	Maintenance
5-ASA	+	+
Steroids	+	
Immunosuppressive	±	+

When Considering Complications of IBD, Think:

#### ULCERATIVE COLITIS

Urinary calculi  
Liver problems  
Cholelithiasis  
Epithelial problems  
Retardation of growth/sexual maturation  
Arthralgias  
Thrombophlebitis  
Iatrogenic complications  
Vitamin deficiencies  
Eyes  
Colorectal cancer  
Obstruction  
Leakage (perforation)  
Iron deficiency  
Toxic megacolon  
Inanition (wasting)  
Strictures

### Prognosis

- chronic relapsing pattern in most patients
- 10-15% chronic continuous pattern
- >1 attack in almost all patients
- more colonic involvement in the 1st yr correlates with increased severity of attacks and increased colectomy rate
  - colectomy rate = 1% for all patients after the 1st yr; 20-25% eventually undergo colectomy
- normal life expectancy
- if proctitis only, usually benign course
- stool calprotectin increasingly recognized as a marker of bowel mucosal inflammation, reported especially to be useful in monitoring the activity of inflammatory bowel disease, but still accuracy is still controversial

## Irritable Bowel Syndrome

### Definition

- a form of functional bowel disease; more than just a label for GI symptoms unexplained after normal investigations

### Epidemiology

- 20% of North Americans
- onset of symptoms usually in young adulthood
- F>M

### Pathophysiology

- associated with either abnormal perception of intestinal activity or abnormal intestinal motility
- abnormal motility: multiple abnormalities described; unclear if associations or if causative
- psychological: stress may increase IBS symptoms but probably does not cause IBS
- types of IBS: IBS with diarrhea, IBS with constipation, IBS-mixed type (both diarrhea and constipation), and IBS untyped (insufficient abnormality in stool consistency to meet other types)

### Diagnosis

**Table 13. Rome III Criteria for Diagnosing Irritable Bowel Syndrome**

#### IBS Rome III Criteria

≥12 wk in the past 12 mo of abdominal discomfort plus pain that has 2 out of 3 features

- Relieved with defecation
- Associated with a change in frequency of stool
- Associated with a change in consistency of stool

The following are supportive, but not essential to the diagnosis:

- Abnormal stool frequency (>3/d or <3/wk)
- Abnormal stool form (lumpy/hard/loose/watery) > 1/4 of defecations
- Abnormal stool passage (straining, urgency, feeling of incomplete evacuation) > 1/4 of defecations
- Passage of mucus > 1/4 of defecations
- Bloating

#### Diagnosis of IBS Less Likely in Presence of "Red Flag" Features

Weight loss	Anemia
Fever	Blood or pus in stool
Nocturnal defecation	Abnormal gross findings on flexible sigmoidoscopy

#### Normal Physical Exam

### Investigations

- if history consistent with Rome III criteria, no alarm symptoms, and no family history of IBD or colorectal cancer, limited investigations required
- aim is to rule out diseases which mimic IBS, particularly celiac disease and IBD
- investigations can be limited to CBC, inflammatory markers (ESR, CRP) and celiac serology
- if available, fecal calprotectin is likely more reliable test to rule out IBD
- consider TSH, stool cultures depending on clinical circumstances
- consider colonoscopy (e.g. if alarming features present, family history of IBD or age > 50)

### Treatment

- reassurance, explanation, support, aim for realistic goals
- relaxation therapy, biofeedback, hypnosis, stress reduction, probably exercise
- low FODMAP diet for pain, bloating gas, irregular bowel movements
- no therapeutic agent consistently effective, pain most difficult to control, no drug changes natural history so the drug should be "wanted, since it is not needed"

#### IBS Mimickers

- Enteric infections e.g. *Giardia*
- Lactose intolerance/other disaccharidase deficiency
- Crohn's disease
- Celiac sprue
- Drug-induced diarrhea
- Diet-induced (excess tea, coffee, colas)

- symptom-guided treatment
  - pain predominant
    - ♦ antispasmodic medication before meals (e.g. hyoscine, pinaverium, trimebutine - low level evidence)
    - ♦ increase dietary fibre (bran or psyllium)
    - ♦ tricyclic antidepressants (TCA), selective serotonin reuptake inhibitors (SSRI - moderate level of evidence)
  - IBS with diarrhea (IBS-D)
    - ♦ increase dietary fibre (bran or psyllium) to increase stool consistency but worsens abdominal gas
    - ♦ loperamide (Imodium<sup>®</sup>)
    - ♦ diphenoxylate (Lomotil<sup>®</sup>)
    - ♦ cholestyramine
  - IBS with constipation (IBS-C)
    - ♦ increase fibre in diet
    - ♦ linaclotide
    - ♦ osmotic or other laxatives (help more with the constipation than the pain)
  - mixed (alternating constipation and diarrhea) (IBS-M)

### Prognosis

- 80% improve over time
- most have intermittent episodes
- normal life expectancy

#### Rifaximin Therapy for Patients with Irritable Bowel Syndrome Without Constipation

*NEJM* 2011;364:22-32

**Purpose:** Previous evidence suggests that gut flora may play an important role in the pathophysiology of IBS. This study evaluated rifaximin, a minimally absorbed antibiotic, in treating IBS without constipation.

**Methods:** Two phase 3, double-blind, placebo-controlled trials (TARGET 1 and TARGET 2). 1,260 patients who had IBS without constipation were randomly assigned to rifaximin (550 mg dose) or placebo, 3 times daily for 2 wk, with a follow-up of 10 wk. The primary endpoint was adequate self-reported relief of global IBS symptoms.

**Results:** Significantly more patients in the rifaximin group had adequate self-reported relief of global IBS symptoms compared to the placebo group during the first 4 wk after treatment (40.8% vs. 31.2% respectively). Also, more patients in the rifaximin group had adequate relief of bloating compared to the placebo group (39.5% vs. 28.7% respectively).

**Conclusions:** Rifaximin therapy for 2 wk provided significant relief of symptoms, bloating, abdominal pain, and stool consistency associated with IBS without constipation.

## Constipation

### Definition

- passage of infrequent or hard stools with straining (stool water <50 mL/d); bowel frequency <3x/wk

### Epidemiology

- increasing prevalence with age; F>M
- rare in Africa and India where stool weight is 3-4x greater than in Western countries

### Etiology

- most common: idiopathic attributed to colon dysmotility but this is difficult to measure
- organic causes
  - medication side effects (narcotics, antidepressants) are the most common
  - intestinal obstruction, left sided colon cancer (consider in older patients), and fecal impaction
  - metabolic
    - ♦ DM
    - ♦ hypothyroidism
    - ♦ hypercalcemia, hypokalemia, uremia
  - neurological
    - ♦ intestinal pseudo-obstruction
    - ♦ Parkinson's disease
    - ♦ MS
  - collagen vascular disease (e.g. scleroderma)
  - painful anal conditions (e.g. fissures)

### Clinical Presentation

- overlaps with IBS
- stool firm, difficult to expel, passed with straining, abdominal pain relieved by defecation, flatulence, overflow diarrhea, tenesmus, abdominal distension, infrequent BMs (<3/wk)

### Investigations

- underlying disease rarely found if constipation is the only presenting symptom
  - only test indicated in this situation is a CBC (2013 recommendation of American Gastroenterology Association), but also consider TSH, calcium, and glucose, X-ray of abdomen
- colon visualization if concomitant symptoms such as rectal bleeding, weight loss, or anemia (colonoscopy, CT colonography)
- if refractory to treatment, consider classification based on colon transit time; can measure colonic transit time with radio-opaque markers that are ingested and followed with a series of plain film abdominal x-rays (normal: 70 h)
  1. normal = misperception of normal defecation (IBS)
  2. prolonged throughout = "colonic inertia" (infrequent bowel movements with gas/bloating, tends to occur in youth)
  3. outlet obstruction = inability to coordinate pelvic floor muscles to empty rectum, straining, stool in rectum on digital exam, tends to occur in old age
- combination of 1 and 3 common

#### Causes of Constipation

**DOPED**  
**D**rugs  
**O**bstuction  
**P**ain  
**E**ndocrine dysfunction  
**D**epression

### Treatment (in order of Increasing Potency)

- dietary fibre
  - useful if mild or moderate constipation, but not if severe
  - aim for 30 g daily, increase dose slowly
- surface-acting (soften and lubricate)
  - docusate salts, mineral oils
- osmotic agents (effective in 2-3 d)
  - lactulose, sorbitol, magnesium salts (e.g. magnesium hydroxide, i.e. milk of magnesia), lactitol ( $\beta$ -galactosido-sorbitol), polyethylene glycol 3350
- cathartics/stimulants (effective in 24 h)
  - castor oil, senna (avoid prolonged use to prevent melanosis coli), bisacodyl
- enemas and suppositories (e.g. saline enema, phosphate enema, glycerin suppository, bisacodyl suppository)
- prokinetic agents (prucalopride)
- linaclotide (increases water secretion into the intestinal lumen)

## Upper Gastrointestinal Bleeding

### Definition

- bleeding proximal to the ligament of Treitz, *see Gastrointestinal Tract, G2* (75% of GI bleeds)
  - ligament of Treitz: suspensory ligament where fourth portion of the duodenum transitions to jejunum

### Etiology

- above the GE junction
  - epistaxis
  - esophageal varices (10-30%)
  - esophagitis
  - esophageal cancer
  - Mallory-Weiss tear (10%)
- stomach
  - gastric ulcer (20%) (*see Peptic Ulcer Disease, G11*)
  - erosive gastritis (e.g. from EtOH or post-surgery) (20%)
  - gastric cancer
  - gastric antral vascular ectasia (rare, associated with cirrhosis and CTD)
  - Dieulafoy's lesion (very rare)
- duodenum
  - ulcer in bulb (25%)
  - aortoenteric fistula: usually only if previous aortic graft (see sidebar)
- coagulopathy (drugs, renal disease, liver disease)
- vascular malformation (Dieulafoy's lesion, AVM)

### Clinical Features

- in order of decreasing severity of the bleed: hematochezia (brisk upper GI bleed) > hematemesis > coffee ground emesis > melena > occult blood in stool

### Treatment

- stabilize patient (1-2 large bore IVs, IV fluids, monitor)
- send blood for CBC, cross and type, platelets, PT, PTT, electrolytes, BUN, Cr, LFTs
- keep NPO
- consider NG tube to determine upper vs. lower GI bleeding in some cases
- IV PPI: decrease risk of rebleed if endoscopic predictors of rebleeding seen (see prognosis section)
  - given to stabilize clot, not to accelerate ulcer healing
  - if given before endoscopy, decreases need for endoscopic therapeutic intervention
- for variceal bleeds, octreotide 50  $\mu$ g loading dose followed by constant infusion of 50  $\mu$ g/h
- consider IV erythromycin (or metoclopramide) to accelerate gastric emptying prior to gastroscopy to remove clots from stomach
- endoscopy (OGD): establish bleeding site + treat lesion
  - if bleeding peptic ulcer: most commonly used method of controlling bleeding is injection of epinephrine around bleeding point + thermal hemostasis (bipolar electrocoagulation or heater probe); less often thermal hemostasis may be used alone, but injection alone not recommended
  - endoclips
  - hemospray

### Prognosis

- 80% stop spontaneously
- peptic ulcer bleeding: low mortality (2%) unless rebleeding occurs (25% of patients, 10% mortality)
- endoscopic predictors of rebleeding (Forrest classification): spurt or ooze, visible vessel, fibrin clot
- can send home if clinically stable, bleed is minor, no comorbidities, endoscopy shows clean ulcer with no high risk predictors of rebleeding
- H<sub>2</sub>-antagonists should not be used since they impact minimally on rebleeding rates and need for surgery
- esophageal varices have a high rebleeding rate (55%) and mortality (29%)

Always ask about NSAID/Aspirin® or anticoagulant therapy in GI bleed

**Aortoenteric Fistula** is a rare and lethal cause of GI bleed, most common in patients with a history of aortic graft surgery. Therefore, perform emergency endoscopy if suspected, emergency surgery if diagnosed. Note: The window of opportunity is narrow. Suspect if history of aortic graft, abdominal pain associated with bleeding

### Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

*NEJM* 2013;368:11-21

**Study:** Prospective, unblinded, RCT, follow-up to 45 d.

**Populations:** 921 patients with hematemesis, bloody nasogastric aspirate, melena, or both. Exclusion criteria included massive bleed, ACS, stroke/TIA or transfusion within previous 90 d; recent trauma/surgery; lower GI bleed.

**Intervention:** Patients randomized to restrictive (<70 g/L) or liberal (<90 g/L) transfusion.

**Outcome:** Mortality, further bleeding, adverse events.

**Results:** Fewer patients in the restrictive group required transfusion (51% vs. 15%;  $p < 0.001$ ). The hazard ratio for death for restrictive compared to liberal transfusion was 0.55; 95% CI 0.33-0.92;  $p = 0.02$ . Further bleeding occurred in 10% vs. 16% ( $p = 0.01$ ) of patients, while adverse effects occurred in 40% vs. 48% ( $p = 0.02$ ) of patients in the restrictive and liberal strategies, respectively. The restrictive strategy had a better survival rate in patients with bleeding associated with cirrhosis Child-Pugh class A or B (HR: 0.30; 95% CI 0.11-0.85), but not in cirrhosis Child-Pugh class C (HR: 1.04; 95% CI 0.45-2.37) or a peptic ulcer (HR: 0.70; 95% CI 0.26-1.25).

**Conclusions:** Transfusing patients with an acute upper GI bleed at hemoglobin of <70 g/L rather than 90 g/L is associated with fewer transfusions, better survival, and fewer adverse events.

### Forrest Prognostic Classification of Bleeding Peptic Ulcers

Forrest Class	Type of Lesion	Risk of Rebleed (%)
I	Arterial bleeding (oozing/spurting)	55-100
IIa	Visible vessel	43
IIb	Sentinel clot	22
IIc	Hematin covered flat spot	10
III	No stigmata of hemorrhage	5

*Lancet* 1974;2:394-397

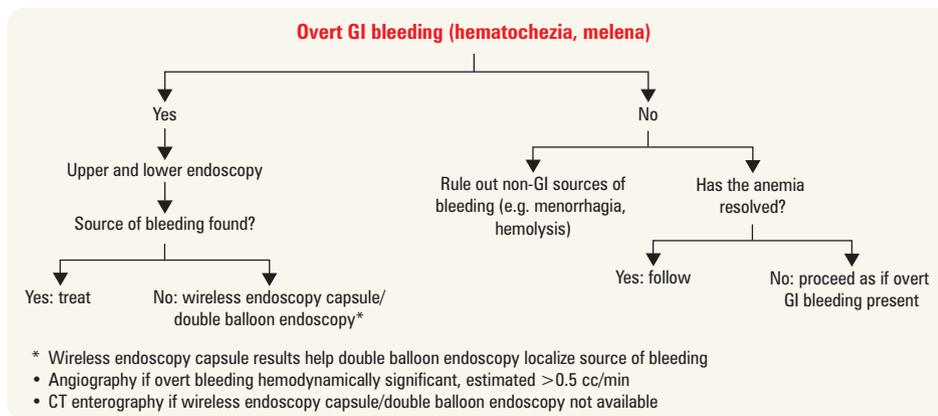

Figure 8. Approach to iron deficiency anemia

## Esophageal Varices

### Etiology

- almost always due to portal hypertension

### Clinical Features

- characteristically massive upper GI bleeding

### Prognosis

- risk of bleeding: 30% in 1st yr
- risk of rebleeding: 50-70% (20% mortality at 6 wk)

### Investigations

- endoscopy

### Management

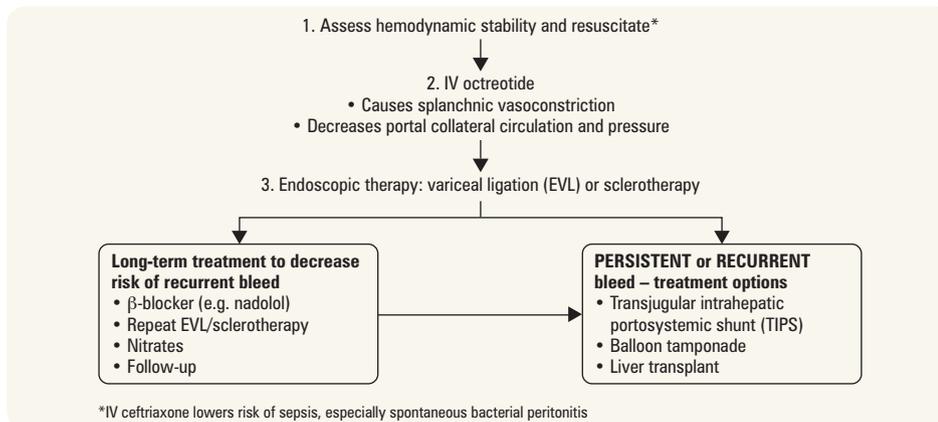

Figure 9. Management of bleeding esophageal varices

Not depicted: Intravenous ceftriaxone (lowers risk of sepsis, especially spontaneous bacterial peritonitis)

If varices isolated to stomach, think of splenic vein thrombosis

Gastric varices best treated by endoscopic injection of cyanoacetate ("crazy glue")

## Mallory-Weiss Tear

### Definition

- longitudinal laceration in gastric mucosa on lesser curvature near GE junction (20% straddle junction, 5% in distal esophagus)

### Etiology

- due to rapid increases in gastric pressure from retching/vomiting against a closed glottis
- hiatus hernia usually present

### Clinical Features

- hematemesis ± melena, classically following an episode of retching without blood
- can lead to fatal hematemesis

### Management

- 90% stop spontaneously
- if persistent: endoscopy with epinephrine injection ± clips or surgical repair

## Lower Gastrointestinal Bleeding

### Definition

- bleed distal to ligament of Treitz

### Etiology

- if blood per rectum with hemodynamic instability, rule out upper GI source
- diverticular (60% from right colon)
- vascular
  - angiodysplasia (small vascular malformations of the gut)
  - anorectal (hemorrhoids, fissures)
- neoplasm
  - cancer
  - polyps
- inflammation
  - colitis (ulcerative, infectious, radiation, ischemic)
- post-polypectomy

### Clinical Features

- hematochezia (see Figure 10)
- anemia
- occult blood in stool
- rarely melena

### Treatment

- treat underlying cause

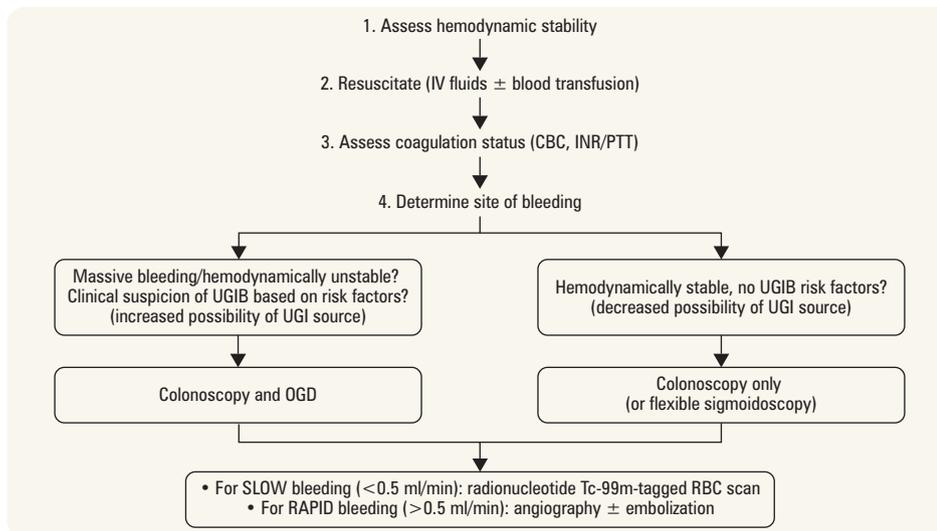

Figure 10. Approach to hematochezia

### Lower GI Bleed

#### CHAND

Colitis (radiation, infectious, ischemic, IBD [UC > CD])

Hemorrhoids/fissure

Angiodysplasia

Neoplastic

Diverticular disease

Always exclude upper GI lesion before localizing the site of the bleeding to the lower GI tract

## Colorectal Carcinoma

- see [General Surgery, GS34](#)

## Colorectal Polyps

- see [General Surgery, GS33](#)

## Familial Colon Cancer Syndromes

- see [General Surgery, GS33](#)

## Benign Anorectal Disease

- see [General Surgery, GS38](#)

# Liver

## Investigations of Hepatobiliary Disease

### A. Tests of Liver Function

Table 14. Liver Function Tests

Test	What Do Levels Correlate With?	Increased by	How to Interpret
<b>Prothrombin Time (PT or INR)</b>	Hepatic protein synthesis All coagulation factors except VIII	Hepatocellular dysfunction Vitamin K deficiency (due to malnutrition, malabsorption, etc.)	PT/INR will promptly correct if vitamin K is administered, so increased PT/INR in absence of vitamin K deficiency is a reliable marker of hepatocellular dysfunction
<b>Serum Albumin</b>	Hepatic protein synthesis (and other causes listed in next column)	Hepatocellular dysfunction Malnutrition Renal or GI losses Significant inflammation Malignancy	Rule out potential causes other than hepatocellular dysfunction
<b>Serum Direct Bilirubin*</b>	Hepatic excretion from hepatocyte to biliary system	Liver dysfunction	Conjugation is preserved even in end stage liver failure, thus increased direct bilirubin indicates liver dysfunction

\*Serum Bilirubin

• canaliculus breakdown product of hemoglobin; metabolized in the reticuloendothelial system of liver, transported through biliary system, excreted via gut

• direct bilirubin = conjugated; indirect = unconjugated bilirubin

### B. Tests of Liver Injury

- disproportionately increased AST or ALT = hepatocellular damage
  - ALT more specific to liver; AST from multiple sources (especially muscle)
  - elevation of both highly suggestive of liver injury
  - most common cause of elevated ALT is fatty liver
- disproportionately increased ALP (and GGT) = cholestasis (stasis of bile flow)
  - if ALP is elevated alone, rule out bone disease by fractionating ALP and/or checking GGT
  - if ALP elevation out of proportion to ALT/AST elevation, consider
    - obstruction of common bile duct (e.g. extraluminal = pancreatic Ca, lymphoma; intraluminal = stones, cholangiocarcinoma, sclerosing cholangitis, helminths)
    - destruction of microscopic ducts (e.g. PBC)
    - bile acid transporter defects (e.g. drugs, intrahepatic cholestasis of pregnancy)
    - infiltration of the liver (e.g. liver metastases, lymphoma, granulomas, amyloid)

## Acute Viral Hepatitis (General)

### Definition

- viral hepatitis lasting <6 mo

### Clinical Features

- most are subclinical
- flu-like prodrome may precede jaundice by 1-2 wk
  - nausea/vomiting, anorexia, headaches, fatigue, myalgia, low-grade fever, arthralgia and urticaria (especially HBV)
- only some progress to icteric (clinical jaundice) phase, lasting days to weeks
  - pale stools and dark urine 1-5 d prior to icteric phase
  - hepatomegaly and RUQ pain
  - splenomegaly and cervical lymphadenopathy (10-20% of cases)

### Investigations

- AST and ALT (>10-20x normal in hepatocellular necrosis)
- ALP minimally elevated
- viral serology, particularly the IgM antibody directed to the virus

### Treatment

- supportive (hydration, diet)
- usually resolves spontaneously, but if severe HBV infection, treatment with entecavir should be considered; in anicteric hepatitis C, anti-viral treatment should be considered (see hepatitis C)
- indications for hospitalization: encephalopathy, coagulopathy, severe vomiting, hypoglycemia

### Prognosis

- poor prognostic indicators: comorbidities, persistently high bilirubin (>340 mmol; 20 mg/dL), increased INR, decreased albumin, hypoglycemia

All clotting factors except factor VIII and von Willebrand factor are exclusively synthesized in the liver. Factor VIII is also produced in the endothelium. In cirrhosis, risk of bleeding does not correlate closely with elevations in INR/PTT since so many of the proteins in the coagulation cascade are affected

ALT > AST = most causes of hepatitis  
AST > ALT = alcoholic liver disease or other causes of hepatitis (i.e. non-alcoholic liver disease) that have progressed to advanced cirrhosis

**Serum Transaminases >1000 due to**

- Viral hepatitis
- Drugs/toxins
- Autoimmune hepatitis
- Hepatic ischemia
- Less often, common bile duct stone

**Alcoholic hepatitis:** history of recent alcohol, RUQ abdominal pain, AST/ALT > 2, AST usually <300, low grade fever, mildly elevated WBC

**Major Sources of ALP**

- Hepatobiliary tree
- Bone
- Placenta

## Complications

- cholestasis (most commonly associated with HAV infection)
- hepatocellular necrosis: AST, ALT >10-20x normal, ALP and bilirubin minimally increased, increased cholestasis

## Hepatitis A Virus

- RNA virus
- fecal-oral transmission; incubation period 4-6 wk
- diagnosed by elevated transaminases, positive anti-HAV IgM
- in children: characteristically asymptomatic
- in adults: fatigue, nausea, arthralgia, fever, jaundice
- can cause acute liver failure and subsequent death (<1-5%)
- can relapse (rarely), but never becomes chronic

## Hepatitis B Virus

Table 15. Hepatitis B Serology

	HBsAg	Anti-HBs	HBeAg	Anti-HBe	Anti-HBc	Liver Enzymes
Acute HBV	+	-	+	-	IgM	
Chronic (e-Ag positive) HBV (generally high HBV DNA)	+	-	+	-	IgG	ALT, AST elevated
Chronic (e-Ag negative) HBV (generally low HBV DNA)	+	-	-	+	IgG	ALT, AST normal
Resolved infection	-	±	-	±	IgG	
Immunization	-	+	-	-	-	

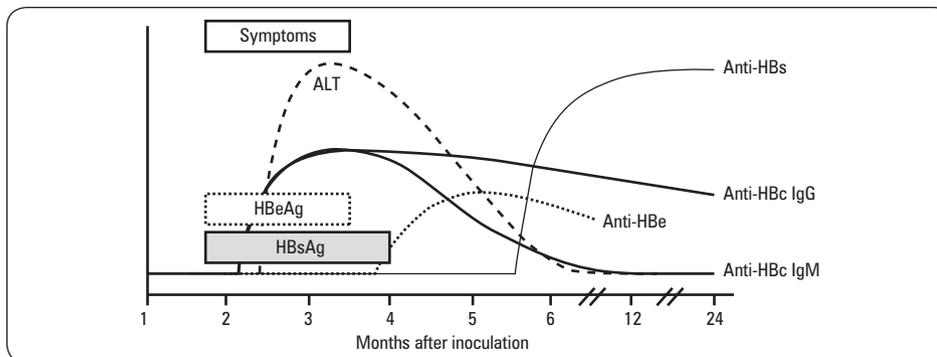

Figure 11. Time course of acute hepatitis B infection

## Epidemiology

- 4 phases of chronic hepatitis B: not all carriers will go through all 4 phases, but all carriers will have positive HBsAg
  - immune tolerance:** extremely high HBV-DNA (>20,000 IU/mL), HBeAg positive, but normal ALT/AST; due to little immune control and minimal immune-mediated liver damage; characteristic of perinatal infection (or 'incubation period' in adult with newly-acquired HBV)
  - immune clearance** (or immunoinactive): HBV-DNA levels (>20,000 IU/mL), HBeAg positive; due to immune attack on the virus and immune-mediated liver damage; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment
  - immune control:** lower HBV-DNA (<20,000 IU/mL), HBeAg negative, anti-HBe positive, ALT/AST normal; due to immune control without immune-mediated liver damage; risk of reactivation to phase 2 (clinically resembles acute hepatitis B), especially with immunosuppression e.g. corticosteroids or chemotherapy
  - immune escape** ("core or precore mutant"): elevated HBV-DNA (>2,000 IU/mL), HBeAg negative because of pre-core or core promoter gene mutation, anti-HBe positive, ALT/AST high; characterized by progressive disease without treatment and increasing liver fibrosis (sometimes progressing to cirrhosis and/or hepatocellular carcinoma); likely to benefit from treatment

### DDx for Hepatitis

- Viral infection
- Alcohol
- Drugs
- Immune-mediated
- Toxins

### Causes of Elevated Serum Transaminases in Chronic Hepatitis B

- Ongoing immune-mediated liver injury without immune control of HBV (HBeAg positive)
- Immune escape (anti-HBe positive)
- Reactivation, seroconversion (conversion from anti-HBe to HBeAg)
- Hepatitis D
- Heptocellular carcinoma
- Other liver insult (fatty liver, alcohol, drugs, hepatitis A)

### Risk Factors for Progression

- EtOH
- HIV coinfection
- Old age at diagnosis

In acute hepatitis B, HDV coinfection increases severity of hepatitis but does not increase risk of progression to chronic hepatitis. However in the context of chronic hepatitis B, superinfection with HDV increases progression to cirrhosis

Without treatment, 8-20% of those with ongoing immunoinactive chronic hepatitis can develop cirrhosis within 5 yr. In contrast, those in the immune tolerant phase (with extremely high HBV-DNA levels) are at minimal risk for liver fibrosis as they do not have immune-mediated liver injury

Risk of hepatocellular carcinoma in HBV increases with increasing age, which is likely a surrogate for increasing liver fibrosis/cirrhosis, and serum HBV-DNA  
Risk of hepatocellular carcinoma in HCV increases only after cirrhosis develops

HCV (and HBV) treatment lowers the risk of hepatocellular carcinoma

## Treatment

- counselling: 40% of men and 10% of women with perinatal infection without treatment will die from HBV-related complications
- prolonged immune-mediated damage leads to higher risk of liver fibrosis
- hepatocellular carcinoma screening with ultrasound q6mo, especially if high serum HBV-DNA levels, cirrhosis, men, (age >40 in Asian men, >50 in Asian women, and >20 in African descent)
- consider pharmacological therapy if
  1. HBeAg positive + HBV-DNA >20,000 IU/mL + elevated ALT ; or
  2. HBeAg negative + HBV-DNA >2,000 IU/mL + elevated ALT ± stage ≥2 fibrosis on liver biopsy
  3. treat to prevent flare when placed on immunosuppressive therapy such as prednisone, chemotherapy, biologics, etc.
- treatment goal: reduce serum HBV-DNA to undetectable level
- treatment options: interferon, tenofovir, entecavir, lamivudine
- vaccinate against HAV if serology negative (to prevent further liver damage)
- follow blood and sexual precautions

### DDx for Hepatomegaly

- Congestive (right heart failure, Budd-Chiari syndrome)
- Infiltrative
  - Malignant (primary, secondary, lymphoproliferative, leukemia)
  - Benign (fatty liver, cysts, hemochromatosis, extramedullary hematopoiesis, amyloid)
- Proliferative
  - Infectious (viral, tuberculosis, abscess, echinococcus)
  - Inflammatory (granulomas [sarcoid], histiocytosis X)

### From Description to Cure in One Generation

Ledipasvir and Sofosbuvir for Untreated HCV

Genotype 1 Infection  
*NEJM* 2014;370:1889-1898.

If you ever need an example to demonstrate the miraculous advances of modern medicine, consider using chronic hepatitis C. It inflicts about 6 per 1000 of Canadians and is the commonest reason for liver transplant in most studies. Yet until 1989, when the virus was first cloned, this condition was so poorly understood that it was labelled as what it wasn't - it was called hepatitis non-A, non-B because there was insufficient evidence to even appreciate that it was one disease, let alone an infection. Today it can be cured by taking a safe drug regimen for 6 to 24 weeks, depending on the virus strain, previous treatments, and the degree of liver damage. This recent study showed that sofosbuvir (nucleoside polymerase inhibitor) and ledipasvir (NS5A inhibitor) led to a 99% cure rate in genotype 1 (the most common) infection with only minimal side-effects. These antiviral drugs are designer drugs: specifically tailored in the laboratory to combat pathogenic features of the hepatitis C virus.

### Treatment of Hepatitis C: A Systematic Review

*JAMA* 2014;312(6):631-40.

**Purpose:** To evaluate the evidence for the safety, efficacy and tolerability of interferon and non-interferon based, oral therapies in the treatment of Hepatitis C virus (HCV).

**Study:** Literature review of phase 2, 3, and 4 studies published from January 1, 2009 – May 30, 2014, with data graded according to Oxford Centre for Evidence-Based Medicine criteria.

**Population:** 19, 063 adult patients infected with HCV genotype 1, 2, or 3 with or without HIV coinfection.

**Outcome:** Sustained virologic response (SVR) of undetectable plasma HCV RNA at 12 or 24 weeks post-therapy.

**Results:** Achievement of SVR was more difficult in HCV genotype 1 patients. Treatment of HCV genotype 1 patients with sofosbuvir with pegylated interferon and ribavirin yielded high rates of SVR (89-90%) and shorter duration of therapy. HCV genotype 2 or 3 patients treated with sofosbuvir and ribavirin alone achieved SVR of 82-93% and 80-95% for genotype 2 at 12 weeks and genotype 3 at 24 weeks, respectively. Patients with HCV and HIV coinfection with compensated cirrhosis should be treated in the same manner as HCV-monoinfected patients.

**Conclusions:** High SVR rates can be achieved for HCV patients with or without HIV coinfection using shorter durations of non-interferon therapies. HCV genotype 1 patients are likely to benefit from co-treatment with interferon and non-interferon therapies.

## Hepatitis D

- defective RNA virus requiring HBsAg for entry into hepatocyte, therefore infects only patients with HBV; causes more aggressive disease than hepatitis B virus alone
- coinfection: acquire HDV and HBV at the same time
- HDV can present as ALF and/or accelerate progression to cirrhosis
- treatment: low-dose interferon (20% response) and liver transplant for end-stage disease

## Hepatitis C Virus

- RNA virus (7 genotypes; genotype 1 is most common in North America)
- blood-borne transmission; sexual transmission is “inefficient”
- major risk factor: injection drug use
- other risk factors: blood transfusion received before 1992 (or received in developing world), tattoos, intranasal cocaine use
- clinical manifestation develops 6-8 wk after exposure
  - symptoms mild and vague (fatigue, malaise, nausea) therefore not commonly diagnosed in acute stage

## Diagnosis

- suspected on basis of elevated ALT/AST and positive serum anti-HCV
- diagnosis established by detectable HCV-RNA in serum
- virus genotype correlates with response to treatment but not prognosis
  - serum HCV-RNA inversely correlates with response to treatment
- normal transaminases can have underlying cirrhosis on biopsy, but otherwise excellent prognosis

## Treatment

- blood-borne precautions; vaccinate for hepatitis A and B if serology negative; avoid alcohol
- clearest indication for treatment is in subgroup likely to develop clinically significant liver disease
- persistently elevated transaminases, liver biopsy shows fibrosis/cirrhosis and at least moderately severe necrosis/inflammation
- treatment depends on genotype
- oral interferon-free regimens (e.g. sofosbuvir/ledipasvir, ombitasvir/paritaprevir/ritonavir+dasabuvir, or elbasvir/grazoprevir) are now becoming the standard of care with >90% success rate without significant side-effects including those who failed previous interferon-based treatment

## Prognosis

- 80% of acute hepatitis C become chronic (of these 20% evolve to cirrhosis)
- risk of hepatocellular carcinoma increases if cirrhotic
- can cause cryoglobulinemia; associated with membranoproliferative glomerulonephritis, lymphoma

**Table 16. Characteristics of the Viral Hepatitides**

	HAV	HBV	HCV	HDV	HEV	CMV	EBV	Yellow Fever
<b>Virus Family</b>	<i>Picornaviridae</i>	<i>Hepadnaviridae</i>	<i>Flaviviridae</i>	<i>Deltaviridae</i>	<i>Caliciviridae</i>	<i>Herpesviridae</i>	<i>Herpesviridae</i>	<i>Flavivirus</i>
<b>Genome</b>	RNA	DNA	RNA	RNA	RNA	DNA	RNA	RNA
<b>Envelope</b>	No	Yes	Yes	Yes	No	Yes	Yes	Yes
<b>Transmission</b>	Fecal-oral	Parenteral/sexual or equivalent Vertical	Parenteral/sexual (transfusion, IVDU, sexual [ $<$ HBV]) 40% have no known risk factors	Non-parenteral (close contact in endemic areas) Parenteral (blood products, IVDU)- sexual transmission is inefficient	Fecal-oral (endemic: Africa, Asia, central America, India, Pakistan)	Close contacts, most body fluids	Saliva-oral	Vector (mosquito)
<b>Incubation</b>	4-6 wk	6 wk-6 mo	2-26 wk	3-13 wk	2-8 wk	20-60 d	30-50 d	3-6 d
<b>Onset</b>	Usually abrupt	Usually insidious	Insidious	Usually abrupt	Usually abrupt	Variable	Variable	Usually abrupt
<b>Communicability</b>	2-3 wk in late incubation to early clinical phase Acute hepatitis in most adults, 10% of children	HBsAg + state highly communicable Increased during third trimester or early post-partum	Communicable prior to overt symptoms and throughout chronic illness	Infectious only in presence of HBV (HBsAg required for replication)	Unknown	Variable – dormant or persistent	Communicable highest during year after primary infection but never zero	Variable, vector-dependent
<b>Chronicity</b>	None, although can relapse	5% adults, 90% infants	80%, 20% of which develop cirrhosis	5%	None	Common; latent	Common; latent	Infection confers lifelong immunity
<b>Serology</b>	Anti-HAV (IgM)	See Table 15	HCV-RNA Anti-HCV (IgG/IgM)	HBsAg Anti-HDV (IgG/IgM)	Anti-HEV (IgG/IgM)	Anti- CMV (IgM/IgG)	Monospot; anti-EBV IgM/IgG, EBV DNA quantitation	Anti-YF (IgM/IgG)
<b>Immunity</b>	Yes	Yes	?	Yes	?	?	?	Yes
<b>Vaccine</b>	Havrix, 2 doses q6mo, combined with Tivinrix at 0, 7, and 21 d	Recombivax HBTM, age 11-15, 2 doses q6mo	No	No	No	No	No	YF-VAX, 1 dose booster q10yr
<b>Management</b>	General hygiene Treat close contacts (anti-HAV Ig) Prophylaxis for high-risk groups (HAV vaccine $\pm$ HAV Ig) unless immune	Prevention: HBV vaccine and/or hepatitis B Ig (HBIG) for needlestick, sexual contact, infants of infected mothers unless already immune Rx: oral antivirals vs interferon if indications met	Prevention: no vaccine Rx: IFN + ribavirin $\pm$ protease inhibitor; although all oral anti-viral (IFN-free) therapy now available is highly efficacious	Prevention: HBV vaccine	Prevention: general hygiene, no vaccine	In high risk transplant patients: CMV IG and anti-virals (ganciclovir, valganciclovir)	Supportive treatment post infection	Prevention Supportive treatment post infection
<b>Acute Mortality</b>	0.1-0.3%	0.5-2%	1%	2-20% coinfection with HBV, 30% superinfection Predisposes HBV carriers to more severe hepatitis and faster progression to cirrhosis	1-2% overall, 10-20% in pregnancy	Rare in immunocompetent adults	Rare	20-60% in developing countries
<b>Oncogenicity</b>	No	Yes	Yes	?	No	No	Yes	No
<b>Complications</b>	Can cause acute liver failure and subsequent death ( $<$ 1-5%)	Hepatocellular carcinoma secondary to cirrhosis, serum sickness-like syndrome, glomerulonephritis, cryoglobulinemia, polyarteritis nodosa, porphyria cutanea tarda	Hepatocellular carcinoma in 2-5% of cirrhosis per yr, cryoglobulinemia, B-cell non-Hodgkin lymphoma	Leukocytoclastic vasculitis, membranous glomerulonephropathy	Mild, except in third trimester (10-20% fulminant liver failure)	5% of newborns with multiple handicaps Immunocompromised patients at risk of CMV-induced hepatitis, retinitis, colitis, esophagitis, pneumonitis	Associated with Burkitt's lymphoma and nasopharyngeal carcinoma (rare in Western world)	Can cause a recurrent toxic phase with liver damage, GI bleeding, and high mortality rates

## Autoimmune Chronic Active Hepatitis

- diagnosis of exclusion: rule out viruses, drugs, metabolic, or genetic causes
- can be severe: 40% mortality at 6 mo without treatment
- extrahepatic manifestations
  - sicca, Raynaud's, thyroiditis, Sjögren's, arthralgias
  - hypergammaglobulinemia
    - ♦ anti-smooth muscle antibody elevation is most characteristic; also elevations in
    - ♦ anti-LKM elevation (liver kidney microsome), especially in children
      - less specific: elevated ANA, RF
    - ♦ can have false positive viral serology (especially anti-HCV)
    - ♦ biopsy – periportal (zone 1) and interface inflammation and necrosis
- treatment: corticosteroids (80% respond)  $\pm$  azathioprine (without this, most will relapse as corticosteroids are withdrawn)

## Drug-Induced Liver Disease

**Table 17. Classification of Hepatotoxins**

	Direct	Indirect
<b>Example</b>	Acetaminophen, CCl <sub>4</sub>	Phenytoin, INH
<b>Dose-Dependence</b>	Usual	Unusual
<b>Latent Period</b>	Hours-days	Weeks-months
<b>Host Factors</b>	Not important	Very important
<b>Predictable</b>	Yes	No (idiosyncratic)

### Specific Drugs

- acetaminophen
  - metabolized by hepatic cytochrome P450 system
  - can cause ALF (transaminases >1,000 U/L followed by jaundice and encephalopathy)
  - requires 10-15 g in healthy, 4-6 g in alcoholics/anticonvulsant users
  - mechanism: high acetaminophen dose saturates glucuronidation and sulfation elimination pathways → reactive metabolite is formed → covalently binds to hepatocyte membrane
  - presentation
    - first 24 h: N/V (usually within 4-12 h of overdose)
    - 24-48 h: asymptomatic, but ongoing hepatic necrosis resulting in increased transaminases
    - >48 h: continued hepatic necrosis possibly complicated with ALF or resolution
    - note: potential delay in presentation in sustained-release products
  - blood levels of acetaminophen correlate with the severity of hepatic injury, particularly if time of ingestion known
  - therapy
    - gastric lavage/emesis (if <2 h after ingestion)
    - oral activated charcoal
    - N-acetylcysteine (NAC, Mucomyst®) can be given PO or IV (most effective within 8-10 h of ingestion, but should be given no matter when time of ingestion)
      - promotes hepatic glutathione regeneration
      - no recorded fatal outcomes if NAC given before increase in transaminases
- chlorpromazine: cholestasis in 1% after 4 wk; often with fever, rash, jaundice, pruritus, and eosinophilia
- INH (isoniazid)
  - 20% develop elevated transaminases but <1% develop clinically significant disease
  - susceptibility to injury increases with age
- methotrexate
  - causes fibrosis/cirrhosis; increased risk in the presence of obesity, DM, alcoholism (i.e. with underlying risk for pre-existing fatty liver)
  - scarring develops without symptoms or changes in liver enzymes, therefore biopsy may be needed in long-term treatment
- amiodarone: can cause same histology and clinical outcome as alcoholic hepatitis
- others: azoles, statins, methyl dopa, phenytoin, propylthiouracil (PTU), rifampin, sulfonamides, tetracyclines
- herbs: chaparral, Chinese herbs (e.g. germander, comfrey, bush tea)

**Hy's Law:** drug-induced hepatocellular jaundice indicates a mortality of at least 10%

## Wilson's Disease

### Definition

- autosomal recessive defect in copper metabolism (gene ATP7B)

### Etiology

- decreased biliary excretion of copper plus decreased incorporation of copper into ceruloplasmin

### Clinical Features

- liver: acute hepatitis, acute liver failure, chronic active hepatitis, cirrhosis, low risk of hepatocellular carcinoma
- eyes: Kayser-Fleischer rings (copper deposits in Descemet's membrane); more common in patients with CNS involvement, present in 50% if only liver involvement
- CNS: basal ganglia (wing flapping tremor, Parkinsonism), cerebellum (dysarthria, dysphagia, incoordination, ataxia), cerebrum (psychosis, affective disorder)
- kidneys: Fanconi's syndrome (proximal tubule transport defects) and stones
- blood: intravascular hemolysis; may be initial presentation in fulminant hepatitis
- joints: arthritis, bone demineralization, calcifications

### Investigations

- suspect if increased liver enzymes with clinical manifestations at young age (<30); especially combination of liver disease with dystonia, psychiatric symptoms

### Clinical Manifestations of Wilson's Disease

#### ABCD

#### Asterixis

Basal ganglia degeneration: suspect if parkinsonian features in the young  
Ceruloplasmin decreases

#### Cirrhosis

Corneal deposits (Kayser-Fleischer ring)

#### Copper

#### Dementia

- screening tests
  1. reduced serum ceruloplasmin (<50% of normal)
  2. Kayser-Fleischer rings (usually require slit-lamp examination)
  3. increased urinary copper excretion
- gold standard
  1. increased copper on liver biopsy by quantitative assay
  2. genetic analysis imperfect as many mutations in ATP7B are possible

### Treatment

- 4 drugs available
  1. penicillamine chelates copper, poorly tolerated
  2. trientine chelates copper
  3. zinc impairs copper excretion in stool and decreases copper absorption from gut
  4. tetrathiomolybdate preferred if neurological involvement
- screen relatives
- liver transplant in severe cases

## Hemochromatosis

### Definition

- excessive iron storage causing multiorgan system dysfunction (liver, in particular) with total body stores of iron increased to 20-40 g (normal 1 g)

### Etiology

- primary (hereditary) hemochromatosis
  - hepcidin deficiency results in ongoing gut absorption of iron despite adequate iron stores
- secondary hemochromatosis
  - parenteral iron overload (e.g. transfusions)
  - chronic hemolytic anemia: thalassemia, pyruvate kinase deficiency
  - excessive iron intake

### Epidemiology

- hereditary hemochromatosis most common in Northern European descent
- primarily due to common recessive gene (HFE, 5%); 1/400 patients are homozygotes

### Clinical Features

- usually presents with trivial elevation in serum transaminases
- liver: cirrhosis (30%), HCC (200x increased risk) – most common cause of death (1/3 of patients)
- pancreas: DM, chronic pancreatitis
- skin: bronze or grey (due to melanin, not iron)
- heart: dilated cardiomyopathy
- pituitary: hypogonadotropic hypogonadism (impotence, decreased libido, amenorrhea)
- joints: arthralgia (any joint, but especially MCP joints), chondrocalcinosis

### Investigations

- screening for individuals with clinical features and/or family history (1/4 chance of sibling having the disease)
  - transferrin saturation (free Fe<sup>2+</sup>/TIBC) >45%
  - serum ferritin >400 ng/mL
  - HFE gene analysis: 90% of primary hemochromatosis involves C282Y allele, while H63D and S65C alleles also commonly involved and screened
- liver biopsy (generally used to detect cirrhosis or if potential for other causes of liver disease)
  - markers of advanced fibrosis: if any of the following are present at the time of diagnosis → age >40, elevated liver enzymes, or ferritin >1000
  - considered if compound heterozygote and potential other cause of liver injury (e.g. fatty liver, etc.)
  - if C282Y/C282Y and no markers of advanced fibrosis, then biopsy generally not needed
- HCC screening if cirrhosis

### Treatment

- phlebotomy: weekly or q2wk then lifelong maintenance phlebotomies q2-6mo
- deferoxamine if phlebotomy contraindicated (e.g. cardiomyopathy, anemia)
- primary hemochromatosis responds well to phlebotomy
- secondary hemochromatosis usually requires chelation therapy (administration of agents that bind and sequester iron, and then excreted)

### Prognosis

- normal life expectancy if treated before the development of cirrhosis or DM

#### Hemochromatosis Clinical Features ABCD

- Arthralgia
- Bronze skin
- Cardiomyopathy, cirrhosis of liver
- Diabetes (pancreatic damage)
- Hypogonadism (anterior pituitary damage)

Ferritin may never normalize if other causes of high ferritin present (e.g. fatty liver from metabolic syndrome or alcohol)

Gene mutation not 100% penetrant, so not all with homozygous gene defect have clinically significant iron overload

## Alcoholic Liver Disease

### Definition

- fatty liver (all alcoholics): always reversible if alcohol stopped
- alcoholic hepatitis (35% of alcoholics): usually reversible if alcohol stopped
- cirrhosis (10-15% of alcoholics): potentially irreversible

### Pathophysiology

- several mechanisms, poorly understood
- ethanol oxidation to acetaldehyde
  - reduces NAD<sup>+</sup> to NADH; increased NADH decreases ATP supply to liver, impairing lipolysis so fatty acids and triglycerides accumulate in liver
  - binds to hepatocytes evoking an immune reaction
- ethanol increases gut permeability leading to increased bacterial translocation
- alcohol metabolism causes
  - relative hypoxia in liver zone III (near central veins; poorly oxygenated) > zone I (around portal tracts, where oxygenated blood enters)
  - necrosis and hepatic vein sclerosis
- histology of alcoholic hepatitis
  - ballooned (swollen) hepatocytes often containing Mallory bodies, characteristically surrounded by neutrophils
  - large fat globules
  - fibrosis: space of Disse and perivenular

### Clinical Features

- >2-3 standard drinks/d in females and >3-6 standard drinks/d in men for >10 yr leads to cirrhosis, but only in about 10-20% of those who consume this amount daily on a continuous basis; cirrhosis risk increases with amount of alcohol consumed above threshold
- clinical findings do not accurately predict type of liver involvement
- fatty liver
  - mildly tender hepatomegaly; jaundice rare
  - mildly increased transaminases <5x normal
- alcoholic hepatitis
  - variable severity: mild to fatal liver failure
  - mild: stops drinking because feels unwell, resumes when feeling better (if assessed, findings of hepatitis, potentially mild jaundice, and mildly elevated INR)
  - severe: stops drinking but feels unwell, low grade fever, RUQ discomfort, increased white blood cell count – mimics RLL pneumonia and cholecystitis

### Investigations

- blood tests are non-specific, but in general
  - AST:ALT >2:1 (both usually <300)
  - if ALT>AST, usually cirrhosis has developed (assuming alcohol in the cause of the liver disease)
  - CBC: increased MCV, increased WBC

### Treatment

- alcohol cessation ([see Psychiatry, PS23](#))
  - Alcoholics Anonymous, disulfiram, naltrexone, acamprosat
- multivitamin supplements (especially thiamine)
- caution with drugs metabolized by the liver
- prednisone and pentoxifylline less used since most definitive trial did not show efficacy

### Prognosis

- Maddrey's discriminant function (based on PT and bilirubin) and MELD predict mortality and guide treatment
- fatty liver: complete resolution with cessation of alcohol intake
- alcoholic hepatitis mortality
  - immediate: 30%-60% in the first 6 mo if severe
  - with continued alcohol: 70% in 5 yr
  - with cessation: 30% in 5 yr

#### Standard Drink Equivalent

- 1 standard drink = 14 g EtOH
- = 12 oz beer (5% alcohol)
- = 5 oz wine (12-17%)
- = 3 oz fortified wine (17-22%)
- = 1.5 oz liquor (40%)

Tip: percentage alcohol multiplied by oz in 1 standard drink roughly equals 60

#### Biopsy + Histology of Alcoholic Hepatitis (triad)

- Hepatocyte necrosis with surrounding inflammation in zone III
- Mallory bodies (intracellular eosinophilic aggregates of cytokeratins)
- Chicken-wire fibrosis (network of intralobular connective tissue surrounding cells and venules)

#### GI Complications of Alcohol Abuse

- Esophagus
  - Mallory-Weiss tear
  - Esophageal varices (secondary to portal hypertension)
- Stomach
  - Alcoholic gastritis
- Pancreas
  - Acute pancreatitis
  - Chronic pancreatitis
- Liver
  - Alcoholic hepatitis
  - Fatty liver
  - Cirrhosis
  - Hepatic encephalopathy
  - Portal hypertension
  - Ascites
  - HCC

## Non-Alcoholic Fatty Liver Disease

### Definition

- spectrum of disorders characterized by macrovesicular hepatic steatosis, sometimes with inflammation and/or fibrosis
- most common cause of liver disease in North America

**Etiology**

- pathogenesis not well elucidated; insulin resistance implicated as key mechanism, leading to hepatic steatosis
- histological changes indistinguishable from those of alcoholic hepatitis despite negligible history of alcohol consumption

**Risk Factors**

- likely a component of the metabolic syndrome along with type 2 DM, HTN, hypertriglyceridemia
- rapid weight loss or weight gain

**Clinical Features**

- often asymptomatic
- may present with fatigue, malaise, and vague RUQ discomfort
- elevated serum triglyceride/cholesterol levels and insulin resistance

**Investigations**

- elevated serum AST, ALT  $\pm$  ALP; AST/ALT  $<1$
- presents as echogenic liver texture on ultrasound
- liver biopsy diagnostic, but often necessary only for prognosis

**Treatment**

- mainstay is gradual weight loss (0.5-1 kg/wk) as rapid weight loss can worsen liver disease
  - ideally, aim to lose at least 7-10% of body weight
- some evidence for vitamin E (800 U daily) if there is hepatic inflammation
- some evidence for benefits of coffee drinking (3 cups per day) and vitamin D

**Prognosis**

- most die from cardiovascular or cerebrovascular disease
- better prognosis than alcoholic hepatitis
  - $<25\%$  progress to cirrhosis over a 7-10 yr period
- risk of progression increases if inflammation or scarring occurs alongside fat infiltration (non-alcoholic steatohepatitis)
- other clinical indicators of unfavourable prognosis: DM, age, metabolic syndrome

**Acute Liver Failure (formerly Fulminant Hepatic Failure)****Definition**

- severe decline in liver function characterized by coagulation abnormality (INR  $>1.5$ ) and encephalopathy
- in setting of previously normal liver
- rapid ( $<26$  wk duration)

**Etiology**

- drugs (especially acetaminophen), hepatitis B (measure anti-HBc, IgM fraction because sometimes HBV-DNA and even HBsAg rapidly becomes negative), hepatitis A, hepatitis C (rare), ischemic, idiopathic

**Treatment**

- correct hypoglycemia, monitor level of consciousness, prevent GI bleeding with PPI, monitor for infection and multiorgan failure (usually requires ICU)
- consider liver biopsy before INR becomes too high
- chief value of biopsy is to exclude chronic disease, less helpful for prognosis
- liver transplant (King's College criteria can be used as prognostic indicator): consider early, especially if time from jaundice to encephalopathy  $>7$  d (e.g. not extremely rapid), age  $<10$  or  $>40$ , cause is drug or unknown, bilirubin  $>300$   $\mu\text{mol/L}$ , INR  $>3.5$ , creatinine  $>200$   $\mu\text{mol/L}$

**Cirrhosis****Definition**

- liver damage characterized by diffuse distortion of the basic architecture and replacement with scar tissue and formation of regenerative nodules
- Stage 1 cirrhosis is compensated and asymptomatic, can last for 10-20 yr with almost normal life expectancy
- Stage 2 cirrhosis is decompensation, typically development of ascites (most common), variceal bleeding, encephalopathy, characteristically presents abruptly even though histologically the liver fibrosis is gradually progressive

**Etiology**

- fatty liver (alcoholic or non-alcoholic fatty liver disease)
- chronic viral hepatitis (B, B+D, C; not A or E)

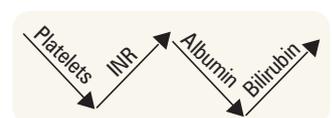

Figure 12. Progression of liver dysfunction based on liver function tests – the “W”

- autoimmune hepatitis
- hemochromatosis
- primary biliary cirrhosis
- chronic hepatic congestion
  - cardiac cirrhosis (chronic right heart failure, constrictive pericarditis)
  - hepatic vein thrombosis (Budd-Chiari)
- cryptogenic (i.e. no identifiable cause, although many of these patients may represent “burnt-out NASH”)
- rare: Wilson’s disease, Gaucher’s disease,  $\alpha$ 1-antitrypsin deficiency

### Investigations

- definitive diagnosis is histologic (liver biopsy)
- other tests may be suggestive
  - blood work: fall in platelet count  $<150$  is the earliest finding, followed many years later with rise in INR, fall in albumin, rise in bilirubin, fall in glucose level (pre-terminal event)
  - FibroTest: combination of various clinical and biochemical markers that can predict degree of fibrosis
  - imaging
    - ♦ U/S is the primary imaging modality but only finds advanced cirrhosis
    - ♦ CT to look for varices, nodular liver texture, splenomegaly, ascites
    - ♦ Ultrasound elastography (FibroScan): non-invasive tool using elastography (variable availability)
- gastroscopy: varices or portal gastropathy

### Treatment

- treat underlying disorder
- decrease insults (e.g. alcohol cessation, hepatotoxic drugs, immunize for Hep A and B if non-immune)
- follow patient for complications (esophageal varices, ascites, HCC defines stage 2 cirrhosis)
- prognosis: Child-Pugh Score and MELD score
- liver transplantation for end-stage disease if no alcohol for  $>6$  mo; use MELD score

**Table 18. Child-Pugh Score and Interpretation**

Classification	1	2	3
Serum bilirubin ( $\mu\text{mol/L}$ )	$<34$	34-51	$>51$
Serum albumin (g/L)	$>35$	28-35	$<28$
INR	$<1.7$	1.7-2.3	$>2.3$
Presence of ascites	Absent	Controllable	Refractory
Encephalopathy	Absent	Minimal	Severe
Interpretation			
Points	Class	Life Expectancy	Perioperative Mortality
5-6	A	15-50 yr	10%
7-9	B	Candidate for transplant	30%
10-15	C	1-3 mo	82%

Score: 5-6 (Child’s A), 7-9 (Child’s B), 10-15 (Child’s C)

\*Note: Child’s classification is rarely used for shunting (TIPS or other surgical shunts), but is still useful to quantitate the severity of cirrhosis

### Complications

- hematologic changes in cirrhosis
  - pancytopenia from hypersplenism: platelets first, then WBC, then hemoglobin
  - decreased clotting factors resulting in elevated INR
  - relationship of INR to bleeding tendency is controversial; some patients may be hypocoagulable, others may be hypercoagulable
- variceal bleeds
  - half of patients with cirrhosis have gastroesophageal varices and one-third of these develop hemorrhage with an overall mortality of  $>30\%$
  - hepatic venous pressure gradient (HVPG)  $\geq 10$  mmHg is the strongest predictor of variceal development
  - treatment: resuscitation, antibiotic prophylaxis, vasoactive drugs (e.g. octreotide IV) combined with endoscopic band ligation or sclerotherapy, TIPS
- renal failure in cirrhosis
  - classifications
    - ♦ pre-renal (usually due to over-diuresis)
    - ♦ acute tubular necrosis
    - ♦ HRS
      - Type I: sudden and acute renal failure (rapid doubling of creatinine over 2 wk)
      - Type II: gradual increase in creatinine with worsening liver function (creatinine doubling over years)

#### MELD-Na (Model for End Stage Liver Disease)

- Predicts 3 mo survival and used to stratify patients on transplant list
- Based on creatinine, INR, total bilirubin, and serum sodium concentration

#### Cirrhosis Complications

##### VARICES

- Varices
- Ascites/Anemia
- Renal failure (hepatorenal syndrome)
- Infection
- Coagulopathy
- Encephalopathy
- Sepsis

Usual causes of death in cirrhosis: renal failure (hepatorenal syndrome), sepsis, GI bleed, or HCC

#### Hepatorenal Syndrome vs. Pre-Renal Failure – Difficult to Differentiate

- Similar blood and urine findings
- Urine sodium: very low in hepatorenal; low in pre-renal
- Intravenous fluid challenge: giving volume expanders improves pre-renal failure, but not hepatorenal syndrome

- ◆ HRS can occur at any time in severe liver disease, especially after
  - overdiuresis or dehydration, such as diarrhea, vomiting, etc.
  - GI bleed
  - sepsis
- ◆ treatment for hepatorenal syndrome (generally unsuccessful at improving long-term survival)
  - for type I HRS: octreotide + midodrine + albumin (increases renal blood flow by increasing systemic vascular resistance)
  - definitive treatment is liver transplant
- hepatopulmonary syndrome
  - majority of cases due to cirrhosis, though can be due to other chronic liver diseases, such as non-cirrhotic portal HTN
  - thought to arise from ventilation-perfusion mismatch, intrapulmonary shunting and limitation of oxygen diffusion, failure of damaged liver to clear circulating pulmonary vasodilators vs. production of a vasodilating substance by the liver
  - clinical features
    - ◆ hyperdynamic circulation with cardiac output >7 L/min at rest and decreased pulmonary + systemic resistance (intrapulmonary shunting)
    - ◆ dyspnea, platypnea (increase in dyspnea in upright position, improved by recumbency), and orthodeoxia (desaturation in the upright position, improved by recumbency)
    - ◆ diagnosis via contrast-enhanced echocardiography: inject air bubbles into peripheral vein; air bubbles appear in left ventricle after third heartbeat (normal = no air bubbles; in ventricular septal defect, air bubbles seen <3 heart beats)
    - ◆ only proven treatment is liver transplantation

#### Hepatopulmonary Syndrome

##### Clinical Triad

- Liver disease
- Increased alveolar-arterial gradient while breathing room air
- Evidence for intrapulmonary vascular abnormalities

Fibrosis may regress and disappear if cause of liver injury is treated or resolves

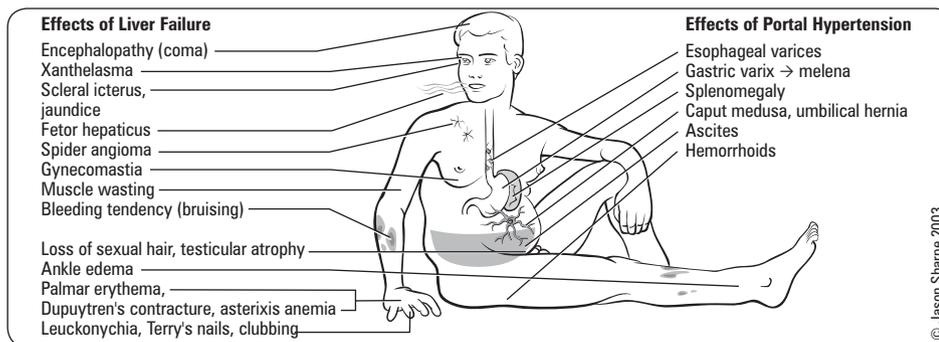

Figure 13. Clinical features of liver disease

## Hepatocellular Carcinoma

- see [General Surgery, GS44](#)

## Liver Transplantation

- see [General Surgery, GS45](#)

## Portal Hypertension

### Definition

- pressure gradient between hepatic vein pressure and wedged hepatic vein pressure (corrected sinusoidal pressure) >5 mmHg

### Pathophysiology

- 3 sites of increased resistance (remember pressure = flow x resistance)
  - pre-sinusoidal (e.g. portal vein thrombosis, schistosomiasis, sarcoidosis)
  - sinusoidal (e.g. cirrhosis, alcoholic hepatitis)
  - post-sinusoidal (e.g. right-sided heart failure, hepatic vein thrombosis, veno-occlusive disease, constrictive pericarditis)

### Complications

- GI bleeding from varices in esophagus, less commonly in stomach, even less frequently from portal hypertensive gastropathy
- ascites
- hepatic encephalopathy
- thrombocytopenia
- renal dysfunction
- sepsis
- arterial hypoxemia

## Treatment

- non-selective  $\beta$ -blockers (propranolol, nadolol) decrease risk of bleeding from varices
- TIPS: to decrease portal venous pressure
  - radiologically inserted stent between portal and hepatic vein via transjugular vein catheterization and percutaneous puncture of portal vein
  - can be used to stop acute bleeding or prevent rebleeding or treat ascites
  - shunt usually remains open for <1 yr
  - complications: hepatic encephalopathy, deterioration of hepatic function
  - contraindicated with severe liver dysfunction
  - most commonly used as a "bridge" to liver transplant
- other surgically created shunts: portacaval, distal spleno-renal (Warren shunt) - all used only rarely in the modern era

### Portal Hypertension

#### Signs

- Esophageal varices
- Melena
- Splenomegaly
- Ascites
- Hemorrhoids

#### Management

- $\beta$ -blockers
- Nitrates
- Shunts (e.g. TIPS)

## Hepatic Encephalopathy

### Definition

- spectrum of potentially reversible neuropsychiatric syndromes secondary to liver disease diagnosed after ruling out other causes for symptoms (e.g. structural/metabolic)

### Pathophysiology

- portosystemic shunt around hepatocytes and decreased hepatocellular function increase level of systemic toxins (believed to be ammonia from gut, mercaptans, fatty acids, amino acids) which go to the brain

### Precipitating Factors

- nitrogen load (GI bleed, protein load from food intake, renal failure, constipation)
- drugs (narcotics, CNS depressants)
- electrolyte disturbance (hypokalemia, alkalosis, hypoxia, hypovolemia)
- infection (spontaneous bacterial peritonitis)
- deterioration in hepatic function or superimposed liver disease

### Stages

- I: apathy, restlessness, reversal of sleep-wake cycle, slowed intellect, impaired computational abilities, impaired handwriting
- II: asterixis, lethargy, drowsiness, disorientation
- III: stupor (rousable), hyperactive reflexes, extensor plantar response (upgoing Babinski)
- IV: coma (response to painful stimuli only)

### Investigations

- clinical diagnosis: supported by laboratory findings and exclusion of other neuropsychiatric diseases
- rule out
  - non-liver-related neuropsychiatric disease in a patient with liver problems (e.g. alcohol withdrawal or intoxication, sedatives, subdural hematoma, metabolic encephalopathy)
  - causes of metabolic encephalopathy (e.g. renal failure, respiratory failure, severe hyponatremia, hypoglycemia)
- characteristic EEG findings: diffuse (non-focal), slow, high amplitude waves
- serum ammonia levels increased, but not often necessary to measure in routine clinical use

### Treatment

- treat underlying precipitating factors
- decrease generation of nitrogenous compounds
  - routine protein restriction is no longer recommended given patients generally have concurrent malnutrition and muscle wasting; however, vegetable protein is better tolerated than animal protein
  - lactulose: titrated to achieve 2-3 soft stools/d
    - ◆ prevents diffusion of  $\text{NH}_3$  (ammonia) from the colon into blood by lowering pH and forming non-diffusible  $\text{NH}_4$  (ammonium)
    - ◆ serves as a substrate for incorporation of ammonia by bacteria, promotes growth in bowel lumen of bacteria which produce minimal ammonia
    - ◆ also acts as a laxative to eliminate nitrogen-producing bacteria from colon
- oral rifaximin for both acute treatment and maintenance therapy has high level evidence for efficacy
- best acute treatment in comatose patient is lactulose enemas
- other antibiotics that may be used include metronidazole and vancomycin

### Precipitating Factors for Hepatic Encephalopathy

#### Hepatics

Hemorrhage in GI tract/Hypokalemia

Excess dietary protein

Paracentesis

Alkalosis/AAemia

Trauma

Infection

Colon surgery

Sedatives

## Ascites

### Definition

- accumulation of excess fluid in the peritoneal cavity

### Etiology

**Table 19. Serum-Ascites Albumin Gradient as an Indicator of the Causes of Ascites**

Serum [Alb] – Ascitic [Alb] >11 g/L (1.1 g/dL) Portal Hypertension Related	Serum [Alb] – Ascitic [Alb] <11 g/L (1.1 g/dL) Non-Portal Hypertension Related
Cirrhosis/severe hepatitis	Peritoneal carcinomatosis
Chronic hepatic congestion (right heart failure, Budd-Chiari)	TB
Massive liver metastases	Pancreatic disease
Myxedema	Serositis
	Nephrotic syndrome*

\* In nephrotic syndrome: decreased serum [Alb] to begin with therefore gradient not helpful

### Pathophysiology

- key factor in pathogenesis is increased sodium (and water) retention by the kidney for reasons not fully understood. Theories include:
  - underfill hypothesis: first step in ascites formation is increased portal pressure and low oncotic pressure (e.g. low serum albumin) driving water out of the splanchnic portal circulation into abdominal cavity; the resulting decreased circulating volume causes secondary sodium retention by the kidney
  - overflow hypothesis: cirrhosis directly causes increased sodium retention by the kidney in the absence of hypovolemia and ascites arises secondarily
  - peripheral arterial vasodilation theory (most popular): as portal HTN develops in cirrhosis, production of local mediators such as nitric oxide lead to splanchnic arterial vasodilation which ultimately results in reduction of effective arterial volume and compensatory sodium and fluid retention by the kidneys (i.e. circulation volume is increased, as per overflow hypothesis, but relatively underfilled, as per underfill hypothesis)

### Diagnosis

- abdominal ultrasound
- physical exam (clinically detectable when >500 mL)
  - bulging flanks, shifting dullness, fluid-wave test positive
  - most sensitive symptom: ankle swelling

### Investigations

- diagnostic paracentesis
  - 1st aliquot: cell count and differential
  - 2nd aliquot: chemistry (especially albumin, but also total protein; amylase if pancreatitis; TG and chylomicrons if turbid and suspect chylous ascites)
  - 3rd aliquot: C&S, Gram stain
  - 4th aliquot: cytology (usually positive in peritoneal carcinomatosis)

### Treatment

- non-refractory ascites
  - Na<sup>+</sup> restriction (daily sodium intake <2 g)
  - diuretics: spironolactone, furosemide
  - aim for weight loss 0.5-1 kg/d, more if concomitant peripheral edema (which is mobilized quicker than ascitic fluid); overly rapid weight loss increases risk of renal failure
  - if target weight loss is not achieved and there are no complications, increase dose to achieve target while monitoring for complications
- refractory ascites (diuretics are inadequate or not tolerated)
  - therapeutic paracentesis with intravenous albumin
  - TIPS in an appropriate patient (no contraindications) with potential transplant-free survival advantage
  - liver transplantation should be considered in every case, since development of ascites in patients with cirrhosis is associated with 50% 2 yr mortality

**Complication: Primary/Spontaneous Bacterial Peritonitis**

- primary/spontaneous bacterial peritonitis (SBP)
  - complicates ascites, but does not cause it (occurs in 10% of cirrhotic ascites); higher risk in patients with GI bleed
  - 1/3 of patients are asymptomatic, thus do not hesitate to do a diagnostic paracentesis in ascites even if no clinical indication of infection
  - fever, chills, abdominal pain, ileus, hypotension, worsening encephalopathy, acute kidney injury
  - Gram-negatives compose 70% of pathogens: *E. coli* (most common), *Streptococcus*, *Klebsiella*
- diagnosis
  - absolute neutrophil count in peritoneal fluid  $>0.25 \times 10^9$  cells/L (250 cells/mm<sup>3</sup>)
  - Gram stain positive in only 10-50% of patients
  - culture positive in  $<80\%$  of patients (not needed for diagnosis)
- prophylaxis: consider in patients with
  - cirrhosis or GI bleed: ceftriaxone IV daily or norfloxacin bid x 7 d
  - previous episode of SBP: long-term prophylaxis with daily norfloxacin or TMP-SMX
- treatment
  - IV antibiotics (cefotaxime 2 g IV q8h or ceftriaxone 2g IV daily is the treatment of choice for 5 d; modify if response inadequate or culture shows resistant organisms)
  - IV albumin (1.5 g/kg at time of diagnosis and 1 g/kg on day 3) decreases mortality by lowering risk of acute renal failure

Secondary bacterial peritonitis (as opposed to primary bacterial peritonitis) usually results from a perforated viscus or surgical manipulation

**Serum Ascites Albumin Gradient (SAAG) = serum albumin – ascites albumin**

- $>11$  g/L portal HTN
- ascitic fluid total protein  $>25$  g/L, suggests cardiac portal hypertension
- ascitic fluid total protein  $<25$  g/L, suggests cirrhosis portal hypertension
- $<11$  g/L unrelated to portal HTN

# Biliary Tract

## Jaundice

• see Table 2 and Figures 15 and 16

**Signs and Symptoms**

- dark urine, pale stools: suggests that bilirubin elevation is from direct fraction
- pruritus: suggests chronic disease, cholestasis
- abdominal pain: suggests biliary tract obstruction from stone or pancreatic tumour (obstructive jaundice)
- painless jaundice in the elderly: think of pancreatic cancer, although most patients with pancreatic cancer have pain
- kernicterus: rarely seen in adults due to maturation of blood brain barrier

**Investigations**

- blood work: CBC, bilirubin (direct and total), liver enzymes (AST, ALT, ALP, GGT), liver function tests (INR/PT, PTT, albumin), amylase
- U/S or CT for evidence of bile duct obstruction (e.g. bile duct dilation)
- direct bile duct visualization
- magnetic resonance cholangiopancreatography (MRCP): non-invasive
- endoscopic ultrasound (EUS): sensitive for stones and pancreatic tumours
- endoscopic retrograde cholangiopancreatography (ERCP): invasive, most accurate, allows for therapeutic intervention
- percutaneous transhepatic cholangiography (PTC): if ERCP fails (endoscopic access not possible)

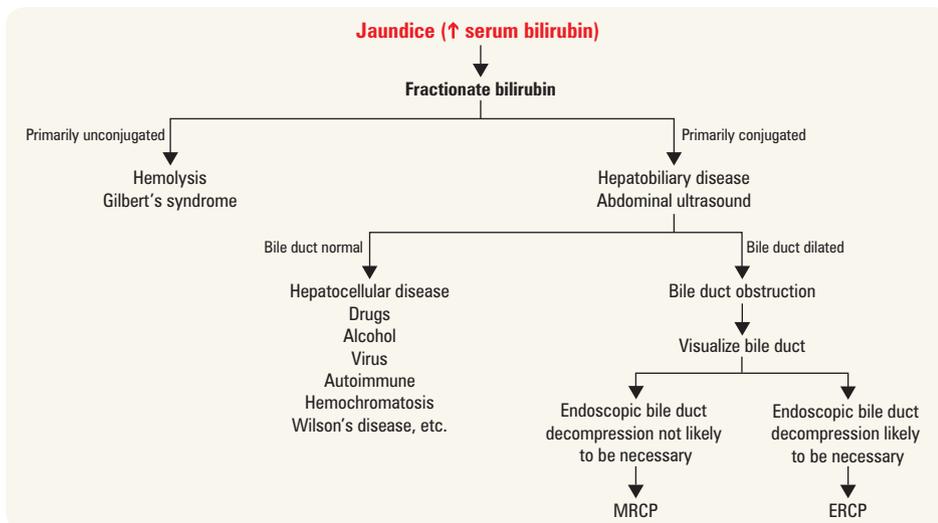

Figure 14. Approach to jaundice

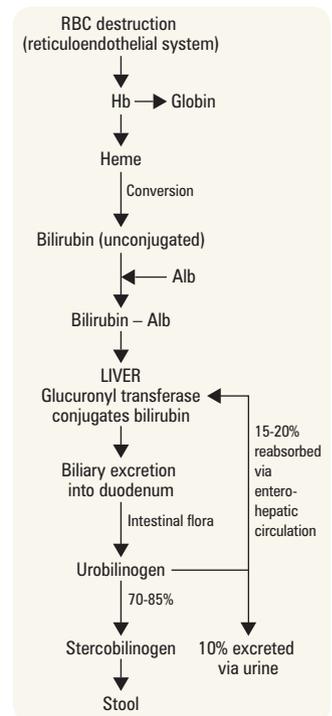

Figure 15. Production and excretion of bilirubin

## Gilbert's Syndrome

### Definition

- mild decrease in glucuronyltransferase activity leading to defective conjugation of bilirubin
- an abnormality of bilirubin metabolism with no clinical relevance

### Etiology/Epidemiology

- some patients have decreased hepatobiliary uptake
- affects 7% of population, especially males
- autosomal dominant, 70% due to a mutation in the UGT gene

### Clinical Features

- presents in teens-20s, often an incidental finding
- only manifestation is intermittent jaundice with increased serum unconjugated bilirubin developing most characteristically while fasting, or at times of acute illness; no other clinical implications

### Treatment

- none indicated (entirely benign)

#### Gilbert's Syndrome vs. Crigler-Najjar Syndrome

**Gilbert's Syndrome:** mild decrease in glucuronyltransferase activity

**Crigler-Najjar Syndrome:** complete deficiency of glucuronyltransferase

## Primary Sclerosing Cholangitis

### Definition

- narrowing of biliary tree (intra and/or extrahepatic bile ducts) from scarring

### Etiology

- primary/idiopathic (most common)
  - associated with IBD, more commonly UC, in up to 70% of patients (usually male)
  - one of the most common indications for liver transplant
- secondary (less common)
  - long-term choledocholithiasis
  - cholangiocarcinoma
  - surgical/traumatic injury (iatrogenic)
  - contiguous inflammatory process
  - post-ERCP
  - associated with HIV/AIDS ("HIV cholangiopathy")
  - IgG4-related disease

### Signs and Symptoms

- often insidious, may present with fatigue and pruritus
- may present with signs of episodic bacterial cholangitis secondary to biliary obstruction

### Investigations

- increased ALP (hallmark), less often increased bilirubin
- mildly increased AST, usually <300 U/L
- p-ANCA (30-80%), elevated IgM (40-50%)
- MRCP and ERCP shows narrowing and dilatations of bile ducts that may result in "beading", both intrahepatic and extrahepatic bile ducts
  - if intrahepatic narrowing only, do anti-mitochondrial antibody to rule out PBC

### Complications

- repeated bouts of cholangitis may lead to complete biliary obstruction with resultant secondary biliary cirrhosis and hepatic failure
- increased incidence of cholangiocarcinoma (10-15%): difficult to diagnose and treat

### Treatment

- image bile duct (MRCP) at least annually for early detection of cholangiocarcinoma (controversial)
- endoscopic sphincterotomy, biliary stent in selected cases of dominant CBD stricture
- antibiotics for cholangitis
- suppurative cholangitis requires emergency drainage of pus in CBD
- liver transplantation appears to be the best treatment for advanced sclerosing cholangitis (nearly 90% 1-yr survival; mean follow-up from time of diagnosis to need for transplant is 10 yr)
- ursodiol: previously recommended, but studies suggest that at least in high doses it increases mortality

### Prognosis

- unfavourable regardless of treatment
- mean survival after diagnosis remains 4-10 yr

## Primary Biliary Cholangitis (formerly cirrhosis)

### Definition

- chronic inflammation and fibrous obliteration of intrahepatic bile ductules

### Etiology/Epidemiology

- likely autoimmune (associated with Sjögren's syndrome, scleroderma, CREST syndrome, RA, thyroiditis)
- affects mainly middle-aged women (M:F = 1:9)

### Signs and Symptoms

- often asymptomatic
- initial symptoms: pruritus, fatigue
- chronic: jaundice and melanosis (darkening skin) and other signs of cholestasis
- end-stage: hepatocellular failure, portal HTN, ascites
- high incidence of osteoporosis

### Investigations

- increased ALP, GGT; bilirubin rises in later stage
- positive anti-mitochondrial antibodies (AMA; 95% specificity and sensitivity)
- increased serum cholesterol (mild increase in LDL, larger increase in HDL)
  - may have: xanthelasma, xanthomas
- liver biopsy confirms diagnosis and stages severity
- normal bile duct on MRCP rules out bile duct obstruction which can mimic PBC
- recently described "overlap" syndromes with autoimmune cholangitis, autoimmune hepatitis, sclerosing cholangitis

### Treatment

- treat with ursodiol (less frequently colchicine, methotrexate)
- cholestyramine (for pruritus and hypercholesterolemia)
- calcium and vitamin D for low bone density; bisphosphonates if osteoporosis severe
- monitor for thyroid disease
- liver transplant if disease severe, progressive

### Prognosis

- can be fatal, although not all asymptomatic patients show progression

Table 20. Primary Sclerosing Cholangitis vs. Primary Biliary Cholangitis

	Primary Sclerosing Cholangitis	Primary Biliary Cholangitis
Predominant Gender	Male	Female
Associated Comorbidities	IBD, especially UC	Other autoimmune disorders (Sjögren's, CREST, RA)
Affected Ducts	Both intra- and extra-hepatic	Intrahepatic only
Investigations	ERCP/MRCP (narrowing and dilatations of ducts visualized)	Anti-mitochondrial antibodies, IgM, increased lipids, liver biopsy (absence of duct narrowing on ERCP)

#### MRCP/ERCP

- Absence of narrowing in PBC
- Narrowing of intra and extrahepatic ducts in PSC

## Secondary Biliary Cirrhosis

### Definition

- cirrhosis from prolonged partial or total obstruction of major bile ducts

### Etiology

- acquired: post-operative strictures, chronic pancreatitis, sclerosing cholangitis, stone in bile duct
- congenital: CF, congenital biliary atresia, choledochal cysts

### Investigations

- cholangiography and liver biopsy

### Treatment

- treat obstruction, give antibiotics for cholangitis prophylaxis

## Biliary Colic, Cholecystitis

- see [General Surgery, GS47](#)

## Ascending Cholangitis

- see [General Surgery, GS49](#)

### Definition

- infection of the biliary tree

### Etiology

- stasis in the biliary tract due to obstruction or stricture (usually from previous cholecystectomy)
- infection originates in the duodenum or spreads hematogenously from the portal vein
- bacteria
  - *E. coli*, *Klebsiella*, *Enterobacter*, *Enterococcus*
  - co-infection with *Bacteroides* and Clostridia can occur

### Signs and Symptoms

- Charcot's triad: fever, RUQ pain, jaundice (50-70%)
- Reynolds' Pentad in patients with suppurative cholangitis: fever, RUQ pain, jaundice, hypotension, altered mental status

### Investigations

- increased WBC
- usually increased ALP and bilirubin, ALT variably elevated
- blood culture
- abdominal U/S: CBD dilation, stones

### Treatment

- most important is drainage, ideally via ERCP, but if not possible technically by percutaneous biliary or least often by surgical routes
- antibiotic therapy: broad spectrum to cover Gram-negatives, *Enterococcus*, and anaerobes (especially if CBD manipulation); no clear consensus on antibiotic choice but consider:
  - ampicillin + sulbactam or piperacillin/tazobactam
  - metronidazole + 3rd generation cephalosporin (e.g. ceftriaxone) or fluoroquinolone (e.g. ciprofloxacin or levofloxacin)
  - carbapenem monotherapy (e.g. imipenem or meropenem)

### Prognosis

- good with effective drainage and antibiotics in mild to moderate cases
- high mortality (~50%) in patients with Reynolds Pentad

#### Charcot's Triad

- RUQ pain
- Fever
- Jaundice

#### Reynolds Pentad

- Charcot's triad
- Hypotension
- Altered mental status

## Pancreas

### Pancreatic Enzyme Abnormalities

#### Causes of Increased Serum Amylase

- pancreatic disease
  - pancreatitis, pancreatic duct obstruction (e.g. ampullary cancer), pseudocyst, abscess, ascites, trauma, cancer
- non-pancreatic abdominal disease
  - biliary tract disease, bowel obstruction/ischemia, perforated or penetrating ulcer, ruptured ectopic pregnancy, aneurysm, chronic liver disease, peritonitis
- non-abdominal disease
  - cancer (lung, ovary, esophagus, etc.), salivary gland lesions, bulimia, renal transplant/insufficiency, burns, ketoacidosis
  - macroamylasemia

#### Causes of Increased Serum Lipase

- pancreatic disease: same as above
- non-pancreatic abdominal disease (mild elevations only): same as above
- non-abdominal disease
  - macrolipasemia
  - renal failure

#### Pancreatic Enzymes

**TALC**  
 Trypsin  
 Amylase  
 Lipase  
 Chymotrypsin

When serum amylase >5x normal, the cause is almost always pancreatitis or renal disease

## Acute Pancreatitis

**Etiology** (most common are alcohol and gallstones)

Idiopathic: thought to be hypertensive sphincter or microlithiasis

Gallstones (45%)

Ethanol (35%)

Tumours: pancreas, ampulla, choledochocoele

Scorpion stings

Microbiological

- bacterial: *Mycoplasma*, *Campylobacter*, TB, *M. avium intracellulare*, *Legionella*, leptospirosis
- viral: mumps, rubella, varicella, viral hepatitis, CMV, EBV, HIV, Coxsackie virus, echovirus, adenovirus
- parasites: ascariasis, clonorchiasis, echinococcosis

Autoimmune: SLE, polyarteritis nodosa (PAN), Crohn's disease

Surgery/trauma

- manipulation of sphincter of Oddi (e.g. ERCP), post-cardiac surgery, blunt trauma to abdomen, penetrating peptic ulcer

Hyperlipidemia (TG >11.3 mmol/L; >1000 mg/dL), Hypercalcemia, Hypothermia

Emboli or ischemia

Drugs/toxins

- azathioprine, mercaptopurine, furosemide, estrogens, methyldopa, H<sub>2</sub>-blockers, valproic acid, antibiotics, acetaminophen, salicylates, methanol, organophosphates, steroids (controversial)

### Pathophysiology

- activation of proteolytic enzymes within pancreatic cells, starting with trypsin, leading to local and systemic inflammatory response
- in gallstone pancreatitis, this is due to mechanical obstruction of the pancreatic duct by stones
- in ethanol-related pancreatitis, pathogenesis is unknown
- in rare genetic diseases, mutations prevent the physiological breakdown of trypsin required normally to stop proteolysis (e.g. mutant trypsin in hereditary pancreatitis or mutation in SPINK 1 gene which normally inhibits activated trypsin); may be model for ethanol-related pancreatitis

### Pathology

- mild (interstitial)
  - peri-pancreatic fat necrosis
  - interstitial edema
- severe (necrotic)
  - extensive peri-pancreatic and intra-pancreatic fat necrosis
  - parenchymal necrosis and hemorrhage → infection in 60%
  - release of toxic factors into systemic circulation and peritoneal space (causes multi-organ failure)
- severity of clinical features may not always correlate with pathology
- 3 phases
  - local inflammation + necrosis → hypovolemia
  - systemic inflammation in multiple organs, especially in lungs, usually after IV fluids given → pulmonary edema
  - local complications 2 wk after presentation → pancreatic sepsis/abscess

### Signs and Symptoms

- pain: epigastric, noncolicky, constant
- can radiate to back
- may improve when leaning forward (Ingelfinger's sign)
- tender rigid abdomen; guarding
- N/V
- abdominal distention from paralytic ileus
- fever: chemical, not due to infection
- jaundice: compression or obstruction of bile duct
- Cullen's/Grey-Turner's signs
- tetany: transient hypocalcemia
- hypovolemic shock: can lead to renal failure
- acute respiratory distress syndrome
- coma

### Investigations

- increased serum pancreatic enzymes: amylase, lipase (more specific)
- ALT >150 specific for biliary cause
- increased WBC, glucose, low calcium
- imaging: CT most useful for diagnosis and prognosis
  - x-ray: "sentinel loop" (dilated proximal jejunum), calcification, and "colon cut-off sign" (colonic spasm)
  - U/S: useful for evaluating biliary tree (67% sensitivity, 100% specificity)
  - CT scan with IV contrast: useful for diagnosis and prognosis because contrast seen only in viable pancreatic tissue, non-viable areas can be biopsied percutaneously to differentiate sterile from infected necrosis
  - ERCP or MRCP if cause uncertain, assess for duct stone, pancreatic or ampullary tumour, pancreas divisum

When thinking about the causes of acute pancreatitis remember: **I GET SMASHED**, but vast majority due to gallstones or ethanol

Gallstones only cause acute pancreatitis (not chronic pancreatitis)

**Cullen's Sign**  
Periumbilical ecchymosis

**Grey-Turner's Sign**  
Flank ecchymosis

**Increased Amylase**  
• Sensitive, not specific

**Increased Lipase**  
• Higher sensitivity and specificity  
• Stays elevated longer

## Classification

- interstitial edematous vs. necrotizing
- mild, moderate, severe

## Prognosis

- usually a benign, self-limiting course, single or recurrent
- occasionally severe leading to
  - shock
  - pulmonary edema
  - multi-organ dysfunction syndrome
  - GI ulceration due to stress
  - death
- numerous scales to describe severity: probably most useful is proportion of pancreas not taking up contrast on CT done 48 hours after presentation (necrotic pancreas does not take up the contrast dye)
- presence of organ failure, particularly organ failure that persists > 48 hours, is associated with worse outcomes

**Table 21. Collections in pancreatitis (Revised 2012 Atlanta Classification)**

	Liquid	Solid
<b>Acute</b>	Acute peripancreatic fluid collection (APFC)	Acute necrotic collection (ANC)
<b>Chronic</b>	Pancreatic pseudocyst	Walled-off necrosis (WON)

All of these collections are classified as infected or not infected

## Treatment

- goals (only supportive therapy available)
  1. hemodynamic stability
  2. analgesia
  3. oxygen
  4. stop progression of damage (difficult)
  5. treat local and systemic complications
- antibiotics controversial except in documented infection (use cephalosporins, imipenem)
- aspirate necrotic areas of pancreas to diagnose infection; drain if infected
- IV fluids (crystalloid or colloid)
  - beware third spacing of fluid, monitor urine output carefully
- NG suction (lets pancreas rest) if vomiting, stomach very dilated
- endoscopic sphincterotomy if severe gallstone pancreatitis (i.e. cholangitis or ongoing obstruction)
- nutritional support: nasojejunal feeding tube or TPN if cannot tolerate enteric feeds
  - recent evidence supports nasogastric enteral (or oral if feasible) feeds
- no benefit: glucagon, atropine, aprotinin, H<sub>2</sub>-blockers, peritoneal lavage
- follow clinically and CT/ultrasound to exclude complications
- chief role of invasive intervention is to excise necrotic tissue (necrosectomy) in the case of infected pancreatic necrosis (try to delay for >2 wk to allow demarcation between viable and necrotic tissue), better done endoscopically or radiologically than surgically if technically possible

## Late Complications

- pseudocysts: follow if asymptomatic, drain if symptomatic or growing
  - drain: choice of endoscopic, percutaneous under radiological guidance, or surgical
- infected necrosis/abscesses: antibiotics + percutaneous drainage, endoscopic vs. surgical
- bleeding: (1) gastric varices if splenic vein thrombosis, (2) pseudoaneurysm of vessels in areas of necrosis, especially splenic artery, (3) duodenal ulcer related to compression of duodenum by enlarged pancreas
- splenic and portal vein thrombosis: no effective therapy described, anticoagulation not proven, hazardous
- rare: DM, pancreatic duct damage

### When to call the surgeon in acute pancreatitis? Endoscopic Transgastric vs Surgical Necrosectomy for Infected Necrotizing Pancreatitis: A Randomized Trial

*JAMA* 2012; 307:1053-61

Once it was recognized that severe acute (necrotizing) pancreatitis had a terrible prognosis because of an exuberant inflammatory response leading to multiorgan failure, pancreatectomy was attempted. However, contrary to the expected favourable results, clinical experience has shown that surgical pancreatectomy is usually not helpful, perhaps because once the inflammatory cascade starts, it persists as a self-perpetuating cycle. The problems caused by acute pancreatitis can be thought of a widespread burn initiated by inflammation in the pancreas, but having little to do with ongoing problems within the pancreas itself. Studies suggest that the only compelling indication for surgery is infected necrotizing pancreatitis not responding to antibiotics. As predicted, without removal of such infected pancreatic tissue, death is likely from sepsis.

In this recent randomized trial, transgastric necrosectomy, an endoscopic technique that also removes infected necrotic pancreatic tissue, reduced both a composite end-point of major pancreatitis complications (especially new onset organ failure) and the pro-inflammatory response (as measured by serum IL-6 levels) to a greater extent than surgical necrosectomy. Of course, not all necrotic collections are in areas amenable to endoscopic intervention, and the advice of an experienced surgeon should always be welcomed in severe acute pancreatitis, but the role of surgery in this previously considered surgical disease is rapidly diminishing.

### Prophylactic Antibiotics Cannot Reduce Infected Pancreatic Necrosis and Mortality in Acute Necrotizing Pancreatitis: Evidence from a Meta-Analysis of Randomized Controlled Trials

*Am J Gastroenterol* 2008;103:104-110

**Purpose:** To review the effectiveness of IV antibiotics on pancreatic necrosis.

**Study Selection:** RCTs comparing antibiotics with placebo or no treatment.

**Results:** Seven trials (n=467) were included. Antibiotics were not statistically superior to controls in reduction of infected necrosis and mortality.

**Conclusion:** Prophylactic antibiotics cannot reduce infected pancreatic necrosis and mortality in patients with acute necrotizing pancreatitis.

**Note:** In practice the temptation to give antibiotics for pancreatitis is mainly in the setting of a sick patient with fever and suggestive pancreatic necrosis on CT scan. It is difficult to determine whether pancreatic necrosis has become infected without aspiration biopsy (see *Curr Gastroenterol Rep* 2009;11:104-110).

### Symptoms of Chronic Pancreatitis

- Abdominal pain
- Diabetes
- Steatorrhea

**Etiology** = Almost Always Alcohol

### Treatment

- Alcohol abstinence
- Pancreatic enzyme replacement
- Analgesics
- Pancreatic resection if ductular blockage

## Chronic Pancreatitis

### Definition

- irreversible damage to pancreas characterized by
  1. pancreatic cell loss (from necrosis)
  2. inflammation
  3. fibrosis

### Etiology/Pathophysiology

- alcohol (most common)
  - causes a larger proportion (>90%) of chronic pancreatitis than acute pancreatitis
  - changes composition of pancreatic juice (e.g. increases viscosity)

- decreases pancreatic secretion of pancreatic stone protein (lithostathine) which normally solubilizes calcium salts
  - ♦ precipitation of calcium within pancreatic duct results in duct and gland destruction
- toxic effect on acinar and duct cells – directly or via increasing free radicals
- acinar cell injury leads to cytokine release, which stimulates pancreatic stellate cells to form collagen (leading to fibrosis)
- varying degrees of ductular dilatation, strictures, protein plugs, calcification
- no satisfactory theory to explain why only a minority of alcoholics develop pancreatitis
- unusual causes
- CF
  - severe protein-calorie malnutrition
  - hereditary
  - idiopathic

### Signs and Symptoms

- early stages
  - recurrent attacks of severe abdominal pain (upper abdomen and back)
  - chronic painless pancreatitis: 10%
- late stages: occurs in 15% of patients
  - malabsorption syndrome when >90% of function is lost, steatorrhea
  - diabetes, calcification, jaundice, weight loss, pseudocyst, ascites, GI bleed

### Investigations

- laboratory
  - increase in serum glucose
  - increase in serum ALP, less commonly bilirubin (jaundice)
  - serum amylase and lipase usually normal
  - stool elastase is low in steatorrhea
- AXR: pancreatic calcifications
- U/S or CT: calcification, dilated pancreatic ducts, pseudocyst
- MRCP or ERCP: abnormalities of pancreatic ducts-narrowing and dilatation
- EUS: abnormalities of pancreatic parenchyma and pancreatic ducts, most sensitive test
- 72-h fecal fat test: measures exocrine function
- secretin test: gold standard, measures exocrine function but difficult to perform, unpleasant for patient, expensive
- fecal pancreatic enzyme measurement (elastase-1, chymotrypsin): available only in selected centres

### Treatment

- most common problem is pain, difficult to control
- general management
  - total abstinence from alcohol
  - enzyme replacement may help pain by resting pancreas via negative feedback
  - analgesics
  - celiac ganglion blocks
  - time: pain decreases with time as pancreas “burns out”
- endoscopy: sphincterotomy, stent if duct dilated, remove stones from pancreatic duct
- surgery: drain pancreatic duct (pancreaticojejunostomy) if duct dilated (more effective than endoscopy); resect pancreas if duct contracted
- steatorrhea
  - pancreatic enzyme replacement
  - restrict fat, increase carbohydrate and protein (may also decrease pain)
  - neither endoscopy nor surgery can improve pancreatic function

## Autoimmune Pancreatitis

- most commonly presents as a mimicker of pancreatic cancer (pancreatic mass detected because of jaundice ± abdominal pain)

### Investigations

- histology: lymphocyte and plasma cell infiltration of pancreas
- imaging: focal or diffuse enlargement of pancreas on CT or MRI, sausage shaped, low density rim around pancreas
- serology: increased serum IgG4
- other organ involvement: sialadenitis, retroperitoneal fibrosis, biliary duct narrowing, nephritis

### Treatment

- responds to prednisone

# Clinical Nutrition

## Determination of Nutritional Status

- corrected weight loss (expressed as body mass index [ $\text{kg}/\text{m}^2$ ]) is most important parameter in assessing need for nutritional support
- Subjective Global Assessment: simple bedside tool to assess nutritional status, to help identify those who will benefit from nutritional support

### Investigations

- plasma proteins: albumin, pre-albumin (shorter half life than albumin), transferrin
- decrease may indicate decreased nutritional status or disease state
- thyroid-binding globulin, retinol-binding protein (may be too sensitive)
- anthropometry (e.g. triceps skinfold thickness), grip strength less often used

**Table 22. Areas of Absorption of Nutrients**

	Fe	CHO	Proteins, Lipids Na <sup>+</sup> , H <sub>2</sub> O	Bile Acids	Vit B <sub>12</sub>
Duodenum	+++	+++	+++	+	
Jejunum	+	+	++	+	+
Ileum	+	+	++	+++	+++

## Enteral Nutrition

### Definition

- enteral nutrition (tube feeding) is a way of providing food through a tube placed in the stomach or the small intestine
- choice of tubes: nasogastric (NG), nasojejunal (NJ), percutaneous endoscopic gastrostomy (“G-tube” or “PEG tube”), percutaneous endoscopic jejunostomy (J-tube) or tubes can be placed radiologically, surgically

### Indications

- oral feeding inadequate or contraindicated

### Feeds

- polymeric feeds contain whole protein, carbohydrate, fat as a liquid, with or without fibre
- elemental feeds contain protein as amino acids, carbohydrate as simple sugars, fat content low (therefore high osmolarity)
- specific diets: low carbohydrate/high fat solution for ventilated patients (carbohydrate has a high respiratory quotient so minimizes carbon dioxide production), high energy, low electrolyte solutions for dialysis patients

### Relative Contraindications

- non-functioning gut (e.g. intestinal obstruction, enteroenteral or entero-cutaneous fistulae)
- uncontrolled diarrhea
- GI bleeding

### Complications

- aspiration
- diarrhea
- refeeding syndrome (rare): carbohydrate can stimulate excessive insulin release, leading to cellular uptake and low serum levels of phosphate, magnesium, potassium
- overfeeding syndrome (rare): hypertonic dehydration, hyperglycemia, hypercapnea, azotemia (from excess protein)

### Enteral Nutrition Advantages over Parenteral Nutrition

- fewer serious complications (especially sepsis)
- nutritional requirements for enterally administered nutrition better understood
- can supply gut-specific fuels such as glutamine and short chain fatty acids
- nutrients in the intestinal lumen prevent atrophy of the gut and pancreas
- prevents gallstones by stimulating gallbladder motility
- much less expensive

#### Most Common Indications for Artificial Nutrition Support

- Preexisting nutritional deprivation
- Anticipated or actual inadequate energy intake by mouth
- Significant multiorgan system disease

Whenever possible, enteral nutrition is ALWAYS preferable over parenteral nutrition

## Parenteral Nutrition

### Definition

- parenteral nutrition (PN) is the practice of feeding a person intravenously, bypassing the usual process of eating and digestion

### Indications

- short-term (<1 mo)
  - whenever GI tract not functioning
  - only situations where PN has been well shown to increase survival are after bone marrow transplant and in short bowel syndrome, some evidence for benefit in gastric cancer, but often used in ICU, perioperatively, and in difficult to control sepsis
  - pre-operative: only useful in severely malnourished (e.g. loss of >15% of pre-morbid weight, serum albumin <28 g/L or <2.8 g/dL), and only if given for ≥2 wk
  - renal failure: PN shown to increase rate of recovery; no increase in survival
  - liver disease: branched chain amino acids may shorten duration of encephalopathy; no increase in survival
  - IBD: PN closes fistulae and heals acute exacerbations of mucosal inflammation, but effect is transient (EN is equally effective)
  - some evidence for efficacy, but convincing data not available for
    - radiation/chemotherapy-induced enteritis
    - AIDS with wasting diarrhea
    - severe acute pancreatitis
- long-term (>1 mo): can be given at home
  - severe untreatable small bowel disease (e.g. radiation enteritis, extensive CD, high output fistulae)
  - following surgical resection of >70% of small bowel (e.g. small bowel infarction)
  - severe motility diseases (e.g. scleroderma affecting bowel)

### Relative Contraindications

- functional GI tract for enteral nutrition
- active infection; at least until appropriate antibiotic coverage
- inadequate venous access; triple-lumen central venous lines usually prevent this problem
- unreliable patient or clinical setting

### Complications of PN

- sepsis: most serious of the common complications
- mechanical pneumothorax from insertion of central line, catheter migration and thrombosis, air embolus
- metabolic: CHF, hyperglycemia, gallstones, cholestasis

Hypomagnesemia may be an initial sign of short bowel syndrome in patients who have undergone surgical bowel resection

#### Enteral vs. Parenteral Nutrition for Acute Pancreatitis

*Cochrane DB of Syst Rev 2010;1:CD002837*

**Purpose:** Compare EN vs. TPN on mortality, morbidity, and hospital stay in patients with pancreatitis.

**Study Selection:** RCTs of TPN vs. EN in pancreatitis.

**Results:** Eight trials (n=348) were included. Enteral nutrition decreases RR of death (0.50), multiple organ failure (0.55), infection (0.39), and other local complications (0.70). It also decreased hospital stay by 2.37 d.

**Conclusion:** EN reduces mortality, organ failure, infections, and length of hospital stay in patients with pancreatitis.

# Common Medications

**Table 23. Common Drugs Prescribed in Gastroenterology**

Class	Generic Drug Name	Trade Name	Dosing	Mechanism of Action	Indications	Contraindications	Side Effects
<b>Proton Pump Inhibitors</b> (H <sup>+</sup> /K <sup>+</sup> -ATPase inhibitors)	omeprazole	Losec®/Prilosec®	20 mg PO OD	Inhibits gastric enzymes H <sup>+</sup> /K <sup>+</sup> -ATPase (proton pump)	Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, reflux esophagitis, symptomatic GERD, dyspepsia, Zollinger-Elison syndrome, eradication of <i>H. pylori</i> (combined with antibiotics)	Hypersensitivity to drug	Dizziness, headache, flatulence, abdominal pain, nausea, rash, increased risk of osteoporotic fracture (secondary to impaired calcium absorption)
	lansoprazole or dexlansoprazole	Prevacid®/Dexilant®	Oral therapy: lansoprazole 15-30 mg OD (before breakfast), dexlansoprazole 30-60mg OD (does not need to be taken before breakfast)	Same as above	Same as above	Same as above	Same as above
	pantoprazole	Pantoloc®/Protonix®	40 mg PO OD for UGIB: 80 mg IV bolus then 8 mg/h infusion	Same as above	Same as above and UGIB	Same as above	Same as above
	rabeprazole	Pariet®/Aciphex®	40 mg PO OD	Same as above	Same as above	Same as above	Same as above
	esomeprazole	Nexium®	20-40 mg PO OD	Same as above	Same as above	Same as above	Same as above
<b>Histamine H2-Receptor Antagonists</b>	ranitidine	Zantac®	300 mg PO OD or 150 mg bid IV therapy: 50 mg q8h (but tachyphylaxis a problem)	Inhibits gastric histamine H2-receptors	Duodenal ulcer, gastric ulcer, NSAID-associated gastric and duodenal ulcers, ulcer prophylaxis, reflux esophagitis, symptomatic GERD; not useful for acute GI bleeds	Hypersensitivity to drug	Confusion, dizziness, headache, arrhythmias, constipation, nausea, agranulocytosis, pancytopenia, depression
	famotidine	Pepcid®	Oral therapy: duodenal/gastric ulcers: 40 mg qhs GERD: 20 mg bid IV therapy: 20 mg bid	Same as above	Same as above	Same as above	Same as above
<b>Stool Softener</b>	docusate sodium	Colace®	100-400 mg PO OD, divided in 1-4 doses	Promotes incorporation of water into stool	Relief of constipation	Presence of abdominal pain, fever, NV	Throat irritation, abdominal cramps, rashes
<b>Osmotic Laxatives</b>	lactulose	Lactulose/Constulose®	Constipation: 15-30 mL PO OD to bid Encephalopathy: 15-30 mL bid to qid	Poorly absorbed in GI tract and is broken down by colonic bacteria into lactic acid in the colon, increases osmotic colonic contents, increases stool volume	Chronic constipation, prevention, and treatment of portal-systemic encephalopathy	Patients who require a low galactose diet	Flatulence, intestinal cramps, nausea, diarrhea if excessive dosage
	PEG3350	Lax-a-day®/Golytely®	Constipation: 17 g powder dissolved in 4-8 oz liquid PO OD	Osmotic agent causes water retention in stool and promotes frequency of stool	Relief of constipation Colonoscopy prep	Hypersensitivity to drug	Abdominal distension, pain, anal pain, thirst, nausea, rigor, tonic-clonic seizures (rare)
	magnesium hydroxide	Milk of Magnesia/Pedia-Lax®	Constipation (adult): 400 mg/5 mL: 30-60 mL PO qhs	Osmotic retention of fluid which distends the colon and increases peristaltic activity	Relief of constipation	Patients with myasthenia gravis or other neuromuscular disease Renal impairment	Abdominal pain, vomiting, diarrhea
<b>Stimulant Laxatives</b>	senna	Senokot®	Tablets: 1-4 PO qhs Syrup: 10-15 mL PO qhs	Induce peristalsis in lower colon	Constipation	Patients with acute abdomen	Abdominal cramps, discoloration of breast milk, urine, feces, melanosis coli and atonic colon from prolonged use (controversial)
	bisacodyl	Bisacodyl®	5-30 mg PO OD (start at 10 mg for bowel preparation)	Enteric nerve stimulation and local contact-induced secretory effects Colonic movements	Constipation Preparation of bowel for procedure	GI obstruction Gastroenteritis	Abdominal colic, abdominal discomfort, proctitis (with suppository use), diarrhea
	metoclopramide	Maxeran®	See anti-emetics	See anti-emetics	See anti-emetics	See anti-emetics	See anti-emetics
<b>Bulk Laxatives</b>	psyllium	Metamucil®	2-6 tabs (1 tab = 0.52 g) PO od-tid pm	Increases stool bulk → water retention in stool	Constipation	Hypersensitivity to drug GI obstruction	GI obstruction, diarrhea, constipation, abdominal cramps
<b>Antidiarrheal Agents</b>	loperamide	Imodium®	Acute diarrhea: 4 mg PO initially, followed by 2 mg after each unformed stool	Acts as antidiarrheal via cholinergic, noncholinergic, opiate, and nonopiate receptor-mediated mechanisms; decreases activity of myenteric plexus	Adjunctive therapy for acute non-specific diarrhea, chronic diarrhea associated with IBD and for reducing the volume of discharge for ileostomies, colostomies, and other intestinal resections	Children <2 yr, known hypersensitivity to drug, acute dysentery characterized by blood in stools and fever, acute ulcerative colitis or pseudomembranous colitis associated with broad-spectrum antibiotics	Abdominal pain or discomfort, drowsiness or dizziness, tiredness, dry mouth, nausea and vomiting, hypersensitivity reaction
	diphenoxylate/atropine	Lomotil®	5 mg PO tid to qid	Inhibits GI propulsion via direct action on smooth muscle, resulting in a decrease in peristaltic action and increase in transit time	Adjunctive therapy for diarrhea, as above	Hypersensitivity to diphenoxylate or atropine, jaundice, pseudomembranous enterocolitis, diarrhea caused by enterotoxin producing bacteria	Dizziness, drowsiness, insomnia, headache, NV, cramps, allergic reaction

**Table 23. Common Drugs Prescribed in Gastroenterology (continued)**

Class	Generic Drug Name	Trade Name	Dosing	Mechanism of Action	Indications	Contraindications	Side Effects
Anti-Emetics	dimenhydrinate	Gravol®	25-50 mg PO/IV/IM q4-6h prn	Competitive H1 receptor antagonist in GI tract, blood vessels, and respiratory tract. Blocks chemoreceptor trigger zone. Diminishes vestibular stimulation and disrupts labyrinthine function through central anticholinergic action	Motion sickness, radiation sickness, postoperative vomiting, and drug-induced N/V	Hypersensitivity to drug	Xerostomia, sedation
	prochlorperazine	Stemetil®	5-10 mg PO/IV/IM bid-tid prn	D1, D2 receptor antagonist in chemoreceptor trigger zone and $\alpha$ adrenergic and anti-cholinergic effects. Depresses reticular activating system (RAS) affecting emesis	Post-operative N/V, antipsychotic, anxiety	Hypersensitivity to drug	Dystonia, EPS, seizure, neuroleptic malignant syndrome (NMS) (rarely)
	metoclopramide	Maxeran®	10 mg IV/IM q2-3h prn, 10-15 mg PO qid (30 min before meals and qhs)	Dopamine and 5-HT receptor antagonist in chemoreceptor trigger zone. Enhances response to ACh in upper GI tract, enhancing motility and gastric emptying. Increases LES tone	GERD, diabetic gastroparesis, post-operative and chemotherapy induced N/V, migraines, constipation	Hypersensitivity to drug, GI obstruction, perforation, hemorrhage, pheochromocytoma, seizures, and EPS	Restlessness, drowsiness, dizziness, fatigue, EPS, some rare serious side effects include NMS, agranulocytosis
	ondansetron	Zofran®	Depends on procedure, generally 8-16 mg PO	Selective 5HT3 receptor antagonist in central chemoreceptor trigger zone and peripherally on vagus nerve	N/V caused by cancer chemotherapy and radiation therapy; multiple off label uses, including gastroenteritis N/V	Morphine, hypersensitivity to drug	Constipation, diarrhea, increased liver enzymes, headache, fatigue, malaise, cardiac dysrhythmia
	granisetron	Kytril®	1 mg PO bid (for nausea from chemotherapy/ radiation)	Same as above	N/V caused by cancer chemotherapy and radiation therapy	Same as above	Constipation, prolonged QT interval (rarely)
IBD Agents	mesalamine	Pentasa® Salofalk® Asacol® Mesasal®	CD: 1 g PO tid/qid Active UC: 1 g PO qid Maintenance UC: 1.6 g PO divided doses daily also as suppositories and enemas	5-ASA: Blocks arachidonic acid metabolism to prostaglandins and leukotrienes	IBD	Hypersensitivity to mesalamine salicylates; Asacol contains phthalate, potential urogenital teratogenicity for male fetus	Abdominal pain, constipation, arthralgia, headache
	sulfasalazine	Salazopyrin®	3-4 g/d PO in divided doses	Compound composed of 5-ASA bound to sulfapyridine, hydrolysis by intestinal bacteria releases 5-ASA, the active component	Colonic disease	Hypersensitivity to sulfasalazine, sulfa drugs, salicylates; intestinal or urinary obstruction, porphyria  Hypersensitivity to sulfasalazine, sulfa drugs, salicylates; intestinal or urinary obstruction, porphyria	Rash, loss of appetite, N/V, headache, oligospermia (reversible)  Rash, loss of appetite, N/V, headache, oligospermia (reversible)
	prednisone		20-40 mg PO OD for acute exacerbation	Anti-inflammatory	Mod-severe CD and UC		Complications of steroid therapy
	Immuno-suppressive Agents	6-mercaptopurine (6-MP)	Purinethol®	CD: 1.5 mg/kg/d PO	Immunosuppressive	IBD: active inflammation and to maintain remission	Hypersensitivity to mercaptopurine, prior resistance to mercaptopurine or thioguanine, history of treatment with alkylating agents, hypersensitivity to azathioprine, pregnancy
azathioprine		Azasan® Imuran®	IBD: 2-3 mg/kg/d PO	Same as above	Same as above	Same as above	Same as above
Biologics	infliximab	Remicade®	5-10 mg/kg IV over 2 h	Monoclonal antibody to TNF $\alpha$	Medically refractory CD	Heart failure, moderate to severe, doses >5 mg/kg	Reported cases of reactivated TB, PCP, lymphoma, other infections Other TNF $\alpha$ share similar serious side-effects
	adalimumab	Humira®	CD induction: four 40 mg SC on day 1, then 80 mg 2 wks later (day 15) CD maintenance: 40 mg every other wk beginning day 29	Monoclonal antibody to TNF $\alpha$	Medically refractory CD or poor response to infliximab	Hypersensitivity to adalimumab Severe infection Moderate-to-severe heart failure	Headaches, skin rashes, upper respiratory tract infection
	golimumab	Simponi®	RA: 2 mg/kg at wks 0, 4 and then every 8 wks thereafter (use with methotrexate) UC induction: 200 mg SC at wk 0, then 100 mg at wk 2 UC maintenance: 50 mg every 4 wk	Monoclonal antibody to TNF $\alpha$	Active ankylosing spondylitis Psoriatic arthritis Moderate-to-severe active RA (combined with methotrexate) UC: medically refractory UC	Hypersensitivity to golimumab or latex Severe infection Moderate-to-severe heart failure	
	vedolizumab	Entyvio®	CD/UC: 300 mg at 0, 2, 6 wks and then every 8 wks thereafter	Monoclonal antibody to $\alpha$ 4 $\beta$ 7 integrin	Medically refractory CD/UC, including other TNF $\alpha$ inhibitors and corticosteroids	Hypersensitivity to vedolizumab	Infections, liver injury, and progressive multifocal leukoencephalopathy

# Landmark Gastroenterology Trials

Trial	Reference	Results
MELD score as a predictor of death in chronic liver disease	<i>Gastroenterology</i> 2003;124:91-6	MELD score can be applied for allocation of donor livers as it accurately predicts 3 mo mortality in patients with chronic liver failure
Infliximab, azathioprine, or combination for Crohn's disease	<i>NEJM</i> 2010; 362:1383-95	In moderate-severe Crohn's disease, infliximab + azathioprine was more likely to result in corticosteroid-free remission than infliximab monotherapy. Infliximab monotherapy was more effective than azathioprine monotherapy. Similar results have been reported for ulcerative colitis ( <i>Gastroenterology</i> 2014; 146:392-400)
Enteral versus parenteral nutrition for acute pancreatitis	<i>Cochrane DB Syst Rev</i> 2010; 1: CD002837	For acute pancreatitis, no trial was convincing alone, but in aggregate, enteral feeds via nasogastric tube is preferable to either no feeding or parenteral nutrition
Rifaximin treatment in hepatic encephalopathy	<i>NEJM</i> 2010; 362:1071-81	The most convincing of several articles establishing this non-absorbable antibiotic as the treatment of choice for hepatic encephalopathy for maintaining remission from hepatic encephalopathy and reducing hospitalization associated with the disease
Adenoma detection rate and risk of colorectal cancer and death	<i>NEJM</i> 2014; 370:1298-1306	A high miss rate for colorectal cancers has been suggested, chiefly in the right colon. This study demonstrates a method of assessing the competence of endoscopists in detecting cancers using adenoma detection rate (the proportion of colonoscopic exams in which a physician detects one or more adenomas) as a surrogate marker. Adenoma detection rate was associated with lower risk of interval colorectal cancer and has launched quality assurance programs for screening colonoscopies
Prednisolone or pentoxifylline for alcoholic hepatitis	<i>NEJM</i> 2015; 372:1619-28	For alcoholic hepatitis, prednisolone improved survival when the Maddrey's discriminant function > 32, but the benefit did not reach statistical significance and pentoxifylline was of no advantage at all. Other studies had shown some benefit with pentoxifylline, but this study was the most definitive

# Basic Anatomy Review

<b>Kocher's (subcostal)</b>	Access to RUQ or LUQ contents i.e. gallbladder, spleen
<b>Upper Midline</b>	Access to stomach, duodenum, gallbladder, liver, transverse colon
<b>Paramedian</b>	Can make similar incision in each quadrant for access to each quadrant's contents Not commonly used Post-operative ventral hernias common
<b>Lateral Paramedian</b>	Incision made at outer 1/3 - medial 2/3 border of rectus Modification of paramedian but with lower risk of dehiscence or ventral hernia Not commonly used
<b>Lower Midline</b>	Access to pelvic organs, sigmoid colon, and rectum
<b>Pfannenstiel</b>	Suprapubic incision for access to pelvic cavity
<b>McBurney's</b>	Access to appendix

© Cassandra Cetlin 2014, after Agnes Chan 2012

Figure 1. Abdominal incisions

## Lateral Abdominal Wall Layers and their Continuous Spermatic and Scrotal Structures (superficial to deep)

1. skin (epidermis, dermis, subcutaneous fat)
2. superficial fascia
  - Camper's fascia (fatty) → Dartos fascia
  - Scarpa's fascia (membranous) → Colles' superficial perineal fascia
3. muscle (see Figure 2 and Figure 3)
  - external oblique → inguinal ligament → external spermatic fascia and fascia lata
  - internal oblique → cremasteric muscle/fascia
  - transversus abdominis → posterior inguinal wall
4. transversalis fascia → internal spermatic fascia
5. preperitoneal fat
6. peritoneum → tunica vaginalis

## Midline Abdominal Wall Layers (superficial to deep)

1. skin
2. superficial fascia
3. rectus abdominis muscle: in rectus sheath, divided by linea alba
  - above arcuate line (midway between symphysis pubis and umbilicus)
    - ♦ anterior rectus sheath = external oblique aponeurosis and anterior leaf of internal oblique aponeurosis
    - ♦ posterior rectus sheath = posterior leaf of internal oblique aponeurosis and transversus abdominis aponeurosis
  - below arcuate line
    - ♦ aponeuroses of external oblique, internal oblique, transversus abdominis all pass in front of rectus abdominis
4. arteries: superior epigastric (branch of internal thoracic), inferior epigastric (branch of external iliac); both arteries anastomose and lie behind the rectus muscle (superficial to posterior rectus sheath above arcuate line)
5. transversalis fascia
6. peritoneum

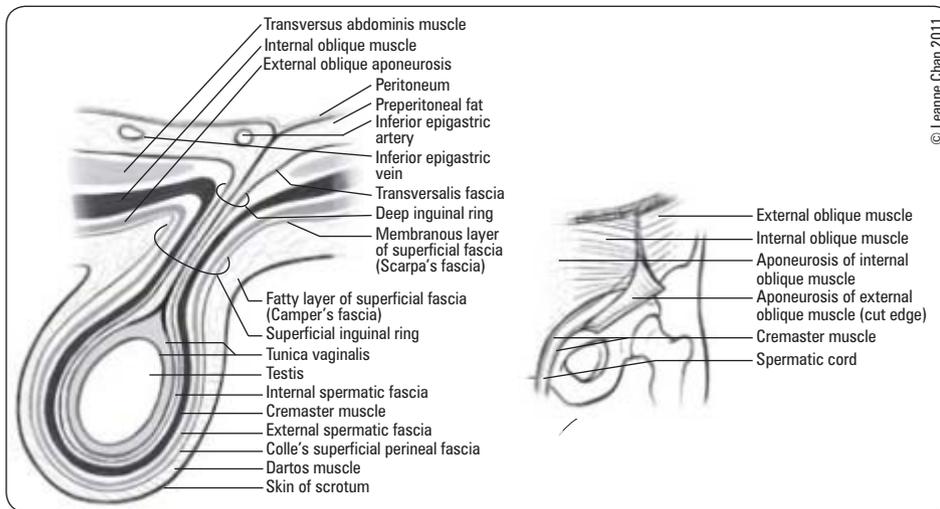

Figure 2. Continuity of the abdominal wall with layers of the scrotum and spermatic cord

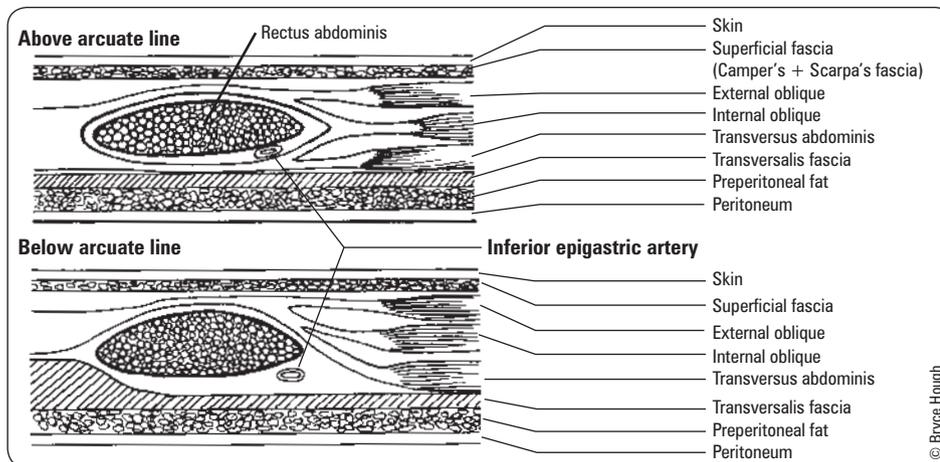

Figure 3. Midline cross-section of abdominal wall

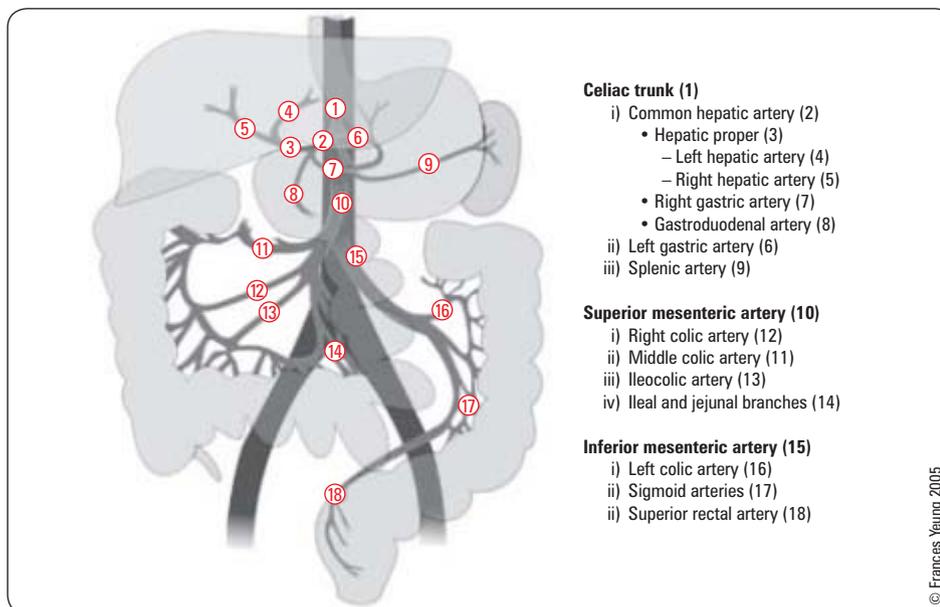

Figure 4. Blood supply to the GI tract

**Venous Flow**

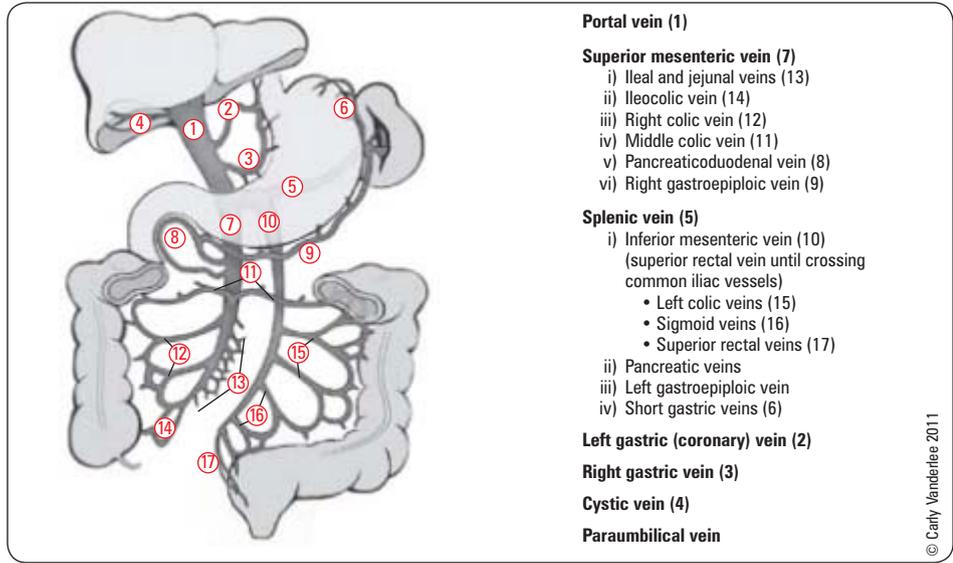

Figure 5. Venous drainage of the GI tract

Organ	Arteries
<b>Liver</b>	Left and right hepatic (branches of hepatic proper)
<b>Spleen</b>	Splenic
<b>Gallbladder</b>	Cystic (branch of right hepatic artery)
<b>Stomach</b>	1. Lesser curvature: right and left gastric 2. Greater curvature: right (branch of gastroduodenal) and left (branch of splenic) gastroepiploic 3. Fundus: short gastrics (branch of splenic)
<b>Duodenum</b>	1. Gastroduodenal 2. Pancreaticoduodenals (superior branch of gastroduodenal, inferior branch of superior mesenteric)
<b>Pancreas</b>	1. Pancreatic branches of splenic 2. Pancreaticoduodenals
<b>Small intestine</b>	Superior mesenteric branches: jejunal, ileal, ileocolic
<b>Large intestine</b>	1. Superior mesenteric branches: right colic, middle colic 2. Inferior mesenteric branches: left colic, sigmoid, superior rectal

**Differential Diagnoses of Common Presentations**

**Acute Abdominal Pain**

- acute abdomen = severe abdominal pain of acute onset and requires urgent medical attention
- in patients with acute abdominal pain, the first diagnoses that you should consider are those requiring potential urgent surgical intervention
- two main patterns constituting urgent general surgery referrals are peritonitis and obstruction

Table 1. Differential Diagnosis of Acute Abdominal Pain

RUQ	RLQ
<b>Hepatobiliary</b> Biliary colic Cholecystitis Cholangitis CBD obstruction (stone, tumour) Hepatitis Budd-Chiari Hepatic abscess/mass Right subphrenic abscess	<b>Gastrointestinal</b> Appendicitis Crohn's disease Tuberculosis of the ileocecal junction Cecal tumour Intussusception Mesenteric lymphadenitis (Yersinia) Cecal diverticulitis Cecal volvulus Hernia: femoral, inguinal obstruction, Amyand's (and resulting cecal distention)
<b>Gastrointestinal</b> Pancreatitis Presentation of gastric, duodenal, or pancreatic pathology Hepatic flexure pathology (CRC, subcostal incisional hernia)	<b>Gynecological</b> See 'suprapubic' <b>Genitourinary</b> See 'suprapubic' <b>Extraperitoneal</b> Abdominal wall hematoma/abscess Psoas abscess
<b>Genitourinary</b> Nephrolithiasis Pyelonephritis Renal: mass, ischemia, trauma	
<b>Cardiopulmonary</b> RLL pneumonia Effusion/empyema CHF (causing hepatic congestion and R pleural effusion) MI Pericarditis Pleuritis	
<b>Miscellaneous</b> Herpes zoster Trauma Costochondritis	

In all patients presenting with an acute abdomen, order the following:  
**KEY TESTS FOR SPECIFIC DIAGNOSIS**

- ALP, ALT, AST, bilirubin
- Lipase/ amylase
- Urinalysis
- β-hCG (in women of childbearing age)
- Troponins
- Lactate

**KEY TESTS FOR OR PREPARATION**

- CBC, electrolytes, creatinine, glucose
- INR/PTT
- CXR (if history of cardiac or pulmonary disease)
- ECG if clinically indicated by history or if >69 years and no risk factors

**Types of Peritonitis**

- Primary peritonitis: spontaneous without clear etiology
- Secondary peritonitis: due to a perforated viscus
- Tertiary peritonitis: recurrent secondary peritonitis more often with resistant organisms

**Localization of Pain**

Most digestive tract pain is perceived in the midline because of bilaterally symmetric innervation; kidney, ureter, ovary, or somatically innervated structures are more likely to cause lateralized pain

**Referred Pain**

- Biliary colic: to right shoulder or scapula
- Renal colic: to groin
- Appendicitis: periumbilical to right lower quadrant (RLQ)
- Pancreatitis: to back
- Ruptured aortic aneurysm: to back or flank
- Perforated ulcer: to RLQ (right paracolic gutter)
- Hip pain: to groin

Table 1. Differential Diagnosis of Acute Abdominal Pain (continued)

LUQ	LLQ	
<b>Pancreatic</b> <b>Pancreatitis (acute vs. chronic)</b> Pancreatic pseudocyst Pancreatic tumours <b>Gastrointestinal</b> <b>Gastritis</b> <b>PUD</b> Splenic flexure pathology (e.g. CRC, ischemia) <b>Splenic</b> <b>Splenic infarct/abscess</b> Splenomegaly Splenic rupture Splenic artery aneurysm <b>Cardiopulmonary (see RUQ and Epigastric)</b> <b>Genitourinary (see RUQ)</b>	<b>Gastrointestinal</b> <b>Diverticulitis</b> Diverticulosis Colon/sigmoid/rectal cancer Fecal impaction Proctitis (ulcerative colitis, infectious; i.e. <i>gonococcus</i> or <i>Chlamydia</i> ) Sigmoid volvulus Hernia <b>Gynecological</b> See 'suprapubic' <b>Genitourinary</b> See 'suprapubic' <b>Extraperitoneal</b> Abdominal wall hematoma/abscess Psoas abscess  See <a href="#">Gynecology</a> , <a href="#">Urology</a> , and <a href="#">Respirology</a> for further details regarding respective RLQ and suprapubic pain	
EPIGASTRIC	SUPRAPUBIC	DIFFUSE
<b>Cardiac</b> <b>Aortic dissection/ruptured</b> <b>AAA</b> <b>MI</b> <b>Pericarditis</b> <b>Gastrointestinal</b> <b>Gastritis</b> <b>GERD/esophagitis</b> <b>PUD</b> <b>Pancreatitis</b> Mallory-Weiss tear	<b>Gastrointestinal (see RLQ/LLQ)</b> Acute appendicitis IBD <b>Gynecological</b> <b>Ectopic pregnancy</b> <b>PID</b> <b>Endometriosis</b> <b>Threatened/incomplete</b> <b>abortion</b> <b>Hydrosalpinx/salpingitis</b> Ovarian torsion Hemorrhagic fibroid Tubo-ovarian abscess Gynecological tumours <b>Genitourinary</b> Cystitis (infectious, hemorrhagic) Hydroureter/urinary colic Epididymitis Testicular torsion Acute urinary retention <b>Extraperitoneal</b> Rectus sheath hematoma	<b>Gastrointestinal</b> <b>Peritonitis</b> <b>Early appendicitis, perforated appendicitis</b> <b>Mesenteric ischemia</b> <b>Gastroenteritis/colitis</b> <b>Constipation</b> <b>Bowel obstruction</b> Pancreatitis Inflammatory bowel disease Irritable bowel syndrome Ogilvie's syndrome <b>Cardiovascular/Hematological</b> Aortic dissection/ruptured AAA Sickle cell crisis <b>Genitourinary/Gynecological</b> Perforated ectopic pregnancy PID Acute urinary retention <b>Endocrinological</b> Carcinoid syndrome Diabetic ketoacidosis Addisonian crisis Hypercalcemia <b>Other</b> Lead poisoning Tertiary syphilis

#### Most Common Presentations of Surgical Pain

- Sudden onset with rigid abdomen = perforated viscus
- Pain out of proportion to physical findings = ischemic bowel
- Vague pain that subsequently localizes = appendicitis or other intra-abdominal process that irritates the parietal peritoneum
- Waves of colicky pain = bowel obstruction

## Abdominal Mass

Table 2. Differential Diagnosis of Abdominal Mass

Right Upper Quadrant (RUQ)	Upper Midline	Left Upper Quadrant (LUQ)
<b>Gallbladder:</b> cholecystitis, cholangiocarcinoma, peri-ampullary malignancy, cholelithiasis <b>Biliary tract:</b> Klatskin tumour <b>Liver:</b> hepatomegaly, hepatitis, abscess, tumour (hepatocellular carcinoma, metastatic tumour, etc.)	<b>Pancreas:</b> pancreatic adenocarcinoma, other pancreatic neoplasm, pseudocyst <b>Abdominal aorta:</b> AAA (pulsatile) <b>GI:</b> gastric tumour (adenocarcinoma, gastrointestinal stromal tumour, carcinoid tumour), MALT lymphoma	<b>Spleen:</b> splenomegaly, tumour, abscess, subcapsular splenic hemorrhage, can also present as RLQ mass if extreme splenomegaly <b>Stomach:</b> tumour
Right Lower Quadrant (RLQ)	Lower Midline	Left Lower Quadrant (LLQ)
<b>Intestine:</b> stool, tumour (CRC), mesenteric adenitis, appendicitis, appendiceal phlegmon or other abscess, typhlitis, intussusception, Crohn's inflammation <b>Ovary:</b> ectopic pregnancy, cyst (physiological vs. pathological), tumour (serous, mucinous, struma ovarii, germ cell, Krukenberg) <b>Fallopian tube:</b> ectopic pregnancy, tubo-ovarian abscess, hydrosalpinx, tumour	<b>Uterus:</b> pregnancy, leiomyoma (fibroid), uterine cancer, pyometra, hematometra <b>GU:</b> bladder distention, tumour	<b>Intestine:</b> stool, tumour, abscess (see RLQ) <b>Ovary:</b> see RLQ <b>Fallopian tube:</b> see RLQ

Pancreatitis can look like a surgical abdomen, but is rarely an indication for immediate surgical intervention

# Gastrointestinal Bleeding

• see [Gastroenterology, G25 and G27](#)

## Indications for Surgery

- failure of medical management
- exsanguinating hemorrhage: hemodynamic instability despite vigorous resuscitation
- recurrent hemorrhage after initial stabilization procedures with up to two attempts of endoscopic hemostasis
- prolonged bleeding with transfusion requirement >3 units
- bleeding at rate >1 unit/8 h

## Surgical Management of GI Bleeding

- UGIB
  - bleeding from a source proximal to the ligament of Treitz
  - often presents with hematemesis and melena unless very brisk (then can present with hematochezia)
  - initial management with endoscopy; if fails, then consider surgery
  - PUD accounts for approximately 55% of severe UGIB
- LGIB
  - bleeding from a source distal to the ligament of Treitz
  - often presents with BRBPR unless proximal to transverse colon
    - ♦ may occasionally present with melena
  - initial management with colonoscopy to detect and potentially stop source of bleeding
  - 75% of patients will spontaneously stop bleeding, however if bleeding continues barium enema should NOT be performed
  - angiography or RBC scan to determine source as indicated
  - surgery indicated if bleeding is persistent - aimed at resection of area containing source of bleeding
  - obscure bleed may require blind total colectomy if the source is not found

**Table 3. Differential Diagnosis of GI Bleeding**

Anatomical Source	Etiology	
<b>Hematological</b>	Excess anticoagulation (coumadin, heparin, etc.) Excess antiplatelet (clopidogrel, ASA)	DIC Congenital bleeding disorders
<b>Nose</b>	Epistaxis	
<b>Esophagus</b>	Esophageal varices Mallory-Weiss tear Esophagitis	Aorto-esophageal fistula (generally post endovascular aortic repair)* Esophageal cancer
<b>Stomach</b>	Gastritis Gastric varices Dieulafoy's lesion	Gastric ulcer Gastric cancer*
<b>Duodenum</b>	Duodenal ulcer Perforated duodenal ulcer*	Duodenal cancer*
<b>Jejunum</b>	Tumours* Polyps Ulcers	
<b>Ileum and Ileocecal Junction</b>	Meckel's diverticulum (rare surgical management) Small bowel obstruction	Crohn's disease* Tuberculosis of ileocecal junction
<b>Large Intestine</b>	Colorectal cancer* Mesenteric thrombosis/ischemic bowel* Ulcerative colitis* (subtotal colectomy if failure of medical management) Angiodysplasia Diverticulosis (*if bleeding is persistent)	Crohn's disease (less frequently presents with bleeding)* Pancolitis (infectious, chemotherapy, or radiation induced) Bleeding post-gastrointestinal anastomosis
<b>Sigmoid</b>	Diverticulosis (*if bleeding is persistent) Sigmoid cancer* Bleeding post-polypectomy	Polyps (*if not amenable to colonoscopic polypectomy) Inflammatory bowel disease (IBD)
<b>Rectum and Anus</b>	Hemorrhoids Fissures Rectal cancer* Anal varices	Polyps (*if not amenable to colonoscopic polypectomy) Crohn's or ulcerative colitis* Solitary rectal ulcer syndrome

\*Managed surgically in most cases

### Indications for Urgent Operation

- IHOP**  
Ischemia  
Hemorrhage  
Obstruction  
Perforation

**Overt bleeding:** obvious hematochezia or melena per rectum visible to naked eye  
**Occult bleeding:** bleeding per rectum is not obvious to naked eye (e.g. positive guaiac test)  
**Obscure bleeding:** overt bleeding with no identifiable source after colonoscopy and endoscopy

### Transfusion Strategies for Acute Upper Gastrointestinal Bleeding

*NEJM* 2013;368:11-21  
Recent study by Villanueva et al., demonstrates that a restrictive transfusion strategy (transfusion with hemoglobin below 70 g/L) significantly improves outcomes in patients with acute UGIB, compared to a liberal transfusion strategy (transfusion with hemoglobin below 90 g/L). Refer to study for details.

**Biochemical Signs for Differentiating Jaundice**  
**Hepatocellular:** Elevated bilirubin + elevated ALT/AST  
**Cholestatic:** Elevated bilirubin + elevated ALP/GGT ± duct dilatation upon biliary U/S  
**Hemolysis:** ↓ haptoglobin ↑ LDH

Note: cholestatic jaundice is often surgical

# Jaundice

• see [Gastroenterology, G40](#)

## Pre-Operative Preparations

### Considerations

- informed consent (see [Ethical, Legal, and Organizational Medicine, ELOM6](#))
- screening questionnaire to determine risk factors e.g. age, exercise capacity, medication use, allergies
- consider pre-operative anesthesia, medicine consult as indicated to optimize patient status
- NPO according to guidelines (see [Anesthesia and Perioperative Medicine, A4](#))
- IV – balanced crystalloid at maintenance rate (4:2:1 rule → roughly 100-125 cc/h): normal saline or Ringer's lactate; bolus to catch up on estimated losses including losses from bowel prep
  - appropriate use of fluids perioperatively decreases risk of cardiorespiratory complications
- patient's regular medications included with the exception of hypoglycemic agents, diuretics and ACEI
- patients on steroids may require stress dose coverage, anticoagulation/ antiplatelet medication must be managed to decrease surgical bleeding but not put patient at risk for increased thrombotic events (e.g. switching from warfarin to LMWH)
- prophylactic antibiotics depending on wound class (within 1 h prior to incision): usually cefazolin (Ancef®) ± metronidazole (Flagyl®)
- consider bowel prep: cleans out bowel and decreases bacterial population
  - oral cathartic (e.g. fleet Phosphosoda®) starting previous day
  - in selected cases, current evidence does not support routine use
- consider VTE prophylaxis for all inpatient surgery (LMWH or heparin)
- do not hold anticoagulation prior to surgery unless epidural is expected
- smoking cessation and weight loss pre-operative can significantly decrease post-operative complications
- infection: delay elective surgery until infection controlled including respiratory infection particularly in asthma patients

### Investigations

- see [Anesthesia and Perioperative Medicine, A4](#)
- routine pre-operative laboratory investigations for elective procedures should be selective
  - only ASA class and surgical risk have been found to independently predict post-operative adverse effects
- blood components: group and screen or cross and type depending on procedure
- CBC, electrolytes, creatinine
- INR/PT, PTT
- CXR (PA and lateral) for patients with history of cardiac or pulmonary disease
- ECG as indicated by history or if >69 yr and no risk factors
- β-hCG testing in all women of reproductive age

### Drains

- NGT
  - indications: gastric decompression, analysis of gastric contents, irrigation/dilution of gastric contents, feeding, if necessary
  - contraindications: suspected basal skull fracture, obstruction of nasal passages due to trauma
- Foley catheter with urometer
  - indications: to accurately monitor urine output, decompression of bladder, relieve obstruction, rapidly expanding suprapubic mass
  - contraindications: suspected urethral injury, difficult insertion of catheter

## Surgical Complications

- general principles in preventing complications during the post-operative period include
  - frequent examination of the patient (daily or more) and their wound
  - removal of surgical tubes as soon as possible (e.g. Foley catheters and surgical drains)
  - early ambulation
  - monitor fluid balance and electrolytes
  - analgesia - enough to adequately address pain, but not excessive
  - skillful nursing care

## Post-Operative Fever

- fever does not necessarily imply infection particularly in the first 24-48 h post-operative
- fever may not be present or is blunted if patient is receiving chemotherapy, glucocorticoids, or immunosuppression
- timing of fever may help identify cause
  - hours after surgery – POD #1 (immediate)
    - inflammatory reaction in response to trauma from surgery; unlikely to be infectious
    - reaction to blood products received during surgery
    - malignant hyperthermia

### Bilirubin Levels

	Prehepatic	Intrahepatic	Posthepatic
<b>Serum Bilirubin</b>			
Indirect	↑	↑	N
Direct	N	↑	↑
<b>Urine</b>			
Urobilinogen	↑	↑	–
Bilirubin	–	+	+
<b>Fecal</b>			
Urobilinogen	↑	↑	–

In patients with liver disease and an acute abdomen, spontaneous bacterial peritonitis must be ruled out

### Surgical Emergencies: Take an AMPLE History

**Allergies**  
**Medications**  
 Past medical/surgical history (including anesthesia and bleeding disorders)  
**Last meal**  
**Events (HPI)**

### Best Practice in General Surgery (BPIGS)

<http://www.bpigs.ca/>  
 BPIGS is a University of Toronto initiative with the goal of standardizing care in general surgery. This link contains EBM based guidelines which have been implemented by consensus within all Toronto teaching hospitals. This is a highly recommended source for the most up-to-date pre-operative and general treatment guidelines

### Drain Size

Measured by the unit French:  
 French = diameter (mm) x 3

### Pre and Post-Operative Orders

#### ADDAVIDS

Admit to ward X under Dr. Y  
**Diagnosis**  
**Diet**  
**Activity**  
 Vitals (q4h from ED and post-operative is standard)  
 IV, Investigations, Ins and Outs  
 Drugs, Dressings, Drains  
 Special procedures

### 5 Ws of Post-Operative Fever

**Wind** POD #1-2 (pulmonary – atelectasis, pneumonia)  
**Water** POD #3-5 (urine – UTI)  
**Wound** POD #5-8 (wound infection - if earlier think streptococcal or clostridial infection)  
**Walk** POD #8+ (thrombosis – DVT/PE)  
**Wonder** drugs POD #1+ (drug)

- POD #1-2 (acute)
  - ♦ atelectasis (most common cause of fever on POD #1)
  - ♦ early wound infection (especially *Clostridium*, Group A *Streptococcus* – feel for crepitus and look for “dishwater” drainage)
  - ♦ aspiration pneumonitis
  - ♦ other: Addisonian crisis, thyroid storm, transfusion reaction
- POD #3-7 (subacute): likely infectious
  - ♦ UTI, surgical site infection, IV site/line infection, septic thrombophlebitis, leakage at bowel anastomosis (tachycardia, hypotension, oliguria, abdominal pain)
- POD #8+ (delayed)
  - ♦ intra-abdominal abscess, DVT/PE (can be anytime post-operative, most commonly POD #8-10), drug fever
  - ♦ other: cholecystitis, peri-rectal abscess, URTI, infected seroma/biloma/hematoma, parotitis, *C. difficile* colitis, endocarditis

**Treatment**

- treat primary cause
- antipyrexia (e.g. acetaminophen)

**Drugs – 7 As**

- Analgesia
- Anti-emetic
- Anticoagulation
- Antibiotics
- Anxiolytics
- Anticonstipation
- All other patient meds (home meds, stress dose steroids, and β-blockers)

**Approach to the Critically Ill Surgical/Trauma Patient**

**ABC, I'M FINE**

- ABC
- IV: 2 large bore IVs with NS, wide open
- Monitors: O: sat, ECG, BP
- Foley catheter to measure urine output
- Investigations: blood work
- NGT if indicated
- \*Ex\* rays (abdomen 3 views, CXR), other imaging – only when stable

## Wound/Incisional Complications

**WOUND CARE** (see [Plastic Surgery, PL8](#))

- can shower POD #2-3 after epithelialization of wound
- dressings can be removed POD #2 and left uncovered if dry
- examine wound if wet dressing, signs of infection (fever, tachycardia, pain)
- skin sutures and staples can be removed POD #7-10
  - exceptions: incision crosses crease (groin), closed under tension, in extremities (hand) or patient factors (elderly, corticosteroid use, immunosuppressed) removed POD #14, earlier if signs of infection
- negative pressure dressings consist of foam and suction, promote granulation
  - ideal for large (grafted sites) or non-healing wounds (irradiated skin, ulcer)

**DRAINS**

- drains may be placed selectively at the time of surgery to prevent fluid accumulation (blood, pus, serum, bile, urine)
  - can be used to assess quantity of third space fluid accumulation post-operatively
- potential route of infection; to decrease risk of wound infection bring out through separate incision (vs. operative wound) and remove as soon as possible
- types of drains
  - open (e.g. Penrose), higher risk of infection
  - closed: 1) Gravity drainage (e.g. Foley catheter); 2) Underwater-seal drainage system (e.g. chest tube); 3) Suction drainage (e.g. Jackson-Pratt)
  - sump (e.g. NGT)
- monitor drain outputs daily
- drains should be removed once drainage is minimal (usually <30-50 cc/24 h)
- drains do not guarantee that the patient will not form a collection of fluid
- ridged drains can erode through internal structures, and excessive suction can cause necrosis
- evidence does not support routine post-operative drainage of abdominal cavity

**SURGICAL SITE INFECTION**

**Etiology**

- *S. aureus*, *E. coli*, *Enterococcus*, *Streptococcus* spp., *Clostridium* spp.

**Risk Factors**

**Table 4. Procedures and Their Impact on Surgical Site Infection**

Classification	Clean	Clean-Contaminated	Contaminated	Dirty/Infected
<b>Definition</b>	Incision under sterile conditions; nontraumatic; no entrance of hollow organ	Incision under sterile conditions; ENTRANCE of hollow viscus; no evidence of active infection; minimal contamination	Incision under sterile conditions; MAJOR contamination of wound during procedure (i.e. gross spillage of stool, infection in biliary, respiratory, or GU systems)	Established infection present before wound is made in skin
<b>Example</b>	Wound created to repair hernia	Routine cholecystectomy; colon resection	Bowel obstruction with enterotomy and spillage of contents; necrotic bowel resection; fresh traumatic wounds	Appendiceal abscess; traumatic wound with contaminated devitalized tissue; perforated viscus
<b>Infection Rate</b>	<2%	3-4%	7-10%	30-40%
<b>Wound Closure</b>	Primary closure	Primary closure	Often secondary closure	Secondary closure

- patient characteristics
  - age, DM, steroids, immunosuppression, obesity, burn, malnutrition, patient with other infections, traumatic wound, radiation, chemotherapy
- other factors
  - prolonged pre-operative hospitalization, reduced blood flow, break in sterile technique, multiplantibiotics, hematoma, seroma, foreign bodies (drains, sutures, grafts), skin preparation, hypoxemia, hypothermia

### Prophylaxis

- pre-operative antibiotics for most surgeries (cefazolin ± metronidazole or if β-lactam allergy, clindamycin ± gentamycin)
  - within 1 h pre-incision; can redose at 1-2 half-lives (~q4-8h) in the OR
  - not required for low risk elective cholecystectomy, hemorrhoidectomy, fistulotomy, sphincterotomy for fissure
  - some evidence suggests role in breast surgery
    - ♦ reserve post-operative antibiotics for treatment of suspected or documented intra-abdominal infection, hair removal should not be performed unless necessary; if so, clipping superior to shaving chlorhexidine-alcohol wash of surgical site
- normothermia (maintain patient temperature 36-38°C during OR)
- hyperoxygenation (consider FiO<sub>2</sub> of 80% in OR)
- consider delayed primary closure of incision for contaminated wounds

### Clinical Presentation

- typically fever POD #5-8 (*Streptococcus* and *Clostridium* can present in 24 h)
- pain, blanchable wound erythema, induration, purulent discharge, warmth
- complications: fistula, sinus tracts, sepsis, abscess, suppressed wound healing, superinfection, spreading infection to myonecrosis or fascial necrosis (necrotizing fasciitis), wound dehiscence, evisceration, hernia

### Treatment

- examination of the wound: inspect, compress adjacent areas, swab drainage for C&S and Gram stain
- re-open affected part of incision, drain, pack, heal by secondary intention in most cases
- for deeper infections, debride necrotic and non-viable tissue
- antibiotics and demarcation of erythema only if cellulitis or immunodeficiency

### WOUND HEMORRHAGE/HEMATOMA

- secondary to inadequate surgical control of hemostasis

### Risk Factors

- anticoagulant therapy, coagulopathies, thrombocytopenia, DIC, severe liver disease, myeloproliferative disorders, severe arterial HTN, severe cough
- more common with transverse incisions through muscle, due to cutting of muscle

### Clinical Features

- pain, swelling, discolouration of wound edges, leakage
- rapidly expanding neck hematoma can compromise airway and is a surgical emergency: consider having a suture kit at bedside in all neck surgery in the event of having to open the wound emergently

### Treatment

- pressure dressing
- open drainage ± wound packing (large hematoma only)
- if significant bleeding, may need to re-operate to find source (often do not find a discrete source)

### SEROMA

- fluid collection other than pus or blood
- secondary to transection of lymph vessels
- delays healing
- increased infection risk

### Treatment

- consider pressure dressing ± needle drainage
- if significant may need to re-operate

### WOUND DEHISCENCE

- disruption of fascial layer, abdominal contents contained by skin only
- 95% caused by intact suture tearing through fascia

### Clinical Features

- typically POD #1-3; most common presentation sign is serosanguinous drainage from wound ± evisceration
- palpation of wound edge: should normally feel a "healing ridge" from abdominal wall closure (raised area of tissue under incision)

#### Systemic Prophylactic Antibiotics Recommendations

Updated Recommendations for Control of Surgical Site Infections

*Ann Surg* 2011;253:1082-93

- Choice of routine prophylactic antibiotic depends on the pathogen and patient allergies.
- Vancomycin and fluoroquinolones should be administered 1-2 h prior to incision; all other antibiotics should be administered 30 min prior to incision.
- Short-acting antibiotics should be redosed ~3 h after incision.
- Antibiotic administration >24 h after surgery does not appear to add benefits.
- Antibiotics should no longer be routinely administered in three doses.
- The majority of antibiotics are renally excreted hence renal function must be considered in antibiotic administration.
- Obese patients need higher antibiotic doses to achieve therapeutic concentrations.
- Drug half-life and length of operation need to be considered in antibiotic administration.

#### Pre-Operative Skin Antiseptics for Preventing Surgical Wound Infections After Clean Surgery

*Cochrane DB Syst Rev* 2015;4:CD003949

**Purpose:** To determine if pre-operative skin antiseptics prior to clean surgery prevents surgical-site infection (SSI) and compare the effectiveness of other antiseptics.

**Methods:** Systematic review of randomized-controlled trials (RCTs) part of the Cochrane Wounds Group Specialised Register and the Cochrane Central Register of Controlled Trials (CENTRAL). Main outcome was SSI. Secondary outcomes included quality of life, mortality, and resource use.

**Results:** 13 RCTs (n=2,623 patients) were included that made 11 total comparisons between skin antiseptics. A single study found that 0.5% chlorhexidine solution in methylated spirits was significantly superior in preventing SSIs after clean surgery compared to alcohol based povidone iodine solution. No other statistically significant differences were found.

**Conclusions:** Further research is warranted to determine the effectiveness of one antiseptic over the others at preventing SSI post clean surgery.

#### Systemic Review and Meta-Analysis of Randomized Clinical Trials Comparing Primary vs. Delayed Primary Skin Closure in Contaminated and Dirty Abdominal Incisions

*JAMA Surg* 2013;148:779-786

**Purpose:** To compare rates of surgical site infection (SSI) with delayed primary closure (DPC) vs. primary skin closure (PC).

**Results/Conclusions:** 8 RCTs with 623 patients. Most common diagnosis was appendicitis (77.4%). Although there was significant heterogeneity between studies, DPC (2-5 d time to first review) was found to significantly reduce the chance of SSI (OR 0.65, 95% CI 0.40-0.93). Although current trials are poorly designed, DPC may be a simple and cost-effective way of reducing the rates of SSIs following abdominal surgery with contaminated or dirty wounds.

**Risk Factors**

- local: technical failure of closure, increased intra-abdominal pressure (e.g. COPD, ileus, bowel obstruction), hematoma, infection, poor blood supply, radiation, patient not fully paralyzed while closing, transverse incision
- systemic: smoking, malnutrition (hypoalbuminemia, vitamin C deficiency), connective tissue diseases, immunosuppression, pulmonary disease, ascites, poor nutrition, steroids, chemotherapy, obesity, other (e.g. age, sepsis, uremia)
- DM alone is not a risk factor

**Treatment**

- place moist dressing over wound with binder around abdomen and transfer to OR
- may consider conservative management with debridement of fascial and/or skin margins
- evisceration, also known as 'burst abdomen', is a surgical emergency): take patient for operative re-closure.

## Urinary and Renal Complications

**URINARY RETENTION**

- may occur after any operation with general anesthesia or spinal anesthesia
- more likely in older males with history of benign prostatic hyperplasia, patients on anticholinergics

**Clinical Presentation**

- abdominal discomfort, palpable bladder, overflow incontinence, post-void residual urine volume >100 mL

**Treatment**

- Foley catheter to rest bladder, then trial of voiding

**OLIGURIA/ANURIA** (see [Nephrology, NP18](#))**Etiology**

- prerenal vs. renal vs. postrenal
- most common post-operative cause is prerenal ± ischemic ATN
  - external fluid loss: hemorrhage, dehydration, diarrhea
  - internal fluid loss: third-spacing due to bowel obstruction, pancreatitis

**Clinical Presentation**

- urine output <0.5 cc/kg/h, increasing Cr, increasing BUN

**Treatment**

- according to underlying cause; fluid deficit is treated with crystalloid (NS or RL)

## Post-Operative Dyspnea

- see *Respiratory Complications next and Cardiac Complications, GS12*

**Etiology**

- respiratory: atelectasis, pneumonia, pulmonary embolus (PE), ARDS, asthma, pleural effusion
- cardiac: MI, arrhythmia, CHF
- inadequate pain control

## Respiratory Complications

**ATELECTASIS**

- comprises 90% of post-operative pulmonary complications

**Clinical Features**

- low-grade fever on POD #1, tachycardia, crackles, decreased breath sounds, bronchial breathing, tachypnea

**Risk Factors**

- COPD, smoking, obesity, elderly persons
- upper abdominal/thoracic surgery, oversedation, significant post-operative pain, poor inspiratory effort

**Treatment**

- pre-operative prophylaxis
  - smoking cessation (best if >8 wk pre-operative)
- post-operative prophylaxis
  - incentive spirometry, deep breathing exercise, chest physiotherapy, intermittent positive-pressure breathing
  - selective NGT decompression after abdominal surgery
  - short-acting neuromuscular blocking agents
  - minimize use of respiratory depressive drugs, appropriate pain control, early ambulation

**PNEUMONIA/PNEUMONITIS**

- may be secondary to aspiration of gastric contents during anesthetic induction or extubation, causing a chemical pneumonitis

**Risk Factors**

- aspiration: general anesthetic, decreased LOC, GERD, full stomach, bowel/gastric outlet obstruction + non-functioning NGT, pregnancy, seizure disorder
- non-aspiration: atelectasis, immobility, pre-existing respiratory disease

**Clinical Features**

- productive cough, fever
- tachycardia, cyanosis, respiratory failure, decreased LOC
- CXR: pulmonary infiltrate

**Treatment**

- prophylaxis: see atelectasis prophylaxis, pre-operative NPO/NGT, rapid sequence anesthetic induction
- immediate removal of debris and fluid from airway
- consider endotracheal intubation and flexible bronchoscopic aspiration
- IV antibiotics to cover oral nosocomial aerobes and anaerobes (e.g. ceftriaxone, metronidazole)

**PULMONARY EMBOLUS** (See [Respirology, R18](#))**Clinical Features**

- unilateral leg swelling and pain (DVT as a source of PE), sudden onset shortness of breath, tachycardia, fever
- most commonly POD #8-10, but can occur anytime post-operatively, even after discharge
- diagnosis made by Chest CT scan usually

**Treatment**

- initial treatment IV heparin or therapeutic- dose LMWH, bridging to therapeutic anticoagulation is required for a minimum of 3 months; for patients with cancer, or other risk factors for hypercoagulability, the duration of anticoagulation may be longer
- Greenfield (IVC) filter if contraindications to anticoagulation
- prophylaxis: subcutaneous heparin (5,000 U bid) or LMWH, compression stockings (TED™ Hose), sequential compression devices

**PULMONARY EDEMA****Etiology**

- cardiogenic vs. noncardiogenic
- circulatory overload: excess volume replacement, LV failure, shift of fluid from peripheral to pulmonary vascular bed, negative airway pressure, alveolar injury due to toxins (e.g. ARDS)
  - more common with pre-existing cardiac disease
- negative pressure pulmonary edema due to inspiratory efforts against a closed glottis upon awakening from general anesthesia

New onset "asthma" and wheezing in the elderly is cardiogenic until proven otherwise

**Clinical Features**

- shortness of breath, crackles at lung bases, CXR abnormal

**Treatment (LMNOP)**

- Lasix
- Morphine (decreases symptoms of dyspnea, venodilator and afterload reduction)
- Nitrates (venodilator)
- Oxygen + non-invasive ventilation
- Position (sit patient up)

## RESPIRATORY FAILURE

### Clinical Features

- dyspnea, cyanosis, evidence of obstructive lung disease
- earliest manifestations – tachypnea and hypoxemia (RR >25, pO<sub>2</sub> <60)
- pulmonary edema, unexplained decrease in SaO<sub>2</sub>

### Treatment

- ABCs, O<sub>2</sub>, ± positive pressure ventilation, intubation
- bronchodilators, diuretics to treat CHF
- adequate blood pressure to maintain pulmonary perfusion
- if these measures fail to keep PaO<sub>2</sub> >60, consider ARDS

## Cardiac Complications

- abnormal ECGs common in post-operative period (compare to pre-operative ECG)
- common arrhythmias: supraventricular tachycardia, atrial fibrillation (secondary to fluid overload, PE, MI)

### MYOCARDIAL INFARCTION

- see [Cardiology and Cardiac Surgery, C27](#)
- surgery increases risk of MI
- incidence
- 0.5% in previously asymptomatic men >50 yr old
- 40-fold increase in men >50 yr old with previous MI

### Risk Factors

- pre-operative HTN, CHF
- previous MI (highest risk ≤6 mo, but risk never returns to baseline)
- increased age
- intra-operative hypotension
- operations >3 h
- angina

### Clinical Features

- majority of cases on day of operation or POD #3-4 (shifting of third space fluid back into intravascular compartment)
- often silent without chest pain, may only present with new-onset CHF (dyspnea), arrhythmias, hypotension

## Intra-Abdominal Abscess

### Definition

- collection of pus walled-off from rest of peritoneal cavity by inflammatory adhesions and viscera

### Etiology

- usually polymicrobial: Gram-negative bacteria, anaerobes
  - consider Gram-positives if coexisting cellulitis

### Risk Factors

- emergency surgery, contaminated OR
- GI surgery with anastomoses
- poor healing risk factors (DM, poor nutrition, etc.)
- may occur POD #3 after laparotomy when third space fluid re-distribution occurs

### Clinical Features

- persistent spiking fever, dull pain, weight loss
- mass difficult to palpate
- peritoneal signs if abscess perforation and secondary peritonitis
- leukocytosis or leukopenia (immunocompromised, elderly)
- co-existing effusion (pleural effusion with subphrenic abscess)
- common sites: pelvis, Morrison's pouch (space between kidney and liver), subphrenic, paracolic gutters, lesser sac, peri-appendiceal, post-surgical anastomosis, diverticular, psoas

### Investigations

- CBC, blood cultures x2
- CT ± IV and water-soluble contrast
- DRE (pelvic abscess)

**Treatment**

- drain placement by interventional radiology (preferred), laparoscopy, open drainage
- subsequent antibiotic coverage; ceftriaxone + metronidazole or piperacilin-tazobactam (PepTazo)

**Paralytic Ileus**

- see *Bowel Obstruction, GS23*

**Delirium**

- see *Psychiatry, PS19* and *Neurology, N20*

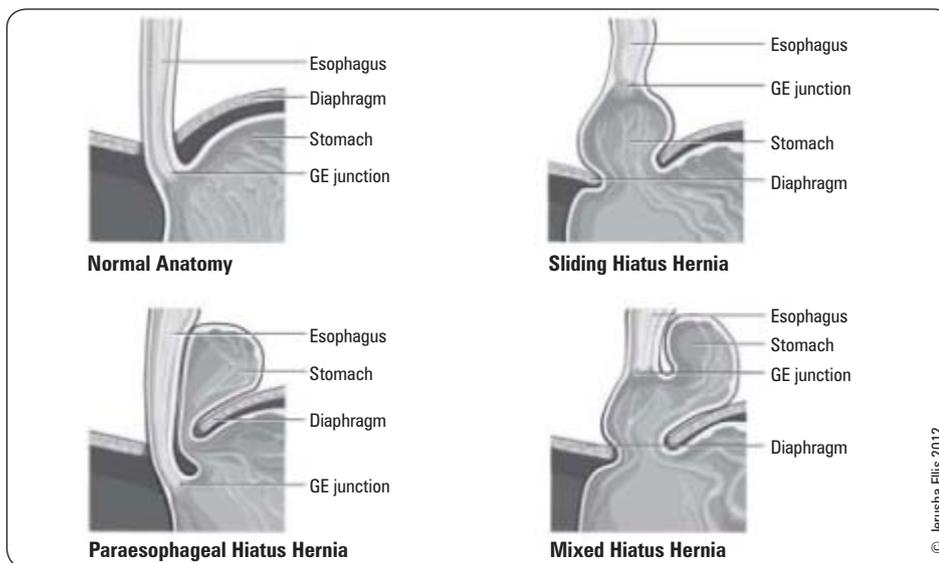

**Thoracic Surgery****Hiatus Hernia**

Figure 6. Types of hiatus hernia

**SLIDING HIATUS HERNIA (TYPE I)**

- see Figure 6
- herniation of both the stomach and the gastroesophageal (GE) junction into thorax
- 90% of esophageal hernias

**Risk Factors**

- age
- increased intra-abdominal pressure (e.g. obesity, pregnancy, coughing, heavy lifting)
- smoking

**Clinical Features**

- majority are asymptomatic
- hernias frequently associated with GERD due to decreased competence of LES

**Complications**

- most common complication is GERD
- other complications are rare and are related to reflux
- esophagitis (dysphagia, heartburn)
- consequences of esophagitis (peptic stricture, Barrett's esophagus, esophageal carcinoma)
- extra-esophageal complications (aspiration pneumonitis/pneumonia, asthma type bronchospasm, cough, laryngitis)

**Investigations**

- barium swallow, endoscopy (esophago-gastroscopy), or esophageal manometry (technique for measuring LES pressure)
- 24 h esophageal pH monitoring to quantify reflux
- endoscopy with biopsy to document type and extent of tissue damage and rule out esophagitis, Barrett's esophagus, and cancer

**Differential Diagnosis of Hiatus Hernia**

GI Causes	Non-GI Causes
Cholelithiasis	MI
Diverticulitis	Angina
Peptic ulcer	Pericarditis
Achalasia	
Pancreatitis	
GERD	
Gastritis	

**Treatment**

- lifestyle modification
  - stop smoking, weight loss, elevate head of bed, no meals <3 h prior to sleeping, smaller and more frequent meals, avoid alcohol, coffee, mint, and fat
- medical
  - antacid, H<sub>2</sub>-antagonist, PPI, prokinetic agent
- surgical (<15%)
  - if failure of medical therapy, complications of GERD such as esophageal stricture, severe nocturnal aspiration, Barrett's esophagus
  - anti-reflux procedure (usually laparoscopic) e.g. Nissen fundoplication
    - ◆ fundus of stomach is wrapped around the lower esophagus and sutured in place
    - ◆ 90% success rate

**PARAESOPHAGEAL HIATUS HERNIA (TYPE II)**

- see Figure 6
- herniation of all or part of the stomach through the esophageal hiatus into the thorax with an undisplaced GE junction
- least common esophageal hernia (<10%)

**Clinical Features**

- usually asymptomatic due to normal GE junction
- pressure sensation in lower chest, dysphagia

**Complications**

- hemorrhage, incarceration, strangulation (gastric volvulus), obstruction, gastric stasis ulcer (Cameron's lesion – causes Fe-deficiency anemia)

**Treatment**

- surgery to address symptoms or treat/prevent complications
- reduce hernia and excise hernia sac, repair defect at hiatus, and anti-reflux procedure (e.g. Nissen fundoplication)
- may consider suturing stomach to anterior abdominal wall (gastropexy)
- in very elderly patients at high surgical risk consider PEG (percutaneous endoscopic gastrostomy) to anchor the stomach in the abdomen

**MIXED HIATUS HERNIA (TYPE III)**

- see Figure 6
- combination of Types I and II

**TYPE IV HERNIA**

- herniation of stomach and other abdominal organs into thorax: colon, spleen, small bowel
- Fe-deficiency anemia is common

## Esophageal Perforation

**Etiology**

- iatrogenic (most common)
  - endoscopic, dilatation, biopsy, intubation, operative, NGT placement (rare)
- barogenic
  - trauma
  - repeated, forceful vomiting (Boerhaave's syndrome)
  - other: convulsions, defecation, labour (rare)
- ingestion injury
  - foreign body, corrosive substance
- carcinoma

**Clinical Features**

- neck or chest pain
- fever, tachycardia, hypotension, dyspnea, respiratory compromise
- subcutaneous emphysema, pneumothorax, pleural effusion, and hematemesis,

**Investigations**

- CXR: pneumothorax, pneumomediastinum, pleural effusion, subdiaphragmatic air, widened mediastinum
- CT chest: pneumomediastinum, pleural effusion, pneumothorax, contrast in the chest, subq emphysema
- Upper GI swallow study with water soluble contrast. If negative then perform with diluted barium: contrast extravasation

**Boerhaave's syndrome:** transmural esophageal perforation  
**Mallory-Weiss tear:** non-transmural esophageal tear (partial thickness tear)  
 Both are associated with forceful emesis

**6Ss of SCC**  
 Smoking  
 Spirits (alcohol)  
 Seeds (betel nut)  
 Scalding (hot liquid)  
 Strictures  
 Sack (diverticula)

## Treatment

- supportive if rupture is contained
  - NPO, fluid resuscitation, broad-spectrum antibiotics, possible percutaneous drainage of mediastinum or pleura
- surgical
  - <24 h
    - ♦ primary closure of a healthy esophagus or resection of diseased esophagus
  - >24 h or non-viable wound edges
    - ♦ diversion and exclusion followed by delayed reconstruction (i.e. esophagostomy proximally, close esophagus distally, gastrostomy/jejunostomy for decompression/feeding)

## Complications

- sepsis, abscess, fistula, empyema, mediastinitis, death
- post-operative esophageal leak
- mortality 10-50% dependent on timing of diagnosis

# Esophageal Carcinoma

## Epidemiology

- M:F = 3:1
- onset 50-60 yr of age
- upper (20-33%), middle (33%), lower (33-50%)
- main types
  - most common worldwide: SCC in upper 2/3 of esophagus
  - most common in Western countries: adenocarcinoma in distal 1/3 of esophagus

## Risk Factors

- geographic variation in incidence
- SCC
  - underlying esophageal disease such as strictures, diverticula, achalasia
  - smoking, alcohol, hot liquids
  - more common in patients from Asia
- adenocarcinoma
  - Barrett's esophagus (most important), smoking, obesity (increased reflux), GERD

## Clinical Features

- progressive dysphagia (mechanical): first solids then liquids
- odynophagia then constant pain
- constitutional symptoms
- regurgitation and aspiration (aspiration pneumonia)
- hematemesis, anemia
- direct, hematogenous, or lymphatic spread
  - trachea (coughing), recurrent laryngeal nerves (hoarseness, vocal paralysis), aortic, liver, lung, bone, celiac and mediastinal nodes

## Investigations and Staging

- barium swallow: shows narrowing – suggestive but not diagnostic
- endoscopic biopsy and assess resectability
- both SCC and adenocarcinoma use TNM staging system but have separate stage groupings according to histology
- endoscopic U/S (EUS)
  - visualize local disease
  - regional nodal involvement (number of nodes may be more important than location)
- bronchoscopy ± thoracoscopy
  - rule out airway invasion in tumours of the upper and mid esophagus
- full metastatic workup (CXR, bone scan, CT head, CT chest/abdomen/pelvis, LFTs, etc.)
- PET scan more sensitive than CT in detecting metastatic disease

## Treatment

- if present with distant metastatic disease
  - treat with systemic therapy and treat symptoms (esophageal stent)
- if locally advanced (locally invasive disease or nodal disease on CT or EUS)
  - multimodal therapy
    - ♦ concurrent external beam radiation and chemotherapy (cisplatin and 5-FU)
    - ♦ possibility of curative esophagectomy after chemoradiation if disease responds well
  - if unable to tolerate multimodal therapy or if highly advanced disease, consider palliative resection, brachytherapy, or endoscopic dilatation/stenting/laser ablation for palliation

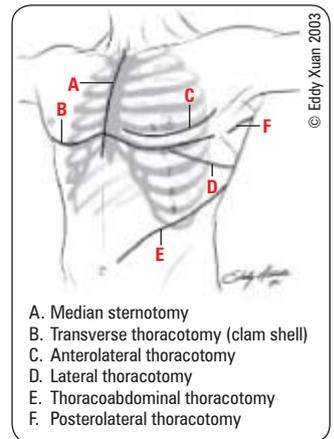

Figure 7. Typical thoracic surgery incisions

### Perioperative Chemo(radio)therapy vs. Primary Surgery for Resectable Adenocarcinoma of the Stomach, Gastroesophageal Junction, and Lower Esophagus

Cochrane DB Syst Rev 2013;5:CD008107

**Study:** Review of RCTs to examine the effect of perioperative chemotherapy for gastroesophageal adenocarcinoma on survival and other clinically relevant outcomes.

**Results/Conclusions:** 14 RCTs, 2,422 participants.

- 1) Perioperative chemotherapy was associated with a significantly longer overall survival (HR 0.81, 95% CI 0.73 to 0.89), a relative survival increase of 19% and an absolute increase of 9%.
- 2) Tumours of the GE junction showed a more pronounced response to perioperative chemotherapy compared to other sites.
- 3) Combined chemoradiotherapy was more effective for tumours of the esophagus and GE junction compared to chemotherapy alone.
- 4) Perioperative chemotherapy was more effective in younger patients and is associated with longer disease-free survival, higher rates of R0 resection, and a more favourable tumour stage upon resection.
- 5) Resection with negative margins is a strong predictor of survival.

- if early stage (non-transmural and without evidence of nodal disease)
  - endoscopic mucosal resection can be considered for early mucosal cancer or high grade dysplasia
  - esophagectomy (transthoracic or trans-hiatal approach) and lymphadenectomy
    - ◆ anastomosis in chest or neck
    - ◆ stomach most often used for reconstruction; may also use colon
  - neoadjuvant chemotherapy and radiation are controversial
  - adjuvant chemotherapy ± radiation usually recommended for post-operative node-positive disease

### Prognosis

- TNM status - usually poor because presentation is usually at advanced stage.

### OTHER DISORDERS

- esophageal motor disorders (see [Gastroenterology, G8](#))
- esophageal varices (see [Gastroenterology, G26](#))
- Mallory-Weiss tear (see [Gastroenterology, G26](#))

## Thymoma

### Epidemiology

- most common neoplasms in thymus including both thymoma and thymic carcinoma
- patients between 40 and 60 yr
- M > F

### Risk Factors

- no known risk factors, strong association with myasthenia gravis and other paraneoplastic syndromes

### Clinical Presentation

- frequently asymptomatic: incidental finding on imaging
- symptoms related to tumour size and location or myasthenia gravis: chest pain, SOB, cough, phrenic nerve palsy
- ddx includes lymphoma, other anterior mediastinal tumours (see [Respirology, R21](#))

### Investigations

- CT chest (and/or MRI)
- Germ cell tumour markers (β-hCG, alpha fetoprotein), thyroid function, PFTs

### Treatment

- for patients with resectable disease
- surgical resection of thymus via median sternotomy or VATS depending on the size
- ± post-operative radiation based on Masaoka staging
- for non-surgical patients
- multimodal therapy including neoadjuvant or palliative chemotherapy and post-operative chemoradiotherapy if de-bulking procedure feasible

### Prognosis

- depends upon stage of disease and resectability
- generally slow growing tumours and have good prognosis

## Pleura, Lung, and Mediastinum

- see [Respirology, R21](#)

## Tube Thoracostomy

### Indications

- to drain abnormal large-volume air or fluid collections in the pleural space
  - hemothorax, pleural effusion, chylothorax, empyema
  - pneumothorax, if
    - ◆ large or progressive
    - ◆ patient is on mechanical ventilation
    - ◆ bronchopleural fistula
    - ◆ tension pneumothorax
- to treat symptomatic and/or recurrent pleural effusion
  - see [Respirology, R22](#)
  - for long-term drainage of malignant effusions use: 1. Tunneled pleural catheter; 2. Pleural drainage and chemical pleurodesis
  - via facilitation of pleurodesis (obliteration of the pleural space by instilling talc or doxycycline to cause fibrosis and adherence of parietal and visceral pleura)

Tube thoracostomy can be completed under U/S guidance by an interventional radiologist or surgeon

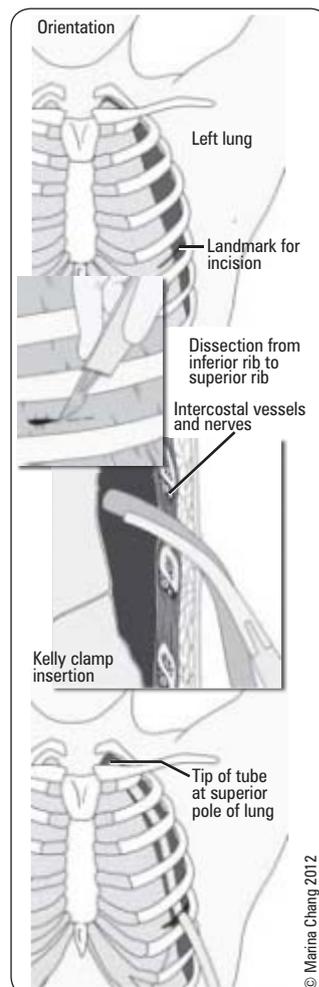

Figure 8. Tube thoracostomy

### Complications

- overall complications are rare (1-3%)
- malposition (most common complication), especially by inexperienced operators
  - tubes may dissect along the external chest wall, or may be placed below the diaphragm
- bleeding (anticoagulation is a relative contraindication)
- local infection, empyema
- perforation of lung parenchyma or vasculature
- risk of re-expansion pulmonary edema when large volumes of air or fluid are drawn off quickly (>1.0-1.5 L)

## Lung Transplantation

### Conditions Leading to Transplantation

- chronic acquired lung disease: COPD
- genetic: CF, emphysema due to  $\alpha$ -1 antitrypsin deficiency
- idiopathic interstitial pneumonias: IPF, nonspecific interstitial pneumonitis
- HTN-related: IPAH, secondary pulmonary HTN, Eisenmenger's syndrome
- other: sarcoidosis, lymphangioliomyomatosis, pulmonary Langerhans cell histiocytosis

### Clinical Indications

- transplantation should be considered for patients with advanced lung disease refractory to maximal medical or surgical therapy
- patients who are symptomatic during activities of daily living and have limited expected survival over the next 2 yr

### Criteria for Transplantation

- lung allocation score based on: 1) post-transplant survival measure, and 2) waiting list urgency measure
- transplant benefit = post-transplant survival (days) – waitlist survival (days)

### Contraindications

- uncontrolled or untreatable pulmonary or extrapulmonary infection
- malignancy in the last 2 yr
- advanced cardiopulmonary disease
- significant chest wall/spinal deformity
- active cigarette smoking
- HIV infection, ongoing HBV or HCV infections

### Post-Operative Complications

- primary graft dysfunction: main cause is ischemia-reperfusion injury, graded by PaO<sub>2</sub>/FiO<sub>2</sub> ratio and CXR findings
- airway anastomotic complications (focal infection, bronchial necrosis and dehiscence, excess granulation tissue, tracheobronchomalacia, stenosis, fistula)
- chronic graft dysfunction: bronchiolitis obliterans syndrome
- infectious complications (bacterial, fungal, CMV, community-acquired respiratory viruses, mycobacteria)
- malignancy (non-melanoma skin cancer, post-transplant lymphoproliferative disease, colon, breast, Kaposi's sarcoma, bladder)

### Prognosis

- median survival for all adult recipients: 5.4 yr
- 1 yr survival: COPD > IPF > IPAH
- 10 yr survival: CF,  $\alpha$ -1 antitrypsin deficiency > IPAH > COPD, IPF

## Chronic Obstructive Pulmonary Disease

- see [Respirology, R9](#)

### Treatment

- indications for surgical management
  - dyspnea despite maximal medical therapy and pulmonary rehabilitation
  - CT showing hyperinflation and heterogeneously distributed emphysema predominant in the upper lung zone
  - may be used as a bridging procedure to lung transplantation
- contraindications
  - age >75, cigarette smoking within the prior 6 mo, higher risk of surgical mortality
  - homogeneously distributed emphysematous changes without areas of preserved lung tissue
  - diffusing capacity of lung for carbon monoxide <20% of predicted, PaCO<sub>2</sub> >60 mmHg, PaO<sub>2</sub> <45 mmHg
- surgical procedures
  - lung volume reduction surgery: wedge excision of emphysematous tissue
  - bilateral or unilateral, thoracotomy or VATS

#### Long-Term Survival Analysis of the Canadian Lung Volume Reduction Surgery Trial

*Ann Thorac Surg* 2013;96:1217-1222

**Study:** Retrospective observational study assessing the long-term survival of patients enrolled in the CLVRS at 8-10 yr follow-up.

**Results/Conclusions:** Compared with the best medical care group, patients in the LVRS group showed a 16-mo survival advantage and a 20% reduction in mortality. Although not statistically significant, LVRS may provide long-term benefits in the treatment of end-stage emphysema.

**Complications of Treatment**

- air leak: may require reintubation and mechanical ventilation
- arrhythmias, pneumonia

**Prognosis**

- total mortality at 2 yr same as with maximal medical therapy, but better exercise capacity and quality of life with LVRS

# Stomach and Duodenum

## Peptic Ulcer Disease

**GASTRIC ULCERS**

- see [Gastroenterology, G11](#)

**Indications for Surgery**

- refractory to medical management
- suspicion of malignancy (even if biopsy benign)
- complications of PUD: obstruction, perforation, bleeding (3x greater risk compared to duodenal ulcers)
- surgical treatment is increasingly rare due to *H. pylori* eradication and medical treatment

**Procedures**

- ligation of bleeding vessels
- distal gastrectomy with ulcer excision: Billroth II, Roux-en-Y gastrojejunostomy or Billroth I (rarely) reconstruction
- vagotomy and pyloroplasty only if acid hypersecretion (rare)
- wedge resection if possible or biopsy with primary repair

**DUODENAL ULCERS**

- see [Gastroenterology, Bleeding Peptic Ulcer, G12, and Peptic Ulcer Disease, G11](#)
- most within 2 cm of pylorus (duodenal bulb)

**Indications for Surgery**

- hemorrhage, rebleed in hospital, perforation, gastric outlet obstruction
- refractory to medical and endoscopic management

**Procedures**

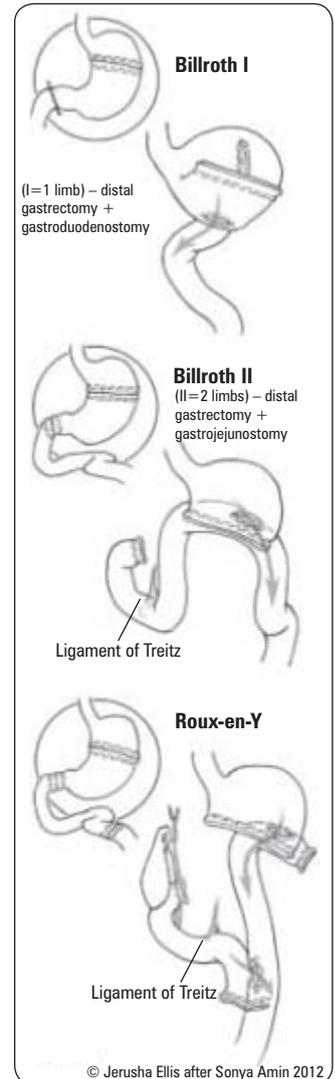

- omental (Graham) patch: plication of ulcer supported by overlying omental patch
  - oversewing of bleeding ulcer ± pyloroplasty
- treat with *H.pylori* eradication protocol post operatively.

**Complications of Gastric Surgery**

- retained antrum
- fistula (gastrocolic/gastrojejunal)
- dumping syndrome, postvagotomy diarrhea, afferent loop syndrome (see [Complications of Gastric Surgery, GS21](#))

**Table 5. Complications of Duodenal Ulceration**

Complication	Clinical Features	Management
<b>Perforated Ulcer</b> (typically on anterior surface)	Sudden onset of pain (possibly in RLQ due to track down right paracolic gutter) Acute abdomen: rigid, diffuse guarding Ileus Initial chemical peritonitis followed by bacterial peritonitis	Investigation CXR – free air under diaphragm (70% of patients)  Treatment Oversew ulcer (plication) and omental (Graham) patch – most common treatment
<b>Posterior Penetration</b>	Elevated amylase/lipase if penetration into pancreas Constant mid-epigastric pain burrowing into back, unrelated to meals	
<b>Hemorrhage</b> (typically on posterior surface)	Gastroduodenal artery involvement	Resuscitation initially with crystalloids; blood transfusion if necessary Diagnostic and/or therapeutic endoscopy (laser, cautery, or injection); if recurs, may have second scope Consider interventional radiology: angiography with embolization/coiling Surgery if severe or recurrent bleeding, hemodynamically unstable, or failure of endoscopy and IR: oversewing of ulcer, pyloroplasty
<b>Gastric Outlet Obstruction</b>	Ulcer can lead to edema, fibrosis of pyloric channel, neoplasm N/V (undigested food, non-bilious), dilated stomach, crampy abdominal pain Succession splash (splashing noise heard with stethoscope over the stomach when patient is shaken) Auscultate gas and fluid movement in obstructed organ	NGT decompression and correction of hypochloremic, hypokalemic metabolic alkalosis Medical management initially: high dose PPI therapy Surgical resection if obstruction does not resolve: either Billroth I, pyloroplasty, or gastrojejunostomy

**Figure 9. Billroth I and Billroth II with Roux-en-Y reconstruction (gastrojejunostomy)**

**Kissing Ulcer:** combination of perforation and bleeding

# Gastric Carcinoma

## Epidemiology

- 5th most common cancer in the world
- M:F = 3:2
- most common age group = 50-59 yr
- incidence has decreased by 2/3 in past 50 yr
- incidence of adenocarcinoma <10 (US) vs. 40 (Japan, Korea) per 100,000 (incidence highest in Asia, Latin America, and Caribbean)

## Risk Factors

- compensatory epithelial cell proliferation via gastric atrophy from:
  - *H. pylori*, causing chronic atrophic gastritis
  - pernicious anemia associated with achlorhydria and chronic atrophic gastritis
  - previous partial gastrectomy (>10 yr post-gastrectomy)
- host-related factors
  - blood type A
  - hereditary nonpolyposis colorectal cancer (HNPCC), hereditary diffuse gastric carcinoma (HDGC)
  - gastric adenomatous polyps
  - hypertrophic gastropathy
  - genetic syndromes: hereditary diffuse gastric cancer E-cadherin (CDH-1) gene
- environmental factors: smoking, alcohol, smoked food, nitrosamines

## Clinical Features

- clinical suspicion
  - ulcer fails to heal
  - lesion on greater curvature of stomach or cardia
- asymptomatic, insidious, or late onset of symptoms
  - postprandial abdominal fullness, vague epigastric pain
  - anorexia, weight loss
  - burping, N/V, dyspepsia, dysphagia
  - hepatomegaly, epigastric mass (25%)
  - hematemesis, fecal occult blood, melena, iron-deficiency anemia
- metastasis
  - peritoneum, ovarian, liver, lung, brain

## Investigations

- OGD and biopsy; consider EUS to assess pre-operative T-stage and N-stage
- CT chest/abdomen/pelvis (for metastatic workup see Table 7)

**Table 6. TNM Classification System for Staging of Gastric Carcinoma (AJCC/IUCC 2010)**

Primary Tumour (T)		Regional Lymph Nodes (N)		Distant Metastasis (M)	
T0	No evidence of primary tumour	NX	Cannot be assessed	M0	No distant metastasis
Tis	Carcinoma <i>in situ</i>	N0	No regional node metastasis	M1	Distant metastasis
T1a	Invasion into lamina propria or muscularis mucosae	N1	Metastasis in 1-2 regional nodes		
T1b	Invasion into submucosa	N2	Metastasis in 3-6 regional nodes		
T2	Invasion into muscularis propria	N3a	Metastasis in 7-15 regional nodes		
T3	Penetration of subserosal connective tissue without tissue invasion of visceral peritoneum or adjacent structures	N3b	Metastasis in ≥16 regional nodes		
T4a	Invasion into serosa				
T4b	Invasion into adjacent structures				
N0	No regional node metastasis				
N1	Metastasis in 1-2 regional nodes				
N2	Metastasis in 3-6 regional nodes				
N3a	Metastasis in 7-15 regional nodes				
N3b	Metastasis in ≥16 regional nodes				

## Treatment

- adenocarcinoma
  - proximal lesions
    - ♦ total gastrectomy and Roux-en-Y esophagojejunostomy
  - distal lesions
    - ♦ distal gastrectomy: wide margins, en bloc removal of omentum and lymph nodes with Roux-en-Y or Billroth II reconstruction
  - palliation
    - ♦ limited gastric resection or endoscopic stenting to decrease bleeding and relieve obstruction, enables the patient to eat
    - ♦ radiation therapy
  - studies are showing larger role for adjuvant/ neoadjuvant and palliative chemotherapy

**Signs of Metastatic Gastric Carcinoma**  
**Virchow's node:** left supraclavicular node  
**Blumer's shelf:** mass in pouch of Douglas  
**Krukenberg tumour:** metastases to ovary  
**Sister Mary Joseph node:** umbilical metastases  
**Irish's node:** left axillary nodes

**Staging and 5 Yr Survival Rates for Gastric Cancer**

Stage	TNM	5-Yr Survival
IA	T1N0M0	71%
IB	T2N0M0	57%
IIA	T1N1M0	45%
	T3N0M0	
	T2N1M0	
IIB	T1T2M0	33%
	T4aN0M0	
	T3N1M0	
IIIA	T2N2M0	20%
	T1N3M0	
	T4aN1M0	
IIIB	T3T2M0	14%
	T2N3M0	
	T4bN0M0	
	T4bN1M0	
IIIC	T4aN2M0	9%
	T3N3M0	
	T4bN2M0	
	T4bN3M0	
IV	TxNxM1	4%

- lymphoma
  - *H. pylori* eradication, chemotherapy ± radiation, surgery in limited cases (perforation, bleeding, obstruction)

## Gastrointestinal Stromal Tumour

### Epidemiology

- most common mesenchymal neoplasm of GI tract
- derived from interstitial cells of Cajal (cells associated with Auerbach's plexus that have autonomous pacemaker function which coordinate peristalsis throughout the GI tract)
- 75-80% associated with tyrosine kinase (c-KIT) mutations
- most common in stomach (50%) and proximal small intestine (25%), but can occur anywhere along GI tract
- typically present with vague abdominal mass, feeling of abdominal fullness, or with secondary symptoms of bleeding and anemia
- often discovered incidentally on CT, laparotomy, or endoscopy

### Risk Factors

- Carney's triad: GISTs, paraganglioma, and pulmonary chondroma
- Type IA neurofibromatosis

### Investigations

- pre-operative biopsy (endoscopic ultrasound): controversial, but useful for indeterminate lesions
  - not recommended if index of suspicion for GIST is high
  - percutaneous biopsy is NOT recommended due to high friability and risk of peritoneal spread

### Treatment

- surgical resection if >2 cm; follow with serial endoscopy if <2 cm and resect if growing or symptomatic
- localized GIST
  - surgical resection with preservation of intact pseudocapsule
  - lymphadenectomy NOT required, as GISTs rarely metastasize to lymph nodes
  - consider adjuvant treatment with imatinib (Gleevec) or high-risk GIST (large, >4 cm with significant mitotic activity)
- advanced disease (i.e. metastases to liver and/or peritoneal cavity)
  - palliative intent chemotherapy with imatinib
  - metastectomy may be considered for liver limited disease

### Prognosis

- risk of metastatic potential depends on
  - tumour size (worse if >10 cm)
  - mitotic activity (worse if >5 mitotic figures or 50/hpf)
  - degree of nuclear pleomorphism
  - location: with identical sizes, extra-gastric location has a higher risk of progression than GISTs in the stomach
- metastases to liver, omentum, peritoneum; nodal metastases rare

## Bariatric Surgery

- weight reduction surgery for morbid obesity
- indications: BMI ≥40 without illness or BMI ≥35 with 1+ serious comorbidity (e.g. DM, CAD, sleep apnea, severe joint disease)

### Surgical Options

- malabsorptive/restrictive
  - laparoscopic Roux-en-Y gastric bypass (most common – see Figure 9)
  - staple off small gastric pouch (restrictive) with Roux-en-Y limb to pouch (malabsorptive) with dumping syndrome physiology
  - most effective, higher complication rates
- restrictive
  - laparoscopic adjustable gastric banding
    - ♦ silicone band around fundus creates pouch, adjustable through port under skin
  - laparoscopic vertical sleeve gastrectomy
    - ♦ vertical stapled small gastric pouch
- malabsorptive
  - biliopancreatic diversion with duodenal switch
  - gastrectomy, enteroenterostomy, duodenal division closure and duodenoenterostomy

**Bariatric (Weight Loss) Surgery for Obesity is Considered when Other Treatments have Failed**  
*Cochrane DB Syst Rev 2009;2:CD003641*

#### Benefits

- Greater weight loss in patients with BMI >30 at 2 yr.
- Reduction in comorbidities (type 2 DM, HTN, and medication use).
- Improvement in quality of life at 2 yr (physical function, physical role, general health, vitality, and emotional role).

#### Risks

- Complications: leaks, hernias, infection, pulmonary embolism, post-operative mortality.
- Side effects specific to type of procedure (i.e. vomiting, dumping syndrome, food intolerance).
- Cholecystitis occurs as a result of rapid weight loss.

**Complications**

- perioperative mortality ~1% (anastomotic leak with peritoneal signs, PE)
- obstruction at enteroenterostomy (see *Complications of Gastric Surgery*)
- staple line dehiscence
- dumping syndrome
- cholelithiasis due to rapid weight loss (20-30%)
- band abscess (if long-term)

**Complications of Gastric Surgery**

- most resolve within 1 yr

**Alkaline Reflux Gastritis** (see Figure 10A)

- duodenal contents (bilious) reflux into stomach causing gastritis ± esophagitis
- treatment
  - medical: H<sub>2</sub>-blocker, metoclopramide, cholestyramine (bile acid sequestrant)
  - surgical: conversion of Billroth I or II to Roux-en-Y

**Afferent Loop Syndrome** (see Figure 10B)

- accumulation of bile and pancreatic secretions causes intermittent mechanical obstruction and distention of afferent limb
- clinical features
  - early postprandial distention, RUQ pain, nausea, bilious vomiting, anemia
- treatment: surgery (conversion to Roux-en-Y increases afferent loop drainage)

**Dumping Syndrome** (see Figure 10C)

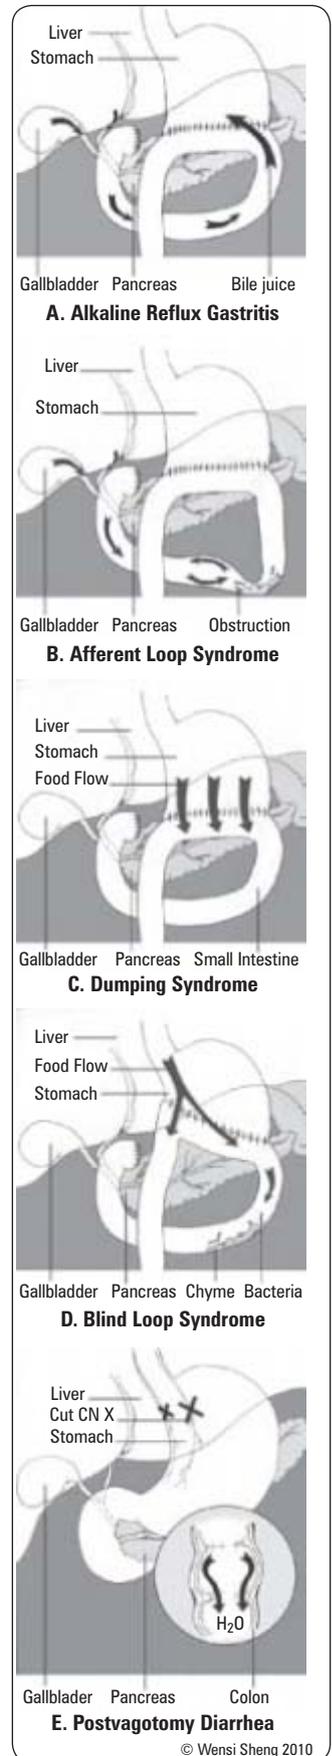

- early – 15 min post-prandial
  - etiology
    - ♦ hyperosmotic chyme released into small bowel (fluid accumulation and jejunal distention)
  - clinical features
    - ♦ post-prandial symptoms
    - ♦ epigastric fullness or pain, emesis, nausea, diarrhea, palpitations, dizziness, tachycardia, diaphoresis
  - treatment
    - ♦ small multiple low carbohydrate, low fat, and high protein meals and avoidance of liquids with meals
    - ♦ last resort is interposition of antiperistaltic jejunal loop between stomach and small bowel to delay gastric emptying
- late – 3 h post-prandial
  - etiology: large glucose load leads to large insulin release and hypoglycemia
  - treatment: small snack 2 h after meals

**Blind-Loop Syndrome** (see Figure 10D)

- bacterial overgrowth of colonic Gram-negative bacteria in afferent limb
- clinical features
  - anemia/weakness, diarrhea, malnutrition, abdominal pain, and hypocalcemia
- treatment: broad-spectrum antibiotics, surgery (conversion to Billroth I)

**Postvagotomy Diarrhea** (see Figure 10E)

- up to 25%
- bile salts in colon inhibit water resorption
- treatment: medical (cholestyramine), surgical (reversed interposition jejunal segment)

**Figure 10. Complications of gastric surgery**

# SMALL INTESTINE

## Small Bowel Obstruction

### Mechanical Small Bowel Obstruction

#### Etiology

Table 7. Common Causes of SBO

Intraluminal	Intramural	Extramural
Intussusception Gallstones Bezoars	Crohn's Radiation stricture Adenocarcinoma	Adhesions from previous surgeries (75% SBO) Incarcerated hernia Peritoneal carcinomatosis

#### Pathophysiology

- obstruction → gas & fluid (swallowed or GI secretions) accumulate proximal to site of obstruction and distal decompression → intestinal activity increases to overcome obstruction → colicky pain and diarrhea (initially)
- bowel wall edema and disruption of normal bowel absorptive function can lead to increased intraluminal fluid and transudative fluid loss into peritoneal cavity, electrolyte disturbances
- increase intramural pressure can lead to impaired microvascular perfusion leading to intestinal ischemia and necrosis (strangulated bowel obstruction)
- three types**
  - partial SBO: only a portion of intestinal lumen is occluded, allows passage of some gas & fluid, low risk of strangulation
  - complete SBO: the lumen of the intestine is occluded, no passage of gas or stool, at higher risk of strangulation
  - closed-loop obstruction: segment of intestine is obstructed both proximally and distally (e.g. volvulus), leading to rapid rise in intraluminal pressure from gas and fluid that cannot escape, high risk of strangulation due to bowel wall ischemia

#### Risk Factors

- prior abdominal or pelvic surgery, abdominal wall or groin hernia, history of malignancy, prior radiation

#### Clinical Features

- 1) distinguish mechanical obstruction from ileus; 2) determine etiology of obstruction; 3) recognize partial from complete SBO; 4) differentiate simple from complicated (e.g. strangulated) obstruction
- symptoms:** colicky abdominal pain, nausea/vomiting, obstipation
  - vomiting is more prominent with proximal than distal
  - more feculent vomitus suggest more established obstruction because of bacterial overgrowth
  - continue passage of gas and/or stool 6-12 h after onset of symptoms suggest partial than complete obstruction
- signs:** abdominal distention (most prominent if obstruction at distal ileum), hyperactive proceeding to minimal bowel sound
- strangulated obstruction: abdominal pain disproportionate to physical exam findings suggest intestinal ischemia
  - may have tachycardia, localized abdominal tenderness, fever, marked leukocytosis, lactate acidosis

#### Investigations

- radiological**
  - abdominal x-ray (3 views): triad of dilated small bowel (>3 cm in diameter), air-fluid levels on upright film, paucity of air in colon (high sensitivity, low specificity as ileus and LBO can present similarly)
  - CT: discrete transition zone with proximal bowel dilation, distal bowel decompression, and intraluminal contrast does not pass the transition zone
    - most importantly to r/o ischemic bowel/strangulation: pneumatosis intestinalis (free air in bowel wall) & thickened bowel wall, air in portal vein, free intraperitoneal fluids, differential wall enhancements (poor uptake of IV contrast into the wall of the affected bowel)
  - other
    - less used: upper GI series/small bowel series (if no cause apparent, i.e. no hernias, no previous surgeries)
    - may consider U/S or MRI in pregnant patients
- laboratory**
  - may be normal early in disease course
  - creatinine, hematocrit to assess degree of dehydration
  - fluid, electrolyte abnormalities; metabolic alkalosis due to frequent emesis; amylase elevated
  - if strangulation: leukocytosis with left shift, elevated lactate (late signs)

#### MUST DO

Rule out CRC in constipated patient  
Send for TURP in patient with BPH (treat intra-abdominal HTN)

#### Increased Risk of Perforation with Distention as seen on Abdomen Imaging

- Small bowel  $\geq 3$  cm
- Distal colon  $\geq 6$  cm
- Proximal colon  $\geq 9$  cm
- Cecum  $\geq 12$  cm

Patients presenting with a SBO in setting of "virgin" abdomen should have surgery ASAP  
– EXCEPTION: malignant obstruction from history and imaging

In a non-virgin abdomen – adhesional SBOs resolve spontaneously with NGT decompression 70% of time

#### Top 3 Causes of SBO (in order)

##### ABC

- Adhesions
- Bulge (hernias)
- Cancer (neoplasms)

#### Causes of SBO

##### SHAVING

- Stricture
- Hernia
- Adhesions
- Volvulus
- Intussusception/IBD
- Neoplasm
- Gallstones

### Treatment

- IV isotonic fluid resuscitation + urine output monitoring with catheter
  - SBO related vomiting and decrease PO intake leads to volume depletion
- NG tube in the stomach for gastric decompression; decrease nausea, distention, and risk of aspiration from vomiting
- **Partial SBO/Crohn's/Carcinomatosis:** conservative management with fluid resuscitation and NG tube decompression
  - 48 h of watchful waiting; if no improvement or develops complications, surgery
- **Complete SBO,** if no clinical features of strangulation, short course of conservative management with fluid resuscitation and NG tube decompression with frequent re-examination by surgical team
  - duration of observation varies from hours to a few days
  - if SBO fails to resolve, or if symptoms of strangulation develop then surgery

### High risk for strangulation based on clinical symptoms: urgent surgery to prevent irreversible ischemia

- early post-operative SBO: if bowel function do not return within 3-5 d after surgery; usually partial, extended conservative therapy (2-3 wk) with bowel rest, fluids, and TPN is appropriate
  - surgery if presence of peritonitis or complete SBO demonstrated

### Prognosis

- related to etiology; mortality: non-strangulating <1%, strangulating 8% (25% if >36 h), ischemic = up to 50%

### Prevention

- open surgery has four fold increase in risk of SBO in 5 yr compared to laparoscopic surgery

## Paralytic Ileus

### Pathogenesis

- temporary, reversible impairment of intestinal motility; mostly frequently caused by:
  - abdominal operations, infections & inflammation, medications (opiates, anesthetics, psychotropics), and electrolyte abnormalities
  - passing gas is the most useful indicator
- **NOT** the same as intestinal pseudo-obstruction
  - chronic pseudo-obstruction refers to specific disorders that affect the smooth muscle and myenteric plexus, leading to **irreversible** intestinal dysmotility

### Clinical Features

- symptoms and signs of intestinal obstruction without mechanical obstruction
  - bowel sounds are diminished or absent (in contrast to initial hyperactive bowel sounds in SBO)

### Investigations

- routine post-operative ileus: expected, no investigation needed
- if ileus persists or occurs without abdominal surgery
  - review patient medications (especially opiates)
  - measure serum electrolyte to monitor for electrolyte abnormalities (including extended lytes like Mg, Ca<sup>2+</sup>, PO<sub>4</sub>)
  - CT scan to rule out abscess or peritoneal sepsis, or to exclude complete mechanical obstruction

### Treatment

- most important: NPO + fluid resuscitation
- NGT decompression, correct causative abnormalities (e.g. sepsis, medications, electrolytes), consider TPN for prolonged ileus
- **post-operative:** gastric and small bowel motility returns by 24-48 h, colonic motility by 3-5 d
- current interest in novel therapies such as gum chewing and pharmacologic therapy (e.g. alvimopan, an opioid antagonists)

## Intestinal Ischemia

### Etiology

- acute
  - arterio-occlusive mesenteric ischemia (AOMI)
    - ♦ thrombotic, embolic, extrinsic compression (e.g. strangulating hernia)
  - non-occlusive mesenteric ischemia (NOMI)
    - ♦ mesenteric vasoconstriction secondary to systemic hypoperfusion (preserves supply to vital organs)
  - mesenteric venous thrombosis (MVT)
    - ♦ consider hypercoagulable state (i.e. rule out malignancy), DVT (prevents venous outflow)
- chronic: usually due to atherosclerotic disease – look for CVD risk factors
- can lead to occlusion in vessels that supplies the small intestine and the large intestine

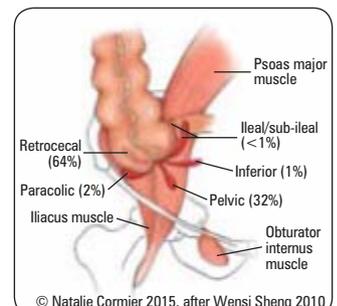

Figure 11. Appendix anatomy

**Clinical Features**

- acute: severe abdominal pain out of proportion to physical findings, vomiting, bloody diarrhea, bloating, minimal peritoneal signs early in course, hypotension, shock, sepsis
- chronic: postprandial pain (from mesenteric angina), fear of eating, weight loss
- common sites: SMA supplied territory, “watershed” areas of colon – splenic flexure, left colon, sigmoid colon

Pain “out of keeping with physical findings” is the hallmark of early intestinal ischemia

**Investigations**

- laboratory: leukocytosis (non-specific), lactic acidosis (late finding)
  - amylase, lactate, CK, ALP can be used to observe progress
  - hypercoagulability workup if suspect venous thrombosis
- AXR: portal venous gas, intestinal pneumatosis, free air if perforation
- contrast CT: thickened bowel wall, luminal dilatation, SMA or SMV thrombus, mesenteric/portal venous gas, pneumatosis
- CT angiography is the gold standard for acute arterial ischemia

An acute abdomen + metabolic acidosis is bowel ischemia until proven otherwise

**Treatment**

- fluid resuscitation, correct metabolic acidosis, NPO, NGT decompression of stomach, prophylactic broad-spectrum antibiotics, avoid vasoconstrictors and digitalis
- exploratory laparotomy
- angiogram, embolectomy/thrombectomy, bypass/graft, mesenteric endarterectomy, anticoagulation therapy, percutaneous transluminal angioplasty ± stent
- segmental resection of necrotic intestine
- assess extent of viability; if extent of bowel viability is uncertain, a second look laparotomy 12-24 h later is mandatory

**Tumours of Small Intestine**

**BENIGN TUMOURS**

- 10x more common than malignant
- usually asymptomatic until large
- most common sites: terminal ileum, proximal jejunum
- polyps
  - adenomas
  - hamartomas
  - FAP (see *Familial Colon Cancer Syndromes, GS33*)
  - juvenile polyps
- other: leiomyomas, lipomas, hemangiomas

**Carcinoid Syndrome Symptoms**

- FDR**
- Flushing
- Diarrhea
- Right-sided heart failure

**Table 8. Malignant Tumours of the Small Intestine**

	<b>Adenocarcinoma</b>	<b>Carcinoid</b>	<b>Lymphoma</b>	<b>Metastatic</b>
<b>Epidemiology</b>	Usually 50-70 yr M>F	Increased incidence 50-60 yr	Highest incidence in 70s M>F Usually non-Hodgkin's lymphoma	Most common site of GI metastases in patients with metastatic melanoma
<b>Risk Factors</b>	Crohn's, FAP, history of CRC, HNPCC		Crohn's, celiac disease, autoimmune disease, immunosuppression, radiation therapy, nodular lymphoid hyperplasia	Melanoma, breast, lung, ovary, colon, cervical cancer
<b>Clinical Features</b>	Early metastasis to lymph nodes 80% metastatic at time of operation Abdominal pain (common)	N/V, anemia, GI bleeding, jaundice, weight loss (less common) Often slow-growing Usually asymptomatic, incidental finding Obstruction, bleeding, crampy abdominal pain, intussusception Carcinoid syndrome (<10%) Hot flashes, hypotension, diarrhea, bronchoconstriction, right heart failure Requires liver involvement: lesion secretes serotonin, kinins, and vasoactive peptides directly to systemic circulation (normally inactivated by liver)	Fatigue, weight loss, fever malabsorption, abdominal pain, anorexia, vomiting, constipation, mass Rarely – perforation, obstruction, bleeding, intussusception	Obstruction and bleeding
<b>Investigations</b>	CT abdomen/pelvis Endoscopy	Most found incidentally at surgery for obstruction or appendectomy Chest thorax/abdomen/pelvis Consider small bowel enteroclysis to look for primary Serum chromogranin A as a tumour marker Elevated 5-HIAA (breakdown product of serotonin) in urine or increased 5-HT in blood Radiolabelled octreotide or MIBG scans to search for metastases and locate tumour	CT abdomen/pelvis	CT abdomen/pelvis

**Table 8. Malignant Tumours of the Small Intestine (continued)**

	Adenocarcinoma	Carcinoid	Lymphoma	Metastatic
<b>Treatment</b>	Surgical resection ± chemotherapy	Surgical resection ± chemotherapy Carcinoid syndrome treated with steroids, histamine, octreotide Metastatic risk 2% if size <1 cm, 90% if >2 cm	Low grade: chemotherapy with cyclophosphamide High grade: surgical resection, radiation Palliative: somatostatin, doxorubicin	Palliation
<b>Prognosis</b>	5 yr survival 25% (if node positive)	5 yr survival 70%; 20% with liver metastases	5 yr survival 40%	Poor
<b>Origin/Location</b>	Usually in proximal small bowel, incidence decreases distally	Classified based on embryological origin (foregut, midgut, hindgut) Originate from gut enterochromaffin cell Appendix 46%, distal ileum 28%, rectum 17%	Usually distal ileum Proximal jejunum in patients with celiac disease	Hematogenous spread from breast, lung, kidney Direct extension from cervix, ovaries, colon
<b>Staging System</b>	TNM	TNM	Ann Arbor	

## Short Gut Syndrome

### Definition

- reduced surface area (length) of small bowel causing insufficient intestinal absorption leading to diarrhea, malnutrition, and dehydration

### Risk Factors

- acute mesenteric ischemia: resection of large amount of bowel at once
- Crohn's disease: cumulative resections
- malignancies

### Prognostic Factors

- residual small bowel length, residual colon length (reabsorption of water and electrolytes and some reabsorption of nutrients), condition of the remnant small bowel (healthier bowel facilitate better reabsorption), presence of ileocecal valve (delay transition into colon leading to more reabsorption)
- resection of ileum is less tolerated than resection of jejunum (ileum reabsorbs bile salt and vitamin B12)

### Therapy

- medical
  - TPN: replenish lost fluid and electrolytes in diarrhea
  - HT2R antagonist or PPI to prevent gastric acid secretion
  - antimotility agent to prolong transit time in the small intestine
  - consider octreotide to decrease GI secretion & cholestyramine for bile acid absorption
- surgical: non-transplant
  - to slow transit time: small bowel segmental reversal, intestinal valve construction, or electrical pacing of small bowel
  - to increase intestinal length:
    - LILT (longitudinal intestinal lengthening and tailoring) procedure
    - STEP (serial transverse enteroplasty procedure) in dilated small bowels
- surgical: transplant
  - indication: life-threatening complication from intestinal failure or long-term TPN
    - liver failure, thrombosis of major central veins, recurrent catheter-related sepsis, recurrent severe dehydration

## Abdominal Hernia

- see *Hiatus Hernia*, GS13

### Definition

- defect in abdominal wall causing abnormal protrusion of intra-abdominal contents

### Epidemiology

- M:F = 9:1
- lifetime risk of developing a hernia: males 20-25%, females 2%
- frequency of occurrence: 50% indirect inguinal, 25% direct inguinal, 8-10% incisional (ventral), 5% femoral, 3-8% umbilical
- most common surgical disease of males

### Risk Factors

- activities which increase intra-abdominal pressure
  - obesity, chronic cough, asthma, COPD, pregnancy, constipation, bladder outlet obstruction, ascites, heavy lifting
- congenital abnormality (e.g. patent processus vaginalis, indirect inguinal hernia)
- previous hernia repair, especially if complicated by wound infection
- loss of tissue strength and elasticity (e.g. hiatus hernia, aging, repetitive stress)

#### Indirect Inguinal Hernias: Rule of 5s

5% lifetime incidence in males  
5x more common than direct inguinal hernias  
5-10x more common in males than females  
Generally occur by 5th decade of life

#### Inguinal Hernias – MD's don't Lie

MD: Medial to the inferior epigastric a. = Direct inguinal hernia  
LI: Lateral to the inferior epigastric a. = Indirect inguinal hernia

#### Inguinal Canal Walls = MALT x 2

2M Roof 2 muscles (internal oblique, transversus abdominis)  
2A Ant. wall 2 aponeuroses (external and internal oblique)  
2L Floor 2 ligaments (inguinal and lacunar)  
2Ts Post. wall 2T (transversalis fascia, conjoint tendon)

#### Borders of Hesselbach's Triangle

- Lateral: inferior epigastric artery
- Inferior: inguinal ligament
- Medial: lateral margin of rectus sheath

## Clinical Features

- mass of variable size
- tenderness worse at end of day, relieved with supine position or with reduction
- abdominal fullness, vomiting, constipation
- transmits palpable impulse with coughing or straining

## Investigations

- physical examination usually sufficient
- U/S ± CT (CT required for obturator hernias, internal abdominal hernias, and Spigelian and/or femoral hernias in obese patients)

## Classification

- complete: hernia sac and contents protrude through defect
- incomplete: partial protrusion through the defect
- internal hernia: sac herniating into or involving intra-abdominal structure
- external hernia: sac protrudes completely through abdominal wall
- strangulated hernia: vascular supply of protruded viscus is compromised (ischemia)
  - requires **emergency** repair
- incarcerated hernia: irreducible hernia, not necessarily strangulated
- Richter's hernia: only part of bowel circumference (usually anti-mesenteric border) is incarcerated or strangulated so may not be obstructed
  - a strangulated Richter's hernia may self-reduce and thus be overlooked, leaving a gangrenous segment at risk of perforation in the absence of obstructive symptoms
- sliding hernia: part of wall of hernia sac formed by retroperitoneal structure (usually colon)

## Anatomical Types

- groin
  - indirect and direct inguinal, femoral
  - pantaloon: combined direct and indirect hernias, peritoneum draped over inferior epigastric vessels
- epigastric: defect in linea alba above umbilicus
- incisional: ventral hernia at site of wound closure, may be secondary to wound infection
- other: Littre's (involving Meckel's), Amyand's (containing appendix), lumbar, obturator, peristomal, umbilical, Spigelian (ventral hernia through linea semilunaris)

## Complications

- incarceration
- strangulation
  - small, new hernias more likely to strangulate
  - femoral >> indirect inguinal > direct inguinal
  - intense pain followed by tenderness
  - intestinal obstruction, gangrenous bowel, sepsis
  - surgical emergency
  - **DO NOT** attempt to manually reduce hernia if septic or if contents of hernial sac gangrenous
  - will cause closed loop SBO – and EMERGENCY

## Treatment

- surgical treatment (herniorrhaphy) is only to prevent strangulation and evisceration, for symptomatic relief, for cosmesis; if asymptomatic can delay surgery
- repair may be done open or laparoscopic and may use mesh for tension-free closure
- most repairs are now done using tension free techniques – a plug in the hernial defect and a patch over it or patch alone
- observation is acceptable for small asymptomatic inguinal hernias

## Post-Operative Complications

- recurrence (15-20%)
  - risk factors: recurrent hernia, age >50, smoking, BMI >25, poor pre-operative functional status (ASA ≥3 – see [Anesthesia and Perioperative Medicine, A4](#)), associated medical conditions: type 2 DM, hyperlipidemia, immunosuppression, any comorbid conditions increasing intra-abdominal pressure
  - less common with mesh/"tension-free" repair
- scrotal hematoma (3%)
  - painful scrotal swelling from compromised venous return of testes
  - deep bleeding: may enter retroperitoneal space and not be initially apparent
  - difficulty voiding
- nerve entrapment
  - ilioinguinal (causes numbness of inner thigh or lateral scrotum)
  - genital branch of genitofemoral (in spermatic cord)
- stenosis/occlusion of femoral vein
  - acute leg swelling
- ischemic colitis

### Shouldice Technique vs. Other Open Techniques for Inguinal Hernia Repair

*Cochrane DB Syst Rev* 2012;4:CD001543

**Purpose:** To evaluate the efficacy and safety of the Shouldice technique to other non-laparoscopic techniques.

**Results/Conclusions:** 16 RCTs or quasi-randomized RCTs with 2,566 hernias (1,121 mesh; 1,608 non-mesh). The recurrence rate with Shouldice was higher than mesh (OR 3.80, 95% CI 1.99-7.26) but lower than non-mesh (OR 0.62, 95% CI 0.45-0.85). There was no difference in chronic pain or complications. In conclusion, with respect to recurrence rates, Shouldice herniorrhaphy is the best non-mesh technique, although inferior to mesh. However, it is also more time consuming and results in slightly longer post-operative hospital stays.

### Watchful Waiting vs. Repair of Inguinal Hernia in Minimally Symptomatic Men: A Randomized Clinical Trial

*JAMA* 2006;295:285-292

**Purpose:** To compare pain and the physical component score (PCS) of the Short Form-36 Version 2 survey at 2 yr in men with minimally symptomatic inguinal hernias treated with watchful waiting or surgical repair.

**Methods:** RCT of 720 men (n=364 watchful waiting, n=356 surgical repair) followed up for 2-4.5 yr. Watchful-waiting patients were followed up at 6 mo and annually and watched for hernia symptoms; repair patients received standard open tension-free repair and were followed up at 3 and 6 mo and annually. The main outcome was pain and discomfort interfering with usual activities at 2 yr and change in PCS from baseline to 2 yr. Secondary outcomes were complications, patient-reported pain, functional status, activity levels, and satisfaction with care.

**Results:** Primary intention-to-treat outcomes were similar at 2 yr for watchful waiting vs. surgical repair: pain limiting activities (5.1% vs. 2.2%, respectively; p=0.06 [corrected]); PCS (improvement over baseline, 0.29 points vs. 0.13 points; p=0.79). Twenty-three percent of patients assigned to watchful waiting crossed over to receive surgical repair (increase in hernia-related pain was the most common reason offered); 17% assigned to receive repair crossed over to watchful waiting. Self-reported pain in watchful-waiting patients crossing over improved after repair. Occurrence of post-operative hernia-related complications was similar in patients who received repair as assigned and in watchful-waiting patients who crossed over. One watchful-waiting patient (0.3%) experienced acute hernia incarceration without strangulation within 2 yr; a second had acute incarceration with bowel obstruction at 4 yr, with a frequency of 1.8/1,000 patient/yr inclusive of patients followed up for as long as 4.5 yr.

**Conclusion:** Watchful waiting is an acceptable option for men with minimally symptomatic inguinal hernias. Delaying surgical repair until symptoms increase is safe because acute hernia incarcerations occur rarely.

### Outcomes of Laparoscopic vs. Open Repair of Primary Ventral Hernias

*JAMA Surg* 2013;148:1043-1048

**Purpose:** To compare outcomes (surgical site infection (SSI), hernia recurrence and bulging) of patients undergoing laparoscopic ventral hernia repair (LVHR) versus open ventral hernia repair (OVHR).

**Results/Conclusions:** 79 patients with LVHR matched to 79 patients with OVHR with mesh with a median follow-up of 56 mo. LVHR was associated with fewer SSIs (7.6% vs. 34.1%) but more cases of bulging (21.5% vs. 1.3%) and port-site hernia (2.5% vs. 0.0%). No differences in recurrence were observed.

# Groin Hernias

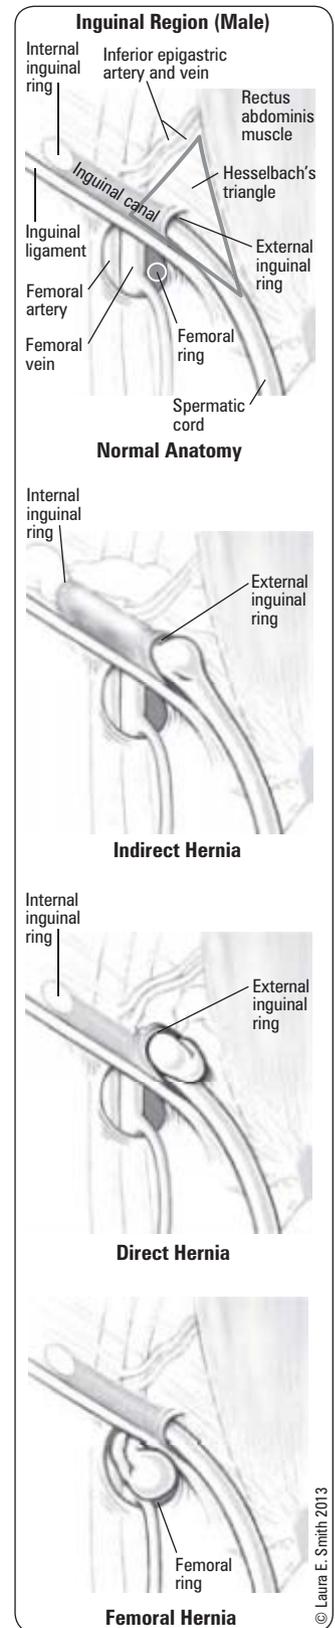

**Table 9. Groin Hernias**

	Direct Inguinal	Indirect Inguinal	Femoral
<b>Epidemiology</b>	1% of all men	Most common hernia in men and women M>F	Affects mostly females
<b>Etiology</b>	Acquired weakness of transversalis fascia "Wear and tear" Increased intra-abdominal pressure	Congenital persistence of processus vaginalis in 20% of adults	Pregnancy – weakness of pelvic floor musculature Increased intra-abdominal pressure
<b>Anatomy</b>	Through Hesselbach's triangle <b>Medial</b> to inferior epigastric artery Usually does not descend into scrotal sac	Originates in deep inguinal ring Lateral to inferior epigastric artery Often descends into scrotal sac (or labia majora)	Into femoral canal, below inguinal ligament but may override it Medial to femoral vein within femoral canal
<b>Treatment</b>	Surgical repair	Surgical repair	Surgical repair
<b>Prognosis</b>	3-4% risk of recurrence	<1% risk of recurrence	

**Table 10. Superficial Inguinal Ring vs. Deep Inguinal Ring\***

Superficial Inguinal Ring	Deep Inguinal Ring
Opening in external abdominal aponeurosis; palpable superior and lateral to pubic tubercle	Opening in transversalis fascia: palpable superior to mid-inguinal ligament
Medial border: medial crus of external abdominal aponeurosis	Medial border: inferior epigastric vessels
Lateral border: lateral crus of external oblique aponeurosis	Superior-lateral border: internal oblique and transversus abdominis muscles
Roof: intercrural fibres	Inferior border: inguinal ligament

\*see Basic Anatomy Review, Figure 2, GS3

**Figure 12. Schematic of inguinal (direct and indirect) and femoral hernias**

**McBurney's Sign**  
Tenderness 1/3 the distance from the ASIS to the umbilicus on the right side

# Appendix

## Appendicitis

### Epidemiology

- 6% of population, M>F
- 80% between 5-35 yr of age

### Pathogenesis

- luminal obstruction → bacterial overgrowth → inflammation/swelling → increased pressure → localized ischemia → gangrene/perforation → localized abscess (walled off by omentum) or peritonitis
- etiology
  - children or young adult: hyperplasia of lymphoid follicles, initiated by infection
  - adult: fibrosis/stricture, fecolith, obstructing neoplasm
  - other causes: parasites, foreign body

### Clinical Features

- most reliable feature is progression of signs and symptoms
- low grade fever (38°C), rises if perforation
- abdominal pain then anorexia, N/V
- classic pattern: pain initially periumbilical; constant, dull, poorly localized, then well localized pain over McBurney's point
  - due to progression of disease from visceral irritation (causing referred pain from structures of the embryonic midgut, including the appendix) to irritation of parietal structures
  - McBurney's sign
- signs
  - inferior appendix: McBurney's sign (see sidebar), Rovsing's sign (palpation pressure to left abdomen causes McBurney's point tenderness). McBurney's sign is present whenever the opening of the appendix at the cecum is directly under McBurney's point; therefore McBurney's sign is present even when the appendix is in different locations
  - retrocecal appendix: psoas sign (pain on flexion of hip against resistance or passive hyperextension of hip)
  - pelvic appendix: obturator sign (flexion then external or internal rotation about right hip causes pain)
- complications
  - perforation (especially if >24 h duration)
  - abscess, phlegmon
  - sepsis

## Investigations

- laboratory
  - mild leukocytosis with left shift (may have normal WBC counts)
  - higher leukocyte count with perforation
  - $\beta$ -hCG to rule out ectopic pregnancy
  - urinalysis
- imaging
  - U/S: may visualize appendix, but also helps rule out gynecological causes – overall accuracy 90-94%, can rule in but CANNOT rule out appendicitis (if >6 mm, SENS/SPEC/NPV/PPV 98%)
  - =CT scan: thick wall, appendicolith, inflammatory changes – overall accuracy 94-100%, optimal investigation

## Treatment

- hydrate, correct electrolyte abnormalities
- appendectomy (gold standard)
  - laparoscopic vs. open (see sidebar)
  - complications: intra-abdominal abscess, appendiceal stump leak
  - perioperative antibiotics:
    - cefazolin + metronidazole if uncomplicated peri-operative dose is adequate
    - consider treatment with post-operative antibiotics for perforated appendicitis
- for patients who present with an abscess (palpable mass or phlegmon on imaging and often delayed diagnosis with symptoms for >4-5 d), consider radiologic drainage + antibiotics x 14 d  $\pm$  interval appendectomy once inflammation has resolved =(controversial)
- recent research supports antibiotic only treatment as reasonable for uncomplicated appendicitis, with 10-20% recurrence rates
- colonoscopy in the elderly to rule out other etiology (neoplasm)

## Prognosis

- mortality rate: 0.08% (non-perforated), 0.5% (perforated appendicitis)

# Inflammatory Bowel Disease

- see [Gastroenterology, G19](#)

## Principles of Surgical Management

- can alleviate symptoms, address complications, improve quality of life
- conserve bowel: resect as little as possible to avoid short gut syndrome
- perioperative management
  - optimize medical status: may require TPN (especially if >7 d NPO) and bowel rest
  - hold immunosuppressive therapy pre-operative, provide pre-operative stress dose of corticosteroid if patient had recent steroid therapy, taper steroids post-operative
  - VTE prophylaxis: LMWH or heparin (IBD patients at increased risk of thromboembolic events)

# Crohn's Disease

- see [Gastroenterology, G20](#)

## Treatment

- surgery is for symptom management, it is NOT curative, but over lifetime ~70% of Crohn's patients will have surgery
- indications for surgical management
  - failure of medical management
  - SBO (due to stricture/inflammation): indication in 50% of surgical cases
  - abscess, fistula (enterocolic, vesicular, vaginal, cutaneous abscess), quality of life, perforation, hemorrhage, chronic disability, failure to thrive (children), perianal disease
- surgical procedures
  - resection and anastomosis/stoma if active or subacute inflammation, perforation, fistula
    - resection margin only has to be free of gross disease (microscopic disease irrelevant to prognosis)
  - stricturoplasty – widens lumen in chronically scarred bowel: relieves obstruction without resecting bowel (contraindicated in acute inflammation)

## Complications of Treatment

- short gut syndrome (diarrhea, steatorrhea, malnutrition)
- fistulas
- gallstones (if terminal ileum resected, decreased bile salt resorption  $\rightarrow$  increased cholesterol precipitation)
- kidney stones (loss of calcium in diarrhea  $\rightarrow$  increased oxalate absorption and hyperoxaluria  $\rightarrow$  stones)

### Laparoscopic vs. Open Appendectomy

*Cochrane DB Syst Rev 2010;10:CD001546*

#### Laparoscopic Surgery

- Wound infection less likely
- Intra-abdominal abscesses 2x more likely
- Reduced pain on POD #1
- Reduced hospital stay by 1.1 d
- Sooner return to normal activity, work, and sport
- Costs outside hospital are reduced

#### Open Surgery

- Shorter duration of surgery
- Lower operation costs

#### Overview

Diagnostic laparoscopy and laparoscopic appendectomy appear to be advantageous over open appendectomy, particularly for young female patients and obese patients.

### Effect of Delay to Operation on Outcomes in Adults with Acute Appendicitis

*Arch Surg 2010;145:886-892*

**Purpose:** To examine the effect of delay to appendectomy on morbidity and mortality among adults with appendicitis.

**Method:** Retrospective cohort study with the main exposure being time to operation, and main outcomes being 30 d overall morbidity and serious morbidity/mortality.

**Results:** Of 32,782 patients in the study, 75.2%, 15.1%, and 9.8% underwent surgeries within 6 h, 6-12 h, and >12 h of admission, respectively. Differences in operative duration and length of post-operative stay were statistically significant but not clinically meaningful. No significant differences were observed in adjusted overall morbidity or serious morbidity/mortality. Duration from surgical admission to anesthesia induction was not predictive in regression models for either outcomes.

**Conclusions:** Delay of appendectomy for acute appendicitis among adults does not adversely affect outcomes.

### Antibiotics vs. Placebo for Prevention of Post-Operative Infection After Appendectomy

*Cochrane DB Syst Rev 2005;3:CD001439*

**Purpose:** To determine the effectiveness of antibiotics against post-operative infections after appendectomy.

**Method:** Meta-analysis of randomized controlled trials (RCTs) and controlled clinical trials (CCTs), on both adults and children, in which any antibiotic regime was compared to placebo in patients undergoing appendectomy for suspected appendicitis. The main outcomes of interest were wound infection, intra-abdominal abscess, length of hospital stay, and mortality.

**Results:** 45 studies (n=9,576) were included. Treatment with antibiotics decreased wound infection and abscess rates.

**Conclusion:** Various prophylactic antibiotic regimens are effective in preventing post-operative complications after appendectomy.

### Crohn's 3 Major Patterns

- Ileocecal 40% (RLQ pain, fever, weight loss)
- Small intestine 30% (especially terminal ileum)
- Colon 25% (diarrhea)

**Prognosis**

- recurrence rate at 10 yr: ileocolic (25-50%), small bowel (50%), colonic (40-50%)
- re-operation at 5 yr: primary resection (20%), bypass (50%), stricturoplasty (10% at 1 yr)
- 80-85% of patients who need surgery lead normal lives
- mortality: 15% at 30 yr

**Findings in Crohn's**

- "Cobblestoning" on mucosal surface due to edema and linear ulcerations
- "Skip lesions": normal mucosa in between
- "Creeping fat": mesentery infiltrated by fat
- Granulomas: 25-30%

**Ulcerative Colitis**

- see [Gastroenterology, G21](#)

**Treatment**

- indications for surgical management
  - failure of medical management (including inability to taper steroids)
  - complications: hemorrhage, obstruction, perforation, toxic megacolon (emergency), failure to thrive (children)
  - reduce cancer risk (1-2% risk per yr after 10 yr of disease)
- surgical procedures
  - proctocolectomy and ileal pouch-anal anastomosis (IPAA) ± rectal mucosectomy (operation of choice)
  - proctocolectomy with permanent end ileostomy (if not a candidate for ileoanal procedures)
  - colectomy and IPAA ± rectal mucosectomy
  - in emergency: total colectomy and ileostomy with Hartmann closure of the rectum, rectal preservation

**Findings in Ulcerative Colitis**

- Patients usually present with diarrhea (± blood in their stool)
- Associated symptoms include colicky abdominal pain, urgency, tenesmus, and incontinence
- Presence of extra-intestinal manifestations
- Endoscopically, there is loss of vascular markings, erythema, granularity of mucosa, petechiae, exudates, edema, erosions, and spontaneous bleeding
- Biopsy features included crypt abscesses, crypt branching, shortening and disarray, and crypt atrophy
- Inflammation is continuous and usually involves rectum

**Complications of Treatment**

- early: bowel obstruction, transient urinary dysfunction, dehydration (high stoma output), anastomotic leak
- late: stricture, anal fistula/abscess, pouchitis, poor anorectal function, reduced fertility

**Prognosis**

- mortality: 5% over 10 yr
- total proctocolectomy will eliminate risk of cancer
- perforation of the colon is the leading cause of death from ulcerative colitis

**LARGE INTESTINE**

**Large Bowel Obstruction**

**Mechanical Large Bowel Obstruction**

**Etiology**

Table 11. Common Causes of LBO

Intraluminal	Intramural	Extramural
Constipation Foreign bodies	Adenocarcinoma Diverticulitis IBD stricture Radiation stricture	Volvulus Adhesions Hernias (sigmoid colon in a large groin hernia)

**Top 3 Causes of LBO (in order)**

- Cancer
- Diverticulitis
- Volvulus

**Clinical Features (unique to LBO)**

- open loop (10-20%)
  - incompetent ileocecal valve allows relief of colonic pressure as contents reflux into ileum, therefore clinical presentation similar to SBO
- closed loop (80-90%) (dangerous)
  - competent ileocecal valve, resulting in proximal and distal occlusions
  - massive colonic distention → increased pressure in cecum → bowel wall ischemia → necrosis → perforation

**In a patient with clinical LBO consider impending perforation when:**

- Cecum ≥12 cm in diameter
- Tenderness present over cecum

**Treatment**

- surgical correction of obstruction (usually requires resection + temporary diverting colostomy)
- volvulus requires sigmoidoscopic or endoscopic decompression followed by operative reduction if unsuccessful
  - if successful, consider interval sigmoid resection on same admission
- cecal volvulus can be a true volvulus or a cecal 'bascule' (cecum folds anteriorly to the ascending colon producing a flap valve occlusion to cecal emptying) – both need surgical treatment

**Prognosis**

- overall mortality: 10%
- cecal perforation + feculent peritonitis: 20% mortality

**Table 12. Bowel Obstruction vs. Paralytic Ileus**

	SBO	LBO	Paralytic Ileus
<b>N/V</b>	Early, may be bilious	Late, may be feculent	Present
<b>Abdominal Pain</b>	Colicky	Colicky	Minimal or absent
<b>Abdominal Distention</b>	+ (prox SBO), ++ (distal SBO)	++	+
<b>Constipation</b>	+	+	+
<b>Bowel Sounds</b>	Normal, increased Absent if secondary ileus (delayed presentation)	Normal, increased (borborygmi) Absent if secondary ileus (delayed presentation)	Decreased, absent
<b>AXR Findings</b>	Air-fluid levels "Ladder" pattern (plicae circularis) Proximal distention (>3 cm) + no colonic gas	Air-fluid levels "Picture frame" appearance Proximal distention + distal decompression No small bowel air if competent ileocecal valve Coffee bean sign (sigmoid volvulus)	Air throughout small bowel and colon

## Functional LBO: Colonic Pseudo-Obstruction (Ogilvie's Syndrome)

**Definition**

- acute pseudo-obstruction
- distention of colon without mechanical obstruction in distal colon
- exact mechanism unknown, likely autonomic motor dysregulation → possibly sympathetic deprivation to colon, unopposed parasympathetic tone, and interruption of sacral parasympathetic tone to distal bowel

**Associations**

- most common: trauma, infection, cardiac (MI, CHF)
- disability (long-term debilitation, chronic disease, bed-bound nursing home patients, paraplegia), drugs (narcotic use, laxative abuse, polypharmacy), other (recent orthopedic or neurosurgery, post-partum, electrolyte abnormalities including hypokalemia, retroperitoneal hematoma, diffuse carcinomatosis)

**Clinical Features**

- most prominent is abdominal distention (acute or graduate over 3-7 days)
- abdominal pain, nausea and vomiting, constipation/diarrhea
- watch out for fever, leukocytosis, and presence of peritoneal signs

**Investigations**

- AXR: cecal dilatation – if diameter  $\geq 12$  cm, increased risk of perforation

**Treatment**

- treat underlying cause
- NPO, NGT
- decompression: rectal tube, colonoscopy, neostigmine (cholinergic drug), surgical decompression (ostomy/resection) uncommon
- surgery (extremely rare): if perforation, ischemia, or failure of conservative management

**Prognosis**

- most resolve with conservative management

## Diverticular Disease

### Definitions

- diverticulum: abnormal sac-like protrusion from the wall of a hollow organ
- diverticulosis: presence of multiple diverticula
- diverticulitis: inflammation of diverticula
- true (congenital) diverticuli: contain all layers of colonic wall, often right-sided
- false (acquired) diverticuli: contain mucosa and submucosa, often left-sided

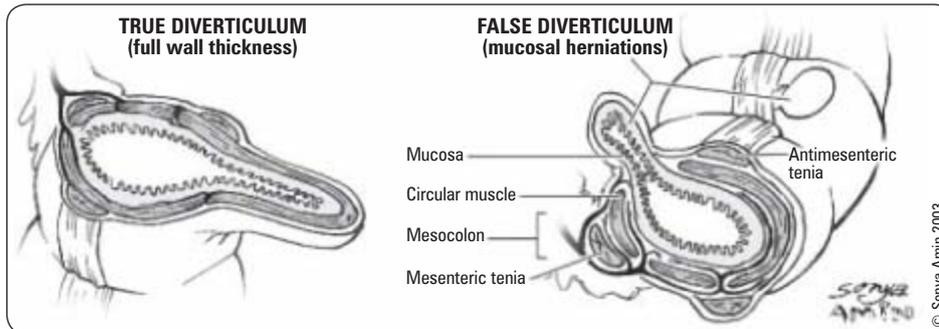

Figure 13. Diverticular disease – cross-sections of true and false diverticuli

### Diverticulosis vs. Diverticulitis

Diverticulosis represents the presence of diverticuli (bulging pouches) within the colonic wall, whereas diverticulitis is the inflammation of one or more diverticuli

## Diverticulosis

### Epidemiology

- 5-50% of Western population, lower incidence in non-Western countries, M=F
- prevalence is age dependent: <5% by age 40, 30% by age 60, 65% by age 85
- 95% involve sigmoid colon (site of highest pressure)

### Pathogenesis

- risk factors
  - lifestyle: low-fibre diet (predispose to motility abnormalities and higher intraluminal pressure), inactivity, obesity
  - muscle wall weakness from aging and illness (e.g. Ehler-Danlos, Marfan's)
- high intraluminal pressures cause outpouching to occur at point of greatest weakness, most commonly where vasa recta penetrate the circular muscle layer, therefore increased risk of hemorrhage

### Clinical Features

- uncomplicated diverticulosis: asymptomatic (70-80%)
- episodic abdominal pain (often LLQ), bloating, flatulence, constipation, diarrhea
- absence of fever/leukocytosis
- no physical exam findings or poorly localized LLQ tenderness
- complications
  - diverticulitis (15-25%): 25% of which are complicated (i.e. abscess, obstruction, perforation, fistula)
  - bleeding (5-15%): PAINLESS rectal bleeding, 30-50% of massive LGIB
  - diverticular colitis (rare): diarrhea, hematochezia, tenesmus, abdominal pain

### Treatment

- uncomplicated diverticulosis: high fibre, education
- diverticular bleed
  - initially workup and treat as any LGIB
  - if hemorrhage does not stop, resect involved region

## Diverticulitis

### Epidemiology

- 95% left-sided in patients of Western countries, 75% right-sided in Asian populations

### Pathogenesis

- erosion of the wall by increased intraluminal pressure or inspissated food particles → inflammation and focal necrosis → micro or macroscopic perforation
- usually mild inflammation with perforation walled off by pericolic fat and mesentery; abscess, fistula, or obstruction can ensue
- poor containment results in free perforation and peritonitis

### Clinical Features

- depend on severity of inflammation and whether or not complications are present; hence ranges from asymptomatic to generalized peritonitis
- LLQ pain/tenderness (2/3 of patients) often for several days before admission
- constipation, diarrhea, N/V, urinary symptoms (with adjacent inflammation)
- complications (25% of cases)
  - abscess: palpable tender abdominal mass
  - fistula: colovesical (most common), coloenteric, colovaginal, colocutaneous
  - colonic obstruction: due to scarring from repeated inflammation
  - perforation: generalized peritonitis (feculent vs. purulent)
    - ♦ recurrent attacks rarely lead to peritonitis
- low-grade fever, mild leukocytosis common, occult or gross blood in stool rarely coexist with acute diverticulitis

### Investigations

- AXR, upright CXR
  - localized diverticulitis (ileus, thickened wall, SBO, partial colonic obstruction)
  - free air may be seen in 30% with perforation and generalized peritonitis
- CT scan (test of choice): very useful for assessment of severity and prognosis; usually done with rectal contrast
  - 97% sensitive, 99% specific
  - increased soft tissue density within pericolic fat secondary to inflammation, diverticula secondary to inflammation, bowel wall thickening, soft tissue mass (pericolic fluid, abscesses), fistula
  - 10% of diverticulitis cannot be distinguished from carcinoma
- elective evaluation: establish extent of disease and rule out other diagnoses (polyps, malignancy) AFTER resolution of acute episode
  - colonoscopy or barium enema and flexible sigmoidoscopy

### Treatment

- uncomplicated: conservative management
- outpatient: clear fluids only until improvement and antibiotics (e.g. cefazolin and metronidazole) 7-10 d to cover gram negative rods and anaerobes (e.g. *B. fragilis*)
- hospitalize: if severe presentation, inability to tolerate oral intake, significant comorbidities, fail to improve outpatient management
- treat with NPO, IVF, IV antibiotics (e.g. IV ceftriaxone + metronidazole)
- indications for surgery
  - unstable patient with peritonitis
  - Hinchey stage 3-4
  - after 1 attack if immunosuppressed
  - consider if recurrent episodes of diverticulitis (3 or more), recent trend is toward conservative management of recurrent mild/moderate attacks
  - complications: perforation, abscess, fistula, obstruction, hemorrhage, inability to rule out colon cancer on endoscopy, or failure of medical management
- surgical procedures
  - for unstable patient or complex cases: Hartmann procedure
    - ♦ colon resection + colostomy and rectal stump → colostomy reversal in 3-6 mo
  - for more stable patients with Hinchey stage III and IV acute diverticulitis, colonic resection, primary anastomosis + diverting loop ileostomy is becoming more common, with benefits for mortality and morbidity
  - laparoscopic peritoneal lavage with drain placement near the affected colon, in addition to IV antibiotics (NO resection) has been proposed for Hinchey stage III

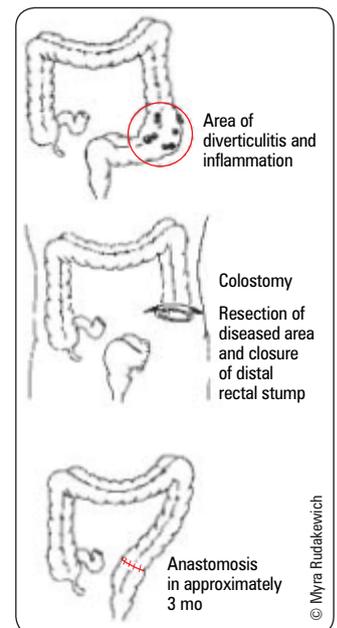

Figure 14. Hartmann procedure

### Prognosis

- mortality rates: 6% for purulent peritonitis, 35% for feculent peritonitis
- recurrence rates: 13-30% after first attack, 30-50% after second attack

Table 13. Hinchey Staging and Treatment for Diverticulitis

Hinchey Stage	Description	Acute Treatment
1	Phlegmon/small pericolic abscess	Medical
2	Large abscess/fistula	Medical, abscess drainage ± resection with primary anastomosis
3	Purulent peritonitis (ruptured abscess)	Resection or Hartmann procedure
4	Feculent peritonitis	Hartmann procedure

# Colorectal Neoplasms

## Colorectal Polyps

### Definition

- polyp: protuberance into the lumen of normally flat colonic mucosa
- sessile (flat) or pedunculated (on a stalk)

### Epidemiology

- 30% of the population have polyps by age 50, 40% by age 60, 50% by age 70

### Clinical Features

- 50% in the rectosigmoid region, 50% are multiple
- usually asymptomatic, do not typically bleed, tenesmus, intestinal obstruction, mucus
- usually detected during routine endoscopy or familial/high risk screening

### Pathology

- non-neoplastic
  - hyperplastic: most common non-neoplastic polyp
  - mucosal polyps: small <5 mm, no clinical significance
  - inflammatory pseudopolyps: associated with IBD, no malignant potential
  - submucosal polyps: lymphoid aggregates, lipomas, leiomyomas, carcinoids
- neoplastic
  - lipomas, leiomyomas, carcinoids
  - hamartomas: juvenile polyps (large bowel), Peutz-Jegher syndrome (small bowel)
    - ♦ malignant risk due to associated adenomas (large bowel)
    - ♦ low malignant potential → most spontaneously regress or autoamputate
  - adenomas: premalignant, considered carcinoma in situ IF high grade dysplasia
  - some may contain invasive carcinoma ("malignant polyp" – 3-9%): invasion into submucosa
    - ♦ malignant potential: villous > tubulovillous > tubular

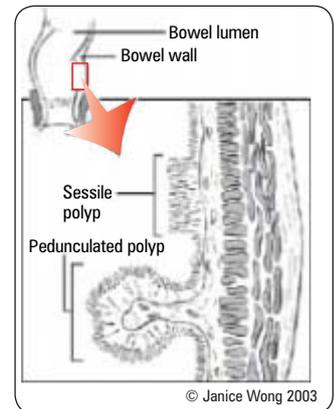

Figure 15. Sessile and pedunculated polyps

Table 14. Characteristics of Tubular vs. Villous Polyps

	Tubular	Villous
Incidence	Common (60-80%)	Less common (10%)
Size	Small (<2 cm)	Large (usually >2 cm)
Attachment	Pedunculated	Sessile
Malignant Potential	Lower	Higher
Distribution	Even	Left-sided predominance

### Investigations

- colonoscopy is the gold standard for diagnosis and treatment of colonic polyps
- CT colonography: increasing in availability; patients still require bowel prep and will require colonoscopy if polyps are identified
- other: flexible sigmoidoscopy if polyps are detected, proceed to colonoscopy for examination of entire bowel and biopsy

### Treatment

- indications: symptoms, malignancy or risk of malignancy (i.e. adenomatous polyps)
- endoscopic removal of entire growth
- indications for segmental resection for malignant polyps: 1) lymphovascular invasion; 2) tumour budding; 3) positive resection margin; 4) poorly differentiated cells; 5) evidence of regional or distant metastases on staging. Most of these cases are usually discussed at multi-disciplinary tumour boards
- follow-up endoscopy 1 yr later, then every 3-5 yr

## Familial Colon Cancer Syndromes

### FAMILIAL ADENOMATOUS POLYPOSIS

#### Pathogenesis

- autosomal dominant inheritance, mutation in adenomatous polyposis coli (APC) gene on chromosome 5q21

### Clinical Features

- hundreds to thousands of colorectal adenomas usually by age 20 (by 40s in attenuated FAP)
- extracolonic manifestations
  - carcinoma of small bowel (i.e. polyps in colon), bile duct, pancreas, stomach, thyroid, adrenal, small bowel
  - congenital hypertrophy of retinal pigment epithelium presents early in life in 2/3 of patients; 97% sensitivity
  - virtually 100% lifetime risk of colon cancer (because of number of polyps)
- variants
  - Gardner's syndrome: FAP + extra-intestinal lesions (sebaceous cysts, osteomas, desmoid tumours)
  - Turcot syndrome: FAP + CNS tumours (childhood cerebellar medulloblastoma)

### Investigations

- genetic testing (80-95% sensitive, 99-100% specific)
- if no polyposis found: annual flexible sigmoidoscopy from puberty to age 50, then routine screening
- if polyposis or APC gene mutation found: annual colonoscopy and consider surgery (see Figure 14); consider upper endoscopy to evaluate for periampullary tumours

### Treatment

- surgery indicated by age 17-20
- total proctocolectomy with ileostomy or total colectomy with ileorectal anastomosis
- doxorubicin-based chemotherapy
- NSAIDs for intra-abdominal desmoids

## HEREDITARY NON-POLYPOSIS COLORECTAL CANCER – LYNCH SYNDROME

### Pathogenesis

- autosomal dominant inheritance, mutation in a DNA mismatch repair gene (MSH2, MSH6, MLH1) resulting in microsatellite genomic instability and subsequent mutations
- microsatellite instability account for approximately 15% of all colorectal cancers

### Clinical Features

- early age of onset, right > left colon, synchronous and metachronous lesions
- mean age of cancer presentation is 44 yr, lifetime risk 70-80% (M>F)
  - HNPCC I: hereditary site-specific colon cancer
  - HNPCC II: cancer family syndrome – high rates of extracolonic tumours (endometrial, ovarian, hepatobiliary, small bowel)

### Diagnosis

- Amsterdam Criteria
  - 3 or more relatives with verified Lynch syndrome associated cancers, and 1 must be 1st degree relative of the other 2
  - 2 or more generations involved
  - 1 case must be diagnosed before 50 yr old
  - FAP is excluded
- genetic testing (80% sensitive) – colonoscopy mandatory even if negative
  - refer for genetic screening individuals who fulfill EITHER the Amsterdam Criteria OR the revised Bethesda Criteria
- colonoscopy (starting age 20) annually
- surveillance for extracolonic lesions

### Treatment

- total colectomy and ileorectal anastomosis with annual proctoscopy

## Colorectal Carcinoma

### Epidemiology

- 4th most common cancer (after lung, prostate, and breast), 2nd most common cause of cancer death

### Risk Factors

- most patients have no specific risk factors
- age >50 (dominant risk factor in sporadic cases), mean age is 70
- genetic: FAP, HNPCC, family history of CRC
- colonic conditions
  - adenomatous polyps (especially if >1 cm, villous, multiple)
  - IBD (especially UC: risk is 1-2%/yr if UC >10 yr)
  - previous colorectal cancer (also gonadal or breast)
- diet (increased fat, red meat, decreased fibre) and smoking
- DM and acromegaly (insulin and IGF-1 are growth factors for colonic mucosal cells)

#### Referral Criteria for Genetic Screening for APC

- To confirm the diagnosis of FAP (in patients with  $\geq 100$  colorectal adenomas)
- To provide pre-symptomatic testing for individuals at risk for FAP (1st degree relatives who are  $\geq 10$  yr old)
- To confirm the diagnosis of attenuated FAP (in patients with  $\geq 20$  colorectal adenomas)

#### Revised Bethesda Criteria for HNPCC and Microsatellite Instability (MSI) Tumours from individuals should be tested for MSI in the following situations:

- Colorectal cancer diagnosed in a patient who is <50 yr
- Presence of synchronous, metachronous colorectal, or other HNPCC-associated tumours, regardless of age
- Colorectal cancer with the MSI-H histology diagnosed in a patient who is <60 yr
- Colorectal cancer diagnosed in one or more first-degree relatives with an HNPCC-related tumour, with one of the cancers being diagnosed <50 yr
- Colorectal cancer diagnosed in two or more first- or second-degree relatives with HNPCC-related tumours, regardless of age

Elderly persons who present with iron-deficiency anemia should be investigated for colon cancer

#### Staging for CRC

- I T1,2 N0M0
- II T3,4 N0M0
- III TxN+M0
- IV TxNxM1

APR removes distal sigmoid colon, rectum, and anus; permanent end colostomy required  
LAR removes distal sigmoid and rectum with anastomosis of distal colon to anus

**Pathogenesis**

- adenoma-carcinoma sequence; rarely arise de novo

**Clinical Features**

- often asymptomatic
- hematochezia/melena, abdominal pain, change in bowel habits
- others: weakness, anemia, weight loss, palpable mass, obstruction
- 20% patients have distant metastatic disease at time of presentation
- spread
  - direct extension, lymphatic, hematogenous (liver most common, lung, bone, brain; tumour of distal rectum → IVC → lungs)
  - peritoneal seeding: ovary, Blumer's shelf (pelvic cul-de-sac)

**Table 15. Clinical Presentation of CRC**

	Right Colon	Left Colon	Rectum
<b>Frequency</b>	25%	35%	30%
<b>Pathology</b>	Exophytic lesions with occult bleeding	Annular, invasive lesions	Ulcerating
<b>Symptoms</b>	Weight loss, weakness, rarely obstruction	Constipation ± overflow (alternating bowel patterns), abdominal pain, decreased stool calibre, rectal bleeding	Obstruction, tenesmus, rectal bleeding
<b>Signs</b>	Fe-deficiency anemia, RLQ mass (10%)	BRBPR, LBO	Palpable mass on DRE, BRBPR

**Investigations**

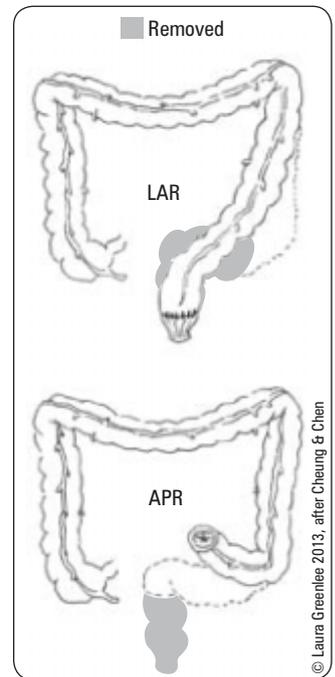

- colonoscopy (best), look for synchronous lesions (3-5% of patients); alternative: air contrast barium enema ("apple core" lesion) + sigmoidoscopy
- if a patient is FOBT +ve, or has microcytic anemia or has a change in bowel habits, do colonoscopy
- laboratory: CBC, urinalysis, liver enzymes, liver function tests, carcinogenic embryonic antigen (CEA) (pre-operative for baseline, >5 ng/mL have worse prognosis)
- staging: CT chest/abdomen/pelvis; bone scan, CT head only if lesions suspected
- rectal cancer: pelvic MRI or endorectal U/S to determine T and N stage

**Table 16. TNM Classification System for Staging of Colorectal Carcinoma (AJCC/UCC 2010)**

Primary Tumour (T)	Regional Lymph Nodes (N)	Distant Metastasis (M)
T0 No primary tumour found	N0 No regional node involvement	M0 No distant metastasis
Tis Carcinoma <i>in situ</i>	N1 Metastasis in 1-3 regional nodes	M1 Distant metastasis
T1 Invasion into submucosa	N2 Metastasis in 4 or more regional nodes	
T2 Invasion into muscularis propria		
T3 Invasion through muscularis propria and into serosa		
T4 Invasion into adjacent structures or organs		

**Treatment**

- **colon cancer**
  - wide surgical resection of lesion and regional lymphatic drainage; usually colectomy with primary anastomosis
    - ◆ curative: wide resection of lesion (5 cm margins) with nodes (>12) and mesentery
    - ◆ metastatic lesions confined to the liver can be resected with curative intent
    - ◆ palliative: if distant spread, local control for hemorrhage or obstruction
    - ◆ care is taken to not spread tumour by unnecessary palpation
    - ◆ cancer-bearing portion of colon is removed according to vascular distribution of segment
  - adjuvant chemotherapy (5-FU or oral capecitabine with oxaliplatin) for stage III and is considered in select stage II patients
- **rectal cancer**
  - choice of operation depends on individual case; types of operations
    - ◆ low anterior resection of rectum (LAR): curative procedure of choice if adequate distal margins (~2cm); uses technique of total mesorectal excision
    - ◆ abdominoperineal resection of rectum (APR): if adequate distal margins cannot be obtained; involves the removal of distal sigmoid colon, rectum, and anus – permanent end colostomy required
    - ◆ transanal minimally invasive surgery (TAMIS)- local excision for select T1 lesions only
    - ◆ palliative procedures involve proximal diversion with an ostomy for obstruction and radiation for bleeding or pain
  - adjuvant therapy
    - ◆ combined neoadjuvant chemoradiation therapy followed by post-operative adjuvant chemotherapy for stages II and III

**Figure 16. APR vs. LAR**

**5-yr Survival Rates for CRC**

Stage	Colon	Rectum
I	74%	74%
IIA	67%	64%
IIB	59%	52%
IIC	37%	32%
IIIA	73%	74%
IIIB	46%	45%
IIIC	28%	33%
IV	6%	6%

**Pre-Operative vs. Post-Operative Chemoradiotherapy for Locally Advanced Rectal Cancer: Results of the German CAQ/ARO/AIO-94 Randomized Phase III Trial after a Median Follow-Up of 11 Yr**

*J Clin Oncol* 2012;30:1926-1933  
**Background:** The CAQ/ARO/AIO-94 trial (published 2004) recommended pre-operative chemoradiotherapy (CRT) as standard treatment for locally advanced rectal cancer. However, no survival benefit was shown after median follow-up of 46 mo, and this study reports long-term effects.  
**Methods:** Patients with stage II to III rectal cancer (n=799) were randomly assigned to pre-operative (n=404) or post-operative CRT (n=395) with fluorouracil (FU), radiation, and adjuvant FU chemotherapy, in addition to total mesorectal excision surgery. Follow-up was designed to assess long-term overall survival as the primary end point; and cumulative incidence of local and distant relapses and disease-free survival as secondary end points.  
**Results:** 10 yr incidence of local relapse was significantly lower in the pre-operative CRT group than in the post-operative group (7.1% vs. 10.1%, p=0.048). Overall survival at 10 yr was similar at ~60% for patients treated with pre-operative or post-operative CRT (p=0.85). Disease-free survival rates at 10 yr was similar at ~68% for patients treated with pre-operative or post-operative CRT (p=0.54). No significant difference was detected for 10-yr incidence of distant metastases (pre-operative CRT 29.8% vs. post-operative CRT 29.6%, p=0.9).  
**Conclusion:** There is long-term reduction in local recurrence of stage II to III rectal cancer with pre-operative chemotherapy, but no improvement in overall survival or distant recurrence of disease.

**Follow-Up**

- currently there are no data suggesting optimal follow-up
- combination of periodic CT chest/abdomen/pelvis, CEA, and colonoscopy is recommended
- CEA to monitor for initial response to treatment, and for surveillance (q6months)

## Other Conditions of the Large Intestine

### Angiodysplasia

**Definition**

- vascular anomaly: focal submucosal venous dilatation and tortuosity

**Clinical Features**

- most frequently in right colon of patients >60 yr old
- bleeding typically intermittent, rarely massive, not usually hypotensive (melena, anemia, guaiac positive stools)

**Investigations**

- colonoscopy: cherry red spots, branching pattern from central vessel
- angiography: early-filling vein, vascular tuft, delayed emptying vein; rarely active bleeding
- RBC technetium-99 scan
- barium enema is contraindicated (obscures other x-rays, i.e. angiogram)

**Treatment**

- none if asymptomatic
- cautery, right hemicolectomy, embolization, vasopressin infusion, sclerotherapy, band ligation, laser, octreotide, and rarely segmental resection if other treatments fail

### Volvulus

**Definition**

- rotation of segment of bowel about its mesenteric axis
- sigmoid (65%), cecum (30%), transverse colon (3%), splenic flexure (2%)
- 5-10% of large bowel obstruction; 25% of intestinal obstruction during pregnancy

**Risk Factors**

- age (50% of patients >70 yr: stretching/elongation of bowel with age is a predisposing factor)
- high fibre diet (can cause elongated/redundant colon), chronic constipation, laxative abuse, pregnancy, bedridden, institutionalization (less frequent evacuation of bowels)
- congenital hypermobile cecum

**Clinical Features**

- symptoms due to bowel obstruction (*see Large Bowel Obstruction, GS29*) or intestinal ischemia (*see Intestinal Ischemia, GS23*)
- colicky abdominal pain, persistence of pain between spasms, abdominal distention, vomiting

**Investigations**

- AXR (classic findings): “omega”, “bent inner-tube”, “coffee-bean” signs
- barium/Gastrografin® enema: “ace of spades” (or “bird’s beak”) appearance due to funnel-like luminal tapering of lower segment towards volvulus
- sigmoidoscopy or colonoscopy as appropriate
- CT

**Treatment**

- initial supportive management (same as initial management for bowel obstruction (*see Large Bowel Obstruction, GS29*))
- cecum
  - nonsurgical
    - ♦ may attempt colonoscopic detorsion and decompression
  - surgical
    - ♦ right colectomy + ileotransverse colonic anastomosis
- sigmoid
  - nonsurgical
    - ♦ decompression by flexible sigmoidoscopy and insertion of rectal tube past obstruction
    - ♦ subsequent elective surgery recommended (50-70% recurrence)
  - surgical: Hartmann procedure (if urgent)
    - ♦ indications: strangulation, perforation, or unsuccessful endoscopic decompression

**Cecal Volvulus**  
AXR: Central cleft of “coffee bean” sign points to RLQ

**Sigmoid Volvulus**  
AXR: Central cleft of “coffee bean” sign points to LLQ  
**Barium enema:** “ace of spades” or “bird’s beak” sign

## Toxic Megacolon

### Pathogenesis

- extension of inflammation into smooth muscle layer causing paralysis
- damage to myenteric plexus and electrolyte abnormalities are not consistently found

### Etiology

- inflammatory bowel disease (ulcerative colitis > Crohn's disease)
- infectious colitis: bacterial (*C. difficile*, *Salmonella*, *Shigella*, *Campylobacter*), viral (cytomegalovirus), parasitic (*E. histolytica*)

### Clinical Features

- infectious colitis usually presents for >1 wk before colonic dilatation
- diarrhea ± blood (but improvement of diarrhea may portend onset of megacolon)
- abdominal distention, tenderness, ± local/general peritoneal signs (suggest perforation)
- triggers: hypokalemia, constipating agents (opioids, antidepressants, loperamide, anticholinergics), barium enema, colonoscopy

### Diagnostic Criteria

- must have both colitis and systemic manifestations for diagnosis
- radiologic evidence of dilated colon
- three of: fever, HR >120, WBC >10.5, anemia
- one of: fluid and electrolyte disturbances, hypotension, altered LOC

### Investigations

- CBC (leukocytosis with left shift, anemia from bloody diarrhea), electrolytes, elevated CRP, ESR
- metabolic alkalosis (volume contraction and hypokalemia) and hypoalbuminemia are late findings
- AXR: dilated colon >6 cm (right > transverse > left), loss of haustra
- CT: useful to assess underlying disease

### Treatment

- NPO, NGT, stop constipating agents, correct fluid and electrolyte abnormalities, transfusion
- serial AXRs
- broad-spectrum antibiotics (reduce sepsis, anticipate perforation)
- aggressive treatment of underlying disease (e.g. steroids in IBD, metronidazole for *C. difficile*)
- indications for surgery (50% improve on medical management)
- worsening or persisting toxicity or dilation after 48-72 h
- severe hemorrhage, perforation
- high lactate and WBC especially for *C. difficile*
- procedure: subtotal colectomy + end ileostomy (may be temporary, with second operation for re-anastomosis later)

### Prognosis

- average 25-30% mortality

## Fistula

### Definition

- abnormal communication between two epithelialized surfaces (e.g. enterocutaneous, colovesical, aortoenteric, entero-enteric)

### Etiology

- foreign object erosion (e.g. gallstone, graft)
- inflammatory states (e.g. infection, IBD [especially Crohn's], diverticular disease)
- iatrogenic/surgery (e.g. post-operative anastomotic leak, radiation)
- congenital, trauma
- neoplastic

### Investigations

- U/S, CT scan, fistulogram
- measure amount of drainage from fistula

### Treatment

- decrease secretion: octreotide/somatostatin/omeprazole
- surgical intervention: dependent upon etiology (for non-closing fistulas); uncertainty of diagnosis

Use caution when giving antidiarrheal agents, especially with bloody diarrhea

### Why Fistulae Stay Open

#### FRIENDO

Foreign body

Radiation

Infection

Epithelialization

Neoplasm

Distal obstruction (most common)

Others: increased flow; steroids (may inhibit closure, usually will not maintain fistula)

## Stomas

### Definition

- an opening of the GI tract onto the surface of the abdomen wall
  - stomas can be constructed as either **end stomas**: the proximal end of the GI tract forms the stoma and the distal end of the GI tract is not part of the stoma, or **loop stomas**: a loop of the GI tract is brought up to the skin and the anti-mesenteric surface of the bowel is matured as a stoma. The proximal and distal GI tract remain in continuity

### Ileostomy

- usually positioned in RLQ; ileum is brought through rectus abdominus muscles
- indications: after protocolectomy for ulcerative colitis, in some cases of Crohn's disease or familial polyposis
- conventional ileostomy: discharges small quantities of liquid material continuously, appliance (plastic bag attached to a sheet of protective material) required at all times
- continent ileostomy: reservoir is constructed from distal ileum, emptied by inserting catheter into stoma several times a day; rarely used, has mostly been replaced by ileal pouch anal anastomosis

### Colostomy

- indications: to decompress an obstructed colon, to protect a distal anastomosis after resection, or to evacuate stool after distal colon or rectum is removed
- colostomies can be done by making an opening in a loop of colon (loop colostomy) or by dividing the colon and bringing out one end (end colostomy)
- most common permanent colostomy is a sigmoid colostomy – expels stool once per day, no appliance required
- chronic paracolostomy hernia is a common complication

### Complications (10%)

- obstruction: herniation, stenosis (skin and abdominal wall), adhesive bands, volvulus
- peri-ileostomy abscess and fistula
- skin irritation
- prolapse or retraction
- diarrhea (excessive output)

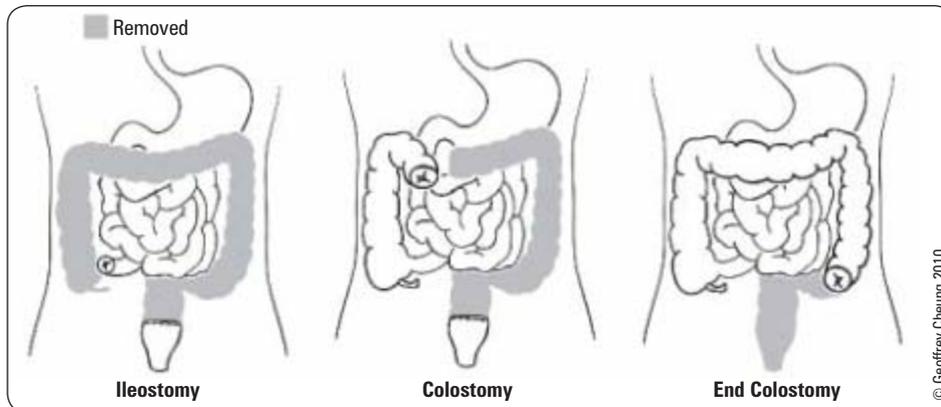

Figure 17. Ostomies

### Colostomy/Ileostomy

- Connection of proximal limb of colon or ileum to abdominal wall skin

### Mucous Fistula

- Connection of distal limb of colon to abdominal wall skin

### Ileal Conduit

- Connection of bowel to ureter proximally and abdominal wall distally to drain urine

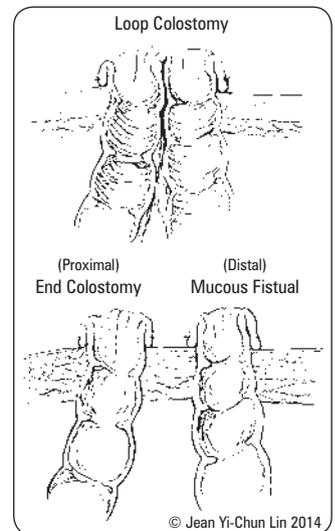

Figure 18. End vs. loop colostomy

## Anorectum

### Hemorrhoids

#### Etiology

- vascular and connective tissue complexes form a plexus of dilated veins (cushion)
- internal: superior hemorrhoidal veins, above dentate line, portal circulation
- external: inferior hemorrhoidal veins, below dentate line, systemic circulation

#### Risk Factors

- increased intra-abdominal pressure: chronic constipation, pregnancy, obesity, portal HTN, heavy lifting

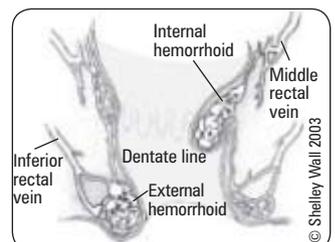

Figure 19. Hemorrhoids

## Clinical Features and Treatment

- internal hemorrhoids
  - engorged vascular cushions usually at 3, 7, 11 o'clock positions (patient in lithotomy position)
  - PAINLESS rectal bleeding, anemia, prolapse, mucus discharge, pruritus, burning pain, rectal fullness
    - ◆ **1st degree:** bleed but do not prolapse through the anus
      - treatment: high fibre/bulk diet, sitz baths, steroid cream, parmaxine (Anusol®), rubber band ligation, sclerotherapy, photocoagulation
    - ◆ **2nd degree:** bleed, prolapse with straining, spontaneous reduction
      - treatment: rubber band ligation, photocoagulation
    - ◆ **3rd degree:** bleed, prolapse, requires manual reduction
      - treatment: same as 2nd degree, but may require closed hemorrhoidectomy
    - ◆ **4th degree:** bleed, permanently prolapsed, cannot be manually reduced
      - treatment: closed hemorrhoidectomy
- external hemorrhoids
  - dilated venules usually mildly symptomatic
    - ◆ PAIN after bowel movement, associated with poor hygiene
    - ◆ medical treatment: dietary fibre, stool softeners, steroid cream (short course), parmaxine (Anusol®), avoid prolonged straining
  - thrombosed hemorrhoids are very painful
    - ◆ resolve within 2 wk, may leave excess skin = perianal skin tag
    - ◆ treatment: consider surgical decompression within first 48 h of thrombosis, otherwise medical treatment

Always rule out more serious causes (e.g. colon CA or anal canal cancer) in a person with hemorrhoids and rectal bleeding

Band ligation can be done as outpatient

External hemorrhoids will often recur

**Table 17. Signs and Symptoms of Internal vs. External Hemorrhoids**

Internal Hemorrhoids	External Hemorrhoids
Painless BRBPR	Sudden severe perianal pain
Rectal fullness or discomfort	Perianal mass
Mucus discharge	

## Anal Fissures

### Definition

- tear of anal canal below dentate line (very sensitive squamous epithelium)
- 90% posterior midline, 10% anterior midline
- if off midline: consider other possible causes such as IBD, STIs, TB, leukemia, or anal carcinoma
- repetitive injury cycle after first tear
  - sphincter spasm occurs preventing edges from healing and leads to further tearing
  - ischemia may ensue and contribute to chronicity

### Etiology

- forceful dilation of anal canal: large, hard stools and irritant diarrheal stools
- tightening of anal canal secondary to nervousness/pain leads to further tearing
- others: habitual use of cathartics, childbirth

### Clinical Features

- acute fissure
  - very painful bright red bleeding especially after bowel movement, sphincter spasm on limited DRE
  - treatment is conservative: stool softeners, bulking agent, sitz baths (heals 90%)
- chronic fissure (anal ulcer)
  - triad: fissure, sentinel skin tags, hypertrophied papillae
  - treatment
    - stool softeners, bulking agents, sitz baths
    - topical nitroglycerin or nifedipine: increases local blood flow, promoting healing and relieves sphincter spasm
    - lateral internal anal sphincterotomy (most effective): objective is to relieve sphincter spasm → increases blood flow and promotes healing; but 5% chance of fecal incontinence therefore not commonly done
    - alternative treatment
      - ◆ botulinum toxin: inhibits release of acetylcholine (ACh), reducing sphincter spasm

## Anorectal Abscess

### Definition

- infection in one or more of the anal spaces
- usually bacterial infection of blocked anal gland at the dentate line
- *E. coli*, *Proteus*, *Streptococci*, *Staphylococci*, *Bacteroides*, anaerobes

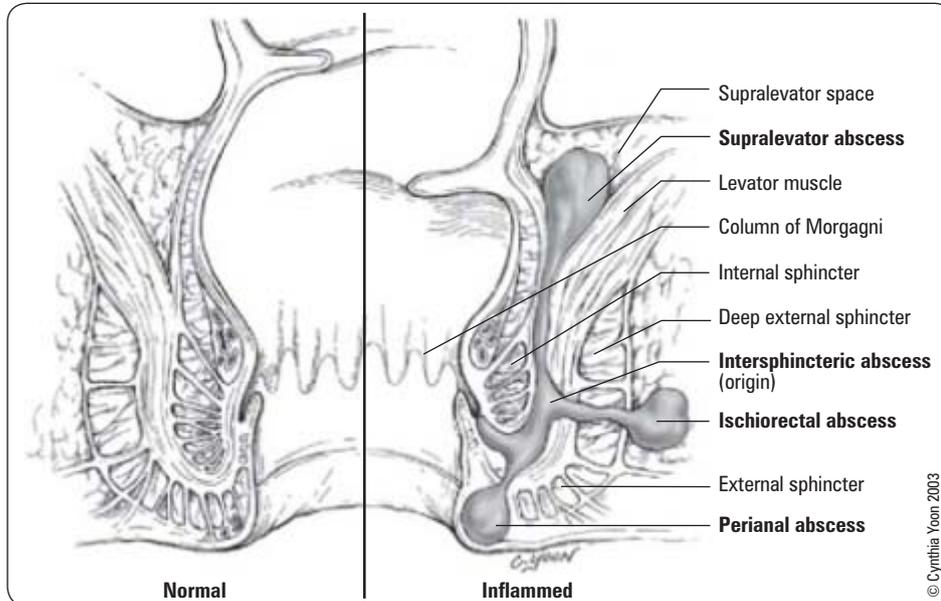

Figure 20. Different types of perianal abscesses

### Clinical Features

- throbbing pain that may worsen with straining and ambulation
- abscess can spread vertically downward (perianal), vertically upward (supralevator), or horizontally (ischiorectal)
- tender perianal/rectal mass on exam

### Treatment

- I&D
  - curative in 50% of cases
  - 50% develop anorectal fistulas
- may require antibiotics if diabetic, heart murmur, or cellulitis

Recurrent perianal abscesses is associated with Crohn's disease

Antibiotics are not typically helpful in the treatment of perianal abscesses

## Fistula-In-Ano

### Definition

- anal fistula from rectum to perianal skin
- an inflammatory tract with internal os at dentate line, external os on skin

### Etiology

- see *Fistula*, GS37
- same perirectal process as an anal abscess, therefore usually associated with an abscess
- other causes: post-operative, trauma, anal fissure, malignancy, radiation proctitis

### Clinical Features

- intermittent or constant purulent discharge from perianal opening
- pain
- palpable cord-like tract

### Treatment

- identification
  - internal opening
    - ♦ Goodsall's rule
      - fistulas originating anterior to a transverse line through the anus will have a straight course and exit anteriorly, whereas those originating posterior to the transverse line will begin in the midline and have a curved tract
  - fistulous tract
    - ♦ probing or fistulography under anesthesia

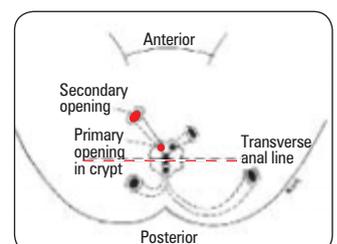

Figure 21. Goodsall's rule

- surgery
  - fistulotomy: unroof tract from external to internal opening, allow drainage, heals by secondary intention
  - low lying fistula (does not involve external sphincter) → primary fistulotomy
  - high lying fistula (involves external sphincter) → staged fistulotomy with Seton suture placed through tract
    - ◆ promotes drainage
    - ◆ promotes fibrosis and decreases incidence of incontinence
    - ◆ delineates anatomy
    - ◆ usually done to spare muscle cutting

### Post-Operative

- sitz baths, irrigation, and packing to ensure healing proceeds from inside to outside

### Complications

- recurrence
- rarely fecal incontinence

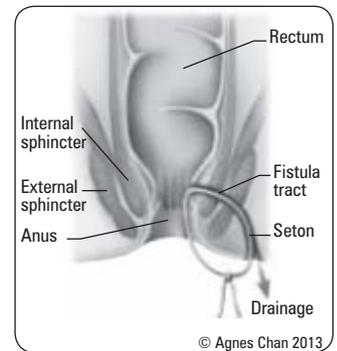

Figure 22. Fistulotomy

## Pilonidal Disease

### Definition

- chronic recurring abscess or chronic draining sinus in sacrococcygeal area

### Epidemiology

- occurs most frequently in young men age 15-40 yr; rare in >50 yr

### Etiology

- obstruction of the hair follicles in this area → formation of cysts, sinuses, or abscesses

### Clinical Features

- asymptomatic until acutely infected, then pain/tenderness, purulent discharge, inspissated hair

### Treatment

- acute abscess
  - I&D (often performed by primary care doctors)
  - wound packed open
  - 40% develop chronic pilonidal sinuses
- surgery
  - indication: failure of healing after I&D, recurrent disease, complex disease
  - pilonidal cystotomy: excision of sinus tract and cyst; wound closed by secondary intention, primary closure with tissue flap, or marsupialization (cyst edge sewn to surrounding tissue to leave sinus tract open)

## Rectal Prolapse

### Definition

- protrusion of some or all of rectal mucosa through external anal sphincter

### Epidemiology

- extremes of ages: <5 yr old and >5th decade
- 85% women

### Etiology

- lengthened attachment of rectum secondary to constant straining
- 2 types
  1. false/partial/mucosal: protrusion of mucosa only, radial furrows at junction with anal skin; most common type of rectal prolapse in childhood
  2. true/complete (most common): full thickness extrusion of rectal wall, concentric folds in:
    - ◆ first degree: prolapse includes mucocutaneous junction
    - ◆ second degree: without involvement of mucocutaneous junction
    - ◆ third degree (internal intussusception): prolapse is internal, concealed, or occult

### Risk Factors

- gynecological surgery
- chronic neurologic/psychiatric disorders affecting motility

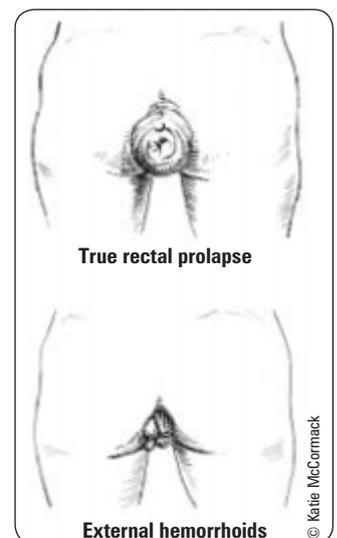

Figure 23. Rectal prolapse (true vs. false)

### Clinical Features

- extrusion of mass with increased intra-abdominal pressure
  - straining, coughing, laughing, Valsalva
- difficulty in bowel regulation
  - tenesmus, constipation, fecal incontinence
- permanently extruded rectum with excoriation, ulceration, and constant soiling
- may be associated with urinary incontinence or uterine prolapse

### Treatment

- Type I
  - conservative: gentle manual reduction of prolapsed area, especially in children
  - mucosectomy with excision of redundant mucosa, mostly in adults
- Type II
  - conservative: reduce if possible
  - surgery: abdominal, perineal, transsacral approaches

## Anal Neoplasms

### ANAL CANAL

#### Squamous Cell Carcinoma of Anal Canal (Above Dentate Line)

- most common tumour of anal canal (75%)
- anus prone to human papillomavirus (HPV) infection, therefore at risk for anal squamous intra-epithelial lesions (ASIL)
  - high grade squamous intra-epithelial lesion (HSIL) and low grade squamous intra-epithelial lesion (LSIL) terminology used
- clinical features: anal bleeding, pain, mass, ulceration, pruritus; 25% asymptomatic
- treatment: chemotherapy ± radiation ± surgery
- prognosis: 80% 5-yr survival

#### Malignant Melanoma of Anal Canal

- 3rd most common site for primary malignant melanoma after skin, eyes
- aggressive, distant metastases common at time of diagnosis
- treatment: wide excision or APR ± chemoradiation
- prognosis: <5% 5 yr survival

### ANAL MARGIN

- clinical features and treatment as for skin tumours elsewhere
- squamous and basal cell carcinoma, Bowen's disease (SCC *in situ*), and Paget's disease

## Liver

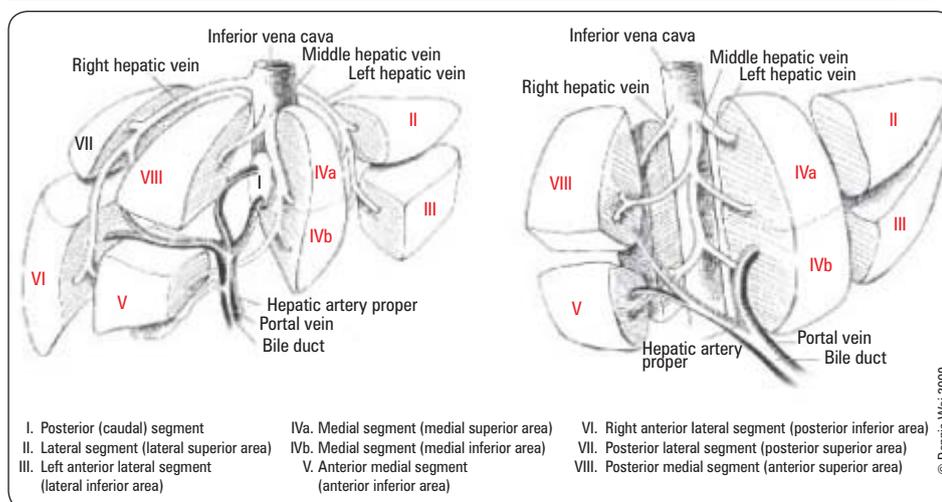

Figure 24. Anatomy of liver

## Liver Cysts

Table 18. Characteristics of Liver Cysts

	Simple Cysts	Polycystic Liver Disease	Choledochal Cysts	Hydatid (Cystic Echinococcosis)	Cystadenoma (Premalignant)/Cystadenocarcinoma
<b>Description</b>	Contain clear fluid that do not communicate with the intrahepatic biliary tree Most common	Several cysts that replace much of the liver	Congenital malformations of pancreaticobiliary tree high risk of malignancy majority present before age 10	Infection with parasite <i>Echinococcus granulosus</i> associated with exposure to dogs, sheep, and cattle in Southern Europe, Middle East, Australasia, South America	Rare cystic tumours that occur in the liver parenchyma or the extrahepatic bile ducts Cystadenocarcinoma is an invasive carcinoma
<b>Clinical Features</b>	Usually asymptomatic may have multiple simple cysts	Progressive 50% associated with polycystic kidney disease	Recurrent abdominal pain Intermittent jaundice RUQ mass Cholangitis Pancreatitis	Asymptomatic mass chronic pain Hepatomegaly	Upper abdominal mass Abdominal pain Anorexia
<b>Investigations</b>	U/S: Used for diagnosis and follow-up CT: well demarcated lesion that does not enhance with contrast	U/S	U/S CT Transhepatic cholangiography LFIs	Anti-Echinococcus Ab (IgG) U/S CT: calcified mass Needle biopsy	Appear as complex cysts: internal septae, papillary projections, irregular lining Need histology for definite diagnosis
<b>Treatment</b>	Not required unless very large Monitor if >4 cm	Only if symptomatic partial liver resection drainage	Complete excision of cysts liver transplant if cyst involves intrahepatic bile ducts (Caroli's disease)	Albendazole (anti-helminthic) – cure up to 30% Surgical (risk of spillage into abdomen): Conservative: open endocystectomy or PAIR (Percutaneous Aspiration, Injection of protoscolicidal agent, Re-aspiration) Radical: partial hepatectomy or total pericystectomy	All complex, multiloculated cysts (except echinococcal) should be excised because of malignancy risk
<b>Complications</b>	Intracystic hemorrhage		Biliary cirrhosis, portal HTN, rupture, cholangiocarcinoma Abnormal pancreaticobiliary junction is associated with increased risk of malignancy	Inferior vena cava compression rupture can cause biliary colic, jaundice, cholangitis, pancreatitis, or anaphylactic reaction	Cystadenocarcinoma can invade adjacent tissues and metastasize

## Liver Abscesses

### Etiology

- types
- pyogenic (bacterial): most common etiology; most often polymicrobial – *E. coli*, *Klebsiella*, *Proteus*, *Strep. milleri*
- parasitic (amoebic): *Entamoeba histolytica*, *Echinococcal* cyst
- fungal: *Candida*
- sources: direct spread from biliary tract infection, portal spread from GI infection, systemic infection (e.g. endocarditis)

### Clinical Features

- fever, malaise, chills, anorexia, weight loss, abdominal pain, nausea
- RUQ tenderness, hepatomegaly, jaundice

### Investigations

- leukocytosis, anemia, elevated liver enzymes, echinococcal serology
- U/S, CXR (right basilar atelectasis/effusion), CT, cyst aspiration with C&S, MRI

### Treatment

- treat underlying cause
- bacterial abscesses generally will treat initially with antibiotics, and add surgical or percutaneous drainage and IV antibiotics for larger abscesses (initially ceftriaxone + metronidazole or piperacillin/tazobactam)
- consider potential source of sepsis (e.g. biliary source, infected tumour)

### Prognosis

- overall mortality 15% – higher rate if delay in diagnosis, multiple abscesses, malnutrition

# Neoplasms

## BENIGN LIVER NEOPLASMS

### Hemangioma (cavernous)

- pathogenesis: most common benign hepatic tumour; results from malformation of angioblastic fetal tissue
- risk factors: F:M = 3:1
- clinical features
  - usually small and asymptomatic
  - consumptive coagulopathy if giant (in children)
- investigations
  - contrast CT (well-demarcated hypodense mass with peripheral enhancement on arterial phase with centripetal filling on delayed phases), U/S (homogenous hyperechoic mass), MRI
  - avoid biopsy: may result in hemorrhage
- treatment
  - usually none

### Focal Nodular Hyperplasia

- pathogenesis: unclear, may be regenerative response to hyperperfusion from anomalous arteries at centre of nodule
- risk factors: female, age 20-50
- clinical features: asymptomatic, rarely grows or bleeds, no malignant potential
- investigations: central stellate scar on CT scan; MRI, biopsy may be required
- treatment: may be difficult to distinguish from adenoma/fibrolamellar HCC (malignant potential)
  - if confirmed to be FNH → no treatment required

### Adenoma

- definition: benign glandular epithelial tumour
- risk factors: female, age 20-50, estrogen (OCP, pregnancy)
- clinical features: asymptomatic, 25% present with RUQ pain or mass, may present with bleeding
- investigations: CT (well-demarcated masses, often heterogeneous enhancement on arterial phase, isodense on venous phase without washout of contrast), U/S, MRI, biopsy often needed
- treatment
  - stop anabolic steroids or OCP
  - excise, especially if large (>5 cm), due to risk of transformation to hepatocellular carcinoma and spontaneous rupture/hemorrhage

## MALIGNANT LIVER NEOPLASMS

### Primary

- most commonly hepatocellular carcinoma (HCC) and cholangiocarcinomas
- others include angiosarcoma, hepatoblastoma, hemangioendothelioma, HCC
- epidemiology: 3rd leading cause of cancer death worldwide, 9th in United States; highest in Africa, China, Taiwan
- risk factors
  - chronic liver inflammation: cirrhosis from any cause, chronic hepatitis B (inherently oncogenic) and hepatitis C, hemochromatosis,  $\alpha$ 1-antitrypsin deficiency
  - medications: OCPs (3x increased risk), steroids
  - smoking, alcohol, Betel nuts
  - chemical carcinogens (aflatoxin, microcystin, vinyl chloride – associated with angiosarcoma)
- clinical features
  - RUQ discomfort, right shoulder pain
  - jaundice, weakness, weight loss,  $\pm$  fever (if central tumour necrosis)
  - hepatomegaly, bruit, hepatic friction rub
  - ascites with blood (sudden intra-abdominal hemorrhage)
  - paraneoplastic syndromes – hypoglycemia, hypercalcemia, erythrocytosis, watery diarrhea
  - metastasis: lung, bone, brain, peritoneal seeding
- investigations
  - elevated ALP, bilirubin, and  $\alpha$ -fetoprotein (80% of patients)
  - U/S (poorly-defined margins with internal echos), triphasic CT (enhancement on arterial phase and washout on portal venous phase), MRI
  - liver enzyme and liver function tests: AST, ALT, ALP, bilirubin, albumin, INR
- treatment
  - cirrhosis is a relative contraindication to tumour resection due to decreased hepatic reserve
  - surgical: resection (10% of patients have resectable tumours)
  - liver transplant; may use bridging therapy while awaiting transplant
    - ♦ **absolute contraindications:** extrahepatic disease, vascular invasion
    - ♦ **relative contraindications:** dependent on liver transplant protocol based on staging criteria followed by transplant centre

### Differential Diagnosis of Metastatic Liver Mass

Some GU Cancers Produce Bumpy Lumps

Stomach  
GenitoUrinary cancers (kidney, ovary, uterus)  
Colon  
Pancreas  
Breast  
Lung

### Staging Criteria for Hepatocellular Carcinoma

<b>Milan Criteria*</b>	1 tumour $\leq$ 5 cm Up to 3 tumours each $\leq$ 3 cm
<b>UCSF Criteria*</b>	1 tumour $\leq$ 6.5 cm Up to 3 tumours each $\leq$ 4.5 cm, total diameter $\leq$ 8 cm
<b>Toronto Criteria*</b>	No tumour size or number restrictions No systemic symptoms Not poorly differentiated

\*Each criteria assumes no extrahepatic and no macrovascular invasion

### Child-Turcotte-Pugh Score (Prognosis of Chronic Liver Disease/Cirrhosis, Including Post-Operatively)

	1 Point	2 Points	3 Points
Albumin (g/L)	>35	28-35	<28
Ascites	Absent	Easily controlled	Poorly controlled
Bilirubin ( $\mu$ mol/L)	<34	34-51	>51
(mg/dL)	<2.0	2.0-3.0	>3.0
Coagulation (INR)	<1.7	1.7-2.3	>2.3
Hepatic Encephalopathy	None	Minimal (Grade I-II)	Advanced (Grade III-IV)

Points	Class	One Yr Survival	Two Yr Survival
5-6	A	100%	85%
7-9	B	81%	57%
10-15	C	45%	35%

- non-surgical: radiofrequency ablation, percutaneous ethanol injection, transcatheter arterial chemoembolization (TACE), chemotherapy (consider sorafenib for HCC; pre-operative chemotherapy for hepatoblastoma is standard of care), radiotherapy
- prognosis
  - median survival: 6-20 mo
  - 5 yr survival: all patients – 5%; patients undergoing complete resection – 11-40%

**Secondary**

- metastases to the liver are the most common malignant tumours found in the liver
- etiology
  - GI (colorectal most common), lung, breast, pancreas, ovary, uterus, kidney, gallbladder, prostate
- treatment
  - depends on the primary cancer site and prognosis. Often liver metastases are a manifestation of Stage IV disease, and chemotherapy is indicated
  - metastasectomy may be appropriate for some cancers
    - ◆ hepatic resection metastatic colorectal liver metastases is standard of care as part of multi-modality treatment that includes chemotherapy if complete resection of the primary cancer and metastases is possible
    - ◆ prognosis following liver resection for colorectal metastases is an overall survival of 30-60% at 5 yr

Secondary liver metastases are common in many cancers, with some studies showing a prevalence of 40-50% amongst patients with extrahepatic cancers. They commonly arise from breast, lung, and colorectal cancers. For metastases secondary to colorectal cancer, surgical resection offers the greatest likelihood of cure

**Living Liver Donors vs. Deceased Liver Donors**

The right lobe of a living donor liver is transplanted into the recipient, whereas whole livers from deceased donors are transplanted orthotopically into the recipient

**Which Matters Most: Number of Tumours, Size of the Largest Tumour, or Total Tumour Volume?**

*Liver Transplant 2011;17:S58-66*  
**Purpose:** To determine if the size and/or number of hepatocellular carcinoma (HCC) nodules predict disease recurrence and survival after liver transplantation.

**Methods:** Systematic review and meta-analysis.  
**Results:** 74 studies were included for analysis. Patients beyond the Milan criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the UCSF criteria had reduced overall and disease-free survivals and higher recurrence. Patients outside the Milan criteria but within the UCSF criteria had reduced overall and disease-free survivals. Overall and disease-free survivals were reduced for patients with larger total tumour diameter, ≥10 cm vs. <10 cm and ≥9 cm vs. <9 cm, respectively. Similarly, patients with higher diameter of largest tumour nodule (≥3 cm vs. <3 cm) had reduced overall survival and higher recurrence. Overall and disease-free survivals were reduced and recurrence higher for patients with tumour size ≥5 cm vs. <5 cm. Mixed results were found regarding number of tumour nodules.  
**Conclusion:** Tumour size and volume are important factors in survival after liver transplantation.

**Living Donor Liver Transplantation vs. Deceased Donor Liver Transplantation for Hepatocellular Carcinoma: Comparable Survival and Recurrence**

*Liver Transplant 2012;18:315-322*  
**Purpose:** To compare the overall survival and hepatocellular carcinoma (HCC) recurrence rates after living donor liver transplantation (LDLT) versus deceased donor liver transplantation (DDLT) in a series of patients with HCC.  
**Methods:** Study conducted between 1996 and 2009 at a single centre. 345 patients with HCC undergoing liver transplantation included.  
**Results:** The overall survival rates at 1, 3, and 5 yr did not significantly differ between the LDLT and DDLT groups (p=0.62). Disease free survival at 1, 3, and 5 yr did not differ between the groups (p=0.82). The recurrence rates at 1, 3, and 5 yr also did not differ between the two group (p=0.54).  
**Conclusion:** LDLT and DDLT lead to similar survival and recurrence rates.

**Liver Transplantation**

**Table 19. Conditions Leading to Transplantation**

Parenchymal Disease	Cholestatic Disease	Inborn Errors	Tumours
Chronic hepatitis B or C*	Biliary atresia**	α1-antitrypsin deficiency	Hepatocellular carcinoma
Alcoholic cirrhosis	Primary biliary cirrhosis	Wilson's disease	
Acute liver failure	Sclerosing cholangitis	Hemochromatosis	
Budd-Chiari syndrome			
Congenital hepatic fibrosis			
CF			
Autoimmune hepatitis			
Cryptogenic cirrhosis			
Drug induced hepatotoxicity			
Non-alcoholic steatohepatitis			

\*leading cause in adults; \*\*leading cause in children

**Clinical Indications**

- early referral for transplant should be considered for all patients with progressive liver disease not responsive to medical therapy, especially:
  - decompensated cirrhosis (ascites, esophageal variceal hemorrhage, spontaneous hepatic encephalopathy, coagulopathy, progressive jaundice, severe fatigue)
  - unresectable primary liver cancers
  - fulminant hepatic failure
- end-stage liver disease with life expectancy <1 yr and if no other therapy is appropriate
  - suitable HCC not amenable to liver resection

**Criteria for Transplantation**

- Model for End-Stage Liver Disease (MELD): prognostic model to estimate 3 mo survival and disease severity if patient does not receive transplant; based on creatinine, bilirubin, INR; MELD scores from 6-40 used to prioritize liver allocation
- Child-Turcotte-Pugh Score: classification system to assess the prognosis and mortality of liver disease; patient must have ≥7 points (Class B)

**Contraindications**

- active alcohol/substance abuse
- extrahepatic malignancy within 5 yr
- advanced cardiopulmonary disease
- active uncontrolled infection

**Post-Operative Complications**

- primary non-function (graft failure): urgent re-transplantation is indicated
- acute and chronic rejection, ischemia-reperfusion injury
- vascular: hepatic artery or portal vein thrombosis, IVC obstruction
- biliary complications: fever, increasing bilirubin and ALP
- complications related to immunosuppression: HTN, renal disease, DM, obesity, hyperlipidemia, osteoporosis, malignancy, neurologic complications, infection (leading cause of mortality following transplant)

**Prognosis**

- patient survival at 1 yr: 85%
- graft survival at 1 yr: >80%, at 5 yr: 60-70%

# Biliary Tract

## Cholelithiasis

### Definition

- the presence of gallstones

### Pathogenesis

- imbalance of cholesterol and its solubilizing agents (bile salts and lecithin)
- excessive hepatic cholesterol secretion → bile salts and lecithin are “overloaded” → supersaturated cholesterol can precipitate and form gallstones
- North America: cholesterol stones (80%), pigment stones (20%)

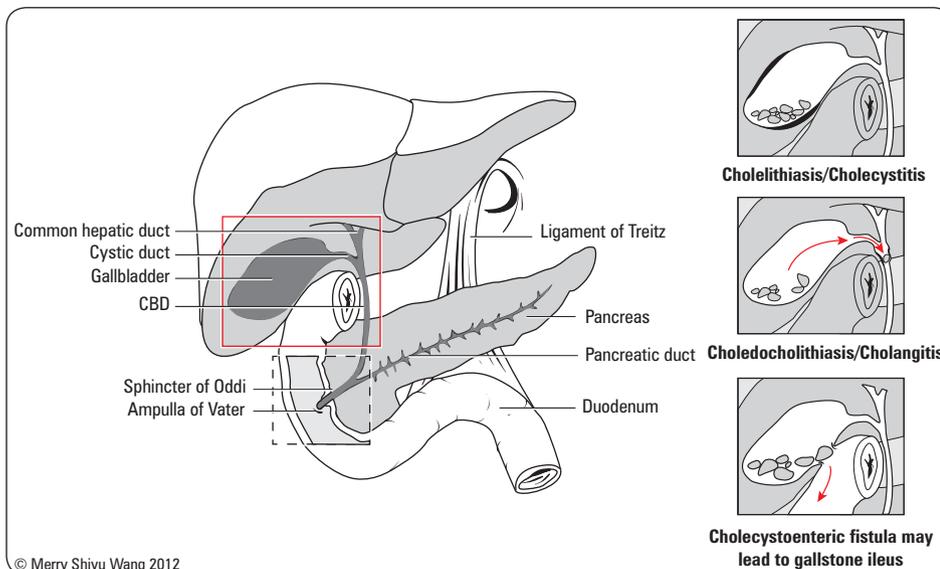

### Risk Factors

- cholesterol stones
  - obesity, age <50
  - estrogens: female, multiparity, OCPs
  - ethnicity: First Nations heritage (especially Pima Indians) > Caucasian > Black
  - terminal ileal resection or disease (e.g. Crohn’s disease)
  - impaired gallbladder emptying: starvation, TPN, DM
  - rapid weight loss: rapid cholesterol mobilization and biliary stasis
- pigment stones (contain calcium bilirubinate)
  - cirrhosis
  - chronic hemolysis
  - biliary stasis (strictures, dilation, biliary infection)
  - protective factors: statins, vitamin C, coffee, exercise

#### Risk Factors for Cholesterol Stones

4Fs  
 Fat  
 Female  
 Fertile  
 Forties

© Merry Shiyu Wang 2012

Figure 25. Gallstone disease

### Clinical Presentation

- asymptomatic (80%)
  - most do NOT require treatment
  - consider cholecystectomy if: increased risk of malignancy (choledochal cysts, Caroli’s disease, porcelain or calcified gallbladder), sickle cell disease, pediatric patient, bariatric surgery, immunosuppression
- biliary colic (10-25%)
- cholecystitis
- choledocholithiasis (8-15%)
- cholangitis
- gallstone pancreatitis (see *Acute Pancreatitis, GS51*)
- gallstone ileus (0.3-0.5%)
- other: empyema of the gallbladder, liver abscess, gallbladder perforation with bile peritonitis

#### Summary of Biliary Tract Conditions

Gall Bladder	Asymptomatic	Pain Only	Infection + Pain
Cholelithiasis	✓ (majority)		
Biliary Colic		✓	
Cholecystitis			✓
Common Bile Duct	Asymptomatic	Pain Only	Infection + Pain
Choledocholithiasis	✓ (majority)	✓	
Cholangitis			✓ (majority)

## Investigations

- Labs
  - CBC, LFTs, amylase, and lipase
- U/S: diagnostic procedure of choice
  - image for signs of inflammation, obstruction, localization of stones
  - 95% specific for detecting stones
  - signs: gallbladder wall thickening >4 mm, edema (double-wall sign), gallbladder sludge, pericholecystic fluid, sonographic Murphy's sign
- HIDA scan
  - used less commonly
  - radioisotope technetium-99 injected into a vein is excreted in high concentrations into bile, allowing visualization of the biliary tree
  - does not visualize stones; diagnosis by seeing occluded cystic duct or CBD

## Choledocholithiasis (suspected or confirmed)

- MRCP
  - visualization of ampullary region, biliary and pancreatic anatomy
  - non-invasive diagnostic test of choice
- ERCP
  - CBD stones in periampullary region
  - complications: retained stones, ERCP pancreatitis (1-2%), pancreatic or biliary sepsis

## Percutaneous Transhepatic Cholangiography

- percutaneous approach to the proximal biliary tree (i.e. intra-hepatic biliary system) via the hepatic parenchyma
- useful for proximal bile duct obstruction or when ERCP fails or not available
- requires prophylactic antibiotics
- contraindications: coagulopathy, ascites, peri/intrahepatic sepsis, disease of right lower lung or pleura
- complications: bile peritonitis, chylothorax, pneumothorax, biliary sepsis, hemobilia

# Biliary Colic

## Pathogenesis

- gallstone transiently impacted in cystic duct, no infection

## Clinical Features

- steady, severe dull pain in epigastrium or RUQ for minutes to hours (<6 h), crescendo-decrescendo pattern
- may present with chest pain
- N/V
- frequently occurs at night or after fatty meal, not after fasting
- can radiate to right shoulder or scapula
- no peritoneal findings, no systemic signs

## Investigations

- normal blood work: CBC, electrolytes, LFTs, bilirubin, amylase
- U/S shows cholelithiasis, may show stone in cystic duct

## Treatment

- analgesia, rehydration during colic episode
- elective cholecystectomy (95% success)
  - complications: CBD injury (0.3-0.5%), hollow viscus injury, bile peritonitis, vessel injury
  - laparoscopic cholecystectomy is the standard of care, no benefit to delaying surgery
  - risk of open cholecystectomy higher in emergency situations

# Acute Cholecystitis

## Pathogenesis

- inflammation of gallbladder resulting from sustained gallstone impaction in cystic duct or Hartmann's pouch
- no cholelithiasis in 5-10% (see *Acalculous Cholecystitis*, GS48)

## Clinical Features

- often have history of biliary colic
- severe constant (<6hr) epigastric or RUQ pain, anorexia, N/V, low grade fever (<38.5°C)
- focal peritoneal findings: Murphy's sign, palpable, tender gallbladder (in 33%)
- Boas' sign: right subscapular pain

Biliary colic is a **constant pain**, not colicky

**2 Most Important Lab Tests for Biliary Pain**

- Amylase
- Bilirubin

Biliary colic is treated with analgesia and elective cholecystectomy  
Acute cholecystitis is treated with antibiotics and early cholecystectomy

**Early vs. Delayed Laparoscopic Cholecystectomy for Uncomplicated Biliary Colic**

*Cochrane DB Syst Rev* 2013;6:CD007196

**Study:** To assess the benefits and harms of early vs. delayed laparoscopic cholecystectomy for patients with uncomplicated biliary colic due to gallstones.

**Results:** One trial with 75 participants, average age 43 yr. Early laparoscopic cholecystectomy (<24 h) vs. delayed (mean wait period 4.2 mo). The proportion of serious adverse events was lower in the early vs. delayed group (0% vs. 22.5%, respectively). There was a shorter hospital stay in the early group (MD -1.25 d, 95% CI -2.05 to -0.45) and a shorter operating time in the early group (MD -14.80 min, 95% CI -18.02 to -11.58). There was no difference in the proportion of patients requiring conversion to open cholecystectomy in the two groups.

**Conclusion:** Early laparoscopic cholecystectomy (<24 h of diagnosis of biliary colic) decreased morbidity during the waiting period for elective laparoscopic cholecystectomy, hospital stay, and operating time.

## Investigations

- blood work: elevated WBC and left shift, mildly elevated bilirubin, AST, ALT, and ALP
- U/S: 98% sensitive, consider HIDA scan if U/S negative

## Complications

- Mirizzi syndrome: extra-luminal compression of CBD/CHD due to large stone in cystic duct
- empyema of gallbladder: suppurative cholecystitis, pus in gallbladder + sick patient
- emphysematous cholecystitis: bacterial gas present in gallbladder lumen, wall, or pericholecystic space (risk in diabetic patient); organisms involved in secondary infection: *E. coli*, *Klebsiella*, *Enterococcus*
- gangrenous gallbladder (20%), perforation (2%): result in abscess formation or peritonitis
- cholecystoenteric fistula, from repeated attacks of cholecystitis, can lead to gallstone ileus

## Treatment

- admit, hydrate, NPO, NGT (if persistent vomiting from associated ileus), analgesics once diagnosis is made
- antibiotics
  - cefazolin if uncomplicated cholecystitis
- ERCP prior to surgery if US if CBD stones are present
  - MRCP ± ERCP if CBD is markedly dilated or CBD stones suspected
- cholecystectomy
  - early (within 72 h) vs. delayed (after 6 wk)
    - ◆ equal morbidity and mortality
    - ◆ early cholecystectomy preferred: shorter hospitalization and recovery time, no benefit to delaying surgery
    - ◆ emergent OR indicated if high risk, e.g. emphysematous
  - laparoscopic is standard of care (convert to open for complications or difficult case)
    - ◆ laparoscopic: reduced risk of wound infections, shorter hospital stay, reduced post-operative pain, increased risk of bile duct injury
- intra-operative cholangiography (IOC)
  - indications: clarify bile duct anatomy, history of biliary pancreatitis, small stones in gallbladder with a wide cystic duct (>15 mm), jaundice
- percutaneous cholecystostomy tube: critically ill or if general anesthetic contraindicated

### Mirizzi Syndrome

Extrinsic compression of the common hepatic duct by a gallstone in the cystic duct or Hartmann's pouch. Impacted gallstone may erode into the CHD or CBD, creating a cholecystohepatic or cholecystocholedochal fistula; Mirizzi syndrome has an association with gallbladder cancer

### Rouviere's Sulcus

Fissure between right lobe and caudate process of liver; keeping dissection anterior to this landmark prevents bile duct injury

### Critical View of Safety

Space between the gallbladder and liver clear of any structures other than the cystic artery

### Laparoscopic vs. Open Cholecystectomy

- Shorter operating time
- Shorter length of stay
- Shorter sick leave
- Shorter time to return to daily activities
- Less post-operative pain
- Decreased use of post-operative analgesia
- Decreased reduction in pulmonary function\*
- Fewer pulmonary complications
- Decreased acute phase response
- Less impairment in intestinal motility\*

### Open Cholecystectomy

- Lower conversion rates to open surgery (for mini-laparotomies)

\*NOTE:

Pulmonary function = O<sub>2</sub> consumption, spirometric parameters, ABG, and acid-base balance  
Intestinal motility = auscultating intestinal peristalsis, abdominal circumference measurement, and time interval to restitution of defecation

### American Society of Gastrointestinal Endoscopy 2010 Predictors for Risk of CBD Stones

#### Very strong

- CBD stone on U/S
- Clinical ascending cholangitis
- Bilirubin > 68 μmol/L

#### Strong

- CBD dilated >6 mm on U/S
- Bilirubin 31-68 μmol/L

#### Moderate

- Abnormal liver test (besides bilirubin)
- Age > 55 yr
- Clinical gallstone pancreatitis

## Acalculous Cholecystitis

### Definition

- acute or chronic cholecystitis in the absence of stones

### Pathogenesis

- typically due to gallbladder ischemia, stasis

### Risk Factors

- DM, immunosuppression, ICU admission, trauma patient, TPN, sepsis

### Clinical Features

- see *Acute Cholecystitis*, GS47
- occurs in 20% of cases of acute cholecystitis

### Investigations

- U/S: shows sludge in gallbladder, other U/S features of cholecystitis (see *Acute Cholecystitis*)
- CT or HIDA scan

### Treatment

- broad-spectrum antibiotics, cholecystectomy
- if patient unstable → cholecystostomy

## Choledocholithiasis

### Definition

- stones in CBD

### Clinical Features

- 50% asymptomatic
- often have history of biliary colic
- tenderness in RUQ or epigastrium
- acholic stool, dark urine, fluctuating jaundice
- primary vs. secondary stones
  - primary: formed in bile duct, indicates bile duct pathology (e.g. benign biliary stricture, sclerosing cholangitis, choledochal cyst, CF)
  - secondary: formed in gallbladder (85% of cases in U.S.)

### Investigations

- CBC: usually normal; leukocytosis suggests cholangitis
- LFTs: increased AST, ALT early in disease, increased bilirubin (more sensitive), ALP, GGT later
- amylase/lipase: to rule out gallstone pancreatitis
- U/S: intra-/extra-hepatic duct dilatation; differential diagnosis is choledochal cyst
- MRCP (90% sensitive)

### Complications

- cholangitis, pancreatitis, biliary stricture, and biliary cirrhosis

### Treatment

- treat with ERCP for CBD stone extraction possibly followed by elective cholecystectomy in 25% of patients

## Acute Cholangitis

### Pathogenesis

- obstruction of CBD leading to biliary stasis, bacterial overgrowth, suppuration and biliary sepsis – may be life-threatening, especially in elderly

### Etiology

- choledocholithiasis (60%), stricture, neoplasm (pancreatic or biliary), extrinsic compression (pancreatic pseudocyst or pancreatitis), instrumentation of bile ducts (PTC, ERCP), biliary stent
- organisms: *E. coli*, *Klebsiella*, *Pseudomonas*, *Enterococcus*, *B. fragilis*, *Proteus*

### Clinical Features

- Charcot's triad: fever, RUQ pain, jaundice
- Reynold's pentad: fever, RUQ pain, jaundice, shock, confusion
- may have N/V, abdominal distention, ileus, acholic stools, tea-coloured urine (elevated direct bilirubin)

### Investigations

- CBC: elevated WBC + left shift
- may have positive blood cultures
- LFTs: obstructive picture (elevated ALP, GGT, and conjugated bilirubin, mild increase in AST, ALT)
- amylase/lipase: rule out pancreatitis
- U/S: intra-/extra-hepatic duct dilatation

### Treatment

- initial: NPO, fluid and electrolyte resuscitation, ± NGT, IV antibiotics (treats 80%)
- biliary decompression
  - ERCP + sphincterotomy: diagnostic and therapeutic
  - PTC with catheter drainage: if ERCP not available or unsuccessful
  - laparotomy with CBD exploration and T-tube placement if above fails
- all patients should also have a cholecystectomy, unless contraindicated

### Prognosis

- suppurative cholangitis mortality rate: 50%

## Gallstone Ileus

### Pathogenesis

- repeated inflammation causing a cholecystoenteric fistula (usually duodenal) → large gallstone enters the gut and impacts near the ileocecal valve, causing a true bowel obstruction (note: ileus is a misnomer in this context)

### Clinical Features

- crampy abdominal pain, N/V (see *Large Bowel Obstruction*, GS29)

### Investigations

- AXR: dilated small intestine, air fluid levels, may reveal radiopaque gallstone, air in biliary tree (pneumobilia) (40%)
- CT: biliary tract air, obstruction, gallstone in intestine
- Rigler's triad: pneumobilia (air in biliary tree), small bowel obstruction (partial or complete), gallstone (usually in right iliac fossa)

### Treatment

- fluid resuscitation, NGT decompression
- surgery: enterolithotomy and removal of stone, inspect small and large bowel for additional proximal stones
- may close fistula surgically or manage expectantly (can resolve spontaneously)
- cholecystectomy is generally not performed

#### Charcot's Triad

Fever, RUQ pain, jaundice

#### Reynold's Pentad

Fever, RUQ pain, jaundice, shock, confusion

#### Common Bacteria in Biliary Tract

##### KEEPS

*Klebsiella*  
*Enterococcus*  
*E. coli*, *Enterobacter*  
*Proteus*, *Pseudomonas*  
*Serratia*

#### Rigler's Triad of Gallstone Ileus

Pneumobilia  
Small bowel obstruction  
Gallstone

#### Bouveret's Syndrome

Gastric outlet/duodenal obstruction caused by a large gallstone passing through a cholecystogastric or cholecystoduodenal fistula

## Carcinoma of the Gallbladder

### Risk Factors

- chronic symptomatic gallstones (70% of cases), old age, female, gallbladder polyps, porcelain gallbladder, chronic infection (*Salmonella*, *Helicobacter*), abnormal pancreaticobiliary duct junction

### Clinical Features

- majority are adenocarcinoma
- may be incidental finding on elective cholecystectomy (~1% of open cholecystectomies 0.1% in laparoscopic cholecystectomies)
- many patients are asymptomatic until late
- local: non-specific RUQ pain, ± palpable RUQ mass
- Courvoisier's gallbladder: an enlarged, often palpable gallbladder in a patient with carcinoma of the head of the pancreas; associated with jaundice due to obstruction of the CBD
- systemic: jaundice (50%) due to invasion of CBD or compression of CBD by pericholedochal nodes, weight loss, malaise, anorexia
- early local extension to liver, may extend to stomach, duodenum
- early metastasis common to liver, lung, bone

### Investigations

- U/S: mural thickening, calcification, loss of interface between gallbladder and liver, fixed mass
- endoscopic U/S (EUS): good for distinguishing carcinomas from other diagnoses such as polyps, good for staging, allows sampling of bile for cytology
- abdominal CT: polypoid mass, mural thickening, liver invasion, nodal involvement, distant metastases
- MRI/MRCP: good for distinguishing benign and malignant polyps

### Treatment

- if carcinoma of the gallbladder is suspected pre-operatively, an open cholecystectomy should be considered to avoid tumour seeding of the peritoneal cavity
- confined to mucosa (rare): cholecystectomy
- beyond mucosa: cholecystectomy, en bloc wedge resection of 3-5 cm underlying liver, dissection of hepatoduodenal lymph nodes

### Prognosis

- poor 5 yr survival (10%) as gallbladder carcinoma is often detected late
- better outcomes when detected incidentally following cholecystectomy

## Cholangiocarcinoma

### Definition

- malignancy of extra- or intrahepatic bile ducts

### Risk Factors

- age 50-70, gallstones, ulcerative colitis, primary sclerosing cholangitis, choledochal cyst, Clonorchis sinensis infection (liver fluke), chronic intrahepatic stones (hepatolithiasis)

### Clinical Features

- majority are adenocarcinomas
- gradual signs of biliary obstruction: jaundice, pruritus, dark urine, pale stools
- anorexia, weight loss, RUQ pain, Courvoisier's sign (if CBD obstructed), hepatomegaly
- early metastases are uncommon, but commonly tumour grows into portal vein or hepatic artery
- Klatskin tumour: cholangiocarcinoma located at bifurcation of common hepatic duct

### Investigations

- LFTs show obstructive picture
- U/S, CT: bile ducts usually dilated, but not necessarily
- ERCP or PTC: to determine resectability, for biopsies
- CXR, bone scan: for metastatic workup

### Treatment

- if resectable: biliary drainage and wide excision margin
- intra-hepatic lesions: liver resection
  - upper third lesions: duct resection + Roux-en-Y hepaticojejunostomy, ± liver resection
  - middle third lesions (uncommon): duct resection + Roux-en-Y hepaticojejunostomy
  - lower third lesions: Whipple procedure
- unresectable lesions: stent or choledochojejunostomy (surgical bypass)
- chemotherapy ± radiotherapy
- role for transplantation in selected patients with Klatskins tumours

### Prognosis

- overall 5 yr survival: 15%

#### Courvoisier's Sign

Palpable, nontender distended gallbladder due to CBD obstruction. Present in 33% of patients with pancreatic carcinoma. The distended gallbladder could not be due to acute cholecystitis or stone disease because the gallbladder would actually be scarred and smaller, not larger

#### Efficacy of Neoadjuvant Chemoradiation, Followed by Liver Transplantation, for Perihilar Cholangiocarcinoma at 12 US Centres

*Gastroenterology* 2012;143:88-98

**Purpose:** To determine the effectiveness of neoadjuvant chemoradiation and liver transplantation for unresectable perihilar cholangiocarcinoma and to determine the appropriateness of the United Network of Organ Sharing/Organ Procurement and Transplantation Network (UNOS/OPTN) criteria for model of end-stage liver disease (MELD) exception for patients with this disease.

**Methods:** Study conducted from 1993-2010 in 12 transplant centres. 287 patients included.

**Results:** Median follow-up was 2.5 yr. 43% of patients (n=122) died after a median of 1.2 yr from presentation, and of these, 60 died pretransplant. Post-transplant, 43 patients had recurrences and 62 died. Recurrence-free survival at 2, 5, and 10 yr were 78%, 65%, and 59%, respectively. Intention-to-treat survival rates at 2 and 5 yr were 68% and 53%, respectively. 25% of patients left the waiting list after a median of 4.6 mo. The waiting list drop-out rate increased by an average of 11.5% every 3 mo. Patients who received transplantation outside of the criteria for MELD exception or who had a malignancy within 5 yr had significantly worse recurrence-free survival compared to those who met the criteria (HR=2.98, 95% CI 1.79, 4.95). Recurrence-free survival at 5 yr was shorter for patients with tumours >3 cm vs. ≤3 cm (p<0.001).

**Conclusions:** Neoadjuvant chemoradiation and liver transplantation are effective treatments for unresectable perihilar cholangiocarcinoma. Furthermore, the UNOS/OPTN criteria for MELD exception appear to be appropriate.

Obstructive jaundice is the most common presenting symptom for cholangiocarcinoma

#### Ranson's Criteria

##### A. At admission

- Age >55 yr
- WBC >16 x 10<sup>9</sup>/L
- Glucose >11 mmol/L
- LDH ≥350 IU/L
- AST >250 IU/L

##### B. During initial 48 h

- Hct drop >10%
- BUN rise >1.8 mmol/L
- Arterial PO<sub>2</sub> <60 mmHg
- Base deficit >4 mmol/L
- Calcium <2 mmol/L
- Fluid sequestration >6 L

##### C. Interpretation

- ≥2 = difficult course
- ≥3 = high mortality (≥15%)

# Pancreas

## Acute Pancreatitis

- see [Gastroenterology, G44](#)

### GALLSTONE PANCREATITIS (35% of Acute Pancreatitis)

#### Pathogenesis

- obstruction of pancreatic duct by large or small gallstones and biliary sludge
- backup of pancreatic enzymes can cause autodigestion of the pancreas

#### Clinical Features (Pancreatitis of Any Etiology)

- pain (epigastric pain radiating to back), N/V, ileus, peritoneal signs, jaundice, fever
- Ingelfinger's sign: pain worse when supine, better when sitting forward
- may have coexistent cholangitis or pancreatic necrosis
- Ranson's criteria for determining prognosis of acute pancreatitis (see sidebar)
- physical exam may show: tachypnea, tachycardia, hypotension, abdominal distention and tenderness, Cullen's sign, Grey Turner's sign

#### Investigations

- elevated amylase (higher than alcoholic pancreatitis), lipase, leukocytosis
- elevated ALT (>150 IU/L), AST strongly suggest gallstone etiology of pancreatitis
- U/S may show multiple stones (may have passed spontaneously), edematous pancreas
- CXR, AXR, CT (if severe to evaluate for complications)

#### Treatment

- supportive: e.g. NPO, hydration, analgesia, early enteric nutrition
- antibiotics for severe cases of necrotizing pancreatitis or signs of sepsis
- stone often passes spontaneously (~90%); usually no surgical management in uncomplicated acute pancreatitis
- cholecystectomy during same admission (25-60% recurrence if no surgery)
- may need urgent ERCP + sphincterotomy if CBD stone impacted or cholangitis
- **surgical indications** in acute pancreatitis (rare):
  - drain placement and debridement for necrotizing pancreatitis if refractory to medical management, if septic or in ICU without other sources of sepsis

#### Complications

- acute fluid collections
- pseudocyst (collection of pancreatic secretions >4 wk old surrounded by a defined wall of granulation tissue)
- abscess/infection, necrosis
- splenic/mesenteric/portal vessel thrombosis
- pancreatic ascites/pancreatic pleural effusion
- DM
- ARDS/sepsis/multiorgan failure
- coagulopathy/DIC
- severe hypocalcemia

## Chronic Pancreatitis

- see [Gastroenterology, G45](#)

#### Surgical Treatment

- treatment is generally medical
- indications for surgery
  - failure of medical treatment
  - debilitating abdominal pain
  - pseudocyst complications: persistence, hemorrhage, infection, rupture
  - CBD obstruction (e.g. strictures), duodenal obstruction
  - pancreatic fistula, variceal hemorrhage secondary to splenic vein obstruction
  - rule out pancreatic cancer (present in 15% of chronic pancreatitis treated surgically)
  - anatomical abnormality causing recurrent pancreatitis
- pre-operative CT and/or ERCP are mandatory to delineate anatomy
- minimally invasive options
  - endoscopic pancreatic duct decompression: less effective than surgery
  - extracorporeal shockwave lithotripsy: if pancreatic duct stones
  - celiac plexus block: lasting benefit in 30% patients, less effective in those <45 yr or with prior pancreatic surgery

The hallmark of chronic pancreatitis is epigastric pain radiating to the back

- surgical options
  - drainage procedures: only effective if ductal system is dilated
    - ♦ Puestow procedure (lateral pancreaticojejunostomy): improves pain in 80% of patients
  - pancreatectomy: best option in absence of dilated duct
    - ♦ proximal disease: Whipple procedure (pancreaticoduodenectomy) – pain relief in 80%
    - ♦ distal disease: distal pancreatectomy ± Roux-en-Y pancreaticojejunostomy
    - ♦ total pancreatectomy: refractory disease
  - denervation of celiac ganglion and splanchnic nerves

### PSEUDOCYST

- localized fluid collections rich in pancreatic enzymes, with a non-epithelialized wall consisting of fibrous and granulation tissue
- complication of chronic and/or acute pancreatitis
- often resolve spontaneously
- cyst wall must be mature prior to drainage (4-6 wk)
- pseudoaneurysm an absolute contraindication to endoscopic drainage, must embolize first

### Treatment

- expectant management if asymptomatic
- endoscopic drainage
  - cystgastrostomy
  - cystduodenostomy
- percutaneous catheter drainage
- surgical drainage (gold standard)
  - cystgastrostomy
  - cystenterostomy
- resection
  - consider biopsy of cyst wall to rule out cystadenocarcinoma

## Pancreatic Cancer

### Epidemiology

- fourth most common cause of cancer-related mortality in both men and women in Canada
- M:F = 1.3:1, average age: 50-70

### Risk Factors

- increased age
- smoking: 2-5x increased risk, most clearly established risk factor
- high fat/low fibre diets, heavy alcohol use
- obesity
- DM, chronic pancreatitis
- partial gastrectomy, cholecystectomy
- chemicals: betanaphthylamine, benzidine
- African descent

### Clinical Features

- head of the pancreas (70%)
  - weight loss, obstructive jaundice, steatorrhea, vague constant mid-epigastric pain (often worse at night, may radiate to back)
  - painless jaundice, Courvoisier's sign
- body or tail of pancreas (30%)
  - tends to present later and usually inoperable
  - weight loss, vague mid-epigastric pain
  - <10% jaundiced
  - sudden onset DM

### Investigations

- serum chemistry is non-specific, can have elevated ALP and high bilirubin
- CA 19-9 (most useful serum marker of pancreatic cancer)
- U/S, CT (also evaluates metastasis and resectability) ± ERCP, MRI, EUS

### Pathology

- ductal adenocarcinoma: most common type (75-80%); exocrine pancreas
- intraductal papillary mucinous neoplasm (IPMN)
- other: pancreatic neuroendocrine tumours (non-functional, insulinoma, gastrinoma, VIPoma, glucagonoma, somatostatinoma), mucinous cystic neoplasm (MCN), acinar cell carcinoma
- *see Surgical Endocrinology, GS60* for functional pancreatic neuroendocrine tumours

#### Trousseau's Sign

Spontaneous peripheral venous thrombosis, often associated with pancreatic and other cancers

Vague abdominal pain with weight loss ± jaundice in a patient over 50 yr old is pancreatic cancer until proven otherwise

#### Courvoisier's Sign

Palpable, nontender distended gallbladder due to CBD obstruction. Present in 33% of patients with pancreatic carcinoma. The distended gallbladder could not be due to acute cholecystitis or stone disease because the gallbladder would actually be scarred and smaller, not larger

**Treatment**

- resectable (10-20% of pancreatic cancer)
  - no involvement of liver, peritoneum, or vasculature (hepatic artery, SMA, SMV, portal vein, IVC, aorta), no distant metastasis
  - Whipple procedure (pancreaticoduodenectomy) for cure <5% mortality
  - distal pancreatectomy ± splenectomy, lymphadenectomy if carcinoma of midbody and tail of pancreas
- locally advanced, borderline resectable
  - tumours that abut the SMA, SMV, portal vein, hepatic artery, or celiac artery
- locally advanced, non-resectable (palliative → relieve pain, obstruction)
  - encasement of major vascular structures including arterie
  - most body/tail tumours are not resectable (due to late presentation)
  - relieve biliary/duodenal obstruction with endoscopic stenting or double bypass procedure (choledochostomy + gastroenterostomy)
  - palliative chemotherapy (gemcitabine + nab-paclitaxel, FOLFIRINOX) ± radiotherapy

**Prognosis**

- most important prognostic indicators are lymph node status, margin status, size >3 cm, perineural invasion (invasion of tumour into microscopic nerves of pancreas)
- overall 5 yr survival for all patients with pancreas cancer is 1%; following surgical resection 5 yr survival is 20%
- median survival for unresectable disease: 3-6 mo if metastatic, 8-12 mo if locally advanced at presentation

**Table 20. TNM Classification System for Exocrine and Endocrine Tumours of the Pancreas**

Primary Tumour (T)		Regional Lymph Nodes (N)		Distant Metastasis (M)	
TX	Primary tumour cannot be assessed	NX	Regional lymph nodes cannot be assessed	M0	No distant metastasis
T0	No evidence of primary tumour	N0	No regional lymph node metastasis	M1	Distant metastasis
Tis	Carcinoma <i>in situ</i>	N1	Regional lymph node metastasis		
T1	Tumour limited to pancreas, <2 cm in greatest dimension				
T2	Tumour limited to pancreas, >2 cm in greatest dimension				
T3	Tumour extends beyond pancreas, no involvement of celiac axis or SMA				
T4	Tumour involves celiac axis or SMA (unresectable)				

**Table 21. Staging and Treatment of Pancreatic Cancer**

Stage	Classification	5 Yr Survival	Treatment
0	Tis, N0, M0		Surgical resection ± chemotherapy
IA	T1, N0, M0	14%	Same as above
IB	T2, N0, M0	12%	Same as above
IIA	T3, N0, M0	7%	Same as above
IIB	T1-3, N1, M0	5%	Same as above
III	T4, any N, M0	3%	Borderline resectable, trial of chemotherapy and radiation
IV	any T, any N, M1	1%	Non-resectable, palliative treatments

**Steps of a Whipple Resection (Pancreaticoduodenectomy)**

1. Assessment of metastatic disease (all peritoneal surfaces)
2. Mobilization of the duodenum and head of the pancreas
3. Identification of the superior mesenteric vein and mobilization of the pancreatic neck
4. Mobilization of the stomach; dissection of the hepatoduodenal ligament and cholecystectomy
5. Division of the stomach, proximal jejunum, and CBD
6. Transection of the pancreatic neck and dissection of the uncinate process from the retroperitoneum
7. Restoration of gastrointestinal continuity: construction of a pancreaticojejunostomy, hepaticojejunostomy, gastrojejunostomy using a neoduodenum

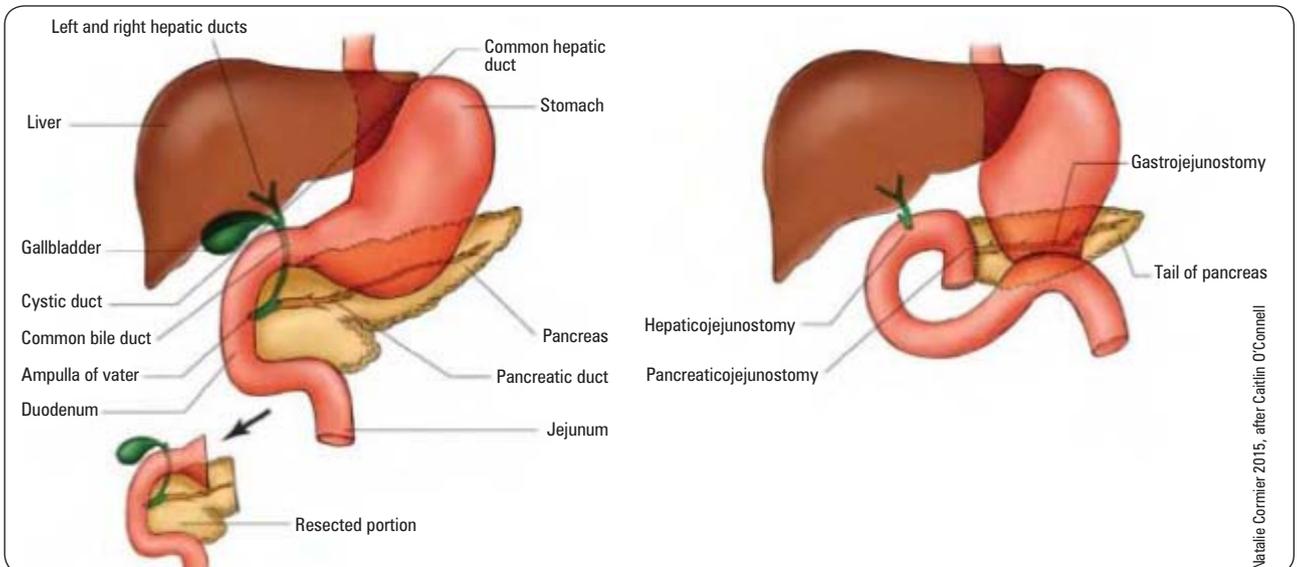

**Removed**

- CBD
- Gallbladder
- Duodenum
- Pancreatic head
- Distal stomach (sometimes)

**Diagnostic Value of Serum Carbohydrate Antigen 19-9 in Pancreatic Cancer: A Meta-Analysis**

*Tumour Biol* 2014 [Epub ahead of print]  
**Summary:** 11 studies with 2,316 patients were included in the analysis. The sensitivity of CA19-9 in the diagnosis of pancreatic cancer was found to be 0.8 (95% CI 0.77-0.82) and the specificity also 80% (95% CI 0.77-0.82) with a diagnostic odds ratio of 14.79 (95% CI 8.55-25.59). Overall, CA19-9 plays an important role in the diagnosis of pancreatic cancer.

**Figure 26. Schematic of Whipple resection, showing the resected components**

Natalie Cormier 2015, after Caitlin O'Connell

# Spleen

## Splenic Trauma

- typically from blunt trauma (especially in people with splenomegaly)
- most common intra-abdominal organ injury in blunt trauma
- may have Kehr's sign

### Treatment

- non-operative
  - in stable patients: extended bed rest with serial hematocrit levels, close monitoring for 3-5 d; pediatric guidelines for days of bed rest is grade plus 1 (i.e. grade 3 splenic laceration requires 4 d of bed rest)
  - hemostatic control
  - splenic artery embolization if patient stable and one of: active contrast extravasation, splenic pseudoaneurysm, hemoperitoneum
- operative
  - splenorrhaphy (suture of spleen) ± splenic wrapping with hemostatic mesh – if patient hemodynamically stable, patient has stopped bleeding and laceration does not involve hilum
  - partial splenectomy, rarely performed due to risk of recurrent hemorrhage
  - total splenectomy if patient unstable or high-grade injury

#### Kehr's Sign

Left shoulder pain due to diaphragmatic irritation from splenic rupture, worsens with inspiration

## Splenectomy

### Indications

- splenic trauma (most common reason for splenectomy), hereditary spherocytosis, primary hypersplenism, chronic immune thrombocytopenic purpura (ITP), splenic vein thrombosis causing esophageal varices, splenic abscess, thrombotic thrombocytopenic purpura (TTP), sickle cell disease
- does not benefit all thrombocytopenic states (e.g. infection, most malignancies involving the bone marrow, drugs/toxins)
- probability of cure of ITP by splenectomy is 60-70%, may be predicted by response to IVIg

### Complications

- short-term
  - injury to surrounding structures (e.g. gastric wall, tail of pancreas)
  - post-operative thrombocytosis, leukocytosis
  - thrombosis of portal, splenic, or mesenteric veins
  - subphrenic abscess
- long-term
  - post-splenectomy sepsis (encapsulated organisms): 4% of splenectomized patients (highest risk in those <16 yr old)
    - ◆ 50% mortality
    - ◆ prophylaxis with vaccinations, ideally 2 wk pre- or post-operative (pneumococcal, *H. influenzae*, and meningococcus)
    - ◆ liberal use of penicillin especially in children <6 yr old
  - splenosis: intra-abdominal "seeding" of splenic tissue during removal

#### Indication of Splenectomy

##### SHIRTS

Splenic abscess/splenomegaly  
 Hereditary spherocytosis  
 Immune thrombocytopenic purpura  
 Rupture of spleen  
 Thrombotic thrombocytopenic purpura  
 Splenic vein thrombosis

# Breast

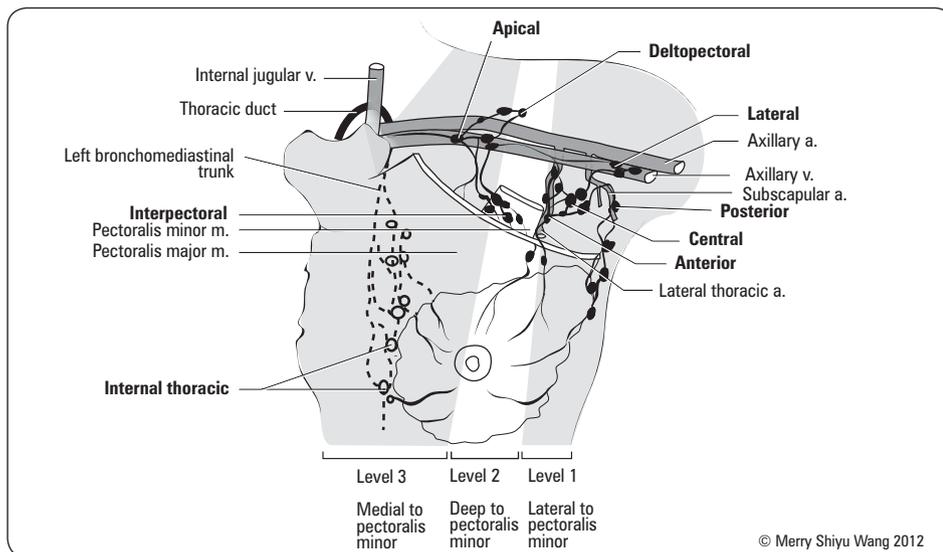

Figure 27. Anatomy of the breast

**Levels of Axillary Lymph Nodes**  
**Level I:** lateral to pectoralis minor  
**Level II:** deep to pectoralis minor  
**Level III:** medial to pectoralis minor  
 (higher level of nodal involvement = worse prognosis)

## Benign Breast Lesions

### Three Categories

1. nonproliferative
2. proliferative without atypia
3. atypical hyperplasia

### NONPROLIFERATIVE LESIONS

- benign breast condition characterized by fibrous and cystic changes in the breast
- most common: breast cysts
- other lesions include papillary apocrine change, epithelial-related calcifications and mild hyperplasia of the usual type
- no increased risk of breast cancer
- age 30 to menopause (and after if HRT used)
- clinical features
  - **breast pain**, focal areas of nodularity or cysts often in the upper outer quadrant, frequently bilateral, mobile, varies with menstrual cycle, nipple discharge (straw-like, brown, or green)
- treatment
  - evaluation of breast mass (U/S, mammography as indicated) and reassurance
  - no strong evidence for avoidance of xanthine-containing products (coffee, tea, chocolate, cola)
  - analgesia (ibuprofen, ASA)
  - for severe symptoms: OCP, danazol, bromocriptine

- DDx for Breast Mass**
- Benign**
- Fibrocystic changes
  - Fibroepithelial lesions (fibroadenoma most common; benign phyllodes also)
  - Fat necrosis
  - Papilloma/papillomatosis
  - Galactocele
  - Duct ectasia
  - Ductal/lobular hyperplasia
  - Sclerosing adenosis
  - Lipoma
  - Neurofibroma
  - Granulomatous mastitis (e.g. TB, granulomatosis with polyangiitis, sarcoidosis)
  - Abscess
  - Silicone implant
- Malignant**
- Breast cancer (likely invasive, DCIS rarely forms a breast mass)
  - Malignant phyllodes
  - Angiosarcoma (rare)

### PROLIFERATIVE LESIONS – WITHOUT ATYPIA

Table 22. Proliferative Lesions - without Atypia

	Clinical Features	Diagnosis	Treatment	Risk of Breast Cancer	
<b>Fibroadenoma</b>	Most common breast tumour in women <30 yr	Nodules: firm, rubbery, discrete, well-circumscribed, <b>non-tender</b> , mobile, hormone-dependent (unlike cysts), needle aspiration yields no fluid	Core or excisional biopsy some times required if concerned about malignancy U/S and FNA alone cannot differentiate fibroadenoma from Phyllodes tumour	Generally conservative: serial observation Consider excision if size 2-3 cm and growing on serial U/S (q6mo x 2 yr is usual follow-up), if symptomatic, formed after age 35, or patient preference or features on core biopsy suggestive of a Phyllodes tumour	Increased if complex, adjacent atypia or strong family history of breast cancer
<b>Intraductal Papilloma</b>	Solitary intraductal benign polyp	Can present as nipple discharge (most common cause of spontaneous, unilateral, bloody nipple discharge = pathologic nipple discharge), breast mass, nodule on U/S	Surgical excision of involved duct to ensure no atypia	Can harbour areas of atypia or DCIS	
<b>Usual Ductal Hyperplasia</b>	Increased number of cells within the ductal space	Incidental finding on biopsy of mammographic abnormalities or breast masses	None required	Generally low risk, slightly increased if moderate or florid hyperplasia	
<b>Sclerosing Adenosis</b>	Lobular lesion with increased fibrous tissue and glandular cells	Mass or mammographic abnormality	None required	Low risk	

**ATYPICAL HYPERPLASIA**

- can involve ducts (ductal hyperplasia with atypia) or lobules (lobular hyperplasia with atypia)
- cells lose apical-basal orientation
- increased risk of breast cancer
- diagnosis: core or excisional biopsy
- treatment: complete resection, risk modification (avoid exogenous hormones), close follow-up

**OTHER LESIONS****Fat Necrosis**

- uncommon, result of trauma (may be minor, positive history in only 50%), after breast surgery (i.e. reduction)
- firm, ill-defined mass with skin or nipple retraction,  $\pm$  tenderness
- regress spontaneously, but complete imaging  $\pm$  biopsy to rule out carcinoma

**Mammary Duct Ectasia**

- obstruction of a subareolar duct leading to duct dilation, inflammation, and fibrosis
- may present with nipple discharge, bluish mass under nipple, local pain
- risk of secondary infection (abscess, mastitis)
- resolves spontaneously

**Montgomery Tubercle**

- Montgomery tubercles (or Morgagni tubercles) are papular projections at the edge of the areola
- obstruction of these glands can lead to inflammation or cystic collections (cyst of Montgomery i.e. retroareolar cyst)
- if signs of secondary infection, start treatment for mastitis
- resolves spontaneously in weeks to years

**Abscess**

- lactational (see [Obstetrics, OB45](#)) vs. periductal/subareolar
- unilateral localized pain, tenderness, erythema, subareolar mass, nipple discharge, nipple inversion
- rule out inflammatory carcinoma, as indicated
- treatment: initially broad-spectrum antibiotics and I&D, if persistent total duct excision (definitive)
- if mass does not resolve: U/S to assess for presence of abscess, core biopsy to exclude cancer, consider MRI

## Breast Cancer

**Epidemiology**

- leading cancer diagnosis in women in NA, 2nd leading cause of cancer mortality in women
- 1 in 8 (12.9% life time risk) women in Canada will be diagnosed with breast cancer in their lifetime
- 1 in 30 women in Canada will die from breast cancer
- all age relative survival is 88%

**Risk Factors**

- gender (99% female)
- age (80% >40 yr old)
- personal history of breast cancer and/or prior breast biopsy (regardless of pathology)
- family history of breast cancer (greater risk if relative was first degree and premenopausal)
- high breast density, nulliparity, first pregnancy >30 yr, menarche <12 yr, menopause >55 yr
- decreased risk with lactation, early menopause, early childbirth
- radiation exposure (e.g. mantle radiation for Hodgkin's disease)
- >5 yr HRT use, >10 yr OCP use
- BRCA1 and BRCA2 gene mutations
- alcohol use, obesity, sedentary lifestyle

**Male breast cancer (<1%)**

- most commonly invasive ductal carcinoma
- often diagnosed at later stages
- stage-for-stage similar prognosis to breast cancer in females
- consider genetic testing: most often hormone receptor positive

**Investigations**

- mammography
  - indications
    - ♦ screening guidelines (see [Family Medicine, FM4](#))
  - findings indicative of higher risk of malignancy
    - ♦ mass that is poorly defined, spiculated border
    - ♦ microcalcifications
    - ♦ architectural distortion
    - ♦ interval mammographic changes
  - normal mammogram does not rule out suspicion of cancer based on clinical findings

Gender followed by age are the two greatest risk factors for breast cancer

Any palpable dominant breast mass requires further investigation

- other radiographic studies
  - U/S: differentiate between cystic and solid
  - MRI: high sensitivity, low specificity
  - galactogram/ductogram (for nipple discharge): identifies lesions in ducts
  - metastatic workup indicated in Stage II-IV disease: bone scan, abdominal U/S, CXR (or CT chest/abdomen/pelvis), CT head (if specific neurological symptoms)

**Diagnostic Procedures**

- needle aspiration: for palpable cystic lesions; send fluid for cytology if blood or cyst does not completely resolve
- U/S or mammography guided core needle biopsy (most common)
- FNA: for palpable solid masses; need experienced practitioner for adequate sampling
- excisional biopsy: only performed as second choice to core needle biopsy; should not be done for diagnosis if possible

Diagnostic mammography is indicated in all patients, even in women <50 yr

**Genetic Screening**

- consider testing for BRCA1/2 if
  - patient diagnosed with breast AND ovarian cancer
  - strong family history of breast/ovarian cancer
  - family history of male breast cancer
  - young patient (<35 yr)
  - bilateral breast cancer in patients <50 yr

Phyllodes tumours are rare fibroepithelial breast tumours that can be benign or malignant that mostly affect women from 35-55 yr

**Staging**

- patients are assigned a clinical stage pre-operatively (cTNM); following surgery the pathologic stage is determined (pTNM)
- clinical
  - tumour size by palpation, mammogram, U/S and/or MRI
  - nodal involvement by palpation, imaging
  - metastasis by physical exam, CXR, and abdominal U/S (or CT chest/abdomen/pelvis), bone scan (usually done post-operative if node-positive disease)
- pathological
  - tumour size and type (see Pathology)
  - grade: modified Bloom and Richardson score (I to III) – histologic, nuclear, and mitotic grade
  - number of axillary nodes positive for malignancy out of total nodes resected, extranodal extension, sentinel lymph node biopsy (SLNB) positive/negative
  - tumour biology: estrogen receptor (ER), progesterone receptor (PR) and HER2/neu oncogene status
  - margins: for invasive breast cancer negative margin is sufficient, for DCIS prefer 2mm margin
  - lymphovascular invasion (LVI)
  - extensive in situ component (EIC): DCIS in surrounding tissue
  - involvement of dermal lymphatics (inflammatory) – automatically Stage IIIb

**Table 23. Staging of Breast Cancer (American Joint Committee on Cancer)**

Stage	Tumour	Nodes (regional) (clinical)	Metastasis	Survival (5 yr)
0	<i>in situ</i>	None	None	99%
I	<2 cm	None	None	94%
II A	<2 cm	Mobile ipsilateral	None	85%
II B	2-5 cm or > 5 cm	None or mobile ipsilateral	None	70
III A	Any size	Fixed ipsilateral or internal mammary	None	52%
III B	Skin/chest wall invasion	Any	None	48%
III C	Any size	Ipsilateral infraclavicular/internal mammary plus axillary nodes; ipsilateral supraclavicular node(s) ± axillary nodes	None	33%
IV	Any	Any	Distant	18%

Favourable Features	Unfavourable Features
<ul style="list-style-type: none"> <li>• &lt;2 cm</li> <li>• Grade I (low grade)</li> <li>• Node negative</li> <li>• ER positive</li> <li>• Mucinous pattern</li> </ul>	<ul style="list-style-type: none"> <li>• &gt;5 cm</li> <li>• Grade III (high grade)</li> <li>• Node positive</li> <li>• ER negative</li> <li>• Inflammatory cancer</li> <li>• Her2Neu positive</li> <li>• Positive margins</li> <li>• LVI</li> <li>• EIC</li> <li>• Dermal lymphatics involved</li> </ul>

**Pathology**

**NON-INVASIVE**

**Ductal Carcinoma *in situ* (DCIS)**

- proliferation of malignant ductal epithelial cells completely contained within breast ducts, often multifocal
- 80% non-palpable, detected by screening mammogram
- risk of invasive ductal carcinoma in same breast up to 35% in 10 yr

- treatment
  - lumpectomy with wide excision margins + radiation (5-10% risk of invasive cancer)
  - mastectomy if large area of disease, high grade, or multifocal (risk of invasive cancer reduced to 1%)
  - possibly tamoxifen as an adjuvant treatment
  - 99% 5 yr survival

### Lobular Carcinoma *in situ* (LCIS)

- neoplastic cells completely contained within breast lobule
- no palpable mass, no mammographic findings, usually incidental finding on breast biopsy for another indication
- LCIS is a risk factor for invasive carcinoma (approximately 1%/yr)
- treatment
- if diagnosed on core biopsy, excisional biopsy necessary to rule out malignancy
- if diagnosed on excisional biopsy, wide excision not needed since LCIS if often multicentric and not managed as precursor lesion
- clinical follow-up and surveillance
- consider chemoprevention (e.g. tamoxifen)

## INVASIVE

### Invasive Ductal Carcinoma (most common 80%)

- originates from ductal epithelium and infiltrates supporting stroma
- characteristics: hard, scirrhous, infiltrating tentacles, gritty on cross-section

### Invasive Lobular Carcinoma (8-15%)

- originates from lobular epithelium
- 20% bilateral (i.e. more often than infiltrating ductal carcinoma)
- does not form microcalcifications, harder to detect mammographically (may benefit from MRI)

### Paget's Disease (1-3%)

- ductal carcinoma that invades nipple with scaling, eczematoid lesion

### Inflammatory Carcinoma (1-4%)

- ductal carcinoma that invades dermal lymphatics
- most aggressive form of breast cancer
- clinical features: erythema, skin edema, warm, swollen, and tender breast ± lump
- peau d'orange indicates advanced disease (IIIb-IV)

### Sarcomas: rare

- most commonly Phyllodes tumour, a variant of fibroadenoma with potential for malignancy
- can also be angiosarcomas – after previous radiation

### Lymphoma: rare

### Other

- papillary, medullary, mucinous, tubular cancers
- generally better prognosis

## Treatment

**Table 24. Breast Cancer Treatment by Stage**

Stage	Primary Treatment Options	Adjuvant Systemic Therapy
0 ( <i>in situ</i> )	BCS + radiotherapy BCS alone if margins >1 cm and low nuclear grade Mastectomy* ± SLNB	Consider post-operative tamoxifen for ER+, trastuzumab for HER2+
I	BCS + axillary node dissection + radiotherapy Mastectomy* + axillary node dissection/SLNB	May not be needed; discuss risks/benefits of chemotherapy and tamoxifen
II	BCS + axillary node dissection + radiotherapy Mastectomy* + axillary node dissection/SLNB	Chemotherapy for premenopausal women or postmenopausal and ER negative, followed by tamoxifen if ER+
III	Likely mastectomy + axillary node dissection + radiotherapy after chemotherapy (neoadjuvant)	Neoadjuvant therapy should be considered i.e. pre-operative especially if not resectable chemotherapy and/or hormone therapy. Adjuvant radiation and chemotherapy may also be appropriate (i.e. post-operative)
Inflammatory	Mastectomy + axillary node dissection + radiotherapy	Neoadjuvant therapy
IV	Surgery as appropriate for local control	Primary treatment is systemic therapy i.e. chemotherapy and/or hormone therapy

BCS = breast conserving surgery; SLNB = sentinel lymph node biopsy

\*If no reason to select mastectomy, the choice between BCS + radiotherapy and mastectomy can be made according to patient's preference since choice of local treatment does not significantly affect survival if local control is achieved

### Diagnosis of Breast Lesions: Fine-Needle Aspiration Cytology or Core Needle Biopsy?

#### A Review

*J Clin Pathol* 2012;65:287-292

#### CNB

- High sensitivity (85%-100%) and specificity (86%-100%).
- High success rates for diagnosis of malignancy for palpable lesions (97%), non-palpable lesions (94%), and lesions <10 mm (90%).
- More accurate for histologic and immunohistochemistry examinations, and differentiation between *in situ* and invasive malignancies.
- Reliable for testing of ER, PR, and HER2 status and proliferation assessment.
- More painful procedure.

#### FNAC

- Variable sensitivity (35%-95%) and specificity (48%-100%).
- Quality correlates with skill of aspirator.
- Lower success rates for diagnosis of malignancy for palpable lesions (75-90%), non-palpable lesions (34-58%), and lesions <10 mm (50%).
- High rates of insufficient sampling for lesions >40 mm or calcified lesions.
- Quick to perform.
- Low technical costs.

**Conclusions:** FNAC is preferable for palpable, low malignancy-risk lesions. However, for potential malignancies, CNB is advantageous with respect to prognostication and prediction and is likely cost-effective in the long-term.

### Analysis of Circulating Tumour DNA to Monitor Metastatic Breast Cancer

*NEJM* 2013;368:1199-1209

**Study:** The quantification of circulating tumour DNA, cancer antigen 15-3 (CA 15-3), and circulating tumour cells in 30 women with metastatic breast cancer receiving systemic therapy. The results were compared with radiographic imaging of tumours.

**Results/Conclusions:** Circulating tumour DNA was detected in 97% of women and showed greater correlation with changes in tumour burden than did CA 15-3 or circulating tumour cells, providing the earliest measure of treatment response in 53% of women. CA 15-3 and circulating tumour cells were detected in 78% and 87% of women, respectively. Circulating tumour DNA may therefore be an informative biomarker for metastatic breast cancer.

## PRIMARY SURGICAL TREATMENT

### Breast Conservation Surgery (BCS)

- lumpectomy must be combined with radiation for survival equivalent to mastectomy
- contraindications include
  - high risk of local recurrence e.g. extensive malignant-type calcifications on mammogram, multifocal primary tumours
  - failure to obtain tumour-free margins after re-excision
  - not suitable for radiation therapy (pregnancy, previous radiation, collagen vascular disease)
  - large tumour size relative to breast

Breast conserving surgery can be offered to most women with stage I/II disease

### Mastectomy

- radical mastectomy (rarely): removes all breast tissue, skin, pectoralis muscle, axillary nodes
- modified radical mastectomy (MRM): removes all breast tissue, skin, and axillary nodes
- simple mastectomy: removes all breast tissue and skin
- see [Plastic Surgery, PL34](#) for breast reconstruction

There is no survival benefit of mastectomy over lumpectomy plus radiation for stage I and II disease

### Sentinel Lymph Node Biopsy (SLNB)

- perform in women with clinically node-negative invasive breast cancer and those with extensive DCIS who are undergoing mastectomy
- patients with clinically suspicious nodes should U/S + FNA prior to decision to proceed with SLNB
- technetium-99 ± blue dye injected at tumour site prior to surgery to identify sentinel node(s)
- intra-operative frozen section evaluated can be considered
- proceed with ALND if >3 positive nodes, with 1-3 nodes whole breast radiation therapy may be alternative
- 5% false negative rate

### Axillary Lymph Node Dissection (ALND)

- perform in all patients with pathologic confirmation of nodal involvement (including positive SLNB as above)
- risk of arm lymphedema (10-15%) especially if getting radiation therapy, decreased arm sensation, shoulder pain

## ADJUVANT/NEOADJUVANT

### Radiation

- indications
  - decrease risk of local recurrence; almost always used after BCS, sometimes after mastectomy
  - inoperable locally advanced cancer
  - axillary nodal radiation may be added if nodal involvement

### Hormonal

- indications
  - ER positive plus node-positive or high-risk node-negative
  - SERM if premenopausal (e.g. tamoxifen) or aromatase inhibitors if postmenopausal (e.g. anastrozole); optimal duration 5-10 yr
  - ovarian ablation (e.g. goserelin/GnRH agonist, oophorectomy), progestins (e.g. megestrol acetate), androgens (e.g. fluoxymesterone) are other options
  - palliation for metastatic disease

### Chemotherapy

- indications
  - ER negative plus node-positive or high-risk node-negative
  - ER positive and young age
  - stage I disease at high risk of recurrence (high grade, lymphovascular invasion)
  - palliation for metastatic disease
  - can consider oncotype DX (21 gene analysis) to provide recurrence score (low, intermediate, high)

## FOLLOW-UP

### Post-Treatment Follow-Up

- assessment and physical exam q3-6mo x 3 yr, q6-12mo x 2yr, and annually thereafter
- following BCS mammography q6-12mo; can reduce to annual once stable, no other routine imaging unless clinically indicated
- women who receive tamoxifen should have regular gynecologic follow-up (increased risk of endometrial cancer)
- psychosocial support and counselling
- delayed breast reconstruction if underwent a mastectomy

**Local/Regional Recurrence**

- recurrence in treated breast or ipsilateral axilla
- 1% per yr up to maximum of 15% risk of developing contralateral malignancy
- 5x increased risk of developing metastases

**Metastasis**

- bone > lungs > pleura > liver > brain
- treatment is palliative: hormone therapy, chemotherapy, radiation
- overall survival of metastatic breast cancer is 36-60 mo

## Surgical Endocrinology

### Thyroid and Parathyroid

- see [Endocrinology, E20](#) and [Otolaryngology, OT34](#)

**Thyroidectomy**

- indications: thyroid cancer, symptomatic thyroid mass or goitre, medically refractory Graves' or hyperthyroidism
- contraindications: uncontrolled severe hyperthyroidism (i.e. Graves') due to risk of intra-operative or post-operative thyroid storm
- pre-operative workup: thyroid U/S for thyroid nodules, FNA for large nodules, U/S of the neck for lesions suspicious for papillary or medullary thyroid cancer, CT neck useful to rule out extension, vocal cord function
- complications: hypocalcemia secondary to hypoparathyroidism, recurrent/superior laryngeal nerve injury, neck hematoma, infection, thyrotoxic storm

**Parathyroidectomy**

- indications: symptomatic primary hyperparathyroidism due to effects of PTH on bone or kidneys, asymptomatic primary hyperparathyroidism with specific laboratory criteria (elevated serum Ca, marked hypercalciuria, Cr clearance <30% normal, bone density reduction with T score <2.5, <50 yr)
- contraindications: familial hypocalciuric hypercalcemia
- pre-operative workup: <sup>99m</sup>Tc sestamibi scanning, ± SPECT or CT, U/S
- complications: recurrent/superior laryngeal nerve injury, post-operative hypocalcemia, infection, bleeding

**Hypertrophic Pyloric Stenosis**  
Non-bilious emesis in infant is the classic presentation

### Adrenal Gland

- see [Endocrinology, E29](#)
- functional anatomy
  - cortex: glomerulosa (mineralocorticoids), fasciculata (glucocorticoids), reticularis (sex steroids)
  - medulla: catecholamines (epinephrine, norepinephrine)
- types of adrenal tumours: functional (e.g. Cushing's syndrome, Conn's syndrome) or non-functional

**INCIDENTALOMA**

- adrenal mass discovered by investigation of unrelated symptoms

**Epidemiology**

- benign adenoma (38%) > metastases to adrenal (22%) >> cyst, carcinoma, pheochromocytoma, neuroblastoma
- metastasis to adrenal gland from: lung > breast, colon, lymphoma, melanoma, kidney
- peak incidence of carcinoma: females age 50-60, risk decreases with increasing age and male gender

**Investigations**

- MRI, CT: size >6 cm is best predictor of primary adrenal carcinoma (92% are >6 cm)
- functional studies
  - pheochromocytoma: 24 h urine epinephrine, norepinephrine, metanephrine, normetanephrine, VMA (vanillylmandelic acid)
  - Cushing's: 24 h urine cortisol or 1 mg overnight dexamethasone suppression test
  - aldosteronoma: electrolytes, aldosterone:renin level, saline suppression test if appropriate
  - adrenal androgens: 17-OH progesterone, DHEAS
- FNA biopsy: if suspect metastasis to adrenal (must exclude pheochromocytoma first to prevent a hypertensive crisis)
  - indicated if history of cancer or patient is smoker
- iodocholesterol scintigraphy: may distinguish benign vs. malignant disease

**Treatment**

- functional tumour: resect
- non-functional tumour
  - >4 cm: resect
  - <4 cm: follow-up imaging in 6-12 mo, resect if >1 cm enlargement

## Pancreas

**INSULINOMA**

- tumour that secretes insulin
- most common pancreatic endocrine neoplasm; 10% associated with MEN1 syndrome

**Clinical Features**

- Whipple's triad
- palpitations, trembling, diaphoresis, confusion, seizure, personality changes

**Investigations**

- blood work: decreased serum glucose and increased serum insulin and C-peptide
- U/S, CT: insulinomas evenly distributed throughout head, body, tail of pancreas

**Treatment**

- only 10% are malignant
- enucleation of solitary insulinomas may be done endoscopically
- tumours >2 cm located close to the pancreatic duct may require pancreatectomy or pancreaticoduodenectomy

**GASTRINOMA**

- tumour secreting gastrin; cause of Zollinger-Ellison syndrome

**Clinical Features**

- abdominal pain, PUD, severe esophagitis
- multiple ulcers in atypical locations refractory of antacid therapy

**Investigations**

- blood work: serum gastrin levels (usually >1,000 pg/mL), secretin stimulation test
- U/S, CT: 70-90% found in Passaro's triangle (head of pancreas medially, 2nd portion of duodenum inferiorly, and the confluence of the cystic and CBD superiorly)
- octreotide scintigraphy scan

**Treatment**

- 50% are malignant
- surgical resection of tumour dependent on location
- non-surgical treatment: chemotherapy, somatostatin analogues, interferon, chemoembolization
- if inoperable, vagotomy can be performed for symptomatic control

**VASOACTIVE INTESTINAL PEPTIDE-SECRETING TUMOUR**

- tumour secreting VIP; commonly located in the distal pancreas and most are malignant when diagnosed

**Clinical Features**

- severe watery diarrhea causing dehydration, weakness, electrolyte imbalance

**Investigations**

- blood work: serum VIP levels
- U/S, CT

**Treatment**

- somatostatin analogues
- surgical resection/palliative debulking

**Whipple's Triad**

- Symptomatic fasting hypoglycemia
- Serum glucose <50 mg/dL
- Relief of symptoms when glucose is administered

**Rule of 2s for Meckel's Diverticulum**

- 2% of the population
- 2:1 male-to-female ratio
- Symptomatic in 2% of cases
- Found within 2 feet (10-90 cm) of the ileocecal (IC) valve
- 2 inches in length
- 2 inches in diameter
- 2 types of tissue (gastric, pancreatic)
- Often present by 2 yr of age

# Pediatric Surgery

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical Exam	Investigations	Treatment	Prognosis
<b>Hydrocele (see Urology, U29)</b> 	1-2% of live births Present at birth, majority close spontaneous by 1 yr M:F = 6:1 Prematurity	<b>Communicating hydroceles:</b> processus vaginalis fails to close with small opening for fluid to move freely between peritoneal cavity through patent processus (if opening progresses to allow passage of intestine, it is a hernia) <b>Noncommunicating hydroceles:</b> fluid trapped in tunica vaginalis; in older children, may be secondary to testicular pathology (reactive hydrocele)	Painless scrotal mass Communicating hydroceles increase in size with standing or valsalva, may be absent in the morning and large in the evening	Transillumination suggests hydrocele Silk glove sign: gently palpating hydrocele sac over pubic tubercle feels like rubbing silk on silk	U/S if suspect pathology	Most resolve spontaneously by 1 yr Surgical repair if: Persistence >2 yr Pain Fluctuating in size which suggests communication Cosmetic reasons Infection	<2% recurrence
<b>Hypertrophic Pyloric Stenosis</b>	0.03-1.0% of live births Can present at 1-20 wk, most commonly at 6-8 wk M:F = 4:1 Early erythromycin exposure (<13 d old)	Acquired pyloric circular muscle hypertrophy results in gastric outlet obstruction Hypovolemia caused by emesis of gastric contents causes hypochloremic hypokalemic metabolic alkalosis Electrolyte exchange based volume retention in kidneys results in paradoxical aciduria	Projectile non-bilious vomiting Vomiting 30-60 min after feeds Hungry after vomiting Dehydration (variable severity)	Smooth oblong 1-2 cm mass palpable above umbilicus, "olive" visible left-to-right gastric contraction "waves" after feeding	Electrolytes (assess hypochloremia, dehydration) U/S shows pyloric length >14 mm, muscle thickness >4 mm Upper GI series necessary only when U/S unavailable or non-diagnostic will show "string sign"	Fluid resuscitate with normal saline, correct electrolyte and acid/base abnormalities with D5, 1/2NS + 20 mEq/L KCl at maintenance rate NGT decompression unnecessary Pyloromyotomy, open (Ramstedt vs. transumbilical or laparoscopic approach) Alternative therapies such as TPN/wait or atropine impractical due to long time course of effect	Pyloromyotomy curative
<b>Congenital Diaphragmatic Hernias</b> 3 types: Posterolateral (Bochdalek) Left-sided, 85% Right-sided, 13% Bilateral, rare, often fatal Anterior (Morgagni) Hiatus	1 in 2,000 to 5,000 live births Presents within hours of life although some cases of delayed presentation M=F >10% are associated with other congenital anomalies Prenatal diagnosis common	<b>Left-sided:</b> small bowel, large bowel, stomach, and solid viscera (spleen, left lobe of liver) herniate into thorax <b>Right-sided:</b> liver, large bowel herniate into thorax Pulmonary hypoplasia Pulmonary HTN	Early respiratory distress Cyanosis Scaphoid abdomen Prenatal diagnosis	Decreased air entry ± bowel sounds in the chest Displaced heart sounds	Prenatal US/MRI ABG CXR (bowel loops in hemithorax, shifted heart) Echocardiography Genetic consultation if warranted	Intubate Orogastric suction Period of respiratory stabilization due to associated pulmonary hypoplasia (may require ECMO) Surgical repair after stable by hernia reduction and closure of diaphragmatic defect – open vs. thoracoscopic vs. laparoscopic with or without prosthetic or muscular patch depending on size of defect	Better outcomes in later presentations Hearing deficit (40%) Associated GERD MSK defects – chest wall and scoliotic defects a potential complication of thoracotomy Long-term surveillance for potential recurrence Failure to thrive Chronic lung disease if severe hypoplasia
<b>Meckel's Diverticulum</b> Most common remnant of vitelline duct that connects yolk sac with primitive midgut	1-3% of population M:F = 3:1 Present most frequently during first 5 yr of life Symptomatic in 2% of cases	Failure of vitelline duct to regress 5-7 wk in utero; 50% contain heterotopic tissue (e.g. gastric mucosa, ectopic pancreas); other associated anomalies include omphalomesenteric fistula, umbilical sinus, umbilical cyst, fibrous band	BRBPR (heterotopic gastric mucosa in Meckel's causing mucosal ulceration and bleeding in adjacent small bowel mucosa) Abdominal sepsis (Meckel's diverticulitis ± perforation) Small bowel volvulus around fibrous band	Tenderness (lower abdomen) near umbilicus	AXR Meckel scan: scan for ectopic gastric mucosa with technetium Tc99m pertechnetate IV (sensitivity 85%, specificity 95%)	Stabilize, resection by laparotomy or laparoscopy ± incidental appendectomy	Resection curative

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical Exam	Investigations	Treatment	Prognosis
<b>Malrotation</b>	1:500 live births 1/3 present by 1 wk of age, 3/4 by 1 mo of age, 90% by 1 yr of age M:F = 1:1; higher incidence among patients with cardiac anomalies, heterotaxy syndromes	Failure of gut to normally rotate around SMA with associated abnormal intestinal attachments and anatomic positions Represent a spectrum of rotational abnormalities including complete non-rotation (which is not at high risk for volvulus)	Bilious emesis is THE cardinal sign, especially if abdomen nondistended If bilious emesis in ill child with distended abdomen, consider surgical exploration to rule out volvulus Rectal bleed (late/ominous signs) Intermittent symptoms	Bilious drainage from NGT Tachycardic, pale Diaphoretic Flat abdomen Tenderness	AXR: obstruction of proximal SBO, double-bubble sign, intestinal wall thickened Immediate UGI: dilated duodenum, duodenojejunal segment (Ligament of Treitz) right of midline and not fixed posteriorly over spinal column, "corkscrew" sign indicating volvulus US: "whirlpool" sign, abnormal SMA/SMV relationship indicates UGI to rule out rotational anomalies	IV antibiotics Fluid resuscitation EMERGENT LAPAROTOMY Ladd procedure: counterclockwise reduction of midgut volvulus, division of Ladd's bands, division of peritoneal attachments between cecum and abdominal wall that obstruct duodenum, broadening of the mesentery (open folded mesentery like a book and divide congenital adhesions), ± appendectomy Positioning the bowel into non-rotation (SBO in right abdomen, LBO in left abdomen)	Mortality related to length of bowel loss: 10% necrosis – 100% survival rate, 75% necrosis – 35% survival rate Recurrence 2-6%
<b>Gastroschisis</b>	1:2,000 live births Antenatal diagnosis common Increases with younger maternal age and associated with IUGR M:F = 1:1	Defect of abdominal wall, with free extrusion of intestine into amniotic cavity No specific environmental factor identified Defect in embryogenesis unclear	Not associated with genetic syndromes 10% with intestinal atresia Some cases associated with short bowel syndrome due to antenatal volvulus and necrosis of herniated bowel	Hollow viscera (stomach, small and large bowels) Defect lateral to cord (usually right) Bowel may be inflamed, thickened, matted, foreshortened Defect size variable	Prenatal U/S Elevated MS-AFP	NGT decompression IV fluids IV antibiotics Keep viscera moist and protected until surgical reduction with primary abdominal closure or staged closure with silo May have bowel dysmotility requiring motility medications	>90% survival rate
<b>Omphalocele</b>	1:5,000 live birth Antenatal diagnosis common Lower gestational age Increased maternal age M:F = 1.5:1	Defect of abdominal wall, with extrusion of sac covered viscera (amnion, Wharton's jelly, peritoneum) Duhamel's theory – failure of body wall morphogenesis	Associated with genetic syndromes 30-70% (e.g. Pentalogy of Cantrell, congenital heart disease, Beckwith-Wiedemann syndrome) Associated pulmonary hypoplasia	Hollow viscera (stomach, small and large bowels, often liver) Cord on the sac	Prenatal U/S Elevated MS-AFP	NGT decompression IV fluids, IV antibiotics Small defect (<2 cm): Primary closure Medium (2-4 cm) and large (>4 cm) defects: silver sulfadiazine coupled with compression dressing to allow epithelialization and gradual reduction, followed by future repair ± mesh	40-70% survival rate Higher survival rates most likely related to antenatal mortality of fetuses with giant omphaloceles
<b>Umbilical Hernias</b>	Incidence 2-14% Increases with prematurity Decreases with increasing age	Incomplete closure of peritoneal and fascial layers within umbilicus by 5 yr	Majority asymptomatic Majority spontaneously resolve by age 5 Incarceration prior to age 5 very rare Most symptoms occur in late adolescence or adulthood	Protrusion from umbilicus Different from less common abdominal wall hernias that do not spontaneously resolve (e.g. epigastric hernias) Most defects >1.5 cm in infancy will not close spontaneously	None if uncomplicated	Repair if not spontaneously closed by age 5 Earlier repair of large "proboscoid" hernias with extensive skin stretching may be warranted for cosmetic reasons Simple primary closure of fascial defect	Low risk of recurrence
<b>Intestinal Atresia</b>	Incidence 2-14% May be antenatally diagnosed by dilated bowel loops or "double-bubble" sign on x-ray for duodenal atresia Decreased with increasing age	Duodenal – failure of bowel to recanalize after endodermal epithelium proliferation (wk 8-10) Jejunal/ileal – acquired as a result of vascular disruption → ischemic necrosis → resorption of necrotic tissue → blind distal and proximal ends Colonic – mechanism unknown, thought to be similar to small bowel atresia	Gastric distension and vomiting (usually bilious) Duodenal – may be associated with other anomalies (tracheoesophageal fistula, cardiac, renal, and vertebral anomalies), 24-28% have Down syndrome Jejunal/ileal – within 2 d of birth, may be associated with CF Colonic – within 3 d of birth	Complete physical Special attention to abdominal exam Perineum and anus Include evaluation of respiratory distress and signs of volume depletion Congenital anomalies Jaundice	Contrast enema ± UGI with small bowel follow through (SBFT) Group and screen INR and PTT if for surgery	NPO NGT decompression Fluid resuscitate TPN Broad spectrum antibiotics Duodenal – duodenoduodenostomy or duodenojejunostomy Jejunal/ileal – primary anastomosis; or if atresia associated with short bowel then may create end stoma or defer surgery for bowel lengthening procedures Colonic – primary anastomosis	Long-term survival Duodenal – 86% Jejunal/ileal – 84% Colonic – 100%

Condition	Epidemiology and Risk Factors	Pathophysiology	Clinical Features and History	Physical Exam	Investigations	Treatment	Prognosis
<b>Hirschsprung's Disease</b>	1:5,000 births M:F = 3:1 to 4:1, approaches 1:1 when whole colon involved Can have aganglionosis of small bowel as well Familial Hirschsprung's in <5% of cases	Defect in migration of neurocrest cells to intestine resulting in aganglionic bowel that fails to peristaltise and internal sphincter that fails to relax (internal anal sphincter achalasia) causing functional and partial mechanical obstruction, respectively; always starts in the rectum and variable involvement proximally; RET mutation	Failure to pass meconium spontaneously within 48 h of life is the classic history (95% pass meconium within 24h, 5% within 48h) Symptoms of bowel obstruction: abdominal distension, constipation, bilious emesis Enterocolitis/sepsis Failure to thrive	± abdominal distension Squirt/blast sign	Rectal biopsy (gold standard) – look for aganglionosis and neural hypertrophy AXR Contrast enema to find narrow rectum and transition zone Anal manometry unreliable in infants – classic finding is absence of rectoanal inhibitory reflex	Surgical resection of aganglionic intestinal segment and anastomosis of remaining intestine to anus Either in newborn period or staged if extensive aganglionosis	Most have normal/near-normal anorectal function Complications: Fecal incontinence and constipation, post-operative enterocolitis (medical emergency if progresses to sepsis)
<b>Cryptorchidism</b>	2-5% of term males – most of these descend spontaneously by 6mo of age 1% of males do not spontaneously descend	Idiopathic Descent is mediated by descendent which is created in response to testosterone Descent usually begins at 28 wk	Palpable testicle within inguinal canal or testicle which can be milked down into scrotum (called retractile testis) Occasionally no palpable testis as it is intra-abdominal Consider other congenital abnormalities	Bi-annual testicular exam with palpation Distinguish truly undescended testis from retractile testis (which is "high" testis due to hyperactive cremasteric muscles)	Depends on age of presentation U/S or MRI if no palpable testis Older child: LH, FSH, MIS, hCG stimulation test for gonadotropin production Infant: U/S, FSH, LH, karyotype, MIS, 17-hydroxy-progesterone	hCG to stimulate testosterone production and descent Orchidopexy – especially if undescended by age 6 mo-2 yr	Orchidopexy Decreased risk of torsion and blunt trauma to testicle No effect on malignant potential of testicle Descent can preserve spermatogenesis if performed by 1 yr of age
<b>Intussusception</b>	Most common cause of bowel obstruction between 6-36 mo 26:100,000 newborns M:F = 3:2 Pathologic lead points: enlarged Peyer's patches due to viral infections of the GI tract, polyps, Meckel's diverticulum CF, lymphoma, IBD may increase risk	Idiopathic is most common Usually starts at ileocecal junction Telescoping of bowel into itself causing an obstruction and vascular compromise	Acute onset of abdominal pain which is classic episodic "colicky" pain Vomiting ± bilious Abdominal mass Currant-jelly stool suggests mucosal necrosis and sloughing	Abdominal exam Palpate for masses (especially sausage shaped upper abdominal mass) and tenderness Signs of bowel obstruction: distended abdomen Look for localized peritonitis which suggests transmural ischemia	AXR for signs of bowel obstruction or perforation U/S if suspect pathology	If peritonitis, then consider operative management Non-operative management involves reduction via air contrast enema Operative reduction can be done open or laparoscopically Resection of involved colon if failure to reduce or bowel appears compromised	10% recurrence rate If recurrent = more likely non-idiopathic If successfully reduced by enema in older children allow 2wk resolution of edema then perform SBFT to rule out pathologic lead points
<b>Tracheoesophageal Fistula (TEF)</b>	1:3,000-1:4,500	Associated anomalies in 50%: VACTERL association (see <a href="#">Pediatrics, P40</a> ) 	Varies with type of fistula May have history of maternal polyhydramnios May present after several months (if no associated esophageal atresia) of non-bilious vomiting, coughing, cyanosis with feeds, respiratory distress, recurrent pneumonia, frothy bubbles of mucus in mouth and nose that return after suctioning		X-ray: anatomic abnormalities, NGT curled in pouch	Investigate for other congenital anomalies, early repair by surgical ligation to prevent lung damage and maintain nutrition and growth	Complications: pneumonia, sepsis, reactive airways disease Following repair: esophageal stenosis and strictures at repair site, GERD and poor swallowing (i.e. dysphagia, regurgitation)
<b>Inguinal Hernias</b>	5% of all term newborns 2x risk and more likely bilateral if pre-term M:F = 4:1 Low birth weight increases risk 1/5 inguinal hernias will become incarcerated if patient is <1 yr old Incarceration is more common in females Associated with other conditions: androgen insensitivity, connective tissue diseases	All infant hernias are indirect: descent of intra-abdominal contents through the internal inguinal ring through a patent tunica vaginalis	Most common presentation: painless intermittent mass in groin, may also note extension into scrotum (scrotal mass in absence of inguinal mass is a hydrocele) If incarcerated: tender, vomiting, firm mass, erythema then cyanosis of mass may be noted	Palpate for "bag of worms" suggests possible testicular varicocele Biannual testicular exam + palpation along inguinal canal to evaluate for any masses "Silk sign" – palpable thickening of cord Mass palpated at external inguinal ring and reducible through inguinal canal into abdomen Must always try reduction to confirm that hernia is not incarcerated	Physical exam is gold standard U/S only if physical exam uncertain (e.g. in small infants where exam can be difficult)	Manual reduction – to relieve acute symptoms Herniorrhaphy – definitive treatment by reduction of herniated contents and high ligation of sac for indirect hernias Laparoscopic or open techniques	Risk of recurrence after surgical reduction <3% but higher if repair done in premature infants or if hernia was incarcerated/strangulated at repair

# Skin Lesions

- see [Dermatology, D5](#); [Emergency Medicine, ER17](#); [Plastic Surgery, PL5](#)

All inguinal hernias of infancy and childhood require repair at the earliest convenience; emergent repair if incarcerated/strangulated

## Common Medications

<b>Antiemetics</b>	<ul style="list-style-type: none"> <li>• dimenhydrinate (Gravol®) 25-50 mg PO/IV/IM q4-6h prn</li> <li>• prochlorperazine (Stemetil®) 5-10 mg PO/IV/IM bid-tid prn</li> <li>• metoclopramide (Maxeran®) 10 mg IV/IM q2-3h prn, 10-15 mg PO qid (30 min before meals and qhs)</li> <li>• ondansetron (Zofran®) 4-8 mg PO q8h prn</li> <li>• granisetron (Kytril®) 1 mg PO bid (for nausea from chemotherapy/radiation)</li> </ul>
<b>Analgesics</b>	<ul style="list-style-type: none"> <li>• acetaminophen ± codeine (Tylenol® #3/plain) 1-2 tabs q4-6h PO/PR prn</li> <li>• hydromorphone i-ii tabs PO q4h prn, 0.5-2 mg IV q3-4h prn</li> <li>• ibuprofen 200-400 mg PO q4-6h prn</li> <li>• morphine 2.5-10 mg IM/SC q4-6h prn + 1-2 mg IV q1h prn for breakthrough</li> <li>• ketorolac (Toradol®) 30-60 mg IM/IV q6h prn</li> <li>• Percocet® (acetaminophen/oxycodone, 325/5 mg) 1-2 tabs PO q4-6h prn</li> </ul>
<b>DVT Prophylaxis</b>	<ul style="list-style-type: none"> <li>• heparin 5,000 units SC bid, if cancer patient then heparin 5,000 units SC tid</li> <li>• dalteparin (Fragmin®) 5,000 units SC daily</li> <li>• enoxaparin (Lovenox®) 40 mg SC daily</li> </ul>
<b>Antidiarrheals</b>	<ul style="list-style-type: none"> <li>• loperamide (Imodium®) 4 mg PO initially, then 2 mg PO after each loose stool up to 16 mg/d</li> <li>• diphenoxylate + atropine (Lomotil®) 2 tabs/10 mL PO qid</li> </ul>
<b>Laxatives</b>	<ul style="list-style-type: none"> <li>• sennosides (Senokot®) 1-2 tabs qhs</li> <li>• docusate sodium (Colace®) 100 mg PO bid</li> <li>• glycerine suppository 1 tab PR prn</li> <li>• lactulose 15-30 mL PO qid prn</li> <li>• milk of magnesia (MOM) 30-60 mL PO qid prn</li> <li>• bisacodyl (Dulcolax®) 10-15 mg PO prn</li> </ul>
<b>Sedatives</b>	<ul style="list-style-type: none"> <li>• zopiclone (Imovane®) 5-7.5 mg PO qhs prn</li> <li>• lorazepam (Ativan®) 0.5-2 mg PO/SL qhs prn</li> </ul>
<b>Antibiotics</b>	<ul style="list-style-type: none"> <li>• cefazolin (Ancef®) 1 g IV/IM on call to OR or q8h – GP except <i>Enterococcus</i>, GN only <i>E. coli</i>, <i>Klebsiella</i>, and <i>Proteus</i></li> <li>• cefalexin (Keflex®) 250-500 mg PO qid – <i>Listeria</i>, GP except <i>Enterococcus</i>, GN only <i>E. coli</i>, <i>Klebsiella</i>, and <i>Proteus</i></li> <li>• ceftriaxone 1-2 g IM/IV q24h – broad coverage including <i>Pseudomonas</i></li> <li>• ampicillin 1-2 g IV q4-6h – <i>Listeria</i>, GP (<i>Enterococcus</i>) except <i>Streptococcus</i> and <i>E. coli</i>, oral anaerobes except <i>Bacteroides</i></li> <li>• gentamicin 3-5 mg/kg/d IM/IV divided q8h; monitor creatinine, gentamicin levels – GN including <i>Pseudomonas</i></li> <li>• ciprofloxacin 400 mg IV q12h, 500 mg PO bid – GN including <i>Pseudomonas</i></li> <li>• metronidazole (Flagyl®) 500 mg PO/IV bid (500 mg PO tid for <i>C. difficile</i>) – anaerobes</li> <li>• clindamycin 600-900 mg IV q8h, 150-400 mg PO qid – GP except <i>Enterococcus</i>, anaerobes</li> <li>• piperacillin/tazobactam 4.5 mg IV q6h – GP, GN, and anaerobes</li> <li>• vancomycin 1g IV q12h – GP and MRSA</li> <li>• sulfamethoxazole/trimethoprim DS (Septra®) PO bid – GP, GN including <i>Nocardia</i></li> </ul>
<b>Over-the-Counter Medications</b>	<ul style="list-style-type: none"> <li>• Pepto-Bismol® (bismuth subsalicylate) 2 tabs or 30 mL PO q30min-1h up to 8 doses/d side effects: black stools, risk of Reye's syndrome in children</li> <li>• Alka-Seltzer® (ASA + citrate + bicarbonate) 2 tabs in 4 oz water PO q4h prn, max 8 tabs</li> <li>• Maalox® (aluminum hydroxide + magnesium hydroxide) 10-20 mL or 1-4 tabs PO prn</li> <li>• Turns® (calcium carbonate) 1-3 g PO q2h prn</li> <li>• Roloids® (calcium carbonate and magnesium hydroxide) 2-4 tabs PO q1h prn, max 12 tabs/d</li> </ul>

## Acronyms

ACEI	angiotensin converting enzyme inhibitor	CVA	cerebrovascular accident	GCA	giant cell arteritis	NG	nasogastric
ADL	activities of daily living	DHPCCB	dihydropyridine calcium channel blocker	HR	heart rate	NSTEMI	non-ST elevation myocardial infarction
ARB	angiotensin receptor blocker	DM	diabetes mellitus	IBD	inflammatory bowel disease	PPI	proton pump inhibitor
BPH	benign prostatic hypertrophy	DNR	do not resuscitate	IBS	irritable bowel syndrome	PPS	palliative performance scale
CABG	coronary artery bypass graft	ESAS	Edmonton symptom assessment scale	ICP	intracranial pressure	PTH	parathyroid hormone
CBT	cognitive behavioural therapy	FAP	familial adenomatous polyposis	LOC	level of consciousness	RA	rheumatoid arthritis
CHF	congestive heart failure			MMSE	mini mental status examination	SLE	systemic lupus erythematosus
CO	cardiac output			NE	norepinephrine	UTI	urinary tract infection

## Seniors in Canada and the U.S.

### Health Status

**Table 1. Causes of Mortality and Morbidity in Canadian and American Seniors**

Mortality (Can/U.S. <sup>2</sup> )	Morbidity <sup>1,2</sup>	
1. Diseases of the heart and circulatory system (19.7/27.0%)	1. Hypertension	5. Ulcers
2. Malignant neoplasms (29.9/22.0%)	2. Arthritis	6. Stroke
3. Cerebrovascular disease (5.5/6.0%)	3. Heart disease	7. Asthma
4. Chronic lower respiratory disease (4.6/7.0%)	4. Diabetes	8. Allergies
5. Accidents (4.4%)		
6. Alzheimer's (2.6/5.0%)		

<sup>1</sup>Statistics Canada, 2011 <sup>2</sup>Minino AM, 2009

## Physiology and Pathology of Aging

### Definition

- major categories of impairment that appear with old age and affect the physical, mental, and social domains of the elderly, usually due to many predisposing and precipitating factors, rather than a single cause

**Table 2. Changes Occurring Frequently with Aging**

System	Physiological Changes	Pathological Changes
<b>Neurologic</b>	Decreased wakefulness, brain mass, cerebral blood flow, increased white matter changes	Increased insomnia, neurodegenerative disease, stroke, decreased reflex response
<b>Special Senses</b>	Decreased lacrimal gland secretion, lens transparency, dark adaptation, decreased sense of smell and taste	Increased glaucoma, cataracts, macular degeneration, presbycusis, presbyopia, tinnitus, vertigo, oral dryness
<b>Cardiovascular</b>	Increased sBP, dBP, decreased HR, CO Decreased vessel elasticity, cardiac myocyte size and number, $\beta$ -adrenergic responsiveness	Increased atherosclerosis, CAD, MI, CHF, hypertension, arrhythmias, orthostatic hypotension
<b>Respiratory</b>	Increased tracheal cartilage calcification, mucous gland hypertrophy Decreased elastic recoil, mucociliary clearance, pulmonary function reserve	Increased COPD, pneumonia, pulmonary embolism
<b>Gastrointestinal</b>	Increased intestinal villous atrophy Decreased esophageal peristalsis, gastric acid secretion, liver mass, hepatic blood flow, calcium and iron absorption	Increased cancer, diverticulitis, constipation, fecal incontinence, hemorrhoids, intestinal obstruction, malnutrition, weight loss
<b>Renal and Urologic</b>	Increased proteinuria, urinary frequency Decreased renal mass, creatinine clearance, urine acidification, hydroxylation of vitamin D, bladder capacity	Increased urinary incontinence, nocturia, BPH, prostate cancer, pyelonephritis, nephrolithiasis, UTI
<b>Reproductive</b>	Decreased androgen, estrogen, sperm count, vaginal secretion Decreased ovary, uterus, vagina, breast size	Increased breast and endometrial cancer, cystocele, rectocele, atrophic vaginitis
<b>Endocrine</b>	Increased NE, PTH, insulin, vasopressin Decreased thyroid and adrenal corticosteroid secretion	Increased DM, hypothyroidism, stress response
<b>Musculoskeletal</b>	Increased calcium loss from bone Decreased muscle mass, cartilage	Increased arthritis, bursitis, osteoporosis, muscle weakness with gait abnormalities, polymyalgia rheumatica
<b>Integumentary</b>	Atrophy of sebaceous and sweat glands Decreased epidermal and dermal thickness, dermal vascularity, melanocytes, collagen synthesis	Increased lentigo, cherry hemangiomas, pruritus, seborrheic keratosis, herpes zoster, decubitus ulcers, skin cancer, easy bruising
<b>Psychiatric</b>	None	Increased depression, dementia, delirium, suicidality, anxiety, sleep disruption

# Differential Diagnoses of Common Presentations

## Constipation

• see [Gastroenterology, G24](#)

### Definition

- less than 3 bowel movements in one wk and/or hard stools, straining, sense of blockade, needing manual maneuvers or incomplete evacuation on more than 25% of occasions for at least 12 wk (does not need to be consecutive)

### Epidemiology

- chronic constipation increases with age (up to 1/3 of patients >65 yr experience constipation and 1/2 of patients >80)
- in the elderly, chronic constipation may present as fecal impaction

### Pathophysiology

- impaired rectal sensation (increased rectal distention required to stimulate the urge to defecate)
- colorectal dysmotility

### Treatment

- non-pharmacological
  - increase fibre intake
  - ensure adequate fluid intake
  - discourage chronic laxative use
  - engage in regular exercise
  - review medication regime, reduce dosages or substitute
- pharmacologic
  - see [Common Medications, GM11](#)

#### Common Causes of Constipation Include:

- Electrolyte abnormalities (hypokalemia, hypercalcemia)
- Endocrine (hypothyroidism, DM)
- GI (IBS, colon cancer)
- Neurologic (multiple sclerosis, Parkinson's disease)
- Psychiatric (depression, dementia)
- Other (dehydration, immobility)

#### Drugs Associated with Constipation Include:

- Analgesics (narcotics, NSAIDs)
  - Anticholinergics
  - Calcium channel blockers
  - Diuretics
  - Supplements (iron or calcium)
- Am Fam Physician 2011;84:299-306*

#### Treatment of Constipation in Older Adults

*CMAJ 2013;185(8):663-70*  
**Objectives:** To discuss management of constipation in older adults.  
**Results/Conclusions:** In older adults, the predominant symptom of constipation is more frequently straining than decreased stool frequency. RCTs support the use of osmotic agents to treat symptoms of constipation in older adults. In contrast evidence supporting the use of bulk agents, stool softeners stimulants and prokinetic agents is limited and inconsistent.

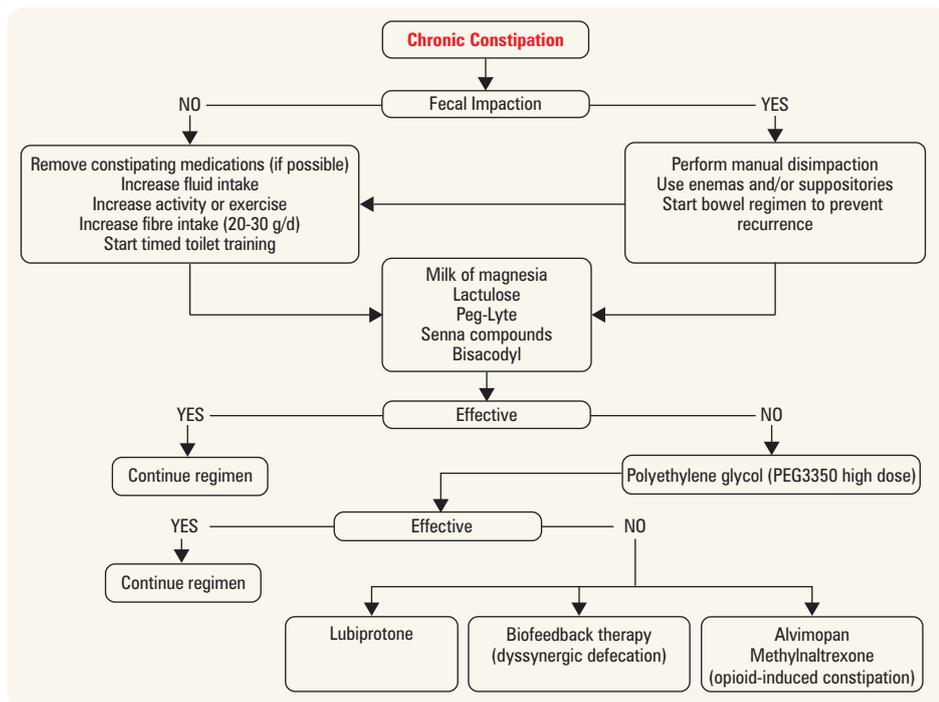

Figure 1. Treatment algorithm for the management of chronic constipation in the elderly

Adapted from: *Clin Interv Aging* 2010;5:163-171

## Delirium, Dementia, and Depression

- see [Psychiatry, PS19, PS20, PS10](#) and [Neurology, N20](#)

### Definition

- all of the above may present with pathologic decrease in memory, language, or executive function

### Differential Diagnosis

- delirium, dementia, or pseudodementia of depression (see [Psychiatry](#))

### Delirium Prevention in Elderly

- ensure optimal vision and hearing to support orientation (e.g. appropriate eye wear and hearing aids)
- provide adequate nutrition and hydration (up in chair to eat and drink whenever feasible)
- encourage regular mobilization to build and maintain strength, balance, and endurance
- avoid unnecessary medications and monitor for drug interactions
- avoid bladder catheterization if possible
- ensure adequate sleep

## Elder Abuse

### Definition

- includes physical abuse, sexual abuse, emotional/psychological abuse, financial abuse, abandonment, and neglect
- elder abuse is a criminal offence under the Criminal Code of Canada
- in the U.S., most states have criminal penalties for elder abuse

### Epidemiology

- in Canada in 2013, almost 3000 seniors were victims of family violence. The perpetrators of family violence against seniors were identified to be their grown child (43% of cases) and their spouses (28% of the cases)
- in Canada in 2013, the rate of family-related homicides against seniors was 3.2 for every 1 million seniors
- in the U.S., estimates of the frequency of elder abuse range from 3-8%
- physician reporting is mandatory only in Newfoundland, Nova Scotia, and Prince Edward Island; in Ontario, only abuse occurring in nursing homes is mandatory to report
- insufficient evidence to include/exclude screening in the Periodic Health Exam

### Risk Factors

**Table 3. Risk Factors for Elder Abuse**

<b>Situational Factors</b>	Isolation Unstable or unsafe living arrangements Lack of family, community or living facility resources for additional care
<b>Victim Characteristics</b>	Physical or emotional dependence on caregiver Lack of close family ties History of family violence Dementia or recent deterioration in health
<b>Perpetrator Characteristics</b>	Related to victim Living with victim Long duration of care for victim (mean 9.5 yr) Financial, marital, occupational or other stressors

### Caregiver Abuse Screen (CASE)

- instructions
  - to be answered by caregivers, if answer “yes” to a question, further explore issue
  - the more “yes” responses, the more likely the presence of abuse
- screening tool
  - please answer the following questions as a helper/caregiver:
    1. Do you sometimes have trouble making \_\_\_\_\_ control his/her temper or aggression?
    2. Do you often feel you are being forced to act out of character/do things you feel badly about?
    3. Do you find it difficult to manage \_\_\_\_\_’s behaviour?
    4. Do you sometimes feel that you are forced to be rough with \_\_\_\_\_?
    5. Do you sometimes feel that you can’t do what is really necessary or what should be done for \_\_\_\_\_?
    6. Do you often feel you have to reject/ignore \_\_\_\_\_?
    7. Do you often feel so tired and exhausted that you cannot meet \_\_\_\_\_’s needs?
    8. Do you often feel you have to yell at \_\_\_\_\_?

From: NICE. Case: Caregiver Abuse Screen. 2010. Reproduced with permission from NICE.

### Antipsychotics for Delirium

*Cochrane DB Syst Rev* 2009;CD005594

**Objectives:** To compare the efficacy and incidence of adverse effects of haloperidol with risperidone, olanzapine, and quetiapine in the treatment of delirium.

**Selection Criteria:** Types of studies included, unconfounded, randomized trials with concealed allocation of subjects.

**Results:** Three studies were included, comparing haloperidol with risperidone, olanzapine, and placebo in the management of delirium and in the incidence of adverse drug reactions. Decreases in delirium scores were not significantly different when comparing the effect of low dose haloperidol (<3.0 mg/d) with olanzapine and risperidone (odds ratio 0.63; 95% CI 10.29-1.38; p=0.25). High dose haloperidol (>4.5 mg/d) was associated with an increased incidence of extrapyramidal adverse effects compared with olanzapine. Low dose haloperidol decreased the severity and duration of delirium in post-operative patients, although not the incidence of delirium compared to placebo.

**Conclusions:** There is no evidence that haloperidol in low dosage has different efficacy in comparison with the atypical antipsychotics olanzapine and risperidone in the management of delirium or has a greater frequency of adverse drug effects than these drugs. High dose haloperidol was associated with a greater incidence of side effects. Low dose haloperidol may be effective in decreasing the degree and duration of delirium in post-operative patients, compared with placebo. However, all studies were small and should be repeated.

### Elder Abuse Suspicion Index (EASI)

#### Instructions

- Questions 1-5 are to be asked of the patient
  - Question 6 is to be answered by the doctor
  - A response of “yes” on one or more of questions 2-6 may establish concern
  - Validated for use by family practitioners of cognitively intact seniors seen in ambulatory setting
1. Have you relied on people for any of the following: bathing, dressing, shopping, banking, or meals?
  2. Has anyone prevented you from getting food, clothes, medication, glasses, hearing aids, or medical care, or from being with people you wanted to be with?
  3. Have you been upset because someone talked to you in a way that made you feel shamed or threatened?
  4. Has anyone tried to force you to sign papers or to use your money against your will?
  5. Has anyone made you afraid, touched you in ways that you did not want, or hurt you physically?
  6. Doctor: elder abuse may be associated with findings such as: poor eye contact, withdrawn nature, malnourishment, hygiene issues, cuts, bruises, inappropriate clothing, or medication compliance issues. Did you notice any of these today or in the last 12 mo?

NICE net. Elder Abuse Suspicion Index. 2006

## Management

- assess safety and determine capacity to make decisions about living arrangements
- establish need for hospitalization or alternate accommodation (e.g. immediate risk of physical harm by self or caregiver)
- involve multidisciplinary team (e.g. nurse, social worker, family members, and physicians including geriatrician, psychiatrist or family physician)
- educate and assist caregiver, contact local resources (e.g. legal aid, crisis support, PSW, caregiver support groups)
- interpret critical and lab findings that are key in exclusion, differentiation and diagnosis

### Red Flags for Elder Abuse

- Delay in seeking medical attention
- Disparity in histories
- Implausible or vague explanations
- Frequent emergency room visits for exacerbations of chronic disease despite plan for medical care and adequate resources
- Presentation of functionally impaired patient without designated caregiver
- Lab findings inconsistent with history

### Key Physical Findings in the Elderly Patient Who Falls or Nearly Falls

#### I HATE FALLING

Inflammation of joints  
 Hypotension (orthostatic changes)  
 Auditory and visual abnormalities  
 Tremor  
 Equilibrium (balance) problem  
 Foot Problems  
 Arrhythmia, heart block or valvular disease  
 Leg-length discrepancy  
 Lack of conditioning (generalized weakness)  
 Illness  
 Nutrition  
 Gait disturbance  
*Am Fam Phys* 2001;61:2159-2172

A history of falls within the past 1-2 yr is a predictor of motor vehicle crashes in the older population. These patients should be evaluated on their ability to drive and counselled about driving

### Drugs That May Increase the Risk of Falling

- Sedative-hypnotic and anxiolytic drugs (especially long-acting benzodiazepines)
- Antidepressants (including MAOIs, SSRIs, TCAs)
- Antipsychotics and tranquilizers (phenothiazines and butyrophenones)
- Antihypertensive drugs
- Antiarrhythmics (Class IA)
- Diuretics
- Systemic corticosteroids
- NSAIDs
- Anticholinergic drugs
- Hypoglycemic agents
- Alcohol

Adapted from: *Am Fam Phys* 2001;61:2159-2172  
 Geriatrics At Your Fingertips, 13th ed. New York: *Am Geriat Soc*, 2011

### Fall Prevention Tips

- Improve lighting, especially on stairs
- Caution while adjusting to new bifocal prescription (poor depth perception)
- Side rails in bathtubs
- Railings on steps
- Connect patient to lifeline button signaling systems
- Remove loose mats or carpets, telephone cords and other tripping hazards
- Recommend support hose for varicose veins and swelling of ankles

Essential Geriatrics: Managing 6 Conditions. *Patient Care Canada* 1997;8

## Falls

### Definition

- an event which results in a person coming to rest inadvertently on the ground or floor or other lower level

### Epidemiology

- 30-40% of people >65 yr old and ~50% of people >80 yr old fall each year
  - equally common between men and women, but more likely to result in injury in women and death in men
  - 5% of falls lead to hospitalization
  - falls are the leading cause of death from injury in persons older than 65 yr
  - 25% associated with serious injuries (e.g. hip fracture, head injury, bruises, laceration)
  - between 25-75% do not recover to previous level of ADL function
  - mortality increases with age (171/100,000 in men >85 yr old) and type of injury (25% with hip fracture die within 6 mo)

### Etiology

- multifactorial
  - extrinsic
    - environmental (e.g. home layout, lighting, stairs, overcrowding)
    - accidental, abuse
    - side effects of medications and substance abuse (e.g. alcohol)
    - acute illness, exacerbation of chronic illness
  - intrinsic
    - orthostatic/syncopal
    - age-related changes and diseases associated with aging: musculoskeletal (arthritis, muscle weakness), sensory (visual, proprioceptive, vestibular), cognitive (depression, dementia, delirium, anxiety), cardiovascular (CAD, arrhythmia, MI, low BP), neurologic (stroke, decreased LOC, gait disturbances/ataxia), metabolic (glucose, electrolytes)

### Investigations

- directed by history and physical
- comprehensive geriatric assessment to identify all potential causes
- CBC, electrolytes, BUN, creatinine, glucose, Ca<sup>2+</sup>, TSH, B<sub>12</sub>, urinalysis, cardiac enzymes, ECG, CT head

### Prevention

- multidisciplinary, multifactorial, health, and environmental risk factor screening and intervention programs in the community
- muscle strengthening, balance retraining, and group exercise programs (e.g. Tai Chi)
- home hazard assessment and modification (e.g. remove rugs, add shower bars, etc.)
- prescription of vitamin D 1000 IU daily
- tapering or gradual discontinuation of psychotropic medication
- postural hypotension, heart rate, and rhythm abnormalities management
- eyesight and footwear optimization

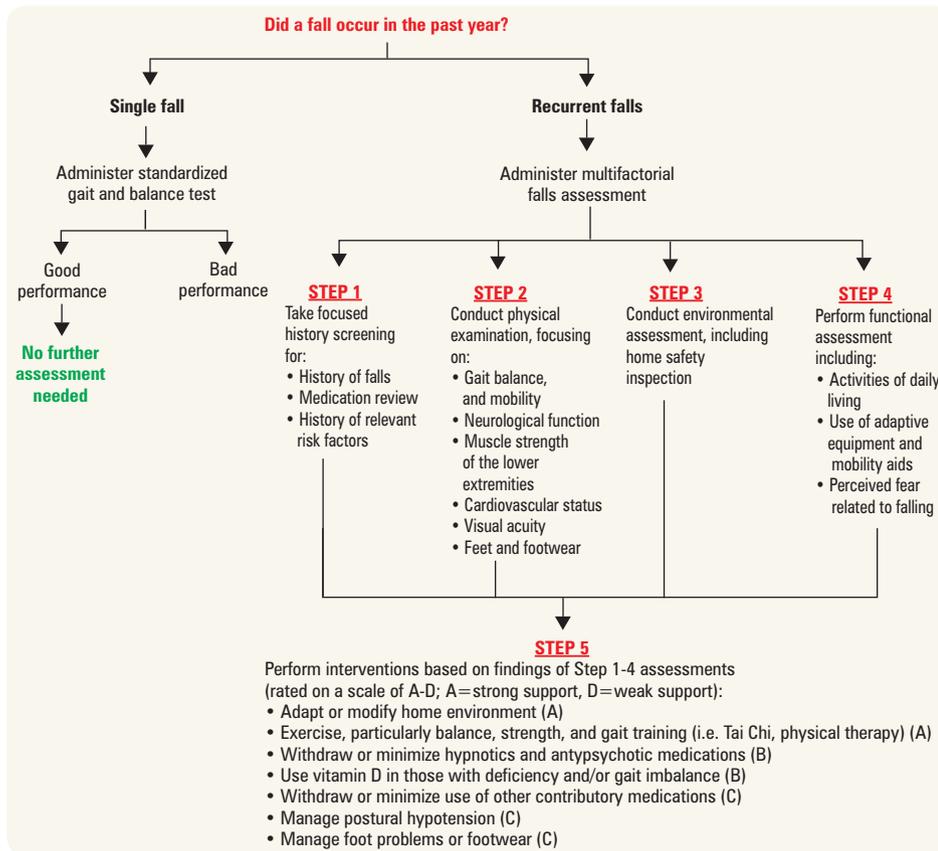

Figure 2. Approach to falls in the elderly

Adapted from: Davuluri S, Dharmarajan TS. Clinical Geriatrics 2013;21(10)

**Falls Prevention in Community-Dwelling Older Adults**

JAMA 2013;309:1406-1407

**Purpose:** To identify interventions that led to decreased falls in community dwelling older patients.

**Study Selection:** Meta-analysis of RCTs testing interventions intended to reduce falls.

**Results:** 159 RCTs were assessed, yielding a population of 79 193 participants (30%M:70%F). The interventions tested included exercise programs, vitamin D supplementation, home assessment, and multi-factorial interventions. Primary outcomes were rate of falls and number of people who fell. Interventions that significantly reduced fall rates included exercise programs (group or home-based) and multi-factorial interventions. Vitamin D supplementation only significantly improved outcomes for patients with deficiency. Home assessment was only significant for patients with high fall risk.

**Conclusions:** Multiple interventions have been found to significantly decrease falls in patients living in the community. Assessment of fall risk may help to guide choice of interventions. It is noted that patients with dementia, Parkinson's disease, or stroke were not included in these studies.

**Will My Patient Fall?**

JAMA 2007;297:77-86

**Purpose:** To identify the prognostic value of risk factors for future falls among older patients.

**Study Selection:** Meta-analysis of prospective cohort studies of risk factors for falls.

**Results:** 18 studies were included. Clinically identifiable risk factors were identified across 6 domains: orthostatic hypotension, visual impairment, impairment of gait or balance, medication use, limitations in basic or instrumental activities of daily living, and cognitive impairment. The estimated pretest probability of falling at least once in any given yr for individuals 65 yr and older was 27% (95% CI 19-36%). Patients who have fallen in the past yr are more likely to fall again (LR2.3-2.8). Best predictors of future falls were disturbances in gait or balance (LR 1.7-2.4), while visual impairment, impaired cognition and medication were not reliable predictors.

**Conclusions:** Screening for risk of falling during the clinical examination begins with determining if the patient has fallen in the past yr. For patients who have not previously fallen, screening consists of an assessment of gait and balance. Patients who have fallen or who have a gait or balance problem are at higher risk of future falls.

**Four Syndromes in Failure to Thrive**

- My Pa Can't Drive
- Malnutrition
- Physical impairment
- Cognitive impairment
- Depression

## Frailty (Functional Decline/Failure to Thrive)

**Definition**

- frailty - clinical state of older adults with increased vulnerability to acute stressors resulted from functional decline
- functional decline - progressive limitation in the ability to carry out basic functional activities
- failure to thrive - a state of decline that may be characterized by weight loss, decreased appetite, poor nutrition, and inactivity

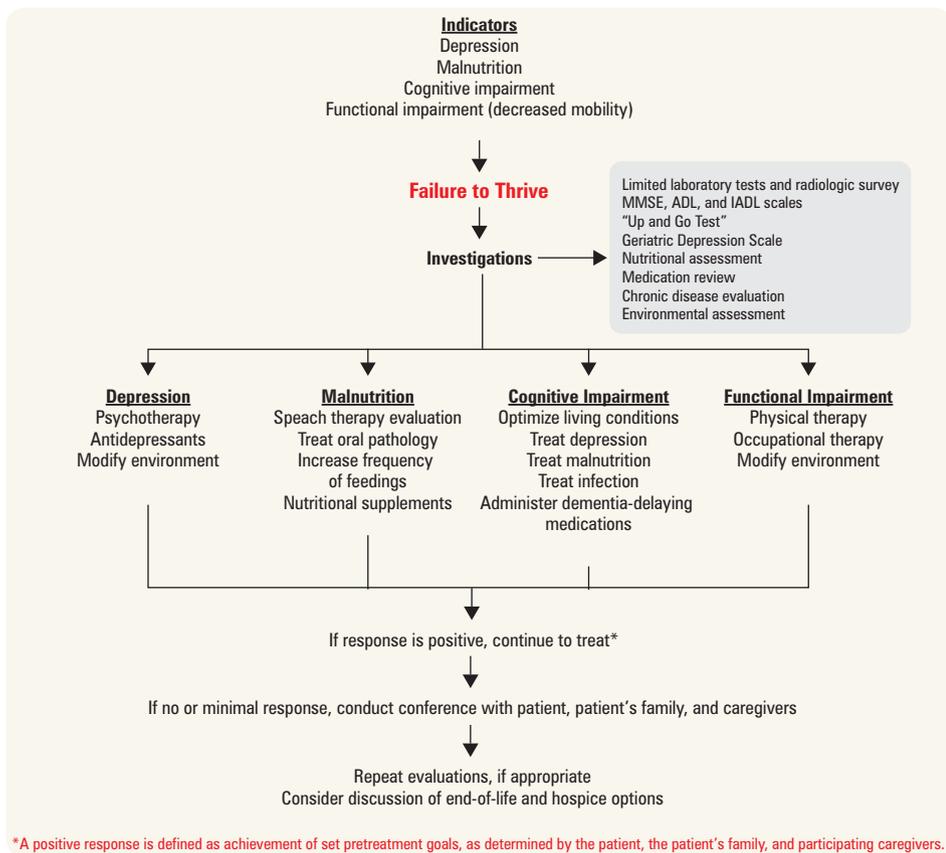

**Etiology**

- multifactorial - malnutrition, functional impairment, cognitive impairment, and depression

Table 4. Common Medical Conditions Associated with Failure to Thrive

Medical Condition	Cause of Failure to Thrive
Cancer	Metastases, malnutrition, cachexia
Chronic lung disease	Respiratory failure
Chronic renal insufficiency	Renal failure
Chronic steroid use	Steroid myopathy, diabetes, osteoporosis, vision loss
Cirrhosis, hepatitis	Hepatic failure
Depression, other psychiatric disorders	Major depression, psychosis, poor functional status, cognitive loss
Diabetes	Malabsorption, poor glucose homeostasis, end-organ damage
Gastrointestinal surgery	Malabsorption, malnutrition
Hip, long bone fracture	Functional impairment
Inflammatory bowel disease	Malabsorption, malnutrition
Myocardial infarction, congestive heart failure	Cardiac failure
Recurrent UTI, pneumonia	Chronic infection, functional impairment
Rheumatologic disease (GCA, RA, SLE)	Chronic inflammation
Stroke	Dysphagia, depression, cognitive loss, functional impairment
Tuberculosis, other systemic infections	Chronic infection

Adapted from: Clin Geriatr Med 1997;13:769-778

**Figure 3. Failure to thrive in elderly patients**

Adapted from: *American Family Physician* 2004;70: 343-350

#### A Global Clinical Measure of Fitness and Frailty in Elderly People

*CMAJ* 2005;173:489-495

The CHSA Clinical Frailty Scale – shown to predict death and need for institution

1. Very fit – robust, active, energetic, well motivated and fit; these people commonly exercise regularly and are in the most fit group for their age.
2. Well – without active disease, but less fit than people in category 1.
3. Well, with treated comorbid disease – its symptoms are well controlled compared with those in category 4.
4. Apparently vulnerable – although not frankly dependent, these people commonly complain of being "slowed up" or have disease symptoms.
5. Mildly frail – with limited dependence on others for instrumental activities of daily living.
6. Moderately frail – help is needed with both instrumental and non-instrumental activities of daily living.
7. Severely frail – completely dependent on others for the activities of daily living, or terminally ill.

#### Functional Assessment (ADLs and IADLs)

**ADLs: ABCDE-TT    IADLs: SHAFT-TT**

Ambulating	Shopping
Bathing	Housework
Continence	Accounting/Managing finances
Dressing	Food preparation
Eating	Transportation
Transferring	Telephone
Toileting	Taking medications

Can use formal assessment tools such as the Lawton-Brody Instrumental Activities of Daily Living Scale to assess functioning

#### Transient Causes of Incontinence

##### DIAPERS

Delirium  
Infection  
Atrophic urethritis/vaginitis  
Pharmaceuticals  
Excessive urine output  
Restricted mobility  
Stool impaction

## Incontinence

### FECAL INCONTINENCE

#### Definition

- involuntary passage or the inability to control the discharge of fecal matter through the rectum
- severity can range from unintentional flatus to the complete evacuation of bowel contents
- there are three subtypes
  1. passive incontinence: involuntary discharge of stool or gas without awareness
  2. urge incontinence: discharge of fecal matter in spite of active attempts to retain bowel contents
  3. fecal: leakage of stool following otherwise normal evacuation

#### Epidemiology

- second leading cause of nursing home placement
- US estimates show that 10-25% of hospitalized geriatric patients suffer from fecal incontinence

#### Etiology

- commonly multifactorial
  - structural abnormalities
  - trauma (e.g. prior vaginal delivery, surgery)
  - prolapse
  - tumour/trauma (e.g. brain, spinal cord, cauda equina)
  - overflow (e.g. encopresis, impaction)
- functional abnormalities
  - neurologic conditions – neuropathy, multiple sclerosis, stroke, dementia
- others
  - constipation with overflow may be a factor
  - psychosis (willful soiling)
  - age >80 yr: decreased external sphincter strength and weak anal squeeze, increased rectal compliance, decreased resting tone and internal sphincter, impaired anal sensation
  - medications (e.g. laxatives, anticholinergics, antidepressants, caffeine, muscle relaxants)

**Investigations (if cause not apparent from history and physical)**

- differentiate true incontinence from frequency and urgency (i.e. IBS, IBD)
- stool studies
- endorectal ultrasound
- colonoscopy, sigmoidoscopy, anoscopy
- anorectal manometry/functional testing

**Management**

- diet/bulking agent if stool is liquid or loose
- disimpaction, prevent impaction
- anti-diarrheal agents (e.g. loperamide)
- regular defecation program in patients with dementia
- counsel about biofeedback therapy (retraining of pelvic floor muscles)

**URINARY INCONTINENCE**

- see [Urology, U5](#)

**Definition**

- complaint of any involuntary loss of urine
- can be further classified according to patients symptoms as urgency urinary incontinence, stress urinary incontinence, mixed urinary incontinence, nocturnal enuresis, post-micturition dribble, and continuous urinary leakage

**Epidemiology**

- 15-30% prevalence dwelling in community and at least 50% of institutionalized seniors
- morbidity: cellulitis, pressure ulcers, urinary tract infections, falls with fractures, sleep deprivation, social withdrawal, depression, sexual dysfunction
- not associated with increased mortality

**Pathophysiology**

- not a normal part of aging, urinary incontinence is a loss of control due to a combination of:
- genitourinary pathology: increased post-void residual volume, increased involuntary bladder contractions (urge incontinence)
- age-related changes: decreased bladder capacity
- comorbid conditions and medications
- functional impairment
- in elderly women: decline in bladder outlet and urethral resistance pressure promoting stress incontinence
- in elderly men: prostatic enlargement can cause overflow and urge incontinence

**Gait Disorders**

- see [Neurology, N10](#)

**Hazards of Hospitalization****Table 5. Recommendations for Sequelae of Hospitalization in Older Patients**

Sequelae	Recommendations
Malnutrition	No dietary restrictions (except diabetes), assistance, dentures if necessary, sitting in a chair to eat
Urinary incontinence	Medication review, remove environmental barriers, discontinue use of catheter
Depression	Routine screening
Adverse drug event	Medication review
Confusion/delirium	Orientation, visual and hearing aids, volume repletion, noise reduction, early mobilization, medication review, remove restraints
Pressure ulcers	Low-resistance mattress, daily inspection, repositioning every 2 h
Infection	Early mobilization, remove unnecessary IV lines, catheters, NG tubes
Falls	Appropriate footwear, assistive devices, early mobilization, remove restraints, medication review
Hypotension/dehydration	Early recognition and repletion
Diminished aerobic capacity/loss of muscle strength/contractures	Early mobilization
Decreased respiratory function	Incentive spirometry, physiotherapy

Source: Asher, Richard AJ. Dangers of going to bed. British Medical Journal 2.4536 (1947): 967

## Hypertension

- see [Family Medicine, FM34](#)

### Definition

- blood pressure at which an otherwise healthy person would have increased risk of cardiovascular disease
- definition of high blood pressure has changed over time and differs between guidelines proposed by expert bodies
- target: <140/90 mm Hg for adults younger than 80. <130/80 mm Hg for individuals with DM. <150sBP for adults aged 80 or older

### Epidemiology

- 60-80% of elderly (>65 yr old) have hypertension
  - 60% of these have isolated systolic HTN
  - the benefit of treating hypertension in the elderly is 2-4 times greater than that achieved in the treatment of younger patients with primary hypertension
  - systolic and pulse pressure are major predictors of outcome in the elderly patient
  - in older adults, base treatment on sBP

### Management

- non-pharmacologic treatments are first-line, then thiazide or thiazide-like diuretic monotherapy is recommended in patients without comorbidities
- add ACEI/ARB if also atherosclerosis, DM, CHF or chronic kidney disease
- add  $\beta$ -blockers if also angina or CHF

## Immobility

### Complications

- cardiovascular: orthostatic hypotension, venous thrombosis, embolism
- respiratory: decreased ventilation, atelectasis, pneumonia
- gastrointestinal: anorexia, constipation, incontinence, dehydration, malnutrition
- genitourinary: infection, urinary retention, bladder calculi, incontinence
- musculoskeletal: atrophy, contractures, bone loss
- skin: pressure ulcers
- psychological: sensory deprivation, delirium, depression

## Immunizations

- the following immunizations are recommended for **people 65 yr of age and older**
- tetanus: every 10 yr
- pneumococcus: every 5 yr
- influenza: every autumn
- herpes zoster: Zostivax®

## Malnutrition

### Definition

- involuntary weight loss of  $\geq 5\%$  baseline body weight or  $\geq 5$  kg
- hypoalbuminemia, hypocholesterolemia

### Etiology

- nutritional
  - decreased assimilation: impaired transit, maldigestion, malabsorption
  - decreased intake: financial, psychiatric (depression), cognitive deficits, anorexia associated with chronic disease, functional deficits (e.g. difficulty shopping, preparing meals or feeding oneself due to functional impairment)
- stress: acute or chronic illness/infection, chronic inflammation, abdominal pain
- mechanical: dental problems, dysphagia
- age-related changes: appetite dysregulation, decreased thirst
- mixed: increased energy demands (e.g. hyperthyroidism), abnormal metabolism, protein-losing enteropathy

### Clinical Features

- history
  - recent or chronic illness
    - ◆ depression, GI symptoms

### Treatment of Hypertension in Patients 80 Years of Age or Older

*NEJM* 2008;358:1887-1898

**Study:** Randomized, double-blind, placebo-controlled, multicentre trial.

**Subjects:** 3,845 patients who were 80 yr of age or older and had a sustained systolic blood pressure of 160 mmHg were followed for a median 1.8 yr. Intervention: Indapamide (sustained release, 1.5 mg) or matching placebo. The angiotensin-converting enzyme inhibitor perindopril (2 or 4 mg), or matching placebo, was added if necessary to achieve the target blood pressure of 150/80 mmHg.

**Primary Outcome:** Fatal or nonfatal stroke.

**Results:** Treatment was associated with a 30% reduction in the rate of fatal or nonfatal stroke (95% CI -1-51;  $p=0.06$ ), 39% reduction in the rate of death from stroke (95% CI 1-62;  $p=0.05$ ), 21% reduction in the rate of death from any cause (95% CI 4-35;  $p=0.02$ ), 23% reduction in the rate of death from cardiovascular causes (95% CI -1-40;  $p=0.06$ ), and 64% reduction in the rate of heart failure (95% CI 42-78;  $p<0.001$ ). Fewer serious adverse events were reported in the treatment group (358 vs. 448 in the placebo group;  $p=0.001$ ).

**Conclusions:** Antihypertensive treatment with indapamide (sustained release), with or without perindopril, in persons 80 yr of age or older reduces death from stroke, death from any cause, and the incidence of heart failure.

### Etiology of Malnutrition in the Elderly

#### MEALS ON WHEELS

##### Medications

Emotional problems

Anorexia

Late-life paranoia

Swallowing disorders

Oral problems

Nosocomial infections

Wandering/dementia related activity

Hyperthyroid/Hypercalcemia/Hypoadrenalism

Enteric disorders

Eating problems

Low-salt/Low-fat diet

Stones

### Remember to Calculate BMI

BMI outside 22-27 kg/m<sup>2</sup> is a health risk

- functional disability: impaired ADLs and IADLs
- social factors: economic barriers, dental problems and living situation (e.g. living alone)
- constitutional symptoms (e.g. recent weight loss)
- physical exam
  - BMI <23.5 in males, <22 in females should raise concern
  - temporal wasting, muscle wasting, presence of triceps skin fold
  - assess cognition

### Investigations

- CBC, electrolytes,  $\text{Ca}^{2+}$ ,  $\text{Mg}^{2+}$ ,  $\text{PO}_4^{3-}$ , creatinine, LFTs (albumin, INR, bilirubin),  $\text{B}_{12}$ , folate, TSH, transferrin, lipid profile, urinalysis, ESR, CXR

### Treatment

- direct treatment at underlying causes
- dietary modification: high calorie foods, oral nutritional supplementation

#### Calculating Basic Caloric and Fluid Requirements

WHO daily energy estimates for adults > 60 yr:

**Female:**  $10.5 \times (\text{weight in kg}) + 596$

**Male:**  $13.5 \times (\text{weight in kg}) + 487$

Maintenance fluid requirements for the elderly without cardiac or renal disease: 1500-2500 cc/24 h

- see [Endocrinology, E40](#)

## Presbycusis

- see [Otolaryngology, OT19](#)

#### Risk Assessment and Prevention of Pressure Ulcers

*Ann Intern Med* 2015;162:359-369

The American College of Physicians (ACP) strongly recommends advanced static mattresses or advanced static overlays for patients who are at an increased risk of developing pressure ulcers. The ACP also recommends against using alternating air-mattresses or alternating-air overlays.

#### Pressure-Reducing Devices

Static devices distribute pressure over a greater surface area. Dynamic devices use alternating air currents to shift pressure to different body sites

## Osteoporosis

## Pressure Ulcers

- see [Plastic Surgery, PL16](#)

### Risk Factors

- extrinsic factors: friction, pressure, shear force
- intrinsic factors: immobility, malnutrition, moisture, sensory loss

**Table 6. Classification of Pressure Ulcers**

<b>Stage I</b>	Changes include skin temperature, tissue consistency or sensation An area of persistent erythema in lightly pigmented, intact skin; in darker skin, it may appear red, blue or purple
<b>Stage II</b>	Partial thickness skin loss involving the epidermis, dermis or both The ulcer is superficial and presents as an abrasion, blister or shallow crater
<b>Stage III</b>	Full thickness skin loss involving damage or necrosis of subcutaneous tissue which may extend down to, but not through, underlying fascia Presents as a deep crater with or without undermining of adjacent tissue
<b>Stage IV</b>	Full thickness skin loss with extensive destruction, tissue necrosis or damage to muscle, bone or supporting structures May have associated undermining and/or sinus tracts

### Prevention

- pressure reduction
  - frequent repositioning
  - pressure-reducing devices (static, dynamic)
- maintaining nutrition, encouraging mobility and managing incontinence

### Treatment

- optimize nutritional status
- minimize pressure on wound
- analgesia
- wound debridement (mechanical, enzymatic, autolytic) and dressing application
- maintain moist wound environment to enable re-epithelialization
- treatment of wound infections (topical gentamicin, silver sulfadiazine, mupirocin)
- swab wounds not demonstrating clinical improvement for C&S; biopsy chronic wounds to rule out malignancy
- stage IV ulcers typically warrant surgical debridement
- consider other treatment options
  - negative pressure wound therapy/vacuum-assisted closure (VAC)
  - biological agents: application of fibroblast growth factor, platelet-derived growth factor to wound
  - non-contact normothermic wound therapy
  - electrotherapy

# Driving Competency

## Reporting Requirements

- physician-reporting to the Ministry of Transportation is mandatory in all provinces and territories except in Quebec, Nova Scotia, and Alberta, where it is discretionary
- not an issue unique to geriatrics – any patient may suffer from a medical condition that impairs their ability to drive should be reported
- in the U.S., varies by state

### Simplified Functional Approach to Driving Assessment

1. Unimpaired vision
2. Adequate cognition
3. Ability to maintain consciousness
4. Physical mobility (e.g. mobility of arms/legs/neck)

## Conditions that may Impair Driving

Table 7. Conditions that Impair Driving

<b>Alcohol</b>	<p>Patients with history of impaired driving and those with high probability of future impaired driving should not drive until further assessed</p> <p>Alcohol dependence or abuse: if suspected, should be advised not to drive</p> <p>Alcohol withdrawal seizure: must complete a rehabilitation program and remain abstinent and seizure-free for 6 mo before driving</p>
<b>Blood Pressure Abnormalities</b>	<p>Hypertension: sustained BP &gt;170/110 should be evaluated carefully</p> <p>Hypotension: if syncopal, discontinue until attacks are treated and preventable</p>
<b>Cardiovascular Disease</b>	<p>Suspected asymptomatic CAD or stable angina: no restrictions</p> <p>STEMI, NSTEMI with significant LV damage, coronary artery bypass surgery: no driving for one mo following hospital discharge</p> <p>NSTEMI with minor LV damage, unstable angina: no driving for 48 h if percutaneous coronary intervention (PCI) performed or 7 d if no PCI performed</p>
<b>Cerebrovascular Conditions</b>	<p>TIA: should not be allowed to drive until a medical assessment is completed</p> <p>Stroke: should not drive for at least one mo; may resume driving if functionally able; no clinically significant motor, cognitive, perceptual or vision deficits; no obvious risk of sudden recurrence; underlying cause appropriately treated; no post-stroke seizure</p>
<b>COPD</b>	<p>Mild/moderate impairment: no restrictions</p> <p>Moderate or severe impairment requiring supplemental oxygen: road test with supplemental oxygen</p>
<b>Cognitive Impairment/ Dementia</b>	<p>Moderate to severe dementia is a contraindication to driving; defined as the "inability to independently perform 2 or more IADLs or any basic ADL"</p> <p>Patients with mild dementia should be assessed; if indicated, refer to specialized driving testing centre; if deemed fit to drive, re-evaluate patient every 6-12 mo</p> <p>Poor performance on MMSE, clock drawing or Trails B suggests a need to investigate driving ability further</p> <p>MMSE score alone (whether normal or low) is insufficient to determine fitness to drive</p>
<b>Diabetes</b>	<p>Diet controlled or oral hypoglycemic agents: no restrictions in absence of diabetes complications that may impair ability to drive (e.g. retinopathy, nephropathy, neuropathy, cardiovascular or cerebrovascular disease)</p> <p>Insulin use: may drive if no complications (as above) and no severe hypoglycemic episode in the last 6 mo</p>
<b>Drugs</b>	<p>Be aware of: analgesics, anticholinergics, anticonvulsants, antidepressants, antipsychotics, opiates, sedatives, stimulants</p> <p>Degree of impairment varies: patients should be warned of the medication/withdrawal effect on driving</p>
<b>Hearing Loss</b>	<p>Effect of impaired hearing on ability to drive safely is controversial</p> <p>Acute labyrinthitis, positional vertigo with horizontal head movement, recurrent vertigo: advise not to drive until condition resolves</p>
<b>Musculoskeletal Disorders</b>	<p>Physician's role is to report etiology, prognosis and extent of disability (pain, range of motion, coordination, muscle strength)</p>
<b>Post-Operative</b>	<p>Outpatient, conscious sedation: no driving for 24 h</p> <p>Outpatient, general anesthesia: no driving for ≥24 h</p>
<b>Seizures</b>	<p>First, single, unprovoked: no driving for 3 mo until complete neurologic assessment, EEG, CT head</p> <p>Epilepsy: can drive if seizure-free on medication and physician has insight into patient compliance</p>
<b>Sleep Disorders</b>	<p>If patient is believed to be at risk due to a symptomatic sleep disorder but refuses investigation with a sleep study or refuses appropriate treatment, the patient should not drive</p>
<b>Visual Impairment</b>	<p>Visual acuity: contraindicated to drive if &lt;20/50 with both eyes examined simultaneously</p> <p>Visual field: contraindicated to drive if &lt;120° along horizontal meridian and 15° continuous above and below fixation with both eyes examined simultaneously</p>

N.B. guidelines included refer specifically to private driving; please see CMA guidelines for commercial driving

### Key Factors to Consider in Older Drivers

#### SAFEDRIVE

#### Safety record

Attention (e.g. concentration lapses, episodes of disorientation)

#### Family observations

#### Ethanol abuse

#### Drugs

#### Reaction time

#### Intellectual impairment

#### Vision/Visuospatial function

Executive functions (e.g. planning, decision-making, self-monitoring behaviours)

Geriatrics 1996;51:36-45

### Systematic Review of Driving Risk and the Efficacy of Compensatory Strategies in Persons with Dementia

*J Am Geriatr Soc* 2007;55:878-884

**Purpose:** To determine whether persons with dementia are at greater driving risk and, if so, to estimate the magnitude of this risk and determine whether there are efficacious methods to compensate for or accommodate it.

**Study Selection:** Systematic review of the case-control studies of drivers with a diagnosis of dementia.

**Results:** Drivers with dementia universally exhibited poorer performance on road tests and simulator evaluations. The one study that used an objective measure of motor vehicle crashes found that the crash risk in persons with dementia was 2-2.5 times greater than matched controls. No studies were found that examined the efficacy of methods to compensate for or accommodate the decreased driving performance.

**Conclusions:** Drivers with dementia are poorer drivers than cognitively normal drivers, but studies have not consistently demonstrated higher crash rates. Clinicians and policy makers must take these findings into account when addressing issues pertinent to drivers with a diagnosis of dementia.

# Health Care Institutions

**Table 8. Classification of Health Care Services and Institutions**

Institution/Service	Description
<b>Community Support Services</b>	Health care services offered at home for those who can live independently at home or under the care of family members including professional health care services, personal care and support (ADL assistance), homemaking (IADL assistance), community support services (e.g. transportation, meal delivery, day programs, caregiver relief, security checks, etc.)
<b>Rehabilitation</b>	Health care services offered in an institution to optimize patients' function, independence and quality of life
<b>Residential</b>	Divided into short (<60-90 d/yr) and long (indefinite) stay
<b>a) Seniors Affordable Housing</b>	Seniors who live independently and manage their own care but prefer to live near other seniors; usually has accessibility features and rent is adjusted based on income
<b>b) Retirement/Nursing Home</b>	Residents are fairly independent and require minimal support with ADLs and IADLs; often privately owned
<b>c) Supportive Housing</b>	Residents require minimal to moderate assistance with daily activities while living independently; often rental units in an apartment and may offer some physiotherapy and rehabilitation services
<b>d) Long-term Care/Skilled Nursing Facility</b>	Around the clock nursing care and on-call physician coverage; often offers occupational therapy, physiotherapy, respiratory therapy, and rehabilitation services; may be used short-term for caregiver respite or for supportive patient care to regain strength and confidence after leaving the hospital
<b>e) Hospice</b>	Free-standing facility or designated floor in a hospital or nursing home for care of terminally ill patients and their families; focus is on quality of life and often requires prognosis $\leq$ 3 mo

- names of community health care institutions, types of facilities, and services offered vary between geographical locations
- factors to consider when seeking services/institutions include level of care required, support networks, duration of stay, and cost

## Palliative and End-of-Life Care

### Principles and Quality of Life

- support, educate, and treat both patient and family
- address physical, psychological, social and spiritual needs
- focus on symptom management and comfort measures
- offer therapeutic environment and bereavement support
- ensure maintenance of human dignity

### End-of-Life Care Discussions

#### When to Initiate End-of-Life Care Discussions

- recent hospitalization for serious illness
- severe progressive medical condition(s)
- death expected within 6-12 mo
- patient inquires about end-of-life care

#### Suggested Topics for Discussion

- goals of care (disease vs. symptom management)
- advance directives, power of attorney, public guardian and trustee
- treatment options and likelihood of success
- common medical interventions
  - mechanical ventilation
  - antibiotic therapy
  - feeding tubes
- resuscitation options and likelihood of success (Full Code vs. DNR status including preferences for CPR, intubation, ICU admission, artificial hydration)

### Power of Attorney

- see [Ethical, Legal, and Organizational Medicine, ELOM9](#)

#### Guidance on the Management of Pain in Older People

*Age and Aging* 2013; 42:1-57

The three most common sites of pain in older adults are the back, leg/knee and hip. Acetaminophen should be considered first-line treatment for the management of both acute and persistent pain, particularly that which is of musculoskeletal origin. NSAIDs should be prescribed with caution and co-prescribed with a PPI.

# Instructional Advance Directives

- see [Ethical, Legal, and Organizational Medicine, ELOM9](#)

## Symptom Management

### Assessment Tools

- **Edmonton Symptom Assessment System (ESAS):** a tool that asks patients to rate the intensity of symptoms from 0 to 10 and allows for tracking of the efficacy of interventions. Assesses: pain, tiredness, nausea, depression, anxiety, drowsiness, appetite, well-being, shortness of breath, and “other problems”
- **Palliative Performance Scale (PPS):** a tool that uses functional status to predict survival in terminally ill patients. Assesses 5 components: ambulation, activity and evidence of disease, self-care, intake and conscious level

Source: *J Palliat Care* 1991;7:6-9 and *Victoria Hospice Society* 2006;120-121

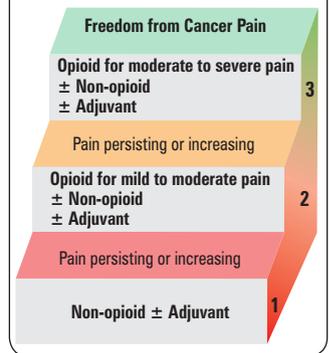

**Table 9. Management of Common End-of-Life Symptoms**

Symptom	Non-Pharmacologic Management	Pharmacologic Management
<b>Constipation</b>	Rule out obstruction, impaction, anorectal disease; hydration and high fibre intake; increase mobility	Stop unnecessary opioids and medications with anticholinergic side effects; provide stool softener (e.g. docusate sodium), increase peristalsis (e.g. senna), alter water and electrolyte secretion (e.g. magnesium hydroxide, lactulose, peg3350)
<b>Death Rattle/ Increased Pulmonary Secretions</b>	Oral suctioning Discontinue unnecessary IV solutions	Scopolamine SC or transdermal
<b>Dry mouth</b>	Oral hygiene q2h, ice cubes, sugarless gum	Artificial saliva substitutes, bethanechol, pilocarpine 1% solution as mouth rinse
<b>Dysphagia</b>	Frequent small feeds, ideally seated, keep head of bed elevated for 30 min after eating, suction as necessary	Treat painful mucositis (diphenhydramine: lidocaine: Maalox® in a 1:2:8 mixture), candidiasis (fluconazole)
<b>Dyspnea</b>	Elevate head of bed, eliminate allergens, open window/use fan	Oxygen, bronchodilators, opioids (e.g. morphine, hydromorphone)
<b>Hiccups</b>	Dry sugar, breathing in paper bag	Chlorpromazine, haloperidol, metoclopramide, baclofen, marijuana
<b>Nausea and Vomiting</b>	Frequent and small meals, avoid offensive strong odours, treat constipation if present	Raised ICP: dexamethasone  Anticipatory nausea, anxiety: lorazepam Vestibular disease, vertigo: dimenhydrinate  Drug induced, hepatic or renal failure: prochlorperazine, haloperidol GERD: PPI or H2 antagonist Gastric stasis: metoclopramide Bowel obstruction: metoclopramide, dexamethasone, octreotide
<b>Pain</b>	Hot and cold compresses, music therapy, relaxation techniques, individualized program of physical activity designed to improve flexibility, strength and endurance, and cognitive behavioural therapy (CBT)	Nociceptive pain: non-opioids (NSAIDs, acetaminophen), weak opioids (codeine, hydrocodone, oxycodone), strong opioids (morphine, hydromorphone, oxycodone, fentanyl)  Neuropathic pain: anticonvulsants (gabapentin, pregabalin), antidepressants (TCAs, SSRIs), steroids (dexamethasone) Bony pain: non-opioids, weak opioids, bisphosphonates, radiation therapy
<b>Pruritus</b>	Bathing with tepid water, avoid soap, bath oils; sodium bicarbonate for jaundice	Antihistamines, phenothiazines, topical corticosteroids, calamine lotion
<b>Weakness</b>	Modify environment and activities to decrease energy expenditure	Treat insomnia, anemia, depression; consider psychostimulants

Source: *J Am Geriatr Soc* 2002;50:S205-S224 and *On Continuing Practice* 1993;20:20-25 and *Am Fam Physician* 2009;79(12):1059-1065

### WHO's Pain Relief Ladder

### Death Rattle

Noise caused by the oscillatory movement of mucous secretions in the upper airway with inspiration and expiration

### Opioid Equivalent Doses (to 10 mg of IV morphine)

Opioid	SC/IV dose	PO dose
Morphine	10 mg	20-30 mg
Codeine	Not recommended	180-240 mg
Oxycodone	Not recommended	10-15 mg
Hydromorphone	2 mg	4-6 mg

Fentanyl transdermal 25 µg/h = morphine 90 mg PO/24 h, however fentanyl takes 12-16 h to reach steady state  
N.B. Dosing may need to be adjusted in the older adult population

### Nociceptive Pain

Somatic: localized to bone/skin/joint/muscle; gnawing, dull pain  
Visceral: not well localized; crampy pain, pressure

### Neuropathic Pain

Burning, shooting, radiating pain; localized to dermatomal regions

Serum creatinine does not reflect creatinine clearance in the elderly

Instead, use:  
CrCl = (weight in kg)(140 - age)(1.23) / (mL/min) (serum creatinine in µmol/L)

Multiply by 0.85 for females

# Geriatric Pharmacology

## Pharmacokinetics

Table 10. Age-Associated Pharmacokinetics

Parameter	Age Effect	Implications
<b>Absorption</b> (less significant)	Increased gastric pH	Drug-drug and drug-food interactions are more likely to affect absorption
	Decreased splanchnic blood flow, GI absorptive surface and dermal vascularity; delayed gastric emptying	
<b>Distribution</b>	Increased total body fat and $\alpha$ 1-glycoprotein	Lipophilic drugs have a larger volume of distribution
	Decreased lean body mass, total body water, and albumin	Decreased binding of acidic drugs, increased binding of basic drugs
<b>Metabolism</b> (less significant)	Decreased hepatic mass and hepatic blood flow; impaired phase I reactions (oxidative system)	Lower doses may be therapeutic
<b>Elimination</b>	Decreased renal blood flow, GFR, tubular secretion and renal mass	For every x% reduction in clearance, decrease the dose by x% and increase the interval by x%

## Pharmacodynamics

### Drug Sensitivity

- changes in pharmacokinetics as well as intrinsic sensitivity lead to altered drug responses
- increased sensitivity to warfarin, sedatives, antipsychotics, digoxin and narcotics
- decreased sensitivity to  $\beta$ -blockers in majority of elderly patients, though some may have increased sensitivity

### Decreased Homeostasis

- poorer compensatory mechanisms leading to more adverse reactions (e.g. bleeding with NSAIDs/ anticoagulants, altered mental status with anticholinergic/sympathomimetic/anti-Parkinsonian drugs)

## Polypharmacy

### Definition

- prescription, administration or use of five or more medications at the same time

### Epidemiology

- in Canada, > 60% of elderly individuals reported using  $\geq 5$  medications
- hospitalized elderly are given an average of 10 medications during admission

### Risk Factors for Non-Compliance

- risk of non-compliance correlates with medication factors, not age
  - number of medications: compliance with 1 medication is 80%, but drops to 25% with  $\geq 6$  medications
- increased dosing frequency, complicated container design, financial constraints, and cognitive impairment

### Adverse Drug Reactions (ADRs)

- any noxious or unintended response to a drug that occurs at doses used for prophylaxis or therapy
- risk factors in the elderly
  - intrinsic: comorbidities, age-related changes in pharmacokinetics and pharmacodynamics
  - extrinsic: number of medications, multiple prescribers, unreliable drug history
- 90% of ADRs are from: ASA, analgesics, anticoagulants, antimicrobials, antineoplastics, digoxin, diuretics, hypoglycemics, and steroids

### Preventing Polypharmacy

- consider drug: safer side effect profiles, convenient dosing schedules, convenient route, efficacy
- consider patient: other medications, clinical indications, medical comorbidities
- consider patient-drug interaction risk factors for ADRs
- review drug list regularly to eliminate medications with no clinical indication or with evidence of toxicity
- avoid treating an ADR with another medication

### Benzodiazepines of Choice in the Elderly

#### LOT

Lorazepam  
Oxazepam  
Temazepam

N.B. benzodiazepines are generally avoided in the elderly

### Approach to Medication Review in the Elderly

#### NO TEARS

Need and indication

Open-ended questions (to get patient's perspective on medications)

Tests and monitoring (to assess disease control)

Evidence and guidelines

Adverse events

Risk reduction (of adverse events such as falls)

Simplification/switches

New medications: Start Low, Go Slow!

Adverse drug reactions in the elderly may present as delirium, falls, fractures, urinary incontinence/retention or fecal incontinence/impaction

### Principles for Prescribing in the Elderly

#### CARED

Caution/Compliance

Age (adjust dosage for age)

Review regimen regularly

Educate

Discontinue unnecessary medications

Geriatric Pearls. Philadelphia: FA Davis Company, 1999

## Inappropriate Prescribing in the Elderly

### Epidemiology

- the estimated prevalence of potentially inappropriate prescribing ranges from 12-40%

### Beers Criteria

- a list of medications to avoid in adults 65 yr and older due to safety concerns
- examples include long-acting benzodiazepines, strong anticholinergics, high-dose sedatives
- the elderly are also often under-treated (ACEI, ASA,  $\beta$ -blockers, thrombolytics, warfarin)

#### Beers Criteria

For full list of medications, consult the following reference:  
The American Geriatrics Society 2012 Beers Criteria Update Expert Panel  
*J Am Geriatr Soc* 2012;60(4):616-31  
<http://www.americangeriatrics.org>

## Common Medications

Table 11. Common Medications

Drug Name	Brand Name	Dosing Schedule	Indications	Contraindications	Side Effects	Mechanism of Action
<b>Cognitive Enhancers</b>						
donepezil	Aricept®	5-10 mg PO daily	Moderate to severe dementia of Alzheimer's type	Known hypersensitivity, caution in pulmonary disease, sick sinus syndrome, seizure disorder	N/V, diarrhea, anorexia, falls, hip fracture, increase need for pacemaker insertion	Reversible inhibition of acetylcholinesterase
galantamine	Reminyl®	8-12 mg PO bid	Mild to moderate dementia of Alzheimer's type	Known hypersensitivity, caution in sick sinus syndrome, seizure disorder, pulmonary disease, low body weight	N/V, diarrhea, anorexia, falls, hip fracture, increase need for pacemaker insertion	Reversible inhibition of acetylcholinesterase
rivastigmine	Exelon®	1.5 mg PO daily (starting) up to 6 mg PO bid	Mild to moderate dementia of Alzheimer's type	Known hypersensitivity, severe hepatic disease, caution in sick sinus syndrome, pulmonary disease, seizure disorder	N/V, diarrhea, anorexia, falls, hip fracture, increase need for pacemaker insertion	Acetylcholinesterase inhibition (reversible but very slow)
memantine	Ebixa®/Namenda® (Can)/(U.S.)	5 mg PO daily (starting) up to 10 mg PO bid	Mild to moderate dementia of Alzheimer's type	Known hypersensitivity, conditions that alkalize urine, caution in cardiovascular conditions	Agitation, fatigue, dizziness, headache, hypertension, constipation	NMDA-receptor antagonist
<b>Laxatives</b>						
bran	All-Bran®	1 cup/d	Constipation		Bloating, flatus	Bulk-forming laxative
psyllium	Metamucil® Prodiem Plain®	1 tsp PO tid	Constipation, hypercholesterolemia	N/V, abdominal pain, obstruction	Bloating, flatus	Bulk-forming laxative
lactulose	Chronulac® Cephulac® Kristalose®	15-30 cc PO daily/bid	Constipation, hepatic encephalopathy, bowel evacuation following barium exam	Patients on low galactose diets Abdominal pain, N/V	Flatus, cramps, nausea, diarrhea	Hyperosmolar agent, lowers pH of colon to decrease blood ammonia levels
senna	Senokot®/Ex-lax® Glyssennid®	1-2 tabs PO daily or 10-15 cc syrup PO daily	Constipation	Abdominal pain, N/V	Cramps, griping, dependence	Stimulant laxative
bisacodyl	Dulcolax®	5-15 mg PO (10 mg PR)	Constipation	Ileus, obstruction, abdominal pain, N/V, severe dehydration	Cramps, pain, diarrhea	Stimulant laxative
<b>Parkinsonian Agents – see Neurology, N32</b>						
<b>Sleeping Medications</b>						
zopiclone	Imovane®	3.75 mg PO qhs (initially)	Insomnia	Known hypersensitivity, caution in myasthenia gravis, severe hepatic disease Geriatrics: dose reduction (dose-related adverse events)	Bitter taste, palpitations, vomiting, anorexia, sialorrhea, confusion, agitation, anxiety, tremor, sweating, cognitive impairment, falls	Short-acting hypnotic (no tolerance effects)
temazepam	Restoril®	15 mg PO qhs	Short-term management of insomnia	Known hypersensitivity, myasthenia gravis, sleep apnea Geriatrics: dose reduction recommended	Drowsiness, dizziness, impaired coordination, hangover, lethargy, dependence, cognitive impairment, falls	Benzodiazepine: generalized CNS depression mediated by GABA
lorazepam	Ativan®	0.5 mg PO qhs (initially)	Anxiety, insomnia	Known hypersensitivity, myasthenia gravis, narrow-angle glaucoma Geriatrics: dose reduction recommended	Dizziness, drowsiness, lethargy, dependence, cognitive impairment, falls	Benzodiazepine: generalized CNS depression mediated by GABA
melatonin	Good Neighbor Pharmacy Melatonin, Nature's Blend Melatonin	Immediate release 5mg PO qhs (initially), or extended release 2mg PO qhs	Insomnia	Known hypersensitivity, concurrent immunosuppressive treatment	Hypothermia, sedation, somnolence, fatigue	Mimics hormone produced by pineal gland, regulates sleep cycle

Note: Docusate has been shown to be ineffective for the prevention/treatment of constipation in the elderly

## Landmark Geriatric Trials

Trial	Reference	Results
Optimal management of urinary tract infections in older people	<i>Clin Interv Aging</i> 2011; 6:173-180	UTIs are over diagnosed and over treated in older people. Asymptomatic bacteriuria is very common in later life and should not be screened for or treated
Delirium is a strong risk factor for dementia in the oldest-old: a population-based cohort study	<i>Brain</i> 2012; 135(9): 2809-16	First population study to show that delirium is a strong risk factor for dementia and cognitive decline in elderly patients
Donepezil and Memantine for Moderate-to-Severe Alzheimer's Disease	<i>NEJM</i> 2012; 366:893-903	Continued treatment with donepezil was associated with cognitive benefits over the course of 12 mo in patients with moderate or severe Alzheimer's disease
Early palliative care for metastatic lung cancer	<i>NEJM</i> 2010; 363:733-742	Among patients with metastatic non-small-cell lung cancer, early palliative care led to significant improvements in both quality of life and mood. As compared with patients receiving standard care, patients receiving early palliative care had less aggressive care at the end-of-life but longer survival
Hip protectors for fracture prevention	<i>NEJM</i> 2000; 343:1506-1513	The risk of hip fracture can be reduced in frail elderly adults by the use of an anatomically designed external hip protector
HYVET	<i>NEJM</i> 2008; 358:1887-1898	Antihypertensive treatment with indapamide (sustained release), with or without perindopril, in adults 80 yr or older is beneficial
PROFET	<i>Lancet</i> 1999; 353:93-97	Demonstrates that an interdisciplinary approach to elderly adults with a previous history of falls can significantly decrease the risk of further falls and limit functional impairment
Yale Delirium Prevention Trial	<i>NEJM</i> 1999; 340:669-676	A risk-factor intervention strategy can result in significant reductions in the number and duration of episodes of delirium in hospitalized older patients

## Acronyms

β-hCG	beta-human chorionic gonadotropin	GIFT	gamete intrafallopian transfer	JRA	juvenile rheumatoid arthritis	RPR	rapid plasma reagin
AFP	alpha-fetoprotein	GnRH	gonadotropin-releasing hormone	LDH	lactate dehydrogenase	SCC	squamous cell carcinoma
AIS	androgen insensitivity syndrome	GTD	gestational trophoblastic disease	LEEP	loop electrosurgical excision procedure	SERM/s	selective estrogen receptor modifiers
ASCUS	atypical squamous cells of undetermined significance	GTN	gestational trophoblastic neoplasia	LH	luteinizing hormone	SHBG	sex hormone binding globulin
AUB	abnormal uterine bleeding	HERS	heart and estrogen/progestin replacement study	LHRH	luteinizing hormone releasing hormone	SHG	sonohysterography
BMI	body mass index	HMG	human menopausal gonadotropin	LMP	last menstrual period	SSRI	selective serotonin reuptake inhibitors
BSO	bilateral salpingo-oophorectomy	HPO	hypothalamic-pituitary-ovarian	LN	lymph node	STI	sexually transmitted infections
BV	bacterial vaginosis	HPV	human papillomavirus	LNMP	last normal menstrual period	TAH	total abdominal hysterectomy
CAH	congenital adrenal hyperplasia	HRT	hormone replacement therapy	LSIL	low grade squamous intraepithelial lesion	TET	tubal embryo transfer
CMV	cytomegalovirus	HSG	hysterosalpingography	LVSI	lymphovascular space involvement	TH	total hysterectomy
D&C	dilatation and curettage	HSIL	high grade squamous intraepithelial lesion	MRKH	Mayer-Rokitansky-Küster-Hauser	TOT	tension-free obturator tape
DES	diethylstilbestrol	HSV	herpes simplex virus	NK	natural killer	TSH	thyroid stimulating hormone
DHEA	dihydroepiandrosterone	IBD	inflammatory bowel disease	OC	oral contraceptive pill	TVT	tension-free vaginal tape
DMPA	depo -medroxyprogesterone acetate or Depo-Provera®	ICSI	intracytoplasmic sperm injection	OGTT	oral glucose tolerance test	TZ	transformation zone
DUB	dysfunctional uterine bleeding	ITP	immune thrombocytopenic purpura	PCOS	polycystic ovarian syndrome	VDRL	venereal disease research laboratory
DVT	deep venous thrombosis	IUD	intrauterine device	PCR	polymerase chain reaction	VIN	vulvar intraepithelial neoplasia
EPC	emergency postcoital contraception	IUI	intrauterine insemination	PG	prostaglandin	VTE	venous thromboembolism
FSH	follicle stimulating hormone	IVF	in vitro fertilization	PID	pelvic inflammatory disease	vWD	von Willebrand's disease
GA	gestational age	IVDU	intravenous drug use	PMDD	premenstrual dysphoric disorder	W/D	withdrawal
		IVF	in vitro fertilization	PMN	polymorphonuclear neutrophils	WHI	Women's Health Initiative
		IVM	in vitro maturation	PMS	premenstrual syndrome	ZIFT	zygote intrafallopian transfer

## Basic Anatomy Review

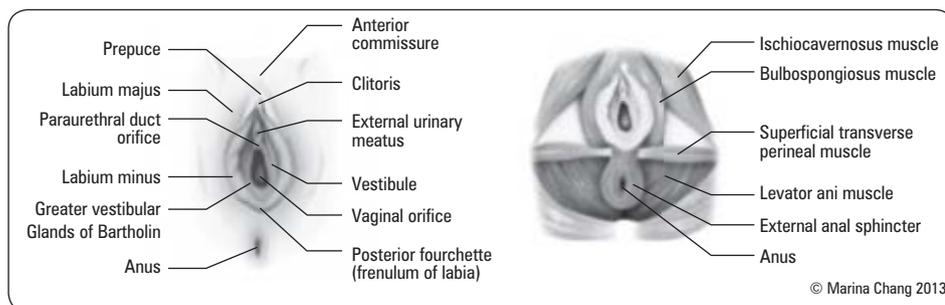

Figure 1. Vulva and perineum

### A. EXTERNAL GENITALIA

- referred to collectively as the vulva
- blood supply: internal pudendal artery
- sensory innervation: pudendal nerve
- lymphatic drainage: inguinal nodes

### B. VAGINA

- muscular canal extending from cervix to vulva, anterior to rectum and posterior to bladder
- lined by rugated, stratified-squamous epithelium
- upper vagina separated by cervix into anterior, posterior, and lateral fornices
- blood supply: vaginal branch of internal pudendal artery with anastomoses from uterine, inferior vesical, and middle rectal arteries

### C. UTERUS

- thick walled, muscular organ between bladder and rectum, consisting of two major parts:
  - uterine corpus
    - ♦ blood supply: uterine artery (branch of the internal iliac artery)
  - cervix
    - ♦ blood supply: cervical branch of uterine artery
- supported by the pelvic diaphragm, the pelvic organs, and 4 paired sets of ligaments
  - round ligaments: travel from anterior surface of uterus, through broad ligaments, and inguinal canals then terminate in the labia majora
    - ♦ function: anteversion
    - ♦ blood supply: Sampson's artery (branch of uterine artery running through round ligament)
  - uterosacral ligaments: arise from sacral fascia and insert into posterior inferior uterus
    - ♦ function: mechanical support for uterus and contain autonomic nerve fibres
  - cardinal ligaments: extend from lateral pelvic walls and insert into lateral cervix and vagina
    - ♦ function: mechanical support, prevent prolapse
  - broad ligaments: pass from lateral pelvic wall to sides of uterus; contain fallopian tube, round ligament, ovarian ligament, nerves, vessels, and lymphatics
- infundibulopelvic ligament: continuous tissue that connects ovary to pelvic wall
  - contains the ovarian artery, ovarian vein, ovarian plexus, and lymphatic vessels
- position of the uterus
  - anteverted (majority), retroverted, neutral

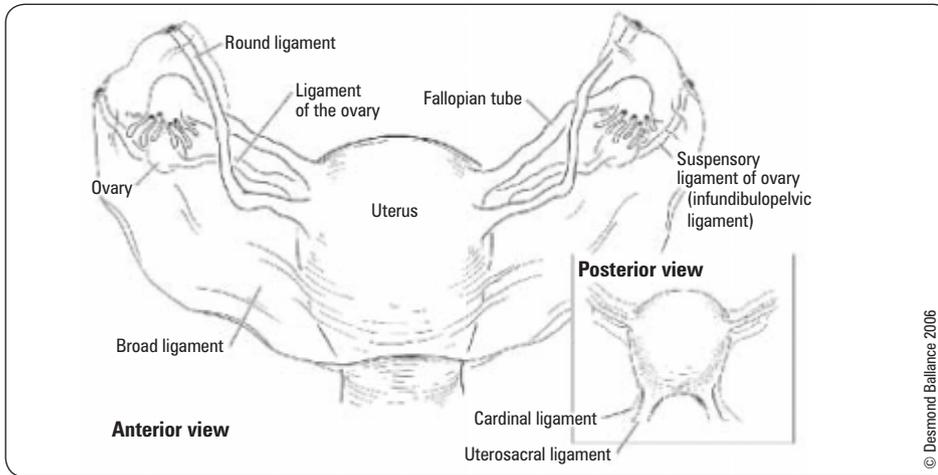

Figure 2. External genital organs

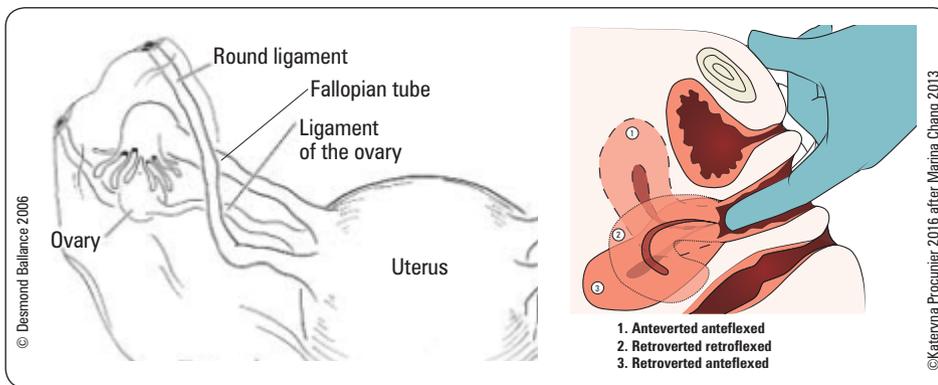

Figure 3. Positioning of uterus

**D. FALLOPIAN TUBES**

- 8-14 cm muscular tubes extending laterally from the uterus to ovary
- interstitial, isthmic, ampullary, and infundibular segments; terminates at fimbriae
- mesosalpinx: peritoneal fold that attaches fallopian tube to broad ligament
- blood supply: uterine and ovarian arteries

**E. OVARIES**

- consist of cortex with ova and medulla with blood supply
- supported by infundibulopelvic ligament (suspensory ligament of ovary)
- mesovarium: peritoneal fold that attaches ovary to broad ligament
- blood supply: ovarian arteries (branches off aorta), left ovarian vein (drains into left renal vein), right ovarian vein (drains into inferior vena cava)

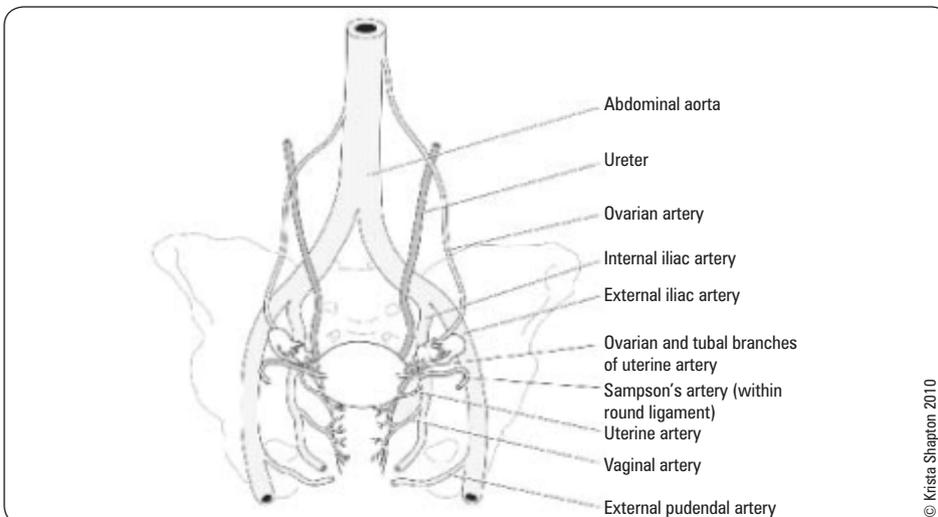

Figure 4. Vascular supply

**Determination of uterine position by clinical exam**

- If cervix faces anteriorly (under the urethra and less easily accessible), i.e. toward vaginal orifice, more likely **RETROVERTED UTERUS**
- If cervix faces posteriorly (easily accessible), i.e. toward sacrum or rectum, more likely **ANTEVERTED UTERUS**
- If uterus palpable on bimanual exam, more likely **ANTEVERTED UTERUS**

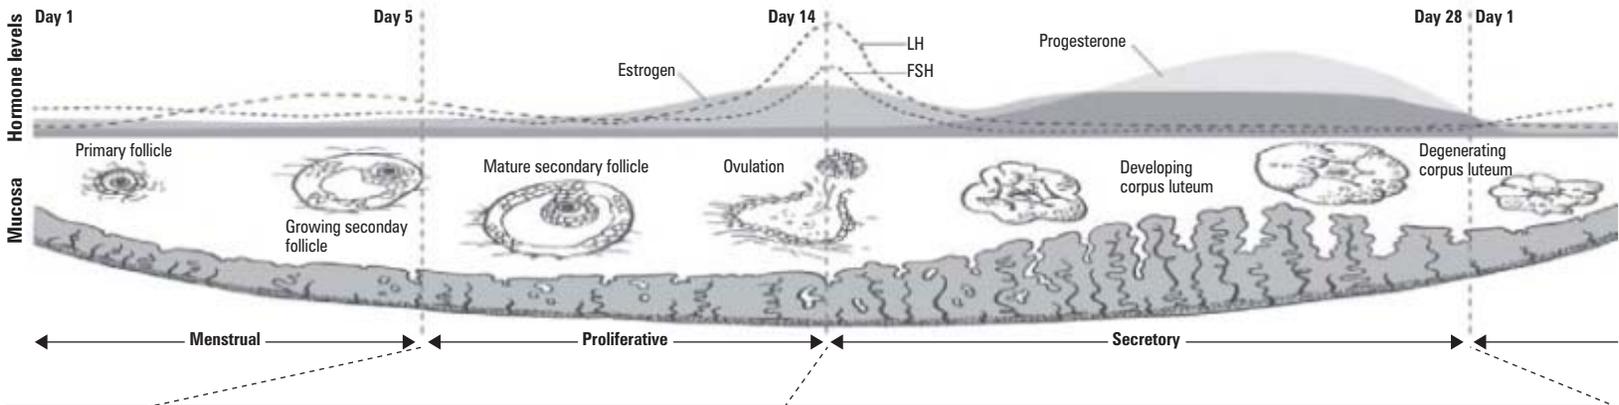

**"Water Under the Bridge"**

The ureters run posterior to the uterine arteries

# Menstruation

## Menstrual Cycle

© Tess Peters 2009 and Sonya Amin 2003

	FOLLICULAR/PROLIFERATIVE PHASE (Variable Duration)			LUTEAL/SECRETORY PHASE (Fixed Duration - 14 days)		
	Early	Mid	Late	OVULATION	Early-Mid	Late
<b>Initiating Events</b>	↓ E and ↓ P (from end of previous cycle)	↑ FSH acts on ovarian granulosa cells	Growing follicles continue to secrete E	Sudden switch from negative to positive feedback (E and P now ↑ FSH & LH)	Switch back to negative feedback	No fertilized oocyte
<b>HPO Axis</b>	↑ GnRH pulse frequency ↑ FSH ↑ LH pulse frequency	↑ E from follicles (ovary)		↑↑ LH pulse amplitude (LH surge)	↓ LH	
<b>Hormones</b>			↑ E from follicles, especially from dominant follicle	E peaks → LH surge → ovulation	↑ P from corpus luteum	↓ P secondary to degeneration of corpus luteum
<b>Feedback on HPO Axis</b>		Negative feedback E → ↓ FSH, ↓ LH		Positive feedback: E and P → ↑ FSH, ↑ LH	Negative feedback P → ↓ FSH, ↓ LH	
<b>Ovaries</b>	↑ FSH → follicular growth in 3-30 follicles	↑ follicular growth (by reducing atresia) → ↑ E	Dominant follicle persists, remainder undergo atresia Granulosa cells luteinize → produce P	~36 h after LH surge, dominant follicle releases oocyte; corpus luteum (remnant of dominant follicle) produces P		Cessation of P from corpus luteum
<b>Endometrium</b>	Menses from P withdrawal (from end of previous cycle)		E builds up endometrium		P stabilizes endometrium	Withdrawal of P → menses
<b>Cervical Mucus</b>		Cervical mucus: Clear, ↑ amount, Spinnbarkeit 8-10 cm, more stringy				Opaque, scant amount, Spinnbarkeit 1-2 cm

### CHARACTERISTICS

- Menarche 10-15 yr
- Average 12.2 yr
- Entire cycle 28 ± 7 d with bleeding for 1-6 d
- 25-80 mL blood loss per cycle

### ESTROGEN

ESTROGEN is the main hormone in the follicular/proliferative phase and is stimulated by FSH. As the level increases it acts negatively on FSH. The majority of estrogen is secreted by the dominant follicle

#### Estrogen effects

- On the follicles in the ovaries
  - Reduces atresia
- On the endometrium
  - Proliferation of glandular and stromal tissue
- On all target tissues
  - Decreases E receptors

### PROGESTERONE

PROGESTERONE is the main hormone in the luteal/secretory phase and is stimulated by LH. Increased progesterone acts negatively on LH and is secreted by the corpus luteum (remnant of dominant follicle)

#### Progesterone effects

- On the endometrium
  - Cessation of mitoses (stops building endometrium up)
  - "Organization" of glands (initiates secretions from glands)
  - Inhibits macrophages, interleukin-8, and enzymes from degrading endometrium
- On all target tissues
  - Decrease E receptors (the "anti-estrogen" effect)
  - Decrease P receptors

Figure 5. Events of the normal menstrual cycle  
E = estrogen; FSH = follicle-stimulating hormone; GnRH = gonadotropin-releasing hormone; HPO = hypothalamic-pituitary-ovarian; LH = luteinizing hormone; P = progesterone

## Stages of Puberty

- see [Pediatrics, P30](#)
- adrenarche: increase in secretion of adrenal androgens; usually precedes gonadarche by 2 yr
- gonadarche: increased secretion of gonadal sex steroids; ~age 8 yr
- thelarche: breast development
- pubarche: pubic and axillary hair development
- menarche: onset of menses, usually following peak height velocity and/or 2 yr following breast budding

### Stages of Puberty

#### "Boobs, Pubes, Grow, Flow"

Thelarche, Pubarche, Growth spurt, Menarche

### Tanner Stage

#### Thelarche

1. None
2. Breast bud
3. Further enlargement of areola and breasts with no separation of contours
4. 2<sup>o</sup> mound of areola and papilla
5. Areola recessed to general contour of breast – adult

#### Pubarche

1. None
2. Downy hair along labia only
3. Darker/coarse hair extends over pubis
4. Adult type covers smaller area, no thigh involvement
5. Adult hair in quantity and type; extends over thighs

### Premenstrual Syndrome

Physiological and emotional disturbances that occur 1-2 wk prior to menses and last until a few days after onset of menses; common symptoms include depression, irritability, tearfulness, and mood swings

## Premenstrual Syndrome

- synonyms: "ovarian cycle syndrome," "menstrual molimina" (moodiness)

### Etiology

- multifactorial: not completely understood; genetics likely play a role
- CNS-mediated neurotransmitter interactions with sex steroids (progesterone, estrogen, and testosterone)
- serotonergic dysregulation – currently most plausible theory

### Diagnostic Criteria for Premenstrual Syndrome

- at least one affective and one somatic symptom during the 5 d before menses in each of the three prior menstrual cycles
  - affective: depression, angry outbursts, irritability, anxiety, confusion, social withdrawal
  - somatic: breast tenderness, abdominal bloating, headache, swelling of extremities
- symptoms relieved within 4 d of onset of menses
- symptoms present in the absence of any pharmacologic therapy, drug or alcohol use
- symptoms occur reproducibly during 2 cycles of prospective recording
- patient suffers from identifiable dysfunction in social or economic performance

### Treatment

- goal: symptom relief
- psychological support
- medications
  - NSAIDs for discomfort and pain
  - spironolactone for fluid retention: used during luteal phase
  - SSRIs: used during luteal phase x 14 d or continuously
  - OCP: primarily beneficial for physical/somatic symptoms
  - danazol: an androgen that inhibits the pituitary-ovarian axis
  - GnRH agonists if PMS is severe and unresponsive to treatment (may use prior to considering definitive treatment with BSO)
- mind/body approaches
  - regular aerobic exercise
  - cognitive behavioural therapy
  - relaxation, light therapy biofeedback, and guided imagery
- herbal remedies (variable evidence)
  - black cohosh, kava, ginkgo, agnus castus fruit extract
- BSO if symptoms severe

## Premenstrual Dysphoric Disorder

### Clinical Presentation

- irritability, depressed mood
- breast pain and bloating

### Diagnostic Criteria for Premenstrual Dysphoric Disorder

- at least 5 of the following 11 symptoms during most menstrual cycles of the last year (with at least 1 of the first 4)
  - depressed mood or hopelessness
  - anxiety or tension
  - affective symptoms
  - anger or irritability
  - decreased interest in activities
  - difficulty concentrating
  - lethargy
  - change in appetite
  - hypersomnia or insomnia
  - feeling overwhelmed
  - physical symptoms: breast tenderness/swelling, headaches, joint/muscle pain, bloating, or weight gain
- symptoms interfere with social or occupational functioning
- symptoms must be discretely related to the menstrual cycle
- 1, 2 and 3 must be confirmed during at least 2 consecutive symptomatic menstrual cycles

## Differential Diagnoses of Common Presentations

### Abnormal Uterine Bleeding

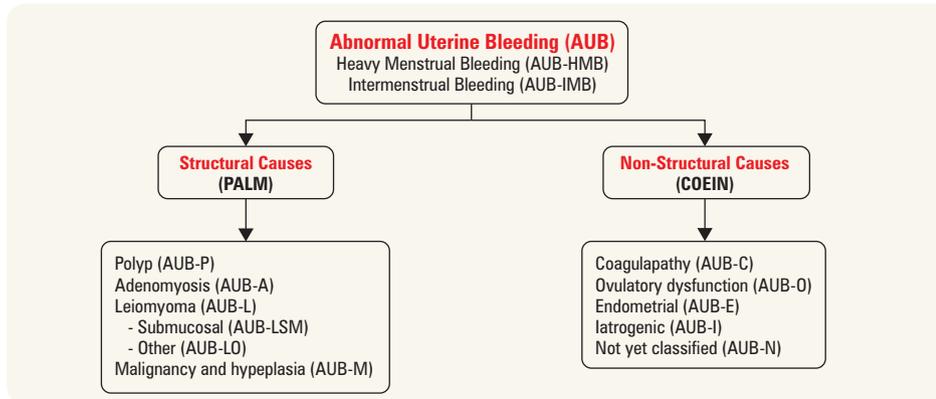

Figure 6. Differential diagnosis of abnormal uterine bleeding

- see *Disorders of Menstruation, GY11*
- menstrual bleeding should be evaluated by ascertaining: frequency/regularity of menses, duration, volume of flow, affects on quality of life and timing (inter or premenstrual or breakthrough)
- classified as
  - regular: cycle to cycle variability of <20 d
  - irregular: cycle to cycle variability of  $\geq 20$  d
  - heavy menstrual bleeding:  $\geq 80$  cc of blood loss per cycle or  $\geq 8$  d of bleeding per cycle or bleeding that significantly affects quality of life
  - postmenopausal bleeding: any bleeding that presents >1 yr after menopause; must rule out endometrial cancer

Postmenopausal bleeding is endometrial cancer until proven otherwise

### Dysmenorrhea

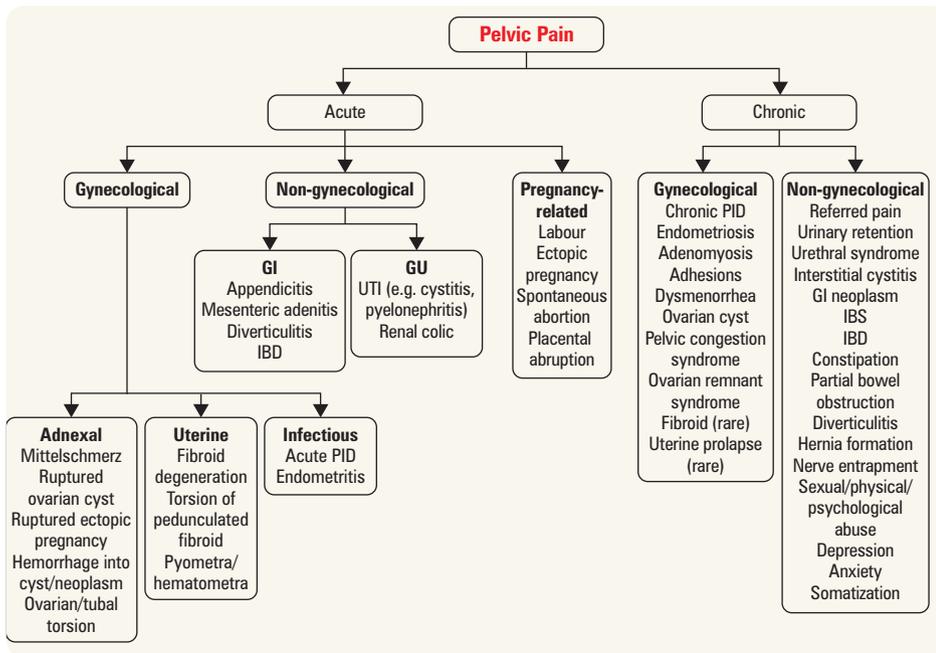

- see *Disorders of Menstruation, GY10*
- primary/idiopathic
- secondary (acquired)
  - endometriosis
  - adenomyosis
  - uterine polyps
  - uterine anomalies (e.g. non-communicating uterine horn)
  - leiomyoma
  - intrauterine synechiae
  - ovarian cysts
  - cervical stenosis
  - imperforate hymen, transverse vaginal septum
  - pelvic inflammatory disease
  - IUD (copper)
  - foreign body

### Pruritus

- see *Gynecological Infections, GY25*
- physiologic discharge and cervical mucus production
- non-physiologic
  - genital tract infection
  - vulvovaginitis: candidiasis, trichomoniasis, BV, polymicrobial superficial infection
  - chlamydia, gonorrhea
  - pyosalpinx, salpingitis
  - genital tract inflammation (non-infectious)
  - local: chemical irritants, douches, sprays, foreign body, trauma, atrophic vaginitis, desquamative inflammatory vaginitis, focal vulvitis
  - neoplasia: vulvar, vaginal, cervical, endometrial
  - systemic: toxic shock syndrome, Crohn's disease, collagen disease, dermatologic (e.g. lichen sclerosis)
  - IUD, OCP (secondary to progesterone)

# Pelvic Pain

20% of chronic pelvic pain patients have a history of previous sexual abuse/assault; remember to ask about it

**Pyometra**  
Pus within the uterine cavity  
**Hematometra**  
Blood within the uterine cavity  
**Hydrometra**  
Fluid within the uterine cavity  
**Hematocolpos**  
Blood within the vagina

Figure 7. Approach to pelvic pain

# Pelvic Mass

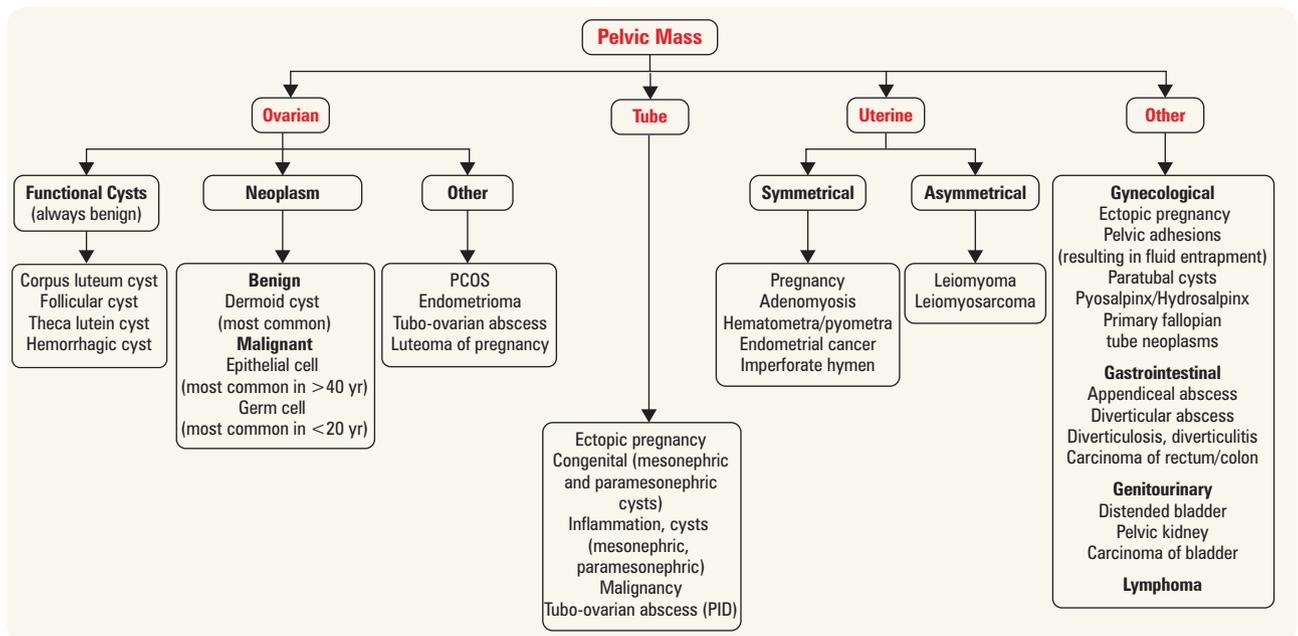

Figure 8. Differential diagnosis of pelvic mass

## Dyspareunia

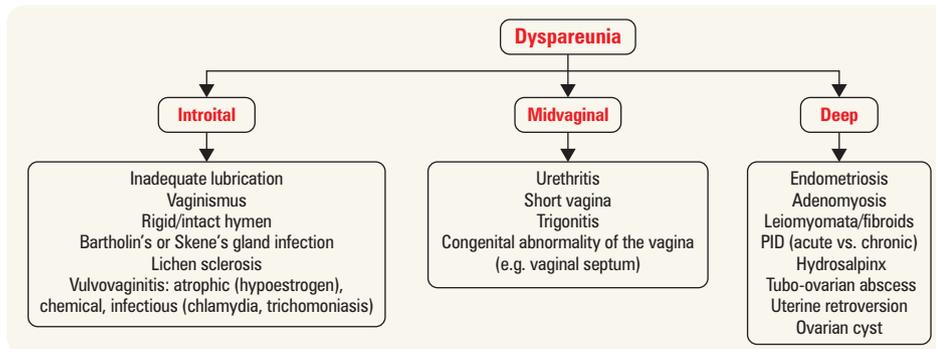

Figure 9. Approach to dyspareunia

## First and Second Trimester Bleeding

### Approach to the Patient with Bleeding in T1/T2

#### History

- risk factors for ectopic pregnancy (see *Ectopic Pregnancy, GY21*)
- previous spontaneous abortion
- recent trauma
- characteristics of the bleeding (including any tissue passed)
- characteristics of the pain (cramping pain suggests spontaneous abortion)
- history of coagulopathy
- gynecological/obstetric history
- fatigue, dizziness, syncopal episodes due to hypovolemia, fever (may be associated with septic abortion)

#### Physical

- vitals (including orthostatic changes)
- abdomen (symphysis fundal height, tenderness, presence of contractions)
- perineum (signs of trauma, genital lesions)
- speculum exam (cervical os open or closed, presence of active bleeding/clots/tissue)
- pelvic exam (uterine size, adnexal mass, uterine/adnexal tenderness)

#### Investigations

- $\beta$ -hCG (lower than expected for GA in spontaneous abortion, ectopic pregnancy)
- U/S (confirm intrauterine pregnancy and fetal viability)
- CBC
- group and screen

#### Treatment

- IV resuscitation for hemorrhagic shock
- treat the underlying cause

#### Bleeding in Pregnancy Definitions

- First trimester bleeding: vaginal bleeding within the first 12 wk
- Second trimester bleeding: 12-20 wk

#### Differential Diagnosis

- Physiologic bleeding: spotting, due to implantation of placenta – reassure and check serial  $\beta$ -hCGs
- Abortion (threatened, inevitable, incomplete, complete)
- Abnormal pregnancy (ectopic, molar) (see *Hydatidiform Mole, GY48*)
- Trauma (post-coital or after pelvic exam)
- Genital lesion (e.g. cervical polyp, neoplasms)

## Common Investigations and Procedures

### Imaging

#### Ultrasound (U/S)

- transabdominal or transvaginal U/S is the imaging modality of choice for pelvic structures
- transvaginal U/S provides better resolution of uterus and adnexal structures
  - detects early pregnancy if  $\beta$ -hCG  $\geq 1,500$  ( $\beta$ -hCG must be  $\geq 6,500$  for transabdominal U/S)
- may be used to identify pelvic pathology
  - identify ectopic pregnancy, intrauterine pregnancy
  - assess uterine, adnexal, cul-de-sac, ovarian masses (e.g. solid or cystic)
  - determine endometrial thickness, locate/characterize fibroids
  - monitor follicles during assisted reproduction
  - assess endometrial lining in postmenopausal women

Every woman of childbearing age presenting to ER with abdominal or pelvic pain should have  $\beta$ -hCG measured

## Endometrial Biopsy

- performed in the office using an endometrial suction curette (pipelle) guided through the cervix to aspirate fragments of endometrium
  - pre-treatment with misoprostol (Cytotec®) if nulliparous or postmenopausal
- more invasive procedure (D&C) may be done in the office or operating room ± hysteroscopy. This may be required if endometrial biopsy is not possible in the office setting
- indications
  - AUB/PMB
    - age > 40
    - risk factors for endometrial cancer
    - failure of medical treatment
    - significant intermenstrual bleeding
    - consider in women with infrequent menses suggesting anovulatory cycles

## Hysterectomy

### Indications

- uterine fibroids
- endometriosis, adenomyosis
- uterine prolapse
- pelvic pain
- AUB
- cancer (endometrium, ovaries, fallopian tubes, cervix)

### Complications

- general anesthetic
- bleeding
- infection
- injury to other organs (ureter, bladder, rectum)
- loss of ovarian function (if ovaries removed, iatrogenic menopause)

### Approaches

- open (abdominal approach): uterus removed via transverse (pfannenstiel) or midline laparotomy
- minimally Invasive Approaches
  - vaginal: uterus removed via vagina; uterus is separated from surrounding structures by vaginal route, no abdominal incisions
    - indications: mobile uterus, uterine size <12 wk
    - advantages : less pain, faster recovery time, allows for simultaneous repair of rectocele/cystocele/enterocele, improved aesthetics. This is the gold standard of the minimally invasive routes.
- Robotic
  - similar advantages to laparoscopy
  - may be advantageous in high BMI patients
  - more costly

**Table 1. Classification of Hysterectomy**

Classification	Tissues Removed	Indications
<b>Subtotal Hysterectomy</b>	Uterus	Inaccessible cervix (e.g. adhesions) Patient choice/preference Severe endometriosis
<b>Total Hysterectomy (extrafascial simple hysterectomy/type 1)</b>	Uterus, cervix, uterine artery ligated at uterus	Uterine fibroids Endometriosis Adenomyosis Menorrhagia DUB
<b>Total Hysterectomy (extrafascial simple hysterectomy/type 1) + Bilateral Salpingo-Oophorectomy</b>	Uterus, cervix, uterine artery ligated at uterus, fallopian tubes, ovaries	Endometrial cancer Malignant adnexal masses Consider for endometriosis
<b>Modified Radical Hysterectomy (type 2)</b>	Uterus, cervix, proximal 1/3 parametria, uterine artery ligated medial to the ureter, mid point of uterosacral ligaments and upper 1-2 cm vagina	Cervical cancer (up to stage IBI)
<b>Radical Hysterectomy (type 3)</b>	Uterus, cervix, upper 1/3-1/2 vagina, entire parametria, uterine artery ligated at its origin from internal iliac artery, uterosacral ligament at most distal attachment (rectum)	Cervical cancer

# Disorders of Menstruation

## Amenorrhea

### Differential Diagnosis of Amenorrhea

**Table 2. Differential Diagnosis of Primary Amenorrhea**

With Secondary Sexual Development		Without Secondary Sexual Development	
<b>Normal breast and pelvic development</b>	<b>Normal breast, abnormal uterine development</b>	<b>High FSH (hypergonadotropic hypogonadism)</b>	<b>Low FSH (hypogonadotropic hypogonadism)</b>
Hypothyroidism Hyperprolactinemia PCOS Hypothalamic dysfunction	Androgen insensitivity Anatomic abnormalities Müllerian agenesis, uterovaginal septum, imperforate hymen	Gonadal dysgenesis Abnormal sex chromosome (Turner's XO) Normal sex chromosome (46XX, 46XY)	Constitutional delay (most common) Congenital abnormalities Isolated GnRH deficiency Pituitary failure (Kallman syndrome, head injury, pituitary adenoma, etc.) Acquired Endocrine disorders (type 1 DM) Pituitary tumours Systemic disorders (IBD, JRA, chronic infections, etc.)

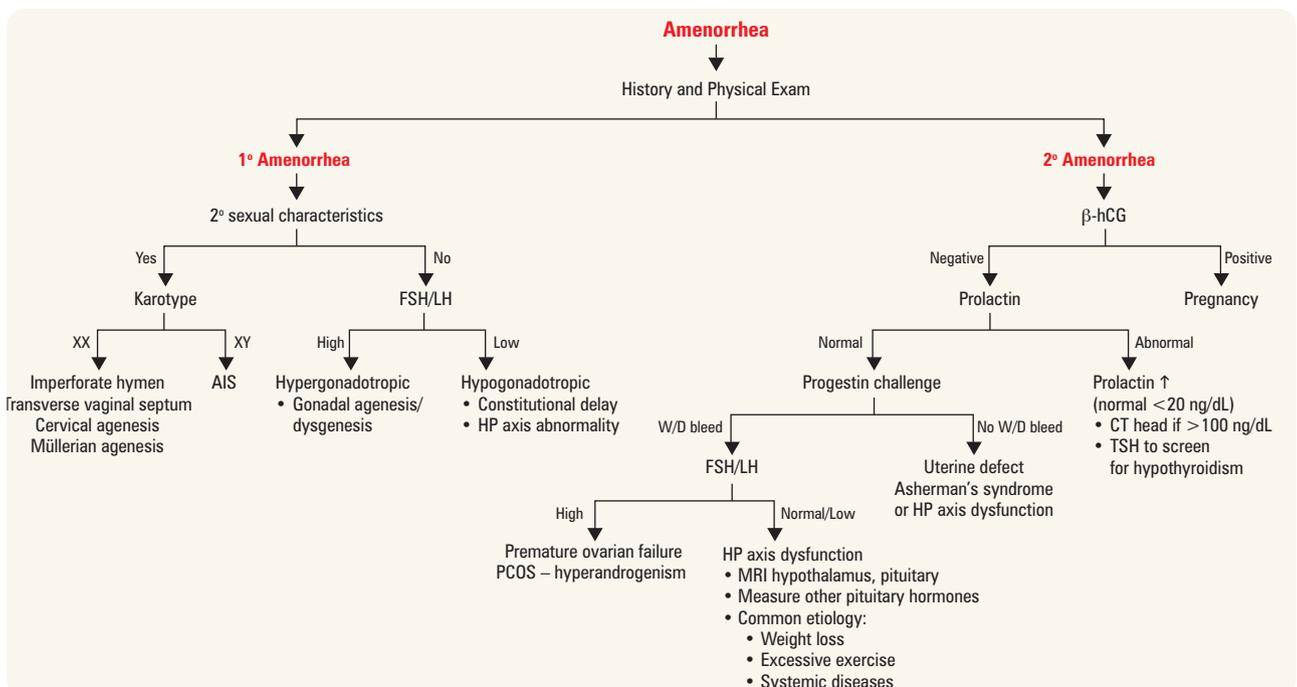

**Table 3. Differential Diagnosis of Secondary Amenorrhea**

With Hyperandrogenism	Without Hyperandrogenism
PCOS Autonomous hyperandrogenism (androgen secretion independent of the HPO axis) Ovarian: tumour, hyperthecosis Adrenal androgen-secreting tumour Late onset or mild congenital adrenal hyperplasia (rare)	Hypergonadotropic hypogonadism (i.e. premature ovarian failure: high FSH, low estradiol) Idiopathic Autoimmune: type 1 DM, autoimmune thyroid disease, Addison's disease Iatrogenic: cyclophosphamide drugs, radiation Hyperprolactinemia Endocrinopathies: most commonly hyper or hypothyroidism Hypogonadotropic hypogonadism (low FSH): Pituitary compression or destruction: pituitary adenoma, craniopharyngioma, lymphocytic hypophysitis, infiltration (sarcoidosis), head injury, Sheehan's syndrome Functional hypothalamic amenorrhea (often related to stress excessive exercise and/or anorexia)

Functional hypothalamic amenorrhea is the most common cause of secondary amenorrhea

### Investigations

**Figure 10. Diagnostic approach to amenorrhea**

- $\beta$ -hCG, hormonal workup (TSH, prolactin, FSH, LH, androgens, estradiol)
- progesterone challenge to assess estrogen status
  - medroxyprogesterone acetate (Provera<sup>®</sup>) 10 mg PO OD for 10-14 d
  - any uterine bleed within 2-7 d after completion of Provera<sup>®</sup> is considered to be a positive test/ withdrawal bleed
    - ♦ withdrawal bleed suggests presence of adequate estrogen to thicken the endometrium; thus withdrawal of progesterone results in bleeding
    - ♦ if no bleeding occurs, there may be inadequate estrogen (hypoestrogenism), excessive androgens, or progesterones (decidualization)
- karyotype: indicated if premature ovarian failure or absent puberty
- U/S to confirm normal anatomy, identify PCOS

**Treatment**

**Table 4. Management of Amenorrhea**

Etiology	Management
<b>1° AMENORRHEA</b>	
Androgen insensitivity syndrome	Gonadal resection after puberty Psychological counselling Creation of neo-vagina
Anatomical	Surgical management
Imperforate hymen	
Transverse vaginal septum	
Cervical agenesis	
Müllerian dysgenesis (MRKH syndrome)	Psychological counselling Creation of neo-vagina with dilation Diagnostic study to confirm normal urinary system and spine
<b>2° AMENORRHEA</b>	
Uterine defect	Evaluation with hysterosalpingography or sonohysterography
Asherman's syndrome	Hysteroscopy: excision of synechiae
HP-axis dysfunction	<b>Identify modifiable underlying cause</b> Combined OCP to decrease risk of osteoporosis, maintain normal vaginal and breast development (NOT proven to work)
Premature ovarian failure	Screen for DM, hypothyroidism, hypoparathyroidism, hypocortisolism Hormonal therapy with estrogen + progestin to decrease risk of osteoporosis; can use OCP
Hyperprolactinemia	MRI/CT head to rule out lesion If no demonstrable lesions by MRI Bromocriptine, cabergoline if fertility desired Combined OCPs if no fertility desired Demonstrable lesions by MRI: surgical management
Polycystic ovarian syndrome	<i>See Polycystic Ovarian Syndrome, GY24</i>

**Prolactinoma Symptoms**

Galactorrhea, visual changes, headache

**Primary Amenorrhea**

No menses by age 13 in absence of 2° sexual characteristics or no menses by age 15 with 2° sexual characteristics or no menses 2 yr after thelarche

**Secondary Amenorrhea**

No menses for >6 mo or 3 cycles after documented menarche

**Oligomenorrhea**

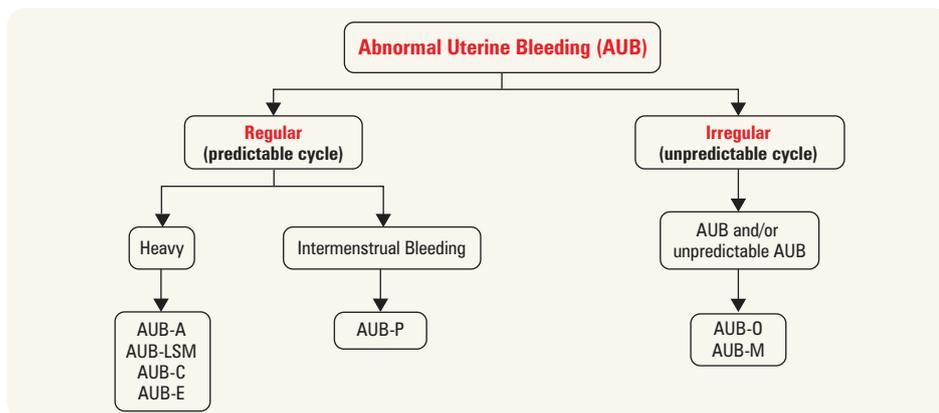

Episodic vaginal bleeding occurring at intervals >35 d

2° amenorrhea is pregnancy until proven otherwise

**Abnormal Uterine Bleeding**

**Figure 11. Diagnostic approach to abnormal uterine bleeding**

**Approach**

- is it regular?
  - regular: cycle to cycle variability of <20 d – “Can you predict your menses within 20 days?”
  - irregular: cycle to cycle variability of ≥20 d
- is it heavy
  - ≥80 cc of blood loss per cycle or
  - ≥8 d of bleeding per cycle or
  - bleeding that significantly affects quality of life
- is it structural?
  - PALM
- is it non-structural?
  - COEIN

**Abnormal Uterine Bleeding**  
Change in frequency, duration, or amount of menstrual flow

**Table 5. AUB – Etiologies, Investigations, and Management**

Etiology	Investigations	Management
<b>STRUCTURAL</b>		
<b>Polyps (AUB-P)</b>	Transvaginal Sonography Saline Infusion Sonohysterography MRI	Polypectomy (triage based on symptomatic, polyp size, histopathology and patient age)
<b>Adenomyosis (AUB-A)</b>	Transvaginal Sonography MRI	See <i>Adenomyosis</i> , GY15
<b>Leiomyoma (AUB-L)</b> <b>Submucosal (AUB-Lsm)</b> <b>Other (AUB-Lo)</b>	Transvaginal Sonography Saline Infusion Sonohysterography Diagnostic Hysteroscopy	See <i>Fibroids (Leiomyomata)</i> , GY15
<b>Malignancy and Hyperplasia (AUB-M)</b>	Transvaginal Sonography Endometrial Biopsy - consider biopsy in women >40 yr to exclude endometrial cancer	Dependent on diagnosis
<b>NON-STRUCTURAL</b>		
<b>Coagulopathy (AUB-C)</b>	CBC, coagulation profile (especially in adolescents), von Willebrand Factor, Ristocetin Cofactor, Factor VIII	Dependent on diagnosis (Hormonal modulation (e.g. OCP), Mirena IUD, endometrial ablation)
<b>Ovulatory dysfunction (AUB-O)</b>	Bloodwork: β-hCG, ferritin, prolactin, FSH, LH, serum androgens (free testosterone, DHEA), progesterone, 17-hydroxy progesterone, TSH, FT4 pelvic ultrasound	See <i>Infertility</i> , GY23
<b>Endometrial (AUB-E)</b>	Endometrial Biopsy	Tranexamic acid Hormonal modulation (eg. OCP) Mirena IUD endometrial ablation
<b>Iatrogenic (AUB-I)</b>	Transvaginal Sonography (rule out forgotten IUD) Review OCP/HRT use Review meds (especially neuroleptic use)	Remove offending agent
<b>Not yet classified (AUB-N)</b>	—	—

**Abnormal Uterine Bleeding**  
Abnormal bleeding not attributable to organic (anatomic/systemic) disease  
AUB is a diagnosis of exclusion  
In the new nomenclature, AUB is referred to as AUB-O, AUB-E or AUB-C

AUB in women >40 yr requires an endometrial biopsy to rule out cancer even if known to have fibroids

\*Ferrous gluconate 300 mg PO TID will raise Hb 10 points per wk

**Treatment**

- resuscitate patient if hemodynamically unstable
- treat underlying disorders
  - if anatomic lesions and systemic disease have been ruled out, consider AUB
- medical
  - mild AUB
    - ◆ NSAIDs
    - ◆ anti-fibrinolytic (e.g. Cyklokapron®) at time of menses
    - ◆ combined OCP
    - ◆ progestins (Provera®) on first 10-14 d of each month or every 3 mo if AUB-O
    - ◆ Mirena® IUD
    - ◆ danazol
  - acute, severe AUB

Determine if patient is hemodynamically stable prior to any other task

replace fluid losses, consider admission

- ◆ a) estrogen (Premarin®) 25 mg IV q4h x 24 h with Graval® 50 mg IV/PO q4h or anti-fibrinolytic (e.g. Cyklokapron®) 10 mg/kg IV q8h
- ◆ b) Tapering OCP regimen, 35µg pill TID x7d then taper to 1 pill/d for 3w with
- ◆ Graval® 50 mg IV/PO q4h
  - taper to 1 tab tid x 2 d → bid x 2 d → OD
- ◆ after (a) or (b), maintain patient on monophasic OCP for next several months or consider alternativemedical treatment

- surgical
  - endometrial ablation
    - ♦ if finished childbearing
    - ♦ repeat procedure may be required if symptom reoccur especially if <40 yr
  - hysterectomy: definitive treatment

## Dysmenorrhea

### Etiology

- see *Differential Diagnoses of Common Presentations, GY6*

**Table 6. Comparison of Primary and Secondary Dysmenorrhea**

	Primary Dysmenorrhea	Secondary Dysmenorrhea
<b>Features</b>	Menstrual pain in absence of organic disease Begins 6 mo-2 yr after menarche (once ovulatory cycles established)	Menstrual pain due to organic disease Usually begins in women who are in their 20s, worsens with age May improve temporarily after childbirth
<b>Signs and Symptoms</b>	Colicky pain in abdomen, radiating to the lower back, labia, and inner thighs beginning hours before onset of bleeding and persisting for hours or days (48-72 h) Associated symptoms: N/V, altered bowel habits, headaches, fatigue (prostaglandin-associated)	Associated dyspareunia, abnormal bleeding, infertility
<b>Diagnosis</b>	Associated dyspareunia, abnormal bleeding, infertility Rule out underlying pelvic pathology and confirm cyclic nature of pain	Bimanual exam: uterine or adnexal tenderness, fixed uterine retroflexion, uterosacral nodularity, pelvic mass, or enlarged irregular uterus (findings are rare in women <20 yr) U/S, laparoscopy and hysteroscopy may be necessary to establish the diagnosis Screening for infections (vaginal and cervical cultures) may be required
<b>Treatment</b>	PG synthetase inhibitors (e.g. Anaprox®): should be started before onset of pain OCP: suppress ovulation/reduce menstrual flow	Treat underlying cause

#### Primary Dysmenorrhea

Menstrual pain in absence of organic disease

#### Secondary Dysmenorrhea

Menstrual pain due to organic disease

## Endometriosis

### Etiology

- not fully understood
- proposed mechanisms (combination likely involved)
  - retrograde menstruation (Sampson's theory)
  - immunologic theory: altered immunity may limit clearance of transplanted endometrial cells from pelvic cavity (may be due to decreased NK cell activity)
  - metaplasia of coelomic epithelium
  - extrapelvic disease may be due to aberrant vascular or lymphatic dissemination of cells
    - ♦ e.g. ovarian endometriosis may be due to direct lymphatic flow from uterus to ovaries

### Epidemiology

- incidence: 15-30% of pre-menopausal women
- mean age at presentation: 25-30 yr
- regresses after menopause

### Risk Factors

- family history (7-10x increased risk if affected 1st degree relative)
- obstructive anomalies of the genital tract (earlier onset) – resolve with treatment of anomaly
- nulliparity
- age >25 yr

### Sites of Occurrence

- ovaries: 60% patients have ovarian involvement
- broad ligament, vesicoperitoneal fold
- peritoneal surface of the cul-de-sac, uterosacral ligaments
- rectosigmoid colon, appendix
- rarely may occur in sites outside abdomen/pelvis, including lungs

#### Endometriosis

The presence of endometrial tissue (glands and stroma) outside of the uterine cavity

#### Endometrioma

Endometriotic cyst encompassing the ovary

#### Differential Diagnoses

- Chronic PID, recurrent acute salpingitis
- Hemorrhagic corpus luteum
- Benign/malignant ovarian neoplasm
- Ectopic pregnancy

#### Classic Triad of Endometriosis

- Dysmenorrhea
- Dyspareunia (cul-de-sac, uterosacral ligament)
- Dyschezia (uterosacral ligament, cul-de-sac, rectosigmoid attachment)

A sharp, firm, and exquisitely tender "barb" on the uterosacral ligament is a classic feature of endometriosis

## Clinical Features

- may be asymptomatic and can occur with one of 3 presentations
- 1. **pain**
  - menstrual symptoms
    - ◆ cyclic symptoms due to growth and bleeding of ectopic endometrium, usually precede menses (24-48 h) and continue throughout and after flow
    - ◆ secondary dysmenorrhea
    - ◆ sacral backache with menses
    - ◆ pain may eventually become chronic, worsening perimenstrually
    - ◆ deep dyspareunia
  - bowel and bladder symptoms
    - ◆ frequency, dysuria, hematuria
    - ◆ cyclic diarrhea/constipation, hemochezia, dyschezia (suggestive of deeply infiltrating disease)
- 2. **infertility**
  - 30-40% of patients with endometriosis will be infertile
  - 15-30% of those who are infertile will have endometriosis
- 3. **mass (endometrioma)**
  - ovarian mass can present with any of above symptoms or be asymptomatic
  - physical
  - tender nodularity of uterine ligaments and cul-de-sac felt on rectovaginal exam
  - fixed retroversion of uterus
  - firm, fixed adnexal mass (endometrioma)
  - physical findings not present in adolescent population

## Investigations

- definitive diagnosis requires
  - direct visualization of lesions typical of endometriosis at laparoscopy
  - biopsy and histologic exam of specimens (2 or more of: endometrial epithelium, glands, stroma, hemosiderin-laden macrophages)
- laparoscopy
  - mulberry spots: dark blue or brownish-black implants on the uterosacral ligaments, cul-de-sac, or anywhere in the pelvis
  - endometrioma: “chocolate” cysts on the ovaries
  - “powder-burn” lesions on the peritoneal surface
  - early white lesions and clear blebs
  - peritoneal “pockets”
- CA-125
  - may be elevated in patients with endometriosis but should NOT be used as a diagnostic test

### Endometriosis – Take Home Points

- Suggestive history even with a negative exam should be considered adequate for a presumptive diagnosis
- Pelvic pain that is not primary dysmenorrhea should be considered endometriosis until proven otherwise
- Medical management is the mainstay of endometriosis

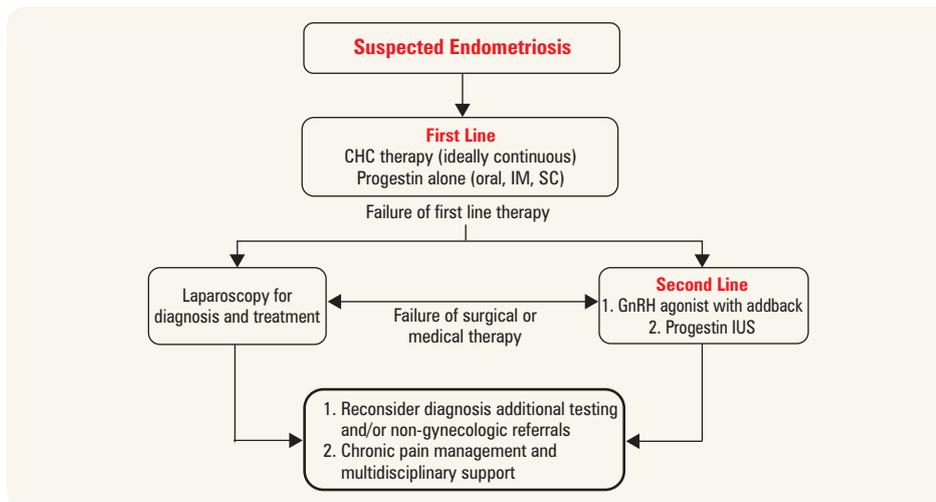

Figure 12. SOGC guidelines for treatment of endometriosis

## Treatment

- **surgical** confirmation of disease is NOT required prior to starting medical management.
- Asymptomatic endometriosis does not require treatment. Management depends on certainty of the diagnosis, severity of symptoms, extent of disease, desire for future fertility, and impact to GI/GU systems (e.g. intestinal obstruction)
- **medical**
  - NSAIDs (e.g. naproxen sodium – Anaprox®)
  - 1st line
    - ◆ cyclic/continuous estrogen-progestin (OCP)
    - ◆ **progestin** (IM medroxyprogesterone (Depo-Provera®) or oral dienogest (Visanne®)
    - ◆ Mirena® IUS

- 2nd line
  - ◆ 2nd line: GnRH-a example: leuprolide (Lupron®): GnRH agonist (suppresses pituitary)
    - side effects: hot flashes, vaginal dryness, reduced libido
    - can use  $\geq 12$  mo with add-back progestin or estrogen
  - ◆ danazol (Danocrine®): weak androgen
    - side effects: weight gain, fluid retention, acne, hirsutism, voice change
- surgical
  - conservative laparoscopy using laser, electrocautery  $\pm$  laparotomy
    - ◆ ablation/resection of implants, lysis of adhesions, ovarian cystectomy of endometriomas
  - definitive: bilateral salpingo-oophorectomy  $\pm$  hysterectomy
  - $\pm$  follow-up with medical treatment for pain control not shown to impact on preservation of fertility
  - best time to become pregnant is immediately after conservative surgery

## Adenomyosis

- synonym: “endometriosis interna” (uterine wall may be diffusely involved)

### Epidemiology

- 15% of females  $>35$  yr old; found in 20-40% of hysterectomy specimens
- mean age at presentation: 40-50 yr old (older age group than seen in endometriosis)
- adenomyosis is a common histologic finding in asymptomatic patients

### Clinical Features

- often asymptomatic
- menorrhagia, secondary dysmenorrhea, pelvic discomfort
- dyspareunia, dyschezia
- uterus symmetrically bulky, usually  $<14$  cm, mobility not restricted, no associated adnexal pathology
- Halban sign: tender, softened uterus on premenstrual bimanual exam

### Investigations

- clinical diagnosis
- U/S or MRI can be helpful
- endometrial sampling to rule out other pathology

### Treatment

- iron supplements as necessary
- analgesics, NSAIDs
- OCP, medroxyprogesterone (Depo-Provera®)
- GnRH agonists (e.g. leuprolide)
- Mirena® IUS
- low dose danazol 100-200 mg PO OD (trial x 4 mo)
- definitive: hysterectomy (no conservative surgical treatment)

#### Adenomyosis

Extension of areas of endometrial glands and stroma into the myometrium

Final diagnosis of adenomyosis is based on pathologic findings, but predictably identified on MRI

## Fibroids

### Epidemiology

- diagnosed in approximately 40-50% of pre-menopausal women  $>35$  yr
- more common in African Americans, where they are also larger and occur at earlier age
- common indication for major surgery in females
- minimal malignant potential (1:1,000)
- typically regress after menopause; enlarging fibroids in a postmenopausal woman should prompt consideration of malignancy

### Pathogenesis

- estrogen stimulates monoclonal smooth muscle proliferation
- progesterone stimulates production of proteins that inhibit apoptosis
- degenerative changes (occur when tumour outgrows blood supply)
  - fibroids can degenerate, become calcified, have sarcomatous component or obtain parasitic blood supply

### Clinical Features

- majority asymptomatic (60%), often discovered as incidental finding on pelvic exam or U/S
- abnormal uterine bleeding (30%): dysmenorrhea, menorrhagia
- pressure/bulk symptoms (20-50%)
  - pelvic pressure/heaviness
  - increased abdominal girth
  - urinary frequency and urgency
  - acute urinary retention (extremely rare but surgical emergency!)
  - constipation, bloating (rare)

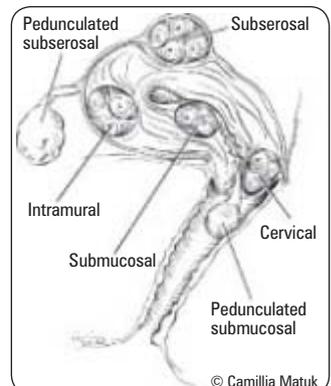

Figure 13. Possible anatomic locations of uterine leiomyomata

#### Leiomyomata/Fibroids

Benign smooth muscle tumour of the uterus (most common gynecological tumour)

- acute pelvic pain
  - fibroid degeneration
  - fibroid torsion (pedunculated subserosal)
- infertility, recurrent pregnancy loss
- pregnancy complications (potential enlargement and increased pain, obstructed labour, difficult C-section)

**Investigations**

- bimanual exam: uterus asymmetrically enlarged, usually mobile
- CBC: anemia
- U/S: to confirm diagnosis and assess location of fibroids
- sonohysterogram: useful for differentiating endometrial polyps from submucosal fibroids, or if intracavitary growth
- endometrial biopsy to rule out uterine cancer for abnormal uterine bleeding (especially if age >40 yr)
- occasionally MRI is used for pre-operative planning (e.g. before myomectomy)

**Treatment**

- only if symptomatic, rapidly enlarging, menorrhagia, menometrorrhagia, or intracavitary
- treat anemia if present
- conservative approach (watch and wait) if
  - symptoms absent or minimal
  - fibroids <6-8 cm or stable in size
  - not submucosal (submucosal fibroids are more likely to be symptomatic)
  - currently pregnant due to increased risk of bleeding (follow-up U/S if symptoms progress)
- medical approach to treat AUB-L
  - antiprostaglandins (ibuprofen, other NSAIDs)
  - tranexamic acid (Cyklokapron®)
  - OCP/Depo-Provera®
  - GnRH agonist: leuprolide (Lupron®), danazol (Danocrine®)
    - ♦ short-term use only (6 mo)
    - ♦ often used pre-myomectomy or pre-hysterectomy to reduce fibroid size
    - ♦ reduced bleeding
  - ulipristal acetate: a partial progesterone receptor agonist
- interventional radiology approach
  - uterine artery embolization (occludes both uterine arteries) → shrinks fibroids by 50% at 6 mo; improves heavy bleeding in 90% of patients within 1-2 mo; not an option in women considering childbearing
- surgical approach
  - myomectomy (hysteroscopic, transabdominal, or laparoscopic): preserves fertility
  - hysteroscopic resection of fibroid and endometrial ablation for AUB-Lsm
  - hysterectomy (see *Hysterectomy*, GY9)
  - note: avoid operating on fibroids during pregnancy (due to → vascularity and potential pregnancy loss); expectant management usually best

Submucosal leiomyomata are most symptomatic (bleeding, infertility)

The effect of pregnancy on fibroid size is variable

**Ulipristal Acetate vs. Leuprolide Acetate for Uterine Fibroids**

*NEJM* 2012;366:421-432

**Study:** Phase III, double-blind RCT of the efficacy and side-effect profile of ulipristal acetate versus those of leuprolide acetate for the treatment of symptomatic uterine fibroids before surgery.

**Outcomes:** Control of uterine bleeding at week 13 was the primary outcome. Secondary outcomes included bleeding pattern, amenorrhea, changes in fibroid/uterine volume, and global pain score.

**Patients:** 307 premenopausal women with symptomatic fibroids and excessive uterine bleeding were randomly assigned to oral ulipristal acetate (5 mg or 10 mg) or intramuscular injections of leuprolide acetate.

**Results:** Control of bleeding at week 13 was not significantly different between the treatment groups. All three treatments reduced uterine volume, although this decrease was significantly greater in the leuprolide group (47% reduction) than in the ulipristal groups (20-22%). 40% of the leuprolide group reported moderate-to-severe hot flashes, but only 11% (5 mg) and 10% (10 mg) of the ulipristal groups did.

**Conclusions:** Oral ulipristal acetate (5 mg or 10 mg) is noninferior to intramuscular leuprolide acetate for control of uterine bleeding due to fibroids, and it had a better side-effect profile.

**Counseling the Adolescent about Contraception**

More than 90% of adolescent pregnancies are unintended, and ~50% of all pregnancies occur within the first 6 mo of initiating sexual activity; in addition, 85% of sexually active women become pregnant within 1 yr if no contraception is used and even some of the least effective contraceptive methods markedly decrease the risk of pregnancy

# Contraception

- see *Family Medicine*, FM19

**Table 7. Classification of Contraceptive Methods**

Type	Effectiveness (Perfect Use, Typical Use)
<b>Physiological</b>	
Withdrawal/coitus interruptus	77%
Rhythm method/calendar/mucus/symptothermal	98%, 76%
Lactational amenorrhea	98% (first 6 mo postpartum)
Chance – no method used	10%
Abstinence of all sexual activity	100%
<b>Barrier Methods</b>	
Condom alone	98%, 85%
Spermicide alone	82%, 71%
Sponge – Parous	80%, 68%
– Nulliparous	91%, 84%
Diaphragm with spermicide	94%, 84%
Female condom	95%, 79%
Cervical cap – Parous	74%, 68%
– Nulliparous	91%, 84%

**Table 7. Classification of Contraceptive Methods (continued)**

Type	Effectiveness (Perfect Use, Typical Use)
<b>Hormonal</b>	
OCP	99.7%, 92%
Nuva Ring®	99.7%, 92%
Transdermal (Ortho Evra®)	99.7%, 92%
Depo-Provera®	99.7%, 97%
Progestin-only pill (Micronor®)	90-99%
Mirena® IUS	99.9%
Jaydess® IUS	99.9%
<b>Copper IUD</b>	
	99.3%
<b>Surgical</b>	
Tubal ligation	99.65%
Vasectomy	99.9%
<b>Emergency Postcoital Contraception (EPC)</b>	
Yuzpe® method	98% (within 24 h), decreases by 30% at 72 h
"Plan B" levonorgestrel only	98% (within 24 h), decreases by 70% at 72 h
Postcoital IUD	99.9%
Ella	98% (within 120 h)

Effectiveness: percentage of women reporting no pregnancy after 1 yr of use

## Hormonal Methods

### Combined Oral Contraceptive Pills

- most contain low dose ethinyl estradiol (20-35 µg) plus progestin (norethindrone, norgestrel, levonorgestrel, desogestrel, norgestimate, drospirenone)
- failure rate (0.3% to 8%) depending on compliance
- monophasic or triphasic formulations (varying amount of progestin throughout cycle)

### Transdermal (Ortho Evra®)

- continuous release of 6 mg norelgestromin and 0.60 mg ethinyl estradiol into bloodstream
- applied to lower abdomen, back, upper arm, buttocks, NOT breast
- worn for 3 consecutive weeks (changed every wk) with 1 wk off to allow for menstruation
- as effective as OCP in preventing pregnancy (>99% with perfect use)
- may be less effective in women >90 kg
- may not be covered by drug plans

### Contraceptive Ring (Nuva Ring®)

- thin flexible plastic ring; releases etonogestrel 120 µg/d and estradiol 15 µg/d
- works for 3 wk then removed for 1 wk to allow for menstruation
- as effective as OCP in preventing pregnancy (98%)
- side effects: vaginal infections/irritation, vaginal discharge
- may have better cycle control; i.e. decreased breakthrough bleeding

### Starting Hormonal Contraceptives

- thorough history and physical exam, including blood pressure and breast exam
- can start at any time during cycle but ideal if within 5 d of LMP
- follow-up visit 6 wk after hormonal contraceptives prescribed
- pelvic exam not required as STI screening can be done by urine and pap smear screening does not start until >21 yr

#### Oral Contraceptives and the Risk of Venous Thromboembolism: An Update (2010)

*J Obstet Gyn Canada* 2010;32:1192-1197

#### Rates of Venous Thromboembolism

(VTE: DVT and PE) expressed in women/yr	
Non-users of reproductive age	4-5/10,000
OCP users*	9-10/10,000
Pregnancy	29/10,000
Immediate post-partum	300-400/10,000

\*Risk is highest in the first months of use and in medication switch and if stop and restart.

#### Effect of Ethinyl Estradiol Dose

ALL OCPs with ≤35 µg ethinyl estradiol carry a lower risk of VTE compared with oral contraceptives with 50 µg.

#### Effect of Progestin Type

Drospirenone: third generation progestin,

e.g. Yasmin® and Yaz®

Levonorgestrel: second generation progestin,

e.g. Alesse®

Two high quality research studies found comparable VTE rates with drospirenone-containing OCPs and other approved products.

1. Dinger et al., *Contraception* 2007;75:344-354

2. Seeger et al., *Obstet Gynecol* 2007;110:587-593

Two reports with significant methodological flaws found increased VTE risk. Results and conclusions may have been distorted by residual confounding.

1. Lidegaard et al., *BMJ* 2009;339:b2890

2. Van Hylckama Vlieg et al., *BMJ* 2009;339:b2921

#### Conclusion

- Occurrence of serious risks, such as VTE, is rare with all contemporary OCPs.
- Individualized risk assessment is mandatory.
- For most healthy women of reproductive age, the benefits of OCPs will outweigh the risks.

#### Thrombotic Stroke and Myocardial Infarction with Hormonal Contraception

*NEJM* 2012;366:2257-2266

**Study:** 15 yr Danish historical cohort study. Non-pregnant women 15-49 yr of age with no history of cardiovascular disease or cancer.

**Results:** Total of 1,626,158 women, thrombotic stroke rate 21.4/100,000 person yr; MI rate 10.1/100,000 person yr. Oral contraceptives with ethinyl estradiol at a dose of 30-40 µg according to progestin type and risk of thrombotic stroke and MI (RR [CI]): norethindrone 2.2 (1.5-3.2) and 2.3 (1.3-3.9); levonorgestrel 1.7 (1.4-2.0) and 2.0 (1.6-2.5); norgestimate 1.5 (1.2-1.9) and 1.3 (0.9-1.9); desogestrel 2.2 (1.8-2.7) and 2.1 (1.5-2.8); gestodene 1.8 (1.6-2.0) and 1.9 (1.6-2.3); and drospirenone 1.6 (1.2-2.2) and 1.7 (1.0-2.6). With ethinyl estradiol at a dose of 20 µg, risks according to progestin type were: desogestrel 1.5 (1.3-1.9) and 1.6 (1.1-2.1); gestodene 1.7 (1.4-2.1) and 1.2 (0.8-1.9) and drospirenone 0.9 (0.2-3.5) and 0.0.

**Conclusions:** Although the absolute risk of thrombotic stroke and MI with hormonal contraception is low, it is increased by a factor of 0.9-1.7 with oral contraceptives that contain ethinyl estradiol at a dose of 20 µg and by a factor of 1.3-2.3 with ethinyl estradiol doses of 30-40 µg, with relatively small differences in risk according to progestin type.

**Table 8. Combined Estrogen and Progestin Contraceptive Methods**

Mechanism of Action	Advantages	Side Effects	Contraindications
Ovulatory suppression through inhibition of LH and FSH Decidualization of endometrium Thickening of cervical mucus resulting in decreased sperm penetration	Highly effective Reversible Cycle regulation Decreased dysmenorrhea and menorrhagia (less anemia) Decreased benign breast disease and ovarian cyst development Decreased risk of ovarian and endometrial cancer Increased cervical mucus which may lower risk of STIs Decreased PMS symptoms Improved acne Osteoporosis protection (possibly)	<b>Estrogen-related</b> Nausea Breast changes (tenderness, enlargement) Fluid retention/bloating/edema Weight gain (rare) Migraine, headaches Thromboembolic events Liver adenoma (rare) Breakthrough bleeding (low estradiol levels)  <b>Progestin-related</b> Amenorrhea/breakthrough bleeding Headaches Breast tenderness Increased appetite Decreased libido Mood changes HTN Acne/oily skin* Hirsutism*  * Androgenic side effects may be minimized by prescribing formulations containing desogestrel, norgestimate, drospirenone, or cyproterone acetate	<b>Absolute</b> Known/suspected pregnancy Undiagnosed abnormal vaginal bleeding Prior thromboembolic events, thromboembolic disorders (Factor V Leiden mutation; protein C or S, or antithrombin III deficiency), active thrombophlebitis Cerebrovascular or coronary artery disease Estrogen-dependent tumours (breast, uterus) Impaired liver function associated with acute liver disease Congenital hypertriglyceridemia Smoker age > 35 yr Migraines with focal neurological symptoms (excluding aura) Uncontrolled HTN  <b>Relative</b> Migraines (non-focal with aura < 1 h) DM complicated by vascular disease SLE Controlled HTN Hyperlipidemia Sickle cell anemia Gallbladder disease  <b>Drug Interactions/Risks</b> Rifampin, phenobarbital, phenytoin, griseofulvin, primidone, and St. John's wort can decrease efficacy, requiring use of back-up method No evidence of fetal abnormalities if conceived on OCP No evidence that OCP is harmful to nursing infant but may decrease milk production; not recommended until 6 wk postpartum in BF and non BF moms, ideally 3 mo postpartum if BF

Reference: World Health Organization Guidelines for Oral Contraceptive Pill Use

**Table 9. Selected Examples of OCPs**

Type	Active Compounds (estriol and progestin derivative)	Advantages	Disadvantages
<b>Alesse®</b>	20 µg ethinyl estradiol and 0.5 mg levonorgestrel	Low dose (20 µg) OCP Less estrogen side effects	Low-dose pills can often result in breakthrough bleeding If this persists for longer than 3 mo, patient should be switched to an OCP with higher estrogen content
<b>Tri-cyclen®</b>	35 µg ethinyl estradiol and 0.180/0.215/0.250 mg norgestimate Triphasic oral contraceptive (graduated levels of progesterone)	Low androgenic activity can help with acne	Triphasic OCPs not ideal for continuous use > 3 weeks in a row (unlike monophasic formulation)
<b>Yasmin® and Yaz®</b>	Yasmin®: 30 µg ethinyl estradiol + 3 mg drospirenone (a new progestin) Yaz®: 20 µg ethinyl estradiol + 3 mg drospirenone – 24/4-d pill (4 d pill free interval) Drospirenone has antimineralocorticoid activity and antiandrogenic effects	Decreased perception of cyclic weight gain/bloating Fewer PMS symptoms Improved acne	Hyperkalemia (rare, contraindicated in renal and adrenal insufficiency) Check potassium if patient also on ACEI, ARB, K <sup>+</sup> -sparing diuretic, heparin Continue use of spironolactone

Irregular breakthrough bleeding often occurs in the first few months after starting OCP; usually resolves after three cycles

**Missed Combined OCPs**  
**Miss 1 pill in <24 h**  
 • Take 1 pill ASAP, and the next pill at the usual time  
**Miss ≥ 1 pill in a row in first wk**  
 • Take 1 pill ASAP, and continue taking one pill daily until the end of the pack  
 • Use back-up contraception for 7 d; EPC may be necessary  
**Miss < 3 pills in 2nd or 3rd wk of cycle**  
 • Take 1 pill ASAP, and continue taking one pill daily until the end of the pack  
 • Do not take placebo (28-d packs) or do not take a hormone free interval (21-d packs)  
 • Start the next pack immediately after finishing the previous one  
 • No need for back-up contraception  
**Miss ≥ 3 pills during the 2nd or 3rd wk**  
 • Take 1 pill ASAP, and continue taking one pill daily until the end of the pack  
 • Don't take placebo (28-d packs) or do not take a hormone free interval (21-d packs)  
 • Start the next pack immediately after finishing the previous one  
 • Use back-up contraception for 7 d; EPC may be necessary  
 SOGC Committee Opinion on Missed Hormonal Contraceptives: New Recommendations. *JGCM* 2008;30:1050-1062. <http://www.sogc.org/guidelines/documents/gui219ECC00811.pdf>

**PROGESTIN-ONLY METHOD**

**Table 10. Progestin Only Contraceptive Methods**

Indications	Mechanism of Action	Side Effects	Contraindications
Suitable for postpartum women (does not affect breast milk supply) Women with contraindications to combined OCP (e.g. thromboembolic or myocardial disease) Women intolerant of estrogenic side effects of combined OCPs	Progestin prevents LH surge Thickening of cervical mucus Decrease tubal motility Endometrial decidualization Ovulation suppression – oral progestins (not IM) do not consistently suppress compared to combined OCPs	Irregular menstrual bleeding Weight gain Headache Breast tenderness Mood changes Functional ovarian cysts Acne/oily skin Hirsutism	<b>Absolute</b> None

**SELECTED EXAMPLES OF PROGESTIN-ONLY METHODS**

**Progestin-Only Pill (“minipill”)**

- Micronor® 0.35 mg norethindrone
- taken daily at same time of day to ensure reliable effect; no pill free interval
- higher failure rate (1.1-13% with typical use, 0.51% with perfect use) than other hormonal methods
- ovulation inhibited only in 60% of women; most have regular cycles (but may cause oligo/amenorrhea)
- highly effective if also post-partum breastfeeding, or if >35 yr
- relies on the progestin effects on the cervical mucous and endometrial lining

**Depo-Provera®**

- injectable depot medroxyprogesterone acetate
- dose 150 mg IM q12-14wk (convenient dosing)
- initiate ideally within 5 d of beginning of normal menses, immediately postpartum in breastfeeding and non-breastfeeding women. Can consider quick start
- irregular spotting progresses to complete amenorrhea in 70% of women (after 1-2 yr of use)
- highly effective 99%; failure rate 0.3%
- suppresses ovulation very effectively
- side effect: decreased bone density (may be reversible)
- disadvantage: restoration of fertility may take up to 1-2 yr

**Missed Progestin-Only Pills >3 h**

Use back-up contraceptive method for at least 48 h; continue to take remainder of pills as prescribed

**Missed Depo-Provera**

- If last injection given 13-14 wk prior: give next injection immediately
- if > 14 wk prior, do β-hCG
  - If β-hCG is positive, give EPC and no injection
  - If β-hCG is negative, give next injection right away and:
    - Intercourse occurred in last 5 d: give EPC, use back-up contraception for 7 d
    - Repeat β-hCG in 3 wk
    - Intercourse occurred >5 d ago but within the last 14 d: use back-up contraception for 7 d
    - Repeat β-hCG in 3 wk
    - Intercourse occurred >14 d ago: use back-up contraception for 7 d
- No evidence of fetal abnormalities if conceived on DMPA

SOGC Committee Opinion on Missed Hormonal Contraceptives: New Recommendations  
 JGOC 2008;30:1050-62. <http://www.sogc.org/guidelines/documents/gu219EC00811.pdf>

**Steroidal Contraceptives and Bone Fractures in Women: Evidence from Observational Studies**

*Cochrane Database Syst Rev* 2015; 7

**Purpose:** Systematic review of observational studies assessing the association between hormonal contraceptive use and risk of fractures in women.

**Results:** Systematic review identified 14 observational studies (7 cohort and 7 case-control) that assessed hormonal contraceptives use and fracture risk. Analysis of six moderate to high quality studies, all of which analyzed oral contraceptives, suggest minimal association between OCs and fractures risk. There is some evidence that suggests higher fracture risk in certain subgroups, such as the long-term users. However, this evidence is minimal. Two-case control studies reported higher risk of fractures in those who use progestin only contraceptives. The first suggested higher fracture risk for DMPA ever-use (OR = 1.44). The second reports higher risk for any previous users (OR = 1.17)

**Conclusion:** Current evidence does not support an association between OCP use and fracture risk. However, there is some evidence suggesting DMPA may be associated with higher fracture risk in women.

**Continuous or Extended Cycle vs. Cyclic Use of Combined Hormonal Contraceptives for Contraception**

*Cochrane DB Syst Rev* 2014;7

**Purpose:** Systematic review of RCTs assessing the efficacy and side effects of cyclic administration vs. extended use (longer periods of active pills and/or shorter periods placebo) or continuous use (uninterrupted active pill administration) of combination oral contraceptives (COC).

**Results:** The initial review published in 2012 identified 12 RCTs that ultimately showed no difference between groups with regards to efficacy (pregnancy rates), safety, and compliance rates. Continuous or extended CHCs were shown to reduce menstrual symptoms (headaches, tiredness, bloating, and menstrual pain). In addition, 11 of 12 studies reported similar or improved bleeding patterns with continuous or extended cycles.

**Conclusions:** This recently published updated systematic review identified a further 4 RCTs, however, results did not change.

**Committee Opinion No. 602: Depot Medroxyprogesterone Acetate and Bone Effects**

*Obstet Gynecol* 2014(6): 1298-402.

- The effect of DMPA on BMD should neither prevent practitioners from prescribing DMPA nor limit its use to 2 consecutive yr.
- BMD loss due to DMPA appears to be substantially or fully reversible.
- Contraceptive implants and intrauterine devices that do not affect BMD should be considered as first-line for adolescents.
- Inform patients about benefits and the potential risks of DMPA, and encourage daily exercise, calcium and vitamin D intake.
- Routine BMD monitoring is not recommended for DMPA users.

**Intrauterine Device**

**Table 11. IUS/IUD Contraceptive Methods**

Mechanism of Action	Side Effects	Contraindications
<p><b>Copper-Containing IUD (Nova-T®):</b> mild foreign body reaction in endometrium toxic to sperm and alters sperm motility</p> <p><b>Progesterone-Releasing IUS (Mirena®, Jaydess®):</b> decidualization of endometrium and thickening of cervical mucus; minimal effect on ovulation</p> <p>Highly effective (95-99%); failure rate 0-1.2% Contraceptive effects last 5 yr Reversible, private, convenient May be used in women with contraindications to OCPs or wanting long-term contraception</p>	<p><b>Both Copper and Progesterone IUD</b></p> <p>Breakthrough bleeding Expulsion (5% in the 1st yr, greatest in 1st mo and in nulliparous women) Uterine wall perforation (1/1,000) on insertion If pregnancy occurs with an IUD, increased risk of ectopic Increased risk of PID (within first 10 d of insertion only)</p> <p><b>Copper IUD:</b> increased blood loss and duration of menses, dysmenorrhea</p> <p><b>Progesterone IUD:</b> bloating, headache</p>	<p><b>Absolute</b></p> <p><b>Both Copper and Progesterone IUD</b></p> <p>Known or suspected pregnancy Undiagnosed genital tract bleeding Acute or chronic PID Lifestyle risk for STIs* Copper IUD Known allergy to copper Wilson’s disease</p> <p><b>Relative</b></p> <p><b>Both Copper and Progesterone IUD</b></p> <p>Valvular heart disease Past history of PID or ectopic pregnancy Presence of prosthesis Abnormalities of uterine cavity, intracavitary fibroids Cervical stenosis Immunosuppressed individuals (e.g. HIV)</p> <p><b>Copper IUD:</b> severe dysmenorrhea or menorrhagia</p>

\*Cervical swabs for gonorrhea and chlamydia should be done prior to insertion

## Emergency Postcoital Contraception

Table 12. Emergency Contraceptive Methods

Method	Mechanism of Action	Side Effects	Contraindications
<b>HORMONAL</b>			
<b>Yuzpe Method</b> Used within 72 h of unprotected intercourse; limited evidence of benefit up to 5 d Ovral® 2 tablets then repeat in 12 h (ethinyl estradiol 100 µg/levonorgestrel 500 µg) Can substitute with any OCP as long as same dose of estrogen used 2% overall risk of pregnancy Efficacy decreased with time (e.g. less effective at 72 h than 24 h)	Unknown; theories include: Suppresses ovulation or causes deficient luteal phase Alters endometrium to prevent implantation Affects sperm/ova transport	Nausea (due to estrogen; treat with Gravol®) Irregular spotting	Pre-existing pregnancy (although not teratogenic) Caution in women with contraindications to OCP (although NO absolute contraindications)
<b>"Plan B"</b> Consists of levonorgestrel 750 µg q12h for 2 doses (can also take 2 doses together); taken within 72 h of intercourse. Can be taken up to 5 d Greater efficacy (75-95% if used within 24 h) and better side effect profile than Yuzpe method but efficacy decreases with time; 1st line if >24 h No estrogen thus very few contraindications/side effects (less nausea) Less effective in overweight individuals (>75 kg less effective, >80 kg not recommended)	Same as above	Same as above	Same as above
<b>Ulipristal</b> 30 mg PO within 5 d	Selective Progesterone Receptor Modulator (SPERM) with primarily antiprogesterin activity; may delay ovulation by up to 5 d	Headache, hot flashes, constipation, vertigo, endometrial thickening	Same as above
<b>NON-HORMONAL</b>			
<b>Postcoital IUD (Copper)</b> Insert up to 7 d postcoitus Prevents implantation 1% failure rate Can use for short duration in higher risk individuals Mirena® IUS cannot be used as EPC	See Table 11	See Table 11	See Table 11

### Follow-up

- 3-4 wk post treatment to confirm efficacy (confirmed by spontaneous menses or pregnancy test)
- contraception counselling

## Termination of Pregnancy

### Definition

- active termination of a pregnancy before fetal viability (usually <500 g or <20 wk GA)

### Indications

- inability to carry a pregnancy to term due to medical or social reasons (including patient preference)

### Management

- medical
  - <9 wk: methotrexate + misoprostol
  - >12 wk: prostaglandins (intra- or extra-amniotically or IM) or misoprostol
- surgical
  - <12 wk: dilatation + vacuum aspiration ± curettage
  - >12 wk: dilatation and evacuation, early induction of labour
  - common complications: pain or discomfort
  - less common complications: hemorrhage, perforation of uterus, laceration of cervix, risk of infertility, infection/endometritis, Asherman's syndrome (adhesions within the endometrial cavity causing amenorrhea/infertility), retained products of conception
- counselling
  - supportive and counselling services
  - future contraception and family planning services
  - ensure follow-up

#### Any OCP can be used as EPC; 100 µg ethinyl estradiol PO q12h x 2 doses

- Levonorgestrel emergency contraception regimens are more effective and cause fewer side effects than the Yuzpe regimen
- Levonorgestrel emergency contraception single dose (1.5 mg) and the 2-dose levonorgestrel regimen (0.75 mg 12 h apart) have similar efficacy with no difference in side effects

SOGC Clinical Practice Guidelines: Emergency Contraception. *JOGC* 2012;34:870-878.  
[http://www.sogc.org/guidelines/documents/gui280CPG1209E\\_000.pdf](http://www.sogc.org/guidelines/documents/gui280CPG1209E_000.pdf)

#### CMA Policy (1988)

"Induced abortion should be uniformly available to all women in Canada" and "there should be no delay in the provision of abortion services"

Terminations are generally done until the stage of viability (~23.5 wk), although this varies depending on the provider

# Pregnancy-Related Complications

## Spontaneous Abortions

- see *Termination of Pregnancy* for therapeutic abortions

**Table 13. Classification of Spontaneous Abortions**

Type	History	Clinical	Management (± Rhogam®)
<b>Threatened</b>	Vaginal bleeding ± cramping	Cervix closed and soft	Watch and wait <5% go on to abort
<b>Inevitable</b>	Increasing bleeding and cramps ± rupture of membranes	Cervix closed until products start to expel, then external os opens	a) Watch and wait b) Misoprostol 400-800 µg PO/PV c) D&C ± oxytocin
<b>Incomplete</b>	Extremely heavy bleeding and cramps ± passage of tissue noticed	Cervix open	a) Watch and wait b) Misoprostol 400-800 µg PO/PV c) D&C ± oxytocin
<b>Complete</b>	Bleeding and complete passage of sac and placenta	Cervix closed, bleeding stopped	No D&C – expectant management
<b>Missed</b>	No bleeding (fetal death in utero)	Cervix closed	a) Watch and wait b) Misoprostol 400-800 µg PO/PV c) D&C ± oxytocin
<b>Recurrent</b>	≥3 consecutive spontaneous abortions		Evaluate mechanical, genetic, environmental, and other risk factors
<b>Septic</b>	Contents of uterus infected – infrequent		D&C IV broad spectrum antibiotics

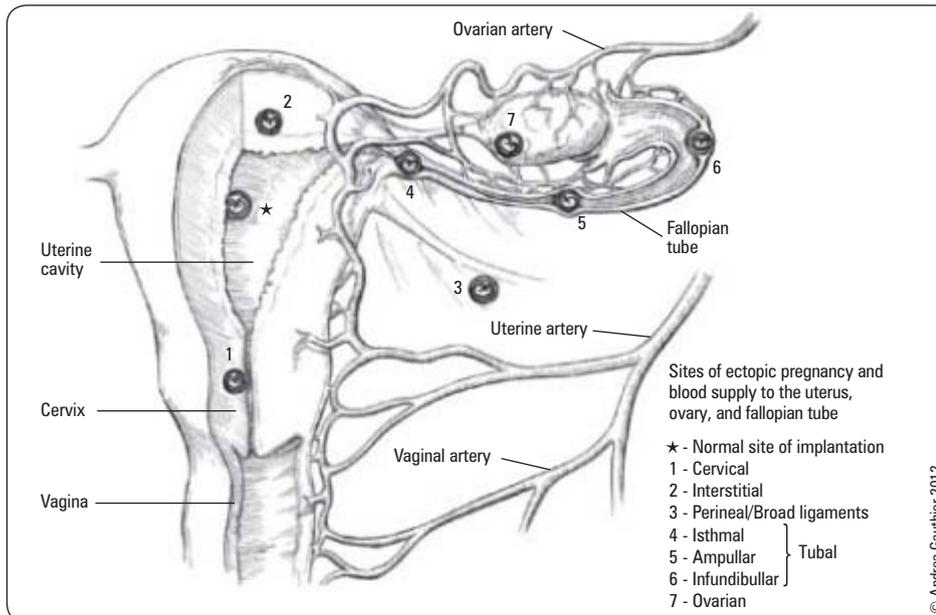

### Etiology of Recurrent Pregnancy Loss MAKE ME

Type	History
<b>Mechanical</b>	Uterine anomalies Congenital (septate uterus) Leiomyoma Endometrial polyps Intrauterine adhesions
<b>Autoimmune</b>	Immunologic Factors Antiphospholipid syndrome (blood tests: lupus anticoagulant, anti-cardiolipin Ab, anti-β2 glycoprotein-I)
<b>Karyotype</b>	Aneuploidy with increasing age or poor sperm quality Chromosomal rearrangements Check both parents Young mother, ≥3 miscarriages, Fhx miscarriage/stillbirth/malformation
<b>Endocrine</b>	Poorly controlled disease Thyroid (associated with high antibody/hormone levels) DM (secondary to hyperglycemia, maternal vascular disease) PCOS
<b>Maternal Infection</b>	No infectious agent has been proven to cause recurrent pregnancy loss, though some cause sporadic loss (Listeria, toxoplasmosis, CMV, HSV)
<b>Environment</b>	Obesity, smoking, alcohol use, and caffeine consumption may contribute
<b>Other</b>	Prothrombotic conditions (i.e. thrombophilia)

## Ectopic Pregnancy

### Definition

- embryo implants outside of the endometrial cavity

**Figure 14. Sites of ectopic pregnancy implantation**  
Ampullary (70%) >> isthmal (12%) > fimbrial (11%) > ovarian (3%) > interstitial (2%) > abdominal (1%)

### Epidemiology

- 1/100 pregnancies
- fourth leading cause of maternal mortality, leading cause of death in first trimester
- increase in incidence over the last 3 decades
- three commonest locations for ectopic pregnancy: ampullary (70%), isthmic (12%), fimbrial (11%)

## Etiology

- 50% due to damage of fallopian tube cilia following PID
- intrinsic abnormality of the fertilized ovum
- conception late in cycle
- transmigration of fertilized ovum to contralateral tube

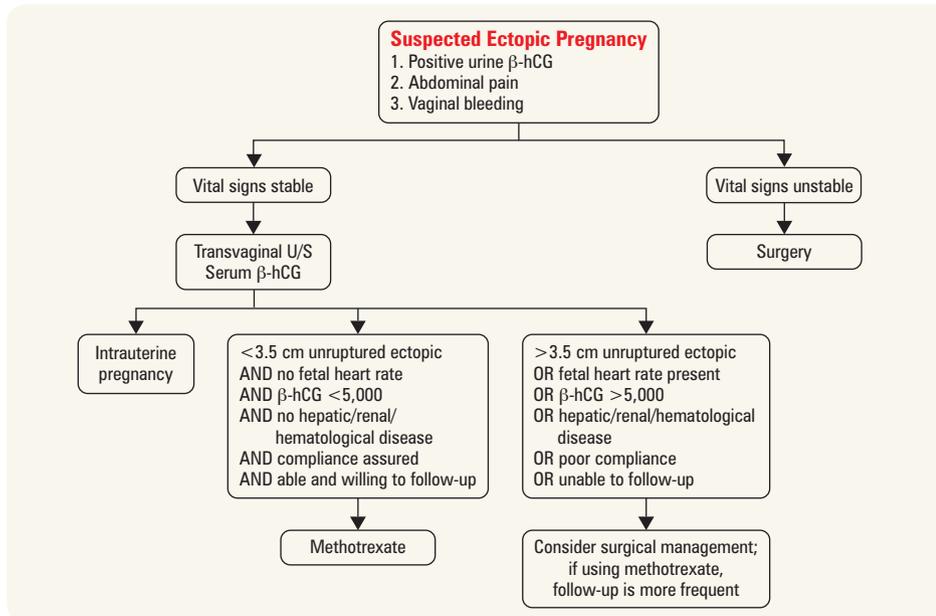

Figure 15. Algorithm for suspected ectopic pregnancy

## Risk Factors

- previous ectopic pregnancy
- gynecologic
  - current IUD use – increased risk of ectopic if pregnancy occurs
  - history of PID (especially infection with *C. trachomatis*), salpingitis
  - infertility
- infertility treatment (IVF pregnancies following ovulation induction [7% ectopic rate])
- previous procedures
  - any surgery on fallopian tube (for previous ectopic, tubal ligation, etc.)
  - abdominal surgery for ruptured appendix, etc.
- smoking
- structural
  - uterine leiomyomas
  - adhesions
  - abnormal uterine anatomy (e.g. T-shaped uterus)

## Investigations

- serial  $\beta$ -hCG levels; normal doubling time with intrauterine pregnancy is 1.6-2.4 d in early pregnancy
  - rise of <20% of  $\beta$ -hCG is 100% predictive of a non-viable pregnancy
  - prolonged doubling time, plateau, or decreasing levels before 8 wk implies nonviable gestation but does not provide information on location of implantation
  - 85% of ectopic pregnancies demonstrate abnormal  $\beta$ -hCG doubling
- ultrasound
  - U/S is only definitive if fetal cardiac activity is detected in the tube or uterus
  - specific finding on transvaginal U/S is a tubal ring
- suspect ectopic in case of empty uterus with  $\beta$ -hCG >5000 and no bleeding
- laparoscopy (sometimes used for definitive diagnosis)

## Treatment

- goals of treatment: conservative (preserve tube if possible), maintain hemodynamic stability
- surgical = laparoscopy
  - linear salpingostomy an option if tube salvageable
  - salpingectomy if tube damaged or ectopic is ipsilateral recurrence
  - 15% risk of persistent trophoblast; must monitor  $\beta$ -hCG titres weekly until they reach non-detectable levels
  - consider Rhogam® if Rh negative
  - may require laparotomy if patient is unstable, extensive abdominal surgical history, etc.

### DDx of Lower Abdominal Pain

- Urinary tract: UTI, kidney stones
- GI: diverticulitis, appendicitis
- Gyne: endometriosis, PID, fibroid (degenerating, infarcted, torsion), ovarian torsion, ovarian neoplasm, ovarian cyst, pregnancy-related

### Clinical Features of Ectopic Pregnancy

#### 4Ts and 1S

Temperature > 38°C (20%)

Tenderness: abdominal (90%) ± rebound (45%)

Tenderness on bimanual examination, cervical motion tenderness

Tissue: palpable adnexal mass (50%) (half have contralateral mass due to lutein cyst)

Signs of pregnancy (e.g. Chadwick's sign, Hegar's sign)

More than half of patients with ectopic pregnancy have no risk factors

### If Ectopic Pregnancy Ruptures

- Acute abdomen with increasing pain
- Abdominal distention
- Shock

### Management of Abortions

- Always rule out an ectopic
- Always check Rh; if negative, give Rhogam®
- Always ensure patient is hemodynamically stable

- medical = methotrexate (for indications see Figure 4)
  - use 50 mg/m<sup>2</sup> body surface area; given in a single IM dose
  - this is 1/5 to 1/6 chemotherapy dose, therefore minimal side effects (reversible hepatic dysfunction, diarrhea, gastritis, dermatitis)
  - follow  $\beta$ -hCG levels weekly until  $\beta$ -hCG is non-detectable
    - ♦ plateau or rising levels suggest persisting trophoblastic tissue (requires further treatment)
  - 82-95% success rate, but up to 25% will require a second dose
  - tubal patency following methotrexate treatment approaches 80%

### Prognosis

- 9% of maternal deaths during pregnancy
- 40-60% of patients will become pregnant again after surgery
- 10-20% will have subsequent ectopic pregnancy

#### Interventions for Tubal Ectopic Pregnancy

*Cochrane DB Syst Rev 2007;1:CD000324*

**Study:** Cochrane Review of randomized controlled trials comparing treatments in women with tubal ectopic pregnancy.

**Patients:** Women with a diagnosis of tubal ectopic pregnancy.

**Intervention:** Surgery (salpingectomy/salpingostomy by open surgery or by laparoscopy), medical treatment, and expectant management.

**Main Outcome:** Primary treatment success, defined as an uneventful decline in serum  $\beta$ -hCG to undetectable levels by the initial treatment.

**Results:** Intramuscular MTX therapy and salpingostomy yielded similar treatment success rates (82-95% for MTX therapy vs. 80-92% for salpingostomy).

**Infertility:** inability to conceive or carry to term a pregnancy after one year of regular, unprotected intercourse

**Primary infertility:** infertility in the context of no prior pregnancies

**Secondary infertility:** infertility in the context of a prior conception

Generally, 75% of couples achieve pregnancy within 6 mo, 85% within 1 yr, 90% within 2 yr

#### Requirements for Conception

- Ovary
- Tube
- Cervix
- Endometrium
- Sperm

#### When Should Investigations Begin?

- <35 yr: after 1 yr of regular unprotected intercourse
- 35-40 yr: after >6 mo
- >40 yr: immediately
- Earlier if
  - History of PID
  - History of infertility in previous relationship
  - Prior pelvic surgery
  - Chemotherapy/radiation in either partner
  - Recurrent pregnancy loss
- Moderate-severe endometriosis

#### Controversial and Evolving Ethical Issues

- Infertility demands non-judgmental discussion
- Ethical issues surrounding therapeutic donor insemination in same sex couples, surrogacy, donor gametes, and other advanced reproductive technologies are still evolving and remain controversial
- If the doctor finds that certain treatment options lie outside of their moral boundaries, the infertile couple should be referred to another physician

## Infertility

### Epidemiology

- 10-15% of couples, must investigate both members of the couple

## Female Factors

### Etiology

- ovulatory dysfunction (15-20%)
  - hypothalamic (hypothalamic amenorrhea)
    - ♦ stress, poor nutrition, excessive exercise (even with presence of menstruation)
  - pituitary (prolactinoma, hypopituitarism)
    - ♦ PCOS
  - ovarian
    - ♦ premature ovarian failure
    - ♦ luteal phase defect (poor follicle production, premature corpus luteum failure, failed uterine lining response to progesterone), poorly understood
  - systemic diseases (thyroid, Cushing's syndrome, renal/hepatic failure)
  - congenital (Turner's syndrome, gonadal dysgenesis or gonadotropin deficiency)
- outflow tract abnormality (15-20%)
  - tubal factors (20-30%)
    - ♦ PID
    - ♦ adhesions (previous surgery, peritonitis, endometriosis)
    - ♦ ligation/occlusion (e.g. previous ectopic pregnancy)
  - uterine factors (<5%)
    - ♦ congenital anomalies, bicornuate uterus, septate uterus, prenatal DES exposure, intrauterine adhesions (e.g. Asherman's syndrome), fibroids/polyps (particularly intrauterine)
    - ♦ infection (endometritis, pelvic TB)
    - ♦ endometrial ablation
  - cervical factors (5%)
    - ♦ hostile or acidic cervical mucus, anti-sperm antibodies
    - ♦ structural defects (cone biopsies, laser or cryotherapy)
- endometriosis (15-30%)
- multiple factors (30%)
- unknown factors (10-15%)

### Investigations

- ovulatory
  - day 3: FSH, LH, TSH, prolactin  $\pm$  DHEA, free testosterone (if hirsute) add estradiol for proper FSH interpretation
  - day 21-23: serum progesterone to confirm ovulation
  - initiate basal body temperature monitoring (biphasic pattern)
  - postcoital test: evaluate mucus for clarity, pH, spinnbarkeit/fibrosity (rarely done)
- tubal factors
  - HSG (can be therapeutic – opens fallopian tube)
  - SHG (can be therapeutic; likely less – opens fallopian tube)
  - laparoscopy with dye insufflation (or tubal dye test)
- peritoneal/uterine factors
  - HSG/SHG, hysteroscopy
- other
  - karyotype

## Treatment

- education: timing intercourse relative to ovulation (from 2 d prior to 2 d following presumed ovulation), every other day
  - medical
    - ovulation induction
      - ♦ clomiphene citrate (Clomid<sup>®</sup>): estrogen antagonist causing a perceived decreased estrogen state, resulting in increased pituitary gonadotropins; which increases FSH and LH and induces ovulation (better results if anovulatory)
      - ♦ followed by  $\beta$ -hCG for stimulation of ovum release
    - may add
      - ♦ bromocriptine (dopamine agonist) if elevated prolactin
      - ♦ dexamethasone for hyperandrogenism (adult onset congenital adrenal hyperplasia)
      - ♦ metformin (for PCOS)
      - ♦ luteal phase progesterone supplementation for luteal phase defect (mechanism not completely understood)
      - ♦ anticoagulation and ASA (81 mg PO OD) for women with a history of recurrent spontaneous abortions (for antiphospholipid antibody syndrome)
      - ♦ thyroid replacement to keep TSH < 2.5
  - surgical/procedural
    - tubuloplasty
    - lysis of adhesions
    - artificial insemination: intracervical insemination (ICI), intrauterine insemination (IUI), intrauterine tuboperitoneal insemination (IUTPI), intratubal insemination (ITI)
    - sperm washing
    - IVF (in vitro fertilization)
    - IFT (intrafallopian transfer)
    - GIFT\* (gamete intrafallopian transfer): immediate transfer with sperm after oocyte retrieval
    - ZIFT\* (zygote intrafallopian transfer): transfer after 24 h culture of oocyte and sperm
    - TET\* (tubal embryo transfer): transfer after >24 h culture
    - ICSI (intracytoplasmic sperm injection)
    - IVM (in vitro maturation)
      - ± oocyte or sperm donors
      - ± pre-genetic screening for single gene defects in karyotype of zygote
- \*not performed in Canada

### Livebirth After Uterus Transplantation

*Lancet* 2015;385:607-16.

**Purpose:** Treatment for absolute uterine infertility. Eleven previous human uterus transplantations performed but all unsuccessful in producing livebirths.

**Patient/Method:** 35 yr old woman with congenital absence of uterus (Rokitansky syndrome) underwent transplantation of uterus donated from a living 61 yr old P2 woman. Implantation was performed using in vitro fertilization generated embryo derived from the recipient and her partner.

**Results:** Recipient and donor had uneventful postoperative recoveries. The recipient initiated menstruation 43 d after transplantation and her menstrual cycle remained regular, ranging from 26-36 d. Embryo transfer was performed 1 yr after transplantation, resulting in intrauterine pregnancy. The recipient was then treated with triple immunosuppressive therapy (tacrolimus, azathioprine, and corticosteroids), which was continued throughout her pregnancy. The patient experienced one episode of mild rejection during her pregnancy, which was treated with corticosteroids. Fetal growth paras and doppler studies were normal throughout her pregnancy. The patient was admitted at 31 + 5 wk for pre-eclampsia and a caesarean section was performed owing to abnormal fetal tracings. A male baby with normal birth weight (1775g) and APGAR scores was born.

**Conclusions:** Successful proof-of-concept uterus transplantation as treatment for uterine factor infertility using live uterus donation from a postmenopausal donor.

## Male Factors

- see [Urology, U34](#)

### Etiology

- varicocele (>40%)
- idiopathic (>20%)
- obstruction (~15%)
- cryptorchidism (~8%)
- immunologic (~3%)

### Investigations

- semen analysis and culture
- postcoital (Huhner) test: rarely done

### Normal Semen Analysis (WHO lower reference limits)

- Must be obtained after 2-7 d of abstinence
  - Volume 1.5 cc
  - Count 15 million/cc
  - Vitality 58% live
  - Motility 32% progressive, 40% total (progressive + non-progressive)
- Morphology 4.0% normal

## Polycystic Ovarian Syndrome

- also called chronic ovarian androgenism

### Etiology

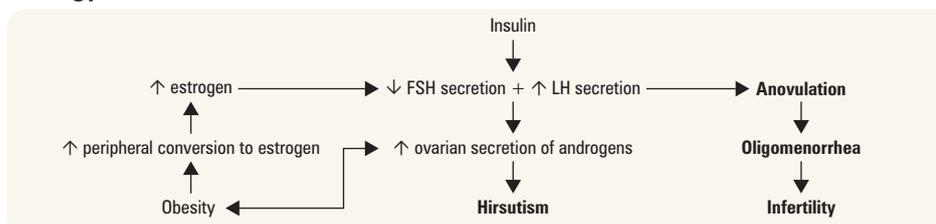

Figure 16. Pathophysiology of polycystic ovarian syndrome

**Polycystic Ovarian Syndrome – HAIR-AN**  
Hirsutism, HyperAndrogenism, Infertility, Insulin Resistance, Acanthosis Nigrans

## Diagnosis

- Rotterdam diagnostic criteria: 2 of 3 required
  - oligomenorrhea/irregular menses for 6 mo
  - hyperandrogenism
    - clinical evidence - hirsutism or male pattern alopecia or
    - biochemical evidence - raised free testosterone
  - polycystic ovaries on U/S

## Clinical Features

- average age 15-35 yr at presentation
- in adolescents, wait at least 1-2 yr to make diagnosis
- abnormal/irregular uterine bleeding, hirsutism, infertility, obesity, virilization
- acanthosis nigricans: browning of skin folds in intertriginous zones (indicative of insulin resistance)
- insulin resistance occurs in both lean and obese patients, family history of DM

## Investigations

- goal: identify hyperandrogenism or chronic anovulation; and rule out specific pituitary or adrenal disease as the cause
- laboratory
  - prolactin, 17-hydroxyprogesterone, free testosterone, DHEA-S, TSH, free T4, androstenedione, SHBG
  - LH:FSH >2:1; LH is chronically high with FSH mid-range or low (low sensitivity and specificity)
  - increased DHEA-S, androstenedione and free testosterone (most sensitive), decreased SHBG
- transvaginal or transabdominal U/S: polycystic-appearing ovaries ("string of pearls" – 12 or more small follicles 2-9 mm, or increased ovarian volume)
- tests for insulin resistance or glucose tolerance
  - fasting glucose:insulin ratio <4.5 is consistent with insulin resistance (U.S. units)
  - 75 g OGTT yearly (particularly if obese)
- laparoscopy
  - not required for diagnosis
  - most common to see white, smooth, sclerotic ovaries with a thick capsule; multiple follicular cysts in various stages of atresia; hyperplastic theca and stroma
- rule out other causes of abnormal bleeding

## Treatment

- cycle control
  - lifestyle modification (decrease BMI, increase exercise) to decrease peripheral estrone formation
  - OCP monthly or cyclic Provera® to prevent endometrial hyperplasia due to unopposed estrogen
  - oral hypoglycemic (e.g. metformin) if type 2 diabetic or if trying to become pregnant
  - tranexamic acid (Cyklokapron®) for menorrhagia only
- infertility
  - medical induction of ovulation: clomiphene citrate, human menopausal gonadotropins (HMG [Pergonal®]), LHRH, recombinant FSH, and metformin
    - metformin may be used alone or in conjunction with clomiphene citrate for ovulation induction
  - ovarian drilling (perforate the stroma), wedge resection of the ovary
  - bromocriptine (if hyperprolactinemia)
- hirsutism
  - any OCP can be used
    - Diane 35® (cyproterone acetate): antiandrogenic
    - Yasmin® (drospirenone and ethinyl estradiol): spironolactone analogue (inhibits steroid receptors)
  - mechanical removal of hair
  - finasteride (5- $\alpha$  reductase inhibitor)
  - flutamide (androgen reuptake inhibitor)
  - spironolactone: androgen receptor inhibitor

### PCOS may be Confused with

- Late onset congenital adrenal hyperplasia (21-hydroxylase deficiency)
- Cushing's syndrome
- Ovarian and adrenal neoplasms
- Hyperprolactinemia
- Hypothyroidism

### Clinical Signs of Endocrine Imbalance

- Menstrual disorder/amenorrhea (80%)
- Infertility (74%)
- Hirsutism (69%)
- Obesity (49%)
- Impaired glucose tolerance (35%)
- DM (10%)

### Long-Term Health Consequences

- Hyperlipidemia
- Adult-onset DM
- Endometrial hyperplasia
- Infertility
- Obesity
- Sleep apnea

### Use of Metformin in Polycystic Ovary Syndrome: A Meta-Analysis

*Obstet Gynecol* 2008;111(4):959-68.

**Study:** This meta-analysis of 17 RCTs assessed the efficacy of metformin or metformin in combination with clomiphene citrate in women with PCOS who were seeking pregnancy.

**Main Outcomes:** Ovulation, pregnancy, and live birth. Patients: 1,639 patients with PCOS were followed up for up to 12 mo.

**Results:** Compared to placebo, metformin increased the odds of ovulation (OR 2.94, 95% CI 1.43-6.02). However, when used alone, metformin did not significantly increase the odds of achieving pregnancy (OR 1.56, 95% CI 0.74-3.33). When compared to clomiphene alone, the combination of metformin and clomiphene increased the likelihood of ovulation (OR 4.39, 95% CI 1.94-9.96) and pregnancy (OR 2.67, 95% CI 1.45-4.94). The effect of combination therapy was most prominent in clomiphene-resistant and obese women with PCOS. Furthermore, the combination therapy had a higher likelihood of having a live birth compared to clomiphene alone, but this did not reach significance (OR 1.74, 95% CI 0.79-3.86).

**Conclusions:** Metformin increases the likelihood of ovulation. When used together with clomiphene, metformin increases the likelihood of both ovulation and pregnancy, especially in clomiphene-resistant and obese women.

### Diagnostic Criteria for Polycystic Ovary Syndrome: Pitfalls and Controversies

*JOGC* 2008;8:671-679

At present, there is no clear-cut definition of biochemical hyperandrogenemia, particularly since there is dependence on poor atory standards for measuring androgens in women. Clinical signs of hyperandrogenism are ill-defined in women with PCOS, and diagnosis of both hirsutism and polycystic ovarian morphology remains subjective. There is also the inappropriate tendency to assign ovulatory status solely on basis of menstrual cycle history or poorly timed endocrine measurements. Therefore it is important as clinicians to recognize the multi-factorial and complex nature of PCOS and place this in the context of our present diagnostic limitations.

# Gynecological Infections

## Physiologic Discharge

- clear, white, flocculent, odourless discharge; pH 3.8-4.2
- smear contains epithelial cells, Lactobacilli
- increases with increased estrogen states: pregnancy, OCP, mid-cycle, PCOS, or premenarchal
- if increased in perimenopausal/postmenopausal woman, consider investigation for other effects of excess estrogen (e.g. endometrial cancer)

## Vulvovaginitis

### PREPUBERTAL VULVOVAGINITIS

- clinical features
  - irritation, pruritus
  - discharge
  - vulvar erythema
  - vaginal bleeding (specifically due to Group A Streptococci and *Shigella*)
- differential diagnosis
  - non-specific vulvovaginitis (25-75%)
  - infections (respiratory, enteric, systemic, sexually acquired)
  - foreign body (toilet paper most common)
  - Candida (if using diapers or chronic antibiotics)
  - pinworms
  - polyps, tumour (ovarian malignancy)
  - vulvar skin disease (lichen sclerosis, condyloma acuminata)
  - trauma (accidental straddle injury, sexual abuse)
  - psychosomatic vaginal complaints (specific to vaginal discharge)
  - endocrine abnormalities (specific to vaginal bleeding)
  - blood dyscrasia (specific to vaginal bleeding)
- etiology
  - infectious
    - ◆ poor hygiene, proximity of vagina to anus
    - ◆ recent infection (respiratory, enteric, systemic)
    - ◆ STI: investigate sexual abuse
  - non-specific
    - ◆ lack of protective hair and labial fat pads
    - ◆ lack of estrogenization
    - ◆ susceptible to chemicals, soaps (bubble baths), medications, and clothing
    - ◆ enuresis
- investigations
  - vaginal swab for culture (specifically state that it is a pre-pubertal specimen), pH, wet-mount, and KOH smear in adults only
- treatment
  - enhanced hygiene and local measures (handwashing, white cotton underwear, no nylon tights, no tight fitting clothes, no sleeper pajamas, sitz baths, avoid bubble baths, use mild detergent, eliminate fabric softener, avoid prolonged exposure to wet bathing suits, urination with legs spread apart)
  - A&D® dermatological ointment (vitamin A/D) to protect vulvar skin
  - infectious: treat with antibiotics for organism identified

**Table 14. Other Common Causes of Vulvovaginitis in Prepubertal Girls**

	Pinworms	Lichen Sclerosis	Foreign Body
<b>Diagnosis</b>	Cellophane tape test	Area of white patches and thinning of skin	
<b>Treatment</b>	Empirical treatment with mebendazole	Topical steroid creams	Irrigation of vagina with saline, may require local anesthesia or an exam under anesthesia

### VAGINITISROPHIC / VAGINITIS

- clinical features
  - dyspareunia, postcoital spotting, mild pruritus
- investigations
  - atrophy is usually a visual diagnosis: thinning of tissues, erythema, petechiae, bleeding points, dryness on speculum exam
  - rule out malignancy, especially endometrial cancer
- treatment
  - local estrogen replacement (ideal): Premarin® cream, VagiFem® tablets, or Estrin®
  - oral or transdermal hormone replacement therapy (if treatment for systemic symptoms is desired)
  - good hygiene

**Vulvovaginitis**  
Vulvar and vaginal inflammation

**Prepubertal and Adolescent Gynecological Infections: Legal Aspects of Confidentiality**

- Clinicians who treat adolescents must be aware of federal, state, and provincial laws related to adolescent consent and confidentiality
- They must be aware of guidelines governing funding sources for particular services and be familiar with the consent and confidentiality policies of the facility in which they practice

There is no high quality evidence showing a link between vulvovaginal candidiasis and hygienic habits or wearing tight or synthetic clothing

Most common gynecological problem in prepubertal girls is non-specific vulvovaginitis, not yeast

**INFECTIOUS VULVOVAGINITIS**

**Table 15. Infectious Vulvovaginitis**

	<b>Candidiasis</b>	<b>Bacterial Vaginosis (BV)</b>	<b>Trichomoniasis</b>
<b>Organisms</b>	<i>Candida albicans</i> (90%) <i>Candida glabrata</i> (<5%) <i>Candida tropicalis</i> (<5%)	<i>Gardnerella vaginalis</i> <i>Mycoplasma hominis</i> Anaerobes: <i>Prevotella</i> , <i>Mobiluncus</i> , <i>Bacteroides</i>	<i>Trichomonas vaginalis</i> (flagellated protozoan)
<b>Pathophysiology or Transmission</b>	Predisposing factors include: Immunosuppressed host (DM, AIDS, etc.) Recent antibiotic use Increased estrogen levels (e.g. pregnancy, OCP)	Replacement of vaginal <i>Lactobacillus</i> with organisms above	Sexual transmission
<b>Discharge</b>	Whitish, "cottage cheese," minimal	Grey, thin, diffuse	Yellow-green, malodorous, diffuse, frothy
<b>Other</b>	20% asymptomatic	50-75% asymptomatic	25% asymptomatic
<b>Signs/Symptoms</b>	Intense pruritus Swollen, inflamed genitals Vulvar burning, dysuria, dyspareunia	Fishy odour, especially after coitus Absence of vulvar/vaginal irritation	Petechiae on vagina and cervix Occasionally irritated tender vulva Dysuria, frequency
<b>pH</b>	≤4.5	≥4.5	≥4.5
<b>Saline Wetmount</b>	KOH wetmount reveals hyphae and spores	>20% clue cells = squamous epithelial cells dotted with coccobacilli ( <i>Gardnerella</i> ) Paucity of WBC Paucity of <i>Lactobacilli</i> Positive whiff test: fishy odour with addition of KOH to slide (due to formation of amines)	Motile flagellated organisms Many WBC Inflammatory cells (PMNs)
<b>Treatment</b>	Clotrimazole, butoconazole, miconazole, terconazole suppositories, and/or creams for 1, 3, or 7 d treatments Treatment in pregnancy is usually topical Fluconazole 150 mg PO in single dose (can be used in pregnancy)	No treatment if non-pregnant and asymptomatic, unless scheduled for pelvic surgery or procedure <b>Oral</b> Metronidazole 500 mg PO bid x 7 d <b>Topical</b> Metronidazole gel 0.75% x 5 d OD (may be used in pregnancy) Clindamycin 2% 5 g intravaginally at bedtime for 7 d Probiotics ( <i>Lactobacillus</i> sp.): oral or topical alone or as adjuvant	Treat even if asymptomatic Metronidazole 2 g PO single dose or 500 mg bid x 7 d (alternative) Symptomatic pregnant women should be treated with 2 g metronidazole once
<b>Other</b>	Prophylaxis for recurrent infection includes boric acid, vaginal suppositories, luteal phase fluconazole Routine treatment of partner(s) not recommended (not sexually transmitted)	Associated with recurrent preterm labour, preterm birth, and postpartum endometritis Need to warn patients on metronidazole not to consume alcohol (disulfiram-like action) Routine treatment of partner(s) not recommended (not sexually transmitted)	Warnings accompanying metronidazole use Treat partner(s)

**Sexually Transmitted Infections**

• see [Family Medicine, FM42](#)

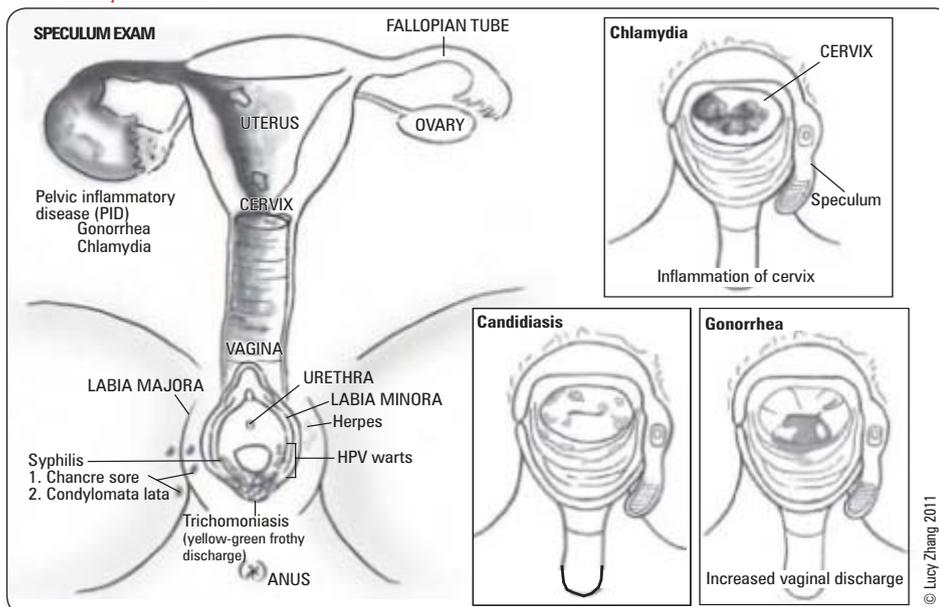

Figure 17. Speculum exam

**CDC Notifiable Diseases**

- Chancroid
- Chlamydia
- Gonorrhea
- Hepatitis A, B, C
- HIV
- Syphilis

**Risk Factors for STIs**

- History of previous STI
- Contact with infected person
- Sexually active individual <25 yr
- Multiple partners
- New partner in last 3 mo
- Lack of barrier protection use
- Street involvement (homelessness, drug use)

## TRICHOMONIASIS

- see *Infectious Vulvovaginitis*, Table 15

## CHLAMYDIA

### Etiology

- Chlamydia trachomatis

### Epidemiology

- most common bacterial STI in Canada
- often associated with *N. gonorrhoeae*

### Clinical Features

- asymptomatic (80% of women)
- muco-purulent endocervical discharge
- urethral syndrome: dysuria, frequency, pyuria, no bacteria on culture
- pelvic pain
- postcoital bleeding or intermenstrual bleeding (particularly if on OCP and prior history of good cycle control)
- symptomatic sexual partner

### Investigations

- cervical culture or nucleic acid amplification test
- obligate intracellular parasite: tissue culture is the definitive standard
- urine and self vaginal tests now available, which are equally or more effective than cervical culture

### Treatment

- doxycycline 100 mg PO bid for 7 d or azithromycin 1 g PO in a single dose (may use in pregnancy)
- also treat gonorrhoea because of high rate of co-infection
- treat partners
- reportable disease
- test of cure for chlamydia required in pregnancy (cure rates lower in pregnant patients) → retest 3-4 wk after initiation of therapy

### Screening

- high risk groups
- during pregnancy
- when initiating OCP if sexually active (independent risk factor)

### Complications

- acute salpingitis, PID
- Fitz-Hugh-Curtis syndrome (liver capsule inflammation)
- reactive arthritis (male predominance, HLA-B27 associated), conjunctivitis, urethritis
- infertility: tubal obstruction from low grade salpingitis
- ectopic pregnancy
- chronic pelvic pain
- perinatal infection: conjunctivitis, pneumonia

### Etiology

- *Neisseria gonorrhoeae*
- symptoms and risk factors same as with chlamydia

### Investigations

- Gram stain shows Gram-negative intracellular diplococci
- cervical, rectal, and throat culture (if clinically indicated)

### Treatment

- single dose of ceftriaxone 250 mg IM plus azithromycin 1 g PO
  - if pregnant: above regimen or 2 g spectinomycin IM plus azithromycin 1 g PO (avoid quinolones)
  - also treat chlamydia, because of high rate of co-infection
- treat partners
  - reportable disease
  - screening as with chlamydia

#### STI Testing

- Vaginal swab
- Tests for bacterial vaginosis, trichomoniasis, candida
- Cervical swab
- Tests for gonorrhoea and chlamydia

Test of cure for *C. trachomatis* and *N. gonorrhoeae* is not routinely indicated  
Repeat testing if symptomatic, if compliance with treatment is uncertain, or if pregnant

## HUMAN PAPILLOMAVIRUS

### Etiology

- most common viral STI in Canada
- >200 subtypes, of which >30 are genital subtypes
- HPV types 6 and 11 are classically associated with anogenital warts/condylomata acuminata
- HPV types 16 and 18 are the most oncogenic (classically associated with cervical HSIL)
- types 16, 18, 31, 33, 35, 36, 45 (and others) associated with increased incidence of cervical and vulvar intraepithelial hyperplasia and carcinoma

### Clinical Features

- latent infection
  - no visible lesions, asymptomatic
  - only detected by DNA hybridization tests
- subclinical infection
  - visible lesion found during colposcopy or on Pap test
- clinical infection
  - visible wart-like lesion without magnification
  - hyperkeratotic, verrucous or flat, macular lesions
  - vulvar edema

### Investigations

- cytology
- koilocytosis: nuclear enlargement and atypia with perinuclear halo
- biopsy of lesions at colposcopy
- detection of HPV DNA subtype using nucleic acid probes (not routinely done but can be done in presence of abnormal Pap test to guide treatment)

### Treatment

- patient administered
  - podofilox 0.5% solution or gel bid x 3 d in a row (4 d off) then repeat x 4 wk
  - imiquimod (Aldara®) 5% cream 3x/wk qhs x 16 wk
- provider administered
  - cryotherapy with liquid nitrogen: repeat q1-2wk
  - podophyllin resin in tincture of benzoin: weekly
  - trichloroacetic acid (TCA) or bichloroacetic acid weekly (80-90%); safe in pregnancy
  - surgical removal/laser
  - intralesional interferon

### Prevention

- vaccination: Gardasil®, Cervarix® see Table 25, GY43
- condoms may not fully protect (areas not covered, must be used every time throughout entire sexual act)

## HERPES SIMPLEX VIRUS OF VULVA

### Etiology

- 90% are HSV-2, 10% are HSV-1

### Clinical Features

- may be asymptomatic
- initial symptoms: present 2-21 d after contact
- prodromal symptoms: tingling, burning, pruritus
- multiple, painful, shallow ulcerations with small vesicles appear 7-10 d after initial infection (absent in many infected persons); lesions are infectious
- inguinal lymphadenopathy, malaise, and fever often with first infection
- dysuria and urinary retention if urethral mucosa affected
- recurrent infections: less severe, less frequent, and shorter in duration (usually only HSV-2)

### Investigations

- viral culture preferred in patients with ulcer present, however decreased sensitivity as lesions heal
- cytologic smear (Tzanck smear) shows multinucleated giant cells, acidophilic intranuclear inclusion bodies
- HSV DNA PCR
- type specific serologic tests for antibodies to HSV-1 and HSV-2 (not available routinely in Canada)

#### Genital Warts During Pregnancy

- Condyloma tend to get larger in pregnancy and should be treated early (consider excision)
- C-section only if obstructing birth canal or risk of extensive bleeding
- Do not use imiquimod, podophyllin, or podofilox

#### Human Rights in Health Equity: Cervical Cancer and HPV Vaccines

*Am J Law Med* 2009;35:365-387

- While cervical cancer rates have drastically fallen in developed countries due to effective prevention and treatment, socially disadvantaged women within these countries remain disproportionately more likely to develop and die of cervical cancer.
- In most developing countries cervical cancer rates have risen or remained unchanged.
- Must recognize that cervical cancer disparities between race groups, urban and rural residence, and high and low socioeconomic status are attributed to disparate screening and vaccination coverage.
- Programs are implemented without sufficient attention to conditions that render screening less effective or inaccessible to disadvantaged social groups including: lack of information, undervaluing of preventive care, opportunistic delivery in limited health care settings, sexual health stigma, and related privacy concerns.

#### A 9-Valent HPV Vaccine Against Infection and Intraepithelial Neoplasia in Women

*NEJM* 2015;372:711-23.

**Purpose:** To determine the efficacy and immunogenicity of the qHPV (types 6, 11, 16, 18) vs. 9vHPV (five additional types 31, 33, 45, 52, 58) vaccines.

**Method:** International randomized, double-blinded phase 2B-3 study of 9vHPV vaccine in 14,215 women between ages of 16-26. Participants were randomized to the 9vHPV vaccine group or the qHPV vaccine group and each received a series of three IM injections (day 1, 2 and 6 months). Swabs of labial, vulvar, perineal, perianal, endocervical, and ectocervical tissue was obtained and used for HPV DNA testing/Pap smear.

**Results:** Rate of high-grade cervical, vulvar, or vaginal disease was 14.0 per 1,000 person-years in both vaccine groups. The rate of high-grade cervical, vulvar, or vaginal disease related to HPV-31, 33, 45, 52, and 58 was 0.1 per 1,000 person-years in the 9vHPV group and 1.6 per 1,000 person-years in the qHPV group (95% CI = 80.9-99.8). Antibody responses to HPV-6, 11, 16, and 18 were not significantly different between the two vaccine groups although adverse events related to injection sites were more common in the 9vHPV group.

**Conclusions:** The 9vHPV vaccine was non-inferior to qHPV vaccine in preventing infection and disease related to HPV-6, 11, 16, and 18 and also covered additional oncogenic types HPV-31, 33, 45, 52, and 58 in a susceptible population.

## Treatment

- first episode
  - acyclovir 200 mg PO five times daily x 5-10 d, or famciclovir 250 mg PO tid x 7-10 5 d, or valacyclovir 1 g PO bid x 10 d
- recurrent episode
  - acyclovir 200 mg PO five times daily x 5 d, or famciclovir 125 mg PO bid x 5 d, or valacyclovir 500 mg PO bid OR 1 g PO OD x 3 d
- daily suppressive therapy
  - consider for > 6 recurrences per yr or one every 2 mo
  - acyclovir 400 mg PO bid, or famciclovir 250 mg bid, or valacyclovir 0.5-1 g PO OD
- severe disease: consider IV therapy: acyclovir 55 mg/kg IV over 60 min q8h
- education regarding transmission
- avoid contact from onset of prodrome until lesions have cleared
- use barrier contraception

## SYPHILIS

### Etiology

- *Treponema pallidum*

### Classifications

- primary syphilis
  - 3-4 wk after exposure
  - painless chancre on vulva, vagina, or cervix
  - painless inguinal lymphadenopathy
  - serological tests usually negative, local infection only
- secondary syphilis (can resolve spontaneously)
  - 2-6 mo after initial infection
  - nonspecific symptoms: malaise, anorexia, headache, diffuse lymphadenopathy
  - generalized maculopapular rash: palms, soles, trunk, limbs
  - condylomata lata: anogenital, broad-based fleshy grey lesions
  - serological tests usually positive
- latent syphilis
  - no clinical manifestations; detected by serology only
- tertiary syphilis
  - may involve any organ system
  - neurological: tabes dorsalis, general paresis
  - cardiovascular: aortic aneurysm, dilated aortic root
  - vulvar gumma: nodules that enlarge, ulcerate and become necrotic (rare)
- congenital syphilis
  - may cause fetal anomalies, stillbirths, or neonatal death

### Investigations

- aspiration of ulcer serum or node
- darkfield microscopy (most sensitive and specific diagnostic test for syphilis)
  - spirochetes
- non-treponemal screening tests (VDRL, RPR); nonreactive after treatment, can be positive with other conditions
- specific anti-treponemal antibody tests (FTA-ABS, MHA-TP, TP-PA)
  - confirmatory tests; remain reactive for life (even after adequate treatment)

### Treatment

- treatment of primary, secondary, latent syphilis of <1 yr duration
  - benzathine penicillin G 2.4 million units IM single dose
  - treat partners, reportable disease
- treatment of latent syphilis of >1 yr duration
  - benzathine penicillin G 2.4 million units IM q1wk x 3 wk
- treatment of neurosyphilis
  - IV aqueous penicillin G 3-4 million units IM q4h x 10-14 d
- screening
  - high risk groups
  - in pregnancy (see [Obstetrics, Table Infections During Pregnancy, OB29](#))

### Complications

- if untreated, 1/3 will experience late complications

### HIV

- see [Infectious Diseases, ID27](#)

#### HSV Infections During Pregnancy

- Antiviral suppression of women with first episode or history of HSV infections from 36 wk GA onward
- C-section should be performed on women who have active genital lesions at time of delivery
- Treatment: acyclovir 400 mg PO tid

#### Epidemiology of Genital Ulcers

HSV	70-80%
1° Syphilis	5%
Chancroid ( <i>Haemophilus ducreyi</i> )	<1%

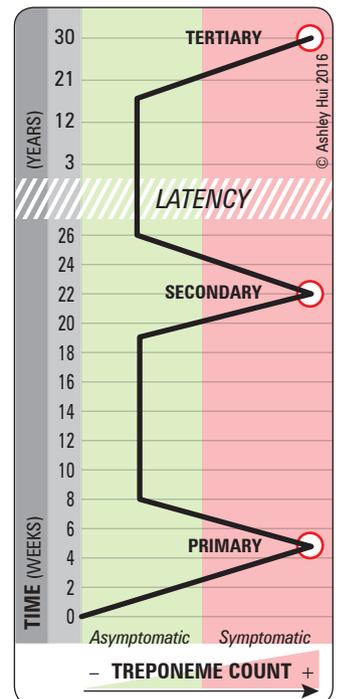

Figure 18. Natural history of syphilis infection

## Bartholin Gland Abscess

### Etiology

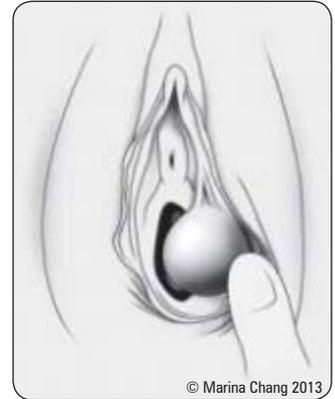

- often anaerobic and polymicrobial
- *U. urealyticum*, *N. gonorrhoeae*, *C. trachomatis*, *E. coli*, *P. mirabilis*, *Streptococcus* spp., *S. aureus* (rare)
- blockage of duct

### Clinical Features

- unilateral swelling and pain in inferior lateral opening of vagina
- sitting and walking may become difficult and/or painful

### Treatment

- sitz baths, warm compresses
- antibiotics: cephalexin x 1 wk
- incision and drainage using local anesthesia with placement of Word catheter (10 French latex catheter) for 2-3 wk (or as long as stays insitu)
- marsupialization under general anesthetic – more definitive treatment
- rarely treated by removing gland

© Marina Chang 2013

Figure 19. Bartholin's gland abscess

## Pelvic Inflammatory Disease

- up to 20% of all gynecology-related hospital admissions

### Etiology

- causative organisms (in order of frequency)
  - *C. trachomatis*
  - *N. gonorrhoeae*
    - ♦ gonorrhea and chlamydia often co-exist
  - endogenous flora: anaerobic, aerobic, or both
    - ♦ *E. coli*, *Staphylococcus*, *Streptococcus*, *Enterococcus*, *Bacteroides*, *Peptostreptococcus*, *H. influenzae*, *G. vaginalis*
    - ♦ cause of recurrent PID
    - ♦ associated with instrumentation
  - *Actinomyces israelii* (Gram-positive, non acid-fast anaerobe)
    - ♦ 1-4% of PID cases associated with IUDs
  - others (TB, Gram-negatives, CMV, *U. urealyticum*, etc.)

### Risk Factors

- age <30 yr
- risk factors as for chlamydia and gonorrhea
- vaginal douching
- IUD (within first 10 d after insertion)
- invasive gynecologic procedures (D&C, endometrial biopsy)

### Clinical Presentation

- up to 2/3 asymptomatic: many subtle or mild symptoms
- common: fever >38.3° C, lower abdominal pain and tenderness, abnormal discharge: cervical or vaginal
- uncommon: N/V, dysuria, AUB
- chronic disease (often due to chlamydia)
  - constant pelvic pain
  - dyspareunia
  - palpable mass
  - very difficult to treat, may require surgery

### Investigations

- blood work
  - $\beta$ -hCG (must rule out ectopic pregnancy), CBC, blood cultures if suspect septicemia
- urine R&M
- speculum exam, bimanual exam
  - vaginal swab for Gram stain, C&S
  - cervical cultures for *N. gonorrhoeae*, *C. trachomatis*
  - endometrial biopsy will give definitive diagnosis (rarely done)
- ultrasound
  - may be normal
  - free fluid in cul-de-sac
  - pelvic or tubo-ovarian abscess
  - hydrosalpinx (dilated fallopian tube)
- laparoscopy (gold standard)
  - for definitive diagnosis: may miss subtle inflammation of tubes or endometritis

PID accounts for up to 20% of all gynecological hospital admissions

**PID**  
Inflammation of the upper genital tract (above cervix) including endometrium, fallopian tubes, ovaries, pelvic peritoneum,  $\pm$  contiguous structures

**PID Diagnosis**  
**Must have**

- Lower abdominal pain

**Plus one of**

- Cervical motion tenderness
- Adnexal tenderness

**Plus one or more of**

- High risk partner
- Temperature >38°C
- Mucopurulent cervical discharge
- Positive culture for *N. gonorrhoeae*, *C. trachomatis*, *E. coli*, or other vaginal flora
- Cul-de-sac fluid, pelvic abscess or inflammatory mass on U/S or bimanual
- Leukocytosis
- Elevated ESR or CRP (not commonly used)

## Treatment

- must treat with polymicrobial coverage
- inpatient if
  - moderate to severe illness
  - atypical infection
  - adnexal mass, tubo-ovarian mass, or pelvic abscess
  - unable to tolerate oral antibiotics or failed oral therapy
  - immunocompromised
  - pregnant
  - adolescent – first episode
  - surgical emergency cannot be excluded (e.g. ovarian torsion)
  - PID is secondary to instrumentation
  - recommended treatment
    - ◆ cefoxitin 2 g IV q6h (no longer available in U.S.A.) + doxycycline 100 mg IV/PO q12h or clindamycin 900 mg IV q8h + gentamicin 2 mg/kg IV/IM loading dose then gentamicin 1.5 mg/kg IV q8h maintenance dose
    - ◆ continue IV antibiotics for 24 h after symptoms have improved then doxycycline 100 mg PO bid to complete 14 d
    - ◆ percutaneous drainage of abscess under U/S guidance
    - ◆ when no response to treatment, laparoscopic drainage
    - ◆ if failure, treatment is surgical (salpingectomy, TAH/BSO)
- outpatient if
  - typical findings
  - mild to moderate illness
  - oral antibiotics tolerated
  - compliance ensured
  - follow-up within 48-72 h (to ensure symptoms not worsening)
  - recommended treatment
    - ◆ ceftriaxone 250 mg IM x 1 + doxycycline 100 mg PO bid x 14 d or cefoxitin 2 g IM x 1 + probenecid 1 g PO + doxycycline 100 mg PO bid ± metronidazole 500 mg PO bid x 14 d
    - ◆ ofloxacin 400 mg PO bid x 14 d or levofloxacin 500 mg PO OD x 14 d ± metronidazole 500 mg PO bid x 14 d
    - ◆ consider removing IUD after a minimum of 24 h of treatment
    - ◆ reportable disease
    - ◆ treat partners
    - ◆ consider re-testing for *C. trachomatis* and *N. gonorrhoeae* 4-6 wk after treatment if documented infection

## Complications of Untreated PID

- chronic pelvic pain
- abscess, peritonitis
- adhesion formation
- ectopic pregnancy
- infertility
  - 1 episode of PID → 13% infertility
  - 2 episodes of PID → 36% infertility
- bacteremia
- septic arthritis, endocarditis

### Alternative PID Treatments

For patients with contraindications to treatment with cephalosporins or quinolones, recent evidence suggests that a short course of azithromycin at a dose of either 250 mg PO daily for

1 wk or 1 g PO weekly for 2 wk combined with metronidazole is effective in achieving a clinical cure for acute PID

Source: Update to the Canadian Guidelines on Sexually Transmitted Infections. January 2010

Treat PID with **FOXY DOXY**  
(cefoxitin + doxycycline)

### PID Complications

#### I FACE PID

Infertility  
Fitz-Hugh-Curtis syndrome  
Abscesses  
Chronic pelvic pain  
Ectopic pregnancy  
Peritonitis  
Intestinal obstruction  
Disseminated infection (sepsis, endocarditis, arthritis, meningitis)

### Toxic Shock Syndrome

Multiple organ system failure due to *S. aureus* exotoxin (rare condition)

## Toxic Shock Syndrome

- see [Infectious Diseases, ID23](#)

### Risk Factors

- tampon use
- diaphragm, cervical cap, or sponge use (prolonged use, i.e. >24 h)
- wound infections
- post-partum infections
- early recognition and treatment of syndrome is imperative as incorrect diagnosis can be fatal

### Clinical Presentation

- sudden high fever
- sore throat, headache, diarrhea
- erythroderma
- signs of multisystem organ failure
- refractory hypotension
- exfoliation of palmar and plantar surfaces of the hands and feet 1-2 wk after onset of illness

### Treatment

- remove potential sources of infection (foreign objects and wound debris)
- debride necrotic tissues
- adequate hydration
- penicillinase-resistant antibiotics, e.g. cloxacillin
- steroid use controversial but if started within 72 h, may reduce severity of symptoms and duration of fever

## Surgical Infections

### Post-Operative Infections in Gynecological Surgery

- pelvic cellulitis
  - common post hysterectomy, affects vaginal vault
  - erythema, induration, tenderness, discharge involving vaginal cuff
  - treat if fever and leukocytosis with broad spectrum antibiotics, i.e. clindamycin and gentamicin
  - drain if excessive purulence or large mass
  - can result in intra-abdominal and pelvic abscess
- see [General Surgery, Post-Operative Fever, GS7](#)

## Sexual Abuse

- see [Family Medicine, FM26](#), [Emergency Medicine, ER27](#)

## Sexuality and Sexual Dysfunction

### SEXUAL RESPONSE

1. desire: energy that allows an individual to initiate or respond to sexual stimulation
2. arousal: physical and emotional stimulation leading to breast and genital vasodilation and clitoral engorgement
3. orgasm: physical and emotional stimulation is maximized, allowing the individual to relinquish their sense of control
4. resolution: most of the congestion and tension resolves within seconds, complete resolution may take up to 60 min

### SEXUAL DYSFUNCTION

#### Etiology

- psychological or emotional: depression, abuse
- hormonal: menopause
- neurologic dysfunction: spinal cord injury
- vascular insufficiency: DM
- drug side effects:  $\beta$ -blockers
- trauma: episiotomy

#### Classification

- lack of desire (60-70% of women)
- lack of arousal
- anorgasmia (5-10%)
  - primary anorgasmia: never before achieved orgasm under any circumstances
  - secondary anorgasmia: was able to achieve orgasms before but now unable to
- dyspareunia (3-6%): painful intercourse, superficial or deep
  - vaginismus (15%)
  - vulvodynia
  - vaginal atrophy
  - vulvar vestibulitis: associated with history of frequent yeast infections
  - PID

#### Treatment

- lack of desire: assess factors, rule out organic causes, relationship therapy, sensate focus exercises
- anorgasmia: self-exploration/pleasuring, relationship therapy if needed, bridging techniques (different sexual positions, clitoral stimulation during intercourse)
- dyspareunia
  - Kegel and reverse Kegel exercises
  - dilator treatment
  - comfort with self-exam
  - psychotherapy, other behavioural techniques
  - female on top position: allows for control of speed and duration
  - vestibulitis: remove local irritants, change in contraceptive methods, dietary changes (increased citrate, decreased oxalate), and vestibulectomy (rare)
  - vulvodynia: local moisturization, cold compresses, systemic nerve blocking therapy (amitriptyline, gabapentin) orally or topically, topical anesthetics, estrogen cream
  - pain clinic

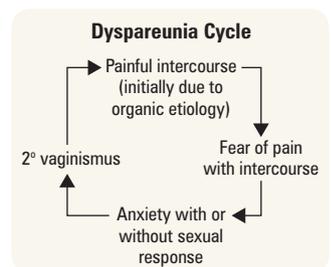

Figure 20. Dyspareunia Cycle

#### Kegel Exercises

Regular contraction and relaxation to strengthen pelvic floor muscles

#### Reverse Kegel Exercises

1 s contraction then 5 s of relaxation

# Menopause

- see [Family Medicine, FM40](#)

## Definitions

- lack of menses for 1 yr
- types of menopause
  - physiological; average age 51 yr (follicular atresia)
  - premature ovarian failure; before age 40 (autoimmune disorder, infection, Turner's syndrome)
  - iatrogenic (surgical/radiation/chemotherapy)

## Clinical Features

- associated with estrogen deficiency
  - vasomotor instability (tends to dissipate with time)
    - ◆ hot flushes/flashes, night sweats, sleep disturbances, formication, nausea, palpitations
  - urogenital atrophy involving vagina, urethra, bladder
    - ◆ dyspareunia, pruritus, vaginal dryness, bleeding, urinary frequency, urgency, incontinence
  - skeletal
    - ◆ osteoporosis, joint and muscle pain, back pain
  - skin and soft tissue
    - ◆ decreased breast size, skin thinning/loss of elasticity
  - psychological
    - ◆ mood disturbance, irritability, fatigue, decreased libido, memory loss

## Investigations

- increased levels of FSH (>35 IU/L) on day 3 of cycle (if still cycling) and LH (FSH>LH)
- FSH level not always predictive due to monthly variation; use absence of menses for 1 yr to diagnose
- decreased levels of estradiol (later)

## Treatment

- goal is for individual symptom management
  - vasomotor instability
    - ◆ HRT (first line), SSRIs, venlafaxine, gabapentin, propranolol, clonidine
    - ◆ acupuncture
  - vaginal atrophy
    - ◆ local estrogen: cream (Premarin®), vaginal suppository (VagiFem®), ring (Estring®)
    - ◆ lubricants (Replens®)
  - urogenital health
    - ◆ lifestyle changes (weight loss, bladder re-training), local estrogen replacement, surgery
  - osteoporosis
    - ◆ 1,000-1,500 mg calcium OD, 800-1,000 IU vitamin D, weight-bearing exercise, smoking cessation
    - ◆ bisphosphonates (e.g. alendronate)
    - ◆ selective estrogen receptor modifiers (SERMs): raloxifene (Evista®) – mimics estrogen effects on bone, avoids estrogen-like action on breast and uterine cancer; does not help hot flashes
    - ◆ HRT: second-line treatment (unless for vasomotor instability as well)
  - decreased libido
    - ◆ vaginal lubrication, counselling, androgen replacement (testosterone cream or the oral form Andriol®)
  - cardiovascular disease
    - ◆ management of cardiovascular risk factors
  - mood and memory
    - ◆ antidepressants (first line), HRT (augments effect)
  - alternative choices (not evidence-based, safety not established)
    - ◆ black cohosh, phytoestrogens, St. John's wort, ginkgo biloba, valerian, evening primrose oil, ginseng, Don Quai

## Hormone Replacement Therapy

- see [Family Medicine, FM40](#)
- primary indication is treatment of menopausal symptoms (vasomotor instability)
- keep doses low (e.g. 0.3 mg Premarin®) and duration of treatment short (<5 yr)

## HRT Components

- estrogen
- oral or transdermal (e.g. patch, gel)
- transdermal preferred for women with hypertriglyceridemia or impaired hepatic function, smokers, and women who suffer from headaches associated with oral HRT

### Menopause

Occurrence of last spontaneous menstrual period, resulting from loss of ovarian function (loss of oocyte response to gonadotropins)

### "Being in menopause"

Lack of menses for 1 yr

### Perimenopause

Period of time surrounding menopause (2-8 yr preceding + 1 yr after last menses) characterized by fluctuating hormone levels, irregular menstrual cycles, and symptom onset

- 85% of women experience hot flashes
- 20-30% seek medical attention
- 10% are unable to work

### Menopause Pathophysiology

Degenerating theca cells fail to react to endogenous gonadotropins (FSH, LH)

↓  
Less estrogen is produced

↓  
Decreased negative feedback on hypothalamic-pituitary-adrenal axis

↓  
Increased FSH and LH

↓  
Stromal cells continue to produce androgens as a result of increased LH stimulation

Figure 21. Menopause pathophysiology

- Osteoporosis is the single most important health hazard associated with menopause
- Cardiovascular disease is the leading cause of death post-menopause

- Increased risk of breast cancer (RR 1.3) is associated with estrogen+progesterone HRT, but not with estrogen-only HRT
- All women taking HRT should have periodic surveillance and counselling regarding its benefits and risks

- low-dose (preferred dose: 0.3 mg Premarin®/25 µg Estradot® patch, can increase if necessary)
- progestin
- given in combination with estrogen for women with an intact uterus to prevent development of endometrial hyperplasia/cancer

**Table 16. Examples of HRT Regimens**

HRT Regimen	Estrogen Dose	Progestin Dose	Notes
<b>Unopposed Estrogen</b>	CEE 0.625 mg PO OD	None	If no intact uterus
<b>Standard-dose</b>	CEE 0.625 mg PO OD	MPA 2.5 mg PO OD, or micronized progesterone 100 mg PO OD	Withdrawal bleeding may occur in a spotty, unpredictable manner Usually abates after 6-8 mo due to endometrial atrophy Once patient has become amenorrheic on HRT, significant subsequent bleeding episodes require evaluation (endometrial biopsy)
<b>Standard-dose Cyclic</b>	CEE 0.625 mg PO OD	MPA 5-10 mg PO days 1-14 only, or micronized progesterone 200 mg PO OD days 1-14 only	Bleeding occurs monthly after day 14 of progestin (can continue for years) PMS-like symptoms (breast tenderness, fluid retention, headache, nausea) are more prominent with cyclic HRT
<b>Pulsatile</b>	CEE 0.625 mg PO OD	MPA low-dose	3 d on, 3 d off
<b>Transdermal</b>	Estroderm®-Estradiol 0.05 mg/d or 0.1 mg/d Estalis®-Estradiol 140 µg/d or 250 µg/d	Estroderm®-MPA 2.5 mg PO OD Estalis®-NEA 50 µg/d	Use patch twice weekly Can use oral progestins (Estroderm®) Combined patches available (Estalis®)
<b>Topical</b>	Estrace® 2-4 g/d x 1-2 wk, 1 g/d maintenance Premarin® 0.5-2 g/d for 21 d then off 7 d for vaginal atrophy, 0.5 g/d for 21 d then off 7 d or twice/wk for dyspareunia Estragyn® 2-4 g/d	Crinone® 4% or 8% (45 or 90 mg applicator)	If simultaneously taking oral estrogen tablet, may need to adjust dosing If intact uterus, also take progesterone

CEE = conjugated equine estrogen (e.g. Premarin®); MPA = medroxyprogesterone acetate (e.g. Provera®); NEA = norethindrone acetate  
Consider lower dose regimens, PREMPRO® 0.45/1.5 (Premarin® 0.45 mg and Provera® 1.5 mg); Estrace® (topical 17β-estradiol) = 0.1 mg active ingredient/g; Premarin® (topical CEE) = 0.625 mg active ingredient/g; Estragyn® (topical estrone) = 1 mg active ingredient/g

### Side Effects of HRT

- abnormal uterine bleeding
- mastodynia – breast tenderness
- edema, bloating, heartburn, nausea
- mood changes (progesterone)
- can be worse in progesterone phase of combined therapy

### Contraindications to HRT

- absolute
  - acute liver disease
  - undiagnosed vaginal bleeding
  - known or suspected uterine cancer/breast cancer
  - acute vascular thrombosis or history of severe thrombophlebitis or thromboembolic disease
  - cardiovascular disease
- relative
  - pre-existing uncontrolled HTN
  - uterine fibroids and endometriosis
  - familial hyperlipidemias
  - migraine headaches
  - family history of estrogen-dependent cancer
  - chronic thrombophlebitis
  - DM (with vascular disease)
  - gallbladder disease, hypertriglyceridemia, impaired liver function (consider transdermal estrogen)
  - fibrocystic disease of the breasts

#### Absolute Contraindications to HRT

##### ABCD

Acute liver disease  
Undiagnosed vaginal **B**leeding  
**C**ancer (breast/uterine), **C**ardiovascular disease  
**D**VT (thromboembolic disease)

**WOMEN'S HEALTH INITIATIVE (launched in 1991)**

- two non-randomized studies investigating health risks and benefits of HRT in healthy postmenopausal women 50-79 yr old
  - continuous combined HRT (CEE 0.625 mg + MPA 2.5 mg OD) in 16,608 women with an intact uterus
  - estrogen-alone (CEE 0.625 mg) in 10,739 women with a previous hysterectomy
- both arms of the trial were stopped early because of evidence of increased risk of breast cancer, stroke, PE, and CHD in the combined HRT arm, and increased risk of stroke with no CHD benefits in the estrogen-alone arm
- the apparent increase in CHD was in disagreement with results of previous observational trial
- results of the WHI study have since been challenged and revision of how CHD was diagnosed led to loss of statistical significance of the results
- benefits and risks reported as number of cases per 10,000 women each year

**Table 17. HRT Benefits vs. Risks**

Benefits	Risks
<p><b>Vasomotor Symptoms:</b> less frequent and severe with use of either combined or estrogen-alone HRT</p> <p><b>Osteoporosis:</b> 5 fewer cases of hip fractures and 47 fewer cases of all fractures with combined HRT; 6 fewer cases of hip fractures with estrogen alone</p> <p><b>Colon Cancer:</b> 6 fewer cases with combined HRT (WHI) One additional case with estrogen-alone</p>	<p><b>Stroke:</b> 8 additional cases with combined HRT, and 12 additional cases for estrogen alone (WHI)</p> <p><b>DVT/PE:</b> 18 additional cases with combined HRT, and 9 additional cases for estrogen-alone (WHI)</p> <p><b>CHD:</b> 7 additional MIs with combined HRT (WHI); secondary analysis suggests greater absolute risk for women aged &gt; 70 yr and for women who start HRT &gt; 10 yr post-menopause</p> <p><b>Breast Cancer:</b> 8 additional cases with combined HRT (WHI) Risk only increased after &gt; 5 yr of combined HRT use; no increased risk for estrogen-alone</p> <p><b>Dementia and Mild Cognitive Impairment:</b> 50% greater risk of developing dementia in women taking estrogen-alone after age 65; risk is greater for women taking combined HRT; risk of developing dementia was reduced for women taking HRT before age 65</p>

**Long-Term Hormone Therapy for Perimenopausal and Postmenopausal Women**

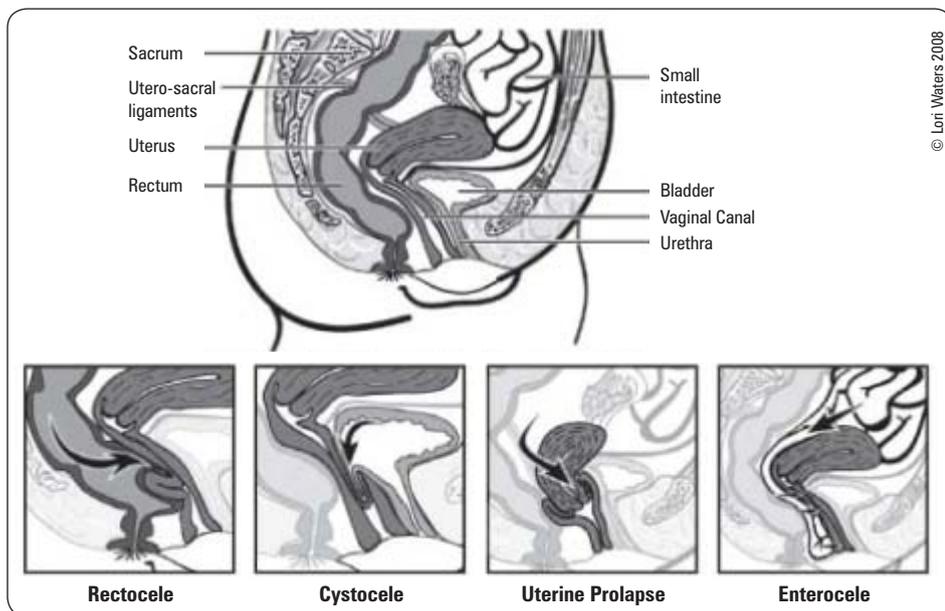

*Cochrane DB Syst Rev 2012;7:CD004143*

**Purpose:** To determine the effect of long-term HRT on mortality, cardiovascular outcomes, cancer, gallbladder disease, fractures, cognition, and QOL in perimenopausal and postmenopausal women, during HRT use, and after cessation of HRT.

**Results:** 23 studies with 42,380 women included. 70% of the data from the WHI (1998) and HERS (1998). None of the studies focused on perimenopausal women. Combined continuous HRT: increased risk of coronary event after 1 yr (absolute risk 18/1,000, 95% CI 3-7), venous thromboembolism after 1 yr (AR 7/1,000, 95% CI 4-11), stroke after 3 yr (AR 18/1,000, 95% CI 14-23), breast cancer after 5.6 yr (AR 23/1,000, 95% CI 19-29), gallbladder disease after 5.6 yr (AR 27/1,000, 95% CI 21-34), and death from lung cancer after 5.6 yr use (AR 9/1,000, 95% CI 6-13). Estrogen only HRT: increased risk of venous thromboembolism after 1-2 yr use (AR 5/1,000, 95% CI 2-10; after 7 yr AR 21/1,000, 95% CI 16-28), stroke after 7 yr (AR 32/1,000, 95% CI 25-40), and gallbladder disease after 7 yr use (AR 45/1,000, 95% CI 36-57) and did not significantly affect the risk of breast cancer. Women >65 yr of age taking combined HRT had a statistically significant increase in the incidence of dementia after 4 yr use (AR 18/1,000, 95% CI 11-30). Women taking HRT had a decreased risk of fractures with combined HRT after 5.6 yr (AR 86/1,000, 95% CI 79-84) and 7.1 yr of estrogen only HRT (AR 102/1,000, 95% CI 91-112).

**Conclusions:** HRT is not indicated for primary or secondary prevention of cardiovascular disease or dementia. Although HRT is considered effective for the prevention of postmenopausal osteoporosis, it is generally recommended as an option only for women at significant risk, for whom non-estrogen therapies are unsuitable.

**Urogynecology**

**Figure 22. Pelvic anatomy**

## Prolapse

### Etiology

- relaxation, weakness, or defect in the cardinal and uterosacral ligaments which normally maintain the uterus in an anteflexed position and prevent it from descending through the urogenital diaphragm (i.e. levator ani muscles)
- related to
  - vaginal childbirth
  - aging
  - decreased estrogen (post-menopause)
  - following pelvic surgery
  - increased intra-abdominal pressure (obesity, chronic cough, constipation, ascites, heavy lifting)
  - congenital (rarely)
  - ethnicity (Caucasian women > Asian or African women)
  - collagen disorders

### GENERAL CONSERVATIVE TREATMENT

(for pelvic relaxation/prolapse and urinary incontinence)

- Kegel exercises
- local vaginal estrogen therapy
- vaginal pessary (intravaginal suspension disc)

Table 18. Pelvic Prolapse

Type	Clinical Features	Treatment
