FOREWORD

Committee E02 on Terminology presents the Tenth Edition of the *ASTM Dictionary of Engineering Science & Technology*.

This volume allows the reader to reference terminology developed by various ASTM Committees. The dictionary also facilitates the comparison of definitions created by technical subject experts in many disciplines.

Vincent Diaz
Chairman
ASTM Committee E02 on Terminology

ASTM TERMINOLOGY STANDARDS CITED IN THIS COMPILATION

The definitions contained in this compilation are standard definitions that are published in the terminology standards listed below. The designation of the terminology standard and the committee having jurisdiction appear at the end of each definition. Further discussion of terms may be included in the text of the terminology standard.

Designation	Title	Committee
A 340	Symbols and Definitions Relating to Magnetic Testing	A06
A 644	Iron Castings	A04
A 902	Metallic Coated Steel Products	A05
A 941	Steel, Stainless Steel, Related Alloys, and Ferroalloys	A01
B 243	Powder Metallurgy	B09
B 354	Uninsulated Metallic Electrical Conductors	B01
B 374	Electroplating	B08
B 542	Electrical Contacts and Their Use	B02
B 846	Copper and Copper Alloys	B05
B 881	Aluminum- and Magnesium-Alloy Products	B07
B 899	Non-ferrous Metals and Alloys	B02
C 11	Gypsum and Related Building Materials and Systems	C11
C 43	Structural Clay Products	C15
C 51	Lime and Limestone (as used by the Industry)	C07
C 71	Refractories	C08
C 119	Dimension Stone	C18
C 125	Concrete and Concrete Aggregates	C09
C 162	Glass and Glass Products	C14
C 168	Thermal Insulation	C16
C 219	Hydraulic Cement	C01
C 242	Ceramic Whitewares and Related Products	C21
C 274	Structural Sandwich Constructions	D30
C 286	Porcelain Enamel and Ceramic-Metal Systems	B08
C 634	Environmental Acoustics	E33
C 709	Manufactured Carbon and Graphite	D02
C 717	Building Seals and Sealants	C24
C 822	Concrete Pipe and Related Products	C13
C 896	Clay Products	C04
C 904	Chemical-Resistant Nonmetallic Materials	C03
C 1145	Advanced Ceramics	C28
C 1154	Non-Asbestos Fiber-Reinforced Cement Products	C17
C 1180	Mortar and Grout for Unit Masonry	C12
C 1209	Concrete Masonry Units and Related Units	C15

C 1232	Masonry	C15
D 8	Materials for Roads and Pavements	D04
D 9	Wood	D07
D 16	Paint, Related Coatings, Materials, and Applications	D01
D 121	Coal and Coke	D05
D 123	Textiles	D13
D 459	Soaps and Other Detergents	D12
D 653	Soil, Rock, and Contained Fluids	D18
D 804	Naval Stores, Including Tall Oil and Related Products	D01
D 883	Plastics	D20
D 907	Adhesives	D14
D 996	Packaging and Distribution Environments	D10
D 1038	Veneer and Plywood	D07
D 1079	Roofing and Waterproofing	D08
D 1129	Water	D19
D 1356	Sampling and Analysis of Atmospheres	D22
D 1517	Leather	D31
D 1554	Wood-Base Fiber and Particle Panel Materials	D07
D 1566	Rubber	D11
D 1600	Abbreviated Terms Relating to Plastics	D20
D 1695	Cellulose and Cellulose Derivatives	D01
D 1711	Electrical Insulation	D09
D 1968	Paper and Paper Products	D06
D 2050	Subassemblies	D13
D 2652	Activated Carbon	D28
D 2825	Polishes and Related Materials	D21
D 2864	Electrical Insulating Liquids and Gases	D27
D 2946	Asbestos and Asbestos-Cement Products	C17
D 3053	Carbon Black	D24
D 3064	Aerosol Products	D10
D 3136	Care Labeling for Apparel, Textile, Home Furnishing, and Leather Products	D13
D 3766	Catalysts and Catalysis	D32
D 3853	Rubber and Rubber Latices—Abbreviations for Chemicals Used in Compounding	D11
D 3878	Composite Materials	D30
D 3888	Open-End Spinning	D13
D 3918	Reinforced Plastic Pultruded Products	D20
D 3990	Fabric Defects	D13
D 4092	Plastics: Dynamic Mechanical Properties	D20
D 4127	Ion-Selective Electrodes	D19
D 4150	Gaseous Fuels	D03
D 4175	Petroleum, Petroleum Products, and Lubricants	D02
D 4391	The Burning Behavior of Textiles	D13
D 4410	Fluvial Sediment	D19
D 4439	Geosynthetics	D35
D 4466	Multicomponent Textile Fibers	D13
D 4538	Protective Coating and Lining Work for Power Generation Facilities	D33
D 4725	Engine Coolants	D15
D 4790	Aromatic Hydrocarbons and Related Chemicals	D16
D 4845	Wool	D13
D 4848	Force, Deformation and Related Properties of Textiles	D13
D 4849	Yarns and Fibers	D13
D 4850	Fabric	D13

D 4920	Moisture in Textiles	D13
D 4965	Seams and Seam Finishes Used in Home Sewing	D13
D 5038	Textile Conservation	D13
D 5077	Electrostatic Discharge (ESD) Packaging Materials	D10
D 5219	Body Dimensions for Apparel Sizing	D13
D 5253	Floor Coverings and Textile Upholstered Furniture	D13
D 5497	Buttons	D13
D 5535	Formed-in-Place Sealants for Joints and Cracks in Pavements	D04
D 5646	Basic Sewing Machine Stitches for Home Use	D13
D 5681	Waste and Waste Management	D34
D 5684	Pile Floor Coverings	D13
D 6161	Used for Microfiltration, Ultrafiltration, Nanofiltration and Reverse Osmosis Membrane Processes	D19
D 6384	Biodegradability and Ecotoxicity of Lubricants	D02
D 6440	Hydrocarbon Resins	D01
D 6477	Tire Cord, Bead Wire, Hose Reinforcing Wire, and Fabrics	D13
D 6488	Print Problems	D01
D 7023	Home Furnishings	D13
E 6	Methods of Mechanical Testing	E28
E 7	Metallography	E04
E 41	Conditioning	G03
E 131	Molecular Spectroscopy	E13
E 135	Analytical Chemistry for Metals, Ores, and Related Materials	E01
E 170	Radiation Measurements and Dosimetry	E10
E 175	Microscopy	E41
E 176	Fire Standards	E05
E 253	Sensory Evaluation of Materials and Products	E18
E 284	Appearance	E12
E 344	Thermometry and Hydrometry	E20
E 349	Space Simulation	E21
E 456	Quality and Statistics	E11
E 473	Thermal Analysis	E37
E 609	Pesticides	E35
E 631	Building Constructions	E06
E 673	Surface Analysis	E42
E 772	Solar Energy Conversion	E44
E 833	Building Economics	E06
E 856	Physical and Chemical Characteristics of Refuse Derived Fuel	D34
E 867	Vehicle-Pavement Systems	E17
E 943	Biological Effects and Environmental Fate	E47
E 957	Geothermal Energy	E44
E 1102	Agricultural Chemical Application	E35
E 1142	Thermophysical Properties	E37
E 1187	Conformity Assessment	E36
E 1316	Nondestructive Testing	E07
E 1325	Design of Experiments	E11
E 1328	Photovoltaic Solar Energy Conversion	E44
E 1402	Sampling	E11
E 1445	Hazard Potential of Chemicals	E27
E 1480	Facility Management (Building-Related)	E06
E 1481	Railing Systems and Rails for Buildings	E06
E 1519	Agricultural Tank Mix Adjuvants	E35

E 1542	Occupational Health and Safety	E34
E 1547	Industrial and Specialty Chemicals	E15
E 1605	Lead in Buildings	E06
E 1620	Liquid Particles and Atomization	E29
E 1638	Sieve Analysis	E29
E 1658	Expressing Conclusions of Forensic Document Examiners	E30
E 1705	Biotechnology	E48
E 1732	Forensic Science	E30
E 1749	Rigid Wall Relocatable Shelters	E06
E 1778	Pavement Distress	E17
E 1823	Fatigue and Fracture Testing	E08
E 1992	Terminology Management	E02
E 2035	Forensic Psychophysiology	E52
E 2110	Exterior Insulation and Finish Systems (EIFS)	E06
E 2114	Sustainability Relative to the Performance of Buildings	E06
E 2135	Property and Asset Management	E53
E 2151	Guides for Specifying and Evaluating Performance of Single Family Attached and Detached Dwellings	E06
E 2201	Coal Combustion Products	E50
E 2265	Anchors and Fasteners in Concrete and Masonry	E06
E 2363	Process Analytical Technology in the Pharmaceutical Industry	E55
F 17	Flexible Barrier Materials	F02
F 109	Surface Imperfections on Ceramics	C21
F 141	Resilient Floor Coverings	F06
F 149	Optical Character Recognition	F05
F 221	Carbon Paper and Inked Ribbon Products and Images Made Therefrom	F05
F 335	Electrostatic Imaging	F05
F 395	Vacuum Cleaners	F11
F 412	Plastic Piping Systems	F17
F 471	Combination Locks	F12
F 472	Geometry of Alpine Skis	F27
F 538	Characteristics and Performance of Tires	F09
F 547	Nails for Use with Wood and Wood-Base Materials	F16
F 549	Carbonless Copy Products	F05
F 552	Chain Link Fencing	F14
F 592	Collated and Cohered Fasteners and Their Application Tools	F16
F 747	Amusement Rides and Devices	F24
F 818	Spill Response Barriers	F20
F 819	Electrical Protective Equipment for Workers	F18
F 869	Athletic Shoes and Biomechanics	F08
F 909	Printers	F05
F 921	Hemostatic Forceps	F04
F 1078	Surgical Scissors—Inserted and Non-Inserted Blades	F04
F 1107	Snowboarding	F27
F 1125	Image Quality in Impact Printing Systems	F05
F 1177	Emergency Medical Services	F30
F 1251	Polymeric Biomaterials in Medical and Surgical Devices	F04
F 1294	Automatic Identification Hard Copy Printing Systems	F05
F 1327	Barrier Materials for Medical Packaging	F02
F 1379	Barbed Tape	F14
F 1457	Laser Printers	F05
F 1479	Microwave Food Packaging	F02

F 1490	Search and Rescue	F32
F 1494	Protective Clothing	F23
F 1549	Underwater Search, Rescue, and Recovery Activities	F32
F 1582	Spinal Implants	F04
F 1600	Bioremediation	F20
F 1623	Thermal Imaging Products	F05
F 1638	Surgical Tissue/Dressing/Pick-Up Forceps (Thumb-Type)	F04
F 1646	Safety and Traction for Footwear	F13
F 1773	Climbing and Mountaineering Equipment and Practices	F08
F 1789	F16 Mechanical Fasteners	F16
F 1827	Food Service Equipment	F26
F 1840	Surgical Suture Needles	F04
F 1857	Ink Jet Printers and Images Made Therefrom	F05
F 1972	Candles and Associated Accessory Items	F15
F 2005	Nickel-Titanium Shape Memory Alloys	F04
F 2112	Membrane Switches	F01
F 2312	Tissue Engineered Medical Products	F04
F 2395	Unmanned Air Vehicle Systems	F38
F 2429	Aerospace Transparent Materials and Enclosures	F07
F 2463	Livestock, Meat, and Poultry Evaluation Systems	F10
G 15	Corrosion and Corrosion Testing	G01
G 40	Wear and Erosion	G02
G 113	Natural and Artificial Weathering Tests of Nonmetallic Materials	G03
G 126	Compatibility and Sensitivity of Materials in Oxygen Enriched Atmospheres	G04

Following is a list of committees whose terminology standards appear in the *ASTM Dictionary of Engineering Science & Technology, 10th Edition*. The title of each committee is also included.

Committee	Title
A01	Steel, Stainless Steel and Related Alloys
A04	Iron Castings
A05	Metallic-Coated Iron and Steel Products
A06	Magnetic Properties
B01	Electrical Conductors
B02	Nonferrous Metals and Alloys
B05	Copper and Copper Alloys
B07	Light Metals and Alloys
B08	Metallic and Inorganic Coatings
B09	Metal Powders and Metal Powder Products
C01	Cement
C03	Chemical-Resistant Nonmetallic Materials
C04	Vitrified Clay Pipe
C07	Lime
C08	Refractories
C09	Concrete and Concrete Aggregates
C11	Gypsum and Related Building Materials and Systems
C12	Mortars and Grouts for Unit Masonry
C13	Concrete Pipe
C14	Glass and Glass Products
C15	Manufactured Masonry Units
C16	Thermal Insulation
C17	Fiber-Reinforced Cement Products
C18	Dimension Stone
C21	Ceramic Whitewares and Related Products
C24	Building Seals and Sealants
C28	Advanced Ceramics
D01	Paint and Related Coatings, Materials, and Applications
D02	Petroleum Products and Lubricants
D03	Gaseous Fuels
D04	Road and Paving Materials
D05	Coal and Coke
D06	Paper and Paper Products
D07	Wood
D08	Roofing and Waterproofing
D09	Electrical and Electronic Insulating Materials
D10	Packaging
D11	Rubber
D12	Soaps and Other Detergents
D13	Textiles
D14	Adhesives

D15	Engine Coolants
D16	Aromatic Hydrocarbons and Related Chemicals
D18	Soil and Rock
D19	Water
D20	Plastics
D21	Polishes
D22	Air Quality
D24	Carbon Black
D27	Electrical Insulating Liquids and Gases
D28	Activated Carbon
D30	Composite Materials
D31	Leather
D32	Catalysts
D33	Protective Coating and Lining Work for Power Generation Facilities
D34	Waste Management
D35	Geosynthetics
E01	Analytical Chemistry for Metals, Ores and Related Materials
E02	Terminology
E04	Metallography
E05	Fire Standards
E06	Performance of Buildings
E07	Nondestructive Testing
E08	Fatigue and Fracture
E10	Nuclear Technology and Applications
E11	Quality and Statistics
E12	Color and Appearance
E13	Molecular Spectroscopy and Chromatography
E15	Industrial and Specialty Chemicals
E17	Vehicle-Pavement Systems
E18	Sensory Evaluation
E20	Temperature Measurement
E21	Space Simulation and Applications of Space Technology
E27	Hazard Potential of Chemicals
E28	Mechanical Testing
E29	Particle and Spray Characterization
E30	Forensic Sciences
E33	Environmental Acoustics
E34	Occupational Health and Safety
E35	Pesticides and Alternative Control Agents
E36	Conformity Assessment
E37	Thermal Measurements
E41	Laboratory Apparatus
E42	Surface Analysis
E44	Solar, Geothermal and Other Alternative Energy Sources
E47	Biological Effects and Environmental Fate
E48	Biotechnology

E50	Environmental Assessment, Risk Management and Corrective Action
E52	Forensic Psychophysiology
E53	Property Management Systems
E55	Pharmaceutical Application of Process Analytical Technology
F01	Electronics
F02	Flexible Barrier Materials
F04	Medical and Surgical Materials and Devices
F05	Business Imaging Products
F06	Resilient Floor Coverings
F07	Aerospace and Aircraft
F08	Sports Equipment and Facilities
F09	Tires
F10	Livestock, Meat, and Poultry Evaluation Systems
F11	Vacuum Cleaners
F12	Security Systems and Equipment
F13	Pedestrian/Walkway Safety and Footwear
F14	Fences
F15	Consumer Products
F16	Fasteners
F17	Plastic Piping Systems
F18	Electrical Protective Equipment for Workers
F20	Hazardous Substances and Oil Spill Response
F23	Protective Clothing
F24	Amusement Rides and Devices
F26	Food Service Equipment
F27	Snow Skiing
F30	Emergency Medical Services
F32	Search and Rescue
F38	Unmanned Air Vehicle Systems
G01	Corrosion of Metals
G02	Wear and Erosion
G03	Weathering and Durability
G04	Compatibility and Sensitivity of Materials in Oxygen Enriched Atmospheres

A

- a**—height of cantilevered shear wall, in metres (feet). **E 631, E06**
- a**—span length of cantilever diaphragm, in. (or mm) **E 631, E06**
- A4A**—symbol for ISO standard metric cut-size paper which is nominally 20 by 30 cm or exactly 210 by 297 mm. **F 1457, F05**
- AASHTO compaction**—see **compaction test**. **D 653, D18**
- AATCC blue wool lightfastness standards, n**—standard dyed-wool samples of seven grades, each step in the series representing a doubling of lightfastness. **E 284, E12**
- abandonment**—see **decommissioning**. **D 653, D18**
- Abbe condenser**—see **condenser, Abbe**. **E 175, E41**
- Abbé value**—the reciprocal dispersive power, a value used in optical design, expressed mathematically as:
- $$\text{Abbé value} = (n_d - 1)/(n_F - n_C)$$
- where n_d is the refractive index for the helium line at 587.6 nm and n_F and n_C are the refractive indices for the hydrogen lines at 486.1 and 656.3 nm, respectively. See synonymous term **nu-value** and related term **dispersion**. **C 162, C14**
- abbreviation, n**—a shortened form of a single-element term created by the omission of some of its letters. **E 1992, E02**
- abduction**—the movement of a body part from the longitudinal (midline) of the body or in reference to fingers and toes, movement away from the midline of hand or foot. **F 869, F08**
- aberration**—any error that results in image degradation. Such errors may be chromatic, spherical, astigmatic, comatic, distortion, or curvature of field; and can result from design or execution, or both. **E 175, E41**
- abietic acid, commercial grade, n**—a product consisting chiefly of rosin acids in substantially pure form, separated either from rosin or tall oil commercially for specific purposes and in which abietic acid and its isomers are the principal components. **D 804, D01**
- ablation, n**—a self-regulating heat and mass transfer process in which incident thermal energy is expended by sacrificial loss of material. **E 349, E21**
- above-grade, adj**—above the surface of the ground, as related to floor location, above a well-ventilated space with at least 18 in. between the bottom of the lowest horizontal structural member and any point of the ground. **F 141, F06**
- abrasion, n**—the wearing away of any part of a material by rubbing against another surface. **D 123, D13**
- abrasion**—a rubbing and wearing away. (ISRM) **D 653, D18**
- abrasion**—the mechanical wearing, grinding, scraping or rubbing away (or down) of rock surfaces by friction or impact, or both. **D 653, D18**
- abrasion, n**—the surface loss of a material due to frictional forces. **D 1566, D11**
- abrasion, n**—wear by displacement of material caused by hard particles or hard protuberances. **D 4175, D02**
- abrasion, n**—the wearing away of any part of a material by rubbing against another surface. **D 4850, D13**
- abrasion, n**—*for inflatable restraint fabrics*, a fuzzy cluster of broken filaments damaged by scraping. **D 6799, D13**
- abrasion, n**—wearing, grinding, or rubbing away by friction. **F 141, F06**
- abrasion-corrosion, n**—a synergistic process involving both abrasive wear and corrosion in which each of these processes is affected by the simultaneous action of the other and, in many cases, is thereby accelerated. **G 40, G02**
- abrasion cycle, n**—one complete movement across the surface of a material. **D 123, D13**
- abrasion cycle, n**—one complete movement across the surface of a material. **D 4850, D13**
- abrasion mark, n**—an area damaged by friction. **D 123, D13**
- abrasion mark, n**—an area damaged by friction. (*Syn.* chafe mark) **D 3990, D13**
- abrasion of refractories, n**—wearing away of refractory surfaces by the scouring action of moving solids. **C 71, C08**
- abrasion resistance**—the degree to which a porcelain enamel will resist attack by abrasive materials. **C 286, B08**
- NOTE**—See Test Methods C 448. **C 286, B08**
- abrasion resistance, n (for coatings)**—the ability of a coating to resist being worn away and to maintain its original appearance and structure when subjected to rubbing, scraping, or wear. **D 16, D01**
- abrasion resistance**—the property of a particle to resist attrition or wearing away by friction. **D 2652, D28**
- abrasion resistance**—the ability of the polished shoe finish to withstand scuff marks versus the nonpolished shoe finish. **D 2825, D21**
- abrasion resistance (coatings)**—ability of a coating to resist being worn away and to maintain its original appearance, integrity, and structure when subjected to rubbing, scraping, or wear. **E 631, E06**
- abrasion resistance (coatings)**—ability of a coating to resist being worn away and to maintain its original appearance, integrity, and structure when subjected to rubbing, scraping, or wear. **E 1605, E06**
- abrasion resistance index, n**—a measure of the abrasion resistance of a rubber relative to that of a standard rubber under the same specified conditions, expressed as a percentage. **D 1566, D11**
- abrasion tester**—a machine for determining the quantity of material lost by friction wear under specified conditions. **F 869, F08**
- abrasive**—any rock, mineral, or other substance that, owing to its superior hardness, toughness, consistency, or other properties, is suitable for grinding, cutting, polishing, scouring, or similar use. **D 653, D18**
- abrasive blasting**—a process for cleaning or finishing by means of an abrasive directed at high velocity against the work piece. **B 374, B08**
- abrasiveness**—the property of a material to remove matter when scratching and grinding another material. (ISRM) **D 653, D18**
- abrasive wear**—wear due to hard particles or hard protuberances forced against and moving along a solid surface. **D 4175, D02**
- abrasive wear, n**—wear due to hard particles or hard protuberances forced against and moving along a solid surface. **G 40, G02**
- abrasivity, n**—the ability of a material or substance to cause abrasive wear. **G 40, G02**
- abridged spectrophotometry, n**—the measurement of reflectance factor or transmittance factor in a number of wavelength bands rather than as continuous functions of wavelength. **E 284, E12**
- ABS**—an abbreviation for alkyl benzene sulfonate. Although strictly speaking this might apply to any such compound, present practice is to use it for those containing branched chains. (See **LAS**). **D 459, D12**
- absolute coil**—a coil (or coils) that respond(s) to the total detected electric or magnetic properties, or both, of a part or section of the test part without comparison to another section of the part or to another part. (E 566) **E 1316, E07**
- absolute filter**—See **filter**. **D 1356, D22**
- absolute filter rating**—particle size above which 100 % of particles that are trapped on or within the filter medium. **D 6161, D19**
- absolute filtration rating, n**—the diameter of the largest hard

absolute filtration rating, n

spherical particle that will pass through a filter under specified test conditions. This is an indication of the largest opening in the filter element. **D 4175, D02**

absolute humidity, n —the mass of water vapor present in a unit volume of air. (See **humidity** and **relative humidity**) **D 123, D13**

absolute humidity, n —the mass of water vapor present in a unit volume of air. **D4920, D13**

absolute humidity, vapor concentration, vapor density (d_v), n —the ratio of the mass of water vapor, m_v , to the total volume of the moist air, v :

$$d_v = \frac{m_v}{v}$$

relative humidity, n —the ratio of the actual water vapor pressure to the saturation pressure.

relative humidity with respect to ice (U_i), n —the ratio in percent of the mole fraction of water vapor, x_v , in moist air to the mole fraction of water vapor, x_{vi} , that the moist air would have if it were saturated with respect to ice at the same pressure, p , and temperature, t .

$$U_i = \frac{X_v}{X_{vi}} \times 100$$

relative humidity with respect to water (U_w), n —the ratio in percent of mole fraction of water vapor, x_v , in moist air to the mole fraction of water vapor, x_{vw} , that the moist air would have if it were saturated with respect to water at the same pressure, p , and temperature, t

$$U_w = \frac{X_v}{X_{vw}} \times 100$$

D 1356, D22

absolute impact velocity—See **impact velocity**. **G 40, G02**

absolute judgment, n —an evaluation of a stimulus made without direct comparison. **E 253, E18**

absolute manometer—a manometer whose calibration can be calculated from the measurable physical constants of the instrument and for which calibration is the same for all ideal gases. **E 1316, E07**

absolute measurements—in electromagnetic testing, measurements made without a direct reference using an absolute coil in contrast to differential and comparative measurements. (See also **absolute coil**). **E 1316, E07**

absolute or true density—See *absolute or true density under density*. **C 242, C21**

absolute pressure—pressure above the absolute zero corresponding to empty space, that is, local atmospheric pressure plus gage pressure. **E 1316, E07**

absolute readout—in electromagnetic testing, the signal output of an absolute coil. (See also **absolute coil**.) **E 1316, E07**

absolute sealing—a level of sealing that requires all seams, slots, holes, and fasteners passing through the seal plane to be sealed. **E 631, E06**

absolute sealing—a level of sealing that requires all seams, slots, holes, and fasteners passing through the seal plane to be sealed. **E 1749, E06**

absolute spectral response, n — $R_a(\lambda)$, AW^{-1} , n —of a photovoltaic device, the short-circuit current density per unit irradiance at a given wavelength. **E 1328, E44**

absolute system—a system that uses a coil assembly and associated electronics to measure the total electromagnetic properties of a test part without direct comparison to another section of the part or to another part (see **absolute coil**.) (E 566) **E 1316, E07**

absolute temperature—See **temperature**. **D 1356, D22**

absorbance—the logarithm of that fraction of an incident light beam that is dissipated in the sample, being neither transmitted nor reflected. **C 242, C21**

absorbance, n —the logarithm to the base of 10 of the reciprocal of transmittance. **D 1356, D22**

absorbance—the logarithm to the base 10 of the reciprocal of the relative transmittance, T , expressed as:

$$A = \log_{10}(1/T) = -\log_{10} T$$

D 4790, D16

absorbance, A, n —the molecular property of a substance that determines its ability to take up radiant power, expressed by:

$$A = \log_{10}(1/T) = -\log_{10} T$$

where T is the transmittance.

D 4175, D02

absorbance, A —the logarithm to the base 10 of the reciprocal of the transmittance, (T).

$$A = \log_{10}(1/T) = -\log_{10} T$$

E 131, E13

absorbance, A, n —logarithm to the base 10 of the reciprocal of the internal transmittance T_I . $A = \log_{10}(1/T_I) = -\log_{10} T_I$. **E 284, E12**

absorbate, n —material that has been retained by the process of absorption. **D 1356, D22**

absorbed dose—the amount of energy imparted by ionizing radiation per unit mass of irradiated matter. Denoted by "rad;" 1 rad = 0.01 j/kg. SI unit is "gray;" 1 gray = 1 j/kg. **E 1316, E07**

absorbed dose (D)—Quantity of ionizing radiation energy imparted per unit mass of a specified material. The SI unit of absorbed dose is the gray (Gy), where 1 gray is equivalent to the absorption of 1 joule per kilogram of the specified material (1 Gy = 1 J/kg). The mathematical relationship is the quotient of $d\bar{\epsilon}$ by dm , where $d\bar{\epsilon}$ is the mean incremental energy imparted by ionizing radiation to matter of incremental mass dm (see ICRU 33).

$$D = d\bar{\epsilon} / dm$$

E 170, E10

absorbed dose rate—the absorbed dose per unit of time; rads/s. SI unit, grays/s. **E 1316, E07**

absorbed dose rate, \dot{D} —the absorbed dose in a material per incremental time interval, that is, the quotient of dD by dt (see ICRU Report 33).

$$\dot{D} = dD/dt$$

SI unit: $Gy \cdot s^{-1}$.

E 170, E10

absorbed moisture—water held mechanically in the material and having physical properties not substantially different from ordinary water at the same temperature and pressure. **C 242, C21**

absorbed moisture, n —water held within the materials and having physical properties not substantially different from ordinary water at the same temperature and pressure. **C 1145, C28**

absorbed water—water held mechanically in a soil or rock mass and having physical properties not substantially different from ordinary water at the same temperature and pressure. **D 653, D18**

absorbent, n —material in which absorption occurs. **D 1356, D22**

absorbent compound, n —in textile cleaning, sponge-like particles which, when saturated with water or dry solvent and detergent and brushed into the textile, remove soil from the textile. See **powder cleaner**. **D 123, D13**

absorbent compound, n —in textile cleaning, sponge-like particles which, when saturated with water or dry solvent and detergent and brushed into the textile, remove soil from the textile. See **powder cleaner**. **D 5253, D13**

absorbent packing—See **packing**. **D 996, D10**

absorbent pad, n —for cleaning textile floor coverings, a damp textile material (fabric, felt, sponge, or mop) used to agitate and wipe the pile and, in the process, absorb soil. **D 123, D13**

absorbent pad, n —for cleaning textile floor coverings, a damp textile material (fabric, felt, sponge, or mop) used to agitate and wipe the pile and, in the process, absorb soil. **D 5253, D13**

absorber—that part of a solar collector whose primary function is to absorb radiant energy and transform it into another form of energy.

NOTE—A thermal absorber usually possesses a solid surface through which energy is transmitted by thermal conduction to the transfer fluid; however, the transfer fluid itself can be the absorber in the case of an optically transparent container and a “black liquid”. A photovoltaic absorber converts part of the incident solar flux into electrical energy, and part to thermal energy. E 772, E44

absorptance, n —the ratio of the radiant flux absorbed by a body to that incident upon it. C 168, C16

absorptance α , n —the ratio of the absorbed radiant or luminous flux to the incident flux. E 284, E12

absorptance, n —ratio of the absorbed radiant or luminous flux to the incident flux. Symbol: α_e , α_v , α .

NOTE—In general, the value of the absorptance depends upon the mode of irradiation, the spectral composition, and the state of polarization of the incident radiation. E 349, E21

absorptance, α —the ratio of the absorbed radiant or luminous flux to the incident flux. (Practice E 491). See **radiometric properties and quantities**. E 772, E44

absorptance, α —the ratio of radiant flux absorbed by a surface to that incident upon it. E 1316, E07

absorption, n —weight of water picked up by a clay masonry unit during immersion at prescribed conditions expressed in relation to the dry weight of the unit. C 43, C15

absorption, n —the process by which a liquid is drawn into and tends to fill permeable pores in a porous solid body; also, the increase in mass of a porous solid body resulting from the penetration of a liquid into its permeable pores. C 125, C09

absorption, n —transformation of radiant energy to a different form of energy by interaction with matter. C 168, C16

absorption—(I) the relationship of the weight of the water absorbed by a ceramic specimen, subjected to prescribed immersion procedure, to the weight of the dry specimen.

(2) the capacity of a substance to take up a substance, usually a liquid or gas, with the formation of an apparently homogeneous mixture. C 242, C21

absorption—the increase in weight of concrete resulting from the penetration of water into the concrete. C 822, C13

absorption—difference in the amount of water contained within a concrete masonry unit or related unit between a saturated and oven-dry condition in accordance with the requirements of Test Methods C 140. It is expressed as weight of water per volume of concrete. C 1209, C15

absorption, n —a process in which one material (the absorbent) takes in or absorbs another (the absorbate); as the absorption of moisture by fibers. (See also **adsorption**, and **moisture equilibrium for testing**. Compare **desorption** and **resorption**.) D 123, D13

absorption—the assimilation of fluids into interstices. D 653, D18

absorption, n —a process in which one material (the absorbent) takes up and retains another (the absorbate) with the formation of an homogeneous mixture having the attributes of a solution. D 1356, D22

absorption—a process in which fluid molecules are taken up by a liquid or solid and distributed throughout the body of that liquid or solid. D 2652, D28

absorption, n —the process by which a liquid is drawn into and tends to fill permeable pores in a porous solid body, also, the increase in mass of a porous solid body resulting from penetration of a liquid into its permeable pores. D 4439, D35

absorption, n —a process in which one material (the absorbent) takes in or absorbs another (the absorbate); as the absorption of moisture by fibers. (See also **adsorption**, and **moisture equilibrium for testing**. Compare **desorption** and **resorption**.) D4920, D13

absorption—the release for desorption holding of a substance within a solid by cohesive or capillary forces. D 6161, D19

absorption—the decrease in intensity which radiation undergoes

during its passage through matter when the ratio of transmitted or reflected luminous flux to incident is less than 1. E 7, E04

absorption, n —the transformation of radiant energy to a different form of energy by interaction with matter. E 284, E12

absorption, n —transformation of radiant energy to a different form of energy by interaction with matter. E 349, E21

absorption—a process in which one material (the absorbent) takes in and retains another (the absorbate). E 609, E35

absorption—the process by which incident radiant energy is transformed into another form of energy by interaction with matter. E 772, E44

absorption—the process whereby the incident particles or photons of radiation are reduced in number or energy as they pass through matter. E 1316, E07

absorption—in leak testing, the binding or incorporation of gas in the interior of a solid (or liquid). E 1316, E07

absorption—a process in which one material (the absorbent) takes in and retains another (the absorbate). E 1519, E35

absorption band—a region of the absorption spectrum in which the absorbance passes through a maximum. E 131, E13

absorption coefficient—specific factor characteristic of a substance on which its absorption radiation depends. The rate of decrease of the natural logarithm of the intensity of a parallel beam per unit distance traversed in a substance. For X-rays, the linear absorption coefficient is the natural logarithm of the ratio of the incident intensity of an X-ray beam incident on unit thickness of an absorbing material to the intensity of the beam transmitted. If I_0 is the incident intensity of a beam of X-rays, I_t the transmitted intensity, and X the thickness of the absorbing material, then:

$$I_t = I_0 \exp(-\mu X)$$

Here μ is the linear absorption coefficient. The mass absorption coefficient is given by μ/ρ where ρ is the density. E 7, E04

absorption coefficient, α —a measure of absorption of radiant energy from an incident beam as it traverses an absorbing medium according to Bouguer's law, $P/P_0 = e^{-\alpha b}$. E 131, E13

absorption coefficient, α , n —measure of the absorption of radiant energy from an incident beam (P_0) as it traverses an absorbing medium according to Bouguer's law, $P = P_0 e^{-\alpha b}$, where b is the sample optical pathlength. E 284, E12

absorption edge—an abrupt change in absorption coefficient at a particular wavelength. The absorption coefficient is always larger on the short wavelength side of the absorption edge. E 7, E04

absorption limit—See **absorption edge**. E 7, E04

absorption loss—that part of transmitted energy (mechanical) lost due to dissipation or conversion into other forms (heat, etc.). D 653, D18

absorption (of electromagnetic radiation), n —a decrease in radiant energy when passing through matter, resulting in a corresponding increase in the energy of the absorbing system. E 135, E01

absorption parameter, a —the relative reflection loss per reflection that results from the absorption of radiant energy at a reflecting surface: $a = 1 - R$, and R = the reflected fraction of incident radiant power. E 131, E13

absorption spectrum—a plot, or other representation, of absorbance, or any function of absorbance, against wavelength, or any function of wavelength. E 131, E13

absorption test—a test made to determine the absorption of concrete. C 822, C13

absorption tinting strength, n —relative change in the absorption properties of a standard white material when a specified amount of an absorbing colorant, black or chromatic, is added to it. E 284, E12

absorptivity, a , n —the specific property of a substance to absorb radiant power per unit sample concentration and path length, expressed by:

$$a = Aflbc$$

absorptivity, a , n

where:

- A = the absorbance defined in 3.1.4,
- f = the dilution factor defined in 3.1.5,
- b = sample cell path length, and
- c = the quantity of absorbing substance contained in a volume of solvent.

D 4175, D02

absorptivity, a —the absorbance divided by the product of the concentration of the substance and the sample pathlength, $a = A/bc$. The units of b and c shall be specified. E 131, E13

absorptivity, a , n —the absorbance divided by the product of the concentration, c , of the substance and the sample optical pathlength, b , $a = A/bc$. The units of b and c shall be specified. E 284, E12

absorptivity, molar, ϵ —the product of the absorptivity, a , and the molecular weight of the substance. E 131, E13

absorptivity of an absorbing material, n —internal absorptance of a layer of the material such that the path of the radiation is of unit length. E 349, E21

ac—symbol used to designate an electric voltage or current whose amplitude varies periodically as a function of time, its average value over one complete period being zero. One complete repetition of the wave pattern is referred to as a CYCLE, and the number of cycles occurring in one second is called the FREQUENCY, measured in hertz (Hz). For example, the electricity supplied by commercial utility companies in the United States is, in most localities, 60 Hz, although other frequencies may be encountered. D 2864, D27

accelerant, n —any material used to initiate or promote the spread of a fire. The most common accelerants are flammable or combustible liquids. Whether a substance is an accelerant depends not on its chemical structure but on its use (source: IAAI Forensic Science Committee, *Glossary of Terms Related to Chemical and Instrumental Analysis of Fire Debris*) (use: Test Method E 1387) CRIM. E 1732, E30

accelerated adsorption tests—adsorption tests in which the end point is hastened by testing at conditions more severe than those anticipated in service. D 2652, D28

accelerated aging, n —in *textile processing and testing*, the use of controlled environmental conditions to promote rapid physical or chemical change in a textile material. D 123, D13

accelerated aging, n —in *textile processing and testing*, the use of controlled environmental conditions to promote rapid physical or chemical change in a textile material. D 6799, D13

accelerated aging—the deterioration of a material faster than normal by subjecting the material to conditions specified by the test method being followed. F 869, F08

accelerated aging—a technique to simulate the effects of time on a package by subjecting the product/package system to elevated temperatures in a controlled environment representative of controlled environment storage conditions. The equivalent time is generally estimated by assuming the degradation of packaging materials follows the kinetics described by the Arrhenius reaction rate function, more discussion of which is available in Guide F 1980. F 1327, F02

accelerated erosion—erosion at a rate greater than geologic or natural erosion. D 4410, D19

accelerated life test, n —a test method designed to approximate in a short time, the deteriorating effect of normal long-term service conditions. D 1566, D11

accelerated life test—method designed to approximate, in a short time, the deteriorating effect of normal, long-term service conditions. (D 1566, D11) F 869, F08

accelerated outdoor weathering, n —outdoor weathering using the sun as the source of irradiance, and where the rate of deterioration is accelerated over that of the in-service exposure position increasing one or more of the influencing parameters. G 113, G03

accelerated test—See **test, accelerated**. E 631, E06

accelerated test—See **test, accelerated**. E 1749, E06

accelerated weathering, v —the exposure of a specimen to a specified test environment for a specified time with the intent of producing, in a shorter time period, effects similar to actual weathering. D 1079, D08

accelerating potential—a relatively high voltage applied between the cathode and anode of an electron gun to accelerate electrons. E 7, E04

accelerating potential—the difference in electric potential between the cathode and anode in an X-ray tube through which a charged particle is accelerated; usually expressed in units of kV or MV. E 1316, E07

acceleration period, n —in *cavitation and liquid impingement erosion*, the stage following the incubation period during which the erosion rate increases from near zero to a maximum value. (See also **erosion rate-time pattern**.) G 40, G02

accelerator, n —a material that reduces setting time. C 11, C11

accelerator—a material that increases the rate at which chemical reactions would otherwise occur. D 653, D18

accelerator, delayed action, n —an accelerator that, in conjunction with other curing agent(s), produces, at vulcanizing temperatures, a period of no significant cross-linking, followed by a period of rapid cross-link formation. D 1566, D11

accelerator (rubber), n —a compounding material used in small amounts with a vulcanizing agent to increase the speed of vulcanization. D 1566, D11

accelerometer, n —an instrument that senses inertial reaction to measure linear or angular acceleration. F 538, F09

acceptability/unacceptability, n —degree to which a stimulus is judged to be favorable or unfavorable. E 253, E18

acceptable quality level—the maximum percent defective or the maximum number of units defective per hundred units that, for the purpose of sampling test, can be considered satisfactory as a process average. E 1316, E07

acceptable quality level (AQL), n —the maximum percent nonconforming which, for purposes of sampling inspection, is considered satisfactory as a process average. D 1711, D09

acceptable quality level (AQL or p_1), n —in *acceptance sampling*, the maximum fraction of nonconforming items at which the process average can be considered satisfactory; the process average at which the risk of rejection is called the producer's risk. D 123, D13

acceptance angle, n —for an optical fiber, the maximum angle, measured from the longitudinal axis or centerline of the fiber to an incident ray, within which the ray will be accepted for transmission along the fiber by total internal reflection. E 131, E13

acceptance angle ($\pm \alpha$, deg), n —the angular distance, centered on the array axis of symmetry, over which the following conditions are met: (a) wind components are unambiguously defined, and (b) flow across the transducers is unobstructed or remains within the angular range for which transducer shadow corrections are defined. D 1356, D22

acceptance (control chart or acceptance control chart usage, n), n —a decision that the process is operating in a satisfactory manner with respect to the statistical measures being plotted: action limits: *control limits*. E 456, E11

acceptance criteria, n —numerical limits, ranges, process signatures, or other suitable measures that are necessary for making a decision to accept or reject the result of a process, in-process variable, a product or any other convenient subgroups of manufactured units. E 2363, E55

acceptance level—a test level above or below which test specimens are acceptable in contrast to rejection level. E 1316, E07

acceptance limit (AL), n —a numerical value that defines the point between acceptable and unacceptable quality. D 4175, D02

acceptance limits—test levels used in electromagnetic sorting which establish the group into which the material under test belongs. (E 566) E 1316, E07

acceptance number, *n*—the maximum allowable number of nonconformities for a given AQL and sample size (lot-sample size).

D 1711, D09

acceptance number—numerical value representing the maximum number of permissible non-conformances within a sample submitted for testing and acceptance of the population. **F 1789, F16**

acceptance number (*c*), *n*—in acceptance sampling, the maximum number of nonconforming items in a sample that allows the conclusion that the lot conforms to the specification. **D 123, D13**

acceptance of a lot—the approval of a lot as conforming to contract or specification. **D 1517, D31**

acceptance quality limit (AQL), *n*—quality level that is the worst tolerable process average when a continuing series of lots is submitted for acceptance sampling. **E 1402, E11**

acceptance range—a relative range of variation in impact pressure and release characteristic over which the image acceptor media will receive an image of specified quality. **F 221, F05**

acceptance sampling, *n*—sampling done to provide specimens for acceptance testing. **D 123, D13**

acceptance standard—a tube with artificial discontinuities specified in the applicable product standard used to establish the acceptance level. (E 215) **E 1316, E07**

acceptance standard—in tubing inspection, a tube used to establish the acceptance level with artificial discontinuities as specified in the applicable product standard. **E 1316, E07**

acceptance test, *n*—a test, or series of tests conducted by the procuring agency, or an agent thereof, upon receipt to determine whether an individual lot of materials conforms to the purchase order or contract or to determine the degree of uniformity of the material supplied by the vendor, or both. (Compare **preproduction test** and **qualification test**.) **D 907, D14**

acceptance testing, *n*—testing performed to decide if a material meets acceptance criteria. **D 123, D13**

acceptance testing—testing performed on a product to determine whether or not an individual lot of the product conforms with specified requirements. **F 412, F17**

accepted engineering practice—that which conforms to accepted principles, tests, or standards of nationally recognized technical or scientific authorities. **F 747, F24**

accepted reference value, *n*—a value that serves as an agreed-upon reference for comparison and that is derived as (1) a theoretical or established value, based on scientific principles, (2) an assigned value, based on experimental work of some national or international organization, such as the U.S. National Institute of Standards and Technology (NIST), or (3) a consensus value, based on collaborative experimental work under the auspices of a scientific or engineering group. **D 4175, D02**

accepted reference value, *n*—a value that serves as an agreed-upon reference for comparison, and which is derived as: (1) a theoretical or established value, based on scientific principles, (2) an assigned or certified value, based on experimental work of some national or international organization, or (3) a consensus or certified value, based on collaborative experimental work under the auspices of a scientific or engineering group. **E 456, E11**

accepts, *n*—the output stream from a materials separation device that contains the highest concentration (purity) of the components that the device is designed to separate. **D 5681, D34**

access, *n*—the process of reaching the patients or subjects and establishing physical contact with them. **F 1490, F32**

accessibility—the fraction of total cellulose present that is accessible to certain reagents under certain specified conditions. The conditions of determination should always be indicated. **D 1695, D01**

accessible—permitting close approach or contact that could include requiring removal or opening of an access panel or door. **E 1705, E48**

accessible bag, *n*—for sampling, a bag (in a pile of bags of asbestos fiber) of which at least one side or one end is fully exposed. **D 2946, C17**

accessible surface, *n*—for sampling, in a pile of bags of asbestos fiber, a side (of the pile) in which all the bags are accessible bags. **D 2946, C17**

accessible surface—interior or exterior surface (usually up to 5 ft (1.5 m) from floor or ground) that is accessible for young child to mouth or chew. See also **chewable surface**. **E 631, E06**

accessible surface—interior or exterior surface (usually up to 5 ft (1.5 m) from floor or ground) that is accessible for a young child to mouth or chew. See also **chewable surface**. **E 1605, E06**

accessories, *n*—products fabricated for the purpose of forming corners, edges, control joints, or decorative effects. **C 11, C11**

accessories, *n*—subordinate material such as fasteners, backer strips, closure strips, ridge and corner rolls, roofing starters and finishing pieces, couplings, gaskets, pipe fittings or other supplementary material necessary for the proper application of primary fiber-reinforced cement products. **C 1154, C17**

accessories—subordinate material such as fasteners, backer strips, closure strips, ridge and corner rolls, roofing starters and finishing pieces, couplings, gaskets, pipe fittings or other supplementary material necessary for the proper application of primary asbestos-cement products. **D 2946, C17**

accessories, *n*—preformed metal, fiberglass, or plastic members for use to form corners, edges, control joints, or decorative effects. **E 2110, E06**

accessories—optional mechanical devices used on or in conjunction with a boom system but not included with the basic boom and end connector; for example, lights, paravanes, drogues, buoys, anchor systems, storage bags, boxes or reels, bulkhead connectors or repair kits, and so forth. **F 818, F20**

accessory cord, *n*—ropes used for climbing and mountaineering purposes that are not designed to absorb fall impact energy. **F 1773, F08**

accessory item—an item that facilitates or enhances the operation of equipment but is not essential for its basic operation. **E 2135, E53**

acclimation period—the time necessary for an animal to adjust to the laboratory and specific test environments. **E 609, E35**

Ac_{cm}, Ac₁, Ac₃, Ac₄—See **transformation temperature**. **A 941, A01**

accommodation, visual—adjustment of the eye, either the focus or the iris opening, to optimize its performance under the specific viewing conditions prevailing. **E 1316, E07**

accreditation, *n*—official authorization, approval, or recognition accorded an individual or organization based upon specific qualification. **E 631, E06**

accreditation—procedure by which an authoritative body gives formal recognition that a body or person is competent to carry out specific tasks, (ISO Guide 2). **E 1187, E36**

accreditation, *n*—Official authorization, approval, or recognition accorded an individual or organization based upon specific qualifications. **E 1605, E06**

accreditation, *n*—procedure by which an authoritative body gives formal recognition that a body or person is competent to carry out specific tasks. **E 1732, E30**

accreditation criteria, for laboratory accreditation, *n*—set of requirements used by an accrediting body which a testing laboratory must meet to be accredited, (ISO Guide 2, A). **E 1187, E36**

accredited laboratory—testing laboratory to which accreditation has been granted, (ISO Guide 2, A). **E 1187, E36**

accredited laboratory test report—test report that includes a statement by the testing laboratory that it is accredited for the test reported and that the test has been performed in accordance with the conditions prescribed by the accrediting body, (ISO Guide 2, A). **E 1187, E36**

accrediting authority, *n*—a body that evaluates the capability of a testing agency or an inspection agency, or both, in certain specific fields of activity. **D 1356, D22**

accrediting body—governmental or non-governmental body that conducts and administers a laboratory accreditation system and grants accreditation, (ISO Guide 2, A). **E 1187, E36**

accrediting body, n

accrediting body, n—governmental or non-governmental body that conducts and administers a laboratory accreditation system, and grants accreditation. **E 1732, E30**

accretion, n—a phenomenon consisting of the increase in size of particles by the process of external additions. **D 1356, D22**

accretion—a process of sediment accumulation. **D 4410, D19**

accumulation period, n—in *cavitation and liquid impingement erosion*, a less-preferred term for **acceleration period**. **G 40, G02**

accumulation test—a leak test used to detect very small leaks in which gas contained in a component being tested will, if a leak is present, collect for a specified period of time in a closed evacuated chamber into which the component has been placed. At the end of the test period the chamber is opened to a leak detector which is sensitive to the gas. **E 1316, E07**

accumulative pump, n—a mechanical pump dispenser that accumulates internal pressure by means of a valving-system that maintains a high velocity flow of the product no matter what the actuation velocity that results in a consistent fine mist spray. **D 6655, D10**

accumulator—a pulsation dampener installed on the suction and/or discharge lines of pumps, generally plunger type, to minimize pressure surges and provide uniformity of flow. **D 6161, D19**

accuracy, n—of *atest method*, the degree of agreement between the true value of the property being tested (or an accepted standard value) and the average of many observations made according to the test method, preferably by many observers. (See also **bias** and **precision**.) **D 123, D13**

accuracy, n—a measure of the degree of conformity of a value generated by a specific procedure to the assumed or accepted true value, and includes both precision and bias. **D 1129, D19**

accuracy, n—the degree of conformity of a value generated by a specific procedure to the assumed or accepted true value and includes both precision and bias. **D 1356, D22**

accuracy, n—the closeness of agreement between a test result and an accepted reference value. **D 4175, D02**

accuracy—the agreement between the mean of a series of repeated measurements of a property and the accepted reference value of the property. **D 4790, D16**

accuracy, n—closeness of a measured value to the true or an accepted reference or standard value. **D 5681, D34**

accuracy—the closeness of agreement between an observed value and an accepted reference value. Where an accepted reference value is not available, accuracy is a description of a measure of the degree of conformity of a value generated by a specific procedure to the assumed or accepted true value, including both precision and bias. **D 6161, D19**

accuracy—the closeness of agreement between an observed value and an accepted reference value (See Terminology E 456). **E 131, E13**

accuracy, n—of *methods of chemical analysis*, a characteristic manifested by agreement. **E 135, E01**

accuracy—the closeness of agreement between a measurement result and an accepted reference value (see Terminology E 456). **E 170, E10**

accuracy, n—the closeness of agreement between a test result and an accepted reference value. **E 284, E12**

accuracy, n—of *temperature measurement*, closeness of agreement between the result of a temperature measurement and a true value of the temperature. **E 344, E20**

accuracy, n—ability of an *infrared thermometer* to give a reading close to the *true temperature*. **E 344, E20**

accuracy, n—the closeness of agreement between a test result and an accepted reference value. **E 456, E11**

accuracy, n—degree of conformity of a measured or calculated value to some recognized standard or specified value.

ACH₅₀, n—the ratio of the air leakage rate at 50 Pa (0.2 in. H₂O), corrected for a standard air density, to the volume of the test zone (1/h). **E 631, E06**

accuracy—generally, a term used to indicate the reliability of a

measurement, or an observation. Specifically, a measure of closeness of agreement between a test result and a recognized standard value. For example, the difference between the observed and a standard value for the sulfur content of a sample of refuse-derived fuel. This difference includes both random and systematic errors. **E 856, D34**

accuracy, n—the closeness or degree of agreement (within a stated tolerance and probability of conformity) between a value measured or estimated by a WIM system and an accepted reference value. **E 867, E17**

accuracy—the agreement between an experimentally determined value and the accepted reference value. In chemical work, this term is frequently used to express freedom from bias, but in other fields it assumes a broader meaning as a joint index of precision and bias. To avoid confusion, the term *bias* will be used in appraising the systematic error of test methods for industrial chemicals. See also **bias**. **E 1547, E15**

accuracy, n—the closeness of the agreement between the result of a measurement and a true value of the quantity that is being measured. (Adapted from draft ISO VIM, International Vocabulary of Basic and General Terms) **E 1605, E06**

accuracy—the agreement between an experimentally determined value and the accepted reference value. **E 2161, E37**

accuracy, n—a measurement concept that describes the degree of correspondence between an average measured value and an accepted reference or standard value for the object, material or phenomenon under test. **F 538, F09**

accuracy (as distinguished from precision)—the degree of conformity of a measured or calculated value to some recognized standard or specified value. This concept involves the systematic error of an operation, which is seldom negligible. (E 380) **F 221, F05**

accurate, adj—when performance or value of a device, as determined by tests made with a suitable reference material, conforms to the standard within the allowable tolerance. **F 2463, F10**

acetal plastic, n—a plastic based on polymers having a predominance of acetal linkages in the main chain. (See also *polyoxymethylene*.) **F 1251, F04**

acetal plastics, n—plastics based on polymers having a predominance of acetal linkages in the main chain. (See also *polyoxymethylene*.) **D 883, D20**

acetal plastics, n—highly crystalline linear thermoplastic homopolymers or copolymers characterized by repeating oxymethylene units. **F 412, F17**

acetate—a manufactured fiber in which the fiber-forming substance is cellulose acetate. Where not less than 92 % of the hydroxyl groups are acetylated, the term triacetate may be used as a generic description of the fiber. **D 123, D13**

acetylation—substitution of an acetyl radical for an active hydrogen. Specifically, formation of cellulose acetate from cellulose. **D 1695, D01**

acetylation pulps—pulps used in the manufacture of cellulose acetate or other esters, and subject to various specifications by the manufacturers, including those of purity, moisture content, sheet properties, and viscosity. **D 1695, D01**

acetyl groups—the characteristic groups of acetic acid; CH₃CO—. **D 1695, D01**

ac excitation, N₁/Iℓ₁—the ratio of the rms ampere-turns of exciting current in the primary winding of an inductor to the effective flux path length of the inductor. **A 340, A06**

achieved width, n—the calculated bar or other element width based on measurements. **F 1294, F05**

achromatic—literally, color-free. A lens or prism is said to be achromatic when corrected for two colors. The remaining color seen in an image formed by such a lens is said to be secondary chromatic aberration. See **apochromatic objective**. **E 7, E04**

achromatic—literally, color-free. A lens or prism is said to be achromatic when corrected for two colors. The remaining color

- seen in an image formed by such a lens is said to be secondary chromatic aberration. **E 175, E41**
- achromatic**, *adj*—(1) for primary light sources, the computed chromaticity of the equal-energy spectrum.
(2) for surface colors, the color of a whitish light, serving as the illuminant, to which adaptation has taken place in the visual system of the observer.
(3) perceived as having no hue, that is, as white, gray, or black. **E 284, E12**
- achromatic objective**—an objective that is corrected chromatically for two colors, and spherically for one, usually in the yellow-green part of the spectrum. **E 7, E04**
- achromatic objective**—an objective that is corrected chromatically for two colors, and spherically for one, usually in the yellow-green part of the spectrum. **E 175, E41**
- achromatic objective lens**—an objective lens with longitudinal chromatic correction for green and blue, and spherical chromatic correction for green. Note—Lens should be used with a green filter. **E 7, E04**
- acicular powder**, *n*—needle-shaped particles. **B 243, B09**
- acid annealing**—an annealing process in which ferrous metal shapes are coated with acid before and in conjunction with the annealing. **C 286, B08**
- acid content**, *n*—of felt, the number of milliequivalents of acid present per unit weight of felt, measured under prescribed conditions. **D 123, D13**
- acid content**, *n*—of felt, the number of milliequivalents of acid present per unit weight of felt, measured under prescribed conditions. **D 4845, D13**
- acid etch**, *v*—to clean or alter a surface by the application of acid. **C 904, C03**
- acid-etched**—treated in an acid bath, usually phosphoric, to provide a rough surface. **F 547, F16**
- acid-extractable material**—substances dissolved by an acid under specified conditions. **D 2652, D28**
- acid extraction**—See **extraction**. **E 7, E04**
- acid foods**—foods that have a natural pH of 4.6 or below. **F 17, F02**
- acid gas**—natural gas containing high concentrations of hydrogen sulfide or carbon dioxide, or both, which is acidic when in contact with water or water vapor. **D 4150, D03**
- acid groups**—functional groups having the properties of acids. In cellulose and its derivatives, these are usually carboxyl groups. **D 1695, D01**
- acidifier**—a material that can be added to spray mixtures to lower the pH. **E 1519, E35**
- acidity**, *n*—the quantitative capacity of aqueous media to react with hydroxyl ions. **D 1129, D19**
- acidity**, *n*—the quality, state or degree of being acid. **D 4175, D02**
- acidity**—the number of milligrams of sodium hydroxide consumed when 100 mL of the sample are titrated under the conditions prescribed in this method. **D 4790, D16**
- acidity**—the quantitative capacity of aqueous media to react with hydroxyl ions. **D 6161, D19**
- acidity, free mineral**, *n*—the quantitative capacity of aqueous media to react with hydroxyl ions to pH 4.3. **D 1129, D19**
- acidity, theoretical free mineral**, *n*—the free mineral acidity that would result from the conversion of the anions of strong acids in solution to their respective free acids. **D 1129, D19**
- acid mine drainage (AMD)**, *n*—water exhibiting a pH of less than 6.0 and in which total acidity exceeds total alkalinity, discharged from an active, inactive or abandoned coal mine and reclamation operation or from an area affected by surface coal mining and reclamation operations. **E 2201, E50**
- acid mine water**, *n*—see **AMD**. **E 2201, E50**
- acid number**, *n* (for coatings)—the number of milligrams of potassium hydroxide (KOH) required to neutralize the free acids in 1 g of an oil, resin, varnish, or other substance; generally reported on the nonvolatile content. **D 16, D01**
- acid number**, *n*—the quantity of base, expressed in milligrams of potassium hydroxide, that is required to titrate acidic constituents present in 1 g of sample. **D 907, D14**
- acid number**, *n*—the quantity of base, expressed as milligrams of potassium hydroxide per gram of sample, required to titrate a sample to a specified end point. **D 4175, D02**
- acid number**, *n*—the quantity of base, expressed in milligrams of potassium hydroxide per gram of sample that is required to titrate a sample to a specified end point. **D 4175, D02**
- acid polishing**—the polishing of a glass surface by acid treatment. **C 162, C14**
- acid producing potential (AP)**, *n*—the potential for a solid material sample to produce acidic effluent, based on the percent of sulfide contained in that sample as iron-sulfide mineral (for example, pyrite or pyrrhotite). The AP is commonly converted to the amount of calcium carbonate required to neutralize the resulting amount of acidic effluent produced by the oxidation of contained iron sulfide minerals; it is expressed as the equivalent tons of calcium carbonate per 1000 tons of solid material. The AP is therefore calculated by multiplying the percent of sulfide contained in the material by a stoichiometric factor of 31.25. **D 5681, D34**
- acid rain**—rain having a pH of less than 5.65.
active hours—See **hours of operation**.
active solar energy system—See **building subsystem**.
adapt—See **building modification**.
add—See **building modification**. **E 631, E06**
- acid reaction**—a characteristic of materials producing the acid-color of the indicator used under the conditions prescribed in this method. **D 4790, D16**
- acid refractories**, *n*—see **refractories, acid**. **C 71, C08**
- acid resistance**—the degree to which a porcelain enamel will resist attack by acids. **C 286, B08**
- acid-resistant brick**, *n*—brick suitable for use in contact with chemicals, usually in conjunction with acid-resistant mortars. See **Specification C 279**. **C 43, C15**
- acid-sized paper**, *n*—paper that has been manufactured using a procedure or process at pH values below 7 (usually 4.0 to 6.5) that results in paper that has resistance to aqueous liquid penetration. See **sizing**. **D 1968, D06**
- acid treating**—a refining process in which an unfinished petroleum insulating oil is contacted with sulfuric acid to improve its color, odor, stability, and other properties. **D 2864, D27**
- acid value**—see **acid number**. **D 16, D01**
- acid-wash color**—the color developed in the separated acid when a sample of detergent alkylate is agitated with sulfuric acid under the conditions prescribed by the method. **D 459, D12**
- acid wash color**—the color developed in the separated acid when a sample is agitated with sulfuric acid under the condition prescribed in this method. **D 4790, D16**
- acid-washed**—a worn surface produced by applying acid. **C 119, C18**
- AC impedance**—See **electrochemical impedance**. **G 15, G01**
- aciniform**, *adj*—shaped like a cluster of grapes. **D 3053, D24**
- ACK**, *n*—a communication control character transmitted by a receiver as an affirmative response to a sender; a signal that the printer receiver sends to the host indicating that the printer has received a message and is ready to receive the next message. **F 1457, F05**
- ac loss characteristics**—those properties of a dielectric or insulation system (such as dissipation factor, power factor, and loss index) that may be used as a measure of the power or energy losses that would result from the use of such material in an ac electric field. **D 2864, D27**
- acoustical barrier**—contiguous objects such as solid walls, buildings, or earthen berms that substantially block the direct path of sound between a source and receiver, and which, if they have an

acoustical barrier

open edge or edges allowing diffraction around them, are sufficiently wide and high to cause significant reduction of the sound traveling from the source to the receiver. **C 634, E33**

acoustical board—a low-density, sound absorbing cellulose fiber-board having a factory-applied finish and a fissured, felted-fiber, slotted or perforated surface pattern provided to reduce sound reflection. Usually supplied for use in the form of tiles. **D 1554, D07**

acoustical ceiling panel, *n*—a form of a prefabricated sound absorbing ceiling element used with exposed suspension systems (see Specification E 1264). **E 176, E05**

acoustical ceiling tile, *n*—a form of a prefabricated sound absorbing ceiling element used with concealed or semi-exposed suspension systems, stapling, or adhesive bonding (see Specification E 1264). **E 176, E05**

acoustical material—any material considered in terms of its acoustical properties. *Commonly and especially*, a material designed to absorb sound. **C 634, E33**

acoustic birefringence—the effect observed when orthogonally polarized SH-shear waves are propagated through the same material thickness and the difference in phase velocity is related to components of plane stress. **E 1316, E07**

acoustic emission (AE)—the class of phenomena whereby transient elastic waves are generated by the rapid release of energy from localized sources within a material, or the transient waves so generated. Acoustic emission is the recommended term for general use. Other terms that have been used in AE literature include (1) stress wave emission, (2) microseismic activity, and (3) emission or acoustic emission with other qualifying modifiers. **E 1316, E07**

acoustic emission channel—see **channel, acoustic emission**. **E 1316, E07**

acoustic emission count (emission count) (N)—see **count, acoustic emission**. **E 1316, E07**

acoustic emission count rate—see **count rate, acoustic emission (emission rate or count rate) (N)**. **E 1316, E07**

acoustic emission event—see **event, acoustic emission**. **E 1316, E07**

acoustic emission event energy—see **energy, acoustic event**. **E 1316, E07**

acoustic emission sensor—see **sensor, acoustic emission**. **E 1316, E07**

acoustic emission signal amplitude—see **signal amplitude, acoustic emission**. **E 1316, E07**

acoustic emission signal (emission signal)—see **signal, acoustic emission**. **E 1316, E07**

acoustic emission signature (signature)—see **signature, acoustic emission**. **E 1316, E07**

acoustic emission transducer—see **sensor, acoustic emission**. **E 1316, E07**

acoustic emission waveguide—see **waveguide, acoustic emission**. **E 1316, E07**

acoustic impedance, $Z \equiv R + jX$; $[ML^{-4}T^{-1}]$; mks acoustic ohm ($Pa \cdot s/m^3$)—of a surface, for a given frequency, the complex quotient obtained when the sound pressure averaged over the surface is divided by the volume velocity through the surface. The real and imaginary components are called, respectively, **acoustic resistance and acoustic reactance**. **C 634, E33**

acoustic pathlength (d , (m)), *n*—the physical distance between transducer transmitter-receiver pairs. **D 1356, D22**

acousto-ultrasonics (AU)—a nondestructive examination method that uses induced stress waves to detect and assess diffuse defect states, damage conditions, and variations of mechanical properties of a test structure. The AU method combines aspects of acoustic emission (AE) signal analysis with ultrasonic materials characterization techniques. **E 1316, E07**

acquisition—(1) the act of acquiring. (2) Acquiring hardware, supplies or services through purchase, lease, or other means, including transfer or fabrication, whether the supplies or services are already

in existence or must be created, developed, demonstrated, and evaluated. **E 2135, E53**

acromion, *n*—in anatomy, that part of the shoulder blade located at the end of the spine which articulates with the collar bone. (See also **shoulder joint**.) **D 123, D13**

acromion, *n*—that part of the shoulder blade located at the end of the spine, which articulates with the collarbone. (See also **shoulder joint**.) **D 5219, D13**

across back shoulder, *n*—the horizontal distance across the back from the top of one shoulder joint to the top of the other shoulder joint, taken with the arms down. **D 5219, D13**

across front shoulder width, *n*—the horizontal distance across the front from the top of one shoulder joint to the top of the other shoulder joint, taken with the arms down. **D 5219, D13**

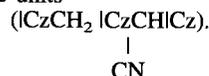

across machine direction, *n*—the direction perpendicular to which a product moves through the manufacturing process. **F 141, F06**

across (or against) grain, *n*—the direction in a body with preferred orientation due to forming stresses that has the maximum *c*-axis alignment as measured in an X-ray diffraction test. **C 709, D02**

across (or against) grain, *n*—the direction in a body with preferred orientation due to forming stresses that has the maximum *c*-axis alignment as measured in an X-ray diffraction test. **D 4175, D02**

across shoulder, *n*—in body measurements, the distance from shoulder joint to shoulder joint across the back. **D 123, D13**

acrylic—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85 % by weight of acrylonitrile units

****anidex**—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 50 % by weight of one or more esters of a monohydric alcohol and acrylic acid, $CH_2|C_xCH(C_2COOH)$.

******aramid**—a manufactured fiber in which the fiber-forming substance is a long-chain synthetic aromatic polyamide in which at least 85 % of the amide ($|C_2C(C_2NH(C_2))$) linkages

are attached directly to two aromatic rings. **D 123, D13**

acrylic plastic, *n*—a plastic based on polymers made with acrylic acid or a structural derivative of acrylic acid. **F 1251, F04**

acrylic plastics—plastics based on polymers made with acrylic acid or a structural derivative of acrylic acid. **D 883, D20**

acrylic resin—under **resin, synthetic**, see **acrylic resin**. **D 16, D01**

acrylonitrile-butadiene-styrene (ABS) pipe and fitting plastics—plastics containing polymers or blends of polymers, or both, in which the minimum butadiene content is 6%, the minimum acrylonitrile content is 15 %, the minimum styrene or substituted styrene content, or both, is 15 %, and the maximum content of all other monomers is not more than 5 %; plus lubricants, stabilizers, and colorants. **F 412, F17**

actinic radiation, *n*—the spectral region(s) of a light source responsible for the photodegradation of a particular material. **G 113, G03**

actinolite asbestos—asbestiform variety of the monoclinic amphibole silicate minerals of the tremolite-actinolite series. **D 2946, C17**

action level, *n*—a level of a contaminant in a medium at or above which activities to control the level are initiated. **E 1605, E06**

action level (AL)—the level above or below which will lead to the adoption of one of two alternative actions. **D 5681, D34**

activated carbon—a family of carbonaceous substances manufactured by processes that develop adsorptive properties. **D 2652, D28**

activated carbon—granulated or powdered activated carbon used to remove tastes, odor, chlorine, chloramines, and some organics from water. A family of carbonaceous substances manufactured by processes that develop adsorptive properties. **D 6161, D19**

activated charcoal, *n*—activated charcoal refers to properly conditioned coconut-shell charcoal. **D 1356, D22**

activated sintering, *v*—a sintering process during which the rate of sintering is increased, for example, by addition of a substance to the powder or by changing sintering conditions. **B 243, B09**

activated sludge, *n*—the precipitated solid matter, consisting mainly of bacteria and other aquatic microorganisms, that is produced in a domestic wastewater treatment plant; activated sludge is used primarily in secondary sewage treatment to microbially oxidized dissolved organic matter in the effluent. **D 4175, D02**

activated sludge, *n*—the precipitated solid matter, consisting mainly of bacteria and other aquatic microorganisms, that is produced at a domestic wastewater treatment plant; activated sludge is used primarily in secondary sewage treatment to microbially oxidize dissolved organic matter in the effluent. **D 6384, D02**

activation—elimination of a passive condition on a surface. **B 374, B08**

activation—a process in which contamination of the surface of contacts causes arcing at lower than usual voltage or arcing persists at lower than usual current, or both. For example, palladium contacts operated in an organic vapor produce arcs at voltage and current less than the minimum arcing voltage and current because of the presence of carbon on the contact surfaces. **B 542, B02**

activation—any process whereby a substance is treated to develop adsorptive properties. **D 2652, D28**

activation—in neutron radiography, the process of causing a substance to become artificially radioactive by subjecting it to bombardment by neutrons or other particles. **E 1316, E07**

activation—the process of causing a substance to become artificially radioactive by subjecting it to bombardment by neutrons or other particles. **E 1316, E07**

activation cross section—the cross section for processes in which the product nucleus is radioactive (see **cross section**). **E 170, E10**

activation temperature—temperature which generates an optical density of 0.20. **F 1623, F05**

activator—in *diffusion coatings*, a chemical, usually a halide salt, that enters into a reaction with the source or master alloy, depositing the source on the substrate. **B 374, B08**

activator—a material that causes a catalyst to begin its function. **D 653, D18**

activator, *n*—compounding material used in small proportions to increase the effectiveness of an accelerator. **D 1566, D11**

activator—a material that increases the biological efficacy of agricultural chemicals. **E 1519, E35**

active—the negative direction of electrode potential. (Also used to describe corrosion and its associated potential range when an electrode potential is more negative than an adjacent depressed corrosion rate [passive] range.) **G 15, G01**

active chemical deposit rate—the amount of active ingredient deposited per unit area. **E 1102, E35**

active chemical rate—the amount of active ingredient (a.i.) applied per unit treated, expressed in terms of mass per relevant unit treated. (For area treatment, kg a.i./ha, lb a.i./A, or oz a.i./1000 ft. of row; for space application, mg a.i./m³, or oz a.i./1000 ft³; for individual units, kg a.i./plant or animal.) **E 1102, E35**

active coat, *n*—a coating layer which contains the primary image (color) forming ingredients. **F 1623, F05**

active earth pressure—see **earth pressure**. **D 653, D18**

active fiber optic chemical sensor, *n*—a fiber optic chemical sensor in which a transduction mechanism other than the intrinsic spectroscopic properties of the analyte is used to modulate the optical signal. **E 131, E13**

active hours—See **hours of operation**. **E 1480, E06**

active hours, *n* (heuresd'activité)—times when a facility is normally fully occupied and operational. **E 631, E06**

active ingredient—component of an aerosol formulation that produces the specific effect for which the formulation is designed. **D 3064, D10**

active ingredient—a component of the formulation that produces a specific effect for which the formulation is designed. **E 1519, E35**

active ingredient of a synthetic detergent—the organic surface-active material present in the detergent. **D 459, D12**

active layer—the top layer of ground that is subject to annual freezing and thawing. (In the zone of discontinuous permafrost, the active layer is often underlain by unfrozen ground.) **D 7099, D18**

active layer failure—any of several possible forms of slope failure in the active layer. **D 7099, D18**

active layer thickness—the thickness of the top layer of ground that is subject to annual freezing and thawing. **D 7099, D18**

active oxygen—in *cleaning compounds*, the oxidizing power of oxygen present as peroxide or other active oxygen-containing moieties in solution expressed as oxygen (equivalent weight 8.00). **D 459, D12**

active (real) power, *P*—the product of the rms current, *I*, in an electrical circuit, the rms voltage, *E*, across the circuit, and the cosine of the angular phase difference, θ between the current and the voltage.

$$P = EI \cos\theta$$

NOTE—The portion of the active power that is expended in a magnetic core is the total core loss, *P_c*. **A 340, A06**

active rock glacier—a mass of rock fragments and finer material, on a slope, that contains an ice core or interstitial ice, and which shows evidence of recent movement. **D 7099, D18**

active solar energy system—a **building subsystem** in which solar energy is collected and transferred predominantly by mechanical power not derived from solar radiation. **E 631, E06**

active state of plastic equilibrium—see **plastic equilibrium**. **D 653, D18**

activity—for *activated carbon*, the adsorptive capacity of an adsorbent, usually as measured by a standard test. **D 2652, D28**

activity—*of a catalyst*, the measure of the rate of a specific catalytic reaction conducted in the presence of a catalyst. **D 3766, D32**

activity—the thermodynamically effective concentration of a free ion in solution. In dilute solutions, ionic activity, and concentration are practically identical, but in solutions of high ionic strength, or in the presence of complexing agents, activity may differ significantly from concentration. Ionic activity, not concentration, determines both the rate and the extent of chemical reactions. **D 4127, D19**

activity, *A*—of an amount of radioactive nuclide in a particular energy state at a given time, the quotient of *dN* by *dt*, where *dN* is the expectation value of the number of spontaneous nuclear transitions from that energy state in the time interval *dt* (ICRU).

$$A = dN/dt$$

Unit: s⁻¹

The special name for the unit of activity is the becquerel (Bq).

$$1 \text{ Bq} = 1 \text{ s}^{-1}$$

E 170, E10

activity coefficient—a factor, γ , that relates activity, *A*, to the concentration, *C* of a species in solution:

$$A = \gamma C$$

The activity coefficient is dependent on the ionic strength of the solution. Ions of similar size and charge have similar activity coefficients. **D 4127, D19**

activity (ion)—the ion concentration corrected for deviations from ideal behavior. Concentration multiplied by activity coefficient. **B 374, B08**

activity limit—the lowest activity that can be measured in a solution that is well buffered with respect to the ion being measured. The activity limit will vary as a function of solution pH. **D 4127, D19**

activity standard

- activity standard**—a standardizing solution whose value is reported in terms of ionic activity. If the electrode is calibrated using activity standards, the activity of the free, unbound ion in the sample is determined. **D 4127, D19**
- actuation force**—the maximum force measured prior to or including point at which contact closure is achieved on a membrane switch. **F 2112, F01**
- actuator, button, or spray head, n**—the fingerpad that the consumer depresses to dispense product. **D 6655, D10**
- acuity, n**—the ability to repeatedly detect or discriminate sensory stimuli. **E 253, E18**
- acute ecotoxicity, n**—the propensity of a material to produce adverse behavioral, biochemical, or physiological effects in non-human organisms or populations in a short period of time, usually not constituting a substantial portion of the life span of the organism. **D 4175, D02**
- acute ecotoxicity, n**—the propensity of a test material to produce adverse behavioral, biochemical or physiological effects in non-human organisms or populations in a short period, usually not constituting a substantial portion of the life span. **D 4175, D02**
- acute ecotoxicity, n**—the propensity of a test material to produce adverse behavioral, biochemical, or physiological effects in non-human organisms or populations in a short period, usually not constituting a substantial portion of the life span. **D 6384, D02**
- acute ecotoxicity test, n**—a comparative ecotoxicity test in which a representative subpopulation of organisms is exposed to different treat rates of a test material and is observed for a short period, usually not constituting a substantial portion of their life span. **D 4175, D02**
- acute ecotoxicity test, n**—a comparative ecotoxicity test in which a representative subpopulation of organisms is exposed to different treat rates of a test material and is observed for a short period, usually not constituting a substantial portion of their life span. **D 6384, D02**
- acute radiation syndrome**—the immediate effects of a short term, whole body overexposure of a person to ionizing radiation. These effects include nausea and vomiting, malaise, increased temperature, and blood changes. **E 1316, E07**
- acute test**—a comparative study in which organisms, that are subjected to different treatments, are observed for a short period usually not constituting a substantial portion of their life span. **E 943, E47**
- acute toxicity test, n**—a comparative toxicity test in which a representative subpopulation of organisms is exposed to different treat rates of a test material and is observed for a short period usually not constituting a substantial portion of their life span. **D 4175, D02**
- acyl groups**—radicals derived from carboxylic acids by removal of the hydroxyl group. **D 1695, D01**
- Adams color difference, n**—color difference calculated by using the Adams-Nickerson opponent-color equations, based on applying the Munsell Value function to CIE 1931 tristimulus values X, Y, Z . **E 284, E12**
- adapt, v—in building, to make suitable for a particular purpose by means of change or modification. E 631, E06**
- adaptation, sensory, n**—a decrease in sensitivity to a given stimulus which occurs as a result of exposure to that stimulus. **E 253, E18**
- adaptive location**—source location by iterative use of simulated sources in combination with computed location. **E 1316, E07**
- ADC**—abbreviation for **automatic density control. F 1457, F05**
- add, v—in building, to extend by means of new construction, or by enclosing an existing structure. E 631, E06**
- addition, n**—a material that is interground or blended in limited amounts into a hydraulic cement during manufacture.
- functional addition, n**—an addition introduced to modify one or more properties of a hydraulic cement.
- air-entraining addition, n**—a functional addition that will entrain air in mortar or concrete.
- processing addition, n**—an addition introduced to aid in the manufacture or handling, or both, of a hydraulic cement. **C 219, C01**
- addition agent**—a material added in small quantities to a solution to modify its characteristics. It is usually added to a plating solution for the purpose of modifying the character of a deposit. **B 374, B08**
- addition polymerization**—polymerization in which monomers are linked together without the splitting off of water or other simple molecules. **D 883, D20**
- addition polymerization, n**—polymerization in which monomers are linked together without the splitting off of water or other simple molecules and involves the opening of a double bond. **F 1251, F04**
- additive, n**—a substance added in small quantities to another substance, usually to improve specific properties (for example, a drier, mildewcide, etc.). **D 16, D01**
- additive**—any material other than the basic components of a grout system. **D 653, D18**
- additive**—a chemical compound or compounds added to an insulating fluid for the purpose of imparting new properties or altering those properties which the fluid already has. **D 2864, D27**
- additive, n**—a material added to another, usually in small amounts, to impart or enhance desirable properties or to suppress undesirable properties. **D 4175, D02**
- additive color mixture, n**—superposition or other nondestructive combination of lights of different perceived colors. **E 284, E12**
- additive color stimulus mixture, n**—method of simulation that combines on the retina the actions of various color stimuli in such a manner that they cannot be perceived individually. **E 284, E12**
- additive primaries, n**—same as **primary color stimuli. E 284, E12**
- adfreeze shear strength**—the shear stress required to separate two objects that are bonded together by ice. **D 7099, D18**
- adfreeze tensile strength**—the tensile stress required to separate two objects that are bonded together by ice. **D 7099, D18**
- adfreezing**—the process by which objects are bonded together by the ice formed between them. **D 7099, D18**
- adhere, v**—to cause two surfaces to be held together by adhesion. **D 907, D14**
- adherence**—(1) the degree of adhesion of a porcelain enamel or other ceramic coating to a metal substrate.
(2) Stress necessary to cause separation of one material from another at their interface. **C 286, B08**
- adherent, n**—a body held to another body by an adhesive. **D 907, D14**
- adherend preparation, n**—see **surface preparation. D 907, D14**
- adhesion**—the attractive force that exists between an electrodeposit and its substrate that can be measured as the force required to separate an electrodeposit and its substrate. **B 374, B08**
- adhesion**—the physical attraction of two substances, especially the macroscopically observable attraction of dissimilar substances. **C 904, C03**
- adhesion, n**—the property denoting the ability of a material to resist delamination or separation into two or more layers. **D 123, D13**
- adhesion, n—in tirefabrics, the force required to separate a textile material from rubber or other elastomer by a definite prescribed method. D 123, D13**
- adhesion**—shearing resistance between soil and another material under zero externally applied pressure.
- | | Symbol | Unit |
|----------------|--------|-----------------------|
| Unit Adhesion | C_a | FL ⁻² |
| Total Adhesion | C_a | F or FL ⁻¹ |
- D 653, D18**
- adhesion**—shearing resistance between two unlike materials under zero externally applied pressure. **D 653, D18**
- adhesion, n**—the state in which two surfaces are held together by interphase forces.
- mechanical adhesion, n**—adhesion between surfaces in which

the adhesive holds the parts together by interlocking action.

specific adhesion, n—adhesion between surfaces which are held together by intermolecular forces of a chemical or physical nature. **D 907, D14**

adhesion, n—condition in which surfaces are held together by chemical or physical forces or both. **D 1566, D11**

adhesion, n—*for asbestos*, see **fiber adhesion**. **D 2946, C17**

adhesion, n—the property denoting the ability of a material to resist delamination or separation into two or more layers. **D 6477, D13**

adhesion, n—*in tirefabrics*, the force required to separate a textile material from rubber or other elastomer by a definite prescribed method. **D 6477, D13**

adhesion, n—the bonding of the ink to the substrate. **D 6488, D01**

adhesion, n—the tendency of one surface to adhere to another surface prior to movement due to dwell time, as well as other factors. **F 1646, F13**

adhesion failure, n—rupture of an adhesive bond in which the separation appears visually to be at the adhesive/adherend interface. **D 907, D14**

adhesion failure, n—*in characterizing the locus of an adhesive-joint-failure*, the fracture occurring within the interphase region. (Compare *cohesion failure*.) **D 907, D14**

adhesion failure, n—the loss of structural integrity due to the separation of two bonded surfaces at the bond interface. **D 1566, D11**

adhesion, practical, n—the force or work required to detach or remove a coating from the underlayer or substrate; it can be measured in terms of peel, pull, or shear strength as an experimentally determined quantity. **B 374, B08**

adhesion promoter, n—a material built into a binder or added to a paint to form primary bonds to either the substrate or the previously applied coating, with the specific aim of improving the dry or wet adhesion, or both. **D 16, D01**

adhesion promoter, n—a substance used to improve bonding of the adhesive to the substrate. (Compare *coupling agent* and *primer*.) **D 907, D14**

adhesion value, n—force required to cause adhesion failure. **D 1566, D11**

adhesive, n—a substance capable of holding materials together by surface attachment. **C 11, C11**

adhesive, n—a substance capable of holding materials together by surface attachment. **C 274, D30**

adhesive, n—a substance capable of holding materials together by surface attachment. (See also **glue, gum, mucilage, paste, resin, and sizing**.)

adhesive, assembly, n—see **assembly adhesive**.

adhesive, bulk, n—see **bulk adhesive**.

adhesive, casein, n—see **casein adhesive**.

adhesive, cellular, n—see **cellular adhesive**.

adhesive, cold-setting, n—see **cold-setting adhesive**.

adhesive, contact, n—see **contact adhesive**.

adhesive, foamed, n—see **foamed adhesive**.

adhesive, gap-filling, n—see **gap-filling adhesive**.

adhesive, heat activated, n—see **heat activated adhesive**.

adhesive, hot-melt, n—see **hot-melt adhesive**.

adhesive, hot-setting, n—see **hot-setting adhesive**.

adhesive, intermediate-temperature-setting, n—see **intermediate-temperature-setting adhesive**.

adhesive, mastic, n—see **mastic adhesive**.

adhesive, multiple-layer, n—see **multiple-layer adhesive**.

adhesive, polyvinyl acetate emulsion, n—see **polyvinyl acetate emulsion adhesive**.

adhesive, pressure-sensitive, n—see **pressure-sensitive adhesive**.

adhesive, room-temperature-setting, n—see **room-temperature-setting adhesive**.

adhesive, separate application, n—see **separate-application adhesive**.

adhesive, solvent, n—see **solvent adhesive**.

adhesive, solvent-activated, n—see **solvent-activated adhesive**.

adhesive, structural, n—see **structural adhesive**.

adhesive, warm-setting, n—see **warm-setting adhesive**.

adhesive, urea-formaldehyde, n—see **urea-formaldehyde adhesive**. **D 907, D14**

adhesive, n—a substance capable of holding materials together by surface attachment. **D 996, D10**

adhesive—a substance capable of holding materials together by surface attachment.

NOTE—adhesive is the general term and includes, among others, cement, glue, mucilage, and paste. All of these terms are loosely used interchangeably. Various descriptive adjectives are applied to the term adhesive to indicate certain characteristics as follows:

(1) Physical form, that is, liquid adhesive, tape adhesive

(2) Chemical type, that is, silicate adhesive, resin adhesive

(3) Materials bonded, that is, paper adhesive, metal-plastic adhesive, can label adhesive

(4) Conditions of use, that is, hot-setting adhesive **D 1038, D07**

adhesive—a substance capable of holding materials together by means of surface attachment.

cold setting adhesive—an adhesive which sets at temperatures below 20°C (68°F).

contact pressure adhesive—a resinous adhesive which is aggressively and permanently tacky at room temperature and adheres to a variety of surfaces upon contact with a minimum of pressure required. (Syn. **pressure-sensitive adhesives**.)

core splice adhesive—a film adhesive, capable of expansion of at least 175 % of its original thickness, used primarily to join or splice together two or more separate sections of core material in sandwich constructions.

foamed adhesive—an adhesive, the apparent density of which has been decreased substantially by the presence of numerous gaseous cells dispersed throughout its mass.

supported film adhesive—an adhesive material incorporating a carrier that remains in the bond when the adhesive is employed; carrier support material is usually composed of organic/inorganic fibers which may be in woven (knit) or nonwoven (mat) form.

unsupported film adhesive—an adhesive material in film form without a carrier support. **E 631, E06**

adhesive—a substance capable of holding materials together by means of surface attachment.

cold setting adhesive—an adhesive which sets at temperatures below 20°C (68°F).

contact pressure adhesive—a resinous adhesive which is aggressively and permanently tacky at room temperature and adheres to a variety of surfaces upon contact with a minimum of pressure required. (Syn. **pressure-sensitive adhesives**.)

core splice adhesive—a film adhesive, capable of expansion of at least 175 % of its original thickness, used primarily to join or splice together two or more separate sections of core material in sandwich constructions.

foamed adhesive—an adhesive, the apparent density of which has been decreased substantially by the presence of numerous gaseous cells dispersed throughout its mass.

supported film adhesive—an adhesive material incorporating a carrier that remains in the bond when the adhesive is employed; carrier support material is usually composed of organic/inorganic fibers which may be in woven (knit) or nonwoven (mat) form.

unsupported film adhesive—an adhesive material in film form without a carrier support. **E 1749, E06**

adhesive—a substance capable of holding materials together by surface attachment. **F 412, F17**

adhesive, anaerobic, n—see **anaerobic adhesive**.

adhesive, anaerobic, n—see **anaerobic adhesive**. D 907, D14

adhesive-bonded anchor—anchor placed into a hole in the base material, and which derives its holding strength from a chemical adhesive placed between the wall of the hole in the base material and the embedded portion of the anchor. E 2265, E06

adhesive bonded joint—see **joint, adhesive bonded**. F 412, F17

adhesive, contact—an adhesive that is apparently dry to the touch and that will adhere to itself instantaneously upon contact. E 631, E06

adhesive, contact—an adhesive that is apparently dry to the touch and that will adhere to itself instantaneously upon contact. E 1749, E06

adhesive dispersion, n—a two-phase system in which one phase is suspended in a liquid. (Compare to **emulsion**.) D 907, D14

adhesive failure, n—in *building construction*, failure of the bond between the sealant, adhesive, or coating and the substrate surface. C 717, C24

adhesive failure, n—a separation of two bonded surfaces that occurs within the bonding material. D 1566, D11

adhesive joint, n—location at which two adherends are held together with adhesive. D 907, D14

adhesive-joint failure, n—the locus of fracture occurring in an adhesively-bonded joint resulting in a loss of load-carrying capability. D 907, D14

adhesive, solvent—see **solvent cement**. F 412, F17

adhesive transfer—a condition occurring when an adhesive-coated material is peeled away from an opposing material to which it has been sealed and shows visible evidence of the adhesive being left on the opposing material. This evidence is in the form of an adhesive layer that remains with the opposing material, the adhesive having separated either adhesively from the coated web or cohesively within the adhesive itself. F 1327, F02

adhesive treated-tire cord, n—a tire cord whose adhesion to rubber or other elastomer has been improved by the application of a dip followed by rapid drying and (normally) additional heat treatment. D 123, D13

adhesive treated tire cord, n—a tire cord whose adhesion to rubber or other elastomer has been improved by the application of a dip followed by rapid drying and (normally) additional heat treatment. D 6477, D13

adhesive wear, n—wear due to localized bonding between contacting solid surfaces leading to material transfer between the two surfaces or loss from either surface. G 40, G02

adhesive wear (scuffing), n—wear due to localized bonding between contacting solid surfaces leading to material transfer between the two surfaces or loss from either surface. D 4175, D02

adiabatic calorimeter, n—a calorimeter that has a jacket temperature adjusted to follow the calorimeter temperature as closely as possible so as to maintain zero thermal head. D 5681, D34

adiabatic decomposition temperature rise, (T)_d, n—an estimation of the computed temperature which a specimen would attain if all of the enthalpy (heat) of decomposition reaction were to be absorbed by the sample itself. High values represent high hazard potential. E 1445, E27

adiabatic extrusion—a method of extrusion in which, after the extrusion apparatus has been heated sufficiently by conventional means to plastify the material, the extrusion process can be continued with the sole source of heat being the conversion of the drive energy, through viscous resistance of the plastic mass in the extruder. D 883, D20

adiabatic extrusion—a method of extrusion in which the sole source of heat is the conversion of the drive energy, through viscous resistance of the plastic mass in the extruder. (D20) F 412, F17

adiabaticity, n—the condition in which there is no significant gain or loss of heat throughout the length of the column. D 4175, D02

adjacency—two OCR characters printed on the same line with character spacing reference lines separated by the proper space for the font and system. F 149, F05

adjunct instructor—an individual with specialized subject matter expertise, who, on occasion, instructs a specific topic of a curriculum under the direction of the course instructor/coordinator. F 1177, F30

adjusted internal rate-of-return (AIRR)—the compound rate of interest that, when used to discount the terminal values of costs and benefits of a project over a given study period, will make the costs equal the benefits when cash flows are reinvested at a specified rate. (Syn. *financial management rate of return (FMRR)*)

adjusted serviceability score—See **serviceability score**. E 631, E06

adjusted internal rate-of-return (AIRR), n—the compound rate of interest that, when used to discount the terminal values of costs and benefits of a project over a given study period, will make the costs equal the benefits when cash flows are reinvested at a specified rate. (Syn. *financial management rate of return (FMRR)*)

E 833, E06

adjusted mode, n—output of an *IR thermometer* that gives temperature measured and calculated from a subject or object, by correcting such temperature for variations in ambient temperature, *subject's* temperature, emissivity, body site (that is, *oral*, or *rectal*), etc. E 344, E20

adjusted serviceability score—See **serviceability score**. E 1480, E06

adjusting device, n—a section of the instrument used to adjust the amount of mercury in the bulb and main capillary to that needed for the intended temperature interval. E 344, E20

adjuvant—a material added to a tank mix to aid or modify the action of an agrichemical, or the physical characteristics of the mixture. E 1519, E35

administrative controls—Administrative measures that are used to control occupational exposures to hazards. E 1605, E06

administrative removal—(*of workers*), temporary removal of workers from a job site prior to blood-lead levels reaching values requiring medical removal. E 631, E06

administrative removal—(*of workers*), temporary removal of workers from a job site prior to blood-lead levels reaching values requiring medical removal. E 1605, E06

admittance ratio, ypc \equiv *gpc* - *jbpc*; [dimensionless]—the reciprocal of the impedance ratio. The real and imaginary components are called, respectively, **conductance ratio** and **susceptance ratio**. C 634, E33

admittance, Y—the reciprocal of impedance. E 1142, E37

admixed mortar, n—masonry mortar that deviates from those combinations of materials recognized by Specification C 270 in that it also contains an admixture. C 1180, C12

admixture, n—a material other than water, aggregates, hydraulic cementitious material, and fiber reinforcement that is used as an ingredient to modify properties and is added to the batch before or during its mixture. C 11, C11

admixture, n—a material other than water, aggregates, hydraulic cementitious material, and fiber reinforcement that is used as an ingredient of a cementitious mixture to modify its freshly mixed, setting, or hardened properties and that is added to the batch before or during its mixing.

accelerating admixture, n—admixture that accelerates the setting and early strength development of concrete. (C 494/C 494M)

air-entraining admixture, n—admixture that causes the development of a system of microscopic air bubbles in concrete or mortar during mixing.

chemical admixture, n—a nonpozzolanic admixture in the form of a liquid, suspension, or water-soluble solid.

mineral admixture, n—deprecated term.

retarding admixture, n—admixture that retards the setting of concrete. (C 494/C 494M)

water-reducing admixture, n—admixture that either increases the slump of freshly mixed mortar or concrete without increasing the water content or that maintains the slump with a reduced amount of water due to factors other than air entrainment.

- water-reducing admixture, high-range, n*—a water-reducing admixture capable of producing at least 12 % reduction of water content when tested in accordance with Specification C 494/C 494M and meeting the other relevant requirements of Specification C 494/C 494M. **C 125, C09**
- admixture**—a material other than water, aggregates, cement and fibre reinforcing used as an ingredient of concrete and added to the batch immediately before or during its mixture. **C 822, C13**
- admixture, n**—substance other than the Specification C 270 prescribed materials of water, aggregate, and cementitious materials that is added to a masonry mortar as an ingredient to improve one or more chemical or physical properties of the conventional masonry mortar. **C 1180, C12**
- admixture**—a material other than water, aggregates, or cementitious material, used as a grout ingredient for cement-based grouts. **D 653, D18**
- admixture, n**—a material other than water, aggregates, hydraulic cement, and fiber reinforcement, used as an ingredient of concrete or mortar, and added to the concrete batch immediately before or during its mixing. **E 2201, E50**
- adsorbate, n**—material that has been retained by the process of adsorption. **D 1356, D22**
- adsorbate**—any substance that is adsorbed. **D 2652, D28**
- adsorbed water**—water in a soil or rock mass attracted to the particle surfaces by physiochemical forces, having properties that may differ from those of pore water at the same temperature and pressure due to altered molecular arrangement; adsorbed water does not include water that is chemically combined within the clay minerals. **D 653, D18**
- adsorbent, n**—solid material on the surface of which adsorption takes place. **D 1356, D22**
- adsorbent**—any solid having the ability to concentrate significant quantities of other substances on its surface. **D 2652, D28**
- adsorption**—the capacity of a substance to accept and retain on its surface a layer of another substance, usually a gas or a liquid. **C 242, C21**
- adsorption, n**—a process in which the surface of a solid takes on or absorbs in an extremely thin layer molecules of gases, of dissolved substances, or of liquids with which it is in contact. (See also **absorption, moisture equilibrium of testing**. Compare **desorption** and **resorption**.) **D 123, D13**
- adsorption**—the attachment of water molecules or ions to the surfaces of soil particles. **D 653, D18**
- adsorption, n**—a physical process in which molecules of gas, of dissolved substances, or of liquids, adhere in an extremely thin layer to the surfaces of solid bodies with which they are in contact. **D 1356, D22**
- adsorption**—a process in which fluid molecules are concentrated on a surface by chemical or physical forces, or both. **D 2652, D28**
- adsorption, n**—a process in which the surface of a solid takes on or adsorbs in an extremely thin layer molecules of gases, of dissolved substances, or of liquids with which it is in contact. (See also **absorption and moisture equilibrium for testing**. Compare **desorption** and **resorption**.) **D 4920, D13**
- adsorption**—the holding of a substance onto the surface of a solid by chemical surface forces, without forming new chemical bonds. **D 6161, D19**
- adsorption zone*—see **mass transfer zone**. **D 2652, D28**
- advanced ceramic, n**—a highly engineered, high performance, predominantly non-metallic, inorganic, ceramic material having specific functional attributes. **C 1145, C28**
- advanced life support**—medically accepted life sustaining, invasive or non-invasive procedures; provided under the direction of a physician or other authorized health care provider. **F 1177, F30**
- advanced sulfur control products (ASC), n**—products generated from advanced coal conversion technologies including FBC (fluidized-bed combustion) and products from advanced environmental emission cleanup technologies such as duct injection and lime injection multiphase burners (LIMB). The type of by-product is technology-dependent and could be a bed ash and high-lime fly ash for an FBC technology, etc. **E 2201, E50**
- advancing slope grouting**—a method of grouting by which the front of a mass of grout is caused to move horizontally by use of a suitable grout injection sequence. **D 653, D18**
- adventitious agents, n**—an unintentionally introduced microbiological or other infectious contaminant. In the production of TEMPs, these agents may be unintentionally introduced into the process stream or the final product, or both. **F 2312, F04**
- adventitious carbon referencing**—XPS, determining the charging potential of a particular specimen by comparing the experimentally determined binding energy of the C 1s binding energy from absorbed hydrocarbon on the specimen with a standard binding energy value.
- NOTE—A nominal value of 285.0 is often used for the binding energy of the relevant C 1s peak, although some analysts prefer specific values in the range 284.6 eV to 285.2 eV depending on the nature of the substrate. **E 673, E42**
- AE activity, n**—the presence of acoustic emission during a test. **E 1316, E07**
- AE amplitude*—see **dB_{AE}**. **E 1316, E07**
- Ae_{cm}, Ae₁, Ae₃, Ae₄*—See **transformation temperature**. **A 941, A01**
- aeolian deposits**—wind-deposited material such as dune sands and loess deposits. **D 653, D18**
- aeolian vibration**—resonant vibration of a conductor caused by the alternate shedding of wind-induced vortices from opposite sides of the conductor. (Frequency is usually less than 200 Hz and amplitude rarely exceeds one conductor diameter.) **B 354, B01**
- aerating nozzle**—a device to atomize liquid for the purpose of aeration.
- NOTE—Although this term is occasionally used to designate certain types of airblast or internal mixing pneumatic atomizers, it is ambiguous and is not recommended for describing the latter devices. **E 1620, E29**
- aeration, n**—exposing a substance or area to air circulation; the process of mixing air with a pulverized fuel or a powdered material such as fly ash in a transport pipe or storage bin. **E 2201, E50**
- aeration system**—a type of circulation system that causes the beverage to cascade across the top and down the sides of the bowl interior incorporating air into the beverage. **F 1827, F26**
- AE rms, n**—the rectified, time averaged AE signal, measured on a linear scale and reported in volts. **E 1316, E07**
- aerobe, n**—an organism that requires oxygen to remain metabolically active. **D 4175, D02**
- aerobes**—organisms that require air or free oxygen for growth. **F 1600, F20**
- aerobic, adj**—(1) taking place in the presence of oxygen; (2) living or active in the presence of oxygen. **D 4175, D02**
- aerobic, n**—a condition in which a measurable volume of air is present in the incubation chamber or system. **D 4439, D35**
- aerobic, adj**—(1) taking place in the presence of oxygen; (2) living or active in the presence of oxygen. **D 6384, D02**
- aerobic**—able to live, grow, or take place only where free oxygen is present. **E 1705, E48**
- aerobic bacteria**—bacteria that require oxygen for growth. See **bacteria, aerobes**. **D 6161, D19**
- aerobic fermentation**—fermentation processes that require the presence of air. **E 1705, E48**
- aerodynamic diameter**—the diameter of a hypothetical sphere having a specific gravity of unity and the same settling velocity as the actual particle. **E 1620, E29**
- aerosol, n**—a dispersion of solid or liquid particles in a gaseous medium. **D 1356, D22**
- aerosol, n**—a dispersion of solid particles or liquid particles, or both, in gaseous media. **E 1620, E29**
- aerosol can side seam**—cans which are formed from rectangular

aerosol can side seam

sheets have a soldered, bonded or welded strip which joins two corresponding or matching side gill edges to form a cylinder.

D 3064, D10

aerosol container, empty, *n*—*in building construction*, an aerosol container is considered empty when the product flow reaches 0.5 g per second or less.

C 717, C24

aerosol development—development in which the toner is carried to the field of the electrostatic image by means of a suspending gas.

F 335, F05

aerosol generator—any mechanical or thermal device that produces a liquid dispersion having a volume median less than 50 μm .

E 1102, E35

aerosol package—See **package**.

D 996, D10

aerosol packaging—pressurizing sealed containers with liquefied or compressed gases, enabling the product to self-dispense. The term "aerosol" as used here is not confined to the scientific definition (that is, a suspension of fine solid or liquid particles in air or gas).

D 3064, D10

aerosols—distribution of droplets with $D_{V,5} \leq 50 \mu\text{m}$.

E 1102, E35

AE signal duration—the time between AE signal start and AE signal end.

E 1316, E07

AE signal end—the recognized termination of an AE signal, usually defined as the last crossing of the threshold by that signal.

E 1316, E07

AE signal generator—a device which can repeatedly induce a specified transient signal into an AE instrument.

E 1316, E07

AE signal rise time—the time between AE signal start and the peak amplitude of that AE signal.

E 1316, E07

AE signal start—the beginning of an AE signal as recognized by the system processor, usually defined by an amplitude excursion exceeding threshold.

E 1316, E07

aesthetic joint, *n*—a deprecated term. See **aesthetic reveal**.

E 2110, E06

aesthetic reveal, *n*—a groove cut into the insulation board which serves the function of decoration or to provide a starting or stopping point for finish-coat application, or both.

E 2110, E06

affective test, *n*—any method to assess acceptance, attitudes, emotions, or preference for a stimulus (i).

E 253, E18

aftercure, *n*—a continuation of the process of vulcanization after the energy source has been removed.

D 1566, D11

after effects, *n*—total array of sensations that occur after elimination of the physical stimulus from the sensing field.

E 253, E18

afterflame, *n*—persistent flaming of a material after the ignition source has been removed.

D 123, D13

after-flame time, *n*—the length of time for which a material continues to flame after the ignition source has been removed.

D 123, D13

afterflame time, *n*—the length of time in seconds for which a material continues to flame after the ignition source has been removed.

F 819, F18

after-flame time, *n*—the length of time for which a material continues to flame after the ignition source has been removed.

F 1494, F23

afterglow, *n*—glow in a material after the removal of an external ignition source or after the cessation (natural or induced) of flaming of the material. (See also **flame, glow**, and **smoldering**.)

D 123, D13

afterglow, *n*—glow in material after the removal of an external ignition source or after the cessation (natural or induced) of flaming of the material. (See also **flame, glow**, and **smoldering**.)

D 4391, D13

afterglow, *n*—emission of light, usually subsiding, from a material undergoing combustion, but occurring after flaming has ceased.

E 176, E05

afterglow, *n*—a glow in a material after the removal of an external ignition source or after the cessation (natural or induced) of flaming of the material (see also **glow**).

F 1494, F23

afterglow time, *n*—the time afterglow continues after the cessation of flaming or after removal of the ignition source.

D 123, D13

aftersensation, *n*—sense impression after direct stimulation of the sense organ has ceased.

E 253, E18

aftertaste, *n*—the oral or nasal sensations that occur after the source of the stimulus has been removed from the oral cavity. See **after effects**.

E 253, E18

agar, *n*—a semisolid culture medium used to support the growth of bacteria and other micro-organisms.

F 1494, F23

aged insulation value—thermal resistance (R-value) of a thermal insulation material as determined after standard conditioning to simulate service exposure.

E 631, E06

age hardening, *n*—hardening by **aging**, usually after rapid cooling or **cold working**.

A 941, A01

aging, accelerated, *n*—exposure of rubber to a test environment with the intent of producing, in a shorter time period, effects similar to normal ageing.

D 1566, D11

aging (act of), *n*—exposure of materials to a deteriorating environment for a specified time interval.

D 1566, D11

aging, air bomb, *n*—the process of exposing materials to the action of air at an elevated temperature and pressure.

D 1566, D11

aging, air oven, *n*—The process of exposing materials to the action of air at an elevated temperature at atmospheric pressure.

D 1566, D11

aging, natural, *n*—ageing under normal service conditions.

D 1566, D11

aging, oxygen bomb, *n*—the process of exposing materials to the action of oxygen at an elevated temperature and pressure.

D 1566, D11

aging (rubber), *n*—the irreversible change of material properties during exposure to a deteriorating environment, for a specified time interval.

D 1566, D11

aging, shelf, *n*—ageing during storage.

D 1566, D11

agency, *n*—an organization or part of an organization engaged in the activities of testing or inspection, or both.

D 1356, D22

age resistance, *n*—the ability of a material to resist deterioration caused by ageing.

D 1566, D11

ageusia, *n*—lack of sensitivity to taste stimuli.

E 253, E18

agglomerate, *n*—several particles adhering together.

B 243, B09

agglomerate—a jumbled mass or collection of two or more particles or aggregates, or a combination thereof, held together by relatively weak cohesive forces caused by weak chemical bonding or an electrostatic surface charge generated by handling or processing.

C 242, C21

agglomerate, *n*—*in manufactured carbon and graphite product technology*, a composite particle containing a number of grains.

C 709, D02

agglomerate, *n*—*as used in fractography*, a cluster of grains, particles, platelets, or whiskers, or a combination thereof, present in a larger solid mass.

C 1145, C28

agglomerate, *n*—*in manufactured carbon and graphite product technology*, a composite particle containing a number of grains.

D 4175, D02

agglomerate, *n*—two or more particles adhering together.

E 1638, E29

agglomerate, compounding material, *n*—a cluster of particles of one or more compounding materials loosely held together.

D 1566, D11

agglomerate, latex, *n*—a cluster of rubber particles in a colloidal aqueous suspension of such particles.

D 1566, D11

agglomerates, *n*—clusters of particles of compounding materials contained in a continuous rubber phase.

D 1566, D11

agglomerating, *adj*—*as applied to coal*, the property of softening when it is heated to above about 400°C in a nonoxidizing atmosphere, and then appearing as a coherent mass after cooling to room temperature.

D 121, D05

agglomeration, *n*—a process of contact and adhesion whereby the particles of a dispersion form clusters of increasing size.

D 1356, D22

agglomeration (latex), *n*—reversible or irreversible joining together of latex particles.

D 1566, D11

agglomeration or flocculation—the coalescence of dispersed suspended matter into large flocs or particles which settle rapidly.

D 4410, D19

aggradation—the geologic process by which stream beds, flood plains, and the bottoms of other water bodies are raised in elevation by the deposition of material eroded and transported by water from other areas.

D 4410, D19

aggradational ice—newly formed ice lenses, especially in the lower part of the active layer, which become incorporated into the permafrost due to a raising of the permafrost table or a lowering of the permafrost base.

D 7099, D18

aggradation of permafrost—see **permafrost aggradation**.

D 7099, D18

aggregate, *n*—an inert granular material which may be added to gypsum plasters.

C 11, C11

aggregate, *n*—granular material, such as sand, gravel, crushed stone, or iron blast-furnace slag, used with a cementing medium to form hydraulic-cement concrete or mortar.

*coarse aggregate, *n**—(1) aggregate predominantly retained on the 4.75-mm (No. 4) sieve; or (2) that portion of an aggregate retained on the 4.75-mm (No. 4) sieve.

*fine aggregate, *n**—(1) aggregate passing the 9.5-mm (3/8-in.) sieve and almost entirely passing the 4.75-mm (No. 4) sieve and predominantly retained on the 75- μ m (No. 200) sieve; or (2) that portion of an aggregate passing the 4.75-mm (No. 4) sieve and retained on the 75- μ m (No. 200) sieve.

*heavyweight aggregate, *n**—see *high-density aggregate*.

*high-density aggregate, *n**—aggregate with relative density greater than 3.3, such as: barite, magnetite, limonite, ilmenite, iron, or steel.

*lightweight aggregate, *n**—see *low-density aggregate*.

*low-density aggregate, *n**—aggregate with bulk density less than 1120 kg/m³ (70 lb/ft³), such as: pumice, scoria, volcanic cinders, tuff, and diatomite; expanded or sintered clay, shale, slate, diatomaceous shale, perlite, vermiculite, or slag; and end products of coal or coke combustion.

*normal-density aggregate, *n**—aggregate that is neither high nor low density.

*normalweight aggregate, *n**—see *normal-density aggregate*.

C 125, C09

aggregate—a dense mass of particles held together by strong intermolecular or atomic cohesive forces that is stable to normal mixing techniques, including high-speed stirring and ultrasonics.

C 242, C21

aggregate—any inert material such as sand, gravel, slag, carbon, etc., usually consisting of various-sized particles and used with chemical-resistant binders to form chemical-resistant mortars.

C 904, C03

aggregate, *n*—a dense mass of particles held together by strong intermolecular or atomic cohesive forces. It is stable to normal handling and ordinary mixing techniques including high-speed stirring and ultrasonics.

C 1145, C28

aggregate, *n*—a granular material of mineral composition such as sand, gravel, shell, slag, or crushed stone, used with a cementing medium to form mortars or concrete, or alone as in base courses, railroad ballasts, etc.

D 8, D04

aggregate—as a *grouting material*, relatively inert granular mineral material, such as sand, gravel, slag, crushed stone, etc. "Fine aggregate" is material that will pass a No. 4 (6.4-mm) screen,

"Coarse aggregate" is material that will not pass a No. 4 (6.4-mm) screen. Aggregate is mixed with a cementing agent (such as Portland cement and water) to form a grout material.

D 653, D18

aggregate—(1) crushed stone, crushed slag, or water-worn gravel used for surfacing a built-up roof;

(2) any granular mineral material.

D 1079, D08

aggregate—granular material such as sand, gravel, crushed stone.

D 6161, D19

aggregate, *v*—to process or combine like items into a category; for example, adding together 30-s traffic volume counts, or averaging speeds from lane-by-lane detectors that are parts of traffic data counting station to be the total traffic volume or average speed at that traffic counting station for a 5-min time period.

E 867, E17

aggregate, *n*—granular material such as sand, gravel, crushed stone, crushed hydraulic-cement concrete, iron blast furnace slag, or coal bottom ash and boiler slag used as a component in concrete or mortar with a hydraulic cementing medium to produce either concrete or mortar.

E 2201, E50

aggregate, lightweight (LWA), *n*—aggregate of low density. Examples of LWA include coal bottom ash, pumice, scoria, volcanic cinders, tuff, and diatomite; expanded or sintered clay, shale, slate, diatomaceous shale, perlite, vermiculite, or slag; and bonded or sintered coal combustion products (CCPs) used to produce lightweight concrete or component products.

E 2201, E50

aggregates, *n*—a granular mineral material such as natural sand, manufactured sand, gravel, crushed stone, and air cooled blast furnace slag.

C 1180, C12

aggregation, *n*—the resultant set of aggregated data associated with an aggregating process.

E 867, E17

aggressiveness index (A.I.), *n*—the value computed from the sum of the pH + log alkalinity + log hardness of water sample where both alkalinity and hardness are reported as CaCO₃L.

D 4175, D02

aggressive tack, *n*—see *aggressive tack* under **tack**.

D 907, D14

aggressivity index, *n*—measure of the corrosiveness of water toward asbestos-cement defined as:

$$\text{pH} + \log(AH)$$

where:

pH = negative of the logarithm of the hydronium molarity (index of acidity of the water) pH units.

A = total alkalinity, ppm as CaCO₃, as determined by Test Methods D 1067, and

H = calcium hardness, ppm as CaCO₃, as determined by Test Method D 1126.

D 2946, C17

aging, *n*—a change in the properties of certain **steels** that occurs at ambient or moderately elevated temperatures after hot working or a heat treatment (**quench aging**, **natural aging**, or **artificial aging**) or after a cold-working operation (**strainingaging**).

A 941, A01

aging—the storing of porcelain enamel slips or powders before use. The change occurring in slips or powders with the lapse of time.

C 286, B08

aging, *n*—(1) the effect on materials of exposure to an environment for an interval of time. (2) the process of exposing materials to an environment for an interval of time.

D 883, D20

aging—in general, the change of properties with the passage of time. Specifically, the changes occurring in shredded alkali cellulose when allowed to stand exposed to air.

D 1695, D01

aging, *n*—(1) the effect on materials of exposure to an environment for an interval of time.

(2) the process of exposing materials to an environment for an interval of time. (D20)

F 412, F17

aging—(1) the effect on materials of exposure to an environment for an interval of time. (2) the process of exposing materials to an environment for an interval of time. (D 883, D20)

F 869, F08

aging, *n*—the process of exposing materials to an environment for an interval of time.

F 1251, F04

aging, *n*—the exposure of a material to individual or combined stresses such as time, temperature, pressure, abrasion, ionizing radiation, light, impact with gas or particles, tensile or compressive

aging, *n*

force (either static or cyclic), contact with other materials or chemicals, or any other feature that may be present during a material's service life.

artificial aging, *n*—aging in which a stress variable is outside the domain of exposure that a material might see in a component for oxygen service or in which an alternative mechanism is used to produce an effect that simulates the results of natural aging.

natural aging, *n*—aging in which a material is exposed to conditions replicating those that are present in actual service in a component for oxygen service. **G 126, G04**

aging coefficient—the percentage change in a specific magnetic property resulting from a specific aging treatment.

NOTE—The aging treatments usually specified are:

(a) 100 h at 150°C or

(b) 600 h at 100°C.

A 340, A06

aging effect, *n*—a change in a material brought about by exposure of the material to an environment for an interval of time. **F 1251, F04**

aging, magnetic—the change in the magnetic properties of a material resulting from metallurgic change due to a normal or specified aging condition.

NOTE—This term implies a deterioration of the magnetic properties of magnetic materials for electronic and electrical applications, unless otherwise specified. **A 340, A06**

aging time, *n*—see **joint conditioning time**. **D 907, D14**

agitator, *n*—a device that is in contact with the surface to be cleaned and assists in dirt removal by mechanical action, rotary and otherwise. **F 395, F11**

agitators—a removable device attached to the power output shaft that extends downward into the mixer bowl and converts or imparts the desired action on the contents of the bowl. **F 1827, F26**

agitator tank—a tank, usually vertical and with open top, with rotation paddles used to prevent segregation of grout after mixing. **D 653, D18**

agricultural lime—either ground quicklime or hydrated lime whose calcium and magnesium content is capable of neutralizing soil acidity. **C 51, C07**

agricultural limestone—ground or pulverized limestone whose calcium and magnesium content is capable of neutralizing soil acidity. **C 51, C07**

"A" Horizon—see **horizon**. **D 653, D18**

AIAG, *n*—an abbreviation for the Automotive Industry Action Group; a standards body composed of representatives from the U.S. automobile industry responsible for the development of a common automotive industry standard relating to symbol technologies and Electronic Data Interchange (EDI). **F 1294, F05**

aid climbing, *n*—a technique of climbing that utilizes auxiliary devices as a means of ascent to supplement the natural features of the surface being climbed. **F 1773, F08**

AIM, *n*—an acronym for the Automatic Identification Manufacturers; a trade association of automatic identification suppliers. **F 1294, F05**

air assist nozzle—a pneumatic atomizer in which pressurized air is utilized to enhance the atomization produced by pressurized liquid. The air may be required only for part of the operating range (for example, low liquid flow rates). **E 1620, E29**

air at normal conditions (standard air), *n*—air at 50 % relative humidity, 25°C and 101.3 kPa (77°F and 760 mm Hg). See also **atmosphere**. **D 1356, D22**

air atomizing—air used to atomize powder and to control powder/air mix and powder cloud density. **C 286, B08**

air atomizing nozzle—see **pneumatic atomizer**. **E 1620, E29**

air bells—bubbles of irregular shape formed generally during the pressing or molding operations in the manufacture of optical glass. **C 162, C14**

air blast nozzle—see **airblast nozzle**. **E 1620, E29**

airblast nozzle—a pneumatic atomizer that utilizes a relatively large volume of low-pressure air.

NOTE—The term is occasionally used to designate the entire class of pneumatic atomizers. **E 1620, E29**

airborne drift—the dispersion of chemical particles to the atmosphere outside the intended target. **E 1102, E35**

airborne sound—sound that arrives at the point of interest, such as one side of a partition, by propagation through air. **C 634, E33**

air bubble barrier—special-purpose barrier created by rising stream of air bubbles and entrained water, produced by injecting air at some depth below water surface. **F 818, F20**

air carrier sprayer—an apparatus consisting of a pressure source and controls for the spray liquid and a blower with suitable ducts to produce an air jet in which spray nozzles are located. Air from the blower carries the spray for a distance for deposition on the target being treated. **E 1102, E35**

air chain, *n*—*in mica*, a series of air inclusions in the form of a chain or streak. **D 1711, D09**

air-change rate—air-leakage in volume units per hour divided by the building space volume with identical volume units (normally expressed as air changes per hour, ACH or ACPH). **E 631, E06**

air classification, *n*—the separation of powder into particle size fractions by means of an air stream of controlled velocity. **B 243, B09**

air conditioning—the simultaneous control of all, or at least the first three, of those factors affecting both the physical and chemical conditions of the atmosphere within any structure. These factors include temperature, humidity, motion, distribution, dust, bacteria, odor, and toxic gases. **E 41, G03**

air content, *n*—the volume of air voids in cement paste, mortar, or concrete, exclusive of pore space in aggregate particles, usually expressed as a percentage of total volume of the paste, mortar, or concrete. **C 125, C09**

air content, *n*—of freshly mixed mortar the volume of air (and other gases) in mortar, expressed as a percentage of total volume of mortar. **C 219, C01**

air-cooled blast-furnace slag, *n*—the material resulting from solidification of molten blast-furnace slag under atmospheric conditions; subsequent cooling may be accelerated by application of water to the solidified surface. **C 125, C09**

air-dried moisture—this term has been used inappropriately to refer to both residual moisture and air-dry loss. Because of the potential for confusion, this term shall not be used. **D 121, D05**

air drop, *n*—lengths of open run conductors or cables supported only at each end. **E 176, E05**

air-dry—a condition applied to paper or pulp whereby its moisture content is in equilibrium with the atmospheric conditions to which it is exposed. According to trade custom, pulps are generally understood to be air dry when they contain 10 % of moisture, for example, a pound of air-dry pulp contains 0.9 lb of oven-dry pulp and 0.1 lb of moisture (see *STP 60-B*). **D 1695, D01**

air, dry—air containing no water vapor. **E 41, G03**

air drying, *n*—a process of partial drying of coal to bring its moisture near to equilibrium with the atmosphere in the room in which further reduction and division of the sample will take place. **D 121, D05**

air drying—a process of partial drying of RDF-3 to bring its moisture content near to equilibrium with the atmosphere in the room in which the sieving is to take place. **D 5681, D34**

air drying—a process of partial drying of RDF to bring its moisture content near to equilibrium with the atmosphere in which further reduction, division, and characterization of the sample are to take place. In order to bring about the equilibrium, the RDF is usually subjected to drying under controlled temperature conditions ranging from 30 to 40°C. **D 5681, D34**

air-drying—a process of partial drying of refuse-derived fuel (RDF)

to bring its moisture content near to equilibrium with the atmosphere in which further reduction, division, and characterization of the sample are to take place. In order to bring about this equilibrium, the RDF is usually subjected to drying under controlled temperature conditions ranging from 30 to 40°C.

E 856, D34

air-dry loss, n —in coal, the loss in mass, expressed as a percentage, resulting from each air-drying stage or the sum of all sequential air-drying stages in which the results from each stage are adjusted to the as-received basis. D 121, D05

air-dry loss—the decrease in sample mass due to air-drying. This decrease is presumed to be moisture. E 856, D34

air-entraining addition, n —see **addition**; **functional addition**; **air-entraining addition** C 219, C01

air-entraining hydraulic cement, n —a hydraulic cement containing an air-entraining addition in such amount as to cause air to be entrained in mortar within specified limits when measured by the prescribed method. C 219, C01

air entry value—the applied suction at which water menisci of the porous segment of a suction sampler break down, and air enters. D 653, D18

air exfiltration—air leakage out of the building driven by negative pressure.

negative pressure—air pressure on the outdoor side of a building envelope lower than on the indoor side. E 631, E06

air-felting—forming of a fibrous-felted board from an air suspension of damp or dry fibers on a batch or continuous forming machine (sometimes referred to as the dry or semi-dry process). D 1554, D07

air flow rate—the flow rate of air, expressed in volume per relevant unit (ft³/min, m³/s, m³/tree). E 1102, E35

airflow resistance, R ; [ML⁻⁴T⁻¹]; mks acoustic ohm (Pa·s/m³)—the quotient of the air pressure difference across a specimen divided by the volume velocity of airflow through the specimen. The pressure difference and the volume velocity may be either steady or alternating. C 634, E33

airflow resistivity, r_o ; [ML⁻³T⁻¹]; mks rayl/m (Pa·s/m²)—of a homogeneous material, the quotient of its specific airflow resistance divided by its thickness. C 634, E33

air fluidizer—air used to impart fluid-like properties to powder via a fluid bed. C 286, B08

Air Force modified general question test (AFMGQT), n —test format with flexible question orderings and numbers of relevant questions. The AFMGQT can be used in single-issue, multiple facet, and multiple-issue PDD examinations. The AFMGQT uses relevant, comparison, sacrifice relevant and irrelevant questions. E 2035, E52

air freezing index—see **freezing index**. D 7099, D18

air-fuel ratio, n —in internal combustion engines, the mass ratio of air-to-fuel in the mixture being induced into the combustion chambers. D 4175, D02

air-gap magnetic field strength, H_g —the magnetic field strength required to produce the induction existing at some point in a nonmagnetic gap in a magnetic circuit.

NOTE—In the cgs-emu system of units, H_g is numerically equal to the induction existing at such a point and exceeds the magnetic field strength in the magnetic material. A 340, A06

air-handling unit—the distribution-system fan and portion of the distribution system that is integral to the furnace, air-conditioner, or heat-pump. E 631, E06

air handling unit—a device used for distributing conditioned air supply to a room, space, or area. E 772, E44

air header—the pipe running within a cassette that distributes the air to the individual modules or aerators. D 6161, D19

air infiltration—air leakage into the building drive by positive pressure.

positive pressure—air pressure on the outdoor side of a building envelope higher than on the indoor side. E 631, E06

air leakage, n —in buildings, the passage of uncontrolled air through cracks or openings in the building envelope or its components, such as ducts, because of air pressure or temperature difference. E 631, E06

air leakage—the movement/flow of air through the building envelope, which is driven by either or both positive (infiltration) and negative (exfiltration) pressure differences across the envelope. E 631, E06

air-leakage graph—the graph that shows the relationship of measured air flow rates to the corresponding measured pressure differences (usually plotted on a log-log scale). E 631, E06

air-leakage rate—the volume of air movement per unit time across the building envelope.

NOTE—This movement includes flow through joints, cracks, and porous surfaces, or combination thereof. The driving force for such an air leakage in service can be either mechanical pressurization and de-pressurization, natural wind pressures, or air temperatures differentials between the building interior and the outdoors, or combination thereof. E 631, E06

air leakage rate—the time rate of air flow across the air retarder. Expressed as cubic feet per minute per square foot of AR surface at a stated pressure differential across the AR expressed in inches of H₂O. (Cubic meters per second per square meter of AR surface at a pressure differential in Pascals.) E 631, E06

air leakage rate—the volume of air movement per unit time across the building envelope. This movement includes flow through joints, cracks, and porous surfaces or combinations thereof. The driving force for such air leakage in buildings can be either mechanical pressurization or evacuation, natural wind pressures, or air temperature differentials between the building interior and the outdoors, or combinations thereof. E 631, E06

air-leakage rate—the volume of air movement per unit time across the building envelope or the exterior envelope of the air distribution system. E 631, E06

air leakage rate, Q_{env} , n —the total volume of air passing through the test zone envelope per unit of time (m³/s, ft³/min). E 631, E06

air leakage site—a location on the building envelope where air enters or exits the building causing air leakage to occur. E 631, E06

air-lock—an intermediate enclosed chamber of a vacuum or pressure system through which an object may be passed without materially changing the vacuum or pressure of the system. E 7, E04

air mass, AM—the ratio of the mass of atmosphere in the actual observer-sun path to the mass that would exist if the observer was at sea level, at standard barometric pressure, and the sun was directly overhead.

NOTE—(Sometimes called air mass ratio.) Air mass varies with the zenith angle of the sun and the local barometric pressure, which changes with altitude. For sun zenith angle, Z , of 62° or less and local atmospheric pressure, P , where P_o is standard atmospheric pressure, $AM \approx \sec Z (P/P_o)$. E 772, E44

air permeability, n —the rate of air flow passing perpendicular through a known area under a prescribed air pressure differential between the two surfaces of a material. D 123, D13

air permeability, n —the rate of air flow passing perpendicular through a known area under a prescribed air pressure differential between the two surfaces of a material. D 4850, D13

air pollution, n —the presence of unwanted material in the air. D 1356, D22

air power (AP, W), n —(1) in a vacuum cleaner, the net time rate of work performed by an air stream while expending energy to produce an airflow by a vacuum cleaner under specified air resistance conditions. (2) a measure of the ability of the air stream to do work. Air power is expressed in terms of air watts. F 395, F11

air retarder (AR)—a material or system in building construction that is designed and installed to reduce air leakage either into or through the opaque wall. E 631, E06

air sampling pump—a portable, battery-powered air pump that may

air sampling pump

be attached to a belt on a worker or to a stationary object. The pump is used to draw air through a filter holder that is placed within the personal breathing zone of a worker. Alternatively, the pump may be attached to a stationary object in order that it may be used for area sampling. **E 631, E06**

air, saturated—a mixture of dry air and water vapor in which the latter is at its maximum concentration for the prevailing temperature and pressure. **E 41, G03**

air scour—distributing air over the entire area at the bottom of a filter media flowing upward or immersed membrane to improve the effectiveness of filtration or backwashing or to permit the use of lower backwash water flow rate, or both. **D 6161, D19**

air-slaked lime—the product containing various proportions of the oxides, hydroxides, and carbonates of calcium and magnesium which results from the exposure of quicklime to the air in sufficient quantity to show physical signs of hydration (difficult to determine visually in pulverized quicklime). **C 51, C07**

air-space ratio, G_a (D)—ratio of: (1) volume of water that can be drained from a saturated soil or rock under the action of force of gravity, to (2) total volume of voids. **D 653, D18**

air splice, n —*for inflatable restraint fabrics*, the thicker portion of a yarn resulting from the entanglement of the filaments at the ends of two multifilament yarns to create a continuous yarn. **D 6799, D13**

air stripping—removal of volatile substances from a water solution by passing a gas through the solution. **D 6161, D19**

air-supported roof, n —a fabric roof-system that is properly secured and primarily supported and held in place by air pressure. **D 123, D13**

air-supported roof, n —a fabric roof-system that is properly secured and primarily supported and held in place by air pressure. **D 4850, D13**

air-supported structure—an amusement device that incorporates a structural and mechanical system and employs a high-strength fabric or film that achieves its strength, shape, and stability by pretensioning with internal air pressure, all of which are intended to provide an enclosed area for the self enjoyment of those so confined within. **F 747, F24**

air thawing index—see **thawing index**. **D 7099, D18**

airtightness, n —the degree to which a test zone envelope resists the flow of air.

NOTE— ACH_{50} , air leakage rate, and effective leakage area are examples of measures of building airtightness. **E 631, E06**

air void, n —a space in cement paste, mortar, or concrete filled with air; an entrapped air void is characteristically 1 mm or more in width and irregular in shape; an entrained air void is typically between 10 and 1000 μm in diameter and spherical or nearly so. **C 125, C09**

air-void ratio, G_v (D)—the ratio of: (1) the volume of air space, to (2) the total volume of voids in a soil or rock mass. **D 653, D18**

air wicking, n —*in tires*, the passage of air longitudinally along or through yarns in a fabric that has been encased and cured in rubber or other elastomer, that is, air permeability in the plane of the fabric. **D 123, D13**

air wicking, n —*in tires*, the passage of air longitudinally along or through yarns in a fabric that has been encased and cured in rubber or other elastomer, that is, air permeability in the plane of the fabric. **D 6477, D13**

Airy disk—the image of a bright point object, as focused by a lens system. With monochromatic light, it consists of a central point of maximum intensity surrounded by alternate circles of light and darkness caused by the reinforcement and interference of diffracted rays. The light areas are called maxima and the dark areas minima. The distribution of light from the center to the outer areas of the figure was investigated mathematically by Sir George Airy. The diffraction disk forms a basis for determining the resolving power of an ideal lens system. The diameter of the disk depends largely on the aperture of the lens. The diffraction of light causing the Airy disk is a factor limiting the resolution of a well corrected optical system. **E 175, E41**

alabaster—a soft, easily carved massive form of gypsum (calcium sulfate), often pleasingly blotched and stained. A banded stalagmitic calcite is also called alabaster. **C 119, C18**

alabaster glass—a milky-white glass that diffuses light without fiery color. **C 162, C14**

albedo—the fraction of the total solar radiation incident on a body that is reflected by it. **D 7099, D18**

albedo—the use of the term *albedo* is discouraged in favor of the preferred term, **reflectance**. **E 772, E44**

ALC—apparent lead concentration. **E 631, E06**

Alclad, adj —having an aluminum or aluminum-alloy coating that is metallurgically bonded to either one side or both surfaces of an aluminum alloy product, and that is anodic to the alloy to which it is bonded, thus electrolytically protecting the core alloy against corrosion. (See also individual product type such as *Alcladplate*, *Alclad sheet*, and so forth). **B 881, B07**

alclad sheet and plate—composite sheet (and plate) having on both surfaces a metallurgically bonded aluminum or aluminum alloy coating that is anodic to the core alloy to which it is bonded, thus electrolytically protecting the core alloy against corrosion.

alter—See **building modification**.

ambient light—See **lighting**.

E 631, E06

alclad sheet and plate—composite sheet (and plate) having on both surfaces a metallurgically bonded aluminum or aluminum alloy coating that is anodic to the core alloy to which it is bonded, thus electrolytically protecting the core alloy against corrosion.

E 1749, E06

alcohol-benzene solubility—solubility of a cellulosic pulp in a mixture of ethanol and benzene. The term is without precise meaning unless complete specification of an analytical procedure is attached explicitly or implicitly. **D 1695, D01**

alcohols—series of liquid products composed of a hydrocarbon plus a hydroxyl group, such as ethanol ($\text{C}_2\text{H}_5\text{OH}$). **E 1705, E48**

alcove—a narrow channel to convey molten glass from refiner to forehearth or to the revolving pot where it is gathered by the Owens machine. **C 162, C14**

aldehyde groups—carbonyl groups to which a hydrogen atom is attached; the first oxidation stage of an alcohol;—CHO. **D 1695, D01**

aldehydes—a broad class of organic compounds having a generic formula RCHO , and characterized by a carbonyl group. **D 4790, D16**

algae—a major group of lower plants, generally aquatic, photosynthetic of extremely varied morphology and physiology, mono cellular plants with chlorophyll often masked by a brown or red pigment. **D 6161, D19**

alginate, n —a polysaccharide obtained from some of the more common species of marine algae, consisting of an insoluble mix of calcium, magnesium, sodium, and potassium salts. **F 2312, F04**

alginitite—See *alginitite* under **maceral**.

D 121, D05

aliases, n —*in a fractional factorial design*, two or more effects which are estimated by the same contrast and which, therefore, cannot be estimated separately. **E 456, E11**

aliases, n —*in a fractional factorial design*, two or more effects which are estimated by the same contrast and which, therefore, cannot be estimated separately. **E 1325, E11**

aliasing—the appearance of features at wavenumbers other than their true value caused by using a sampling frequency less than twice the highest modulation frequency in the interferogram; also known as “folding.” **E 131, E13**

aliasing, n —the spectrum of a digitized data record exists over the range of frequencies from zero to one half the sampling frequency. If the spectrum of the original signal extends beyond one half the sampling frequency, then those components of the signal at frequencies higher than one half the sampling frequency will, when digitized, be folded back into the spectrum of the digitized signal. The excessive high frequency components will thus be “aliased” into low frequency components. **E 867, E17**

- aligning stiffness coefficient**, *n*—of a tire, the ratio of tire aligning stiffness to the tire normal force. **F 538, F09**
- aligning stiffness** [FL/γ], *n*—of a tire, the rate of change of tire aligning torque with respect to change in tire slip angle, usually evaluated at zero slip angle. **F 538, F09**
- aligning torque** [FL], *n*—of a tire, the component of a tire moment vector tending to rotate a tire about the Z' -axis, positive clockwise when looking in the positive direction of the Z' -axis. **F 538, F09**
- alignment**—a mechanical or electrical adjustment of the components of an optical device in such a way that the path of the radiating beam coincides with the optical axis or other predetermined path in the system. In electron optics there are three general types:
- (1) **magnetic alignment**—an alignment of the electron optical axis of the electron microscope such that the image rotates about a point in the center of the viewing screen when the current flowing through a lens is varied.
 - (2) **mechanical alignment**—a method of aligning the geometrical axis of the electron microscope by relative physical movement of the components, usually as a step preceding either magnetic or voltage alignment.
 - (3) **voltage alignment**—a condition of alignment of an electron microscope such that the image expands or contracts symmetrically about the center of the viewing screen when the accelerating voltage is changed. **E 7, E04**
- alignment**, *n*—the adjustment of various parts of the vehicle's suspension system to ensure proper handling stability and to minimize abnormal tire treadwear. **F 538, F09**
- aliquot**, *n*—a representative portion of the whole that can be expressed as the inverse of an integer. **D 1356, D22**
- alkali**—an industrial term for the oxide of sodium or potassium; less frequently of lithium. **C 162, C14**
- alkali**, *n*—salts of alkali metals, principally sodium and potassium; a hydroxide or carbonate of an alkali metal. **E 2201, E50**
- alkali aggregate reaction**—a chemical reaction between Na_2O and K_2O in the cement and certain silicate minerals in the cement and certain silicate minerals in the aggregate, which causes expansion resulting in weakening and cracking of Portland cement grout. See **reactive aggregate**. **D 653, D18**
- alkali equivalent**, *n*—deprecated term; see **equivalent alkalis**. **C 219, C01**
- alkali ion diode**—a sensor for halogen gases. (See also **halogen leak detector**.) **E 1316, E07**
- alkali metal**, *n*—a metal in Group 1A of the Periodic Table, that is, lithium, sodium, potassium, rubidium, cesium, and francium. **E 2201, E50**
- alkaline detergent**—under **detergent**, see **inorganic alkaline detergent**. **D 459, D12**
- alkaline earth solutions** (AES)—an aqueous solution of the oxide or hydroxide of an element of group IIa in the periodic table, such as calcium or magnesium. These solutions may be strongly alkaline. See **pH**. **C 51, C07**
- alkaline-filled paper**, *n*—a paper containing an alkaline filler such as calcium carbonate; having a pH value in excess of 7 (extract pH usually in the range from 7.5 to 10.0), and containing a reserve buffering capacity that can neutralize acidic materials formed in the paper or acidic gases sorbed from the atmosphere. **D 1968, D06**
- alkaline or basic reaction**—a characteristic of the materials producing the alkalicolor of the indicator used under the conditions prescribed in this method. **D 4790, D16**
- alkaline reserve**, *n*—the level, expressed as moles per kilogram or percent by weight of paper, of alkaline materials (such as calcium carbonate) capable of neutralizing either acidic degradation products formed in paper during its use and storage, or acidic gases sorbed by the paper from the atmosphere. **D 1968, D06**
- alkaline-sized paper**, *n*—paper that has been manufactured using a procedure or process at a pH value above 7 (usually 7.5 to 10.0) that results in paper that has resistance to aqueous liquid penetration. See **sizing**. **D 1968, D06**
- alkalinity**, *n*—the quantitative capacity of aqueous media to react with hydrogen ions. **D 1129, D19**
- alkalinity**—the quantitative capacity of aqueous media to react with hydrogen ions. "M" alkalinity is that which will react with acid as the pH of the sample is reduced to the methylorange endpoint of about 4.5. "P" alkalinity is that which reacts with acid as the pH of the sample is reduced to the phenolphthalein end point of 8.3. "M" is the total alkalinity which is the sum of hydroxide, carbonate, and bicarbonate contents, "P" includes all the hydroxyl and half the carbonate content. **D 6161, D19**
- alkalinity**, *n*—the capacity of water to neutralize acids, a property imparted by the water's content of carbonates, bicarbonates, and hydroxides and occasionally borates, silicates, and phosphates. It is often expressed in milligrams per liter of calcium carbonate (see **calcium carbonate equivalent**). **E 2201, E50**
- alkalinity agent**—a material that can be added to the spray mixture to raise the pH. **E 1519, E35**
- alkali resistance**—for **porcelain enamels**, the degree to which a porcelain enamel will resist attack by aqueous alkaline solutions. **C 286, B08**
- alkali resistance**—for a cellulosic pulp, the fraction insoluble in alkali, usually sodium hydroxide, of a fixed concentration under specified conditions. The term is without precise meaning unless complete specification of an analytical procedure is attached explicitly or implicitly. (see also **alkali solubility**.) **D 1695, D01**
- alkali solubility**, *n*—in **wool**, the percent of clean wool that is soluble in a specified alkaline solution under controlled conditions of temperature and time. **D 123, D13**
- alkali solubility**—for a cellulosic pulp, the fraction in alkali of a fixed concentration under specified conditions. This term is without precise meaning unless complete specification of an analytical procedure is attached explicitly or implicitly. Some related terms imply at least a partial specification, for example, "ten percent potassium hydroxide solubility" or "nondilution alkali solubility." **D 1695, D01**
- alkali-solubility**, *n*—in **wool**, the percent of clean wool that is soluble in a specified alkaline solution under controlled conditions of temperature and time. **D 4845, D13**
- alkali soluble resin**—low molecular weight, acid functional natural resins, modified natural resins, or synthetic copolymers characterized by forming a true solution in water when basified to pH 8 or greater, while being insoluble in water at pH 6 or lower. **D 2825, D21**
- alkali staining**—discoloration caused by the presence of an alkali. **D 1695, D01**
- alkyd plastics**—plastics based on alkyd resins. **D 883, D20**
- alkyd resin**—under **resin, synthetic**, see **alkyd resin**. **D 16, D01**
- alkyd resin**—a polyester convertible into a crosslinked form; requiring a reactant of functionality higher than two, or having double bonds. **D 883, D20**
- alkyd resin**, *n*—a polyester convertible into a crosslinked form; requiring a reactant of functionality higher than two, or having double bonds. **F 1251, F04**
- alkyl benzene sulfonate (in the context of soaps and detergents)**—the detergent produced by sulfonating detergent alkylate; any surface-active substance having the molecular structure of a benzene sulfonic acid having as a ring substituent(s) an alkyl group(s) sufficiently large to confer detergent properties. **D 459, D12**
- alkyl groups**—monovalent aliphatic radicals derived from aliphatic hydrocarbons by removal of a hydrogen. **D 1695, D01**
- alligator**—a general term used for leather made from the skins of all aquatic species with a grain similar to the american alligator which cannot be killed legally and, therefore, is not used by the United States industry. **D 1517, D31**
- alligator (crocodile) cracking**, *n*—interconnected or interlaced cracks forming a pattern which resembles an alligator's hide. **E 867, E17**

alligator (crocodile) cracking, *n*

alligator (crocodile) cracking, *n*—interconnected or interlaced cracks forming a pattern which resembles an alligator's hide.

E 1778, E17

alligator-grained leather—leather of various types, such as calf, sheep or cattlehide embossed to resemble the grain of alligator hide.

D 1517, D31

alligator hide—a defect characterized by an extreme roughness of the porcelain enamel surface: a severe case of orange peel. **C 286, B08**

alligatoring—the cracking of the surfacing bitumen on a built-up roof, producing a pattern of cracks similar to an alligator's hide; the cracks may not extend through the surfacing bitumen.

D 1079, D08

alligatoring—*in protective coatings*, surface cracking of coating film having an appearance similar to alligator hide. **D 4538, D33**

all-in-one cartridge—(also known as cartridge), a process unit that incorporates all the components, including a photoreceptor, toner compartment and charging devices, used in certain electrostatic imaging devices. **F 335, F05**

allogenic or allogenic, *adj*—cells, tissues, and organs in which the donor and recipient are genetically different individuals of the same species. Synonyms: *allograft* and *homograft*. **F 2312, F04**

allograft, *n*—a graft of tissue between individuals of the same species but of disparate genotype. Called also *allogeneic graft* and *homograft*. **F 2312, F04**

allotriomorphic crystal—a crystal whose lattice structure is normal, but whose outward shape is imperfect since it is determined to some extent by the surroundings; the grains in a metallic aggregate are allotriomorphic crystals. **E 7, E04**

allowable bearing value (allowable soil pressure), q_w, p_a (FL⁻²)—the maximum pressure that can be permitted on foundation soil, giving consideration to all pertinent factors, with adequate safety against rupture of the soil mass or movement of the foundation of such magnitude that the structure is impaired. **D 653, D18**

allowable load—capacity assigned to an anchor in accordance with allowable-stress design procedures. **E 2265, E06**

allowable pile bearing load, Q_w, P_a (F)—the maximum load that can be permitted on a pile with adequate safety against movement of such magnitude that the structure is endangered. **D 653, D18**

allowable properties—mechanical properties of materials as prepared for design use. Allowable properties of wood are identified with stress-grade descriptions and reflect the orthotropic structure of wood. Often considered synonymous with allowable unit stresses, working stresses, and design stresses. **D 9, D07**

allowance, *n*—*in construction design planning and estimating*, an allocation of money that is intended to be spent for a specific purpose. **E 833, E06**

alloy, *n*—a unique composition of two or more polymers that has one or more of the polymers treated or processed in a special way to confer enhanced performance characteristics on the resulting material. **D 1566, D11**

alloy, *n*—*in plastics*, two or more immiscible polymers united, usually by another component, to form a plastic vein having enhanced properties. (D20) **F 412, F17**

alloy groups—alloy group includes alloys considered to be chemically equivalent for general purpose use in specifying stainless steel bolts, hex cap screws, studs and nuts. **F 1789, F16**

alloy, *n* (in plastics)—two or more immiscible polymers united, usually by another component, to form a plastic resin having enhanced performance properties. **D 883, D20**

alloy phase, *n*—*in a shape memory alloy*, the crystal structure stable at a particular temperature and stress. **F 2005, F04**

alloy steel, *n*—a steel, other than a stainless steel, that conforms to a specification that requires one or more of the following elements, by mass percent, to have a minimum content equal to or greater than: 0.30 for aluminum; 0.0008 for boron; 0.30 for chromium; 0.30 for cobalt; 0.40 for copper; 0.40 for lead; 1.65 for manganese; 0.08 for molybdenum; 0.30 for nickel; 0.06 for niobium (columbium); 0.60 for silicon; 0.05 for titanium; 0.30 for tungsten (wolfram); 0.10 for vanadium; 0.05 for zirconium; or 0.10 for any

other alloying element, except sulphur, phosphorus, carbon, and nitrogen. **A 941, A01**

alloy steel—steel is considered to be alloy when the maximum range given for manganese exceeds 1.65 % or a definite minimum quantity for any of the following elements is specified or required within the limits of the recognized field of constructional alloy steels: chromium, molybdenum, nickel, or any other alloying element added to obtain a desired alloying effect. **F 1789, F16**

alloy system—a complete series of compositions produced by mixing in all proportions any group of two, or more, components, at least one of which is a metal. **E 7, E04**

all purpose compound, *n*—a compound formulated and manufactured to serve as a taping or finishing compound, or both. **C 11, C11**

all season radial, *n*—a highway tire designed to meet the weather conditions in all seasons of the year, that meets the Rubber Manufacturers Association definition of a mud and snow tire. **D 5681, D34**

alluvial channel—See *alluvial stream*. **D 4410, D19**

alluvial deposit—sediment deposited by the action of moving water. **D 4410, D19**

alluvial fans—sediment deposited in the shape of a segment of a cone formed because of a sudden flattening of a stream gradient especially at debouchures of tributaries on main stream flood plains. **D 4410, D19**

alluvial stream—a stream whose boundary is composed of appreciable quantities of the sediments transported by the flow and which generally changes its bed forms as the rate of flow changes. **D 4410, D19**

alluviation—the process of accumulating sediment deposits at places where the flow is retarded. **D 4410, D19**

alluvium—soil, the constituents of which have been transported in suspension by flowing water and subsequently deposited by sedimentation. **D 653, D18**

alluvium—a general term for all fluvial deposits resulting directly or indirectly from the sediment transport of (modern) streams, thus including the sediments laid down in riverbeds, flood plains, lakes, fans, and estuaries. **D 4410, D19**

allyl plastics—plastics based on allyl resins. **D 883, D20**

allyl resin—a resin made by polymerization of chemical compounds containing the allyl group. **D 883, D20**

alpaca, *n*—the fleece and fiber produced by the alpaca, an animal of the genus *Llama* (*Lama glama pacus*). **D 123, D13**

alpaca, *n*—the fleece and fiber produced by the alpaca, an animal of the genus *Llama* (*Lama glama pacus*). The fiber is obtained from several species, namely, Huacaya and Suri. **D 4845, D13**

alpha (α)—the temperature coefficient of resistance of a PRT over the range 0 to 100 °C. **E 344, E20**

alpha-amylase—enzyme that acts specifically to accelerate the hydrolysis of starch to dextrins. **E 1705, E48**

alpha brass—a solid solution phase of one or more alloying elements in copper and having the same crystal lattice as copper. **E 7, E04**

alpha-cellulose—(1) Historically, a term used to indicate the pure, relative undegraded cellulose found in pulps. (2) Alpha-cellulose content is often measured by TAPPI Method T 203 om-93 where alpha-cellulose is that portion of the pulp which does not dissolve under the test conditions. **D 1695, D01**

alpha complementation—the ability of a short amino-terminal fragment (alpha fragment) of β -galactosidase to form a functional complex with the carboxyl terminal fragment (omega fragment). **E 1705, E48**

alpha iron (Fe)—solid phase of pure iron which is stable at temperatures below 910°C and possesses the body-centered cubic lattice. It is ferro-magnetic below 768°C. **E 7, E04**

alpha (α) loss peak—*in dynamic mechanical measurement*, first peak in the damping curve below the melt, in order of decreasing temperature or increasing frequency, (D 4092, D20). **E 1142, E37**

alpha (α) loss peak (in dynamic mechanical measurement)—the first

- peak in the damping curve below the melt, in order of decreasing temperature or increasing frequency. **D 4092**, D20
- alphameric**—See **alphanumeric**. **F 149**, F05
- alpha-methylstyrene**—2-phenylpropene (C₉H₁₀) mol weight 119.16; colorless liquid; subject to polymerization by heat or catalysts; freezing point, -23.21°C; boiling point, 165.38°C. **D 4790**, D16
- alphanumeric**—term pertaining to both numbers and alphabetical characters, typically used to designate a device capable of handling both types of characters. **E 1316**, E07
- alphanumeric**—pertaining to a character set that contains letters, digits, and usually other characters such as punctuation marks. *Syn.* **alphameric**. **F 149**, F05
- alphanumeric character set**—a character set that contains both letters and digits and may contain control characters, special characters, and the space character. **F 149**, F05
- alphanumeric character subset**—a character subset that contains both letters and digits and may contain control characters, special characters, and the space character. **F 149**, F05
- alpha particle**—a positively charged particle emitted by certain radio-nuclides. It consists of two protons and two neutrons, and is identical to the nucleus of a helium atom. **E 1316**, E07
- alpha pulps**—see **chemical cellulose**. **D 1695**, D01
- alpine permafrost**—permafrost developed in temperate climate mountainous areas. **D 7099**, D18
- altazimuthal mount**—a supporting device that facilitates tracking of the sun and allows rotation about horizontal and vertical axes. It can be used to aim equipment such as heliostats, concentrating collectors, exposure specimens, or radiometers. **E 772**, E44
- alter**, *v*—*in building*, to make different, or to rearrange the layout. **E 631**, E06
- alter**—to change fastener properties such as hardness, tensile strength, surface finish, length, or other characteristics of the fastener through such processes as heat treatment, plating, and machining. **F 1789**, F16
- alteration distributor**—distributor of fasteners who alters a fastener prior to sale and assumes the full responsibilities of the alteration and its affected mechanical and performance characteristics. **F 1789**, F16
- altered tire**, *n*—a scrap tire which has been modified so that it is no longer capable of retaining air, holding water, or being used on a vehicle. **D 5681**, D34
- alternate grade reference line**, *n*—an optional internal line whose orientation is used for the “x” axis of a grade rule. **D 6963**, D13
- alternating force**—See **loading amplitude**. **E 1823**, E08
- alternative agricultural products**, *n*—bio-based industrial products (non-food, non-feed) manufactured from agricultural materials and animal by-products. **E 2114**, E06
- alternative energy**, *n*—see **renewable energy**. **E 2114**, E06
- altitudinal permafrost limit**—the lowest altitude at which mountain permafrost occurs in a highland area outside of the general permafrost region. **D 7099**, D18
- altitudinal permafrost zonation**—the vertical subdivision of mountain permafrost into zones based on mean annual temperatures. **D 7099**, D18
- alum**—aluminum sulfate, AL₂(SO₄)₃XH₂O (X = 14-18), a coagulant. **D 6161**, D19
- alumina-chromia brick**, *n*—a refractory brick, which may be burned or unburned, manufactured predominantly of a mixture of a high-alumina raw material and chromic oxide (Cr₂O₃), with the alumina (Al₂O₃) content being 50 % or greater by weight and with chromic oxide (Cr₂O₃) predominating by weight among the other constituent oxides. **C 71**, C08
- alumina porcelain**—See **alumina porcelain** under **porcelain**. **C 242**, C21
- alumina whiteware**—See **alumina whiteware** under **ceramic whiteware**. **C 242**, C21
- aluminized**—dipped in molten aluminum for coating purposes resulting in smooth, continuous, and adherent aluminum coating. **F 547**, F16
- aluminized**—*in chain link fabric*, describes fabric woven from steel wire that is coated with aluminum before weaving (see Specification A 491). **F 552**, F14
- aluminized coating**, *n*—a coating on steel consisting of either commercially-pure aluminum (Type 2) or aluminum-silicon alloy (Type 1), applied by the hot-dip process. **A 902**, A05
- aluminizing**—forming of an aluminum or aluminum alloy coating on a metal by hot dipping, hot spraying, or diffusion. **B 374**, B08
- aluminous cement**, *n*—deprecated term. **C 219**, C01
- aluminum common nail**—plain-shank, aluminum-alloy, 1 by 0.072 to 6 by 0.262-in. nails with flat 5/32 to 1/32-in. head and medium diamond point. **F 547**, F16
- aluminum enamel**—a porcelain enamel specifically designed for application to aluminum. **C 286**, B08
- alum leather**—leather produced by alum tannage, usually in combination with other substances. Before the invention of chrome-tanning this was the principal method of tanning with mineral agents. **D 1517**, D31
- ambient**, *adj*—surrounding on all sides. **D 1356**, D22
- ambient field**, *n*—when an object or light source is viewed, the complete area beyond the surround from which light might reach the observer’s eyes and influence the object’s appearance. See **surround**. **E 284**, E12
- ambient light**—light not provided by the visual testing system. **E 1316**, E07
- ambient light**—See **lighting**. **E 1480**, E06
- ambient light** (lumièreambiente)—surrounding light, such as that reaching an object in a room from all light sources in the room. **E 631**, E06
- ambient noise**—the composite of airborne sound from many sources near and far associated with a given environment. No particular sound is singled out for interest. **C 634**, E33
- ambient temperature**—the temperature of the surrounding atmosphere as determined by an instrument shielded from direct or reflected rays of the sun. **D 2864**, D27
- ambient temperature**—the temperature of the surroundings, generally assumed to be 20°–25°C. **D 6161**, D19
- ambient temperature**, *n*—the existing temperature of the air or of an object in thermal equilibrium with the surrounding atmosphere. **G 113**, G03
- ambulance**—a vehicle for transportation of the sick and injured, equipped and staffed to provide emergency medical care during transit. **F 1177**, F30
- ambulance service**—a qualified provider of medical transportation for patients requiring treatment or monitoring, or both, due to illness or injury. **F 1177**, F30
- ambulance service provider**—a person or organization, either public or private, responsible for operation, maintenance, and administration of an ambulance service. **F 1177**, F30
- American grain count**, *n*—a direct yarn numbering system for expressing linear density, equal to the mass in grains per 120 yards of sliver or roving. **D 123**, D13
- American grain count**, *n*—a direct yarn numbering system for expressing linear density, equal to the mass in grains per 120 yards of sliver or roving. **D 4849**, D13
- American method**, *n*—*in shingles*, a method of application for roofing shingles, generally rectangular in shape, to provide double coverage with head lap and no side lap. **C 1154**, C17
- American method**—method of application for roofing shingles, generally rectangular in shape, to provide double coverage with head lap and no side lap. **D 2946**, C17
- American Public Health Association (APHA) color**, *n*—see **platinum cobalt color scale**. **E 284**, E12
- American softwood lumber standard**—a voluntary product standard of the U. S. Department of Commerce which serves as a basis for the preparation and revision of industry-sponsored grading rules for lumber. **D 9**, D07
- American Standard Code for Information Interchange**—a data

communications code set consisting of a 7-bit-plus-parity code that can be translated with a leading "0" as an 8-bit set. (See **ASCII**.)
F 1457, F05

American standard lumber—lumber conforming to the basic provisions of the American Softwood Lumber Standard. **D 9, D07**

amino plastics, n—plastics based on amino resins. **D 883, D20**

amino resin, n—a resin made by polycondensation of a compound containing amino groups, such as urea or melamine, with an aldehyde, such as formaldehyde, or an aldehyde-yielding material.
D 883, D20

ammeter shunt—a low-resistance precision resistor with high current carrying capacity connected in parallel with an ammeter.
E 1316, E07

ammoniated ash, n—ash that contains ammonia and/or ammonium salts as a result of the addition of ammonia or ammonium salts to the flue gas at the power plant.
E 2201, E50

amorphous—noncrystalline, or devoid of regular structure.
B 374, B08

amorphous—non crystalline, devoid of regular cohesive structure.
D 6161, D19

amorphous alloy—a semiprocessed alloy produced by a rapid quenching, direct casting process resulting in metals with noncrystalline structure.
A 340, A06

amorphous peat—see **sapric peat**.
D 653, D18

amorphous regions—those regions within a cellulosic material which, on the basis of X-ray diffraction or other suitable technique, do not show any evidence of crystalline structure. The technique should be specified.
D 1695, D01

amorphous selenium (a-Se) radiation detector array—an array employing a biased amorphous selenium photo-conductor that directly converts incident radiation into electrical charge which can then be read to form a digital image.
E 1316, E07

amorphous silica fiber, n—a continuous filament of heat insulating material whose principal constituent is amorphous silica.
E 344, E20

amorphous silicon (α -Si) X-ray detector, n—an amorphous silicon (α -Si) X-ray detector consists of a glass substrate with a matrix of photodiodes fabricated from amorphous silicon and switches arranged in rows and columns upon it; the photodiodes are activated by light photons emitted from a scintillator which is activated by X rays and is usually in close contact with the diode matrix.
E 1316, E07

amosite, n—the acronym assigned to **grunerite asbestos**, and derived from the name of the first developers of a major deposit of this mineral.
D 2946, C17

amount, n—*in cottonfiber testing with the Length Analyzer*, a measure of the thickness or pneumatic density of the test beard, proportional to the number of fibers present at various distances from the base of the specimen clamp jaws.
D 123, D13

amount, n—*in cottonlength testing with the Fibrograph*, a measure of the thickness, or optical density, of the test beard, proportional to the number of fibers present at various distances from the comb(s).
D 123, D13

amount, n—*in cotton fiber testing with the Length Analyzer*, a measure of the thickness or pneumatic density of the test beard, proportional to the number of fibers present at various distances from the base of the specimen clamp jaws.
D 7139, D13

amount, n—*in cotton length testing with the Fibrograph*, a measure of the thickness, or optical density, of the test beard, proportional to the number of fibers present at various distances from the comb(s).
D 7139, D13

ampere—the current that will deposit silver at the rate of 0.0011180 g/s. Current flowing at the rate of 1 C/s.
B 374, B08

ampere per metre, A/m—the unit of magnetic field strength in the SI system of units.
A 340, A06

ampere (turn), A—the unit of magnetomotive force in the SI system of units. The symbol A represents the unit of electric current, ampere, in the SI system of units.
A 340, A06

ampere turns—the product of the number of turns of a coil and the current in amperes flowing through the coil. **E 1316, E07**

amphibole asbestos, n—asbestiform amphibole silicate minerals including the orthorhombic anthophyllite series and the monoclinic cummingtonite (grunerite asbestos [amosite]) series, the tremolite-actinolite series, and the alkali amphibole (riebeckite asbestos [crocidolite]) series, among others. **D 2946, C17**

ampholytic or amphoteric (zwitterionic) surfactant—a chemical compound capable of producing either (or both) positively or negatively charged surface active ions in an aqueous solution. The charge carried on the *ampholytic* surface active ions depends upon the pH of the solution but that on *amphoteric (zwitterionic)* surfactants does not.
D 459, D12

ampholytic surfactant or amphoteric surfactant—see **surface-active agent**.
D 459, D12

amphoteric—capable of acting as an acid or a base. **D 6161, D19**

amphoteric surfactant—a surface-active agent capable of forming, in aqueous solution, either surface-active anions or surface-active cations depending on the pH.
E 609, E35

amphoteric surfactant—a surface-active agent capable of forming, in aqueous solution, either surface-active anions or surface-active cations depending on the pH.
E 1519, E35

amplification factor—ratio of dynamic to static displacement.
D 653, D18

amplifier—a negative lens, used in lieu of an eyepiece, to project under magnification the image formed by an objective. The amplifier is especially designed for flatness of field and should be used with an apochromatic objective.
E 7, E04

ampliphon eyepiece—See **amplifier**.
E 7, E04

amplitude—the vertical pulse height of a signal, usually base to peak, when indicated by an A-scan presentation.
E 1316, E07

amplitude distortion—same as **harmonic distortion**. **E 1316, E07**

amplitude hologram—a recording of the variation of light intensity caused by the interference between the reference beam and the object beam, as light or dark areas on the recording medium. The light and dark interference lines in the recording medium diffract laser light to produce the reconstruction.
E 1316, E07

amplitude response—that property of a test system whereby the amplitude of the detected signal is measured without regard to phase. (See also **harmonic analysis and phase analysis**.)
E 1316, E07

ampoule—a glass container designed to be filled and sealed by fusion of the glass neck.
C 162, C14

ampoule, n—a hermetically sealed, small bulbous glass or plastic vessel. Opening is achieved by breaking the stem. (Also *ampule* or *ampul*.)
D 996, D10

ampule, n—a glass vessel for the storage of liquid materials, possessing a long narrow neck for the purpose of providing a flame-sealed closure.
D 4175, D02

amusement ride or amusement device—a device or combination of devices or elements that carry, convey, or direct a person(s) over or through a fixed or restricted course or within a defined area, for the primary purpose of amusement or entertainment.
F 747, F24

amylaceous, adj—pertaining to, or of the nature of, starch; starchy.
D 907, D14

anaerobe, n—an organism that cannot grow or proliferate in the presence of oxygen.
D 4175, D02

anaerobes—organisms that grow in the absence of air or oxygen and do not use molecular oxygen in respiration.
F 1600, F20

anaerobic, adj—(1) taking place in the absence of oxygen; (2) living or active in the absence of oxygen.
D 4175, D02

anaerobic, n—a condition in which no measurable volume of air is present in the incubation chamber or system.
D 4439, D35

anaerobic—living or active in an airless environment. **E 1705, E48**

anaerobic adhesive, n—an adhesive that is kept in the uncured state by oxygen, as in air, and that cures in the absence of oxygen when exposed to metal ions, especially copper or iron. **D 907, D14**

- anaerobic bacteria**—bacteria that do not use oxygen. Oxygen is toxic to them. See **bacteria, anaerobes**. **D 6161, D19**
- anaerobic bacteria**—microbes whose metabolisms require the absence of free oxygen. **E 1705, E48**
- anaerobic digester**—a chemical reactor in which anaerobic bacteria are used to decompose biomass or organic wastes to produce methane and carbon dioxide. **E 1705, E48**
- anaerobic digestion**—degradation of organic matter by microbes in the absence of air (oxygen) to produce methane and carbon dioxide (biogas). **E 1705, E48**
- anaerobic fermentation**—fermentation processes conducted in the absence of air. The following anaerobic fermentation processes are significant in obtaining useful forms of energy from biomass: (1) alcoholic fermentation, fermentation processes whereby certain microorganisms convert glucose and other substrates with alcohol as an end product, (2) methane fermentation, generally termed anaerobic digestion (See also **anaerobic digestion**). **E 1705, E48**
- analate addition**—a variation of the known addition measurement technique in which the sample (analate) is added to a reagent containing the ion being measured. The electrode is placed in the reagent, and the sample concentration is calculated from the change in electrode potential after the addition of the sample. **D 4127, D19**
- analate subtraction**—a variation of the known subtraction measurement technique in which the sample (analate) is added to a reagent containing an ion that reacts with the species being determined. The electrode is placed in the reagent, the change in electrode potential is observed when the sample is added, and the sample concentration calculated. **D 4127, D19**
- analog image**—an image produced by a continuously variable physical process (for example, exposure of film). **E 1316, E07**
- analog pH/mV meter**—an instrument that displays voltages, pH units, or other concentration units by means of a needle pointer and scale. **D 4127, D19**
- analog to digital converter (a/d)**—a device that changes an analog signal to a digital representation of the signal. **E 1316, E07**
- analysis, *n***—the activity to determine the proximate and ultimate analysis, fuel value and size specification of TDF. **D 5681, D34**
- analysis:**
- analysis area (specimen)*—two-dimensional region of a specimen surface measured in the plane of that surface from which the entire analytical signal or a specified percentage of that signal is detected.
- analysis volume (specimen)*—three-dimensional region of a specimen surface from which the entire analytical signal or a specified percentage of that signal is detected.
- analysis volume (spectrometer)*—three-dimensional region within a spectrometer from which the entire analytical signal or a specified percentage of that signal is detected. **E 673, E42**
- analysis, *n***—an act of inspecting the S/H image and associating this image with a known calibration reference. **F 538, F09**
- analysis bandwidth**—spectral band used in a photometric instrument, such as a densitometer, for the measurement of optical absorbance or reflectance. **E 170, E10**
- analysis cycle time, *n***—the period of time required to properly obtain and analyze a representative sample of the process stream material. **D 4175, D02**
- analysis of variance (ANOVA), *n***—a procedure for dividing the total variation of a set of data into two or more parts, one of which estimates the error due to selecting and testing specimens and the other part(s) possible sources of additional variation. **D 123, D13**
- analysis of variance (ANOVA), *n***—a procedure for dividing the total variation of a set of data into two or more parts, one of which estimates the error due to selecting and testing specimens and the other part(s) possible sources of added variation. **D 4175, D02**
- analysis of variance (ANOVA), *n***—a statistical method of decomposing (or breaking down) the total variance and estimating or testing its contributing component variances for statistical significance. **D 5681, D34**
- analysis run**—a period of measurement time on a given instrument during which data is calculated from a single calibration curve (or single set of curves). Recalibration of a given instrument produces a new analysis run. **E 631, E06**
- analysis sample**—See **analysis sample** under **sample**. **D 121, D05**
- analysis sample, *n***—the final subsample prepared from the air-dried laboratory sample but reduced in particle size by passing through a mill with a 0.5 mm (0.02-in.) size or smaller final screen. **D 5681, D34**
- analysis sample**—the final subsample prepared from the air-dried laboratory sample but reduced by passing through a mill with a 0.5 mm (0.02 in.) size or smaller final screen. **D 5681, D34**
- analysis sample**—final subsample prepared from the air-dried laboratory sample but reduced by passing through a mill with a 0.5-mm (0.02-in.) size or smaller final screen. **E 856, D34**
- analysis wavelength**—wavelength used in a spectrophotometric instrument for the measurement of optical absorbance or reflectance. **E 170, E10**
- analyte, *n***—a possible sample component whose presence and concentration is of interest. **D 1129, D19**
- analyte**—the constituent to be measured. **D 5681, D34**
- analyte, *n***—in *methods of chemical analysis*, the component determined by a method. **E 135, E01**
- analyte, *n***—chemical or element that is the subject of the testing or measurement in a sampling and analytical procedure, e.g. lead in paint. **E 1605, E06**
- analyte**—the specific component measured in an analysis. **E 2161, E37**
- analytical curve**—the graphical representation of a relation between some function of radiant power and the concentration or mass of the substance emitting or absorbing it. **E 131, E13**
- analytical curve**—see **calibration curve**. **E 135, E01**
- analytical detection limit, *n***—a number, expressed in units of concentration (or amount), that describes the lowest concentration level (or amount) that an analyst can determine to be different from an analytical blank (background level). **F 1494, F23**
- analytical gap, *n***—in *atomic emission spectrometry*, the region between two electrodes in which the specimen is excited and from which radiant energy is used for analysis. **E 135, E01**
- analytical line, *n***—the particular wavelength of an element used in determining the presence or concentration of that element. **E 135, E01**
- analytical technique, *n***—a procedure whereby the concentration of the test chemical in a collection medium is quantitatively determined. **F 1494, F23**
- analytical unit, *n***—the actual amount of the sample material analyzed in the laboratory. **D 5681, D34**
- analytical wavelength**—any wavelength at which an absorbance measurement is made for the purpose of the determination of a constituent of a sample. **E 131, E13**
- analyzer, *n***—the instrumental equipment necessary to perform automatic analysis of ambient air through the use of physical and chemical properties and giving either cyclic or continuous output signal.
- analyzer system, *n**—all sampling, analyzing, and readout instrumentation required to perform ambient air quality analysis automatically.
- full scale, *n**—the maximum measuring limit for a given range of an analyzer.
- lag time, *n**—the time interval from a step change in the input concentration at the analyzer inlet to the first corresponding change in the analyzer signal readout.
- linearity, *n**—the maximum deviation between an actual analyzer reading and the reading predicted by a straight line drawn between upper and lower calibration points.
- minimum detection limit, *n**—the smallest input concentration

that can be determined as the concentration approaches zero.

noise, n—random deviations from a mean output not caused by sample concentration changes.

open path analyzer, n—an analytical system that measures the average atmospheric or emission compound concentration along one or more monitoring paths open to the atmosphere. See **monitoring path**.

operating humidity range of analyzer, n—the range of ambient relative humidity of air surrounding the analyzer, over which the analyzer will meet all performance specifications.

operating temperature range of analyzer, n—the range of ambient temperatures of air surrounding the analyzer, over which the monitor will meet all performance specifications.

operational period, n—the period of time over which the analyzer can be expected to operate unattended within specifications.

output, n—a signal that is related to the measurement, and intended for connection to a readout or data acquisition device.

range, n—the concentration region between the minimum and maximum measurable limits.

readout instrumentation, n—output meters, recorder, or data acquisition system for monitoring analytical results.

response time, n—the time interval from a step change in the input concentration at the analyzer inlet to an output reading of 90 % of the ultimate reading.

rise time, n—response time minus lag time.

sample system, n—equipment necessary to provide the analyzer with a continuous representative sample.

span drift, n—the change in analyzer output over a stated time period, usually 24 h of unadjusted continuous operation, when the input concentration is at a constant, stated upscale value.

zero drift, n—the change in analyzer output over a stated time period of unadjusted continuous operation when the input concentration is zero; usually expressed as a percentage change of full scale over a 24-h operational period.

See also **point analyzer**. **D 1356, D22**

analyzer—an optical device, capable of producing plane polarized light, used for detecting the state of polarization. **E 7, E04**

analyzer—an optical device, capable of producing plane polarized light, used for detecting the state of polarization. **E 175, E41**

analyzer, n—an instrument designed to measure a property of the process, material, or environmental condition. **E 2363, E55**

analyzer lag, n—Deprecated term. Use the preferred term **instrument response time**. **D 4175, D02**

analyzer system—See **analyzer**. **D 1356, D22**

analyzer transmission—see **spectrometer transmission**. **E 673, E42**

anchor—in general, a metal shape inserted into a slot or hole in the stone that provides for the transfer of loads from the stone to the building structure, either directly or through an intermediate structure. **C 119, C18**

anchor, v—to secure firmly (*Webster*). **D 996, D10**

anchor, n—a device used to connect securely a **building component** to adjoining construction, to a supporting member, or to the ground. **E 631, E06**

anchor—cast-in-place or post-installed fastening device installed in the base material for the purpose of transferring loads to the base material. **E 2265, E06**

anchor—in a surface-micromachining process, the portion of the test structure where a structural layer is intentionally attached to its underlying layer. **E 2444, E08**

anchor, n—components that are directly attached to the bony elements of the spine (sacrum, lamina, pedicle, vertebral body, spinous process, transverse process, the pelvis, or ribs). **F 1582, F04**

anchorage—the system consisting of stone, anchor and primary

structure, secondary structure or back-up preventing lateral movement of the stone. **C 119, C18**

anchorage, n—a means of connecting securely, by using an **anchor**, a **building component** to adjoining construction, supporting member(s), or to the ground. **E 631, E06**

anchorage system—a group of interacting elements, components, and structures. **E 631, E06**

anchor bolt—steel rod or bar, one end of which is intended to be cast in concrete while the opposite end is threaded and projects from the concrete for anchoring other material to the concrete. The end cast in concrete may be either straight or provided with an anchor, such as a bent hook, forged head, or a tapped or welded attachment to resist forces imposed on the anchor bolt as required. **F 1789, F16**

anchoring point, n—a reference point against which other items are judged. **E 253, E18**

anchoring system—a group of interacting anchors and elements. **E 631, E06**

anchor lip—in a surface-micromachining process, the freestanding extension of the structural layer of interest around the edges of the anchor to its underlying layer. In some processes, the width of the anchor lip may be zero. **E 2444, E08**

anchor loading: axial—load applied concentrically with the anchor longitudinal axis. **E 2265, E06**

anchor loading: bending—flexure induced in the anchor by application of a shear load at a distance from the surface of the base material. **E 2265, E06**

anchor loading: combined—axial and shear loading applied simultaneously (oblique loading). **E 2265, E06**

anchor loading: shear—load applied parallel to the surface of the base material and perpendicular to the anchor's longitudinal axis. **E 2265, E06**

anchor point—structural point on the end connector or along the length of a boom section designed for the attachment of anchor or mooring lines. **F 818, F20**

anchor spacing—distance between anchors measured centerline to centerline. **E 2265, E06**

ancillary equipment—mechanical devices *essential* to the operation of a given boom system; for example, air pumps, hydraulic power supplies, control manifolds, and so forth. **F 818, F20**

andalusite—a polymorph, along with sillimanite and kyanite, of composition $Al_2O_3 \cdot SiO_2$ which on firing dissociates to yield principally mullite. **C 242, C21**

angle, n—see **aperture angle, aperture solid angle, azimuthal angle, entrance angle, observation angle, rotation angle, specular angle**. **E 284, E12**

angle:

collection—*SIMS*, the angle between the normal to the original specimen surface and the axis of the secondary ion collection optics.

of detector—*EIA, SIMS*, the angle between the incident beam direction and the direction pointing from the beam spot to the center of the detector.

of emission—*AES, XPS*, the angle of emission or ejection of electrons from a solid measured relative to the normal to the surface.

of incidence—the angle between the incident beam and the normal to the surface.

of scattering—*EIA*, the angle between the incident beam direction and the direction in which a particle is traveling after it is scattered. If the particle is incident on the detector, this angle will be the same as **angle of detector**.

solid, of detector—*EIA*, the solid angle intercepted by the detector, with the radius originating at the beam spot.

takeoff—*AES, XPS* the angle at which particles leave a specimen measured relative to the plane of the specimen surface. (see **angle of emission**). **E 673, E42**

angle—on countersunk head, total included angle formed by conical underportion or bearing surface. **F 547, F16**

angle—See **lead angle**. **F 547, F16**

angle beam—a term used to describe an angle of incidence or refraction other than normal to the surface of the test object, as in angle beam examination, angle beam search unit, angle beam longitudinal waves, and angle beam shear waves. **E 1316, E07**

angle lapping—a method specimen preparation in which a specimen is mechanically polished at an angle to the original surface.

NOTE—This angle may often be less than 1° so that depth information with respect to the original surface is transformed lateral information. **E 673, E42**

angle of attack, n —in *impingement erosion*, the angle between the direction of motion of an impinging liquid or solid particle and the tangent to the surface at the point of impact. **G 40, G02**

angle of bend, n —the change in the angle between the two legs of the specimen during a bend test, measured before release of the bending forces. **E 6, E28**

angle of external friction (angle of wall friction), δ (degrees)—angle between the abscissa and the tangent of the curve representing the relationship of shearing resistance to normal stress acting between soil and surface of another material. **D 653, D18**

angle of friction (angle of friction between solid bodies), ϕ (degrees)—angle whose tangent is the ratio between the maximum value of shear stress that resists slippage between two solid bodies at rest with respect to each other, and the normal stress across the contact surfaces. **D 653, D18**

angle of illumination, n —angle between the specimen normal and the illuminator axis. **E 284, E12**

angle of incidence, θ —the angle between an incident radiant beam and a perpendicular to the interface between two media. **E 131, E13**

angle of incidence, n —the angle between a ray impinging on a surface at a point and the perpendicular to the surface at that point. In *the description of a beam*, the angle of incidence of the ray at the center of the beam. **E 284, E12**

angle of incidence—the angle between a ray and the normal to the plane on which it is incident. (The plane of incidence may be the aperture plane, the collector, or any other plane of interest.) **E 772, E44**

angle of incidence, n —the angle between an incident ray and the normal to a surface at the point of contact. When referring to a scanner reading a printed symbol, the angle between the light source scanner beam and the symbol position. **F 1294, F05**

angle of incidence, n —in *impingement erosion*, the angle between the direction of motion of an impinging liquid or solid particle and the normal to the surface at the point of impact. **G 40, G02**

angle of inclination—an angle at which the test sheet and supporting base are inclined from the horizontal. (F 254) **F 221, F05**

angle of internal friction (angle of shear resistance), ϕ (degrees)—angle between the axis of normal stress and the tangent to the Mohr envelope at a point representing a given failure-stress condition for solid material. **D 653, D18**

angle of obliquity, $\alpha, \beta, \phi, \Psi$ (degrees)—the angle between the direction of the resultant stress or force acting on a given plane and the normal to that plane. **D 653, D18**

angle of placement of metal connector plate—angle of inclination of lengthwise axis of metal connector plate parallel to longitudinal axis of coiled metal strip, that is, main direction of metal connector plate to direction of test-load application to wood member of connection; with *zero-degree angle* defined as that of lengthwise plate axis being parallel to load direction; and *angle greater than zero* defined as that of lengthwise plate axis being rotated clockwise away from the loading axis when facing the plated connection. **E 631, E06**

angle of reflection: (I) reflection—the angle between the reflected beam and the normal to the reflecting surface.

(2) *diffraction*—the angle between the diffracted beam and the diffracting planes. **E 7, E04**

angle of reflection, n —the angle between a ray reflected from a surface at a point and the perpendicular to the surface at that point. **E 284, E12**

angle of reflection—the angle between the direction of propagation of a reflected ray and the normal to the surface at the point of reflection. **E 772, E44**

angle of refraction—the angle between the direction of propagation of a refracted ray and the normal to the interface at the point of refraction. **E 772, E44**

angle of repose, n —the basal angle of a pile formed by powder when freely poured under specified conditions onto a horizontal surface. **B 243, B09**

angle of repose, n —the acute angle measured from the horizontal to the slope of a cone-shaped pile of free-flowing material. **C 71, C08**

angle of repose, n —the greatest angle, measured from horizontal, attained by a coal so that material on the sides of top of the inverted cone or trench created in car top sampling remains stable, that is, will not shift or slide. Coal size and moisture content are contributing factors to this angle. In all cases, the coal shall be dug so that the physical angle is less than the angle of repose. **D 121, D05**

angle of repose, n —the maximum angle from horizontal at which a given material will rest on a particular stationary surface without sliding or rolling. **E 2201, E50**

angle of repose, α (degrees)—angle between the horizontal and the maximum slope that a soil assumes through natural processes. For dry granular soils the effect of the height of slope is negligible; for cohesive soils the effect of height of slope is so great that the angle of repose is meaningless. **D 653, D18**

angle of shear resistance—see **angle of internal friction**. **D 653, D18**

angle of twist (torsion test), n —the angle of relative rotation measured in a plane normal to the torsion specimen's longitudinal axis over the gage length. **E 6, E28**

angle of view, n —angle between the normal to the surface of the specimen and the axis of the receiver. **E 284, E12**

angle of wall friction—see **angle of external friction**. **D 653, D18**

angle ply—any filamentary lamina orientated in a direction other than that specified as 0° (that is, the reference axis) within a composite assembly. **E 631, E06**

angle ply—any filamentary lamina orientated in a direction other than that specified as 0° (that is, the reference axis) within a composite assembly. **E 1749, E06**

angleply laminate—any balanced laminate consisting of plus and minus theta plies where theta is an acute angle with respect to a reference direction. **D 3878, D30**

angle resolved AES—the recording of Auger electron spectra as a function of angle emission. **E 673, E42**

angle, rotation, n —see **rotation angle**. **E 284, E12**

angstrom (Å)—a unit of length equaling 10^{-10} metres, 10^{-4} μ metres, 10^{-8} centimetres and 3.937×10^{-9} in. The symbol is Å, Å or ÅU. **D 6161, D19**

ångström unit—a unit of linear measure named after A. J. Ångström. It is 1×10^{-10} metres; $1 \mu\text{m} = 10,000 \text{ Å}$. It is generally abbreviated as Å. in the United States; elsewhere, it is variously abbreviated Å, Å., Å.U., Å., or ÅU. **E 175, E41**

ångström unit (Å)— 10^{-8} cm. **B 374, B08**

angstrom unit (Å)—a unit of length which may be used to express the wavelength of electromagnetic radiation, that is, light. One angstrom unit is equal to 0.1 nanometres. ($1 \text{ nm} = 10^{-9} \text{ m}$).

E 1316, E07

Angstrom unit (abbreviation) = Å, Å., or Å. U—a unit of length equal to 10^{-8} cm. This is the standard unit of measurement in X-ray crystallography. **E 7, E04**

angular aggregate—aggregate, the particles of which possess well-defined edges formed at the intersection of roughly planar faces. **D 653, D18**

angular aperture—See **aperture, optical**. E 7, E04
angular aperture—see **aperture, angular**. E 175, E41
angular deviation—the angular displacement of a light ray from its original path caused by non-parallelism of opposite surfaces as it passes through a transparent material, which is expressed in units of angle (degree, minutes of arc, milliradians) and is a function of the angle of incidence at each surface of the material and the index of refraction of the material. F 2429, F07
angular displacement—the angular separation of the secondary image from the primary image as measured from the design eye position of a transparency. F 2429, F07
angular distribution of secondary ions—see **secondary ions**. E 673, E42
angular frequency, ω —the number of radians per second traversed by a rotating vector that represents any periodically varying quantity. E 1142, E37
angular strain, n —use **shear strain**. E 6, E28
angular subtense, n —*visual*, the angle subtended (by an object) at the first nodal point of the eye. E 284, E12
anhydrite, n —the mineral consisting primarily of anhydrous calcium sulfate, CaSO₄. C 11, C11
anhydrite, n —see **calcium sulfate**. C 219, C01
anhydroglucose units—the repeating unit of many polysaccharides, including cellulose; since the glucose molecules have combined with elimination of water, the unit is called “anhydroglucose” rather than “glucose.” D 1695, D01
anhydrous—a material that does not contain water either absorbed on its surface or as water of crystallization; a water-free product. E 1705, E48
anhydrous ethanol—100 % ethanol, neat ethanol, 199 + proof ethanol. E 1705, E48
anhydrous soap—under **soap**, see **anhydrous soap**. D 459, D12
anhydrous, without water—term used in chemistry to denote absence of water. 199 + proof ethanol is considered anhydrous ethanol. E 1705, E48
aniline dyed leather—leather which has been colored by transparent dyes as distinguished from leather treated by pigments or other opaque material. D 1517, D31
aniline finish—a clear finish with little or no pigmentation. D 1517, D31
aniline point—the minimum temperature for complete miscibility of equal volumes of aniline and the sample under test. See Test Methods D 611. In comparing two samples of similar molecular weight, the aniline point can be used as a means of comparing aromatic content of the two samples. A product of high aniline point will be low in aromatics and naphthenes, and therefore high in paraffins. D 2864, D27
aniline point, n —the minimum equilibrium solution temperature for equal volumes of aniline (aminobenzene) and sample. D 4175, D02
aniline point, n —the minimum equilibrium solution temperature for equal volumes of aniline and sample. D 4175, D02
animal fiber, n —any natural protein-base fiber. D 123, D13
animal fiber, n —any natural protein-base fiber. D 4845, D13
anion—a negatively-charged ion. B 374, B08
anion—negatively charged ion. D 6161, D19
anion—a negatively charged ion. G 15, G01
anion-exchange material, n —a material capable of the reversible exchange of negatively charged ions. D 1129, D19
anion exchange material—a material capable of the reversible exchange of negatively charged ions. D 6161, D19
anion exchange membrane—membrane containing fixed cationic charges and mobile anions that can be exchanged with other anions present in an external fluid in contact with the membrane. D 6161, D19

anionic detergent—under **detergent**, see **anionic detergent**. D 459, D12
anionic emulsion, n —a type of emulsion such that a particular emulsifying agent establishes a predominance of negative charges on the discontinuous phase. D 8, D04
anionic emulsion—an emulsion in which the emulsifying system establishes a predominance of negative charges on the discontinuous phase. D 1079, D08
anionic polyelectrolyte—usually acrylamide or acrylamide and acrylic copolymers, negatively charged, used for coagulation/flocculation. See **Polyelectrolyte**. D 6161, D19
anionic surfactant—a chemical compound that produces negatively charged surface active ions in solution. D 459, D12
anionic surfactant—a surface-active agent in which the active portion of the molecule containing the lipophilic segment forms exclusively a negative ion (anion) when placed in aqueous solution. E 609, E35
anionic surfactant—a surface-active agent in which the active portion of the molecule containing the lipophilic segment forms exclusively a negative ion (anion) when placed in aqueous solution. E 1519, E35
anisotropic, *adj*—as used in Test Method D 5061, exhibiting optical properties of different values when viewed with an optical microscope having mutually exclusive polarized light, for example, crossed nicols. D 121, D05
anisotropic—not isotropic; having mechanical or physical properties, or both, that vary with direction relative to natural reference axes in a material. E 631, E06
anisotropic—not isotropic; having mechanical or physical properties, or both, that vary with direction relative to natural reference axes in a material. E 1749, E06
anisotropic, *adj*—having different values for a specific property in different directions. F 1494, F23
anisotropic mass—a mass having different properties in different directions at any given point. D 653, D18
anisotropic material—a material in which the magnetic properties differ in various directions. A 340, A06
anisotropic membrane—a non-uniform structure in cross-section; typically the support substructure has pores much larger than the barrier layer. See **asymmetric membranes**. D 6161, D19
anisotropic (replaces anisotropy)—having different values for a property, in different directions. E 7, E04
anisotropy—having different properties in different directions. (ISRM) D 653, D18
anisotropy of loss—the ratio of the specific core loss measured with flux parallel to the rolling direction to the specific core loss with flux perpendicular to the rolling direction.

$$\text{anisotropy of loss} = \frac{P_{c(B:f)l}}{P_{c(B:f)t}}$$

where:

$P_{c(B:f)l}$ = specific core loss value with flux parallel to the rolling direction, W/lb [W/kg], and
 $P_{c(B:f)t}$ = specific core loss value with flux perpendicular to the rolling direction, W/lb [W/kg].

NOTE—This definition of anisotropy normally applies to electrical steels with measurements made in an Epstein frame at a flux density of 15 kG [1.5 T] and a frequency of 60 Hz (see Test Method A 343).

A 340, A06

anisotropy of permeability—the ratio of relative peak permeability measured with flux parallel to the rolling direction to the relative peak permeability measured with flux perpendicular to the rolling direction.

$$\text{anisotropy of permeability} = \frac{\mu_{prl}}{\mu_{prt}}$$

where:

μ_{prl} = relative peak permeability value with flux parallel to the rolling direction, and

μ_{prt} = relative peak permeability value with flux perpendicular to the rolling direction.

NOTE—This definition of anisotropy normally applies to electrical steels with measurements made in an Epstein frame at a flux density of 15 kG [1.5 T] and a frequency of 60 Hz (see Test Method A 343).

A 340, A06

ankle, n—*in anatomy*, the joint between the foot and the lower leg.

D 123, D13

ankle, n—the joint between the foot and the lower leg. D 5219, D13

ankle girth, n—*in body measurements*, the circumference of the leg over the greatest prominence of the ankle. D 123, D13

ankle girth, n—the maximum horizontal circumference of the ankle, taken over the greatest prominence of the anklebones.

D 5219, D13

ankle height, n—*in body measurements*, with the subject standing barefoot, the distance from the center of the prominent outside ankle bone to the floor. D 123, D13

ankle height, n—the vertical distance from the prominence of the outer ankle bone to the floor, taken with subject standing and without shoes.

ankle height (infant special case), n—the straight distance from the prominence of the outer ankle bone to the soles of the feet, taken with subject lying down flat with legs extended and the foot positioned at 1.57 rad (90°) to the leg.

D 5219, D13

anneal—to attain acceptably low stresses, or desired structure, or both, in glass by controlled cooling from a suitable temperature.

C 162, C14

anneal, v—to heat treat in order to remove the effects of cold-working or aging heat treatments, or both.

F 2005, F04

anneal (annealing)—a thermal treatment to change the properties or grain structure of the product. When applied to a cold-worked product having a single phase: to produce softening by recrystallization or recrystallization and grain growth, with the accompanying changes in properties. When applied to a product having two or more phases: to produce softening by changes in the phase relationship which may include recrystallization and grain growth.

B 846, B05

annealed—heated and subsequently cooled to provide increased ductility.

F 547, F16

annealed wire—see **soft wire**.

B 354, B01

annealing, n—a generic term covering any of several **heat treatments**.

A 941, A01

annealing—a controlled cooling process for glass designed to reduce residual stress to a commercially acceptable level and modify structure.

C 162, C14

annealing—see Terminology A 919.

C 286, B08

annealing—general term applied to a variety of thermal treatments applied to fasteners for the purpose of softening or homogenizing material properties.

F 1789, F16

annealing acid—see **acid annealing** and **annealing**. C 286, B08

annealing point (A.P.)—that temperature corresponding either to a specific rate of elongation of a glass fiber when measured by Test Method C 336, or a specific rate of midpoint deflection of a glass beam when measured by Test Method C 598. At the annealing point of glass, internal stresses are substantially relieved in a matter of minutes.

C 162, C14

annealing range—the range of glass temperature in which stress in glass can be relieved at a commercially practical rate. For purposes of comparing glasses, the annealing range is assumed to corre-

spond with the temperature between the annealing point (A.P.) and the strain point (St.P.).

C 162, C14

annealing-twin bands—See **twin bands**.

E 7, E04

annihilation radiation—gamma radiation produced by the annihilation of a positron and an electron. For particles at rest, two photons are produced, each having an energy corresponding to the rest mass of an electron (511 keV).

E 170, E10

annotation text, n—optional user text that can be specifically defined and displayed when the pattern piece is plotted. D 6963, D13

annually recurring costs—those costs that are incurred in a regular pattern each year throughout the study period.

apartment—See **dwelling unit**.

apartment building—See **building**.

E 631, E06

annually recurring costs, n—those costs that are incurred in a regular pattern each year throughout the study period. E 833, E06

annual ring—the growth layer produced by the tree in a single growth year, including earlywood and latewood. D 9, D07

annual space; annulus—the space between two concentric tubes or casings, or between the casing and the borehole wall. This would include the space(s) between multiple strings of tubing/casings in a borehole installed either concentrically or multi-cased adjacent to each other.

D 653, D18

annual value—a uniform annual amount equivalent to the project costs or benefits taking into account the time value of money throughout the study period (Syn. *annual worth, equivalentuniform annual value*).

annual worth—See **annual value**.

E 631, E06

annual value, n—a uniform annual amount equivalent to the project costs or benefits taking into account the time value of money throughout the study period (Syn. *annual worth, equivalent uniform annual value*).

E 833, E06

annual worth, n—See **annual value**.

E 833, E06

annular, adj—descriptor for directional illuminating (or viewing) geometry in which the illuminator provides radiation (or the receiver possesses responsivity) that is distributed continuously and uniformly throughout the 360° of azimuth of the measurement. (See also *circumferential*.)

E 284, E12

annular coil clearance—the mean radial distance between adjacent coil assembly and test part surface in electromagnetic encircling coil examination.

E 1316, E07

annular coils—see **encircling coils**.

E 1316, E07

annular space—the space between the inner surface of the female end and the outer surface of the male end of an assembled pipe joint.

C 822, C13

annular thread—multiple ring-like threads rolled completely around shank in planes perpendicular to nail axis; having a lead angle of zero degree.

F 547, F16

anode—the electrode in electrolysis, at which negative ions are discharged, positive ions are formed, or other oxidizing reactions occur.

B 374, B08

anode—positive electrode.

D 6161, D19

anode—the positive electrode of a discharge tube. In an X-ray tube, the anode carries the target.

E 1316, E07

anode—the electrode of an electrolytic cell at which oxidation is the principal reaction. (Electrons flow away from the anode in the external circuit. It is usually the electrode where corrosion occurs and metal ions enter solution.)

G 15, G01

anode aperture—See **aperture**.

E 7, E04

anode corrosion—dissolution of anode metal by the electrochemical action in an electrolytic cell.

B 374, B08

anode corrosion efficiency—the ratio of the actual corrosion (weight loss) of an anode to the theoretical corrosion (weight loss) calculated by Faraday's law from the quantity of electricity that has passed.

G 15, G01

anode current—the electrons passing from the cathode to the anode in an X-ray tube, minus the small loss incurred by the back scattered fraction.

E 1316, E07

anode efficiency

anode efficiency—current efficiency of a specified anodic process.

B 374, B08

anode fall—the potential difference between the anode and the electrical discharge plasma.

B 542, B02

anode film—(1) the layer of solution in contact with the anode that differs in composition from that of the bulk of the solution. (2) The outer layer of the anode itself consisting of oxidation or reaction products of the anode metal.

B 374, B08

anode polarization—See **polarization**.

B 374, B08

anodic (anode) material transfer—see **material transfer**.

B 542, B02

anodic coating—a protective, decorative, or functional coating, formed by conversion of the surface of a metal in an electrolytic oxidation process.

B 374, B08

anodic inhibitor—a corrosion inhibitor whose primary action is to slow the kinetics of the anodic reaction, producing a positive shift in corrosion potential.

G 15, G01

anodic polarization—the change of the electrode potential in the noble (positive) direction due to current flow. (See **polarization**.)

G 15, G01

anodic protection—a technique to reduce the corrosion rate of a metal by polarizing it into its passive region where dissolution rates are low.

G 15, G01

anodic stripping voltammetry—an electroanalytical technique in which the concentration of analyte metal species dissolved in solution is determined in the following manner. The analyte is first deposited (preconcentrated) electrochemically by reducing the dissolved ion in solution to immobilized metal species at a mercury electrode surface. The metal is deposited in the form of an amalgam (with Hg) at an applied potential (voltage) which is negative of the standard oxidation potential for the metal/ion redox couple. After deposition, the preconcentrated metal species is then “stripped” from the mercury electrode by applying a positive potential sweep, which causes anodic oxidation of the analyte metal species to dissolved ion. The current associated with this reoxidation is measured. The peak current is proportional to the original concentration of dissolved analyte species over a wide range of concentrations.

E 631, E06

anodic stripping voltammetry—an electroanalytical technique in which the concentration of a metal species analyte (such as lead) in a solution is determined by deposition (by reduction) on an electrode, then stripping from it (by oxidation). The peak electrical current is measured during stripping, and is proportional to the original metal concentration.

E 1605, E06

anodized aluminum—natural-colored or surface-colored aluminum having increased anodic corrosion resistance.

F 547, F16

anodizing—an electrolytic oxidation process in which the surface of a metal, when anodic, is converted to a coating having desirable protective, decorative, or functional properties.

B 374, B08

anolyte—the portion of electrolyte in the vicinity of the anode; in a divided cell, the portion of electrolyte on the anode side of the diaphragm.

B 374, B08

anolyte—the electrolyte adjacent to the anode of an electrolytic cell.

G 15, G01

anomaly, n—a change in the strain pattern of the rubber surface of a straining block as a result of applied stress brought about through a change in atmospheric pressure on the rubber surface.

F 538, F09

anosmia, n—lack of sensitivity to odor stimuli.

E 253, E18

A-not-A test, n—a method of discrimination testing comprised of at least two samples; at least one sample is a previously identified sample (“A”) and at least one is a test sample. All samples are presented blindly, and the assessor’s task is to assign the label “A” or “not-A” to each of the samples.

E 253, E18

ANOVA, n—in statistics, acronym for analysis of variance.

D 4175, D02

anoxic, adj—oxygen free.

D 4175, D02

antagonism, n—joint action of two or more stimuli whose combination elicits a level of sensation lower than that expected from combining the effects of each stimulus taken separately.

E 253, E18

antelope finish suede—applied to lambskin, goatskin, or calfskin, sueded and finished to resemble antelope.

D 1517, D31

antelope leather—a fine, soft leather made from an antelope skin, velvety in texture and sheen, sueded on the flesh side. This leather is so rare, that for practical purposes, it is virtually nonexistent.

D 1517, D31

anteroposterior—extending from the front to the rear.

F 869, F08

anthophyllite asbestos, n—asbestiform variety of the orthorhombic amphibole silicate minerals of the anthophyllite series.

D 2946, C17

anthracite—See **anthracite** under **rank**.

D 121, D05

anthracite—a granular hard coal used as a filtration media, commonly used as the coarser layer in dual and multimedia filters.

D 6161, D19

anthracite-coal-base carbon refractory, n—see **carbon refractory, anthracite-coal-base**.

C 71, C08

anthracitic class—See **anthracitic class** under **rank**.

D 121, D05

anthropometry—the science of the measurement of the human body and its parts.

F 869, F08

anti-aliasing filter, n—a low-pass analog filter applied to the original analog profile signal to suppress those components of the signal at frequencies higher than one half the intended digital sampling frequency.

E 867, E17

anticoagulant (natural rubber latex), n—a substance added to field latex to retard bacterial action which would otherwise cause rapid coagulation of the latex.

D 1566, D11

antidegradant, n—compounding material used to retard deterioration caused by oxidation, ozone, light, and combinations of these.

D 1566, D11

antidunes—bed forms that occur at a velocity higher than that velocity which forms dunes and plane beds. Antidunes commonly move upstream, and are accompanied by, and in phase with, waves on the water surface.

D 4410, D19

antiferromagnetic material—a feebly magnetic material in which almost equal magnetic moments are lined up antiparallel to each other. Its susceptibility increases as the temperature is raised until a critical (Neél) temperature is reached; above this temperature the material becomes paramagnetic.

A 340, A06

antiflex cracking agent, n—a compounding material used to retard cracking caused by cyclic deformations.

D 1566, D11

antifoam, n—a substance added to engine coolant concentrate, corrosion inhibitor packages, or supplemental coolant additives to prevent or suppress foam.

D 4725, D15

antifoaming agent, n—an agent that inhibits bubble formation in an agitated liquid, usually by reducing the surface tension.

D 1566, D11

antifoaming agent—a material used to inhibit or prevent the formation of foam.

E 1519, E35

antifoulant—see **antiscalant**.

D 6161, D19

antifreeze, n—a term frequently used in the marketplace for engine coolant concentrate. (See **engine coolant concentrate**.)

D 4725, D15

antifreeze—a material that lowers the freezing point of a liquid formulation.

E 609, E35

anti-knock index, n—the arithmetic average of the Research octane number (RON) and Motor octane number (MON).

D 4175, D02

antiknock index, n—the arithmetic average of the Research octane number (RON) and Motor octane number (MON), that is, (RON + MON)/2.

D 4175, D02

anti-lock braking system (ABS), n—a collection of sensing and control hardware installed on a vehicle to prevent wheel lock-up during brake application.

F 538, F09

antimicrobial, n—see **biocide**.

D 4175, D02

antimony—an industrial term for an oxide of antimony.

C 162, C14

antioxidant, n—compounding material used to retard deterioration caused by oxidation.

D 1566, D11

antioxidant—compounding ingredient used to retard deterioration caused by oxidation. (D11)

F 412, F17

- antioxidant*—see **stabilizer**. **F 1623, F05**
- antiozonant**, *n*—compounding material used to retard deterioration caused by ozone. **D 1566, D11**
- anti-pitting agent**—an addition agent for the specific purpose of preventing gas pits in a deposit. **B 374, B08**
- antiqued**—a worn surface produced by applying abrasive tools, sometimes in combination with acid and/or wet/dry abrasive. **C 119, C18**
- antiscalant**—a compound added to a water which inhibits the precipitation of sparingly soluble inorganic salts. **D 6161, D19**
- anti-scale compound**—a preparation that is applied to burning tools to protect them from scaling in service. **C 286, B08**
- anti-skid plate**—See **loading**. **D 996, D10**
- antistat**—a chemical additive, generally added to the back side or printhead side of thermal products, which enhances the conductivity of the coating, allowing static electric charges to be bled off during the production processes or during the operation of the product in a machine. **F 1623, F05**
- antistatic agent**, *n*—a material which reduces the tendency for accumulation of electric charge on the surface of an article. **D 1566, D11**
- antistatic agent**—a chemical compound which, when impregnated or formulated into or topically applied to a primary material or substrate, gives the primary material antistatic properties. See **antistatic property**. **D 5077, D10**
- antistatic property**—the prevention of triboelectric charge generation by effectively minimizing the production of a static charge when materials are separated from another surface. **D 5077, D10**
- anti-Stokes line (band)**—a Raman line (band) that has a frequency higher than that of the incident monochromatic beam. **E 131, E13**
- anti-telescoping device**—a plastic or metal device attached to the ends of a spiral wound cartridge to prevent movement of the cartridge leaves in the feed flow direction, due to high feed flows. **D 6161, D19**
- anti-thixotropy**—an increase of the apparent viscosity under constant shear stress or shear rate followed by a gradual recovery when the stress or shear rate is reduced to zero. **E 1142, E37**
- anvil**—the base on which objects for hardness test are placed. **E 7, E04**
- anvil**, *n*—the smooth, hardened surface upon which the test sample or cup containing the sample rests. **E 1445, E27**
- anvil**—tool arm against which staple legs are driven to form clinch. **F 592, F16**
- anvil effect**—the effect caused by use of too high a load or when testing the hardness of too thin a specimen, resulting in a bulge or shiny spot on the under side of the specimen. **E 7, E04**
- AOC**—assimilable organic carbon. **D 6161, D19**
- AOQL**, *n*—The average outgoing quality limit of a sampling plan is the maximum value of the proportion defective accepted on average by that plan. AOQL is the maximum value of the multiplicand of the proportion nonconforming and the probability of acceptance from the sampling plan operating characteristic. **C 1154, C17**
- APA bead**, *n*—alginate-poly-L-lysine-alginate bead. **F 2312, F04**
- apartment**—a separate part of a **building** intended as a **dwelling unit** for an individual, family, group, or small household (also used as a synonym for **apartment building**). **E 631, E06**
- apartment building**—a **building** containing more than two **dwelling units** not intended for individual unit ownership. **E 631, E06**
- aperture**—an opening in material, space, or time over which an element is considered to be active. **E 1316, E07**
- aperture angle**, 2κ , *n*—angle subtended at a point on a specimen by the maximum dimension of the illuminator or receiver, within which the flux in a directional beam is contained. **E 284, E12**
- aperture, angular**—the angle between the most divergent rays that can pass through a lens to form the image of an object. **E 175, E41**
- aperture area**—see **area, aperture**. **E 772, E44**
- aperture diaphragm**—a device to define the aperture. **E 7, E04**
- aperture, effective**—the diameter of the entrance pupil; it is the apparent diameter of the limiting aperture measured from the front. **E 175, E41**
- aperture, electron**:
- anode aperture**—the opening in the accelerating voltage anode shield of the electron gun through which the electrons must pass to illuminate or irradiate the specimen.
- condenser aperture**—an opening in the condenser lens controlling the number of electrons entering the lens and the angular aperture of the illuminating beam. The angular aperture can also be controlled by the condenser lens current.
- physical objective aperture**—a metal diaphragm, centrally pierced with a small hole, used to limit the cone of electrons accepted by the objective lens. This improves image contrast since highly scattered electrons are prevented from arriving at the Gaussian image plane and therefore can not contribute to background fog. **E 7, E04**
- aperture leak**—a leak of such geometric configuration that the length of the leakage path is much smaller than the shortest diameter of the path, so that the leak may be considered the equivalent of an opening in an infinitesimally thin wall. **E 1316, E07**
- aperture mode**, *n*—color seen through an aperture which prevents its association with a specific object or source. **E 284, E12**
- aperture of an IRE**, *A'*—that portion of the IRE surface that can be utilized to conduct light into the IRE at the desired angle of incidence. **E 131, E13**
- aperture, optical**—the working diameter of a lens or a mirror.
- angular aperture**—the angle between the most divergent rays which can pass through a lens to form the image of an object. **E 7, E04**
- aperture size**, *n*—the dimension defining an opening in a sieving medium. **E 1638, E29**
- aperture solid angle**, ω , *n*—solid angle subtended at a point on the specimen, defined by the sum of rays from the illuminator or the sum of directions in which the receiver is sensitive to incoming radiation. **E 284, E12**
- aperture stop**, *n*—the physical diameter that limits the size of the cone of radiation that an optical system will accept from an axial point on the object. **E 284, E12**
- apex**, *n*—the uppermost point of a character. **E 2195, E30**
- apex (aka pocket)**—pocket formed at the downstream end of a U, V, J, or W shaped configuration. **F 818, F20**
- API**—abbreviation for American Petroleum Institute. **D 4175, D02**
- API gravity**—an arbitrary scale developed by the American Petroleum Institute and frequently used in reference to petroleum insulating oil. The relationship between API gravity and specific gravity 60/60°F is defined by the following:
- $$\text{Deg API Gravity at } 60^\circ\text{F} = 141.5/(\text{sp gr } 60/60^\circ\text{F}) - 131.5$$
- D 2864, D27**
- API gravity**, *n*—a special function of relative density (specific gravity) 60/60°F (15.56/15.56°C), represented by:
- $$\text{API gravity, deg} = (141.5/\text{sp gr } 60/60^\circ\text{F}) - 131.5$$
- D 4175, D02**
- API gravity**, *n*—the gravity obtained from the following relationship:
- $$\text{API Gravity, deg} = 141.5/(\text{sp gr } 60/60^\circ\text{F}) - 131.5$$
- E 344, E20**
- aplanatic**—corrected for spherical aberration and coma. **E 175, E41**
- apochromatic objective**—an objective with longitudinal chromatic correction for red, green and blue, and spherical chromatic correction for green and blue. This is the best choice for high resolution or color photomicrography. **E 7, E04**

apochromatic objective

apochromatic objective—a lens system whose secondary chromatic aberrations have been substantially reduced. (See *achromatic*).

E 175, E41

apodization—modification of the ILS function by multiplying the interferogram by a weighting function the magnitude of which varies with retardation.

E 131, E13

apparent area of contact, n —*in tribology*, the area of contact between two solid surfaces defined by the boundaries of their macroscopic interface. (Contrast with **real area of contact**.)

G 40, G02

apparent attenuation—the observed ultrasound energy loss. In addition to the true loss, the apparent attenuation may also include losses attributable to instrumentation, specimen configuration, beam divergence, interface reflections, and measurement procedure. (E 664)

E 1316, E07

apparent cohesion—see **cohesion**.

D 653, D18

apparent density, n —the mass of a unit volume of powder, usually expressed as grams per cubic centimetre, determined by a specified method.

B 243, B09

apparent density—See **density, apparent**.

D 883, D20

apparent density, n —See **density, bulk**, the preferred term.

D 1566, D11

apparent density—the density calculated when the pycnometer is calibrated with water, weighed in air, and when the sample is weighed in air and no air buoyancy correction is used for either weighing, even though the density in vacuum of water is used in calculating the apparent volume of the pycnometer. D 4790, D16

apparent density—the weight per unit volume of a material including voids inherent in the material as tested.

F 412, F17

apparent density—see **density, apparent**.

F 1251, F04

apparent density at 60°F—the weight in air of a unit volume of sample at 60°F; in this method, the weight is in pounds and the volume in U.S. liquid gallons. Average air in this method is assumed to have a density of 0.0012 g/cm³.

D 4790, D16

apparent hardness, n —the hardness of a P/M material (including the effects of porosity), measured using macroindentation hardness equipment.

B 243, B09

apparent heat capacity—the amount of heat required to raise the temperature of a unit mass of frozen ground by one degree. It is expressed in Joules per kg per degree K.

D 7099, D18

apparent lead concentration (ALC)—the average of at least three XRF analyzer readings on a coated surface.

architectural program—See **facility program**.

E 631, E06

Apparent Lead Concentration (ALC)—The x-ray fluorescence (XRF) reading or average of more than one reading on a painted surface, not corrected for the substrate.

E 1605, E06

apparent opening size (AOS), O_{95} , n —*for a geotextile*, a property which indicates the approximate largest particle that would effectively pass through the geotextile.

D 4439, D35

apparent or pycnometric density—See *apparent or pycnometric density* under **density**.

C 242, C21

apparent porosity, n —specific to cemented carbides, microstructural features that appear to be pores in a properly prepared, unetched surface; these features may result from uncombined carbon or nonmetallic inclusions as well as actual porosity.

B 243, B09

apparent porosity—See *apparent porosity* under **porosity**.

C 242, C21

apparent power, P_a —the product (volt-amperes) of the rms exciting current and the applied rms terminal voltage in an electric circuit containing inductive impedance. The components of this impedance as a result of the winding will be linear, while the components as a result of the magnetic core will be nonlinear. The unit of apparent power is the volt-ampere, VA.

A 340, A06

apparent power, specific, $P_{a(B,f)}$ —the value of the apparent power divided by the active mass of the specimen, that is, volt-amperes per unit mass. The values of voltage and current are those developed at a maximum value of cyclically varying induction B and specified frequency f .

A 340, A06

apparent rank, n —*of coal*, the rank designation obtained on samples

other than channel samples, but otherwise conforming to procedures of Classification D 388.

D 121, D05

apparent solar time, apt—the hours of the day as computed from the position of the sun using the equation of time. (See ASHRAE *Handbook of Applications*, 1982, Chapter 57.)

E 772, E44

apparent surface resistivity—the surface resistance between two electrodes forming opposite sides of a square on the surface of the copy substrate or the electrical equivalent.

F 335, F05

apparent temperature—the temperature of an object as determined solely from the measured radiance, assuming an emissivity of unity.

E 1316, E07

apparent thermal conductivity, λ_a , k_a , n —a thermal conductivity assigned to a material that exhibits thermal transmission by several modes of heat transfer resulting in property variation with specimen thickness, or surface emittance. See **conductivity, thermal**.

C 168, C16

apparent thermal resistivity, r_a , n —a thermal resistivity assigned to a material that exhibits thermal transmission by several modes of heat transfer resulting in property variation with specimen thickness, or surface emittance. See **resistivity, thermal**.

C 168, C16

apparent viscosity, n —*in non-Newtonian behavior*, the ratio of the shearing stress to the rate of shear of a fluid, given at the corresponding shearing stress.

D 907, D14

apparent viscosity, n —*of a lubricating grease*, the ratio of shear stress to shear rate calculated from Poiseuille's equation, and is measured in poises.

D 4175, D02

apparent viscosity, n —the determined viscosity obtained by use of this test method.

D 4175, D02

appearance, n —(1) the aspect of visual experience by which things are recognized.

(2) *in psychophysical studies*, perception in which the spectral and geometric aspects of a visual stimulus are integrated with its illuminating and viewing environment.

E 284, E12

apple-box nail—coated, regular-stock-steel, 1½ and 1¾ by 0.080-in. nails with flat 1¼-in. head and medium diamond point.

F 547, F16

applicable or relevant and appropriate requirements (ARAR)

—those requirements, cleanup standards, standards of control, and other substantive environmental protection requirements, criteria, or limitations promulgated under federal or state law that show either a direct correspondence or address problems or situations sufficiently similar at a site to show that they are well suited for application.

D 5681, D34

applicable standards—those having the capability of being applied in some fashion to the host standard.

F 1789, F16

application rate—the quantity (mass, volume or thickness) of material applied per unit area.

D 1079, D08

application rate—the amount of any material applied per unit treated:

E 1102, E35

application temperature, n —the range of material temperature, as recommended by the manufacturer, that is to be used when installing sealant; for hot-applied sealants, the application temperature is any temperature between the minimum application temperature and safe heating temperature.

D 5535, D04

applicator—any device used to mechanically apply molten sealants that is capable of delivering the required volume at the specified application temperature.

C 717, C24

applied-K curve—a curve (a fixed-force or fixed-displacement crack-extension-force curve) obtained from a fracture mechanics analysis for a specific configuration. The curve relates the stress-intensity factor to crack size and either applied force or displacement.

E 1823, E08

approving authority—the individual official, board, department, or agency established and authorized by a state, county, city, or other political subdivision, created by law to administer and enforce specified requirements.

C 896, C04

approving authority—the individual official, board, department, or agency established and authorized by a state, county, city, or other

- political subdivision, created by law to administer and enforce specified requirements. **F 412, F17**
- approximate freezing index**—the cumulative number of degree-days below 0°C for a given period, calculated from the mean monthly temperatures for a given station without making corrections for positive degree-days in the spring and fall. **D 7099, D18**
- approximate thawing index**—the cumulative number of degree-days above 0°C for a given period, calculated from the mean monthly temperatures for a given station without making corrections for negative degree-days in the spring and fall. **D 7099, D18**
- apron leathers**—any one of several varieties of leather used in connection with textile machinery and blacksmith aprons. Comber and Gill Box apron leather is soft, mellow, tough leather, tanned from steerhides, heavily stuffed and boarded or otherwise softened. Rub Roll apron leather is a flexible but firm, dry, strong leather. **D 1517, D31**
- apron mark**—See **decating mark**. **D 3990, D13**
- aqueous extract**, *n*—*in wool testing*, the solution obtained by digesting a material with water or with a sodium chloride solution to dissolve soluble materials. **D 123, D13**
- aqueous extract**, *n*—*in wool testing*, the solution obtained by digesting a material with water or with a sodium chloride solution to dissolve soluble materials. **D 4845, D13**
- aquiclude**—a relatively impervious formation capable of absorbing water slowly but will not transmit it fast enough to furnish an appreciable supply for a well or spring. **D 653, D18**
- aquifer**—a geologic formation, group of formations, or part of a formation that is saturated and is capable of providing a significant quantity of water. **D 653, D18**
- aquifer**—a water-bearing geological formation that provides a ground water reservoir. **D 6161, D19**
- aquifer**, *n*—a water-bearing, permeable body of rock or granular material below the surface of the earth. **E 957, E44**
- aquifer**, *n*—a geologic formation, group of formations, or part of a formation that is saturated with water and capable of providing a significant quantity of water. **E 2201, E50**
- aquifer, confined**—an aquifer bounded above and below by confining beds and in which the static head is above the top of the aquifer. **D 653, D18**
- aquifer, unconfined**—an aquifer that has a water table. **D 653, D18**
- aquitard**—a confining bed that retards but does not prevent the flow of water to or from an adjacent aquifer; a leaky confining bed. **D 653, D18**
- araban**—a pentosan yielding essentially only arabinose on hydrolysis. **D 1695, D01**
- arabinogalactan**—a polysaccharide consisting of arabinose and galactose units, like the water-soluble polysaccharide of larch. **D 1695, D01**
- arabinomethylglucuronoxylan**—a hemicellulose containing arabinose, 4-O-methylglucuronic acid, and xylose groups in its structure. **D 1695, D01**
- arabinose**—a pentose that occurs as one of the sugar units in some hemicelluloses. **D 1695, D01**
- aramid**—a fully aromatic polyamide. **D 6161, D19**
- arbitration hardness location**—prescribed location on the fastener, such as at mid-radius, using 90° intervals taken through the cross section, one diameter from the threaded end for bolts and screws. **F 1789, F16**
- arc, anode**—the arc that occurs at less than a critical electrode spacing (see arc, cathode), and results in anode material loss. **B 542, B02**
- arc, cathode**—the arc that occurs at greater than a critical electrode spacing (see arc, anode), and results in cathode material loss. **B 542, B02**
- arc, condensed**—see **discharge, triggered capacitor**.
- continuous dc**, *n*—a self-maintaining dc discharge.
- noncapacitive ac**, *n*—*in atomic emission spectrometry*, a series of separate electrical discharges, individually self-initiating or initiated separately by another means, in which each current pulse has a polarity that is reversed from the previous one. **E 135, E01**
- arc discharge**—a self-sustaining, high current density, high temperature discharge, uniquely characterized by a cathode fall nearly equal to the ionization potential of the gas or vapor in which it exists. **B 542, B02**
- arc duration**, *n*—time duration of the arc(s). **F 819, F18**
- arc energy (vi dt)**, *n*—sum of the instantaneous arc voltage values multiplied by the instantaneous arc current values multiplied by the incremental time values during the arc, (J). **F 819, F18**
- arc gap**—distance between the arc electrodes (inch). **F 819, F18**
- arch**, *n*—a part of a melter; a crown. **C 162, C14**
- arch**, *v*—to heat a pot in a pot arch. **C 162, C14**
- arch**, *n*—the bony framework of the foot extending from the heel to the toes and sustained by the muscles and ligaments in the form of an arch. Also, the bottom curve of a shoe last from heel to ball. **F 1646, F13**
- arch-footwear**—the bottom curve of a shoe last from heel to ball. **F 869, F08**
- arching**—the transfer of stress from a yielding part of a soil or rock mass to adjoining less-yielding or restrained parts of the mass. **D 653, D18**
- architectural coatings**, *n*—coatings intended for on-site application to interior or exterior surfaces of residential, commercial, institutional or industrial buildings. **D 16, D01**
- architectural program**—See **facility program**. **E 1480, E06**
- architectural strip seal**—a preformed membrane or tubular extrusion, manufactured from a fully cured elastomeric alloy, having flanges or other means of mechanically or chemically securing it. **E 631, E06**
- architectural-use**, *n*—*in the building trade*, a descriptive term for fabrics used in fabric roof-systems or similar industrial applications. (See also **fabric roof-system**.) **D 123, D13**
- architectural-use**, *n*—*in the building trade*, a descriptive term for fabrics used in fabric roof-systems or similar industrial applications. (See also **fabric roof-system**.) **D 4850, D13**
- archival quality**—the ability of a print to retain specified characteristics and legibility over a period of use and storage under specified conditions. **F 221, F05**
- archival quality**—the properties of a copy or print necessary to retain specified information under specified conditions of storage, time and use. **F 335, F05**
- archive**, *n*—the organized collection of data and information derived from selected ITS-generated data flows and other data sources. **E 867, E17**
- archived data administrator**, *n*—the person who is responsible for the day-to-day operations and long-term management of an ADMS. **E 867, E17**
- archived data management subsystem (ADMS)**, *n*—a subsystem of the National ITS Architecture that provides a means for several organizations to collect, store, and subsequently, analyze and retrieve data from ITS data sources, usually by way of one or more ITS centers. **E 867, E17**
- archived data management system (ADMS)**, *n*—a system that is a specific implementation of an ADMS within the context of a local, regional, or statewide ITS architecture. **E 867, E17**
- archived data user service (ADUS)**, *n*—one of the ITS user services that defines the scope of the National ITS Architecture with regard to archiving and retrieving ITS-generated data. **E 867, E17**
- archive structure metadata**, *n*—descriptive data about the structure of the data archive itself and of the data and information in the archive that facilitate use of the archive. **E 867, E17**
- archiving**, *v*—collecting and actively managing original source and other data with the intent of saving the data as well as associated metadata. **E 867, E17**
- arch support**—a device of leather, metal, or other material shaped to

arch support

the contour of the longitudinal arch of the foot and inserted or built in a shoe. **F 869**, F08

arcing—in electron diffraction, the production of segments of circular patterns, indicating a departure from completely random orientation of the crystals of the specimen. **E 7**, E04

arc line—not recommended, see **atom line**. **E 135**, E01

Ar_{cm} , Ar_1 , Ar_2 , Ar_3 , Ar_4 —See **transformation temperature**. **A 941**, A01

arc propagation, n —the movement of an electric arc from its point of inception to another location. **D 1711**, D09

arc, shortest—a limiting state of an arc in which the total arc voltage approaches the sum of the cathode and anode falls. **B 542**, B02

arc strikes—localized burn damage to a part from an arc caused by making or breaking an energized electrical circuit. **E 1316**, E07

Arc thermal performance value (ATPV), n —in *arc testing*, the incident energy on a fabric or material that results in a 50 % probability that sufficient heat transfer through the tested specimen is predicted to cause the onset of a second-degree skin burn injury based on the Stoll curve. **F 819**, F18

arctic—the biogeographic realm that comprises the tundra and treeless grounds lying north of the timberline in the Northern hemisphere or south of the timberline in the Southern hemisphere. **F 1600**, F20

arc tracking, n —the process producing tracks when arcs occur on or close to the insulation surface. **D 1711**, D09

arc voltage, n —voltage across the gap caused by the current flowing through the resistance created by the arc gap, V . **F 819**, F18

arc welding—a group of welding processes wherein coalescence is produced by heating with an arc or arcs, with or without the application of pressure and with or without the use of filler metal. **B 846**, B05

area—See **space categories**.

area—See **space categories**. **E 631**, E06

area, A—the geometric cross-sectional area of a magnetic path which is perpendicular to the direction of the induction. **A 340**, A06

area, absorber—the total uninsulated heat transfer surface area of the absorber, including unirradiated as well as irradiated portions. **E 772**, E44

area amplitude response curve—a curve showing the changes in amplitude at normal incidence from planar reflectors of different areas located at equal distances from the search unit in an ultrasonic-conducting medium. **E 1316**, E07

area, aperture—of a flat plate collector, (1) the maximum projected area of a solar collector through which the unconcentrated solar radiant energy may be admitted to the absorber. (2) *effective aperture area*—the area as defined above projected normal to the sun's rays and corrected for any shading. Units: square metres (m²) [square feet (ft²)]. **E 772**, E44

area, collector panel—the total area of the panel assembly (with its containing box, if present), projected on the aperture plane. **E 772**, E44

area density—mass per unit area. **B 354**, B01

area, gross aperture—of a *concentrating collector*, the maximum projected area through which the unconcentrated solar radiant energy is admitted, including any area of the reflector or refractor shaded by the receiver and its supports, and including gaps between reflector segments within a collector module. **E 772**, E44

area, gross collector—the maximum area of the complete collector module, including integral mounting means, projected on the aperture plane. **E 772**, E44

area grouting—grouting a shallow zone in a particular area utilizing holes arranged in a pattern or grid. **D 653**, D18

area, net aperture—of a *concentrating collector*, the maximum projected area through which the unconcentrated solar radiant energy is admitted, excluding any area of the reflector or refractor shaded by the receiver and its supports, and excluding gaps between reflector segments within a collector module. **E 772**, E44

area of influence of a well, α (L²)—area surrounding a well within

which the piezometric surface has been lowered when pumping has produced the maximum steady rate of flow. **D 653**, D18

area of interest—the specific portion of the object image on the radiograph that is to be evaluated. **E 1316**, E07

area ratio of a sampling spoon, sampler, or sampling tube, A_r (D)—the area ratio is an indication of the volume of soil displaced by the sampling spoon (tube), calculated as follows:

$$A_r = [(D_e^2 - D_i^2)/D_i^2] \times 100$$

where:

D_e = maximum external diameter of the sampling spoon, and

D_i = minimum internal diameter of the sampling spoon at the cutting edge. **D 653**, D18

area reflector, n —reflector subtending a relatively large solid angle at the observer's eye, so that the observer can clearly distinguish its size and shape. **E 284**, E12

area samples—air samples that are collected at various stationary sites, but not for a person; area samples are therefore to be distinguished from personal air samples. **E 631**, E06

arithmetic mean sound pressure level—of *several related sound pressure levels measured at different positions or different times, or both, in a specified frequency band*, the sum of the sound pressure levels divided by the number of levels. **C 634**, E33

arm—cantilever part of tool to hold the clinching mechanism, permitting placement of fastener away from edges of the work. **F 592**, F16

armhole, n —in *garment construction*, the area of a garment through which the arm passes or into which a sleeve is fitted. (Compare **armscye**.) **D 123**, D13

armhole, n —the area of a garment through which the arm passes or into which a sleeve is fitted. **D 5219**, D13

armhole, n —in *garment construction*, the area of a garment through which the arm passes or into which a sleeve is fitted. (See **armscye**.) **F 1494**, F23

arm length, n —in *body measurements*, with the arm bent at 90 degrees and the clenched fist placed on the hip, the distance from the shoulder joint along the outside of the arm over the elbow to the greatest prominence on the outside of the wrist. **D 123**, D13

arm length, n —the distance from the top of the shoulder joint along the outside of the arm over the elbow to the prominent wrist bone, taken with the arm bent (1.57 rad or 90°) and the hand placed on the hip. **D 5219**, D13

armor—the artificial surfacing of bed, banks, shore, or embankment to resist erosion or scour. **D 653**, D18

armoring—the formation of a resistant layer of relatively large particles by erosion of the finer particles. **D 4410**, D19

armor stone—(generally one ton to three tons in weight) stone resulting from blasting, cutting, or by other methods to obtain rock heavy enough to require handling two individual pieces by mechanical means. **D 653**, D18

armpit, n —in *anatomy*, the hollow under the junction of the arm and the shoulder. **D 123**, D13

armpit, n —the hollow under the junction of the arm and the shoulder. **D 5219**, D13

armscye, n —in *garment construction*, the opening in a garment for the attachment of a fitted sleeve. (Compare **armhole**.) **D 123**, D13

armscye, n —the opening in a garment for the attachment of a fitted sleeve. **D 5219**, D13

armscye, n —in *garment construction*, the opening in a garment for the attachment of a fitted sleeve. (See **armhole**.) **F 1494**, F23

armscye circumference, n —in *body measurements*, with the arm hanging down, the distance from the shoulder joint through the front-break point, the armpit, the back-break point and to the starting point. **D 123**, D13

armscye girth, n —the circumference taken from the shoulder joint

through the front break-point, the armpit, the back break-point and to the starting point, taken with the arms down. **D 5219, D13**

aroma, n—perception resulting from stimulating the olfactory receptors; in a broader sense, the term is sometimes used to refer to the combination of sensations resulting from stimulation of the entire nasal cavity. **E 253, E18**

aromatic oil, n—a hydrocarbon process oil containing at least 35 %, by mass, of aromatic hydrocarbons. **D 1566, D11**

aromatic polyester, n—a polyester derived from monomers in which all the hydroxyl and carboxyl groups are linked directly to aromatic nuclei. **D 883, D20**

aromatics—that class of organic compounds which behave chemically like benzene. They are cyclic unsaturated organic compounds that can sustain an induced electronic ring current due to delocalization of electrons around the ring. **D 2864, D27**

array—an arrangement of devices connected to common feed, product and reject headers; that is, a 2:1 array. **D 6161, D19**

array, n—a group of two or more AE sensors positioned on a structure for the purposes of detecting and locating sources. The sources would normally be within the array. **E 1316, E07**

array processor—a special purpose logical processing device that performs extremely fast mathematical operation on digital arrays. **E 1316, E07**

arrest—that portion of a cooling curve in which temperature is invariant with time (for example, thermal or eutectic arrest). **E 7, E04**

arrester, n—a term for an air cleaning device. **D 1356, D22**

arrest mark—See **dwelt mark**. **C 162, C14**

arrhenius equation—a mathematical relationship between the specific reaction rate and the temperature given as

$$k = Ae^{-E/RT}$$

where:

k is the reaction rate constant, A is the frequency factor, E is the energy of activation, R is the gas constant, and T is the absolute temperature. **E 1142, E37**

Arrhenius equation— $k = Ze^{-E/RT}$ where k is the specific reaction rate constant in reciprocal minutes for first order, Z is the pre-exponential factor in reciprocal minutes, E is the Arrhenius activation energy in J/mol, R is the gas constant, 8.32 J/mol K, and T is the temperature in kelvin. **E 1445, E27**

Arrhenius plot, n—a graph of the logarithm of thermal life as a function of the reciprocal of absolute temperature. **D 1711, D09**

arris—the junction of two planes of the same stone forming an external edge. **C 119, C18**

arris (of an arch), n—the outside corner or angle formed by the meeting of a wall surface with the curved surface of an arch. **C 11, C11**

arrival time interval (Δt_{ij})—see **interval, arrival time**. **E 1316, E07**

arsenic—an industrial term for an oxide of arsenic. **C 162, C14**

artifact—a false microstructural feature that is not an actual characteristic of the specimen; it may be present as a result of improper or inadequate preparation, handling methods, or optical conditions for viewing. **E 7, E04**

artifact, n—an object (as a tool, ornament, or element of a structure) showing human workmanship or modification. **E 631, E06**

artifact—spurious indication on a radiograph arising from, but not limited to, faulty manufacture, storage, handling, exposure, or processing. **E 1316, E07**

artifact, n—a change in a PDD tracing that is not attributable to a review test question, stimulus, recovery, or homeostasis. **E 2035, E52**

artificial aging, n—aging above room temperature. **A 941, A01**

artificial climbing wall (ACW), n—a wall exclusively designed and built for climbing. The ACWs may be designed and used for lead climbing, top rope climbing or bouldering. The ACWs may be transportable or permanent. **F 1773, F08**

artificial daylight, n—an artificial light that has a spectral power distribution approximating that of a phase of natural daylight. **E 284, E12**

artificial discontinuity—reference discontinuities, such as holes, grooves, or notches that are introduced into a reference standard to provide accurately reproducible sensitivity levels for electromagnetic test equipment. **E 1316, E07**

artificial ground freezing—the process of freezing earth materials by artificial means. **D 7099, D18**

artificially soiled cloth (sometimes called “standard soiled cloth”)—cloth soiled with one or more materials and used to evaluate the effectiveness of detergents or washing equipment. **D 459, D12**

artificial weathering—exposure to laboratory conditions, which may be cyclic, involving changes in temperature, relative humidity, radiant energy, and any other elements found in the atmosphere in various geographical areas. **D 883, D20**

artificial weathering, v—exposure to conditions, which may be cyclic, involving temperature, relative humidity, radiant energy, and/or any other conditions or pollutants found in the atmosphere in various geographical areas, which may accelerate changes in properties of materials over those of natural weather conditions. **D 1079, D08**

artificial weathering—exposure to laboratory conditions, which may be cyclic, involving temperature, relative humidity, radiant energy, or any other conditions or pollutants found in the atmosphere in various geographical areas; or both. **F 412, F17**

artificial weathering, n—exposure of a material to laboratory conditions that simulate outdoor weathering. **F 1251, F04**

as-analyzed moisture—synonym for **as-determined moisture**. **D 121, D05**

asbestiform—having an inherent fine-textured morphology, resulting from unequal relative development of the principal crystal axes in a silicate mineral, that predetermines subdivision into strong flexible fibers having microscopic to submicroscopic thickness and a high length to width ratio when the mineral is subjected to comminution. **D 2946, C17**

asbestos—see **industrial talc and industrial talc, nonasbestos type**. **D 16, D01**

asbestos—a group of natural fibrous impure silicate materials. **D 1079, D08**

asbestos, n—the generic term for naturally occurring inorganic hydrated silicates, occurring in layered structures composed of chains of silicon and oxygen tetrahedra, that can subdivide into flexible fibers. **D 2946, C17**

asbestos—six naturally occurring fibrous minerals found in certain types of rock formations. Of the six, the minerals chrysotile, amosite, and crocidolite have been most commonly used in building products. When mined and processed, asbestos is typically separated into very thin fibers. Because asbestos is strong, incombustible, and corrosion-resistant, asbestos was used in many commercial products beginning early in this century and peaking in the period from World War II into the 1970s. When inhaled in sufficient quantities, asbestos fibers can cause serious health problems. **D 5681, D34**

asbestosboard nail—galvanized, hardened-steel, helically threaded, 1¼ and 1½ by 0.083-in. screw nails with flat, slightly countersunk, ¾-in. head and blunt diamond point. **F 547, F16**

asbestos-containing material (ACM)—any material or product that contains more than 1 % asbestos. **D 5681, D34**

asbestos fiber, n—acicular silicate mineral, with a structure based upon silicon-oxygen tetrahedra, that fits the definition of a fiber, and is composed of single crystals in predominantly parallel orientation. **D 2946, C17**

asbestos-shingle nail—See **shingle nail**. **F 547, F16**

as-built, adj—pertaining to the as-constructed, **as-fabricated**, **as-manufactured**, or **as-furnished** state of a finished product relating to size, shape, materials, and finish regardless of drawings or specifications. **E 631, E06**

as-built drawing—See **drawing**. **E 631, E06**

as-built drawing—See **drawing**.

E 1480, E06

A-scan—a method of data presentation utilizing a horizontal base line that indicates distance, or time, and a vertical deflection from the base line which indicates amplitude.

E 1316, E07

ascender, *n*—a stroke that rises above the height of the body of the letter formation.

E 2195, E30

ascender, *n*—a device used to ascend a rope.

F 1773, F08

ascending fork point—in a ternary phase diagram, the configuration at the convergence of the three bivariant curves upon each of the four phases associated in Class II univariant equilibrium; for example, the union of two ascending liquidus surface valleys to form one ascending liquidus surface valley.

E 7, E04

ascent rate, *n*—the speed of vertical movement toward the water's surface.

F 1549, F32

ASCII—American Standard Code for Information Interchange.

F 1457, F05

as-determined basis—See *as-determined basis* under **reporting bases**.

D 121, D05

as-determined basis, *n*—analytical data obtained from an analysis sample after conditioning and preparation which represent the numerical values obtained at the particular moisture and ash level in the sample at the time of analysis.

D 5681, D34

as-determined basis—analytical data obtained from the analysis sample after conditioning and preparation in accordance with Method E 829. As-determined basis data represent the numerical values obtained at the particular moisture and ash level in the sample at the time of analysis.

E 856, D34

aseptic—as applied to aseptic packaging, synonymous with commercially sterile.

F 17, F02

aseptic, *adj*—sterile, free from viable microbiological contamination.

F 1494, F23

aseptic packaging—filling of a commercially sterilized product into presterilized containers, followed by hermetic sealing in a commercially sterile atmosphere.

F 17, F02

aseptic packaging—See Terminology F 17.

F 1327, F02

aseptic sampling—sampling process in which no extraneous microorganisms or substances are introduced into the sample or its original bulk material as a result of the sampling system and activity.

E 1705, E48

as-fabricated, *adj*—(1) of a milled metal product, pertaining to the surface appearance and texture or temper produced by the original forming process. (2) of a formed metal product, pertaining to the surface appearance of the product to removal of disfigurations caused by the forming process.

E 631, E06

ash, *n*—in carbon and graphite technology, the residue remaining after oxidation of a carbon or graphite.

C 709, D02

ash, *n*—inorganic residue remaining after ignition of combustible substances, determined by definite prescribed methods.

D 121, D05

ash, *n*—the residue from incineration of a material under specified conditions.

D 1566, D11

ash—the inorganic residue obtained by igniting a specimen of pulp, paper, or other cellulosic material in such a way that all combustible and volatile compounds are removed. Conditions of ashing should be specified.

D 1695, D01

ash, *n*—in wood, pulp, or paper; general term, the residue after the ignition of a specimen of wood, pulp, or paper at a specified temperature for a specified time so as to remove combustible and volatile components.

D 1968, D06

ash—residue after the combustion of a substance under specified conditions.

D 2652, D28

ash, *n*—in carbon and graphite technology, the residue remaining after oxidation of a carbon or graphite.

D 4175, D02

ash—the residue remaining after ignition of refuse-derived fuel determined by definite prescribed methods. The ash may not be identical in composition or quantity with the inorganic substances present in the refuse-derived fuel before ignition.

E 856, D34

ash—the residual inorganic matter obtained on ignition of a sample in air at a specified temperature.

E 1547, E15

ash—inorganic residue remaining after combustion, determined by definite prescribed methods.

E 1705, E48

ash content—the percentage by dry weight of material remaining after an oven dry organic soil or peat is burned by a prescribed method.

D 653, D18

ash content, *n*—the residue from an engine coolant concentrate, antirust, or engine coolant that remains after evaporation, charring, and ignition at strong heat.

D 4725, D15

ash content of paper, *n*—the solid residue remaining after combustion of the paper under specified conditions, expressed as a percentage of the dry mass of the original paper.

D 1711, D09

ash fusion temperature—melting point of ash, usually expressed in degrees Fahrenheit. Variations include oxidizing atmosphere or reducing atmosphere, initial softening, or final fluid temperature. Some specifications include two intermediate points between initial softening and final fluid.

E 1705, E48

ashlar—(1) a squared block of building stone; (2) a masonry of such stones; (3) a thin-dressed rectangle of stone for facing of walls (often called ashlar veneer).

C 119, C18

ash *n*—the residue remaining after ignition of a substance as determined by definite prescribed methods.

D 5681, D34

ash pond, *n*—an impoundment or surface impoundment used to store or dispose of ash primarily from the combustion of coal. See **surface impoundment**.

E 2201, E50

as is basis—as received.

D 2652, D28

askarel—a generic term for a group of synthetic, fire-resistant, chlorinated aromatic hydrocarbons used as electrical insulating liquids. They have a property under arcing conditions such that any gases produced will consist predominantly of noncombustible hydrogen chloride with lesser amounts of combustible gases.

D 2864, D27

as-mined coal—for the purpose of Test Method D 4749, same as **run-of-mine (ROM) coal**.

D 121, D05

aspect, *n*—of serviceability, a broad component of serviceability, comprising several related topics of serviceability.

E 631, E06

aspect ratio—the length-to-width ratio of a microstructural feature in a two-dimensional plane.

E 7, E04

aspect ratio—a ratio of long side to short side of glass plate.

E 631, E06

aspect ratio, *n*—in a bar code symbol, the ratio of bar height to symbol length.

F 1294, F05

aspecular, *adj*—away from the specular direction.

E 284, E12

aspecular angle, *n*—viewing angle measured from the specular direction, in the illuminator plane unless otherwise specified.

E 284, E12

aspergillus niger—one of the most common mold growths found on vegetable tanning vats and on leather, usually greenish or blackish in color.

D 1517, D31

asperity, *n*—in tribology, a protuberance in the small-scale topographical irregularities of a solid surface.

G 40, G02

asphalt, *n*—a dark brown to black cementitious material in which the predominating constituents are bitumens which occur in nature or are obtained in petroleum processing.

D 8, D04

asphalt—a dark brown to black cementitious material in which the predominating constituents are bitumens that occur in nature or are obtained in petroleum processing.

D 1079, D08

asphalt, *n*—a dark brown-to-black cementitious material in which the predominating constituents are bitumens.

D 4175, D02

asphalt, air blown—an asphalt produced by blowing air through molten asphalt at an elevated temperature to raise its softening point and modify other properties.

D 1079, D08

asphalt cement, *n*—a fluxed or unfluxed asphalt specially prepared as to quality and consistency for direct use in the manufacture of bituminous pavements, and having a penetration at 25°C (77°F) of between 5 and 300, under a load of 100 g applied for 5 s.

D 8, D04

- asphaltene**—a high molecular weight hydrocarbon fraction precipitated from asphalt by a designated paraffinic naphtha solvent at a specified temperature and solvent-asphalt ratio. **D 1079**, D08
- asphaltenes, *n***—the high molecular weight hydrocarbon fraction precipitated from asphalt by a designated paraffinic naphtha solvent at a specified solvent-asphalt ratio. **D 8**, D04
- asphaltenes, *n***—wax-free organic material insoluble in heptane, but soluble in hot toluene (benzene). **D 4175**, D02
- asphalt felt**—an asphalt-saturated felt. **D 1079**, D08
- asphalt felt, breather type, *n***—an underlayment sheet material saturated with asphalt, which allows the transmission of water vapor. **C 1154**, C17
- asphalt felt, breather type**—an underlayment sheet material, saturated with asphalt, which allows the transmission of water vapor. **D 2946**, C17
- asphaltite**—a natural asphalt found below ground level. **D 1079**, D08
- asphalt mastic**—a mixture of asphaltic material and graded mineral aggregate that can be poured when heated, but requires mechanical manipulation to apply. **D 1079**, D08
- asphalt rock (rock asphalt), *n***—a naturally occurring rock formation, usually limestone or sandstone, impregnated throughout its mass with a minor amount of bitumen. **D 8**, D04
- asphalt rock (rock asphalt)**—a naturally occurring rock formation, usually limestone or sandstone, containing throughout its mass a minor amount of asphalt. **D 1079**, D08
- asphalt roof cement, *n***—a trowelable mixture of asphalt, solvents, mineral stabilizers, fillers or fibers, or both. See Specifications D 2822 and D 4586. **D 1079**, D08
- asphalt roof cement, *n***—see *flashing cement*. **D 1079**, D08
- asphalt-rubber, *n***—a blend of asphalt cement, reclaimed tire rubber, and certain additives in which the rubber component is at least 15 % by weight of the total blend and has reacted in the hot asphalt cement sufficiently to cause swelling of the rubber particles. **D 8**, D04
- asphalt-shingle nail**—See *roofing nail*. **F 547**, F16
- asphalt, steam blown**—an asphalt produced by blowing steam through molten asphalt to modify its properties. **D 1079**, D08
- asphalt tile, *n***—an obsolete floor surfacing unit composed of asphalt or hydrocarbon resins, or both, crysotile asbestos fibers, mineral fillers, and pigments. **F 141**, F06
- aspirated psychrometer**—See *psychrometer*. **D 1356**, D22
- aspirating nozzle**—see *siphon nozzle*. **E 1620**, E29
- aspirator, *n***—any apparatus such as a squeeze bulb, fan, pump, or venturi that produces a movement of a fluid by suction. **D 1356**, D22
- aspirator valve**—a valve in which the propellant vapor is aspirated through an orifice in the valve chamber, causing a suction effect that draws the product up the dip tube and into the valve. **D 3064**, D10
- a-spot**—the areas of two mating contacts through which current flows from one contact to the other. **B 542**, B02
- as-received basis**—See *as-received basis* under *reportingbases*. **D 121**, D05
- as-received basis, *n***—test data calculated to the condition of the sample as it arrived in the laboratory and before any laboratory processing or conditioning. **D 5681**, D34
- as-received basis**—the test data calculated to the moisture condition of the sample as it arrived in the laboratory and before any laboratory processing or conditioning. **E 856**, D34
- assay, *n***—analysis of a mixture to determine the presence or concentration of a particular component. **F 1494**, F23
- assay fluid, *n***—a sterile liquid used to wash the test specimen surface to determine microbiological penetration. **F 1494**, F23
- assembled button, *n***—a decorative button consisting of combinations of similar or dissimilar materials, such as plastic and metal or metal and metal, which have been joined together by such processes as gluing, swedging or metal stamping. **D 5497**, D13
- assembly, *n***—see *adhesive assembly*. **D 907**, D14
- assembly, *n***—a unit or structure composed of a combination of materials or products, or both. **E 176**, E05
- assembly, *n***—a unit or structure composed of a combination of materials or products, or both. **E 176**, E05
- assembly**—a number of parts or subassemblies joined together. **E 2135**, E53
- assembly, *n***—a complete implant configuration (not including spine, pelvis, ribs, or substitute material) as intended for surgical use. **F 1582**, F04
- assembly adhesive, *n***—an adhesive that can be used for bonding parts together, such as in the manufacture of a boat, airplane, furniture, and the like. **D 907**, D14
- assembly (for adhesives), *n***—a group of materials or parts, including adhesive, placed together for bonding or which has been bonded together. **D 907**, D14
- assembly lot**—assembly lot may consist of a combination of different products. As long as the products that make up the assembly are in accordance with *lot*, the quantity of assemblies determine the sample size. Example: ten assemblies consisting of a bolt, nut, and a washer would have a lot size of ten if the bolts, nuts, and washers meet the criteria of *lot*. However, if any of the components in the assembly are not in accordance with *lot* then the ten assemblies will have to be separated into lots that meet all the requirements of *lot*. **F 1789**, F16
- assembly time, *n***—the time interval between applying the adhesive on the substrate and the application of pressure, or heat, or both, to the assembly.
- closed assembly time, *n***—the time interval between the closing together of substrates after the adhesive has been applied, and the application of pressure, heat, or both, to the assembly.
- open assembly time, *n***—the time interval between applying adhesive on the substrates and closing them together before bonding. **D 907**, D14
- assessment monitoring**—an investigative monitoring program that is initiated after the presence of a contaminant in ground water has been detected. The objective of this program is to determine the concentration of constituents that have contaminated the ground water and to quantify the rate and extent of migration of these constituents. **D 653**, D18
- assessment, of a laboratory**—the activity of evaluating a laboratory's compliance with accreditation criteria. **E 1187**, E36
- assessor, *n***—a general term for any individual responding to stimuli in a sensory test. **E 253**, E18
- assessor, of a laboratory**—an individual who carries out some or all functions related to laboratory assessment, (ISO Guide 2, *B*). **E 1187**, E36
- asset**—(1) anything owned having monetary value; (2) tangible or intangible items owned by an entity that have probable economic benefits that can be obtained or controlled by the entity. **E 2135**, E53
- as-shipped or produced coal**—for the purpose of Test Method D 4749, raw or prepared coal in any state or condition at which it leaves the mine property or loading facility. **D 121**, D05
- assignable area**—See *space categories*. **E 631**, E06
- assignable area**—See *space categories*. **E 1480**, E06
- assignable cause, *n***—a factor which contributes to variation and is feasible to detect and identify. **D 123**, D13
- assignable cause, *n***—a factor that contributes to variation and that is feasible to detect and identify. **D 4175**, D02
- assignable cause, *n***—a factor that contributes to variation, and which is feasible to detect and identify.
- NOTE—Many factors will contribute to variation but it may not be feasible (economically or otherwise) to identify some of them. **E 456**, E11
- assigned test value (ATV), *n***—the average of all results obtained in

assigned test value (ATV), *n*

the several laboratories which are considered acceptable based on the reproducibility of the test method. **D 4175, D02**

assisted hand signature, *n*—a signature executed by a writer while the writer's hand, arm, or writing instrument is steadied or stabilized by another. **E 2195, E30**

associated gas—natural gas, also known as gas-cap gas or dome gas, that overlies and is in immediate contact, but not in solution, with crude oil in a reservoir. **D 4150, D03**

associate instructor—an individual who possesses the qualifications and education/training of a course instructor/coordinator, but, in a specific course, assumes a supportive or assisting role to the course instructor/coordinator. This individual may substitute for the course instructor/coordinator in case of necessity or, in other courses, serves as a course instructor/coordinator. **F 1177, F30**

associative evidence, *n*—that evidence which tends to link a person, place, or thing with another person, place, or thing. **E 1732, E30**

associative thickener, *n*—water-soluble polymers containing hydrophobic groups that are capable of nonspecific hydrophobic association similar to surfactants that elevate viscosity presumably by association between thickener particles or thickener and dispersed particles that may be present in the aqueous system such as latex particles rather than through high molecular weight or chain stiffness of the thickener molecules themselves. **D 16, D01**

assurance of conformity—procedure resulting in a statement giving confidence that a product, process or service fulfills specified requirements, (ISO Guide 2). **E 1187, E36**

A-stage, *n*—an early stage in the preparation of certain thermosetting resins in which the material is still soluble in certain liquids, and may be liquid or capable of becoming liquid upon heating. **D 883, D20**

A-stage, *n*—an early stage in the preparation of certain thermosetting resins, in which the material is still soluble in certain liquids, and fusible. **D 907, D14**

A-stage—an early stage in the reaction of certain thermosetting resins in which the material is fusible and still soluble in certain liquids. (Syn. *resol.*) (Compare with **B-stage** and **C-stage**.) **E 631, E06**

A-stage—an early stage in the reaction of certain thermosetting resins in which the material is fusible and still soluble in certain liquids. (Syn. *resol.*) (Compare with **B-stage** and **C-stage**.) **E 1749, E06**

asterism—a lengthening of diffraction spots usually in the radial direction. **E 7, E04**

astigmatism—a defect in a lens or optical system which causes rays in one plane parallel to the optical axis to focus at a distance different from those in the plane at right angles to it. **E 7, E04**

ASTM cement types—Portland cements meeting the requirements of Specifications C 150. Cement types have slightly different formulations that result in various characteristics which address different construction conditions and different physical and chemical environments. They are as follows:

Type I (Portland)—a general-purpose construction cement with no special properties.

Type II (Portland)—a construction cement that is moderately resistant to sulfates and generates a lower head of hydration at a slower rate than Type I

Type III (Portland: high early strength)—a construction cement that produces a high early strength. This cement reduces the curing time required when used in cold environments, and produces a higher head of hydration than Type I.

Type IV (Portland)—a construction cement that produces a low head of hydration (lower than Types I and II) and develops strength at a slower rate.

Type V (Portland)—a construction cement that is a high sulfate resistant formulation. Used when there is severe sulfate action from soils and ground water. **D 653, D18**

ASTM color, *n*—the name of an empirical scale of expressing of the color of a petroleum liquid darker than Saybolt color based on a scale of 0.5 (lightest) to 8.0 Dil (darkest) and determined by Test Method D 1500. **D 4175, D02**

ASTM grain size number—See **grain size**. **E 7, E04**

ASTM supercharge octane number of a fuel below 100, *n*—the whole number nearest the percentage by volume of *isooctane* (equals 100) in a blend with *n*-heptane (equals 0) that matches the knock characteristics of the fuel when compared by this test method. **D 4175, D02**

ASTM supercharge rating of a fuel above 100, *n*—the amount of tetraethyllead (TEL) in *isooctane*, expressed in millilitres per U.S. gallon. **D 4175, D02**

astringency, *n*—the complex of sensations due to shrinking, drawing, or puckering of the epithelium as a result of exposure to substances such as alums or tannins. **E 253, E18**

as-welded condition—a condition created as a result of forming annealed sheet or plate into tubular form and welding without subsequent heat treatment or cold work. **B 846, B05**

asymmetrical—this refers to a snowboard shape that does not have a longitudinal line of symmetry. Heel-side and toe-side sidecuts shaped and offset differently from each other; they are not mirror images of each other. This typically requires that a different snowboard be utilized for regular-foot (left foot forward) and goofy-foot (right foot forward) snowboard binding mounting positions. **F 1107, F27**

asymmetrical arc current, *n*—the total arc current produced during closure; it includes a direct component and a symmetrical component, *A*. **F 819, F18**

asymmetrical offset, *O_s, O_h*—the distance along the longitudinal axis that each side of an asymmetrical shape is offset from the other side. Offset may be different at the shoulder and heel. **F 1107, F27**

asymmetric membrane—membrane which has a change in pore structure. See **anisotropic membranes**. **D 6161, D19**

asymmetry potential—the potential across a glass pH electrode membrane when the inside and outside of the membrane are in contact with solutions of identical pH. This term has also been used to define the observed potential differences between identical electrode pairs placed in identical solutions. **D 4127, D19**

asynchronous, *adj*—a data transmission in which the time between transmitted characters can vary, it is controlled by start and stop codes at the beginning and end of data sets. (See **synchronous**.) **F 1457, F05**

ATD—see **anti-telescoping device**. **D 6161, D19**

athermal—not isothermal, with changing rather than constant temperature conditions. **E 7, E04**

at-line analysis—analytical procedure performed in a process environment using manually entered samples. **D 4790, D16**

at-line instrument—instrument requiring operator interaction to sample gas directly from the pipeline. **D 4150, D03**

at-line measurements, *n*—measurement where the sample is removed, isolated from, and analyzed in close proximity to the process stream. **E 2363, E55**

atmosphere, *n*—the gaseous envelope which surrounds the earth and includes ambient air, indoor air, and workplace air. See also **air at normal conditions**.

*synthetic atmosphere, *n**—a specific gaseous mass containing any number of constituents and in any proportion produced for a special purpose. **D 1356, D22**

atmosphere for testing, *n*—air at ambient conditions of relative humidity and temperature in which tests or experiments are conducted. (See also **standard atmosphere for testing**.) **D 123, D13**

atmosphere for testing, *n*—air at ambient conditions of relative humidity and temperature in which tests or experiments are conducted. (See also **standard atmosphere for testing**.) **D4920, D13**

atmosphere for testing geosynthetics, *n*—air maintained at a relative humidity between 50 to 70 % and a temperature of 21 ± 2°C (70° ± 4°F). **D 4439, D35**

atmosphere for testing textiles, *n*—for glass, air maintained at a relative humidity of at least 48 % and no greater than 67 % and at

- a temperature of at least 20°C (68°F) and no greater than 25°C (77°F). **D 123, D13**
- atmosphere for testing textiles, *n***—for glass, air maintained at a relative humidity of at least 48 % and no greater than 67 %, and at a temperature of at least 20°C (68°F) and no greater than 25°C (77°F). **D 7018, D13**
- atmosphere, standard**—air maintained at a specified temperature, relative humidity, and standard atmospheric pressure. **E 41, G03**
- atmosphere (standard)**—the pressure exerted by a mercury column 760 mm in height at 0°C under standard acceleration of gravity; equivalent to 101 325 Pa. **E 1316, E07**
- atmospheric pressure**—the pressure due to the weight of the atmosphere. It is the pressure indicated by a barometer that registers actual atmospheric pressure which is not corrected to sea level equivalence. Standard atmospheric pressure is a pressure of 76 cm Hg (101325 Pa) having a density of 13.5951 g/cm³, under standard gravity of 980.665 cm/s². **E 41, G03**
- atmospheric pressure**—the pressure of the atmosphere at a specified place and time. **E 1316, E07**
- atomic absorption**—the absorption of radiant energy by ground state atoms. Substances when dispersed as an atomic vapor will absorb characteristic radiations identical to those which the same substances can emit. This property is the basis for analysis by atomic absorption spectroscopy. **D 2864, D27**
- atomic absorption**—absorption of radiant energy by groundstate atoms. **E 631, E06**
- atomic absorption**—absorption of radiant energy by ground-state atoms. **E 1605, E06**
- atomic emission spectrometry (AES), *n***—pertaining to emission spectrometry in the ultraviolet, visible, or infrared wavelength regions of the electromagnetic spectrum. **E 135, E01**
- atomic mass unit (amu)**—the unit of measure of the mass of a particle (atom, molecule, ion, and so forth), defined as 1/12 of the mass of carbon-12. The numerical value of the mass of a particle in terms of amu is identical with the older atomic weight. **E 1316, E07**
- atomic replica**—See **replica**. **E 7, E04**
- atomic scattering factor**—the ratio of the amplitude of the wave scattered by an atom to that scattered by a single electron. Symbol = *f*. **E 7, E04**
- atomic weight**—the relative mass of an atom based on a scale in which a specific carbon atom (carbon 12) is assigned a mass value of 12. **D 6161, D19**
- atomization, *n***—the dispersion of a molten metal into particles by a rapidly moving gas or liquid stream or by mechanical means. **B 243, B09**
- atomization, *n***—the separation process of liquid into small particles. **D 6655, D10**
- atomization, *n***—the process of atomizing. **E 1620, E29**
- atomize, *v***—to transform bulk liquid or slurry into particles. **E 1620, E29**
- atomized metal powder, *n***—metal powder produced by the dispersion of a molten metal by a rapidly moving gas, or liquid stream, or by mechanical dispersion. **B 243, B09**
- atomizer, *n***—a device for atomizing. **E 1620, E29**
- atom line, *n***—a spectral line resulting from radiation emitted during electron transition as an excited atom returns to a lower energy level. **E 135, E01**
- ATP**—adenosine triphosphate. **D 6161, D19**
- atraumatic**—teeth that would interdigitate except for being spaced apart a predesigned distance so they will not stress, crush, or otherwise traumatize the tissue being grasped. **F 1638, F04**
- attached cushion, *n***—for pile yarn floor covering, a material, bonded to the backing fabric side of a pile yarn floor covering to provide additional dimensional stability, thickness, and padding. **D 123, D13**
- attached cushion, *n***—for pile yarn floor covering, a material, bonded to the backing fabric side of a pile yarn floor covering to provide additional dimensional stability, thickness, and padding. **D 5684, D13**
- attached dwelling, *n***—two or more dwelling units, each with an independent means of entry and means of egress, that are connected to each other at a common wall, but not by a common floor/ceiling. **E 2151, E06**
- attached upholstery fabric, *n***—the exterior fabric covering secured to a furniture unit by the furniture manufacturer or custom upholsterer. (See **furniture coverings**) **D 123, D13**
- attached upholstery fabric, *n***—the exterior fabric covering secured to a furniture unit by the furniture manufacturer or custom upholsterer. (See **furniture coverings**.) **D 7023, D13**
- attachment**—structural element (fixture) external to the surface of the base material, and which transmits loads to the anchor. **E 2265, E06**
- attachment area, *n***—portion of the needle where the attachment of the suture takes place. For example, eyed, drilled, and channel. **F 1840, F04**
- attachment hub**—a device featuring an industry-standard square drive, that supports and powers ancillary devices such as a vegetable slicer or chopping attachment. **F 1827, F26**
- attachment points, *n***—points where alternate pairs of coil loops are joined around the circumference creating the concertina effect. **F 1379, F14**
- attapulgite clay**—a chain-lattice clay mineral. The term also applies to a group of clay materials that are lightweight, tough, matted, and fibrous. **D 653, D18**
- attenuated total reflection (ATR)**—reflection that occurs when an absorbing coupling mechanism acts in the process of total internal reflection to make the reflectance less than unity. **E 131, E13**
- attenuation**—reduction of amplitude with time or distance. **D 653, D18**
- attenuation, *n***—the decrease in AE amplitude per unit distance, normally expressed in dB per unit length. **E 1316, E07**
- attenuation**—a factor that describes the decrease in ultrasound intensity with distance. Normally expressed in decibel per unit length. **E 1316, E07**
- NOTE**—The attenuation parameter is sometimes expressed in nepers (Np) per unit length. The value in decibels (dB) is 8.68 times the value in nepers. If the loss over a path is 1 Np, then the amplitude has fallen to 1/e of its initial value ($e = 2.7183\dots$). (E 664) **E 1316, E07**
- attenuation coefficient**—for a parallel beam of specified particles or radiation, the quantity μ in the expression $\mu\Delta x$ for the fraction removed in passing through a thin layer Δx of a substance in the limit as Δx approaches zero, where Δx is measured in the direction of the beam. **E 673, E42**
- attenuation coefficient**—related to the rate of change in the intensity of a beam of radiation as it passes through matter. (See **linear and mass attenuation coefficient**.) **E 1316, E07**
- attenuation cross section**—the probability, expressed in barns, that a neutron will be totally absorbed by the atomic nucleus. **E 1316, E07**
- attenuation index, κ** —a measure of the absorption of radiant energy by an absorbing material. κ is related to the absorption coefficient by: $n\kappa = \alpha c_o / 4\pi v$, where c_o = the speed of light in vacuo, v = the frequency of radiant energy, and n = the refractive index of the absorbing medium. **E 131, E13**
- attenuation period, *n***—in cavitation and liquid impingement erosion, a less-preferred term for **deceleration period**. **G 40, G02**
- attenuator**—a device for altering the amplitude of an ultrasonic indication in known increments, usually decibels. **E 1316, E07**
- attic, *n***—an accessible enclosed space in a building immediately below the roof and wholly or partly within the roof framing. **E 176, E05**
- attic**—See **building space**. **E 631, E06**
- attic, *n***—an accessible enclosed space immediately below the roof and wholly or partly within the roof framing. **E 631, E06**

attitude, *n*

attitude, *n*—a predisposition to respond in a characteristic way toward a class of objects, concepts, or stimuli. E 253, E18

attitude scale, *n*—a means for eliciting indications of the attitudes or opinions held, usually on a measuring system using marks or value designations. E 253, E18

attractant—an agent that increases the attentive frequency of an organism. E 609, E35

attractant—a material that attracts specific pests. E 1519, E35

attraction—a response towards or to facilitate contact with a material or condition. E 943, E47

attribute, *n*—a specific characteristic of a thing. (See **attribute data**.) D 123, D13

attribute, *n*—a quality of samples or a population. D 5681, D34

attribute, *n*—a perceived characteristic. E 253, E18

attribute data, *n*—observed values or determinations which indicate the presence or absence of specific characteristics. D 123, D13

attribute data, *n*—observed values or determinations which indicate the presence or absence of specific characteristics. E 456, E11

attribute data, *n*—observed values or determinations which indicate the presence or absence of specific characteristics. F 1773, F08

attributes, method of, *n*—measurement of quality by the method of attributes consists of noting the presence (or absence) of some characteristic or attribute in each of the units in the group under consideration, and counting how many units do (or do not) possess the quality attribute, or how many such events occur in the unit, group, or area. E 456, E11

attributes of color—(1) for the object mode of appearance, hue, lightness, and saturation. In the Munsell system, Munsell Hue, Munsell Value, and Munsell Chroma.

(2) for the illuminant or aperture mode, hue, brightness, and saturation. E 284, E12

attrital coal—See **attrital coal** under **coal**. D 121, D05

A-tuft, *n*—a single-pass process for aligning hook free fibers on the Fibroliner FL-101. D 123, D13

A-tuft, *n*—a single-pass process for aligning hook free fibers on the Fibroliner FL-101. D 7139, D13

ATV—in statistics, abbreviation for assigned test value. D 4175, D02

audible leak indicator—an accessory to a leak detector which converts the output signal to an audible note whose frequency is a function of the leakage rate. E 1316, E07

audition, *n*—the sense of hearing. E 253, E18

Auger:

analysis volume—see **volume** under **analysis**.

chemical effects—AES, see **chemical**.

chemical shift—AES, see **chemical**.

current—the electron current due to the emission of Auger electrons.

electron—an electron emitted as the result of an Auger process.

electron yield—the probability that an atom with a vacancy in a particular inner shell will relax by an Auger process.

line scan—a plot of Auger signal strength as a function of displacement along a designated line on the specimen surface. Normally, the abscissa is the line along which the signal is measured and the ordinate is directly proportional to signal strength.

line shape—the energy distribution in an Auger spectrum for a particular Auger transition.

map—two dimensional image of the specimen surface showing the location of emission of Auger electrons from a particular element. A map is normally produced by rastering the incident electron beam over the specimen surface and simultaneously recording the Auger signal strength for a particular transition as a function of position.

matrix effects—see **matrix effects**, Auger.

parameter—XPS, the kinetic energy of the sharpest Auger peak in the spectrum minus the kinetic energy of the most intense photoelectron peak from the same element; the energy of the

ionizing photons must be specified.

peak energy for $dN(E)/dE$, $N(E)$ —the designation of the energy of the Auger electron distribution. In dN/dE spectra, peak energies should be measured at the most negative excursions of the Auger features. In $N(E)$ spectra, peak energies are measured at peak maxima. (Peak energies in dN/dE spectra are not the same as those in $N(E)$ spectra.)

process—the relaxation, by electron emission, of an atom with a vacancy in an inner electron shell.

signal strengths—AES, XPS, in dN/dE spectra, signal strengths are measured as the peak-to-peak heights of the Auger features. In $N(E)$ spectra, signal strengths are measured as the heights of the Auger peaks above background. In $I(E)$, signal strengths are measured as the areas under the electron energy distribution, $N(E)$.

spectrum, $dN(E)/dE$, $N(E)$, $I(E)$ —AES, the display of Auger signal strength as a function of electron energy. Auger spectra from solids may be measured as the first derivative of the electron energy distribution and may be designated by dN/dE . The Auger electron energy distribution may be designated as $N(E)$. With certain type analyzers (for example, the CMA) the displays are $dEN(E)/dE$ and $EN(E)$. The area under Auger peaks may be designated as $I(E)$ with background subtraction method, and integration limits specified.

transition—transitions involved in electron emission by an Auger process are designated by indicating the electron shells. The first letter designates the shell containing the initial vacancy and the last two letters designate the shells containing electron vacancies created by Auger emission (for example, KLL, and LMN). When a bonding electron is involved the letter V is used (for example, LMV and KVV). When a particular subshell involved is known this can also be indicated (for example, KL_1L_2). Coupling terms may also be added where known ($L_3M_{4,5}M_{4,5};^1D$). More complicated Auger processes (such as, multiple initial ionizations and additional electronic excitations) can be designated by separating the initial and final states by a dash (for example, LL-VV and K-VVV). When an Auger process involves an electron from the same principal shell as the initial vacancy (for example, L_1L_2M) it is referred to as a Coster-Kronig transition. If both electrons are from the same principal shell as the initial vacancy (for example, $M_1M_2M_3$) it is called a super Coster-Kronig transition.

transition rate—the probability per unit time for two bound electrons to undergo energy state transitions such that one will fill an initial core hole vacancy and the other will go to a final state in the positive energy continuum. E 673, E42

auger increment, *n*—the retained portion of one extraction operation of the auger. D 121, D05

ausferrite, *n*—a cast iron matrix microstructure, produced by a controlled thermal process, which consists of predominantly acicular ferrite and high carbon austenite. (See **austempered ductile iron**.) A 644, A04

austempered ductile iron, *n*—a ductile cast iron that has been produced by a controlled thermal process which results in a matrix microstructure consisting of predominately acicular ferrite and high carbon austenite. A 644, A04

austempering, *n*—heat treatment involving quenching a steel object from a temperature above the transformation range in a medium maintained at a temperature above the martensite range sufficiently fast to avoid the formation of high temperature transformation products, and then holding it at that temperature until transformation is complete. A 941, A01

austenite—a face-centered cubic solid solution of carbon or other elements in gamma iron. E 7, E04

austenite, *n*—the highest temperature phase in Ni-Ti shape memory alloys. F 2005, F04

austenite finish temperature (A_f), *n*—the temperature at which the

martensite to austenite transformation is completed on heating in a single-stage transformation or the temperature at which the R-phase to austenite transformation is completed on heating in a two-stage transformation. **F 2005, F04**

austenite grain size—the grain size which exists or existed in austenite at a given temperature. See Test Methods E 112. **E 7, E04**

austenite peak temperature (A_p), *n*—the temperature of the endothermic peak position on the differential scanning calorimeter (DSC) curve upon heating for the martensite to austenite transformation in a single-stage transformation or the temperature of the endothermic peak position on the DSC curve upon heating for the R-phase to austenite transformation in a two-stage transformation. **F 2005, F04**

austenite start temperature (A_s), *n*—the temperature at which the martensite to austenite transformation begins on heating in a single-stage transformation or the temperature at which the R-phase to austenite transformation begins on heating in a two-stage transformation. **F 2005, F04**

austenitic stainless alloys—steel alloys that contain a minimum of 15 % chromium and from a residual to 20 % nickel. Some alloys may contain as much as 18 % manganese. The metal is predominantly face centered cubic in structure and hardenable only by cold working. Essentially nonmagnetic in its wire form, it may become slightly magnetic from cold working. Austenitic stainless steels can be grouped into three categories: 300 series alloy, Cr-Ni-Mn alloys, and Cr-Ni-Mo-Ti. **F 1789, F16**

austenitize, *vt*—to convert the matrix of a ferrous alloy to austenite by heating above the transformation temperature. **A 644, A04**

austenitizing, *n*—forming austenite by heating a steel object above the transformation range. **A 941, A01**

authority—the person (organization) authorizing the testing. **C 717, C24**

authority—body that has legal powers and rights, (EN 45020). **E 1187, E36**

authority having jurisdiction, *n*—the organization, office, or individual responsible for approving any equipment, installation, or procedure. **F 1494, F23**

autocatalytic plating—deposition of a metal coating by a controlled chemical reduction, catalyzed by the metal or alloy being deposited. **B 374, B08**

autoclave—a closed vessel for producing an environment of fluid pressure, with or without heat, to an enclosed object undergoing a chemical reaction or other operation. **E 631, E06**

autoclave—a closed vessel for producing an environment of fluid pressure, with or without heat, to an enclosed object undergoing a chemical reaction or other operation. **E 1749, E06**

autoclave cure—means for accelerating the cure reaction at elevated temperature and pressure in saturated steam, where reactive siliceous material has been incorporated into the cementitious matrix, such that a hydrothermal reaction takes place between the cement and silica yielding calcium silicate. **D 2946, C17**

autoclaved products, *n*—those that have been treated in a saturated steam atmosphere at between 620 and 1517 kPa (90 and 220 psi,) for at least 6 h, and that contain portland cement as defined in Specifications C 150 and C 618 together with silica in the ratio of 3:2 that can react to form calcium silicate reaction products. **C 1154, C17**

autoclaved products, *n*—for asbestos-cement, those that have been treated in a saturated steam atmosphere at between 689 and 1517 MPa (100 and 200 psi) for at least 8 h, and that contain portland cement as defined in Specifications C 150 and C 618, together with silica in the ratio of 3:2, that can react to form calcium silicate reaction products. **D 2946, C17**

autoclave molding—a process where the lay-up or other assembly is covered by a vacuum bag and placed in an autoclave capable of providing heat and pressure for curing the part. **E 631, E06**

autoclave molding—a process where the lay-up or other assembly is covered by a vacuum bag and placed in an autoclave capable of providing heat and pressure for curing the part. **E 1749, E06**

autoclave (rubber), *n*—a pressure vessel used for vulcanizing rubber products by means of steam under pressure. **D 1566, D11**

autodeposition, *n*—a single-step immersion metal finishing process in which an organic coating is applied by means of unique surface chemical reactions carried out in an aqueous latex dispersion, also referred to as chemiphoresis. Components within the bath give rise to chemical reactions that slightly solubilize the metallic surface and lead to destabilization, deposition, and coalescence of the dispersed latex particles at that surface. **D 16, D01**

autodiscrimination, *n*—the ability of a symbol reader to automatically recognize and decode multiple symbologies. **F 1294, F05**

auto-fill—a water height sensor device that activates a fresh water fill solenoid if the water level in the cooking vessel drops below predetermined height. **F 1827, F26**

autograft, *n*—a graft of tissue derived from another site in or on the body of the organism receiving it. **F 2312, F04**

autographic dilatometer—a dilatometer that automatically records instantaneous and continuous changes in dimensions and some other controlled variable such as temperature or time. **E 7, E04**

autographic pyrometer—See **pyrometer**. **E 7, E04**

autohesion, *n*—adhesion developed by interdiffusion of the molecules of two surfaces of the same material and consequent obliteration of the interface between them. (Sometimes called “autoadhesion.”) (Compare **blocking**.) **D 907, D14**

autoignition, *n*—the ignition of a material caused by the application of pressure, heat, or radiation, rather than by an external ignition source, such as a spark, flame, or incandescent surface. **D 4175, D02**

autoignition, *n*—the ignition of a material commonly in air as the result of heat liberation due to an exothermic oxidation reaction in the absence of an external ignition source such as a spark or flame. **E 1445, E27**

autoignition temperature, *n*—the minimum temperature at which autoignition occurs. **D 4175, D02**

autoignition temperature, *n*—the minimum temperature at which autoignition occurs under the specified conditions of test. **E 1445, E27**

autoignition temperature (AIT), *n*—the lowest temperature at which a material will spontaneously ignite in an oxygen-enriched atmosphere under specific test conditions. **G 126, G04**

autologous, *adj*—cells, tissues, and organs in which the donor and recipient is the same individual. Synonyms: *autogenous*, *autograft*, or *autotransfusion*, a *self-to-self graft*. **F 2312, F04**

automatic density control, *n*—the process whereby the toner layer deposited on the substrate is controlled by the printer. (See **ADC**.) **F 1457, F05**

automatic image analysis—the separation and quantitative evaluation of an image into its elements with or without operator interaction. It includes the enhancement, detection, and quantification of the features contained in an image through the use of optical, geometrical, and stereological parameters and a computer program. Image analysis data output can provide individual measurements on each separate feature (feature specific) or totals for all features of a particular type in the field (field specific). **E 7, E04**

automatic image analyzer—a device which can be programmed to detect and measure features of interest in an image. It may include accessories such as automatic focus and an automatic traversing stage to permit unattended operation. **E 7, E04**

automatic lock slider, *n*—in *zippers*, a slider that provides involuntary, positive locking action on the chain when the pull is released. **D 123, D13**

automatic lock slider, *n*—a slider that provides involuntary, positive locking action on the chain when the pull is released. **D 2050, D13**

automatic machine (or conveyor)—a machine for mechanically processing parts through treatment cycles, such as cleaning, anodizing, or plating. **B 374, B08**

automatic plating: (1) full—plating in which the cathodes are

automatic plating: (1) full

- automatically conveyed through successive cleaning and plating tanks. (2) *semi*—plating in which the cathodes are conveyed automatically through only one plating tank. **B 374, B08**
- automatic trip**—machine-activated tool mechanism providing continuous cycling while trip is in contact with the work. **F 592, F16**
- automobile leather*—see **upholstery leather**. **D 1517, D31**
- automotive, adj**—descriptive of equipment associated with self-propelled machinery, usually vehicles driven by internal combustion engines. **D 4175, D02**
- automotive wheel bearing grease, n**—a lubricating grease specifically formulated to lubricate automotive wheel bearings at relatively high grease temperatures and bearing speeds. **D 4175, D02**
- auto nail**—nail of ¼ to 5/4-in. length, sheared off bright, smooth, knurled, or helically fluted, regular-stock-steel or stiff-stock, 0.032-in. (21-gage) to 0.162-in. (8-gage) wire and driven subsequently by the same machine at a rapid rate. This nail has a sheared-bevel or sheared-square point. **F 547, F16**
- autopsy**—the dissection of a membrane module or element to investigate causes of unsatisfactory performance. **D 6161, D19**
- autoradiograph**—the image of an object containing a radioelement obtained, on a recording medium, by means of its own radiation. **E 1316, E07**
- auxiliary anode**—a supplementary anode employed during electrodeposition to achieve a desired thickness distribution of the deposit. **B 374, B08**
- auxiliary cathode**—See **thief**. **B 374, B08**
- auxiliary electrode*—See **counter electrode**. **G 15, G01**
- auxiliary energy subsystem**—in solar energy applications, equipment using nonsolar energy sources to supplement or backup the output provided by a solar energy system. **E 772, E44**
- auxiliary solvent**—liquid material used in addition to the primary solvent. It is generally used to replace part of the primary solvent to produce a specific effect, or, as a matter of economics. **D 3064, D10**
- auxiliary variable, n**—the secondary characteristic or measurement of interest. **D 5681, D34**
- availability**—the on-stream time or rated operating capacity of a water treatment system. **D 6161, D19**
- available chlorine in cleaning compounds**—the oxidizing power of chlorine present as hypochlorite or other oxidizing chlorine moieties in solution, expressed as chlorine of equivalent weight 35.45, and as determined by thiosulfate titration. **D 459, D12**
- available lime index**—those constituents of a lime which enter into a desired reaction under the conditions of a specific method or process. **C 51, C07**
- available program, n**—a qualifying term which can be used in the definition of recyclable, reusable, refillable, returnable, compostable, establishing limits; for example, by population and access within geographic area. **D 996, D10**
- a-value**—membrane water permeability coefficient. The coefficient is defined as the amount of water produced per unit area of membrane per unit of net driving pressure (NDP); units of measurement are $\text{m}^3/\text{hr}/\text{m}^2/\text{kPa}$. **D 6161, D19**
- aventurine**—glass containing colored, opaque spangles of nonglassy material. **C 162, C14**
- average, n**—for *series of observations*, the total divided by the number of observations. **D 123, D13**
- average background reflectance**—expressed as a percent, is the simple arithmetic average of the background reflection readings from at least five different points on a sheet. **F 149, F05**
- average breaking stress (ABS)**—the average maximum principal tensile stress (MPTS) at failure, representative of the glass under test. The ABS is dependent on a number of factors including geometry, time history of load, surface condition, etc. Glasses with residual surface stresses, such as heat-strengthened or fully tempered, must have their residual stresses added to the state of stress at the specified load. As defined for use in the standard, the ABS is for annealed glass. **E 631, E06**
- average coating thickness**—determined as either the value obtained by analytical methods or the mean value of a specified number of local thickness measurements that are evenly distributed over the significant surface. **F 1789, F16**
- average coefficient of cubical expansion**—average change in unit volume of a substance per unit change in temperature over a specified range of temperature. **E 7, E04**
- average coefficient of linear expansion**—average change in unit length of a body per unit change in temperature over a specified range of temperature. **E 7, E04**
- average coefficient of thermal expansion**—general term. (See also **average coefficient of cubical expansion** and **average coefficient of linear expansion**.) **E 7, E04**
- average diameter, n**—the average of the maximum and minimum outside the diameters, as determined at any one section of the pipe or tube. **B 899, B02**
- average diameter (for round tubes only)**—the average of the maximum and minimum outside diameters or the maximum and minimum inside diameters, whichever is applicable, as determined at any one cross section of the tube. **B 846, B05**
- average discharge (corona) current (I_d), n**—the sum of the absolute magnitudes of the individual discharges during a certain time interval divided by that time interval. **D 1711, D09**
- average dynamic air permeability (ADAP), n**—for *inflatable restraints*, the average of all of DAP measurements within a specified range of pressure differentials. **D 6799, D13**
- average edge**—an imaginary line bisecting the irregularities of the character edge. **F 149, F05**
- average emission function decay length**—the negative reciprocal slope of the logarithm of a specified exponential approximation to the emission depth distribution function over a specified range of depths, as determined by a straightline fit to the emission depth distribution function plotted on a logarithmic scale versus depth on a linear scale. **E 673, E42**
- average erosion rate, n**—a less preferred term for **cumulative erosion rate**. **G 40, G02**
- average fiber diameter, n**—in *wool and other animal fibers*, the average width of a group of fibers when measured on a projected image. **D 123, D13**
- average fiber diameter, n**—in *wool and other animal fibers*, the average width of a group of fibers when measured on a projected image. **D 4845, D13**
- average grade*—See **grade**. **E 631, E06**
- average grade*—the arithmetic mean of the elevations of various ground surfaces within a stated area of **building construction**. **E 631, E06**
- average grain diameter*—See **grain size**. **E 7, E04**
- average injection velocity, n**—the mean value of the velocity of the molten plastic flow front within a cavity during the injection time that is calculated from the shot volume and injection time. **D 883, D20**
- average interstitial velocity**—see **velocity, average interstitial**. **D 653, D18**
- average outgoing quality (AOQ)**—the average percent defective of outgoing product including all accepted lots or batches, after any defective units found in them are replaced by acceptable units, plus all lots or batches which are not accepted after such lots or batches have been effectively 100 % inspected and all defective units replaced by acceptable units. **E 456, E11**
- average outgoing quality limit (AOQL)**—the maximum of the AOQs for all possible incoming percentages defective for the process, for a given acceptance sampling plan. **E 456, E11**
- average particle size**—a single value representing the entire particle-size distribution. **C 242, C21**
- average quality protection**—a type of protection in which there is prescribed some chosen value of average percent defective in the product after inspection (average outgoing quality limit (AOQL), that shall not be exceeded in the long run no matter what may be

- the level of percent defective in the product submitted to the inspector. **E 456**, E11
- average regression rate** (*apparent burn rate*), *n*—the average rate at which the burning/solid-metal interface advances along the test sample length. **G 126**, G04
- average run length (ARL)**—(1) *sample sense*, *n*—the average number of times that a process will have been sampled and evaluated before a shift in process level is signaled, and (2) *unit sense*, *n*—the average number of units that will have been produced before a shift in level is signaled. **E 456**, E11
- average signal level**, *n*—the rectified, time averaged AE logarithmic signal, measured on the AE amplitude logarithmic scale and reported in dB_{ac} units (where 0 dB_{ac} refers to 1 μV at the preamplifier input). **E 1316**, E07
- average sound pressure level**—of several related sound pressure levels measured at different positions or different times, or both, in a specified frequency band, ten times the common logarithm of the arithmetic mean of the squared pressure ratios from which the individual levels were derived. **C 634**, E33
- average standard deviation**, \bar{s} , *n*—arithmetic average of sample standard deviations. **E 456**, E11
- average tire tread depth [L]**, *n*—the average of all tire groove (void) depth measurements. **F 538**, F09
- aversion**, *n*—feeling of dislike provoking avoidance of a stimulus. **E 253**, E18
- aviation gasoline**, *n*—gasoline possessing specific properties suitable for fueling aircraft powered by reciprocating spark ignition engines. **D 4175**, D02
- avicide**—a chemical used to kill, control, or cause other adverse effects on birds. **E 609**, E35
- avoidance**—a response away from or to limit contact with a material or condition. **E 943**, E47
- avulsion**—a sudden, natural change of a stream channel, so that the water flows elsewhere than in its previous course. **D 4410**, D19
- awkward hand**, *n*—see **unaccustomed hand**. **E 2195**, E30
- AWWA**—American Water Works Association. **D 6161**, D19
- AWWARF**—American Water Works Association Research Foundation. **D 6161**, D19
- axial ratio**—the ratio of the length of one axis to that of another (for example, *c/a*) or the continued ratio of three axes (for example, *a:b:c*). **E 7**, E04
- axial strain**, *n*—linear strain in a plane parallel to the longitudinal axis of the specimen. **E 6**, E28
- axillary temperature**, *t_{ba}*, *n*—temperature at the apex of either axilla (armpit) as measured by a *contact thermometer*. **E 344**, E20
- axis (crystal)**—the edge of the unit cell of a space lattice. Any one axis of any one lattice is defined, in length and direction, with respect to the other axes of that lattice. **E 7**, E04
- axis, optic**—the direction, or directions in an anisotropic crystal along which light is not doubly refracted. **E 175**, E41
- axis, optical**—the line formed by the coinciding principal axes of a series of optical elements comprising an optical system. It is the line passing through the centers of curvature of the optical surfaces. **E 175**, E41
- axle**, *n*—the axis oriented transversely to the nominal direction of vehicle motion, and extending the full width of the vehicle, about which the wheels(s) at both ends rotate. **E 867**, E17
- axle efficiency [nd]**, *n*—in a vehicle, the ratio of the sum of the wheel torques at the driven wheels to the product of driveshaft torque and axle ratio. **F 538**, F09
- axle-group load [lb (kg)]**, *n*—the sum of all tire loads on a group of adjacent axles a portion of the gross vehicle weight. **E 867**, E17
- axle load [lb (kg)]**, *n*—the sum of all tire loads of the wheels on an axle; a portion of the gross-vehicle weight. **E 867**, E17
- azeotrope**—constant boiling mixture, for ethanol-water, the azeotrope of 95.6 % ethanol and 4.4 % water (both percentages by volume) boils at one atmosphere pressure. **E 1705**, E48
- azeotropic distillation**—the use of an organic solvent to create a new constant boiling point mixture, a method used to produce anhydrous ethanol from the ethanol water azeotrope. **E 1705**, E48
- azimuthal angle, η**, *n*—angle between the plane containing the axis of the illuminator (or the path of illumination) and the specimen normal and the plane containing the axis of the receiver (or the path of reception) and the specimen normal. The origin and direction of measure of the angle should be specified when required. **E 284**, E12
- azimuthal viewing**, *n*—deprecated term; do not use. Replace *azimuthal* by *annular* or *circumferential*. **E 284**, E12
- azimuth angle, n**—an angle of a plane to the horizon measured clockwise to the object. **G 113**, G03
- azlon**—a manufactured fiber in which the fiber-forming substance is composed of any regenerated naturally occurring proteins. **D 123**, D13

B

- b**—length of cantilevered shear wall, in metres (feet). **E 631, E06**
- b**—depth of diaphragm, in. (or mm) **E 631, E06**
- Δ_b —bending deflection of diaphragm, in. (or mm) **E 631, E06**
- Babo's law**—the vapor pressure over a liquid solvent is lowered approximately in proportion to the quantity of a nonvolatile solute dissolved in the liquid. **E 7, E04**
- back**—the side reverse to the face of a panel, or the poorer side of a panel in any grade of plywood calling for a face and back. **D 1038, D07**
- back**—a crop with the head trimmed off behind the horn holes. **D 1517, D31**
- back bedding, n*—See **bedding**. **C 717, C24**
- back bedding*—See **windows and doors**. **E 631, E06**
- back breakpoint, n**—*in anatomy*, the location on the back of the body where the arm separates from the body. **D 123, D13**
- back-break point, n**—the location on the back of the body where the arm separates from the body. **D 5219, D13**
- back coating, n**—*in textile floor covering*, an adhesive compound applied for such purpose as locking pile yarn tufts into a carpet backing, bonding a secondary backing to a primary backing, or increasing fabric body or stiffness and increasing dimensional stability. **D 123, D13**
- back coating, n**—*in textile floor covering*, an adhesive compound applied for such purpose as locking pile yarn tufts into a carpet backing, bonding a secondary backing to a primary backing, increasing fabric body or stiffness and increasing dimensional stability. **D 5684, D13**
- back coating, n**—*in textile floor covering*, an adhesive compound applied for such purpose as locking pile yarn tufts into a carpet backing, bonding a secondary backing to a primary backing, or increasing fabric body or stiffness and increasing dimensional stability. **D 7023, D13**
- backdrafting, n**—the reversal of the normal (upward) direction of air flow in a vent for a vented combustion appliance (boiler, fireplace, furnace, or water heater), when the vented appliance is operating. **D 1356, D22**
- backed exposure, n**—a technique of weathering in which the test specimens being exposed are mounted onto a solid backing material, of sufficient strength to hold the specimen. When the specimen and the backing are in direct contact the backing material must be of a type that will not contaminate the specimen. When two materials are intimately joined together to form one composite, the materials below the top surface are not considered as a backing. **G 113, G03**
- back emf (electromotive force)**—the potential set up in an electrolytic cell that opposes the flow of current, caused by such factors as concentration polarization and electrode films. See **emf (electromotive force)**. **B 374, B08**
- back emission**—the electrical breakdown of air due to excessive charge build-up in the porcelain enamel powder film during powder application. This is due to the self-limiting characteristic of electrostatic powders. **C 286, B08**
- backer material, n**—a compressible material that is placed in joints or cracks before applying sealant to prevent bonding of the sealant on the bottom of the joint, control sealant depth, and prevent sagging of the sealant. **D 5535, D04**
- backer printing**—printing on the reverse side of the sheet. For OCR forms, the paper should have sufficient opacity so that printing on the back can't be seen on the front by the optical scanner. **F 149, F05**
- backer strip**—water-repellent strip of asphalt-coated felt applied behind each joint where the vertical edges of two shingles meet. **D 2946, C17**
- backer strips, n**—*in shingles*, water-repellent strips of asphalt-coated felt applied behind each joint where the vertical edges of two shingles meet. **C 1154, C17**
- back-face strain, n**—the strain as measured with a strain gage mounted longitudinally on the compressive surface of the specimen, opposite the crack or notch mouth (often this is the top surface of the specimen as tested). **C 1145, C28**
- backfill**—all the material used to fill the trench from bedding to finished surface. **C 896, C04**
- backfill**—all material used to fill the trench from bedding to finished surface. **F 412, F17**
- backfill, final**—material used to fill the trench from initial backfill to finished surface. **C 896, C04**
- backfill, final**—material used to fill the trench from initial backfill to finished surface. **F 412, F17**
- backfill, initial**—material used to fill the trench from top of bedding to a designated height over the pipe. **C 896, C04**
- backfill, initial**—material used to fill the trench from top of bedding to a designated height over the pipe. **F 412, F17**
- backfill, unconsolidated**—non-compacted material in place in the trench. **C 896, C04**
- backfill, unconsolidated**—noncompacted material in place in trench. **F 412, F17**
- backflush**—temporary reversal of the permeate or retentate flow. **D 6161, D19**
- back flushing, n**—a process by which liquid is forced in the reverse direction to the flow direction. **D 4439, D35**
- background**—apparent absorption caused by anything other than the substance for which the analysis is being made. **E 131, E13**
- background:**
- inelastic*—*ISS*, the response of the energy filtering and detection system to probe ions that have undergone inelastic scattering events at the specimen surface.
 - instrumental*—*ISS*, the response of the energy filtering and detection system to events other than those induced by bombardment of the specimen surface by a beam of probe ions.
 - secondary ion*—*ISS*, the response of the energy filtering and detection system to secondary ions produced by bombardment of the target material with probe ions.
 - signal*—*for a specific measurement*, any signal present at a particular position due to processes or sources other than those of primary interest. **E 673, E42**
- background**—the surface of the test part against which the indication is viewed. It may be the natural surface of the test part or the developer coating on the surface. **E 1316, E07**
- background**—in magnetic particle examination, the appearance of the surface of the test part against which indications are viewed. **E 1316, E07**
- background**—the reflectance of the receptor virgin surface. **F 221, F05**
- background,, n**—a measure of the reflectance or density of the unimaged portion of a thermal paper; typically measured using a densitometer, reflectometer, or opacimeter. **F 1623, F05**
- background blackening**—a continuous, slowly varying blackening of photographic film which has been exposed to diffracted X-rays, on which the blackening due to diffracted spots or lines is superimposed. **E 7, E04**
- background noise**—noise from all sources unrelated to a particular sound that is the object of interest. Background noise may include airborne, structureborne, and instrument noise. **C 634, E33**
- background potential**—applies only to charged area development process, see **charged area development**. See **residual potential**. **F 335, F05**
- background potential*—see **residual potential**. **F 335, F05**
- background radiation**—all radiation received by the infrared sensing device that was not emitted by the specified area of the surface being examined. **E 1316, E07**
- background reflectance**—a measurement of the brightness of paper referring to the amount of light reflected back from the paper at a

- particular point when that point is flooded with light, as compared with the known value representing absolute white (such as BaSO_4). **F 149, F05**
- background signal**—in leak testing, the steady or fluctuating output signal of the leak detector caused by the presence of residual tracer gas or other substance to which the detecting element responds. **E 1316, E07**
- background, target**—that portion of the background which is confined to the field of view. **E 1316, E07**
- backing, n**—for *pile yarn floor covering*, all materials in a pile yarn floor covering other than pile yarn. **D 123, D13**
- backing, n**—in *pile yarn floor covering*, all materials in a pile floor covering other than the pile yarn. **D 5684, D13**
- backing board, n**—a board with the same dimensions as the specimen and used to back the specimen so as to represent end-use conditions. **E 176, E05**
- backing board, n**—a noncombustible insulating board, mounted behind the specimen during actual testing to satisfy the theoretical analysis assumption of no heat loss through the specimen. It shall be roughly 25 ± 5 mm thick with a density no greater than 200 ± 50 kg/m³. **E 176, E05**
- backing fabric, n**—in *textiles*, a fabric into which a pile yarn is inserted, or a reinforcing layer which is adhered to the reverse side of a fabric. **D 123, D13**
- backing fabric, n**—in *textile conservation*, a support textile fabric located behind the textile artifact. **D 123, D13**
- backing fabric, n**—in *textiles*, a fabric into which a pile yarn is inserted; or a reinforcing layer which is adhered to the reverse side of a fabric. **D 5684, D13**
- backing film**—a film used as auxiliary support for the thin replica or specimen-supporting film. **E 7, E04**
- backing pump**—Same as **fore pump**. **E 1316, E07**
- backing space**—the space between a backing pump (fore pump) and the associated diffusion pump (or other type of pump requiring a fore pump). (See also **ballast**.) **E 1316, E07**
- backing space technique**—a method of testing for leaks in which the leak detector is connected to the backing space to take advantage of the compression of gas that occurs between the vacuum system and the backing pump, due to the action of the diffusion pump (or other type of pump of high speed relative to its backing pump). **E 1316, E07**
- back ionization**—see **back emission**. **C 286, B08**
- back joint**—a vertical mortar joint, parallel to the vertical substrate, between a chemical-resistant construction unit and a substrate or another chemical-resistant construction unit. **C 904, C03**
- backnailing**—the practice of blind-nailing roofing felts to a substrate in addition to hot-mopping to prevent slippage. **D 1079, D08**
- backpack grouting**—the filling with grout of the annular space between a permanent tunnel lining and the surrounding formation. **D 653, D18**
- back-packing**—any material (usually granular) that is used to fill the empty space between the lagging and the rock surface. (ISRM) **D 653, D18**
- backpart molding**—a preparatory shaping operation to heel seat prior to lasting, usually performed on the thermoplastic counters where backpart components are heated on a metal heel form and molded into the backpart heel shape combining counter, upper and lining before the actual lasting operation is performed on the backpart of the shoe. **F 869, F08**
- back pressure**—Same as **forepressure**. **E 1316, E07**
- back pressure test**—Same as **pressure-evacuation test**. **E 1316, E07**
- backpulse**—pumping treated water with or without added chemicals in the reversed direction from the lumen to the feed side of the membrane (inside-out). **D 6161, D19**
- back putty, n**—See **bedding**. **C 717, C24**
- back putty**—See **windows and doors**. **E 631, E06**
- back reflection**—the diffraction of X-rays at a Bragg angle approaching 90°. **E 7, E04**
- back reflection**—indication of the echo from the far boundary of the material under test. **E 1316, E07**
- backrinding, n**—a molding defect in which the rubber adjacent to the spew line shrinks below the surface of the molded product, with the spew line often being ragged and torn. **D 1566, D11**
- backscattered electrons**—AES, electrons originating in the incident beam which are emitted after interaction with the target. By convention, electrons with energies greater than 50 eV are considered as backscattered electrons. **E 673, E42**
- back scattered radiation**—radiation which is scattered more than 90° with respect to the incident beam, that is, backward in the general direction of the radiation source. **E 1316, E07**
- backscattering:**
- energy*—EIA, energy of a particle from the analyzing beam after it has undergone a backscattering collision and escaped the specimen.
- factor*—AES, the fractional increase in the Auger current due to backscattered electrons.
- spectrum*—EIA, a plot of backscattering yield (ordinate) versus backscattering energy (abscissa).
- yield*—EIA, the number of particles detected (counts) per unit backscattering energy per incident ion. **E 673, E42**
- backscatter peak**—a peak in the observed photon spectrum (normally below about 0.25 MeV) resulting from large-angle (>110°) Compton scattering of gamma rays from materials near the detector. This peak will not have the same shape as the full-energy peaks (being wider and skewed toward lower energy). **E 170, E10**
- backset**—the liquid portion of the thin stillage that is recycled as part of the process liquid in mash preparation. **E 1705, E48**
- backshelf**—used for counter-height equipment typically located against a wall, but could be freestanding. **F 1827, F26**
- back side, n**—*intextile materials*, the side of the material that faces inward in the completed object. (Ant. **face side**.) **D 123, D13**
- back side, n**—*intextile materials*, the side of the material that faces innermost in the completed product. (Ant. **face side, right side**. Syn. *wrong side*.) **D 4965, D13**
- backside density, n**—the optical density of ink image on topside of a substrate as measured from the backside of the media on which it was printed. **F 1857, F05**
- back surface**—the end of a reference block that is opposite the entry surface. (E 127) **E 1316, E07**
- back titration**—a titration in which an excess of reagent is added to the sample to complex or precipitate the species being determined. The excess reagent is then determined by second titration, usually with the species that was originally in the sample. Back titrations are useful for increasing accuracy in the analysis of very dilute solutions. **D 4127, D19**
- back-up material**—See **sealant backing**. **C 717, C24**
- back waist length, n**—in *body measurements*, the vertical distance along the spine from the cervicale to the waist. **D 123, D13**
- back waist length, n**—in *body measurements*, the vertical distance along the spine from the cervical to the waist. **F 1494, F23**
- back wall**—the wall at the charging end of a melter. **C 162, C14**
- backwash**—reversing the flow of water with/without air either across or through a medium or membrane. Designed to remove the collected foreign material from the bed or membranes. **D 6161, D19**
- back width, n**—in *body measurements*, the distance from back-breakpoint to back-breakpoint. **D 123, D13**
- back width, n**—the horizontal distance across the back from back break-point to back break-point over the shoulder blades, taken with the arms down. **D 5219, D13**
- back wrapping, n**—a deprecated term. See **wrap**. **E 2110, E06**
- bacteria**—any of a class of microscopic single-celled organisms

bacteria

- reproducing by fission or by spores. Characterized by round, rod-like, spiral, or filamentous bodies, often aggregated into colonies or mobile by means of flagella. Widely dispersed in soil, water, organic matter, and the bodies of plants and animals. Either autotrophic (self-sustaining, self-generative), saprophytic (derives nutrition from non-living organic material already present in the environment), or parasitic (deriving nutrition from another living organism). Often symbiotic (advantageous) in man, but sometimes pathogenic. **D 6161, D19**
- bactericide**—agent capable of killing bacteria. **D 6161, D19**
- bacteriophage**—a virus that infects bacteria. **E 1705, E48**
- bacteriophage, n**—a type of virus which infects bacteria. **F 1494, F23**
- bacteriostat**—substance that prevents bacterial growth and metabolism but does not necessarily kill them. **D 6161, D19**
- bacterium (pl. bacteria), n**—a single cell microorganism characterized by the absence of defined intracellular membranes that define all higher life forms. **D 4175, D02**
- BAF (bioaccumulation factor), n**—the quotient obtained by dividing the concentration of a substance in an organism (or specified tissue) by its concentration in a specified exposure medium, for example, air, food, sediment, soil, water, when several media are possible sources (see **bioaccumulation**). **E 943, E47**
- baffle**—a mold part used to close the delivery or baffle hole in a blank mold. **C 162, C14**
- baffle**—a pier, weir, sill, fence, wall, or mound built on the bed of a stream to parry, deflect, check, or regulate the flow or to float on the surface to dampen the wave action. **D 653, D18**
- baffle**—a deflector plate in a vessel that disperses the inlet fluid. **D 6161, D19**
- baffle filters**—a series of vertical baffles designed to capture grease and drain it away to a container. The filters are arranged in a channel or bracket for easy insertion into, and removal from, the hood for cleaning, and are usually constructed of aluminum, steel, or stainless steel and they come in various standard sizes. See **exhaust hood**. **F 1827, F26**
- baffle mark**—a mark or seam on a bottle resulting from a mold joint between blank mold and baffle. **C 162, C14**
- baffle wall**—a wall used to deflect gases or flames in a melter. See **shadow wall**. **C 162, C14**
- bag, n**—a preformed **container** of tubular construction made of flexible material, generally enclosed on all sides except one forming an opening that may or may not be sealed after filling. (See also **pouch**.)
- paper multiwall-sack**—a flexible **container** made of several plies, usually of kraft paper. The various plies may be specially treated, such as waxed paper, glassine, greaseproof, polyethylene, **wet strengthpaper**, or other specialty sheets. The particular nature of the sack depends upon the material to be packed and the type of transportation to be employed.
- bag liner**—See **liner**. **D 996, D10**
- bag, n**—for **sampling**, any quantity of asbestos fiber corresponding to one particular grade that is packed in a suitable container. **D 2946, C17**
- bagasse**—residue remaining after extraction of a sugar-containing juice from plants like sugar cane. **E 1705, E48**
- bag cure, n**—a method of vulcanization in which an inflated flexible bag is used to impart positive internal pressure on the article being vulcanized. **D 1566, D11**
- bagging, n**—any fabric, of any fiber content, used to protect commodities during shipment and/or storage. **D 123, D13**
- bagging, n**—any material, such as fabric or other suitable material used to protect commodities during shipment and/or storage. **D 4850, D13**
- baggy cloth**—See **wavy cloth**. **D 3990, D13**
- baggy selvage**—See **slack selvage**. **D 3990, D13**
- baghouse**—a chamber containing bag filters for the removal of particles from a process exhaust stream. **C 162, C14**
- baghouse, n**—a facility that removes fly ash from the flue gas by the use of fabric filter bags. **E 2201, E50**
- bag leather**—a general term for leathers used in traveling bags and suitcases. It does not include the light leathers employed for women's fancy handbags. The staple material for bag and case leather at present is leather made from the hides of animals of the bovine species, but heavy sealskins and goatskins are also used. **D 1517, D31**
- bag modeling**—a method of molding or laminating which involves the application of fluid pressure, usually by means of air, steam, water or vacuum, to a flexible barrier material which transmits the pressure to the material being molded or bonded. **D 883, D20**
- bag molding, n**—a method of molding or bonding involving the application of fluid pressure, usually by means of air, steam, water, or vacuum, to a flexible cover which, sometimes in conjunction with the rigid die, completely encloses the material to be bonded. **D 907, D14**
- bag molding**—a method of molding or bonding involving the application of fluid pressure, usually by means of air, steam, water, or vacuum, to a flexible cover which, sometimes in conjunction with a rigid die, completely encloses the material to be bonded. (Compare with **vacuum bag molding**.) **E 631, E06**
- bag molding**—a method of molding or bonding involving the application of fluid pressure, usually by means of air, steam, water, or vacuum, to a flexible cover which, sometimes in conjunction with a rigid die, completely encloses the material to be bonded. (Compare with **vacuum bag molding**.) **E 1749, E06**
- bag sampler**—a sampler that utilizes a collapsible bag as the sample collection container. **D 4410, D19**
- bail, n**—in **zippers**, a portion or portions of the slider to which the pull or pulls are attached. **D 123, D13**
- bail, n**—the usually arched handle of a pail or can. **D 996, D10**
- bail, n**—a portion or portions of the slider to which the pull or pulls are attached. (*Syn. lug*.) **D 2050, D13**
- bailer**—a hollow tubular receptacle used to facilitate withdrawal of fluid from a well or borehole. **D 653, D18**
- bail-out bottle, n**—A diver-carried supply of air or mixed gas (as appropriate) sufficient under standard operating conditions to allow the diver to reach the surface or another source of breathing gas, or to be reached by a safety diver. **F 1549, F32**
- bainite—upper, lower, intermediate**—metastable microstructure or microstructures resulting from the transformation of austenite at temperatures between those which produce pearlite and martensite. These structures may be formed on continuous (slow) cooling if the transformation rate of austenite to pearlite is much slower than that of austenite to bainite. Ordinarily, these structures may be formed isothermally at temperatures within the above range by quenching austenite to a desired temperature and holding for a period of time necessary for transformation to occur. If the transformation temperature is just below that at which the finest pearlite is formed, the bainite (upper bainite) has a feathery appearance. If the transformation temperature is just above that at which martensite is produced, the bainite (lower bainite) is acicular, resembling slightly tempered martensite. At the higher resolution of the electron microscope, upper bainite is observed to consist of plates of cementite in a matrix of ferrite. These discontinuous carbide plates tend to have parallel orientation in the direction of the longer dimension of the bainite areas. Lower bainite consists of ferrite needles containing carbide platelets in parallel array cross-striating each needle axis at an angle of about 60°. Intermediate bainite resembles upper bainite; however, the carbides are smaller and more randomly oriented. **E 7, E04**
- bait**—the tool dipped into molten glass to start any drawing operation. **C 162, C14**
- bake-out**—in leak testing, the degassing of a vacuum system by heating during the pumping process. **E 1316, E07**
- baking, n**—heating to a low temperature in order to remove gases. **A 941, A01**
- baking**—heating to a temperature at least 50°F below the tempering

or aging temperature of the metal or alloy to remove hydrogen before embrittlement occurs by the formation of microcracks.

F 2078, F07

baking duration—time measured from when the plated product reaches a specified temperature in the baking furnace or oven until it is removed.

F 1789, F16

baking finish, *n*—a paint or varnish that requires baking at temperatures above 150°F (65°C) for the development of desired properties.

D 16, D01

baking temperature, *n*—a temperature above 150°F (65°C).

D 16, D01

balance—See **windows and doors**.

E 631, E06

balanced construction—See under **construction**.

D 1038, D07

balanced design, *n*—a statistical study where replication in each of the levels of ANOVA is identical.

D 5681, D34

balanced filters (X-rays)—a pair of filters used to eliminate all but a narrow range of wavelengths. The filter materials and thicknesses are chosen so that their absorption edges lie very close together and so that they have the same absorption except for wavelengths lying in the range between their absorption edges. When these filters are used alternately, the difference in effect, if any, is due to X-rays that have wavelengths in this range. Balanced filters thus can be made to serve as a crude monochromator.

E 7, E04

balanced incomplete block design (BIB), *n*—an incomplete block design in which each block contains the same number *k* of different versions from the *t* versions of a single principal factor arranged so that every pair of versions occurs together in the same number, λ , of blocks from the *b* blocks.

E 456, E11

balanced incomplete block design (BIB), *n*—an incomplete block design in which each block contains the same number *k* of different versions from the *t* versions of a single principal factor arranged so that every pair of versions occurs together in the same number, λ , of blocks from the *b* blocks.

E 1325, E11

balanced laminate—any laminate that contains one ply of minus theta orientation with respect to the laminate principal axis for every identical ply with a plus theta orientation.

D 3878, D30

balanced laminate—a composite laminate in which all laminae occur in pairs symmetric about the midplane (but not necessarily adjacent to each other). See **symmetrical laminate**.

E 631, E06

balanced laminate—a composite laminate in which all laminae occur in pairs symmetric about the midplane (but not necessarily adjacent to each other). See **symmetrical laminate**.

E 1749, E06

balancing, *n*—a process to correct for heavy or light areas of a tire and wheel assembly.

F 538, F09

balata, *n*—a hard thermoplastic consisting of approximately equal proportions of trans-polyisoprene and resin, obtained from trees of the *Sapotaceae* family.

D 1566, D11

bald roof—See **smooth-surfaced roof**.

D 1079, D08

bale, *n*—in packaging a shaped unit, bound with cord or metal ties under tension, and containing compressed articles or materials. It may be wrapped.

D 996, D10

bale coating, *n*—a coating applied to surfaces of rubber bales that inhibits adhesion to other surfaces.

D 1566, D11

bale (jute), *n*—a bag, sack, etc., containing packages of yarn.

D 123, D13

baling, *n*—a method of volume reduction whereby tires are compressed into bales.

D 5681, D34

ballast—materials used to provide stability to a buoyant object (such as casing within a borehole filled with water).

D 653, D18

ballast—in leak testing, a backing space large enough to maintain a low forepressure when the fore pump is temporarily stopped.

E 1316, E07

ballast—weight applied to the skirt to improve boom performance.

F 818, F20

ball burnishing—See **barrel burnishing**.

B 374, B08

ball clay—a secondary clay, commonly characterized by the presence of organic matter, high plasticity, high dry strength, long vitrification range, and a light color when fired.

C 242, C21

ball cratering—a method of specimen preparation in which a specimen is polished by a sphere in order to expose compositional changes below the original surface of a specimen with the intent that the depth of these layers can be related to the position on the surface created by the ball.

E 673, E42

ball element—an element used in an impact printing device in which the fully formed characters are located on the outer surface of a sphere-like device. Frequently called *golf-ball element*.

F 909, F05

ball head—spherical head.

F 547, F16

balling up—See **fuzz ball**.

D 3990, D13

ballistic point—bullet-shaped point.

F 547, F16

ball measurement—the line running completely around the foot or last coplanar to the joints of large and small toes.

F 869, F08

ball mill—in *porcelainenamels*, a dense, ceramic-lined rotating cylinder in which ceramic materials are wet or dry ground, generally using pebbles or porcelain balls as grinding media.

C 286, B08

ball mill, *n*—a closed rotating cylinder containing hard balls (or other shaped members) that serves to grind coarse materials to a finer particle size.

D 1566, D11

ball milling—a method of grinding and mixing material, with or without liquid, in a rotating cylinder or conical mill partially filled with grinding media such as balls or pebbles.

C 242, C21

ball or spherical valve, *n*—depending on the design of the pump, it may be used as the upper or lower valve, or both.

D 6655, D10

ball point—spherical point on shank of nail, having a diameter equal to that of shank.

F 547, F16

ball printer—an impact printing device utilizing a ball element. The paper on the carriage remains stationary while the element is positioned and caused to strike the paper to produce characters in their proper positions.

F 909, F05

balsam, Canada—a resin from the balsam fir *Abies balsamea*. Dissolved in xylene, toluene, or benzene it is used as a mountant for permanent microscopical preparations. Its refractive index may vary from 1.530 to 1.545 and its softening point from room temperature to 100°C, these properties varying with age and solvent content. If impure it discolors with age.

E 175, E41

baluster—See **railing systems**.

E 631, E06

baluster, *n*—(baluster bar). Synonym for **picket**.

E 631, E06

baluster, baluster bar, *n*—one of a series of closely spaced, upright, and parallel infill members of a balustrade, located between top rail or handrail and bottom rail or tread or floor beneath balustrade. Synonym for **picket**.

E 1481, E06

baluster casting—an ornamental cast element attached to a baluster. Also, cast element designed to attach baluster to top and bottom rails.

E 1481, E06

baluster (picket), *n*—one of a series of closely-spaced upright members that support the handrail in a railing system.

balustrade—See **railing systems**.

E 631, E06

baluster (picket), *n*—one of a series of closely-spaced upright members that support the handrail in a railing system.

E 1605, E06

baluster railing system—a system consisting of posts, balusters, top rail, and bottom rail.

E 1481, E06

balustrade, *n*—a railing system consisting of a row of pickets capped by a rail or handrail.

E 631, E06

balustrade, *n*—a railing system consisting of a row of balusters capped by a rail or handrail.

E 1481, E06

band—in electron diffraction, a broad intensity maximum with sharp edges.

E 7, E04

band—the light frequency spectrum between two defined limits; also light band.

F 149, F05

band, *n*—a flexible anchor component with a noncircular cross section that connects the bony elements of the spine, pelvis, or ribs to each other or to other implant components using a knot or similar tying mechanism, forming a locked, closed loop.

F 1582, F04

band aid sealant joint, n

band aid sealant joint, n—Use **bridge sealant joint** (preferred term).
C 717, C24

band application—an application of a pesticide to a continuous restricted area such as in or along a crop row rather than over the entire field area.
E 609, E35

band application—an application of a pesticide to a continuous restricted area such as in or along a crop row rather than over the entire field area (see Definitions E 609).
E 1102, E35

banded coal—See **banded coal** under **coal**.
D 121, D05

banded cryogenic fabric—a distinct soil morphology in which soil particles form subhorizontal layers as the result of freezing and thawing.
D 7099, D18

banded structure (banding)—alternate bands parallel with the direction of working resulting from the elongation of segregated areas.
E 7, E04

banding—Use **strapping**.
D 996, D10

banding, n—a non-uniformity of color appearance on a scale much larger than colorant particles, characterized by a band or several nearly parallel indistinct stripes differing slightly in color from the remaining area.
E 284, E12

banding, n—uniform density variations or voids in a given color which appear in the direction that the printhead travels.
F 1857, F05

banding (railing)—a portion of wood or other material extending around one or more edges of a plywood panel.
D 1038, D07

band pass filter—a wave filter having a single transmission band; neither of the cut-off frequencies being zero or infinity.
E 1316, E07

band printer—a type of printer that employs an endless steel band containing fully formed characters. The band transverses the width of the paper form. Hammers strike the back of the form, synchronized in such a way as to produce the desired characters in their proper position.
F 909, F05

band width or span (Δ), n—the temperature difference defined by the equation:

$$\Delta = SB - SR$$

E 344, E20

band width or span (Δ), n—the temperature difference defined by the following equation:

$$\Delta = T^{470} - T^{650}$$

E 344, E20

bandwidth [1/ T], n—the range of frequencies within which certain performance characteristics occur; specific limits normally apply.
F 538, F09

bank—a grouping of devices. See **array, block, train**.
D 6161, D19

bank gravel, n—gravel found in natural deposits, usually more or less intermixed with fine material, such as sand or clay, or combinations thereof; gravelly clay, gravelly sand, clayey gravel, and sandy gravel indicate the varying proportions of the materials in the mixture.
D 8, D04

banking—the alignment of the first graphic shape in a line with respect to the left (right) margin, by certain devices (that is, typewriters, line printers, etc.).
F 149, F05

bank (mill, calender, or spreader), n—a reservoir of material at the opening between rolls (mill or calender), or at the spreader bar.
D 1566, D11

bar, n—solid wrought product that is long in relation to its cross section, is square or rectangular with sharp or rounded corners/edges (excluding plate and flattened wire), or is a regular hexagon or octagon, and in which at least one perpendicular distance between parallel faces is 0.375 in. or greater [over 10.00 mm].

bus bar, n—rigid electric conductor in the form of a bar.

extruded bar, n—bar brought to final dimensions by hot extruding.

rolled bar, n—bar brought to final dimensions by hot rolling.

saw-plate bar, n—bar brought to final thickness by hot or cold rolling and to final width by sawing.
B 881, B07

bar, n—an elongated, forged or rolled metal product with uniform strength, length and section (such as rectangular, square, round, oval or hexagonal).

NOTE—In the following standards the term “bar” has a similar definition, but with greater and more specific detail.
B 899, B02

bar—unit of pressure; 14.50 lbs/in.², 1.020 kg/cm², 0.987 atm, 0.1 MPa.
D 6161, D19

bar, n—a round, square, rectangular, or other polygonal solid member having a length greater than its width or thickness; and usually of rolled, drawn, or extruded metal (if of steel, having dimensions of 0.204 in. (5.2 mm) or more in thickness, and 8.0 in. (20.3 mm) or less in width).
E 631, E06

bar—See **type bar**.
F 909, F05

bar, n—one of two types of elements comprising a bar code symbol. An element of a bar code symbol whose reflectance is less than the Global Threshold.
F 1294, F05

bar—solid rolled or forged section that is long in relationship to its cross-sectional dimensions with a relatively constant cross-section throughout its length. Carbon and alloy steel bars are produced from hot rolled or cast billets, or from blooms rolled single strand into coils.
F 1789, F16

barb, n—*as related to barbed wire*, a short length of wire, with exposed ends cut on a bias to produce sharp points.
A 902, A05

barb, n—*in down*, the primary structure of plumage emanating from a quill point of a down cluster.
D 123, D13

barb, n—*in feathers*, the primary structure of plumage emanating from the quill of a feather.
D 123, D13

barb, n—*in down*, the primary structure of plumage emanating from a quill point of a down cluster.
D 7022, D13

barb, n—*in feathers*, the primary structure of plumage emanating from the quill of a feather.
D 7022, D13

barb—as related to barbed wire— a short length of wire, with exposed ends cut on a bias to produce sharp points.
F 552, F14

barbed—shank provided with repetitive, shallow or deep, symmetrical or nonsymmetrical, cross-wise or oblique, diagonal or perpendicular indentations and ridges, excluding grip marks.
F 547, F16

barbed tape—strip of metal, machined to produce clusters of sharp points.
F 552, F14

barbed tape, n—strip of metal, machined to produce clusters of sharp points.
F 1379, F14

barbed wire, n—a fabricated wire product consisting of two line wires twisted to form a two-wire strand, into which 2-point or 4-point barbs are tightly wrapped and locked into place at specified intervals.
A 902, A05

barbed wire—a fabricated wire product consisting of two line wires twisted to form a two-wire strand, into which 2-point or 4-point barbs are tightly wrapped and locked into place at specific intervals. (*Syn.* barbwire).
F 552, F14

barbed wire arm—a post fitting used to hold barbed wire in place. May be vertical or angled to hold three or more strands of barbed wire, or “V” shaped to hold six or more strands of barbed wire.
F 552, F14

barbed wire arm base—a casting of aluminum, malleable iron, or steel, used in combination with one or two barbed wire extension arms held in place by a bolt and nut.
F 552, F14

barbed wire extension arm—pressed aluminum or pressed galvanized steel used in combination with barbed wire arm base to hold three strands of barbed wire either vertically or angled in or out from the fence line. Also used in pairs in a “V” configuration to hold 6 strands of barbed wire.
F 552, F14

barb length, n—measured from the barb point to the center line of the barb cluster.
F 1379, F14

barb length classification, n—commonly used barbed types describing length and shape; such as long barb, medium barb, and short barb.
F 1379, F14

barb spacing, *n*—the circumferential or linear distance between the center lines of the barb clusters. **F 1379, F14**

bar code—a binary coding system consisting of vertical marks or bars that, when read by an optical scanner, can be converted to machine language. **F 149, F05**

bar code, *n*—an array of parallel rectangular marks and spaces in a predetermined pattern. **F 1294, F05**

bar code density, *n*—the number of characters that can be represented in a lineal inch. (See **symbol density**.) **F 1294, F05**

bar code label, *n*—an adhesive-backed carrier bearing printed bar code information suitable for affixing to an apparatus, equipment, or container surface. **F 1294, F05**

bar code reader—see **bar code scanner**. **F 1294, F05**

bar code scanner, *n*—a device used to identify and decode a bar code symbol. **F 1294, F05**

bar code symbol, *n*—an array of rectangular bars and spaces, arranged in a predetermined pattern, following specific rules that represent elements of data referred to as characters. **F 1294, F05**

bare conductor—a conductor having no nonmetallic covering. **B 354, B01**

barefoot, *adv or adj*—with the feet uncovered or unclothed; without shoes or stockings. **F 1646, F13**

bare soil, *n*—soil or sand not covered by grass, sod, other live ground covers, wood chips, gravel, artificial turf, or similar covering. **E 1605, E06**

bar height, *n*—the dimension of a symbol element perpendicular to its width. **F 1294, F05**

barium sulfate (BaSO₄)—a standard reflecting agent used to calibrate instruments for measuring the whiteness and reflectance of papers. **F 149, F05**

bark—the layer of a tree outside the cambium comprising the inner bark and the outer bark.

inner bark—the layer of living bark (phloem) that separates the outer bark from the cambium and which in the living tree generally is moist and soft.

outer bark—the layer of dead bark outside the inner bark, forming the exterior surface of the tree stem. The outer bark frequently is corky and dry.

bark product—an opening between annual growth rings that contains bark. Bark pockets appear as dark streaks on radial surfaces and as rounded areas on tangential surfaces. **D 9, D07**

barkometer—a hydrometer used for determining the specific gravity of tanning solutions. A specific gravity of 1.000 is equivalent of 0 deg barkometer (Bk), and each additional degree Bk is equivalent to an increase of 0.001 in specific gravity. **D 1517, D31**

bark tannage—leather tanned by use of vegetable tannins found in barks, wood, and other plant derivatives, as distinguished from mineral tannages. **D 1517, D31**

barn—a unit of area used for expressing the area of nuclear cross sections.

$$1 \text{ barn} = 10^{-24} \text{ cm}^2$$

E 1316, E07

barometric efficiency—the ratio of the change in depth to water in a well to the inverse of water-level change in barometric pressure, expressed in length of water. **D 653, D18**

bar printer—an impact printer in which the type slugs are carried on a **type bar**. *Syn.* print bar. **F 909, F05**

barré, *n*—an unintentional, repetitive visual pattern of continuous bars and stripes usually parallel to the filling of woven fabric or to the courses of circular knit fabric. (Compare **warp streaks** and **mixedfilling**, see **filling blend**.) **D 123, D13**

barré, *n*—an unintentional, repetitive visual pattern of continuous bars and stripes usually parallel to the filling of woven fabric or to the courses of circular knit fabric. (Compare **warp streak**, **mixed filling**) **D 3990, D13**

barré, *n*—a defect characterized by bars or streaks, fillingwise in

woven fabrics or coursewise in weft-knit fabrics, caused by uneven tension in knitting, or defective yarn, improper needle action, or other similar factors. **E 284, E12**

bar reflectance (R_b), *n*—the smallest reflectance value in a bar. **F 1294, F05**

barrel—the cylindrical portion of a vitrified clay pipe exclusive of branches, spurs, joints, and handling rings or lugs. **C 896, C04**

barrel, *n*—a bulged cylindrical container of greater length than breadth, made of wooden **staves** bound together with hoops and having two flat ends of equal diameter. (Compare **drum**.)

cask, *n*—a term used synonymously with **barrel** but usually of large size or capacity.

keg, *n*—a small slack or tight **barrel** of 30-gal capacity or less. **D 996, D10**

barrel burnishing—the smoothing of surfaces by means of tumbling the work in rotating barrels in the presence of metallic or ceramic shot, and in the absence of abrasive. In ball burnishing, the shot consists of hardened steel balls. **B 374, B08**

barrel distortion—See **distortion**. **E 7, E04**

barrel electroplating—an electroplating process in which electrodeposits are applied to articles in bulk in a rotating, oscillating, or otherwise moving container. **B 374, B08**

barrel finishing (or tumbling)—bulk processing in barrels, in either the presence or absence of abrasives or burnishing shot, for the purpose of improving the surface finish. **B 374, B08**

barrel-galvanized—See **hot-galvanized**. **F 547, F16**

barrel, glass container—{archaic} See **sidewall, glass container**. **C 162, C14**

barrel nail—bright or coated, regular-stock-steel, $\frac{3}{8}$ by 0.067 to 1½ by 0.092-in. nails with flat 0.148 to 0.219-in. head and medium diamond point. **F 547, F16**

barrel plating (or cleaning)—plating or cleaning in which the work is processed in bulk in a rotating container. **B 374, B08**

barrel-plating process—fastener-coating process which employs a containment vessel called a barrel that is designed to move a given batch of fasteners together through each of the process steps, allowing ready ingress and egress of processing solutions and rinses. As the barrel moves through the process steps, it is rotated or oscillated, causing the fasteners to cascade over one another, and in the electrocleaning and electroplating steps, and electric current is applied. **F 1789, F16**

barrel processing—mechanical, chemical, cleaning, or electrolytic treatment of articles in bulk or in a rotating, oscillating, or otherwise moving container. **B 374, B08**

barrens—areas of discontinuous vegetation cover in the polar semi-desert of the High Arctic. **D 7099, D18**

barrier—any material limiting passage through itself of solids, liquids, semisolids, gases, vapors, or forms of energy such as ultraviolet light. **F 17, F02**

barrier—See Terminology **F 17**. **F 1327, F02**

barrier layer—in *anodizing aluminum*, the thin, pore-free, semiconducting aluminum oxide region nearest the metal surface and distinct from the main anodic oxide coating which has a pore structure. **B 374, B08**

barrier material—

grease-resistant barrier—a material that prevents or retards the transmission of grease or oils.

water-resistant barrier—a material that retards the transmission of liquid water.

water-vapor-resistant barrier—a material that retards the transmission of water vapor. **D 996, D10**

barrier materials—specialized porous or nonporous packaging materials that provide environmental protection to the package contents as well as protection to the environment from the package contents: (1) gas, vapor, humidity, liquid, microbial, or light resistant materials that control or eliminate the amount of those environmental constituents that pass into or out of a package; (2)

barrier materials

- a porous material preventing the passage of microorganisms that might contaminate the contents of the package. **F 1327, F02**
- bar-size section**—a hot-rolled steel angle, channel, tee, or zee having a maximum cross-section dimension of less than (76 mm) (3.0 in.) **E 631, E06**
- bartack**, *n*—in garment construction, a reinforcement at points of strain. **F 1494, F23**
- bar width**, *n*—the thickness of a bar measured from the edge closest to the symbol start character to the trailing edge of the same bar. **F 1294, F05**
- bar width ratio**, *n*—in symbologies having two widths, the ratio of the widest to the narrowest width within the bar code symbol. (See also **wide to narrowratio**.) **F 1294, F05**
- bar width reduction**, *n*—a diminution of the nominal bar width dimension on film masters or printing plates to compensate for systematic errors in some printing processes. **F 1294, F05**
- basal application**—application of a chemical to the base of a plant. **E 1102, E35**
- basal cryopeg**—a layer of unfrozen ground, forming the basal portion of permafrost, in which the temperature is perennially below 0°C (32°F). **D 7099, D18**
- basal cryostructure**—the structural characteristics of a frozen deposit of boulders that is saturated with ice. **D 7099, D18**
- basal-layered cryostructure**—the structural characteristics of a frozen layered deposit of gravel and boulders that is saturated with ice. **D 7099, D18**
- basal plane**—that plane of a hexagonal or tetragonal crystal which is perpendicular to the axis of highest symmetry. Its Miller indices are (0001) or (001), respectively. **E 7, E04**
- basalt ware**—a black unglazed vitreous ceramic ware having the appearance of basalt rock. **C 242, C21**
- base**—{archaic} the bottom of a bottle. **C 162, C14**
- base**—in grouting, main component in a grout system. **D 653, D18**
- baseball leather**—leather used for covers of baseballs. The better grades of balls have covers of alum-tanned horsehide front leather. Some cheaper grades are made of kip and sheepskins. **D 1517, D31**
- baseboard**, *n*—a molding covering the juncture of a wall and the adjoining floor. **E 631, E06**
- baseboard**, *n*—a molding covering the juncture of a wall and the adjoining floor. **E 1605, E06**
- baseboard application**—application to a building on the lower portion of the inside walls. **E 1102, E35**
- base building**, *n* (immeublede base)—a general-purpose office building intended, but not yet adapted, to suit the operational requirements of a specific tenant. **E 631, E06**
- base building**, *n* (immeublede base)—a general-purpose office building intended, but not yet adapted, to suit the operational requirements of a specific tenant. **E 1480, E06**
- basecoat**, *n*—a coating applied to a base substrate to produce a level surface for the application of the active coat; may also function to improve the heat/energy transfer of the active coat layer. **F 1623, F05**
- basecoat**, *n*—the first layer or layers of plaster applied over lath or other substrate. **C 11, C11**
- base coat**—for two coat-one fire application, the thin layer of bonding frit applied first and used to promote adherence after firing to the metal substrate. **C 286, B08**
- base coat**, *n*—the initial wet-state material, either factory or field-mixed, used to encapsulate the nonmetallic reinforcing mesh or fasten the insulation to the substrate. **E 2110, E06**
- base conditions**—temperature and pressure conditions at which natural gas volumes are determined for purposes of custody transfer. In natural gas measurement the properties of interest are temperature, pressure, and composition. Assuming ideal gas properties, for simplicity, tables of pure compounds can be prepared for use in calculating gas properties for any composition at “base conditions.” These “base conditions” are chosen near ambient. **D 4150, D03**
- base course (base)**—a layer of specified or selected material of planned thickness constructed on the subgrade or subbase for the purpose of serving one or more functions such as distributing load, providing drainage, minimizing frost action, etc. **D 653, D18**
- base date**—See **base time**. **E 631, E06**
- base date**, *n*—See **base time**. **E 833, E06**
- base exchange**, *n*—a surface property exhibited by colloidal inorganic materials, usually clays, whereby adsorbed surface cations are replaced by other cations. **C 1145, C28**
- base exchange**—the physicochemical process whereby one species of ions adsorbed on soil particles is replaced by another species. **D 653, D18**
- base flow**—stream flow that is sustained by ground water and other delayed sources. **D 4410, D19**
- baselength**, *n*—the length of a segment of a pavement macrotexture profile being analyzed required to be 100 mm. **E 867, E17**
- baseline**—any line drawn on an absorption spectrum to establish a reference point representing a function of the radiant power incident on a sample at a given wavelength. **E 131, E13**
- base line**—the time of flight or distance trace (horizontal) across the A-scan CRT display (for no signal condition). **E 1316, E07**
- baseline**—the resultant analytical trace when no test specimen is present. **E 2161, E37**
- baseline**, *n*—the ruled or imaginary line upon which writing or typewriting appears to rest. **E 2195, E30**
- base line**—a reference line used to specify the nominal relative vertical position of OCR characters printed on the same line. **F 149, F05**
- baseline plan**, *n*—an established scope, cost, schedule, and technical performance plan against which the status of resources and the effort of the overall program or project activities are measured, assessed, and controlled. **E 833, E06**
- base material**—material in which anchor is installed, such as concrete or masonry. **E 2265, E06**
- basement**—See **building space**. **E 631, E06**
- basement**—See **space categories**. **E 631, E06**
- basement**—a space partly below **average grade** having less than one half of its clear height (measured from floor level to ceiling level) below **average grade**. **E 631, E06**
- basement**—See **space categories**. **E 1480, E06**
- base metal**, *n*—as related to **metallic-coated steel**, the steel to which the coating is applied, as distinguished from the coating metal. **A 902, A05**
- base metal**—(1) See **basis metal**; (2) in **diffusion coatings**, the metal present in the largest proportion in an alloy. **B 374, B08**
- base metal**—the sheet or plate from which the pipe is formed. **B 846, B05**
- base metal**—the metal to which porcelain enamel is applied. **C 286, B08**
- base metal thermocouple**, *n*—thermocouple whose thermoelements are composed primarily of base metals and their alloys. (See also **noble metal thermocouple**; **refractory metal thermocouple**.) **E 344, E20**
- base number**, *n*—the quantity of an acid, expressed in terms of the equivalent number of milligrams of potassium hydroxide per gram of sample, that is required to titrate a sample dissolved in the specified solvent to a specified end point (for example, Test Method D 4739). **D 4175, D02**
- base number**, *n*—the quantity of acid, expressed in milligrams of potassium hydroxide per gram of sample that is required to titrate a sample to a specified end point. **D 4175, D02**
- base oil**, *n*—a base stock or a blend of two or more base stocks used to produce finished lubricants, usually in combination with additives. **D 4175, D02**

base paper, *n*—the fiber network existent prior to the application of any material onto the surface of that fiber network. **D 1968**, D06

base ply—the bottom or first ply in a built-up roofing membrane when additional plies are to be subsequently installed.

D 1079, D08

base sheet—a product intended to be used as a base ply in a built-up roofing system.

D 1079, D08

base side, *adj*—when referring to a film master, the nonimage bearing side (See also the reverse, **emulsion side**.)

F 1294, F05

base size, *n*—the digitized or created size of a style. (See **sample size**.)

D 6963, D13

base stock, *n*—a hydrocarbon lubricant component, other than an additive, that is produced by a single manufacturer to the same specifications (independent of feed source or manufacturer's location), and that is identified by a unique formula number or product identification number, or both.

D 4175, D02

base stock—see **conductive base stock**.

F 335, F05

base substrate—a material upon which films, treatments, adhesives, sealants, membranes, and coatings are applied. The base substrate can also be considered to be the actual material of construction that the surface is attached to. This does not refer to the layers of paint under the outermost or surface layer.

E 631, E06

base time—the date to which all future and past benefits and costs are converted when a present value method is used (usually the beginning of the study period) (Syn. *base date*).

E 631, E06

base time, *n*—the date to which all future and past benefits and costs are converted when a present value method is used (usually the beginning of the study period) (Syn. *base date*).

E 833, E06

base weight—the weight of a specified area of paper stock expressed in grams per square metre or in pounds per ream, where the size and number of sheets per ream may vary for each particular grade of paper. Common ream sizes used in electrostatic papers are:

25 by 38 in. by 500 sheets (3300 ft²)

24 by 36 in. by 500 sheets (3000 ft²)

17 by 22 in. by 500 sheets (1300 ft²)

F 335, F05

basic color terms, *n*—a group of eleven color names found in anthropological surveys to be in wide use in fully developed languages: white, black, red, green, yellow, blue, brown, gray, orange, purple, pink.

E 284, E12

basic fiber—unprocessed glass fibers directly from the forming equipment.

C 162, C14

basic hydrolysis—the chemical addition of water to a compound.

E 1705, E48

basicity, *n*—the quality, state or degree of being basic.

D 4175, D02

basic life support (BLS)—medically accepted non-invasive procedures used to sustain life.

F 1177, F30

basic life support/cardiopulmonary resuscitation (BLS/CPR)—a set of skills that includes airway management, chest compressions, and others as defined by the American Heart Association.

F 1177, F30

basic NMR frequency, ν_0 —the frequency, measured in hertz (Hz), of the oscillating magnetic field applied to induce transitions between nuclear magnetic energy levels.

E 131, E13

basic refractories, *n*—see **refractories, basic**.

C 71, C08

basic stress (*archaic*)—the term once used for an allowable property for clear, straight-grained lumber.

D 9, D07

basil—uncolored vegetable-tanned sheepskin and lambskin.

D 1517, D31

basis—See **reporting bases**.

D 121, D05

basis metal—see **base metal**.

C 286, B08

basic metal (or material)—material upon which coatings are deposited.

B 374, B08

basis weight—deprecated term (do not use in the sense of mass per unit area).

D 4439, D35

basis weight—the weight in pounds of a ream cut to a specified basic size. The number of sheets in a ream is usually 500. The basic size for writing papers commonly used in OCR applications is 17 by 22

in. Also measured metrically in grams per square metre (g/m²) and referred to as grammage.

F 149, F05

basis weight of paper, *n*—basis weight is expressed in grams per square metre. In countries where the metric system is not universal, basis weight is also expressed in pounds per ream.

D 4175, D02

basket, *n*—a semirigid container usually open at the top and provided with one or two handles for carrying. (Compare **hammer**.)

D 996, D10

basket nail—bright, regular-stock-steel, 5/8 and 3/4 by 0.048-in. nails with large flat head and medium needle point.

F 547, F16

basket, pickle—see **pickle basket** and **pickling**.

C 286, B08

bast and leaf fiber, *n*—fiber derived from the inner fibrous bark and the hard coarse leaves of dicotyledonous plants such as flax, hemp, jute, and abaca.

D 123, D13

bast fibers, *n*—*in flax stems*, fibers found in the layer of phloem of the flax stem between the inner xylem tissue and the epidermis tissue.

D 123, D13

bast fibers, *n*—*in flax stems*, fibers found in the layer of phloem of the flax stem between the inner xylem tissue and the epidermis tissue.

D 6798, D13

bat, *v*—to reject or discard a brick or shape.

C 71, C08

BAT—best available technology.

D 6161, D19

batch, *n*—the component raw materials properly weighed, proportioned, and mixed for delivery to a processing unit. Also, the product output from a processing unit in which there is essentially no product output until all component materials are charged and processed.

A 644, A04

batch—(1) the recipe of batch ingredients.

(2) the raw materials weighed but unmixed.

(3) the raw materials, properly proportioned and mixed, for delivery to the furnace.

C 162, C14

batch, *n*—the total quantity of a material produced in a single final mixing operation after all production processes are complete, or just prior to filling.

D 16, D01

batch—*in grouting*, quantity of grout mixed at one time.

D 653, D18

batch, *n*—the manufactured unit or a blend of two or more units of the same formulation and processing. (Compare **manufactured unit**.)

D 907, D14

batch, *n*—the product of one mixing operation.

D 1566, D11

batch, *n*—a definite quantity of some product or material produced under conditions that are considered uniform.

NOTE—A batch is usually smaller than a lot.

E 456, E11

batch—a group of field or quality control (QC) samples that are processed together using the same reagents and equipment.

E 631, E06

batch—a group of samples ($n > 2$) that are obtained in a similar environment (for example, a set of area or personal samples) and are processed together using the same reagents and equipment.

E 631, E06

batch—the quantity of material that has been formulated in a single continuous operation and subjected to chemical processing or physical mixing to produce a homogeneous material.

E 631, E06

batch—a group of field or quality control samples that are processed together using the same reagents and equipment.

E 1605, E06

batch—the quantity of material that has been formulated in a single continuous operation and subjected to chemical processing or physical mixing to produce a homogeneous material.

E 1749, E06

batch, *n*—quantity of concrete, mortar, ash grout, or flowable fill mixed at one time.

E 2201, E50

batch average thickness—calculated average thickness of a coating if it were uniformly distributed on the surfaces of the items.

F 1789, F16

batch charger—a mechanical device for introducing batch to the melter.

C 162, C14

batch coating, *n*—*of metallic coated steel products*, the process of discontinuous-sequential passage of steel articles through the

batch coating, n

various steps of the coating process, such as, cleaning, pickling, fluxing, and coating. **A 902, A05**

batch feeder—See **batch charger**. **C 162, C14**

batch fermentation—batch of nutrient mixture and microorganisms mixed in a vessel and allowed to ferment. **E 1705, E48**

batch furnace, n—a heating device within which steel objects are held stationary or oscillated during the thermal processing cycle. **A 941, A01**

batch house—the place where batch materials are received, handled, weighed, and mixed. **C 162, C14**

batch method—*in grouting*, a quantity of grout materials are mixed or catalyzed at one time prior to injection. **D 653, D18**

batch mixer—*in grouting*, a machine that mixes batches of grout, in contrast to a continuous mixer. **D 653, D18**

batch mixer samples—those obtained during or immediately after the discharge of the mortar from the batch mixer. **C 1180, C12**

batch number, n—a combination of numbers, letters, and/or symbols that uniquely identifies a batch and from which the production and distribution history can be determined. **E 2363, E55**

batch sampling—sampling over some time period in such a way as to produce a single test sample for analysis. **E 176, E05**

batch smelter—any smelter that operates as a periodic unit, being charged, fired, and discharged according to a predetermined cycle. **C 286, B08**

bate—to treat unhaired hides or skins with a warm aqueous solution of an enzyme in order to remove certain undesirable nitrogenous constituents. **D 1517, D31**

bath—synonymous with **float bath**. **C 162, C14**

bath—see **suspension**. **E 1316, E07**

bath gradient error, n—the error caused by temperature differences in the working space of the bath. (The bath or temperature equalizing blocks should be explored to determine the work areas in which the temperature gradients are insignificant.) **E 344, E20**

bath mat, n—an absorbent textile floor covering normally used in the bathroom as a pad on which to step when getting out of the tub or shower. **D 123, D13**

bathochromic shift, n—change of a spectral band to longer wavelength (lower frequency) because of structural modifications or environmental influence; also known as “red shift.” **E 131, E13**

bathroom—See **building space**. **E 631, E06**

bathroom—a room containing a bathtub or shower, or both, and usually a lavatory (wash basin) and toilet (water closet). **E 631, E06**

bathroom soil—the soil composed of water insoluble, or practically insoluble, materials or a mixture of these materials, present on typical bathroom surfaces other than those of floors and toilets. A major component of this soil is the insoluble precipitate, commonly referred to as “soap scum,” that is deposited when soap is used in hard water. **D 459, D12**

bath rug, n—a scatter rug used in the bathroom. **D 123, D13**

bath sheet, n—a textile terry product with end hems or fringes and side hems or selvages that is generally much larger than a bath towel. **D 123, D13**

bath sheet, n—a textile terry product with end hems or fringes and side hems or selvages that is generally much larger than a bath towel. **D 7023, D13**

bath towel, n—a textile terry product with end hems or fringes and side hems or selvages, which is used to dry a person’s body after bathing or swimming. **D 123, D13**

bath towel, n—a textile terry product with end hems or fringes and side hems or selvages, which is used to dry a person’s body after bathing or swimming. **D 7023, D13**

batt, n—blanket insulation manufactured to dimensions as required by a specific application. **C 168, C16**

batten, n—a long narrow strip, either flat or corrugated, used to conceal the joints in butt joint application of flat or corrugated sheets. **C 1154, C17**

batten—a narrow strip of lumber for covering the adjoining edges of roofing or siding, often designated as “batts.” **D 9, D07**

batten—See **box**. **D 996, D10**

batten—long narrow strip of asbestos-cement, either flat or corrugated, used to conceal the joints in butt joint application of flat or corrugated sheets. **D 2946, C17**

batten lugs, n—protrusions on the underside of tile designed to engage over the upper edge of tiling battens. **C 43, C15**

battery charger, n—an electrical circuit designed to restore the electrical potential of a battery. **E 344, E20**

batting, n—a textile filling material consisting of a continuous web of fibers formed by carding, garnetting, air laying, or other means. **D 123, D13**

batting, n—a textile filling material consisting of a continuous web of fibers formed by carding, garnetting, air laying, or other means. **D 7022, D13**

batting integrity, n—the ability of a textile filling material to resist distortion or change when subjected to multiple home launderings or drycleanings. **D 123, D13**

batting integrity, n—the ability of a textile filling material to resist distortion or change when subjected to multiple home launderings or drycleanings. **D 7022, D13**

batting integrity, n—the ability of a textile filling material to resist distortion or change when subjected to multiple home launderings or drycleanings. **D 7022, D13**

baud, n—a measure of data transmission speed; ideally one baud equals one bit per second. **F 1457, F05**

Baumé gravity—a unit of density based on specific gravity and defined by the following equation:

$$\text{Baumé gravity} = 145 - [145/\text{sp gr}] \text{ at } 15.5/15.5^{\circ}\text{C} (60/60^{\circ}\text{F})$$

See also **density** and **specific gravity**. **E 1547, E15**

baume scale, Be—a measure of the density of a solution relative to water.

$${}^{\circ}\text{BE} = 145 - \frac{145}{\text{specific gravity}^*}$$

United States for densities greater than unity.

$${}^{\circ}\text{BE} = \frac{140}{\text{specific gravity}^*} - 130$$

For densities less than unity.

*at 60°F

D 6161, D19

Bayard-Alpert ionization gage—see **ionization vacuum gage**.

E 1316, E07

BCD—abbreviation for **block circuit diagram**. **F 1457, F05**

bead—(1) an enlarged, rounded raised section on a glass article.

(2) a small piece of glass tubing bonded around a wire lead.

(3) in fiber glass, a tear drop-shaped glass mass which forms as a result of the interruption of the fiber forming process below an orifice. **C 162, C14**

bead, n—*in building construction*, in sealants and glazing, a strip of applied sealant, glazing compound, or putty. **C 717, C24**

bead, n—*in a separatelement zipper*, an enlarged section on inner edge of each tape to which interlockable elements are affixed. **D 123, D13**

bead, n—*in continuouselement zippers*, an optional enlarged section of the tape located at the outer edge of the continuous interlockable elements and against which the slider flanges bear. **D 123, D13**

bead, n—*in a separatelement zipper*, an enlarged section on the inner edge of each tape to which interlockable elements are affixed. **D 2050, D13**

bead, n—*in continuouselement zippers*, an optional enlarged section of the tape located at the outer edge of the continuous interlockable elements and against which the slider flanges bear. **D 2050, D13**

bead, n—the anchoring part of the tire which is shaped to fit the rim and is constructed of bead wire wrapped by the plies. **D 5681, D34**

bead, n—the anchoring part of the tire, which is shaped to fit the rim. The bead is constructed of high tensile steel wires wrapped by the plies. **D 5681, D34**

- bead**—See **windows and doors**. E 631, E06
- bead**, n —of a tire, the part of a tire that comes in contact with the rim and is shaped to secure the tire to the rim. F 538, F09
- beadboard**, n —molded expanded polystyrene thermal insulation board; also called MEPS. E 631, E06
- bead carryover**—beads of developer appearing on a print or copy, or both; a deletion around each particle is common. F 1457, F05
- beaded selvage**—See **loopy selvage**. D 3990, D13
- beaded stream**—a characteristic pattern of small streams underlain by ice wedges. “Beads,” or pools, occur at junctions of wedges. The pools are linked by narrow channels. D 7099, D18
- beading**—(1) the application of porcelain enamel, usually of a contrasting color, to the edge or rim of porcelain enameled articles. (2) Removal of excess slip from the edge of dipped ware. (3) In dry processing enameling, a bead of porcelain enamel along the edge of ware. C 286, B08
- beading enamel**—any of the special porcelain enamels used for beading. C 286, B08
- bead separation**, n —a breakdown of bond between tire components in the bead area. F 538, F09
- bead wire**, n —a high tensile steel wire surrounded by rubber, which forms the bead of a tire that provides a firm contact to the rim. D 5681, D34
- beam**, n —in textiles, a large spool containing many ends of yarn wound parallel, and used for such purposes as weaving or warp knitting. D 123, D13
- beam**—a convex wooden slab sloping downward from about waist height over which a hide is placed for trimming off excess flesh and ragged edges and scudding by hand. D 1517, D31
- beam**, n —in textiles, a large spool containing many ends of yarn wound parallel, and used for such purposes as weaving or warp knitting. D 4849, D13
- beam**, n —in optics, a concentrated unidirectional flow of radiant energy. E 284, E12
- beam**, n —a structural member intended primarily to resist transverse forces, and subject to bending by these forces. E 631, E06
- beam**:
- analyzing*—same as *incident*.
 - current*—the total current incident on the specimen by the primary particle source.
 - current density*—the current incident on the specimen per unit area.
 - diameter*—in surface analysis, the full width of the incident beam at half maximum intensity measured in a plane normal to the beam direction. This plane must be specified and is often taken at the intersection of the beam center with the specimen.
 - divergence, convergence*—angles spanned by the directions of all particles of the incident beam.
 - energy*—the energy of the particles incident on the specimen surface, expressed in electron volts (eV).
 - energy, primary*—the kinetic energy of the primary beam, usually expressed in kiloelectronvolts (keV).
 - incident*—the energetic particles incident on the specimen.
 - particle*—atomic or molecular species contained in the incident beam, regardless of state of ionization.
 - primary*—a directed flux of particles (ions or neutrals) incident on the specimen.
 - profile, primary ion*—the spatial distribution of the primary ion current in a plane perpendicular to the primary ion beam axis.
 - size*—the full width at half-maximum of the beam at a given point in space that must be defined.
 - spot*—the area on the specimen surface illuminated by the incident beam. E 673, E42
- beam axis**—the acoustic centerline of a search unit’s beam pattern as defined by the locus of points of maximum sound pressure in the far field, and its extension into the near field. E 1316, E07
- beam loading**—the application of a load to a pipe between two points of support, usually expressed in newtons (or pounds-force) and the distance between the centers of the supports. F 412, F17
- beam, radiant energy**—a collection of rays confined to a specific path. E 772, E44
- beam ratio**—the measured intensity of the reference beam divided by the measured intensity of the object beam in the plane of the recording medium. E 1316, E07
- beams**, n —all horizontally oriented structural members employed in building construction and known variously as beams, joists, or girders. E 176, E05
- beam set**, n —in textiles, one or more beams of yarn in a single shipment to be further processed together for a specific end use. D 123, D13
- beam set**, n —in textiles, one or more beams of yarn in a single shipment to be further processed together for a specific end use. D 4849, D13
- beam shear**—a term describing the stresses developed in planes parallel to facing planes of flat sandwich constructions when subjected to flatwise flexure in such a manner that the applied moments produce curvature of the plane of a sheet of the sandwich construction (see Test Method C 393). E 631, E06
- beam shear**—a term describing the stresses developed in planes parallel to facing planes of flat sandwich constructions when subjected to flatwise flexure in such a manner that the applied moments produce curvature of the plane of a sheet of the sandwich construction (see Test Method C 393). E 1749, E06
- beamsplitter**—a semireflecting device used to create, and often to recombine, spatially separate beams. E 131, E13
- beamsplitter**—an optical device for dividing a beam into two or more separate beams. E 1316, E07
- beamsplitter efficiency**—the product $4RT$, where R is the reflectance and T is the transmittance of the beamsplitter. E 131, E13
- beam spread**—a divergence of the ultrasonic beam as the sound travels through a medium. E 1316, E07
- bear claw**, n —the rough-edged bead wire sticking out from a shredded tire. D 5681, D34
- bearer arch**—See **rider arch**. C 162, C14
- bearer bars**, n —solid lines that are located at the perimeter of some bar code symbols whose purpose is to reduce partial, incorrect scans and support the printing plate. Bearer bars do not contain information. F 1294, F05
- bearing area**—for chemical-resistant polymer machinery grout, the portion of the grout surface in contact with the underside of a supported surface. C 904, C03
- bearing area** $[L^2]$, n —the product of the pin diameter and specimen thickness. E 6, E28
- bearing capacity**—see **ultimate bearing capacity**. D 653, D18
- bearing capacity (of a pile)**, Q_p , P_p (F)—the load per pile required to produce a condition of failure. D 653, D18
- bearing force** $[F]$, n —a compressive force on an interface. E 6, E28
- bearing strain**, n —the ratio of the bearing deformation of the bearing hole, in the direction of the applied force, to the pin diameter. E 6, E28
- bearing strength**—the non-destructive limit of pipe load, as determined by 3-edge bearing test method, used to determine field supporting strength. C 896, C04
- bearing strength** $[FL^{-2}]$, n —the maximum bearing stress which a material is capable of sustaining. E 6, E28
- bearing stress** $[FL^{-2}]$, n —the force per unit of bearing area. E 6, E28
- bearing surface**—the outside surface of an item of glassware on which it rests when in its normal upright position. C 162, C14
- bearing surface**—underside of head in contact with nailed member. F 547, F16
- bearing wall**—See **wall**. E 631, E06
- bearing yield strength** $[FL^{-2}]$, n —the bearing stress at which a material exhibits a specified limiting deviation from the proportionality of bearing stress to bearing strain. E 6, E28

bed, v—in *building construction in glazing*, to apply a bead of sealant between a lite of glass or a panel and the stationary stops or sight bars of the sash or frame. C 717, C24

bed, n—See **bedding**. C 717, C24

bedcovering, n—a textile product used on a bed over the sheets for warmth or decoration. D 123, D13

bedcovering, n—a textile product used on a bed over the sheets for warmth or decoration. D 7023, D13

bed depth—the depth of the filter medium or ion exchange resin in a vessel. D 6161, D19

bedding, n—in *building construction in glazing*, a bead of sealant applied between a lite of glass or a panel and the stationary stop or sight bar of the sash or frame. It is usually the first bead to be applied when setting glass or panels. C 717, C24

bedding—the materials, their placement, consolidation, and configuration, as designed to support, and to develop field supporting strength of vitrified clay pipe. C 896, C04

bedding—applies to rocks resulting from consolidation of sediments and exhibiting surfaces of separation (bedding planes) between layers of the same or different materials, that is, shale, siltstone, sandstone, limestone, etc. (ISRM) D 653, D18

bedding—collective term signifying the existence of layers of beds. Planes or other surfaces dividing sedimentary rocks of the same or different lithology. D 653, D18

bedding, n—materials that provide support for buried pipe. F 412, F17

bedding, v—placement of support materials for buried pipe. F 412, F17

bedding coat, n—that coat of plaster to receive aggregate or other decorative material of any size, impinged or embedded into its surface, before it sets. C 11, C11

bed expansion—the depth increase of filter medium or ion exchange resin that occurs during backwashing. D 6161, D19

bed joint—a horizontal mortar joint between a chemical-resistant construction unit and a substrate or another chemical-resistant construction unit. C 904, C03

bed-load—material moving on or near the stream bed by rolling, sliding, and skipping. D 4410, D19

bed-load discharge—the quantity of bed-load passing a cross section of a stream in a unit of time. D 4410, D19

bed-load sampler—a device for sampling the bed-load. D 4410, D19

bed material—the sediment mixture of which the stream bed is composed. D 4410, D19

bed-material discharge—that part of the total sediment discharge composed of grain sizes occurring in appreciable quantities in the bed material. D 4410, D19

bed-material load—that part of the total load which is composed of particle sizes present in appreciable quantities in the shifting portions of the stream bed. D 4410, D19

bed moisture—synonym for *inherent moisture*. D 121, D05

bedrock—the more or less continuous body of rock which underlies the overburden soils. (ISRM) D 653, D18

bedrock (ledge)—rock of relatively great thickness and extent in its native location. D 653, D18

bedspread, n—a type of bedcovering that is placed over the blankets and sheets for appearance and warmth. D 123, D13

bedspread, n—a type of bedcovering that is placed over the blankets and sheets for appearance and warmth. D 7023, D13

bed surface, n—(1) the nonvertical surfaces of a manufactured masonry unit intended by the manufacturer to be joined by mortar or other methods. (2) the in situ nonvertical surfaces of a manufactured masonry unit joined by mortar or other methods. C 1232, C15

beehive coke—See *beehive coke* under *coke*. D 121, D05

beer—term used to describe the product of ethanol fermentation by microorganisms. E 1705, E48

beer-case cleat nail—bright, regular-stock-steel, 1 by 0.080 to 1 7/8 by

0.106-in. nails with 3/16 to 1/4-in. oval head and duckbill or clinch point. F 547, F16

beer-case hinge, lock and latch nail—bright, regular-stock-steel, 5/8 by 0.080 to 1 5/16 by 0.092-in. nails with oval 3/16 to 7/32-in. head and duckbill or clinch point. F 547, F16

beer-case strap nail—bright, regular-stock-steel, 1 1/4 by 0.092 to 2 by 0.113-in. nails with oval 1 5/4 to -in. head and medium diamond point. F 547, F16

Beer's law—the absorbance of a homogeneous sample containing an absorbing substance is directly proportional to the concentration of the absorbing substance. See also **absorptivity**. E 131, E13

Beer's law, n—the absorbance of a homogeneous sample containing an absorbing substance is directly proportional to the concentration of the absorbing substance. See also **absorptivity**. ^A E 284, E12

behavior, n—observable, recordable, or measurable actions or activity of an organism. E 943, E47

Beilby layer, n—an altered surface layer of supposedly amorphous material formed on a crystalline solid during mechanical polishing, whose existence was proposed in Sir George Beilby's writings. The existence of such a layer is not supported by recent research, and the use of this term is therefore considered archaic and is strongly discouraged. G 40, G02

belay, n—a technique where a stationary person controls a rope connected to a moving climber in order to provide protection against a fall, or in the event of a fall, to catch the climber. F 1773, F08

belay, v—to protect a climber with a belay. F 1773, F08

belay anchor, n—an anchor used to secure the rope or belayer, or both, while belaying a climber. It also may be used with ropes while descending or lowering. F 1773, F08

belay bar, n—a belay anchor made from pipe or a bar. F 1773, F08

belay device, n—a mechanical device used to control the friction on a rope. F 1773, F08

belayer, n—the one who performs the belay. F 1490, F32

belayer, n—a person who is belaying. F 1773, F08

belay station, n—a place where belay anchors are located. F 1773, F08

bell—see **female end of pipe**. C 822, C13

bell—the flared-end portion of a vitrified clay pipe or fitting, designed to function in the joining of other such pipe. C 896, C04

bell-and-spigot joint—see **joint, bell-and-spigot gasket**. F 412, F17

Belleek china—a highly translucent whiteware composed of a body containing a significant amount of frit and normally having a luster glaze. C 242, C21

bell end—the enlarged portion of a pipe that resembles the socket portion of a fitting and that is intended to be used to make a joint. F 412, F17

bell jar—a container, open at one end (usually the bottom), which is used as a vacuum chamber or test vessel. E 1316, E07

bell jar testing—a test used for detecting leakage from an object completely or partially filled with a tracer gas and placed in a vacuum chamber or bell jar. E 1316, E07

bellows length—the distance from the eyepiece to the photosensitive material or viewing screen in a photomicrographic apparatus. E 7, E04

belly—that part of the hide below the belly line. For steerhide leather, the belly line (RU) passes through a point at or above the top of the rear break. For cowhide leather, the belly line passes through a point at or above the top of the front break and a point not more than 2 1/2 in. (64 mm) below the top of the rear break. D 1517, D31

below-grade, *adj*—below the surface of the ground, *as related to floor location*, part or all of the floor is below the ground. F 141, F06

belt, n—an assembly of rubber coated fabric or wire used to reinforce a tire's tread area. In radial tires, also constrains the outside diameter against inflation pressure and centrifugal force. D 5681, D34

belt, *n*—*in a tire*, a breaker that substantially restricts the carcass in a circumferential direction. **F 538, F09**

belting butt—a double back with the tail cut off at the butt line. **D 1517, D31**

belting butt bend—a double bend with the tail cut off at the butt line. **D 1517, D31**

beltmarks—See **chain marks**. **C 162, C14**

belt printer—a type of printer that employs an endless belt, the outer surface of which contains fully formed characters. The belt is caused to transverse the width of the paper form. Hammers are caused to strike the back of the form, synchronized in such a way as to produce the desired characters in their proper positions. **F 909, F05**

belt separation, *n*—a breakdown of bonding between the belts or plies or tread, or combination thereof. **F 538, F09**

belt wire, *n*—a brass-plated high tensile steel wire cord used in steel belts. **D 5681, D34**

bench—See **siege**. **C 162, C14**

bench—(1) the unexcavated rock having a nearly horizontal surface which remains after a top heading has been excavated, or (2) step in a slope; formed by a horizontal surface and a surface inclined at a steeper angle than that of the entire slope. (ISRM) **D 653, D18**

benchmark neutron field—a well-characterized neutron field which will provide a fluence of neutrons for validation or calibration of experimental techniques and methods and for validation of cross sections and other nuclear data. The following classification of benchmark neutron fields for reactor dosimetry has been made:

controlled neutron field—a neutron field physically well-defined, and with some spectrum definition, employed for a restricted set of validation experiments.

reference neutron field—a permanent and reproducible neutron field less well characterized than a standard field but accepted as a measurement reference by a community of users.

standard neutron field—a permanent and reproducible neutron field with neutron fluence rate and energy spectra, and their associated spatial and angular distributions characterized to state-of-the-art accuracy. Important field quantities must be verified by interlaboratory measurements and calculations. **E 170, E10**

bench marks, *n*—marks placed on a specimen to define gage length, that is, the portion of the specimen that will be evaluated in a specific test. **D 123, D13**

bench marks, *n*—two marks of known separation applied to a specimen to measure the strain of the specimen during extension. **D 1566, D11**

bench marks, *n*—marks placed on a specimen to define gage length, that is, the portion of the specimen that will be evaluated in a specific test. **D 4849, D13**

bench stock—low cost, high usage, non-sensitive consumable material issued to work areas. Quantities of such stock do not normally exceed an amount that would normally be consumed within a 30-day period or as established in the property control system. **E 2135, E53**

bench test—a modified service test in which the service conditions are approximated, but the equipment is laboratory equipment and not necessarily identical with that in which the product will be employed. **F 869, F08**

bend—a back with the shoulder cut off at right angles to the backbone line at the break of the fore flank. **D 1517, D31**

bend, *vt*—*in mechanics*, to force an object from its natural or manufactured shape into a curve or into increased curvature. **D 4439, D35**

bend—a fitting either molded separately or formed from pipe for the purpose of accommodating a directional change. **F 412, F17**

bend—to force from a straight form into different and especially a curved one. **F 2112, F01**

bendable bolts—bolts furnished with an altered section at some location at which the bolt will bend. **F 1789, F16**

bend angle—180° minus the internal angle created by applying a load on the weld joining two sheets of plastic. **C 904, C03**

bend cycle—a fold of a sample around a specified mandrel which is “rolled” in one direction, followed by rolling in the opposite direction, returning the sample to its original position. **F 2112, F01**

bending—process of deformation normal to the axis of an elongated structural member when a moment is applied normal to its long axis. (ISRM) **D 653, D18**

bending length, *n*—(1) *general*—a measure of the interaction between fabric weight and fabric stiffness as shown by the way in which a fabric bends under its own weight. It reflects the stiffness of a fabric when bent in one plane under the force of gravity, and is one component of drape. (2) *specific*—the cube root of the ratio of the flexural rigidity to the weight per unit area. **D 123, D13**

bending length, *n*—(1) *general*—a measure of the interaction between fabric weight and fabric stiffness as shown by the way in which a fabric bends under its own weight. It reflects the stiffness of a fabric when bent in one plane under the force of gravity, and is one component of drape; (2) *specific*—the cube root of the ratio of the flexural rigidity to the weight per unit area. **D 4850, D13**

bending moment, *n*—*of paper*, the work (force multiplied by the distance over which it is applied) required to deflect the test piece under specified conditions. **D 1968, D06**

bending stiffness, *n*—the sandwich property which resists bending deflections. $D=EI$; the facing modulus times the panel moment of inertia. **C 274, D30**

bending stress—a stress system that simultaneously imposes a compressive component at one surface, graduating to an imposed tensile component at the opposite surface of a glass section. **C 162, C14**

bend test, *n*—a test for ductility performed by bending or folding a specimen, usually by steadily applied forces but in some instances by blows. The bending may be interrupted to examine the bent surface for cracks. **E 6, E28**

bend test—various tests in which a fastener is bent through its axis or on a round mandrel to determine the toughness and ductility of the fastener. **F 1789, F16**

beneficial use of a CCP, *n*—the use of or substitution of the coal combustion product (CCP) for another product based on performance criteria. For purposes of this definition, beneficial use includes but is not restricted to raw feed for cement clinker, concrete, grout, flowable fill, controlled low strength material; structural fill; road base/sub-base; soil modification; mineral filler; snow and ice traction control; blasting grit and abrasives; roofing granules; mining applications; wallboard; waste stabilization/solidification; soil amendment and agriculture. **E 2201, E50**

beneficiation, *n*—improvement of the chemical or physical properties of a raw material or intermediate product by the removal or modification of undesirable components or impurities. **E 2201, E50**

benefit-cost analysis—a method of evaluating projects or investments by comparing the present value or annual value of expected benefits to the present value or annual value of expected cost. **E 631, E06**

benefit-cost analysis, *n*—a method of evaluating projects or investments by comparing the present value or annual value of expected benefits to the present value or annual value of expected costs. **E 833, E06**

benefit-to-cost ratio (BCR)—benefits divided by costs, where both are discounted to a present value or equivalent uniform annual value (Syn. *benefit-cost ratio*). **E 631, E06**

benefit-to-cost ratio (BCR), *n*—benefits divided by costs, where both are discounted to a present value or equivalent uniform annual value (Syn. *benefit-cost ratio*). **E 833, E06**

bent glass—flat glass that has been shaped while hot into a body having curved surfaces. **C 162, C14**

bent head

bent head—wire bent and upset to form head. (See **hook head**.)

F 547, F16

bentonite—a distinct type of fine-grained clay containing not less than 85 % montmorillonite clay having the formula $(\text{OH})_4\text{Si}_8\text{Al}_4\text{O}_{20}\text{H}_2\text{O}$ and composed of units made up of two silica tetrahedral sheets with a central alumina octahedral sheet.

C 242, C21

bentonitic clay—a clay with a high content of the mineral montmorillonite, usually characterized by high swelling on wetting.

D 653, D18

benzene—cyclohexatriene, benzol (obsolete) (C_6H_6) mol weight 78.11; clear, colorless, highly flammable liquid; characteristic odor; solidification point $+5.5^\circ\text{C}$; boiling point 80.1°C .

D 4790, D16

benzene, carbon disulfide-free—benzene treated with alcoholic sodium hydroxide and used as a spectrophotometric reference standard.

D 4790, D16

benzene-535, refined—benzene with impurities limited to trace amounts by a solidification point of 5.35°C and having a total distillation range of no more than 1.0°C . Refer to Specification D 2359 for complete specifications.

D 4790, D16

benzene-545, refined—benzene with impurities limited to trace amounts by a solidification point of 5.45°C and having a total distillation range of no more than 1°C . Refer to Specification D 4734.

D 4790, D16

benzene-485, refined (nitration grade)—benzene with impurities limited by a solidification point of 4.85°C and having a total distillation range of no more than 1.0°C . Refer to Specification D 835 for complete specifications.

D 4790, D16

benzene, thiophene-free—benzene refined by special treatment and used as a reagent in ASTM standards.

D 4790, D16

Berglund-Liu atomizer—a vibratory atomizer in which a piezoelectric transducer transmits high-frequency oscillations to a liquid stream discharged through an orifice, creating relatively uniform drops whose size is a function of the frequency of oscillation and the flow rate of the liquid through the orifice.

E 1620, E29

berm—a shelf that breaks the continuity of a slope.

D 653, D18

berry-box nail—bright, regular-stock-steel, $\frac{3}{4}$ to $\frac{1}{4}$ by 0.054 and 0.062-in. nails with flat and medium diamond or needle point.

F 547, F16

Bertrand lens—an auxiliary removable lens in the body of a microscope, used to examine images in the back focal plane of the objective, for example, interference figures with polarized light.

E 7, E04

Bertrand lens—see **lens, Bertrand**.

E 175, E41

beryllium oxide (beryllia) (BeO)—an inorganic material of exceptionally high thermal conductivity which is toxic in the powder form.

C 242, C21

beta-cellulose—(1) Historically, a term used to indicate impurities of moderate chain lengths found in pulps, predominately degraded cellulose. (2) Beta-cellulose content, as measured by TAPPI Method T 203 om-93, is the pulp fraction soluble in caustic, which precipitates upon acidification.

D 1695, D01

beta (β) loss peak—in *dynamic mechanical measurement*, second discrete peak in damping curve below the melt, in order of decreasing temperature or increasing frequency, (D 4092, D20).

E 1142, E37

beta (β) loss peak (in dynamic mechanical measurement)—the second peak in the damping curve below the melt, in order of decreasing temperature or increasing frequency.

D 4092, D20

beta structure—structurally analogous body-centered cubic phases (similar to beta brass), or electron compounds, that have ratios of 3 valence electrons to 2 atoms.

E 7, E04

betatron—an electron accelerator in which acceleration is provided by a special magnetic field constraining the electrons to a circular orbit. This type of equipment usually operates at energies between 10 and 31 MEV.

E 1316, E07

between-laboratory standard deviation, S_R, n —the standard deviation of results obtained on the same material in different laboratories (synonym: **reproducibility**).

E 135, E01

beveled pipe—a pipe with an end angled to mate with a complementary pipe end or adjust to another surface.

C 896, C04

beveled pipe—a pipe with an end chamfered to mate or adjust to another surface or to assist in assembly.

F 412, F17

beveled square point—extremity of nail shank opposite head sheared obliquely to shank axis. (See **sheared-bevel point**.)

F 547, F16

beveling—the process of edge finishing flat glass to a bevel angle.

C 162, C14

bevel point—point sheared obliquely to staple-leg axis, with beveled face across staple-leg end; used to produce an outward clinch or to provide additional penetration, or both, in thin stapling member.

F 592, F16

beyond line-of-sight, BLOS, n —transmitter and receiver are not in direct, point-to-point contact. See R-103-2004.

F 2395, F38

"B" horizon—see **horizon**.

D 653, D18

bias—a constant or systematic error, as opposed to a random error, manifesting itself as a persistent positive or negative deviation of the method average from the accepted reference value.

C 242, C21

bias, n —the difference between the population mean of the test results and an accepted reference value.

D 121, D05

bias, n —in statistics, a constant or systematic error in test results.

D 123, D13

bias, n —the persistent positive or negative deviation of the method average value from the assumed or accepted true value.

D 1129, D19

bias, n —a systematic (nonrandom) deviation of the method average value or the measured value from an accepted value.

laboratory bias, n —systematic differences between the true value and a value reported by a laboratory due to errors of application such as losses, contamination, miscalibration, and faulty manipulations, for example.

method bias, n —systematic departures of the limiting mean from the true value of the parameter measured caused by physical or chemical phenomena inherent in the methodology.

D 1356, D22

bias—See **skew**.

D 3990, D13

bias, n —the difference between the population mean of the test results and an accepted reference value.

D 4175, D02

bias, n —a systematic error that contributes to the difference between a population mean of the measurements or test results and an accepted reference or true value.

D 4175, D02

bias—a persistent positive or negative deviation of a test method average value from the assumed or accepted true value.

D 4790, D16

bias, n —the difference between the sample value of the test results and an accepted reference value.

D 5681, D34

bias, n —a systematic positive or negative deviation of the sample or estimated value from the true population value.

D 5681, D34

bias—the difference between the value determined using the measurement protocol in question and the true value; operationally the difference between the expected mean of the sample test results and an accepted true value.

D 5681, D34

bias—a systematic error that is consistently negative or consistently positive. The mean of errors resulting from a series of observations that does not tend towards zero.

D 5681, D34

bias—a systematic error that contributes to the difference between a population mean of the measurements or test results and an accepted or reference value (see Terminology E 456).

E 131, E13

bias, n —systematic error manifested as a persistent positive or negative deviation of the method average from its accepted true value.

E 253, E18

bias, n —a systematic difference between the sample mean of the measurements or test results and an accepted reference value.

E 284, E12

- bias**, *n*—the scatter between the mean values of subsets of data, from each other or from the accepted value. **E 344**, E20
- bias**, *n*—the difference between the expectation of the test results and an accepted reference value. **E 456**, E11
- bias**, *n*—systematic error that contributes to the difference between a population mean of the measurements or test results and an accepted reference or true value. **E 631**, E06
- bias**—a systematic error that is consistently negative or consistently positive. The mean of errors resulting from a series of observations which does not tend toward zero. **E 856**, D34
- bias**—a constant or systematic error as opposed to a random error. It manifests itself as a persistent positive or negative deviation of the method average from the accepted reference value. See also **accuracy**. **E 1547**, E15
- bias**, *n*—systematic error of the indication of a measuring instrument. **E 1605**, E06
- bias**, *n*—the difference between the average measured test result and the accepted reference value; it measures in an inverse manner the accuracy of a test. **F 538**, F09
- biased gun**—an electron gun in which there is a bias voltage on the cathode cap. (See also **self-biased gun**.) **E 7**, E04
- biased sampling**, *n*—the taking of a sample(s) with prior knowledge that the sampling result will be biased relative to the true value of the population. **D 5681**, D34
- bias ply tires**, *n*—a tire built with two or more casing plies, which cross each other in the crown at an angle of 30 to 45° to the tread centerline. **D 5681**, D34
- bias, relative**, *n*—the difference between the population mean of the test results and an accepted reference value, which is the agreed upon value obtained using an accepted reference method for measuring the same property. **D 4175**, D02
- biaxial compression**—compression caused by the application of normal stresses in two perpendicular directions. (ISRM) **D 653**, D18
- biaxial state of stress**—state of stress in which one of the three principal stresses is zero. (ISRM) **D 653**, D18
- bicellular sealant backing**, *n*—a flexible and very compressible extruded shape (usually cylindrical), with a surface skin, that is composed of both open and closed cell material. **C 717**, C24
- bicheroux process**—[archaic] an intermittent process for making plate glass, in which the glass is cast between rolls, onto driven conveyer rolls, or a flat moving table. **C 162**, C14
- bicomponent fiber**, *n*—a fiber consisting of two polymers which are chemically different, physically different, or both. **D 123**, D13
- bicomponent fiber**, *n*—a fiber consisting of two polymers which are chemically different or physically different, or both. **D 4466**, D13
- biconical**, *adj*—see the preferred but not equivalent term, **bidirectional**, as in bidirectional optical measuring system. **E 284**, E12
- biconstituent fiber**, *n*—deprecated term. Use the preferred term **bicomponent bigeneric fiber**. **D 4466**, D13
- bidirectional**, *adj*—see **bidirectional optical measuring system**. **E 284**, E12
- bi-directional**, *adj*—*in reference to bar codes*, symbologies that may be decoded whether scanned in one direction or the reverse direction. **F 1294**, F05
- bidirectional optical measuring system**, *n*—an optical system for measuring the reflecting or transmitting properties of specimens, wherein the illuminator and receiver each subtend small angles at the specimen surface. **E 284**, E12
- biff**—to beat a salted hide that has been placed on a rack, in order to shake loose salt from the hair. **D 1517**, D31
- bifilar eyepiece**—a Filar eyepiece with motion in two mutually perpendicular directions. **E 7**, E04
- bilateral agreement**—recognition arrangement that covers acceptance of each other's results by two parties, (ISO Guide 2). **E 1187**, E36
- bilateral specifications**—specifications that have both an upper and a lower value. **F 1789**, F16
- billet**—refinery shape used for piercing or extrusion into tubular products or for extrusion into rods, bars, and shapes. Circular in cross section, usually 3 to 16 in. (76 to 406 mm) in diameter, normally ranging in weight from 100 to 4200 lb (45 to 1905 kg). **B 846**, B05
- billet**, *n*—a formed shape that may be further worked, or a solid, semifinished, round, or rectangular product that has been hot-worked by forging, rolling, or extrusion. **B 899**, B02
- bill of lading**—contract between the shipper and the carrier whereby the carrier agrees to furnish transportation service subject to the conditions printed on the reverse side of the bill of lading. **E 2135**, E53
- bill of lading, government (GBL)**—a government document used to procure freight and cargo transportation and related services from commercial carriers for the movement of material at government expense. **E 2135**, E53
- bi-modal technique**—Ultrasonic examination method that utilizes both the longitudinal (L-wave) and shear (S-wave) modes of propagation in order to estimate or measure flaw height. **E 1316**, E07
- binary alloy**—any specific composition in a binary system. **E 7**, E04
- binary cycle plant**, *n*—a facility that generates electric power by transferring heat from produced geothermal fluids to a non-aqueous working fluid that vaporizes and causes a turbine to rotate the shaft of a generator. **E 957**, E44
- binary digit**, *n*—a unit of electronic data. (See **bit**.) **F 1457**, F05
- binary elastic scattering event**—*ISS*, the collision between an incident probe ion and a single surface atom in which the total kinetic energy and momentum are conserved. **E 673**, E42
- binary elastic scattering peak**—*ISS*, an increase in the spectrometer detection system response above the background level which can be attributed to binary elastic scattering of the probe ion from a surface atom of a particular mass. **E 673**, E42
- binary separator**—a device that separates a single input feed stream into two output or product streams. **D 5681**, D34
- binary synchronous transmission**, *n*—a form of data sending. (See **binary digit**, **synchronous**, and **asynchronous**.) **F 1457**, F05
- binary system**—the complete series of compositions produced by mixing a pair of components in all proportions. **E 7**, E04
- binder**, *n*—a cementing medium; either a material added to the powder to increase the green strength of the compact, and which is expelled during sintering; or a material (usually of relatively lower melting point) added to a powder mixture for the specific purpose of cementing together powder particles which alone would not sinter into a strong body. **B 243**, B09
- binder**, *n*—a substance added to a granular material to give it workability and green or dry strength. **C 71**, C08
- binder**—(*I*) for a continuous filament process, a constituent of a fiber glass sizing that couples the fiber to the composite matrix.
(2) for insulation, material applied to glass fibers to hold them in a desired arrangement. **C 162**, C14
- binder**—a cementing medium; either a material added to the mixture to increase the green or dry strength as compacted, and which may be expelled during sintering or calcining, or a material added to a mixture for the purpose of cementing together particles. **C 242**, C21
- binder**, *n*—a substance, usually an organic material such as coal tar pitch or petroleum pitch, used to bond the coke or other filler material prior to baking. **C 709**, D02
- binder**—a substance used to bond aggregates or fillers, or both, into a solid mass. **C 904**, C03
- binder**—anything that causes cohesion in loosely assembled substances, such as clay or cement. **D 653**, D18
- binder**, *n*—in a reinforced plastic, the continuous phase which holds together the reinforcement. **D 883**, D20
- binder**, *n*—*in adhesive compounds*, a component of an adhesive composition that is primarily responsible for its mechanical strength and adhesion. **D 907**, D14

binder

binder—an extraneous bonding agent, either organic or inorganic, used to bind particles together to produce a particle board.

D 1554, D07

binder, *n*—a substance, usually an organic material such as coal tar pitch or petroleum pitch, used to bond the coke or other filler material prior to baking.

D 4175, D02

binder—a substance used in dry formulations to produce or enhance cohesion of solid particles.

E 609, E35

binder—the resinous adhesive component of a pigmented coating composition.

F 335, F05

binder—in a reinforced plastic, the continuous phase that holds together the reinforcement.

F 412, F17

binder, *n*—a material employed to bind the image-forming materials to the substrate.

F 1623, F05

binder phase, *n*—*as used in Test Method D 5061*, a continuous solid carbon matrix formed during the thermoplastic deformation of those coal macerals that become plastic during carbonization.

D 121, D05

binder removal, *n*—the chemical or thermal extraction of binder from a compact. Synonymous with **debinding**.

B 243, B09

binders—in reference to cartridge filters, chemicals used to hold, or 'bind', short fibers together in a filter.

D 6161, D19

binder (soil binder)—portion of soil passing No. 40 (425- μ m) U.S. standard sieve,

D 653, D18

binder tape—see **core wrap (binder tape)**.

D 1711, D09

binding—in surface filtration, a build-up of particulates on the filter, restricting fluid flow through the filter at normal pressures.

D 6161, D19

binding energy—the work that must be expended in removing an electron from a given electronic level to a reference level, such as the vacuum level or the Fermi level.

E 673, E42

binding site, *n*—*for pile yarn floor covering*, a place at which the pile yarn is, or can be, bound to the backing fabric.

D 123, D13

binding site, *n*—*for pile yarn floor covering*, a point at which the pile yarn is, or can be, bound to the backing fabric.

D 5684, D13

binocular disparity—the difference in angular deviation between two light rays passing through a transparency, originating from two eye positions located 2.5 in. apart.

F 2429, F07

binodal curve—in a two-dimensional phase diagram, a continuous line consisting of both of the pair of conjugate boundaries of a two-phase equilibrium and which join, without inflection, at a critical point. See **miscibility gap**.

E 7, E04

binomial distribution, *n*—the frequency distribution which has the probability function:

$$P(r) = (n!/[r!(n-r)!])p^r q^{n-r}$$

where:

$P(r)$ = probability of obtaining exactly r "successes" in n independent trials,

p = probability, constant from trial to trial, of obtaining a "success" in a single trial, and

q = $1 - p$.

D 123, D13

bioaccumulation—the net accumulation of a substance by an organism as a result of uptake from all environmental sources.

E 943, E47

bioaccumulation, *n*—the net accumulation of a substance by an organism as a result of uptake from all environmental sources.

E 2114, E06

bioactive agents, *n*—any molecular component in, on, or with the interstices of a device that is intended to elicit a desired tissue or cell response.

F 2312, F04

bioassay—an experiment that uses living whole organisms, tissues or cells to measure the presence, the concentration, or the relative potency of one or more chemicals.

E 943, E47

bioaugmentation—the addition of microorganisms (predominantly bacteria) to increase the biodegradation rate of target pollutants.

F 1600, F20

biobased products, *n*—products fabricated from alternative agricultural materials and forestry materials, or both.

E 2114, E06

bioburden, *n*—the level of microbial contamination (*biomass*) in a system.

D 4175, D02

biocide, *n*—a poisonous substance that can kill living organisms.

D 4175, D02

biocide, *n*—a chemical used to kill bacteria and other microorganisms.

D 4439, D35

biocide—a substance that kills all living organisms.

D 6161, D19

biocompatibility, *n*—a material may be considered biocompatible if the materials perform with an appropriate host response in a specific application.

F 2312, F04

bioconcentration—the net accumulation of a substance by an aquatic organism as a result of uptake directly from aqueous solution.

E 943, E47

bioconversion—a general term describing the use of biological systems to transform one compound into another. Examples are digestion of organic wastes or sewage by microorganisms to produce methane.

E 1705, E48

biodegradable, *adj*—capable of undergoing decomposition into carbon dioxide, methane, water, inorganic compounds, or biomass in which the predominant mechanism is the enzymatic action of microorganisms, that can be measured by standardized tests, in a specified period of time, reflecting available disposal conditions.

D 996, D10

biodegradable, *adj*—capable of decomposing under natural conditions into elements found in nature.

E 2114, E06

biodegradable plastic, *n*—a degradable plastic in which the degradation results from the action of naturally-occurring microorganisms such as bacteria, fungi, and algae.

D 883, D20

biodegradable plastic, *n*—See **degradable plastic**.

D 883, D20

biodegradation, *n*—the process of chemical breakdown or transformation of a material caused by organisms or their enzymes.

D 4175, D02

biodegradation, *n*—the process of chemical breakdown or transformation of a substance caused by organisms or their enzymes.

D 4175, D02

biodegradation, *n*—the process of chemical breakdown or transformation of a substance caused by organisms or their enzymes.

D 4175, D02

biodegradation, *n*—the process of chemical breakdown or transformation of a substance caused by organisms or their enzymes.

D 4175, D02

biodegradation, *n*—the process of chemical breakdown or transformation of a substance caused by organisms or their enzymes.

D 6384, D02

biodegradation—the chemical alteration and breakdown of a substance, usually to smaller products caused by microorganisms or their enzymes.

F 1600, F20

biodeterioration, *n*—the loss of commercial value or performance characteristics, or both, of a product (fuel) or material (fuel system) through biological processes.

D 4175, D02

biodiesel (B-100), *n*—fuel comprised of mono-alkyl esters of long chain fatty acids derived from vegetable oils or animal fats.

D 4175, D02

biodiversity, *n*—the variability among living organisms from all sources including: terrestrial, marine, and other aquatic ecosystems and the ecological complexes of which they are a part; this includes diversity within species, between species and of ecosystems.

E 2114, E06

biofilm, *n*—a film or layer of microorganisms, biopolymers, water, and entrained organic and inorganic debris that forms as a result of microbial growth and proliferation at phase interfaces (liquid-liquid, liquid-solid, liquid-gas, and so forth). (Synonym—**skinnogen**.)

D 4175, D02

biofuel—biomass-derived fuel.

E 1705, E48

biogas—a composition of methane and carbon dioxide and minor

- constituents produced by the digestion of organic substrates in the absence of oxygen. **E 1705, E48**
- biological control agents, *n***—living organisms used to eliminate or regulate the population of other living organisms. **E 2114, E06**
- biological deposits, *n***—deposits of organisms or the products of their life processes. **D 1129, D19**
- biological deposits**—the debris left by organisms as a result of their life processes. **D 6161, D19**
- biological diversity, *n***—see **biodiversity**. **E 2114, E06**
- biological evaluation test (biotest)**—a test which involves exposure of sealed packages to biological indicators and is designed to determine the microbiological integrity of a package under the specific conditions of the test. **F 17, F02**
- biological evaluation test (biotest)**—See Terminology F 17. **F 1327, F02**
- biological monitoring**—analysis of a person's blood or urine, or both, to determine the level of lead contamination in the body. **E 631, E06**
- biological monitoring**—analysis of a person's blood or urine, or both, to determine the level of lead contamination in the body. **E 1605, E06**
- biological monitoring, *n***—the chemical analysis of chemicals or metabolites, or both, from a worker's blood, urine, fingernails, sweat, breath, and so forth. **F 1494, F23**
- biological product, *n***—"any virus, therapeutic serum, toxin, antitoxin, vaccine, blood, blood component or derivative, allergenic product, or analogous product, or arsenamine or its derivatives (or any trivalent organic arsenic compound) applicable to the prevention, treatment, or cure of diseases or injuries of man." **F 2312, F04**
- biomagnification**—the increase in tissue concentration of poorly depurated materials in organisms along a series of predator-prey associations, primarily through the mechanism of dietary accumulation. **E 943, E47**
- biomagnification, *n***—the increase in tissue concentration of poorly depurated materials in organisms along a series of predator-prey associations, primarily through the mechanism of dietary accumulation. **E 2114, E06**
- biomarker, *n***—a biological measure (within organisms) of exposure to, effects of, or susceptibility to, environmental stress using molecular, genetic, biochemical, histological, or physiological techniques. **E 943, E47**
- biomarker assay**—an experiment that uses a molecular, genetic, biochemical, histological, anatomical, or physiological technique to assess exposure, response, or susceptibility of an organisms tissue or cells to environmental stress. **E 943, E47**
- biomass, *n***—any material, excluding fossil fuels, which is or was a living organism or component of a living organism. **D 4175, D02**
- biomass, *n***—density of biological material per unit sample volume, area, or mass (g biomass / g (or / mL or / cm²) sample). **D 4175, D02**
- biomass**—any material which is or was a living organism or excreted from a micro-organism. **D 6161, D19**
- biomass, *n***—any material, excluding fossil fuels, which is or was, a living organism or component of a living organism. **D 6384, D02**
- biomass**—any material, excluding fossil fuels, which is or was a living organism that can be used as a fuel peanut hulls, agricultural waste, corn and other grains, sugar, and bagasse are all examples of biomass. **E 772, E44**
- biomass**—total weight of living matter in a given volume. When considered as an energy source, biomass is further subdivided into: (1) primary biomass, rapidly growing plant material that may be used directly or after a conversion process for the production of energy, and (2) secondary biomass, biomass residues remaining after the production of fiber, food, or other products of agriculture, or biomass by-products from animal husbandry or food preparation that are modified physically rather than chemically. Examples include waste materials from agriculture and forestry industries (manure, sewage, etc.) from which energy may be produced. The above distinction noted between primary and secondary biomass is based on economic factors; these are defined differently in ecological science. **E 1705, E48**
- biomass**—any material, excluding fossil fuels, which is or was a living organism that can be used as a fuel directly or after a conversion process. Peat is not a biomass. **E 1705, E48**
- biomass, *n***—(1) All living material in a given area. (2) Any material which is or was a living organism or excreted from a microorganism. **E 2114, E06**
- biomass fuel**—fuel derived from biomass. **E 772, E44**
- biomass fuel**—fuel derived from biomass. **E 1705, E48**
- biomaterial, *n***—any substance (other than a drug), synthetic or natural, that can be used as a system or part of a system that treats, augments, or replaces any tissue, organ, or function of the body. **F 2312, F04**
- biomolecule, *n***—a biologically active peptide, protein, carbohydrate, vitamin, lipid, or nucleic acid produced by and purified from naturally occurring or recombinant organisms, tissues or cell lines or synthetic analogs of such molecules. A biomolecule may be used as a component of a TEMP. **F 2312, F04**
- biomolecule therapy, *n***—the use of biomolecules to repair, modify, or regenerate the recipient's cells, tissues, or organs or their structure and function, or both. Biomolecule therapy technologies can be applied in tissue engineering to generate TEMPs. **F 2312, F04**
- bioremediation**—the biological degradation treatment of waste sludge and soils to breakdown organic and hydrocarbons. **D 6161, D19**
- bioremediation**—the enhancement of biodegradation. **F 1600, F20**
- bioremediation agents**—inorganic and organic compounds and microorganisms that enhance biological degradation processes, predominantly microbial. **F 1600, F20**
- biostat**—a substance that inhibits biological growth. **D 6161, D19**
- biostimulation**—the addition of microbial nutrients, oxygen, heat, or water, or some combination thereof, to enhance the rate of biodegradation of target pollutants by indigenous species (predominantly bacteria and fungi). **F 1600, F20**
- biosurfactant, *n***—a biologically produced molecule that acts as a soap or detergent. **D 4175, D02**
- bipolar electrode**—an electrode that is not directly connected to the power supply but is so placed in the solution between the anode and the cathode that the part nearest the anode becomes cathodic and the part nearest the cathode becomes anodic. **B 374, B08**
- bipolar field**—see **field, bipolar**. **E 1316, E07**
- bipolar membrane**—synthetic membrane containing two oppositely charged ion-exchange layers that are in contact with each other. **D 6161, D19**
- birdseye, *n***—*in knittedfabrics*, an unintentional tuck stitch. **D 123, D13**
- birdseye, *n***—*in knittedfabrics*, an unintentional tuck stitch. **D 3990, D13**
- birdseyes**—small localized areas in wood with the fibers indented and otherwise contorted to form small circular or elliptical figures remotely resembling birds' eyes on the tangential surface. Common in sugar maple; rare in other hardwood species. **D 9, D07**
- birefringence, *n***—(*double refraction*) a property of anisotropic materials which manifests itself as a splitting of a light ray into components having different vibration directions which are transmitted at different velocities. **D 123, D13**
- birefringence**—the separation of a light beam as it penetrates a doubly refracting material into two diverging beams commonly known as ordinary and extraordinary beams, which may appear in transparencies as rainbowing or the apparent random dispersion of light into its component colors. **F 2429, F07**
- birefringent**—having more than one refractive index. Such materials exhibit alternately bright and dark reflections at 45° intervals during a 360° rotation with plane-polarized light. (See also **anisotropic**.) **E 7, E04**

bisectrix, acute

bisectrix, acute—in biaxial crystals, that principal axis of the ellipsoid of indexes which bisects the smaller angle between the optic axes. **E 175, E41**

bisectrix, obtuse—in biaxial crystals, that principal axis of the ellipsoid of indexes which bisects the larger angle between the optic axes. **E 175, E41**

bison—leather made from hides of the American Bison, commonly referred to as the North American Buffalo, and not from the domesticated Asian or Eastern Water Buffalo. **D 1517, D31**

bispectral fluorescence radiance factor, $b_F(\mu, n)$ —the ratio of the spectral radiance at wavelength λ due to fluorescence from a point on the specimen when irradiated at wavelength μ to the total radiance of the perfectly reflecting diffuser similarly irradiated and viewed (see NPL Report MOM 12). **E 284, E12**

bispectral radiance factor, $b_\lambda(\mu, n)$ —the ratio of the spectral radiance (radiance per unit waveband) at wavelength λ from a point on a specimen when irradiated at wavelength μ to the total (integrated spectral) radiance of the perfectly reflecting diffuser similarly irradiated and viewed.

$$b_\lambda(\mu) = L_\lambda(\mu)/L(\mu)_d$$

E 284, E12

bispectral reflection radiance factor, $b_{R\lambda}(\mu, n)$ —the ratio of the spectral radiance at wavelength λ due to reflection from a point on the specimen when irradiated at wavelength μ to the total radiance of the perfectly reflecting diffuser similarly irradiated and viewed. **E 284, E12**

bispectrometer, n —an optical instrument equipped with a source of irradiation, two monochromators, and a detection system, such that a specimen can be measured at independently-controlled irradiation and viewing wavelengths. The bispectrometer is designed to allow for calibration to provide quantitative determination of the bispectral radiation-transfer properties of the specimen. **E 284, E12**

bisque—a coating of wet-process porcelain enamel that has been dried, but not fired. **C 286, B08**

bisque fire—See *bisque fire* under **firing**. **C 242, C21**

bisulfiting—the treatment of hot solutions of vegetable tanning extracts with sodium bisulfite in order to increase their solubility and rate of take-up by hides. **D 1517, D31**

bisync (BSC), n —an IBM-developed method of binary synchronous transmission. **F 1457, F05**

bit—any device that may be attached to or is an integral part of a drill string and is used as a cutting tool to bore into or penetrate rock or other materials. **D 653, D18**

bit—binary digit. **F 1457, F05**

bite, n —in *building construction in glazing*, the effective structural contact dimension of a structural sealant. **C 717, C24**

bite—See **windows and doors**. **E 631, E06**

bite, chemical, n —stinging experienced primarily in the oral cavity as a result of exposure to substances such as highly carbonated beverages. **E 253, E18**

bit map—a pattern of bits representing the dots in a printed image. **F 1457, F05**

bitter, *adj*—taste produced by substances such as quinine or caffeine when in solution. **E 253, E18**

bitumen, n —a class of black or dark-colored (solid, semisolid, or viscous) cementitious substances, natural or manufactured, composed principally of high molecular weight hydrocarbons, of which asphalts, tars, pitches, and asphaltites are typical. **D 8, D04**

bitumen—(1) a class of amorphous, black or dark-colored, (solid, semi-solid, or viscous) cementitious substances, natural or manufactured, composed principally of high molecular weight hydrocarbons, soluble in carbon disulfide, and found in asphalts, tars, pitches, and asphaltites;

(2) a generic term used to denote any material composed principally of bitumen. **D 1079, D08**

bitumen trap—See **pitch pocket**.

D 1079, D08

bituminized, *adj*—impregnated with bitumen. Example: bituminized fiber pipe. **D 1079, D08**

bituminous, *adj*—containing or treated with bitumen (also *bituminized*); for example: bituminous concrete, bituminized felts and fabrics, bituminous pavement. **D 8, D04**

bituminous, *adj*—containing or treated with bitumen. Examples: bituminous concrete, bituminous felts and fabrics, bituminous pavement. **D 1079, D08**

bituminous bleeding, n —excess bitumen on the surface of the pavement, usually found in the wheel paths. **E 867, E17**

bituminous bleeding, n —excess bitumen on the surface of the pavement, usually found in the wheel paths. **E 1778, E17**

bituminous class—See *bituminous class* under **rank**. **D 121, D05**

bituminous emulsion, n —(1) a suspension of minute globules of bituminous material in water or in an aqueous solution, or (2) a suspension of minute globules of water or of an aqueous solution in a liquid bituminous material. **D 8, D04**

bituminous emulsion—(1) a suspension of minute globules of bituminous material in water or in an aqueous solution; (2) a suspension of minute globules of water or of an aqueous solution in a liquid bituminous material (invert emulsion). **D 1079, D08**

bituminous grout—a mixture of bituminous material and fine sand that will flow into place without mechanical manipulation when heated. **D 1079, D08**

bituminous pavement, n —a pavement comprising an upper layer or layers of aggregate mixed with a bituminous binder, (such as asphalt, coal tars and natural tars) and surface treatments such as chip seals, slurry seals, sand seals, and cape seals are also included. **E 867, E17**

bituminous pavement, n —a pavement comprising an upper layer or layers of aggregate mixed with a bituminous binder, such as asphalt, coal tars, and natural tars for purposes of this terminology; surface treatments such as chip seals, slurry seals, sand seals, and cape seals are also included. **E 1778, E17**

bituminous varnish—under **varnish**, see *bituminous varnish*.

D 16, D01

bivariant equilibrium—a stable state among a number of phases equal to the number of components in a system and in which any two of the external variables (temperature, pressure, or concentrations) may be varied, at will, without necessarily causing a change in the number of phases; sometimes called *divariant equilibrium*. **E 7, E04**

black, *adj*—color description applied to opaque objects that are highly light absorbing throughout the visible spectrum. **D 2946, C17**

blackboard enamel—see **chalkboard enamel**. **C 286, B08**

blackbody, n —the ideal, perfect emitter and absorber of thermal radiation. It emits radiant energy at each wavelength at the maximum rate possible as a consequence of its temperature, and absorbs all incident radiance. **C 168, C16**

blackbody—the ideal, perfect emitter and absorber of thermal radiation which emits radiant energy at the maximum rate possible, as a consequence of its temperature, and absorbs all incident radiation. **C 242, C21**

blackbody, n —see the preferred term, **full radiator**. **E 284, E12**

blackbody, n —the perfect or ideal source of thermal radiant power having a spectral distribution described by the Planck equation. **E 344, E20**

blackbody, n —a reference source of infrared radiation made in the shape of a cavity and characterized by precisely known temperature of the cavity walls and having effective emissivity at the cavity opening arbitrarily considered equal to unity. **E 344, E20**

blackbody—a hypothetical “body” that completely absorbs all incident radiant energy, independent of wavelength and direction; that is, one which neither reflects nor transmits any of the incident

radiant energy. It is the emitter of electromagnetic radiant energy which, at a given temperature, presents the maximum spectral density of radiant exitance or radiance at all wavelengths.

NOTE—No real material is a blackbody. A completely enclosed cavity with opaque walls at a uniform temperature contains blackbody radiation. A blackbody radiator can be approximated in the laboratory to any desired degree of approximation by a furnace containing a cavity with opaque walls at a uniform temperature, that contains an aperture through which the blackbody radiation is observed. The degree of approximation to a true blackbody radiator is inversely related to the ratio of the area of the aperture to the area of the interior wall of the cavity. E 772, E44

blackbody—an ideal thermal radiator (emissivity = 1.0) that emits and absorbs all of the available thermal radiation at a given temperature. E 1316, E07

blackbody equivalent temperature—the apparent temperature of an object as determined from the measured radiance and the assumption that it is an ideal blackbody with emissivity of 1.0. E 1316, E07

blackbody radiant energy—see **radiant energy, blackbody**. E 772, E44

blackbody temperature, *n*—the temperature of a perfect radiator—a surface with an emissivity of unity and, therefore, a reflectivity of zero. E 176, E05

blackbody temperature, t_{BB} , *n*—temperature of blackbody cavity walls as measured by an imbedded or immersed *contact thermometer*. E 344, E20

black box, *n*—a thin metal box painted flat black on the outside only exclusive of the bottom surface with an open top where the flat test specimens to be exposed constitute the top surface of the box; the box is equipped with mounting strips to hold the test specimens firmly in place; the top surface of the box must be completely filled at all times; any blank spaces on the top surface must be occupied by flat black “dummy” panels to maintain correct operating condition. G 113, G03

black box under glass, *n*—a glass covered enclosure or cabinet of any convenient size. It shall be constructed of corrosion resistant metal and be enclosed to prevent ambient air from circulating over the samples. Exterior non-glass surfaces shall be painted black. The interior shall remain unpainted. G 113, G03

black density—see **image density**. F 335, F05

black edging—a black porcelain enamel applied over the ground coat and exposed in specified areas by brushing the cover coat bisque prior to firing (see also **edging**). C 286, B08

black felt, *n*—those classifications of felt manufactured to various shades of the color black. D 123, D13

black felt, *n*—those classifications of felt manufactured to various shades of the color black. D 4845, D13

black light—electromagnetic radiation in the near ultraviolet range of wavelength (330 to 390 nm) (3300 to 3900 Å). E 1316, E07

black light filter—a filter that transmits near ultraviolet radiation while absorbing other wavelengths. E 1316, E07

black marking—black marks on a flooring surface usually caused by the impact of the soles and heels of footwear. D 2825, D21

black marking—black smudges on the surface of the pultruded product that cannot be removed by cleaning or scrubbing or wiping with solvent.

NOTE—Black marking results from excessive pressures in the die when the pultrusion is rubbing against soft or unchromed die surfaces. D 3918, D20

black oil, *n*—lubricant containing asphaltic materials. Black oils are used in heavy-duty equipment applications, such as mining and quarrying, where extra adhesiveness is desired. D 4175, D02

black oxide—a finish on metal produced by immersing a metal in hot oxidizing salts or salt solutions. B 374, B08

black panel thermometer, *n*—a temperature measuring device consisting of a metal panel, having a black coating which absorbs

all wavelengths uniformly, with a thermal sensitive element firmly attached to the center of the exposed surface. The black panel thermometer is used to control an artificial weathering device and to provide an estimate of the maximum temperature of samples exposed to a radiant energy source. G 113, G03

black sidewall, *n*—a sidewall on which only black compounds comprise the outer visible surface of the tire. F 538, F09

black speck—a defect that appears in the fired cover coat as a small dark spot. C 286, B08

black write—a process in electrostatic printing where the photoconductive element is charged with a charge of the same sign as that of the toner. A light beam, used like a “stylus” is used to discharge only those areas that are to receive toner to form the image. In the development process, the charged background areas repel the like charged toner to the discharged areas on the photoconductor. F 909, F05

bladder temperature, *n*—temperature of the interior of urinary bladder as measured by a *contact thermometer*. E 344, E20

blade—the segment that contains the cutting edge which may be with or without serrations. F 1078, F04

blade alignment—the positioning of the blades with respect to tip match-up and blade setting. F 1078, F04

blade clincher—thin clinching arm; usually designed for insertion between layers of corrugated boards. F 592, F16

blaine fineness—the fineness of powdered materials, such as cement and pozzolans, expressed as surface area usually in square centimetres per gram. D 653, D18

blank, *n*—a pressed, presintered, or fully sintered compact, usually in the unfinished condition, requiring cutting, machining, or some other operation to give it its final shape. B 243, B09

blank—a piece of flat product intended for subsequent fabrication by forming, bending, cupping, drawing, hot pressing, and so forth. B 846, B05

blank—(1) a preliminary shape from which a finished article is further formed, molded, or cut.

(2) a semi-finished piece of glass for making an optical element, such as a lens or prism. Also known as a pressing. C 162, C14

blank—the piece cut from metal sheet that is to be used in forming the finished article. C 286, B08

blank, *n*—matrix carried through all or part of the analytical process, where the analyte is not present, or where the analyte response is suppressed.

NOTE—A blank must be appropriate to the analytical process it is being used with.

NOTE—A blank is typically used to monitor contamination or to establish a baseline for quantitation. D 1129, D19

blank, *n*—a portion of a rubber compound of suitable volume to fill the cavity of a mold. D 1566, D11

blank, *n*—in *biodegradability testing*, a test system containing all system components with the exception of the test substance. D 4175, D02

blank, *n*—in *biodegradability testing*, a test system containing all system components with the exception of the test material. D 6384, D02

blank—the measured value obtained when a specific component is not present during the measurement. E 2161, E37

blank, *n*—the contamination level, sometimes referred to as the background level, of a fluid when the test coupon is omitted. G 126, G04

blank carburizing, *n*—simulating the **carburizing** operation without introducing carbon. A 941, A01

blanket, *n*—flexible insulation product, supplied rolled or flat. C 168, C16

blanket, *n*—for *bedding*, an unquilted fabric covering designed primarily to provide thermal insulation. D 123, D13

blanket, n

blanket, n—for bedding, an unquilted fabric covering designed primarily to provide thermal insulation. **D 7023, D13**

blanket feed—a method for charging batch designed to produce an even distribution of batch across the width of the melter. **C 162, C14**

blanket grouting—a method in which relatively closely spaced shallow holes are drilled and grouted on a grid pattern over an area, for the purpose of making the upper portions of the bedrock stronger and less pervious. **D 653, D18**

blanket insulation, n—a relatively flat and flexible insulation in coherent sheet form furnished in units of substantial area. **C 168, C16**

blanket insulation, metal mesh, n—blanket insulation covered by flexible metal-mesh facings attached on one or both sides. **C 168, C16**

blanket mark—See **sanforizing mark**. **D 3990, D13**

blanket roll-up—a container made from fabric or similar material and specifically designed to protect the blanket from damage during storage or transportation. **F 819, F18**

blanking band—a band of uniform height with its longitudinal center positioned optimally between the highs and lows of the surface record depicting at least 100 ft (30 m) of pavement. **E 867, E17**

blank mold—the metal mold that first shapes the glass in the manufacture of hollow ware. **C 162, C14**

blank nitriding, n—simulating the nitriding operation without introducing nitrogen. **A 941, A01**

blank sample—unexposed specimen of the *medium* used in testing, such as a wipe or a filter, which is analyzed with other samples to determine whether samples are either (1) contaminated before collection (for example, in the field, or at the testing site), or are (2) contaminated after collection (for example, during transportation to the laboratory or in the laboratory), or both. Also called a *media blank*, or a *dummy specimen*. **E 631, E06**

blank sample—unexposed specimen of the *medium* used in testing, such as a wipe or a filter, which is analyzed with other samples to determine whether samples are either (1) contaminated before collection (for example, in the field, or at the testing site), or are (2) contaminated after collection (for example, during transportation to the laboratory or in the laboratory), or both. Also called a *media blank*, or a *dummy specimen*. **E 1605, E06**

blast-furnace slag, n—the nonmetallic product, consisting essentially of silicates and aluminosilicates of calcium and other bases, that is developed in a molten condition simultaneously with iron in a blast furnace. **C 125, C09**

blast-furnace slag, n—the nonmetallic product, consisting essentially of silicates and aluminosilicates of calcium and other bases, that is developed in a molten condition simultaneously with iron in a blast furnace. **C 219, C01**

blast-furnace slag, n—the nonmetallic product, consisting essentially of silicates and aluminosilicates of lime and of other bases, that is developed simultaneously with iron in a blast furnace. **D 8, D04**

blast-furnace slag—the nonmetallic product, consisting essentially of silicates and aluminosilicates of calcium and other bases, that is developed in a molten condition simultaneously with iron in a blast furnace. **D 1079, D08**

blastability—index value of the resistance of a rock formation to blasting. (ISRM) **D 653, D18**

blasting—See **sand blasting; grit blasting; wet blasting**. **B 374, B08**

blasting—haze around a letter, word or image in the form of fine spotting or speckling. **F 335, F05**

blasting cap (detonator, initiator)—a small tube containing a flashing mixture for firing explosives. (ISRM) **D 653, D18**

blast nozzle—see **pneumatic atomizer**. **E 1620, E29**

bleach, n—in care of textiles, a product for brightening and aiding in the removal of soils and stains from textile materials by oxidation that is inclusive of both chlorine and non-chlorine products. **D 123, D13**

bleach, n—in care of textiles, a product for brightening and aiding the removal of soils and stains from textile materials by oxidation that is inclusive of both chlorine and non-chlorine products. **D 3136, D13**

bleachability—the capacity of a pulp to bleach to a given whiteness. This is approximately and indirectly related to lignin content. **D 1695, D01**

bleached, adj—having been subjected to the process of bleaching. **D 1968, D06**

bleached specimen, n—specimen whose absorbance has been decreased by chemical or radiant means. **E 284, E12**

bleaching—(1) the process of removing oxidized tannins and insoluble materials from the surface layers of leather, in order to prevent crackiness of the grain. It is performed by dipping the leather in a weak alkaline solution to render the tannin readily soluble, dipping in water, neutralizing in weak acid solution and washing.

(2) the process of lightening the color of chrome leather by treating with synthetic tannins or precipitating white pigment in the surface of the leather. **D 1517, D31**

bleaching, n—a process involving a chemical or biological treatment of pulp, primarily to increase whiteness and brightness; such a process may alter or remove noncellulosic materials, such as but not limited to lignin, resin, and colorants. **D 1968, D06**

bleed, n—the spreading or running of a dye or pigment color by the action of a solvent. **D 6488, D01**

bleed, n—the spreading of ink into an unwanted area on the printed sheet. **D 6488, D01**

bleed, n—ink feathering of one color into an adjacent color over time. **F 1857, F05**

bleed (bleeding), n—of lubricating greases, the separation of a liquid lubricant from a lubricating grease for any cause. **D 4175, D02**

bleeder cloth—a nonstructural layer of material used in the manufacture of composite assemblies to allow the escape of excess gas and resin during cure. **E 631, E06**

bleeder cloth—a nonstructural layer of material used in the manufacture of composite assemblies to allow the escape of excess gas and resin during cure. **E 1749, E06**

bleeding, n—the autogenous flow of mixing water within, or its emergence from, newly placed concrete or mortar caused by the settlement of the solid materials within the mass, also called water gain. **C 125, C09**

bleeding, n—the diffusion of coloring matter through a coating from the substrate; also, the discoloration arising from such diffusion. In the case of printing ink, the spreading or running of a pigment color by the action of a solvent such as water or alcohol. **D 16, D01**

bleeding—in grouting, the autogeneous flow of mixing water within, or its emergence from, newly placed grout caused by the settlement of the solid materials within the mass. **D 653, D18**

bleeding—the transfer of materials exuded from leather to other materials that come in contact with it. **D 1517, D31**

bleeding, n—the exuding of a liquid compounding material from the surface of a vulcanized or unvulcanized rubber. **D 1566, D11**

bleeding, n—the unintentional transfer of coloring matter from one medium to or through another. **E 284, E12**

bleeding of coating—the diffusion of coloring matter through a substrate from the coating, or to copy paper from the coating. **F 221, F05**

bleeding rate—in grouting, the rate at which water is released from grout by bleeding. **D 653, D18**

bleed of image—spread or diffusion of an image with time. **F 221, F05**

bleedout—the action of an entrapped liquid penetrant in surfacing from discontinuities to form indications. **E 1316, E07**

bleed through—glue or components of glue that have seeped through the outer layer or ply of a glued wood product and that show as a blemish or discoloration on the surface. **D 1038, D07**

bleedthrough, *n*—*for coated inflatable restraint fabrics*, the presence of coating material on the uncoated side, between two yarns, without covering either yarn. **D 6799**, D13

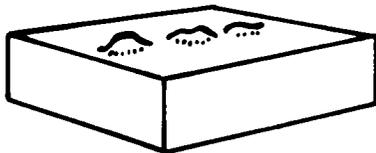

bleed through, *n*—the diffusion of ink through the substrate. **F 1857**, F05

blemish—in dry process enameling, an insignificant imperfection in the porcelain enamel surface. **C 286**, B08

blemish—in grading lumber, anything marring the appearance. May not be classified as a defect. **D 9**, D07

blemish—anything marring the appearance of the veneer that is not classifiable as a defect. **D 1038**, D07

blemish—strained or discolored area attributable to normal composition or forming, or both. (See also **inclusion**.)

F 109, C21

blend—a combining of various cementitious materials. **C 822**, C13

blended hydraulic cement, *n*—a hydraulic cement consisting of two or more inorganic constituents (at least one of which is not portland cement or portland cement clinker) which separately or in combination contribute to the strength-gaining properties of the cement, (made with or without other constituents, processing additions and functional additions, by intergrinding or other blending).

portland blast-furnace slag cement, *n*—a hydraulic cement consisting of an intimately interground mixture of portland cement clinker and granulated blast-furnace slag or an intimate and uniform blend of portland cement and fine granulated blast-furnace slag in which the amount of the slag constituent is within specified limits.

portland-pozzolan cement, *n*—a hydraulic cement consisting of an intimate and uniform blend of portland cement or portland blast-furnace slag cement and fine pozzolan produced by intergrinding portland cement clinker and pozzolan, by blending portland cement or portland blast-furnace slag cement and finely divided pozzolan, or a combination of intergrinding and blending, in which the amount of the pozzolan constituent is within specified limits. **C 219**, C01

blended soap—under **soap**, see **blended soap**. **D 459**, D12

blending, *n*—the thorough intermingling of powders of the same nominal composition (not to be confused with mixing). **B 243**, B09

blending, *n*—*in hydraulic cement manufacture*, a process in which two or more ingredients are combined into an intimate and uniform product of finely divided dry material, as by intergrinding or mixing, or both. **C 219**, C01

blending-batch—{archaic} stepwise changes in batch composition to arrive at the final change in finished glass. **C 162**, C14

blending plan, *n*—the instructions for mixing fibers during specimen preparation. **D 123**, D13

blending plan, *n*—the instructions for mixing fibers during specimen preparation. **D 7139**, D13

blind clinch—clinch between the layers of corrugated boards, usually buried with wide-crown retractable anvil tools. **F 592**, F16

blind hem stitch, *n*—*in home sewing*, a complex machine stitch pattern consisting of small groups of straight or narrow zigzag stitches separated by a wide zigzag stitch unit at consistent intervals. **D 123**, D13

blind hem stitch, *n*—*in home sewing* a complex machine stitch pattern consisting of small groups of straight or narrow zigzag stitches separated by a wide zigzag stitch unit at consistent intervals. **D 5646**, D13

blinding, *n*—*for geotextiles*, the condition where soil particles block

the surface openings of the fabric, thereby reducing the hydraulic conductivity of the system. **D 4439**, D35

blinding—placing selected material to completely cover the pipe or tubing. **F 412**, F17

blind ink—See **reflective ink**. **F 149**, F05

blind nailing—the use of nails that are not exposed to the weather in the finished roofing. **D 1079**, D08

blind reference oil, *n*—a reference oil, the identity of which is unknown by the test facility. **D 4175**, D02

blip, *n*—*for inflatable restraint fabrics*, any short, irregularly shaped or textured portion of an individual multifilament yarn that has been woven into the fabric, including slough offs, stripbacks, fuzz balls, snarls, and slubs. **D 6799**, D13

blister—a dome-shaped imperfection or defect, resulting from loss of adhesion between a metallic deposit and the substrate. **B 374**, B08

blister—a relatively large gaseous inclusion in glass. **C 162**, C14

blister—a defect caused by gas evolution consisting of a bubble that forms during fusion and remains when the porcelain enamel solidifies. **C 286**, B08

blister—a convex, raised area on the pipe surface indicating an internal separation. **C 896**, C04

blister, *n*—*in bonded, fused, or laminated fabrics*, a bulge, swelling, or similar surface condition on either the face fabric or the backing fabric characterized by the fabric being raised from the plane of the underlying component over a limited area to give a puffy appearance. **D 123**, D13

blister, *n*—an imperfection, a rounded elevation of the surface of a plastic, with boundaries that may be more or less sharply defined, somewhat resembling in shape a blister on the human skin. **D 883**, D20

blister, *n*—an elevation of the surface of varied contour and dimensions, with a void beneath it. **D 907**, D14

blister—*in plywood*, an elevation of the surface of an adhering (separation between plies), somewhat resembling in shape a blister on the human skin; its boundaries may be indefinitely outlined and it may have burst or become flattened. **D 1038**, D07

blister—(1) a raised portion of a roofing membrane resulting from local internal pressure;

(2) the similarly formed protuberances in coated prepared roofing. **D 1079**, D08

blister—a rounded elevation of the pultruded surface with boundaries that may be more or less sharply defined.

NOTE—The rounded elevation somewhat resembles in shape a blister on the surface of human skin. Blisters may exist within the pultrusion as a hollow delaminated area (usually gas-filled) under a raised portion of the surface. **D 3918**, D20

blister—bubble or gaseous inclusion at the surface which if broken could form a pit, pock, or hole.

F 109, C21

blister, *n*—rounded elevation of the surface of a plastic, with boundaries that may be more or less sharply defined, somewhat resembling in shape a blister on the human skin. (D20) **F 412**, F17

blister, *n*—in sheet plastics, an imperfection, a rounded elevation of the surface, with boundaries that may be more or less sharply defined, somewhat resembling in shape a blister on the human skin. **F 1251**, F04

blister crack, *n*—*in a rigid die system*, typically small defects (star burst) over or around a bump or blister. **B 243**, B09

blistered compact, *n*—a sintered object characterized by having blisters or eruptions on the surface. **B 243**, B09

blistering—the development during firing of enclosed or broken

blistering

macroscopic vesicles or bubbles in a body, or in a glaze or other coating. C 242, C21

blistering, *n*—the formation of small air pockets under the printed paper surface. D 6488, D01

blistering, *n*—an enclosed raised spot or air bubble on the paper surface that can be caused by moisture trapped during the drying process. D 6488, D01

blistering resistance, *n*—the ability of a coating to resist the formation in the film of dome-shaped, liquid- or gas-filled projections resulting from local loss of adhesion and lifting of the film from the previously applied coating or the substrate. D 16, D01

blister pack—See **pack**. D 996, D10

blister(s), *n*—surface or internal imperfection(s), produced by entrapped gases or other volatiles, during the manufacture of rubber articles. D 1566, D11

blotch—{archaic} an imperfection resulting from incompletely grinding plate glass, caused by a low place in the plate which retains part of the original rough surface. C 162, C14

blotting—substantial swelling produced by a heat treatment that causes the formation of a vesicular structure. C 242, C21

blotting of refractories, *v*—substantial swelling produced by a heat treatment that causes the formation of a vesicular structure. C 71, C08

Bloch wall—a domain wall in which the magnetic moment at any point is substantially parallel to the wall surface. See also **domain wall**. A 340, A06

block, *n*—*in experimenting*, a group of units that is relatively homogeneous within itself, but may differ from other similar groups. D 123, D13

block, *v*—to align warp and weft yarns at right angles, by some form of manipulation. D 123, D13

block—a grouping of devices in a single unit having common control. See **array**, **bank**, **train**. D 6161, D19

block, *n*—*for cutting standard def.*, a sequence of commands within a cut file and which activate a response by the automated fabric cutter. D 6963, D13

block—*in a honeycomb core material*, a single production unit of honeycomb before slicing. E 631, E06

block—*in a honeycomb core material*, a single production unit of honeycomb before slicing. E 1749, E06

block—*in fatigue loading*, a specified number of constant amplitude loading cycles applied consecutively, or a spectrum loading sequence of finite length that is repeated identically. E 1823, E08

block, *n*—synonym for *element*. F 538, F09

block, *n*—a group of data transmitted as a unit. F 1457, F05

block circuit diagram, *n*—an illustration of the interconnection of the major elements of a system, each element being presented by a block. (See **BCD**.) F 1457, F05

block copolymer—an essentially linear copolymer in which there are repeated sequences of polymeric segments of different chemical structure. D 883, D20

block copolymer, *n*—an essentially linear copolymer in which there are repeated sequences of polymeric segments of different chemical structure. F 1251, F04

block cracking, *n*—a pattern of cracks that divide the pavement into approximately rectangular pieces, ranging in size from approximately 0.1 m² to 10 m² (1 to 100 ft²). E 867, E17

block cracking, *n*—a pattern of cracks that divide the pavement into approximately rectangular pieces, ranging in size from approximately 0.1 m² to 1.0 m² (1 ft² to 100 ft²). E 1778, E17

blocked curing agent, *n*—a curing or hardening agent temporarily rendered unreactive, which can be reactivated as desired by physical or chemical means. D 907, D14

block flow—the distance an adhesive, sealant, or coating will sag on a vertical surface in a given period of time. Also referred to as *slump*. E 631, E06

block flow—the distance an adhesive, sealant, or coating will sag on

a vertical surface in a given period of time. Also referred to as *slump*. E 1749, E06

blocking—(1) shaping a gather of glass in a cavity of wood or metal.

(2) *archaic*, promoting mixing and fining of glass by immersion of a wooden block or other object to create bubbles.

(3) reprocessing to remove surface imperfections.

(4) *archaic*, mounting of glass for grinding and polishing.

(5) *archaic*, idling a furnace at reduced temperatures.

See **hothold**.

C 162, C14

blocking, *n*—*for coatings other than powder coatings*, the sticking of a coated surface to an adjacent surface when the two surfaces have been in contact for an extended period of time. D 16, D01

blocking, *n*—*of coated fiber glass yarn solar screening*, an undesired adhesion between touching layers of a material, such as occurs under moderate pressure, during storage or use. D 123, D13

blocking, *n*—the measurement of the development of surface tack and the thermal softening point of the material. D 123, D13

blocking—wood blocks placed between the excavated surface of a tunnel or shaft and the main bracing system. (ISRM) D 653, D18

blocking, *n*—unintentional adhesion between plastic films or between a film and another surface. D 883, D20

blocking, *n*—an undesired adhesion between touching layers of a material, such as occurs under moderate pressure during storage or use. D 907, D14

blocking—See **loading**.

D 996, D10

blocking—(1) wood built into a roofing system above the deck and below the membrane and flashing to (a) stiffen the deck around an opening, (b) act as a stop for insulation, (c) serve as a nailer for attachment of the membrane or flashing.

(2) wood cross-members installed between rafters or joists to provide support at cross-joints between deck panels.

(3) cohesion or adhesion between similar or dissimilar materials in roll or sheet form that may interfere with the satisfactory and efficient use of the material. D 1079, D08

blocking—the adhesion between touching layers of leather such as occurs under moderate pressures during storage or use.

D 1517, D31

blocking, *n*—*of paper or paperboard*, undesired cohesion or adhesion that interferes with the satisfactory and efficient use of the material.

D 1968, D06

blocking, *n*—an undesired adhesion between sheets of printed material that might occur under moderate pressure or increased temperature, or both, while in storage or in use. D 6488, D01

blocking, *n*—*of coated fiber glass yarn solar screening*, an undesired adhesion between touching layers of a material. Such as occurs under moderate pressure, during storage or use. D 7018, D13

blocking, *n*—the measurement of the development of surface tack and the thermal softening point of the material. D 7023, D13

blocking—the tendency for coated sheets to stick together under pressure. (F 335) F 221, F05

blocking—the tendency for coated sheets to stick together under pressure. F 335, F05

blocking, *n*—image is transferred upon contact from one substrate to another substrate which may cause the images or substrate coatings, or both, to stick to one another. See also **transference**, **offset**. F 1857, F05

blocking geometry—*EIA*, experimental situation wherein the atom rows or planes of a single crystal target are aligned parallel to a vector from the specimen to the detector. E 673, E42

blocking or masking—surrounding specimens or covering their sections with absorptive material. E 1316, E07

blocking resistance, *n*—*of paper or paperboard*, the capacity of a given paper or paperboard to resist blocking. See **blocking**.

D 1968, D06

block insulation, *n*—rigid insulation preformed into rectangular units. C 168, C16

block mold—a one-piece mold.

C 162, C14

block reek, rake—{archaic} a scratch imperfection caused by cullet lodged in the felt in the polishing operation. **C 162, C14**

blood-lead level (blood level)—concentration of lead in the blood, 1 $\mu\text{mole/L} = 20.72 \mu\text{g/mL}$. **E 631, E06**

blood-lead level (blood level)—concentration of lead in the blood, 1 $\mu\text{mole/L} = 20.72 \mu\text{g/mL}$. **E 1605, E06**

blood-lead testing—testing by laboratories to determine the blood-lead level. **E 631, E06**

bloom—a visible exudation or efflorescence on a surface. **B 374, B08**

bloom—(1) a visible surface film resulting from attack by the atmosphere or from the deposition of particulate or vapor condensates. (See also **smoked**.)
(2) a blemish in float glass appearing on the bottom (tin contact) surface after reheating as a result of the presence of tin diffused into the surface. **C 162, C14**

bloom, *n*—in *buildingconstruction*, a substance formed by blooming. **C 717, C24**

bloom, *n*—a visible exudation or efflorescence on the surface of a material. **D 883, D20**

bloom—a light-colored deposit of ellagic acid appearing on the grain surface of leather tanned with certain pyrogallo tannins, such as myrabolans, valonia, and dividivi. The appearance may be objectionable for some purposes, but bloom does not significantly affect the other physical properties of the leather. **D 1517, D31**

bloom—a condition in which moisture has condensed upon and is being trapped by a polish film, rendering a haze over the surface. **D 2825, D21**

bloom, *n*—for *asbestos-cement*, see **efflorescence (bloom)**. **D 2946, C17**

bloom, *n*—the scattering of light in directions near the specular angle of reflection by a deposit on or exudation from a specimen. **E 284, E12**

bloom, *n*—a visible exudation or efflorescence on the surface of a material. (D20) **F 412, F17**

bloom, *n*—a visible exudation or efflorescence of a performance additive on the surface of a material. **F 1251, F04**

blooming, *v*—in *buildingconstruction*, movement or diffusion of a component such as a plasticizer, monomer, unreacted polymer or other formulation ingredient to a sealant, coating, or membrane surface. **C 717, C24**

blooming—in radiologic real-time imaging, an undesirable condition exhibited by some image conversion devices and television pickup tubes brought about by exceeding the allowable input brightness for the device, causing the image to go into saturation, producing a fuzzy image of degraded spatial resolution and grey scale rendition. **E 1316, E07**

blooming/blushing, *n*—a foggy appearance in a printed ink film commonly caused by incompatibility of the ingredients in the ink. **D 6488, D01**

blooming, fiber—a pultrusion surface condition exhibiting a fiber prominence or fiber show that usually has a white or bleached color and a sparkling appearance.

NOTE—The surface generally feels rough when touched by the fingers and is of superficial thickness easily removed by buffing or light sanding. **D 3918, D20**

blooming, undercure—a dull and bleached surface color that is evident in pultruded material not exposed to the weather.

NOTE—This condition is usually the result of insufficient surface cure. **D 3918, D20**

bloom (rubber), *n*—a liquid or solid material that has migrated to the surface of a rubber and generally changes the surface appearance. **D 1566, D11**

blotch, *n*—an irregularly shaped offcolored area. **D 123, D13**

blotch, *n*—an offcolored area of any shape caused by grease or oil. (*Syn.* **oil spot**) **D 3990, D13**

blotting—the action of the developer in soaking up the penetrant from the discontinuity to accelerate bleedout. **E 1316, E07**

blow, *n*—the volume expansion that occurs during the production of cellular or sponge rubber. **D 1566, D11**

blow-and-blow process—the process of forming hollow ware in which both the preliminary and final shapes are formed by air pressure. **C 162, C14**

blow back—the enlargement of a minified radiograph to its original size by use of an optical direct reader. **E 1316, E07**

blowby, *n*—in *internalcombustion engines*, the combustion products and unburned air-and-fuel mixture that enter the crankcase. **D 4175, D02**

blowby, *n*—in *internalcombustion engines*, that portion of the combustion products and unburned air/fuel mixture which leaks past piston rings into the engine crankcase during operation. **D 4175, D02**

blower—one who forms glass by blowing. (See also **gaffer**.) **C 162, C14**

blower door, *n*—a fan pressurization device incorporating a controllable fan and instruments for airflow measurement and building pressure difference measurement that mounts securely in a door or other opening. **E 631, E06**

blow head—part of a forming machine serving to introduce air under pressure to blow any hollow glass article. **C 162, C14**

blow hole—a unintended hole or void in a metal casting resulting from entrained gases. **E 631, E06**

blowholes—a hole produced in a casting by gas which was trapped during solidification. **E 7, E04**

blow-in—the inflow of ground water and unconsolidated material into a borehole or casing caused by differential hydraulic heads; that is, caused by the presence of a greater hydraulic head outside of a borehole/casing than inside. **D 653, D18**

blowing agent—a compounding ingredient used to produce gas by chemical or thermal action, or both, in manufacture of hollow or cellular articles. **D 883, D20**

blowing agent, *n*—a compounding material used to produce gas by chemical or physical action, or both, in the manufacture of hollow or cellular articles. **D 1566, D11**

blowing agent—a compounding ingredient used to produce gas by chemical or thermal action, or both, in manufacture of hollow or cellular articles. (D20). **F 412, F17**

blowing iron—See **blowpipe**. **C 162, C14**

blow mold—the metal mold in which a blown glass article is finally shaped. **C 162, C14**

blow molding—a method of fabrication in which a heated parison is forced into the shape of a mold cavity by internal gas pressure. **D 883, D20**

blow molding—a method of fabrication in which a parison (hollow tube) is forced into the shape of the mold cavity by internal gas pressure. (D20) **F 412, F17**

blown glass—glassware shaped by air pressure, as by compressed air or by mouth blowing. **C 162, C14**

blow-off resistance—the degree to which a deposited layer of powder resists being blown off by a standard jet of air. **C 286, B08**

blowout—the displacement and lengthening of an arc to facilitate its extinction. The blowout effect can be achieved by a magnetic field, air blast, etc. **B 542, B02**

blowout—a sudden or violent uncontrolled escape of fluids or gas, or both, from a borehole. **D 653, D18**

blowout, *n*—the extinguishing of the arc caused by a magnetic field. **F 819, F18**

blow-over—the thin-walled bubble formed above a blow mold in hand-shop operation to facilitate bursting-off. **C 162, C14**

blowpipe—the pipe used by a glassmaker for gathering and blowing by mouth. **C 162, C14**

blowups, *n*—localized upward movement of the pavement surface at transverse joints or cracks, often accompanied with shattering of the concrete in that area. **E 867, E17**

blowups, *n*—localized upward movement of the pavement surface at

blowups, *n*

transverse joints or cracks, often accompanied with shattering of the concrete in that area. **E 1778, E17**

blue—usually in the phrase “in the blue,” applied to hides or skins that have been chrome-tanned but not dyed nor fat-liquored. **D 1517, D31**

blue—that temperature at which the intensity of 470 nm light reflected by the liquid crystal is maximum, symbolized as T^{470} . **E 344, E20**

blueberry—See **strawberry**. **D 1079, D08**

blued—heated to result in oxidized bluish surface of steel nail. **F 547, F16**

blue dip—a solution, once widely used, containing a mercury compound used to deposit mercury upon a metal by immersion, usually prior to silver plating. **B 374, B08**

blue enamel—(1) in dry-process porcelain enameling, an area of enamel coating so thin that it appears blue in color.

(2) In wet-process enameling, a cover coat applied too thin to hide the substrate. **C 286, B08**

bluing—the formation of a thin oxide film on steel, either by heating in air, or by immersion in oxidizing solutions. **B 374, B08**

bluestone—a dense, hard, fine-grained, commonly feldspathic sandstone of medium to dark greenish-gray or bluish-gray color that may split readily along original bedding planes to form thin slabs (flagstone). The term bluestone is applied principally to stone with the above characteristics quarried in the eastern United States. **C 119, C18**

bluing, *n*—subjecting the scale-free surface of a steel object to the action of air, steam, or other agents at a suitable temperature, thereby forming a thin blue film of oxide and improving the object's appearance and corrosion resistance. **A 941, A01**

blunging—the wet process of blending, or suspending ceramic material in liquid by agitation. **C 242, C21**

blunt chisel point, short chisel point—chisel point with large included angle. **F 547, F16**

blunt diamond point, short diamond point—diamond point with large included angle. **F 547, F16**

blunted-point—point end of nail purposely dulled by nail user prior to driving of nail. (See **dullpoint**.) **F 547, F16**

blunting line—*in fracturetesting*, a line that approximates apparent crack advance due to crack-tip blunting in the absence of slow stable crack tearing. The line is defined based on the assumption that the crack advance is equal to one half of the crack-tip opening displacement. This estimate of pseudo-crack advance, Δa_B , is based on the effective yield strength of the material tested.

$$\Delta a_B = J/2 \sigma_Y$$

E 1823, E08

blunt point, short point—point with large included angle; designed to punch and not to split. (See **dull point**.) **F 547, F16**

blush—a premature coloration of a CFB sheet caused by component migration from the CB to the CF within the sheet. **F 549, F05**

blushing—dulling or mottling of the finish of the leather resulting from condensed moisture during the drying of the finish. Also referred to as lacquer bloom. **D 1517, D31**

boarded leather—leather on which a false or accentuated grain has been produced by folding the grain side and working the leather back and forth. Hand boarding is done with a curved cork board attached to the worker's arm and rolled over the folded skin. **D 1517, D31**

board foot—a unit of measurement represented by a board 1 ft long, 1 ft wide, and 1 in. thick. Abbreviation ft. b.m.; bd. ft., fmb. In finished or surfaced lumber, the board-foot measure is based on the nominal size. In practice, the working unit is 1000 board feet. Abbreviation M bd. ft.; M B.M.; M B.F. **D 9, D07**

board insulation, *n*—semirigid insulation preformed into rectangular units having a degree of suppleness particularly related to their geometrical dimensions. **C 168, C16**

board measure—a unit of measurement of the volume in board feet of logs or lumber. Abbreviation B.M. **D 9, D07**

boards—See **lumber**.

D 9, D07

boardy—adjective applied to stiff, inflexible leather. **D 1517, D31**

boat nail—light-duty or heavy-duty, bright or galvanized, regular-stock-steel, 1½ by ¾ to 4 by ¾-in., round-wire nails with oval, countersunk, 1⅓ to ¾-in. head and medium chisel point. Also, bright, annularly or helically threaded, nonferrous or stainless-steel, 1 by 0.062 to 3 by 0.165-in., round-wire nails with flat or oval, slightly countersunk, ⅛ to ⅜-in. head and medium diamond point. Also, galvanized, regular-stock-steel, 2 to 2½-in. square, cut nails with oval head. **F 547, F16**

bobbin coil—see **ID coil**. **E 1316, E07**

BOD (biochemical oxygen demand)—the amount of dissolved oxygen utilized by natural agencies in water in stabilizing organic matter at specified test conditions. **D 6161, D19**

body—the attribute of molten glass, associated with viscosity and homogeneity, which is conducive to workability. **C 162, C14**

body—the structural portion of a ceramic article, or the material or mixture from which it is made. **C 242, C21**

body—See **pipe body**. **C 896, C04**

body, *n*—the structural portion of a ceramic article, or the material or mixture from which it is made. (C21, C 242) **C 1145, C28**

body—See **container**. **D 996, D10**

body, *n*—tire structure not including the tread portion of the tire. (See also **casing** and **carcass**.) **D 5681, D34**

body, *n*—central portion of the needle intended to be grasped by the needle holder. **F 1840, F04**

body-centered—having an atom (or group of atoms) separated by a translation of ½, ½, ½ from a similar atom (or group of atoms). The number of atoms in a body-centered cell must be a multiple of two. **E 7, E04**

body color, *n*—color produced by absorption and scattering of light by colorants within a colored material. **E 284, E12**

body dimension, *n*—*in garment construction*, a body measurement which can be used to build a sizing system or to select an appropriately sized garment. (See also **sizing system**.) **D 123, D13**

body dimension, *n*—a body measurement that can be used to build a sizing system or to select an appropriately sized garment. **D 5219, D13**

body dimension, *n*—*in garment construction*, a body measurement which can be used to build a sizing system or to select an appropriately sized garment. **F 1494, F23**

body feed—the continuous addition of filter medium (for example, diatomaceous earth) to sustain the efficacy of the filter. **D 6161, D19**

body fluid simulant, *n*—a liquid which is used to act as a model for human body liquids. **F 1494, F23**

body (food), *n*—the quality of a food or beverage relating either to its consistency, compactness of texture, fullness, flavor, or combination thereof. **E 253, E18**

body force—a force such as gravity whose effect is distributed throughout a material body by direct action on each elementary part of the body independent of the others. (ISRM) **D 653, D18**

body, housing, or accumulator, *n*—the primary chamber for creating the positive and negative pressure during the pumping action. **D 6655, D10**

body measurement, *n*—*in anthropometry*, a standardized distance between two specified points on the human anatomy. **F 1494, F23**

body measurements, *n*—*in anthropometry*, a standardized distance between two specified points on the human anatomy. **D 123, D13**

body measurements, *n*—a standardized distance between two specified points on the human anatomy. **D 5219, D13**

body temperature, *n*—temperature measured from the interior of a human body cavity, such as pulmonary artery, distal esophagus, urinary bladder, ear canal, oral, or rectal. **E 344, E20**

body weight, *n*—*in body measurements*, mass in kilograms (pounds). **D 123, D13**

body weight, *n*—the weight as measured on a calibrated scale taken with the subject in undergarments. **D 5219, D13**

bog—a peat covered area with a high water table and a surface dominated by a carpet of mosses, chiefly sphagnum. It is generally nutrient poor and acidic. It may be treed or treeless. **D 653, D18**

boghead coal—See *boghead coal* under **coal**. **D 121, D05**

Bohr magneton—a constant that is equal to the magnetic moment of an electron because of its spin. The value of the constant is $(9\ 274\ 078 \times 10^{-21} \text{ erg/gauss or } 9\ 274\ 078 \times 10^{-24} \text{ J/T})$.

A 340, A06

bolt—(1) {archaic} an imperfection; a gaseous inclusion larger in size than a seed.

(2) turbulence caused by gases escaping from the melting batch. **C 162, C14**

boiler—self-contained electric, gas, or steam coil-powered vessel wherein water is boiled to produce steam for the steam cooker. **F 1827, F26**

boiler slag, n—a molten ash collected at the base of slag tap and cyclone boilers that is quenched with water and shatters into black, angular particles having a smooth, glassy appearance. **E 2201, E50**

boiling—a defect visible in the fired porcelain enamel caused by gas evolution which results in the formation of blisters, pinholes, black specks, dimples, or spongy surface. **C 286, B08**

boiling point, n—the temperature at which the vapor pressure of an engine coolant reaches atmospheric pressure under equilibrium boiling conditions. **D 4725, D15**

boiling pressure—at a specified temperature, the pressure at which a liquid and its vapor are in equilibrium. **E 7, E04**

boiling pressure—at a specific temperature, the value of the vapor pressure of the liquid at which it is equal to the external pressure. **E 1142, E37**

boiling temperature—at a specified pressure, the temperature at which a liquid and its vapor are in equilibrium. **E 7, E04**

boiling temperature—at a specific pressure, the temperature at which the vapor pressure of the liquid is equal to the external pressure. **E 1142, E37**

boilup rate, n—in *column distillation*, the quantity of vapor entering the column per unit of time. **D 4175, D02**

boilup rate, n—the quantity of vapor entering the column per unit of time. **D 4175, D02**

bole—the stem or trunk of a tree of size sufficient to yield lumber, veneer, or poles. **D 9, D07**

bolometer—instrument for measuring irradiance. Its principle is based on the variation of electrical resistance, with the incoming radiation, as a result of temperature change, of one or both of the resistance elements which comprise the instrument. **E 772, E44**

bolster, n—pillow or similarly shaped unit containing upholstery material covered by upholstery cover material that may or may not be attached to the upholstered furniture item but is sold and delivered with it. **E 176, E05**

bolt—(1) a short section of a tree trunk or limb;

(2) a short log of a length suitable for peeling in a lathe for veneer; and

(3) a short portion of a log prepared for production of shingles, staves, etc. **D 9, D07**

bolt—the component or part of a combination lock that locks or blocks another mechanism from operating until it is retracted. **F 471, F12**

bolt, n—an anchor component that connects to the bony elements of the spine, pelvis, or ribs by means of threads with the lead threads accommodating a nut thus sandwiching the bony element or implant component between the nut or washer and bolt head or other fixed stop. **F 1582, F04**

bolt—headed and externally threaded fastener designed to be assembled with a nut. **F 1789, F16**

bolt hanger, n—a device which, when attached to a surface by the means of a bolt, is used to provide an anchor point. **F 1773, F08**

bolt-hole brush—a special round brush used to remove porcelain enamel bisque from in and around small openings in the ware. **C 286, B08**

bolt interconnection, n—an interconnection having an implant component sandwiched between two nuts or between a nut and fixed stop. **F 1582, F04**

bolt load-elongation behavior—when tensile loaded, a bolt will elongate elastically until stressed beyond its proportional limit where it will behave plastically. **F 1789, F16**

bolt (veneer)—a short log cut to length suitable for peeling in a lathe; also block. **D 1038, D07**

bomb test—see **pressure-evacuation test**. **E 1316, E07**

bond—see **adherence**. **C 286, B08**

bond, n—the attachment between an adhesive and an adherend.

edge joint, n—in *wood bonding*, a type of laminate joint made by bonding adherends edge-to-edge with grain directions parallel to form wider stock.

face joint, n—in *wood bonding*, a type of laminate joint made by bonding adherends face-to-face with grain directions parallel to form thicker stock.

laminate joint, n—in *wood bonding*, a joint made by bonding layers of adherends face-to-face or edge-to-edge to form thicker or wider stock. **D 907, D14**

bond, v—to join adherends by means of an adhesive. **D 907, D14**

bond, n—the attachment at an interface between an adhesive and an adherend. **D 1038, D07**

bond, v—to attach materials together by means of an adhesive. **D 1038, D07**

bond—the adhesive and cohesive forces holding two roofing components in intimate contact. **D 1079, D08**

bond, v—to connect two parts of a system electrically by means of a conductive wire to eliminate voltage differences. **D 4175, D02**

bond area, n—in *describing a bonded test specimen*, the cemented area between elastomer and high-modulus attachment member. **D 1566, D11**

bond breaker—in *building construction*, a material to prevent adhesion at a designated interface. **C 717, C24**

bond breaker, n—a material installed in pavement cracks or joints that is intended to prevent adherence of the sealant to the bottom of the crack or joint. **D 5535, D04**

bonded, adj—in *describing a test specimen*, one in which the elastomer to be tested is permanently cemented to members of much higher modulus for two purposes: (1) to provide convenient rigid attachment to the test machine, and (2) to define known areas for the application of forces to the elastomer. **D 1566, D11**

bonded abrasive disk—a rigid support surface with an abrasive, typically diamond, bonded to the surface by a ceramic, resin, or metal based material. **E 7, E04**

bonded fabric, n—a layered fabric structure wherein a face or shell fabric is joined to a backing fabric, such as tricot, with an adhesive that does not significantly add to the thickness of the combined fabrics. (See also **laminated fabric, coated fabric**.) **D 123, D13**

bonded glycerin, n—is the glycerin portion of the mono-, di-, and triglyceride molecules. **D 4175, D02**

bond enhancer, n—admixture incorporated into a masonry mortar to increase the bond strength between the mortar and the masonry unit. **C 1180, C12**

bonderized—phosphate coated. (See **parkerized**.) **F 547, F16**

bond failure—failure mode characterized by loss of bond either between the anchor and adhesive or between the adhesive and the base material. **E 2265, E06**

bond fireclay, n—see **fireclay, plastic or bond**. **C 71, C08**

bonding—touching the sampling equipment to the drum to form an electrically conductive path to minimize potential electrical differences between the sampling equipment and the drum, reducing the buildup of static electricity. **D 5681, D34**

bondline, n—the layer of adhesive which attaches two adherends. (See **interphase**.) **D 907, D14**

bond paper, n

bond paper, n—one of many grades of paper covering a wide range of quality, from grades requiring superior permanence, strength and durability to applications where permanence and durability are less important, but in all cases requiring good printing properties, color fidelity, erasability, and cleanliness. **D 1968, D06**

bond plaster, n—a calcined gypsum plaster specially formulated for application over rough monolithic concrete as a bonding coat for a subsequent gypsum plaster layer. **C 11, C11**

bond strength, n—of *bonded, fused, or laminated fabrics*, the tensile force expressed in ounces per 25 mm (1 in.) of width, required to separate the component layers under specified conditions. **D 123, D13**

bond strength—in *grouting*, resistance to separation of set grout from other materials with which it is in contact; a collective expression for all forces such as adhesion, friction, and longitudinal shear. **D 653, D18**

bond strength, n—the unit load applied to tension, compression, flexure, peel, impact, cleavage, or shear, required to break an adhesive assembly with failure occurring in or near the plane of the bond. (See also **adhesion** and **bond**.)

dry strength, n—the strength of an adhesive joint determined immediately after drying under specified conditions or after a period of conditioning in a standard laboratory atmosphere.

wet strength, n—the strength of an adhesive joint determined immediately after removal from a liquid in which it has been immersed under specified conditions of time, temperature, and pressure. **D 907, D14**

bond strength, n—a measure of the force required to separate surfaces which have been bonded together. **D 1711, D09**

bone ash—calcined bone consisting essentially of calcium phosphate. **C 242, C21**

bone china—a translucent china made from a ceramic whiteware body composition containing a minimum of 25 % bone ash. **C 242, C21**

bone coal—See *bone coal* under **coal**. **D 121, D05**

bone-dry—see **oven-dry**. **D 1695, D01**

bonnet, n—in *cleaningpile floor coverings*, an absorbent pad which can be mounted under a rotary shampoo machine. **D 123, D13**

bonnet, n—in *cleaningpile floor coverings*, an absorbent pad which can be mounted under a rotary shampoo machine. **D 5253, D13**

BOO—build, own, operate. **D 6161, D19**

bookbinder's wire—wire used in stitchers to fasten paper; measured according to AWG sizes. **F 592, F16**

book bulk, n—the overall thickness of a given number of sheets. See **thickness**. **D 1968, D06**

book fold, n—a fabric doubled selvage to selvage, then folded back and forth upon itself in predetermined lengths. (See also **shoe fold**.) **D 123, D13**

book fold, n—a fabric doubled selvage to selvage, then folded back and forth upon itself in predetermined lengths. (See also **shoe fold**.) **D 4850, D13**

book paper, n—a general term for a group of uncoated or coated papers (exclusive of newsprint) suitable for the graphic arts. **D 1968, D06**

boom—floating mechanical barrier used to control the movement of substances that float. **F 818, F20**

boom planing—heeling over of a boom and loss of draft. **F 818, F20**

boom section—length of boom between two end connectors. **F 818, F20**

boom segment—repetitive identical portion of the boom section. **F 818, F20**

boom sprayer—a sprayer apparatus consisting of a pressure source and controls, and employing a boom (vertical or horizontal) with atomizers (hydraulic, rotary, or other) arranged to provide uniform coverage of the treated surfaces. **E 1102, E35**

boom submergence (aka submarining)—containment failure due to loss of freeboard. **F 818, F20**

boom weight—dry weight of a fully assembled boom section including end connectors. **F 818, F20**

booster, n—synonym for **secondary accelerator**, which is the preferred term. **D 1566, D11**

booster heater—the water heater responsible for heating and maintaining the final sanitizing rinse water (to a minimum of 180°F) to dishwasher, may be separate from dishwasher or integral. **F 1827, F26**

booster heater inlet temperature—the temperature of water being supplied to the booster heater (see **dishwashing machine, commercial: booster heater**) measured at the booster heater inlet. **F 1827, F26**

boost melting—See **electric boosting**. **C 162, C14**

boot—a suspended enclosure in the nose of a melter protecting a portion of the surface and serving as a gathering opening. **C 162, C14**

BOOT—build, own, operate and transfer. **D 6161, D19**

borax glass—vitreous anhydrous sodium tetraborate ($\text{Na}_2\text{B}_4\text{O}_7$). **C 162, C14**

borderline pumping temperature, n—the lowest temperature at which the critical yield stress or critical viscosity that allows a fluid to be pumped occurs. **D 4175, D02**

bore—the hole or lumen in the stem. **E 344, E20**

borehole, n—the circular hole through soil and rock strata made by boring. **D 121, D05**

borehole—a hole of circular cross-section made in soil or rock. **D 653, D18**

borehole log—the record of geologic units penetrated, drilling progress, depth, water level, sample recovery, volumes and types of materials used, and other significant facts regarding the drilling of an exploratory borehole or well. **D 653, D18**

borehole television log—a borehole or well video record produced by lowering a television camera into the borehole or well. This record is useful in visually observing downhole conditions such as collapsed casing or a blocked screen. **D 653, D18**

borer holes—voids made by wood-boring insects. **D 1038, D07**

borescope—A flexible or rigid tube-like instrument used for a remote direct viewing visual aid. The instrument may consist of mirrors, prisms, lenses, optic-fibers, or a miniature CCD camera to transmit images to the viewing or recording medium. **E 1316, E07**

borosilicate glass—a silicate glass with B_2O_3 content above 4 weight percent, characterized by a moderate to low thermal expansion, long in viscosity versus temperature, and low in density. **C 162, C14**

borrow, n—an area designated as a source for soil in construction or mine reclamation projects; a source or sources of material other than the required excavation. **E 2201, E50**

bottle—See **container**. **D 996, D10**

bottom—See **box**. **D 996, D10**

bottom ash, n—agglomerated ash particles formed in pulverized coal boilers that are too large to be carried in the flue gases and impinge on the boiler walls or fall through open grates to an ash hopper at the bottom of the boiler. Bottom ash is typically grey to black in color, is quite angular, and has a porous surface structure. **E 2201, E50**

bottom assembly, n—the components of the lowermost part of a slide fastener which determine whether the slide fastener will be non-separable or separable. (See also **non-separable zipper** and **separable zipper**.) **D 123, D13**

bottom assembly, n—the components of the lowermost part of a slide fastener which determine whether the slide fastener will be non-separable or separable. (See also **non-separable zipper** and **separable zipper**.) **D 2050, D13**

bottom charge—concentrated explosive charge at the bottom of a blast hole. (ISRM) **D 653, D18**

bottom echo—see **back reflection**. **E 1316, E07**

bottom out, v—to deform a tire by radial load on the tread until radial movement of the inside surface is stopped by the rim or other tire inside surface. **F 538, F09**

bottom protective plate—a safety device installed on a Type II, Class 1, cantilever slide gate with external rollers to isolate the lower roller mechanism to reduce the possibility of contact with the roller mechanism by a person. See Specification F 1184. **F 552, F14**

bottom rail—See **railing systems**. **E 631, E06**

bottom rail—the lowest member of a railing system, supporting pickets or panels, if any. **E 631, E06**

bottom rail—the lowest member of a railing system, supporting balusters or panels, if any. **E 1481, E06**

bottom rail—horizontal member of the framework running continuously along the bottom edge of the fence. **F 552, F14**

bottoms—the underface of the shoe sole which extends from the toe to the heel breast. The heel is not a part of the bottom. **F 869, F08**

bottom scissor half—the component which contains the threaded end of the screw. **F 1078, F04**

bottomset bed—fine-grained material (usually silts and clays) slowly deposited on the bed of a quiescent body of water which may in time be buried by foreset beds and topset beds. **D 4410, D19**

bottomsize, nominal—for the purpose of Test Method D 4749, the sieve designating the lower limit or bottomsize shall be that sieve of the series given in the Standard Series of Sieves section with the largest openings through which passes a total of less than 15 % of the sample. This defined bottomsize is not to be confused with the size of the smallest particles in the lot. **D 121, D05**

bottom stop, n—a part affixed to both stringers immediately below, or over, the chain, holding the two stringers together at the bottom and preventing the slider from leaving the chain. **D 123, D13**

bottom stop, n—a part affixed to both stringers immediately below, or over the chain, holding the two stringers together at the bottom and preventing the slider from leaving the chain. **D 2050, D13**

bottom temperature of snow cover—temperature measured at the base of the snow cover during mid- to late-winter (February/March). The measurements are used in the BTS method to predict the presence or absence of permafrost. **D 7099, D18**

bottom-tension boom—boom with tension member located along the bottom of the skirt. **F 818, F20**

bottom time, n—the total elapsed time measured in minutes from the time that the diver leaves the surface in descent to the time that the diver begins ascent. **F 1549, F32**

bottom trip—tool activation by tool nose touching the work, while at the same time activating trigger trip. **F 592, F16**

Bouguer's law—the absorbance of a homogeneous sample is directly proportional to the thickness of the sample in the optical path. **E 131, E13**

Bouguer's law, n—the absorbance of a homogeneous sample is directly proportional to the thickness of the sample in the optical path. (Also known as **Lambert's[thickness] law**.) **E 284, E12**

boulder clay—a geological term used to designate glacial drift that has not been subjected to the sorting action of water and therefore contains particles from boulders to clay sizes. **D 653, D18**

bouldering, n—a technique of climbing where climbers remain close to the ground and do not use a rope to safeguard their progress. **F 1773, F08**

boulders—a rock fragment, usually rounded by weathering or abrasion, with an average dimension of 12 in. (305 mm) or more. **D 653, D18**

boulder size (fluvial sediment)—larger than 256 mm in diameter. **D 4410, D19**

boulevard clamp—a two piece clamp with carriage bolts and nuts designed for 180° horizontal rail connections to a line post (also called **line rail clamp**). **F 552, F14**

boundary friction, n—friction at low sliding speeds (0.02 m/min or less) where lubrication occurs under thin-film lubricant conditions. **D 123, D13**

boundary friction, n—friction at low sliding speeds (0.02 m/min or less) where lubrication occurs under thin-film lubricant conditions. **D 4849, D13**

boundary grain—in the Jeffries' method for grain size measurement,

a grain that is intersected by the boundary of the standard area and is, therefore, counted only as one-half grain. (See also **Jeffries' Method**.) **E 7, E04**

boundary layer—a thin layer at the membrane surface where water velocities are significantly less than those in the bulk flow. **D 6161, D19**

bound monomer, n—monomer that is combined or reacted with itself or other types of monomers in a polymerization reaction to form a polymer. **D 1566, D11**

bound seam-finish, n—a finish for the raw edges of a plain seam, in which another fabric encloses the raw edges of one or more seam allowances. (Compare **Hong Kong seam-finish**.) **D 123, D13**

bound seam-finish, n—in home sewing, a seam finish in which another material is used to enclose the cut edges of one or more seam allowances. (Compare **Hong Kong seam finish**.) **D 4965, D13**

bow—the distortion of a piece of lumber in which there is a deviation in a direction perpendicular to the flat face from a straight line from end to end of the piece. **D 9, D07**

bow, n—a fabric condition resulting when filling yarns or knitted courses are displaced from a line perpendicular to the selvages and form one or more arcs across the width of the fabric. (See also **double bow**.) **D 123, D13**

bow—a condition of longitudinal curvature in pultruded parts. **D 3918, D20**

bow, n—a fabric condition resulting when filling yarns or knitting courses are displaced from a line perpendicular to the selvages and form one or more arcs across the width of fabric. (See also **double bow**) **D 3990, D13**

bow, n—a fabric condition resulting when filling yarns or knitted courses are displaced from a line perpendicular to the selvages and form one or more arcs across the width of the fabric. (See also **double bow**.) **D 4850, D13**

bow—the maximum deviation between an actual instrument reading and the reading predicted by a straight line drawn between upper and lower calibration points, expressed as a percent of full scale. **E 2161, E37**

bow, double—See **double bow**. **D 3990, D13**

bowl—See **spout**. **C 162, C14**

bowl guard—the barrier, assembled over the bowl area, intended to reduce the user's access to the hazards that exist in the bowl during machine operation. **F 1827, F26**

box, n—a rigid **container** having closed faces and completely enclosing the contents. When this term is used in connection with fiberboard boxes, such fiber boxes must comply with all the requirements of the carrier rules. (See **carton**.)

bottom, n—the **face** of a **box** on which it usually rests while filling.

box batten, n—a reinforcing member, (1) for a **wood box** internally or externally applied to the sides, top and bottoms. When applied externally it should be applied in pairs; (2) in a **wirebound box**, a batten is a reinforcement used on the ends of the container only.

cleated fiberboard box—a rigid **container** having five or six **panel faces** with wood strips fastened to them, the panels being made of **solid** or **corrugated fiberboard**.

cleated plywood box—a rigid **container** having five or six **panel faces** with wood strips fastened to them, the panels being made of plywood.

flange, n—in **fiberboard boxes**, an extension to a panel similar to a short flap that may be folded in or out, usually at angles of 90 or 180° to the panel.

nailed wood box—a rigid **container** constructed of wood in several standard styles, assembled by fastening sides, top and bottom to the ends with nails or other suitable fasteners.

skid box—a metal, wooden, or fiber **box** fastened to a platform raised on skid members or legs; it may or may not be collapsible. (See also **skid**.)

box, n

wirebound box—a rigid **container** whose sides, top, and bottom are of rotary-cut lumber, sliced lumber, **resawn lumber**, **fiberboard**, or combinations thereof, usually $\frac{3}{8}$ in. (9.5 mm) or less in thickness, fastened to **cleats** and to each other by means of binding wires and staples; and ends of similar material, plain or stapled to **battens** or **liners**, fastened in place by means of nails or staples or wires stapled thereto.

D 996, D10

box annealing, n—**annealing** in a sealed container under conditions that minimize oxidation.

A 941, A01

boxboard—See **paperboard**.

D 996, D10

box calf or sides—sides or skins finished by folding with the grain side in and rubbing the flesh side with a cork-surfaced instrument known as a hand board. Machinery is now also used. The effect is sometimes imitated by embossing. Also called “box” or “willow” finish.

D 1517, D31

boxcar truncation—identical effective weighting of all points in the measured interferogram prior to the Fourier transform; all points outside of the range of the measured interferogram take a value of zero.

E 131, E13

boxed heart—the term used when the pith falls entirely within the four faces of a piece of wood throughout its length.

D 9, D07

boxed pith—See **boxed heart**.

D 9, D07

box furnace—a furnace in which, periodically, a load of ware is introduced; fired, and removed.

C 286, B08

box lock—the junction where the female member and the male member are secured forming the pivoting feature.

F 921, F04

box mark—See **shuttle mark**.

D 3990, D13

box nail—bright, coated or galvanized, regular-stock-steel, 1 by 0.058 to 5 by 0.162-in. nails, made of lighter-gage wire than common nails and sinkers, with flat $\frac{1}{4}$ to $\frac{3}{32}$ -in. head and medium diamond point.

F 547, F16

box section—a concrete pipe with a rectangular cross section.

C 822, C13

box section bottom slab—lower horizontal portion of a box section in the installed condition.

C 822, C13

box section top slab—upper horizontal portion of a box section in the installed condition.

C 822, C13

box section wall—vertical sides of a box section in the installed condition.

C 822, C13

box stay wire—wire used in stitchers for assembly of containers; with dimensions measured in thousandths of inches.

F 592, F16

BP—an abbreviation for base paper, referring to an uncoated paper that is coated to form a carbonless product. Also known as base stock or rawstock.

F 549, F05

brace band—a symmetrically formed strip of metal shaped to fit around a post and used with a carriage bolt and nut to attach the rail end or brace rail end truss rod tightener to the post. Also used for attaching barbed wire, tension wire, and other items to a terminal post.

F 552, F14

brace rail—a compression member at terminal posts or corner posts.

F 552, F14

brace rail end—a cup-shaped fitting similar to a rail end with provision for attaching a truss rod.

F 552, F14

bracing—See **loading**.

D 996, D10

bracket, n—projecting element or hardware attached to the surface of a member to support other members.

E 631, E06

brackish water, n—water that contains dissolved matter at an approximate concentration range from 1000 to 30 000 mg/L.

D 1129, D19

brackish water—water with an approximate concentration of total dissolved solids ranging from 500 to 10 000 mg/L. See **high brackish water**, **potable water**, **sea water**.

D 6161, D19

brad—small nail with small head.

brad, common wire—slender, regular-stock-steel, $\frac{3}{8}$ by 0.035 to 6 by 0.262-in. wire nails with brad 0.050 to 0.331-in. head and medium diamond point.

brad, cut—slender, usually small, regular-stock-steel nails of

same thickness throughout, but tapering in width; with slight projection on one side serving as head. Also, tapering, square-bodied, finishing nail with countersunk head.

F 547, F16

brad-clinched point—pointed end of nail, having been driven through member, flattened and bent sideways to a limited extent when striking flat anvil plate.

F 547, F16

brad head—small-diameter, deep, circular, barrel-shaped head with flat or concavely cupped top surface, as found on finishing nails and common brads for countersinking where concealment is important.

F 547, F16

Bragg angle—the angle between the incident beam and the lattice planes considered.

E 7, E04

Bragg equation—

$$n\lambda = 2d \sin \theta$$

where:

n = order of reflection,

λ = wavelength of X-rays,

d = distance between lattice planes, and

θ = Bragg angle.

E 7, E04

Bragg method—a method of X-ray diffraction in which a single crystal is mounted on a spectrometer with a crystal face parallel to the axis of the instrument.

E 7, E04

Bragg's rule—an empirical rule formulated by W. H. Bragg and R. Kleeman that states that the stopping cross section of a compound specimen is equal to the sum of the products of the elemental stopping cross sections for each constituent and its atomic fraction, that is,

$$\epsilon(A_x B_y) = x\epsilon_A + y\epsilon_B$$

where:

$\epsilon(A_x B_y)$ = the stopping cross section of the compound, and

$A_x B_y$, and ϵ_A and ϵ_B = the stopping cross section of elements A and B respectively.

E 673, E42

braid, n—a narrow tubular or flat fabric produced by intertwining a single set of yarns according to a definite pattern (Maypole process).

D 123, D13

braid, n—(1) woven metallic wire used as a shield for insulated conductors and cables.

(2) A woven fibrous protective outer covering over an insulated conductor or cable.

D 1711, D09

braid, n—a narrow tubular or flat fabric produced by intertwining a single set of yarns according to a definite pattern (Maypole process).

D 7018, D13

braided fabric, n—a structure produced by interlacing three or more ends of yarns in a manner such that the paths of the yarns are diagonal to the vertical axis of the fabric.

D 123, D13

braided fabric—see *braided fabric* under **fabric**.

D 3878, D30

braided fabric, n—a structure produced by interlacing three or more ends of yarns in a manner such that the paths of the yarns are diagonal to the vertical axis of the fabric.

D 4850, D13

braided river—a wide- and shallow-river where the flow passes through a number of small interlaced channels separated by bars or shoals.

D 4410, D19

braided rope, n—a cylindrically produced rope made by intertwining, maypole fashion, several to many strands according to a definite pattern with adjacent strands normally containing yarns of the opposite twist.

D 123, D13

braising pan—equipment suitable for the preparation of foods by several methods, such as frying, braising, boiling and simmering.

F 1827, F26

brake bar rack, *n*—a variable friction device consisting of a u-shaped metal bar to which are attached several metal bars that create friction on the rope. Also known as a rappel rack.

F 1490, F32

braking coefficient [*nd*], *n*—the ratio of the braking force to the normal force on a tire.

F 538, F09

braking force coefficient, *n*—of a tire, the ratio of braking force to normal force.

F 538, F09

braking force coefficient, peak, *n*—of a tire, the maximum value of tire braking force coefficient that occurs prior to wheel lockup as the braking torque is progressively increased.

F 538, F09

braking force coefficient, slide, *n*—of a tire, the value of braking force coefficient obtained on a locked wheel.

F 538, F09

braking force coefficient, tire—the ratio of braking force to vertical load.

E 867, E17

braking force coefficient, tire, peak—the maximum value of tire braking force coefficient that occurs prior to wheel lockup as the braking torque is progressively increased.

E 867, E17

braking force coefficient, tire, slide—the value of the braking force coefficient obtained on a locked wheel.

E 867, E17

braking force [*F*], *n*—of a tire, the negative longitudinal force resulting from braking torque application.

F 538, F09

braking force, tire—the negative longitudinal force resulting from braking torque application.

E 867, E17

braking torque—the negatively directed wheel torque. (See **torque (T), wheel**).

E 867, E17

braking torque [ML^2/T^2], *n*—of a vehicle, the negative wheel torque.

F 538, F09

branched polyethylene plastics, *n*—those containing significant amounts of both short-chain and long-chain branching and having densities in the 0.910 to 0.940 g/cm³ range.

D 883, D20

brand, *n*—of a tire, the name under which one or more tire lines are marketed.

F 538, F09

brand, tire, private, *n*—a brand name used by a tire seller or group of sellers who are not manufacturers.

F 538, F09

brashness—a condition that causes some pieces of wood to be relatively low in shock resistance for the species and, when broken in bending, to fail abruptly without splintering at comparatively small deflections.

D 9, D07

Braun's law—the ratio of the solubility change with pressure, temperature being constant, $(\delta X/\delta P)T$, to the solubility change with temperature, pressure being constant, $(\delta X/\delta T)P$, is equal to the negative of the product of the absolute temperature, T , and the (fictitious) volume change (Δv) which accompanies the solution of 1 g-molecular weight of the solute in an infinitely large quantity of the saturated solution at T degrees, divided by the amount of heat, Q , developed in the process:

$$(\delta X/\delta P)T/(\delta X/\delta T)P = -T\Delta v/Q$$

E 7, E04

brazing—the joining of ends of two wires, rods, or groups of wires with a nonferrous filler metal at temperatures above 800°F [427°C].

B 354, B01

break—(1) *heavy leather*—the places, in the areas where the fore shank and hind shank join the body of the hide, where the texture of the leather changes quite sharply from the firm, close weave of the bend to a loose, open texture.

(2) *shoe upper leather*—the superficial wrinkling formed when the leather is bent, grain inward. Adjectives commonly used to describe this characteristic are "tight," "fine," "loose," "coarse," and "pipy," or "flanky."

D 1517, D31

break, *n*—a crack or tear extending into or through the reinforcing material.

F 538, F09

breakaway staple—staple with its crown designed to break off if

removal is attempted; used to discourage pilfering and shop-lifting.

F 592, F16

breakaway torque—torque necessary to start a fastener in motion after the axial load of the mating components has been reduced to zero.

F 1789, F16

breakdown, electrical—the electrical discharge or arc occurring between the electrodes and through the equipment being tested.

F 819, F18

breakdown potential—the least noble potential where pitting or crevice corrosion, or both, will initiate and propagate.

G 15, G01

breakdown voltage—see **dielectric breakdown voltage**.

breaker, *n*—in *atire*, one or more plies under the tread region of a tire that are additional to those which extend from bead to bead.

F 538, F09

breakeven analysis—a technique for determining that value of a variable which results in benefits (savings) just equal to costs.

E 631, E06

break even analysis, *n*—a technique for determining that value of a variable which results in benefits (savings) just equal to costs.

E 833, E06

break factor, *n*—in *yarn testing*, the comparative breaking load of a skein of yarn adjusted for the linear density of the yarn expressed in an indirect system.

D 123, D13

break-in, *n*—in *tribology*, an initial transition process occurring in newly established wearing contacts, often accompanied by transients in coefficient of friction or wear rate, or both, that are uncharacteristic of the given tribological system's long term behavior. (Synonym—*run-in, wear-in*.)

D 4175, D02

break-in, *n*—in *tribology*, an initial transition process occurring in newly established wearing contacts, often accompanied by transients in coefficient of friction or wear rate, or both, which are uncharacteristic of the given tribological system's long-term behavior.

D 4175, D02

break-in, n—See **run-in**.

G 40, G02

break in, v—See **run in**.

G 40, G02

breaking, *n*—the crushing of the structure of the stem; loosening the bond between the fiber bundles and shives and breaking the shives into short pieces to facilitate its removal.

D 123, D13

breaking, *v*—in *flaxstems*, the crushing of the structure of the stem; loosening the bond between the fiber bundles and shives and breaking the shives into short pieces to facilitate its removal.

D 6798, D13

breaking elongation—See **elongation break**.

D 4848, D13

breaking force, *n*—the maximum force applied to a material carried to rupture. (Compare **breakingpoint**. See **breaking strength**.)

D 123, D13

breaking force, *n*—the maximum force applied to a material carried to rupture. (Compare **breakingpoint, breaking strength, Syn. force-at-break**)

D 4848, D13

breaking force, *n*—the maximum force applied to a material carried to rupture.

D 6477, D13

breaking force[F], *n*—the force at which fracture occurs.

E 6, E28

breaking force, (*F*), *J*, *n*—the force at failure.

D 4439, D35

breaking length, *n*—of *pulp and paper*, a calculated value expressed as the length of a strip of paper, usually stated in metres, which would break of its own weight when suspended vertically; calculated from the tensile strength and the basis weight of the sheet.

D 1968, D06

breaking load, *n*—the maximum force applied to a specimen in a tensile test carried to rupture.

D 4439, D35

breaking load—deprecated term. Use the preferred term **breaking force**.

D 4848, D13

breaking point, *n*—on a *force-extension or force-elongation curve, or stress-strain curve*, the point corresponding with the breaking force or the breaking stress in a tensile test. (Compare **breaking force**.)

D 123, D13

breaking point, *n*—on a *force-elongation curve, or stress-strain*

breaking point, n

curve, the point corresponding with the breaking force or the breaking stress in a tensile test. (Compare **breaking force**.)

D 4848, D13

breaking strength, n—as related to wire, the maximum force developed prior to fracture during tension testing of wire and wire products.

A 902, A05

breaking strength—the maximum load that a conductor attains when tested in tension to rupture.

B 354, B01

breaking strength, n—the ability or capacity of a specific material to withstand the ultimate tensile load or force required for rupture. (See also **tensile strength**)

D 123, D13

breaking strength, n—strength expressed in terms of breaking force. (See also **breaking force** and **strength**. *Syn.*, strength at break)

D 4848, D13

breaking strength, n—a strength expressed in terms of breaking force.

D 6477, D13

breaking tenacity, n—the tenacity at the breaking force.

D 123, D13

breaking tenacity, n—the tenacity corresponding to the breaking load.

D 4845, D13

breaking tenacity, n—the tenacity at the breaking force. (See also **breaking force, tenacity**.)

D 4848, D13

breaking tenacity, n—the tenacity at the breaking force.

D 6477, D13

breaking toughness, n—the actual work per unit volume or per unit mass of material that is required to rupture the material.

D 123, D13

breaking toughness, n—toughness up to the breaking force of a material.

D 4848, D13

breaking toughness, T, (FL⁻), Jm⁻², n—for geotextiles, the actual work-to-break per unit surface area of material.

D 4439, D35

break-in [L], n—one or more periods of initial standardized tire operation during which tire is brought to the state which will lead to more consistent test results.

F 538, F09

break loose torque—torque applied in a removal direction necessary to start the fastener in motion from its fully preloaded installed position.

F 1789, F16

break-open—in testing thermal protective material, a response evidenced by the formation of a hole in the material which allows the molten substance to pass through the material.

F 1494, F23

break out—in dry process enameling, a defect characterized by an area of blisters with well defined boundaries.

C 286, B08

break-out—See **smash**.

D 3990, D13

breakout—fiber separation or break on surface plies at drilled, machined, etc., edges.

E 631, E06

breakout—fiber separation or break on surface plies at drilled, machined, etc., edges.

E 1749, E06

breakout pressure, n—for inflatable restraints, the pressure level during deployment which ruptures the module cover.

D 123, D13

breakout pressure, n—for inflatable restraints, the pressure level during deployment which ruptures the module cover.

D 6799, D13

breakpoint—the appearance in the effluent of a specified concentration of an adsorbate.

D 2652, D28

breakpoint chlorination—the point at which the water chlorine demand is satisfied and any further chlorine is the chlorine residual, the "free" chlorine species.

D 6161, D19

break tank—a storage device used for hydraulic isolation and surge protection.

D 6161, D19

breakthrough, n—the first appearance in the effluent of an adsorbate of interest under specified conditions.

D 2652, D28

breakthrough detection time, n—the elapsed time measured from the start of the test to the sampling time that immediately precedes the sampling time at which the test chemical is first detected.

F 1494, F23

breakup, n—liquid disintegration that occurs during atomization.

E 1620, E29

breakup length, n—the distance between the liquid discharge point of an atomizing device and the point where liquid breakup commences.

E 1620, E29

breakwater stone—(generally three tons to twenty tons in weight) stone resulting from blasting, cutting, or other means to obtain rock heavy enough to require handling individual pieces by mechanical means.

D 653, D18

breast, n—the forward or front face of a shoe heel.

F 1646, F13

breast wall—(1) the entire side wall of a melter between the flux block and the crown, but not including the ends.

(2) refractory wall between pillars of a pot furnace and in front of or surrounding the front of a pot.

C 162, C14

breather—a loosely woven cloth (such as glass fabric) which serves as a continuous vacuum path over a part but does not come in contact with the resin.

E 631, E06

breather—a loosely woven cloth (such as glass fabric) which serves as a continuous vacuum path over a part but does not come in contact with the resin.

E 1749, E06

breather finish—coating system allowing the passage of water vapor.

E 631, E06

breather string, n—a string, composed of a material such as glass, that provides a vacuum path from the laminate to a breather.

D 3878, D30

breathing zone, n—that location in the atmosphere at which persons breathe.

D 1356, D22

breezing—{archaic} buckwheat anthracite coal or coarse sand spread on the sieve before setting of pots.

C 162, C14

bremsstrahlung—XPS, photon radiation, continuously distributed in energy up to the energy of the incident electrons, emitted from an anode due to deceleration of incident electrons within the anode. The bremsstrahlung from a conventional X-ray source contributes to the background and the Auger signal strengths in an XPS spectrum.

E 673, E42

BRI, n—see **building related illness**.

E 2114, E06

brick, n—a solid or hollow masonry unit of clay or shale, usually formed into a rectangular prism while plastic and burned or fired in a kiln; brick is a ceramic product.

C 43, C15

brick-siding nail—galvanized, colored (baked-lacquer finished), plain-shank barbed or annularly threaded, regular-stock-steel, 7/8 by 0.092 to 2 1/2 by 0.099-in. nails with flat checkered 3/16 or 1/4-in. head and medium diamond point.

F 547, F16

bridge—the structure formed by the end walls of the adjacent melter and refiner compartments of a melting furnace and the covers spanning the gap between the end walls.

C 162, C14

bridge, n—in buttons, the area between the holes partially covered by the sewing threads with dimensions varying upon design and end use.

D 123, D13

bridge—an obstruction within the annulus which may prevent circulation or proper emplacement of annular materials.

D 653, D18

bridge, n—the area of a button between the holes partially covered by the sewing threads with dimensions varying upon design and end use.

D 5497, D13

bridge cover—See **bridge wall cover**.

C 162, C14

bridge sealant joint, n—in building construction, a joint where sealant is applied over the joint to the face of substrates that are in approximately the same plane.

C 717, C24

bridge top stop, n—in zippers, a part affixed immediately above the chain, holding the tops of the two stringers together and preventing the slider from leaving the chain.

D 123, D13

bridge top stop, n—a part affixed immediately above the chain, holding the tops of two stringers together and preventing the slider from leaving the chain.

D 2050, D13

bridgewall—that part of a melting furnace forming a bridge or separation between melter and refiner.

C 162, C14

bridge wall cover—refractory blocks spanning the space between the bridge walls.

C 162, C14

bridging, v—the formation of arched cavities in a powder mass.

B 243, B09

bridging, n—in framing, sections of wood or metal pieces used between framing members to stiffen, give lateral support, and minimize rotation.

C 11, C11

bridging—spanning a feature without full contact, such as tape or fabric spanning a radius, step, core edge, etc., or vacuum bagging material spanning tool or part surfaces. **E 631, E06**

bridging—spanning a feature without full contact, such as tape or fabric spanning a radius, step, core edge, etc., or vacuum bagging material spanning tool or part surfaces. **E 1749, E06**

bridging—enlargement of a graphic shape beyond the COL, which produces undesired character fill in. **F 149, F05**

bridging—combination of peaks and smudges that may close or partially close the loop of a character (F 149). **F 335, F05**

bridging, v—the clumping of toner which causes a hollow area in the toner supply that prevents the free flow of toner to the dispenser auger. **F 1457, F05**

bridging failure—portions of a boom emerging from the water due to poor wave conformance, with resulting containment failure. **F 818, F20**

bridle—device attached to a boom to distribute the load exerted by towing or anchoring the boom. **F 818, F20**

bridle leather—a harness-finished strap leather. **D 1517, D31**

brief (of a facility)—See **facility program**. **E 631, E06**

brief (of a facility)—See **facility program**. **E 1480, E06**

bright—term applied to nails with natural bare finish resulting from cleaning of nails which have not undergone treatments affecting finish, such as hardening, bluing, coating, plating, etching, painting, etc. Also applied to polished appearance after plating. **F 547, F16**

bright annealing, n—annealing in a protective medium to prevent discoloration of the bright surface. **A 941, A01**

bright annealing—see Terminology A 919. **C 286, B08**

bright dip (nonelectrolytic)—a solution used to produce a bright surface on a metal. **B 374, B08**

bright electroplating—a process that produces an electrodeposit having a high degree of specular reflectance in the as-plated condition. **B 374, B08**

bright electroplating range—the range of current densities within which an electroplating solution produces a bright deposit under a given set of operating conditions. **B 374, B08**

brightener—an addition agent that leads to the formation of a bright plate, or that improves the brightness of the deposit. **B 374, B08**

brightener—see **fluorescent whitening agents (FWA)**. **D 459, D12**

brightening agent—see **fluorescent whitening agents (FWA)**. **D 459, D12**

brightfield illumination—for *reflected light*, the illumination which causes specularly reflected surfaces normal to the axis of a microscope to appear bright. For *transmission electron microscopy*, the illumination of an object so that it appears on a bright background. **E 7, E04**

bright finish—non-coated wire finish. **F 547, F16**

bright glaze—See **bright glaze** under **glaze**. **C 242, C21**

brightness—as commonly used in the paper industry, the reflectivity of a sheet of pulp or paper for blue light measured under standardized conditions on a particular instrument designed and calibrated specifically for the purpose. **D 1695, D01**

brightness, n—in *paper and paperboard*, reflectance of an infinitely thick stack of material measured for blue light with centroid wavelength of 457 nm under specified spectral and geometric conditions. **D 1968, D06**

brightness, n—see **color (of an object)**. (For consensus technical definition see **brightness** in Terminology E 284). **E 253, E18**

brightness, n—(1) aspect of visual perception whereby an area appears to emit more or less light. [CIE]^B (F 923)^B

(2) *of an object color*, combination of lightness and saturation.

(3) *in the textile industry*, perceived as saturated, vivid, deep, or clean.

(4) *of paper*, reflectance of an infinitely thick specimen (reflectivity) measured for blue light with a centroid wavelength of 457 nm under specified spectral and geometric conditions of measurement.

(5) *dyer's*, the color quality, combining lightness and saturation, that would be decreased by adding black, gray, or a complementary color to a chromatic dye. **E 284, E12**

brightness—in *paper*, a characteristic of white paper measured in terms of reflectance in the blue and violet portions of the spectrum. **F 149, F05**

bright or mirror finish—highly reflective surface. **F 1840, F04**

bright plating—a process that produces an electrodeposit having a high degree of specular reflectance in the as-plated condition. **B 374, B08**

bright plating range—the range of current densities within which a given plating solution produces a bright plate. **B 374, B08**

bright-throwing power—the measure of the ability of a plating solution or a specified set of plating conditions to deposit uniformly bright electroplate upon an irregularly shaped cathode. **B 374, B08**

bright-wood—wood free of stain or any discoloration. **D 9, D07**

brine, n—water that contains dissolved matter at an approximate concentration of more than 30 000 mg/L. **D 1129, D19**

brine—the concentrate (reject) stream from a crossflow membrane device performing desalination. Portion of the feed stream which does not pass through the membrane. **D 6161, D19**

brine, n—in geothermal, fluids in a liquid phase that have been produced from geothermal wells or from hot springs and that contain appreciable amounts of sodium chloride and other salts. **E 957, E44**

brine (concentrate) seal—a rubber lip seal on the outside of a spiral wound cartridge which prevents feed by-pass between the cartridge and the inside pressure vessel wall. **D 6161, D19**

Brinell hardness number, HB, n—a number related to the applied force and to the surface area of the permanent impression made by a ball indenter computed from the equation:

$$HB = 2P/\beta D(D - \sqrt{D^2 - d^2})$$

where:

P = applied force, kgf,

D = diameter of ball, mm, and

d = mean diameter of the impression, mm.

E 6, E28

Brinell hardness test, n—an indentation hardness test using calibrated machines to force a hard ball, under specified conditions, into the surface of the material under test and to measure the diameter of the resulting impression after removal of the force. **E 6, E28**

brinelling, n—damage to a solid bearing surface characterized by one or more plastically formed indentations caused by static or impulsive overloads, especially as found in rolling contact bearings. (See also **false brinelling**.) **G 40, G02**

brine seal carrier—see **ATD**. **D 6161, D19**

brine system staging—a process in which the concentrate, under pressure, of a group of membrane devices is fed directly to another set of membrane devices to improve the efficiency of the water separation. **D 6161, D19**

brining—a process of curing hides by soaking with salt solution (sodium chloride). **D 1517, D31**

briquet, n—see **compact**. **B 243, B09**

briquette, n—a cylindrical block composed of granulated coal or coke particles compressed and embedded with an epoxy binder. **D 121, D05**

brittle—the inability of a material to deform plastically before fracturing. **F 2078, F07**

brittle erosion behavior, n—erosion behavior having characteristic properties that can be associated with brittle fracture of the

brittle erosion behavior, *n*

exposed surface; that is, little or no plastic flow occurs, but cracks form that eventually intersect to create erosion fragments. (See also **ductile erosion behavior**.) **G 40, G02**

brittle failure—a pipe failure mode which exhibits no visible (to the naked eye) material deformation (stretching, elongation, or necking down) in the area of the break. **F 412, F17**

brittle fracture, *n*—fracture that occurs without appreciable plastic deformation of the material. **A 644, A04**

brittle fracture area, *n*—The fraction or percent of the fracture surface that formed by brittle fracture. (When observed with no or low magnification, brittle fracture appears whiter and shinier than ductile fracture.) **A 644, A04**

brittleness—the tendency of a material to break at a very low strain, elongation, or deflection, and to exhibit a clean fracture surface with no indications of plastic deformation. **E 631, E06**

brittleness—the tendency of a material to break at a very low strain, elongation, or deflection, and to exhibit a clean fracture surface with no indications of plastic deformation. **E 1749, E06**

broadcast application—the distribution of a material uniformly over the entire area to be treated and not just to portions of the area. **E 609, E35**

broadcast application—an application of a material over the entire area of a field. **E 1102, E35**

broadcast resin monolithic floor surfacing—a flooring system whereby a film of catalyzed resin binder is applied on a prepared concrete substrate followed immediately by the seeding to excess, into this wet film, of a dry inert filler. Upon hardening, any unbonded filler is removed. The application may be repeated once or several times to yield a greater thickness of surfacing. A top coat may be applied. **C 904, C03**

broadgoods—non-preimpregnated or uncured preimpregnated materials wider than 12 in. (300 mm). **E 631, E06**

broadgoods—non-preimpregnated or uncured preimpregnated materials wider than 12 in. (300 mm). **E 1749, E06**

broad head—See **large head**. **F 547, F16**

broiler, conveyor—equipment that carries the food product on a wire rack through a tunnel that heats using high temperature radiant heat sources above and or below the rack, for cooking on one or both sides of the food product at once. See **broiler, overfired** and **broiler, underfired**. **F 1827, F26**

broiler, overfired—equipment with a high temperature radiant heat source above a grate for cooking food. **F 1827, F26**

broiler, underfired—equipment with a high temperature radiant heat source below a grate for cooking food, including charbroiler, radiant-broilers, smokeless broilers, etc.. **F 1827, F26**

broken end, *n*—*inwoven fabrics*, a void in the warp direction due to yarn breakage. **D 123, D13**

broken end, *n*—*inwoven fabrics*, a void in the warp direction due to yarn breakage. **D 3990, D13**

broken end, *n*—*inwoven fabrics*, a void in the warp direction due to yarn breakage. **D 4850, D13**

broken filament, *n*—*in multifilament yarn*, breaks in one or more filaments. **D 123, D13**

broken filament, *n*—*in multifilament yarn*, breaks in one or more filaments. (*Syn.* strip back, skin back) **D 3990, D13**

broken filament, *n*—*in multifilament yarn*, breaks in one or more filaments. **D 4849, D13**

broken filament, *n*—*for inflatable restraint fabrics*, an individual filament, separated from a multifilament yarn bundle, that lies on the surface of the fabric. **D 6799, D13**

broken grain (shelling, leafing, grain separation)—a separation on veneer surface between annual rings. **D 1038, D07**

broken pick, *n*—*in woven fabrics*, a discontinuity in the filling direction caused by a break or cut in the filling yarn. **D 123, D13**

broken pick, *n*—*in woven fabrics*, a discontinuity in the filling direction caused by a break or cut in the filling yarn. **D 3990, D13**

broken selvage—See **cut selvage**. **D 3990, D13**

bromine index, *n*—the number of milligrams of bromine that will react with 100 g of sample under the conditions of the test. **D 4175, D02**

bromine index—the number of milligrams of bromine consumed by 100 g of sample under given conditions. **D 4790, D16**

bromine number, *n*—the number of grams of bromine that will react with 100 g of the sample under the conditions of the test. **D 4175, D02**

bromine number, total—number of centigrams of bromine equivalent to the total unsaturation present in 1 g of sample. It is a measure of the total ethylenic unsaturation present in the designated aliphatic compound. **E 1547, E15**

bronzing—the application of a chemical finish to copper or copper alloy surfaces to alter the color. **B 374, B08**

bronzing—excessive concentration of crystallized dyestuff on the surface of the leather tending to give a metallic sheen. **D 1517, D31**

bronzing—reflection of reddish-brown highlights from surface, characteristic of nonuniformly deposited film. **D 2825, D21**

bronzing, *n*—the metal-like reflectance which sometimes appears at the surface of nonmetallic colored materials. **D 6488, D01**

bronzing, *n*—an image which has a bronze sheen. **F 1857, F05**

bronzy color (or bronzing), *n*—a metallic coloration observed when viewing the light reflected at angles near the angle of specular reflection, the color usually being quite different from that observed for other directions. **E 284, E12**

brooming—embedding a ply by using a broom to smooth it out and ensure contact with the adhesive under the ply. **D 1079, D08**

broom nail—bright, regular-stock-steel, $\frac{5}{8}$ to $\frac{3}{4}$ by 0.072 or 0.080-in. nails with flat $\frac{1}{4}$ or $\frac{7}{32}$ in. head and medium diamond point. **F 547, F16**

brown coat, *n*—the second layer in three-coat plaster application. **C 11, C11**

bruise—synonymous with **percussion cone**. **C 162, C14**

bruise, *n*—*in fabrics*, an area that has been subjected to impact or pressure, which differs from the adjacent normal fabric. **D 123, D13**

bruise, *n*—*in fabrics*, an area that has been subjected to impact or pressure, that differs from the adjacent normal fabric. (*Syn.* pressure mark.) **D 3990, D13**

bruise, *n*—*for inflatable restraint fabrics*, a shift in the squareness of the weave pattern in an area that has been subjected to impact or pressure. **D 6799, D13**

brush—a sliding contact member consisting of one or more sliders (see sliders). **B 542, B02**

brush—to remove bisque in a definite pattern by means of a brush. **C 286, B08**

brush, *n*—a hand-held cleaning tool consisting of a base into which bristles are inserted. **D 123, D13**

brush, *vt*—*in refurbishing textiles*, (1) to use a brush to remove surface particulate soils, (2) work a cleaning solution or spot cleaning agent into carpet pile or upholstery fabric, or (3) restore the appearance of pile fabrics. **D 123, D13**

brush, *n*—a hand-held cleaning tool consisting of a base into which bristles are inserted. **D 5253, D13**

brush, *v*—*in refurbishing textiles*, (1) to use a brush to remove surface particulate soils, (2) work a cleaning solution or spot cleaning agent into carpet pile or upholstery fabric, or (3) restore the appearance of pile fabrics. **D 5253, D13**

brush, bolt-hole—see **bolt-hole brush**. **C 286, B08**

brush coat—*in sealants*, a thin layer of Class A curing type sealant used alone or in conjunction with a Type B sealant. **E 631, E06**

brush coat—*in sealants*, a thin layer of Class A curing type sealant used alone or in conjunction with a Type B sealant. **E 1749, E06**

brush coloring—the application of dye-stuff to leather with a brush or swab, the leather being laid on a table. Also called table dyeing. **D 1517, D31**

brush-drag, *n*—resistance encountered when applying a coating by brush, directly related to the high-shear viscosity of the coating.

D 16, D01

brushing—see **brush**.

C 286, B08

brush plating—a method of plating in which the plating solution is applied with a pad or brush, within which is an anode and which is moved over the cathode to be plated.

B 374, B08

brush polishing (electrolytic)—a method of electropolishing (q.v.) in which the electrolyte is applied with a pad or brush in contact with the part to be polished.

B 374, B08

BS—abbreviation for base stock. (see **BP**.)

F 549, F05

B-scan presentation—a means of ultrasonic data presentation which displays a cross section of the specimen indicating the approximate length (as detected per scan) of reflectors and their relative positions.

E 1316, E07

B-stage, *n*—an intermediate stage in the reaction of certain thermosetting resins in which the material swells when in contact with certain liquids and softens when heated, but may not entirely dissolve or fuse.

D 883, D20

B-stage, *n*—an intermediate stage in the reaction of certain thermosetting resins in which the material swells when in contact with certain liquids and softens when heated, but may not entirely dissolve or fuse.

D 907, D14

B-stage—an intermediate stage, in the reaction of certain thermosetting resins in which the material softens when heated and swells in contact with certain liquids, but may not entirely fuse or dissolve. The resin in an uncured thermosetting adhesive is usually in this stage. Sometimes referred to as *resitol*.

E 631, E06

B-stage—an intermediate stage, in the reaction of certain thermosetting resins in which the material softens when heated and swells in contact with certain liquids, but may not entirely fuse or dissolve. The resin in an uncured thermosetting adhesive is usually in this stage. Sometimes referred to as *resitol*.

E 1749, E06

BTDC, *adj*—abbreviation for Before Top Dead Center; used with the degree symbol to indicate the angular position of the crankshaft relative to its position at the point of uppermost travel of the piston in the cylinder.

D 4175, D02

BTS method—a method to predict the presence or absence of permafrost in a mountainous area, using measurements of the bottom temperature of the snow in mid- to late-winter.

D 7099, D18

Btu—British thermal unit, the amount of energy required to raise the temperature of one pound of water one degree Fahrenheit. One Btu_{IT} (International Table) is equal to 1055.056 J.

D 4150, D03

BTU—one British Thermal Unit is the amount of heat required to raise 1 lb of water 1°F.

E 1705, E48

B-tuft, *n*—a two-pass process for aligning hooked fibers on the Fibroliner FL-101.

D 123, D13

B-tuft, *n*—a two-pass process for aligning hooked fibers on the Fibroliner FL-101.

D 7139, D13

bubble immersion test—a form of leak test of gas-containing enclosures in which a leak is indicated by the formation of a bubble at the site of a leak.

E 1316, E07

bubble packaging material—a material consisting of a flexible plastic film having uniformly spaced bubbles integrally molded therein.

D 996, D10

bubble point—pressure differential at which bubbles first appear on one surface of an immersed porous membrane as gas pressure is applied to the other side.

D 6161, D19

bubble point pressure—the pressure differential necessary to displace a liquid held by surface tension forces from the largest equivalent capillaries in a membrane filter.

D 6161, D19

bubble point test—a nondestructive membrane filter test used to assess filter integrity and proper installation.

D 6161, D19

bubbler, *n*—a sampling device consisting of a gas disperser immersed in an absorbing liquid.

fritted bubbler, *n*—a bubbler having a frit as the gas disperser.

D 1356, D22

bubbler—a device using a liquid stream to couple an ultrasonic beam to the test piece.

E 1316, E07

bubble structure—size and spatial distribution of voids within the fired porcelain enamel.

C 286, B08

bubbling pressure—the applied air pressure at which water menisci of the porous segment of a suction sampler break down, and air exists.

D 653, D18

buck—a special support for ware during the firing of porcelain enamel on heavy ware.

C 286, B08

bucket pump sprayer—a sprayer apparatus consisting of a manually operated pump that may be held or mounted in a bucket containing the spray solution. The pump is connected to an atomizing device that forms and distributes the spray.

E 1102, E35

bucking coils—same as **differential coils**.

E 1316, E07

buckle (centre bulge or oil can)—alternate bulges and hollows recurring along the length of a strip with the edges remaining relatively flat.

B 846, B05

buckling—a bulge, bend, bow, kink, or wavy condition produced in sheets, plates, columns, or beams by compressive stresses.

D 653, D18

buck sides—cattlehide shoe upper leather finished to resemble buckskin.

D 1517, D31

buckskin—leather from deer and elk skins, used for shoes, gloves, and clothing. Only the outer cut of the skin from which the surface grain has been removed may be correctly defined as “genuine buckskin.” Leather finished from the split or under-cut of deerskin must be described as “split buckskin.”

D 1517, D31

buddy system, *n*—a means of organizing employee work groups whereby each participant is matched with another so that prompt assistance can be rendered in the case of any emergency.

F 1494, F23

buffable—capable of improvement in gloss or general appearance, or both, of a polish film by a mechanical action.

D 2825, D21

buffalo leather—leather made from the hides of domesticated water buffalo of the Far East, not the American bison.

D 1517, D31

buffer—a compound or mixture that, when contained in solution, causes the solution to resist change in pH. Each buffer has a characteristic limited range of pH over which it is effective.

B 374, B08

buffer, *n*—a material or device, such as folded up **corrugated fiberboard**, placed in a container to position and protect the contents from the forces of impact.

D 996, D10

buffer—a substance in solution that accepts hydrogen or hydroxyl ions added to the solution minimizing a change in pH.

D 6161, D19

buffer—*in fiber optics*, see **fiber optic buffer**.

E 131, E13

buffer, *n*—*in spectrometric analysis*, a substance that tends to minimize the effects of one or more elements on the emission of other elements.

E 135, E01

buffer—a solution of partially ionized acids or bases capable of reducing pH changes in the presence of added alkalis or acids.

F 1600, F20

buffer action—the resistance of a solution to change in pH.

D 459, D12

buffer or buffering agent—a compound or mixture that, when contained in solution, causes the solution to resist change in pH. Each buffer has a characteristic limited range of pH over which it is effective.

E 1519, E35

buffing—the smoothing of a surface by means of a rotating flexible wheel to the surface of which fine, abrasive particles are applied in liquid suspension, paste, or grease stick form.

B 374, B08

buffing—the mechanical operation of removing a superficial portion of the grain of flesh surface with sand paper or knife in order to produce a velvet surface or to minimize natural surface defects on the grain or flesh.

D 1517, D31

buffing dust—the fine particulate leather fiber that is sanded off during buffing.

D 1517, D31

buffing paper—rolls or continuous paper coated with specially

buffing paper

graded and treated abrasive particulates that is used to buff leather on a belt sanding machine. **D 1517, D31**

buffing rubber, n—particulate rubber produced as a byproduct of the buffing operation in the carcass preparation stage of a tire retreading; characterized by a wide range of particle sizes that are predominately elongated or acicular in shape. See **particulate rubber**. **D 1566, D11**

buffing rubber, n—vulcanized rubber usually obtained from a worn or used tire in the process of removing the old tread in preparation for retreading. **D 5681, D34**

buffing-type of floor polish—a floor polish that requires buffing to maintain or enhance appearance, or both. **D 2825, D21**

builder—a material added to a soap or synthetic detergent formulation that enhances or maintains the cleaning efficiency of the surfactant, principally by inactivating water hardness either by sequestration, precipitation, or ion exchange. Other functions, depending on the performance capability of the builder compound used, include supplying alkalinity, buffering to maintain alkalinity at effective cleaning levels, helping to keep removed soil in suspension, and emulsifying oily soils. **D 459, D12**

builder's model, n—a reference standard of quality for specific building components, denoting by example, the level of quality adopted by a builder. **E 631, E06**

building, n—(1) a shelter comprising a partially or totally enclosed space, erected by means of a planned process of forming and combining materials. (2) the act or process of constructing. **E 631, E06**

building, n—a structure comprising a partially or totally enclosed space, erected by means of a planned process of forming and combining materials. **E 1481, E06**

building, n—(1) A shelter comprising a partially or totally enclosed space(s), erected by means of planned forces of forming and combining materials. (2) The act or process of construction. **E 2114, E06**

building, n (bâtiment)—a shelter comprising a partially or totally enclosed space, erected by means of a planned process of forming and combining materials. Compare **building construction**. **E 1480, E06**

building board—a natural finished multi-purpose cellulosic fiberboard. **D 1554, D07**

building brick, n—brick for load-resisting or other purposes where appearance properties such as texture or color are not important (formerly called common brick); see Specification C 62 and Specification C 652. **C 43, C15**

building code—See **code**. **E 631, E06**

building code, n—a code applicable to buildings, adopted and administered with the primary intent of protecting public health, safety, and welfare. **E 631, E06**

building component, n—a building element using industrial products that are manufactured as independent units capable of being joined with other elements. **E 631, E06**

building component, n (composant de bâtiment)—a building element using industrial products that are manufactured as independent units capable of being joined with other elements. **E 1480, E06**

building construction, n—(1) the act or process of making or forming a building by assembling or combining elements, components, or systems. (2) the structure or part thereof so formed. **E 631, E06**

building construction, n (construire de bâtiment)—(1) the act or process of making or forming a building by assembly or combining elements, components or systems. (2) the structure or part thereof so formed. Compare **building**. **E 1480, E06**

building construction joint, n—a designed division of a building that allows movement of all component parts of the building, in any plane, which may be caused by thermal, seismic, wind loading, or any other force. The construction of the separation is accomplished by one of the following methods: (1) manufactured devices suitable for this application, or (2) by field fabrication of suitable materials. **C 11, C11**

building core and service area—See **space categories**. **E 631, E06**

building core and service area—See **space categories**. **E 1480, E06**

building decision—a decision regarding the design, financing, engineering, construction, management, or operation of a building. **E 631, E06**

building decision, n—a decision regarding the design, financing, engineering, construction, management, or operation of a building. **E 833, E06**

building drain—that part of the lowest horizontal piping of a drainage system that receives the discharge from soil, waste, and other drainage pipes inside the walls of the building and conveys it to the building sewer beyond the foundation walls of the building or structure. **F 412, F17**

building drain (sanitary)—a building drain that conveys gray water or sewage, or both. **F 412, F17**

building drain (storm)—a building drain that conveys storm water only. **F 412, F17**

building economics—the application of economic analysis to the design, financing, engineering, construction, management, operation, or ownership of buildings. **E 631, E06**

building economics, n—the application of economic analysis to the design, financing, engineering, construction, management, operation, ownership, or disposition of buildings. **E 833, E06**

building enclosure—Use **building envelope**. **E 631, E06**

building envelope—the outer elements of a building, both above and below ground, that divide the external from the internal environments. **E 631, E06**

building envelope—the boundary or barrier separating the interior volume of a building from the outside environment. **E 631, E06**

building envelope, n (enveloppe d'un immeuble)—perimeter elements of a building, both above and below ground, that divide the external from the internal environment. **E 631, E06**

building envelope, n (enveloppe d'un immeuble)—perimeter elements of a building, both above and below ground, that divide the external from the internal environment. **E 1480, E06**

building environmental survey—for lead systematic inspection of a building and associated on-site paint, dust, soil, and water for the presence of lead compounds. **E 631, E06**

building fabric—(1) elements, components, parts, materials, or systems of a building separately or in combination; (2) loadbearing part of a structure without windows, doors, interior or exterior finishes. **E 631, E06**

building gross area—See **space categories**. **E 631, E06**

building gross area—See **space categories**. **E 1480, E06**

building heat loss factor—a measure of the heat loss rate of a building expressed in joules per degree day (or Btu per degree day). This factor is multiplied by the number of degree days in a given period to estimate the energy required to heat the building during that period. **E 772, E44**

building modification—change or activity affecting the materials, structure, operations, or appearance of a building or its systems. **E 631, E06**

building occupant—See **occupant**. **E 631, E06**

building occupant—See **occupant**. **E 1480, E06**

building or construction lime—a lime whose chemical and physical characteristics and method of processing make it suitable for the ordinary or special construction uses of the product. **C 51, C07**

building performance, n—the behavior in service of a construction as a whole, or of the building components. **E 631, E06**

building performance, n—the behavior in service of construction as a whole, or of the building components. **E 2114, E06**

building performance, n (rendement d'édifice)—the behavior in service of a construction as a whole, or of the building components. Compare **facility performance**.

durability, n (durée)—the capability of a building, assembly, component, product, or construction to maintain serviceability for at least a specified period of time. Compare **facility durability**.

serviceability, n (fonctionnalité)—the capability of a **building**, assembly, component, product, or construction to perform the function(s) for which it is designed or used, or both.
Compare **facilityserviceability**. E 1480, E06

building permit, n—an authorization granted by the agency having jurisdiction to an applicant to proceed with construction on a specific project. E 631, E06

building preservation, n—measures taken to conserve, protect, rehabilitate, restore, or stabilize a building. See **preservation**. E 631, E06

building pressure difference—the pressure difference across the building envelope, expressed in pascals (inches of water, pounds-force per square foot, or inches of mercury). E 631, E06

building pressure difference, P, n—the pressure difference across the test zone envelope (Pa, in. H₂O). E 631, E06

building projection, n (saillie d'un immeuble)—pilaster, convector, baseboard heating unit, radiator, or other building element located in the interior of a building wall that prevents the use of that space for furniture, equipment, circulation, or other functions. E 631, E06

building projection, n (saillie d'un immeuble)—pilaster, convector, baseboard heating unit, radiator, or other building element located in the interior of a building wall that prevents the use of that space for furniture, equipment, circulation, or other functions. E 1480, E06

building related illness, BRI, n—diagnosable illness of which cause and symptoms can be directly attributed to a specific pollutant source within a building (for example, Legionnaire's disease, hypersensitivity, pneumonitis). BRI differs from sick building syndrome (SBS) conditions because the symptoms of the disease persist after leaving the building, unlike SBS where the occupant experiences relief shortly after leaving the building. E 2114, E06

building sanitary sewer—that part of the horizontal piping of a sanitary drainage system which extends from the building sanitary drain, receives the discharge of the building sanitary drain, and conveys it to a public sewer, private sewer, individual sewage disposal system, or other point of disposal. F 412, F17

building seal—See **seal**. C 717, C24

building service area—Preferred term is **building core and service area**. See **space categories**.

building space: E 631, E06

building service area—Preferred term is **building core and service area**. See **space categories**. E 1480, E06

building space—See **space categories**. E 1480, E06

building stone—natural rock of adequate quality to be quarried and cut as dimension stone as it exists in nature, as used in the construction industry. C 119, C18

building storm sewer—that part of the horizontal piping of a storm drainage system which extends from the building storm drain, receives the discharge of the building storm drain, and conveys it to a public storm sewer, private storm sewer, or other point of disposal. F 412, F17

building subsystem—a complete, integrated set of parts that functions as a unit within the finished **building**. See also **cladding system, hard-coat system, railing systems**. E 631, E06

building subsystem, n (sous-système d'immeuble)—complete, integrated set of parts that functions as a unit within the finished **building**. E 1480, E06

building supply—See **water service**. F 412, F17

building system—(1) group of structural or non-structural components or assemblies, or both, of a building interacting to serve a common purpose; (2) method for fabricating or erecting an entire structure. See also **anchorage system, anchoring system, hard-coat system, structural system, exterior installation, finish system**. E 631, E06

building system—an aggregation or assemblage of items joined in regular interaction or interdependence in buildings or building construction. E 631, E06

building system, n—an aggregation or assemblage of items joined in regular interaction or interdependence in buildings or building construction. E 833, E06

building system, n (système d'immeuble)—collection of equipment, facilities, and software designated to perform a specific function. E 631, E06

building system, n (système d'immeuble)—collection of equipment, facilities, and software designated to perform a specific function. E 1480, E06

building up—electroplating for the purpose of increasing the dimensions of an article. B 374, B08

build-up—condition resulting from lack of self-sensitivity in a polish, whereby new film deposits over old, with little or no self-cleaning action. D 2825, D21

buildup factor—for radiation passing through a medium, the ratio of the total value of a specified radiation quantity (such as absorbed dose) at any point in that medium to the contribution to that quantity from the incident uncollided radiation reaching that point. E 170, E10

built soap—under **soap**, see *built soap*. D 459, D12

built-up laminated wood, n—see *built-up laminated wood under wood laminate*. D 907, D14

built-up roofing—a continuous, semiflexible membrane consisting of plies of saturated felts, coated felts, fabrics or mats assembled in place with alternate layers of bitumen, and surfaced with mineral aggregate, bituminous materials, or a granule surfaced sheet (abbreviation, BUR). D 1079, D08

built-up timbers—an assembly made by joining layers of lumber together with mechanical fastenings so the grain of all laminations is essentially parallel. D 9, D07

bulb, n—of a *liquid-in-glass thermometer*, reservoir for the thermometric liquid. E 344, E20

bulb edge—the heavy rounded edge or bead of flat glass. C 162, C14

bulb length, n—the distance from the bottom of the bulb to the junction of the bulb and the stem tubing. E 344, E20

bulb of pressure—see **pressure bulb**. D 653, D18

bulge—doughnut-like protrusion perpendicular to nail shank below nail head. F 547, F16

bulk adherend, n—as related to *interphase*, the adherend, unaltered by the adhesive. (Compare to **bulk adhesive**.) D 907, D14

bulk adhesive, n—as related to *interphase*, the adhesive, unaltered by the adherend. (Compare to **bulk adherend**.) D 907, D14

bulk density, n—the mass per unit volume of a powder under nonstandard conditions, for example, in a shipping container (not to be confused with apparent density). B 243, B09

bulk density, n—of *aggregate*, the mass of a unit volume of bulk aggregate material (the unit volume includes the volume of the individual particles and the volume of the voids between the particles). C 125, C09

bulk density, n—apparent mass per unit volume. D 123, D13

bulk density, ρ—the mass of a quantity of a bulk solid divided by its total volume. D 653, D18

bulk density, n—the weight per unit volume of a loosely packed material, such as a molding powder or pellets. D 883, D20

bulk density, n—mass per unit volume of a material, including any voids present. D 1566, D11

bulk density, n—the mass per unit volume of a material, including voids inherent in the material as tested. E 1638, E29

bulk density, n—the mass of a material per unit volume including voids. Bulk density is usually reported on a dry basis. E 2201, E50

bulk density—the weight per unit volume of a material including voids inherent in the material as tested. F 1251, F04

bulk factor, n—the ratio of the volume of a given mass of molding material to its volume in the molded form. D 883, D20

bulk factor, n—the ratio of the volume of a given mass of molding material to its volume in the molded form. F 412, F17

bulk factor, n—the ratio of the volume of a given mass of molding material to its volume in the molded form. F 1251, F04

bulkhead

bulkhead—a steep or vertical structure supporting natural or artificial embankment. **D 653, D18**

bulking—the increase in volume of a material due to manipulation. Rock bulks upon being excavated; damp sand bulks if loosely deposited, as by dumping, because the apparent cohesion prevents movement of the soil particles to form a reduced volume. **D 653, D18**

bulking—the act of emptying multiple containers of compatible materials and mixing those materials together in a single package unit destined for shipment. This would also include material placed in storage tanks to be packaged for shipment at a later date, or pumped into a bulk tank truck for shipment. **D 5681, D34**

bulking number, *n*—of paper, the number of sheets required to produce a stack of 25 mm thickness (approximately 1 in.). See **thickness**. **D 1968, D06**

bulking value, *n*—solid volume of a unit weight of material, usually expressed as gallons per pound. For practical purposes this is 0.120 divided by the specific gravity. **D 16, D01**

bulk material length (BML), *n*—a single length of thermocouple material (produced from the same raw material lot) after completion of fabrication resulting in sheathed thermocouple material. **E 344, E20**

bulk micromachining—a MEMS fabrication process where the substrate is removed at specified locations. **E 2444, E08**

bulk molding compound (BMC), *n*—a putty-like mixture of any thermosetting resin containing fillers, fiber reinforcements, catalysts and thickening agents, or thermoplastic polymers, often extruded into logs or ropes. **D 883, D20**

bulk packaging—see **packaging**. **D 996, D10**

bulk reflection—reflection in which radiant energy is returned exclusively from within the specimen. **E 131, E13**

bulk sample, *n*—in the sampling of bulk material, one or more portions which (1) are taken from material that does not consist of separately identifiable units and (2) can be identified after sampling as separate or composited units. (Compare to **discretesample, lot sample**.) **D 123, D13**

bulk sample, *n*—a large sample, either from one place or made up of several incremental samples of the same material. **D 4175, D02**

bulk shrinkage, *n*—a measure of potential stretch and power of stretch yarns or a measure of bulk of textured-set yarns. **D 123, D13**

bulk shrinkage, *n*—a measure of potential stretch and power of stretch yarns or a measure of bulk of textured-set yarns. **D 4849, D13**

bulk solid—an assembly of solid particles handled in sufficient quantities that its characteristics can be described by the properties of the mass of particles rather than the characteristics of each individual particle. May also be referred to as granular material, particulate solid or powder. Examples are sugar, flour, ore, and coal. **D 653, D18**

bulk specific gravity, *n*—the ratio of the mass of a volume of a material (including the permeable and impermeable voids in the material, but excluding the voids between particles of the material) at a stated temperature to the mass of an equal volume of distilled water at a stated temperature. **C 125, C09**

bulk specific gravity (saturated surface dry), *n*—the ratio of the mass of a volume of a material including the mass of water within the pores in the material (but excluding the voids between particles) at a stated temperature, to the mass of an equal volume of distilled water at a stated temperature. **C 125, C09**

bulk storage—the storage of hose or covers together with one or more layers piled neatly, but without the benefit of spacers, supports, or special protective containers. **F 819, F18**

bullhides—hides from bulls are characterized by thick and rough head, neck and shoulders, and coarse flanks. They are often poor in quality and heavy, ranging from 60 lb (27 kg) up. **D 1517, D31**

bull's eye—(1) a tempered solid cylindrical sight glass.

(2) the glass left by the punty in the center of a flat disk of glass made by the hand blown crown process.

(3) in flat glass, an optical distortion that arises from a polishing depression or a solid inclusion trapped between layers of laminated glass. **C 162, C14**

bump check—See **percussion cone**. **C 162, C14**

bumping, molding process, *n*—the application, release, and reapplication of pressure prior to the start of vulcanization to vent entrapped gases, thereby facilitating complete filling of the mold. **D 1566, D11**

bunch, *n*—a defect in a yarn characterized by a segment not over 6 mm (¼ in.) in length that shows an abrupt increase in diameter caused by more fibers matted in this particular place. (See **slug, slub**.) **D 123, D13**

bunch—See **slug**. **D 3990, D13**

bunch, *n*—a defect in a yarn characterized by a segment not over 6 mm (¼ in.) in length that shows an abrupt increase in diameter caused by more fibers matted in this particular place. (See **slug, slub**.) **D 4849, D13**

bunch-stranded conductor—a conductor composed of wires twisted together with a given length and direction of lay in such manner that the respective wires at successive cross sections along the length of the conductor do not necessarily form a symmetrical geometric pattern, nor necessarily occupy the same positions relative to each other. **B 354, B01**

bundle, *n*—two or more articles held together with rope, wire, or strapping so as to form a shipping unit; it may be wrapped. **D 996, D10**

bundle—an assemblage of asbestos in which the fibers remain entirely in their original close-packed parallel configuration (or not appreciably displaced therefrom) and having a transverse dimension typically between 2 and 8 mm. **D 2946, C17**

bundle—a general term for a collection of essentially parallel filaments. **D 3878, D30**

bundle—a general term for a collection of parallel filaments or fibres. **D 6161, D19**

bung—usually a 2-in. (5.1-cm) or ¾-in. (1.3-cm) diameter threaded plug designed specifically to close a bung hole. **D 5681, D34**

bung hole—in packaging, an opening in a barrel or drum through which material can be poured to fill, empty or vent. **D 996, D10**

bung hole—an opening in a barrel or drum through which it can be filled, emptied, or vented. **D 5681, D34**

bunker—synonym for **bin**, but sometimes understood as being a bin without any or only a small vertical part at the top of the hopper. **D 653, D18**

Bunsen coefficient, *n*—the solubility of a gas expressed as the volume, reduced to 273 K (32°F) and 101.3 kPa (1 atm), dissolved by one volume of liquid at the specified temperature and 101.3 kPa. **D 4175, D02**

Bunsen coefficient, *n*—the solubility of a gas, expressed as the gas volume reduced to 273 K (32°F) and 0.10 MPa (1 atm), dissolved by one volume of liquid at the specified temperature and 0.10 MPa. **D 4175, D02**

buoyancy chamber (aka flotation chamber)—enclosed compartment of air or other buoyant material providing flotation for the boom. **F 818, F20**

buoyant unit weight (submerged unit weight)—see **unitweight**.

D 653, D18

burden—in an explosive blasting, the distance between the charge and the free face of the material to be blasted. **D 653, D18**

burden—distance between charge and free surface in direction of throw. (ISRM) **D 653, D18**

burglar-resistant spindle—a tapered, shouldered, or other specially designed and treated spindle intended to resist punching, pulling, and drilling. **F 471, F12**

buried ice—ice formed on the ground surface and later covered by sediments. **D 7099, D18**

buried pile yarn, *n*—for coated pile yarn floor covering, that portion of the pile tuft elements which remains after the tuft legs have been removed by shearing. **D 123, D13**

buried pile yarn, *n*—*for coated pile yarn floor covering*, the part of pile yarn tufts which is in or under the primary backing.

D 5684, D13

curl—(1) a hard, woody outgrowth on a tree, more or less rounded in form, usually resulting from the entwined growth of a cluster of adventitious buds.

(2) in wood or veneer, a localized severe distortion of the grain generally rounded in outline, usually resulting from overgrowth of dead branch stubs, varying from 1/2 in. to several inches in diameter; frequently includes one or more clusters of several small contiguous conical protuberances, each usually having a core of pith but no appreciable amount of end grain (in tangential view) surrounding it.

D 9, D07

burllap, *n*—a coarse, heavy, plain weave fabric of coarse single bask fiber yarn.

D 123, D13

burllap, *n*—a coarse, heavy, plain weave fabric of yarns, such as bast or cotton fiber yarn.

D 4850, D13

burn, *v*—the heat treatment to which refractory materials are subjected in the firing process.

C 71, C08

burn—a discoloration, distortion, or destruction of the pultruded surface as a result of thermal decomposition.

D 3918, D20

burn, *vt*—*in emissionspectroscopy*, to vaporize and excite a specimen with sufficient energy to generate spectral radiation.

D 4175, D02

burn, *n*—*in emission spectrometry*, (1) that portion of a solid specimen from which atoms were volatilized; (2) the act of burning.

E 135, E01

burn, *vt*—*in emission spectrometry*, to vaporize and excite a specimen with sufficient energy to generate spectral radiation.

E 135, E01

burn, *v*—to undergo combustion.

E 176, E05

burn chemical, *n*—perception of increased temperature and irritation resulting from exposure to such substances as ethyl alcohol, or high concentrations of NaCl or acids. The sensation lingers a short time after the stimulus is removed.

E 253, E18

burn distance, *n*—the measurement from the bottom edge of the specimen to the farthest point that shows evidence of damage due to combustion.

F 1494, F23

burner block—a refractory block with one or more orifices through which fuel is admitted to a furnace.

C 162, C14

burner fuel oil, *n*—any petroleum liquid suitable for the generation of heat by combustion in a furnace or firebox as a vapor or a spray, or a combination of both.

D 4175, D02

burning—see **firing**.

C 286, B08

burning bars, points, or tools—equipment used to suspend or support ware during the firing operations.

C 286, B08

burning behavior, *n*—all the changes that take place when materials or products are exposed to a specified ignition source.

D 123, D13

burning behavior, *n*—all the changes that take place when materials or products are exposed to a specified ignition source.

D 4391, D13

burning behavior, *n*—all the changes that take place when materials or products are exposed to a specified ignition source.

F 1494, F23

burning (burnt, burned)—a term applied to metal which has been permanently damaged by having been heated to a temperature close to or within the melting range. This results in a structure exhibiting incipient melting or intergranular oxidation.

E 7, E04

burning (firing) of refractories, *v*—the final heat treatment in a kiln to which refractory brick and shapes are subjected in the process of manufacture for the purpose of developing bond and other necessary physical and chemical properties.

C 71, C08

burning tool mark—a defect in the porcelain enamel appearing on the surface opposite to the point of contact with the supporting burning tool.

C 286, B08

burnishing—the smoothing of surfaces by rubbing, accomplished chiefly by the movement rather than the removal of the surface layer.

B 374, B08

burnishing—similar to buffing but using polishing paper/cloths with no or very fine abrasives that produces a very smooth polished appearance on the leather surface.

D 1517, D31

burnishing—enhancement of the appearance of a polish accomplished by dry mechanical abrasion with a suitable machine and accessories.

D 2825, D21

burn-off, *n*—removal of organic additives (binder or lubricant) from a compact by heating.

B 243, B09

burn off—the unintentional removal of an autocatalytic deposit from a nonconducting substrate, during subsequent electroplating operations, owing to the application of excess current or a poor contact area.

B 374, B08

burn-off—the process of severing an unwanted portion of a glass article by fusing the glass.

C 162, C14

burn-off papers—materials sensitive to and that will produce an image by electric current.

F 221, F05

burn rate—the rate at which a material burns after removal of the ignition heat source.

E 631, E06

burn rate—the rate at which a material burns after removal of the ignition heat source.

E 1749, E06

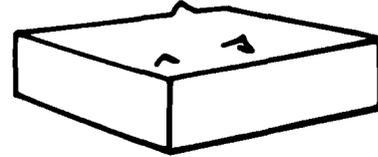

burnt deposit—a rough, noncoherent or otherwise unsatisfactory deposit produced by the application of an excessive current density and usually containing oxides or other inclusions.

B 374, B08

burnt lime—calcined limestone (CaO · MgO, dolomitic), or CaO (calcitic), or a mixture of these.

C 162, C14

burr—fragment of excess material or foreign particle adhering to the surface.

F 109, C21

burr—thin, wing-like ridge protruding from side or edge of point or underside of top of head; defect formed during pointing or heading process and intended to be removed during manufacturing process. (See **whisker**.)

F 547, F16

burr-wool waste, *n*—waste removed by the burr guard of cards or burr pickers having a very short fiber and full of burrs or seeds.

D 123, D13

burr-wool waste, *n*—waste removed by the burr guard of cards or burr pickers having a very short fiber and full of burrs or seeds.

D 4845, D13

burst—open break in the metal during forging located on the flats or corners of bolt and screw heads, or at the periphery of a flanged or circular headed bolt or screw, or on the flats or corners of the nut.

F 1789, F16

burst emission—see **emission, burst**.

E 1316, E07

bursting force, *n*—the force or pressure required to rupture a fabric by distending it with a force, applied at right angles to the plane of the fabric, under specified conditions

D 123, D13

bursting-off—the breaking of the blowover.

C 162, C14

bursting strength, *n*—*in fabric*, the capacity of a material to withstand the ultimate bursting force required to rupture a fabric.

D 123, D13

bursting strength—See **packagetesting**.

D 996, D10

bursting strength—*of paper or paperboard*, the maximum liquid pressure required to produce rupture of the material when the pressure is increased at a controlled rate through a rubber diaphragm to a constrained circular area of the material.

D 1968, D06

bursting strength, *n*—the force or pressure required to rupture a fabric by distending it with a force, applied at right angles to the plane of the fabric, under specified conditions.

D 4850, D13

bursting strength of paper, *n*—the hydrostatic pressure required to produce rupture of a circular area of the material under specified test conditions.

D 1711, D09

bursting strength "points", *n*—*in paper*, a unit of measure for bursting strength, measured in pounds per square inch, that should

bursting strength "points", *n*

- be considered colloquial and directly interchangeable with "pounds per square inch". See **bursting strength**. **D 1968**, D06
- bursting strength test**—See **package testing**. **D 996**, D10
- burst strength**—the internal pressure required to cause a pipe or fitting to fail. **F 412**, F17
- burst strength**—a measure of the internal pressure necessary to rupture a package or seal. **F 1327**, F02
- bus bar**—includes material of solid rectangular or square cross section or a solid section with two plane parallel surfaces and round or other simple regular-shaped edges. **B 846**, B05
- bus (bus bar)**—a rigid conducting section, for carrying current to the anode and cathode bars. **C 374**, B08
- bus conductor**, *n*—rigid electric conductor of any cross section. **B 881**, B07
- bus conductor stock**—a bar, rod, or shape of high-conductivity copper used to make bus conductors. **B 846**, B05
- bush-hammered**—a uniformly textured surface with small evenly-spaced pits produced by a hand or pneumatic hammer and carbide-tipped head having numerous points. **C 119**, C18
- bushing**—(1) a liner in the feeder orifice for molten glass.
(2) a precious metal or refractory/metal structure with single or multiple hole(s) through which glass flows and is attenuated into fiber(s). **C 162**, C14
- bust girth**, *n*—*inbody measurements*, the circumference of the body over the fullest part of the breasts and parallel to the floor. (Compare **chestgirth**.) **D 123**, D13
- bust girth**, *n*—*inbody measurement*, the circumference of the body over the fullest part of the breasts and parallel to the floor. (See **chest girth**.) **F 1494**, F23
- bust point to bust point**, *n*—*in body measurements*, the distance across the front from the apex of one breast to the apex of the other. **D 123**, D13
- bust point to bust point**, *n*—the horizontal distance from bust apex to bust apex, taken with the arms down. **D 5219**, D13
- butcher cuts**—damage to hides caused by improper removal from the animal, usually in the form of cuts or furrows on the flesh side. **D 1517**, D31
- butler finish**—a finish composed of fine, uniformly distributed parallel lines, having a characteristic luster usually produced with rotating wire brushes or cloth wheels with applied abrasives. **B 374**, B08
- butt**—that part of the hide or skin covering the rump or hind part of the animal. **D 1517**, D31
- butted wood member**—wood member with its squared end or side placed adjoining the squared end or side of another wood member; with both abutting members of same thickness and in a single plane. **E 631**, E06
- butterfly bruise**—See **percussion cone**. **C 162**, C14
- butterfly point**—a defective point with one or two thin fins projecting. (See **burr**.) **F 547**, F16
- butt-fused joint**—see **joint, butt-fused**. **F 412**, F17
- butt glazing**, *n*—in building construction, a glazing system wherein butt joints are formed between lites and filled with a glazing sealant. **C 717**, C24
- butt joint**, *n*—See **butt sealant joint**. **C 717**, C24
- butt joint**—See **joint**. **E 631**, E06
- butt joint**—a joint having the edge or end of one member matching the edge, end, or face of another member without overlap. **E 631**, E06
- button**, *n*—a knob, disc, or similar object which when forced through a narrow opening or buttonhole, fastens one part of a garment or other flexible substrate to another. (See also **sew-through flange button**.) **D 123**, D13
- button**, *n*—a knot, disc, or similar object which when forced through a narrow opening or buttonhole, fastens one part of a garment or other flexible substrate to another. **D 5497**, D13
- button clincher**—circular clincher. **F 592**, F16
- button head**—cylindrical head with flat upper and bearing surfaces, smaller in diameter and thicker than flat head for same size nail shank. **F 547**, F16
- buttonhole stitch**, *n*—*in home sewing*, a complex machine stitch pattern made by coordinated motions of needle and feed, appearing as very close stitches forming a narrow rectangle of stitching that is usually composed of four stitch segments, one on each side and on each of the two ends of the rectangle. **D 123**, D13
- buttonhole stitch**, *n*—*in home sewing*, a complex machine stitch pattern made by coordinated motions of needle and feed, appearing as very close stitches forming a narrow rectangle of stitching that is usually composed of four stitch segments, one on each side and on each of the two ends of the rectangle. **D 5646**, D13
- button sample**—*in sealants*, an identified small amount of sealant extruded from a mixed sealant cartridge. **E 631**, E06
- button sample**—*in sealants*, an identified small amount of sealant extruded from a mixed sealant cartridge. **E 1749**, E06
- button test**—a test designed to determine relative fusibility of porcelain enamel frit or powder and so called because the completed specimens resemble buttons.

NOTE—See **flow button** and Test Methods C 374. **C 286**, B08
- butress-type thread**—thread with flank on head side of crest almost perpendicular to nail axis; while flank on point side of crest is noticeably inclined. **F 547**, F16
- butt sealant joint**, *n*—*in building construction*, a joint where sealant is applied within the joint between approximately parallel substrate surfaces that are face-to-edge or edge-to-edge. **C 717**, C24
- butt welding (machine)**—the fusing together of two pieces of plastic which are aligned in the same plane, with the same mating thickness, by application of heat and pressure. Also called *hot-plate welding*. **C 904**, C03
- butylene plastic**—plastic based on resins made by the polymerization of butene or copolymerization of butene with one or more unsaturated compounds, the butene being in greatest amount by weight. **F 1251**, F04
- butylene plastics**—plastics based on resins made by the polymerization of butene or copolymerization of butene with one or more unsaturated compounds, the butene being in greatest amount by weight. **D 883**, D20
- butylene plastics**—plastics based on resins made by the polymerization of butene or copolymerization of butene with one or more unsaturated compounds, the butene being in greatest amount by weight. (D20) **F 412**, F17
- b-value**, *n*—*in statistics*, the difference between the mean of a set of results on a material and its accepted reference value. (Compare **error**.) **E 135**, E01
- B-value**—**salt diffusion coefficient**—defined as the amount of salt transferred per unit area of membrane per unit of concentration difference across the membrane. A unit of measurement is m/h or more specifically, m³/m²/h. **D 6161**, D19
- BWRO**—brackish water reverse osmosis. **D 6161**, D19
- by-pass clinch**—clinch with legs paralleling and adjacent to each other. **F 592**, F16
- bypass nozzle**—see **by-pass nozzle**. **E 1620**, E29
- by-pass nozzle**—a swirl chamber atomizer containing by-pass orifice(s) or port(s) through which part of the inlet liquid may be withdrawn from the swirl chamber and returned to the supply tank or pressure pump suction. The discharge flow is modulated by controlling the pressure in the bypass line, using a valve in the line. **E 1620**, E29
- by-product coke**—See **by-product coke** under **coke**. **D 121**, D05
- by-product lime**—by-product limes include a variety of Calcium and/or Calcium/Magnesium compounds that are usable for specific applications but generally do not meet one or more specifications required of primary lime products. Examples include lime kiln dust and lime hydrator rejects. It is advised that the specific compositions, physical properties, performance characteristics, and anticipated variabilities of such materials be evaluated for the service intended. **C 51**, C07

byte, *n*—a set of seven or eight bits used to represent a character or control function.
F 1457, F05

C

C—initial length of the diagonal $\sqrt{a^2 + b^2}$, in metres (feet).

- E 631, E06**
- cabal glass**—a glass consisting primarily of the oxides of calcium, boron, and aluminum. **C 162, C14**
- cable**, *n*—a multi-strand, flexible longitudinal element designed primarily to resist axial tension loading. **F 1582, F04**
- cable end closure**—a moisture barrier at the cable end of the sheath. **E 344, E20**
- cable twist**, *n*—the construction of cabled yarn, cord, or rope in which each successive twist is in the opposite direction to the preceding twist; an S/Z/S or Z/S/Z construction. **D 123, D13**
- cable twist**, *n*—the construction of cabled yarn, cord, or rope in which each successive twist is in the opposite direction to the preceding twist; an S/Z/S or Z/S/Z construction. **D 4849, D13**
- cable wrap**, *n*—paper used for mechanical protection or for space-filling (rather than as electrical insulation) in low-voltage cables with nonmetallic sheaths. **D 1711, D09**
- cabretta**—skin of hair sheep, originally Brazilian, used principally for glove and garment leathers. (See also **cape**.) **D 1517, D31**
- CAC**—combined available chlorine. **D 6161, D19**
- cadmium ratio**—the ratio of the neutron reaction rate measured with a given bare neutron detector to the neutron reaction rate measured with an identical neutron detector enclosed by a particular cadmium cover and exposed in the same neutron field at the same or an equivalent spatial location. **E 170, E10**
- cadmium ratio**—the ratio of the neutron reaction rate measured with a given bare neutron detector to the reaction rate measured with an identical neutron detector enclosed by a particular cadmium cover and exposed in the same neutron field at the same or an equivalent spatial location.
- NOTE**—In practice, meaningful experimental values can be obtained in an isotropic neutron field by using a cadmium filter approximately 1-mm thick. **E 1316, E07**
- Cady test**—See **package testing**. **D 996, D10**
- cage**—an assembled unit of steel reinforcement consisting of circumferential and longitudinal bars or wires. **C 822, C13**
- cage**—a structural fabrication fitted around the perimeter of the cassette with one or more lifting eye suitable for installing or removing the cassette. The four bottom corners of the cage rest within the frame in the tank. **D 6161, D19**
- cake**, *n*—a bonded mass of unpressed metal powder. **B 243, B09**
- cake**—refinery shape used for rolling into plate, sheet, strip, or shape. Rectangular in cross section and of various sizes, normally ranging in weight from 140 to 62 000 lb (63 to 28 123 kg). **B 846, B05**
- cake layer**—layer comprised of particulate materials residing on the upstream face of a membrane. **D 6161, D19**
- caking**, *n*—a settling out of pigments in a fluid ink during storage (sedimentation). **D 6488, D01**
- calcarenite**—a limestone composed predominantly of clastic sand-size grains of calcite, or rarely aragonite, commonly as tiny fossils, shell fragments, or other fossil debris. **C 119, C18**
- calcareous**—originating from predominately calcium carbonate or one of its derivative forms. **C 51, C07**
- calcia**—the chemical compound calcium oxide (CaO). **C 51, C07**
- calcine**—a ceramic material or mixture fired to less than fusion for use as a constituent in a ceramic composition. **C 242, C21**
- calcine**, *v* (**calcination**, *n*)—firing or heating a granular or particulate solid at less than fusion temperature, but sufficient to remove most of its chemically combined volatile matter (that is, H₂O, CO₂) and otherwise to develop the desired properties for use. **C 1145, C28**
- calcine**, **calcines**, *n*—refractory material, often fireclay, that has been heated to eliminate volatile constituents and to produce desired physical changes. **C 71, C08**
- calcined coke**, *n*—petroleum coke that has been thermally treated to drive off the volatile matter and to develop crystalline structure. **D 4175, D02**

- calcined coke**, *n*—raw petroleum coke that has been thermally treated to drive off the volatile matter and to develop crystalline structure. **D 4175, D02**
- calcined gypsum**, *n*—a dry powder; primarily calcium sulfate hemihydrate, resulting from calcination of gypsum; cementitious base for production of most gypsum plasters: also called plaster of paris, sometimes called stucco. **C 11, C11**
- calcined petroleum coke**, *n*—green petroleum coke which has been thermally treated to drive off the volatile matter and to develop crystalline structure. **D 4175, D02**
- calcined petroleum coke**, *n*—raw petroleum coke that has been thermally treated to drive off the volatile matter and to develop crystalline structure. **D 4175, D02**
- calcined refractory dolomite**, *n*—see **dolomite**, **calcined refractory**. **C 71, C08**
- calcining of refractory materials**, *v*—the heat treatment to which raw refractory materials are subjected, preparatory to further processing or use, for the purpose of eliminating volatile chemically combined constituents and producing volume changes. **C 71, C08**
- calcite**—a doubly refracting mineral used in the manufacture of polarizing prisms. It is uniaxial negative and in the trigonal division of the hexagonal system of crystals. Its indexes are $\epsilon = 1.486$, $\omega = 1.658$; its hardness is 3 on the Mohr scale and specific gravity 2.711. **E 175, E41**
- calcium carbonate equivalent (CCE)**, *n*—the content of carbonate in a liming material or calcareous soil calculated as if all the carbonate is in the form of CaCO₃. **E 2201, E50**
- calcium carbonate equivalents (mg/L as CaCO₃)**—a method for expressing mg/L as ion in terms of calcium carbonate. Concentration in calcium carbonate equivalents is calculated by multiplying concentration in mg/L of the ion by the equivalent weight of calcium carbonate (50) and dividing by the equivalent weight of the ion. **D 6161, D19**
- calcium hypochlorite**—Ca (HClO)₂, a disinfection agent. **D 6161, D19**
- calcium silicate**, *n*—insulation composed principally of hydrous calcium silicate, and which usually contains reinforcing fibers. **C 168, C16**
- calcium-silicate brick**, *n*—a pressed and subsequently autoclaved unit that consists of sand and lime, with or without the inclusion of other materials. **C 1209, C15**
- calcium sulfate**, *n*—the chemical compound CaSO₄. **C 11, C11**
- calcium sulfate**, *n*—in cement manufacture, a material composed essentially of calcium sulfate in one or more of its hydration states: **anhydrite** (CaSO₄), **gypsum** (CaSO₄·2H₂O), or **calcium sulfate hemihydrate** (CaSO₄·½ H₂O). **C 219, C01**
- calcium sulfate dihydrate (CaSO₄·2H₂O)**, *n*—gypsum; the primary product of a forced-oxidation wet flue gas desulfurization system in which additional air is introduced and lime or limestone is used as the reagent. **E 2201, E50**
- calcium sulfite (CaSO₃)**, *n*—the primary product of a wet flue gas desulfurization system where there is no forced oxidation and lime or limestone is used as the reagent. **E 2201, E50**
- calendar staple**—staple formed to provide a hanger for use with calendars or booklets. **F 592, F16**
- calender**, *n*—a machine with two or more parallel, counter-rotating rolls with a controllable, roll-to-roll spacing, rotating at selected surface speeds and controlled temperatures, used for sheeting, laminating, skim coating (topping) and friction coating, to a controlled thickness and/or surface condition. **D 1566, D11**
- calf girth**, *n*—*inbody measurements*, the maximum circumference around the leg between the knee and ankle, parallel to the floor. **D 123, D13**
- calf girth**, *n*—the maximum horizontal circumference of the lower leg, taken between the knee and the ankle. **D 5219, D13**
- calf leather**—leather made from the skins of young cattle from a few

days up to a few months old, the skins weighing up to 25 lb (11.3 kg). It is finer grained, lighter in mass and more supple than cowhide, or kip leathers. **D 1517, D31**

calibrant, *n*—a reference material used for a calibration. **E 135, E01**

calibrate, *v*—to determine and record the relationship between a set of standard units of measure and the output of an instrument or test procedure. **D 123, D13**

calibrate, *v*—to determine the indication or output of a measuring device with respect to that of a standard. **D 4175, D02**

calibrate, *v*—to determine and record the relationship between a set of standard units of measure and the output of an instrument or test procedure. **D 4849, D13**

calibrate, *vt*—(1) to establish the relationship between the response of an instrument and the concentration or mass of the analyte; (2) to establish a table of corrections to improve the accuracy of equipment used to measure physical properties such as mass, volume, temperature, and so forth. **E 135, E01**

calibrate, *v*—to find and eliminate systematic errors of an instrument scale or method of measurement by use of material standards and techniques traceable to an authorized national or international measurement system. **E 284, E12**

calibrated instrument—an instrument for which the response has been documented upon being directly compared with the response of a standard instrument, both having been exposed to the same radiation field under the same conditions; or one for which the response has been documented upon being exposed to a standard radiation field under well-defined conditions. **E 170, E10**

calibrated test stand, *n*—a test stand on which the testing of reference material(s), conducted as specified in the standard, provided acceptable test results. **D 4175, D02**

calibration, *n*—the act or process of calibrating; the recorded relationship resulting from calibrating. **D 123, D13**

calibration, *n*—the act of determining the indication or output of a measuring device or a given engine with respect to a standard. **D 4175, D02**

calibration, *n*—the determination of the values of the significant parameters by comparison with values indicated by a set of reference standards. **D 4175, D02**

calibration, *n*—determination of the values of the significant parameters by comparison with values indicated by a reference instrument or by a set of reference standards. **E 6, E28**

calibration—1) the act or process of determining the relationship between a set of standard units of measure and the output of an instrument or test procedure, 2) the graphical or mathematical relationship relating the desired property (expressed in a standard unit of measure such as micrometers or Kg/mm²) to the instrument output (instrument units such as filar divisions or pixels). **E 7, E04**

calibration, *n*—the act, process, or result of establishing: (1) the relationship between the response of an instrument and the concentration or mass of the substance determined; (2) a table of corrections to improve the accuracy of equipment used to measure physical properties such as mass, volume, temperature, and so forth. **E 135, E01**

calibration, *n*—of a thermometer or thermometric system, the set of operations that establish, under specified conditions, the relationship between the values of a thermometric quantity indicated by a thermometer or thermometric system and the corresponding values of temperature realized by standards. **E 344, E20**

calibration, *n*—the determination of the indications of a thermometer with respect to temperatures established by a standard resulting in scale corrections to be applied when maximum accuracy is required. **E 344, E20**

calibration, *n*—the determination of the resistance-temperature relationship for a specific thermometer. The resistance-temperature relationship may be specified as the ratio of the resistance of the thermometer at a given temperature to its resistance at the ice point as a function of the temperature, or simply as the resistance of the thermometer as a function of the temperature. **E 344, E20**

calibration—the set of operations that establishes, under specified conditions, the relationship between values indicated by a measuring instrument or measuring system, or values represented by a material, and the corresponding known values of measurement, (ISO Guide 25). **E 1187, E36**

calibration, *n*—the set of operations that establishes, under specified conditions, the relationship between values indicated by a measuring instrument or measuring system or values represented by a material, and the corresponding known values of measurement. **E 1732, E30**

calibration—the act of standardizing or determining the deviation from a standard so as to ascertain the proper correction factors. **E 2135, E53**

calibration—to check, adjust, or systematically standardize the gradations of a quantitative measuring signal. **E 2161, E37**

calibration cotton standards, *n*—cotton samples taken from blended bulk source on which fiber properties have been determined under the International Calibration Cotton Standards Program. **D 123, D13**

calibration cotton standards, *n*—cotton samples taken from blended bulk source on which fiber properties have been determined under the International Calibration Cotton Standards Program. **D 7139, D13**

calibration curve—a plot of the potential (emf) of a given ion-selective electrode cell assembly (ion-selective electrode combined with an identified reference electrode) versus the logarithm of the ionic activity (concentration) of a given species. For uniformity, it is recommended that the potential be plotted on the ordinate (vertical axis) with the more positive potentials at the top of the graph and that p_{A} ($-\log$ activity of the species measured, A) or pc_{A} ($-\log$ concentration of species measured, A) be plotted on the abscissa (horizontal axis) with increasing activity to the right. **D 4127, D19**

calibration curve, *n*—the graphical or mathematical representation of a relationship between the assigned (known) values of standards and the measured responses from the measurement system. **D 4175, D02**

calibration curve, *n*—the graphical or mathematical representation of the relationship between the response of an instrument and the concentration or mass of the analyte. **E 135, E01**

calibration curve—graphical or mathematical representation of a relation between a measured parameter and a property of the standard for the substance under consideration. **E 631, E06**

calibration curve—graphical or mathematical representation of a relation between a measured parameter and a property of the standard for the substance under consideration. **E 1605, E06**

calibration date—the date on which the scale is affixed to a thermometer. **E 344, E20**

calibration factor, *n*—the factor by which the change in extensometer reading must be multiplied to obtain the equivalent strain. **E 6, E28**

calibration, instrument, *n*—the comparison of an instrument with, or the adjustment of an instrument to, a known reference(s) often traceable to the National Institute of Standards and Technology (NIST). (See also **standardization, instrument.**) **E 1316, E07**

calibration laboratory—laboratory that performs calibration, (ISO Guide 25). **E 1187, E36**

calibration method—defined technical procedure for performing a calibration, (ISO Guide 25). **E 1187, E36**

calibration oil, *n*—an oil that is used to determine the indication or output of a measuring device or a given engine with respect to a standard. **D 4175, D02**

calibration platform—on a moving platform for applying a force in the contact plane of a tire, and associated means for measuring the applied force. The calibration platform consists of a rigid plate with a high friction surface, in contact with the tire footprint, supported on a frictionless, preferably air, bearing. It may also be instrumented to measure vertical forces (loads). **E 867, E17**

calibration point, *n*—a specific value, established by a reference, at

calibration point, *n*

which the indication or output of a measuring device is determined. **E 344, E20**

calibration reference signals—repeatable signals in the range of expected wheel-force transducer system loading. These signals could either be constant voltages or preferably produced by a strain-gage calibration shunt resistor. **E 867, E17**

calibration source or field—see **electron standard field, γ -ray standard field, and X-ray standard field.**

E 170, E10

calibration standard, *n*—a standard having an accepted value (reference value) for use in calibrating a measurement instrument or system. **D 4175, D02**

calibration standard—solutions of known analyte concentration used to calibrate instruments. **E 1605, E06**

calibration standards—standard solutions used to calibrate instruments. **E 631, E06**

calibration tire, *n*—a witness tire designed to provide a fixed or known test value for selected properties. **F 538, F09**

California bearing ratio, CBR (D)—the ratio of: (1) the force per unit area required to penetrate a soil mass with a 3-in.²(19-cm)² circular piston (approximately 2-in. (51-mm) diameter) at the rate of 0.05 in. (1.3 mm)/min, to (2) that required for corresponding penetration of a standard material. The ratio is usually determined at 0.1-in. (2.5-mm) penetration, although other penetrations are sometimes used. Original California procedures required determination of the ratio at 0.1-in. intervals to 0.5 in. (12.7 mm). Corps of Engineers' procedures require determination of the ratio at 0.1 in. and 0.2 in. (5.1 mm). Where the ratio at 0.2 in. is consistently higher than at 0.1 in., the ratio at 0.2 in. is used. **D 653, D18**

california process—this process requires the accurate drafting of patterns, cutting, and stitching of the upper, sock lining, and platform cover. The upper and sock lining are stitched together. The platform cover is stitched to the other two parts in a separate operation. The last is then inserted into the upper. After the last is inserted, the platform is accurately pressed into place. **F 869, F08**

caliper—See **package testing.** **D 996, D10**

caliper, *n*—of paper and paperboard, see **thickness.** **D 1968, D06**

caliper—the thickness of a sheet of paper measured under specified conditions and usually expressed in thousandths of an inch (mils). **F 149, F05**

caliper—the thickness of a sheet expressed in millimeters or in thousandths of an inch. **F 335, F05**

caliper diameter (Feret's diameter)—the length of a line normal to two parallel lines, tangent to opposite edges of a phase or object. **E 7, E04**

caliper log—a geophysical borehole log that shows to scale the variations with depth in the mean diameter of a cased or uncased borehole. **D 653, D18**

C₅ aliphatic resin, *n*—a resin produced by the cationic polymerization of a low-boiling aliphatic steam-cracker fraction. **D 6440, D01**

call rotation—a system in which emergency medical responses are allocated sequentially to multiple providers. **F 1177, F30**

calm water boom—boom intended for use in calm waters (see Practice F 625 for environmental descriptors). **F 818, F20**

calomel half cell (calomel electrode)—a half cell containing a mercury electrode in contact with a solution of potassium chloride of specified concentration that is saturated with mercurous chloride (calomel). **B 374, B08**

calomel reference electrode—a reference electrode with an internal reference element of mercury/mercurous chloride. The filling solution is usually saturated KCl, saturated with mercurous chloride. **D 4127, D19**

calorific value, *n*—the heat of combustion of a unit quantity of a substance. **D 121, D05**

calorific value, *n*—the heat produced by combustion of a unit quantity of a specimen under specified conditions. **D 5681, D34**

calorific value—the heat of combustion of a unit quantity of a

substance. It may be expressed in joules per gram (J/g), British thermal units per pound (Btu/lb), or calories per gram (cal/g) when required.

NOTE—The unit equivalents are as follows:

1 Btu (International Table) = 1055.06 absolute joules

1 Calorie (International Table) = 4.1868 absolute joules

1 Btu/lb = 2.326 J/g

1.8 Btu/lb = 1.0 cal/g

D 5681, D34

calorific value—the energy of combustion of a unit quantity of refuse-derived fuel. It may be expressed in kilojoules per kilogram (kJ/kg), British thermal units per pound (Btu/lb), or calories per gram (cal/g) (obsolete). **E 856, D34**

calorimeter, *n*—as used in Test Method D 5865, the bomb and its contents, the calorimeter vessel with stirrer, the water in which the bomb is immersed, and the portions of the thermometer and the ignition leads within the calorimeter vessel. **D 121, D05**

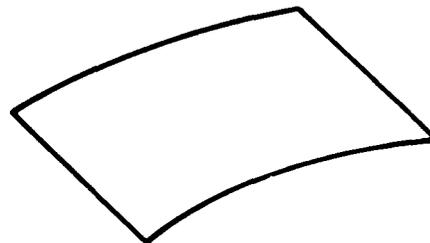

calorimeter—an instrument capable of making absolute measurements of energy deposition (or absorbed dose) in a material through measurement of its change in temperature and a knowledge of the characteristics of its material construction. **E 170, E10**

calorimeter jacket, *n*—the insulating medium surrounding the calorimeter. **D 121, D05**

calorimeter jacket, *n*—the insulating medium surrounding a calorimeter. **D 5681, D34**

calorizing—imparting resistance to oxidation to an iron or steel surface by heating in aluminum powder at 800 to 1000°C (1470 to 1830°F). **B 374, B08**

camber—a single arch of curvature. (See also **waviness.**)

F 109, C21

camber height, *h*—distance between the running surface of the ski and a plane surface, measured with the ski resting freely under its own mass. X_h indicates the location of camber height from the tail of the ski. **F 472, F27**

cambium—the layer of cells that lies between the inner bark and the wood of a tree, that repeatedly subdivides to form new wood and bark cells. **D 9, D07**

cam lock slider, *n*—in zippers, a slider that incorporates a curled projection or projections on the pull that extends through a window or windows to effect a locking action by pressing against the interlocking elements when the cam lock slider is in the locked position. **D 123, D13**

cam lock slider, *n*—a slider that incorporates a curled projection or projections on the pull that extends through a window or windows to effect a locking action by pressing against the interlocking elements when the cam lock slider is in the locked position. **D 2050, D13**

camouflet—the underground cavity created by a fully contained explosive. (ISRM) **D 653, D18**

campaign—the working life of a melting furnace between major cold repairs. **C 162, C14**

camping tentage, *n*—any portable temporary shelter or structure designed to protect persons from the elements, all or a portion of the covering which is made of fabric or other pliable materials. **D 123, D13**

can, *n*—the container used to encapsulate the powder during the pressure consolidation process; it is removed from the final part. **B 899, B02**

can, *n*—*in packaging*, a receptacle generally of 10-gal capacity or less, normally not used as a **shipping container**. **D 996**, D10

Canada balsam—see **balsam, Canada**. **E 175**, E41

canal—that part of a melting furnace leading from the fining area to the forming area. See **channel** and **forehearth**. **C 162**, C14

candela—a unit of luminous intensity (formerly candle). One candela is the luminous intensity in the perpendicular direction of a surface of 1/600 000 m² of a blackbody radiator at the temperature of freezing platinum under a pressure of 101 325 Pa. One candela produces 1 lumen of luminous flux per steradian of a solid angle measured from the source. **E 1316**, E07

candela, *cd*, *n*—the SI unit of luminous intensity; the luminous intensity, in a given direction, of a source that emits monochromatic radiation of frequency 540×10^{12} hertz and that has a radiant intensity in that direction of (1/683) watt per steradian. ^A
E 284, E12

candidate method, *n*—an analytical method or measurement process being considered for standardization. **D 1356**, D22

candidate oil, *n*—an oil that is intended to have the performance characteristics necessary to satisfy a specification and is to be tested against that specification. **D 4175**, D02

candidate tire, *n*—a test tire that is part of a test program. **F 538**, F09

candidate tire set, *n*—a set of candidate tires. **F 538**, F09

candle, *n*—one or more combustible wicks supported by a material that constitutes a fuel which is solid, semi-solid, or quasi-rigid at room temperature, 68° to 80°F (20 to 27° C); it can also contain additives that are used for color, odor, stability, or to modify the burning characteristics; the combined function of which is to sustain a light-producing flame. **F 1972**, F15

candle accessory, *n*—an object designed for use with a candle. **F 1972**, F15

candled ice—ice that has rotted or otherwise formed, by melting during the spring, into long columnar crystals which are very loosely bonded together. A distinctive “chiming” sound accompanies movement during “ice-out.” **D 7099**, D18

candle pitch, *n*—a dark brown-to-black, tarry or solid, by-product residue from soap and candle stock manufacture, refining of vegetable oils, refining of wool grease, or refining of refuse animal fats. **D 4175**, D02

cane—solid glass rods. **C 162**, C14

canister vacuum cleaner, *n*—a portable floor-supported vacuum cleaner, having a nozzle separated from the cleaner housing by a hose and designed for normal-duty cleaning of household dirt. In use, only the nozzle is guided over the surface area to be cleaned. The cleaner may have detachable nozzles, attachments, and wands for both floor and above-the-floor cleaning. The nozzle may employ a driven agitator to assist in cleaning. **F 395**, F11

cannel coal—See **cannel coal** under **coal**. **D 121**, D05

cannot be associated/cannot be connected—these terms are too vague and may be interpreted as reflecting bias as they have no counterpart suggesting that the writer cannot be eliminated either. **E 1658**, E30

canonical-form definition, *n*—see **intensional definition**. **E 1992**, E02

canopy—a covering fixed above cooking equipment and overhanging on all sides of its unclosed sides, whose lower edge is a minimum height of 6 ft 6 in. from the finished floor. The purpose of the canopy is to contain and capture the unwanted by-products resulting from cooking activities and may be Type I or Type II. See **Type I**, **Type II**, and **exhaust hood**. **F 1827**, F26

canopy penetrating agent—an adjuvant that increases the penetration of the spray material into the crop canopy. See **deposition aid**. **E 1519**, E35

cant—a log that has been slabbed on one or more sides, usually with the intention of resawing at right angles to the widest sawn face. **D 9**, D07

cantilever, *n*—an overhanging portion or a member or slab projecting beyond support(s) sufficiently to induce bending and shear stresses

in projecting part(s) when subjected to transverse loading including uniform, concentrated, or other load types. **E 631**, E06

cantilever—a test structure that consists of a freestanding beam that is fixed at one end. **E 2444**, E08

cantilever slide gate—any horizontal slide gate spanning an opening lacking a top or bottom support within that opening (see Specification F 1184). **F 552**, F14

cant strip—a beveled strip used under flashings to modify the angle at the point where the roofing or waterproofing membrane meets any vertical element. **D 1079**, D08

cap, *n*—(1) another name for crown.
(2) a type of bottle closure. **C 162**, C14

cap, *v*—{archaic} to cut off the ends of a glass cylinder. **C 162**, C14

cap—a horizontal wood member, generally square or near square; used to crown and bind the top ends of upright posts and piles together as a unit and to support upper construction. **D 9**, D07

cap—See **container (cover)**. **D 996**, D10

cap—See **railing systems**. **E 631**, E06

cap, *n*—a fitting or plug used to close the end of a pipe, tubular post, newel, or rail. **E 631**, E06

cap, *n*—a fitting or plug used to close the end of a pipe, tubular post, newel, or rail. **E 1481**, E06

cap, *n*—a layer of clay or other low permeability material installed over the top of a closed landfill to prevent entry of rainwater and minimize leachate. **E 2201**, E50

capability index (C_p), *n*—for a stable process, the specification range divided by six times the standard deviation.

$$C_p = \frac{(USL - LSL)}{6 \times s}$$

A 644, A04

capability index (C_{pk}), *n*—for a stable process, the smaller of the upper capability index (CPU) or the lower capability index (CPL). **A 644**, A04

capacitance—that property of a system of conductors and dielectrics that permits the storage of electrical charge when a potential difference exists between the conductors. **E 1142**, E37

capacitance, *C*, *n*—that property of a system of conductors and dielectrics which permits the storage of electrically separated charges when potential differences exist between the conductors. **D 1711**, D09

capacitance—the same as **permittivity, relative**. **D 2864**, D27

capacitor tissue, *n*—very thin (5 to 50 μm) pure, nonporous paper used as the dielectric in capacitors, usually in conjunction with an insulating liquid. **D 1711**, D09

capacity, *n*—**fortensile testing machines**, the maximum force for which the machine is designed. **D 123**, D13

capacity, *n*—**for tensile testing machines**, the maximum force for which the machine is designed. **D 4849**, D13

capacity, *n*—the power which a component of a geothermal facility (e.g., a well, a reservoir, a power plant, or a direct-use facility) is capable of supplying at a point in time, assuming that other required components of the geothermal facility are available. Capacity is expressed in units of power (e.g., Megawatts, kilowatts). **E 957**, E44

cape, skin or leather—skin of South African hair sheep. Fine-grained leather, superior to wool sheep for gloves and garments. Loosely applied to all hair sheep, but should be qualified to show origin, if other than South African. **D 1517**, D31

cap flashing—See **flashing**. **D 1079**, D08

cap head—extra large, flat or dished, round or squared sheet-metal head applied to nail shank during nail manufacture. **F 547**, F16

capillary action—the phenomenon of intrusion of a liquid into interconnected small voids, pores, and channels in a solid, resulting from surface tension. **C 242**, C21

capillary action, *n*—the phenomenon of intrusion of a liquid into interconnected small voids, pores, and channels in a solid, resulting from surface tension. **C 1145**, C28

capillary action (capillarity)

capillary action (capillarity)—the rise or movement of water in the interstices of a soil or rock due to capillary forces. **D 653, D18**
capillary flow—see **capillary action**. **D 653, D18**
capillary fringe—the basal region of the vadose zone comprising sediments that are saturated, or nearly saturated, near the water table, gradually decreasing in water content with increasing elevation above the water table. **D 653, D18**
capillary fringe zone—the zone above the free water elevation in which water is held by capillary action. **D 653, D18**
capillary head, h (L)—the potential, expressed in head of water, that causes the water to flow by capillary action. **D 653, D18**
capillary migration—see **capillary action**. **D 653, D18**
capillary migration—of water, movement of water induced by the force of molecular attraction (surface tension) between the water and the material it contacts. Compare **rising damp**. **E 631, E06**
capillary rise (height of capillary rise), h_c (L)—the height above a free water elevation to which water will rise by capillary action. **D 653, D18**
capillary water—water subject to the influence of capillary action. **D 653, D18**
capital cost, n —the costs of acquiring, substantially improving, expanding, changing the functional use of, or replacing a building or building system. **E 833, E06**
capital cost, n (coûten capital (frais d'immobilisations))—costs of acquiring, substantially improving, expanding, changing the functional use of, or replacing, a **building** or **building system**. **E 631, E06**
capital cost, n (coûten capital (frais d'immobilisations))—costs of acquiring, substantially improving, expanding, changing the functional use of, or replacing, a **building** or **building system**. **E 1480, E06**
cap nail—bright, galvanized or electroplated, plain-shank or threaded, regular-stock-steel, $\frac{3}{4}$ by 0.105 to 6 by 0.135-in. nails with integral nominal 1-in. cap head and medium diamond point. **F 547, F16**
capped steel, n —a **rimmed steel** in which, during ingot solidification, the rimming action was limited by mechanical or chemical means. **A 941, A01**
cap rail—See **railing systems**. **E 631, E06**
cap rail—a secondary railing element, often a handrail, fastened to the top rail of a railing system. (Syn. *rail cap*.) **E 631, E06**
cap rail—a secondary railing element, often a handrail, fastened to the top rail of a railing system. (Syn. *rail cap*.) **E 1481, E06**
cap sheet—a granule-surfaced coated felt used as the top ply of a built-up roofing membrane. **D 1079, D08**
capsomere—a structural subunit of the outer protein shell (capsid) of a virus consisting of protein monomers. **E 1705, E48**
capstan head—See **dual head**. **F 547, F16**
carabiner, n —a self-closing, gated, load-bearing, connective device. **F 1773, F08**
carabiner, locking, n —a carabiner with a gate-locking mechanism. **F 1773, F08**
carabiner, nonlocking, n —a carabiner without a gate-locking mechanism. **F 1773, F08**
caravan, n —for purposes of a tire test, two or more vehicles running in the same time frame, over the same test course(s), under similar but independent conditions. **F 538, F09**
carbide—a compound of carbon with one or more elements, which, in customary formulation, are considered as being more positive than carbon. **E 7, E04**
carbide precipitation "sensitization"—condition which affects some austenitic stainless steels which have been subjected to temperatures in the critical range, typically 800° to 1400°F. Complex chromium carbides precipitate and reside primarily at the grain boundaries, causing deterioration of its corrosion resistance by depleting its adjacent areas of chromium. **F 1789, F16**
carbide, primary, n —carbide precipitated in cast iron during solidification. **A 644, A04**

carbohydrates—molecules consisting of carbon, hydrogen and oxygen that include celluloses, starches and sugars. **E 1705, E48**
carbohydrates not cellulose—the noncellulosic carbohydrates of a cellulosic material. **D 1695, D01**
carbon, n —an element, number 6 of the periodic table of elements, electronic ground state $1s^2 2s^2 2p^2$. **C 709, D02**
carbon, n —in *carbon and graphite technology*, an artifact consisting predominantly of the element carbon and possessing limited long range order. **C 709, D02**
carbon, n —an element, number 6 of the periodic table of elements, electronic ground state $1s^2 2s^2 2p^2$. **D 4175, D02**
carbon, n —in *carbon and graphite technology*, an artifact consisting predominantly of the element carbon and possessing limited long range order. **D 4175, D02**
carbon, n —in *manual transmissions and final drive axles*, a hard, dry, generally black or gray deposit that can be removed by solvents but not by wiping with a cloth. **D 4175, D02**
carbonate carbon, n —the carbon content present in the solid products derived from the combustion or reaction of coal, coal by-products, or coke as carbonates and which is noncombustible in standard industry practice. **D 121, D05**
carbonate hardness—the hardness in a water caused by carbonates and bicarbonates of calcium and magnesium. The amount of hardness equivalent to the alkalinity formed and deposited when water is boiled. In boilers, carbonate hardness is readily removed by blowdown. **D 6161, D19**
carbonation, n —*building (s)*, a process of chemical weathering whereby minerals that contain sodium oxide, calcium oxide, potassium oxide, or other basic oxides are changed to carbonates by the action of carbonic acid derived from atmospheric carbon dioxide and water. **E 631, E06**
carbon black, n —a material consisting essentially of elemental carbon in the form of near-spherical colloidal particles and coalesced particle aggregates of colloidal size, obtained by partial combustion or thermal decomposition of hydrocarbons. **D 1566, D11**
carbon black, n —an engineered material, primarily composed of elemental carbon, obtained from the partial combustion or thermal decomposition of hydrocarbons, existing as aggregates of aciniform morphology which are composed of spheroidal primary particles, uniformity of primary particle sizes within a given aggregate, and turbostratic layering within the primary particles. **D 3053, D24**
carbon black agglomerate, n —a cluster of physically bound and entangled aggregates. **D 3053, D24**
carbon black aggregate, n —a discrete, rigid, colloidal mass of extensively coalesced particles; it is the smallest dispersible unit. **D 3053, D24**
carbon black, carcass grade, n —a type of furnace carbon black having an average particle size in the range from 31 to 200 nm. **D 3053, D24**
carbon black, furnace, n —a type of carbon black produced by the decomposition reaction of hydrocarbons when injected into a high-velocity stream of combustion gases under controlled conditions. **D 3053, D24**
carbon black, hard, n —See **carbon black, tread grade**, the preferred term. **D 3053, D24**
carbon black microstructure, n —arrangement of carbon atoms within a carbon black particle. **D 3053, D24**
carbon black particle, n —a small spheroidally shaped (paracrystalline, non-discrete) component of a carbon black aggregate; it is separable from the aggregate only by fracturing. **D 3053, D24**
carbon black particle diameter, n —arithmetic average of the diameters of particles within a carbon black aggregate as measured by electron microscopy. **D 3053, D24**
carbon black pellet, n —a relatively large agglomerate mass that has been densified in spheroidal form to facilitate handling and processing. **D 3053, D24**

carbon black reinforcing, n—See **carbon black, tread grade**, the preferred term. **D 3053, D24**

carbon black, semi-reinforcing, n—See **carbon black, carcass grade**, the preferred term. **D 3053, D24**

carbon black, soft, n—See **carbon black, carcass grade**, the preferred term. **D 3053, D24**

carbon black structure, n—the quality of irregularity and deviation from sphericity of the shape of a carbon black aggregate. **D 3053, D24**

carbon black, surface activity, n—the inherent ability of the carbon black surface to interact physically or chemically, or both, with rubber or other molecules. **D 3053, D24**

carbon black, target value, n—a consensus value for selected primary properties on which producers center their manufacturing process and users center their specification. **D 3053, D24**

carbon black, thermal, n—a type of carbon black produced under controlled conditions by the thermal decomposition of hydrocarbons in the absence of air or flames. **D 1566, D11**

carbon black, thermal, n—a type of carbon black produced under controlled conditions by the thermal decomposition of hydrocarbons in the absence of air or flames. **D 3053, D24**

carbon black, thermal, acetylenic, n—a thermal black produced from acetylene gas. **D 1566, D11**

carbon black, thermal, acetylenic, n—a thermal black produced from acetylene gas. **D 3053, D24**

carbon black, tread grade, n—a type of furnace carbon black having an average particle size in the range from 1 to 30 nm. **D 3053, D24**

carbon black, typical value, n—a consensus value for those carbon black properties that are not specifically targeted for control in the manufacturing process and that are somewhat dependent upon the targeted properties. **D 3053, D24**

carbon black weight mean particle size, n—ratio equal to the sum of individual particle diameters, each raised to the fourth power, divided by the sum of the individual particle diameters, raised to the third power. **D 3053, D24**

carbon boron steel—carbon steel in which boron has been intentionally added at a minimum of 0.0005 % and a maximum of 0.003 % in order to obtain an expected hardenability. **F 1789, F16**

carbon-ceramic refractory, n—a manufactured refractory comprised of carbon (including graphite) and one or more ceramic materials such as fireclay and silicon carbide. **C 71, C08**

carbon disulfide (CS₂)—mol weight 76.14; clear, colorless, flammable, volatile liquid; boiling point, 45.6°C; freezing point, 111.6°C. **D 4790, D16**

carbon fiber precursor—a material from which carbon fiber is made by pyrolysis. Polyacrylonitrile, rayon, or pitch fibers are commonly used precursors. **D 3878, D30**

carbon foam, n—*in carbon and graphite technology*, a porous carbon product containing regularly shaped, predominantly concave, homogeneously dispersed cells which interact to form a three-dimensional array throughout a continuum material of carbon, predominantly in the non-graphitic state. The final result is either an open or closed cell product. **C 709, D02**

carbon foam, n—*in carbon and graphite technology*, a porous carbon product containing regularly shaped, predominantly concave, homogeneously dispersed cells which interact to form a three-dimensional array throughout a continuum material of carbon, predominantly in the non-graphitic state. The final result is either an open or closed cell product. **D 4175, D02**

carbon form, n—*as used in Test Method D 5061*, microscopically distinguishable carbonaceous textural components of coke, but excluding mineral carbonates. **D 121, D05**

carbon gel (carbon-rubber-gel), n—the portion of rubber that is not leached by a solvent under specified conditions, from an intimate mixture of carbon black and unvulcanized rubber. **D 1566, D11**

carbonitriding, n—**case hardening** in which a suitable steel object is heated above A_c_1 in a gaseous atmosphere of such composition as

to cause simultaneous absorption of carbon and nitrogen by the surface and, by diffusion, to create a concentration gradient.

A 941, A01

carbonized and neutralized wool, n—a term descriptive of scoured wool processed to destroy cellulosic impurities by treating with a mineral acid or an acid salt, drying and baking, crushing, and dusting out the embrittled cellulosic matter followed by neutralization of the acidified wool. **D 123, D13**

carbonized and neutralized wool, n—a term descriptive of scoured wool processed to destroy cellulosic impurities by treating with a mineral acid or an acid salt, drying and baking, crushing, and dusting out the embrittled cellulosic matter followed by neutralization of the acidified wool. **D 4845, D13**

carbonless manifold set—a set that contains multiple plies of carbonless paper consisting of one CB and one CF, or one CB, one or more CFBs and one CF. **F 549, F05**

carbonless paper—a sheet coated or treated to provide manifolding capability without the use of carbon paper interleaves. **F 549, F05**

carbon or carbon sheet—see **carbon paper**. **F 221, F05**

carbon paper—a sheet composed of a supporting substrate on one or both sides of which is a coating containing a transferable (usually colored) material. The coating is of such nature that it will transfer in part or entirely to a copy sheet at the point of pressure contact. **F 149, F05**

carbon paper—a sheet composed of a supporting substrate on one or both sides of which is a coating containing a transferable (usually colored) material. The coating is of such nature that it will transfer in part or entirely to a copy sheet at the point of pressure contact. (F 129) **F 221, F05**

carbon potential, n—the carbon content at the surface of a specimen of pure iron in equilibrium with the carburizing medium considered, and under the conditions specified. **A 941, A01**

carbon reduction process, n—a process to reduce the concentration of carbon in high-carbon fly ash. **E 2201, E50**

carbon refractory, n—a manufactured refractory comprised substantially or entirely of carbon (including graphite). **C 71, C08**

carbon refractory, anthracite-coal base, n—a manufactured refractory comprised substantially of calcined anthracite coal. **C 71, C08**

carbon refractory, graphite-base, n—a manufactured refractory comprised substantially of graphite. **C 71, C08**

carbon refractory, metallurgical-coke-base, n—a manufactured refractory comprised substantially of metallurgical coke. **C 71, C08**

carbon refractory, petroleum-coke-base, n—a manufactured refractory comprised substantially of calcined petroleum coke. **C 71, C08**

carbon residue, n—*in petroleum products*, the part remaining after a sample has been subjected to thermal decomposition. **D 4175, D02**

carbon residue, n—the residue formed by evaporation and thermal degradation of a carbon-containing material. **D 4175, D02**

carbon restoration, n—replacing the carbon lost from the surface layer in previous processing by carburizing this layer to substantially the original carbon level. **A 941, A01**

carbon steel, n—steel for which (1) no minimum content is specified for chromium, cobalt, molybdenum, nickel, titanium, tungsten, or zirconium, or any other element added to obtain a desired alloying effect; (2) for which the specified minimum for copper does not exceed 0.40 %; (3) for which the specified maximum for any of the following elements does not exceed these percentages: manganese 1.65 %, silicon 0.60 %, or copper 0.60 %; and (4) in which the incidental content of the following elements does not exceed these percentages: nickel, 0.25 %; chromium, 0.20 %; and molybdenum, 0.06 %.

A 902, A05

carbon steel, n—a steel that conforms to a specification that prescribes a maximum limit, by **heat analysis** in mass percent, of not more than: 2.00 for carbon and 1.65 for manganese, but does not prescribe a minimum limit for chromium, cobalt, molybdenum,

carbon steel, *n*

nickel, niobium (columbium), tungsten (wolfram), vanadium, or zirconium. **A 941, A01**

carbon steel—steel for which no minimum content is specified or required for chromium, molybdenum, nickel, or any other element added to obtain a desired alloying effect; or steel for which maximum content specified for manganese does not exceed 1.65 %. When specified, boron may be added to killed carbon steel with a maximum allowable of 0.003 %. **F 1789, F16**

carbon tissue—a substrate manufactured for use in the production of carbon paper. **F 221, F05**

carbonyl group—the bivalent radical, —CO—, especially as it occurs in aldehydes or ketones. **D 1695, D01**

carbonyl powder, *n*—a metal powder prepared by the thermal decomposition of a metal carbonyl. **B 243, B09**

carboxyhemoglobin saturation, *n*—the percent of blood hemoglobin converted to carboxyhemoglobin from reaction with inhaled carbon monoxide. **E 176, E05**

carboxyl group—the radical —COOH characteristic of most organic acids. **D 1695, D01**

carboxymethylcellulose, CMC—the common name for a cellulose ether of glycolic acid. It is usually marketed as a water-soluble sodium salt, more properly called sodium carboxymethylcellulose. In the early literature, it is sometimes called cellulose glycolate or cellulose glycolic acid. **D 1695, D01**

carboy, *n*—a container made of glass, ceramic, plastic, or metal, having a capacity of 5 to 15 gal (19 to 57 L) with the pouring and filling opening at the top. **D 996, D10**

carburing, *n*—a process in which an austenitized steel object is brought into contact with a carbonaceous environment of sufficient carbon potential to cause absorption of carbon at the surface and, by diffusion, to create a concentration gradient. **A 941, A01**

carcass, *n*—the fabric, cord, or metal reinforced section, or all three, of a rubber product as distinguished from the rubber tube, cover, or tread. **D 1566, D11**

carcass, *n*—see casing. **D 5681, D34**

carcass, *n*—of tire, the part of a tire structure that does not include the tread and sidewall rubber. **F 538, F09**

carcass, *n*—harvested animal, whether eviscerated or not.

carcass primal, n—basic major cuts into which carcasses and sides are separated.

carcass subprimal, n—smaller cuts derived from primal cuts.

F 2463, F10

carcinogen—an agent producing or inciting cancerous growth.

E 609, E35

carcinogen—cancer-causing agent.

F 1600, F20

carded wool, *n*—scoured wool which has been processed through a carding machine. **D 123, D13**

carded wool, *n*—scoured wool which has been processed through a carding machine. **D 4845, D13**

carding leather—a type of tannage of side leather used on the cards of textile machinery. **D 1517, D31**

cardiovascular tracing, *n*—a display of physiological patterns of the subject's relative blood volume and pulse rate. The cardiograph component records this activity. **E 2035, E52**

care and maintenance, *n*—effective cleaning to remove soil and maximize use life of garments while maintaining (not removing) protective properties. **F 1494, F23**

career apparel, *n*—garments, the styling and performance of which are designed for various end uses so as to be suitable for on-the-job wear in a variety of businesses and professions. (See also dress career apparel and vocational career apparel.) **D 123, D13**

career apparel, *n*—garments, the styling and performance of which are designed for various end uses so as to be suitable for on-the-job wear in a variety of businesses and professions. (See also dress career apparel and vocational career apparel.) **D 7022, D13**

care instructions, *n*—in textiles, a series of directions that describes practices which should refurbish a product without adverse effects

and warn against any part of the directions which one could reasonably be expected to use that may harm the item. **D 123, D13**

care instructions, *n*—in textiles, a series of directions that describes practices which should refurbish a product without adverse effects and warn against any part of the directions which one could reasonably be expected to use that may harm the item.

D 3136, D13

care label, *n*—in textiles, a label or other affixed instructions that report how a product should be refurbished. **D 123, D13**

care label, *n*—in textiles, a label or other affixed instructions that report how a product should be refurbished. **D 3136, D13**

care procedure, *n*—in textiles, one or more refurbishing methods to which products may be subjected for soil and stain removal and aesthetic improvement such as appearance restoration or hand. **D 123, D13**

care procedure, *n*—in textiles, one or more refurbishing methods to which products may be subjected for soil and stain removal and aesthetic improvement such as appearance restoration or hand. **D 3136, D13**

care symbol, *n*—a pictorial symbol that gives directions for refurbishing a consumer textile product. **D 123, D13**

car nail—light-duty or heavy-duty, bright or coated, barbed or helically threaded, regular-stock-steel, 1½ by 0.105-in. (light) or 0.135-in. (heavy) to 6 by 0.225-in. (light) or 0.244-in. (heavy) nails and screw nails with flat or oval countersunk head and medium diamond point. Also, light-duty or heavy-duty, coated, barbed or helically threaded, regular-stock-steel, 1½ by 0.092 or 0.106 to 6 by 0.207 or 0.225-in. nails with oval countersunk 1⁄₄ to 1⁄₃₂-in. head and medium diamond point. **F 547, F16**

carnival—a mobile enterprise principally devoted to offering amusement or entertainment to the public in, upon, or by means of portable amusement rides or devices or temporary structures in any number or combination, whether or not associated with other structures or forms of public attraction. **F 747, F24**

carnival glass—glass having an iridescent coloration obtained by firing metallic salts applied onto a colored glass body. See lusters. **C 162, C14**

C₉ aromatic resin, *n*—a resin produced by the cationic polymerization of heavy aromatic steam-cracker or coal-tar fractions.

D 6440, D01

carpet, *n*—all textile floor coverings not designated as rugs.

D 123, D13

carpet, *n*—all textile floor coverings not designated as rugs.

D 5684, D13

carpet-embedded dust—See dust.

D 1356, D22

carpet lay, *n*—orientation of the pile of a carpet (or fabric) relative to the backing; the tendency of a carpet's pile to lean uniformly in a specific direction relative to the backing. **F 395, F11**

carpet module, *n*—textile floor covering sections usually having dimensions of less than 1 m². **D 123, D13**

carpet module, *n*—textile floor covering sections usually having dimensions of less than 1 m². **D 5684, D13**

carpet shampoo, n—See shampoo.

D 5253, D13

carpet sweep, *v*—remove loose soil particles and lint from the textile floor covering surface using a carpet sweeper. **D 5253, D13**

carpet sweeper, *n*—a manually powered machine which has rotary brushes and which is used for light surface cleaning of carpets and rugs. **D 123, D13**

carpincho leather—leather from the skin of the carpincho, a large South American rodent. The skin is used in making glove leather, usually chrome-tanned and washable. In the glove-leather trade, it is classified as a pigskin. It resembles pigskin in appearance, a characteristic being the occurrence of bristle holes in straight-line groups, usually five holes in a group. **D 1517, D31**

carriage—the device for holding the food product that is manually or automatically reciprocated to bring the product in contact with the knife. **F 1827, F26**

- carriage return**, *n*—an operation which advances the cursor to the beginning of a new line. (See **CR**.) **F 1457, F05**
- carrier**, *n*—*in braiding machinery*, that part of a braiding machine that holds the package of yarn, thread, or cord, and carries the yarn when the machine is operated. **D 123, D13**
- carrier**, *n*—*in braiding machinery*, that part of a braiding machine that holds the package of yarn, thread, or cord, and carries the yarn when the machine is operated. **D 7018, D13**
- carrier**—(1) a gas, liquid, or solid used to propel or transport a pesticide; (2) an organism that bears an infectious agent, but that shows no marked symptoms of the disease caused by that agent. **E 609, E35**
- carrier**—See **scrim**. **E 631, E06**
- carrier**—a liquid, either aqueous or nonaqueous, in which liquid penetrant examination materials are dissolved or suspended. **E 1316, E07**
- carrier**—See **scrim**. **E 1749, E06**
- carrier**—that substance in a developer that conveys a toner, but does not itself become a part of the image in the finished print. In a liquid developer the carrier may be called a dispersant. **F 335, F05**
- carrier detect**, *n*—a communication control character used in an RS232 system to signal the sender that the receiver is on-line. (See **CD**.) **F 1457, F05**
- carrier fluid**—the fluid in which fluorescent and nonfluorescent magnetic particles are suspended to facilitate their application. **E 1316, E07**
- carrier fluid**, *n*—*in impingement or slurry erosion*, fluid medium that transports impinging solid or liquid particles and that gives the particles their momentum relative to the solid surface on which they are impinging. **G 40, G02**
- carrier return**, *n*—a code which instructs the printer to begin a new line. **F 1457, F05**
- carry-in**—manual Lehr loading. **C 162, C14**
- carrying capacity**, *n*—(1) The theoretical maximum population of a biological organism that an ecosystem can sustain indefinitely. **E 2114, E06**
- carton**, *n*—a folding **box**, generally made from **boxboard** for merchandising consumer quantities of products (for example, shelf packages or prime packages). **D 996, D10**
- carton**—See **packaging**. **F 547, F16**
- cartridge**—see **spiral-wound cartridge**. **D 6161, D19**
- cartridge**—a case containing an inked ribbon correction ribbon, or dry ink toner for insertion into an image producing device. **F 221, F05**
- car vacuum cleaner**, *n*—a relatively small, lightweight, portable cleaner that is designed for operation from a d-c power source, generally a 12-V automotive battery (see also **hand-held vacuum cleaner**). **F 395, F11**
- cascade development**—development in which dry toner and carrier are drawn over an electrostatic image by gravity. **F 335, F05**
- cascade impactor**—See **impactor**. **D 1356, D22**
- cascade mixing**—the rearrangement of the constituents of a solid, within the penetration depth of an incident particle, caused by collisions between the incident particles and the atoms of the solid. **E 673, E42**
- cascading**, *n*—a condition where ink is absorbed into the substrate before it has time to spread, causing negative stitch lines or low density bands between print swaths in solid image areas. **F 1857, F05**
- cascading booms**—booming configuration formed by positioning two or more booms in a deflection mode such that successive booms progressively move oil to the desired area. **F 818, F20**
- cascading water**—perched ground water that enters a well casing via cracks or uncovered perforations, trickling, or pouring down the inside of the casing. **D 653, D18**
- case**, *n*—*in casehardening*, the outer portion that has been made harder than the **core** as a result of altered composition or microstructure, or both, from treatments such as **carburizing**, **nitriding**, and **induction hardening**. **A 941, A01**
- case**, *n*—*in textiles*, a shipping unit, usually a carton, box, bale, or other container holding a number of yarn packages. **D 123, D13**
- case**—See **container**. **D 996, D10**
- case**, *n*—*in textiles*, a shipping unit, usually a carton, box, bale, or other container holding a number of yarn packages. **D 4849, D13**
- case**—*in a ferrous alloy*, the outer portion that has been made harder than the inner portion (see **core**) as a result of altered composition, or structure, or both, from treatments such as carburizing, nitriding, and induction hardening. **E 7, E04**
- cased glass**—glassware whose surface layer has a different composition from that of the main glass body. **C 162, C14**
- casehardened**—a term sometimes used for tempered glass. (See **tempered glass**.) **C 162, C14**
- case-hardened, surface-hardened**—surface of steel nail carburized and subsequently hardened, by suitable heat treatment, leaving a soft core. **F 547, F16**
- case hardening**, *n*—a generic term covering any of several processes applicable to **steel** that change the chemical composition or microstructure, or both, of the surface layer. **A 941, A01**
- casehardening**—a condition of stress and set in wood due to drying in which outer fibers are under compressive stress and inner fibers under tensile stress, a condition that often exists during subsequent processing. In commerce, the term often connotes a degree of severity regarded as detrimental in use. **D 9, D07**
- casein adhesive**, *n*—an aqueous colloidal dispersion of casein that may be prepared with or without heat, may contain modifiers, inhibitors, and secondary binders to provide specific adhesive properties, and includes a subclass, usually identified as *casein glue*, that is based on a dry blend of casein, lime, and sodium salts, mixed with water and prepared without heat. **D 907, D14**
- case leather**—see **bag leather**. **D 1517, D31**
- case liner**—See **liner**. **D 996, D10**
- cash flow**—the stream of monetary (dollar) values—costs and benefits—resulting from a project investment. **E 631, E06**
- cash flow**, *n*—the stream of monetary (dollar) values—costs and benefits—resulting from a project investment. **E 833, E06**
- cashmere**, *n*—*in roving, yarn, or fabrics*, cashmere hair or products made therewith having a cashmere coarse-hair content not exceeding a specified maximum percentage by length. **D 123, D13**
- cashmere**, *n*—*in roving, yarn, or fabrics*, cashmere hair or products made therewith having a cashmere coarse-hair content not exceeding a specified maximum percentage by length. **D 4845, D13**
- cashmere coarse-hair**, *n*—those coarse fibers in cashmere hair having widths greater than 30 μm . **D 123, D13**
- cashmere coarse-hair**, *n*—those coarse fibers in cashmere hair having widths greater than 30 μm . **D 4845, D13**
- cashmere coarse-hair content**, *n*—the total length of the cashmere coarse-hair fibers that are present, expressed as a percentage of the total length of all the cashmere hair fibers; that is, the percentage by length of cashmere coarse-hair in cashmere hair. **D 123, D13**
- cashmere coarse-hair content**, *n*—the total length of the cashmere coarse-hair fibers that are present, expressed as a percentage of the total length of all the cashmere hair fibers; that is, the percentage by length of cashmere coarse-hair in cashmere hair. **D 4845, D13**
- cashmere coarse-hair content**, *n*—the total length of the cashmere coarse-hair fibers that are present, expressed as a percentage of the total length of all the cashmere hair fibers; that is, the percentage by length of cashmere coarse-hair in cashmere hair. **D 4845, D13**
- cashmere down**, *n*—those fibers in cashmere hair widths of 30 μm or less. **D 123, D13**
- cashmere down**, *n*—those fibers in cashmere hair having widths of 30 μm or less. **D 4845, D13**
- cashmere hair**, *n*—the fibers produced by a form of goat (*Capra hircus*) indigenous to Asia and known as the cashmere goat. **D 123, D13**
- cashmere hair**, *n*—the fibers produced by a form of goat (*Capra hircus*) indigenous to Asia and known as the cashmere goat. **D 4845, D13**
- casing**—pipe, finished in sections with either threaded connections or bevelled edges to be field welded which is installed temporarily or

casing

permanently to counteract caving, to advance the borehole, or to isolate the zone being monitored, or combination thereof.

D 653, D18

casing, n—the basic tire structure excluding the tread (Syn. *carcass*).

D 5681, D34

casing, n—*of a tire*, a used or treadless tire to which additional tread rubber may be attached for the purpose of retreading. **F 538, F09**

casing head—deep countersunk (32°) head with flat or cupped, circular top surface as found on casing nails to facilitate flush driving of nail. **F 547, F16**

casing nail—bright or galvanized, slender, regular-stock-steel, 1 by 0.067 to 3½ by 0.135-in. nails with flat or cupped 0.099 to 0.177-in. casing head and medium diamond point for countersinking where concealment is important. **F 547, F16**

casing, protective—a section of larger diameter pipe that is emplaced over the upper end of a smaller diameter monitoring well riser or casing to provide structural protection to the well and restrict unauthorized access into the well. **D 653, D18**

casing, surface—pipe used to stabilize a borehole near the surface during the drilling of a borehole that may be left in place or removed once drilling is completed. **D 653, D18**

case—See **barrel**. **D 996, D10**

cassette—an assembly of membrane elements (or modules), membrane aerators, air and permeate manifolds, and hardware in the cage; this is how the membranes are installed or removed from the process tank. **D 6161, D19**

cassette—a light-tight film or plate holder. **E 7, E04**

cassette—a light-tight container for holding radiographic recording media during exposure, for example, film, with or without intensifying or conversion screens. **E 1316, E07**

cassette—a light-tight device for holding film or conversion screens and film in close contact during exposure. **E 1316, E07**

cassette—see **cartridge**. **F 221, F05**

cassiterite (SnO₂)—an inorganic mineral of the tetragonal form used as a source of tin and tin oxide. **C 242, C21**

CASS test (copper accelerated salt spray)—an accelerated corrosion test for some electrodeposits and for anodic coatings on aluminum (see Test Method B 368). **B 374, B08**

cast—an impression or mold taken from a person or thing. **F 869, F08**

castable, n—a combination of refractory grain and a suitable amount of bonding agent that, after the addition of a proper liquid, is generally poured into place to form a refractory shape or structure which becomes rigid because of chemical action (see Classification C 401). **C 71, C08**

castable, n—a combination of filler and suitable binder that is generally poured or compacted into place and which hardens. **C 904, C03**

cast analysis—Deprecated term. Use the preferred term **heat analysis**. **A 941, A01**

cast film—a film made by depositing a layer of plastic, either molten, in solution, or in a dispersion, onto a surface, solidifying and removing the film from the surface. **D 883, D20**

cast film, n—a film made by depositing a layer of plastic, either molten, in solution, or in a dispersion, onto a surface, solidifying the deposit and removing the film from the surface. **F 1251, F04**

casting—a general term for a metal object produced at or near-finished shape by pouring or otherwise introducing molten metal into a mold and allowing it to solidify. **B 846, B05**

casting, n—metal object, at or near dimensions shape, produced by introducing molten metal into a mold or a die and allowing it to solidify.

die casting, n—casting produced by introducing molten metal under substantial pressure into a metal die and characterized by a high degree of fidelity to the die cavity.

investment casting, n—casting produced by surrounding (investing) an expendable pattern (usually wax or plastic) with a refractory slurry that sets at room temperature, after which the pattern is removed through the use of heat, and

the resultant cavity is filled with molten metal and allowed to solidify.

permanent mold casting, n—casting produced by introducing molten metal by gravity or low pressure into a mold constructed of durable material, usually iron or steel, and allowing it to solidify.

sand casting, n—casting produced by pouring molten metal into a sand mold and allowing it to solidify.

semi-permanent mold casting, n—permanent mold casting which is made using an expendable core such as sand. **B 881, B07**

casting—a process of shaping glass by pouring molten glass into molds, onto tables, or between rollers. **C 162, C14**

casting—a process for forming ceramic ware by introducing a body slip into a porous mold which absorbs sufficient water (or other liquid) from the slip to produce a semirigid article.

drain casting (hollow casting)—forming ceramic ware by introducing a body slip into an open porous mold, and then draining off the remaining slip when the case has reached the desired thickness.

solid casting—forming ceramic ware by introducing a body slip into a porous mold which usually consists of two major sections, one section forming the contour of the outside and the other forming the contour of the inside of the ware and allowing a solid cast to form between the two mold faces. **C 242, C21**

casting, centrifugal—a casting produced in a cylindrical mold rotating on its axis with the major axis of the product coinciding with the axis of rotation. The axis of rotation may be horizontal, vertical, or any angle in between. **B 846, B05**

casting, centrifuged—a casting produced in a mold, a number of which may be mounted around a central sprue. The molds are rotated, in a vertical position, about a central axis concentric with the central sprue. **B 846, B05**

casting, continuous—a casting produced by the continuous pouring and solidification of molten metal through a water-cooled mold which determines the cross-sectional shape. The length of the product is not restricted by mold dimensions. **B 846, B05**

casting, drain (hollow casting), v—forming ceramic ware by introducing a body slip into an open, porous mold, and then draining off the remaining slip when the cast piece has reached the desired thickness. **(C21, C 242)** **C 1145, C28**

casting, permanent mold—a product produced in a reusable mold constructed of a durable material, usually iron or steel, with the molten metal being introduced by gravity, low-pressure or vacuum. **B 846, B05**

casting, sand—a casting produced in a sand mold. **B 846, B05**

casting, semicentrifugal—a casting produced in a manner similar to the centrifugal casting except that a central core is used to allow the formation of other than a cylindrical inside surface. The axis of rotation is always vertical. **B 846, B05**

cast-in-place anchor—anchor installed in formwork prior to placement of concrete. **E 2265, E06**

cast iron, n—a generic term for a series of alloys primarily of iron, carbon, and silicon in which the carbon is in excess of the amount which can be retained in solid solution in austenite at the eutectic temperature. **A 644, A04**

cast iron enamel—a porcelain enamel specifically designed for application to cast iron. **C 286, B08**

cast lead head—half-round or bell-shaped lead head serving as head and washer requiring approximately 25 % more lead than compressed lead head. (See **lead head**.) **F 547, F16**

cast replica—See **replica**. **E 7, E04**

cast structure—the structure, on a macroscopic or microscopic scale, of a casting. **E 7, E04**

catalyst—a substance whose presence initiates or changes the rate of a chemical reaction, but does not itself enter into the reaction. **C 904, C03**

catalyst—a material that causes chemical reactions to begin. **D 653, D18**

catalyst, *n*—a substance that initiates or changes the rate of chemical reaction, but is not consumed or changed by the reaction. (See also **hardener**.) (Compare **inhibitor**.) **D 907, D14**

catalyst—a substance whose presence initiates or changes the rate of a chemical reaction, but does not itself enter into the reaction. **D 6161, D19**

catalyst—a substance that increases the rate of a chemical reaction; used extensively in polymerization reactions. **E 631, E06**

catalyst—a substance that increases the rate of a chemical reaction; used extensively in polymerization reactions. **E 1749, E06**

catalyst bed support—an essentially inert plate, grid, particulate bed, or other structural component designed to hold up or bear a quantity of catalyst in a catalytic reactor. **D 3766, D32**

catalyst carrier—a solid, generally porous material upon the surface or into the voids of which catalytic materials are placed to create the desired catalyst. **D 3766, D32**

catalyst substrate—less preferred alternative term for **catalyst carrier**. **D 3766, D32**

catalyst support—less preferred alternative term for **catalyst carrier**. **D 3766, D32**

catalyst system—those materials that, in combination, cause chemical reactions to begin; catalyst systems normally consist of an initiator (catalyst) and an activator. **D 653, D18**

cataphoresis—See **electrophoresis**. **B 374, B08**

catastrophic period, *n*—*in cavitation or liquid impingement erosion*, a stage during which the erosion rate increases so drastically that continued exposure threatens or causes gross disintegration of the exposed surface. This stage is not inevitable; it is observed most commonly with some brittle materials. When it does occur, it may begin during any stage of the more common erosion rate-time pattern. **G 40, G02**

catastrophic wear, *n*—rapidly occurring or accelerating surface damage, deterioration, or change of shape caused by wear to such a degree that the service life of a part is appreciably shortened or its function is destroyed. **G 40, G02**

catcher blade—(also known as a recovery blade or slip sheet), a strip of semi-rigid plastic material that guides the waste toner removed from the photoreceptor into the waste bin. **F 335, F05**

catch up, *n*—a condition that occurs when the non-image area of the plate becomes ink receptive. See **scum**. **D 6488, D01**

category, *n*—*in engine oils*, a designation such as SH, SJ, CF-4, CF, CF-2, CG-4, Energy Conserving, and so forth for a given level of performance in specified engine tests. **D 4175, D02**

catenary:

filament catenary—the difference in length of the filaments in a specified length of tow, end, or strand as a result of unequal tension; the tendency of some filaments in a taut horizontal tow, end, or strand to sag lower than others.

roving catenary—the difference in length of the ends, tows, or strands in a specified length of roving as a result of unequal tension; the tendency of some ends, tows, or strands in a taut horizontal roving to sag lower than others. **D 3878, D30**

catenary configuration (aka “U,” “J” configuration)—booming configuration formed by towing or anchoring each end of a length of boom, resulting in a characteristic “U” or “J” shape. **F 818, F20**

catenary drag force—load imposed on a boom, deployed in a catenary configuration, resulting from towing, current, and/or wind forces. **F 818, F20**

catenary length, *n*—the difference between the length of the shortest and the longest component in a plied yarn or cables cord after twisting. **D 6477, D13**

cat eye—an imperfection; an elongated bubble containing a piece of foreign matter. **C 162, C14**

cathode—the electrode in electrolysis at which positive ions are discharged, negative ions are formed, or other reducing actions occur. **B 374, B08**

cathode—unmelted, electrodeposited, and somewhat rough flat plate normally used for melting. The customary size is about 3 ft (0.914 m) square, about 1/2 to 7/8 in. (12.7 to 22.2 mm) thick, weighing up to about 300 lb (136 kg) and may have hanging loops attached. Cathodes may also be cut to smaller dimensions. **B 846, B05**

cathode—negative electrode. **D 6161, D19**

cathode—the electrode of an electrolytic cell at which reduction is the principal reaction. (Electrons flow toward the cathode in the external circuit.) **G 15, G01**

cathode efficiency—the current efficiency of a specified cathodic process. **B 374, B08**

cathode fall—the potential difference between the cathode and the electric discharge plasma. **B 542, B02**

cathode film—the layer of solution in contact with the cathode that differs in composition from that of the bulk of the solution. **B 374, B08**

cathode lens—a lens field terminated on one side by a surface at zero potential (cathode) normal to the optic axis. A cathode lens occurs in any system in which a cathode is imaged by its own electron emission, be it thermionic, photoelectric, secondary, or field emission. **E 7, E04**

cathode polarization—See **polarization**. **B 374, B08**

cathodic (cathode) material transfer—see **material transfer**. **B 542, B02**

cathodic corrosion—corrosion of a metal when it is a cathode. (It usually happens to metals because of a rise in pH at the cathode or as a result of the formation of hydrides.) **G 15, G01**

cathodic inhibitor—a corrosion inhibitor whose primary action is to slow the kinetics of the cathodic reaction, producing a negative shift in corrosion potential. **G 15, G01**

cathodic polarization—the change of the electrode potential in the active (negative) direction due to current flow. (See **polarization**.) **G 15, G01**

cathodic protection, *n*—protection of a metal from corrosion by making it a cathode through the galvanic sacrifice of a less noble metal or through an impressed electric current. **B 899, B02**

cathodic protection—a technique to reduce the corrosion rate of a metal surface by making it the cathode of an electrochemical cell. **G 15, G01**

catholyte—the portion of the electrolyte in the vicinity of the cathode; in a divided cell the portion of the cathode side of the diaphragm. **B 374, B08**

catholyte—the electrolyte adjacent to the cathode of an electrolytic cell. **G 15, G01**

cation—a positively-charged ion. **B 374, B08**

cation—an ion that moves, or would move toward a cathode; thus nearly always synonymous with positive ion. **D 653, D18**

cation—positively charged ion. **D 6161, D19**

cation—a positively charged ion. **G 15, G01**

cation conductivity, *n*—a conductivity measurement performed on water after cations have been exchanged for protons using cation exchange media. **D 1129, D19**

cation exchange—see **base exchange**. **D 653, D18**

cation exchange capacity (CEC)—the total capacity of a porous system to absorb cations from a solution. **D 653, D18**

cation-exchange material, *n*—a material capable of the reversible exchange of positively charged ions. **D 1129, D19**

cation exchange material—a material capable of the reversible exchange of positively charged ions. **D 6161, D19**

cation exchange membrane—membrane containing fixed anionic charges and mobile cations that can be exchanged with other cations present in an external fluid in contact with the membrane. **D 6161, D19**

cationic detergent—under **detergent**, see **cationic detergent**. **D 459, D12**

cationic emulsion, *n*—a type of emulsion such that a particular emulsifying agent establishes a predominance of positive charges on the discontinuous phase. **D 8, D04**

cationic emulsion—an emulsion in which the emulsifying system establishes a predominance of positive charges on the discontinuous phase. **D 1079, D08**

cationic polyelectrolyte—a polymer containing positively charged groups used for coagulation/flocculation, usually dimethyl - aminoethyl methacrylate or dimethyl-aminoethyl acrylate. See **polyelectrolyte**. **D 6161, D19**

cationic surfactant—a chemical compound that produces positively charged surface active ions in solution. **D 459, D12**

cationic surfactant—a surface-active agent in which the active portion of the molecule containing the lipophilic segment forms exclusively a positive ion (cation) when placed in aqueous solution. **E 1519, E35**

cat scratch—an imperfection; surface irregularities on glassware resembling the marks of a cat's claws. **C 162, C14**

caul, n—a sheet of material employed singly or in pairs in hot or cold pressing of assemblies being bonded. **D 907, D14**

caul, n—a flat or contoured tool used to distribute pressure and to define a surface for the top of the laminate during laminate consolidation or cure. **D 3878, D30**

caul—a sheet of material employed singly or in pairs in hot or cold pressing of assemblies being bonded. **E 631, E06**

caul—a sheet of material employed singly or in pairs in hot or cold pressing of assemblies being bonded. **E 1749, E06**

caulk, v—in *building construction*, to install or apply a sealant across or into a joint, crack, or crevice. **C 717, C24**

caulk, n—See **sealant**. **C 717, C24**

caulk, v—to fill joints, **cracks**, or crevices in order to prevent the passage of air or water. **E 631, E06**

caulking, n—See **sealant**. **C 717, C24**

caulking, n—a material ranging in physical characteristics from plastic, to solid, to preformed, used to seal and waterproof joints and overlaps in structures, other assemblies, or portions thereof where movement may occur. **C 1154, C17**

caulking—a composition of vehicle and pigment, used at ambient temperatures for filling joints, that remains plastic for an extended time after application. **D 1079, D08**

caulking—material ranging in physical characteristics from plastic, to solid, to preformed, used to seal and waterproof joints and overlaps in structures, other assemblies or portions thereof where movement may occur. **D 2946, C17**

caulking compound, n—See **sealant**. **C 717, C24**

caulking compound, n—a soft, plastic material, consisting of pigment and vehicle, used for sealing joints in buildings and other structures where normal structural movement may occur. **D 16, D01**

cauls, n—sheets of material employed singly or in pairs in hot or cold pressing of assemblies being bonded. Cauls are employed usually to protect either the faces or the press platen or both against marring and staining, to prevent sticking, to facilitate press loading, or to impart a desired surface texture or finish, and to provide uniform pressure distribution.

NOTE—Cauls may be made of any material such as aluminum, stainless steel, hardboard, fiberboard, or plastic, with the length and width generally equal to the platen size of the press in which they are employed. **D 1038, D07**

caustic cracking—stress corrosion cracking of metals in caustic solutions. (See also **stress-corrosion cracking**.) **G 15, G01**

caustic dip—in *diffusion coatings*, a strongly alkaline treatment applied by dip or spray for neutralizing acid residues. **B 374, B08**

caustic embrittlement, n—a form of metal failure that occurs in steam boilers at riveted joints and at tube ends, the cracking being predominantly intercrystalline. **D 1129, D19**

caustic embrittlement—See **caustic cracking**. **G 15, G01**

cave ice—ice formed in an open or closed cave. **D 7099, D18**

caves or washouts, n—zones of increased hole diameter caused by rock fragments that fall from the walls of a borehole and can block

the hole or contaminate the cuttings and which erode or abrade the sidewall of the borehole by the action of the drilling. These zones can affect the accuracy of certain geophysical logs (especially density). Corrections to other geophysical logs can be made if a caliper log is available. The most common causes of caves or washouts include soft or fractured lithologies, the presence of water-producing zones, and the downhole pressure of the drilling medium (fluid or air) that often causes differential erosion of various strata within the borehole. **D 121, D05**

caving; sloughing—the inflow of unconsolidated material into a borehole which occurs when the borehole walls lose their cohesive strength. **D 653, D18**

cavitating disk device (or apparatus), n—a flow cavitation test device in which cavitating wakes are produced by holes in, or protuberances on, a disk rotating within a liquid-filled chamber. Erosion test specimens are attached flush with the surface of the disk, at the location where the bubbles are presumed to collapse. **G 40, G02**

cavitating jet, n—a continuous liquid jet (sometimes submerged) in which cavitation is induced by the nozzle design, or sometimes by an obstruction placed in the center of the flow passage. **G 40, G02**

cavitating wake, n—See **flow cavitation**. **G 40, G02**

cavitation, n—the formation of vapor-filled cavities in the interior or on the solid boundaries of liquids in motion where the pressure is reduced to a critical value without a change in ambient temperature. **E 1620, E29**

cavitation—the formation and rapid collapse within a liquid of cavities or bubbles that contain vapor or gas or both. **G 15, G01**

cavitation, n, n—the formation and subsequent collapse, within a liquid, of cavities or bubbles that contain vapor or gas or both. **G 40, G02**

cavitation cloud, n—a collection of a large number of cavitation bubbles. The bubbles in a cloud are small, typically less than 1 mm (0.04 in.) in cross section. A surface that is being eroded by cavitation is usually obscured by a cavitation cloud. **G 40, G02**

cavitation corrosion, n—a form of localized, accelerated corrosion characterized by deep pitting and caused by high mechanical forces resulting from coolant vapor bubble collapse at the surface of the metal. **D 4725, D15**

cavitation corrosion—the conjoint action of cavitation-erosion and corrosion. **G 15, G01**

cavitation damage—the degradation of a solid body resulting from its exposure to cavitation. (This may include loss of material, surface deformation, or changes in properties or appearance.) **G 15, G01**

cavitation damage, n—See **damage**. **G 40, G02**

cavitation-erosion—loss of material from a solid surface due to mechanical action of continuing exposure to cavitation. **G 15, G01**

cavitation erosion, n—progressive loss of original material from a solid surface due to continued exposure to cavitation. **G 40, G02**

cavitation erosion corrosion, n—the mechanical removal of protective films on metal by the formation and collapse of vapor bubbles in a liquid, and the abrasive action of a liquid, which may contain suspended solids, moving at high velocity. **D 4725, D15**

cavitation erosion test, n—a procedure whereby the surface of a solid is subjected to cavitation attack under specified, or measurable, or at least repeatable conditions. **G 40, G02**

cavitation number, σ , n—a dimensionless number that measures the tendency for cavitation to occur in a flowing stream of liquid, and that is computed from the equation:

$$\sigma = \left(P_o - P_v \right) / \frac{1}{2} \rho V_o^2$$

where:

P_v = vapor pressure,

P_o = static pressure in the stream in an undisturbed state,

V_o = undisturbed stream velocity, and

ρ = liquid density.

- G 40, G02**
- cavitation tunnel, n**—a flow cavitation test facility in which liquid is pumped through a pipe or tunnel, and cavitation is induced in a test section by conducting the flow through a constriction, or around an obstacle, or a combination of these. **G 40, G02**
- cavity**—a natural underground opening that may be small or large. **D 653, D18**
- cavity**—underground opening created by a fully contained explosive. (ISRM) **D 653, D18**
- cavity, n**—in specimen preparation, the part of the hollow space of a mold that forms one specimen. **D 883, D20**
- cavity**—that portion of the oven in which food may be heated, cooked, or defrosted. **F 1827, F26**
- CB**—an abbreviation for coated back, referring to a carbonless paper of the two-coat, transfer type. **F 549, F05**
- “C” blade**—blade clincher resembling the letter “C”; designed to fasten partially overlapping container panels. **F 592, F16**
- CBR**—an abbreviation for *chemical, biological, radiological*. **E 631, E06**
- CBR**—an abbreviation for *chemical, biological, radiological*. **E 1749, E06**
- CCITT**—abbreviation for *Comite Consultatif International Telegraphique et Telephonique* (Consultive Committee for International Telephone and Telegraph). **F 1457, F05**
- CD**—abbreviation for **carrier detect**. **F 1457, F05**
- CED** (*cupriethylenediamine*) **viscosity**—see **viscosity, cupriethylene-diamine**. **D 1695, D01**
- ceiling limit**—an exposure which shall not be exceeded during any part of the workday. If instantaneous monitoring is not feasible, then the ceiling limit shall be assessed as a 15-min time-weighted average exposure which shall not be exceeded at any time over a working day except for substances which cause immediate irritation upon short exposure. **E 1542, E34**
- ceiling protective membrane, n**—a ceiling membrane attached to or suspended from the structural members of the floor or ceiling assembly, usually by hanger wire or threaded rods, consisting of a grid suspension system with lay-in ceiling panels or a grid of steel furring channels to which the ceiling membrane is directly attached, intended to provide fire protection, acoustical and or aesthetic enhancements, or both. **E 176, E05**
- cell, n**—a single small cavity surrounded partially or completely by walls. **C 717, C24**
- cell**—a general term for the minute units of wood structure having distinct cell walls and cell cavities including wood fibers, vessel segments, and other elements of diverse structure and function. **D 9, D07**
- cell, n**—a small cavity surrounded partially or completely by walls. **D 883, D20**
- cell, n**—a single small cavity surrounded partially or completely by walls. **D 1566, D11**
- cell, n**—a portion of a landfill that is isolated, usually by means of soil or an impermeable barrier, from its surroundings. **E 2201, E50**
- cell, n**—a small partially or completely enclosed cavity. (D20) **F 412, F17**
- cell, n**—a small partially or completely enclosed cavity. **F 1251, F04**
- cell, n**—“the smallest structural unit of an organism that is capable of independent functioning, consisting of one or more nuclei, cytoplasm, and various organelles, all surrounded by a semipermeable cell membrane”. **F 2312, F04**
- cellar**—a space wholly or partly below **average grade** having more than one half of its clear height (measured from floor level to ceiling level) below **average grade**. **E 631, E06**
- cellar**—See **space categories**. **E 631, E06**
- cellar**—See **building space**. **E 631, E06**
- cellar**—See **space categories**. **E 1480, E06**
- cell (bubble), n**—in *carbon and graphite technology*, a single small cavity formed by gaseous displacement in a precursor material in its plastic state, and surrounded completely by its walls when formed. Cells can be open or closed. **C 709, D02**
- cell (bubble), n**—in *carbon and graphite technology*, a single small cavity formed by gaseous displacement in a precursor material in its plastic state, and surrounded completely by its walls when formed. Cells can be open or closed. **D 4175, D02**
- cell, closed**—a cell totally enclosed by its walls and hence not interconnecting with other cells. (ISO) (See **cell** and **cell, open**.) **D 883, D20**
- cell, closed, n**—a cell totally enclosed by its walls, hence not interconnecting with other cells. **D 1566, D11**
- cell, closed**—a cell totally enclosed by its walls and hence not interconnecting with other cells. (ISO, D20)(See also **cell** and **cell, open**.) **F 412, F17**
- cell, closed**—see **closed cell**. **F 1251, F04**
- cell count, n**—in *carbon and graphite technology*, in closed-cell foams, the number of cells aligned in one plane in one linear inch, as determined by stereoscopic image analysis. **C 709, D02**
- cell count, n**—in *carbon and graphite technology*, in closed-cell foams, the number of cells aligned in one plane in one linear inch, as determined by stereoscopic image analysis. **D 4175, D02**
- cell culture, n**—the *in vitro* growth or maintenance of cells. **F 2312, F04**
- cell, open**—a cell not totally enclosed by its walls and hence interconnecting with other cells. (See **cell** and **cell, closed**.) **D 883, D20**
- cell, open, n**—a cell not totally enclosed by its walls and hence interconnecting with other cells. **D 1566, D11**
- cell, open**—a cell not totally enclosed by its walls and hence interconnecting with other cells. (D20) (See also **cell** and **cell, closed**.) **F 412, F17**
- cell, open**—see **open cell**. **F 1251, F04**
- cellophane pulps**—pulps used in the manufacture of cellophane, and subject to various specifications by the manufacturers, including those of purity, moisture content, sheet properties, and viscosity. **D 1695, D01**
- cells/core holes, n**—continuous openings or perforations within extruded clay products. **C 43, C15**
- cell size, n**—in *carbon and graphite technology*, the average diameter of the cells in the final foam product. **C 709, D02**
- cell size, n**—in *carbon and graphite technology*, the average diameter of the cells in the final foam product. **D 4175, D02**
- cell temperature, n**—the temperature of the semiconductor junction of a photovoltaic cell. **E 1328, E44**
- cell therapy, n**—the administration of cells (any kind and form) to repair, modify or regenerate the recipient’s cells, tissues, and organs or their structure and function, or both. Cell therapy technologies can be applied in tissue engineering to generate TEMPs. **F 2312, F04**
- cellular, adj**—having a composition of plastic or rubber with relative density decreased by the presence of cells disposed throughout its mass. In closed-cell materials, the cells are predominantly separate from each other. In open-cell materials, the cells are predominantly interconnected. **C 717, C24**
- cellular adhesive**—see **foamed adhesive**. **D 907, D14**
- cellular concrete, n**—a lightweight hydraulic-cement concrete having a homogeneous void or cell structure attained using gas-forming chemicals or foaming agents. **C 125, C09**
- cellular elastomeric, n**—insulation composed principally of natural or synthetic elastomers, or both, processed to form a flexible, semirigid, or rigid foam which has a predominantly closed-cell structure. **C 168, C16**
- cellular glass, n**—insulation composed of glass processed to form a rigid foam having a predominantly closed-cell structure. **C 168, C16**
- cellular material, n**—a generic term for materials containing many cells (either open, closed, or both) dispersed through the mass. **C 717, C24**

cellular material, n

cellular material, n—a generic term for materials containing many cells (either open, closed, or both) dispersed throughout the mass.

D 1566, D11

cellular material, collapse, n—undesirable densification of a cellular material resulting from the breakdown of its cellular structure.

D 1566, D11

cellular material, cored, n—cellular material containing a multiplicity of holes (usually, but not necessarily, cylindrical in shape), molded or cut into the material in some pattern normally perpendicular to the largest surface, and extending part or all the way through the piece.

D 1566, D11

cellular material, flexible, n—a cellular organic polymeric material that will not rupture when a specimen 200 by 25 by 25 mm (8 by 1 by 1 in.) is bent around a 25-mm (1-in.) diameter mandrel at a uniform rate of one lap in 5 s at a temperature between 18 and 29°C.

D 1566, D11

cellular plastic—a plastic containing numerous cells, intentionally introduced, interconnecting or not, distributed throughout the mass. (See also **syntactic cellular plastics**.)

D 883, D20

cellular plastic—a plastic containing numerous cells, intentionally introduced, interconnecting or not, distributed throughout the mass. (D20)

F 412, F17

cellular plastic—a plastic containing numerous cells, intentionally introduced, interconnecting or not, distributed throughout the mass. (D 883, D20)

F 869, F08

cellular polyimide, n—insulation composed of the reaction product in which the bonds formed between monomers during polymerization are essentially imide units forming a cellular structure.

C 168, C16

cellular polystyrene, n—insulation composed principally of polymerized styrene resin processed to form a rigid foam having a predominantly closed-cell structure.

C 168, C16

cellular polystyrene, n—polymerized styrene resin processed to form a rigid foam having a predominately closed-cell structure making it suitable as thermal insulation.

E 631, E06

cellular polyurethane, n—insulation composed principally of the catalyzed reaction product of polyisocyanate and polyhydroxy compounds, processed usually with fluorocarbon gas to form a rigid foam having a predominantly closed-cell structure.

C 168, C16

cellular rubber, n—rubber products containing cells or hollow receptacles which may be open, interconnecting, or closed and not interconnecting.

D 1566, D11

cellular striation, n—a condition characterized by a layer within a cellular material that differs greatly from the characteristic cell structure.

D 883, D20

cellular striation, n—a condition characterized by a layer within a cellular material that differs greatly from the characteristic cell structure.

D 1566, D11

cellulose—the carbohydrate that is the principal constituent of wood and forms the structural framework of the wood cells. **D 9, D07**

cellulose—(1) the main solid constituent of woody plants; it occurs widely elsewhere in the vegetable kingdom, and to a small extent in the animal kingdom. (2) chemically, cellulose is β -1-4 glucan of high degree of polymerization. It is desirable to apply "cellulose" to this material only and to designate the predominantly cellulosic residue obtained by subjecting woody tissues to various pulping processes as "cellulosic residues," "cellulosic pulps," or the like.

D 1695, D01

cellulose—an amorphous carbohydrate ($C_6H_{10}O_5$) that is the principal constituent of wood and plants.

D 6161, D19

cellulose acetate—in the broad sense, any of several esters of cellulose and acetic acid. (see also **cellulose triacetate**)

D 1695, D01

cellulose acetate butyrate—a mixed ester of cellulose containing both acetate and butyrate groups.

D 1695, D01

cellulose acetate butyrate (CAB) plastics—plastic made by compounding a cellulose acetate butyrate ester with plasticizers and other ingredients. Cellulose acetate butyrate ester is a derivative of

cellulose (obtained from cotton or wool pulp, or both) made by converting some of the hydroxyl groups in cellulose to acetate and butyrate groups with chemicals.

F 412, F17

cellulose acetate (CA)—in the broad sense, any of several esters of cellulose and acetic acid.

D 6161, D19

cellulose acetate phthalate—a mixed ester of cellulose containing both acetate and phthalate groups.

D 1695, D01

cellulose acetate propionate—a mixed ester of cellulose containing both acetate and propionate groups.

D 1695, D01

cellulose derivative—a substance derived from cellulose by substitution of one or more of the hydroxyl groups with some other radical. Most derivatives are ethers or esters.

D 1695, D01

cellulose esters—derivatives of cellulose in which one or more of the hydroxyl hydrogens have been replaced acyl groups.

D 1695, D01

cellulose ethers—derivatives of cellulose in which one or more of the hydroxyl hydrogens have been replaced by alkyl groups.

D 1695, D01

cellulose I—the crystalline modification of cellulose that normally occurs in nature.

D 1695, D01

cellulose II—the crystalline modification of cellulose that is found in mercerized cellulose, in regenerated cellulose, and in cellulose produced by the hydrolysis of various cellulose derivatives.

D 1695, D01

cellulose III—a crystalline modification of cellulose produced by treatment, under certain conditions, with ammonia or sometimes by amines. The method of removing the reagent determines the modification produced.

D 1695, D01

cellulose IV—a crystalline modification of cellulose produced by heat treatment of cellulose II.

D 1695, D01

cellulose lacquer—see **lacquer**.

D 16, D01

cellulose lacquer—a liquid coating composition containing as the basic film-forming ingredient a cellulose ester or ether and plasticizers with or without resins or pigments.

D 1695, D01

cellulose mixed ester—a cellulose ester containing more than one type of acyl group.

D 1695, D01

cellulose nitrate—any of various nitrate esters of cellulose.

D 1695, D01

cellulose plastics—plastics based on cellulose compounds, such as esters (cellulose acetate) and ethers (ethylcellulose).

D 1695, D01

cellulose propionate—any ester of cellulose with propionic acid.

D 1695, D01

cellulose, purified cotton—see **cotton cellulose, purified**.

D 1695, D01

cellulose, purified wood—see **wood cellulose, purified**.

D 1695, D01

cellulose sodium glycolate—see **carboxymethyl cellulose**.

D 1695, D01

cellulose triacetate—that form of cellulose acetate in which the degree of substitution approaches 3 sufficiently that the product is not soluble in acetone.

D 1695, D01

cellulose X—a crystalline modification of cellulose produced by treatment of cellulose with strong hydrochloric acid or phosphoric acid.

D 1695, D01

cellulose xanthates—the salts of cellulose xanthic acid. Commonly, cellulose xanthate refers to sodium cellulose xanthate, the essential constituent of the viscose solution, from which viscose rayon is spun.

D 1695, D01

cellulosic fiber, n—insulation composed principally of cellulose fibers usually derived from paper, paperboard stock, or wood, with or without binders.

C 168, C16

cellulosic fiberboard—a generic term for a homogeneous panel made from lignocellulosic fibers (usually wood or cane) characterized by an integral bond produced by inter-felting of the fibers, to which other materials may have been added during manufacture to improve certain properties, but which has not been consolidated under heat and pressure as a separate stage in manufacture, said board having a density of less than 31 lb/ft³ (specific gravity 0.50) but having a density of more than 10 lb/ft³ (specific gravity 0.16).

D 1554, D07

cellulosic plastics, *n*—plastics based on cellulose compounds, such as esters (cellulose acetate) and ethers (ethyl cellulose). **D 883, D20**

Celsius, *adj*—pertaining to or denoting something related to the expression of temperature in degrees Celsius. **E 344, E20**

Celsius—designation of the degree on the International Practical Temperature Scale; also used for the name of the scale, as “Celsius Temperature Scale.” Formerly (prior to 1948) called “Centigrade.” The Celsius temperature scale is related to the International Kelvin Temperature Scale by the equation $T_c = T - 273.15$ K. **E 1142, E37**

celsius (°C)—the designation of the degree on the International Practical Temperature Scale. Formerly called centigrade, °C = °K minus 273.15. K = Kelvin. °C = (°F-32)*0.556. **D 6161, D19**

cement; Portland cement—commonly known as Portland cement. A mixture that consists of a calcareous argillaceous, or other silica-, alumina-, and iron-oxide bearing materials that is manufactured and formulated to produce various types which are defined in Specification C 150. Portland cement is also considered a hydraulic cement because it must be mixed with water to form a cement-water paste that has the ability to harden and develop strength even if cured under water (see **ASTM cement types**). **D 653, D18**

cement, *n*—see Discussion under **adhesive**. **D 907, D14**

cement, *v*—see **bond**. **D 907, D14**

cement, *n*—a general term for a binding element. See specific terms such as Portland cement, Keene’s cement, and adhesive cement. **E 631, E06**

cement, API, Class A—a cement intended for use from the surface to a depth of 6000 ft (1828 m). This cement is similar to ASTM Type I cement. **D 653, D18**

cement, API, Class B—a cement intended for use from the surface to a depth of 6000 ft (1828 m) when conditions require moderate- to high-sulfate resistance. This cement is similar to ASTM Type II cement. **D 653, D18**

cement, API, Class C—this cement is intended for use from the surface to a depth of 6000 ft (1828 m) when conditions require high early strength. This cement is similar to ASTM Type III cement. Also available as a high sulfate resistant type. **D 653, D18**

cement, API, Class G—this cement is intended for use from the surface to a depth of 8000 ft (2438 m). It can be used with accelerators or retarders to cover a wide range of well depths and temperatures. No additions other than calcium sulfate or water, or both, can be interground or blended with the clinker during manufacture of the cement. Also available as several sulfate-resistant types. **D 653, D18**

cement, API, Class H—this cement is intended for use from the surface to a depth of 8000 ft (2438 m). It can be used with accelerators or retarders to cover a wide range of well depths and temperatures. No additions other than calcium sulfate or water, or both, can be interground or blended with the clinker during manufacture of the cement. Also available as a sulfate-resistant type. **D 653, D18**

cement, API, Class J—this cement is intended for use from depths of 12 000 to 16 000 ft (3658 to 4877 m) under conditions of extremely high temperatures and pressures. It can be used with accelerators and retarders to cover a range of well depths and temperatures. No additions of retarders other than calcium sulfate, or water, or both, can be interground or blended with the clinker during manufacture of the cement. **D 653, D18**

cementation, *n*—the introduction of one or more elements into the outer portion of a steel object by means of diffusion at high temperature. **A 941, A01**

cementation—See **pack cementation**. **B 374, B08**

cement-bonded particle board, *n*—manufactured flat sheets of hydraulic cementitious matrices and fibrous wood particles. **C 1154, C17**

cement bond (sonic) log—a borehole geophysical log that can be used to determine the effectiveness of a cement seal of the annular space of a well. **D 653, D18**

cement-coated—surface coated by tumbling or immersion in natural

resin or shellac to produce a limited temporary bond between driven nail and surrounding wood, provided coating is not removed during driving, and to reduce rusting during storage. **F 547, F16**

cement construction—a process in which the outsole is attached to the upper by cementing instead of sewing or by other methods. Also known as the compo process, after Compo Industries, Inc., which introduced this method commercially into the U.S. about 1930; also known as cement process and as cemented process. **F 869, F08**

cemented carbide, *n*—sintered material characterized by high strength and wear resistance and comprising one or more carbides of refractory metals as the main component bonded by metallic binder phase. **B 243, B09**

cemented materials—materials consisting of one or more substances that develop hardness by chemical reaction after placement of the material in a fill. **D 5681, D34**

cement factor—quantity of cement contained in a unit volume of concrete or grout, expressed as weight, or volume (specify which). **D 653, D18**

cement, finishing, *n*—a mixture of dry fibrous or powdery materials, or both, that when mixed with water develops a plastic consistency, and when dried in place forms a relatively hard, protective surface. **C 168, C16**

cement grout—a grout in which the primary cementing agent is Portland cement. **D 653, D18**

cement, insulating, *n*—a mixture of dry granular, flaky, fibrous, or powdery materials that when mixed with water develops a plastic consistency, and when dried in place forms a coherent covering that affords substantial resistance to heat transmission. **C 168, C16**

cementite, *n*—a very hard and brittle compound of iron and carbon corresponding to the empirical formula Fe₃C, commonly known as iron carbide. **A 644, A04**

cementite—a very hard and brittle compound of iron and carbon corresponding to the empirical formula Fe₃C. It is commonly known as iron carbide and possesses an orthorhombic lattice. In “plain-carbon steels” some of the iron atoms in the cementite lattice are replaced by manganese, and in “alloy steels” by other elements such as chromium or tungsten. Cementite will often appear as distinct lamellae or as spheroids or globules of varying size in hypo-eutectoid steels. Cementite is in metastable equilibrium and has a tendency to decompose into iron and graphite, although the reaction rate is very slow. **E 7, E04**

cementite, primary, *n*—cementite precipitated in cast iron during solidification. Also known as primary carbide. (See **cementite**.) **A 644, A04**

cementitious ash, *n*—fly ash, which hardens irreversibly when mixed with water. Also referred to as self-cementing ash. **E 2201, E50**

cementitious factor—quantity of cement and other cementitious materials contained in a unit volume of concrete or grout, expressed as weight or volume (specify which). **D 653, D18**

cementitious material, *n*—a material that, when mixed with water, with or without aggregate, provides the plasticity and the cohesive and adhesive properties necessary for placement, and the formation of a rigid mass. **C 11, C11**

Cementitious material, *n*—Committee C12 standards for mortar and grout consider the following as cementitious materials: Hydraulic cements, pozzolans, hydrated lime, lime putty, and ground granulated blast furnace slag. **C 1180, C12**

cementitious material (hydraulic), *n*—an inorganic material or a mixture of inorganic materials that sets and develops strength by chemical reaction with water by formation of hydrates and is capable of doing so under water. **C 125, C09**

cementitious material, hydraulic, *n*—an inorganic material or a mixture of inorganic materials which sets and develops strength by chemical reaction with water by formation of hydrates, and which is capable of doing so underwater. **C 219, C01**

cementitious material (hydraulic), *n*—an inorganic material or a mixture of inorganic materials that sets and develops strength by

cementitious material (hydraulic), *n*

chemical reaction with water by formation of hydrates and is capable of doing so under water. **E 2201, E50**

cementitious mixture, *n*—a mixture (mortar, concrete, or grout) containing hydraulic cement. **C 125, C09**

cementitious mixture, *n*—a combination of more than any one of the following materials to make a cement paste: hydraulic cement; Portland cement; coal fly ash; FBC ash; lime; ground granulated blast furnace slag; lime kiln dust; cement kiln dust. It may be used by itself for grout, or used to bind aggregates or fine materials to make concrete or controlled low strength materials (CLSM), or used for soil stabilization and solidification. **E 2201, E50**

Cement-Lime Mortar—Cement-Lime Mortar primarily consists of hydraulic cement, hydrated lime or lime putty, mason's sand and water. **C 51, C07**

cement paste, *n*—an unhardened or hardened mixture of finely divided hydraulic cementitious material and water. **C 219, C01**

cement, rubber, *n*—an adhesive that is either a liquid dispersion or solution of raw or compounded rubber, or both. **D 1566, D11**

center—inner layers whose grain direction runs parallel to that of the outer plies; may be of parallel laminated plies. (See also **core**.) **D 1038, D07**

center back waist length, *n*—*in body measurements*, the vertical distance along the spine from the cervicale to the waist. **D 123, D13**

center back waist length, *n*—the distance from the cervicale to the center back waist level, taken along the spine (contour). **D 5219, D13**

centerburst—the region of greatest amplitude in an interferogram. **E 131, E13**

center front waist length, *n*—*in body measurements*, the vertical distance from the neck baseline at the center front to the waist level. **D 123, D13**

center front waist length, *n*—the distance from the center front neck base line to the center front waist level (contour). **D 5219, D13**

center green (CG) or mid green (MG), *n*—that temperature which unifies the visual and instrumental evaluation methods and is defined by the equation:

$$CG = MG = \frac{SG + SB}{2} = T^{*520}$$

See 3.2.7.2 for description of T^{*520} . **E 344, E20**

centering—an operation on lens elements wherein the element is optically aligned with the axis of rotation and the edges ground concentric with the optical axis. **C 162, C14**

centerline—the vertical axis around which character elements are located for letters, numerals, or symbols of an OCR font. **F 149, F05**

centerline, *n*—*in foot protective devices*, a line which extends from the toe of the footwear horizontally along the sole to the heel vertically to the top of the footwear, and diagonally to the point of intersection at the toe. **F 1494, F23**

center match—matched lumber with tongues and grooves precisely centered on the edges. **D 9, D07**

center of tire contact, *n*—the intersection of the wheel plane and the vertical projection of the spin axis of a wheel onto the road plane. **F 538, F09**

center rib, *n*—a rib at or near the circumferential centerline of the tread band. **F 538, F09**

center row, *n*—a row located at or near the circumferential centerline. **F 538, F09**

center stop—a device to receive and hold the drop bar on a double gate. **F 552, F14**

center wavelength, *n*—a wavelength, usually near the middle of the band of radiant power over which a radiation thermometer responds, that is used to characterize its performance. **E 344, E20**

center wear, *n*—a type of irregular wear characterized by a wear rate continuously increasing from shoulder to center of the tread band. **F 538, F09**

centigrade—since 1948, now called Celsius, a temperature scale. **D 6161, D19**

Centigrade—see **Celsius**. **E 1142, E37**

central conductor—a conductor passed through a hollow part and used to produce circular magnetization within the part. **E 1316, E07**

centralizer—a device that assists in the centering of a casing or riser within a borehole or another casing. **D 653, D18**

central pencil—a bundle of rays originating in the axis with an angular aperture equal to the effective aperture of the lens. These rays pass through the lens aperture and contribute to the formation of the image. **E 7, E04**

central vacuum cleaning system, *n*—a cleaning system consisting of a stationary vacuum producer and dust collector that incorporates the use of a tubing system internal to a building structure and a flexible hose, or both, for conveying dust from the area being cleaned to the dust collector. The system is designed for all-purpose cleaning including various types of larger debris and may be designed for liquid pickup. The system is used by inserting one end of a hose into a wall vacuum inlet valve and attaching a cleaning nozzle to the other end. In use, the nozzle is guided over the surface area to be cleaned. The system may contain a driven agitator to assist in dirt removal and it normally has detachable nozzles, attachments, and wands for both floor and above-the-floor cleaning. **F 395, F11**

central vacuum tubing, *n*—plastic tubing used for residential central vacuum systems in which outside diameter is controlled and where the wall thickness is usually small when compared to the diameter. **F 412, F17**

centrifugal atomizer—a device wherein a rotating solid surface is the primary source of energy utilized to produce a spray.

NOTE—Alternatively, an atomizer that rotates to distribute the liquid. **E 1620, E29**

centrifugal cast button, *n*—see *rotation cast button*. **D 5497, D13**

centrifugal pressure nozzle—see **swirl chamber atomizer**. **E 1620, E29**

centrifuge—machine that separates a mixture of solids and liquids by centrifugal force. **E 1705, E48**

centrifuged rubber latex, *n*—latex, the rubber concentration of which has been increased by the removal of water by centrifugal force. **D 1566, D11**

centrifuge moisture equivalent—see **moisture equivalent**. **D 653, D18**

centripetal acceleration [ML^2/T^2], *n*—*of a vehicle*, the component of the vector acceleration (of a point in a vehicle) perpendicular to the tangent of the path of the point and parallel to the road plane. **F 538, F09**

centroid wavelength, *n*—wavelength marking the center, in terms of area under a curve, of a function of wavelength weighted by multiplication with a specified response function. **E 284, E12**

centronics interface, *n*—a parallel interface standard that connects elements of a communications system. **F 1457, F05**

ceramic article—an article having a glazed or unglazed body of crystalline or partly crystalline structure, or of glass, which body is produced from essentially inorganic, nonmetallic substances and either is formed from a molten mass which solidifies on cooling, or is formed and simultaneously or subsequently matured by the action of the heat. **C 242, C21**

ceramic coating—an inorganic, essentially nonmetallic coating, on metal. **C 286, B08**

ceramic colorant—see **color oxide**. **C 286, B08**

ceramic glass enamel (also ceramic enamel or glass enamel)—a decorative, usually colored, vitreous inorganic coating for bonding to glass at temperatures above 425°C (800°F). **C 162, C14**

ceramic ink—an ink containing a ceramic pigment that develops its color on firing. Also known as stamping, screening, or printing ink. **C 286, B08**

ceramic junction reference electrode—a reference electrode in

- which the filling solution contacts the sample solution by means of a small porous ceramic junction. **D 4127, D19**
- ceramic marking**—marking by fusing a ceramic colorant onto the glass surface. **E 344, E20**
- ceramic membrane**—generally a glass, silica, alumina, or carbon based membrane. Generally used in micro and ultrafiltration. They tend to withstand high temperatures and wide pH ranges and be more chemically inert than polymeric membranes. **D 6161, D19**
- ceramic-metal coating**—a mixture of one or more ceramic materials in combination with a metallic phase applied to a metallic substrate which may or may not require heat treatment prior to service. This term may also be used for coatings applied to nonmetallic substrates, for example, graphite. **C 286, B08**
- ceramic mosaic tile**—an unglazed tile formed by either the dust-pressed or plastic method, usually $\frac{1}{4}$ to $\frac{3}{8}$ in. (6.4 to 9.5 mm) thick, and having a facial area of less than 6 in.² (39 cm²) and which is usually mounted on sheets approximately 1 by 2 ft (0.3 by 0.6 m) to facilitate setting. **C 242, C21**
- ceramic paste**—a French term synonymous with “ceramic body.” **C 242, C21**
- ceramic process**—the production of articles or coatings from essentially inorganic, nonmetallic materials, the article or coating being made permanent and suitable for utilitarian and decorative purposes by the action of heat at temperatures sufficient to cause sintering, solid-state reactions, bonding, or conversion partially or wholly to the glassy state. **C 242, C21**
- ceramics**—a general term applied to the art or technique of producing articles by a ceramic process, or to the articles so produced. **C 242, C21**
- ceramic whiteware**—a fired ware consisting of a glazed or unglazed ceramic body which is commonly white and of fine texture, designating such product classifications as tile, china, porcelain, semivitreous ware and earthenware.
- alumina whiteware*—any ceramic whiteware in which alumina (Al₂O₃) is an essential crystalline phase.
- cordierite whiteware*—any ceramic whiteware in which cordierite (2MgO·2Al₂O₃·5SiO₂) is the essential crystalline phase.
- forsterite whiteware*—any ceramic whiteware in which forsterite (2MgO·SiO₂) is the essential crystalline phase.
- steatite whiteware*—any ceramic whiteware in which magnesium metasilicate (MgO·SiO₂) is the essential crystalline phase.
- titanium whiteware*—any ceramic whiteware in which titania (TiO₂) is the essential crystalline phase.
- zircon whiteware*—any ceramic whiteware in which zircon (ZrO₂·SiO₂) is the essential crystalline phase. **C 242, C21**
- ceric-cerous sulfate dosimeter**—a liquid chemical radiation dosimetry system composed of water with ceric sulfate or ceric ammonium sulfate in aqueous sulfuric acid solution, and whose response is based quantitatively on the amount of reduction of ceric to cerous ions by ionizing radiation, as analyzed by spectrophotometry or electrochemical potentiometry. It is generally considered to be a reference-standard dosimetry system. **E 170, E10**
- cermet**, *n*—sintered material containing at least one metallic phase and at least one nonmetallic phase that is generally of a ceramic nature. **B 243, B09**
- cermet**, *n*—a composite material or article comprised of a ceramic and a metal or metal alloy, interdistributed in any of various geometrical forms but intimately bonded together. **C 1145, C28**
- cermet coating*—see **ceramic-metal coating**. **C 286, B08**
- certainty equivalent technique**—a technique used to adjust economic measures of project worth to reflect risk exposure and risk attitude. **E 631, E06**
- certainty equivalent technique**, *n*—a technique used to adjust economic measures of project worth to reflect risk exposure and risk attitude. **E 833, E06**
- certificate of competence**—document issued under the rules of a certification system indicating that adequate confidence is provided that the named person is competent in performing specific services, (EN 45020). **E 1187, E36**
- certificate of compliance**, *n*—*in manufactured products*, a document that states that the product was manufactured, sampled, tested, and inspected in accordance with the requirements of the specification (including year of issue) and any other requirements specified in the purchase order or contract, and has been found to meet such requirements. **A 941, A01**
- certificate of compliance**—document or electronic record, signed by an authorized party, affirming that the supplier of the fastener or related service, or both, has met the requirements of the relevant specifications, contract, or regulation. **F 1789, F16**
- certificate of conformance**—document or electronic record affirming that the fastener has met the requirements of the relevant specifications, contract, or regulation. **F 1789, F16**
- certificate of conformity**—document issued under the rules of a certification system, indicating that adequate confidence is provided that a duty identified product, process or service is in conformity with a specific standard or other normative document, (ISO Guide 2). **E 1187, E36**
- certification**—*in protectivecoatings*, the written documentation of the qualification of personnel or material. **D 4538, D33**
- certification**, *n*—a written declaration that a particular product or service complies with stated criteria. **E 631, E06**
- certification**—the process of testing and evaluating against certain specifications the competence of a person, organization, or other entity in performing a function or service, usually for a specified period of time. (HUD Guidelines) **E 1605, E06**
- certification**, *n*—a system whereby an organization determines that a manufacturer has demonstrated the ability to make a product that complies with the requirements of the specification, authorizes the manufacturer to use a label on products that comply with the requirements of the specification, and conducts a follow-up program to verify the methods the manufacturer uses to determine compliance with the requirements of this specification. **F 1494, F23**
- certification**—procedure and action by a duly authorized body of determining, verifying, and attesting in writing to the qualifications of personnel, processes, procedures, or items in accordance with applicable requirements. **F 1789, F16**
- certification body**—body that conducts certification of conformity, (ISO Guide 2). **E 1187, E36**
- certification body**, *n*—a body that conducts certifications of conformity. **E 1732, E30**
- certification of conformity**, *n*—document issued under the rules of a certification system indicating that adequate confidence is provided that a duly identified product, process or service is in conformity with a specific standard or other normative document. **E 1732, E30**
- certification organization**, *n*—an independent, third party organization that determines product compliance with the requirements of the specification with a labeling and listing follow-up program. **F 1494, F23**
- certification scheme**—certification system as related to specified products, processes or services to which the same particular standards and rules, and the same procedure, apply, (ISO Guide 2). **E 1187, E36**
- certification system**—system that has its own rules of procedure and management for carrying out certification of conformity, (ISO Guide 2). **E 1187, E36**
- certified quality assurance system**—system so designated officially by a recognized accrediting body as having met all of the criteria within a national or an international third party quality system standard. **F 1789, F16**
- certified reference material**—a reference material, the composition or properties of which are certified by a recognized standardizing agency or group. Typically such a material is accompanied by documentation (certificate). **E 7, E04**

certified reference material, *n*

certified reference material, *n*—a reference material, the composition or properties of which are certified by a recognized standardizing agency or group. **E 131, E13**

certified reference material—a material that has been characterized by a recognized standard or testing laboratory, for some of its chemical or physical properties, and that is generally used for calibration of a measurement system, or for development or evaluation of a measurement method. **E 170, E10**

certified reference material (CRM), *n*—a reference material, accompanied by a certificate, one or more of whose property values are certified by a procedure which establishes traceability to an accurate realization of the unit in which the property values are expressed, and for which each certified value is accompanied by an uncertainty at a stated level of confidence. **E 135, E01**

Certified Reference Material (CRM)—a reference material accompanied by a certificate, one or more of whose property values are certified by a procedure that establishes its traceability to an accurate realization of the unit in which the property values are expressed. **E 1605, E06**

certified reference material (CRM), *n*—a reference material, accompanied by a certificate, one or more of whose property values are certified by a procedure that establishes traceability to an accurate realization of the unit in which the property values are expressed, and for which each certified value is accompanied by an uncertainty at a stated level of confidence. **E 1732, E30**

certifying organization, *n*—in *product specifications*, the entity responsible for the conformance and certification of the product to the specification requirements. **A 941, A01**

cervical, *n*—in *body measurements*, the most prominent bone at the base of the neck. **F 1494, F23**

cervicale, *n*—in *anatomy*, the prominent point of the seventh or lowest neck vertebra at the back of the body. **D 123, D13**

cervicale, *n*—the prominent point of the seventh or lowest neck vertebra at the back of the body. **D 5219, D13**

cervicale height, *n*—the vertical distance from the cervicale to the floor, taken with subject standing and without shoes.

*cervicale height (infant special case), *n**—the straight distance from the cervicale to the soles of the feet, taken with subject lying down flat with legs extended and foot positioned at 1.57 rad (90°) to the leg. **D 5219, D13**

cervicale to bust point, *n*—in *body measurements*, the distance from the cervicale around the base of the neck and down to the bust point. **D 123, D13**

cervicale to knee height, *n*—the vertical distance from the cervicale to a point level with the midpoint of the back of the knee (or crease).

*cervicale to knee height (infant special case), *n**—the straight distance from the cervicale to a point level with the midpoint of the back of the knee (or crease), taken with subject lying down flat with legs extended. **D 5219, D13**

cervicale to wrist length, *n*—the distance from the cervicale over the top of the shoulder joint, along the outside of the arm, over the elbow to the prominent wrist bone, taken with the arm bent 1.57 rad (90°) and the hand placed on the hip. **D 5219, D13**

cervical to wrist, *n*—in *body measurements*, with the arm bent, the distance from the cervical to the shoulder joints, along the outside of the arm, over the elbow to the greater prominence on the outside of the wrist. **D 123, D13**

cetane index, *n*—an approximation of the cetane number (the ignition performance) of distillate diesel fuel, which does not contain a cetane improver additive, calculated from the density and the mid-boiling point temperature (see also *dieselindex*). **D 4175, D02**

cetane number, *n*—a measure of the ignition performance of a diesel fuel oil obtained by comparing it to reference fuels in a standardized engine test. **D 4175, D02**

cetane number, *cn* *n*—a measure of the ignition performance of a diesel fuel obtained by comparing it to reference fuels in a standardized engine test. **D 4175, D02**

CF—an abbreviation for coated front, referring to a carbonless paper of the two-coat, transfer type. **F 549, F05**

CFB—an abbreviation for coated front and backed, referring to a carbonless paper of the two-coat, transfer type. **F 549, F05**

CFR—Code of Federal Regulations. **E 631, E06**

CFU—colony forming unit; unit used in the measure of total bacteria count (TBC). **D 6161, D19**

cGMP—abbreviation for current good manufacturing practices as defined in CFR Title 21, Parts 210 and 211. **E 1705, E48**

cgs-emu system of units—the system for measuring physical quantities in which the base units are the centimetre, gram, and second, and the numerical value of the magnetic constant, Γ_m , is unity. **A 340, A06**

chafe mark—See *abrasion mark*. **D 3990, D13**

chafer fabric, *n*—in *tire fabrics*, a woven fabric, usually coated with unvulcanized rubber, which is laid around the bead of a tire before vulcanization. **D 123, D13**

chafer fabric, *n*—woven fabric, usually coated with unvulcanized rubber, which is laid around the bead of a tire before vulcanization. **D 6477, D13**

chain, *n*—in *zippers*, the assemblage formed by interlocking several elements of two stringers. **D 123, D13**

chain, *n*—the assemblage formed by interlocking several elements of two stringers. **D 2050, D13**

chain length distribution—in a linear polymer like cellulose, the frequency distribution of molecular size, usually expressed in units of degree of polymerization. **D 1695, D01**

chain marks—marks made on the bottoms of glass articles as they ride through a Lehr on a chain belt slightly overheated. **C 162, C14**

chain of custody, *n*—procedures and documents that account for the possession of a sample by tracking its handling and storage from its point of collection to its final disposition. **E 1732, E30**

chain printer—a type of printer that employs an endless chain, each link of which contains a fully formed character. The chain is caused to transverse the width of the paper form. Hammers are caused to strike the back of the form, synchronized in such a way as to produce the desired characters in their proper position. **F 909, F05**

chain sampling, *n*—in *acceptance sampling*, a sampling plan for which the decision to accept or reject a lot is based in part on the results of inspection of the lot and in part on the results of inspection of the immediately preceding lots. **D 123, D13**

chain saw, *n*—a portable power operated tool used for cutting wood which has cutters linked in a chain. **F 1494, F23**

chain speed, *n*—the velocity of synchronized movement of linked cutters around a bar and sprocket. **F 1494, F23**

chainstop, *n*—for *chainsaw cut resistance*, the resulting action when a material clogs (jams) the drive sprocket or slows the speed sufficiently to prevent advancement of the chain saw. **F 1494, F23**

chain thickness, *n*—in *zippers*, the measurement from front to back of the chain. **D 123, D13**

chain thickness, *n*—the measurement from front to back of the chain. **D 2050, D13**

chain width, *n*—the measurement between the shoulders of the interlocked elements or between the outermost edges of the bead if the bead extends beyond the elements. **D 123, D13**

chain width, *n*—the measurement between the shoulders of the interlocked elements or between the outermost edges of the bead if the bead extends beyond the elements. **D 2050, D13**

chalk, *n*—in *building construction*, a powder formed by chalking. **C 717, C24**

chalkboard enamel—a special type of mat porcelain enamel used to provide a writing surface for chalk. **C 286, B08**

chalking, *v*—in *building construction*, formation of a powder on the surface of a sealant, coating, or membrane that is caused by the disintegration of the polymer or binding medium due to weathering. **C 717, C24**

chalking_n—(plastics) a powdery residue on the surface of a material

- resulting from degradation or migration of an ingredient, or both. **D 883, D20**
- chalking, n*—see **powdering**. **D 6488, D01**
- chalking, n**—formation on a pigmented coating of a friable powder evolved from the film itself at or just beneath the surface. **E 631, E06**
- chalking, n**—formation on a pigmented coating of a friable powder evolved from the film itself at or just beneath the surface. **E 1605, E06**
- chalking, n**—*in plastics*, a powdery residue on the surface of a material resulting from degradation or migration of an ingredient, or both. (D20) **F 412, F17**
- chalking resistance, n**—the ability of a pigmented coating to resist the formation of a friable powder on its surface caused by the disintegration of the binding medium by degradative weather factors. **D 16, D01**
- chalking (rubber), n**—the formation of a powdery residue on the surface of a rubber, commonly resulting from surface degradation. **D 1566, D11**
- chalky or chalked**—the condition of a porcelain enameled surface that has lost its natural gloss and become powdery. **C 286, B08**
- challenge chemical**—a chemical used to contact a protective clothing material sample to determine chemical/protective clothing material interactions or compatibility. **F 1494, F23**
- challenge suspension, n**—a liquid containing an agent that is used to test the penetration resistance of materials. **F 1494, F23**
- chamber**—a large room excavated underground, for example, for a powerhouse, pump station, or for storage. (ISRM) **D 653, D18**
- chamber blasting (coyotehole blasting)**—a method of quarry blasting in which large explosive charges are confined in small tunnel chambers inside the quarry face. (ISRM) **D 653, D18**
- chamfer**—the broken edge of the jaw serrations and the external edges of the box lock surfaces. **F 921, F04**
- chamfer**—the broken external edges of the instrument. **F 1078, F04**
- chamois leather**—a soft, pliable absorbent leather which is recognized in this country and abroad as being made from the inner side of a sheepskin, known technically as fleshier, from which the outer or grain side has been split prior to tanning. **D 1517, D31**
- champion, n**—an advocate, or small group of advocates, in an agency that recognizes the need for a pavement management system and works to get it adopted and implemented. **E 867, E17**
- chance error, n**—error that has equal probability of being positive or negative. The mean of the chance errors resulting from a series of observations tends toward zero as the number of observations approaches infinity. **D 121, D05**
- change in surface appearance**—*for pile yarn floor coverings*, the physical affect of changing the use-surface by mechanical means or foot traffic. **D 5684, D13**
- channel**—(1) in container glass, that part of a forehearth which carries the glass from the melter to the flow spout and in which temperature adjustments are made.
- (2) in fiber glass, the structure to deliver glass from the melter to the refiner or forehearth. **C 162, C14**
- channel**—a natural or artificial waterway that periodically or continuously contains moving water. **D 4410, D19**
- channel**—*EIA*, an interval of the measured energy of backscattered particles defined by adjacent energy thresholds in the analog-to-digital converter used for spectrum production. **E 673, E42**
- channel**—any unimpaired pathway across the entire width of the intended seal. **F 1327, F02**
- channel, acoustic emission**—an assembly of a sensor, preamplifier or impedance matching transformer, filters secondary amplifier or other instrumentation as needed, connecting cables, and detector or processor.
- may be processed independently or in predetermined groups having similar sensitivity and frequency characteristics. **E 1316, E07**
- channel-fill deposits**—deposits of sediment within a channel, partly or completely filling the channel. Such materials accumulate where the transporting capacity has been insufficient to remove it as rapidly as it has been delivered. **D 4410, D19**
- channel glazing**—the method of glazing in which lights or panels are set in a channel formed by two stops. **C 717, C24**
- channeling**—the process of forming a vertical cavity resulting from a faulty cement job in the annular space. **D 653, D18**
- channeling**—the preferential flow of fluid through passages of lower resistance that can occur in fixed beds or columns of particles owing to nonuniform packing, irregular sizes and shapes of the particles, gas pockets, wall effects, and other causes. **D 2652, D28**
- channeling**—unequal flow distribution in the desalination bundle or filter bed. **D 6161, D19**
- channeling**—motion of energetic particles along certain axial or planar directions of a crystalline solid as the particles penetrate the specimen. The potentials of the individual atoms of the solid combine to reduce scattering with those atoms. **E 673, E42**
- channeling**—*SIMS*, the process by which particles preferentially penetrate crystalline specimens in certain crystallographic directions because of the relatively open arrangement of atoms presented to the impinging particle beam. **E 673, E42**
- channel mopping*—See **mopping, (3) strip**. **D 1079, D08**
- channelyzer, n**—a pulse height analyzer; places voltage pulses into appropriate size bins for the size distribution data. **F 2312, F04**
- char, v**—to form carbonaceous residue during pyrolysis or during incomplete combustion. **E 176, E05**
- char, n**—a carbonaceous residue formed by pyrolysis or incomplete combustion. **E 176, E05**
- character, n**—any language symbol (for example, letter, numeral, punctuation mark, or other sign), other symbol or ornament. **E 2195, E30**
- character**—(1) a member of a set of elements upon which agreement has been reached and that is used for the organization, control, or representation of information. Characters may be letters, digits, punctuation marks, or other symbols, often represented in the form of a spatial arrangement of adjacent or connected strokes or in the form of other physical conditions in data media.
- (2) a letter, digit, or other symbol that is used as part of the organization, control, or representation of data. A character is often in the form of a spatial arrangement of adjacent or connected strokes. **F 149, F05**
- character alignment**—the vertical or horizontal position of characters with respect to a given reference line. **F 149, F05**
- character boundary**—*in character recognition*, the largest rectangle with a side parallel to the document reference edge, each of whose sides is tangential to a given character outline. **F 149, F05**
- character cel, n**—the rectangular-shaped areas on a page containing a single character with its portion of the space which separates it from adjacent characters. **F 1457, F05**
- character erase**—an OCR graphic shape that will cover a single character or a single space and will be read by the interpreter as a deletion. **F 149, F05**
- characteristic**—a distinguishing feature or trait. In grading lumber and other wood products, a feature in or on the wood which by its nature, extent, and frequency of occurrence determines the grade or level of quality. **D 9, D07**
- characteristic, n**—a property of items in a sample or population which, when measured, counted, or otherwise observed, helps to distinguish between the items. **D 123, D13**
- characteristic, n**—a property of items in a sample or population that can be measured, counted, or otherwise observed, such as viscosity, flash point, or concentration. **D 5681, D34**
- characteristic, n**—a property of items in a sample or population that can be measured, counted, or otherwise observed. **D 5681, D34**

NOTE—A channel for examining fiberglass reinforced plastic (FRP) may utilize more than one sensor with associated electronics. Channels

characteristic, *n*

characteristic, *n*—a property of items in a sample or population which, when measured, counted or otherwise observed, helps to distinguish between the items. **E 456, E11**

characteristic—a directly measurable distinguishing property of the pavement surface. Examples are pavement longitudinal profile, transverse profile, and separations in the continuity of a pavement surface. (See Terminology E 867). **E 867, E17**

characteristic, *n*—*in terminology*, any of the properties that constitute or distinguish a concept. **E 1992, E02**

characteristic curve—the curve showing the relationship between exposure and resulting density in a photographic image. It is usually plotted as the density against the log exposure. Called also the “H and D curve” and the “sensitometric curve.” **E 7, E04**

characteristic curve—the plot of density versus log of exposure or of relative exposure. (Also called the D-log E curve or the *H* and *D* curve.) **E 1316, E07**

characteristic electron loss phenomena—*AES*, the inelastic scattering of electrons in solids that produces a discrete energy loss determined by the characteristics of the material. The most probable form is due to excitation of valence electrons. For some solids (for example, nontransition metals), inelastic scattering is dominated by plasmon excitations (a collective excitation of valence electrons). For other solids, the inelastic scattering may be due to a combination of plasmon excitation and single valence electron excitations. Inelastic scattering can also occur through the excitation of core level electrons when this is energetically possible. **E 673, E42**

characteristic emulsion curve—see **emulsion calibration curve**. **E 135, E01**

characteristic impedance of the medium, ρc ; [$\text{ML}^{-2}\text{T}^{-1}$]; mks rayl(Pa·s/m)—the specific normal acoustic impedance at a point in a plane wave in a free field. It is a pure specific resistance since the sound pressure and the particle velocity are in phase and it is equal in magnitude to the product of the density of the medium, ρ , and the speed of sound in the medium, c . Its value when the medium is air at 20°C and 101.325 kPa is 413 mks rayl (Pa·s/m). **C 634, E33**

characteristic product size, *n*—the screen size corresponding to 63.2 % cumulative passing by mass. **D 5681, D34**

characteristic radiation—X-radiation of a particular set of wavelengths, produced by and characteristic of a particular element used as a target whenever its excitation potential is exceeded. **E 7, E04**

characteristic radiation, *n*—of X rays, a unique set of X rays emitted by an element. **E 135, E01**

characteristics—see **hazardous waste characteristics**. **E 631, E06**

characteristic value—the 5 % fractile (value with a 95 % probability of being exceeded, with a confidence of 90 %). **E 2265, E06**

characteristic X-rays—photons emitted by ionized atoms and having a particular distribution in energy and intensity characteristic of the atomic number and chemical environment of the atom; in XPS, the term is ordinarily used in reference to the X-ray source of the spectrometer. **E 673, E42**

characterize, *v*—to specify the parameters or performance of an instrument or method of measurement. **E 284, E12**

character outline limit (COL)—the minimum, nominal, and maximum limits of a given graphic shape. **F 149, F05**

character pitch, *n*—the number of characters that can be printed in a horizontal 1 in. (25.4 mm). **F 1457, F05**

character reader—an input unit that performs character recognition. **F 149, F05**

character reading—machine reading of alpha or numeric characters, or symbols, or both, by optical means (as opposed to optical mark reading). **F 149, F05**

character recognition—(1) The identification of characters by automatic means.

(2) See **magnetic ink character recognition; optical character recognition**. **F 149, F05**

characters, *n*—*in bar code symbols*, the smallest group of elements that represent one or more numbers, letters, punctuation marks or other information. **F 1294, F05**

character set—(1) a finite set of different characters upon which agreement has been reached and that is considered complete for some purpose, for example, each of the character sets contained in ANSI X3.17-81 Character Set for Optical Character Recognition (OCR-A) and ANSI X3.49-75 (R 1982) Character Set for Optical Character Recognition (OCR-B).

(2) an ordered set of unique representations called characters, for example, the 26 letters of the English alphabet, Boolean 0 and 1, the set of symbols in the Morse code, and the 128 ASCII characters. **F 149, F05**

character set, *n*—those characters available for encodation in a particular automatic identification technology. **F 1294, F05**

character set—the collection of all the characters available in a given font. **F 1457, F05**

character skew—the rotational deviation of the printed image from its intended orientation relative to a document reference edge. **F 149, F05**

character spacing—the pitch distance between adjacent characters. **F 149, F05**

character stroke width—the distance between the average edges of a character element. **F 149, F05**

character subset—a selection of characters from a character set, comprising all characters that have a specified common feature, for example, in each of the character sets contained in ANSI X3.17-81 Character Set for Optical Character Recognition (OCR-A) and ANSI X3.49-75, (R 1982) Character Set for Optical Character Recognition (OCR-B), the digits 0 to 9 may constitute a character subset. **F 149, F05**

charge, *n*—See batch (3). **C 162, C14**

charge, *v*—to add batch to a melter. **C 162, C14**

charge:
charge modification—any method used to alter the amount or the distribution of charge on a specimen surface.

charge neutralization—*ISS, SIMS*, a technique in which a surface under ion bombardment is maintained at a known potential by compensating for the accumulated charge.

charge referencing—any method used to adjust the energy scale calibration of a spectrometer to accommodate the effects of steady-state charging of a specimen surface. **E 673, E42**

charge acceptance—the apparent surface voltage present on an electrostatic recording medium immediately after charging. **F 335, F05**

charge capacity—see **thermal capacity**. **E 772, E44**

charge-coupled device (CCD), *n*—a light-detecting video device in which individual components are connected so that the electrical charge or signal at the output of one component provides the input to the next. **E 1316, E07**

charge coupled device, CCD, *n*—an array (linear or matrix) of transductive elements wherein packets of electrons are set in each element as a result of the quantity of light received during an exposure interval, and where these packets are recovered from the array in the form of a pulse height-modulated electric signal. **F 1294, F05**

charged area development—(CAD), a process in electrostatic copying where the photoconductive element is charged with a charge of the opposite sign as that of the toner. A light source is used to discharge all areas on the photoconductor that are NOT to receive toner to form the image. The toner is attracted to the non-discharged areas of the photoconductor when the latent electrostatic image is developed. **F 335, F05**

charge decay—loss of charge on the deposited powder due to electrical leakage. **C 286, B08**

charge decay rate—loss of charge per unit of time. **C 286, B08**

charged particle equilibrium—a condition that exists in an incremental volume within a material under irradiation if the kinetic

- energies and number of charged particles (of each type) entering that volume are equal to those leaving that volume. **E 170, E10**
- charge-mosaic membranes**—synthetic membranes composed of two-dimensional or three dimensional alternating cation and anion exchange channels throughout the membrane. **D 6161, D19**
- charge neutralizer gun**—an electron gun used to dissipate the charges which tend to build up on specimen surfaces, within an electron-diffraction camera, which would introduce undesired electrostatic fields. **E 7, E04**
- charge retention**—the ability of an electrically charged layer to retain its initial charge. **C 286, B08**
- charge to mass ratio**—ratio of the charge on a powder expressed in coulombs to the mass of the powder expressed in kilograms. **C 286, B08**
- charging**—the process of establishing an electrostatic surface charge of uniform density on an insulating medium. **F 335, F05**
- charging potential**—*insurface analysis*, the electrical potential of the surface of an insulating specimen caused by irradiation. If the specimen is heterogeneous, there may be different charging potentials on different areas of the surface. **E 673, E42**
- charring, *n***—the formation of carbonaceous residue as the result of pyrolysis or incomplete combustion. **D 123, D13**
- charring, *n***—the formation of carbonaceous residue as the result of pyrolysis or incomplete combustion. **D 4391, D13**
- charring, *n***—the formation of carbonaceous residue as the result of pyrolysis or incomplete combustion. **F 819, F18**
- charring**—the formation of a carbonaceous residue as the result of pyrolysis or incomplete combustion. **F 1494, F23**
- chatoyance, *n***—appearance characterized by a changeable luster or color, sometimes including a spatially-undulating narrow white band or stripe. **E 284, E12**
- chat sawn**—a surface with shallow linear grooves, produced by gangsawing with coarse chat sand. **C 119, C18**
- chatter, *n***—an undesirable pattern created on the surface of a work piece, usually at regularly spaced intervals, due to an out-of-round, out-of-balance condition or due to an induced natural frequency, or its harmonics, or both, in a grinding machine. **C 1145, C28**
- chatter marks, *n***—defect on calendered sheeting consisting of transverse narrow bands of alternately thicker and thinner material. **D 1566, D11**
- chatter sleek**—[archaic] See **frictive track**. **C 162, C14**
- check**—an imperfection; a surface crack in a glass article. **C 162, C14**
- check**—a separation of the wood along the fiber direction that usually extends across the rings of annual growth, commonly resulting from stresses set up in wood during seasoning.
- end check**—a seasoning check occurring on the end of a board or other piece of wood.
- heart check**—a check that extends across the growth layers in one or more directions from the pith toward, but not to, the surface of a piece of wood. A synonym is *pith check*.
- pith check**—see *heart check*.
- roller check**—a crack in the wood structure caused by a piece of cupped lumber being flattened between machine rollers.
- star check**—a heart check in which the separation extends in more than one direction from the pith.
- surface check**—a check occurring on the surface of a piece of wood, usually on the tangential face not extending through the piece.
- through check**—a check that extends through a piece of wood, or from a surface to the opposite or to an adjoining surface. **D 9, D07**
- check analysis**—Deprecated term. Use the preferred term **product analysis**. **A 941, A01**
- check analysis**—see *product analysis*. **F 1789, F16**
- check character, *n***—a calculated character included within a symbol whose value is used to perform a mathematical check of the accuracy of the decoded data. **F 1294, F05**
- checkered head**—flat head with raised or depressed, checker or grid marks of various designs. **F 547, F16**
- checkers**—(1) an open structure of firebrick serving as a heat exchanger.
(2) slang for regenerators of this type.
(3) slang for refractory brick used in such a construction. **C 162, C14**
- Check Fuel, *n***—*for quality control testing*, a spark-ignition engine fuel of selected characteristics having an octane number accepted reference value (O.N._{ARV}) determined by round-robin testing under reproducibility conditions. **D 4175, D02**
- checking**—*in protective coatings*, the formation of slight breaks in a coating film that do not penetrate to the underlying surface. **D 4538, D33**
- checking (coatings), *n***—phenomenon manifested in paint films by slight breaks in the film that do not penetrate to the underlying surface. **E 631, E06**
- checking (coatings), *n***—phenomenon manifested in paint films by slight breaks in the film that do not penetrate to the underlying surface. **E 1605, E06**
- checking resistance, *n***—the ability of a coating to resist slight breaks in the film that do not penetrate to the previously applied coating or to the substrate. The breaks should be called cracks if penetration extends to the previously applied coating or to the substrate. See **cracking resistance**. **D 16, D01**
- check valve**—a valve that will allow water to pass in one direction but will close and prevent flow in the opposite direction. **D 6161, D19**
- cheesemelter**—a low input unit, designed to melt cheese on top of specialty foods, but usually incapable of fully cooking a food item such as steak or chicken. See **broiler, overfired**. **F 1827, F26**
- chelate compound**—a compound in which the metal is contained as an integral part of a ring structure and is not readily ionized. **B 374, B08**
- chelating agent**—a compound capable of forming a chelate compound with a metal ion. See **chelate compound**. **B 374, B08**
- chelating agent**—a sequestering or complexing agent that, in aqueous solution, renders a metallic ion inactive through the formation of an inner ring structure with the ion. **D 459, D12**
- chelating agents**—a sequestering or complexing agent that, in aqueous solution, renders a metallic ion inactive through the formation of an inner ring structure with the ion. **D 6161, D19**
- chemical:**
- effects**—AES, any change in the shape of an Auger spectrum or in the Auger peak energy for an element which is due to chemical bonding.
- shift**—AES, XPS, a change in peak energy because of a change in the chemical environment of the atom. **E 673, E42**
- chemical adsorption**—see **chemisorption**. **D 2652, D28**
- chemical anchors**—chemical materials that provide anchorage between a bolt or bar and a drilled hole. **F 1789, F16**
- chemical attack**—chemical reaction or solvent effect, causing failure or deterioration of plastic and rubber parts, organic coating, metals, or lithography involved in the completed package. **D 3064, D10**
- chemical carbonless transfer paper**—a transfer paper that produces a visible image by transferring a relatively colorless material from one sheet to another where it reacts to form a visible image. **F 549, F05**
- chemical cellulose**—a chemically purified cellulosic material that is intended for chemical treatment to produce derivatives. **D 1695, D01**
- chemical cleaner**—see **cleaner, chemical**. **F 412, F17**
- chemical conversion coating**—a protective or decorative nonmetallic coating produced *in situ* by chemical reaction of a metal with a chosen environment. (It is often used to prepare the surface prior to the application of an organic coating.) **G 15, G01**
- chemical cotton**—chemical cellulose prepared from cotton; generally, but not necessarily, cotton linters. **D 1695, D01**
- chemical deposition, *n***—the precipitation of one metal from a

chemical deposition, *n*

solution of its salts by the addition of another metal or reagent to the solution. **B 243, B09**

chemical durability—the lasting quality (both physical and chemical) of a glass surface. It is frequently evaluated, after prolonged weathering or storing, in terms of chemical and physical changes in the glass surface, or in terms of changes in the contents of a vessel. **C 162, C14**

chemical feed pump—a pump used to meter chemicals, such as chlorine of polyphosphate, into a feed water supply. **D 6161, D19**

chemical grout—any grouting material characterized by being a true solution; no particles in suspension. See also **particulate grout**. **D 653, D18**

chemical grout system—any mixture of materials used for grouting purposes in which all elements of the system are true solutions (no particles in suspension). **D 653, D18**

chemical lime—a quicklime or hydrated lime whose chemical and physical characteristics and method of processing make it suitable for one or more of the many and varied chemical and industrial uses of the product. **C 51, C07**

chemical luminescence, *n*—luminescence resulting from a chemical reaction. (See also **luminescence**.) **E 284, E12**

chemically bonded brick, *n*—see **unburned brick**. **C 71, C08**

chemically curing sealant, *n*—a sealant that cures primarily through chemical reaction. **D 5535, D04**

chemically foamed polymeric material—a cellular material in which the cells are formed by gases generated from thermal decomposition or other chemical reaction. **D 883, D20**

chemically foamed polymeric material, *n*—a cellular material in which the cells are formed by gases generated by thermal decomposition or other chemical reaction. **F 1251, F04**

chemically formed polymeric material—a cellular material in which the cells are formed by gases generated from thermal decomposition or other chemical reaction. (D20) **F 412, F17**

chemically precipitated metal powder, *n*—powder produced by the reduction of a metal from a solution of its salts either by the addition of another metal higher in the electromotive series or by other reducing agent. **B 243, B09**

chemically refined copper—copper recovered from an aqueous solution by other than electrolytic means. Usually when this term is used alone it refers to chemically refined tough pitch copper. This designation applies to the following:

—copper cast in refinery shapes suitable for hot or cold working, or both, and by extension, to fabricators products made therefrom, —ingots or ingot bars suitable for remelting. **B 846, B05**

chemically strengthened—glass that has been ion-exchanged to produce a compressive stress layer at the treated surface. **C 162, C14**

chemical milling—the shaping of a work piece by immersion in an etchant employing a resist for selective removal of material. **B 374, B08**

chemical plating—deposition of a metal coating by chemical, non-electrolytic methods. See also **immersion plate, contact plating**. **B 374, B08**

chemical polishing—the improvement in surface smoothing of a metal by simple immersion in a suitable solution. See **bright dip (nonelectrolytic)**. **B 374, B08**

chemical porcelain—See *chemical porcelain* under **porcelain**. **C 242, C21**

chemical potential—(μ_i or \bar{G}_i) the partial molar free energy of component *i*, that is, the change in free energy of a solution upon adding one mole of component *i* to an infinite amount of solution of given composition,

$$(\delta G/\delta n_i)_{T,P,n_{j \neq i}} = \bar{G}_i = \mu_i$$

where:

G = Gibbs free energy, and

n_i = number of moles of the *i*th component.

E 7, E04

chemical protective clothing (CPC), *n*—any material or combination of materials used in an item of clothing for the purpose of isolating parts of the body from direct contact with a potentially hazardous chemical. **F 1494, F23**

chemical-protective suit ensemble—the combination of a chemical-protective suit (totally encapsulating, splash-protective) with the wearer's respiratory protective equipment, gloves, boots, communications system, and cooling device, or some combination of those. **F 1494, F23**

chemical pulp, *n*—fibrous material obtained by a predominantly chemical treatment of wood or other plant material; principal processes are sulfate (also known as kraft), sulfite, and soda. (see **mechanical pulp** and **semichemical pulp**) **D 1968, D06**

chemical pulps—in the paper industry, pulps produced by chemical processes, as contrasted to those produced by mechanical processes. (see also **chemical wood pulp**). **D 1695, D01**

chemical reaction papers—papers that produce a visible image by the reaction of relatively colorless materials which come into contact under pressure. **F 221, F05**

chemical repellent—any substance whose odor, taste, appearance, tactile sensation, or combination thereof produces an aversion response in the target animal. **E 609, E35**

chemical resistance—for *asbestos cement products*, the ability of the product to resist chemical attack, dissolution, decomposition or other chemical changes when in contact with liquid, gaseous, or solid media normally encountered in its service environment. **D 2946, C17**

chemical resistance, *n*—the ability to resist chemical attack. **D 4439, D35**

chemical resistance—the ability to resist chemical attack. **E 631, E06**

chemical resistance—the ability to resist chemical attack. **E 1749, E06**

chemical resistance—the ability to resist chemical attack. **F 412, F17**

chemical-resistant—the ability of a material to resist degradation by reaction with, dissolution by, or reduction of physical continuity from contact with a chemical agent or agents, thereby retaining its capacity to perform as a structural or aesthetic entity. **C 904, C03**

chemical-resistant carbon brick—a brick comprised of carbon (including graphite) that is carbon bonded and fired to a minimum temperature of 1850°F (1010°C). This brick exhibits good resistance to thermal shock and resists exposure to a wide range of alkalies and acids, particularly hydrofluoric acid. When used in oxidizing conditions, temperature exposure should be less than 600°F (315°C). **C 904, C03**

chemical-resistant construction unit—a modular nonmetallic material, either vitreous or nonvitreous, used in industrial processes primarily for applications where chemical, thermal, and mechanical resistance is required. **C 904, C03**

chemical-resistant fireclay or shale brick—a kiln fired brick from clay, shale, or mixtures thereof that exhibits low absorption and high resistance to a wide range of chemical environments. This brick should not be used in hot caustic or where hydrofluoric acid or other fluoride chemical compounds are found. Commonly referred to as acid-resistant brick or acid-proof brick. **C 904, C03**

chemical-resistant polymer concrete—a construction material composed of a continuous phase (binder) of a polymer and a discontinuous phase (aggregate) generally used in applications where chemical resistance is required. **C 904, C03**

chemical-resistant polymer machinery grout—an intimate mixture of liquid resinous material, selected filler materials, and setting agent, which harden by chemical reaction to provide support for machine bases. **C 904, C03**

chemical-resistant resin grout—a mixture of liquid resin, filler and setting agent. The components form a mixture that subsequently hardens by chemical reaction. The setting agent may be separate or incorporated in the filler. **C 904, C03**

chemical-resistant resin monolithic surfacing—an intimate mixture of liquid resinous materials, selected filler materials, and setting agent. These components are mixed together, placed to a minimum

thickness of 60 mils (1.5 mm), then hardened to form a bonded overlay. **C 904, C03**

chemical-resistant resin mortar—an intimate mixture of liquid resinous material, selected filler materials, and setting agent. These components form a trowelable mortar that subsequently hardens by chemical reaction. **C 904, C03**

chemical-resistant tile grout—an intimate mixture of liquid resinous material, selected filler materials, and setting agent. These components form a flowable mixture that subsequently hardens by chemical reaction. **C 904, C03**

chemical sanitizing—solution to destroy or kill any residual bacteria from multiple-use tableware. **F 1827, F26**

chemical sanitizing, recirculated wash, fresh water rinse type—machines with a final rinse using fresh water from an outside source combined with chemical sanitizing solution; additional parts: chemical sanitizing equipment. See **dishwashing machine, commercial**. **F 1827, F26**

chemical sanitizing, stationary rack, dump type—machines with chemical sanitizing solution added to the rinse cycle; additional parts: chemical sanitizing equipment. See **dishwashing machine, commercial**. **F 1827, F26**

chemical setting silicate and silica chemical-resistant mortar—an intimate mixture of a silicate or silica binder, a chemically inert solid filler, and a setting agent. The binder may be a liquid silicate or silica, or a powder to which water is added. These components are subsequently hardened by the chemical reaction between the setting agent and the binder. **C 904, C03**

chemical shift (NMR), δ —the defining equation for δ is the following:

$$\delta = \frac{\Delta\nu}{\nu_R} \times 10^6$$

where ν_R is the frequency with which the reference substance is in resonance at the magnetic field used in the experiment and $\Delta\nu$ is the frequency difference between the reference substance and the substance whose chemical shift is being determined, at constant field. The sign of $\Delta\nu$ is to be chosen such that shifts to the high frequency side of the reference shall be positive. **E 131, E13**

chemical treatment, n —a passivating treatment normally applied to metallic coatings to retard the formation of corrosion products (storage stain) during shipment and storage. **A 902, A05**

chemical wash, n —in rug cleaning, a specialized professional process used on oriental rugs. **D 123, D13**

chemical wash, n —in rug cleaning, a specialized professional process used on oriental rugs. **D 5253, D13**

chemical wood pulp—a term used in the paper industry for pulps obtained by digestion of wood with solutions of various chemicals. **D 1695, D01**

chemisorption, n —adsorption, especially when irreversible, by means of chemical forces in contrast with physical forces. **D 1356, D22**

chemisorption (chemical adsorption)—the binding of an adsorbate to the surface of a solid at strengths approximating those of a chemical bond. **D 2652, D28**

chest, n —in garment construction, a measurement taken from below each armhole seam straight across the garment while it is laid flat. **F 1494, F23**

chest/bust girth, n —the horizontal circumference around the body, taken under the arms and across the fullest part of the chest/bust apex including the lower portion of the shoulder blades. **D 5219, D13**

chest girth, n —in body measurements, the circumference of the body over the shoulder blades, under the arms and across the upper chest. (Compare **bust girth**.) **D 123, D13**

chest girth, n —in body measurements, the circumference of the body over the shoulder blades, under the arms and across the upper chest. (See **bust girth**.) **F 1494, F23**

chest harness, n —a type of harness worn around the chest for upper body support. **F 1490, F32**

chestnut extract—a vegetable tanning agent extracted from the wood of the chestnut tree and used in tanning/re-tanning heavy leathers. **D 1517, D31**

chevron configuration—booming configuration used in narrow watercourses, formed by positioning two lengths of boom in a deflection mode, the leading end of each length is positioned in the middle of the watercourse and the trailing ends lead to opposite shores. **F 818, F20**

chewable surface—surface easily accessible to children (usually up to five feet from the floor or ground), and likely to be chewed-on, such as window sills, balusters, and handrails. See **accessible surface**. **E 631, E06**

chewable surface—surface easily accessible to children (usually up to five feet from the floor or ground), and likely to be chewed-on, such as window sills, balusters, and handrails. See **accessible surface**. **E 1605, E06**

child-occupied facility—a facility constructed prior to 1978 that is visited regularly by the same child, six years of age or under, at least two different days within any week, for at least three hours per visit, six hours per week, and 60 hours per year. (40 CFR 745.223, adapted) **E 1605, E06**

child-resistant packaging—See **packaging**. **D 996, D10**

chill, n —an object, usually metal, imbedded in a portion of the mold to accelerate the local rate of heat removal from the metal being cast. **A 644, A04**

chill, v —to accelerate the freezing rate of cast iron, usually in a localized region, to refine the graphite structure or cause formation of primary carbides. **A 644, A04**

chilled iron, n —a cast iron that would normally solidify free of primary carbide which is purposely caused to solidify as white cast iron, locally or entirely, by accelerated cooling. **A 644, A04**

chill mark—a wrinkled surface condition on glassware resulting from uneven cooling in the forming process. **C 162, C14**

chill, microstructural, n —a localized region of primary carbides in a casting made from a cast iron that would normally solidify free of primary carbides. **A 644, A04**

chime (chine), n —in packaging, the rim of a **container**, such as a **drum, barrel, or can**. **D 996, D10**

chimney effect, n —a phenomenon consisting of a vertical movement of a localized mass of air or other gases due to temperature differences. **D 1356, D22**

chimney effect—upward thrust of smoke and hot gases by convection currents confined in a vertical enclosure. **E 176, E05**

china—a glazed or unglazed vitreous ceramic whiteware made by the china process and used for nontechnical purposes, designating such products as dinnerware, sanitary ware, and artware when they are vitreous. (See also **bone china**.) **C 242, C21**

china clay—See **kaolin**. **C 242, C21**

china process—the method of producing glazed ware by which the ceramic body is fired to maturity, following which the glaze is applied and matured by firing at a lower temperature. **C 242, C21**

china sanitary ware (sanitary plumbing fixtures)—glazed, vitrified whiteware fixtures having a sanitary service function. **C 242, C21**

Chinese script eutectic—a configuration of eutectic constituents, found particularly in some cast alloys of aluminum containing iron and silicon and in magnesium alloys containing silicon, which resembles in appearance the characters in Chinese script. **E 7, E04**

Chinese wok range—equipment characterized as having one or more “wells” or chamber and designed to use a wok as the cooking utensil. See **range**. **F 1827, F26**

chip—an irregularly shaped fragment dislodged from a stone surface. **C 119, C18**

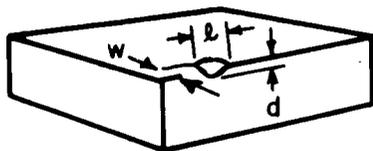

chip—an imperfection due to breakage of a small fragment out of an otherwise regular surface. **C 162, C14**

chip—a small piece of broken-off material, or the location where a small piece of the unit material has been broken off. **C 896, C04**

chip

chip—crushed angular rock fragment of a size smaller than a few centimetres. (ISRM) **D 653, D18**

chip—area along an edge or corner where the material has broken off.

where:

w = width

l = length, and

d = depth.

F 109, C21

chip and tear, n —a special type of irregular wear characterized by a rough tread surface which may contain cracks, abrasion pits or surface ruptures. **F 538, F09**

chipboard—See **paperboard**. **D 996, D10**

chip marks—shallow depressions or indentations in or on the surface of dressed lumber caused by chips or shavings getting embedded in the surface during dressing. **D 9, D07**

chipped glass—a glass article with chipped surface produced intentionally. **C 162, C14**

chipped tire, n —a classified scrap tire particle that has a basic geometrical shape, which generally is 2 in. (5.08 cm) or smaller and has most of the bead wire removed. Also referred to as a *tire chip*. **D 5681, D34**

chipping—the process of removing thin extra glass prior to grinding. **C 162, C14**

chipping—fracturing and breaking away of fragments of a porcelain enameled surface. **C 286, B08**

chipping resistance, n —the ability of a coating or layers of coatings to resist removal, usually in small pieces, resulting from impact by hard objects or from wear during service. **D 16, D01**

chipping resistance (coatings)—ability of a coating or layers of coatings to resist removal, usually in small pieces, resulting from impact by hard objects or from wear during service. **E 631, E06**

chipping resistance (coatings)—ability of a coating or layers of coatings to resist removal, usually in small pieces, resulting from impact by hard objects or from wear during service. **E 1605, E06**

chips—small fragments of wood chopped or broken by cuts such as by a planer, chipper, mechanical hog, hammermill. **D 9, D07**

chips—small pieces of wood chopped off a block by ax-like cuts as in a chipper of the paper industry, or produced by mechanical hogs, hammermills, etc. **D 1554, D07**

chips—minor damage to the pultruded surface that removes material but does not cause a crack or craze. **D 3918, D20**

chip size, n —the range of rubber particle sizes resulting from the processing of whole tires. **D 5681, D34**

chirping—the process of dispersing the zero phase difference points for different wavelengths across the interferogram, so that the magnitude of the signal is reduced in the short region of the interferogram where all wavelengths would otherwise constructively interfere. **E 131, E13**

chirp test, n —the progressive application of brake torque required to produce the maximum value of longitudinal braking force that will occur prior to wheel lockup, with subsequent brake release to prevent any wheel lockup (tire slide). **E 867, E17**

chisel—the steel cutting tool used in percussion drilling. (ISRM) **D 653, D18**

chisel point—point with two major planes forming “V” and pair of minor planes on each flank; forming hexagonal cross section. **F 547, F16**

chisel point—point with two symmetrically beveled planes forming “V” at end of staple leg, resulting in straight penetration. (See **cross-cut chisel point**.) **F 592, F16**

chitosan, n —a linear polysaccharide consisting of $\beta(1 \rightarrow 4)$ linked 2-acetamido-2-deoxy-D-glucopyranose (GlcNAc) and 2-amino-2-deoxy-D-glucopyranose (GlcN). Chitosan is a polysaccharide derived by *N*-deacetylation of chitin. **F 2312, F04**

chloramine—a combination of chlorine and ammonia in water which has bactericidal qualities for a longer time than does free chlorine. **D 6161, D19**

chlorinated poly(vinyl chloride)—a poly(vinyl chloride) (PVC) polymer modified by additional chlorination. **D 883, D20**

chlorinated poly(vinyl chloride) plastics—plastics based on chlorinated poly(vinyl chloride) in which the chlorinated poly(vinyl chloride) is in the greatest amount by weight. **D 883, D20**

chlorinated poly(vinyl chloride) plastics—plastics based on chlorinated poly(vinyl chloride) in which the chlorinated poly(vinyl chloride) is in the greatest amount by weight. (D20) **F 412, F17**

chlorine—chemical used for its qualities as a bleaching or oxidizing agent and disinfectant in water purification. **D 6161, D19**

chlorine bleach, n —a bleach that releases the hypochlorite ion in solution, for example, sodium hypochlorite. **D 123, D13**

chlorine bleach, n —a bleach that releases the hypochlorite ion in solution, for example, sodium hypochlorite. **D 3136, D13**

chlorine, combined available, n —residual chlorine combined with ammonia nitrogen or nitrogenous compounds. **D 1129, D19**

chlorine demand—the amount of chlorine used up by reacting with oxidizable substances in water before chlorine residual can be measured. **D 6161, D19**

chlorine, free available, n —the hypochlorite ions (OCl^-), hypochlorous acid (HOCl) or the combination thereof present in water. **D 1129, D19**

chlorine, free available—the chlorine (Cl_2), hypochlorite ions (OCl^-), hypochlorous acid (HOCl) or the combination thereof present in water. **D 6161, D19**

chlorine number—the number of grams of chlorine gas or of bleaching powder (expressed as its equivalent in chlorine) that is consumed by 100 g of oven-dry pulp in a definite time under certain specified conditions. The chlorine number is an indication of the bleach requirement of the pulp and an indirect estimate of the lignin content. **D 1695, D01**

chlorine or volatile halide extraction—See **extraction**. **E 7, E04**

chlorine requirement, n —the amount of chlorine required to achieve, under specified conditions, the objectives of chlorination. **D 1129, D19**

chlorine residual, n —the amount of available chlorine present in water at any specified time. **D 1129, D19**

chlorine, residual—the amount of available chlorine present in water at any specified time. **D 6161, D19**

chlorine, total available—the sum of free available chlorine plus chloramines present in water. **D 6161, D19**

chlorofluorocarbon plastic, n —a plastic based on polymers made with monomers composed of chlorine, fluorine, and carbon only. **F 1251, F04**

chlorofluorocarbon plastics—plastics based on polymers made with monomers composed of chlorine, fluorine, and carbon only. (ISO) **D 883, D20**

chlorofluorocarbon plastics—plastics based on polymers made with monomers composed of chlorine, fluorine, and carbon only. (ISO, D20) **F 412, F17**

chlorofluorohydrocarbon plastic, n —a plastic based on polymers made with monomers composed of chlorine, fluorine, hydrogen, and carbon only. **F 1251, F04**

chlorofluorohydrocarbon plastics, n —plastics based on polymers made with monomers composed of chlorine, fluorine, hydrogen, and carbon only. (ISO) **D 883, D20**

chlorofluorohydrocarbon plastics, n —plastics based on polymers made with monomers composed of chlorine, fluorine, hydrogen, and carbon only. (ISO, D20) **F 412, F17**

chlorosity, n —the concentration of the dissolved chloride equivalent in water at 20°C. **D 1129, D19**

chock, *n*—a device that is placed in a crack or pocket in rock and designed to withstand a load applied through webbing, rope, wire, or a carabiner. **F 1773, F08**

chock, active, *n*—a chock containing moving parts that control its width. **F 1773, F08**

chock, passive, *n*—a chock containing no moving parts. **F 1773, F08**

choke—an imperfection consisting of an insufficient opening in the finish and neck of a container. **C 162, C14**

chopped fiber—fiber glass strand which has been chopped to specified lengths. **C 162, C14**

chopped strand, *n*—*in glass textiles*, a strand made from short predetermined lengths of cut continuous filament and used as a reinforcing material. (See also **strand**.) **D 123, D13**

chopped strand, *n*—*in glass textiles*, a strand made for short predetermined lengths of cut continuous filament and used as a reinforcing material. (See also **strand**.) **D 7018, D13**

chopped tire, *n*—a scrap tire that is cut into relatively large pieces of unspecified dimensions. **D 5681, D34**

chord length—(LTS) the straight-line distance between the snowboard tail and the snowboard tip with the snowboard pressed flat to a plane surface to take out the camber. **F 1107, F27**

chord length, *n*—the straight line distance between the two ends of a curved needle. **F 1840, F04**

chord length, L_{TS} —straight line distance measured between the ski tail and ski tip with the ski pressed against a plane surface.

NOTE—Either method at the manufacturer's discretion may be used to indicate nominal ski length or ski size when rounded to common increment. **F 472, F27**

chord modulus, *n*—*in a stress-strain curve*, the ratio of the change in stress to the change in strain between two specified points on the curve. **D 123, D13**

chord modulus, *n*—*in a stress-strain curve*, the ratio of the change in stress to the change in strain between two specified points on the curve. **D 4848, D13**

"C" *Horizon*—see **horizon**. **D 653, D18**

chroma, *n*—see **color**. (For consensus technical definition see **chroma** in Terminology E 284). **E 253, E18**

chroma, *n*—(1) attribute of color used to indicate the degree of departure of the color from a neutral color of the same lightness. See also **Munsell chroma**.

(2) C^* , (in the CIE 1976 L^* , a^* , b^* or L^* , u^* , v^* system) the quantity $C^*_{ab} = (a^{*2} + b^{*2})^{1/2}$ or $C^*_{uv} = (u^{*2} + v^{*2})^{1/2}$.

(3) attribute of a visual perception, produced by an object color, that permits a judgment to be made of the amount of pure chromatic color present, irrespective of the amount of achromatic color. **E 284, E12**

chromatic, *adj*—perceived as having a hue; not white, gray, or black. **E 284, E12**

chromatic aberration—a defect in a lens or lens system as a result of which the lens possesses different focal lengths for radiation of different wavelengths. **E 7, E04**

chromatic aberration—a defect in a lens or lens system as a result of which the lens possesses different focal lengths for radiation of different wavelengths. **E 175, E41**

chromatic adaptation, *n*—changes in the visual system's sensitivities due to changes in the spectral quality of illuminating and viewing conditions. **E 284, E12**

chromaticity, *n*—the color quality of a color stimulus definable by its chromaticity coordinates, or by its dominant (or complementary) wavelength and its purity taken together. **E 284, E12**

chromaticity coordinates, *n*—the ratio of each of the tristimulus values of any viewed light to the sum of the three. **E 284, E12**

chromaticity diagram, *n*—a plane diagram in which points specified by chromaticity coordinates represent the chromaticities of lights (color stimuli). **E 284, E12**

chromaticness, *n*—(1) attribute of visual perception combining the hue and saturation.

(2) attribute of a visual perception according to which the color of an area appears to be more or less chromatic. **E 284, E12**

chromating—the process for producing a conversion coating (q.v.) containing chromium compounds. **B 374, B08**

chrome brick, *n*—a refractory brick, which may be burned or unburned, manufactured predominantly or entirely of refractory-grade chrome ore, and having a Cr_2O_3 content of 30 % or greater (see also **chromic oxide brick**). **C 71, C08**

chrome-finished griddle—equipment with a polished chrome-finished cooking surface that is easier to clean and radiates less heat towards the chef and the kitchen. See **griddle**. **F 1827, F26**

chrome-magnesia brick, *n*—a refractory brick, which may be burned or unburned, manufactured predominantly of a mixture of refractory-grade chrome ore and refractory-grade magnesia in which the refractory-grade chrome ore predominates by weight; the refractory-grade magnesia may be either seawater magnesia, dead-burned magnesite, fused magnesia, or a combination of these materials. **C 71, C08**

chrome ore, refractory-grade, *n*—a refractory ore consisting essentially of chrome-bearing spinel with only minor amounts of accessory minerals and having physical and chemical properties suitable for making refractory products. **C 71, C08**

chrome retannage—the process of applying trivalent chromium salts as a secondary adjunct to the main tannage to impart or enhance certain leather properties; usually applied after splitting and shaving. **D 1517, D31**

chrome tannage—conversion of raw hides/skin into leather with chromium compounds, thereby substantially increasing strength properties and resistance to various biological and physical agents. **D 1517, D31**

chromia-alumina brick, *n*—a refractory brick, which may be burned or unburned, manufactured predominantly of a mixture of chromic oxide (Cr_2O_3) and a high-alumina raw material, with the chromic oxide content being 50 % or greater by weight and with alumina (Al_2O_3) predominating by weight among the other constituent oxides. **C 71, C08**

chromic oxide brick—a refractory brick, which may be burned or unburned, manufactured predominantly of chromic oxide (Cr_2O_3) and having a Cr_2O_3 content of 90 % or greater (may also be called **chromia brick**). **C 71, C08**

chromizing—a surface treatment at elevated temperatures, generally carried out in pack, vapor, or salt baths, in which an alloy is formed by the inward diffusion of chromium into the base metal. **B 374, B08**

chronic ecotoxicity test, *n*—a comparative ecotoxicity test in which a representative subpopulation of organisms is exposed to different treat rates of a test material and is observed for a period of time which constitutes a major portion of their life span. **D 4175, D02**

chronic ecotoxicity test, *n*—a comparative ecotoxicity test in which a representative subpopulation of organisms is exposed to different treat rates of a test material and is observed for a period of time which constitutes a major portion of their life span. **D 6384, D02**

chronic test—a comparative study in which organisms that are subjected to different treatments are observed for a long period or a substantial portion of their life span. **E 943, E47**

chronic toxicity test, *n*—a comparative toxicity test in which a representative subpopulation of organisms are exposed to different treat rates of a test material and is observed for a period of time which constitutes a major portion of their life span. **D 4175, D02**

chrysotile, *n*—an asbestos mineral belonging to the serpentine group, having a chemical composition close to $Mg_3Si_2O_5(OH)_4$. **D 2946, C17**

chrysotile asbestos—see **chrysotile**. **D 2946, C17**

chunk glass—[archaic] optical glass obtained in breaking open a pot of transfer glass. **C 162, C14**

CIAP—an abbreviation for *corrosion inhibiting adhesive primer*. **E 631, E06**

CIAP—an abbreviation for *corrosion inhibiting adhesive primer*. E 1749, E06

cidaphobia—sensitivity of target animals that increases their aversion to the high mortality within the population. E 609, E35

CIE, *n*—abbreviation for International Commission on Illumination, which in French is Commission Internationale de l'Éclairage. D 2946, C17

CIE, *n*—the abbreviation for the French title of the International Commission on Illumination, or Commission Internationale de l'Éclairage. D 4175, D02

CIE, *n*—the abbreviation for the French title of the International Commission on Illumination, Commission Internationale de l'Éclairage. E 284, E12

CIE color-rendering index, R, *n*—measure of the degree to which the computed chromaticity of a CIE test color sample illuminated by a test illuminant conforms to that of the same sample illuminated by a reference illuminant. E 284, E12

CIELAB color difference, *n*—color difference calculated by using the CIE 1976 $L^* a^* b^*$ opponent-color scales, based on applying a cube-root transformation to CIE 1931 tristimulus values X, Y, Z or CIE 1964 tristimulus values X_{10}, Y_{10}, Z_{10} . E 284, E12

CIELUV color difference, *n*—color difference calculated by using the CIE 1976 $L^* u^* v^*$ opponent-color scales, based on a linear transformation of CIE chromaticity coordinates x, y , or x_{10}, y_{10} and a cube-root transformation of Y or Y_{10} to L^* , applied to CIE 1931 tristimulus values X, Y, Z or CIE 1964 tristimulus values X_{10}, Y_{10}, Z_{10} . E 284, E12

CIE observer, *n*—for *colordetermination*, see **standard observer**, **CIE 1931** and **supplementary observer**, **CIE 1964**. D 2946, C17

CIE primaries, *n*—the primary color stimuli used in the CIE system of colorimetry. E 284, E12

CIE source C, *n*—see **standard source**. D 2946, C17

CIE spectral tristimulus values, *n*—tristimulus values or color-matching functions of the spectral components of an equal-energy spectrum in the CIE (XYZ) system. E 284, E12

CIE 1931 standard colorimetric system, *n*—a system for determining the tristimulus values of any spectral power distribution using the set of reference color stimuli X, Y, Z and the three CIE color-matching functions $\bar{x}(\lambda), \bar{y}(\lambda), \bar{z}(\lambda)$ adopted by the CIE in 1931. E 284, E12

CIE standard illuminant A, *n*—colorimetric illuminant, representing the full radiator at 2855.6 K, defined by the CIE in terms of a relative spectral power distribution. E 284, E12

CIE standard illuminant B, *n*—colorimetric illuminant, representing direct sunlight with a correlated color temperature of 4874 K, defined by the CIE in terms of a relative spectral power distribution. Declared obsolete by the CIE in 1983. E 284, E12

CIE Standard Illuminant C, *n*—Colorimetric illuminant, representing daylight with a correlated color temperature of 6774 K, defined by the CIE in terms of a relative spectral power distribution. D 4175, D02

CIE standard illuminant C, *n*—colorimetric illuminant, representing daylight with a correlated color temperature of 6774 K, defined by the CIE in terms of a relative spectral power distribution. E 284, E12

CIE standard illuminant D₆₅, *n*—colorimetric illuminant, representing daylight with a correlated color temperature of 6504 K, defined by the CIE in terms of a relative spectral power distribution. E 284, E12

CIE 1931 standard observer, *n*—ideal colorimetric observer with color matching functions $x(\lambda), y(\lambda), z(\lambda)$ corresponding to a field of view subtending a 2° angle on the retina; commonly called the “2° Standard Observer.” D 4175, D02

CIE 1931 standard observer, *n*—ideal colorimetric observer with color matching functions $\bar{x}(\lambda), \bar{y}(\lambda), \bar{z}(\lambda)$ corresponding to a field of view subtending a 2° angle on the retina; commonly called the “2° standard observer.” E 284, E12

CIE standard source A, *n*—a gas-filled tungsten-filament lamp operated at a correlated color temperature of 2855.6 K. E 284, E12

CIE standard source B, *n*—standard source A combined with a specified liquid filter, to provide radiant flux with a correlated color temperature of 4874 K. Declared obsolete by the CIE in 1983. E 284, E12

CIE standard source C, *n*—standard source A combined with a specified liquid filter, to provide radiant flux with a correlated color temperature of 6774 K. E 284, E12

CIE 1964 supplementary standard colorimetric system, *n*—a system for determining the tristimulus values of any spectral power distribution using the set of reference color stimuli X_{10}, Y_{10}, Z_{10} , and the three CIE color-matching functions $\bar{x}_{10}(\lambda), \bar{y}_{10}(\lambda), \bar{z}_{10}(\lambda)$ adopted by the CIE in 1964. E 284, E12

CIE 1964 supplementary standard observer, *n*—ideal colorimetric observer with color matching functions $\bar{x}_{10}(\lambda), \bar{y}_{10}(\lambda), \bar{z}_{10}(\lambda)$ corresponding to a field of view subtending a 10° angle on the retina; commonly called the “10° standard observer.” E 284, E12

CIE 1976 uniform-chromaticity-scale diagram, *n*—the uniform-chromaticity-scale diagram produced by plotting in rectangular coordinates v' against u' , quantities defined as follows:

$$u' = 4X/(X + 15Y + 3Z) = 4x/(-2x + 12y + 3)$$

$$v' = 9Y/(X + 15Y + 3Z) = 9y/(-2x + 12y + 3)$$

for the CIE 1931 standard colorimetric system, or v'_{10} against u'_{10} for the CIE 1964 supplementary standard colorimetric system, in which case in the above formulae X_{10}, Y_{10}, Z_{10} are used instead of X, Y, Z and x_{10}, y_{10} instead of x, y . E 284, E12

CIE 1976 (u', v') or (u'_{10}, v'_{10}) chromaticity diagram, *n*—chromaticity diagram in which the CIE 1976 $L^* u^* v^*$ (CIE-LUV) chromaticity coordinates are plotted, with u' (or u'_{10}) as abscissa and v' (or v'_{10}) as ordinate. E 284, E12

CIE 1931 (x, y) chromaticity diagram, *n*—chromaticity diagram for the CIE 1931 standard observer, in which the CIE 1931 chromaticity coordinates are plotted, with x as abscissa and y as ordinate. E 284, E12

CIE 1964 (x_{10}, y_{10}) chromaticity diagram, *n*—chromaticity diagram for the CIE 1964 supplementary standard observer, in which the CIE 1964 chromaticity coordinates are plotted, with x_{10} as abscissa and y_{10} as ordinate. E 284, E12

cigar-box nail—bright, smooth, or barbed, regular-stock-steel, 1/2, 5/8, 3/4, and by 0.044-in. nails with flat slightly countersunk 0.099-in. head and medium diamond point. F 547, F16

cinematography—an instrumentation system for filming, measuring, and analyzing movements of the athlete, usually including a computerized digitizer for data analysis. F 869, F08

cine-radiography—the production of a series of radiographs that can be viewed rapidly in sequence, thus creating an illusion of continuity. E 1316, E07

CIP—cleaning-in-place. D 6161, D19

circle, *n*—circular blank fabricated from plate, sheet, or foil. B 881, B07

circuit—in filament winding, the winding produced by a single revolution of mandrel or form. D 883, D20

circuit grouting—a grouting method by which grout is circulated through a pipe extending to the bottom of the hole and back up the hole via the annular space outside the pipe. Then the excess grout is diverted back over a screen to the agitator tank by means of a packing gland at the top of the hole. The method is used where holes tend to cave and sloughing material might otherwise clog openings to be grouted. D 653, D18

circuit resistance—electrical resistance as measured between two test points whose internal contacts, when held closed, complete a circuit. F 2112, F01

circular anisotropic phase, *n*—as used in *Test Method D 5061*, a group of binder-phase anisotropic carbon textures that are distinguished by approximately circular domains (that is length equals width) and composed of fine circular (0.5- to 1.0- μm), medium

- circular (1.0- to 1.5- μm), and coarse circular (1.5- to 2.0- μm) size categories. **D 121, D05**
- circular bend**, *n*—simultaneous, multidirectional deformation of a fabric in which one face of a flat specimen becomes concave and the other becomes convex. **D 123, D13**
- circular bend**, *n*—simultaneous, multidirectional deformation of a fabric in which one face of a flat specimen becomes concave and the other becomes convex. **D 4850, D13**
- circular field**—see **field, circular**. **E 1316, E07**
- circularity**, *n*—ratio of a single ink dot height divided by its width with 1.0 being a perfect circle. **F 1857, F05**
- circular magnetization**—the magnetization in a part resulting from current passed directly through the part or through a central conductor. **E 1316, E07**
- circular mil (cmil)**—a unit of area equal to the area of a circle one mil (0.001 in., 0.0254 mm) in diameter. The area of a circle in circular mils is equal to the square of the diameter in mils [area(cmils) = diameter(mils)²], 1 cmil = 7.854×10^{-7} in.² [5.067×10^{-10} m²]. **B 354, B01**
- circular reinforcement**—a circular-shaped line of reinforcement. **C 822, C13**
- circular ride**—an amusement ride whose motion is primarily rotary in a fixed or variable plane from horizontal to 45° above horizontal. **F 747, F24**
- circulation**—applies to the fluid rotary drilling method; drilling fluid movement from the mud pit, through the pump, hose and swivel, drill pipe, annular space in the hole and returning to the mud pit. **D 653, D18**
- circulation rate** [$\text{L}^3 \text{T}^{-1}$]—in *fatigue testing*, the volume rate of change of the environment chamber volume. **E 1823, E08**
- circulation space**—See **space categories**. **E 631, E06**
- circulation space**—See **space categories**. **E 1480, E06**
- circulation system**—the system that moves the beverage within the bowl to ensure proper cooling and mixing. **F 1827, F26**
- circumduction**—the movement of a body part about an axis so as to describe a cone or the conical movement of a body part about an axis. **F 869, F08**
- circumferential**, *adj*—descriptor for directional illuminating (or viewing) geometry in which the illuminator provides radiation (or the receiver possesses responsivity) in many beams (or directions), normally distributed at uniform intervals throughout the 360° of azimuth of the measurement. The number and angular distribution of the beams (or directions) should be specified. (See also **annular**.) **E 284, E12**
- circumferential coils**—see **encircling coils**. **E 1316, E07**
- circumferential line**, *n*—on a tire, any real or imaginary circle on the surface of a tire, lying in a plane that is perpendicular to the spin axis. **F 538, F09**
- circumferential patternation**, *n*—measurements taken in a circumferential direction, showing the variation in liquid flux about the nozzle axis. **E 1620, E29**
- circumferential reinforcement**—reinforcement that is approximately perpendicular to the longitudinal axis of the concrete pipe. **C 822, C13**
- ciromg accelerator**—a material added to cement to decrease the time for curing. Examples are sodium chloride, calcium sulfate (gypsum), and aluminum powder. **D 653, D18**
- citric acid**— $\text{C}_3\text{H}_4(\text{OH})(\text{CO}_2\text{H})_3$, membrane cleaning chemical. **D 6161, D19**
- C.L.A.**, *n*—in measuring surface finish, the arithmetic average of the absolute distances of all profile points from the mean line for a given distance. **D 4175, D02**
- clad**—See **cladding**. **E 131, E13**
- clad**—surface sheathed. **F 547, F16**
- cladding**—nonload-bearing stone used as the facing material in wall construction that contains other materials. **C 119, C18**
- cladding**, *n*—of *anoptical fiber*, a layer of a optically transparent lower refractive index material in intimate contact with a core of higher refractive index material used to achieve total internal reflection. **E 131, E13**
- cladding ratio**—ratio by percent thickness of the component layers, for example. **B 846, B05**
- cladding system**, *n*—material assembly applied to a building as a non-load-bearing wall, or attached to a wall surface as a protective and ornamental covering. **E 631, E06**
- clad wire**—wire comprised of a given metal covered with a relatively thick application of a different metal. The bonding process is normally a combination of heat and pressure and results in a metallurgical bond. **B 354, B01**
- clamp**, *n*—that part of a testing machine used to grip the specimen by means of suitable jaws. **D 123, D13**
- clamp**, *n*—that part of a testing machine used to grip the specimen by means of suitable jaws. **D 4849, D13**
- clamp**, *n*—an interconnection component whose mechanism to secure the longitudinal element is through a squeezing action. **F 1582, F04**
- clamping force**—compression force transmitted to the base material as a result of preload in the anchor. **E 2265, E06**
- clamping pressure**—the pressure exerted by the lip of the lock-strip gasket on material installed in the channel, when the lock-strip is in place. **C 717, C24**
- clamp load**—sometimes called preload or initial load. It is a tension on a bolt or screw, which results in equal and opposite forces which exist at the interface between two members generated through the cumulative effect of tightening one or more fasteners. **F 1789, F16**
- clarifier**—a tank in which precipitate settles and supernatant overflows, a liquid-solids separation unit using gravity to remove solids by sedimentation. **D 6161, D19**
- clarity**, *n*—the characteristic of a transparent body whereby distinct high-contrast images or high-contrast objects (separated by some distance from the body) are observable through the body. **E 284, E12**
- clark degree**—number of grains of substance per one British imperial gallon of water expressed CaCO_3 . Concentration in Clark or English degree is calculated by dividing concentration in calcium carbonate equivalents by 14.3. One grain weighs 1/7000 lb and one imperial gallon of water weighs 10 lbs at 25°C. **D 6161, D19**
- class**—the descriptive term for categorizing solvent removers with similar characteristics. **E 1316, E07**
- class**, *n*—a group, set, or kind marked by common attributes or a common attribute (source: *Webster's Unabridged Dictionary*, 1967) (use: Test Method E 1387) CRIM. **E 1732, E30**
- class C fly ash**, *n*—fly ash, which meets criteria defined in ASTM C 618 for use in concrete. **E 2201, E50**
- class characteristic(s)**, *n*—the attribute(s) that establish membership in a class. **E 1732, E30**
- classes of buildings**, *adj* (catégories d'immeubles)—buildings categorized by selected attributes concerning **facility serviceability** and performance. **E 631, E06**
- classes of buildings**, *adj* (catégories d'immeubles)—buildings categorized by selected attributes concerning **facility serviceability** and performance. **E 1480, E06**
- class F fly ash**, *n*—fly ash, which meets criteria defined in ASTM C 618 for use in concrete. **E 2201, E50**
- classic gully**—a channel that is formed by gully erosion and is not interrupted by mechanical tillage operations to fill the resulting void. Gully depth can exceed 30 m. (See **gully erosion**.) **D 4410, D19**
- classification**, *n*—separation of a powder into fractions according to particle size. **B 243, B09**
- classification**, *n*—in *engine oils*, the systematic arrangement into categories in accordance with different levels of performance in specified engine tests. **D 4175, D02**
- classification**, *n*—a method of sorting stimuli into predefined categories. **E 253, E18**

classification, *n*

classification, *n*—the systematic arrangement of persons or objects into categories (groups or classes) based on shared traits or characteristics (source: Osterburg and Ward, *Criminal Investigation*, 1992, p. 835) (use: Test Method E 1387). **E 1732, E30**

classifier, *n*—equipment designed to separate oversized tire shreds from the desired size. **D 5681, D34**

Class III quaternary equilibrium—in a four-component system, the stable univariant coexistence of five phases, three of which appear in both of the associated bivariant equilibria at temperatures and pressures above, while the other two phases occur in all three of the associated bivariant equilibria below; for example, $L + \alpha + \beta = \gamma + \delta$. **E 7, E04**

Class III quinary equilibrium—in a five-component system, the stable univariant coexistence of six phases, three of which appear in all three of the associated bivariant equilibria at temperatures and pressures above, while the other three occur in all three of the associated bivariant equilibria below; for example, $L + \alpha + \beta = \gamma + \delta + \epsilon$. **E 7, E04**

Class III ternary equilibrium—in a three-component system, the stable univariant coexistence of four phases, one of which must disappear at higher temperature or pressure; for example, the ternary peritectic equilibrium, $L + \alpha + \beta = \gamma$. **E 7, E04**

Class II quaternary equilibrium—in a four-component system, the stable univariant coexistence of five phases, two of which appear in each of the three associated bivariant equilibria at temperatures and pressures above, while the other three phases all occur in both of the associated bivariant equilibria below; for example, $L + \alpha = \beta + \gamma + \delta$. **E 7, E04**

Class II quinary equilibrium—in a five-component system, the stable univariant coexistence of six phases, two of which appear in each of the four associated bivariant equilibria at temperatures and pressures above, while the other four phases occur in both of the associated bivariant equilibria below; for example, $L + \alpha = \beta + \gamma + \delta + \epsilon$. **E 7, E04**

Class II ternary equilibrium—in a three-component system, the stable univariant coexistence of four phases, two of which appear in both of the associated bivariant equilibria at higher temperature and pressure, while the other two phases occur in both bivariant equilibria below; for example, $L + \alpha = \beta + \gamma$. **E 7, E04**

Class I quaternary equilibrium—in a four-component system, the stable univariant coexistence of five phases, one of which must disappear upon lowering the temperature or pressure; for example, the quaternary eutectic equilibrium, $L = \alpha + \beta + \gamma + \delta$. **E 7, E04**

Class I quinary equilibrium—in a five-component system, the stable univariant coexistence of six phases, one of which must disappear upon lowering the temperature or pressure; for example, the quinary eutectic equilibrium, $L = \alpha + \beta + \gamma + \sigma + \epsilon$. **E 7, E04**

Class I ternary equilibrium—in a three-component system, the stable univariant coexistence of four phases, one of which must disappear upon lowering the temperature or pressure; for example, the ternary eutectic equilibrium, $L = \alpha + \beta + \delta$. **E 7, E04**

Class IV quaternary equilibrium—in a four-component system, the stable univariant coexistence of five phases, one of which must disappear at higher temperature or pressure; for example, the quaternary peritectic equilibrium, $L + \alpha + \beta + \gamma = \delta$. **E 7, E04**

Class IV quinary equilibrium—in a five-component system, the stable univariant coexistence of six phases, four of which appear in both associated bivariant equilibria at temperatures and pressures above, while the other two occur in all four associated bivariant equilibria below; for example, $L + \alpha + \beta + \gamma = \delta + \epsilon$. **E 7, E04**

Class V quinary equilibrium—in a five-component system, the stable univariant coexistence of six phases, one of which must disappear upon increasing the temperature or pressure; for example, the quinary peritectic equilibrium, $L + \alpha + \beta + \gamma + \delta = \epsilon$. **E 7, E04**

Clausius-Clapeyron equation—the rate of change of the pressure of a heterogeneous equilibrium with change of temperature dP/dT is equal to the heat of transformation from the low to the high

temperature state ΔH_v divided by the product of the absolute temperature of the equilibrium and the volume change of the transformation $T\Delta V$:

$$dP/dT = \Delta H_v/T\Delta V$$

or,

$$d \ln P/d T \approx H_v/RT$$

where R is the gas constant and the equilibrium is not near a critical point. **E 7, E04**

clay, *n*—an earthy or stony mineral aggregate consisting essentially of hydrous silicates of alumina, plastic when sufficiently pulverized and wetted, rigid when dry, and vitreous when fired to a sufficiently high temperature. **C 43, C15**

clay—a natural mineral agglomerate, consisting essentially of hydrous aluminum silicates; plastic when sufficiently wetted, rigid when dried en masse, and vitrified when fired to a sufficiently high temperature. **C 242, C21**

clay—an earthy or stony mineral aggregate consisting essentially of hydrous silicates of alumina, plastic when sufficiently pulverized and wetted, rigid when dry, and vitreous when fired to a sufficiently high temperature. **C 896, C04**

clay (clay soil)—fine-grained soil or the fine-grained portion of soil that can be made to exhibit plasticity (putty-like properties) within a range of water contents, and that exhibits considerable strength when air-dry. The term has been used to designate the percentage finer than 0.002 mm (0.005 mm in some cases), but it is strongly recommended that this usage be discontinued, since there is ample evidence from an engineering standpoint that the properties described in the above definition are many times more important. **D 653, D18**

clay roof tile, *n*—a solid unit of clay or shale, or both, formed into any of a range of generally rectangular planar shapes while plastic and fired in kiln. Clay roof tile is a ceramic product. See Specification C 1167. **C 43, C15**

clay size—that portion of the soil finer than 0.002 mm (0.005 mm in some cases) (see also **clay**). **D 653, D18**

clay size (fluvial sediment)—0.00024 to 0.004 mm in diameter. **D 4410, D19**

clay soil—see **clay**. **D 653, D18**

CLC—corrected lead concentration. **E 631, E06**

clean—free of contaminants. **E 1316, E07**

clean, *n*—free from visible or tactile contamination. **F 1646, F13**

cleanability—the relative ease with which soils or stains can be removed from a material. **C 286, B08**

clean coal combustion—the burning of coal, coal culm, or coal fines in a furnace designed to operate to minimize emissions (that is, a fluidized bed or aerated fluidized bed, etc.) or coal burned in the presence of alkaline materials, which combine to reduce these emissions. **D 5681, D34**

clean coal technology combustion products, *n*—products generated from any technology, including technologies applied at the pre-combustion, combustion, or post combustion stage, at a new or existing facility which will achieve significant reductions in air emissions of sulfur dioxide or oxides of nitrogen associated with the utilization of coal in the generation of electricity, or process steam which was not in widespread use as of November 15, 1990. **E 2201, E50**

cleaned—oil and other foreign matter removed from surface by tumbling with sawdust or by chemical process. **F 547, F16**

cleaned component—the result of substantially removing toner, dust and other undesirable materials, either by mechanical an/or chemical means. **F 335, F05**

cleaner—a solution, usually alkaline, used to remove oil, grease, drawing compounds, and loose dirt from metal as a step in preparing the surface for porcelain enameling. **C 286, B08**

cleaner blade—(also known as wiper blade), a blade which cleans the

- surface of the photoreceptor to mechanically remove toner and debris. **F 335, F05**
- cleaner, chemical**—an organic solvent used to remove foreign matter from the surface of plastic pipe and fittings. **F 412, F17**
- cleaner, mechanical**—an abrasive material or device used to remove foreign matter and gloss from the surface of plastic pipe and fittings. **F 412, F17**
- clean-finish seam-finish, *n***—a finish for the raw edges of the seam allowances of a plain seam, in which the raw seam allowance is folded under and edge stitched. **D 123, D13**
- clean-finish seam finish, *n***—in home sewing, a seam finish in which the cut edge is folded under and the fold line is edge stitched. (Syn. **turned and stitched seam finish**.) **D 4965, D13**
- cleaning**—the removal of grease, oxides, or other foreign material from a surface.
- alkaline cleaning*—cleaning by means of alkaline solutions.
- anodic or reverse cleaning*—electrolytic cleaning in which the work is the anode.
- cathodic or direct cleaning*—electrolytic cleaning in which the work is the cathode.
- diphase cleaning*—cleaning by means of solutions that contain a solvent layer and an aqueous layer. Cleaning is effected both by solvent and emulsifying action.
- direct current cleaning*—See *cathodic or direct cleaning*.
- electrolytic cleaning*—alkaline cleaning in which a current is passed through the solution, the work being one of the electrodes.
- emulsion cleaning*—cleaning by means of solutions containing organic solvents, water, and emulsifying agents.
- immersion*—See *soak cleaning*.
- reverse current cleaning*—See *anodic or reverse cleaning*.
- soak cleaning*—cleaning by immersion without the use of current, usually in alkaline solution.
- solvent cleaning*—cleaning by means of organic solvents.
- spray cleaning*—cleaning by means of spraying.
- ultrasonic cleaning*—cleaning by any chemical means aided by ultrasonic energy. **B 374, B08**
- cleaning**—the removal of unwanted materials, such as mold release agents. **B 374, B08**
- cleaning**—a process of removing undesirable matter.
- dry cleaning*—cleaning fabrics in a substantially nonaqueous liquid medium.
- wet cleaning*—a term used in the dry cleaning industry to denote cleaning in an aqueous medium. **D 459, D12**
- cleaning**—removal of marks, dust, and other extraneous materials from the surface. **D 2825, D21**
- cleaning ability, dry, *n***—the potential of a vacuum cleaner to remove dirt from a surface (sometimes referred to in the industry as *cleanability, dry*). **F 395, F11**
- cleaning agent, *n***—a chemical compound or formulation of several compounds which loosens, disperses, dissolves, or emulsifies soil to facilitate removal by mechanical action. **D 123, D13**
- cleaning agent, *n***—a chemical compound or formulation of several compounds which loosens, disperses, dissolves, or emulsifies soil to facilitate removal by mechanical action. **D 3136, D13**
- cleaning agent, *n***—a chemical compound or formulation of several compounds which loosens, disperses, dissolves, or emulsifies soil to facilitate removal by mechanical action. **D 7023, D13**
- cleaning effectiveness, dry, *n***—the ratio of the quantity of dirt removed to the quantity of dirt distributed on a test area. **F 395, F11**
- cleaning effectiveness factor (CEF), *n***—the fraction of contaminant removed from an initially contaminated test coupon as determined by gravimetric techniques. **G 126, G04**
- cleaning-emulsifiable solvent**—two-stage cleaning system wherein a concentrate containing organic solvents and surface-active agents is applied to a surface, subsequently emulsified, and removed along with the soil, by water rinsing. **B 374, B08**
- cleaning tool, *n***—a customer-installed device for a vacuum cleaner that is applied to the surface to be cleaned and is attached to the hose or the nozzle, for specialty cleaning functions. **F 395, F11**
- cleanliness**—the degree of freedom from undesirable and unintentional ink transfer from carbon paper and inked ribbons. **F 221, F05**
- cleanliness, *n***—the degree to which an oxygen system is free of contaminant. **G 126, G04**
- cleanup, *n***—wet-sweeping, HEPA-vacuuming, and washing down of surfaces within the work area at the end of each day. Compare **final cleanup**. **E 631, E06**
- clean-up**—in leak testing, the time required for a leak testing system to reduce its signal output to 37 % of the signal indicated at the time the tracer gas ceases to enter the leak system. Also called *clean-up time*. **E 1316, E07**
- clean wool fiber present, *n***—in raw wool, the mass of wool base present in the raw wool, adjusted to a moisture content of 12 %, an alcohol-extractable content of 1.5 %, and a mineral matter content of 0.5 %. **D 123, D13**
- clean wool fiber present, *n***—in raw wool, the mass of wool base present in the raw wool, adjusted to a moisture content of 12 %, an alcohol-extractable content of 1.5 %, and a mineral matter content of 0.5 %. **D 4845, D13**
- clear**—free of defects or imperfections. **D 9, D07**
- clear**—free of turbidity. **D 4790, D16**
- clearance**—plain section of shank between head and shank deformation (disregarding gripmarks). **F 547, F16**
- clearance area, *n***—work area and additional spaces outside the work area where lead contamination may have occurred during lead hazard control and other building maintenance or modification activities. **E 1605, E06**
- clearance examination, *n***—a process conducted after a lead hazard reduction activity, or other building maintenance and modification activities, to determine that no lead hazards remain in the area examined. **E 1605, E06**
- clearance level, *n***—the amount of lead in samples collected during a clearance examination that is not to be equaled or exceeded so that a residential dwelling or child-occupied facility may be classified as adequately clean and safe for re-occupancy, as promulgated by authorities having jurisdiction. **E 1605, E06**
- clear area**—that region of a document reserved for OCR characters and the required clear space around these characters. **F 149, F05**
- clear area, *n***—a space containing no dark marks, which precedes the start character of a symbol and which follows the stop character. Also, the region of a document reserved for OCR characters and the required unmarked space around these characters. (See also **quiet zone**.) **F 1294, F05**
- clear cross test**—an experimental method for determining which of two conceivable two-phase equilibria is real; at that composition at which the two conceivable two-phase fields cross, an alloy is brought to equilibrium and the phases identified; the same principle may be applied to higher-order equilibria in higher-order systems. **E 7, E04**
- clear frit**—a frit that remains essentially transparent or non-opaque when processed into a porcelain enamel. **C 286, B08**
- clear glass focusing screen**—a glass screen polished on both sides and mounted for use in a camera, in lieu of photo-sensitive material, for the purpose of establishing a plane on which to focus an image prior to recording it. **E 7, E04**
- clear glaze*—See *clear glaze* under **glaze**. **C 242, C21**
- clear ice**—ice that is transparent and contains only a moderate number of air bubbles. **D 7099, D18**
- clear to send, *n***—a control circuit that indicates to the data terminal equipment that data can or cannot be transmitted. (See **CTS**.) **F 1457, F05**

clear well

clear well—a collection basin that houses filtered or clarified water.

D 6161, D19

cleat, *n*—the joint system of coal seams, usually oriented normal or nearly normal to the bedding.

D 121, D05

cleat, *n*—a wood or metal strip attached along the edge of a **panel** of a **container** for the attaching of an adjacent panel, or fastened to the panel between the edges, or to barrel heads, for reinforcement and stiffening.

D 996, D10

cleat—L-shaped nail.

F 547, F16

cleated fiberboard box—See **box**.

D 996, D10

cleated plywood box—See **box**.

D 996, D10

cleat nail—bright, regular-stock-steel, 1½ by 0.080 to 1 7⁄8 by 0.106-in. nails with oval 3⁄16 to ¼-in. head and duckbill or clinch point. (See **clinch nail**.)

F 547, F16

cleavage—in *crystallography*, the splitting, or tendency to split, along planes determined by the crystal structure. In *petrology*, a tendency to cleave or split along definite, parallel, closely spaced planes. It is a secondary structure, commonly confined to bedded rocks.

D 653, D18

cleavage—the tendency to cleave or split along definite parallel planes, which may be highly inclined to the bedding. It is a secondary structure and is ordinarily accompanied by at least some recrystallization of the rock. (ISRM)

D 653, D18

cleavage, *n*—in an *adhesively bonded joint*, a separation in the joint caused by wedge or other crack-opening type action.

D 907, D14

cleavage crack—damage produced by the translation of a hard, sharp object across a glass surface. This fracture system typically includes a plastically deformed groove on the damaged surface, together with median and lateral cracks emanating from this groove.

C 162, C14

cleavage-peel strength, *n*—the force per unit width of bondline required to produce progressive separation by wedge or other crack-opening type action of two adherends where one or both undergo significant bending.

D 907, D14

cleavage planes—the parallel surfaces along which a rock or mineral cleaves or separates; the planes of least cohesion, usually parallel to a certain face of the mineral or crystal.

D 653, D18

cleavage planes—that family of planes of a crystal along which the crystal is easily split.

E 7, E04

cleavage strength, *n*—the force per unit width of bond line required to produce progressive separation by wedge or other crack-opening type action of two adherends.

D 907, D14

cleft water—water that exists in or circulates along the geological discontinuities in a rock mass.

D 653, D18

climatological types, *n*—major regions of significantly different recurring weather patterns. In weathering, several distinct climatological types are used to evaluate the atmospheric durability of materials. Within any single climatological variation, at a specific geographic location, short term weather patterns may fluctuate significantly. This may cause variability in short term exposures. Major climatic variations that are used for the study of weathering are:

G 113, G03

climber, *n*—a person engaging in the sport of climbing and mountaineering.

F 1773, F08

climbing and mountaineering, *n*—the sport of ascending, descending, and traversing on mountainous terrain, snow and ice, and natural and simulated rock surfaces.

F 1773, F08

climbing and mountaineering equipment, *n*—the equipment exclusively designed for use in climbing and mountaineering.

F 1773, F08

climbing drum peel test—See **test, climbing drum peel**.

E 631, E06

climbing drum peel test—See **test, climbing drum peel**.

E 1749, E06

clinch—point end bent sideways to provide increased holding power or to eliminate protrusion of point end of excessively long fastener, or both.

F 547, F16

clinch—protruding point end turned over or flattened when driven or driven against clinching plate.

F 592, F16

clinched point—pointed end of nail, having been driven through

member bent sideways. (See **brad-clinchedpoint**, **J-clinched point**, **plate-clinched point**.)

F 547, F16

clincher—part of tool that folds fastener legs to form clinch.

F 592, F16

clinching plate—(See **anvil**.) Also, hardened flat metal plate; used in clinching nails and staples designed for clinching.

F 592, F16

clinch nail—any nail designed for clinching after driving. Bright, regular-stock-steel, 1 by 0.080 to 4 by 0.177-in. nails with oval 3⁄16 to 3⁄8-in. head and duckbill or clinch point. (See **cleat nail**.)

F 547, F16

clinch point—end of wire flattened or notched or both for easy clinching when striking anvil plate or “nail buck.” (See **self-clinching**.)

F 547, F16

clinch point—point designed to facilitate clinching when driven against clinching plate. (See **step point**.)

F 592, F16

clinch strip, *n*—high-modulus or high-hardness compound applied between the carcass and the sidewall in the bead area to reinforce the bead.

F 538, F09

clinical accuracy, *n*—ability of an infrared ear canal thermometer to give a reading close to *true temperature* of the site that it purports to represent.

E 344, E20

clinical bias, \bar{x}_d , *n*—mean difference between IR thermometer output and an internal body site temperature from *subjects* at specified conditions of ambient temperature and humidity and averaged over a selected group of subjects.

E 344, E20

clinical certification—a standardized process for evaluation and recognition of an acceptable level of competence in a specific aspect of patient care.

F 1177, F30

clinical experience—exposure to and practice in an area of patient care.

F 1177, F30

clinical/field preceptor—an individual who supervises and evaluates the students during clinical or field experiences under the direction of the course instructor/coordinator.

F 1177, F30

clinical medical practice—patient diagnosis and treatment, including treatment protocols, which are the purview of qualified professionals (as determined by the state or other appropriate authority).

F 1177, F30

clinical repeatability, s_p , *n*—pooled standard deviation of changes in multiple *ear canal temperature* readings as taken from the same subject from the same ear with the same *infrared thermometer* by the same operator within a relatively short time.

E 344, E20

clinical thermometer, *n*—thermometer of any type designed to measure human body temperature.

E 344, E20

clinker, *n*—generally a fused or partly fused by-product of the combustion of coal, but also including lava and portland-cement clinker, and partly vitrified slag and brick.

D 8, D04

clip, *n*—in *shingles*—See **storm anchor**.

C 1154, C17

clip, *n*—for *shingles*, see **storm anchor (clip)**.

D 2946, C17

clip, *n*—a small fastening device, usually of metal, designed to hold an element or **component** in place.

E 631, E06

clip—See **strip**.

F 592, F16

clip, *n*—a mechanical means of joining two loops.

F 1379, F14

clip mark, *n*—a visible deformation near the edge of a fabric parallel with the lengthwise direction caused by pressure exerted by a clasping device on a clip tenter frame. (See also **pin mark**.)

D 123, D13

clip mark, *n*—a visual deformation near the edge of a fabric parallel with the lengthwise direction caused by pressure exerted by a clasping device on a clip tenter frame. (See also *pin mark*.)

D 3990, D13

clipped head—misnomer for D head. (See **notched head**.)

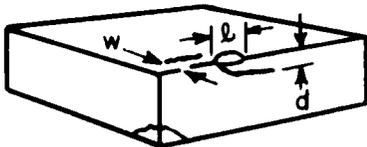

F 592, F16

clipper—the shearing machine used to dimension dry or green veneers to width.

D 1038, D07

clipping—in *fatigue spectrumloading*, the process of decreasing or increasing the magnitude of all loads (strains) that are, respectively, above or below a specified level, referred to as clipping

- level; the loads (strains) are decreased or increased to the clipping level. **E 1823, E08**
- clo, n**—unit of thermal resistance equal to $0.155 \text{ Km}^2/\text{W}$. **D 123, D13**
- clo, n**—a unit of thermal resistance (insulation) equal to $0.155 \text{ K}\cdot\text{m}^2/\text{W}$. **F 1494, F23**
- clogging, n**—the restriction of a flow path due to the accumulation of material along the flow path boundaries. **D 4175, D02**
- clogging, n**—*forgeotextiles*, the condition where soil particles move into and are retained in the openings of the fabric, thereby reducing the hydraulic conductivity. **D 4439, D35**
- clogging, v**—the restriction of normal product flow. Most commonly due to product drying in a product flow passage area of the mechanical break-up system. **D 6655, D10**
- clogging potential, n**—*in geotextiles*, the tendency for a given geotextile to decrease permeability due to soil particles that have either lodged in the geotextile openings or have built up a restrictive layer on the surface of the geotextile. **D 4439, D35**
- closed assembly time, n**—the time between the assembling of adhesive-coated surfaces and the application of heat or pressure, or both, to set the adhesive. **D 907, D14**
- closed-cavity ice**—ice formed in a closed space, cavity, or cave, in permafrost. **D 7099, D18**
- closed cell, n**—*in carbon and graphite technology*, a cell totally enclosed by its walls and hence not interconnected with other cells. A closed cell foam is a foam consisting predominantly of closed cells. **C 709, D02**
- closed cell, n**—a cell totally enclosed by its walls and hence not interconnecting with other cells. **C 717, C24**
- closed cell, n**—*in carbon and graphite technology*, a cell totally enclosed by its walls and hence not interconnected with other cells. A closed cell foam is a foam consisting predominantly of closed cells. **D 4175, D02**
- closed cell, n**—a cell totally enclosed by its walls and hence not interconnecting with other cells. (See also **cell** and **open cell**.) **F 1251, F04**
- closed-cell cellular plastics**—cellular plastics in which almost all the cells are noninterconnecting. **D 883, D20**
- closed-cell cellular plastics**—cellular plastics in which almost all the cells are noninterconnecting. (D20) **F 412, F17**
- closed cell foam, n**—a material comprised predominantly of individual non-interconnecting cellular voids. **C 168, C16**
- closed-cell foamed plastic, n**—a plastic in which almost all the cells are noninterconnecting. **F 1251, F04**
- closed-cell foamed plastics**—See **closed-cell cellular plastics**. **F 412, F17**
- closed cell material, n**—a cellular material in which substantially all cells in the mass are closed cells. **C 717, C24**
- closed cell sealant backing, n**—*in building construction*, a flexible and somewhat compressible extruded shape (usually cylindrical), with a surface skin, that is composed of closed cell material. **C 717, C24**
- closed chip**—fractured area on the edge or corner when the material has not broken off (Syn. *potential chip*).

where:

W = width

l = length, and

d = depth.

F 109, C21

closed construction—a method by which a **building, system, assembly, or component** is manufactured, in such a manner that portions

cannot be readily inspected at the installation site without disassembly or destruction. **E 631, E06**

closed construction—See **building construction**. **E 631, E06**

closed-face fabric, n—a face or shell fabric of closed construction so that no open-face areas appear. **D 123, D13**

closed-loop, adj—refers to a testing mode in which the collection medium volume is fixed. **F 1494, F23**

closed pore, n—a pore not communicating or connected with an exterior surface. **B 243, B09**

closed porosity—See **closed porosity** under **porosity**. **C 242, C21**

closed pot—a pot having a crown protecting the glass from the furnace atmosphere. **C 162, C14**

closed system—a building system having interchangeability of only its own **subsystems, subassemblies, and components**. **E 631, E06**

closed system—See **building system**. **E 631, E06**

closed-system freezing—freezing that occurs under conditions that preclude the gain or loss of water by the system. **D 7099, D18**

closed-system pingo—a pingo formed by the doming of frozen ground due to the freezing of injected water. The water is provided by the expulsion of pore water during the growth of permafrost. Closed-system pingos are found in poorly-drained terrain in the continuous permafrost zone. **D 7099, D18**

closed talik—a body of unfrozen ground occupying a depression in the permafrost table below a lake or river. **D 7099, D18**

closeness sum of squares (CSS), n—a statistic used to quantify the degree of agreement between the results from two test methods after bias-correction using the methodology of this practice. **D 4175, D02**

close nipple—a nipple with no shoulder or unthreaded portion between two threads; the shortest possible pipe nipple with complete threads. **B 846, B05**

close out—enclosure of honeycomb or other core material within a structure that may contain hard edges or attachment points, or both. **E 631, E06**

close out—enclosure of honeycomb or other core material within a structure that may contain hard edges or attachment points, or both. **E 1749, E06**

close packed—a geometric arrangement whereby a collection of equally sized spheres (atoms) may be packed together in a minimum total volume. **E 7, E04**

closure—See **compression joint**. **C 896, C04**

closure—the opening is reduced in dimension to the extent that it cannot be used for its intended purpose. (ISRM) **D 653, D18**

closure—*in grouting*, closure refers to achieving the desired reduction in grout take by splitting the hole spacing. If closure is being achieved, there will be a progressive decrease in grout take as primary, secondary, tertiary, and quaternary holes are grouted. **D 653, D18**

closure, n—*in packaging*, a means of closing a **container** to retain the contents.

plug, n—*in packaging*, a type of **closure** that is designed to be inserted into a **container** opening. It may be held by friction or by screw threads. (See **cap**.) **D 996, D10**

closure—process by which a person cognitively completes patterns or shapes that are incompletely perceived. **E 1316, E07**

closure, n—the decommissioning of a disposal facility. **E 2201, E50**

closure, n—point on supply current wave form where arc is initiated. **F 819, F18**

closure or screw cap, n—a fitment that attaches the pump to the container. **D 6655, D10**

closure plan, n—a written plan that describes the steps the owner or operator of the disposal facility will take to close the facility in accordance with regulatory or other requirements. **E 2201, E50**

closure strip, n—an asphalt or rubber preformed filler strip having the same shape and pitch as the corrugated product, used to close openings in the corrugated sheets at window beads, eaves, lower edge of siding, and similar places. **C 1154, C17**

closure strip—asphalt or rubber preformed filler strip having the

closure strip

same shape and pitch as the asbestos-cement corrugated product and used to close openings in the corrugated sheets at window beads, eaves, lower edge of siding, and similar places.

D 2946, C17

cloth, *n*—any textile fabric, but especially one designed for apparel, domestic, or industrial use. (See also **fabric**.)

D 123, D13

clothing ensemble, *n*—a group of garments worn together on the body at the same time.

F 1494, F23

cloud, *n*—any collection of particulate matter in the atmosphere dense enough to be perceptible to the eye, especially a collection of water drops.

cloud water, *n*—an aggregate of condensed water vapor or ice crystals that are suspended in the atmosphere.

D 1356, D22

cloud, *n*—any collection of particulate matter in the atmosphere dense enough to be perceptible to the eye, especially a collection of water drops.

E 1620, E29

cloud cover—that portion of the sky which is covered by clouds, usually expressed in tenths of sky covered.

E 772, E44

cloud development—see **aerosol development**.

F 335, F05

cloud point, *n*—in *petroleum products and biodiesel fuels*, the temperature of a liquid specimen when the smallest observable cluster of wax crystals first appears upon cooling under prescribed conditions.

D 4175, D02

cloud point, *n*—in *petroleum products and biodiesel fuels*, the temperature of a liquid specimen when a wax crystal structure that is similar in appearance to a cloud is formed upon cooling under prescribed conditions.

D 4175, D02

cloud point, *n*—the temperature at which a defined liquid mixture, under controlled cooling, produces perceptible haze or cloudiness due to the formation of fine particles of an incompatible material.

D 6440, D01

cloud point of phenol—the temperature at which a separate phase forms when a homogeneous solution of phenol in water is allowed to cool at a prescribed rate from a temperature above that at which phase separation occurs. It may precisely be defined as follows: when a homogeneous solution of phenol and water is allowed to cool at a prescribed rate with stirring, the solution will show a slight cloudiness or turbidity as the cloud point is approached. On further cooling, the cloudiness will increase rapidly and the thermometer bulb, which is centrally located in the test tube, will suddenly become invisible. The temperature at which the thermometer bulb becomes invisible is taken as the cloud point.

D 4790, D16

cloud water—See **cloud**.

D 1356, D22

cloudy—qualitative expression of turbidity.

D 4790, D16

cloudy ice—ice that is translucent or relatively opaque due to the content of air or for other reasons, but which is essentially sound and nonpervious.

D 7099, D18

clout nail—bright, regular-stock-steel, $\frac{3}{4}$ by 0.072 to 1 $\frac{1}{2}$ by 0.092-in. nails with large flat 0.225 to 0.262-in. head and long side point or duckbill point.

F 547, F16

clusec—an obsolete unit of flow rate equal to 10-2 lusecs.

E 1316, E07

cluster controller, *n*—a device in an IBM Model 3274, 3276, or equivalent that controls the flow of information in a local area network.

F 1457, F05

cluster sampling, *n*—when the primary sampling unit comprises a bundle of elementary units or a group of subunits, the term cluster sampling may be applied.

E 456, E11

cluster sampling, *n*—when the primary sampling unit comprises a bundle of elementary units or a group of subunits, the term cluster sampling may be applied.

E 1402, E11

cmc (*l:c*) color difference, *n*—color difference calculated by use of the formula developed by the Colour Measurement Committee of the Society of Dyers and Colourists of Great Britain.

E 284, E12

coadsorption—the adsorption of two or more components on an adsorbent, each affecting the adsorbability of the other.

D 2652, D28

coagent, *n*—a compounding ingredient used in small amounts to increase the crosslinking efficiency of certain non-sulfur vulcanizing systems, or to modify the properties given by such systems.

D 1566, D11

coagulant—chemical added in water and wastewater applications to cause destabilization of suspended particles and subsequent formation of flocs that adsorb, entrap, or otherwise bring together suspended matter that is so fine, it is defined as colloidal. Compounds of iron and aluminum are generally used to form flocs to allow removal of turbidity, bacteria, color, and other finely divided matter from water and waste water.

D 6161, D19

coagulant dipping (latex), *n*—a dipping process in which the product form is first immersed in a coagulant solution, withdrawn, dried, and then immersed in the latex.

D 1566, D11

coagulate, *v*—to cause to become viscous or thickened into a coherent mass.

D 4175, D02

coagulated pentane insolubles, *n*—in *used oil analysis*, separated matter that results when a coagulant is added to a solution of used oil in pentane.

D 4175, D02

coagulated toluene insolubles, *n*—in *used oil analysis*, coagulated and separated matter not soluble in pentane or toluene.

D 4175, D02

coagulation—the agglomeration of colloidal or finely divided suspended matter caused by the addition to the liquid of an appropriate chemical coagulant, by biological processes, or by other means (see also **agglomeration**).

D 4410, D19

coagulation (rubber latex), *n*—irreversible agglomeration of particles originally dispersed in a rubber latex.

D 1566, D11

coagulum—an agglomerate of particles.

D 2825, D21

coagulum (latex), *n*—an undesirable, irreversible, agglomeration of rubber particles retained on a 180- μ m mesh screen.

D 1566, D11

coal, *n*—a brown to black combustible sedimentary rock (in the geological sense) composed principally of consolidated and chemically altered plant remains.

lithotype, *n*—any of the constituents of banded coal: vitrain, fusain, clarain, durain, or attrital coal or a specific mixture of two or more of these.

banded coal, *n*—coal that is visibly heterogeneous in composition, being composed of layers of vitrain and attrital coal, and, commonly, fusain.

attrital coal, *n*—the ground mass or matrix of banded coal in which vitrain and, commonly, fusain layers as well, are embedded or enclosed.

fusain, *n*—coal layers composed of chips and other fragments in which the original form of plant tissue structure is preserved; commonly has fibrous texture with a very dull luster.

vitrain, *n*—shiny black bands, thicker than 0.5 mm, of subbituminous and higher rank banded coal.

nonbanded coal, *n*—consistently fine-granular coal essentially devoid of megascopic layers.

cannel coal, *n*—nonbanded coal in which the liptinite is predominantly sporinite.

boghead coal, *n*—nonbanded coal in which the liptinite (the waxy component) is predominantly alginite.

impure coal, *n*—coal having 25 weight % or more, but less than 50 weight %, of ash on the dry basis.

bone coal, *n*—impure coal that contains much clay or other fine-grained detrital mineral matter.

mineralized coal, *n*—impure coal that is heavily impregnated with mineral matter, either dispersed or discretely localized along cleat joints or other fissures. Pyritic or calcareous mineralized coal is most common.

D 121, D05

coal ash, *n*—a collective term referring to any solid materials or residues (such as fly ash, bottom ash or boiler slag) produced primarily from the combustion of coal.

E 2201, E50

coal combustion products (CCPs), *n*—fly ash, bottom ash, boiler

- slag, fluidized-bed combustion (FBC) ash, or flue gas desulfurization (FGD) material produced primarily from the combustion of coal or the cleaning of the stack gases. **E 2201, E50**
- coalescence, n**—a process by which the particles of a dispersion combine into one body. **D 1356, D22**
- coalescence**—growth of grains at the expense of the remainder by absorption or the growth of a phase or particle at the expense of the remainder by absorption or by reprecipitation. **E 7, E04**
- coalescence, n**—the merging of two or more liquid particles to form a single liquid particle. **E 1620, E29**
- coalescence, n**—the puddling or pooling of adjacent ink drops on the substrate before they can be dried or absorbed resulting in nonuniformity of color density. **F 1857, F05**
- coalescing**—the separation of mixtures of immiscible fluids (such as oil and water) based on different specific gravities and surface tensions. Coalescence occurs whenever two or more droplets collide and remain in contact and then become larger by passing through a coalescer. The enlarged drops then separate out of solution more rapidly. **D 6161, D19**
- coal mine waste, n**—the coal processing waste and underground development waste. **E 2201, E50**
- coal processing waste, n**—the earth materials which are separated and wasted from the coal during cleaning, concentrating, or other processing or preparation of coal. **E 2201, E50**
- coal refuse, n**—waste products of coal mining, cleaning, and coal preparation operation (for example, culm, gob, etc.) containing coal, matrix material, clay, and other organic and inorganic material. This does not include overburden from surface mines. **E 2201, E50**
- coal seam, n**—the stratum, layer, or bed of coal that lies between two other rock layers whose compositions differ significantly from that of coal. **D 121, D05**
- coal tar, n**—a dark brown to black cementitious material produced by the destructive distillation of bituminous coal. **D 8, D04**
- coal tar**—a dark brown to black cementitious material produced by the destructive distillation of coal. **D 1079, D08**
- coal-tar felt**—a felt that has been saturated with refined coal tar. **D 1079, D08**
- coal-tar pitch**—a dark brown to black, solid cementitious material obtained as residue in the partial evaporation or distillation of coal tar. **D 1079, D08**
- coal tar roof cement, n**—a trowelable mixture of processed coal tar base, solvents, mineral fillers or fibers, or both. See Specification D 4022. **D 1079, D08**
- coal washability, n**—the determination of the theoretical limits for the removal of mineral impurities from coal by beneficiation processes that rely on specific gravity separations.
- coarse coal, n*—that portion of a coal sample being subjected to a washability study that is larger than a specific predetermined particle size, generally between 2.36 mm (No. 8 USA Standard Sieve Series) and 9.5 mm (3/8 in.) round in diameter. **D 121, D05**
- coarse aggregate, n**—(1) aggregate predominantly retained on the 4.75-mm (No. 4) sieve; or (2) that portion of an aggregate retained on the 4.75-mm (No. 4) sieve. **D 8, D04**
- coarse end, n**—a larger than normal diameter warp end. (Compare **fine end**.) **D 123, D13**
- coarse end, n**—a larger than normal diameter warp end. (*Syn.* heavy end) (Compare **fine end**)
coarse filling—See **coarse pick**. **D 3990, D13**
- coarse grain*—See **grain**. **D 9, D07**
- coarse grain practice, n**—a steelmaking practice for other than **stainless steel** that is intended to produce a **killed steel** in which aluminum, niobium (columbium), titanium, and vanadium are **residual elements**. **A 941, A01**
- coarse grains**—grains either larger than normal for the particular wrought metal or alloy, or grains of such a size that a surface roughening, popularly known as “orange peel” or “alligator skin,” is produced. **E 7, E04**
- coarse material**—material coarser than a No. 200 (75- μ m) U.S. standard sieve. **D 5681, D34**
- coarse pick, n**—*in woven fabrics*, one or more picks of larger diameter than the normal filling yarn in the fabric. **D 123, D13**
- coarse pick, n**—*in woven fabrics*, one or more picks of larger diameter than the normal filling yarn in the fabric. (*Syn.* thick filling) **D 3990, D13**
- coarse rough fiber**—fibers of flesh surfaces of leather or splits which are frayed, separated, and present a shaggy appearance. **D 1517, D31**
- coarse sprays*—distribution of droplets with $D_{v,5} > 1200 \mu\text{m}$. **E 1102, E35**
- coat, n**—a layer of plaster applied in a single operation. **C 11, C11**
- coat, n**—an outer garment which covers at least the upper half of the body, has sleeves and a front opening, and is usually worn over another garment, such as a shirt or dress. **D 123, D13**
- coat, n**—an outer garment which covers at least the upper half of the body, has sleeves and a front opening, and is usually worn over another garment, such as a shirt or dress. **D 7022, D13**
- coated**—covered fully or partially with natural resin or conversion coating to provide ease of driving, increased holding power, or corrosion resistance, or a combination of these. **F 547, F16**
- coated fabric, n**—a flexible material composed of a fabric and any adherent polymeric material applied to one or both surfaces. (See also **laminated fabric**) **D 123, D13**
- coated fabric, n**—a flexible product composed of a textile fabric and an adherent polymeric material applied to one or both surfaces. **D 1566, D11**
- coated fabric, n**—a flexible material composed of a fabric and any adherent polymeric material applied to one or both surfaces. (See also **laminated fabric**.) **D 4850, D13**
- coated fastener**—a fastener with appropriate material applied to its surface to increase the fastener-withdrawal resistance. **F 592, F16**
- coated finish, n**—the surface feature resulting when mineral particles are applied to the column in the extrusion process to impart color, texture, opacity, or other characteristics. **C 43, C15**
- coated paper, n**—paper which has been coated on one or both sides with a minimum coat weight of 2.5 lb/3300-ft² (3.7 g/m²) of coating material per side. see **coating**. **D 1968, D06**
- coated paper**—paper which has one or both surfaces covered with a substance to produce certain desired properties for use in specific electrophotographic processes. **F 335, F05**
- coated paper copying**—a form of direct electrophotographic copying. **F 335, F05**
- coated sheet (or felt)**—(1) an asphalt felt that has been coated on both sides with harder, more viscous asphalt;
(2) a glass fiber felt that has been simultaneously impregnated and coated with asphalt on both sides. **D 1079, D08**
- coated wire**—wire comprised of a given metal covered with a relatively thin application of a different metal. The coating process is normally electroplating or dip coating. **B 354, B01**
- coating, n**—a liquid or semiliquid that dries or cures to form a protective finish, suitable for application to thermal insulation or other surfaces in thickness of 30 mils (0.76 mm) or less, per coat. **C 168, C16**
- coating*—see **ceramic coating** and **ceramic-metal coating**. **C 286, B08**
- coating, n**—a liquid, liquefiable or mastic composition that is converted to a solid protective, decorative, or functional adherent film after application as a thin layer. **D 16, D01**
- coating, n**—*of paper*, the layer of pigment and adhesive applied to the surface of paper or paperboard to create a new surface. **D 1968, D06**
- coating, n**—liquid, liquefiable, or mastic composition that is converted to a solid protective, or decorative, or functional adherent film after application as a thin layer. **E 631, E06**

coating, n

coating, n—a liquid, liquefiable, or mastic composition that, after application as a thin layer, is converted to a solid protective, or decorative, or functional adherent film. **E 631, E06**

coating, n—a liquid or semiliquid, including but not limited to paint, varnish, or shellac, that dries or cures to form a protective or decorative finish after being applied as a thin layer. **E 1605, E06**

coating, n—a layer of any substance intentionally applied to a surface to modify its functional or decorative characteristics. **F 1646, F13**

coating applicator—*inprotective coatings*, an organization or individual responsible for applying a protective or decorative coating. **D 4538, D33**

coating cycle—specific time and temperature to achieve desired depth of diffusion. **B 374, B08**

coating, diffusion—an alloy coating produced by applying heat to one or more coatings deposited on a metal substrate. **B 374, B08**

coating pick, n—the removal of coating particles from the sheet surface that occurs when the tack of the ink exceeds the surface strength of the substrate. **D 6488, D01**

coating powder, n—a heat-fusible, finely-divided solid resinous material used to form electrical insulating coatings. **D 1711, D09**

coating slub, n—*for coated inflatable restraint fabrics*, an irregularly shaped lump of coating material on the surface of the coated layer resembling a yarn slub. **D 6799, D13**

coating streak, n—*for coated inflatable restraint fabrics*, minor variation in the color or opacity of the coated layer. **D 6799, D13**

coating system—*in protective coatings*, a protective film consisting of one or more coats, applied in a predetermined order by prescribed methods. **D 4538, D33**

coating transfer, n—*for coated inflatable restraint fabrics*, the presence of coating material on the uncoated side, covering one or more yarns. **D 6799, D13**

coating weight—the wet or dry weight of coating material applied to a paper or other substrate expressed as grams per square metre or pounds per specified ream. **F 335, F05**

coating work—*in protective coatings*, an all-inclusive term to define all operations required to accomplish a complete coating job; construed to include materials, equipment, labor, preparation of surfaces, control of ambient conditions, application of coating systems, and inspection. **D 4538, D33**

coaxial thermocouple—a thermocouple consisting of a thermoelement in wire form within a thermoelement in tube form with the wire being electrically insulated from the tube except at the measuring junction. **E 344, E20**

cobble (cobblestone)—a rock fragment, usually rounded or semirounded, with an average dimension between 3 and 12 in. (75 and 305 mm). **D 653, D18**

cobble size (fluvial sediment)—64 to 256 mm in diameter. **D 4410, D19**

cobwebbing—*in protective coatings*, the formation of fine filaments (cobwebs) or partly dried coating, during spray application. **D 4538, D33**

cobwebbing, n—a filmy buildup of dried ink or coating on the doctor blade, ends of the impression roll, or printing cylinder. **D 6488, D01**

cockle—hard, firm nodules appearing on the necks and bellies of sheepskins. **D 1517, D31**

cockle, n—*of paper*, a defective, puckered condition of a paper sheet as a result of non-uniform hygro-expansion which can be related to any non-uniformity in the sheet, including mass distribution and drying stresses. **D 1968, D06**

cockle finish, n—*of paper*, an intentional rough, puckered surface, typically obtained by rewetting and drying of a paper sheet without physical restraint. **D 1968, D06**

cockles, n—*in yarns*, irregular, thick, uneven lumps. **D 123, D13**

cockles, n—*in yarns*, irregular thick, uneven, lumps. **D 3990, D13**

cockles, n—*in yarns*, irregular, thick, uneven lumps. **D 4849, D13**

cocoon, v—*in packaging*, to employ strippable, usually plastic, sometimes multi-layered films to encapsulate an item. **D 996, D10**

co-curing, n—curing a composite laminate and simultaneously bonding it to the sandwich core. **C 274, D30**

cocuring—the act of curing a composite laminate and simultaneously bonding it to some other hard detail during the same cure cycle (for example, curing a skin laminate and bonding it to honeycomb core simultaneously). **E 631, E06**

cocuring—the act of curing a composite laminate and simultaneously bonding it to some other hard detail during the same cure cycle (for example, curing a skin laminate and bonding it to honeycomb core simultaneously). **E 1749, E06**

co-current flow—flow pattern through a membrane in which the fluids on the upstream and downstream sides of the membrane move parallel to the membrane surface and in the same directions. **D 6161, D19**

COD—chemical oxygen demand—the amount of oxygen required under specified test conditions for the oxidation of water borne organic and inorganic matter. **D 6161, D19**

code, v—to assign numbers, letters, words, or symbols as identifying marks to **containers**, packaged materials, or articles to convey information concerning the qualities of the container or its contents, date, place of manufacture, or other significant identification. (Compare **marking**.) **D 996, D10**

code—(1) a system of symbols, letters or numbers, used to convey a message requiring brevity; (2) a set of rules established by a legal or quasi-legal body. **F 412, F17**

code, classification—a code that identifies a plastic material by its properties in accordance with the pertinent ASTM specification. **F 412, F17**

code density, n—the number of characters that can appear per unit of length, usually expressed as characters per inch (cpi). **F 1294, F05**

code, n (in the Law)—a collection of laws (regulations, ordinances, or statutory requirements) adopted by governmental (legislative) authority. **E 631, E06**

code, manufacturer's—a code that provides manufacturing identity for a piping product. **F 412, F17**

code medium, n—the material used to construct a machine-readable code; such materials may be retroreflective, luminescent, magnetic, opaque, transponder or conductive. **F 1294, F05**

code of accounts, n—a hierarchical, company-specific system for cost accounting, control, and management. **E 833, E06**

Code of Federal Regulations (CFR)—basic component of the *Federal Register* publication system. The CFR is a codification of the regulations of the various Federal agencies. **E 631, E06**

Code of Federal Regulations (CFR)—basic component of the *Federal Register* publication system. The CFR is a codification of the regulations of the various Federal agencies. **E 1605, E06**

code set, n—the specific assignment of data characters to symbol characters. **F 1294, F05**

code, thermoplastic pipe materials designation—ciphers and letters for the designation of stress-rated thermoplastic compound, which consists of two or three letters to indicate the abbreviation as listed in Terminology D 1600, for the type of thermoplastic resin—followed by four arabic numerals—two to describe the short-term properties, in accordance with the ASTM standard being referenced, and two to designate the hydrostatic design stress when tested in water at 73°F (23°C) in units of 100 psi, with any decimal figures dropped. **F 412, F17**

code word, n—*inference to bar codes*, an arrangement of bars and spaces used to communicate one or more data characters. **F 1294, F05**

co-dispensing valve—an arrangement whereby two components of a product are separated inside the container and mixed at the time of use, when ejected through dual channels into the valve. **D 3064, D10**

coefficient of absolute viscosity—see **coefficient of viscosity**.

D 653, D18

coefficient of active earth pressure—see **coefficient of earth pressure**.

D 653, D18

coefficient of compressibility—the change in volume per unit volume of a substance per unit increase in effective compressive stress, under isothermal conditions.

D 7099, D18

coefficient of compressibility (coefficient of compression), α_v (L^2F^{-1})—the secant slope, for a given pressure increment, of the pressure-void ratio curve. Where a stress-strain curve is used, the slope of this curve is equal to $\alpha_v/(1+e)$.

D 653, D18

coefficient of consolidation, c_v (L^2T^{-1})—a coefficient utilized in the theory of consolidation, containing the physical constants of a soil affecting its rate of volume change.

$$c_v = k(1+e)/\alpha_v\gamma_w$$

where:

k = coefficient of permeability, LT^{-1} ,

e = void ratio, D,

α_v = coefficient of compressibility, L^2F^{-1} , and

γ_w = unit weight of water, FL^{-3} .

D 653, D18

coefficient of earth pressure, K (D)—the principal stress ratio at a point in a soil mass.

coefficient of earth pressure, active, K_A (D)—the minimum ratio of: (1) the minor principal stress, to (2) the major principal stress. This is applicable where the soil has yielded sufficiently to develop a lower limiting value of the minor principal stress.

coefficient of earth pressure, at rest, K_O (D)—the ratio of: (1) the minor principal stress, to (2) the major principal stress. This is applicable where the soil mass is in its natural state without having been permitted to yield or without having been compressed.

coefficient of earth pressure, passive, K_P (D)—the maximum ratio of: (1) the major principal stress, to (2) the minor principal stress. This is applicable where the soil has been compressed sufficiently to develop an upper limiting value of the major principal stress.

D 653, D18

coefficient of expansion—see **coefficient of linear thermal expansion**.

E 1142, E37

coefficient of friction—the ratio of the parallel component of force required to overcome or have a tendency to overcome the resistance to relative motion of two surfaces in physical contact one with another, but otherwise unconstrained, to the normal component of the force—usually the force as a result of gravity—applied through the object which tends to cause the friction.

C 242, C21

coefficient of friction, n —the ratio of the tangential force that is needed to maintain uniform relative motion between two contacting surfaces to the perpendicular force holding them in contact.

D 123, D13

coefficient of friction, n —the ratio of the tangential force that is needed to maintain uniform relative motion between two contacting surfaces to the perpendicular force holding them in contact.

D 4849, D13

coefficient of friction—the ratio of the tangential force that is needed to start or maintain uniform relative motion between two contacting surfaces to the perpendicular force holding them in contact. (See DCOF and SCOF in for clarification.)

F 141, F06

coefficient of friction (coefficient of friction between solid bodies), f (D)—the ratio between the maximum value of shear stress that resists slippage between two solid bodies with respect to each other, and the normal stress across the contact surfaces. The tangent of the angle of friction is ϕ_s .

D 653, D18

coefficient-of-friction (COF or μ), n —a dimensionless number: the ratio of two forces acting at the interface of two contacting solid bodies. The force used in the numerator is parallel to the surfaces

and the force used in the denominator is perpendicular (normal) to the surfaces. See also *dynamiccoefficient of friction*.

coefficient of friction, f —a constant proportionality factor, μ , relating normal stress and the corresponding critical shear stress at which sliding starts between two surfaces:
 $T = \mu \cdot \sigma$. (ISRM)

D 653, D18

coefficient of friction, μ or f , n —in tribology, the dimensionless ratio of the friction force (F) between two bodies to the normal force (N) pressing these two bodies together.

$$\mu \text{ or } f = (F/N)$$

D 4175, D02

coefficient of friction μ or f , n —in tribology, the dimensionless ratio of the friction force (F_f) between two bodies to the normal force (F_n) pressing these bodies together.

$$\mu = (F_f/F_n)$$

D 4175, D02

coefficient of friction μ or f , n —in tribology, the dimensionless ratio of the friction force (F) between two bodies to the normal force (N) pressing these bodies together. (See also **static coefficient of friction** and **kinetic coefficient of friction**.)

$$\mu = (F/N)$$

G 40, G02

coefficient of image removal—the change in reflectance of the printed pattern divided by one hundred. (F 362)

F 221, F05

coefficient of internal friction, μ (D)—the tangent of the angle of internal friction (angle of shear resistance) (see **internal friction**).

D 653, D18

coefficient of kinetic or sliding friction, n —of paper, the ratio of the force required to sustain the uniform relative movement of the surfaces, to the normal force.

D 1968, D06

coefficient of length variation, n —a measure of fiber length distribution.

D 123, D13

coefficient of length variation, n —a measure of fiber length distribution.

D 7139, D13

coefficient of linear thermal expansion, α_l —change in length, relative to the length of the specimen, accompanying a unit change of temperature, at a specified temperature.

E 1142, E37

coefficient of line retroreflection, R_M , n —of a reflecting stripe, the ratio of the coefficient of luminous intensity (R_l) of a retroreflecting stripe to its length (l), expressed in candelas per lux per metre ($cd \cdot lx^{-1} \cdot m^{-1}$). $R_M = (R_l/l)$.

E 284, E12

coefficient of luminous intensity R_l , n —of a retroreflector, ratio of the luminous intensity (I) of the retroreflector in the direction of observation to the illuminance (E_{\perp}) at the retroreflector on a plane perpendicular to the direction of the incident light, expressed in candelas per lux ($cd \cdot lx^{-1}$). $R_l = (I/E_{\perp})$.

E 284, E12

coefficient of permeability (permeability), k (LT^{-1})—the rate of discharge of water under laminar flow conditions through a unit cross-sectional area of a porous medium under a unit hydraulic gradient and standard temperature conditions (usually 20°C).

D 653, D18

coefficient of retroreflected luminance, R_L , n —ratio of the luminance, L , of a projected surface to the normal illuminance, E_{\perp} , at the surface on a plane normal to the incident light, expressed in candelas per square metre per lux ($cd \cdot m^{-2} \cdot lx^{-1}$). $R_L = (L/E_{\perp})$.

E 284, E12

coefficient of retroreflection, R_A , n —of a plane reflecting surface, the ratio of the coefficient of luminous intensity (R_l) of a plane retroreflecting surface to its area (A), expressed in candelas per lux per square metre ($cd \cdot lx^{-1} \cdot m^{-2}$). $R_A = (R_l/A)$.

E 284, E12

coefficient of scatter—the rate of increase of reflectance with thickness at infinitesimal thickness of porcelain enamel over an ideally black backing.

C 286, B08

coefficient of shear resistance—see **coefficient of internal friction**, μ (D). D 653, D18

coefficient of static or starting friction, n —of paper, the ratio of the force resisting initial motion of the surfaces, to the normal force. D 1968, D06

coefficient of subgrade reaction (modulus of subgrade reaction), k , k_s (FL^{-3})—ratio of: (1) load per unit area of horizontal surface of a mass of soil, to (2) corresponding settlement of the surface. It is determined as the slope of the secant, drawn between the point corresponding to zero settlement and the point of 0.05-in. (1.3-mm) settlement, of a load-settlement curve obtained from a plate load test on a soil using a 30-in. (762-mm) or greater diameter loading plate. It is used in the design of concrete pavements by the Westergaard method. D 653, D18

coefficient of thermal expansion—change in unit of length (or volume) accompanying a unit change of temperature, at a specified temperature. E 7, E04

coefficient of transmissibility—the rate of flow of water in gallons per day through a vertical strip of the aquifer 1 ft (0.3 m) wide, under a unit hydraulic gradient. D 653, D18

coefficient of uniformity, C_u (D)—the ratio D_{60}/D_{10} , where D_{60} is the particle diameter corresponding to 60 % finer on the cumulative particle-size distribution curve, and D_{10} is the particle diameter corresponding to 10 % finer on the cumulative particle-size distribution curve. D 653, D18

coefficient of variation—the ratio (decimal fraction) of the standard deviation of the maximum principal tensile stress (MPTS) at failure to the ABS. E 631, E06

coefficient of variation, v —ratio of the standard deviation of the failure load to the mean failure load. E 631, E06

coefficient of variation—a measure of relative precision calculated as the standard deviation of a series of values divided by their average. It is often multiplied by 100 and expressed as a percentage. E 1547, E15

coefficient of variation, CV, n —a measure of the dispersion of observed values equal to the standard deviation for the values divided by the average of the values; may be expressed as a percentage of the average (CV %). D 123, D13

coefficient of variation unevenness, n —in textiles, the standard deviation of the linear densities over which unevenness is measured expressed as a percentage of the average linear density for the total length within which unevenness is measured. (See also **unevenness** and **mean deviation unevenness**.) D 123, D13

coefficient of variation unevenness, n —in textiles, the standard deviation of the linear densities over which unevenness is measured expressed as a percentage of the average linear density for the total length within which unevenness is measured. (See also **unevenness** and **mean deviation unevenness**.) D 4849, D13

coefficient of viscosity—the ratio between an infinitesimally small increase in stress and the corresponding increase in strain rate. E 1142, E37

coefficient of viscosity (coefficient of absolute viscosity), η (FTL^{-2})—the shearing force per unit area required to maintain a unit difference in velocity between two parallel layers of a fluid a unit distance apart. D 653, D18

coefficient of volume compressibility (modulus of volume change), m_v (L^2F^{-1})—the compression of a soil layer per unit of original thickness due to a given unit increase in pressure. It is numerically equal to the coefficient of compressibility divided by one plus the original void ratio, or $a_v/(1+e)$. D 653, D18

coefficient of volume thermal expansion α_v —for a solid or liquid, the change in volume, relative to the volume of the specimen, accompanying a change of temperature at a specified temperature. E 1142, E37

coefficient of variation—the standard deviation divided by the value of the parameter measured. E 2161, E37

coercive field strength, H_c —the (dc) magnetic field strength required to restore the magnetic induction to zero after the material has been symmetrically cyclically magnetized. A 340, A06

coercive field strength, intrinsic, H_{ci} —the (dc) magnetic field strength required to restore the intrinsic magnetic induction to zero after the material has been symmetrically cyclically magnetized. A 340, A06

coercive force—the magnetizing force at which the magnetic flux density is equal to zero. The corresponding field intensity value is indicative of the ease of difficulty or demagnetization. E 1316, E07

coercivity, H_{cs} —the maximum value of coercive field strength that can be attained when the magnetic material is symmetrically cyclically magnetized to saturation induction, B_s . A 340, A06

coextrusion—in flexible barrier materials, (1) a process whereby two or more plastic streams are forced simultaneously through one or more shaping orifices to become one continuously-formed multi-layered structure. (2) Also, the product resulting from such a process. F 17, F02

coextrusion—a process whereby two or more heated or unheated plastic material streams forced through one or more shaping orifice(s) become one continuously formed piece. F 412, F17

coextrusion—See Terminology F 17. F 1327, F02

COF—coefficient of friction. F 141, F06

COF—coefficient of friction. F 1646, F13

co-fab, n —fabrication process where close-outs and inserts are bonded into the panel the same time the facings are bonded to the core. C 274, D30

cogeneration, n —the simultaneous production of electrical or mechanical energy (power) and useful thermal energy from a single energy stream, such as oil, coal, natural or liquefied gas, biomass, or solar. E 2114, E06

cognizant engineering organization—the company, government agency or other authority responsible for the design, or end use, of the material or component for which nondestructive testing is required. E 1316, E07

cohered—fastened together in strip form, usually with adhesive. (See **collated**.) F 547, F16

cohered—assembled in strip, coil, or other predetermined form as defined in Terminology F 547. F 592, F16

coherence—a property of a beam of electromagnetic radiation in which the phase relationship between any two points across the beam or in time remains essentially constant (see **coherence-length**). E 1316, E07

coherence length—the path difference between the object beam and the reference beam at which interference fringes reduce in contrast by a factor of $\sqrt{2}/2$ (0.707) from the point of maximum contrast. The coherence length is related to the width of the spectral line emitted from the laser: $L_c = c/\Delta\nu$, where c is the speed of light and $\Delta\nu$ is the bandwidth of the spectral emission line. E 1316, E07

coherent precipitate—a precipitated particle of a second phase, the lattice of which still maintains registry with the matrix lattice. Because the lattice spacings are usually different, strains usually exist at the interface. E 7, E04

coherent scattering—a kind of X-ray electron scattering in which the phase of the scattered beam has a definite (not random) relation to the phase of the incident beam. Also called unmodified scattering. E 7, E04

coherent unit system—system in which relations between units contain as numerical factor only the number “one” or “unity,” because all derived units have a unity relationship to the constituent base and supplementary units. E 631, E06

cohesion—the mutual attraction by which elements of a substance are held together. C 904, C03

cohesion—shear resistance at zero normal stress (an equivalent term in rock mechanics is intrinsic shear strength). (ISRM) D 653, D18

cohesion, n —the state in which the constituents of a mass of material are held together by chemical and physical forces. D 907, D14

cohesion, n —for asbestos, lateral force resisting separation of adjacent fibrous elements. D 2946, C17

cohesion, c (FL^{-2})—the portion of the shear strength of a soil

- indicated by the term c , in Coulomb's equation, $s = c + p \tan \phi$.
See intrinsic shear strength.
- apparent cohesion*—cohesion in granular soils due to capillary forces. **D 653, D18**
- cohesion failure, n*—rupture of an adhesive bond, such that the separation appears to be within the adhesive. (Compare *adhesive failure*.) **D 907, D14**
- cohesion failure; cohesive failure, n**—rupture of a bonded assembly in which the separation appears visually to be in the adhesive or the adherend. **D 907, D14**
- cohesionless soil**—a soil that when unconfined has little or no strength when air-dried and that has little or no cohesion when submerged. **D 653, D18**
- cohesive blocking, n*—see **blocking**. **D 907, D14**
- cohesive failure, n**—*in building construction*, failure characterized by rupture within the sealant, adhesive, or coating. **C 717, C24**
- cohesive failure (bonded assembly), n**—a rupture occurring entirely within any single uniform layer of the assembly. **D 1566, D11**
- cohesive force, n**—*in a textile strand*, the force required to overcome fiber cohesion as the strand is being reduced in linear density. **D 123, D13**
- cohesive force, n**—*in a textile strand*, the force required to overcome fiber cohesion as the strand is being reduced in linear density. **D 4849, D13**
- cohesive sediments**—that material whose resistance to initial movement or erosion depends upon the strength of the bond between particles. **D 4410, D19**
- cohesive soil**—a soil that when unconfined has considerable strength when air-dried and that has significant cohesion when submerged. **D 653, D18**
- coil**—a length of the product wound into a series of connected turns. The unqualified term "coil" as applied to tube usually refers to a bunched coil. **B 846, B05**
- coil, absolute*—see **absolute coil**. **E 1316, E07**
- coil, bunched**—a coil in which the turns are bunched and held together such that the cross section of the bunched turns is approximately circular. **B 846, B05**
- coil, double layer flat**—a coil in which the product is spirally wound into two connected disk-like layers such that one layer is on top of the other. (Sometimes called "double layer pancake coil" or "double layer spirally wound coil.") **B 846, B05**
- coiled**—assembled in coil form. **F 592, F16**
- coiled sheet, n**—sheet in coils with slit edges. **B 899, B02**
- coil-fed tool**—tool utilizing a coil of collated fasteners or a coil or wire. **F 592, F16**
- coil, helical**—See **coil, level or traverse wound**. **B 846, B05**
- coil, level or traverse wound**—a coil in which the turns are wound into layers parallel to the axis of the coil such that successive turns in a given layer are next to one another. (Sometimes called a "helical coil.") **B 846, B05**
- coil, level or traverse wound on a reel or spool**—a coil in which the turns are positioned into layers on a reel or spool parallel to the axis of the reel or spool such that successive turns in a given layer are next to one another. **B 846, B05**
- coil loop, n**—one complete rotation (360°) of barbed tape. **F 1379, F14**
- coil method**—a method of magnetization in which part, or whole, of the component is encircled by a current-carrying coil. **E 1316, E07**
- coil, reference*—see **reference coil**. **E 1316, E07**
- coil rotation, n**—the spiraling effect that occurs as the concertina coils are deployed. **F 1379, F14**
- coil, single layer flat**—a coil in which the product is spirally wound into a single disk-like layer. (Sometimes called "pancake coil" or "single layer spirally wound coil.") **B 846, B05**
- coil size**—the dimension of a coil, for example, length or diameter. **E 1316, E07**
- coil spacing**—in electromagnetic testing, the axial distance between two encircling coils of a differential system. **E 1316, E07**
- coil, stagger wound**—a coil in which the turns are positioned into layers approximately parallel to the axis of the coil, but not necessarily with the fixed regularity of a level or traverse wound coil. **B 846, B05**
- coil technique**—a technique of magnetization in which all, or a portion, of the part is encircled by a current-carrying coil. **E 1316, E07**
- coil, test**—in electromagnetic testing, the section of the probe or coil assembly that excites or detects, or both, the electromagnetic field in the material under test. **E 1316, E07**
- coin, v**—to repress a sintered compact to obtain a definite surface configuration. Synonymous with **emboss** (not to be confused with **restrike** or **size**). **B 243, B09**
- coincidence, n**—more than one cell transversing the aperture at the same time. **F 2312, F04**
- coincidence sum peak**—a peak in the observed photon spectrum produced at an energy corresponding to the sum of the energies of two or more gamma- or x-rays from a single nuclear event when the emitted photons interact with the detector within the resolving time of the detector. **E 170, E10**
- coke, n**—a carbonaceous solid produced from coal, petroleum, or other materials by thermal decomposition with passage through a plastic state. **C 709, D02**
- coke**—a carbonaceous solid produced from coal, petroleum, or other materials by thermal decomposition with passage through a plastic state.
- beehive coke, n*—coke manufactured in beehive, rectangular, or similar forms of ovens in a horizontal bed, where heat for the coking process is secured by combustion within the oven chamber.
- by-product coke, n*—coke manufactured with attendant recovery of by-products, in ovens that are heated externally.
- coke breeze, n*—the fine screenings from crushed coke or from coke as taken from the ovens, of a size varied in local practice but usually passing a 12.7-mm (½-in.) or 19.0-mm (¾-in.) screen opening.
- dry coke, n*—a laboratory term applied to coke that has been dried to constant weight in accordance with definite prescribed methods. **D 121, D05**
- coke, n**—a carbonaceous solid produced from coal, petroleum, or other materials by thermal decomposition with passage through a plastic state. **D 4175, D02**
- coke-oven tar, n**—coal tar produced in by-product coke ovens in the manufacture of coke from bituminous coal. **D 8, D04**
- coke-oven tar*—See **coal tar**. **D 1079, D08**
- coke pore, n**—*as used in Test Method D 5061*, a microscopically distinguishable void that is a structural element of coke. **D 121, D05**
- coke reactivity, n**—*as used in Test Method D 5061*, a measure of the mass loss when coke, held at a designated temperature, is contacted with gaseous carbon dioxide over a specific time interval. **D 121, D05**
- coke wall, n**—*as used in Test Method D 5061*, a predominantly carbonaceous layer that encloses a coke pore and which is a structural element and essence of coke. **D 121, D05**
- COL**—See **character outline limit**. **F 149, F05**
- Colburn sheet process**—{archaic} manufacture of sheet glass by bending the vertically drawn sheet over a roll which establishes the definition of draw. **C 162, C14**
- cold-applied**—capable of being applied without heating as contrasted to hot-applied; cold-applied products are furnished in a liquid state, whereas hot-applied products are furnished as solids that must be heated to liquefy them. **C 717, C24**
- cold-cathode gun**—an electron gun in which electrons produced in a gas discharge are accelerated through a small aperture in the anode. **E 7, E04**

cold-cathode ionization gage—see **ionization vacuum gage**.

E 1316, E07

cold checks, n—defect on calendered sheeting consisting of surface roughness.

D 1566, D11

cold-drawing—reducing the cross section by pulling through a die or dies, at a temperature lower than the recrystallization temperature.

B 354, B01

cold filling—the pressurizing of a container by cooling the propellant (and sometimes the product) below its boiling point and transferring it into the container before the valve is put in place. The operation is usually carried out at atmospheric pressure (that is, high pressure equipment is not needed).

D 3064, D10

cold flow—See **creep**.

D 883, D20

cold flow—see **creep**.

D 907, D14

cold flow—See **creep**.

F 412, F17

cold flow—see preferred term **creep**.

F 1251, F04

cold flow (unvulcanized rubber), n—slow deformation, under gravitational force, at or below room temperature.

D 1566, D11

cold forming—process of forming material below the recrystallization temperature by forcing or pressing metal into various dies.

F 1789, F16

cold heading quality material—material that has dimensional, chemical, and residual limits such that it will successfully form a given fastener geometry when machine-applied pressure produces a metal flow that results in the desired geometry. Additionally, subsequent treatment as necessary to achieve given mechanical properties results in a fastener with freedom from internal or external imperfections that would impair its intended use.

F 1789, F16

cold heading wire—wire produced by specially controlled manufacturing practices to provide satisfactory quality for heading, forging, and roll threading.

F 1789, F16

cold isostatic pressing, n—the pressing of a powder, compact, or sintered object by subjecting it, at ambient temperature, to nominally equal pressure from every direction.

B 243, B09

cold joint, n—a plane of weakness in concrete caused by an interruption or delay in the placing operation, which permits the first batch to start setting before the next batch is placed, resulting in little or no bond between the two batches.

C 717, C24

cold joint—See **joint**.

E 631, E06

cold joint, n—boundary between later-applied and previously-applied coatings, plaster, mortar, or concrete.

E 631, E06

cold joint, n—the visible junction in a finish coat.

E 2110, E06

cold junction—See **reference junction**.

E 7, E04

cold junction correction—See **reference junction correction**.

E 7, E04

cold-laps—sheath surface defects where the sheath surface has been galled and torn by a drawing die and the torn surfaces smoothed by a subsequent diameter reduction.

E 344, E20

cold molding—a special process of compression molding in which the molding is formed at room temperature and subsequently baked at elevated temperatures.

D 883, D20

cold molding—a special process of compression molding in which the molding is formed at room temperature and subsequently baked at elevated temperatures. (D20)

F 412, F17

cold pressing, n—the forming of a compact at room temperature.

B 243, B09

cold pressing, n—a bonding operation in which an assembly is subjected to pressure without the application of heat.

D 907, D14

cold-process roofing—a continuous, semiflexible membrane consisting of plies of felts, mats, or fabrics laminated on a roof with alternate layers of roof cement and surfaced with a cold-applied coating.

D 1079, D08

cold-rolled steel—a low-carbon, cold-reduced and annealed sheet steel.

C 286, B08

cold-setting adhesive, n—an adhesive that sets without the application of heat.

D 907, D14

cold setting adhesive—See **adhesive, cold setting**.

E 631, E06

cold setting adhesive—See **adhesive, cold setting**.

E 1749, E06

cold sticking, n—of piston rings, a condition in which the ring is free in its groove while the engine is running but stuck when the piston is cold, normally indicated by the absence of varnish or other deposits on the outer face of the ring and of signs of blowby on the piston skirt.

D 4175, D02

cold-stuck piston ring, n—in internal combustion engines, a piston ring that is stuck when the piston and ring are at room temperature, but inspection shows that it was free during engine operation.

D 4175, D02

cold top melter—an all electric melting furnace in which a thermally insulating layer of batch is maintained on top of the molten glass.

C 162, C14

cold treatment, n—exposing a steel object to temperatures below room temperature for the purpose of obtaining desired conditions or properties, such as dimensional or structural stability.

A 941, A01

cold welding, n—cohesion between two surfaces of metal, generally under the influence of externally applied pressure, at room temperature.

B 243, B09

cold work—controlled mechanical operations for changing the form or cross section of a product and for producing a strain-hardened product at temperatures below the recrystallization temperature.

B 846, B05

cold worked structure—a microstructure resulting from plastic deformation of a metal or alloy below its recrystallization temperature.

E 7, E04

cold working, n—mechanical deformation of a metal at temperatures below its recrystallization temperature.

A 941, A01

cold zone—the volume in the fryer below the heating element or heat exchanger surface designed to remain cooler than the cook zone. See **fryer**.

F 1827, F26

coliform bacteria—a particular group of bacteria primarily found in human and animal intestines and wastes.

D 6161, D19

collaborative test, n—an interlaboratory study of a test method wherein the participants analyze or make measurements on subsamples of the same test material.

D 1356, D22

collagen—the principal fibrous protein in the corium or derma layer of a hide or skin.

D 1517, D31

collagen, n—Type I collagen is a member of a family of structural proteins found in animals.

F 2312, F04

collapse—the flattening of single cells or rows of cells during the drying or pressure treatment of wood, characterized by a caved-in or corrugated appearance.

D 9, D07

collapse, n—inadvertent densification of cellular material during manufacture resulting from breakdown of cell structure.

D 883, D20

collapse, n—(1) inadvertent densification of cellular material during manufacture resulting from breakdown of cell structure; (2) the buckling of the inner liner of composite piping; (3) the buckling or flattening of a plastic rehabilitation liner; (4) the buckling or crushing of a plastic pipe from external forces, such as earth loads or external hydrostatic load.

F 412, F17

collapse scar—that part of a peatland where the whole, or part, of a peat plateau has thawed and collapsed to the level of the surrounding land. Collapses scars are not depressions but are marked by vegetation different from the peatland that was not underlain by permafrost.

D 7099, D18

collapsible tube—See **tube**.

D 996, D10

collar—in grouting, the surface opening of a borehole.

D 653, D18

collar, n—Synonym for **escutcheon**.

E 631, E06

collar—See **railing systems**.

E 631, E06

collar, n—Synonym for **escutcheon**.

E 1481, E06

collar head—intermediate flat head with shanks protruding in both directions of nail axis.

F 547, F16

collar leather—a subdivision of harness leather, made from very light cattlehides in full thickness, or of cattlehide splits, and used for covering horse collars.

D 1517, D31

collar nail—See **collar head, gudgeon, projection head**. F 547, F16

collated—fastened next to each other in strip form. (See **cohered**.)
F 547, F16

collated—assembled in strip or other predetermined form. F 592, F16

collecting surface, *n*—in the rotor of an open-end spinning machine, that portion of the internal surface of the rotor, often in the form of a groove, in which the fibers are condensed for assembly into yarn.
D 123, D13

collecting surface, *n*—in the rotor of an open-end spinning machine, that portion of the internal surface of the rotor, often in the form of a groove, in which the fibers are condensed for assembly into yarn.
D 3888, D13

collection angle—See **angle**. E 673, E42

collection efficiency—See **efficiency**. D 1356, D22

collection efficiency, *n*—in impingement erosion and particulate flows, the cross-sectional area of undisturbed fluid containing particles that will all ultimately impinge on a given solid surface, divided by the projected area of the solid surface, where these two areas are perpendicular to the direction of relative motion between the solid surface and the particles in the undisturbed fluid.
G 40, G02

collection medium, *n*—a liquid or gas that does not affect the measured permeation and in which the test chemical is freely soluble or adsorbed to a saturation concentration greater than 0.5 weight or volume percent.
F 1494, F23

collector, *n*—a reagent used in froth flotation to promote contact and adhesion between particles and air bubbles. D 121, D05

collector, *n*—a device for removing and retaining contaminants from air or other gases. D 1356, D22

collector, *n*—optical components, such as the cornea and lens of the eye, which guide radiant flux from a specimen being observed or measured to a sensor. E 284, E12

collector, concentrating—a solar collector that uses reflectors, lenses, or other optical elements to redirect and concentrate the solar irradiance on the collector aperture onto an absorber of which the surface area is smaller than the collector aperture area.
E 772, E44

collector cover (glazings)—see **cover plate, collector**. E 772, E44

collector efficiency—see **efficiency, collector**. E 772, E44

collector, evacuated tube—a solar collector made from transparent tubing (usually glass) with an evacuated space between the tube and the absorber. The absorber may consist of an inner tube or another shape, with means for removal of thermal energy and may be specially coated.
E 772, E44

collector, flat plate—a nonconcentrating solar collector in which the absorbing surface is essentially planar.
E 772, E44

collector, line-focus—a concentrating solar collector that concentrates the solar flux in one dimension only.
E 772, E44

collector, point focus—a concentrating collector that focuses the solar flux to a point.
E 772, E44

collector, solar thermal—a device designed to absorb solar irradiance and to transfer the thermal energy to a fluid passing through it.
E 772, E44

collector subsystem—that portion of the solar system which includes the solar collectors and related piping or ducts.
E 772, E44

collector, tracking—a solar collector that moves so as to follow the apparent motion of the sun during the day, rotating about one axis or two orthogonal axes.
E 772, E44

collector, trickle—a flat plate solar collector in which unpressurized liquid flows or “trickles” over the absorber.
E 772, E44

collimate—to render fibers parallel.
E 631, E06

collimate—to render fibers parallel.
E 1749, E06

collimation—the operation of controlling a beam of radiation so that its rays are as nearly parallel as possible.
E 7, E04

collimation—the operation of controlling a beam of radiation so that if the light source were a point, the light rays would become parallel. The total bundle of rays diverge as the source size increases.
E 175, E41

collimator—a device of radiation absorbent material intended for defining the direction and angular divergence of the radiation beam.
E 1316, E07

collimator—a device for controlling the size and direction of the ultrasonic beam.
E 1316, E07

collision cascade—a sequential energy transfer between atoms in a solid as a result of bombardment by an energetic species.
E 673, E42

collodion replica—See **replica**. E 7, E04

colloid—a substance of very fine particle size, typically between 0.1 and 0.001 μm in diameter suspended in liquid or dispersed in gas. A system of at least two phases, including a continuous liquid plus solid, liquid or gaseous particles so small that they remain in dispersion for a practicable time.
D 6161, D19

colloidal grout—in grouting, a grout in which the dispersed solid particles remain in suspension (colloids).
D 653, D18

colloidal mixer—in grouting, a mixer designed to produce colloidal grout.
D 653, D18

colloidal particle—an electrically-charged particle, generally smaller in size than 200 μm , dispersed in a second continuous phase.
B 374, B08

colloidal particle, *n*—a dispersed particle with a linear dimension of 5 to 100 nm.
C 1145, C28

colloidal particles—particles that are so small that the surface activity has an appreciable influence on the properties of the aggregate.
D 653, D18

colloids (fluvial sediment)—smaller than 0.00024 mm in diameter.
D 4410, D19

colluvial deposits—that material accumulated along valley margins by mass movements from the adjacent hillsides.
D 4410, D19

colony forming unit (CFU)—unit used in the measure of total bacterial count (TBC).
D 6161, D19

colophony, *n*—a term denoting medium and high grades of rosin.
D 804, D01

colophony, *n*—see **rosin**. D 907, D14

color—a quality of visible phenomena of insulating fluids, the numerical value for which is derived by comparing this quality using transmitted light with that of a series of numbered reference standards.
D 2864, D27

color—that is, the presence of dissolved matter that absorbs the light emitted by *P. phosphoreum* (that is, wavelength of $490 \pm 100 \text{ nm}$).
D 5681, D34

color, *n*—(1) of an object, aspect of object appearance distinct from form, shape, size, position, or gloss that depends upon the spectral composition of the incident light, the spectral reflectance or transmittance of the object, and the spectral response of the observer, as well as the illuminating and viewing geometry.

(2) *perceived*, attribute of visual perception that can be described by color names such as white, gray, black, yellow, brown, vivid red, deep reddish purple, or by combinations of such names.

(3) *colorimetric*, characteristics of a color stimulus denoted by a colorimetric specification with three values, such as tristimulus values.
E 284, E12

Colorado steer—a side-branded steerhide, not necessarily from Colorado.
D 1517, D31

color anodizing—in anodizing aluminum, formation of a colored coating on aluminum where the colored compound, pigment, or dye is incorporated after the coating has been formed. B 374, B08

colorant, *n*—dye, pigment, or other agent used to impart a color to a material.
E 284, E12

colorant—a material used to alter the color of a formulation.
E 609, E35

colorant—a material used to alter the color of the tank mix.
E 1519, E35

color atlas, *n*—a collection of color samples arranged according to a color order system.
E 284, E12

color bleeding, *n*—the loss of color from a dyed fabric when

color bleeding, *n*

immersed in water, drycleaning solvent, or similar liquid medium, with consequent coloring of the liquid medium. (Compare **color staining, crocking**.) **D 123, D13**

color bleeding, *n*—the loss of color from a dyed fabric when immersed in water, dry-cleaning solvent, or similar liquid medium, with consequent coloring of the liquid medium. (Compare **color staining**.) **D 3990, D13**

color bleed resistance—the freedom from intermixing of the inks on multiple-colored ribbons. **F 221, F05**

color blindness, *n*—total or partial inability to differentiate certain hues. **E 253, E18**

color constancy, *n*—the general tendency of the colors of an object to remain constant when the color of the illumination is changed. **E 284, E12**

color contrast, *n*—in *textiles*, a general term for a visible color difference between two adjacent areas. **D 123, D13**

color contrast, *n*—in *textiles*, a general term for a visible color difference between two adjacent areas. **D 4850, D13**

color difference—(1) the magnitude and character of the difference between two colors, described by such terms as redder, bluer, lighter, darker, grayer, or cleaner. (2) the magnitude and direction of the difference between a sample and a standard, computed from tristimulus values, or chromaticity coordinates and luminance factor, by means of a specified set of color difference equations. **C 242, C21**

color difference, *n*—(1) *perceived*, the magnitude and character of the difference between two colors described by such terms as redder, bluer, lighter, darker, grayer, or cleaner.

(2) *computed*, the magnitude and direction of the difference between two psychophysical color stimuli and their components computed from tristimulus values, or chromaticity coordinates and luminance factor, by means of a specified set of color-difference equations. **E 284, E12**

color-difference units, *n*—units of size of the color differences calculated according to various equations. Such color differences *cannot* be accurately converted between different equations by the use of average factors. **E 284, E12**

colored—See **anodized, blued, enameled, lacquered, painted**.

F 547, F16

colored fiber, *n*—in *wool top*, any fiber the color or shade of which differs from the normal color or shade of the fiber mass of the sample. **D 123, D13**

colored fiber, *n*—in *wool top*, any fiber the color or shade of which differs from the normal color or shade of the fiber mass of the sample. **D 4845, D13**

color frit—a frit containing a colorant in order to produce a strong color in the porcelain enamel. **C 286, B08**

colorfastness, *n*—the resistance of a material to change in any of its color characteristics, to transfer its colorant(s) to adjacent materials, or both, as the result of exposure of the material to any real or simulated environment that might be encountered during processing, storage, use or testing of the material. **D 123, D13**

colorfastness, *n*—the resistance of a material to change in any of its color characteristics, to transfer its colorant(s) to adjacent materials, or both, as the result of exposure of the material to any real or simulated environment that might be encountered during processing, storage, use or testing of the material. **D 4849, D13**

color film—a photographic film consisting of several emulsion layers, where the individual layers selectively record various wavelengths of light. **E 7, E04**

color former—see **leuco dye**.

F 1623, F05

colorfulness, *n*—see **chromaticness**.

E 284, E12

color grading, *n*—the act of identifying a specimen by a color grade or color score that is specific to the color and the material graded.

D 123, D13

color grading, *n*—the act of identifying a specimen by a color grade or color score that is specific to the color and the material graded.

D 7139, D13

color grading, *n*—the act of identifying a specimen by a color grade or color score, which is specific to the color and the material graded. **E 284, E12**

colorimeter, *n*—an instrument used for color measurement based on optical comparison with standard colors. **D 1356, D22**

colorimeter, *n*—see **tristimulus colorimeter, visual colorimeter**. **E 284, E12**

colorimetric purity, *p_c*—the fraction of spectrally pure light in an additive mixture with reference achromatic (white) light to produce a color that matches that of the color stimulus considered. (As a reference achromatic light, the CIE recommends an equal energy source for self-luminous bodies and illuminant D_{65} (daylight) for nonself-luminous bodies.) **E 284, E12**

colorimetric spectrometer, *n*—spectrometer that is capable of producing spectral reflectance or transmittance data and colorimetric data (such as tristimulus values and derived coordinates) derived from the spectral data. See **spectrocolorimeter**. **E 284, E12**

colorimetry, *n*—the science of color measurement. **E 284, E12**

colorimetry—an analytical technique that is similar to spectrophotometry except that ultraviolet-visible light of a single, narrow wavelength range is passed through a sample cell containing dissolved analyte, and the absorption measured. **E 631, E06**

coloring—(1) the production of desired colors on metal surfaces by appropriate chemical or electrochemical action.

(2) light buffing of metal surfaces for the purpose of producing a high luster. Called "color buffing." **B 374, B08**

color lamp, *n*—*in color determination of cotton with a Color Meter*, a lamp with a specific energy output function used in conjunction with special tristimulus filters to obtain a desired response function. **D 123, D13**

color lamp, *n*—*in color determination of cotton with a Color Meter*, a lamp with a specific energy output function used in conjunction with special tristimulus filters to obtain a desired response function. **D 7139, D13**

color match, *n*—(1) condition existing when colors match within a specified or agreed tolerance. Sometimes called *commercial color match*.

(2) condition existing when colors are indistinguishable; a normal observer is usually implied. Sometimes called an *exact color match*. **E 284, E12**

color matching, *n*—procedure for providing, by selection, formulation, adjustment, or other means, a trial color that is indistinguishable from, or within specified tolerances of, a specified standard color under specified conditions. **E 284, E12**

color-matching functions, *n*—the amounts, in any trichromatic system, of the three reference color stimuli needed to match by an additive mixture monochromatic components of an equal energy spectrum. **E 284, E12**

color measurement, *n*—process of deriving, by visual or instrumental means, a set of three numbers that describe the attributes of a color, in the form of a color notation or a colorimetric specification. **E 284, E12**

color meter, *n*—an instrument which measures the fiber sample color as presented in the viewing window, in terms of the tristimulus values Y and Z and transmits these values to the IC/TC for further processing. **D 123, D13**

color meter, *n*—an instrument which measures the fiber sample color as presented in the viewing window, in terms of the tristimulus values Y and Z and transmits these values to the IC/TC for further processing. **D 7139, D13**

color mixture, *n*—see **additive color mixture, additive color stimulus mixture, or subtractive color mixture**. **E 284, E12**

color notation, *n*—the symbols used in a systematic way to designate colors. **E 284, E12**

color of an object, *n*—the aspect of the appearance of an object dependent upon the spectral composition of the incident light, the spectral reflectance or transmittance of the object, and the spectral response of the observer.

- hue, *n***—The attribute of color perception by means of which a color is judged to be red, orange, yellow, green, blue, purple, or intermediate between adjacent pairs of these, considered in a close ring, red and purple being an adjacent pair. (White, gray and black colors possess no hue).
- lightness, *n***—(1) The attribute by which a perceived color is judged to be equivalent to a member of a series of grays ranging from black to white. (2) The attribute of color perception by which a non-self-luminous body is judged to reflect more or less light.
- saturation**—attribute of a visual sensation that permits a judgment to be made of the proportion of pure chromatic color in the total sensation. **D 16, D01**
- color (of an object), *n***—the appearance of an object dependent upon the spectral composition of radiant and incident light, the spectral reflectance or transmittance of the object, and the psychological response of the observer. The experience may be described in terms of three attributes: hue, brightness, and chroma. (For consensus technical definition see **color** in Terminology E 284 as defined by Committee E12.)
- hue**—attribute of color related to the wavelength of electromagnetic energy and experienced as “red,” “green,” “blue,” and other elements of the visible spectrum.
- brightness**—aspect of visual perception whereby an area appears to emit more or less light.
- chroma**—experienced as color purity, attribute of color used to indicate the degree of departure of the color from a gray of the same brightness. **E 253, E18**
- color order system, *n***—a rational method or plan of ordering and specifying all producible object or display colors, or all within a limited domain, by means of a set of physical standards selected and displayed so as to represent adequately the whole set of such colors under consideration. **E 284, E12**
- color oxide**—a material used to impart color to a porcelain enamel. **C 286, B08**
- color perception, *n***—subjective impression of color, as modified by the conditions of observation and by mental interpretation of the stimulus object. **E 284, E12**
- color play, *n***—the predictable sequence of colors exhibited by a liquid crystal formulation as it passes through its active temperature range. For example, as temperature increases, a formulation exhibits successive tan, red, green, and blue colors. **E 344, E20**
- color preference, *n***—preference, within a specific application, for one color over other related colors. **E 284, E12**
- color rendering, *n***—effect of a light source on the color appearances of objects compared to their color appearances under a reference light source. (See also **CIE color rendering index**.) **E 284, E12**
- color reversion**—a process common to almost all bleached cellulose pulps in which the color darkens to a greater or lesser extent on standing. **D 1695, D01**
- color scale, *n***—see **Gardner color scale, petroleum color scale, platinum-cobalt color scale, Saybolt color**. **E 284, E12**
- color solid, *n***—see **color space**. **E 284, E12**
- color space**—a three dimensional arrangement for representing all possible colors; for example, in the color space defined by the color scales *L*, *a*, and *b* used to describe the color of opaque specimens, scale *L* is a measure of lightness, *a* is a measure of redness (plus) or greenness (minus), and *b* is a measure of yellowness (plus) or blueness (minus). **C 242, C21**
- color space, *n***—*specific to this standard*, the daylight color of opaque specimens are represented by points in a space in terms of three color scales: reflectance, R_d , and the chromaticity coordinates for redness or greenness, $\pm a$, and yellowness or blueness, $\pm b$. **D 123, D13**
- color space, *n***—*specific to this standard*, the daylight color of opaque specimens are represented by points in a space in terms of three color scales: reflectance, R_d , and the chromaticity coordinates for redness or greenness, $\pm a$, and yellowness or blueness, $\pm b$. **D 7139, D13**
- color space, *n***—a geometric space, usually of three dimensions, in which colors are arranged systematically. **E 284, E12**
- color specification, *n***—notation or set of three color-scale values used to designate a color in a specified color system. Practical color specifications may include color tolerances as well as target color designation. **E 284, E12**
- color splash**—a splash, smear, or streak of contrasting color evident on the inside or outside surface of the gloves or sleeves that was deposited during the dipping operation and is vulcanized into the material as part of the homogenous compound. **F 819, F18**
- color stability, *n***—*in coated glass textiles*, the ability of the applied coating to resist fading from exposure to sunlight and water. **D 123, D13**
- color stability**—the ability of the applied coating color to resist fading from exposure to sunlight and water. **D 2825, D21**
- color stability, *n***—*in coated glass textiles*, the ability of the applied coating to resist fading from exposure to sunlight and water. **D 7018, D13**
- color staining, *n***—the undesired pickup of color by a fabric: (1) when immersed in water, drycleaning solvent, or similar liquid medium, that contains dyestuffs or coloring material not intended for coloring the fabric, or (2) by direct contact with other dyed material from which color is transferred by bleeding or sublimation. (Compare **crocking** and **color bleeding**.) **D 123, D13**
- color staining, *n***—the undesired pickup of color by a fabric: (1) when immersed in water, dry-cleaning solvent, or similar liquid medium, that contains dyestuffs or coloring material not intended for coloring the fabric, or (2) by direct contact with other dyed material from which color is transferred by bleeding or sublimation. (Compare **crocking, color bleeding**) **D 3990, D13**
- color staining, *n***—the discoloration of a material by transfer of colorant from another material. **E 284, E12**
- color standard**—a plaque or other physical standard of established color value, against which standardization of an instrument is made. **C 242, C21**
- color stimulus, *n***—a radiant flux capable of producing a color perception. **E 284, E12**
- color stimulus function, $\phi(\lambda)$, *n***—description of a color stimulus by the spectral concentration of a radiometric quantity, such as radiance or radiant power, as a function of wavelength. **E 284, E12**
- color temperature**—the temperature of a blackbody in degrees Kelvin (K). In photography, the apparent temperature in K of a luminous source which may be measured by its emission ratio of blue to red light. **E 7, E04**
- color temperature, *n***—*of a source*, the temperature, usually expressed in kelvins, of a full radiator that would emit light of the same chromaticity as the source. (See also **correlated color temperature, distribution temperature**.) **E 284, E12**
- color temperature**—temperature in degrees Kelvin (K) at which a black body must be operated to give a color equal to that of the source in question. **E 1142, E37**
- color tolerance, *n***—the permissible color difference between sample and specified color. **E 284, E12**
- color tolerance set, *n***—a group of colored standards, usually seven painted chips, arranged on a single card, one exhibiting a desired color, and two each exhibiting the limits of the permissible range of color variation in each of the color attributes. **E 284, E12**
- color variation**—*for asbestos-cement products*, property of nonuniform color exhibited before or after weathering. **D 2946, C17**
- column, *n***—a building member, usually structural and vertical, subjected to longitudinal (axial) compression and also to lateral forces such as bending. **E 631, E06**
- columnar structure**—a macro- or microstructure characterized by elongated grains whose long axes are parallel, for example, to solidification direction, electroplated direction, etc. **E 7, E04**
- column, electron microscope**—the assembly of gun, lenses, and specimen, viewing and plate chambers. **E 7, E04**
- coma**—a lens aberration occurring in that part of the image field that

is some distance from the principal axis of the system. It results from different magnification in the various lens zones. Extra-axial object points appear as short comet-like images with the brighter small head toward the center of the field (positive coma) or away from the center (negative coma). **E 175, E41**

combed finish, *n*—the surface texture resulting when faces are altered by more or less parallel scratches or scarfs in manufacture. **C 43, C15**

comber/brusher, *n*—an instrument which prepares the test beard of fibers for length, length uniformity, strength, and elongation measurements by combing the test specimen to remove loose or unclamped fibers and paralleling the individually clamped fibers, and by brushing the clamped fibers to remove fiber crimp and smooth the test beard of cotton. **D 123, D13**

comber/brusher, *n*—an instrument which prepares the test beard of fibers for length, length uniformity, strength, and elongation measurements by combing the test specimen to remove loose or unclamped fibers and paralleling the individually clamped fibers, and by brushing the clamped fibers to remove fiber crimp and smooth the test beard of cotton. **D 7139, D13**

comber leather—a steerhide leather, heavily stuffed and usually boarded, used in textile combing machines. **D 1517, D31**

combination change key—a key used in resetting a key change combination. **F 471, F12**

combination electrode—an electrochemical apparatus that incorporates an ion-selective electrode and a reference electrode in a single assembly thereby avoiding the need for a separate reference electrode. **D 4127, D19**

combination last (or shoe)—designed to provide a proper fit for the individual with thinner than normal instep or heel. Length and width will be of standard measurements, but narrower fitting qualities will prevail through instep, waist, and heel. **F 869, F08**

combination of features, *n*—See **feature**—*of a facility*. **E 631, E06**

combination of features, *n*—*of a facility*, two or more features which, when present together in a facility, affect a level of serviceability of that facility. **E 631, E06**

combination of features, *n*—See **feature**—*of a facility*. **E 1480, E06**

combination of features, *n* (éléments caractéristiques combiné)—*of a facility*, features which, when present together in a facility, affect satisfying a requirement for serviceability. **E 631, E06**

combination oven—equipment that combines the function of hot air convection or super-heated steam heating, or both, to perform steaming, baking, roasting, rethermalizing, and proofing of various food products. See **oven**. **F 1827, F26**

combination oven/steamer—See **combination oven**. **F 1827, F26**

combination product, *n*—as defined in 21 CFR § 3.2(e), the term combination product includes: (1) A product comprised of two or more regulated components, that is, drug/device, biologic/device, drug/biologic, or drug/device/biologic, that are physically, chemically, or otherwise combined or mixed and produced as a single entity; (2) Two or more separate products packaged together in a single package or as a unit and comprised of drug and device products, device and biological products, or biological and drug products; (3) A drug, device, or biological product packaged separately that according to its investigational plan or proposed labeling is intended for use only with an approved individually specified drug, device, or biological product where both are required to achieve the intended use, indication, or effect and where upon approval of the proposed product the labeling of the approved product would need to be changed, for example, to reflect a change in intended use, dosage form, strength, route of administration, or significant change in dose; or (4) Any investigational drug, device, or biological product packaged separately that according to its proposed labeling is for use only with another individually specified investigational drug, device, or biological product where both are required to achieve the intended use, indication, or effect." Furthermore, "many somatic cell products administered to patients will be combinations of a biological

product and a device or of a drug, a biological product, and a device." The term "combination product" may apply to TEMPs. **F 2312, F04**

combination stranded conductor—a conductor constructed with wires of different diameters with such differences occurring either within a single layer or from layer to layer. **B 354, B01**

combination tanned—formerly, tanned with a blend of vegetable extracts. Today, tanned with two or more types of tanning materials, such as chromium compounds and vegetable extracts, or chromium compounds and synthetic tannins. **D 1517, D31**

combination vacuum cleaner, *n*—a canister vacuum cleaner having a motorized nozzle separated from the cleaner housing but connected to it by means of a hose or hose and wand. **F 395, F11**

combined, *adj*—the application of two or more techniques to different samples at the same time. (ICTAC) **E 473, E37**

combined sewer—a pipeline intended to convey sewage and storm water. **C 822, C13**

combined site offset, μ_s , *n*—calculated difference in degrees of measured temperature between a selected reference body site and ear canal temperature and averaged over the population of representative study samples. **E 344, E20**

combined water, *n*—the water chemically held, as water of crystallization, by the calcium sulfate dihydrate or hemihydrate crystal. **C 11, C11**

combing, *n*—*in flax*, the processing of two so as to produce tops or sliver which have the staple length and width suitable for use in the worsted spinning system. **D 123, D13**

combing, *v*—*in flax*, the processing of tow so as to produce tops or silver which have the staple length and width suitable for use in the worsted spinning system. **D 6798, D13**

combing wool, *n*—wool that is strong and strictly of combing length, that is, 2 in. (50 mm) or more. **D 123, D13**

combing wool, *n*—wool that is strong and strictly of combing length, that is, 2 in. (50 mm) or more. **D 4845, D13**

comb-rack—(1) a burning tool shaped like a comb used for supporting ware during firing.

(2) A comb-like tool for supporting ware during the metal pickling operation. **C 286, B08**

combustible, *adj*—capable of undergoing combustion. **E 176, E05**

combustible—that portion of the refuse-derived fuel sample which is consumed upon ignition exclusive of the moisture present in the sample. **E 856, D34**

combustible carbon, *n*—carbon content remaining in the solid products derived from the combustion or reaction of coal, coal by-products, or coke, exclusive of carbonate in any form. **D 121, D05**

combustible gases—flammable gases formed from breakdown (partial or complete) of some insulating materials subjected to electrical or thermal stress, or both. **D 2864, D27**

combustible liquid—a liquid having a flash point at or above 37.8°C (100°F). The flash point of a liquid having a viscosity less than 45 SUS at 37.8°C (100°F) and a flash point below 93.4°C (200°F) shall be determined in accordance with Test Methods D 93. **E 772, E44**

combustibles, *n*—the value obtained by subtracting the dry weight (in percent) of the ash (as determined in Test Method D 3174) from 100 % representing original weight of analyzed sample. **D 121, D05**

combustibles, *n*—the portion of a sample which is consumed by oxidation upon ignition and exclusive of the moisture present in the sample. **D 5681, D34**

combustible textile, *n*—a textile that will ignite and burn or that will give off vapors that will ignite and burn when subjected to external sources of ignition. (See **noncombustible textile**) **D 123, D13**

combustible textile, *n*—a textile that will ignite and burn or that will give off vapors that will ignite and burn when subjected to external

- sources of ignition. (Compare **flammable textile, noncombustible textile**.) **D 4391, D13**
- combustion, n**—a chemical process of oxidation that occurs at a rate fast enough to produce heat and usually light either as glow or flames. **D 123, D13**
- combustion, n**—a chemical process of oxidation that occurs at a rate fast enough to produce heat and usually light either as glow or flames. **D 4391, D13**
- combustion, n**—the chemical reaction of a material through rapid oxidation with the evolution of heat and light. **D 5681, D34**
- combustion, n**—a chemical process of oxidation that occurs at a rate fast enough to produce temperature rise and usually light either as a glow or flame. (See also **glow** and **smoldering**.) **E 176, E05**
- combustion, n**—a chemical process of oxidation that occurs at a rate fast enough to produce heat and usually light either as glow or flames. **F 1494, F23**
- combustion chamber, n**—*in reciprocating internal combustion engines*, the volume bounded by the piston crown and any portion of the cylinder walls extending above the piston crown when in the top dead center position, and the inner surface of the cylinder head including any spark plugs and other inserted components. **D 4175, D02**
- combustion products, n**—effluent produced when a material undergoes combustion (see also **smoke**; see also **combustion**). **E 176, E05**
- combustion products**—airborne effluent from a material undergoing combustion; this may also include pyrolysates. **E 176, E05**
- combustion system downdrafting, n**—the reversal of the ordinary (upward) direction of air flow in a combustion system when vented combustion appliances are not operating. **D 1356, D22**
- combustion system spillage, n**—entry of combustion products into a building, caused by backdrafting, vent blockage, or a leaky heat exchanger. **D 1356, D22**
- combustion unit, n**—any number of devices to produce or release energy for the beneficial purpose of production by burning a fuel to include, but not limited to, units such as industrial power boilers, electrical utility generating boilers, and cement kilns. **D 5681, D34**
- comeback**—the time required for a box furnace to return to temperature after the introduction of a load of ware. **C 286, B08**
- comet, n**—extraneous ink deposited in the shape of a round dot with a trailing tail. **D 6488, D01**
- comforter, n**—a bedcovering assembly, consisting of an insulating filler secured between two layers of fabric, used primarily to reduce heat loss. **D 123, D13**
- comforter, n**—a bedcovering assembly, consisting of an insulating filler secured between two layers of fabric, used primarily to reduce heat loss. **D 7023, D13**
- Comite Consultatif International Telegraphique et Telephonique (Consultive Committee for International Telephone and Telegraph), n**—a committee established under the United Nations to recommend worldwide communication usage standards. (See **CCITT**.) **F 1457, F05**
- command, n**—a byte or sequence of bytes from the host computer which invokes options available with the laser printer. **F 1457, F05**
- commentary, n**—the fourth part of a performance statement, consisting of an informative narrative explaining aspects of the performance statement. **E 2151, E06**
- commercial allowance, n**—an arbitrary value equal to the commercial moisture regain plus a specified allowance for finish, used with the mass of scoured, oven-dried yarn, to compute (1) yarn linear density, (2) the commercial or legal mass of a shipment or delivery of any specific textile material (see also **commercial moistureregain**) or (3) the mass of a specific component in the analysis of fiber blends. **D 123, D13**
- commercial allowance, n**—an arbitrary value equal to the commercial moisture regain plus a specified allowance for finish, used with the mass of scoured, oven-dried yarn, to compute (1) yarn linear density, (2) the commercial or legal mass of a shipment or delivery of any specific textile material (see also **commercial moisture regain**) or (3) the mass of a specific component in the analysis of fiber blends. **D 4849, D13**
- commercial allowance (CA), n**—an arbitrary value, equal to the commercial moisture regain, plus a specified allowance for finish, used with the mass of scoured, oven-dried yarn, to compute (1) yarn linear density, (2) the commercial or legal mass of a shipment or delivery of any specific textile material (see also **commercial moistureregain**), or (3) the mass of a specific component in the analysis of fiber blends. **D4920, D13**
- commercial composition, n**—*in wool*, the percentages by weight of wool base, moisture, and other non-wool base components in wool to which a specific commercial designation is applied. **D 123, D13**
- commercial composition, n**—*in wool*, the percentages by weight of wool base, moisture, and other nonwool-base components in wool to which a specific commercial designation is applied. **D 4845, D13**
- commercial designation, n**—*in wool*, a term applied to a lot of wool in a stated form, and having a specified commercial composition. **D 123, D13**
- commercial designation, n**—*in wool*, a term applied to a lot of wool in a stated form, and having a specified commercial composition. **D 4845, D13**
- commercial laundering**—a process by which textile products or specimens may be washed, bleached, rinsed, dried, and pressed typically at higher temperatures, higher pH and longer times than used for home laundering. **D 123, D13**
- commercial laundering, n**—a process by which textile products or specimens may be washed, bleached, rinsed, dried, and pressed typically at higher temperatures, higher pH, and longer times than used for home laundering. **D 3136, D13**
- commercial mass, n**—billed mass as determined by a generally accepted method or as agreed upon between the purchaser and supplier. **D 123, D13**
- commercial mass, n**—billed mass as determined by a generally accepted method or as agreed upon between the purchaser and supplier. **D 4849, D13**
- commercial mass, n**—billed mass as determined by a generally accepted method or as agreed upon between the purchaser and seller. **D4920, D13**
- commercial moisture content, n**—*for wool*, the moisture calculated as a percentage of the weight of the wool, top, noils, yarn, fabric, etc., in the “as-is” condition; that is, containing whatever moisture, oil, grease, or other extraneous matter that may be present. **D 123, D13**
- commercial moisture content, n**—the moisture calculated as a percentage of the weight of the wool, top, noils, yarn, fabric, etc., in the “as-is” condition; that is, containing whatever moisture, oil, grease, or other extraneous matter that may be present. **D 4845, D13**
- commercial moisture content, n**—*in wool*, the moisture calculated as a percentage of the mass of the wool, top, noils, yarn, fabric, etc., in the “as-is” condition; that is, containing whatever moisture, oil, grease, or other extraneous matter that may be present. **D4920, D13**
- commercial moisture regain, n**—a formally adopted arbitrary value, to be used with the oven-dried mass of textile fibers, when calculating the commercial mass of a shipment or delivery. **D 123, D13**
- commercial moisture regain**—see **moisture regain, commercial**. **D 1695, D01**
- commercial moisture regain (CMR), n**—a formally adopted, arbitrary value, to be used with the oven-dried mass of textile fibers, when calculating the commercial mass of a shipment or delivery. **D4920, D13**
- commercial sterility**—*of thermally processed food*, the condition achieved by application of heat, alone or in combination with other appropriate treatments, to render the food free of microorganisms

commercial sterility

- capable of growing in the food at normal nonrefrigerated conditions at which the food is likely to be held during distribution and storage. **F 17, F02**
- commercial tire, n**—truck and industrial tires. **D 5681, D34**
- commercial vacuum cleaner, n**—a vacuum cleaner suitable for the heavy-duty and sometimes continuous cleaning tasks encountered in establishments such as hotels, motels, office buildings, churches, clubs, etc. **F 395, F11**
- commercial weight, n**—billed weight as determined by a generally accepted method or as agreed to by the purchaser and the seller. **D 4845, D13**
- commingling**—mixing of fasteners from different lots that are of the same grade and size in the same container. **F 1789, F16**
- comminuted powder, n**—a powder produced by mechanical attrition of solid metal or powder. **B 243, B09**
- comminution**—the act or process of reduction of particle size with attendant increase in surface area and population of particles, usually but not necessarily by grinding, milling, or pulverizing. **C 242, C21**
- comminution, n**—the act or process of reduction in particle size, usually but not necessarily by grinding or milling. **C 1145, C28**
- comminution, n**—*in sample preparation*, a process that reduces the particle size of a sample. **E 135, E01**
- common area**—room or area that is accessible to all tenants in a building or development (for example, hallway, vestibule, laundry area). **E 631, E06**
- common area, n**—a portion of a building that is generally accessible to all occupants. Such an area may include, but is not limited to, hallways, stairways, laundry and recreational rooms, playgrounds, community centers, garages, and boundary fences. **E 1605, E06**
- common brad**—See **brad**. **F 547, F16**
- common cause**—common cause variation affects all the individual values of the process output being studied. In control chart analysis, it appears as part of the random process variation. **F 1789, F16**
- common cut nail**—normally, wedge-shaped, 1/2 to 6-in. nails of various types sheared from stiff-stock-sheet steel, with sheared-square point end narrower than upset head end. **F 547, F16**
- common nail, common wire nail**—bright, plain-shank, regular-stock-steel, 1/2 by 0.035 to 6 by 0.262-in. nails with flat 1/64 to 1/32-in. head and medium diamond point. Diameter is larger than that for sinkers, coolers, corkers, and box nails of same length. **F 547, F16**
- common ungrounded junction, n**—measuring junctions within the same multi-pair thermocouple that are electrically isolated from the sheath but electrically connected to each other. **E 344, E20**
- communicating pores, n**—see **interconnected porosity**. **B 243, B09**
- communication**—*in grouting*, subsurface movement of grout from an injection hole to another hole or opening. **D 653, D18**
- communication resource**—an entity responsible for implementation of direct medical direction, or entities responsible for response and scene two-way communication, or both (also known as medical control resource). **F 1177, F30**
- comonomer, n**—one of two or more monomer species that polymerize to form a copolymer. **D 1566, D11**
- compact, n**—an object produced by the compression of metal powder, generally while confined in a die, with or without the inclusion of nonmetallic constituents. Synonymous with **briquet**. **B 243, B09**
- compact, n**—the consolidated powder from one can; it may be used to make one or more parts. **B 899, B02**
- compact**—to treat glass in a manner, such as by heat treatment, to approach maximum density. **C 162, C14**
- compacted backfill, n**—*in pipe laying*, backfill material which has been compacted to the density specified by the engineer. **C 1154, C17**
- compacted backfill, n**—*for pipe laying*, backfill material that has been compacted to the density specified by the engineer. **D 2946, C17**

- compacted graphite iron, n**—a cast iron that has been treated in the liquid state so as to cause its graphitic carbon to occur in the compacted graphite shape in the as-cast condition. (See **graphite, compacted and graphite, spheroidal**.) **A 644, A04**
- compactibility, n**—a conceptual term, encompassing the powder characteristics of compressibility, green strength, edge retention, and lamination tendency, that relates to the ability of a powder to be consolidated into a usable green compact. **B 243, B09**
- compactibility**—measure of a boom's storage volume per unit length (m^3/m). **F 818, F20**
- compacting, n**—a process in which a powder held in a die or other container is subjected to an external force in order to densify the powder and produce a compact of prescribed shape and dimensions. **B 243, B09**
- compacting**—See **debulking**. **E 631, E06**
- compacting**—See **debulking**. **E 1749, E06**
- compacting tool set, n**—an assembly of tooling items in which powder is pressed. **B 243, B09**
- compaction**—mechanical or hydraulic consolidation of backfill to achieve stability. **C 896, C04**
- compaction**—the densification of a soil by means of mechanical manipulation. **D 653, D18**
- compaction**—in crossflow filtration, the result of applied pressure and temperature compressing a polymeric membrane which may result in a decline in flux. **D 6161, D19**
- compaction, n**—the densification of a soil or coal combustion product by means of mechanical manipulation; reduction in bulk volume of solid waste by rolling and tamping. **E 2201, E50**
- compaction curve (Proctor curve) (moisture-density curve)**—the curve showing the relationship between the dry unit weight (density) and the water content of a soil for a given compactive effort. **D 653, D18**
- compaction ratio, n**—the measurement of the relationship of volume displacement of a package before and after simulated landfill conditions as determined in standardized tests. **D 996, D10**
- compaction, soil**—act of packing soil with mechanical force to increase its density. **F 412, F17**
- compaction test (moisture-density test)**—a laboratory compacting procedure whereby a soil at a known water content is placed in a specified manner into a mold of given dimensions, subjected to a compactive effort of controlled magnitude, and the resulting unit weight determined. The procedure is repeated for various water contents sufficient to establish a relation between water content and unit weight. **D 653, D18**
- compact stranded conductor**—a unidirectional or unilay or conventional concentric conductor, constructed with a central core surrounded by one or more layers of helically laid wires and formed into final shape by rolling, drawing, or other means; and manufactured to a specified nominal diameter, approximately 8 to 10 % below the nominal diameter of a conventional non-compact conductor of the same cross-sectional area. **B 354, B01**
- comparative measurements**—in electromagnetic testing, measurements made in which the unbalance in the system is measured using comparator coils in contrast to differential and absolute measurements. (See also **comparator coils**.) **E 1316, E07**
- comparative readout**—in electromagnetic testing, the signal output of comparator coils. (See also **comparator coils**.) **E 1316, E07**
- comparative system**—a system that uses coil assemblies and associated electronics to detect any electric or magnetic condition, or both, that is not common to the test specimen and the standard (see **comparator coils**). (E 566) **E 1316, E07**
- comparator coils**—in electromagnetic testing, two or more coils electrically connected in series opposition but arranged so that there is no mutual induction (coupling) between them such that any electric or magnetic condition, or both, that is not common to the test specimen and the standard, will produce an unbalance in the system and thereby yield an indication. **E 1316, E07**

comparison question, *n*—type of question, the physiological responses from which are compared to those generated by the relevant questions. **E 2035, E52**

comparison sample, *n*—(fire debris) 1) a sample of material collected from a fire scene which is, to the best of the investigator's knowledge, identical in every respect to a sample suspected of containing ignitable substance, but which does not contain ignitable substance. 2) a sample of suspected ignitable substance submitted for the purpose of comparing with any ignitable substance separated from a debris sample. (see **control sample**) **E 1732, E30**

comparison standard—a standard micrograph or a series of micrographs, usually taken at 75 or 100 diameters, or a suitable equivalent built into the eyepiece and used to determine grain size by direct comparison with the image. **E 7, E04**

compatibility, *n*—*in building construction*, the capability of two or more materials to be placed in contact or close proximity with one another and each material maintaining its usual physical or chemical properties, or both. **C 717, C24**

compatibility—the ability of various components or an aerosol formulation to be used together without undesirable physical or chemical results. **D 3064, D10**

compatibility, *adj*—the ability of materials to exist in contact without specified (usually hazardous) consequences under a defined scenario. **E 1445, E27**

compatibility agent—a surface-active agent that allows simultaneous application of liquid fertilizer and agrichemical, or two or more agrichemical formulations, as a uniform tank mix, or improves the homogeneity of the mixture and the uniformity of the application. **E 1519, E35**

compatible—nonstaining to substrate and sealant and nondetrimental to sealant performance. **C 717, C24**

compatible—(1) a condition wherein components of a plastic piping system or different specific plastic materials, or both, can be joined together for satisfactory joints. (2) in relation to elastomeric seal joints, a condition wherein the elastomer does not adversely affect the pertinent properties of the plastic pipe or fittings, or both, when the sealing gasket is in intimate contact with the plastic for a prolonged period. **F 412, F17**

compatible—not injurious to or changing the physical or electrical characteristics of the blankets or affecting their application, use, or acceptability. **F 819, F18**

compatible cartridge—any all-in-one cartridge that can be used in a particular printer or copier, whether new, recycled or remanufactured. **F 335, F05**

compatible materials, *n*—*in building construction*, compounds or substances that can exist in close proximity to one another without detrimental effects on either. **C 717, C24**

compensating extension wires, *n*—those extension wires fabricated from materials basically different in composition from the thermocouple. **E 344, E20**

compensating eyepiece—one designed for use with objectives such as apochromats, the lateral chromatic aberration of which is undercorrected. **E 7, E04**

compensating eyepieces—those designed for use with objectives such as apochromats in order to correct chromatic aberration. **E 175, E41**

compensating lead wires—wires leading from a thermocouple to the voltage-measuring instrument. These wires must be of such compositions that they will generate an *emf* equivalent to the *emf* generated by the reference junction of the couple. **E 7, E04**

compensating thermocouple, *n*—a thermocouple for the purpose of generating an electrical signal representing long-term changes in the stack metal temperatures wherein a fraction of the signal generated is subtracted from the signal developed by the stack-gas thermocouples. **E 176, E05**

compensation line, *n*—a line of plot on log-log paper where the coordinates are scar diameter in millimetres and applied load in

kilograms-force (or newtons) obtained under dynamic conditions. **D 4175, D02**

compensation scar diameter, *n*—the average diameter, in millimetres, of the wear scar on the stationary balls caused by the rotating ball under an applied load in the presence of a lubricant, but without causing either seizure or welding. **D 4175, D02**

competence, *n*—demonstrated ability to apply knowledge and skills. **E 1605, E06**

complementary color percepts, *n*—(1) pairs of color percepts, one of which is induced by the other through simultaneous contrast; (2) pairs of color percepts, one of which is the negative after-image of the other. **E 284, E12**

complementary colors, *n*—color stimuli that produce a specified achromatic stimulus when they are suitably mixed in an additive manner. **E 284, E12**

complementary color stimuli, *n*—pairs of color stimuli that, by additive mixture produce an achromatic stimulus. **E 284, E12**

complementary wavelength, *n*—the wavelength of a spectrally pure light that when added to the light reflected or transmitted by the specimen will produce a combination that color matches a reference achromatic (white) light. **E 284, E12**

complete immersion thermometer, *n*—a liquid-in-glass thermometer designed to indicate temperatures correctly when the entire thermometer is exposed to the temperature being measured. (Compare **total immersion thermometer** and **partial immersion thermometer**.) **E 344, E20**

completely alloyed powder, *n*—see **pre-alloyed powder**. **B 243, B09**

completely mixed (perfectly mixed) flow—flow through a membrane module in which fluids on both the upstream and downstream sides of the membrane are individually well-mixed. **D 6161, D19**

completely randomized design, *n*—a design in which the treatments are assigned at random to the full set of experimental units. **E 456, E11**

completely randomized design, *n*—a design in which the treatments are assigned at random to the full set of experimental units. **E 1325, E11**

completely randomized factorial design, *n*—a factorial experiment (including all replications) run in a completely randomized design. **E 456, E11**

completely randomized factorial design, *n*—a factorial experiment (including all replications) run in a completely randomized design. **E 1325, E11**

complex, *adj*—*as a modifier of dynamic force*, descriptive of the total force; denoted by the asterisk (*) as a superscript symbol (F^*); F^* can be resolved into elastic and damping components using the phase of displacement as reference. **D 1566, D11**

complexing agent—a compound that will combine with metallic ions to form complex ions. See **complex ion**. **B 374, B08**

complexing agent—see **sequestering agent**. **D 459, D12**

complex ion—an ion composed of two or more ions or radicals, both of which are capable of independent existence, for example, cuprocyanide ($\text{Cu}(\text{CN})_3^-$). **B 374, B08**

complex machine stitch pattern, *n*—*in home sewing*, a machine stitch pattern formed when two or more simple machine stitch patterns are combined in one repeating unit. (Compare **simple machine stitch pattern**.) **D 5646, D13**

complex modulus, E^* , G^* , or K^* —ratio of the stress to strain where each is a factor that may be represented by a complex number as follows: $E^* = E' + iE''$, $G^* = G' + iG''$, and $K^* = K' + iK''$.

where:

E^* = complex modulus, measured in tension or flexure,

E' = storage modulus, measured in tension or flexure,

E'' = loss modulus, measured in tension or flexure,

G^* = complex modulus, measured in shear,

G' = storage modulus, measured in shear,

G'' = loss modulus, measured in shear,

complex modulus, E^* , G^* , or K^*

K^* = complex modulus, measured in compression,
 K' = storage modulus, measured in compression
 K'' = loss modulus, measured in compression, and
 $i = \sqrt{-1}$, measured in compression.

The complex modulus may be measured in tension or flexure, (E^*), compression, (K^*), or in shear, (G^*), (D 4092, D20).

E 1142, E37

complex modulus, E^* or G^* —the ratio of the stress to strain where each is a vector that may be represented by a complex number.

$$E^* = E' + iE''$$

$$G^* = G' + iG''$$

$$K^* = K' + iK''$$

where:

E^* = complex modulus, measured in tension or flexure,
 E' = storage modulus, measured in tension or flexure,
 E'' = loss modulus, measured in tension or flexure,

G^* = complex modulus, measured in shear,
 G' = storage modulus, measured in shear,
 G'' = loss modulus, measured in shear,

K^* = complex modulus, measured in compression,
 K' = storage modulus, measured in compression
 K'' = loss modulus, measured in compression, and
 $i = \sqrt{-1}$, measured in compression.

D 4092, D20

complexometric titration—a titration in which the titrant and sample ion form a complex. Many classic complexometric titrations can conveniently be followed by electrode. The success of the titration depends on the lower limit of detection of the electrode, the strength of the complex, and the possible presence of ions that compete for the complexing agent or which interfere with the electrode. Examples of complexometric titrations are the determination of calcium with EDTA, and acid-base titrations.

D 4127, D19

complex radiation, n —radiation composed of a number of monochromatic radiations.

E 349, E21

complex seam, n —a seam made in two or more steps. (Ant. plain seam.)

D 123, D13

complex seam, n —in home sewing, a seam made in two or more steps. (Ant. plain seam.)

D 4965, D13

complex shear compliance, J^* —the reciprocal of complex shear modulus.

$$J^* = \frac{1}{G^*}$$

D 4092, D20

complex shear compliance, J^* —reciprocal of complex shear modulus, where $J^* = 1/G^*$, (D 4092, D20).

E 1142, E37

complex silicate inclusions—a general term describing silicate inclusions containing visible constituents besides the silicate matrix. An example would be corundum or spinel crystals occurring in a silicate matrix in steel.

E 7, E04

complex tensile compliance, D^* —the reciprocal of complex tensile modulus.

$$D^* = \frac{1}{E^*}$$

D 4092, D20

complex tensile compliance, D^* —reciprocal of complex tensile modulus, where $D^* = 1/E^*$, (D 4092, D20).

E 1142, E37

complex viscosity, η^* —the complex modulus divided by the imposed frequency in rad/s.

E 1142, E37

compliance, C (Pa^{-1})—the quotient of strain and stress.

$$C = \frac{c}{\sigma} = \frac{1}{M}$$

D is the tensile compliance; J is the shear compliance; B is the bulk compliance; O is the longitudinal compression compliance.

D 4092, D20

compliance indicator, n —a specified string of three characters indicating that the message which follows conforms to the requirements of a particular standard.

F 1294, F05

compliance, J —the strain divided by the corresponding stress.

E 1142, E37

compliance (LF^{-1}), n —the ratio of displacement increment to force increment.

E 1823, E08

component, n —as used with textile fiber polymers, a polymer with distinguishable properties.

D 123, D13

component, n —as used with textile fiber polymers, a polymer with distinguishable properties.

D 4466, D13

component—one of the independently variable substances by means of which the composition of each phase of a system of heterogeneous equilibrium may be described completely; usually an element, or a compound that remains undissociated throughout the range of temperature and pressure concerned.

E 7, E04

component—See **building component**.

E 631, E06

component—See **building component**.

E 1480, E06

component, n —a building element using industrial products that are manufactured as independent units capable of being joined with other elements.

E 1605, E06

component, n —any single element used in an assembly.

F 1582, F04

component (of the waste)—each of those different and distinguishable materials that comprise the waste.

E 1605, E06

component of variance, n —a part of a total variance identified with a specified source of variability.

D 123, D13

component of variance, n —a part of a total variance identified with a specified source of variability.

E 456, E11

component replacement (building)—an abatement method in which painted components with leaded paint are removed with minimal disturbance of the paint, and replaced with new components.

E 1605, E06

components, n —for pile yarn floor covering, the individual yarn or fabric elements into which a pile yarn floor covering can be separated.

D 123, D13

components, n —for pile yarn floor covering, the individual yarn or fabric elements into which a pile yarn floor covering can be dissected.

D 123, D13

components, n —for pile yarn floor covering, the individual yarn or fabric elements into which a pile yarn floor covering can be separated.

D 5684, D13

components pattern—process of identifying specific building components containing LBP at a hazardous level within a building or group of buildings.

E 631, E06

composite, n —a solid product consisting of two or more distinct phases, including a binding material (matrix) and a particulate or fibrous material.

D 883, D20

composite:

composite material—a substance consisting of two or more materials, insoluble in one another, which are combined to form a useful engineering material possessing certain properties not possessed by the constituents.

discontinuous fiber-reinforced composite—any composite material consisting of a matrix reinforced by discontinuous fibers. The fibers may be whiskers or chopped fibers.

fabric-reinforced composite—any composite material consisting of a matrix reinforced by fabric (woven, knitted, or braided assemblages of fibers).

fiber-reinforced composite—any composite material consisting of a matrix reinforced by continuous or discontinuous fibers.

filamentary composite—a composite material reinforced with continuous fibers.

unidirectional fiber-reinforced composite—any fiber-reinforced composite with all fibers aligned in a single direction.

D 3878, D30

- composite**, *n*—a combination of materials, which generally are recognized as distinct entities, for example, coated or laminated materials. **E 176, E05**
- composite**, *n*—*as applied to loadbearing elements*, an interaction between structural components which is to be taken into account in the evaluation of load capacity. **E 176, E05**
- composite**, *n*—*as related to a pipe or duct insulation*, see **duct insulation system** or **pipe insulation system**. **E 176, E05**
- composite coating**—a coating consisting of deposits incorporating particles of another material. See also **dispersion coating**. **B 374, B08**
- composite compact**, *n*—a metal powder compact consisting of two or more adhering layers, rings, or other shapes of different metals or alloys with each material retaining its original identity. **B 243, B09**
- composite conductor**—a conductor consisting of two or more types of wire, each type of wire being plain, clad, or coated; stranded together to operate mechanically and electrically as a single conductor. **B 354, B01**
- composite design**, *n*—a design developed specifically for fitting second order response surfaces to study curvature, constructed by adding further selected treatments to those obtained from a 2ⁿ factorial (or its fraction). **E 456, E11**
- composite design**, *n*—a design developed specifically for fitting second order response surfaces to study curvature, constructed by adding further selected treatments to those obtained from a 2ⁿ factorial (or its fraction). **E 1325, E11**
- composite, filamentary**—a major form of advanced composites in which the fiber constituent consists of continuous filaments. **E 631, E06**
- composite, filamentary**—a major form of advanced composites in which the fiber constituent consists of continuous filaments. **E 1749, E06**
- composite item**—an object in the waste composed of multiple waste components or dissimilar materials, such as disposable diapers, bi-metal beverage containers, electrical conductors composed of metallic wire encased in plastic insulation, etc. **D 5681, D34**
- composite material**, *n*—structured combination of two or more discrete materials. **E 176, E05**
- composite material**—a material consisting of any combination of high-strength, high-modulus fibers, whiskers, or particles in a homogenous matrix. **E 631, E06**
- composite material**—a material consisting of any combination of high-strength, high-modulus fibers, whiskers, or particles in a homogeneous matrix. **E 1749, E06**
- composite membrane**—a membrane having two or more layers with different physical or chemical properties. Membrane manufactured by forming a thin desalinating barrier layer on a porous carrier membrane. **D 6161, D19**
- composite pipe**—pipe consisting of two or more different materials arranged with specific functional purpose to serve as pipe. **F 412, F17**
- composite plate**—an electrodeposit consisting of two or more layers of metal deposited successively. **B 374, B08**
- composite powder**, *n*—a powder in which each particle consists of two or more distinct constituents. **B 243, B09**
- composite sample**, *n*—a combination of two or more samples. **D 1129, D19**
- composite sample**—a portion of leather, which may be the scraps from the cuttings of physical test specimens, that has been taken from each of the sample units constituting the sample. The leather is composited as specified for the purpose of testing a lot for chemical properties. **D 1517, D31**
- composite sample**, *n*—*for asbestos*, a set of unit samples of asbestos fiber (drawn systematically or at random) taken from a lot, comprising not less than two and not more than 200 bags, for use in the laboratory as a test sample, that is, as a source of test specimens. **D 2946, C17**
- composite sample**—a thoroughly mixed gross sample. **D 4175, D02**
- composite sample**—a sample formed by combining two or more individual samples or representative portions of the samples. **D 4410, D19**
- composite sample**, *n*—a combination of two or more samples. **D 5681, D34**
- composite tube**—See **tube**. **D 996, D10**
- composite viewing**—the viewing of two or more superimposed radiographs from a multiple film exposure. **E 1316, E07**
- composite wedge**—a wedge, containing both soil and ice, that shows evidence of both primary and secondary filling. **D 7099, D18**
- composition**—the quantity of each of the components of a mixture; usually expressed in terms of the weight percentage, or the atomic percentage of each of the components in the mixture. **E 7, E04**
- composition**—quantity of the components of a mixture; usually expressed in terms of the weight percentage, or the atomic percentage of each of the components in the mixture, (E 7, E04), **E 1142, E37**
- composition**—materials composed of granulated fillers, such as cork, leather, fibers, minerals, in a resinous matrix, usually an elastomer. Compressed and molded into sheet materials, compositions are used for insoles, heel bases, etc. **F 869, F08**
- compositional depth profile**—the chemical composition and the atomic concentration measured as a function of distance from the surface. **E 673, E42**
- compositional inhomogeneity, (CI)**, *n*—*as used in fractography*, a volume-distributed flaw that is a microstructural irregularity related to the nonuniform distribution of an additive, a different crystalline or glass phase or in a multiphase material, the nonuniform distribution of a second phase. **C 1145, C28**
- compost**—the product of composting. **D 883, D20**
- compost**, *n*—the stable humus material that is produced from a composting process. **E 2114, E06**
- compostable**, *adj*—capable of undergoing biological decomposition in a compost site as part of an available program, such that the material (that is, feedstock) is not visually distinguishable and breaks down to carbon dioxide, water, inorganic compounds, and biomass, at a rate consistent with known compostable materials. **D 996, D10**
- compostable plastic**—a plastic that undergoes biological degradation during composting to yield carbon dioxide, water, inorganic compounds, and biomass at a rate consistent with other known compostable materials and leaves no visually distinguishable or toxic residues. **D 883, D20**
- composting**, *v*—the controlled biological decomposition of organic material in the presence of air to form a humus. **E 2114, E06**
- compound**, *n*—an intimate mixture of all the ingredients necessary for a finished material or product. **C 717, C24**
- compound**, *n*—an intimate admixture of (a) polymer(s) with all the materials necessary for the finished product. **D 883, D20**
- compound**, *n*—an intimate admixture of a polymer(s) with all the materials necessary for the finished article. **D 1566, D11**
- compound**, *n*—a mixture of blended chemicals tailored to meet the needs of the specific components of the tire. **D 5681, D34**
- compound**, *n*—a mixture of a polymer with other ingredients such as fillers, stabilizers, catalysts, processing aids, lubricants, modifiers, pigments, or curing agents. **F 412, F17**
- compound**—a mixture of a polymer with other ingredients such as fillers, stabilizers, catalysts, processing aids, lubricants, modifiers, pigments, or curing agents. (F 412, F17) **F 869, F08**
- compound compact**, *n*—a metal powder compact consisting of mixed metals, the particles of which are joined by pressing or sintering or both, with each metal particle retaining substantially its original composition. **B 243, B09**
- compounding ingredient**, *n*—See **compounding material**, the preferred term. **D 1566, D11**
- compounding material**, *n*—a substance used as part of a rubber mix. **D 1566, D11**

compound, standard, n

compound, standard, n—a control or reference compound prepared according to a prescribed formula and mixing procedure.

D 1566, D11

compound term, n—a term that contains more than one word in the natural spoken word order.

E 1992, E02

compreg—synthetic resin-treated, compressed wood with reduced swelling and shrinking characteristics and increased density and strength properties.

D 1038, D07

Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA), n—also known as “Superfund,” CERCLA prescribes actions and regulatory requirements for reducing risks to human health and the environment resulting from releases or threatened releases of hazardous substances into the environment.

E 833, E06

Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS)—the list of sites compiled by EPA that EPA has investigated or is currently investigating for potential hazardous substance contamination for possible inclusion on the National Priorities List.

D 5681, D34

compressed air sprayer—a spraying apparatus that uses air pressure to move liquid from a container through an atomizing device.

E 1102, E35

compressed natural gas (CNG)—natural gas that is typically pressurized to 3600 psi. CNG is primarily used as a vehicular fuel.

D 4150, D03

compressed oil absorption number (COAN), n—See **oil absorption number of compressed sample**, the preferred term.

D 3053, D24

compressed stranded conductor—a unidirectional or unilay or conventional concentric conductor manufactured to a specified nominal diameter 3 % less than the calculated diameter of non-compressed conductor of the same construction and cross-sectional area.

B 354, B01

compressed thickness (t, (L), mm), n—thickness under a specified stress applied normal to the material.

D 4439, D35

compressibility, n—the capacity of a metal powder to be densified under a uniaxially applied pressure in a closed die.

B 243, B09

compressibility—property of a soil or rock pertaining to its susceptibility to decrease in volume when subjected to load.

D 653, D18

compressibility—the property of a material that permits it to decrease in volume when subjected to an increase in pressure.

D 4150, D03

compressibility factor (z)—a factor calculated by taking the ratio of the actual volume of a given mass of gas at a specified temperature and pressure to its volume calculated from the ideal gas law at the same conditions.

D 4150, D03

compressible-washer-type direct tension indicator—direct tension indicator having the capability of indicating the achievement of a required minimum bolt tension by the degree of its plastic deformation.

F 1789, F16

compression, n—the act, process, or result of compacting, condensing, or concentrating.

D 4848, D13

compressional wave—see **longitudinal wave**.

E 1316, E07

compression coupling—See **compression joint**.

C 896, C04

compression curve—see **pressure-void ratio curve**.

D 653, D18

compression deflection—the amount of deformation of material when being compressed.

F 869, F08

compression disk—a disk of compressible material placed between the ends of adjacent pipe for the purpose of distributing the jacking force.

C 896, C04

compression failure—deformation of the wood fibers resulting from excessive compression along the grain either in direct end compression or in bending. It may develop in standing trees due to bending by wind or snow or to internal longitudinal stresses developed in growth, or it may result from stresses imposed after the tree is cut. In surfaced lumber, compression failures appear as fine wrinkles across the face of the piece.

D 9, D07

compression fitting joint—see **joint, compression fitting**.

F 412, F17

compression gasket, n—a gasket designed to be used under compression.

C 717, C24

compression gasket joint—see **joint, compression gasket**. **F 412, F17**
compression glazing, n—see **compression glazing system**.

C 717, C24

compression glazing, v—in *building construction*, the act of installing components into a compression glazing system.

C 717, C24

compression glazing system, n—in *building construction*, gasket(s) or a combination of sealant(s) and gasket(s) used to provide weather-tightness by way of continuous pressure on the components in the joint.

C 717, C24

compression index, C_c (D)—the slope of the linear portion of the pressure-void ratio curve on a semi-log plot.

D 653, D18

compression joint—a joint designed so that a sealing action is obtained by compressing elastomeric components.

C 896, C04

compression load—load which tends to compress or shorten the member. The value for compressive strength may depend upon the degree of distortion.

F 1789, F16

compression mold—a mold which is open when the material is introduced and which shapes the material by heat and by the pressure of closing.

F 869, F08

compression molded button, n—a button or button blank which is produced by compression molding.

D 123, D13

compression molded button, n—a button or button blank which is produced by compression molding, thermoset-molding compounds such as urea-formaldehyde, melamine-formaldehyde, styrene-modified polyester, or any combination thereof. This method using styrene modified polyester resin, and having in its formulation pearlescent pigments which are oriented in the molding process, form a button or button blank which resembles natural shell.

D 5497, D13

compression molding, n—the method of molding a material already in a confined cavity by applying pressure and usually heat.

D 123, D13

compression molding—the method of molding a material already in a confined cavity by applying pressure and usually heat.

D 883, D20

compression molding, n—molding process in which the material is placed directly in the mold cavity and compressed to shape by closure of the mold.

D 1566, D11

compression molding, n—the method of molding a material already in a confined cavity by applying pressure and usually heat.

D 5497, D13

compression molding—the method of molding a material in a confined cavity by applying pressure and usually heat. (D20)

F 412, F17

compression molding, n—a process for molding a material in a confined cavity by applying pressure and usually heat.

F 1251, F04

compression parallel to grain—compression, endwise (parallel to the grain). The imposition of a compressive stress that acts in a direction parallel to the grain of the wood, as in a column.

D 9, D07

compression perpendicular to grain—compression, sidewise (perpendicular to the grain). The imposition of a compressive stress that acts in a direction approximately perpendicular to the grain of the wood.

D 9, D07

compression ratio, n—the ratio of the volume of the loose powder to the volume of the compact made from it. Synonymous with **fill ratio**.

B 243, B09

compression ratio, n—the ratio of the volume of the combustion chamber including the precombustion chamber with the piston at bottom dead center to the comparable volume with the piston at top dead center.

D 4175, D02

compression recovery, n—the degree to which a material returns to its original dimension(s) after removal of a compressive force.

D 4848, D13

compression resistance, n—the ability of a material to oppose deformation under a compressive force.

D 4848, D13

compression seal, *n*—a seal which is attained by a compressive force on the sealing material. C 717, C24

compression set, *n*—the residual deformation of a material after removal of the compressive stress. D 1566, D11

compression test—a test made on a concrete specimen to determine the compressive strength. C 822, C13

compression wave (irrotational)—wave in which element of medium changes volume without rotation. D 653, D18

compression wood—abnormal wood formed typically on the lower side of branches and inclined trunks of softwood trees. Compression wood is identified by its relatively wide annual rings, usually eccentric, relatively large amount of latewood, sometimes more than 50 % of the width of the annual rings in which it occurs, and its lack of demarcation between earlywood and latewood in the same annual rings. Compression wood shrinks excessively lengthwise, as compared with normal wood. D 9, D07

compressive force, *n*—the perpendicular force applied to surface(s) of a material in compaction. D 4848, D13

compressive strength, *n*—the maximum load sustained by a standard specimen of a material when subjected to a crushing force. C 11, C11

compressive strength, *n*—a property of solid material that indicates its ability to withstand a uniaxial compressive load. C 709, D02

compressive strength—the maximum resistance of a concrete specimen to axial compressive loading; or the specified resistance used in design calculations. C 822, C13

compressive strength—the maximum stress that a specimen or material will support when subjected to a crushing force applied at a specified rate. C 904, C03

compressive strength, *n*—the maximum compressive load which a specimen will support divided by the cross-sectional area of the specimen. C 1180, C12

compressive strength, *n*—a property of solid material that indicates its ability to withstand a uniaxial compressive load. D 4175, D02

compressive strength—the load per unit area at which an unconfined cylindrical specimen of soil or rock will fail in a simple compression test. Commonly the failure load is the maximum that the specimen can withstand in the test. D 7099, D18

compressive strength—See **strength, compressive.** E 631, E06

compressive strength—See **strength, compressive.** E 1749, E06

compressive strength [FL⁻²], *n*—the maximum compressive stress which a material is capable of sustaining. Compressive strength is calculated from the maximum force during a compression test and the original cross-sectional area of the specimen. E 6, E28

compressive strength (unconfined or uniaxial compressive strength), *p_c, q_w, C_o* (FL⁻²)—the load per unit area at which an unconfined cylindrical specimen of soil or rock will fail in a simple compression test. Commonly the failure load is the maximum that the specimen can withstand in the test. D 653, D18

compressive stress—normal stress tending to shorten the body in the direction in which it acts. (ISRM) D 653, D18

compressive stress [FL⁻²], *n*—normal stress due to forces directed toward the plane on which they act. E 6, E28

compressometer, *n*—a specialized extensometer used for sensing negative or compressive strain. E 6, E28

Compton edge (*E_c*)—the maximum energy value of electrons of the Compton scattering continuum. The energy value of the Compton edge is

$$E_c = E_\gamma - \frac{E_\gamma}{1 + \frac{2E_\gamma}{0.511}}$$

which corresponds to 180° scattering of the primary photon of energy *E_γ* (MeV). For a 1 MeV photon, the Compton edge is about 0.8 MeV. E 170, E10

Compton scattering—X-ray scattering by atoms in which the scattered beam has, relative to the incident beam, a longer wavelength

and a random phase relationship. Also called incoherent or modified scattering. E 7, E04

Compton scattering—elastic scattering of a photon by an atomic electron, under the condition of conservation of momentum, that is, the vector sum of the momenta of the outgoing electron and photon is equal to the momentum of the incident photon. The scattered photon energy, *E'γ*, is given by

$$E'_\gamma = \frac{E_\gamma E_\gamma (1 - \cos\theta)}{1 + 0.511}$$

where *E_γ* is the incident photon energy in MeV and θ is the angle between the direction of the primary and scattered photon. The electron energy, *E_e*, is equal to *E_γ* - *E'γ*. E 170, E10

compton scatter radiation—the scattered X-ray or gamma ray which results from the inelastic scattering of an incident X-ray or gamma ray on an electron. Since the ejected electron has short range in most materials, it is not considered part of the scattered radiation. E 1316, E07

computed radiology (photo stimulated luminescence method)—a two-step radiological imaging process; first, a storage phosphor imaging plate is exposed to penetrating radiation; second, the luminescence from the plate's photostimulable luminescent phosphor is detected, digitized, and presented via hard copy or a CRT. E 1316, E07

computer system, *n*—a group of hardware components and associated software designed and assembled to perform a specific function or group of functions. E 2363, E55

Conbur test—See **package testing.** D 996, D10

concatenation, *n*—the linking or chaining together of either separate items of data in a bar code symbol, or of the data contained in two or more separate bar code symbols (also referred to as "message append"). F 1294, F05

concave surface—a local concave curvature in the flat surfaces of pultruded plastic parts as measured transversely to their length. D 3918, D20

concealed membrane waterproofing, *n*—also referred to as **structural slab waterproofing**; (1) for below grade: refers to a form of waterproofing where the membrane is applied to the mud mat and later covered with a topping, usually concrete, to act as a wearing layer or course, and (2) for elevated structural concrete deck: applied over the structural surface and covered/concealed by other components such as a topping slab, pavers, ballast, pavement, and plantings. D 1079, D08

concentrate, *n*—the froth product recovered in coal froth flotation. D 121, D05

concentrate—the product mix to which the propellant is added. D 3064, D10

concentrate—the stream exiting a crossflow membrane device which has increased concentration of solutes and particles over the feed stream; portion of the feed stream which does not pass through the membrane. The stream in which dissolved solids or particulates, or both, are concentrated in a membrane separation process. D 6161, D19

concentrate recycle—a technique for improving recovery in which a fraction of the concentrate is recycled through the membrane system. D 6161, D19

concentrate (reverse osmosis), *n*—the residual portion of an aqueous solution applied to a membrane. D 1129, D19

concentrating collector—see **collector, concentrating.** E 772, E44

concentration, *n*—the quantity of a substance contained in a total unit quantity of sample.

*mass concentration, *n**—concentration expressed in terms of mass of substance per unit volume of gas or liquid.

*ppb(v), *n**—a unit of measure of the concentration of gases in air expressed as parts of the gas per billion (10⁹) parts of the air-gas mixture, both by volume.

concentration, *n*

ppm(v), *n*—a unit of measure of the concentration of gases in air expressed as parts of the gas per million parts of the air-gas mixture, both by volume.

vapor concentration, *n*—concentration expressed in terms of gaseous volume of substance per unit volume of air or other gas usually expressed in percent or parts per million by volume. See also **absolute humidity**.

volume concentration, *n*—concentration expressed in terms of gaseous volume of substance per unit volume of air or other gas usually expressed in percent or parts per million.

D 1356, D22

concentration—the actual amount of a substance in a given volume of solution. When measuring ionic concentrations by electrode, a distinction is made between the concentration of the free, unbound ion, and total concentration that includes ions bound to complexing agents.

D 4127, D19

concentration, *n*—quantity of substance in a unit quantity of sample.

E 631, E06

concentration—amount of the active ingredient contained in the chemical formulation expressed as a percent or mass per relevant unit basis.

E 1102, E35

concentration, *n*—quantity of substance in a unit quantity of sample.

E 1605, E06

concentration—see **number density**.

E 1620, E29

concentration, *c*—the quantity of the substance contained in a unit quantity of sample.

E 131, E13

concentration cell—an electrolytic cell, the emf of which is caused by a difference in concentration of some component in the electrolyte. (This difference leads to the formation of discrete cathode and anode regions.)

G 15, G01

concentration factor, CF—the ratio of the concentration of a component in the retentate (concentrate, brine) to the concentration of the same component in the feed

$$CF = \frac{C_B (\text{brinewater concentration})}{C_F (\text{feedwater concentration})}$$

$$= \frac{1}{1 - \text{conversion}} \quad (\text{approximation})$$

D 6161, D19

concentration factor, *n* (D)—a parameter used in modifying the Boussinesq equations to describe various distributions of vertical stress.

D 653, D18

concentration of sediment (by mass)—the ratio of the mass of dry sediment in a water-sediment mixture to the mass of the mixture.

D 4410, D19

concentration polarization—that part of the total polarization that is caused by changes in the activity of the potential-determining components of the electrolyte.

B 374, B08

concentration polarization—the increase of the solute concentration over the bulk feed solution which occurs in a thin boundary layer at the feed side of the membrane surface, resulting from the removal of the solvent. Concentration profile that has a higher level of solute nearest to the upstream membrane surface compared with the more-or-less mixed bulk fluid far from the membrane surface.

D 6161, D19

concentration ratio—in leak testing, the ratio of the number of atoms (molecules) of a given constituent of a (gas) mixture to the total number of atoms (molecules) in the mixture. For ideal gases the concentration ratio has the same value as the volume fraction or the partial pressure of the constituent.

E 1316, E07

concentration ratio, geometric—the ratio of the collector aperture area to the absorber area.

E 772, E44

concentration standard—a standardizing solution whose value is reported in terms of total concentration of the ion of interest. If the electrode is calibrated using pure-concentration standards and measurements made on untreated samples, results must be corrected for the sample ionic strength. More commonly, a reagent is

added to all standards and samples before measurement in order to fix the ionic strength, thus avoiding the need for correction.

D 4127, D19

concentration-time curve, *n*—a plot of the concentration of a gaseous toxicant as a function of time.

E 176, E05

concentration (volume)—the ratio of the volume of dry sediment to the volume of the water-sediment mixture.

D 4410, D19

concentrator—an optical device (lenses or mirrors) that, as part of a solar collector, receives the unconcentrated solar irradiance and redirects (concentrates) it to a smaller area (the receiver).

E 772, E44

concentricity, *n*—the ratio, expressed in percent, of the minimum wall thickness to the maximum wall thickness.

D 1711, D09

concentric-lay conductor—conductor constructed with a central core surrounded by one or more layers of helically laid wires. Several types are as follows:

compact round conductor—see **compact stranded conductor**.

conventional concentric conductor—conductor constructed with a round central core surrounded by one or more layers of helically laid round wires. The direction of lay is reversed in successive layers, and generally with an increase in length of lay for successive layers.

equilay conductor—conductor constructed with a central core surrounded by more than one layer of helically laid wires, all layers having a common length of lay, direction of lay being reversed in successive layers.

parallel core conductor—conductor constructed with a central core of parallel-laid wires surrounded by one layer of helically laid wires.

rope-lay conductor—conductor constructed of a bunch-stranded or a concentric-stranded member or members, as a central core, around which are laid one or more helical layers of such members.

unidirectional conductor—conductor constructed with a central core surrounded by more than one layer of helically laid wires, all layers having a common direction of lay, with increase in length of lay for each successive layer.

unilay conductor—conductor constructed with a central core surrounded by more than one layer of helically laid wires. All layers having a common direction of lay and essentially similar length of lay, which is a multiple of the outer diameter of the finished conductor, for each successive layer. The lay length of the inner layers shall not vary by more than $\pm 10\%$ of the lay length of the outer layer.

concentric-lay conductor, *n*—a conductor composed of a central core surrounded by one or more layers of helically laid strands.

D 1711, D09

conceptual model—a simplified representation of the hydrogeologic setting and the response of the flow system to stress.

D 653, D18

conceptual site model, *n*—a mental or physical representation of the physical system and the iterative characterization of the physical and chemical processes and conditions that affect the transport of contaminants from sources through environmental media to receptors or potential receptors.

D 5681, D34

concertina, *n*—a pattern formed by attaching adjacent loops of helical coils to one another at specified points on the circumference, resulting in an accordion-like configuration.

F 1379, F14

concertina spacing, *n*—distance between adjacent concertina attachments in a concertina configuration, as measured down the length of the extended coil (also called *concertinaattachment spacing*).

F 1379, F14

concrete, *n*—a composite material that consists essentially of a binding medium within which are embedded particles or fragments of aggregate; in hydraulic-cement concrete, the binder is formed from a mixture of hydraulic cement and water.

C 125, C09

concrete—a homogeneous mixture of portland cement, fine aggregate, coarse aggregate, and water. The mixture may also contain admixtures, or other cementitious materials, or both.

C 822, C13

concrete, *n*—a hard, strong material made by mixing a cementing

- material (commonly portland cement) and a mineral aggregate (as washed sand and gravel or broken rock) with sufficient water to cause the cement to set and bind the entire mass. **F 141, F06**
- concrete breakout failure**—anchor failure mode characterized by concrete cone failure or concrete edge failure. **E 2265, E06**
- concrete brick, *n***—a concrete masonry unit made from portland cement, water, and suitable aggregates, with or without the inclusion of other materials. See Specification C 55. **C 1209, C15**
- concrete nail, concrete stub nail**—hardened-steel, ½ by 0.135 to 3 ½ by 0.207-in. nails with flat countersunk ⅝ to ½-in. head and medium diamond point. **F 547, F16**
- concrete, refractory, *n***—a hardened castable. **C 71, C08**
- concretion, *n***—*ina geological sense*, a mass of mineral matter found in rock of a composition different from its own and produced by deposition from aqueous solution in the rock. **D 121, D05**
- condensate, *n***—liquid or solid matter formed by condensation from the vapor phase. **D 1356, D22**
- condensate**—a mixture of condensed steam and cooling water, exiting cooking equipment and if applicable, directed to the floor drain. **F 1827, F26**
- condensation, *n***—a chemical reaction in which two or more molecules combine with the separation of water or some other simple substance. (See also **polymerization**.) **D 907, D14**
- condensation**—the conversion of water vapor or other gas to liquid as the temperature drops or atmospheric pressures rises. (See also **dew point**.) **D 1079, D08**
- condensation, *n***—the process of converting a material in the gaseous phase to a liquid or solid state by decreasing temperature or by increasing pressure, or both. **D 1356, D22**
- condensation polymer**—a polymer made by condensation polymerization. **D 883, D20**
- condensation polymer, *n***—polymerization in which during an acid/base reaction a small molecule is often split out. **F 1251, F04**
- condensation polymerization**—polymerization in which monomers are linked together with the splitting off of water or other simple molecules. **D 883, D20**
- condensation sampling**—See **sampling**. **D 1356, D22**
- condensed system**—a pure substance, or mixture, at a pressure and temperature such that the vapor phase does not exist. **E 7, E04**
- condenser**—a term applied to lenses or mirrors designed to collect, control, and concentrate radiation in an illumination system. **E 7, E04**
- condenser, Abbe**—originally a two-lens substage condenser combination designed by Ernst Abbe. It lacks chromatic correction though designed for a minimum of spherical aberration and has only a very low-angle aplanatic cone. It may be rated with a numerical aperture as high as 1.3. **E 175, E41**
- condenser aperture**—See **aperture**. **E 7, E04**
- condenser, darkfield**—a condenser forming a hollow cone of light with its apex (or focal point) in the plane of the specimen. When used with an objective having a numerical aperture lower than the minimum numerical aperture of the hollow cone, only light deviated by the specimen enters the objective. Objects are seen as bright images against a dark background. **E 175, E41**
- condenser, darkfield, bispheric**—a darkfield condenser consisting of a convex spherical reflector mounted concentric with a larger concave reflector. The rays are formed into a diverging cone by the convex reflector. The annular concave reflector then forms a hollow converging cone which is focused on the subject. See **condenser, darkfield**. **E 175, E41**
- condenser, darkfield, paraboloid**—a darkfield condenser consisting of a reflecting surface in the form of a segment of a paraboloid of revolution. Parallel rays entering the condenser around the periphery of the central stop are reflected from the curved surfaces and converge at the focus of the paraboloid. See **condenser, darkfield**. **E 175, E41**
- condenser lens**—a device used to focus radiation in or near the plane of the object. **E 7, E04**
- condenser or condenser lens**—a term applied to lenses or mirrors designed to collect, control, and concentrate radiation in an illumination system. **E 175, E41**
- condenser, variable-focus**—essentially an Abbe condenser in which the upper lens element is fixed and the lower movable. The lower lens may be used to focus the illumination between the elements so that it emerges from the stationary lens as a large diameter parallel bundle. The field of low-power objectives may thus be filled without removing the top element. At the opposite extreme it can be adjusted to have a numerical aperture as high as 1.3. **E 175, E41**
- condensoid, *n***—the particles of a dispersion formed by condensation. **constant flow high-volume sampler**—See **sampler**. **D 1356, D22**
- condition, *v***—to bring a material to moisture equilibrium with a specified atmosphere. **D 123, D13**
- condition, *v***—to bring a material to moisture equilibrium with a specified atmosphere. **D4920, D13**
- condition code**—a symbol that signifies the physical operating condition of property. **E 2135, E53**
- conditioned ash, *n***—ash that has been moistened with water during the load out process at the temporary storage silo at the power plant to allow for its handling, transport, and placement without causing fugitive dusting. **E 2201, E50**
- conditioning**—the conversion of a surface to a suitable state for successful treatment in succeeding steps. **B 374, B08**
- conditioning, *v***—the storage of a specimen under specified temperature, humidity, etc., for a specified time prior to testing. **D 1079, D08**
- conditioning, *n***—*for sampling*, the process by which the fiber is put into a consistent state to be tested. **D 2946, C17**
- conditioning**—the exposure of a material to the influence of a prescribed atmosphere for a stipulated period of time or until a stipulated relation is reached between material and atmosphere. **E 41, G03**
- conditioning agent**—an additive to water suspensions that imparts specific properties such as: proper wetting, particle dispersion, corrosion resistance, biological resistance, or foam inhibition. **E 1316, E07**
- conditioning agents, *n***—all chemicals that enhance the performance of the collectors or frothers. Conditioning agents change the characteristics of the surface of the minerals or the environment. There are many subgroups according to their function: activators, depressants, emulsifiers, dispersants, flocculants, chelating agents, froth depressants, pH modifiers, etc. **D 121, D05**
- conditioning (environmental), *n***—the storage of a rubber, under specified conditions (time, temperature, humidity) prior to testing. **D 1566, D11**
- conditioning heat treatment, *n***—a preliminary **heat treatment** used to prepare a steel object for a desired reaction to a subsequent **heat treatment**. **A 941, A01**
- conditioning (mechanical), *n***—the prescribed program of deformation of a specimen prior to testing. **D 1566, D11**
- conditioning time, *n***—see **joint conditioning time**. (See also **curing time** and **setting time**.) **D 907, D14**
- condition, standard**—the condition reached by a specimen when it is in temperature and moisture equilibrium with a standard atmosphere. **E 41, G03**
- condominium, *n***—an **apartment building**, group of townhouses, or single dwellings in which each **dwelling unit** is individually owned and each owner holds an interest in common areas. Also commonly used to denote an individual unit. **E 631, E06**
- condominium**—See **building**. **E 631, E06**
- conductance**—the capacity of a medium, usually expressed in mhos, for transmitting electric current. The reciprocal of resistance. **B 374, B08**
- conductance**—the ratio of the current carried through a material to

conductance

the difference in potential applied across the material. It is the reciprocal of *resistance*. The unit is: (ohm)⁻¹ or siemens.

D 2864, D27

conductance—in leak testing, the ratio of the throughput (under steady state, conservative conditions) of a gas flowing through a conduit or an orifice to the difference in the partial pressures of the gas at the two ends of the conduit or on the two sides of the orifice, expressed in volume units per unit time, such as cubic metres per second.

E 1316, E07

conductance, apparent dc—the dc conductance measured at the end of a specific electrification time. The “apparent dc conductance” is the reciprocal of the “apparent dc resistance.” The unit is: (ohm)⁻¹ or siemens.

D 2864, D27

conductance, dc—the ratio of the total current (in amperes) passing through a material to the dc voltage (in volts) applied between two electrodes that are in contact with, or immersed in a specimen. The “dc conductance” is the reciprocal of the “dc resistance.” The unit is: (ohm)⁻¹ or siemens.

D 2864, D27

conductance, film, n—the time rate of heat flow from a unit area of a surface to its surroundings, induced by a unit temperature difference between the surface and the environment. C 168, C16

conductance, insulation, n—the ratio of the total volume and surface current between two electrodes (on or in a specimen) to the dc voltage applied to the two electrodes.

D 1711, D09

conductance (specific)—a measure of the ability of the water to conduct an electric current at 77°F (25°C). It is related to the total concentration of ionizable solids in the water. It is inversely proportional to electrical resistance.

D 653, D18

conductance, surface, n—the ratio of the current between two electrodes (on the surface of a specimen) to the dc voltage applied to the electrodes.

D 1711, D09

conductance, thermal—the thermal transmission in unit time through unit area of a particular body or assembly having defined surfaces, when unit average temperature difference is established between the surfaces. $C = W/m^2 \cdot K$ ($C = \text{Btu}/h \cdot \text{ft}^2 \cdot ^\circ\text{F}$).

D 1079, D08

conductance, thermal, C, n—the time rate of steady state heat flow through a unit area of a material or construction induced by a unit temperature difference between the body surfaces.

$$C = q/\Delta T$$

A conductance (C) associated with a material shall be specified as a material C . A conductance (C) associated with a system or construction of materials shall be specified as a system C . (C in SI units: $W/m^2 \cdot K$.) (C in inch-pound units: $(\text{Btu}/h)/\text{ft}^2/\text{F} = \text{Btu}/h \text{ ft}^2/\text{F}$)

C 168, C16

conductance, volume, n—the ratio of the current in the volume of a specimen between two electrodes (on or in the specimen) to the dc voltage applied to the two electrodes.

D 1711, D09

conducting material (conductor), n—a material within which an electric current is produced by application of a voltage between points on, or within, the material.

D 1711, D09

conducting salt—a salt added to the solution in order to increase its conductivity.

B 374, B08

conductive base stock—paper stock intended as a substrate for electrostatic coating with surface or volume conductivity over a range of relative humidities controlled by special treatment.

F 335, F05

conductive ceramic tile—tile made from special body compositions or by methods that result in specific properties of electrical conductivity while retaining other normal physical properties of ceramic tile.

C 242, C21

conductivity—specific conductance—the current transferred across unit area per unit potential gradient. In the metric system, $K = \text{amperes per square centimetre divided by volts per centimetre}$. The reciprocal of resistivity.

B 374, B08

conductivity—the ratio of the current density carried through a

specimen to the potential gradient paralleling the current. This is numerically equal to the conductance between opposite faces of a unit cube of liquid. It is the reciprocal of **resistivity**.

D 2864, D27
conductivity—the property of a substance's (in this case, water and dissolved ions) ability to transmit electricity. The inverse of resistivity. Measured by a conductivity meter, and described in microsiemens/cm or micromhos/cm, $\mu\text{S}/\text{cm}$.

D 6161, D19

conductivity—the intrinsic property of a particular material to carry electric current; it is commonly expressed in percent IACS (International Annealed Copper Standard) or MS/m (MegaSiemens/metre).

E 1316, E07

conductivity, apparent dc volume—the “dc volume conductivity” measured at the end of a specified electrification time. It is the reciprocal of the apparent dc volume resistivity. The unit most commonly used is: (ohm-centimetre)⁻¹ or siemens per centimetre. The SI unit is (ohm-metre)⁻¹.

D 2864, D27

conductivity, dc—the ratio of the current density passing through a specimen at a given instant of time and under prescribed conditions, to the dc potential gradient paralleling the current. It is the reciprocal of the dc resistivity. In common practice the “dc conductivity” is numerically equal to the “dc conductance” between opposite faces of a centimetre cube of liquid. The unit is: (ohm-centimetre)⁻¹ or siemens per centimetre. The SI unit is: (ohm-metre)⁻¹.

D 2864, D27

conductivity, dc volume—the property of a material that permits the flow of electricity through its volume. It is numerically equal to the ratio of the steady-state current density to the steady direct voltage gradient parallel with the current in the material. The dc volume conductivity is the reciprocal of the dc volume resistivity. The unit commonly used is: (ohm-centimetre)⁻¹ or siemens per centimetre. The SI unit is (ohm-metre)⁻¹.

D 2864, D27

conductivity, electrical (volume), σ —the ratio of the current density ($A \cdot \text{cm}^{-2}$) through a specimen to the potential gradient (V/cm) in the same direction as the current.

E 1142, E37

conductivity, surface, n—the surface conductance multiplied by that ratio of specimen surface dimensions (distance between electrodes divided by the width of electrodes defining the current path) which transforms the measured conductance to that obtained if the electrodes had formed the opposite sides of a square.

D 1711, D09

conductivity, thermal—the thermal transmission, by conduction only, in unit time through unit area between two isothermal surfaces of an infinite slab of a homogeneous material of unit thickness, in a direction perpendicular to the surface, when unit temperature difference is established between the surfaces. $k = W/m \cdot K$ ($k = \text{Btu} \cdot \text{in.}/h \cdot \text{ft}^2 \cdot ^\circ\text{F}$).

D 1079, D08

conductivity, thermal, λ or k, n —the time rate of steady state heat flow through a unit area of a homogeneous material induced by a unit temperature gradient in a direction perpendicular to that unit area. (λ or k in SI units: $(W/m^2)/(K/m) = W/m \cdot K$.) (λ or k in inch-pound units: $(\text{Btu}/h)/\text{ft}^2/(F/\text{ft}) = \text{Btu}/h \text{ ft}^2/(F/\text{in.}) = \text{Btu} \text{ in.}/h \text{ ft}^2 \text{ F}$.) (See discussion under **apparent thermal conductivity**.)

C 168, C16

conductivity, volume, n—the volume conductance multiplied by that ratio of specimen volume dimensions (distance between electrodes divided by the cross-sectional area of the electrodes) which transforms the measured conductance to that conductance obtained if the electrodes had formed the opposite sides of a unit cube.

D 1711, D09

conductor—a wire or combination of wires not insulated from one another, suitable for carrying an electric current.

B 354, B01

conductor, n—a wire, or combination of wires not insulated from each other, suitable for carrying electric current.

D 1711, D09

conductor—a substance or body that allows a flow of electric current to pass continuously along it or through it when a sufficient voltage is applied across any two points.

D 5077, D10

conductor core—the center strand or member about which one or more layers of wires or members are laid helically to form a concentric-lay.

B 354, B01

conductor resistance—the measured electrical resistance through a circuit loop between two test points. **F 2112, F01**

conduit—a pipe for conveying fluid. **C 896, C04**

conduit, n—pipe used to protect wires for electric-power or communication systems, for both underground and exposed situations. **C 1154, C17**

conduit, n—for *asbestos-cement*, asbestos-cement pipe used to protect wires for electric-power or communication systems, for both underground and exposed situations. **D 2946, C17**

conduit—a solid or flexible tube, pipe, or channel through which insulated electrical wires are run or through which water or some other fluid flows. **E 631, E06**

conduit—a solid or flexible tube, pipe, or channel through which insulated electrical wires are run or through which water or some other fluid flows. **E 1749, E06**

conduit—a tubular raceway for carrying electric wires, cables, or other conductors. **F 412, F17**

conduit nail—bright or copper-plated, regular-stock-steel or hardened-steel, 1¼ to 3½ by 0.161-in. nails with annularly threaded shank; bent, curved hook head, and medium needle point. Different types of head designed for fastening ½, ¾, or 1-in. conduit, tubing, pipe, cable, etc. **F 547, F16**

cone, n—in *textiles*, (1) a yarn holder or bobbin of conical shape used as a core for a yarn package of conical form, also called a cone core. (2) the yarn package obtained when yarn is wound upon a cone core. **D 123, D13**

cone, n—in *textiles*, (1) a yarn holder or bobbin of conical shape used as a core for a yarn package of conical form, also called a cone core. (2) the yarn package obtained when yarn is wound upon a cone core. **D 4849, D13**

cone atomizer—an atomizer that produces a conical spray pattern. **E 1620, E29**

cone head—head consisting of truncated cone with large diameter usually nearest shank of nail. **F 547, F16**

cone of impression, n—a rise of the potentiometric surface in the approximate shape of a cone that develops around an injection well. **D 653, D18**

cone pattern, n—a diverging spray pattern that is nominally symmetric about the nozzle axis and whose apex is located at or near the nozzle discharge orifice. **E 1620, E29**

cone penetration—See **penetration**. **D 1079, D08**

cone proof load—inch series—a calculated value derived from the formula

$$CPL = (1 - 0.30D) \times f \times A_s$$

where:

CPL = cone proof load (lbs),

D = nominal diameter of nut (in.),

f = specified proof stress of nut (psi), and

A_s = tensile stress area of nut (in.²).

To meet the requirements of the cone proof load test, the nut shall support its specified cone proof load without stripping or rupture. **F 1789, F16**

cone proof load—metric series—a calculated value derived from the formula

$$CPL = (1 - 0.012D)f \times A_s \times 0.001$$

where:

CPL = cone proof load (kN),

D = nominal diameter of nut (mm),

f = specified proof stress of nut (MPa), and

A_s = tensile stress area of nut (mm²).

To meet the requirements of the cone proof load test, the nut shall support its specified cone proof load without stripping or rupture. **F 1789, F16**

cone proof load test—test performed using a conical washer and threaded mandrel to determine the influence of surface discontinuities (that is, forging cracks or seams) on the load-carrying capability of hardened steel nuts. The test includes a simultaneous dilation and stripping action of the nut. **F 1789, F16**

cone-screen test—a method for testing fineness of enamel with a cone-shaped sieve. (see also **screen test**) **C 286, B08**

cone spray nozzle—see **cone atomizer**. **E 1620, E29**

confidence bound, n—see **confidence limit**. **E 456, E11**

confidence coefficient, n—the value, C , of the probability associated with a confidence interval or statistical coverage interval. It is often expressed as a percentage. **E 456, E11**

confidence interval, n—an interval estimate of a population parameter computed so that the statement “the population parameter lies in this interval” will be true, on the average, in a stated proportion of the times such statements are made. **D 123, D13**

confidence interval, n—an interval used to bound the value of a population parameter with a specified degree of confidence (this is an interval that has different values for different samples). **D 5681, D34**

confidence interval, n—a numerical range used to bound the value of a population parameter with a specified degree of confidence (that the interval would include the true parameter value). **D 5681, D34**

confidence interval—an interval estimate of a population parameter computed so that the statement “the population parameter included in this interval” will be true, on the average, in a stated proportion of the times such computations are made based on different samples from the population. **E 1823, E08**

confidence level, n—the probability, or expected percent of the times, that the selected percent ($P\%$) of the actual population lies within the tolerance interval calculated from the data sample. **A 644, A04**

confidence level, n—the stated proportion of times the confidence interval is expected to include the population parameter. **D 123, D13**

confidence level, n—the probability, usually expressed as a percent, that a *confidence interval* is expected to contain the parameter of interest (see discussion of *confidence interval*). **D 5681, D34**

confidence level, n—the probability, usually expressed as a percent, that a confidence interval will contain the parameter of interest. **D 5681, D34**

confidence level, n—see **confidence coefficient**. **E 456, E11**

confidence level (or coefficient)—the stated proportion of the times the confidence interval is expected to include the population parameter. **E 1823, E08**

confidence limit, n—each of the limits, T_1 and T_2 , of the two sided confidence interval, or the limit T of the one sided confidence interval. **E 456, E11**

confidence limits, n—the two statistics that define the ends of a confidence interval. **D 123, D13**

confidence limits—the limits on either side of the mean value of a group of observations which will, in a stated fraction or percent of the cases include the expected value. Thus the 95 % confidence limits are the values between which the population mean will be situated in 95 out of 100 cases. **D 4790, D16**

confidence limits, n—the limits on either side of the mean value of a group of observations which will, in a stated fraction or percent of the cases, include the expected value. Thus the 95 % confidence limits are the values between which the population mean will be situated in 95 out of 100 cases. **D 5681, D34**

confidence limits—the two statistics that define a confidence interval. **E 1823, E08**

configuration, n—the state of the various interface and printing options that are set for the host and printer. **F 1457, F05**

confining bed—a hydrogeologic unit of less permeable material bounding one or more aquifers. **D 653, D18**

confining unit—a term that is synonymous with “aquiclude,” “aquitard,” and “aquifuge”: defined as a body of relatively low

confining unit

permeable material stratigraphically adjacent to one or more aquifers. **D 653, D18**

conformance—ability of a boom to maintain freeboard and draft when subjected to a given set of environmental conditions. **F 818, F20**

conformity—fulfillment by a product, process or service of specified requirements, (ISO Guide 2). **E 1187, E36**

conformity, *n*—fulfillment of a requirement. **E 1605, E06**

conformity surveillance—evaluation for conformity to determine the continuing conformity with specified requirements, (ISO Guide 2). **E 1187, E36**

conformity testing—evaluation for conformity by means of testing, (EN 45020). **E 1187, E36**

confounded factorial design, *n*—a factorial experiment in which only a fraction of the treatment combinations are run in each block and where the selection of the treatment combinations assigned to each block is arranged so that one or more prescribed effects is(are) confounded with the block effect(s), while the other effects remain free from confounding. **E 456, E11**

confounded factorial design, *n*—a factorial experiment in which only a fraction of the treatment combinations are run in each block and where the selection of the treatment combinations assigned to each block is arranged so that one or more prescribed effects is(are) confounded with the block effect(s), while the other effects remain free from confounding.

NOTE—All factor level combinations are included in the experiment.

E 1325, E11

confounding, *n*—combining indistinguishably the main effect of a factor or a differential effect between factors (interactions) with the effect of other factor(s), block factor(s) or interaction(s).

E 456, E11

confounding, *n*—combining indistinguishably the main effect of a factor or a differential effect between factors (interactions) with the effect of other factor(s), block factor(s) or interaction(s).

NOTE—Confounding is a useful technique that permits the effective use of specified blocks in some experiment designs. This is accomplished by deliberately preselecting certain effects or differential effects as being of little interest, and arranging the design so that they are confounded with block effects or other preselected principal factor or differential effects, while keeping the other more important effects free from such complications. Sometimes, however, confounding results from inadvertent changes to a design during the running of an experiment or from incomplete planning of the design, and it serves to diminish, or even to invalidate, the effectiveness of an experiment.

E 1325, E11

congealing point, *n*—that temperature at which molten petroleum wax ceases to flow, when allowed to cool under prescribed conditions. **D 4175, D02**

congealing point, *n*—of petroleum wax, that temperature at which molten petroleum wax, when allowed to cool under prescribed conditions, ceases to flow. **D 4175, D02**

conglomeric cryogenic fabric—a distinct soil micromorphology resulting from the effects of freezing and thawing, in which coarser soil particles form compound arrangements. **D 7099, D18**

congruent phases—those states of matter of unique composition that co-exist at equilibrium at a single point in temperature and pressure; for example, the two coexisting phases of a two-phase equilibrium (E 7, E04). **E 1142, E37**

congruent transformation—an isothermal, or isobaric, phase change in which both of the phases concerned have the same composition throughout the process; the order of a system becomes unary at a composition of congruency. **E 7, E04**

congruent transformation—an isothermal, or isobaric, phase change in which both of the phases concerned have the same composition throughout the process; the order of a system becomes unary at a composition of congruency, (E 7, E04). **E 1142, E37**

conical, ω —over a solid angle larger than an infinitesimal element of solid angle and less than a hemisphere. The geometry of the solid

angle must be described in the text. For incident beams it is assumed that the radiance is constant over the entire solid angle.

(See **Radiometric properties and quantities**) **E 772, E44**

conical head—See **countersunk head**. **F 547, F16**

conical washer—washer that has a crown height that flattens under load and is partially recovered following load removal. **F 1789, F16**

conifer—a tree belonging to the order *Coniferae*, usually evergreen, with cones and needle-shaped or scalelike leaves, and producing wood known commercially as “softwood.” **D 9, D07**

conjugate joints (faults)—two sets of joints (faults) that formed under the same stress conditions (usually shear pairs). (ISRM) **D 653, D18**

conjugate phases—those states of matter of unique composition which coexist at equilibrium at a single point in temperature and pressure; for example, the two coexisting phases of a two-phase equilibrium. **E 7, E04**

conjugate planes—two planes of an optical system such that one is the image of the other. **E 7, E04**

connate water, *n*—water entrapped in the voids of a sedimentary or extrusive igneous rock at the time of its deposition or emplacement. **D 653, D18**

connected porosity—See **connected porosity** under **porosity**. **C 242, C21**

connecting ring, *n*—in zippers, a device shaped like the letter “D” used to secure a pull, having more than one component in its design, to the bail of the slider. **D 123, D13**

connecting ring, *n*—a device shaped like the letter “D” used to secure a pull, having more than one component in its design, to the bail of the slider. **D 2050, D13**

connecting stroke, *n*—a line joining two adjacent characters. **E 2195, E30**

connecting wire error, *n*—the error caused by uncompensated connecting wire resistance. (Although the connecting wire is part of the measurement circuit, most of it is not at the temperature that is being determined. Thermometers are available in two-, three-, and four-wire configurations. There is no satisfactory way to compensate for the wire resistance in the measurement with a two-wire thermometer although the wire resistance can be compensated for in three and four-wire thermometers.) **E 344, E20**

connecting wires, *n*—the wires that run from the element through the cable end closure and external to the sheath. **E 344, E20**

connection—device or method used to fasten together two or more components of a structural system using mechanical means, welding, adhesives, or a combination of them. **E 631, E06**

connection, *n*—structural junction of two or more wood members, components, or assemblies, designed to be connected with mechanical fasteners, adhesives, welds, or a combination thereof, to transmit structural forces safely. Colloquially, the term *joint* is used in place of the term *connection*. **E 631, E06**

connection—attachment of load-bearing element to concrete or masonry base materials using anchors. **E 2265, E06**

connection head, *n*—a housing enclosing a terminal block for an electrical temperature-sensing device and usually provided with threaded openings for attachment to a protecting tube and for attachment of conduit. **E 344, E20**

connection point, *n*—any point on the wheel or metal loading plate where the resistance measuring instrument’s leads are connected. **F 538, F09**

connector, *n*—within the restrictions of this terminology, abbreviation for **metal connector plate**. **E 631, E06**

connector hole—opening in metal connector plate, resulting from punching integral tooth from, or nail hole in, connector plate during its fabrication. Also called *slot* when opening is not round. **E 631, E06**

connector pair, *n*—an assembly consisting of a plug and a jack, each having both positive and negative inserts, that will connect two

- parts of an electrical circuit and provide a means of physically disconnecting the two parts without the use of tools. **E 344**, E20
- consensus**, *n*—substantial agreement achieved through a **consensus process**, but not necessarily unanimity. **E 631**, E06
- consensus**—general agreement, characterized by the absence of substantial issues by any important part of the concerned interests and by a process that involves seeking to take into account the views of all parties concerned and to reconcile any conflicting arguments, (ISO Guide 2). **E 1187**, E36
- consensus process**, *n*—a formal procedure for reaching **consensus** that includes the elements of due process. **E 631**, E06
- consensus standard**—widely available standard developed by ASTM, ASME, SAE, ISO, or any other standards-setting organization which has under its structure those parties which include users, producers, and other interested persons. **F 1789**, F16
- conservation**, *n*—the examination, preservation, and restoration of cultural objects with minimal sacrifice of their aesthetic and historic integrity. **D 123**, D13
- conservation**, *n*—the profession devoted to the preservation of cultural property for the future. Conservation activities include examination, documentation, treatment, and preventive care, supported by research and education. **D 5038**, D13
- conservation**—See **preservation**. **E 631**, E06
- conservator**, *n*—a person whose activity involves the science, technology, and documentation associated with the conservation of cultural objects. **D 123**, D13
- conservator**, *n*—a professional whose primary occupation is the practice of conservation and who, through specialized education, knowledge, training, and experience, formulates and implements all the activities of conservation in accordance with an ethical code such as the AIC Code of Ethics and Guidelines for Practice. **D 5038**, D13
- consistency**, *n*—a property of a material determined by the complete flow force relation. **C 11**, C11
- consistency**, *n*—the degree of mobility of a refractory castable as determined by Practices C 860. **C 71**, C08
- consistency**, *n*—of fresh concrete, mortar, or grout, the relative mobility or ability to flow. **C 125**, C09
- consistency**—the properties of a slip that control its draining, flowing, and spraying behavior. **C 286**, B08
- consistency**—the relative ease with which a soil can be deformed. **D 653**, D18
- consistency**—in grouting, the relative mobility or ability of freshly mixed mortar or grout to flow; the usual measurements are slump for stiff mixtures and flow for more fluid grouts. **D 653**, D18
- consistency**, *n*—that property of a liquid adhesive by virtue of which it tends to resist deformation. (See also **viscosity** and **viscosity coefficient**.) **D 907**, D14
- consistency**, *n*—of lubricating grease, the degree of resistance to movement under stress. **D 4175**, D02
- consistency index**—see **relative consistency**. **D 653**, D18
- consistency (normal)**, *n*—the number of millilitres of water per 100 g of gypsum plaster or gypsum concrete required to produce a mortar or a slurry of specified fluidity. **C 11**, C11
- consistent with**—there are times when this expression is perfectly appropriate, such as when “evidence consistent with disguise is present” or “evidence consistent with a simulation or tracing is present, but “the known writing is consistent with the questioned writing” has no intelligible meaning. **E 1658**, E30
- console**, *n*—an instrument package that contains one or more instruments used to monitor depth, bottom time, surface intervals, air pressure, compass direction, decompression status, or some combination thereof. **F 1549**, F32
- consolidated**—the characteristic of being cemented or compacted, or both, and not separated easily into smaller particles. **D 5681**, D34
- consolidated-drained test (slow test)**—a soil test in which essentially complete consolidation under the confining pressure is followed by additional axial (or shearing) stress applied in such a manner that even a fully saturated soil of low permeability can adapt itself completely (fully consolidate) to the changes in stress due to the additional axial (or shearing) stress. **D 653**, D18
- consolidated-undrained test (consolidated quick test)**—a soil test in which essentially complete consolidation under the vertical load (in a direct shear test) or under the confining pressure (in a triaxial test) is followed by a shear at constant water content. **D 653**, D18
- consolidation**—the gradual reduction in volume of backfill matter to achieve stability. **C 896**, C04
- consolidation**—the gradual reduction in volume of a soil mass resulting from an increase in compressive stress
- initial consolidation (initial compression)**—a comparatively sudden reduction in volume of a soil mass under an applied load due principally to expulsion and compression of gas in the soil voids preceding primary consolidation.
- primary consolidation (primary compression) (primary time effect)**—the reduction in volume of a soil mass caused by the application of a sustained load to the mass and due principally to a squeezing out of water from the void spaces of the mass and accompanied by a transfer of the load from the soil water to the soil solids.
- secondary consolidation (secondary compression) (secondary time effect)**—the reduction in volume of a soil mass caused by the application of a sustained load to the mass and due principally to the adjustment of the internal structure of the soil mass after most of the load has been transferred from the soil water to the soil solids. **D 653**, D18
- consolidation**—the act of combining two or more materials to make a single package unit. Common types of consolidation packaging used by HHW programs include: bulking, lab packaging, and composite packaging. **D 5681**, D34
- consolidation**, *n*—the reduction in volume of a fill caused by movement of water out of the fill mass. Consolidation generally occurs due to an increase in the vertical stress on a fill. It is the movement of water rather than the compression of air-filled voids that distinguishes consolidation from compaction. **E 2201**, E50
- consolidation**—reduction in volume of soil as a result of gravitational forces. **F 412**, F17
- consolidation curve**—see **consolidation time curve**. **D 653**, D18
- consolidation grouting**—injection of a fluid grout, usually sand and Portland cement, into a compressible soil mass in order to displace it and form a lenticular grout structure for support. **D 653**, D18
- consolidation ratio**, U_s (**D**)—the ratio of: (1) the amount of consolidation at a given distance from a drainage surface and at a given time, to (2) the total amount of consolidation obtainable at that point under a given stress increment. **D 653**, D18
- consolidation test**—a test in which the specimen is laterally confined in a ring and is compressed between porous plates. **D 653**, D18
- consolidation-time curve (time curve) (consolidation curve) (theoretical time curve)**—a curve that shows the relation between: (1) the degree of consolidation, and (2) the elapsed time after the application of a given increment of load. **D 653**, D18
- consortium (pl. consortia)**, *n*—microbial community comprised of more than one, species that exhibits properties not shown by individual community members. **D 4175**, D02
- conspicuity**, *n*—the characteristics of an object that determine the likelihood that it will come to the attention of an observer. **E 284**, E12
- constant amplitude loading**—in fatigue loading, a loading (straining) in which all of the peak forces (strains) are equal and all of the valley forces (strains) are equal. **E 1823**, E08
- constant dollars**—dollars of uniform purchasing power exclusive to general inflation or deflation. **E 631**, E06
- constant dollars**, *n*—dollars of uniform purchasing power exclusive of general inflation or deflation. **E 833**, E06
- constant energy resolution**—AES, XPS, a mode of operation in which the instrumental resolution is constant over the spectrum. See **fixed analyzer transmission**. **E 673**, E42

constant-head boundary

constant-head boundary—the conceptual representation of a natural feature such as a lake or river that effectively fully penetrates the aquifer and prevents water-level change in the aquifer at that location. **D 653, D18**

constant life diagram—*in fatigue*, a plot (usually on rectangular coordinates) of a family of curves each of which is for a single fatigue life, N , relating stress amplitude, S_a , to mean stress, S_m , or maximum stress, S_{max} , or both, to minimum stress, S_{min} . The constant life fatigue diagram is usually derived from a family of $S-N$ curves each of which represents a different stress ratio (A or R) for a 50 % probability of survival. **E 1823, E08**

constant load—See **load**. **D 996, D10**

constant potential—a method of electrically generating x-rays by placing a constant potential electrical source (voltage and current) across the x-ray tube anode and cathode; the ripple component of the constant potential electrical source is typically less than 2.0 %. **E 1316, E07**

constant-rate-of-extension (CRE) type tensile testing machine, n —*in tensile testing*, an apparatus in which the pulling clamp moves at a uniform rate, and the force-measuring mechanism moves a negligible distance with increasing force, less than 0.13 mm (0.005 in.). **D 4845, D13**

constant-rate-of-extension tensile type testing machine (CRE), n —a testing machine in which the rate of increase of specimen length is uniform with time. **D 5684, D13**

constant-rate-of-extension type tensile testing machine (CRE), n —a testing machine in which the rate of increase of specimen length is uniform with time. **D 123, D13**

constant-rate-of-extension type tensile testing machine (CRE), n —*in tensile testing*, an apparatus in which the pulling clamp moves at a uniform rate, and the force-measuring mechanism moves a negligible distance with increasing force, less than 0.13 mm (0.005 in.). **D 123, D13**

constant-rate-of-extension type tensile testing machine (CRE), n —*in tensile testing*, an apparatus in which the pulling clamp moves at a uniform rate, and the force-measuring mechanism moves a negligible distance with increasing force, less than 0.13 mm (0.005 in.). **D 4849, D13**

constant-rate-of-loading (CRL) type tensile testing machine, n —*in testing tensile*, an apparatus in which the rate of increase of the force is uniform with time after the first 3 s and the specimen is free to elongate, this elongation being dependent on the extension characteristics of the specimen at any applied force. **D 4845, D13**

constant-rate-of-load tensile testing machine (CRL), n —*in tensile testing*, an apparatus in which the rate of increase of the force is uniform with time after the first 3 s and the specimen is free to elongate, this elongation dependent on the extension characteristics of the specimen at any applied force. **D 123, D13**

constant-rate-of-load tensile testing machine (CRL), n —a testing machine in which the rate of increase of the load being applied to the specimen is uniform with time after the first 3 s. **D 4439, D35**

constant-rate-of-load tensile testing machine (CRL), n —*in tensile testing*, an apparatus in which the rate of increase of the force is uniform with time after the first 3 s and the specimen is free to elongate, this elongation dependent on the extension characteristics of the specimen at any applied force. **D 4849, D13**

constant-rate-of-traverse (CRT) type tensile testing machine, n —*in tensile testing*, an apparatus in which the pulling clamp moves at a uniform rate and the force is applied through the other clamp, which moves appreciably to actuate a force-measuring mechanism, producing a rate of increase of force or extension that is usually not constant and is dependent on the extension characteristics of the specimen. **D 4845, D13**

constant-rate-of-traverse tensile testing machine (CR), n —a testing machine in which the pulling clamp moves at a uniform rate and the force is applied through the other clamp which moves appreciably to actuate a force-measuring mechanism, producing a

rate of increase of force or extension that is usually not constant and is dependent upon the extension characteristics of the specimen. **D 4849, D13**

constant-rate-of-traverse tensile testing machine (CRT), n —*in tensile testing*, an apparatus in which the pulling clamp moves at a uniform rate and the force is applied through the other clamp which moves appreciably to actuate a weighing mechanism, so that the rate of increase of force or extension that is usually not constant and is dependent upon the extension characteristics of the specimen. **D 123, D13**

constant-temperature stability (CTS) value, n —the maximum temperature at which a chemical compound or mixture may be held for a 2-h period under the conditions of the test without exhibiting a measurable exothermic reaction. **E 1445, E27**

constant velocity transport, n —a mechanism which feeds the paper through the printer at a steady rate. (See **CVT**.) **F 1457, F05**

constant weight—the condition of a substance in which all volatile components have been vaporized, and repeated exposure to a specified temperature, for any period of time, causes no change in weight. **C 896, C04**

constituent, n —an element, component, or ingredient of the population. **D 5681, D34**

constituent—a phase, or combination of phases, which occurs in a characteristic configuration in an alloy micro-structure. **E 7, E04**

constitutional diagram—graphical representation of the compositions, temperatures, pressures or combinations thereof at which the heterogeneous equilibria of an alloy system occur; also called "phase diagram," or "equilibrium diagram." **E 7, E04**

constitutional diagram—graphical representation of the compositions, temperatures, pressures, or combinations thereof at which the heterogeneous equilibria of a system occur. **E 1142, E37**

constitutive equation—force deformation function for a particular material. (ISRM) **D 653, D18**

constraint, n —any restriction to the deformation of a body. **E 6, E28**

construction—an obstruction in the bore of a clinical thermometer which permits the passage of mercury from the bulb when the bulb is heated, but which restricts its passage back to the bulb when heat is removed. **E 344, E20**

construction resistance—the increase in resistance arising from a change in current density distribution. In electric contacts it is that portion of contact resistance resulting from the convergence of current into the a-spots. **B 542, B02**

construct, n —a complete implant configuration attached to and including the spine, pelvis, ribs or substitute material as intended for surgical use. **F 1582, F04**

construction—details of arrangement or thickness or both, of veneers and other components used in the fabrication of plywood.

all-veneer construction—plywood in which all plies are veneer. Ordinarily no single ply of veneer will exceed $\frac{5}{16}$ in. (7.9 mm) in thickness.

balanced construction—a construction such that the forces induced by uniformly distributed changes in moisture content will not cause warpage.

composite construction—a panel assembly consisting of veneers and other wood-based materials. Normally the non-veneer component is identified in describing the construction.

lumber core construction—plywood in which the center ply or core is of lumber rather than of veneer. Ordinarily cores that are $\frac{3}{8}$ in. (9.5 mm) or greater in thickness will be of lumber.

symmetrical construction—plywood panels in which the plies on one side of the panel center line are essentially equal in thickness, grain direction, properties, and arrangement to those on the other side of the center line. **D 1038, D07**

constructional units, n —*in pile floor covering*, the needles, pitch, rows, shot, etc. into which the warp and filling yarns are commonly grouped. **D 123, D13**

construction contingency—the funds added to estimated and known costs in case of cost overruns during construction. **E 631, E06**

construction contingency, *n*—the funds added to estimated and known costs in case of cost overruns during construction.

E 833, E06

construction documents—materials that convey the physical, aesthetic, technical, performance, and administrative requirements necessary to initiate a contract for construction of the proposed project.

E 631, E06

construction documents, *n*—materials that convey the physical, aesthetic, technical, performance, and administrative requirements necessary to initiate a contract for construction of the proposed project.

E 833, E06

construction joint, *n*—*in building construction*, a formed or assembled joint at a predetermined location where two successive placements (“lifts”) of concrete meet.

C 717, C24

construction joint—See **joints**.

E 631, E06

construction joint—in the construction of members intended to be continuous, a predetermined, intentionally created discontinuity between or within constructions and having the ends of the discontinuous members fastened to each other to provide structural continuity.

E 631, E06

construction methods in permafrost—special procedures of design and construction that are required when engineering works are undertaken in areas of permafrost.

D 7099, D18

constructor, *n*—*in pipe laying*, the party that furnishes the work and materials for placement and installation.

C 1154, C17

constructor, *n*—*for pipe laying*, party that furnishes the work and materials for placement and installation.

D 2946, C17

consumed—the loss of identity of an item by incorporation into a higher assembly or through use and ultimate disappearance as a known item or substance.

E 2135, E53

consumer care, *n*—*of consumer textile products*, cleaning and maintenance procedures as customarily undertaken by the ultimate user.

D 123, D13

consumer care, *n*—*of consumer textile products*, cleaning and maintenance procedures as customarily undertaken by the ultimate user.

D 3136, D13

consumer panel, *n*—a group that is representative of the potential user population and that does not have technical knowledge of the products to be tested.

E 253, E18

consumer’s risk (β), *n*—the probability of accepting a lot when the process average is at the limiting quality level.

D 123, D13

consumer’s risk—the probability that a lot whose percentage defective is equal to the LTPD will be accepted by the plan.

E 456, E11

consumer textile product, *n*—a textile product intended to satisfy human wants and needs.

D 123, D13

consumer textile product, *n*—a textile item intended to satisfy human wants and needs.

D 3136, D13

consumption—(1) the process of incorporating material into an end item or otherwise using it in the performance of a documented business objective. (2) The measurement of actual use of consumable items against planned use.

E 2135, E53

contact, *n*—a) a generic term that applies to a device or part of a device and that has the capability of completing or interrupting the flow of an electrical signal in a circuit. b) may also be used with modifiers such as: electrical contact, arcing contact, noble metal contact, separable contact, etc.

B 542, B02

contact, *adj*—contact area, the part of an electrical device that is actually touching and where the electrical signal is expected to pass. Contact member, one of the electrical path parts that can make or break an electrical path.

B 542, B02

contact adhesive, *n*—adhesive that is applied to both adherends and after a specified open assembly time will instantly develop a bond when a firm but not sustained pressure is applied.

D 907, D14

contact adhesive, *n*—an adhesive that is apparently dry to the touch and that will adhere to itself instantaneously upon contact; also called contact bond adhesive or dry bond adhesive (D 907, D14).

D 996, D10

contact adhesive—see **adhesive**.

D 996, D10

contact adhesive—See **adhesive**, **contact**.

E 631, E06

contact adhesive—See **adhesive**, **contact**.

E 1749, E06

contact angle, *n*—*for paper wettability*, the angle formed by a paper substrate and the tangent to the surface of the liquid drop at the point of contact with the substrate when measured under specified conditions.

D 1968, D06

contact, **arcing**—an electrical contact whose primary mode of wearout occurs on the contacting surfaces as a result of an arc formed between separating or closing contact pairs.

B 542, B02

contact area, *n*—*in an unbonded specimen*, that area in contact with a high-modulus fixture, and through which applied forces pass; may or may not be constant, and if lubricated, may deliberately be allowed to change.

D 1566, D11

contact batch operation—an adsorption process in which an adsorbent is dispersed in a fluid to be treated and then separated when practical equilibrium is attained.

D 2652, D28

contact bond adhesive, *n*—Synonym for **contact adhesive**.

D 907, D14

contact bounce—the unwanted operation of contacts immediately following intentional operation.

B 542, B02

contact bounce—intermittent contact opening and contact closure that may occur after switch operation.

F 2112, F01

contact chatter—the unwanted operation of contacts resulting from external forces operating on them. For example, vibration may cause contacts to open and close or “chatter.”

B 542, B02

contact-closing force—the transient force between contacts during closure. At the first instant of closure this force is zero. It then builds up to a maximum value dependent on the forces and inertia of the contact system and finally stabilizes at the static contact force.

B 542, B02

contact closure—the event at which a specified resistance is achieved on a membrane switch.

F 2112, F01

contact, composite—a contact made of two or more distinct materials or alloys bonded to each other. For example, a contact with a facing of a precious metal bonded to a base-metal backing.

B 542, B02

contact force—the force to close, maintain, or open contacts. See also **insertion force**, **withdrawal force**, and **normal force**.

B 542, B02

contact force—the force at contact closure.

F 2112, F01

contact grouting—see **backpack grouting**.

D 653, D18

contact head—electrode assembly used to clamp and support a part to facilitate passage of electrical current through the part for circular magnetization.

E 1316, E07

contact herbicide—a chemical that kills those plant parts with which it comes into contact.

E 609, E35

contact inserts, *n*—metallic conductor assemblies which, when installed in connector bodies, provide connections between two parts of an electrical circuit. Plug connectors will contain projecting prong contacts, while jack connectors will contain recessed socket or receptacle contacts.

E 344, E20

contact length—the difference between the projected length, L_p , and the sum of $L_t + L_s$ or $L_c = L_p - (L_t + L_s)$.

F 1107, F27

contact length, l_c —the difference between the projected length, L_p and the sum of l_T plus l_s or $l_c = L_p - (l_T + l_s)$.

F 472, F27

contact noise—a varying voltage across a pair of electric contacts due to conditions at their interface.

B 542, B02

contact, non-arcing—mating electrical contact surfaces that do not experience wearout due to arc erosion that is opposite of arcing contacts.

B 542, B02

contact pad—replaceable metal pad, usually of copper braid, placed on electrodes to give good electrical contact, thereby preventing damage, such as arc strikes, to the part under test.

E 1316, E07

contact, pitted—a contact that has numerous discrete hollows in its surface.

B 542, B02

contact plating—deposition of a metal by the use of an internal source of current by immersion of the work in solution in contact with another metal.

B 374, B08

contact potential

contact potential—the potential difference at the junction of two dissimilar substances. **B 374, B08**

contact pressure—the force per unit area of physical contact between two contacts. This term is frequently but improperly used when contact force is meant. The area of physical contact is usually difficult to determine and quite different from the apparent area of contact. **B 542, B02**

contact pressure—an imprecise term denoting the minimum amount of pressure necessary to ensure an essentially void-free area between two mating surfaces. **E 631, E06**

contact pressure—an imprecise term denoting the minimum amount of pressure necessary to ensure an essentially void-free area between two mating surfaces. **E 1749, E06**

contact pressure molding, n—a method of molding or laminating in which the pressure, usually less than 70 kPa (10 psi), is only slightly more than necessary to hold the materials together during the molding operation. **D 883, D20**

contact pressure, p (FL⁻²)—the unit of pressure that acts at the surface of contact between a structure and the underlying soil or rock mass. **D 653, D18**

contact resistance—the resistance to current flow offered by the contact interface, comprising the sum of the constriction resistance plus the film resistance.

NOTE—In a practical measurement, correction must be made for bulk resistance consisting of contact material, lead wires, etc.

B 542, B02

contact resistance, n—the resistance to current flow between two touching bodies, consisting of constriction resistance and film resistance. **B 899, B02**

contact resistance probe, n—an apparatus for determining electrical contact resistance characteristics of a metal surface. **B 899, B02**

contact(s), butting—a type of contacts in which the direction of the motion of the moving contact is perpendicular to the contact faces. The contacts close and open with no appreciable sliding or rolling action. **B 542, B02**

contact scanner, n—a bar code reader that requires physical contact between the code medium and the scanner. **F 1294, F05**

contact, screw—a contact fabricated with an external thread for attachment to a support member or for adjustment. **B 542, B02**

contact, sliding—an electric contact which is expected to do its primary function during sliding. **B 542, B02**

contact, solid—a monolithic contact member. **B 542, B02**

contact, spring—a contact system in which one piece of material is used for both the driving spring and electric contact. **B 542, B02**

contact, static—an electric junction designed for infrequent separation and connection. **B 542, B02**

contact stress—the tensile stress component imposed at a glass surface immediately surrounding the contact area between the glass surface and an object generating a locally applied force. **C 162, C14**

contact surface area—the product of the average width times the contact length expressed quantitatively as follows:

$$A_c = \left[\frac{(b_H + 2b_M + b_V)}{4} \right] [L_c]$$

F 472, F27

contact surface area—the product of the average width times the contact length expressed quantitatively as follows:

$$A_c = \frac{b_h + 2b_m + b_v}{4} (L_c)$$

F 1107, F27

contacts, wiping—contacts that have some sliding motion during opening or closing. **B 542, B02**

contact testing—a technique in which the search unit makes contact directly with the test piece through a thin layer of couplant. **E 1316, E07**

contact thermometer, n—an instrument that is adapted for measur-

ing temperature by means of thermal conductivity by determining temperature at the moment when negligible thermal energy flows between the thermometer and the object of measurement. **E 344, E20**

contact time, n—in an intermittent contact test, the duration during each cycle that the challenge side chamber of the permeation cell is filled with the test chemical. **F 1494, F23**

contact trip—See **bottom trip**. **F 592, F16**

contact wipe—relative tangential motion between contacting surfaces that occurs during the normal course of contact closure. **B 542, B02**

container, n—a receptacle designed to hold a material, or to give integrity to the material. **D 123, D13**

container—a nonspecific term for a receptacle capable of closure (See also: **bag, barrel, basket, box, can, carton, crate, cylinder, drum, envelope, hamper, pail, tube**.)

body, n—in packaging, the principal part of a container, usually the largest part in one piece containing the sides.

bottle, n—a rigid or semirigid container typically of glass or plastic, having a comparatively narrow neck or mouth, and usually no handle (*Webster*).

case, n—a nonspecific term for a shipping container. In domestic commerce, case usually refers to a box made from corrugated or solid fiberboard wood, or metal.

cover, n—in packaging, the top or bottom, or both of a container, usually the part that closes the filling and dispensing opening. It is often called a cap when used with fiberboard containers. (See also **shroud**.)

cylinder, n—a rigid cylindrical metal container designed as a portable vessel for the storage and transportation of compressed gases. Generally equipped with protected valve closure and suitable pressure-relief safety device.

die-cut, adj—(1) a method of preparation in which a part or container has been cut, slotted, and scored or any combination of these by custom-made dies; (2) *n*, a part so made.

expendable container—a container for shipping or storage, or both, intended primarily for a single trip.

face, n—in packaging, any one of the plane surfaces of a container.

fast pack container—a standard size, reusable container with foam cushion inserts.

fiberboard container—a box, package, or drum made of fiberboard. When the term box is used for classification purposes, the structure must comply with all requirements of the carrier rules.

flap, n—one of the closing members of a fiberboard container.

glass container—any glass receptacle capable of holding a seal or closure for retention of contents.

intermodal container—a reusable shipping container manufactured to standard dimensions intended to unitize cargo or freight for shipping by one or more modes of transportation without the need for intermediate handling of the contents.

jar, n—a widemouthed container made typically of glass, plastic, or earthenware.

jug, n—a large, deep, usually glass, plastic, or earthenware container with a narrow mouth and a handle.

manufacturer's joint—that part of a fiberboard container where the ends of the box blank are joined together in the manufacturing process by taping, stitching, or gluing.

modular container—a family of containers designed to be assembled into a unit load.

returnable container—a shipping container of any material designed to be used for more than one shipment.

reusable container—a shipping and storage container designed for reuse without impairment of its protective function.

seam, n (when referring to a fiberboard container)—the lines

- of junction created by any free edge of a container flap or wall where it abuts or overlaps another portion of the **container** (except the **manufacturer's joint**).
- shipping container**—a container that is sufficiently strong to be used in commerce for **packing**, storing, and shipping commodities. (See also **barrel**, **crate**, **drum**.) **D 996**, D10
- container**, *n*—a receptacle designed to hold a material, or to give integrity to the material. **D 4849**, D13
- container**, *n*—a usually portable device in which material is stored, transported, treated, disposed of, or otherwise handled. **E 631**, E06
- containerboard**—any **paperboard** made specifically for the manufacture of **corrugated** and **solid fiberboard shipping containers**. Basis weight is expressed in pounds per 1000 ft² (or grams per square metre). It is customarily shipped in rolls.
- cylinder kraft—containerboard** made from kraft pulp on a cylinder machine.
- Fourdrinier kraft—containerboard** made from kraft pulp on a Fourdrinier machine, basically of single-ply formation, although possibly with supplementary second-ply, with less prominent grain direction. The sheet is formed on a traveling endless-wire screen which may also be vibrated to obtain more random orientation of fibers.
- solid fiberboard**—a solid board made by laminating two or more plies of **containerboard**. **D 996**, D10
- containerization**, *n*—(1) a shipping method in which material (such as merchandise) is packaged together in one **container**. (2) the use of transport **containers** to unitize cargo for transportation, supply, and storage. **D 996**, D10
- containment**, *n*—a physical barrier used to limit the spread of leaded dust and debris from a designated work area. **E 1605**, E06
- containment material**—in a solar energy system, a material that encloses the heat-transfer fluid or is in contact with the heat transfer or heat storage material, or both. **E 772**, E44
- containment mode**—placement of a boom to prevent free movement of a floating substance. **F 818**, F20
- contaminant**—an undesirable substance not normally present in water or soil. **D 653**, D18
- contaminant**, *n*—a material added by human or natural activities which may, in sufficient concentrations, render the atmosphere unacceptable. **D 1356**, D22
- contaminant**, *n*—a general term applicable to various extraneous and undesirable materials in pulp or other papermaking raw materials. **D 1968**, D06
- contaminant**, *n*—any substance potentially hazardous to human health or the environment and present in the environment above background concentration. **D 5681**, D34
- contaminant**—any foreign substance present which will adversely affect performance or quality. **D 6161**, D19
- contaminant**—any foreign substance present on the test surface or in the inspection materials which will adversely affect the performance of liquid penetrant materials. **E 1316**, E07
- contaminant**, *n*—a physical, chemical, biological, or radiological substance or matter that has an adverse effect on air, water, or soil. **E 2114**, E06
- contaminant**, *n*—any substance between and not a part of either of the two surfaces; *contaminant*, *contaminating*, *contamination*. **F 1646**, F13
- contaminant**, *n*—unwanted molecular or particulate matter that could adversely affect or degrade the operation, life, or reliability of the systems or components upon which it resides. **G 126**, G04
- contaminants**, *n*—*for asbestos*, any foreign matter (other than associated minerals and fines) in a sample of asbestos fiber. **D 2946**, C17
- contaminants**—all adventitious substances or microorganisms present in raw materials, bulk drugs, or final products. **E 1705**, E48
- contaminant unit**, *n*—the largest particle size that contains the contaminant of interest. **D 5681**, D34
- contaminate**, *v*—to make unfit for use, either intentionally or unintentionally, by introduction of a contaminant. **G 126**, G04
- contaminated public wells**—public wells used for drinking water that have been designated by a government entity as contaminated by toxic substances (for example, chlorinated solvents), or as having water unsafe to drink without treatment. **D 5681**, D34
- contamination**, *n*—*for coated inflatable restraint fabrics*, the presence of non-coating material in the coated layer. **D 6799**, D13
- contamination**, *n*—the undesired introduction of impurities of a chemical or microbiological nature, or of foreign matter, into or onto a raw material, intermediate, API (active pharmaceutical ingredient), or dosage form during production, sampling, packaging, or repackaging, storage, or transport. **E 2363**, E55
- contamination**—the presence of a substance not intentionally incorporated in a product. **F 412**, F17
- contamination**, *n*—any undesirable solid or liquid material that rests upon a surface or exists between two mating surfaces; *contaminant*, *contaminating*. **F 1646**, F13
- contamination**, *n*—(1) the amount of unwanted molecular or particulate matter in a system; (2) the process or condition of being contaminated. **G 126**, G04
- contemporary permafrost**—(1) newly formed permafrost in an area where surface temperatures have fallen below 0°C (32°F); (2) permafrost that is in thermal equilibrium with the existing mean annual surface or sea-bottom temperature and the geothermal heat flux. **D 7099**, D18
- context effect**, *n*—effect upon the perception of a stimulus arising from its interrelationship with other stimuli in a presentation set. **E 253**, E18
- contingency**, *n*—*in construction design planning and estimating*, an allocation of money that is not planned to be spent and is held for unplanned events. **E 833**, E06
- contingency plan**—document setting out an organized, planned, and coordinated course of action to be followed in case of an emergency, such as a fire or explosion, or a release of hazardous waste or hazardous waste constituents from a treatment, storage, or disposal facility that could threaten human health or the environment. **E 631**, E06
- continuing calibration blank**—a solution containing no analyte which is used to verify blank response and freedom from carryover. **E 1605**, E06
- continuing calibration blank (CCB)**—a standard solution that has no analyte and is used to verify blank response and freedom from carryover. **E 631**, E06
- continuing calibration verification**—a solution (or set of solutions) of known analyte concentration used to verify freedom from excessive instrumental drift; the concentration is to cover the range of a linear calibration curve. **E 1605**, E06
- continuing calibration verification (CCV)**—a standard solution (or set of solutions) used to verify freedom from excessive instrument drift; the concentration is to be near the mid-range of a linear curve. **E 631**, E06
- continuity of coating**—the degree to which a porcelain enamel or ceramic coating is free of defects, such as bare spots, boiling, blisters or copperheads, that could reduce its protective properties. **C 286**, B08
NOTE—See Test Method C 743.
- continuous** (as related to data acquisition), *adj*—conducted at data collection intervals of 5 s or less. **E 176**, E05
- continuous** (as related to data acquisition), *adj*—conducted at data collection intervals of 6 s or less. **E 176**, E05
- continuous bar code**, *n*—a bar code symbology where all spaces within the symbol are parts of characters and no inter-character spaces are present. **F 1294**, F05
- continuous cast drawing stock**—the as-rolled section, normally round, produced by a continuous casting and rolling process. **B 354**, B01
- continuous cleaning (coating)**—a term describing a type of porcelain

continuous cleaning (coating)

enamel designed to provide the continuous removal, at normal use temperatures, of food soils accumulated on the interior surfaces of ovens. **C 286, B08**

continuous coating, n—of metallic coated steel products, the process of uninterrupted passage of long lengths of steel products, usually steel sheet or wire, through the various processing steps such as cleaning, annealing, and coating. **A 902, A05**

continuous-conveyance furnace, n—a heating device through which steel objects are intentionally moved at a constant rate during the thermal processing cycle. **A 941, A01**

continuous deionization—a deionization process that does not require regular interruptions in service to discharge ionic materials collected from the water being processed. **D 6161, D19**

continuous element, n—a configured element formed continuously along a length of monofilament. **D 123, D13**

continuous element, n—a configured element formed continuously along a length of monofilament. (Compare **separate element**.) **D 2050, D13**

continuous element zipper, n—in *zippers*, a zipper consisting of two continuously formed elements, each attached to one of the opposing edges of two tapes, which are engaged and disengaged by the movement of a slider. (Compare **separate element zipper**.) **D 123, D13**

continuous element zipper, n—a zipper consisting of two continuously formed elements, each attached to one of the opposing edges of two tapes, which are engaged and disengaged by the movement of a slider. (Compare **separate element zipper**.) **D 2050, D13**

continuous emission—see **emission, continuous**. **E 1316, E07**

continuous fermentation—nonstop flow of nutrients into a fermenting vessel, with the simultaneous outflow of products, organisms, and by-products. **E 1705, E48**

continuous fiber-reinforced ceramic matrix composite, n—a ceramic matrix composite in which the reinforcing phase(s) consists of continuous filaments, fibers, yarn, braid, or knitted or woven fabrics. **C 1145, C28**

continuous filament—a single glass fiber of sufficiently small diameter to be flexible enough for textile uses and of great or indefinite length. **C 162, C14**

continuous filament yarn, n—a yarn made of filaments that extend substantially throughout the length of the yarn. **D 123, D13**

continuous filament yarn, n—two or more continuous filaments twisted into a single fiber bundle. **D 3878, D30**

continuous filament yarn, n—a yarn made of filaments that extend substantially throughout the length of the yarn. **D 7018, D13**

continuous form, n—a quantity of paper made up of numerous connected individual perforated sheets, folded to form a pack. **D 1968, D06**

continuous furnace—synonymous with **melter**. **C 162, C14**

continuous furnace—a furnace into which ware is fed continuously and through which it progresses during firing. **C 286, B08**

continuous jet, n—See **liquid jet**. **G 40, G02**

continuously reinforced concrete pavement (CRCP), n—Portland cement concrete pavement with sufficient longitudinal steel reinforcement to control transverse crack spacings and openings in lieu of transverse contraction joints for accommodating concrete volume changes and load transfer. **E 867, E17**

continuously reinforced concrete pavement (CRCP), n—Portland cement concrete pavement with sufficient longitudinal steel reinforcement to control transverse crack spacings and openings in lieu of transverse contraction joints for accommodating concrete volume changes and load transfer. **E 1778, E17**

continuous method—with relation to magnetic particle inspection: a method wherein the indicating medium is applied while the magnetizing force is present. **E 1316, E07**

continuous mixer—a mixer into which the ingredients of the mixture are fed without stopping, and from which the mixed product is discharged in a continuous stream. **D 653, D18**

continuous moving bed—an adsorption process characterized by

flow of a fluid through a continuously moving bed of granular adsorbent with continuous withdrawal of spent adsorbent and continuous addition of reprocessed or virgin adsorbent. **D 2652, D28**

continuous partial discharges (continuous corona), n—discharges that recur at rather regular intervals; for example on approximately every cycle of an alternating voltage or at least once per minute for an applied direct voltage. **D 1711, D09**

continuous permafrost—permafrost occurring everywhere beneath the exposed land surface throughout a geographic region, with the exception of widely scattered sites, such as newly-deposited unconsolidated sediments, where the climate has just begun to impose its influence on the ground thermal regime and will cause the formation of continuous permafrost. **D 7099, D18**

continuous permafrost zone—a major subdivision of a permafrost region, in which permafrost occurs everywhere beneath the land surface, with the possible exception of widely scattered sites; both in North American (GPRGIT) and in Russian (Permafrost Map of the USSR) usage: >80 % of area underlain by permafrost. **D 7099, D18**

continuous phase—the phase forming the matrix or background in which other phases may be dispersed as isolated units. **E 7, E04**

continuous sampling—See **sampling**. **D 1356, D22**

continuous sintering, v—presintering, or sintering, in such manner that the objects are advanced through the furnace at a fixed rate by manual or mechanical means. Synonymous with **stoking**. **B 243, B09**

continuous smelter—a type of smelter into which the raw mix is fed continuously and from which the molten product is discharged continuously. **C 286, B08**

continuous spectrum (X-rays)—the polychromatic radiation given off by the target of an X-ray tube, containing all wavelengths above a certain minimum value called the short wave length limit. **E 7, E04**

continuous variate, n—a variate that is a measurement based on a scale that is assumed to be continuous. **D 123, D13**

continuous waste—a drain connecting two or more plumbing fixtures or components of plumbing fixtures to a common trap. **F 412, F17**

continuous wave—a constant flow of ultrasonic waves, as opposed to pulsed. **E 1316, E07**

continuum—the smooth distribution of energy deposited in a gamma detector arising from partial energy absorption from Compton scattering or other processes (for example, Bremsstrahlung). See **Compton scattering**. **E 170, E10**

contract furniture, n—furniture manufactured for use in non-household applications. **D 123, D13**

contract furniture, n—furniture manufactured for use in non-household applications. **D 7023, D13**

contraction—linear strain associated with a decrease in length. (ISRM) **D 653, D18**

contraction chamber, n—an enlargement of the capillary, that will appear below the main scale or between the main scale and the auxiliary scale, which serves to reduce its length or to prevent contraction of the liquid column into the bulb. **E 344, E20**

contract manufacturer, n—a manufacturer who performs some aspect of manufacturing on behalf of another entity. **E 2363, E55**

contractor—see **lead abatement contractor**. **E 631, E06**

contra lateral, adj—located, occurring, or acting on the opposite side of the body. **F 1646, F13**

contrast, n—*visual*, the degree of dissimilarity in appearance of two parts of a field of view seen simultaneously or successively. **E 253, E18**

contrast, n—(1) *objective*, the degree of dissimilarity of a measured quantity such as luminance of two areas, expressed as a number computed by a specified formula.

(2) *subjective*, the degree of dissimilarity in appearance of two parts of a field of view seen simultaneously or successively.

E 284, E12

contrast, *n*—a linear function of the observations for which the sum of the coefficients is zero. E 456, E11

contrast—the difference in visibility (brightness or coloration) between an indication and the background. E 1316, E07

contrast—the difference between the amount of light reflected or transmitted by an object and by the background within the field of view. E 1316, E07

contrast, *n*—a linear function of the observations for which the sum of the coefficients is zero.

NOTE—With observations Y_1, Y_2, \dots, Y_n , the linear function $a_1Y_1 + a_2Y_2 + \dots + a_nY_n$ is a contrast if, and only if $\sum a_i = 0$, where the a_i values are called the contrast coefficients. E 1325, E11

contrast—(1) in optical character recognition, the difference between color or shading of the printed material on a document and the background on which it is printed.

(2) See **print contrast ratio**. F 149, F05

contrast, *n*—the difference in reflectance between dark bars and light spaces of a bar code symbol. F 1294, F05

contrast agent—a material added to a component to enhance details by selective absorption of the incident radiation. E 1316, E07

contrast analysis, *n*—a technique for estimating the parameters of a model and making hypothesis tests on preselected linear combinations of the treatments (contrasts). E 456, E11

contrast analysis, *n*—a technique for estimating the parameters of a model and making hypothesis tests on preselected linear combinations of the treatments (contrasts).

NOTE—Contrast analysis involves a systematic tabulation and analysis format usable for both simple and complex designs. When any set of orthogonal contrasts is used, the procedure, as in the example, is straightforward. When terms are not orthogonal, the orthogonalization process to adjust for the common element in nonorthogonal contrast is also systematic and can be programmed. E 1325, E11

contrast effect, *n*—special case of context effect in which the perceived degree of difference between stimuli is exaggerated as a result of their interrelationship. E 253, E18

contrast enhancement (electron optics)—an improvement in electron image contrast by the use of an objective aperture diaphragm, shadow casting, or other means. E 7, E04

contrast gloss, *n*—see **luster**. E 284, E12

contrast perception—the ability to differentiate various components of the object structure by different intensity levels in the image. E 7, E04

contrast, photographic—the word contrast has been used in many different senses in connection with various photographic characteristics; there are different types of photographic contrast and different methods of measuring it. It is frequently used to designate the magnitude of the density difference resulting from a given exposure difference. (For another use, see **gamma**.) E 7, E04

contrast ratio—the ratio of the reflectance of a coating over black backing to its reflectance over a backing of reflectance of 0.80 (80 percent). C 286, B08

contrast ratio, *n*—ratio of the reflectance of a dry paint film over a black substrate of 5 % or less reflectance, to the reflectance of the same paint, equivalently applied and dried, over a substrate of 80 % reflectance. D 16, D01

contrast ratio, *n*—see the preferred terms **contrast** or **opacity**. E 284, E12

contrast sensitivity—a measure of the minimum percentage change in an object which produces a perceptible density/brightness change in the radiological image. E 1316, E07

contrast stretch—a function that operates on the greyscale values in an image to increase or decrease image contrast. E 1316, E07

control—(evaluation), *n*—an evaluation to check, test, or verify; (authority): the act of guiding, directing, or managing; (stability): a state of process in which the variability is attributable to a constant system of chance causes. E 456, E11

control, *n*—material of established origin that is used to evaluate the performance of a test or comparison. E 1732, E30

control—a standard production-inked ribbon (film or fabric), carbon paper, manifold sets, etc. that has known values in normal use. (F 153) F 221, F05

control, *n*—in weathering, the term control has three current widespread uses:

1. A material which is of similar composition and construction to the test material used for comparison, exposed at the same time.

G 113, G03

control access system—a device, barrier or mechanism that prohibits unauthorized activation of a ride or device control system.

F 747, F24

control analyses, *n*—the determination of specific parameters used as criteria for proper operation of a system. D 1129, D19

control block—a group of devices having a common piping and control system. D 6161, D19

control chart factor, *n*—a factor, usually varying with sample size, to convert specified statistics or parameters into a central line value or control limit appropriate to the control chart. E 456, E11

control chart method, *n*—the method of using control charts to determine whether or not processes are in a stable state.

E 456, E11

control coupon (also witness coupon), *n*—(1) a coupon made from the same material and prepared in exactly the same way as the test coupons which is used to verify the validity of the method or part thereof (G 120, G 131); (2) a coupon made from the same material as the test coupons but in this test method is not coated with the contaminant (G 121). G 126, G04

control echo—reference signal from a constant reflecting surface, such as a back reflection. E 1316, E07

control (expansion-contraction) joint, *n*—a designed separation in the system materials that allows for movement caused by expansion or contraction of the system. The construction of the separation is accomplished by one of the following methods: (1) manufactured devices suitable for this application, or (2) by field fabrication of suitable materials. C 11, C11

control joint, *n*—in building construction, a formed, sawed, tooled, or assembled joint acting to regulate the location and degree of cracking and separation resulting from the dimensional change of different elements of a structure. C 717, C24

control joint—See **joint**. E 631, E06

control joint—in concrete, concrete masonry, stucco, or coating systems; a formed, sawed, or assembled joint acting to regulate the location of cracking, separation, and distress resulting from dimensional or positional change. E 631, E06

controlled blasting—includes all forms of blasting designed to preserve the integrity of the remaining rocks, that is, smooth blasting or pre-splitting. (ISRM) D 653, D18

controlled cooling, *n*—cooling a steel object from an elevated temperature in a predetermined manner to avoid hardening, cracking, or internal damage, or to produce a desired microstructure or mechanical properties. A 941, A01

controlled flow—a characteristic of a resin system with elevated viscosity during cure. E 631, E06

controlled flow—a characteristic of a resin system with elevated viscosity during cure. E 1749, E06

controlled low strength material (CLSM)—flowable low compressive strength cementitious material used in the pipe zone as a bedding material. Also referred to as controlled density fill, flowable fill, slurry, or lean concrete. C 896, C04

controlled low-strength material (CLSM), *n*—a flowable fill conforming to ACI 229 R. E 2201, E50

controlled-pore filter—See **filter**. D 1356, D22

controlled-rate thermal analysis, (CRTA), *n*—a family of techniques that monitors the temperature versus time profile needed to maintain a chosen, fixed rate of change of a property of a substance. (ICTAC)

NOTE—Compared to controlled-temperature experiments, where the reaction rate tends to increase exponentially and the rate can become limited by heat or mass transfer, CRTA experiments are more likely to involve the chemical reaction as the limiting step. This technique can also improve the resolution of multiple reactions. For example, in controlled rate experiments, power to the furnace is controlled to ensure a fixed rate of mass loss (or gain). **E 473, E37**

controlled-strain test—a test in which the load is so applied that a controlled rate of strain results. **D 653, D18**

controlled-stress test—a test in which the stress to which a specimen is subjected is applied at a controlled rate. **D 653, D18**

controlled-temperature program, *n*—the temperature history experienced by a sample during the course of a thermal analysis experiment.

NOTE—In contrast to controlled-rate experiments, power to the furnace is controlled to ensure a fixed rate of temperature change for controlled-temperature experiments. The program may include heating or cooling segments in which the temperature is changed at a fixed rate, isothermal segments in which time becomes the explicit independent variable, or any sequence of these individual segments. If the atmosphere (or vacuum) around the sample is changed by some external action (depending on the independent variable only—temperature or time) during the course of the experiment, that too becomes part of the controlled-temperature program. **E 473, E37**

control limit—limits on a control chart which are used as criteria for signaling the need for action, or for judging whether a set of data does or does not indicate a state of statistical control. **E 456, F1789, F16**

control limits, *n*—predetermined ranges based on the variability of past observations between which the instrument data for a test must fall to be considered valid. **D 123, D13**

control limits, *n*—limits on a control chart that are used as criteria for signaling the need for action or for judging whether a set of data does or does not indicate a state of statistical control. **D 4175, D02**

control limits, *n*—predetermined ranges based on the variability of past observations between which the instrument data for a test must fall to be considered valid. **D 7139, D13**

control limits, *n*—limits on a control chart which are used as criteria for signaling the need for action, or for judging whether a set of data does or does not indicate a state of statistical control. **E 456, E11**

control plan—written description of a system for controlling fasteners and the processes used in their manufacture. Three distinct phases are used in a control plan, including prototype, pre-launch, and production. **F 1789, F16**

control plate—See **solidmetal-coupon control specimen**. **E 631, E06**

control rinse water—water used for equipment washing and rinsing having a known chemistry. **D 653, D18**

control sediment—a sediment that is essentially free of contaminants and is used routinely to assess the acceptability of a test. **E 943, E47**

control specimen—See **solid metal-coupon control specimen**. **E 631, E06**

control tire, *n*—a reference tire, used in a specified manner throughout a test program. **F 538, F09**

control undercover garment, *n*—a garment having a known history, the performance of which in a specific end-use has been established previously, and which is used as a standard of comparison. **D 123, D13**

control well—well by which the aquifer is stressed, for example, by pumping, injection, or change of head. **D 653, D18**

convection—the transport of heat by fluid flow. **E 772, E44**

convection, forced—convection caused by mechanical forces such as fans and injectors. **E 772, E44**

convection, natural—convection within a fluid, due to density differences caused by temperature differences. **E 772, E44**

convection oven, commercial—equipment for cooking food by forc-

ing hot air over surface of the food using a fan in a closed cavity. See **oven**. **F 1827, F26**

convection tube—a closed single-phase heat transfer device that removes heat from the ground whenever conditions are appropriate to drive the internal convection cell. **D 7099, D18**

conventional blanket, *n*—a blanket woven in either a plain or twill weave that is napped on both sides. **D 123, D13**

conventional blanket, *n*—a blanket woven in either a plain or twill weave that is napped on both sides. **D 7023, D13**

conventional sulfur vulcanizing system, *n*—as applied to natural and isoprene rubbers and butadiene-based synthetic rubbers, a vulcanizing system using a relatively high proportion of sulfur in which the combined sulfur exists predominantly in the polysulfidic cross links chain modifications. **D 1566, D11**

conventional true value of a quantity, *n*—value attributed to a particular quantity and accepted, sometimes by convention, as having an uncertainty appropriate for a given purpose.

NOTE—“Conventional true value” is sometimes called “assigned value”, “best value”, “conventional value”, or “reference value”. “Reference value”, in this sense, should not be confused with “reference value” in the sense of an influence quantity affecting a measuring instrument.

NOTE—Frequently, a number of results of measurements of a quantity is used to establish a conventional true value. **E 456, E11**

convergence—generally refers to a shortening of the distance between the floor and roof of an opening, for example, in the bedded sedimentary rocks of the coal measures where the roof sags and the floor heaves. Can also apply to the convergence of the walls toward each other. (ISRM) **D 653, D18**

convergence, *n*—tendency of a stimulus to be perceived as similar to prior stimulus or stimuli. **E 253, E18**

convergence effect, *n*—special case of context effect in which the perceived degree of difference between stimuli is diminished as a result of their interrelationship. **E 253, E18**

conversion coating—a coating produced by chemical or electrochemical treatment of a metallic surface that gives a superficial layer containing a compound of the metal, for example, chromate coatings on zinc and cadmium, oxide coating on steel. **B 374, B08**

conversion efficiency—the ratio of the actual to theoretical fuel ethanol yield per unit mass of the feedstock. **E 1705, E48**

conversion, hardness—the exchange of a hardness number determined by one method for an equivalent hardness number of a different scale. **E 7, E04**

conversion screen—a device that converts the imaged neutron beam to radiation or light that exposes the radiographic film. **E 1316, E07**

conversion treatment—a chemical or electrochemical process producing a superficial layer containing a compound of the metal. **B 374, B08**

conversion (Y)—product water flow rate divided by feed water flow rate. Also called recovery; given as fraction or decimal. See **recovery**. **D 6161, D19**

converted tire, *n*—a scrap tire that has been processed into a usable commodity other than a tire. **D 5681, D34**

convex head—See **umbrella head**. **F 547, F16**

convex surface—a local convex curvature in the flat surfaces of pultruded plastic parts as measured transversely to their length. **D 3918, D20**

conveyor—a mechanism designed to move racked/unracked dishware through the treatment stages and out to the clean end of conveyor type dishwashing machines. **F 1827, F26**

conveyor oven—equipment that carries the food product on a moving conveyor into and through a heated chamber. The chamber may be heated by gas or electric forced convection, radiants, or quartz tubes. Top and bottom heat may be independently controlled. See **oven**. **F 1827, F26**

convolution—the combination of local measurements of drop size

distribution and number density into equivalent line-of-sight values of drop size distribution and optical extinction. **E 1620**, E29

convoy, *n*—*in tiretesting*, two or more vehicles running at the same time, over the same test course, under the same interdependent conditions. **F 538**, F09

cooking area—See **cooking surface**. **F 1827**, F26

cooking cavity—the volume within equipment. **F 1827**, F26

cooking container—a vessel used to hold the food product that is being heated by the equipment. **F 1827**, F26

cooking energy—energy consumed (Btu or kJ) by the equipment as it is used to cook a specified food product to a specified cooked condition under all cooking-load (see **load**) scenarios, $E_{equipment}$. **F 1827**, F26

cooking energy efficiency—quantity of energy imparted to the specified food product, expressed as a percentage of energy consumed by the equipment during the cooking event, η_{cook} .

$$\eta_{cook} = \frac{E_{food}}{E_{appliance}} \times 100$$

where:

η_{cook} = see *cooking energy efficiency*,
 $E_{equipment}$ = energy into the equipment (see *cooking energy*),
 E_{food} = see energy to food, and
 $= E_{sens} + E_{thaw} + E_{evap}$

where:

E_{sens} = quantity of heat added to food product, that causes their temperature to increase from the starting temperature to the average bulk temperature of a “done” food product,
 $= (W_i) (C_p) (T_f - T_i)$

where:

W_i = initial weight of food product, lb (kg), as specified in the applicable standard test method,
 C_p = specific heat of food product, Btu/lb, °F (kJ/kg, °C), as specified in the applicable standard test methods,
 T_f = final cooked temperature of food product, °F (°C), as specified in the applicable standard test method,
 T_i = initial internal temperature of food product, °F (°C), as specified in the applicable standard test method.

where:

E_{thaw} = latent heat (of fusion) added to the food product, that causes the moisture (in the form of ice) contained in the food product to melt when the temperature of the food product reaches 32°F (0°C) (the additional heat required to melt the ice is not reflected by a change in the temperature of the food product), Btu (kJ),
 $= W_{iw} \times H_f$

where:

W_{iw} = initial weight of water in the food product, lb (kg),
 H_f = heat of fusion, Btu/lb (kJ/kg), and
 $= 144$ Btu/lb (36 kJ/kg) at 32°F (0°C).

where:

E_{evap} = latent heat (of vaporization) added to the food product, that causes some of the moisture contained in the food product to evaporate. Similar to the heat fusion, the heat of vaporization cannot be perceived by a change in temperature and must be calculated after determining how much moisture was lost from a “done” food product.

$$= W_{loss} \times H_v$$

where:

W_{loss} = weight loss of water during cooking, lb (kg),
 H_v = heat of vaporization, Btu/lb (kJ/Kg),
 $= 970$ Btu/lb (2256 kJ/kg) at 212°F (100°C), and

where:

$E_{equipment}$ = energy into equipment, Btu (kJ).

F 1827, F26

cooking energy rate—average rate of energy consumption (Btu/h or kJ) during the cooking energy efficiency tests, refers to all loading scenarios, $E_{cook\ rate}$.

$$E_{cook\ rate} = \frac{E_{cook} \times 60}{t_{cook}}$$

where:

E_{cook} = equipment energy consumption, and
 t_{cook} = cook time, min.

F 1827, F26

cooking medium—a substance within equipment that transfers heat to the food product, e.g., oil in a fryer, water in a pasta cooker, or air in an oven. **F 1827**, F26

cooking surface—an area of the equipment that receives a source of heat upon which a food product is cooked (or defrosted), for example, griddle surface, element or burner of a range, or broiler grate. **F 1827**, F26

cooking unit—a heating device located on the equipment that is powered by a single heat source comprised of either a gas burner or an electrical element, that is independently controlled.

F 1827, F26

cook time—time required to cook the specified food product to a specified cooked condition during a cooking energy efficiency (see **cooking energy efficiency**) test. **F 1827**, F26

cook zone—the volume of oil in the fryer in which foods are cooked; typically the entire volume from the heating element(s), or heat exchange surface to the surface of the frying-medium. See **fryer**. **F 1827**, F26

coolant additive package, *n*—the combination of inhibitors added to an engine coolant to mitigate cooling system degradation, corrosion, scaling, and foaming, or to provide other desirable properties. **D 4725**, D15

cooler nail—usually coated, slender, regular-stock-steel, 1 by 0.062 to 2⁷/₈ by 0.120-in. nails with flat 1¹/₆₄ to 1⁵/₆₄-in. head and medium diamond point, with head diameter same as or smaller than that of common wire nail of same length. **F 547**, F16

cool-flame, *n*—a faint, pale blue luminescence or flame occurring below the autoignition temperature (AIT). **E 1445**, E27

cooling, chemical, *n*—sensation of reduced temperature experienced as a result of exposure to certain substances such as menthol or anise. The sensation usually persists after the stimulus is removed. **E 253**, E18

cooling curve—graphical representation of the course of temperature fall of a chemical mixture as a function of time commonly exhibiting more or less abrupt changes of rate at, or near, those temperatures at which phase changes begin; used in finding the temperatures at which phase changes occur. Occasionally, some property or function other than time may be used; for example, thermal expansion. **E 7**, E04

cooling curve—graphical representation of specimen temperature or temperature change as a function of time or decreasing environment temperature. **E 1142**, E37

cooling-down period—{archaic} (1) the time elapsing after a covered pot is opened before the glass is cool enough to work.

(2) period between fining stage and the removal of the glass from the furnace. **C 162**, C14

cooling, physical, *n*—sensation of reduced temperature experienced as a result of exposure to thermally cold substances, such as ice; to substances that evaporate rapidly, such as acetone or alcohol; or to

cooling, physical, *n*

substances that have a negative heat of solution, such as crystalline sorbitol. The duration of the sensation is usually limited to the time of direct contact with the stimulus. **E 253, E18**

cooling rate—See **setting rate**. **C 162, C14**

cooling rate—the average slope of the time-temperature curve taken over a specified time and temperature interval. **E 7, E04**

cooling rate—average slope of the time-temperature curve taken over a specific time and temperature interval as the temperature is decreased. **E 1142, E37**

cooling time, *n*—in molding, the time interval from the start of forward screw movement until the mold starts to open. **D 883, D20**

cooling zone—that part of the continuous furnace in which the ware is allowed to cool after firing. **C 286, B08**

coping—dimension stone used as the top course of a masonry wall, often sloped to shed water. **C 119, C18**

coping—a covering on top of a wall exposed to the weather, usually sloped to carry off water. **D 1079, D08**

copolymer—See **polymer**. **D 883, D20**

copolymer, *n*—see **polymer**. **D 907, D14**

copolymer, *n*—a polymer formed from two different monomers. **D 1566, D11**

copolymer, *n*—a polymer consisting of molecules characterized by the repetition (neglecting ends, branch junctions and other irregularities) of two or more different types of monomeric units. See **polymer**. **F 1251, F04**

copolymerization—See **polymerization**. **D 883, D20**

copolymerization, *n*—see **polymerization**. **D 907, D14**

copolymerization, *n*—the polymerization of two or more different monomers into a single polymer. **D 1566, D11**

copolymerization—see **polymerization** and **copolymer**. **F 1251, F04**

copper common nail—bright, solid-copper, $\frac{5}{8}$ by 0.065 to 6 by 0.284-in. nails with flat head and medium diamond point. **F 547, F16**

copper corrosion—a qualitative indication of reactive impurities in aromatic hydrocarbons. An iridescent, gray, or black discoloration of polished copper strip is considered cause for rejection. **D 4790, D16**

coppered, copper-washed—all surfaces chemically plated with copper, usually by chemical rather than electrolytic process. (See **electroplated**.) **F 547, F16**

copper enamel—a porcelain enamel specifically designed for application to copper. **C 286, B08**

copperhead—a defect occurring in sheet metal ground coat that appears as a small freckle or pimple-like spot, reddish brown in color. **C 286, B08**

copper number—the number of grams of copper in the cuprous oxide reduced from a cupric compound by 100 g of pulp or paper (after deduction of moisture, ash, and sizing materials) treated under specified conditions with an excess of cupric solution. The copper number is an indication of the relative number of reducing groups in the pulp or paper. **D 1695, D01**

copper number—the weight in grams of copper reduced from the cupric to the cuprous state by exposure to 100 g of paper, paperboard, or pulp as determined by a specified method; indicates the relative number of reducing groups in the pulp or paper and is used as a measure of its chemical quality and stability. **D 1968, D06**

copying—the act of producing an image on a document or other receptor media which is a duplication of the image of another document, such as by a photographic, xerographic, or facsimile process or by carbon or carbonless papers. **F 335, F05**

copying—the act of producing an image on a document or other receptor media which is a duplication of the image of another document, such as by a photographic, xerographic or facsimile process or by carbon or carbonless papers. **F 909, F05**

coquina—a limestone composed predominantly of unaltered shells or shell fragments loosely cemented by calcite. **C 119, C18**

cord—a generally attenuated glassy inclusion with properties differing from those of the surrounding glass. **C 162, C14**

cord, *n*—a twisted or formed structure composed of one or more single or plied filaments, strands, or yarns of organic polymer or inorganic materials. **D 123, D13**

cord, *n*—in *zippers*, a strand of multiple yarns for use in forming a bead. **D 123, D13**

cord, *n*—of *glassfiber*, a strand made by combining multiple ends of filament strands, including cabled yarns, primarily for structural application. **D 123, D13**

cord, *n*—a strand of multiple yarns for use in forming a bead. **D 2050, D13**

cord, *n*—a twisted or formed structure composed of one or more single or plied filaments, strands, or yarns of organic polymer or inorganic materials. **D 6477, D13**

cord, *n*—of *glassfiber*, a strand made by combining multiple ends of filament stands, including cabled yarns, primarily for structural application. **D 7018, D13**

cord, *n*—in a *tire*, filament(s) or plied yarns used in making a tire ply. **F 538, F09**

corded selvage—See **loopy selvage**. **D 3990, D13**

cordierite porcelain—See **cordierite porcelain** under **porcelain**. **C 242, C21**

cordierite whiteware—See **cordierite whiteware** under **ceramic whiteware**. **C 242, C21**

cordovan—leather made from the tight, firm portion of horse butts. It has very fine pores and characteristic waxy finish, and is very durable. **D 1517, D31**

cords, *n*—the strands of wire or fabric that form the plies and belts in a tire. **D 5681, D34**

cord twist, *n*—the amount of twist in a cord made from two or more single or plied yarns. **D 123, D13**

cord twist, *n*—the amount of twist in a cord made from two or more single or plied yarns. **D 6477, D13**

corduroy, *n*—a filling cut-pile fabric in which the cut fibers form a surface of wales (rounded cords or ribs) which usually run warpwise. **D 123, D13**

corduroy, *n*—a filling cut-pile fabric in which the cut fibers form a surface of wales (rounded cords or ribs) which usually run warpwise. **D 4850, D13**

corduroy flesh—a rough condition of the flesh side of leather caused by failure to remove the twitching muscles. **D 1517, D31**

core, *n*—in *casehardening*, the interior portion of unaltered composition or microstructure, or both, of a case hardened steel object. **A 941, A01**

core, *n*—in *cladproducts*, the central portion of a multilayer composite metallic material. **A 941, A01**

core—see **conductor core**. **B 354, B01**

core, *n*—a centrally located layer of a sandwich construction, usually low density, which separates and stabilizes the facings and transmits shear between the facings and provides most of the shear rigidity of the construction. **C 274, D30**

core—a cylinder of concrete obtained from concrete by means of a core drill. **C 822, C13**

core, *n*—in *drilling*, a cylindrical section of rock (coal) that is usually 5 to 10 cm in diameter, taken as part of the interval penetrated by a core bit and brought to the surface for geologic examination, representative sampling and laboratory analyses. **D 121, D05**

core, *n*—in *samplingfiber packages*, the portion of wool or other fiber obtained using a sampling tube. **D 123, D13**

core, *n*—a filament or strand that serves as an extended axis about which other elements can be wound. **D 123, D13**

core—a cylindrical sample of hardened grout, concrete, rock, or grouted deposits, usually obtained by means of a core drill. **D 653, D18**

core, *n*—in *packaging*, a cylindrical structure used as a carrier of flexible material that is wound around it. **D 996, D10**

core—(1) *in decorative or hardwood plywood*, the center most ply. It may be of lumber (either edgeglued or closely assembled) or other wood-based panel material, or of one or more thicknesses of veneer.

(2) *in construction plywood*, all plies or layers between the face and back. **D 1038, D07**

core, *n*—*in sampling fiber packages*, the portion of wool or other fiber obtained by using a sampling tube. **D 4845, D13**

core, *n*—a filament or strand that serves as an extended axis about which other elements can be wound. **D 6477, D13**

core—(1) *case hardening*—interior portion of unaltered composition, or microstructure, or both, of a case-hardened steel article.

(2) *clad products*—the central portion of a multilayer composite metallic material. **E 7, E04**

core, *n*—*of an optical fiber*, the center region of an optical waveguide through which radiant energy is transmitted. **E 131, E13**

core—a generally centrally located layer or composite component of a sandwich construction, usually low density, which separates and stabilizes the facings and transmits shear between them and provides most of the shear rigidity of the construction. **E 631, E06**

core—a generally centrally located layer or composite component of a sandwich construction, usually low density, which separates and stabilizes the facings and transmits shear between them and provides most of the shear rigidity of the construction. **E 1749, E06**

core—See **rail**.

F 592, F16

core, *n*—a paper, plastic, or fiber core upon which the thermal product is wound. **F 1623, F05**

core barrels, *n*—two nested tubes above the bit of a core drill, the outer rotating with the bit, the inner receiving and preserving a continuous section or core of the material penetrated. The following two types of inner barrels are commonly used.

split-tube barrel, *n*—a type of inner barrel consisting of two longitudinal halves of pipe bound together by reinforced tape at intervals along the barrel length that allows easy access to a relatively intact core (by cutting the tape). (This is the preferred barrel type for coal exploration, where available.)

solid-tube barrel, *n*—a type of inner barrel consisting of a single solid-walled length of pipe in which removal of the core is accomplished by mechanical or hydraulic pressure at one end of the pipe thus extruding the core onto a core tray. (The core is likely to be less intact than when a split-tube barrel is used.) **D 121, D05**

core block—in cutting rotary veneer, the portion of the bolt remaining after available veneer has been removed. **D 1038, D07**

core compressive modulus—the ratio of the compressive load (below the proportional limit of the core) per unit of original area to the corresponding deformation per unit of original thickness. **E 631, E06**

core compressive modulus—the ratio of the compressive load (below the proportional limit of the core) per unit of original area to the corresponding deformation per unit of original thickness. **E 1749, E06**

cored, annular, conductor—a conductor in which one or more layers of wires are laid helically around a central core of metallic or nonmetallic material. The core is used as a mandrel for the application of subsequent layers of wire to maintain consistent spacing of these members around the conductor axis. **B 354, B01**

cored bar, *n*—a compact of bar shape heated by its own electrical resistance to a temperature high enough to melt its interior. **B 243, B09**

cored braid, *n*—*in rope*, a hollow braid construction, either plain or twill, the center of which is filled with yarns which are not braided. **D 123, D13**

core drilling; diamond drilling—a rotary drilling technique, using diamonds in the cutting bit, that cuts out cylindrical rock samples. (ISRM) **D 653, D18**

cored tile or block, *n*—see **gypsum tile or block**. **C 11, C11**

core, laminated—a magnetic component constructed by stacking suitably thin pieces of magnetic material which are stamped, sheared, or milled from sheet or strip material. Individual pieces usually have an insulating surface coating to minimize eddy current losses in the assembled core. **A 340, A06**

core loss, ac eddy current, incremental, $P_{\Delta e}$ —the power loss caused by eddy currents in a magnetic material that is cyclically magnetized. **A 340, A06**

core loss, ac eddy current, normal, P_e —the power losses as a result of eddy currents in a magnetic material that is symmetrically cyclically magnetized.

NOTE—The voltage is generally assumed to be across the parallel combination of core inductance, L_1 , and core resistance, R_1 .

A 340, A06

core loss, ac, incremental, $P_{c\Delta}$ —the core loss in a magnetic material when the material is subjected simultaneously to a dc biasing magnetizing force and an alternating magnetizing force. **A 340, A06**

core loss, ac, specific, $P_{c(B;f)}$ —the active power (watts) expended per unit mass of magnetic material in which there is a cyclically varying induction of a specified maximum value, B , at a specified frequency, f . **A 340, A06**

core loss, ac, (total), P_c —the active power (watts) expended in a magnetic circuit in which there is a cyclically alternating induction.

NOTE—Measurements of core loss are normally made with sinusoidally alternating induction, or the results are corrected for deviations from the sinusoidal condition. **A 340, A06**

core loss density—the active power (watts) expended in a magnetic core in which there is a cyclically varying induction of a specified maximum value, B , at a specified frequency, f , divided by the effective volume of the core.

NOTE—This parameter is normally used only for non-laminated cores such as ferrite and powdered cores. **A 340, A06**

core loss, residual, P_r —the portion of the core loss power, P_c , which is not attributed to hysteresis or eddy current losses from classical assumptions. **A 340, A06**

core, mated—two or more magnetic core segments assembled with the magnetic flux path perpendicular to the mating surface. **A 340, A06**

core module—See **module**. **E 631, E06**

core module—a **module** containing electrical, plumbing, heating, and related subsystems. **E 631, E06**

core (of an electromagnetic inspection circuit)—that part of the magnetic circuit which is within the electrical winding. **E 1316, E07**

core (of gypsum board), *n*—the hardened material filling the space between the face and back papers consisting substantially of rehydrated gypsum with additives. **C 11, C11**

core plate—a generic term for any insulating material, formed metallurgically or applied externally as a thin surface coating, on sheet or strip stock used in the construction of laminated and tape wound cores. **A 340, A06**

core, powder (dust)—a magnetic core comprised of small particles of electrically insulated metallic ferromagnetic material. These cores are characterized by low hysteresis and eddy current losses. **A 340, A06**

core recovery—ratio of the length of core recovered to the length of hole drilled, usually expressed as a percentage. **D 653, D18**

core rod, *n*—a member of the compacting tool set that forms internal features such as splines, diameters, keyways, or other profiles in a P/M compact. **B 243, B09**

core sample, *n*—that part of a core of rock or coal obtained so as to represent accurately a thickness of a unit penetrating by drilling. **D 121, D05**

core sample—a fragment of a dry paint film removed from the

core sample

substrate with a coring tool which is designed to remove a specified area (that is, a square centimetre) of dry paint film.

E 631, E06

core shear—the shear stress applied to the core material used in sandwich panel construction.

E 631, E06

core shear—the shear stress applied to the core material used in sandwich panel construction.

E 1749, E06

core shear modulus—the ratio of the shear stress to the corresponding shear strain for stresses below the proportional limit in shear of the core.

E 631, E06

core shear modulus—the ratio of the shear stress to the corresponding shear strain for stresses below the proportional limit in shear of the core.

E 1749, E06

core splice adhesive—See **adhesive, core splice**.

E 631, E06

core splice adhesive—See **adhesive, core splice**.

E 1749, E06

core-spun yarn, n—a compound structure in which a filament or strand serves as an axis around which a cover of either loose fiber or a yarn is wound.

D 123, D13

core-spun yarn, n—a compound structure in which a filament or strand serves as an axis around which a cover of either loose fiber or a yarn is wound.

D 4849, D13

core stabilization—a process to rigidize honeycomb core materials to prevent distortion during machining or curing.

E 631, E06

core stabilization—a process to rigidize honeycomb core materials to prevent distortion during machining or curing.

E 1749, E06

core, tape-wound—a magnetic component constructed by the spiral winding of strip material onto a suitable mandrel. The strip material usually has an insulating surface coating which reduces interlaminar eddy current losses in the finished core.

A 340, A06

core temperature, t_c , n—temperature at a *subject's* body site, such as pulmonary artery, distal esophagus, urinary bladder, or tympanic membrane, recognized as indicative of internal body temperature and obtained with a *contact thermometer*.

E 344, E20

core wrap (binder tape), n—paper used to wrap groups of insulated wire into cable configuration prior to sheathing.

D 1711, D09

coring, v—the process of perforating structural clay products, generally performed during extrusion by supporting cores (rods) within the shaping cap of the extruder.

C 43, C15

coring—a variable composition between the center and outside of a unit of structure, (such as a dendrite, grain, carbide particle) resulting from non-equilibrium growth which occurs over a range of temperatures or compositions.

E 7, E04

coring—method of collecting soil or paint samples that ensures that materials at each depth are collected proportionately, usually with a hollow cylindrical extraction device.

E 1605, E06

corner nail—usually coated, slender, regular-stock-steel, 1 by 0.062 to 5/8 by 0.244-in. nails with 5/32 to 1/2-in. sinker head and medium diamond point.

F 547, F16

cork-insulation nail—galvanized, regular-stock-steel, 3 to 9 by 0.148-in. nails with flat 1/2-in. head and medium diamond point.

F 547, F16

cork tile, n—a floor surfacing unit made from natural cork shavings compressed and baked to be thoroughly and uniformly bonded together.

F 141, F06

corner barbed wire arm—a combination post cap and fitting used to hold barbed wire in place on a corner post. May be angled in or out from the fence line to hold three or more strands of barbed wire, or "V" shaped to hold six or more strands of barbed wire.

F 552, F14

cornerbead, n—an accessory for outside corners.

C 11, C11

corner breaks, n—(*JCP only*) a portion of the slab separated by a crack that intersects the adjacent transverse and longitudinal joints, describing approximately a 45° angle with the direction of traffic, where the length of the sides is from 0.3 m (1 ft) to one half the width of the slab.

E 867, E17

corner breaks, n—(*JCP only*) a portion of the slab separated by a crack that intersects the adjacent transverse and longitudinal joints, describing approximately a 45 degree angle with the direction of

traffic where the length of the sides is from 0.3 m (1 ft) to one half the width of the slab.

E 1778, E17

corner effect—the reflection of an ultrasonic beam directed at normal incidence to the line of intersection of two perpendicular planes.

E 1316, E07

cornering force coefficient [nd], n —the ratio of cornering force to the normal force on a tire.

F 538, F09

cornering force [ML^2/T^2], n —of a tire, the horizontal force acting perpendicularly to the instantaneous motion vector of the center of contact for a tire operating at a slip angle.

F 538, F09

cornering stiffness coefficient, n—of a tire, the ratio of tire cornering stiffness to tire normal force.

F 538, F09

cornering stiffness [F/γ], n —of a tire, the negative of the rate of change of tire lateral force with respect to change in tire slip angle, usually evaluated at zero slip angle.

F 538, F09

cornering traction coefficient, n—the ratio of the cornering tractive force vector and normal force.

F 538, F09

cornering traction vector angle, n—the angle between the resultant cornering traction force vector and the X' axis.

F 538, F09

cornering tractive force, (F), n—the vectorial sum of lateral and longitudinal tractive force components.

F 538, F09

corner post—a terminal post, at which the direction of the line of fence changes in two or more directions.

F 552, F14

corner radius on square or rectangular wire—any configuration on the corner between a chamfer and a full radius. The measurement of a corner radius is the distance from the blend point on one surface to the extension of the other surface.

B 846, B05

corner rail clamp—a two-piece clamp with carriage bolts and nuts designed for horizontal rail connections to a 90° corner post.

F 552, F14

corner reinforcement, exterior, n—a preformed section of wire or expanded sheet steel, for the reinforcement of exterior stucco external corners (arrises).

C 11, C11

corner roll—half-round unit of asbestos cement used to trim and flash corners in asbestos-cement corrugated applications.

D 2946, C17

corner rolls, n—half-round units used to trim and flash corners in corrugated application.

C 1154, C17

corn stover—the stalks of the maize plant.

E 1705, E48

corona, n—visible partial discharges in gases adjacent to a conductor.

D 1711, D09

corona—a luminous discharge due to ionization of the air surrounding an electrode, caused by the high electric field strength in the vicinity of the electrode, exceeding a certain critical (that is, threshold) value.

D 2864, D27

corona—gaseous ions, either positively or negatively charged. Usually produced at atmospheric pressure using a high voltage source and either one or more pointed conductors or a thin long conductor (that is, corona wire).

F 335, F05

corona, n—a device used to place a uniform electrical charge on the surface of a xerographic photoreceptor.

F 1457, F05

corona, n—chemical separation of ink dispersant and pigment caused by interaction with substrate which appears as an image with a dark center surrounded by a lighter shadow.

F 1857, F05

corona charging—depositing of an electrical charge on a surface by means of corona.

F 335, F05

corona (discharge)—a self-sustaining discharge characterized by highly asymmetrical electric fields with the result that ionization predominantly occurs near the electrode with the higher potential gradient.

B 542, B02

corona effect—light emitted in the UV range of the electromagnetic spectrum by electronically excited molecules that have reached a singlet state and have not consumed the absorbed energy by other physical process.

D 2864, D27

corona (partial discharge) extinction voltage, CEV—the highest voltage at which partial discharge (or corona) no longer exceeds a specified intensity as the applied voltage is gradually decreased from a value above the corona inception voltage. Where the

applied voltage is alternating the CEV is expressed as $1/\sqrt{2}$ of the peak voltage. **D 2864, D27**

corona (partial discharge) inception voltage, CIV—the lowest voltage at which continuous partial discharge (or corona) exceeding a specified intensity is observed as the applied voltage is gradually increased. Where the applied voltage is alternating, the CIV is expressed as $1/\sqrt{2}$ of the peak voltage. **D 2864, D27**

corona shield—a smooth, rounded metal covering placed around exposed high-voltage components to prevent electrical discharge. **E 7, E04**

corona wire—a long, thin wire suspended in air and electrically isolated that when connected to a high voltage source will produce corona. **F 335, F05**

corotron, *n*—a name for a specific type of corona. **F 1457, F05**

correctable (as related to typewriter ribbons)—an image that may be completely removed from the substrate by means of lift-off rather than erasure or cover-up. **F 221, F05**

corrected air flow, *n*—the volume of air movement per unit of time under standard atmospheric conditions. The flow is expressed in cubic feet per minute or litres per second. **F 395, F11**

corrected count, *n*—the cell count corrected for coincidence. **F 2312, F04**

corrected grain—portions of the grain surface lightly abraded with emery wheel or sandpaper, so as to lessen the effect of grain damage. **D 1517, D31**

corrected load, *n*—the load in kilograms-force (or newtons) for each run obtained by multiplying the applied load by the ratio of the Hertz scar diameter to the measured scar diameter at that load. **D 4175, D02**

corrected load, *n*—the load in kilograms-force (or newtons) obtained by multiplying the applied load by the ratio of the Hertz scar diameter to the measured scar diameter at that load. **D 4175, D02**

corrected temperature rise, *n*—the temperature of the calorimeter, caused by the process that occurs inside the bomb; that is, the observed temperature change corrected for various effects. **D 121, D05**

corrected temperature rise, *n*—the increase in temperature of the calorimeter caused by the process that occurs inside the bomb; the observed temperature change corrected for various effects. **D 5681, D34**

corrective maintenance—maintenance required to return property to such condition that it may be effectively utilized for its designated purpose. **E 2135, E53**

correlated color temperature, *n*—of a source, the temperature, usually expressed in kelvins, of a full radiator that would emit light of the chromaticity most closely resembling that of the light from the source. **E 284, E12**

correlation coefficient (*r*)—a measure of the strength of the linear relationship between *X* and *Y*, calculated by the equation:

$$r_{xy} = \frac{(\sum_{i=1}^n X_i Y_i)}{(\sum_{i=1}^n X_i^2)^{1/2} (\sum_{i=1}^n Y_i^2)^{1/2}}$$

where:

n = the number of observations in *X* and *Y*. **E 131, E13**

corresponding elongation—See **elongation at specified force**. **D 4848, D13**

corresponding force, *n*—synonym for force at specified elongation. **D 4439, D35**

corresponding force—See **force-at-specified-elongation**. **D 4848, D13**

corridor, *n*—an enclosed space connecting a room or compartment with an exit. The corridor may include normal extensions, such as lobbies and other enlarged spaces. **E 176, E05**

Corrodkote test—an accelerated corrosion test for electrodeposits (see Method B 380). **B 374, B08**

corrosion—(1) gradual solution or oxidation of a metal.

(2) solution of anode metal by the electrochemical action in the plating cell. **B 374, B08**

corrosion, *n*—the chemical or electrochemical reaction between a material, usually a metal, and its environment that produces a deterioration of the material and its properties (G15, G01).

corrosion, inhibitor, *n*—a chemical substance or combination of substances that, when present in the proper concentration and form in the environment, prevents or reduces corrosion.

volatile corrosion inhibitor (VCI)—a material that slowly releases vapor to inhibit corrosion within a package by neutralizing the effects of moisture-laden air. **D 996, D10**

corrosion, *n*—the chemical or electrochemical reaction between a material, usually a metal surface, and its environment that can produce a deterioration of the material and its properties. **D 4175, D02**

corrosion—the formation of rust. **F 921, F04**

corrosion—the formation of rust. **F 1078, F04**

corrosion—the chemical or electrochemical reaction between a material, usually a metal, and its environment that produces a deterioration of the material and its properties. **G 15, G01**

corrosion fatigue—the process by which fracture occurs prematurely under conditions of simultaneous corrosion and repeated cyclic loading at lower stress levels or fewer cycles than would be required in the absence of the corrosive environment. **E 1823, E08**

corrosion fatigue—the process in which a metal fractures prematurely under conditions of simultaneous corrosion and repeated cyclic loading at lower stress levels or fewer cycles than would be required in the absence of the corrosive environment. **G 15, G01**

corrosion fatigue strength—the maximum repeated stress that can be endured by a metal without failure under definite conditions of corrosion and fatigue and for a specific number of stress cycles and a specified period of time. **G 15, G01**

corrosion inhibitor—a material added to a product to reduce its tendency to degrade metals. **E 609, E35**

corrosion inhibitor—a chemical substance or combination of substances that, when present in the proper concentration and forms in the environment, prevents or reduces corrosion. **G 15, G01**

corrosion inhibitor package, *n*—the combination of inhibitors added to an engine coolant to mitigate cooling system corrosion. **D 4725, D15**

corrosion of refractories, *n*—destruction of refractory surfaces by the chemical action of external agencies. **C 71, C08**

corrosion potential—the potential of a corroding surface in an electrolyte relative to a reference electrode measured under open-circuit conditions. **G 15, G01**

corrosion products, *n*—products that result from chemical or electrochemical reaction between a metal and its environment. **D 1129, D19**

corrosion products—products that result from chemical or electrochemical reaction between a metal and its environment. **D 6161, D19**

corrosion rate—the amount of corrosion occurring in unit time. (For example, mass change per unit area per unit time; penetration per unit time.) **G 15, G01**

corrosion resistance—ability of a fastener to resist corrosion under specified conditions. **F 1789, F16**

corrosion-resistant—term used to describe a material or treatment designed to inhibit corrosion. (See **rustproof**.) **F 547, F16**

corrosive substance—in *Committee D16 Standards*, material in industrial aromatic hydrocarbons that discolors or tarnishes polished copper. **D 4790, D16**

corrosive sulfur—*n*, elemental sulfur and thermally unstable sulfur compounds in electrical insulating oil that can cause corrosion of certain transformer metals such as copper and silver. **D 2864, D27**

corrosive water, *n*—a standard solution containing 100 ppm each of sulfate, chloride, and bicarbonate ions introduced as the sodium salts to distilled water. **D 4725, D15**

corrosive wear, *n*—wear in which chemical or electrochemical reaction with the environment is significant. **G 40, G02**

corrugated, *adj*—pertaining to a sheet product having a design of sinusoidal alternating ridges and valleys manufactured according to a specific pitch. **C 1154, C17**

corrugated—denotes an asbestos-cement sheet product having a design of alternating ridges and valleys manufactured according to a specified pitch. **D 2946, C17**

corrugated box—See **box**. **D 996, D10**

corrugated fiberboard:

(1) *single face*—the structure formed by one corrugated member glued to the flat facing;

(2) *single wall*—the structure formed by one corrugated inner member glued between two flat facings; also known as double face;

(3) *double wall*—the structure formed by three flat facings and two intermediate corrugated members;

(4) *triple wall*—the structure formed by four flat facings and three intermediate corrugated members. (See also **container-board**.)

corrugating medium—**paperboard** used in forming the fluted portion of the **corrugated board**.

corrugation flute—one of the wave shapes formed in the inner member, that is, the corrugating medium, of corrugated fiberboard. Flutes most commonly used are:

	Number, per Linear ft	Span Between Adjacent Flutes, mm	Height, in. (mm) ^{A,B}
A-flute	36 ± 3	7.9 to 9.1	3/16 (4.7)
B-flute	50 ± 3	4.7 to 6.6	3/32 (2.4)
C-flute	42 ± 3	6.8 to 7.8	3/64 (3.6)
E-flute	94 ± 4	3.0 to 3.5	3/64 (1.2)

^A The values are approximate.

^B Height does not include thickness of facing.

V-board—a term adopted from the grade symbol of **corrugated** or **solid fiberboard** made to comply with the weather-resistant class as defined in Federal Specification PPP-F-320, made of wet strength **paperboard**. Components are especially made to exhibit high strength (against bursting, tearing, or rupturing) when wet.

W-board—same as V-board except the “W” grades are of lower test requirements and primarily for use as interior or intermediate containers. **D 996, D10**

corrugated glass—glass rolled to produce a corrugated contour. **C 162, C14**

corrugated roofing/siding nail—See **roofing nail**. **F 547, F16**

corrugation, *n*—transverse undulations at regular intervals in the surface of the pavement consisting of alternate valleys and crests not more than 1 m (3 ft) apart. **E 867, E17**

corrugation, *n*—transverse undulations at regular intervals in the surface of the pavement consisting of alternate valleys and crests not more than 1 m (3 ft) apart. **E 1778, E17**

cortex, *n*—*in mammalianhair fibers*, the principal body of the fiber made up of elongated cells. **D 123, D13**

cortex, *n*—*in mammalianhair fibers*, the principal body of the fiber made up of elongated cells. **D 4845, D13**

corundum—a naturally occurring hexagonal mineral of the composition Al₂O₃, which can also be prepared synthetically to high purity; noted for its hardness (9 on Mohs scale) and refractoriness (M.P. = 2045°C). **C 242, C21**

cosolvent—solvent used to improve the mutual solubility of other ingredients. **D 3064, D10**

cost analysis—subdividing the project estimate into component parts to find and compare their relationship to previously established historical costs. **E 631, E06**

cost analysis, *n*—subdividing the project estimate into component

parts to find and compare their relationship to previously established historical costs. **E 833, E06**

cost effective—the condition whereby the present value benefits (savings) of an investment exceeds its present value costs. **E 631, E06**

cost effective, *adj*—the condition whereby the present value benefits (savings) of an investment exceeds its present value costs. **E 833, E06**

cost effective—among decision alternatives, the one whose cost is lower than its benefit. The most cost effective program would be the one whose cost-benefit ratio is the lowest among various programs competing for a given amount of funds. **E 2135, E53**

Coster-Kronig transition—*AES, XPS* Auger process involving an electron from the same principal shell as the initial vacancy (for example, *L₁L₂M*). **E 673, E42**

cost limitations—the budget boundaries for project elements. **E 631, E06**

cost limitations, *n*—the budget boundaries for project elements. **E 833, E06**

cost model—the description of the project divided into discrete elements showing quantities and unit price for each element. **E 631, E06**

cost model, *n*—the description of the project divided into discrete elements showing quantities and unit price for each element. **E 833, E06**

cost overruns, *n*—in project design or construction, or both, the unanticipated increase in cost due to factors such as unanticipated site conditions, changes in the cost of building materials, labor, weather, and labor disputes. **E 833, E06**

cost professional, *n*—in project design or construction, or both, a person engaged in the occupation of understanding, managing or estimating project costs, or a combination thereof. **E 833, E06**

cotton, *n*—a vegetable seed fiber consisting of unicellular hairs attached to the seed of several species of the genus *Gossypium* of the family Malvaceae. **D 123, D13**

cotton, *n*—a vegetable seed fiber consisting of unicellular hairs attached to the seed of several species of the genus *Gossypium* of the family Malvaceae. **D 7139, D13**

cotton cellulose, purified—chemical cellulose from cotton fiber or linters. (see also **chemicalcotton**) **D 1695, D01**

cotton color diagram, *n*—a diagram showing the color ranges of standards officially established by the U.S. Department of Agriculture for the various grades of cotton in relation to scales of reflectance. *R_v*, on the vertical axis, and yellowness, + *b*, on the horizontal axis. **D 123, D13**

cotton color diagram, *n*—a diagram showing the color ranges of standards officially established by the U.S. Department of Agriculture for the various grades of cotton in relation to scales of reflectance. *R_v*, on the vertical axis, and yellowness, + *b*, on the horizontal axis. **D 7139, D13**

cotton count, *n*—an indirect yarn numbering system generally used in the cotton system equal to the number of 840-yd lengths of yarn per pound. **D 123, D13**

cotton count, *n*—an indirect yarn numbering system generally used in the cotton system equal to the number of 840-yd lengths of yarn per pound. **D 4849, D13**

cottonizing, *n*—*in flax*, the processing of flax fiber so as to make it suitable for use in the cotton spinning system. **D 123, D13**

cottonizing, *v*—*in flax*, the processing of flax fiber so as to make it suitable for use in the cotton spinning system. **D 6798, D13**

cotton linters—see **linters**. **D 1695, D01**

cotton linters, *n*—the short fibers adhering to cottonseed after the operation of ginning (seed removal and cleaning); cut from the seed in a series of passes through cutting blades and referred to as “first-cut linters,” “second-cut linters,” “mill run,” and so forth; used primarily in the manufacture of cotton fiber content paper and cellulose derivatives. **D 1968, D06**

cotton maturity, *n*—the degree of fiber wall development.

D 123, D13

cotton maturity, *n*—the degree of fiber wall development.

D 7139, D13

cotton system, *n*—a spinning system adapted to fibers less than 65 mm (2.5 in.) in length.

D 123, D13

cotton system, *n*—a spinning system adapted to fibers less than 65 mm (2.5 in.) in length.

D 4849, D13

cotton waste, *n*—material removed from seed cotton, ginned lint, or stock in process by any cleaning or processing machinery and usually consisting of undesirable fibers or a mixture of cotton fibers with foreign matter.

D 123, D13

cotton waste, *n*—material removed from seed cotton, ginned lint, or stock in process by any cleaning or processing machinery and usually consisting of undesirable fibers or a mixture of cotton fibers with foreign matter.

D 7139, D13

could not be identified/cannot identify—these terms are objectionable not only because they are ambiguous but also because they are biased; they imply that the examiner's task is only to identify the suspect, not to decide whether or not the suspect is the writer. If one of these terms is used, it should always be followed by "or eliminate[d]".

E 1658, E30

coulomb—the quantity of electricity that is transmitted through an electric circuit in 1 s when the current in the circuit is 1 A. The quantity of electricity that will deposit 0.0011180 g of silver.

B 374, B08

coulometer—an electrolytic cell arranged to measure the quantity of electricity by the chemical action produced in accordance with Faraday's law.

B 374, B08

count, *n*—in *woventextiles*, the number of warp yarns (ends) and filling yarns (picks) per unit distance as counted while the fabric is held under zero tension, and is free of folds and wrinkles.

D 123, D13

count, *n*—in *knittedfabrics*, the number (counted units) of wale loops and course loops per 25 mm (1 in.).

D 123, D13

count, *n*—in *wovenfabric*, the number of warp yarns (ends) and filling yarns (picks) per unit distance as counted while the fabric is held under zero tension, and is free of folds and wrinkles.

D 4850, D13

count, *n*—in *knittedfabrics*, the number (counted units) of wale loops and course loops per 25 mm (1 in.).

D 4850, D13

count—approximate number of nails per pound influenced by sizing of individual elements.

F 547, F16

count, acoustic emission (emission count) (N)—the number of times the acoustic emission signal exceeds a preset threshold during any selected portion of a test.

E 1316, E07

counter—a device for the measurement of radiation intensity by means of an electrical triggering principle (Geiger-Müller).

E 7, E04

counter—a piece of stiffening material inserted between the lining and the outside of a shoe upper at the back of the shoe. The purpose of the counter is to strengthen the back part and to prevent it from sagging and losing its shape. There are two types of counter: flat and molded.

F 869, F08

countercurrent adsorption—an adsorption process in which the flow of fluid is in a direction opposite to the movement of the adsorbent.

D 2652, D28

counter-current flow—flow through a membrane module in which the fluid on the upstream and downstream sides of the membrane move parallel to the membrane surface but in the opposite direction.

D 6161, D19

counter electrode, *n*—in *atomic emission spectrometry*, the electrode in an analytical pair that does not contain the specimen being analyzed.

E 135, E01

counter electrode—the electrode in an electrochemical cell that is used to transfer current to or from a test electrode.

G 15, G01

counterflashing—formed metal or elastomeric sheeting secured on or into a wall, curb, pipe, roof-top unit, or other surface, to cover and

protect the upper edge of a base flashing and its associated fasteners.

D 1079, D08

counterintelligence-scope polygraph (CSP), *n*—screening examination administered by the Federal Government on individuals with sensitive security clearances to detect and deter espionage, security breaches, sabotage, or other acts against the government. Sometimes referred to as a *loyalty* examination.

E 2035, E52

counter pocket—a piece of lining material attached to inside quarters of unlined shoes to conceal counter.

F 869, F08

countersunk head—head with bearing surface conically shaped: "deep" having 32° to 74° included angle; "medium" having 75° to 99° included angle; "slight" having 100° to 160° included angle.

F 547, F16

count, event (N_e)—the number obtained by counting each discerned acoustic emission event once.

E 1316, E07

counting method—in *fatiguespectrum loading*, a method of counting the occurrences and defining the magnitude of various loading parameters from a load-time history; (some of the counting methods are: level crossing count, peak count, mean crossing peak count, range count, range-pair count, rain-flow count, racetrack count).

E 1823, E08

count median size, *n*—a measurement of particle size of samples of particulate matter, consisting of that diameter of particle such that one half of the number of particles is larger and half is smaller.

D 1356, D22

count rate, acoustic emission (emission rate or count rate) (Ṅ)—the time rate at which emission counts occur.

E 1316, E07

count, ring-down—see **count, acoustic emission**, the preferred term.

E 1316, E07

country hides—hides taken off by butchers and farmers; their quality is usually lower than that of packer hides because they are removed by less skilled hands and are not cured as well as packer hides.

D 1517, D31

counts—EIA, events recorded by the detector and registered in a channel of a backscattering spectrum. Counts constitute the ordinate of a BS spectrum.

integrated—sum of all counts registered in a given set of channels or their corresponding energy ranges.

per channel—number of counts in a single channel; unit of the ordinate of a backscattering spectrum.

E 673, E42

couplant—a material used at the structure-to-sensor interface to improve the transmission of acoustic energy across the interface during acoustic emission monitoring.

E 1316, E07

couplant—a substance used between the search unit and test surface to permit or improve transmission of ultrasonic energy.

E 1316, E07

coupler, color—a substance capable of reacting with the oxidation product of a color-forming developer to produce a colored dye image.

E 7, E04

coupling, *n*—in *nonpressure sewer pipe*, a section for joining non-pressure sewer pipe, that when properly installed with the proper accessories, develops an assembled joint equivalent in serviceability and strength to the pipe sections, when tested in accordance with 8.3 of Specification C 428.

C 1154, C17

coupling, *n*—for *asbestos-cement conduit, sewer, underdrain, and storm drain pipe*, component made from a larger diameter pipe of the same type or type II and of the same class, or of a higher class, or produced otherwise to yield at least equal performance, for joining asbestos-cement pipe that when properly installed, forms a silt-tight joint, allows alignment corrections and slight changes in direction, and provides an assembled joint equivalent in serviceability and strength to the pipe sections.

D 2946, C17

coupling, *n*—for *asbestos-cement non-pressure sewer pipe*, section for joining asbestos-cement non-pressure sewer pipe, that when properly installed with the proper accessories, develops an assembled joint equivalent in serviceability and strength to the pipe sections when tested in accordance with 8.3 of Specification C 428.

D 2946, C17

coupling, *n*—for *asbestos-cement pressure pipe*, section for joining

coupling, *n*

asbestos-cement pipe that, when properly installed with the proper accessories, develops a joint equivalent in strength and serviceability to the pipe sections. **D 2946**, C17

coupling—two electric circuits are said to be coupled to each other when they have an impedance in common so that a current in one causes a voltage in the other. **E 1316**, E07

coupling agent, *n*—a substance having functional groups that are capable of reacting with the surfaces of two different substances, thereby chemically bridging them. **D 907**, D14

coupling coefficient, *k'*—the ratio of the mutual inductance between two windings and the geometric mean of the individual self-inductances of the windings. **A 340**, A06

coupon, *n*—a solid specimen, rectangular in any cross-section, that is saw-cut from a concrete masonry unit or related unit for the purpose of testing, and whose properties are considered representative of the whole unit. **C 1209**, C15

coupon, *n*—a portion of a material or laboratory sample from which multiple specimens can be taken for testing. **D 4439**, D35

coupon—a specimen, usually flat, but occasionally curved or cylindrical.. **G 15**, G01

course, *n*—*in knitted fabrics*, a row of successive loops in the width direction of the fabric. **D 123**, D13

course, *n*—*in knitted fabrics*, a row of successive loops in the width direction of the fabric. **D 4850**, D13

course administrator—an individual responsible for managing administrative details of a course, separate from actual instruction of the course. **F 1177**, F30

course instructor/coordinator (I/C)—an individual who is authorized by the appropriate entity to present and assess competence in all of the subject matter contained in a curriculum. This person also oversees all instruction in the course and makes final evaluations concerning student competence. **F 1177**, F30

cover, *n*—*in yarns*, the outside layer of fibers that form the surface of a yarn. **D 123**, D13

cover—the perpendicular distance from any point in the roof of an underground opening to the ground surface. (ISRM) **D 653**, D18

cover—*in grouting*, the thickness of rock and soil material overlying the stage of the hole being grouted. **D 653**, D18

cover—See **container**. **D 996**, D10

cover, *n*—*in yarns*, the outside layer of fibers that form the surface of a yarn. **D 4849**, D13

cover—the section of the lock case designed to be removed for access to components within the case. **F 471**, F12

cover—an electrically insulated enclosure designed to be installed temporarily on various types of irregularly shaped electrical equipment to protect personnel and equipment working in close proximity. **F 819**, F18

coverage, *n*—the area to be covered per unit volume of coating to obtain specified dry thickness and desired performance. **C 168**, C16

coverage—the surface area to be continuously covered by a specific quantity of a particular material. **D 1079**, D08

cover coat—a porcelain enamel finish applied and fused over a ground coat or direct to the metal substrate. **C 286**, B08

covered yarn, *n*—a compound structure which contains distinguishable inner and outer fibrous elements which can be different. **D 123**, D13

covered yarn, *n*—a compound structure which contains distinguishable inner and outer fibrous elements which can be different. **D 4849**, D13

cover flange—See **railing systems**. **E 631**, E06

cover flange—Synonym for **escutcheon**. **E 631**, E06

cover flange—Synonym for **escutcheon**. **E 1481**, E06

covering capacity, dry, *n*—the area covered to a dry thickness of 1 in. (25 mm) by 100 lb (45.4 kg) of dry cement when mixed with the recommended amount of water, molded and dried to constant weight. **C 168**, C16

covering capacity, wet, *n*—the area covered to a wet thickness of 1

in. (25 mm) by 100 lb (45.4 kg) of dry cement when mixed with the recommended amount of water, and molded. **C 168**, C16

covering power—the ability of a plating solution under a specified set of plating conditions to deposit metal on the surfaces of recesses or deep holes. (To be distinguished from throwing power.) **B 374**, B08

covering power—the ability of a glaze to cover the surface of the fired ware uniformly and completely. **C 242**, C21

covering power—the degree to which a porcelain enamel coating obscures the underlying surface. **C 286**, B08

cover plate—Synonym for **escutcheon**. **E 631**, E06

cover plate—Synonym for **escutcheon**. **E 1481**, E06

cover plate, collector—a sheet of transparent (or translucent) glazing placed above the absorber in a solar collector, to provide thermal and environmental protection. **E 772**, E44

cover ring—Synonym for **escutcheon**. **E 631**, E06

cover ring—Synonym for **escutcheon**. **E 1481**, E06

coverstrip, *n*—a thin layer of black compound which covers the unexposed white sidewall portion of a finished tire. **F 538**, F09

cover-up—the obliteration of one or more images by means of an opaque material similar in color to the substrate. **F 221**, F05

cowhide—term specifically applied to leather made from hides of cows, although it is sometimes loosely used to designate any leather tanned from hides of animals of the bovine species. **D 1517**, D31

CPU—chloroplatinate unit (color indicator). **D 6161**, D19

CR—abbreviation for **carriage return**. **F 1457**, F05

crack—a partial break in the stone (see fracture, microcrack, seam). **C 119**, C18

crack—an irregular separation with well-defined sharp edges visible on the surface of a pipe. **C 896**, C04

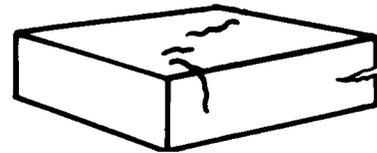

crack—a small fracture, that is, small with respect to the scale of the feature in which it occurs. (ISRM) **D 653**, D18

crack—a visual separation that occurs internally or penetrates down from the pultruded surface to the equivalent of one full ply or more of reinforcement. **D 3918**, D20

crack, *n*—fissure or discontinuity of the pavement surface not necessarily extending through the entire thickness of the pavement. **E 867**, E17

crack, *n*—fissure or discontinuity of the pavement surface not necessarily extending through the entire thickness of the pavement. **E 1778**, E17

crack—line of fracture without complete separation.

F 109, C21

crack—any narrow opening or fissure in the surface that is visible to the naked eye. **F 412**, F17

crack—crystalline fracture passing through or along the grain boundaries which is normally caused by overstressing the metal during manufacturing, such as forging, forming, or heat treating. **F 1789**, F16

crack and crevice application—application by a means that projects the material into cracks and crevices of a structure. **E 1102**, E35

crack-arrest fracture toughness, K_{Ic} [FL^{-3/2}]—the value of the stress-intensity factor shortly after crack arrest. **E 1823**, E08

crack (building defect), *n*—a flaw consisting of complete or incomplete separation within a single element or between contiguous elements of constructions. **E 631**, E06

crack, (CK), *n*—*as used in fractography*, a volume-distributed flaw that is a plane of fracture without complete separation. **C 1145**, C28

crack deflection, n —a toughening mechanism in advanced ceramics or ceramic matrix composites characterized by fracture surface roughening and crack tilting/twisting during propagation around grains or a reinforcing component caused by stress fields around the grains or component developed through mismatches in thermal expansion or mechanical properties (such as elastic modulus), or both, between grains or between reinforcement and matrix.

C 1145, C28

crack depth, a [L]—in *part-through surface-crack specimens (PS)*, the distance from, and normal to, the cracked plate surface to the point of maximum penetration of the crack front into the material. Crack depth is less than the specimen thickness. E 1823, E08

crack displacement [L]—the force-induced separation vector between two points (on the facing surfaces of a crack) that were initially coincident. E 1823, E08

cracked ammonia, n —see **dissociated ammonia**. B 243, B09

cracked gases, n —hydrocarbon gases that contain unsaturates.

D 4175, D02

cracker, n —heavy-duty mill having two deeply corrugated or pyramid-cut rolls for breaking down a rubber or a mix, or for cutting rubber or a mix into pieces. D 1566, D11

crack extension, Δa [L]—an increase in crack size. E 1823, E08

crack-extension force, G [FL⁻¹ or FLL⁻²]—the elastic energy per unit of new separation area that is made available at the front of an ideal crack in an elastic solid during a virtual increment of forward crack extension. E 1823, E08

crack-extension resistance, K_R [FL^{-3/2}], G_R [FL⁻¹] or J_R [FL⁻¹]—a measure of the resistance of a material to crack extension expressed in terms of the stress-intensity factor, K ; crack-extension force, G ; or values of J derived using the J -integral concept. E 1823, E08

crack filler, n —bituminous material used to fill and seal cracks in existing pavements. D 8, D04

cracking—a defect in the bisque consisting of fractures or separations. C 286, B08

cracking—in *protective coatings*, the formation of breaks in a coating film that extend through to the underlying surface. D 4538, D33

cracking—in leak testing, same as **dissociation**. E 1316, E07

cracking, n —a condition where ink that has been absorbed into a substrate causes the coating to shrink to a state much smaller than the original coating dimension causing fractures in the image area. F 1857, F05

cracking, alligator (crocodile)—see **alligator (crocodile) cracking**. E 867, E17

cracking, block—see **block cracking**. E 867, E17

cracking (coatings), n —phenomenon manifested in paint films by a break extending through to the surface painted. E 631, E06

cracking (coatings), n —phenomenon manifested in paint films by a break extending through to the surface painted. E 1605, E06

cracking, durability "D"—see **durability "D" cracking**. E 867, E17

cracking, edge—see **edge cracking**. E 867, E17

cracking, longitudinal—see **longitudinal cracking**. E 867, E17

cracking, map—see **map cracking**. E 867, E17

cracking, reflection, at joints—see **reflection cracking at joints**. E 867, E17

cracking resistance, n —the ability of a coating to resist breaks of the film where the breaks extend through to the surface painted and the previously applied coating or the substrate is visible. The use of a minimum magnification of 10 diameters is recommended in cases where it is difficult to differentiate between cracking and checking. See **checking resistance**. D 16, D01

cracking, slippage—see **slippage cracking**. E 867, E17

cracking, transverse—see **transverse cracking**. E 867, E17

crack jump behavior—in *chevron-notch specimen tests*, that type of sporadic crack growth which is characterized primarily by periods during which the crack front is nearly stationary until a critical force is reached, whereupon the crack becomes unstable and suddenly advances at high speed to the next arrest point, where it

remains nearly stationary until the force again reaches a critical value, and so forth. E 1823, E08

crackled—glassware, the surface of which has been intentionally cracked by water immersion and partially healed by reheating before final shaping. C 162, C14

crackled—a mottled textural effect in a wet process porcelain enamel resembling a wrinkled surface. C 286, B08

crack length, a [L]—See **crack size** and **surface crack length**. Also see crack length in the *Description of Terms*. E 1823, E08

crack mark, n —an open place causing a streak of variable length approximately parallel to the length or width. D 123, D13

crack mark, n —*inbonded, fused, or laminated fabrics*, a sharp break or crease in the surface contour of either the face fabric or the backing fabric that becomes evident when the bonded, fused, or laminated composite is rolled, bent, draped, or folded. D 123, D13

crack mark, n —an open place causing a streak of variable length approximately parallel to the length or width. (*Syn.* open place, thin spot) D 3990, D13

crack-mouth opening displacement (CMOD), $2v_m$ [L]—the Mode I (also called opening-mode) component of crack displacement resulting from the total deformation (elastic plus plastic), measured under force at the location on a crack surface that has the greatest elastic displacement per unit force. E 1823, E08

crack-off—the process of severing a glass article by breaking, as by scratching and then heating. C 162, C14

crack orientation, n —a description of the plane and direction of a fracture in relation to a characteristic direction of the product. This identification is designated by a letter or letters indicating the plane and direction of crack extension. The letter or letters represent the direction normal to the crack plane and the direction of crack propagation. C 1145, C28

crack-plane orientation—an identification of the plane and direction of a fracture in relation to product configuration. This identification is designated by a hyphenated code with the first letter(s) representing the direction normal to the crack plane and the second letter(s) designating the expected direction of crack propagation. E 1823, E08

crack (RD), n —in a rigid die system, generally a planar defect.

B 243, B09

cracks, n —fissure(s) originating in the surface of a rubber vulcanizate or product as a result of natural weathering. D 1566, D11

cracks, flex, n —fissures originating in the surface of a rubber vulcanizate, resulting from cyclic deformation (usually bending). D 1566, D11

crack size, a [L]—a lineal measure of a principal planar dimension of a crack. This measure is commonly used in the calculation of quantities descriptive of the stress and displacement fields and is often also termed crack length or depth. E 1823, E08

crack size, a [L]—in Test Method E 1457, the physical crack size is represented as a_p . The subscript p is everywhere implied.

E 1823, E08

crack(s), ozone, n —fissure(s) originating in the surface of a rubber vulcanizate, caused by exposure to an ozone-containing environment; these fissures are perpendicular to the direction of strain, and usually occur in rubbers having main chain unsaturation. D 1566, D11

cracks (rigid die system (RD)), n —the following names and definitions apply only to items produced in a rigid die system (RD) as opposed to those cracks produced by other systems, that is, metal injection molding, vacuum hot pressing, and so forth. B 243, B09

crack strength—the maximum value of the nominal stress that a cracked specimen is capable of sustaining. F 2078, F07

crack strength, σ_c [FL⁻²]—the maximum value of the nominal stress that a cracked structure is capable of sustaining. E 1823, E08

crack-tip opening displacement (CTOD), δ , [L]—the crack displacement resulting from the total deformation (elastic plus plastic) at variously defined locations near the original (prior to force application) crack tip. E 1823, E08

crack-tip plane strain

crack-tip plane strain—a stress-strain field (near the crack tip) that approaches plane strain to the degree required by an empirical criterion. **E 1823, E08**

crack-tip plane stress—a stress-strain field (near the crack tip) that is not in plane strain. **E 1823, E08**

craftsman, n—an artisan who is skilled in creating new cultural objects. **D 123, D13**

craftsman, n—an artisan who is skilled in creating new cultural objects. **D 5038, D13**

crampon, n—a foot-mounted piece of equipment with spikes designed to provide traction or support on snow and ice. **F 1773, F08**

crash towel, n—a plain weave nonterry product with hems or selvages which has a rough texture caused by uneven yarns. **D 123, D13**

crash towel, n—a plain weave non-terry product with hems or selvages which has a rough texture caused by uneven yarns. **D 7023, D13**

crate, n—a rigid **shipping container** of framed construction joined together with nails, bolts or any equivalent method of fastening. The framework may or may not be enclosed with sheathing. It may be demountable (reusable) or nondemountable. (See also **rubbing strip, strut**.)

open crate—a **crate** with exposed frame members and not enclosed by **sheathing**.

sheathed crate—a **crate** that is enclosed by having the frame members completely covered with **sheathing** boards or material. **D 996, D10**

crater—excavation (generally of conical shape) generated by an explosive charge. (ISRM) **D 653, D18**

crater, n—a small, shallow surface imperfection. **D 883, D20**

crater—a small, shallow pultrusion surface imperfection. **D 3918, D20**

crater, n—a small, shallow surface imperfection. (D20) **F 412, F17**

crater edge effect—*SIMS*, a signal caused by secondary ions that originate from depths shallower than the maximum depth of the crater formed by primary bombardment. **E 673, E42**

cratering—*in protective coatings*, the formation of round depressions in a coating film that do not expose the previous coat or the substrate. **D 4538, D33**

crawling—a parting and contraction of the glaze on the surface of ceramic ware during drying or firing, resulting in unglazed areas bordered by coalesced glaze. **C 242, C21**

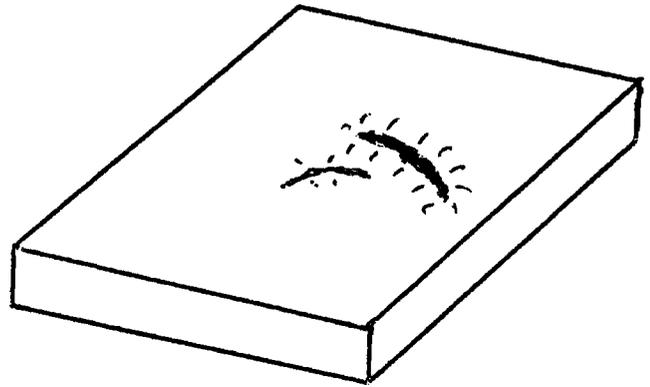

crawling—a defect in the porcelain enamel appearing as agglomerates or irregularly shaped islands. **C 286, B08**

crawling, n—defect in which the wet film recedes from localized areas of the substrate (usually caused by insufficient wetting) leaving those areas uncoated. **D 16, D01**

crawling—*in protective coatings*, a defect in which a wet coating film recedes from a small area to form an uneven surface shortly after application. **D 4538, D33**

crawling, n—a nonuniform contraction of the printing ink on the substrate due to poor wetting. Also referred to as *reticulation* or *pearling*. **D 6488, D01**

crawling—a parting and contraction of the glaze on the surface of ceramic ware during drying or firing, resulting in unglazed areas bordered by coalesced glaze.

F 109, C21

craze—multiple fine cracks at or under the pultruded surface.

D 3918, D20

craze, crazing—a defect appearing as one or more fine cracks in the porcelain enamel. **C 286, B08**

crazed, adj—*in building construction*, having a random network of cracks in a sealant, coating, or membrane surface which do not penetrate through the body of the material. **C 717, C24**

crazed, adj—*in building construction*, exhibiting crazing. **C 717, C24**

craze, hairline—multiple fine pultrusion surface separation cracks that exceed 1/4 in. (6.4 mm) in length and do not penetrate in depth to the equivalent of full ply of reinforcement. **D 3918, D20**

craze, resin—multiple fine separation cracks at the pultruded surface not penetrating into the reinforcement.

NOTE—This condition is usually due to resin shrinkage during cure in resin-rich areas. **D 3918, D20**

craze, star—multiple fine pultrusion surface separation cracks exceeding 1/4 in. (6.4 mm) in length but not penetrating in depth to the equivalent of a full ply of reinforcement, that appear to emanate from a central point.

NOTE—This condition is often caused by impact damage.

D 3918, D20

crazing—a network of fine hairline cracks in a coating. **B 374, B08**

crazing—the cracking that occurs in fired glazes or other ceramic coatings as a result of tensile stresses. May also occur in the surface portion of uncoated (unglazed) whiteware bodies.

C 242, C21

crazing, n—*in building construction*, a network of cracks in a sealant, coating or membrane surface. **C 717, C24**

crazing, v—*in building construction*, the formation of a network of random surface cracks in a sealant, coating, or membrane. **C 717, C24**

crazing, n—apparent fine cracks at or under the surface of a plastic. **D 883, D20**

crazing, n—a fracture at or under the surface. **D 907, D14**

crazing, n—formation of a random pattern of shallow cracks on a rubber surface usually due to ageing by light. **D 1566, D11**

crazing—*in protective coatings*, the formation of a criss-cross pattern of minute cracks on the surface of a coating film. **D 4538, D33**

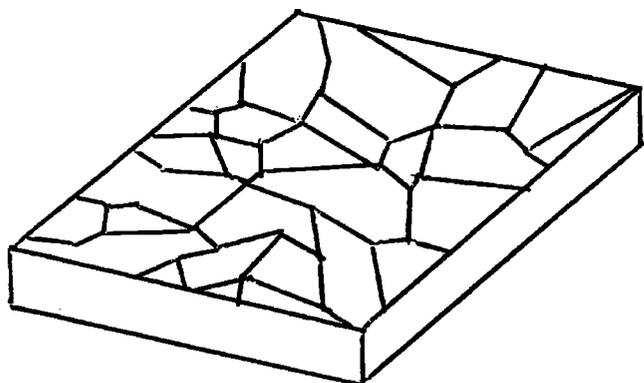

crazing, n—a network of apparent fine cracks on or beneath the

surface of materials such as in transparent plastics, glazed ceramics, glass, or clear coatings. **E 284, E12**

crazing—the development of a multitude of very fine cracks in a material such as ceramic glaze, varnish, paint, etc., often the result of exposure to sunlight, weathering, or certain solvents. **E 631, E06**

crazing—the development of a multitude of very fine cracks in a material such as ceramic glaze, varnish, paint, etc., often the result of exposure to sunlight, weathering, or certain solvents. **E 1749, E06**

crazing—the cracking that occurs in fired glazes or other ceramic coatings as a result of tensile stresses, may also occur in the surface portion of uncoated (unglazed) whiteware bodies.

crazing, n—apparent fine cracks at or under the surface of a plastic. **F 109, C21**

crazing, n—minute, closely grouped, generally superficial cracks that usually results from light activated oxidation. **F 412, F17**

crazing, n—apparent fine cracks at or under the surface of a plastic. **F 538, F09**

crazing, n—apparent fine cracks at or under the surface of a plastic. **F 1251, F04**

crazing—the occurrence of very small, localized, micro-cracks at or under the surface of, but not extending entirely through, a transparent material, which act like tiny mirrors that reflect light in unwanted directions. **F 2429, F07**

CRC—abbreviation for cyclic redundancy check. **F 1457, F05**

CRE—abbreviation for constant-rate-of-extension. **D 123, D13**

CRE—abbreviation for constant-rate-of-extension. **D 4849, D13**

creaming—the separation of a layer of the dispersed phase of an emulsion polish to the surface of the liquid continuous phase. **D 2825, D21**

creaming (rubber latex), n—a reversible process of concentration by gravitational force of rubber particles near the bottom or top of the latex. **D 1566, D11**

crease, n—a fabric defect evidenced by a break, line, or mark in a fabric generally caused by a sharp fold. **D 123, D13**

crease, n—a fabric defect evidenced by a break, line, or mark generally caused by a sharp fold. (*Syn.* mill wrinkle) **D 3990, D13**

crease—a ridge or groove made by folding and pressing. **F 2112, F01**

crease cycle—a 180 degree crease followed by a flattening of the crease. **F 2112, F01**

crease mark, n—a visible deformation left in a fabric after a crease has been incompletely removed during fabric processing. **D 123, D13**

crease mark, n—a visible deformation left in a fabric after a crease has been incompletely removed during fabric processing. **D 3990, D13**

crease retention, n—that property of a fabric which enables it to maintain an inserted crease. **D 123, D13**

crease retention, n—that property of a fabric which enables it to maintain an inserted crease. **D 4850, D13**

creep, n—the time dependent part of a strain resulting from stress. **C 717, C24**

creep—time dependent deformation of a material under load. **C 904, C03**

creep, n—the time-dependent part of a strain resulting from stress. **C 1145, C28**

creep—slow movement of rock debris or soil usually imperceptible except to observations of long duration. Time-dependent strain or deformation, for example, continuing strain with sustained stress. **D 653, D18**

creep, n—the time-dependent part of strain resulting from stress. **D 883, D20**

creep, n—in an adhesive, the time-dependent deformation usually resulting from sustained stress (sometimes called cold flow). **D 907, D14**

creep—the time-dependent part of a strain resulting from stress. **D 1079, D08**

creep, n—the time-dependent part of a strain resulting from stress. **D 1566, D11**

creep, n—the time-dependent increase in accumulative strain in a material resulting from an applied constant force. **D 4439, D35**

creep, n—the time-dependent increase in strain in a solid resulting from force. **E 6, E28**

creep, n—the time-dependent part of strain resulting from stress. (D20) **F 412, F17**

creep, n—the time-dependent part of strain resulting from stress. **F 1251, F04**

creep crack growth behavior—a plot of the time rate of crack growth, da/dt , as a function of $C^*(t)$. **E 1823, E08**

creeping wave—A compression wave that travels in a solid immediately adjacent to a boundary and generates a shear mode “head-wave” (q.v.) travelling away from the boundary at the critical angle. **E 1316, E07**

creep of frozen ground—the slow deformation that results from long-term application of a stress too small to produce failure in the frozen material. **D 7099, D18**

creep recovery, n—the time-dependent decrease in strain in a solid, following the removal of force. **E 6, E28**

creep rupture strength [FL^{-2}], n —the stress that will cause fracture in a creep test at a given time, in a specified constant environment. **E 6, E28**

creep strain, n—the total strain, at any given time, produced by the applied stress during a creep test. **D 907, D14**

creep strength—the failure strength of a material at a given rate of strain or after a given period under deviatoric stress. **D 7099, D18**

creep strength [FL^{-2}], n —the stress that causes a given creep in a creep test at a given time in a specified constant environment. **E 6, E28**

creep zone boundary—the locus of points ahead of the crack front where the equivalent strain caused by the creep deformation equals the equivalent strain caused by the elastic deformation. **E 1823, E08**

crenulations—multiple kinks that can increase the apparent fiber cohesion. **D 2946, C17**

creped duplex paper—See paper. **D 996, D10**

creped paper—See paper. **D 996, D10**

crepe rubber—originally unvulcanized natural rubber with light color and knobby surface for soles and heels. Most crepe rubber for shoes is now of synthetic elastomers. **F 869, F08**

crescent crack—damage having the appearance of a crescent, produced in a glass surface by the frictional translation of a hard, blunt object across the glass surface. The crescent shape is concave toward the direction of translation on the damaged surface. **C 162, C14**

cresol(s)—methyl phenol, hydroxymethyl benzene (C_7H_8O) mol weight 108.13; colorless, yellowish, brownish, yellow, or pinkish liquid; phenolic odor. Three isomeric cresols exist. **D 4790, D16**

crest—outermost part of thread, joining flanks. (See **double crest**.)
F 547, F16

crest diameter—twice the distance between nail axis and crest, measured perpendicular to nail axis. Thread crest diameters for given shank diameters:

Wire Diameter, in.	Helically Threaded Nails		Annularly Threaded Nails, Stiff-Stock and
	Stiff-stock, in.	Hardened, in.	Hardened, in.
0.120	0.134 to	0.140 to	0.132 to
	0.138	0.144	0.136
0.135	0.161 to	0.161 to	0.149 to
	0.166	0.166	0.154
0.148	0.173 to	0.173 to	0.161 to
	0.180	0.180	0.166
0.165	0.196 to	0.196 to	0.180 to
	0.201	0.201	0.185
0.177	0.209 to	0.209 to	0.193 to
	0.213	0.213	0.197

F 547, F16

crest factor, *cf*—the ratio of the maximum value of a periodically alternating quantity to its rms value.

NOTE—For a sinusoidal variation the crest factor is $\sqrt{2}$. A 340, A06

creylic acids—commercial mixtures of phenolic materials which may include phenol, cresols, xylenols, and other alkylated phenols.
D 4790, D16

crevice corrosion—localized corrosion of a metal surface at, or immediately adjacent to, an area that is shielded from full exposure to the environment because of close proximity between the metal and the surface of another material.
G 15, G01

cricket, *n*—a construction to divert water around or away from a chimney, curb, wall, expansion joint, or other penetration. (See **saddle**.)
D 1079, D08

criminalistics, *n*—a branch of forensic science concerned with the examination and interpretation of physical evidence, for the purpose of aiding forensic investigation.
E 1732, E30

crimp, *n*—as applied to a continuous-element zipper, the predetermined formation of the monofilament cross-section at the point where the continuous element is interlocked.
D 123, D13

crimp, *n*—in a textile strand, the undulations, waviness, or succession of bend, curls, or waves in the strand induced either naturally, mechanically, or chemically.
D 123, D13

crimp, *n*—as applied to a continuous element zipper, the predetermined formation of the monofilament cross-section at the point where the continuous element is interlocked.
D 2050, D13

crimp—an operation that mechanically seals the valve to the container.
D 3064, D10

crimp, *n*—in a textile strand, the undulations, waviness, or succession of bend, curls, or waves in the strand induced either naturally, mechanically, or chemically.
D 4849, D13

crimp, *n*—in a yarn, the undulations, waviness, or succession of bends, curls, or waves in the yarn induced either naturally, mechanically, thermally, or chemically.
D 4849, D13

crimp contraction, *n*—an indicator of crimp capacity or a characterization of a yarn's ability to contract under tension.
D 123, D13

crimp contraction, *n*—an indicator of crimp capacity or a characterization of a yarn's ability to contract under tension.
D 4849, D13

crimp development medium, *n*—for testing of textured yarn, an environment that allows the temporary set of fiber crimp to be overcome and that allows the filaments to assume their permanently set configuration.
D 123, D13

crimp development medium, *n*—for testing of textured yarn, an environment that allows the temporary set of fiber crimp to be overcome and that allows the filaments to assume their permanently set configuration.
D 4849, D13

crimped head—head with undulating or pronged rim, or both.
F 547, F16

crimp frequency, *n*—in manufactured staple fibers, the number of crimps or waves per unit length of extended or straightened fiber.
D 123, D13

crimp frequency, *n*—in manufactured staple fibers, the number of crimps or waves per unit length of extended or straightened fiber.
D 4849, D13

crimp index, *n*—an indirect measure of the amplitude of the crimp.
D 123, D13

crimp index, *n*—an indirect measure of the amplitude of the crimp.
D 4849, D13

crimp recovery, *n*—a measure of the ability of a yarn to return to its original crimped state after being subjected to tension.
D 123, D13

crimp recovery, *n*—a measure of the ability of a yarn to return to its original crimped state after being subjected to tension.
D 4849, D13

crinkled—a textural effect in a porcelain enamel surface having the appearance of fine wrinkles or ridges.
C 286, B08

criteria, *n*—the second part of a performance statement, consisting of quantitative statements defining the level or range of performance necessary to meet an objective or, where such a level or range cannot be established, the units of measurement of the performance.
E 2151, E06

criterion—See **requirement statement**.
E 631, E06

criterion, *n*—An established precedent, rule, measure, norm, or code upon which a decision may be based.
E 631, E06

criterion—See **requirement statement**.
E 1480, E06

criterion, *n*—an established precedent, rule, measure, norm, or code upon which a decision may be based.
E 2114, E06

criterion of failure—complete separation, or the presence of a crack of specified length visible at a specified magnification. Other criteria may be used but should be clearly defined.
E 1823, E08

critical angle—the incident angle of the ultrasonic beam beyond which a specific refracted wave no longer exists.
E 1316, E07

critical angle, θ_c —the angle whose sine is equal to the relative refractive index for light striking an interface from the greater to the lesser refractive medium: $\theta_c = \sin^{-1} n_{21}$, where n_{21} = the ratio of the refractive indices of the two media.
E 131, E13

critical anodic current density—the maximum anodic current density observed in the active region for a metal or alloy electrode that exhibits active-passive behavior in an environment.
G 15, G01

critical bed depth—the minimum depth of an adsorbent bed required to contain the mass transfer zone.
D 2652, D28

critical circle (critical surface)—the sliding surface assumed in a theoretical analysis of a soil mass for which the factor of safety is a minimum.
D 653, D18

critical cooling rate, *n*—the slowest rate of continuous cooling at which austenite can be cooled from above the transformation range to prevent its transformation above M_s .
A 941, A01

critical crack size [L]—the crack size in a chevron-notch specimen at which the specimen's stress-intensity factor coefficient, Y^* , is a minimum, or equivalently, the crack size at which the maximum force would occur in a purely linear elastic fracture mechanics test. At the critical crack size, the width of the crack front is approximately one third the dimension B.
E 1823, E08

critical current density—a current density above which a new and sometimes undesirable reaction occurs.
B 374, B08

critical curve—in a binary, or higher order, phase diagram, a line along which the phases of a heterogeneous equilibrium become identical.
E 7, E04

critical curve—in a binary, or higher order, phase diagram, a locus of points along which two or more phases exist in stable thermodynamic equilibrium.
E 1142, E37

critical damping—the minimum viscous damping that will allow a displaced system to return to its initial position without oscillation.
D 653, D18

critical damping (in dynamic mechanical measurement)—that damping required for the borderline condition between oscillatory and nonoscillatory behavior.
D 4092, D20

critical defect, *n*—a serious defect that judgment and experience indicate is likely to prevent the usability or proper performance of a product from its intended purpose.
D 123, D13

- critical defect**, *n*—a serious defect that judgment and experience indicate is likely to prevent the usability or proper performance of a product from its intended purpose. **D 4850**, D13
- critical density**—the unit weight of a saturated granular material below which it will lose strength and above which it will gain strength when subjected to rapid deformation. The critical density of a given material is dependent on many factors. **D 653**, D18
- critical difference**, *n*—the observed difference between two test results, which should be considered significant at the specified probability level. **D 123**, D13
- critical edge distance**—minimum anchor edge distance, measured from the anchor centerline to the edge of the structural member, at which the full anchor capacity can be obtained without concrete edge breakout failure or splitting failure. **E 2265**, E06
- critical flow**—open channel flow in which the energy, expressed in terms of depth plus velocity head, is a minimum for a given flow rate and channel. The Froude number is unity at critical flow. **D 4410**, D19
- critical flux at extinguishment**, *n*—a flux level at the specimen surface corresponding to the distance of farthest advance and subsequent self-extinguishment of the flame on the centerline of a specimen. **E 176**, E05
- critical frequency**, f_c —frequency at which maximum or minimum amplitudes of excited waves occur. **D 653**, D18
- critical half thickness**, (*a*), *n*—an estimation of the half thickness of a sample in an *unstirred container*, in which the heat losses to the environment are less than the retained heat. This buildup of internal temperature leads to a thermal-runaway reaction. **E 1445**, E27
- critical height** (*ch*), *n*—the maximum exposed height of a cone or pyramid that will not cause a puncture failure of a geosynthetic at a specified hydrostatic pressure for a given period of time. **D 4439**, D35
- critical height**, H_c (*L*)—the maximum height at which a vertical or sloped bank of soil or rock will stand unsupported under a given set of conditions. **D 653**, D18
- critical humidity**—the relative humidity above which the atmospheric corrosion rate of some metals increases sharply. **G 15**, G01
- critical hydraulic gradient**—see **hydraulic gradient**. **D 653**, D18
- critical illumination**—see **illumination, critical**. **E 175**, E41
- critical parts**, *n*—those components used in the test that are known to affect test severity. **D 4175**, D02
- critical path method**—method of scheduling in a detailed manner the essential steps or actions that must be taken in sequence from the start to the completion of a construction project. **E 631**, E06
- critical pitting potential**—the least noble potential where pitting corrosion will initiate and propagate. (See breakdown potential.) **G 15**, G01
- critical point**—in a phase diagram, that specific value of composition, temperature, pressure or combinations thereof at which the phases of a heterogeneous equilibrium become identical. (See also **transformation temperature**.) **E 7**, E04
- critical point**—in a binary phase diagram, that specific value of composition, temperature, pressure, or combinations thereof at which the phases of a heterogeneous equilibrium become identical. **E 1142**, E37
- critical pressure**—that pressure above which the liquid and vapor states are no longer distinguishable. **E 7**, E04
- critical pressure**—that pressure at the critical point. **E 1142**, E37
- critical property**, *n*—a quantitatively measurable characteristic which is absolutely necessary to be met if a material or product is to provide satisfactory performance for the intended use. **D 1711**, D09
- critical radiant flux**, *n*—the level of incident radiant heat energy on the floor covering system at the most distant flame-out point. It is reported as W/cm^2 (or $Btu/ft^2 \cdot s$). **E 176**, E05
- critical radiant flux**, *n*—the level of incident radiant heat energy on the attic floor insulation system at the most distant flame-out point. It is reported as W/cm^2 (or $Btu/ft^2 \cdot s$). **E 176**, E05
- critical slip angle**, (rad or degree), *n*—the value of the slip angle at the peak lateral force coefficient. **F 538**, F09
- critical slope**—the maximum angle with the horizontal at which a sloped bank of soil or rock of given height will stand unsupported. **D 653**, D18
- critical slope ratio**, r_c —the unloading slope ratio at the critical crack size. **E 1823**, E08
- critical spacing**—minimum anchor spacing, measured centerline to centerline of the anchors, at which the full anchor capacity can be obtained without influence from adjacent anchors. **E 2265**, E06
- critical surface**—see **critical circle**. **D 653**, D18
- critical surface**—in a ternary, or higher order, phase diagram, the area upon which the phases in equilibrium become identical. **E 7**, E04
- critical surface**—in a ternary or higher order phase diagram, the area upon which the phases in equilibrium become identical. (E 7, E04). **E 1142**, E37
- critical temperature**—that temperature above which the vapor phase cannot be condensed to liquid by an increase in pressure. **E 7**, E04
- critical temperature**—that temperature at the critical point. **E 1142**, E37
- critical temperature**, (T_c), *n*—an estimation of the lowest temperature of an *unstirred container* at which the heat losses to the environment are less than the retained heat leading to a buildup of internal temperature. This temperature buildup leads to a thermal-runaway reaction. **E 1445**, E27
- critical void ratio**—see **void ratio**. **D 653**, D18
- critical wax strength number**, *n*—in *paper surface strength*, the average highest numerical designation of wax that does not disturb the surface of the paper whose surface strength is tested by the wax pick method under specified conditions. See **pick**. **D 1968**, D06
- crizzle**—an imperfection in the form of a multitude of fine surface fractures. **C 162**, C14
- CRL**—abbreviation for constant-rate-of-loading. **D 123**, D13
- CRL**—abbreviation for constant-rate-of-loading. **D 4849**, D13
- crocidolite**, *n*—common name for **riebeckite asbestos**. **D 2946**, C17
- crocking**, *n*—a transfer of color from the surface of a colored fabric to an adjacent area of the same fabric or to another surface principally by rubbing action. (Compare **color staining, color bleeding**.) **D 123**, D13
- crocking**—the transfer of finish or color when leather is rubbed with a wet or dry cloth. **D 1517**, D31
- crocking**, *n*—a transfer of color from the surface of a colored fabric to an adjacent area of the same fabric or to another surface principally by rubbing action. (Compare **color staining**.) **D 3990**, D13
- crook**—a distortion of a piece of lumber in which there is a deviation in a direction perpendicular to the edge from a straight line from end to end of the piece. **D 9**, D07
- Crookes glass**—a glass having low transmission for ultraviolet light, and containing cerium and other rare earths. **C 162**, C14
- crop**—a side with the belly trimmed off. **D 1517**, D31
- crop oil concentrate**—an emulsifiable petroleum oil-based product containing 15 to 20 % w/w surfactant and a minimum of 80 % w/w phytobland oil. **E 1519**, E35
- crop oil (emulsifiable)**—an emulsifiable petroleum oil-based product containing up to 5 % w/w surfactant and the remainder of a phytobland oil. **E 1519**, E35
- crop oil (non-emulsifiable)**—See **phytobland oil**. **E 1519**, E35
- cross band**, *n*—inner layers of veneer whose grain direction is usually perpendicular to that of the face plies, applied particularly to plywood of five or more plies and lumber-core panels. **D 1038**, D07
- cross band**, *v*—to place the grain of the inner layer of veneer at right angles to that of the face and back. **D 1038**, D07
- crossbar**, *n*—a stroke that intersects other portions of the character at both ends. (cf. arm and cross stroke). **E 2195**, E30

crossbend test

crossbend test—a test in which fired or bisque porcelain enamel panels are progressively distorted by bending to determine the resistance of the coating to cracking. **C 286, B08**

cross break—a separation of the wood cells across the grain. Such breaks may be due to internal stress resulting from unequal longitudinal shrinkage or external forces. **D 9, D07**

cross-chest width, *n*—in body measurements, the distance from front break-point to front break-point. **D 123, D13**

cross-contamination, *n*—contamination of a material or product with another material or product. **E 2363, E55**

cross-contamination, *n*—the unintended presence of a cell or a material with another cell or material. **F 2312, F04**

cross-country track, *n*—surface not subject to repeated traffic in addition, no roads, routes, well-worn trails or man-made improvements; can consist of tank trails with crushed rock or having large exposed obstacles (rocks, boulders, etc.). **F 538, F09**

crosscut—to cut a board, timber, or log generally transverse to the direction of the fibers. A synonym is “buck.” **D 9, D07**

cross-cut chisel point—chisel point with beveled point faces parallel to staple-crown axis. (See **right-angle chisel point**.) **F 592, F16**

cross direction—the direction of the paper or paperboard at right angles to the machine direction. Sometimes referred to as CD, CMD (cross machine direction), and across machine direction. **D 1968, D06**

cross direction—one of three mutually perpendicular directions used to define a worked material, specifically that direction in the plane of working which is at right angles to the direction of maximum elongation. **E 7, E04**

cross-dye effect, *n*—variation in dye pick-up between yarns or fibers, resulting from their inherent dye affinities. **D 123, D13**

crossed head—cup head with raised lines in cup forming cross. Also known as X head. **F 547, F16**

cross-fiber—asbestos that is located in (or derives from) veins or seams in which the fibers are close-packed and are oriented at a large angle to the boundaries of the veins or seams. **D 2946, C17**

cross-fired furnace—See **side-fired furnace**. **C 162, C14**

cross flow—flow through a membrane module in which the fluid on the upstream side of the membrane moves parallel to the membrane surface and the fluid on the downstream side of the membrane moves away from the membrane in the direction normal to the membrane surface. **D 6161, D19**

crossflow membrane filtration—a separation of the components of a fluid by semipermeable membranes through the application of pressure and flow parallel to the membrane surface. Includes the processes of reverse osmosis, ultrafiltration, nanofiltration, and microfiltration. **D 6161, D19**

cross grain—See **grain**. **D 9, D07**

cross grains or reeves, *n*—in mica, tangled laminations causing imperfect cleavage. **D 1711, D09**

cross grating—a two-dimensional diffraction grating, patterns from which are similar in the effects produced by diffracted electrons from thin flakes and films, and whose theory may therefore be used to explain the latter. **E 7, E04**

cross laminate—a laminate in which some of the layers of material are oriented approximately at right angles to the remaining layers with respect to the grain or strongest direction in tension. (See also **parallel laminate**.) **D 883, D20**

cross laminate, *n*—see **cross laminate** under **laminate, *n***. **D 907, D14**

cross laminate—a laminate in which some of the layers of material are oriented approximately at right angles to the remaining layers with respect to the grain or strongest direction in tension. (See also **parallel laminate**.) (D20) **F 412, F17**

crosslink, *v*—to form chemical bonds between molecules to produce a three-dimensional network. **D 907, D14**

crosslink, *n*—chemical bond bridging one polymer chain to another. **D 1566, D11**

crosslink density, *n*—number of crosslinks per unit mass or volume of vulcanizate. **D 1566, D11**

crosslinking, *n*—the formation of a three dimensional polymer by means of interchain reactions resulting in changes in physical properties. **D 883, D20**

cross linking—the reaction of a difunctional molecule with each of two molecules of a polymer. This change of the polymer from linearity produces profound changes in the physical properties. **D 1695, D01**

crosslinking, *n*—the formation of a three dimensional polymer by means of interchain reactions resulting in changes in physical properties. (D20) **F 412, F17**

crosslinking (the act of), *n*—formation of chemical bonds between polymer chains to give a network structure. **D 1566, D11**

cross-machine direction, *n*—the direction in the plane of the fabric perpendicular to the direction of manufacture. **D 4439, D35**

cross-machine direction, CD, *n*—the direction in the plane of the fabric perpendicular to the direction of manufacture. **D 123, D13**

cross-method reproducibility (R_{XY}), *n*—a quantitative expression of the random error associated with the difference between two results obtained by different operators using different apparatus and applying the two methods *X* and *Y*, respectively, each obtaining a single result on an identical test sample, when the methods have been assessed and an appropriate bias-correction has been applied in accordance with this practice; it is defined as the 95 % confidence limit for the difference between two such single and independent results. **D 4175, D02**

crossply laminate—a laminate composed of only 0 and 90° plies. This is not necessarily symmetric. **D 3878, D30**

cross-product contamination, *n*—the unintentional mixing of powders with distinct differences in either physical characteristics or chemical composition or both. **B 243, B09**

cross section—a section of a stem, board, or other piece of wood taken at right angles to its longitudinal axis. **D 9, D07**

cross section, σ —the quotient of *P* by Φ , where *P* is the probability of the interaction for one target entity when subjected to the particle fluence Φ (ICRU).

$$\sigma = P/\Phi$$

Unit: m²

The special unit of cross section is the barn, *b*.

$$1 \text{ b} = 10^{-28} \text{ m}^2$$

E 170, E10

cross section:

enhanced elastic—EIA, cross section for elastic scattering that is larger than that predicted by *Rutherford* due to partial penetration of a nucleus in the specimen by the incident particle.

nuclear reaction—EIA, the probability of a particular nuclear reaction as a function of energy and the emission direction of the detected product. Usually expressed as an area in units of barns = 10⁻²⁸ m².

Rutherford—EIA, nuclear reaction cross section for the particular case of elastic scattering as calculated from classical mechanics. First evaluated by *Rutherford*.

stopping—EIA, the energy loss of a particle incident on the specimen per unit area density of specimen atoms. Usually expressed in units of eV·cm²/atom. **E 673, E42**

cross section—the apparent cross-sectional area of the nucleus as calculated on the basis of the probability of occurrence of a reaction by collision with a particle. It does not necessarily coincide with the geometrical cross-sectional area πr^2 . It is given in units of area, 1 barn = 10⁻²⁴ cm². **E 1316, E07**

cross section, *n*—shows the width and thickness of material, including the center section's shape, core diameter, and core wrap. **F 1379, F14**

- cross-sectioning**—a method in which a specimen is mechanically cleaved, cut, or polished in a plane perpendicular to the interface under study, so that associated compositional differences or gradients in the plane of the polished surface may be observed. **E 673, E42**
- cross section of the cavity, *n***—in a mold for test specimens, the area of a planar section perpendicular to the flow pattern during filling of the mold that forms the critical portion of the test specimen. **D 883, D20**
- cross stroke, *n***—a stroke that crosses another portion of the character and is not attached at either end. (For example, the horizontal stroke of the “t”) (cf. crossbar). **E 2195, E30**
- crosstalk, *n***—the undesired effect of force readings appearing on an unloaded axis of a transducer while applying force to another. **E 867, E17**
- cross talk**—the signal leakage (acoustic or electric) across an intended acoustic or electric barrier. **E 1316, E07**
- croch, *n***—*in anatomy*, the body area adjacent to the vertex of the included angle between the legs. **D 123, D13**
- croch, *n***—the body area adjacent to the vertex of the included angle between the legs. **D 5219, D13**
- croch, *n***—*in anatomy*, the body area adjacent to the vertex of the included angle between the legs. **F 1494, F23**
- croch height, *n***—the vertical distance from the midpoint of the croch to the floor, taken with the subject standing and without shoes.
- croch height (infant special case), *n***—the straight distance from the midpoint of the croch to the soles of the feet, taken with subject lying down flat with legs extended and foot positioned at 1.57 rad (90°) to the leg. **D 5219, D13**
- croch length (total), *n***—the distance from waist level at the center front, through the croch and to the waist level at the center back, avoiding constriction at the croch. **D 5219, D13**
- croupon**—untanned, whole cattlehide with the belly and shoulder cut off. Comparable to a butt bend in tanned leather. **D 1517, D31**
- crowding**—improper horizontal character spacing. **F 149, F05**
- crowfoot weave, *n***—a broken-twill weave 1-up and 3-down or 3-up and 1-down with two ends to the right and two ends to the left, commonly referred to as four-harness satin or broken crow. **D 123, D13**
- crowfoot weave, *n***—a broken-twill weave one-up and three-down or three-up and one-down with two ends to the right and two ends to the left, commonly referred to as 4-harness satin or broken crow. **D 7018, D13**
- crow**—the top or roof of a melter. **C 162, C14**
- crow**—the top or highest point of the internal surface of the transverse cross section of a pipe. **C 822, C13**
- crow, *n***—*in anatomy*, the top of the head. **D 123, D13**
- crow**—also roof or back, that is, the highest point of the cross section. *In tunnel linings*, the term is used to designate either the arched roof above spring lines or all of the lining except the floor or invert. (ISRM) **D 653, D18**
- crow, *n***—the top of the head. **D 5219, D13**
- crow**—staple end opposite staple point, connecting both staple legs and providing bearing area. **F 592, F16**
- crow optical glass**—See **optical crown glass**. **C 162, C14**
- crow process**—{archaic} a method of making flat glass by blowing a large bulb, opening it, and then spinning it flat. **C 162, C14**
- crow width**—overall width of staple including both staple legs. **F 592, F16**
- crowfeet, *n***—*infabrics*, fine wrinkles of varying degree of intensity, size, and shape. **D 123, D13**
- crowfeet, *n***—small flowmarks of V-shape on calendered sheeting. **D 1566, D11**
- crowfeet, *n***—*infabrics*, fine wrinkles of varying degrees of intensity, size, and shape. **D 3990, D13**
- CRT**—abbreviation for constant-rate-of-traverse. **D 4849, D13**
- crude asbestos**—hand-cobbed (released from its ore by manual hammer impact) cross-vein asbestos in its natural or unfiberized form. **D 2946, C17**
- crude mica**—mica as mined; crude crystals with dirt and rock adhering. **D 1711, D09**
- crude oil, *n***—a naturally occurring hydrocarbon mixture, generally in a liquid state, which may also include compounds of sulfur, nitrogen, oxygen, metals, and other elements. (Synonym—*crude petroleum, crude*.) **D 4175, D02**
- crude stripper oil, *n***—a by-product of the manufacture of citrus juice, composed largely of d-limonene and containing up to 1.5 % of aldehydes. (See also **d-limonene**.) **D 804, D01**
- crudiness (kroodiness)**—the extent to which a sample of asbestos contains crudy elements. See **crudy**. **D 2946, C17**
- crudy (kroodi)**—the quality of processed asbestos with relatively low specific surface area and degree of fiberization, containing an appreciable portion of intact assemblages of fiber (derived from the term crude asbestos). **D 2946, C17**
- crudy (kroodi) bundle**—a heavy assemblage of asbestos in closed-packed parallel orientation, that may be partially crushed, and that has a transverse dimension exceeding 8 mm. **D 2946, C17**
- crush**—*on flat glass sheets*, a lightly pitted condition with a dull gray appearance. **C 162, C14**
- crush, *n***—*in pile yarn floor coverings*, loss of tuft definition due to entanglement and compression of pile fibers. **D 123, D13**
- crush, *n***—*in pile yarn floor coverings*, loss of tuft definition due to entanglement and compression of pile fibers. **D 5684, D13**
- crushed feathers, *n***—feathers and feather fiber resulting from curling, crushing, or chopping feathers without removing the quill. **D 123, D13**
- crushed feathers, *n***—feathers and feather fiber resulting from curling, crushing, or chopping feathers without removing the quill. **D 7022, D13**
- crushed gravel, *n***—the product resulting from the artificial crushing of gravel with substantially all fragments having at least one face resulting from fracture. **C 125, C09**
- crushed leather**—leather made from chrome-vegetable retanned kidskins with the grain accentuated by boarding or other process. **D 1517, D31**
- crushed stone, *n***—the product resulting from the artificial crushing of rocks, boulders, or large cobblestones, substantially all faces of which have resulted from the crushing operation. **C 125, C09**
- crushed stone**—the product resulting from the artificial crushing of rocks, boulders, or large cobblestones, substantially all faces of which have resulted from the crushing operation. **D 1079, D08**
- crusher-run, *n***—the total unscreened product of a stone crusher. **D 8, D04**
- crushing strength, *n***—*for pipes*, a property of solid material that indicates its ability to withstand collapse from external, compressive loads. **C 1154, C17**
- crushing strength**—the property of a particle to resist physical breakdown when contained and subjected to a slowly increasing continuously applied force. **D 2652, D28**
- crushing strength**—property of solid material that indicates its ability to withstand collapse from external compressive loads. **D 2946, C17**
- crush strength, *n***—*in catalysis*, a measure of the resistance of a single particle of a formed catalyst to loss of form when subjected to a compressive force. **D 3766, D32**
- crust**—used as an adjective or in the phrase “in the crust,” refers to leather than has been tanned but not finished (see also **rough**). **D 1517, D31**
- crust-like cryostructure**—the structural properties of a frozen deposit of angular blocks that are coated with ice, while large spaces between the blocks are not filled with ice. **D 7099, D18**

cryofront

cryofront—the boundary between frozen and unfrozen ground, as indicated by the position of the 0°C isotherm in the ground.

D 7099, D18

cryogenesis—the combination of thermophysical, physico-chemical, and physico-mechanical processes that occur in freezing, frozen, and thawing earth materials.

D 7099, D18

cryogenic aquiclude—a frozen layer of ground with sufficiently low permeability as to act as a confining bed for an aquifer.

D 7099, D18

cryogenic fabric—the distinct soil micromorphology which results from the effects of freezing and thawing processes.

D 7099, D18

cryogenic temperature—the term can apply to temperatures below -50°C but is usually used for those temperatures close to absolute zero (-273°C).

D 7099, D18

cryogenic temperatures—for purposes of this practice, cryogenic temperatures are temperatures at or below -70°C.

E 1705, E48

cryogenic temperatures—temperatures below or equal to -100°C.

E 1705, E48

cryolithology—the study of the genesis, structure, and lithology of frozen earth materials.

D 7099, D18

cryology—the study of the properties of snow, ice, and frozen ground.

D 653, D18

cryopedology—the study of soils at temperatures below 0°C.

D 7099, D18

cryopeg—a layer of unfrozen ground in which the temperature is perennially below 0°C. In general, the freezing of such layers is prevented due to the depression of the freezing point by solids dissolved in the pore water.

D 7099, D18

cryoplanation—the process through which cryoplanation terraces form.

D 7099, D18

cryoplanation terraces—hillside benches or table-like summit surfaces which are thought to have resulted from intense frost wedging associated with snowbanks. These are usually underlain by permafrost and are considered by some as diagnostic landforms of permafrost terrain.

D 7099, D18

cryoprotectant—a chemical substance used to protect cells during freezing and rewarming.

E 1705, E48

cryosol—soil within 1 to 2 m of the surface in which the mean annual ground temperature is below 0°C.

D 7099, D18

cryosphere—that part of the Earth's crust, hydrosphere, and atmosphere subject, for at least a part of each year, to temperatures below 0°C (32°F).

D 7099, D18

cryostructure—the structural characteristics of frozen earth materials.

D 7099, D18

cryosuction—a suction which develops in freezing or partially-frozen fine-grained materials due to temperature-dependent differences in unfrozen water content.

D 7099, D18

cryotexture—the textural characteristics of frozen earth materials cemented together with ice.

D 7099, D18

cryotic ground—soil or rock in which the temperatures are 0°C, or below.

D 7099, D18

cryoturbate—a body of earth material moved or disturbed by the action of frost.

D 7099, D18

cryoturbation—(1) a collective term to describe all soil movements due to frost action; (2) irregular structures formed in earth materials by deep frost penetration and frost action processes.

D 7099, D18

cryptoflorescence, n—crystalline deposit of water-soluble compounds in the pores of masonry.

C 1232, C15

cryptosporidium—a waterborne protozoan that forms cysts and causes acute gastrointestinal illness in humans.

D 6161, D19

crystal—a solid composed of atoms, ions, or molecules arranged in a pattern which is periodic in three dimensions.

E 7, E04

crystal—solid composed of atoms, ions, or molecules, arranged in a pattern which is periodic in three dimensions, (E 7, E04).

E 1142, E37

crystal analysis—a method for determining crystal structure, for

example, the size and shape of the unit cell and the location of all atoms within the unit cell.

E 7, E04

crystal, birefringent—a cr pertaining to the use of a microscope.

E 175, E41

crystal glass—(1) colorless, highly transparent glass which is frequently used for art or tableware.

(2) colorless, highly transparent glass historically containing

lead oxide.

C 162, C14

crystalline glaze—See *crystalline glaze* under **glaze**.

C 242, C21

crystalline regions—see **crystallinity**.

D 1695, D01

crystallinity—a regular arrangement of the atoms of a solid in space.

In most polymers, including cellulose, this state is usually imperfectly achieved. The crystalline regions (ordered regions) are submicroscopic volumes in which there is more or less regularity of arrangement of the component molecules. In these regions there is sufficient geometric order to enable definite X-ray diffraction patterns to be obtained. (see also **degree of crystallinity; degree of order**)

D 1695, D01

crystallinity—regular arrangement of the atoms of a solid in space.

E 1142, E37

crystallinity index—a number used to represent the state of crystallinity of cellulose as a whole. Unfortunately, it has been differently defined by different investigators and should not be used unless it is clearly stated which crystallinity index is meant. (see also **crystallinity**)

D 1695, D01

crystallite—a single crystalline region. (see also **crystallinity**)

D 1695, D01

crystallite—a crystalline grain not bounded by habit planes. E 7, E04

crystallite—crystalline grain not bounded by habit planes, (E 7, E04).

E 1142, E37

crystallization—arrangement of previously disordered material segments of repeating patterns into geometric symmetry. E 1142, E37

crystallization, n—a condition where ink evaporates and forms crystals.

F 1857, F05

crystallization, polymer, n—arrangement of previously disordered polymer segments of repeating patterns into geometric symmetry.

D 1566, D11

crystallization temperature—that temperature at which a specimen undergoes crystallization upon cooling.

E 1142, E37

crystallographic cleavage—the separation of a crystal along a plane of fixed orientation relative to the three-dimensional crystal structure within which the separation process occurs, with the separation process causing the newly formed surfaces to move away from one another in directions containing major components of motion perpendicular to the fixed plane.

E 1823, E08

crystallographic discoloration, n—*in mica*, discoloration appearing as bands of lighter or darker shades of basic color of a block of mica.

D 1711, D09

crystal membrane or solid-state electrode membrane—a thin single or mixed crystal that is an ionic conductor and that separates the internal reference element or internal reference solution from the sample solution.

D 4127, D19

crystal (see transducer)—the piezoelectric element in an ultrasonic search unit. The term is used to describe single crystal piezoelectrics as well as polycrystalline piezoelectrics, such as ferroceramics.

E 1316, E07

crystal system—one of seven groups into which all crystals may be divided; triclinic, monoclinic, orthorhombic, hexagonal, rhombohedral, tetragonal, and cubic.

E 7, E04

C-scan—an ultrasonic data presentation which provides a plan view of the test object, and discontinuities therein.

E 1316, E07

C-stage, n—the final stage in the reaction of certain thermosetting materials in which they have become practically insoluble and infusible.

D 883, D20

C-stage, n—the final stage in the reaction of thermosetting resins, in which the material is practically insoluble and infusible.

D 907, D14

C-stage—the final stage in the reaction of certain thermosetting resins

- in which the material is relatively insoluble and infusible. Certain thermosetting resins in a fully cured adhesive layer are in this stage. Sometimes referred to as *resite*. **E 631, E06**
- C-stage**—the final stage in the reaction of certain thermosetting resins in which the material is relatively insoluble and infusible. Certain thermosetting resins in a fully cured adhesive layer are in this stage. Sometimes referred to as *resite*. **E 1749, E06**
- C*(t)**—Integral, $C^*(t)$ [$FL^{-1} T^{-1}$]—a mathematical expression, a line or surface integral that encloses the crack front from one crack surface to the other, used to characterize the local stress-strain rate fields at any instant around the crack front in a body subjected to extensive creep conditions. **E 1823, E08**
- C test, n**—a standard statistical test for homogeneity of variance. **D 121, D05**
- Ct product, n**—the concentration-time product in ppm · min obtained by integration of the area under a concentration-time curve. **E 176, E05**
- CTS**—abbreviation for **clear to send**. **F 1457, F05**
- cuam viscosity**—see **viscosity, cuprammonium**. **D 1695, D01**
- cube, n**—in *packaging*, the volume of space occupied by the unit under consideration, computed by multiplying overall exterior length, width, and height. For shipping purposes cube is expressed to the nearest 0.1 ft³ (2830 cm³). (Compare **displacement**.) **D 996, D10**
- cube texture**—a texture found in wrought metals in the cubic system, in which nearly all the crystal grains have a plane of the type (100) parallel or nearly parallel to the plane of working and a direction of the type [001] parallel or nearly parallel to the direction of elongation. **E 7, E04**
- cubic**—having three mutually perpendicular axes of equal length. **E 7, E04**
- cubic stock**—in general, a thick dimension stone unit which is not precisely defined in terms of thickness for every kind of stone, particularly for limestone and sandstone. For marble or granite, cubic stock is a unit that is greater than 50 mm in thickness. For limestone, cubic stock is a unit that is greater than 75 mm to 100 mm in thickness, and for sandstone, a unit that is greater than 150 mm to 200 mm in thickness. (In contrast, see *thin stone*.) **C 119, C18**
- cuene viscosity**—see **viscosity, cupriethylenediamine**. **D 1695, D01**
- cuff, n**—in *garment construction*, a finished edge at the end of either a garment sleeve or trouser leg created by turning back or rolling up and stitching the fabric. **F 1494, F23**
- cull**—in grading lumber or other wood products, pieces or parts thereof, that do not meet the lowest quality standards requirements. **D 9, D07**
- cullet**—glass product or portions of product usually suitable for addition to raw batch.
- foreign cullet—cullet from an outside source.
 - domestic cullet (factory cullet)—cullet from within the plant.
 - a portion of a glass article that will later be cut off and discarded or remelted. **C 162, C14**
- cullet cut**—synonymous with **block reek**. **C 162, C14**
- cultural object, n**—any man-made or modified natural article that reflects the beliefs, social forms, and material traits of racial, social, religious, or other specific groups. **D 123, D13**
- culture**—controlled inoculation, growth, and harvesting of known microorganisms. **F 1600, F20**
- culvert**—a pipeline intended to convey water under a highway, railroad, canal, or similar facility. **C 822, C13**
- cumene**—(C₉H₁₂) mol weight 120.19; clear, flammable liquid; melting point, -96.0°C; boiling point, 152.4°C. **D 4790, D16**
- cumulative (acoustic emission) amplitude distribution F(V)**—see **distribution, amplitude, cumulative**. **E 1316, E07**
- cumulative (acoustic emission) threshold crossing distribution F_t(V)**—see **distribution, threshold crossing, cumulative**. **E 1316, E07**
- cumulative droplet diameter (D_{v,1} and D_{v,9})**—diameter of drop such that 10 % and 90 %, respectively, of the liquid volume is in drops of smaller diameter. **E 1102, E35**
- cumulative erosion, n**—in *cavitation and impingement erosion*, the total amount of material lost from a solid surface during all exposure periods since it was first exposed to cavitation or impingement as a newly-finished surface. (More specific terms that may be used are *cumulative mass loss*, *cumulative volume loss*, or *cumulative mean depth of erosion*. See also **cumulative erosion-time curve**.) **G 40, G02**
- cumulative erosion rate, n**—the cumulative erosion at a specified point in an erosion test divided by the corresponding cumulative exposure duration; that is, the slope of a line from the origin to the specified point on the cumulative erosion-time curve. (*Synonym: average erosion rate*) **G 40, G02**
- cumulative erosion-time curve, n**—in *cavitation and impingement erosion*, a plot of cumulative erosion versus cumulative exposure duration, usually determined by periodic interruption of the test and weighing of the specimen. This is the primary record of an erosion test. Most other characteristics, such as the incubation period, maximum erosion rate, terminal erosion rate, and erosion rate-time curve, are derived from it. **G 40, G02**
- cumulative frequency spectrum**—See **exceedances spectrum**. **E 1823, E08**
- cumulative occurrences spectrum**—See **exceedances spectrum**. **E 1823, E08**
- cumulative oversize distribution graph, n**—a graph obtained by plotting the total (cumulative) percentage by the mass retained on each of a set of sieves versus the corresponding aperture sizes. **E 1638, E29**
- cumulative permeation, n**—the total mass of chemical that permeates during a specified time from when the material is first contacted. **F 1494, F23**
- cumulative sample**—See **sample**. **D 1356, D22**
- cumulative undersize distribution graph, n**—a graph obtained by plotting the total (cumulative) percentage by the mass passing each of a set of sieves versus the corresponding aperture sizes. **E 1638, E29**
- cup**—a distortion of a board in which there is a deviation flatwise from a straight line across the width of the board. **D 9, D07**
- cup, cupped head**—head with concave or recessed, instead of flat, top surface to accommodate nail set and to prevent its slipping during countersinking. **F 547, F16**
- cup grease, n**—any lubricating grease having physical properties, such as consistency and texture, suitable for its use in spring-loaded or screw-type lubricating cups. **D 4175, D02**
- cup gun**—a spray gun with a fluid container as an integral part. **C 286, B08**
- cupped oval head**—head with oval or convex top surface and concave bearing surface. (See **umbrella head**.) **F 547, F16**
- cupped point**—incomplete needle point; resulting from breaking of tip of point during forming. **F 547, F16**
- cupping**—the pouring of slip over areas of a part during draining to produce uniform application. **C 286, B08**
- cupping**—the condition sometimes occurring in heavily cold worked rods and wires, in which the outside fibers are still intact and the central zone has failed in a series of cup-and-cone fractures. **E 7, E04**
- cupping, n**—a type of irregular wear characterized by a variation in wear rate that may be periodic (essentially cycloidally shaped) around the tread band circumference in one or more rows; the variation of loss is essentially independent of individual projections if the pattern contains these projections. **F 538, F09**
- cuprammonium process**—a process for making rayon by dissolving

cuprammonium process

cellulose in an ammoniacal copper solution and spinning the resulting solution into an acid bath, thereby regenerating the cellulose as fibers.

D 1695, D01

cuprammonium viscosity—see **viscosity, cuprammonium**.

D 1695, D01

cupriethylenediamine viscosity (cuene or CED)—see **viscosity, cupriethylenediamine**.

D 1695, D01

curb—a component for holding the tumblers in place. F 471, F12

cure, *v*—*in building construction*, to attain the intended performance properties of a compound by means of evaporation, chemical reaction, heat, radiation, or combinations thereof. C 717, C24

cure, *n*—*in building construction*, the process by which a compound attains its intended performance properties by means of evaporation, chemical reaction, heat, radiation, or combinations thereof.

C 717, C24

cure, *n*—the reaction mechanism in which the physical, chemical and mechanical properties of a hydraulic cement change through the phases of slurry-paste-solid with time, with or without external heat, in the presence of water.

C 1154, C17

cure—*in grouting*, the change in properties of a grout with time.

D 653, D18

cure, *v*—to change the properties of a polymeric system into a more stable, usable condition by the use of heat, radiation, or reaction with chemical additives.

D 883, D20

cure, *v*—to develop the strength properties of an adhesive by chemical reaction.

D 907, D14

cure, *n*—See **vulcanization**, the preferred term.

D 1566, D11

cure—reaction mechanism in which the physical, chemical, and mechanical properties of a hydraulic cement change through the phases of slurry-paste-solid with time, with or without external heat, in the presence of water.

D 2946, C17

cure—to change the properties of a polymeric system into a more stable, usable condition by the use of heat, radiation, or reaction with chemical additives.

E 631, E06

cure—to change the properties of a polymeric system into a more stable, usable condition by the use of heat, radiation, or reaction with chemical additives.

E 1749, E06

cure, *v*—to develop the ultimate properties of a wet-state material by a chemical process.

E 2110, E06

cure, *v*—to change the properties of a polymeric system into a more stable, usable condition by the use of heat, radiation, or reaction with chemical additives. (ISO, D20)

F 412, F17

cure, *v*—to change the properties of a polymeric system into a more stable, usable condition by the use of heat, radiation, or reaction with chemical additives.

F 1251, F04

cure, air or ambient, *n*—the method of setting or hardening products wherein the portland cement is allowed to hydrate at atmospheric conditions of pressure, preferably under conditions to inhibit water and heat loss.

C 1154, C17

cure, autoclave, *n*—a means for accelerating the cure reaction at elevated temperature and pressure in saturated steam, where reactive siliceous material has been incorporated into the cementitious matrix, such that a hydrothermal reaction takes place between the cement and silica yielding calcium silicate.

C 1154, C17

cure cycle—the schedule of time periods, at specified conditions, to which a reacting thermosetting material is subjected to reach a specified property level.

D 883, D20

cured, *adj*—*in building construction*, pertaining to the state of a compound that has attained its intended performance properties by means of evaporation, chemical reaction, heat, radiation, or combinations thereof.

C 717, C24

cure meter, *n*—a testing device that measures the progress of vulcanization at a vulcanizing temperature.

D 1566, D11

cure (portland cement plaster or stucco), *v*—(*I*) to provide conditions conducive to the hydration process of portland cement plaster

or stucco, or (*2*) to maintain proper temperature and a sufficient quantity of water within the plaster to ensure cement hydration.

C 11, C11

cure time—*in grouting*, the interval between combining all grout ingredients or the formation of a gel and substantial development of its potential properties.

D 653, D18

cure time—the period of time that a reacting thermosetting material is exposed to specific conditions to reach a specified property level.

D 883, D20

cure time—the amount of time required for an adhesive anchor to develop its specified strength.

E 2265, E06

Curie point—that temperature above which a substance becomes paramagnetic.

E 7, E04

Curie point—see **Curie temperature**.

E 1142, E37

Curie point—the temperature at which ferromagnetic materials can no longer be magnetized by outside forces, and at which they lose their residual magnetism (approximately 1200 to 1600°F (649 to 871°C) for many metals).

E 1316, E07

Curie temperature—temperature above which a ferromagnetic or ferroelectric material becomes paramagnetic, or paraelectric, respectively.

E 1142, E37

Curie temperature, T_c —the temperature above which a ferromagnetic material becomes paramagnetic.

A 340, A06

curing, *n*—action taken to maintain moisture and temperature conditions in a freshly-placed cementitious mixture to allow hydraulic cement hydration and (if applicable) pozzolanic reactions to occur so that the potential properties of the mixture may develop (see ACI 308).

C 125, C09

curing, *n*—see the preferred term **vulcanization**.

D 123, D13

curing—treating raw hides or skins so as to minimize putrefaction and bacterial action, but to enable the skins to be wet back conveniently in preparation for tanning (see **brining**, **dry pickling**, **dry salting**, **green salting**, and **pickle**).

D 1517, D31

curing, *n*—see the preferred term **vulcanization**.

D 6477, D13

curing, *n*—chemical process of developing ultimate properties of a finish or other material over a specified period of time. Compare **drying**.

E 631, E06

curing agent, *n*—an additive incorporated in the constituents of products producing a change in chemical activity between the cementitious components with an increase or decrease in the rate of cure.

C 1154, C17

curing agent, *n*—a substance or mixture of substances that controls a curing reaction.

D 907, D14

curing agent, *n*—synonym for **vulcanizing agent**, the preferred term.

D 1566, D11

curing agent—additive incorporated in the furnish of asbestos-cement products resulting in modified chemical activity between the cementitious components with an increase or decrease in the rate of cure.

D 2946, C17

curing compound, *n*—a liquid that, when applied as a coating to the surface of newly-placed concrete, forms a membrane that retards the evaporation of water and, in the case of white pigmented compounds, reflects heat (see also **curing**).

C 125, C09

curing retarder—a material added to cement to increase the time for curing. Sodium chloride in high concentrations is an example.

D 653, D18

curing temperature, *n*—the temperature to which an adhesive or an assembly is subjected to cure the adhesive.

D 907, D14

curing time—the period between application and the time when the material attains its intended physical properties.

C 717, C24

curing time, *n*—the period of time during which an assembly is subjected to heat or pressure, or both, to cure the adhesive. (See also **joint-conditioning time**, **setting time**.)

D 907, D14

curl—See **kink**.

D 3990, D13

curl—the degree of curvature of a sheet of paper or carbon paper.

F 221, F05

curl, *n*—a phenomenon in which the edges of a paper substrate bend towards the center of the paper.

F 1857, F05

curled selvage, n—self-descriptive. **D 123, D13**

curled selvage, n—self-descriptive. (*Syn.* rolled selvage, turned-over edge) **D 3990, D13**

curling—a defect similar to crawling. **C 286, B08**

curling temperature—the temperature at which noticeable curling occurs on gradually heating a leather specimen in water. **D 1517, D31**

curl resistance—the tendency of sheet carbon to be flat on exposure to varying conditions of temperature and humidity. **F 221, F05**

curls—long flat flakes manufactured by the cutting action of a knife in such a way that they tend to be in the form of a helix. **D 1554, D07**

current, ac core loss, I_c —the rms value of the in-phase component (with respect to the induced voltage) of the exciting current supplied to a coil which is linked with a ferromagnetic core. **A 340, A06**

current, ac exciting, I —the rms value of the total current supplied to a coil that is linked with a ferromagnetic core.

NOTE—Exciting current is measured under the condition that any other coil linking the same core carries no current. **A 340, A06**

current, ac, magnetizing, I_m —the rms value of the magnetizing component (lagging with respect to applied voltage) of the exciting current supplied to a coil that is linked with a ferromagnetic core. **A 340, A06**

current carrying capacity—the maximum level of electrical current that a circuit can conduct without sustaining damage. **F 2112, F01**

current, dc, I_{dc} —a steady-state dc current. A dc current flowing in an inductor winding will produce a unidirectional magnetic field in the magnetic material. **A 340, A06**

current density—the electric current to or from a unit area of an electrode surface. **G 15, G01**

current density (cd)—current per unit area. **B 374, B08**

current dollars—dollars of purchasing power in which actual prices are stated, including inflation or deflation. **E 631, E06**

current dollars, n—dollars of purchasing power in which actual prices are stated, including inflation or deflation. **E 833, E06**

current efficiency—the proportion, usually expressed as a percentage, of the current that is effective in carrying out a specified process in accordance with Faraday's law. **B 374, B08**

current efficiency—the ratio of the electrochemical equivalent current density for a specific reaction to the total applied current density. **G 15, G01**

current flow method—a method of magnetizing by passing a current through a component via prods or contact heads. The current may be alternating, rectified alternating, or direct. **E 1316, E07**

current good manufacturing practices (CGMP)—current regulations published by the United States Food and Drug Administration (FDA) regarding manufacturing, processing, packaging and storing of drug and biological products. **E 1705, E48**

current induction method—a method of magnetizing in which a circulating current is induced in a ring component by the influence of a fluctuation magnetic field that links the component. **E 1316, E07**

current integration—the measurement of total electric charge deposited into a specimen by the incident beam. **E 673, E42**

current response—change in freeboard or draft due to current forces acting to displace the boom from rest. **F 818, F20**

currying—a process of treating tanned hides with oils and greases to prepare them for belting, sole, harness leathers, etc. **D 1517, D31**

curstive, n—a type of writing in which the letters are joined and the writing instrument is not lifted after most strokes. **E 2195, E30**

curtain grouting—injection of grout into a sub-surface formation in such a way as to create a barrier of grouted material transverse to the direction of the anticipated water flow. **D 653, D18**

curtaining—see **sag** or **sagging**. **D 16, D01**

curtains—a defect in sheet steel ground coatings characterized by a draped pattern of darkened areas that are sometimes blistered. May

also appear in cover coats applied over the ground coat or direct-on. **C 286, B08**

"curtain type" boom—boom consisting of a flexible skirt supported by flotation. **F 818, F20**

curtain wall—See **wall**. **E 631, E06**

curvature, n—the shape of the needle viewed in profile. Some common shapes include, but are not limited to: straight, 1/2 curve or "ski", 1/8 circle, 1/4 circle, 3/8 circle, 1/2 circle, 5/8 circle, and compound curvature. **F 1840, F04**

curvature of field—a property of a lens that causes the image of a plane to be focused into a curved surface instead of a plane. **E 7, E04**

curved head—head with hemispherical or nearly hemispherical bearing surface and flat top surface. Also, head of plain, flat-headed nail with two opposite edges cupped downward. **F 547, F16**

curve interpolation point, n—those intermediate points generated between curve points by means of a CAD vendor's system curve interpolation algorithm; those points used to create a curve in order to represent a contour. **D 6963, D13**

curve point, n—a user defined point on a contour. **D 6963, D13**

curve resolving—the construction of the individual peaks of a spectrum that consists of overlapping peaks, also called curve fitting or peak fitting. **E 673, E42**

curve, thermal, n—the plot of a parameter against temperature or time. (ICTAC) **E 473, E37**

curve tolerance, n—the maximum perpendicular distance that the resulting curve can deviate from the original curve after transferring the data for the first time. **D 6963, D13**

cushion, n—for *inflatable restraints*, the inflatable fabric envelope portion of a module. **D 123, D13**

cushion, v—to use **cushioning material** to reduce shock and vibration transmitted to a packaged product from an externally applied force. **D 996, D10**

cushion, n—for *inflatable restraints*, the inflatable fabric envelope portion of a module. **D 6799, D13**

cushioned vinyl flooring, n—any vinyl sheet floor covering incorporating a foam layer as part of its construction. **F 141, F06**

cushioning material—a material used to isolate or reduce the effect of externally applied shock or vibration forces, or both. (See also **buffer, divider, molded shape**.)

creped cellulose wadding—a material consisting of cellulose fibers produced by the sulfite process, loosely matted into sheet form and then creped. It is available in single or multiple sheet form, either plain or embossed, and may be backed with various papers. It is also available impregnated with asphalt for water resistance.

filler pad—in *packaging*, a **pad** used to fill space; sometimes applied to a soft flexible pad made with various loose filling materials to provide cushioning effects. (Compare **buffer**.)

foam-in-place cushioning material, n—one formed by dispensing, usually into a box or mold, reactive chemical components that expand to envelop items packaged or occupy void areas.

macerated paper—generally, waste paper torn up mechanically for use as a **cushioning material**. **D 996, D10**

cushion overpressurization, n—for *inflatable restraints*, the process of inflating a cushion at internal pressures greater than design deployment pressures; bag burst. **D 6799, D13**

custodial records—memoranda in any form written or electronic that documents the life cycle of property. **E 2135, E53**

custody—having charge and control; to be in possession of. **E 2135, E53**

customary units—a set of industry-unique units from the cgs-emu system of units and U.S. inch-pound systems and units derived from the two systems.

NOTE—Examples of customary units used in ASTM A06 standards include:

customary units

Quantity Name	Quantity Symbol	Unit Name	Unit Symbol
Magnetic field strength	<i>H</i>	oersted	Oe
Magnetic induction (magnetic flux density)	<i>B</i>	gauss	G
Specific core loss	$P_c(\beta; f)$	watt/pound	W/lb

A 340, A06

customer video, *n*—a printer control printed wiring board that receives video data and commands from a host to transfer them to the image output terminal control. (See **C-Video**.) F 1457, F05

cut, *n*—see **fraction**. B 243, B09

cut, *n*—*in asbestos and glass yarns*, the number of 100-yd lengths of yarn per pound; an indirect yarn numbering system. D 123, D13

cut, *n*—*in wool yarns*, the number of 300-yd lengths of yarn per pound; an indirect yarn numbering system. D 123, D13

cut, *n*—*as applied to woven fabric*, a length approximately 60 yard in the greige. D 123, D13

cut, *n*—*in asbestos and glass yarns*, the number of 100-yd lengths of yarn per pound; an indirect yarn numbering system. D 4849, D13

cut, *n*—*in wool yarns*, the number of 300-yd lengths of yarn per pound; an indirect yarn numbering system. D 4849, D13

cut, *n*—*as applied to woven fabric*, a length approximately 60 yard in the greige. D 4850, D13

cutaneous sense, *n*—any of the senses whose receptors lie in the skin or immediately beneath it (or in the external mucous membranes): contact, pressure, warmth, cold, and pain. E 253, E18

cutback—solvent-thinned bitumen used in cold-process roofing adhesives, flashing cements, and roof coatings. D 1079, D08

cut-back asphalt, *n*—petroleum residuum (asphalt) which has been blended with petroleum distillates. D 8, D04

cut-back products, *n*—petroleum or tar residuums which have been blended with distillates. D 8, D04

cut file, *n*—numerically controlled fabric cutter instructions entered in blocks of ASCII characters. D 6963, D13

cut glass—glassware decorated by grinding figures or patterns on its surface by abrasive means, followed by polishing. C 162, C14

cuticle, *n*—*in mammalian hair fibers*, the layers of flattened cells enclosing the cortex, which forms an envelope of overlapping scales surrounding the fiber. D 123, D13

cuticle, *n*—*in mammalian hair fibers*, the layers of flattened cells enclosing the cortex, which forms an envelope of overlapping scales surrounding the fiber. D 4845, D13

cutinite—See **cutinite** under **maceral**. D 121, D05

cut-layers—as applied to laminated plastics, a condition of the surface of machined or ground rods and tubes and of sanded sheets in which cut edges of the surface layer or lower laminations are revealed. D 883, D20

cut lines, *n*—the outside edges of a pattern piece used as a guide for cutting out the pattern piece. (See **piece boundary**.) D 6963, D13

cut-off, *n*—*in zippers*, the measurement of a separate element from the head side to the pocket side of the legs. D 123, D13

cutoff—a detail designed to prevent lateral water movement into the insulation where the membrane terminates at the end of a day's work, or used to isolate sections of the roofing system. It is usually removed before the continuation of the work. D 1079, D08

cut-off, *n*—the measurement of a separate element from the head side to the pocket side of the legs. D 2050, D13

cutoff frequency—*of an anechoic wedge or set of wedges*, the lowest frequency above which the normal incidence sound absorption coefficient is at least 0.990. C 634, E33

cutoff height—a specified distance of a high on the surface record from a chord representing 25 ft (7.5 m) on the longitudinal scale. The chord may represent less than 25 ft (7.5 m) if it is from the lows on each side of the high. E 867, E17

cut-off level—same as **rejection level**. E 1316, E07

cut-off scar—a mark on the base of a glass bottle caused by the cutting of the gob in the Owens process. C 162, C14

6/8 cut (or 6/8 point)—a herringbone patterned surface, consisting of short parallel concave grooves rotated 10 to 30 degrees from each other, produced by a hand or pneumatic hammer fitted with a carbide-tipped chisel of closely-spaced blades. C 119, C18

cut pick—See **broken pick**. D 3990, D13

cut pile floor covering, *n*—a pile floor covering in which the pile is composed of adjacent tuft elements that are separated or cut. D 123, D13

cut pile yarn floor covering, *n*—a pile floor covering in which the pile is composed of adjacent tuft elements that are separated or cut. D 5684, D13

cut resistance, *n*—*in chainsaw testing*, the ability of a material, while in contact with the linked cutters, to resist cut through of the cutters of a moving saw chain, independent of either jamming or chain stop. F 1494, F23

cut selvage, *n*—cuts or breaks that occur in the selvage only. D 123, D13

cut selvage, *n*—cuts or breaks that occur in the selvage only. (*Syn.* broken selvage, damaged selvage) D 3990, D13

cut sizes—flat glass sheets cut to specific dimensions. C 162, C14

cut stock—a term for softwood lumber indicating the product generally has been manufactured to dimensions suitable for a fabricating operation with little further processing required. D 9, D07

cut stock—a term generally applied to bottom stock for shoes, such as soles, taps, lifts, blocks, and strips cut from sole leather. Also applies to cut-to-pattern leather. D 1517, D31

cut stone—stone fabricated to specific dimensions. C 119, C18

cut strip test, *n*—*in fabric testing*, a strip test in which the specimen is cut to the specified testing width. D 123, D13

cut strip test, *n*—*in fabric testing*, a strip test in which the specimen is cut to the specified testing width. D 4850, D13

cutting—(1) a workman engaged in grinding designs on glass.

(2) one who cuts flat glass.

(3) the tool used in cutting glass. C 162, C14

cut thread—produced by removing material from the surface with a form cutting tool. F 1789, F16

cut-through time, *n*—*for chainsaw cut resistance*, the time required for a running chainsaw to effect complete breakthrough of a protective garment or protective device. F 1494, F23

cutting—(1) scoring flat glass with a diamond or a steel wheel, and breaking it along the scratch.

(2) producing cut glass. C 162, C14

cutting down—polishing or buffing for the purpose of removing roughness or irregularities. B 374, B08

cutting edge, *n*—cutting edges are made of various geometric shapes, that is, triangular, diamond, and hexagonal. The various edges may be sharpened by the manufacturer depending on the user performance. F 1840, F04

cuttings—small-sized rock fragments produced by a rock drill. (ISRM) D 653, D18

cutting wear, *n*—*in solid impingement erosion*, the erosive wear associated with the dissipation of kinetic energy of impact arising from the tangential component of the velocity of the impacting particles. G 40, G02

cut wire blasting—blasting with short, cut lengths of metal wire. See **abrasive blasting**. B 374, B08

C-Video—customer video. F 1457, F05

CVR—contrast variation ratio is the ratio between the maximum and minimum PCS within a graphic shape:

$$CVR = \frac{PCS, \max}{PCS, \min}$$

F 149, F05

CVT—abbreviation for **constant velocity transport**. F 1457, F05

cycle—the firing period in a regenerative furnace. C 162, C14

- cycle**—*in fatigue*, one complete sequence of values of force (strain) that is repeated under constant amplitude loading (straining). The symbol N (see definition of **fatigue life**) is used to indicate the number of cycles. **E 1823, E08**
- cycle annealing, *n***—**annealing** employing a predetermined and closely controlled time-temperature cycle to produce specific properties or a specific microstructure. **A 941, A01**
- cycle length, *n***—*in braided rope*, the distance, parallel to the rope axis, of the strand to make one revolution around the rope. **D 123, D13**
- cycle ratio, *D***—the ratio of cycles endured, n , to the estimated fatigue life, N_f , obtained from the stress versus fatigue life ($S-N$) or the strain versus fatigue life ($\epsilon-N$) diagram for cycles of the same character, that is, $D = n/N_f$. **E 1823, E08**
- cycles endured, *n***—*in fatigue*, the number of cycles of specified character (that produce fluctuating force) which a specimen has endured at any time in its force history. **E 1823, E08**
- cycle time, *n***—in molding, the total time used to carry out a complete sequence of operations making up the molding cycle. **D 883, D20**
- cycle time**—the time required by an alcohol plant to complete one cycle. **E 1705, E48**
- cycle time, *n***—*in an intermittent contact test*, the interval of time from the start of one contact period to the start of the next contact period. **F 1494, F23**
- cyclically magnetized condition, *CM***—a magnetic material is in a cyclically magnetized condition when, after having been subjected to a sufficient number of identical cycles of magnetizing field, it follows identical hysteresis or flux-current loops on successive cycles which are not symmetrical with respect to the origin of the axes. **A 340, A06**
- cyclic loading**—See **fatigue loading**. **E 1823, E08**
- cyclic redundancy check, *n***—an error checking system used in data transmission. (See **CRC**.) **F 1457, F05**
- cyclohexane-995**—cyclohexane with a purity of 99.5 weight % minimum determined by analysis by gas chromatography. Refer to proposed specifications for complete requirements. **D 4790, D16**
- cyclone, *n***—a cone-shaped air-cleaning apparatus that operates by centrifugal separation and is used in particle collecting and fine grinding operations. **E 2201, E50**
- cylinder**—See **container**. **D 996, D10**
- cylinder height, *n***—*for the CFR engine*, the relative vertical position of the engine cylinder with respect to the piston at top dead center (tdc) or the top machined surface of the crankcase. **D 4175, D02**
- cylinder kraft**—See **containerboard**. **D 996, D10**
- cylinder process**—{archaic} manufacture of window glass wherein molten glass is blown and drawn into the form of a cylinder, which is subsequently split longitudinally, reheated in a flattening kiln, and flattened. **C 162, C14**
- cylinder stock, *n***—lubricant for independently lubricated engine cylinders, such as those of steam engines and air compressors. Cylinder stock are also used for lubrication of valves and other elements in the cylinder area. **D 4175, D02**
- cylinder (test)**—a cast cylindrical specimen of concrete. **C 822, C13**
- cylindrical wet-scrub extraction, *n***—a carpet cleaning method in which (1) a cleaning agent is sprayed onto the carpet, and (2) soil and cleaning agents are removed by a machine which feeds water into two counter-rotating brushes. **D 123, D13**
- cylindrical wet-scrub extraction, *n***—a carpet cleaning method in which (1) a cleaning agent is sprayed onto the carpet, and (2) soil and cleaning agents are removed by a machine which feeds water into two counter-rotating brushes. **D 5253, D13**

D

- d-10**—the diameter of a soil particle (preferably in millimetres) at which 10 % by weight (dry) of the particles of a particular sample are finer. Synonymous with the effective size or effective grain size. **D 653, D18**
- d-60**—the diameter of a soil particle (preferably in millimetres) at which 60 % by weight (dry) of the particles of a particular sample are finer. **D 653, D18**
- DAC (distance amplitude correction) (swept gain, time corrected gain, time variable gain, and so forth)**—electronic change of amplification to provide equal amplitude from equal reflectors at different depths. **E 1316, E07**
- daisy wheel element**—an element used in an impact printing device in which the fully formed characters are contained on the ends of finger-like projections radiating out from the center of a disk, the device resembling a daisy. **F 909, F05**
- daisy wheel printer**—an impact printing device utilizing a daisy wheel element. The paper on the carriage remains stationary while the element is positioned and caused to strike the paper to produce the characters in their proper positions. **F 909, F05**
- Dalton**—an arbitrary unit of molecular weight, one twelfth the mass of the nuclide of carbon 12. **D 6161, D19**
- dam, n**—a solid material (such as silicone rubber, steel, or aluminum), used in processing composites, to contain the matrix material within defined boundaries or to prevent crowning of a processing bag. **D 3878, D30**
- damage, n**—*in structures and structural mechanics*, a structural anomaly in material or structure created by manufacturing or service usage. **D 3878, D30**
- damage, n**—*in cavitation or impingement*, any effect on a solid body resulting from its exposure to these phenomena. This may include loss of material, surface deformation, or any other changes in microstructure, properties, or appearance. **G 40, G02**
- damaged feathers, n**—feathers that have been broken, damaged by insects, by mildew or rot, or otherwise materially injured. **D 123, D13**
- damaged feathers, n**—feathers that have been broken, damaged by insects, by mildew or rot, or otherwise materially injured. **D 7022, D13**
- damaged selvage**—See **cut selvage**. **D 3990, D13**
- damage resistance, n**—*in structures and structural mechanics*, a measure of the relationship between the force, energy, or other parameter(s) associated with an event or sequence of events and the resulting damage size and type. **D 3878, D30**
- damage tolerance, n**—1) *in structures and structure materials*, a measure of the relationship between damage size and type and the level of a performance parameter, such as stiffness or strength, at which the structure or structural material can operate for a particular loading condition; 2) *in structural systems*, a measure of the ability of such systems to function at designated performance parameters (for example, magnitude, length of time, and type of loading(s)) without system failure in the presence of a particular or specified level of damage. **D 3878, D30**
- damp**—to cause a loss or dissipation of the oscillatory or vibrational energy of an electrical or mechanical system. **C 634, E33**
- damp, adj**—moist but not visibly wet. **D 4538, D33**
- damping**—reduction in the amplitude of vibration of a body or system due to dissipation of energy internally or by radiation. (ISRM) **D 653, D18**
- damping, n**—that property of a material or system that causes it to convert mechanical energy to heat when subjected to deflection; in rubber, the property is caused by hysteresis; in some types of systems, it is caused by friction or viscous behavior. **D 1566, D11**
- damping, adj**—*as a modifier of dynamic force*, descriptive of that component of complex force leading dynamic deflection by 90°, and that is responsible for the conversion of mechanical energy to heat; denoted by the double prime (") as a superscript symbol, as F". **D 1566, D11**
- damping**—the loss in energy, dissipated as heat, that results when a material or material system is subjected to an oscillatory load or displacement. **D 4092, D20**
- damping**—loss in energy, dissipated as heat, that results when a material or material system is subjected to an oscillatory load or displacement, (D 4092, D20). **E 1142, E37**
- damping ratio**—for a system with viscous damping, the ratio of actual damping coefficient to the critical damping coefficient. **D 653, D18**
- damping ratio, μ** —the ratio of actual damping to critical damping. **D 4092, D20**
- damping, search unit**—limiting the duration of a signal from a search unit subject to a pulsed input by electrically or mechanically decreasing the amplitude of successive cycles. **E 1316, E07**
- dampproofing**—treatment of a surface or structure to resist the passage of water in the absence of hydrostatic pressure. **D 1079, D08**
- D.A.N., n**—Divers Alert Network. **F 1549, F32**
- dangerously flammable textile, n**—not defined. This term is implied in the Standard For The Flammability Of Clothing Textiles (16 CFR Part 1610) under the Flammable Fabrics Act (15 USC 1191 et seq.) from which a meaning can be inferred. (See also **flammable textile**.) **D 123, D13**
- dangerously flammable textile, n**—not defined. This term is implied in the Standard for the Flammability of Clothing Textiles (16 CFR Part 1610) under the Flammable Fabrics Act (15 USC 1191, et seq.) from which a meaning can be inferred. (See also **flammable textile**.) **D 4391, D13**
- Danner process**—a mechanical process for continuously drawing glass cane or tubing from a rotating mandrel. **C 162, C14**
- DAPI staining**—staining of DNA in particular by using DAPI fluorochrome stain (Serva 18860). **E 1705, E48**
- dark adaptation**—the adjustment of the eyes when one passes from a bright to a darkened place. **E 1316, E07**
- dark adaptation**—conditioning of photoelectrostatic copying papers in the absence of light to permit the recovery of photoconductive properties. **F 335, F05**
- dark decay**—loss of apparent surface voltage in the absence of light. **F 335, F05**
- dark decay rate**—the rate of loss of apparent surface voltage per unit time in the absence of light. **F 335, F05**
- darkfield illumination**—the illumination of an object such that it appears illuminated with the surrounding field dark. This results from illuminating the object with rays of sufficient obliquity so that none can enter the objective directly. As applied to electron microscopy, the image is formed using only electrons scattered by the object. **E 7, E04**
- dark (or Townsend) discharge**—a discharge which may or may not be self-sustaining. It is characterized by a uniform field, current in the microampere range, and a nonluminous inter-electrode space. **B 542, B02**
- darts, n**—See **comet**. **D 6488, D01**
- dashpot**—a hydraulic cylinder device with a controlled leak designed to eliminate impact loading of mechanisms. Hardness testers may employ a dashpot to bring an indenter into contact with a specimen without impact or other disturbance. **E 7, E04**
- data, n**—a quantitative or qualitative representation that is observed, measured, collected, or gathered that characterizes some static or dynamic attribute of the physical world or the use of it by individuals or groups of people and that is suitable for communication, interpretation, or processing by humans or machines. **E 867, E17**
- database, n**—a collection of related data typically organized in a computerized record keeping system that is part of a system whose purpose is to maintain the data and information derived from it so it can be made available for use. **E 867, E17**
- database management system (DBMS), n**—a set of programs that

manipulate and maintain a database while providing independence from an application. **E 867, E17**

data collection objective—a statement explaining the reasons that certain data is needed, the questions it is expected to answer, and the decisions that will be made on the basis of the data, that is used in developing sampling and analytical plans. **E 1605, E06**

data collection system metadata, *n*—data about the conditions and procedures under which original source data were observed, surveyed, measured, gathered, or collected, as well as about the equipment that was used. **E 867, E17**

data dictionary, *n*—an information construct that describes the particular data stored in a database typically in terms of a common set of attributes that include the meaning, concept, and use; see IEEE 1489. **E 867, E17**

data element, *n*—a data item that is a basic building block of a data dictionary that is a formal representation of some single unit of information of interest with a singular instance value at any point in time about some entity of interest. **E 867, E17**

data element, *n*—a single, atomic piece of data that cannot be subdivided and still retain any meaning. **F 1294, F05**

data identifier, DI, *n*—a specified character, or string of characters, that define the intended use of the data elements that follow. **F 1294, F05**

data logging, *v*—to capture a stream of near-real-time data as it passes through a transportation management center. **E 867, E17**

data mart, *n*—a National ITS Architecture market package in which an archiving system collects and archives operational data from one organizational source; it is analogous to a library whose collection is acquired from a single publisher. **E 867, E17**

data monitor, *n*—a mode of printer operation in which the information transmitted to the printer is printed in hexadecimal numbers. **F 1457, F05**

data products interface, *n*—a parallel interface standard that is used to connect elements of a communications system. **F 1457, F05**

data quality, *n*—the fitness of data for all purposes that require it. Examples of data quality measures include accuracy, completeness, coverage, and timeliness. **E 867, E17**

data quality objective (DQO)—qualitative and quantitative statements of the overall level of uncertainty that a decision-maker is willing to accept in results or decisions derived from environmental measurements, includes uncertainties in sampling location, sample handling, and sample analysis. **D 5681, D34**

data quality objective process, *n*—a quality management tool based on the scientific method and developed by the U.S. Environmental Protection Agency to facilitate the planning of environmental data collection activities. **D 5681, D34**

data quality objectives (DQOs), *n*—qualitative and quantitative statements derived from the DQO process describing the decision rules and the uncertainties of the decision(s) within the context of the problem(s). **D 5681, D34**

data quality objectives process, *n*—a quality management tool based on the scientific method and developed by the U.S. Environmental Protection Agency (EPA) to facilitate the planning of environmental data collection activities. The DQO process enables planners to focus their planning efforts by specifying the use of the data (the decision), decision criteria (decision point), and decision maker's acceptable decision error rates. The products of the DQO process are the DQOs. **D 5681, D34**

data quality objectives process, *n*—a quality management tool based on the Scientific Method and developed by the U.S. Environmental Protection Agency to facilitate the planning of environmental data collection activities. The DQO process enables planners to focus their planning efforts by specifying the use of the data (the decision), decision criteria (action level), and decision maker's acceptable decision error rates. The products of the DQO process are the DQOs. **D 5681, D34**

data set, *n*—data communications equipment for transmitting coded data over phone lines. **F 1457, F05**

data sources, *n*—the systems that provide data. **E 867, E17**

data stream compatibility, *n*—the extent to which an electronic signal agrees with the signal requirements of a system. (See DSC.) **F 1457, F05**

data terminal equipment, *n*—any piece of equipment at which a communications path ends or begins, a terminal or a printer. (See DTE.) **F 1457, F05**

data terminal ready, *n*—an electronic signal from the printer to the host that the printer is ready to be used. (See DTR.) **F 1457, F05**

data traceability, *n*—the ability to verify data by having access to, and documentation of, all prior information used to generate it and needed for its interpretation. **D 1129, D19**

data warehouse, *n*—a National ITS Architecture market package in which physically distributed data sources (1) contribute to a central clearinghouse, where each data source is locally managed and (2) exchange multiple transportation-related data; it is analogous to a library whose collection is acquired from multiple publishers. **E 867, E17**

dating nail—galvanized, regular-stock-steel, copper or brass, 1½ by ¼ to 2½ by ⅜ in. nails with ⅜ to ½ in. flat numeral head and medium diamond point. **F 547, F16**

Daubert v. Merrell Dow Pharmaceuticals, Inc., *n*—although not a PDD case, the Daubert case set aside the landmark Frye rule's "general acceptability" provisions in favor of the Federal Rules of Evidence. This paved the way for the admissibility of PDD evidence in most jurisdictions. See: Daubert v. Merrell Dow Pharmaceuticals, Inc. (1992), 509 U. S. 579, 125 1. Ed 2d 469; United States v. Frye 54 App D.C. 46, 293 F 1013. **E 2035, E52**

daylight, *n*—as used in weathering, the term equivalent to "sunlight". It refers to the full spectrum of solar irradiance, that is, ultraviolet through infrared, and includes both diffuse sky and direct solar irradiance. **G 113, G03**

daylight illuminant, *n*—illuminant having the same, or nearly the same, relative spectral power distribution as a phase of daylight. **E 284, E12**

daylight 0.785 rad, 0 rad (45°, 0°) luminous directional reflectance, *n*—daylight 0.785 rad, 0 rad (45°, 0°) luminous directional reflectance (for brevity called reflectance) is the ratio of the luminous flux from a specimen illuminated at an angle of 0.785 rad (45°) by CIE Standard Source C (average daylight) and viewed perpendicularly by the CIE Standard Observer, to the luminous flux from the standard magnesium oxide layer, similarly illuminated and viewed. **D 2946, C17**

day tank—a periodic melting unit, which supplies glass for small volume applications. **C 162, C14**

dB_{AE}—a logarithmic measure of acoustic emission signal amplitude, referenced to 1 µV at the sensor, before amplification.

$$\text{Signal peak amplitude (dB}_{AE}) = (dB_{1\mu V \text{ at sensor}}) = 20 \log_{10}(A_1/A_0)$$

where:

A_0 = 1 µV at the sensor (before amplification), and

A_1 = peak voltage of the measured acoustic emission signal (also before amplification).

Acoustic Emission Reference Scale:

dB _{AE} Value	Voltage at Sensor
0	1 µV
20	10 µV
40	100 µV
60	1 mV
80	10 mV
100	100 mV

E 1316, E07

dB control—a control that adjusts the amplitude of the display signal in dB units. **E 1316, E07**

DBP—disinfection by-products (a rule as part of the SDWA). **D 6161, D19**

dc—symbol used to designate an electric voltage or current whose

amplitude does not vary periodically with respect to time, as for example the output of a chemical cell or that of a thermocouple. The term is also applied to the output of such devices as dynamos and rectifiers, whose amplitude is not strictly time-invariant.

D 2864, D27

DC1/DC3, n—a control sequence used with asynchronous transmission that enables the printer to signal the host to start and to stop transmitting data.

F 1457, F05

DCOF—dynamic coefficient of friction.

F 141, F06

DCOF—dynamic coefficient of friction

F 1646, F13

D-cracking, n—*in concrete*, a series of cracks near to and roughly parallel to features such as joints, edges, and structural cracks.

C 125, C09

DCS, n—decompression sickness, a medical condition with a variety of symptoms that may result from gas or bubbles in the tissues of divers after pressure reduction.

F 1549, F32

3-D data set—a three-dimensional data set with a topographical z-data value for each (x, y) pixel location within the interferometer's field of view.

E 2444, E08

2-D data trace—a two-dimensional data trace that is extracted from a topographical 3-D data set and that is parallel to the xz- or yz-plane of the interferometer.

E 2444, E08

deactivation, n—the process of placing a facility in a safe and stable condition to minimize the long-term cost of a surveillance and maintenance program and to protect the workers, the public, and the environment.

E 833, E06

deactivation—the process of prior removal of the active corrosive constituents, usually oxygen, from a corrosive liquid by controlled corrosion of expendable metal or by other chemical means, thereby making the liquid less corrosive.

G 15, G01

dead anneal—jargon for a state of negligible residual stress.

C 162, C14

dead-burned, adj—the state of a basic refractory material resulting from a heat treatment that yields a product resistant to atmospheric hydration or recombination with carbon dioxide.

C 71, C08

dead burned dolomite—dolomitic limestone that has been heated with or without additives to a temperature sufficiently high and for a long enough time to decompose the carbonate structure so as to form calcium oxide and periclase in a matrix that provides resistance to subsequent hydration and recombination with carbon dioxide.

C 51, C07

dead-burned magnesite, n—see **magnesite, dead-burned**.

C 71, C08

dead-burned refractory dolomite, n—see **dolomite, dead-burned refractory**.

C 71, C08

dead cotton, n—a small nep of cotton fibers which is gathered on the surface of the fabric and which is different in color from the surrounding fabric

D 123, D13

dead cotton, n—a small nep of cotton fibers which is gathered on the surface of the fabric and which is different in color from the surrounding fabric.

D 3990, D13

dead end filtration—a process in which water is forced through a media which captures the retained particles on and within it, where the process involves one influent and one effluent stream.

D 6161, D19

dead end flow—flow through a membrane module in which the only outlet for the upstream fluid is through the membrane.

D 6161, D19

dead leg—any inactive, trapped or stagnant zone of a biological fluid that is to be sampled aseptically where this liquid zone would not be representative of the bulk fluid that is to be sampled. This "dead leg" zone could deviate from the bulk system in oxygen content, nutrients levels, material composition, temperature, bacterial contamination, and other process variables that would prevent any sample drawn through this system from representing the bulk fluid quality to be tested.

E 1705, E48

dead level—absolutely horizontal, or zero slope (see also **slope**).

D 1079, D08

dead level asphalt—a roofing asphalt conforming to the requirements of Specification D 312, Type I.

D 1079, D08

dead level roofing—a roofing system applied on a surface with a 0 to 2 % incline.

D 1079, D08

deadload—the load imposed on pipe, that is determined by depth and width of the trench at top of pipe, as well as unit weight and character of backfill material.

C 896, C04

dead load—See **load**.

D 996, D10

deadload—the static load imposed on the top of the pipe.

F 412, F17

dead plate—*in automatic production of molded glass*, a stationary plate receiving a glass article awaiting transfer.

C 162, C14

dead time—any interval during data acquisition when the instrument or system is unable to accept new data for any reason.

(E 750)

E 1316, E07

dead-weight loading—a method of loading in which a weight is supported solely by the specimen and has no other mechanical connection to the testing machine. In hardness testing, the weight is supported by the indenter.

E 7, E04

dead zone—the distance in the material from the surface of the test object to the depth at which a reflector can first be resolved under specified conditions. It is determined by the characteristics of the search unit, the ultrasonic test instrumentation, and the test object.

E 1316, E07

deaeration—*in environmentally affected fatigue testing*, the process of removal of air from the liquid environment before and during a test.

E 1823, E08

deaerator—a device to remove air from water.

D 6161, D19

deagglomeration—the process of breaking down, usually by physical means, the masses of particles that are held together by relatively weak cohesive forces resulting in a final system of aggregates or primary particles, or both.

C 242, C21

deairing—the process of removing entrapped air, or absorbed air from a mass or slurry, usually by application of a vacuum.

C 242, C21

deairing, n—the process of removing entrapped air or absorbed air from a mass or slurry, usually by application of a vacuum.

C 1145, C28

dealloying—See **parting**.

G 15, G01

debinding, n—see **binder removal**.

B 243, B09

debiteuse—a slotted, floating clay block through which glass issues in the Fourcault process.

C 162, C14

debond—a deliberate separation of a bonded joint or interface, usually for repair or rework purposes.

D 3878, D30

debossment—the depth of a print impression into the surface of a document.

F 149, F05

debris, n—*in internal combustion engines*, solid contaminant materials unintentionally introduced into the engine or resulting from wear.

D 4175, D02

debris—as applied to geologic debris flows, a mixture of loose, poorly-sorted rock fragments or soil material, or both, potentially ranging from clay to boulder-size particles that may include fragmental organic matter and other exotic detritus.

D 4410, D19

debris, n—*in tribology*, particles that have become detached in a wear or erosion process.

G 40, G02

debris flow—a sudden and destructive form of landslide, in which loose materials on a slope, with at least half of the particles being larger than sand, are mobilized by saturation and flow downwards.

D 7099, D18

debulk, v—to decrease voids between lamina before laminate consolidation through use of vacuum or by mechanical means.

D 3878, D30

debulking—the application of a temporary vacuum bag, bleeder, vacuum, or pressure, with or without heat, to remove trapped air and possibly some resin, in order to compact a composite lay-up. (Syn. **pre-bleeding, compacting**.)

E 631, E06

debulking—the application of a temporary vacuum bag, bleeder, vacuum, or pressure, with or without heat, to remove trapped air

- and possibly some resin, in order to compact a composite lay-up. (Syn. **pre-bleeding, compacting**.) E 1749, E06
- deburring**—the removal of burrs, sharp edges, or fins by mechanical, chemical, or electrochemical means. B 374, B08
- debutanization**, *n*—of *crude petroleum*, the removal of the light hydrocarbons up to and including *n*-butane, and retention of the heavier hydrocarbons. D 4175, D02
- Debye ring**—a continuous circle, concentric about the undeviated beam, produced by monochromatic X-ray diffraction from a randomly oriented crystalline powder. An analogous effect is obtained with electron diffraction. E 7, E04
- Debye-Scherrer method**—a method of X-ray diffraction employing monochromatic radiation and a polycrystalline specimen mounted on the axis of a cylindrical strip of film. (See **powder method**.) E 7, E04
- decarbonator**—a device to remove carbon dioxide from water. D 6161, D19
- decarburization**, *n*—the loss of carbon from the surface of a steel object as a result of its being heated in a medium that reacts with the carbon. A 941, A01
- decarburization**—loss of carbon from the surface layer of a carbon containing alloy due to reaction with one or more chemical substances in a medium that contacts the surface. B 374, B08
- decarburization**—loss of carbon from the surface of a carbon containing alloy due to a reaction with one or more chemical substances in a medium that contacts the surface. Decarburization may be either (1) *partial*, that is, where carbon content is less than the unaffected interior but greater than the room temperature solubility limit of carbon in ferrite or (2) *complete*, that is, where carbon content is less than the solubility limit of carbon in ferrite so that only ferrite is present. E 7, E04
- decarburization**—loss of carbon from the surface layer of the fastener, normally associated with heat treatment. F 1789, F16
- decarburized enameling steel**—a special type of steel sheet of extremely low carbon content, suitable for porcelain enamel cover coat application direct to the metal (Type I of Specification A 424). C 286, B08
- decarburized steel*—see **decarburized enameling steel**. C 286, B08
- decating mark**, *n*—a crease mark or impression extending across the cloth near the beginning or end of a piece due to the thickness of the fabric leader seam. D 123, D13
- decating mark**, *n*—a crease mark or impression extending across the cloth near the beginning or end of a piece due to the thickness of the fabric leader seam. (Syn. apron mark, leader mark) D 3990, D13
- decay**—decomposition of wood substance caused by action of wood-destroying fungi, resulting in softening, loss of strength and weight, and often in change of texture and color.
- advanced (or typical) decay*—the older stage of decay in which the destruction is readily recognized because the wood has become punky, soft and spongy, stringy, ring-shaked, pitted, or crumbly. Decided discoloration or bleaching of the rotted wood is often apparent.
- incipient decay*—the early stage of decay that has not proceeded far enough to soften or otherwise perceptibly impair the hardness of the wood. It may be accompanied by a slight discoloration or bleaching of the wood.
- pocket rot*—advanced decay that appears in the form of a hole, pocket, or area of soft rot usually surrounded by apparently sound wood. D 9, D07
- decay constant**, λ —of a radioactive nuclide in a particular energy state, the quotient of dP by dt , where dP is the probability of a given nucleus undergoing a spontaneous nuclear transition from that energy state in the time interval dt (ICRU).
- $$\lambda = dP/dt$$
- Unit: s^{-1} E 170, E10
- decay rate**, d ; $[T^{-1}]$; dB/s—*for airborne sound*, the rate of decrease of sound pressure level after the source of sound has stopped; *for vibration*, the rate of decrease of vibratory acceleration, velocity, or displacement level after the excitation has stopped. C 634, E33
- decay time**—the interval of time required for a pulse to decay from its maximum value to some specified fraction of that value. (ISRM) D 653, D18
- deceleration period**, *n*—*in cavitation or liquid impingement erosion*, the stage following the acceleration period or the maximum rate period (if any) during which the erosion rate has an overall decreasing trend although fluctuations may be superimposed on it. (See also **erosion rate-time pattern**.) G 40, G02
- deception indicated (DI)**, *n*—deception indicated is a conventional term for a PDD outcome. A decision of DI means that the physiological data are stable and interpretable and that the evaluation criteria used by the examiner concluded that the examinee was not being completely truthful to the relevant issue. Deception indicated corresponds to the term “Significant Physiological Responses,” or SPR. E 2035, E52
- deception test**, *n*—a family of PDD examinations where direct questions are posed to the examinee during physiological recording regarding the examinee’s involvement in what is covered in the relevant question. Unlike recognition tests, both truthful and deceptive examinees are aware of which questions are relevant, and direct participation, not just recognition, is tested. Deception tests include PDD comparison question tests and PDD Relevant/Irrelevant tests. E 2035, E52
- decibel**, dB—the term used to identify ten times the common logarithm of the ratio of two like quantities proportional to power or energy. (See **level, sound transmission loss**.) Thus, one decibel corresponds to a power ratio of $10^{0.1}$ and n decibels corresponds to a power ratio of $(10^{0.1})^n$. C 634, E33
- decibel (dB)**—twenty times the base ten logarithm of the ratio of two ultrasonic signal amplitudes, $dB = 20 \log_{10}(\text{amplitude ratio})$. E 1316, E07
- decision analysis**—a technique for making economic decisions in an uncertain environment that allows a decision maker to include alternative outcomes, risk attitudes, or subjective impressions about uncertain events in an evaluation of investments. E 631, E06
- decision analysis**, *n*—a technique for making economic decisions in an uncertain environment that allows a decision maker to include alternative outcomes, risk attitudes, or subjective impressions about uncertain events in an evaluation of investments. E 833, E06
- decision error**
- false negative error*, *n*—this occurs when environmental data mislead decision maker(s) into not taking action specified by a decision rule when action should be taken.
- false positive error*, *n*—this occurs when environmental data mislead decision maker(s) into taking action specified by a decision rule when action should not be taken. D 5681, D34
- decision point**, *n*—the numerical value that causes the decision-maker to choose one of the alternative actions point (for example, compliance or noncompliance). D 5681, D34
- decision point**, *n*—the numerical value which causes the decision maker to choose one of the alternative actions (for example, conclusion of compliance or noncompliance). D 5681, D34
- decision rule**, *n*—a set of directions in the form of a conditional statement that specify the following: (1) how the sample data will be compared to the decision point, (2) which decision will be made as a result of that comparison, and (3) what subsequent action will be taken based on the decisions. D 5681, D34
- decision rule**, *n*—a set of directions in the form of conditional statements that specifies: (1) how the sample data will be compared to the decision point or action level, (2) which decision will be made as a result of that comparison, and (3) what subsequent action will be taken based on the decisions. D 5681, D34
- deck**—the horizontal structural substrate supporting the plaza deck system. See also **structural slab**. C 717, C24
- deck**—the structural surface to which the roofing or waterproofing system (including insulation) is applied. D 1079, D08

deck, *n*—in upholstered furniture, the upholstered support under the seat cushion in a loose-seat construction. E 176, E05

decking—the multiple layer loading of ware for firing. C 286, B08

deck oven—equipment where the cavity is generally wider than it is tall, and the bottom of the cavity is called the deck. See oven.

F 1827, F26

decoder, *n*—as part of the two-dimensional symbol and linear bar code reading systems, the electronic package that receives the signals from the scanner, executes the algorithm to interpret the signals into meaningful data, and acts as the interface to other devices.

F 1294, F05

decolorizing—the process of producing a colorless appearance in glass.

C 162, C14

decommissioning, *n*—takes place after deactivation, and includes surveillance and maintenance, decontamination, dismantlement, surveillance and long-term monitoring, or any combination thereof.

E 833, E06

decommissioning (closure)—the engineered closure of a well, borehole, or other subsurface monitoring device sealed with plugging materials. Decommissioning also includes the planning and documenting of all associated activities. A synonym is abandonment.

D 653, D18

decomposers—microorganisms, predominantly bacteria and fungi, that convert complex organic matter into simpler organic and inorganic molecules.

F 1600, F20

decomposition—for peats and organic soils, see humification.

D 653, D18

decomposition potential—the minimum potential, exclusive of IR drop, at which an electrochemical process can take place at an appreciable rate.

B 374, B08

decompression, *n*—the technique used to allow the controlled removal of excess inert gas from the body during and after a dive to prevent decompression sickness (DCS).

F 1549, F32

deconstruction, *n*—disassembly of buildings for the purpose of recovering materials.

E 2114, E06

decontamination—the process of removing undesirable physical or chemical constituents, or both, from equipment to reduce the potential for cross-contamination.

The process of removing or reducing to a known level undesirable physical or chemical constituents, or both, from a sampling apparatus to maximize the representativeness of physical or chemical analysis proposed for a given sample.

D 653, D18

decontamination, *n*—the removal of hazardous or radioactive material, or both, from facilities, soils, or equipment to preclude the occurrence of foreseeable adverse health effects.

E 833, E06

decontamination, *n*—the removal of a contaminant or contaminants from the surface or matrix, or both, of CPC to the extent necessary for its next intended action (for example, reuse and disposal).

F 1494, F23

deconvolution—AES, XPS, a mathematical procedure to (1) remove the contribution to a peak of one of the factors contributing to its line width, for example, X-ray linewidth, analyzer broadening; or (2) remove the energy loss background by deconvoluting the spectrum with an electron energy loss spectrum.

E 673, E42

deconvolution—a procedure by which line-of-sight measurements of drop size distribution and optical extinction are converted into local representations of the distribution and number density.

E 1620, E29

decorated—adorned, embellished, or made more attractive by means of color or surface detail.

C 242, C21

decorating fire—See decorating fire under firing.

C 242, C21

decoration:

inglaze decoration—a ceramic decoration applied on the surface of an unfired glaze and matured with the glaze.

overglaze decoration—a ceramic or metallic decoration applied and fired on the previously glazed surface of ceramic ware.

polychrome decoration—a multicolor decoration.

underglaze decoration—a ceramic decoration applied directly on the surface of ceramic ware and subsequently covered with a transparent glaze.

C 242, C21

decortivating, *n*—in flax, the process of mechanically separating fiber bundles from straw.

D 123, D13

decortivating, *v*—in flax, the process of mechanically separating fiber bundles from straw.

D 6798, D13

decoupling—the ratio of the radius of the blasthole to the radius of the charge. In general, a reducing of the strain wave amplitude by increasing the spacing between charge and blasthole wall. (ISRM)

D 653, D18

de-enameling—the removal of porcelain enamel from the base metal.

C 286, B08

deep buff—the first cut or split underneath the top grain or machine buff on which no traces of the grain remain.

D 1517, D31

deep emission function decay length—the asymptotic emission function decay length for increasing depths from the surface.

E 673, E42

deep etching—macroetching; etching preliminary to macro-examination, intended to develop gross features such as segregation, grain flow, cracks or porosity.

E 7, E04

deep mine injection, *n*—placement of materials such as ash and flue gas cleaning material into underground depleted mine cavities through boreholes, either pneumatically or hydraulically.

E 2201, E50

deep wood failure, *n*—failure that is invariably several to many cells away from the adhesive layer, in which the fracture path is strongly influenced by the grain angle and the growth-ring structure.

D 907, D14

deerskin—a deerskin tanned and finished with the grain surface intact.

D 1517, D31

defect, *n*—an imperfection of sufficient magnitude to warrant rejection based on the specified requirements.

A 941, A01

defect, *n*—of a manufactured carbon or graphite product, any irregularity in the chemistry, microstructure, or macrostructure.

C 709, D02

defect—any irregularity or imperfection in a tree, log, piece, product, or lumber that reduces the volume of sound wood or lowers its durability, strength, or utility value.

D 9, D07

defect, *n*—specific for inflatable restraints, an imperfection in a cut piece of fabric that judgment and experience indicate is likely to result in either the hazardous or improper deployment of the inflatable restraint module in which the imperfection is incorporated.

D 123, D13

defect, *n*—a departure of a quality characteristic from its intended level, or state, that occurs with a severity sufficient to cause an associated product or service not to satisfy intended normal, or reasonably foreseeable, usage requirements.

D 1711, D09

defect, *n*—of a manufactured carbon or graphite product, any irregularity in the chemistry, microstructure, or macrostructure.

D 4175, D02

defect, *n*—in inspection and grading, the departure or non-conformance of some characteristic from its intended level or state.

D 4850, D13

defect, *n*—specific for inflatable restraints, an imperfection in a cut piece of fabric that judgment and experience indicate is likely to result in either hazardous or improper deployment of the inflatable restraint module in which the imperfection is incorporated.

D 6799, D13

defect, *n*—one or more flaws whose aggregate size, shape, orientation, location, or properties do not meet specified acceptance criteria and are rejectable.

E 1316, E07

defect—condition in which a functional segment, a sample item, or sample item element of a property control system contains one or more deficiencies.

E 2135, E53

defect—departure of a quality characteristic from its intended level or state (or the sum of departures of different quality characteristics) that occurs with a severity sufficient to cause a fastener not to

- satisfy intended normal, or reasonably foreseeable, usage requirements. The term *defect* is appropriate for use when a quality characteristic is evaluated in terms of its usage. **F 1789, F16**
- defect, in inspection and grading, *n***—the departure or nonconformance of some characteristic from its intended level or state. **D 123, D13**
- defective, *adj***—having flaws or dimensional deviations greater than acceptable for the intended use. **C 709, D02**
- defective, *adj***—having flaws or dimensional deviations greater than acceptable for the intended use. **D 4175, D02**
- defective pain surface**—pain that is cracking, flaking, chipping, or peeling from a building component (for example, window sill, door, or door frame). **E 631, E06**
- defective unit**—a unit that fails to conform to one or more of the visual, dimensional, or tactile requirements. **D 1517, D31**
- defect resolution**—a property of a test system that enables the separation of indications due to defects in a test specimen that are located in close proximity to each other. **E 1316, E07**
- deficiency**—departure from, or noncompliance with, specified accreditation criteria. **E 1187, E36**
- define (X-rays)**—limit a beam of X-rays by passage through apertures in order to obtain a parallel, divergent, or convergent beam. **E 7, E04**
- defining fixed point, *n***—thermometric fixed point of an idealized system, to which a numerical value has been assigned, used in defining a temperature scale. **E 344, E20**
- definition**—the clarity or sharpness of a microscopical image. **E 7, E04**
- definition, *n***—statement that describes a concept and permits its differentiation from other concepts within a system of concepts. **E 1992, E02**
- definition, image definition**—the sharpness of delineation of image details in a radiograph. Generally used qualitatively. **E 1316, E07**
- definitive care**—a level of therapeutic intervention capable of providing comprehensive health care services for a specific condition. **F 1177, F30**
- deflagration**—an explosion in which the flame or reaction front propagates at a speed well below the speed of sound in the unburned medium, such that the pressure is virtually uniform throughout the enclosure (shredder) at any time during the explosion. **D 5681, D34**
- deflagration index, (K_{St}), *n***—maximum dP/dt normalized to a 1.0 m³ volume. It is measured at the optimum dust concentration. K_{St} is defined according to the following cubic relationship:
- $$K_{St} = (dP/dt)_{max} V^{1/3}$$
- where:
- P = pressure, (bar)
 t = time, (s)
 V = volume, (m³)
 K_{St} = (bar m/s)
- E 1445, E27**
- deflection**—the deviation of a structural element from its original shape or plane due to physical loading, temperature changes or rotation of its supports. **C 717, C24**
- deflection**—deformation or displacement from the original contour or shape. **C 904, C03**
- deflection, *n***—the linear distance that a test specimen bends at the center from no load to stated load, when loaded as a beam with the load applied at the center of the span. **C 1154, C17**
- deflection**—linear distance that a test specimen bends at the center from no load to stated load when loaded as a beam. **D 2946, C17**
- deflection temperature**—the temperature at which a specimen will deflect a given distance at a given load under prescribed conditions of test. (See Test Method D 648.) Formerly called heat distortion. **F 412, F17**
- deflectometer, *n***—a specialized extensometer used for sensing of extension or motion, usually without reference to a specific gage length. **E 6, E28**
- deflector atomizer**—an atomizer in which a liquid jet spreads out over a solid surface, forming a spray whose shape depends upon the solid surface. **E 1620, E29**
- deflocculate**—to separate agglomerates in a slurry by chemical and physical means to achieve and maintain particle-to-particle separation. **C 242, C21**
- deflocculating**—the thinning of the consistency of a slip by adding a suitable electrolyte. **C 286, B08**
- deflocculating agent (deflocculant) (dispersing agent)**—an agent that prevents fine soil particles in suspension from coalescing to form flocs. **D 653, D18**
- defoaming agent**—a material that eliminates or suppresses foam in the spray tank. **E 1519, E35**
- defoliant**—a chemical that causes the foliage to drop from plants. **E 609, E35**
- deformability**—*in grouting*, a measure of the elasticity of the grout to distort in the interstitial spaces as the sediments move. **D 653, D18**
- deformability**—the ability of a material to change its shape or size under the influence of an external or internal agency. **D 7099, D18**
- deformation, *n***—a change in shape of a material caused by forces of compression, shear, tension, or torsion. **D 123, D13**
- deformation**—change in shape or size. **D 653, D18**
- deformation**—a change in the shape or size of a solid body. (ISRM) **D 653, D18**
- deformation, *n***—a change in shape of a material caused by forces of compression, shear, tension, or torsion. **D 4848, D13**
- deformation bands**—bands produced within individual grains during cold working which differ variably in orientation from the matrix. **E 7, E04**
- deformation eutectic*—See **eutectic, deformation**. **C 242, C21**
- deformation lines**—thin bands or lines produced in grains of some metals, particularly those of face-centered cubic structure, by cold working; they are not removed by repolishing and re-etching. **E 7, E04**
- deformation, permanent, *n***—the net long-term change in a dimension of a specimen after deformation and relaxation under specified conditions. (Syn. **permanent set, nonrecoverable deformation, and nonrecoverable stretch**.) **D 4848, D13**
- deformation point**—See **dilatometric softening point**. **C 162, C14**
- deformation resolution (deformation sensitivity), R_d (L)**—ratio of the smallest subdivision of the indicating scale of a deformation-measuring device to the sensitivity of the device. **D 653, D18**
- deformation wear, *n***—*in solid impingement erosion*, the erosive wear of a material associated with the dissipation of kinetic energy of impact arising from the normal component of the velocity of the impacting particles. It is therefore the sole component of wear for particles impacting at a 90° angle of attack. **G 40, G02**
- deformed*—See **mechanically deformed**. **F 547, F16**
- degas, *v***—the process of removing gases from a liquid. **G 126, G04**
- degasification**—the process of removing dissolved gasses from water. **D 6161, D19**
- degassing**—removal of gases. **D 2652, D28**
- degradable, *adj***—*in erosion control*, decomposes under biological, chemical processes, or ultraviolet stresses associated with typical application environments. **D 653, D18**
- degradable plastic, *n***—a plastic designed to undergo a significant change in its chemical structure under specific environmental conditions resulting in a loss of some properties that may vary as measured by standard test methods appropriate to the plastic and the application in a period of time that determines its classification. **D 883, D20**
- degradation**—a deleterious change in the physical or chemical properties, or both, of a material. **C 904, C03**
- degradation, *n***—a deleterious change in the chemical structure, physical properties, or appearance of a plastic. **D 883, D20**
- degradation**—in general chemical use, the conversion of a complex

degradation

compound to a simpler. Specifically for cellulose, the breakdown of the polymer chain, usually by hydrolysis or oxidation. Degradation is usually applied to changes in chemical structure. (see also **deterioration**) **D 1695, D01**

degradation, n—change of a chemical compound to a less complex compound (dictionary definition). **D 1968, D06**

degradation—the geologic process by which stream beds, flood plains, the bottoms of other water bodies, and other land surfaces are lowered in elevation by the removal of material by fluids. **D 4410, D19**

degradation—damage by weakening or loss of some property, quality, or capability. **E 631, E06**

degradation—damage by weakening or loss of some property, quality, or capability. **E 1749, E06**

degradation, n—a deleterious change in chemical structure, physical properties, or appearance of a plastic. (D20) **F 412, F17**

degradation, n—a deleterious change in the chemical structure, physical properties, or appearance of a plastic. **F 1251, F04**

degrade, n—a reduction in quality of lumber, logs, or other wood products due to processing. **D 9, D07**

degrained leather—leather from which the grain has been removed after tanning, by splitting, abrading, or other process. **D 1517, D31**

degras, moellon—the partially oxidized oil pressed out of sheepskin after tannage with cod or other marine oil. (See also **moellon**.) **D 1517, D31**

degras (wool fat, wool grease, wool wax), n—a fat-like material comprised primarily of sterols, other higher alcohols, and fatty acids, obtained from the solvent extraction of sheep's wool. **D 4175, D02**

degreasing—the removal of grease and oils from a surface.

solvent degreasing—degreasing by immersion in liquid organic solvent.

vapor degreasing—degreasing by solvent vapors condensing on the parts being cleaned. **B 374, B08**

degree Celsius, °C, n—derived unit of temperature in the International System of Units (SI). (See **kelvin**.) **E 344, E20**

degree centigrade, n—obsolete term. Use **degree Celsius**. **E 344, E20**

degree-day—a unit of heat measurement equal to one degree of the variation of the mean temperature for a day from a given reference (or, base) temperature. **D 7099, D18**

degree day—see **degree day, heating** and **degree day, cooling**. **E 772, E44**

degree-day, cooling, (DDC or DDF, Celsius or Fahrenheit respectively)—one cooling degree-day is counted for each degree that the daily mean temperature is higher than a base temperature; used to estimate energy requirements for air conditioning or refrigeration. **E 772, E44**

degree-day, heating, (DDC or DDF, Celsius or Fahrenheit respectively)—one heating degree-day is counted for each degree that the daily mean temperature is lower than a base temperature; used to estimate energy requirements for heating. **E 772, E44**

degree-days—the difference between the average temperature each day and 32°F (0°C). In common usage degree-days are positive for daily average temperatures above 32°F and negative for those below 32°F (see **freezing index**). **D 653, D18**

degree Fahrenheit, °F, n—non-SI unit of temperature commonly used in the United States of America. **E 344, E20**

degree of consolidation (percent consolidation), U (D)—the ratio, expressed as a percentage, of: (1) the amount of consolidation at a given time within a soil mass, to (2) the total amount of consolidation obtainable under a given stress condition. **D 653, D18**

degree of crystallinity—the fraction by mass of a cellulose sample occurring in crystalline regions. The method of determining crystallinity must be stated. (see also **crystallinity**) **D 1695, D01**

degree of deacetylation, n—the fraction or percentage of glu-

cosamine units (GlcN: deacetylated monomers) in a chitosan polymer molecule. **F 2312, F04**

degree of freedom—in heterogeneous equilibrium, an external variable that may be adjusted independently without causing a change of state; the external variables usually considered are: temperature, pressure, and concentration parameters numbering one less than the order of the system. **E 7, E04**

degree of lateral order—the relative degree of molecular alignment. As for degree of crystallinity, quantitative values must be defined in terms of the experimental measurements. (see also **crystallinity**) **D 1695, D01**

degree of polymerization, DP—in general, the average number of base units, or of monomeric units per molecule in linear polymers. Specifically, the average number of anhydroglucose units (or derivative units) per molecule of cellulose (or cellulose derivative). The type of average obtained depends upon the method used for the determination. Hence, the method must always be specified. **D 1695, D01**

degree of saturation—see **percent saturation**. **D 653, D18**

degree of saturation—the extent or degree to which the voids in rock contain fluid (water, gas, or oil). Usually expressed in percent related to total void or pore space. (ISRM) **D 653, D18**

degree of saturation—(1) the total degree of saturation of frozen soil is the ratio, expressed as a percentage, of the volume of ice and unfrozen water in the soil pores to the volume of the pores; (2) the degree of saturation of frozen soil by ice, expressed as a percentage, is the ratio of the volume of ice in the soil pores to the volume of the pores. **D 7099, D18**

degree of sensitivity (sensitivity ratio)—see **remolding index**. **D 653, D18**

degree of substitution, DS—in a cellulose derivative, the average number of hydroxyl groups substituted per anhydroglucose unit. DS varies from zero to about 3. **D 1695, D01**

degree of thickening (DT), n—the ratio of an oil's viscosity with an additive to that oil's viscosity without the additive. A measure of the amount by which an additive increases the base fluid viscosity. **D 4175, D02**

degrees of freedom, n—for a set, the number of values that can be assigned arbitrarily and still get the same value for each of one or more statistics calculated from the set of data. **D 123, D13**

degrees-of-freedom—the minimum number of independent coordinates required in a mechanical system to define completely the positions of all parts of the system at any instant of time. In general, it is equal to the number of independent displacements that are possible. **D 653, D18**

degrees of freedom, n—the divisor used in the calculation of variance. **D 4175, D02**

degrees of freedom—the number of observations minus the number of constraints imposed upon the system. In general, only one constraint (for example, the mean value) is imposed and the total degrees of freedom are one less than the number of observations. **D 4790, D16**

deheading—removal of the lid of a closed-head drum; usually accomplished with a drum deheader. **D 5681, D34**

dehumidify—to reduce, by any process, the quantity of water vapor within a given space. **E 41, G03**

deionization—the removal of ions from a solution by ion exchange. **B 374, B08**

deionization (DI)—the removal of ions from a solution by ion exchange. **D 6161, D19**

delamination, n—as related to metallic coated steel, the separation of a coating (either full or partial thickness) from underlying layers; the separation can occur in small localized areas or large areas of surface. **A 902, A05**

delamination, n—the separation of the layers of material in a laminate. **D 883, D20**

delamination, n—the separation of layers in a laminate because of failure of the adhesive, either in the adhesive itself or at the interface between the adhesive and the adherend. **D 907, D14**

delamination, *n*—the separation of layers in a laminate because of failure of the adhesive, either in the adhesive itself or at the interface between the adhesive and the adherend. **D 1038, D07**

delamination—separation of plies in a laminate. This may be local or may cover a large area in the laminate. **D 3878, D30**

delamination—the separation of two or more layers or plies of reinforcing material within a pultrusion. **D 3918, D20**

delamination—*in protective coatings*, a separation of one coat from another coat within a coating system; or from the substrate. **D 4538, D33**

delamination—See *resistance to delamination*. **D 5684, D13**

delamination—the separation of the layers (lamina) of material in a laminate. **E 631, E06**

delamination—separation into constituent layers. **E 631, E06**

delamination, *n*—(1) the separation of one coating from another coat within a coating system, or from the substrate. (D 4538) (2) the separation of layers in a laminated material such as plywood because of failure of the adhesive. (D 907) **E 1605, E06**

delamination—the separation of the layers (lamina) of material in a laminate. **E 1749, E06**

delamination—the separation of layers in a multilayered structure. **F 17, F02**

delamination—See Terminology F 17. **F 1327, F02**

delamination strength, *n*—the tensile force required to separate the component layers under specified force. **D 123, D13**

delay—time interval (fraction of a second) between detonation of explosive charges. (ISRM) **D 653, D18**

delay distance (*D*), *n*—the distance the air flows past a wind vane during the time it takes the vane to return to 50 % of the initial displacement. **D 1356, D22**

delayed deformation, *n*—deformation which is time-dependent and exhibited by material subject to a continuing force. **D 123, D13**

delayed deformation, *n*—deformation which is time-dependload of a skein of yarn adjusted for the linear density of the yarn expressed in an indirect system. **D 4848, D13**

delayed fishscaling—a fishscaling defect that occurs after the final porcelain enamel processing (see also **fishscaling**). **C 286, B08**

delayed sweep—an A-scan or B-scan presentation in which an initial part of the time scale is not displayed. **E 1316, E07**

deleading—deprecated term. Use **lead-based paint hazard abatement**. **E 631, E06**

deleading—activities conducted to eliminate lead-based paint or lead-based paint hazards in public buildings, commercial buildings, or steel structures. **E 1605, E06**

delegated practice—the medical activities of providers performed under the authority and direction of a licensed physician. **F 1177, F30**

deleterious impurities—impurities that might be a health or safety concern, particularly with respect to toxicity, carcinogenicity, or immunogenicity. Deleterious impurities must be controlled and their levels determined using suitable analytical methods. **E 1705, E48**

delft ware—a calcareous earthenware having an opaque white glaze and monochrome overglaze decorations. (Originated in Delft, Holland.) **C 242, C21**

delicate or gentle cycle, *n*—a cycle in which agitation is slow and time is reduced. **D 123, D13**

delicate or gentle cycle, *n*—a cycle in which agitation is slow and time is reduced. **D 7023, D13**

delicate pretreatment procedure, *n*—*in textile conservation*, the washing, rinsing, drying, and pressing actions followed when fabrics are of certain yarn and fabric constructions or fiber contents, such as lightweight or sheer fabrics, fine yarns, silks, or wools. (Compare **sturdy pretreatment procedure**.) **D 123, D13**

delimited term, *n*—a term whose term entry includes a specified domain or area of application. **E 1992, E02**

delivery—(1) the final act of any glass-forming unit on a particular article; consisting of motion to remove the article from the mold.

(2) the process or equipment used for directing charges or gobs of glass to a forming machine. **C 162, C14**

delivery—the leather or fabricated leather articles presented at any one time for inspection or test. **D 1517, D31**

delivery rate—mass of mixture discharged from the dispenser per unit of time at a specified temperature, usually expressed in g/s at 80 °F (26 °C). **D 3064, D10**

delivery rate—use **sedimentdelivery ratio** or sediment yield, whichever is meant. **D 4410, D19**

delta, δ , *n*—*in the measurement of rubber properties*, the symbol for the phase angle by which the dynamic force leads the dynamic deflection; mathematically true only when the two dynamic waveforms are sine waves (Synonym—*loss angle*). **D 1566, D11**

delta—a sediment deposit formed where moving water is slowed by a slower moving body of water. **D 4410, D19**

delta code, *n*—*in encoding information in a one-dimensional medium*, intervals that are subdivided into modules that are assigned values of “1” or “0” where “1s” are bars and “0s” are spaces. Examples are UPC, Code 128, Code 93 and Code 49. **F 1294, F05**

delta ferrite—designation commonly assigned to delta iron containing alloying elements in solid solution. Small amounts of carbon and large amounts of other alloying elements markedly affect the high-and-low-temperature limit of equilibrium. **E 7, E04**

delta iron (δ Fe)—solid phase of pure iron which is stable at temperatures between 1400 and 1539°C and possesses the body-centered cubic lattice. Strictly, there is no difference between delta and alpha iron. **E 7, E04**

delta peak temperature, *n*—difference between the maximum temperature and the initial temperature of the sensor during the test, °C. **F 819, F18**

demagnetization—the reduction of residual magnetism to an acceptable level. **E 1316, E07**

demagnetization curve—the portion of a flux versus dc current plot (dc hysteresis loop) that lies in the second or fourth quadrant, that is, between the residual induction point, B_r , and the coercive force point, H_c . Points on this curve are designated by the coordinates, B_d and H_d . **A 340, A06**

demagnetizing coefficient, D_B —is defined by the equation:

$$D_B = [\Gamma_m(H_a - H)]/B_i$$

where:

H_a = applied magnetic field strength,

H = magnetic field strength actually existing in the magnetic material,

B_i = intrinsic induction, and

Γ_m = 1 in the cgs system and $4\pi \times 10^{-7}$, henry/metre in the SI system.

NOTE—For a closed, uniform magnetic circuit, the demagnetizing coefficient is zero. **A 340, A06**

demagnetizing factor, N_D —defined as 4π times the demagnetizing coefficient, D_B . **A 340, A06**

demagnetizing field strength, H_d —a magnetic field strength applied in such a direction as to reduce the induction in a magnetized body. See **demagnetization curve**. **A 340, A06**

demineralization—the process of removing minerals from water. **D 6161, D19**

demulsibility, *n*—*in petroleum products*, the ability of a mixture of liquids (usually hydrocarbons and water) to separate into its components after the mixture has been vigorously agitated. **D 4175, D02**

denaturant—toxins or noxious materials added to ethanol to make it unfit for human consumption. **E 1705, E48**

denaturants, *n*—natural gasoline, gasoline components, unleaded gasoline, or toxic or noxious materials added to fuel ethanol to make it unsuitable for beverage use but not unsuitable for automotive fuel use. **D 4175, D02**

denatured alcohol

denatured alcohol—ethyl alcohol containing an addition of a poisonous substance, making it unfit for human consumption.

E 7, E04

denatured ethanol—ethanol that is mixed with other chemicals or denaturants to make it unsuitable for human consumption.

E 1705, E48

denatured fuel ethanol, n—fuel ethanol made unfit for beverage use by the addition of denaturants.

D 4175, D02

denatured fuel ethanol—fuel ethanol to which chemicals (denaturants) have been added to make the ethanol unfit for human consumption in accordance with regulations of the Bureau of Alcohol, Tobacco, and Firearms of the U. S. Treasury Department.

E 772, E44

denatured fuel ethanol—fuel ethanol to which chemicals (denaturants) have been added to make the ethanol unfit for human consumption in accordance with the regulations of the Bureau of Alcohol, Tobacco, and Firearms of the U.S. Treasury Department.

E 1705, E48

dendrites—crystals, usually formed during solidification or sublimation, which are characterized by a tree-like pattern composed of many branches; pine-tree or fir-tree crystals.

E 7, E04

dendritic powder, n—particles, usually of electrolytic origin, having the typical pine tree structure.

B 243, B09

denier, n—the unit of linear density, equal to the mass in grams of 9000 m of fiber, yarn, or other textile strand that is used in a direct yarn numbering system. (See also **linear density**)

D 123, D13

denier, n—a direct numbering system for expressing linear density, equal to the mass in grams per 9000 metres of yarn, filament, fiber, or other textile strand.

D 3878, D30

denier, n—the unit of linear density, equal to the mass in grams of 9000 m of fiber, yarn, or other textile strand that is used in a direct yarn numbering system. (See also **linear density**)

D 4849, D13

denier, n—the number of grams per 9000 m.

E 631, E06

denim, n—a durable woven twill fabric, usually of all cotton or a blend of cotton and manufactured fibers, made from a variety of yarn numbers, and in various fabric weights, colors, designs, and finishes.

D 123, D13

denim, n—a durable woven twill fabric, usually of all cotton or a blend of cotton and manufactured fibers, made from a variety of yarn numbers, and in various fabric weights, colors, designs, and finishes.

D 4850, D13

denitrification—aqueous nitrate reduction or removal.

D 6161, D19

dense—a term used for optical glass having a high index of refraction.

C 162, C14

dense—(1) term used in stress grading of certain softwood species to signify a high specific gravity. (2) a visual estimate of high specific gravity. To be classified as dense, the softwood species shall average on one end or the other of each piece, not less than six annual rings per inch and one-third or more latewood. Pieces not less than four rings per inch shall be accepted as dense if they average one-half or more latewood.

D 9, D07

dense-graded aggregate, n—an aggregate that has a particle size distribution such that when it is compacted, the resulting voids between the aggregate particles, expressed as a percentage of the total space occupied by the material, are relatively small.

D 8, D04

dense (non-porous) membrane—membrane with no detectable pores.

D 6161, D19

dense rubber, n—in building construction, a solid rubber material substantially free of cells or porosity.

C 717, C24

densification crack, n—in a rigid die system, a defect caused by differential stresses in a region of a part that has experienced large differences in shrinkage during sintering.

B 243, B09

densified particulate biomass fuels—a fuel made by mechanical compression of biomass to increase the bulk density and to press the fuel into a specific shape, such as pellets and briquettes. The fuel can have a maximum volume of 16.39 cm³ (1 in.³) such that the largest dimension is 7.62 cm (3 in.).

E 1705, E48

densitometer—an instrument which measures the relationship be-

tween incident light and transmitted or reflected light and, using a logarithmic scale, gives a numerical measurement that corresponds to a material's opacity or a film's photographic density.

E 7, E04

densitometer—not recommended, see **microphotometer**.

E 135, E01

densitometer, n—instrument designed for measuring optical density of a photographic negative or positive or a printed image.

A 284, E12

densitometer—a device for measuring the optical density of radiograph film.

E 1316, E07

densitometry, n—technique for measurement of optical density by use of a densitometer.

E 284, E12

density, δ —the ratio of mass to volume of a material. In the cgs-emu system of units, g/cm³. In SI units, kg/m³.

A 340, A06

density, n—the weight per unit volume of a material.

C 11, C11

density, n—mass per unit volume (preferred over deprecated term **unit weight**).

C 125, C09

density, ρ , n—the mass per unit volume of a material. (ρ in SI units: kg/m³.) (ρ in inch-pound units: lb/ft³.)

C 168, C16

density:

absolute or true density—the weight divided by the volume excluding open and closed pores.

apparent or pycnometric density—the weight divided by the volume excluding open pores, but including closed pores.

tap density—the apparent density of a powdered or granulated material resulting when the receptacle containing the material is vibrated or tapped under standard or specified conditions.

C 242, C21

density—the weight per unit volume in air, expressed in pounds per cubic foot of a product.

C 904, C03

density, n—mass per unit volume expressed in g/cm³ or lb/ft³.

C 1154, C17

density, n—the mass per unit volume of a substrate at a specified temperature and pressure; usually expressed in g/mL, kg/L, g/cm³, g/L, kg/m³ or lb/gal. See **specific gravity**.

D 16, D01

density, n—mass per unit volume.

D 123, D13

density—the mass per unit, ρ (ML⁻³) kg/m³.

density of dry soil or rock, ρ_d (ML⁻³) kg/m³—the mass of solid particles per the total volume of soil or rock.

density of saturated soil or rock, ρ_{sat} (ML⁻³) kg/m³—the total mass per total volume of completely saturated soil or rock.

density of soil or rock (bulk density), ρ (ML⁻³) kg/m³—the total mass (solids plus water) per total volume.

density of solid particles, ρ_s (ML⁻³) kg/m³—the mass per volume of solid particles.

density of submerged soil or rock, ρ_{sub} (ML⁻³) kg/m³—the difference between the density of saturated soil or rock, and the density of water.

density of water, ρ_w (ML⁻³) kg/m³—the mass per volume of water.

D 653, D18

density, n—mass per unit volume (D 3288, D09).

D 996, D10

density, n—the mass per unit volume of substance.

D 1356, D22

density, n—the mass per unit volume of a material.

D 1566, D11

density—the mass per unit volume at a specified temperature.

D 1695, D01

density—mass of a given volume of material at a specified temperature.

D 3064, D10

density, n—mass per unit volume at a specified temperature.

D 4175, D02

density—the weight in vacuo, (that is, the mass) of a unit volume of the material at any given temperature.

D 4175, D02

density—the mass of a substance per unit volume, ρ in kg/L or kg/m³. Use ρ_s for density of solid particles, ρ_w for water, ρ_d for dry sediment with voids, ρ_{sat} for saturated sediment, ρ_{wet} for wet sediment, and ρ_b for submerged sediment (buoyant weight).

D 4410, D19

density, n —see **reflectance density, reflection density, transmission density, or transmittance density.** E 284, E12

density, n —the mass of a unit volume of material. E 344, E20

density—weight per unit volume, usually expressed in pounds per cubic inch, pounds per cubic foot, or kilograms per cubic metre. E 631, E06

density—the mass of a unit volume of a material at a specified temperature. The units shall be stated, such as grams per millilitre, grams per cubic centimetre, pounds per cubic foot, or other. The form of the expression shall be the following:

Density at x . . .

where x = temperature of the material. See also **Baumé gravity and specific gravity.** E 1547, E15

density—weight per unit volume, usually expressed in pounds per cubic inch, pounds per cubic foot, or kilograms per cubic metre. E 1749, E06

density, n —the mass per unit volume; weight per unit volume, expressed as grams per cubic centimeter or pounds per cubic foot for solids and liquids and usually as grams per liter for gases. E 2201, E50

density—see **image density.** F 335, F05

density, n —in *printed symbologies*, the number of data characters that can be contained in a given unit of measure. Linear bar code density is expressed in characters per inch (CPI) and two-dimensional symbol density is expressed in characters per square inch (CPSI). F 1294, F05

density, absolute or true—the mass under specified conditions of a unit volume of a solid sorbent excluding its pore volume and inter-particle voids. D 2652, D28

density, apparent—the weight in air of a unit volume of a material. D 883, D20

density, apparent—the mass per unit volume of a sheet of pulp or paper. It is commonly calculated by dividing the basis weight by the caliper, although it must be recognized that the numerical value thus obtained is dependent upon the definition of the ream. D 1695, D01

density, apparent—the weight in air of a unit volume of a material at a specified temperature. The units shall be stated. The form of expression shall be the following:

Apparent density at x

where x = temperature of the material. E 1547, E15

density, apparent, n —the weight in air of a unit of volume of a material. F 1251, F04

density, apparent (density, bulk, packing)—the mass under specified conditions of a unit volume of a solid sorbent including its pore volume and inter-particle voids. D 2652, D28

density, apparent (of applied insulation), n —the mass per unit volume of in-place mass thermal insulation. C 168, C16

density, block—see **density, particle.** D 2652, D28

density, bulk—the weight per unit volume of a material including voids inherent in material as tested. D 883, D20

density, bulk, n —the mass per unit volume of a material, including any voids present. D 1566, D11

density, bulk—the mass of a cellulosic material that will fill a unit volume of a container under specified conditions. D 1695, D01

density, bulk—see **density, apparent.** D 2652, D28

density, bulk, n —the weight in air of a unit of volume of a material. F 1251, F04

density comparison strip—alternative term for **step-wedge comparison film.** E 1316, E07

density current—the movement of one fluid under, through, or over another fluid of differing density. D 4410, D19

density (dry), n —the mass per unit volume of an unimpregnated powder metallurgy part. B 243, B09

density (film)—transmission density is the common logarithm of the

ratio of the radiant flux incident on the sample to the radiant flux transmitted by the sample, assuming no reflection. E 7, E04

density (film)—the quantitative measure of film blackening when light is transmitted or reflected.

$$D = \log (I_0/I) \text{ or } D = \log (I_0/R)$$

where:

D = density,

I_0 = light intensity incident on the film,

I = light intensity transmitted, and

R = light intensity reflected.

E 1316, E07

density in air—the weight per unit volume in vacuum minus the weight of a volume of air equal to the difference between the volume of the sample and the volume of brass weights equivalent to weight in vacuum of the sample. D 4790, D16

density (ρ , (ML⁻³), kg/m³), n —mass per unit volume. D 4439, D35

density of frozen ground—the ratio of mass per unit of volume of frozen earth materials. D 7099, D18

density (of gases)—the mass of a unit volume of a gas at a stated temperature and pressure. The units shall be stated. The form of expression shall be the following:

Density at x, y

where:

x = temperature of the gas, and

y = pressure of the gas.

E 1547, E15

density of plastics—the weight per unit volume of material at 23°C expressed as D23c, g/cm³ (kg/m³). F 412, F17

density, packing—see **density, apparent.** D 2652, D28

density, packing (bulk)—the ratio of the mass of a collection of discrete pieces of solid material to the sum of the volumes of: the solids in each piece, the voids within the pieces, and the voids among the pieces of the particular collection. D 3766, D32

density, particle (density, block)—the mass under specified conditions of a unit volume of a solid sorbent including its pore volume but excluding inter-particle voids. D 2652, D28

density, particle (envelope)—the ratio of the mass of a particle to the sum of the volumes of: the solid in each piece and the voids within each piece, that is, within close-fitting imaginary envelopes completely surrounding each piece. D 3766, D32

density ratio, n —the ratio, often expressed as a percentage, of the density of a porous material to the density of the same material completely free of porosity. Synonymous with **relative density.** B 243, B09

density, skeletal—the ratio of the mass of discrete pieces of solid material to the sum of the volumes of: the solid material in the pieces and closed (or blind) pores within the pieces. D 3766, D32

density, tamped—the density of packed bed of powdered carbon. D 2652, D28

density, theoretical—the ratio of the mass of a collection of discrete pieces of solid material to the sum of the volumes of said pieces, the solid material having an ideal regular arrangement at the atomic level. D 3766, D32

density (wet), n —the mass per unit volume of a powder metallurgy part impregnated with oil or other nonmetallic materials. B 243, B09

dents—depressions in the copper foil which do not significantly change the thickness of the copper foil. B 846, B05

dents per unit width, n —for *woven pile yarn floor covering*, the number of binding sites per unit width; dents being the reed spaces through which the warp yarns pass in the loom or the metal strips, in the reed that form these spaces. D 123, D13

dents per unit width, n —for *woven pile floor covering*, the number of binding sites per unit width; dents being the reed spaces through which the warp yarns pass in the loom or the metal strips in the reed that form these spaces. D 5684, D13

denuder, *n*

denuder, *n*—a device designed to collect or remove gases from an air stream by diffusion to a collecting surface or secondary air stream while permitting the passage of particles. **D 1356, D22**

deoxidation—process of reducing the oxygen content from steel during the process of steel making, either by adding strong oxide forming elements, such as silicon or aluminum, or by the process of vacuum degassing to such a level that no oxidation of carbon or other elements takes place during solidification of steel. **F 1789, F16**

deoxidation products—a term specifically applied to those non-metallic inclusions formed as a result of the addition of deoxidizing agents to molten metal. **E 7, E04**

deoxidized copper, high-residual phosphorus—copper deoxidized with phosphorus residual in amounts 0.015 to 0.040 %. The copper is not susceptible to hydrogen embrittlement, as determined in Specification B 379. The copper is of relatively low-electrical conductivity due to the amount of phosphorus present.

NOTE—International Standards Organization specifications permit up to 0.050 % phosphorus. **B 846, B05**

deoxidized copper, low-residual phosphorus—copper deoxidized with phosphorus residual in amounts 0.004 to 0.012 %. The copper is not readily susceptible to hydrogen embrittlement, as determined in Specification B 379. The copper in the annealed condition has a minimum conductivity of 90 % IACS. **B 846, B05**

depacifying, *adj*—the process of removing hydrogen ions (protons) from the cathodic surface of an electrolytic cell, thereby promoting continued electrolytic corrosion. **D 4175, D02**

dependent variable, *n*—See **response variable**. **E 456, E11**

dependent variable, *n*—see **response variable**. **E 1325, E11**

deplasticize, *v*—the process of breaking down polymers in plastics and similar materials, resulting in loss of the material's structural integrity. **D 4175, D02**

depletion—selective removal of one component of an alloy, usually from the surface or preferentially from grain boundary regions. **E 7, E04**

depletion—decrease of toner concentration in a developer composition characterized by low-image density. **F 335, F05**

deployed length, *n*—the coils as extended for use. It is specified by the coverage where:

Helical coverage = number of coil loops per unit × helical loop spacing

Concertina coverage = number of coil loops divided by 2 × concertina loop spacing.

F 1379, F14

deployment, *n*—*for inflatable restraints*, the sequence of events related to the activation of a module. **D 123, D13**

deployment, *n*—*for inflatable restraints*, the sequence of events related to the activation of a module. **D 6799, D13**

deployment—placing a boom in the water and making it operational. **F 818, F20**

depolarization—a decrease in the polarization of an electrode at a specified current density. **B 374, B08**

depolarization—not a preferred term. (See **polarization**.) **G 15, G01**

depolarizer—a substance or a means that produces depolarization. **B 374, B08**

depolymerization, *n*—reduction in length of a polymer chain to form shorter polymeric units. Depolymerization may reduce the polymer chain to oligomeric or monomeric units, or both. **F 2312, F04**

deposit—the amount of pesticide on a unit area of surface. **E 609, E35**

deposit corrosion—localized corrosion under or around a deposit or collection of material on a metal surface. (See also **crevice corrosion**.) **G 15, G01**

deposition, *n*—the transfer of an atmospheric constituent to a surface due to gravity or another mechanism, or the material which is transferred.

dry deposition, *n*—all forms of deposition derived from the net vertical transfer of chemical species to a surface that are not

the result of precipitation.

wet deposition, *n*—the precipitation of water from the atmosphere in the form of hail, rain, sleet, and snow.

D 1356, D22

deposition—the chemical, mechanical, or biological processes through which sediments accumulate in a resting place.

D 4410, D19

deposition aid—a material that improves the ability of agricultural sprays to deposit on targeted surfaces. **E 1519, E35**

depositional carbon, *n*—as used in *Test Method D 5061*, a group of carbon forms that are formed from cracking and nucleation of gas-phase hydrocarbon molecules during coal carbonization.

pyrolytic carbon, *n*—as used in *Test Method D 5061*, an anisotropic carbon form that is formed by the deposition of carbon parallel to an inert substrate causing the resulting texture to appear ribbon-like.

sooty carbon, *n*—as used in *Test Method D 5061*, an isotropic carbon form comprised of approximately spherical particles of less than 1- μ m diameter sometimes referred to as combustion black.

spherulitic carbon, *n*—as used in *Test Method D 5061*, a spherical anisotropic carbon form sometimes referred to as thermal black that is formed by the deposition of carbon concentrically around a nucleus.

divided sample—See **divided sample** under **sample**. **D 121, D05**

deposit rate—the amount of any material deposited per unit area. **E 1102, E35**

depreciation—the annual charge to income that results from a systematic and rational allocation of costs over the life of a tangible asset. **E 2135, E53**

depression, *n*—localized pavement surface areas at a lower elevation than the adjacent paved areas. **E 867, E17**

depression, *n*—localized pavement surface areas at a lower elevation than the adjacent paved areas. **E 1778, E17**

depth, *n*—in the case of a beam, the dimension parallel to the direction in which the load is applied. **D 883, D20**

depth, *n*—in the case of a beam, the dimension parallel to the direction in which the load is applied. (D20) **F 412, F17**

depth-dose distribution—variation of absorbed dose with depth from the incident surface of a material exposed to a given radiation. **E 170, E10**

depth factor—the factor included in deriving the allowable bending stress for rectangular members which takes into account the somewhat lower unit strength developed in larger members as compared to smaller members. Archaic terminology, more correctly termed **size factor**. **D 9, D07**

depth-integrated sample—a discharge-weighted (velocity-weighted) sample of water-sediment mixture collected at one or more verticals in accordance with the technique of depth integration; the discharge of any property of the sample expressible as a concentration can be obtained as the product of the concentration and the water discharge represented by the sample. **D 4410, D19**

depth-integrating sediment sampler—a device that collects a representative water-sediment mixture at all points along the sampling vertical. **D 4410, D19**

depth integration—a method of sampling at every point throughout a given depth (the sampled depth) whereby the water-sediment mixture is collected isokinetically so that the contribution from each point is proportional to the stream velocity at the point. This process yields a sample with properties that are discharge weighted over the sampled depth. Ordinarily, depth integration is performed by traversing either a depth- or point-integrating sampler vertically at an acceptably slow and constant rate; however, depth integration can also be accomplished with vertical slot samplers. **D 4410, D19**

depth of field—the depth or thickness of the object space that is simultaneously in acceptable focus. **E 7, E04**

depth of field—the range of distance over which an imaging system

gives satisfactory definition when it is in the best focus for a specific distance. **E 1316, E07**

depth of field, *n*—in bar code reading, the difference between the minimum and maximum distance from the aperture of the reader to the symbol throughout which the bar code can be accurately interpreted. **F 1294, F05**

depth of flow in hydraulics, *n*—the distance from the channel thalweg to the water surface, measure normal to the direction of flow, for a given discharge. **D 653, D18**

depth of focus—the depth or thickness of the image space that is simultaneously in acceptable focus. **E 7, E04**

depth of gloss—the optical phenomenon of relative depth perceived when viewing reflective surfaces. **D 2825, D21**

depth of penetration, *n*—(1) the distance a penetrant has entered into a solid material as measured from the surface of the material; (2) the maximum depth at which a magnetic or ultrasonic indication can be measured in a test specimen. **C 1145, C28**

depth of penetration—in electromagnetic testing, the depth at which the magnetic field strength or intensity of induced eddy currents has decreased to 37 % of its surface value. The depth of penetration is an exponential function of the frequency of the signal and the conductivity and permeability of the material. Synonymous terms are standard depth of penetration and skin depth. (See also **skin effect**.) **E 1316, E07**

depth of penetration, *d_p*—in internal reflection spectroscopy, the distance into the less refractive medium at which the amplitude of the evanescent wave is e^{-1} (that is, 36.8 %) of its value at the surface:

$$d_p = \frac{\lambda_1}{2\pi(\sin^2\theta - n_{21}^2)^{1/2}}$$

where: $n_{21} = n_2/n_1$ = refractive index of sample divided by that of the IRE; $\lambda_1 = \lambda/n_1$ = wavelength of radiant energy in the sample; and θ = angle of incidence. **E 131, E13**

depth of seasonal frost penetration—the maximum thickness of the seasonally frozen layer. **D 7099, D18**

depth of thaw—the distance from the ground surface downward to frozen ground at any time during the thaw season. **D 7099, D18**

depth of zero annual amplitude—the distance from the ground surface downward to the point beneath which there is virtually no annual fluctuation in the mean ground temperature. **D 7099, D18**

depth profiling—AES, XPS, SIMS, monitoring the signal strength as a function of some variable (for example, sputtering time) that can be related to distance from the surface. **E 673, E42**

depth resolution—AES, XPS, SIMS, the depth range over which a signal increases (or decreases) by a specified amount when profiling an ideally sharp interface between two media. By convention, the depth resolution corresponds to the distance over which a 16 % to 84 % (or 84 % to 16 %) change in signal is measured. **E 673, E42**

depth scale—EIA, a relationship between energy loss and target depth that allows a direct correlation between multichannel analyzer channel number and depth in the specimen. **E 673, E42**

depuration—loss of a substance from an organism as a result of any active or passive process. **E 943, E47**

derivative, *adj*—pertaining to the first derivative (mathematical) of any curve with respect to temperature or time. **E 473, E37**

derivative absorption spectrum—a plot of rate of change of absorbance or of any function of absorbance with respect to wavelength or any function of wavelength, against wavelength or any function of wavelength. **E 131, E13**

derived differential curve—the curve derived from the data obtained by the use of the differential method of thermal analysis. The changes in the temperature difference $\Delta(\theta - \theta')$, between a specimen and a neutral body, for a constant interval of temperature $\Delta\theta$ are plotted against the temperature. An arithmetic treatment of the differential data resulting in a plot of $\Delta(\theta - \theta')/\Delta\theta$ versus θ . (See **differential curve**.) **E 7, E04**

dermal autograft, *n*—a skin [autograft] from which epidermis and subcutaneous fat have been removed; used instead of fascia in various plastic [surgery] procedures. **F 2312, F04**

dermal toxicity—the toxic effect to an organism resulting from contact of the pesticide with the skin. **E 609, E35**

desalination—see **demineralization**. **D 6161, D19**

descender, *n*—a stroke that extends below the baseline of the body of the letter formation. **E 2195, E30**

descender, *n*—that portion of an alphabetic character that extends below the baseline. **F 1457, F05**

descender, *n*—a rappel device. **F 1773, F08**

descending fork point—in a ternary phase diagram, the configuration at the convergence of the three divariant curves upon each of the three high-temperature phases associated in Class III univariant equilibrium; for example, the division of a descending liquidus surface valley into two descending liquidus-surface valleys. **E 7, E04**

descriptive analysis, *n*—any method to describe and quantify the sensory characteristics of stimuli by a panel of trained assessors. **E 253, E18**

de-seeding, *n*—in flax, the process of removing seeds and seed-holding structures from plants. **D 123, D13**

de-seeding, *v*—in flax, the process of removing seeds and seed-holding structures from plants. **D 6798, D13**

desiccant, *n*—a hygroscopic substance used to absorb water vapor from the air to maintain a low relative humidity in a container. **D 996, D10**

desiccant, *n*—compounding material used to irreversibly absorb moisture present (in a rubber mix) particularly for the purpose of minimizing risk of porosity during vulcanization. **D 1566, D11**

desiccation crack—a crack or fissure in fine-grained soil material resulting from shrinkage during drying. **D 7099, D18**

desiccation polygon—a closed, multi-sided, pattern in the ground formed by desiccation cracks in fine-grained soils. **D 7099, D18**

designated person—an individual who is qualified by experience or training to perform an assigned task. **F 819, F18**

designated size—the dimensional name for a particular size that may or may not be equal to or related to the dimensions used for design purposes or of the manufactured product. **C 822, C13**

design contingency, *n*—in project design/construction, the amount of funds added to the estimated construction costs to cover unanticipated construction costs due to the incompleteness of the design, where the contingency is inversely proportional to the level of completeness of the design documentation. **E 833, E06**

design depth of frost penetration—(1) in North American usage: the mean of the three largest depths of seasonal frost penetration measured during the past thirty years, or, the largest depth of seasonal frost penetration beneath a snow-free soil surface measured during the past ten years; (2) in Russian usage: the mean of the depths of seasonal frost penetration during at least the last ten years with the ground surface free of snow and the groundwater level beneath the depth of seasonal frost penetration. **D 7099, D18**

design development—the phase of a project consisting of drawings and document preparation to fix and describe the size and character of the building systems, material, and elements. **E 631, E06**

design development, *n*—the phase of a project consisting of drawings and document preparation to fix and describe the size and character of the building systems, material, and elements. **E 833, E06**

design discharge in erosion control, *n*—the volumetric quantity of water flow within a channel which is typically used in determining required channel dimensions and suitable lining materials for ensuring adequate channel capacity and stability. **D 653, D18**

design eye—the reference point in aircraft design from which all visual or optical anthropometrical design considerations are taken. **F 2429, F07**

design life—the period of time during which a system or component is expected to perform its intended function, without significant

design life

- degradation of performance and without requiring major maintenance or replacement. **E 772, E44**
- design load**—the load at which the geosynthetic is required to operate in order to perform its intended function. **D 4439, D35**
- design load, n**—the intended maximum design load condition allowed by design under appropriate nationally recognized structural design criteria. **E 176, E05**
- design of experiments, n**—the arrangement in which an experimental program is to be conducted, and the selection of the levels (versions) of one or more factors or factor combinations to be included in the experiment. Synonyms include experiment design and experimental design. **E 456, E11**
- design of experiments, n**—the arrangement in which an experimental program is to be conducted, and the selection of the levels (versions) of one or more factors or factor combinations to be included in the experiment. Synonyms include experiment design and experimental design. **E 1325, E11**
- design program**—the information detailing project function, purpose, and characteristics inclusive of floor area, functional spaces, equipment, and building systems. **E 631, E06**
- design program**—See **facility performance**. **E 631, E06**
- design program, n**—the information detailing project function, purpose, and characteristics inclusive of floor area, functional spaces, equipment, and building systems. **E 833, E06**
- design program**—See **facility performance**. **E 1480, E06**
- design program, n** (programmed conception)—(*design brief*) document specifying what facilities will be provided to the occupants, and confirming to the owner the requirements for the facility. **E 631, E06**
- design strength**—the minimum acceptable 0.01-in. (0.3-mm) crack D-load. **C 822, C13**
- desires, n**—the functions that the value analysis team determines to be fulfilled if cost is not a factor, or functions which do not otherwise violate a constraint. **E 833, E06**
- desorption, n**—a process in which a sorbed material is released from another material, as the desorption of moisture from fibers; the reverse of absorption, adsorption, or both. **D 123, D13**
- desorption, n**—the process of freeing from a sorbed state. **D 1356, D22**
- desorption**—the separation of an adsorbate as such from a sorbent. **D 2652, D28**
- desorption, n**—a process in which a sorbed material is released from another material, as the desorption of moisture from fibers; the reverse of absorption, adsorption, or both. **D4920, D13**
- desorption**—opposite of absorption. See **absorption**. **D 6161, D19**
- destructive test**—See **test, destructive**. **E 631, E06**
- destructive test**—See **test, destructive**. **E 1749, E06**
- destructive test**—test to determine the properties of a material or the behavior of an item which results in the destruction of the sample or item. **F 1789, F16**
- detached dwelling**—See **dwelling**. **E 631, E06**
- detached dwelling**—a **dwelling unit** standing by itself. **E 631, E06**
- detachment failure**—a slope failure in which the thawed or thawing part of the active layer detaches from the underlying frozen material. **D 7099, D18**
- detected feature**—in *imageanalysis*, an object or constituent of interest that is isolated for measurement by adjustment of the threshold setting to its particular range of gray level. **E 7, E04**
- detection limit, n**—for an analytical instrument, the minimum quantity of analyte expected to yield a response greater than zero. **E 135, E01**
- detection limit**—stated limiting value that designates the lowest concentration or mass that is capable of being estimated or determined with confidence and that is specific to the analytical procedures used. **E 631, E06**
- detection limit**—the smallest concentration of an element or compound that can be measured for specific analysis conditions and data collection periods. **E 673, E42**
- detection limit**—the lowest level of an analyte that can be detected by an instrument or an analytical method.
- instrumental detection limit*—the lowest concentration at which the instrumentation can distinguish analyte content from the background generated by a minimal matrix.
- method detection limit*—the minimum concentration of an analyte that, in a given matrix and with a specific method, has a 99 % probability of being identified, qualitatively or quantitatively measured, and reported to be greater than zero concentration. **E 1605, E06**
- detection limit**—the minimum quantity of analyte that can be reliably detected but not necessarily quantified. **E 2161, E37**
- detection monitoring**—a program of monitoring for the express purpose of determining whether or not there has been a contaminant release to ground water. **D 653, D18**
- detection process**—past-oriented strategy of quality control that attempts to identify the nonconforming product after it has been produced, and then to separate it from the conforming product. **F 1789, F16**
- detection system**—system which relies on final inspection as the primary means of controlling the quality of finished fasteners. **F 1789, F16**
- detector, n**—device to convert radiant energy into a neural signal (such as the eye) or an electrical signal (such as a phototube, photomultiplier tube, photocell, photodiode, or the like). **E 284, E12**
- detector:**
- angle*—EIA, see *angle of detector*:
- efficiency*—EIA, fraction of particles incident on the detector that actually generate a detectable signal.
- foil*—EIA, a thin sheet, usually metal or plastic, placed over a detector to absorb low energy or high mass products, or both, from nuclear reactions, while transmitting other reaction products.
- solid angle*—see *angle, solid, of detector*. **E 673, E42**
- detergency**—the removal of soil, using a detergent. **D 459, D12**
- detergent**—a surface-active agent that possesses the ability to clean soiled surfaces.
- anionic detergent*—a detergent that produces aggregates of negatively-charged ions with colloidal properties.
- cationic detergent*—a detergent that produces aggregates of positively-charged ions with colloidal properties.
- nonionic detergent*—a detergent that produces aggregates of electrically-neutral molecules with colloidal properties. **B 374, B08**
- detergent, n**—*intextile product care*, a cleaning agent containing one or more surfactants as the active ingredient(s). **D 123, D13**
- detergent**—a composition that removes soil.
- anionic detergent*—a detergent that produces negatively charged colloidal ions in solution.
- cationic detergent*—a detergent that produces positively charged colloidal ions in solution.
- dry-cleaning detergent (charge-type)*—a dry-cleaning detergent used at a given percentage by volume that can pass through a diatomaceous earth-coated filter in the dry-cleaning system without change in composition.
- dry-cleaning detergent (dry-cleaning aid)*—a detergent that when added to a dry-cleaning solvent increases cleaning effectiveness.
- dry-cleaning detergent (non-charge type)*—any dry-cleaning detergent that is not of the charge type.
- inorganic alkaline detergent*—a water-soluble inorganic alkali or alkaline salt having detergent properties, but containing no soap or synthetics.
- nonionic detergent*—a detergent that produces electrically neutral-colloidal particles in solution.
- synthetic detergent*—a detergent produced by chemical synthesis

and comprising an organic composition other than soap.

D 459, D12

detergent—a formulated cleaning composition, generally containing one or more surfactant(s) as the essential component(s). However, under **detergent**, see *inorganic alkaline detergent*. Imprecisely, the terms *detergent* and *surfactant* have been used interchangeably.

D 459, D12

detergent, n—*intextile product care*, a cleaning agent containing one or more surfactants as the active ingredient(s).

D 3136, D13

detergent—a cleansing agent; any of numerous synthetic water soluble or liquid-organic preparations that are chemically different from soaps but resemble them in the ability to emulsify oils and hold dirt in suspension.

D 6161, D19

detergent alkylate—a mixture of alkylated aromatic hydrocarbons which when sulfonated yields an alkyl aryl sulfonate detergent. The term usually refers to an alkyl benzene in which the alkyl radical is a mixture of straight-chain and isomeric branched-chain groups, averaging 10 or more carbon atoms.

D 459, D12

detergent feeder—a device that automatically feeds detergents into wash tanks of spray-type commercial dishwashing and glasswashing machines.

F 1827, F26

detergent remover—a penetrant remover that is a solution of a detergent in water.

E 1316, E07

detergent resistance—the degree to which a polish film exhibits no apparent deterioration when spotted or cleaned with a solution of a nonabrasive, nonammoniacal detergent.

D 2825, D21

deteriorated condition—condition of surfaces of such components as walls, windows, and baseboards that are in need of repair (or replacement) due to physical or mechanical breakdown of paint or other materials.

E 631, E06

deteriorated paint—paint or other coating that is cracking, flaking, chipping, peeling, or otherwise damaged or delaminating from the substrate of a building component.

E 1605, E06

deterioration—a permanent impairment of the physical properties. (see also **degradation**)

D 1695, D01

determinability, n—a quantitative measure of the variability associated with the same operator in a given laboratory obtaining successive determined values using the same apparatus for a series of operations leading to a single result; it is defined as that difference between two such single determined values as would be exceeded in the long run in only one case in 20 in the normal and correct operation of the test method.

D 4175, D02

determination, n—the process of carrying out the series of operations specified in the test method whereby a single value is obtained.

D 4175, D02

determination, n—the application of the complete measurement procedure to one piece, specimen or object to produce one numerical measured value to be used to form an average or median.

F 538, F09

determination value, n—the numerical quantity calculated by means of the test method equation from the measurement values obtained as directed in a test method. (See also **observation**.)

D 123, D13

deterministic design, n—design based on the physical and mechanical properties of the materials, elements, and structures involved (compare **probabilistic design**).

E 631, E06

detonation—an extremely rapid and violent chemical reaction causing the production of a large volume of gas. (ISRM)

D 653, D18

detonation—an explosion in which the flame or reaction front propagates at a supersonic speed into the unburned medium, such that the pressure increases occur in the form of shock waves.

D 5681, D34

detonation meter, n—for *knock testing*, the signal conditioning instrumentation that accepts the electrical signal from the detonation pickup and provides an output signal for display.

D 4175, D02

detonation pickup, n—for *knock testing*, a magnetostrictive-type transducer that threads into the engine cylinder and is exposed to combustion chamber pressure to provide an electrical signal that is proportional to the rate-of-change of cylinder pressure.

D 4175, D02

developed footprint length [L], n—the maximum footprint dimension in the circumferential direction of the tire, under stated conditions of measurement.

F 538, F09

developed footprint width [L], n—the maximum lateral dimension of a tire footprint under stated conditions of measurement.

F 538, F09

developed length, L_N—bottom contour length as measured from the ski tip to the ski tail, commonly called the material length.

F 472, F27

developed length, LN—the bottom contour length from the snowboard tip to the snowboard tail, sometimes called the material length.

F 1107, F27

developer, n—*of an ASTM test method*, the assigned ASTM group, working under the supervision of its governing subcommittee and main committee, that formats the test method in accordance with the Form and Style for ASTM Standards, and continually refines the test method.

D 4175, D02

developer, n—*of a test procedure*, an individual or organization that selects the test apparatus and operating conditions.

D 4175, D02

developer—a material that is applied to the test surface to accelerate bleedout and to enhance the contrast of indications.

E 1316, E07

developer—the material or combination of materials that renders visible a latent electrostatic image when brought into intimate contact with it. Electrostatic developers can be either liquid or dry and can consist of a toner and a carrier.

F 335, F05

developer, n—acidic materials which react with leuco dyes to form color.

F 1623, F05

developer, aqueous—a suspension of developer particles in water.

E 1316, E07

developer, dry powder—a fine free-flowing powder used as supplied.

E 1316, E07

developer, liquid film—a suspension of developer particles in a vehicle which leaves a resin/polymer film on the test surface after drying.

E 1316, E07

developer, non-aqueous—developer particles suspended in a non-aqueous vehicle prior to application.

E 1316, E07

developer roller—(also magnetic roller or mag roller), a cylinder built into the copier toner cartridge or printer toner cartridge intended to present correctly charged toner from the toner reservoir to the charged areas of the photoreceptor.

F 335, F05

developer, soluble—a developer completely soluble in its carrier, not a suspension of powder in a liquid, which dries to an absorptive coating.

E 1316, E07

developing time—the elapsed time between the application of the developer and the examination of the part.

E 1316, E07

development—the process of converting a latent electrostatic image into a visible image.

F 335, F05

deviation—*in protective coatings*, a departure of a characteristic from established procedures or from specified requirements.

D 4538, D33

deviation, n—the difference between a measurement or quasi-measurement and its stated value or intended level.

E 456, E11

deviation, n—departure from an approved instruction or established standard.

E 2363, E55

deviation (X-ray)—the angle between the diffracted beam and the transmitted incident beam. It is equal to twice the Bragg angle θ .

E 7, E04

deviator of stress (strain)—the stress (strain) tensor obtained by subtracting the mean of the normal stress (strain) components of a stress (strain) tensor from each normal stress (strain) component. (ISRM)

D 653, D18

deviator stress, Δ, σ (FL⁻²)—the difference between the major and minor principal stresses in a triaxial test.

D 653, D18

device, n—“an instrument, apparatus, implement, machine, contrivance, implant, *in vitro* reagent, or other similar or related article...intended for use in the diagnosis of disease or other conditions, or in the cure, mitigation, treatment, or prevention of disease, in man or other animals...which does not achieve its primary

device, *n*

intended purposes through chemical action within or on the body of man or other animals and which is not dependent upon being metabolized for the achievement of its primary intended purposes." Devices are "intended to affect the structure or any function of the body." **F 2312, F04**

devitrification—crystallization of glass. **C 162, C14**

devitrification—a surface defect manifested by loss of gloss as a result of crystallization. **C 286, B08**

devitrification—crystallization of an amorphous substance. **E 7, E04**

devitrification—crystallization of an amorphous substance, (E 7, E04). **E 1142, E37**

devulcanization, n—destruction of the chemical crosslinks in a vulcanized rubber. **D 1566, D11**

dew, n—water vapor that has condensed onto a surface near the ground because of radiational cooling of that surface to a temperature that is below the dew point of the air surrounding the surface. **D 1356, D22**

dewatering, v—a physical process which removes sufficient water from a sludge, FGD material, or ponded ash and FGD solids so that its physical form is changed from essentially that of a fluid to that of a damp solid. **E 2201, E50**

dew cell, dew probe, n—an instrument that measures the temperature at which a saturated salt solution (usually of lithium chloride) is in equilibrium with the water vapor in moist air. **D 1356, D22**

dewetting—a condition that results when molten solder has coated a surface and then receded leaving irregular-shaped mounds of solder separated by areas covered with a thin film but base metal is not exposed. **B 846, B05**

dew-/frost-point hygrometer—See **hygrometer**. **D 1356, D22**

dewired, n—the absence of exposed wire on the perimeter of the tire chips. Belt wire typically remains in the chip, but is embedded in the chip. **D 5681, D34**

dew point, n—the temperature below which condensation of water vapor begins to take place when the atmosphere is cooled. **D 123, D13**

dew point—the temperature at any given pressure at which liquid initially condenses from a gas or vapor. It is specifically applied to the temperature at which water vapor starts to condense from a gas mixture (**water dew point**), or at which hydrocarbons start to condense (**hydrocarbon dew point**). **D 4150, D03**

dew point, n—the temperature below which condensation of water vapor begins to take place when the atmosphere is cooled. **D4920, D13**

dew point—the temperature to which water vapor must be reduced to obtain saturation vapor pressure, that is, 100 % relative humidity.

NOTE—As air is cooled, the amount of water vapor that it can hold decreases. If air is cooled sufficiently, the actual water vapor pressure becomes equal to the saturation water-vapor pressure, and any further cooling beyond this point will normally result in the condensation of moisture. **E 41, G03**

dewpoint temperature, n—the temperature at which condensation of water vapor in a space begins for a given state of humidity and pressure as the vapor temperature is reduced; the temperature corresponding to saturation (100 % relative humidity) for a given absolute humidity at constant pressure. **C 168, C16**

dew-point temperature—See **temperature**. **D 1356, D22**

dew-point temperature—the temperature (above 0°C) to which a gas or vapor must be cooled at constant pressure and constant water-vapor composition in order for saturation to occur. **D 2864, D27**

dew probe—See **dew cell**. **D 1356, D22**

dextrins—high molecular weight sugars, intermediates obtained in the conversion of starch to fermentable sugar. **E 1705, E48**

dezincification—a type of corrosion found with some copper-zinc alloys which occurs by solution of a small region and immediate redeposition of the copper in a spongy porous form, thus giving the impression of selective removal of zinc from the alloy. **E 7, E04**

dezincification—See **parting**; specific to copper-zinc alloys.

G 15, G01

DGS (distance gain size-German AVG)—distance amplitude curves permitting prediction of reflector size compared to the response from a back surface reflection. **E 1316, E07**

D head—nail head with semi-circular rim and head segment omitted during heading, with omitted segment reaching from rim to shank projection, to allow tight collating of nails in strip form. **F 592, F16**

diagnostic verifier, n—a device that automatically evaluates the quality of a film master or a printed code by comparing the observed information to a standard for the printed symbol. **F 1294, F05**

diagonal—in hardness testing, a line joining two opposite corners of a diamond pyramid indentation. **E 7, E04**

diagonal bracing—See **loading**. **D 996, D10**

diagonal elements, n—in *bispectral photometry*, elements of a bispectral matrix for which irradiation and viewing wavelengths are equal. **E 284, E12**

diagonal fluorescence, n—in *bispectral photometry*, the contribution of fluorescence to diagonal values of a bispectral radiance factor matrix, due to the finite range of actual irradiation and viewing wavelengths when nominal irradiation and viewing wavelengths are equal ($\mu = \lambda$). **E 284, E12**

diagonal wear, n—a type of irregular wear characterized by an increased wear rate region or band oriented transversely (from shoulder to shoulder) at some non-90° angle with respect to the circumferential centerline of the tread band. **F 538, F09**

dial—a numerically calibrated part used to align the tumblers and operate the lock. **F 471, F12**

dial and ring (spy-resistant)—a dial and ring designed to restrict the unauthorized observation of combination dialing. **F 471, F12**

dial indicator reading, n—for the *CFR engine*, a numerical indication of cylinder height, in thousandths of an inch, indexed to a basic setting at a prescribed compression pressure when the engine is motored. **D 4175, D02**

dial shield—a shroud to shield the dial from unauthorized observation of combination dialing. **F 471, F12**

dialysis—a separation process dependent on different diffusion rates of solutes across a permeable membrane without an applied hydraulic driving force. It is a process in which transport is driven primarily by concentration differences, rather than by pressure or electrical potential differences, across the thickness of a membrane. **D 6161, D19**

dialysis permeability coefficient—permeability coefficient on a transmembrane driving force expressed in terms of the concentration difference of a given component. **D 6161, D19**

diamagnetic material—a material whose relative permeability is less than unity.

NOTE—The intrinsic induction, B_i , is oppositely directly to the applied magnetizing force H . **A 340, A06**

diamagnetic material—a material whose relative permeability is less than unity.

NOTE—The intrinsic induction B_i is oppositely directed to the applied magnetizing force H . **E 1316, E07**

diameter:

arithmetic mean diameter—that diameter located at the centroid of the distribution of size.

equivalent diameter (sphere)—the diameter of a theoretical sphere of a material which under identical physical conditions yields the same value of the particular fineness characteristic as the actual irregularly shaped dispersed particle of the same material.

median diameter—that diameter at which the area under the curve of size versus frequency is divided into two equal parts. **C 242, C21**

diameter, n—the largest outside dimension of the glass as measured with a ring gage. **E 344, E20**

diameter—length of longest straight line through center of largest cross section of head. **F 547, F16**

diameter—length of longest straight line through center of cross section of wire from which nail is formed. Diameter of pointed nail is that immediately below the grip marks. Diameter of nail with roll-threaded shank is that of wire or nail prior to being threaded. In the case of fluted, roll-grooved, and twisted nails, formed diameter refers to crest diameter. Diameter does not include coating except cladding. (See **thread-crest diameter**.) **F 547, F16**

diameter, n—specified size diameters shall be measured across the center line of the packaged coil with a tolerance of ± 2 in.; installed diameters are always less than the packaged diameter of the coil. **F 1379, F14**

diameter, average fiber—See **average fiber diameter**. **D 4845, D13**

diameter, sedimentation—the diameter of a hypothetical sphere of the same specific gravity and the same settling velocity as the given particle in the same fluid. **D 4410, D19**

diamond, n—in *zippers*, the wedge-shaped portion of a slider between the throats. **D 123, D13**

diamond, n—the wedge-shaped portion of a slider between the throats. **D 2050, D13**

diamond—the opening formed by the woven wires in chain link fence fabric. **F 552, F14**

diamond core bit—non-percussion drill bit, usually utilizing a hollow cylindrical pipe or tube with a diamond-impregnated matrix at the end that is used to drill in the base material. **E 2265, E06**

diamond count—the number of diamond openings from one edge of fabric to the other. The count of a given fabric shall begin at the first completed diamond at one edge and continue to the unfinished (half) or full opening at the other edge. **F 552, F14**

diamond head—square head of trapezoidal longitudinal section, with flat upper and bearing surfaces and bearing surface larger than upper surface. **F 547, F16**

diamond paste, n—diamond dust dispersed in a paste or slurry for use as a grinding or polishing compound. **C 1145, C28**

diamond point—symmetrical point having four approximately equal bevelled planes forming a pyramid; its length measured along cut edge of point. Usually applied unless otherwise specified. **F 547, F16**

diamond sawn—a surface with a very low-relief pattern of linear and/or curved grooves, produced by diamond saw blades (either circular, belt, or gang). **C 119, C18**

diamond tool, n—any tool in which the working area is inset with diamonds or diamond dust. **C 1145, C28**

diamond wheel, n—a bonded grinding wheel in which the abrasive grains are crushed and sized natural or synthetic diamonds. **C 1145, C28**

diaphragm—a porous or permeable membrane separating anode and cathode compartments of an electrolytic cell from each other or from an intermediate compartment. **B 374, B08**

diaphragm nail—stout, bright or galvanized, regular-stock-steel or hardened-steel, helically threaded, $1\frac{1}{2}$ by 0.135 to $2\frac{1}{2}$ by 0.148-in. nails with flat slightly countersunk $\frac{3}{16}$ -in. head and medium diamond point. **F 547, F16**

diaspore clay, n—a rock consisting essentially of diaspore bonded by fireclay. **C 71, C08**

diatom—single cell marine animal having a coating consisting principally of silica. **D 6161, D19**

diatomaceous earth—See **diatomite**. **C 242, C21**

diatomaceous earth (DE) filtration—filtration using an amorphous, lightweight siliceous earth medium occurring naturally as the fossil remains of diatoms. **D 6161, D19**

diatomaceous silica, n—insulation composed principally of diatomaceous earth with or without binders, and which usually contains reinforcing fibers. **C 168, C16**

diatomite (diatomaceous earth)—amorphous lightweight siliceous material having the theoretical formula $\text{SiO}_2 \cdot n\text{H}_2\text{O}$, occurring

naturally as the fossil remains of tiny plants termed diatoms; also known as *kiesel-guhr*, *tripolite*, and *infusorial earth*. **C 242, C21**

dice—the more or less cubical fracture of tempered glass. **C 162, C14**

dicyclopentadiene resin, n—a resin produced by the thermal polymerization of a concentrated dicyclopentadiene stream. **D 6440, D01**

die, n—a member of the compacting tool set forming the cavity in which the powder is compacted or a P/M compact is repressed. **B 243, B09**

die body, n—the stationary or fixed part of a die. **B 243, B09**

die casting, n—a casting process in which molten metal is injected under high velocity and pressure into a metal die and solidified; also, a product produced by such a process. Alternately known as pressure die casting. **B 899, B02**

die cut—See **container**. **D 996, D10**

die insert, n—a removable liner or part of a die body. **B 243, B09**

dielectric, n—a medium in which it is possible to maintain an electric field with little supply of energy from outside sources. **D 1711, D09**

dielectric—a medium in which it is possible to maintain an electric field with little supply of energy from outside sources. The energy required to produce the electric field is recoverable, in whole or in part. A vacuum, as well as any insulating material is a dielectric. **D 2864, D27**

dielectric, adj—pertaining to the appearance of those materials for which the first surface reflectance is characteristic of the illuminant; compare **metal-like**. **E 284, E12**

dielectric breakdown—a threshold effect in a dielectric medium where, at some electric field strength across the medium, bound electrons become unbound and travel through the medium as a current. In solid media, the region of the current path is permanently damaged. The unit of measurement is usually volts per unit of thickness. **D 5077, D10**

dielectric breakdown voltage—the potential difference at which electrical failure occurs in an electrical insulating material or insulation structure, under prescribed test conditions. **D 2864, D27**

dielectric breakdown voltage (electric breakdown voltage), n—the potential difference at which dielectric failure occurs under prescribed conditions, in an electrical insulating material located between two electrodes. (See also Test Method D 149, Appendix X1.) **D 1711, D09**

dielectric constant—see **relative permittivity**. **D 1711, D09**

dielectric constant—See **dielectric constant, relative** (especially Note 2). (See also **permittivity** (especially Note 2).) **D 2864, D27**

dielectric constant—a measure of the ability of a material to store electrical energy in the presence of an electrostatic field. **D 7099, D18**

dielectric constant—see **permittivity, relative**. **E 1142, E37**

dielectric constant, absolute—the same as **permittivity**. **D 2864, D27**

dielectric constant, relative—the same as **permittivity, relative**. **D 2864, D27**

dielectric dissipation factor, D—the ratio of the loss factor, ϵ'' , to the absolute permittivity, ϵ' , or

$$D = \epsilon''/\epsilon'$$

E 1142, E37

dielectric failure—the failure of an element in a dielectric circuit that exists when the insulating element becomes conducting. This event may take the form of a gradual increase in current exceeding a specified value, but it usually takes the form of an almost instantaneous charge transfer accompanied by collapse of the insulating properties and partial or complete localized destruction of the dielectric medium. In the case of liquids and gases the failure may be self-healing. **D 2864, D27**

dielectric failure (under test), n—an event that is evidenced by an increase in conductance in the dielectric under test limiting the electric field that can be sustained. **D 1711, D09**

dielectric loss angle—the angle whose tangent is the dissipation factor or $\arctan \epsilon''/\epsilon'$. **E 1142, E37**

dielectric printing process—a nonimpact printing technique in which specially treated paper consisting of a conductive base layer coated with a nonconductive thermoplastic material is used to hold an electric charge usually applied directly by a set of electrode styli. The electric charge corresponds to the latent image of the original. Following the charging step, the paper is imaged by a toner system similar to that of electrostatic copying devices. This technique is sometimes called electrographic, and is currently employed on general purpose nonimpact printers, plotting and facsimile devices. **F 909, F05**

dielectric strength, *n*—the voltage gradient at which dielectric failure of the insulating material occurs under specific conditions of test. **D 1711, D09**

dielectric strength—a property of an insulating material described by the average voltage gradient at which electric breakdown occurs under specific conditions of test. **D 2864, D27**

dielectric thermal analysis, (*DETA or DEA*), *n*—a technique in which the dielectric constant (permittivity, or capacitance) and dielectric loss (conductance) of a substance under oscillating electric field are measured as a function of temperature or time while the substance is subjected to a controlled-temperature program in a specified atmosphere. (*ICTAC*) **E 473, E37**

dielectric withstand voltage—the maximum voltage a dielectric can withstand in a membrane switch without a visual change from a voltage discharge or specified change of insulation resistance, or both. **F 2112, F01**

die lubricant, *n*—a lubricant applied to the walls of the die and to the punches to facilitate the pressing and ejection of the compact. **B 243, B09**

die marks—See **grip marks**. **F 547, F16**

diene polymer, *n*—a polymer formed from one or more monomer species, at least one of which is a diolefin. **D 1566, D11**

diene rubber, *n*—polymer having unsaturated carbon in the main chain, derived from butadiene or a substituted butadiene. **D 1566, D11**

die-parting line—a lengthwise flash or depression on the surface of a pultruded plastic part.

NOTE—The die-parting line is associated with the area where separate pieces of the die join together to form the cavity. **D 3918, D20**

diesel fuel oil, *n*—any petroleum liquid suitable for the generation of power by combustion in compression ignition (diesel) engines. **D 4175, D02**

diesel index, *n*—an approximation of the cetane number (the ignition performance) of diesel fuel, calculated from the density and the aniline point. (No longer widely used for distillate fuels but applicable to some blended distillate residual fuels (see also **cetane index**)). **D 4175, D02**

die set, *n*—the parts of a press that hold and locate the die in proper relation to the punches. **B 243, B09**

die swell, *n*—difference between the dimensions of the cross section of an extrudate and the corresponding dimensions of the die orifice by which the extrudate is formed. **D 1566, D11**

dietary accumulation—the net accumulation of a substance by an organism as a result of ingestion in the diet. **E 943, E47**

die-wall lubricant, *n*—synonymous with **die lubricant**. **B 243, B09**

difference absorption spectrum—a plot of the difference between two absorbances or between any function of two absorbances, against wavelength or any function of wavelength. **E 131, E13**

difference limen, *n*—See **threshold, difference**. **E 253, E18**

differentia, *n*—a characteristic that distinguishes one species of a genus from all other species of that genus. **E 1992, E02**

differential, *adj*—pertaining to a difference in measured or measurable quantities usually between a substance and some reference or standard material. **E 473, E37**

differential (acoustic emission) amplitude distribution $f(V)$ —see **distribution, differential (acoustic emission) amplitude $f(V)$** . **E 1316, E07**

differential (acoustic emission) threshold crossing distribution $f_{\lambda}(V)$ —see **distribution, differential (acoustic emission) threshold crossing**. **E 1316, E07**

differential aeration cell (oxygen concentration cell)—a concentration cell caused by differences in oxygen concentration along the surface of a metal in an electrolyte. (See **concentration cell**.) **G 15, G01**

differential blackbody—an apparatus for establishing two parallel isothermal planar zones of different temperatures, and with effective emissivities of 1.0. (E 1213) **E 1316, E07**

differential coils—two or more coils electrically connected in series opposition such that any electric or magnetic condition, or both, that is not common to the areas of a specimen being electromagnetically tested will produce an unbalance in the system and thereby yield an indication. **E 1316, E07**

differential curve: (1) in thermal analysis—a curve resulting from the differential method of thermal analysis when the difference in temperature ($\theta - \theta'$) between a specimen and a neutral body is plotted against the temperature of the latter.

(2) *in dilatometry*—a curve produced by plotting against the temperature the difference in changes of length or volume between a body of known expansivity and a body (specimen) of unknown expansivity. **E 7, E04**

differential dyeing behavior, *n*—of cotton, the tendency of cotton fibers to absorb and retain selectively varying proportions of different dyes from a binary dye bath. **D 123, D13**

differential dyeing behavior, *n*—of cotton, the tendency of cotton fibers to absorb and retain selectively varying proportions of different dyes from a binary dye bath. **D 7139, D13**

differential heating, *n*—heating that intentionally produces a temperature gradient within a steel object such that, after cooling, a desired stress distribution or variation in properties is present within the object. **A 941, A01**

differential heat of adsorption—the heat evolved during the adsorption of an incremental quantity of adsorbate at a given level of adsorption. **D 2652, D28**

differential interference contrast illumination—a microscopical technique employing a beam-splitting double-quartz prism; that is a modified Wollaston prism placed ahead of the objective with a polarizer and analyzer in the 90° crossed positions. The two light beams are made to coincide at the focal plane of the objective, thus rendering height differences visible as variations in color. The prism can be moved, shifting the interference image through the range of Newtonian colors. **E 7, E04**

differential leak detector—a leak detector employing two similar gage tubes in a bridge circuit with a trap which is selective for the tracer gas between the system and one of the tubes. **E 1316, E07**

differentially coated sheet, *n*—metallic coated sheet with specified difference in weight (mass) of metallic coating between the two surfaces. **A 902, A05**

differential measurements—in electromagnetic testing, measurements made in which the imbalance in the system is measured using differential coils in contrast to absolute and comparative measurements. (See also **differential coils**.) **E 1316, E07**

differential Pirani gage—a leak detecting device employing two similar Pirani tubes as arms of a Wheatstone bridge. **E 1316, E07**

differential pressure (ΔP , dP)—the difference in pressure between two points. **D 6161, D19**

differential price escalation rate—the expected percent difference between the rate of increase assumed for a given item of cost (such as energy), and the general rate of inflation. **E 631, E06**

differential price escalation rate, *n*—the expected percent difference between the rate of increase assumed for a given item of cost (such as energy), and the general rate of inflation. **E 833, E06**

differential readout—in electromagnetic testing, the signal output of differential coils. (See also **differential coils**.) **E 1316, E07**

differential scanning calorimeter (DSC), *n*—a device which is capable of heating a test specimen and a reference at a controlled rate and of automatically measuring the difference in heat flow between the specimen and the reference both to the required sensitivity and precision. **F 2005, F04**

differential scanning calorimetry (DSC), *n*—A technique in which the heat flow difference into a substance and a reference material is measured as a function of temperature while the substance and reference material are subjected to a controlled-temperature program. (ICTAC)

NOTE—The record is the differential scanning calorimetric or DSC curve. Two modes, power compensation differential scanning calorimetry, and heat flux differential scanning calorimetry can be distinguished, depending on the method of measurement used. **E 473, E37**

differential scanning calorimetry (DSC), *n*—a technique in which the difference in energy inputs into a substance and a reference material is measured as a function of temperature, while the substance and the reference material are subjected to a controlled temperature program. **E 1445, E27**

differential scanning calorimetry (DSC), *n*—a technique in which the difference in heat flow into or out of a substance and an inert reference is measured as a function of temperature while the substance and the reference material are subjected to a controlled temperature program.

F 2005, F04

differential settlement—settlement that varies in rate or amount, or both, from place to place across a structure. **D 653, D18**

differential shrinkage, *n*—in *zippers*, the difference in longitudinal dimensional change between the zipper tape and the fabric to which the zipper is attached. **D 123, D13**

differential signal—in electromagnetic testing, an output signal that is proportional to the rate of change of the input signal.

E 1316, E07

differential system—an electromagnetic testing system that uses coil assemblies and associated electronics to detect an electric or magnetic condition, or both, that is not common to the areas of the specimen being tested. (See also **differential coils**.) **E 1316, E07**

differential thermal analysis (DTA), *n*—A technique in which the temperature difference between the substance and a reference material is measured as a function of temperature, while the substance and reference material are subjected to a controlled-temperature program. (ICTAC)

NOTE—The term *quantitative differential thermal analysis* covers those uses of DTA where the equipment is designed to produce quantitative results. **E 473, E37**

differential thermal analysis (DTA), *n*—a technique in which the temperature difference between a substance and reference material is measured as a function of temperature while the substance and the reference material are subjected to a controlled temperature program. **E 1445, E27**

differential thermocouple—two thermocouples placed in series opposition (bucking). **E 7, E04**

differential thermocouple—see **differential thermopile**. **E 1142, E37**

differential thermopile—a number of temperature sensors connected in series-opposing and arranged so that there is an increase in output signal for a given temperature difference between alternate junctions maintained at a reference temperature and the measured temperature. **E 1142, E37**

differential titration—determination of the concentration of two or more species in one sample by titration with a reagent containing a species that reacts with both sample species. In order to obtain distinct end-point breaks, the formation constants or solubility products of the two species formed must differ by several orders of magnitude. **D 4127, D19**

diffraction—a change in the direction of propagation of sound energy in the neighborhood of a boundary discontinuity, such as the edge of a reflective or absorptive surface. **C 634, E33**

diffraction:—(1) a modification which radiation undergoes, as in passing by the edge of opaque bodies or through narrow slits, in

which the rays appear to be deflected.

(2) coherent scattering of X-radiation by the atoms of a crystal which necessarily results in beams in characteristic directions. Sometimes called reflection.

(3) the scattering of electrons, by any crystalline material, through discrete angles depending only on the lattice spacings of the material and the velocity of the electrons. **E 7, E04**

diffraction—the spreading or bending of waves as they pass through an aperture or around the edge of a barrier. **E 1316, E07**

diffraction grating—an artificially produced periodic array of scattering centers capable of producing a pattern of diffracted energy, such as accurately ruled lines on a plane surface. **E 7, E04**

diffraction pattern (X-rays)—the spatial arrangement and relative intensities of diffracted beams. **E 7, E04**

diffraction ring—the diffraction pattern produced by a given set of planes from randomly oriented crystalline material. (See also **Debye ring**.) **E 7, E04**

diffuse, *adj*—in *optical propagation*, transmission or reflection of flux with diffusion. **E 284, E12**

diffuse, *adj*—referring to radiometric quantities, indicates that the flux propagates in many directions, as opposed to direct beam which refers to collimated flux. When referring to solar irradiance, it is the global irradiance less the direct beam irradiance. When referring to reflectance, it is the directional hemispherical reflectance less the specular reflectance.

NOTE—Diffuse has been used in the past to refer to hemispherical collection (including the specular component) or irradiation, with equal radiance for all directions over a hemisphere. This use is deprecated in favor of the more precise term hemispherical.

E 772, E44

diffuse indications—indications that are not clearly defined as, for example, indications of subsurface defects. **E 1316, E07**

diffuse porous wood—certain hardwoods in which the pores exhibit little or no variation in size or distribution throughout the growth ring, only decreasing slightly in size, gradually toward the outer border of the ring. **D 9, D07**

diffuser, *n*—*forgas*, a device for dispersing gas into a fluid. **D 4175, D02**

diffuser, *n*—*forgas*, a device for dispersing gas into a liquid. (Test Method D 892). **D 4175, D02**

diffuser, *n*—device used to alter the spatial distribution of flux by diffusion. **E 284, E12**

diffuse reflectance, ρ_d , *n*—the ratio of the reflected flux to the incident flux, where the reflection is at all angles within the hemisphere bounded by the plane of measurement except in the direction of the specular reflection angle. **E 284, E12**

diffuse reflectance factor, R_d , *n*—the ratio of the flux reflected at all angles within the hemisphere bounded by the plane of measurement except in the direction of the specular reflection angle, to the flux reflected from the perfect reflecting diffuser under the same geometric and spectral conditions of measurement. **E 284, E12**

diffuse reflection, *n*—process by which incident flux is distributed by reflection over a wide range of angles. **D 2946, C17**

diffuse reflection—reflection in which the flux is scattered in many directions by diffusion at or below the surface, (see Terminology E 284). **E 131, E13**

diffuse reflection, *n*—reflection in which flux is scattered in many directions by diffusion at or below the surface. See **diffusion**. **E 284, E12**

diffuse reflection, *n*—diffusion by reflection in which, on the macroscopic scale, there is no regular reflection. **E 349, E21**

diffuse reflection, *n*—the component of reflected light that emanates uniformly in all directions from the reflecting surface. **F 1294, F05**

diffuse sound field—the sound in a region where the intensity is the same in all directions and at every point. **C 634, E33**

diffuse transmission, *n*—transmission in which diffusion occurs, independently, on a macroscopic scale, of the laws of refraction.

E 284, E12

diffuse transmission, n

diffuse transmission, n —transmission in which diffusion occurs independently, on the macroscopic scale, of the laws of refraction.

E 349, E21

diffuse transmittance, T_D, n —the ratio of the flux transmitted by a specimen to the incident flux, the transmitted flux being measured at all forward angles except the regular transmission angle.

E 284, E12

diffusion—(1) spreading of a constituent in a gas, liquid, or solid tending to make the composition of all parts uniform; (2) the spontaneous movement of atoms or molecules to new sites within a material.

B 374, B08

diffusion, n —change of the angular distribution of a beam of radiant flux by a transmitting material or a reflecting surface such that flux incident in one direction is continuously distributed in many directions, the process not conforming (on a macroscopic scale) to the laws of Fresnel (regular) reflection and refraction and there being no change in frequency (wavelength) of the monochromatic components of the flux.

E 284, E12

diffusion, n —change of the spatial distribution of a beam of radiation when it is deviated in many directions by a surface or a medium.

E 349, E21

diffusion—in leak testing, the flow of the gas through a substance in which the gas actually migrates through the crystal lattice of the substance rather than through a geometrical leak (molecular diameters versus hole dimension).

E 1316, E07

diffusion—the movement of a material such as a gas or liquid, in the body of a plastic.

F 412, F17

diffusion-alloyed powder, n —a partially alloyed powder produced by means of a diffusion anneal.

B 243, B09

diffusion coating, n —any process whereby a base metal is either coated with another metal and heated to a sufficient temperature in a suitable environment, or exposed to a gaseous or liquid medium containing the other metal, thereby causing diffusion of the coating or other metal into the base metal, with a resultant change in the composition and properties of its surface.

A 941, A01

diffusion coating—an alloy coating produced by applying heat to one or more coatings deposited on a basis metal.

B 374, B08

diffusion cycle—specific time and temperature to acquire a depth of diffusion and composition.

B 374, B08

diffusion limited current density—the current density, often referred to as limiting current density, that corresponds to the maximum transfer rate that a particular species can sustain due to the limitation of diffusion.

G 15, G01

diffusion, molecular—See **molecular diffusion**.

D 1356, D22

diffusion-transfer process—a rapid photographic process in which a negative image is produced at one location, with unused imaging materials then diffusing across a thin fluid layer to produce a positive image on a receptor sheet.

E 7, E04

diffusion treatment (or coating)—(1) process of producing a surface layer (diffusion layer) by diffusion of another metal or non-metal into the surface of the basis material.

B 374, B08

(2) in electroplating, heat treatment applied to a work piece to achieve alloying or intermetallic compound formation between two or more coatings on a basis material.

B 374, B08

diffusion zone—the zone of viable composition at the junction between two different materials, such as in welds or between the surface layer and the core of clad materials or bearings, in which interdiffusion between the various components has taken place.

E 7, E04

diffusivity, thermal, n —the ratio of thermal conductivity of a substance to the product of its density and specific heat. (In SI units: $(W/(m \cdot K))/((kg/m^3) \cdot (J/(kg \cdot K))) = m^2/s$.) (In inch-pound units: $(Btu/(hr \cdot ft) F)/((lb/ft^3)(Btu/(lb \cdot F))) = ft^2/hr$)

C 168, C16

digestate—an acidified aqueous solution that results from digestion of the sample.

E 631, E06

digestate—an acidified aqueous solution produced by digestion.

E 1605, E06

digester—a bioreactor in which anaerobic bacteria are used to

decompose biomass or organic wastes into methane and carbon dioxide.

E 1705, E48

digestion—the sample preparation process that will solubilize (extract) targeted analytes present in the sample and results in an acidified aqueous solution called the digestate.

E 631, E06

digestion—a high temperature sample preparation process that solubilizes targeted analytes that may be present in the sample, and results in an acidified aqueous solution called the digestate.

E 1605, E06

digital—the representation of data or physical quantities in the form of discrete codes, such as numerical characters, rather than a continuous stream.

E 1316, E07

digital counter reading, n —for the CFR engine, a numerical indication of cylinder height, indexed to a basic setting at a prescribed compression pressure when the engine is motored.

D 4175, D02

digital detector array—an electronic device which converts ionizing or penetrating radiation into a discrete array of analog signals that are subsequently digitized and transferred to a computer for display as a digital image corresponding to the radiologic dose pattern incident upon the input region of the device.

E 1316, E07

digital image—an image composed of discrete pixels each of which is characterized by a digitally represented luminance level.

E 1316, E07

digital image acquisition system—a system of electronic components which, by either directly detecting radiation or converting analog radiation detection information, creates an image of the spatial radiation intensity map comprised of an array of discrete digital intensity values (see **pixel**).

E 1316, E07

digital image enhancement—any operation used for the purpose of enhancing some aspect of the original image.

E 1316, E07

digital image processing system—a system which uses algorithms to process digital image data.

E 1316, E07

digital pH/mV meter—an instrument with digital display of millivolts or pH units. Less operator error is associated with digital instruments since there is no need for interpolation and no risk of confusing scales.

D 4127, D19

digitization—the conversion of an analog signal to digital values using an analog-to-digital converter “sampling” or “digital sampling.”

E 131, E13

digitization noise—the noise generated in an interferogram through the use of an analog-to-digital converter whose least significant bit represents a value comparable to, or greater than, the peak-to-peak noise level in the analog data.

E 131, E13

digitize (for radiology)—the act of converting an analog image or signal to a digital presentation.

E 1316, E07

digs—deep, short scratches.

C 162, C14

di-hydrated or double hydrated lime—dolomitic lime which has been hydrated under greater than atmospheric pressure and contains less than 8 % unhydrated oxides.

C 51, C07

dike, n —an embankment or ridge of either natural or synthetic materials used to contain or hold a liquid, slurry, sludge, or other material in ponds.

E 2201, E50

dilatancy—property of volume increase under loading. (ISRM)

D 653, D18

dilatancy—the expansion of cohesionless soils when subject to shearing deformation.

D 653, D18

dilation crack—a tensile fracture in a frozen material caused by surface extension due to doming, slope or embankment movement, or toppling.

D 7099, D18

dilation crack ice—ice that forms in dilation cracks.

D 7099, D18

dilatometer—the instrument used in dilatometry for measuring lengths or volume changes.

E 7, E04

dilatometric softening point—the temperature at which the viscous sag of the glass specimen exactly counteracts the expansion as thermal expansion measurements proceed during heating.

C 162, C14

dilatometry—the measurement of length or volume changes of a

- substance undergoing a change in temperature, pressure, or state. See Practice E 80. E 7, E04
- dilatometry, *n***—see **Thermodilatometry**. E 473, E37
- diluent, *n***—a liquid additive, whose function is to reduce the concentration of solids and viscosity of an adhesive. D 907, D14
- diluent**—a gas, liquid, or solid used to reduce the concentration of an active ingredient in the formulation or application of a pesticide. E 609, E35
- diluent**—a gas, liquid, or solid used to reduce the concentration of an active ingredient in the formulation or application of a pesticide (see Definitions E 609). E 1102, E35
- dilution factor**—the ratio of the volume of a diluted solution to the volume of original solution containing the same quantity of solute as the diluted solution. E 131, E13
- dilution factor, *f, n***—the proportion of solvent increase made to reduce the concentration and thus the absorbance of a solute, expressed by the ratio of the volume of the diluted solution to the volume of original solution containing the same quantity of solute as the diluted solution. D 4175, D02
- dimensional change, *n***—a generic term for changes in length or width of a specimen subjected to specified conditions. D 123, D13
- dimensional change, *n***—*in pressing and finishing of garments*, the change in dimensions of a fabric caused by pressing and finishing during garment manufacture. D 123, D13
- dimensional change, *n***—a generic term for changes in length or width of a specimen subjected to specified conditions. D 4850, D13
- dimensional change, *n***—*in pressing and finishing of garments*, the change in dimensions of a fabric caused by pressing and finishing during garment manufacture. D 7022, D13
- dimensional change in boiling water (felt), *n***—the change in length and width with any associated change in thickness produced by immersion in boiling water under specified conditions. D 123, D13
- dimensional change in boiling water (felt), *n***—the change in length and width with any associated change in thickness produced by immersion in boiling water under specified conditions. D 4845, D13
- dimensional change of a compact, *n***—the difference, at room temperature, between the size of the sintered specimen and the die size. B 243, B09
- dimensional stability, *n***—the ability of a material to retain its length and width dimensions under specified conditions. D 123, D13
- dimensional stability, *n***—the ability of a material to retain its length and width dimensions under specified conditions. D 4850, D13
- dimensional stability, *n***—the ability of a resilient flooring to retain its original dimensions during the service life of the product. F 141, F06
- dimensional stabilization**—treatment of wood to reduce swelling and shrinking caused by changes in its moisture content. D 9, D07
- dimension ratio**—the average specified diameter of a pipe divided by the minimum specified wall thickness. F 412, F17
- dimensions, *n***—*in packaging*, the measurement of length, width (or diameter), and depth of **containers**, expressed in that order; it should be stated as “inside” or “outside.” D 996, D10
- dimension stone**—natural stone that has been selected and fabricated to specific sizes or shapes. C 119, C18
- dimple**—a shallow depression in the porcelain enamel, sometimes a defect. C 286, B08
- DIN**—abbreviation for Deutsches Institut für Normung (the German Standards Body). D 4175, D02
- DIN color system, *n***—color order system developed for the Deutsche Industrie Normung (German Standardization Institute) to provide equality of visual spacing of colors in specified series, based on the attributes hue, saturation, and relative darkness degree. E 284, E12
- dinnerware**—ceramic whiteware made in a given pattern and in a full line of articles comprising a dinner service. C 242, C21
- dip, *n***—a chemical composition that is applied to a textile cord or fabric to improve its adhesion to rubber or other elastomer. D 123, D13
- dip, *n***—a chemical composition that is applied to a textile cord or fabric to improve its adhesion to rubber or other elastomer. D 6477, D13
- dip application**—application by direct immersion. E 1102, E35
- dip encapsulation** (a type of conformal coating), *n*—an embedding process in which the insulating material is applied by immersion and without the use of an outer container. D 1711, D09
- dipentene, *n***—chemically defined as the optically inactive form of the monocyclic terpene hydrocarbon limonene.
- chemically processed dipentene, *n**—recovered as a product or a by-product in connection with the chemical treatment and conversion of other terpenes.
- destructively distilled dipentene, *n**—from the lighter portions of the oil recovered during the destructive distillation of pine wood.
- steam-distilled dipentene, *n**—fractionated from the crude oleoresinous extract during the processing of related steam-distilled wood naval stores.
- sulfate dipentene, *n**—from the crude condensate of the vapors generated in the digestion of wood in the sulfate paper pulp process. D 804, D01
- diphase metal cleaner**—a composition which produces two phases in the cleaning tank, namely, a solvent layer and an aqueous layer, which cleans by solvent action and emulsification. D 459, D12
- dipole relaxation time, γ** —the exponential decay time required for the electric polarization of any point of a suitably charged dielectric to fall from its original value to $1/e$ of that value, due to the loss of dipole orientation. E 1142, E37
- dipped**—dipped in bath of molten zinc for coating purposes, with excess zinc removed; resulting in coating essentially free from blisters, lumps, gritty areas, acid spots, dross warts, and flux. F 547, F16
- dip pick-up, *n***—*in glass cords*, the amount of dip solids present as supplied. D 123, D13
- dip pick-up, *n***—*in a textile cord or fabric*, the amount of dip or dip components present after processing, including drying, as determined by prescribed methods, and expressed as a percentage of the mass of the oven-dried dip-free material. D 123, D13
- dip pick-up, *n***—the amount of dip or dip components present in a textile cord or fabric after processing, expressed as a percentage of the mass of the oven-dried dip-free material. D 6477, D13
- dipping**—the process of coating a metal shape by immersion in slip, removal, and draining. In dry process enameling, the method of coating by immersing the heated metal shape for a short time in powdered frit. C 286, B08
- dipping (latex), *n***—a process in which a layer of rubber is deposited on a mold or form as a result of immersion in a bath of compounded latex. D 1566, D11
- dipping weight*—see **pick-up**. C 286, B08
- DIP switch**—dual in-line package switch. F 1457, F05
- dip tube**—tubing connecting the lower portion of the container or dispenser with the valve. D 3064, D10
- dip tube, *n***—a tube which provides passage of the product from the container to the pump system. D 6655, D10
- direct bonded basic brick, *n***—a fired refractory in which the grains are joined predominantly by a solid state diffusion mechanism. C 71, C08
- direct cabling technology, *n***—a single-step manufacturing system that produces a twist-balanced cabled yarn (2 fold) from twistless single yarns. D 123, D13
- direct cabling technology, *n***—a single-step manufacturing systems that produces a twist-balanced cabled yarn (2 fold) from twistless single yarns. D 4849, D13

direct contact magnetization

direct contact magnetization—a technique of magnetizing in which the current is passed through a part via prods or contact heads.

E 1316, E07

direct detection of mycoplasma—detection of mycoplasma by cultivation in culture media.

E 1705, E48

direct development—see **positive development**.

F 335, F05

directed application—an application to a restricted area such as a row, bed, or at the base of plants.

E 609, E35

directed application—an application to a restricted area such as a row, bed, or at the base of plants (see Definitions).

E 1102, E35

direct electrophotographic copying process—an electrophotographic copying process in which the photoconductor is an integral part of the final copy.

F 335, F05

direct exposure imaging—in the direct exposure imaging method, the conversion screen and image recorder are simultaneously exposed to the neutron beam.

E 1316, E07

direct fire—a method of maturing porcelain enamel wherein the products of combustion come in contact with the ware.

C 286, B08

direct-fired furnace—a melting furnace having neither recuperator nor regenerator.

C 162, C14

direct incident cause, *n*—the mechanical or thermodynamic event, such as breakage of a component or near-adiabatic compression, the physicochemical property, such as heat of combustion, the procedure, such as a valve opening rate, or any departure(s) from the intended state of any of these items, that leads directly to an incident (see *incident*).

G 126, G04

directional, *adj*—(1) so designed that performance depends on direction or is restricted in direction; more effective in some directions than others.

(2) referring to a beam, beam in which the flux measured is confined to directions that differ moderately from the centroid direction or axis of the beam. (E 179)

E 284, E12

directional—over an infinitesimal element of solid angle in a given direction. For properties, a solid angle small enough that the property does not vary within the solid angle may be considered an element of solid angle. Indicated by the symbols θ , Φ , where θ is the angle between the given direction and the normal to the sample surface, and ϕ is the azimuth angle of the direction measured counter-clockwise from a reference mark on the sample. See **radiometric properties and quantities**.

E 772, E44

directional emissivity of a thermal radiator, *n*—ratio of the thermal radiance of the radiator in a given direction to that of a full radiator at the same temperature. Symbol: $\epsilon(\theta, \phi)$; $\epsilon(\theta, \phi) = L_{e,th}(\theta, \phi)/L_e(\epsilon = 1)$.

E 349, E21

directionality, *n*—(1) *perceived*, the degree to which the appearance of a surface changes as the surface is rotated in its own plane, under fixed conditions of illumination and viewing.

(2) *measured*—(scattering indicatrix, azimuthally nonisotropic)—difference in pattern of near-specular and semidiffusely scattered light, dependent upon the azimuthal angles of the incident and viewing beams.

E 284, E12

direction change—a change in the orientation of the principal dimension or of the support of adjoining units of the roofing system.

D 1079, D08

direction of lay—the lateral direction, designated as left-hand or right-hand, in which the wires of a member or units of a conductor run over the top of the member or conductor as they recede from an observer looking along the axis of the member or conductor.

B 354, B01

direction of lay, *n*—the helical disposition of the components of a strand or cord

D 123, D13

direction of lay, *n*—the helical disposition of the components of a strand or cord.

D 6477, D13

direction of slippage, *n*—at the seam line of movement parallel to either the filling or the warp on a woven fabric in which minimum force is required to produce yarn slippage.

D 123, D13

direction of slippage, *n*—at the seam, the line of movement parallel

to either the filling or the warp on a woven fabric in which minimum force is required to produce yarn slippage.

direction of twist, *n*—the right or left direction of the helix formed in a twisted strand as indicated by superimposition of the capital letter "S" or "Z."

D 123, D13

direction of twist, *n*—the right or left direction of the helix formed in a twisted strand as indicated by superimposition of the capital letter "S" or "Z."

D 4849, D13

direction of twist, *n*—see **direction of lay**.

D 6477, D13

directly applied fire resistive coating, *n*—materials that are normally sprayed onto substrates to provide fire-resistive protection of the substrates.

E 176, E05

direct material—material that may become an integral part or used up or expended in making a finished product. Examples are steel used to make an automobile and the wood to make furniture for the production of commercial items. Direct materials are charged to work-in-progress as part of inventory cost.

E 2135, E53

direct measurement—determination of sample concentration or activity by directly relating the electrode potential to the level of the species being measured. The level can be read from a calibration curve or the log scale of a selective ion meter.

D 4127, D19

direct-measuring bed-load sampler—a device which physically collects and holds bed load.

D 4410, D19

direct medical control—the process of providing immediate physician orders to EMS personnel through direct communication (also known as on-line medical control).

F 1177, F30

direct memory access, *n*—an input/output facility which allows transfers directly in or out of main storage without passing through the processors general registers. (See DMA.)

F 1457, F05

direct-on—see **cover coat**.

C 286, B08

director, *n*—optical components, such as mirrors, lenses, gratings, or other objects, such as ceilings or walls, that direct radiant flux from a source to a specimen to be observed or measured.

E 284, E12

direct oxygen service, *n*—service in contact with oxygen-enriched atmosphere during normal operations.

G 126, G04

direct print—a photographic print of an original negative.

E 7, E04

direct quenching, *n*—in *thermomechanical processing*, quenching immediately following the final hot deformation.

A 941, A01

direct quenching, *n*—in *thermochemical processing*, quenching immediately following the thermochemical treatment.

A 941, A01

direct-reading XRF—see **XRF direct-reading analyzer**.

E 631, E06

direct reduced iron, *n*—iron ores that have been reduced to essentially metallic iron by heat and reducing agents, but without melting, and processed into suitable shapes (typically pellets) for use as a charge material in a melting operation.

A 644, A04

direct shear test—a shear test in which soil or rock under an applied normal load is stressed to failure by moving one section of the sample or sample container (shear box) relative to the other section.

D 653, D18

direct sound field—the sound that arrives directly from a source without reflection.

C 634, E33

direct thermal imaging product—paper, film, or other substrate upon which a coating is applied; the imaging components consist of a color former, a developer, a sensitizer and antioxidants which react to form an image when heated from a thermal printhead.

F 1623, F05

direct thermal paper, *n*—paper coated with a heat-reactive coating, which changes from a colorless form to an intense colored state upon contact with a thermal printhead.

F 1623, F05

direct thermal product, *n*—substrate coated with a heat-sensitive formulation for the purpose of creating an image when heat is applied from a thermal printhead.

F 1623, F05

direct-use facility, *n*—a facility which uses geothermal energy for purposes other than the generation of electricity (e.g., space heating, greenhouses, bathing, and industrial processes).

E 957, E44

- direct viewing**—a view that is not redefined by optical or electronic means. **E 1316, E07**
- direct weathering, *n***—a technique of weathering in which the test specimens are exposed to all prevailing elements of the atmosphere. **G 113, G03**
- direct yarn numbering system, *n***—a system that expresses the linear density of yarn in mass per unit length. **D 123, D13**
- direct yarn numbering system, *n***—a system that expresses the linear density of yarn in mass per unit length. **D 4849, D13**
- dirt**—a small particle of foreign material imbedded in the surface of flat glass sheets. **C 162, C14**
- dirt, *n***—*general term*, any undesirable, extraneous, or contamination material visible in transmitted or reflected light in or on pulp, paper, or paperboard. **D 1968, D06**
- dirt, *n***—*quantitative term*, any undesirable, extraneous, or contaminating material in or on pulp, paper or paperboard, that has marked contrasting color to the rest of the sheet when viewed at more than one angle by reflected light, and that has an equivalent black area of 0.04 mm² or more. See **dirt, equivalent black area of a dirt speck (EBA)**. **D 1968, D06**
- dirt, *n***—*equivalent black area of a dirt speck (EBA)*, the area of the black spot on the white background of the TAPPI Standard Dirt Chart that makes the same visual impression on its background as does the dirt speck on the particular background in which it is embedded. **D 1968, D06**
- dirt**—*in paper*, refers to the presence of relatively nonreflective foreign particles embedded in the sheet. The size and lack of reflectance of the particles may be such that they will be mistaken for inked areas by an optical scanner. **F 149, F05**
- dirt, *n***—*when referenced for scanning purposes*, the presence of non-reflective foreign particles embedded in a substrate. **F 1294, F05**
- dirt (for coatings)* —see **soil**. **D 16, D01**
- dirt pick-up, *n***—*in building construction*, soiling caused by a foreign material other than micro-organism growth that is deposited on, adhered to, or embedded into a sealant, coating, or membrane. **C 717, C24**
- dirt receptacle first vacuum cleaner system, *n***—a vacuum cleaner construction in which the dirt laden air is passed through a dirt receptacle (bag type filter, bagless filter, or other type of dirt separator). The separated air is then pulled through the fan (bypass) or fan and motor (flow through) and expelled from the cleaner. This type of construction is sometimes referred to as clean air or indirect system. **F 395, F11**
- dirt resistance, *n*** (*for coatings*)—the ability of a coating to resist soiling by foreign material, other than microorganisms, deposited on or embedded in the dried coating. **D 16, D01**
- disbond**—an area within a bonded interface between two adherents in which an adhesive or cohesive failure has occurred. It may occur at any time during the life of the structure and may arise from a wide variety of causes. It is sometimes used to describe an area of separation between two laminae in the finished laminate (the term “delamination” is preferred). **D 3878, D30**
- discarded tires, *n***—a worn or damaged tire that has been removed from a vehicle. **D 5681, D34**
- discharge**—see **hazardous waste discharge**. **E 631, E06**
- discharge, *n***—the release of any solid, liquid or gas waste stream or any constituent thereof to the environment. **E 2201, E50**
- discharge capacity, thermal**—the amount of heat that can be removed from a storage device during a period of time and for a specific set of values for the initial and final temperatures of the storage device, the temperature of the entering fluid, and the mass flow rate of fluid through the storage system. **E 772, E44**
- discharged area development (DAD)**—a process in electrostatic copying where the photoconductive element is charged with a charge of the same sign as that of the toner. A light source is used to discharge only those areas that are to receive toner to form the image. In the development process, the charged background areas repel the like charged toner to the discharged areas on the photoconductor. **F 335, F05**
- discharge pressure**—in leak testing, same as **forepressure**. **E 1316, E07**
- discharge test time**—the duration of a single transient test in which energy is removed from the storage device. **E 772, E44**
- discharge, triggered capacitor, *n***—a series of electrical discharges from capacitors initiated by a separate means and extinguished when the voltage across the analytical gap falls to a value that no longer is sufficient to maintain it. **E 135, E01**
- discharge tube leak indicator**—a glass tube attached to a system being leak tested, with the glass tube having electrodes attached to a source of high-frequency high voltage, such as a Tesla coil or induction coil, so that changes in the color of the electrical discharge can be observed when a suitable tracer gas (methane, carbon dioxide, alcohol) flows through the leak. **E 1316, E07**
- discharge velocity, *v, q*** (LT⁻¹)—rate of discharge of water through a porous medium per unit of total area perpendicular to the direction of flow. **D 653, D18**
- discharge (water)**—the volume of water flowing through a cross-section in a unit of time, including sediment or other solids that may be dissolved in or mixed with the water; usually cubic feet per second (ft³/s), or cubic metres per second (m³/s). **D 4410, D19**
- discipline, *n***—one of the specific types or categories of lead-based paint activities defined in applicable Federal, state, or local regulations for which individuals may receive training from accredited training programs and become certified. **E 1605, E06**
- disclosure examinations over sexual history, *n***—A clinical polygraph examination intended to explore pre-conviction “lifetime” sexual behavioral histories and activities which include the disclosure of additional victims, sexual education sources, victimization, exposure and utilization of pornography, the onset of masturbation, paraphilias, sexual deviance and therapeutic issues. It is a utility-designed multiple-issue polygraph test, subject to the successive hurdles decision approach. **E 2035, E52**
- discoloration**—a streak or other pattern on the surface that causes a noticeable change of color from the rest of the pultruded surface. **D 3918, D20**
- discontinuity, *n***—a lack of continuity or cohesion; an intentional or unintentional interruption in the physical structure or configuration of a material or component. **E 1316, E07**
- discontinuity surface**—any surface across which some property of a rock mass is discontinuous. This includes fracture surfaces, weakness planes, and bedding planes, but the term should not be restricted only to mechanical continuity. (ISRM) **D 653, D18**
- discontinuous fiber**—a polycrystalline or amorphous fiber that is discontinuous within the sample or component or that has one or both ends inside of the stress field under consideration. The minimum diameter of a discontinuous fiber is not limited, but the maximum diameter may not exceed 0.25 mm (0.010 in.). **D 3878, D30**
- discontinuous fiber-reinforced composite, *n***—a ceramic matrix composite material reinforced by chopped fibers. **C 1145, C28**
- discontinuous permafrost**—permafrost occurring in some areas beneath the ground surface throughout a geographic region where other areas are free of permafrost. **D 7099, D18**
- discontinuous permafrost zone**—a major subdivision of a permafrost region in which permafrost occurs in some areas beneath the ground surface while other areas are free of permafrost; (1) in North American usage: 30 to 80 % of area underlain by permafrost; (2) in Russian usage: 3 to 80 % of area underlain by permafrost. **D 7099, D18**
- discontinuous stringer**—three or more Type B or C inclusions aligned in a plane parallel to the hot working axis and offset by no more than 15 μm with a separation of less than 40 μm (0.0016 in.) between the two nearest neighbor inclusions (see Practices E 45 and E 1122). **E 7, E04**
- discontinuous yielding, *n***—a hesitation or fluctuation of force

discontinuous yielding, *n*

observed at the onset of plastic deformation, due to localized yielding. E 6, E28

discounted payback (DPB) period—the time required for the cumulative benefits from an investment to pay back the investment cost and other accrued costs considering the time value of money. E 631, E06

discounted payback (DPB) period, *n*—the time required for the cumulative benefits from an investment to pay back the investment cost and other accrued costs considering the time value of money. E 833, E06

discount factor—a multiplicative number (calculated from a discount formula for a given discount rate and interest period) that is used to convert costs and benefits occurring at different times to a common time. E 631, E06

discount factor, *n*—a multiplicative number (calculated from a discount formula for a given discount rate and interest period) that is used to convert costs and benefits occurring at different times to a common time. E 833, E06

discounting—a technique for converting cash flows that occur over time to equivalent amounts at a common time. E 631, E06

discounting, *n*—a technique for converting cash flows that occur over time to equivalent amounts at a common time. E 833, E06

discount rate—the rate of interest reflecting the investor's time value of money, used to determine discount factors for converting benefits and costs occurring at different times to a base time. E 631, E06

discount rate, *n*—the rate of interest reflecting the investor's time value of money, used to determine discount factors for converting benefits and costs occurring at different times to a base time. E 833, E06

discrepancies incident to shipment—all deficiencies incident to shipment of property to or from an organization's facility whereby differences exist between the property purported to have been shipped and property actually received. Such deficiencies include loss, damage, destruction, improper status and condition coding, errors in identity or classification, and improper consignment. E 2135, E53

discrete bar code, *n*—a bar code symbol in which the intercharacter space is not part of the code and is allowed to vary dimensionally within wider tolerances than those specified for bars and spaces. An example would be Code 39. F 1294, F05

discrete bispectral radiance factor, $B(\mu, \lambda)$, *n*—the matrix defined for specified irradiation and viewing bandpass functions, and viewing-wavelength sampling interval ($\Delta\lambda$) as follows:

$$B(\mu, \lambda) = \bar{b}_\lambda(\mu) \cdot \Delta\lambda$$

where:

$\bar{b}_\lambda(\mu)$ = the average bispectral radiance factor of the specimen, as weighted by the specified irradiation and viewing bandpass functions. E 284, E12

discrete depth sample, *n*—sample obtained from a defined level within the liquid being sampled. D 5681, D34

discrete sample, *n*—one or more units taken from a material that consists of separately identifiable units. (Compare to **bulk sample**.) D 123, D13

discrete throughput method—the method whereby average throughput is calculated as the average of a number of discrete throughput measurements conducted during a test period. D 5681, D34

discrete variate, *n*—a variate that is a measurement based on a scale that has a limited or finite number of steps; such as a count, a rating scale, or a ratio of successes to total observations. D 123, D13

discrimination, *n*—the process of qualitatively or quantitatively differentiating among stimuli. E 253, E18

discrimination test, *n*—any method to determine if differences among stimuli are perceptible. For example: triangle tests, duo-trio tests, paired comparison tests, etc. E 253, E18

disequilibrium permafrost—permafrost that is not in thermal equi-

librium with the existing mean annual surface or sea-bottom temperature and the geothermal heat flux. D 7099, D18

dish (cross or transverse bow)—the departure from flatness across the full width of the strip in the form of a single arc, excluding burrs. B 846, B05

dished head—See **cup head**. F 547, F16

dish grinder, *n*—a grinding machine equipped with a dish-shaped abrasive wheel as a grinding mechanism. C 1145, C28

dishload—a dishrack (see **dishwashing machine, commercial: dishrack**), loaded with ten 9 in. plates of a specified weight, used to put a thermal load in the dishwasher during the washing energy test. F 1827, F26

dish rack—a peg type, polypropylene, or other noncorrosive material rack designed to hold tableware in place during washing. F 1827, F26

dishwashing machine, commercial—machines that uniformly wash, rinse, and sanitize kitchen ware. The machines shall be capable of removing physical soil from properly racked and prescraped tableware, and sanitizing multiple-use tableware. F 1827, F26

dishwater inlet—incoming water to dishwater. F 1827, F26

dishwater inlet temperature—the temperature of the incoming water to dishwater, measured at the dishwater inlet connection. See **dishwashing machine, commercial** and **dishwasher inlet**. F 1827, F26

dish wheel, *n*—dish-shaped abrasive grinding wheel. C 1145, C28

disinfectants—physical and chemical agents used for inactivating or destroying microorganisms. F 1600, F20

disinfection—the process of killing organisms in a water supply or distribution system by means of heat, chemicals, or UV light. D 6161, D19

disinfection, *n*—the destruction or reduction of pathogenic and other kinds of microorganisms by thermal or chemical means (for example, alcohol, antibiotics, germicides). F 2312, F04

disinfectant—an agent that kills, inactivates, or repels organisms in or on plants, animals, or inanimate objects. E 609, E35

disintegration, *n*—the reduction of massive material to powder. B 243, B09

disk—a round, commercially flat solid blank made from a flat rolled product. B 846, B05

disk feeder, *n*—a rotating disk beneath the opening of a bin which delivers material from the bin at a specified rate by controlling the rate of rotation of the disk and the size of the gate opening of the bin. C 1145, C28

disk grinder, *n*—a grinding machine equipped with a large abrasive disk as the work mechanism. C 1145, C28

disk wheel, *n*—a bonded abrasive wheel mounted on a plate so that grinding may be done on the side of the wheel. C 1145, C28

disordered structure—the crystal structure of a solid solution in which the atoms of different elements are randomly distributed with respect to the available lattice sites. E 7, E04

dispatch life support—the knowledge, procedures, and skills used by trained emergency medical dispatchers in guiding care by means of post-dispatch (pre-arrival) instruction to callers. F 1177, F30

dispenser—commercial equipment designed to deliver a beverage or food product. F 1827, F26

dispersant, *n*—*inengine oil*, an additive that reduces deposits on oil-wetted engine surfaces primarily through suspension of particles. D 4175, D02

dispersant—a material that inhibits the agglomeration of suspended particles by electrostatic or steric stabilization. E 609, E35

dispersant—the material, usually an organic solvent, in a liquid developer system that conveys toner particles, but does not itself become a part of the image in a finished print. (See also **carrier**.) F 335, F05

dispersed system—in laboratory analysis of grain sizes, an initial condition whereby the particles begin to settle from a stirred mixture; when stirring stops, each particle settles independently of other particles. D 4410, D19

dispersing agent—a material that increases the stability of a suspension of particles in a liquid medium. **B 374, B08**

dispersing agent—a material that increases the stability of a suspension of particles in a liquid medium. **D 459, D12**

dispersing agent—*in grouting*, an addition or admixture that promotes dispersion of particulate grout ingredients by reduction of interparticle attraction. **D 653, D18**

dispersing agent—see **deflocculating agent**. **D 653, D18**

dispersing agent (latex), *n*—a surface-active substance used to facilitate the suspension of solid compounding materials in a liquid medium and to stabilize the dispersion thereby produced. **D 1566, D11**

dispersion—the variation of refractive index with wavelength of light. See related term **Abbévalue**. **C 162, C14**

dispersion—*in a fine particle suspension*, the condition which results when a stable suspension of particles is achieved by physical or chemical means in which no evidence of reflocculation or re-agglomeration of the particles is observed. **C 242, C21**

dispersion—the phenomenon of varying speed of transmission of waves, depending on their frequency. (ISRM) **D 653, D18**

dispersion, *n*—a two-phase system in which one phase is suspended in a liquid. **D 907, D14**

dispersion, *n*—the most general term for a system consisting of particulate matter suspended in a fluid. **D 1356, D22**

dispersion, *n*—a system of particles distributed in a solid, liquid, or gas. **E 1620, E29**

dispersion, *n*—the spread of values of a frequency distribution about an average (in statistics). (Quantitative measures of dispersion include range, variance, standard deviation, mean deviation, and relative span.) **E 1620, E29**

dispersion coating—a coating consisting of particles of one material contained in a matrix of another metal or nonmetal. **B 374, B08**

dispersion coating—*in flexible barrier materials, (1)* a process of applying a material, suspended or dispersed in a vehicle, to a surface in such a way that a continuous, coalesced, adherent layer results when the vehicle liquid (usually water) is evaporated. (2) Also, the product resulting from such a process. **F 17, F02**

dispersion coating—See Terminology F 17. **F 1327, F02**

dispersion staining, *n*—the color effects produced when a transparent object, immersed in a liquid having a refractive index near that of the object is viewed under the microscope by a transmitted light and precise-aperture control. **D 1129, D19**

dispersion-strengthened material, *n*—a material consisting of a metal and finely dispersed, substantially insoluble, metallic or nonmetallic phase. **B 243, B09**

dispersion (the act of), *n*—application of shearing forces to distribute one or more compounding materials uniformly throughout the mass of a continuum of material. **D 1566, D11**

dispersoid, *n*—the particles of a dispersion. **D 1356, D22**

dispersoid—in metallography, finely divided particles of relatively insoluble constituents which can be seen in the microstructure of certain alloys. **E 7, E04**

displacement—a change in position of a material point. (ISRM) **D 653, D18**

displacement, *n*—*in packaging*, the volume occupied by a container, calculated from its outside dimensions. (Compare **cube**.) **D 996, D10**

displacement—movement of anchor relative to the structural member. **E 2265, E06**

displacement-controlled expansion anchor—a post-installed anchor that derives its holding strength by expansion against the side of the drilled hole through movement of an internal plug in the sleeve or through movement of the sleeve over an expansion element (plug). Once set, the anchor does not expand further under load. **E 2265, E06**

displacement dose (D_d)—the quotient of $d \bar{\epsilon}_d$ by dm , where $d \bar{\epsilon}_d$ is that part of the mean energy imparted by radiation to matter which

produces atomic displacements (that is, excluding the part that produces ionization and excitation of electrons) in a volume element of mass dm .

$$D_d = d \bar{\epsilon}_d / dm$$

Unit: $J \cdot kg^{-1}$

E 170, E10

displacement grouting—injection of grout into a formation in such a manner as to move the formation; it may be controlled or uncontrolled. See also **penetration grouting**. **D 653, D18**

displacements per atom (dpa)—the mean number of times each atom of a solid is displaced from its lattice site during an exposure to displacing radiation, as calculated following standard procedures (see **displacement dose**). **E 170, E10**

displayed temperature range, *n*—temperature range in degrees Celsius or Fahrenheit that can be shown by an *IR thermometer*. **E 344, E20**

disposal facility—facility or part of a facility at which hazardous waste is intentionally placed into or on any land or water, and at which waste will remain contained after closure. **E 631, E06**

disposal facility, *n*—a facility or part of a facility at which waste is intentionally placed into or on any land or water, and at which waste will remain after closure. **E 2201, E50**

dispose, *v*—to discard, abandon, or manage as waste. **D 5681, D34**

dispute, *n*—when there is a question as to product quality because a test value obtained falls outside the acceptance limit. **D 4175, D02**

dissipation constant, δ , *n*—the ratio of the change in energy dissipated per unit time (power) in a thermistor, $\Delta \dot{Q} = \dot{Q}_2 - \dot{Q}_1$, to the resultant temperature change of the thermistor, $\Delta t = t_2 - t_1$.

$$\delta = \frac{\Delta \dot{Q}}{\Delta t}$$

The dimensions of the dissipation constant are $W/^\circ C$. For this specification, t_1 is in the range from 20 to 38 $^\circ C$ and $\Delta t = 10^\circ C$.

E 344, E20

dissipation factor—see **tan delta**. **D 4092, D20**

dissipation factor—see **tangent delta**. **E 1142, E37**

dissipation factor, *D*—the ratio of the loss index to its relative permittivity or

$$D = \kappa''/\kappa'$$

It is also the tangent of its loss angle, δ , or the cotangent of its phase angle, θ . The dissipation factor is related to the power factor, *PF*, by the following equation:

$$D = PF/\sqrt{1 - (PF)^2}$$

D 2864, D27

dissipation factor, dielectric—same as **dissipation factor**.

D 2864, D27

dissipation factor (loss tangent) (tan δ), *D, n*—the ratio of the loss index to its relative permittivity or

$$D = \kappa''/\kappa'$$

It is also the tangent of its loss angle, δ , or the cotangent of its phase angle, θ . **D 1711, D09**

dissipation factor, magnetic, D_m —the tangent of the hysteresis angle that is equal to the ratio of the core loss current, I_c , to the magnetizing current, I_m . Thus:

$$D_m = \tan \beta = \cot \gamma = I_c/I_m = \omega L_1/R_1 = I/Q_m$$

NOTE—This dissipation factor is also given by the ratio of the energy dissipated in the core per cycle of a periodic *SCM* excitation (hysteresis and eddy current heat loss) to 2π times the maximum energy stored in the core. **A 340, A06**

dissociated ammonia, *n*—a reducing gas produced by the thermal decomposition of anhydrous ammonia over a catalyst, resulting in

dissociated ammonia, *n*

a gas of 75 % hydrogen and 25 % nitrogen. Synonymous with **cracked ammonia**. **B 243, B09**

dissociation—as applied to heterogeneous equilibria, the transformation of one phase into two, or more, new phases, all of different composition. **E 7, E04**

dissociation—as applied to heterogeneous equilibria, the transformation of one phase into two or more new phases, all of different composition. (E 7, E04). **E 1142, E37**

dissociation—in leak testing, the breakdown of a substance into two or more constituents.

NOTE—Dissociation is sometimes referred to as cracking.

E 1316, E07

dissociation constant—a number indicating the extent to which a substance dissociates in solution. [For a simple two-species complex *AB*, the constant is given by the product of the molar concentrations of *A* and of *B* divided by the molar concentrations of the undissociated species *AB*. For example, with hydrofluoric acid:

$$([H^+][F^-])/([HF]) = K = 6.7 \times 10^{-4} \text{ at } 25^\circ\text{C}$$

The smaller the value of *K*, the less the complex is dissociated. *K* varies with temperature, ionic strength, and the nature of the solvent.] **D 4127, D19**

dissociation pressure—at a designated temperature, the pressure at which a phase will transform into two, or more new phases, of different composition. **E 7, E04**

dissolved gas—natural gas held in solution in reservoir liquids at the prevailing temperature and pressure of the reservoir. **D 4150, D03**

dissolved load—the part of the stream load that is carried as dissolved solids. **D 4410, D19**

dissolved matter, *n*—that matter, exclusive of gases, which is dispersed in water to give a single homogeneous liquid phase. **D 1129, D19**

dissolved solids—the mass of constituents in a filtered water sample. For operational purposes, the filter pore is usually 0.00045 mm. **D 4410, D19**

dissolved solids—the residual material remaining after filtering the suspended material from a solution and evaporating the solution to a dry state at a specified temperature. That matter, exclusive of gases, which is dissolved in water to give a single homogeneous liquid phase. **D 6161, D19**

dissolving pulps—see **pulps, dissolving**. **D 1695, D01**

distal end—the working end, comprised of two jaws, that is furthest from the surgeon when in use. **F 921, F04**

distal end—the working end, comprised of two blades, that is furthest from the surgeon when in use. **F 1078, F04**

distance amplitude compensation (electronic)—the compensation or change in receiver amplification necessary to provide equal amplitude on the display of the ultrasonic flaw detector for reflectors of equal area which are located at different depths in the material. **E 1316, E07**

distance amplitude response curve—a curve showing the relationship between the different distances and the amplitudes of ultrasonic response from targets of equal size in an ultrasonic response from targets of equal size in an ultrasonic transmitting medium. (E 127) **E 1316, E07**

distance constant (*L, m*), *n*—the distance the air flows past a rotating anemometer during the time it takes the cup wheel or propeller to reach $(1 - 1/e)$ or 63 % of the equilibrium speed after a step change in wind speed. **D 1356, D22**

distance linearity range—the range of horizontal deflection in which a constant relationship exists between the incremental horizontal displacement of vertical indications on the A-scan presentation and the incremental time required for reflected waves to pass through a known length in a uniform transmission medium. (E 494) **E 1316, E07**

distillate—the overhead product of distillation such as ethanol liquid from the top of a beer still. **E 1705, E48**

distillation—the process of condensing steam from boiling water on a cool surface. **D 6161, D19**

distillation—the act of vaporizing and condensing a liquid in sequential steps to effect separation from a liquid mixture. **E 1705, E48**

distillation pressure, *n*—the pressure measured as close as possible to the point where the vapor temperature is taken, normally at the top of the condenser. **D 4175, D02**

distillation residue, *n*—that portion of the sample remaining after distillation using specified procedures. **D 4175, D02**

distillation temperature, *n*—in *column distillation*, the temperature of the saturated vapor measured just above the top of the fractionating column. (Synonym—*head temperature, vapor temperature*.) **D 4175, D02**

distillers grains—the insoluble solids that have been separated from the stillage bottoms or beer. Moisture content may range from 60 to 85 %, depending upon the level of dewatering during separation. **E 1705, E48**

distinctness of image—degree of clarity exhibited by images reflected from a surface. **D 2825, D21**

distinctness-of-image gloss, *n*—the sharpness with which image outlines are reflected by the surface of an object. **D 16, D01**

distinctness-of-image gloss, *n*—aspect of gloss characterized by the sharpness of images of objects produced by reflection at a surface. **E 284, E12**

distinctness of (reflected) image—see **distinctness-of-image gloss**. **E 284, E12**

distorted—physically changed from the natural and original shape, caused by stress of any type. **F 819, F18**

distorted image, *n*—a character, symbol, line drawing, or halftone that is deformed in shape or is vague and lacking a definite outline. **F 1457, F05**

distortion, *n*—infabrics, a general term for a visible defect in the texture of a fabric. **D 123, D13**

distortion, *n*—intextile battings, defects such as holes, lumps, or thin areas caused by movement of fibers. **D 123, D13**

distortion—a change in shape of a solid body. (ISRM) **D 653, D18**

distortion, *n*—infabrics, a general term for a visible defect in the texture of a fabric. **D 4850, D13**

distortion, *n*—intextile battings, defects such as holes, lumps, or thin areas caused by movement of fibers. **D 7022, D13**

distortion—an aberration of lens systems where axial and marginal magnifications are unequal.

(1) *barrel distortion*—the distortion in the image which occurs when the magnification of the image in the center of the field is greater than in the edge of the field. This is also called negative distortion.

(2) *pincushion distortion*—the distortion in the image which results when the magnification in the center of the field is less than it is at the edge of the field. This is also called positive distortion. **E 7, E04**

distortion, *n*—optical, a defect in an image-forming system whereby the image is not the shape of an ideal image of the object. For example, a straight pole, viewed through a window having nonplanar surfaces, may appear to have bends in it. **E 284, E12**

distortion—the rate of change of angular deviation across the transparency, usually characterized by grid-line slope, resulting in the non-linear mapping of objects viewed through the transparency. **F 2429, F07**

distortion factor, *df*—a numerical measure of the distortion in any ac nonsinusoidal waveform. For example, if by Fourier analysis or direct measurement E_1, E_2, E_3 , and so forth are the effective values of the pure sinusoidal harmonic components of a distorted voltage waveform, then the distortion factor is the ratio of the root mean square of the second and all higher harmonic components to the fundamental component.

$$df = [E_2^2 + E_3^2 + E_4^2 + \dots]^{1/2} E_1$$

NOTE—There are no dc components (E_0) in the distortion factor.

A 340, A06

distortion, harmonic—the departure of any periodically varying waveform from a pure sinusoidal waveform.

NOTE—The distorted waveform that is symmetrical about the zero amplitude axis and is most frequently encountered in magnetic testing contains only the odd harmonic components, that is fundamental, 3rd harmonic, 5th harmonic, and so forth. Nonsymmetrical distorted waveforms must contain some even harmonic components, in addition to the fundamental and, perhaps, some odd harmonic components.

A 340, A06

distributed impact test, *n*—in *impingement erosion testing*, an apparatus or method that produces a spatial distribution of impacts by liquid or solid bodies over an exposed surface of a specimen.

G 40, G02

distribution—the thicknesses of the walls of a glass article over its entire area.

C 162, C14

distribution, amplitude, cumulative (acoustic emission) $F(V)$ —the number of acoustic emission events with signals that exceed an arbitrary amplitude as a function of amplitude V .

E 1316, E07

distribution, differential (acoustic emission) amplitude $f(V)$ —the number of acoustic emission events with signal amplitudes between amplitudes of V and $V + \Delta V$ as a function of the amplitude V . $f(V)$ is the absolute value of the derivative of the cumulative amplitude distribution $F(V)$.

E 1316, E07

distribution, differential (acoustic emission) threshold crossing $f_t(V)$ —the number of times the acoustic emission signal waveform has a peak between thresholds V and $V + \Delta V$ as a function of the threshold V . $f_t(V)$ is the absolute value of the derivative of the cumulative threshold crossing distribution $F_t(V)$.

E 1316, E07

distribution, logarithmic (acoustic emission) amplitude $g(V)$ —the number of acoustic emission events with signal amplitudes between V and αV (where α is a constant multiplier) as a function of the amplitude. This is a variant of the differential amplitude distribution, appropriate for logarithmically windowed data.

E 1316, E07

distribution reinforcement—reinforcement, typically running 90° to the main or circumferential reinforcement, intended to disperse concentrated loads to larger areas of a structural member.

C 822, C13

distribution subsystem—that portion of the solar system from the storage device to the point of ultimate use.

E 772, E44

distribution-system pressure difference—the pressure difference across the exterior air-distribution envelope, expressed in pascals (inches of water, pounds-force per square foot, or inches of mercury).

E 631, E06

distribution temperature, *n*—of a source, temperature, usually expressed in kelvins, of the full radiator having a relative spectral power distribution in the visible region approximately the same as that of the source.

E 284, E12

distribution, threshold crossing, cumulative (acoustic emission) $F_t(V)$ —the number of times the acoustic emission signal exceeds an arbitrary threshold as a function of the threshold voltage (V).

E 1316, E07

distribution tube (Type D)—a seamless or welded copper tube known as copper distribution tube (Type D).

B 846, B05

distributor, *n*—any person who furthers the marketing of a device from the original manufacturer to the person who makes final delivery or sale to the ultimate consumer or user but who does not repackage or otherwise change the container, wrapper, or labeling of the device or device package.

E 344, E20

distributor—person or organization who purchases fasteners for the purpose of reselling them. A distributor may or may not alter the fasteners prior to resale. (Significant alterations and insignificant alterations are defined separately.)

F 1789, F16

disturbed sample—any plastic mortar test sample which is taken at some time after mixing and bulk sampling, that is further remixed or molded immediately prior to test, or both.

C 1180, C12

diurnal, *adj*—recurring daily.

D 1356, D22

dive computer, *n*—a microprocessor-based electronic instrument that provides data based on a specific decompression model.

F 1549, F32

dive profile, *n*—the depth/time history of a dive that typically consists of bottom time, maximum depth, and surface interval.

F 1549, F32

divergence loss—that part of transmitted energy lost due to spreading of wave rays in accordance with the geometry of the system.

D 653, D18

divergent bevel point—points sheared obliquely to staple-leg axis, with beveled face in opposite direction on each leg, across thick leg side leading from lower to upper thick face; designed to lead staple legs into opposite directions perpendicular to staple plane during driving.

F 592, F16

divergent chisel point—chisel point with beveled point faces at angle to staple crown in plane perpendicular to staple crown axis; designed to lead staple legs into opposite directions perpendicular to staple plane during driving.

F 592, F16

divergent point—See **divergent bevel point**.

F 592, F16

diversion mode—placement of a boom to redirect the movement of a floating substance.

F 818, F20

divided cell—a cell containing a diaphragm or other means for physically separating the anolyte from the catholyte.

B 374, B08

divider, *n*—a device, made of various materials, that separates the space within a container into two or more spaces, cells, compartments, or layers.

D 996, D10

division, *n*—in *sample preparation*, a process which divides a sample into two or more subsamples without changing the composition.

E 135, E01

divorced eutectic—a structure in which the components of an eutectic appear to be entirely separate.

E 7, E04

d-limonene, *n*—a purified optically active terpene hydrocarbon recovered from by-products of the citrus industry.

D 804, D01

D-load—the supporting strength of a pipe loaded under three-edge-bearing test conditions expressed in pounds per linear foot per foot of inside diameter or horizontal span, or expressed in newtons per linear metre per millimetre of inside diameter or horizontal span.

C 822, C13

D-load, 0.01-in. (0.3-mm) crack—the maximum three-edge-bearing test load supported by a concrete pipe before a crack having a width of 0.01 in. (0.3 mm) occurs, measured at close intervals, throughout a continuous length of 1 ft (300 mm) or more measured parallel to the longitudinal axis of pipe barrel expressed as D-load.

C 822, C13

D-load ultimate (D_u)—the maximum three-edge-bearing test load supported by a pipe, expressed as D-load.

C 822, C13

DMA—abbreviation for **direct memory access**.

F 1457, F05

2D matrix symbols—see **matrix symbols**.

F 1294, F05

DNA fluorochrome stain—staining of DNA specifically by the use of bisbenzamide fluorochrome stain or other DNA fluorochromes of comparable quality and performance, such as DAPI (4',6-diamidino-2-phenyl-indole-2HCl)-Serva 18860.

E 1705, E48

D_{Np} , D_{Lp} , D_{Ap} , D_{Vp} —diameters such that the cumulative number of particles, (N), length of diameter, (L), surface area, (A), or volume, (V), from zero diameter to these respective diameters is the fraction, (f), of the corresponding sum for the total distribution.

Example:

$D_{V0.5}$ is the volume median diameter; that is, 50 % of the total volume of liquid is in drops of smaller diameter and 50 % is in drops of larger diameter.

E 1620, E29

doctor blade, *n*—A scraper mechanism that regulates the dimensional thickness of adhesive on the spreader rolls or on the surface being coated. (*Synonyms:* **doctor knife; doctor bar**.)

D 907, D14

doctor blade—(also known as a charging blade), a component that imparts an electrical charge to toner by means of the triboelectric effect and/or controls the amount of toner delivered to the developer roller.

F 335, F05

doctor blade streaks, n

doctor blade streaks, n—lines in the image or non-image areas of a gravure print caused by a defect of the doctor blade. **D 6488, D01**

doctor roll, n—a revolving roller mechanism resulting in a wiping action for regulating the adhesive supplied to the spreader roll. **D 907, D14**

doctor roller—see **doctor roll**. **D 907, D14**

doctor streak, n—*in printed cloth*, a wavy white or colored streak in the warp direction of printed cloth caused by a defective doctor blade. **D 123, D13**

doctor streak, n—*in printed cloth*, a wavy white or colored streak in the warp direction of printed cloth caused by a defective doctor blade. **D 3990, D13**

document—a form designed as input to a document reader. **F 149, F05**

documentary characteristic, n—any historic, stylistic, iconographic, technological, intellectual, aesthetic, or religious data pertaining to an object under consideration for conservation. **D 123, D13**

documentary characteristic, n—any historic, stylistic, iconographic, technological, intellectual, aesthetic, or religious data pertaining to an object under consideration for conservation. **D 5038, D13**

documentary standard, n—document, arrived at by open consensus procedures, specifying necessary details of a method of measurement, definitions of terms, or other practical matters to be standardized. (Compare **physical standard**.) **E 284, E12**

documentation, n—the record of information (historic, stylistic, iconographic, technological, intellectual, aesthetic, scientific, or spiritual) about any object of cultural or natural heritage. **D 123, D13**

documentation, n—the recording, in a permanent format, of information derived from conservation activities. **D 5038, D13**

document glass—{archaic} an ultraviolet absorbing glass used for protecting documents. **C 162, C14**

document reader—a scanning device that scans one to five lines of data in fixed locations on a document at a single pass. Generally, re-scanning of a portion of the document is not possible, one direction of the scan being provided by movement of the form past the reading head. The forms used generally don't exceed 8 to $\frac{3}{4}$ in. in width by 4 to $\frac{1}{4}$ in. in depth. Also see **page reader**. **F 149, F05**

doeskin—commercial term for white leather from sheep or lambskin, tanned with alum or formaldehyde or both. **D 1517, D31**

doffing tube, n—a component of an open-end spinning machine, which is an extension to the navel and is used to guide the withdrawn yarn en route to the take-up rollers. (See also **navel**) **D 123, D13**

doffing tube, n—a component of an open-end spinning machine which is an extension to the navel and is used to guide the withdrawn yarn en route to the take-up rollers. (See also **navel**.) **D 3888, D13**

doghhouse—a protrusion in or near the back wall through which batch is introduced into the melter. **C 162, C14**

dolly, n—a low platform or structure mounted on wheels or casters, designed primarily for moving bulky loads for short distances. (Compare **pallet**.) **D 996, D10**

doloma-carbon refractory, n—a refractory brick manufactured predominantly from a mixture of refractory-grade doloma and 2 to 20 weight percent carbonaceous materials, with resin, tar, pitch or a combination of these materials as the bonding agent; the refractory-grade doloma may be either dead-burned dolomite, synthetic doloma, fused doloma or combinations of these materials, and the carbonaceous material may be either graphite, carbon black, or a combination of these materials. **C 71, C08**

doloma, fused, n—refractory-grade material consisting predominantly of lime and magnesia which has solidified from a fused or molten state. **C 71, C08**

doloma-magnesia refractory, n—a refractory, which may be burned or unburned, manufactured predominantly of a mixture of refractory-grade doloma and refractory-grade magnesia in which the refractory-grade doloma predominates by weight. **C 71, C08**

doloma refractory, n—a refractory manufactured predominantly of dead-burned dolomite, synthetic doloma, fused doloma or combinations of these materials. **C 71, C08**

doloma, refractory-grade, n—a dead-burned or fused refractory material consisting predominately of lime and magnesia; the three principal types are dolomite, dead-burned; doloma, synthetic; and doloma, fused. **C 71, C08**

doloma, synthetic, n—a refractory-grade doloma which has been derived from blending magnesia and lime or dolomite and dead-burning to form a dense, hydration-resistant material; and having a MgO content of 30 % to 80 % and maximum CaO content of 70 %. **C 71, C08**

dolomite, n—a carbonate rock consisting predominantly of magnesium carbonate ($MgCO_3$) and calcium carbonate ($CaCO_3$) in approximately an equal molecular ratio. **C 71, C08**

dolomite—a sedimentary carbonate rock (a variety of limestone) that consists largely or entirely of the mineral dolomite. **C 119, C18**

dolomite—a double carbonate of lime and magnesium having the general formula $CaCO_3 \cdot MgCO_3$. See also **limestone**. **C 162, C14**

dolomite—the double carbonate of lime and magnesia having the general formula $CaCO_3 \cdot MgCO_3$. **C 242, C21**

dolomite, dead-burned, n—a refractory grade doloma which is obtained by burning dolomite above 1450°C long enough to form a dense hydration-resistant material composed primarily of lime and magnesia. **C 71, C08**

dolomitic—indicates the presence of 35 to 46 % magnesium carbonate ($MgCO_3$) in the limestone from which the material was formed. **C 51, C07**

dolomitic limestone—see **limestone**. **C 51, C07**

domain, n—*as used in Test Method D 5061*, a region of anisotropy in a carbon form that is distinctively marked by its isochromatic boundary and cleavage. **D 121, D05**

domains, ferromagnetic—magnetized regions, either macroscopic or microscopic in size, within ferromagnetic materials. Each domain, in itself, is magnetized to intrinsic saturation at all times, and this saturation induction is unidirectional within the domain. **A 340, A06**

domain wall—a boundary region between two adjacent domains within which the orientation of the magnetic moment of one domain changes into a different orientation of the magnetic moment in the other domain. **A 340, A06**

dome, n—in reinforced plastics, an end of a filament-wound cylindrical container. **D 883, D20**

dominant wavelength, n—the wavelength of a spectrally pure light that, when added to a reference achromatic (white) light, will produce a combination that matches the color of a specimen light. **E 284, E12**

Donaldson radiance factor, $D(\mu, \lambda)$, n—in *bispectral photometry*, a special case of the discrete bispectral radiance factor, for which the specified irradiation and viewing bandpass functions are perfectly rectangular, with bandwidth equal to irradiation and viewing-wavelength sampling interval. **E 284, E12**

Donnan exclusion—reduction in concentration of mobile ions within an ion exchange membrane due to the presence of fixed ions of the same sign as the mobile ions. **D 6161, D19**

donor—relatively colorless material capable of generating color when transferred to a reactive receptor surface. **F 549, F05**

donor, n—a living or deceased organism who is the source of cells or tissues, or both, for research or further processing for transplantation in accordance with established medical criteria and procedures. **F 2312, F04**

donut fryer—see *specialty fryer*. **F 1827, F26**

door, n—usually swinging or sliding barrier by which an entry is closed and opened. **E 631, E06**

door—combination nose and closure for nose-loading stapler. **F 592, F16**

door—the movable barrier that permits access to the cavity for placement or removal of food, and whose function is to prevent

- emission of energy from the passage or opening that provides access to the cavity. **F 1827, F26**
- DOP**, *n*—dioctyl phthalate (di-2-ethylhexyl phthalate). **D 1356, D22**
- dope**—slang for mold lubricant. **C 162, C14**
- dope**, *n*—a composition, usually a cellulosic lacquer, for application on textiles and leathers. **D 16, D01**
- dope**—a composition, usually a cellulose lacquer, for application on textiles and leathers. Also a very viscous crude reaction product, as acetylation dope. **D 1695, D01**
- dope**, *vt*—in this specification, to add potassium, silicon and aluminum compounds to the alloy powders during the preparation to produce a ductile wire. See NASA CR-72884. **E 344, E20**
- doping**—the addition of foreign species into a photoconductive material to modify its semiconductor properties such as light sensitivity, response times, and dark conductivity. **F 335, F05**
- Doppler bubble detector**, *n*—a device that uses the Doppler Effect to monitor specific areas of the circulatory system and detect the presence of bubbles as a measure of decompression stress. **F 1549, F32**
- doré bead**, *n*—a gold and silver alloy bead which results from cupellation. **E 135, E01**
- dormant oil**—a horticultural spray oil applied during the dormant phase of the targeted plant. (See **horticulturalspray oil**.) **E 1519, E35**
- dosage**—the quantity of substance applied per unit weight or volume of the fluid being treated. **D 2652, D28**
- dose**—number of beam particles per unit area that impinge on the specimen. Alternatively, the dose may be defined as the charge per unit area that impinges on the specimen.
- rate*—number of beam particles per unit area per second that impinge on the specimen. Alternatively, the dose rate may be defined as the current per unit area that impinges on the specimen. **E 673, E42**
- dose, dosage**—the quantity of substance applied per unit treated or applied to or entering an organism. **E 609, E35**
- dosimeter**—a device that, when irradiated, exhibits a quantifiable change in some property of the device that can be related to absorbed dose in a given material using appropriate analytical instrumentation and techniques. **E 170, E10**
- dosimetry system**—a system used for determining absorbed dose, consisting of dosimeters, measurement instruments and their associated reference standards, and procedures for the system's use. **E 170, E10**
- dot distortion**, *n*—an undesired change in shape of halftone dots during plate making or printing operations, or both. **D 6488, D01**
- dot doubling**, *n*—the unintentional printing of two images slightly out of register from a single form. **D 6488, D01**
- dote*—See **decay**. **D 9, D07**
- dot gain**, *n*—the increase in halftone dot size in relation to the dots on the lithographic film; it is the arithmetic difference between the dot area on the original film and dot area on the printed sheet. **D 6488, D01**
- dot loss**, *n*—the total or partial loss of the smallest dots on the sheets, usually in the areas of 25 % screen or less. **D 6488, D01**
- dot matrix**—a method of character generation in which each character is formed by a pattern of dots selected from a grid or matrix. **F 909, F05**
- dot slur**, *n*—dot gain that occurs in a pronounced direction and is not symmetrical. **D 6488, D01**
- double-action pressing**, *n*—a method by which a powder is pressed in a die between opposing moving punches. **B 243, B09**
- double aging**, *n*—employment of two different aging treatments, in sequence, to control the type of precipitate formed from a supersaturated alloy matrix in order to obtain the desired properties. **A 941, A01**
- double amplitude**—total or peak to peak excursion. **D 653, D18**
- double boiling system**—a series of mixtures characterized by the vaporization of a liquid phase in one temperature (or pressure) range and the vaporization of another liquid phase within another temperature (or pressure) range; for example, a salt and water mixture which boils with the expulsion of water at moderately elevated temperature and then at higher temperature the molten salt itself boils to produce salt vapor. **E 7, E04**
- double bow**, *n*—two fabric bows, arcing in the same direction, as in a flattened *M* or *W* depending on the viewing angle. (Compare **double reverse bow and double bow**) **D 123, D13**
- double bow**, *n*—two fabric bows, arcing in the same direction, as in a flattened *M* or *W* depending on the viewing angle. (See also **bow**) (Compare **double reverse bow**) **D 3990, D13**
- double bow**, *n*—two fabric bows, arcing in the same direction, as in a flattened *M* or *W* depending on the viewing angle. (Compare **double reverse bow and double bow**.) **D 4850, D13**
- double braid**, *n*—*in rope*, a braided construction consisting of two hollow braided ropes, one inside the other. **D 123, D13**
- double-cavity mold**—see **multiple cavity mold**. **C 162, C14**
- double-cavity process**—see **multiple cavity process**. **C 162, C14**
- double coil**, *n*—a configuration where a smaller diameter coil is placed inside a larger diameter coil. The assembled rolls may be either concertina style or helical style. **F 1379, F14**
- double crest**—crest having two ridges separated by slight depression. **F 547, F16**
- double draining**—a defect evidenced by flowing of the slip on the ware, which occurs after it appears that draining has been completed. **C 286, B08**
- double-dressed**—as applied to chamois skins, with the grain removed and buffed or sueded on both surfaces. **D 1517, D31**
- double drive gate**—a gate comprised of two gate leaves which is used to close a gate opening through which vehicles are intended to pass. While often referring to a swing gate (that is, double swing gate), the gate may be any double leaf gate intended for vehicular (that is, slide gate or others). See specifications F 654, F 900, and F 1184. **F 552, F14**
- double, duplex, dual head**—thick flat head to be struck by hammer, with a second head, flange, or collar spaced slightly below to act as bearing head to prevent nail head from sinking into material into which nail is driven and to facilitate withdrawal after temporary use of nail. On double and duplex heads, the first and second heads are flat; whereas the second head of dual head is a cone head. **F 547, F16**
- double-face ware**—ware that has a finish coat on both surfaces. **C 286, B08**
- double fold**, *n*—*of paper*, one complete oscillation of the paper test specimen, during which it is folded first forward, then backward about the same base. **D 1968, D06**
- double glazing**—insulated glazing that incorporates two panes separated by an air gap. **C 162, C14**
- double glazing unit**—two panes of glass separated by a permanently sealed cavity. **C 162, C14**
- double-gob process*—See **double-cavity process**. **C 162, C14**
- double-headed, duplex-head, dual-head, nail**—bright or coated, regular-stock-steel, 1¾ by 0.113 to 4 by 0.207-in. nails with double ⅜ to ⅞-in. head, medium diamond point, and ¼ to ⅞-in. distance between head to be struck by hammer and bearing head. Length of nails measured from bearing surface of head. **F 547, F16**
- double hooked bow**, *n*—one hooked bow at each side of the fabric that are in opposite directions. (See also **hooked bow**) **D 123, D13**
- double hooked bow**, *n*—one hooked bow at each side of the fabric that arc in opposite directions. (See also **hooked bow**) **D 3990, D13**
- double hooked bow**, *n*—one hooked bow at each side of the fabric that arc in opposite directions. (See also **hooked bow**.) **D 4850, D13**
- double island canopy**—used for all types of cooking equipment mounted back to back in an island configuration. See **canopy**. **F 1827, F26**

double-junction reference electrode

- double-junction reference electrode**—a reference electrode that utilizes two separate filling solutions: an inner solution to provide a constant level of the ion sensed by the reference element and an outer filling solution that provides a low-junction potential liquid junction with the sample solution. The liquid junction potential between the inner and outer solutions is constant but not necessarily zero. **D 4127, D19**
- double liners, n**—a combination of two synthetic and/or natural buffers acting independently to separate waste from underlying soil and ground water. **E 2201, E50**
- double loop ties, n**—twistable ties used to secure the barbed tape at the tie point (also known as *bag ties*). **F 1379, F14**
- double melting system**—a series of mixtures which, with rising temperature, first develops a liquid phase that is totally converted to vapor before a second liquid phase appears; for example, a salt and water mixture which, upon heating, first melts to an aqueous solution of the salt, the water then boils away and the salt residue itself melts. **E 7, E04**
- double modulation, n**—a technique in which a modulated signal is further varied by a second means. **E 131, E13**
- double-pass internal reflection element**—an internal reflection element in which the radiant power transverses the length of the optical element twice, entering and leaving via the same end. **E 131, E13**
- double pick, n**—in woven fabrics, two picks wrongly placed in the same shed. (See also *mispick*. Compare *jerk-in*.) **D 123, D13**
- double pick, n**—in woven fabrics, two picks wrongly placed in the same shed. (See also *mispick*) (Compare *jerk-in*) **D 3990, D13**
- double pour**—to apply two layers of aggregate and bitumen to a built-up roof. **D 1079, D08**
- double press-double sinter, n**—to repress and sinter a previously presintered or sintered compact. **B 243, B09**
- double reverse bow, n**—two fabric bows arcing in opposite directions. (See also *bow*. Compare *double bow*.) **D 123, D13**
- double reverse bow, n**—two fabric bows arcing in opposite directions. (See also *bow*) (Compare *double bow*) **D 3990, D13**
- double reverse bow, n**—two fabric bows arcing in opposite directions. (See also *bow*. Compare *double bow*.) **D 4850, D13**
- doubleers, n**—an extra piece of facing attached to strength or stiffen the panel or to distribute the load more widely to the core. **C 274, D30**
- double salt**—a compound of two salts that crystallize together in a definite proportion. **B 374, B08**
- double sampling, n**—a form of multi-phase sampling, in which there are only two phases. See *phase*. **E 1402, E11**
- double shoulder**—the fore part of the hide cut off at right angles to the backbone line at the break of the fore flank, with the belly cut off and the head cut off behind the horn holes. **D 1517, D31**
- double-sided griddle**—equipment for cooking food by direct contact with two hot surfaces. See *griddle*. **F 1827, F26**
- double spread, n**—see *double spread* under *spread*. **D 907, D14**
- double spread adhesive, n**—an application of adhesive to both adherends or as two layers on one adherend. **D 907, D14**
- double-stitched seam-finish, n**—a finish for the raw edges of a plain seam, in which another row of machine stitching is made through both seam allowances placed together. **D 123, D13**
- double-stroke, n**—in *flex and abrasion testing*, an abrasion cycle that forward and one backward motion. **D 123, D13**
- double-stroke, n**—in *flex and abrasion testing*, an abrasion cycle that consists of one forward and one backward motion. **D 4850, D13**
- double tempering, n**—a treatment in which a quench-hardened steel object is given two complete tempering cycles at substantially the same temperature for the purpose of ensuring completion of the tempering reaction and promoting stability of the resultant microstructure. **A 941, A01**
- doublet (in characteristic X-ray spectra)**—a separation of characteristic radiation into subspecies of slightly different wavelength. **E 7, E04**
- doublet injector**—an impinging jet atomizer in which there are two colliding liquid jets. **E 1620, E29**
- double welt seam, n**—a complex seam formed on the inside of the object, with one trimmed raw seam edge enclosed and two rows of stitching visible on the face side. (Compare *welt seam*.) **D 123, D13**
- double-welt seam, n**—in home sewing, a complex seam formed on the inside of the product, in which one trimmed seam allowance is enclosed and two rows of stitching are visible on the face side. (Compare *welt seam*. Syn. *mock flat-felledseam*.) **D 4965, D13**
- doubling, n**—a printing defect in offset printing products (and other indirect printing processes) that manifests itself as a doubled or multiple (shadow-like) contour of the image elements. **D 6488, D01**
- doughnuts, hickies, n**—round voids in a solid print with ink in the center. **D 6488, D01**
- dough (rubber), n**—a paste-like mass of smooth texture, consisting of a rubber mix and solvent; it is used for spreading. **D 1566, D11**
- down, n**—the fine, soft plumage of waterfowl, consisting of light, fluffy filaments having at least two barbs attached; that is, barbs growing from the quill point but without a quill shaft. **D 123, D13**
- down, n**—the fine, soft plumage of waterfowl, consisting of light, fluffy filaments having at least two barbs attached; that is, barbs growing from the quill point but without a quill shaft. **D 7022, D13**
- down discharge**—makeup air method is used when spot cooling of the cooking staff is desired to help relieve the effects of severe radiant heat generated from equipment such as charbroilers. The makeup air must be heated or cooled, or both, depending on the climate. **F 1827, F26**
- down draw**—process of continuously drawing glass downward from an orifice. **C 162, C14**
- down fibers, n**—detached barbs from down; plumules and detached barbs from the basal end of waterfowl feather quill shafts that are indistinguishable from the barbs of down. **D 123, D13**
- down fibers, n**—detached barbs from down; plumules and detached barbs from the basal end of waterfowl feather quill shafts that are indistinguishable from the barbs of down. **D 7022, D13**
- download, v**—to transfer data from the host to a server, in this case a printer. **F 1457, F05**
- down, nestling, n**—a down not fully developed with a sheath and with soft barbs emanating from the sheath. **D 123, D13**
- down, nestling, n**—a down not fully developed with a sheath and with soft barbs emanating from the sheath. **D 7022, D13**
- downstream**—side of a membrane from which permeate emerges. **D 6161, D19**
- down-tank**—the direction in a melter from the batch feeding end toward the exit. **C 162, C14**
- (dP/dt)_{ex}, n**—the maximum rate of pressure rise during the course of a single deflagration. **E 1445, E27**
- (dP/dt)_{max}, n**—maximum value for the rate of pressure increase per unit time reached during the course of a deflagration for the optimum concentration of the dust tested. It is determined by a series of tests over a large range of concentrations. It is reported in bar/s. **E 1445, E27**
- draft**—minimum vertical depth of the membrane below the water line. **F 818, F20**
- drag**—the resistance to shrinkage of the foot or base of a ceramic article during drying or firing as a result of friction with the setter, slab, or sagger on which it rests. **C 242, C21**
- drag, n**—the resistance of the foot or base of a ceramic article to shrinkage during firing time due to friction with the slab or sagger on which it rests. **C 1145, C28**
- drag**—physical resistance to spreading of a polish. **D 2825, D21**
- dragade**—{archaic} see *drag ladle*. **C 162, C14**
- drag bit**—a noncoring or full-hole boring bit, which scrapes its way through relatively soft strata. (ISRM) **D 653, D18**
- dragging**—a fringe effect attached to the trailing edge of the developed electrostatic image. (See also *tailing*.) **F 335, F05**

- drag-in**—the water or solution that adheres to the objects introduced into a bath. **B 374, B08**
- drag ladle**—{archaic} to produce cullet by ladling glass from the melt into water. **C 162, C14**
- drag-out**—the solution that adheres to the objects removed from a bath. **B 374, B08**
- drag out, *n***—excessive ink around shadow areas of the image usually associated with excessively deep etches on less absorbent substrate. **D 6488, D01**
- dragout**—the carryout or loss of penetrant materials as a result of their adherence to the test pieces. **E 1316, E07**
- drag stroke, *n***—a stroke resulting from incomplete lifting of the pen. **E 2195, E30**
- drain**—a means for intercepting, conveying, and removing water. **D 653, D18**
- drainage, *n***—of an insulating varnish, a measure of the variation in thickness from top to bottom of a varnish film obtained on the surface of a vertically dipped coated panel after a specified time and temperature. **D 1711, D09**
- drainage basin**—See **watershed**. **D 4410, D19**
- drainage blanket, *n***—a uniform layer of permeable material such as sand, crushed stone, or bottom ash/boiler slag installed with properly designed filter media at the base of a structural fill to maintain the fill in a drained condition. **E 2201, E50**
- drainage course**—See **percolation layer**. **C 717, C24**
- drainage curtain**—in *grouting*, a row of open holes drilled parallel to and downstream from the grout curtain of a dam for the purpose of reducing uplift pressures. **D 653, D18**
- drainage gallery**—in *grouting*, an opening or passageway from which grout holes or drainage curtain holes, or both, are drilled. See also **grout gallery**. **D 653, D18**
- drainage hole**—an opening in a construction provided for the escape of unwanted liquid, as in a retaining wall. Compare **vent hole, weep hole**. **E 631, E06**
- drainage loss**—oil accumulating and pooling against the boom skirt and escaping with the flow of water down and along the skirt. **F 818, F20**
- drainage mat, *n***—component used in some EIFS-clad drainage wall assemblies, a corrosion resistive material used as a spacer to provide a drainage path between the EIFS and the weather resistive barrier. **E 2110, E06**
- drain and dry mode, *n***—the effect from being sprayed, dipped, or brushed with a fluid lubricant and the excess material draining from the surface leaving behind a thin film that remains wet and must act as a lubricant on its own, without benefit of recirculation or continuous supply. **D 4175, D02**
- drainback solar energy system**—see **solar energy system, drainback**. **E 772, E44**
- drain casting**—See **drain casting** under **casting**. **C 242, C21**
- draindown solar energy system**—see **solar energy system, draindown**. **E 772, E44**
- draining**—in *ceramic manufacture*, the process of removing excess slip from dipped or cast items by gravity flow. **C 242, C21**
- draining**—the part of the dipping or flowcoating process in which the excess slip flows from suitably positioned ware. **C 286, B08**
- drain line**—a nonuniform thickness of coating appearing as a line or streak in dipped or flow-coated ware. **C 286, B08**
- drains**—a piping system used to collect and carry off surface and ground water. **C 896, C04**
- drain tile**—pipe for collecting and conveying surface and subsurface water from an area. **C 822, C13**
- drain time**—time required for porcelain enamel slip applied by dipping, slushing, or flow coating to complete movement across the surfaces of a coated part. **C 286, B08**
- drain time**—that portion of the dwell time during which the excess penetrant or emulsifier drains from the part. **E 1316, E07**
- DRAM**—dynamic random access memory. **F 1457, F05**
- draw**—See **pull**. **C 162, C14**
- draw, *n***—a term used in sample selection. See **step**. **E 1402, E11**
- draw-back, *n***—a weave distortion characterized by tight and slack places in the same warp yarn. **D 123, D13**
- draw-back, *n***—a weave distortion characterized by tight and slack places in the same warp yarn. (*Syn.* hitch-back) **D 3990, D13**
- draw bar**—a refractory member submerged in molten glass that defines the position of the sheet in a drawing process. **C 162, C14**
- drawdown (L)**—vertical distance the free water elevation is lowered or the pressure head is reduced due to the removal of free water. **D 653, D18**
- draw gang**—{archaic} people employed to cut and handle glass as it comes from the lehr. **C 162, C14**
- drawing, *n***—in *textile processing*, the process of stretching or attenuating a material to increase the length per unit mass. **D 123, D13**
- drawing, *n***—in *textile processing*, the process of stretching or attenuating a material to increase the length per unit mass. **D 4849, D13**
- drawing, *n***—an architectural, structural, mechanical, or electrical plan, elevation, or section indicating in isometric perspective or in axonometric perspective the detailed location, dimension, quantity, or extent of material, product, or member to be furnished. Compare **shop drawing, working drawing**. **E 631, E06**
- drawing, *n***—(dessin): **E 631, E06**
- drawing, *n*** (dessin):
*record set drawing (as-built drawing), *n** (dessin de l'ouvrage fini (dessin d'après exécution))—construction drawing revised to show changes made during the construction process, usually based on marked-up prints, drawings, and other data furnished by the contractor.
*working drawing, *n** (dessin d'exécution)—detail drawing, usually produced by a draftsman under direction of an architect, engineer, or other designer showing the form, quantity, and relationship of construction elements and materials and indicating their location, identification, grades, dimensions, and connections. **E 1480, E06**
- drawings, *n***—in *pipe laying*, drawings prepared by the purchaser to show the location and details for the construction of the pipeline and appurtenances. **C 1154, C17**
- drawings, *n***—for *pipe laying*, illustrations (such as drawings, sketches, graphs, or photographs) on paper, film, diskettes, magnetic tape or other media, blueprints, layouts, designs, figures, portrayals, pictures, charts, maps, images, patterns, diagrams, representations, and plans supplied by the purchaser to show the location and details for the construction of the pipeline and appurtenances. **D 2946, C17**
- drawing stock**—the as-rolled or extruded section, normally round, made from any of a variety of manufacturing processes, intended as feed stock for subsequent drawing operations. **B 354, B01**
- drawn glass**—glass made by a continuous drawing operation. **C 162, C14**
- drawn grain**—shrunken, shriveled, or wrinkled grain surface of leather. **D 1517, D31**
- drawn stress relieved (DSR)**—a thermal treatment of a cold-drawn tubular product to improve ductility without significantly affecting its tensile strength or microstructure. **B 846, B05**
- draw ratio (DR), *n***—the relation of the final length per unit mass to original length per unit mass of a material resulting from drawing. **D 123, D13**
- draw ratio (DR), *n***—the relation of the final length per unit mass to original length per unit mass of a material resulting from drawing. **D 4849, D13**
- draw texturing, *n***—for *processing thermoplastic fibers*, the simultaneous or sequential process of drawing and imparting crimp, thus producing increased molecular orientation and increased bulk. **D 123, D13**

draw texturing, n

draw texturing, n—for processing thermoplastic fibers, the simultaneous or sequential process of drawing and imparting crimp, thus producing increased molecular orientation and increased bulk.

D 4849, D13

d-RDF—abbreviation for densified refuse-derived fuel. **E 856, D34**

dredge, dredging—in dryprocess enameling, (1) the application of dry, powdered frit to hot ware by sifting.

(2) The sieve used to apply powdered porcelain enamel frit to the ware.

C 286, B08

dress career apparel, n—career apparel which is not generally subject to abusive wear and for which appearance is a more important attribute than durability. (See also **careerapparel, vocational career apparel**)

D 123, D13

dress career apparel, n—career apparel which is not generally subject to abusive wear and for which appearance is a more important attribute than durability. (See also **careerapparel, vocational career apparel**.)

D 7022, D13

dressed crude mica, n—crude mica from which the dirt and rock have been mainly removed.

D 1711, D09

dressed size—See **lumber**.

D 9, D07

dressed stone—See **cut stone, finished stone**.

C 119, C18

dress glove, n—a covering for the hand, often extending part way up the arm, worn primarily for formal or dress occasions.

D 123, D13

dress glove, n—a covering for the hand, often extending part way up the arm, worn primarily for formal or dress occasions.

D 7022, D13

dressings, n—(1) the process of restoring the efficiency of an abrasive grinding wheel by removal of dulled grains; (2) reshaping the faces of grinding wheels to special contours.

C 1145, C28

dressings, n—any of various materials utilized for covering and protecting a wound.

F 2312, F04

dress shirt, n—for boys, a shirt made with a specific collar size or numerical size and designed to be worn with a tie and jacket.

D 123, D13

dress shirt, n—for men, a shirt made with a specific collar size and sleeve length where appropriate, and designed to be worn with a tie and jacket.

D 123, D13

dress shirt, n—for boys, a shirt made with a specific collar size or numerical size and designed to be worn with a tie and jacket.

D 7022, D13

dress shirt, n—for men, a shirt made with a specific collar size and sleeve length where appropriate, and designed to be worn with a tie and jacket.

D 7022, D13

drier, n—an additive that accelerates the drying of an oil, paint, printing ink, or varnish.

D 16, D01

drift—this is the slow nonrandom change with time in the potential (emf) of an ion-selective electrode cell assembly maintained in a solution of constant composition and temperature.

D 4127, D19

drift—in electron optics, motion of the electron beam or image due to current, voltage or specimen instabilities or charging of a projection such as dirt in or near the electron beam.

E 7, E04

drift—The physical movement of an agrochemical through the air at the time of application or soon thereafter to any non or off target site. Drift shall not include movement to non or off-target sites caused by erosion, migration, volatility or wind blown soil particles that occur after application unless specifically advertised on the label.

E 609, E35

drift—the movement of chemicals outside the intended target by air mass transport or diffusion.

E 1102, E35

drift—in leak testing, the relatively slow change in the background output level of the leak detector due to the electronics rather than a change in the level of the tracer gas.

E 1316, E07

drift—the relatively slow change in baseline output due to instrument performance taken to be the maximum deviation between any two points within a specified time period.

E 2161, E37

drift control agent—a material used in liquid spray mixtures to reduce spray drift.

E 1519, E35

drift reduction agent—See **drift control agent**.

E 1519, E35

drill—a machine or piece of equipment designed to penetrate earth or rock formations, or both.

D 653, D18

drill—electric-, hydraulic-, or air-powered tool for boring holes into the base material, using rotary action, often supplemented by percussion or hammering.

E 2265, E06

drillability—index value of the resistance of a rock to drilling.

(ISRM)

D 653, D18

drill bit—solid-shaft, carbide-tipped bit, usually with spiral flutes, used to drill holes in the base material.

E 2265, E06

drill carriage; jumbo—a movable platform, stage, or frame that incorporates several rock drills and usually travels on the tunnel track; used for heavy drilling work in large tunnels.

(ISRM)

D 653, D18

drill cuttings—fragments or particles of soil or rock, with or without free water, created by the drilling process.

D 653, D18

drill-drive test—test in which a self-drilling screw is driven into and through a test plate, under specified test conditions, to determine drilling and thread forming performance characteristics of the screw.

F 1789, F16

drill hole, n—a point that is part of a pattern piece that is not part of any line.

D 6963, D13

drilling fluid—a fluid (liquid or gas) that may be used in drilling operations in remove cuttings from the borehole, to clean and cool the drill bit, and to maintain the integrity of the borehole during drilling.

D 653, D18

drilling pattern—the number, position, depth, and angle of the blastholes forming the complete round in the face of a tunnel or sinking pit.

(ISRM)

D 653, D18

drill mud—in grouting, a dense fluid or slurry used in rotary drilling; to prevent caving of the bore hole walls, as a circulation medium to carry cuttings away from the bit and out of the hole, and to seal fractures or permeable formations, or both, preventing loss of circulation fluid.

D 653, D18

dripping—in testing thermal protective material, a response evidenced by flowing of the fiber polymer.

F 1494, F23

drips—in protective coatings, the small drops of coating that collect on the edge of the coated work.

D 4538, D33

drive cam—a cam that actuates the tumblers by a drive pin and is gated to retract or accept a locking mechanism.

F 471, F12

drive nail, drive screw—terms applied to helically threaded nails, twisted nails, and annularly threaded shoe nail. (See **nail, thread**.)

F 547, F16

drive pin—a protrusion on or through a drive cam or tumbler which drives or turns the next tumbler.

F 471, F12

driver—tool component that pushes fastener from the driving chamber of the tool into the members being assembled.

F 592, F16

drive test—test in which a tapping screw is driven into a test plate hole to determine thread forming and thread cutting performance characteristics.

F 1789, F16

driving coefficient [nd], n—the ratio of the driving force to the normal force.

F 538, F09

driving coefficient, peak[nd], n—the maximum value of the driving coefficient.

F 538, F09

driving force, [F], n—of a tire, the positive longitudinal force resulting from the application of driving torque.

F 538, F09

driving torque [ML²/T²], n—of a wheel, the positive wheel torque.

F 538, F09

drop, n—in bodymeasurements, the difference between the chest girth and the waist girth.

D 123, D13

drop, n—that part of a bedcovering that hangs perpendicular to the floor.

D 123, D13

drop, n—that part of a bedcovering that hangs perpendicular to the floor.

D 7023, D13

drop, n—a single liquid particle having a generally spheroidal shape.

E 1620, E29

drop bar—component of a double gate latch assembly (sometimes called **drop rod**) (see Specification F 900).

F 552, F14

- drop cap**—the cover of a railing post or newel that is exposed to view, usually below the stair stringer or floor. **E 631, E06**
- drop cap**—See **railing systems**. **E 631, E06**
- drop cap**—the cover of a railing post or newel that is exposed to view, usually below the stair stringer or floor. **E 1481, E06**
- droplet, n**—a small liquid particle of such size and density as to fall under still conditions but which may remain suspended under turbulent conditions. **D 1356, D22**
- droplet, n**—see **drop**; also a small drop. **E 1620, E29**
- drop, liquid, n**—see **liquid drop**. **G 40, G02**
- drop melting point of petroleum wax, n**—the temperature at which material becomes sufficiently fluid to drop from the thermometer used in making the determination under definite prescribed conditions. **D 4175, D02**
- drop out colors**—See **reflective ink**. **F 149, F05**
- drop out ink**—See **reflective ink**. **F 149, F05**
- dropped stitch, n**—*in knitted fabrics*, an unknitted stitch. **D 123, D13**
- dropped stitch, n**—*in knitted fabrics*, an unknitted stitch. **D 3990, D13**
- dropping**—{archaic} forming by heating in a mold without the use of pressure. **C 162, C14**
- dropping point, n**—a numerical value assigned to a grease composition representing the corrected temperature at which the first drop of material falls from the test cup and reaches the bottom of the test tube. **D 4175, D02**
- drop size, n**—the diameter of a liquid drop if it is approximately spherical; otherwise, the approximate shape and appropriate dimensions must be described. **G 40, G02**
- drop test**—See **package testing**. **D 996, D10**
- drop throat**—See **submerged throat**. **C 162, C14**
- drop weight, n**—that weight which is raised to a selected height and released. This weight does not impact the sample directly; rather it strikes another stationary weight that is in contact with the sample. **E 1445, E27**
- drop-weight tear test (DWTT)**—a test of plain-carbon or low-alloy pipe steels over the temperature range where the fracture changes from a brittle to a ductile mode. The mode can be determined from the appearance of propagating fractures. **E 1823, E08**
- dress**—a mixture of metal oxide and metal on the surface of a float bath. **C 162, C14**
- drug, n**—“articles intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease in man or other animals.” Drugs are “intended to affect the structure or any function of the body of man or other animals.” **F 2312, F04**
- drug product, n**—a drug product is a finished dosage form (for example, tablets, capsule, or solution) that contains a drug substance, generally, but not necessarily, in association with one or more other ingredients. **E 2363, E55**
- drug therapy, n**—is the delivery of drug(s) that stimulate a specific physiologic (metabolic) response. Drug therapy technologies can be applied in tissue engineering to generate TEMPs. **F 2312, F04**
- drum, n**—(1) a cylindrical **shipping container** having straight sides, and flat, convex or embossed ends, designed for storage and shipment as an unsupported outer package that may be shipped without boxing or crating. It may be made of metal, or of plywood, or of fiber with wooden, metal or fiber ends. Drums are also made of rubber or plastics (Compare **barrel**.); (2) in set-up paper boxes, a shell or tube with paper or cellophane head, used for powder box. (See **divider**.) **D 996, D10**
- drum**—implies any drum, barrel, or non-bulk container of 5 to 110 U.S. gal (19 to 416 L) capacity. **D 5681, D34**
- drum**—a container (typically, but not necessarily, holding 55 gal [208 L] of liquid) that may have been used to store hazardous substances or petroleum products. **D 5681, D34**
- drum dryer, n**—a heated, rotating drum in which tumbling or cascading raw materials are dried. **C 1145, C28**
- drum dyeing**—the application of dyestuffs to leather by immersion of the leather in a revolving drum containing the dyestuff solution, as contrasted with table dyeing. **D 1517, D31**
- drumhead leather**—see **parchment**. **D 1517, D31**
- drum printer**—a type of printer that employs a rotating cylinder or drum, the outer surface of which contains fully formed characters. As the drum rotates in front of the paper form, hammers are caused to strike the back of the form synchronized in such a way as to produce the desired character in their proper position. **F 909, F05**
- drunken forest**—a group of trees leaning in random directions in a permafrost region; usually associated with thermokarst topography. **D 7099, D18**
- dry, v**—to change the physical state of an adhesive on an adherend or between adherends by the loss of solvent constituents by evaporation or absorption, or both. **D 907, D14**
- dry, v**—*in in-planttextile floor covering cleaning*, suspend textile floor covering in a heated room until dry. **D 5253, D13**
- dry, adj**—a condition which does not exceed the equivalent of 50 % relative humidity at 22 °C. **E 344, E20**
- dry, v**—to develop the ultimate properties of a wet-state material solely by evaporation of volatile ingredients. **E 2110, E06**
- dry, ash-free**—the test data calculated to a theoretical base of no moisture or ash associated with the sample. **E 856, D34**
- dry, ash-free basis**—See **dry, ash-free basis** under **reporting bases**. **D 121, D05**
- dry ash-free basis, n**—test data calculated to a theoretical base of no moisture or ash associated with the sample. **D 5681, D34**
- dry basis**—See **dry basis** under **reporting bases**. **D 121, D05**
- dry basis**—exclusive of any moisture which may be present. **D 2652, D28**
- dry basis, n**—test data calculated to a theoretical base of no moisture associated with the sample. **D 5681, D34**
- dry basis**—the test data calculated to a theoretical base of no moisture associated with the sample. **E 856, D34**
- dry basis moisture content**—of biomass fuels, the ratio of the weight of the water in a sample to the weight of the dry material. It is expressed as a percent. **E 1705, E48**
- dry-blend, n**—a dry compound prepared without fluxing or addition of solvent (also called powder blend). **D 883, D20**
- dry-blend, n**—a free-flowing dry compound prepared without fluxing or addition of solvent (also called powder blend). (D20) **F 412, F17**
- dry bond adhesive, n**—Synonym for **contact adhesive**. **D 907, D14**
- dry bright polish**—a polish that dries to a gloss without buffing. **D 2825, D21**
- dry-bulb temperature**—temperature of the air as indicated by an accurate thermometer, corrected for radiation if significant. **D 9, D07**
- dry-bulb temperature**—See **temperature**. **D 1356, D22**
- dry-bulb temperature, n**—the temperature of the ambient air; for example, the temperature that is measured by the dry-bulb thermometer of a psychrometer. **G 113, G03**
- dry carrier toner**—dry powdered toner mixed with bead or granular particles as a carrier to form a developer. **F 335, F05**
- dry-cast, adj**—manufacturing concrete products using low frequency, high amplitude vibration to consolidate concrete of stiff or extremely dry consistency in a form. **C 1209, C15**
- dry chop**—dried fiber glass strand which has been chopped. See **chopped fiber** and **wet chop**. **C 162, C14**
- drycleanable button, n**—a button that can be solvent-cleaned without damage such as dissolving or loss of finish. (See **dry-cleaning, finish**.) **D 123, D13**
- drycleaning, n**—*in the care of textiles*, the cleaning of consumer textiel products with organic solvents such as petroleum solvent or perchloroethylene. **D 123, D13**
- dry cleaning**—under **cleaning**, see **dry cleaning**. **D 459, D12**
- drycleaning, n**—*in the care of textiles*, the cleaning of consumer textile products with organic solvents such as a petroleum solvent or perchloroethylene. **D 3136, D13**

dry cleaning, n

dry cleaning, n—in *textile floor covering cleaning*, a deprecated term.

See the preferred term, **dry extraction cleaning**. D 5253, D13

dry-cleaning detergent—a formulated composition added to the solvent bath in dry-cleaning operations to improve cleaning.

D 459, D12

dry-cleaning detergent—under **detergent**, see *dry-cleaning detergent*.

D 459, D12

dry cockle, n—a wave pattern which is apparent after ink drying.

F 1857, F05

dry coke—See *dry coke* under **coke**.

D 121, D05

dry crock—same as wet crock without using water.

D 2825, D21

dry density—the mass of a unit volume of dried material.

D 7099, D18

dry deposition—See **deposition**.

D 1356, D22

dry edging—rough edges and corners of glazed ceramic ware caused by insufficient glaze coating.

C 242, C21

dryer—a kiln or chamber, or machine through which the green veneers are passed to remove excess moisture.

D 1038, D07

dry extraction clean, v—in *cleaning upholstered furniture and textile floor coverings*, brush an absorbent compound into the fabric, allow to dry, and remove by suction, following manufacturer's instructions.

D 5253, D13

dry extraction cleaning, n—a method in which an absorbent compound is dispersed over the surface of a textile product by hand or machine, thoroughly brushed through the pile, allowed to dry, and removed by suction.

D 123, D13

dry felt—(1) see felt;

(2) a felt which has not been saturated with bitumen.

D 1079, D08

dry fiber—a condition in which fibers are not fully encapsulated by resin during pultrusion.

D 3918, D20

dry-film thickness, n—the thickness of a cured film, coating, or membrane.

C 717, C24

dry fly ash, n—fly ash that has been collected by particulate removal equipment such as electrostatic precipitators, Baghouses, mechanical collectors, or fabric filters.

E 2201, E50

dry foam extraction cleaning, n—a process by which a highly aerated, low moisture content shampoo is brushed through the textile floor covering pile or applied to the surface of upholstery.

D 123, D13

dry foam extraction cleaning, n—a process by which a highly aerated, low moisture content shampoo is brushed through the textile floor covering pile or applied to the surface of upholstery.

D 5253, D13

dry frozen ground—frozen ground with a very low total water content, consisting almost completely of interfacial water, and not cemented by ice.

D 7099, D18

dry gage (drigage) v.—to form cullet by running a stream of molten glass into a water bath. (See synonymous term **frit**, v.)

C 162, C14

dry gas—natural gas containing little or no water vapor.

D 4150, D03

dry impingement—See **impingement**.

D 1356, D22

dry in, n—a situation where the cells in the anilox cylinder become partly or completely filled with dry ink.

D 6488, D01

drying—removal by evaporation, of uncombined water or other volatile substance from a ceramic raw material or product, usually expedited by low-temperature heating.

C 242, C21

drying—See **seasoning**.

D 9, D07

drying, n—process of developing, solely by evaporation of volatile ingredients, ultimate properties of a finish or other material over a specified period of time. Compare **curing**.

E 631, E06

drying crack—a defect characterized by a fissure in the bisque.

C 286, B08

drying in, n—the accumulation of dried ink in the cells of the cylinder.

D 6488, D01

drying oil, n—an oil that possesses to a marked degree the property of readily taking up oxygen from the air and changing to a relatively hard, tough, elastic substance when exposed in a thin film to the air.

D 16, D01

drying oven, n—a closed unit in which specimens are dried by heating.

C 1145, C28

drying oven—an oven used for increasing the evaporation rate of rinse water or an aqueous developer vehicle from test parts.

E 1316, E07

drying room yellowing, n—a yellowish cast on linoleum resultant from the oxidation process that will go away with light exposure. Without continued light exposure, the cast may reappear.

F 141, F06

drying shrinkage, n—the contraction of a moist body during the drying process, expressed as linear percent of the original length or volume percent of the original volume.

C 1145, C28

drying shrinkage, n—in this test method, the change in linear dimension of the test specimen due to drying from a saturated condition to an equilibrium weight and length under specified accelerated drying conditions.

C 1209, C15

drying temperature, n—the temperature to which an adhesive or an assembly is subjected to dry the adhesive.

D 907, D14

drying time, n—the period of time during which an adhesive or an assembly is allowed to dry, with or without the application of heat or pressure, or both.

D 907, D14

drying time—the time required for a cleaned, rinsed or wet developed part to dry.

E 1316, E07

drying, vacuum, n—the technique of expediting the removal of moisture from a material or body by the use of a vacuum in conjunction with a conventional drying system.

C 1145, C28

dry method—magnetic particle inspection in which the ferromagnetic particles employed are in the dry powder form.

E 1316, E07

dry milling—the grinding of porcelain enamel materials without a liquid vehicle.

C 286, B08

dry milling, n—the process of reducing the particle size of a substance by milling without the use of a liquid medium.

C 1145, C28

dry mix—See *dry process* under **process**.

C 242, C21

dry objective—any microscopical objective designed for use without immersion liquids.

E 7, E04

dry occupancy—an occupied space below the plaza deck system in which the computed or anticipated relative humidity is below 30 %.

C 717, C24

dry pack—a cement-sand mix with minimal water content used to fill small openings or repair imperfections in concrete.

D 653, D18

dry permafrost—perennially frozen soil or rock without ice, or with an ice content lower than the pore volume, so that it does not yield excess water on thawing.

D 7099, D18

dry pickling—a method of curing skins from wool sheep with sodium sulfate and sodium chloride.

D 1517, D31

dry point, n—in *batch distillation*, the temperature observed at the instant the last drop of liquid evaporates from the lowest point in the flask.

D 4175, D02

dry point temperature—the temperature observed immediately after the liquid just disappears from the bottom of the flask during a distillation test.

D 4790, D16

dry powder—finely divided ferromagnetic particles suitably selected and prepared for magnetic particle inspection.

E 1316, E07

dry pressing—See *dry pressing* under **pressing**.

C 242, C21

dry process—See *dry process* under **process**.

C 242, C21

dry process enameling—a porcelain enameling process in which the metal article is heated to a temperature above the maturing temperature of the coating (usually 1600 to 1750°F, (approximately 870 to 955°C)), the coating materials applied to the hot metal as a dry powder, and fired.

C 286, B08

dry salting—a method of curing hides in which the hides are first greensalted and then dried.

D 1517, D31

dry scraping—of *coatings*, method of removing dried, often deteriorated, paint film using a blade or similar tool.

E 631, E06

dry screening, n—the process of separating small sizes of granular or powdered solids from coarser particles by passing them through a screen of desired mesh size while in the dry state.

C 1145, C28

dry sieving—for the purpose of Test Method D 4749, the test method for the sieving of coal after the sample has been airdried under prescribed conditions; this is generally used when testing with coal particles larger than 600 μm (No. 30 U.S.A. Standard Sieve Series.) **D 121, D05**

dry solid film lubricants, *n*—dry coatings consisting of lubricating powders in a solid matrix bonded to one or both surfaces to be lubricated. **D 4175, D02**

dry solvent, *n*—any organic solvent used to dissolve another material. (See **solvent**.) **D 123, D13**

dry solvent, *n*—any organic solvent used to dissolve another material. See **solvent**. **D 5253, D13**

dry-spot, *n*—an imperfection in reinforced plastics, an area of incomplete surface film where the reinforcement has not been wetted with resin. **D 883, D20**

dry spray—a defect confined to sprayed ware manifesting itself in the fired porcelain enamel as a rough, sandy texture. **C 286, B08**

dry spray—in protective coatings, a rough, powdery, non-coherent film produced when an atomized coating partially dries before reaching the surface. **D 4538, D33**

dry strength, *n*—see **bond strength**. **D 907, D14**

dry strength—See **strength, dry**. **E 631, E06**

dry strength—See **strength, dry**. **E 1749, E06**

dry tack, *n*—see **dry tack under tack**. **D 907, D14**

dry technique—in magnetic particle examination, the examination technique in which the ferromagnetic particles are applied in the dry powder form. **E 1316, E07**

dry time—the time that a copy must reside in the copy tray before it appears to be dry. **F 335, F05**

dry time, *n*—a measure of the rate of ink absorption into a substrate to the point at which no image transfer, smear, or surface damage occurs when in contact with another surface. **F 1857, F05**

dry toner, *n*—the material in a dry developer system which when deposited on a substrate by the field of an electrostatic charge pattern, becomes the visible record. **F 1457, F05**

dry unit weight (dry density)—see **unit weight**. **D 653, D18**

drywall nail—See **gypsum-wallboard nail**. **F 547, F16**

dry weight—the weight per unit area of the bisque. **C 286, B08**

dry weight—a term is usually applied to the mass of the oven-dry material, but it is ambiguous unless the method of drying is specified. **D 1695, D01**

DSC—abbreviation for **data stream compatibility**. **F 1457, F05**

2D stacked symbols—see **multi-row symbols**. **F 1294, F05**

DT—in viscometry, abbreviation for degree of thickening. **D 4175, D02**

D2T2,, *n*—abbreviation for **dye diffusion thermal transfer**. **F 1623, F05**

DTA (DSC) curve, *n*—a record of a thermal analysis where the temperature difference (ΔT) or the energy change (Δq) is plotted on the ordinate and temperature or time is plotted on the abscissa. **E 1445, E27**

DTE—abbreviation for **data terminal equipment**. **F 1457, F05**

DTR—abbreviation for **data terminal ready**. **F 1457, F05**

2D (two-dimensional) symbol, *n*—a machine-readable symbol that must be examined both vertically and horizontally to read the entire message. Two-dimensional symbols may be of two types: matrix symbols and multi-row symbols. **F 1294, F05**

dual-drum mixer, *n*—a mixer consisting of a long drum containing two compartments separated by a bulkhead with a swinging chute extending through the unit. **C 1145, C28**

dual-head nail—See **double-headed nail**. **F 547, F16**

dual in-line package switch, *n*—a device used to direct the signal line to or from one component or another. (See **DIP switch**.) **F 1457, F05**

dual metal, *n*—two metals of different composition that are fusion bonded at all interfacial surfaces by casting metal of one composition against metal of a second composition. **A 644, A04**

dual orifice nozzle—a swirl chamber atomizer containing a primary injector and a concentric annular secondary injector, each injector comprising a separate orifice and set of tangential slots. The nozzle is normally operated only with the primary injector at low flow rates, with secondary liquid introduced at a specified pressure. (This definition applies to devices used in the gas turbine industry.) **E 1620, E29**

dual ovenable—terms describing a food packaging container used to prepare food in either a conventional oven or a microwave oven. **F 1479, F02**

dual search unit—a search unit containing two elements, one a transmitter, the other a receiver. **E 1316, E07**

dubbing, (dubbin)—a mixture, primarily oils and fats, used for restoring fatty matter to military footwear in the field. **D 1517, D31**

duck, *n*—a compact, firm, heavy, plain-weave cotton fabric, mass per square yard 6 to 50 oz. (See also **flat duck**, and **plied yarn duck**) **D 123, D13**

duck, *n*—a compact, firm, heavy, plain-weave cotton fabric, mass per square yard 6 to 50 oz. (See also **flat duck**, and **plied yarn duck**.) **D 4850, D13**

duckbill point—end of wire flattened to thin elliptical cross section having sharp periphery, in appearance somewhat like bill of duck, to facilitate clinching at predetermined point, slight transverse depression may be formed across point. **F 547, F16**

duct, *n*—as related to heating ventilating, air conditioning or exhaust systems, a passageway made of sheet metal or other suitable material used for conveying air or other gases. **E 176, E05**

ductile—the ability of a material to deform plastically before fracturing. **F 2078, F07**

ductile erosion behavior, *n*—erosion behavior having characteristic properties that can be associated with ductile fracture of the exposed solid surface; that is, considerable plastic deformation precedes or accompanies material loss from the surface which can occur by gouging or tearing or by eventual embrittlement through work hardening that leads to crack formation. (See also **brittle erosion behavior**.) **G 40, G02**

ductile failure—a pipe failure mode which exhibits material deformation (stretching, elongation, or necking down) in the area of the break. **F 412, F17**

ductile fracture, *n*—fracture that occurs with appreciable plastic deformation of the material. **A 644, A04**

ductile fracture area, *n*—The fraction or percent of the fracture surface that formed by ductile fracture. (When observed with no or low magnification, ductile fracture appears grayer and duller than brittle fracture.) **A 644, A04**

ductile iron, *n*—a cast iron that has been treated in the liquid state so as to cause substantially all of its graphitic carbon to occur as spheroids or nodules in the as-cast condition. **A 644, A04**

ductility—the ability of a material to deform plastically without fracturing. **B 374, B08**

ductility—condition in which material can sustain permanent deformation without losing its ability to resist load. (ISRM) **D 653, D18**

ductility, *n*—the ability of a material to deform plastically before fracturing. **E 6, E28**

ductility of externally threaded fasteners—ability of a fastener to deform before it fractures. Machined test specimens made from a fastener allow the measurement of elongation and reduction of area which are criteria used to evaluate the specimen. However, since yielding and fracture normally occur in the screw threads, these are impractical for the actual fastener. Hardness and the wedge tensile test are ductility indicators for the actual fastener. The lower the ratio of its specified minimum yield strength to its specified minimum tensile strength, the greater the fastener ductility. **F 1789, F16**

duct insulation supplementary materials, *n*—as related to fire testing, components, including tapes and sealants used for transverse joints as well as fitting covers that are intermittently spaced, as needed, within the duct insulation system, as well as adhesives

duct insulation supplementary materials, *n*

used to bond the insulation to the duct substrate and that do not cover the duct continuously for an extended length. **E 176, E05**

duct insulation system, *n*—*as related to fire testing*, system intended to insulate and cover, continuously for an extended length, the outside surface of a duct; the system shall have an insulation core, with or without a covering or vapor retarder facing which includes longitudinal closure systems (if used) and perhaps other duct insulation supplementary materials such as adhesives, fasteners, or tapes (if used). **E 176, E05**

duct lining, *n*—material such as an insulation, coating or film, including adhesive, used to line the inside surface of a duct. **E 176, E05**

dullness—a lack of normal pultruded surface gloss or shine.

NOTE—This condition can be caused by insufficient cure locally or in large areas, resulting in the dull band created on a pultruded part within the die when the pultrusion process is interrupted briefly (see **stop mark**). **D 3918, D20**

dull point—end of point rounded in contrast to being sharp. **F 547, F16**

dumbbell specimen (rubber), *n*—a flat specimen having a narrow straight central portion of essentially uniform cross section with enlarged ends. **D 1566, D11**

dumet, *n*—round, copper-coated 42 % nickel-iron wire intended primarily for sealing to soft glass. Also known as CuNiFe in some communities. **E 344, E20**

dummy—a mechanical device, operated by the blower's feet, for wetting, raising, opening and closing the paste mold in mouth-blowing glassware. **C 162, C14**

dummy microphone—a microphone substitute which has electrical characteristics identical to a functional microphone, but which has essentially no sensitivity to incident sound pressure. **C 634, E33**

dummy (or dummy cathode)—a cathode in a plating solution that is not to be made use of after plating. Often used for removal or decomposition of impurities. **B 374, B08**

dummy specimen, *n*—a noncombustible (as defined by 46 CFR 164.009) specimen used for standardizing the operating condition of the equipment, roughly 20 mm in thickness with a density of $750 \pm 100 \text{ kg/m}^3$. **E 176, E05**

dummy specimen, *n*—a noncombustible insulating board used for stabilizing the operating condition of the equipment, mounted in the apparatus in the position of the specimen and removed only when a test specimen is to be inserted. It shall be roughly $20 \pm 5 \text{ mm}$ in thickness with a density of $750 \pm 100 \text{ kg/m}^3$. **E 176, E05**

dummy specimen—Use **blank sample**. **E 631, E06**

dunes (stream)—bed forms of coarse sediment, generally transverse to the direction of flow, with a triangular profile having a gentle upstream slope. Dunes advance downstream by the movement of sediment along the upstream slope and by the deposition of sediment on the steep downstream slope. Dunes move downstream at low velocities compared to the stream flow velocity. **D 4410, D19**

dunnage—See **loading**. **D 996, D10**

dunnage—lumber or other material used to brace and secure cargo to prevent damage. **E 2135, E53**

dunting—the cracking that occurs in fired ceramic bodies as a result of thermally induced stresses. **C 242, C21**

duo-trio test, *n*—a method of discrimination testing comprised of two coded samples and one identified reference. One of the coded samples and the reference are identical. The assessor is asked to select which of the two coded samples is different from the reference or which of the two coded samples is the same as the reference. **E 253, E18**

duple nozzle—see **dual orifice nozzle**. **E 1620, E29**

duplex channel, *n*—a data transmission system capable of transmitting in both directions at once. **F 1457, F05**

duplex coating—See **composite plate**. **B 374, B08**

duplex copy—a sheet with copied images on both sides. **F 335, F05**

duplex dwelling—See **dwelling**. **E 631, E06**

duplex dwelling—one of a pair of **dwelling units**, generally joined by a common floor/ceiling. **E 631, E06**

duplex grain size—the simultaneous presence of two grain sizes, in substantial amounts, with one grain size appreciably larger than the other. (Synonymous with **mixed grain size**.) **E 7, E04**

duplex-head nail—See **double-headed nail**. **F 547, F16**

duplexing—*in a copy system*, the process by which images are placed on both sides of the copy sheet. **F 335, F05**

duplex microstructure—a two-phase structure. **E 7, E04**

duplex nozzle—a swirl chamber atomizer comprising a single discharge orifice and two sets of tangential slots, each with a separately controlled liquid supply. The smaller (primary) slots supply liquid at low flow rates, and both sets (primary and secondary) are utilized as flow increases. **E 1620, E29**

duplex wire, *n*—a matched pair of parallel, solid thermoelements, individually insulated (double wrap or braid) with insulating fibers and a fiber braid of the same material overall. **E 344, E20**

duplicate, *n*—*in experimenting or testing*, one of two or more runs with the same specified experimental or test conditions but with each experimental or test condition not being established independently of all previous runs. (Compare **replicate**.) **D 123, D13**

duplicate, *vt*—*in experimenting or testing*, to repeat a run so as to produce a duplicate. (Compare **replicate**.) **D 123, D13**

duplicate analysis—paired determinations on the same sample performed by one analyst at essentially the same time. **E 856, D34**

duplicate analysis, *n*—paired determinations on the same sample performed by one analyst at essentially the same time. **D 5681, D34**

duplicates—two independent determinations performed by one analyst at essentially the same time. **E 1547, E15**

duplicate sample, *n*—one of two (2) representative portions taken from the same sample or sample source. **D 1129, D19**

duplicate sample—a second portion of a homogenized sample carried through sample digestion. Analysis results for these samples are used to provide information on the precision of the homogenization process. **E 631, E06**

durability—the measure of the ability of dimension stone to endure and to maintain its essential and distinctive characteristics of strength, resistance to decay, and appearance. Durability is based on the length of time that a stone can maintain its innate characteristics in use. This time will vary depending on the environment, the use, and the finish of the stone in question (for example, outdoor versus indoor use). **C 119, C18**

durability—See **chemical durability**. **C 162, C14**

durability—*in building construction*, a general term for resistance to deleterious change of an installed sealant, coating or membrane. **C 717, C24**

durability, *n*—the property of an article of being resistant to physical or chemical damage, or both, under the usual conditions of service, and of being useful over extended periods of time and use. **C 1145, C28**

durability, *n*—the ability of a material to resist weathering action, chemical attack, abrasion, and other conditions of service. **C 1180, C12**

durability—a general term for permanence or resistance to deterioration. Frequently used to refer to the degree of resistance of a species of wood to attack by wood-destroying fungi under conditions that favor such attack. In this connection the term "decay resistance" is more specific. **D 9, D07**

durability, *n*—a relative term indicating degree of permanency. It may be applied to individual protective, decorative, or functional properties, for example, "the durability of gloss," but if used in a general way, for example, "the excellent durability of a paint," implies the ability of the described coating to retain, to the

indicated degree, all the properties required for the continued service of the coating. **D 16, D01**

durability, *n*—as related to adhesive joints, the endurance of joint strength relative to the required service conditions. **D 907, D14**

durability—(1) as applied to wood, its lasting qualities or permanence in service with particular reference to decay.
(2) as applied to the glue bond, its resistance to deterioration related to exposure conditions. (See also **delamination**.)
D 1038, D07

durability, *n*—of paper, the capacity of paper or paperboard to resist the effects of wear in performance situations. **D 1968, D06**

durability, *n*—for pile yarn floor coverings, a property of a pile yarn floor covering describing the ability to maintain specific physical properties or product integrity without deterioration after a significant amount of time or a significant extended stress. **D 5684, D13**

durability, *n*—the capability of a **building**, assembly, **component**, product, or construction to maintain **serviceability** over at least a specified time. **E 631, E06**

durability—the measure of the ability of a material or structure to endure and maintain its essential and distinctive characteristics of strength, resistance to decay, and appearance, with relation to a specific environment of use. **E 631, E06**

durability—See **building performance**. **E 631, E06**

durability—See **building performance**. **E 1480, E06**

durability—the quality of a component to perform as designed for its design life. **E 1705, E48**

durability—the measure of the ability of a material or structure to endure and maintain its essential and distinctive characteristics of strength, resistance to decay, and appearance, with relation to a specific environment of use. **E 1749, E06**

durability, *n*—the capability of a building assembly, component, product, or construction to maintain serviceability over not less than a specified time. **E 2110, E06**

durability, *n*—in weathering, a measure of the retention of original condition and function of a material after exposure to a specified set of conditions. **G 113, G03**

durability "D" cracking, *n*—closely spaced crescent-shaped hairline cracking pattern that initiates adjacent to joints, cracks, or free edges, first manifesting itself at the intersection of joints, cracks, or free edges; dark coloring of the cracking pattern and surrounding area often exists with "D" cracking. **E 867, E17**

durability "D" cracking, *n*—closely spaced crescent-shaped hairline cracking pattern that initiates adjacent to joints, cracks, or free edges, first manifesting itself at the intersection of joints, cracks or free edges; dark coloring of the cracking pattern and surrounding area often exists with "D" cracking. **E 1778, E17**

durability limit, *n*—see the preferred term, **service life**. **C 717, C24**

durable-press, *adj*—having the ability to retain substantially the initial shape, flat seams, pressed-in creases, and unwrinkled appearance during use and after laundering or drycleaning. (See **wash and wear**.) **D 123, D13**

durable-press, *adj*—having the ability to retain substantially the initial shape, flat seams, pressed-in creases, and unwrinkled appearance during use and after laundering or drycleaning. (See **wash and wear**.) **D 4850, D13**

duration of load—the duration of stress or the time during which a load acts on a member. In wood, a design consideration for modifying allowable stresses, based on the accumulated loadings anticipated in the life of a structure. **D 9, D07**

durometer—(1) an instrument for measuring the hardness of rubber-like materials. (2) a term used to identify the relative hardness of rubber-like materials, for example "low durometer" (relatively soft) or "high durometer" (relatively hard). **C 717, C24**

durometer, *n*—an instrument for measuring indentation hardness. **D 883, D20**

durometer, *n*—an instrument for measuring the indentation hardness of rubber. **D 1566, D11**

durometer—an instrument for measuring hardness, that is, the

resistance to the penetration (without puncturing) of the indenter into the surface of rubber or other shoe material. **F 869, F08**

durometer hardness—an arbitrary numerical value which measures the resistance to indentation of the blunt indenter point of the durometer. The value may be taken immediately or after a very short specified time. **F 869, F08**

dust, *n*—a general term, depending upon application, applied to solid particles predominantly larger than colloidal and capable of temporary suspension in air or other gases.

dust loading, *n*—an engineering term for **dust concentration**, usually applied to the contents of collection ducts and the emissions from stacks.

carpet-embedded dust, *n*—soil and other particulate matter, approximately 5- μ m equivalent aerodynamic diameter and larger, embedded in carpet pile and normally removable by household vacuum cleaners.

surface dust, *n*—soil and other particulate matter, approximately 5- μ m equivalent aerodynamic diameter and larger, adhering to floor surfaces and normally removable by household vacuum cleaners. **D 1356, D22**

dust—an imprecise term referring to particulates capable of temporary suspension in air or other gases; also, particles smaller than an arbitrarily selected size. **D 2652, D28**

dust binder, *n*—a light application of bituminous material for the express purpose of laying and bonding loose dust. **D 8, D04**

dust coat—a relatively thin, sprayed coating of slip. **C 286, B08**

dust concentration, *n*—the mass of dust divided by the internal volume of the test chamber. **E 1445, E27**

dustfall—See **particle fall** under **particle**. **D 1356, D22**

dusting—(1) In dry-process enameling, see **dredging**.
(2) A spraying defect characterized by a piling up of almost dry slip in confined areas.
(3) The removal of extraneous material from the bisque before firing.
(4) See **dry spray**. **C 286, B08**

dusting, *n*—the application of a powder to a rubber surface, generally to prevent adhesion to another surface. **D 1566, D11**

dusting—the developer/toner particles deposited in and around the machine on other than the electrostatic copy. **F 335, F05**

dust-lead hazard, *n*—surface dust in a building that contains, or is presumed to contain, a mass-per-area concentration of lead equal to or exceeding limits set in regulations promulgated by authorities having jurisdiction. **E 1605, E06**

dust loading—See **dust**. **D 1356, D22**

dust pressing, *n*—the process of forming ceramic bodies of 1.5 % or less water content by pressing in a mold. **C 1145, C28**

dust ruffle, *n*—a fabric which (1) lies flat over the box spring under the mattress on a bed, and (2) has a pleated, tucked, or gather drop to the floor. **D 123, D13**

dust ruffle, *n*—a fabric which (1) lies flat over the box spring under the mattress on a bed, and (2) has a pleated, tucked, or gathered drop to the floor. **D 7023, D13**

dust wipe sample—a settled dust sample collected on a moistened disposable towel. **E 631, E06**

dust-wipe sample—a sample of surface dust collected on a wipe. **E 1605, E06**

dutchman—a thin wedge of leather or fiberboard inserted between the insole and outsole of a shoe, or between the lifts of a built-up heel, to throw the foot inward or outward and to correct foot posture. **F 869, F08**

Dutch or Scotch method, *n*—in shingles, a method of application for roofing shingles which are rectangular in shape and lap at the top and one side to form either a square or rectangular pattern. **C 1154, C17**

Dutch or Scotch method—method of application for asbestos-cement roofing shingles which are rectangular in shape and lap at the top and one side to form either a square or rectangular pattern. **D 2946, C17**

duty cycle

duty cycle—the ratio of switch closed time to total cycle time.

F 2112, F01

dwarf width—a condition in which the crosswise (of the direction of pultrusion) dimension of a flat surface of the part is less than that the die normally would yield for a particular composite.

NOTE—This condition is usually caused by a partial blockage of the pultrusion die cavity caused by “build-up” or particles of the composite adhering to the cavity surface. This condition is commonly called a “lost edge” when the flat surface has a free edge that is altered by the build-up.

D 3918, D20

dwelling—structure or portion thereof used for residential habitation.
D 5681, D34

dwelling, n—a building designed or occupied as the living quarters for one or more families or households.
E 631, E06

dwelling, n (logement)—building designed or occupied as the living quarters for one or more families or households.
E 1480, E06

dwelling unit—a unit providing complete independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking, and sanitation. (See also **house**.)
E 631, E06

dwelling unit—unit providing complete independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking, and sanitation.
E 1605, E06

dwelling unit, n—a unit providing complete independent living facilities for one or more persons, including permanent provisions for living, sleeping, eating, cooking, and sanitation.
E 2151, E06

dwel mark—a fracture surface marking representing the site of a fracture discontinuity caused by a sudden shift in the stress distribution or by a fracture stopping for some length of time; also known as an arrest line.
C 162, C14

dwel time—the total time that the penetrant or emulsifier is in contact with the test surface, including the time required for application and the drain time.
E 1316, E07

dwel time, n—the duration of time beginning at the instant a tribometer’s test foot is placed upon the surface to be tested, and ending at the instant a shear force is applied to the sensor.
F 1646, F13

dye, n—a colorant added to an engine coolant to give it a distinctive color.
D 4725, D15

dye sensitizing—the incorporation of dye-stuffs into a photoconductive coating to alter its spectral response.
F 335, F05

dye spot—See **dyestain**.
D 3990, D13

dyestain, n—an area of discoloration due to uneven absorption of a colorant.
D 123, D13

dyestain, n—an area of unintended discoloration due to uneven absorption of a colorant.
D 3990, D13

dye streak, n—an unintended stripe in a fabric due to uneven absorption of a colorant.
D 123, D13

dye streak, n—an unintended irregular stripe in a fabric due to uneven absorption of a colorant.
D 3990, D13

dye sublimation, n—an imaging process from thermal dye ribbons, which employ selected organic dyes, and have characteristics different from an imaging process using pigmented materials employed in thermal transfer wax ribbons.
F 1623, F05

dye tracer—*in grouting*, an additive whose primary purpose is to change the color of the grout or water.
D 653, D18

dynamic—exhibiting change or movement.
C 717, C24

dynamic, adj—*in testing*, descriptive of a force or deflection function characterized by an oscillatory or transient condition, as contrasted to a static test.
D 1566, D11

dynamic, adj—*as a modifier of stiffness or modulus*, descriptive of the property measured in a test employing an oscillatory force or motion, usually sinusoidal.
D 1566, D11

dynamic, adj—*in petroleum products*—the condition where the vapor above the test specimen and the test specimen are not in temperature equilibrium at the time that the ignition source is applied.
D 4175, D02

dynamic adsorptive capacity—the quantity of a given component adsorbed per unit of adsorbent from a fluid, or fluid mixture moving through a fixed bed at the breakpoint for that component.
D 2652, D28

dynamic air permeability (DAP), n—*for inflatable restraints*, the dynamic air permeability measured at a single specified pressure differential.
D 6799, D13

dynamical theory—the explanation of diffraction phenomena in terms of dynamical interaction between the incident beam, all scattered waves and the crystal lattice, where the latter is treated as a triply periodic field of potential.
E 7, E04

dynamic coefficient of friction—the ratio of the parallel component of force applied to a moving body that maintains constant relative motion of two surfaces in physical contact one with another, but otherwise unconstrained, to the normal component of the force—usually the force caused by gravity—applied to the body under clean, dry conditions.
C 242, C21

dynamic coefficient of friction (DCOF), n—a coefficient of friction, μ_d , obtained during relative translation between two contacting solid bodies; used interchangeably with *kinetic coefficient of friction*.
F 1646, F13

dynamic fuel level, n—*for knock testing*, test procedure in which the fuel-air ratio for maximum knock intensity for sample and reference fuels is determined using the falling level technique that changes carburetor fuel level from a high or rich mixture condition to a low or lean mixture condition, at a constant rate, causing knock intensity to rise to a maximum and then decrease, thus permitting observation of the maximum knockmeter reading.
D 4175, D02

dynamic hold-up, n—*in column distillation*, the quantity of liquid held up in the column under normal operating conditions.
D 4175, D02

dynamic hold-up, n—the quantity of liquid held up in the column under normal operating conditions.
D 4175, D02

dynamic hydroplaning, n—hydroplaning of pneumatic tires with separation caused by a thick fluid film due principally to the generation of fluid inertial forces.
E 867, E17

dynamic intermediate precision—the precision of the measurement of a characteristic determined under dynamic intermediate precision conditions in which the same equipment moving at operating speed measures the characteristic at the same location repeatedly.
E 867, E17

dynamic leakage measurement—leakage determined by measuring the tracer gas equilibrium partial pressure while the system is actively being pumped.
E 1316, E07

dynamic leak test—a form of leak test in which some of the tracer gas entering through a leak is continually removed for sensing purposes.
E 1316, E07

dynamic load—See **load**.
D 996, D10

dynamic mechanical analysis (DMA), n—a technique in which the storage modulus (elastic response) and loss modulus (viscous response) of a substance under oscillatory load is measured as a function of temperature, time, or frequency of oscillation, while the substance is subjected to a controlled-temperature program in a specified atmosphere. (ICTAC)
E 473, E37

dynamic mechanical measurement—a technique in which either the modulus or damping, or both, of a substance under oscillatory load or displacement is measured as a function of temperature, frequency, or time, or combination thereof.
D 4092, D20

dynamic membrane formation—process in which an active layer is formed on the membrane surface by the deposition of substances contained in the fluid being treated.
D 6161, D19

dynamic modulus—see **complex modulus**.
D 4092, D20

dynamic modulus—see **complex modulus**.
E 1142, E37

dynamic modulus of elasticity—the ratio of stress to strain for a material under dynamic loading conditions.
D 7099, D18

dynamic Poisson’s ratio—the absolute value of the ratio between the linear strain changes, perpendicular to and in the directions of a

given uniaxial stress change, respectively, under dynamic loading conditions. **D 7099**, D18

dynamic random access memory, *n*—RAM that cannot be retained without continuous or regular stimulation. (See **DRAM**.) **F 1457**, F05

dynamic range—the difference, in decibels, between the overload level and the minimum signal level (usually fixed by one or more of the noise levels, low-level distortion, interference, or resolution level) in a system or sensor. **E 1316**, E07

dynamic range—a measure of the capability of a test system to accept input signals of varying magnitudes, given by the ratio of the maximum to minimum input signals which at constant gain will produce distortion-free outputs having discernible changes with incremental variations in input.

NOTE—Dynamic range may be stated as the numerical value of the ratio; however, this is usually expressed in decibels.

NOTE—When the output indications can be related to the size of recognized targets, such as flat-bottomed holes, dynamic range is sometimes expressed in terms of the maximum and minimum hole sizes that can be displayed. **E 1316**, E07

dynamic range (for radiology)—the span of signal intensity which defines the system's range of performance. **E 1316**, E07

dynamic rope (rope systems), *n*—a class of ropes that is used for rescue work and rappelling when greater energy absorption qualities are required, such as in lead climbing or whenever a high fall potential exists. Such ropes are typically certified to UIAA or CE climbing rope standards. **F 1490**, F32

dynamic sensitivity of leak detector—the minimum leak rate that the detector is capable of detecting while the enclosure under test is actively being evacuated continuously under specified conditions. **E 1316**, E07

dynamic tear (DT) energy [J]—the total energy required to fracture standard DT specimens tested in accordance with the provisions of Test Method E 604. **E 1823**, E08

dynamic thermal response curve, *n*—graphical representation of the response characteristic of a thermal printing system over a given range of print energies; the y-axis is optical density and the x-axis

is print energy (watts/dot or millijoules) or energy density (millijoules/square millimetres). **F 1623**, F05

dynamic vehicle tire force [lb(kg)], *n*—the component of time-varying force applied perpendicularly to the road surface by the tire of a moving vehicle. **E 867**, E17

dynamic vulcanizate, *n*—See **thermoplastic vulcanizate**, the preferred term. **D 1566**, D11

dynamic vulcanization, *n*—the process of intimate melt mixing a thermoplastic polymer and a suitable reactive rubbery polymer to generate a thermoplastic elastomer with a chemically cross-linked rubbery phase resulting in properties close to those of a thermoset rubber when compared to the same cross-linked composition. **D 1566**, D11

dynamography—the instrumentation method for recording forces. **F 869**, F08

dynamometer—an elastic calibration device used to verify the indicated forces applied by a fatigue testing system. It shall consist of an instrumented member having mass, stiffness, and end displacements such that the inertial effects of the specimen and its attachments to the testing machine for which the verification of forces is desired are duplicated within 5 %. The instrumentation shall permit an accurate determination of the magnitude of the average strain in a region of the uniform transverse cross section when the dynamometer is subjected to a tensile or compressive force along its longitudinal axis, within 1 % of the true strains. A strain gaged specimen is often used as a dynamometer. **E 1823**, E08

dynamometer dynamic forces [F]—the maximum and minimum forces (or the mean force and the force amplitude) that correspond to the readings obtained from the dynamometer output according to an existing static calibration. Such forces are considered true specimen dynamic forces for the purpose of this terminology. **E 1823**, E08

dynamometer range [F]—the range of forces for which the dynamometer may be used for verification purposes. A dynamometer for use in tension and in compression will have two dynamometer ranges, one in tension and one in compression. **E 1823**, E08

dystetic equilibrium—synonymous with **eutectoid equilibrium**. **E 7**, E04

E

E—modulus of elasticity of flange or web material, depending upon which material is held constant in a transformed section analysis, psi (or MPa) **E 631, E06**

EAN International, *n*—abbreviation for the (European) International Article Numbering Association. **F 1294, F05**

EAN symbology, *n*—symbologies specified by the International Article Numbering Association, EAN International. **F 1294, F05**

ear canal temperature, t_{ec} , *n*—displayed unadjusted temperature measured from the *field of view* of an *IR thermometer* whose *probe* is placed into the auditory canal of a *subject* according to the manufacturer's recommendations. **E 344, E20**

early action, *n*—any remedial plan initiated in advance of a complete or final characterization of a contaminated site. **D 5681, D34**

early stiffening, *n*—rapid loss of plasticity or rapid development of rigidity in freshly mixed hydraulic cement paste, mortar, or concrete.

false set, *n*—with little evolution of heat, which can be dispelled by further mixing without the addition of water.

flash set, *n*—with evolution of considerable heat, which cannot be dispelled by further mixing without the addition of water. **C 219, C01**

earlywood—the less dense, large-celled, part of the growth layer formed first during the annual growth cycle. A synonym is *springwood*. **D 9, D07**

earth—see **soil**. **D 653, D18**

earthenware—a glazed or unglazed nonvitreous ceramic whiteware. **C 242, C21**

earth hummock—a hummock having a core of silty and clayey mineral soil which may show evidence of cryoturbation. **D 7099, D18**

earth material—soil, bedrock, or fill. **D 653, D18**

earth pressure—the pressure or force exerted by soil on any boundary.

Pressure Force	Symbol p P	Unit FL ⁻² F or FL ⁻¹
-------------------	----------------------	---

active earth pressure, P_A , p_A —the minimum value of earth pressure. This condition exists when a soil mass is permitted to yield sufficiently to cause its internal shearing resistance along a potential failure surface to be completely mobilized.

earth pressure at rest, P_o , p_o —the value of the earth pressure when the soil mass is in its natural state without having been permitted to yield or without having been compressed.

passive earth pressure, P_p , p_p —the maximum value of earth pressure. This condition exists when a soil mass is compressed sufficiently to cause its internal shearing resistance along a potential failure surface to be completely mobilized. **D 653, D18**

ease, *n*—in *garment construction*, the difference between garment measurement and body measurement. **F 1494, F23**

easement, *n*—the curved portion of a rail and handrail forming a transition in the vertical plane between the horizontal and inclined sections of a handrail. **E 631, E06**

easement—See **railing systems**. **E 631, E06**

easement, *n*—the curved portion of a rail and handrail forming a transition in the vertical plane between the horizontal and inclined sections of a handrail. **E 1481, E06**

ease of use—cumulative effect of drag encountered in application or removal, or both, and the amount of time required to achieve the desired finish. **D 2825, D21**

easily oxidized coals, *n*—low rank coals such as subbituminous or lignitic coals. **D 121, D05**

EBCDIC—extended binary code decimal interchange code. **F 1457, F05**

Eberbach—See **micro penetration tester**. **E 7, E04**

EBL—elevated blood level. **E 631, E06**

EBL—See elevated blood lead level. **E 1605, E06**

ebonite, *n*—a hard material made by sulfur vulcanization of rubber, in which the hardness is substantially obtained by the action of the sulfur. **D 1566, D11**

EC₅₀—the concentration of the test candidate in this procedure (volume percent or mg/L) that results in a reduction of respiration rate to 50 % of that observed for the control. **D 5681, D34**

EC50—a statistically or graphically estimated concentration that is expected to cause one or more specified effects in 50 % of a group of organisms under specified conditions. **E 943, E47**

ECA—an abbreviation for *environmentally controlled area*; an area whose temperature and humidity is controlled within specified limits; the presence of grease, dirt, chemical contaminants, etc., are excluded. **E 631, E06**

ECA—an abbreviation for *environmentally controlled area*; an area whose temperature and humidity is controlled within specified limits; the presence of grease, dirt, chemical contaminants, etc., are excluded. **E 1749, E06**

echo—indication of reflected energy. **E 1316, E07**

echo dynamic—amplitude versus time of arrival relationship of ultrasonic signals relative to probe position. **E 1316, E07**

E. coli—one of the members of the coliform bacterium associated with animal and human waste. **D 6161, D19**

ecological impact, *n*—the effect that an activity has on living organisms, their non-living (abiotic) environment, and the ecosystem. **E 2114, E06**

ecological indicator, *n*—a characteristic of an ecosystem that is related to, or derived from, a measure of biotic or abiotic variable, that can provide quantitative information on ecological structure and function. An indicator can contribute to a measure of integrity and sustainability. **E 2114, E06**

economic evaluation methods—a set of economic analysis techniques that consider all relevant costs associated with a project investment during its study period, comprising such techniques as life-cycle cost, benefit-to-cost ratio, savings-to-investment ratio, internal rate of return, and net savings. **E 631, E06**

economic evaluation methods, *n*—a set of economic analysis techniques that consider all relevant costs associated with a project investment during its study period, comprising such techniques as life-cycle cost, benefit-to-cost ratio, savings-to-investment ratio, internal rate of return, and net savings. **E 833, E06**

economic life—that period of time over which an investment is considered to be the least-cost alternative for meeting a particular objective. **E 631, E06**

economic life, *n*—that period of time over which an investment is considered to be the least-cost alternative for meeting a particular objective. **E 833, E06**

ecosystem, *n*—a community of biological organisms and their physical environment, functioning together as an interdependent unit within a defined area. **E 2114, E06**

ecosystem—organisms and the surrounding environment combined in a community that is self-supporting. **F 1600, F20**

ecotoxicity, *n*—the propensity of a material to produce adverse behavioral, biochemical, or physiological effects in non-human organisms or populations. **D 4175, D02**

ecotoxicity, *n*—the propensity of a test material to produce adverse behavioral, biochemical, or physiological effects in non-human organisms or populations. **D 6384, D02**

ED50—a statistically or graphically estimated dose that is expected to cause one or more specified effects in 50 % of a group of organisms under specified conditions. **E 943, E47**

eddy current—an electric current developed in a material as a result of induced voltages developed in the material. **A 340, A06**

eddy current—an electrical current caused to flow in a conductor by the time or space variation, or both, of an applied magnetic field. **E 1316, E07**

eddy current testing—a nondestructive testing method in which eddy current flow is induced in the test object. Changes in the flow caused by variations in the specimen are reflected into a nearby coil, coils, or Hall effect device for subsequent analysis by suitable instrumentation and techniques. **E 1316, E07**

edge—a sharp, narrow, steel surface that is attached throughout the length of the sidecut on the bottom edge of the snowboard. **F 1107, F27**

edge angle—the included angle between two opposite edges of a hardness indenter. **E 7, E04**

edge clearance—the distance between the bottom of a channel of a lock-strip gasket and the edge of material installed in the channel. **C 717, C24**

edge close-outs, n—members placed around the panel sides to protect the sandwich from damage or to attach the panel to a support or another panel. **C 274, D30**

edge closures—structural members framing the periphery of a sandwich panel providing support and a means of attachment to the panel as well as an environmental seal. **E 631, E06**

edge closures—structural members framing the periphery of a sandwich panel providing support and a means of attachment to the panel as well as an environmental seal. **E 1749, E06**

edgecombing, n—for inflatable restraints, the separation of yarns from their normal orthogonal configuration in a woven fabric due to seam stress or similar action near the edge of a cut part. **D 6799, D13**

edge contrast, EC, n—the difference between the space reflectance (R_s) and the adjoining bar reflectance (R_b) as calculated by the equation: $EC = R_s - R_b$. **F 1294, F05**

edge cracking, n—crescent-shaped cracks or fairly continuous cracks that are located within 0.6 m (2 ft) of the pavement edge. **E 867, E17**

edge cracking, n—crescent-shaped cracks or fairly continuous cracks that are located within 0.6 m (2 ft) of the pavement edge. **E 1778, E17**

edge distance—perpendicular distance from the centerline of the anchor to the edge of the structural member in which anchor is installed. **E 2265, E06**

edge distance [L], n—the distance from the edge of a bearing specimen to the center of the hole in the direction of applied force. **E 6, E28**

edge distance ratio, n—the ratio of the edge distance to the pin diameter. **E 6, E28**

edge effect—in electromagnetic testing, the disturbance of the magnetic field and eddy-currents due to the proximity of an abrupt change in specimen geometry (edge). This effect generally results in the masking of discontinuities within the affected region. (This effect is also termed the **end effect**.) **E 1316, E07**

edge effect—an image defect characterized by a low density or poor fill-in of solid areas coupled with a higher density outline. **F 335, F05**

edge irregularity—a variation in the stroke width of a printed character. **F 149, F05**

edge joint—see **joint**. **D 907, D14**

edge (of gypsum board), n—the paper-bound edge as manufactured. **C 11, C11**

edge protector—See **loading**. **D 996, D10**

edge spacer, n—in building construction in glazing, a spacer placed to prevent edge contact and to position laterally a pane of glass or a panel within the supporting frame. **C 717, C24**

edge-stitched seam-finish, n—a finish for the raw edges of a plain seam, in which machine stitching is placed close to the raw edge of each seam allowance. (Compare **zigzaggedseam-finish**.) **D 123, D13**

edge-stitched seam finish, n—in home sewing, a seam finish in

which machine stitching is placed close to the cut edge of each seam allowance. (Compare **zigzagged seam finish**.) **D 4965, D13**

edge stripping—application of felt strips cut to narrower widths than the normal felt-roll width to cover a joint between flashing and built-up roofing. **D 1079, D08**

edge-to-edge symbologies, n—a bar code scheme that can be decoded using edge-to-similar-edge measurements, such as from the start of one bar to the start of another or from the end of one bar to the end of another. Examples are Code 93, Code 128, Code 49 and Code 16K. **F 1294, F05**

edge-tracking, n—a residual, discernible pattern in a roller-applied coating, characterized by trails from either or both ends of the roller. **D 16, D01**

edge trim, n—an accessory to cover exposed ends or edges of gypsum board. **C 11, C11**

edge venting—the practice of providing regularly spaced protected openings at a roof perimeter to relieve water vapor pressure in the insulation. **D 1079, D08**

edgewise compressive strength—a term describing the load carrying capacity of flat sandwich constructions when a compressive load is applied uniformly to each facing, usually defined in terms of developed facing stresses as compared to the yield stress of the facings (see Test Method C 364). **E 631, E06**

edgewise compressive strength—a term describing the load carrying capacity of flat sandwich constructions when a compressive load is applied uniformly to each facing, usually defined in terms of developed facing stresses as compared to the yield stress of the facings (see Test Method C 364). **E 1749, E06**

edging—grinding the edge of flat glass to a desired shape or size. See also **centering**. **C 162, C14**

edging—(1) the process of removing bisque from the edge of a piece of ware to expose the underlying porcelain enamel.
(2) The spraying of special slip onto the edge of the ware. **C 286, B08**

edging brush—a stiff-bristled brush with metal guide, used to remove bisque from edges of ware before the firing operation. **C 286, B08**

EDTA—a term used to designate the compound ethylene diamine tetraacetic acid having the structural formula:

$$\begin{array}{ccccccc} \text{HOOC—CH}_2 & & & & & & \text{CH}_2\text{COOH} \\ & & \vee & & / & & \\ & & & \text{NC}_2\text{H}_4\text{N} & & & \\ & & / & & \vee & & \\ \text{HOOC—CH}_2 & & & & & & \text{CH}_2\text{COOH} \end{array}$$

or any of its salts that may be specified, used as a sequestering agent. **D 459, D12**

effect diameter (effective size), D_{10}, D_e (L)—particle diameter corresponding to 10 % finer on the grain-size curve. **D 653, D18**

effective attenuation length—the average emission function decay length when the emission depth distribution function is sufficiently close to exponential for a given application. **E 673, E42**

effective cadmium cut-off energy (E_c)—the energy at which a specified cadmium container performs like a theoretically perfect filter and, therefore, has the following properties:
(1) for all energies below E_c , no neutron reactions occur, and
(2) for all energies above E_c , neutron reactions occur at the same rate as if the cadmium were not present. **E 170, E10**

effective carriage mass, n—in CRL-type tensile testing machine, the force actually applied to a specimen by the mass of the carriage, plus any added masses. **D 123, D13**

effective carriage mass, n—in CRL-type tensile testing machine, the force actually applied to a specimen by the mass of the carriage, plus any added masses. **D 4849, D13**

effective case depth—perpendicular distance from the surface of a hardened case to the furthest point where a specified level of hardness is maintained. **F 1789, F16**

effective circuit permeability, μ_{eff} —when a magnetic circuit consists of two or more components, each individually homogeneous

effective circuit permeability, μ_{eff}

throughout but having different permeability values, the effective (overall) permeability of the circuit is that value computed in terms of the total magnetomotive force, the total resulting flux, and the geometry of the circuit. **A 340, A06**

effective coefficient of permeability—the coefficient of permeability that characterizes a fill and is the result of combined materials characteristics and construction techniques including compaction, capping, placement of impermeable layers, etc. **D 5681, D34**

effective crack size, a_e [L]—the physical crack size augmented to account for crack-tip plastic deformation. **E 1823, E08**

effective depth penetration (EDP)—in electromagnetic testing, for (a) thickness, the minimum depth beyond which a test system can no longer reliably detect a further increase in specimen thickness, or (b) defects, the limit for reliably detecting metallurgical or mechanical discontinuities by way of conventional continuous wave (CW) eddy current instrumentation and sensors. The EDP point is approximately three times the standard depth of penetration. **E 1316, E07**

effective drainage porosity—see **effective porosity**. **D 653, D18**

effective embedment depth—the overall depth through which the anchor transfers force to or from the surrounding base material, measured from the surface: for adhesive-bonded anchors measured to the deepest point of the anchor; for cast-in-place anchors measured to the upper surface of the direct bearing element; for undercut and sleeve anchors measured to the bottom of the expansion mechanism; for expansion anchors measured to the farthest point of contact between the expansion mechanism and surrounding material. **E 2265, E06**

effective fiber length, n —in *vibroscope test for linear density*, that portion of the fiber free to vibrate between fixed supports or holders. **D 123, D13**

effective fiber length, n —in *vibroscope test for linear density*, that portion of the fiber free to vibrate between fixed supports or holders. **D 4849, D13**

effective force, \bar{F} (F)—the force transmitted through a soil or rock mass by intergranular pressures. **D 653, D18**

effective gage length, n —in *tensile testing*, the estimated length of the specimen subjected to a strain equal to that observed for the true gage length. **D 123, D13**

effective gage length, n —in *tensile testing*, the estimated length of the specimen subjected to a strain equal to that observed for the true gage length. **D 4849, D13**

effective heat of combustion, n —the amount of heat generated per unit mass lost by a material, product or assembly, when exposed to specific fire test conditions (contrast **gross heat of combustion**). **E 176, E05**

effective heat of combustion, n —the measured heat release divided by the mass loss for a specified time period. **E 176, E05**

effective heat of combustion, n —the total measured heat released divided by the mass loss for a specified time period. **E 176, E05**

effective heat of combustion, EHC, (kJ/kg), n —the energy generated by chemical reactions per unit mass of fuel vaporized. **E 176, E05**

effective insulation ratio, n —in *thermal transmittance of textile only*, the increase in insulation afforded by the fabric in comparison to the uncovered test plate under specified conditions of test. **D 123, D13**

effectiveness—extent to which actual performance compares with targeted performance. For example, if a company has established a target sales plan of 10 000 units at the beginning of the year and the company's salespeople sell only 8000 units during the year, the salespeople are appropriately considered "ineffective," as opposed to "inefficient." **E 2135, E53**

effective pathlength (or effective thickness), d_e —in *internal reflection spectroscopy*, the analog of the sample thickness in transmission spectroscopy that represents the distance of propagation of the evanescent wave within an absorbing sample in IRS. It is defined from the relationship: $R = 1 - \alpha d_e$, and is related to the absorption parameter by: $a = \alpha d_e$. **E 131, E13**

effective permeability—a hypothetical quantity that describes the magnetic permeability that is experienced under a given set of physical conditions such as a cylindrical test specimen in an encircling coil at a specific test frequency. This quantity may be different from the permeability of the particular metal being tested in that it takes into account such things as the geometry of the part, the relative position of the encircling coil, and characteristics of the magnetic field. **E 1316, E07**

effective porosity (effective drainage porosity), n_e (D)—the ratio of: (1) the volume of the voids of a soil or rock mass that can be drained by gravity, to (2) the total volume of the mass. **D 653, D18**

effective pressure—see **stress**. **D 653, D18**

effective rolling radius, n —the ratio of the linear velocity of the wheel center of the free rolling tire in the X' direction to the spin velocity. **F 538, F09**

effective size—see **effective diameter**. **D 653, D18**

effective size—the particle size, in SI units, which corresponds to 10 percent finer on the cumulative particle size distribution curve. **D 2652, D28**

effective stress—see **stress**. **D 653, D18**

effective thermal property, n —thermal properties derived from heat-conduction theory applied to ignition/flame-spread data treating the material as homogenous in structure. **E 176, E05**

effective thickness B_e [L]—for compliance-based extension measurements:

$$B_e = B - (B - B_N)^2/B$$

E 1823, E08

effective unit weight—see **unit weight**. **D 653, D18**

effective unloading slope ratio, r —the ratio of an effective unloading slope to that of the initial elastic loading slope on a test record of force versus specimen mouth opening displacement. **E 1823, E08**

effective velocity, n —velocity calculated on the basis of arrival times and propagation distances determined by artificial AE generation; used for computed location. **E 1316, E07**

effective yield strength, σ_Y [FL⁻²]—an assumed value of uniaxial yield strength, that represents the influences of plastic yielding upon fracture test parameters. **E 1823, E08**

effect load XX (ELXX), n —a statistically or graphically estimated loading rate of test material that is expected to cause one or more specified effects in XX % of a group of organisms under specified conditions for a specified time. **D 4175, D02**

effect load XX (ELXX), n —a statistically or graphically estimated loading rate of test material that is expected to cause one or more specified effects in XX % of a representative subpopulation of organisms under specified conditions. **D 4175, D02**

effect load XX (ELXX), n —a statistically or graphically estimated loading rate of test material that is expected to cause one or more specified effects in XX % of a representative subpopulation of organisms under specified conditions. **D 6384, D02**

effervescent atomizer—an internal mixing pneumatic atomizer in which gas bubbles are dispersed in the liquid stream. **E 1620, E29**

efficiency, n —a measure of the performance of a collector.

collection efficiency, n —the percentage of a specified substance retained by a gas cleaning or sampling device.

fractional efficiency, n —the mean collection efficiency for specific size fractions of a contaminant. **D 1356, D22**

efficiency—see **total efficiency and full-energy peak efficiency**. **E 170, E10**

efficiency, n —of a photovoltaic device, the ratio of the power produced by a photovoltaic device operated at its maximum power point to the incident radiant power. **E 1328, E44**

efficiency—cost of inputs for each unit of output produced. For example, the assembly department spent 2320 hours of direct labor in order to produce 2000 actual units of output, while the budget allows only 2000 direct labor-hours for that level of output. The department was clearly inefficient (or wasteful) in the use of labor since it spent 320 hours more than allowed. **E 2135, E53**

efficiency, collector—of a solar thermal collector, the ratio of the amount of energy removed by the heat transfer fluid to the solar energy incident on the collector.

NOTE—For flat-plate collectors, the value of the incident solar energy used is usually based on gross collector area; for concentrating collectors the value is usually based on the aperture area. E 772, E44

efficiency, instantaneous collector—ratio of the amount of energy removed by the heat transfer fluid of a solar collector over a specified time period (usually 5 or 15 min) to the solar energy incident on the collector area in the same period, under steady-state or quasi-steady state.

NOTE—For flat plate collectors, the area used is usually the gross collector area; for concentrating collectors the area used is usually the gross aperture area. E 772, E44

efficiency, period system—ratio of the useful energy supplied by the solar energy system over a period of time to the solar energy incident on the collector area of the system in the same period.

NOTE—The period considered has to be of a suitable length for the type of system. For example, it would not be useful to define the efficiency of a solar space heating system over a month in the summer.

NOTE—For flat-plate collector systems, the value of incident solar energy used is usually based on the gross collector area; for concentrating collector systems, the value is usually based on the aperture area. E 772, E44

efficiency variance—difference between inputs (materials and labor) that were actually used (that is, actual quantity of inputs used) and inputs that should have been used (that is, standard quantity of inputs allowed for actual production), multiplied by the standard price per unit. Efficiency (quantity, usage) variance = (actual quantity - standard quantity) × standard price per unit of input. The efficiency variance is unfavorable if the actual quantity exceeds the standard quantity; it is favorable if the actual quantity is less than the standard. E 2135, E53

efficient vulcanizing (EV) systems, *n*—as applied to natural rubber and isoprene- and butadiene-based synthetic rubbers, a vulcanizing system making efficient use of sulfur and producing at optimum cure a network containing a preponderance of thermally stable monosulfidic crosslinks. D 1566, D11

efflorescence, *n*—crystalline deposit, usually white, of water-soluble compounds on the surface of masonry. C 1232, C15

efflorescence, *n*—a condition that occurs when soluble salts in a dry coating or the substrate migrate to the surface due to the movement of water through the film; characterized by a (commonly) white, nonuniform powder or crystalline incrustation, not removable with neutral water but usually removed with dilute mineral acid. D 16, D01

efflorescence, *n*—a powdery (usually white) exudation on the surface of a specimen caused by precipitation or crystallization of soluble material that has migrated to the surface. E 284, E12

efflorescence (bloom), *n*—a white powdery substance occurring on the surface of products and caused by the migration of soluble salts, followed by precipitation of calcium hydroxide at the surface followed by an atmospheric carbonation. C 1154, C17

efflorescence (bloom)—white powdery substance occurring on the surface of asbestos-cement products, caused by the migration of soluble salts to the surface, followed by precipitation and atmospheric carbonation of calcium hydroxide. D 2946, C17

effluent—exit stream from a unit/vessel. D 6161, D19

effluent—the liquid discharge from a process. F 1600, F20

efflux time—time required for all grout to flow from a flow cone. D 653, D18

1/E fluence—that fluence in the portion of the neutron spectrum produced by moderating media for which the fluence per unit energy, ideally, is inversely proportional to the neutron energy. E 170, E10

egg-case nail—coated, regular-stock-steel, 1 1/8 by 0.072-in. nail with flat 7/32-in. head and sharp medium diamond point. F 547, F16

eggshell, *adj*—semimatte, having a texture resembling that of the outer surface of the shell of a chicken egg. E 284, E12

eggshelling—the texture of a fired glaze similar in appearance to the surface of an eggshell. C 242, C21

eggshell or eggshelling—the texture of a fired ceramic coating similar in appearance to the surface of an eggshell. In porcelain enamel, usually a defect. C 286, B08

E-glass, *n*—a family of calcia-alumina-silicate glasses that are used for general purposes and most electrical applications. E 344, E20

EIFS, *n*—See **exterior insulation and finish system**. E 631, E06

EIFS back-wrapping—process of enclosing exposed edges of thermal insulation board by applying the reinforced base coat around the edges and onto the backside of the insulation or onto the substrate. E 631, E06

EIFS base-coat adhesive—semi-liquid adhesive material providing a matrix within which reinforcing mesh is embedded as a base coat. E 631, E06

EIFS-clad barrier wall assembly, *n*—a wall assembly for which the EIFS cladding provides weather resistance for the EIFS clad portion of the assembly. E 2110, E06

EIFS-clad drainage wall assembly, *n*—a wall assembly incorporating a means of drainage between the EIFS and a weather resistive barrier, for incidental moisture resulting from a breach in the EIFS, to the exterior of the EIFS clad portion of the assembly. E 2110, E06

EIFS insulation board—rigid thermal insulation, interposed between lamina and substrate, providing thermal resistance to the wall assembly. See also **expanded polystyrene thermal insulation board**. E 631, E06

EIFS mechanical fastener, *n*—special mechanical device providing structural connection of the EIFS system, including the insulation board, to the wall structure. E 631, E06

EIFS reinforcement—mesh or other fibrous component of the EIFS base coat included to provide increased toughness and resistance to mechanical impact and cracking. E 631, E06

EIFS reinforcing mesh, *n*—woven or non-woven mesh fabric used as a reinforcement in the EIFS base coat. E 631, E06

EIFS substrate—surface or structure of a wall to which EIFS is adhesively or mechanically attached. E 631, E06

eight-harness satin, *n*—a warp-faced or filling-faced weave illustrating that the entire face of the fabric surface is covered with warp or filling yarn, respectively. D 123, D13

eight-harness satin, *n*—a warp-faced or filling-faced weave illustrating that the entire face of the fabric surface is covered with warp or filling yarn, respectively. D 7018, D13

ejection crack, *n*—in a rigid die system, a defect that occurs during the removal of the compact from the tooling (usually occurs in multilevel parts that are not supported uniformly on all lower surfaces). B 243, B09

ejector, *n*—a device that uses a fluid under pressure, such as steam, air, or water, to move another fluid by developing suction through differential pressure. D 1356, D22

ejector air—air used to convey powder from pump to the part being coated. C 286, B08

elastic, *adj*—of or pertaining to elasticity. D 1566, D11

elastic, *adj*—as a modifier of dynamic force, descriptive of that component of complex force in phase with dynamic deflection, that does not convert mechanical energy to heat, and that can return energy to an oscillating mass-spring system; denoted by the single prime (') as a superscript symbol, as F'. D 1566, D11

elastic electron scatter—the scatter of electrons by an object without loss of energy, usually an interaction between electrons and atoms. E 7, E04

elastic fabric, *n*—a fabric made from an elastomer either alone or in combination with other textiles. (See also **elastomeric yarn**.) D 123, D13

elastic fabric, *n*—a fabric made from an elastomer either alone or in combination with other textiles. D 4850, D13

elasticity, *n*

elasticity, *n*—that property of a material by virtue of which it tends to recover its original size and shape immediately after removal of the force causing deformation. **D 123, D13**

elasticity—property of material that returns to its original form or condition after the applied force is removed. (ISRM) **D 653, D18**

elasticity, *n*—The rapid recovery of a material to its approximate initial shape and dimensions after substantial deformation by force and subsequent release of that force. **D 1566, D11**

elasticity—that property of materials that causes them to return to their original form or condition after the applied force is removed. **D 4092, D20**

elasticity, *n*—that property of a material by virtue of which it tends to recover its original size and shape immediately after removal of the force causing deformation. **D 4848, D13**

elasticity—that property of materials that causes them to return to their original form or condition after the applied force is removed, (D 4092, D20). **E 1142, E37**

elasticity—the capacity of the instrument to undergo induced stress without permanent distortion or breakage of any component. **F 921, F04**

elastic limit, *n*—the greatest stress that a material is capable of sustaining without permanent strain remaining upon complete release of the stress. **C 1145, C28**

elastic limit, *n*—the greatest stress that can be applied to a material without permanent deformation (Compare **yield point**) **D 123, D13**

elastic limit—point on stress strain curve at which transition from elastic to inelastic behavior takes place. (ISRM) **D 653, D18**

elastic limit, *n*—the greatest stress that a material is capable of sustaining, without any permanent strain remaining, upon complete release of the stress. **D 1566, D11**

elastic limit, *n*—*of paper and paperboard*, the value of paper or paperboard tensile force above which the ratio of the rate of change in the tensile force to the rate of change in length is no longer constant. See **elongation** and **tensile strength**. **D 1968, D06**

elastic limit, *n*—*in mechanics*, the stress intensity at which stress and deformation of a material subjected to an increasing force cease to be proportional; the limit of stress within which a material will return to its original size and shape when the force is removed, and hence, not a permanent set. **D 4439, D35**

elastic limit, *n*—*in mechanics*, the maximum stress which can be obtained in a material without causing permanent deformation of the material. (Compare **yield point**.) **D 4848, D13**

elastic limit [FL⁻²], *n*—the greatest stress which a material is capable of sustaining without any permanent strain remaining upon complete release of the stress. **E 6, E28**

elastic modulus, *n*—the ratio of stress to strain below the proportional limit. **C 1145, C28**

elastic modulus—see **complex modulus and storage modulus**.

D 4092, D20

elastic modulus—see **complex modulus and storage modulus**.

E 1142, E37

elastic recovery—in hardness testing, the shortening of the original dimensions of the indentation upon release of the applied load. **E 7, E04**

elastic region, *n*—*of paper and paperboard*, the region of tensile force-elongation behavior of a specific paper or paperboard where the ratio of the rate of change in the tensile force to the rate of change in length is constant. See **elongation** and **tensile strength**. **D 1968, D06**

elastic state of equilibrium—state of stress within a soil mass when the internal resistance of the mass is not fully mobilized. **D 653, D18**

elastic strain energy—potential energy stored in a strained solid and equal to the work done in deforming the solid from its unstrained state less any energy dissipated by inelastic deformation. (ISRM) **D 653, D18**

elastic tape, *n*—a tape containing rubber or other elastomers to permit rubber-like stretch in at least one direction. **D 123, D13**

elastic tape, *n*—a tape containing rubber or other elastomers to permit rubber-like stretch in at least one direction. **D 4850, D13**

elastic true strain, ϵ_e , *n*—elastic component of the true strain. **E 6, E28**

elastic webbing, *n*—a webbing containing rubber or other elastomers to permit rubber-like stretch in at least one direction. **D 123, D13**

elastic webbing, *n*—a webbing containing rubber or other elastomers to permit rubber-like stretch in at least one direction. **D 4850, D13**

elastomer, *n*—a macromolecular material that returns rapidly to approximately its original dimensions and shape after substantial deformation by a weak force and release of the force. **C 717, C24**

elastomer, *n*—a macromolecular material that at room temperature returns rapidly to approximately its initial dimensions and shape after substantial deformation by a weak stress and release of the stress. **D 883, D20**

elastomer, *n*—a macromolecular material that returns rapidly to approximately the initial dimensions and shape after substantial deformation by a weak stress and release of the stress. **D 907, D14**

elastomer—a macromolecular material that returns rapidly to its approximate initial dimensions and shape after substantial deformation by a weak stress and subsequent release of that stress. **D 1079, D08**

elastomer, *n*—an elastic polymer. **D 1566, D11**

elastomer, *n*—a natural or synthetic polymer having the property of substantially recovering its size and shape after removal of a deforming force. **D 4175, D02**

elastomer, *n*—a natural or synthetic polymer having the rubber-like property of substantially recovering its size and shape after removal of a deforming force. **D 4175, D02**

elastomer, *n*—a macromolecular material that returns rapidly to approximately its initial dimensions and shape after substantial deformation by a weak stress and release of the stress. (D11) **F 412, F17**

elastomer—a macromolecular material that at room temperature returns rapidly to approximately its initial dimensions and shape after substantial deformation by a weak stress and release of the stress. (D 883, D20) **F 869, F08**

elastomer, *n*—a macromolecular material that at room temperature returns rapidly to approximately its initial dimensions and shape after substantial deformation by a weak stress and release of the stress. **F 1251, F04**

elastomer, *n*—a term often used for rubber and polymers that have properties similar to rubber. **F 1494, F23**

elastomeric, *adj*—having the characteristics of an elastomer. **C 717, C24**

elastomeric seal—a material or device that uses an elastomer to effect a seal between separable piping components. **F 412, F17**

elastomeric yarn, *n*—a nontextured yarn which can be stretched repeatedly at room temperature to at least twice its original length and which after removal of the tensile force will immediately and forcibly return to approximately its original length. **D 123, D13**

elastomeric yarn, *n*—a nontextured yarn which can be stretched repeatedly at room temperature to at least twice its original length and which after removal of the tensile force will immediately and forcibly return to approximately its original length. **D 4849, D13**

elbow, *n*—*in anatomy*, the joint which articulates between the upper arm and the lower arm. **D 123, D13**

elbow, *n*—the joint that articulates between the upper arm and the lower arm. **D 5219, D13**

elbow, *n*—*in anatomy*, the joint that articulates between the upper arm and the lower arm. **F 1494, F23**

elbow girth, *n*—*in body measurements*, with the arm bent at 90° and the clenched fist placed on the hip, the circumference of the elbow. **D 123, D13**

elbow girth, *n*—the maximum circumference of the elbow, taken over

the outer prominence of the elbow bone with the arm bent 1.57 rad (90°). **D 5219, D13**

electrical center—the center established by the electromagnetic field distribution within a test coil. A constant intensity signal, irrespective of the circumferential position of a discontinuity, is indicative of electrical centering. The electrical center may be different from the physical center of the test coil. **E 1316, E07**

electrical conductivity, *n*—the reciprocal of the resistance in ohms measured between opposite faces of a centimetre cube of an aqueous solution at a specified temperature. **D 1129, D19**

electrical conductivity, *n*—the property of a fluid or solid that permits the passage of an electrical current as a result of an impressed emf. **D 1356, D22**

electrical conductivity—the property of conducting electricity. **D 7099, D18**

electrical contact, *n*—any physical contact between two or more parts which will permit the flow of electricity between the parts. **C 1145, C28**

electrical discharge—a discontinuous movement of electrical charges through an insulating medium, initiated by electron avalanches and supplemented by secondary processes. **D 2864, D27**

electrically continuous surface—a surface that is electrically conductive in that current can be passed at an applied voltage between any two points of its physical surface. **D 5077, D10**

electrical metering system—a system composed of current and potential transformers and a wattmeter electrically connected in such a manner so as to measure the energy usage of a piece of equipment driven by an electric motor. **D 5681, D34**

electrical overstress (EOS)—overstress which may be due to ESD or the operation of items beyond their electrical specifications. **D 5077, D10**

electrical porcelain—vitrified whiteware having an electrical insulating function. **C 242, C21**

electrical properties of frozen ground—these include the: dielectric constant, electrical conductivity, and electrical resistivity. **D 7099, D18**

electrical resistivity, *n*—the electrical resistance offered by a material to the flow of current, times the cross-sectional area of current flow and per unit length of current path, the reciprocal of conductivity. It is also known as resistivity, or specific resistance. **D 4175, D02**

electrical resistivity—the property of a material that determines the electrical current flowing through a centimeter cube of the material when an electrical potential is applied to the opposite faces of the cube. **D 7099, D18**

electrical steel—a term used commercially to designate strip or sheet used in electrical applications and historically has referred to flat-rolled, low-carbon steels or alloyed steels with silicon or aluminum, or both. Common types of electrical steels used in the industry are grain-oriented electrical steel, nonoriented electrical steel, and magnetic lamination steel. **A 340, A06**

electrical steel, grain oriented—a flat-rolled silicon-iron alloy usually containing approximately 3 % silicon, having enhanced magnetic properties in the direction of rolling and normally used in transformer cores. **A 340, A06**

electrical steel, nonoriented—a flat-rolled silicon-iron or silicon-aluminum-iron alloy containing 0.0 to 3.5 % silicon and 0.0 to 1.0 % aluminum and having similar core loss in all directions. **A 340, A06**

electrical system components, *n*—cable trays, conduits and other raceways, open run cables and conductors, cables, conductors, cabinets, and other components, as defined or used in the National Electrical Code, and air drops. **E 176, E05**

electrical testing facility—a location with qualified personnel, testing equipment, and procedures for the inspection and electrical testing of electrical insulating protective equipment. **F 819, F18**

electric boosting—an auxiliary method of adding heat to the glass in a gas- or oil-fired melter by passing electric current through the molten glass. **C 162, C14**

electric breakdown voltage—see **dielectric breakdown voltage**. **D 1711, D09**

electric-butt, cold-upset weld—a weld between two prepared ends of adjacent lengths of work-hardenable material that is pressed together in a resistance welding apparatus which melts the abutting ends to unite them and form the weld. In turn, the resulting weld zone is forced out in the form of flash by a cold-upsetting operation which, through cold-working, restores the material substantially to its original tensile strength. **B 354, B01**

electric constant—the same as **permittivity of free space**. **D 2864, D27**

electric creepage strength—the average voltage gradient under specific conditions of test and for a specific electrode configuration, at which dielectric failure occurs along the interface between a solid insulating material and the fluid in which it is immersed, or at the interface between two solids that are in close physical contact with each other but are not bonded chemically. Dielectric creepage failure may result in tracking. **D 2864, D27**

electric field strength, *n*—the magnitude of the vector force on a point charge of unit magnitude and positive polarity. **D 1711, D09**

electric furnace, *n*—a furnace or kiln in which the main source of heat is provided by electrical means. **C 1145, C28**

electric hygrometer—See **hygrometer**. **D 1356, D22**

electric log—a record or log of a borehole obtained by lowering electrodes into the hole and measuring any of the various electrical properties of the rock formations or materials traversed. **D 653, D18**

electric strength—see **dielectric strength**. **D 1711, D09**

electric typewriter—a typewriter in which an electromechanical device causes the type element to be activated when the keys are struck. **F 909, F05**

electrification time, *n*—the time during which a steady direct potential is applied to electrical insulating materials before the current is measured. **D 1711, D09**

electrification time—the time during which a steady direct potential is applied to electrical insulating materials before the current is measured. **D 2864, D27**

electricified shearling, (electricified lambskin)—shearling in which the wool has been straightened by a special process. **D 1517, D31**

electrochemical admittance—the reciprocal of the electrochemical impedance, $\Delta I/\Delta E$. **G 15, G01**

electrochemical cell—an electrochemical system consisting of an anode and a cathode in metallic contact and immersed in an electrolyte. (The anode and cathode may be different metals or dissimilar areas on the same metal surface.) **G 15, G01**

electrochemical equivalent—the weight of an element, compound, radical, or ion involved in a specified electrochemical reaction during the passage of unit quantity of electricity, such as a Faraday, ampere-hour, or coulomb. **B 374, B08**

electrochemical impedance—the frequency dependent, complex valued proportionality factor, $\Delta E/\Delta I$, between the applied potential (or current) and the response current (or potential) in an electrochemical cell. This factor becomes the impedance when the perturbation and response are related linearly (the factor value is independent of the perturbation magnitude) and the response is caused only by the perturbation. The value may be related to the corrosion rate when the measurement is made at the corrosion potential. **G 15, G01**

electrochemical noise—fluctuations of potential or current, or both, originating from uncontrolled variations in a corrosion process. **G 15, G01**

electrochemical potential (electrochemical tension)—the partial derivative of the total electrochemical free energy of the system with respect to the number of moles of the constituent in a solution when all other factors are constant. (Analogous to the chemical potential of the constituent except that it includes the electrical as well as the chemical contributions to the free energy.) **G 15, G01**

electrochemistry—the branch of science and technology which deals with transformations between chemical and electrical energy.

B 374, B08

electrode—a conductor through which current enters or leaves an electrolytic cell, at which there is a change from conduction by electrons to conduction by charged particles of matter, or vice versa.

B 374, B08

electrode, *n*—in *atomic emission spectrometry*, either of two terminals between which an electrical discharge occurs.

E 135, E01

electrode—the energized or grounded conductor portion of electrical test equipment which is placed near or in contact with the material or equipment being tested.

F 819, F18

electrode clearance—the shortest path from the energized electrode to the ground electrode.

F 819, F18

electrode gap—not recommended, see **analytical gap**.

E 135, E01

electrode life—the length of time that an electrode functions usefully. Life-time of solid-state and glass electrodes is limited by mechanical failure of the electrode body or chemical attack on the sensing membrane, and can range from a few days, if the electrode is used continuously in hot or abrasive flowing streams, to several years under normal laboratory conditions. The life-time of liquid membrane electrodes is limited by loss of ion exchanger with use, and is generally 1 to 6 months.

D 4127, D19

electrode pair—a sensing electrode and a reference electrode; the reference electrode may be separate or combined in one body with the sensing electrode.

D 4127, D19

electrodeposition—the process of depositing a substance upon an electrode by electrolysis. See **electroforming, electroplating, electrorefining, and electrowinning**.

B 374, B08

electrode potential—the difference in potential between an electrode and the immediately adjacent electrolyte referred to some standard electrode potential as zero.

dynamic *E.P.*—the electrode potential measured when current is passing between the electrode and the electrolyte.

equilibrium *E.P.*—a static electrode potential when the electrode and the electrolyte are in equilibrium with respect to a specified electrochemical reaction.

standard *E.P.*—an equilibrium electrode potential for an electrode in contact with an electrolyte in which all of the components of a specified chemical reaction are in their standard states. The standard state for an ionic constituent is unit ion activity.

static *E.P.*—the electrode potential measured when no net current is flowing between the electrode and the electrolyte.

B 374, B08

electrode potential—the potential of an electrode in an electrolyte as measured against a reference electrode. (The electrode potential does not include any resistance losses in potential in either the solution or external circuit. It represents the reversible work to move a unit charge from the electrode surface through the solution to the reference electrode.)

G 15, G01

electrodermal tracing, *n*—the display of physiological patterns of either skin resistance or skin conductance obtained through exosomatic recording with a galvanograph component.

E 2035, E52

electrodialysis (ED)—a process in which ions are transferred through membranes from a less concentrated to a more concentrated solution using direct current electric power as the driving force.

D 6161, D19

electrodialysis reversal (EDR)—same as ED with the addition of a polarity reversal step added to improve performance.

D 6161, D19

electroforming—the production or reproduction of articles by electrodeposition upon a mandrel or mold that is subsequently separated from the deposit.

B 374, B08

electro-galvanized, electro-zinc plated—See **zinc-plated**.

F 547, F16

electrogalvanizing—electrodeposition of zinc coatings.

B 374, B08

electrogoniometry—an instrumentation system for recording angular displacement at a joint continuously during movement.

F 869, F08

electrographite, *n*—in *carbon and graphite technology*, a synonym for manufactured graphite.

C 709, D02

electrographite, *n*—in *carbon and graphite technology*, a synonym for manufactured graphite.

D 4175, D02

electrokinetics—involves the application of an electric field to soil for the purpose of dewatering materials of very low permeability to enhance stability. The electric field produces negative pore pressures near a grout pipe that facilitates grout injection.

D 653, D18

electroless plating—term in use but not recommended. See **autocatalytic plating**.

B 374, B08

electroluminescence, *n*—luminescence resulting from electrical excitation. (See also **luminescence**.)

E 284, E12

electrolysis—production of chemical changes by the passage of current through an electrolyte.

B 374, B08

electrolysis—production of chemical changes of the electrolyte by the passage of current through an electrochemical cell.

G 15, G01

electrolyte—(1) a conducting medium in which the flow of current is accompanied by movement of matter. Most often an aqueous solution of acids, bases, or salts, but includes many other media, such as fused salts, ionized gases, some solids, etc. (2) a substance that is capable of forming a conducting liquid medium when dissolved or melted.

B 374, B08

electrolyte—a substance that ionizes in aqueous solution; also, a solution containing ions. Weak electrolytes are only slightly dissociated into ions in solution (acetic acid), and strong electrolytes are highly dissociated (HCl, NaCl).

D 4127, D19

electrolyte, *n*—diluent, offering slight conductivity, in which cells are suspended.

F 2312, F04

electrolytic capacitor paper, *n*—very pure, porous paper, 17 to 100 μm thick, used to separate the metallic electrodes in electrolytic capacitors.

D 1711, D09

electrolytic cell—a unit apparatus in which electrochemical reactions are produced by applying electrical energy, or which supplies electrical energy as a result of chemical reactions and which includes two or more electrodes and one or more electrolytes contained in a suitable vessel.

B 374, B08

electrolytic cleaning—a process of removing soil, scale, or corrosion products from a metal surface by subjecting it as an electrode to an electric current in an electrolytic bath.

G 15, G01

electrolytic copper—copper of any origin, refined by electrolytic deposition including electrowinning. Usually when this term is used alone it refers to electrolytic tough pitch copper. This designation applies to the following:

- cathodes that are the direct product of the refining operation.
- electrodeposited copper cast in refinery shapes suitable for hot or cold working or both, and by extension, to fabricators' products made therefrom.

—electrodeposited copper cast into ingots or ingot bars suitable for remelting.

B 846, B05

electrolytic extraction—See **extraction**.

E 7, E04

electrolytic polishing—a metallographic preparation procedure where metal is preferentially dissolved from high points on an anodic surface by passage of an electric current through a conductive bath, to produce a specular reflecting surface. Used as an alternative to mechanical polishing.

E 7, E04

electrolytic powder, *n*—powder produced by electrolytic deposition or by the pulverization of an electrodeposit.

B 243, B09

electrolytic printer—a facsimile printing device employing a moist, electrolyte-impregnated roll-fed paper. The current (signals) is applied by feeding the paper between a stationary contact and a revolving drum with a helical contractor. The revolving of the drum causes the point of electrical contact between the blade and helical wire to move laterally across the paper, one line per revolution. As the electrical current passes through the paper, it causes a change of coloration at all points of contact.

F 909, F05

electrolytic process, *n*—the application of a metallic coating on a steel product by passing an electric current through a chemical solution in which the product is immersed; the coating may be applied in a continuous process or a batch process.

A 902, A05

electromagnet—a soft iron core surrounded by a coil of wire that temporarily becomes a magnet when an electric current flows through the wire. **E 1316, E07**

electromagnetic focusing device—See **focusing device**. **E 7, E04**

electromagnetic interference—See **EMI**. **E 631, E06**

electromagnetic interference—See **EMI**. **E 1749, E06**

electromagnetic lens—an electromagnet designed to produce a suitably shaped magnetic field for the focusing and deflection of electrons or other charged particles in electron-optical instrumentation. **E 7, E04**

electromagnetic pulse—See **EMP**. **E 631, E06**

electromagnetic pulse—See **EMP**. **E 1749, E06**

electromagnetic shield—a screen or other housing placed around a device or circuit to reduce the effects on them from both electric and magnetic fields. **D 5077, D10**

electromagnetic spectrum, *n*—a continuum of electric and magnetic radiation, encompassing all wavelengths from electricity, radio and microwaves, at the low-frequency end to infrared, visible light, and ultraviolet light in the midrange, to X rays and gamma rays at the high frequency end of the spectrum. (As defined by the Institute of Electrical and Electronic Engineers, Inc. (IEEE), the spectrum of electromagnetic radiation consists of gamma rays, wavelengths shorter than 0.0006 nm; X rays, 0.0006–5 nm; ultraviolet rays, 5 nm–0.4 μm; visible light, 0.4–0.7 μm; infrared, 0.7 μm–0.1 mm; radio, greater than 0.1 mm.). **E 2114, E06**

electromagnetic testing—a nondestructive test method for materials, including magnetic materials, that uses electromagnetic energy having frequencies less than those of visible light to yield information regarding the quality of testing material. **E 1316, E07**

electromagnetic vibratory atomizer—a vibratory atomizer in which an electromagnetic transducer transmits high-frequency oscillations to the liquid. **E 1620, E29**

electromigration—(1) Current-induced atomic diffusion in a solid metal due to electron momentum and the potential gradient, (2) electrochemical process of growth of metallic path across an insulating surface under imposed electric field. **B 542, B02**

electromotive force (emf), *n*—the electrical potential difference which produces or tends to produce an electric current. **E 344, E20**

Electromotive Force Series (EMF Series)—a list of elements arranged according to their standard electrode potentials, with “noble” metals such as gold being positive and “active” metals such as zinc being negative. **G 15, G01**

electromotive series—a table that lists in order the standard electrode potentials of specified electrochemical reactions. **B 374, B08**

electron—a subatomic particle having a negative charge of 4.8025×10^{-10} esu, and a charge-to-mass ratio or specific charge of $5.2737 \pm 0.0015 \times 10^{17}$ esu/g. **E 7, E04**

electron:

flooding—in *surface analysis*, irradiation of a specimen with low-energy electrons in order to change (generally to reduce) or stabilize the charging potential.

inelastic mean free path—the average of distances, measured along the trajectories, that particles with a given energy travel between inelastic collisions in a substance.

retardation—*AES, XPS*, a method of measuring the kinetic energy distribution by retarding the emitted electrons before or within the analyzer.

spectrometer—see **electron energy analyzer**. **E 673, E42**

electron beam—a stream of electrons in an electron optical system. **E 7, E04**

electron diffraction—the phenomenon, or the technique of producing diffraction patterns through the incidence of electrons upon matter. **E 7, E04**

electro-negative developer—a developer containing negatively charged toner particle. **F 335, F05**

electron energy analyzer—*AES, XPS*, a device for measuring the number of electrons as a function of kinetic energy. (See also **spectrometer**)

pass energy—*XPS, AES*, the mean kinetic energy of electrons in the energy dispersive portion of an electron energy analyzer that will allow them to traverse the analyzer and be counted.

fixed analyzer transmission—*AES, XPS*, a mode of analyzer operation that varies the electron retardation but keeps the pass energy constant in the final analyzer stage.

fixed retarding ratio—*AES, XPS*, a mode of operation in which the electron kinetic energy is analyzed by varying the retarding potential on lens elements preceding the analyzer and the analyzer pass energy so that the analyzer pass energy is a constant fraction of the kinetic energy. **E 673, E42**

electron energy loss spectrum—*XPS*, the energy spectrum of electrons from a monoenergetic electron source after interaction with the specimen, exhibiting peaks due to inelastic loss processes. The spectrum obtained using an incident electron beam of about the same energy as an XPS peak approximates the loss spectrum associated with that XPS peak. Also see **characteristic electron loss phenomena**. **E 673, E42**

electron equilibrium—charged-particle equilibrium for electrons. **E 170, E10**

electron flooding—see **electron**. **E 673, E42**

electron gun—a device for producing and accelerating a beam of electrons. **E 7, E04**

Electronic and Information Technology (EIT)—has the same meaning as “information technology” except EIT also includes any equipment that is used in the creation, conversion, or duplication of data or information. The term EIT includes, but is not limited to, telecommunications products (such as telephones), information kiosks and transaction machines, worldwide websites, multimedia, and office equipment (such as copies and fax machines). The term replaced the term “Automated Data Processing Equipment” (APDE) in the FAR. **E 2135, E53**

electronic data interchange, *n*—the computer to computer exchange of business information in a standardized format. **A 941, A01**

electronic data interchange, *EDI*, *n*—the communication of data between business trading partners accomplished in a standard format and syntax. **F 1294, F05**

Electronic Industries Association, EIA, *n*—an abbreviation for a standards organization in the United States specializing in the electrical and functional characteristics of interface equipment. **F 1294, F05**

electronic scanning system, *n*—a device used to look at readable pages and convert the text found there to an electronic signal. (See **ESS**.) **F 1457, F05**

electronic thermometer, *n*—an instrument that provides a display of temperature sensed through the use of a transducer and electronic circuitry. **E 344, E20**

electronic typewriter—an electric typewriter in which the keyboard input is received by an electronic processor built into the typewriter. This unit then controls the print head and other features to produce the typing action. **F 909, F05**

electron image—a representation of an object formed by a beam of electrons focused by an electron optical system (See **image**.) **E 7, E04**

electron lens—a device for focusing an electron beam to produce an image of an object. **E 7, E04**

electron micrograph—a reproduction of an image formed by the action of an electron beam on a photographic emulsion. **E 7, E04**

electron microscopy—the study of materials by means of the electron microscope. **E 7, E04**

electron microscopy impression—See **impression**. **E 7, E04**

electron optical axis—the path of an electron through an electron optical system along which it suffers no deflection due to lens fields. This axis does not necessarily coincide with the mechanical axis of the system. **E 7, E04**

electron optical system—a combination of parts capable of producing and controlling a beam of electrons to produce an image of an object. **E 7, E04**

electron optics

electron optics—the science that deals with the propagation of electrons, as light optics deals with that of light and its phenomena.

E 7, E04

electron probe—a narrow beam of electrons used to scan or illuminate an object or screen.

E 7, E04

electron retardation—see **electron**.

E 673, E42

electron spectrometer—see **electron energy analyzer**.

E 673, E42

electron standard field—an electron field whose particle energy and direction, spatial uniformity, and particle fluence rate uniformity are well established and reproducible.

E 170, E10

electron trajectory—the path of an electron.

E 7, E04

electron velocity—the rate of motion of an electron.

E 7, E04

electron volt—the kinetic energy gained by an electron after passing through a potential difference of 1 V.

E 1316, E07

electron wavelength—the wavelength necessary to account for the deviation of electron rays in crystals by wave diffraction theory. It is numerically equal to the quotient of Planck's constant divided by the electron momentum. This is approximately $\lambda = (12.3/V) \text{ \AA}$, where V = the accelerating potential in volts.

E 7, E04

electrophoresis—the movement of colloidal particles produced by the application of an electric potential.

B 374, B08

electrophoresis, n —the movement of colloidal particles or macromolecules through a solution under the action of an electromotive force applied through electrodes in contact with the solution.

C 1145, C28

electrophoretic deposition—the process of depositing material on a workpiece from a porcelain enamel slip suspension due to the movement of particles under the influence of an impressed direct current voltage.

C 286, B08

electrophotographic copying process—a process in which a copy of an original document results from the combined action of light and externally applied electric forces.

F 335, F05

electrophotographic material—photoconductor suitable for application in photographic processes.

F 335, F05

electrophotographic printer—a nonimpact printing technique that is similar to the technology employed in typical office copiers, which forms a copy by attracting toner particles to a static charge on the surface of a photoconductor, then transferring the toner image to the surface of a sheet of paper. In the normal office copier, the charged image (latent image) of the original document is formed on the photoconductor simply through exposure of the photoconductor to reflected light from the document. In an electrophotographic printer, the image is formed by a light-source (laser, CRT, LED, LCS, laser diode, or other controlled light source) which erases or discharges a static image charge on the photoconductor according to information being supplied through the input data stream. Each bit of data can be related to a character shape in the memory of the printing system, and in most cases characters are formed by a dot matrix method similar in concept to that of the matrix printer. Paper can be sheet- or roll-fed or continuous form.

F 909, F05

electroplated—surface provided with usually thin electrochemical deposit of brass, cadmium, copper, nickel, tin, zinc, etc., as a result of immersion in electrolytic bath.

F 547, F16

electroplated button, n —plastic buttons which have been made conductive by chemical treatment followed by the electroplating of metallic coatings.

D 123, D13

electroplated button, n —plastic buttons which have been made conductive by chemical treatment followed by the electroplating of metallic coatings.

D 5497, D13

electroplating—the electrodeposition of an adherent metallic coating upon an electrode for the purpose of securing a surface with properties or dimensions different from those of the basis metal.

B 374, B08

electropolishing—the improvement in surface finish of a metal effected by making it anodic in an appropriate solution.

B 374, B08

electro-positive developer—a developer containing positively charged toner particle.

F 335, F05

electrorefining—the process of anodically dissolving a metal from an impure anode and depositing it cathodically in a purer form.

B 374, B08

electrosensitive printer—a nonimpact printing device employing a double layer coated paper. Imaging is accomplished by touching or nearly touching the paper surface with an electrically charged stylus which burns away the top coating, exposing an undercoating of a contrasting color to produce the desired images. This process is also known as electroerosion printing.

F 909, F05

electrostatic atomizer—a device wherein an electric charge is the primary source of energy utilized to produce a spray.

E 1620, E29

electrostatic copying process—a process in which a copy of an original document results from charged particle development of an electrostatically formed image.

F 335, F05

electrostatic decay half-life, n —in textiles, the time in minutes for the maximum voltage induced on the textile to be reduced to one half of the maximum voltage by the various decay mechanisms: conduction and ionization of the air.

D 123, D13

electrostatic decay half-life, n —in textiles, the time in minutes for the maximum voltage induced on the textile to be reduced to one half of the maximum voltage by the various decay mechanisms: conduction and ionization of the air.

D 4849, D13

electrostatic discharge—the transfer of electrostatic charge between bodies at different electrostatic potentials.

D 5077, D10

electrostatic discharge (ESD) protective—a property of materials capable of one or more of the following:

preventing the generation of static electricity.

dissipating electrostatic charges over its surface or volume.

providing shielding from ESD or electrostatic fields.

D 5077, D10

electrostatic discharge sensitive (ESDS)—a property of items in which they are inherently sensitive (ESDS) susceptible to either catastrophic failure or latent damage when exposed to sources of ESD. Items are often categorized as to their levels of sensitivity but in all cases require some means of ESD protective packaging and handling.

D 5077, D10

electrostatic focusing device—See **focusing device**.

E 7, E04

electrostatic immersion lens—See **immersion objective**.

E 7, E04

electrostatic lens—a lens producing a potential field capable of deflecting electron rays to form an image of an object.

E 7, E04

electrostatic powder porcelain enamel—a mixture comprised of frit and additives ground and/or blended together to form a powder suitable for dry electrostatic application.

C 286, B08

electrostatic precipitation—See **precipitation**.

D 1356, D22

electrostatic precipitator—See **precipitator**.

D 1356, D22

electrostatic precipitator (ESP), n —a facility that removes fly ash from the flue gas by producing an electric charge on the fly ash and collecting it electrostatically.

E 2201, E50

electrostatic propensity, n —the capacity of a nonconducting material to acquire and hold an electrical charge by induction (by means of corona discharge) or by triboelectric means (rubbing with another material).

D 123, D13

electrostatic propensity, n —the capacity of a nonconducting material to acquire and hold an electrical charge by induction (by means of corona discharge) or by triboelectric means (rubbing with another material).

D 4849, D13

electrostatic retention—the tenacity with which a charged, electrostatically deposited powder porcelain coating adheres to the work piece before it is fired.

C 286, B08

electrostatics—the science of forces and fields of electric charges in a state of rest.

F 335, F05

electrostatic shield—a barrier or enclosure that prevents the penetration of an electrostatic field.

D 5077, D10

electrostatic spraying—a technique for attaining a uniform coating in which the material sprayed is given an electrical charge.

E 1316, E07

electrotyping—the production of printing plates by electroforming.

B 374, B08

electrowinning—the production of metals by electrolysis with insoluble anodes in solutions derived from ores or other materials.

B 374, B08

element, *n*—in *zippers*, a device designed for interlocking, capable of being affixed along the edge of a tape. (Compare **continuous element**.)

D 123, D13

element, *n*—a device designed for interlocking, capable of being affixed along the edge of a tape. (Compare **continuous element** and **separate element**.)

D 2050, D13

element—the component containing the membrane, generally replaceable, such as a spiral wound cartridge or cassette.

D 6161, D19

element, *n*—in *construction planning, design, specification, estimating, and cost analysis*, is a significant component part of the whole that performs a specific function, or functions, regardless of design, specification, or construction.

E 833, E06

element, *n*—an isolated (totally bounded by void) projection.

F 538, F09

element—the interchangeable type font of an impact printing device: see **thimble, ball, daisy wheel**.

F 909, F05

element, *n*—in *codedsymbologies*, a single bar or space in linear or stacked configurations or a single cell in matrix (2-D) configurations.

F 1294, F05

elemental cost analysis, *n*—in *construction planning, design, specification, estimating, and cost analysis*, is a tabulation of cost categorized by **group element, element**, or **sub-element**, or any combination thereof, to which a **parameter quantity**, or parameter quantities, has, or have, been applied to derive benchmark figures (rates, ratios, percentages, and so forth).

E 833, E06

elemental cost summary, *n*—in *construction planning, design, specification, estimating, and cost analysis*, is a tabulation of cost categorized by **group element, element**, or **sub-element**.

E 833, E06

element edge, *n*—the location where the scan reflectance profile intersects the midpoint between the space reflectance (Rs) and bar reflectance (Rb) of adjoining elements.

F 1294, F05

element printer—an impact printer that generates copy via interchangeable “elements” that each contain a full set of characters. Characters are formed when the element strikes the paper itself through an ink ribbon.

F 909, F05

element width, *n*—the thickness of an element measured from the leading edge of an element to the trailing edge of the same element. (See **X dimension**.)

F 1294, F05

elevated blood lead level (EBL)—lead content in blood that exceeds the safe level established by regulation/local jurisdiction.

E 1605, E06

elevated blood level (EBL)—lead content in blood that exceeds the safe level established by regulation/local jurisdiction.

E 631, E06

elevated temperature testing—tests on plastic pipe above 23°C (73°F).

F 412, F17

elevator, *n*—a general term describing a mechanical device on the Motion Control, Inc. Fiber Information System which moves the specimen clamp while preparing the specimen or while taking a length/uniformity index or strength/elongation measurement.

D 123, D13

elevator—synonym for **bin**, commonly used in the grain industry.

D 653, D18

elevator, *n*—a general term describing a mechanical device on the Motion Control, Inc. Fiber Information System which moves the specimen clamp while preparing the specimen or while taking a length/uniformity index or strength/elongation measurement.

D 7139, D13

elimination—this, like the *definite conclusion of identity*, is the

highest degree of confidence expressed by the document examiner in handwriting comparisons. By using this expression the examiner denotes no doubt in his opinion that the questioned and known writings were not written by the same individual.

Examples—It has been concluded that the John Doe of the known material did not write the questioned material, or it is my opinion (or conclusion or determination) that the John Doe of the known material did not write the questioned material.

E 1658, E30

elk leather—trade term used to designate chrome-tanned cattlehide for uppers of work shoes, hunting boots, some children’s shoes, and others requiring flexibility and durability. More properly **elk-finished cowhide**. Leather made from elkhide is known as “buckskin.”

D 1517, D31

ellipsis, *n*—in *atabular entry*, three periods (...) that indicate that there is no requirement.

A 941, A01

elliptical reinforcement—a line of reinforcement in the approximate shape of an ellipse.

C 822, C13

Elmendorf test—See **packagetesting**.

D 996, D10

elongated grain—a grain with one principal axis significantly longer than either of the other two.

E 7, E04

elongated piece (of aggregate), *n*—a particle of aggregate for which the ratio of the length to width of its circumscribing rectangular prism is greater than a specified value (see also **flat piece (of aggregate)**).

C 125, C09

elongation, *n*—extension produced by a tensile stress.

C 717, C24

elongation, *n*—the ratio of the change in length of a rope during application of tension to the original length of the rope when new.

D 123, D13

elongation, *n*—the ratio of the extension of a material to the length of the material prior to stretching, expressed as a percent. (Compare **extension**.)

D 123, D13

elongation, *n*—extension produced by a tensile stress.

D 1566, D11

elongation, *n*—of *paper and paperboard*, See **stretch**.

D 1968, D06

elongation, *n*—the ratio of the extension of a material to the length of the material prior to stretching, expressed as a percent.

D 4848, D13

elongation, *n*—the ratio of the extension of a material to the length of the material prior to stretching.

D 6477, D13

elongation—increase in length of the anchor under loading resulting from axial strain of the anchor material.

E 2265, E06

elongation—extension produced by a tensile stress. (D 1566, D 11)

F 869, F08

elongation—increase in length of the gage length expressed as a percentage of the original gage length.

F 1789, F16

elongation at break, *n*—the elongation corresponding to the breaking force. (Compare **elongation at rupture**. See also **elongation**.)

D 123, D13

elongation at break, *n*—the elongation corresponding to the breaking load, that is, the maximum load.

D 4439, D35

elongation at break, *n*—the elongation corresponding to the breaking force. (Compare **elongation at rupture**. See also **elongation**.) Syn. **breaking elongation**.

D 4848, D13

elongation at breaking force, *n*—in *fiber strength testing of cotton*, the elongation corresponding to the maximum force, and expressed as a percentage of the 1/8-in. (3.2-mm) gage length.

D 7139, D13

elongation at breaking load, *n*—in *fiber strength testing of cotton*, the elongation corresponding to the maximum load, and expressed as a percentage of the 1/8-in. (3.2-mm) gage length.

D 123, D13

elongation at rupture, *n*—the elongation corresponding to the force-at-rupture. (Compare **elongation at break**.)

D 123, D13

elongation at rupture, *n*—the elongation corresponding to the force-at-rupture. (Compare **elongation at break**.)

D 4848, D13

elongation at specified force, (EASF), *n*—the elongation associated with a specified force on the force-extension curve.

D 123, D13

elongation at specified force, (EASF), *n*—the elongation associated with a specified force on the force-extension curve. (Syn. **corresponding elongation**).

D 4848, D13

elongation at the breaking load, n—deprecated term. Use the preferred term **elongation at break**. **D 4848, D13**

elongation, *El, n*—the increase in gage length of a body subjected to a tension force, referenced to a gage length on the body. Usually elongation is expressed as a percentage of the original gage length. **E 6, E28**

elongation, percent, *n*—the extension of a uniform section of a specimen expressed as percent of the original length. **D 1566, D11**

elongation, ultimate, *n*—the elongation at the time of rupture. **D 1566, D11**

eluant—a liquid used to extract one material from another, as in chromatography. **E 1316, E07**

elute, *v*—to remove sorbed materials from a sorbent by means of a fluid. **D 1356, D22**

EM—abbreviation for **end of message**. **F 1457, F05**

embed, *v*—to encapsulate the nonmetallic reinforcing mesh in the base coat. **E 2110, E06**

embedding, *n*—a general term for all methods of surrounding or enclosing components and assemblies with a substantial thickness of electrically insulating solid or foam material with voids and interspaces between the parts substantially filled. See **potting, encapsulation, and dip encapsulation**. **D 1711, D09**

embedding compound—see **taping compound**. **C 11, C11**

embedment—(1) the process of pressing a felt, aggregate, fabric, mat, or panel uniformly and completely into hot bitumen or adhesive to ensure intimate contact at all points;

(2) the process of pressing granules into coating in the manufacture of factory-prepared roofing, such as shingles. **D 1079, D08**

embedment—the placement of materials completely around the pipe to provide support. **F 412, F17**

embedment depth—distance measured from the surface of the base material to the farthest point of anchor, measured prior to setting of anchor. **E 2265, E06**

embodied energy, *n*—the energy used through the life cycle of a material or product to extract, refine, process, fabricate, transport, install, commission, utilize, maintain, remove, and ultimately recycle or dispose of the substances comprising the item. **E 2114, E06**

embossed—decorated in relief on the surface of the ware. **C 242, C21**

embossed, *adj*—having a permanent multilevel surface produced by mechanical or chemical means. **F 141, F06**

embossed—any deformation of the back of the acceptor media due to imaging, usually by type action. **F 221, F05**

embossed head—head with raised or impressed figure or design. **F 547, F16**

embossed leather—leather that has been ornamented with a geometrical or fancy design by heavy pressure in a machine. **D 1517, D31**

embossing, *n*—the tendency of a paper to take a permanent pattern, either depressed or raised, as a result of contact with the blanket during printing. **D 6488, D01**

embossment—a decoration in relief or excised on the ware surface. **C 242, C21**

embossment—the height of raised print or raised surface on a document. **F 149, F05**

embrittle—to make brittle; that is, to lose ductility. **F 2078, F07**

embrittlement, *n*—the loss or partial loss of ductility in a steel, such that failure is characteristically by fracture without appreciable deformation. **A 902, A05**

embrittlement—the reduction of the normal ductility in a metal due to a physical or chemical change. As it relates to these test methods, embrittlement is the loss of ductility caused by the reaction of cuprous oxide in the copper product when exposed at elevated temperatures to a reducing atmosphere. **B 846, B05**

embrittlement, *n*—the formation of a brittle residue as the result of pyrolysis or incomplete combustion. **D 123, D13**

embrittlement, *n*—the formation of a brittle residue as the result of pyrolysis or incomplete combustion. **D 4391, D13**

embrittlement, *n*—the formation of a brittle residue as the result of pyrolysis or incomplete combustion. **F 819, F18**

embrittlement—the formation of a brittle residue as a result of pyrolysis or incomplete combustion. **F 1494, F23**

embrittlement—the loss of ductility or toughness of a metal or alloy. **F 2078, F07**

embrittlement—the severe loss of ductility or toughness or both, of a material, usually a metal or alloy. **G 15, G01**

embrittlement, hydrogen—See **hydrogen embrittlement**. **B 374, B08**

emergency medical dispatcher (EMD)—a trained public safety telecommunicator with additional training and specific emergency medical knowledge essential for the efficient management of emergency communications. **F 1177, F30**

emergency medical facility—a physical structure, excluding mobile vehicles, which has been approved by the appropriate regulatory authority to receive emergency patients and which is equipped and staffed to evaluate and treat patients with life threatening conditions. **F 1177, F30**

emergency medical services—the provision of services to patients requiring immediate assistance due to illness or injury, including access, response, rescue, prehospital and hospital treatment, and transportation. **F 1177, F30**

emergency medical services (EMS) system—a coordinated arrangement of resources (including personnel, equipment, and facilities) organized to respond to medical emergencies, regardless of the cause. **F 1177, F30**

EMF, *n*—electric and magnetic fields, see **electromagnetic spectrum**. **E 2114, E06**

emf (electromotive force)—an electrical potential. **B 374, B08**

emf stability—the change in emf output expressed in millivolts (or in equivalent degrees), over a period of time. **E 344, E20**

emf stability—the change in output expressed in millivolts (or in equivalent degrees if the thermoelectric power is known) occurring over a specified time at a specified temperature. **E 344, E20**

EMI—an abbreviation for *electromagnetic interference*; caused by electric and magnetic fields that emanate from a wide range of electrical circuitry. **E 631, E06**

EMI—an abbreviation for *electromagnetic interference*; caused by electric and magnetic fields that emanate from a wide range of electrical circuitry. **E 1749, E06**

emission, *n*—release of radiant energy. **E 349, E21**

emission, burst—a qualitative description of the discrete signal related to an individual emission event occurring within the material.

NOTE—Use of the term burst emission is recommended only for describing the qualitative appearance of emission signals. **E 1316, E07**

emission, continuous—a qualitative description of the sustained signal level produced by rapidly occurring acoustic emission from structural sources, leaks, or both.

NOTE—Use of the term *continuous emission* is recommended only for describing the qualitative appearance of emission signals. **E 1316, E07**

emission depth distribution function (for a measured signal)—for particles or radiation emitted from a surface in a given direction, the probability that the particle or radiation leaving the surface in a specified state originated from a specified depth measured normally from the surface into the material. **E 673, E42**

emission function decay length—the negative reciprocal slope of the logarithm of the emission depth distribution function at a specified depth. **E 673, E42**

emission microscope—a type of electron microscope in which the specimen is the cathode source of the electrons. Sometimes used synonymously with shadow microscope. **E 7, E04**

emission mixture, *n*—the total mixture in the outside atmosphere of emissions from all sources. **D 1356, D22**

emissions, *n*—substances discharged into the air from a stack, vent, or other discrete source.

emission rate, *n*—the mass emitted per unit of time from a source or, alternatively, per unit of material or energy produced or consumed by a process. **D 1356, D22**

emission spectroscopy, *n*—measurement of energy spectrum emitted by or from an object under some form of energetic stimulation; for example, light, electrical discharge, and so forth. **D 4175, D02**

emissive power—the use of the term emissive power is discouraged in favor of the preferred term **radiantexitance**. **E 772, E44**

emissivity—the ratio of the radiation given off by the surface of a body to the radiation given off by a perfect black body at the same temperature. **C 242, C21**

emissivity, *n*—the ratio of the radiation given off by the surface of a body to the radiation given off by a perfect black body at the same temperature. **C 1145, C28**

emissivity, *n*—the ratio of the power per unit area radiated from a material's surface to that radiated from a black body at the same temperature. **E 176, E05**

emissivity, ϵ —the ratio of the radiance of a body at a given temperature to the corresponding radiance of a blackbody at the same temperature. **E 1316, E07**

emissivity of a thermal radiator, *n*—ratio of the thermal radiant exitance of the radiator to that of a full radiator at the same temperature. Symbol: ϵ , $\epsilon = M_{e,th}/Me$ ($\epsilon = 1$).

NOTE—Formerly "*pouvoir émissif*" (fr). **E 349, E21**

emittance, ϵ , *n*—the ratio of the radiant flux emitted by a specimen to that emitted by a blackbody at the same temperature and under the same conditions. **C 168, C16**

emittance, ϵ —for a sample at a given temperature, ratio of the radiant flux emitted by a sample to that emitted by a blackbody radiator at the same temperature, under the same spectral and geometric conditions of measurement. See **radiometric properties and quantities**. **E 772, E44**

emittance, directional $\epsilon(\theta; \phi)$, *n*—the ratio of the radiance from a surface in a particular direction to the radiance from a blackbody at the same temperature under the same conditions. **C 168, C16**

emittance, hemispherical ϵ_H or $\epsilon(2\pi)$, *n*—the average directional emittance over a hemispherical envelope covering a surface. **C 168, C16**

emittance, spectral ϵ_λ or $\epsilon(\lambda; \theta; \phi)$, *n*—an emittance based on the radiant energy emitted per unit wavelength interval (monochromatic radiant energy). **C 168, C16**

emittance, total ϵ_T or $\epsilon(t)$, *n*—an emittance that is an integrated average over all wavelengths of radiant energy emitted. **C 168, C16**

emitting spray angle, *n*—see **initial spray angle**. **E 1620, E29**

EMP—an abbreviation for *electromagnetic pulse*; a sudden intense discharge of electromagnetic energy that occurs naturally as a result of lightning discharge and can be induced by near-surface or high-altitude nuclear explosions. **E 631, E06**

EMP—an abbreviation for *electromagnetic pulse*; a sudden intense discharge of electromagnetic energy that occurs naturally as a result of lightning discharge and can be induced by near-surface or high-altitude nuclear explosions. **E 1749, E06**

emplacement—the establishment of contaminant residence in the vadose zone in a particular phase. **D 653, D18**

EMS region—a defined geographic area used for EMS planning, development, and coordination. **F 1177, F30**

emu—the notation emu is an indicator of electromagnetic units. When used in conjunction with magnetic moment, m , it denotes units of ergs per oersted, erg/Oe. A moment of 1 erg/Oe is produced by a current of 10 amperes (1 abampere) flowing in a loop of area 1 cm². The work done to rotate a moment of 1 erg/Oe from parallel to perpendicular in a uniform field of 1 Oe is 1 erg. The conversion to the SI units of magnetic moment J/T (joule/tesla) or $A\ m^2$ is given by

$$\frac{\text{erg/Oe (cgs-emu)}}{J/T\ (\text{SI})} = \frac{10\ \text{amperes cm}^2\ (\text{cgs-emu})}{A\ \text{m}^2\ (\text{SI})} = 10^{-3}$$

Magnetization, M , the magnetic moment per unit volume, has units erg/(Oe-cm³), often expressed as emu/cm³. **A 340, A06**

emulation, *n*—a technique where one device (in this case, a printer) is expected to behave exactly like another. **F 1457, F05**

emulsifiable concentrate—a single-phase liquid system having the property of forming an emulsion when mixed with water. **E 609, E35**

emulsification, *n*—the process of dispersing an immiscible liquid in another liquid. **C 1145, C28**

emulsification time—the time that an emulsifier is permitted to remain on the part to combine with the surface penetrant prior to removal. Also called emulsification dwell time. **E 1316, E07**

emulsifier—a substance that modifies the surface tension of colloidal droplets, keeping them from coalescing, and keeping them suspended. **D 653, D18**

emulsifier—see **emulsifying agent**. **E 609, E35**

emulsifier—a liquid that interacts with an oily substance to make it water-washable. **E 1316, E07**

emulsifier—a surfactant that promotes the suspension of one immiscible liquid in another. **E 1519, E35**

emulsifier, hydrophilic—a water-based liquid used in penetrant examination which interacts with the penetrant oil rendering it water-washable. **E 1316, E07**

emulsifier, lipophilic—an oil based liquid used in penetrant examination which interacts with the penetrant oil rendering it water-washable. **E 1316, E07**

emulsifying agent—a substance that increases the stability of an emulsion. **B 374, B08**

emulsifying agent—a material that increases the stability of a dispersion of one liquid in another. **D 459, D12**

emulsifying agent—a surfactant that promotes the suspension of one liquid in another. **E 609, E35**

emulsifying agent (latex), *n*—a surface-active substance used to facilitate the dispersion of an immiscible liquid compounding material in another liquid and to stabilize the emulsion thereby produced. **D 1566, D11**

emulsion—a suspension of fine particles or globules of one or more liquids in another liquid. **B 374, B08**

emulsion—a suspension of fine particles or globules of one or more liquids in another liquid. **D 459, D12**

emulsion—a system containing dispersed colloidal droplets. **D 653, D18**

emulsion, *n*—a heterogeneous system in which an immiscible liquid is distributed in fine drops in another liquid. **D 907, D14**

emulsion—an intimate mixture of bitumen and water, with uniform dispersion of the bitumen or water globules, usually stabilized by an emulsifying agent or system. **D 1079, D08**

emulsion, *n*—a suspension of fine particles or globules, or both, of one or more liquids in another liquid. **D 4175, D02**

emulsion—a suspension of fine particles or globules of one or more liquids in another liquid. **E 609, E35**

emulsion cleaner—a composition which forms an emulsion capable of dissolving or suspending soil. **D 459, D12**

emulsion paint—under **paint**, see **emulsion paint**. **D 16, D01**

emulsion side, *n*—the image-bearing side of a film master. (See also the opposite **base side**.) **F 1294, F05**

enamel—see **porcelain enamel**. **C 286, B08**

enamel, *n*—a paint that is characterized by an ability to form an especially smooth film. **D 16, D01**

enamel, aluminum—see aluminum enamel. C 286, B08
 enamel, beading—see beading enamel. C 286, B08
 enamel, blackboard—see chalkboard enamel. C 286, B08
 enamel, cast iron—see cast iron enamel. C 286, B08
 enamel, chalkboard—see chalkboard enamel. C 286, B08
 enamel, copper—see copper enamel. C 286, B08
 enameled—coated with enamel of desired color and often baked. F 547, F16
 enameling iron—a very low-carbon, low-metalloid, cold-rolled sheet steel, produced specifically for use as a base metal for porcelain enamel. C 286, B08
 enamel, jewelers'—see jewelers' enamel. C 286, B08
 enamel, reclaim—see reclaim. C 286, B08
 enamel scrapings—see scrapings. C 286, B08
 enantiotropic transformation—a reversible metastable phase change; for example, the freezing of sulfur directly to the rhombic phase, or the direct melting of the latter, without passing through the stable intermediate monoclinic phase. E 7, E04
 encapsulation, *n*—an embedding process utilizing removable molds or other techniques in which the insulating material forms the outer surfaces of the finished unit. D 1711, D09
 encapsulation—see lead-based paint encapsulation. E 631, E06
 encapsulation, *n*—the application of an encapsulant. An encapsulant or encapsulation product is a substance that forms a barrier between lead-based paint and the environment using a liquid-applied coating (with or without reinforcement materials) or an adhesively bonded covering material. E 1605, E06
 encapsulation, *n*—the complete enclosure of a waste in another material in such a way as to isolate it from external effects. E 2201, E50
 encapsulation, *n*—a procedure by which biological materials, such as cells, tissues, or proteins, are enclosed within a microscopic or macroscopic semipermeable barrier. F 2312, F04
 encasement—special materials, their placement and configuration which are designed to fully surround the pipe, and develop a field supporting strength which exceeds that developed by other commonly used installation and bedding techniques. C 896, C04
 encasement, *n*—see incasement, *n*. F 412, F17
 encasement, *v*—see incasement, *v*. F 412, F17
 encephalopathy, *n*—damage to the brain that is caused by severe lead toxicity that is capable of becoming permanent brain damage. E 631, E06
 encircling coils—in electromagnetic testing, coil(s) or coil assembly that surround(s) the part to be tested. Coils of this type are also referred to as annular, circumferential, or feed-through coils. E 1316, E07
 enclosed carbon arc, *n*—a light source in which an arc is produced across a pair of carbon rods by a high energy electrical source, such that a high intensity light is emitted. The carbons are enclosed in an inverted glass dome which acts to prolong the life of the carbons, and to modify the spectral power distribution received by the specimens. G 113, G03
 enclosure, *n*—the use of rigid, durable construction materials that are mechanically fastened to the substrate in order to act as a dust-tight barrier between lead-based paint and the environment. E 1605, E06
 end, *n*—an individual sliver, roving, yarn, or cord. D 123, D13
 end, *n*—*in fabric*, an individual warp yarn (single or ply) or cord. D 123, D13
 end, *n*—*in fibrous composites*, a general term for a continuous, ordered assembly of essentially parallel, collimated filaments, with or without twist. D 3878, D30
 end, *n*—an individual silver, roving, yarn, or cord. D 4849, D13
 end, *n*—*in woven fabric*, an individual warp yarn (single or ply) or cord. D 4850, D13
 endangered species, *n*—a species which is in danger of extinction

throughout all or a significant portion of its habitat range as determined by the governmental entity having jurisdiction.

E 2114, E06

end-centered—having an atom (or group of atoms) separated by a translation of the type $\frac{1}{2}$, $\frac{1}{2}$, 0 from a similar atom (or group of atoms). The number of atoms in an end-centered cell must be a multiple of two. E 7, E04

end connector—device permanently attached to the boom used for joining boom sections to one another or to other accessory devices. F 818, F20

end-construction tile, *n*—tile designed to receive its compressive stress parallel to the axes of the cells. C 43, C15

end count, *n*—*in woven fabric*, the number of individual warp yarns per inch of fabric regardless of whether they are comprised of single or plied components. D 4850, D13

end effect—see edge effect. E 1316, E07

end effect—the loss in sensitivity to discontinuities located near the extreme ends of the tube as the ends of the tube enter or leave the test coil. (E 215) E 1316, E07

end-fired furnace—a melter with fuel supplied from the back wall. C 162, C14

end-grain nailing—nailing in such a way that the point of the nail follows the grain of the wood so that the shank is parallel, or nearly parallel to the grain in that member holding the nail point. It is weaker than side-grain nailing in direct withdrawal. D 996, D10

end groups—the functional groups at either end of the cellulose molecule. It is frequently used for the terminal glucose units that contain these groups. It is usually clear from the context which is meant, and the differentiation is seldom important. One end group is reducing (probably a hemiacetal) and one nonreducing (a free hydroxyl in the 4-position). D 1695, D01

ending inventory—goods on hand at the end of the accounting period. Ending inventory shows up in the income statement in the calculation of cost of goods sold and in the balance sheet. E 2135, E53

end item—deliverable or product. E 2135, E53

end match—matched lumber with a tongue on one end of the piece and a matching groove on the opposite end. D 9, D07

end (of gypsum board), *n*—the end perpendicular to the paper-bound edge. The gypsum core is always exposed. C 11, C11

end of life—the practical or theoretical limit of page production for an all-in-one cartridge used in a page yield test. F 335, F05

end of message, *n*—an electronic signal from the sender to the receiver indicating the last byte has been transmitted. (See EM.) F 1457, F05

end of text, *n*—an electronic signal sent to indicate the end of the printable body of the message, it may be followed by control bytes. (See ETX.) F 1457, F05

end-of-the-pipe technologies, *n*—technologies (such as scrubbers on smokestacks) that reduce emissions of pollutants after they have formed. E 2114, E06

endothermic—pertaining to a reaction that occurs with the adsorption of heat. D 653, D18

endothermic gas, *n*—a reducing gas atmosphere used in sintering, produced by the reaction of a hydrocarbon vapor and air over a catalyst with the use of an external heat source. It is low in carbon dioxide and water vapor while containing combustibles of about 60 atomic percent hydrogen and carbon monoxide combined. B 243, B09

endothermic reaction, *n*—a chemical reaction in which heat is absorbed. C 1145, C28

endotoxin, *n*—a high molecular weight lipopolysaccharide (LPS) complex associated with the cell wall of gram-negative bacteria that is pyrogenic in humans. Though endotoxins are pyrogens, not all pyrogens are endotoxins. F 2312, F04

end out, *n*—a void caused by a missing warp yarn. D 123, D13

end out, *n*—a void caused by a missing warp yarn. (*Syn.* missing end) D 3990, D13

end point—the occurrence in the effluent of the maximum permissible concentration of an adsorbate of interest. **D 2652, D28**

end-port furnace—synonymous with **end-fired furnace**.

C 162, C14

end post—the terminal post at the end of a line of fence. **F 552, F14**

end product—supplies delivered under a line item of a government contract. **E 2135, E53**

end product—the chemical compound resulting from a particular metabolic process. **F 1600, F20**

end rail clamp—a two-piece clamp with carriage bolt and nut designed for horizontal rail connections to an end post. **F 552, F14**

endurance limit—maximum stress below which a bolt or screw can presumably endure an infinite number of stress cycles. **F 1789, F16**

endurance, thermal, *n*—the ability of a ceramic product to withstand thermal shock or to withstand deterioration during exposure to high temperatures. **C 1145, C28**

end-use, *n*—*in wear testing*, the use for which a textile is intended.

D 123, D13

end user, *n*—the facility which utilizes the heat content or other forms of energy from the combustion of scrap tires (for energy recovery). The last entity who uses the tire, in whatever form, to make a product or provide a service with economic value (for other uses).

D 5681, D34

end user—one that has been provided property, and exercises the right to use it. **E 2135, E53**

end user, *n*—*for the purpose of this guide*, this term is used to identify specifically the party requiring protective clothing (for example, the employer of the person wearing the garment). **F 1494, F23**

end user—party that installs the mechanical fastener during assembly of a component or product. **F 1789, F16**

energizing cycle—the application of a magnetizing force to a conductor. **E 1316, E07**

energy:

per channel—*EIA*, energy differences between two successive channels.

edge—*EIA*, values of the backscattering energy in a BS spectrum for an element (or isotope) that is located at the surface of the specimen.

loss—*EIA*, energy dissipated by the particles of the incident beam as they penetrate through the specimen.

of incident beam—average energy of analyzing particle in the incident beam at the moment of impact.

pass—(See *pass energy* under **electron energy analyzer**.)

surface approximation—*EIA*, see **surface energy approximation**. **E 673, E42**

energy absorption—the dissipation or transfer of energy due to motion into heat energy. **F 869, F08**

energy, acoustic emission event—the total elastic energy released by an emission event. **E 1316, E07**

energy, acoustic emission signal—the energy contained in a detected acoustic emission burst signal, with units usually reported in joules and values which can be expressed in logarithmic form (dB, decibels). **E 1316, E07**

energy calibration—a process of establishing the relationship between photon or particle energy and channel number in the spectrometer. The energy calibration may be as simple as building a table of two or more energy-channel pairs or as complex as using a least squares algorithm to establish a function describing the energy versus channel relationship. **E 170, E10**

energy efficiency—the product of the current efficiency and the voltage efficiency for a specified electrochemical process. **B 374, B08**

energy equivalent, *n*—the energy required to raise the temperature of a calorimeter system 1°C (or 1°F) per gram of sample. **D 5681, D34**

energy equivalent, heat capacity, or water equivalent, *n*—the energy required to raise the temperature of the calorimeter an arbitrary unit. This is the quantity that, when multiplied by the

corrected temperature rise, then adjusted for extraneous heat effects, and divided by the weight of the sample, gives the gross calorific value. **D 121, D05**

energy input rate—peak rate (Btu/h or kW) at which the equipment consumes energy; typically reflected during preheating, $E_{input\ rate}$

$$E_{input\ rate} = \frac{E \times 60}{t}$$

where:

$E_{input\ rate}$ = measured peak energy input rate. Btu/h, kW,
 E = energy consumed during period of peak energy input, Btu, kWh or kJ and, and
 t = period of peak energy input, min.

F 1827, F26

energy loss—the energy per unit volume that is lost in each deformation cycle. (ISO) **D 4092, D20**

energy product, $B_d H_d$ —the product of the coordinate values of any point on a demagnetization curve. **A 340, A06**

energy-product curve, magnetic—the curve obtained by plotting the product of the corresponding coordinates, B_d and H_d , of points on the demagnetization curve as abscissa against the induction, B_d , as ordinates.

NOTE—The maximum value of the energy product, $(B_d H_d)_m$, corresponds to the maximum value of the external energy.

NOTE—The demagnetization curve is plotted to the left of the vertical axis and usually the energy-product curve to the right.

A 340, A06

energy product, maximum $(B_d H_d)_m$ —for a given demagnetization curve, the maximum value of the energy product. **A 340, A06**

energy recovery, *n*—a process by which all or part of the tire is utilized as fuel (TDF) to recover its entire value. **D 5681, D34**

energy recovery, *n*—obtaining usable energy by consuming waste through a variety of processes. **E 2114, E06**

energy-to-food—the energy (Btu or kWh) imparted to a food product during a cooking energy efficiency (see **cooking energy efficiency**) test, E_{food} . **F 1827, F26**

energy utilization—amount of energy used, E_{util} .

$$E_{util} = \frac{H_g}{P}$$

where:

E_{util} = energy utilization, Btu/lb
 H_g = amount of energy burned, Btu, and
 P = weight of product, lb.

F 1827, F26

energy value, *n*—the assignment of a value to the tire-derived fuel as measured in British thermal units per pound or calories per gram. **D 5681, D34**

engine coolant, *n*—a fluid used to transfer heat from an engine to the radiator, usually containing specific amounts of glycols, water, corrosion inhibitors, and a foam suppressor. **D 4725, D15**

engine coolant concentrate, *n*—a formulated liquid product intended to be diluted with water for use in engine cooling systems. **D 4725, D15**

engine dynamometer test, *n*—a laboratory full-scale engine test designed to evaluate corrosion protection and inhibitor stability of engine coolants under simulated operational conditions. **D 4725, D15**

engineer, *n*—*in pipe laying*, the person, firm, corporation, or government agency acting for the owner as his duly authorized agent in the designing and engineering of the project. **C 1154, C17**

engineer, *n*—*for pipe laying*, the person, firm, corporation, or government agency acting for the owner as his duly authorized agent in the designing and engineering of the project. **D 2946, C17**

engineered controls—measures implemented at the work site to

engineered controls

- contain, control, or otherwise reduce exposure to lead dust and debris. **E 631, E06**
- engineered plastic, *n***—a material that has been made by specific design and through use of particular monomers and monomer sequences to produce a plastic with desired properties, possibly for a specific application. **D 883, D20**
- engineering controls**—measures other than respiratory protection or administrative controls that are implemented at the work site to contain, control, and/or otherwise reduce exposure to lead-contaminated dust and debris, usually in the occupational health setting. The measures include process and product substitution, isolation, and ventilation. (HUD Guidelines, OSHA) **E 1605, E06**
- engineering economics**—the application of economic techniques to the evaluation of design and engineering alternatives. **E 631, E06**
- engineering economics, *n***—the application of economic techniques to the evaluation of design and engineering alternatives. **E 833, E06**
- engineering economics, *n*** (économie du génie)—application of engineering, mathematical, and economic techniques to the economic evaluation of engineering alternatives. **E 631, E06**
- engineering economics, *n*** (économie du génie)—application of engineering, mathematical, and economic techniques to the economic evaluation of engineering alternatives. **E 1480, E06**
- engineering plastics, *n***—those plastics and polymeric compositions for which well-defined properties are available such that engineering rather than empirical methods can be used for the design and manufacture of products that require definite and predictable performance in structural applications over a substantial temperature range. **D 883, D20**
- engineering plastics, *n***—those plastics and polymeric compositions for which well-defined properties are available, such that engineering rather than empirical methods can be used for design and manufacture of products requiring definite and predictable performance in structural applications over a substantial temperature range. (D20) **F 412, F17**
- engineering strain, *e, n***—a dimensionless value that is the change in length (ΔL) per unit length of original linear dimension (L_0) along the loading axis of the specimen; that is, $e = (\Delta L)/L_0$. **E 6, E28**
- engineering stress, *S* [FL^{-2}], *n***—the normal stress, expressed in units of applied force, F , per unit of original cross-sectional area, A_0 ; that is, $S = F/A_0$. **E 6, E28**
- engine motor octane requirement, *n***—one full motor octane number greater than the maximum motor octane number that results in knock (graphic knock level descriptions can be seen in Annex A1). For example, a test engine knocks on primary reference fuels with 96 and 97 motor octane numbers. The test engine does not knock on a primary reference fuel with a 98 motor octane number. The maximum motor octane number that results in knock is 97, so the motor octane requirement is 98. **D 4175, D02**
- engine oil, *n***—a liquid that reduces friction or wear, or both, between the moving parts within an engine; removes heat, particularly from the underside of pistons; and serves as a combustion gas sealant for piston rings. **D 4175, D02**
- English degree**—number of grains of substance per one British imperial gallon of water. **D 6161, D19**
- engobe, *n***—a slip, other than a glaze, that is not impervious and is applied to a ceramic body to function as a glaze undercoat or to impart color, texture, opacity, or other characteristics. **C 43, C15**
- engobe**—a slip coating applied to a ceramic body for imparting color, opacity, or other characteristics, and subsequently covered with a glaze. **C 242, C21**
- engraftment, *n***—incorporation of grafted tissue into the body of the host. **F 2312, F04**
- engraving**—the process of carving figures, letters, etc., upon glass by abrasive means. **C 162, C14**
- enhancement factor, *n***—the correction for the departure of the mixture of air and water vapor from ideal gas laws. **D 1356, D22**
- enrichment culture**—a liquid culture that enhances the growth of a given type of organism. **F 1600, F20**
- ensonification**—see **insonification**. **E 1316, E07**
- entanglement, *n***—the extent or degree to which the filaments in a yarn are interlocked and cannot be readily separated. **D 123, D13**
- entanglement, *n***—the extent or degree to which the filaments in a yarn are interlocked and cannot be readily separated. **D 4849, D13**
- enthalpy**—a thermodynamic *function* defined by the equation $H = U + PV$ where H is the enthalpy, U is the *internal* energy, P is the pressure, and V the volume of the system. **E 1142, E37**
- entity**—that which can be individually described and considered. **E 1187, E36**
- entrained air**—see **air void**. **C 125, C09**
- entrained air (or gas), *n***—in *liquids*, a two-phase mixture of air (or gas) dispersed in a liquid in which the liquid is the major component on a volumetric basis. **D 4175, D02**
- entrainment loss**—oil droplets escaping with the flow of water diverted under the skirt. **F 818, F20**
- entrance angle, β , *n***—in *retroreflection*, angle between the illumination axis and the retroreflector axis. **E 284, E12**
- entrapped air**—see **air void**. **C 125, C09**
- envelope, *n***—in *packaging*, a container of flexible material having only two **faces** and joined at three edges to form a partial enclosure. The nonjoined edge provides a filling opening which later may be closed or sealed. **D 996, D10**
- envelope**—a continuous membrane edge seal formed at the perimeter and at penetrations by folding the base sheet or ply over the plies above and securing it to the top of the membrane. The envelope prevents bitumen seepage from the edge of the membrane. **D 1079, D08**
- envelope**—*of a particle in catalysis*, a theoretical surface that encloses the particle and that bridges openings to the interior of the particle. **D 3766, D32**
- envelope**—a layer of cell membrane-derived lipoprotein that surrounds the protein coat (capsid) of some viruses. **E 1705, E48**
- envelope, drainage**—the materials completely surrounding a pipe to provide support or protection or act as a filter. **F 412, F17**
- envelope grouting**—grouting of rock surrounding a hydraulic pressure tunnel for purpose of consolidation, and primarily, reduction of permeability. **D 653, D18**
- environment, *n***—*as related to fire*, the conditions and surroundings that may influence the behavior of a material, product, or assembly when it is exposed to ignition sources or fire. **E 176, E05**
- environment**—in *fatiguetesting*, the aggregate of chemical species and energy that surrounds a test specimen. **E 1823, E08**
- environmental baseline survey (EBS)**—a survey of DoD real property based on all existing environmental information related to the storage, release, treatment, or disposal of hazardous substances or petroleum products or derivatives on the property to determine or discover the obviousness of the presence or likely presence of a release or threatened release of any hazardous substance or petroleum product. In certain cases, additional data, including sampling and analysis, may be needed in the EBS to support classification of the property into one of the standard environmental condition of property area types. Additionally, an EBS may also satisfy the uncontaminated property identification requirements of CERFA. An EBS will consider all sources of available information concerning environmentally significant current and past uses of the real property and shall, at a minimum, consist of the following: (1) a detailed search and review of available information and records in the possession of the DoD components or records made available by the regulatory agencies or other involved Federal agencies. DoD components are responsible for requesting and making reasonable inquiry into the existence and availability of relevant information and records to include any additional study information (for example, surveys for radioactive materials, asbestos, radon, lead-based paint, transformers containing PCB, Resource Conservation and Recovery Act Facility Assessments and Investigations (RFA and RFI), and underground storage tank cleanup program) to determine the environmental condition of the property; (2) a review of all reasonably obtainable Federal, state,

and local government records for each adjacent facility where there has been a release or likely release of any hazardous substance or any petroleum product, and that is likely to cause or contribute to a release or threatened release of any hazardous substance or any petroleum product on the DoD real property; (3) an analysis of aerial photographs that may reflect prior uses of the property, which are in the possession of the Federal government or are reasonably obtainable through state or local government agencies; (4) interviews with current or former employees, or both, involved in operations on the real property; (5) visual inspections of the real property; any buildings, structures, equipment, pipe, pipeline, or other improvements on the real property; and of properties immediately adjacent to the real property, noting sewer lines, runoff patterns, evidence of environmental impacts (for example, stained soil, stressed vegetation, and dead or ill wildlife), and other observations that indicate the actual or potential release of hazardous substances or petroleum products; (6) the identification of sources of contamination on the installation and on adjacent properties that could migrate to the parcel during Federal government ownership; (7) ongoing response actions or actions that have been taken at or adjacent to the parcel; and (8) physical inspection of the property adjacent to the real property, to the extent permitted by owners or operators of such property. **D 5681, D34**

environmental baseline survey (EBS) report—the written record of an EBS that includes the following: (1) an executive summary briefly stating the areas of real property (or parcels) evaluated and the conclusions of the EBS; (2) the property identification (for example, the address, assessor parcel number, or legal description); (3) any relevant information obtained from a detailed search of Federal government records pertaining to the property, including available maps; (4) any relevant information obtained from a review of the recorded chain of title documents regarding the real property. The review should address those prior ownerships and uses that could reasonably have contributed to an environmental concern, and, at a minimum, cover the preceding 60 years; (5) a description of past and current activities, including all past DoD uses to the extent such information is reasonably available, on the property and on adjacent properties; (6) a description of hazardous substances or petroleum products management practices (to include storage, release, treatment, or disposal) at the property and adjacent properties; (7) any relevant information obtained from records reviews and visual and physical inspections of adjacent properties; (8) a description of ongoing response actions or actions that have been taken at or adjacent to the property; (9) an evaluation of the environmental suitability of the property for an intended lease or deed transaction, if known, including the basis for determination of such suitability; and (10) references to key documents examined (for example, aerial photographs, spill incident reports, and investigation results). **D 5681, D34**

environmental challenging—the process of subjecting a package to extremes of temperature, or humidity, or both, with the goal of determining sensitivities of the package to environmental stresses. In contrast to accelerated aging, environmental challenging often includes conditions, or transitions, or both, of temperature and humidity that equal or exceed those that can be encountered in a package life cycle. **F 1327, F02**

environmental chamber, n—an enclosed space, used for testing designed and constructed to provide control of interior atmosphere to specified conditions. **E 631, E06**

environmental chamber—See **building space**. **E 631, E06**

environmental compartment, n—a subdivision of the environment based on physical or chemical properties, or both. **D 4175, D02**

environmental compartment, n—a subdivision of the environment based on physical or chemical properties, or both. **D 6384, D02**

environmental condition of property map—a map, prepared on the basis of all environmental investigation information conducted to date, that shows the environmental condition of a DoD installation's real property in terms of the seven standard environmental condition of property area types defined in this classification. **D 5681, D34**

environmental conditions, n—in *textile testing*, the atmosphere in which specified moisture levels, temperature ranges, and concentrations of gases are controlled. **D 123, D13**

environmental conditions, n—in *textile testing*, the atmosphere in which specified moisture levels, temperature ranges, and concentrations of gases are controlled. **D 6799, D13**

environmental hydrogen embrittlement (EHE)—generally caused by hydrogen introduced into the steel from the environment after exposure to an externally applied stress. **F 2078, F07**

environmental hydrogen embrittlement—can be “corrosion-assisted hydrogen embrittlement” caused by the liberation of hydrogen during the corrosion process, which is absorbed as atomic hydrogen, resulting in embrittlement under certain conditions of material strength and applied external stress. The end result is brittle failure. The hydrogen may also be absorbed from other external chemical sources. **F 1789, F16**

environmental indicator, n—a measurement, statistic or value that provides a proximate gage or evidence of the effects of environmental management programs or of the state or condition of the environment in a given area. **E 2114, E06**

environmental lien—a charge, security, or encumbrance upon title to a property to secure the payment of a cost, damage, debt, obligation, or duty arising out of response actions, cleanup, or other remediation of hazardous substances or petroleum products upon a property, including (but not limited to) liens imposed pursuant to CERCLA 42 USC § 9607(1) and similar state or local laws. **D 5681, D34**

environmentally-assisted cracking—the initiation or acceleration of a cracking process due to the conjoint action of a chemical environment and tensile stress. **G 15, G01**

environmentally assisted cracking (EAC)—generic, crack growth as a result of exposure to the environment. **F 2078, F07**

environmentally controlled area—See **ECA**. **E 631, E06**

environmentally controlled area—See **ECA**. **E 1749, E06**

environmental resistance, n—a measure of a direct thermal product's ability to resist the effects of exposure to environmental contaminants on either the imaged or unimaged areas. **F 1623, F05**

environmental stress cracking—the development of cracks in a material that is subjected to stress or strain in the presence of specific chemicals. **F 412, F17**

environment-assisted cracking, EAC—a cracking process in which the environment promotes crack growth or higher crack growth rates than would occur without the presence of the environment. **E 1823, E08**

environment chamber—in *fatigue testing*, the container of the bulk volume surrounding a test specimen. **E 1823, E08**

environment chamber volume [L³]—in *fatigue testing*, that bulk volume surrounding a test specimen. **E 1823, E08**

environment composition [ML⁻³]—in *corrosion fatigue testing*, the concentration of the chemical components in the fluid environment surrounding a test specimen. **E 1823, E08**

environment hydrogen content [ML⁻³]—in *corrosion fatigue testing*, the hydrogen gas concentration of the fluid environment surrounding a test specimen. **E 1823, E08**

environment monitoring—in *fatigue testing*, the periodic or continuous measurement of fluid concentrations of the environment. **E 1823, E08**

environment oxygen content [ML⁻³]—in *corrosion fatigue testing*, the oxygen concentration of the fluid environment surrounding a test specimen. **E 1823, E08**

environment pressure [FL⁻²]—in *fatigue testing*, the pressure of the bulk volume surrounding a test specimen. **E 1823, E08**

environment temperature—in *fatigue testing*, the temperature of the bulk volume surrounding a test specimen. **E 1823, E08**

environment volume [L³]—in *fatigue testing*, the total volume immediately surrounding a test specimen plus that contained in a circulating reservoir if applicable. **E 1823, E08**

enzyme—biological catalyst that is protein in nature. **E 1705, E48**

- EP**—*in tribology*, abbreviation for extreme pressure. **D 4175, D02**
- EPA**—Environmental Protection Agency **E 631, E06**
- EPA—Environmental Protection Agency (USA)**—an organization that has set the potable water standards. **D 6161, D19**
- EPA identification**—unique number assigned by EPA to each generator or transporter of hazardous waste, and to each treatment, storage, or disposal facility. **E 631, E06**
- ephemeral gully**—a channel that is formed by gully erosion on cropland and that is routinely but temporarily obscured by mechanical operations such as tilling. **D 4410, D19**
- epicondyles**—the bony prominence above the condyles where the ligaments attach. **F 869, F08**
- epidermal autograft, n**—an autograft consisting primarily of epidermal tissue, including keratinocyte stem cells, but with little dermal tissue. **F 2312, F04**
- epidermis, n**—*in mammalian hair fibers*, the outside or surface layer of the fiber consisting of flat, irregular, horny cells or scales. **D 123, D13**
- epidermis, n**—*in mammalian hair fibers*, the outside or surface layer of the fiber consisting of flat, irregular, horny cells or scales. **D 4845, D13**
- epigenetic ice**—ice in the ground that formed after the deposition of the earth material in which it occurs. **D 7099, D18**
- epigenetic ice wedge**—an ice wedge that developed after the deposition of the earth material in which it occurs. **D 7099, D18**
- epigenetic permafrost**—(1) permafrost that formed after the deposition of the earth material in which it occurs; (2) permafrost that formed through the lowering of the permafrost base in previously deposited material. **D 7099, D18**
- epithermal neutrons**—a general classification of neutrons with energies above those of thermal neutrons; or frequently, neutrons with energies in the resonance range, between the thermal limit and some upper limit, such as 0.1 MeV (see **thermal neutrons**). **E 170, E10**
- EP lubricating oil, n**—a liquid lubricant containing an extreme pressure (EP) additive. **D 4175, D02**
- epoxy**—a multicomponent resin grout that usually provides very high, tensile, compressive, and bond strengths. **D 653, D18**
- epoxy plastic, n**—a thermoplastic or thermosetting plastic containing ether or hydroxyalkyl repeating units, or both, resulting from the ring-opening reactions of lower-molecular weight polyfunctional oxirane resins, or compounds, with catalysts or with various polyfunctional acidic or basic coreactants. **F 1251, F04**
- epoxy plastics, n**—thermoplastic or thermosetting plastics containing ether or hydroxyalkyl repeating units, or both, resulting from the ring-opening reactions of lower molecular weight polyfunctional oxirane resins, or compounds, with catalysts or with various polyfunctional acidic or basic coreactants. **D 883, D20**
- epoxy resin**—a viscous liquid or brittle solid containing epoxide groups that can be crosslinked into final form by means of a chemical reaction with a variety of setting agents used with or without heat. **C 904, C03**
- EPROM**—erasable programmable read only memory; a type of memory chip used in computing equipment (in this case, a printer). **F 1457, F05**
- EPS**—extra-cellular polysaccharide produced by bacteria to form a protective coating especially after attaching to the membrane surface. **D 6161, D19**
- EPS, n**—expanded polystyrene. See **rigid cellular polystyrene thermal insulation board**. See also **cellular polystyrene**. **E 631, E06**
- epsilon (ε)**—designation generally assigned to intermetallic, metal-metalloid, and metal-nonmetallic compounds found in ferrous alloy systems (for example, Fe_3Mo_2 , $FeSi$, Fe_3P). **E 7, E04**
- epsilon carbide**—carbide with hexagonal close-packed lattice which precipitates during the first stage of tempering of primary martensite. Its composition corresponds to the empirical formula $Fe_{2.4}C$. **E 7, E04**
- epsilon structure**—structurally analogous close-packed phases (similar to epsilon brass), or electron compounds, that have ratios of 7 valence electrons to 4 atoms. **E 7, E04**
- equal allocation, n**—this occurs when the number of sets in ranked set sampling is an integer multiple of the size of the set. **D 5681, D34**
- equal-discharge-increment (EDI) method**—a procedure for obtaining the discharge weighted suspended-sediment concentration of flow at a cross section whereby depth integration is performed at the centers of three or more equal flow segments of the cross section. If approximately equal volumes of water-sediment mixture are collected from each flow segment, the samples may be composited for analysis. If unequal volumes are collected, samples from each flow segment must be analyzed separately and the results combined mathematically. **D 4410, D19**
- equal-energy illuminant, n**—illuminant having the same spectral power at all wavelengths in the specified spectral region. **E 284, E12**
- equal-energy source, n**—a source having the same radiant exitance in each constant wavelength interval in the spectral region under consideration. **E 284, E12**
- equalizing, n**—see **blending**. **B 243, B09**
- equalizing block**—an object, usually metal, that when placed in a nonuniform temperature region, has greater temperature uniformity (due to its relatively high thermoconductivity and mass) than the medium surrounding the object. **E 344, E20**
- equal-width-increment (EWI) method**—a procedure of obtaining the discharge weighted suspended-sediment concentration of flow at a cross section by performing depth integration at a series of verticals equally spaced across the cross section and using the same vertical transit rate at all sampling verticals. **D 4410, D19**
- equatorial mount**—a sun-tracking mount, usually clock-driven, whose axis of rotation is parallel to that of the earth. **E 772, E44**
- equiaxed grain**—a polygonal crystallite, in an aggregate, whose dimensions are approximately the same in all directions. **E 7, E04**
- equilay conductor**—see **concentric-lay conductor**. **B 354, B01**
- equilibrium, n**—condition reached in air drying in which change in weight of the sample, under conditions of ambient temperature and humidity, is no more than 0.1 %/h or 0.05 %/½ h. **D 121, D05**
- equilibrium, n**—*in petroleum products*—the condition where the vapor above the test specimen and the test specimen are at the same temperature at the time the ignition source is applied. **D 4175, D02**
- equilibrium**—a state of dynamic balance between the opposing actions, reactions, or velocities of a reversible process. **E 7, E04**
- equilibrium adsorptive capacity**—the quantity of a given component adsorbed per unit of adsorbent from a fluid or fluid mixture at equilibrium temperature and concentration, or pressure. **D 2652, D28**
- equilibrium diagram**—See **constitutional diagram**. **E 7, E04**
- equilibrium diagram**—see **constitutional diagram**. **E 1142, E37**
- equilibrium eutectic**—See **eutectic, equilibrium**. **C 242, C21**
- equilibrium fuel level, n**—*for knock testing*, test procedure in which the fuel-air ratio for maximum knock intensity for sample and reference fuels is determined by making incremental step changes in carburetor fuel level, observing the equilibrium knock intensity for each step and selecting the level that produces the highest knock intensity reading. **D 4175, D02**
- equilibrium headspace, n**—the vapor space above the liquid in which all vapor components are in equilibrium with the liquid components. **D 4175, D02**
- equilibrium moisture basis**—See **equilibrium moisture basis** under **reporting bases**. **D 121, D05**
- equilibrium moisture content**—a moisture content at which wood neither gains nor loses moisture to the surrounding air. **D 9, D07**
- equilibrium moisture content**—(1) the moisture content of a material stabilized at a given temperature and relative humidity, expressed as percent moisture by weight;

(2) the typical moisture content of a material in any given geographical area. **D 1079, D08**

equilibrium moisture content—the percentage mass of moisture in a material when it has attained equilibrium with water vapor at a specified pressure or partial pressure. It is determined by successive weighings of the sample, either on the adsorption or desorption curve, and plotting moisture content against the logarithm of time. It should be designated as adsorption equilibrium or desorption equilibrium. **D 1695, D01**

equilibrium permafrost—permafrost that is in equilibrium with the existing mean annual surface or sea-bottom temperature and with the geothermal heat flux. **D 7099, D18**

equilibrium (reversible) potential—the potential of an electrode in an electrolytic solution when the forward rate of a given reaction is exactly equal to the reverse rate. (The equilibrium potential can only be defined with respect to a specific electrochemical reaction.) **G 15, G01**

equilibrium surface composition—see **sputtering**. **E 673, E42**

equipment—non-expendable, tangible moveable property needed for the performance of a task or useful in effecting an obligation. **E 2135, E53**

equipment check, n—an indication of a problem in the printer, sent by the printer to the cluster controller. **F 1457, F05**

equipment package, n—the building blocks of ITS subsystems that perform a specific function. **E 867, E17**

equipment test level accuracy—(1) For a single test equipment, using a large group of test specimens, the average percentage of test deviation from the correct average value.

(2) The average percentage deviation from the average value obtained from similar tests, on the same test specimen or specimens, when measured with a number of other test equipments that have previously been proven to have both suitable reproducibility of measurement and test level, and whose calibrations and quality have general acceptance for standardization purposes and where better equipment for establishing the absolute accuracy of test is not available. **A 340, A06**

equipotential line—a line connecting points of equal hydraulic head. A set of such lines provides a contour map of a potentiometric surface. **D 653, D18**

equitranference—equal diffusion rates of the positively and negatively charged ions of an electrolyte across a liquid junction. **D 4127, D19**

equitransferent filling solution—a reference electrode filling solution in which the diffusion rates of negatively and positively charged ions are equal. For low liquid junction potentials, the ionic strength of the filling solution must be high compared to the sample solution. **D 4127, D19**

equivalent alkalis, Na₂Oeq, n—in hydraulic cement, total combined sodium and potassium oxides, expressed as a percentage, calculated from the analysis, by means of the formula (Na₂Oeq = % Na₂O + 0.658 × % K₂O). **C 219, C01**

equivalent conductivity—in an electrolyte, the conductivity of the solution divided by the number of equivalents of conducting solute per unit volume, that is, the conductivity divided by the normality of the solution. **B 374, B08**

equivalent design load—a magnitude of 60-s duration uniform load selected by specifying authority to represent design loads. **E 631, E06**

equivalent diameter (equivalent size), D (L)—the diameter of a hypothetical sphere composed of material having the same specific gravity as that of the actual soil particle and of such size that it will settle in a given liquid at the same terminal velocity as the actual soil particle. **D 653, D18**

equivalent diameter (sphere)—See **equivalent diameter (sphere) under diameter**. **C 242, C21**

equivalent-energy fracture toughness (K-EE) [FL^{-3/2}]—the crack extension resistance determined by the procedure specified in Practice E 992. **E 1823, E08**

equivalent fission fluence—the fluence of fission spectrum neutrons that would give a detector or material response for a particular reaction equal to that in a given neutron field. **E 170, E10**

equivalent fluid—a hypothetical fluid having a unit weight such that it will produce a pressure against a lateral support presumed to be equivalent to that produced by the actual soil. This simplified approach is valid only when deformation conditions are such that the pressure increases linearly with depth and the wall friction is neglected. **D 653, D18**

equivalent I.Q.I. sensitivity—that thickness of I.Q.I. expressed as a percentage of the section thickness radiologically examined in which a 2T hole or 2 % wire size equivalent would be visible under the same radiological conditions. **E 1316, E07**

equivalent monoenergetic neutron fluence, $\Phi_{eq}(E_o)$ —characterizes an incident energy fluence spectrum, $\Phi(E)$, in terms of the fluence of monoenergetic neutrons at a specific energy, E_o , required to produce the same displacement kerma, K_o , in a specific material (for example, silicon) as $\Phi(E)$. **E 170, E10**

equivalent 2200 m/s fluence, Φ_o —a measure of the thermal neutron fluence made with a 1/v detector and using the 2200 m/s cross section.

$$\Phi_o = n v_o t$$

where:

n = neutron density,

v_o = 2200 m/s, and

t = exposure time of the detector.

E 170, E10

equivalent nitrogen pressure—the calculated pressure that a gage or another device would indicate if the gas in the device were replaced by nitrogen at the same molecular density. **E 1316, E07**

equivalent orifice, n—the diameter of the sharp-edged circular opening in the plate mounted in an ASTM Plenum Chamber (see Specification F 431, for Air Performance Measurement Plenum Chamber for Vacuum Cleaners), the opening having a resistance to air flow equivalent to the resistance caused by a specific usage of the vacuum cleaner. The equivalent orifice diameter is expressed in inches or millimetres. **F 395, F11**

equivalent penetrometer sensitivity—that thickness of penetrometer, expressed as a percentage of the section thickness radiographed, in which a 2T hole would be visible under the same radiographic conditions. **E 1316, E07**

equivalent per million (epm), n—a unit chemical equivalent weight of solute per million unit weights of solution. **D 1129, D19**

equivalent per million (EPM)—a unit chemical equivalent weight of solute per million unit weights of solution. Concentration in equivalents per million is calculated by dividing concentration in ppm by the equivalent weight of the substance or ion. Equivalent weight is the atomic weight of the substance divided by the valence of the substance. **D 1616, D19**

equivalent product, n—provides the same amount of product or number of recommended uses as contained in the package being replaced (as related to Subcommittee D10.46 package source reduction). **D 996, D10**

equivalent spherical diameter—See **equivalent diameter (sphere) under diameter**. **C 242, C21**

equivalent thickness, n—the calculated solid thickness of concrete or masonry for purposes of determining fire resistance ratings of barrier elements on the basis of heat transmission end-point criteria. **E 176, E05**

equivalent uniform annual value—See **annual value**. **E 631, E06**

equivalent uniform annual value, n—See **annual value**. **E 833, E06**

equivalent viscous damping, c, n—at a given frequency, the quotient of $F''(1)$ divided by the velocity of the imposed deflection.

$$c = F''(1) / \omega X^*(1)$$

D 1566, D11

equivalent volume sphere diameter—the diameter of a hypothetical sphere having the same volume as the actual particle. **E 1620, E29**

equivalent weight

equivalent weight—the weight of an ion determined by dividing the sum of the atomic weights of its component atoms by its valence.

D 6161, D19

equiviscous temperature (EVT), *n*—the temperature at which a bitumen attains the proper viscosity for built-up membrane application. EVT may or may not be applicable to polymer modified bituminous sheet materials. (See **EVT for asphalt** and **EVT for coal tar**).

D 1079, D08

equiviscous temperature for asphalt, *n*—the equiviscous temperature (EVT) for roofing asphalt (Specification D 312, Type I, II, III, or IV) is as follows: (1) *mop application*—the temperature at which the asphalt's apparent viscosity is 125 cP. (2) *mechanical spreader application*—the temperature at which the asphalt's apparent viscosity is 75 cP. See **equiviscous temperature and EVT application range**.

D 1079, D08

equiviscous temperature for coal tar—the equiviscous temperature (EVT) for roofing coal tar (Specification D 450, Type I or III) is the temperature at which the coal tar's apparent viscosity is 25 cP. See **equiviscous temperature and EVT application range**.

D 1079, D08

eradication—the complete elimination of a pest from an area.

E 609, E35

erasability—ease with which the image may be removed without impairing the surface of the paper.

F 221, F05

erasable optical medium—an erasable and rewritable storage medium where the digital data is represented by the degree of reflectivity of the medium recording layer; the data can be altered.

E 1316, E07

erasable programmable read only memory, *n*—a type of memory chip used in printers where the content of the chip can be read only when in normal use, but with special treatment it can be erased and reprogrammed.

F 1457, F05

erasure correction, *n*—a use of error correction characters to correct data errors that have unknown locations.

F 1294, F05

ERD—energy recovery device.

D 6161, D19

ERNS list—EPA's Emergency Response Notification System list of reported CERCLA hazardous substance releases or spills in quantities equal to or greater than the reportable quantity, as maintained by the National Response Center. Notification requirements for such releases or spills are codified in 40 CFR Parts 302 and 355.

D 5681, D34

erosion—the progressive loss of material from a solid surface due to mechanical interaction between that surface and a fluid, a multicomponent fluid, or solid particles carried with the fluid.

G 15, G01

erosion, *n*—in tribology, progressive loss of original material from a solid surface due to mechanical interaction between that surface and a fluid, a multicomponent fluid, or impinging liquid or solid particles.

G 40, G02

erosion corrosion, *n*—nonuniform, accelerated corrosion characterized by a smooth appearance and caused by high velocity coolant.

D 4725, D15

erosion-corrosion—a conjoint action involving corrosion and erosion in the presence of a moving corrosive fluid, leading to the accelerated loss of material.

G 15, G01

erosion-corrosion, *n*—a synergistic process involving both erosion and corrosion, in which each of these processes is affected by the simultaneous action of the other, and in many cases is thereby accelerated.

G 40, G02

erosion, electrical, *n*—the progressive wearing away of electrical insulation by the action of electrical discharges.

D 1711, D09

erosion of refractories, *n*—wearing away of refractory surfaces by the washing action of moving liquids.

C 71, C08

erosion rate, *n*—any determination of the rate of loss of material (erosion) with exposure duration. (See also **rationalized erosion rate**).

G 40, G02

erosion rate-time curve, *n*—a plot of instantaneous erosion rate versus exposure duration, usually obtained by numerical or graphi-

cal differentiation of the cumulative erosion-time curve. (See also **erosion rate-time pattern**).

G 40, G02

erosion rate-time pattern, *n*—any qualitative description of the shape of the erosion rate-time curve in terms of the several stages of which it may be composed.

G 40, G02

erosion resistance, *n*—the ability of a coating to withstand being worn away by chalking or by the abrasive action of water or windborne particles of grit. The degree of resistance is measured by the amount of the coating retained. See **abrasion resistance**.

D 16, D01

erosion resistance, electrical, *n*—the resistance of electrical insulating materials to erosion by the action of electrical discharges.

C 1145, C28

erosion resistance, electrical, *n*—the quantitative expression of the amount of electrical erosion under specific conditions.

D 1711, D09

ERR—external ROM receptacle.

F 1457, F05

ERR, *n*—an error.

F 1457, F05

erroneous data, *n*—one or more pieces of data in a data set that has incorrect values due to a variety of reasons such as improper functioning of the data collection device, miscommunications, or shortcomings in subsequent processing programs.

E 867, E17

error—difference of an observation from the best obtainable estimate of the true value.

D 121, D05

error, *n*—the random or systematic deviation of the observed sample value from its true value (see *bias* and *sampling error*).

D 5681, D34

error, *n*—of a result, the difference between a result obtained on a material and its accepted reference value. (compare *b-value*.)

E 135, E01

error, *n*—of a temperature measurement, result of a temperature measurement minus a true value of temperature.

E 344, E20

error—*in a statistical sense*, any deviation of an observed value from the true, but generally unknown, value. When expressed as a fraction or percentage of the value measured, it is called a relative error. All statements of precision or bias should indicate clearly whether they are expressed in absolute or relative sense.

E 1547, E15

error—the substitution of one character for another.

F 149, F05

error correction, *n*—use of error correction characters to locate and correct data errors that have unknown locations.

F 1294, F05

error correction characters, *n*—special symbol characters that are calculated mathematically from other symbol characters for the purpose of error correction, error detection or erasure correction.

F 1294, F05

error correction level, *n*—an indicator of the number of error correction characters in a symbol.

F 1294, F05

error detection, *n*—use of error correction characters to determine that the number of errors in the symbol exceeds the error correction capacity.

F 1294, F05

error of result, *n*—the test result minus the accepted reference value (of the characteristic).

NOTE—It is not possible to correct for random error.

E 456, E11

error of the first kind, α , *n*—*in a statistical test*, the rejection of a statistical hypothesis when it is true.

D 123, D13

error of the second kind, β , *n*—*in a statistical test*, the acceptance of a statistical hypothesis when it is false.

D 123, D13

error, random—the chance variation encountered in all experimental work despite the closest possible control of variables. It is characterized by the random occurrence of both positive and negative deviations from the mean value for the method, the algebraic average of which will approach zero in a long series of measurements.

E 1547, E15

error rate—the ratio of the number of character substitutions to the total number of characters read.

F 149, F05

ERT—energy recovery turbine.

D 6161, D19

- ESC**, *n*—abbreviation for **escape**; a keyboard control character whose function varies with the software or type of terminal. **F 1457**, F05
- ESCA**—acronym for “electron spectroscopy for chemical analysis,” a term historically used to describe a technique whereby one generates electron spectra by irradiating a specimen with narrow band characteristic X-rays. **E 673**, E42
- escape or pair production peak**—a peak in a gamma ray spectrum resulting from the pair production process within the detector, annihilation of the positron produced, and escape from the detector of one or more of the annihilation photons (see **pair production and annihilation radiation**).
single escape peak—the gamma ray spectrum peak corresponding to escape of one of the annihilation photons from the active volume of the detector. The energy of the single escape peak is equal to the original gamma ray energy minus 511 keV.
double escape peak—the gamma ray spectrum peak corresponding to escape of both of the annihilation photons from the active volume of the detector. The energy of the double escape peak is equal to the original gamma ray energy minus 1.022 MeV. **E 170**, E10
- Escherichia colia**—see **E. coli**. **D 6161**, D19
- Esc key**, *n*—the keyboard key which is used to generate the ESC. **F 1457**, F05
- escutcheon**, *n*—a protective or ornamental cover located at the termination of a post, picket, or rail against a tread, floor, or wall. (Syn. *collar, cover flange, cover plate, or cover ring*.) **E 631**, E06
- escutcheon*—See **railing systems**. **E 631**, E06
- escutcheon**, *n*—a protective or ornamental cover located at the termination of a post, baluster, or rail against a tread, floor, or wall. (Syn. *collar, cover flange, cover plate, or cover ring*.) **E 1481**, E06
- escutcheon pin**—small, regular-stock-steel or nonferrous, $\frac{1}{4}$ by 0.035 to 2 by 0.092-in. nails with oval head and medium diamond point. **F 547**, F16
- ESS**—abbreviation for **electronic scanning system**. **F 1457**, F05
- essentially flat surface**, *n*—surface where the irregularity from a plane does not exceed ± 1 mm. **E 176**, E05
- ester-based insulating fluid**—an insulating fluid that may be either synthetic or natural-based. Synthetic ester fluids are produced by the reaction of an organic acid with an alcohol, usually a diol, triol, or tetraol. Natural ester fluids are derived from an animal or agricultural (vegetable or seed) source. They are generically referred to as triglycerides, being a combination of glycerol and various organic acids of varying molecular weights. **D 2864**, D27
- ester gum*—under **resin, synthetic**, see *ester gum*. **D 16**, D01
- ester gum**, *n*—a resin made from rosin and a polyhydric alcohol, generally glycerol or pentaerythritol. **D 804**, D01
- esterified seed oil**—a modified seed oil wherein the fatty acids are esterified with an alcohol (such as: methyl or ethyl). **E 1519**, E35
- estimate**—*in statistical analysis*, the particular value or values of a parameter computed by an estimation procedure for a given sample. **E 1823**, E08
- estimated crack extension, Δa [L]**—an increase in estimated crack size ($\Delta a = a - a_{og}$). **E 1823**, E08
- estimated crack size a [L]**—the distance from a reference plane to the observed crack front developed from measurements of elastic compliance or other methods. The reference plane depends on the specimen form, and it is normally taken to be either the boundary, or a plane containing either the force line or the centerline of a specimen or plate. The reference plane is defined prior to specimen deformation. **E 1823**, E08
- estimated texture depth, (ETD)**, *n*—the estimate of mean texture depth (MTD), by means of a linear transformation of mean profile depth (MPD). **E 867**, E17
- estimation**—*in statistical analysis*, a procedure for making a statistical inference about the numerical values of one or more unknown population parameters from the observed values in a sample. **E 1823**, E08
- ESWTR**—enhanced surface water treatment rule. **D 6161**, D19
- etch**, *n*—a roughened surface produced by a chemical or electrochemical means. **B 374**, B08
- etch**, *v*—to dissolve unevenly a part of the surface of a metal. **B 374**, B08
- etch**—to attack the surface of glass with hydrofluoric acid or other agent, generally for marking or decoration. **C 162**, C14
- etch**—to attack the surface of glass with hydrofluoric acid or other agent, generally for marking or decoration. **E 344**, E20
- etched**—(1) treated by etching.
 (2) weathered so that surface is roughened. **C 162**, C14
- etched**—an altered surface texture resulting from chemical attack. **C 286**, B08
- etched**—cleaned of grease and oil, with slightly dulled, microscopically roughened surface, usually by a chemical process. **F 547**, F16
- etch figures**—markings formed on a crystal surface by etching or chemical solution and usually related geometrically to the crystal structure. **E 7**, E04
- etching**—controlled preferential attack on a metal surface for the purpose of revealing structural details. **E 7**, E04
- etching**—the removal of surface material by chemical or electrochemical methods. **E 1316**, E07
- ethanol**, *n*—ethyl alcohol, the chemical compound C_2H_5OH . **D 4175**, D02
- ethanol**—ethyl alcohol, the chemical compound C_2H_5OH , a two carbon alcohol. **E 1705**, E48
- ethanol (ethyl alcohol, grain alcohol)**— CH_3CH_2OH ; can be produced chemically from ethylene or biologically from the fermentation of various sugars from carbohydrates found in agricultural crops and cellulosic residues from crops or wood. **E 1705**, E48
- ethylbenzene (C_8H_{10})**—mol weight 106.16; clear, colorless, flammable liquid; freezing point, $-94.97^\circ C$; boiling point, $136^\circ C$. **D 4790**, D16
- ethylcellulose**—any of several ethyl ethers of cellulose. The one most generally used in industry has sufficient substitution to be soluble in organic solvents. **D 1695**, D01
- ethylene plastic**—a plastic based on polymers of ethylene or copolymers of ethylene with other monomers, the ethylene being in greatest amount by mass. **F 1251**, F04
- ethylene plastics**, *n*—plastics based on polymers of ethylene or copolymers of ethylene with other monomers, the ethylene being in greatest amount by mass. (ISO) **D 883**, D20
- ethylene plastics**, *n*—plastics based on polymers of ethylene or copolymers of ethylene with other monomers, the ethylene being in greatest amount by mass. (ISO, D20) **F 412**, F17
- ethylene product**, *n*—hydrocarbon product containing at least 99.85 mass % ethylene. **D 4175**, D02
- ethylene-vinyl acetate (EVA)**—copolymers from these two monomers form a class of plastic materials. **F 869**, F08
- ettringite**, *n*—a high-calcium sulfoaluminate mineral ($Ca_6Al_2(SO_4)_3(OH)_{12} \cdot 26H_2O$). **E 2201**, E50
- ETX**—abbreviation for **end of text**. **F 1457**, F05
- ETX/ACK**, *n*—a standard for “ready/not-ready” status communication between the host and a printer. **F 1457**, F05
- eutectic**:
deformation eutectic—the composition within a system of two or more components that, on heating under specified conditions, develops sufficient liquid to cause deformation at the minimum temperature.
equilibrium eutectic—the composition within any system of two or more crystalline phases that melts completely at the minimum temperature, or the temperature at which such a composition melts. **C 242**, C21
- eutectic**—mixture of two or more substances which solidifies as a whole when cooled from the liquid state, without change in composition. **E 1142**, E37

eutectic alloy

eutectic alloy—the alloy which has the composition of the eutectic point. E 7, E04

eutectic arrest—in a cooling curve (or heating curve) an approximately isothermal segment, corresponding to the time interval during which the heat of transformation from the liquid phase to two or more conjugate solid phases is being evolved, (or conversely). E 7, E04

eutectic carbides—in hypereutectic tool steels, the skeleton-like structure of the eutectic carbide. E 7, E04

eutectic colony, grain—a two-phase region which solidified progressively from a simple center and, therefore, has some uniformity of structural relationship. E 7, E04

eutectic equilibrium—a reversible univariant transformation in which a liquid, that is stable only at superior temperature, decomposes into two or more conjugate solid phases; for example, $L = \alpha + \beta$, $L = \alpha + \beta + \gamma$, etc. E 7, E04

eutectic point—the composition of a liquid phase that is in univariant equilibrium with two or more solid phases; the lowest melting alloy of a composition series. E 7, E04

eutectic point—see **eutectic**. E 1142, E37

eutectic structure—the structure resulting when an alloy has passed through a eutectic equilibrium upon freezing. E 7, E04

eutectic temperature—the temperature below which all liquid portions of an aqueous suspension have entered the solid phase. E 1705, E48

eutectoid equilibrium—a reversible univariant transformation in which one solid phase, that is stable only at superior temperature, decomposes into two or more conjugate solid phases; for example, $\alpha = \beta + \gamma$, $\alpha = \beta + \gamma + \delta$, etc. E 7, E04

eutectoid point—the composition of a solid phase which, upon cooling, undergoes univariant transformation into two, or more, other solid phases. E 7, E04

eutectoid reaction—See **eutectoid equilibrium**. E 7, E04

eutectoid structure—the microstructure resulting when an alloy has passed through an eutectoid equilibrium upon cooling. E 7, E04

evacuated tube collector—see **collector, evacuated tube**. E 772, E44

evacuation, n—the process used to move the patient/subject between the completion of extraction and the beginning of transportation. F 1490, F32

evaluate, v (évaluer(installations))—(a facility) to assess the capability of a facility to perform the function(s) for which it is designed, used, or required to be used. E 631, E06

evaluate, v (évaluer(installations))—(a facility) to assess the capability of a facility to perform the function(s) for which it is designed, used, or required to be used. E 1480, E06

evaluation—See **facility evaluation**. E 631, E06

evaluation—determination of whether a relevant indication is cause to accept or to reject a material or component. E 1316, E07

evaluation—See **facility evaluation**. E 1480, E06

evaluation, n—for lead hazards, a general term to include risk (hazard) assessment, visual assessment, clearance examination, paint inspection and the results of testing for lead. E 1605, E06

evaluation, n—the third part of a performance statement, consisting of the method(s) of assessing conformance of the element being addressed to the criteria. E 2151, E06

evaluation device, n—equipment designed to measure composition or quality constituents used to determine the value of live animals, carcasses, and individual cuts of meat. F 2463, F10

evaluation period, n—the period of time an item is used before being evaluated on the specific performance properties. D 123, D13

evaluation system, n—device or group of devices used to measure and record composition or quality constituents used to determine the value of live animals, carcasses, and individual cuts of meat. F 2463, F10

evaluation threshold—a threshold value used for analysis of the examination data. Data may be recorded with a *system examination threshold* lower than the *evaluation threshold*. For analysis

purposes, dependence of measured data on the *system examination threshold* must be taken into consideration. E 1316, E07

evaluator, n—a part of, or an attachment to, an unevenness testing instrument, which automatically gives an estimate of R_u . D 123, D13

evaluator, n—a part of, or an attachment to, an unevenness testing instrument, which automatically gives an estimate of R_u . D 4849, D13

evanescent wave—the standing wave that exists in the less refractive medium, normal to the reflecting surface of the IRE during internal reflection. E 131, E13

evaporation—process where a liquid (water) passes from a liquid to a gaseous state. D 6161, D19

evaporation—the vaporization of a material by heating it, usually in a vacuum. In electron microscopy this process is used for shadowing or to produce thin support films by condensation of the vapors of metals or salts. E 7, E04

evaporation reduction agent—a material that reduces the evaporation rate of a spray mix during or after application, or both. E 1519, E35

evaporation residue—the nonvolatile impurities remaining after vaporizing a substance. D 4790, D16

even flow atomizer—see **even spray atomizer**. E 1620, E29

even spray atomizer—a fan spray atomizer that produces a relatively uniform band of liquid, usually by means of injection, through an elliptical orifice. (This definition applies to devices utilized in the agricultural industry.) E 1620, E29

event, acoustic emission (emission event)—a local material change giving rise to acoustic emission. E 1316, E07

event count (Ne)—see **count, event**. E 1316, E07

event count rate (Ne)—see **rate, event count**. E 1316, E07

event sampling—See **sampling**. D 1356, D22

eversion—a turning outward, eversion of the foot; turning the sole away from the mid-line of the body. F 869, F08

evidentiary PDD examination, n—test procedures that are designed to meet minimum standards for admissibility in court or administrative hearings. Among the necessary components are: electronic recording of the session, use of a PDD technique for which the preponderance of the published peer-reviewed research shows an average accuracy of 90% or better; individually validated scoring rules, and; optimized decision rules. Use of a movement sensor is also recommended. E 2035, E52

evolutionary operation (EVOP), n—a sequential form of experimentation conducted in production facilities during regular production. E 456, E11

evolutionary operation (EVOP), n—a sequential form of experimentation conducted in production facilities during regular production.

NOTE—The principal theses of EVOP are that knowledge to improve the process should be obtained along with a product, and that designed experiments using relatively small shifts in factor levels (within production tolerances) can yield this knowledge at minimum cost. The range of variation of the factors for any one EVOP experiment is usually quite small in order to avoid making out-of-tolerance products, which may require considerable replication, in order to be able to clearly detect the effect of small changes. E 1325, E11

evolved gas analysis (EGA), n—a technique in which the nature and amount, or both, of gas or vapor evolved by a substance is subjected to a controlled-temperature program. (ICTAC)

NOTE—Some specific forms of EGA have become established for investigating different aspects of catalysis, such as reduction, oxidation or desorption. In this context, EGA in a hydrogen atmosphere is known as temperature-programmed reduction (TPR); EGA in an oxygen atmosphere is temperature-programmed oxidation (TPO); and EGA in the absence of decomposition, in an inert atmosphere or vacuum, is temperature-programmed desorption (TPD). For each technique the

method used for gas identification and quantification should always be clearly stated. E 473, E37

evolved gas detection, (EGD), *n*—see **evolved gas analysis**.

E 473, E37

EVT application range, *n*—the bitumen application temperature range. The range is from 25°F below the EVT to 25°F above the EVT (50°F span). The temperature is measured in the mop cart or mechanical spreader just prior to the application of bitumen to the substrate. D 1079, D08

Ewald sphere—a geometric construction, of radius equal to the reciprocal of the wavelength of the incident radiation, with its surface at the origin of the reciprocal lattice. Any crystal plane will reflect if the corresponding reciprocal lattice point lies on the surface of this sphere. E 7, E04

examination, *n*—analysis of (1) the materials, structure, embellishments, and condition of a cultural object, and (2) the impact of these factors along with documentary characteristics on the treatment, display, and storage of the object. D 123, D13

examination—an element of investigation, without the use of special laboratory appliances or procedures, of supplies and services to determine conformance to those specified requirements which can be determined by such investigations. Examination is generally nondestructive and includes, but is not limited to visual, auditory, olfactory, tactile, gustatory, and other investigations, simple physical manipulation, gaging, and measurement. D 1517, D31

examination, *n*—the investigation of the structure, materials, and condition of cultural property including the identification of the extent and causes of alteration and deterioration. D 5038, D13

examination, *n*—a procedure for determining a property (or properties) or other conditions or characteristics of a material or component by direct or indirect means.

NOTE—Examples include utilization of X-rays or ultrasonic waves for the purpose of determining (directly or by calculation) flaw content, density, or (for ultrasound) modulus; or detection of flaws by induction of eddy currents, observing thermal behavior, AE response, or utilization of magnetic particles or liquid penetrants. E 1316, E07

examination area—that portion of a structure being monitored with acoustic emission. E 1316, E07

examination medium—a powder or suspension of magnetic particles that is applied to a magnetized test surface to determine the presence or absence of surface or slightly subsurface discontinuities. E 1316, E07

examination region—that portion of the test article evaluated using acoustic emission technology. E 1316, E07

exceedances spectrum—*in fatigue loading*, representation of spectrum loading contents by the number of times specified values of a particular loading parameter (peak, range, and so forth) are equaled or exceeded (also known as *cumulative occurrences* or *cumulative frequencyspectrum*). E 1823, E08

excess capacity—machinery and equipment kept on standby.

E 2135, E53

excess electrostatic charge, *n*—the algebraic sum of all positive and negative electric charges on the surface of, or in, a specific volume.

D 1711, D09

excess hydrostatic pressure—see **hydrostatic pressure**. D 653, D18

excess ice—the ice in the ground that exceeds the total volume of the pores that the ground would have under natural unfrozen conditions. D 7099, D18

excessive corrosion—corrosion that is not removed by cleaning as described in Practice E 864. E 631, E06

excessive corrosion—corrosion that is not removed by cleaning as described in Practice E 864. E 1749, E06

excess moisture—synonym for *surface moisture*. D 121, D05

excess property—property no longer required. E 2135, E53

exchange capacity—the capacity to exchange ions as measured by the quantity of exchangeable ions in a soil or rock. D 653, D18

exchange capacity—see **ion-exchange capacity**. D 1695, D01

exchange current density—the rate of charge transfer per unit area

when an electrode reaches dynamic equilibrium (at its reversible potential) in a solution; that is, the rate of anodic charge transfer (oxidation) balances the rate of cathodic charge transfer (reduction). G 15, G01

excitation, *n*—the electrical current passing through the element.

E 344, E20

excitation depth distribution function—the probability that specified excitations are created at specified depths measured normally from a surface into the material by a beam of specified particles or radiation incident on the surface in a given direction. E 673, E42

excitation potential—the applied potential on an X-ray tube required to produce characteristic radiation from the target. E 7, E04

excitation potential (X-ray), *n*—the potential required to produce characteristic radiation from an element. E 135, E01

excitation purity, P_e , *n*—the ratio of the lengths of line segments NC to ND, obtained when a straight line is drawn on the CIE chromaticity diagram from the achromatic (neutral) point (N), through the point (C) representing the color stimulus considered, to the intersection (D) with the spectrum locus or the straight boundary of nonspectral colors, as the case may be. E 284, E12

excitation (stimulus)—an external force (or other input) applied to a system that causes the system to respond in some way. D 653, D18

exciting current, *ac*, *I*—See **current, *ac* exciting**. A 340, A06

exciting power, rms, P_z —the product of the ac rms exciting current and the rms voltage induced in the exciting (primary) winding on a magnetic core.

NOTE—This is the apparent volt-amperes required for the excitation of the magnetic core only. When the core has a secondary winding, the induced primary voltage is obtained from the measured open-circuit secondary voltage multiplied by the appropriate turns ratio.

A 340, A06

exciting power, specific, $P_{z(B:f)}$ —the value of the ac rms exciting power divided by the active mass of the specimen (volt-amperes/unit mass) taken at a specified maximum value of cyclically varying induction *B* and at a specified frequency *f*. A 340, A06

exciting voltage, *E*—the ac rms voltage across a winding linking the flux of a magnetic core. The voltage across the winding equals that across the assumed parallel combination of core inductance *L*₁, and core resistance, *R*₁. A 340, A06

exclusion booming—placement of a boom to protect an area from the entry of a floating substance. F 818, F20

exemplar, *n*—a specimen of physical evidence of known origin (source: Osterburg and Ward, *CriminalInvestigation*, 1992, p. 837). E 1732, E30

exfiltration—the volume of pipeline flow leaving a sewer and its connections into the soil from pipe, joints, connections, and appurtenances. C 822, C13

exfiltration—the quality of water leaving the test section during a specified time period. C 896, C04

exfiltration, pipe—the passage of fluid from a pipe section through small holes or leaks. F 412, F17

exfoliation—corrosion that proceeds laterally from the sites of initiation along planes parallel to the surface, generally at grain boundaries, forming corrosion products that force metal away from the body of the material, giving rise to a layered appearance. G 15, G01

exhaust hood—a device that captures hot air, odors, and vapors produced in the cooking process and directs them to an exhaust fan. F 1827, F26

exhaust pressure—in leak testing, same as **forepressure**. E 1316, E07

exhaust tubulation—Same as **pump-out tubulation**. E 1316, E07

xinite—See **xinite** under **maceral**. D 121, D05

exitance, *M*, *n*—flux leaving a surface per unit area. E 284, E12

exitance, radiant—see **radiant exitance**. E 772, E44

exit orifice, *n*—the final passage found in the insert that the liquid flows through before exiting the dispensing system where the size of the orifice diameter can determine the size of the spray particles and spray pattern. D 6655, D10

exogenous inclusion

exogenous inclusion—a nonmetallic constituent produced by entrapment of foreign material in the melt. (See **inclusions**.) E 7, E04

exotherm—the temperature rise resulting from the liberation of heat by any process of chemical reaction. E 631, E06

exotherm—the temperature rise resulting from the liberation of heat by any process of chemical reaction. E 1749, E06

exothermic—pertaining to a reaction that occurs with the evolution of heat. D 653, D18

exothermic atmosphere (gas), n—a reducing gas atmosphere used in sintering, produced by partial or complete combustion of hydrocarbon fuel gas and air with the associated generation of heat. The maximum combustible content is approximately 25 atomic percent. B 243, B09

exothermic reaction, n—a chemical reaction in which heat is evolved. C 1145, C28

exotic species, n—an introduced species not native or indigenous to the area where it is found. E 2114, E06

expandable plastic, n—a plastic in a form capable of being made cellular by thermal, chemical, or mechanical means. D 883, D20

expandable plastic, n—a plastic in a form capable of being made cellular by thermal, chemical, or mechanical means. (D20) F 412, F17

expanded bed—a bed of granular particles through which a fluid flows upward at a rate sufficient to slightly elevate and separate the particles without changing their relative positions. D 2652, D28

expanded blast-furnace slag, n—the lightweight cellular material obtained by controlled processing of molten blast-furnace slag with water or water and other agents, such as steam or compressed air or both. C 125, C09

expanded metal—See **screen**. E 631, E06

expanded metal—See **screen**. E 1481, E06

expanded plastics—See **cellular plastic**. D 883, D20

expanded plastics—See **cellular plastics**. F 412, F17

expanded rubber, n—*in building construction*, an elastomeric closed-cell material made by incorporating a gas-producing ingredient into a rubber compound that decomposes during vulcanization, producing gas bubbles that expand the compound; the bubbles are predominately non-interconnecting. C 717, C24

expanded rubber (sponge), n—cellular rubber having closed cells, made from solid rubber compound. D 1566, D11

expanded vinyl wall covering, n—a wall covering consisting of a woven textile backing, an expanded vinyl base coat layer (which is a homogeneous vinyl layer that contains a blowing agent), and a nonexpanded vinyl skin coat. E 176, E05

expansion anchor—post-installed anchor that derives its capacity predominately from frictional forces generated by mechanical expansion of the anchor against sides of hole. E 2265, E06

expansion anchor, n—a component that forms a connection to bony element by means of a mechanism which enlarges once the component is inserted into the bony elements. F 1582, F04

expansion chamber, n—an enlargement at the top of the capillary to provide protection against breakage caused by excessive gas pressure. E 344, E20

expansion curve, thermal—the curve produced by plotting a dimension or the volume of a substance versus the temperature. E 7, E04

expansion joint, n—see **control (expansion-contraction) joint**. C 11, C11

expansion joint, n—*in building construction*, a formed or assembled joint at a predetermined location, which prevent the transfer of forces across the joint as a result of movement or dimensional change of different elements of a structure or building. C 717, C24

expansion joint—a structural separation between two building elements that allows free movement between the elements without damage to the roofing or waterproofing system. D 1079, D08

expansion joint—See **joints**. E 631, E06

expansion joint—a discontinuity between two constructed elements, or **components**, allowing for differential movement (such as expansion) between them without damage. E 631, E06

expansion joint, n—a structural separation between building elements that allow independent movement without damage to the assembly. E 2110, E06

expansion joint seal, n—*in building construction*, a seal or sealant system that provides an elastic, compressible, or flexible barrier to the passage of gases, liquids, or solids. C 717, C24

expansion sleeve—outer part of expansion anchor, which is forced outward by its center part as a result of applied torque or impact, to bear against the sides of the predrilled hole. E 2265, E06

expansive cement—a cement that tends to increase in volume after it is mixed with water. D 653, D18

expansive hydraulic cement, n—a hydraulic cement that forms a paste when mixed with water, and increases in volume a controlled amount during the early hardening period occurring after setting. C 219, C01

expectation, error of, n—a bias due to preconceived ideas that influences an assessor's judgment. E 253, E18

expendable—property that can be consumed or become scrap as a result of intended use like drill bits and sanding wheels. E 2135, E53

expendable container—See **container**. D 996, D10

expendable pallet—See **pallet**. D 996, D10

experimental design, n—see **design of experiments**. E 456, E11

experimental design, n—see **design of experiments**. E 1325, E11

experimental error, n—variability attributable only to a test method itself. D 123, D13

experimental unit, n—a portion of the experiment space to which a treatment is applied or assigned in the experiment. E 456, E11

experimental unit, n—a portion of the experiment space to which a treatment is applied or assigned in the experiment.

NOTE—The unit may be a patient in a hospital, a group of animals, a production batch, a section of a compartmented tray, etc. E 1325, E11

experiment space, n—the materials, equipment, environmental conditions and so forth that are available for conducting an experiment. E 456, E11

experiment space, n—the materials, equipment, environmental conditions and so forth that are available for conducting an experiment. E 1325, E11

expert, n—a common term for a person with extensive experience in a product category who performs perceptual evaluations to draw conclusions about the effects of variations in raw materials, processing, storage, aging, etc. Experts often operate alone. (See also **assessor** and **expert assessor**.) E 253, E18

expert assessor, n—an assessor with a high degree of sensory acuity who has experience in the test procedure and established ability to make consistent and repeatable sensory assessments. An expert assessor functions as a member of a sensory panel. (See also **assessor** and **expert**.) E 253, E18

expired data, n—the status assigned to a set of data, summary statistics, or information that is no longer current or valid and needs to be replaced. E 867, E17

explosion—a rapid release of energy (usually by means of combustion) with a corresponding pressure buildup capable of damaging equipment and building structures. D 5681, D34

explosion suppression—the technique of detecting and extinguishing incipient explosions in the shredder enclosure and contiguous enclosed areas before pressures exceed the damage threshold. D 5681, D34

explosion venting—the provision of an opening(s) in the shredder enclosure and contiguous enclosed areas to allow gases to escape during a deflagration and thus prevent pressures from reaching the damage threshold. D 5681, D34

exponent of dynamic air permeability (EXP), n—*for inflatable restraints*, a descriptive factor used in a mathematical model integral to the apparatus software which relates the change in dynamic air permeability as the pressure differential changes. D 6799, D13

exposed surface, *n*—that surface of the specimen subjected to the incident heat. **E 176**, E05

exposed tape width, *n*—*in zippers*, the part of the tape extending beyond the shoulders of the interlocking elements to the outer tape edge. **D 123**, D13

exposed tape width, *n*—the part of the tape extending beyond the shoulders of the interlocking elements to the outer tape edge. **D 2050**, D13

exposed underlayer—the underlying layer of mat or roving not covered by surface mat in a pultrusion.

NOTE—This condition can be caused by reinforcement shifting, too narrow surface mat, too wide underlying mat, uneven slitting of surface mat, or necking down of surface mat or excessive tension in pulling it off the spindle. **D 3918**, D20

exposure—(1) the transverse dimension of a roofing element not overlapped by an adjacent element in any roofing system. The exposure of any ply in a membrane may be computed by dividing the felt width minus 51 mm (2 in.), by the number of shingled plies; thus, the exposure of a 914-mm (36-in.) wide felt in a shingled, four-ply membrane should be 216 mm (8½ in.);

(2) the time during which a portion of a roofing element is exposed to the weather. **D 1079**, D08

exposure, *n*—contact with a chemical, biological, physical or other agent over a specified time period. **D 1356**, D22

exposure:—(1) The act of submitting material to radiation to which it is sensitive.

(2) the quantitative measure of exposure as a function of intensity and time of the radiation (often the product of $I \times t$) falling on a sensitive material.

(3) *X-ray*—the product of X-ray intensity and time. **E 7**, E04

exposure—contact with a chemical or physical agent. **E 943**, E47

exposure—the product of irradiance and time required to produce a suitable pattern on the recording medium. **E 1316**, E07

exposure, *n*—contact with a physical, chemical, biological, or radiological agent. **E 2114**, E06

exposure, *n*—the act of subjecting the test specimen to the test conditions. **G 113**, G03

exposure angle, *n*—the tilt from horizontal of the test specimen or any other exposed material, or both. **G 113**, G03

exposure duration, *n*—*in erosion or wear*, exposure time, or any other appropriate measure of the accumulation of exposure to an erosion or wear environment. **G 40**, G02

exposure index—the rating of a film for use in connection with exposure tables, exposure computers, and exposure meters. (See also **sensitivity**.) **E 7**, E04

exposure latitude—range of light or time settings over which an acceptable copy can be produced. **F 335**, F05

exposure racks, at-latitude—in solar energy applications, racks that hold specimens at an inclination angle equal to the latitude of the rack location, facing south. **E 772**, E44

exposure, radiographic exposure—the subjection of a recording medium to radiation for the purpose of producing a latent image. Radiographic exposure is commonly expressed in terms of milliamperes-seconds or millicurie-hours for a known source-to-film distance. **E 1316**, E07

exposure rate, *X*—the quotient of dX by dt , where dX is the increment of exposure in the time interval, dt (ICRU).

$$X = dX/dt$$

Unit: $C \cdot kg^{-1} s^{-1}$ **E 170**, E10

exposure scale—in a photographic process, the range of exposure over which substantially correct reproduction is obtained. This is measured by the ratio of the exposure corresponding to the minimum useful gradient at the high exposure end of the scale to that corresponding to the minimum useful gradient at the low exposure end. **E 7**, E04

exposure table—a summary of values of radiographic exposures suitable for the different thicknesses of a specified material.

E 1316, E07

exposure, *X*—the quotient of dQ by dm , where the value of dQ is the absolute value of the total charge of the ions of one sign produced in air when all the electrons (negatrons and positrons) liberated by photons in air of mass dm are completely stopped in air (ICRU).

$$X = dQ/dm$$

Unit: $C \cdot kg^{-1}$

E 170, E10

ex situ—a term used to describe work performed after removal to another location or away from a facility. **E 1605**, E06

ex situ treatment, *n*—treatment, remediation, or cleanup of contaminated material in a treatment facility at a different location from the contaminated site. **E 833**, E06

extended binary code decimal interchange code, *n*—an eight-bit code set used on communications lines with IBM or IBM-compatible terminals and computers. (See **EBCDIC**.) **F 1457**, F05

extended life coolant, *n*—an engine coolant for light-duty service vehicles with recommended change-out of the coolant after 160 000 km (100 000 miles), 5 years, or 4000 operating hours. **D 4725**, D15

extended life mortars—mortar consisting of cementitious materials, aggregate, water, and set-control admixtures which are measured and mixed at a central location using weight-or-volume-control equipment. This mortar as delivered to a construction site shall be usable for a period in excess of 2½ h. **C 1180**, C12

extended pigments, *n*—organic pigments diluted with an extender (for example, alumina trihydrate, blanc fixe, or calcium carbonate). **D 16**, D01

extended source—a source of infrared radiation whose image completely fills the field of view of a detector.

NOTE—The irradiance is independent of the distance from the source to the region of observation. In practice, sources that are not extended sources are considered to be point sources; see **point source**.

E 1316, E07

extender—an additive whose primary purpose is to increase total grout volume. **D 653**, D18

extender, *n*—substance added to an adhesive to reduce the amount of the primary binder required per unit area. **D 907**, D14

extender, *n*—an organic material used to augment the polymer in a compound. **D 1566**, D11

extender—a material that increases the effective life of an agricultural after application. **E 1519**, E35

extensibility, *n*—that property by virtue of which a material can undergo extension or elongation following the application of sufficient force. (See also **elongation**.) **D 123**, D13

extensibility, *n*—that property by virtue of which a material can undergo extension or elongation following the application of sufficient force. **D 4848**, D13

extension, *n*—the change in length of a material due to stretching. (Compare **elongation**.) **D 123**, D13

extension—linear strain associated with an increase in length. (ISRM) **D 653**, D18

extension, *n*—the change in length of a material due to stretching. (Compare **elongation**.) **D 4848**, D13

extension—movement by which the angle at the joint is increased in the sagittal plane; the opposite of flexion. **F 869**, F08

extensional definition, *n*—a definition of a term formed by listing all of the entities that comprise the concept. **E 1992**, E02

extension force, *n*—the force required to stretch a material to a given length. **D 123**, D13

extension lead wires—wires leading from a thermocouple to the voltage-measuring instrument. These wires should have the same temperature-emf relationship as the thermocouple wires. **E 7**, E04

extension-recovery chart, *n*—in *elastic materials testing*, a continuously plotted graph of tension versus extension resulting from an extension-recovery cycle. (Compare **tension-recovery chart**. See also **extension-recovery cycle** and **tension-recovery cycle**.)

D 123, D13

extension-recovery cycle, *n*—in *tension testing*, the continuous extension of a specimen, with a momentary hold at a specified extension, followed by a controlled rate of return to zero extension. (Compare **tension-recovery cycle**. See also **extension-recovery chart** and **tension-recovery chart**.)

D 123, D13

extension-recovery cycle, *n*—in *tension testing*, the continuous extension of a specimen, with a momentary hold at a specified extension, followed by a controlled rate of return to zero extension.

D 4848, D13

extension wires, *n*—those having temperature-emf characteristics that when connected to a thermocouple effectively transfer the reference junction to the other end of the wires. (Compare **compensating wires**.)

E 344, E20

extension wires, *n*—wires of either Seebeck matching or of compensating extension wire type used to extend the effective length of the thermoelements. Compensating extension wires match the Seebeck coefficient only over a limited temperature range.

E 344, E20

extensometer, *n*—a device for determining elongation of a specimen as it is strained.

D 1566, D11

extensometer, *n*—a device for sensing strain.

E 6, E28

extensometer—device for sensing the elongation of fastener material while it is subjected to tensile stress, for the purpose of measuring linear deformation under controlled test conditions.

F 1789, F16

extensometer system, *n*—a system for sensing and indicating strain.

*Type 1 extensometer system, *n**—an extensometer system that both defines gage length and senses extension; for example, a clip-on strain gage type with conditioning electronics.

*Type 2 extensometer system, *n**—an extensometer system that senses extension of a gage length that is defined by specimen features such as ridges, notches, or overall height (in case of a compression test piece).

*Type 3 extensometer system, *n**—an extensometer system that intrinsically senses strain (ratiometric principle); for example, video camera system.

E 6, E28

exterior air-distribution envelope—the boundary or barrier separating the interior volume of the air distribution system from the outside environment or unconditioned spaces.

E 631, E06

exterior insulation and finish system (EIFS), *n*—non-load-bearing outdoor wall finish system consisting of a thermal insulation board, an attachment system, a reinforced base coat, exterior joint sealant, and a compatible finish.

E 631, E06

exterior insulation and finish system (EIFS), *n*—nonload bearing, exterior wall cladding system that consists of an insulation board attached either adhesively or mechanically, or both, to the substrate; an integrally reinforced base coat; and a textured protective finish coat.

E 2110, E06

exterior pack—See **pack**.

D 996, D10

exterior type plywood—a term applied to plywood that is capable of withstanding prolonged exposure to severe service conditions including prolonged and repeated wetting without failure in the glue bonds; the commercial classification is a function of veneer grade as well as glue durability.

D 1038, D07

exterior work area—outdoor porch, stairway, or other element of trim or walls on the exterior of a building.

E 631, E06

external circuit—the wires, connectors, measuring devices, current sources, and so forth, that are used to bring about or measure the desired electrical conditions within the test cell.

G 15, G01

external flotation (aka outboard flotation)—flotation element located external to the boom membrane.

F 818, F20

external force—a force that acts across external surface elements of a material body. (ISRM)

D 653, D18

external load-crushing strength test—a test of the pipe in which

external crushing forces are exerted in specified directions and locations on a specified length of pipe.

C 822, C13

external mixing pneumatic atomizer—a pneumatic atomizer in which pressurized gas is directed on a liquid film or jet outside the nozzle, so as to form a spray.

E 1620, E29

external ROM receptacle, *n*—a printed wiring board that accepts read only memory cartridges containing fonts or emulations. (See **ERR**.)

F 1457, F05

external sealing bands—flexible wrappings that are applied to the outside of a concrete pipe, box section, or manhole section joint intended to control the movement of fluids or solids through the joint.

C 822, C13

external tension—external tension member separated from the boom membrane by bridles.

F 818, F20

extinction—a decrease in the intensity of the diffracted beam caused by perfection or near perfection of crystal structure. (See also **primary extinction** and **secondary extinction**.)

E 7, E04

extinction coefficient—the ratio of the diffracted beam intensity when extinction is present to the diffracted beam intensity when extinction is absent. It is applicable to either **primary** or **secondary extinction**.

E 7, E04

extra-atomic relaxation energy—XPS, see **screening energy**.

E 673, E42

extracellular matrix, *n*—“(ECM), any material produced by cells and excreted to the extracellular space within the tissues. It takes the form of both ground substance and fibers and is composed chiefly of fibrous elements, proteins involved in cell adhesion, and glycosaminoglycans and other space-filling molecules. It serves as a scaffolding holding tissues together and its form and composition help determine tissue characteristics.” Extracellular matrix, a biological material or tissue derivative, may be used as a component of a TEMP.

F 2312, F04

extract—a liquid, powder, or solid concentrate of vegetable tannin obtained by extracting tannins from natural sources.

D 1517, D31

extractable matter, *n*—nonfibrous material in or on a textile, not including water, which is removable by a specified solvent or solvents, as directed in a specified procedure.

D 123, D13

extractable matter, *n*—nonfibrous material in or on a textile, not including water, which is removable by a specified solvent or solvents as directed in a specified procedure.

D 4845, D13

extractable matter, *n*—nonfibrous material in or on a textile not including water that is removable by a specified solvent or solvents, as directed in a specified procedure.

D 5684, D13

extraction—a general term concerning chemical methods of isolating phases from the metal matrix.

(1) *acid extraction*—removal of phases by dissolution of the matrix metal in an acid.

(2) *chlorine extraction*—removal by formation of a volatile chloride.

(3) *electrolytic extraction*—removal by using an electrolytic cell containing an electrolyte which preferentially dissolves the metal matrix.

E 7, E04

extraction—the dissolution of target analytes from a solid matrix into a liquid form. During sample digestion, target analytes are extracted (solubilized) into an acid solution.

E 631, E06

extraction, *n*—the dissolution of target analytes from a solid matrix into a liquid form.

E 1605, E06

extraction, *n*—the process of removing the patient/subject from an immediately hazardous environment along with assessment, treatment, stabilization, and packaging.

F 1490, F32

extraction cleaner, *n*—a portable, floor-supported cleaning system that can have the floor nozzle directly connected to the extractor or separated from the extractor housing by a hose, and is designed primarily for wet cleaning of carpet. The cleaning involves applying a solution on the carpet and its subsequent removal. The solution dispensing system may be totally self-contained or require hook up to a water supply when in use. The extractor may have some form of agitation to assist in the soil removal. The extractor

may have attachments and provisions for cleaning other surfaces. **F 395, F11**

extraction cleaning, n—a general term for a number of refurbishing methods in which the cleaning agent is delivered onto the textile product, agitated, and simultaneously removed by suction. **D 123, D13**

extraction cleaning, n—a general term for a number of refurbishing methods in which the cleaning agent is delivered onto the textile product, agitated, and simultaneously removed by suction. **D 5253, D13**

extraction cleaning, dry foam, n—See **dry foam extraction cleaning, D 5253, D13**

extraction cleaning, hot water, n—See **hot water extraction cleaning, D 5253, D13**

extraction cleaning, rotary, n—See **rotary extraction cleaning, D 5253, D13**

extraction cleaning, steam, n—a deprecated term since no steam is used. See the preferred term, **hot water extraction cleaning, D 5253, D13**

extractives—compounds occurring in plant materials but not forming part of the structural elements, that are removed with neutral solvents such as ether, alcohol, and water. **D 9, D07**

extractives—compounds occurring in plant materials, but not forming part of the structural elements, that are removed with neutral solvents such as ether, alcohol, and water. **D 1695, D01**

extrados—the exterior curved surface of an arch, as opposed to intrados, which is the interior curved surface of an arch. (ISRM) **D 653, D18**

extra-large head—usually more than 3½ times shank diameter, normally referring to head of regular-stock-steel nail. **F 547, F16**

extraneous ink—any spot appearing within the “read” area, but outside the COL, caused by smear, tracking, or splatter that can be caused either in the manufacturing or while entering data on the form and can result in less optimum readability. **F 149, F05**

extraneous moisture—synonym for *surface moisture*. **D 121, D05**

extraordinary repairs—work that extends the life of a fixed asset that is capitalized, based on the entity’s capitalization thresholds, rather than expensed. **E 2135, E53**

extrapolated onset point (temperature or time), n—the temperature or time found by extrapolating the baseline prior to the thermal event to the intersection of a tangent constructed at the inflection point on the leading edge of the thermal event. **E 473, E37**

extrapolated onset temperature, n—empirically, the temperature found by extrapolating the baseline (prior to the peak) and the leading side of the peak to their intersection. **E 1445, E27**

extra smooth sheet, n—product produced by cold rolling (skin passing) the metallic coated sheet with a small reduction in thickness to smooth the surface and impart resistance to stretcher strain. (Syn. **skin passed sheet**) **A 902, A05**

extra-steep asphalt—See **super-steep asphalt, D 1079, D08**

extreme pressure (EP) additive, n—in a lubricant, a substance that minimizes damage to metal surfaces in contact under high stress rubbing conditions. **D 4175, D02**

extreme weather conditions—environmental conditions that have occurred only once during the past 30 years. **E 1705, E48**

extrinsic fiber optic chemical sensor, n—a fiber optic chemical sensor in which modulation of the optical signal is not effected through a change in the properties of the fiber itself. **E 131, E13**

extrudability, n—in building construction, the ability of a sealant under pressure to flow through an orifice. **C 717, C24**

extrudate, n—the material that issues from an extruder. **D 1566, D11**

extrude, v—to shape a plastic body by forcing the body through a die. **C 1145, C28**

extruded, v—formed by being forced through a shaping orifice as a continuous body. **C 709, D02**

extruded, v—formed by being forced through a shaping orifice as a continuous body. **D 4175, D02**

extruded particleboard—a particleboard manufactured by forcing a mass of particles coated with an extraneous binding agent through a heated die with the applied pressure parallel to the faces and in the direction of extruding. **D 1554, D07**

extruder, n—a device, such as a pug mill, that forces plastic bodies through a die of appropriate shape and size in a continuous column. **C 1145, C28**

extruder, n—machine designed to force a rubber or rubber mix through an orifice, which is often shaped to the geometry of the desired product. **D 1566, D11**

extrusion—a uniform metal shape, long in relation to its cross-sectional dimensions, produced by forcing a suitably preheated billet or preform through an orifice (die) of the desired cross section. Extrusions generally are furnished in straight lengths. **B 846, B05**

extrusion, n—shaping of brick by pushing plastic clay or shale through a die opening that forms the peripheral dimensions of the brick. **C 43, C15**

extrusion, n—a process in which heated or unheated plastic is forced through a shaping orifice (a die) in one continuously formed shape, as in film, sheet, rod, or tubing. **D 883, D20**

extrusion, n—the continuous shaping of a material during plastic passage through a die. **D 1566, D11**

extrusion, n—a process whereby heated or unheated plastic forced through a shaping orifice becomes one continuously formed piece. (D20) **F 412, F17**

extrusion billet, n—solid or hollow form, commonly cylindrical, used as the final length of material charged into the extrusion press cylinder, and is usually a cast product, but may be a wrought product or sintered from powder compact. **B 881, B07**

extrusion coating—in flexible barrier materials, (1) a process of extrusion whereby a molten extrudate adheres to the surface of another (solid) material, forming a continuous layer upon cooling. (2) Also, the product resulting from such a process. **F 17, F02**

extrusion coating—See Terminology F 17. **F 1327, F02**

extrusion ingot, n—solid or hollow cast form, usually cylindrical, suitable for extruding. **B 881, B07**

extrusion log, n—starting stock for extrusion billet. Extrusion log is usually produced in lengths from which shorter extrusion billets are cut. **B 881, B07**

extrusion mark (score line), n—a mark formed on an extrudate during the extrusion process either by accident or intent. **D 1566, D11**

extrusion welding—a process in which heated plastic is forced through a shaping orifice (or die) and applied with pressure to suitably prepared, locally preheated plastic pieces of the same resin base, to join them. **C 904, C03**

exudation, n—the action by which all or a portion of the low melting constituent of a compact is forced to the surface during sintering. Sometimes referred to as “bleed out.” Synonymous with **sweating, B 243, B09**

exudation—the migration of a substance to the surface of a coating or lining film. **D 4538, D33**

eye—the opening in the bottom of a pot furnace through which the flame enters. **C 162, C14**

eye bolt—bolt having a head which is a closed or open ring which as a threaded shank and has a defined breaking strength, proof load, and tensile strength. **F 1789, F16**

eyebrow—used for direct mounting to ovens and some dishwashers. **F 1827, F26**

eye clearance—the distance from the back lens of an eyepiece to the proper location of the viewer’s eye, typically about 8 mm (about 20 mm for high eyepoint eyepieces which permit the use of eyeglasses). **E 7, E04**

eye lens—the lens in an eyepiece nearest to the eye. **E 7, E04**

eyepiece—the lens system used in an optical instrument for magnification of the image formed by the objective. **E 7, E04**

eyepiece micrometer—See **ocular micrometer, E 7, E04**

F

- F**—an F factor that contains a portion of the *E. coli* genome. E 1705, E48
- fabric, n**—*in textiles*, a planar structure consisting of yarns or fibers. D 123, D13
- fabric**—a fibrous material containing natural or synthetic fibers, or both, in yarn form, interlaced in various configurations (woven, knitted, or nonwovens). D 459, D12
- fabric**—*for rock or soil*, the spatial configuration of all textural and structural features as manifested by every recognizable material unit from crystal lattices to large scale features requiring field studies. D 653, D18
- fabric**—the orientation in space of the elements composing the rock substance. (ISRM) D 653, D18
- fabric, n**—a woven or nonwoven cloth of organic or inorganic filaments, threads, or yarns. D 1079, D08
- fabric**—a planar textile (Synonym: cdth)
- braided fabric, n*—a cloth constructed by a braiding process.
- knitted fabric, n*—a cloth constructed by a knitting process.
- nonwoven fabric, n*—a cloth constructed by bonding or interlocking, or both (but not interlacing) fiber by any combination of mechanical, chemical, thermal, or solvent means.
- plied yarn, n*—a yarn formed by twisting together two or more single yarns in one operation.
- woven fabric, n*—a cloth constructed by a weaving process. D 3878, D30
- fabric, n**—*in textiles*, a planar structure consisting of yarns or fibers. D 4850, D13
- fabric, n**—textiles cords used in tire manufacturing. D 5681, D34
- fabric, n**—*in textiles*, a planar structure consisting of yarns or fibers. D 6477, D13
- fabric**—the micromorphology of soil. D 7099, D18
- fabricate, v**—*in buttons*, the conversion of a blank into a complete button. D 123, D13
- fabricate, v**—*in buttons*, the conversion of a blank into a completed button. D 5497, D13
- fabricate, v**—to manufacture, form, construct, or assemble a product or component. E 631, E06
- fabricated**—assembled or built. E 2135, E53
- fabricating, n**—the manufacture of plastic products from molded parts, rods, tubes, sheeting, extrusions, or other forms by appropriate operations such as punching, cutting, drilling, and tapping including fastening plastic parts together or to other parts by mechanical devices, adhesives, heat sealing, or other means. D 883, D20
- fabricating, n**—the manufacture of plastic products from molded parts, rods, tubes, sheeting, extrusions, or other forms by appropriate operations such as punching, cutting, drilling, and tapping including fastening plastic parts together or to other parts by mechanical devices, adhesives, heat sealing, or other means. (D20) F 412, F17
- fabrication**—*when applied to dimension stone*, any of the processes involved in changing a raw stone piece to its final end use form. This includes, but is not limited to cutting, splitting, grinding, drilling, or face-finishing. C 119, C18
- fabricator, n**—*as related to corrugated metal pipe*, (1) the organization that produces the finished pipe, or (2) for structural plate pipe, the organization that processes flat sheets and other items needed for the field assembly of the finished products. A 902, A05
- fabric (chain link fence)**—a fencing material made from wire helically wound and interwoven in such a manner as to provide a continuous mesh without knots or ties except in the form of knuckling or of twisting the ends of the wires to form the selvages of the fabric. F 552, F14
- fabric dip, n**—*for tire fabrics*, a chemical composition which is applied to a textile cord or fabric to improve its adhesion to rubber compounds. D 123, D13
- fabric dip, n**—*for tire fabrics*, a chemical composition which is applied to a textile cord or fabric to improve its adhesion to rubber compounds. D 6477, D13
- fabric, n (édifice)**—*of a building*, all the elements, components, parts, and materials of a building, at any scale and of any age. E 631, E06
- fabric, n (édifice)**—*of a building*, all the elements, components, parts, and materials of a building, at any scale and of any age.
- historic fabric, n (édificehistorique)*—those portions of the building fabric that have historic significance. E 1480, E06
- fabric growth, n**—the increase in the original length of a specimen after the application of a specified force for a prescribed time and the subsequent removal of the tension D 123, D13
- fabric growth, n**—the increase in the original length of a specimen after the application of a specified force for a prescribed time and the subsequent removal of the tension. D 4850, D13
- fabric package, n**—a length of fabric in a form suitable for handling, storing, or shipping. D 123, D13
- fabric package, n**—a length of fabric in a form suitable for handling, storing, or shipping. D 4849, D13
- fabric ribbon**—an inked ribbon wherein the substrate is a woven cloth material, such as nylon, cotton, silk, etc. F 221, F05
- fabric roof-system, n**—a system of coated fabric or laminated fabric along with support cables, edge ropes, clamps, neoprene, roof drains, arch wear strips, and anchor bolts that constitutes the outside top covering of a building. D 123, D13
- fabric roof-system, n**—a system of coated fabric or laminated fabric along with support cables, edge ropes, clamps, neoprene, roof drains, arch wear strips, and anchor bolts that constitutes the outside top covering of a building. D 4850, D13
- fabric softener**—a laundry auxiliary product or laundry detergent ingredient whose primary function is to give fabrics a soft feel, smooth surface, or reduce static electricity, or a combination thereof. D 459, D12
- fabric stability, n**—*in vinyl-coated glass screening and louver cloth*, the property denoting the ability to resist slippage of yarn segments in one direction over yarn segments in the opposite direction. D 123, D13
- fabric stability, n**—*in vinyl coated glass screening and louver cloth*, the property denoting the ability to resist movement of yarn segments in one direction over yarn segments in the opposite direction. D 7018, D13
- fabric stretch, n**—the increase in length of a specimen of fabric resulting from a force applied under specified conditions. D 123, D13
- fabric stretch, n**—the increase in length of a specimen of fabric resulting from a force applied under specified conditions. D 4850, D13
- FAC**—free available chlorine. D 6161, D19
- facade paint, n**—a decorative and protective coating for exterior masonry surfaces—usually for buildings and walls. D 16, D01
- face, n**—the surface designed to be left exposed to view or to receive decoration or additional finishes. C 11, C11
- face**—to cover with a new surface. C 896, C04
- face**—the wide surface of rectangular pieces of lumber. Often the surface that determines the grade of lumber destined for remanufacture. D 9, D07
- face, n**—*in buttons*, that portion which will be exposed after attaching to the substrate. D 123, D13
- face**—See **container**. D 996, D10
- face**—the better side of a panel in any grade of plywood calling for a face and back; also either side of a panel where the grading rules draw no distinction between faces. D 1038, D07
- face, n**—*in buttons*, that portion which will be exposed after attachment to the substrate. D 5497, D13

face, *adj*—pertaining to viewing a specimen at an angle close to its surface normal. **E 284**, E12

face angle—the included dihedral angle between two opposite faces of an indenter. **E 7**, E04

face angle, *n*—the aspecular angle when a specimen is viewed close to its surface normal and illuminated near 45°, or when those angles of illumination and viewing are interchanged. **E 284**, E12

face-centered—having atoms (or groups of atoms) separated by translations of 1/2, 1/2, 0; 1/2, 0, 1/2; and 0, 1/2, 1/2 from a similar atom (or group of atoms). The number of atoms in a face-centered cell must be a multiple of four. **E 7**, E04

face color, *n*—the color of a material when viewed at its face angle. **E 284**, E12

face (crystal)—an idiomorphic plane surface on a crystal. **E 7**, E04

face dimpling, *n*—buckling of the compressive facing into the individual cells of the honeycomb core due to compressive loading or the prepreg facing sagging into the individual honeycomb cells during cocure. **C 274**, D30

face, exposed, *n*—the in situ exposed surface(s) of a manufactured masonry unit. **C 1232**, C15

face, finished, *n*—any surface(s) of a manufactured masonry unit intended by the manufacturer to be exposed to view. **C 1232**, C15

face glazing, *n*—the method of glazing in which a rabbeted glazing recess, with no removable stop, is used and a triangular bead of compound is applied to the face of the lite and extended onto the recess. **C 717**, C24

face (heading)—the advanced end of a tunnel, drift, or excavation at which work is progressing. (ISRM) **D 653**, D18

face nail—See **siding nail**. **F 547**, F16

facer, *n*—the outermost, adhered top or bottom, or both, sheet (or layer) of an insulation board that is comprised of a different material than the insulation itself. It is commonly composed of organic paper, glass mat, or a combination thereof, generally impregnated or coated, or both, with asphalt, latex, or the like; or metal foil. **D 1079**, D08

face side, *n*—*intextile materials*, the side of the material that is outward in the completed object. (Ant. **back side**.) **D 123**, D13

face side, *n*—in textile materials, the side of the material that is outermost in the completed product. (Ant. **back side**, *wrong side*. Syn. *right side*.) **D 4965**, D13

face surface bend—procedure whereby load is applied perpendicular to the weld axis of the joint, at the weld, such that the weld face is subject to tension. **C 904**, C03

face wrinkling, *n*—buckling of the compressive facing into or away from the core. This progresses the width of the panel and causes failure. **C 274**, D30

facilities capital—the net book value of tangible capital assets and of those intangible capital assets that are subject to amortization. **E 2135**, E53

facility, *n*—a physical setting used to serve a specific purpose. **E 631**, E06

facility—see **hazardous-waste facility**. **E 631**, E06

facility, *n*—a physical setting used to serve a specific purpose. **E 1605**, E06

facility durability, *n*—the capability of a **facility** to maintain serviceability for a specified time. **E 631**, E06

facility durability, *n*—(durée de facilité)—*of a facility*, the capability of a facility to maintain serviceability for at least a specified period of time. Compare **durability—of a building**. **E 1480**, E06

facility durability, *n* (durée de facilité)—*of a facility*, the capability of a facility to maintain serviceability for at least a specified period of time. Compare **durability—of a building**. **E 631**, E06

facility evaluation, *n*—comparison of the qualitative and quantitative results of observations, measurements, analyses, or other tests against criteria established for a specified purpose and to a specified precision and reliability. **E 631**, E06

facility evaluation, *n*—comparison of the qualitative and quantitative results of judgments, observations, measurements, analyses, or

other tests against performance criteria established for a specified purpose, and to a specified precision and reliability. (See also **requirement statement**.) Compare **rating process**. **E 631**, E06

facility evaluation, *n*—comparison of the qualitative and quantitative results of judgments, observations, measurements, analyses, or other tests against performance criteria established for a specified purpose, and to a specified precision and reliability. (See also **requirement statement**.) Compare **rating process**. **E 1480**, E06

facility function, *n*—the purpose or activity for which the **facility** is designed, used, or required to be used. **E 631**, E06

facility-in-service, *n* (installation en service)—facility as completed and operational; for example, an occupied **building** or a road in service. **E 631**, E06

facility-in-service, *n* (installation en service)—facility as completed and operational; for example, an occupied **building** or a road in service. **E 1480**, E06

facility management—practice of planning and managing workplaces. **E 631**, E06

facility, *n* (facilité)—a physical setting used to serve a specific purpose. **E 1480**, E06

facility operator, *n* (exploitant d'installations)—organization or agency having a contract with the owner or investor to operate a facility.

facility program, *n* (programme d'installations): **E 631**, E06

facility operator, *n* (exploitant d'installations)—organization or agency having a contract with the owner or investor to operate a facility. **E 1480**, E06

facility performance, *n*—the behavior in service of a **facility** for a specified use. **E 631**, E06

facility performance, *n* (rendement d'installations)—behavior in service of a facility for a specified use. **E 1480**, E06

facility program, *n* (programme d'installations): **design program**, *n* (programme de conception)—(*design brief*) document specifying what facilities will be provided to the **occupants**, and confirming to the owner the requirements for the facility.

functional program, *n* (programme fonctionnel)—document that specifies functional facility serviceability requirements of **occupants** and owner.

project brief, *n* (exposé projet)—document describing the required **facility serviceability** in detail sufficient for the project to proceed. **E 1480**, E06

facility project brief (statement of work)—document describing services to be provided by the design consultant (architect, engineer, or interior designer) for a **facility**, in detail sufficient for the design to proceed. **E 631**, E06

facility project brief (statement of work), *n* (exposé de projet d'installations (exposé travaux))—document describing services to be provided by the design consultant (architect, engineer, or interior designer) for a facility, in detail sufficient for the design to proceed. **E 1480**, E06

facility scattered neutrons—neutrons scattered in the facility that contribute to the film exposure. **E 1316**, E07

facility serviceability, *n* (fonctionnalité d'installations)—capability of a facility to perform the function(s) for which it is designed, used, or required to be used. **E 1480**, E06

facility serviceability, *n*—the capability of a **facility** to perform the function(s) for which it is designed, used, or required to be used. **E 631**, E06

facility serviceability profile, *n*—a graphic representation, usually as a bar chart, of the level of serviceability for each topic of serviceability. **E 631**, E06

facility serviceability profile, *n* (profil de fonctionnalité d'installations)—graphic display, usually as a bar chart, of the set of **rating scores** for aspects of the serviceability of a facility.

E 631, E06

facility serviceability profile, n (profil de fonctionnalité d'installations)

facility serviceability profile, n (profil de fonctionnalité d'installations)—graphic display, usually as a bar chart, of the set of **rating scores** for aspects of the serviceability of a facility.

E 1480, E06

facility use, n—the functions and activities that take place in a **facility**.

E 631, E06

facility use, n (utilisation d'installations)—functions and activities that take place in a facility.

E 1480, E06

facing, n—a protective or decorative (or both) surface applied as the outermost layers of an insulation system.

C 168, C16

facing, n—the outermost layer or composite component of a sandwich construction, generally thin and of high density, which resists most of the edgewise loads and flatwise bending moments: synonymous with **face**, **skin** and **facesheet**.

C 274, D30

facing—the outer layer of **revetment**.

D 653, D18

facing, n—a form of **linerboard** used as a flat member of **corrugated fiberboard** (sometimes erroneously called a **liner**).

D 996, D10

facing—the outermost layer or composite component of a sandwich construction, generally thin and of high density, that resists most of the edgewise loads and flatwise bending moments (Syn. **face**; **skin**).

E 631, E06

facing—the outermost layer or composite component of a sandwich construction, generally thin and of high density, that resists most of the edgewise loads and flatwise bending moments (Syn. **face**; **skin**).

E 1749, E06

facing brick, n—brick for general purposes where appearance properties such as color, texture, and chippage are important; see **Specification C 216** and **Specification C 652**.

C 43, C15

facing delamination, n—where the facing becomes disbonded from the core.

C 274, D30

facing leathers—a lightweight leather generally used for facing seams, and binding the edges of shoe uppers. Also applied to lightweight, smooth calf and lamb, and to skivers, of which the inner surfaces of billfolds and wallets are frequently made.

D 1517, D31

facing unit—manufactured masonry unit designed for use where one or more faces will be exposed and for which the specification includes requirements on color, finish, and other properties affecting appearance.

C 1232, C15

factor, n—*in experimenting*, a condition or circumstance that is being investigated to determine if it has an effect upon the result of testing the property of interest.

D 123, D13

factorial experiment (general), n—in general, an experiment in which all possible treatments formed from two or more factors, each being studied at two or more levels (versions) are examined so that interactions (differential effects) as well as main effects can be estimated.

E 456, E11

factorial experiment (general), n—in general, an experiment in which all possible treatments formed from two or more factors, each being studied at two or more levels (versions), are examined so that interactions (differential effects) as well as main effects can be estimated.

E 1325, E11

factory-finished boards—boards with a factory-applied surface as, for example, powder or liquid coatings or overlays. These finished boards require no further field finishing.

D 1554, D07

factory mix, n—a material that is prepared at the point of manufacture and is ready to use without the addition of other materials, except possibly water to adjust consistency.

E 2110, E06

factory-primed boards—boards with a factory-applied primer that requires subsequent finishing in the field.

D 1554, D07

factory sole leather—one of the two principal types of sole leather. It is tanned and finished to have more flexibility and compressibility than Finders' sole leather, and is more suitable for use in shoemaking machinery. (See also **Finders' soleleather**.)

D 1517, D31

factory square—10 m² (108 ft²).

D 1079, D08

facultative anaerobe, n—a microorganism capable of growing in both oxic and anoxic environments.

D 4175, D02

facultative organisms—microbes capable of adapting to either aerobic or anaerobic environments.

D 6161, D19

fade—{archaic} attack of the surface of glass causing an oily or whitish surface.

C 162, C14

fading, n—a change in color, usually to a lighter and less-saturated color.

E 284, E12

fading (slate)—a slate that has a significant color change within the first year of exposure to weather, often the result of chemical alteration of the iron minerals.

C 119, C18

fading unit (AATCC), n—a specific amount of exposure made under the conditions specified in various test methods where one Fading Unit is one-twentieth (1/20 th) of the exposure required to produce a color change equal to Step No. 4 on the Gray Scale for Color Change or 1.7 ± 0.3 CIELAB units of color difference on Blue Wool Lightfastness Standard L 4 or 20 ± 1.7 CIELAB units of color difference on the Xenon Reference Fabric or combination thereof. (AATCC Technical Manual

G 113, G03

)
Fahrenheit, adj—pertaining to or denoting something related to the expression of temperature in degrees Fahrenheit.

E 344, E20

Fahrenheit—designation of a degree on the Fahrenheit temperature scale that is related to the International Practical Temperature Scale by means of the equation: $T_F = 1.8 T_C + 32$.

where:

T_F is the temperature in degree Fahrenheit and T_C is the temperature in degrees Celsius.

E 1142, E37

Fahrenheit (°F)—designation of a degree on the Fahrenheit temperature scale that is related to the International Practical Temperature Scale.

D 6161, D19

faience mosaics—faience tile that are less than 6 in.² (39 cm²) in facial area, usually 3/16 to 3/8 in. (8 to 9.5 mm) thick, and usually mounted to facilitate installation.

C 242, C21

faience tile—glazed or unglazed tile, generally made by the plastic process, showing characteristic variations in the face, edges, and glaze that give a handcrafted, nonmechanical, decorative effect.

C 242, C21

faience ware—formerly a decorated earthenware with an opaque glaze, but currently designating a decorated earthenware having a transparent glaze.

C 242, C21

failure, n—an arbitrary point beyond which a material ceases to be functionally capable of its intended use. (Compare **rupture**.)

D 123, D13

failure, n—*in sewnfabric seams*, fabric or sewing thread rupture or seam (yarn) slippage.

D 123, D13

failure, n—see **adhesive-joint failure, adhesion failure, cohesion failure** and **substrate failure**.

D 907, D14

failure—see **dielectric failure**.

D 1711, D09

failure, n—an arbitrary point beyond which a material ceases to be functionally capable of its intended use.

D 4439, D35

failure, n—*in testinggeosynthetics*, water or air pressure in the test vessel at failure of the geosynthetic.

D 4439, D35

failure, n—an arbitrary point beyond which a material ceases to be functionally capable of its intended use. (Compare **rupture**.)

D 4848, D13

failure, adhesive—rupture of an adhesive bond, such that the plane of separation appears to be at the adhesive-adherend interface.

F 412, F17

failure by rupture—see **shear failure**.

D 653, D18

failure criterion—specification of the mechanical condition under which solid materials fail by fracturing or by deforming beyond some specified limit. This specification may be in terms of the stresses, strains, rate-of-change of stresses, rate-of-change of strains, or some combination of these quantities, in the materials.

D 653, D18

failure criterion—theoretically or empirically derived stress or strain relationship characterizing the occurrence of failure in the rock. (ISRM)

D 653, D18

failure (in rocks)—exceeding the maximum strength of the rock or

exceeding the stress or strain requirement of a specific design. (ISRM) **D 653, D18**

failure mode—failure mechanism during load application to anchor. **E 2265, E06**

failure (of a bulk solid)—plastic deformation of an overconsolidated bulk solid subject to shear, causing dilation and a decrease in strength. **D 653, D18**

fairing—a shape that produces a smooth transition from one direction to another. Also referred to as a *feathering*. **E 631, E06**

fairing—a shape that produces a smooth transition from one direction to another. Also referred to as a *feathering*. **E 1749, E06**

fair value—is the amount at which the asset (liability) could be bought (incurred) or sold (settled) in a current transaction between willing parties, that is, other than in a forced or liquidation sale. Quoted market prices in active markets are the best evidence of fair value and shall be used as the basis of the measurement, if available. However, in many instances, quoted market prices in active markets will not be available for the long-lived asset (asset groups) covered by this definition. In those instances, the estimate of fair value shall be based on the best information available, including prices for similar assets (groups) and the results of using other valuation techniques. **E 2135, E53**

fall, n—undesirable descent due to the force of gravity, usually from a standing posture or during ambulation, to a lower level, usually the ground or floor. **F 1646, F13**

fallback—shrinkage, settlement, or loss of plugging material placed in a borehole or well. **D 653, D18**

fallback—a reduction in bitumen softening point, sometimes caused by refluxing or overheating in a relatively closed container. (See also **softening point drift**). **D 1079, D08**

fall-off—tendency of an electrostatically deposited powder to fall off the work piece during normal processing. **C 286, B08**

fall velocity—the settling rate of a particle in a given medium. **D 4410, D19**

false brinelling, n—damage to a solid bearing surface characterized by indentations not caused by plastic deformation resulting from overload but thought to be due to other causes such as *fretting corrosion*. (See also **brinelling**). **G 40, G02**

false indication, n—an NDT indication that is interpreted to be caused by a condition other than a discontinuity or imperfection. **E 1316, E07**

false negative, n—misclassification of a deceptive person as truthful. **E 2035, E52**

false negative error, n—occurs when environmental data mislead decision maker(s) into not taking action specified by a decision rule when action should be taken. **D 5681, D34**

false negative error, n—an error which occurs when (environmental) data misleads the decision maker(s) into not taking action when action should be taken. **D 5681, D34**

false positive, n—a test result that states that a drug is present when, in fact, such a drug is not present in an amount greater than a threshold or designated cut-off concentration. **E 1732, E30**

false positive, n—misclassification of a truthful person as deceptive. **E 2035, E52**

false positive error, n—occurs when environmental data mislead decision maker(s) into taking action specified by a decision rule when action should not be taken. **D 5681, D34**

false positive error, n—an error which occurs when environmental data misleads the decision maker(s) into taking action when action should not be taken. **D 5681, D34**

false set—see **early stiffening** **C 219, C01**

false set—*in grouting*, the rapid development of rigidity in a freshly mixed grout without the evolution of much heat. **D 653, D18**

family—a complete series of penetrant materials required for the performance of a liquid penetrant examination. **E 1316, E07**

family, n—a set of fonts sharing the same type style, but differing in height, weight, and posture. **F 1457, F05**

family (of crystal planes)—the planes in any one crystal that have common Miller indices, regardless of sign. **E 7, E04**

fan airflow rate, Q_{fan} , n—the volume of airflow through the blower door per unit of time (m^3/s , ft^3/min). **E 631, E06**

fan/control energy rate—the rate of energy consumption (Btu/h or kW) by the equipment's controls or fan motor, to both, E_{fan} .

$$E_{fan} = \frac{E_{fan} \times 60}{t_{preheat} \times 1000}$$

where:

E_{fan} = fan/control energy measured in Btu or Wh, and
 $t_{preheat}$ = preheat time, min.

F 1827, F26

fancy leather—leathers made from hides and skins of all kinds that have commercial importance and value primarily because of grain, or distinctive finish, whether natural or the result of processing. Such processing may be graining, printing, embossing, ornamenting (including in gold, silver, and aluminum finishes), or any other finishing operation enhancing the appeal of leather. **D 1517, D31**

fan first vacuum cleaner system, n—a vacuum cleaner construction in which the dirt laden air is passed through the fan system and then into the dirt receptacle (bag type filter, bagless filter or other type of dirt separator). The separated air is then expelled from the cleaner. This type of construction is sometimes referred to as dirty air or direct system. **F 395, F11**

fan-out effect, n—widening of the paper web in a web-fed press, normally caused by dampening but also by printing pressure, which can theoretically occur in sheet-fed printing as well. **D 6488, D01**

fan pattern, n—a spray pattern in which the liquid flux is concentrated in a narrow oval or ellipse in a plane perpendicular to the spray axis. **E 1620, E29**

fan spray atomizer—a pressure atomizer that produces a flat sheet of liquid that collapses into particles. The angle or width of the sheet is controlled by the shape of a slot or oval discharge orifice, by an external deflector, or by impinging jets. **E 1620, E29**

faraday—the number of coulombs (96,490) required for an electrochemical reaction involving one chemical equivalent. **B 374, B08**

far field—the zone of the beam where equal reflectors give exponentially decreasing amplitudes with increasing distance. **E 1316, E07**

far-infrared—pertaining to the infrared region of the electromagnetic spectrum with wavelength range from approximately 25 to 1000 μm (wavenumber range 400 to 10 cm^{-1}). **E 131, E13**

fastener, n—in packaging, a device that serves to secure one part to another; for example, nail, screw, **staple, strapping, stitch**, or adhesive. **D 996, D10**

fastener, n—integral tooth of connector plate and/or separate nail used to fasten connector plate to wood member. **E 631, E06**

fasteners:

fastener—see **anchor**. **E 2265, E06**

fastener—see **mechanical fastener**. **F 1789, F16**

fastener electroplating—electro-deposition by electrolysis of an adherent metallic coating upon a fastener serving as an electrode. This coating may function as protective, decorative, or in a defined engineering function such as wearability or abrasive resistance. **F 1789, F16**

fastener manufacturer—organization or firm that procures a raw material, fabricates it into a mechanical fastener, and processes it to have certain mechanical properties. **F 1789, F16**

fastener quality—conformance of a fastener to its specification for dimensions, mechanical properties, performance requirements, and other requirements of a specification. **F 1789, F16**

fasteners:

self-sealing fastener—a fastener that provides a tight seal without the need for sealant material nor the use of a mechanical seal (for example, an interference fit fastener).

wet-installed fastener—a fastener that is coated on the shank and under the head with a curing-type sealant to provide a

fasteners:

corrosion barrier and a secondary seal. **E 1749, E06**

fastener specification—precise statement of a set of requirements to be satisfied by a fastener, its material, or its processing. It also indicates the procedure used to determine whether the requirements given are satisfied. **F 1789, F16**

fastener standard—document which details the attributes of a finished fastener and includes such characteristics as geometry, material or chemistry, heat treatment, finish, lot size, and packaging. **F 1789, F16**

fastener tensile stress area—assumed cross sectional area of a threaded fastener through the thread, which is used when computing the load a fastener can support in tension. **F 1789, F16**

fastener testing—determination or verification that the fastener meets its specification requirements. **F 1789, F16**

fast Fourier transform (FFT)—a method for speeding up the computation of a discrete FT by factoring the data into sparse matrices containing mostly zeroes. **E 131, E13**

fast neutrons—a term for designating neutrons of energy exceeding some threshold that must be specified (typically 0.1 or 1 MeV); often associated with those neutrons predominantly responsible for displacement damage of materials in neutron radiation fields. **E 170, E10**

fast pack container—See **container**. **D 996, D10**

fate, environmental—the form and location of a material resulting from transport and transformation. **E 943, E47**

fatigue—the process of progressive localized permanent structural change occurring in a material subjected to conditions that produce fluctuating stresses and strains at some point or points and that may culminate in cracks or complete fracture after a sufficient number of fluctuations. **D 653, D18**

fatigue—decrease of strength by repetitive loading. (ISRM) **D 653, D18**

fatigue, n —in atomic spectrometry, the decrease in response of a photoelectric radiant energy receiver caused by the accumulated exposure of the receiver to radiant energy. **E 135, E01**

fatigue—the process of progressive localized permanent structural change occurring in a material subjected to conditions that produce fluctuating stresses and strains at some point or points and that may culminate in cracks or complete fracture after a sufficient number of fluctuations. **E 1823, E08**

fatigue—any degradation in electrophotographic properties of a photoconductive material caused by repetitive charging, light exposure, or other operation in the imaging process. **F 335, F05**

fatigue, n —the process of progressive localized permanent structural change occurring in a material subjected to conditions that produce fluctuating stresses and strains at some point or points and that may culminate in cracks or complete fracture after a sufficient number of fluctuations. **F 1582, F04**

fatigue breakdown, n —the deterioration of an elastomeric product during repeated deformation. **D 1566, D11**

fatigue-crack-growth rate, da/dN , [L]—the rate of crack extension under fatigue loading, expressed in terms of crack extension per cycle of fatigue. **E 1823, E08**

fatigue-crack-growth threshold, ΔK_{th} [$FL^{-3/2}$]—that asymptotic value of ΔK at which da/dN approaches zero. For most materials an *operational*, though arbitrary, definition of ΔK_{th} is given as that ΔK which corresponds to a fatigue crack growth rate of 10^{-10} m/cycle. **E 1823, E08**

fatigue cycle—See **cycle**. **E 1823, E08**

fatigue ductility, D_f —the ability of a material to deform plastically before fracturing, determined from a constant-strain amplitude, low-cycle fatigue test. **E 6, E28**

fatigue ductility exponent, c , n —the slope of a log-log plot of the plastic strain range and the fatigue life. **E 6, E28**

fatigue, dynamic, n —the deterioration of a material by repeated deformation. See **fatigue breakdown.** **D 1566, D11**

fatigue life, n —the number of deformations required to produce a

specified state of fatigue breakdown in a test specimen or product that is deformed under a prescribed set of conditions. **D 1566, D11**

fatigue life, n —the number of loading cycles, N , of a specified character that a given specimen sustains before failure of a specified nature occurs. **F 1582, F04**

fatigue life for p % survival—an estimate of the fatigue life that p % of the population would attain or exceed under a given loading. The observed value of the median fatigue life estimates the fatigue life for 50 % survival. Fatigue life for p % survival values, where p is any number, such as, 95, 90, and so forth, also may be estimated from the individual fatigue life values. **E 1823, E08**

fatigue life, N_p , n —the numbers of cycles of stress or strain of a specified character that a given specimen sustains before failure of a specified nature occurs. **E 6, E28**

fatigue life, N_f —the number of cycles of a specified character that a given specimen sustains before failure of a specified nature occurs. Fatigue life, or the logarithm of fatigue life, is a dependent variable. **E 1823, E08**

fatigue limit—point on stress-strain curve below which no fatigue can be obtained regardless of number of loading cycles. (ISRM) **D 653, D18**

fatigue limit—see *endurance limit*. **F 1789, F16**

fatigue limit for p % survival [FL^{-2}]—the limiting value of fatigue strength for p % survival as N becomes very large; p may be any number, such as 95, 90, and so forth. **E 1823, E08**

fatigue limit, S_f [FL^{-2}]—the limiting value of the median fatigue strength as the fatigue life, N_f , becomes very large. **E 1823, E08**

fatigue loading—periodic, or not periodic, fluctuating loading applied to a test specimen or experienced by a structure in service. (Also known as *cyclic loading*.) **E 1823, E08**

fatigue notch factor, k_f —the ratio of the fatigue strength of a specimen with no stress concentration to a specimen with a stress concentration for the same percent survival at N cycles and for the same conditions. **E 1823, E08**

fatigue notch sensitivity, q —a measure of the degree of agreement between fatigue notch factor, k_f , and theoretical stress concentration factor, k_t . **E 1823, E08**

fatigue strength—maximum stress on an externally threaded fastener which can be tolerated for a specified number of repeated cycles prior to failure. **F 1789, F16**

fatigue strength at N cycles, S_N [FL^{-2}]—a value of stress for failure at exactly N cycles as determined from an $S-N$ diagram. The value of S_N thus determined is subject to the same conditions as those which apply to the $S-N$ diagram. **E 1823, E08**

fatigue strength at N Cycles, S_n [FL^{-2}], n —a value of stress for failure at exactly N cycles as determined from an $S-N$ diagram. The value S_n thus determined is subject to the same conditions as those that apply to the $S-N$ diagram. **F 1582, F04**

fatigue strength for p % survival at N cycles [FL^{-2}]—an estimate of the stress level at which p % of the population would survive N cycles; p may be any percent, such as 95, 90, and so forth. **E 1823, E08**

fatigue test—test involving repeated loading cycles, usually in excess of 2×10^6 cycles. **E 2265, E06**

fatigue test, n —a test designed to evaluate the cyclic load properties of a material, component, interconnection, subconstruct, construct, subassembly, or assembly. **F 1582, F04**

fatigue testing system—a device for applying repeated force cycles to a specimen or component. **E 1823, E08**

fatigue wear, n —wear of a solid surface caused by fracture arising from material fatigue. **G 40, G02**

fatiguing force, n —in testing sewn seams, the force that is repeatedly applied to a test specimen. **D 123, D13**

fatiguing force, n —in testing sewn seams, the force that is repeatedly applied to a test specimen. **D 4850, D13**

fatliquor—an emulsion of oils or greases in water, usually with an emulsifying agent, used to lubricate the fibers of leather. **D 1517, D31**

- fatty alcohol sulfate**—the product obtained by treating a one-chain fatty alcohol with a sulfonating agent, the major constituent being the half sulfuric acid ester of the fatty alcohol or a salt thereof. **D 459, D12**
- fatty matter, free**—the sum of the free rosin acids and free fatty acids plus the unsaponified and unsaponifiable fatty matter. **D 459, D12**
- fatty matter, total**—fatty and rosin acids plus unsaponified and unsaponifiable fatty matter. This fatty matter is usually isolated from an acidic 50/50 volume percent solution of ethanol and water by extraction with petroleum ether, as per Test Method D 460 and Test Methods D 820. **D 459, D12**
- fatty matter, unsaponifiable**—fatty matter (other than acids) that contain no saponifiable esters, such as fatty alcohols, and mineral oil. **D 459, D12**
- fatty matter, unsaponified**—fatty matter containing saponifiable esters, such as fatty oils, glycerides, and lanolin. **D 459, D12**
- fat wrinkle**—wrinkles on the grain of leather caused by fat deposits in the live animal. **D 1517, D31**
- fault**—a fracture or fracture zone along which there has been displacement of the two sides relative to one another parallel to the fracture (this displacement may be a few centimetres or many kilometres). (See also **joint fault set** and **joint fault system**. (ISRM) **D 653, D18**
- fault breccia**—the assemblage of broken rock fragments frequently found along faults. The fragments may vary in size from inches to feet. (ISRM) **D 653, D18**
- fault gouge**—a clay-like material occurring between the walls of a fault as a result of the movement along the fault surfaces. (ISRM) **D 653, D18**
- faulting of joints and cracks, n**—difference in elevation across a joint or crack. **E 867, E17**
- faulting of joints and cracks, n**—difference in elevation across a joint or crack. **E 1778, E17**
- faying surface**—the surface that makes contact with another surface. **E 631, E06**
- faying surface**—the surface that makes contact with another surface. **E 1749, E06**
- faying surface seal**—a seal installed between two overlapping surfaces. **E 631, E06**
- faying surface seal**—a seal installed between two overlapping surfaces. **E 1749, E06**
- FDA**—Food and Drug Administration (USA). **D 6161, D19**
- feasibility study, n** (étude de faisabilité)—study of a planned scheme or development, the practicality of its achievement, and its projected financial outcome. **E 631, E06**
- feasibility study, n** (étude de faisabilité)—study of a planned scheme or development, the practicality of its achievement, and its projected financial outcome. **E 1480, E06**
- feather**—See **striation**. **C 162, C14**
- feather fiber, n**—detached barbs of feathers which are not joined or attached to each other. **D 123, D13**
- feather fiber, n**—detached barbs of feathers which are not joined or attached to each other. **D 7022, D13**
- feathering, n**—a ragged edge on printed type. **D 6488, D01**
- feathering, n**—a ragged or finely trailing pattern at the sharp edge of type or solid areas. **D 6488, D01**
- feathering**—See **fairing**. **E 631, E06**
- feathering**—See **fairing**. **E 1749, E06**
- feathering**—an undesirable thread-like deposit extending radially from the edge of an image. **F 221, F05**
- feathering**—an undesirable thread-like deposit extending radially from the edge of an image (Terminology F 221). **F 335, F05**
- feathering, n**—a type of element irregular wear characterized by thin strips of rubber extending from the edge of the element. **F 538, F09**
- feathering, n**—ink spread over substrate causing fuzzy edges, spidery lines and poor print quality. See also **wicking**. **F 1857, F05**
- feathers**—an imperfection consisting of clusters of fine seed caused by dirt or foreign material entering the glass at the time of casting or shaping. **C 162, C14**
- feathers, n**—the outgrowth forming the contour and external covering of fowl. **D 123, D13**
- feathers, n**—the outgrowth forming the contour and external covering of fowl. **D 7022, D13**
- feathers, crushed, n**—feathers and feather fiber resulting from curling, crushing, or chopping feathers without removing the quill. **D 123, D13**
- feathers, crushed, n**—feathers and feather fiber resulting from curling, crushing, or chopping feathers without removing the quill. **D 7022, D13**
- feathers, damaged, n**—feathers that have been broken, damaged by insects, by mildew or rot, or otherwise materially injured. **D 123, D13**
- feathers, damaged, n**—feathers that have been broken, damaged by insects, by mildew or rot, or otherwise materially injured. **D 7022, D13**
- feathers, landfowl, n**—See **feathers, nonwaterfowl**. **D 123, D13**
- feathers, landfowl, n**—See **feathers, nonwaterfowl**. **D 7022, D13**
- feathers, nestling, n**—immature feathers in which the barbs are held together and covered by a sheath. **D 123, D13**
- feathers, nestling, n**—immature feathers in which the barbs are held together and covered by a sheath. **D 7022, D13**
- feathers, nonwaterfowl, n**—feathers derived from chickens, turkeys, or other landfowl. (Syn. *feathers, landfowl*) **D 123, D13**
- feathers, nonwaterfowl, n**—feathers derived from chickens, turkeys, or other landfowl. (Syn. *feathers, landfowl*.) **D 7022, D13**
- feathers, quill, n**—feathers which are over 100 mm (4 in.) in length or which have a quill point exceeding 9.5 mm (3/16 in.) in length. **D 123, D13**
- feathers, quill, n**—feathers which are over 100 mm (4 in.) in length or which have a quill point exceeding 9.5 mm (3/16 in.) in length. **D 7022, D13**
- feathers, waterfowl, n**—feathers from ducks or geese, or both. **D 123, D13**
- feathers, waterfowl, n**—feathers from ducks or geese, or both. **D 7022, D13**
- feature, n**—of a facility, a physical element of a building, building component, building subsystem, unit of furnishing or equipment, or of a location, or of an aspect of design, arrangement, form or color, which helps or hinders the satisfaction of a requirement for serviceability. **E 631, E06**
- featured edge, n**—an edge configuration of the paper bound edge of gypsum board that provides special design or performance. **C 11, C11**
- feature, n** (élément caractéristique)—of a facility, a building element, building component, building subsystem, unit of furnishing or equipment, or aspects of design, arrangement, form of color, which helps or hinders the satisfaction of a requirement for serviceability. **E 631, E06**
- feature, n** (élément caractéristique)—of a facility, a building element, building component, building subsystem, unit of furnishing or equipment, or aspects of design, arrangement, form of color, which helps or hinders the satisfaction of a requirement for serviceability. **E 631, E06**
- combination of features, n** (éléments caractéristiques combinés)—of a facility, features which, when present together in a facility, affect satisfying a requirement for serviceability. **E 1480, E06**
- feature extraction**—characterization of objects in an image, usually with the goal of distinguishing those objects. **E 1316, E07**
- feature-specific measurement, n**—an individual measurement of each detected feature in the field of view. **E 7, E04**
- federal agency**—any department, agency, office, or other independent establishment of the government. **E 2135, E53**
- Federal Register (FR)**—publication of the United States government published daily (except for Federal holidays and weekends) containing all proposed and final regulations and some other

activities of the Federal government. When regulations become final, they are included in the Code of Federal Regulations (CFR) as well as published in the Federal Register. **D 5681, D34**

Federal Register (FR)—document published daily by the Federal Government that contains such entries as proposed or final regulations. See **CFR** and **Code of Federal Regulation**.

E 631, E06

feebly magnetic material—a material generally classified as “non-magnetic,” whose maximum normal permeability is less than 4.

A 340, A06

feed—the input solution to a treatment/purification system or device, including the raw water supply prior to any treatment. The liquid entering the module. **D 6161, D19**

feed channel spacer—a plastic netting between membrane leaves which provides the flow channel for the fluid passing over the surface of the membrane and increases the turbulence of the feed-brine stream. **D 6161, D19**

feed chute—a device that can replace the carriage for the purpose of slicing multiple small cross-sectional food products. This device also includes an end weight or spring to permit slicing of product to within the last one-quarter inch. **F 1827, F26**

feed distributor—the plastic mesh cylinder at the core of the fiber bundle which distributes the feed evenly. **D 6161, D19**

feeder—a mechanical device for regularly producing and delivering gobs of glass to a forming unit. **C 162, C14**

feeder process—See **gob process**. **C 162, C14**

feeder shoe—See **pusher**. **F 592, F16**

feed, gravity, n—the movement of materials from one container to another container or location by force of gravity. **C 1145, C28**

feed pretreatment—process carried out on a crude (raw) feed stream prior to feeding to a membrane separation system to eliminate objectionable components such as biological agents and colloids that might impede the stable operation of the membrane. **D 6161, D19**

feedstock, n—*in metal injection molding (MIM)*, a moldable mixture of metal powder and binder. **B 243, B09**

feedstock—the base raw material that is the source of carbohydrate, such as starch, for producing sugars that can be fermented into alcohol and carbon dioxide. **E 1705, E48**

feed-through coils—see **encircling coils**. **E 1316, E07**

feed unit, n—*inan open-end spinning machine*, the device which presents the feed stock to the opening roller by either a feed roller and feed plate combination or interacting feed rollers. (See also **opening device**.) **D 123, D13**

feed unit, n—*inan open-end spinning machine*, the device which presents the feed stock to the opening roller by either a feed roller and feed plate combination or interacting feed rollers. (See also **opening device**.) **D 3888, D13**

feed water—that water entering a device or process. **D 6161, D19**

feldspar—a mineral aggregate consisting chiefly of microcline, albite, or anorthite or combination thereof. **C 242, C21**

Felicity effect—the presence of acoustic emission, detectable at a fixed predetermined sensitivity level at stress levels below those previously applied. (E 1067) **E 1316, E07**

Felicity ratio—the ratio of the stress at which the Felicity effect occurs to the previously applied maximum stress. (E 1067, E 1118)

NOTE—The fixed sensitivity level will usually be the same as was used for the previous loading or test. (E 1118) **E 1316, E07**

felt, n—a textile (fabric) characterized by the densely matted condition of most or all of the fibers of which it is composed. **D 123, D13**

felt, n—a textile structure characterized by interlocking and consolidation of its constituent fibers achieved by the interaction of a suitable combination of mechanical energy, chemical action, moisture, and heat but without the use of weaving, knitting, stitching, thermal bonding, or adhesives. **D 123, D13**

felt—a flexible sheet manufactured by the interlocking of fibers with

a binder or through a combination of mechanical work, moisture, and heat. Felts are manufactured principally from vegetable fibers (organic felts), asbestos fibers (asbestos felts) or glass fibers (glass fiber felts); other fibers may be present in each type. **D 1079, D08**

felt, n—a textile structure characterized by interlocking and consolidation of its constituent fibers achieved by the interaction of a suitable combination of mechanical energy, chemical action, moisture, and heat but without the use of weaving, knitting, stitching, thermal bonding, or adhesives. **D 4845, D13**

felt layer—(1) a machine used for applying bitumen and built-up roofing felts;

(2) See **ply**. **D 1079, D08**

felt mill ream—the mass in pounds of 480 ft² of dry, unsaturated felt, also termed “point weight.” **D 1079, D08**

felt side—the top side of the paper in the paper manufacturing process as opposed to **wire side**. Optical scanning forms should be printed on the felt side. **F 149, F05**

female end of pipe (bell, socket, groove, modified groove)—that portion of the end of the pipe, regardless of its shape or dimensions, which overlaps a portion of the end of the adjoining pipe. **C 822, C13**

female member—the component that accommodates and encloses the male member at the box lock junction. **F 921, F04**

FEMF—Fuel Ethanol Manufacturing Facility. **E 1705, E48**

femtolitre, n—a cubic micron; a measurement of cell volume. **F 2312, F04**

fence—a part of the lever that fits into tumbler gates, permitting the lever to engage the drive cam. **F 471, F12**

fence—a type of barrier consisting of, but not limited to, posts, boards, wire, stakes, or rails that is used to inhibit patrons from coming into contact with the moving portion or restricted portion of an amusement ride or device. **F 747, F24**

fence nail—stout, bright, regular-stock-steel, 1¼ by 0.135 to 4 by 0.225-in. nails with large flat ⅝ to 1⅝³²-in. head and medium diamond point. **F 547, F16**

“fence type” boom—boom consisting of a self-supporting or stiffened membrane supported by flotation. **F 818, F20**

Feret’s diameter—See **caliper diameter**. **E 7, E04**

fermentation—decomposition of organic compounds, by microorganisms, to fuels and chemicals such as alcohols, acids, and energy-rich gases. **E 1705, E48**

fermentation—the biochemical reaction process where microorganisms in a nutrient medium convert a feedstock to a product. **E 1705, E48**

fermentation fuel—a fuel produced by fermentation of biomass. **NOTE**—Ethyl alcohol is the most common form of fermentation fuel. **E 772, E44**

fermentation fuel—a fuel produced by fermentation of biomass. **E 1705, E48**

Fermi energy (level)—*for metals*, the energy of the top-most filled electron level at zero Kelvin. *For insulators and semiconductors*, the Fermi level is usually between the valence and conduction bands. **E 673, E42**

Fermi level referencing—*XPS*, a method of establishing the binding energy scale for a particular specimen by assigning the kinetic energy corresponding to the Fermi level, as determined by analysis of the specimen’s XPS or UPS spectrum, as the point of zero binding energy. See also **Fermi energy (level)**. **E 673, E42**

ferric chloride—crystalline form of FeCl₃ · 6H₂O, a coagulant. **D 6161, D19**

ferric sulfate—Fe₂(SO₄)₃ · 9H₂O, a coagulant. **D 6161, D19**

ferrimagnetic material—a material whose atomic magnetic moments are both ordered and anti-parallel but being unequal in magnitude produce a net magnetization in one direction. **A 340, A06**

ferrite—a term referring to magnetic oxides in general, and especially to material having the formula M O Fe₂ O₃, where M is a divalent

- metal ion or a combination of such ions. Certain ferrites, magnetically "soft" in character, are useful for core applications at radio and higher frequencies because of their advantageous magnetic properties and high volume resistivity. Other ferrites, magnetically "hard" in character, have desirable permanent magnet properties. **A 340, A06**
- ferrite**—designation commonly assigned to alpha iron containing alloying elements in solid solution. Increasing carbon content markedly decreases the high-temperature limit of equilibrium. **E 7, E04**
- ferrite grain size**—the grain size of the ferrite in predominantly ferritic steels. See Test Methods E 112. **E 7, E04**
- ferritize, vt**—to increase the quantity of ferrite in the matrix of a ferrous casting through an appropriate heat treatment. **A 644, A04**
- ferritizing anneal, *n***—the process of producing a predominantly ferritic matrix in cast iron through an appropriate heat treatment. **A 644, A04**
- ferritizing anneal, *n***—a heat treatment that produces a predominantly ferritic matrix in a steel object. **A 941, A01**
- ferritizing anneal**—the process of producing a predominantly ferritic matrix in a ferrous alloy through an appropriate heat treatment. **E 7, E04**
- ferroalloy, *n***—an alloy of iron and one or more other metals, for use as an addition to the molten metal during the manufacture of steels, nickel alloys, or cobalt alloys. **A 941, A01**
- ferromagnetic**—a term applied to materials that can be magnetized or strongly attracted by a magnetic field. **E 1316, E07**
- ferromagnetic material**—a material whose magnetic moments are ordered and parallel producing magnetization in one direction. **A 340, A06**
- ferromagnetic material**—a material that, in general, exhibits the phenomena of magnetic hysteresis and saturation, and whose permeability is dependent on the magnetizing force. **E 1316, E07**
- ferrous sulfate**— $\text{FeSO}_4 \cdot 7\text{H}_2\text{O}$, a coagulant. **D 6161, D19**
- ferrous sulfate**—cupric sulfate dosimeter—a liquid chemical radiation dosimetry system composed of water with ferrous sulfate or ferrous-ammonium sulfate and cupric sulfate in aqueous sulfuric acid solution and whose response is based quantitatively on the amount of oxidation of ferrous to ferric ions by ionizing radiation, as analyzed by spectrophotometry. It is considered to be a reference standard dosimeter. **E 170, E10**
- festooning**—loading a cartridge with a supply of imaging material without the use of carrier spools. **F 221, F05**
- fetter ring nail**—term applied to annularly threaded nail. (See thread.) **F 547, F16**
- F factor**—an episode of *E. coli*. Encoded on it are the functions necessary to produce an F pilus. **E 1705, E48**
- fiber**—attenuated glass generally with a diameter of less than a millimetre and a length/diameter ratio of more than 5. **C 162, C14**
- fiber, *n*—in fiber-cement**, any material in a form such that it has a minimum length to average maximum transverse dimension of 10 to 1, a maximum cross-sectional area of $5.06 \times 10^{-2} \text{ mm}^2$ (corresponding to a circular cross section of 0.254 mm in diameter) and a maximum transverse dimension of 0.254 mm. **C 1154, C17**
- fiber, *n*—in fiber-reinforced cement**, any material in a form such that it has an aspect ratio of at least 10 and a typical transverse dimension less than 2 mm. **C 1154, C17**
- fiber, *n*—in textiles**, a generic term for any one of the various types of matter that form the basic elements of a textile and that is characterized by having a length at least 100 times its diameter. (See also **manufactured fiber**, **natural fiber**, and **and**.) **D 123, D13**
- fiber**—for peats and organic soils, a fragment or piece of plant tissue that retains a recognizable cellular structure and is large enough to be retained after wet sieving on a 100-mesh sieve (openings 0.15 mm). **D 653, D18**
- fiber**—the unit cell of vegetable growth, which is many times longer than its diameter and which consists largely of cellulose. It is the basic unit of pulps and papers. **D 1695, D01**
- fiber, *n***—a thread-like body or filament many times longer than its diameter. For paper, fibers usually are of vegetable origin but may be derived from animal, mineral, or synthetic sources for special types of paper products. **D 1968, D06**
- fiber, *n***—any material in a form such that it has a minimum length to average maximum transverse dimension of 10 to 1, a maximum cross-sectional area of $5.06 \times 10^{-2} \text{ mm}^2$ (corresponding to a circular cross section of 0.254 mm in diameter) and a maximum transverse dimension of 0.254 mm. **D 2946, C17**
- fiber, *n***—one or more filaments in an ordered assemblage. **D 3878, D30**
- fiber adhesion, *n*—for asbestos**, force required to overcome the tendency of fibers to remain affixed to the host rock. **D 2946, C17**
- fiber-axis**—the preferred direction of fiber texture. **E 7, E04**
- fiber beard, *n*—in length testing of fibers**, fibers caught randomly on a comb which are subsequently straightened and parallelized without stretching or damaging. **D 123, D13**
- fiber beard, *n*—in length testing of fibers**, fibers caught randomly on a comb which are subsequently straightened and parallelized without stretching or damaging. **D 4849, D13**
- fiber birefringence, *n***—the algebraic difference of the index of refraction of the fiber for plane polarized light vibrating parallel to the longitudinal axis of the fiber and the index of refraction for light vibrating perpendicular to the long axis. (See also **birefringence**.) **D 123, D13**
- fiberboard**—See **containerboard**. **D 996, D10**
- fiberboard container**—See **container**. **D 996, D10**
- fiberboard nail**—bright or electroplated, regular-stock-steel or hardened-steel 1 by 0.054 to 2 by 0.062-in. nails with flat $\frac{3}{32}$ or $\frac{7}{64}$ -in. head and medium needle point. **F 547, F16**
- fiberboard partitions**—a set of corrugated or solid fiberboard or paperboard pieces slotted so they will interlock when assembled to form a number of cells into which articles may be placed for shipment. (See also **divider**.) **D 996, D10**
- fiberboard tube**—See **tube**. **D 996, D10**
- fiber bridging**—reinforcing fiber material that is found bridging across on an inside radius of a pultruded product.
NOTE—This condition is caused by shrinkage stresses around such a radius during cure. **D 3918, D20**
- fiber bundle, *n***—group of ultimate fibers which are held together in the flax stem by pectins, lignins or any combination thereof. **D 123, D13**
- fiber bundle**—the heart of the permeator consisting of the hollow fiber polymer membrane, epoxy tube sheet, nub and feed distributor. **D 6161, D19**
- fiber bundle, *n*—in flax**, group of ultimate fibers which are held together in the flax stem by pectins, lignins or any combination thereof. **D 6798, D13**
- fiber-cement products, *n***—manufactured thin section composites of hydraulic cementitious matrices and discrete non-asbestos fibers. **C 1154, C17**
- fiber channel, *n***—a component of an open-end spinning machine through which the fibers are conveyed by an air current from the opening device to the rotor. (See also **opening device**.) **D 123, D13**
- fiber channel, *n***—a component of an open-end spinning machine through which the fibers are conveyed by an air current from the opening device to the rotor. (*Syn.* fiber transport tube.) (See also **opening device**.) **D 3888, D13**
- fiber chip, *n*—inmanufactured textiles**, staple fibers that are massed together as a unit and that maintain a single geometry or alignment textiles. **D 123, D13**
- fiber chip, *n*—in manufactured textiles**, staple fibers that are massed together as a unit and that maintain a single geometry or alignment. **D 4849, D13**
- fiber cohesion, *n*—in textiles** the resistance to separation of fibers in contact with one another. **D 123, D13**

fiber cohesion, *n*

fiber cohesion, *n*—*for asbestos*, force required to separate fibers from each other. **D 2946, C17**

fiber cohesion, *n*—in textiles, the resistance to separation of fibers in contact with one another. **D 4849, D13**

fiber content—the amount of fiber present in a composite expressed either as percent by weight or percent by volume. This is sometimes stated as a fraction, that is, fiber volume fraction. **D 3878, D30**

fiber content—the amount of fiber present in a composite, usually expressed as volume percent of the composite. **E 631, E06**

fiber content—the amount of fiber present in a composite, usually expressed as volume percent of the composite. **E 1749, E06**

fiber density, *n*—mass per unit volume of the solid matter of which a fiber is composed, measured under specified conditions. **D 123, D13**

fiber (fibre)—a structural feature of wrought metal revealed by directional properties, manifested by the appearance of an etched longitudinal section, by the appearance of a fracture, or by an X-ray pattern of crystal orientations. **E 7, E04**

fiberfill, *n*—manufactured fibers especially engineered as to linear density, cut length, and crimp for use as a textile filling material. **D 123, D13**

fiberfill, *n*—manufactured fibers especially engineered as to linear density, cut length, and crimp for use as a textile filling material. **D 7022, D13**

fiberglass, reinforcement—continuously formed fibers added to enhance the overall performance of a matrix. Fiber glasses used for specific chemical or physical properties, or both, include:

A-glass—compositions typically with lower electrical resistivity, strength, and durability than E-glass.

AR-glass—compositions resistant to corrosion by alkali.

C-glass—compositions resistant to corrosion by most acids.

D-glass—compositions with a low dielectric constant.

E-glass—compositions with electrical properties, strength, and durability appropriate for most applications.

E-CR-glass—E-glass compositions modified for improved resistance to corrosion by most acids.

R-glass—compositions with high tensile strength, resistant to corrosion by most acids.

S-glass—compositions with high tensile strength, elastic modulus and service temperature. **C 162, C14**

fiber length—when applied to a pulp, this applies to the mean fiber length and both the experimental details and the calculations must be specified. **D 1695, D01**

fiber length distribution—the frequency distribution of the individual fiber lengths in a material about the mean fiber length. **D 1695, D01**

fiber-mat reinforced products, *n*—manufactured thin section composites of hydraulic cementitious matrices and non-asbestos fibers in two-dimensional scrim(s). **C 1154, C17**

fiber, optical—a fiber with high transmittance, low scattering, and minimal transverse loss of light. **C 162, C14**

fiber optic buffer, *n*—material placed on or around a clad optical fiber to protect it from mechanical damage. **E 131, E13**

fiber optic chemical sensor, *n*—a fiber optic sensor that responds to a chemical stimulus. **E 131, E13**

fiber optics, *n*—the branch of science and technology devoted to the transmission of radiant energy through fibers made of transparent materials. **E 131, E13**

fiber optics—method by which light is transmitted through thin transparent fibers. **E 1316, E07**

fiber optic sensor, *n*—a device that responds to an external stimulus and transmits through an optical fiber a modulated optical signal, indicating one or more characteristics of the stimulus. **E 131, E13**

fiber or frit-type reference electrode—a reference electrode in

which the filling solution contacts the sample solution by means of asbestos fibers or a small sintered piece of porous glass.

D 4127, D19

fiber orientation—the direction or alignment of the longitudinal axis of the fiber with respect to a stated reference axis. **E 631, E06**

fiber orientation—the direction or alignment of the longitudinal axis of the fiber with respect to a stated reference axis. **E 1749, E06**

fiber pick, *n*—the delaminating, splitting, or tearing of paper surface fibers that occurs when the force between the paper and blanket exceeds the surface strength of the paper. **D 6488, D01**

fiber prominence—a visible and measurable pattern of the reinforcing material on the surface of a pultruded plastic part. **D 3918, D20**

fiber-reinforced, *adj*—imparting improved properties to hydraulic cement matrices due to the inclusion of fibers. **C 1154, C17**

fiber-reinforced plastic (FRP), *n*—a plastic that contains fibers in various forms such as cloth, mat, strands, or chopped to enhance properties. **D 907, D14**

fiber rope, *n*—a rope produced primarily from textile fibers. **D 123, D13**

fibers, *n*—slender filaments, which may be discrete or in the form of bundles, networks, or strands of natural or manufactured materials, which can be distributed uniformly throughout a fresh cementitious mixture. **C 125, C09**

fibers—the slender threadlike elements or groups of wood fibers or similar cellulosic material resulting from chemical or mechanical defiberization, or both, and sometimes referred to as fiber bundles. **D 1554, D07**

fibers, *n*—particulate matter with a length of 100 μm or greater and a length-to-width ratio of 10 to 1 or greater. **G 126, G04**

fiber saturation point—the moisture content at which the cell walls are saturated with water (bound water) and no water is held in the cell cavities by capillary forces. It usually is taken as 25 to 30 % moisture content, based on weight when oven-dry. **D 9, D07**

fiber saturation point—the moisture content in the absorption of water by cellulose when the cell walls are saturated, but virtually no free water is present in the grosser capillary structure. The concept is based on the hypothesis that a discontinuity occurs in the sorption curve at this point. Some careful studies of the region have failed to show a discontinuity, but it is still possible to define "fiber saturation point" as an extrapolation of the adsorption curve. In any case, it should only be used with reference to the method of determination. **D 1695, D01**

fiber show, *n*—strands or bundles of fibers not covered by resin which are at or above the surface of a reinforced plastic. **D 883, D20**

fiber show—strands or bundles of fibers that are not covered by resin and that are at or above the surface of a reinforced plastic pultrusion. **D 3918, D20**

fiber spicule—rod-like piece composed of asbestos fibers that are in close-packed parallel orientation, undisturbed from their natural relative positions, and sufficiently numerous to render the piece inflexible. **D 2946, C17**

fiber strength unit—see **strengthunit**. **D 2946, C17**

fiber structure—the morphological structure of a fiber at the visual or microscopic level. (see also **fine structure**) **D 1695, D01**

fiber tear, *n*—in an FRP adhesively bonded joint, failure occurring exclusively within the fiber reinforced plastic matrix, characterized by the appearance of reinforcing fibers on both ruptured surfaces. (Also called *fiber tear failure*.) **D 907, D14**

*fiber-tear failure, *n**—in an FRP adhesively bonded joint—see **fiber tear**. **D 907, D14**

fiber texture—a texture characterized by having only one preferred crystallographic direction. **E 7, E04**

fiber volume fraction—see **fiber content**. **D 3878, D30**

Fiberweigh, *n*—an instrument having a capacity for weighing a 51-grain (3.30-g) specimen with a sensitivity of at least 0.2 % of the mass being weighed. **D 123, D13**

Fiberweigh, *n*—an instrument having a capacity for weighing a

- 51-grain (3.30-g) specimen with a sensitivity of at least 0.2 % of the mass being weighed. **D 7139, D13**
- fiber, wood**—a comparatively long (1/25 in. or less to 1/3 in.), narrow, tapering wood cell closed at both ends. **D 9, D07**
- fibric peat**—peat in which the original plant fibers are slightly decomposed (greater than 67 % fibers). **D 653, D18**
- fibril**—a fiberlike bundle of molecules, oriented in one direction either with the fiber axis or spirally around it. It makes up the fibrous structural unit of the single fiber. The cellulose fibrils are crystalline as shown by X-ray diffraction. **D 1695, D01**
- fibril, n**—*for asbestos*, a fiber composed of a single crystal. **D 2946, C17**
- fibrogram, n**—*intesting cotton fibers for length*, the curve representing the second cumulation of the length distribution of the fibers sensed by the length measuring instrument in scanning the fiber board. **D 123, D13**
- fibrogram, n**—*in testing cotton fibers for length*, the curve representing the second cumulation of the length distribution of the fibers sensed by the length measuring instrument in scanning the fiber board. **D 7139, D13**
- Fibronaire, n**—an instrument which determines the micronaire reading of raw cotton fibers using the “porous-plug” air flow technique. **D 123, D13**
- Fibronaire, n**—an instrument which determines the micronaire reading of raw cotton fibers using the “porous-plug” air flow technique. **D 7139, D13**
- fibrous, adj**—pertaining to, consisting of, or containing fibers. **C 1154, C17**
- fibrous, adj**—*for asbestos*, pertaining to fine acicular (needle-like), flexible crystalline morphology associated with the subdivision of macro-assemblages of an asbestiform mineral. **D 2946, C17**
- fibrous-felted boards**—a felted wood-base panel material manufactured of refined or partly refined lignocellulosic fibers characterized by an integral bond produced by an interfelting of fibers and in the case of certain densities and control of conditions of manufacture by ligneous bond, and to which other materials may have been added during manufacture to improve certain properties. **D 1554, D07**
- fibrous glass, n**—A synthetic vitreous fiber insulation made by melting predominantly silica sand and other inorganic materials, and then physically forming the melt into fibers. **C 168, C16**
- fibrous particulate, n**—*for asbestos*, fiber, fiber fragment, or fiber agglomerate. **D 2946, C17**
- fibrous peat**—see **fibric peat**. **D 653, D18**
- Fick's laws of diffusion, n**—mathematical descriptions of the movement of one type of molecule through another. **F 1494, F23**
- fid, n**—a wooden or hard plastic tool used as an aid in rope splicing. **D 123, D13**
- fiduciary**—individual or institution responsible for holding or administering property owned by another. An executor, guardian, trustee, and administrator are examples of a fiduciary. **E 2135, E53**
- fiduciary accounting**—proper accounting for property that is entrusted to the fiduciary acting under the conditions set forth in a deed. **E 2135, E53**
- field**—the portion of the object in view. **E 7, E04**
- field, n**—that portion of the surface of a specimen that is illuminated by the illuminator or viewed by the receiver. **E 284, E12**
- field**—any group of characters defined as a unit of information. **F 149, F05**
- field adaption**—the forced recovery of excited electrons (as in dark adaption) by means of an externally applied electrical field such as a charging corona. **F 335, F05**
- field angle**—the included angle between those points on opposite sides of a light beam at which the luminous intensity is 10 % of the maximum value. **E 1316, E07**
- field, bipolar**—longitudinal magnetic field within a part that has two poles. **E 1316, E07**
- field blank**—blank sample prepared at the field sampling location. **E 631, E06**
- field blank**—a wipe that is exposed to the same handling as field samples except that no sample is collected (no surface is actually wiped). Analysis results from field blanks provide information on the analyte background level in the wipe combined with the potential contamination experienced by samples collected within the batch resulting from handling. **E 631, E06**
- field blank**—a sample that is handled in exactly the same way that field samples are handled, except that no air is drawn through it. **E 631, E06**
- field blank**—blank sample prepared at the field sampling location. **E 1605, E06**
- field-box nail**—coated, barbed, regular-stock-steel, 2 by 0.099 to 2¼ by 0.106-in. nails with ¼-in. oval head and medium diamond point. **F 547, F16**
- field check**—(1) a survey of existing conditions at a construction site (also called *field observation*). (2) verification of an existing structure and its dimensions compared with those shown on drawings (also called *field measure*). **E 631, E06**
- field, circular magnetic**—generally, the magnetic field surrounding any electrical conductor or part resulting from a current being passed through the part or conductor from one end to another. **E 1316, E07**
- field delimiter—See **field separator**. **F 149, F05**
- field joint**—See **joints**. **E 631, E06**
- field joint**—a connection between adjoining members or parts, made at the time of installation. Compare **construction joint**. **E 631, E06**
- field latex, n**—See **latex, field**. **D 1566, D11**
- field lens**—the lens nearest the field diaphragm in an eyepiece. **E 7, E04**
- field, longitudinal magnetic**—magnetic field wherein the flux lines traverse the component in a direction essentially parallel with its longitudinal axis. **E 1316, E07**
- field, magnetic**—the space, within and surrounding a magnetized part or a conductor carrying current, in which the magnetic force is exerted. **E 1316, E07**
- field, magnetic leakage**—the magnetic field that leaves or enters the surface of a part at a discontinuity or change in section configuration of a magnetic circuit. **E 1316, E07**
- field mark—See **field separator**. **F 149, F05**
- field measure**—See **field check**. **E 631, E06**
- field measurement, in image analysis**—the aggregate measurement of the detected features in a field of view. **E 7, E04**
- field mix, n**—a material that is mixed in the field with other components or water, or both. **E 2110, E06**
- field moisture equivalent**—see **moisture equivalent**. **D 653, D18**
- field of testing**—broad sphere of science, engineering, or technology used to describe a general area of testing for classification purposes only. (For accreditation purposes, fields of testing are subdivided into specific tests, groups of tests, or product areas.) **E 1187, E36**
- field of view, n**—area of a subject's surface that exchanges thermal radiation with the sensor. **E 344, E20**
- field of view, n**—the lineal dimension defining the length of a bar code that can be read in one scan, particularly significant in moving beam and array technologies. **F 1294, F05**
- field of view (FOV)**—the shape and angular dimensions of the cone or the pyramid which define the object space imaged by the system; for example, rectangular, 4° wide by 3° high. **E 1316, E07**
- field operation laboratory**—a laboratory that uses portable technology to provide analytical services in the field near the sampling site. **E 1605, E06**
- field requirements, n**—*in construction design planning and estimating*, the nonpermanent portion of construction cost that is essential to permit implementation of the construction work in the field. **E 833, E06**
- field, residual magnetic**—the field that remains in a piece of

field, residual magnetic

- magnetizable material after the magnetizing force has been removed. **E 1316, E07**
- field, resultant magnetic**—(sometimes called vector): a magnetic field that is the result of two magnetizing forces impressed upon the same area of a magnetizable object. **E 1316, E07**
- field separator**—a mark or symbol printed in scan ink that identifies fields to the scanner (Syn. *field mark*). **F 149, F05**
- field sound transmission class, FSTC**—sound transmission class calculated in accordance with Classification E 413 using values of field transmission loss. **C 634, E33**
- fieldstone, n**—natural building stone as found in the field. **E 631, E06**
- field stop, n**—the physical diameter that limits the angular field of view of an optical system. **E 284, E12**
- field strength**—see **magnetic field strength**. **E 1316, E07**
- field testing, n**—testing performed in the field under actual conditions of temperature and exposure to the fluids for which the immersion testing is being performed. **D 4439, D35**
- field transmission loss, FTL**—sound transmission loss measured in accordance with Annex A1 of Test Method E 336. **C 634, E33**
- figure**—the pattern produced in a wood surface by annual growth rings, rays, knots, deviations from regular grain such as interlocked and wavy grain, and irregular coloration. **D 9, D07**
- figured glass**—flat glass having a pattern on one or both surfaces. **C 162, C14**
- figure-of-merit**—a performance characteristic of a method believed to be useful when deciding its applicability for a specific measurement situation. **E 2161, E37**
- figure of merit, magnetic, $\mu'/\cot \gamma$** —the ratio of the real part of the complex relative permeability to the dissipation factor of a ferromagnetic material.
- NOTE—The figure of merit index of the magnetic efficiency of the core in various ac electromagnetic devices. **A 340, A06**
- filament**—a single glass fiber of indefinite length. **C 162, C14**
- filament, n**—a long flexible thread of small cross section, usually extruded or drawn. **C 1145, C28**
- filament, n—in textiles**, a continuous fiber of extremely long length. **D 123, D13**
- filament, n—in steelcord**, the individual element in a steel strand or cord. **D 123, D13**
- filament, n**—a fibrous form of matter with an aspect ratio >10 and an effective diameter <1 mm. (See also **monofilament**.) **D 3878, D30**
- filament**—an electrically heated wire used as a source of a radiation, such as electrons, or as a source of heat, such as in the vaporization of a metal. **E 7, E04**
- filament**—a variety of fibers characterized by extreme length. Also known as *fibers* and used interchangeably. **E 631, E06**
- filament**—a variety of fibers characterized by extreme length. Also known as *fibers* and used interchangeably. **E 1749, E06**
- filamentary composites**—See **composite, filamentary**. **E 631, E06**
- filamentary composites**—See **composite, filamentary**. **E 1749, E06**
- filament count**—number of filaments in the cross section of a fiber bundle. **D 3878, D30**
- filament yarn, n**—a yarn composed of (continuous) filaments assembled with or without twist. **D 123, D13**
- filament yarn, n**—a yarn composed of (continuous) filaments assembled with or without twist. **D 4849, D13**
- filar micrometer or filar eyepiece**—an eyepiece equipped with a fiducial line in its focal plane, which is movable by means of a calibrated micrometer screw, in order to make accurate measurements of length. **E 7, E04**
- file-grip nail, file-thread nail**—terms applied to helically threaded nails provided with file threads. (See **thread**.) **F 547, F16**
- file specimen, n**—portion of the material to be tested which is stored under conditions in which it is stable, and is used for comparison between exposed and original state. **G 113, G03**
- file thread, file-grip thread**—large number of fine, closely spaced helical threads, with large or extra large lead angle, rolled onto shank. Usually applied to certain aluminum asbestos-shingle face nails. **F 547, F16**
- filiform corrosion**—corrosion that occurs under some coatings in the form of randomly distributed threadlike filaments. **G 15, G01**
- filiform corrosion resistance, n**—the ability of a coating to resist that type of corrosion of metal substrates characterized by a definite thread-like structure and directional growth that occurs under coatings. **D 16, D01**
- fill**—the unit charge of batch into a melter or pot. **C 162, C14**
- fill**—man-made deposits of natural soils or rock products and waste materials. **D 653, D18**
- fill, n—in a woven fabric**, the yarn running from selvage to selvage at right angles to the warp. **D 3878, D30**
- fill**—deprecated term, see **filling**. **D 4439, D35**
- filled candle, n**—a candle produced and used within the same vessel. **F 1972, F15**
- filler**—a material used to increase the bulk of a product without adding to its effectiveness in functional performance. **B 374, B08**
- filler, n—in manufactured carbon and graphite product technology**, carbonaceous particles comprising the base aggregate in an unbaked green-mix formulation. **C 709, D02**
- filler, n**—an inert inorganic material used as an extender or mineral diluent in the constituents of products which does not add to the cementitious value of the cement. **C 1154, C17**
- filler, n**—a pigmented composition for filling pores or irregularities in a surface preparatory to application of other finishes. **D 16, D01**
- filler, n**—nonfibrous material, such as insoluble clays or gypsum, together with starches, gums, etc., added to a fabric to increase its weight or to modify the appearance or handle of the fabric. (Syn. back-sizing.) **D 123, D13**
- filler**—a material added to soap or other detergent that does not improve its attractiveness or its effectiveness under the conditions of use. **D 459, D12**
- filler, n**—a relatively inert material added to a plastic to modify its strength, permanence, working properties, or other qualities, or to lower costs. (See also **reinforced plastic**.) **D 883, D20**
- filler, n**—a relatively inert solid material added to an adhesive to modify its strength, permanence, working properties, or other qualities, or to lower cost. **D 907, D14**
- filler, n**—a solid compounding material, usually in finely divided form, which may be added in relatively large proportions to a polymer for technical or economic reasons. **D 1566, D11**
- filler, n—for paper or paperboard**, a material, generally nonfibrous and inorganic, added to the fiber furnish. **D 1968, D06**
- filler, n—for paperboard**, the inner ply or plies of a multi-ply sheet. **D 1968, D06**
- filler**—inert inorganic material used as an extender or diluent in the furnish of asbestos-cement which does not add to the cementitious value of the cement. **D 2946, C17**
- filler**—in composite materials, a primarily inert solid constituent added to the matrix to modify the composite properties or to lower cost. **D 3878, D30**
- filler, n—in manufactured carbon and graphite product technology**, carbonaceous particles comprising the base aggregate in an unbaked green-mix formulation. **D 4175, D02**
- filler, n—in testing sewn seams** nonfibrous material, such as insoluble clays or gypsum, together with starches, gums, and so forth, added to a fabric to increase its weight or to modify the appearance or handle of the fabric. (Syn. back-sizing.) (Compare **sizing**.) **D 4850, D13**
- filler, n**—a substance added to a system or product to increase bulk, weight, viscosity, opacity, or strength. **E 2201, E50**
- filler, n**—a relatively inert material added to a plastic to modify its strength, permanence, working properties, or other qualities or to lower costs. (See also **reinforced plastic**.) (D20) **F 412, F17**
- filler, n**—a relatively inert material added to a plastic to modify its strength, performance, working properties, or other qualities, or to lower costs. (See also **reinforced plastic**.) **F 1251, F04**

- filler character, n**—a character inserted to extend an item of data to achieve a desired length. (See also **pad character**.) **F 1294, F05**
- filler, inert, n**—a filler having no reinforcing effect. **D 1566, D11**
- filler pad**—See **cushioning material**. **D 996, D10**
- filler phase, n**—as used in *Test Method D 5061*, a discontinuous solid formed from coal macerals and minerals that do not deform thermoplastically during carbonization.
- fine coal, n**—that portion of a coal sample being subject to a washability study that is smaller than the predetermined particle size, generally between 2.36 mm (No. 8 USA Standard Sieve Series) and 9.5 mm ($\frac{3}{8}$ in.) round in diameter, which is specified in *Test Method D 4371*. **D 121, D05**
- filler sheet, n**—sheet of deformable or resilient material which, when placed between the assembly to be bonded and the pressure applicator, or when distributed within a stack of assemblies, aids in providing uniform application of pressure over the area to be bonded. **D 907, D14**
- filler strip**—See **lock-strip**, the preferred term. **C 717, C24**
- fillet, n**—that portion of an adhesive which fills the corner or angle formed where two adherends are joined. **D 907, D14**
- fillet**—curved intersection of head and shank, specified by its radius. **F 547, F16**
- fillet bead joint, n**—Use **fillet sealant joint** (preferred term). **C 717, C24**
- fillet head**—head with extra large curved intersection of head and shank. **F 547, F16**
- fillet seal**—a seal applied at the juncture of two adjoining parts or surfaces and along the edges of faying surfaces as a continuous bead of sealing material. **E 631, E06**
- fillet seal**—a seal applied at the juncture of two adjoining parts or surfaces and along the edges of faying surfaces as a continuous bead of sealing material. **E 1749, E06**
- fillet sealant joint, n**—in *building construction*, a joint where sealant is applied over the joint to the face of substrates that are approximately perpendicular to each other. **C 717, C24**
- fill factor**—the ratio of the weight of a given length of a stranded conductor to the weight of the solid conductor of the same diameter, length, and material. It may also be expressed by the ratio of the nominal area of the conductor times (1 plus the stranding factor) and the area of the circle that encloses the strands of the conductor. **B 354, B01**
- fill factor**—for internal probe electromagnetic testing, the ratio of the effective cross-sectional area of the primary internal probe coil to the cross-sectional area of the tube interior. **E 1316, E07**
- fill factor**—for encircling coil electromagnetic testing, the ratio of the cross-sectional area of the test specimen to the effective cross-sectional core area of the primary encircling coil (outside diameter of coil form, not inside diameter which is adjacent to specimen). **E 1316, E07**
- fill factor**—in magnetic particle examination, the ratio of the cross sectional area of the part being tested to the cross sectional area of the encircling coil. **E 1316, E07**
- fill factor, n**—of a photovoltaic device, the ratio of maximum power to the product of open-circuit voltage and short-circuit current. **E 1328, E44**
- fill in, n**—a condition where the halftone dots and fine type lose definition because the non-image areas of the plate between the dots or characters become plugged with dry ink or a mixture of dry ink and paper fibers. **D 6488, D01**
- fill-in**—image spread within nonimage areas of characters, digits, or designs. **F 549, F05**
- filling**—the application of materials, often cements or synthetic resins, into natural voids in a stone during fabrication. **C 119, C18**
- filling, n**—yarn running from selvage to selvage at right angles to the warp in a woven fabric. **D 123, D13**
- filling**—generally, the material occupying the space between joint surfaces, faults, and other rock discontinuities. The filling material may be clay, gouge, various natural cementing agents, or alteration products of the adjacent rock. (ISRM) **D 653, D18**
- filling, n**—yarn running from selvage to selvage at right angles to the warp in a woven fabric. **D 4439, D35**
- filling, n**—in *woven fabric*, an individual yarn running from selvage to selvage at right angles to the warp in a woven fabric. **D 4850, D13**
- filling band, n**—in *woven fabrics*, a visual defect across the width due to a change occurring in the yarn for a large number of picks. (Compare **filling bar**) **D 123, D13**
- filling band, n**—in *woven fabrics*, a visual defect across the width due to a change occurring in the yarn for a large number of picks. (Compare **filling bar**) **D 3990, D13**
- filling bar, n**—in *woven fabrics*, a visual defect across the width which contains a limited number of picks of different appearance than normal. (Compare **filling band**) **D 123, D13**
- filling bar, n**—in *woven fabrics*, a visual defect across the width which contains a limited number of picks of different appearance than normal. (Compare **filling band**) **D 3990, D13**
- filling bar, n**—for *inflatable restraint fabrics*, a temporary change in the filling-wise density of the weave pattern. (Syn: *stop/start mark*.) **D 6799, D13**
- filling elongation and tension, n**—stretch or tension measured at right angles to the warp direction of the fabric. **D 123, D13**
- filling elongation and tension, n**—stretch or tension measured at right angles to the warp direction of the fabric. **D 4850, D13**
- filling-faced twill, n**—a weave in which filling yarns float over warp yarns, to produce a diagonal effect in the resulting fabric. (See also **twill weave** and **warp faced twill**.) **D 123, D13**
- filling-faced twill, n**—a weave in which filling yarns float over warp yarns, to produce a diagonal effect in the resulting fabric. (See also **twill weave** and **warp faced twill**.) **D 4850, D13**
- filling material, n**—for *feathers or down*, the contents of an industry product containing feathers or down of any kind or type, with or without natural or synthetic materials. **D 123, D13**
- filling material, n**—for *feathers or down*, the contents of an industry product containing feathers or down of any kind or type, with or without natural or synthetic materials. **D 7022, D13**
- filling point**—the level at which a glass bottle has the nominal capacity. **C 162, C14**
- filling run-out**—See **broken pick**. **D 3990, D13**
- filling solution**—the solution inside a sensing or reference electrode that is replenished periodically. Solutions that are permanently sealed within the electrode (like the buffer inside a pH electrode) are usually called internal reference solutions to differentiate them from filling solutions. **D 4127, D19**
- filling tests, n**—in *fabric testing*, tests in which the filling yarns are torn. **D 123, D13**
- filling tests, n**—in *fabric testing*, tests in which the filling yarns are torn. **D 4850, D13**
- filling-to-filling seam, n**—a sewn seam in which the yarns in the filling direction on both sides of the sewn seam are perpendicular to the seam. **D 123, D13**
- filling-to-filling seam, n**—a sewn seam in which the yarns in the filling direction on both sides of the sewn seam are perpendicular to the seam. **D 4850, D13**
- fill leakage, n**—in *comforters*, either partial or total penetration of the stuffing material through the outer or face fabric. **D 123, D13**
- fill leakage, n**—in *comforters*, either partial or total penetration of the stuffing material through the outer or face fabric. **D 7023, D13**
- fill material, n**—material used in the construction of a structural fill. **D 5681, D34**
- fill pin, n**—the part of the compact in the spout used to fill the can; it is usually integral to the part produced. **B 899, B02**
- fill ratio, n**—see **compression ratio**. **B 243, B09**
- film, n**—a thin coating or layer of a substance over the surface of another material. **C 1145, C28**
- film, n**—in plastics, an optional term for sheeting having a nominal thickness not greater than 0.25 mm (0.01 in.). **D 883, D20**

film

film—sheeting, including that composed of cellulose or its derivatives, having nominal thickness not greater than 10 mils. (see also **films**) **D 1695, D01**

film, n—in plastics, term for sheeting having a nominal thickness not greater than 0.25 mm (0.01 in.). (See also **sheeting**.) **F 1251, F04**

film cassette—See **cassette**. **E 7, E04**

film clarity—characteristic of a deposited film which permits an unobstructed view of the substrate. **D 2825, D21**

film contrast—a qualitative expression of the slope or steepness of the characteristic curve of a film; that property of a photographic material which is related to the magnitude of the density difference resulting from a given exposure difference. **E 1316, E07**

film master, n—a master negative or positive film transparency of a specific bar code symbol from which a printing plate is made. **F 1294, F05**

film resistance—that portion of the contact resistance that is due to the presence of contaminants on one or both of the contact members. **B 542, B02**

films—transparent sheeting. If this is used as a generic term, regardless of sheet thickness, the plural should be used and the singular restricted to a specified size. (see also **film**) **D 1695, D01**

films, n—trimmed mica split to specific ranges of thickness under 0.15 mm processed from block and thins. **D 1711, D09**

film speed—a numerical value expressing the response of an image receptor to the energy of penetrating radiation under specified conditions. **E 1316, E07**

film strength—the relative resistance of the bisque to mechanical damage. **C 286, B08**

film weight—in the classification of film adhesives, weight per unit area of film adhesive usually expressed in pounds per square foot, kilograms per square metre, etc. **E 631, E06**

film weight—in the classification of film adhesives, weight per unit area of film adhesive usually expressed in pounds per square foot, kilograms per square metre, etc. **E 1749, E06**

filter—see **plugging compound**. **C 286, B08**

filter, n—a porous medium for collecting particulate matter.

absolute filter, n—a filter or filter medium of ultra-high collection efficiency for very small particles (submicrometre size) so that essentially all particles of interest or of concern are collected.

controlled-pore filter, n—a filter of various plastics or metals having a structure of controlled uniform pore size. **D 1356, D22**

filter—a device which modifies the light coming from the light source either chromatically or with regard to intensity.

(1) **color**—a device which transmits principally a predetermined range of wavelengths.

(2) **contrast**—a color filter, usually with strong absorption, whose function is to utilize the spectral absorption bands of the subject to control the contrast of the image by exaggerating or diminishing the brightness difference between areas of different color. Maximum contrast is obtained when the transmission of the filter is entirely within the absorption band of an area but not of its surroundings.

(3) **interference**—a combination of several thin optical films to form a layered coating for transmitting or reflecting a narrow band of wavelengths by virtue of interference effects.

(4) **neutral**—(a) a color filter that reduces the intensity of the transmitted illumination without affecting its hue.

(b) a color filter having identical transmission at all wavelengths throughout the spectrum. Such an ideal filter does not exist in practice.

(5) **orthochromatic**—a color filter whose function is to modify the illumination quality reaching the film so that the brightness of colored objects will be relatively the same in the resultant black-and-white positive.

(6) **photometric**—a color filter whose function is to convert the quality of illumination from that of one source to that of another. Most frequently the term is used for a filter altering the illumina-

tion quality from that of one color temperature to that of another.

(7) **X-Ray**—a material that preferentially absorbs certain wavelengths. **E 7, E04**

filter—a substance that attenuates the radiant power reaching the detector in a definite manner with respect to spectral distribution. **E 131, E13**

filter, n—in atomic spectrometry, a substance that attenuates the radiant power in a definite manner with respect to spectral distribution.

neutral, n—a filter that attenuates the radiant power reaching the detector by the same factor at all wavelengths within a prescribed wavelength region.

nonselective—not recommended, see **filter, neutral**. **E 135, E01**

filter—a network that passes electromagnetic wave energy over a described range of frequencies and attenuates energy at all other frequencies. **E 1316, E07**

filter—uniform layer of material, usually of higher atomic number than the specimen, placed between the radiation source and the film for the purpose of preferentially absorbing the softer radiations. **E 1316, E07**

filter—a processing component or function that excludes, passes or amplifies a selected kind of signal or part of a signal. **E 1316, E07**

filter aid—an inert, insoluble material, more or less finely divided, used as a filter medium or to assist in filtration by preventing excessive packing of the filter cake. **B 374, B08**

filter bedding stone—(generally 6-in. minus material) stone placed under graded riprap stone or armor stone in a layer or combination of layers designed and installed in such a manner as to prevent the loss of underlying soil or finer bedding materials due to moving water. **D 653, D18**

filter block—a cellular vitrified clay block unit, of proprietary configuration, designed to underbed the media in trickling filters. **C 896, C04**

filter cake—the accumulated particles on a filter surface, usually from a slurry mixture. **D 6161, D19**

filter coefficients—values which define a mask filter in image processing. **E 1316, E07**

filter holder—a plastic holder that supports the filter medium upon which airborne particulate matter is collected. **E 631, E06**

filtering, n—*indata acquisition*, a means of attenuating signals in a given frequency range. They can be mechanical (volume tank, spring, mass) or electrical (capacitance, inductance) or digital (mathematical formulas), or a combination thereof. Typically, a low-pass filter attenuates the unwanted high frequency noise. **D 4175, D02**

filter, neutral—a filter that attenuates the radiant power reaching the detector by the same factor at all wavelengths within a prescribed wavelength region. **E 131, E13**

filter (protective filter)—a layer or combination of layers of pervious materials designed and installed in such a manner as to provide drainage, yet prevent the movement of soil particles due to flowing water. **D 653, D18**

filtrate—the fluid that has passed through a filter. **D 4410, D19**

filtrate—the portion of the feed stream which has passed through a filter. **D 6161, D19**

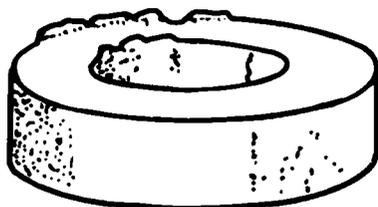

filtration—the process of passing a liquid through a porous medium for the removal of suspended matter. **D 4410, D19**

fin—(1) an imperfection caused by entrance of glass into a seam between mold parts during forming.

(2) the feather edge obtained when cutting flat glass.

C 162, C14

fin—fine feather-edge protrusion from the surface (Syn. *flash*).

- fin**—thin projection from cut edge of point, a defect. Occasionally found on rim of head. **F 109, C21**
F 547, F16
- fin**—See **burr**. **F 547, F16**
- fin**—portion of the boom membrane above the float. **F 818, F20**
- final boiling point (FBP)**—the point at which a cumulative volume count equal to 99.5 % of the total volume count under the chromatogram is obtained. **D 4175, D02**
- final cover, *n***—cover material that is applied as part of closure of a landfill or surface impoundment. **E 2201, E50**
- final inspection**—inspection by a qualified inspector, industrial hygienist, or local public health official to determine whether abatement and cleanup meet applicable standards. **E 631, E06**
- final remedy, *n***—site restoration. **D 5681, D34**
- final sample, *n***—sample obtained at the final stage of multi-stage sampling. **E 1402, E11**
- final set**—*in grouting*, a degree of stiffening of a grout mixture greater than initial set, generally stated as an empirical value indicating the time in hours and minutes that is required for cement paste to stiffen sufficiently to resist the penetration of a weighted test needle. **D 653, D18**
- final twist, *n***—the number of turns per unit length in a single yarn component of a plied yarn or the plied yarn component of a cabled yarn as the component lies in the more complex structure. **D 123, D13**
- final twist, *n***—the number of turns per unit length in a single yarn component of a plied yarn or the plied yarn component of a cabled yarn as the component lies in the more complex structure. (syn. “as-is” twist) **D 4849, D13**
- financial management rate-of-return (FMRR)**—See **adjusted internal rate-of-return (AIRR)**. **E 631, E06**
- financial management rate-of-return (FMRR), *n***—See **adjusted internal rate-of-return (AIRR)**. **E 833, E06**
- financing lease**—a capital lease. **E 2135, E53**
- finder patterns, *n***—a unique pattern, containing no data, that is specific to each symbology, whose purpose is to locate the symbol within the reader’s field of view. **F 1294, F05**
- Finders’ sole leather**—one of the two principal types of sole leather. It has less flexibility and compressibility than factory sole leather and is more suitable for use in shoe repair. (See also **factory sole leather**.) **D 1517, D31**
- fine aggregate, *n***—(1) aggregate passing the 3/8-in. (9.5-mm) sieve and almost entirely passing the 4.75-mm (No. 4) sieve and predominantly retained on the 75- μ m (No. 200) sieve: or (2) that portion of an aggregate passing the 4.75-mm (No. 4) sieve and retained on the 75- μ m (No. 200) sieve. **D 8, D04**
- fine annealing**—to attain more uniform structure than ordinarily required, maximizing homogeneity of physical properties by minimizing prior thermally induced variations. **C 162, C14**
- fine end, *n***—a smaller than normal diameter warp end. (Syn. light end, thin end. (Compare **coarse end**.) **D 123, D13**
- fine end, *n***—a smaller than normal diameter warp end. (Syn. light end, thin end) (Compare **coarse end**) **D 3990, D13**
- fine filling**—See **thin filling**. **D 3990, D13**
- fine grain practice, *n***—a steelmaking practice for other than **stainless steel** that is intended to produce a **killed steel** that is capable of meeting the requirements specified for fine austenitic grain size. **A 941, A01**

fine hackle—See **mist**.

C 162, C14

fine material—material finer than No. 200 (75- μ m) U.S. standard sieve. **D 5681, D34**

fine-material load—that part of the total sediment load that is composed of particles of a finer size than the particles present in appreciable quantities in the bed material; normally, the fine-material load consists of material finer than 0.062 mm.

D 4410, D19

fine mineral surfacing—water-insoluble inorganic material, more than 50 % of which passes the 500- μ m (No. 35) sieve, used on the surface of roofing. **D 1079, D08**

fine mist pump, *n*—a mechanical pump dispenser that atomizes liquid into a fine mist. An accumulative pump is the most common type of fine mist pump. **D 6655, D10**

fine nail—slender, bright, regular-stock-steel, 1/2 by 0.035 to 1 1/8 by 0.072-in. nails with flat 1/8 to 1/64-in. head and medium diamond point. Also, slender, electroplated, hardened-steel, 1/4 by 0.054 to 2 1/2 by 0.083-in. nails with brad head and short diamond point.

F 547, F16

fineness, *n*—a measure of the purity of precious metals expressed in parts per thousand. **B 899, B02**

fineness—a measurement number designating the particle size of a material, usually reported as percent passing a screen of a particular standard size. **C 242, C21**

fineness, *n*—a measurement number designating the particle size of a material, usually reported as passing a screen of a particular standard size. **C 1145, C28**

fineness, *n*—of *fibers*, a relative measure of size, diameter, linear density, or mass per unit length expressed in a variety of units.

D 123, D13

fineness—a measure of particle-size.

D 653, D18

fineness, *n*—of *textile fibers*, a relative measure of size, diameter, linear density or mass per unit length expressed in a variety of units. **D 4845, D13**

fineness modulus, *n*—an empirical factor obtained by adding total percentages of a sample of aggregate retained on each of a specified series of sieves and dividing by 100. The sieve sizes used are: No. 100 (150 μ m), No. 50 (300 μ m), No. 30 (600 μ m), No. 16 (1.18 mm), No. 8 (2.36 mm), No. 4 (4.75 mm), 3/8 in. (9.5 mm), 3/4 in. (19.0 mm), 1 1/2 in. (38.1 mm) and larger, increasing in the ratio of 2 to 1. **C 11, C11**

fineness modulus, *n*—a factor obtained by adding the percentages of material in the sample that is coarser than each of the following sieves (cumulative percentages retained), and dividing the sum by 100: 150- μ m (No. 100), 300- μ m (No. 50), 600- μ m (No. 30), 1.18-mm (No. 16), 2.36-mm (No. 8), 4.75-mm (No. 4), 9.5-mm (3/8-in.), 19.0-mm (3/4-in.), 37.5-mm (1 1/2-in.), 75-mm (3-in.), 150-mm (6-in.). **C 125, C09**

fineness modulus—an empirical factor obtained by adding the total percentages of an aggregate sample retained on each of a specified series of sieves, and dividing the sum by 100; in the United States, the U.S. Standard sieve sizes are: No. 100 (149 μ m), No. 50 (297 μ m), No. 30 (590 μ m), No. 16 (1,190 μ m), No. 8 (2,380 μ m), and No. 4 (4,760 μ m) and 3/8 in. (9.5 mm), 3/4 in. (19 mm), 1 1/2 in. (38 mm), 3 in. (76 mm), and 6 in. (150 mm). **D 653, D18**

fineness of enamel—a measurement of the degree to which a frit has been milled in wet or dry form, usually expressed in grams residue retained on a certain mesh screen from a 50-cm³ or a 100-g sample. **C 286, B08**

fine pick—See **thin filling**.

D 3990, D13

fines, *n*—the portion of a powder composed of particles which are smaller than a specified size, currently less than 44 μ m. See also **superfines**. **B 243, B09**

fines—the portions of a powder composed of particles smaller than a specified size. **C 242, C21**

fines, *n*—the portions of a powder composed of particles smaller than a specified size. **C 1145, C28**

fin

fin—portion of a soil finer than a No. 200 (75- μ m) U.S. standard sieve. **D 653, D18**

fin, *n*—particles smaller than the smallest nominal specified particle size. **D 2652, D28**

fin, *n*—*for asbestos*, the class of material having the smallest range of particle size, that is segregated by a particle size classification of asbestos by any relevant test method. **D 2946, C17**

fin, *n*—that portion of pelleted carbon black that passes through a specified sieve under standard conditions. **D 3053, D24**

fine sprays—distribution of droplets with $100\ \mu\text{m} < D_{v,5} \leq 400\ \mu\text{m}$. **E 1102, E35**

fine structure—a generic term denoting the submicroscopic structure that depends on molecular arrangement. **D 1695, D01**

fine transfer—see **material transfer, bridge**. **B 542, B02**

finger blisters—finger shaped blisters or wrinkles in the plies of a built-up roofing or waterproofing membrane. **D 1079, D08**

finger joint, *n*—see *finger joint* under **joint**. **D 907, D14**

finger mark, *n*—an irregular spot showing variation in picks per inch for a limited width. **D 123, D13**

finger mark, *n*—an irregular spot showing variation in picks per inch for a limited width. **D 3990, D13**

finger rings—the feature of both the female and the male members that forms the gripping surface for the surgeon (commonly classified as the ring-handled feature in ISO 7151). **F 921, F04**

finger rings—the feature of the scissors that forms the gripping surface for the surgeon (commonly classified as the ring-handled feature). **F 1078, F04**

fingertip towel, *n*—a textile product with fringes and side hems or selvages which is smaller than a hand towel, generally used as decoration and to dry hands. **D 123, D13**

fingertip towel, *n*—a textile product with fringes and side hems or selvages which is smaller than a hand towel, generally used as decoration and to dry hands. **D 7023, D13**

finger wrinkles—See **finger blisters**. **D 1079, D08**

finial, *n*—an ornamental piece on the top of a post, newel, or railing; frequently in the form of an urn or pineapple, and so named. **E 631, E06**

finial—See **railing systems**. **E 631, E06**

finial, *n*—an ornamental piece on the top of a post, newel, or railing; frequently in the form of an urn or pineapple, and so named. **E 1481, E06**

fining, also refining—the process by which molten glass becomes relatively free of undissolved gases. **C 162, C14**

finish—(1) the part of a bottle for holding the cap or closure.

(2) stage in melting process after glass appears free of seeds.

(3) the quality of a glass surface as influenced by very fine pits and cracks remaining from a grinding and polishing process. **C 162, C14**

finish—the exposed top surface of the plaza deck system, or traffic, or wearing surface. **C 717, C24**

finish, *n*—(1) final coat in a paint system; at the termination of cure or drying (2) sometimes refers to the entire coating system: the texture, color, and smoothness of a surface, and other properties affecting appearance. **D 16, D01**

finish, *n*—*in buttons*, the surface condition or texture. **D 123, D13**

finish, *n*—See **paperboard**. **D 996, D10**

finish—materials applied to the grain and sometimes split surface of the leather to cover blemishes, create smoothness and give uniformity of color and appearance which may vary from dull to glossy. **D 1517, D31**

finish, *n*—(1) the final treatment or coating of a surface, (2) the fine or decorative work required to make a **building** or its parts complete. **E 631, E06**

finish—the final surface visual appearance of the instrument classified as follows:

(1) bright or mirror finish—highly reflective surfaces.

(2) satin, matte, or black finish—reduced reflected surfaces (as compared to bright or mirror finish). **F 921, F04**

finish—the final surface visual appearance of the instrument classified as follows:

(1) **bright or mirror finish**—highly reflective surfaces.

(2) **satin, matte, or black finish**—reduced reflected surfaces (as compared to bright or mirror finish). **F 1078, F04**

finish, *n*—a chemical or mechanical modification, or both, of the fabric for a specific performance result. **F 1494, F23**

finish—the final surface visual appearance of a needle, that may be classified as follows: **F 1840, F04**

finish coat, *n*—the final layer of plaster applied over a basecoat or other substrate. **C 11, C11**

finish coat, *n*—the final wet-state material, which provides color and texture, applied over the reinforced base coat. **E 2110, E06**

finished, *adj*—*forglass laminates*, a descriptive term for woven fabrics that have passed through a treating procedure which is compatible with a resin matrix or facilitates manufacturing, or both. **D 123, D13**

finished, *adj*—*intextile floor covering materials*, the completion of all manufacturing operations. **D 123, D13**

finished, *adj*—*in textile floor covering materials*, the completion of all manufacturing operations. **D 5684, D13**

finished, *adj*—*forinflatable restraint fabrics*, a descriptive term for fabric that has been treated after weaving and that is suitable for coating or piece cutting. **D 6799, D13**

finished, *adj*—*forglass laminates*, a descriptive term for woven fabrics that have passed through a treating procedure which is compatible with a resin matrix or facilitates manufacturing, or both. **D 7018, D13**

finished fabric weight, *n*—mass per unit area expressed in grams per square metre (ounces per square yard), grams per linear metre (ounces per linear yard), or inversely as metres per kilogram (linear yards per pound), or square metres per kilogram (square yards per pound). **D 123, D13**

finished fabric weight, *n*—mass per unit area expressed in grams per square metre (ounces per square yard), grams per linear metre (ounces per linear yard), or inversely as metres per kilogram (linear yards per pound), or square metres per kilogram (square yards per pound). **D 4850, D13**

finished grade—See **grade**. **E 631, E06**

finished grade—the surface elevation of lawns, walks, drives, or other improved surfaces after completion of construction or grading operations. **E 631, E06**

finished metal connector plate—galvanized or chemically surfaced steel connector plate, with or without prepunched holes. **E 631, E06**

finished pile yarn floor covering, *n*—*in textile floor covering materials*, the pile yarn floor covering that has undergone all steps of the manufacturing process. **D 123, D13**

finished pile yarn floor covering, *n*—*in textile floor covering materials*, the pile yarn floor covering that has undergone all of the steps of the manufacturing process. **D 5684, D13**

finished stone—dimension stone with one or more mechanically exposed surfaces. **C 119, C18**

finished thermocouple material—sheathed thermocouple material fabricated in final form, ready for delivery to the purchaser. **E 344, E20**

finished thermocouple material—sheathed thermocouple material in final form, fabricated, and tested in accordance with Specification E 585. **E 344, E20**

finished yield, *n*—*in knitted fabrics*, the number of finished square metres per kilogram (square yards per pound) of finished fabric. **D 123, D13**

finished yield, *n*—*in knitted fabrics*, the number of finished square metres per kilogram (square yards per pound) of finished fabric. **D 4850, D13**

finisher—(1) person in charge of a day-tank during the melting and firing of the glass.
(2) the workman who does the final work, such as polishing or putting the handle or foot on a piece of ware. C 162, C14

finish grinding, *n*—the completion of a grinding operation to obtain a desired surface appearance or accurate dimensions. C 1145, C28

finishing bar, *n*—uneven appearance across the entire fabric width. D 123, D13

finishing bar, *n*—an uneven appearance across the entire fabric width. D 3990, D13

finishing compound, *n*—(sometimes called *topping compound*) a compound specifically formulated and manufactured for use over taping or all purpose compounds to provide a smooth and level surface for the application of decoration. C 11, C11

finishing head—brad head, as found on finishing nail. F 547, F16

finishing hydrated lime—hydrated lime suitable for use in the finish coat of plaster. C 51, C07

finishing nail—slender, bright, regular-stock-steel, 1 by 0.058 to 4 by 0.135-in. nails with flat or cupped 0.086 to 0.177-in. brad head and medium diamond point for countersinking where concealment of head is important. (See also, **fine nail**, **moulding and trim nails**, **wallboard nails**.) F 547, F16

finishing quicklime—quicklime suitable (after slaking to a lime putty) for use in the finish coat of plaster. C 51, C07

finishing technique, *n*—as applies to laundry and dry cleaning procedures, the mechanical means by which the garment is put in its final state (for example, pressing, drying, wrinkle removal, and so forth). F 1494, F23

finish wearing surface—See *traffic surface*. C 717, C24

finite element—one of the regular geometrical shapes into which a figure is subdivided for the purpose of numerical stress analysis. (ISRM) D 653, D18

fire—See *bisque fire*; *decorating fire*; *glost fire*; *single fire* under **firing**. C 242, C21

fire, *n*—as related to *textile flammability*, an uncontrolled conflagration in which materials are destroyed by burning as evidenced by flames of varying size and shape, and a high-intensity heat source of 5 kw or greater, such as burning contents of a room, a burning basket, burning building, or forest fire. D 123, D13

fire, *n*—as related to *textile flammability*, an uncontrolled conflagration in which materials are destroyed by burning as evidenced by flames of varying size and shape, and a high intensity heat source of 5 kw or greater, such as a burning waste basket, grease-fire on a stove, burning building or forest fire. D 4391, D13

fire, *n*—destructive burning as manifested by any or all of the following: light, flame, heat, smoke. E 176, E05

firebrick, *n*—any type of refractory brick specifically fireclay brick. C 71, C08

firebrick, insulating, *n*—a refractory brick characterized by low thermal conductivity and low heat capacity. C 71, C08

fire-characteristic profile, *n*—an array of fire-test-response characteristics, all measured using tests relevant to the same fire scenario, for a material, product, or assembly to address, collectively, the corresponding fire hazard. (See also **fire hazard**, **fire risk**, and **fire-test-response characteristic**.) E 176, E05

fire-characteristic profile, *n*—array of fire-test-response characteristics, all measured using tests relevant to the same fire scenario, for a material product, or assembly to address, collectively, the corresponding fire hazard. E 176, E05

fire check—a check resulting from localized thermal stress during forming. C 162, C14

fire clay, *n*—a sedimentary clay of low flux content. C 43, C15

fireclay, *n*—an earthy or stony mineral aggregate that has as the essential constituent hydrous silicates of aluminum with or without free silica, plastic when sufficiently pulverized and wetted, rigid when subsequently dried, and of suitable refractoriness for use in commercial refractory products. C 71, C08

fire clay—a sedimentary clay of low-flux content. C 896, C04

fire clay—a silicious clay rich in hydrous aluminum silicates. D 653, D18

fireclay, nodular, *n*—a rock containing aluminous or ferruginous nodules, or both, bonded by fireclay. C 71, C08

fireclay, plastic or bond, *n*—a fireclay of sufficient natural plasticity to bond nonplastic materials. C 71, C08

fireclay plastic refractory, *n*—a fireclay material tempered with water and suitable for ramming into place to form a monolithic furnace lining that will attain satisfactory physical properties when subjected to the heat of furnace operation. C 71, C08

fire crack—cracking, frequently intergranular in nature, that occurs in some metallic materials when too rapidly heated or when stressed and heated rapidly. Not to be confused with “quench crack.” E 7, E04

fire cracks—see synonymous term **fire check**. C 162, C14

fire cracks—cracks in glass caused by local temperature shock. E 344, E20

fired bond, *n*—bond developed between particulate constituents of brick solely as the result of the firing process. C 43, C15

fire-door nail—bright, regular-stock-steel, barbed, 1¼ by 0.092-in. nail (3d shingle nail) with flat ¼-in. head and medium diamond point and 2 by 0.099-in. nail (6d box nail) with flat 17/64-in. head and medium diamond point. F 547, F16

fire endurance, *n*—a measure of the elapsed time during which a material or assemblage continues to exhibit fire resistance. E 176, E05

fire exposure, *n*—process by which or extent to which humans, animals, materials, products, or assemblies are subjected to the conditions created by fire. E 176, E05

fire gases, *n*—the airborne products emitted by a material, product, or assembly undergoing pyrolysis or combustion, that exist in the gas phase at the relevant temperature. E 176, E05

fire hazard, *n*—the potential for harm associated with fire. E 176, E05

fire hazard, *n*—the potential for harm associated with fire. E 176, E05

fire limit, *n*—the threshold limit conditions that will just support sustained combustion of a material under a combination of specified conditions and at least one variable parameter. G 126, G04

fire marks—a defect characterized by tiny indentations similar in appearance to shallow pinholes. C 286, B08

fire model, *n*—a physical representation or set of mathematical equations that approximately simulate the dynamics of burning and associated processes. E 176, E05

fire over—idling a melting unit at operating temperature. C 162, C14

fire performance, *n*—response of a material, product, or assembly in a particular fire, other than in a fire test involving controlled conditions (different from **fire-test-response characteristic**). E 176, E05

fire performance, *n*—response of a material, product, or assembly in a specific fire, other than in a fire test involving controlled conditions (different from fire-test-response characteristics, q.v.) E 176, E05

fire performance characteristic, *n*—this term is deprecated. (See **fire-test-response characteristic** and **fire performance** (q.v.)) E 176, E05

fire performance test, *n*—this term is deprecated. (See **fire-test-response characteristic** and **fire performance** (q.v.)) E 176, E05

fire point—the lowest temperature at which a specimen will sustain burning for 5 s under specified conditions of test. D 2864, D27

fire point, *n*—the lowest temperature at which a liquid or solid specimen will sustain burning for 5 s. D 4175, D02

fire point, *n*—*in petroleum products*, the lowest temperature corrected to a barometric pressure of 101.3 kPa (760 mm Hg), at which application of an ignition source causes the vapors of a test specimen of the sample to ignite and sustain burning for a minimum of 5 s under specified conditions of test. D 4175, D02

fire-polish

fire-polish—to make glass smooth, rounded, or glossy by heating the glass surface. C 162, C14

fireproof, *adj*—an inappropriate and misleading term. Do not use. (See commentary in X1.) E 176, E05

fireproofing tile, *n*—tile for use as a protection for structural members against fire. C 43, C15

fire-refined copper—copper of any origin or type finished by furnace refining without having been processed at any stage by electrolytic or chemical refining. Usually when the term fire-refined copper is used alone it refers to fire-refined tough pitch copper. This designation applies to the following:

—copper cast in refinery shapes suitable for hot or cold working or both, and by extension, to fabricators' products made therefrom.

—ingots or ingot bars suitable for remelting. B 846, B05

fire resistance, *n*—the ability of a material, product, or assembly to withstand fire or give protection from it for a period of time. (Contrast **fire resistance rating**.) E 176, E05

fire resistance, *n*—the property of a material or assemblage to withstand fire or give protection from it. E 176, E05

fire resistance—as applied to buildings, the property of a material or assembly to withstand fire or to give protection from it, characterized by the ability to confine a fire or to continue to perform a structural function, or both. E 631, E06

fire-resistance classification, *n*—a standard rating of fire-resistance and protective characteristics of a building construction or assembly. C 11, C11

fire resistance rating, *n*—a measure of the elapsed time during which a material, product, or assembly continues to exhibit fire resistance under specified exposure conditions. (Contrast **fire resistance**.)

E 176, E05

fire resistant, *adj*—See **fire resistive**, the preferred term. E 176, E05

fire resistant boom (aka fire containment boom)—boom intended for containment of burning oil slicks. F 818, F20

fire resistive, *adj*—having fire resistance (TCG-01). E 176, E05

fire-resistive barrier system, *n*—a specific construction of devices, materials, or coatings installed around, or applied to, the electrical system components. E 176, E05

fire resistive joint system, *n*—a device or designed feature that provides a fire separating function along continuous linear openings, including changes in direction, between or bounded by fire separating elements. E 176, E05

fire retardance, *n*—the resistance to combustion of a material when tested under specified conditions. D 123, D13

fire retardant—having or providing comparatively low flammability or flame spread properties. D 9, D07

fire-retardant, *adj*—a descriptive term which implies that the described product, under accepted methods of test, will significantly: (a) reduce the rate of flame spread on the surface of a material to which it has been applied, or (b) resist ignition when exposed to high temperatures, or (c) insulate a substrate to which it has been applied and prolong the time required to reach its ignition, melting, or structural-weakening temperature. D 16, D01

fire-retardant, *adj*—having or providing comparatively low flammability or flame spread properties (E 176, E05). D 996, D10

fire retardant, *adj*—not a defined term. Use as a modifier only with defined compound terms: **fire-retardant barrier**, **fire-retardant chemical**, **fire-retardant coating**, and **fire-retardant treatment**.

E 176, E05

fire-retardant barrier, *n*—a layer of material which, when secured to a combustible material or otherwise interposed between the material and a potential fire source, delays ignition and combustion of the material when the barrier is exposed to fire. E 176, E05

fire-retardant chemical, *n*—a chemical, which when added to a combustible material, delays ignition and combustion of the resulting material when exposed to fire. E 176, E05

fire-retardant coating, *n*—a coating that will do one or more of the following: (1) reduce the flame spread on the substrate over which the coating is applied, sometimes at the sacrifice of the coating (see

intumescent coating);

(2) resist ignition of the substrate when exposed to high temperature; or

(3) insulate the substrate to which the coating is applied and thereby prolong the time required to reach its ignition, melting or structural-weakening temperature. D 16, D01

fire-retardant coating, *n*—a fluid-applied surface covering on a combustible material which delays ignition and combustion of the material when the coating is exposed to fire. (See also **flame-retardant coating**. Compare **fire-retardant barrier**.) E 176, E05

fire retardant, *n*—a deprecated term. Do not use. E 176, E05

fire-retardant treatment, *n*—the use of a fire-retardant chemical or a fire-retardant coating. (See also **flame-retardant treatment**.)

E 176, E05

fire risk, *n*—an estimation of expected fire loss that combines the potential for harm in various fire scenarios that can occur with the probabilities of occurrence of those scenarios. E 176, E05

fire scale—copper oxide subscale formed just under the surface of silver-copper alloys when they are annealed in air. E 7, E04

fire scenario, *n*—a detailed description of conditions, including environmental, of one or more of the stages from before ignition to the completion of combustion in an actual fire, or in a full scale simulation. E 176, E05

fire scenario, *n*—a detailed description of conditions, including environmental, of one or more of the steps from before ignition to the completion of combustion in an actual fire, or in a full-scale simulation. E 176, E05

fire separating element, *n*—floors, walls, and partitions having a period of fire resistance determined in accordance with Test Methods E 119 or E 1529. E 176, E05

fire stop—a through-penetration fire stop is a specific construction consisting of the materials that fill the opening around penetrating items such as cables, cable trays, conduits, ducts, and pipes and their means of support through the wall or floor opening to prevent spread of fire. E 176, E05

fire test, *n*—a procedure, not necessarily a standard test method, in which the response of materials to heat or flame (or both) under controlled conditions is measured or otherwise described.

E 176, E05

fire test exposure severity, *n*—a measure of the degree of fire exposure; specifically in connection with Test Methods E 119, E 152, and E 163, the ratio of the area under the curve of average furnace temperature to the area under the standard time/temperature curve, each from the start of the test to the end or time of failure, and above the base temperatures 68°F (20°C).

E 176, E05

fire-test-response characteristic, *n*—a response characteristic of a material, product, or assembly, to a prescribed source of heat or flame, under controlled fire conditions; such response characteristics may include but are not limited to ease of ignition, flame spread, heat release, mass loss, smoke generation, fire resistance, and toxic potency of smoke. E 176, E05

fire-test-response-characteristic index, *n*—a single quantitative measure that combines two or more fire-test-response characteristics for a material, product, or assembly, all developed under test conditions compatible with a common fire scenario, addressing collectively the corresponding threat. See also **fire-test-response-characteristic profile**, **fire hazard**, **fire risk**, **fire-test-response characteristic**. E 176, E05

fire-test-response-characteristic profile, *n*—array of fire-test-response characteristics for a material, product, or assembly, all developed under test conditions compatible with a common fire scenario, addressing collectively the corresponding threat. See also **fire hazard**, **fire risk**, **fire-test-response characteristic**. E 176, E05

fire window assembly, *n*—a window or glass block configuration, intended for use in walls or partitions, for which a fire endurance rating has been determined in accordance with this fire-test-response standard. E 176, E05

firing, *v*—process of heating the material to elevated temperatures.

C 43, C15

firing—the controlled heat treatment of ceramic ware in a kiln or furnace, during the process of manufacture, to develop the desired properties.

bisque fire—the process of kiln-firing ceramic ware before glazing.

decorating fire—the process of firing ceramic or metallic decorations on the surface of glazed ceramic ware.

firing curve—a diagram or table showing the time and temperature planned or experienced by ware going through a firing operation.

firing cycle—the time required for one complete firing operation (cold-to-cold).

firing range—the range of firing temperature within which a ceramic composition develops properties which render it commercially useful.

glost fire—the process of kiln-firing bisque ware to which glaze has been applied.

single fire—the process of maturing an unfired ceramic body and its glaze in one firing operation.

C 242, C21

firing—the controlled heat treatment of ceramic ware in a kiln or furnace to develop the desired final properties.

C 286, B08

firing, *n*—for the CFR engine, operation of the CFR engine with fuel and ignition.

D 4175, D02

firing expansion, *n*—the increase in the dimensions of a substance or product during thermal treatment.

C 1145, C28

firing range—the time-temperature interval in which a porcelain enamel or ceramic coating is satisfactorily matured.

C 286, B08

firing temperature—the degree of sensible heat attained by the ware during the maturing of the coating.

C 286, B08

firing time—the period during which the ware remains in the firing zone of the furnace to mature the coating.

C 286, B08

firing zone—that portion of the furnace, usually a continuous furnace, through which the ware passes and that remains at or near the firing temperature of the coating.

C 286, B08

first article—preproduction models, initial production samples, test samples, first lots, or pilot samples submitted for testing and evaluation for conformance with specified contract requirements before or in the initial stages of production.

E 2135, E53

first article testing—testing and evaluating the first article for conformance with specified contract requirements before or in the initial stage of production.

E 2135, E53

first cost—costs incurred in placing a building or building subsystem into service, including, but not limited to, costs of planning, design, engineering, site acquisition and preparation, construction, purchase, installation, property taxes and interest during the construction period, and construction related fees (Syn. *initial investment cost, initial cost*).

E 631, E06

first cost, *n*—costs incurred in placing a building or building subsystem into service, including, but not limited to, costs of planning, design, engineering, site acquisition and preparation, construction, purchase, installation, property taxes and interest during the construction period, and construction related fees (Syn. *initial investment cost, initial cost*).

E 833, E06

first cryoscopic constant, *A, n*—a constant of proportionality between the freezing point depression of, and concentration of impurities in, a sample of reference material, given by the ratio of the molar heat of fusion of the pure material, *L*, to the product of the molar gas constant, *R*, and the square of the thermodynamic temperature of fusion, *T*, of the pure material (freezing point):

$$A = \frac{L}{RT^2}$$

E 344, E20

first floor—See **floor**.

E 631, E06

first floor—in a building, (1) (in the United States) the floor of a

building that is at, or closest to, **finished grade** (also used as a synonym for **groundfloor**). (2) (except in the United States) the floor of a building that is next above the floor at, or closest to, **finished grade**.

E 631, E06

first hit location—a zone location method defined by which a channel among a group of channels first detects the signal.

E 1316, E07

first-in, first-out (FIFO)—method of inventory valuation that assumes merchandise is sold in the order of its receipt. The first-price in the first-price out; hence, cost of sales is based on older dollars.

E 2135, E53

first-loss tow/current velocity—minimum tow/current velocity normal to the membrane at which oil escapes past a boom.

F 818, F20

first point of no break—the amount (weight-mass) of porcelain enamel slip retained when it stops sliding off an enameled pick-up panel and is observed to drain smoothly from the panel without showing a wavy pattern on the wet surface (known also as “yield point”).

C 286, B08

first side—{archaic} the surface of plate which is ground and polished first.

C 162, C14

first story—the lowermost story of a building entirely above the average grade (also used as a synonym for **ground floor**).

E 631, E06

first story—See **building space**.

E 631, E06

fishbone—a striation that does not reach entirely across the fracture surface.

C 162, C14

fish-eye, *n*—small globular mass that has not blended completely into the surrounding material. See **gel**.

D 883, D20

fish-eye—a small globular mass that has not blended completely into the surrounding pultruded material.

NOTE—This condition is particularly evident in a transparent or translucent material.

D 3918, D20

fish-eye, *n*—small globular mass that has not blended completely into the surrounding material. (D20)

F 412, F17

“fish-hook-like” thread—See **buttess-type thread**.

F 547, F16

fishhooks, *n*—strands of belt or bead wire exposed from a processed scrap tire or an individual piece of belt or bead wire. (See also *bear claw*).

D 5681, D34

fishing tool—in *grouting*, a device used to retrieve drilling equipment lost or dropped in the hole.

D 653, D18

fishmouth—(1) a half-cylindrical or half-conical opening formed by an edge wrinkle or failure to embed a roofing felt;

(2) in *shingles*, a half-conical opening formed at a cut edge.

D 1079, D08

“fish-mouth” point—incomplete chisel wedge point with two narrow ridges at end, a defect resulting from premature breaking of wire during forming.

F 547, F16

fishscaling—a defect appearing as small half-moon shaped fractures somewhat resembling the scales of a fish.

C 286, B08

fishscaling, delayed—see **delayed fishscaling**.

C 286, B08

fission chamber—an ionization chamber containing one or more surfaces coated with fissionable material.

E 170, E10

fissure—a gapped fracture. (ISRM)

D 653, D18

fissures, *n*—surface defects consisting of narrow openings or cracks.

C 1145, C28

fit, *n*—the quality, state or manner in which the length and closeness of clothing, when worn, relates to the human body.

F 1494, F23

fit, *n*—the ability of the shoe or hosiery to conform to the size, width, shape, and proportion of the foot.

F 1646, F13

fit-for-use, *n*—a product, system, or service that is suitable for its intended use.

D 4175, D02

fitted sheet, *n*—in *textiles*, a product usually made with boxed corners, sometimes elasticized with shape and size to conform to the contours of the mattress and used for covering the mattress on a bed.

D 123, D13

fitted sheet, *n*—in *textiles*, a product usually made with boxed corners, sometimes elasticized with shape and size to conform to

fitted sheet, n

- the contours of the mattress and used for covering the mattress on a bed. **D 7023, D13**
- fitting**—products such as wyes, tees, elbows, adapters, etc. used in the installation of vitrified clay pipelines. **C 896, C04**
- fitting, n—for pipes**, component such as wyes, tees, and adapters for use in laying pipe, such that, when properly installed yields an assembly equivalent in serviceability and strength to the pipe sections. **C 1154, C17**
- fitting, n—for conduit**, component such as adapters, reducers, increasers, bends and bell ends, for use in laying conduit and made to such dimensions as will provide equivalent strength and silt-tight joints when assembled with the conduit. **C 1154, C17**
- fitting, n—for conduit**, component such as adapters, reducers, increasers, bends, and bell ends, for use in laying asbestos-cement conduit and made of equivalent strength and to such dimensions as will provide silt-tight joints when assembled with the conduit. **D 2946, C17**
- fitting, n**—a piping component used to join or terminate sections of pipe or to provide changes of direction or branching in a pipe system. **F 412, F17**
- fittings, n—for pipes**, components such as wyes, tees, elbows, and adapters for use in laying asbestos-cement pipe, such that, when properly installed, yield as an assembly equivalent inserviceability and strength to the pipe sections. **D 2946, C17**
- fitting stool**—a low stool, generally having a forward projection, the top of which recedes at an approximate angle of 30° and is utilized for the fitting of shoes. **F 869, F08**
- fit-up, n (aménagement)**—alterations and improvements to the **base building** and to the **building systems** including demolition, where required, to prepare the accommodation for occupancy. **E 631, E06**
- fit-up, n (aménagement)**—alterations and improvements to the **base building** and to the **building systems** including demolition, where required, to prepare the accommodation for occupancy. **E 1480, E06**
- fixated CCPs, n**—CCPs that are blended with a cementitious binder to induce or enhance a pozzolanic reaction. **E 2201, E50**
- fixation, n**—solidification or stabilization. **E 2201, E50**
- fixed**—See **windows and doors**. **E 631, E06**
- fixed analyzer transmission**—see **electron energy analyzer**. **E 673, E42**
- fixed-angle internal reflection element**—an internal reflection element which is designed to be operated at a fixed angle of incidence. **E 131, E13**
- fixed asset**—item that has physical substance that meets the entity's capitalization thresholds. It is bought for use in the operation of business and not intended for resale to customers. Examples are building, machinery, auto, and land. Fixed assets with the exception of land are subject to **depreciation**. Fixed assets are usually referred to as property, plant, and equipment (PP&E). Fixed assets meet the definition of "assets." **E 2135, E53**
- fixed asset turnover**—measurement that reflects the productivity and efficiency of property, plant, and equipment in generating revenue. A high turnover rate reflects positively on the company's ability to utilize its fixed assets in business operations properly. The turnover equals sales divided by fixed assets. **E 2135, E53**
- fixed asset unit**—element making up the fixed asset account. An example is a specified machine within the machinery account. Referred to as an "asset accountability unit" in CAS 404. **E 2135, E53**
- fixed beam scanner, n**—either a visible light or laser scanner reading in a set plane. **F 1294, F05**
- fixed bed**—a stationary bed of granular particles. **D 2652, D28**
- fixed carbon, n—in the case of coal, coke, and bituminous materials**, the solid residue other than ash, obtained by destructive distillation, determined by definite prescribed methods. **D 121, D05**
- fixed carbon, n**—the ash-free carbonous material that remains after volatile matter is driven off during the proximate analysis of a dry sample. **D 5681, D34**
- fixed carbon**—carbon remaining after heating in a prescribed manner to decompose thermally unstable components and to distill volatiles. **E 1705, E48**
- fixed-feed grinding, n**—the process of feeding a material to be ground to a grinding wheel at a given rate or in specific increments. **C 1145, C28**
- fixed-fixed beam**—a test structure that consists of a freestanding beam that is fixed at both ends. **E 2444, E08**
- fixed-force or fixed-displacement applied K curves**—curves obtained from a fracture mechanics analysis of a specific specimen configuration. **E 1823, E08**
- fixed matter, n**—residues from the ignition of particulate or dissolved matter, or both. **D 1129, D19**
- fixed matter**—residues from the ignition of particulate or dissolved matter, or both. **D 6161, D19**
- fixed mount reader, n**—a bar code reader that is mounted in a stationary fashion to intersect the plane of a bar code symbol passing before the reader. Often employed in conveyor and transport systems. **F 1294, F05**
- fixed pitch, adj**—describes a character set in which all character cells are of equal width. (See **proportional spacing**.) **F 1457, F05**
- fixed point, n—in thermometry**, reproducible temperature of equilibrium of a system of two or more phases under specified conditions. **E 344, E20**
- fixed retainer, n—in zippers**, a device permanently attached to the retainer pin at the bottom of one stringer. **D 123, D13**
- fixed retainer, n**—a device permanently attached to the retainer pin at the bottom of one stringer. **D 2050, D13**
- fixed retarding ratio**—see **electron energy analyzer**. **E 673, E42**
- fixed-site laboratory**—a laboratory that is located in improved real estate such as a building or similar structure. **E 1605, E06**
- fixing**—the process of rendering a developed image permanent. **F 335, F05**
- fixture**—fixed asset whose utility is derived from its physical attachment to a property and that usually cannot be removed without causing loss of value or damage. An example is a lighting fixture. A fixture under the terms of a lease or other agreement can be detached. A fixture is classified as a **fixed asset**. **E 2135, E53**
- fixture**—see **attachment**. **E 2265, E06**
- flagging, n—in sewnseams**, a mode of failure evidenced by slippage of one or more yarns entirely out of the original seam. **D 123, D13**
- flagging, n—in sewnseams**, a mode of failure evidenced by slippage of one or more yarns entirely out of the original seam. **D 4850, D13**
- flake**—a small wood particle of predetermined thickness specifically produced as a primary function of specialized equipment of various types, with the cutting action across the direction of the grain (either radially, tangentially, or at an angle between), the action being such as to produce a particle of uniform thickness, essentially plane of the flakes, in over-all character resembling a small piece of veneer. **D 1554, D07**
- flake-galvanized**—See **hot-galvanized**. **F 547, F16**
- flake-glass**—hot glass squeezed thin between two metal rolls or blown into a thin film, followed by fracturing into small particles. **C 162, C14**
- flake powder, n**—flat or scale-like particles whose thickness is small compared with the other dimensions. **B 243, B09**
- flakes**—in wrought ferrous products, flakes appear as short discontinuous internal cracks attributed to stresses produced by localized transformation and hydrogen solubility effects during cooling after hot working. They appear in a fracture surface as bright silvery areas with a coarse texture. In deep acid-etched transverse section they appear as discontinuities which are usually located in the midway to center location of the section. Known also as shatter cracks and hairline cracks. **E 7, E04**
- flaking**—See **delamination**. **A 902, A05**
- flaking—in protectivecoatings**, the detachment of small pieces of the coating film. **D 4538, D33**

flaking—that phenomenon manifested in film carbon ribbons and carbon paper by the actual detachment of pieces of the ink itself from the substrate. Flaking is the result of loss of adhesion, usually due to strain or extension of the film ribbon substrate due to tension or to contact with ribbon guides or parts other than the type font, or both. Flaking of carbon paper is usually due to stress or cracking of the ink film by folding, handling, etc. **F 221, F05**

flaking resistance, *n*—the ability of a coating to resist the actual detachment of film fragments either from the previously applied coating or the substrate. Flaking is generally preceded by cracking, checking, or blistering and is the result of loss of adhesion. Also known as scaling resistance. **D 16, D01**

flaking (scaling), *n*—phenomenon manifested in paint films by the actual detachment of pieces of the film itself either from its substrate or from paint previously applied. **E 631, E06**

flaking (scaling), *n*—phenomenon manifested in paint films by the actual detachment of pieces of the film itself either from its substrate or from paint previously applied. **E 1605, E06**

flaky finish—appearance of crazing, checking or flaking with or without separation of finish film. **D 1517, D31**

flame, *n*—*as related to ignition of textiles*, a controlled hot, luminous zone of gas or matter in gaseous suspension, or both, of constant size and shape that is undergoing combustion as evidenced by a low-intensity heat flux of less than 1 kw such as candle flame or match flame. (Compare **fire**.) **D 123, D13**

flame, *n*—*as related to textile flammability*, a hot luminous zone of gas or matter in gaseous suspension, or both, that is undergoing combustion, that is relatively constant in size and shape, and that produces a relatively low heat flux. (Compare **fire**.) **D 4391, D13**

flame, *n*—a hot, usually luminous zone of gas that is undergoing combustion. **E 176, E05**

flame, *n*—*as related to ignition of textiles*, a controlled hot luminous zone of gas or matter in gaseous suspension, or both, of constant size and shape that is undergoing combustion as evidenced by a low-intensity heat source of less than 5 kW, such as a burner flame on a gas stove. **F 1494, F23**

flame annealing, *n*—**annealing** in which the heat is applied directly by a flame. **A 941, A01**

flame application time, *n*—the time interval for which the ignition flame is applied to a material. **D 123, D13**

flame front, *n*—the leading edge of a flame propagating through a gaseous mixture or across the surface of a liquid or solid. **E 176, E05**

flame hardening, *n*—a process in which only the surface layer of a suitable steel object is heated by flame to above Ac_3 or Ac_{cm} , and then the object is **quenched**. **A 941, A01**

flame impingement, *n*—direct contact between a flame and a material. **F 1494, F23**

flame-out, *n*—the time at which the last vestige of flame or glow disappears from the surface of the test specimen, frequently accompanied by a final puff of smoke; Time 0 is the time at which the specimen is moved into the chamber and the door closed. **E 176, E05**

flameproof, *adj*—an inappropriate and misleading term. Do not use. **E 176, E05**

flame resistance, *n*—the property of a material whereby flaming combustion is prevented, terminated, or inhibited following application of a flaming or nonflaming source of ignition, with or without subsequent removal of the ignition source. **D 123, D13**

flame resistance, *n*—the property of a material whereby flaming combustion is prevented, terminated, or inhibited following application of a flaming or nonflaming source of ignition, with or without subsequent removal of the ignition source. **D 4391, D13**

flame resistance, *n*—the property of a material whereby flaming combustion is prevented, terminated, or inhibited following application of a flaming or nonflaming source of ignition, with or without subsequent removal of the ignition source. **D 4845, D13**

flame resistance, *n*—that property of a material whereby flaming combustion is prevented, terminated, or inhibited following appli-

cation of a flaming or nonflaming source of ignition, with or without subsequent removal of the ignition source. **D 5684, D13**

flame resistance, *n*—the ability to withstand flame impingement or give protection from it. **E 176, E05**

flame resistance—the property of a material whereby flaming combustion is prevented, terminated, or inhibited following application of a flaming or non-flaming source of ignition, with or without subsequent removal of the ignition source. **E 631, E06**

flame resistance—the property of a material whereby flaming combustion is prevented, terminated, or inhibited following application of a flaming or non-flaming source of ignition, with or without subsequent removal of the ignition source. **E 1749, E06**

flame resistant, *adj*—having flame resistance. **D 123, D13**

flame resistant, *adj*—having flame resistance. **D 4391, D13**

flame resistant, *adj*—having flame resistance. **E 176, E05**

flame resistive, *n*—See **flame resistant**, the preferred term. **E 176, E05**

flame retardant, *n*—a chemical used to impart flame resistance. **D 123, D13**

flame retardant, *adj*—not defined. This term should not be used as an adjective except in the terms “flame-retardant-treated” and “flame-retardant treatment”. **D 4391, D13**

flame retardant, *n*—a chemical used to impart flame resistance. **D 4391, D13**

flame retardant, *n*—a chemical used to impart flame resistance. **D 5684, D13**

flame retardant, *adj*—not a defined term. Use only as a modifier with defined compound terms: **flame-retardant chemical, flame-retardant coating, and flame-retardant treatment**. **E 176, E05**

flame-retardant chemical, *n*—a chemical, which when added to a combustible material, delays ignition and reduces flame spread of the resulting material when exposed to flame impingement. (See also **fire-retardant chemical**.) **E 176, E05**

flame-retardant coating, *n*—a fluid-applied surface covering on a combustible material which delays ignition and reduces flame spread when the covering is exposed to flame impingement. (See also **fire-retardant coating**.) **E 176, E05**

flame retardant, FR, *n*—a substance that markedly retards the propagation of a flame. (See ISO 472.) **D 1600, D20**

flame retardant, *n*—a deprecated term. Do not use. **E 176, E05**

flame-retardant-treated, *adj*—having received a flame-retardant treatment. **D 123, D13**

flame-retardant-treated, *adj*—having received a flame-retardant treatment. **D 4391, D13**

flame-retardant treatment, *n*—a process for incorporating or adding flame retardant(s) to a material or product. **D 123, D13**

flame-retardant treatment, *n*—a process for incorporating or adding flame retardant(s) to a material or product. **D 4391, D13**

flame-retardant treatment, *n*—a process for incorporating or adding flame retardant(s) to a material or product. **D 5684, D13**

flame-retardant treatment, *n*—the use of a flame-retardant chemical or a flame-retardant coating. (See also **fire-retardant treatment**.) **E 176, E05**

flame speed, *n*—the velocity of propagation of a flame front through a gaseous mixture (fuel and oxidizer) relative to a reference point. **E 176, E05**

flame spread, *n*—the propagation of a flame away from the source of ignition. **D 123, D13**

flame spread classification, *n*—a standard rating of relative surface burning characteristics of a building material as compared to a standard material. **C 11, C11**

flame spread index, *n*—a comparative measure expressed as a dimensionless number, derived from visual measurements of the spread of flame versus time in Test Method E 84. **E 176, E05**

flame spread, *n*—See **surface flame spread, volumetric flame spread.** E 176, E05

flame-spread time, *n*—the time taken by a flame on a burning material to travel a specified distance under specified conditions. D 123, D13

flaming debris, *n*—material which continues to flame as it separates and moves away from the flaming source. D 123, D13

flaming mode, *n*—the mode of testing that uses a pilot flame. E 176, E05

flammability, *n*—those characteristics of a material that pertain to its relative ease of ignition and relative ability to sustain combustion. D 123, D13

flammability, *n*—those characteristics of a material that pertain to its relative ease of ignition and relative ability to sustain combustion. D 4391, D13

flammability, *n*—those characteristics of a material that pertain to its ignition and support of combustion. F 1494, F23

flammable, *adj*—(1) capable of burning with a flame under specified conditions, or (2) when used to designate high hazard, subject to easy ignition and rapid flaming combustion. E 176, E05

flammable liquid—a liquid having a flash point below 37.8°C (100°F) and having a vapor pressure not exceeding 40 psi (absolute) at 37.8°C and shall be known as a Class I liquid. E 772, E44

flammable textile, *n*—any combustible textile that burns with a flame. (See also **flammability**. Compare **combustible textile, noncombustible textile**.) D 123, D13

flammable textile, *n*—any combustible textile that burns with a flame. (See also **flammability**.) (Compare **combustible textile, noncombustible textile**.) D 4391, D13

flange—that part of a lock-strip gasket which extends to form one side of a channel. C 717, C24

flange, *n*—See **box**. D 996, D10

flange, *n*—a flat plate or formed piece at the end of a railing or rail element for attachment to the adjoining construction or supporting member. E 631, E06

flange, *n*—a flat plate or formed piece at the end of a railing or rail element for attachment to the adjoining construction or supporting member. E 1481, E06

flange, *n*—that part of the rim which gives lateral support to the tire. F 538, F09

flange—in chain link fencing, a plate or casting for securing a post to a floor or a horizontal rail to a wall. F 552, F14

flange, *n*—the extension of the wrap beyond the core wire or stiffening groove. F 1379, F14

flanged joint—see **joint, flanged**. F 412, F17

flange lock slider, *n*—in **zippers**, a slider with notches in the flanges of the slider that block the shoulders of the elements when the stringers are pulled apart, thus preventing further separation of the chain. D 123, D13

flange lock slider, *n*—a slider with notches in the flanges of the slider that block the shoulders of the elements when the stringers above the slider are pulled apart, thus preventing further separation of the chain. D 2050, D13

flange plate—See **railing systems**. E 631, E06

flanges, *n*—in **zippers**, the edges of the slider formed to contain the chain. D 123, D13

flanges, *n*—the edges of the slider formed to contain the chain. D 2050, D13

flanking transmission—transmission of sound from the source to a receiving location by a path other than that under consideration. C 634, E33

flank, side—surface between root and crest; “leading” flank being on point side of crest and “following” flank being on head side of crest. F 547, F16

flanky—a characteristic of loose grain leather that forms coarse wrinkles on bending with the grain inward. D 1517, D31

flannel, *n*—as **applied to bed sheeting**, a napped fabric used in the fabrication of sheeting products. D 123, D13

flannel, *n*—as **applied to bed sheeting**, a napped fabric used in the fabrication of sheeting products. D 7023, D13

flare, *n*—the spreading of the filament ends or the strand ends at the cut end of a steel tire cord, expressed as the unravelled length. D 123, D13

flare, *n*—the spreading of the filament ends or the strand ends at the cut end of a steel tire cord, expressed as the unraveled length. D 6477, D13

flare—extraneous light in the dark area. F 335, F05

flared—staple legs spread into outward opposite directions 90° with crown plane. F 592, F16

flare decay—image contrast loss due to flare. F 335, F05

flare joint—see **joint, flare**. F 412, F17

flash—as in welding, the metal that protrudes at the weld of the tube, internally, externally, or both, as a result of the pressure applied when a forge-type seam is produced; the two types of flash are internal flash and external flash. B 846, B05

flash, *n*—the excess material protruding from the surface of a molded article at the mold junctions. D 1566, D11

flash, *n*—appearance of a material when viewed close to the angle at which it is lightest. E 284, E12

flash—excess material that forms at the parting line of a mold or die, or the overflow of excess adhesive outside the area of attachment in a bonded assembly. E 631, E06

flash—excess material that forms at the parting line of a mold or die, or the overflow of excess adhesive outside the area of attachment in a bonded assembly. E 1749, E06

flushed finish, *n*—the surface feature resulting when faces have a range of color produced by the control of the atmospheric conditions in the kiln during firing. C 43, C15

flashing—applying a thin layer of opaque or colored glass to the surface of clear glass or vice versa. See also **striking**. C 162, C14

flashing—a generic term describing the transitional area between the waterproofing membrane and surfaces above the wearing surface of the building deck; a terminal closure or barrier to prevent ingress of water into the system. C 717, C24

flashing—the system used to seal membrane edges at walls, expansion joints, drains, gravel stops, and other places where the membrane is interrupted or terminated. Base flashing covers the edges of the membrane. Cap or counterflashing shields the upper edges of the base flashing. D 1079, D08

flashing, *n*—existence of flame on or over the surface of the specimen for periods of less than 1 s. E 176, E05

flashing cement—a trowelable mixture of cutback bitumen and mineral stabilizers including asbestos or other inorganic fibers. D 1079, D08

flash magnetization—magnetization by a current flow of very brief duration. E 1316, E07

flash (or flash plate)—a very thin electrodeposit used for a final coating; for intermediate coatings of the same nature use **strike**. B 374, B08

flashover, *n*—a disruptive electrical discharge at the surface of electrical insulation or in the surrounding medium, which may or may not cause permanent damage to the insulation. D 1711, D09

flashover, *n*—the rapid transition to a state of total surface involvement in a fire of combustible materials within an enclosure. E 176, E05

flashover, *n*—the rapid transition to a state of total surface involvement in a fire of combustible materials within an enclosure. E 176, E05

flashover—the electrical discharge or arc occurring between electrodes and over or around, but not through, the equipment being tested. F 819, F18

flash point, *n*—the lowest temperature of a specimen, corrected to a pressure of 760 mm Hg (101.3 kPa), at which application of an

- ignition source causes any vapor from the specimen to ignite under specified conditions of test. **D 1711, D09**
- flash point**—the lowest temperature corrected to a barometric pressure of 101.3 kPa (760 mm Hg), at which application of a test flame causes the vapor of a specimen to ignite under specified conditions of test. **D 2864, D27**
- flash point**—the lowest temperature corrected to a pressure of 101.3 kPa (760 mm Hg) at which application of an ignition source causes the vapors of a specimen of the sample to ignite under specified conditions of test. **D 4175, D02**
- flash point, *n***—in petroleum products, the lowest temperature corrected to a barometric pressure of 101.3 kPa (760 mm Hg) at which application of an ignition source causes the vapors of a specimen of the sample to ignite under specified conditions of test. **D 4175, D02**
- flash point, *n***—the lowest temperature corrected to a pressure of 101.3 kPa at which application of an ignition source causes the vapors of a specimen of the sample to ignite momentarily under specified conditions of the test. **D 4175, D02**
- flash point**—of a liquid, the minimum temperature at which it gives off vapor in sufficient concentration to form an ignitable mixture with air near the surface of the liquid within the vessel as specified by appropriate test procedure and apparatus. **E 772, E44**
- flash point**—the temperature at which a vapor will ignite in the presence of an ignition source. **E 1316, E07**
- flash point**—the lowest temperature at which vapors above a volatile combustible substance ignite in air when exposed to a flame. **E 1316, E07**
- flash point, *n***—the lowest temperature, corrected to a pressure of 101.3 kPa (760 mm Hg, 1013 mbar), at which application of an ignition source causes the vapors of the specimen to ignite under specified conditions of test. **E 1445, E27**
- flash point**—the temperature at which a combustible liquid ignites. **E 1705, E48**
- flash set*—see **early stiffening** **C 219, C01**
- flash set**—in grouting, the rapid development of rigidity in a freshly mixed grout, usually with the evolution of considerable heat; this rigidity cannot be dispelled nor can the plasticity be regained by further mixing without addition of water; also referred to as quick set or grab set. **D 653, D18**
- flash set (quick set), *n***—the early hardening or stiffness in the working characteristics of Portland-cement paste, mortar, or concrete, usually with the evolution of considerable heat. Stiffness cannot be dispelled nor the plasticity regained by further mixing without addition of water; also known as quick set. **E 2110, E06**
- flat**—See **container**. **D 996, D10**
- flat, *adj***—(1) of a coating material, a material that is capable of imparting a finish free of gloss. **E 284, E12**
- (2) of a surface finish, free of gloss.
- flat, *n***—a rectangular metal bar of width greater than thickness. **E 631, E06**
- flat asphalt**—a roofing asphalt conforming to the requirements of Specification D 312, Type II. **D 1079, D08**
- flat cable, *n***—any cable with two smooth or corrugated, but essentially flat, surfaces. **D 1711, D09**
- flat clinch**—clinch formed by folding staple legs parallel to crown with movable clincher. **F 592, F16**
- flat conductor, *n***—a conductor with a width-to-thickness ratio arbitrarily chosen as 5 to 1 or greater. **D 1711, D09**
- flat conductor cable, *n***—a cable of flat conductors. **D 1711, D09**
- flat crown**—straight staple crown in contrast to rounded, formed, or offset staple crown. **F 592, F16**
- flat cure, *n**—a synonym for **plateau vulcanization**. **D 1566, D11**
- flat duck, *n***—duck fabric having the warp of two single yarns woven as one and either single or plied filling yarn. (See also **duck**.) **D 123, D13**
- flat duck, *n***—duck fabric having the warp of two single yarns woven as one and either single or plied filling yarn. (See also **duck**.) **D 4850, D13**
- flat-felled seam, *n***—a complex seam formed on the outside of an object with raw edges enclosed and two rows of machine stitching visible on the face side. **D 123, D13**
- flat-felled seam, *n***—in home sewing, a complex seam formed on the outside of a product with cut edges enclosed and two rows of machine stitching visible from the face side. **D 4965, D13**
- flat glass**—a general term covering sheet glass, plate glass, float glass, and various forms of rolled glass. See related term **bent glass**. **C 162, C14**
- flat grain*—See **grain**. **D 9, D07**
- flat head**—most common head, having flat, circular, parallel top and bearing surfaces and slightly rounded edge or rim. **F 547, F16**
- flat jet atomizer*—see **flat spray atomizer**. **E 1620, E29**
- flat magnifying lens**—thermometer stem glass in which the numerals, graduations, and lens lie on the same relative surface. It is so named for its approximately flat cross section. **E 344, E20**
- flatness of field**—a qualitative term describing how well the image of a planar specimen is reproduced as a plane in the image field. (See **curvature of field**.) **E 7, E04**
- flat piece (of aggregate), *n***—a particle of aggregate for which the ratio of the width to thickness of its circumscribing rectangular prism is greater than a specified value (see also **elongated piece (of aggregate)**). **C 125, C09**
- flat-platen pressed**—a method of consolidating and hot pressing a panel product in which the applied pressure is perpendicular to the faces. **D 1554, D07**
- flat product**—a rectangular or square solid section of relatively great length in proportion to thickness. Included in the designation “flat product” depending on the width and thickness, are plate, sheet, strip, and bar. Also included is the product known as “flat wire.” **B 846, B05**
- flat-ride**—an amusement ride that operates on a single level whether over a controlled, fixed course or track, or confined to a limited area of operation. **F 747, F24**
- flats**—a longitudinal flat area on a normally convex surface of a pultrusion.
- NOTE—This condition may be caused by shifting in the reinforcement, lack of sufficient reinforcement, or local fouling of the die surface. **D 3918, D20**
- flat sheet, *n***—sheet with sheared, silt, or sawed edges that has been flattened or leveled. **B 899, B02**
- flat sheet, *n***—*intextiles*, a flat, hemmed product, usually rectangular, used for covering the mattress on a bed and used for sleeping on or under. **D 123, D13**
- flat sheet, *n***—*incomforters*, a flat, hemmed product, usually rectangular, used for covering the mattress on a bed and used for sleeping on or under. **D 7023, D13**
- flat sheet membrane**—a sheet type membrane may be coated onto a fabric substrate. **D 6161, D19**
- flat sheets, Type A, *n***—sheet intended for exterior applications, where it may be subjected to the direct action of sun, rain, or snow, and when tested in accordance with Test Methods C 1185, does demonstrate compliance with Specification C 1186. **C 1154, C17**
- flat sheets, Type B, *n***—sheet intended for exterior applications where it will not be subjected to the direct action of sun, rain, or snow, and when tested in accordance with Test Methods C 1185, does demonstrate compliance with Specification C 1186. **C 1154, C17**
- flat spray atomizer**—a fan spray atomizer that produces a planar spray pattern.
- NOTE—In agricultural applications, the spray patterns have tapered edges. **E 1620, E29**
- flattened-shank nail**—round wire nail with portion of shank flattened for a certain distance between point and head to facilitate driving of nail between steel members and wrapping of flattened portion of shank around steel rod during driving. **F 547, F16**

flattened thread, flat-bottom thread

flattened thread, flat-bottom thread—thread having flat root. Flattened thread occasionally referring to flattened thread crest.

F 547, F16

flattening agent, *n*—a material added to paints, varnishes, and other coating materials to reduce the gloss of the dried film. D 16, D01

flat wire—a product up to and including 0.188 in. (4.78 mm) in thickness and up to and including 1¼ in. (31.8 mm) in width.

B 846, B05

flavor, *n*—(1) perception resulting from stimulating a combination of the taste buds, the olfactory organs, and chemesthetic receptors within the oral cavity; (2) the combined effect of taste sensations, aromatics, and chemical feeling factors evoked by a substance in the oral cavity.

E 253, E18

flaw—in dry process enameling, a defect of the ware that is cause for rejection.

C 286, B08

flaw, *n*—a defect sufficiently greater than those typical of the morphology of a carbon or graphite body to influence a property.

C 709, D02

flaw, *n*—a defect sufficiently greater than those typical of the morphology of a carbon or graphite body to influence a property.

D 4175, D02

flaw, *n*—an imperfection or discontinuity that may be detectable by nondestructive testing and is not necessarily rejectable.

E 1316, E07

flaw characterization, *n*—the process of quantifying the size, shape, orientation, location, growth, or other properties, of a flaw based on NDT response.

E 1316, E07

flax, *n*—the generic name for plants that are botanically classified as *Linum usitatissimum*, which are cultivated for seed and/or fiber.

D 123, D13

flax, *n*—the generic name for plants that are botanically classified as *Linum usitatissimum*, which are cultivated for seed and/or fiber.

D 6798, D13

fleece, *n*—the wool of one sheep as obtained by shearing. D 123, D13

fleet—any group of ships, motor vehicles, trucks, buses, airplanes, and so forth acting together or under one control. E 2135, E53

flesh—the inner side of hide or skin. Also, adjective referring to that side.

D 1517, D31

flesher—the flesh split or under-cut of a sheepskin, split before tanning. (See also **chamoisleather**.)

D 1517, D31

flex cracking, *n*—cracking primarily caused by application of mechanical stress-strain cycling.

F 538, F09

flexibility, *n*—that property of a material to endure repeated flexing, bending, or bowing without rupture.

D 123, D13

flexibility—the ability of applied shoe polish to flex and bend in creases of the shoe without powdering, peeling, or cracking, and without damaging the shoe finish.

D 2825, D21

flexibility, *n*—that property of a material to endure repeated flexing, bending, or bowing without rupture.

D 4850, D13

flexibility, *n*—the ability to be bent, turned, or twisted without cracking, breaking or showing other permanent damage and with or without returning of itself to its former shape.

F 141, F06

flexible—easily hand-folded, flexed, twisted, and bent. F 17, F02

flexible—See Terminology F 17.

F 1327, F02

flexible polypropylene, *n*—a material having a 2 % secant modulus of less than 300 MPa (40,000 psi) as determined by Test Method D 5323 produced by polymerization of propylene with or without other alpha olefin monomers.

D 4439, D35

flexion—the condition of decreasing the angle between two body segments; opposite of extension.

F 869, F08

flex life, *n*—the number of cycles required to produce a specified state of failure in a specimen that is flexed in a prescribed method.

D 1566, D11

flex life—the number of cycles required to produce a specified state of failure in a specimen that is flexed in a prescribed method. (D 1566, D11)

F 869, F08

flex life test—a laboratory method used to determine the life of a product when subjected to dynamic bending stresses. F 869, F08

flexometer, *n*—a machine that subjects a test specimen to repeated deformation by compression, tension, shear, bending, torsion, or any combination thereof.

D 1566, D11

flexural rigidity, *n*—

general—resistance to bending.

specific—the couple on either end of a strip of unit width bent into unit curvature in the absence of any tension. D 123, D13

flexural rigidity, *n*—*general*—resistance to bending; *specific*—the couple on either end of a strip of unit width bent into unit curvature in the absence of any tension. D 4850, D13

flexural strength, *n*—the maximum load sustained by a standard specimen of a sheet material when subjected to a bending force.

C 11, C11

flexural strength, *n*—a property of solid material that indicates its ability to withstand a flexural or transverse load. C 709, D02

flexural strength, *n*—a measure of the ultimate strength of a specified beam in bending. C 1145, C28

flexural strength, *n*—a measure of the strength of a specified beam specimen in bending determined at a given stress rate in a particular environment. C 1145, C28

flexural strength, *n*—*in bulkheading*, the transverse breaking load in newtons per meter of width (lbf/ft of width) of saturated sheets when loaded on a span of 1.524 m (5 ft) with the load applied equally and simultaneously at both one-third points of the span.

C 1154, C17

flexural strength, *n*—*in plastic-foam core insulating panels*, the average breaking load in newtons (or lbf) of specimens conditioned at 50 % relative humidity, loaded as simple beams with the load applied equally and simultaneously at both one-third points of the span.

C 1154, C17

flexural strength, *n*—*in flat sheet*, the average breaking load in newtons (or lbf) per metre (foot) of width of dried specimens loaded as simple beams on a span of 254 mm (10 in.) with the load applied at the center of the span. C 1154, C17

flexural strength, *n*—*in corrugated sheets*, the average breaking load in newtons per meter of width (or lbf-ft of width) of dried specimens loaded as simple beams on a 762-mm (30-in.) span with the load applied equally and simultaneously at both one-third points of the span. C 1154, C17

flexural strength, *n*—*in pipe*, the ability of a standard pipe longitudinal section to withstand external loads that bear on the pipe transversely to its longitudinal axis and induce bending.

C 1154, C17

flexural strength, *n*—*for asbestos-cement bulkheading*, the transverse breaking load in newtons per metre of width (lbf/ft of width) of saturated sheets when loaded on a span of 1.524 m (5 ft) with the load applied equally and simultaneously at both one-third points of the span. D 2946, C17

flexural strength, *n*—*for asbestos-cement plastic-foam core insulating panels*, the average breaking load in newtons (or lbf) of specimens conditioned seven days at 23 ± 2°C and 50 ± 10 % relative humidity, loaded as simple beams with the load applied equally and simultaneously at both one-third points of the span. D 2946, C17

flexural strength, *n*—*for corrugated asbestos-cement sheets*, the average breaking load in newtons per metre of width (or lbf/ft of width) of dried specimens loaded as simple beams on a 762 mm (30 in.) span with the load applied equally and simultaneously at both one-third points of the span. D 2946, C17

flexural strength, *n*—*for flat asbestos-cement sheet*, the average breaking load in newtons (or lbf) of dried specimens loaded as simple beams on a span of 254 mm (10 in.) with the load applied equally and simultaneously at both one-third points of the span. D 2946, C17

flexural strength, *n*—*for pipe*, the ability of a standard pipe longitudinal section to withstand external loads that bear on the pipe transversely to its longitudinal axis and induce bending.

D 2946, C17

flexural strength, *n*—for plastic foam core asbestos-cement insulating panels, see **flexural strength, for asbestos-cement/plastic-foam core insulating panels.** D 2946, C17

flexural strength, *n*—property of solid material that indicates its ability to withstand a flexural or transverse bending load. D 2946, C17

flexural strength, *n*—a property of solid material that indicates its ability to withstand a flexural or transverse load. D 4175, D02

flexure plate pivot—a type of pivot or hinge in which the motion occurs through the bending of a thin elastic plate. E 7, E04

flexure stress—the tensile component of the bending stress produced on the surface of a glass section opposite to that experiencing a locally impinging force. C 162, C14

flicker method, in image analysis—the procedure of alternating between the live video image and the detected image while altering the gray-level threshold range to establish the optimum discrimination and detection. E 7, E04

flint—usually in phrases “flint-dried” or “flint hides.” Air or sun-dried without other curing. D 1517, D31

flint fireclay, *n*—a hard or flint-like fireclay occurring as an unstratified massive rock, practically devoid of natural plasticity and showing a conchoidal fracture. C 71, C08

flint glass—(1) a lead-containing glass.

(2) term used by container industry for colorless glass.

C 162, C14

flint glass cullet, *n*—a particulate glass material that contains no more than 0.1 mass percent Fe_2O_3 , or 0.0015 mass percent Cr_2O_3 , as determined by chemical analysis. D 5681, D34

flint glass cullet—a particulate glass material that contains no more than 0.1 weight % Fe_2O_3 , or 0.0015 weight % Cr_2O_3 , as determined by chemical analysis. D 5681, D34

flint optical glass—See **optical flint glass.** C 162, C14

flip—deprecated term, do not use. This term may have various meanings that are not clearly defined. E 284, E12

flitch—a portion of a log sawed on two or more sides and intended for remanufacture into lumber or sliced or sawed veneer. The term is also applied to the resulting sheets of veneer laid together in sequence of cutting. D 9, D07

flitch—a portion of a log sawed on two or more sides and intended for remanufacture into sliced or sawn veneer. The term is also applied to the resulting sheets of veneer stacked together in sequence of cutting. D 1038, D07

float, *n*—in woven fabric, the portion of a warp or filling yarn that extends unbound over two or more filling or warp yarns. D 123, D13

float, *n*—a defect in which a warp or filling yarn extends unbound over the ends with which it should be interlaced. D 123, D13

float, *n*—in woven fabric, the portion of a warp (or fill) yarn that extends unbound over two or more fill (or warp) yarns. D 3878, D30

float, *n*—a defect in which warp or filling yarn extends unbound over the ends with which it should be interlaced. (Syn. harness skip, overshot, skip) D 3990, D13

float, *n*—in woven fabric, the portion of a warp or filling yarn that extends unbound over two or more filling or warp yarns. D 4850, D13

float—separable component of a boom that provides buoyancy. F 818, F20

float bath—a pool of molten metal, commonly tin, contained within a refractory receptacle and protected from oxidation by an inert atmosphere, upon which molten glass is drawn into a flat sheet. See **float glass.** C 162, C14

float finish—a concrete finish provided by consolidating and leveling the concrete with only a power driver or hand float, or both. A floated finish is coarser than a troweled finish. For specifications, See ACI 301-72. C 717, C24

float—(1) a floating clay shape to skim foreign materials or control their passage in a melter.

(2) an object, generally a porous silica brick, introduced into a melting furnace, which will float on the surface of the molten glass for tens of minutes to several hours, thus revealing the surface flow. C 162, C14

float—(2) an object, generally a porous silica brick, introduced into a melting furnace, which will float on the surface of the molten glass for tens of minutes to several hours, thus revealing the surface flow. C 162, C14

floaters—the material floating on the surface of water into which carbon has been added and has been thoroughly wetted. D 2652, D28

float glass—flat glass that has been formed on molten metal, commonly tin. C 162, C14

floating, *v*—the act of spreading, compacting, or consolidating to achieve a specified uniform appearance. C 11, C11

floating controlled load—See **load.** D 996, D10

floating roller peel test—See **test, floating roller peel.** E 631, E06

floating roller peel test—See **test, floating roller peel.** E 1749, E06

floating threshold—any threshold with amplitude established by a time average measure of the input signal. (E 750) E 1316, E07

floats (as in asbestos floats)—air conveyed asbestos fractions such as accumulate in the air filtration system of an asbestos mill. D 2946, C17

float/sink, *n*—a reference to the physical action that particles undergo when immersed in a liquid of a predetermined specific gravity. D 121, D05

floc—loose, open-structured mass formed in a suspension by the aggregation of minute particles. D 653, D18

floc—a loose, open-structured mass produced by the aggregation of minute particles. D 6161, D19

flocculant—an agent that produces flocs or aggregates from small suspended particles. D 4410, D19

flocculate—to aggregate into larger particles, to increase in size to the point where precipitation occurs. B 374, B08

flocculate—a grouping of primary particles, aggregates, or agglomerates having weaker bonding than either the aggregate or agglomerate structures. C 242, C21

flocculating—the thickening of the consistency of a slip by adding a suitable electrolyte. C 286, B08

flocculating agent—a coagulating substance such as alum, ferrous sulfate, or lime which, when added to water, forms a precipitate that expedites the settling of suspended matter. D 4410, D19

flocculation—the process of forming flocs. D 653, D18

flocculation, *n*—synonymous with agglomeration. D 1356, D22

flocculation, *n*—formation (sometimes reversible) of loosely coherent, partially agglomerated rubber, distributed in the liquid phase of a latex. D 1566, D11

flocculation—the process of agglomerating fine particles into larger groupings called flocs. D 6161, D19

flocculent—chemical(s) which, when added to water, form bridges between suspended particles causing them to agglomerate into larger groupings (flocs) which then settle or float by specific gravity differences. D 6161, D19

flocculent structure—see **soil structure.** D 653, D18

flock, *n*—a material obtained by reducing textile fibers to fragments as by cutting, tearing, or grinding, to give various degrees of comminution. D 123, D13

flock, *n*—a material obtained by reducing textile fibers to fragments as by cutting, tearing, or grinding, to give various degrees of comminution. D 7023, D13

flocked blanket, *n*—a blanket made with a fishnet-type scrim sandwiched between two thin layers of foam with flock adhered to the outside of the foam. D 123, D13

flocked blanket, *n*—a blanket made with a fishnet-type scrim sandwiched between two thin layers of foam with flock adhered to the outside of the foam. D 7023, D13

flocs or floccules—masses of solids formed in a liquid by addition of coagulants (flocculants), or through biochemical processes, or by agglomeration of individual particles. D 4410, D19

floor coat

floor coat—the top layer of bitumen used to hold the aggregate on an aggregate-surfaced, built-up roofing membrane. **D 1079, D08**

flooded system—a system which, while being tested, becomes so filled with tracer gas as to make impracticable further leak testing. **E 1316, E07**

flooding—a means of compacting trench backfill by the introduction of water by gravity. **C 896, C04**

flooding nozzle—see **deflector atomizer**. **E 1620, E29**

floor nozzle—see **deflector atomizer**. **E 1620, E29**

floor point, n—(in *column distillation*) the point at which the upflowing vapor flow obstructs the down-coming reflux and the column suddenly loads with liquid. **D 4175, D02**

floor point, n—the point at which the velocity of the upflowing vapors obstructs the downcoming reflux and the column suddenly loads with liquid. **D 4175, D02**

floor, n—the rock material immediately underlying a coal bed. **D 121, D05**

floor—bottom of near horizontal surface of an excavation, approximately parallel and opposite to the roof. (ISRM) **D 653, D18**

floor, n—in a building, a supporting structure (generally horizontal) and constituting the bottom level of each story. **E 631, E06**

floor anchor, n—a belay anchor on the floor. **F 1773, F08**

floor area, n (superficie de plancher):
gross floor area (superficie brute de plancher)—entire area within the inside perimeter of the exterior walls.
net floor area (superficie nette de plancher)—that part of the gross floor area located within occupiable space. **E 1480, E06**

floor brick, n—smooth, dense brick, highly resistant to abrasion, used as finished floor surfaces. See Specification C 410. **C 43, C15**

floor covering, n—an essentially planar material, having a relatively small thickness in comparison to its length or width, which is laid on a floor to enhance the beauty, comfort, and utility of the floor. **D 123, D13**

floor covering, n—an essentially planar material, having a relatively small thickness in comparison to its length or width, that is laid on a floor to enhance the beauty, comfort, and utility of the floor. **D 5684, D13**

floor covering, n—an essentially planar material having a relatively small thickness in comparison to its length or width, which is laid on a floor to enhance the beauty, comfort, and utility of the floor. **E 176, E05**

floor covering system, n—a single material, composite or assembly comprised of the floor covering and related installation components (adhesive, cushion, etc.) if any. **E 176, E05**

flooring—stone used as in interior pedestrian wearing surface. **C 119, C18**

flooring, n—a material used to construct the uppermost layer of a floor. **E 631, E06**

flooring brad—bright, regular-stock-steel, 2 by 0.120 to 4 by 0.192-in. nails with deep (32°) countersunk flat or cupped 0.162 to 0.244-in. head and medium diamond point. Also, slender, bright, regular-stock-steel, 1¼ by 0.076 to 2½ by 0.113-in. nails with deep (32°) countersunk flat or cupped or brad 0.128 to 0.155-in. head and blunt diamond point.

machine flooring brad—bright, regular stock-steel, 1 by 0.072-in. nail with special 0.113-in. brad head with cylindrical rim and medium diamond point. **F 547, F16**

flooring material, n—any pliable planar structure used as a base surface in camping tentage, but excluding such things as rugs or carpets placed in the tent that are not integral parts of the item. **D 123, D13**

flooring nail—bright, stiff-stock or hardened-steel, helically threaded, 1 by 0.072 to 3½ by 0.148-in. nails with flat or checkered ¼ to ½-in. countersunk or casing head and blunt diamond point. **F 547, F16**

floor, n (plancher)—(in a building) supporting structure (generally horizontal) and constituting the bottom level of each story. **E 1480, E06**

floor surface, n—See *walkway surface*. **F 1646, F13**

flop, n—a difference in appearance of a material viewed over two widely different aspecular angles. **E 284, E12**

flop, adj—pertaining to the appearance of a material when viewed from a direction far from the specular angle, typically 70° or more. **E 284, E12**

flop angle, n—the aspecular angle when a material is viewed from a direction far from the specular, typically 70° or more. **E 284, E12**

flop color, n—color of a material when viewed from a specified direction far from the specular angle, typically 70° or more. **E 284, E12**

flop contrast, n—a measure of the degree of dissimilarity in appearance of a specimen when it is viewed at two widely different aspecular angles. **E 284, E12**

flop index, n—a numerical scale of flop obtained by visual experiments. **E 284, E12**

flotation—portion of a boom that provides buoyancy. **F 818, F20**

flotation cell, n—the vessel or compartment in which the flotation test is performed. **D 121, D05**

flounce, n—a ruffled drop on a bedcovering. **D 123, D13**

flounce, n—a ruffled drop on a bedcovering. **D 7023, D13**

flow, v—in *building construction*, the deformation of a tape sealant under stress. **C 717, C24**

flow, n—a laboratory measured mortar property that indicates the percent increase in diameter of the base of the truncated cone of mortar when it is placed on a flow table, and mechanically raised and dropped specified times under specified conditions. **C 1180, C12**

flow, n—movement of an adhesive during the bonding process before the adhesive is set. **D 907, D14**

flow—Same as **flow rate**. **E 1316, E07**

flowable fill, n—a material that flows like a liquid, is self-leveling, requires no compaction or vibration to achieve maximum density, hardens to a predetermined strength and is sometimes a controlled low strength material (CLSM). **E 2201, E50**

flowback nozzle—see **by-pass nozzle**. **E 1620, E29**

flow balancing—the use of an imposed pressure drop (flow balancing tube), to minimize conversion differences of modules operating in parallel. **D 6161, D19**

flow balancing tube—see **flow balancing**. **D 6161, D19**

flow brightening—the melting of an electrodeposit, followed by solidification, especially of tin plate. **B 374, B08**

flow-button—the pellet of frit used in the Fusion Flow Test.

NOTE—See Test Methods C 374. **C 286, B08**

flow cavitation, n—cavitation caused by a decrease in static pressure induced by changes in velocity of a flowing liquid. Typically, this may be caused by flow around an obstacle or through a constriction, or relative to a blade or foil. A cavitation cloud or “cavitating wake” generally trails from some point adjacent to the obstacle or constriction to some distance downstream, the bubbles being formed at one place and collapsing at another. **G 40, G02**

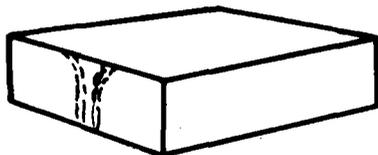

flow channel—the portion of a flow net bounded by two adjacent flow lines. **D 653, D18**

flow coating—the process of coating a metal shape by causing the slip to flow over its surface and allowing it to drain. **C 286, B08**

flow cone—in *grouting*, a device for measurement of grout consistency in which a predetermined volume of grout is permitted to escape through a precisely sized orifice, the time of efflux (flow factor) being used as the indication of consistency. **D 653, D18**

flow curve—the locus of points obtained from a standard liquid limit test and plotted on a graph representing water content as ordinate on an arithmetic scale and the number of blows as abscissa on a logarithmic scale. **D 653, D18**

- flow failure**—failure in which a soil mass moves over relatively long distances in a fluid-like manner. **D 653, D18**
- flow function, FF**—the plot of unconfined yield strength versus major consolidation stress for one specified bulk solid. **D 653, D18**
- flow hole**—(archaic) See **throat**. **C 162, C14**
- flow index, $F_w, I_f (D)$** —the slope of the flow curve obtained from a liquid limit test, expressed as the difference in water contents at 10 blows and at 100 blows. **D 653, D18**
- flowing ground, n** —in *tunneling*, soil or rock of soft and plastic consistency and with very low cohesion that flows into the excavation even through small unsupported areas. See *running ground*. See **running ground**. **D 653, D18**
- flow line, n** —a defect induced by discontinuous flow velocities during forming of molded or extruded bodies. **C 709, D02**
- flow line**—a line formed by the inverts of pipe. **C 822, C13**
- flow line**—the path that a particle of water follows in its course of seepage under laminar flow conditions. **D 653, D18**
- flow line, n** —a defect induced by discontinuous flow velocities during forming of molded or extruded bodies. **D 4175, D02**
- flow line**—one or more streaks distinguished by a difference in light reflectance from the surrounding area, characteristic of injection-molded parts. (See also **weld mark**.)

F 109, C21

- flow lines**—a fiber pattern, frequently observed in wrought metal, which indicates the manner in which the metal flowed during deformation. **E 7, E04**
- flow log**—a borehole geophysical log used to record vertical movement of ground water and movement of water into or out of a well or borehole and between formations within a well. **D 653, D18**
- flow marks, n** —marks or line on a molded product, caused by imperfect fusion of flowing fronts. **D 1566, D11**
- flowmeter, n** —an instrument for measuring the rate of flow of a fluid (that is, liquid or gas) moving through a system. **D 1356, D22**
- flow net**—a graphical representation of flow lines and equipotential (piezometric) lines used in the study of seepage phenomena. **D 653, D18**
- flow path**—represents the area between two flow lines along which ground water can flow. **D 653, D18**
- flow process**—See **gob process**. **C 162, C14**
- flow-proportioned average property value (FPAPV), n** —the average property value of the collected material in the tank or vessel, calculated by using the flow-proportioned average technique described in the practice of all measurements performed on aliquots of the material while it is flowing into the tank or vessel. **D 4175, D02**
- flow-proportioned sample, n** —a sample obtained by collecting an aliquot volume in proportion to the rate of flow of the stream sampled. **D 1129, D19**
- flow rate, n** —the time required for a powder sample of standard weight to flow through an orifice in a standard instrument according to a specified procedure. **B 243, B09**
- flow rate**—in leak testing, (1) the rate at which gas passes a given cross section of a system, determined by the product of the volume passing per unit time and its (partial) pressure at the cross section; (2) a product of the (partial) pressure difference of a gas at the ends of a conduit or across the face of an orifice, and the conductance of the gas for the conduit or orifice. Expressed in pressure-volume per unit time, such as pascal cubic metres per second. **E 1316, E07**
- flow rate**—rate of extrusion, weight per unit of time, g/10 min (kg/s), of molten resins through a die of specified length and diameter,

under prescribed conditions of temperature, load, and piston position in the barrel as the timed measurement is being made.

F 412, F17

- flow slide**—the failure of a sloped bank of soil in which the movement of the soil mass does not take place along a well-defined surface of sliding. **D 653, D18**
- flow steady, n** —a characteristic of a flow system where the specific discharge is constant in time at any point. **D 653, D18**
- flowthrough electrodes**—ion-selective and reference electrodes designed for anaerobic measurements. The two electrodes are connected by plastic tubing to a syringe or peristaltic pump, and the sample is pumped through the electrodes at a constant rate. Ion-selective electrodes can be made in a flow through configuration for the measurement of very small samples (0.2 to 0.3 mL) or samples that must be measured anaerobically. **D 4127, D19**
- flow value, N_ϕ (degrees)**—a quantity equal to $\tan [45 \text{ deg} + (\phi/2)]$. **D 653, D18**
- flow velocity**—see **specificdischarge**. **D 653, D18**
- flue gas conditioning, n** —the process of adding chemicals such as sulfur trioxide or ammonia to the flue gas in order to improve the performance of the electrostatic precipitator (ESP) or reduce the opacity of emissions from the stack. **E 2201, E50**
- flue gas desulfurization (FGD), n** —removal of gaseous sulfur dioxide from boiler exhaust gas. Primary types of FGD processes are wet scrubbers, dry scrubbers and sorbent injection. Sorbents include lime, limestone, sodium-based compounds and high-calcium coal fly ash.
- dry FGD ash, n* —see *dry FGD material*.
- dry FGD material, n* —the product that is produced from dry FGD systems and consists primarily of calcium sulfite, fly ash, portlandite (Ca(OH)_2), and/or calcite.
- fixated FGD material, n* —a designed mixture of dewatered FGD sludge that is primarily calcium sulfite with either a high-lime fly ash or a low lime fly ash combined with a cementitious material. FGD sludge is also known as scrubber sludge, scrubber material, FGD solids, filter cake or centrifuge cake.
- lime spray drier ash, n* —see *dry FGD material*.
- stabilized FGD material, n* —another name for *fixated FGD material*.
- wet FGD products, n* —the product of wet FGD processes or systems. It is composed primarily of water, calcium sulfite/sulfate solids, and small quantities of fly ash. Wet FGD products can be thixotropic.
- FGD gypsum, n* —gypsum formed from an oxidizing and calcium-based flue gas desulfurization process.
- FGD material, n* —a product of an FGD process typically using a high-calcium sorbent such as lime or limestone. Sodium-based sorbent and high-calcium coal fly ashes are also used in some systems. The physical nature of these materials varies from a wet thixotropic sludge to a dry powdered material depending on the process.
- FGD material dry scrubbers, n* —the dry powdered material from dry scrubbers that is collected in a baghouse along with fly ash and consists of a mixture of sulfites, sulfates, and fly ash. **E 2201, E50**
- flue lining**—a manufactured tubular non-load bearing fired clay unit, normally used for conveying hot gases in chimneys. **C 896, C04**
- fluence**—the number of beam particles per unit area, where that area is defined perpendicular to the direction of the beam. **E 673, E42**
- fluff, n** —the fibrous, nonrubber, nonmetal portion of a tire that remains after the scrap tire is processed (that is, cotton, rayon, polyester, fiberglass, or nylon). **D 5681, D34**
- fluid-applied elastomer**—an elastomeric material, fluid at ambient temperature, that dries or cures after application to form a continuous membrane. Such systems normally do not incorporate reinforcement. **D 1079, D08**

fluid carrier, *n*

fluid carrier, *n*—a fluid in which particles are suspended to facilitate their movement or application. C 1145, C28

fluid coke, *n*—petroleum coke with a granular, microscopic layered structure resulting from injection of petroleum feedstock into a flowing, loose bed of coke particles. D 4175, D02

fluid-energy mill, *n*—a size-reduction apparatus in which grinding is achieved by the collision of the particles being ground in a high-velocity stream of air, steam, or other fluid. C 1145, C28

fluidifier—*in grouting*, an admixture employed in grout to increase flowability without changing water content. D 653, D18

fluidity—the reciprocal of viscosity. D 1695, D01

fluidized bed—a bed of particles in which the fluid flows upward at a rate sufficient to suspend the particles completely and randomly in the fluid phase. D 2652, D28

fluidized-bed combustion (FBC) ash, *n*—the fly ash and bed ash produced by an FBC boiler. E 2201, E50

fluidized-bed combustion (FBC) bed ash, *n*—the spent bed material that is produced by an FBC boiler. The bed ash is usually collected separately and can be considered as being equivalent to bottom ash in dry bottom or wet-bottom wall-fired furnace. E 2201, E50

fluidized-bed combustion (FBC) products, *n*—the unburned coal, ash, spent bed material, and unreacted sorbent produced by an FBC boiler. E 2201, E50

fluid migration, *n*—*in building construction*, accumulation of a fluid from a sealant, coating, or membrane on or in an adjacent material. C 717, C24

fluid permeability, *n*—see **permeability**. B 243, B09

fluid temperature (FT), *n*—*in reference to the fusibility of coal and coke ash according to Test Method D 1857*, the temperature at which the fused mass has spread out in a nearly flat layer with a maximum height of 1.6 mm ($\frac{1}{16}$ in.). D 121, D05

fluid temperature, FT, *n*—*in ash fusion determinations*, the temperature at which a fused mass has spread out in a nearly flat layer with maximum height of 1.6 mm ($\frac{1}{16}$ in.). D 5681, D34

fluid temperature, FT—the temperature at which the fused mass has spread out in a nearly flat layer with a maximum height of 1.6 mm ($\frac{1}{16}$ in.). D 5681, D34

fluorescence—photoluminescence in which the emitted optical radiation results from direct transitions from a photo-excited singlet energy level to a lower singlet level, these transitions taking place generally within 10 nanoseconds after excitation. D 2864, D27

fluorescence—the emission of radiant energy from an atom, molecule, or ion resulting from absorption of a photon and a subsequent transition to the ground state without a change in total spin quantum number. E 131, E13

fluorescence, *n*—photoluminescence that ceases when excitation ceases. E 284, E12

fluorescence—the emission of light by a substance as a result of the absorption of some other radiation of shorter wavelengths only as long as the stimulus producing it is maintained. E 1316, E07

fluorescence—the emission of visible radiation by a substance as a result of, and only during, the absorption of black light radiation. E 1316, E07

fluorescence—the emission of visible radiation by a substance as the result of, and only during, the absorption of black light radiation. E 1316, E07

fluorescence—the property of emitting radiation in the visible range as a result of absorption of radiation in the ultraviolet range from some other source. Optical brighteners that have this property are sometimes added to paper to enhance its whiteness or brightness to the eye in normal lighting. The emitted radiation can cause erratic reflectance values. F 149, F05

fluorescent, *adj*—(1) exhibiting fluorescence.

(2) *of a source*, having a primary radiant flux emitter that excites fluorescence in a phosphor to produce light. E 284, E12

fluorescent brightener, *n*—discouraged term for **fluorescent whitening agent**. E 284, E12

fluorescent examination method—the magnetic particle examina-

tion method employing a finely divided fluorescent ferromagnetic inspection medium. E 1316, E07

fluorescent illuminant, *n*—illuminant representing the spectral distribution of the radiation from a specified type of fluorescent lamp. E 284, E12

fluorescent magnetic particle inspection—the magnetic particle inspection process employing a finely divided fluorescent ferromagnetic inspection medium that fluoresces when activated by black light (3200 to 4000 Å (320 to 400 nm)). E 1316, E07

fluorescent penetrant, *n*—an inspection penetrant which fluoresces or glows in ultraviolet light. C 1145, C28

fluorescent screen—a sheet of material which emits visible light when exposed to invisible radiation. E 7, E04

fluorescent screen—alternative term for **intensifying screen (b)**. E 1316, E07

fluorescent ultraviolet lamp, *v*—a lamp in which the irradiance from a low pressure mercury arc is transformed to a longer wavelength UV radiation by a phosphor; the spectral power distribution of a fluorescent lamp is determined by the emission spectrum of the mercury arc light source, the emission spectrum of the phosphor and the UV transmittance of the glass tube. G 113, G03

fluorescent whitening agent, FWA, *n*—fluorescent dye or pigment that absorbs near-ultraviolet radiant flux and re-emits the power as visible light (violet-blue), thereby causing a whiter appearance when added to a yellowish-white material. E 284, E12

fluorescent whitening agents (FWA)—(optical bleach, fluorescent brightener) complex, organic molecules that adhere to fabrics as though they were dyes. Ultraviolet (UV) energy is absorbed, converted, and emitted as visible blue light to enhance fabric appearance and maintain whiteness or brightness. D 459, D12

fluorescent X-rays (fluorescent analysis)—characteristic X-rays excited by radiation of wavelength shorter than the corresponding absorption edge. E 7, E04

fluorite (CaF₂) (fluorspar)—an inorganic mineral of the isometric form, used as a source of fluorine for fluxing of glasses, and glazes. C 242, C21

fluorocarbon plastic, *n*—a plastic based on polymers made with perfluoromonomers. D 883, D20

fluorocarbon plastic, *n*—a plastic based on polymers made with perfluoromonomers. (ISO, D20) F 412, F17

fluorocarbon plastic, *n*—a plastic based on polymers made with monomers composed of fluorine and carbon only. F 1251, F04

fluorohydrocarbon plastic, *n*—a plastic based on polymers made with monomers composed of fluorine, hydrogen, and carbon only. F 1251, F04

fluorohydrocarbon plastics, *n*—plastics based on polymers made with monomers composed of fluorine, hydrogen, and carbon only. (ISO) D 883, D20

fluorohydrocarbon plastics, *n*—plastics based on polymers made with monomers composed of fluorine, hydrogen, and carbon only. (ISO, D20) F 412, F17

fluoroplastic, *n*—a plastic based on polymers made from monomers containing one or more atoms of fluorine, or copolymers of such monomers with other monomers, the fluorine-containing monomer(s) being in greatest amount by mass. D 883, D20

fluoroplastic, *n*—a plastic based on polymers made from monomers containing one or more atoms of fluorine, or copolymers of such monomers with other monomers, the fluorine-containing monomer(s) being in the greatest amount by mass. (D20) F 412, F17

fluoroplastic, *n*—a plastic based on polymers with monomers containing one or more atoms of fluorine or copolymers of such monomers with other monomers, the fluorine-containing monomer(s) being in greatest amount by mass. (See also **fluorocarbon plastic, chlorofluorocarbon plastic, fluorohydrocarbon plastic, and chlorofluorohydrocarbon plastic.**) F 1251, F04

fluoroptic temperature measurement—temperature measurement based on the variation in total luminescence of a fluoroptic phosphor which has been previously calibrated versus a known temperature standard. F 1479, F02

fluoroscopy—the visual observation on a fluorescent screen of the image of an object exposed to penetrating, ionizing radiation.

E 1316, E07

flush installation—anchor that is installed so that its top is flush with the surface of the structural member and does not protrude beyond the surface.

E 2265, E06

flush joint or flush coupled—casing or riser with ends threaded such that a consistent inside and outside diameter is maintained across the threaded joints or couplings.

D 653, D18

flush out, v—the process of reducing or removing VOCs and other airborne contaminants from a building.

E 2114, E06

flute—See **corrugated fiberboard**.

D 996, D10

flute—helical and, sometimes, vertical deformation rolled onto shank.

F 547, F16

fluted—deformed with continuous, symmetrical, helical, or longitudinal depressions. Four or five of these flutes are usually formed onto wire from which fluted nail is made, in contrast to threading where shapes are rolled onto nail shank in a thread-rolling process. Flutes resulting from this manufacturing process extend the full length of the nail shank. (See **roll-grooved** and **mechanically deformed**.)

F 547, F16

flutes—continuous symmetrical depressions along nail shank.

F 547, F16

fluvial sediment—particles derived from rocks, biological materials, or chemical precipitants, that are transported by, suspended in, or deposited by flowing water.

D 4410, D19

flux—an ingredient that reduces batch melting temperature.

C 162, C14

flux—a substance that promotes fusion in a given ceramic mixture.

C 242, C21

flux—a substance that promotes fusion in a given ceramic mixture.

C 286, B08

flux, n—a bituminous material, generally liquid, used for softening other bituminous materials.

D 8, D04

flux—a bituminous material used as a feed stock for further processing and as a material to soften other bituminous materials.

D 1079, D08

flux—the membrane throughput, usually expressed in volume of permeate per unit time per unit area, such as gallons per day per ft² or litres per hour per m². Number of moles, volume or mass of a specified component that is passing per unit of time through a unit of membrane surface area normal to the thickness direction.

D 6161, D19

flux—see **radiant flux, luminous flux**.

E 284, E12

flux—the number of beam particles per unit area per second, where the area is defined to be perpendicular to the direction of the beam.

E 673, E42

flux—the number of particles flowing through a given area per unit time.

E 1620, E29

flux, n—the combining of photons of light energy to create radiant power.

F 1294, F05

flux block—a refractory furnace block used in contact with glass in melting.

C 162, C14

flux-current loop, incremental (biased)—the curve developed by plotting magnetic induction, B , versus magnetic field strength, H , when the magnetic material is cyclically magnetized while under dc bias condition. This loop will not be symmetrical about the B and H axes.

A 340, A06

flux-current loop, normal—the curve developed by plotting magnetic induction, B , versus magnetic field strength, H , when the magnetic material is symmetrically cyclically magnetized.

NOTE—The area of the loop is proportional to the sum of the static hysteresis loss and all dynamic losses.

A 340, A06

flux density, magnetic—the strength of a magnetic field, expressed in flux lines per unit area.

E 1316, E07

fluxing agent, n—any substance which will promote fusion of ceramic materials.

C 1145, C28

fluxing lime—a term referring to quicklime used as an agent in the manufacture of steel or glass.

C 51, C07

flux leakage field—the magnetic field that leaves or enters the surface of a part as the result of a discontinuity or a change in section.

E 1316, E07

flux line—See **metal line**.

C 162, C14

flux lines—see **lines of force**.

E 1316, E07

flux linkage, \mathcal{L} —the sum of all flux lines in a coil.

$$\mathcal{L} = \phi_1 + \phi_2 + \phi_3 + \dots + \phi_N$$

where:

ϕ_1 = flux linking turn 1;

ϕ_2 = flux linking turn 2, and so forth; and

ϕ_N = flux linking the N th turn.

NOTE—When the coupling coefficient, k' , is less than unity, the flux linkage equals the product of the average flux linking the turns and the total number of turns. When the coupling coefficient is equal to unity, the flux linkage equals the product of the total flux linking the coil and the total number of turns.

A 340, A06

flux linkage, mutual, \mathcal{L}_m —the flux linkage existing between two windings on a magnetic circuit. Mutual linkage is maximum when the coupling coefficient is unity.

A 340, A06

flux path length, effective, ℓ_1 —the calculated length of the flux paths in a magnetic core, which is used in the calculations of certain magnetic parameters.

A 340, A06

flux path length, ℓ —the distance along a flux loop.

A 340, A06

flux penetration—the depth to which a magnetic flux exists in a part.

E 1316, E07

flux profile, n —the curve relating incident radiant heat energy on the specimen plane to distance from the point of initiation of flaming ignition, that is, 0 cm.

E 176, E05

flux, radiant—see **radiant flux**.

E 772, E44

flux-sensitive—a sampling process where the magnitude measured responds to the flux of particles through the sampling region.

E 1620, E29

flux size distribution—the size distribution of particles passing through a sampling zone during a given interval of time, wherein individual particles are counted and sized.

E 1620, E29

fluxstone—a term referring to limestone (high-calcium, magnesian, or dolomitic) used as an agent in the manufacture of iron and steel or glass.

C 51, C07

flux volts, E_f —the voltage induced in a winding of a magnetic component when the magnetic material is subjected to repeated magnetization under *SCM* or *CM* conditions.

$$E_f = 4.443 B_{\max} A' N f \times 10^{-8} \text{ V (SCM excitation)}$$

$$E_f = 2.221 \Delta BA' N f \times 10^8 \text{ V (CM excitation)}$$

$$E_f = 1.1107 E_{\text{avg}}$$

which

A' = solid cross-sectional area of the core in cm²,

N = number of winding turns, and

f = the frequency in hertz.

A 340, A06

fly—a part that makes contact with the drive pin for rotation of the tumblers.

F 471, F12

fly ash, n—the finely divided residue that results from the combustion of ground or powdered coal and that is transported by flue gases from the combustion zone to the particle removal system.

C 125, C09

fly ash—the finely divided residue resulting from the combustion of ground or powdered coal and which is transported from the firebox through the boiler by flue gases.

D 653, D18

fly ash, n

fly ash, n—the finely divided particles of ash entrained in flue gases arising from the combustion of fuel. **D 1356, D22**

fly ash, n—residual material that exits a combustion chamber in the flue gas. **D 5681, D34**

fly ash—finely sized ash generated from combustion of pulverized coal. Descriptions and types are listed in Specifications C 593 and C 618. **D 5681, D34**

fly ash, n—coal ash that exits a combustion chamber in the flue gas and is captured by air pollution control equipment such as electrostatic precipitators, Baghouses, and wet scrubbers. **E 2201, E50**

fly ash-lime content, n—the total calcium content of fly ash, including reactive and non-reactive calcium species expressed as calcium oxide (CaO). **E 2201, E50**

flyer—See **loom fly**. **D 3990, D13**

flying, n—the tendency of a printing ink or vehicle to be ejected as large globules from a roller distribution system. **D 6488, D01**

flying spot scanning—in *optical character recognition*, a device employing a moving spot of light to scan a sample space, the intensity of the transmitted or reflected light being sensed by the photoelectric transducer. **F 149, F05**

FMC-2 color difference, n—color difference calculated by use of the Friele-MacAdam-Chickering, Version 2, equations based on the MacAdam chromaticity-difference-perceptibility ellipses and the Munsell value function. **E 284, E12**

foam—a layer of bubbles on the surface of molten glass. **C 162, C14**

foam, n—in *cleaning textiles*, a frothy mass of fine bubbles generated by whipping or agitating a shampoo. **D 123, D13**

foam—a mass of bubbles formed on liquids by agitation. **D 459, D12**

foam, n—in *liquids*, a collection of bubbles formed in the liquid or on (at) its surface in which the air (or gas) is the major component on a volumetric basis. **D 4175, D02**

foam, n—in *liquids*, a collection of bubbles formed in or on the surface of a liquid in which the air or gas is the major component on a volumetric basis. **D 4175, D02**

foam, n—in *cleaning textiles*, a frothy mass of fine bubbles generated by whipping or agitating a shampoo. **D 5253, D13**

foam clean, v—use a prepared foam to clean. **D 5253, D13**

foam cleaning, n—a process in which a prepared foam is applied to a textile product, scrubbed in, allowed to dry, and the encapsulated soil is removed by suction. **D 123, D13**

foam cleaning, n—a process in which a prepared foam is applied to a textile product, scrubbed in, allowed to dry, and the encapsulated soil is removed by suction. **D 5253, D13**

foam core—a lightweight cellular structure (rigid foam) material used in sandwich panel construction; innermost portion of a multilayer adherend assembly. **E 631, E06**

foam core—a lightweight cellular structure (rigid foam) material used in sandwich panel construction; innermost portion of a multilayer adherend assembly. **E 1749, E06**

foamed adhesive, n—an adhesive whose apparent density has been decreased by the presence of numerous gas-filled cells throughout its mass. **D 907, D14**

foamed adhesive—See **adhesive, foamed**. **E 631, E06**

foamed adhesive—See **adhesive, foamed**. **E 1749, E06**

foamed plastics, n—See **cellular plastics** (the preferred terminology). (D20) **F 412, F17**

foamed plastics, n—See **cellular plastics** (the preferred terminology). **D 883, D20**

foam glass—a thermally insulating material consisting of a high volume fraction of gaseous inclusions distributed throughout a glass matrix. **C 162, C14**

foaming agent—a material that increases the stability of a suspension of gas bubbles in a liquid medium. **D 459, D12**

foaming agent—a material that increases the volume or stability of the foam formed in a spray mixture. **E 1519, E35**

foaming agent (latex), n—a substance used to facilitate the formation of suspended gas in latex during the production of latex foam. **D 1566, D11**

foaming tendencies, n—a laboratory test conducted in glassware to evaluate the tendency of an engine coolant to foam under standard conditions of aeration and temperature. **D 4725, D15**

foam-in place cushioning material—See **cushioning material**. **D 996, D10**

foam line—a boundary in a melting furnace beyond which foam no longer appears on the glass surface. **C 162, C14**

foam stabilizer (latex), n—a substance used in the preparation of latex foam, before gelation, drying, and vulcanization to help maintain the foam cell structure. **D 1566, D11**

foam suppressant—See **defoamer**. **E 1519, E35**

foam tear, n—a condition wherein the foam portion of a laminated fabric ruptures prior to the failure of the bond. **D 123, D13**

F.O.B. destination—free on board at destination; that is, the seller or consignor delivers the goods on seller's on consignor's conveyance at destination. Unless the contract provides otherwise, the seller or consignor is responsible for the cost of shipping and the risk of loss. **E 2135, E53**

F.O.B. origin—free on board at origin; that is, the seller or consignor places the goods on the conveyance. Unless the contract provides otherwise, the buyer or consignee is responsible for the cost of shipping and the risk of loss. **E 2135, E53**

focal length—the distance from the second principal point to the point on the axis where parallel rays entering the lens will converge or focus. **E 7, E04**

focal spot—that area on the target of an X-ray tube which is bombarded by electrons. **E 7, E04**

focal spot—for x-ray generators, that area of the anode (target) of an x-ray tube which emits x-ray when bombarded with electrons. **E 1316, E07**

focus—a point at which rays originating from a point in the object converge or from which they diverge or appear to diverge under the influence of a lens or diffracting system. **E 7, E04**

focused beam—converging energy of the sound beam at a specified distance. **E 1316, E07**

focusing camera (X-rays)—a diffraction camera in which the X-ray source of a divergent X-ray beam, specimen (polycrystalline) and film all lie on one circle, which results in the diffracted beams all being focused on the film. **E 7, E04**

focusing device (electrons)—a device which effectively increases the angular aperture of the electron beam illuminating the object, rendering the focusing more critical. **E 7, E04**

focusing magnifier: (1)—a low-power microscope, telescope or simple lens used to observe the electron image formed on a fluorescent screen.

(2) a magnifying lens mounted so that its focal plane is coincident with its base, used to obtain a sharp focus in the plane of the sensitive material in a camera. **E 7, E04**

focusing (X-rays)—the operation of producing a convergent beam in which all rays meet in a point or line. **E 7, E04**

fog, n—a visible aggregate of condensed water vapor or ice crystals suspended in the atmosphere near the earth's surface. **D 1356, D22**

fog—a general term used to denote any increase in optical density of a processed photographic emulsion caused by anything other than direct action of the image forming radiation and due to one or more of the following:

(a) *aging*—deterioration, before or after exposure, or both, resulting from a recording medium that has been stored for too long a period of time, or other improper conditions.

(b) *base*—the minimum uniform density inherent in a processed emulsion without prior exposure.

(c) *chemical*—resulting from unwanted reactions during chemical processing.

(d) *dichroic*—characterized by the production of colloidal silver

within the developed sensitive layer.

(e) *exposure*—arising from any unwanted exposure of an emulsion to ionizing radiation or light at any time between manufacture and final fixing.

(f) *oxidation*—caused by exposure to air during developing.

(g) *photographic*—arising solely from the properties of an emulsion and the processing conditions, for example, the total effect of inherent fog and chemical fog.

(h) *threshold*—the minimum uniform density inherent in a processed emulsion without prior exposure.

fog, *n*—a quiescent cloud near the earth's surface. **E 1316, E07**
fog, *n*—see **background**. **F 335, F05**

fog density—a general term used to denote any increase in the optical density of a processed film caused by anything other than the direct action of the image-forming radiation. **E 1316, E07**

fog nozzle—a high capacity pressure atomizer that produces a dispersion of fine drops. **E 1620, E29**

fog quenching, *n*—**quenching** in a mist. **A 941, A01**

fog room, *n*—a moist room in which the humidity is controlled by atomization of water. **C 219, C01**

fog seal, *n*—a light application of bituminous material to an existing pavement as a seal to inhibit raveling, or to seal the surface, or both; medium and slow-setting bituminous emulsions are usually used and may be diluted with water. **D 8, D04**

foil—a term often applied to thin sheet or strip usually 0.005 in. (0.13 mm) or less in thickness. **B 846, B05**

foil, *n*—rolled wrought product, rectangular in cross section, and of thickness less than 0.006 in. [up through 0.15 mm].

bright two-side foil, *n*—foil having a uniform bright specular finish on both sides.

matte one-side foil, *n*—foil having a diffuse reflecting finish on one side and a bright specular finish on the other. **B 881, B07**

foil—a thin sheet of a material, usually a metal, not exceeding 0.005 in. in thickness. **E 7, E04**

fold—See **lap**. **C 162, C14**

fold—a bend in the strata or other planar structure within the rock mass. (ISRM) **D 653, D18**

fold—doubling over of metal which occurs during forging at or near the intersection of diameter changes which are found on the shoulders, heads, or shanks of bolts and screws, or on nuts at the intersection of diameter changes on the top face or on the bottom face. **F 1789, F16**

folded reinforcement—an unintentional or unspecified misalignment of mat or fabric reinforcing material in relation to the contour of a pultruded section.

NOTE—Such folds may or may not affect the surface appearance of the pultrusion and are chiefly visible in a cut cross section of the product. Such reinforcement irregularities are usually due to shifting and crowding of the reinforcing material during pultrusion.

D 3918, D20

folder stock, *n*—a paperboard used for the manufacture of folders for filing purposes. **D 1968, D06**

folding—see **aliasing**. **E 131, E13**

folding endurance, *n*—of paper, the average of the logarithms to the base 10 of the individual folding numbers. See **folding number**. **D 1968, D06**

folding number, *n*—the number of double folds required to cause failure of a paper test specimen when it is subjected to a prescribed folding procedure. **D 1968, D06**

fold number, *n*—See **folding number**. **D 1968, D06**

folds—defects in metal, usually on or near the surface, caused by continued fabrication of overlapping surfaces. **E 7, E04**

foliar application—application of a chemical to the stems, fruit, leaves, needles, or blades of a plant. **E 1102, E35**

foliar retention agent—a substance that increases the time and agrichemical remains in the targeted foliar zone. **E 1519, E35**

foliation—the somewhat laminated structure resulting from segregation of different minerals into layers parallel to the schistosity. (ISRM) **D 653, D18**

follower—See **pusher**. **F 592, F16**

follow-up expansion—movement of an expansion anchor during tension loading, whereby the expansion sleeve remains stationary and further expands as the anchor body moves axially in response to the load application. **E 2265, E06**

follow-up program, *n*—the sampling, inspection, tests, or other measures conducted by the certification organization on a periodic basis to determine the continued compliance of products that are being made by the manufacturer to the requirements of the standard specification. **F 1494, F23**

font—a set of graphic shapes that may be alphabetic, numeric, or both and may include other symbols. **F 149, F05**

font, *n*—a set of characters that share the same type style and size. **F 1457, F05**

food cutters—machine that uniformly reduces food products to a small particle size for salads, spreads, bread crumbs, and other food service recipes. Reduction of the food product is accomplished by combining the rotation of the product bowl with the perpendicular high speed rotation of a set of stainless steel cutlery knives. **F 1827, F26**

food mixing machines—vertical electric machine that shall be adaptable for mixing, whipping, and beating food products. The size range (as expressed by bowl capacity) from 12 qt to 140 qt and does not include special purpose machines that are intended solely for mixing dough. **F 1827, F26**

food service equipment manuals—manuals for food service equipment shall contain as a minimum, complete installation, operating, preventive maintenance, safety warnings, cleaning, and service instructions, including applicable charts and diagrams. **F 1827, F26**

food simulant—a well-characterized substance used in place of food for investigative studies. **F 1479, F02**

food slicing machines—a machine with electrically-driven rotating slicing blades. **F 1827, F26**

food waste disposal, commercial—a device intended for grinding food waste into small particles that are then flushed by water into a sanitary sewer system. Food wastes can be cooked or noncooked soils from the preparation or serving of foods. Use not intended for grinding glass, china, metals, clam or oyster shells, large bones, wood, paper, cardboard, or plastic. **F 1827, F26**

food waste pulper and waterpress assembly, commercial—a device intended for grinding food waste, food service paper, cardboard products, food service plastic products, documents including computer printouts, general office and retail store paper, and cardboard waste. Materials are ground in a water-filled tank (*pulper*) to produce a slurry which is then passed to the waterpress to be dewatered. Use not intended for grinding glass, china, metal, wood, clam, or oyster shells. Any small pieces of metal inadvertently placed in the pulper, such as cardboard box staples, aluminum refreshment cans, or tin food cans, shall be removable from the outside of the pulper tank. **F 1827, F26**

foot, *n*—the terminal part of the vertebrate leg, including the ankle, upon which an individual stands (see **foot protective device**). **F 1494, F23**

footcandle, *n*—unit of illuminance equal to one lumen per square foot. **E 284, E12**

footcandle (fc)—the illumination on a surface, 1 ft² in area, on which is uniformly distributed a flux of 1 lm (lumen). It equals 10.8 lm/m². **E 1316, E07**

footing—portion of the foundation of a structure that transmits loads directly to the soil. **D 653, D18**

foot length, *n*—in body measurements, with the subject standing barefoot, the distance from the most prominent part of the heel where it touched the floor to the end of the most prominent toe. **D 123, D13**

foot length, *n*—the straight distance from the prominence of the back

foot length, *n*

of the heel to the prominence of the longest toe, taken with the foot on a flat surface without shoes (use stable, flat ruler). **D 5219**, D13

foot portion—the portion of the footwear below the wearer's ankle bone. **F 819**, F18

footprint area [L^2], *n*—the gross contact area of a tire that is loaded (under stated conditions) against a smooth flat surface. **F 538**, F09

foot protective device, *n*—for chain saw cut resistance, an article of personal equipment which is worn over the foot and ankle for the purpose of providing limited protection from injury due to contact with a moving saw chain. **F 1494**, F23

foot traffic units, *n*—for pile floor covering, the number of passes by human walkers over a specific group of carpet samples. **D 123**, D13

footwall—the mass of rock beneath a discontinuity surface. (ISRM) **D 653**, D18

footwear, *n*—a boot or shoe of any construction. **F 1494**, F23

footwear, *n*—wearing apparel for the feet (such as shoes, boots, slippers, or overshoes), excluding hosiery. **F 1646**, F13

foot width, *n*—the straight distance from one side of the foot to the other side at the widest part, taken with the subject standing and without shoes (use stable, flat ruler). **D 5219**, D13

force, *n*—a physical influence exerted by one body on another which produces acceleration of bodies that are free to move and deformation of bodies that are not free to move. (Compare **strength**.) **D 123**, D13

force, *n*—a physical influence exerted by one body on another which produces acceleration of bodies that are free to move and deformation of bodies that are not free to move. (Compare **strength**.) **D 4848**, D13

force account—term describing PHA self-performance of modernization work by the use of employees, as distinct from performance by a contractor. **E 631**, E06

force at break, *n*—See **breaking force**. **D 4848**, D13

force-at-rupture, *n*—the force applied to a material immediately preceding rupture. (Compare **breaking force**. See also **rupture**.) **D 123**, D13

force at rupture, *n*—the force applied to a material immediately preceding rupture. (Compare **breaking force**. See also **rupture**.) **D 4848**, D13

force at specific elongation, **FASE**, *n*—the force associated with a specific elongation on the force-elongation curve. **D 4439**, D35

force-at-specified-elongation (FASE), *n*—the force associated with a specific elongation on the force-extension or force-elongation curve. **D 123**, D13

force at specified elongation (FASE), *n*—the force associated with a specific elongation on the force-extension or force-elongation curve. (*Syn.* **corresponding force**.) **D 4848**, D13

force cycle—See **cycle**. **E 1823**, E08

forced convection—see **convection, forced**. **E 772**, E44

forced drying temperature, *n*—a temperature between room temperature and 150°F (65°C). **D 16**, D01

force-deformation curve, *n*—a graphical representation of the force and deformation relationship of a material under conditions of compression, shear, tension, or torsion. (Compare **force-elongation curve**, **force-extension curve**, and **stress-strain curve**.) **D 123**, D13

force-deformation curve, *n*—a graphical representation of the force and deformation relationship of a material under conditions of compression, shear, tension or torsion. (Compare **force-elongation curve**, **force-extension curve** and **stress-strain curve**.) **D 4848**, D13

forced oxidation, *n*—a process employed to supply additional air in wet FGD systems, resulting in the production of gypsum. **E 2201**, E50

forced vibration (forced oscillation)—vibration that occurs if the response is imposed by the excitation. If the excitation is periodic and continuing, the oscillation is steady-state. **D 653**, D18

force-elongation curve, *n*—a graphical representation of the force

and elongation relationship of a material under tension. (Compare **force-deformation curve**, **force-extension curve**, and **stress-strain curve**.) **D 123**, D13

force-elongation curve, *n*—in a tensile test, a graphical representation of the relationship between the magnitude of an externally applied force and the change in length of the specimen in the direction of the applied force. (*Synonym* for **stress-strain curve**.) **D 4439**, D35

force-elongation curve, *n*—a graphical representation of the force and elongation relationship of a material under tension. (Compare **force-deformation curve**, **force-extension curve** and **stress-strain curve**.) **D 4848**, D13

force-extension curve, *n*—a graphical representation of the force and extension relationship of a material under tension. (Compare **force-deformation curve**, **force-elongation curve**, and **stress-strain curve**.) **D 123**, D13

force-extension curve, *n*—a graphical representation of the force and extension relationship of a material under tension. (Compare **force-deformation curve**, **force-elongation curve** and **stress-strain curve**.) **D 4848**, D13

force [F], *n*—in mechanical testing, a vector quantity of fundamental nature characterized by a magnitude, a direction, a sense, and a discrete point of application, that acts externally upon a test object and creates stresses in it. **E 6**, E28

force [F]—used in Practices E 1049 to denote force, stress, strain, torque, acceleration, or other parameters of interest. **E 1823**, E08

force-line displacement resulting from creep, V_c [L]—displacement at the loading pins from cracking associated with creep strain accumulation. **E 1823**, E08

force, P[F]—the force applied to a test specimen or to a component. **E 1823**, E08

force range, ΔP [FL^{-2}]—in fatigue loading, the algebraic difference between successive valley and peak forces (positive range or increasing force range) or between successive peak and valley forces (negative range or decreasing force range). In constant amplitude loading, the range is given as follows:

$$\Delta P = P_{\max} - P_{\min}$$

E 1823, E08

force ratio (also stress ratio), R, A—in fatigue, the algebraic ratio of the two loading parameters of a cycle. The most widely used ratios are as follows

$$R = \frac{\text{minimum load}}{\text{maximum load}} = \frac{P_{\min}}{P_{\max}} = \frac{S_{\min}}{S_{\max}}, \text{ and}$$

$$A = \frac{\text{loading amplitude}}{\text{mean load}} = \frac{P_a}{P_m} = \frac{S_a}{S_m}$$

E 1823, E08

force-recovery cycle, *n*—in elastic fabric testing, a continuous curve or plot of force versus elongation (with movement stopped momentarily at point of reversal) describing the elongation and recovery of an elastic fabric; also known as the loading and unloading cycle. **D 123**, D13

force-recovery cycle, *n*—in elastic fabric testing, a continuous curve or plot of force versus elongation (with movement stopped momentarily at point of reversal) describing the elongation and recovery of an elastic fabric; also known as the loading and unloading cycle. **D 123**, D13

force-recovery cycle, *n*—in elastic fabric testing, a continuous curve or plot of force versus elongation (with movement stopped momentarily at point of reversal) describing the elongation and recovery of an elastic fabric; also known as the loading and unloading cycle. **D 4850**, D13

force (strain) amplitude, P_a (S_a or ε_a) [F or FL⁻²]—in fatigue loading, one half of the range of a cycle (also known as *alternating force*). **E 1823**, E08

force to actuate (FTA), *n*—the peak force that corresponds to the pressure on the finger that a consumer feels upon fully actuating the mechanical pump dispenser. **D 6655**, D10

force transducer—a device which indicates the applied force by means of an electrical voltage. Usually the electrical voltage increases linearly with applied force. **E 1823, E08**

forehearth—a section of a melting furnace in one of several forms from which glass is taken for forming. **C 162, C14**

foreign matter, n—in cotton, non-lint material commonly referred to as waste or trash such as dust, sand, seed-coat fragments, leaves, and stems normally present in raw and partially processed cotton. **D 123, D13**

foreign matter—in protective coatings, insoluble foreign particles such as sand, lint, dust, and dirt that get mixed with the coating material before, during, or after application; causing the formation of raised specks in the dried film. **D 4538, D33**

foreign matter, n—for inflatable restraint fabrics, an extraneous interwoven fragment whose size, color, or texture indicates that it is not of the same material as the fibers in the base fabric. **D 6799, D13**

foreign matter, n—in cotton, non-lint material commonly referred to as waste or trash such as dust, sand, seed-coat fragments, leaves, and stems normally present in raw and partially processed cotton. **D 7139, D13**

fore-line—in leak testing, the line between a fore pump and the pump it backs. **E 1316, E07**

fore-line valve—in leak testing, a vacuum valve placed in the fore-line to permit isolation of the diffusion pump from its backing pump. **E 1316, E07**

forensic psychophysiology, n—the scientific discipline dealing with the relationship and applications of PDD tests within the legal system. It encompasses the academic discipline that provides the student, the practitioner, and the researcher with the theoretical and applied psychological, physiological, and psychophysiological fundamentals for a thorough understanding of PDD tests, and the skills and qualifications for conducting PDD examinations. The modifier “forensic” delineates and delimits this discipline from the broader discipline of psychophysiology. **E 2035, E52**

forepoling—driving forepoles (pointed boards or steel rods) ahead of the excavation, usually over the last set erected, to furnish temporary overhead protection while installing the next set. (ISRM) **D 653, D18**

forepressure—in leak testing, the total pressure on the outlet side of a pump measured near the outlet port. Sometimes called the back pressure, backing pressure, outlet pressure, exhaust pressure, or discharge pressure. In discussing the action of a vapor jet, the term forepressure may be used to designate the total pressure of the gas against which the jet impinges. **E 1316, E07**

fore pump—in leak testing, the pump that produces the necessary fore vacuum for a pump which is incapable of discharging gases at atmospheric pressure. Sometimes called the backing pump. **E 1316, E07**

foreset bed—the advancing and relatively steep frontal slope of a delta, that progressively covers the bottomset bed and in turn is covered by the topset bed. Foreset beds represent the greater part of the volume of a delta. **D 4410, D19**

forest products laboratory etch—See **FPL etch and sulfochromate etch**. **E 631, E06**

forest products laboratory etch—See **FPL etch and sulfochromate etch**. **E 1749, E06**

forged structure—the macrostructure through a suitable section of a forging which reveals direction of working. **E 7, E04**

forging, n—metal part worked to a predetermined shape by one or more processes such as hammering, upsetting, pressing, rolling, and so forth.

blocker-type forging, n—forging made in a single set of impressions to the general contour of a finished part.

die forging, n—forging formed to the required shape and size by working in impression dies.

hammer forging, n—forging produced by repeated blows of a forging hammer.

hand forging, n—forging, manually-manipulated, which is

worked, through repeated strokes or blows, between flat or simply shaped dies.

rolled ring forging, n—cylindrical product of relatively short height, circumferentially rolled from a hollow section. **B 881, B07**

forging cracks—occur during fastener manufacturing at the cutoff or forging operations and are located on the top of the head or on the raised periphery of indented head bolts and screws. **F 1789, F16**

forging stock, n—wrought or cast rod, bar, or other section suitable for forging. **B 881, B07**

fork—a set of metal equipment used during the firing operation for placing ware in, and removing it from a box furnace. **C 286, B08**

forked blade clincher—special clincher (anvil) for hooking plastic bags to facilitate placement of encircling staple. **F 592, F16**

forking—a mechanism whereby a propagating fracture branches to form two new fractures separated by an acute angle. **C 162, C14**

form—a set of equivalent planes in a crystal. In general, they will have the same spacing but different Miller indices. For example, in the cubic system, the planes (101), (110), (011), etc. are planes of the form (110). In the tetragonal system, however, the planes (101) and (110) belong to different forms. Equivalent directions are also spoken of as directions of a form. **E 7, E04**

form—the descriptive term for categorizing developers with similar characteristics. **E 1316, E07**

formaldehyde tannage—tannage used especially for white leathers and washable glove leathers. **D 1517, D31**

format, n—the established sequence or rules for ordering questions for presentation during testing. **E 2035, E52**

format—preprogrammed identification of fields to be read by an optical scanner. **F 149, F05**

format classification interrogation, n—interactive direct on-line communication between systems which generates cut file interchange and fabric cutting equipment. **D 6963, D13**

formed—See **mechanically deformed**. **F 547, F16**

formed crown—staple crown formed during driving, for example, for carding or fastening wire. **F 592, F16**

former (latex), n—a shaped object on which a rubber article is produced by dipping into a latex, from which the article is subsequently removed. **D 1566, D11**

form factor—a factor used in the calculation of the bending strength of wood members to compensate for nonrectangular shape. Defined as the ratio of the modulus of rupture of a member of desired shape to that of a “standard” member. **D 9, D07**

form factor, ff—the ratio of the rms value of a periodically alternating quantity to its average absolute value.

NOTE—For a sinusoidal variation, the form factor is:

$$\pi / 2\sqrt{2} = 1.1107$$

A 340, A06

forming—the shaping of hot glass. **C 162, C14**

forming—the shaping or molding of ceramic ware. **C 242, C21**

forming, n—a process in which the shape of plastic pieces such as sheets, rods, or tubes is changed to a desired configuration. **D 883, D20**

forming, n—a process in which the shape of plastic pieces such as sheets, rods, or tubes is changed to a desired configuration. **F 412, F17**

forming—primary operation in the fastener industry which includes heading, upsetting, extruding and forging. **F 1789, F16**

forming hood—the partially enclosed volume in which individual glass fibers and groups of fibers are collected into a wool pack. **C 162, C14**

forming rolls—rolls used in forming flat glass. **C 162, C14**

forms of refuse-derived fuel (RDF)—RDF-1—Wastes used as a fuel in as-discarded form.

RDF-2—Wastes processed to coarse particle size with or without ferrous metal separation.

forms of refuse-derived fuel (RDF)

RDF-3—shredded fuel derived from municipal solid waste (MSW) that has been processed to remove metal, glass, and other inorganics. This material has a particle size such that 95 weight % passes through a 2-in. (50-mm) square mesh screen.

RDF-4—Combustible waste processed into powder form, 95 weight % passing 10-mesh screening.

RDF-5—Combustible waste densified (compressed) into the form of pellets, slugs, cubettes, or briquettes.

RDF-6—Combustible waste processed into liquid fuel.

RDF-7—Combustible waste processed into gaseous fuel.

D 5681, D34

formula, *n*—a list of the materials and their amounts used in the preparation of a compound. **D 1566, D11**

formulation—the form in which a chemical is offered to the user. **E 1102, E35**

formulation deposit rate—the amount of formulation deposited per unit area. **E 1102, E35**

formulation rate—the amount of chemical formulation applied per unit treated, expressed in terms of mass or volume per relevant unit treated. (For area treatment, kg/ha, lb/A, or oz/1000 ft of row; for space application, mg/m³, or oz/1000 ft³; for individual units, kg/plant or animal). **E 1102, E35**

formula weight—the weight, in grams, pounds, or other units, obtained by adding the atomic weights of all elemental constituents in a chemical formula. **B 374, B08**

Formvar—a plastic material used for the preparation of replicas, or specimen supporting membranes. Trade name for poly(vinyl formal) 15/95. **E 7, E04**

Formvar replica—See **replica**. **E 7, E04**

forsterite (2MgO·SiO₂)—a magnesium silicate mineral, usually produced synthetically as a ceramic raw material; may be a reaction-produced phase in fired ceramics. **C 242, C21**

forsterite porcelain—See **fosterite porcelain** under **porcelain**. **C 242, C21**

forsterite whiteware—See **fosterite whiteware** under **ceramic whiteware**. **C 242, C21**

forward scattered radiation—radiation which is scattered less than 90° with respect to the incident beam, that is, forward in the general direction of the radiation source. **E 1316, E07**

fossil resin, *n*—under **resin, natural**, see **fossilresin**. **D 16, D01**

fouling—the reduction of flux due to a build-up of solids on the surface or within the pores of the membrane, resulting in changed element performance. **D 6161, D19**

fouling index (FI)—see **SDI**. **D 6161, D19**

foundation—lower part of a structure that transmits the load to the soil or rock. **D 653, D18**

foundation soil—upper part of the earth mass carrying the load of the structure. **D 653, D18**

foundry casting, *n*—a casting process wherein a molten metal is poured by gravity into the cavity of a mold and solidified; also, a product of such a process. **B 899, B02**

foundry nail, smooth foundry nail—bright, regular-stock-steel, ¾ by 0.120 to 9 by 0.162-in. nails with large thin flat ⅞ to ½-in. head and medium diamond point. **F 547, F16**

Fourcault process—the method of making sheet glass by drawing vertically upward from a slotted debiteuse block. **C 162, C14**

Fourdrinier kraft—See **containerboard**. **D 996, D10**

Fourier transform (FT)—the mathematical process used to convert an amplitude-time spectrum to an amplitude-frequency spectrum, or *vice versa*. **E 131, E13**

Fourier transform infrared (FT-IR) spectrometry—a form of infrared spectrometry in which an interferogram is obtained; this interferogram is then subjected to a Fourier transform to obtain an amplitude-wavenumber (or wavelength) spectrum. **E 131, E13**

four-point-¼ point flexure, *n*—configuration of flexural strength testing where a specimen is symmetrically loaded at two locations

that are situated one quarter of the overall span, away from the outer two support bearings. **C 1145, C28**

four-side structural sealant glazing, *n*—in *building construction*, a glazing system wherein all sides of a rectangular-shaped lite or panel are structural sealant glazed. **C 717, C24**

foxing—a shoe component that reinforces or covers the shoe at a point of particular wear or stress, such as the heel area of the joint between sole and upper. **F 869, F08**

foxing, *n*—a piece of material applied to the upper or extending around the outsole of a boot or shoe. **F 1646, F13**

F pilus—a protrusion on *E. coli* that is necessary for mating. The F pilus also contains the receptor for phage M13. **E 1705, E48**

FPL etch—an abbreviation for *forest products laboratory etch*; an etchant used for preparing the surface of aluminum alloys for adhesive bonding. (Syn. **sulfochromate etch**.) **E 631, E06**

FPL etch—an abbreviation for *forest products laboratory etch*; an etchant used for preparing the surface of aluminum alloys for adhesive bonding. (Syn. **sulfochromate etch**.) **E 1749, E06**

FR, *n*—a designation noting that an electrical insulating material has been subjected to a standard test for flammability and has a rating in accordance with that standard. **D 1711, D09**

fraction, *n*—the portion of a powder sample that lies between two stated particle sizes. Synonymous with **cut**. **B 243, B09**

fractional efficiency—See **efficiency**. **D 1356, D22**

fractional evaporation, *n*—the continuous evaporation of the quantity of liquid that results in a progressive increase in the concentration of a less-volatile constituent(s) in the remaining liquid. **G 126, G04**

fractional exposure dose (FED), *n*—the ratio of the Ct product for a gaseous toxicant produced in a given test to that Ct product of the toxicant which has been determined statistically from independent experimental data to produce lethality in 50% of test animals within a specified exposure and postexposure time. Since the time values in this ratio numerically cancel, the FED also is simply the ratio of the average concentration of a gaseous toxicant to its LC₅₀ value for the same exposure time. When not used with reference to a specific toxicant, the term FED represents the summation of FEDs for individual toxicants in a combustion atmosphere. **E 176, E05**

fractional factorial design, *n*—a factorial experiment in which only an adequately chosen fraction of the treatments required for the complete factorial experiment is selected to be run. **E 456, E11**

fractional factorial design, *n*—a factorial experiment in which only an adequately chosen fraction of the treatments required for the complete factorial experiment is selected to be run.

NOTE—This procedure is sometimes called fractional replication.

E 1325, E11

fractional ion yield—*SIMS*, the ratio of the number of secondary ions of a particular species to the total number of secondary ions emitted by a specimen. **E 673, E42**

fractional reflectance, *R_p*, *n*—the ratio of the flux reflected from a specimen in a specified solid angle to that incident on the specimen. **E 284, E12**

fractional transmittance, *T_p*, *n*—the ratio of the flux transmitted through a specimen in a specified solid angle to the incident flux. **E 284, E12**

fractionation, *n*—the process of separating a mixture into components having different properties (as by distillation, precipitation, or screening). **D 1356, D22**

fractionation, elastic, *n*—a process in which soft aggregate is separated from harder aggregate by hurling the composite aggregate against a steel plate, the hard particles rebounding farther from the plate than the softer, more friable particles. **C 1145, C28**

fractography, *n*—means and methods for characterizing a fractured specimen or component. **C 1145, C28**

fracture—a complete break in the stone (see **crack**, **microcrack**, **seam**). **C 119, C18**

fracture—that portion of a vitrified clay pipe from which a fragment

- has been broken. It is distinguished by well-defined fracture faces and sharp edges where the fracture faces meet the surface of the pipe. **C 896, C04**
- fracture**—the general term for any mechanical discontinuity in the rock; it therefore is the collective term for joints, faults, cracks, etc. (ISRM) **D 653, D18**
- fracture**—a break in the mechanical continuity of a body of rock caused by stress exceeding the strength of the rock. Includes joints and faults. **D 653, D18**
- fracture**—a rupture or break of the polish film (usually multiple). **D 2825, D21**
- fracture**—cracks, crazing, or delamination, or a combination thereof, resulting from physical damage to the pultrusion. **D 3918, D20**
- fracture** (*as in fractured asbestos*)—a clearly defined transverse break in the asbestos in situ. **D 2946, C17**
- fractured face, *n***—an angular, rough, or broken surface of an aggregate particle created by crushing, by other artificial means, or by nature. **D 8, D04**
- fracture ductility, ϵ_f , *n***—the true plastic strain at fracture. **E 6, E28**
- fracture frequency**—the number of natural discontinuities in a rock or soil mass per unit length, measured along a core or as exposed in a planar section such as the wall of a tunnel. **D 653, D18**
- fracture grain size**—grain size determined by comparing a fracture of a specimen with a set of standard fractures. For steel, a fully martensitic specimen is generally used and the depth of hardening as well as the prior austenitic grain size is determined. **E 7, E04**
- fracture mirror**—a smooth portion of a fracture surface surrounding the fracture origin. **C 162, C14**
- fracture origin**—the single, unique location at which a fracture system begins. **C 162, C14**
- fracture origin, *n***—the source from which brittle fracture commences. **C 1145, C28**
- fracture pattern**—spatial arrangement of a group of fracture surfaces. (ISRM) **D 653, D18**
- fractures**—internal or external breaks or cracks in the glass. Internal fractures usually occur in the area between the bulb and the constriction. **E 344, E20**
- fracture, spontaneous, *n***—cracking or chipping which occurs without immediately apparent external causes. **C 1145, C28**
- fracture strength**—the load at the beginning of fracture during a tension test divided by the original cross-sectional area. **F 2078, F07**
- fracture strength, S_f [FL^{-2}], *n***—the normal stress at the beginning of fracture. Fracture strength is calculated from the force at the beginning of fracture during a tension test and the original cross-sectional area of the specimen. **E 6, E28**
- fracture stress [FL^{-2}], *n***—the true normal stress on the minimum cross-sectional area at the beginning of fracture. **E 6, E28**
- fracture surface markings**—fracture surface features that may be used to determine the fracture origin location and the nature of the stress that produced the fracture. **C 162, C14**
- fracture system**—that family of related fracture surfaces lying within an object, having a common cause and origin. **C 162, C14**
- fracture test: (1)**—*general* the production of a fracture in a metal sample to determine such things as discontinuities, grain size, and composition.
- (2) *steel*—a test which utilizes a hardened steel disk section prepared from billet or bar stock which is fractured parallel to the grain flow so that, among other things, discontinuities due to inclusion segregates can be detected visually. **E 7, E04**
- fracture toughness, *n***—a generic term for measures of resistance to crack extension. **C 1145, C28**
- fracture toughness**—a conventional fracture mechanics strength parameter indicating the resistance of a material to crack extension. **D 9, D07**
- fracture toughness**—a generic term for measures of resistance to extension of a crack. **E 1823, E08**
- fracturing**—*in grouting*, intrusion of grout fingers, sheets, and lenses along joints, planes of weakness, or between the strata of a formation at sufficient pressure to cause the strata to move away from the grout. **D 653, D18**
- fragmentation**—the breaking of rock in such a way that the bulk of the material is of a convenient size for handling. (ISRM) **D 653, D18**
- fragmic cryogenic fabric**—a distinct soil micromorphology, resulting from processes of freezing and thawing, in which soil particles form discrete units that are densely packed. **D 7099, D18**
- fragmoidal cryogenic fabric**—a distinct soil micromorphology, resulting from the processes of freezing and thawing, in which soil particles form discrete units that are coalescing. **D 7099, D18**
- fragrance**—an odorant used to mask another odor to impart a specific small to a formulation. **E 609, E35**
- frame, *n***—a list, compiled for sampling purposes, which designates the items (units) of a population or universe to be considered in a study. **E 456, E11**
- frame**—See **windows and doors**. **E 631, E06**
- frame hinge**—a fitting that attaches to the gate frame and functions with the post hinge. **F 552, F14**
- framework**—the basic structure supporting installed fabric, namely the posts, rails, and tension wire. **F 552, F14**
- frame yarn, *n***—pile yarn in a Wilton-type carpet. **D 123, D13**
- framing member, *n***—stud, plate, track, joist, furring, and other support to which a gypsum panel product, or metal plaster base is attached. **C 11, C11**
- framing member, *n***—studs, joists, runners (tracks), bridging, bracing, and related accessories manufactured or supplied in wood for hot- or cold-formed steel. **E 2110, E06**
- framing nail**—See **common nail, threaded common nail, threaded nail**. **F 547, F16**
- frayed, *adj*—in textiles**, a worn condition characterized by damaged yarn surfaces, projecting yarn ends, hairiness, etc. **D 123, D13**
- frayed, *adj*—in textiles**, a worn condition characterized by damaged yarn surfaces, projecting yarn ends, hairiness, etc. **D 4849, D13**
- frazil ice**—crystals of ice that form in turbulent streams in cold weather. **D 7099, D18**
- FRC**—free residual chlorine. **D 6161, D19**
- free alkali, *n***—*in lubricating grease*, unreacted basic (alkaline) material present in the product. **D 4175, D02**
- free (available) chlorine**—chlorine existing as hypochlorous acid or its dissociated ions. Chlorine remaining after the demand has been satisfied. **D 6161, D19**
- free bend, *n***—the bend obtained by applying forces to the ends of a specimen without the application of force at the point of maximum bending. **E 6, E28**
- free-blown**—See **offhand glass**. **C 162, C14**
- freeboard**—the space above a filter bed in a filtration vessel to allow for expansion of the bed during back washing. **D 6161, D19**
- freeboard**—minimum vertical height of the boom above the waterline. **F 818, F20**
- freeboard**—the distance between the level of liquid in the kettle and the top of the lip of the kettle. **F 1827, F26**
- free bottom camber, h_F** —the maximum height of the running surface measured from a plane vertical surface with the ski on an edge, free from the deflection caused by its weight. X_{h_F} is the location of h_F from the tail of the ski. **F 472, F27**
- free bottom camber, H_f** —the height of the running surface from a vertical plane surface measured at the highest point, with the snowboard held laterally on edge, free from the effect of the snowboard weight. **F 1107, F27**
- “free-carbon” in tar, *n***—the hydrocarbon fraction that is precipitated from a tar by dilution with carbon disulfide or benzene. **D 8, D04**
- “free carbon” in tars**—the hydrocarbon fraction that is precipitated from a tar by dilution with carbon disulfide. **D 1079, D08**
- free-choice profiling, *n***—a form of sensory profiling in which each assessor independently generates attributes to evaluate a group of samples. The assessors' attributes may be the same or may differ

free-choice profiling, *n*

from sample to sample. The assessors' sensory profiles are combined statistically (for example, by Generalized Procrustes Analysis) to produce a map of the samples. **E 253, E18**

free climbing, *n*—a technique of climbing that uses only the natural features of the surface being climbed. In free climbing, equipment may be utilized to provide protection in the event of a fall, but is not used to assist progress. **F 1773, F08**

free convection—see **convection, natural**. **E 772, E44**

free cyanide: (1) true—the actual concentration of cyanide radical, or equivalent alkali cyanide, not combined in complex ions with metals in solution. **(2) calculated**—the concentration of cyanide, or alkali cyanide, present in solution in excess of that calculated as necessary to form a specified complex ion with a metal or metals present in solution. **(3) analytical**—the free cyanide content of a solution, as determined by a specified analytical method.

NOTE—The true value of free cyanide is rarely known with certainty and is therefore usually only dealt with in discussions of theory. The calculated or analytical value is usually used in practice. **B 374, B08**

free edge, *n*—an unrestrained pavement boundary. **E 867, E17**

free edge, *n*—an unrestrained pavement boundary. **E 1778, E17**

free electrons—an electron, not directly associated with the structure of an atom or molecule, free to move under the influence of an applied electric or magnetic field. **D 2864, D27**

free-energy diagram—a graphical representation of the variation with concentration of the Gibbs Free Energy, at constant pressure and temperature. **E 7, E04**

free-energy surface—in a ternary, or higher order, free energy diagram, the locus of points representing the Gibbs Free Energy as a function of concentration, with pressure and temperature constant. **E 7, E04**

free fatty acid, *n*—in *lubricating grease*, unreacted carboxylic acid(s) present in the product. **D 4175, D02**

free form (unformatted form)—a form on which the data appears in variable length fields. Preprinted symbols and guides are absent or minimal. Field delimiters are entered with the data. **F 149, F05**

free impurity, *n*—the impurities in a coal that exist as individual discrete particles that are not a structural part of the coal and that can be separated from it by coal preparation methods. **D 121, D05**

free lime, *n*—uncombined calcium hydroxide. **C 1154, C17**

free lime, *n*—*forasbestos-cement*, uncombined calcium hydroxide. **D 2946, C17**

free lime, *n*—reactive lime and hydroxide species available to react with a pozzolan to form a cementitious product, usually expressed as a percentage by total weight of the product. **E 2201, E50**

free moisture—that water, which is not chemically bound, and that is loosely bound to a material, but which can be removed by drying at 105°C, for a time to achieve constant weight, expressed as a percent of the initial weight of the material. **C 242, C21**

free moisture—synonym for *surface moisture*. **D 121, D05**

free piston ring, *n*—in *internal combustion engines*, a piston ring that will fall in its groove under its own weight when the piston, with the ring in a horizontal plane, is turned 90° (putting the ring in a vertical plane). **D 4175, D02**

free product—liquid phase contaminants released into the environment. **D 653, D18**

free rolling tire, *n*—a loaded tire rolling without applied driving or braking torque. **F 538, F09**

freestanding candle, *n*—a rigid candle (that is, pillar-shaped, column-shaped, or figurine) recommended to be used on a heat-resistant, nonflammable surface or on a candle accessory. **F 1972, F15**

freestone—a stone having little or no preferential direction of splitting which may be cut freely in any direction without fracture or splitting. **C 119, C18**

free vapor phase—a condition of contaminant residence in which volatilized contaminants occur in porosity that is effective to free

and open gaseous flow and exchange, such porosity generally being macroporosity. **D 653, D18**

free vibration—vibration that occurs in the absence of forced vibration. **D 653, D18**

free vibration (in dynamic mechanical measurement)—a technique for performing dynamic mechanical measurements in which the sample is deformed, released, and allowed to oscillate freely at the system's natural resonant frequency. **D 4092, D20**

free water, *n*—all water contained by gypsum board or plaster in excess of that chemically held as water of crystallization. **C 11, C11**

free water—that portion of the pore water that is free to move between interconnected pores under the influence of gravity. **D 7099, D18**

free water elevation (water table) (ground water surface) (free water surface) (ground water elevation)—elevations at which the pressure in the water is zero with respect to the atmospheric pressure. **D 653, D18**

free water (gravitational water) (ground water) (phreatic water)—water that is free to move through a soil or rock mass under the influence of gravity. **D 653, D18**

freewheeling condition—a piece of equipment under an unloaded condition wherein the electrical energy is dissipated due to friction and windage. **D 5681, D34**

freewheeling power—power requirement of a piece of equipment under unloaded, or freewheeling, conditions. **D 5681, D34**

freeze, *n*—an experiment or test run conducted with a freezing-point cell while the reference material in the cell solidifies. **E 344, E20**

freezeback—refreezing of thawed materials. **D 7099, D18**

freeze-drying—sublimation of water from a frozen aqueous suspension. **E 1705, E48**

freeze protection agent—a material that lowers the freezing point or helps to restore the formulation to its original state after freezing and thawing. **E 609, E35**

freeze recovery agent—a material, which aids in the restoring viscosity, homogeneity and other physical properties of a liquid formulation to the original properties before freezing and thawing. **E 609, E35**

freeze-thaw cycle—the freezing and subsequent thawing of a material. **C 717, C24**

freeze-thaw cycle—the freezing of a material followed by thawing. **D 7099, D18**

freeze thaw resistance, *n*—the ability of masonry to maintain integrity under the forces caused by cyclic action of freezing and thawing in the presence of moisture. **C 1232, C15**

freezing—lowering the temperature of an aqueous suspension to a point at or below the temperature of ice crystal formation. **E 1705, E48**

freezing curve, *n*—the entire time-temperature relation of the reference material in a freezing-point cell during freezing, including initial cooling, undercool, recalescence, freezing plateau, and final cooling to complete solidification. **E 344, E20**

freezing front—the advancing boundary between frozen (or partially frozen) and unfrozen ground. **D 7099, D18**

freezing index—(1) the cumulative number of degree-days below 0°C for a given period; (2) the number of degree-days between 0°C (32°F) and the mean temperature each day. The index is determined from temperatures measured about 1.4 m (4.5 ft) above the ground surface. That determined from temperatures measured at, or immediately below, a surface is known as the **surface freezing index**. **D 7099, D18**

freezing index, *F* (degree-days)—the number of degree-days between the highest and lowest points on the cumulative degree-days—time curve for one freezing season. It is used as a measure of the combined duration and magnitude of below-freezing temperature occurring during any given freezing season. The index determined for air temperatures at 4.5 ft (1.4 m) above the ground is commonly designated as the **air freezing index**, while that

determined for temperatures immediately below a surface is known as the surface freezing index. **D 653, D18**

freezing (of ground)—the changing of phase from water to ice in soil or rock. **D 7099, D18**

freezing plateau, *n*—the period during freezing in which the temperature does not change significantly. **E 344, E20**

freezing point, *n*—*in aviation fuels*, the fuel temperature at which solid hydrocarbon crystals, formed on cooling, disappear when the temperature of the fuel is allowed to rise under specified conditions of test. **D 4175, D02**

freezing point, *n*—the temperature at which crystallization begins in the absence of supercooling, or the maximum temperature reached immediately after initial crystal formation in the case of supercooling, or the temperature at which solid crystals, formed on cooling, disappear when the temperature of the specimen is allowed to rise. **D 4725, D15**

freezing point—the temperature at which the liquid and solid states of a substance are in equilibrium at a given pressure (usually atmospheric). For pure substances it is identical with the melting point of the solid form. **Lange, 10th Ed. D 4790, D16**

freezing point—(1) the temperature at which a pure liquid solidifies under atmospheric pressure; (2) the temperature at which a ground material starts to freeze. **D 7099, D18**

freezing point—See **melting point**. **E 7, E04**

freezing point, *n*—fixed point of a single component system in which liquid and solid phases are in equilibrium at a specified pressure, usually 101 325 Pa, and the system is losing heat slowly. (Compare **melting point**.) **E 344, E20**

freezing-point cell, *n*—a device that contains and protects a sample of reference material in such a manner that the freezing point of the material can establish a reference temperature. **E 344, E20**

freezing-point depression—the number of degrees by which the freezing point of an earth material is depressed below 0°C (32°F). **D 7099, D18**

freezing pressure—the positive pressure developed at ice-water interfaces in a soil as it freezes. **D 7099, D18**

freezing range, *n*—the range of temperature over which most of the reference material in a freezing-point cell solidifies. **E 344, E20**

freezing temperature—see **crystallization temperature**. **E 1142, E37**

French antelope lambskin—when tanned in France, a lustrous suede finish applied to French, Spanish, Algerian, and Balkan skins; in the United States “French antelope finish” is applied to suede leathers made from South American and New Zealand pickled lambskins. **D 1517, D31**

French degree—calcium carbonate equivalents expressed in parts per hundred thousand. Concentration in French degree is calculated by dividing concentration in calcium carbonate equivalents by ten. **D 6161, D19**

French kid—leather tanned from kidskin by an alum or vegetable process. **D 1517, D31**

French or hexagonal method, *n*—*in shingles*, a method of application for asbestos-cement roofing, whereby the shingles have at least three corners clipped so that when they are laid with their diagonals perpendicular to the eave of the roof, they lap at the top and sides to form a hexagonal pattern. **C 1154, C17**

French or hexagonal method—a method of application for asbestos-cement roofing, whereby the shingles have at least three corners clipped so that when they are laid with their diagonals perpendicular to the eaves of the roof, they lap at the top and sides to form a hexagonal pattern. **D 2946, C17**

French seam, *n*—a complex seam formed on the inside of the object with both raw edges enclosed and no stitching rows visible on the face side. (Compare **mock French seam**.) **D 123, D13**

French seam, *n*—*in home sewing*, a complex seam formed on the inside of a product with both cut edges enclosed and no stitching rows visible on the face side. (Compare **mock French seam**.) **D 4965, D13**

frequency, ν —the number of cycles per unit time. **E 131, E13**

frequency, *n*—reciprocal of the period. Symbol; f, ν .

NOTE—When the independent variable is time, the unit of frequency is the hertz. Symbol: Hz (1 Hz = 1 s⁻¹). (This unit is also called “cycle per second,” c/s.) **E 349, E21**

frequency—the number of cycles per second of alternating electric current induced into the tubular product. For eddy-current testing described herein, the frequency is normally 1 to 125 kHz, inclusive. (E 215) **E 1316, E07**

frequency, angular, ω —the number of radians per second traversed by a rotating vector that represents any periodically varying quantity.

NOTE—Angular frequency, ω , is equal to 2π times the cyclic frequency, f . **A 340, A06**

frequency, cyclic, *f*—the number of hertz (cycles/second) of a periodic quantity. **A 340, A06**

frequency distribution, *n*—*of a sample*, a table giving for each value of a discrete variate, or for each group of values of a continuous variate, the corresponding number of observations. **D 123, D13**

frequency distribution, *n*—*of a population*, a function that, for a specific type of distribution, gives for each value of a random discrete variate, or each group of values of a random continuous variate, the corresponding probability of occurrence. **D 123, D13**

frequency distribution—the way in which the frequencies of occurrence of members of a population, or a sample, are distributed in accordance with the values of the variable under consideration. **E 1823, E08**

frequency domain filtering, *n*—a filtering operation performed by first calculating the spectrum of the profile record and then multiplying the spectral components by the frequency response transfer function of the filter. **E 867, E17**

frequency, *f*—the number of cycles per unit time of periodic process. **E 1142, E37**

frequency factor—See **multiplicity factor**. **E 7, E04**

frequency, *f* (T⁻¹)—number of cycles occurring in unit time. **D 653, D18**

frequency (fundamental)—in resonance testing, the frequency at which the wave length is twice the thickness of the examined material. **E 1316, E07**

frequency (inspection)—effective ultrasonic wave frequency of the system used to inspect the material. **E 1316, E07**

frequency profile, *n*—a plot of the dynamic properties of a material, at a constant temperature, as a function of test frequency. **D 4092, D20**

frequency profile—*indynamic mechanical measurement*, plot of the dynamic properties of a material, at a constant temperature, as a function of test frequency, (D 4092, D20). **E 1142, E37**

frequency (pulse repetition)—the number of times per second an electro-acoustic search unit is excited by the pulse generator to produce a pulse of ultrasonic energy. This is also called pulse repetition rate. **E 1316, E07**

frequency (X-ray)—the number of alternations per second of the electric vector of the X-ray beam. It is equal to the velocity divided by the wavelength. **E 7, E04**

fresh concrete, *n*—concrete which possesses enough of its original workability so that it can be placed and consolidated by the intended methods. **C 125, C09**

fresh hide—a recently flayed hide or skin that has not been preserved (such as salt-cured). See **curing**. **D 1517, D31**

fresh water environment, *n*—the aerobic, fresh water environmental compartment. **D 4175, D02**

fresh water environment, *n*—the aerobic, aqueous compartment, characteristically with a salinity of less than five parts per thousand. **D 4175, D02**

fresh water environment, *n*—the aerobic, aqueous compartment, characteristically with a salinity of less than five parts per thousand. **D 6384, D02**

Fresnel fringes—a class of diffraction fringes formed when the

Fresnel fringes

source of illumination and the viewing screen are at a finite distance from a diffracting edge. In the electron microscope these fringes are best seen when the object is slightly out of focus.

E 7, E04

Fresnel lens, circular—a sheet of transparent material into which concentric grooves have been formed in such a pattern that light will be focused as with a lens. (Focusing mirrors of similar design are also available.)

E 772, E44

Fresnel lens, linear—a sheet of transparent material into which parallel grooves have been formed in such a pattern that light will be focused as by a cylindrical lens. (Focusing mirrors of similar design are also available.)

E 772, E44

Fresnel reflection, *n*—the process by which radiant flux is reflected from an optically smooth interface between two dielectric media.

E 284, E12

Fresnel-reflector system—flat mirrors arranged in an array such that they reflect onto a target, the illuminated area of which simulates the shape and size of the flat mirror. (Such an array simulates the ray-tracing of a parabolic trough of the same aperture angle.)

E 772, E44

fresnel-reflector system, *n*—flat mirrors arranged in an array such that they reflect onto a target, the illuminated area of which simulates the size and shape of the flat mirror. Such an array simulates the ray-tracing of a parabolic trough of the same aperture angle.

G 113, G03

fretting, *n*—small amplitude oscillatory motion, usually tangential, between two solid surfaces in contact.

B 542, B02

fretting, *n*—in tribology, small amplitude oscillatory motion, usually tangential, between two solid surfaces in contact.

G 40, G02

fretting corrosion—a form of fretting wear in which corrosion plays a significant role.

B 542, B02

fretting corrosion—the deterioration at the interface between contacting surfaces as the result of corrosion and slight oscillatory slip between the two surfaces.

G 15, G01

fretting corrosion, *n*—a form of fretting wear in which corrosion plays a significant role.

G 40, G02

fretting wear—wear arising as a result of fretting. See **fretting**.

B 542, B02

fretting wear, *n*—a form of attritive wear caused by vibratory or oscillatory motion of limited amplitude characterized by the removal of finely-divided particles from the rubbing surfaces.

D 4175, D02

fretting wear, *n*—wear arising as a result of fretting (see **fretting**).

G 40, G02

Freundlich adsorption isotherm—a logarithmic plot of quantity of component adsorbed per unit of adsorbent versus concentration of that component at equilibrium and at constant temperature, which approximates the straight line postulated by the Freundlich adsorption equation

$$X/M = kC^n$$

where:

- X* = quantity adsorbed,
M = quantity of adsorbent,
C = concentration,
k and *n* = constants.

D 2652, D28

friable, *adj*—in tunneling as applied to rock, easily fragmented, disaggregated, crumbled, or pulverized.

D 653, D18

friable—a condition under which the material is easily broken up under light to moderate pressure.

D 7099, D18

friable permafrost—permafrost in which the soil particles are not held together by ice.

D 7099, D18

Fricke dosimeter—a liquid chemical radiation dosimetry system composed of water and ferrous sulfate or ferrous ammonium sulfate in aqueous sulfuric acid solution and whose response is based quantitatively on the amount of oxidation of ferrous to ferric

ions by ionizing radiation, as analyzed by spectrophotometry. It is considered to be a reference-standard dosimetry system.

E 170, E10

friction—the resistance developed between the physical contacting, but otherwise unconstrained, surfaces of two bodies when there is movement or tendency for movement of one body relative to the other parallel to the plane of contact. (See also **coefficient of friction, dynamic coefficient of friction, in service coefficient of friction, and static coefficient of friction.**)

C 242, C21

friction, *n*—the resistance to the relative motion of one body sliding, rolling, or flowing over another body with which it is in contact.

D 123, D13

friction, *n*—resistance to relative motion between two bodies in contact (*Websters*).

coefficient of friction—the ratio of the force required to move one surface over another, to the total force applied normal to those surfaces.

kinetic coefficient of friction—the ratio of the force required to move one surface over another, to the total force applied normal to those surfaces, once that motion is in progress.

static coefficient of friction—the ratio of the force required to move one surface over another, to the total force applied normal to those surfaces, at the instant motion starts.

D 996, D10

friction, *n*—the resistance to sliding exhibited by two surfaces in contact with each other. Basically there are two frictional properties exhibited by any surface; static friction and kinetic friction.

D 4175, D02

friction, *n*—the resistance to the relative motion of one body sliding, rolling, or flowing over another body with which it is in contact.

D 4849, D13

friction, *n*—resistance to the relative motion of one body sliding, rolling, or flowing over another with which it is in contact.

F 141, F06

friction, *n*—resistance to the relative motion of one body sliding, rolling, or flowing over another with which it is in contact.

F 1646, F13

friction coat, calender, *n*—a layer of rubber compound applied to a fabric by shearing action so that it impregnates the fabric.

D 1566, D11

friction coating, *n*—applying a rubber coat (friction coat) on a textile by shearing action so that the coat impregnates the textile.

D 1566, D11

friction force, *n*—the resisting force tangential to the interface between two bodies when, under the action of an external force, one body moves or tends to move relative to the other.

D 4175, D02

friction force, *n*—the resisting force tangential to the interface between two bodies when, under the action of an external force, one body moves or tends to move relative to the other. (See also **coefficient of friction.**)

G 40, G02

friction polymerization—the process by which organic compounds (such as adsorbed air pollutants) on mating surfaces that move relative to each other polymerize to yield compounds of high molecular weight.

NOTE—When this occurs on electrical contacts and the materials formed remain on the surface, contact resistance may increase substantially. The solid materials that are produced by the polymerization process are called “friction polymers” or “frictional polymers.”

B 542, B02

friction ratio, *n*—ratio of surface speeds of two adjacent rolls (mill, calender, or refiner).

D 1566, D11

friction surface, *n*—an interior or exterior surface that is subject to abrasion or friction, including, but not limited to, certain surfaces of windows, floors, and stairs.

E 1605, E06

frictive track—a series of crescent cracks lying along a common axis, paralleling the direction of frictive contact; also known as a chatter sleek.

C 162, C14

frigorifico hides—cattlehides from South American slaughtering and freezing plants, cured in brine and salted. **D 1517, D31**

fringe, *n*—one of the light or dark bands produced by the interference of the light scattered by the real object and the virtual image of the object. **E 1316, E07**

fringe effect—toner deposition in non-printed areas adjacent to the printed areas, such as heading and tailing. **F 335, F05**

frit, *n*—glass in particulate form, generally of controlled size distribution. **C 162, C14**

frit, *v*—(1) the process of pouring molten glass into water or between cooled rollers. See **shrend, dry gage**.

(2) to decorate or seal with glass in particulate form.

C 162, C14

frit—a product made by quenching and breaking up a glass of a specific composition, used customarily used as a component of a glaze, body, or porcelain enamel. **C 242, C21**

frit, *n*—a porous material permeable to gas flow usually made by sintering microbeads of an appropriate material. **D 1356, D22**

frit, clear—see **clear frit**. **C 286, B08**

frit, colored—see **colored frit**. **C 286, B08**

frit, porcelain enamel—the small friable particles produced by quenching a molten glassy material (see also **clear frit** and **colored frit**). **C 286, B08**

fritted bubbler—See **bubbler**. **D 1356, D22**

fritted glaze—See **fritted glaze** under **glaze**. **C 242, C21**

fritting—the rapid chilling of the molten glassy material to produce frit. **C 286, B08**

fritting (A-fritting)—an electric breakdown between mating metallic contacts, separated by an insulating film, which occurs when the field strength exceeds approximately 1 000 000 V/cm. Metallic bridges are produced through the film if the fritting voltage is above the contact melting voltage. **B 542, B02**

fritting voltage—the voltage at which fritting occurs. **B 542, B02**

frizing (friezing)—in tanning Mocha glove leather, a process of removing the grain surface involving severe liming for not less than a month, during which the elastin structure of the grain layer is destroyed. **D 1517, D31**

frog, *n*—an indentation in a bed surface of a masonry unit. Indentations not exceeding $\frac{3}{8}$ in. are termed a frog, sometimes called a panel or panel frog. Indentations exceeding $\frac{3}{8}$ in. are termed a deep frog. **C 1232, C15**

front—the forepart of a hide or skin. Particularly in horsehide leathers, the front is used for garments, baseballs, etc. It is the part left when the butt is cut off about 22 in. (559 mm) from the root of the tail. **D 1517, D31**

front break-point, *n*—*in anatomy*, the location on the front of the body where the arm separates from the body. **D 123, D13**

front-break point, *n*—the location on the front of the body where the arm separates from the body. **D 5219, D13**

front chest width, *n*—the horizontal distance across the chest from the front break-point, taken with the arms down. **D 5219, D13**

front end breakaway, *n*—*in cornering vehicle*, the point in the curved trajectory of a vehicle when it can no longer be maintained on its intended path because of front wheel departure toward the outside of the curve. **F 538, F09**

front face discharge—makeup air method that is very flexible, but should be directed away from the hood, but the closer the air outlet's lower edge is to the bottom of the hood, the lower the velocity must be to avoid drawing effluent out of the hood. **F 1827, F26**

front high-hip, *n*—*in body measurements*, the distance from one imaginary side seam to the other imaginary side seam at the high-hip level. **D 123, D13**

frost, *n*—ice crystals resulting from the direct sublimation of water vapor onto a surface that is below freezing. **D 1356, D22**

frost—the occurrence of air temperatures below 0°C. **D 7099, D18**

frost action—freezing and thawing of moisture in materials and the

resultant effects on these materials and on structures of which they are a part or with which they are in contact. **D 653, D18**

frost action—the process of alternate freezing and thawing of moisture in soil, rock, and other materials, and the resulting effects on materials and on structures placed on, or in, the ground.

D 7099, D18

frost blister—a seasonal frost mound produced through doming of seasonally frozen ground through a subsurface accumulation of water under elevated hydraulic potential during progressive freezing of the active layer. The areas affected can be quite large.

D 7099, D18

frost boil—(a) softening of soil occurring during a thawing period due to the liberation of water from ice lenses or layers.

(b) the hole formed in flexible pavements by the extrusion of soft soil and melt waters under the action of wheel loads.

(c) breaking of a highway or airfield pavement under traffic and the ejection of subgrade soil in a soft and soupy condition caused by the melting of ice lenses formed by frost action. **D 653, D18**

frost boil—a small mound of soil material, presumed to have been formed through frost action. **D 7099, D18**

frost bulb—a more-or-less symmetrical zone of frozen ground formed around a buried chilled pipeline, or beneath or around a structure maintained at temperatures below 0°C (32°F).

D 7099, D18

frost cracking—fracturing of the ground by thermal contraction at temperatures below 0°C (32°F). **D 7099, D18**

frost creep—the net downslope displacement that occurs when a soil, during a freeze-thaw cycle, expands normal to the ground surface and settles in a nearly vertical direction. **D 7099, D18**

frosted—surface treated to scatter light or to simulate frost.

C 162, C14

frosted area—{archaic} See **hackle**.

C 162, C14

frost heave—the raising of a surface due to the accumulation of ice in the underlying soil or rock. **D 653, D18**

frost-heave extent—the difference between the elevations of the ground surface before and after the occurrence of frost heave.

D 7099, D18

frost heave (heaving)—the upward or outward movement of the ground surface (or objects on, or in the ground), caused by the formation of ice in the soil. **D 7099, D18**

frosting, *n*—a change in color in a limited area of a fabric caused by abrasive wear. **D 123, D13**

frosting, *n*—formation of a matte, whitish appearance on a rubber surface exposed to air, resulting from the action of ozone; often confused with bloom. **D 1566, D11**

frosting, *n*—a change in color in a limited area of a fabric caused by abrasive wear.

D 3990, D13

frosting, *n*—a light-scattering surface resembling fine crystals. See also **chalking, haze, bloom**. (D20) **F 412, F17**

frost jacking—the cumulative upward or outward displacement of slabs or blocks of rock, or of objects embedded in the ground, due to repetitive freezing and thawing. **D 7099, D18**

frost mound—any mound-shaped landform produced by ground freezing combined with accumulation of ground ice due to groundwater movement or the migration of soil moisture.

D 7099, D18

frost penetration—the movement of the freezing front into the ground during freezing. **D 7099, D18**

frost phenomena—the effects on earth material and structures resulting from frost action. **D 7099, D18**

frost point—the temperature at which visible frost begins to deposit on the lower air space glass surface of a sealed insulating glass unit in contact with the measuring surface of the frost point apparatus.

E 631, E06

frost-point hygrometer—See **dew-/frost-point hygrometer** under **hygrometer**. **D 1356, D22**

frost-point temperature—See **temperature**. **D 1356, D22**

frost shattering—the mechanical disintegration of rock caused by the pressure of the freezing of water in pores and along grain boundaries. **D 7099, D18**

frost sorting—the differential movement of soil particles of different size ranges as a result of frost action. **D 7099, D18**

frost-stable ground—soil or rock in which little or no segregated ice forms during seasonal freezing. **D 7099, D18**

frost state—the case where the frost point of a sealed insulating glass unit is above the test temperature specified by the purchaser or user. **E 631, E06**

frost-susceptible ground—soil or rock in which segregated ice will form, causing frost heave, under the required conditions of moisture supply and temperature. **D 7099, D18**

frost weathering—the disintegration and break-up of soil or rock by the combined action of frost shattering, frost wedging, and hydration shattering. **D 7099, D18**

frost wedging—the mechanical disintegration, splitting, or breaking-up of rock caused by the pressure of the freezing of water in cracks, crevices, pores, joint, or bedding planes. **D 7099, D18**

froth, *n*—a collection of bubbles and particles on the surface of a pulp in a froth flotation cell. **D 121, D05**

frother, *n*—a reagent used in froth flotation to control the size and stability of the air bubbles, principally by reducing the surface tension of water. **D 121, D05**

froth flotation, *n*—a process for cleaning fine coal in which hydrophobic particles, generally coal, attach to air bubbles in a water medium and rise to the surface to form a froth. The hydrophilic particles, generally the ash-forming matter, remain in the water phase. **D 121, D05**

Froude number—dimensionless number expressing the ratio of inertial to gravity forces in free-surface flow. It is equal to the average velocity divided by the square root of the product of the average depth and the acceleration due to gravity. **D 4410, D19**

frozen fringe—the zone in a freezing, frost-susceptible soil between the warmest isotherm at which ice exists in pores and the isotherm at which the warmest ice lens is growing. **D 7099, D18**

frozen ground—soil or rock in which all or part of the pore water has turned into ice. **D 7099, D18**

FRP—fiberglass reinforced plastic. **D 6161, D19**

FRP insulating tubes and rods—fiberglass reinforced plastic (FRP) products manufactured so that the tubes and rods produced will meet the electrical and mechanical requirements in the standard. **F 819, F18**

fruit-box nail—coated, regular-stock-steel, 1 $\frac{3}{8}$ by 0.072-in. nail with flat $\frac{7}{32}$ -in. head and medium diamond point. **F 547, F16**

frustrated total reflection (FTR)—the reflection which occurs when a nonabsorbing coupling mechanism acts in the process of total internal reflection to make the reflectance less than unity. **E 131, E13**

fryer—equipment, including a cooking vessel, in which oils are placed to such a depth that the cooking food is essentially supported by displacement of the cooking fluid within a perforated container rather than by the bottom of the vessel. Heat delivery to the cooking oils varies with fryer models. **F 1827, F26**

F-test, *n*—a test of statistical significance based on the use of George W. Snedecor's F-distribution and used to compare two sample variances or a sample variance and a hypothetical value. **D 123, D13**

fuel-air ratio for maximum knock intensity, *n*—for knock testing, that proportion of fuel to air that produces the highest knock intensity for each fuel in the knock testing unit, provided this occurs within specified carburetor fuel level limits. **D 4175, D02**

fuel alcohol—ethyl, methyl, or higher alcohols with impurities

(including water but excluding denaturants) produced for use as a fuel alone or as an addition to other fuels, such as gasoline.

E 772, E44
