fuel alcohol—ethyl, methyl, or higher alcohols with impurities (including water but excluding denaturants) produced for use as a fuel alone or as an addition to other fuels, such as gasoline.

E 1705, E48

fuel diluent, *n*—in used oil analysis, unburnt fuel components that enter the engine crankcase causing dilution of the oil. **D 4175, D02**

fuel ethanol—ethanol with impurities (including water but excluding denaturants). **E 1705, E48**

fuel ethanol (Ed75-Ed85), *n*—a blend of ethanol and hydrocarbons of which the ethanol portion is nominally 75 to 85 volume % denatured alcohol. **D 4175, D02**

fuel ethanol manufacturing facility—a manufacturing facility of any size designed to produce fuel ethanol by a fermentation process. **E 1705, E48**

fuel value, *n*—the heat content, as measured in British thermal units (Btu)/lb or cal/g. **D 5681, D34**

full annealing, *n*—annealing a steel object by austenitizing it and then cooling it slowly through the transformation range. **A 941, A01**

full annealing—heating steel above the upper critical transformation temperature, holding it there long enough to fully transform the steel to austenite, and then cooling it at a controlled rate, in a furnace, to below a specified temperature. A full anneal refines grain structure and provides a relatively soft, ductile material that is free of internal stresses. **F 1789, F16**

full cone nozzle—see **solid cone atomizer**. **E 1620, E29**

full cone pattern, *n*—a cone pattern wherein the liquid is distributed throughout the pattern. **E 1620, E29**

full-energy peak—the peak in an energy spectrum recorded by a photon detector that occurs when the full energy of an incident photon is absorbed by the detector. This is sometimes referred to as the photopeak. **E 170, E10**

full-energy peak efficiency—the ratio of the net count rate in the full-energy peak to the emission rate of the photons from a sample giving rise to the peak. The value is dependent on the source-detector-shield geometry and the photon energy. This is sometimes referred to as the photopeak efficiency. **E 170, E10**

full grain—having the original grain surface of the skin. **D 1517, D31**

full-impulse-voltage wave, *n*—an aperiodic transient voltage that rises rapidly to a maximum value, then falls less rapidly to zero. **D 1711, D09**

full length burn, *n*—the outcome of a determination in which the cigarette burns to or past the front plane of the tipping paper, which covers the filter and perhaps a short section of the tobacco column in a filter tip cigarette, or past the tips of the metal pins if the cigarette has no filter. **E 176, E05**

full radiator, *n*—a thermal radiator that completely absorbs all incident radiant flux, whatever the wavelength, direction of incidence, or polarization. **E 284, E12**

full radiator: blackbody (USA), Planckian radiator, *n*—thermal radiator that absorbs completely all incident radiation, whatever the wavelength, the direction of incidence, or the polarization. This radiator has, for any wavelength, the maximum spectral concentration of radiant exitance at a given temperature. **E 349, E21**

full radiator—see **blackbody**. **E 772, E44**

full rich, *n*—condition in which the mixture control is at the full stop position with the fuel flow within manufacturer's recommended settings. **D 4175, D02**

full scale—See **analyzer**. **D 1356, D22**

full scale test, *n*—a test in which the product(s) to be tested is utilized in the same size as its end use. **E 176, E05**

full size specimen—tension test specimen consisting of a completed fastener for testing in the ready to use condition without altering the configuration. **F 1789, F16**

- full thickness skin autograft, n**—a skin [auto]graft consisting of the epidermis and the full thickness of the dermis. **F 2312, F04**
- full-thickness skin wound, n**—a skin wound with the loss of epidermis, and all of the dermis or at least the depth of dermis that includes most or all sources of epidermal cells from epidermal adnexae (glands and follicles). **F 2312, F04**
- full-wave direct current (FWDC)**—a rectified three-phase alternating current. **E 1316, E07**
- fully autonomous, adj**—mode of control of a UAV where the UAV is expected to execute its mission, within the pre-programmed scope, with only monitoring from the pilot-in-command. As a descriptor for *mode of control*, this term includes: (1) fully automatic operation, (2) autonomous functions (like takeoff, landing, or collision avoidance), and (3) “intelligent” fully autonomous operation. **F 2395, F38**
- fully dense material, n**—a material completely free of porosity and voids. **B 243, B09**
- fully nested experiment, n**—a nested experiment in which the second factor is nested within levels (versions) of the first factor and each succeeding factor is nested within versions of the previous factor. **E 456, E11**
- fully nested experiment**—a nested experiment in which the second factor is nested within levels (versions) of the first factor and each succeeding factor is nested within versions of the previous factor. **E 1325, E11**
- fully tempered glass**—flat glass that has been tempered to a high surface or edge compression to meet the requirements of Specification C 1048. See **heat-strengthened glass**. **C 162, C14**
- fumarole, n**—a vent at the earth’s surface that emits steam or gaseous vapor. **E 957, E44**
- fume, n**—properly, the solid particles generated by condensation from the gaseous state, generally after volatilization from melted substances, and often accompanied by a chemical reaction such as oxidation. **D 1356, D22**
- fume stack, n**—a box-like duct with thermocouples and baffles through which flames and hot fumes from a burning specimen pass whose purpose is to permit measurement of the heat release from the burning specimen. **E 176, E05**
- fumigant**—a chemical used in gaseous form to kill or inhibit pests. **E 609, E35**
- function**—a purpose of the entire project or some portion thereof determined by the needs or desires of the user/owner and expressed in two words, an active verb and a measurable noun. **E 631, E06**
- function, n**—a purpose of the entire project or some portion thereof determined by the needs or desires of the user/owner and expressed in two words, an active verb and a measurable noun. **E 833, E06**
- functional barrier**—*in food packaging*, a material that effectively restricts passage of solids, liquids, semi-solids, vapors, or forms of energy such as ultraviolet light through itself, across its borders, or interface with another material or substance. **F 1479, F02**
- functional compatibility, n**—effect of physical or chemical interaction between a consumer product and a specific pump mechanism where problems typically include deformation and degradation of components that result in a lower performance of the mechanical pump dispenser. **D 6655, D10**
- functional element, n**—*in construction planning, design, specification, estimating, and cost analysis*; see **element**. **E 833, E06**
- functional, adj (fonctionnel)**—performing or able to perform a regular function; designed or developed chiefly from the point of view of use. **E 631, E06**
- functional, adj (fonctionnel)**—performing or able to perform a regular function; designed or developed chiefly from the point of view of use. **E 1480, E06**
- functionality, adj**—*of a building*, being suitable for a particular use or function. (E 1480) **E 631, E06**
- functionality, adj (fonctionnalité)**—being suitable for a particular use or function. **E 1480, E06**
- functional program**—See **facility program**. **E 631, E06**
- functional program**—See **facility program**. **E 1480, E06**
- functional program, n (programme fonctionnel)**—document that specifies functional facility serviceability requirements of occupants and owner. **E 631, E06**
- functional properties, n**—those properties of the mineral lubricating oil that are required for satisfactory operation of the machinery. These properties are listed in Section 5. **D 4175, D02**
- functional requirement, n**—See **serviceability requirement**. **E 631, E06**
- functional requirement, n**—See **serviceability requirement**. **E 1480, E06**
- function analysis**—an examination of the project consisting of (1) the determination of the project functions; (2) the examination and sorting of these functions into categories; (3) the selection of the critical functions and arrangement into a logical order; and (4) the determination of the project cost allocated to performing each critical function. **E 631, E06**
- function analysis, n**—an examination of the project consisting of (1) the determination of the project functions; (2) the examination and sorting of these functions into categories; (3) the selection of the critical functions and arrangement into a logical order; and (4) the determination of the project cost allocated to performing each critical function. **E 833, E06**
- function, basic**—a function that is necessary to achieve the primary purpose of a building system or element. **E 631, E06**
- function, basic, n**—a function that is necessary to achieve the primary purpose of a building system or element. **E 833, E06**
- function codes, n**—codes used to control fabric cutter instructions and govern interpretation of subsequent commands and data in a block. **D 6963, D13**
- function, n (fonction)**—the action for which a person or thing is specially fitted or used or for which a thing exists. **E 631, E06**
- function, n (fonction)**—the action for which a person or thing is specially fitted or used or for which a thing exists. **E 1480, E06**
- function performance, n**—See **facility serviceability**. **E 631, E06**
- function performance, n**—See **facility serviceability**. **E 1480, E06**
- fundamental frequency**—lowest frequency of periodic variation. **D 653, D18**
- fundamental resonant frequency, n**—*in linear density testing*, the lowest frequency at which free oscillations can exist in a fiber tensioned between two fixed points. **D 123, D13**
- fundamental resonant frequency, n**—*in linear density testing*, the lowest frequency at which free oscillations can exist in a fiber tensioned between two fixed points. **D 4849, D13**
- fungi resistance**—the ability of plastic pipe to withstand fungi growth or their metabolic products, or both, under normal conditions of service or laboratory tests simulating such conditions. **F 412, F17**
- fungistat**—an agent that inhibits the germination of fungus spores or the development of mycelium. **E 609, E35**
- fungus**—primitive plants distinguished from algae by the absence of chlorophyll. **D 6161, D19**
- fungus (pl. fungi), n**—single cell (yeasts) or filamentous (molds) microorganisms that share the property of having the true intracellular membranes (organelles) that characterize all higher life forms (*Eukaryotes*). **D 4175, D02**
- fungus resistance**—the ability of a sandwich construction to withstand fungi growth or their metabolic products, or both, under normal conditions of service or laboratory test simulating such conditions. **E 631, E06**
- fungus resistance**—the ability of a sandwich construction to withstand fungi growth or their metabolic products, or both, under normal conditions of service or laboratory test simulating such conditions. **E 1749, E06**
- furanic compounds**—a class of chemical compounds characterized by the presence of heterocyclic structures consisting of a five-membered ring containing four carbon atoms and one oxygen atom. These compounds may be found dissolved in electrical

furanic compounds

- insulating fluids, either as residual contaminants of refinery extraction processes in which furfural is used, or from the degradation of cellulose insulation. **D 2864, D27**
- furan plastics**—plastics based on furan resins. (ISO) **D 883, D20**
- furan resin**—a thermosetting catalyzed condensation reaction product from furfuryl alcohol, furfural or combination thereof. **C 904, C03**
- furan resin, n**—a resin in which the furan ring is an integral part of the polymer chain and represents the greatest amount by mass. (ISO) **D 883, D20**
- fur brush development**—development of electrostatic images by transporting the toner to the image area through the use of fur-like fibers. **F 335, F05**
- furfural**—an aldehyde derivative of certain biomass conversion processes, used as a solvent. **E 1705, E48**
- furnace, arc-image, n**—a furnace in which high temperatures are produced by focusing radiation from high-temperature arcs into the furnace chamber. **C 1145, C28**
- furnace, box**—see **box furnace**. **C 286, B08**
- furnace carbon black, n**—type of carbon black produced by the decomposition reaction of hydrocarbons when injected into a high velocity stream of combustion gases under controlled conditions. **D 1566, D11**
- furnace, continuous**—see **continuous furnace**. **C 286, B08**
- furnace, image, n**—a furnace in which high temperatures are generated by focusing radiation from a high-temperature source, such as the sun or an electric arc. **C 1145, C28**
- furnace, recuperative, n**—a furnace equipped with a heat exchanger in which heat is conducted from the combustion products through a system of ducts or through flue walls in a manner so as to preheat the air as it enters the burner to unite with the fuel. **C 1145, C28**
- furnace, regenerative, n**—a furnace having a cyclic heat exchanger which alternately receives heat from gaseous combustion products and transfers heat to the air or gas of the fuel mixture before combustion takes place. **C 1145, C28**
- furnace, solar, n**—an image-type furnace in which solar radiation is focused into a relatively small area as a source of heat producing extremely high temperatures. **C 1145, C28**
- furnace, thermal gradient, n**—a tubular furnace in which a controlled temperature gradient is maintained along its length. **C 1145, C28**
- furnish, n**—in any papermaking process, all of the materials added prior to sheet formation **D 1968, D06**
- furniture and fixtures**—noncurrent depreciable asset consisting of office or store equipment (for example, desks), lighting, and showroom items. **E 2135, E53**
- furniture-carton nail**—bright, regular-stock-steel, $\frac{3}{4}$ to 2-in. nails with circular 1-in. cap head and medium diamond point. (See **cap nail**.) **F 547, F16**
- furniture covering, n**—a general term for attached upholstery fabric, slipcovers and throws. **D 123, D13**
- furniture covering, n**—a general term for attached upholstery fabric, slipcovers and throws. **D 7023, D13**
- furniture mock-up or assembly, n**—a representation of production furniture that uses the same upholstery cover material and upholstery material, constructed in the same manner as in production furniture, but with straight, vertical sides. **E 176, E05**
- furniture nail**—plated, regular-stock-steel or brass, $\frac{3}{8}$ to $\frac{3}{4}$ -in. nails with extra large, decorative head and long diamond or needle point. **F 547, F16**
- furniture unit, n**—in *upholstered furniture*, a complete single piece of upholstered seating, such as a sofa, love seat, lounge chair, rocker, or recliner. **D 123, D13**
- furniture unit, n**—in *upholstered furniture*, a complete single piece of upholstered seating, such as a sofa, love seat, lounge chair, rocker, or recliner. **D 7023, D13**
- furring**—buildup or bristling of magnetic particles due to excessive magnetization of the component under examination resulting in a furry appearance. **E 1316, E07**
- furring nail**—See **self-furring nail**. **F 547, F16**
- furring tile, n**—tile for lining the inside of walls and carrying no superimposed loads. **C 43, C15**
- fusain**—See **fusain** under **coal**. **D 121, D05**
- fuse, v**—to melt or join by the use of heat. **C 1145, C28**
- fuse, v**—(1) to convert plastic powder or pellets into a homogeneous mass through heat and pressure; (2) to make a plastic piping joint by heat and pressure. **F 412, F17**
- fused fabric, n**—a type of bonded fabric made by adhering a fusible fabric to another fabric, such as for use in an interlining. **D 123, D13**
- fused grain refractory, n**—a refractory made predominantly from grain that has solidified from a fused or molten condition. **C 71, C08**
- fused or fusion cast refractory, n**—a solidified material made by melting refractory ingredients and pouring it into molds (see also **molten cast refractory**). **C 71, C08**
- fused quartz**—vitreous silicon dioxide produced by melting silica, generally in the form of granular quartz. See related terms **fused silica** and **vitreous silica**. **C 162, C14**
- fused silica**—vitreous silicon dioxide produced by flame hydrolysis of silicon tetrachloride (or similar compounds) or by thermal consolidation of a silica gel. See related terms **vitreous silica** and **fused quartz**. **C 162, C14**
- fused silica refractory, n**—a product composed predominantly of fused, noncrystalline silica. **C 71, C08**
- fusel oil**—a clear, colorless, poisonous, liquid mixture of alcohols obtained as a by-product of grain fermentation; generally amyl, isoamyl, propyl, isopropyl, butyl, and isobutyl alcohols and acetic and lactic acids. **E 1705, E48**
- fuse oils**—complex group of higher molecular weight materials including ketones and aldehydes produced as a byproduct by the yeast fermentation during ethanol production. **E 1705, E48**
- fusible fabric, n**—a utilitarian fabric which has a thermoplastic adhesive applied to one side, sometimes in a pattern of dots, so that the surface can be bonded to another fabric surface by the use of heat and pressure. **D 123, D13**
- fusing**—see **heat fixing**. **F 335, F05**
- fusinite**—see **fusinite** under **maceral**. **D 121, D05**
- fusion**—the process of melting; usually the result of interaction of two or more materials. **C 242, C21**
- fusion bonded, n**—a method for creating a carpet pile construction by adhering loops or lengths of yarn to the face of a primary backing. **D 123, D13**
- fusion bonded, n**—a method of creating a carpet pile construction by adhering loops or lengths of yarn to the face of a primary backing. **D 5684, D13**
- fusion casting, n**—the process of forming items by casting molten materials in mold. **C 1145, C28**
- fusion flow**—the relative flow of various glasses or frits in the molten state. **C 286, B08**
- fusion point, n**—the temperature or range of temperatures at which melting or softening, as a result of partial melting, of a composition, will occur. **C 1145, C28**
- fusion seal**—a bond formed by combining two or more materials through melting or other means so that the joining layers become indistinguishable at the interface. **F 17, F02**
- fusion seal**—See **Terminology F 17**. **F 1327, F02**
- fusion test, n**—any test to determine the temperature or range of temperatures at which fusion takes place, or to determine the flow or other properties of a material at fusion temperatures. **C 1145, C28**
- fusion test, button**—see **button test**. **C 286, B08**
- fusion welding**—a joining process in which the mating surfaces of two thermoplastic parts are melted by induced heat and rapidly

pressed together while still molten to form a homogeneous bond.

C 904, C03

future value—the value of a benefit or a cost at some point in the future, considering the time value of money (*Syn. future worth*).

E 631, E06

future value, *n*—the value of a benefit or a cost at some point in the future, considering the time value of money (*Syn. future worth*).

E 833, E06

future worth—See **future value**.

E 631, E06

*future worth, *n**—See **future value**.

E 833, E06

fuzz, *n*—untangled fiber ends that protrude from the surface of a yarn or fabric.

D 123, D13

fuzz, *n*—untangled fiber ends that protrude from the surface of a yarn or fabric.

D 4849, D13

fuzz ball, *n*—loose and frayed fibers that have formed into a ball and have then been woven or knitted into the fabric. (Compare **pills**.)

D 123, D13

fuzz ball, *n*—loose and frayed fibers that have formed into a ball and have then been woven or knitted into the fabric. (*Syn. lint ball, snow ball*) (Compare **pills**)

D 3990, D13

fuzz balls—broken or abraded filaments which have collected as loose bundles or balls during the manufacture of impregnated material, occasionally incorporated into the impregnated material.

E 631, E06

fuzz balls—broken or abraded filaments which have collected as loose bundles or balls during the manufacture of impregnated material, occasionally incorporated into the impregnated material.

E 1749, E06

fuzzy, *adj*—characterized by a hairy appearance due to broken fibers or filaments.

D 123, D13

fuzzy, *adj*—characterized by a hairy appearance due to protruding broken fibers or filaments. (*Syn. hairy*)

D 3990, D13

fuzzy, *adj*—characterized by a hairy appearance due to broken fibers or filaments. (*Syn. hairiness*)

D 4849, D13

fuzzy texture—a defect characterized by a myriad of minute bubbles, broken bubbles, and dimples in the porcelain enamel surface.

C 286, B08

FWA buildup—the course of change in fluorescence emission intensity or fluorescence shade or both, using specified exhaust procedure:

(1) for a specified number of successive applications of FWA, or

(2) by varying the FWA concentration in a series of single applications.

D 459, D12

FWA exhaust efficiency—a measure of FWA substantivity as ex-

pressed by:

(1) exhaust coefficient (E.C.)—the ratio of FWA concentration taken up by unprewhitened substrate, (wt of FWA (s)/wt of substrate) to that concentration of FWA remaining in the bath, (wt of FWA (b)/wt of bath) under specified application conditions.

$$\text{E.C.} = \frac{\text{wt FWA (s)/wt substrate}}{\text{wt FWA (b)/wt bath}}$$

D 459, D12

FWA fastness (on substrate)—degree of change in fluorescence emission intensity or fluorescence shade or both, when a substrate containing FWA is exposed for a specific length of time to any specified natural or artificial environment.

D 459, D12

FWA fluorescence emission intensity—the difference between the Z (CIE standard observer) tri-stimulus value of a sample treated with FWA and that of the untreated sample under standardized illumination conditions (D_{65}) and viewing conditions (CIE approved geometry) for any specified substrate and specimen presentation techniques.

D 459, D12

FWA fluorescence shade—(1) the perceived direction of the shift in hue caused by the addition of an FWA to any specified near-white substrate (psychological definition), or (2) the wave length at which an extension of the line connecting the points on a CIE diagram corresponding to the chromaticity coordinates (measured under standardized illumination conditions (D_{65}) (CIE approved geometry)) of the untreated substrate to those of the treated substrate intersects the spectrum locus (psychophysical definition).

D 459, D12

FWA formulation-dependent fluorescence emission intensity ratio—the fluorescence emission intensity obtained with a given FWA on a specified substrate under specified conditions in a designated formulation system relative to that obtained with the same FWA under identical conditions in a different formulation.

D 459, D12

FWA levelness—the uniformity of distribution of FWA on substrate when applied by a specified method.

D 459, D12

FWA rate of exhaust index—the time required for an FWA bath of specified composition to be half-depleted by exhaustion onto a particular substrate under specified conditions.

D 459, D12

FWA stability (in solution)—degree of resistance of FWA in solution under specified exposure condition to specific bath additives.

D 459, D12

FWA substrate selectivity ratio—the fluorescence emission intensity exhibited by a substrate, relative to that obtained on a reference substrate, after treating these in a specified mixed load, using a given FWA, a designated formulation system, and specified conditions.

D 459, D12

G

G—symbol for the dimensionless ratio between an acceleration in length per time-squared units, and the acceleration of gravity in the same units (D 1596).
D 996, D10

g—symbol for the acceleration of gravity at the earth's surface.
D 996, D10

G—shear modulus of the web material, psi (or MPa) **E 631, E06**

G'—shear stiffness of the diaphragm obtained from test (includes shear deformation factor for the connection system), lbf/in. (or N/mm) **E 631, E06**

G—shear stiffness obtained from test, in newtons per metre (pound-force per inch). **E 631, E06**

G'—global shear stiffness, includes rotation and translational displacements as well as diaphragm shear displacement. **E 631, E06**

µg—microgram. **E 631, E06**

g, *n*—a unit of acceleration where 1 *g* is equal to the acceleration of gravity, 9.8 m/s² (32.2 ft/s²). **F 538, F09**

gable wall—[archaic] the charging end wall of a glass-melting furnace. **C 162, C14**

GAC—granular activated carbon. **D 6161, D19**

gaffer—head workman, foreman, or blower of a glass hand shop. **C 162, C14**

gage, *n*—of a tufting machine, the average centerline distance between the needles. **D 123, D13**

gage, *n*—of tufted pile yarn floor covering, the average distance between adjacent binding sites in the widthwise direction. **D 123, D13**

gage, *n*—in knitted fabrics, a measure of fineness expressing the number of needles per unit of width (across the wales). **D 123, D13**

gage, *n*—in full-fashioned hosiery, a measure of fineness expressing the number of needles per 38 m (1.5 in.) on the needle bar. **D 123, D13**

gage, *n*—in warp knitting, for simplex, tricot, milanese, number of needles per English inch; for raschel, kayloom, twice the number of needles per English inch. **D 123, D13**

gage, *n*—in knitted fabrics, a measure of fineness expressing the number of needles per unit of width (across the wales). **D 4850, D13**

gage, *n*—in full-fashioned hosiery, a measure of fineness expressing the number of needles per 38 m (1.5 in.) on the needle bar. **D 4850, D13**

gage, *n*—in warp knitting, for simplex, tricot, milanese, number of needles per English inch; for raschel, kayloom, twice the number of needles per English inch. **D 4850, D13**

gage (also *gauge*), *n*—(1) in metal products, a number designating a specific thickness of metal sheet, or diameter of wire, cable, or fastener shank tabulated in a standardized series, each of which represents a decimal fraction of an inch (or millimetre). (2) distance in inches (or millimetres) between adjacent lines of holes or fasteners. **E 631, E06**

gage height—the height of a water surface above an established or arbitrary datum at a particular gaging station; also termed stage. **D 4410, D19**

gage length, *n*—in cement testing, the nominal length between the innermost ends of metal studs that are molded into a test specimen with the axis of the stud in each end of the test specimen coincident with the longitudinal axis of the test specimen and with each other. **C 219, C01**

gage length, *n*—in tensile testing, the length of a specimen measured between the points of attachment to clamps while under uniform tension. **D 123, D13**

gage length, *n*—the known distance between bench marks. **D 1566, D11**

gage length, *n*—in tensile testing, the length of a specimen measured between the points of attachment to clamps while under uniform tension. **D 4845, D13**

gage length [L], *n*—the original length of that portion of the specimen over which strain or change of length is determined. **E 6, E28**

gage length, *L* (L)—distance over which the deformation measurement is made. **D 653, D18**

gage plate—a device that determines the thickness of an individual slice of food product. **F 1827, F26**

gage plate adjuster—a manually operated dial or a lever that is used by the operator to set the *gage plate*. Usual practice is to indicate the thickness by a graduated scale with a 0 (zero) setting to indicate that the *gage plate* is completely closed. **F 1827, F26**

gage pressure—See **pressure**. **D 1356, D22**

gage pressure—pressure measured from atmospheric pressure as the base. **E 631, E06**

gage pressure—the difference in pressure existing within a system and that of the atmosphere. Zero gage pressure is equal to atmospheric pressure. **E 631, E06**

gage pressure—difference between the absolute pressure and atmospheric pressure. **E 1316, E07**

gage pressure—the difference in pressure existing within a system and that of the atmosphere. Zero gage pressure is equal to atmospheric pressure. **E 1749, E06**

gage protector—in grouting, a device used to transfer grout pressure to a gage without the grout coming in actual contact with the gage. **D 653, D18**

gage saver—see **gage protector**. **D 653, D18**

gaging station—a particular site on a stream, canal, lake, or reservoir at which systematic observations of hydrologic data are obtained. **D 4410, D19**

gaiter, *n*—for chainsaw cut resistance, a foot protective device worn outside the footwear. **F 1494, F23**

gaiting, *n*—in warp knitting, the setting of a guide bar one or more needle spaces to the right or left in order to increase the pattern possibilities. **D 123, D13**

gaiting, *n*—in warp knitting, the setting of a guide bar one or more needle spaces to the right or left in order to increase the pattern possibilities. **D 4850, D13**

galactan—a polysaccharide composed essentially of galactose units. (see also **arabinogalactan**) **D 1695, D01**

galactoglucomannan—one of the hemicelluloses of softwoods, containing three types of sugar units—galactose, glucose, and mannose. **D 1695, D01**

galactomannan—a polysaccharide containing galactose and mannose units. Galactomannans usually have a long chain of mannose units with galactose side chains and are found in seed gums (guar, locust bean). **D 1695, D01**

gall—layer of molten sulfates floating upon glass. **C 162, C14**

galling, *n*—a form of surface damage arising between sliding solids, distinguished by macroscopic, usually localized, roughening and creation of protrusions above the original surface; it often includes plastic flow or material transfer or both. **G 40, G02**

gallon, U. S., *n*—a volume equal to 231 in.³ For paint, varnish, lacquer, and related products this is measured at 77°F (25°C). **D 16, D01**

galvanic anode, *n*—a metal electrode that sacrificially corrodes when coupled to a more noble metal in a conducting medium, thereby supplying a protective electric current to the more noble electrode. **B 899, B02**

galvanic cell—an electrolytic cell capable of producing electrical energy by electrochemical action. **B 374, B08**

galvanic corrosion—accelerated corrosion of a metal because of an electrical contact with a more noble metal or nonmetallic conductor in an electrolyte. **D 6161, D19**

galvanic corrosion—accelerated corrosion of a metal because of an electrical contact with a more noble metal or nonmetallic conductor in a corrosive electrolyte. **E 631, E06**

- galvanic corrosion**—the corrosion of metallic objects in the presence of moisture, caused by electrolytic action. **E 631, E06**
- galvanic corrosion**—accelerated corrosion of a metal because of an electrical contact with a more noble metal or nonmetallic conductor in a corrosive electrolyte. **E 1749, E06**
- galvanic corrosion**—accelerated corrosion of a metal because of an electrical contact with a more noble metal or nonmetallic conductor in a corrosive electrolyte. **G 15, G01**
- galvanic couple**—a pair of dissimilar conductors, commonly metals, in electrical contact. (See **galvanic corrosion**.) **G 15, G01**
- galvanic current**—the electric current between metals or conductive nonmetals in a galvanic couple. **G 15, G01**
- galvanic series**—a list of metals and alloys arranged according to their relative potentials in a given environment. See **electromotive series**. **B 374, B08**
- galvanic series**—a list of metals and alloys arranged according to their relative corrosion potentials in a given environment. **G 15, G01**
- galvanized**—See **zinc-coated**. **F 547, F16**
- galvanized**—pertaining to zinc-coated articles. **F 552, F14**
- galvanized after weaving**—*in chain link fabric*, describes steel fabric that is hot-dip coated with zinc after weaving (see Specification A 392). **F 552, F14**
- galvanized before weaving**—*in chain link fabric*, describes fabric that is woven from steel wire galvanized before weaving. **F 552, F14**
- galvanized coating, *n***—a coating of virtually pure zinc on steel, applied by various methods or processes including hot-dip process and electrodeposition (electrolytic process). **A 902, A05**
- galvanized steel wire**—steel wire coated with zinc. **B 354, B01**
- galvanizing**—application of a coating of zinc. **B 374, B08**
- galvannealed coating, *n***—a coating on steel of zinc-based alloy, containing about 6 to 15 % iron, produced by hot-dip immersion in a high-zinc content coating bath, followed by heating the steel to induce diffusion alloying between the molten zinc coating and the steel. **A 902, A05**
- galvanodynamic**—refers to a technique wherein current, continuously varied at a selected rate, is applied to an electrode in an electrolyte. **G 15, G01**
- galvanostaircase**—refers to a galvanostep technique for polarizing an electrode in a series of constant current steps wherein the time duration and current increments or decrements are equal for each step. **G 15, G01**
- galvanostatic**—an experimental technique whereby an electrode is maintained at a constant current in an electrolyte. **G 15, G01**
- galvanostep**—refers to a technique in which an electrode is polarized in a series of current increments or decrements. **G 15, G01**
- gamma-cellulose**—(1) Historically, a term used to indicate impurities of short chain lengths found in pulps, predominately hemicelluloses. (2) Gamma-cellulose content, as measured by TAPPI Method T 203 om-93, is the pulp fraction soluble in caustic, which remains in solution upon acidification. **D 1695, D01**
- gamma iron (γ Fe)**—solid nonmagnetic phase of pure iron which is stable at temperatures between 910 and 1400°C and possesses the face-centered cubic lattice. **E 7, E04**
- gamma (γ) loss peak, *n***—the third peak in the damping curve below the melt, in the order of decreasing temperature or increasing frequency. **D 4092, D20**
- gamma (γ) loss peak**—*in dynamic mechanical measurement*, third peak in the damping curve below the melt, in the order of decreasing temperature or increasing frequency, (D 4092, D20). **E 1142, E37**
- gamma number**—degree of substitution (DS) \times 100. This term is of widespread use in the cellulose xanthate field. **D 1695, D01**
- gamma (photography)**—the tangent of the angle which the straight-line part of the characteristic curve makes with the log exposure axis and in a photographic film or plate is a measure of the extent of development. **E 7, E04**
- gamma-radiography**—a technique of producing radiographs using gamma-rays. **E 1316, E07**
- gamma ray**—electromagnetic penetrating radiation having its origin in the decay of a radioactive nucleus. **E 1316, E07**
- gamma ray**—electromagnetic radiation having its origin in an atomic nucleus. **E 1316, E07**
- gamma-ray standard field**—a gamma ray field produced by a particular radioactive nuclide (such as ^{60}Co) that is well established and reproducible as to the absorbed dose rate produced in a specific material at a designated location within the field at any given time. **E 170, E10**
- gap**—an open joint or split in the inner plies which results when crossband or center veneers are broken or not tightly butted. **D 1038, D07**
- gap-filling adhesive, *n***—an adhesive capable of forming and maintaining a bond between surfaces that are not close-fitting. **D 907, D14**
- gap length, ℓ_g** —the distance that the flux transverses in the central region of a gap in a core having an “air” (nonmagnetic) gap in the flux path may be considered unity in the gap. **A 340, A06**
- gap ratio**—sweep width divided by boom length. **F 818, F20**
- gap scanning**—short fluid column coupling technique. **E 1316, E07**
- Gardner color scale, *n***—a color scale for clear, light-yellow fluids, defined by the chromaticities of glass standards numbered from 1 for the lightest to 18 for the darkest. **E 284, E12**
- garment, *n***—a single item of clothing (for example, shirt). **F 1494, F23**
- garment leather**—a name covering material for leather coats, jackets, hats, and breeches made most commonly from sheep, cabretta, pig, or goat skins, cattle, or horse hides. **D 1517, D31**
- gas, *n***—one of the states of matter, having neither independent shape nor volume and tending to expand indefinitely. **D 1356, D22**
- gas**—the state of matter in which the molecules are practically unrestricted by intermolecular forces so that the molecules are free to occupy all space within an enclosure. In vacuum technology, the word gas has been loosely applied to the uncondensed gas and vapor within a vacuum system. **E 1316, E07**
- gas atomizer**—see **pneumatic atomizer**. **E 1620, E29**
- gas chromatography, GC**—all chromatographic methods in which the moving phase is gaseous. The stationary phase may be either a dry granular solid or a liquid supported by the granules or by the wall of the column, or both. Separation is achieved by differences in the partition-distribution of the components of a sample between the mobile and stationary phases, causing them to move through the column at different rates and from it at different times. (E 355) **D 2864, D27**
- gas classification, *n***—the separation of powder into particle size fractions by means of a gas stream of controlled velocity. **B 243, B09**
- gas electrode membrane**—a plastic film, permeable to gases but impermeable to water, separating the electrode from the simple solution. **D 4127, D19**
- gaseous hydrogen embrittlement (GHE)**—a distinct form of EHE caused by the presence of external sources of high pressure hydrogen gas; cracking initiates on the outer surface. **F 2078, F07**
- gaseous inclusion**—a round or elongated bubble in the glass. See **blister** and **seed**. **C 162, C14**
- gas holes**—blow holes, channels, or porosity produced by gas evolution, usually during solidification. **E 7, E04**
- gas-house coal tar, *n***—coal tar produced in gas-house retorts in the manufacture of illuminating gas from bituminous coal. **D 8, D04**
- gas hydrate**—a special form of a solid lattice-like structure in which crystal lattice cages or chambers consisting of host molecules (water) enclose guest molecules (of a variety of gases). **D 7099, D18**
- gasification, *n***—transformation of a solid and/or liquid material into a gaseous state. **E 176, E05**

gasification

gasification—any chemical or heat process used to convert a feedstock to a gaseous fuel. **E 1705, E48**

gasifier—a device that converts solid fuel to gas. Generally refers to thermochemical processes. Major types are moving bed (fixed bed), entrained bed, and fluidized bed. **E 1705, E48**

gasket, n—any preformed, deformable device designed to be placed between two adjoining parts to provide a seal. **C 717, C24**

gasket glazing—a method of setting glass or panels in prepared openings, using a preformed gasket to obtain a weathertight seal. **C 717, C24**

gasket joint—see **joint, compression gasket** and **joint, bell-and-spigot gasket**. **F 412, F17**

gasket leather—a collective term sometimes used for the cattlehide leather, either vegetable, chrome or combination tannages, with special stuffing added, and employed in pump valves, as piston packing, and so forth. **D 1517, D31**

gasket, lock-strip, H-type—two channel recesses, of equal or unequal sizes, one on either side of a central web. **C 717, C24**

gasket, lock-strip, reglet-type—a channel recess on the inner edge and a tongue, or spline, on the outer edge, the latter being designed for insertion in a reglet. **C 717, C24**

gasket (mechanical), n—a deformable material clamped between essentially stationary faces to prevent the passage of matter through an opening or joint. **D 1566, D11**

gasket, structural—See **lock-stripgasket**, the preferred term. **C 717, C24**

gasket, zipper—See **lock-stripgasket**, the preferred term. **C 717, C24**

gas-liquid chromatography, GLC—gas chromatographic method utilizing a liquid as the stationary phase, which acts as a solvent for the sample components. **D 2864, D27**

gas-liquid nozzle—see **pneumatic atomizer**. **E 1620, E29**

gas meter, n—an instrument for measuring the quantity of a gas passing through the meter. **D 1356, D22**

gasoline, n—a volatile mixture of liquid hydrocarbons, generally containing small amounts of additives, suitable for use as a fuel in spark-ignition, internal combustion engines. **D 4175, D02**

gasoline-alcohol blend, n—a fuel consisting primarily of gasoline along with a substantial amount (more than 0.35 mass % oxygen, or more than 0.15 mass % oxygen if methanol is the only oxygenate) of one or more alcohols. **D 4175, D02**

gasoline-alcohol blend, n—a spark-ignition engine fuel consisting primarily of gasoline along with a substantial amount of one or more alcohols. **D 4175, D02**

gasoline-ethanol blend, n—a fuel consisting primarily of gasoline along with a substantial amount (more than 0.35 mass % oxygen) of denatured fuel ethanol. **D 4175, D02**

gasoline-ether blend, n—a fuel consisting primarily of gasoline along with a substantial amount (more than 0.35 mass % oxygen) of one or more ethers. **D 4175, D02**

gasoline-ether blend, n—a spark-ignition engine fuel consisting primarily of gasoline along with a substantial amount of one or more ethers. **D 4175, D02**

gasoline-oxygenate blend, n—a fuel consisting primarily of gasoline along with a substantial amount (more than 0.35 mass % oxygen, or more than 0.15 mass % oxygen if methanol is the only oxygenate) of one or more oxygenates. **D 4175, D02**

gasoline-oxygenate blend, n—a spark-ignition engine fuel consisting primarily of gasoline along with a substantial amount of one or more oxygenates. **D 4175, D02**

gasometer, n—an apparatus employing a calibrated volume which is used to calibrate gas-measuring devices. **D 1356, D22**

gas phase ignition, n—ignition of pyrolysis products leaving a heated surface by a pilot flame or other ignition source that does not impinge on nor significantly affect (by re-radiation) the heated surface. **E 176, E05**

gas quality—quality of gaseous fuel, which is defined by its composition and its physical properties. **D 4150, D03**

gassing—the evolution of gases from one or more of the electrodes during electrolysis. **B 374, B08**

gassing—(I) the formation of gas bubbles due to bacterial contamination in the milled porcelain enamel slip.

(2) See **boiling**.

C 286, B08

gassing tendency—the capability of an insulating liquid either to absorb or generate gases when exposed to voltage stress. The measure of the gassing tendency is the volume of gas evolved or absorbed per unit time by an insulating liquid subjected to electrical stress under prescribed conditions (by Test Method D 2300). It is commonly expressed in units of microlitres per minute ($\mu\text{L}/\text{min}$) with a positive value indicating gas is evolved and a negative value indicating gas is absorbed. The SI unit is cubic millimetres per minute (mm^3/min). **D 2864, D27**

gas-solid chromatography, GSC—gas chromatographic method utilizing an active (absorbant) solid as the stationary phase. **D 2864, D27**

gassy surface—a defect characterized by poor gloss and fuzzy surface texture. **C 286, B08**

gate—a shut-off device for flow of glass and combustion gases in a forehearth, more commonly a water-cooled member rather than a refractory body. **C 162, C14**

gate, n—in an injection mold, a constriction in the flow channel between the runner and the mold cavity. **D 883, D20**

gate—a valve placed in a vacuum system to facilitate the isolation of a selected section of the system. **E 7, E04**

gate—same as **rejection level**. **E 1316, E07**

gate—an electronic means of selecting a segment of the time range for monitoring or further processing. **E 1316, E07**

gate, n—in an injection mold, a constriction in the flow channel between the runner and the mold cavity. (D20) **F 412, F17**

gate—a moveable barrier placed in a fence opening (gate opening) which allows the opening to be closed. See Specifications F 654, F 900, and F 1184. **F 552, F14**

gate clip—a galvanized pressed steel or pressed aluminum fitting designed to secure chain link fabric to the vertical sides of a gate frame. **F 552, F14**

gate cover—a component to prevent the lever from entering the tumbler gateway while changing combination. **F 471, F12**

gate frame—the structural member(s) of the gate. **F 552, F14**

gate holdback or keeper—a device to receive and hold the gate leaf in an open position. **F 552, F14**

gate (injection or transfer mold), n—the orifice through which a shaped cavity in a mold is filled with material. **D 1566, D11**

gate latch—a fitting to hold the gate in place when closed. **F 552, F14**

gate leaf—a component of a swing gate which consists of a gate frame covered with chain link fabric and/or other material. See Specifications F 654 and F 900. **F 552, F14**

gate opening—the clear distance between the gate posts. **F 552, F14**

gate post—the post to which a gate is attached via hinges. It may also be used as a terminal post. **F 552, F14**

gate transom—a panel of chain link fabric over the top of a gate opening, framed with top and bottom rail. Typically used in tennis court fence (see Practice F 969). **F 552, F14**

gather, n—the mass of glass picked up by the hand shop working on the punty or blowing iron. **C 162, C14**

gather, v—to get glass from a pot or day-tank on the pipe or punty. **C 162, C14**

gauge, gage—instrument used to measure wire diameter. (See **wire gage**.) **F 547, F16**

gauging plaster, n—a calcined gypsum plaster designed to be mixed with lime putty. **C 11, C11**

gauntlet—the area of a glove between the wrist and the reinforced edge of the opening. **F 819, F18**

gaussmeter, n—a device that measures magnetic flux density or magnetic induction (a quantity directly related to magnetic field

- strength or magnetic force); also known as a Tesla Meter or Magnetometer. **E 1316, E07**
- gaussmeter (electronic), *n***—a gaussmeter that uses a hall effect probe to measure magnetic flux density. **E 1316, E07**
- gauss (plural gauss), *G***—the unit of magnetic induction in the cgs-emu system of units. The gauss is equal to 1 maxwell per square centimetre of 10^{-4} tesla. See **magnetic induction (flux density)**. **A 340, A06**
- GC**—gas chromatography. **D 5681, D34**
- GC/MS**—gas chromatography with mass spectrometric detection. **D 5681, D34**
- GD**—gallons per day. See **GPD**. **D 6161, D19**
- GDF, *n***—growth and differentiation factor. **F 2312, F04**
- GE**—graphic escape. **F 1457, F05**
- Geiger-Müller counter**—See **counter**. **E 7, E04**
- gel, *n***—a semisolid system consisting of a network of solid aggregates in which liquid is held. **C 1145, C28**
- gel**—*in grouting*, the condition where a liquid grout begins to exhibit measurable shear strength. **D 653, D18**
- gel, *n***—(1) a semisolid system consisting of a network of solid aggregates in which liquid is held.
(2) the initial jelly-like solid phase that develops during the formation of a resin from a liquid.
(3) with respect to vinyl plastisols, gel is a state between liquid and solid that occurs in the initial states of heating, or upon prolonged storage. **D 883, D20**
- gel, *n***—a semisolid system consisting of a network of solid aggregates in which liquid is held. **D 907, D14**
- gel, *n***—(1) a semisolid system consisting of a network of solid aggregates in which liquid is held; (2) the initial jelly-like solid phase that develops during the formation of a resin from a liquid; (3) with respect to vinyl plastisols, gel is a state between liquid and solid that occurs in the initial stages of heating, or upon prolonged storage. (D20) **F 412, F17**
- gel, *n***—*in polymer*, a semisolid system consisting of a network of solid aggregates in which liquid is held. **F 1251, F04**
- gel, *n***—*in polymerization*, the initial jelly-like solid phase that develops during the formation of a resin from a liquid. **F 1251, F04**
- gel, *n***—*with vinylplastisols*, a state between liquid and solid that occurs in the initial stages of heating, or upon prolonged storage. **F 1251, F04**
- gel, *n***—the three-dimensional network structure arising from intermolecular polymer chain interactions. **F 2312, F04**
- gelatinization**—treatment of starch grains with heat and water to cause the swelling and expansion of the starting material. **E 1705, E48**
- gelatin replica**—See **replica**. **E 7, E04**
- gelation, *n***—formation of a gel. **D 907, D14**
- gel, dry rubber, *n***—the portion of unvulcanized rubber insoluble in a chosen solvent. **D 1566, D11**
- gel fouling layer**—highly swollen fouling layer comprising a three-dimensional. Possibly network, structure residing at the surface of a membrane. **D 6161, D19**
- gelification**—the slow downslope flow of unfrozen earth materials on a frozen substrate. **D 7099, D18**
- gelisol**—perennially frozen soil that contain permafrost within 2 m of the surface. **D 7099, D18**
- gel, latex, *n***—a semi-solid system consisting of a network of aggregates in which liquid is held. **D 1566, D11**
- gelling (latex), *n***—the formation of a uniform coagulum from which the aqueous phase has not been separated. **D 1566, D11**
- gel point, *n***—the stage at which a liquid begins to exhibit pseudo-elastic properties. **D 883, D20**
- gel point**—the stage at which a liquid begins to exhibit pseudo-elastic properties. **F 412, F17**
- gel time**—*in grouting*, the measured time interval between the mixing of a grout system and the formation of a gel. **D 653, D18**
- gel time, *n***—the period of time from the initial mixing of the reactants of a liquid material composition to the time when gelation occurs, as defined by a specific test method. **D 883, D20**
- gel time, *n***—the period of time from the initial mixing of the reactants of a plastic or rubber composition to the time when gelation occurs as defined by a specified test. **D 1566, D11**
- gel time, *n***—*of solventless varnish*, the time required, at a specified temperature, for a solventless varnish to be transformed from a liquid state to a gel, as measured with a suitable gel time apparatus. **D 1711, D09**
- gel time, *n***—*in thermosetting polymers*, the period of time from a predetermined starting point to the onset of gelation as determined by a specific test method. **D 3878, D30**
- gel time**—the time after mixing at which an adhesive begins to increase in viscosity and becomes resistant to flow. **E 2265, E06**
- gel time**—the time from the initial mixing of the reactants of a plastic or rubber composition to the time when gelation occurs, as measured by a specific test. **F 412, F17**
- gel type candle, *n***—a candle where the primary fuel is a liquid, such as mineral oil, terpene type chemicals, or modified hydrocarbons that are not mineral oil based, which may or may not contain organic functional groups; it also contains a chemical agent to increase the viscosity (thicken) to a point where the candle has a quasi-rigid property. **F 1972, F15**
- general indices of metamerism, *n***—see **indices of metamerism potential**. **E 284, E12**
- general overhead, *n***—the fixed cost associated with operation of the corporate or main office, plant, equipment, and staffing maintained by a contractor for general business operations. **E 833, E06**
- general precipitate**—a precipitate which is dispersed throughout the matrix. **E 7, E04**
- general-purpose nail**—See **common nail**. **F 547, F16**
- general rate law**— $dC/dt = k(1 - C)^n$ where *C* is fractional conversion, *t* is the time in minutes, and *n* is the reaction order. **E 1445, E27**
- general shear failure**—see **shear failure**. **D 653, D18**
- generic class, *n***—*as used with textile fibers*, a grouping having similar chemical compositions or specific chemical characteristics. **D 123, D13**
- generic class, *n***—*as used with textile fibers*, a grouping having similar chemical compositions or specific chemical characteristics. **D 4466, D13**
- generic criteria, *n***—common characteristics pertaining to organizations' human resources, material resources, and quality systems which provide a basis for assessing the qualifications of testing or inspection agencies. **D 1356, D22**
- generic criteria, for laboratory accreditation, *n***—accreditation criteria expressed in general terms which address organization, human and material resources, operating procedures, calibration and quality assurance practices of a laboratory. **E 1187, E36**
- gene therapy, *n***—“is a medical intervention based on modification of the genetic material of living cells. Cells may be modified *ex vivo* for subsequent administration or may be altered *in vivo* by gene therapy products given directly to the subject. When the genetic manipulation is performed *ex vivo* on cells that are then administered to the patient, this is also a type of somatic cell therapy. The genetic manipulation may be intended to prevent, treat, cure, diagnose, or mitigate disease or injuries in humans.”. Gene therapy technologies can be applied in tissue engineering to generate TEMPs. **F 2312, F04**
- gene therapy products, *n***—“are defined for the purpose of this statement as products containing genetic material administered to modify or manipulate the expression of genetic material or to alter the biological properties of living cells.”. **F 2312, F04**
- genetically modified, *vr***—referring to cells, tissues, and organs of any origin that have an altered or modified genetic content. **F 2312, F04**
- genetic material, *n***—is nucleic acid (either deoxyribonucleic acid or ribonucleic acid). **F 2312, F04**

genome (of a virus)

genome (of a virus)—the genetic material consisting of nucleic acid (RNA or DNA). **E 1705, E48**

geochemistry, n—the study of the chemistry of the rocks and fluids of the earth for the purpose of understanding their composition, their temperature, and their origin. **E 957, E44**

geocomposite, n—a product composed of two or more materials, at least one of which is a geosynthetic. **D 4439, D35**

geocryology—the study of earth materials having a temperature below 0°C (32°F). **D 7099, D18**

geofoam, n—block or planar rigid cellular foamed polymeric material used in geotechnical engineering applications. **D 4439, D35**

geogrid, n—a geosynthetic formed by a regular network of integrally connected elements with apertures greater than 6.35 mm (¼ in.) to allow interlocking with surrounding soil, rock, earth, and other surrounding materials to function primarily as reinforcement. **D 4439, D35**

geologic erosion—the erosion process on a given land form that is not associated with the activities of man. **D 4410, D19**

geologic or natural erosion—the erosion process on or in a given land form undisturbed by activities of man and his agents. **D 4410, D19**

geomembrane, n—an essentially impermeable geosynthetic composed of one or more synthetic sheets. **D 4439, D35**

geometric metamerism, n—deprecated term; do not use. The phenomenon it is used to describe does not conform to the internationally accepted definitions of metamerism. Use **gonioappearance**. **E 284, E12**

geometric unsharpness—the penumbral shadow in a radiological image which is dependent upon 1) the radiation source dimensions, 2) the source to object distance, and 3) object to detector distance. **E 1316, E07**

geonet, n—a geosynthetic consisting of integrally connected parallel sets of ribs overlying similar sets at various angles for planar drainage of liquids or gases. **D 4439, D35**

geophysical borehole log—a log obtained by lowering an instrument into a borehole and continuously recording a physical property of native or backfill material and contained fluids. Examples include resistivity, induction, caliper, sonic, and natural gamma logs. **D 653, D18**

geophysical log, n—a graphic record of the measured or computed physical characteristics of the rock section encountered in a borehole, plotted as a continuous function of depth. Measurements are made by a sonde which contains the detectors, as it is withdrawn from the borehole by a wire line. Several measurements are usually made simultaneously, and the resulting curves are displayed side by side on the common depth scale. A common suite of logs used in coal exploration include caliper, density (gamma-gamma), natural gamma, and resistivity.

caliper log, n—a continuous mechanical measurement of the diameter and thus the rugosity of the borehole. The tool identifies zones where swelling or cavings (washouts) have occurred during drilling. The tool's value is in allowing qualitative or quantitative corrections to be made to other geophysical logs which are affected by borehole size (especially density).

density log (gamma-gamma log), n—measures electron density within lithologic units which is related to their bulk density. The wireline tool records the intensity of gamma radiation (in counts per second) from a nuclear source within the tool after it has been attenuated and backscattered by lithologies within the borehole. Due to the distinctly low density of coals, the density log is essential in coal exploration for identifying coal seams and coal-seam partings. The bias/resolution of density logs can be affected by source-detector spacing (closer spacing increases resolution), borehole size, and irregularities (see *caves* or *washouts*), and the presence of casing and logging speed.

natural gamma-ray log, n—a record of the natural radioactivity of the lithologies encountered in the borehole environment.

During recording of geophysical logs, the amount of natural radiation is recorded and presented in either counts per second (CPS) or American Petroleum Institute (API) units. Unlike many other log types, a representative natural gamma log can be obtained where borehole or fluid conditions, or both, are not optimal or where casing is present. The natural gamma log is most often used in the coal environment for identifying clastic lithologies and differentiating coal seams and coal-seam partings.

resistivity log, n—a measure of the voltage differential of strata along the walls of a borehole when electrical current is passed through the strata. The resistivity log requires a fluid-filled hole to provide a conductive medium constantly between electrodes on the tool. The spacing between the electrodes determines the precision of the bed boundary relationships in much the same manner as with the density log. The resistivity log is useful primarily in conjunction with other log types. The logs are affected by casing, logging speed, electrode spacing, formation porosity, and resistivity changes in the borehole fluid. **D 121, D05**

geosynthetic, n—a planar product manufactured from polymeric material used with soil, rock, earth, or other geotechnical engineering related material as an integral part of a man-made project, structure, or system. **D 4439, D35**

geosynthetic clay liner, n—a manufactured hydraulic barrier consisting of clay bonded to a layer or layers of geosynthetic materials. **D 4439, D35**

geotechnical engineering, n—the engineering application of geotechnics. **D 4439, D35**

geotechnics, n—the application of scientific methods and engineering principles to the acquisition, interpretation, and use of knowledge of materials of the earth's crust to the solution of engineering problems. **D 4439, D35**

geotextile, n—a permeable geosynthetic comprised solely of textiles. **D 4439, D35**

geothermal, adj—relating to or derived from the natural heat of the earth. **E 957, E44**

geothermal anomaly, n—a conspicuous deviation of the earth's temperature, geothermal gradient, or heat flow from average values; an area where such a deviation exists. **E 957, E44**

geothermal energy, n—the thermal energy contained in the rocks and fluids of the earth. **E 957, E44**

geothermal facility, n—the physical components necessary for the utilization of geothermal energy, including the reservoir, production and injection wells, pipelines, and the power plant or direct-use facility. **E 957, E44**

geothermal fluid, n—water in a vapor or liquid phase or in a mixture of these phases that exists within or has been emitted from a geothermal reservoir, together with any entrained or dissolved substances. **E 957, E44**

geothermal gradient—the rate of temperature increase with depth in the earth. **D 7099, D18**

geothermal gradient, n—the change in temperature of the earth with depth, expressed either in degrees of temperature per unit depth, or units of depth per degree. **E 957, E44**

geothermal heat flux—the amount of heat moving steadily outward from the interior of the earth through a unit area in unit time. **D 7099, D18**

geothermal heat pump, n—a heat pump that transfers energy to or from the earth. **E 957, E44**

geothermal power plant, n—a facility for the production of electricity using geothermal energy, typically including a turbine, a generator, and associated surface equipment. **E 957, E44**

geothermal reserves, n—the amount of energy anticipated to be economically recoverable from a geothermal facility over a specified time period (e.g., the project life) using existing technology. Geothermal reserves are expressed in units of energy (e.g., terajoules in SI units), which are dimensionally equivalent to units of power multiplied by units of time (e.g., Megawatt-years or

kilowatt-hours). Geothermal reserves may also be expressed as an equivalent amount of another energy source (e.g., barrels of oil equivalent).

Example of Usage:

This facility has geothermal reserves of 4,000 Megawatt-years, recoverable over a project life of 30 years. **E 957, E44**

geothermal reservoir, n—an aquifer of sufficient temperature and permeability to support the economic use of geothermal energy. **E 957, E44**

geothermal steam, n—a geothermal fluid in the vapor phase. **E 957, E44**

geothermometer, n—a method of estimating the temperature of a geothermal reservoir based on the minerals in the reservoir rock or the concentration of chemical species in geothermal fluids that have come from the reservoir. **E 957, E44**

German degree—Calcium oxide equivalents expressed in parts per hundred thousand. Concentration in German degree is calculated by dividing concentration in calcium carbonate equivalents by 17.86 **D 6161, D19**

geyser, n—a spring that intermittently blows forth hot water and steam. **E 957, E44**

GFD (GPDSF)—unit of permeate rate or flux; gallons per day per square foot of effective membrane area. **D 6161, D19**

ghosting, n—a gas-chromatographic interference, showing as a peak, which appears at the same elution time as a component from previous injection. **D 1129, D19**

ghosting, n—the presence of a faint mirror image of a design appearing in areas not intended to receive that portion of the image. **D 6488, D01**

ghosting—an undesired repeat image. Positive ghost image is an undesired image created in a non-printed area Negative ghost is an undesired reverse repeat image created in a printed area that is seen by the difference in contrast. **F 335, F05**

ghosting—in carbonless copy products, the transferring of a secondary image from the CB sheet to the CF sheet. **F 549, F05**

ghosting, chemical, n—the appearance of gloss or dull mirror images that are printed on the reverse side of the sheet. **D 6488, D01**

ghosting, mechanical, n—the appearance of a phantom image on the printed side of the sheet. **D 6488, D01**

ghosting, starvation, n—mechanical ghosting that appears in solids and shadows as either a lighter image or a darker image than the background. **D 6488, D01**

Gibbs free energy—the maximum useful work that can be obtained from a chemical system without net change in temperature or pressure; $\Delta F = \Delta H - T\Delta S$. **E 7, E04**

Gibbs Phase Rule—maximum number of phases (P) that may coexist at equilibrium is equal to two, plus the number of components (C) in the mixture, minus the number of degrees of freedom (F): $P + F = C + 2$ (E 7, E04). **E 1142, E37**

Gibbs triangle—an equilateral triangle, used for plotting composition in a ternary system. **E 7, E04**

gilbert, Gb—the unit of magnetomotive force in the cgs-emu system of units. The gilbert is a magnetomotive force of $4\pi/10$ ampere-turns. See **magnetomotive force**. **A 340, A06**

gill box leather—a leather used in textile machinery, similar to comber leather. **D 1517, D31**

ginned lint, n—cotton fibers that have been separated from their seeds by ginning but not subjected to any further processing after ginning. (See **lint cotton**.) **D 123, D13**

ginned lint, n—cotton fibers that have been separated from their seeds by ginning but not subjected to any further processing after ginning. (See **lint cotton**.) **D 7139, D13**

G'_{int} —internal shear stiffness, includes only the shear displacement of the wall in calculation. **E 631, E06**

girder—a horizontal member used to support heavy loads such as other beams along its length. **D 9, D07**

girth—distance around; circumference.

(a) *joint*—around *metatarso*—phalangeal joint,

(b) *waist*—smallest girth behind joint,

(c) *instep*—smallest girth passing over prominence on middle cuneiform,

(d) *long heel*—seat to instep to give “pass line” in riding boot,

(e) *short heel*—seat to lowest crease in front of ankle,

(f) *ankle*—around and above ankle bones,

(g) calf, thigh as necessary. (manual of shoemaking: c. & k. clark ltd. 1976, p. 44) **F 869, F08**

girth, n—in body measurements, a circumferential measurement around some part of the body, such as neck, chest, waist, and so forth. **F 1494, F23**

glacial till (till)—material deposited by glaciation, usually composed of a wide range of particle sizes, which has not been subjected to the sorting action of water. **D 653, D18**

glacial till (till)—material left after the retreat of glaciers and ice sheets, usually composed of a wide range of particle sizes, which has not been subjected to the sorting action of water. **D 7099, D18**

glaciolacustrine deposits—glaciofluvial deposits that settled in standing water. **D 7099, D18**

glancing angle—the angle (usually small) between an incident X-ray beam and the surface of the specimen. **E 7, E04**

glancing exit—AES, EIA, XPS, geometrical arrangement in which the scattered (or emitted) particles are near 90° from the normal to the specimen surface. This results in improved depth resolution. **E 673, E42**

glancing incidence—AES, EIA, geometrical arrangement in which the incident particles are near 90° from the normal to the specimen surface. This results in improved depth resolution. **E 673, E42**

glare, n—condition of vision in which there is discomfort or a reduction in ability to see details, objects, or both, caused by an unsuitable distribution or range of luminance, or by extreme contrasts in space. **E 284, E12**

glare—See **lighting**. **E 631, E06**

glare—excessive brightness which interferes with clear vision, critical observation, and judgment. **E 1316, E07**

glare—See **lighting**. **E 1480, E06**

glare (éblouissement)—effect of brightness or brightness differences within the visual field sufficiently high to cause annoyance, discomfort, or loss of visual performance. **E 631, E06**

glass—an inorganic product of fusion that has cooled to a rigid condition without crystallizing. **C 162, C14**

glass—a term sometimes used for porcelain enamel or frit. **C 286, B08**

glass—a manufactured fiber in which the fiber-forming substance is glass. **D 123, D13**

glass, n—an inorganic product of fusion which has cooled to a rigid condition without crystallizing. **D 883, D20**

glass block assembly, n—a light transmitting configuration constructed of glass block held together with mortar or other suitable materials. **E 176, E05**

glass blowing—the shaping of hot glass by air pressure. **C 162, C14**

glass ceramic—solid material, partly crystalline and partly glassy, formed by the controlled crystallization of a glass. **C 162, C14**

glass-coated steel, glass-lined steel, glassed steel—designations generally applied to a class of porcelain enamels that have high resistance to chemical attack at elevated temperatures and pressures. **C 286, B08**

glass container—general term applied to glass bottles and jars. **C 162, C14**

glass container—See **container**. **D 996, D10**

glass count, n—an indirect yarn numbering system, equal to the number of 100 yd. lengths per pound. **D 123, D13**

glass electrode—a half cell in which the potential measurements are made through a glass membrane. **B 374, B08**

glass eye—a defect consisting of a large unbroken blister. **C 286, B08**

glass felt

glass felt—glass fibers bonded into a sheet with resin and suitable for impregnation in the manufacture of bituminous waterproofing, roofing membranes, and shingles. **D 1079, D08**

glass fiber, n—fiber manufactured as continuous filament from molten glass, normally used for reinforcement, tissue or textiles. **C 168, C16**

glass finish—a material applied to the surface of glass fibers used to reinforce plastics and intended to improve the physical properties of such reinforced plastics over that obtained using glass reinforcement without finish. **D 883, D20**

glassiness—a glassy, marbled, streaked appearance at the pultruded surface.

NOTE—This condition is visually evident, but reinforcement is in fact fully encapsulated with resin. **D 3918, D20**

glass mat—a thin mat of glass fibers with or without a binder. **D 1079, D08**

glass paper—a glass fiber product made by dispersing chopped glass fibers in a liquid medium followed by settling and drying to produce a thin sheet. **C 162, C14**

glass redox, redox ratio—a measure of the relative oxidation/reduction state of a glass as indicated typically by any one of the ratios: FeO/total iron as Fe₂O₃, FeO/Fe₂O₃, Fe²⁺/Fe³⁺, or Fe²⁺/(Fe₂₊ + Fe³⁺). **C 162, C14**

glass specimen—the glass to be tested, for example, a single pane, an insulating glass unit, laminated glass, etc. (does not include test frame). **E 631, E06**

glass specimen failure—the fracture or cracking of any glass component of a glass specimen. **E 631, E06**

glass transition—the reversible change in an amorphous polymer or in amorphous regions of a partially crystalline polymer from (or to) a viscous or rubbery condition to (or from) a hard and relatively brittle one. **D 883, D20**

glass transition—the reversible change in amorphous polymer, or in amorphous regions of a partially crystalline polymer, from (or to) a viscous or rubbery condition to (or from) a hard and relatively brittle one. **D 4092, D20**

glass transition—reversible change in an amorphous material or in amorphous regions of a partially crystalline material, from (or to) a viscous or rubbery condition to (or from) a hard and relatively brittle one. **E 1142, E37**

glass transition—the reversible change in an amorphous polymer or in amorphous regions of a partially crystalline polymer from (or to) a viscous or rubbery condition to (or from) a hard and relatively brittle one. **F 412, F17**

glass transition temperature—on heating, the temperature at which a glass transforms from an elastic to a viscoelastic material, characterized by the onset of a rapid change in thermal expansivity. **C 162, C14**

glass transition temperature—a temperature chosen to represent the temperature range over which the glass transition takes place. **E 1142, E37**

glass transition temperature (T_g)—the approximate midpoint of the temperature range over which the glass transition takes place. **D 883, D20**

glass transition temperature, T_g—the approximate midpoint of the temperature range over which the glass transition takes place. **D 4092, D20**

glass transition temperature (T_g)—the approximate midpoint of the temperature range over which the glass transition takes place. **F 412, F17**

glassware corrosion test, n—a laboratory screening test for evaluating the corrosion protection properties of engine coolants on metal test specimens under controlled conditions of aeration and temperature. **D 4725, D15**

glass wool, n—See **fibrous glass**. **C 168, C16**

glaze, n—an impervious facial finish composed of ceramic materials, fused during firing with the body of brick or tile, which is a

semivitreous or vitreous surface and may be clear, white, or colored. **C 43, C15**

glaze—a ceramic coating matured to the glassy state on a formed ceramic article, or the material or mixture from which the coating is made.

bright glaze—a colorless or colored ceramic glaze having high gloss.

clear glaze—a colorless or colored transparent ceramic glaze.

crystalline glaze—a glaze containing macroscopic crystals.

fritted glaze—a glaze in which a part or all of the fluxing constituents are prefused.

leadless glaze—a ceramic coating matured to a glassy state on a formed article, or the material or the mixture from which the coating is made, to which no lead has been deliberately added.

mat glaze—a colorless or colored ceramic glaze having low gloss.

opaque glaze—a nontransparent colored or colorless glaze.

raw glaze—a glaze compounded primarily from raw constituents, that is, containing no prefused materials.

semi-mat glaze—a colorless or colored glaze having moderate gloss.

slip glaze—a glaze consisting primarily of a readily fusible clay or silt.

vellum glaze—a semi-mat glaze having a satin-like appearance. **C 242, C21**

glaze—a hard glassy fused coating. **C 896, C04**

glaze, n—a very thin coating of a paint product usually a semi-transparent coating tinted with Van Dyke brown, burnt sienna, or a similar pigment, applied on a previously painted surface to produce a decorative effect. **D 16, D01**

glaze—See **windows and doors**. **E 631, E06**

glaze coat—(1) the top layer of asphalt in a smooth-surfaced built-up roof assembly;

(2) a thin protective coating of bitumen applied to the lower plies or top ply of a built-up membrane, when application of additional felts, or the flood coat and aggregate surfacing are delayed. **D 1079, D08**

glazed ceramic mosaic tile—ceramic mosaic tile with glazed faces. **C 242, C21**

glazed finish—produced by polishing grain surface under heavy pressure of a roller of agate, glass or steel. Infrequently made by a varnish or shellac coating. **D 1517, D31**

glazed (glace) kid—chrome tanned goatskin and kidskin leather, in either black or colors, which has a glazed finish. **D 1517, D31**

glazed manifold, n—a manifold paper having a high gloss, or polish, formed on the surface of the paper by methods such as friction glazing, calendaring, plating, etc. **D 1968, D06**

glazed pot—generally, a new pot coated inside with a thin layer of glass to protect it from the raw batch. **C 162, C14**

glazed tile—tile with a fused impervious facial finish composed of ceramic materials, fused with the body of the tile which may be a nonvitreous, semivitreous, vitreous, or impervious body resulting in a surface that may be clear, white, or colored.

glazed interior tile—a glazed tile with a body that is suitable for interior use and which is usually nonvitreous, and is not required or expected to withstand excessive impact or be subject to freezing and thawing conditions.

glazed tile, extra duty glaze—tile with a durable glaze that is suitable for light-duty floors and all other surfaces on interiors where there is no excessive abrasion or impact. **C 242, C21**

glaze fit—the stress relationship between the glaze and body of a fired ceramic product. **C 242, C21**

glazing, v—in *building construction*, the installation of glass or other materials in prepared openings. **C 717, C24**

glazing—See **windows and doors**. **E 631, E06**

- glazing**, *n*—material instilled in a window sash, ventilator, or panel such as glass, plastic. E 631, E06
- glazing**, *n*—material installed in a window sash, ventilator, or panel such as glass or plastic. E 1605, E06
- glazing bead**—See **windows and doors**. E 631, E06
- glazing compound**, *n*—*in building construction in glazing*, a putty material composed primarily of oil- or resin-based ingredients used for sealing window glass in frames. C 717, C24
- glazing compound**, *n*—a dough-like material consisting of pigment and vehicle, used for sealing window glass in frames. It differs from putty in that it retains its plasticity for an extended period. D 16, D01
- glazing, construction site**, *n*—*in building construction*, the installation of glass or panels into a metal framing system, at a construction site, under generally uncontrolled environmental conditions. C 717, C24
- glazing, factory**, *n*—See **glazing, shop**. C 717, C24
- glazing, field**, *n*—See **glazing, construction site**. C 717, C24
- glazing material**, *n*—transparent or translucent material used in fire window assemblies. E 176, E05
- glazing material**—See **windows and doors**. E 631, E06
- glazing, protective**, *n*—*in building construction*, systems with glazed openings that are designed to mitigate the effects of bomb blasts, projectiles, natural disasters, or forced entry. C 717, C24
- glazing, shop**, *n*—*in building construction*, the installation of glass or panels into a metal framing system under controlled environmental conditions. C 717, C24
- g-level**, *n*—the acceleration of an object relative to the local acceleration of gravity. E 344, E20
- glitch**, *n*—a print defect that displaces the laser scan line so that it appears to start and stop late. F 1457, F05
- glitter**, *n*—the appearance attributable to brilliant reflection from many small, discrete reflecting elements. E 284, E12
- global**—indicates measurements or observations of a total dispersion of particles (such as, a sample representative of an entire liquid spray). E 1620, E29
- global horizontal solar irradiance**, *n*—See **global solar irradiance** in Terminology E 772. E 1328, E44
- global normal solar irradiance**, *n*—solar irradiance from a 2π steradian field-of-view incident upon a surface that is perpendicular to the axis of the solid angle defined by the disk of the sun. E 1328, E44
- global testing**, *n*—testing conducted at two or more laboratories or test sites for the purpose of comparing candidate tire performance at each location for selected characteristic properties. F 538, F09
- global threshold**, GT, *n*—the reflectance level that discriminates bars from spaces in a scan reflectance profile. F 1294, F05
- glory hole**—an opening exposing the hot interior of a furnace used to reheat the ware in hand-working. C 162, C14
- gloss**—the shine or luster of a porcelain enamel. C 286, B08
- gloss**, *n*—the luminous fractional reflectance of a material in the specular direction. (See **specular gloss**) D 123, D13
- gloss**—the geometrically selective reflectance of a surface responsible for its shiny or lustrous appearance. Surface reflectance is commonly at a maximum in or near the geometric directions in which a mirror would reflect light. D 1695, D01
- gloss**, *n*—angular selectivity of reflectance of surface-reflected light responsible for the degree to which reflected highlights or images of objects may be seen as superimposed on a surface. D 2946, C17
- gloss**, *n*—a shiny appearance resulting from the tendency of a surface to reflect light energy at one angle more than at others. (See **reflectance, directional**. For the consensus technical definition, see **gloss** in Terminology E 284.) E 253, E18
- gloss**, *n*—angular selectivity of reflectance, involving surface-reflected light, responsible for the degree to which reflected highlights or images of objects may be seen as superimposed on a surface. (See also **distinctness-of-image gloss**, **haze** (*in reflection*), **luster**, **sheen**, **specular gloss**.) E 284, E12
- glossary**, *n*—a collection of specialized terms and their meanings. E 1992, E02
- glossmeter**—an instrument for measuring the ratio of the light regularly or specularly reflected from a surface to the total light reflected. E 1316, E07
- gloss oil**, *n*—a solution of limed rosin or limed rosin acids in a volatile solvent, used chiefly in surface coatings. (When made from tall oil, the source is usually indicated.) D 804, D01
- gloss reflectance factor**, R_s , *n*—ratio of the specularly reflected part of the (whole) flux reflected from the specimen to the flux reflected from a specified gloss standard under the same geometric and spectral conditions of measurement. E 284, E12
- gloss retention**—maintenance of gloss of a film under normal use conditions. D 2825, D21
- gloss retention**, *n*—the percent of the original gloss retained by the specimen after aging under specified conditions. It is the final gloss divided by the initial gloss, multiplied by 100. D 4175, D02
- gloss retention**, *n*—portion of original gloss retained by a specimen after treatment such as aging or abrasion under specified conditions, calculated by a specified equation. E 284, E12
- gloss, specular**, *n*—see **specular gloss**. D 2946, C17
- glossy, or bright glaze**—a glaze which exhibits essentially full specular reflection. C 242, C21
- glost fire**—See **glost fire** under **firing**. C 242, C21
- glove leather**—term covering two distinct classes:
- (1) the leather used for dress gloves, including those for street, riding, and sports wear. Tanned predominately from hair sheep, wool sheep, and lamb skins and to a lesser degree from deer, pig, goat, and kid skins, and
 - (2) the leather used for utilitarian or work gloves and made of a variety of hides and skins, of which the most important are horsehides, cattlehide splits and bellies, pigskins, and cowhides. D 1517, D31
- glove splits**—split chrome-tanned cattlehide leather used for work gloves. D 1517, D31
- glow**, *n*—visible, flameless combustion of the solid phase of a material. (See also **afterglow** and **smoldering**.) D 123, D13
- glow**, *n*—visible, flameless combustion of the solid phase of a material. (See also **afterglow** and **smoldering**.) D 4391, D13
- glow**, *n*—(1) the visible light emitted by a substance because of its high temperature. (2) visible light, other than from flaming, emitted by a solid undergoing combustion. E 176, E05
- glow**, *n*—visible, flameless combustion of the solid phase of a material. F 1494, F23
- glow discharge**—a self-sustaining discharge characterized by essentially symmetrical electrodes, low current density, and a high cathode fall of about 200 V. B 542, B02
- GLP**—*in laboratory practice*, abbreviation for good laboratory practice. D 4175, D02
- glucan**—a macromolecular substance that can be hydrolyzed to give almost exclusively glucose. D 1695, D01
- glucoamylase**—enzyme that acts specifically to convert dextrans to glucose by hydrolysis. E 1705, E48
- glucmannan**—a hemicellulose consisting essentially of glucose and mannose. D 1695, D01
- glucose**—the most prominent simple sugar (6-membered $C_6H_{12}O_6$) produced from starches and cellulose material by hydrolysis. E 1705, E48
- glucuronoxylan**—a common designation for the xylose-containing hardwood hemicelluloses. (see also **methylglucuronoxylan**) D 1695, D01
- glue**—see **adhesive**. D 907, D14
- glue**, *v*—see **bond**, *v*. D 907, D14
- glue**, *n*—See **adhesive**. D 1038, D07
- glue (archaic)**, *n*—a hard gelatin obtained from hides, tendons, cartilage, bones, etc., of animals, and also an adhesive prepared from this substance by heating with water. D 907, D14

glued seam, *n*

glued seam, *n*—a seam formed by an adhesive. (Compare **sewn seam**, **stapled seam**, **thermally bonded seam**.) D 123, D13

glued seam, *n*—in home sewing, a seam formed by the use of an adhesive. (Compare **sewn seam**, **stapled seam**, **thermally bonded seam**.) D 4965, D13

glue-laminated wood, *n*—see *glue-laminated wood* under **wood laminate**. D 907, D14

glue line, *n*—Synonym for **bondline**. D 907, D14

GLULAM, *n*—Synonym for **structural-glued-laminated timber**. D 907, D14

glulam rivet nail—plain or galvanized, flat, hardened-steel, $2\frac{3}{8}$ by $\frac{1}{4}$ -in. nail with sheared V-shaped point and flat upset wedge-shaped head; designed to be driven through undersize truncated apertures in regular-stock-steel connector plates from which nails cantilever into wood. F 547, F16

glycol-base antifreeze, *n*—in *engine coolants*, ethylene or propylene glycol commonly used in admixture with water and additives to lower the coolant freezing point. D 4175, D02

glycol engine coolant concentrate, *n*—an engine coolant concentrate in which the freeze point depressant is ethylene or propylene glycol, with inhibitors to minimize foaming and corrosion. D 4725, D15

gmax—the maximum value of acceleration experienced during impact expressed in units of *g*'s. F 869, F08

goniomic projection—a projection in which the orientation of a crystal plane at the center of the unit sphere is represented by the point where the plane normal intersects the plane of projection which is tangent to the unit sphere at the zenith. E 7, E04

gob—(1) a portion of hot glass delivered by a feeder.
(2) a portion of hot glass gathered on a punty or pipe. C 162, C14

gob process—a process whereby glass is delivered to a forming unit in "gob" form. C 162, C14

gold decoration—XPS, a method whereby a very thin coat of evaporated gold on an insulator is used as a charge reference; the gold should be deposited as unconnected islands covering the area analyzed. E 673, E42

gonioapparent, *adj*—pertaining to change in appearance with change in illumination angle or viewing angle. E 284, E12

gonioappearance, *n*—the phenomenon in which the appearance of a specimen changes with change in illumination or viewing angle. E 284, E12

goniochromatic match, *n*—match between a pair of specimens that holds under all sets of angular illuminating-viewing conditions. E 284, E12

goniochromatism, *n*—change in any or all attributes of color of a specimen on change in angular illuminating-viewing conditions but without change in light source or observer. E 284, E12

gonio-conditional match, *n*—two samples that match under some but not all geometric conditions. E 284, E12

goniometer—an instrument devised for measuring the angle through which a specimen is rotated. E 7, E04

goniometer, *n*—in *X-ray spectrometry*, a device used to adjust the angular relationships among a sample, crystal, and detector in an X-ray spectrometer. E 135, E01

goniometer, *n*—an instrument for measuring or setting angles. ^A E 284, E12

goniophotometer, *n*—instrument that measures flux as a function of angles of illumination or observation. E 284, E12

goniophotometer, *n*—photometer for measuring the directional light distribution characteristics of sources, lighting fittings, media, and surfaces.

NOTE—A goniophotometer for measuring the spatial distribution of luminous intensity is also called a distribution photometer. E 349, E21

goniospectrophotometer, *n*—spectrophotometer having the capability of measuring with a variety of illuminating and viewing angles

using bidirectional geometry; also known as multi-angle spectrophotometer. E 284, E12

good engineering practices—include design practices and criteria accepted in professional societies (ASTM, AIChE, ASME, ACS, etc.), proved by experience, verified by actual data, etc., that will meet the process, safety, and environmental requirements of the system. E 1705, E48

good laboratory practices (GLP), *n*—guidelines for the management of laboratory experiments which are published by regulatory agencies or other recognized groups and are concerned with the organizational process and the conditions under which laboratory studies are planned, performed, monitored, recorded, and reported. D 4175, D02

good laboratory practices (GLP), *n*—guidelines for the management of laboratory experiments which are published by regulatory agencies or other recognized groups, and are concerned with the organizational process and the conditions under which laboratory studies are planned, performed, monitored, recorded, and reported. D 6384, D02

gouge—a surface defect in which material has been removed (scooped out by a sharp instrument) that causes a decrease in strength in a highly stressed area. E 631, E06

gouge—a surface defect in which material has been removed (scooped out by a sharp instrument) that causes a decrease in strength in a highly stressed area. E 1749, E06

gouge, *n*—a groove or cavity in the flooring surface accompanied by material removal and penetration below the immediate flooring surface. F 141, F06

gouges—see **chips**. D 3918, D20

gout, *n*—foreign matter trapped in a fabric by accident, usually lint or waste. (See also **slug**.) D 123, D13

gout, *n*—foreign matter trapped in a fabric by accident, usually lint or waste. (See also **slug**) D 3990, D13

GPD—unit of flow rate; gallons per day. See **GD**. D 6161, D19

grab bar—See **railing systems**. E 631, E06

grab bar—Synonym for **grab rail**. E 1481, E06

grab rail—See **railing systems**. E 631, E06

grab rail—a short length of rail located for safety or convenience to assist a person in movement at a specific location. (Syn. *grab bar*.) E 631, E06

grab rail—a short length of rail located for safety or convenience to assist a person in movement at a specific location. (Syn. *grab bar*.) E 1481, E06

grab sample, *n*—individual sample collected over a period of time usually not exceeding 15 min and in such a manner as to be representative of conditions at the time of sampling. Grab samples are sometimes called individual or discrete samples. D 5681, D34

grab test, *n*—*infabric testing*, a tensile test in which the central part of the width of the specimen is gripped in the clamps. D 123, D13

grab test, *n*—*infabric testing*, a tension test in which only a part of the width of the specimen is gripped in the clamps. D 4439, D35

grab test, *n*—*infabric testing*, a tensile test in which the central part of the width of the specimen is gripped in the clamps. D 4850, D13

gradation—the distribution of particles of granular material among standard sizes usually expressed in terms of cumulative percentages larger or smaller than each of a series of sieve openings. C 822, C13

gradation, *n*—the particle size distribution of aggregate as determined by separation with standard screens. Gradation of aggregate is expressed in terms of the individual percentages passing standard screens. Sieve analysis and screen analysis are synonyms when referring to gradation of aggregate. C 1180, C12

gradation (grain-size distribution) (texture)—the proportions by mass of a soil or fragmented rock distributed in specified particle-size ranges. D 653, D18

grade, *n*—the designation given a material by a manufacturer such that it is always reproduced to the same specifications established by the manufacturer. C 709, D02

grade, *n*—subdivision of flat sheets based on minimum wet and equilibrium flexural strengths. **C 1154, C17**

grade—the designation of the quality of logs or of a manufactured piece of wood. **D 9, D07**

grade, *n*—*in warpknitting*, a term used to indicate the defect index evaluation of fabric determined by the number of defects per unit, for example per pound, per linear yard, or per square yard.

D 123, D13

grade, *n*—*in wooland mohair*, a numerical designation used in classifying wool and mohair in their raw, semi-processed, and processed forms based on average fiber diameter and variation of fiber diameter. **D 123, D13**

grade, *v*—to assign a numerical value based on number, size, and severity of defects seen during a visual inspection. **D 123, D13**

grade, *n*—*for asbestos*, asbestos fiber that has the same chemical, physical, and mechanical properties and which is designated by a particular code corresponding to any given specifications.

D 2946, C17

grade, *n*—the designation given a material by a manufacturer such that it is always reproduced to the same specifications established by the manufacturer. **D 4175, D02**

grade, *n*—*in wooland mohair*, a numerical designation used in classifying wool and mohair in their raw, semi-processed, and processed forms based on average fiber diameter and variation of fiber diameter. **D 4845, D13**

grade, *n*—*in warpknitting*, a term used to indicate the defect index evaluation of fabric determined by the number of defects per unit, for example per pound, per linear yard, or per square yard.

D 4850, D13

grade, *v*—to assign a numerical value based on number, size, and severity of defects seen during a visual inspection. **D 4850, D13**

grade, *n*—a level or elevation of a land or water surface. **E 631, E06**

graded nest, *n*—a collection of graded piece boundaries that represent every size in the size line for a particular pattern piece.

D 6963, D13

graded sediment—in geology, a sediment consisting chiefly of grains of the same size range. In engineering, a sediment having a uniform or equable distribution of particles from coarse to fine.

D 4410, D19

graded stream—a stream in which a steady state has been reached such that over a period of time the discharge and sediment load entering the system are balanced by the discharge and sediment load leaving the system. **D 4410, D19**

grade identification symbols—inch series standardized symbols denoting the combination of the fastener's base material, its strength properties, its performance capabilities, and the engineering standard against which it was produced. **F 1789, F16**

grade/recovery, *n*—the relationship between quality and quantity of the clean coal product. The quality can be defined in terms of ash, sulfur, or Btu content. The quantity can be designated as yield or heating value recovery (Btu or combustibles). **D 121, D05**

grade reference line, *n*—the horizontal line that defines the *x* axis for the pattern piece. **D 6963, D13**

C 822, C13

grade rings—precast concrete rings used for vertical adjustment at the top of a manhole to set manhole casting to proper grade.

grade rule, *n*—a named set of grade rule values consisting of one grade rule value for each size in the size line. (See **grade rule values**.) **D 6963, D13**

grade rule identifier, *n*—a user defined numeric name given to a grade rule. **D 6963, D13**

grade rule table, *n*—a collection of grade rules. **D 6963, D13**

grade rule table data exchange file, *n*—a text file to communicate grade rule values between different CAD/CAM systems.

D 6963, D13

grade rule table name, *n*—a user defined name given to a grade rule table. **D 6963, D13**

grade rule values, *n*—values that define how an associated data point

on a pattern piece moves from one size to another expressed in delta *XY* units. **D 6963, D13**

gradient furnace—a furnace within which a known temperature gradient is maintained between the two ends. Sometimes known as a Rosenhain Furnace. **E 7, E04**

gradient ratio, *n*—*in geotextiles*, the ratio of the hydraulic gradient through a soil-geotextile system to the hydraulic gradient through the soil alone. **D 4439, D35**

grading, *n*—the procedure used to identify and quantify the number of imperfections in a roll of fabric detected during visual inspection. **D 123, D13**

grading—the degree of mixing of size classes in sedimentary material. **D 4410, D19**

grading, *n*—the procedure used to identify and quantify the number of imperfections in a roll of fabric detected during visual inspection. **D 6799, D13**

grading, *n*—a method of creating multiple sizes from a base or sample size using a grade rule. **D 6963, D13**

graduated glassware—glassware that is marked with one or more graduations for volumetric measuring purposes. **C 162, C14**

graduations—series of lines on the stem of the thermometer which designate the temperature scale intervals. **E 344, E20**

graft, *n*—any tissue or organ for implantation or transplantation.

F 2312, F04

graft copolymer—a copolymer in which polymeric side chains have been attached to the main chain of a polymer of different structure.

D 883, D20

graft copolymer—a copolymer in which polymeric side chains have been attached to the main chain of a polymer of different structure. (D20) **F 412, F17**

graft take, *n*—engraftment. **F 2312, F04**

grain—(1) a distinguishable rock constituent which itself has a distinct identity, for example, a mineral crystal, an oolith, a rock fragment (in sedimentary rocks), or clast.

(2) a direction in a rock body along which it is more easily broken, split, or cut. See rift. **C 119, C18**

grain, *n*—*in manufactured(synthetic) carbon and graphite*, a particle of filler material (usually coke or graphite) in the starting mix formulation. Also referred to as granular material, filler particle, or aggregate material. The term is also used to describe the general texture of a carbon or graphite body, as in the descriptions listed below:

coarse grained, *adj*—containing grains in the starting mix that are substantially greater than 4 mm in size.

fine grained, *adj*—containing grains in the starting mix that are generally less than 100 μm in size.

medium grained, *adj*—containing grains in the starting mix that are generally less than 4 mm in size.

microfine grained, *adj*—containing grains in the starting mix that are generally less than 2 μm in size.

superfine grained, *adj*—containing grains in the starting mix that are generally less than 50 μm in size.

ultrafine grained, *adj*—containing grains in the starting mix that are generally less than 10 μm in size. **C 709, D02**

grain—the direction, size, arrangement, appearance, or quality of the fibers in lumber or other wood products. To have a specific meaning the term must be qualified.

bastard sawn grain—grain pattern in hardwood lumber in which the annual rings make angles of 30 to 60 deg with the surface of the piece.

chipped grain—a machine defect of surfaced lumber, where the grain of the wood has been torn out in small particles by the action of the planer knives.

close grain—(1) narrow, inconspicuous annual rings. The term is sometimes used to designate wood having small and closely spaced pores, but in this sense the term "fine textured" is more often used.

grain

(2) in stress grading, wood averaging on one end or the other of each piece not less than six nor more than 30 annual rings/in. Pieces averaging at least five or more than 30 rings/in. are accepted as close grain if containing one third or more summerwood.

coarse grain—wide conspicuous annual rings in which there is considerable difference between earlywood and latewood. The term is sometimes used to designate wood with large pores, such as oak, ash, chestnut, and walnut, but in this sense the term “coarse textured” is more often used.

cross grain—fiber deviation from a line parallel to the sides of the piece. Cross grain may be either diagonal or spiral grain or a combination of the two.

curly grain—grain distortion with an irregular curled appearance; “birdseye” is an extreme case of curly grain.

diagonal grain—grain pattern in which the annual rings are at an angle with the axis of a piece as a result of sawing at an angle with the bark of the tree or log. A form of *cross grain*.

edge grain—grain pattern in which the wide surfaces of the sawn piece extend approximately at right angles to the annual growth rings. Lumber is considered edge grained when the rings form an angle of 45 to 90 deg with the wide surface of the piece.

end grain—the grain pattern exposed when ends of logs or timbers, dimension, boards, and other wood products are cut perpendicular to the fiber direction.

fine grain—a synonym for *close grain*.

flat grain—the grain pattern resulting when lumber has been sawed in a plane approximately perpendicular to the radius of the log. Lumber is considered flat grained when the annual growth rings make an angle of less than 45 deg with the surface of the piece.

interlocked grain—wood in which the fibers are inclined in one direction in a number of rings of annual growth, then gradually reverse and are inclined in an opposite direction in succeeding growth rings, then reverse again.

loosened grain—a separation or loosening of the earlywood from the latewood due to defects in the wood or processing such as planing.

medium grain—used in stress grading to denote wood averaging on one end or the other of each piece not less than four annual rings/in.

mixed grain—lumber and other wood products unrestricted or unsegregated as to the grain angle.

open grain—(1) common classification related to finishing of woods with large pores, such as oak, ash, and chestnut. Also known as “coarse textured.”

(2) used in stress grading to denote no limitations on rate of growth as measured by annual rings per inch.

plainsawn—a synonym for *flat grain*.

quartersawn—a synonym for *edge grain*.

raised grain—a condition of the surface of dressed lumber in which the hard latewood is raised above the softer earlywood but not torn loose from it.

rift sawn—a synonym for *edge grain*.

slash grain—a synonym for *flat grain*.

spiral grain—wood in which the fibers take a spiral course about the trunk of a tree instead of the normal vertical course. The spiral may extend in a right-handed or left-handed direction around the tree trunk. Spiral grain is a form of cross grain.

straight-grained wood—wood in which the fibers run parallel to the axis of a piece.

torn grain—a machine defect of surfaced lumber, where the fibers of the wood have been torn out around knots and curly places by the action of the planer knives.

vertical grain—a synonym for *edge grain*.

wavy-grained wood—wood in which the fibers form a pattern of fairly uniform waves or undulations. **D 9, D07**

grain, n—an inch-pound unit of weight, equal to 0.002285 avoirdupois oz (0.0648 g). **D 16, D01**

grain, n—in *yarn spinning*, a direct yarn numbering system for sliver, top or roving, equal to the mass in grains of 120 yds. (See **American graincount**) **D 123, D13**

grain, n—in *measuring mass*, $\frac{1}{7000}$ lb avoirdupois. **D 123, D13**

grain—the outer or hair side of a hide or skin. Also used as an adjective referring to that side. **D 1517, D31**

grain, n—anisotropy introduced into rubber during processing operations. **D 1566, D11**

grain, n—the machine direction of paper. **D 1968, D06**

grain, n—in *manufactured (synthetic) carbon and graphite*, a particle of filler material (usually coke or graphite) in the starting mix formulation. Also referred to as granular material, filler particle, or aggregate material. The term is also used to describe the general texture of a carbon or graphite body, as in the descriptions listed below:

coarse grained, adj—containing grains in the starting mix that are substantially greater than 4 mm in size.

fine grained, adj—containing grains in the starting mix that are generally less than 100 μm in size.

medium grained, adj—containing grains in the starting mix that are generally less than 4 mm in size.

microfine grained, adj—containing grains in the starting mix that are generally less than 2 μm in size.

superfine grained, adj—containing grains in the starting mix that are generally less than 50 μm in size.

ultrafine grained, adj—containing grains in the starting mix that are generally less than 10 μm in size. **D 4175, D02**

grain, n—in *yarn spinning*, a direct yarn numbering system for sliver, top or roving, equal to the mass in grains of 120 yds. (See **American grain count**) **D 4849, D13**

grain, n—in *measuring mass*, $\frac{1}{7000}$ lb avoirdupois **D 4849, D13**

Grain—unit of weight, 0.648 g, 0.000143 lb. **D 6161, D19**

grain—an individual crystallite in metals. **E 7, E04**

grain boundary—an interface separating two grains, where the orientation of the lattice changes from that of one grain to that of the other. When the orientation change is very small the boundary is sometimes referred to as a subboundary. **E 7, E04**

grain drooping—the dislodgement and loss of a grain or grains (crystals) from a metal surface as a result of intergranular corrosion. **G 15, G01**

grained leather—any leather on which the original natural grain, through any method, process, or manipulation, has been changed or altered. **D 1517, D31**

grain growth, n—an increase in the grain size of a steel object, usually as a result of exposure to elevated temperatures. **A 941, A01**

grain growth—an increase in the grain size of a metal usually as a result of heating at an elevated temperature. **E 7, E04**

graininess—the visual impression of nonuniformity of density in a radiographic image typically caused by random, statistical groupings of individual silver particles in processed film. **E 1316, E07**

graining—a process for producing a decorative finish by transferring a pattern to the porcelain enamel surface by means of rolls. **C 286, B08**

graining paste—a mixture of color oxides, fluxes, and oils. **C 286, B08**

graining roll—a specialized type of roll used for transferring the grain pattern to the porcelain enamel. **C 286, B08**

grainline, n—line used to define the horizontal orientation, normally the X-axis, of a piece in a marker. **D 6963, D13**

grain long—paper grain direction in sheets of paper is parallel to the long dimension of the sheet. **F 149, F05**

grain long paper, n—paper in which the machine direction parallels the longest sheet dimension. **D 1968, D06**

grain magnesite, n—see **magnesite, grain**.

C 71, C08

grain short—paper grain direction in sheets of paper is parallel to the short dimension of the sheet.

F 149, F05

grain short paper, n—paper in which the machine direction parallels the shortest sheet dimension.

D 1968, D06

grain size, n—the dimensions of the grains or crystals in a polycrystalline metal, exclusive of twinned regions and subgrains when present.

A 941, A01

grain size—the dimensions of the grains or crystals in a polycrystalline metal exclusive of twinned regions and subgrains when present. Grain size is usually estimated or measured on the cross section of an aggregate of grains. Common units are: (1) average diameter, (2) average area, (3) number of grains per linear unit, (4) number of grains per unit area, and (5) number of grains per unit volume. See Test Methods E 112.

(1) *ASTM grain size number*—a grain size designation bearing a relationship to average intercept distance at 100 diameters magnification according to the equation: $G = \text{ASTM grain size number} = 10.0 - 2 \log_2 \bar{L}$, where \bar{L} is the average intercept distance in millimetres at 100 magnification.

(2) *average grain diameter*—the mean diameter of an equiaxed grain section whose size is representative of all the grain sections in the aggregate being measured.

E 7, E04

grain-size analysis (mechanical analysis) (particle-size analysis)—the process of determining grain-size distribution.

D 653, D18

grain size comparison eyepiece—an eyepiece provided with calibrated patterns representing a series of standard sizes of grains. The eyepiece must be used at a total magnification for which the patterns have been calibrated.

E 7, E04

grains per U.S. gallon (GPG)—number of grains of substance per one U.S. gallon of water. Concentration in GPG is calculated by dividing concentration in ppm of the ion by 17.1. One grain weighs 1/7000 lb and one U.S. gallon weighs 8.3 lb.

D 6161, D19

granic cryogenic fabric—a distinct soil micromorphology, resulting from the processes of freezing and thawing, in which soil particles form discrete loosely packed units.

D 7099, D18

granite (commercial definition)—a visibly granular, igneous rock generally ranging in color from pink to light or dark gray and consisting mostly of quartz and feldspars (Note 1), accompanied by one or more dark minerals. The texture is typically homogeneous but may be gneissic or porphyritic (Note 2). Some dark granular igneous rocks, though not geologically granite, are included in the definition (Note 3).

C 119, C18

graniteware—a one-coat porcelain enameled article with a mottled pattern produced by controlled corrosion of the metal base prior to firing.

C 286, B08

granoidic cryogenic fabric—a distinct soil micromorphology, resulting from the processes of freezing and thawing, in which soil particles form more-or-less discrete loosely packed units.

D 7099, D18

Gran's plot paper—a type of graph paper designed to eliminate calculations when measurements are made by the Gran's plot technique. Electrode potentials in millivolts are plotted on the vertical antilogarithmic axis and either volume of reagent added or sample concentration on the horizontal linear axis. Special Gran's plot papers can be constructed that automatically correct for volume changes occurring during titrations.

D 4127, D19

Gran's plots—a method of plotting apparent concentration (as derived from the electrode potential) versus the volume of reagent added to the sample. Gran's plots are especially useful for plotting titrations that would give poor end-point breaks if plotted conventionally. They can also be used to determine concentration by known addition with greater precision than can be obtained by a single addition measurement.

D 4127, D19

granular—composed of particles visible to the unaided eye. For sedimentary stone, the predominant particle distribution is less than 4 mm in size.

C 119, C18

granular activated carbon—activated carbon in particle sizes predominantly greater than 80 mesh.

D 2652, D28

granular applicator—an apparatus consisting of a hopper, a metering device, and a device for spreading or placing the granules in the target area.

E 1102, E35

granular ice—ice that is composed of coarse, more-or-less equidimensional, crystals that are weakly bonded together.

D 7099, D18

granularity—presence of voids or discontinuities within the image giving the image a grainy appearance.

F 549, F05

granular material—synonym for **bulk solid**.

D 653, D18

granular powder, n—particles having approximately equidimensional nonspherical shapes.

B 243, B09

granulated blast-furnace slag, n—the glassy, granular material formed when molten blast-furnace slag is rapidly chilled, as by immersion in water.

C 125, C09

granulated blast-furnace slag, n—the glassy granular material formed when molten blast-furnace slag is rapidly chilled, as by immersion in water.

C 219, C01

granulated rubber, n—particulate rubber composed of mainly nonspherical particles that span a broad range of maximum "particle dimension" from below 425 μm (40 mesh) to 12 mm (0.47 in.); the key feature of this type of particulate rubber is the fraction of the material in the greater than 1-mm (0.08-in.) up to 12-mm (0.47-in.) maximum "particle dimension" range. See **particulate rubber**.

D 1566, D11

granulated rubber, n—particulate rubber composed of mainly nonspherical particles that span a broad range of maximum particle dimension, from below 425 μm (40 mesh) to 12 mm (also refer to **particulate rubber**).

D 5681, D34

granulation, n—the production of coarse metal particles by pouring the molten metal through a screen into water (shotting) or by violent agitation of the molten metal while solidifying.

B 243, B09

granulations, n—granulation tissue.

F 2312, F04

granulation tissue, n—the newly formed vascular tissue normally produced in the healing of wounds of soft tissue and ultimately forming the cicatrix [scar]; it consists of small, translucent, red, nodular masses or granulations that have a velvety appearance.

F 2312, F04

granule—See **mineral granules**.

D 1079, D08

granules, n—small ceramic or natural colored mineral pellets or grains applied to products to lend color to the surface.

C 1154, C17

granules—small ceramic or colored natural mineral pellets or grains, that may be applied to asbestos-cement products to enhance their surface.

D 2946, C17

graphene layer, n—in *carbon and graphite technology*, a single carbon layer of the graphite structure, describing its nature by analogy to a polycyclic aromatic hydrocarbon of quasi-infinite size.

C 709, D02

graphene layer, n—in *carbon and graphite technology*, a single carbon layer of the graphite structure, describing its nature by analogy to a polycyclic aromatic hydrocarbon of quasi-infinite size.

D 4175, D02

graphic escape, n—an electronic signal sent to the printer to take it out of the graphic mode. (See **GE**.)

F 1457, F05

graphic layer—optional decorated layer of a membrane switch.

F 2112, F01

graphite, n—an allotropic crystalline form of the element carbon, occurring as a mineral, commonly consisting of a hexagonal array of carbon atoms (space group $P 6_3/mmc$) but also known in a rhombohedral form (space group $R 3m$).

C 709, D02

graphite, n—in *carbon and graphite technology*, a material consisting predominantly of the element carbon and possessing extensive long-range three-dimensional crystallographic order as determined by X-ray diffraction studies.

C 709, D02

graphite, n—an allotropic crystalline form of the element carbon, occurring as a mineral, commonly consisting of a hexagonal array of carbon atoms (space group $P 6_3/mmc$) but also known in a rhombohedral form (space group $R 3m$).

D 4175, D02

graphite, n—in *carbon and graphite technology*, a material consisting

graphite, *n*

predominantly of the element carbon and possessing extensive long-range three-dimensional crystallographic order as determined by X-ray diffraction studies. **D 4175, D02**

graphite-base carbon refractory, *n*—see **carbon refractory, graphite-base.** **C 71, C08**

graphite, compacted, *n*—a graphite shape that is intermediate between flake graphite and nodular graphite that typically appears in a polished section as thick flakes with blunt (compacted) ends. **A 644, A04**

graphite flake, *n*—an irregularly shaped particle of graphite, usually appearing in a polished section as curved plates, such as found in gray cast irons. **A 644, A04**

graphite, flake—an irregularly shaped body, usually appearing as long curved plates of graphitic carbon such as found in gray cast irons. **E 7, E04**

graphite foam, *n*—in *carbon and graphite technology*, a porous graphite product containing regularly shaped, predominantly concave, homogeneously dispersed cells which interact to form a three-dimensional array throughout a continuum material of carbon, predominantly in the graphitic state. The final result is either an open or closed cell product. **C 709, D02**

graphite foam, *n*—in *carbon and graphite technology*, a porous graphite product containing regularly shaped, predominantly concave, homogeneously dispersed cells which interact to form a three-dimensional array throughout a continuum material of carbon, predominantly in the graphitic state. The final result is either an open or closed cell product. **D 4175, D02**

graphite, nodular, *n*—spheroidal shaped graphite typically found in ductile irons and compact clusters of graphite typically found in malleable irons. (See **graphite, spheroidal**, and **temper carbon**.) **A 644, A04**

graphite permanent mold casting, *n*—a metal object produced by introducing molten metal by gravity or low pressure into a graphite mold and allowing it to solidify. **B 899, B02**

graphite, primary, *n*—graphite precipitated in cast iron during solidification. **A 644, A04**

graphite rosette, *n*—arrangement of graphite flakes in which the flakes extend radially from centers of crystallization in gray cast iron. **A 644, A04**

graphite, spheroidal, *n*—spheroidal shaped graphite having a polycrystalline radial structure, usually found in ductile iron and to a controlled, limited extent in compacted graphite iron. **A 644, A04**

graphitic, *adj*—in *carbon and graphite technology*, all varieties of substances consisting predominantly of the element carbon in the allotropic form of graphite irrespective of the presence of structural defects. **C 709, D02**

graphitic, *adj*—in *carbon and graphite technology*, all varieties of substances consisting predominantly of the element carbon in the allotropic form of graphite irrespective of the presence of structural defects. **D 4175, D02**

graphitic corrosion—the deterioration of metallic constituents in gray cast iron, which leaves the graphitic particles intact. (The term “graphitization” is commonly used to identify this form of corrosion but is not recommended because of its use in metallurgy for the decomposition of carbide to graphite.) **G 15, G01**

graphitizable carbon, *n*—in *carbon and graphite technology*, a non-graphitic carbon, which, upon graphitization, converts into graphitic carbon (also known as a soft carbon). **C 709, D02**

graphitizable carbon, *n*—in *carbon and graphite technology*, a non-graphitic carbon, which, upon graphitization, converts into graphitic carbon (also known as a soft carbon). **D 4175, D02**

graphitization, *n*—in *carbon and graphite technology*, a solid-state transformation of thermodynamically unstable non-graphitic carbon into graphite by thermal treatment. **C 709, D02**

graphitization, *n*—in *carbon and graphite technology*, a solid-state transformation of thermodynamically unstable non-graphitic carbon into graphite by thermal treatment. **D 4175, D02**

graphitization annealing, *n*—annealing a steel object in such a way that some or all of the carbon is precipitated as graphite. **A 941, A01**

graphitize, *vt*—to precipitate graphite in an iron-carbon alloy. **A 644, A04**

GRAS—materials “generally regarded as safe,” as listed by the FDA. **D 6161, D19**

grassers—calf skins or kips that have a coarser grain due to poor feeding of the animals. **D 1517, D31**

graticule—a scale on glass or other transparent material placed in the eyepiece or at an intermediate plane on the optic axis of a light microscope for the location and measurement of objects (a graticule is different than a reticle, see **reticle**). **E 7, E04**

grating, concave, *n*—a diffraction grating on a concave mirror surface.

diffraction, *n*—a series of a large number of narrow, close, equally spaced, diffracting slits or grooves capable of dispersing light into its spectrum.

plane, *n*—a transmission or reflecting diffraction grating whose surface is flat.

reflection, *n*—a diffraction grating from which the incident light is reflected to form a spectrum.

transmission, *n*—a transparent diffraction grating through which light is transmitted. **E 135, E01**

gravel, *n*—coarse aggregate resulting from natural disintegration and abrasion of rock or processing of weakly bound conglomerate. **C 125, C09**

gravel—rounded or semirounded particles of rock that will pass a 3-in. (76.2-mm) and be retained on a No. 4 (4.75- μ m) U.S. standard sieve. **D 653, D18**

gravel—coarse, granular aggregate, with pieces larger than sand grains, resulting from the natural erosion of rock. **D 1079, D08**

gravel in—to spread aggregate into hot bitumen on the surface of the roofing membrane. **D 1079, D08**

gravel pack—common nomenclature for the terminology, primary filter of a well (see **primary filterpack**). **D 653, D18**

gravel road, *n*—two lane, all-weather, occasionally maintained, hard or loose surface (for example, large rock, paved, crushed rock, gravel) intended for medium-weight, low-density traffic, in accordance with the U.S. Federal Highway Administration. **F 538, F09**

gravel size (fluvial sediment)—between 2.0 and 64 mm in diameter. **D 4410, D19**

gravel stop—a flanged device, frequently metallic, designed to prevent loose aggregate from washing off the roof and to provide a continuous finished edge for the roofing. **D 1079, D08**

gravimetric (total) water content—the ratio, expressed as a percentage, of the mass of the water and ice in a sample to the dry mass of the sample. **D 7099, D18**

gravitational water—see **free water**. **D 653, D18**

gravity filter—a filter through which water flows through it by gravity. **D 6161, D19**

gravity flow, *n*—flow in a direction parallel to the plane of a geotextile or related product driven predominately by a difference in elevation between the inlet and outflow points of a specimen. **D 4439, D35**

gravity grouting—grouting under no applied pressure other than the height of fluid in the hole. **D 653, D18**

gray area—{archaic} See **mist**. **C 162, C14**

graybody, *n*—a body having the same spectral emittance at all wavelengths. **C 168, C16**

gray body, *n*—nonselective radiator whose spectral emissivity is less than one. **E 349, E21**

gray felt, *n*—a blend of white fibers with naturally colored or dyed fibers, or both, that has an overall gray appearance. **D 123, D13**

gray felt, *n*—a blend of white fibers with naturally colored or dyed fibers or both and that has an overall gray appearance. **D 4845, D13**

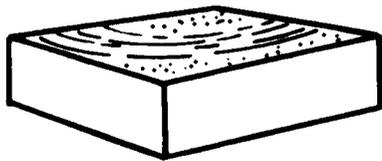

gray iron, *n*—cast iron that has a relatively large proportion of the

- graphitic carbon present in the form of flake graphite. The metal has a gray fracture. **A 644, A04**
- gray level, in image analysis**—a specific neutral color value existing within the range from black to white. **E 7, E04**
- gray scale, n**—the scale consists of nine pairs of standard gray chips each pair representing a difference in color or contrast (shade and strength) corresponding to a numerical fastness rating. The results of colorfastness tests are rated by visually comparing the difference in color represented by the scale. **G 113, G03**
- gray water**—the waste water of a system that may be a combination of the liquid and water-carried wastes except human wastes. **F 412, F17**
- grazing exit (incidence)*—EIA, same as **glancing exit(incidence)**. **E 673, E42**
- grazing incidence**—immersion inspection with the beam directed at a glancing angle to the test surface. **E 1316, E07**
- grease extractors*—a system of components designed for integration within the exhaust hood for the removal of the airborne grease particles and the condensate of grease vapors, or both, for immediate or future disposal. See **exhaust hood**. **F 1827, F26**
- grease removal devices:* **F 1827, F26**
- grease-resistant barrier**—See **barrier material**. **D 996, D10**
- grease wool, n**—wool taken from the living sheep and which has not been commercially scoured. **D 123, D13**
- grease wool, n**—wool taken from the living sheep and which has not been commercially scoured. **D 4845, D13**
- μ (Greek letter Mu)**—in statistics, symbol for true value. **D 4175, D02**
- green, n**—unsintered (not sintered); for example, green compact, green density, green strength. **B 243, B09**
- green, adj**—unsintered (not sintered); for example, green compact, green density, green strength. **B 243, B09**
- green**—(1) freshly sawed wood, or wood that has received no drying; unseasoned. Lumber that may have become wet to above the fiber saturation point may be referred to as being in the “green condition.”
(2) wood above a stipulated moisture content, as lumber above 19 % moisture content in accordance with the American Softwood Lumber Standard. **D 9, D07**
- green, adj**—hue description applied to light of wavelengths from 495 to 550 nm and to visually similar stimuli. **D 2946, C17**
- green*—that temperature at which the intensity of 520 nm light reflected by the liquid crystal is maximum, symbolized as T°520. **E 344, E20**
- green building, n**—a building that provides the specified building performance requirements while minimizing disturbance to and improving the functioning of local, regional, and global ecosystems both during and after its construction and specified service life. **E 2114, E06**
- green carbon, n**—a formed, but unfired carbon body. **C 709, D02**
- green carbon, n**—a formed, but unfired carbon body. **D 4175, D02**
- green coke, n**—as used in *Test Method D 5061*, carbonaceous binder or filler phase material that has exceeded the temperature of thermoplasticity, but has not obtained the temperature of metallurgical coke. **D 121, D05**
- green crack, n**—in a rigid die system, a defect that occurs prior to sintering. **B 243, B09**
- green density, n**—the mass per unit volume of an unsintered compact. **B 243, B09**
- green expansion, n**—the increase in dimensions of an ejected compact relative to the die dimensions, measured at right angles to the direction of pressing. Synonymous with **springback**. **B 243, B09**
- green petroleum coke, n**—same as raw petroleum coke; a solid, carbonaceous residue produced by thermal decomposition of heavy petroleum fractions or cracked stocks, or both. **D 4175, D02**
- green salting**—a process of curing hides in which they are treated with salt on the flesh side and stacked in piles to cure for a period of ten days or more. **D 1517, D31**
- greensand**—a mineral (glauconite), used as a filtration medium. See **manganese greensand**. **D 6161, D19**
- greenstone**—a metamorphic rock of basic or ultrabasic composition, of very fine grain size, ranging in color from medium green to yellowish green to almost black. **C 119, C18**
- greige cord, n**—in tire cords, a cord that has not been adhesive treated, or otherwise treated before use. (See **cord** **D 123, D13**)
- greige cord, n**—in tire cords, a cord that has not been adhesive treated, heat treated, or otherwise treated before use (see *cord*). **D 6477, D13**
- greige goods, n**—textile fabrics that have received no bleaching, dyeing, or finishing treatment after being produced by any textile process. **D 123, D13**
- greige goods, n**—textile fabrics that have received no bleaching, dyeing, or finishing treatment after being produced by any textile process. **D 7018, D13**
- greige thread, n**—undyed or unfinished sewing thread in the state following final plying or equivalent step in processing sequence, such as extruding, texturizing, or braiding. **D 123, D13**
- greige thread, n**—undyed or unfinished sewing thread in the state following final plying or equivalent step in a processing sequence, such as extruding, texturizing or braiding. **D 4849, D13**
- greige tire cord, n**—a tire cord that has not been dip treated or heat treated before use (see *tire cord*). **D 6477, D13**
- greige yield, n**—in knitted fabrics, the number of finished square yards per pound (square metres per kilogram) of greige fabric. **D 123, D13**
- greige yield, n**—in knitted fabrics, the number of finished square yards per pound (square meters per kilogram) of greige fabric. **D 7022, D13**
- grex, n**—an obsolete direct numbering system for fiber yarn or other textile strand equal to the mass in grams per 10 000 m. **D 123, D13**
- grex, n**—an obsolete direct numbering system for fiber yarn or other textile strand equal to the mass in grams per 10 000 m. **D 4849, D13**
- grey, adj**—color description applied to achromatic stimuli of moderate relative luminance. **D 2946, C17**
- griddle**—equipment for cooking food in its own juices or oil by direct contact with a hot surface. **F 1827, F26**
- grid line slope**—an optical distortion evaluation parameter that compares the slope of a deviated grid line to that of a non-deviated grid line, which is expressed as a ratio such as 1 in 8 or 1 in 20 (the visual optical quality improves as the second number of the ratio gets larger). **F 2429, F07**
- grin, v**—in *sewnseams*, to stress a seam so that the individual stitches can be seen. **D 123, D13**
- grindability:**
- absolute grindability index*—a characteristic number expressed as the change in specific surface area of a material per unit of time in a specific comminution system.
- relative grindability index*—a characteristic number expressed as the change in specific surface area or other criteria such as particle size or fineness of a material per unit of time, mill revolutions or other standard with respect to a known standard sample in a specific comminution system. **C 242, C21**
- grinding**—the removal of metal by means of rotating rigid wheels containing abrasive. **B 374, B08**
- grinding**—the removal of material from the surface of a specimen by abrasion through the use of randomly oriented hard-abrasive particles bonded to a suitable substrate, such as paper or cloth, where the abrasive particle size is generally in the range of 60 to 600 grit (approximately 150 to 15 μm) but may be finer. **E 7, E04**

grinding japan—see **japan, grinding**.

D 16, D01

grinding mark—a pattern of fine striations or scoring, usually directional, resulting from machining, as distinct from **surface marks**

F 109, C21

grip, *v*—*in tensile testing*, to hold, grasp, or secure, for example, to grip the specimen by the jaws of the clamps. D 123, D13

grip, *v*—*in tensile testing*, to hold, grasp, or secure, for example, to grip the specimen by the jaws of the clamps. D 4849, D13

grip mark, gripe mark, gripper mark—indentations and ridges along shank, usually near head, made by gripping devices that hold wire during heading; often used with other markings to classify nail manufacturer. F 547, F16

grit, *n*—coarse foreign particles in paint materials and coatings, often of irregular shape, that are hard, abrasive, and resistant to disintegration. D 16, D01

grit blasting—abrasive blasting with small irregular pieces of steel or malleable cast iron. B 374, B08

grog, *n*—a granular material produced from calcined or burned refractories, usually alumina-silica. C 71, C08

grog fireclay mortar, *n*—raw fireclay mixed with calcined fireclay, or with broken fireclay brick, or both, all ground to suitable fineness. C 71, C08

groin—bank or shore-protection structure in the form of a barrier placed oblique to the primary motion of water, designed to control movement of bed load. D 653, D18

grooming, *v*—*in tire testing*, mechanically reworking a snow test surface in order to obtain a surface with more consistent properties. F 538, F09

groove—see **female end of pipe**. C 822, C13

groove, *n*—a channel formed on surfaces other than faces of manufactured masonry units for production or construction purposes. C 1232, C15

groove—a decorative face treatment, consisting of narrow parallel channels formed into the surface of the panel; such as machined. *V-groove*—narrow and shallow V- or U-shaped channels machined on the plywood face to achieve a decorative effect. D 1038, D07

groove, *n*—a void that is relatively narrow compared to its length. F 538, F09

groove angle—the angle of support for a pipe when a formed groove is made in bedding or foundation. F 412, F17

groove, average depth [*L*], *n*—the average of all tire groove depth measurements in a single groove. F 538, F09

grooved—general term sometimes used to denote threaded, fluted, twisted, knurled, barbed, etc. F 547, F16

grooved griddle—equipment with a grooved cooking surface that imitates characteristic striped sear mark of a charbroiler. See **griddle**. F 1827, F26

grooved guide body—formed guiding device used for placing staple over work as in carding or wiring. F 592, F16

groove (void) area fraction [*nd*], *n*—the ratio of the groove (void) area to the footprint area of a tire. F 538, F09

groove (void) area [*L*²], *n*—that portion of tire footprint area which is not contacted by ribs or elements. F 538, F09

groove (void) depth [*L*], *n*—a measurement of the perpendicular distance from a real or calculated reference plane defined by edges of two adjacent ribs (lugs) to the lowest point of contact in the groove (void). F 538, F09

grooving—long narrow grooves or depressions in a surface of a pultrusion parallel to its length.

NOTE—This condition is usually caused by die fouling or by a spot of resin build-up on the die surface, effectively changing the shape of the cross section. D 3918, D20

gross buoyancy—weight of fresh water displaced by a boom totally submerged. F 818, F20

gross buoyancy to weight ratio—gross buoyancy divided by boom weight. F 818, F20

gross calorific value—the heat produced by combustion of a unit quantity of solid fuel, at constant volume, in an oxygen bomb calorimeter under specified conditions such that all water in the products remains in liquid form. D 5681, D34

gross calorific value—the energy released by combustion of a unit quantity of refuse-derived fuel at constant volume or constant pressure in a suitable calorimeter under specified conditions such that all water in the products is in the liquid form. This is the measure of calorific value predominantly used in the United States. **Synonym:** higher heating value. E 856, D34

gross calorific value (gross heat of combustion at constant volume), *Q_v(gross)*, *n*—the heat produced by combustion of unit quantity of a solid or liquid fuel when burned at constant volume in an oxygen bomb calorimeter under specified conditions, with the resulting water condensed to a liquid. D 121, D05

gross calorific value, (gross heat of combustion), Q_v (gross), *n*—the heat produced by combustion of unit quantity of a solid or liquid specimen when burned at constant volume in an oxygen bomb calorimeter under specified conditions with the resulting water condensed to a liquid. D 5681, D34

gross calorific value (gross heat of combustion), Q_v (gross)—the heat produced by combustion of unit quantity of a solid or liquid fuel when burned at constant volume in an oxygen bomb calorimeter under specified conditions with the resulting water condensed to a liquid. D 5681, D34

gross collector area—see **area, gross collector**. E 772, E44

gross cross-sectional connector plate area—cross-sectional area of metal connector plate determined by multiplying gross thickness of plate by gross dimension of plate perpendicular to direction of load application. E 631, E06

gross energy—energy usage of a piece of equipment operating under loaded conditions as measured using an electrical metering system. D 5681, D34

gross erosion—the total of all sheet, gully, and channel erosion in a watershed. D 4410, D19

gross floor area—the entire area within the inside perimeter of the exterior walls. E 631, E06

gross floor area—See **floor area**. E 631, E06

gross floor area—See **floor area**. E 1480, E06

gross heating value (also called higher heating value)—the amount of energy per volume transferred as heat from the complete, ideal combustion of the gas at standard temperature in which all the water formed by the reaction condenses to liquid. D 4150, D03

gross heat of combustion, *n*—the maximum amount of heat per unit mass that theoretically can be released by the combustion of a material, product, or assembly; it can be determined experimentally only under conditions of high pressure and in pure oxygen (contrast **effective heat of combustion**). E 176, E05

gross heat of combustion, Q_g (MJ/kg), *n*—the quantity of energy released when a unit mass of fuel is burned in a constant volume enclosure, with the products being gaseous, other than water that is condensed to the liquid state. D 4175, D02

gross power—power requirement of a piece of equipment under loaded conditions. D 5681, D34

gross sample—See **gross sample** under **sample**. D 121, D05

gross sample, *n*—a large sample made up of several portions (increments) of a mass of material. D 4175, D02

gross sample—a sample representing a lot of RDF and composed of

- a number of increments on which neither reduction nor division has been performed. **D 5681, D34**
- gross sample**—a sample representing one lot and composed of a number of increments on which neither reduction nor division has been performed. **D 5681, D34**
- gross sample**—a sample representing one lot, normally composed of a number of increments, on which neither reduction nor division has been performed. **E 856, D34**
- gross sample *n***—a sample representing one lot, normally composed of a number of increments, on which neither reduction nor division has been performed. **D 5681, D34**
- gross-vehicle weight** [lb (kg)], *n*—the total weight of the vehicle or the vehicle combination including all connected components; also, the sum of the tire loads of all wheels on the vehicle. **E 867, E17**
- ground**, *vt*—to connect electrically with ground (earth). **D 4175, D02**
- ground**—a metallic connection with the earth to establish zero potential. **D 5077, D10**
- ground arch**—the theoretical stable rock arch that develops some distance back from the surface of the opening and supports the opening. (ISRM) **D 653, D18**
- ground coat**—(1) a porcelain enamel applied directly to the base metal to function as an intermediate layer between the metal and the cover coat.
(2) on *sheet steel*, a porcelain enamel coating containing adherence-promoting agents which may be used either as an intermediate layer between the metal and the cover coat or as a single coat over the base metal. **C 286, B08**
- ground-coat boiling**—see **boiling**. **C 286, B08**
- ground fireclay**, *n*—fireclay or a mixture of fireclays that have been subjected to no treatment other than grinding or weathering, or both. **C 71, C08**
- ground fireclay mortar**, *n*—a refractory mortar consisting of finely ground raw fireclay. **C 71, C08**
- ground floor**—See **floor**. (Synonym for **first floor, first story**.)
E 631, E06
- ground-glass focusing screen**—a glass screen, one side of which is ground or made diffusing and mounted for use in a camera, in place of photosensitive material, for the purpose of intercepting, viewing, and focusing a real image formed on it. **E 7, E04**
- ground ice**—(1) ice in pores, cavities, voids, or other openings in soil or rock, including massive ice; (2) a general term referring to all types of ice in freezing and frozen ground. **D 7099, D18**
- grounding**—connecting to ground or to a conductor that is grounded. **D 5077, D10**
- ground reaction forces**—the forces, both shearing and normal, acting on the foot during contact with the ground. **F 869, F08**
- ground refractory material, double-screened**, *n*—a refractory material that contains its original gradation of particle sizes resulting from crushing, grinding, or both, and from which particles coarser and finer than two specified sizes have been removed by screening. **C 71, C08**
- ground refractory material, single-screened**, *n*—a refractory material that contains its original gradation of particle sizes resulting from crushing, grinding, or both, and from which particles coarser than a specified size have been removed by screening. **C 71, C08**
- ground rubber**, *n*—particulate rubber composed of mainly non-spherical particles that span a range of maximum “particle dimension” from well below 425 μm (40 mesh) to 2 mm (0.08 in.) as a maximum “particle dimension.” See **particulate rubber**.
D 1566, D11
- ground rubber**, *n*—particulate rubber composed of mainly non-spherical particles that span a range of maximum particle dimensions, from below 425 μm (40 mesh) to 2 mm (also refer to **particulate rubber**). **D 5681, D34**
- ground settlement**—downward movement of the ground causing a lowering of the ground surface resulting from the melting of ground ice in excess of that contained in pore fillings. **D 7099, D18**
- ground vulcanized rubber**, *n*—vulcanized rubber in particulate form; used as an extender or filler. **D 1566, D11**
- ground water**—that part of the subsurface water that is in the saturated zone. **D 653, D18**
- groundwater**—water confined in permeable sand layers between rock or clay; that part of the subsurface water that is in the saturated zone. **D 6161, D19**
- ground-water barrier**—soil, rock, or artificial material which has a relatively low permeability and which occurs below the land surface where it impedes the movement of ground water and consequently causes a pronounced difference in the potentiometric level on opposite sides of the barrier. **D 653, D18**
- ground-water basin**—a ground-water system that has defined boundaries and may include more than one aquifer of permeable materials, which are capable of furnishing a significant water supply. **D 653, D18**
- ground-water discharge**—the water released from the zone of saturation; also the volume of water released. **D 653, D18**
- ground-water divide**—a ridge in the water table or other potentiometric surface from which ground water moves away in both directions normal to the ridge line. **D 653, D18**
- ground-water elevation**—see **free water elevation**. **D 653, D18**
- ground-water flow**—the movement of water in the zone of saturation. **D 653, D18**
- ground-water level**—the level or the water table surrounding a borehole or well. The ground-water level can be represented as an elevation or as a depth below the ground surface. **D 653, D18**
- ground-water, perched**—see **perched ground-water**. **D 653, D18**
- ground-water recharge**—the process of water addition to the saturated zone; also the volume of water added by this process. **D 653, D18**
- ground-water surface**—see **free water elevation**. **D 653, D18**
- groundwood pulp**, *n*—a type of mechanical pulp produced by grinding wood logs against a rotating stone. **D 1968, D06**
- group**, *n*—in *upholstered furniture*, a number of individual upholstered furniture units that are related by one or more physical characteristics such as styling, color, shape or covering. **D 123, D13**
- group**, *n*—in *upholstered furniture*, a number of individual upholstered furniture units that are related by one or more physical characteristics such as styling, color, shape or covering. **D 7023, D13**
- group**—in *fatigue*, specimens of the same type tested at a specific time, or consecutively, at one stress level. A group may comprise one or more specimens. **E 1823, E08**
- group AQL**, *n*—the AQL assigned to a group of material properties. **D 1711, D09**
- group element**, *n*—in *construction planning, design, specification, estimating, and cost analysis*, is a component part of the whole that includes relevant **elements** which, as a group, perform major specific function, or functions, regardless of design, specification, or construction. **E 833, E06**
- group erase**—an OCR graphic shape that will delete a group or string of three or more characters. **F 149, F05**
- grout**, *n*—gypsum or portland cement plaster used to fill crevices or to fill hollow metal frames. **C 11, C11**
- grout**, *n*—a cementitious mixture, with or without admixtures, that is used primarily to fill voids. **C 125, C09**
- grout**—concrete containing no coarse aggregates; a thin mortar. **C 717, C24**
- grout**, *n*—a mixture of cementitious materials, aggregates, water, with or without admixtures, initially produced to pouring consistency without segregation. Requirements for grout are contained in Specification C 476. **C 1180, C12**
- grout**—in *soil and rock grouting*, a material injected into a soil or rock formation to change the physical characteristics of the formation. **D 653, D18**
- grout**, *n*—a mixture of cementitious material and water with or

grout, *n*

- without aggregate, sometimes incorporating CCPs, proportioned to produce a pourable consistency without segregation of the constituents. It is used for filling voids and spaces. **E 2201, E50**
- grout**—pourable mixture of a cementitious or polymeric binder and water, possibly also containing fine aggregates, coarse aggregates, or both. **E 2265, E06**
- groutability**—the ability of a formation to accept grout. **D 653, D18**
- groutability ratio of granular formations**—the ratio of the 15 % size of the formation particles to be grouted to the 85 % size of grout particles (suspension-type grout). This ratio should be greater than 24 if the grout is to successfully penetrate the formation. **D 653, D18**
- groutable rock bolts**—rock bolts with hollow cores or with tubes adapted to the periphery of the bolts and extending to the bottom of the bolts to facilitate filling the holes surrounding the bolts with grout. **D 653, D18**
- grout cap**—a “cap” that is formed by placing concrete along the top of a grout curtain. A grout cap is often used in weak foundation rock to secure grout nipples, control leakage, and to form an impermeable barrier at the top of a grout curtain. **D 653, D18**
- grouted-aggregate concrete**—concrete that is formed by injecting grout into previously placed coarse aggregate. See also **preplaced aggregate concrete**. **D 653, D18**
- grouted anchor**—anchor installed in the base material using grout. **E 2265, E06**
- grout gallery**—an opening or passageway within a dam utilized for grouting or drainage operations, or both. **D 653, D18**
- grout header**—a pipe assembly attached to a ground hole, and to which the grout lines are attached for injecting grout. Grout injector is monitored and controlled by means of valves and a pressure gate mounted on the header; sometimes called grout manifold. **D 653, D18**
- grout, hydraulic-cement, *n***—a grout made with hydraulic cement. **C 125, C09**
- grout mix**—the proportions or amounts of the various materials used in the grout, expressed by weight or volume. (The words “by volume” or “by weight” should be used to specify the mix.) **D 653, D18**
- grout (monitoring wells)**—a low permeability material placed in the annulus between the well casing or riser pipe and the borehole wall (that is, in a single-cased monitoring well), or between the riser and casing (that is, in a multicased monitoring well), to maintain the alignment of the casing and riser and to prevent movement of ground water or surface water within the annular space. **D 653, D18**
- grout nipple**—*in grouting*, a short length of pipe, installed at the collar of the grout hole, through which drilling is done and to which the grout header is attached for the purpose of injecting grout. **D 653, D18**
- grout (nonshrink), hydraulic-cement, *n***—a hydraulic-cement grout that produces a volume that, when hardened under stipulated test conditions, is greater than or equal to the original installed volume, often used as a transfer medium between load-bearing members. **C 125, C09**
- grout pipe**—a pipe or tube that is used to transport cement, bentonite, or other plugging materials from the ground surface to a specified depth in a well or borehole. The material may be allowed to flow freely or it may be injected under pressure. The term tremie pipe is frequently used interchangeably. **D 653, D18**
- grout shoe**—a plug fabricated of relatively inert materials that is positioned with the lowermost section of a permanent casing and fitted with a passageway, often with a flow check device, through which grout is injected under pressure to fill the annular space. After the grout has set, the grout shoe is usually drilled out. **D 653, D18**
- grout slope**—the natural slope of grout injected into preplaced-aggregate or other porous mass. **D 653, D18**
- grout system**—formulation of different materials used to form a grout. **D 653, D18**
- grout take**—the measured quantity of grout injected into a unit volume of formation, or a unit length of grout hole. **D 653, D18**
- growth, *n***—an increase in dimensions of a compact which may occur during sintering. (Converse of **shrinkage**.) **B 243, B09**
- growth, *n***—an increase in one or more dimensions of an object or a material. **D 123, D13**
- growth, *n*—of textiles**, the difference between the original length of a specimen and its length after the application of a specified force for a prescribed time, and the subsequent removal of the force. (See also **permanentdeformation and dimensional change**.) **D 123, D13**
- growth, *n***—an increase in one or more dimensions of an object or a material. **D 4849, D13**
- growth, *n*—of textiles**, the difference between the original length of a specimen and its length after the application of a specified force for a prescribed time, and the subsequent removal of the force. (See also **permanentdeformation and dimensional change**.) **D 4850, D13**
- growth, *n***—the increase one or more dimensions of an object or a material. **D 6477, D13**
- grub hole**—a hole through the hide caused by the penetration of the warble fly. **D 1517, D31**
- grunerite asbestos, *n***—a member of the mineral group of monoclinic amphiboles derived from grunerite or cummingtonite-grunerite. **D 2946, C17**
- guard electrode, *n***—one or more electrically conducting elements, arranged and connected in an electric instrument or measuring circuit so as to divert unwanted conduction or displacement currents from, or confine wanted currents to, the measurement device. **D 1711, D09**
- guard electrode**—one or more electrically conducting elements, arranged and connected in an electrical instrument or measuring circuit so as to divert unwanted conduction or displacement currents from, or confine wanted currents to, the measuring device. **D 2864, D27**
- guard frame**—in video-based automatic image analysis, an internal border, smaller than the monitor image frame, used to restrict the measurement area and thus eliminate errors in sizing features that intersect the measurement area border when used in conjunction with specific feature selection rules (also called the active frame). **E 7, E04**
- guardrail**—See **railing systems**. **E 631, E06**
- guardrail system**—a railing system, providing protection for building users against accidental fall and injury, located at or near the outer edge of a stair, ramp, landing, platform, deck, balcony, hatchway, manhole, floor opening, porch, or accessible roof; at the perimeter of an opening or accessible surface, such as the opening of a stair; or at a location at which an operating condition requires access limitation to a designated area. (Compare **railing system**.) **E 631, E06**
- guardrail system**—a railing system, providing protection for building users against accidental fall and injury, located at or near the outer edge of a stair, ramp, landing, platform, deck, balcony, hatchway, manhole, floor opening, porch, or accessible roof; at the perimeter of an opening or accessible surface, such as the opening of a stair; or at a location at which an operating condition requires access limitation to a designated area. (Compare **railing system**.) **E 1481, E06**
- guard region**—in video based automatic image analysis, that portion of the imaged area between the guard (active) frame and the image frame which is employed in a variety of ways to eliminate sizing errors of features that intersect the guard frame. **E 7, E04**
- guayule rubber, *n***—naturally occurring *cis*-polyisoprene obtained from the shrub, *Parthenium argentatum*. **D 1566, D11**
- gudgeon**—bright, regular-stock-steel nails with annular flange or collar located along shank. (See **tile nail, acoustical**.) **F 547, F16**
- guide, *n***—a series of options or instructions that do not recommend a specific course of action. **D 4175, D02**

- guide body**—tool component that aligns and supports staple during driving. **F 592, F16**
- guide bushing**, *n*—the steel bushing that surrounds, aligns, and holds the stationary intermediate weight in place. **E 1445, E27**
- guided bend**, *n*—the bend obtained by using a mandrel to guide and force the portion of the specimen being bent between two faces of a die. **E 6, E28**
- guided signature**, *n*—a signature executed by a writer while a writer's hand arm, or writing instrument is influenced or controlled by another. **E 2195, E30**
- guide for rating**, *n* (guide d'évaluation)—a document which explains how to rate the serviceability of an existing or planned facility for a specific purpose. A guide identifies typical requirements and provides a rating scale for comparison with the relevant combinations of features present in the facility. **E 631, E06**
- guide for rating**, *n* (guide d'évaluation)—a document which explains how to rate the serviceability of an existing or planned facility for a specific purpose. A guide identifies typical requirements and provides a rating scale for comparison with the relevant combinations of features present in the facility. **E 1480, E06**
- guideline**, *n*—a written statement or outline of policy, practice, or conduct. **E 631, E06**
- guide pin**—a pin affixed to the inside of one of the forceps halves that aligns with a hole on the other tweezer half without protruding through when closed. **F 1638, F04**
- guide pin hole**—the hole in one forceps half into which the guide pin fits without passing through when closed. **F 1638, F04**
- guide system**, *n*—the rails, wires, and shaft that guide the drop weight during its fall. **E 1445, E27**
- guide tables**, *n*—*for knock testing*, the specific relationship between cylinder height (compression ratio) and octane number at standard knock intensity for specific primary reference fuel blends tested at standard or other specified barometric pressure. **D 4175, D02**
- Guinier-Preston streak**—an elongated spot on the Laue pattern from a single crystal which first appears during age hardening. **E 7, E04**
- Guinier-Preston zones**—those regions of a crystal which give rise to Guinier-Preston streaks. **E 7, E04**
- gum**, *n*—any of a class of colloidal substances, exuded by or prepared from plants, sticky when moist, composed of complex carbohydrates and organic acids, which are soluble or swell in water. (See also **adhesive**, **glue**, *n*, and **resin**.) **D 907, D14**
- gum compound**, *n*—a rubber compound containing only those ingredients necessary for vulcanization and small amounts of other ingredients for processing, coloring, and for improving the resistance to ageing. **D 1566, D11**
- gummed**—See **coated**. **F 547, F16**
- gummed paper tape**—See **tape**. **D 996, D10**
- gun-grade**, *n*—*inbuilding construction*, a material of a suitable viscosity to extrude through the nozzle of a hand- or power-operated device. **C 717, C24**
- gunning**, *v*—an application technique that uses a pneumatic means to transport a refractory material and place it onto a cold or hot surface. **C 71, C08**
- gunning materials, refractory**, *n*—mixtures of refractory aggregate and bond(s) specially prepared for gunning. **C 71, C08**
- gusset**, *n*—(1) a piece used to give additional size or strength in a particular location of an object.
(2) the folded-in portion of flattened tubular film. **D 883, D20**
- gusset**, *n*—a plate used to connect two or more members or to reinforce a joint. **E 631, E06**
- gusset**, *n*—(1) a piece used to give additional size or strength in a particular location of an object.
(2) the folded-in portion of flattened tubular film. (D20)
F 412, F17
- gusset leather**—a soft, flexible leather used for gussets in shoes, bags, and cases. **D 1517, D31**
- gustation**, *n*—(1) the sense of taste. (2) pertaining to the act of tasting. **E 253, E18**
- gustiness**, *adj*—now referred to as intensity of turbulence which is defined as the ratio of the root mean square of wind velocity fluctuations to the mean wind velocity. **D 1356, D22**
- gutta-percha**, *n*—hard thermoplastic substance, mainly *trans*-polyisoprene obtained from trees of the *Sapotaceae* family. **D 1566, D11**
- G value**—see **radiation chemical yield**. **E 170, E10**
- gypsum**, *n*—the mineral consisting primarily of fully hydrated calcium sulfate, $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ or calcium sulfate dihydrate. **C 11, C11**
- gypsum**, *n*—see **calciumsulfate**. **C 219, C01**
- gypsum**, *n*—name for calcium sulfate dihydrate ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$).
E 2201, E50
- gypsum backing board**, *n*—a ¼ in. to ⅝ in. gypsum board for use as a backing for gypsum wallboard, acoustical tile, or other dry cladding.
water resistant gypsum backing board—a gypsum board designed for use on walls primarily as a base for the application of ceramic, or plastic tile. **C 11, C11**
- gypsum base for veneer plasters**, *n*—a gypsum board used as the base for application of a gypsum veneer plaster. **C 11, C11**
- gypsum board**, *n*—the generic name for a family of sheet products consisting of a noncombustible core primarily of gypsum with paper surfacing. **C 11, C11**
- gypsum concrete**, *n*—a calcined gypsum mixed with wood chips or aggregate, or both. **C 11, C11**
- gypsum core board**, *n*—a ¾ in. (19.0 mm) to 1 in. (25.4 mm) gypsum board consisting of a single board or factory laminated multiple boards, used as a gypsum stud or core in semisolid or solid gypsum board partitions. **C 11, C11**
- gypsum-deck nail**—helically threaded cap nails with special type of thread with extra large lead angle. **F 547, F16**
- gypsum formboard**, *n*—a gypsum panel product used as the permanent form for poured gypsum roof decks. **C 11, C11**
- gypsum lath**, *n*—a gypsum board used as the base for application of gypsum plaster.
perforated gypsum lath—a gypsum lath having perforations to provide mechanical keying of the basecoat plaster.
foil-backed gypsum lath—the same as plain gypsum lath except that in addition, the back surface shall be covered with a continuous sheet of pure bright finished aluminum foil.
type X lath—a gypsum lath specially manufactured to provide specific fire-resistant characteristics. **C 11, C11**
- gypsum-lath nail**—bright or blued, regular-stock-steel, 1 by 0.092 to 1¼ by 0.166 and 1¾ by 0.092-in. nails with large flat ⅜ to ⅝-in. head and long diamond point. Also, regular-stock-steel, 1 by 0.120 to 1½ by 0.148-in. nails with flat ½-in. head and medium diamond point. Also, aluminum-alloy, 1⅝ by 0.099 to 1½ by 0.105-in. nails with flat ⅜ or ⅝-in. head and medium diamond point. **F 547, F16**
- gypsum molding plaster**, *n*—a calcined gypsum plaster used primarily for plaster casts or molds, sometimes used as a gauging plaster. **C 11, C11**
- gypsum neat plaster**, *n*—a calcined gypsum mixed at the mill with ingredients to control working quality and setting time. **C 11, C11**
- gypsum panel products**, *n*—the general name for a family of sheet products consisting essentially of gypsum. **C 11, C11**
- gypsum plaster**, *n*—the generic name for a family of powdered cementitious products consisting primarily of calcined gypsum with additives to modify physical characteristics, and having the ability, when mixed with water, to produce a plastic mortar or slurry which can be formed to the desired shape by various methods and will subsequently set to a hard, rigid mass. **C 11, C11**
- gypsum sheathing**, *n*—a gypsum board used as a backing for exterior surface materials, manufactured with water-repellant paper and may be manufactured with a water-resistant core. **C 11, C11**

gypsum-sheathing nail

gypsum-sheathing nail—galvanized, barbed, regular-stock-steel, 1 $\frac{3}{4}$ by 0.120-in. nail with flat $\frac{7}{16}$ -in. head and medium diamond point.

F 547, F16

gypsum tile or block, n—a cast gypsum building unit. C 11, C11

gypsum wallboard, n—a gypsum board used primarily as an interior surfacing for building structures.

foil-backed gypsum wallboard—a gypsum wallboard with the back surface covered with a continuous sheet of pure bright finished aluminum foil.

type X gypsum wallboard—a gypsum wallboard specially manufactured to provide specific fire-resistant characteristics

C 11, C11

gypsum-wallboard nail, gypsumboard nail, drywall nail—bright or blued, regular-stock-steel, annularly threaded, 1 $\frac{1}{8}$ by 0.098 to 2 by 0.105-in. nails with flat, nub, or crossed slightly countersunk $\frac{1}{4}$ to $\frac{1}{64}$ -in. head and long diamond point. Also, slender, colored (baked-lacquer finished), regular-stock-steel, smooth or annularly threaded, 1 $\frac{1}{8}$ by 0.062 to 2 by 0.083-in. nails with slightly countersunk 0.181-in. head and medium diamond or long needle point.

F 547, F16

gypsum wood-fibered plaster, n—a calcined gypsum plaster con-

taining shredded or ground wood fiber added during manufacture.

C 11, C11

gyromagnetic ratio, proton, γ_p —the ratio of the magnetic moment of a hydrogen nucleus to its angular momentum.

NOTE—The gyromagnetic ratio is used to calculate the magnetic field from a measured resonance frequency when using the nuclear magnetic resonance technique.

The relationship is:

$$B = (2\pi f/\gamma_p) \text{ gauss} = (2\pi f/\gamma_p) \times 10^{-4} \text{ teslas}$$

where:

f = resonance frequency in cycles per second (hertz) and

γ_p = gyromagnetic ratio (the accepted value at present for water is $2.67512 \times 10^4 \text{ gauss}^{-1} \text{ s}^{-1}$).

A 340, A06

gyro-stabilized accelerometer, n—a precision vertical gyroscope fitted with one to three accelerometers to provide orthogonal measurements referenced to the earth-fixed axis system.

F 538, F09

H

- HAA**—A group of six halo acetic acids regulated in drinking water (mono, di and tri-chloroacetic acid, mono and di bromoacetic acid and chlorobromoacetic acid). **D 6161, D19**
- habitable space—occupiable space** normally used for living, including such activities as sleeping, eating, and cooking. **E 631, E06**
- habitable space**—See **building space**. **E 631, E06**
- habitat, n**—the place where a population of organisms lives and their surroundings, both living and non-living. **E 2114, E06**
- habitat indicator, n**—a physical attribute of the environment measured to characterize conditions necessary to support an organism, population, or community. **E 2114, E06**
- habit plane**—crystallographic plane in a parent phase along which a new phase (or phases) is (are) generated. **E 7, E04**
- hackle**—a finely structured fracture surface marking giving a matte or roughened appearance to the surface, having varying degrees of coarseness. Finely structured hackle is variously known as fine hackle, frosted area, gray area, matte, mist, and stippled area. Coarsely structured hackle is also known as striation. **C 162, C14**
- hackle marks**—fine ridges on the fracture surface of the glass, parallel to the direction of propagation of the fracture. **C 162, C14**
- hackling, n—in flax**, the process of cleaning and aligning long-line fibers to improve fineness and remove non-fibrous materials and short fibers. **D 123, D13**
- hackling, v—in flax**, the process of cleaning and aligning long-line fibers to improve fineness and remove non-fibrous materials and short fibers. **D 6798, D13**
- hair, n**—natural animal fiber other than sheep's wool or silk. **D 123, D13**
- hair, n**—natural animal fiber other than sheep's wool or silk. **D 4845, D13**
- hair, n**—wire protruding from the perimeter of a tire chip or shred. (See also *fishhooks*). **D 5681, D34**
- hairiness, n—of yarns**, an overall condition characterized by filaments or fibers protruding from the yarn surface and uniformly distributed along the yarn length. (Compare wild fibers.) **D 123, D13**
- hairiness, n—or yarns**, an overall condition characterized by filaments or fibers protruding from the yarn surface and uniformly distributed along the yarn length. (Compare wild fibers.) **D 4849, D13**
- hairline crack—in protectivecoatings**, a very fine crack (having a hairlike appearance) that is visible on the surface of a dried coating film. **D 4538, D33**
- hairline or hairlining**—a defect manifested in finished ware as a line or system of lines in a strain pattern, having the appearance of cracks healed by fusion. **C 286, B08**
- hair-on leather**—leather tanned without removing the hair from the skins or hide. **D 1517, D31**
- hairry**—See **fuzzy**. **D 3990, D13**
- halation, n—(1)** the apparent increase in size of a primary or secondary light source due to scattering of light toward the observer, the surround being significantly darker than the light source.
- (2) *in retroreflection*, the apparent increase in size of a retroreflector, viewed by directional illumination (for example, automobile headlights) in a dark surround. **E 284, E12**
- halation**—the scattering of light by the transparency into the viewer's line-of-sight reducing the perceived contrast of external objects, also referred to as haze. **F 2429, F07**
- half bath**—a room containing a lavatory (wash basin) and a toilet (water closet). **E 631, E06**
- half bath**—See **building space**. **E 631, E06**
- half-car roughness index (HRI), n**—an index resulting from a mathematical simulation of vehicular response to the longitudinal profile of a pavement using the half-car simulation model described in Practice E 1170 and a travelling speed of 50 mph (80 km/h). **E 867, E17**
- half cell**—an electrode immersed in a suitable electrolyte. It may be designed to yield a known constant potential, in which case unknown potentials may be measured against it; for example, the calomel half cell. **B 374, B08**
- half-duplex channel, n**—a data transmission channel capable of transmitting in both directions, but in one direction at a time. **F 1457, F05**
- half-hard wire**—as applied to aluminum, wire that has been processed so as to produce a strength approximately midway between that of soft wire and that of hard-drawn wire. **B 354, B01**
- half-life**—see **decay constant**. **E 170, E10**
- half-life**—the time required for one half of a given number of radioactive atoms to undergo decay. **E 1316, E07**
- half-life**—the time required for one half a given number of radioactive atoms to undergo decay. **E 1316, E07**
- half-value layer**—the thickness of an absorbing material required to reduce the intensity of a beam of incident radiation to one-half of its original intensity. **E 1316, E07**
- half-value layer (HVL)**—the thickness of an absorbing material required to reduce the intensity of a beam of incident radiation to one half of its original intensity. **E 1316, E07**
- half-value thickness**—the thickness of a specified substance which, when introduced into the path of a given beam of radiation, reduces its intensity to one half. **E 1316, E07**
- half-wave current (HW)**—a rectified single-phase alternating current that produces a pulsating unidirectional field. **E 1316, E07**
- hall effect**—a phenomenon in which a transverse electric field is produced in a current-carrying conductor placed in a magnetic field. **E 1316, E07**
- halo, n**—a shadow image created by ink interaction. See also **corona**. **F 1857, F05**
- halocarbon plastics**—plastics based on resins made by the polymerization of monomers composed only of carbon and a halogen or halogens. **D 883, D20**
- halo effect**—a condition characterized by an unusually clean background region at the boundary of the image areas. **F 335, F05**
- halogen**—any element of the family of the elements fluorine, chlorine, bromine and iodine (definition for purpose of this standard). **D 6161, D19**
- halogen**—any element of the family of the elements fluorine, chlorine, bromine, and iodine. Compounds do not fall under the strict definition of halogen. However, for the purpose of this standard, this word provides a convenient descriptive term for halogen-containing compounds. Of significance in halogen leak detection are those which have enough vapor pressure to be useful as tracer gases. **E 1316, E07**
- halogenation treatment**—exposure of the entire rubber surface area to a halogen for the purpose of reducing surface friction. **F 819, F18**
- halogen leak detector**—a leak detector that responds to halogen tracer gases. Also called halogen-sensitive leak detector or halide leak detector. (1) The copper-flame detector or halide torch consists of a bunsen burner with flame impinging on a copper plate or screen, and a hose with sampling probe to carry tracer gas to the air intake of the burner. (2) The alkali-ion diode halogen detector depends on the variation of positive ion emission from a heated platinum anode when halogen molecules enter the sensing element. **E 1316, E07**
- haloing**—the formation of a contrasting discoloration around the edges of the workpiece when compared to interior areas. **C 286, B08**
- haloing, n**—the peripheral lines around print detail caused by excessive ink, excessive roller impression or faulty plate shoulders. **D 6488, D01**
- haloing, n**—a shadow effect around the entire printed segment or

haloing, *n*

around the leading edge of a printed segment caused by excessive pressure between the printing plate and the printed surface.

F 1294, F05

hamper, *n*—a container (commonly used for shipping fruits and vegetables) circular, elliptical, or polygonal in horizontal cross section, the tube dimensions being usually greater than the bottom. It has slotted sides and a bottom that may be loose, stapled, or nailed in place. The top may or may not be open. (Compare **basket**.)

D 996, D10

H and D curve—See **characteristic curve**.

E 7, E04

handful, *n*—for sampling, as much fiber as the hand can contain.

D 2946, C17

hand girth, *n*—the maximum circumference of the hand around the knuckles excluding the thumb, taken with the fingers together.

D 5219, D13

handgrip, *n*—the part of a handrail designed to provide a secure grasp.

E 631, E06

handgrip, *n*—the part of a handrail designed to provide a secure grasp.

E 1481, E06

hand-held scanner, *n*—a scanner held and operated by a human, thus enabling the scanner to be brought to the symbol.

F 1294, F05

hand-held vacuum cleaner, *n*—a small, portable, hand-held, hand-supported vacuum cleaner usually with a nozzle as an integral part of the cleaner. The cleaner is primarily designed for light-duty, all-purpose, small-area cleaning and may be designed for liquid pickup. In use, the usually integrally designed nozzle is guided over the surface area to be cleaned. The cleaner may contain a driven agitator to assist in dirt removal and may have attachments or provisions, or both, for both floor and above-the-floor cleaning.

F 395, F11

handhold—any strap, handle, depression, or other provision for grasping the boom by hand.

F 818, F20

hand length, *n*—the straight distance from the prominence of the longest finger to the inner wrist bone, taken across the palm of the hand with fingers together and palm flat (use a stable, flat ruler).

D 5219, D13

handling crack, *n*—in a rigid die system, a defect that occurs in a green part after removal from the press, and prior to sintering.

B 243, B09

handling damage, (HD), *n*—as used in fractography, scratches, chips, cracks, etc., due to the handling of the specimen/component.

C 1145, C28

handling point, *n*—an indication of the minimum temperature to which an oil should be heated in any part of the suction or delivery line of an oil-handling installation when the installation is operating.

D 4175, D02

handling point, *n*—an indication of the minimum temperature to which an oil should be heated in any part of the suction or delivery line of an oil-handling installation when the installation is operating. If the storage tank does not contain an outflow heater, this temperature is necessarily the minimum oil storage temperature.

D 4175, D02

handling reinforcement—reinforcement intended to reduce the risk of collapse of the pipe or section during handling or storage prior to and during final placement.

C 822, C13

hand of combination, lock installation—a type of lock installation that is determined by the position of the lock bolt viewed from the cover side of the door, that is, vertical up, vertical down, right hand, or left hand.

F 471, F12

hand-overcast seam-finish, *n*—a finish for the raw edges of a plain seam, in which hand stitches are taken over the raw edges of each seam allowance.

D 123, D13

hand-overcast seam finish, *n*—in home sewing, a seam finish in which hand stitches are sewn such that the thread wraps around the cut edges of each seam allowance.

D 4965, D13

hand print boxes—restraints for controlling entry of scannable information by hand. Controlling of size, shape, and configuration of hand printed entries on an optical scanning form.

F 149, F05

hand print character set—Refer to ANSI X3.45-182.

F 149, F05

hand printing, *n*—a style of writing in which the letters are not joined and the writing instrument is lifted after most strokes.

E 2195, E30

handrail—See **railing systems**.

E 631, E06

handrail, *n*—a horizontal, sloping, or vertical member normally grasped by hand for guidance or support.

E 631, E06

handrail, *n*—a horizontal, sloping, or vertical member normally grasped by hand for guidance or support.

E 1481, E06

handrail bracket—See **railing systems**.

E 631, E06

handrail bracket—a device attached to a wall, post, or other surface to support the handrail.

E 631, E06

handrail bracket—a device attached to a wall, post, or other surface to support the handrail.

E 1481, E06

handrail height—See **railing systems**.

E 631, E06

handrail height—the vertical distance from the top surface of the top rail to the surface of the finished floor, top of a ramp, or the nosing line of stair treads.

E 631, E06

handrail height—the vertical distance from the top surface of the top rail to the surface of the finished floor, top of a ramp, or the nosing line of stair treads.

E 1481, E06

hand-rubbed—a non-reflective surface with a slight stipple pattern, produced by hand-applied abrasive pads or hand-held machines.

C 119, C18

handshaking, *v*—an exchange of signals between two devices in a computer network, as prelude to data exchange, it is to determine the readiness of each device to a data exchange.

F 1457, F05

handsheet, *n*—a sheet of fibrous material produced by a specified procedure, generally in a laboratory.

D 1968, D06

hand washing, *n*—the most gentle form of home laundering using hand manipulation without the use of a machine or device such as a scrubbing board.

D 123, D13

hand washing, *n*—the most gentle form of home laundering using hand manipulation without the use of a machine or device such as a scrubbing board.

D 3136, D13

hand width, *n*—the maximum width across the palm of the hand excluding the thumb, taken with fingers together and palm flat (use a stable, flat ruler).

D 5219, D13

hanging rack—see **burning bars, points, or tools**.

C 286, B08

hanging wall—the mass of rock above a discontinuity surface. (ISRM)

D 653, D18

hang pick, *n*—a pick, caught on a warp yarn knot for a short distance, producing a triangular-shaped hole in the fabric.

D 123, D13

hang pick, *n*—a pick, caught on a warp yarn knot for a short distance, producing a triangular-shaped hole in the fabric. (*Syn.* hang shot)

D 3990, D13

hang shot—See **hang pick**.

D 3990, D13

hank—specifically, a coiled or looped bundle (as of yarn, rope or wire) usually containing a definite aggregate measure of the material.

D 2864, D27

hardboard—a generic term for a panel manufactured primarily from inter-felted lignocellulosic fibers (usually wood), consolidated under heat and pressure in a hot-press to a density of 31 lb/ft³ (specific gravity 0.50) or greater, and to which other materials may have been added during manufacture to improve certain properties.

medium-density hardboard—a hardboard as previously defined with a density between 31 and 50 lb/ft³ (specific gravity between 0.50 and 0.80).

high-density hardboard—a hardboard as previously defined with a density greater than 50 lb/ft³ (specific gravity 0.80).

D 1554, D07

hardboard nail—slender, usually colored (baked-lacquer finished), stiff-stock or usually hardened-steel, usually annularly threaded, 1 to 1½ by 0.058-in. nails with small flat head and long needle point for fastening plain or prefinished ½ and ¼-in. hardboard for interior applications. Also, slender bright or colored (baked-lacquer finished), galvanized, stiff-stock, or usually hardened-steel, usually helically threaded, 2 to 3 by 0.105 and 0.120-in. nails with countersunk ⅜ or ⅜-in. head and pilot needle point for fastening hardboard for exterior applications.

F 547, F16

hardboard underlayment—a service-grade hardboard made or machined to close thickness tolerances for use as a leveling course and to provide a smooth surface under floor covering materials. **D 1554, D07**

hard chromium—chromium plate for engineering rather than decorative applications. Not necessarily harder than the latter. **B 374, B08**

hard-coating—*in anodizing aluminum*, an anodic oxide coating on aluminum with a higher apparent density and thickness and a greater resistance to wear than conventional coatings. **B 374, B08**

hard-coat system—type of finish system designed to withstand increased impact loads by increasing the strength of the base coat. Also called high-impact system. **E 631, E06**

hardcopy, n—self-sustaining image on a solid substrate. See **softcopy, print, and transparency**. **E 284, E12**

hard-drawn wire—as applied to aluminum and copper, wire that has been cold drawn to final size so as to approach the maximum tensile strength obtainable. **B 354, B01**

hard edge—an edge reinforcement used to either maintain edge integrity under load or at attachment points. **E 631, E06**

hard edge—an edge reinforcement used to either maintain edge integrity under load or at attachment points. **E 1749, E06**

hardenability, n—the property that determines the depth and distribution of hardness induced by **quenching** a steel object. **A 941, A01**

hard end—See **tight twist end**. **D 3990, D13**

hardened—heat-treated medium-carbon or medium-high-carbon-steel, with treating process resulting in toughened nail with greater stiffness at high flexural loads. (See **heat-treated**.) **F 547, F16**

hardened nail—heat-treated medium-low or medium-high carbon-steel nail. **F 547, F16**

hardener—*in grouting*, in a two component epoxy or resin, the chemical component that causes the base component to cure. **D 653, D18**

hardener, n—synonym for **curing agent**. **D 907, D14**

hardening, n—increasing the hardness by suitable treatment, usually involving heating and cooling. **A 941, A01**

hard frozen ground—frozen soil or rock which is firmly cemented by ice. **D 7099, D18**

hard glass—(1) a glass of relatively high viscosity at elevated temperatures.
(2) a glass with a high softening point.
(3) commonly refers to a glass difficult to melt. **C 162, C14**

hardmetal, n—see **cemented carbide**. **B 243, B09**

hard mica, n—mica which when slightly bent shows no tendency to delaminate. **D 1711, D09**

hardness—the relative refractoriness of a porcelain enamel or frit. **C 286, B08**

hardness, n—the resistance of a material to deformation, particularly permanent deformation, indentation, or scratching. **C 709, D02**

hardness, n—*in building construction*, the resistance to indentation as measured under specified conditions. **C 717, C24**

hardness, n—the resistance to indentation as measured under specified conditions. **C 717, C24**

hardness—a term relating to the capacity of wood to withstand denting and abrasion; for purposes of comparison, hardness in wood is often measured as the load in pounds required to embed a 0.444-in. ball to one-half its diameter (Methods D 143). **D 9, D07**

hardness, n—*in water*, dissolved salts of calcium, magnesium, and other cations that destroy the action of soap; expressed as parts per million (ppm) or grains per gallon (gr/gal) of calcium carbonate. (Compare **softness**.) **D 123, D13**

hardness—resistance of a material to indentation or scratching. (ISRM) **D 653, D18**

hardness, n—the polyvalent-cation concentration of water (generally calcium and magnesium). **D 1129, D19**

hardness, n—a physical property of a rubber vulcanizate, characterized by resistance to indentation. **D 1566, D11**

hardness—a term referring to the degree of cooking of a pulp. A hard pulp is one in which the residual lignin content is relatively high. **D 1695, D01**

hardness—a generic term referring to the resistance of a particle to breakdown as measured by specific tests. **D 2652, D28**

hardness, n—*of anelastomer*, the resistance to deformation or indentation. **D 4175, D02**

hardness, n—resistance to permanent deformation or indentation. **D 4175, D02**

hardness, n—the resistance of a material to deformation, particularly permanent deformation, indentation, or scratching. **D 4175, D02**

hardness—the polyvalent-cation concentration of water (generally calcium and magnesium). Usually expressed as mg/L as CaCO₃. **D 6161, D19**

hardness, n—the resistance of a material to deformation, particularly permanent deformation, indentation, or scratching. **E 6, E28**

hardness—a measurement of the resistance to indentation. **F 921, F04**

hardness—a measurement of the resistance to indentation. **F 1078, F04**

hardness—measure of a material's ability to resist abrasion or indentation, or both. **F 1789, F16**

hardness impression—See **impression**. **E 7, E04**

hardpan—a hard impervious layer, composed chiefly of clay, cemented by relatively insoluble materials, that does not become plastic when mixed with water and definitely limits the downward movement of water and roots. **D 653, D18**

hard particle erosion, n—deprecated term; use the preferred synonyms **solid impingement erosion** or **solid particle erosion**. **G 40, G02**

hard points—reinforced points within a sandwich construction to distribute stresses, resist concentrated compression loads, and maintain integrity of an attachment. **E 631, E06**

hard points—reinforced points within a sandwich construction to distribute stresses, resist concentrated compression loads, and maintain integrity of an attachment. **E 1749, E06**

hard rubber, n—deprecated term, see **ebonite**. **D 1566, D11**

hard shaker thermometer—a thermometer in which the constriction is overly severe thereby restricting the passage of mercury back to the bulb causing the thermometer to fail the ease-of-resetting requirements. **E 344, E20**

hard size, n—sections of cloth containing an excessive quantity of sizing. **D 123, D13**

hard size, n—sections of cloth containing an excessive quantity of sizing. (*Syn.* starch lump) **D 3990, D13**

hardware—physical components or apparatus, including major items of equipment. **E 2135, E53**

hard water, n—*intextile conservation*, water having a concentration of more than 60 ppm (3.5 gr/gal) hardness calculated as calcium carbonate. **D 123, D13**

hardwood dimension—hardwood stock processed to the specified thickness, width, and length, or in multiples thereof. **D 9, D07**

hardwoods—generally one of the botanical groups of trees that have broad leaves in contrast to the conifers or softwoods. The term has no reference to the actual hardness of the wood. **D 9, D07**

hard (X-rays)—of short wavelength. **E 7, E04**

Haring cell—A rectangular box of non-conducting material, with principal and auxiliary electrodes so arranged as to permit estimation of throwing power or electrode polarizations and potentials between them. **B 374, B08**

harmonic analysis—an analytical technique whereby the amplitude or phase, or both, of the frequency components of a complex periodic signal is determined. **E 1316, E07**

harmonic distortion—nonlinear distortion characterized by the appearance in the output of harmonics other than the fundamental component when the input wave is sinusoidal. **E 1316, E07**

harmonics—those vibrations which are integral multiples of the fundamental frequency. **E 1316, E07**

harness, n

harness, n—one or more hookup bundles tied, clamped, or otherwise fitted together for final installation; used for interconnecting electrical circuits. **D 1711, D09**

harness, n—a piece of equipment designed to be worn by a climber or mountaineer that provides an attachment point for a rope and a means to support the climber's body during climbing, resting, rappelling, or falling. **F 1773, F08**

harness, chest, n—the part of a combination harness that fits around the upper part of the body. **F 1773, F08**

harness, combination, n—a harness consisting of a sit harness and chest harness. **F 1773, F08**

harness, full-body, n—a harness that fits around the upper part, the waist, and thighs of the body. **F 1773, F08**

harness leather—a self-explanatory term sometimes so defined as to include collar and saddlery leathers. Harness leather, including the related items mentioned, is practically all made of cattlehides, vegetable-tanned, except for a considerable quantity of pigskins used for making saddle seats. **D 1517, D31**

harness, sit, n—a harness that fits around the waist and thighs of the body. Sometimes referred to as a *seat harness*. **F 1773, F08**

harness skip—See **float**. **D 3990, D13**

harsh (as in *harsh asbestos*)—description for asbestos with relatively high harshness. **D 2946, C17**

harshness—apparent property for asbestos that exhibits a significant degree of stiffness or rigidity. **D 2946, C17**

hat leather—usually sheepskin or calfskin for sweatbands of hats. The grain splits of sheepskin are vegetable-tanned for this purpose. **D 1517, D31**

haunch—that portion of the pipe barrel extending from bottom to springline. **C 896, C04**

haunch—that portion of the pipe barrel extending from bottom to springline. **F 412, F17**

haunching—the act of placing bedding material around the haunch of the pipe. **C 896, C04**

haunching—the act of placing bedding material around the haunch of the pipe. **F 412, F17**

hawser twist, n—the construction of cabled yarn, cord, or rope in which the single and first-ply twist are in the same direction and the second-ply twist is in the opposite direction, and S/S/Z or Z/Z/S construction. **D 123, D13**

hawser twist, n—the construction of cabled yarn, cord, or rope in which the single and first-ply twist are in the same direction and the second-ply twist is in the opposite direction, and S/S/Z or Z/Z/S construction. **D 4849, D13**

hazard—the adverse effect(s) that may result from exposure(s). **E 943, E47**

hazard, n—the adverse effect(s) that may result from exposure(s). **E 2114, E06**

hazard, n—source of danger; something that could harm persons or property. **G 126, G04**

hazard assessment, n—the determination of the lack of safety or degree of risk based on all integral parts of an exposure situation, including the characteristics of the chemical(s) to which one is exposed and the conditions that determine degree of exposure. **F 1494, F23**

hazardous biological materials—living biological materials, and products derived therefrom, that pose a potential threat to human health. **E 1705, E48**

hazardous chemical—any solid, liquid, gas, or mixture thereof that can potentially cause harm to the human body through inhalation, ingestion, or skin absorption. **F 1494, F23**

hazardous material—any used or unused personal property, including scrap and waste, that is ignitable, corrosive, reactive, or toxic because of its quantity, concentration, or physical, chemical, or infectious characteristics. The property can be in a solid, liquid, semiliquid, or contained gas form and may cause or significantly contribute to an increase in mortality or serious illness, or pose a

substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of, or otherwise managed. **E 2135, E53**

hazardous substance—a substance defined as a hazardous substance pursuant to CERCLA 42 USC § 9601(14), as interpreted by EPA regulations and the courts: "(A) any substance designated pursuant to section 1321(b)(2)(A) of Title 33, (B) any element, compound, mixture, solution, or substance designated pursuant to section 9602 of this title, (C) any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Act (42 USC § 6921) (but not including any waste the regulation of which under the Solid Waste Disposal Act (42 USC § 6921 *et seq.*) has been suspended by Act of Congress), (D) any toxic pollutant listed under section 1317(a) of Title 33, (E) any hazardous air pollutant listed under section 112 of the Clean Air Act (42 USC § 7412), and (F) any imminently hazardous chemical substance or mixture with respect to which the Administrator (of EPA) has taken action pursuant to section 2606 of Title 15. The term does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under subparagraphs (A) through (F) of this paragraph, and the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas)." **D 5681, D34**

hazardous waste—any hazardous waste having the characteristics identified under or listed pursuant to section 3001 of the Solid Waste Disposal Act (42 USC § 6901 *et seq.*) (but not including any waste the regulation of which under the Solid Waste Disposal Act has been suspended by Act of Congress) and so forth. **D 5681, D34**

hazardous waste—liquid or solid waste, or combination of solid wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics is capable of: (a) causing, or significantly contributing to an increase in mortality or to an increase in serious irreversible, or incapacitating reversible, illness; or (b) posing a substantial present or potential hazard to human health or to the environment when improperly treated, stored, transported, or disposed of, or otherwise managed. **E 631, E06**

hazardous waste, n—waste that is listed as hazardous by the Environmental Protection Agency (EPA) and/or exhibits one or more of the following characteristics: ignitability, reactivity, corrosivity, or toxicity, as specified in the Code of Federal Regulations (CFR) part 261. **E 833, E06**

hazardous waste—liquid or solid waste, or combination of solid wastes, which because of its quantity, concentration, or physical, chemical, or infectious characteristics is capable of: (a) causing, or significantly contributing to an increase in mortality or to an increase in serious irreversible, or incapacitating reversible, illness; or (b) posing a substantial present or potential hazard to human health or to the environment when improperly treated, stored, transported, or disposed of, or otherwise managed. **E 1605, E06**

hazardous-waste discharge—accidental or intentional spilling, hazardous-waste leaking, pumping, pouring, emitting, discharge emptying, or dumping of hazardous wastes onto any land or water. **E 631, E06**

hazardous-waste facility—all contiguous land, structures, or other appurtenances, and improvements on the land, used for treating, storing, or disposing of hazardous waste. **E 631, E06**

hazardous-waste landfill—disposal facility or part of a facility where hazardous waste is placed in or on land and that is not a land surface treatment facility, a surface impoundment, or an injection well. **E 631, E06**

hazardous-waste manifest—shipping document (EPA Form 8700-22) used for identifying the quantity, composition, origin, routing, and destination of hazardous waste during its transportation from the point of generation to the point of treatment, storage, or disposal. **E 631, E06**

hazardous-waste small quantity generator—generator who produces less than 100 kg of hazardous waste per month (or accumulates less than 100 kg at any one time) or one who produces less than 1 kg of acutely hazardous waste per month (or accumulates less than 1 kg of acutely hazardous waste at any one time.)

E 631, E06

hazardous-waste storage—holding on-site of hazardous waste for a temporary period, at the end of which the hazardous waste is treated, disposed of, or stored elsewhere.

E 631, E06

hazardous-waste treatment—any method, technique, or process, including neutralization, designed to change the physical, chemical, or biological character or composition of any hazardous waste so as to neutralize it, or render it nonhazardous or less hazardous, or to recover it, make it safer to transport, store, or dispose of, or amenable for recovery, storage, or volume reduction.

E 631, E06

haze—the cloudy or turbid aspect or appearance of an otherwise transparent specimen caused by light scattered from within the specimen or from its surfaces.

D 883, D20

haze—the turbidity produced by the material in some cellulose derivatives that is not completely soluble in the medium. This turbidity may refer to solutions or to the solid plastic.

D 1695, D01

haze—film whose clarity is impaired with varying degrees of opacity.

D 2825, D21

haze, *n*—in reflection, (1) scattering of light at the glossy surface of a specimen responsible for the apparent reduction in contrast of objects viewed by reflection at the surface.

(2) percent of reflected light scattered by a specimen having a glossy surface so that its direction deviates more than a specified angle from the direction of specular reflection. (3) cloudy appearance attributable to light scattering.

E 284, E12

haze, *n*—in transmission, (1) the scattering of light by a specimen responsible for the apparent reduction in contrast of objects viewed through it.

(2) the percent of transmitted light that is scattered so that its direction deviates more than a specified angle from the direction of the incident beam.

E 284, E12

haze—the cloudy or turbid aspect or appearance of an otherwise transparent specimen caused by light scattered from within the specimen or from its surfaces. (D20)

F 412, F17

haze—see **smudge**.

F 549, F05

haze, *n*—in plastics, the cloudy or turbid aspect or appearance of an otherwise transparent material caused by light scattered from within the specimen or from its surfaces.

F 1251, F04

haze—the percent of transmitted light that is scattered so that its direction deviates more than a specified angle from the direction of the incident beam, resulting in the reduction of contrast of objects viewed through the transparency.

F 2429, F07

Hazen color, *n*—see platinum-cobalt color scale.

E 284, E12

hazing, *n*—the fine deposit of ink on the non-image area of the gravure cylinder. It is also referred to as *scumming* or dirty wipe.

D 6488, D01

HDLC—abbreviation for **high-level data link control**.

F 1457, F05

head, *n*—in zippers, the portion of the element that engages the pocket.

D 123, D13

head—pressure at a point in a liquid, expressed in terms of the vertical distance of the point below the surface of the liquid. (ISRM)

D 653, D18

head—that portion of the hide from the snout to the flare into the shoulder.

D 1517, D31

head, *n*—the portion of a element that engages the pocket.

D 2050, D13

head, *n*—pressure at a point in a liquid, expressed in terms of the vertical distance of the point below the surface of the liquid.

D 4439, D35

head—See **windows and doors**.

E 631, E06

head—upset or deformation of shank, usually at or near end of shank opposite point end; formed during manufacture of nail to provide

area to be struck by hammer during driving and to offer bearing resistance.

F 547, F16

head and neck length, *n*—the distance from the crown of the head to the cervicale (contour), taken with the head erect and the neck unbent.

head and neck length (infant special case), *n*—the distance from the crown of the head to the cervicale (contour), taken with the head erect and the neck unbent, with subject lying down flat with legs extended.

D 5219, D13

header—see **manifold**.

D 6161, D19

header tile, *n*—tile designed to provide recesses for brick header units in masonry faced walls.

C 43, C15

head girth, *n*—inbody measurements, the maximum circumference of the head above the ears.

D 123, D13

head girth, *n*—the maximum horizontal circumference of the head above the ears.

D 5219, D13

head height—total height of head; the sum of all head elements measured parallel to nail axis; for practical purposes, measured from top of fillet to top of head.

F 547, F16

heading—a fringe effect appearing on the leading edge (relative to copy machine feed direction) of the developed electrostatic image.

F 335, F05

head joint—the mortar joint perpendicular to the substrate and perpendicular to the direction of the course being laid. On a floor it may be called a cross joint.

C 904, C03

head lap, *n*—(1) the distance between the lower (nose) edge of an overlapping tile and the upper edge of the lapped unit in the course immediately below; (2) *for shingle tile only*—the distance between the lower (nose) edge of an overlapping shingle tile and the upper edge of the lapped unit in the second course below.

C 43, C15

headlap, *n*—in shingles, the shortest distance between the lower edge of an overlapping shingle or sheet and the upper edge of the lapped unit in the second course below.

C 1154, C17

headlap, *n*—in roofing, for products installed in a shingle fashion, the area on a shingle or sheet material that is covered by the requisite number of layers in multiply construction; for example, two layers on a strip shingle or three layers in a three-ply built-up roof. Headlap is commonly referred to by its width, thus the designation by linear dimension.

D 1079, D08

headlap—the shortest distance between the lower edge of an overlapping shingle or sheet and the upper edge of the lapped unit in the second course below.

D 2946, C17

head length—on a hook-head or similarly headed nail, projected distance between shank and extremity of head.

F 547, F16

headless—nail without upset or bend at head end.

F 547, F16

head loss—the reduction in liquid pressure usually associated with the passage of a solution through a filter media bed.

D 6161, D19

head rim—peripheral part of head.

F 547, F16

head signature, *n*—a condition where one pass of jets overlaps the next pass causing positive stitch lines. See also **stitch lines.**

F 1857, F05

head space—the unfilled space in a glass container fitted with a closure device.

C 162, C14

head space—volume in the upper portion of the dispenser not filled with liquid contents usually expressed as percent of total volume of dispenser at a specified temperature.

D 3064, D10

headspace, *n*—the unfilled capacity of an ampule that allows for physical expansion due to temperature and pressure changes of the filled material while maintaining the integrity of the package.

D 4175, D02

head, static—the height above a standard datum of the surface of a column of water (or other liquid) that can be supported by the static pressure at a given point. The static head is the sum of the elevation head and the pressure head.

D 653, D18

head-to-shank integrity—assurance that a headed fastener under load is able to meet its mechanical and performance requirements without failure at the junction of the head to shank.

F 1789, F16

head (total)—the sum of three components at a point: (1) elevation

head (total)

- head, *h* which is equal to the elevation of the point above a datum;
(2) pressure head, *hp*, which is the height of a column of static water than can be supported by the static pressure at the point; and
(3) velocity head, *hv*, which is the height the kinetic energy of the liquid is capable of lifting the liquid. **D 653, D18**
- headwave**—a wave that is generated by mode conversion when a point source is located at the boundary of an elastic half-space. **E 1316, E07**
- heal**, *v*—to restore wounded parts or to make healthy. **F 2312, F04**
- healing**—the ability of a polish film to return to original state after being disturbed by fingerprints, marks, etc. **D 2825, D21**
- healing**, *n*—the restoration of integrity to injured tissue. **F 2312, F04**
- healing by first intention**, *n*—healing in which union or restoration of continuity occurs directly without intervention of granulations. **F 2312, F04**
- healing by second intention**, *n*—union by closure of a wound with granulations which form from the base and both sides toward the surface of the wound. **F 2312, F04**
- healing power**—the ability of a glaze to heal surface blemishes during firing. **C 242, C21**
- health care provider**—an organization, institution, or individual authorized to provide direct patient care. **F 1177, F30**
- heartwood**—the inner layer of a woody stem wholly composed of nonliving cells and usually differentiated from the outer enveloping layer (sapwood) by its darker color. It is usually more decay resistant than sapwood. **D 9, D07**
- heat**, *n*—the total molten metal output from a single heating in a batch melting process or the total molten metal output from essentially a single heating in a continuous melting operation using basically constant charge and processing conditions and targeted at a fixed metal chemistry at the furnace spout. A heat can also be defined as a fixed time period for a continuous melting operation provided that it is shorter than the time period covered by the above definition. **A 644, A04**
- heat**, *n*—a specific lot of material representing a single melt of steel produced to a specified chemical analysis. **A 902, A05**
- heat**, *n*—a generic term denoting a specific lot of steel, based upon steelmaking and casting considerations. **A 941, A01**
- heat**, *n*—refer to melt. **B 899, B02**
- heat-absorbing glass**—glass having the property of absorbing a substantial percentage of radiant energy in the near infrared of the spectrum. **C 162, C14**
- heat activated adhesive**, *n*—adhesive, typically preapplied to one or both adherends, that is rendered tacky by application of heat and forms a bond on cooling. **D 907, D14**
- heat-actuated cooling**—the use of thermal energy to initiate a thermodynamic cycle which results in a local decrease in temperature. **E 772, E44**
- heat analysis**, *n*—the chemical composition of a specific production lot of liquid steel. **A 902, A05**
- heat analysis**, *n*—the chemical analysis determined by the steel producer as being representative of a specific heat of steel. **A 941, A01**
- heat analysis**—chemical analysis of a given heat by the producer which determines the percentages of its elements. **F 1789, F16**
- heat attenuation factor HAF**, *n*—in electric arc testing, the percent of the incident energy which is blocked by a material at an incident energy level equal to ATPV. **F 819, F18**
- heat buildup**, *n*—the accumulation of thermal energy generated within a material as a result of hysteresis, evidenced by an increase in temperature. **D 1566, D11**
- heat capacity**, *n*—Synonym for energy equivalent. **D 121, D05**
- heat capacity**, *n*—the quantity of heat required to raise a system one degree in temperature either at constant volume or constant pressure. **D 5681, D34**
- heat capacity**—the quantity of heat required to raise a system one degree in temperature either at constant volume or constant pressure. **D 5681, D34**
- heat capacity**—the amount of heat required to raise the temperature of a unit mass of a substance by one degree. It is commonly expressed in Joules per kg per degree K. **D 7099, D18**
- heat capacity**—see thermal capacity. **E 772, E44**
- heat capacity**—quantity of heat necessary to change the temperature of an entity, substance or system by one Kelvin of temperature. **E 1142, E37**
- heat capacity (energy equivalent, or water equivalent)**, *n*—the energy required to raise the temperature of a calorimeter one arbitrary unit; the quantity that when multiplied by the corrected temperature rise, then adjusted for extraneous heat effects and divided by the mass of the sample, gives the gross calorific value. **D 5681, D34**
- heat, chemical**, *n*—sensation of increased temperature resulting from exposure to substances such as capsaicin or hot peppers. The sensation tends to persist after the stimulus is removed. **E 253, E18**
- heat durability**, *n*—the extent to which a material retains its useful properties at ambient air conditions, following its exposure to a specified temperature and environment for a specified time and its return to the ambient air conditions. (Compare heat resistance.) **D 123, D13**
- heat durability**, *n*—the extent to which a material retains its useful properties at ambient air conditions, following its exposure to a specified temperature and environment for a specified time and its return to the ambient air conditions. (Compare heat resistance.) **D 4391, D13**
- heat durable**, *adj*—having heat durability. **D 123, D13**
- heat durable**, *adj*—having heat durability. **D 4391, D13**
- heat exposure**, *v*—the process of subjecting a specimen to an elevated temperature at atmospheric pressure for a specified period of time with the intent of determining properties by subsequent testing. **D 1079, D08**
- heat fixing**—the process of making a developed image permanent by heating. **F 335, F05**
- heat flow; heat flow rate, Q**, *n*—the quantity of heat transferred to or from a system in unit time. (*Q* in SI units: *W*.) (*Q* in inch-pound units: Btu/h.) **C 168, C16**
- heat flow**, *n*—dissipation or transfer of heat coming from within the earth by conduction, convection or radiation at the surface; usually reported in units of energy per unit time per unit area, for example, joules per second per square metre or watts per square metre. **E 957, E44**
- heat flux**, *n*—the thermal intensity indicated by the amount of power per unit area. **D 123, D13**
- heat flux**, *n*—the thermal intensity indicated by the amount of power per unit area. **D 4391, D13**
- heat flux**, *n*—heat transfer to a surface per unit area, per unit time. **E 176, E05**
- heat flux**, *n*—the thermal intensity indicated by the amount of energy transmitted divided by area and time kW/m^2 ($\text{cal/cm}^2\text{s}$). **F 819, F18**
- heat flux**, *n*—the thermal intensity indicated by the amount of energy transmitted per unit area and per unit time ($\text{cal/cm}^2\text{-s}$) (watts/cm^2). **F 1494, F23**
- heat flux, q**, *n*—the heat flow rate through a surface of unit area perpendicular to the direction of heat flow.
(*q* in SI units: W/m^2)
(*q* in inch-pound units: $\text{Btu/h/ft}^2 = \text{Btu/h ft}^2$) **C 168, C16**
- heat flux transducer, HFT**, *n*—a device containing a thermopile (or equivalent) that produces an output which is a function of the heat flux. **C 168, C16**
- heat for ignition**, *n*—the product of time from initial specimen exposure until the flame front reaches the 150-mm position and the flux level at this position, the latter obtained in prior calibration of the apparatus. **E 176, E05**
- heat for sustained burning**, *n*—the product of time from initial

- specimen exposure until the arrival of the flame front, and the incident flux level at that same location as measured with a dummy specimen during calibration. **E 176, E05**
- heat-fused joint**—see **joint, heat-fused**. **F 412, F17**
- heat gun**—blower-equipped apparatus that emits heat with sufficient intensity to soften dried paint to permit scraping from the surface. **E 631, E06**
- heat gun**—blower-equipped apparatus that emits heat with sufficient intensity to soften dried paint to permit scraping from the surface. **E 1605, E06**
- heating curve**—graphical representation of the course of temperature rise of a sample or body as a function of time. **E 7, E04**
- heating flux, *n***—the prescribed incident flux imposed externally from the heater onto the specimen at the initiation of the test. **E 176, E05**
- heating flux, *n***—the incident flux imposed externally from the heater on the specimen at the initiation of the test. **E 176, E05**
- heating loss, *n***—mass loss, in percent, when carbon black is heated at 125°C for 1 h; the heating loss is primarily attributed to moisture content. **D 3053, D24**
- heat island effect, *n***—see **urban heat island**. **E 2114, E06**
- heat joining**—making a joint by heating the mating surfaces of the pipe components to be joined and pressing them together so that they fuse and become essentially one piece. **F 412, F17**
- heat loss rate**—the rate at which heat is lost from a system or component of a system, per degree temperature difference between its average temperature and the average ambient air temperature. **E 772, E44**
- heat mark**—extremely shallow depression or groove in the surface of a plastic visible because of a sharply defined rim or a roughened surface. (See also **shrink mark**.) **D 883, D20**
- heat mark**—extremely shallow depression or groove in the surface of a plastic visible because of a sharply defined rim or a roughened surface. (See also **sink-mark**.) (D20) **F 412, F17**
- heat number, *n***—the alpha, numeric, or alphanumeric designator used to identify a specific **heat of steel**. **A 941, A01**
- heat of adsorption**—the heat evolved during adsorption. **D 2652, D28**
- heat of formation**—the increase in heat content resulting from the formation of 1 mole of a substance from its elements at constant pressure. **D 5681, D34**
- heat of hydration**—heat evolved by chemical reactions with water, such as that evolved during the setting and hardening of Portland cement. **D 653, D18**
- heat, physical, *n***—sensation experienced as a result of exposure to thermally hot substances such as water above 120°F. The duration of the sensation is usually limited to the time of direct contact with the stimulus. **E 253, E18**
- heat release rate, *n***—the heat evolved from the specimen, per unit of time. **E 176, E05**
- heat release rate, *n***—the calorific energy released per unit time by the combustion of a material under specified test conditions. **E 176, E05**
- heat release rate, *n***—the heat evolved from the specimen, expressed per unit area of exposed specimen area per unit of time. **E 176, E05**
- heat release rate, *n***—the heat evolved from the specimen, per unit of time. **E 176, E05**
- heat release rate, *n***—the heat evolved from the specimen per unit of time and area. **E 176, E05**
- heat resistance, *n***—the extent to which a material retains useful properties as measured during exposure of the material to a specified temperature and environment for a specified time. (Compare **heat durability**.) **D 123, D13**
- heat resistance, *n***—the extent to which a material retains useful properties as measured during exposure of the material to a specified temperature and environment for a specified time. (Compare **heat durability**.) **D 4391, D13**
- heat resistance**—extent to which a material retains useful properties as measured during exposure of the material to a specified temperature and environment for a specified time. **F 1789, F16**
- heat resistant, *adj***—having heat resistance. **D 123, D13**
- heat resistant, *adj***—having heat resistance. **D 4391, D13**
- heat-resisting glass**—glass able to withstand a relatively high thermal shock, because of low expansion coefficient or a high mechanical strength, or both. **C 162, C14**
- heat sanitize**—fresh water, heater to a minimum specified temperature (usually a minimum of 180°F), to destroy or kill any residual bacteria from tableware. **F 1827, F26**
- heat sanitizing, continuous oval-conveyor type**—dishwashing machine and conveyor-table when assembled, shall form an oval-shaped dish handling system. Machines shall automatically convey racks of soiled tableware through the treatment stages, including a final heat sanitizing rinse of the machine, conveying them out to the clean tableware removal area of the conveyor: additional parts: recirculating pre-wash chamber, rinse chamber, conveying mechanisms, heating equipment and horizontal conveyor tables. See **dishwashing machine, commercial**. **F 1827, F26**
- heat sanitizing, conveyor rack type**—machines that automatically convey racks of soiled tableware through treatment stages and final heat sanitizing rinse, conveying them out at the clean end of the machine; additional parts: rinse chamber, heating equipment, and conveying mechanism. See **dishwashing machine, commercial**. **F 1827, F26**
- heat sanitizing, rackless conveyor type**—machines shall automatically convey unracked soiled tableware through the treatment stages, includes a final heat sanitizing rinse, conveying them out at the clean end of the machine; additional parts: rinse chamber, conveying mechanisms, and heating equipment. See **dishwashing machine, commercial**. **F 1827, F26**
- heat sanitizing, stationary rack type**—manually fed machines, includes a final heat sanitizing rinse; additional parts: heating equipment. See **dishwashing machine, commercial**. **F 1827, F26**
- heat seal**—See **seal**. **D 996, D10**
- heat seal**—the result of bonding surfaces by controlled application of heat, pressure, and dwell time. **F 1327, F02**
- heat sealing adhesive tape**—a strip of material (usually fabric, metal foil, paper, or plastic film) coated with an adhesive activated with the application of heat. **E 631, E06**
- heat sealing adhesive tape**—a strip of material (usually fabric, metal foil, paper, or plastic film) coated with an adhesive activated with the application of heat. **E 1749, E06**
- heat sensitive**—a material composition that will produce an image from application of localized heat. **F 221, F05**
- heat-sensitive dipping (latex), *n***—dipping process in which a heated form is immersed in latex containing a substance that causes the latex to gel at an elevated temperature. **D 1566, D11**
- heat sensitizer, *n***—gelling agent effective only at elevated temperature. **D 1566, D11**
- heatset yarn, *n***—*in a textured yarn*, a yarn that is subjected to secondary heat during the texturing process, which is designed to reduce the torque and bulk shrinkage. **D 4849, D13**
- heatset yarns, *n***—*in a textured yarn*, a yarn that is subjected to a secondary heat during the texturing process, which is designed to reduce the torque and bulk shrinkage. **D 123, D13**
- heat shrinkage, *n***—a decrease in one or more dimensions of an object or material exposed to heat. **D 123, D13**
- heat shrinkage, *n***—a decrease in one or more dimensions of an object or material exposed to heat. **D 4849, D13**
- heat-strengthened glass**—flat glass that has been tempered to a moderate surface or edge compression to meet the requirements of Specification C 1048. (See **fully tempered glass**.) **C 162, C14**
- heat stress, *n***—(physiological) adverse condition caused by exposure to elevated temperature, radiant heat flux, or combinations of these factors. **E 176, E05**
- heat transfer fluid**—(1) *in solar energy systems*, a liquid or gas that

heat transfer fluid

passes through the solar collector and carries the absorbed thermal energy away from the collector. (2) any fluid that is used to transfer thermal energy between subsystems in solar energy systems.

F 772, E44

heat-treated—a term sometimes used for tempered glass. (See **tempered glass**.)

C 162, C14

heat-treated—heated above critical temperature and subsequently quenched, which may be followed by tempering for the purposes of obtaining certain desirable conditions or properties, such as hardness, toughness, and stiffness at high flexural loads.

F 547, F16

heat-treating—the process of subjecting a wood-base panel material (usually hardboard) to a special heat treatment after hot pressing to increase some strength properties and water resistance.

D 1554, D07

heat treatment, n—heating and cooling a steel object in such a way as to obtain desired conditions or properties.

A 941, A01

heat treatment—heating to a temperature that produces metallurgical changes in the steel that alter the mechanical properties and microstructure of the metal.

F 2078, F07

heat-up efficiency—the energy imparted to a food product, expressed as a percentage of energy consumed by the equipment during a cooking event, in which a food product is heated from a predetermined initial temperature to a predetermined final temperature, η *heat-up*.

F 1827, F26

heat-up temperature response—temperature rise on the surface of a steel plate during the test period in accordance with the heat-up temperature-response test.

F 1827, F26

heat welded seam, n—a seam produced by grooving abutting edges of resilient flooring and filling said grooves with heated, fused, or melted material to provide a bond and seal. A glazing or top coating may be applied after the seam is trimmed.

F 141, F06

heave—upward movement of soil caused by expansion or displacement resulting from phenomena such as: moisture absorption, removal of overburden, driving of piles, frost action, and loading of an adjacent area.

D 653, D18

heave response—ability of the boom to react to the vertical motion of the water surface.

F 818, F20

heaving pressure—upward pressure developed during freezing of the ground.

D 7099, D18

heavy-centered spray pattern—in *protective coatings*, an uneven spray pattern having more coating in the center, and less at the edges.

D 4538, D33

heavy distillate, n—a fuel produced from the distillation of crude oil which has a kinematic viscosity at 40°C between 5.5 and 24.0 mm²/s, inclusive.

D 4175, D02

heavy distillate/residual fuel oil blend, n—a blend of heavy distillate and residual fuel oil having a viscosity at 40°C between 5.5 and 24.0 mm²/s, inclusive.

D 4175, D02

heavy duty, adj—in *internal combustion engine operation*, characterized by average speeds, power output, and internal temperatures that are close to the potential maximums.

D 4175, D02

heavy-duty, adj—in *internal combustion engine operation*, characterized by average speeds, power output, and internal temperatures that are generally close to the potential maximums.

D 4725, D15

heavy-duty engine, n—in *internal combustion engines*, one that is designed to allow operation continuously at or close to its peak output.

D 4175, D02

heavy-duty engine, n—in *internal combustion engine types*, one that is designed to allow operation continuously at or close to its peak output.

D 4725, D15

heavy-duty tires, n—tires weighing more than 40 lb (18.1 kg), used on trucks, buses, and off the road vehicles in heavy-duty applications.

D 5681, D34

heavy end—See **coarse end**.

D 3990, D13

heavy filling—See **coarse pick**.

D 3990, D13

heavy leather—a somewhat indefinite term, generally understood to include vegetable-tanned sole, belting, strap, and mechanical

leathers made from unsplit cattlehides. More recently it also refers to thick side leathers.

D 1517, D31

heavy metals—elements having a high density or specific gravity of approximately 5.0 or higher. A generic term used to describe contaminants such as cadmium, lead, mercury, etc. Most are toxic to humans in low concentration.

D 6161, D19

heavy metal wastes—industrial wastes containing heavy metals such as arsenic, cadmium, chromium, barium, lead, silver, selenium, and mercury; these wastes are generally liquids, sludges, or filter cakes.

D 5681, D34

heavy nail, heavy-gage nail—See **stout nail**.

F 547, F16

heavy pick—See **coarse pick**.

D 3990, D13

hedonic scale, n—a scale on which liking or disliking of a stimulus is expressed.

E 253, E18

heel, n—a solid part of a shoe or boot projecting downward and attached to or forming the back part of the sole under the heel of the foot.

F 1646, F13

heel-ankle circumference, n—in *body measurements*, with the subject standing barefoot, the distance around the foot from the point where the back of the heel contacts the floor and over the juncture of the foot and leg at the front of the ankle and back to the starting point.

D 123, D13

heel, b_H—the widest part of the ski in the tail section of the ski.

F 472, F27

heel breast, n—the forward or front face of a shoe heel.

F 1646, F13

heel contact—the region on a glass container surface, located between the bearing surface and the sidewall sections, which normally contacts other similarly shaped and upright containers.

C 162, C14

heel (of the snowboard)—the widest part of the tail section of the snowboard.

F 1107, F27

heel seat, n—the part of a shoe to which the heel is attached.

F 1646, F13

heel tap—an imperfection in which the base or bottom of a bottle is very thick in one area and very thin in another.

C 162, C14

heel-toe wear, n—a type of irregular wear characterized by different wear rates at the leading and trailing edges of a projection (element).

F 538, F09

height, n—vertical dimension of the face of a unit when the unit is positioned as a stretcher.

C 1232, C15

height, n—in *body measurements*, the vertical distance from the crown of a standing subject to the soles of the feet.

D 123, D13

height, n—the vertical distance from the crown of the head to the floor, taken with subject standing and without shoes.

height (infant special case), n—the straight distance from the top of the head to the soles of the feet, taken while subject is lying down flat with legs extended and foot positioned at 1.57 rad (90°) to the leg.

D 5219, D13

height, n—of a building, the vertical distance measured from the finished grade to average level of the roof above the level of the highest wall.

E 631, E06

height—distance between root and crest, measured perpendicular to nail axis.

F 547, F16

height—the distance before stretching from one outer edge of a knuckle or twist to the outer edge of the knuckle or twist on the opposite edge of fabric.

F 552, F14

height—sum of draft and freeboard.

F 818, F20

height of capillary rise—see **capillary rise**.

D 653, D18

helical, n—the most simple pattern in a barbed tape coil where there are no concertina attachments and each coil loop is left free in its natural spiral (also called *spiral*).

F 1379, F14

helical loop spacing, n—average distance between each coil loop in a helical coil configuration.

F 1379, F14

helical thread—continuous multiple helical depressions rolled onto nail shank with resulting expansion approximately equal to depression. Unless otherwise specified, medium lead angle is implied.

F 547, F16

heliostat—a reflector that is mechanically moved so that solar flux is reflected in a constant direction to a stationary receiver or target.

E 772, E44

helium accumulation fluence monitor (HAFM)—a passive neutron dosimeter whose measured reaction product is helium. The neutron fluence is obtained by dividing the helium concentration by the spectrum-averaged cross section (see **spectrum-averaged cross section**). (See also Test Method E 910 and ASTM Master Matrix E 706)

E 170, E10

helium bombing—a pressure-evacuation test in which helium is used as the test gas.

E 1316, E07

helium drift—(1) in leak testing with a probe, the drift from a leak or permeable gasket located at some distance from the end of the probe but which is detected by the probe and can mislead the operator into suspecting the area near the probe; (2) a gradual wandering of the output meter needle of the leak detector due to slowly changing helium concentrations (either due to a leak or outgassing) in the detector tube. Expressed in scale divisions per unit time.

E 1316, E07

helium leak detector—a leak detector using helium as the tracer gas.

E 1316, E07

helix angle—See **lead angle**.

F 547, F16

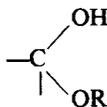

helmet, *n*—a piece of equipment designed to provide protection to climbers' heads from falling objects and the impact of a fall.

F 1773, F08

hem, *n*—*in garment construction*, a simple finish in which the raw fabric edge is turned under and stitched to a garment. (See **cuff**.)

F 1494, F23

hemiacetal groups—functional groups derived from carbonyl groups by addition of one molecule of an alcohol, of the general structure:

D 1695, D01

hemicellulose—any of a number of cell-wall polysaccharides that are removable by extraction with aqueous alkali and that may be hydrolyzed by boiling with dilute acids to give constituent monosaccharide units; any of the noncellulosic cell-wall polysaccharides.

D 1695, D01

hemic peat—peat in which the original plant fibers are moderately decomposed (between 33 and 67 % fibers).

D 653, D18

hemihydrate, *n*—the dry powder, calcium sulfate hemihydrate, resulting from calcination of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$, calcium sulfate dihydrate. See **calcined gypsum**.

C 11, C11

hemispherical, *adj*—see **hemispherical optical measuring system**.

E 284, E12

hemispherical, 2π —over an entire hemisphere. It is assumed that the incident radiance is uniform in density over the hemisphere.

E 772, E44

hemispherical optical measuring system, *n*—an optical measuring system for measuring the reflecting or transmitting properties of specimens, wherein either the specimen is uniformly irradiated from all directions within the hemisphere on one side of the specimen or the flux emanating from the specimen is evaluated uniformly for all directions within a hemisphere.

E 284, E12

hemispherical temperature (HT), *n*—*in reference to the fusibility of coal and coke ash according to Test Method D 1857*, the temperature at which the cone has fused down to a hemispherical lump at which point the height is one half the width of the base.

D 121, D05

hemispherical temperature, HT, *n*—the temperature at which a pyrometric cone has fused down to a hemispherical lump where the height is one half the width of the base.

D 5681, D34

hemispherical temperature, HT—the temperature at which the cone

has fused down to a hemispherical lump at which point the height is one half the width of the base.

D 5681, D34

hemostatic forceps—an instrument, available in various sizes and configurations, used in surgical procedures for the compression of blood vessels and the grasping of tissue.

F 921, F04

henry (plural henries), H—the unit of self- or mutual inductance.

The henry is the inductance of a circuit in which a voltage of 1 V is induced by a uniform rate of change 1 A/s in the circuit. Alternatively, it is the inductance of a circuit in which an electric current of 1 A/s produces a flux linkage of one weber turn (Wb turn) or 10^8 maxwell-turns. See **inductance, mutual, and inductance, self**.

A 340, A06

Henry's Law, *n*—the principle that the mass of a gas dissolved in a liquid is proportional to the pressure of the gas above the liquid.

D 4175, D02

Henry's Law, *n*—the principle that the ratio of partial pressure to mole fraction of gas in solution is a constant.

D 4175, D02

HEPA filter—see **high-efficiency particulate air filter**.

E 631, E06

HEPA filter—see **high-efficiency particulate air filter**.

E 1605, E06

herbaceous plants—nonwoody species of vegetation, usually of low lignin content such as grasses.

E 1705, E48

hermetically sealed aseptic container—a container that is designed and intended to be secure against the entry of microorganisms and thereby to maintain the commercial sterility of its contents.

F 17, F02

hermetically sealed aseptic container—See **Terminology F 17**.

F 1327, F02

hermetically tight seal—a seal which does not exhibit leakage when dynamically tested with commercially built leak detectors that are sensitive to a gas on the pressure side opposite to the side on which the leak detector is located, or which does not exhibit leakage with any form of liquid test.

E 1316, E07

hermetic seal—See **seal**.

D 996, D10

herringbone—a series of long continuous waves running at various angles to the rolling direction.

B 846, B05

herringbones, *n*—*in mica*, numerous rulings that intersect to form a series of "V's" with included angles of about 120° .

D 1711, D09

hertz, Hz—the unit of cyclic frequency, *f*.

A 340, A06

Hertzian cone crack—See **percussion cone**.

C 162, C14

Hertzian contact area, *n*—the apparent area of contact between two nonconforming solid bodies pressed against each other, as calculated from Hertz' equations of elastic deformation.

D 4175, D02

Hertzian contact area, *n*—the apparent area of contact between two nonconforming solid bodies pressed against each other, as calculated from Hertz' equations of elastic deformation.

G 40, G02

Hertzian contact pressure, *n*—the magnitude of the pressure at any specified location in a Hertzian contact area, as calculated from Hertz' equations of elastic deformation.

D 4175, D02

Hertzian contact pressure, *n*—the magnitude of the pressure at any specified location in a Hertzian contact area, as calculated from Hertz' equations of elastic deformation.

G 40, G02

Hertzian stress—See **contact stress**.

C 162, C14

Hertz line, *n*—a line of plot on logarithmic paper, where the coordinates are scar diameter in millimetres and applied load in kilograms-force (or newtons), obtained under static conditions.

D 4175, D02

Hertz scar diameter, *n*—the average diameter, in millimetres, of an indentation caused by the deformation of the balls under static load (prior to test). It may be calculated from the equation

$$D_h = 8.73 \times 10^{-2} (P)^{1/3}$$

where:

D_h = Hertz diameter of the contact area, and

P = the static applied load.

D 4175, D02

hesitation, *n*—a pause in the writing without the instrument being lifted.

E 2195, E30

heterogeneity

heterogeneity—having different properties at different points. (ISRM) **D 653, D18**

heterogeneity, *n*—the condition or degree of the population under which all items of the population are not identical with respect to the characteristic(s) of interest. **D 5681, D34**

heterogeneity, *n*—the condition of the population under which items of the population are not identical with respect to the characteristic of interest. **D 5681, D34**

heterogeneous—non-uniform in microstructure or composition. **E 7, E04**

heterogeneous, *adj*—consisting of dissimilar ingredients, constituents or compositions. **F 141, F06**

heterogeneous equilibrium—in a chemical system, a state of dynamic balance amongst two or more homogeneous phases which are capable of stable coexistence in mutual or sequential contact. **E 7, E04**

heterogeneous rubber flooring, *n*—a rubber floor surfacing material consisting of layers of dissimilar compositions or colors, or both. See also Specification F 1860. **F 141, F06**

heterogeneous vinyl flooring, *n*—a vinyl floor surfacing material consisting of layers of dissimilar compositions or colors, or both. **F 141, F06**

hex, *n*—abbreviation for **hexadecimal**. **F 1457, F05**

hexadecimal, *n*—a base-16 numbering system consisting of 16 different digits, 0 through 9 and A through F. (See **hex**.) **F 1457, F05**

hexagonal close packed:—(1) a structure containing two atoms per unit cell located at (0, 0, 0) and ($\frac{1}{2}$, $\frac{\sqrt{3}}{2}$, $\frac{1}{2}$) (or $\frac{2}{3}$, $\frac{1}{3}$, $\frac{1}{2}$).

(2) one of the two ways in which spherical objects can be most closely packed together, such that the close-packed planes are alternately staggered in the order A-B-A-B-A-B. **E 7, E04**

hexagonal (concerning lattices for crystals)—Having two equal coplanar axes, a_1 and a_2 , at 120 deg to each other and a third axis, c , at right angles to the other two; c may or may not be equal to a_1 and a_2 . **E 7, E04**

hexosan—frequently used in contradistinction to pentosan, for a polysaccharide consisting mainly of hexose units. **D 1695, D01**

Heyn method—an intercept method for determining grain size. See Test Methods E 112. **E 7, E04**

H-gasket—See **gasket, lock-strip, H-type**. **C 717, C24**

hickey, *n*—an imperfection caused by dirt, hardened ink, paper debris or other unwanted particles that cling to the press or plate during printing. **D 6488, D01**

hickey, *halo, n*—a doughnut shaped hickey with an inked center, often caused by foreign particles such as ink skin. **D 6488, D01**

hickey, *void, n*—a totally un-inked spot on the printed sheet, often caused by dust or pick-outs that adhere to the offset blanket or plate, thereby interfering with transfer of ink. **D 6488, D01**

hide—the pelt of a large animal, such as cow, horse, etc. Also used interchangeably with **Skin**. **D 1517, D31**

hide grades—standard hide grades, take-up, and delivery practice are given in the booklet, "Approved Standard Practice Governing the Take-Up and Delivery of Domestic Packer Hides," published by The Leather Industries of America, Inc., 1000 Thomas Jefferson Street NW, Suite 515, Washington, DC 20007. **D 1517, D31**

hide powder—purified, shredded rawhide as a reagent in the determination of tannins. **D 1517, D31**

Hide Powder, Standard—any lot of hide powder officially approved by the American Leather Chemists Association. **D 1517, D31**

hide substance—nitrogen content of hide or leather multiplied by 5.62. **D 1517, D31**

hiding—the ability of the applied polish to cover scuff marks made by scratches in the shoe finish. **D 2825, D21**

hiding power, *n*—the ability of a paint, or paint material as used, to hide or obscure (see **opacity**) a surface to which it has been uniformly applied. **D 16, D01**

hiding power, *n*—(1) the ability of a coating material to hide the surface coated by producing a specified opacity.

(2) the area over which a specified volume of paint can be spread to produce a specified contrast, C_c , between areas where the substrate is black and where it is white. **E 284, E12**

hierarchical experiment, *n*—see **nested experiment**. **E 456, E11**

hierarchical experiment, *n*—see **nested experiment**. **E 1325, E11**

high brackish water—water with an approximate concentration of total dissolved solids ranging from 10 000 to 30 000 mg/L. See **brackish water** and **sea water**. **D 6161, D19**

high-calcium—indicates the presence of 0 to 5 % magnesium carbonate ($MgCO_3$) in the limestone from which the material was formed. **C 51, C07**

high-calcium limestone—see **limestone**. **C 51, C07**

high-carbon steel—See **steel grades**. **F 547, F16**

high-center polygon—an ice-wedge polygon in which melting of the surrounding ice wedges has left the center in a relatively elevated position. **D 7099, D18**

high-clearance sprayer—an apparatus consisting of the components of a boom sprayer mounted on a self-propelled vehicle whose frame is constructed to permit the vehicle to pass over plants with minimum damage. **E 1102, E35**

high-conductivity copper—copper that in the annealed condition has a minimum electrical conductivity of 100 % IACS. **B 846, B05**

high crown—staple crown with inverted "V" wire cross-section prior to staple driving; designed to provide rigidity during driving and flattened when fully driven. (see "V" **Crown**.) **F 592, F16**

high-density fiberboard nail—See **shake nail, shingle nail, wood shingle** and **asbestos shingle nail**. **F 547, F16**

high-density particleboard—a particleboard as previously defined with a density greater than 800 kg/m³ (50 lb/ft³) based on a reported moisture content at the time of weight and volume measurements.

NOTE—It is the industry practice to measure density of particleboards on the basis of moisture content and volume at time of test.

D 1554, D07

high-density polyethylene plastics (HDPE), *n*—those linear polyethylene plastics, having a standard density of 0.941 g/cm³ or greater. (D20) **F 412, F17**

high density polyethylene plastics, (HDPE) *n*—those linear polyethylene plastics, g. v., having a standard density of 0.941 g/cm³ or greater. **D 883, D20**

high-efficiency particulate air (HEPA) filter—filter capable of separating out particles of 0.3 μ m or greater from a body of air at 99.97 % efficiency or greater. See also **ULPA filter**. **E 631, E06**

high-efficiency particulate air (HEPA) filter—filter capable of separating out particles of 0.3 μ m or greater from a body of air at 99.97 % efficiency or greater. See also. **E 1605, E06**

high elongation, *adj*—in **steel tire cord**, a cord with an average elongation at break greater than 3.0%. **D 123, D13**

high elongation, *adj*—in **steel tire cord**, a cord with an average elongation at break greater than 3.0%. **D 6477, D13**

higher heating value—the energy content of gas (Btu/ft³), measured at standard conditions, **HV**. **F 1827, F26**

higher heating value, HHV, *n*—a synonym for gross calorific value. **D 5681, D34**

higher heating value (HHV)—a synonym for gross calorific value. **E 856, D34**

high-hip girth, *n*—in **body measurements**, the circumference of the body at a point approximately 7.5 cm (3 in.) below the waist and parallel to the floor. (Compare **hip girth**.) **D 123, D13**

high-hip girth, *n*—the maximum horizontal circumference around the body, taken at high hip level approximately 7.5 cm (3 inches) below the waist level including the abdominal extension. **D 5219, D13**

high-hip height, *n*—the distance from the high-hip girth level to the hip girth level along the side of the body (contour) then vertically to the floor, taken with the subject standing and without shoes. **D 5219, D13**

high-level data link control, *n*—a CCITT standard for communication line protocol. (See HDLC.) F 1457, F05

high life expectancy, LE-100, *n*—of paper, a paper is expected to be usable for 100 years. D 1968, D06

high life expectancy paper, LE-100, *n*—for paper, a paper expected to be usable for 100 years when stored under prescribed conditions. D 1968, D06

highlighting lines, *n*—in label printing, horizontal, thick, divider lines placed above and below the package identification building block. F 1294, F05

high lights—those portions of a metal article most exposed to buffing or polishing operations, and, hence, having the highest luster. B 374, B08

highloft nonwoven fabric, *n*—a low-density fiber network structure characterized by a high ratio of thickness to mass per unit area. D 123, D13

high-modulus aramid, *n*—for the purpose of these test methods, those aramid yarns with an initial modulus of at least 400 gf/den (35 N/tex). D 123, D13

high-phosphate detergent—detergent that contains the phosphate equivalent of at least 5 % tri-sodium phosphate (TSP). E 631, E06

high point, High—the point on a force-displacement plot, at the start of an unloading-reloading cycle, at which the displacement reverses direction, that is, the point at which the specimen mouth begins closing due to unloading. E 1823, E08

high-pressure, (HP...), *adj*—a prefix for different thermoanalytical techniques in which the pressure in the apparatus is above ambient. (ICTAC)

NOTE—As an example, high-pressure thermogravimetric analysis is designated HPTGA. E 473, E37

high-pressure molding, *n*—a method of molding or laminating in which the pressure used is greater than 1400 kPa (200 psi). D 883, D20

high-pressure steam cooker—equipment wherein the cooking compartment operates between 10 psig and 15 psig. See steam cooker. F 1827, F26

high profile tile, *n*—tile having a rise to width ratio greater than 1:4. C 43, C15

high-purity water—highly treated water with attention to microbiological, particle, organics and mineral reduction or elimination. D 6161, D19

high referral, *adj*—in paper, descriptive of any grade of paper designed for use in situations involving frequent handling. D 1968, D06

high resistance—contact resistance exceeding an arbitrary, specified limit. B 542, B02

high-resolution NMR spectrometer—an NMR apparatus that is capable of producing, for a given isotope, line widths that are less than the majority of the chemical shifts and coupling constants for that isotope. E 131, E13

high ride—an amusement ride whose motion is in a fixed or variable plane from horizontal to vertical. F 747, F24

high strength bolts—term which is used commercially to denote ASTM A 325 or A 490 bolts which are primarily used in construction applications. F 1789, F16

high-strength low-alloy steel, *n*—a steel, other than a carbon steel or an interstitial-free steel, that conforms to a specification that requires the minimum content for each specified alloying element to be lower than the applicable limit in the definition for alloy steel, and the yield point or yield strength of the product to be at least 36 ksi or 250 MPa. A 941, A01

high surfactant oil concentrate—an emulsifiable oil based product containing 25–50% wt./wt. surfactant in a minimum of 50% wt./wt. oil. E 1519, E35

high temperature bolts—bolts that are specifically manufactured of high temperature alloys to sustain tensile loads at temperatures between 500°F and 1800°F, depending upon the alloy and processing during manufacture. F 1789, F16

high temperature fastener alloys—those alloys that will maintain their anticipated strength and characteristics within the high temperature range. F 1789, F16

high temperature for mechanical fasteners—this term is generally understood to refer to a temperature range of approximately 500°F (260°C) to 1800°F (982°C). F 1789, F16

high-tenacity fiber, *n*—a manufactured fiber either (1) belonging to a generic class of fibers having exceptional breaking strength; or (2) having a breaking strength significantly greater than the average strength of other (regular tenacity) fibers in the same generic class and of equivalent linear densities. D 123, D13

high-transmission glass—glass that transmits an exceptionally high percentage of the visible light. C 162, C14

high usage, *adj*—in paper folders, descriptive of any grade of folder designed for use in situations where folders are handled frequently. D 1968, D06

high volatile A bituminous coal—See high volatile A bituminous coal under rank. D 121, D05

high volatile B bituminous coal—See high volatile B bituminous coal under rank. D 121, D05

high volatile C bituminous coal—See high volatile C bituminous coal under rank. D 121, D05

high-voltage power supply, *n*—a source of electrical power which provides voltage above logic levels, usually internal to the component. (See HVPS.) F 1457, F05

hinge—the minimum thickness of gasket material between the channel recess and the lock-strip cavity; the plane at which bonding occurs when the flange is bent open to receive or release installed material. C 717, C24

hinge—location between boom segments at which the boom can be folded back 180° upon itself. F 818, F20

hinge nail—light or heavy, bright, regular-stock-steel, 1¼ by ⅜ to 4 by ⅜-in. nails with flat or oval countersunk (95°) or oval ¼ to ½-in. head and long diamond or chisel point. F 547, F16

hinge pin—an upright pivot used to connect the gate frame hinge to the post hinge, allowing a swing gate to open or close. See frame hinge and post hinge. F 552, F14

hinge stress—the tensile component of the bending stress generated on the same surface of a glass section as, but displaced from, the site of a locally impinging force. C 162, C14

hip, *n*—in anatomy, the laterally projecting region formed by the lateral parts of the pelvis and the upper part of the femur together with the flesh covering them. D 123, D13

hip, *n*—the laterally projecting region formed by the lateral parts of the pelvis and the upper part of the femur together with the flesh covering them. D 5219, D13

hip, *n*—in anatomy, the laterally projecting region formed by the lateral parts of the pelvis and the upper part of the femur together with the flesh covering them. F 1494, F23

hip and ridge, finishing pieces, *n*—in shingles, rectangular pieces of roofing shingles cut to a flare or taper and applied with a side lap to conceal the joint of roofing shingles along the hips and ridge of a roof. C 1154, C17

hip and ridge, finishing pieces—rectangular pieces of roofing shingles cut to a flare or taper and applied with a side lap to conceal the joint of roofing shingles along the hips and ridge of a roof. D 2946, C17

hip and ridge tile, *n*—tile designed for application to the hip or ridge of a roof. C 43, C15

hip girth, *n*—inbody measurements, the maximum circumference of the body at the level of maximum prominence of the buttocks. D 123, D13

hip girth, *n*—the maximum horizontal circumference around the body at hip height. D 5219, D13

hip girth, *n*—inbody measurements, the maximum circumference of the body at the level of maximum prominence of the buttocks. F 1494, F23

hip height, *n*

hip height, *n*—the vertical distance from the hip girth level to the floor along the side of the body, taken with subject standing and without shoes.

hip height (*infant special case*), *n*—the straight distance from the hip girth level to the soles of the feet along the side of the body, taken with subject lying down flat with legs extended and foot positioned at 1.57 rad (90°) to the leg.

D 5219, D13

histel—a suborder of gelisol that contains large quantities of organic matter.

D 7099, D18

historic fabric—See **fabric**.

E 631, E06

historic fabric—See **fabric**.

E 1480, E06

historic fabric, *n* (édificehistorique)—those portions of the building fabric that have historic significance.

E 631, E06

hit—the detection and measurement of an AE signal on a channel.

E 1316, E07

hit-and-miss—a manufacturing imperfection on planed lumber, defined by grade rules as a series of planer skips with surfaced areas between. Permitted depth of misses is usually specified.

D 9, D07

hitch-back—See **draw-back**.

D 3990, D13

hit-or-miss—a manufacturing imperfection on planed, rough, or partially planed lumber, providing a maximum permitted scantness.

D 9, D07

Hi-Vol (*high-volume air sampler*)—See **sampler**.

D 1356, D22

HOBE—an abbreviation for *honeycomb before expansion*; honeycomb made by layering sheets, usually of thin aluminum or paper, containing adhesive at the cell nodes.

E 631, E06

HOBE—an abbreviation for *honeycomb before expansion*; honeycomb made by layering sheets, usually of thin aluminum or paper, containing adhesive at the cell nodes.

E 1749, E06

hob nail—stout, regular-stock-steel, 3/8 to 5/8-in. nails with large decorative (high square, fancy, round bevel, checkered, grooved, etc.) head and sheared-bevel point.

F 547, F16

hockle, *n*—in rope, a strand kink in a rope causing yarn displacement in the strand resulting in rope deformation and damage.

D 123, D13

hogged fuel—ground wood fuel that is usually a by-product of a wood products manufacturing process.

E 772, E44

hogged fuel—ground wood fuel that is usually a by-product of a wood products manufacturing process.

E 1705, E48

hog ring—a preformed open wire clip designed to close up into a ring to secure chain link fabric to horizontal tension wire (see Specification F 626).

F 552, F14

hog ring, hog-ring staple—open-ended, rounded, ring, or rectangular “U”-formed staple; used for encircling applications, that is, for attaching materials to rounded or rectangular base material by closing or wrapping hog ring around base material.

F 592, F16

hold down—see **lockdown**.

F 335, F05

holding pump—a fore pump used to hold a vapor pump at operating conditions while a roughing pump reduces the system pressure to a point at which the valve between the vapor pump and the system can be opened without stopping the flow of vapor from the nozzles.

E 1316, E07

hold pressure, *n*—in molding, the melt pressure during the hold time interval in injection molding.

D 883, D20

hold time [T]—in *fatiguetesting*, the amount of time in the cycle where the controlled test variable (for example, force, strain, displacement) remains constant with time.

E 1823, E08

hole, *n*—in fabric, an imperfection where one or more yarns are sufficiently damaged to create an aperture.

D 123, D13

hole—*in inflatable restraintfabrics*, an opening not characteristic of the normal weave pattern where one or more yarns is cut, torn, or shifted.

D 123, D13

hole, *n*—in fabric, an imperfection where one or more yarns are sufficiently damaged to create an aperture.

D 3990, D13

hole, *n*—for inflatable restraint fabrics, an opening not characteristic of the normal weave pattern where one or more yarns is cut, torn, or shifted.

D 6799, D13

hole—a deep depression or void, the bottom of which is not visible by normal (20/20) vision under 200 fc illumination.

F 109, C21

hole-burning, *n*—in luminescence, the photo-induced disappearance of a narrow segment within a broader absorption or emission band.

E 131, E13

holes—openings in or through lumber that may extend partially or entirely through a piece and may be from any cause.

D 9, D07

hole spacing, *n*—on a button, the distance from the center of one hole to another.

D 123, D13

hole spacing, *n*—on a button, the distance from the center of one hole to another.

D 5497, D13

holiday—an area where a liquid-applied material is missing.

D 1079, D08

holland cloth, *n*—a completely filled woven fabric having a smooth gloss finish on both sides used as a separating medium for sheeted rubber compounds.

D 123, D13

holland cloth, *n*—a completely filled woven fabric (usually starch-filled linen) with a smooth glass-like finish on both sides, used as a separating medium for raw rubber and rubber compounds.

D 1566, D11

holland cloth, *n*—a completely filled woven fabric having a smooth gloss finish on both sides used as a separating medium for sheeted rubber compounds.

D 6477, D13

hollow braid, *n*—in rope, a braided construction of either plain or twill braid, having an empty center.

D 123, D13

hollow casting—See *drain casting* under **casting**.

C 242, C21

hollow characters, *n*—print defects in which the center of the dark area is lighter than the edge, such that the character appears to have a heavy outline.

F 1457, F05

hollow cone atomizer—a cone atomizer wherein most of the liquid is directed toward the outside of the spray pattern.

E 1620, E29

hollow cone pattern, *n*—a cone pattern wherein most of the liquid is concentrated near the outside of the pattern.

E 1620, E29

hollow fiber (HF) membrane—self-supporting membrane fibers which have a hollow bore like a cylinder. In reverse osmosis, the membrane is usually on the outside with the bore conveying the permeate. In ultra and micro filtrations the membrane may be on the inside or the outside of the fiber.

D 6161, D19

hollow masonry unit—unit whose net cross-sectional area in any plane parallel to the surface containing cores, cells, or deep frogs is less than 75 % of its gross cross-sectional area measured in the same plane.

C 1232, C15

hollow ware—a class of utensils such as pots, pans, and kettles.

C 286, B08

holocellulose—the total polysaccharide fraction of extractive-free wood. The method of isolation or of determination should always be given.

D 1695, D01

holography (acoustic)—an inspection system using the phase interface between the ultrasonic wave from an object and a reference signal to obtain an image of reflectors in the material under test.

E 1316, E07

holography (optical)—a technique for recording, and reconstructing, the amplitude and phase distributions of a wave disturbance; widely used as a method of three-dimensional optical image formation. The technique is accomplished by recording the pattern of interference between coherent light reflected from the object of interest (object beam), and light that comes directly from the same source (reference beam).

E 1316, E07

- Homal eyepiece*—See **amplifier**. E 7, E04
- home**, *n*—a place of residence. (See also **dwelling**.) E 631, E06
- home laundering**, *n*—a process by which textile products or parts thereof may be washed, bleached, dried, and pressed by any customary method designed for use in a residence, or nonprofessional use. (See also **professional care**.) D 123, D13
- home laundering**—the process of cleaning and restoring textile materials to a serviceable condition using the washing and drying equipment commonly found in the home. D 459, D12
- home laundering**, *n*—a process by which textile products or parts thereof may be washed, bleached, dried, and pressed by any customary method designed for use in a residence, or nonprofessional use. (See also **professional care**.) D 3136, D13
- homeostasis**, *n*—a complex interactive regulatory system by which the body strives to maintain a state of internal equilibrium. E 2035, E52
- homogeneity**—having the same properties at all points. (ISRM) D 653, D18
- homogeneity**—the uniformity of the characteristics of the packaged material across the entire packaging run determined for the purpose of demonstrating the suitability of the batch for its intended purpose. D 4175, D02
- homogeneity**, *n*—the condition of the population under which all items of the population are identical with respect to the characteristic(s) of interest. D 5681, D34
- homogeneous**, *adj*—the condition of a material in which the relevant properties (composition, structure, density, and so forth) are not a function of position for sample size used, so that a small sample taken from any location in an original body is representative of the whole. Practically, the geometrical dimensions of the sample must be large with respect to the size of the individual grains, crystals, components, pores or microcracks. C 1145, C28
- homogeneous carburizing**, *n*—a process that converts a low-carbon steel to one of substantially uniform and higher carbon content throughout the section, so that a specific response to **hardening** may be obtained. A 941, A01
- homogeneous mass**—a mass that exhibits essentially the same physical properties at every point throughout the mass. D 653, D18
- homogeneous material**, *n*—a material in which relevant properties are not a function of the position within the material. C 168, C16
- homogeneous membrane**—membrane with essentially the same structural and transport properties throughout its thickness. D 6161, D19
- homogeneous (radiation) (monochromatic)**—of the same wavelength. E 7, E04
- homogeneous surface**—surface that exhibits essentially the same appearance and properties at every point throughout the area examined. E 631, E06
- homogeneous vinyl flooring**, *n*—a floor surfacing unit in sheet or tile form that is of uniform structure and composition throughout, usually consisting of vinyl plastic resins, plasticizers, fillers, pigments and stabilizers. F 141, F06
- homogenization (raw rubber)**, *n*—repeated passage of raw rubber through a mill or other mixing device, under specified conditions, to ensure uniformity. D 1566, D11
- homogenizing**, *n*—holding a steel object at high temperature to eliminate or decrease chemical segregation by diffusion. A 941, A01
- homogenous rubber flooring**, *n*—a rubber floor surfacing material, in sheet or tile form, that is of uniform structure and composition throughout. It usually consists of compounded natural or synthetic rubbers, or both, in combination with mineral fillers, pigments, and other additives. See Specification F 1859. F 141, F06
- homologous lines**, *n*—in *atomic emission spectrometry*, spectral lines that exhibit minimal change in their intensity ratios with variations in excitation conditions. E 135, E01
- homologues of phenol**—compounds of the phenol series whose structure differs regularly by some radical (for example, $-\text{CH}_3$) from that of its adjacent neighbor in the series. Also *cresols* and *xyleneols*. D 4790, D16
- homopolymer**, *n*—a polymer resulting from polymerization involving a single monomer. D 883, D20
- homopolymer**, *n*—a polymer formed from a single monomer species. D 1566, D11
- homopolymer**, *n*—a polymer resulting from polymerization involving a single monomer. (D20) F 412, F17
- honed**—a non-reflective to semi-reflective superfine satin-like surface with no surface pattern, produced by mechanical abrasion. C 119, C18
- honeycomb**—advanced stage of decay caused by *Fomes pini*. D 9, D07
- honeycomb before expansion*—See **HOBE**. E 631, E06
- honeycomb before expansion*—See **HOBE**. E 1749, E06
- honeycomb core**—a sheet material, formed into cell structure (usually hexagonal) similar to honeycomb and used as core material in the construction of sandwich panel assemblies. E 631, E06
- honeycomb core**—a sheet material, formed into cell structure (usually hexagonal) similar to honeycomb and used as core material in the construction of sandwich panel assemblies. E 1749, E06
- honeycombing**—in lumber and other wood products, separation of the fibers in the interior of the piece, usually along the wood rays. The failures often are not visible on the surfaces, although they can be the extensions of surface and end checks. D 9, D07
- honeycomb sandwich panel**—sandwich constructions consisting of honeycomb core adhesively clad with face sheets. E 631, E06
- honeycomb sandwich panel**—sandwich constructions consisting of honeycomb core adhesively clad with face sheets. E 1749, E06
- honeycomb structure*—see **soil structure**. D 653, D18
- Hong Kong seam-finish**, *n*—a finish for the raw edges of a plain seam, in which a binding fabric encloses the raw edge of each seam allowance; the binding fabric has one raw edge enclosed and the other raw edge exposed. (Compare **bound seam-finish**.) D 123, D13
- Hong Kong seam finish**, *n*—in home sewing, a seam finish in which a binding fabric is used to encase the cut edge of each seam allowance separately and in which the binding fabric has one cut edge enclosed and the other cut edge exposed. (Compare **bound seam finish**.) D 4965, D13
- hood or dust cap**, *n*—a protective cap placed over the actuator to guard against inadvertent dispensing. D 6655, D10
- hood test**—an overall test in which an object under vacuum test is enclosed by a hood which is filled with tracer gas so as to subject all parts of the test object to examination at one time. A form of dynamic leak test in which the entire enclosure or a large portion of its external surface is exposed to the tracer gas while the interior is connected to a leak detector with the objective of determining the existence of leakage. E 1316, E07
- hood with integrated makeup air*—an exhaust hood that introduces makeup air through a plenum, as an integral part of the hood. Integral makeup air options include *down discharge*, *front face discharge*, or *internal discharge (short-circuit)*, or both. F 1827, F26
- hook**, *n*—an anchoring component that fastens to the spine by means of a curved blade passed under or over lamina, transverse or spinous processes or into an anatomic or surgically created notch or opening. F 1582, F04
- hook and loop fastener**—a touch fastener, comprised of two flexible mating strips, the surface of one mating strip being covered with tiny, stiff protrusions shaped like hooks which engage the other mating strip which is covered with pliable loops. D 123, D13
- hook blade**, *n*—that portion of a spinal hook that is placed under, over, or into a bony structure to provide attachment. F 1582, F04
- hook body**—that portion of a spinal hook that connects the hook blade to the longitudinal element. F 1582, F04
- hooked bow**, *n*—a fabric condition in which the filling yarns or knitted courses are in the proper position for most of the fabric

hooked bow, n

width but are pulled out of alignment at one side of the fabric. (See also **double hooked bow**)

D 123, D13

hooked bow, n—a fabric condition in which the filling or course yarns are in the proper position for most of the fabric width but are pulled out of alignment at one side of the fabric. (See also **double hooked bow**)

D 3990, D13

hooked bow, n—a fabric condition in which the filling yarns or knitted courses are in the proper position for most of the fabric width but are pulled out of alignment at one side of the fabric. (See also **double hooked bow.**)

D 4850, D13

hook head—head, usually flattened; formed by bending wire at right angle to shank; resulting in fastener shaped like “L.”

F 547, F16

hook-head metal-lath nail—See **metal-lath nail.**

F 547, F16

hooks, n—in *fibertesting*, curved or bent fiber ends caused by the carding or specimen preparation processes.

D 123, D13

hooks, n—in *fiber testing*, curved or bent fiber ends caused by the carding or specimen preparation processes.

D 7139, D13

hookup bundle, n—a group of insulated conductors or hookup cables grouped into an assembly prior to installation, usually with multiple breakouts.

D 1711, D09

hookup cable, n—two or more insulating conductors in a common covering, or two or more insulated conductors twisted or molded together without a common covering, or one or more insulated conductors with a conductive shield with or without an outer covering.

D 1711, D09

hookup wire, n—an insulated conductor that is used to make point-to-point connections in an electrical or electronic system.

D 1711, D09

hoop fastener nail—bright, blued or galvanized, regular-stock-steel, $\frac{3}{8}$ by 0.092 to 1 by 0.162-in. nails with thin flat $\frac{3}{8}$ to $\frac{1}{16}$ -in. long, 0.207 to $\frac{3}{8}$ -in. wide hook head and medium diamond point.

F 547, F16

hoop stress—the tensile stress in the wall of the pipe in the circumferential orientation due to internal hydrostatic pressure.

F 412, F17

hopper—the converging portion of a bin.

D 653, D18

horizon (soil horizon)—one of the layers of the soil profile, distinguished principally by its texture, color, structure, and chemical content.

“A” *horizon*—the uppermost layer of a soil profile from which inorganic colloids and other soluble materials have been leached. Usually contains remnants of organic life.

“B” *horizon*—the layer of a soil profile in which material leached from the overlying “A” horizon is accumulated.

“C” *horizon*—undisturbed parent material from which the overlying soil profile has been developed.

D 653, D18

horizontal bar code, n—a bar code symbol presented in such a manner that its overall length dimension is parallel to the horizon; also called, **picket fence.**

F 1294, F05

horizontal ladder gasket—a ladder gasket installed in a vertical plane in such a way that the intermediate cross members (muntins) are vertical members.

C 717, C24

horizontal shear—shear that occurs in planes parallel to the longitudinal axis of the member; sometimes referred to as longitudinal shear.

D 9, D07

horizontal sliding window—See **windows and doors.**

E 631, E06

horizontal traction (traction)—a force acting in a horizontal axis through the wheel transducer; that is, locked wheel drag force.

E 867, E17

hornification—the behavior of certain forms of cellulose and related materials on drying, which results in a lowered reactivity. This is apparently caused by the formation of new hydrogen bonds with a corresponding decrease in accessibility.

D 1695, D01

horsehide leather—leather made from the hide of a horse or a colt. (See also **cordovan** and **front.**)

D 1517, D31

horseshoe, n—a length of sliver folded in a manner such that the two ends can be fed simultaneously into the needle field of the Fibroliner FL-101.

D 123, D13

horseshoe, n—a length of sliver folded in a manner such that the two ends can be fed simultaneously into the needle field of the Fibroliner FL-101.

D 7139, D13

horsetail, n—a rough piece of shredded tire with a width of 2 to 4 in. (5.1 to 10.2 cm) and a length greater than 6 in. (15.2 cm).

D 5681, D34

hose, n—a flexible conduit consisting of a tube, reinforcement, and usually an outer cover.

D 1566, D11

hose—an electrical insulating tube with a longitudinal slit designed to be installed temporarily on energized electrical wires.

F 819, F18

hose assembly, n—a length of hose with a coupling attached to one or each end.

D 1566, D11

hose end sprayer—an apparatus designed to be attached to standard garden hose, consisting of a hand-held container for spray mixture with an integral metering head through which water from the garden hose flows. The metering head uses water pressure, siphon effect, or some other water powered means to meter the spray mixture into the water stream which is then atomized.

E 1102, E35

hose reinforcing wire, n—a single filament of steel wire with a metallic coating (usually brass) used in the reinforcement of a rubber or other elastomer hose

D 123, D13

hose reinforcing wire, n—a single filament of steel wire with a metallic coating (usually brass) used in the reinforcement of a rubber or other elastomer hose.

D 6477, D13

hosiery, n—any covering of the foot not intended for ground contact during ambulation, such as socks, stockings, etc.

F 1646, F13

hospital—a special department in the porcelain enamel shop where damage to fired ware may be repaired.

C 286, B08

host, n—a device or computer delivering the information to a server, in this case a printer.

F 1457, F05

hot-applied sealant, n—a compound that is applied in a molten state and cures primarily by cooling to ambient temperatures.

D 5535, D04

hot cathode—a heated element of a vacuum enclosed electrical system emitting electrons thermionically. It is maintained at a potential negative with respect to a second element to accelerate the emitted electrons.

E 7, E04

hot-cathode ionization gage—see **ionization vacuum gage.**

E 1316, E07

hot chocolate dispenser—commercial equipment designed to deliver a predetermined amount of hot chocolate flavored beverage.

F 1827, F26

hot-cold working, n—the mechanical deformation of austenitic and precipitation hardening steels at a temperature just below the **recrystallization temperature** to increase the yield strength and hardness by plastic deformation or precipitation hardening effects induced by plastic deformation, or both.

A 941, A01

hot corrosion—an accelerated corrosion of metal surfaces that results from the combined effect of oxidation and reactions with sulfur compounds and other contaminants, such as chlorides, to form a molten salt on a metal surface which fluxes, destroys, or disrupts the normal protective oxide.

G 15, G01

hot densification, n—the consolidation, at elevated temperature and pressure, of an unsintered, presintered, or sintered powder preform, or encapsulated or loose powder, to reduce porosity.

B 243, B09

hot dip coating—a metallic coating obtained by dipping the basis metal into a molten metal.

B 374, B08

hot dip galvanizing—immersion of fasteners in a bath of molten zinc for a controlled time period to obtain specified coating weight or thickness.

F 1789, F16

hot-dipped, hot-dip galvanized, hot-dipped zinc-coated—See **dipped.**

F 547, F16

hot-dip process, n—the application of a metallic coating on a steel product by immersion of the product in a bath of the molten metal which forms the coating; the coating may be applied in a continuous process or a batch process.

A 902, A05

- hot, dry climate**—desert climate distinguished as sunny, hot, and dry year round, with rare scattered showers. **G 113, G03**
- hot end**—those manufacturing operations concerned with hot glass, that is, melting, forming, annealing. **C 162, C14**
- hot-filament ionization gage**—see **ionization vacuum gage**.
E 1316, E07
- hot-flame reaction, *n***—a rapid, self-sustaining, luminous, sometimes audible, reaction of the sample or its decomposition products with the atmosphere. **D 4175, D02**
- hot forming**—heat is applied to wire or rod to enhance metal flow into dies using machine applied pressures as opposed to metal removal by cutting for forming purposes. **F 1789, F16**
- hot-galvanized, barrel-galvanized, flake-galvanized, tumbler-galvanized, wean-galvanized**—zinc coating applied in heated tumbling barrel containing zinc-flakes. **F 547, F16**
- hot-gas welding**—a technique for joining thermoplastics (usually sheets) in which the materials are first softened by a jet of hot gas from a welding gun. A rod of the same plastic is used to fill the heated gap and join the sheets at the same time pressure is applied by either the rod or the tip of the gun. Sometimes referred to as string bead welding. **C 904, C03**
- hot hold**—maintaining the temperature of an idled melter below its operating temperature but above the liquidus temperature of the glass. **C 162, C14**
- hot isostatic pressing, *n***—the pressing of a powder, compact, or sintered object by subjecting it, at elevated temperature, to nominally equal pressure from every direction. **B 243, B09**
- hot junction**—See **measuring junction**. **E 7, E04**
- hot-melt adhesive, *n***—a thermoplastic adhesive that is applied in a molten state and forms a bond upon cooling to a solid state. **D 907, D14**
- hot mold**—the process of forming glassware in hot uncoated molds. **C 162, C14**
- hot-plate welding**—see **butt welding (machine)**. **C 904, C03**
- hot pressing, *v***—pressure-assisted, low strain rate uniaxial densification of a powder preform, compact, or encapsulated or loose powder at a temperature sufficient to induce diffusion or creep. **B 243, B09**
- hot pressing**—See **hot pressing** under **pressing**. **C 242, C21**
- hot pressing, *n***—a fabrication of a ceramic component utilizing temperature and uniaxial pressure to achieve the desired density and shape formation. Densification is achieved by particle rearrangement, viscous/plastic flow, or diffusional transport, or both. **C 1145, C28**
- hot-pressing**—process for increasing the density of a wet-felted or air-felted mat of fibers or particles by pressing the dried, damp, or wet mat between platens of hot-press to compact and set the structure by simultaneous application of heat and pressure. **D 1554, D07**
- hot pressing**—the curing of thermosets by heat and pressure application. **E 631, E06**
- hot pressing**—the curing of thermosets by heat and pressure application. **E 1749, E06**
- hot quenching, *n***—an imprecise term used to cover a variety of quenching procedures in which the quenching medium is maintained at a prescribed temperature above 160 °F or 70 °C. **A 941, A01**
- hot repress powder forging, *n***—hot densification of a P/M preform by forging where the material flow is mainly in the direction of forging. **B 243, B09**
- hot-rolled drawing stock**—the as-rolled section, normally round, produced by hot rolling in a rod mill from a billet or wire bar. **B 354, B01**
- hot-setting adhesive, *n***—an adhesive that sets only with the application of heat. **D 907, D14**
- hot spot**—the zone of highest temperature within a melter. **C 162, C14**
- hot spot**—a localized area of soil or groundwater contamination. **D 5681, D34**
- hot spot, *n***—the area of a spray where the product concentration is high which can be visibly seen on a spray pattern as a concentrated stain on the alcohol-sensitive paper. **D 6655, D10**
- hot spring, *n***—a thermal spring whose temperature is above that of the human body. **E 957, E44**
- hot sticking, *n***—of **piston rings**, a condition in which the ring is stuck in its groove while the engine is running, normally indicated by varnish or other deposits on the outer face of the ring, by signs of blowby on the piston skirt, or both. **D 4175, D02**
- hot-stuck piston ring, *n***—in **internal combustion engines**, a piston ring that is stuck when the piston and ring are at room temperature, and inspection shows that it was stuck during engine operation. **D 4175, D02**
- “hot stuff” or “hot”**—a roofer’s term for hot bitumen. **D 1079, D08**
- hot-surface ignition temperature of a dust layer, *n***—lowest set temperature of the hot plate that causes ignition of the dust layer. **E 1445, E27**
- hot tack, *n***—the cohesive strength during the cooling stage before solidification of a heat seal bond formed by a wax-polymer blend. **D 4175, D02**
- hot top range**—equipment with a heavy cast-iron top on which pots and pans are placed, intended for heavy duty continuous cooking. See **range**. **F 1827, F26**
- hot upset powder forging, *n***—hot densification of a P/M preform by forging where there is a significant amount of lateral material flow. **B 243, B09**
- hot water extraction cleaning, *n***—a process in which a heated solution of detergent is sprayed into the textile material and immediately removed by a wet suction nozzle behind the spray-head. **D 123, D13**
- hot water extraction cleaning, *n***—a process in which a heated solution of detergent is sprayed into the textile material and immediately removed by a wet suction nozzle behind the spray-head. **D 5253, D13**
- hot worked structure**—the structure of a material worked at a temperature higher than the recrystallization temperature. **E 7, E04**
- hot working, *n***—mechanical deformation of a metal at temperatures above its **recrystallization temperature**. **A 941, A01**
- hot working**—controlled mechanical operations for shaping a product at temperatures above the recrystallization temperature. **B 846, B05**
- hot zone**—the area surrounding the heating element(s) or heat exchanger surface. **F 1827, F26**
- hours of operation, *n***—(heures d’exploitation): **E 631, E06**
- hours of operation, *n*** (heures d’exploitation):
active hours, n (heures d’activité)—times when a facility is normally fully occupied and operational.
silent hours, n (heures d’inactivité)—period when a facility is essentially unoccupied and only security and building operations staff are present.
transitional hours, n (heures de transition)—times in the morning after the first workers normally arrive, until a facility is fully operational, and in the evening from the end of normal work until the occupants have left. **E 1480, E06**
- house, *n***—a **building** intended in its entirety as a **dwelling**.
split-level house—one divided vertically so that the floor level of rooms in one part is approximately midway between the levels of two successive stories in an adjoining part. **E 631, E06**
house—See **building**. **E 631, E06**
- house depressurization, *n***—the situation, pertaining to a specific location in a house, whereby the static pressure at that location is lower than the static pressure in the immediate vicinity outside the house. **D 1356, D22**

house fuel, n

house fuel, n—*for octane rating*, an unleaded, straight hydrocarbon fuel used for engine warm-up and all non-octane rating testing.

D 4175, D02

household dirt, n—dirt commonly found in residential households, the specific compositions of which will vary from one environment to another and is removable with a household vacuum cleaner.

F 395, F11

household vacuum cleaner, n—a vacuum cleaner suitable for the normal cleaning tasks encountered in residences, in contrast to a commercial vacuum cleaner.

F 395, F11

house, n (maison)—**building** intended in its entirety as a **dwelling**.

E 631, E06

house, n (maison)—**building** intended in its entirety as a **dwelling**.

E 1480, E06

HPC—heterotrophic plate count. Formerly called SPC. **D 6161, D19**

H-test adhesion, n—the force to extract either end of a textile cord structure that is embedded in a rubber compound under specified conditions.

D 6477, D13

huck towel, n—a plain weave nonterry foundation product constructed with small warp and filling floats, having hems or selvages, which is used to dry a person's hands and utensils such as glasses, plates, bowls, and flatware.

D 123, D13

huck towel, n—a plain weave non-terry foundation product constructed with small warp and filling floats, having hems or selvages, which is used to dry a person's hands and utensils such as glasses, plates, bowls, and flatware.

D 7023, D13

HUD—U.S. Department of Housing and Urban Development.

E 631, E06

hue—the attribute of color perception by means of which a color is judged to be red, orange, yellow, green, blue, purple, or intermediate between adjacent pairs of these, considered in a closed ring, red and purple being an adjacent pair (white, gray, and black possess no hue).

C 242, C21

hue—under **color of an object**, see **hue**.

D 16, D01

hue, n—attribute of color perception by means of which objects are judged to be red, yellow, blue, or intermediate between some adjacent pair of these.

D 2946, C17

hue, n—see **color (of an object)**. (For consensus technical definition see **hue** in Terminology E 284.)

E 253, E18

hue, n—the attribute of color perception by means of which a color is judged to be red, orange, yellow, green, blue, purple, or intermediate between adjacent pairs of these, considered in a closed ring (red and purple being an adjacent pair.) (See also **Munsell hue**.)

NOTE—Neutral colors are judged to have no hue. **E 284, E12**

Hull cell—a trapezoidal box of nonconducting material with electrodes arranged to permit observation of cathodic or anodic effects over a wide range of current densities.

B 374, B08

Hull-Davey charts—charts for indexing the lines of powder patterns on which a function of the interplanar spacing of the Bragg angle is plotted against the axial ratio for a number of different lattice planes.

E 7, E04

Hull method (for X-ray crystal analysis)—See **Debye-Scherrer method**.

E 7, E04

human-readable interpretation, n—the letters, digits or other characters associated with specific symbol characters and printed along with the linear bar code or two-dimensional symbol. **F 1294, F05**

human resources, n—those elements of support or capability that are provided by humans using their mental and physical capabilities.

D 1356, D22

human tissue burn tolerance—in the testing of thermal protective materials, the amount of thermal energy predicted to cause a second-degree burn in human tissue.

F 1494, F23

humectant—a material which increases the equilibrium water content and increases the drying time of an aqueous spray deposit.

E 1519, E35

humic acid—a variety of water-soluble organic compounds, formed by the decayed vegetable matter, which is leached into a water source by runoff or percolation. Present in most surface and some

ground waters. Higher concentrations cause a brownish tint; difficult to remove except by adsorption, ultrafiltration, nanofiltration or reverse osmosis.

D 6161, D19

humic peat—see **sapric peat**.

D 653, D18

humidify—to increase, by any process, the quantity of water vapor within a given space.

E 41, G03

humidistat—a regulatory device, activated by changes in humidity, used for the automatic control of relative humidity.

E 41, G03

humidity, n—the condition of the atmosphere in respect to water vapor. (Compare **absolute humidity** and **relative humidity**.)

D 123, D13

humidity, n—a measure of the amount of water vapor in a gas. Also see **absolute humidity** and **relative humidity**.

D 1356, D22

humidity, n—the condition of the atmosphere in respect to water vapor. (Compare **absolute humidity** and **relative humidity**.)

D4920, D13

humidity—the condition of the atmosphere in respect to water vapor. (See also **humidity, absolute; humidity, relative**.)

E 41, G03

humidity, absolute, n—the mass of water vapor per unit volume.

C 168, C16

humidity, absolute—the mass of water vapor per unit volume of the atmosphere usually measured as grams per m³.

D 6161, D19

humidity, absolute—the weight of water vapor present in a unit volume of air, for example, grains per cubic foot, or grams per cubic metre.

NOTE—The amount of water vapor is also reported in terms of weight per unit weight of dry air, for example, grains per pound of dry air. This value differs from values calculated on a volume basis and should not be referred to as absolute humidity. It is designated as **humidity ratio, specific humidity**, or **moisture content**, which also see.

E 41, G03

humidity indicator—an instrument or device that displays the approximate humidity condition within a **package**.

D 996, D10

humidity range—See **operating humidity range of analyzer** under **analyzer**. See also **operating humidity range of sample** under **sample**.

D 1356, D22

humidity ratio—in a mixture of water vapor and air, the mass of water vapor per unit mass of dry air.

E 41, G03

humidity, relative, n—the ratio of the mol fraction of water vapor present in the air to the mol fraction of water vapor present in saturated air at the same temperature and barometric pressure. Approximately, it equals the ratio of the partial pressure or density of the water vapor in the air to the saturation pressure or density, respectively, at the same temperature.

C 168, C16

humidity, relative—the ratio of the actual pressure of existing water vapor to the maximum possible (saturation) pressure of water vapor in the atmosphere at the same temperature, expressed as a percentage.

D 6161, D19

humidity, relative—the ratio of the actual pressure of existing water vapor to the maximum possible (saturation) pressure of water vapor in the atmosphere at the same temperature, expressed as a percentage.

E 41, G03

humidity, specific—in a mixture of water vapor and air, the mass of water vapor per unit mass of moist air.

E 41, G03

humification—a process by which organic matter decomposes.

D 653, D18

humus—a brown or black material formed by the partial decomposition of vegetable or animal matter; the organic portion of soil.

D 653, D18

hung window—See **windows and doors**.

E 631, E06

Hunter color difference, n—color difference calculated by the use of the Hunter equations, based on the opponent-color coordinates, *L*, *a*, *b*, applied to CIE 1931 tristimulus values for CIE standard illuminant C, and by extension to the CIE 1964 standard observer and other CIE standard illuminants.

E 284, E12

Huygens eyepiece—an achromatic eyepiece invented by Huygens and consisting of a plano-convex eyelens and a plano-convex collective, between which is a field diaphragm.

E 7, E04

H₅₀ value, *n*—a drop height with a 50 % probability of reaction, as determined experimentally by the Bruceton up-and-down method.

E 1445, E27

HVPS—abbreviation for **high-voltage power supply**. **F 1457, F05**

hybar wire—flat wire normally used in box stitching. Specifically:

Gage No.	Cross-Sectional Dimensions, in. (mm)
000	0.060 by 0.017 (1.52 by 0.43)
00	0.060 by 0.018 (1.52 by 0.46)
0	0.060 by 0.019 (1.52 by 0.48)
1	0.060 by 0.020 (1.52 by 0.51)
2	0.060 by 0.024 (1.52 by 0.61)
3	0.060 by 0.028 (1.52 by 0.71)

F 592, F16

hybrid—(for composite materials) containing at least two distinct types of matrix or reinforcement. Each matrix or reinforcement type can be distinct because of its a) physical or mechanical properties, or both, b) material form, or c) chemical composition.

D 3878, D30

hybrid asymmetrical—this refers to a snowboard shape that is asymmetrical from side to side but symmetrical from tip to tail, allowing the same board to be used by both regular-foot and goofy-foot riders by reversing the direction of travel, but retaining the non-mirror image sidecut shapes of a full asymmetrical.

F 1107, F27

hybrid longitudinal element, *n*—a longitudinal element consisting of two or more types of longitudinal elements of different size or cross-section manufactured into a single element. **F 1582, F04**

hydrate—a solid, crystalline material composed of water and components of natural gas formed under pressure at temperatures above the freezing point of water.

D 4150, D03

hydrated lime—a dry powder obtained by treating quicklime with water enough to satisfy its chemical affinity for water under the conditions of its hydration. It consists essentially of calcium hydroxide or a mixture of calcium hydroxide and magnesium oxide or magnesium hydroxide, or both.

C 51, C07

hydrated lime—dry calcium hydroxide.

D 6161, D19

hydration, *n*—the chemical reaction between hydraulic cement and water forming new compounds most of which have strength-producing properties.

C 219, C01

hydration—formation of a compound by the combining of water with some other substance.

D 653, D18

hydration resistance, *n*—the degree to which a refractory material resists chemical combination with water. This resistance is measured by either Test Method C 456 or Test Method C 492, whichever is applicable.

C 71, C08

hydraulic atomizer—see **pressure atomizer**.

E 1620, E29

hydraulic cement, *n*—a cement that sets and hardens by chemical reaction with water and is capable of doing so under water.

C 125, C09

hydraulic cement, *n*—a cement that sets and hardens by chemical interaction with water and that is capable of doing so under water.

C 219, C01

hydraulic communication—the migration of fluids from one zone to another, with reference to this guide, especially along a casing grout plug, or through back fill materials.

D 653, D18

hydraulic conductivity—the volume of fluid passing through a unit cross section in unit time under the action of a unit hydraulic potential gradient. It is commonly expressed in cm/second or m/day.

D 7099, D18

hydraulic conductivity (field aquifer tests)—the volume of water at the existing kinematic viscosity that will move in a unit time under a unit hydraulic gradient through a unit area measured at right angles to the direction of flow.

D 653, D18

hydraulic conductivity (*k*), *n*—the rate of discharge of water under laminar flow conditions through a unit cross-sectional area of a porous medium under a unit hydraulic gradient and standard temperature conditions (20°C).

D 4439, D35

hydraulic conductivity ratio (HCR), *n*—the ratio of the hydraulic

conductivity of the soil/geotextile system, k_{sg} , at any time during the test, to the initial hydraulic conductivity, k_{sg0} , measured at the beginning of the test (new).

D 4439, D35

hydraulic diffusivity—the ratio of the hydraulic conductivity and the storage capacity of a groundwater aquifer.

D 7099, D18

hydraulic fluid, *n*—liquid used in hydraulic systems for transmitting power.

D 4175, D02

hydraulic fracturing—the fracturing of an underground strata by pumping water or grout under a pressure in excess of the tensile strength and confining pressure; also called hydrofracturing.

D 653, D18

hydraulic gradient—the change in total hydraulic head of water per unit distance of flow.

critical hydraulic gradient, *i_c* (D)—hydraulic gradient at which the intergranular pressure in a mass of cohesionless soil is reduced to zero by the upward flow of water.

D 653, D18

hydraulic gradient, *i, s* (D)—the loss of hydraulic head per unit distance of flow, dH/dL.

D 4439, D35

hydraulic hydrated lime—the hydrated dry cementitious product obtained by calcining a limestone containing silica and alumina to a temperature short of incipient fusion so as to form sufficient free lime (CaO) to permit hydration, and at the same time, leaving unhydrated sufficient calcium silicates to give a dry powder meeting hydraulic property requirements.

C 51, C07

hydraulic jump—an abrupt transition from supercritical flow to subcritical or tranquil flow, accompanied by considerable turbulence or gravity waves, or both.

D 4410, D19

hydraulic leathers—see **gasket leather**.

D 1517, D31

hydraulic mortar, *n*—deprecated term; see mortar.

C 219, C01

hydraulic mortar—a mortar that is capable of setting and hardening due to the interaction of water and the constituents of the mortar.

C 904, C03

hydraulic pressure test—Same as **hydrostatic test**.

E 1316, E07

hydraulic thawing—artificial thawing and removal of frozen ground by the use of a stream or jet of water under high pressure.

D 7099, D18

hydraulic transmissivity, θ (L² T⁻¹), *n*—for a geotextile or related product, the volumetric flow rate of water per unit width of specimen per unit gradient in a direction parallel to the plane of the specimen.

D 4439, D35

hydic soil—soil that is formed under conditions of saturation, flooding, or ponding long enough to develop anaerobic conditions in the upper part, thereby influencing the growth, survival, and reproduction of plants, microorganisms, and invertebrates.

E 943, E47

hydrocarbon dew point—(see **dew point**)

D 4150, D03

hydrocarbon plastics—plastics based on resins made by the polymerization of monomers composed of carbon and hydrogen only.

D 883, D20

hydrocarbon resins, *n*—plastic materials made by the polymerization of monomers composed of only hydrogen and carbon.

D 1566, D11

hydrocelluloses—water-insoluble products of the hydrolysis of cellulose with acids. They are molecularly heterogeneous in the sense that they are composed of molecules varying in degree of polymerization. The average degree of polymerization (DP) and the DP distribution depend on the nature of the acid treatment and of the original cellulose. The term may also be applied to any insoluble polysaccharide so formed and separated as a more or less homogeneous fraction from the mixture of products, but the singular form "hydrocellulose" should not be used without an article, to avoid the implication of a molecularly homogeneous species.

D 1695, D01

hydrochemical talik—a layer or body of unfrozen ground, at a temperature of less than 0°C, in a permafrost area, which remains unfrozen due to moving mineralized groundwater.

D 7099, D18

hydrocolloid, *n*—a water-soluble polymer of colloidal nature when hydrated.

F 2312, F04

hydrodynamic specific surface

hydrodynamic specific surface—the specific surface of a fibrous material as measured by the filtration resistance of a compacted pad formed from a fiber suspension under specified conditions.

D 1695, D01

hydrogen-assisted stress cracking (HASC)—crack growth as a result of the presence of hydrogen; it can be either IHE or EHE and sometimes is referred to as hydrogen stress cracking (HSC).

F 2078, F07

hydrogenated resin, n—a resin that has been subjected to some degree of reaction with hydrogen to decrease the level of residual unsaturation.

D 6440, D01

hydrogen blistering—the formation of blisters on or below a metal surface from excessive internal hydrogen pressure. (Hydrogen may be formed during cleaning, plating, corrosion, and so forth.)

G 15, G01

hydrogen cycle, n—the operation of a cation-exchange cycle wherein the removal of specified cations from the influent water is accomplished by exchange with an equivalent amount of hydrogen ion from the exchange material.

D 1129, D19

hydrogen embrittlement—embrittlement of a metal or alloy caused by absorption of hydrogen which may occur, for example, during pickling, cathodic cleaning, electroplating, and autocatalytic plating processes.

B 374, B08

hydrogen embrittlement—a permanent loss of ductility in a metal or alloy caused by hydrogen in combination with stress, either an externally applied or an internal residual stress.

F 2078, F07

hydrogen embrittlement—hydrogen-induced cracking or severe loss of ductility caused by the presence of hydrogen in the metal.

G 15, G01

hydrogen embrittlement, internal—see *internal hydrogen embrittlement*.

F 1789, F16

hydrogen embrittlement relief—process applied to fasteners which reduces or eliminates embrittlement caused by the absorption of hydrogen during processing. Normally, this is described as a baking operation.

F 1789, F16

hydrogen loss, n—the loss in weight of metal powder or of a compact caused by heating a representative sample for a specified time and temperature in a purified hydrogen atmosphere—broadly, a measure of the oxygen content of the sample when applied to materials containing only such oxides as are reducible with hydrogen and no hydride-forming element.

B 243, B09

hydrogen overvoltage—overvoltage associated with the liberation of hydrogen.

B 374, B08

hydrogen-reduced powder, n—powder produced by the reduction of a metal oxide in an atmosphere containing hydrogen.

B 243, B09

hydrogen sulfide (H₂S)—mol weight 34.08; flammable, poisonous gas with characteristic odor of rotten eggs.

D 4790, D16

hydrogen susceptibility ratio (Hsr)—the ratio of the threshold for the onset of hydrogen assisted cracking to the tensile strength of the material.

F 2078, F07

hydrogen treating—a refining process in which an unfinished petroleum insulating oil is contacted with hydrogen gas at elevated temperatures and pressures in the presence of a catalyst, to improve its color, odor, stability, and other properties.

D 2864, D27

hydrokinetic roof system, n—a roof system that depends on quick drainage via water shedding to prevent water entry into or through the system.

D 1079, D08

hydrologic unit—geologic strata that can be distinguished on the basis of capacity to yield and transmit fluids. Aquifers and confining units are types of hydrologic units. Boundaries of a hydrologic unit may not necessarily correspond either laterally or vertically to lithostratigraphic formations.

D 653, D18

hydrolysis—the act of cleaving or splitting of complex molecules by the chemical addition of a water molecule. Acid hydrolysis is defined as the chemical addition of water to a compound such as starch in the presence of an acid as a catalyst that will form another compound such as glucose.

E 1705, E48

hydrolytically degradable plastic, n—a degradable plastic in which the degradation results from hydrolysis.

D 883, D20

hydrolytically degradable plastics, n—See **degradable plastic**.

D 883, D20

hydrolytic stability, n—the ability to withstand the environmental effects of high humidity.

D 123, D13

hydrolytic stability, n—the resistance of a material to permanent changes in properties due to reaction with water.

D 4175, D02

hydrolytic stability, n—the ability to withstand the environmental effects of high humidity.

D 7023, D13

hydrometer-thermometer field tester, n—a device designed to indicate the freezing point of an engine coolant by measurement of the relative density of the coolant at a specific temperature.

D 4725, D15

Hydrophelicity—the property that defines a material as attracting water. Water exhibits an acute contact angle with hydrophilic materials.

D 653, D18

hydrophilic—(1) tending to absorb water. (2) tending to concentrate in the aqueous phase.

B 374, B08

hydrophilic—having an affinity for water.

D 1695, D01

hydrophilic—having an affinity for water.

D 6161, D19

hydrophilic emulsifier—see **emulsifier**.

E 1316, E07

hydrophilic (literally, water-loving)—a descriptive term applied to the group or radical of a surfactant molecule that makes or tends to make it soluble in water.

D 459, D12

hydrophobic—(1) tending to repel water. (2) lacking affinity for water.

B 374, B08

hydrophobic—having an antagonism to water.

D 1695, D01

hydrophobic—lacking an affinity to water.

D 6161, D19

hydrophobicity—the property that defines a material as being water repellent. Water exhibits an obtuse contact angle with hydrophobic materials.

D 653, D18

hydrophobic (literally, water-averting)—a descriptive term applied to the moiety of a surfactant molecule that makes it, or tends to make it, insoluble in water.

D 459, D12

hydroplaning (aquaplaning) of pneumatic tires, n—a phenomenon that occurs when the load-bearing surface of a pneumatic tire is separated from a solid surface by a substance (usually a fluid and usually water).

E 867, E17

hydroplaning, dynamic—see **dynamic hydroplaning**.

E 867, E17

hydroplaning, rubber reversion—see **rubber reversion hydroplaning**.

E 867, E17

hydroplaning speed, n—the initial speed at which a pneumatic tire begins to full dynamic hydroplaning under a given set of conditions.

E 867, E17

hydroplaning, viscous—see **viscous hydroplaning**.

E 867, E17

hydrostatic design basis—one of a series of established stress values specified in Test Method D 2837 for a plastic compound obtained by categorizing the long-term hydrostatic strength determined in accordance with Test Method D 2837.

F 412, F17

hydrostatic design stress (HDS)—the estimated maximum tensile stress the material is capable of withstanding continuously with a high degree of certainty that failure of the pipe will not occur. This stress is circumferential when internal hydrostatic water pressure is applied.

F 412, F17

hydrostatic head—the fluid pressure of formation water produced by the height of water above a given point.

D 653, D18

hydrostatic pressure, n—a state of stress in which all the principal stresses are equal (and there is no shear stress), as in a liquid at rest; the product of the unit weight of the liquid and the difference in elevation between the given point and the free liquid elevation.

C 717, C24

hydrostatic pressure—the pressure exerted by water at rest.

C 822, C13

hydrostatic pressure—a state of stress in which all the principal stresses are equal (and there is no shear stress). (ISRMI)

D 653, D18

hydrostatic pressure—see **hydrostatic strength**.

D 2946, C17

hydrostatic pressure, n—a state of stress in which all the principal

stresses are equal (and there is no shear stress), as in a liquid at rest; induced artificially by means of a gaged pressure system; the product of the unit weight of the liquid and the difference in elevation between the given point and the free water elevation.

D 4439, D35

hydrostatic pressure, u_o (FL⁻²)—a state of stress in which all the principal stresses are equal (and there is no shear stress), as in a liquid at rest; the product of the unit weight of the liquid and the difference in elevation between the given point and the free water elevation.

excess hydrostatic pressure (hydrostatic excess pressure), \bar{u}, u (FL⁻²)—the pressure that exists in pore water in excess of the hydrostatic pressure.

D 653, D18

hydrostatic roof system, n —a roof system that is capable of holding water without allowing water to penetrate the system. **D 1079, D08**

hydrostatic strength, n —*in pipes*, the ability of the pipe and coupling sleeve to withstand the forces resulting from internal pressure.

C 1154, C17

hydrostatic strength—the ability of a pipe, under specified conditions, to withstand internal pressure of specified magnitude.

D 2946, C17

hydrostatic test—a test of the ability of a pipe or its joint to withstand internal hydrostatic pressure.

C 822, C13

hydrostatic test—in leak testing, a pressure test in which the component being tested is filled completely with water or another liquid. Pressure, if required, is then applied to the liquid for the required time and the outside of the component is examined visually for leaks.

E 1316, E07

hydrothermal talik—a layer or body of unfrozen ground, at a temperature above 0°C, in an area of permafrost, which is maintained by moving groundwater.

D 7099, D18

hydrotrophy—the increase in solubility of a substance which is only slightly soluble in an aqueous system by the addition of a third substance. This third substance is called a “hydrotrope” or “hydrotropic agent.”

D 459, D12

(2-hydroxyethyl)cellulose—any of several cellulose ethers in which some of the hydroxyl groups have been substituted with hydroxyethyl groups. Hydroxyethyl cellulose, except at very low degrees of substitution, is water-soluble.

D 1695, D01

(2-hydroxyethyl)ethylcellulose—a mixed ether of cellulose containing both hydroxyethyl and ethyl groups.

D 1695, D01

(2-hydroxyethyl)methylcellulose—a mixed ether of cellulose containing both hydroxyethyl and methyl groups.

D 1695, D01

hydroxyl alkalinity—see **alkalinity**.

D 6161, D19

hydroxyl groups—the monovalent group —OH, characteristic of hydroxides and alcohols.

D 1695, D01

hydroxyl number, n —the number of milligrams of potassium hydroxide (KOH) equivalent to the hydroxyl content of 1 g of sample.

D 16, D01

hydroxyl number—the milligrams of potassium hydroxide equivalent to the hydroxyl content of 1 g of sample. In the case of a pure compound, the hydroxyl number is inversely proportional to the hydroxyl equivalent weight:

$$\text{equivalent weight (g/equivalent)} = 56100/\text{hydroxyl number}$$

E 1547, E15

(2-hydroxypropyl)methylcellulose—a mixed ether of cellulose containing both hydroxypropyl and methyl groups.

D 1695, D01

hygrochromic, adj —known to change color when the moisture content or relative humidity varies.

E 284, E12

hygrometer, n —any instrument for measuring the humidity of the atmosphere.

D 123, D13

hygrometer, n —an instrument for measuring the humidity of a gas. *dew-/frost-point hygrometer, n* —an instrument that measures the surface temperature at which ambient water vapor condenses.

electric hygrometer, n —an instrument that determines the water vapor content of an atmosphere by measuring the change in resistance or capacitance of hygroscopic material.

mechanical hygrometer, n —an instrument for determining the

water vapor content of an atmosphere by measuring the dimensional change produced in an hygroscopic material.

D 1356, D22

hygrometer, n —any instrument for measuring the humidity of the atmosphere.

D4920, D13

hygroscopic—attracting, absorbing, and retaining atmospheric moisture.

D 1079, D08

hygroscopic—attracting, absorbing, and retaining atmospheric moisture.

E 631, E06

hygroscopic—attracting, absorbing, and retaining atmospheric moisture.

E 1749, E06

hygroscopic capacity (hygroscopic coefficient), w_e (D)—ratio of: (1) the weight of water absorbed by a dry soil or rock in a saturated atmosphere at a given temperature, to (2) the weight of the oven-dried soil or rock.

D 653, D18

hygroscopic water content, w_H (D)—the water content of an air-dried soil or rock.

D 653, D18

hyperbaric chamber, n —a chamber in which the internal pressure can be elevated by the introduction of compressed air (or other gasses) that is used primarily for medical treatment (including decompression sickness and arterial gas embolism) and physiological studies.

F 1549, F32

hypereutectic alloy—any composition between the eutectic point and the composition of that solid phase, of the pair into which the eutectic liquid decomposes, which is considered the less important; thus, the identification of the hypereutectic range, as distinguished from the hypoeutectic range, is a matter either of personal preference, or a common usage for each alloy system.

E 7, E04

hypereutectoid alloy—any composition between the eutectoid point and the composition of that solid phase, of the pair into which the eutectoid solid phase decomposes, which is considered the less important; for the meaning of “important,” see **hypereutecticalloy**.

E 7, E04

hypereutectoid structure—the microstructure of a hypereutectoid alloy. For example, microstructural aggregate found in iron-carbon alloys which consist of primary crystals of cementite together with nodules of pearlite.

E 7, E04

hyperfiltration—separation of dissolved ions from a feed stream as in nanofiltration and reverse osmosis.

D 6161, D19

hypoeutectic alloy—any composition between the eutectic point and the composition of that solid phase, of the pair into which the eutectic liquid decomposes, which is considered the more important; for the meaning of “important,” see **hypereutecticalloy**.

E 7, E04

hypoeutectoid alloy—any composition between the eutectoid point and the composition of that solid phase, of the pair into which the eutectoid solid phase decomposes, which is considered the more important; for the meaning of “important,” see **hypereutecticalloy**.

E 7, E04

hypoeutectoid structure—the microstructure of a hypoeutectoid alloy. For example, the microstructural aggregate found in iron-carbon alloys which consist of primary crystals of ferrite together with nodules of pearlite.

E 7, E04

hypothesis, n —a supposition or conjecture put forward to account for certain facts and used as a basis for further investigation by which it may be proved or disproved.

D 5681, D34

hysteresis—the residual strain in stone after the stress causing such strain is changed.

C 119, C18

hysteresis—incomplete recovery of strain during unloading cycle due to energy consumption. (ISRM)

D 653, D18

hysteresis, n —the conversion of mechanical energy to heat in rubber undergoing strain.

D 1566, D11

hysteresis, n —the phenomenon taking place within rubber undergoing strain that causes conversion of mechanical energy to heat, and which, in the “rubbery” region of behavior (as distinct from the glassy or transition regions), produces forces essentially independent of frequency. (See also **hysteretic** and **viscous**.)

D 1566, D11

hysteresis—the maximum difference between corresponding transducer outputs (of the wheel force transducer system) at increasing

hysteresis

and decreasing applied calibration force, expressed as a percentage of full load output. Proven outliers are excluded. **E 867, E17**

hysteresis—(1) the lagging of the magnetic effect when the magnetic force acting upon a ferromagnetic body is changed.

(2) the phenomenon exhibited by a magnetic system wherein its state is influenced by its previous history. **E 1316, E07**

hysteresis diagram—*infatigue*, the stress-strain path during a cycle. **E 1823, E08**

hysteresis (electrode memory)—hysteresis is said to have occurred if, after the concentration has been changed and restored to its original value, there is a different potential observed. The reproducibility of the electrode will consequently be poor. The systematic error is generally in the direction of the concentration of the solution in which the electrode was previously immersed. **D 4127, D19**

hysteresis loop, *n*—the Lissajous figure, or closed curve, formed by plotting dynamic force against dynamic deflection for a complete cycle. **D 1566, D11**

hysteresis loop—the divergence between the paths of the adsorption and desorption isotherms. **D 2652, D28**

hysteresis loop, biased—an incremental hysteresis loop that lies entirely in any one quadrant.

NOTE—In this case, both of the limiting values of H and B are in the same direction. **A 340, A06**

hysteresis loop, incremental—the hysteresis loop, nonsymmetrical with respect to the B and H axes, exhibited by a ferromagnetic material in a CM condition.

NOTE—In this case, both of the limiting values H may have opposite polarity, but definitely have different absolute values of H_m . An incremental loop may be initiated at either some point on a normal hysteresis loop or at some point on the normal induction curve of the specimen. **A 340, A06**

hysteresis loop (in dynamic mechanical measurement)—the closed curve representing successive stress-strain status of the material during a cyclic deformation. (ISO) **D 4092, D20**

hysteresis loop, intrinsic—a hysteresis loop obtained with a ferromagnetic material by plotting (usually to rectangular coordinates) corresponding dc values of intrinsic induction, B_i , for ordinates and magnetic field strength H for abscissae. **A 340, A06**

hysteresis loop loss, W_h —the power expended in a single slow excursion around a normal hysteresis loop. The energy is the integrated area enclosed by the loop measured in gauss-oersteds. Using the cgs-emu system of units:

$$W_h = (\int HdB/4\pi) \text{ ergs}$$

where the integrated area enclosed by the loop is measured in gauss-oersteds. **A 340, A06**

hysteresis loop, normal—a closed curve obtained with a ferromagnetic material by plotting (usually to rectangular coordinates) corresponding dc values of magnetic induction (B) for ordinates and magnetic field strength (H) for abscissa when the material is passing through a complete cycle between equal definite limits of either magnetic field strength, $\pm H_m$, or magnetic induction, $\pm B_m$. In general, the normal hysteresis loop has mirror symmetry with respect to the origin of the B and H axes, but this may not be true for special materials. **A 340, A06**

hysteresis loss, *n*—the loss of mechanical energy due to hysteresis. **D 1566, D11**

hysteresis loss, *n*—per cycle, the amount of mechanical energy converted to heat due to straining; mathematically, the area within the hysteresis loop, having units of the product of force and length. **D 1566, D11**

hysteresis loss, incremental, $P_{\Delta h}$ —the power (watts) as a result of hysteresis expended in a ferromagnetic material while being driven through an incremental flux-current loop by a CM -type of excitation. **A 340, A06**

hysteresis loss, normal, P_h —(1) the power expended in a ferromagnetic material, as a result of hysteresis, when the material is subjected to a SCM excitation.

(2) The energy loss/cycle in a magnetic material as a result of magnetic hysteresis when the induction is cyclic (but not necessarily periodic). **A 340, A06**

hysteresis loss, rotational—the hysteresis loss that occurs in a body when subjected to a constant magnetizing force, the direction of which rotates with respect to the body, either in a continuously cyclic or in a repeated oscillatory manner. **A 340, A06**

hysteresis, magnetic—the property of a ferromagnetic material exhibited by the lack of correspondence between the changes in induction resulting from increasing magnetic field strength and from decreasing magnetic field strength. **A 340, A06**

hysteretic, *adj*—*as a modifier of damping*, descriptive of that type of damping in which the damping force is proportional to the amplitude of motion across the damping element. **D 1566, D11**

hysteretic angle, magnetic, β —the mean angle by which the fundamental component of exciting current leads the fundamental component of magnetizing current, I_m , in an inductor having a ferromagnetic core.

NOTE—Because of hysteresis, the instantaneous value of the hysteretic angle will vary during the cycle of SCM excitation. However, β is taken to be the mean effective value of this angle. **A 340, A06**

- I**—moment of inertia of the transformed section of the diaphragm based on webs or flanges, in.⁴ (or mm⁴) **E 631, E06**
- σ_1** —stress at crack initiation **F 2078, F07**
- IACS**—the International Annealed Copper Standard; an international standard of electrical conductivity. **E 1316, E07**
- IAQ, n**—see **indoor air quality**. **E 2114, E06**
- IC20**—a statistically or graphically estimated concentration of test material that, under specified conditions, is expected to cause a 20 % inhibition of a biological process (such as growth, reproduction, or bioluminescence) for which the data are not dichotomous. **D 5681, D34**
- IC50**—a statistically or graphically estimated concentration of test material that, under specified conditions, is expected to cause a 50 % inhibition of a biological process (such as growth or reproduction) for which the data are not dichotomous. **E 943, E47**
- ice**—a glass enamel frit which, when applied to glassware and fired, produces a textured surface. **C 162, C14**
- ice**—water in the frozen, solid, state. **D 7099, D18**
- ice-bearing permafrost**—permafrost that contains ice. **D 7099, D18**
- ice-bonded permafrost**—ice-bearing permafrost in which the soil particles are cemented together by ice. **D 7099, D18**
- ice boom**—boom intended for use in ice-infested waters, designed to withstand effects of ice contact. **F 818, F20**
- ice-bulb temperature**—See **temperature**. **D 1356, D22**
- ice, candled**—see **candleice**. **D 7099, D18**
- ice content**—(1) the ratio, expressed as a percentage, of the weight of the ice phase to the weight of dry soil; (2) the ratio, expressed as a fraction, of the volume of ice in a sample to the volume of the whole sample. In the volumetric calculation the ratio cannot exceed unity. In the gravimetric calculation, the percentage can exceed 100 %. **D 7099, D18**
- ice-cored topography**—topography that is due almost solely to differences in the amount of excess ice underlying the surface. **D 7099, D18**
- ice crystal**—a very small individual crystal or particle of ice visible in, or on, the face of a mass of soil or rock. Crystals may occur alone, or in combination with other ice formations. **D 7099, D18**
- ice dam**—a mass of ice formed at the transition from a warm to a cold roof surface. Frequently formed by refreezing meltwater at the overhang of a steep roof, an ice dam may cause ice and water to back up under shingles or other roofing materials. **D 1079, D08**
- ice, dry, n**—smooth ice without loose surface materials. **F 538, F09**
- ice, epigenetic**—see **epigenetic ice**. **D 7099, D18**
- ice, excess**—see **excessice**. **D 7099, D18**
- ice, frazil**—see **frazilice**. **D 7099, D18**
- ice lens**—a lens-shaped body of ice ranging in thickness from hairline to 0.3 m. Ice layers more than 0.3 m in thickness are better termed massive ice beds. **D 7099, D18**
- ice lenses**—lenticular formations of ice in soil occurring essentially parallel to each other, generally normal to the direction of heat loss, and commonly in repeated layers. **D 7099, D18**
- ice nucleation temperature**—the temperature at which ice first forms during freezing of a soil/water system that does not initially contain ice. **D 7099, D18**
- ice point, n**—thermometric fixed point of ice and water saturated with air at a pressure of 101 325 Pa. **E 344, E20**
- ice-rich permafrost**—perennially frozen ground that contains ice in excess of that required to fill pore spaces. **D 7099, D18**
- ice segregation**—the process of formation of segregated ice by freezing of water in mineral or organic soil. **D 7099, D18**
- ice tool, n**—a hand-held piece of equipment designed to assist climbers and mountaineers on ice or hard snow. **F 1773, F08**
- ice vein**—an ice-filled crack or fissure in the ground. **D 7099, D18**
- ice wedge**—a massive, wedge-shaped body of ice in soil, usually with its apex pointing downwards, and composed of foliated, or layered, vertically-orientated (commonly white) ice. Wedges may be as much as several metres wide at the top, and penetrate the soil to a feather edge at depths of several metres. These may be “active” or “inactive” depending on whether or not these are growing by repeated, but not necessarily annual, winter cracking. **D 7099, D18**
- ice wedge cast**—a filling of soil or sediment into the space formerly occupied by an ice wedge. **D 7099, D18**
- ice wedge polygon**—any polygon surrounded by troughs underlain by ice wedges. **D 7099, D18**
- ICI, n**—trademarked abbreviation for Imperial Chemical Industries. Do not use as the abbreviation for International Commission on Illumination; see **CIE**. **E 284, E12**
- iciness**—a qualitative term describing the quantity of ice in frozen ground. **D 7099, D18**
- icing**—a sheet-like mass of layered ice, formed either on the ground surface or on the surface of river or lake ice, by freezing of successive flows of water that may seep from the ground, flow from a spring or emerge from below river or lake ice through fractures. (**aufeis**, German; **naled**, Russian) **D 7099, D18**
- icing blister**—a seasonal frost mound consisting of ice only and formed at least in part through lifting of one or more layers of icing by injected water. **D 7099, D18**
- icing glade**—an area which remains free of trees and shrubs due to annual occurrences of icings. **D 7099, D18**
- icing mound**—a seasonal frost mound consisting exclusively of thinly-layered ice, which has been formed by the freezing of successive flows of water. **D 7099, D18**
- IC/TC, n**—abbreviation for Intelligent Color/Trash Coordinator. **D 123, D13**
- IC/TC, n**—abbreviation for Intelligent Color/Trash Coordinator. **D 7139, D13**
- ID**—inside dimensions or inside diameter. **D 996, D10**
- ID coil**—a coil or coil assembly used for electromagnetic testing by insertion into the test piece as in the case of an inside probe for tubing. Coils of this type are also referred to as inside coils, inserted coils, or bobbin coils. **E 1316, E07**
- ideal black, n**—object or material that absorbs all light impinging on it. **D 2946, C17**
- ideal crack**—a simplified model of a crack. In a stress-free body, the crack has two smooth surfaces that are coincident and join within the body along a smooth curve called the crack front; in two-dimensional representations the crack front is called the crack tip. **E 1823, E08**
- ideal-crack-tip stress field**—the singular stress field, infinitesimally close to the crack front, that results from loading an ideal crack. In a linear-elastic homogeneous body, the significant stress components vary inversely as the square root of the distance from the crack tip. **E 1823, E08**
- ideal gas**—a gas that obeys Boyle’s law and has zero heat of free expansion (or also obeys Charles’ law). Also known as a perfect gas. **E 1316, E07**
- identification**—the physical marking of property or, in some cases, its container, by which one or more of the following can be ascertained: ownership, classification, part, serial, model, description, contract, or unique organization designation. **E 2135, E53**
- identification**—See **grip mark**. **F 547, F16**
- identification (definite conclusion of identity)**—this is the highest degree of confidence expressed by document examiners in handwriting comparisons. The examiner has no reservations whatever, and although prohibited from using the word “fact,” the examiner is certain, based on evidence contained in the handwriting, that the writer of the known material actually wrote the writing in question. **Examples**—It has been concluded that John Doe wrote the questioned material, or it is my opinion [or conclusion] that John Doe of the known material wrote the questioned material. **E 1658, E30**
- identification limit, n**—for a qualitative chemical spot test kit, this is

identification limit, *n*

the lead content that yields a 50 % chance of either a positive or negative test result for a given sample matrix (1). E 631, E06

identity period—the distance between equivalent points in adjacent unit cells, usually measured in a direction parallel to a crystal axis. E 7, E04

idiomorphic crystal—single crystals that have grown without restraint so that the habit planes are clearly developed. E 7, E04

idle energy rate—the average rate of energy consumed (Btu/h or kW) by the equipment while it is “holding” the cooking medium, cavity, or surface (see **cooking medium, cooking cavity or cooking surface**) at the equipment’s thermostat set point, $E_{idle\ rate}$

$$E_{idle\ rate} = \frac{E_{idle} \times 60}{t_{idle}}$$

where:

- $E_{idle\ rate}$ = idle energy rate,
- E_{idle} = idle energy consumption, Btu, kWh or kJ, and,
- t_{idle} = length of idle test period, min.

F 1827, F26

idling time—time periods during which a size reduction device is freewheeling, that is, not processing refuse. D 5681, D34

IDT, *n*—abbreviation for Intelligent Data Terminal. D 123, D13

IDT, *n*—abbreviation for Intelligent Data Terminal. D 7139, D13

ignitability, *n*—the propensity to ignition, as measured by the time to sustained flaming, in seconds, at a specified heating flux. E 176, E05

ignitability, *n*—the propensity for ignition, as measured by the time to sustained flaming at a specified heating flux. E 176, E05

igniter, *n*—a material such as a small diameter wire that can burn under an electrical influence and is used to ignite the promoter. G 126, G04

ignition, *n*—the initiation of combustion. D 123, D13

ignition, *n*—the initiation of combustion. D 4391, D13

ignition, *n*—the initial combustion. D 5684, D13

ignition, *n*—the initiation of combustion. E 176, E05

ignition, *n*—the initiation of combustion. E 176, E05

ignition, *n*—the initiation of combustion. E 1445, E27

ignition, *n*—the initiation of combustion. F 819, F18

ignition, *n*—the initiation of combustion. F 1494, F23

ignition delay, *n*—that period of time, expressed in degrees of crank angle rotation, between the start of fuel injection and the start of combustion. D 4175, D02

ignition delay time, *n*—the time lapse between application of heat to a material and its ignition. It is the time in seconds between insertion of the sample into the flask and ignition. It is maximum at the minimum autoignition temperature and also referred to as ignition lag. E 1445, E27

ignition delay time, t_a , *n*—experimental parameter defined as the time interval between the initiation of the dust dispersion procedure (the time at which the dispersion air starts to enter the chamber) in an experimental apparatus and the activation of the ignition source. The ignition delay time characterizes the turbulence level prevailing at ignition under the defined test conditions. E 1445, E27

ignition loss, *n*—*in glass textiles*, the amount of organic material consumed by ignition. D 123, D13

ignition loss, *n*—*in glass textiles*, the amount of organic material consumed by ignition. D 7018, D13

ignition of a dust layer, *n*—initiation of self-heating or combustion in a material under test. E 1445, E27

ignition temperature, *n*—the lowest temperature at which sustained combustion of a material can be initiated under specified test conditions. E 176, E05

ignition temperature, *n*—the temperature at which a material will ignite an oxidant under specific test conditions. G 126, G04

ignition temperature (kindling point)—the lowest temperature at

which combustion will occur spontaneously under specified conditions. D 2652, D28

ignition time, *n*—time between the start of heating and the point at which the maximum temperature or flaming combustion is reached. E 1445, E27

illuminance—luminous irradiance. E 772, E44

illuminance—the density of luminous flux on a surface per unit area. Measured in the SI system by lux. E 1316, E07

illuminance, *E, E_v, n*—luminous flux incident per unit of area. E 284, E12

illuminant, *n*—*for color determination*, incident luminous flux, specified only by its spectral distribution (see Terminology E 284). D 2946, C17

illuminant, *n*—radiant flux that may be specified by its spectral power distribution, and that can, in illuminating objects, affect their perceived colors. E 284, E12

illuminant metamerism, *n*—the property of specimens having different spectral characteristics and having the same color when viewed by a normal observer under a given illuminant, but different colors when viewed under a different illuminant, other conditions remaining the same. E 284, E12

illuminant mode, *n*—color seen as ascribed to a source of illumination. E 284, E12

illumination, *n*—*in lighting*, the density or flux of light on a unit area of surface. D 123, D13

illumination, *n*—*in lighting*, the density or flux of light on a unit area of surface. D 7139, D13

illumination—See **brightfield, conical, darkfield, polarized light**. E 7, E04

illuminator, *n*—the portion of a radiometric or photometric instrument that provides the illuminating beam on the specimen, including the source, occasionally the monochromator or spectral filters, a diffuser such as an integrating sphere, if used, and associated optics. E 284, E12

illuminator plane, *n*—the plane containing the specimen normal and the axis of the illuminator. E 284, E12

ilmenite—a mineral having the theoretical composition FeO·TiO₂ used principally in the production of titanium oxide. C 242, C21

image—a representation of an object produced by means of radiation, usually with a lens or mirror system. E 7, E04

image—the optical counterpart of an object produced by means of an image-producing device. F 221, F05

image—the optical counterpart of an object produced by a lens or mirror system or the graphic representation of an object. F 335, F05

image area, *n*—that portion of the page which is printed, including the space between letters and lines. (See **percent coverage** and **maximum image area**.) F 1457, F05

image color—appearance of the image dependent upon the spectral reflectance of the image, the spectral composition of the incident light, and the spectral response of the observer. F 221, F05

image data file—a digital file containing radiological image and text information. E 1316, E07

image definition—see **definition**. E 1316, E07

image density—the contrast between image and background as measured by densitometer. F 221, F05

image density—the optical density of the developed image as detected by the eye, or measured by a reflection densitometer. F 335, F05

image density, *n*—a perception of the image darkness as detected by the eye or measured by a reflection densitometer, where the image density is the log to the base ten of the reciprocal of the reflectance. (See **reflectance**.) F 1457, F05

image density, *n*—a measure of the reflectance or density of the imaged portion of a thermal imaging product after exposure to heat energy; typically measured with a densitometer, reflectometer, or opacimeter. F 1623, F05

image depth profile—AES, XPS, SIMS, a three-dimensional representation of the spatial distribution of a particular elemental or molecular species (as indicated by emitted secondary ions or electrons) as a function of depth or material removed by sputtering. **E 673, E42**

image processing—a method whereby digital image data is transformed through a mathematical function. **E 1316, E07**

image processing, n—techniques for filtering, storing and retrieving images, and for processing pictorial information by computer. **F 1294, F05**

image processing, in image analysis—the computer modification of a digitized image on a pixel-by-pixel basis to emphasize or de-emphasize certain aspects of the image. **E 7, E04**

image quality indicator—a device or combination of devices whose image or images on a neutron radiograph provide visual or quantitative data, or both, concerning the radiographic sensitivity of the particular neutron radiograph. **E 1316, E07**

image quality indicator (IQI)—in industrial radiology, a device or combination of devices whose demonstrated image or images provide visual or quantitative data, or both, to determine radiologic quality and sensitivity. Also known as a penetrameter (disparaged).

NOTE—It is not intended for use in judging size nor establishing acceptance limits of discontinuities. **E 1316, E07**

image rotation—in electron optics, the angular shift of the electron image of an object about the optic axis induced by the tangential component of force exerted on the electrons perpendicular to the direction of motion in the field of a magnetic lens. **E 7, E04**

image well—an imaginary well located opposite a control well such that a boundary is the perpendicular bisector of a straight line connecting the control and image wells; used to simulate the effect of a boundary on water-level changes. **D 653, D18**

imaging line scanner—an apparatus that scans in a single dimension and is moved perpendicular to the scan direction to produce a two-dimensional thermogram of a scene. **E 1316, E07**

immature fibers, n—(1) (cotton fibers treated with sodium hydroxide solution)—fibers that either (a) have swollen and assumed a spiral form, or (b) remained flat, thinly outlined, and almost transparent. Total wall width is less than the lumen width.

(2) (cotton fibers observed under polarized light)—fibers that appear purple, indigo, or blue, turn orange or yellow-orange upon rotation to the subtractive position, and upon removal of the selenite plate show parallel extinction. (Compare **mature fibers**.) **D 123, D13**

immature fibers, n—(1) (cotton fibers treated with sodium hydroxide solution)—fibers that either (a) have swollen and assumed a spiral form, or (b) remained flat, thinly outlined, and almost transparent. Total wall width is less than the lumen width.

(2) (cotton fibers observed under polarized light)—fibers that appear purple, indigo, or blue, turn orange or yellow-orange upon rotation to the subtractive position, and upon removal of the selenite plate show parallel extinction. (Compare **mature fibers**.) **D 7139, D13**

immediate elastic recovery, n—recoverable deformation which is essentially independent of time, that is, occurring in (a time approaching) zero time and recoverable in (a time approaching) zero time after removal of the applied force. (See **delayed deformation**.) **D 123, D13**

immediate elastic recovery, n—recoverable deformation which is essentially independent of time, that is, occurring in (a time approaching) zero time and recoverable in (a time approaching) zero time after removal of the applied force. (Compare **delayed-deformation** and **delayed elastic recovery**.) **D 4848, D13**

immediate seizure region, n—that region of the scar-load curve characterized by seizure or welding at the startup or by large wear scars. **D 4175, D02**

immersed cure—the method of setting or hardening asbestos-cement products by immersion in water or in an aqueous solution,

resulting in modified chemical activity between the cementitious components with an increase or decrease in the rate of cure. **D 2946, C17**

immersed membrane—MF/UF membranes immersed in the water to be filtered, where the transmembrane pressure is applied by suction to the permeate side. **D 6161, D19**

immersion error, n—an error caused by the heat conduction or radiation, or both, between the resistance thermometer element and the environment external to the measurement system, because of insufficient immersion length and thermal contact of the thermometer with the medium under measurement. **E 344, E20**

immersion lens—See **immersion objective**. **E 7, E04**

immersion objective—an objective in which a medium of high refractive index is used in the object space to increase the numerical aperture and hence the resolving power of the lens. **E 7, E04**

immersion objective (electron optics)—a lens system in which the object space is at a potential (or in a medium of index of refraction) different from that of the image space. **E 7, E04**

immersion plate—a metallic deposit produced by a displacement reaction in which one metal displaces another from solution, for example:

B 374, B08

immersion rinse—a means of removing excess penetrant in which the test parts are dipped into an agitated tank of water or remover. **E 1316, E07**

immersion rinse—a means of removing surface penetrant, in which the test part is immersed in a tank of either water or remover. **E 1316, E07**

immersion testing—an ultrasonic examination method in which the search unit and the test part are submerged (at least locally) in a fluid, usually water. **E 1316, E07**

immobilization, n—the entrapment of materials, such as cells, tissues, or proteins within, or bound to, a matrix. **F 2312, F04**

immunity—a state of resistance to corrosion or anodic dissolution of a metal caused by thermodynamic stability of the metal. **G 15, G01**

impact angle, n—in *impingement erosion*, an angle that could be either the **angle of attack** or the **angle of incidence**, which see. Because of this ambiguity, this term should be specially defined when used or, preferably, used only in contexts where the ambiguity does not matter. **G 40, G02**

impact apparatus or machine, n—the total apparatus including the foundation parts, guide rails, electromagnet lift, winch, and tools. **E 1445, E27**

impact atomizer—a pressure atomizer in which a spray pattern is achieved by the impaction of one or more liquid jets against a solid surface. **E 1620, E29**

impact bending—application of an impact load in bending to obtain a measure of the ability of wood to absorb shock loads. **D 9, D07**

impact bruise—See **percussion cone**. **C 162, C14**

impact-ignition resistance, n—the resistance of a material to ignition when struck by an object in an oxygen-enriched atmosphere under a specific test procedure. **G 126, G04**

impact insulation class, IIC—a single-number rating derived from measured values of normalized impact sound pressure levels in accordance with Annex A1 of Test Method E 492. It provides an estimate of the impact sound insulating performance of a floor-ceiling assembly. **C 634, E33**

impaction, n—a forcible contact of particles of matter, a term often used synonymously with impingement. **D 1356, D22**

impact, Izod—a specific type of impact test made with a pendulum-type machine on a cantilever beam specimen and also the values obtained by this method. **F 412, F17**

impact loading—in hardness testing, a phenomenon in which a

impact loading

momentary overload is inadvertently applied to the indenter by the inertia of parts of the tester subjected to large accelerations.

E 7, E04

impactor, *n*—a device for collecting airborne or emission particulate matter in which the air or gas being sampled is impacted or impinging against a surface.

cascade impactor, *n*—a type of impactor which employs several stages of impaction in series to collect successively smaller sizes of particles. D 1356, D22

impact pressure range—the variation in an imaging device due to type font width, on feet, impact, and other adjustments inherent in the device. F 221, F05

impact printer—a printer in which printing is the result of mechanical impacts. See **chain printer**, **drum printer**, **element printer**, **dot matrix**. F 909, F05

impact resistance, *n*—resistance to fracture under the sudden application of an external force. D 123, D13

impact resistance, *n*—resistance to fracture under shock force. D 1566, D11

impact sensitive—the property of a carbon paper, ribbon, or paper to produce an image from impact (as with a typewriter). F 221, F05

impact strength, *n*—the kinetic energy per area absorbed by an adhesively-bonded joint when fractured by shock loading. D 907, D14

impact strength—the property of a particle to resist physical breakdown when subjected to a rapidly increasing applied force. D 2652, D28

impact strength—often referred to as impact energy; it is the amount of energy required to fracture a fastener, usually measured by either an Izod or Charpy test. F 1789, F16

impact surface, *n*—an interior or exterior surface that is subject to damage by repeated sudden force, such as certain parts of doorframes. E 1605, E06

impact test—a test to determine the resistance of a porcelain enamel to fracture caused by a sudden blow. C 286, B08

impact tester, *n*—a device for dropping a cylindrical weight from a variable height onto a coated metal test panel; the greater the height required to produce cracks in the coating, the greater its impact resistance. D 16, D01

impact tool, *n*—the drop weight, intermediate weight, and anvil. E 1445, E27

impact, tup—a falling weight (tup) impact test developed specifically for pipe and fittings. F 412, F17

impact velocity, *n*—in *impingement erosion*, the relative velocity between the surface of a solid body and an impinging liquid or solid particle. G 40, G02

impact wear, *n*—wear due to collisions between two solid bodies where some component of the motion is perpendicular to the tangential plane of contact. G 40, G02

impedance—the total opposition that a circuit presents to the flow of an alternating current, specifically the complex quotient of voltage divided by current. E 1316, E07

impedance, acoustic—the product of the density and sonic velocity of a material. The extent of wave energy transmission and reflection at the boundary of two media is determined by their acoustic impedances. (ISRM) D 653, D18

impedance (acoustic)—a mathematical quantity used in computation of reflection characteristics at boundaries; product of wave velocity and material density. E 1316, E07

impedance analysis—in electromagnetic testing, an analytical method that consists of correlating changes in the amplitude, phase, or quadrature components, or all of these, of a complex test signal voltage to the electromagnetic conditions within the test specimen. E 1316, E07

impedance plane diagram—a graphical representation of the locus of points, indicating the variations in the impedance of a test coil as a function of basic test parameters. E 1316, E07

impedance ratio, $z/\rho c \equiv r/\rho c + jx/\rho c$; [dimensionless]—the ratio of

the specific normal acoustic impedance at a surface to the characteristic impedance of the medium. The real and imaginary components are called, respectively, **resistance ratio** and **reactance ratio**. C 634, E33

impedance, Z—the ratio of the time dependent voltage, $v(t)$, across a circuit, a circuit element, or material to the time dependent current, $i(t)$, through it; that is:

$$Z = v(t)/i(t)$$

E 1142, E37

imperfection, *n*—a material discontinuity or irregularity that is detectable by **inspection**. A 941, A01

imperfection—any defect or blemish in or on wood that detracts from its appearance or lowers its utility. In grading rules, a class of limitation on manufacturing practice. D 9, D07

imperfection, *n*—a departure of a quality characteristic from its intended level or state. D 123, D13

imperfection, *n*—a departure of a quality characteristic from its intended level or state. D 6799, D13

imperfection, *n*—a departure of a quality characteristic from its intended condition. E 1316, E07

imperial gallon (IG)—1.2 times U.S. gallon. D 6161, D19

impermeable boundary—the conceptual representation of a natural feature such as a fault or depositional contact that places a boundary of significantly less-permeable material laterally adjacent to an aquifer. D 653, D18

impervious, *adj*—describes the state of having obtained that degree of vitrification evidenced visually by resistance to penetration of a specified dye. C 43, C15

impervious—that degree of vitrification evidenced visually by complete resistance to dye penetration. C 242, C21

impervious carbon, *n*—the same as impervious graphite with the exception that the base stock has not been graphitized. C 709, D02

impervious carbon, *n*—the same as impervious graphite with the exception that the base stock has not been graphitized. D 4175, D02

impervious graphite, *n*—manufactured graphite that has been impregnated with a resinous material to make the final article impervious to liquids in the recommended operating range. C 709, D02

impervious graphite, *n*—manufactured graphite that has been impregnated with a resinous material to make the final article impervious to liquids in the recommended operating range. D 4175, D02

impingement, *n*—the act of bringing matter forcibly in contact.

dry impingement, *n*—the process of impingement carried out so that particulate matter carried in the gas stream is retained upon the surface against which the stream is directed.

wet impingement, *n*—the process of impingement carried out within a body of liquid, the latter serving to retain the particulate matter. D 1356, D22

impingement, *n*—in *tribology*, a process resulting in a continuing succession of impacts between (liquid or solid) particles and a solid surface. G 40, G02

impingement atomizer—in rocketry, an impinging jet atomizer; in industrial processing, an impact atomizer.

NOTE—Since this term is ambiguous, it is not recommended for describing either device. E 1620, E29

impingement attack, *n*—deprecated term for **impingement corrosion**. (The latter term is preferred so as to avoid confusion with **liquid impingement erosion**.) G 40, G02

impingement corrosion—a form of erosion-corrosion generally associated with the local impingement of a high-velocity, flowing fluid against a solid surface. G 15, G01

impingement corrosion, *n*—a form of erosion-corrosion generally associated with the impingement of a high-velocity, flowing liquid containing air bubbles against a solid surface. G 40, G02

impinger, *n*—broadly, a sampling instrument employing impingement of the collection of particulate matter.

- midget impinger, n*—a specific instrument employing wet impingement, using a liquid volume of 10 mL and a gas flow of 2.8 L/min.
- standard impinger, n*—a specific instrument employing wet impingement, using a liquid volume of 75 mL and a gas flow of 28 L/min. **D 1356, D22**
- impinging jet atomizer**—a pressure atomizer in which atomization is achieved by the external collision of two or more liquid jets. **E 1620, E29**
- implantation, n**—the procedure of inserting materials such as a cell(s), tissue(s), or organ(s) for therapeutic purposes. Synonym: *graft* or *grafting*. TEMPs may be applied to a recipient by implantation or grafting. **F 2312, F04**
- importance factor, n** (coefficient d'importance)—*of a facility requirement*, a numerical indication of the relative importance of a requirement for serviceability, expressed on a scale of 0 to 9, with 0 being not related, 1 being relevant but least important, and 9 being most important. **E 631, E06**
- importance factor, n** (coefficient d'importance)—*of a facility requirement*, a numerical indication of the relative importance of a requirement for serviceability, expressed on a scale of 0 to 9, with 0 being not related, 1 being relevant but least important, and 9 being most important. **E 1480, E06**
- impreg**—wood impregnated with synthetic resin that is cured in place so as to reduce materially swelling and shrinking of the wood on exposure to varying environmental conditions. **D 1038, D07**
- impregnate, v**—in roofing materials manufacture, to completely surround the fibers in a felt or mat with bitumen, with the spaces between the fibers partially or completely filled without a continuous coating of bitumen on the surface. **D 1079, D08**
- impregnate, vt**—to saturate the fiber insulation of wires with a high-temperature electrical insulating compound to form a moisture barrier around the wires and to inhibit fraying of the fibers. **E 344, E20**
- impregnated fabric, n**—a fabric in which the interstices between the yarns are completely filled with the impregnating compound throughout the thickness of the fabric, as distinguished from sized or coated fabrics, where these interstices are not completely filled. **D 123, D13**
- impregnated fabric, n**—a fabric in which the interstices between the yarns are completely filled with the impregnating compound throughout the thickness of the fabric, as distinguished from sized or coated fabrics, where these interstices are not completely filled. **D 4850, D13**
- impregnation, n**—a process of filling the pores of a sintered compact, with a nonmetallic material such as oil, wax, or resin. **B 243, B09**
- impregnation, n**—partial filling of the open pore structure with another material. **C 709, D02**
- impregnation, n**—partial filling of the open pore structure with another material. **D 4175, D02**
- impregnation time of paper, n**—the time in seconds required for a liquid of specified composition and viscosity to penetrate completely from one face of a sheet of paper to the other under certain prescribed conditions. **D 1711, D09**
- impressed current**—an electric current supplied by a device employing a power source that is external to the electrode system. (An example is dc current for cathodic protection.) **G 15, G01**
- impression: (1) electron microscopy**—the reproduction of the surface contours of a specimen formed in a plastic material after the application of pressure and heat, or both.
- (2) *hardness*—the imprint or dent made in the specimen by the indenter of a hardness-measuring device. **E 7, E04**
- impression replica*—See **replica**. **E 7, E04**
- impressions per ribbon**—the average number of characters which can be printed from a given ribbon on a given typewriter or printer of specified print quality under specific usage conditions. **F 221, F05**
- imprinter, pressure**—any device used to produce or impress marks or patterns on a surface, for example, a device such as that used with credit cards and address plates. **F 909, F05**
- imprinting**—(1) The act of using an imprinter; **F 909, F05**
- (2) The output of any imprinter.
- improve, v**—to enhance the quality or value of land or property. **E 631, E06**
- improve*—See **building modification**. **E 631, E06**
- impulsive sound, n**—a brief, intrusive sound, such as that associated with a tire blowout, operation of a punch press, the discharge of a firearm, a door slam, or a shout, usually characterized by a rapid rise time in the initial pressure pulse of less than a few milliseconds, and by a decay time of less than a few seconds. **C 634, E33**
- impure coal*—See *impure coal* under **coal**. **D 121, D05**
- impurities, of a biological drug product**—all process-related (non-adventitious) substances present in the raw materials, bulk drug, or final drug product that are not considered to be the active material, additives, or excipients. **E 1705, E48**
- impurity, n**—any component present in a raw material, intermediate, API, or dosage form that is not the desired entity. **E 2363, E55**
- impurity profile, n**—a description of the identified and unidentified impurities present in a raw material, intermediate, API, or dosage form. **E 2363, E55**
- imputation, n**—the act of putting onto a data set estimated values for that data to fill in for missing values or to replace erroneous values. **E 867, E17**
- inactive ice wedge**—an ice wedge that is no longer growing. **D 7099, D18**
- inactive rock glacier**—a mass of rock fragments and finer material on a slope that contains either an ice core or interstitial ice, and which shows evidence of past, but not present, movement. **D 7099, D18**
- inadequate stimulus, n**—a stimulus which is not regarded as normally affecting a particular sense, but which may actually do so (for example, pressure on the eyeball producing a perception of light, or electrical stimulation generating a taste). **E 253, E18**
- incandescence, n**—emission of light produced by a material when intensely heated; it can be produced with or without combustion. **E 176, E05**
- incandescence, n**—the self-emission of radiant energy in the visible spectrum due to the thermal excitation of atoms or molecules. **E 284, E12**
- incandescent illuminant, n**—illuminant representing the spectral distribution of radiation from an incandescent lamp of specified color temperature. **E 284, E12**
- incasement, n**—a rigid structure or pipe surrounding a buried pipe to provide additional support or protection. **F 412, F17**
- incasement, v**—placement of a rigid structure or pipe surrounding a buried pipe to provide additional support or protection. **F 412, F17**
- inch-pound units**—the units of length, area, volume, weight, and temperature in common use in the United States at the present time. These include, but are not limited to: (1) length—feet, inches, and fractional inches, (2) area—square feet and square inches, (3) volume—cubic feet, cubic inches, gallons, and ounces, (4) weight—pounds and ounces, and (5) temperature—degrees Fahrenheit. **C 896, C04**
- inch threaded Class 2A coating thickness**—a coating thickness which does not exceed $\frac{1}{8}$ of the allowance for Class 2A threads to avoid interference. **F 1789, F16**
- incident, n**—an ignition or fire, or both, that is both undesired and unanticipated, or an undesired and unanticipated consequence of an ignition or fire that was anticipated. **G 126, G04**
- incident angle*—see **angle of incidence**. **E 772, E44**
- incident energy (E_i), n**—the amount of energy (total heat, cal/cm²) received at a surface as a direct result of an electric arc discharge as measured by temperature rise on copper calorimeters. **F 819, F18**
- incident irradiation, n**—the amount of flux per unit area that is normal (perpendicular) to a surface or detector. **F 1294, F05**

incident particle energy

incident particle energy—the effective energy of the primary particles incident on the specimen surface, usually expressed in kiloelectronvolts (keV) per atomic particle. **E 673, E42**

incineration, n—controlled burning of waste products or other combustible material. **D 5681, D34**

incinerator, n—a device constructed for the purpose of containing a material for thermal oxidation. **D 5681, D34**

incinerator—enclosed device using controlled-flame combustion in which waste materials are pyrolyzed or burned. **E 631, E06**

incipient anisotropic phase, n—*as used in Test Method D 5061*, a binder-phase carbon texture having a domain size (less than 0.5 μm) that is near the measuring resolution of the light microscope. **D 121, D05**

incipient fusion, n—beginning of the development of fired bond. **C 43, C15**

incipient seizure or initial seizure region, n—that region at which, with an applied load, there is a momentary breakdown of the lubricating film. **D 4175, D02**

incise—to make slitlike lacerations generally parallel to the grain in the lateral surface of timbers that are resistant to treatment, so that deeper and more uniform penetration of preservative may be obtained. **D 9, D07**

incised—decorated by cutting or indenting the ware surface. **C 242, C21**

inclination angle, n—*of a tire*, the angle between the Z'-axis and the wheel plane. **F 538, F09**

incline—the slope of a roof expressed in percent or in the number of vertical units of rise per horizontal unit of run. **D 1079, D08**

incline impact (Conbur) test—See **package testing**. **D 996, D10**

included angle—angle between the sides of the point in the longitudinal section through the nail in the direction perpendicular to the point sides. **F 547, F16**

inclusion—a foreign solid or gas within or bounded by the glass matrix. **C 162, C14**

inclusion—any foreign matter or particles that are either encapsulated or imbedded in the pultrusion. **D 3918, D20**

inclusion—embedded foreign material or a stain other than from normal composition or forming, or both (see **blemish**). **F 109, C21**

inclusion count—determination of the number, kind, size, and distribution of non-metallic inclusions. See Practice E 45. **E 7, E04**

inclusion, (I), n—*as used in fractography*, a volume-distributed flaw that is a foreign body from other than the normal composition of the bulk advanced ceramic. **C 1145, C28**

inclusions—foreign particles which may or may not be enclosed in the copper foil. **B 846, B05**

inclusions, n—foreign matter in the mica.

air inclusions appear by transmitted light as grayish areas and as silvery areas by reflected light. These are gaseous inclusions.

clay inclusions appear by any light as areas of blue, gray, brown, etc., and are intrusions of earthy materials.

mineral inclusions appear by transmitted light as areas of deep distinct and highly saturated colors such as black, brown, green, red, and so forth. These are concentrated metallic oxides.

vegetable and smokey inclusions appear by transmitted light as areas of pastel colors of low to medium saturation such as pale yellow, pale brown, pale green, and so forth. These are dispersed metallic oxides. The term "vegetable" is a misnomer. **D 1711, D09**

inclusions—foreign material held mechanically, usually referring to non-metallic particles, such as oxides, sulfides, silicates, etc. **E 7, E04**

inclusion shape control, n—the addition of elements during steel making in order to affect the inclusion morphology. **A 941, A01**

incoherent electron scatter—the deflection of electrons by either electrons or atoms which results in a loss of kinetic energy by the incident electron. **E 7, E04**

incomplete block design, n—a design in which the experiment space is subdivided into blocks in which there are insufficient experi-

mental units available to run a complete set of treatments or replicate of the experiment. **E 456, E11**

incomplete block design, n—a design in which the experiment space is subdivided into blocks in which there are insufficient experimental units available to run a complete set of treatments or replicate of the experiment. **E 1325, E11**

incomplete head—nail head with semi-circular rim and portion of head omitted during heading, to allow tight collating of nails in strip form. (See **D head, notched head**.) **F 592, F16**

incomplete thread—thread not fully formed. **F 547, F16**

inconclusive—this is commonly used synonymously with no conclusion when the examiner is at the zero point on the scale of confidence. A potential problem is that some people understand this term to mean something short of definite (or conclusive), that is, any degree of probability, and the examiner should be aware of this ambiguity. **E 1658, E30**

incongruent transformation—a nonisothermal, or nonisobaric, phase change in which one, or both, of the phases involved undergo composition change during the process. **E 7, E04**

increment, n—a small portion of a lot collected by one operation of a sampling device and normally combined with other increments from the lot to make a gross sample. **D 121, D05**

increment, n—a portion of a material to be combined with other portions of the same material to provide a larger sample which will represent the whole material. **D 4175, D02**

increment, n—a portion of a lot as collected by one individual manual or mechanical sampling operation and normally combined with other increments from the lot to make a gross sample. **D 5681, D34**

increment, n—*in sampling*, a portion of material removed from a lot by a single operation. **E 135, E01**

increment—a portion of the lot collected by one individual manual or mechanical sampling operation and normally combined with other increments from the lot to make a gross sample. **E 856, D34**

incremental cost (benefit)—the additional cost (benefit) resulting from an increase in the investment in a building project (Syn. *marginal cost (benefit)*). **E 631, E06**

incremental cost (benefit), n—the additional cost (benefit) resulting from an increase in the investment in a building project (Syn. *marginal cost (benefit)*). **E 833, E06**

incremental permeability—the ratio of the change in magnetic induction to the corresponding change in magnetizing force when the mean induction differs from zero. **E 1316, E07**

increment borer—an augerlike instrument with a hollow bit, used to extract cores from trees for study of growth and age and for other research purposes. **D 9, D07**

increments (solid sample)—portions of material selected from various parts of a lot, which may be tested individually or composited and tested as a unit. **E 1547, E15**

incubation period, n—*in cavitation and impingement erosion*, the initial stage of the erosion rate-time pattern during which the erosion rate is zero or negligible compared to later stages. Also, the exposure duration associated with this stage. (Quantitatively it is sometimes defined as the intercept on the time or exposure axis, of a straight line extension of the maximum-slope portion of the cumulative erosion-time curve.) **G 40, G02**

indent—See **impression**. **E 7, E04**

indentation—See **impression**. **E 7, E04**

indentation—1) the extent of deformation by the indenter point of any one of a number of standard hardness testing instruments; 2) a recess in any surface of a rubber article. **F 869, F08**

indentation hardness, n—the hardness as evaluated from measurements of area or depth of the indentation made by pressing a specified indenter into the surface of a material under specified static loading conditions. **E 6, E28**

indentation hardness—resistance of a material to indentation. This is

- the usual type of hardness test in which a pointed or rounded indenter is pressed into a surface under a substantially static load. **F 1789, F16**
- indentations, *n***—latent or visible impressions in paper or other media. **E 2195, E30**
- indenter**—in hardness testing, a tool, usually of diamond and having a definite geometrical shape, which is forced into the surface of the specimen. **E 7, E04**
- indenter constant**—in hardness testing, a numerical constant relating the area of the indentation to the square of the measured diagonal. **E 7, E04**
- independent third party, *n***—unbiased person or entity that is knowledgeable with subject matter expertise. **F 2463, F10**
- independent variable**—the selected and controlled variable (namely, stress or strain). It is denoted *X* when plotted on appropriate coordinates. **E 1823, E08**
- index**—the upper point of the mercury column whose position, when noted with respect to the corresponding numerals and graduations, indicates the temperature of the mercury within the bulb. **E 344, E20**
- index, *n***—(synonymous with “number in Committee E17 usage, for example; *PSI, RN*), a number or formula expressing some property, form, ratio, etc. of the relation or proportion of one amount or dimension to another. **E 867, E17**
- index, changing**—the mark on the dial ring used when changing the combination. **F 471, F12**
- index, L.O.B.C. (locked on by combination)**—the mark on the dial ring used to set the combination so the back cover can be removed. **F 471, F12**
- index of refraction, *n***—see **refractive index**. **D 4175, D02**
- index of refraction, *n***—the numerical expression of the ratio of the velocity of light in a vacuum to the velocity of light in a substance, at a specified wavelength. **E 284, E12**
- index, opening**—the mark on the dial ring used when dialing the combination to open the lock. **F 471, F12**
- index test, *n***—a test procedure which may contain a known bias but which may be used to establish an order for a set of specimens with respect to the property of interest. **D 4439, D35**
- indian tanned**—combination tanned with alum and vegetable tannins. **D 1517, D31**
- India-tanned**—Term applied to hides and skins from India, considered as a semitanned raw material and generally retanned in the United States before finishing. **D 1517, D31**
- indicated dynamic forces [F]**—the maximum and minimum forces (or the mean force and the force amplitude) that correspond to the readings obtained from the force transducer associated with the fatigue testing system, according to an existing static calibration. The force transducer calibration may have been furnished by the machine manufacturer or may have been developed by the user. **E 1823, E08**
- indication**—the response or evidence from a nondestructive examination. **E 1316, E07**
- indication, *n***—the response or evidence from a nondestructive examination that requires interpretation to determine relevance. **E 1316, E07**
- indication**—that which marks or denotes the presence of a reflector. **E 1316, E07**
- indications**—eddy-current signals caused by any change from uniformity of a tube. These changes from uniformity affect the electrical characteristic of the tube but may not be detrimental to the end use of the product. (E 215) **E 1316, E07**
- indications did not**—this carries the same weight as the indications term that is, it is a very weak opinion.
Examples—There is very little significant evidence present in the comparable portions of the questioned and known writings, but that evidence *suggests* that the John Doe of the known material did not write the questioned material, or I found *indications* that the John Doe of the known material did *not* write the questioned material but the evidence is far from conclusive.
See Discussion after **indications**. **E 1658, E30**
- indications (evidence to suggest)**—a body of writing has few features which are of significance for handwriting comparison purposes, but those features are in agreement with another body of writing.
Examples—There is evidence which *indicates* (or *suggests*) that the John Doe of the known material may have written the questioned material but the evidence falls far short of that necessary to support a definite conclusion. **E 1658, E30**
- indicator, *n***—quantitative value or qualitative information derived from a set of parameters that provides information about the state of a phenomenon. **E 2114, E06**
- indicator (pH)**—a substance that changes color when the pH of the medium is changed. In the case of most useful indicators, the pH range within which the color changes is narrow. **B 374, B08**
- indicator titration**—in ion-selective electrode work, a type of differential complexometric titration in which a metal ion complex is added to the sample as an electrode indicator, and a different metal ion in the sample is determined by titration with the complexing agent contained in the indicator. An electrode that responds to the indicator metal ion is used to detect the point at which the titrant has complexed all of the ion being determined. An abrupt change in the indicator ion concentration occurs when excess complexing agent is added. **D 4127, D19**
- indices**—See **Miller indices**. **E 7, E04**
- indices of metamerism potential, *n***—indices indicating the degree to which two metameric specimens may develop metamerism, derived solely from their different spectral characteristics. **E 284, E12**
- indifferent point**—in a phase diagram, a maximum point, or minimum point, that is, a composition and temperature, or pressure, at which congruent transformation occurs. **E 7, E04**
- indigenous (endogenous) inclusion**—a nonmetallic material that precipitates from the melt. (See **inclusions**.) **E 7, E04**
- indigenous inclusions**—See **deoxidation products**. **E 7, E04**
- indigenous species, *n***—a species that is likely, due to historical presence, to occur at a specified site for some portion of its life span. **E 2114, E06**
- indigneous species**—a species that is likely, due to historical presence, to occur at a specified site for some portion of its life span. **E 943, E47**
- indirect detection of mycoplasma**—detection of mycoplasma by DNA staining or any method other than cultivation. **E 1705, E48**
- indirect electrophotographic copying process**—an electrophotographic copying process in which the photoconductor is not an integral part of the final copy. **F 335, F05**
- indirect exposure**—a method in which only a gamma-insensitive conversion screen is exposed to the neutron beam. After exposure, the conversion screen is placed in contact with the image recorder. **E 1316, E07**
- indirect magnetization**—magnetization induced in a part when no direct electrical contact is made. **E 1316, E07**
- indirect medical direction**—the physician management of all clinical aspects of an EMS system, including but not limited to planning, training, implementation, and evaluation (also known as off-line medical control). **F 1177, F30**
- indirect oxygen service, *n***—service in which oxygen is not normally but may be contacted as a result of an operator error, or process disturbance, such as liquid oxygen tank insulation or liquid oxygen pump motor bearings. **G 126, G04**
- indirect yarn numbering system, *n***—a system that expresses the linear density of yarn in length per unit mass. **D 123, D13**
- indirect yarn numbering system, *n***—a system that expresses the linear density of yarn in length per unit mass. **D 4849, D13**

individualizing characteristic, n

individualizing characteristic, n —marks or properties that serve to individualize writing. **E 2195, E30**

individual pellet hardness, n —the force required to fracture or crush a carbon black pellet. **D 3053, D24**

indoor air pollution, n —the level of air pollution in an enclosed environment. **E 2114, E06**

indoor air quality, IAQ, n —the composition and characteristics of the air in an enclosed space that affect the occupants of that space. **E 2114, E06**

indoor furniture, n —furniture manufactured for use in the interior of a building. **D 123, D13**

indoor furniture, n —furniture manufactured for use in the interior of a building. **D 7023, D13**

induced current method—see **current induction method**.

E 1316, E07

induced field—see **indirect magnetization**.

E 1316, E07

inductance, core, L_1 —the effective parallel circuit inductance of a ferromagnetic core based upon a hypothetical nonresistive path that is exclusively considered to carry the magnetizing current, I_m .

NOTE—The product $I_m^2 \omega L_1$ equals the quadrature power delivered to the core. **A 340, A06**

inductance, incremental, L_Δ —the self-inductance of an electrical circuit when the ferromagnetic core has an ac cyclic magnetization produced by specified values of both ac and dc components of the exciting current. **A 340, A06**

inductance, initial, L_0 —the limiting value of the core inductance, L_1 reached in a ferromagnetic core when, under ac symmetrical cyclic excitation, the magnetizing current has been progressively and gradually reduced from a comparatively high value to a zero value.

NOTE—Initial inductance may be obtained by highly sensitive ASTM bridge methods working in the range in which μ_L is a linear function of H . A series of decreasing values of μ_L is measured and plotted versus corresponding values of magnetizing current, I_m (or other suitable excitation parameter), and the data extrapolated to zero excitation. See **permeability, initial dynamic**.

A 340, A06

inductance, intrinsic (ferric), L_f —that portion of the self-inductance which is due to the intrinsic induction in a ferromagnetic core.

NOTE—It is determined at a specified value of the magnetizing current. **A 340, A06**

inductance, mutual, L_m —the common property of two electrical circuits that determines the flux linkage in one circuit (the secondary) produced by a given current in the other circuit (the primary). The mutual inductance, L_m , is defined by the equation:

$$L_m = \mathcal{L}_2 I_1$$

where:

\mathcal{L}_2 = flux linkage in the secondary and

I_1 = current in the primary, assuming no current in the secondary.

NOTE—If \mathcal{L}_2 is in maxwell-turns and I_1 is in amperes, then the mutual inductance in henries is defined by the equation:

$$L_m = (\mathcal{L}_2 / I_1) \times 10^{-8}$$

NOTE—If the linkage is proportional to the current (no ferromagnetic material present), the inductance is constant and may be obtained from the equation:

$$e_2 = L_m (di_1 / dt)$$

where:

e_2 = instantaneous induced emf in the secondary and

di_1 / dt = time rate of change of the current in the primary.

NOTE—If ferromagnetic materials or eddy currents are present, the mutual inductance must be regarded as a function of the primary current, its rate of change, and the magnetic history of the material. Thus:

$$e_2 = -(d(L_m i_1) / dt) = -[L_m (di_1 / dt) + i_1 (dL_m / dt)]$$

A 340, A06

inductance, self, L —that property of an electric circuit that determines the flux linkage produced by a given current in the circuit. The self-inductance, L , is defined by the equation:

$$L = \mathcal{L} / I$$

where:

\mathcal{L} = flux linkage and

I = current.

NOTE—If \mathcal{L} is in maxwell-turns and I in amperes, then the self-inductance in henries is defined by the equation:

$$L = (\mathcal{L} / I) \times 10^{-8}$$

NOTE—If the linkage is proportional to the current (no ferromagnetic material present), the inductance is constant and may be obtained from the equation:

$$e_2 = -L (di / dt)$$

where:

e = instantaneous induced emf and

di / dt = time rate of change of the current.

NOTE—If ferromagnetic material or eddy currents are present, the self-inductance must be regarded as a function of the circuit current, its rate of change, and the magnetic history of the material. Thus:

$$e = -(d(Li) / dt) = -[L (di / dt) + i (dL / dt)]$$

A 340, A06

inductance, series, L_s —the effective series ac self-inductance exhibited by an inductor having a ferromagnetic core and subjected to an *SCM* excitation after the core has been demagnetized.

NOTE—The value of series inductance is a function of the level of excitation. **A 340, A06**

inductance, winding, L_w —the linear inductance of the magnetizing winding as a result of the flux caused by the ac symmetrical cyclic magnetization exciting current, I . The flux linking the winding is that flux outside of the ferromagnetic core material. **A 340, A06**

induction—the relief of repression of transcription of lysogenic phage genes encoding the functions for lytic growth, so that the phage will grow lytically. **E 1705, E48**

induction, B —See **magnetic induction (flux density)**. **A 340, A06**

induction, biased, B_b —the value of the apparent dc magnetic induction around which the ac cyclic changes are occurring in a magnetic material resulting from the biasing magnetizing field. This value is a function of the incremental magnetizing field and is not determined by the normal induction curve. **A 340, A06**

induction curve, intrinsic (ferric)—a curve of a previously demagnetized specimen depicting the relation between intrinsic induction and corresponding ascending values of magnetic field strength. This curve starts at the origin of the B_i and H axes. **A 340, A06**

induction curve, normal—a curve of a previously demagnetized specimen depicting the relation between normal induction and corresponding ascending values of magnetic field strength. This curve starts at the origin of the B and H axes. **A 340, A06**

induction fryer—a thermostatically controlled piece of equipment,

including a cooking vessel powered by electromagnetic coils inside stainless steel immersion tubes. The electromagnetic field created by these coils causes eddy currents to form in the metal surrounding them, in which the amount of heat in the metal is controlled by changing the magnetic field surrounding the induction coils in response to the fryer thermostat. See **fryer**.

F 1827, F26

induction hardening, *n*—in *surface hardening*, a process in which only the surface layer of a suitable steel object is heated by electrical induction to above Ac_3 or Ac_{cm} , and then the object is **quenched**. A 941, A01

induction hardening, *n*—in *through hardening*, a process in which a suitable steel object is heated by electrical induction to above Ac_3 or Ac_{cm} throughout its section, and then the object is **quenched**. A 941, A01

induction heating, *n*—heating by electrical induction. A 941, A01

induction, incremental, B_Δ —one half the algebraic difference of the extreme values of the magnetic induction during a cycle in a magnetic material that is subjected simultaneously to a biasing magnetizing field and a symmetrically cyclically varying magnetizing field. Twice the incremental induction is indicated by the symbol ΔB , thus:

$$B_\Delta = \Delta B/2$$

A 340, A06

induction, intrinsic, B_i —the vector difference between the dc magnetic induction in a magnetic material and the magnetic induction that would exist in a vacuum under the influence of the same magnetic field strength. This is expressed by the equation:

$$B_i = B - \Gamma_m H$$

NOTE—In the cgs-emu system of units, $B_i/4\pi$ is often called magnetic polarization. A 340, A06

induction, maximum:

(1) B_m —the maximum value of induction, B , in a dc hysteresis loop. The tip of this loop has the magnetostatic coordinates H_m , B_m , which exist simultaneously.

(2) B_{max} —the maximum value of induction, B , in an ac flux-current loop.

NOTE—In a flux-current loop, the magneto-dynamic values B_{max} and H_{max} do not exist simultaneously; B_{max} occurs later than H_{max} . A 340, A06

induction, normal, B —the maximum induction, in a magnetic material that is in a symmetrically cyclically magnetized condition. A 340, A06

induction range—an electric range that causes heat to be generated directly in the magnetic material comprising the cooking container by means of an induced electromagnetic field. The amount of heat generated in the cooking container is controlled by varying the strength of the magnetic field. See **range**. F 1827, F26

induction, remanent, B_d —the magnetic induction that remains in a magnetic circuit after the removal of an applied magnetic field.

NOTE—If there are no air gaps or other inhomogeneities in the magnetic circuit, the remanent induction, B_d , will equal the residual induction, B_r ; if air gaps or other inhomogeneities are present, B_d will be less than B_r . A 340, A06

induction, residual, B_r —the value of magnetic induction corresponding to zero magnetizing field when the magnetic material is subjected to symmetrically cyclically magnetized conditions. A 340, A06

induction, saturation, B_s —the maximum intrinsic induction possible in a material. A 340, A06

industrial grade—a quality of aromatic hydrocarbons suitable for many industrial applications that have a tolerance for nonreactive impurities. D 4790, D16

industrial hygienist—person certified by the American Board of

Industrial Hygiene, or an industrial hygienist in training, or a person with equivalent education or experience or both. E 631, E06

industrial hygienist—person certified by the American Board of Industrial Hygiene, or an industrial hygienist in training, or a person with equivalent education or experience or both. E 1605, E06

industrial hygienist, *n*—a person who, by experience and academic training, is qualified to recognize, evaluate, and control chemical, physical, and biological agents in the workplace, or a person certified by the American Board of Industrial Hygiene. F 1494, F23

industrialized building—a **manufactured building** (preferred term). E 631, E06

industrialized building—See **building**. E 631, E06

industrialized building process—the process of constructing manufactured **buildings**. E 631, E06

industrialized building system—the integration of **subsystems** and **components** into an overall process, utilizing factors of production, transportation, and on-site assembly techniques. E 631, E06

industrialized building system—See **building system**. E 631, E06

industrial talc, *n*—a mineral product varying in composition from that approaching the theoretical formula of talc, $Mg_3Si_4O_{10}(OH)_2$, to mixtures of talc and other naturally associated minerals, some of which may be fibrous as defined in ASTM Definitions D 2946, Terms Relating to Asbestos. These fibrous minerals may or may not be asbestos. D 16, D01

industrial talc, nonasbestos type, *n*—industrial talc of which less than 2 particles per 100 particles (by light microscopy) are asbestos fibers, where "asbestos fiber" is defined as being both a fiber by Definitions D 2946 and one of the asbestiform varieties of serpentine, riebeckite, cummingtonite (which are chrysotile, crocidolite and amosite, respectively), anthophyllite, tremolite, or actinolite. The nonasbestiform varieties of these same minerals are not asbestos. D 16, D01

industrial waste—the water-conveyed residues resulting from manufacturing or processing operations. C 896, C04

industrial yarn, *n*—a yarn composed of continuous filaments, usually of high breaking tenacity, produced with or without twist, and intended for applications in which functional properties are of primary importance; for example, in reinforcing material in elastomeric products (tires, hose, belting), in protective coverings, and in cordage and webbing, etc. D 123, D13

industrial yarn, *n*—a yarn composed of continuous filaments, usually of high breaking tenacity, produced with or without twist, and intended for applications in which functional properties are of primary importance; for example, in reinforcing material in elastomeric products (tires, hose, belting), in protective coverings, and in cordage and webbing, and so forth. D 6477, D13

industry products, *n*—for *feathers or down*, products such as furniture, pillows, comforters, sleeping bags, and wearing apparel which are wholly or partially filled with feathers or down; bulk stocks of processed feathers or down intended for use in the manufacture of such products. D 123, D13

industry products, *n*—for *feathers or down*, products such as furniture, pillows, comforters, sleeping bags, and wearing apparel which are wholly or partially filled with feathers or down; bulk stocks of processed feathers or down intended for use in the manufacture of such products. D 7022, D13

inelastic:

inelastic mean free path—see **electron**.

scattering correction to background—XPS, a method of correcting background for contributions of inelastic scattering processes, most often approximated by simulating the background through a peak by assuming that the rise in background is proportional to the peak area at higher kinetic energy. A more accurate correction is done by deconvolving the energy loss spectrum itself.

scattering cross-section—AES, XPS, a measure of the

inelastic:

probability that an electron traversing a material will undergo an inelastic scattering process, expressed as an area per unit event.

scattering event—ISS, a collision process in which a fraction of the kinetic energy imparted by the probe ion contributes to an increase in the internal energy of the target material, and is not recovered as kinetic energy of the scattered probe ion or target atom recoil. **E 673, E42**

inelastic deformation—the portion of deformation under stress that is not annulled by removal of stress. (ISRM) **D 653, D18**

inelastic electron scatter—See **incoherent electron scatter**. **E 7, E04**

inelastic strain, ϵ_{in} —the strain that is not elastic. **E 1823, E08**

inert—not participating in any fashion in chemical reactions. **D 653, D18**

inert anode—an anode that is insoluble in the electrolyte under the conditions prevailing in the electrolysis. **B 374, B08**

inert components—those elements or components of natural gas (fuel gas) that do not contribute to the heating value. **D 4150, D03**

inertial loading—See **impact loading**. **E 7, E04**

inert (inactive) ingredient—component of an aerosol formulation that does not contribute to the specific effect of the formulation. In some cases, it may be quite arbitrarily defined (for example with insecticides, only the propellants are considered as inert ingredients). **D 3064, D10**

inerting—the technique by which a combustible mixture is rendered nonflammable by addition of a gas incapable of supporting combustion. **D 5681, D34**

inertinite—See **inertinite** under **maceral**. **D 121, D05**

inertodetrinite—See **inertodetrinite** under **maceral**. **D 121, D05**

inferior—lower, also toward the foot. **F 869, F08**

infill, *n*—a series of pickets of a picket railing system and the structural as well as the decorative elements, including the panels, mesh, or similar elements, of a panel railing system; located between top and bottom rails and posts; to serve the twofold purpose of (a) protecting bodies from penetrating and falling through the picket and panel infill areas and (b) providing a specified resistance to horizontal thrusts as are potentially encountered within the infill area. **E 631, E06**

infill, *n*—a series of balusters of a baluster railing system and the structural as well as the decorative elements, including the panels, mesh, or similar elements, of a panel railing system; located between top and bottom rails and posts; to serve the twofold purpose of (a) protecting bodies from penetrating and falling through the baluster and panel infill areas and (b) providing a specified resistance to horizontal thrusts as are potentially encountered within the infill area. **E 1481, E06**

infill area—the field of picket and panel railing systems, bordered by top and bottom rails and posts. **E 631, E06**

infill area—the field of baluster and panel railing systems, bordered by top and bottom rails and posts. **E 1481, E06**

infiltrant efficiency, *n*—the ratio of the mass of infiltrant absorbed by the part to the mass of infiltrant originally used, expressed as a percentage. **B 243, B09**

infiltration, *n*—a process of filling the pores of a sintered, or unsintered, compact with a metal or alloy of lower melting point. **B 243, B09**

infiltration—the volume of groundwater entering a sewer and its connections from the soil through pipe, joints, connections, or appurtenances. **C 822, C13**

infiltration—the quality of ground water entering the test section during a specified time period. **C 896, C04**

infiltration erosion, *n*—the pitting, channeling, and coarsening of the surface porosity that results from the dissolution of the base metal by the liquid infiltrant, as the infiltrant flows into the matrix. **B 243, B09**

infiltration loading density, *n*—infiltrant weight per unit area of contact between infiltrant and part. **B 243, B09**

infiltration (of soil)—movement of water from the ground surface into soil. **D 7099, D18**

infiltration, pipe—the passage of fluid into a pipe section through small holes or leaks. **F 412, F17**

infiltration residue, *n*—material that remains on the surface of the part after infiltration. **B 243, B09**

infinite pad method—in *optical character recognition*, a method of measuring reflectance of a paper stock such that doubling the number of backing sheets of the same stock will not change measured reflectance. **F 149, F05**

infinite thickness, *n*—term applied to a layer of material so thick that increasing its thickness does not change its reflectance or other optical properties. **E 284, E12**

inflatable boom—boom that uses inflated gas-filled chambers as the flotation. **F 818, F20**

inflatable restraint, *n*—a vehicular safety device designed to cushion an occupant or equipment during collision; airbag. **D 123, D13**

inflatable restraint, *n*—a vehicular safety device designed to cushion an occupant or equipment during collision; an airbag. **D 6799, D13**

inflation—a rise in the general price level, usually expressed as a percentage rate. **E 631, E06**

inflation, *n*—a rise in the general price level, usually expressed as a percentage rate. **E 833, E06**

inflation pressure loss rate, *n*—rate of change of normalized inflation pressure, determined from the slope of the linear portion of the log pressure versus time curve. **F 538, F09**

inflator, *n*—*for inflatable restraints*, a device for generating and directing expansion gases into a cushion. [D13.20] **D 5428 D 123, D13**

inflator, *n*—*for inflatable restraints*, a device for generating and directing expansion gases into a cushion. **D 6799, D13**

inflection point, *n*—the first point of the force-elongation curve at which the second derivative equals zero. **D 4439, D35**

inflection point—position on a curved line, such as a phase boundary, where the direction of curvature is reversed. **E 7, E04**

inflow—the volume of any kind of water entering a sewer and its connections from outside sources not including those sources described under “infiltration.” **C 822, C13**

influence value, *I (D)*—the value of the portion of a mathematical expression that contains combinations of the independent variables arranged in dimensionless form. **D 653, D18**

influent stream, *n*—see preferred term **losing stream**. **D 653, D18**

information, *n*—the result of processing one or more pieces of data to produce a meaningful and useful statistic or indicator for users. **E 867, E17**

information depth—maximum depth, normal to the specimen surface, from which useful signal information is obtained. **E 673, E42**

infrared, *adj*—pertaining to the region of the electromagnetic spectrum from approximately 0.78 to 300 μm . **D 1711, D09**

infrared—invisible light and heat radiation, adjacent to the red end of the visible spectrum, with wavelengths from 700 to about 3000 nm (nanometres). **E 7, E04**

infrared—pertaining to the region of the electromagnetic spectrum with wavelength range from approximately 0.78 to 1000 μm (wavenumber range 12 800 to 10 cm^{-1}). **E 131, E13**

infrared, *adj*—referring to radiant flux having wavelengths longer than the wavelengths of light, usually wavelengths from about 780 nm to about 1 mm. **E 284, E12**

infrared imaging system—an apparatus that converts the two-dimensional spatial variations in infrared radiance from any object surface into a two-dimensional thermogram of the same scene, in which variations in radiance are displayed in gradations of gray tone or in color. **E 1316, E07**

infrared (IR), *adj*—of the electromagnetic radiation within the mid- and far infrared spectral ranges (approximately from 3 to 30 μm wavelength). **E 344, E20**

infrared (IR) thermometer, *n*—optoelectronic instrument adapted

for noncontact measurement of temperature of a subject by utilizing *infrared* radiation exchange between the *subject* and the *sensor*. **E 344, E20**

infrared radiation, *n*—radiation for which the wavelengths of the monochromatic components are greater than those for visible radiation, and less than about 1 mm.

NOTE—The limits of the spectral range of infrared radiation are not well defined and may vary according to the user. Committee E-2.1.2 of the CIE distinguishes in the spectral range between 780 nm and 1 mm:

IR-A	780 to 1400 nm
IR-B	1.4 to 3 μ m
IR-C	3 μ m to 1 mm

E 349, E21

infrared reflector—a material with a reflectance in the infrared region as close as possible to 1.00. **E 1316, E07**

infrared response—a particular type of optical system used in some scanners. As a general rule, nonscan inks for this purpose are in the red portion of the color spectrum. **F 149, F05**

infrared sensing device—one of a wide class of instruments used to display or record, or both information related to the thermal radiation received from any object surfaces viewed by the instrument. The instrument varies in complexity from spot radiometers to two-dimensional real-time imaging systems. **E 1316, E07**

infrared spectroscopy—pertaining to spectroscopy in the infrared region of the electromagnetic spectrum. **E 131, E13**

infrared thermographer—the person qualified or trained to use infrared imaging radiometer. **E 1316, E07**

infrared thermography—see **thermography, infrared**. **E 1316, E07**

inglaze decoration—See *inglaze decoration* under **decoration**.

C 242, C21

ingot, *n*—cast form suitable for fabricating (rolling, forging, extruding, and so forth) or remelting. **B 881, B07**

ingot, *n*—a casting of simple shape suitable for hot-working or remelting. **B 899, B02**

ingot—cast metal in a form intended for subsequent fabrication.

E 7, E04

ingot and ingot bar—refinery shapes used for remelting (not fabrication). Ingots normally range in weight from 20 to 35 lb (9 to 16 kg) and ingot bars from 50 to 70 lb (23 to 32 kg). Both are usually notched to facilitate breaking into smaller pieces. **B 846, B05**

ingot scum—slag, dross, or oxidation appearing on the top surface of ingots during pouring, which, when entrapped, is a source of inclusions. **E 7, E04**

inherent ash, *n*—the residue remaining from the inherent impurities after ignition under conditions specified for the ash determination.

D 121, D05

inherent flame-resistance, *n*—as applied to textiles, flame resistance that derives from an essential characteristic of the fiber from which the textile is made. (Compare **flame resistance**.) **D 123, D13**

inherent flame-resistance, *n*—as applied to textiles, flame resistance that derives from an essential characteristic of the fiber from which the textile is made. (Compare **flame resistance**.) **D 4391, D13**

inherent fluorescence—fluorescence that is an intrinsic characteristic of a material. **E 1316, E07**

inherent impurity, *n*—the inorganic material in coal that is structurally part of the coal and cannot be separated from it by coal preparation methods. **D 121, D05**

inherently flame-resistant, *adj*—having inherent flame-resistance.

D 123, D13

inherently-flame-resistant, *adj*—having inherent flame-resistance.

D 4391, D13

inherent moisture—See *inherent moisture* under **moisture**.

D 121, D05

inherent viscosity—see **viscosity, inherent**.

D 1695, D01

inhibition load XX (ILXX), *n*—a statistically or graphically estimated loading rate of test material that is expected to cause a

XX % inhibition of a biological process (such as growth or reproduction) which has an analog as opposed to a digital measure.

D 4175, D02

inhibition load XX (ILXX), *n*—a statistically or graphically estimated loading rate of test material that is expected to cause a XX % inhibition of a biological process (such as growth or reproduction) of a representative subpopulation of organisms under specified conditions and is expressed as an analog as opposed to digital measure. **D 4175, D02**

inhibition load XX (ILXX), *n*—a statistically or graphically estimated loading rate of test material that is expected to cause a XX % inhibition of a biological process (such as growth or reproduction) of a representative subpopulation of organisms under specified conditions and is expressed as an analog as opposed to digital measure. **D 6384, D02**

inhibitor—a substance used to reduce the rate of a chemical or electrochemical reaction, commonly corrosion or pickling.

B 374, B08

inhibitor—a material that stops or slows a chemical reaction from occurring. **D 653, D18**

inhibitor, *n*—a substance used in low concentration which suppresses a chemical reaction. **D 883, D20**

inhibitor, *n*—a substance used to suppress a chemical reaction.

D 907, D14

inhibitor, *n*—material used to suppress a chemical reaction.

D 1566, D11

inhibitor—any substance which when added to an electrical insulating fluid retards or prevents undesirable reactions. **D 2864, D27**

inhibitor, *n*—a chemical compound added to engine coolant to mitigate cooling system degradation. **D 4725, D15**

inhibitor—a substance added to a material to retard or prevent deterioration. **D 4790, D16**

inhibitor, *n*—a substance used in low concentration which suppresses chemical reaction. (D20) **F 412, F17**

initial backfill—location for placement of selected material, native or import, extending from the top of the bedding material to an elevation 1 ft above top of pipe. **C 896, C04**

initial boiling point—the temperature observed immediately after the first drop of distillate falls into the receiving cylinder during a distillation test. **D 4790, D16**

initial boiling point (IBP), *n*—the point at which a cumulative volume count equal to 0.5 % of the total volume count under the chromatogram is obtained. **D 4175, D02**

initial calibration blank—a solution containing no analyte that is used for initial calibration and zeroing of the instrument response.

E 1605, E06

initial calibration blank (ICB)—a standard solution that contains no analyte and is used for the initial calibration and zeroing instrument response. **E 631, E06**

initial calibration verification—a solution (or set of solutions) of known analyte concentration used to verify calibration standard levels; the concentration of analyte is to be near the mid-range of the working range of the linear curve that is made from a stock solution having a different manufacturer or manufactured lot identification than the calibration standards. **E 1605, E06**

initial calibration verification (ICV)—a standard solution (or set of solutions) used to verify calibration standard levels; the concentration of analyte is to be near mid-range of the linear curve that is made from a stock solution having a different manufacturer or manufacturer lot identification than the calibration standards.

E 631, E06

initial consolidation (initial compression)—see **consolidation**.

D 653, D18

initial cost—See **first cost**.

E 631, E06

*initial cost, *n**—See **first cost**.

E 833, E06

initial deformation temperature (IT), *n*—in reference to the fusibility of coal and coke ash according to Test Method D 1857, the temperature at which the first rounding of the apex of the cone

initial deformation temperature (IT), *n*

occurs. Shrinkage or warping of the cone is ignored if the tip remains sharp. **D 121, D05**

initial deformation temperature, IT, *n*—the temperature at which the first rounding of the apex of a pyrometric cone occurs; shrinking or warping of the cone is ignored if the tip remains sharp. **D 5681, D34**

initial deformation temperature, IT—the temperature at which the first rounding of the apex of a pyrometric cone occurs. Shrinking or warping of the cone is ignored if the tip remains sharp. **D 5681, D34**

initial grab, *n*—the ability of a wet-state material to remain in place initially after it has been applied. **E 2110, E06**

initial investment cost—See **first cost**. **E 631, E06**

initial investment cost, *n*—See **first cost**. **E 833, E06**

initial modulus, *n*—the slope of the initial straight portion of a stress-strain or force-elongation curve. **D 123, D13**

initial modulus, *n*—*in a stress-strain curve*, the slope of the initial straight-line portion of the curve. **D 4848, D13**

initial modulus, *n*—the slope of the initial straight portion of a stress-strain (or force elongation) curve. **D 6477, D13**

initial permeability—the slope of the induction curve at zero magnetizing force as the test specimen is being removed from a demagnetizing condition (slope at origin of BH curve before hysteresis is observed). **E 1316, E07**

initial potential—see **charge acceptance**. **F 335, F05**

initial pulse—the response of the ultrasonic system display to the transmitter pulse (sometimes called main bang). **E 1316, E07**

initial rate of absorption, *n*—a measure of the suction of water upward into a dry brick from a bed face during one minute of exposure. **C 43, C15**

initial recovery, *n*—the decrease in strain in a specimen resulting from the removal of force, before creep recovery takes place. **E 6, E28**

initial set—a degree of stiffening of a grout mixture generally stated as an empirical value indicating the time in hours and minutes that is required for a mixture to stiffen sufficiently to resist the penetration of a weighted test needle. **D 653, D18**

initial set, *n*—a time-related set caused by the hydration process. **E 2110, E06**

initial setting time—the time interval from the start of mixing the component parts at a specified temperature, (a) to that time when a Gillmore needle weighing 1 lb (454 g) and having a tip $\frac{1}{24}$ in. (1 mm) in diameter by $\frac{3}{16}$ in. (5 mm) long will penetrate mortar $\frac{5}{8}$ in. (16 mm) thick to a depth of $\frac{3}{16}$ in. (5 mm) in 1 min, or, (b) to that time at which a $\frac{1}{4}$ in. (6.4 mm) wide joint of the mortar between bricks is indented less than $\frac{1}{24}$ in. (1 mm) by a Vicat needle during a 10-min period. **C 904, C03**

initial spray angle, *n*—the plane angle of the spray emerging from the nozzle discharge orifice. **E 1620, E29**

initial strain, *n*—the strain introduced into a specimen by the given loading conditions, before creep takes place. **E 6, E28**

initial stress, *n*—the stress introduced into a specimen by imposing the given constraint conditions before stress relaxation takes place. **E 6, E28**

initial survey—systematic inspection of a dwelling unit by a qualified inspector, using a portable XRF analyzer, atomic absorption spectroscopy, or other approved testing techniques, to determine whether a lead-based paint hazard is present. **E 631, E06**

initial tangent modulus, *n*—the slope of the stress-strain curve at the origin. **D 907, D14**

initial temperature—See **activation temperature**. **F 1623, F05**

initial tensile modulus, J_p (FL^{-1}), Nm^{-1} , *n*—*for geosynthetics*, the ratio of the change in force per unit width to the change in elongation of the initial portion of a force-elongation curve. **D 4439, D35**

injectability—see **groutability**. **D 653, D18**

injection molded button, *n*—a method of forming which requires the filling of a cavity under pressure with polymer that will take the form of the mold when cooled. **D 123, D13**

injection molded flooring—a floor surfacing material made by driving or forcing a polymeric compound into a mold. **F 141, F06**

injection molding, *n*—the process of forming a material by forcing it, in a fluid state under pressure, through a runner system (sprue, runner, gate(s)) into the cavity of a closed mold. **D 123, D13**

injection molding, *n*—the process of forming a material by forcing it, in a fluid state and under pressure, through a runner system (sprue, runner, gate(s)) into the cavity of a closed mold. **D 883, D20**

injection molding, *n*—process by which a rubber compound is forced into a closed mold by pressure other than the mold clamping force. **D 1566, D11**

injection molding, *n*—the process of forming a material by forcing it, in a fluid state under pressure, through a runner system (sprue, runner, gate(s)) into the cavity of a closed mold. **D 5497, D13**

injection molding, *n*—the process of forming a material by forcing it, under pressure, from a heated cylinder through a sprue (runner, gate) into the cavity of a closed mold. (D20) **F 412, F17**

injection seal—a seal accomplished by injecting sealant into holes, joggles, channels, grooves, and other voids caused by buildup of structure boundaries. **E 631, E06**

injection seal—a seal accomplished by injecting sealant into holes, joggles, channels, grooves, and other voids caused by buildup of structure boundaries. **E 1749, E06**

injection time, *n*—the time interval from the beginning of screw forward movement until switching over to hold pressure. **D 883, D20**

injection timing (injection advance), *n*—that time in the combustion cycle, measured in degrees of crank angle, at which fuel injection into the combustion chamber is initiated. **D 4175, D02**

ink deposit—a coating containing a coloring material which transfers in part or entirely to a copy sheet at the point of pressure contact. (F 129) **F 221, F05**

inked ribbon—a ribbon composed of a supporting substrate of film, fabric, or paper and a coating or impregnation of a coloring material. The coloring material is of such nature that it will transfer in part or entirely to a copy sheet at the point of pressure contact. (F 129) **F 221, F05**

ink fading, *n*—term used in offset printing for the variation in the ink density (uneven ink film) in the direction of print (as a consequence of inking unit design and content of the printing sheet). **D 6488, D01**

ink fill-in, *n*—expansion of a mark beyond specified tolerances. **F 1294, F05**

ink jet printer—a nonimpact printer in which the characters are formed by projecting droplets of ink onto a substrate. **F 909, F05**

ink kick-out, *n*—the settling of pigment or resin in the bulk ink. **D 6488, D01**

ink layer—(1) the components of the image coating used in thermal transfer products which contain waxes, resins, pigments and other materials deposited or coated onto a substrate; (2) the layer of thermally sensitive material which is transferred during the thermal transfer printing process. **F 1623, F05**

ink misting, *n*—the ejection of fine particles of ink into the air and onto the press, occurring when the ink film splits in more than one place. The centrifugal forces generated by high speed rollers can cause this problem. **D 6488, D01**

ink mottle, *n*—a condition in which large solid images show very localized variations in color strength or gloss, or both. **D 6488, D01**

ink, OCR—Refer to ANSI X3.86-180. **F 149, F05**

ink over-emulsification, *n*—a condition that occurs when a lithographic ink picks up too much dampening solution resulting in a weak print or snowflake pattern. **D 6488, D01**

- ink refusal**, *n*—the failure of a roller or plate to accept ink. Alternative term: *stripping*—see *Gravure Printing*. **D 6488**, D01
- ink sedimentation**, *n*—the settling out of undissolved resin or improperly ground pigments. **D 6488**, D01
- ink setoff**, *n*—the undesirable transfer of an ink in any printing process from fresh prints to any other surface. **D 6488**, D01
- ink setoff**, *n*—the transfer of ink to the back side of the sheet or area of the web that is the result of slow drying. **D 6488**, D01
- inlaid sheet flooring**, *n*—a floor surfacing material in which the decorative pattern or design is formed by colored areas set in to the surface. The design so formed may or may not extend through to a backing. **F 141**, F06
- in-leakage rate**—the combined leakage rate from all existing leaks in a specified evacuated vessel in pressure volume units per unit of time. **E 1316**, E07
- inlet**—the opening, flange, connection, or coupling on a leak detector or leak testing system through which the tracer gas may enter due to a leak in an object under test. **E 1316**, E07
- inlet flange*—see **inlet**. **E 1316**, E07
- inlet port*—see **inlet**. **E 1316**, E07
- in-line clinch**—flat clinch with both staple legs in straight alignment. **F 592**, F16
- in-line coagulation**—a filtration process performed by continually adding a coagulant to the raw feedwater and then passing the water through a filter(s) to remove the microfloc which has been formed. **D 6161**, D19
- in-line instrument**—instrument whose active element is installed in the pipeline and measures at pipeline conditions. **D 4150**, D03
- in-line measurements**, *n*—measurement where the sample is not removed from the process stream, and can be invasive or non-invasive. **E 2363**, E55
- innerliner**, *n*—the layer or layers of rubber laminated to the inside of a tire and which meets the Rubber Manufacturers Association definition of a mud and snow tire. **D 5681**, D34
- inner liner**, *n*—of a tire, the innermost layer(s) of a tubeless tire that limit(s) diffusion of the inflation medium into the carcass. **F 538**, F09
- inner melt**, *n*—a thin continuous layer of water between the thermometer well and the ice mantle of a water triple-point cell. **E 344**, E20
- inner packing**—See **packing**. **D 996**, D10
- inner plies**—plies other than face or back plies in a panel construction. Subface, subback, crossband, and center are classed as inner plies. **D 1038**, D07
- inner spindle assembly**—a component in some manipulation-resistant locks that connects the knob with the cam slide. **F 471**, F12
- innocuous impurities**—impurities that are not a health or safety concern in the product. The route of administration of the drug may be a significant criterion in the determination of whether an impurity is innocuous. **E 1705**, E48
- inoculated iron**, *n*—cast iron, either liquid or solid, to which one or more inoculating alloys have been added while the iron was in the molten state. **A 644**, A04
- inoculated iron, fully**, *n*—cast iron, either liquid or solid, to which all molten metal additions, including all inoculating alloys, have been added. **A 644**, A04
- inoculating alloy**, *n*—an alloy added to molten iron for the principle purpose of nucleating a primary phase such as graphite. Inoculating alloys are frequently used to avoid the formation of primary carbide by enhancing the nucleation of graphite. **A 644**, A04
- inoculum**, *n*—spores, bacteria, single celled organisms or other live materials that are introduced into a test medium. **D 4175**, D02
- inoculum**, *n*—living spores, bacteria, single celled organisms, or other live materials that are introduced into a test medium. **D 4175**, D02
- inoculum**, *n*—living spores, bacteria, single celled organisms, or other live materials that are introduced into a test medium. **D 6384**, D02
- inorganic**, *adj*—being or composed of matter other than hydrocarbons and their derivatives, or matter that is not of plant or animal origin. **D 1079**, D08
- inorganic alkaline detergent*—a formulated cleaning composition containing water-soluble alkali or alkaline salts, but generally no surfactants. **D 459**, D12
- inorganic alkaline detergent*—under **detergent**, see *inorganic alkaline detergent*. **D 459**, D12
- inorganic silt*—see **silt**. **D 653**, D18
- in-plane flow**, *n*—fluid flow confined to a direction parallel to the plane of a geotextile or related product. **D 4439**, D35
- in-plane length (or deflection) measurement, L (or D) [L]**—a length (or deflection) measurement made parallel to the underlying layer (or the *xy*-plane). **E 2444**, E08
- inplane loads**, *n*—loads which are parallel to the facings. **C 274**, D30
- in-plant cleaning**, *n*—for *textile floor coverings*, a cleaning process performed in a facility away from the location where the product is used. **D 123**, D13
- in-plant cleaning**, *n*—for *textile floor coverings*, cleaning process performed in a facility away from the location where the product is used. **D 5253**, D13
- in-process control**—system that provides a method to detect the variation of product characteristic(s) during manufacturing and processing and initiates corrective action to maintain the product characteristic(s) within its specified limits. **F 1789**, F16
- in-process control**, *n*—monitoring and, if necessary, adjustments performed to ensure that the process conforms to its specification. The control of the environment or equipment may be part of in-process control. **F 2312**, F04
- in-process material**, *n*—any material(s) fabricated, compounded, blended, or synthesized using a chemical, physical, or biological process that is produced for and being used in the preparation of an intermediate, drug substance, or drug product. **E 2363**, E55
- in-process sampling inspection**—random sample of product drawn from prescribed points of the processing stream (usually characteristic sensitive) and performing specific inspections and tests to determine conformance of the product at that point of the processing stream. **F 1789**, F16
- inquartation**, *vt*—the addition of silver to an assay sample to facilitate parting. **E 135**, E01
- inrush current**—a transient current that exists at the instant of contact closure and persists for a relatively short time. **B 542**, B02
- inseam**—the hidden seam of a welted shoe holding together the welt, upper, lining, and insole. **F 869**, F08
- inseam**, *n*—in *garment construction*, with the trousers folded by mating the inside leg seams, measure from center of crotch to bottom edge of trouser's leg or cuff. **F 1494**, F23
- inseam length**, *n*—in *body measurements*, from center of crotch to 25.4 mm (1 in.) below top of the shoe. **F 1494**, F23
- insect screening**, *n*—in *coated glass yarn fabrics*, a woven netting having an approximately even spaced mesh of 12 by 12 yarns or more per 25.4 mm (1 in.). **D 123**, D13
- insect screening**, *n*—in *coated glass yarn fabrics*, a woven netting having an approximately even-spaced mesh of 12 by 12 yarns or more per 25 mm (1 in.). **D 7018**, D13
- insert**, *n*—a part consisting of metal or other material which may be molded into position or may be pressed into the molding after the completion of the molding operation. (ISO) **D 883**, D20
- insert**, *n*—usually a thin filler or frame of wood, **fiberboard**, plastic, or other suitable material used to take up space, or separate articles within a **package**. (Compare **buffer**, **divider**, **separator**.) **D 996**, D10
- insert**—pre-designed and prefabricated cast-in-place or post-installed anchors specifically designed for the attachment of bolted or slotted connections. **E 2265**, E06

insert, *n*—a part consisting of metal or other material that may be molded into position or may be pressed into the molding after the completion of the molding operation. (D20, ISO) **F 412, F17**

insert—a reusable, threaded attachment point fixed permanently in the snowboard at the time of manufacture, used to mount the bindings to the board. It is typically arranged in a pattern corresponding to a particular binding manufacturer's pattern. **F 1107, F27**

inserted coil—see **ID coil**. **E 1316, E07**

insert-fitting joint—see **joint, clamped insert-fitting**. **F 412, F17**

insertion force—the force required to mate two connector halves. **B 542, B02**

insertion loss, *IL*—of a silencer or other sound-reducing element, in a specified frequency band, the decrease in sound power level, measured at the location of the receiver, when a sound insulator or a sound attenuator is inserted in the transmission path between the source and the receiver. **C 634, E33**

insert or orifice cup, *n*—the mechanical break-up component that forces product to flow in a swirl pattern out of the exit orifice in order to produce a fine mist. **D 6655, D10**

inserts, *n*—apparatus placed into the sandwich for attaching items; synonymous with hard points. **C 274, D30**

in service coefficient of friction—a coefficient of friction measured under a specified condition of use, which may not be clean and dry, and hence, not a property of the ceramic surface. **C 242, C21**

in-service conditions—the normal conditions to which a system and its components will be exposed during their operational lifetimes. This does not include stagnation conditions; see **stagnation conditions**. **E 772, E44**

inside bevel point—bevel point with its beveled face on staple inside; used to produce an outward clinch or to provide additional penetration in the base material, or both. **F 592, F16**

inside coil—see **ID coil**. **E 1316, E07**

inside knuckle—the juncture between the inside sidewall and the inside bottom surface of a glass article. **C 162, C14**

inside-leg length, *n*—in body measurements, the vertical distance from the crotch to the soles of the feet. **D 123, D13**

inside-out testing—see **bell jar testing**. **E 1316, E07**

inside seam, *n*—a seam formed in which the completed seam allowance is located on the interior of the object, usually on the back side of the fabric. (Compare **outside seam**.) **D 123, D13**

inside seam, *n*—in home sewing, a seam having seam allowances located within the interior, or the underside, of the product. (Compare **outside seam**.) **D 4965, D13**

in situ—applied to a rock or soil when occurring in the situation in which it is naturally formed or deposited. **D 653, D18**

in-situ—in its original place or environment. **D 7099, D18**

in situ—a term used to describe work performed in place or at a facility. **E 1605, E06**

in situ treatment, *n*—treatment, remediation, or cleanup of contaminated sites and materials in place. **E 833, E06**

insolation—the use of the term *insolation* is discouraged in favor of the preferred term, **solar irradiance**. **E 772, E44**

insole—a sole of leather or other material cut to the size and shape of the bottom of the last. In some shoe constructions, the insole surface forms the inside of the bottom of the shoe; in others it is covered with a sock lining of thin material which conceals stitching, nails, etc. (Also known as innersole). **F 869, F08**

insolubles, *n*—*inlubricating grease analysis*, the material remaining after the acid hydrolysis, water extraction, and solvent extraction of soap-thickened greases. **D 4175, D02**

insonification—the introduction or application of ultrasonic energy to a volume of material for the purpose of ultrasonic examination. Also spelled **ensonification**. **E 1316, E07**

inspection, *n*—the process of measuring, examining, testing, gaging, or otherwise comparing the unit of product with the applicable requirements. **A 941, A01**

inspection, *n*—the process of measuring, examining, testing, gaging,

or otherwise comparing a characteristic or property of a material with applicable requirements. In this case only by visual examination. **D 123, D13**

inspection, *n*—*infabric grading*, the process of viewing, measuring, examining, or otherwise comparing the visual characteristics of a fabric with applicable requirements. **D 123, D13**

inspection, *n*—the process of measuring, examining, testing, gaging, or otherwise evaluating materials, products, services, systems, or environments. **D 1356, D22**

inspection—the process of measuring, examining, testing or otherwise comparing the unit of product. **D 1517, D31**

inspection, *n*—the process of measuring, examining, testing, gaging, or otherwise comparing a characteristic or property of a material with applicable requirements. In this case only by visual examination. **D 4850, D13**

inspection—process of measuring, examining, testing, gaging, or using other procedures to ascertain the quality or state, detect errors or defects, or otherwise appraise materials, products, services, systems, or environments to a pre-established standard. **E 1187, E36**

inspection, *n*—see preferred term **examination**. **E 1316, E07**

inspection—visual examination of the test part after completion of the liquid penetrant processing steps. **E 1316, E07**

inspection—process of measuring, examining, testing, gaging, or using other procedures to ascertain the quality or state of, detect errors or defects in, or otherwise appraise materials, products, services, systems, or environments to a preestablished standard. **F 1789, F16**

inspection agency—see *inspectionbody*, (ISO Guide 2). **E 1187, E36**

inspection band, *n*—an area of the bar code symbol where measurements are taken spanning from 10 to 90 % of the average bar height. **F 1294, F05**

inspection body—body that performs inspection services on behalf of a certification body, (ISO Guide 2). **E 1187, E36**

inspection medium—see **examination medium**. **E 1316, E07**

inspection plan—set of instructions defining product characteristics, specifications, or frequency of inspection, or a combination thereof, for product at a specified operation. **F 1789, F16**

inspection test—fastener or its selected characteristics tested in process or after manufacture to determine conformance of the fastener or its selected characteristics to the manufacturing specifications. **F 1789, F16**

inspection torque—torque necessary to maintain tightening motion in a fastener at its fully preloaded installed tension. **F 1789, F16**

inspector, *n*—*in pipe laying*, an authorized representative of the engineer, or owner, assigned to make any and all necessary inspections of the work performed, including materials and equipment furnished. **C 1154, C17**

inspector—*for pipe laying*, an authorized representative of the engineer, or owner, assigned to make any and all necessary inspections of the work performed, including materials and equipment furnished. **D 2946, C17**

inspector—person appointed by an authority to examine and evaluate designated domains for conformance to established rules and regulations. **E 631, E06**

installation—the process of assembling dimension stone into a structure. **C 119, C18**

installation torque—specified torque applied to an anchor during its installation. **E 2265, E06**

instantaneous coefficient of thermal expansion—See **coefficient of thermal expansion**. **E 7, E04**

instantaneous collector efficiency—see **efficiency, instantaneous collector**. **E 772, E44**

instantaneous erosion rate, *n*—the slope of a tangent to the cumulative erosion-time curve at a specified point on that curve. **G 40, G02**

instantaneous field of view (IFOV)—for a scanning system, the

angular dimensions in object space within which objects are imaged by an individual detector (unit = deg or rad).

NOTE—The IFOV is equivalent to the horizontal and vertical fields of view of the individual detector. For small detectors, the detector angular subtenses or projections, α and β , are defined by $\alpha = af$ and $\beta = bf$ where a and b are the horizontal and vertical dimensions of the detector and f is the effective focal length of the optic. (IFOV may also be expressed as a solid angle in units of sr.) **E 1316, E07**

instantaneous sampler—a suspended-sediment sampler that takes a representative specimen of the water-sediment mixture in a stream at a desired depth and moment of time. **D 4410, D19**

instantaneous sampling—See **sampling**. **D 1356, D22**

instep—top part of the arch of a foot over the metatarsal bones from back of the toes to the ankle, also the corresponding part of a shoe last. **F 869, F08**

instrumental detection efficiency—*SIMS*, the ratio of ions for a particular species detected to ions produced. **E 673, E42**

instrumental detection limit (IDL)—an instrumental measurement value that is used to provide a lower concentration limit for reporting quantitative analysis data for a given instrument. **E 631, E06**

instrumental QC standard—a solution (or set of solutions) of known analyte concentration that provides information on measurement performance during the instrumental analysis portion of the overall analyte measurement process. **E 1605, E06**

instrumental QC standards—these provide information on measurement performance during the instrumental analysis portion of the overall lead measurement process. They include CCBs, CCVs, ICBs, ICVs, and ICSs. **E 631, E06**

instrumental offset, μ_d , n —calculated difference in degrees of measured temperature between *core temperature* and *ear canal temperature*, derived from the population of representative study samples. **E 344, E20**

instrumentation dead time—see **dead time, instrumentation**. **E 1316, E07**

instrument line shape (ILS) function—the FT of the function by which an interferogram is weighted. **E 131, E13**

instrument response time, n —the time required for an indicating or detecting device to undergo a defined displacement following an abrupt change in the property being measured. **D 4175, D02**

instrument response time—the time required for an indicating or detecting device to undergo a defined displacement following an abrupt change in the quantity being measured. **E 131, E13**

instrument traceability—the ability to demonstrate that a particular measuring instrument or artifact standard has been calibrated at acceptable time intervals against a national or international standard or against a secondary standard which has been in turn calibrated against the national standard or transfer standard. **E 170, E10**

insufficient cure—a pultrusion abnormality created by lack of, or incomplete, cross-linking of the resin.

NOTE—This condition can usually be detected by dull surface appearance, low Barcol hardness, and low physical properties. Thick sections, cured from the outside in, can reveal insufficient cure in the center of the section even though completely cured on the surface. This condition can be caused by insufficient die temperature, improper catalyst, or pulling too fast for the die temperature. **D 3918, D20**

insulated—separated from other conducting surfaces by a dielectric substance (including air space) offering a high resistance to the passage of current.

NOTE—When any object is said to be insulated, it is understood to be insulated in a suitable manner for the conditions to which it is subjected. Otherwise, it is, within the purpose of this definition, uninsulated. Insulating covering of conductors is one means of making the conductor insulated. **F 819, F18**

insulated conductor, n —a conductor covered by a layer or layers of

insulating material and whose prime function is to carry current in an electric circuit. **D 1711, D09**

insulating concrete—a lightweight concrete made with lightweight coarse aggregate and having relatively low insulating characteristics. **C 717, C24**

insulating firebrick, n —see **firebrick, insulating**. **C 71, C08**

insulating formboard—a specially fabricated cellulosic fiberboard designed for use as a permanent form for certain poured-in-place roof constructions. **D 1554, D07**

insulating liquid, fluid or gas—a fluid (liquid or gaseous) which does not readily conduct electricity. Electrical insulating fluids typically provide both electrical insulation and heat transfer in electrical equipment. **D 2864, D27**

insulating material—a material of relatively low electrical conductivity and high dielectric strength, usually used to support or provide electrical separation for conductors, in which a voltage applied between two points on or within the material produces a small and sometimes negligible current. **D 2864, D27**

insulating material (insulator), n —a material in which a voltage applied between two points on or within the material produces a small and sometimes negligible current. **D 1711, D09**

insulating roof deck—a cellulosic fiberboard product designed for use in open-beam ceiling roof construction. The product is composed of multiple layers of structural insulating board laminated together with water-resistant adhesive. **D 1554, D07**

insulating-siding nail—See **brick-siding nail**. **F 547, F16**

insulation—See **thermal insulation**. **D 1079, D08**

insulation, n —a material that is normally added to an assembly to provide resistance to heat flow for purpose of energy conservation. **E 176, E05**

insulation blanket, n —a relatively flat and flexible insulation in coherent sheet form furnished in units of substantial area. **E 176, E05**

insulation building-board nail, tileboard nail—galvanized, electro-galvanized or cadmium or nickel-plated, regular-stock-steel, 1¼ and 1¾ by 0.054-in. nails with flat ¾-in. head and medium needle point. Also, plain or colored (baked-lacquer finished) hardened-steel, smooth or annularly threaded, 1¼ by 0.054 to 1¾ by 0.062-in. nails with slightly countersunk 0.109-in. head and medium diamond or long needle point. **F 547, F16**

insulation compaction density—the density of a compacted powder is the combined density of the powder particles and of the voids remaining after the powder compaction. Sometimes the insulation compaction density is divided by the theoretical density of the powder particles to obtain a dimensionless fraction of theoretical density as a convenient method to express the relative compaction. **E 344, E20**

insulation-lath nail—blued, regular-stock-steel, 1½ and 1¾ by 0.092-in. nails with flat ¾-in. head and long diamond point. (See **gypsum-lath nail**.) **F 547, F16**

insulation resistance—the apparent resistance between adjacent contacting laminations, calculated as a ratio of the applied voltage to conduction current. This parameter is normally a function of the applied force and voltage. **A 340, A06**

insulation resistance—see **resistance, insulation**. **D 1711, D09**

insulation resistance—the electrical resistance between two isolated test points on a membrane switch. **F 2112, F01**

insulation resistance, dc, n —the resistance at a specified direct-current voltage between the insulated leads of a thermistor sensor and the metallic enclosure of the sensor, if such an enclosure is present, or else between the sensor leads and a conductive medium in which the sensor is immersed. **E 344, E20**

insulation-sheathing nail—galvanized, barbed, regular-stock-steel, 1¾ and 2 by 0.115 or 0.120-in. nails with flat ¼ or ½-in. head and medium diamond point. **F 547, F16**

insulator (electric)—a device having high electrical resistance and used for supporting or separating conductors to prevent undesired flow of current from them to other objects. (Also known as electrical insulator.) **D 5077, D10**

intangible property

intangible property—property that is not itself intrinsically valuable, but that derives its value from what it represents or evidences, for example, goodwill, knowledge derived from study, experience, or instruction, or knowledge of a specific event or situation.

E 2135, E53

integral, *adj*—*ingeosynthetics*, forming a necessary part of the whole; constituent.

D 4439, D35

integral heat of adsorption—the sum of the differential heats of adsorption from zero to a given level of adsorption.

D 2652, D28

integrally mold—to join and cure two or more uncured (B-staged) composite details to create an assembly during a single autoclave cure cycle.

E 631, E06

integrally mold—to join and cure two or more uncured (B-staged) composite details to create an assembly during a single autoclave cure cycle.

E 1749, E06

integral neutron fluence—the fluence of neutrons integrated over all energies.

$$\Phi = \int_0^{\infty} \Phi(E) dE$$

E 170, E10

integral tooth of metal connector plate—plate projection punched from metal connector plate at right angle to its surface which remains attached to plate and serves as a fastening element.

E 631, E06

integral tripack—See **color film: monopack**.

E 7, E04

integrated pest management, IPM, *n*—(1) The judicious use and integration of various pest control tactics of the associated environment of the pest in ways that complement and facilitate the biological and other natural controls of pests to meet economic, public health, and environmental goals. (2) An environmentally sound system of controlling landscape pests, which includes understanding of the pest's life cycle and well-timed non-toxic treatments.

E 2114, E06

integrating camera—A diffraction camera in which the specimen is moved relative to the incident beam in order to cause diffraction to occur from an extended area of the specimen surface.

E 7, E04

integrating sphere, *n*—an optical device used either to collect flux reflected or transmitted from a specimen into a hemisphere or to provide isotropic irradiation of a specimen from a complete hemisphere, consisting of an approximately spherical cavity with apertures (ports) for admitting and detecting flux, and usually having additional apertures over which sample and reference specimens are placed and for including or excluding the specularly reflected components.

E 284, E12

integrating (Ulbrecht) sphere, *n*—part of an integrating photometer. A sphere that is coated internally with a white diffusing paint as nonselective as possible and is provided with an associated equipment for making a photometric measurement at a point of the inner surface of the sphere. A screen placed inside the sphere prevents the point under observation from receiving any radiation directly from the source.

E 349, E21

integration, *n*—the result of blending compatible data sources into a composite data set has a unity or wholeness for purposes of analysis, summarization, and retrieval of specific data or information.

E 867, E17

integration period, π —the time, in seconds, required for the pen or other indicator to move 98.6 % of its maximum travel in response to a step function.

E 131, E13

integrator, *n*—*in the tensile testing of textiles*, a device for obtaining the time integral of the load.

D 123, D13

integrator, *n*—*intextile unevenness testing*, a device that calculates the coefficient of variation unevenness or the mean deviation unevenness.

D 123, D13

integrator, *n*—*in textile unevenness testing*, a device that calculates the coefficient of variation unevenness or the mean deviation unevenness.

D 4849, D13

integrity—measure of the degree to which a membrane system rejects particles of interest.

D 6161, D19

integrity, *n*—the ability of a test assembly, when exposed to fire from one side, to prevent the passage of flame and hot gases through it or the occurrence of flames on its unexposed side.

E 176, E05

intelligent transportation system (ITS), *n*—systems that apply modern sensing, communication, computing, analysis, or display technologies, or a combination thereof, to one or more aspects of the operations, management, and use of transportation systems.

E 867, E17

intended trajectory, *n*—the intended or ideal path (rectilinear or curvilinear) to bring a vehicle to a stop, that is, under controlled angular orientation.

F 538, F09

intensifying screen—a sheet of a substance which emits visible light or X-rays or photoelectrons, or combinations of these, under the action of X-rays, thus enhancing the darkening of a film placed in contact with it.

E 7, E04

intensifying screen—a material that converts a part of the radiographic energy into light or electrons and that, when in contact with a recording medium during exposure, improves the quality of the radiograph, or reduces the exposure time required to produce a radiograph, or both. Three kinds of screens in common use are:

(a) *metal screen*—a screen consisting of dense metal (usually lead) or of a dense metal compound (for example, lead oxide) that emits primary electrons when exposed to X- or gamma-rays.

(b) *fluorescent screen*—a screen consisting of a coating of phosphors which fluoresces when exposed to X or gamma radiation.

(c) *fluorescent-metallic screen*—a screen consisting of a metallic foil (usually lead) coated with a material that fluoresces when exposed to X or gamma radiation. The coated surface is placed next to the film to provide fluorescence; the metal functions as a normal metal screen.

E 1316, E07

intensional definition, *n*—a two-part definition of a term consisting of a class name for the concept, the genus, and one or two more characteristics that differentiate the concept from others in the same class.

E 1992, E02

intensiostatic—See **galvanostatic**.

G 15, G01

intensity, *n*—the perceived magnitude of a stimulus.

E 253, E18

intensity—apparent depth of a black or colored image produced by a carbon or ribbon.

F 221, F05

intensity, *n*—the amount of radiant or luminous flux per unit solid angle that diverges from a light source.

F 1294, F05

intensity, I_v , I_s , *n*—flux per unit solid angle. (See also **luminous intensity**, **radiant intensity**.)

E 284, E12

intensity of scattering—the energy per unit time per unit area of the general radiation which is diffracted by matter. Its value depends upon the scattering power of the individual atoms of the material, upon the scattering angle, and upon the wavelength of the radiation.

E 7, E04

intensity (X-rays)—the energy per unit of time of a beam per unit area perpendicular to the direction of propagation.

E 7, E04

interaction, *n*—the condition that exists among factors when a test result obtained at one level of a factor is dependent on the level of one or more additional factors.

D 123, D13

interatomic Auger process—*AES*, *XPS*, an Auger transition in which final electron vacancies are in valence levels or molecular orbitals, some of which may be predominantly orbitals of a neighboring bonded atom.

E 673, E42

interbody spacer, *n*—a structure (biologic or synthetic) to replace (partially or totally) the vertebral body or intervertebral disk(s), or both.

F 1582, F04

interception count—the number of particles (or clusters of particles) of a phase or constituent of interest that are crossed by the lines of a test grid.

E 7, E04

intercept method—See **Heyn method**.

E 7, E04

interchangeability, *n*—the extent to which the thermometer matches a resistance-temperature relationship. (The verification of interchangeability can be accomplished only by calibration. The

- deviations at the temperature limits and the maximum deviation from the established resistance-temperature relationship shall be specified.) **E 344, E20**
- intercharacter space, *n***—the space between the last bar of one character and the first bar of the next that separates two adjacent characters. Also called intercharacter gap. **F 1294, F05**
- intercoat contamination**—*in protective coatings*, the presence of foreign matter between successive coats. **D 4538, D33**
- intercolor feathering, *n***—instantaneous ink spread into adjacent inks. **F 1857, F05**
- interconnected porosity, *n***—a network of pores in and extending to the surface of a sintered compact. Usually applied to powder metallurgy materials in which the interconnected porosity is determined by impregnating the specimens with oil. Synonymous with **communicating pores**. **B 243, B09**
- interconnection, *n***—the mechanical interface or connection mechanism between at least two components or between components and bony elements of the spine, pelvis, or ribs. **F 1582, F04**
- interconnector**—a device to connect adjacent membrane elements in series and to seal the product channel from the feed-brine channel. **D 6161, D19**
- intercorrelation coefficient, (r_{xx})**—a measure of the linear association between values of the same type of variable expressed as a correlation coefficient, (*r*). **E 131, E13**
- intercritical annealing/isothermal annealing**—heating a steel above the lower critical transformation temperature, but below the upper-critical transformation temperature, to dissolve all the iron carbides, but not transform all the ferrite to austenite. Cooling slowly from this temperature, through the lower critical temperature, produces a structure of ferrite and pearlite that is free of internal stresses. In *intercritical annealing*, the steel continues to cool slowly in the furnace, similarly to full annealing. In *isothermal annealing*, cooling is stopped just below the lower critical, assuring complete transformation to ferrite and coarse pearlite, and eliminating the potential for bainite formation. The coarse pearlite structure greatly improves machinability of medium carbon steels. **F 1789, F16**
- intercrystalline corrosion**—See **intergranular corrosion**. **G 15, G01**
- intercrystalline cracks**—cracks or fractures that occur between the grains or crystals in a polycrystalline aggregate. **E 7, E04**
- interdendritic**—located within the branches of a dendrite or between the boundaries of two or more dendrites. **E 7, E04**
- interdendritic porosity**—voids occurring between the dendrites in cast metal. **E 7, E04**
- interdigitation**—the interlocking or meshing of the female and male jaw serrations. **F 921, F04**
- interface**—a boundary between two phases with different chemical or physical properties. **E 673, E42**
- interface**—the boundary between two materials. **E 1316, E07**
- interface, *n***—the area in a device where different subsystems connect electrically or a device used to establish a connection between two different devices. **F 1457, F05**
- interface, *n***—one of the two mating surfaces, lines or points of contact within an interconnection between two components, between any component and bone, or between two bony elements. **F 1582, F04**
- interface width, observed**—*AES, XPS, SIMS*, the distance over which a 16 % to 84 % (or 84 % to 16 %) change in signal is measured at the junction of two dissimilar matrices. **E 673, E42**
- interfacial region**—that volume adjacent to an interface having physical or chemical properties different from either bulk phase as a result of its proximity to the interface. **E 673, E42**
- interfacial tension**—the contractile force of an interface between two phases. See **surface tension**. **B 374, B08**
- interfacial tension**—the force existing in a liquid-liquid phase interface that tends to diminish the area of the interface. This force, which is analogous to the surface tension of liquid-vapor interfaces, acts at each point on the interface in the plane tangent at that point. **D 459, D12**
- interfacial tension, *n***—the force existing in a liquid-liquid phase interface that tends to diminish the area of the interface. This force, which is analogous to the surface tension of liquid-vapor interfaces, acts at each point on the interface in the plane tangent at that point. (*Compilation of ASTM Standard Definitions, 7th Edition.*) **D 2864, D27**
- interfacial water**—water in transition layers at mineral/water and mineral/water/ice interfaces in frozen ground. **D 7099, D18**
- interference, *n***—*in testing*, an effect due to the presence of a constituent or characteristic that influences the measurement of another constituent or characteristic. **D 123, D13**
- interference, *n***—an undesired output caused by a substance or substances other than the one being measured. **D 1356, D22**
- interference**—the effect of a combination of wave trains of various phases and amplitudes. **E 7, E04**
- interference**—the variation with distance or time of the amplitude of a wave which results from the superposition of two or more waves having the same, or nearly the same frequency. **E 1316, E07**
- interference check standard, *n***—a solution (or set of solutions) of known analyte concentration used to verify an accurate analyte response in the presence of possible spectral interferences from other analytes that may be present in samples. **E 1605, E06**
- interference check standard (ICS)**—a standard solution (or set of solutions) used for ICP-AES to verify an accurate analyte response in the presence of possible spectral interferences from other analytes present in samples; the concentration of analyte is to be less than 25 % of the highest calibration standard, and concentrations of the interferant will be 200 $\mu\text{g/mL}$ of aluminum, calcium, iron, and magnesium. **E 631, E06**
- interference filter, *n***—filter constructed of extremely thin alternate layers of high and low refractive-index material and capable of transmitting narrow spectral bands formed by constructive interference within the desired waveband and destructive interference at other wavelengths. **E 284, E12**
- interference, *n***—any activity or event that could produce anomalous measurements. **C 634, E33**
- interference seal**—a seal produced between a fastener and its hole when a fastener of a given diameter is driven into a hole of a smaller diameter. An interference seal is also produced when a fastener shank is expanded by the installation process. **E 631, E06**
- interference seal**—a seal produced between a fastener and its hole when a fastener of a given diameter is driven into a hole of a smaller diameter. An interference seal is also produced when a fastener shank is expanded by the installation process. **E 1749, E06**
- interference signal**—*SIMS*, signal measured at the mass position of interest due to another, undesired species. **E 673, E42**
- interfering substance**—any species, other than the ion being measured, whose presence in the sample solution affects the measured potential of a cell. Interfering substances fall into two classes: “electrode” interferences and “method” interferences. Examples of the first class would be those substances which give a similar response to the ion being measured and whose presence generally results in an apparent increase in the activity (or concentration) of the ion to be determined (for example, Na^+ for the Ca^{++} electrode), those species which interact with the membrane so as to change its chemical composition (that is, organic solvents for the liquid or poly(vinyl chloride) (PVC) membrane electrodes) or electrolytes present at a high concentration giving rise to appreciable liquid-junction potentials. The second class of interfering substance is that which interacts with the ion being measured so as to decrease its activity or apparent concentration, but where the electrode continues to report the true activity (that is, CN^- present in the measurement of Ag^+). **D 4127, D19**
- interferogram, double-sided**—interferogram measured with approximately equal retardation on either side of the centerburst. **E 131, E13**
- interferogram, I(δ)**—record of the modulated component of the

interferogram, I(δ)

- interference signal measured as a function of retardation by the detector. **E 131, E13**
- interferogram, laser reference**—sinusoidal interferogram of a laser source measured at the same time as the signal interferogram. **E 131, E13**
- interferogram, signal**—interferogram of the beam of radiant energy whose spectrum is desired. **E 131, E13**
- interferogram, single-sided**—interferogram in which sampling is initiated close to the centerburst and continues through that point to the maximum retardation desired. **E 131, E13**
- interferogram, white light**—reference interferogram of a broadband light source measured at the same time as the signal interferogram and used to initiate data acquisition of consecutive scans for signal-averaging. **E 131, E13**
- interferometer**—device used to divide a beam of radiant energy into two or more paths, generate an optical path difference between the beams, and recombine them in order to produce repetitive interference maxima and minima as the optical retardation is varied. **E 131, E13**
- interferometer**—a non-contact optical instrument used to obtain topographical 3-D data sets. **E 2444, E08**
- interferometer, Genzel**—interferometer in which the beam is focused in the plane of the beamsplitter and collimated before the moving mirror(s). **E 131, E13**
- interferometer, lamellar grating**—interferometer in which the beam is reflected from two interleaved mirrors, one of which is stationary while the other is movable. **E 131, E13**
- interferometer, Michelson**—interferometer in which an approximately collimated beam of radiant energy is divided into two paths by a beamsplitter; one beam is reflected from a movable mirror and the other from a stationary mirror, and they are then recombined at the beamsplitter. **E 131, E13**
- interferometer, rapid-scanning**—interferometer in which the retardation is varied rapidly enough that the modulation frequencies in the interferogram are sufficiently high that the interferogram signal can be amplified directly without additional modulation by an external chopper. **E 131, E13**
- interferometer, refractively scanned**—interferometer in which the retardation between two beams is generated by the movement of a wedged optical element. **E 131, E13**
- interferometer, slow-scanning**—interferometer in which the retardation is continuously varied, but so slowly that an external chopper is needed to modulate the beam at a frequency which is high enough for ac signal amplification. **E 131, E13**
- interferometer, stepped-scanning**—interferometer in which the movable element is held stationary for the length of time required for signal integration and digitization of each sample point, and then translated to the next sample point. **E 131, E13**
- intergranular corrosion**—a preferential attack at the grain boundaries. **E 7, E04**
- intergranular corrosion**—preferential corrosion at or adjacent to the grain boundaries of a metal or alloy. **G 15, G01**
- intergranular pressure**—see **stress**. **D 653, D18**
- interim controls**—a set of measures designed to temporarily reduce human exposure or likely exposure to lead-based paint hazards, including specialized cleaning, repairs, maintenance, painting, temporary containment, ongoing monitoring of lead-based paint hazards or potential hazards, and the establishment and operation of management and resident education programs. **E 1605, E06**
- interim remedial measure, n**—a remedial action that implements a partial solution prior to the selection of a final complete remedy. Interim remedial measures may be early actions, but they are often not. **D 5681, D34**
- interim foam-filled tube**—a tube filled with homogeneous unicellular thermosetting foam having closed cells blown with non-combustible gases, with the filling bonded to the interior wall.
NOTE—The foam filling should be free of voids, separations, holes, cracks, or the like. **F 819, F18**
- interior packing**—See **packing**. **D 996, D10**
- interior pipe size (IPS)**—See **iron pipe size**. **E 631, E06**
- interior type plywood**—a term frequently applied to plywood bonded with adhesives that maintain adequate bonds under conditions usually existing in the interior of buildings; the commercial classification is a function of veneer grade as well as glue durability. **D 1038, D07**
- interior work-area**—hallway, room, part of a room, or group of rooms in which a lead-hazard abatement activity takes place on the inside of a building. **E 631, E06**
- interlaboratory study, ILS, n**—a study undertaken to demonstrate the precision and accuracy of a test method. **E 135, E01**
- interlaboratory test comparison**—organization, performance and evaluation of tests on the same or similar items or materials by two or more laboratories in accordance with predetermined conditions, (ISO Guide 2). **E 1187, E36**
- interlaboratory testing**—the evaluating of a test method in more than one laboratory by analyzing data obtained from one or more materials that are as homogeneous as practical. **D 123, D13**
- interlaminar**—describing objects (for example, voids), events (for example, fracture), or fields (for example, stress) between the laminae of a laminate. **D 3878, D30**
- interlaminar**—descriptive term pertaining to some object (voids), event (fracture), or potential field (shear stress) referenced as existing or occurring between two or more adjacent laminae. **E 631, E06**
- interlaminar**—descriptive term pertaining to some object (voids), event (fracture), or potential field (shear stress) referenced as existing or occurring between two or more adjacent laminae. **E 1749, E06**
- interlayer**—a material used for bonding glass lites together. See related term **laminated glass**. **C 162, C14**
- interlayer paper**—see **layer insulation**. **D 1711, D09**
- interlining, n**—any textile which is intended for incorporation into an article of wearing apparel as a layer between an outer shell and inner lining. **D 123, D13**
- interlock**—See **windows and doors**. **E 631, E06**
- interlock**—a device or system, either electrical, mechanical, or electromechanical, that serves to prevent exposure to an electric shock, physical injury, or excessive radiation emission when a door, cover, or access panel is opened or removed. **F 1827, F26**
- interlocking tile, n**—tile with a system of ribs or grooves enabling the lateral joining of adjacent tiles in the same course with the overlocking edge of one tile covering the underlocking edge of another forming the side lap. **C 43, C15**
- intermediary plane**—any plane in a microscope where a real image of a specimen is formed. Reticles can be inserted at intermediary planes for superposition on the image. **E 7, E04**
- intermediate annealing, n**—annealing wrought steel objects at one or more stages during manufacture prior to final thermal treatment. **A 941, A01**
- intermediate fiberboard sheathing**—a cellulosic fiberboard sheathing product, approximately 22 lb/ft³, used in frame construction under masonry veneer, siding, shingles, and stucco. **D 1554, D07**
- intermediate image**—any image of an object formed by a lens other than the final projector lens. **E 7, E04**
- intermediate pack**—See **pack**. **D 996, D10**
- intermediate package**—See **package**. **D 996, D10**
- intermediate phase**—in a chemical system, a distinguishable homogeneous substance whose composition range of existence does not extend to any of the pure components of the system. **E 7, E04**
- intermediate precision conditions, n**—conditions under which test results are obtained with the same test method using test units or test specimens (see Practice E 691, 10.3) taken at random from a single quantity of material that is as nearly homogeneous as possible, and with changing conditions such as operator, measuring equipment, location within the laboratory, and time. **E 456, E11**

intermediate precisions, n —the closeness of agreement between test results obtained under specified intermediate precision conditions.

NOTE—The specific measure and the specific conditions must be specified for each intermediate measure of precision; thus, "standard deviation of test results among operators in a laboratory," or "day-to-day standard deviation within a laboratory for the same operator."

NOTE—Because the training of operators, the agreement of different pieces of equipment in the same laboratory and the variation of environmental conditions with longer time intervals all depend on the degree of within-laboratory control, the intermediate measures of precision are likely to vary appreciably from laboratory to laboratory. Thus, intermediate precisions may be more characteristic of individual laboratories than of the test method.

intermediate principal plane—see **principal plane**. D 653, D18

intermediate principal stress—see **stress**. D 653, D18

intermediate rail—one of two or more rails between the top rail and floor. E 631, E06

intermediate rail—one of two or more rails between the top rail and floor. E 1481, E06

intermediate rail—horizontal member of the framework running continuously at any point between the top and bottom of the fence (sometimes called *middle rail*). F 552, F14

intermediate rib, n —one or more rib(s) located between the centerline and the shoulder ribs of the tread band. F 538, F09

intermediate row, n —a row located between the circumferential centerline and the shoulder ribs/rows of the tread band. F 538, F09

intermediate temper—as applied to aluminum, any temper between soft and hard drawn. B 354, B01

intermediate-temperature-setting adhesive, n —an adhesive that sets in the temperature range from 31 to 99°C (87 to 211°F). (Synonym *warm-setting adhesive*.) (Compare **cold-setting adhesive**, **hot-setting adhesive**, and **room-temperature-setting adhesive**.) D 907, D14

intermetallic phases—compounds, or intermediate solid solutions, containing two or more metals, which usually have characteristic properties and crystal structures different from those of the pure metals or the terminal solid solutions. E 7, E04

intermittent disfigurement—disfigurement of the shape of the pultrusion for a limited length.

NOTE—This condition usually results from die fouling or from folded or crowded reinforcing material and is corrected after a short distance. D 3918, D20

intermittent human temperature determination—determination of human body temperature that is made periodically by a series of entirely separate measurements. E 344, E20

intermittent moving bed (pulse, slug)—an adsorption process characterized by upward flow of a fluid through a fixed bed of granular adsorbent with periodic withdrawal of spent adsorbent from the bottom of the bed and additions of reprocessed or virgin adsorbent to the top of the bed. D 2652, D28

intermittent sampling—See **sampling**. D 1356, D22

intermodal container—See **container**. D 996, D10

internal, *adj*—of the interior of *subject's* body or body cavity, such as pulmonary artery, urinary bladder, oral, rectal, etc. E 344, E20

internal absorptance, α_p, n —ratio of the absorbed radiant or luminous flux to the flux that has entered the first surface of the layer of material. E 284, E12

internal absorptance of a homogeneous nondiffusing plate, n —ratio of the radiant or luminous flux absorbed between the entry and exit surfaces of the plate to the flux which leaves the entry surface. Symbol: $a_i, a_i + \tau_i = 1$.

NOTE—For a given plate, the internal absorptance is a function of the path length of the radiation in the plate and thus of the angle of incidence. The fundamental concept is spectral internal absorptance. $a_i(\lambda)$. E 349, E21

internal carbon referencing—XPS, a method of determining the charging potential of a specimen by comparing the experimentally determined binding energy of the C1s peak maximum from a

specific carbon group within the specimen to a standard binding energy value for that carbon group. A hydrocarbon group within the specimen is often used for this purpose. E 673, E42

internal conversion, n —a transition between electronic states of the same total spin quantum number (multiplicity). E 131, E13

internal cut outs, n —lines, part of a pattern piece, not part of the piece boundary, which are cut during the cutting process. D 6963, D13

internal discharge—method in which makeup air is introduced inside the hood. This design has limited application, and the amount of supply air able to be introduced varies considerable with the type of cooking equipment and the exhaust flow rate. Makeup air may be untempered depending on climatic conditions. F 1827, F26

internal filling solution of sensing electrode—in liquid membrane electrodes, an aqueous internal filling solution contacts the internal reference element and the membrane, which is saturated with ion exchanger. The filling solution normally contains a fixed level of chloride and of the ion for which the electrode was designed; the concentration of this ion determines the zero potential point of the electrode. In addition, the filling solution is saturated with silver chloride to prevent the silver chloride of the internal reference element from dissolving. D 4127, D19

internal flotation—flotation element located within the boom membrane. F 818, F20

internal friction (shear resistance), (FL^{-2}) —the portion of the shearing strength of a soil or rock indicated by the terms $p \tan \phi$ in Coulomb's equation $s = c + p \tan \phi$. It is usually considered to be due to the interlocking of the soil or rock grains and the resistance to sliding between the grains. D 653, D18

internal hydrogen embrittlement—embrittlement caused by residual hydrogen from fastener processing, such as cleaning, pickling, phosphating, or electroplating. F 1789, F16

internal hydrogen embrittlement (IHE)—hydrogen embrittlement caused by absorbed atomic hydrogen from any chemical process that introduces hydrogen into the steel before exposure to an externally applied stress. F 2078, F07

internal lines, n —lines, part of a pattern piece, not a part of the piece boundary, which are not cut. D 6963, D13

internal mixing pneumatic atomizer—a pneumatic atomizer in which gas and liquid are introduced and mixed within the nozzle, and are then discharged as a two-phase dispersion through a common orifice. E 1620, E29

internal oxidation—preferential oxidation of certain components or phases within the bulk of a solid metal. E 7, E04

internal oxidation—the formation of isolated particles of corrosion products beneath the metal surface. (This occurs as the result of preferential oxidation of certain alloy constituents by inward diffusion of oxygen, nitrogen, sulfur, and so forth.) G 15, G01

internal rate of return (IRR)—the compound rate of interest that, when used to discount study period costs and benefits of a project, will make the two equal. E 631, E06

internal rate of return (IRR), n —the compound rate of interest that, when used to discount study period costs and benefits of a project, will make the two equal. E 833, E06

internal reference electrode—a reference electrode that is contained inside an ion-selective electrode assembly. Comment: The system frequently consists of a silver-silver chloride electrode in contact with an appropriate solution containing chloride and a fixed concentration of the ion for which the membrane is selective. D 4127, D19

internal, reflection attachment, IRA—the transfer optical system which supports the IRE, directs the energy of the radiant beam into the IRE, and then redirects the energy into the spectrometer or onto the detector. The IRA may be part of an internal reflection spectrometer or it may be placed into the sampling space of a spectrometer. E 131, E13

internal reflection element (IRE)—the transparent optical element

internal reflection element (IRE)

used in internal reflection spectroscopy for establishing the conditions necessary to obtain the internal reflection spectra of materials. E 131, E13

internal reflection spectroscopy (IRS)—the technique of recording optical spectra by placing a sample material in contact with a transparent medium of greater refractive index and measuring the reflectance (single or multiple) from the interface, generally at angles of incidence greater than the critical angle. E 131, E13

internal reflux, *n*—the liquid normally running down inside a distillation column. (Synonym—*reflux*.) D 4175, D02

internal reflux—the liquid normally running down inside the column. D 4175, D02

internal seam—See **stepdown test**. E 7, E04

internal shrinkage cracks—longitudinal cracks in the pultrusion that are found within sections of roving reinforcement.

NOTE—This condition is caused by shrinkage strains during cure that show up in the roving portion of the pultrusion where transverse strength is low. D 3918, D20

internal standard, *n*—a material present in or added to samples in known amount to serve as a reference measurement. D 1129, D19

internal standard—a compound of known behavior added to a sample to facilitate the analysis. D 4790, D16

internal standard, *n*—in *spectrometry*, a material present in or added to test samples that serves as an intensity reference for spectral measurements. E 135, E01

internal standard line, *n*—a spectral line of an internal standard, with which the radiant energy of an analytical line is compared. E 135, E01

internal transmission density, *n*—logarithm to the base 10 of the reciprocal of the internal transmittance. Symbol: D_i , $D_i = -\log_{10} \tau_i$.

NOTE—See Note of **internal transmittance of a homogeneous nondiffusing plate**.

NOTE—In German, the symbol E is still in use and the natural logarithm is also used sometimes instead of the common logarithm; the corresponding quantity is then called “natürliches Absorptionsmass.” (= $\ln 1/\tau_i$). E 349, E21

internal transmittance, τ_i, n —the ratio of flux reaching the exit surface of a specimen to the flux that penetrates the entry surface. E 284, E12

internal transmittance of a homogeneous nondiffusing plate, *n*—ratio of the radiant or luminous flux reaching the exit surface of the plate to the flux which leaves the entry surface.

NOTE—For a given plate, the internal transmittance is a function of the path length of the radiation in the plate and thus of the angle of incidence. The fundamental concept is “spectral internal transmittance” $\tau(\lambda)$. E 349, E21

International Organization for Standards, *n*—an organization that develops and publishes international standards for a variety of technical applications, including data processing and communications. (See **ISO**.) F 1457, F05

international pyrheliometric scale—pyrheliometric scale decreed as being in operation from July 1, 1957, in order to meet an urgent need for a single international scale. E 772, E44

International Practical Temperature Scale (IPTS-48), *n*—the temperature scale adopted by the 11th General Conference on Weights and Measures in 1960 and replaced in 1968 by the International Practical Temperature Scale of 1968. E 344, E20

International Practical Temperature Scale of 1968 (IPTS-68), *n*—the temperature scale adopted by the 13th General Conference on Weights and Measures in 1968. E 344, E20

international roughness index (IRI), *n*—an index computed from a longitudinal profile measurement using a quarter-car simulation at a simulation speed of 50 mph (80 km/h). E 867, E17

international roughness index, true—see **true international roughness index**. E 867, E17

International System of Units, SI—a complete coherent system of units whose base units are the metre, kilogram, second, ampere,

kelvin, mole, and candela. Other units are derived as combinations of the base units or supplementary units. A 340, A06

International Temperature Scale of 1990 (ITS-90), *n*—the temperature scale prepared in accordance with instructions of the 18th General Conference on Weights and Measures, and adopted on January 1, 1990. E 344, E20

interphase, *n*—in an adhesive joint, a region of finite dimension extending from a point in the adherend where the local properties (chemical, physical, mechanical, and morphological) begin to change from the bulk properties of the adherend to a point in the adhesive where the local properties equal the bulk properties of the adhesive. D 907, D14

interphase—the region between two distinct phases over which there is a variation of a property. E 673, E42

interplanar distance—the perpendicular distance between adjacent parallel lattice planes. E 7, E04

interpretation—the determination of whether indications are relevant or nonrelevant. E 1316, E07

interpretation, *n*—the determination of whether indications are relevant, nonrelevant, or false. E 1316, E07

interpreter—that part of the OCR system which analyzes the input data and determines what the individual characters are and what their relation is to each other. F 149, F05

inter-projection wear, *n*—a type of irregular treadwear characterized by different wear rates on one or more adjacent projections (either transverse or circumferential orientation); this results in a step-off in tread depth between the adjacent projections. F 538, F09

interpupillary distance—spacing between the pupils of the eyes; eyepieces on binocular microscopes should be set at this distance for comfortable and accurate viewing. E 7, E04

interrupted aging, *n*—aging at two or more temperatures, by steps, and cooling to room temperature after each step. A 941, A01

interrupted quenching, *n*—quenching in which the object being quenched is removed from the quenching medium while the object is at a temperature substantially higher than that of the quenching medium. A 941, A01

intersection count—the number of boundaries between the matrix phase and the phase or constituent of interest that are crossed by the lines of a test grid. For isolated particles in a matrix, the number of feature intersections will equal twice the number of feature interceptions. E 7, E04

interstice—see preferred term **void**. D 653, D18

interstitial—occurring between the grains or in the pores in rock or soil. D 653, D18

interstitial-free steel, *n*—a steel that has essentially all of its carbon and nitrogen chemically combined with stabilization elements rather than being present interstitially. A 941, A01

interstitial water, *n*—the residual water remaining in the sample pore spaces at the completion of the fixed-volume weekly leach. D 5681, D34

interstitial water—water occupying space between sediment or soil particles (syn. **pore water**). E 943, E47

intersystem crossing—a transition between electronic states that differ in total spin quantum number (multiplicity). E 131, E13

interval, arrival time (Δt_{ij})—the time interval between the detected arrivals of an acoustic emission wave at the i th and j th sensors of a sensor array. E 1316, E07

interval erosion rate, *n*—the slope of a line joining two specified points on the cumulative erosion-time curve. G 40, G02

interval error, *n*—the deviation of the nominal value of a temperature interval from its true value; either for the total range (total interval) or for a part of the range (partial interval). E 344, E20

interval estimate—the estimate of a parameter given by two statistics, defining the end points of an interval. E 1823, E08

intervener physician—a licensed M.D. or D.O., having not previously established a doctor/patient relationship with the emergency patient, who is willing to accept responsibility for patient care, and who can provide proof of a current medical license. F 1177, F30

- intervention required, *n***—a message from the host computer indicating to the operator that some action is required before printing can continue. **F 1457, F05**
- intervertebral body fusion cage, *n***—a hollow device which contains graft material. **F 1582, F04**
- intervertebral body fusion devices, *n***—a structure which is placed in the disc space between two adjacent vertebral bodies to provide support for eventual arthrodeses of the two adjacent vertebral bodies. **F 1582, F04**
- intracrystalline cracking*—See **transcrystalline cracking**. **E 7, E04**
- intralaminar**—describing objects (for example, voids), events (for example, fracture), or fields (for example, stress) within the laminae of a laminate. **D 3878, D30**
- intrapermafrost water**—water occurring in unfrozen zones (that is, taliks and cryopegs) within permafrost. **D 7099, D18**
- intra-projection wear, *n***—a type of irregular wear characterized by a different wear rate at two or more locations within a given projection. **F 538, F09**
- intrinsic fiber optic chemical sensor, *n***—a fiber optic chemical sensor in which the modulation of the optical signal is effected through a change in the properties of the optical fiber itself, and such modulation occurs while the radiant energy is guided by the optical fiber. **E 131, E13**
- intrinsic linewidth, of specimen**—AES, XPS, the linewidth contribution arising from the specimen. The measured linewidth is a convolution of this function and broadening contributions of the instrument (for example, X-ray source radiation linewidth, spectrometer energy resolution). **E 673, E42**
- intrinsic shear strength, S_o (FL⁻²)**—the shear strength of a rock indicated by Coulomb's equation when $p \tan \phi$ (shear resistance or internal friction) vanishes. Corresponds to cohesion, c , in soil mechanics. **D 653, D18**
- intrinsic viscosity*—see **viscosity, intrinsic**. **D 1695, D01**
- intrusive ice**—ice formed from water intruded or injected under pressure into soils and rocks. **D 7099, D18**
- intumescent coating, *n***—a fire-retardant coating (which see) that when heated forms a foam produced by nonflammable gases, such as carbon dioxide and ammonia. This results in a thick, highly insulating layer of carbon (about fifty times as thick as the original coating) that serves to protect the coated substrate from fire. **D 16, D01**
- invariant equilibrium**—a stable state amongst a number of phases exceeding by two the number of components in the system and in which more of the external variables (pressure, temperature, or concentrations) may be varied without causing a decrease in the number of phases present. **E 7, E04**
- invariant equilibrium**—stable state among a number of phases exceeding by two the number of components in the system and in which more of the external variables (pressure, temperatures, or concentrations) may be varied without causing a decrease in the number of phases present, (E 7, E04). **E 1142, E37**
- invariant point**—a point defined by the unique values of temperature, pressure, and concentrations in a system with the maximum number phases which can coexist in equilibrium. **E 7, E04**
- invariant point**—point defined by the unique values of temperature, pressure, and concentrations in a system with the maximum number of phases that can coexist in equilibrium, (E 7, E04). **E 1142, E37**
- invasive species, *n***—an exotic species that alters the native ecosystem and negatively impacts native species, resulting in habitat loss, water-table modification, or other disruptions. **E 2114, E06**
- inverse rate curve**—in thermal analysis, the curve that is obtained when the length of time required by the specimen to pass through successive and constant intervals of temperature is plotted against the temperature. **E 7, E04**
- inverse segregation**—a concentration of low melting constituents in those regions in which solidification first occurs. **E 7, E04**
- inverse wear rate [*nd*], *n***—the distance traveled by a tire, after break-in, per unit loss in tread depth. **F 538, F09**
- inversion, *n***—a reversal of the normal atmospheric temperature gradient, thus an increase of temperature of the air with increasing altitude. **D 1356, D22**
- inversion**—the act of turning inward, turning the sole of the foot toward the midline of the body. **F 869, F08**
- invert**—the bottom or lowest point of the internal surface of the transverse cross section of a pipe. **C 822, C13**
- invert**—on the cross section, the lowest point of the underground excavation or the lowest section of the lining. (ISRM) **D 653, D18**
- inverted microscope**—a microscope so arranged that the line of sight is directed upwards through the objective to the object. **E 7, E04**
- invert emulsion**—a water in oil emulsion also known as closed phase emulsion, total emulsion and invert. **E 609, E35**
- invert emulsion suspension**—a water in oil emulsion also known as a multiple emulsion. **E 609, E35**
- investigative PDD procedures, *n***—routine PDD examinations that are used to explore wider issues than evidentiary PDD examinations, and are not intended to meet exacting evidentiary standards. Investigative procedures may include applicant testing, Post-Conviction Sex Offender Testing, and multiple-facet criminal testing. **E 2035, E52**
- investment cost**—first cost and later expenditures which have substantial and enduring value (generally more than one year) for upgrading, expanding, or changing the functional use of a building or building subsystem. **E 631, E06**
- investment cost, *n***—first cost and later expenditures which have substantial and enduring value (generally more than one year) for upgrading, expanding, or changing the functional use of a building or building subsystem. **E 833, E06**
- invisible waste, *n***—*in cotton testing*, weight loss due to dust, moisture, loose fibers, etc., carried away by the air stream during the test. **D 123, D13**
- invisible waste, *n***—*in cotton testing*, weight loss due to dust, moisture, loose fibers, etc., carried away by the air stream during the test. **D 7139, D13**
- iodine adsorption number, *n***—the number of grams of iodine adsorbed per kilogram of carbon black under specified conditions. **D 3053, D24**
- ion**—an electrified portion of matter of atomic or molecular dimensions. **B 374, B08**
- ion**—a charged portion of matter of atomic or molecular dimensions. **D 6161, D19**
- ion beam**—a directed flux of charged atoms or molecules.
- current*—the measured rate of flow of charged atoms or molecules incident upon the specimen per unit time, usually expressed in amperes (A).
- current density*—the ion beam current incident on the specimen per unit cross-sectional area, usually expressed in amperes per square centimetre (A/cm²).
- energy*—in surface analysis, the mean kinetic energy of the ions in the beam (see **beam, energy**). **E 673, E42**
- ion content,, *n***—a measure of the free sodium, potassium, and chloride content in a direct thermal or thermal transfer product; trace amounts may cause chemical attack to the thermal printhead elements. **F 1623, F05**
- ion deposition printer**—a printer where ion charges are gated onto a dielectric drum. Toner is picked up by the charge, then transferred to the paper. Once the toner is deposited on the paper, it can be affixed by either pressure or heat fusion. **F 149, F05**
- ion exchange**—a reversible process by which ions are interchanged between a solid and a liquid with no substantial structural changes of the solid. **B 374, B08**
- ion exchange, *n***—a reversible process by which ions are interchanged between an insoluble material and a liquid with no substantial structural changes of the material. **D 1129, D19**
- ion exchange**—a reversible process by which ions are interchanged between a solid and a liquid with no substantial structural changes in the solid. **D 1695, D01**

ion exchange

ion exchange—a reversible process by which ions are interchanged between a solid and a liquid with no substantial structural changes in the solid; ions removed from a liquid by chemical bonding to the media. **D 6161, D19**

ion-exchange capacity—for cellulosic ion-exchange materials, the number of milliequivalents of ions that can be exchanged by 1 g of the ion-exchange material. **D 1695, D01**

ion-exchange capacity (volume basis), *n*—the number of milliequivalents of exchangeable ions per millilitre of backwashed and settled bed of ion-exchange material in its standard form. **D 1129, D19**

ion-exchange capacity (volume basis)—the number of milliequivalents of exchangeable ions per millilitre of backwashed and settled bed of ion-exchange material in its standard form. **D 6161, D19**

ion-exchange capacity (weight basis), *n*—the number of milliequivalents of exchangeable ions per dry gram of ion-exchange material in its standard form. **D 1129, D19**

ion-exchange capacity (weight basis)—the number of milliequivalents of exchangeable ions per dry gram of ion-exchange material in its standard form. **D 6161, D19**

ion-exchange material, *n*—a water insoluble material that has the ability to exchange reversibly certain ions in its structure, or attached to its surface as functional groups, with ions in a surrounding medium. **D 1129, D19**

ion-exchange material—a water insoluble material that has the ability to reversibly exchange ions in its structure, or attached to its surface as functional groups, with ions in a surrounding medium. **D 6161, D19**

ion-exchange materials—insoluble solid materials with the ability to exchange reversibly certain ions, in the structure or attached to the surface as functional groups, with ions in a surrounding medium. **D 1695, D01**

ion-exchange membrane, *n*—an ion-exchange material in a form suitable for use as a barrier between two fluids. **D 1129, D19**

ion-exchange membrane—an ion-exchange material in a form suitable for use as a barrier between two fluids. **D 6161, D19**

ion-exchange particle, *n*—an ion-exchange material in the form of spheroids or granules with an average diameter less than 10 mm. **D 1129, D19**

ion-exchange particle—an ion-exchange material in the form of spheroids or granules. **D 6161, D19**

ion-exchange resin, *n*—a synthetic, organic-ion-exchange material. **D 1129, D19**

ion-exchange resin—an organic ion-exchange material substrate, usually synthetic. **D 6161, D19**

ionic cellulose ethers—those water-soluble cellulose ethers which contain ionizable groups, in more than trace amounts. Sodium carboxymethyl cellulose is an example. **D 1695, D01**

ionic strength—the weighted concentration of ions in solution, computed by multiplying the concentration (*c*) of each and every ion in solution by the corresponding square of the charge (*Z*) on the ion, summing and dividing by 2: ionic strength = $(1/2)\sum Z^2C$. Conductivity measurements give a rough estimate of ionic strength. The ionic strength (and to a lesser extent, the concentration of nonionic dissolved species) largely determines the activity coefficient of each ion in the solution. **D 4127, D19**

ionic strength—measure of the overall electrolytic potential of a solution, the strength of a solution based on both the concentrations and valencies of the ions present. **D 6161, D19**

ionic-strength adjustment buffer—a pH buffered solution of high ionic strength added to samples and calibration solutions before measurement in order to achieve identical ionic strength and hydrogen ion activity. In addition, complexing agents and other components are often added to minimize the effects of certain interferences. **D 4127, D19**

ion image—SIMS, a two-dimensional representation of the spatial distribution of a particular secondary ion emitted from a specific area of the specimen. **E 673, E42**

ion implantation—the injection of ions into a specimen. **E 673, E42**

ionization, *n*—the process by which electrons are lost from or transferred to neutral molecules or atoms to form positively or negatively charged particles. **D 1711, D09**

ionization—the process by which neutral atoms or molecules, such as air, acquire a positive or negative charge. **D 5077, D10**

ionization—the disassociation of molecules into charged particles (ions). **D 6161, D19**

ionization—a process in which a charged particle is created from a parent atom or molecule or other bound state. **E 170, E10**

ionization chamber—a device for the measurement of radiation intensity by means of determining the degree to which the radiation ionizes a gas. **E 7, E04**

ionization cross-section—the probability that an incident particle traversing a gas or solid will produce an ionizing collision. The total ionization cross-section includes all electron vacancies produced by a primary collision and subsequent Coster-Kronig or Auger decay process. The partial ionization cross-section results from one particular process such as a primary collision to produce an initial innershell vacancy in a particular shell, a Coster-Kronig process, or an Auger ejection process to produce particular distributions of electron vacancies. **E 673, E42**

ionization method—a method of X-ray diffraction in which the intensity of the diffracted beam is measured by means of an ionization chamber. **E 7, E04**

ionization potential—the minimum energy, expressed in (electron) volts, required to remove an electron from an atom or molecule to form a positive ion. **E 1316, E07**

ionization vacuum gage—an indicating device used in vacuum systems to determine the pressure of the residual gas in a system by measuring the positive ion current produced in the process of ionization in an electrical field. **E 7, E04**

ionization vacuum gage—a vacuum gage comprising a means of ionizing the gas molecules, electrodes to facilitate the collection of the positive ions formed, and means of indicating the magnitude of the collected ion current. Various types of ionization gages are distinguished according to the method of producing the ionization. The common types are as follows:

(a) *hot-cathode ionization gage*—the ions are produced by collisions with electrons emitted from a hot filament (or cathode) and accelerated by an electric field. Also called hot-filament ionization gage, or simply ion gage. The Bayard-Alpert ionization gage employs a tube with an electrode structure designed to minimize X-ray-induced electron emission from the ion collector.

(b) *cold-cathode ionization gage*—the ions are produced by a cold-cathode discharge, usually in the presence of a magnetic field which lengthens the path of the electrons between cathode and anode. The discharge tube is a transparent tube in which the color and form of a cold-cathode discharge (without the presence of a magnetic field) gives an indication of the pressure and the nature of the gas. The Phillips ionization gage is a cold-cathode ionization gage in which a magnetic field is directly parallel to the axis of an annular electrode (normally the anode) located between two plate electrodes perpendicular to the axis. Various modifications of the Penning gage are named after the inventors, and certain types are referred to as magnetron vacuum gages.

(c) *radioactive ionization gage*—the ions are produced by radiations (usually alpha particles) emitted from a radioactive source. **E 1316, E07**

ionizing radiation—any type of radiation consisting of *charged* particles or *uncharged* particles, or both, that as a result of physical interaction, creates ions by either primary or secondary processes. (For example, *charged* particles could be positrons or electrons, protons, or other heavy ions, and *uncharged* particles could be X rays, gamma rays, or neutrons.) **E 170, E10**

ion lifetime—the average time that an ion exists in a particular electronic configuration, for example, a vacancy in a particular shell in an atom. **E 673, E42**

ion line, *n*—a spectral line resulting from radiation emitted during electron transition as an ionized atom decays to a lower, but still ionized, energy level. **E 135, E01**

ion neutralization—*ISS, SIMS*, the charge exchange processes in which a probe is neutralized by the material surface or gas phase species with which it interacts. **E 673, E42**

ion pump—an electrical device for pumping gas comprising a means for ionizing the gas and a system of electrodes at suitable potentials, and in some cases also a magnetic field, which causes the ions formed to move towards a surface on which they are absorbed or buried. **E 1316, E07**

ion-scattering:

spectrometer—*ISS*, an instrument capable of generating a beam of principally monoenergetic, singly charged, low-energy ions and determining the energy distribution of the probe ions that have been scattered from the solid surface through a known angle.

spectrometry—*ISS*, a technique to elucidate composition and structure of the outermost atomic layers of a solid material, in which principally monoenergetic, singly charged, low-energy (less than 10 keV) probe ions are scattered from the surface and are subsequently detected and recorded as a function of the energy or scattering angle, or both.

spectrum—*ISS*, a representation in which the scattered ion intensity is presented as a function of the ratio of the scattered ion energy to the incident ion energy. **E 673, E42**

ion-selective electrode—electrochemical sensors, the potentials of which are linearly dependent on the logarithm of the activity of a given ion in solution. Such devices are distinct from systems that involve redox reactions.

(A) Primary Electrodes

(1) *crystalline electrodes*—may be homogeneous or heterogeneous.

(a) *homogeneous membrane electrodes*—are ion-selective electrodes in which the membrane is a crystalline material prepared from either a single compound or a homogeneous mixture of compounds (that is, Ag_2S , $\text{AgI}/\text{Ag}_2\text{S}$).

(b) *heterogeneous membrane electrodes*—are formed when an active substance, or mixture of active substances, is mixed with an inert matrix, such as silicone rubber or PVC, or placed on hydrophobized graphite, to form the sensing membrane that is heterogeneous in nature.

(2) *noncrystalline electrodes*—In these electrodes a support, containing an ionic (either cationic or anionic) species or an uncharged species, forms the ion-selective membrane which is usually interposed between two aqueous solutions. The support used can be either porous (for example, filter, glass frit, etc.) or nonporous (for example, glass or inert polymeric material such as PVC, yielding with the ion-exchanger and the solvent a *solidified* homogeneous mixture). These electrodes exhibit a response due to the presence of the ion-exchange material in the membrane.

(a) *rigid matrix electrodes*—Glass electrodes are ion-selective electrodes in which the sensing membrane is a thin piece of glass whose chemical composition determines the selectivity of the electrode. In this group are: hydrogen ion-selective electrodes and monovalent cation-selective electrodes.

(b) *electrodes with a mobile carrier:*

(1) *positively charged*—bulky cations (for example, those of quaternary ammonium salts or salts of transition metal complexes such as derivatives of 1,10-phenanthroline) which, when dissolved in a suitable organic solvent and held on an inert support (for example, filter or PVC), provide membranes that are sensitive to changes in the activities of anions.

(2) *negatively charged*—complexing agents (for example, of type $(\text{RO})_2\text{PO}_2^-$) or bulky anions (for example, tetra-*p*-chlorophenylborate anions) that when dissolved in a suitable

organic solvent and held in an inert support (for example, filter or PVC), provide membranes that are sensitive to changes in the activities of cations.

(3) *uncharged (neutral) carrier*—electrodes based on solutions of molecular carriers of cations (for example, antibiotics, macrocyclic compounds or other sequestering agents) that can be used in membrane preparations which show sensitivity and selectivity to certain cations.

(B) Sensitized Ion-selective Electrodes

(1) *gas-sensing electrodes:*

(a) *secondary reaction type*—sensors composed of an indicating and a reference electrode that uses a gas-permeable membrane or an air gap to separate the sample solution from a thin film of an intermediate solution, which is held between the gas membrane and the ion-sensing membrane of the electrode, or placed on the surface of the electrode using a wetting agent (for example, air-gap electrode). This intermediate solution interacts with the gaseous species in such a way to produce a change in a measure value (for example, pH) of the intermediate solution. This change is sensed by the ion-selective electrode and is proportional to the partial pressure of the gaseous species in the sample.

(b) *redox reaction type*—a gas sensing electrode using a platinum redox electrode, typified by the hydrogen gas electrode. This responds to the redox equilibrium between hydrogen gas and hydrogen ion in solution.

(c) *amperometric detector*—this is a type that uses an amperometric detector, generally behind a gas permeable membrane. Such devices have been used for oxygen and for free chlorine.

(2) *enzyme substrate electrodes*—sensors in which an ion-selective electrode is covered with a coating containing an enzyme that causes the reaction of an organic or inorganic substance (substrate) to produce a species to which the electrode responds. Alternatively, the sensor could be covered with a layer of substrate that reacts with the enzyme to be assayed.

NOTE—The term *ion-specific electrode* is not recommended. The term *specific* implies that the electrode does not respond to additional ions. Since no electrode is truly specific for one ion, the term *ion-selective* is recommended as more appropriate. *Selective ion-sensitive electrode* is a little-used term to describe an ion-selective electrode. **D 4127, D19**

ion source—in leak testing, that part of a leak detector tube in which tracer gas is ionized preliminary to being detected. **E 1316, E07**

ion species—type and charge of ion such as Ar^+ , O^- , and H_2^+ . If an isotope is used, it should be specified. **E 673, E42**

IOT controller, *n*—a printed wiring board in the image output terminal that controls the operation of the image output terminal and communicates with the electronic scanning system. **F 1457, F05**

IP—abbreviation for Institute of Petroleum. **D 4175, D02**

IPM, *n*—see **integrated pest management**. **E 2114, E06**

ipsilateral, *adj*—located, occurring, or acting on the same side of the body. **F 1646, F13**

IQI sensitivity—in radiography, the minimum discernible image and the designated hole in the plaque-type, or the designated wire image in the wire type image quality indicator. **E 1316, E07**

IR drop—the voltage across a resistance in accordance with Ohm's law:

$$E = IR$$

where:

E = potential (voltage),

I = current, and

R = resistance.

iron

iron—a term used for measuring thickness of sole leather. One iron equals $\frac{1}{48}$ in. (0.53 mm). **D 1517, D31**

iron, enameling—see **enameling iron**. **C 286, B08**

ironing, n—a method of pressing using a heated hand iron, sometimes together with moisture or steam, and a gliding motion. **D 123, D13**

ironing, n—a method of pressing using a heated hand iron, sometimes together with moisture or steam, and a gliding motion. **D 3136, D13**

iron pipe size, IPS, n—the nominal inside dimension of pipe in inches (or millimetres). (Also called *interior pipe size, standard pipe size*.) **E 631, E06**

iron-silicon alloys—a material composition containing up to 5% silicon with balance iron. **A 340, A06**

iron-sodium tartrate, EWNN or FeTNa—a complex tartaric acid salt of sodium and ferric iron. Solutions in aqueous sodium hydroxide will dissolve cellulose. Both the German abbreviation, EWNN, and the English, FeTNa, are to be found in English articles. The details of preparation of the solution should always be given. **D 1695, D01**

iron-sodium tartrate viscosity—the viscosity of a solution or dispersion of cellulose or pulp under standardized condition when dissolved in the iron-sodium tartrate solvent. (see also **iron-sodium tartrate**) **D 1695, D01**

ironstone ware—(stone china, white granite ware)—historic terms for a durable English earthenware. **C 242, C21**

Iron tannage—tannage with salts of iron. **D 1517, D31**

irradiance, n—quotient of the radiant flux incident on an infinitesimal element of surface containing the point, by the area of that element. **E 176, E05**

irradiance, n—the radiant power per unit area incident on a receiver, typically reported in watts per square metre, $W m^{-2}$. **G 113, G03**

irradiance (at a point of a surface), n—ratio of the radiant flux incident on a small but measurable element of surface containing the point, by the area of that element. **E 176, E05**

irradiance at a point on a surface, n—quotient of the radiant flux incident on an element of the surface containing the point by the area of that element. Symbol: $E_e, E; E_e = d\Phi_e/dA$; Unit: Watt per square metre, $W \cdot m^{-2}$.

NOTE—In ultraviolet radiation therapy and photobiology, this quantity is called dose rate (International Photobiology Committee, 1954).

E 349, E21

irradiance, E—the radiant flux (power) per unit area incident on a given surface (unit = W/m^2). **E 1316, E07**

irradiance, E, E_e, n —the radiant flux incident per unit area. **E 284, E12**

irradiance, E, Wm^{-2}, n —See **solar irradiance at a point of surface** in Terminology E 772. **E 1328, E44**

irradiation, n—application of radiation to an object. **E 349, E21**

irradiation—(1) process of exposing a surface or material to radiant flux; (2) at a point on surface, see **radiant exposure**. **E 772, E44**

irregularity factor—*in fatigue loading*, the ratio of the number of zero crossings with positive slope (or mean crossings) to the number of peaks or valleys in a given, force-time history. **E 1823, E08**

irregular loading—See **spectrum loading**. **E 1823, E08**

irregular powder, n—particles lacking symmetry. **B 243, B09**

irregular wear, n—a type of treadwear characterized by substantial variations of tread loss both from projection to projection and frequently from point to point on a given projection. **F 538, F09**

irrelevant question, n—An irrelevant question is designed to be a non-emotion provoking question. Also referred to as “norms” or “neutral questions.” **E 2035, E52**

irreversible adsorption—adsorption in which the desorption isotherm is displaced toward higher equilibrium adsorption capacities from the adsorption isotherm. **D 2652, D28**

irreversible fiber optic chemical sensor, n—a fiber optic chemical

sensor that undergoes a permanent depletion or degradation of the transduction element as a result of the transduction process. **E 131, E13**

irrigation pipe—pipe intended for the distribution of irrigation water by pumping or gravity. **C 822, C13**

IR thermometer, n—an optoelectronic instrument that is capable of noncontact infrared temperature measurement when placed into the auditory canal of a subject (ear canal type) or from the subject's body surface (skin type). **E 344, E20**

IR thermometer type, n—an optoelectronic instrument that is capable of noncontact infrared temperature measurement when placed into the auditory canal of a subject (ear canal type) or from the subject's body surface (skin type). **E 344, E20**

ISCC-NBS color name, n—two- to four-word descriptive phrase for a surface color, such as “vivid orange” or “dark grayish reddish brown,” defined by sections of the Munsell color solid. Developed cooperatively by the Inter-Society Color Council and the National Bureau of Standards. **E 284, E12**

ISL—incremental step load **F 2078, F07**

islanding—a phenomenon that occurs when applied film is not adequately anchored, resulting in migration of film-forming materials to myriads of small pools scattered over the surface and surrounded by completely uncoated areas. **D 2825, D21**

ISL_{th}—threshold from an incremental step-load test **F 2078, F07**

iso—in roofing, see **polyisocyanurate foam board**. **D 1079, D08**

ISO—abbreviation for **International Organization for Standards**. **F 1457, F05**

isoabsorptive point—a wavelength at which the absorptivities of two or more substances are equal. **E 131, E13**

isoband cryogenic fabric—a distinct soil micromorphology, resulting from the processes of freezing and thawing, in which soil particles form subhorizontal layers of similar thickness. **D 7099, D18**

isobar—a plot of quantity adsorbed per unit of adsorbent against equilibrium temperature when concentration or pressure is held constant. **D 2652, D28**

isobar—section, at constant pressure through a phase diagram. **E 7, E04**

isoboard—See **polyisocyanurate foam board**. **D 1079, D08**

isochor—in a phase diagram, a section, or contour, at constant volume. **E 7, E04**

isochrome—a curve showing the distribution of the excess hydrostatic pressure at a given time during a process of consolidation. **D 653, D18**

ISO equation—an equation showing the interrelations between stress, pressure and dimensions in pipe, namely:

$$S = \frac{P (ID + t)}{2t}$$

or

$$S = \frac{P (OD - t)}{2t}$$

where:

S = hoop stress,

P = pressure,

ID = average inside diameter,

OD = average outside diameter, and

t = minimum wall thickness.

(See ISO R 161.)

F 412, F17

isohel—curve on a map showing areas of equal sunshine duration during a given interval of time, normally a year. **E 772, E44**

isokinetic sampling—See **sampling**. **D 1356, D22**

isokinetic sampling—to sample in such a way that the water-sediment mixture moves with no change in velocity as it leaves the ambient flow and enters the sampler intake. **D 4410, D19**

- isolated**—an object that is not readily accessible to persons unless special means of access are used. **F 819, F18**
- isolated cryopeg**—a body of unfrozen ground, in which the temperature is perennially below 0°C, and which is entirely surrounded by perennially frozen ground. **D 7099, D18**
- isolated talik**—a layer or body of unfrozen ground entirely surrounded by perennially frozen ground. **D 7099, D18**
- isolated ungrounded junction, *n***—measuring junctions within the same multi-pair thermocouple that are electrically isolated from the sheath and electrically isolated from each other. **E 344, E20**
- isolation joint, *n***—*in building construction*, a formed or assembled joint specifically intended to separate and prevent the bonding of one element of a structure to another and having little or no transference of movement or vibration across the joint. **C 717, C24**
- isolation test**—in leak testing, a method of determining whether a leak is present in a system, or of obtaining an estimate of its magnitude, by observing the rate of rise of pressure in the evacuated system when the system is isolated from the pump. (See also **rate of rise**.) **E 1316, E07**
- isometric**—a crystal form in which the unit dimension on all three axes is the same. **E 7, E04**
- isomorphous**—having the same crystal structure; usually referring to intermediate phases which form a continuous series of solid solutions. **E 7, E04**
- isomorphous system**—a complete series of mixtures in all proportions of two, or more, components, wherein unlimited mutual solubility exists in both the liquid and solid states. **E 7, E04**
- isoperibol, *adj***—a term used in combustion calorimetry meaning constant temperature jacket (environment). **D 121, D05**
- isoperibol calorimeter, *n***—a calorimeter that has a jacket of uniform and constant temperature. **D 5681, D34**
- isopleth**—in a ternary, or higher order, temperature-concentration, or pressure-concentration, phase diagram, a (vertical) two-dimensional section, having a linear composition series along one axis and temperature, or pressure, along the other axis. **E 7, E04**
- isopleth**—a line on a chart or graph connecting points having a specified constant value of a single variable as a function of two other specified variables. **E 772, E44**
- isopotential point**—for a cell containing an ion-selective electrode and a reference electrode there is often a particular activity of the ion concerned for which the potential of the cell is independent of temperature. That activity, and the corresponding potential, define the isopotential point. The identity of the reference electrode, and the composition of the filling solution of the measuring electrode, must be specified. **D 4127, D19**
- isopropylbenzene**—see **cumene**. **D 4790, D16**
- isosbestic point**—the wavelength at which the absorptivities of two substances, one of which can be converted into the other, are equal. **E 131, E13**
- isostatic pressing, *n***—the pressing of a powder, compact, or sintered object by subjecting it to a nominally equal pressure from every direction. **B 243, B09**
- isostilbil point, *n***—in luminescence, the wavelength at which the intensity of emission of a sample does not change during a physical interaction or chemical reaction. **E 131, E13**
- isotactic, *adj***—pertaining to a type of polymeric molecular structure containing a sequence of regularly spaced asymmetric atoms arranged in like configuration in a polymer chain. **D 883, D20**
- isotactic, *n***—a polymeric molecular structure containing a sequence of regularly spaced asymmetric atoms arranged in like configuration in the polymer chain. **D 1566, D11**
- isotactic, *adj***—pertaining to a type of polymeric molecular structure containing a sequence of regularly spaced asymmetric atoms arranged in like configuration in a polymer chain. **F 412, F17**
- isotactic, *adj***—pertaining to a type of polymeric molecular structure containing a sequence of regularly spaced asymmetric atoms arranged in like configuration in a polymer chain. **F 1251, F04**
- isotere**—a plot of equilibrium concentration or pressure against temperature when the quantity adsorbed per unit of adsorbent is held constant. **D 2652, D28**
- isotherm**—a plot of quantity adsorbed per unit of adsorbent against equilibrium concentration, or pressure, when temperature is held constant. **D 2652, D28**
- isotherm**—a line on a chart that connects all points of equal or constant temperature. **D 7099, D18**
- isotherm**—section, at constant temperature, through a phase diagram. **E 7, E04**
- isothermal annealing, *n***—**austenitizing** a steel object and then cooling it to, and holding it at, a temperature at which austenite transforms to a ferrite-carbide aggregate. **A 941, A01**
- isothermal transformation, *n***—a change in phase at any constant temperature. **A 941, A01**
- isotropic, *adj***—*in carbon and graphite technology*, having an isotropy ratio of 0.9 to 1.1 for a specific property of interest. **C 709, D02**
- isotropic, *n***—having the same value for a property in all directions. **C 1145, C28**
- isotropic, *adj***—*in carbon and graphite technology*, having an isotropy ratio of 0.9 to 1.1 for a specific property of interest. **D 4175, D02**
- isotropic**—having the same value for a property in all directions. **E 7, E04**
- isotropic**—having uniform properties in all directions. The measured properties of an isotropic material are independent of the axis of testing. **E 631, E06**
- isotropic**—having the same magnitude of a property in all directions. **E 1142, E37**
- isotropic**—having uniform properties in all directions. The measured properties of an isotropic material are independent of the axis of testing. **E 1749, E06**
- isotropic diffuser**—see **Lambertian diffuser**. **E 284, E12**
- isotropic mass**—a mass having the same property (or properties) in all directions. **D 653, D18**
- isotropic material**—material in which the magnetic properties are the same for all directions. **A 340, A06**
- isotropic material**—a material whose properties do not vary with direction. **D 653, D18**
- isotropic phase, *n***—*as used in Test Method D 5061*, a binder-phase carbon texture that exhibits optical properties that are the same in all directions when viewed with an optical microscope having mutually exclusive polarized light, for example, crossed nicols. **D 121, D05**
- isotropic radiant energy**—see **radiant energy, isotropic**. **E 772, E44**
- isotropy**—having the same properties in all directions. (ISRM) **D 653, D18**
- isotropy**—the condition of having the same values of properties in all directions. **E 7, E04**
- isotropy ratio, *n***—*in carbon and graphite technology*, the ratio of a given property value in the against grain direction to its corresponding value in the with grain direction (for example, the ratio of coefficients of thermal expansion). **C 709, D02**
- isotropy ratio, *n***—*in carbon and graphite technology*, the ratio of a given property value in the against grain direction to its corresponding value in the with grain direction (for example, the ratio of coefficients of thermal expansion). **D 4175, D02**
- I.S. process**—a bottle-making process using removable, individual forming sections, in which the gob enters the blank or parison mold by gravity. **C 162, C14**
- i^2t , *n***—sum of the instantaneous arc current values squared multiplied by the incremental time values during the arc (A^2s). **F 819, F18**
- item, *n***—(1) an object or quantity of material on which a set of observations can be made: (2) an observed value or test result obtained from an object or quantity of material. **E 456, E11**

J

- jacket, n**—a form of facing applied over insulation. C 168, C16
- jacket, n**—a textile, woven or felted into tubular or sleeve form, ready for covering and shrinking on a machine roll. D 123, D13
- jacket, n**—an integral covering (sometimes fabric, reinforced), which is applied over the insulation, core, shield, or armor of a cable and whose prime function is to provide mechanical or environmental protection for the component(s) that it covers. D 1711, D09
- jacket, n**—a textile, woven or felted into tubular or sleeve form, ready for covering and shrinking on a machine roll. D 4850, D13
- jackhammer**—an air driven percussion drill that imparts a rotary hammering motion to the bit and has a passageway to the bit for the injection of compressed air for cleaning the hole of cuttings. D 653, D18
- jacking**—a method of installing pipe by the trenchless method using equipment and pipe designed for this purpose. C 896, C04
- jacking force**—the force applied to the pipe along the longitudinal axis of the pipeline by the pipe jacking equipment. C 896, C04
- jack-leg**—a portable percussion drill of the jack-hammer type, used in underground work; has a single pneumatically adjustable leg for support. D 653, D18
- jackson turbidity unit, JTU**—unit of measure used with the jackson candle turbidimeter. D 6161, D19
- jamb**—the vertical structural member forming the sidewall of an opening or port in a furnace superstructure, supporting the crown load over that opening. C 162, C14
- jamb**—See **windows and doors**. E 631, E06
- jamming, n**—for *chainsawcut resistance*, the clogging action manifested by a protective garment which can produce a chain stop. F 1494, F23
- japan, n**—a varnish yielding a hard, glossy, dark-colored film. Japans are usually dried by baking at relatively high temperatures. D 16, D01
- japan, n**—a vehicle for japan colors; frequently contains shellac. D 16, D01
- japan color, n**—a paste containing pigment and a grinding japan vehicle used for lettering and decoration. D 16, D01
- japan drier, n**—a resin-base liquid drier. D 16, D01
- japanned**—tumble-pointed. F 547, F16
- japanned leather**—see **patent leather**. D 1517, D31
- jar mill**—a small ball mill (see also **ball mill**). C 286, B08
- jar test**—a laboratory procedure for the evaluation of a treatment to reduce dissolved, suspended colloidal and non settleable matter from water (see Practice D 2035). D 6161, D19
- jasper ware**—a vitreous, opaque, colored, unglazed ceramic ware having white or contrasting relief decorations and containing a substantial amount of barite. C 242, C21
- jaw alignment**—the positioning of the female and male jaws with respect to interdigitation (related to box lock function and ratchet performance). F 921, F04
- jaw face, n**—in *tensiletesting machines*, the surface of a jaw which in the absence of a liner contacts the specimen. D 123, D13
- jaw face, n**—in *tensile testing machines*, the surface of a jaw which in the absence of a liner contacts the specimen. D 4849, D13
- jaw liner, n**—in *tensile testing machines*, any material placed between the jaw face and the specimen to improve the holding power of the jaws. D 123, D13
- jaw liner, n**—in *tensile testing machines*, any material placed between the jaw face and the specimen to improve the holding power of the jaws. D 4849, D13
- jaws, n**—in *tensiletesting machines*, the elements of a clamp which grip the specimen. D 123, D13
- jaws, n**—in *tensile testing machines*, the elements of a clamp which grip the specimen. D 4849, D13
- jaws**—parts that contain serrations to interrupt the flow of blood through any vessel. F 921, F04
- J-clinched point**—pointed end of nail having been driven through member against curved anvil plate, bent sideways and driven back into member. F 547, F16
- "J" configuration**—boom positioned in a "J" shape. F 818, F20
- Jeffries' method**—a method for determining grain size based on counting grains in a prescribed area. See Test Methods E 112. E 7, E04
- Jeffries' multiplier**—a factor used in the Jeffries' method for grain size determinations. See Test Methods E 112. E 7, E04
- jerk-in, n**—in *wovenfabric*, an extra filling thread dragged into the shed with the regular pick and extending only part of the way across the cloth. (Compare **double pick, mispick**.) D 123, D13
- jerk-in, n**—in *wovenfabric*, an extra filling thread dragged into the shed with the regular pick and extending only part of the way across the cloth. (*Syn.* lash-in, pull-in) (Compare **double pick**). D 3990, D13
- jet-blast erosion, n**—(*airfields only*) darkened areas on the pavement surface where bituminous binder has been burned or carbonized; localized burned areas may vary in depth up to approximately 15 mm (½ in.). E 867, E17
- jet-blast erosion, n**—(*airfields only*) darkened areas on the pavement surface where bituminous binder has been burned or carbonized; localized burned areas may vary in depth up to approximately 15 mm (½ in.). E 1778, E17
- jet fuel, n**—any liquid suitable for the generation of power by combustion in aircraft gas turbine engines. D 4175, D02
- jet grouting**—technique utilizing a special drill bit with horizontal and vertical high speed water jets to excavate alluvial soils and produce hard impervious columns by pumping grout through the horizontal nozzles that jets and mixes with foundation material as the drill bit is withdrawn. D 653, D18
- jet, liquid, n**—See **liquid jet**. G 40, G02
- jet segment, n**—See **liquid jet**. G 40, G02
- jetting**—a means of compacting trench backfill by the introduction of water under pressure through a nozzle. C 896, C04
- jetting**—when applied as a drilling method, water is forced down through the drill rods or casings and out through the end aperture. The jetting water then transports the generated cuttings to the ground surface in the annulus of the drill rods or casing and the borehole. The term jetting may also refer to a development technique (see **well screen jetting**). D 653, D18
- jetty**—an elongated artificial obstruction projecting into a body of water from a bank or shore to control shoaling and scour by deflection of the force of water currents and waves. D 653, D18
- jewelers' enamel**—a special type of porcelain enamel used in the manufacture of jewelry, insignia, and art objects. C 286, B08
- jigging**—forming ceramic ware from a plastic body by differential rotation of a profile tool and mold, the mold having the contour of one surface of the ware and the profile tool that of the other surface. C 242, C21
- J-integral, J [FL⁻¹]**—a mathematical expression, a line or surface integral that encloses the crack front from one crack surface to the other, used to characterize the local stress-strain field around the crack front. E 1823, E08
- joggle**—a displacement machined or formed in a structural member to accommodate the base of an adjacent member. E 631, E06
- joggle**—a displacement machined or formed in a structural member to accommodate the base of an adjacent member. E 1749, E06
- john boat (maritime), n**—a skiff with a flat bottom. F 1490, F32
- joining, n**—the juncture of two separate plaster applications of the same coat, usually within a single surface plane. C 11, C11
- joining line, n**—See **seam**. D 4965, D13
- joint**—that portion of the conductor where the ends of two wires, rods, or groups of wires are joined by brazing, soldering, welding, or by mechanical means. B 354, B01
- joint, n**—in *buildingconstruction*, the space or opening between two or more adjoining surfaces. C 717, C24

joint—a connection of two pipe, manhole, or box section ends, made either with or without the use of additional parts and/or materials.

C 822, C13

joint—an individual length of pipe, or the means of closure to form a pipeline.

C 896, C04

joint—the junction of two or more pieces of wood. Usually implies a structural junction in which stress is transmitted from one piece to another.

D 9, D07

joint—a break of geological origin in the continuity of a body of rock occurring either singly, or more frequently in a set or system, but not attended by a visible movement parallel to the surface of discontinuity. (ISRM)

D 653, D18

joint, n

adhesive joint, n—location at which two adherends are held together with a layer of adhesive. (See also **bond, n**.)

edge joint, n—in wood bonding, a joint made by bonding adherends edge to edge (with grain directions parallel) to form wider stock.

finger joint, n—a joint formed by bonding two precut members shaped like fingers.

laminated joint, n—in wood bonding, a joint made by bonding layers of adherends face to face to form thicker stock.

lap joint, n—a joint made by placing one adherend partly over another and bonding together the overlapped portions.

scarf joint, n—a joint made by cutting away similar angular segments of two adherends and bonding the adherends with the cut areas fitted together.

starved joint, n—a joint that has an insufficient amount of adhesive to produce a satisfactory bond.

joint aging time, n—synonym for **joint conditioning time**.

D 907, D14

joint—the junction of two adjacent pieces of wood or veneer.

butt joint—the place where two pieces of wood are joined together end to end.

edge joint—the place where two pieces of wood are joined together edge to edge.

glue joint—the place where two pieces of wood are joined together by means of glue.

open joint—failure of bond or separation of two adjacent pieces of veneer so as to leave veneers.

starved joint—a glue joint that is poorly bonded because of an insufficient quantity of glue.

sunken joint—in the case of plywood, a depression in the surface of the face ply directly above an edge joint in a lumber core or crossband. Usually the result of localized shrinkage in the edge-jointed layer.

D 1038, D07

joint, n—a designed and constructed or sawed space or opening between adjoining pavement surfaces.

D 5535, D04

joint, n—the linear void located between juxtaposed fire-separating elements.

E 176, E05

joint, n—general term. See particular joint of interest. Compare **connection**.

E 631, E06

joint, n—a discontinuity made necessary by design or by interruption of a paving operation.

E 867, E17

joint, n—a discontinuity made necessary by design or by interruption of a paving operation.

E 1778, E17

joint—the location at which two pieces of pipe or a pipe and a fitting are connected together.

F 412, F17

joint—the junction where the scissor blades are secured by a screw allowing the instrument to pivot.

F 1078, F04

joint, adhesive-bonded—a joint made using an adhesive to bond the piping components.

F 412, F17

joint at normal (design) closure—position of the joint when closed to the manufacturer's recommended inside longitudinal separation without joint angular deflection.

C 822, C13

joint backing—See **sealant backing**.

C 717, C24

joint, bell and spigot gasket—a connection between piping components consisting of a bell end on one component, an elastomeric gasket between the components, and a spigot end on the other component. See *joint, push on*.

F 412, F17

joint, butt-fused—a joint in which the prepared ends of the joint components are heated and then placed in contact to form the joint.

F 412, F17

joint compound, n—a compound used for taping or finishing gypsum board, or both.

C 11, C11

joint, compression—a mechanical joint made by deforming a sealing member to form a pressure seal between the fitting or pipe bell and the pipe or tube.

F 412, F17

joint, compression gasket—a mechanical joint that utilizes a compression nut or a gland nut against a gasket to develop a pressure seal.

F 412, F17

joint-conditioning time—the time interval between the removal of the joint from the conditions of heat or pressure, or both, used to accomplish bonding and the attainment of approximately maximum bond strength. (Synonym *joint-aging time*.) (See also **curing time, drying time, and setting time**.)

D 907, D14

joint diagram—a diagram constructed by accurately plotting the strike and dip of joints to illustrate the geometrical relationship of the joints within a specified area of geologic investigation. (ISRM)

D 653, D18

jointed—veneer or other ply components that have machined edges for tightest possible layup.

D 1038, D07

jointed concrete pavement (JCP), n—Portland cement concrete pavement that has transverse joints placed at planned intervals.

E 867, E17

jointed concrete pavement (JCP), n—Portland cement concrete pavement that has transverse joints placed at planned intervals.

E 1778, E17

joint (fault) set—a group of more or less parallel joints. (ISRM)

D 653, D18

joint (fault) system—a system consisting of two or more joint sets or any group of joints with a characteristic pattern, that is, radiating, concentric, etc. (ISRM)

D 653, D18

joint filler, n—a compressible material used in a partial or totally filled expansion, control, or isolation joint by its permanent placement in or between building materials such as concrete or masonry during construction; sometimes used as a sealant backing in a partially filled joint.

C 717, C24

joint, flanged—a mechanical joint using pipe flanges, a gasket, and bolts.

F 412, F17

joint, flare—a mechanical compression connection between flared-end plastic pipe and a fitting specifically designed to accept flared-end plastic pipe.

F 412, F17

joint, heat-fused—a joint made using heat and pressure only.

F 412, F17

jointing yard—[archaic] place between the grinding and polishing operations in the continuous manufacture of plate glass, where the plaster joints are remade, sometimes called "middle yard."

C 162, C14

joint in off-center position—with the joint at normal or design closure, without joint angular deflection, when the spigot or bell has been moved in a radial direction. The maximum off-center position occurs when the outer surface of the spigot and the inner surface of the bell are in contact.

C 822, C13

joint, insert-fitting—a mechanical joint using external metal clamps, rings, or other devices to form a pressure seal between an insert fitting and the pipe or tube.

F 412, F17

joint leakage test—test procedure, utilizing water pressure, air pressure or a vacuum, intended to determine the acceptability of an individual joint relative to leakage.

C 822, C13

joint leakage test apparatus—sealing device used to isolate a single joint so that the joint can be tested for leakage. See **joint leakage test**.

C 822, C13

joint line—See **parting line**.

joint, mechanical—a connection between piping components employing physical force to develop a seal or produce alignment.

F 412, F17

joint pattern—a group of joints that form a characteristic geometrical relationship, and which can vary considerably from one location to another within the same geologic formation. (ISRM) D 653, D18

joint, push on—a joint in which an elastomeric ring gasket is compressed in the annular space between a bell end or socket and a spigot end of pipe.

F 412, F17

joint reinforcement—reinforcement, in or near the joint, intended to enhance the structural characteristics of the joint area of a concrete pipe or box section.

C 822, C13

joint, saddle-fused—a joint in which the curved base of the saddle fitting and a corresponding area of the pipe surface are heated and then placed together to form the joint.

F 412, F17

joint seal deterioration, n—any condition that enables incompressible materials or water to infiltrate into a previously sealed joint from the surface.

E 867, E17

joint seal deterioration, n—any condition which enables incompressible materials or water to infiltrate into a previously sealed joint from the surface.

E 1778, E17

joint shear test—a proof-of-design test procedure to determine minimum shear strength of a joint.

C 822, C13

joint, socket-fused or insert-fused—a joint in which the joining surfaces of the components are heated, and the joint is made by inserting one component into the other.

F 412, F17

joint, solvent-cemented—a joint made using a solvent cement to unite the components.

F 412, F17

joint spalling, n—cracking, breaking, or chipping of concrete pavement edges within 0.6 m (2 ft) of a joint.

E 867, E17

joint spalling, n—cracking, breaking, or chipping of concrete pavement edges within 0.6 m (2 ft) of a joint.

E 1778, E17

joint tape, n—a type of paper, metal, fabric, glass mesh, or other material, commonly used with a cementitious compound, to reinforce the joints between adjacent gypsum boards.

C 11, C11

joint, threaded—a mechanical joint that utilizes threaded pipe and fittings.

F 412, F17

Jordan diagram—a graph showing the variation of some magnetic parameter versus frequency when the excitation is within the Rayleigh range.

A 340, A06

joule, J—the unit of energy in the SI system of units. One joule is one watt-second.

A 340, A06

J-R curve—a plot of resistance to stable crack extension, Δa_p .

E 1823, E08

judge, n—See **assessor**.

E 253, E18

judgment sampling, n—taking of a sample(s) based on judgment that

it will more or less represent the average condition of the population.

D 5681, D34

judgment sampling—the process by which a number of items or areas are selected from the population for analysis without meeting standard random selection and sample size criteria.

E 2135, E53

jumbo—a specially built mobile carrier used to provide a work platform for one or more tunneling operations, such as drilling and loading blast holes, setting tunnel supports, installing rock bolts, grouting, etc.

D 653, D18

jumpers or jumping—see **poppers**.

C 286, B08

junction class, n—the electrical connectivity of a junction. Class U junctions are electrically isolated from conductive sheaths and from reference ground. Class G junctions are electrically connected to conductive sheaths.

E 344, E20

junction potential—the portion of the total observed potential developed between the sensing and reference electrodes that is formed at the liquid/liquid junction between the reference electrode filling solution and the sample solution. For accuracy, the junction potential should be as low and as constant as possible despite variations in the composition of the sample solution. Reference electrode filling solutions should be judiciously chosen to minimize liquid junction potential.

D 4127, D19

junction, n—the interface between two different tire components or different compounds within the same component.

F 538, F09

junction cracking, n—a crack with opening originating at a junction between two components.

F 538, F09

junction opening, n—a separation developing in a junction.

F 538, F09

just noticeable difference, n—See **threshold, difference**.

E 253, E18

just noticeable difference, n—see **just perceptible difference**.

E 284, E12

just-perceptible difference, n—color difference that is just large enough to be perceived in almost every trial.^B

E 284, E12

jute, n—soft fibers from the inner bark of the round pod jute (*Corchorus capsularis*), the long pod jute (*Corchorus olitorius*), and from the inner bark of other closely related plants, such as kenaf, sometimes referred to as Meshta (*Hibiscus cannabinus*).

D 123, D13

juvenile wood—the wood formed adjacent to the pith, characterized by progressive change in cell dimension, different microstructure than mature wood, and greater shrinkage parallel to the grain.

NOTE—In softwoods, juvenile wood is characterized by lower specific gravity and strength. It may vary in quantity from tree to tree and extend from the pith 5 to 20 growth rings.

D 9, D07

J-valve, n—a manually operated, spring-loaded, SCUBA cylinder check valve that incorporates a low air warning/reserve air mechanism.

F 1549, F32

K

Δ_k —empirical expression for that portion of the diaphragm deflection contributed by the shear deformation of the connection system, in. (or mm) **E 631, E06**

Kaiser effect—the absence of detectable acoustic emission at a fixed sensitivity level, until previously applied stress levels are exceeded. **E 1316, E07**

kangaroo—leather made from the hide of the kangaroo. **D 1517, D31**

kaolin—a variety of clay containing a high percentage of kaolinite. **D 653, D18**

kaolin (china clay)—a refractory clay consisting essentially of minerals of the kaolin group and which fires to a white or nearly white color. **C 242, C21**

kaolinite—a common clay mineral having the general formula $Al_2(Si_2O_5)(OH)_4$; the primary constituent of kaolin. **D 653, D18**

kappa number—the number of millilitres of 0.1 *N* potassium permanganate solution consumed by 1 g of oven-dry pulp under specified conditions. It is an indication of the hardness or bleachability of a pulp. An indirect estimate of lignin content. **D 1695, D01**

karat—a twenty-fourth part by weight; thus 18-karat gold is 18/24 pure. **B 374, B08**

karst—a geologic setting where cavities are developed in massive limestone beds by solution of flowing water. Caves and even underground river channels are produced into which surface runoff drains and often results in the land above being dry and relatively barren. (ISRM) **D 653, D18**

K-decreasing test—a test in which the normalized *K*-gradient is nominally negative. In Test Method E 647, *K*-decreasing tests involve force shedding as the crack grows either continuously or by a series of decremental steps. **E 1823, E08**

Keene's cement, n—an anhydrous gypsum plaster characterized by a low mixing water requirement and special setting properties, primarily used with lime to produce hard, dense finish coats. **C 11, C11**

keg—See **barrel**. **D 996, D10**

keg, nail keg—synonymous with 100 lb (45.36 kg) of nails. Round, bulging container for bulk nails, made of wooden staves, steel hoops, and flat heads, usually holding 100 lb of nails. Terms no longer in common usage. **F 547, F16**

K_{EHE} —threshold stress intensity for EHE **F 2078, F07**

Kellner eyepiece—a positive eyepiece consisting of an achromatic eyelen and a single collective, in which the image plane and field diaphragm is external and near the collective. **E 7, E04**

kelly—a heavy-wall tube or pipe, usually square or hexagonal in cross section, which works inside the matching center hole in the rotary table of a drill rig to impart rotary motion to the drill string. **D 653, D18**

kelvin, n—the unit of thermodynamic temperature; the SI unit of temperature for which an interval of one Kelvin (K) equals exactly an interval of one degree Celsius (1°C) and for which a level of 273.15 K equals exactly 0°C. **D 123, D13**

Kelvin—designation of the thermodynamic temperature scale and the degree on this scale, (E 344, E20). **E 1142, E37**

kelvin, K, n—base unit of temperature in the International System of Units (SI). **E 344, E20**

kemp fiber, n—a medullated animal fiber in which the diameter of the medulla is 60 %, or more, of the diameter of the fiber. **D 123, D13**

kemp fiber, n—a medullated animal fiber in which the diameter of the medulla is 60 %, or more, of the diameter of the fiber. **D 4845, D13**

kerf, n—synonym for *sipe*. **F 538, F09**

kerma, K—the quotient of dE_{tr} by dm , where dE_{tr} is the sum of the initial kinetic energies of all the charged ionizing particles liberated by uncharged ionizing particles in a material of mass dm (ICRU).

$$K = dE_{tr} / dm$$

The special name of the unit of kerma is the gray (Gy).

$$1 \text{ Gy} = 1 \text{ J} \cdot \text{kg}^{-1}$$

E 170, E10

kernmantle construction, n—a method of making cord and rope by braiding a sheath or cover (mantle) over a core (kern) of parallel, twisted, or braided strands. **F 1773, F08**

kerosine number—the millilitres of kerosine held per 100 g of felt as determined by Test Method D 727. To obtain the percentage saturating capacity of the felt for any bituminous saturant, obtain the specific gravity of the saturant and multiply that figure by the kerosine number of the felt. **D 1079, D08**

ketones—a class of organic compounds possessing a carbonyl group attached to two hydrocarbon groups. Acetone is the first member of this series. **D 4790, D16**

keV (kilo electron volt)—a unit of energy equal to one thousand electron volts, used to express the energy of X rays, gamma rays, electrons, and neutrons. **E 1316, E07**

key, n—the grip or mechanical bond of one coat of plaster to another coat, or to a substrate. **C 11, C11**

key locking dial—a dial that can be locked with a key to prevent rotation. **F 471, F12**

key locking dial ring—a dial ring containing a key lock to lock dial and prevent rotation. **F 471, F12**

key species—a species of special concern for ecological reasons. **E 943, E47**

key species, n—a species of special concern for ecological reasons. **E 2114, E06**

kick plate—Synonym for **toe board**. **E 631, E06**

kickplate—See **railing systems**. **E 631, E06**

kick plate—Synonym for **toe board**. **E 1481, E06**

kid—originally referring to leathers made from the skins of immature goats, the term is now rather loosely applied to glove and shoe leathers made from goatskins. **D 1517, D31**

kiddie ride—an amusement ride designed primarily for use by children up to 12 years of age. **F 747, F24**

K_{IHE} —threshold stress intensity for IHE **F 2078, F07**

Kikuchi lines—light and dark lines superimposed on the background of a single crystal electron diffraction pattern caused by diffraction of diffusely scattered electrons within the crystal. **E 7, E04**

killed steel, n—a steel deoxidized to such a level that essentially no reaction occurred between carbon and oxygen during solidification. **A 941, A01**

kiln—a chamber used for drying and conditioning lumber, veneer, and other wood products in which the temperature and relative humidity of the circulated air can be varied and controlled, often steam heated and vented. **D 9, D07**

kiln schedule—in kiln drying, the time schedule of predetermined or actual dry-bulb and wet-bulb temperatures used in drying a kiln charge of lumber or other wood products. **D 9, D07**

K-increasing test—a test in which the normalized *K*-gradient is nominally positive. For the standard specimens in Test Method E 647, the constant-force-amplitude test will result in a *K*-increasing test where the normalized *K*-gradient increases but is always positive. **E 1823, E08**

kinematic viscosity, n—the ratio of the viscosity to the density of a liquid. **D 4175, D02**

kinesthesia, n—perception of pressure, position, or motion in muscles, tendons, or joints. **E 253, E18**

kinetic coefficient of friction, n—the coefficient of friction under conditions of macroscopic relative motion between two bodies. **D 4175, D02**

kinetic coefficient of friction, *n*

kinetic coefficient of friction, *n*—the coefficient of friction under conditions of macroscopic relative motion between two bodies.

G 40, G02

kinetic friction, *n*—friction developed between two bodies in motion. (Compare **static friction**.)

D 123, D13

kinetic friction, *n*—the force that resists motion when a surface is moving with a uniform velocity; it is, therefore, equal and opposite to the force required to maintain sliding of the surface with uniform velocity.

D 4175, D02

kinetic friction, *n*—friction developed between two bodies in motion. (Compare **static friction**.)

D 4849, D13

kink, *n*—*in fabric*, a short length of yarn that has spontaneously doubled back on itself to form a loop.

D 123, D13

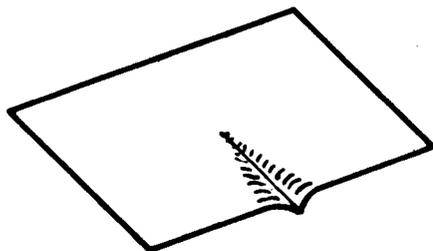

kink, *n*—*in rope*, an abrupt bend or loop in the rope which is the result of an unbalanced twist relationship in the rope structure.

D 123, D13

kink, *n*—*in fabric*, a short length of yarn that has spontaneously doubled back on itself to form a loop. (*Syn.* curl, kinky thread, looped yarn, snarl)

D 3990, D13

kink—a type of waviness occurring interior to the edges, not to be confused with the more abrupt departures as ridges or surface marks. (See also **waviness**.)

F 109, C21

kink (in asbestos)—definite, well defined change in direction of the asbestos in situ that could lead to points of weakness in the fibers when separated.

D 2946, C17

kinky thread—See **kink**.

D 3990, D13

kip—skin from a bovine animal in size between a calf and a cow, weighing in green-salted condition approximately from 15 to 35 lb (6.8 to 15.9 kg).

D 1517, D31

K_{Isc}—threshold stress intensity for stress corrosion cracking

F 2078, F07

kitchen—a space containing facilities primarily for the preparation of food.

E 631, E06

kitchen—See **building space**.

E 631, E06

knapsack sprayer—a sprayer apparatus, carried on the operator's back, consisting of a spray solution tank, pressure source, and an atomizing device that forms and distributes the spray. Spray pressure is supplied by a lever operated manual or engine powered pumps or a compressed air tank. Some knapsack sprayers have air carrier blowers to distribute the spray.

E 1102, E35

knee, *n*—*in anatomy*, the joint between the lower and upper leg.

D 123, D13

knee, *n*—the joint between the lower and upper leg.

D 5219, D13

knee, *n*—*in anatomy*, the joint between the lower and upper leg.

F 1494, F23

knee girth, *n*—*inbody measurements*, with the leg straight, the circumference of the knee over the knee cap and parallel to the floor.

D 123, D13

knee girth, *n*—the maximum horizontal circumference of the knee, taken over the kneecap with the leg straight.

D 5219, D13

knee height, *n*—the vertical distance from the midpoint of the back of the knee (or crease) to the floor, taken with subject standing and without shoes.

knee height (infant special case), *n*—the straight distance from the midpoint (or crease) of the knee to the soles of the feet, taken with subject lying down flat with legs extended and the

foot positioned at 1.57 rad (90°) to the leg. **D 5219, D13**

knife edge pivot—a type of pivot or hinge in which the motion occurs through the rotation of a knife edge resting on a plane or a vee notch.

E 7, E04

knife-grade, *n*—*in building construction*, a compound of such consistency that it is generally applied with a knife or spatula hand tool.

C 717, C24

knife-line attack—intergranular corrosion of an alloy, usually stabilized stainless steel, along a line adjoining or in contact with a weld after heating into the sensitization temperature range.

G 15, G01

knife marks—a series of surface imprints or markings made by the machine knives in dressed lumber.

D 9, D07

knit—a textile process that interlocks, in a specific pattern loop of yarn by means of needles or wires.

D 3878, D30

knit-line—see **weld-line** (preferred terminology). (D20)

F 412, F17

knit-line, *n*—See **weld-line** (the preferred terminology).

D 883, D20

knitted fabric, *n*—a structure produced by interlooping one or more ends of yarn or comparable material.

D 123, D13

knitted fabric—See **knittedfabric** under **fabric**.

D 3878, D30

knitted fabric, *n*—a structure produced by interlooping one or more ends of yarn or comparable material.

D 4850, D13

knitted fabric, *n*—a structure produced by interlooping one or more ends of yarn or comparable material.

D 7023, D13

knob—a component of some manipulation-resistant-locks that is rotated on the dial to operate the cam slide.

F 471, F12

knock, *n*—*in a sparkignition engine*, abnormal combustion, often producing audible sound, caused by autoignition of the air/fuel mixture.

D 4175, D02

knock, *n*—*in an aircraftspark-ignition engine*, abnormal combustion caused by autoignition of the air/fuel mixture.

D 4175, D02

knock condition, *n*—*for octane rating*, when the knock intensity in any cylinder is light knock or greater as described in Annex A1.

D 4175, D02

knockings—the oversize residue obtained in screening a ceramic slip.

C 242, C21

knock intensity, *n*—*for knock testing*, a measure of the level of knock.

D 4175, D02

knockmeter, *n*—*forknock testing*, the 0 to 100 division indicating meter that displays the knock intensity signal from the detonation meter.

D 4175, D02

knock number, *n*—*for octane rating*, a numerical quantification of knock intensity.

D 4175, D02

knock-on—the movement of a constituent of the specimen deeper into the specimen matrix as a result of collisions with the primary particle.

E 673, E42

knockout—(1) a portion of a piece of pressed ware which has been so designed that it can be knocked out to make a hole.

(2) in glass containers, a protrusion of glass caused by missing metal at a junction of mold parts.

C 162, C14

Knoop—See **micro penetrationtester**. In a more restricted sense, a type of diamond hardness indenter having edge angles of 172° 30 min, and 130°.

E 7, E04

Knoop Hardness Number (HK), *n*—an expression of hardness obtained by dividing the force applied to the Knoop indenter by the projected area of the permanent impression made by the indenter.

C 1145, C28

Knoop hardness number, HK, *n*—a number related to the applied force and to the projected area of the permanent impression made by a rhombic-based pyramidal diamond indenter having included edge angles of 172° 30 min and 130° 0 min computed from the equation:

$$HK = P/0.07028d^2$$

where:

P = applied force, kgf, and

d = long diagonal of the impression, mm.

In reporting Knoop hardness numbers, the test force is stated.

E 6, E28

Knoop hardness test, *n*—an indentation hardness test using calibrated machines to force a rhombic-based pyramidal diamond indenter having specified edge angles, under specified conditions, into the surface of the material under test and to measure the long diagonal after removal of the force. E 6, E28

Knoop indenter, *n*—a rhombic-based pyramidal-shaped diamond indenter with edge angles of 172° 30' and 130° 00'. C 1145, C28

knot—an imperfection; an inhomogeneity in the form of a vitreous lump. C 162, C14

knot—that portion of a branch or limb which has been surrounded by subsequent growth of the wood of the tree. As a knot appears on the cut surface it is merely a section of the entire knot, its shape depending upon the direction of the cut.

branch knots—two or more knots diverging from a common point at or near the pith.

centerline knot—a knot whose centroid lies at the center of the width of any lumber face; sometimes referred to as a center knot.

corner knot—an edge knot containing the intersection of adjacent faces.

decayed knot—a knot that, due to advanced decay, is softer than the surrounding wood.

edge knot—(1) a knot located at the edge of the face in a piece of lumber.

(2) in stress grading under Practice D 245, a knot whose perimeter falls within one-sixth of the knot width from the edge of the piece. The knot width is measured along a line transverse to the piece.

elsewhere knot—a knot that is not a centerline, edge, or corner knot.

encased knot—a knot whose rings of annual growth are not intergrown with those of the surrounding wood.

firm knot—a knot that is solid across its face, but which contains incipient decay.

fixed knot—a knot that will hold its place in dry lumber under ordinary conditions, but can be moved under pressure, although not easily pushed out.

group knots—two or more single knots grouped together.

hollow knot—an apparently sound knot containing a hole more than 1/4-in. in diameter.

intergrown knot—a knot whose rings of annual growth are completely intergrown with those of the surrounding wood.

knot cluster—two or more knots grouped together as a unit, the fibers of the wood being deflected around the entire unit. Distinct from a group of single knots in which each is a unit.

loose knot—a knot that is not held firmly in place by growth or position and that cannot be relied upon to remain in place.

oval knot—a knot cut at from 45 to 90° to the long axis of the limb.

pith knot—a sound knot having a pith hole not over 1/4 in. in diameter.

round knot—a knot that is cut at approximately right angles to its long axis of the limb.

single knot—a knot having adjoining wood fibers deflected around it alone and not around another knot.

sound knot—a knot that is solid across its face, at least as hard as the surrounding wood, and shows no indication of decay.

spike knot—a knot cut at from 0 to 45° to the long axis of the limb.

star-checked knot—a knot having radial checks.

tight knot—a knot so fixed by growth or position that it will firmly retain its place in the piece.

unsound knot—a knot which is not solid across the face as a result of decay and is not as hard as the surrounding wood.

watertight knot—having sound and watertight wood completely

intergrown with the surrounding wood on one surface or on the entire projection of one end of the knot. D 9, D07

knot—an imperfection or nonhomogeneity in materials used in fabric construction, the presence of which causes surface irregularities. D 1079, D08

knot breaking force, *n*—*in tensile testing*, the breaking force of a strand having a specified knot configuration tied in the test method portion of the strand mounted between the clamps of a tensile testing machine. (Compare **knot breaking strength**. See also **breaking force**.) D 123, D13

knot breaking force, *n*—*in tensile testing*, the breaking force of a strand having a specified knot configuration tied in the portion of the strand mounted between the clamps of a tensile testing machine. (Compare **knot breaking strength**. See also **breaking force**.) D 4848, D13

knot breaking load, *n*—deprecated term. Use the preferred term, **knot breaking force**. D 4848, D13

knot-breaking strength, *n*—strength expressed in terms of knot breaking force. (See **knot breaking force**.) D 123, D13

knot breaking strength, *n*—strength expressed in terms of knot breaking force. (See also **knot breaking force**.) D 4848, D13

knotholes—voids remaining after removal of knots. D 1038, D07

knowledgeable person, *n*—an individual who has technical knowledge concerning the building or facility, for example, about occupant requirements, building design, mechanical systems, operation, and maintenance. E 631, E06

known, *n*—of established origin associated with the matter under investigation. E 1732, E30

knuckle—See preferred term **crimp**. D 2050, D13

knuckle—the selvage obtained by interlocking adjacent pairs of wire ends and bending the wire back into a loop. F 552, F14

knuckle area—in reinforced plastics, the area of transition between sections of different geometry in a filament-wound part. D 883, D20

knuckles, *n*—small tough rubber pieces scattered throughout a bale of raw rubber that do not disperse easily or accept carbon black and other compounding materials during mixing. D 1566, D11

Knudsen vacuum gage—an absolute manometer based on the principle of the transfer of momentum from a hot to a cold surface by gas molecules as in a radiometer. E 7, E04

knurled—loose term used to denote threaded, fluted, or grooved parallel or nearly parallel to nail axis with deformations not passing around body (see **thread**); also, barbed or deformed in repetitive pattern along surface. F 547, F16

knurling—in glass containers, a raised pattern of beads, ridges, crescents, or other shapes, molded on a glass surface for the purpose of decoration and/or improvement in the mechanical strength of the glass in service. Also known as **stippling**. C 162, C14

Koehler illumination—a specular illumination system. In reflected-light microscopy, used directly for the brightfield mode, and as a preliminary setup for all other modes except darkfield. The image of the field diaphragm is focused on the specimen surface and the image of an undiffused lamp source is focused in the plane of the aperture diaphragm. E 7, E04

Konowalow's law—the vapor of a binary mixture contains the larger proportion of that component, which, upon addition to the liquid, will raise its vapor pressure. E 7, E04

Koopmans energy—a calculated energy of an electron in an orbital, on the assumption that its removal to infinity is unaccompanied by electronic relaxation. E 673, E42

kosher hide—hide of an animal that has been slaughtered according to Jewish religious custom by having its throat cut crosswise, resulting in a different pattern of the hide sometimes referred to as a "cutthroat" or "stuckthroat". D 1517, D31

K radiation—characteristic X-rays produced by an atom when a vacancy in the *K* shell is filled by one of the outer electrons. E 7, E04

K radiation, *n*

K radiation, *n*—characteristic X rays produced by an atom or ion when a vacancy in the K shell is filled by one of the outer electrons. **E 135, E01**

K-radiation, *n*—characteristic X-rays produced by an atom or ion when a vacancy in the K-shell is filled by one of the outer electrons. **E 631, E06**

kraft, *n*—See **paperboard**. **D 996, D10**

kraft pulp—pulp cooked by the alkaline liquor consisting essentially of a mixture of caustic soda and sodium sulfide. The make-up chemical is traditionally sodium sulfate, which is reduced to the sulfide in the chemical recovery process; hence the alternative designation, sulfate pulp. **D 1695, D01**

Krypton 85—a tracer gas used to test for leakage when the radioisotope leak test method is used. **E 1316, E07**

K series—the set of X-ray wavelengths making up K radiation. **E 7, E04**

K-series, *n*—the set of X-ray wavelengths composed of K radiation. **E 135, E01**

Kubelka-Munk absorption coefficient, *K, n*—for a thin layer within an isotropic absorbing and scattering material over a black backing, the limit as the layer thickness approaches zero of the fraction of the incident radiation absorbed by the layer, divided by its thickness. **E 284, E12**

Kubelka-Munk scattering coefficient, *S, n*—for a thin layer within

an isotropic scattering and absorbing material over a black backing, the limit as the layer thickness approaches zero of the fraction of the incident radiation scattered (reflected) by the layer, divided by its thickness. **E 284, E12**

Kubelka-Munk theory, *n*—phenomenological turbid-medium theory relating the reflectance and transmittance of scattering and absorbing materials to optical constants (*Kubelka-Munk absorption coefficient, Kubelka-Munk scattering coefficient*) and the concentrations of their colorants. **E 284, E12**

kurum (Russian)—a general term for all types of coarse formations of broken rocks, on slopes of up to 40°, moving downslope mainly due to creep. **D 7099, D18**

K-value—*EIA*, a kinematic factor (between 0 and 1) that relates the backscattered energy to the incident energy. **E 673, E42**

K-valve, *n*—a simple, manually operated on-off SCUBA cylinder valve. **F 1549, F32**

kV (kilo volt)—a unit of electrical potential difference equal to one thousand volts, used to describe the accelerating potential of an X-ray tube. **E 1316, E07**

K_{xy}—hydraulic conductivity in the horizontal plane, radially from the control well. **D 653, D18**

kyanite (Al₂O₃·SiO₂)—the most abundant of the mineral polymorphs that include andalusite and sillimanite, commonly used as a source of mullite in ceramics. **C 242, C21**

L—total span of a simply supported diaphragm, in. (or mm) **E 631, E06**

label, n—a piece of paper or other material to be affixed to a container or article, on which is printed a legend, information concerning the product, or addresses. It may also be printed directly on the container. (Compare **tag**.) **D 996, D10**

label, n—a piece of paper, cloth, polymer, metal, or other material affixed to something and indicating its contents, destination, or other information. **F 1294, F05**

label, v—for *protective clothing*, to attach a symbol or other identifying mark, the use of which has been authorized by a certification organization. **F 1494, F23**

laboratory accreditation—formal recognition that a testing laboratory is competent to carry out specific tests or specific types of tests, (ISO Guide 2, *B*). **E 1187, E36**

laboratory accreditation system—system having its own rules of procedure and management, for carrying out laboratory accreditation, (ISO Guide 2, *A*). **E 1187, E36**

laboratory assessor—person who carries out some or all functions related to laboratory assessment, (ISO Guide 2). **E 1187, E36**

laboratory bias—See **bias**. **D 1356, D22**

laboratory control sample—an aliquot of the sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes, or a material containing known and verified amounts of analytes. **D 5681, D34**

laboratory error, δ , n—difference between *unadjusted temperature* as measured by an *IR thermometer* and temperature of a blackbody, over specified operating conditions of ambient temperature and humidity and *blackbody* temperature ranges. **E 344, E20**

laboratory performance rating, n—the rating of a product's performance defined by a standard test method. **F 1773, F08**

laboratory rated strength, n—the strength defined by a standard test method that 99.7 %, or more, of a population exceeds. The number shall be derived using a 3-s rating. Rated strength shall be expressed in metric units of force, kilonewtons (kN). **F 1773, F08**

laboratory sample—See *laboratory sample* under **sample**. **D 121, D05**

laboratory sample, n—a portion of material taken to represent the lot sample, or the original material, and used in the laboratory as a source of test specimens. **D 123, D13**

laboratory sample, n—*in wool top*, portions drawn from the lot in accordance with the described procedure. **D 123, D13**

laboratory sample, n—a portion of material taken to represent the lot sample, or the original material, and used in the laboratory as a source of test specimens. **D 4439, D35**

laboratory sample, n—a portion of material taken to represent the lot sample, or the original material, and used in the laboratory as a source of test specimens. **D 4845, D13**

laboratory sample, n—*in wool top*, the portions drawn from the lot in accordance with the described procedure. **D 4845, D13**

laboratory sample, n—a representative portion of the gross sample received by the laboratory for analysis. **D 5681, D34**

laboratory sample—a representative portion of the gross sample delivered to the laboratory for further analysis. **D 5681, D34**

laboratory sample—a representative portion of the gross sample received by the laboratory for analysis. **E 856, D34**

laboratory sample or analysis sample—a portion of one gross sample representative of a lot and taken at random from the gross sample. **D 5681, D34**

laboratory sampling unit, n—a portion of material taken to represent one of the lot sampling units or the original material and used in the laboratory as a source of test specimens. **D 123, D13**

lace leather—a form of rawhide leather (from cattlehides) for lacing together sections of power-transmission belts, sometimes prepared also with an alum and oil, chrome, or combination tannage. **D 1517, D31**

lack of resin fillout—a pultrusion condition where an area contains reinforcement not wetted with sufficient quantity of resin.

NOTE—This condition usually occurs at the edge of a pultrusion. **D 3918, D20**

lacquer, n—a coating composition that is based on synthetic thermoplastic film-forming material dissolved in organic solvent that dries primarily by solvent evaporation. Typical lacquers include those based on nitrocellulose, other cellulose derivatives, vinyl resins, acrylic resins, etc. **D 16, D01**

lacquer—see **cellulose lacquer**. **D 1695, D01**

lacquer-finished—coated with lacquer and often baked, usually in such colors as to match or blend with color of item to be fastened. **F 547, F16**

ladder—See **run**. **D 3990, D13**

ladder code—See **vertical bar code**. **F 1294, F05**

ladder gasket—a lock-strip gasket in the form of a subdivided frame having one or more integrally formed intermediate cross members. **C 717, C24**

ladle—a long-handled, cup-shaped tool for transferring batch or molten glass. **C 162, C14**

ladle analysis—see *heat analysis*. **F 1789, F16**

ladle brick, n—brick suitable for lining ladles used to contain molten metal. **C 71, C08**

lag deposits—the larger and heavier particles that are sorted out and left behind in stream channels. **D 4410, D19**

lagging, n—*in mining or tunneling*, short lengths of timber, sheet steel, or concrete slabs used to secure the roof and sides of an opening behind the main timber or steel supports. The process of installation is also called lagging or lacing. **D 653, D18**

lag phase, n—the period of diminished physiological activity and cell division following the addition of microorganisms to a new culture medium. **D 4175, D02**

lag time—See **analyzer**. **D 1356, D22**

laid fabric, n—a fabric made without filling yarn, the parallel warp yarns being held together by means of rubber latex or other binding material. **D 123, D13**

laid fabric, n—a fabric made without filling yarn, the parallel warp yarns being held together by means of rubber latex or other binding material. **D 4850, D13**

laitance, n—a layer of weak material derived from cementitious material and aggregate fines either: 1) carried by bleeding to the surface or to internal cavities of freshly placed concrete, or 2) separated from the concrete and deposited on the concrete surface or in internal cavities during placement of concrete under water. **C 125, C09**

laitance, n—*in building construction*, a weak layer of cement and aggregate fines on a concrete surface that is usually caused by an overwet mixture, overworking the mixture, improper or excessive finishing, or combinations thereof. **C 717, C24**

lake, n—a special type of pigment consisting essentially of an organic soluble coloring matter combined more or less definitely with an inorganic base or carrier. It is characterized generally by a bright color and a more or less pronounced translucency when made into an oil paint.

Under this term are included two (and perhaps three) types of pigment: (a) the older original type composed of hydrate of alumina dyed with a solution of the natural organic color, (b) the more modern and far more extensive type made by precipitating from solution various coal-tar colors by means of a metallic salt, tannin, or other suitable reagent, upon a base or carrier either previously prepared or coincidentally formed, and (c) a number combining both types in varying degree might be regarded as a third class. **D 16, D01**

lake talik—a layer or body of unfrozen ground occupying a depression in the permafrost table beneath a lake. **D 7099, D18**

Lambertian diffuser, *n*

Lambertian diffuser, *n*—ideal surface that reflects or transmits radiation completely in accordance with Lambert's cosine law. When illuminated from any direction, its radiance is the same for every direction of view. **E 284, E12**

Lambert's law, *n*—the intensity (flux per unit solid angle) emitted in any direction from a surface varies as the cosine of the angle between the normal to the surface and the direction of the emitted flux (also called Lambert's cosine law). See **Lambertian diffuser**. **E 284, E12**

Lambert's (thickness) law, *n*—see **Bouguer's law**. **E 284, E12**

lambskin leather—term applied to leather from either lambskins or sheepskins, which are practically indistinguishable after tanning. **D 1517, D31**

lamb's tongue—See **railing systems**. **E 631, E06**

lamb's tongue—an ornamental curved or tapered fitting terminating a handrail, usually tapered to the tip. **E 631, E06**

lamb's tongue—an ornamental curved or tapered fitting terminating a handrail, usually tapered to the tip. **E 1481, E06**

Lamb wave—a specific mode of propagation in which the two parallel boundary surfaces of the material under examination (such as a plate or the wall of a tube) establish the mode of propagation. The Lamb wave can be generated only at particular values of frequency, angle of incidence and material thickness. The velocity of the wave is dependent on the mode of propagation and the product of the material thickness and the examination frequency. **E 1316, E07**

lamina—a subunit of a laminate consisting of one or more adjacent plies of the same material with identical orientation. **D 3878, D30**

lamina, *n*—composite of the base coat, reinforcement, and finish coat. **E 2110, E06**

lamina orientation—same as **ply orientation**. **D 3878, D30**

laminar flow, *n*—flow in which the head loss is proportional to the first power of the velocity. **D 4439, D35**

laminar flow (streamline flow) (viscous flow)—flow in which the head loss is proportional to the first power of the velocity. **D 653, D18**

laminate, *n*—product made by bonding together two or more layers of material or materials.

cross laminate, *n*—a laminate in which some of the layers of material are oriented at right angles to the remaining layers with respect to the grain or strongest direction in tension. (Compare **parallel laminate**.)

parallel laminate, *n*—a laminate in which all the layers of material are oriented approximately parallel with respect to the grain or strongest direction in tension. (Compare **cross laminate**.) **D 907, D14**

laminate, *v*—to bond layers of material(s). **D 907, D14**

±45° laminate—a balanced symmetric laminate composed of only +45° plies and -45° plies. **D 3878, D30**

laminate—any fiber- or fabric-reinforced composite consisting of laminae (plies) with one or more orientations with respect to some reference direction. **D 3878, D30**

laminate—a product made by bonding together two or more layers of material or materials. **E 631, E06**

laminate—a product made by bonding together two or more layers of material or materials. **E 1749, E06**

laminate—a product made by bonding together two or more layers of material or materials. (See also **multilayered structure**) **F 17, F02**

laminate, *n*—a product made by bonding together two or more layers of material or materials. (See also **cross laminate** and **parallel laminate**.) **F 412, F17**

laminate, *n*—a product made by bonding together two or more layers of material or materials. **F 1251, F04**

laminate—See Terminology F 17. **F 1327, F02**

laminate coordinate axes—a set of coordinate axes, usually right-handed Cartesian, used as reference in describing the directional properties and geometrical structure of the laminate. Usually the

x-axis and the *y*-axis lie in the plane of the laminate and the *x*-axis is the reference axis from which ply angle is measured.

D 3878, D30

laminate, cross-plyed, *n*—a nonparallel laminate. **F 1251, F04**

laminated fabric, *n*—a layered fabric structure wherein a face or outer fabric is joined to a continuous sheet material, such as polyurethane foam, in such a way that the identity of the continuous sheet material is retained, either by the flame method or by an adhesive, and this in turn normally, but not always, is joined on the back with a backing fabric such as tricot. (See also **bonded fabric, coated fabric**.) **D 123, D13**

laminated fabric, *n*—*in fabric roof systems*, a flexible fabric system composed of superimposed layers of fabric firmly united by bonding or impregnating with an adherent polymeric material to one or more surfaces. **D 123, D13**

laminated fabric, *n*—*in fabric roof systems*, a flexible fabric system composed of superimposed layers of fabric firmly united by bonding or impregnating with an adherent polymeric material to one or more surfaces. **D 4850, D13**

laminated glass—(1) in flat glass, an assembly consisting of two or more lites of glass bonded together by an interlayer (see also Specification C 1172) and (2) in tableware, two or more distinct layers of glass fused together. **C 162, C14**

laminated veneer lumber (LVL), *n*—lumber made by laminating veneers in which the grain of all the veneers is essentially parallel to the lengthwise dimension. **D 907, D14**

laminated wood product, *n*—see under **wood laminates**. **D 907, D14**

laminate joint—see **joint**. **D 907, D14**

laminate midplane—the plane that is equidistant from both surfaces of the laminate. **D 3878, D30**

laminate, *n*—a product made by bonding together two or more layers of material or materials. (See also **cross laminate** and **parallel laminate**.) (ISO) **D 883, D20**

laminate, parallel, *n*—a laminate in which all layers or plies are oriented with their principal direction (grain or strongest direction in tension) parallel with the principal direction of the laminate. **F 1251, F04**

laminate principal axis—the laminate coordinate axis that coincides with the direction of maximum inplane Young's modulus. **D 3878, D30**

laminate, symmetrical—a composite laminate in which the ply orientation is symmetrical about the laminate midplane. **E 631, E06**

laminate, symmetrical—a composite laminate in which the ply orientation is symmetrical about the laminate midplane. **E 1749, E06**

lamination, *n*—line of demarcation or elongated void generally parallel to the principal grain direction of a carbon or graphite body. **C 709, D02**

lamination—a stratification of the material in the plane of the wall of a unit. **C 896, C04**

lamination, *n*—1) the process of preparing a laminate. 2) any layer in a laminate. (Compare **laminate, *n*** and **wood laminate**.) **D 907, D14**

lamination, *n*—line of demarcation or elongated void generally parallel to the principal grain direction of a carbon or graphite body. **D 4175, D02**

lamination—imperfection in flat products resulting from the presence of voids or inclusions aligned approximately parallel to the worked surface. **E 7, E04**

lamination—*in flexible barrier materials*, the process of preparing a laminate which consists of two or more flexible barriers bonded together (see also **laminate**). **F 17, F02**

lamination—See Terminology F 17. **F 1327, F02**

lamination crack, *n*—*in a rigid die system*, a defect(s) roughly parallel to the punch faces of the part (these defects usually occur when powder is compressed to high density and the relaxation

forces during pressure release exceed the binding force between the particles). **B 243, B09**

lamination factor, (space factor, stacking factor), *S*—a numeric, less than unity and usually expressed as a percentage, which is defined as the ratio of the uniform solid height *h* of the magnetic material in a laminated core to the actual height *h'* (core buildup) when measured under a specified pressure. *S* is thus equal to the ratio of the volume of magnetic material in a uniform laminated core to the overall geometric volume of the core. **A 340, A06**

lamination stack resistance—the electrical resistance measured in the direction perpendicular to the plane of lamination in a stack of laminations. **A 340, A06**

lamination surface insulation—the insulation between core laminations produced by a surface condition or layer either formed or applied for this purpose.

NOTE—In commercial practice, this insulating layer is frequently designated as core plate. **A 340, A06**

lamination thickness, *d*—the active thickness of a single lamination cut from sheet stock, including any core plate material. **A 340, A06**

lamination width, *w*—the width of a core lamination perpendicular to the direction of the induction therein. **A 340, A06**

lampworking—forming glass articles from tubing and cane by heating in a gas flame. **C 162, C14**

lance—(1) see **hackle**.

(2) a piece of hardware used for introducing a controlled atmosphere gas flow into molten glass or into parts of the furnace structure. **C 162, C14**

landfill—a place, location, tract of land, area, or premises used for the disposal of solid wastes as defined by state solid waste regulations. The term is synonymous with the term solid waste disposal site and is also known as a garbage dump, trash dump, or similar term. **D 5681, D34**

landfill—see **hazardous waste landfill**.

landfill, *n*—a disposal facility where waste is placed in or on land. **E 2201, E50**

landfill—a land disposal technique that uses excavated pits to contain the oil spill waste material. The waste is placed in the excavation, covered over, and left to degrade. **F 1600, F20**

landfill gas—biogas produced from the natural degradation of the organic material in landfills. **E 1705, E48**

landfill liner—continuous layer of natural or man-made materials, beneath or on the sides of a surface impoundment, landfill, or landfill cell, which restricts the downward or lateral escape of hazardous waste, hazardous waste constituents, or leachate. **E 631, E06**

landscape mode, *adj*—a printer output orientation in which the printed lines run parallel to the direction of movement of the paper. (See **portrait mode**.) **F 1457, F05**

landslide—the perceptible downward sliding or movement of a mass of earth or rock, or a mixture of both. (ISRM) **D 653, D18**

landslide (slide)—the failure of a sloped bank of soil or rock in which the movement of the mass takes place along a surface of sliding. **D 653, D18**

lane-to-shoulder dropoff, *n*—(*highways, roads and streets only*) difference in elevation between the traveled surface and the shoulder surface. **E 867, E17**

lane-to-shoulder dropoff, *n*—(*highways, roads and streets only*) difference in elevation between the traveled surface and the shoulder surface. **E 1778, E17**

lane-to-shoulder separation, *n*—(*highways, roads and streets only*) widening of the joint between the edge of the slab and the shoulder. **E 867, E17**

lane-to-shoulder separation, *n*—(*highways, roads and streets only*) widening of the joint between the edge of the slab and the shoulder. **E 1778, E17**

langelier saturation index, LSI—an index calculated from total dissolved solids, calcium concentration, total alkalinity, pH, and

solution temperature that shows the tendency of a water solution to precipitate or dissolve calcium carbonate (see Practice D 3739). **D 6161, D19**

Langmuir adsorption theory—the theory that assumes that the surface of an adsorbent has only uniform energy sites and that adsorption is limited to a monomolecular layer. **D 2652, D28**

Langmuir-Blodgett (LB) membrane—synthetic membrane formed by sequential depositing of one or more monolayers of surface active component onto a porous support. **D 6161, D19**

Langmuir isotherm—a plot of isothermal adsorption data which to a reasonable degree fits the Langmuir adsorption equation. **D 2652, D28**

lap—(1) an imperfection; a fold in the surface of a glass article caused by incorrect flow during forming. **C 162, C14**

(2) a tool used for polishing glass.

lap, *n* (for coatings)—the region where one area of a coated surface merges into an adjacent freshly-coated area during application of a single coat to the entire surface. **D 16, D01**

lap—a condition in which adjacent veneers overlap one another instead of making a smooth edge joint. **D 1038, D07**

lap—(1) a surface imperfection on worked metal caused by folding over a fin overflow, or similar surface condition and then impressing this into the surface by subsequent working without welding it.

(2) A flat surface which holds an abrasive for polishing operations. **E 7, E04**

lap cement, *n*—the cementitious material used to seal the side and end laps of corrugated roofing. **C 1154, C17**

lap cement—the cementitious material used to seal the side and end laps of corrugated roofing. **D 2946, C17**

lap joint, *n*—a joint made by placing one adherend partly over another and bonding together the overlapped portions. **D 907, D14**

lapped seam, *n*—a complex seam formed on the inside of the object with neither raw edge enclosed, and having one visible line of topstitching on the face side and a small fold formed by the topstitching. (Compare **tucked seam**.) **D 123, D13**

lapped seam— except the topstitching is farther from the fold than that of a lapped seam 6 to 10 mm (¼ to ¾ in.). **D 4965, D13**

lapped seam for leather or nonwoven material, *n*—*in home sewing*, a complex seam formed on the outside of the product, with neither cut edge enclosed, and having one or two rows of stitching and a cut edge visible from the outside. (Compare **lapped seam for woven or knitted fabric**.) **D 123, D13**

lapped seam for leather or nonwoven material, *n*—*in home sewing*, a complex seam formed on the outside of the product, with neither cut edge enclosed and having one or two rows of stitching and a cut edge visible from the outside. (Compare **lapped seam for woven or knitted fabric**.) **D 4965, D13**

lapped seam for woven or knitted fabric, *n*—*in home sewing*, a complex seam formed on the inside of the product with neither raw cut edge enclosed, and having one visible line of topstitching on the face side and a small fold formed by topstitching. (Compare **tucked seam**.) **D 123, D13**

lapped seam for woven or knitted fabric, *n*—*in home sewing*, a complex seam formed on the inside of the product with neither raw cut edge enclosed, and having one visible line of topstitching on the face side and a small fold formed by the topstitching. (Compare **tucked seam**.) **D 4965, D13**

lapping—rubbing two surfaces together, with or without abrasives, for the purpose of obtaining extreme dimensional accuracy or superior surface finish. **B 374, B08**

lapping—the abrasive removal of material using graded abrasive particles in a loose form as in a liquid slurry on a platen. **E 7, E04**

lap sealant joint, *n*—*in building construction*, a joint where sealant is applied within the joint between approximately parallel substrates that are face-to-face. **C 717, C24**

lapse rate, *n*—the rate of change of the absolute value of any meteorological element with increase of height. **D 1356, D22**

large grain(s), (LG), *n*

large grain(s), (LG), *n*—as used in *fractography*, a volume-distributed flaw that is a single (or cluster of) grain(s) having a size significantly greater than that encompassed by the normal grain size distribution. **C 1145, C28**

large head—larger than standard head, usually more than 3 to 3½ times shank diameter. **F 547, F16**

large particle emulsion—see **quick breaking emulsion**. **E 609, E35**

large volume testing—using a large volume of the material to be tested as an inoculum in direct detection of mycoplasma. **E 1705, E48**

larrigan leather—oil-tanned light cattlehides, used for moccasins. **D 1517, D31**

LAS—an abbreviation for alkyl benzene sulfonate in which the alkyl radical is a straight chain. **D 459, D12**

LASER—light amplification by stimulated emission of radiation. **F 1457, F05**

laser beam welding, *n*—a welding process that uses a laser beam as the heat source. **A 941, A01**

laser diffraction, *n*—in particle measurement, the creation of a spatial pattern of light produced by the impingement of a laser beam on one or more dispersed particles, wherein the particle size distribution may be inferred from the nature of the pattern. **E 1620, E29**

laser glass—a glass of special composition that emits amplified electromagnetic radiation upon proper electromagnetic stimulation. **C 162, C14**

laser light scattering—a phenomenon suitable for the measurement of particle size in that particles illuminated by a collimated laser beam cause the light to be scattered through angles which are inversely proportional to the size (generally expressed as a diameter) of the particles. **C 242, C21**

laser marking, *n*—etching of data by lasers that directly mark a surface such as metal, wood, and fiberboard. **F 1294, F05**

laser printer—a nonimpact printer that employs a laser light source drive by digital signals to create images on a photoconductor. See **electrophotographic printer**. **F 909, F05**

laser scanner—an optical scanning device that uses the intense monochromatic light beam given off by a laser as its source of illumination. **F 149, F05**

laser scanner, *n*—an optical bar code reading device using a low energy laser light beam as its source of illumination. **F 1294, F05**

lash-in—See **jerk-in**. **D 3990, D13**

Laskin nozzle—a type of portable air-operated aerosol generator capable of producing droplets in the size range from 1 to 2 µm. **E 1620, E29**

last, *n*—a piece of wood, metal, or synthetic material roughly following the shape of the foot and acting as a form on which a shoe is made.

v—to shape a fitted upper to the last using the stretch of the leather (or other material) and then fix it temporarily or permanently to the insole. **F 869, F08**

last nonseizure load, *n*—the last load at which the measured scar diameter is not more than 5 % greater than the compensation value at that load. **D 4175, D02**

latent heat of fusion—the amount of heat required to melt all the ice (or freeze all of the pore water) in a unit mass of soil or rock. **D 7099, D18**

latent image—a condition produced and persisting in the image receptor by exposure to radiation and able to be converted into a visible image by processing. **E 1316, E07**

lateral, *adj*—a descriptive term for a textile fiber composed of two or more polymers at least two of which have a continuous longitudinal external surface. **D 123, D13**

lateral, *adj*—a descriptive term for a textile fiber composed of two or more polymers at least two of which have a continuous longitudinal external surface. **D 4466, D13**

lateral—away from the midline. (Opposite: medial) **F 869, F08**

lateral accretion deposits—See **point bar**. **D 4410, D19**

lateral crack—a crack produced beneath and generally paralleling a glass surface during the unloading phase of mechanical contact with a hard, sharp object. (See **cleavage crack**.) **C 162, C14**

lateral force coefficient, *n*—of a tire, the ratio of lateral force to normal force. **F 538, F09**

lateral force [F], *n*—of a tire, the component of the tire force vector in the *Y'* direction. **F 538, F09**

lateral groove, *n*—a groove that has its long dimension oriented at a direction non-parallel to the tire circumferential centerline; it most frequently opens into a void at both ends. **F 538, F09**

lateral holding strength, *n*—the force required to disengage a snap fastener resulting from a pull in the plane parallel to the material to which the snap fastener is attached. **D 123, D13**

lateral order—the degree of regularity of arrangement of atoms and atomic groups in the direction normal to the molecular chain axes in linear polymers. Quantitative evaluation is impossible without further specification and without description of the particular experimental technique. **D 1695, D01**

lateral resistance of metal connector plate—resistance to slip or pulling, or both, from wood, in direction of applied external shear force, of integral teeth or separate nails, or both, fastening connector plate to wood members. Also called *tooth holding resistance*, *grip resistance*, and *peel resistance* to cover specific events; yet, preferably called *lateral resistance*. See **shear strength of metal connectorplate**. **E 631, E06**

lateral scroll—See **railing systems**. **E 631, E06**

lateral scroll—a fitting that curves in a horizontal plane, used to terminate a handrail; often ending as a round plate covering the top of a post. **E 631, E06**

lateral scroll—a fitting that curves in a horizontal plane, used to terminate a handrail; often ending as a round plate covering the top of a post. **E 1481, E06**

lateral talik—a layer or body of unfrozen ground overlain and underlain by perennially frozen ground. **D 7099, D18**

latewood—the denser, smaller-celled, later-formed part of a growth layer. A synonym is *summerwood*. **D 9, D07**

latex, *n*—a stable dispersion of polymeric substance in an essentially aqueous medium. **D 907, D14**

latex, creamed, *n*—a latex, the rubber concentration of which has been increased by creaming and removal of the separated serum. **D 1566, D11**

latex, creaming, *n*—a reversible process consisting of gravitational accumulation of rubber particles surrounded by serum, near the top or bottom of the latex. **D 1566, D11**

latex, creaming agent, *n*—a material added to latex to promote creaming. See **latex, creaming**. **D 1566, D11**

latex, field, *n*—natural rubber latex with or without a preservative and prior to concentration or any other processing. **D 1566, D11**

latex foam rubber, *n*—in *building construction*, an elastomeric open-cell material made by whipping or stirring air or some other gas into rubber latex compound as it is gelled and before it is subsequently cured. **C 717, C24**

latex, mechanical stability, *n*—the ability of latex to resist coagulation under the influence of mechanical agitation **D 1566, D11**

latex paint—under **paint**, see **latex paint**. **D 16, D01**

latex rubber, *n*—colloidal aqueous dispersion of rubber. **D 1566, D11**

lath—see **gypsum lath**. **C 11, C11**

lath—thin, narrow strips of rough wood. **D 9, D07**

lathe—the machine on which rotary, half-round, and rift veneer is cut. **D 1038, D07**

lather—a foam or froth when a detergent is agitated in water or other liquid. **D 459, D12**

lath nail—See **metal-lath nail, wood-lath nail**. **F 547, F16**

latigo leather—a type of lace leather, alum and vegetable tanned, used in saddlery. **D 1517, D31**

latitude—when the photographic process is represented by an H and D curve, the latitude is the projection on the exposure axis of that

- part of the curve which approximates a straight line within the tolerance permitted for the purpose at hand. **E 7, E04**
- latitudinal limit of permafrost**—the southernmost latitude at which permafrost occurs in a lowland region of the northern hemisphere, or the northernmost latitude for the same in the southern hemisphere. **D 7099, D18**
- latitudinal zonation of permafrost**—the subdivision of a permafrost region into permafrost zones, based on the percentage of the area that is underlain by permafrost. **D 7099, D18**
- lattice**—(1) a space lattice is a set of equal and adjoining parallelepipeds formed by dividing up space by three sets of parallel planes, the planes in any one set being equally spaced. There are seven ways of so dividing space, corresponding to the seven crystal systems. The unit parallelepiped is usually chosen as the unit cell of the system.
(2) a point lattice is a set of points in space so located that each point has identical surroundings. There are fourteen ways of so arranging points in space, corresponding to the 14 Bravais lattices. **E 7, E04**
- lattice parameter**—the term is used for the fractional coordinates x , y , z of lattice points when these are variable. Also used to indicate the lengths of the axes a , b , c , and their included angles α , β , γ . **E 7, E04**
- lattice pattern**—in reinforced plastics, a pattern of filament winding with a fixed arrangement of open voids. **D 883, D20**
- Laue equations**—the three simultaneous equations which state the conditions which must be met for diffraction from a three-dimensional network of diffraction centers. **E 7, E04**
- Laue method (for crystal analysis)**—a method of X-ray diffraction employing a beam of white radiation, a fixed single crystal specimen and a flat photographic film usually normal to the incident beam. If the film is located on the same side of the specimen as the X-ray source, the method is known as the back reflection Laue method, if on the other side as the transmission Laue method. **E 7, E04**
- laundability, n—in buttons**, the ability of a button to undergo multiple cycles of laundering without damage such as cracks or loss of finish. **D 123, D13**
- laundability, n**—the ability of a button to undergo multiple cycles of laundering without damage such as cracks or loss of finish. **D 5497, D13**
- laundering, n—intextile product care**, a process intended to remove soil or stains by treatment (washing) with an aqueous detergent solution (and possibly bleach) and normally including subsequent rinsing, extracting, and drying. **D 123, D13**
- laundering**—a process intended to remove soils or stains, or both, by washing in an aqueous detergent solution, that normally includes subsequent rinsing, extracting, and drying. (See Guide D 5548.) **D 459, D12**
- laundering, n—intextile product care**, a process intended to remove soil or stains by treatment (washing) with an aqueous detergent solution (and possibly bleach) and normally including subsequent rinsing, extracting, and drying. **D 3136, D13**
- laundering, n**—a process used to refurbish a textile product or parts thereof by (1) cleaning it in water containing a cleaning agent, and possibly bleach, (2) drying it, and (3) usually ironing or pressing it. **D 5497, D13**
- laundry additive**—a separately added product that contributes to the effectiveness of laundering or provides a specialized function, or both. (See Guide D 5548.) **D 459, D12**
- laundry formula, n**—a list of chemicals, amounts, and procedures used in a laundry operation. **F 1494, F23**
- lawn, n—as in microbiology**, a cloudy, uniform growth of bacteria in a thin layer of top agar in a petri dish. **F 1494, F23**
- lay, n**—one turn of the helix of a wire or member of a standard conductor. See also **direction of lay** and **length of lay**. **B 354, B01**
- lay, v**—to arrange the wires or members of a conductor either by twisting them or by forming them into one or more layers helically applied. **B 354, B01**
- lay, n**—(1) the length of twist produced by stranding filaments, such as fibers, wires, or roving; (2) the angle that such filaments make with the axis of the strand during a stranding operation. **D 883, D20**
- layer**—{archaic} person who has charge of laying the glass in plaster on the grinding and polishing tables. **C 162, C14**
- layer, n—as related to veneer and plywood**, a single veneer ply or two or more plies laminated with grain direction parallel. **D 907, D14**
- layer**—a single veneer ply or two or more plies laminated with grain direction parallel. Two or more plies laminated with grain direction parallel is a parallel laminated layer. **D 1038, D07**
- layered cryostructure**—the cryostructure of frozen silt or loam in which ice layers alternate with mineral layers that have a massive cryostructure. **D 7099, D18**
- layer insulation, n**—paper, 5 to 1200 μm thick, used to insulate between layers of conductors in transformers or other inductive apparatus. **D 1711, D09**
- layer lattice**—a type of structure found in crystals which tend to form in thin sheets. **E 7, E04**
- layer of reinforcement**—circumferential reinforcement that is one bar or wire in thickness. **C 822, C13**
- lay factor**—the ratio of the length of lay to the external diameter of the corresponding layer of wires or members in the stranded conductor. **B 354, B01**
- laying length**—the centerline length of an installed pipeline system, section, or fitting. **F 412, F17**
- laying yard**—{archaic} place where the rough glass is laid on grinding and polishing tables with plaster. **C 162, C14**
- lay up, n**—in reinforced plastics, an assembly of layers of resin-impregnated material ready for processing. **D 883, D20**
- lay up, v**—in reinforced plastics, to assemble layers of resin-impregnated material for processing. **D 883, D20**
- lay-up, n**—(1) the stack of plies in specified sequence and orientation before cure or consolidation; (2) the complete stack of plies, bagging material, breather material, and so on before cure or consolidation; and (3) a description of the component materials, geometry, and so on of a laminate. **D 3878, D30**
- lay-up, v**—to stack plies of material in specified sequence and orientation. **D 3878, D30**
- lay-up**—a process of fabrication involving the placement of successive layers of materials. **E 631, E06**
- lay-up**—a process of fabrication involving the placement of successive layers of materials. **E 1749, E06**
- lay-up code**—a designation system for abbreviating the stacking sequence of laminated composites. **D 3878, D30**
- LBP**—lead-based paint. **E 631, E06**
- LC₅₀, n**—a measure of lethal toxic potency; the concentration of gas or smoke calculated statistically from concentration-response data to produce lethality in 50 % of test animals within a specified exposure and postexposure time. **E 176, E05**
- LC50**—a statistically or graphically estimated concentration that is expected to be lethal to 50 % of a group of organisms under specified conditions. **E 943, E47**
- LCA, n**—see **life-cycle assessment**. **E 2114, E06**
- LD-50**—concentration required for 50 % mortality (lethal dose). **D 6161, D19**
- LD50**—a statistically or graphically estimated dose that is expected to be lethal to 50 % of a group of organisms under specified conditions. **E 943, E47**
- L/D ratio**—one measure of the resolution capability of a neutron radiographic system. It is the ratio of the distance between the entrance aperture and the image plane (L) to the diameter of the entrance aperture (D). **E 1316, E07**
- lea, n—in cottonyarns**, the number of 120-yd lengths of yarn per pound; an indirect yarn numbering system. **D 123, D13**
- lea, n—in linyarns**, the number of 300-yd lengths of yarn per pound; an indirect yarn numbering system. **D 123, D13**

- lea, *n***—*in cotton yarns*, the number of 120-yd lengths of yarn per pound; an indirect yarn numbering system. **D 4849, D13**
- lea, *n***—*in linen yarns*, the number of 300-yd lengths of yarn per pound; an indirect yarn numbering system. **D 4849, D13**
- leach, *n***—a weekly addition of water to solid material that is performed either dropwise or by flooding for a specified time period. **D 5681, D34**
- leachate**—liquid drainage normally associated with contaminated soils and solid waste landfills. **C 896, C04**
- leachate**—liquid that has percolated through or passed over a solid waste or other medium and contains dissolved or suspended materials, or both, from the medium. **D 5681, D34**
- leachate, *n***—the liquid including any suspended components in the liquid that has percolated through or drained from a pile or cell of solid materials. **E 2201, E50**
- leachate**—the liquid residue from the migration of environmental pollutants mediated by surface or ground water. **F 1600, F20**
- leaching**—the removal in solution of the more soluble materials by percolating or moving waters. (ISRM) **D 653, D18**
- leaching**—the removal of soluble soil material and colloids by percolating water. **D 653, D18**
- leaching, *v***—the operation, natural or designed, of producing leachate. **E 2201, E50**
- leaching (latex), *n***—a process in which latex articles are washed in water to remove water-soluble substances. **D 1566, D11**
- lead abatement contractor**—any business entity, public unit, or person performing the actual abatement for a lead abatement project. **E 631, E06**
- lead angle, helix angle**—angle made by helix of thread with plane perpendicular to nail axis; measured at pitch line; small lead angle usually refers to less than 20°; medium lead angle usually refers to 55° to 65°; large lead angle refers to 65° to 75°; extra large lead angle refers to 80° to 85°. **F 547, F16**
- lead-based paint, *n***—a dried paint film or other surface coating that contains lead in excess of the limits set by authorities having jurisdiction. **E 1605, E06**
- lead-based paint activities**—in the case of target housing and child-occupied facilities, inspection, risk assessment, and abatement. **E 1605, E06**
- lead-based paint inspection, *n***—a surface-by-surface investigation to determine the presence of lead-based paint including a report explaining the results of the investigation. **E 1605, E06**
- lead-based paint removal**—action or process of abatement, that entails stripping lead-based paint from surfaces of components. **E 631, E06**
- lead climbing, *n***—the skill of climbing first up a pitch, utilizing a belayer, climbing rope, and intermediate protection anchors. **F 1773, F08**
- lead-containing paint**—lead-based paint or other similar surface-coating materials containing lead or a lead compound, and in which the lead content is in excess of 0.06 % by weight of the total nonvolatile content of the paint, or the weight in the dried paint film. **E 631, E06**
- lead-containing paint, *n***—paint or other similar surface-coating materials containing lead in excess of 0.06 % by mass of the total nonvolatile content of the paint, or by the mass of the dried paint film. **E 1605, E06**
- leaded**—characteristic of a metallic body containing metallic lead in dispersed form. **E 7, E04**
- leaded dust**—dust containing lead or lead compounds at potentially hazardous concentrations. **E 631, E06**
- leaded dust hazard, *n***—a condition that might result in adverse human health effects due to lead in surface dust. **E 1605, E06**
- leaded glass**—pieces of glass fixed together at their edges with soldered strips of lead or other ductile metal. **C 162, C14**
- leaded paint**—paint or other coatings containing lead compounds at potentially hazardous concentrations. **E 631, E06**
- leaded paint**—paint or other coatings containing lead compounds. See **lead-containing paint**. **E 1605, E06**
- leaded paint characterization**—a procedure for determining the presence of lead in painted surfaces that are expected to be disturbed by planned work. **E 1605, E06**
- leaded paint hazard, *n***—a condition that might result in adverse human health effects due to lead in deteriorated paint on all building surfaces, lead in paint on chewable surfaces, impact surfaces, or dust-producing friction surfaces. **E 1605, E06**
- leaded soil, *n***—bare soil containing lead compounds at potentially hazardous concentrations. **E 1605, E06**
- leaded soil hazard, *n***—a condition that might result in adverse human health effects due to lead in bare soil. **E 1605, E06**
- leader mark**—See **decating mark**. **D 3990, D13**
- lead exposure**—subjection to the presence of a lead hazard that could result in ingestion or inhalation of lead-containing substances. **E 631, E06**
- lead-free (deprecated)**—term used to describe a dwelling that contains no **lead-based paint**, lead-contaminated dust, or lead-contaminated soil. Use of this term is discouraged because **leaded paint** may be present, and there is normally a small amount of lead in any paint, dust, and soil. **E 1605, E06**
- lead hazard, *n***—a leaded-dust hazard, leaded-soil hazard, leaded-paint hazard, or any other condition that may cause exposure to lead that may result in adverse human health effects. **E 1605, E06**
- lead hazard activities, *n***—procedures, measures, and actions including **abatement**, **clearance examination**, control, inspection, maintenance, management, quality systems, reduction, and risk assessment pertaining to lead hazards in buildings and associated grounds. **E 1605, E06**
- lead hazard assessment**—investigation of an assessed unit conducted to determine and report the location, type, severity of lead hazards which are accessible to children. **E 1605, E06**
- lead hazard control**—activities intended to control exposures to lead hazards and actual or potential sources of lead hazard, including **abatement** and in-place management. **E 1605, E06**
- lead hazard management**—activities intended to characterize the presence of lead hazards and actual or potential sources of lead hazards in a defined facility or group of facilities, develop a specific plan to control and eliminate lead hazards based on these findings, and implement a program based on this plan. **E 1605, E06**
- lead hazard reduction, *n***—any measure that results in a lessening of the number or extent, or both, of lead hazards. **E 1605, E06**
- lead hazard screen**—a limited risk assessment activity that involves limited paint and dust sampling as described in applicable Federal, state, or local regulations. **E 1605, E06**
- lead head, cast lead head, compressed lead head**—lead encasement pressed or cast onto or around small $\frac{3}{32}$ -in. steel head, or both. **F 547, F16**
- lead-head nail**—See **roofing nail**. **F 547, F16**
- leading**—a typographical term indicating the amount of white space between lines of printed characters. **F 1457, F05**
- leading edge**—the edge of a form that is used as a base for locating the first line of data to be scanned. **F 149, F05**
- leadless glaze**—See **leadless glaze** under **glaze**. **C 242, C21**
- lead paint (deprecated)**—a term that is sometimes used as an alternative to **lead-based paint**. Use of this term is discouraged because it is unclear what level of lead it refers to. **E 1605, E06**
- lead paint hazard**—presence of lead-based paint in places and site conditions posing a danger of ingestion or inhalation. **E 631, E06**
- lead poisoning**—toxic condition caused by excessive exposure to lead. **E 631, E06**
- lead positive/negative**—qualitative (not quantitative) judgment of lead content that determines abatement action measures. **E 631, E06**

- lead screen**—see **intensifying screen (a)**. E 1316, E07
- lead screen (deprecated)**—a term sometimes used for **lead hazard screen**. Its use is discouraged because there are several alternatives in use, and this one is particularly unclear. E 1605, E06
- leaf**—the sandwich layer of flat-sheet membrane/product channel spacer/flat-sheet membrane, glued together on the sides and across the outer end in a spiral wound element. D 6161, D19
- leak**—a hole, or void in the wall of an enclosure, capable of passing liquid or gas from one side of the wall to the other under action of pressure or concentration differential existing across the wall, independent of the quantity of fluid flowing. E 1316, E07
- leak**—any opening in a flexible package that is contrary to intention and either lets contents escape or permits substances to enter. F 1327, F02
- leakage**, *n*—the flow of liquid from one hydrogeologic unit to another. D 653, D18
- leakage current**—current flow through the insulation between test points. F 2112, F01
- leakage field**—see **field, magnetic leakage**. E 1316, E07
- leakage flux**—the flux outside the boundary of the practical magnetic circuit. A 340, A06
- leakage rate**—the flow rate of a liquid or gas through a leak at a given temperature as a result of a specified pressure difference across the leak. Standard conditions for gases are 25°C and 100 kPa. Leakage rates are expressed in various units such as pascal cubic metres per second or pascal litres per second. E 1316, E07
- leakance**, $n(T^{-1})$ —the ratio K'/b' , in which K' and b' are the vertical hydraulic conductivity and the thickness, respectively, of the confining beds. D 653, D18
- leak artifact**—a device used to introduce gas into a system at a controlled rate, usually 10^{-7} mol/s or less. E 1316, E07
- leak detector**—a device for detecting, locating, or measuring, or combination thereof, leakage. E 1316, E07
- leak exit**—the point where a leak appears. E 631, E06
- leak exit**—the point where a leak appears. E 1749, E06
- leak path**—the path a leak follows from the leak source to the leak exit. E 631, E06
- leak path**—the path a leak follows from the leak source to the leak exit. E 1749, E06
- leak source**—the point where a leak starts. E 631, E06
- leak source**—the point where a leak starts. E 1749, E06
- leak testing**—comprises procedures for detecting or locating or measuring leakage, or combinations thereof. E 1316, E07
- leaky aquifer**, *n*—aquifers, whether artesian or unconfined, that lose or gain water through adjacent less permeable beds. D 653, D18
- lean gas**—natural gas containing little or no hydrocarbons commercially recoverable as liquid products. D 4150, D03
- lease**—grant or rights by a lessor to a lessee to possess and use real or personal property for a period of time in exchange for rent or other consideration. E 2135, E53
- lease (bail)**—contract between the owner of real property (lessor) and another party (lessee) for the possession and use of the property for a specified term in return for rent or other income. E 631, E06
- lease (bail)**—contract between the owner of real property (lessor) and another party (lessee) for the possession and use of the property for a specified term in return for rent or other income. E 1480, E06
- leash**—a cord-like device wherein one end is attached to the top surface of the snowboard, or the binding, and the other end provides an apparatus to attach to one of the rider's legs. F 1107, F27
- least count**, *n*—*in tensile testing machines*, the smallest change in the indicated property that can customarily be determined. (See **sensitivity**) D 123, D13
- least count**, *n*—*in tensile testing machines*, the smallest change in the indicated property that can customarily be determined. D 4849, D13
- least count**, *n*—the smallest change in indication that can customarily be determined and reported. E 6, E28
- least difference of practical importance**, δ , *n*—the smallest difference based on engineering judgment deemed to be of practical importance when considering whether a significant difference exists between two statistics or between a statistic and a hypothetical value. D 123, D13
- leather**—a general term for hide or skin that still retains its original fibrous structure more or less intact, and that has been treated so as to be imputrescible even after treatment with water. The hair or wool may or may not have been removed. Certain skins, similarly treated or dressed, and without the hair removed, are termed “fur.” No product may be described as leather if its manufacture involves breaking down the original skin structure into fibers, powder or other fragments by chemical or mechanical methods, or both, and reconstituting these fragments into sheets or other forms. D 1517, D31
- leatherboard**—a type of fiberboard in which the fiber content is at least 75 % leather, usually with asphaltic or resinous binder. D 1517, D31
- Le Chatelier's theorem**—if a system in equilibrium is subjected to a constraint by which the equilibrium is altered, a reaction takes place which opposes the constraint, that is, one by which its effect is partially annulled. E 7, E04
- LED**—light emitting diode. F 1457, F05
- LF, see **line feed**.
- ledeburite**—intimate mixture of austenite and cementite in metastable equilibrium, formed on rapid cooling during the eutectic reaction in alloys of iron and carbon containing greater than 2 percent but less than 6.67 percent carbon. Further slow cooling causes decomposition of the austenite into ferrite and cementite (pearlite) as a result of the eutectoid reaction. E 7, E04
- ledge**—see **bedrock**. D 653, D18
- ledger paper**, *n*—a paper characterized by strength, high tearing resistance, erasability, water resistance, ink receptivity, uniformity of surface, and smoothness. D 1968, D06
- leeches**—permanent magnets or electromagnets that are attached to the electrodes carrying magnetizing current and that are strong enough to hold electrode contact firmly. E 1316, E07
- leg**—staple part connecting staple crown with staple point; driven through and into or through materials being fastened. F 592, F16
- legging**—the drawing of filaments or strings when adhesive-bonded substrates are separated. (See also **stringiness** and **webbing**.) (Compare **teeth**.) D 907, D14
- legs**, *n*—*in zippers*, the two portions of a separate element that affix the element to the bead. D 123, D13
- legs**, *n*—the two portions of a separate element that affix the element to the bead. D 2050, D13
- leg thickness**—maximum dimension of staple-leg cross section measured parallel to staple-crown axis. F 592, F16
- leg width**—maximum dimension of staple-leg cross section measured perpendicular to staple-crown axis. F 592, F16
- lehr**, **lehr**—a long, tunnel-shaped oven for heat treating glass by continuous passage. C 162, C14
- lehr loader**—a device for properly placing and spacing glass articles on a continuous lehr belt. C 162, C14
- length**, *n*—the maximum dimension of the tile measured parallel to the water channels or perpendicular to the eave of the roof. C 43, C15
- length**, *n*—horizontal dimension of the face of a unit when the unit is positioned as a stretcher. C 1232, C15
- length**, *n*—*of a fabric*, the distance from one end of a fabric to the other, measured parallel to the side edge of the fabric while it is under zero tension and is free of folds or wrinkles. D 123, D13
- length**, *n*—*of a fabric*, the distance from one end of a fabric to the other, measured parallel to the side edge of the fabric while it is under zero tension and is free of folds or wrinkles. D 4850, D13
- length**—distance between beginning and end of point, measured along edge of point. F 547, F16
- length**—distance measured parallel to shank axis from maximum

length

diameter of bearing surface of head to extreme end of point; except in case of cement-coated, brad-headed, and oval-countersunk-headed nails where measurement includes complete head.

Discussion—In evaluating nail performance, length is measured to and including one third of length of point. F 547, F16

length analyzer, *n*—an instrument which determines the upper-half-mean length and length uniformity index of a test beard of cotton. D 123, D13

length analyzer, *n*—an instrument which determines the upper-half-mean length and length uniformity index of a test beard of cotton. D 7139, D13

length between, *L_b*, *n*—in *textile unevenness testing*, the length between which unevenness is measured, the equivalent of the length of strand segments weighed in a direct method of measuring unevenness. D 4849, D13

length between, *L_b*, *n*—in *textile unevennesstesting*, the length between which unevenness is measured; the equivalent of the length of strand segments weighed in a direct method of measuring unevenness. D 123, D13

length change, *n*—in *cement testing*, an increase or decrease in linear dimension due to causes other than applied load, usually measured along the longitudinal axis of a test specimen and expressed as a percentage of a gage length. C 219, C01

length/depth—the distance between the two edges of a form, reached by moving at right angle to a nominal data line. F 149, F05

length distribution, *n*—of *staple fibers*, a graphic or tabular presentation of the proportion or percentage (by number or by mass weight) of fibers having different lengths. D 123, D13

length distribution, *n*—of *staple fibers*, a graphic or tabular presentation of the proportion or percentage (by number or by mass) of fibers having different lengths. D 4849, D13

length group, *n*—all fibers, or pulls, whose lengths fall within a given length interval. D 123, D13

length group, *n*—all fibers, or pulls, whose lengths fall within a given length interval. D 7139, D13

length interval, *n*—a class interval of 1/8 in. (3 mm), usually designated by its midpoint length in odd-numbered sixteenths of an inch. D 123, D13

length interval, *n*—a class interval of 1/8 in. (3 mm), usually designated by its midpoint length in odd-numbered sixteenths of an inch. D 7139, D13

length of lay—the axial length of one turn of the helix of a wire or member. B 354, B01

length of lay, *n*—the axial distance required to make one complete revolution of any element of a strand or cord. D 6477, D13

length of metal connector plate—dimension of metal connector plate parallel to longitudinal axis of coiled metal strip from which plate was sheared during its fabrication, not necessarily along the long plate dimension. E 631, E06

length of tear, *n*—in *tear testing of fabrics*, the measured distance propagated in a specimen by a tearing force from the initiation of the test to the termination of the test. D 123, D13

length of tear, *n*—in *tear testing of fabrics*, the measured distance propagated in a specimen by a tearing force from the initiation of the test to the termination of the test. D 4850, D13

length of the bulb—the distance from the bottom of the bulb to the junction of the bulb and the lower part of the sheath; that is, the point where the internal bulb diameter begins to decrease as the bulb merges into the capillary tube. E 344, E20

length of the scale, *n*—the length of the nominal range in the stem, not including graduations extending above and below the nominal limits. E 344, E20

lengths—straight pieces of the product. B 846, B05

lengths, ends—straight pieces, shorter than the nominal length, left over after cutting the product into mill lengths, stock lengths, or specific lengths. They are subject to minimum length and maximum weight requirements. B 846, B05

lengths, multiple—straight lengths of integral multiples of a base

length, with suitable allowance for cutting, if and when specified. B 846, B05

lengths, random—run of mill lengths without any indicated preferred length. B 846, B05

lengths, specific—straight lengths that are uniform in length, as specified, and subject to established length tolerances. B 846, B05

lengths, specific with ends—specific lengths, including ends. B 846, B05

lengths, standard—uniform lengths recommended in a Simplified Practice Recommendation or established as a Commercial Standard. B 846, B05

lengths, stock with ends—stock lengths, including ends. B 846, B05

lengthwise direction, *n*—in *textiles*, the direction in a machine-made fabric parallel to the warp yarns. D 123, D13

lengthwise direction, *n*—in *textiles*, the direction in a machine-made fabric parallel to the warp yarns. D 5684, D13

length within, *L_w*, *n*—in *textile unevenness testing*, the length over which unevenness is measured. D 4849, D13

length within, *L_w*, *n*—in *textile unevennesstesting*, the length over which unevenness is measured. D 123, D13

leno weave, *n*—a weave in which two adjacent warp yarns cross each other between the picks. D 123, D13

leno weave, *n*—a weave in which two adjacent warp yarns cross each other between the picks. D 7018, D13

lens ice—ground ice occurring as lenses. D 7099, D18

lens-type cryostructure—the cryostructure of frozen silt or loam containing numerous ice lenses. D 7099, D18

lenticular anisotropic phase, *n*—as used in *Test Method D 5061*, a group of binder-phase anisotropic carbon textures distinguished by their lens-shaped domains (that is, length (*L*) to width (*W*) ratio of $2W < L < 4W$) and subdivided based on domain widths as fine lenticular (1.0- to 3.0- μ m), medium lenticular (3.0- to 8.0- μ m), and coarse lenticular (8.0- to 12.0- μ m) size categories. D 121, D05

lesion, *n*—any pathological or traumatic discontinuity of tissue or loss of function of a part. In this guide, “skin lesion” is intended to encompass skin wounds and skin ulcers. F 2312, F04

let-go, *n*—an area in laminated glass over which an initial adhesion between interlayer and glass has been lost. D 883, D20

lethal load XX (LLXX), *n*—a statistically or graphically estimated loading rate of test material that is expected to be lethal to XX % of a group of organisms under specified conditions for a specified time. D 4175, D02

lethal load XX (LLXX), *n*—a statistically or graphically estimated loading rate of test material that is expected to be lethal to XX % of a representative subpopulation of organisms under specified conditions. D 4175, D02

lethal load XX (LLXX), *n*—a statistically or graphically estimated loading rate of test material that is expected to be lethal to XX % of a subpopulation of organisms under specified conditions. D 4175, D02

lethal load XX (LLXX), *n*—a statistically or graphically estimated loading rate of test material that is expected to be lethal to XX % of a subpopulation of organisms under specified conditions. D 6384, D02

let-off mark, *n*—in *woven fabrics*, a corrugated defect pattern distributed across the fabric width. (See **crack mark** and **shier**.) D 123, D13

let-off mark, *n*—in *woven fabrics*, a corrugated defect pattern distributed across the fabric width. (Compare **shier**.) D 3990, D13

lettered head—head with raised or depressed, identifying letter or letters on top surface of head. F 547, F16

letter quality printer—term implies that printer output quality matches that of a typical office electric typewriter. F 909, F05

leuco dye, *n*—color precursors, examples of which are triphenyl methane and fluoran classes which react with a developer to form a colored image. F 1623, F05

Levant—term applied to goatskin on which the grain pattern is

accentuated in tannage. Goatskin embossed to give a Levant pattern is properly described as "Levant-grained goatskin." Sheep, seal, and other skins bearing this pattern should not be described as "Levant leather" but as "Levant-grained sheepskin," etc.

D 1517, D31

level, n—of serviceability, a number indicating the relative serviceability of a building for one topic on a predetermined range, for example, a range from 1 to 9. **E 631, E06**

level crossings—in *fatigueloading*, the number of times that the load-time (strain-time) history crosses a given load (strain) level with a positive slope or a negative slope, or both, as specified during a given period. **E 1823, E08**

leveling, n—(1) the process whereby a film of liquid coating flows out after application so as to minimize any surface irregularities such as brush marks, orange peel, peaks, or craters, that have been produced by the mechanical process of application. (2) a measure or rating of the leveling ability of a coating. **D 16, D01**

leveling—the property of a freshly spread polish to dry to a uniform and streak-free appearance. **D 2825, D21**

leveling action—the ability of a plating solution to produce a surface smoother than that of the substrate. **B 374, B08**

leveling-off degree of polymerization, LODP—the nearly constant degree of polymerization of cellulose reached after very prolonged mild hydrolysis or short drastic hydrolysis. **D 1695, D01**

level, L—ten times the common logarithm of the ratio of a quantity proportional to power or energy to a reference quantity of the same kind. (See **sound power level**, **sound pressure level**.) The quantity so obtained is expressed in decibels. **C 634, E33**

level (of a factor), n—a given value, a specification of procedure or a specific setting of a factor. **E 456, E11**

level (of a factor), n—a given value, a specification of procedure or a specific setting of a factor.

NOTE—*Version* is a general term applied both to quantitative and qualitative factors. The more restrictive term *level* is frequently used to express more precisely the quantitative characteristic. For example, two versions of a catalyst may be presence and absence. Four levels of a heat treatment may be 110°C, 120°C, 140°C, and 160°C.

E 1325, E11

level one (1) test, n—a simple series of measurements designed to provide quantitative data on various aspects of instrument performance and information on which to base the diagnosis of problems. **E 131, E13**

level pile, n—for *pile yarn floor covering*, pile in which all tuft legs are of substantially the same length. **D 123, D13**

level pile, n—for *pile yarn floor covering*, pile in which all tuft legs are of substantially the same length. **D 5684, D13**

level reduction, LR—in a specified frequency band, the decrease in sound pressure level, measured at the location of the receiver, when a barrier or other sound-reducing element is placed between the source and the receiver. **C 634, E33**

level zero (0) test, n—a routine check of instrument performance, that can be done in a few minutes, designed to virtually detect significant changes in instrument performance and provide a database to determine instrument function over time. **E 131, E13**

lever—a part or component that retracts the bolt after alignment of proper combination. **F 471, F12**

lever principle—in a phase diagram, the relative proportions of the conjugate phases, at a stated value of temperature and pressure, or both, is such that a state of mechanical balance would obtain, if the corresponding weight of each phase were placed upon its composition point upon the tie-element (tie-line, tie-triangle, etc.) and the fulcrum were located at the gross composition point of the mixture. **E 7, E04**

lever screw—attached lever to the bolt. **F 471, F12**

lever spring—applies directional force to the lever. **F 471, F12**

Libbey-Owens sheet process—{archaic} See **Colburn sheet process**. **C 162, C14**

lid—abbreviation for **liquid development**. **F 335, F05**

life cycle, n—See **study period**. **E 833, E06**

life-cycle, n—(1) The length of time over which an investment is analyzed.

(2) Consecutive and interlinked stages of a product system, from raw material acquisition or generation of natural resources to the final disposal. **E 2114, E06**

life-cycle assessment, LCA, n—a method of evaluating a product by reviewing the ecological impact over the life of the product. **E 2114, E06**

life-cycle cost (LCC) method—a technique of economic evaluation that sums over a given study period the costs of initial investment (less resale value), replacements, operations (including energy use), and maintenance and repair of an investment decision (expressed in present or annual value terms). **E 631, E06**

life-cycle cost (LCC) method, n—a technique of economic evaluation that sums over a given study period the costs of initial investment (less resale value), replacements, operations (including energy use), and maintenance and repair of an investment decision (expressed in present or annual value terms). **E 833, E06**

life-cycle cost (LCC) method, n—a technique of economic evaluation that sums over a given study period the costs of initial investment (less resale value), replacements, operations (including energy use), and maintenance and repair of an investment decision (expressed in present or annual value terms). **E 2114, E06**

life-cycle test—a comparative study in which organisms, that are subjected to different treatments, are observed at least from a life stage in one generation to the same life stage in the next generation. **E 943, E47**

life expectancy designation, n—for *paper*, a rating in years for the life expectancy of paper, when stored under prescribed conditions. **D 1968, D06**

life expectancy (LE), n—for *paper*, length of time a product can be expected to maintain its functional (that is, physical, chemical, appearance, and so forth) characteristics when stored under prescribed conditions. **D 1968, D06**

lift—a defect characterized by the spontaneous separation of large pieces of porcelain enamel from the base metal. **C 286, B08**

lift, n—the concrete placed between two consecutive horizontal construction joints. **C 717, C24**

lift, n—the depth of soil and other materials placed in an embankment or fill that can be compacted to the specified density with the available equipment. **E 2201, E50**

lift hole—a small hole cast or drilled in the wall of the pipe or section for inserting a bolt, loop of cable or other device used in handling the pipe or section. **C 822, C13**

lifting point—structural point on the end connector or along the length of a boom section designed for the attachment of a lifting device, such as a crane. **F 818, F20**

lift off—the removal of one or more images of copy from the substrate by transferring to an intermediate member. **F 221, F05**

lift-off effect—the effect observed in an electromagnetic test system output due to a change in magnetic coupling between a test specimen and a probe coil whenever the distance between them is varied. **E 1316, E07**

light—(1) a term used for optical glass having a low index of refraction. (2) an architectural term for a panel or sheet of glass. See also **lite**. **C 162, C14**

light, n—Use **lite** (preferred term). **C 717, C24**

light, adj—*highlyreflecting*, as in the term "light green" (see **Terminology E 284**). **D 2946, C17**

light, n—electromagnetic radiation in the spectral range detectable by the normal human eye (approximately 380 to 780 nm). **D 2946, C17**

light, n—for *colordetermination*, radiant energy evaluated according to the CIE photopic spectral luminous efficiency function. **D 2946, C17**

light, n—(1) electromagnetic radiant power that is visually detectable

light, *n*

- by the normal human observer, radiant power having wavelengths from about 380 nm to about 780 nm.
- (2) radiant power evaluated with respect to wavelength according to the CIE spectral luminous efficiency function. **E 284, E12**
- light**, *adj*—referring to the color of a non-self-luminous body, having a high luminous reflectance factor, as “light green” or “light gray.” **E 284, E12**
- light**—See **windows and doors**. **E 631, E06**
- light**—electromagnetic radiation in the spectral range detectable by the normal human eye (wavelengths of approximately 380 to 780 nm). **E 1316, E07**
- light amplification by stimulated emission of radiation**, *n*—a device that generates a narrow beam of coherent light. (See **LASER**.) **F 1457, F05**
- light decay**—reduction of apparent surface voltage caused by exposure to light. **F 335, F05**
- light decay rate**—the reduction of apparent surface voltage at specific exposure conditions. **F 335, F05**
- light-duty**, *adj*—in internal combustion engine operation, characterized by average speeds, power output, and internal temperatures that are generally much lower than the potential maximums. **D 4175, D02**
- light-duty**, *adj*—in internal combustion engine operation, characterized by average speeds, power output, and internal temperatures that are generally much lower than the potential maximums. **D 4725, D15**
- light-duty engine**, *n*—in internal combustion engine types, one that is designed to be normally operated at substantially less than its peak output. **D 4175, D02**
- light duty engine**, *n*—in internal combustion engine types, one that is designed to be normally operated at substantially less than its peak output. **D 4725, D15**
- light duty tires**, *n*—tires weighing less than 40 lb (18.2 kg), used on passenger cars and light trucks. **D 5681, D34**
- light emitting diode**, *n*—a solid-state electronic device or transistor which emits light. (See **LED**.) **F 1457, F05**
- light end**—See **fine end**. **D 3990, D13**
- lightfastness**, *n*—the ability of a material to withstand color change on exposure to light. **E 284, E12**
- lightfastness**, *n*—ability of an image to resist fading on exposure to different lighting conditions. **F 1857, F05**
- lightfastness standards**, *n*—See **AATCC blue wool lightfastness standards**. **E 284, E12**
- lightfield illumination**—See **brightfield illumination**. **E 7, E04**
- light filling**—See **thin filling**. **D 3990, D13**
- light filter**—See **color filter**. **E 7, E04**
- light flame**, *n*—a flame approximately 6 in. (152 mm) long. **E 176, E05**
- light (glazing)**, *n*—use **lite**. **E 631, E06**
- lighting** (éclairage):
- ambient light** (lumière ambiante)—surrounding light, such as that reaching an object in a room from all light sources in the room.
- glare** (éblouissement)—effect of brightness or brightness differences within the visual field sufficiently high to cause annoyance, discomfort, or loss of visual performance.
- task lighting** (éclairage de travail localisé)—localized lighting system consisting of a functional arrangement of luminaires to accommodate the specific visual task or work area needs. **E 1480, E06**
- light intensity**—the light energy reaching a unit area of surface per unit time. **E 1316, E07**
- lightness**—(1) The attribute by which a perceived color is judged to be equivalent to a member of a series of grays ranging from black to white. (2) The attribute of color perception by which a non-luminous body is judged to reflect more or less light. **C 242, C21**

- lightness**—under **color of an object**, see **lightness**. **D 16, D01**
- lightness**, *n*—(1) the attribute of color perception by which a non-self-luminous body is judged to reflect more or less light. (2) the attribute by which a perceived color is judged to be equivalent to one of a series of grays ranging from black to white. **E 284, E12**
- light pen**, *n*—ina bar code system, a handheld scanning wand that is used as a contact bar code reader where the operator traverses the reader across the bar code symbol. **F 1294, F05**
- light pick**—See **thin filling**. **D 3990, D13**
- light-reducing glass**—a term applied to flat glass having reduced light transmittance. **C 162, C14**
- light source**, *n*—for **symbology readers**, light energy can be emitted in straight lines from a point source or from several points as an extended source. **F 1294, F05**
- light stability**—in **optical character recognition**, the resistance to change of the color of the image when exposed to radiant energy. **F 149, F05**
- light stability**—resistance to change of color of the image with exposure to radiant energy. **F 221, F05**
- light truck tires**, *n*—tires with a rim diameter of 16 to 19.5 in. (40.6 to 49.5 cm), manufactured specifically for light truck use. **D 5681, D34**
- light unmanned air vehicle, light-UAV**, *n*—UAV with a maximum gross takeoff weight of 1320 lbs or less. **F 2395, F38**
- lightweight aggregate concrete**, *n*—concrete made with aggregates of expanded clay, shale, slag, or slate or sintered fly ash, and weighing 1360 to 1840 kg/m³ (85 to 115 pcf). **E 176, E05**
- lightweight concrete**, *n*—concrete with a density of less than 115 lb/ft³ (1840 kg/m³). **F 141, F06**
- lightweight concrete masonry unit**—unit whose oven-dry density is less than 105 lb/ft³ (1680 kg/m³). **C 1209, C15**
- ligne**, *n*—a unit of measure for buttons, one ligne equals 0.635 mm (0.025 in.). **D 123, D13**
- ligne**, *n*—a unit of measure for buttons; one ligne equals 0.635 mm (0.025 in.). **D 5497, D13**
- ligne size**, *n*—a unit of measure for button diameter; one ligne equals 0.635 mm (0.025 in.). **D 123, D13**
- lignin**—that part of plant material which is not saccharified by the action of 72 % sulfuric acid or 42 % hydrochloric acid, after the resins, waxes, and tannins have been removed. **D 1695, D01**
- lignin**, *n*—an amorphous, noncarbohydrate polymer of high molecular weight, primarily composed of aromatic organic molecules, which is found within and between the cell walls of most plants. **D 1968, D06**
- lignin**—the noncarbohydrate, polyphenolic, structural constituent of wood and some other plant tissues that encrusts the cell walls and cements the cells together. **E 1705, E48**
- lignin plastics**—plastics based on lignin resins. (ISO) **D 883, D20**
- lignin resin**—a resin made by heating lignin or by reaction of lignin with chemicals or resins, the lignin being in greatest amount by mass. (ISO) **D 883, D20**
- lignite A**—See **lignite A** under **rank**. **D 121, D05**
- lignite B**—See **lignite B** under **rank**. **D 121, D05**
- lignitic class**—See **lignitic class** under **rank**. **D 121, D05**
- lime**—a general term which includes the various chemical and physical forms of quicklime, hydrated lime, and hydraulic lime. It may be high-calcium, magnesian, or dolomitic. **C 51, C07**
- lime**—calcium oxide (CaO), or a mixture of calcium oxide (CaO) and magnesium oxide (MgO). **C 162, C14**
- lime**—specifically, calcium oxide (CaO₂); also loosely, a general term for the various chemical and physical forms of quicklime, hydrated lime, and hydraulic hydrated lime. **D 653, D18**
- lime**—a commercial product derived from the calcination of high calcium or dolomitic limestone. **D 5681, D34**

lime— $\text{Ca}(\text{OH})_2$, calcium hydroxide, a common water treatment chemical. **D 6161, D19**

lime, n —calcium oxide (CaO). **E 2201, E50**

lime glass—jargon for soda-lime-silicate glass. **C 162, C14**

lime mortar—a lime putty mixed with an aggregate, suitable for masonry purposes. **C 51, C07**

lime putty—the product obtained by slaking quicklime with water according to the directions of the manufacturer or by mixing hydrated lime and water to a desired consistency. **C 51, C07**

lime-saturated water, n —in cement testing, water containing calcium hydroxide at a saturated level and in contact with solid calcium hydroxide so that saturation is maintained. **C 219, C01**

lime soda softening—use of lime and Na_2CO_3 for softening water. **D 6161, D19**

limestone—an initially sedimentary rock consisting chiefly of calcium carbonate or of the carbonates of calcium and magnesium. Limestone may be of high calcium, magnesian, or dolomitic.

(1) *dolomitic limestone*—limestone containing from 35 to 46 % magnesium carbonate (MgCO_3).

(2) *magnesium limestone*—a limestone containing from 5 to 35 % MgCO_3 .

(3) *high-calcium limestone*—a limestone containing from 0 to 5 % MgCO_3 . **C 51, C07**

limestone—a rock of sedimentary origin composed principally of calcium carbonate (the mineral calcite), or the double carbonate of calcium and magnesium (the mineral dolomite), or some combination of these two minerals. **C 119, C18**

limestone—either calcitic limestone (CaCO_3) or dolomitic limestone ($\text{CaCO}_3 \cdot \text{MgCO}_3$). **C 162, C14**

limestone—a sedimentary carbonate rock, composed chiefly of calcite (CaCO_3), but sometimes containing appreciable dolomite. **C 242, C21**

limestone—either calcite limestone (CaCO_3) or dolomitic limestone ($\text{CaCO}_3 \cdot \text{MgCO}_3$). **D 6161, D19**

limestone marble—compact, dense limestone that will take a polish is classified as marble in trade practice. Limestone marble may be sold as limestone or as marble. **C 119, C18**

liming material—a general term which includes the various chemical and physical forms of lime, limestone, mollusk shells, marl, and slag whose calcium and magnesium compounds are capable of neutralizing acidity. **C 51, C07**

95 % limit (difference between two results)—the maximum absolute difference expected for approximately 95 % of all pairs of results from laboratories similar to those in the interlaboratory study. **E 1547, E15**

limited solid solution—a crystalline miscibility series whose composition range does not extend all the way between the components of the system, that is, the system is not isomorphous. **E 7, E04**

limiting current density: (1) *cathodic*—the maximum current density at which satisfactory deposits can be obtained.

(2) *anodic*—the maximum current density at which the anode behaves normally, without excessive polarization. **B 374, B08**

limiting current density—current density at which dramatic increases in resistance are observed such as in an ion exchange membrane system under the influence of an applied electric field between the upstream and downstream. Limiting current density is the point where liquid phase ionic diffusion rate limitations result in substantial depletion of ion concentrations at the membrane surface. **D 6161, D19**

limiting quality level (LQL or n)—in acceptance sampling, the fraction of nonconforming items at which the process average can be considered barely tolerable; the process average at which the risk of acceptance is called the **consumer's risk**. **D 123, D13**

limiting resolution—the highest spatial frequency of a target that an imaging sensor is able to resolve. **E 1316, E07**

limiting viscosity number—see **viscosity, intrinsic**. **D 1695, D01**

limit of detection—a calibration curve ordinarily has the shape shown in Fig. 1 of D 4127.

By analogy with definitions adopted in other fields, the limit of detection should be defined as the concentration for which, under the specified conditions, the potential E deviates from the average potential in region I by some arbitrary multiple of the standard error of a single measurement of the potential in region I .

In the present state of the art, and for the sake of practical convenience, a simple (and more convenient) definition is recommended at this time. The practical limit of detection may be taken as the activity (or concentration) of A at the point of intersection of the extrapolated linear segments of the calibration curve, as shown in Fig. 2 of D 4127. Since many factors affect the detection limit, the experimental conditions used should be reported, that is composition of the solution, the history and preconditioning of the electrode, stirring rate, etc. **D 4127, D19**

limit of detection, n —the lowest content that can be measured with reasonable statistical certainty. **E 1732, E30**

Lindemann glass—a high X-ray transmittance glass composed of the oxides of lithium, beryllium, and boron. (No elements with an atomic number above 8.) **C 162, C14**

line, n —a collection of points that define part of a pattern piece. **D 6963, D13**

line, n —of a tire, a group of similar tires of different sizes but common construction type (bias, belted bias or radial) all with a common tire name. **F 538, F09**

lineage structure—orientation deviations, of the order of minutes or a few degrees at most, from perfect alignment of the crystal axes of parallel arms of a dendrite. **E 7, E04**

linear absorption coefficient of an absorbing medium, n —quotient of the internal absorbance of a path element traversed by the radiation, by the length d of this element. Symbol: a ; $-d\Phi = a\Phi dl$; Unit: m^{-1} ; $al = \ln 10D_t$.

NOTE—The linear absorption coefficient is also the part of the linear attenuation coefficient that is due to absorption.

NOTE—In German practice, a linear absorption coefficient is also defined for a homogeneous medium of finite thickness d , as the quotient of the "Absorptions-mass" (logarithm of the reciprocal of the internal transmittance), by the thickness d of the layer. According to whether the natural logarithm or the logarithm to the base 10 is used, one may distinguish the "natürliche Absorptionskoeffizient" (m_n) quotient of the "natürliche Absorptionsmass" (see Note, **internal transmission density**) by the thickness d of the layer traversed by the radiation, and the "dekadische Absorptionskoeffizient" (m) quotient of the internal transmission density by the thickness d of the layer.

NOTE— a/ρ , where ρ is the density of the medium, is called "mass absorption coefficient." **E 349, E21**

linear accelerator—an electron generator in which the acceleration of the particles is connected with the propagation of a high-frequency field inside a linear or corrugated waveguide. **E 1316, E07**

linear attenuation coefficient—a measure of the fractional decrease in radiation beam intensity per unit of distance traveled in the material (cm^{-1}). **E 1316, E07**

linear attenuation (extinction) coefficient of an absorbing and diffusing medium, for a collimated beam of radiation, n —quotient of the relative decrease in spectral concentration of radiant or luminous flux of a collimated beam of radiation during traversal with normal incidence of an infinitesimal layer of the medium by the thickness of that layer. Symbol: μ ; $-d\Phi = \mu\Phi dl$; Unit: m^{-1} .

NOTE—This concept only applies strictly to slightly diffusing media.

NOTE— μ/ρ , where ρ is the density of the medium, is called the "mass attenuation coefficient." **E 349, E21**

linear density—mass per unit length. **B 354, B01**

linear density, n —for fiber and yarn, mass per unit length. **D 123, D13**

linear density, n

linear density, n —mass per unit length; the quotient obtained by dividing the mass of a fiber or yarn by its length. **D 4439**, D35

linear density, n —mass per unit length. **D 4848**, D13

linear density, n —*for fiber and yarn*, mass per unit length. **D 4849**, D13

linear dispersion—the derivative, $dx/d\lambda$, where x is the distance along the spectrum, in the plane of the exit slit, and λ is the wavelength. **E 131**, E13

linear dispersion, n —the derivative $dx/d\lambda$ where x is the distance along the spectrum and λ is the wavelength. **E 135**, E01

linear expansion, coefficient of, $\bar{\alpha}$ —the change in length per unit length per degree change in temperature or

$$\bar{\alpha} = \frac{L_1 - L_0}{L_0 \Delta T}$$

where:

L_1 = length of specimen at the higher temperature,

L_0 = length at lower temperature, and

ΔT = difference between temperatures.

A 340, A06

linear expansion, L_e (**D**)—the increase in one dimension of a soil mass, expressed as a percentage of that dimension at the shrinkage limit, when the water content is increased from the shrinkage limit to any given water content. **D 653**, D18

linear integrator, n —*in textile unevenness testing*, an integrator that operates continuously and reports unevenness for a certain, and unchanging, time past. (*Syn.* fading memory integrator) **D 123**, D13

linear integrator, n —*in textile unevenness testing*, an integrator that operates continuously and reports unevenness for a certain, and unchanging, time past. **D 4849**, D13

linearity—See **analyzer**. **D 1356**, D22

linearity—the maximum deviation of output points from the “best fit” linear curve to the data excluding proven outliers expressed as a percentage of the full-scale computed output. **E 2161**, E37

linearity (amplitude)—a measure of the proportionality of the amplitude of the signal input to the receiver, and the amplitude of the signal appearing on the display of the ultrasonic instrument or on an auxiliary display. **E 1316**, E07

linearity (time or distance)—a measure of the proportionality of the signals appearing on the time or distance axis of the display and the input signals to the receiver from a calibrated time generator or from multiple echoes from a plate of material of known thickness. **E 1316**, E07

linear lea, n —an indirect yarn numbering system in the linen spinning system equal to the number of 300-yd lengths per pound. **D 123**, D13

linear low density polyethylene plastics, (**LLDPE**) n —those linear polyethylene plastics, q.v., having a standard density of 0.919 to 0.925 g/cm³. **D 883**, D20

linearly mixable, *adj*—a property is deemed to be linearly mixable in a mass or volume measurement unit if the property of the mixed material can be calculated from the quantities and properties of the materials used to produce the mixture. **D 4175**, D02

linear magnification—See **magnification**. **E 7**, E04

linear medium density polyethylene plastics, (**LMDPE**) n —those linear polyethylene plastics, q. v., having a standard density of 0.926 to 0.940 g/cm³. **D 883**, D20

linear (normal) strain—the change in length per unit of length in a given direction. (*ISRM*) **D 653**, D18

linear polyethylene plastics, n —those containing insignificant amounts of long-chain branching but which may contain significant amounts, by design, of short-chain branching. **D 883**, D20

linear shrinkage, L_s (**D**)—decrease in one dimension of a soil mass, expressed as a percentage of the original dimension, when the water content is reduced from a given value to the shrinkage limit. **D 653**, D18

linear symbol, n —a one-dimensional, linear sequence of rectangular bars and spaces that are arranged in a predetermined pattern following specific rules to represent elements of data that are defined as characters. **F 1294**, F05

linear (tensile or compressive) strain, n —the change per unit length due to force in an original linear dimension. **E 6**, E28

linear variable differential transformer (LVDT)—a device for measuring movements that utilize a sliding core within a variable magnetic field. **E 2265**, E06

line-at-a-time printer—*syn.* **line printer**. **F 909**, F05

lineation—the parallel orientation of structural features that are lines rather than planes; some examples are parallel orientation of the long dimensions of minerals; long axes of pebbles; striae on slickensides; and cleavage-bedding plane intersections. (*ISRM*) **D 653**, D18

line ending, n —an electronic code sequence denoting the end of a printed line or of a command. **F 1457**, F05

line feed, n —an ASCII command, which when sent to a printer will advance the printing to the next line. (*See LF.*) **F 1457**, F05

line-focus collection—see **collector, line-focus**. **E 772**, E44

line focus (in X-ray tubes)—a long-narrow focal spot. **E 7**, E04

line indices—the Miller indices of the set of planes producing a diffraction line. **E 7**, E04

line (in X-ray diffraction patterns)—an array of small diffraction spots so arranged that they appear to form a continuous line on the film. **E 7**, E04

line item—a single line entry on a reporting form that indicates a quantity of property having the same description. **E 2135**, E53

linen, n —a yarn or fabric made solely from flax fibers. **D 123**, D13

linen, n —a yarn or fabric made solely from flax fibers. **D 6798**, D13

linen blend, n —a yarn or fabric made from a combination of flax and other fibers. **D 123**, D13

linen blend, n —a yarn or fabric made from a combination of flax and other fibers. **D 6798**, D13

line, neutral, n —*of a tire*, a line of tires to which a brand name may be added after their manufacture. **F 538**, F09

line of creep (path of percolation)—the path that water follows along the surface of contact between the foundation soil and the base of a dam or other structure. **D 653**, D18

line of reinforcement—circumferential reinforcement comprised of one or more layers. **C 822**, C13

line of seepage (seepage line) (phreatic line)—the upper free water surface of the zone of seepage. **D 653**, D18

line of sight, LOS, n —direct, point-to-point contact between a transmitter and receiver. See R-103-2004. **F 2395**, F38

line pair, n —*in atomic emission spectrometry*, an analytical line and the internal standard line with which it is compared. **E 135**, E01

line pairs per millimetre—a measure of the spatial resolution of an image conversion device. A line pair test pattern consisting of one or more pairs of equal width, high contrast lines and spaces is utilized to determine the maximum density of lines and spaces that can be successfully imaged. The value is expressed in line pairs per millimetre. **E 1316**, E07

line pair test pattern—a pattern of one or more pairs of objects with high contrast lines of equal width and equal spacing. The pattern is used with an imaging device to measure spatial resolution. **E 1316**, E07

line post—the intermediate post in a fence line supporting the top rail or tension wire and barb arm where applicable. **F 552**, F14

line post cap—a cap or top with a loop used to position the top rail or tension wire on top of the line posts. **F 552**, F14

line printer—(1) a device that prints a line of characters as a unit. *Syn.* **line-at-a-time printer**;

(2) contrast with character printer, page printer. **F 909**, F05

line quality, n —the sum total of the attributes of the writing movement (for example, speed, pressure, and skill). **E 2195**, E30

liner—a small block of stone secured to the rear face of a dimension

- stone panel with pins and adhesive for the purpose of providing a concealed horizontal bearing surface. **C 119, C18**
- liner**, *n*—*in packaging*, (1) generally, any linear material that separates a product within a **container** from the basic walls of the **container**, (2) in **fiberboard containers**, a creased fiberboard sheet inserted in a container and usually fitting against the side and end panels (*liner* is sometimes erroneously used for *linerboard* or *facing*). (Compare **divider**.)
- case liner (bag liner)*—a lining, usually paper, or treated materials placed inside a shipping container for the purpose of preventing sifting, or entrance of moisture, dust, or dirt. **D 996, D10**
- liner**, *n*—a structure of natural and/or manufactured products that serves as a barrier to minimize leachate from reaching or mixing with the ground water. **E 2201, E50**
- liner**, *n*—a foot protective device worn inside the footwear. **F 1494, F23**
- line rail clamp**—See **boulevard clamp**. **F 552, F14**
- linerboard**—See **paperboard**. **D 996, D10**
- line reflector**, *n*—reflector in the form of a line, the width of which subtends a very small solid angle at the observer's eye, so that the observer cannot readily distinguish its width. **E 284, E12**
- liner or external gasket**, *n*—a ring-shaped sealing component made of a deformable material used to make a pressure-tight joint between the pump and container. **D 6655, D10**
- liner pitting**, *n*—cavities that develop on the coolant side of cast iron cylinder liners as a result of cavitation corrosion. **D 4725, D15**
- lines**—fine cords or strings, usually on the surface of sheet glass. **C 162, C14**
- line scanner**—an apparatus that scans along a single line of a scene to provide a one-dimensional thermal profile of the scene. **E 1316, E07**
- line skew**—the angular displacement of a line in relation to its intended position. **F 149, F05**
- lines of force**—a conceptual representation of magnetic flux based upon the line pattern produced when iron filings are sprinkled on paper laid over a permanent magnet. **E 1316, E07**
- line spacing**—the distance between the average base line of one line to the average base line of the next line. **F 149, F05**
- line tender**, *n*—the individual who controls the diver's search pattern. **F 1549, F32**
- lining**—coating or layer adhered to or in intimate contact with the interior surface and ends of asbestos-cement pipe and related fittings, with said coating or layer being more chemically resistant than the pipe and related fittings. **D 2946, C17**
- lining fabric**, *n*—*for apparel*, a textile used to cover the inner sides of garments. **D 123, D13**
- lining fabric**, *n*—*for apparel*, a textile used to cover the inner sides of garments. **D 7022, D13**
- lining leather**—any leather used for making shoe linings which includes sheep, lamb, kid, goat, cattle, calf, kip and splits. **D 1517, D31**
- linoleum**, *n*—a surfacing material composed of a solidified mixture of linseed oil, pine rosin, fossil or other resins or rosins, or an equivalent oxidized oleoresinous binder, ground cork, wood flour, mineral fillers, and pigments, bonded to a fibrous or other suitable backing. **F 141, F06**
- linoleum cement**—the binder in linoleum consisting of a mixture of linseed oil, pine rosin, fossil or other resins or rosins, or an equivalent oxidized oleoresinous binder. **F 141, F06**
- lino-nail**—bright, regular-stock-steel, $\frac{5}{8}$ by 0.062-in. nail with oval head and medium diamond point. **F 547, F16**
- lint**, *n*—*in loose cotton*, fibers mostly of spinnable length. (See also **linters**.) **D 123, D13**
- lint**, *n*—*in loose cotton*, fibers mostly of spinnable length. (See also **linters**.) **D 7139, D13**
- lint ball**—See **fuzz ball**. **D 3990, D13**
- lint content**, *n*—that portion of a mass of cotton fiber consisting of fiber, including normal moisture content, but excluding foreign matter. **D 123, D13**
- lint content**, *n*—that portion of a mass of cotton fiber consisting of fiber, including normal moisture content, but excluding foreign matter. **D 7139, D13**
- lint cotton**, *n*—loose cotton fibers in any form, either raw or processed, free of seeds and not bound together in yarn or fabric. (See also **ginned lint**.) **D 123, D13**
- lint cotton**, *n*—loose cotton fibers in any form, either raw or processed, free of seeds and not bound together in yarn or fabric. (See also **ginned lint**.) **D 7139, D13**
- linters**, *n*—the short fibrous material adhering to the cotton seed after the spinnable lint has been removed by ginning and which is subsequently recovered from the seed by a process called "delinting." **D 123, D13**
- linters**—the short fibrous material adhering to cotton seed after the ginning operation. After removal from the seed it is used to a limited extent as a fibrous raw material for special papers. The principal use, however, is for chemical cellulose, that is, as the raw material for the manufacture of cellulose derivatives. **D 1695, D01**
- linters**, *n*—the short fibrous material adhering to the cotton seed after the spinnable lint has been removed by ginning and which is subsequently recovered from the seed by a process called "delinting." **D 7139, D13**
- lip**—the inner face of the tip of a flange on a lock-strip gasket. **C 717, C24**
- lip**—overhang of tool nose when magazine rests flush with work surface. **F 592, F16**
- lipophilic emulsifier**—see **emulsifier lipophilic**. **E 1316, E07**
- lip pressure**—the pressure exerted by the lip of a lock-strip gasket on material installed in the channel, when the lock-strip is in place. **C 717, C24**
- lip seal pressure**—the lip pressure required to effect a seal against the passage of water and air. **C 717, C24**
- liptinite**—See **liptinite** under **macerals**. **D 121, D05**
- liquefaction**—the process of transforming any soil from a solid state to a liquid state, usually as a result of increased pore pressure and reduced shearing resistance. **D 653, D18**
- liquefaction potential**—the capability of a soil to liquefy or develop cyclic mobility. **D 653, D18**
- liquefaction (spontaneous liquefaction)**—the sudden large decrease of the shearing resistance of a cohesionless soil. It is caused by a collapse of the structure by shock or other type of strain and is associated with a sudden but temporary increase of the prefluid pressure. It involves a temporary transformation of the material into a fluid mass. **D 653, D18**
- liquefied natural gas (LNG)**—natural gas that has been liquefied, after processing, for storage or transportation purposes. (This definition is from ISO NP 14532.) **D 4150, D03**
- liquefied petroleum gas (LPG)**, *n*—a mixture of normally gaseous hydrocarbons, predominantly propane or butane or both, that has been liquefied by compression or cooling, or both, to facilitate storage, transport, and handling. **D 4175, D02**
- liquid**, *n*—(flammability regulations) a substance that has a definite volume but no definite form, except such given by its container. It has a viscosity of 1×10^{-3} to 1×10^3 St (1×10^{-7} to 1×10^{-1} m² s⁻¹) at 104°F (40°C) or an equivalent viscosity at agreed upon temperature. (This does not include powders and granular materials.) Liquids are divided into two classes:
- Class A, low viscosity*—a liquid having a viscosity of 1×10^{-3} to 25.00 St (1×10^{-7} to 25.00×10^{-4} m² s⁻¹) at 104°F (40°C) or an equivalent viscosity at an agreed upon temperature.
- Class B, high viscosity*—a liquid having a viscosity of 25.01 to 1×10^3 St (25.01×10^{-4} to 1×10^{-1} m² s⁻¹) at 104°F (40°C) or an equivalent viscosity at an agreed upon

liquid, *n*

- temperature. **D 16, D01**
- liquid bituminous material**—one having a definite volume but no definite form, except as provided by its container. It has a viscosity of 0.1 to 1×10^5 cSt (mm^2/s) at 40°C . This does not include powders or granular materials. **D 1079, D08**
- liquid curing medium (LCM), *n***—a molten phase, generally a molten mixture of sodium nitrate, that is used as a heating medium for the continuous vulcanization of a rubber mix, usually following extrusion. **D 1566, D11**
- liquid development**—development by means of a toner dispersed in an organic liquid carrier. **F 335, F05**
- liquid drop, *n***—a small body of liquid held together primarily by surface tension. **G 40, G02**
- liquid impingement, *n***—impingement by liquid particles. **G 40, G02**
- liquid impingement damage, *n***—See **damage**. **G 40, G02**
- liquid impingement erosion, *n***—progressive loss of original material from a solid surface due to continued exposure to impacts by liquid drops or jets. **G 40, G02**
- liquid infiltration, *v***—densification of a composite by infiltration with a liquid. **C 1145, C28**
- liquid-in-glass thermometer, *n***—a temperature-measuring instrument whose indications are based on the temperature coefficient of expansion of a liquid relative to that of its containing glass bulb. **E 344, E20**
- liquid ion-exchange electrode membrane**—a porous plastic disk, permeable to the ion exchanger, and impermeable to water, which allows the ion exchanger to contact the sample solution and separates the internal filling solution from the sample. **D 4127, D19**
- liquidity index (water-plasticity ratio) (relative water content), *B, R_w, I_L* (D)**—the ratio, expressed as a percentage, of: (1) the natural water content of a soil minus its plastic limit, to (2) its plasticity index. **D 653, D18**
- liquid jet, *n***—a body of liquid projected into motion, usually of approximately cylindrical shape, such as could be produced by discharging the liquid through an orifice. In liquid impingement testing two kinds of liquid jet are used:
- (1) **continuous jet**—a continuous flow of liquid in the form of a jet.
- (2) **slug, or jet segment**—a body of liquid projected into motion, in the form approximately of a finite cylinder whose length is usually no more than several times its diameter and which moves in a direction approximately parallel to its length. **G 40, G02**
- liquid level**—the level of liquid in a borehole or well at a particular time. The liquid level can be reported as an elevation or as a depth below the top of the land surface. If the liquid in ground water is known as water level. **D 653, D18**
- liquid limit, *LL, L_w, w_L* (D)**—(a) the water content corresponding to the arbitrary limit between the liquid and plastic states of consistency of a soil.
- (b) the water content at which a pat of soil, cut by a groove of standard dimensions, will flow together for a distance of $\frac{1}{2}$ in. (12.7 mm) under the impact of 25 blows in a standard liquid limit apparatus. **D 653, D18**
- liquid medium**—liquid used to quench a steel fastener to achieve desired mechanical properties. The selection of the medium must be compatible with the basic material and geometry to avoid quench cracks. **F 1789, F16**
- liquid nitrogen freezers**—freezers that operate by a refrigeration system in which cooling is provided by a refrigerant such as liquid nitrogen. **E 1705, E48**
- liquid nitrogen storage**—storage directly in liquid nitrogen or in the vapor phase above liquid nitrogen. **E 1705, E48**
- liquid penetrant examination**—a nondestructive test that uses suitable liquids that penetrate discontinuities open to the surface of solid materials and, after appropriate treatment, indicate the presence of discontinuities. **E 1316, E07**
- liquid phase**—contaminant residing as a liquid in vadose zone pore space, often referred to as “free product.” **D 653, D18**
- liquid phase sintering, *v***—sintering of a compact, or loose powder aggregate, under conditions in which a liquid phase is present during part of the sintering cycle. **B 243, B09**
- liquid suspension**—the system resulting from the intimate, physical mixing of a liquid and particulate solids or dispersible materials, to form a time-stable, uniform, fluid mixture. **C 242, C21**
- liquid-tight**—for the purpose of this practice, referring to the absence of detectable liquid penetration inside the chemical protective suit when sprayed with the liquid at specified pressure, direction and duration. **F 1494, F23**
- liquidus, *n***—the lowest temperature at which an alloy under equilibrium conditions begins to freeze on cooling or is completely melted on heating. **B 899, B02**
- liquidus**—the locus of points in a phase diagram, representing the temperature, under equilibrium conditions, at which each composition in the system begins to freeze during cooling, or completes melting during heating. **E 7, E04**
- liquidus**—locus of points in a phase diagram, representing the temperature, under equilibrium conditions, at which each composition in the system begins to freeze during cooling, or completes melting during heating. (E 7, E04). **E 1142, E37**
- liquidus temperature**—the maximum temperature at which equilibrium exists between the molten glass and its primary crystalline phase. **C 162, C14**
- liquid-volume measurement**—in grouting, measurement of grout on the basis of the total volume of solid and liquid constituents. **D 653, D18**
- liquor finish**—very thin wire coating produced by wire immersion in metallic salts, usually copper, offering very limited corrosion resistance. **F 547, F16**
- liquor-finished wire**—wire, usually of ferrous material, drawn through a wet solution of metallic salts, that is, tin or copper, to facilitate drawing and to enhance the appearance and surface characteristics of the finished wire, and not to provide the properties of a coated wire. **B 354, B01**
- lisle, *n***—a fine high-twisted and hard-twisted thread, at least two-ply, used especially for hosiery. **D 123, D13**
- lisle, *n***—for a definition of cotton lisle see Rule 3 of the “Amended Trade Practice Rules for the Hosiery Industry,” as promulgated by the Federal Trade Commission, Aug. 30, 1960 and amended June 10, 1964. **D 123, D13**
- lisle, *n***—a fine high-twisted and hard-twisted thread, at least two-ply, used especially for hosiery. **D 4850, D13**
- list, *v***—for protective clothing, to publish a register of equipment or materials which has been verified by a certification organization as being acceptable and meeting the requirements of standard specifications. **F 1494, F23**
- lite, *n***—one piece of glazing (also spelled light), synonym: pane. **C 717, C24**
- lite, *n***—one piece of glazing (preferred term); (also spelled light) (synonym—pane). **E 631, E06**
- lighting (éclairage):** **E 631, E06**
- lite**—See **windows and doors**. **E 631, E06**
- lite, light**—a panel or sheet of glass. **C 162, C14**
- lithology**—(1) Physical character of a rock, generally as determined megascopically or with the aid of a low power magnifier. (2) The macroscopic study and description of rocks. **D 121, D05**
- lithology**—the description of rocks, especially sedimentary clastics and especially in hand specimens and in outcrops, on the basis of such characteristics as color, structures, mineralogy, and particle size. **D 653, D18**
- lithotype, *n***—(1) Rock form defined on the basis of certain selected physical characteristics. (2) One of the four macroscopically recognized constituents of banded coal: vitrain, clarain, durain and fusain. **D 121, D05**

live field—in video-based automatic image analysis, the visible, real-time gray level image from the television camera. **E 7, E04**

live load—the portion of the load transmitted to pipe from wheel or tread impacts. **C 896, C04**

live load—See **load**. **D 996, D10**

live load—portion of load transmitted to the pipe from wheel or traveling loads or other surcharged load. **F 412, F17**

liver—in dry process enameling, a defect characterized by a wave-like form of abnormally thick porcelain enamel. **C 286, B08**

livestock, *n*—cattle, sheep, swine, and other domesticated meat animals. **F 2463, F10**

load—See **pull**. **C 162, C14**

load, *vt*—to apply a force. **D 123, D13**

load, *n*—(1) the force in weight units applied to a body; (2) the weight of the contents of a **container** or transportation device; (3) a qualitative term denoting the contents of a container.

constant load, *n*—a load that is invariable or unchanging.

dead load, *n*—a constant load that, in structures (as a bridge, building, or machines) is due to the weight of the members, the supporting structure, and permanent attachments or accessories (*Webster*).

dynamic load, *n*—an imposed force in motion; that is, one that may vary in magnitude, sense, and direction.

floating load—(1) a shipment, usually a **unitized load** (or loads), or a large individual article, so prepared that it may move in the carrying vehicle, the movement being restricted or retarded by friction between the load and the vehicle; (2) a method of packing in which the contents of the **container** are supported within the container by **cushioning** devices or **materials**; (3) **floating controlled load**—a **floating load** within a vehicle in which the movement is retarded, snubbed, or restrained by suitable devices.

live load, *n*—a moving load on a structure.

palletized load—a load made up of articles, loose or in **containers** placed on **pallets** or skids.

palletized unit load—a **unitized load** fixed to a pallet.

static load, *n*—an imposed stationary force, constant in magnitude, sense and direction.

unitized load—in **packaging**, a type of unit load consisting of articles or containers secured together so as to be handled as an entity.

unit load—in **distribution**, an item or assembly of items assembled or restrained for handling and transportation as a single entity. **D 996, D10**

load—(1) the amount of nonprotein material in vegetable-tanned leather.
(2) the amount of tannin in vegetable-tanned leather. **D 1517, D31**

load—deprecated term. Use the preferred term, **force**. **D 4848, D13**

load, *vt*—to apply a force. **D 4848, D13**

load—See **static load**. **E 631, E06**

load—see **force**. **E 1823, E08**

load—the amount of food to be cooked during a cooking energy efficiency (see **cooking energy efficiency**) test. **F 1827, F26**

load at specified elongation (LASE)—deprecated term. Use the preferred term, **force at specified elongation (FASE)**. **D 4848, D13**

load-bearing partition, *n*—a partition designed to support a portion of the building structure. **C 11, C11**

loadbearing tile, *n*—tile for use in masonry constructions designed to carry superimposed loads. See Specification C 34. **C 43, C15**

load-carrying capacity, *n*—of a **lubricating grease**, the maximum load or pressure that can be sustained by a lubricating grease without failure of the sliding contact surfaces as evidenced by seizure or welding. **D 4175, D02**

load cell—see **force transducer**. **E 1823, E08**

load-deformation curve, *n*—deprecated term. Use the preferred term, **force-deformation curve**. **D 4848, D13**

loaded condition—equipment doing processing work on solids, liquids, or gases, or all of these, (for example, moving material, changing its characteristics, or separating it into different streams). **D 5681, D34**

loaded radius [*L*], *n*—of a **tire**, the wheel plane distance from the center of tire contact in the footprint to the wheel center, specified as a static or dynamic (rolling) measurement. **F 538, F09**

load-elongation curve, *n*—deprecated term. Use the preferred term, **force-elongation curve**. **D 4848, D13**

load [*F*], *n*—in mechanical testing, an external force or system of forces or pressures, or both, that act upon the test object. **E 6, E28**

load [*F*]—see **force**. **E 1823, E08**

load index, *n*—a numerical code associated with the maximum load a tire can carry at the speed indicated by its speed symbol under specified conditions. **F 538, F09**

loading, *n*—the act of placing a load on or in; to load a car, a vessel, or a test specimen. (See also **unitization**.)

anti-skid plate—a device, generally metal, about 4 by 6 in. (100 by 150 mm), with sharp projections on each face, placed under, against, or between containers and car floor, to retard shifting of load in transit.

blocking, *n*—material used to prevent or control movement of the unit or **load** or to facilitate handling (A 700, A01).

bracing, *n*—material or devices used to hold articles or sections of loads in position and prevent shifting within a transportation vehicle or within a **container**. (See **molded shape, strapping**.)

diagonal bracing—(1) a member reaching at an angle from a gate or other structure to the wall or floor of a freight car or truck to strengthen and reinforce the gate or structure; (2) a member, single or multiple, of a **crate** or **box** attached diagonally or at an angle to add reinforcement to the container.

dunnage, *n*—(1) in a carrying vehicle, the temporary **blocking**, flooring or lining, racks, standards, strips, stakes, or similar **bracing**, or supports not constituting a part of the carrying vehicle, used to protect and make freight secure in, or on a carrying vehicle (Classification, Rule 30); (2) in a **container**, materials not constituting a part of the container, frequently by-product or scrap, used for filling space, for **blocking** or **bracing**, or otherwise to protect and secure the contents.

dynamic compression loading—in **packaging**, the application of a force in motion that usually occurs in 10 s or less.

edge protector—a right-angle piece placed over the edge of **boxes, crates, bundles** and gates, or **bracing** to distribute the pressure from metal bands or ties in order to prevent cutting.

spreader, *n*—(1) a horizontal wooden member placed between two gates in a car to hold the gates in position against the load; (2) a rigid device placed between sling legs, lifting cables, or ropes to prevent them from damaging cargo being loaded or unloaded.

static compression loading—in **packaging**, the application of a force for an extended period, often days, weeks, or months. **D 996, D10**

loading—the addition of glucose, magnesium sulfate, or other materials necessary to give leather the physical properties needed for working in modern shoe machinery. (Also known as filling or stuffing.) **D 1517, D31**

loading, *n*—the product of the weekly concentration for a constituent of interest and the weight of solution collected that may be interpreted for water quality impacts. **D 5681, D34**

loading rate, *n*—the ratio of test material to aqueous medium used in the preparation of a water accommodated fraction (WAF) and in interpretation of the results of a toxicity study with a poorly water soluble lubricant or lubricant component. **D 4175, D02**

loading rate, *n*—the ratio of test material to aqueous medium used in the preparation of WAF, WSF, or mechanical dispersion and in the

loading rate, *n*

interpretation of the results of a toxicity study with a poorly water-soluble lubricant or lubricant component. **D 4175, D02**

loading rate, *n*—the ratio of test material to aqueous medium used in the preparation of WAF, WSF, or mechanical dispersion and in the interpretation of the results of a toxicity study with a poorly water-soluble lubricant or lubricant component. **D 6384, D02**

loading (unloading) rate [F T⁻¹]—the time rate of change in the monotonic increasing (decreasing) portion of the force-time function. **E 1823, E08**

load limit—(1) the maximum force, in weight units, a body can withstand without damage; (2) the greatest allowable weight that may be placed in a **container** or vehicle. For containers, load limit is often expressed in terms of the gross weight of the container and its contents. **D 996, D10**

load range, *n*—a letter designation (A, B, C, D) or, for P-metric tires, standard load (SL) or extra load (XL), used to identify a given size tire with its load and inflation limits when used in a specific type of service. **F 538, F09**

load rating [M], *n*—the maximum load a tire is rated to carry for a given usage at a specified cold inflation pressure. **F 538, F09**

load ratio, R, A, *n*—in fatigue loading, the algebraic ratio of the two loading parameters of a cycle. **F 1582, F04**

load symbol, *n*—a code associated with the maximum load a tire can carry at the speed indicated by its speed symbol under specified conditions. **F 538, F09**

load type, *n*—a qualitative description of the contents of a **container** with respect to **density**, fragility, and degree of **blocking, bracing**, and **cushioning** necessary. Load types are further divided into the following categories:

Type I load (easy)—a qualitative term denoting contents of low or moderate **density** conforming to the shape of the **container** and lending support to all faces of the container.

Type II load (average)—a qualitative term denoting contents of low or moderate density providing, when packed directly into a **shipping container**, nonshifting support at several points on the face of the container.

Type III load (difficult)—a qualitative term denoting contents characterized by irregular shape not lending support to the container, or by great density or extreme fragility. **D 996, D10**

load (water load)—an amount of water used to moderate the microwave radiation absorbed by a susceptor during simulated microwave heating tests. **F 1479, F02**

load-wear index, *n*—an index of the ability of a lubricant to prevent wear at applied loads. (Synonym—*load-carrying property of a lubricant.*) **D 4175, D02**

load-wear index (or the load-carrying property of a lubricant), *n*—an index of the ability of a lubricant to minimize wear at applied loads. Under the conditions of this test, specific loadings in kilograms-force (or newtons) having intervals of approximately 0.1 logarithmic units, are applied to the three stationary balls for ten runs prior to welding. The load-wear index is the average of the sum of the corrected loads determined for the ten applied loads immediately preceding the weld pair. **D 4175, D02**

loam—a mixture of sand, silt, or clay, or a combination of any of these, with organic matter (see **humus**). **D 653, D18**

local—indicates measurements or observations of a small part of a larger region of interest. **E 1620, E29**

local action corrosion—corrosion caused by local corrosion cells on a metal surface. **G 15, G01**

local corrosion cell—an electrochemical cell created on a metal surface because of a difference in potential between adjacent areas on that surface. **G 15, G01**

localized corrosion—corrosion at discrete sites, for example, pitting, crevice corrosion, and stress corrosion cracking. **G 15, G01**

local magnetization—magnetization of a prescribed volume or surface of a part. **E 1316, E07**

local shear failure—see **shear failure**. **D 653, D18**

local street directories—directories published by private (or sometimes government) sources that show ownership, occupancy, or use of sites, or combination thereof, by reference to street addresses. Often local street directories are available at libraries of local governments, colleges or universities, or historical societies. **D 5681, D34**

local testing, *n*—testing conducted at one laboratory or test site for the purpose of comparing a number of candidate tires for selected characteristic properties. **F 538, F09**

local thickness—mean of the thickness measurements of which a specified number is made within a reference area. **F 1789, F16**

local velocity, *n*—in *channel flow*, the velocity at a specific point in the flow region of a channel. May be expressed as a direction-dependent quantity with components V_x , V_y , and V_z . **D 653, D18**

locating boss—an integral part of the case used to align the lock in mounting (not used in all locks). **F 471, F12**

location accuracy, *n*—a value determined by comparison of the actual position of an AE source (or simulated AE source) to the computed location. **E 1316, E07**

location, cluster, *n*—a location technique based upon a specified amount of AE activity located within a specified length or area, for example: 5 events within 12 linear inches or 12 square inches. **E 1316, E07**

location, computed, *n*—a source location method based on algorithmic analysis of the difference in arrival times among sensors.

NOTE—Several approaches to computed location are used, including linear location, planar location, three dimensional location, and adaptive location.

(a) *linear location, *n**—one dimensional source location requiring two or more channels.

(b) *planar location, *n**—two dimensional source location requiring three or more channels.

(c) *3D location, *n**—three dimensional source location requiring five or more channels.

(d) *adaptive location, *n**—source location by iterative use of simulated sources in combination with computed location. **E 1316, E07**

location, continuous AE signal, *n*—a method of location based on continuous AE signals, as opposed to hit or difference in arrival time location methods.

NOTE—This type of location is commonly used in leak location due to the presence of continuous emission. Some common types of continuous signal location methods include signal attenuation and correlation analysis methods.

(a) *signal attenuation-based source location, *n**—a source location method that relies on the attenuation versus distance phenomenon of AE signals. By monitoring the AE signal magnitudes of the continuous signal at various points along the object, the source can be determined based on the highest magnitude or by interpolation or extrapolation of multiple readings.

(b) *correlation-based source location, *n**—a source location method that compares the changing AE signal levels (usually waveform based amplitude analysis) at two or more points surrounding the source and determines the time displacement of these signals. The time displacement data can be used with conventional hit based location techniques to arrive at a solution for the source site. **E 1316, E07**

location marker—a number or letter made of lead (Pb) or other highly radiation attenuative material that is placed on an object to provide traceability between a specific area on the image and the part. **E 1316, E07**

location, source, *n*—any of several methods of evaluating AE data to determine the position on the structure from which the AE originated. Several approaches to source location are used, including zone location, computed location, and continuous location. **E 1316, E07**

location, zone, *n*—any of several techniques for determining the

general region of an acoustic emission source (for example, total AE counts, energy, hits, and so forth).

NOTE—Several approaches to zone location are used, including independent channel zone location, first hit zone location, and arrival sequence zone location.

(a) *independent channel zone location, n*—a zone location technique that compares the gross amount of activity from each channel.

(b) *first-hit zone location, n*—a zone location technique that compares only activity from the channel first detecting the AE event.

(c) *arrival sequence zone location, n*—a zone location technique that compares the order of arrival among sensors. **E 1316, E07**

lock case—the housing into which all components parts are installed or attached. **F 471, F12**

lockdown—adhesion of original or electrostatic copy to bearing surface as due to static charges. **F 335, F05**

locking ability—characteristic intentionally manufactured or added to a fastener to resist loosening. **F 1789, F16**

lock signal (NMR)—the NMR signal used to control the field-frequency ratio of the spectrometer. It may or may not be the same as the reference signal. **E 131, E13**

lockstitch, n—*inhome sewing*, a type of stitch formed with two threads: one needle thread and one bobbin thread interlaced with each other. **D 5646, D13**

lock stitch—a double stitch used at beginning and end of manufacturer's seam on corrugated boxes. **F 592, F16**

lock-strip cavity—the groove in the face of a lock-strip gasket designed to receive and retain the lock-strip. **C 717, C24**

lock-strip gasket, n—*in building construction*, a gasket in which sealing pressure is attained by inserting a keyed locking strip into a mating keyed groove in one face of the gasket. **C 717, C24**

lock strip or locking strip—the strip that is designed to be inserted in the lock-strip cavity to force the lips against material placed in the channel. **C 717, C24**

lockup, n—*of a wheel*, the condition of a wheel in which its rotational velocity about the wheel spin axis is zero and it is prevented from rotating in the presence of applied wheel torque. **F 538, F09**

loess—a uniform aeolian deposit of silty material having an open structure and relatively high cohesion due to cementation of clay or calcareous material at grain contacts. **D 653, D18**

loess—a buff-colored wind-blown deposit of fine silt. **D 7099, D18**

loftiness—the measure of the loose specific volume of an asbestos fiber. This is inversely related to the dry bulk density. **D 2946, C17**

log—a section of the trunk of a tree usually referring to a length suitable for conversion to commercial products. **D 9, D07**

logarithmic (acoustic emission) amplitude distribution(*V*)—see **distribution, logarithmic(acoustic emission) amplitude**. **E 1316, E07**

logarithmic decrement—the natural logarithm of the ratio of any two successive amplitudes of like sign, in the decay of a single-frequency oscillation. **D 653, D18**

logarithmic decrement—*in dynamic mechanical measurement*, natural logarithm of the ratio of any two (or more) successive amplitudes of like sign, in the decay of a single

$$\text{oscillation: } \Delta = \frac{1}{k} \ln \frac{A_n}{A_{(n+k)}}$$

where:

A_n and $A_{(n+k)}$ are amplitudes (in radians of rotation) of two oscillations and K is the number of oscillations separating the two amplitude measurements. **E 1142, E37**

logarithmic decrement, Δ (*in dynamic mechanical measurement*)—the natural logarithm of the ratio of any two (or more) successive amplitudes of like sign, in the decay of single frequency oscillation:

$$\Delta = \frac{1}{k} \ln \frac{A_n}{A_{n+k}}$$

where A_n and A_{n+k} are amplitudes (in radians of rotation) of two oscillations, and k is the number of oscillations separating the two amplitude measurements. **D 4092, D20**

logbook, n—notebook that accompanies each XRF analyzer instrument, for recording such information as daily performance, maintenance problems, and average reading time. **E 631, E06**

log file, n—a usually free form set of text or data, or both, that sequentially lists or enumerates events, many of which may be independent, while some may be chained or interrelated. **E 867, E17**

logger tires, n—a special tire designed for the logging industry. **D 5681, D34**

log normal distribution—drop size distribution described by the following equation:

$$f_n(D) = (1/\sqrt{\pi}) \int_{-\infty}^{K \times \ln(D/D_{gm})} \exp(-z^2) dz$$

where:

$f_n(D)$ = the number fraction of drops of diameter less than D ,

D_{gm} = the geometric mean diameter,

K = $1/[(\sqrt{2})\sigma_{gm}]$, and

σ_{gm} = the standard deviation of the geometric mean diameter. **E 1620, E29**

log-normal distribution—the distribution of N when $\log(N)$ is normally distributed. (Accordingly, it is convenient to analyze $\log(N)$ using methods based on the normal distribution.) **E 1823, E08**

logo—see **logotype**. **F 1457, F05**

logotype, n—a single image which generally contains a symbol, trademark, or identifying name of a business, association, or product. (See **logo**.) **F 1457, F05**

log phase, n—the period of growth of microorganisms during which cells divide at a positive constant rate. **D 4175, D02**

log run—in relation to lumber manufacture in softwoods, the total yield of a log or group of logs in lumber without any grading; in hardwood, certain lower grades are excluded. **D 9, D07**

log scale—the measure of the potential lumber content of a log or logs based on particular cuttings and sizes, with the measure varying according to the exact nature of the log scale or log rule involved. **D 9, D07**

long—a comparative term signifying a slow-setting glass. **C 162, C14**

long barb, n—barbs having an average length of $1.2 \pm 5\%$. **F 1379, F14**

long float, n—*forinflatable restraints fabrics*, a small change in the weave pattern where a warp or filling yarn extends over six or more filling or warp yarns with which it should be interlaced. **D 6799, D13**

longitudinal—generally, the direction parallel to the grain of wood. Sometimes the long axis of a wood specimen. **D 9, D07**

longitudinal corrugation—a condition similar to dish except that the sense of curvature changes sign at least once across the width of the strip. **B 846, B05**

longitudinal cracking, n—cracks in the pavement predominantly parallel to the direction of traffic. **E 867, E17**

longitudinal cracking, n—cracks in the pavement predominantly parallel to the direction of traffic. **E 1778, E17**

longitudinal direction—that direction which is parallel to the direction of maximum elongation in a worked material. (See also **cross direction**.) **E 7, E04**

longitudinal element, n—a component whose long axis is parallel, or nearly so, to the long axis of the spine. **F 1582, F04**

longitudinal force [F], *n*—*of a tire*, the component of the tire force vector in the X' direction. **F 538, F09**

longitudinal force, tire (F_x)—the component of a tire force vector in the X' direction. **E 867, E17**

longitudinal groove, n—an endless groove that has its major (long)

longitudinal groove, *n*

dimension substantially parallel to the tire circumferential centerline; the walls of the groove may not be perfectly parallel planes, but may have short alternating sections of the wall at angles to the tire circumferential centerline. **F 538, F09**

longitudinal magnetization—a magnetic field wherein the lines of force traverse the part in a direction essentially parallel with its longitudinal axis. **E 1316, E07**

longitudinal profile, *n*—the perpendicular deviations of the pavement surface from an established reference parallel to the lane direction, usually measured in the wheel tracks. **E 867, E17**

longitudinal profile—the perpendicular deviations of the pavement surface from an established reference parallel to the lane direction, usually measured in the wheel tracks. (See Terminology E 867). **E 867, E17**

longitudinal profile measurement, *n*—a series of elevation values taken at a constant interval along a wheel track. **E 867, E17**

longitudinal reinforcement—reinforcement, in a concrete pipe or box section, running parallel to the intended flow. **C 822, C13**

longitudinal rod wave—see **compression wave**. **D 653, D18**

longitudinal slip velocity [LTI], *n*—the effective rolling radius multiplied by the difference between the spin velocity (in rad/unit time) of a driven or braked tire and that of a free rolling tire when each is traveling in a straight line. **F 538, F09**

longitudinal sonic pulse, *n*—a sonic pulse in which the displacements are in the direction of propagation of the pulse. **C 709, D02**

longitudinal sonic pulse, *n*—a sonic pulse in which the displacements are in the direction of propagation of the pulse. **D 4175, D02**

longitudinal thread—multiple flutes parallel or nearly parallel to nail axis, rolled onto nail shank, having a lead angle of or closely approaching 90°. **F 547, F16**

longitudinal wave—those waves in which the particle motion of the material is essentially in the same direction as the wave propagation. (E 494) **E 1316, E07**

longitudinal wave, v_l (LT⁻¹)—wave in which direction of displacement at each point of medium is normal to wave front, with propagation velocity, calculated as follows:

$$v_l = \sqrt{(E/\rho)[(1 - \nu)/(1 + \nu)(1 - 2\nu)]} = \sqrt{(\lambda + 2\mu)/\rho}$$

where:

- E = Young's modulus,
- ρ = mass density,
- λ and μ = Lamé's constants, and
- ν = Poisson's ratio.

D 653, D18

long knot, *n*—*inraw silk*, knots which have loose ends from 3 to 25 mm in length. **D 123, D13**

long knot, *n*—*inraw silk*, knots which have loose ends from 3 to 25 mm in length. **D 3990, D13**

long line, *n*—flax fiber bundles that have a minimum length of 50 cm. **D 123, D13**

long line, *n*—*influx*, flax fiber bundles that have a minimum length of 50 cm. **D 6798, D13**

long-line current—electric current through the earth from an anodic to a cathodic area of a continuous metallic structure. (Usually used only where the areas are separated by considerable distance and where the current results from concentration-cell action.) **G 15, G01**

long magazine—magazine providing space for more than regular capacity of a particular tool style. **F 592, F16**

long point—point with 20° or smaller included angle for 0.040 to 0.065-in. wire diameter; 25° or smaller included angle for 0.072 to 0.225-in. wire diameter; 30° or smaller included angle for 0.250 to 0.325-in. wire diameter. **F 547, F16**

long slug, *n*—*inraw silk*, a slug which exceeds 10 mm (½ in.) in length or which is very much larger in diameter than the yarn. **D 123, D13**

long slug, *n*—*inraw silk*, a slug which exceeds 10 mm (½ in.) in length or which is very much larger in diameter than the yarn. **D 3990, D13**

long-term hydrostatic strength (LTHS)—the hoop stress that when applied continuously will cause failure of the pipe at 100 000 h (11.43 years). **F 412, F17**

long term standard deviation, σ_{LT} , *n*—sample standard deviation of all individual (observed) values taken over a long period of time. **E 456, E11**

long-term strength—the failure strength of a material after a long period of creep deformation. **D 7099, D18**

long wave (quer wave), W (LT⁻¹)—dispersive surface wave with one horizontal component, generally normal to the direction of propagation, which decreases in propagation velocity with increase in frequency. **D 653, D18**

loom fly, *n*—waste fibers created during weaving, that are woven into a fabric. **D 123, D13**

loom fly, *n*—waste fibers created during weaving that are woven into a fabric. (*Syn.* flyer) **D 3990, D13**

loop, *n*—*for inflatable restraint fabrics*, a continuous yarn that curls back on itself and protrudes from the surface of the fabric. (*Syn.* kink, snag.) **D 6799, D13**

loop, *n*—a formation that curves and crosses itself. **E 2195, E30**

loopback test, *n*—a test in which a known signal is sent from a source to a remote device or interface, and the received signal is then returned and checked against the transmitted signal to verify that no change occurred. **F 1457, F05**

loop breaking force, *n*—*in tensile testing*, the breaking force of a specimen consisting of two lengths of strand from the same supply looped together in a specified configuration and mounted between the clamps of a tensile testing machine. (Compare **loop breaking strength**. See also **breaking force**.) **D 123, D13**

loop breaking force, *n*—*in tensile testing*, the breaking force of a specimen consisting of two lengths of strand from the same supply looped together in a specified configuration and mounted between the clamps of a tensile testing machine. (Compare **loop breaking strength**. See also **breaking force**.) **D 4848, D13**

loop breaking load, *n*—deprecated term. Use the preferred term, **loop breaking force**. **D 4848, D13**

loop-breaking strength, *n*—strength expressed in terms of loop breaking force. (See **loop breaking force, strength**.) **D 123, D13**

loop breaking strength, *n*—strength expressed in terms of loop breaking force. (See also **loopbreaking force, strength**.) **D 4848, D13**

loop cap—See **line post cap**. **F 552, F14**

looped yarn—See **kink**. **D 3990, D13**

loop pile floor covering, *n*—a pile yarn floor covering in which the pile is composed only of uncut loops. **D 123, D13**

loop pile yarn floor covering, *n*—a pile yarn floor covering in which the pile is composed only of uncut loops. **D 123, D13**

loop pile yarn floor covering, *n*—a pile yarn floor covering in which the pile is composed only of uncut loops. **D 5684, D13**

loop spacer wire, *n*—wire that is attached loop-to-loop (or on consecutive attachment points) on the barbed tape to preset the loop spacing. **F 1379, F14**

loop tension, *n*—*in elastic material testing*, the total tension at any specified extension that is exerted on a specimen in a loop formation. **D 123, D13**

loop tension, *n*—*in elastic material testing*, the total tension at any specified extension that is exerted on a specimen in a loop formation. **D 4850, D13**

loopy, *adj*—a descriptive term for yarns having randomly sized loops of fibers or filaments protruding from the yarn surface. **D 123, D13**

loopy, *adj*—a descriptive term for yarns having randomly sized loops of fibers or filaments protruding from the yarn surface. **D 4849, D13**

- loopy edge*—See **loopy selvage**. **D 3990, D13**
- loopy selvage**, *n*—an improperly woven selvage of uneven width or a selvage containing irregular filling loops extending beyond the outside selvages. **D 123, D13**
- loopy selvage**, *n*—an improperly woven selvage of uneven width or a selvage containing irregular filling loops extending beyond the outside edges. (*Syn.* beaded selvage, corded selvage, loopy edge, rough selvage) **D 3990, D13**
- loose course**, *n*—in knitted fabrics, a row of loops in the widthwise direction that is larger, looser, or longer than the stitches in the main body of the fabric. **D 123, D13**
- loose course**, *n*—in knitted fabrics, a row of loops in the widthwise direction that is larger, looser, or longer than the stitches in the main body of the fabric. **D 3990, D13**
- loose edge*—See **slack selvage**. **D 3990, D13**
- loose fill insulation**, *n*—insulation in granular, nodular, fibrous, powdery, or similar form designed to be installed by pouring, blowing, or hand placement. **C 168, C16**
- loose-laid membrane**—a ballasted roofing membrane that is attached to the substrate only at the edges and penetrations through the roof. **D 1079, D08**
- loose paint**—see **deteriorating paint**. **E 631, E06**
- loose pick*—See **slack pick**. **D 3990, D13**
- loose RO**—see **nanofiltration**. **D 6161, D19**
- loose side**—in knife-cut veneer, the side of the sheet that was in contact with the knife as the sheet was being cut, and that contains cutting checks. (See **tight side**.) **D 1038, D07**
- losing stream**, *n*—a stream or reach of a stream in which water flows from the stream bed into the ground. **D 653, D18**
- loss angle*, *n*—synonym for **delta** (δ). **D 1566, D11**
- loss angle**, δ —the angle whose tangent is the dissipation factor or $\arctan \kappa''/\kappa'$. It is also the difference between 90 deg and the phase angle. **D 2864, D27**
- loss angle*, δ —see **phase angle**. **D 4092, D20**
- loss angle*, δ —see **phase angle**. **E 1142, E37**
- loss angle, dielectric*—same as **loss angle**. **D 2864, D27**
- loss angle, magnetic**, γ —the mean angle by which the fundamental component of core loss current leads the fundamental component of exciting current, *I*, in an inductor having a ferromagnetic core.
- NOTE—The loss angle, γ , is the complement of the hysteretic angle, β .
- NOTE—Because of hysteresis, the instantaneous value of the loss angle will vary during the cycle of *SCM* excitation; however, γ is taken to be the mean effective value of this angle. **A 340, A06**
- loss angle (phase defect angle)**, δ , *n*—the angle whose tangent is the dissipation factor or $\arctan \kappa''/\kappa'$. It is also the difference between 90° and the phase angle. **D 1711, D09**
- loss factor*, *n*—synonym for **tandel** ($\tan\delta$) (η). **D 1566, D11**
- loss factor**—obsolete term; see **loss index**. **D 1711, D09**
- loss factor*—see **tan δ** . **D 4092, D20**
- loss factor*—see **tangent delta**. **E 1142, E37**
- loss factor**, ϵ'' —the magnitude of the imaginary part of the complex permittivity. (See **permittivity, complex**.) **E 1142, E37**
- loss index*—the same as **loss index, dielectric**. **D 2864, D27**
- loss index, dielectric**, $\kappa''(\epsilon'')$ —the product of the “relative permittivity” and the dissipation factor and is a measure of the ac dielectric loss. It is also the magnitude of the imaginary part of the “relative complex permittivity.” **D 2864, D27**
- loss index**, $\kappa''(\epsilon'')$, *n*—the magnitude of the imaginary part of the relative complex permittivity. It is the product of the relative permittivity and dissipation factor. **D 1711, D09**
- loss modulus**— $M''(\text{Pa})$ —[loss compliance O'' (Pa^{-1}):] the imaginary part of the complex modulus (compliance). **D 4092, D20**
- loss modulus**—quantitative measure of energy dissipation, defined as the ratio of stress 90° out of phase with oscillating strain to the magnitude of strain, (D 4092, D20). **E 1142, E37**
- loss of back reflection**—an absence or significant reduction in the amplitude of the indication from the back surface of the part under examination. **E 1316, E07**
- loss of circulation**—the loss of drilling fluid into strata to the extent that circulation does not return to the surface. **D 653, D18**
- loss of tuft definition**, *n*—for pile yarn floor coverings, the bursting, opening, and untwisting of pile yarn, decrimping of the fibers in the surface pile, or any combination of these. **D 123, D13**
- loss of tuft definition**, *n*—for pile yarn floor coverings, the bursting, opening, and untwisting of pile yarn, decrimping of the fibers in the surface pile, or any combination of these. **D 5684, D13**
- loss on ignition**—the percent loss in weight of a material on being calcined at a temperature sufficiently high, and for a time long enough, to achieve constant weight without melting, expressed as a percent of the initial weight of the dry material (without free moisture). **C 242, C21**
- loss on ignition (LOI)**, *n*—the weight change of a material when it is heated under prescribed conditions. The LOI level for coal combustion products is determined in accordance with ASTM Method D 3178 Instrumental Method. **E 2201, E50**
- loss rate**—rate at which oil is lost past a boom (m^3/h). **F 818, F20**
- loss tangent*—same as **dissipation factor**. **D 2864, D27**
- loss tangent*—see **tan delta**. **D 4092, D20**
- loss tangent*—in dielectric measurements, see **tangent delta**. **E 1142, E37**
- lot**, *n*—a finite quantity of a given product manufactured under production conditions that are considered uniform. **A 644, A04**
- lot**, *n*—a finite quantity of a given product, produced under conditions that are considered uniform for sampling purposes. **A 902, A05**
- lot**, *n*—a definite quantity of product manufactured under conditions that are considered uniform. **A 941, A01**
- lot**, *n*—a specified quantity of product manufactured under traceable, controlled conditions as agreed between producer and user. **B 243, B09**
- lot**, *n*—a quantity of metal made under conditions that, for sampling purposes, are considered uniform. **B 899, B02**
- lot**, *n*—a quantity of a single material that is considered as a unit, such as that manufactured during a single production run, offered at one time for sale, or offered at one time for inspection, or the contents of one or more transport containers drawn from one or more bins of material from a single production run, sequentially packaged from one or more bins, or a group of samples secured from one of the above. **C 219, C01**
- lot**—an assemblage of concrete pipe, all being of like size, material, and strength designation, manufactured by the same process. The lot size may differ from the quantity designated in the contract or order. **C 822, C13**
- lot**—specific group of clay products having characteristics of sufficient similarity that individual specimens selected from that group may be considered representative of the whole group. **C 896, C04**
- lot**, *n*—in conduit, each 1000 lengths of conduit or less, of a given class, type and size manufacture on each machine during a 24-h period. **C 1154, C17**
- lot**, *n*—in nonpressure sewer pipe, for pipe sizes 150 mm (6 in.) and smaller, those lengths of pipe of that size, class and type manufactured during the same work shift. For pipe sizes 200 mm (8 in.) through 525 mm (21 in.), each 300 lengths of pipe or less, of identical size, class, and type manufactured on each machine during a 24-h period. For pipe sizes larger than 525 mm (21 in.) each 300 lengths of pipe or less, of identical size, class, and type manufactured on each machine during a period of consecutive working days not exceeding seven days. **C 1154, C17**
- lot**, *n*—in underdrain pipe, each 400 m (1300 ft) of pipe or less of a given type and size manufactured on each machine during a 24-h period. **C 1154, C17**
- lot**—any number of concrete masonry units or related units designated

lot

- by the producer of any configuration or dimension manufactured by the producer using the same materials, concrete mix design, manufacturing process, and curing method. **C 1209, C15**
- lot, n**—a discrete quantity of coal for which the overall quality to a particular precision needs to be determined. **D 121, D05**
- lot, n**—*in acceptancesampling*, that part of a consignment or shipment consisting of material from one production lot. **D 123, D13**
- lot, n**—*in acceptancesampling of cotton*, the main stock, supply, or source of fibers to be sampled. **D 123, D13**
- lot, n**—*in bonded, fused, or laminated fabric*, a single run on the bonding or laminating machine in which the processing is carried out without stopping or changing processing conditions, and consisting of either a single dye lot or a single gray goods lot. **D 123, D13**
- lot, n**—*in wool top*, the entire quantity, not exceeding 20 000 lb (9100 kg) of a single combing, that comprises a single unit for which a test for neps, vegetable matter, or colored fiber, or all three combined is desired. **D 123, D13**
- lot**—in roofing, (1) production lot—all material produced in one eight-hour shift of the same type (and color when applicable); (2) *delivery lot*—all material of the same type delivered at one time by one truck or railroad car. **D 1079, D08**
- lot**—(“inspection lot”)—a collection of units of product from which a sample is to be drawn and inspected to determine conformance with the acceptability criteria, and is to be accepted or rejected as a whole. It may differ from a collection of units designated as a lot for other purposes for example, production, shipment, etc. **D 1517, D31**
- lot, n**—a mass or collection of articles of similar composition and characteristics. **D 1566, D11**
- lot, n**—an entity of electrical insulating material or product which, insofar as is practicable, consists of a single type, grade, class, size, or composition that was manufactured under essentially the same conditions and is available to the user for sampling at one time. **D 1711, D09**
- lot, n**—*of paper or paperboard*, a quantity of paper or paperboard of a single type, grade, grammage, thickness, and composition about which it is desired to make a judgment (usually as to conformance to specification) by examining or testing a small fraction called the sample. **D 1968, D06**
- lot, n**—*for asbestos*, not fewer than 2 and not more than 2000 bags of asbestos fiber of the same type and grade offered at any one time for delivery or testing. **D 2946, C17**
- lot, n**—*for asbestos-cementconduit*, each 1000 lengths of conduit or less, of a given class, type and size manufactured on each machine during a 24-h period. **D 2946, C17**
- lot, n**—*for asbestos-cementnonpressure sewer pipe*, for pipe sizes 150 mm (6 in.) and smaller, those lengths of pipe of that size, class and type manufactured during the same work shift. For pipe sizes 200 through 525 mm (8 through 21 in.), each 300 lengths of pipe or less, of identical size, class and type manufactured on each machine during a 24-h period. For pipe sizes larger than 525 mm (21 in.) each 300 lengths of pipe or less, of identical size, class and type manufactured on each machine during a period of consecutive working days not exceeding seven days. **D 2946, C17**
- lot, n**—*for asbestos-cementpressure pipe, storm drain, and transmission pipe*, for pipe sizes 525 mm (21 in.) in diameter and smaller, each 300 lengths of pipe or less, of identical class and size manufactured on each machine during a 24-h period. For pipe larger than 535 mm (21 in.), each 300 lengths of pipe or less, of identical class and size manufactured on each machine during a period of consecutive working days not exceeding seven days. **D 2946, C17**
- lot, n**—a quantity of carbon black that is essentially uniform in composition and characteristics. **D 3053, D24**
- lot, n**—a definite quantity of a product or material accumulated under conditions that are considered uniform for sampling purposes. **D 4175, D02**
- lot, n**—a unit of production, or a group of other units or packages, taken for sampling or statistical examination, having one or more common properties and being readily separable from other similar units. **D 4439, D35**
- lot, n**—*in acceptancesampling*, that part of a consignment or shipment consisting of a material from one production lot. **D 4845, D13**
- lot, n**—*in wool, top*, the entire quantity, not exceeding 20 000 lb (9100 kg) of a single combing, that comprises a single unit for which a test for neps, vegetable matter or colored fiber, or all three combined is desired. **D 4845, D13**
- lot, n**—a large designated quantity of a material which can be represented by a properly selected gross sample. **D 5681, D34**
- lot**—a large designated quantity of RDF-3. **D 5681, D34**
- lot**—a large designated quantity (greater than the quantity of the final sample) of RDF which can be represented by a properly selected gross sample. **D 5681, D34**
- lot, n**—*in acceptance sampling of cotton*, the main stock, supply, or source of fibers to be sampled. **D 7139, D13**
- lot**—a unit of material processed at one time and subjected to similar processing variables. **E 7, E04**
- lot, n**—*in sampling*, a collection of material regarded as a unit. **E 135, E01**
- lot, n**—a quantity of thermocouples manufactured from the same continuous length of mineral-insulated, metal-sheathed thermocouple cable. **E 344, E20**
- lot, n**—that quantity of finished thermocouple material manufactured from: tubing from the same heat; wire from the same spool and heat; insulation from the same batch; assembled and processed together under controlled production conditions, to the required final outside diameter. **E 344, E20**
- lot**—a definite quantity of a product or material accumulated under conditions that are considered uniform for sampling purposes. **E 456, E11**
- lot**—a batch or fraction thereof, in which each unit is identical in chemical composition, physical properties, and dimensions. **E 631, E06**
- lot**—a designated quantity of refuse-derived fuel that can be represented by a properly selected gross sample. **E 856, D34**
- lot**—a batch or fraction thereof, in which each unit is identical in chemical composition, physical properties, and dimensions. **E 1749, E06**
- lot**—an aggregation of documents, records, articles, or actions selected for review due to common characteristics; often used in sales. For evaluation of the lot, all characteristics for which a lot is tested must be common to all units within the lot. Also referred to as universe or population. **E 2135, E53**
- lot, n**—a collection of units of product manufactured under conditions of production that are considered uniform. **F 412, F17**
- lot, n**—a definite quantity of a product or material accumulated under conditions that are considered uniform for sampling. **F 1773, F08**
- lot**—quantity of product of one part number that has been processed essentially under the same conditions from the same heat treatment lot and produced from one mill heat of material and submitted for inspection at one time. **F 1789, F16**
- lot number, n**—a unique alphanumeric designation for a lot that is traceable to manufacturing records. **B 899, B02**
- lot number, n**—the number used by a producer to identify an entity of electrical insulating material or product. **D 1711, D09**
- lot number, n**—see **batch number**. **E 2363, E55**
- lot quality protection**—a type of protection in which there is prescribed some chosen value of limiting percent defective in a lot (lot tolerance percent defective, (LTPD)) and also some chosen value for the probability (called the consumer’s risk) of accepting a submitted lot that has a percent defective equal to the lot tolerance percent defective. **E 456, E11**
- lot sample, n**—one or more shipping units taken at random to represent an acceptance sampling lot and used as a source of laboratory samples. (See **bulk sample**.) **D 123, D13**
- lot sample, n**—*incotton*, a relatively large sample taken in the field to

represent a consignment, shipment, or lot, for use in the preparation of the laboratory samples. **D 123, D13**

lot sample, *n*—a quantity of carbon black selected to represent a lot for testing purposes and taken in accordance with Practice D 1799 or D 1900. **D 3053, D24**

lot sample, *n*—one or more shipping units taken at random to represent an acceptance sampling lot and used as a source of laboratory samples. **D 4439, D35**

lot sample, *n*—one or more shipping units taken at random to represent an acceptance sampling lot and used as a source of laboratory samples. **D 4845, D13**

lot sample, *n*—*in cotton*, a relatively large sample taken in the field to represent a consignment, shipment, or lot, for use in the preparation of the laboratory samples. **D 7139, D13**

lot sampling inspection—random sample drawn from a lot and performing specified inspections and tests to determine the acceptability of the lot. **F 1789, F16**

lot sampling unit, *n*—a portion of material taken to represent a lot and used as a source of laboratory sampling units or test specimens, or both. (See **primary sampling unit**.) **D 123, D13**

lot size—the number of units of product in a lot. **D 1517, D31**

lot (solid sample)—a discrete quantity of material. It may contain a single batch or several batches or be the product of continuous process broken into units on the basis of time or shipment. It is very desirable that individual batches in a lot be specifically identified so that they may become individual or stratified units for inspection. **E 1547, E15**

lot tolerance fraction defective, *n*—the process average at which quality is considered barely tolerable; the process average at which the risk of acceptance is called the consumer's risk. **D 123, D13**

lot tolerance percent defective (LTPD)—the percentage of defective units in a batch or lot for which, for purposes of acceptance sampling, the consumer wishes the probability of acceptance to be restricted to a specified low value, specifically 10 % for this practice. This is also referred to by the more general term *limiting quality* taken at 10 % consumer risk. **E 456, E11**

louver blade, *n*—a shaped asbestos-cement product used to guard ventilation ports. **C 1154, C17**

louver blade—a shaped asbestos-cement product used to guard ventilation ports. **D 2946, C17**

louver cloth, *n*—*in coated glass yarn fabrics*, a woven netting having an approximately even-spaced mesh of fewer than 12 by 12 yarns per 25.4 mm (1 in.). **D 123, D13**

louver cloth, *n*—*in coated glass yarn fabrics*, a woven netting having an approximately even-spaced mesh of fewer than 12 by 12 yarns per 25 mm (1 in.). **D 7018, D13**

Lovibond color system, *n*—a system of color specification based on the optical densities of yellow, red, and blue filter glasses required to modify light from a standard source to obtain light matching some given light. **E 284, E12**

Lovibond tintometer, *n*—instrument for evaluating the colors of materials by visual comparison with the colors of glasses of the Lovibond color system. **E 284, E12**

low-acid food—any food, other than alcoholic beverages, with a finished equilibrium pH greater than 4.6 and a water activity (a_w) greater than 0.85. Tomatoes and tomato products having a finished equilibrium pH less than 4.7 are not classed as low-acid foods. **F 17, F02**

low-alloy steel, *n*—a steel, other than a carbon steel or an interstitial-free steel, that conforms to a specification that requires the minimum content for each specified alloying element to be lower than the applicable limit in the definition for alloy steel. **A 941, A01**

low carbon martensite—as-quenched phase of low carbon steels, particularly to which Boron has been intentionally added to increase the hardenability of the material, and some stainless steels. **F 1789, F16**

low-carbon-steel—See **steel grades**. **F 547, F16**

low-center polygon—an ice wedge polygon in which thawing of ice-rich permafrost has left the central area in a relatively depressed condition. **D 7099, D18**

low-density particleboard—a particleboard as previously defined with a density of less than 640 kg/m³ (40 lb/ft³) based on a reported moisture content at the time of weight and volume measurements. **D 1554, D07**

low-density polyethylene plastics (LDPE), *n*—those branched polyethylene plastics, having a standard density of 0.910 to 0.925 g/cm³. (D20) **F 412, F17**

low density polyethylene plastics, (LDPE) *n*—those branched polyethylene plastics, q. v., having a standard density of 0.910 to 0.925 g/cm³. **D 883, D20**

low elongation ropes, *n*—ropes with low elongation or stretch properties used principally for static loads. Low elongation ropes sometimes are referred to as *static ropes*. **F 1773, F08**

low-energy gamma radiation—gamma radiation having energy less than 200 keV. **E 1316, E07**

low-energy photon radiation—gamma- and X-ray photon radiation having energy less than 200 keV (excluding visible and ultraviolet light). **E 1316, E07**

lower body, *n*—that part of the human body which includes all portions between the waist and feet, not to include the feet. **F 1494, F23**

lower capability index (CPL), *n*—the difference between the sample mean (\bar{x}) and the lower specification limit divided by three times the standard deviation.

$$CPL = \frac{(\bar{x} - LSL)}{3 \times s}$$

A 644, A04

lower control limit (LCL), *n*—control limit for points below the central line. **E 456, E11**

lower critical point—in a phase diagram, a specified value of composition, temperature and pressure or combinations thereof occurring as a minimum in temperature, or pressure, for the coexistence of two, or more, conjugate phases and at which the conjugate phases become identical. **E 7, E04**

lower heating value, LHV, *n*—a synonym for net calorific value. **D 5681, D34**

lower heating value (LHV)—a synonym for net calorific value. **E 856, D34**

lower limit of flammability or lower flammable limit (LFL), *n*—the minimum concentration of a combustible substance that is capable of propagating a flame through a homogeneous mixture of the combustible and a gaseous oxidizer under the specified conditions of test. **E 1445, E27**

lower process capability index, C_{pkl} , *n*—index describing process capability in relation to the lower specification limit. **E 456, E11**

lower process performance index, P_{pkb} , *n*—index describing process performance in relation to the lower specification limit. **E 456, E11**

lower range value, *n*—the lowest quantity that an instrument is adjusted to measure. **E 344, E20**

lower specification limit (LSL), *n*—the lowest specified value. **A 644, A04**

lower temperature limit of flammability, (LTL), *n*—the lowest temperature, corrected to a pressure of 101.3 kPa (760 mm Hg, 1013 mbar), at which application of an ignition source causes a homogeneous mixture of a gaseous oxidizer and vapors in equilibrium with a liquid (or solid) specimen to ignite and propagate a flame away from the ignition source under the specified conditions of test. **E 1445, E27**

lower tolerance limit (LTL) (lower specification limit), *n*—a tolerance limit that defines the lower conformance boundary for an individual unit of a manufacturing or service operation. **E 456, E11**

lower valve or seal valve, *n*

lower valve or seal valve, *n*—a valve that restricts the flow of product down the dip tube during the pressurization stage and promotes the flow of product from the container into the body during the filling stage. **D 6655, D10**

lower yield strength, *LYS* [FL^{-2}], *n*—the minimum stress recorded during discontinuous yielding, ignoring transient effects. **E 6, E28**

lowest-observed-effect concentration (LOEC)—in a toxicity test, the tested concentration of one or more chemicals immediately above the highest tested concentration that did not result in a statistically significant change in the particular toxicological variable compared to that value in the control (s). **E 943, E47**

low-flow sampling—a ground water sampling technique where the purge and sampling rates do not result in significant changes in formation seepage velocity. **D 5681, D34**

low point, *Low*—the point on the reloading portion of an unloading-reloading cycle where the force is one half the high point force. **E 1823, E08**

low-power stretch, *n*—that property of a fabric whereby it exhibits high fabric stretch and good recovery from low tension **D 123, D13**

low power stretch, *n*—that property of a fabric whereby it exhibits high fabric stretch and good recovery from low tension. **D 123, D13**

low-power stretch, *n*—that property of a fabric whereby it exhibits high fabric stretch and good recovery from low tension. **D 4850, D13**

low-pressure air test—testing procedure, utilizing compressed air, intended to determine the acceptability of a pipe section, joint, or pipeline. **C 822, C13**

low-pressure molding, *n*—a method of molding or laminating in which the pressure is 1400 kPa (200 psi) or less. **D 883, D20**

low-pressure steam cooker—equipment wherein the cooking compartment operates between 3 and 9.9 psig. See **steam cooker**. **F 1827, F26**

low profile tile, *n*—tile having a rise to width ratio equal to, or less than 1:4. **C 43, C15**

low reflecting coating—a dielectric coating applied to an air-glass surface to reduce light reflection to a minimum. **E 7, E04**

low-silicate coolant concentrate, *n*—an engine coolant concentrate containing not more than 250 ppm silicon. **D 4725, D15**

low slope, *adj*—in roofing, that which commonly describes an incline of a roof which is 14° (25 % or 3 in./ft) or less. **D 1079, D08**

low-sloped surfaces—surfaces with a slope smaller than 9.5°. The roofing industry has widely accepted a slope of 2:12 or less as a definition of low-sloped roofs. This corresponds to a slope of approximately 9.5° (16.7 %). **E 631, E06**

low stretch rope (rope systems), *n*—a class of ropes that is used for rescue work and rappelling with an elongation greater than 6 % and less than 10 % at 10 % of its minimum breaking strength. **F 1490, F32**

low temperature preservation—stabilizing viable or biologically active material by freezing or freeze-drying. **E 1705, E48**

low volatile bituminous coal—See **low volatile bituminous coal** under **rank**. **D 121, D05**

low-voltage power supply, *n*—a source of electrical power which provides voltage at logic levels, usually internal to the component. **F 1457, F05**

LPG—abbreviation for liquefied petroleum gas. **D 4175, D02**

L-radiation—characteristic X-rays produced by an atom when a vacancy in the L-shell is filled by one of the outer electrons. **E 7, E04**

L radiation, *n*—characteristic X rays produced by an atom or ion when a vacancy in the L shell is filled by one of the outer electrons. **E 135, E01**

L-radiation, *n*—characteristic X-rays produced by an atom or ion when a vacancy in the L-shell is filled by one of the outer electrons. **E 631, E06**

LRV—Log Reduction Value—a measure of the particle removal

efficiency of the membrane system expressed as the log of the ratio of the particle concentration in the untreated and treated fluid. For example a 10-fold reduction in particle concentration is an LRV of 1. **D 6161, D19**

L-series—the set of X-ray wavelengths making up L-radiation. **E 7, E04**

L-series, *n*—the set of X-ray wavelengths composed of L radiation. **E 135, E01**

LSI—langelier saturation index, measure of CaCO₃ solubility in brackish waters. See Practice D 3739 and **S&DSI**. **D 6161, D19**

Lubbock nozzle—a variable-area nozzle in which a moveable plunger exposes additional inlet area as pressure increases. **E 1620, E29**

lubricant—a solution that, when applied to glass fibers, facilitates their handling by reducing mutual abrasion. (See also **moldd lubricant**.) **C 162, C14**

lubricant, *n*—any material interposed between two surfaces that reduces the friction or wear between them. **D 4175, D02**

lubricant, *n*—any material interposed between two surfaces that reduces the friction or wear, or both, between them. **D 4175, D02**

lubricant, *n*—any material interposed between two surfaces that reduces friction or wear between them. **D 4175, D02**

lubricant, *n*—(1) a material used to reduce the friction between two mating surfaces that are being joined by sliding contact. (2) an additive that is added to a plastic compound to lower the viscosity or otherwise improve the processing or product characteristics. **F 412, F17**

lubricant, *n*—any material interposed between two surfaces that reduces the friction or wear between them. **G 40, G02**

lubricant base stock, *n*—a liquid that may be used alone as a lubricant, but normally is used as a major ingredient in formulated lubricants. **D 4175, D02**

lubricant bloom—See **bloom**. **D 883, D20**

lubricant (mold), *n*—See **release agent (mold)**, the preferred term. **D 1566, D11**

lubricated, *adj*—in describing an elastomeric test specimen having at least two plane parallel faces and to be tested in compression, one in which the plane parallel faces are separated from plane parallel platens of the apparatus by a lubricant, thereby eliminating, insofar as possible, friction between the elastomer and platens, permitting the contact surfaces of the specimen to expand in area as the platens are moved closer together. **D 1566, D11**

lubricating, *n*—mixing with, or incorporating in, a powder, some agent to facilitate pressing and ejecting the compact from the die body; applying a lubricant to the die walls and punch surfaces. **B 243, B09**

lubricating grease, *n*—a semi-fluid to solid product of a dispersion of a thickener in a liquid lubricant. **D 4175, D02**

lubricating oil, *n*—a liquid lubricant, usually comprising several ingredients, including a major portion of base oil and minor portions of various additives. **D 4175, D02**

lubricity—in *grouting*, the physico-chemical characteristic of a grout material flow through a soil or rock that is the inverse of the inherent friction of that material to the soil or rock; comparable to “wetness.” **D 653, D18**

lubricity, *n*—a qualitative term describing the ability of a lubricant to minimize friction between and damage to surfaces in relative motion under load. **D 4175, D02**

Lüder's lines—markings which appear on the surface of metals stretched past the yield point. The markings are approximately parallel to the direction of maximum shear stress and essentially independent of crystal orientation; also called *stretcher strains*, *flow figures*, *Hartmann lines*. **E 7, E04**

lug—See preferred term **bail**. **D 2050, D13**

lugeon—a measure of permeability defined by a pump-in test or pressure test, where one Lugeon unit is a water take of 1 L/min per metre of hole at a pressure of 10 bars. **D 653, D18**

lugging, *adj*—in *internal combustion engine operation*, characterized

by a combined mode of relatively low-speed and high-power output. **D 4175, D02**

Luggin probe or Luggin-Haber capillary—a device used in measuring the potential of an electrode with a significant current density imposed on its surface. (The probe minimizes the IR drop that would otherwise be included in the measurement and without significantly disturbing the current distribution on the specimen.)

G 15, G01

lumber—the product of the sawmill and planing mill usually not further manufactured other than by sawing, resawing, passing lengthwise through a standard planing machine, crosscutting to length, and matching.

blanked lumber—lumber planed to a size in excess of the corresponding standard-dressed size to permit remanufacture or special use.

boards—lumber less than 2 in. in nominal thickness. Boards less than 6 in. in width may be classified as strips.

common lumber—in softwoods, a general term for nonstress graded lumber that has appearance quality less than select grade but is suitable for general construction and utility purposes.

dimension—lumber from nominal 2 in. through 4 in. thick and 2 or more inches wide.

dressed lumber—lumber that is surfaced by a planing machine on one side (S1S), two sides (S2S), one edge (S1E), two edges (S2E), or any combination of sides and edges (S1S1E, S2S1E, S1S2E, or S4S). Dressed lumber may also be referred to as planed or surfaced.

dressed size—the dimensions of lumber after surfacing with a planing machine. Usually 1/4 or 3/4 in. less than nominal size. The American Softwood Lumber Standard lists standard dressed sizes.

factory and shop lumber—lumber that is produced or selected primarily for manufacture into nonstructural products. It is graded on the basis of the percentage of the area that will produce a limited number of cuttings of a specified minimum size and quality.

finish—lumber suitable for millwork or for the completion of the interior of a building. Chosen particularly because of appearance or ability to accept a high quality finish.

framing lumber—lumber used for the structural members of a building, such as studs and joists.

matched lumber—lumber that is edge or end dressed and shaped to make a close tongued-and-grooved joint at the edges or ends when laid edge-to-edge or end-to-end.

patterned lumber—lumber that is shaped to a pattern in addition to being dressed, matched, or shiplapped, or any combination of these workings.

plain end lumber—worked lumber without end matching or with plain trimming and square ends.

planed lumber—See *dressed lumber*.

remanufactured lumber—lumber that has been further processed to change its size or shape after grading.

resawn lumber—the product of sawing any thickness of lumber to develop thinner lumber. The term as used in commercial transactions is mostly to denote the product of resawing dressed and graded lumber.

ripped lumber—the product of sawing any width of lumber to develop narrower lumber. The term as used in commercial transactions is mostly to denote the product of ripping dressed and graded lumber.

rough lumber—lumber as it comes from the saw prior to any dressing operation.

saw-sized lumber—sawn rough lumber of near-exact, uniform, net size, with a plus or minus sawing tolerance permitted.

select lumber—in softwoods a general term for lumber of good appearance and finishing qualities.

shiplapped lumber—lumber that is edge dressed to make a lapped joint.

shop lumber—see *factory and shop lumber*.

stress-graded lumber—lumber of any thickness and width that is graded for its mechanical properties.

surfaced lumber—see *dressed lumber*.

timbers—lumber 5 or more inches in least dimension.

worked lumber—lumber which, in addition to being dressed, has been matched, shiplapped, or patterned.

yard lumber—lumber generally intended for ordinary construction and general building purposes, without further manufacture, but where design properties are not required. Terminology becoming obsolete. **D 9, D07**

lumber, n—the product of the saw and planing wood mill, not further manufactured than by sawing, resawing, planing, crosscutting to length, and matching.

matched lumber—**lumber** that is shaped to make a close-tongued and grooved joint at its edges or ends

plank, n—a broad board usually more than 1 in. thick, laid with its wide dimension horizontal, and used as a bearing surface.

resawn lumber—rough or surfaced **lumber** that has been divided into two or more thicknesses by sawing.

rough lumber—undressed **lumber** as it comes from the saw.

shiplapped lumber—**lumber** that is shaped at its edges to make a close-rabbeted, or lapped joint.

surfaced lumber—**lumber** that is dressed on one or more faces. **D 996, D10**

lumber, n—a sawn piece of wood smaller than 100 mm (4 in.) in its least dimension. **E 631, E06**

lumen, n—*in vegetable fibers*, the central canal of the fiber. **D 123, D13**

lumen, n—*in vegetable fibers*, the central canal of the fiber. **D 7139, D13**

lumen—luminous flux emitted within one steradian by a point source having a spatially uniform luminous intensity of one candela. SI unit of luminous flux. **E 1316, E07**

lumen, lm, n—luminous flux emitted within one steradian by a point source having a spatially uniform luminous intensity of 1 candela. SI unit of luminous flux. **E 284, E12**

luminance—the ratio of the luminous intensity of a surface in a given direction to a unit of projected area. Measured in candela per square metre. **E 1316, E07**

luminance factor, Y, n—ratio of the luminance of a specimen to that of a perfect diffuser, when illuminated and viewed under specified geometric conditions. **E 284, E12**

luminance, L, L_v, n—luminous flux in a beam, emanating from a surface, or falling on a surface, in a given direction, per unit of projected area of the surface as viewed from that direction, per unit solid angle. **E 284, E12**

luminescence—the emission of radiant energy during a transition from an excited electronic state of an atom, molecule, or ion to a lower electronic state. **E 131, E13**

luminescence, n—emission of light ascribable to nonthermal excitation. (See also **electroluminescence, chemical luminescence, and photoluminescence**.) **E 284, E12**

luminometer number, n—a measure of the flame temperature in a wick lamp burning the candidate material as fuel at a specified flame radiation level in the green-yellow band of the visible spectrum. **D 4175, D02**

luminosity—a measure of emitted light intensity. **E 1316, E07**

luminosity function, n—see **spectral luminous efficiency function**. **E 284, E12**

luminous, adj—*for color determination*, indicates that the radiant flux is evaluated by weighting according to the luminous efficiency function of the CIE 1931 standard observer. **D 2946, C17**

luminous, adj—weighted according to the spectral luminous efficiency function V_{λ} of the CIE. **E 284, E12**

luminous efficacy, K_M , n

luminous efficacy, K_M , n —quotient of total luminous flux divided by total radiant flux; lumens per watt. $K_M = 683 \text{ lm/W}$. **E 284, E12**

luminous flux, ϕ , ϕ_v —the time rate of flow of light energy; luminous power. **E 284, E12**

luminous intensity, I , I_v , n —the light flux per unit solid angle. **E 284, E12**

luminous (photometric)—referring to a radiometric quantity, indicates the weighted average of the spectral radiometric quantity, with the photopic spectral luminous efficiency function given in Annex A1 of Practice E 971 being the weighting function. **E 772, E44**

luminous reflectance, n —ratio of luminous flux reflected by a specimen to that incident on it. **D 2946, C17**

luminous transmittance, n —the ratio of the luminous flux transmitted by a body to the flux incident upon it. **D 883, D20**

lump—in porcelain enamels, a rounded projection in the enamel surface, usually a defect. **C 286, B08**

lump—See **slub, slug**. **D 3990, D13**

lump—a raised area on the surface having the appearance of being solid. **F 109, C21**

lusec—a unit of flow rate equal to $0.133 \text{ mPa}\cdot\text{m}^3/\text{s}$. **E 1316, E07**

luster—an iridescent decorative surface appearance. **C 286, B08**

luster, n —in buttons, the degree of brilliance exhibited in pearlized or pearl buttons. **D 123, D13**

luster—in the pulp and paper industry, synonymous with “gloss” or “sheen.” (see also **gloss**) **D 1695, D01**

luster, n —in buttons, the degree of brilliance exhibited in pearlized or pearl buttons. **D 5497, D13**

luster, n —the appearance characteristic of a surface that reflects more in some directions than it does in other directions, but not of such high gloss as to form clear mirror images. **E 284, E12**

lustres—(1) dilute solutions of metallic salts that, when applied and fired to glass, produce an iridescent effect on the surface.

(2) solutions of metallic resins that, when applied and fired to glass, produce an opaque, mother-of-pearl iridescent effect.

C 162, C14

lux, lx, n —illuminance corresponding to a luminous flux density of one lumen per square metre. SI unit of illuminance. **E 284, E12**

LVPS—see **low-voltage power supply**. **F 1457, F05**

lysimeter—a device to measure the quantity or rate of water movement through a block of soil, usually undisturbed or in-situ; or to collect such percolated water for analyses. **D 653, D18**

lysis, n —the disintegration or destruction of whole bacterial cells. **F 1494, F23**

lysogen—a bacterial strain that has a phage stably maintained. In the case of lambda, the phage is integrated into the host genome. The integrated phage is called a prophage. **E 1705, E48**

M

- M**, *n*—the number of standard deviations, mutually concurred by the supplier and purchaser, to be used for calculations of statistical conformance to such items as minimums, maximums, specification ranges, and process capability indices. **A 644**, A04
- MA**—Commonwealth of Massachusetts. **E 631**, E06
- MacAdam color difference**, *n*—nonspecific term for color difference calculated by using one of several equations and methods based on MacAdam's color-difference-perceptibility ellipses or ellipsoids. **E 284**, E12
- macadam, dry-bound and water bound**, *n*—a pavement layer containing essentially one-size coarse aggregate choked in place with an application of screenings or sand; water is applied to the choke material for water-bound macadam; multiple layers must be used. **D 8**, D04
- MacAdam limits**, *n*—see **optimal colors**. **E 284**, E12
- maceral**, *n*—an organic substance in coal that is distinguished and classified on the basis of its optical microscopic properties.
- exinite*—Deprecated term. Use preferred term **liptinite**; sometimes has also been used as a synonym for sporinite.
- liptinite*, *n*—macerals that exhibit lower reflectance than other organic substances in a coal, appearing black to dark gray and that fluoresce under blue to ultraviolet light in coals ranked high volatile bituminous and lower.
- alginate*, *n*—a liptinite maceral that is generally spherical or ovoid, frequently having a crenulated border and somewhat irregular reflectance and sometimes occurring in clusters reflecting an origin from *Botryococcus* algae.
- cutinite*, *n*—a liptinite maceral in the form of a sheet reflecting its origin from leaf- or twig-covering plant cuticle, frequently exhibiting reticulation in planar section and a serrated edge in cross section.
- resinite*, *n*—a liptinite maceral occurring as rounded, ovoid, or rod-like bodies assuming the shape of an enclosing cell lumen or as irregular shapes filling cracks in the coal.
- sporinite*, *n*—a liptinite maceral exhibiting various lenticular, oval, or round forms that reflect the cross-sectioning of a flattened, hollow, ovoid body; sometimes exhibits rod-like projections that are small relative to the size of the total body.
- inertinite*, *n*—macerals that exhibit higher reflectance than other organic substances in the coal.
- fusinite*, *n*—an inertinite maceral distinguished principally by the preservation of some feature(s) of the plant cell wall structure, and with a particle size greater than 50 μm except when it occurs as a fragment within the binder matrix; see also **semifusinite**.
- inertodetrinite*, *n*—an inertinite maceral occurring as individual, angular, clastic fragments incorporated within the matrix of other macerals (commonly vitrinite) or minerals, and in the size range from 2 to 50 μm .
- macrinite*, *n*—an inertinite maceral, generally nonangular, exhibiting no relict plant cell wall structure and larger than 10 μm .
- micrinite*, *n*—an inertinite maceral, generally nonangular, exhibiting no relict plant cell wall structure, smaller than 10 μm and most commonly occurring as particles around 1- to 5- μm diameter.
- sclerotinite*, *n*—an inertinite maceral occurring as round or ovoid bodies, frequently containing voids, reflecting an origin from fungal sclerotia; also occurs (especially in lower rank coals) as interlaced, stringy materials derived from fungal hyphae.
- semifusinite*, *n*—an inertinite maceral with morphology like fusinite sometimes with less distinct evidence of cellular structure, but with reflectance ranging from slightly greater than that of associated vitrinite to some value intermediate to that of the brightest fusinite. The particle size is also greater than 50 μm except when it occurs as a fragment within the binder matrix.
- vitrinite*, *n*—the predominant maceral in most coals of intermediate reflectance occurring as substantial volumes of more or less uniformly reflecting material or as a matrix enclosing particles of other macerals and mineral matter or as particles or bands intermixed with other maceral fragments.
- macrinite*—See *macrinite* under **maceral**. **D 121**, D05
- macerated paper**—See **cushioning material**. **D 996**, D10
- machinability**, *n*—a measure of the ease with which a material can be shaped with the aid of cutting or abrasive tools. **C 709**, D02
- machinability**, *n*—a measure of the ease with which a material can be shaped with the aid of cutting or abrasive tools. **D 4175**, D02
- machine bite**—a depressed cut at the end of a piece of lumber made by the machine knives in dressing; sometimes called snipe. **D 9**, D07
- machine buffs**—that cut of the hide from which a buffing of approximately $\frac{1}{64}$ in. (0.4 mm) (1 oz) in thickness has been removed from the grain. This should leave a portion of the grain on approximately the entire hide. **D 1517**, D31
- machine burn**—a darkening or charring of the wood caused by frictional heat generated by machine knives or rolls. **D 9**, D07
- machine direction**, *n*—the direction parallel to the paper-bound edge of the gypsum board. **C 11**, C11
- machine direction**, *n*—the direction of a paper or paperboard corresponding or parallel to the direction of flow of the stock along the paper machine; sometimes referred to as MD or along machine direction. (See **cross direction**.) **D 1968**, D06
- machine direction**, *n*—the direction in the plane of the fabric parallel to the direction of manufacture. **D 4439**, D35
- machine direction**, *n*—the direction in which a product moves through the manufacturing process. **F 141**, F06
- machine direction, MD**, *n*—the direction in the plane of the fabric parallel to the direction of manufacture. **D 123**, D13
- machined specimen**—test specimen machined from a full-size fastener to specific dimensions to standardize test results; often specified when a full-size fastener cannot be reasonably or practically tested. **F 1789**, F16
- machine gauged**—a process by which stone material is removed to a specified thickness, incidentally resulting in a finish.
- NOTE—The resulting coarsely ground surface can be produced by a number of methods. **C 119**, C18
- machine gouge**—a groove below the regular surface of cut made by machine knives in dressing lumber. **D 9**, D07
- machine language**—a language designed for use by a machine, without translation. **F 149**, F05
- machine offset**—an abrupt dressing variation in the edge surface of lumber, occurring usually near the end of the piece without reducing the width or without changing the plane of the wide surface. **D 9**, D07
- machine process capability study**—study conducted to provide a level of confidence in the ability of a machine/process to meet engineering specification requirements. **F 1789**, F16
- machine quality**—term applied to nails manufactured with closer tolerances than usual and selected for close adherence to specification and freedom from foreign matter. **F 547**, F16
- machine-readable**, *n*—that characteristic of printed information that permits direct transfer of information from a printed surface to a data-processing system without operator intervention. **F 1294**, F05
- machine run**—the product of sawing, dressing, or patterning lumber without further grading. **D 9**, D07

machine stitch, n

machine stitch, n—*in home sewing*, the resulting arrangement of sewing threads in a repeating unit formed by a sewing machine.

D 123, D13

machine stitch, n—*in home sewing*, the resulting arrangement of sewing threads in a repeating unit formed by a sewing machine.

D 5646, D13

machining damage, (MD), n—*as used in fractography*, a surface-distributed flaw that is a microcrack(s), chip(s), striation(s), or scratch(es), or a combination of these, created during the machining process.

NOTE—Machining may result in the formation of surface or subsurface damage, or both.

C 1145, C28

macrocell corrosion—corrosion of a metal embedded in porous media (for example, concrete or soil) caused by concentration or galvanic cells which exist on a scale at least as large as the smallest major dimension of the corroding item (for example, the diameter of a bar or pipe).

G 15, G01

macroetch—controlled etching of the surface of a metallic specimen, intended to reveal a structure which is visible at low magnifications (not usually greater than 10 times).

E 7, E04

macro-etch test—immersion of a prepared fastener specimen into a hot acid or aggressive media followed by examination of the etched surface. The examination is done with the unaided eye or at magnification not exceeding 10×.

F 1789, F16

macrograph—a graphic reproduction of an object, slightly reduced in size, unmagnified, or magnified ten diameters or less (photomacrograph).

E 7, E04

macrograph—photographic reproduction of any object that has not been magnified more than ten times.

F 1789, F16

macromolecular material, n—See **polymer** the preferred term.

D 1566, D11

macropore—interaggregate cavities that service as the principal avenues for the infiltration and drainage of water and for aeration.

D 653, D18

macropore—a pore with widths exceeding 50 nanometres (500 angstrom units).

D 2652, D28

macroporosity—large intergranular porosity with large pore throats, including soil cracks, moldic porosity, animal burrows and other significant void space.

D 653, D18

macro-scale polygons—closed, multi-sided, roughly equidimensional, patterned ground features, commonly resulting from cracking of the ground due to thermal contraction.

D 7099, D18

macroscopic—visible either with the naked eye or under low magnification (as great as about ten diameters).

F 1789, F16

macrostrain, n—the mean strain over any finite gage length of measurement large in comparison with interatomic distances.

E 6, E28

macrostructure—structure of metal as revealed by macroscopic examination.

F 1789, F16

magazine—mechanism for storing and feeding fasteners.

F 592, F16

magma, n—molten rock within the earth or within other planets.

E 957, E44

magnesia—the chemical compound magnesium oxide (MgO).

C 51, C07

magnesia—magnesium oxide (MgO), calcined or hard burned as periclase loosely applied also to the hydrate Mg(OH)₂, and made synthetically from seawater or brine, or (impure) from magnesite.

C 242, C21

magnesia brick, n—a refractory brick, which may be burned or unburned, manufactured predominantly or entirely of either seawater magnesia, dead-burned magnesite, fused magnesia, or combinations of these materials.

C 71, C08

magnesia-carbon brick, n—a refractory brick manufactured predominantly of a mixture of refractory-grade magnesia and 5 to 30 weight percent carbonaceous material, with resin, tar, pitch, or a combination of these materials as the bonding agent; the refractory-grade magnesia may be either sea-water magnesia, dead-burned magnesite, fused magnesia, or a combination of these

materials; and the carbonaceous material may be either flake or vein graphite, carbon black, or petroleum or metallurgical coke, or a combination of these materials.

C 71, C08

magnesia-chrome brick, n—a refractory brick, which may be burned or unburned, manufactured predominantly of a mixture of refractory-grade magnesia and refractory-grade chrome ore in which the refractory-grade magnesia predominates by weight; the refractory-grade magnesia may be either seawater magnesia, dead-burned magnesite, fused magnesia, or a combination of these materials.

C 71, C08

magnesia-doloma refractory, n—a refractory, which may be burned or unburned, manufactured predominantly of a mixture of refractory-grade magnesia and refractory-grade doloma in which the refractory-grade magnesia predominates by weight.

C 71, C08

magnesia, fused, n—a refractory material consisting predominantly of crystalline magnesium oxide which has solidified from a fused or molten state.

C 71, C08

magnesian—indicates the presence of 5 to 35 % magnesium carbonate (MgCO₃) in the limestone from which the material was formed.

C 51, C07

magnesian limestone—see **limestone**.

C 51, C07

magnesia, refractory, n—a dead-burned refractory material consisting predominantly of crystalline magnesium oxide.

C 71, C08

magnesia, refractory-grade, n—a dead-burned or fused refractory material consisting predominantly of crystalline magnesium oxide; the three principal types are magnesia, sea water; magnesite, dead-burned; and magnesia, fused.

C 71, C08

magnesia, sea water, n—a deadburned refractory-grade magnesia which has been derived from the treatment of sea water or other brines.

C 71, C08

magnesia-spinel brick, n—a refractory brick whose predominant component is sintered or fused magnesia and whose lesser component is sintered, fused, or in situ formed magnesium aluminate spinel (MgO · Al₂O₃).

C 71, C08

magnesite, dead-burned, n—the granular product obtained by burning (firing) magnesite or other substances convertible to magnesia, upon heating above 1450°C long enough to form dense, weather-stable granules suitable for use as a refractory or in refractory products.

C 71, C08

magnesite, grain, n—dead-burned magnesia in granular form of size suitable for refractory purposes.

C 71, C08

magnesite, seawater, n—dead-burned magnesia made by a chemical process using seawater or other saline solutions.

C 71, C08

magnet—a body that produces a magnetic field external to itself.

NOTE—By convention, the north-seeking pole of a magnet is marked with an *N*, +, or is colored red.

NOTE—Natural magnets consist of certain ores such as magnetite (loadstone); artificial (permanent) magnets are made of magnetically hard materials; electromagnetics have cores made of magnetically soft materials which are energized by a current carrying winding.

A 340, A06

magnetic alignment—See **alignment**.

E 7, E04

magnetic brush development—development in which the toner is carried by means of a brush-like array of magnetic particles held erect under the influence of a magnetic field.

F 335, F05

magnetic circuit—a region at whose surface the magnetic induction is tangential.

NOTE—A practical magnetic circuit is the region containing the flux of practical interest, such as the core of a transformer. It may consist of ferromagnetic material with or without air gaps or other feebly magnetic materials such as porcelain, brass, and so forth.

A 340, A06

magnetic constant (permeability of space), Γ_m —the dimensional scalar factor that relates the mechanical force between two currents to their intensities and geometrical configurations. That is:

$$dF = \Gamma_m I_1 I_2 dl_1 \times (dl_2 \times r_1) / nr^2$$

where:

- Γ_m = magnetic constant when the element of force, dF , of a current element $I_1 dl_1$ on another current element $I_2 dl_2$ is at a distance r ,
 r_1 = unit vector in the direction from dl_1 to dl_2 , and
 n = dimensionless factor. The symbol n is unity in unrationalized systems and 4π in rationalized systems.

NOTE—The numerical values of Γ_m depend upon the system of units used. In the cgs-emu system of units, $\Gamma_m = 1$, in the SI system, $\Gamma_m = 4\pi \times 10^{-7}$ H/m.

NOTE—The magnetic constant expresses the ratio of magnetic induction to the corresponding magnetizing force at any point in a vacuum and therefore is sometimes called the permeability of space, μ_v .

NOTE—The magnetic constant times the relative permeability is equal to the absolute permeability.

$$\mu_{\text{abs}} = \Gamma_m \mu_r$$

A 340, A06

magnetic excursion range, ΔB , ΔH —the excursion ranges equaling the algebraic differences between the upper and lower values of B , and between the upper and lower values of H , in a hysteresis or flux-current loop.

A 340, A06

magnetic field—the volume within and surrounding either a magnetized part or a current-carrying conductor wherein a magnetic force is exerted.

E 1316, E07

magnetic field indicator—a pocket meter that is used to locate or determine the relative intensity of leakage field emanating from a part.

E 1316, E07

magnetic field meter—an instrument designed to measure the flux density of magnetic fields.

E 1316, E07

magnetic field of induction—the magnetic flux field induced in a region such that a conductor carrying a current in the region would be subjected to a mechanical force, and an electromotive force would be induced in an elementary loop rotated with respect to the field in such a manner as to change the flux linkage. A 340, A06

magnetic field strength—the measured intensity of a magnetic field at a point, expressed in oersteds or amperes per metre.

E 1316, E07

magnetic field strength, ac—the value of one of three dynamic magnetic field strength parameters in common use. They are:

- (a) H_L —an assumed peak value computed in terms of peak magnetizing current (considered to be sinusoidal).
 (b) H_z —an assumed peak value computed in terms of measured rms exciting current (considered to be sinusoidal).
 (c) H_p —computed in terms of a measured peak value of exciting current, and thus equal to the value H'_{max} .

A 340, A06

magnetic field strength, biasing, H_b —the algebraic mean value of the magnetic field strength in a magnetic material that is subjected simultaneously to a constant magnetizing field and a periodically varying magnetizing field.

NOTE—The biasing magnetizing field and the biased magnetic induction are corresponding coordinates of a single point on the B - H plane but not necessarily on the normal induction curve.

NOTE—The biasing magnetic field strength, H_b , is equal to the applied constant magnetizing field only when the applied periodically varying magnetizing field is symmetrical.

A 340, A06

magnetic field strength, H —the magnetic vector quantity at a point in a magnetic field which measures the ability of electric currents or magnetized bodies to produce magnetic induction at the given point.

NOTE—The magnetic field strength, H , may be calculated from the current and the geometry of certain magnetizing circuits. For example, in the center of a uniformly wound long solenoid.

$$H = C (NI/l)$$

where:

- H = magnetic field strength,
 C = constant whose value depends on the system of units,
 N = number of turns,
 I = current, and
 l = axial length of the coil.

If I is expressed in amperes and l is expressed in centimetres, then $C = 4\pi/10$ to obtain H in the cgs-emu system of units, the oersted.

If I is expressed in amperes and l is expressed in metres, then $C = 1$ to obtain H in the SI units, ampere-turn per metre.

NOTE—The magnetic field strength, H , at a point in air may be calculated from the measured value of induction at the point by dividing this value by the magnetic constant Γ_m .

A 340, A06

magnetic field strength, incremental, H_Δ —a value equal to one half the algebraic difference of the maximum and minimum values of the magnetic field strength during a cycle in a magnetic material that is subjected simultaneously to a biasing magnetic field strength and a symmetrical periodically varying magnetic field strength.

Twice the incremental magnetic field strength is indicated by the symbol ΔH .

Thus:

$$H_\Delta = \Delta H/2$$

A 340, A06

magnetic field strength, maximum—(a) H_m —the maximum value of H in a dc hysteresis loop.

(b) H_{max} —the maximum value of H in an ac flux-current loop.

A 340, A06

magnetic flux, ϕ —the product of the magnetic induction, B , and the area of a surface (or cross section), A , when the magnetic induction B is uniformly distributed and normal to the plane of the surface.

$$\phi = BA$$

where:

- ϕ = magnetic flux,
 B = magnetic induction, and
 A = area of the surface.

NOTE—If the magnetic induction is not uniformly distributed over the surface, the flux, ϕ , is the surface integral of the normal component of B over the area.

$$\phi = \iint_s B \cdot dA$$

NOTE—Magnetic flux is a scalar and has no direction. A 340, A06

magnetic flux density, B —that magnetic vector quantity which at any point in a magnetic field is measured either by the mechanical force experienced by an element of electric current at the point, or by the electromotive force induced in an elementary loop during any change in flux linkages with the loop at the point.

NOTE—If the total flux, ϕ is uniformly distributed and normal to a surface or cross section, then the magnetic induction is:

$$B = \phi/A$$

where:

- B = magnetic induction,
 ϕ = total flux, and
 A = area.

NOTE— B_{in} is the instantaneous value of the magnetic induction and B_m is the maximum value of the magnetic induction. A 340, A06

magnetic history

magnetic history—magnetic condition of a ferromagnetic part under test based on previous exposures to magnetic fields. (E 566)

E 1316, E07

magnetic hysteresis—in a magnetic material, as iron, a lagging in the values of resulting magnetization due to a changing magnetic force. (See also **hysteresis**.)

E 1316, E07

magnetician—one skilled in the theory and practice of magnetics.

A 340, A06

magnetic induction, B —an alternate term for **magnetic flux density**.

A 340, A06

magnetic ink character recognition, MICR—a recognition technology that utilizes ink capable of being magnetized and sensed. A practical application is E-13B, which is used primarily within the North American financial industry. E-13B consists of 14 characters printed to high specifications using ink with iron oxide pigments, or other inks utilizing ingredients capable of being magnetized.

F 149, F05

magnetic lamination steel—a flat-rolled, low-carbon (usually below 0.06 %) steel containing 0.0 to 1.0 % silicon and up to 0.4 % aluminum and having similar core loss in all directions.

A 340, A06

magnetic leakage flux—the excursion of magnetic lines of force from the surface of a test specimen.

E 1316, E07

magnetic lens—a device for focussing an electron beam by means of a magnetic field.

E 7, E04

magnetic line of force—an imaginary line in a magnetic field which at every point has the direction of magnetic induction at that point.

NOTE—Extended lines of force must always form nonintersecting closed loops.

A 340, A06

magnetic moment, m —a measure of the magnetic field strength, H , produced at points in space by a plane current loop or a magnetized body.

NOTE—The magnetic moment of a plane current loop is a vector, the magnitude of which is the product of the area of the loop and the current; the direction of the vector is normal to the plane of the loop in that direction around which the current has a clockwise rotation when viewed along the vector.

NOTE—The magnetic moment of a magnetized body is the volume integral of the magnetization, M .

NOTE—In the cgs-emu system of units, magnetic moment is usually defined as the pole strength multiplied by the distance between poles. This is sometimes called the magnetic dipole moment.

A 340, A06

magnetic ohm—the unit of reluctance sometimes used in the cgs-emu system of units. One magnetic ohm equals one gilbert/maxwell or $4\pi/10^9$ ampere-turns/weber.

A 340, A06

magnetic particle examination—a nondestructive test method utilizing magnetic leakage fields and suitable indicating materials to disclose surface and near-surface discontinuity indications.

E 1316, E07

magnetic particle examination flaw indications—the accumulation of ferromagnetic particles along the areas of flaws or discontinuities due to the distortion of the magnetic lines of force in those areas.

E 1316, E07

magnetic particle field indicator—an instrument, typically a bi-metal (for example, carbon steel and copper) octagonal disk, containing artificial flaws used to verify the adequacy or direction, or both, of the magnetizing field.

E 1316, E07

magnetic particle inspection method—a method for detecting magnetic discontinuities or inhomogeneities on or near the surface in suitably magnetized materials that uses finely divided magnetic particles that tend to congregate in regions of magnetic nonuniformity associated with the magnetic discontinuities or inhomogeneities.

NOTE—Magnetic particle inspection is an accepted method for the detection of defects.

A 340, A06

magnetic particles—finely divided ferromagnetic material capable of being individually magnetized and attracted to distortion in a magnetic field.

E 1316, E07

magnetic permeability—degree which a material becomes magnetically attractive.

F 1789, F16

magnetic polarization, J —in the cgs-emu system of units, the intrinsic induction divided by 4π is sometimes called magnetic polarization or magnetic dipole moment per unit volume.

A 340, A06

magnetic pole—the magnetic poles of a magnet are those portions of the magnet toward which or from which the external magnetic induction appears to converge or diverge, respectively.

NOTE—In the hypothetical case of a uniformly magnetized body of constant cross-sectional area, the poles would be located at its ends.

NOTE—By convention, the north-seeking pole is marked with an N , or +, or is colored red.

A 340, A06

magnetic pole—one of two or more areas of flux leakage on a part.

E 1316, E07

magnetic pole strength, p —the magnetic moment divided by the distance between the poles.

$$p = m/l$$

where:

p = pole strength,

m = magnetic moment, and

l = distance between the poles.

A 340, A06

magnetic printer—a printer in which magnetic signals are recorded onto a magnetic belt or drum. A magnetic toner is attracted to the drum and transferred to paper where it is fused to the sheet.

F 149, F05

magnetic rating (MR), n —an empirical value reflecting the effect of the magnetic particles, such as magnetic iron compounds, in asbestos material as measured by a magnetic effect analyzer.

D 2946, C17

magnetic saturation—that degree of magnetization where a further increase in magnetizing force produces no significant increase in magnetic flux density (permeability) in a specimen.

E 1316, E07

magnetic shielding—in electron microscopy, shielding for the purpose of preventing extraneous magnetic fields from affecting the electron beam in the microscope.

E 7, E04

magnetics (magnetism)—that branch of science which deals with the laws of magnetic phenomena and their application to practice.

A 340, A06

magnetic storage medium—a storage medium that uses magnetic properties (magnetic dipoles) to store digital data (for example, a moving drum, disk, or tape or a static core or film).

E 1316, E07

magnetic transformation—an intensive property change from a ferromagnetic to a paramagnetic state, or the reverse, which occurs in certain solid materials under applied pressure and temperature, or both. (See also **Curie point**.)

E 7, E04

magnetic transformation—intensive property change from a ferromagnetic to a paramagnetic state, or the reverse, which occurs in certain solid materials under applied pressure and temperature, or both. (See also **Curie temperature**), (E 7, E04).

E 1142, E37

magnetic writing—a form of nonrelevant indication sometimes caused when the surface of a magnetized part comes in contact with another piece of ferromagnetic material.

E 1316, E07

magnetization, circular—see **field, circular**.

E 1316, E07

magnetization, longitudinal—see **field, longitudinal**.

E 1316, E07

magnetization, M —the component of the total magnetizing force that produces the intrinsic induction in a magnetic material.

$$M = (B - \Gamma_m H) / \Gamma_m \mu_r = B_s / \mu_{abs}$$

where:

M = magnetization,

H = applied magnetizing force,

Γ_m = magnetic constant,

B = total magnetic induction,
 μ_r = relative permeability,
 μ_{abs} = absolute permeability, and
 B_i = intrinsic induction.

NOTE—The magnetization can be interpreted as the volume density of magnetic moment. **A 340, A06**

magnetizing current—the flow of either alternating or direct current used to induce magnetism into the part being inspected. **E 1316, E07**

magnetizing current, ac, I_m —See **current, ac magnetizing**. **A 340, A06**

magnetizing force—the magnetizing field applied to a ferromagnetic material to induce magnetization. **E 1316, E07**

magnetizing force, H —an alternate term for **magnetic field strength**. **A 340, A06**

magnetodynamic—the magnetic condition when the values of magnetic field strength and induction vary, usually periodically and repetitively, between two extreme limits. **A 340, A06**

magnetomotive force, \mathcal{F} —the line integral of the magnetizing field around any flux loop in space.

$$\mathcal{F} = \int H \cdot dl$$

where:

\mathcal{F} = magnetomotive force,
 H = magnetic field strength, and
 dl = unit length along the loop.

NOTE—The magnetomotive force is proportional to the net current linked with any closed loop of flux or closed path.

$$\mathcal{F} = CNI$$

where:

\mathcal{F} = magnetomotive force,
 N = number of turns linked with the loop,
 I = current in amperes, and
 C = constant whose value depends on the system of units. In the cgs-emu system of units, $C = 4\pi/10$. In the SI system, $C = 1$.

A 340, A06

magnetostatic—the magnetic condition when the values of magnetic field strength and induction are considered to remain invariant with time during the period of measurement. This is often referred to as a dc (direct current) condition. **A 340, A06**

magnetostriction—the change in dimensions of a body resulting from magnetization. **A 340, A06**

magnetostrictive cavitation test device, n —a vibratory cavitation test device driven by a magnetostrictive transducer. **G 40, G02**

magnet, permanent—see **permanent magnet**. **E 1316, E07**

magnetron—a type of microwave energy generator usually used in microwave cooking equipment. **F 1827, F26**

magnet wire—a metal electrical conductor, covered with electrical insulation, for use in the assembly of electrical inductive apparatus such as coils for motors, transformers, generators, relays, magnets, and so forth. **D 1711, D09**

magnification—a ratio of the size of an image to its corresponding object. This is usually determined by linear measurement. **E 7, E04**

magnification factor, n —the constant multiplier applied to the nominal dimensions of a bar code symbol to obtain the actual dimensions at which it must be produced. **F 1294, F05**

magnifying lens—stem glass which, due to its configuration, results in a magnification of the mercury column. **E 344, E20**

magnitude estimation, n —process of assigning values to the intensities of an attribute in such a way that the ratios between pairs of assigned values are the same as between the magnitudes of the perceptions to which they correspond. **E 253, E18**

mailing tube—See **tube**. **D 996, D10**

main components, n —in textiles, those sections of a consumer product which constitute the largest continuous homogeneous areas of the product that are typical of the product. **D 123, D13**

main effect, average effect, n —a term describing a measure for the comparison of the responses at each level (version) of a factor averaged over all levels (versions) of other factors in the experiment. **E 456, E11**

main effect, average effect, n —a term describing a measure for the comparison of the responses at each level (version) of a factor averaged over all levels (versions) of other factors in the experiment. **E 456, E11**

NOTE—The term *main effect* may describe the parameter in an assumed model or the estimate of this parameter. **E 1325, E11**

maintain, vt—to monitor the usage of test methods and to take remedial steps when necessary. **D 123, D13**

maintain, v—to keep in working order, or to preserve from decline or failure. **E 631, E06**

maintain—See **building modification**. **E 631, E06**

maintainability (entretenabilité)—capability of a system or facility to be maintained to a specified level of **reliability**, at a specified measure of cost or economy. **E 631, E06**

maintainability (entretenabilité)—capability of a system or facility to be maintained to a specified level of **reliability**, at a specified measure of cost or economy. **E 1480, E06**

maintenance, n —work performed to keep facilities in good condition. **E 1605, E06**

maintenance—(1) the act of maintaining by keeping in an existing state and preserving from failure or decline. (2) Person, place, or thing that maintains. (3) The upkeep of property or equipment. **E 2135, E53**

maintenance and repair cost—the total of labor, material, and other related costs incurred in conducting corrective and preventative maintenance and repair on a building, or on its systems and components, or on both. **E 631, E06**

maintenance and repair cost, n —the total of labor, material, and other related costs incurred in conducting corrective and preventative maintenance and repair on a building, or on its systems and components, or on both. **E 833, E06**

maintenance mix, n —a mixture of bituminous material and mineral aggregate applied at ambient temperature for use in patching holes, depressions, and distress areas in existing pavements. **D 8, D04**

maintenance therapy, n —therapy of chronically ill patients that is aimed at keeping the pathology at its present level and preventing exacerbation. **F 2312, F04**

majolica—formerly an earthenware with an opaque luster glaze and overglaze colored decorations, but currently designating any decorated earthenware having an opaque glaze. **C 242, C21**

major defect, n —a defect other than critical, that judgment and experience indicate is likely to materially reduce the usability of a product for its intended purpose. **D 123, D13**

major defect, n —a defect other than critical, that judgment and experience indicate is likely to materially reduce the usability of a product for its intended purpose. **D 4850, D13**

major imperfection, n —in fabric grading, a deviation in a roll of fabric that judgment and experience indicate is likely to have an adverse affect upon subsequent processing of the fabric. **D 123, D13**

major imperfection, n —in fabric grading, a deviation in a roll of fabric that judgment and experience indicate is likely to have an adverse affect on subsequent use or processing of the fabric. **D 6799, D13**

major modification—any change in either the structural or operational characteristics of the ride or device which will alter its performance from that specified in the manufacturer's design criteria. **F 747, F24**

major package defect—a defect that is likely to result in failure or

major package defect

- reduce significantly the usability of the package for its intended use. **F 17, F02**
- major package defect*—See Terminology F 17. **F 1327, F02**
- major principal plane*—see **principal plane**. **D 653, D18**
- major principal stress*—see **stress**. **D 653, D18**
- major tile facial dimensions**—the overall length or width of the tile, including the lugs on opposite sides. **C 242, C21**
- major tile thickness**—the thickness of tile, including any maximum protuberances or ridges on the back. **C 242, C21**
- makeup air*—the supply of outside air, tempered or untempered, to a building in a controlled manner for the replacement of air exhausted through the hood, or the supply of outside air, untempered, into the hood to reduce the amount of tempered air exhausted from the building. **F 1827, F26**
- male end of pipe (spigot, tongue, modified tongue)**—that portion of the end of the pipe, regardless of its shape or dimensions, which is overlapped by a portion of the end of the adjoining pipe. **C 822, C13**
- maleic resin*—under **resin, synthetic**, see *maleic resin*. **D 16, D01**
- male member**—the component that is inserted through the female member and secured to the female member at the box lock junction. **F 921, F04**
- malleable, ferritic, n**—a ferrous alloy that is cast as white iron but which is converted by an appropriate heat treatment to a microstructure of temper carbon embedded in a ferritic matrix essentially free of pearlite and carbide. **A 644, A04**
- malleable iron, n**—a cast iron of such composition that it solidifies as white iron, which upon proper heat treatment is converted to a metallic matrix with nodules of temper carbon. **A 644, A04**
- malleableize, vt**—to convert white iron into malleable iron through an appropriate graphitizing heat treatment. **A 644, A04**
- malleable, pearlitic, n**—a ferrous alloy that is cast as white iron but which is converted by an appropriate heat treatment to a microstructure of temper carbon embedded in a matrix containing a controlled quantity, form, and distribution of pearlite or tempered martensite. **A 644, A04**
- mA (milliamperes)**—a unit of current equal to 0.001 amperes, used to express the tube current of an X-ray tube. **E 1316, E07**
- mandrel**—a form used as a cathode in electroforming; a mold or matrix. **B 374, B08**
- mandrel**—a form, fixture, or male mold used as the base for production of a part in processes such as lay-up or filament winding. **D 3878, D30**
- mandrel**—a form, fixture, or male mold used in the production of a part by lay-up or filament winding. **E 631, E06**
- mandrel**—a form, fixture, or male mold used in the production of a part by lay-up or filament winding. **E 1749, E06**
- mandrel (in bend testing), n**—the tool used to control the strain on the concave side of a bend in a wrap-around bend test and also to apply the bending force in a semi-guided or guided bend test. **E 6, E28**
- manganese greensand**—a manganese dioxide coated greensand used as a filter medium for removal of manganese and iron. See **greensand**. **D 6161, D19**
- manhole**—a precast concrete structure for vertical access to a pipeline or other closed structure. **C 822, C13**
- manhole base**—a concrete slab foundation and the bottom manhole riser section or a bottom manhole riser section with a connected concrete slab. **C 822, C13**
- manhole base section**—precast concrete slab foundation and the bottom manhole riser section, or the bottom riser section with precast monolithic or integral slab. A monolithic base section is cast as a single unit. An integral base section is made into a single unit by interconnecting precast manhole components such as a riser section and base slab. **C 822, C13**
- manhole reducer section**—a concrete section used as a transition between different diameter manhole riser sections. **C 822, C13**
- manhole riser section**—a concrete section used to construct a manhole exclusive of the base, reducers, and top section. **C 822, C13**
- manhole top**—the concrete slab top or conical top used to reduce the manhole riser diameter to that of the desired access hole. **C 822, C13**
- manifest*—see **hazardous-waste manifest**. **E 631, E06**
- manifest**—a document specifying, in detail, the items carried on a transportation conveyance for a specific destination. **E 2135, E53**
- manifold*—see **grout header**. **D 653, D18**
- manifold**—an enlarged pipe with connections available to the individual feed, brine, air and product ports. **D 6161, D19**
- manifold**—to make many or several copies. **F 221, F05**
- manifolding performance**—the intensity and sharpness of the image as a function of the number of carbon copies produced in one typing or writing. **F 221, F05**
- manifold paper, n**—a lightweight paper used primarily for copies by interleaving with carbon paper. **D 1968, D06**
- manipulation resistant lock**—a combination lock designed so as to resist manipulation. **F 471, F12**
- man-made fiber, n**—a class name for various genera of filament, tow or staple produced from fiber forming substances which are chemically synthesized or modified. (Syn. **manufactured fiber**) **D 123, D13**
- mannan**—strictly, a polysaccharide composed entirely of mannose units, but used conventionally to distinguish the hexosan wood hemicelluloses from the pentosans (xylan). (see also **galactoglucomannan** and **glucomannan**) **D 1695, D01**
- mannogalactan*—see **galactomannan**. **D 1695, D01**
- manufacture, n**—all operations of receipt of materials, production, packaging, repackaging, labeling, relabeling, quality control, release, storage, and distribution of APIs or drug products and related controls. **E 2363, E55**
- manufacture, v**—“any or all steps in the recovery, screening, testing, processing, storage, labeling, packaging or distribution of any human cellular or tissue-based product.” **F 2312, F04**
- manufactured building*—a structure wholly or substantially made in a manufacturing plant for installation or assembly at the building site. **E 631, E06**
- manufactured building*—See **building**. **E 631, E06**
- manufactured carbon, n**—a bonded granular carbon body whose matrix has been subjected to a temperature typically between 900 and 2400°C. **C 709, D02**
- manufactured carbon, n**—a bonded granular carbon body whose matrix has been subjected to a temperature typically between 900 and 2400°C. **D 4175, D02**
- manufactured fiber, n**—a class name for various genera of filament, tow, or staple produced from fiber forming substance which may be (1) polymers synthesized from chemical compound, (2) modified or transformed natural polymers, or (3) glass. (See **man-made fiber**) **D 123, D13**
- manufactured graphite, n**—a bonded granular carbon body whose matrix has been subjected to a temperature typically in excess of 2400°C and whose matrix is thermally stable below that temperature. **C 709, D02**
- manufactured graphite, n**—a bonded granular carbon body whose matrix has been subjected to a temperature typically in excess of 2400°C and whose matrix is thermally stable below that temperature. **D 4175, D02**
- manufactured home*—a **manufactured building** intended to be used as a **dwelling**. **E 631, E06**
- manufactured home*—See **building**. **E 631, E06**
- manufactured masonry unit, n**—a manmade noncombustible building product intended to be laid by hand and joined by mortar, grout, or other methods of joining. **C 1232, C15**

manufactured sand, *n*—fine aggregate produced by crushing rock, gravel, iron blast-furnace slag, or hydraulic-cement concrete.

C 125, C09

manufactured staple fiber, *n*—fiber of spinnable length manufactured directly or by cutting filaments.

D 123, D13

manufactured unit, *n*—a quantity of finished adhesive or finished adhesive component, processed at one time. (Compare **batch**.)

D 907, D14

manufacturer, *n*—*as related to corrugated metal pipe*, the organization that produces the metal sheet from which pipe is made.

A 902, A05

manufacturer, *n*—the organization responsible for the conversion of materials into products meeting the requirements of a product specification.

A 941, A01

manufacturer—the group, corporation, partnership, or individual that manufactures or supplies a product.

C 822, C13

manufacturer, *n*—the party that manufactures, fabricates, or produces materials or products.

C 1154, C17

manufacturer, *n*—*for pipe laying*, the party that manufactures, fabricates, or produces materials or products.

D 2946, C17

manufacturer, *n*—any person, including any repacker or relabeler, or both, who manufactures, fabricates, assemblies, or reprocesses a finished device. (See “Good Manufacturing Practices,” Part 807 Code of Federal Regulations 6.)

E 344, E20

manufacturer, *n*—*of a tire*, the name of a company or wholly owned subsidiary making the tire.

F 538, F09

manufacturer—*see fastener manufacturer*.

F 1789, F16

manufacturer’s joint—*See container*.

D 996, D10

manufacturer’s leather—*see factory sole leather*.

D 1517, D31

manufacturer’s seam—joint produced by corrugated box manufacturer during container fabrication.

F 592, F16

manufacturing imperfections—includes all defects or blemishes that are produced in manufacturing, such as chipped grain, loosened grain, raised grain, torn grain, skips in dressing, hit and miss, variation in sawing, miscut lumber, machine burn, machine gouge, mismatching, and insufficient tongue or groove.

D 9, D07

manufacturing lot, *n*—(1) in the case of continuous manufacturing processes, a *lot* is a specifically identified amount produced in a unit of time or quantity in a manner that assumes its having uniform characteristics and quality within specified limits. (2) In the case of batch processes, a *lot* means a batch or specifically identified portion of a batch assumed to have uniform characteristics and quality within specified limits.

E 344, E20

manufacturing lot—in the case of continuous manufacturing process, a *lot* is a specific identified amount produced in a unit of time or quantity in a manner that assures its having uniform character and quality within specified limits. In the case of batch process, a *lot* means a batch or specific identified portion of a batch having uniform character and quality within specified limits.

E 344, E20

manufacturing process, *n*—a set of activities or operations performed to deliver a desired output.

E 2363, E55

manuscript, *n*—*see handprinting*.

E 2195, E30

map cracking, *n*—a series of interconnected cracks that extend only into the upper portion of the slab.

E 867, E17

map cracking, *n*—a series of interconnected cracks that extend only into the upper portion of the slab.

E 1778, E17

mar—mutilation of polish film repairable only by recoating.

D 2825, D21

mar, *n*—a mark made on the flooring surface by the deposition of material from friction or rubbing of traffic bodies against the surface.

F 141, F06

maraging, *n*—a precipitation hardening treatment applied to a special group of **alloy steels** to precipitate one or more intermetallic compounds in a matrix of essentially carbon-free martensite.

A 941, A01

marble (I calcite, II dolomite)—carbonate rock that has acquired a distinctive crystalline texture by recrystallization, most commonly

by heat and pressure during metamorphism, and is composed principally of the carbonate minerals calcite and dolomite, singly or in combination.

C 119, C18

marbleized finish—a surface appearance, obtained by coloring and graining, that resembles variegated marble.

C 286, B08

marcelling—a process whereby either a uniform helix or a series of waves put in a wire to facilitate tensioning the wire when installed to support the top or bottom or both, of the chain link fence fabric (that is, marcelled tension wire). See **tension wire** and Specification A 824.

F 552, F14

marching modulus curve, *n*—a type of vulcanization during which the increasing modulus does not reach a maximum value.

D 1566, D11

margin—the distance between any boundary of the printing area and the nearest parallel paper edge.

F 149, F05

marginal cost (benefit)—*See incremental cost (benefit)*.

E 631, E06

marginal cost (benefit)—*See incremental cost (benefit)*.

E 833, E06

marine—relating to the ocean.

F 1600, F20

marine board, *n*—an insulation board of $750 \pm 100 \text{ kg/m}^3$ density that meets the noncombustibility criteria of 46 CFR 164.009.

E 176, E05

marine cryopeg—a layer or body of unfrozen ground, in which the temperature is perennially below 0°C , which forms part of coastal or sub-sea permafrost.

D 7099, D18

markers—the electronically generated time pulses or other indicators that are used on the instrument display to measure distance or time.

E 1316, E07

market package, *n*—a service-oriented perspective to the National ITS Architecture, including subsystems (with applicable equipment packages) and architecture flows.

E 867, E17

marking, *n*—*in packaging*, the application of numbers, letters, **labels**, **tags**, symbols or colors to provide identification and to expedite handling during shipment and storage. (Compare **code**.)

D 996, D10

marking, *n*—the removal of printed ink from the web to idler rolls, turn bars, or nose cone on a printing press.

D 6488, D01

marking, marker head—*See lettered head, numeral head*.

F 547, F16

marking nail—*See dating nail, marking head, numeral head*.

F 547, F16

marking position—the area designated to mark information on a mark read form. Also called a **responseposition**.

F 149, F05

mark of conformity, (for certification)—protected mark, applied or issued under the rules of a certification system, indicating that adequate confidence is provided that the relevant product, process or service is in conformity with a specific standard or other normative document, (ISO Guide 2).

E 1187, E36

markoff—an indentation or imprinting of the skin surface due to any cause (such as foreign matter between mating parts, improper tooling, mismatch of detail parts, etc.).

E 631, E06

markoff—an indentation or imprinting of the skin surface due to any cause (such as foreign matter between mating parts, improper tooling, mismatch of detail parts, etc.).

E 1749, E06

mark reading—machine reading, by optical means, of marks (usually vertical or horizontal bars) that have been manually entered.

F 149, F05

mark scanning—the automatic optical sensing of marks usually recorded manually on a data medium.

F 149, F05

mark sensing—machine reading of marks (usually pencil strokes) on a punched card, by using the conductive properties of the mark itself.

F 149, F05

marl—calcareous clay, usually containing from 35 to 65 % calcium carbonate (CaCO_3).

D 653, D18

mar resistance, *n*—(1) ability of a coating to resist visual damage caused by light abrasion, impact, or pressure. (2) resistance of the surface of the coating to permanent deformation resulting from the application of a dynamic mechanical force.

D 16, D01

marsh—a wetland characterized by grassy surface mats which are

marsh

frequently interspersed with open water or by a closed canopy of grasses, sedges, or other herbaceous plants. **D 653, D18**

martempering, n—quenching an austenitized steel object in a medium at a temperature in the upper part of, or slightly above, the **martensiterange**, holding it in the medium until its temperature is substantially uniform throughout, and then cooling it in air through the **martensite range**. **A 941, A01**

martensite—metastable phase resulting from the diffusionless athermal decomposition of austenite below a certain temperature known as the M_s temperature (martensite start temperature). It is produced during quenching when the cooling rate of a steel, in the austenitic condition, is such that the pearlite and bainite, or both, transformation is suppressed. The composition of the martensite is identical with that of the austenite from which it transformed. Hence, martensite is a super-saturated solid solution of carbon in alpha iron (ferrite) having a body-centered tetragonal lattice. It is a magnetic plate-like constituent formed by a diffusionless shear type of transformation. These plates may appear needle-like or veriform in cross-section. **E 7, E04**

martensite, n—the lowest temperature phase in Ni-Ti shape memory alloys. **F 2005, F04**

martensite finish temperature (M_f), n—the temperature at which the transformation from austenite to martensite is completed on cooling in a single-stage transformation or the temperature at which the transformation from R-phase to martensite is completed on cooling in a two-stage transformation. **F 2005, F04**

martensite peak temperature (M_p), n—the temperature of the exothermic peak position on the DSC curve upon cooling for the austenite to martensite transformation or the R-phase to martensite transformation. **F 2005, F04**

martensite range, n—the temperature interval between M_s and M_f . **A 941, A01**

martensite start temperature (M_s), n—the temperature at which the transformation from austenite to martensite begins on cooling in a single-stage transformation or the temperature at which the transformation from R-phase to martensite begins on cooling in a two-stage transformation. **F 2005, F04**

martensitic—a plate-like constituent having a similar appearance and mechanisms of formation to that of martensite. **E 7, E04**

martensitic alloys—iron-chromium alloys with 12% to 17% chromium and sufficient carbon to permit strengthening by conventional heat treatment. **F 1789, F16**

marver—(1) a flat plate on which a hand gather of glass is rolled, shaped, and cooled.

(2) also the process of doing same. **C 162, C14**

marsh—the mixture of sugars, nutrients, and water that is capable of being fermented by microorganisms such as yeast in ethanol fermentation. **E 1705, E48**

masked area, n—a portion of the exposed specimen which is protected from light exposure by masking. (See also **control**.) **G 113, G03**

masking—various materials applied to specific areas of parts to prevent coating from being deposited. **B 374, B08**

masking, n—the phenomenon where one quality within a mixture obscures one or several other qualities present. **E 253, E18**

masking—in leak testing, the covering of a section of a test object so as to prevent tracer gas from entering leaks that may exist in the covered section. **E 1316, E07**

masking power—the ability of a fired glaze to mask visually the body on which it is applied. **C 242, C21**

masonry, n—the type of construction made up of masonry units laid with mortar, grout, or other methods of joining. **C 1232, C15**

masonry, n—construction, usually set in mortar, of natural building stone or manufactured units such as brick, concrete block, adobe, glass block, tile, manufactured stone, or gypsum block. **E 631, E06**

masonry cement, n—a hydraulic cement for use in mortars for masonry construction, containing one or more of the following

materials: portland cement, portland blast furnace slag cement, portland-pozzolan cement, natural cement, slag cement, or hydraulic lime; and in addition usually containing one or more materials such as hydrated lime, limestone, chalk, calcareous shell, talc, slag, or clay as prepared for this purpose. **C 11, C11**

masonry cement, n—a hydraulic cement manufactured for use in mortars for masonry construction or in plasters, or both, which contains a plasticizing material and, possibly, other performance-enhancing addition(s). **C 219, C01**

masonry nail—plain, electro-zinc-plated or galvanized, hardened-steel, knurled (longitudinally or nearly longitudinally threaded or fluted), $\frac{1}{2}$ to 4 by 0.148 or up to 0.250-in. nails with flat or checkered $\frac{5}{16}$ to $\frac{9}{16}$ -in. head and medium diamond point. **F 547, F16**

masons hydrated lime—hydrated lime suitable for use for masonry purposes. **C 51, C07**

masons quicklime—quicklime suitable (after slaking to a lime putty) for use for masonry purposes. **C 51, C07**

mass, n—the quantity of matter in a body. (See also **weight**.) **D 123, D13**

mass, n—the quantity of matter in a body. (See also **weight**.) **D 4849, D13**

mass:

analyzer—a device for dispersing ions as a function of their mass-to-charge ratio.

resolution—the ratio $M/\Delta M$ where ΔM is the full width at half-maximum peak height for the ion peak of mass M .

resolving power—the peak-to-valley ratio between adjacent, equal-sized peaks, separated by one mass unit.

spectrum—a plot of the measured ion signal as a function of mass-to-charge ratio. **E 673, E42**

mass-absorption coefficient—See **absorption coefficient**. **E 7, E04**

mass, active, m_1 —the effective value of mass, which may be used with values of ℓ_1 , and A' to evaluate a magnetic core as though it has an equivalent uniform flux path having the same induction at all points. **A 340, A06**

mass attenuation coefficient—a measure of the fractional decrease in radiation beam intensity per unit of surface density $\text{cm}^2\text{-gm}^{-1}$. **E 1316, E07**

mass burning rate, n—mass loss per unit time by materials burning under specified conditions. **E 176, E05**

mass color, n—the color, when viewed by reflected light, of a pigment-vehicle mixture of such thickness as to obscure completely the background. Sometimes called over-tone or mass-tone. **D 16, D01**

mass concentration—See **concentration**. **D 1356, D22**

mass concentration—the mass of a specified component or phase, per unit mass or unit volume of total. **E 1605, E06**

mass concentration, n—in multi-component or multi-phase mixtures, the mass of a specified component or phase per unit mass or unit volume of the total. (See also **particle concentration**.) **G 40, G02**

mass concentration—which see. **G 40, G02**

mass energy-absorption coefficient, μ_{en}/ρ —of a material for uncharged ionizing particles, the product of the mass energy transfer coefficient, μ_{tr}/ρ , and $(1-g)$, where g is the fraction of the energy of secondary charged particles that is lost to bremsstrahlung in the material (ICRU).

$$(\mu_{en}/\rho) = (\mu_{tr}/\rho)(1 - g)$$

Unit: $\text{m}^2 \cdot \text{kg}^{-1}$

E 170, E10

mass energy-transfer coefficient (μ_{tr}/ρ)—of a material for uncharged ionizing particles, the quotient of dE_{tr}/EN by ρdl , where E is the energy of each particle (excluding rest energy), N is the number of particles, and dE_{tr}/EN is the fraction of incident particle energy that is transferred to kinetic energy of charged particles by interactions in transversing a distance dl in the material of density ρ (ICRU).

$$(\mu_{tr}/\rho) = 1/\rho EN \cdot dE_{tr}/dl$$

Unit: $\text{m}^2 \cdot \text{kg}^{-1}$

E 170, E10

mass-fiber—asbestos that is randomly oriented in situ. D 2946, C17**massive-agglomerate cryostructure**—the cryostructure of frozen silt or loam in which ice veins form an irregular three-dimensional network. D 7099, D18**massive cryostructure**—the cryostructure of frozen ground in which all of the mineral particles are bonded together with ice. D 7099, D18**massive ice**—a comprehensive term used to describe large masses (at least 10 to 100 cm) of underground ice, including ice wedges, pingo ice, buried ice and dominantly horizontal ice beds. Massive ice beds typically have an ice content of at least 250 % (on an ice-to-dry-soil weight basis). If the ice content is less than 250 %, the beds are better termed "massive icy beds." Massive ice beds have a minimum thickness of 0.3 m. Some massive ice beds are more than 40 m thick and several kilometres in horizontal extent. Ice beds less than 0.3 m thick are better termed ice lenses. D 7099, D18**massive-porous cryostructure**—the cryostructure of frozen sand and gravel in which all of the mineral particles and bonder together with ice, but in which larger pore spaces are not completely filled with ice. D 7099, D18**mass loading**—lead concentration in units of mass per unit area. E 1605, E06**mass loss concentration, n**—the mass loss of a test specimen per unit exposure chamber volume in $\text{g} \cdot \text{m}^{-3}$. E 176, E05**mass median size, n**—a measurement of particle size for samples of particulate matter, consisting of that diameter such that the mass of all larger particles is equal to the mass of all smaller particles. D 1356, D22**mass number**—the whole number nearest to the atomic mass expressed in either atomic mass units or as (chemical) atomic weight. E 1316, E07**mass optical density, n**—the ratio of the optical density of smoke and the mass loss of the test specimen, multiplied by the volume of the test chamber and divided by the length of the light path. E 176, E05**mass scattering coefficient**—that part of the mass absorption coefficient due to scattering. E 7, E04**mass spectrometer leak detector**—a mass spectrometer adjusted to respond only to the tracer gas. E 1316, E07**mass spectrometer (M.S.)**—an instrument that is capable of separating ionized molecules of different mass to charge ratio and measuring the respective ion currents. The mass spectrometer may be used as a vacuum gage that relates an output which is proportioned to the partial pressure of a specified gas, as a leak detector sensitive to a particular tracer gas, or as an analytical instrument to determine the percentage composition of a gas mixture. Various types are distinguished by the method of separating the ions. The principal types are as follows:(a) *Dempster (M.S.)*—The ions are first accelerated by an electric field through a slit, and are then deflected by a magnetic field through 180° so as to pass through a second slit.(b) *Bainbridge-Jordan (M.S.)*—The ions are separated by means of a radial electrostatic field and a magnetic field deflecting the ions through 60° so arranged that the dispersion of ions in the electric field is exactly compensated by the dispersion in the magnetic field for a given velocity difference.(c) *Bleakney (M.S.)*—The ions are separated by crossed electric and magnetic fields. Also called cross fields (M.S.).(d) *Nier (M.S.)*—A modification of the Dempster (M.S.) in which the magnetic field deflects the ions.(e) *Time of Flight (M.S.)*—The gas is ionized by a pulse-modulated electron beam and each group of ions is accelerated toward the ion collector. Ions of different mass to charge ratios traverse their paths in different times.(f) *Radio-Frequency (M.S.)*—The ions are accelerated into a radio-frequency analyzer in which ions of a selected mass to

charge are accelerated through openings in a series of spaced plates alternately attached across a radio-frequency oscillator. The ions emerge into an electrostatic field which permits only the ions accelerated in the analyzer to reach the collector.

(g) *Omegatron (M.S.)*—The ions are accelerated by the cyclotron principle. E 1316, E07**mass spectrum**—a record, graph, table, and so forth, that shows the relative number of ions of various mass that are produced when a given substance is processed in a mass spectrometer. E 1316, E07**mass strength, n**—a measure of the tendency for carbon black pellets to pack together and to influence flow in a bulk handling system. D 3053, D24**mass-tone**—see **mass color**. D 16, D01**masstone, n**—in paint technology, a pigment-vehicle mixture containing a single colorant only. E 284, E12**mass, total, m**—the actual mass of a magnetic core. A 340, A06**mass transfer coefficient (MTC)**—mass (or volume) transfer through a membrane based on driving force. D 6161, D19**mass transfer zone (adsorption zone)**—the region in which the concentration of the adsorbate of interest in the fluid decreases from influent concentration to the lowest detectable concentration. D 2652, D28**mass unit weight**—see **unit weight**. D 653, D18**mass wasting**—downslope movement of soil or rock, on or near the ground surface, due to gravity. D 7099, D18**master**—an intermediate, temporary, and usually expendable image vehicle for use on duplicators. F 335, F05**master alloy**—an alloy rich in one or more desired addition elements that is added to a melt to raise the percentage of a desired constituent. B 374, B08**master-alloy powder, n**—a powder with high alloy concentration, designed to be diluted when mixed with a base powder to produce the desired composition. B 243, B09**masterbatch, n**—a homogeneous mixture of rubber and one or more materials in known proportions for use as a raw material in the preparation of the final compounds. D 1566, D11**master composite sample, n**—for *asbestos*, not less than two and not more than ten composite samples so combined and reduced as to form a test sample that represents a lot that consists of more than 200 bags but not more than 2000 bags. D 2946, C17**MasterFormat**—a standard sequence of numbers and titles for organizing information about construction requirements, products, and activities (source 1995 edition of MasterFormat, published by CSI). E 631, E06**MasterFormat, n**—a standard sequence of numbers and titles for organizing information about construction requirements, products, and activities (source 1995 edition of MasterFormat, published by CSI). E 833, E06**master set, n**—a selected group of witness tires, each with different test response characteristics to provide a range of values for the measured property or properties. F 538, F09**mastic, n**—a material of relatively viscous consistency that dries or cures to form a protective finish, suitable for application to thermal insulation in thickness greater than 30 mils (0.76 mm) per coat. C 168, C16**mastic, n**—see **mastic adhesive**. D 907, D14**mastic**—See **flashing cement and asphalt mastic**. D 1079, D08**mastic adhesive, n**—a gap-filling adhesive applied as a paste or putty-like material. (Also called *mastic*.) D 907, D14**mastication, n**—a breakdown or softening of raw rubber, or a mix by the combined action of mechanical work (shear) and atmospheric oxygen, sometimes accelerated by the use of a peptizer and frequently at elevated temperatures. D 1566, D11**mat**—a glass-fiber product of felt-like nature. C 162, C14**mat, n**—a fibrous material consisting of randomly oriented chopped or swirled filaments loosely held together with a binder. D 883, D20

mat—a random arrangement of fine fibers uniformly distributed to form a thin, highly porous, felt-like material. **E 631, E06**

mat—a random arrangement of fine fibers uniformly distributed to form a thin, highly porous, felt-like material. **E 1749, E06**

Matadero hides—Argentinian cattlehides corresponding roughly to city butcher or small packer hides in the United States. **D 1517, D31**

match, n—see color match. **E 284, E12**

match, v—to provide, by selection, formulation, adjustment, or other means, a trial color that is indistinguishable from, or within specified tolerances of, a specified standard color under specified conditions. **E 284, E12**

matched lumber—See **lumber**. **D 996, D10**

matched pairs, n—a set of positive and negative thermoelements chosen so that a thermocouple fabricated from these thermoelements will match a specified temperature-electromotive force relationship to within a specified tolerance, at the time of first use. **E 344, E20**

matched test sieve, n—a test sieve that reproduces the results of a master test sieve within defined limits for a designated material. **E 1638, E29**

matching—Under **lumber** see *matched lumber*. **D 9, D07**

matching—*in plywood*, the arrangement of strips of veneer to obtain a particular repetitive pattern.

book matching—turning alternative adjacent strips of veneer of a flitch over.

mismatching—making sheets of face veneer from specially selected dissimilar (in color or grain or both) strips of veneer.

reversed matching—turning alternate adjacent strips of veneer of a flitch end for end; also called “swing matching.”

slip matching—laying adjacent strips of veneer tight side up without turning; also called “slide matching.” **D 1038, D07**

matching, n—the process of equating or relating stimuli, usually to determine the similarity between standard and unknown or between unknowns. **E 253, E18**

mated mechanical transfer—a system requiring a CB donor sheet, usually a colored or black pigmented layer which may be bound or covered by a protective material and a CF receptor sheet on which an image is produced on application of pressure. **F 549, F05**

mated transfer paper—a transfer paper requiring two different coatings to come into contact to develop an image. **F 549, F05**

material, n—*in homesewing*, a planar structure such as textile fabric, plastic film, or leather **D 123, D13**

material, n—a quantity of carbon black with unique composition and characteristics. **D 3053, D24**

material, n—*in home sewing*, a planar structure such as textile fabric, plastic film, or leather. **D 4965, D13**

material, n—single substance, or uniformly dispersed mixture, for example metal, stone, timber, concrete, mineral fiber, or polymer. **E 176, E05**

material—moveable property that may be consumed or expended. **E 2135, E53**

material, n—a general term used to denote raw materials (starting materials, reagents, solvents), process aids, intermediates, APIs, and packaging and labeling materials. **E 2363, E55**

material form—the contour, arrangement, and structure of an unconsolidated composite material, especially with regard to the geometry and nature of the reinforcement. Factors considered part of the material form include, but are not limited to: reinforcement diameter, reinforcement length (for discontinuous reinforcements), tow size or count, fabric areal weight, fabric style, reinforcement content, and ply thickness. **D 3878, D30**

material, generic, n—is one for which a nationally recognized Standard Specification exists. **E 176, E05**

material lap—longitudinal surface discontinuity extending into rod, bar, or wire, caused by doubling over of metal during hot rolling. **F 1789, F16**

material proprietary, n—is one whose fire performance characteristics are determined in consideration of a formulation or process of production that is proprietary. **E 176, E05**

material requirements list—a type of bill of material used in material requirements planning systems. **E 2135, E53**

material review—evaluation by a team of fastener experts to determine the fasteners’s fitness for general use, fitness for intended use, or fitness for specified use. **F 1789, F16**

material safety data sheet (MSDS)—written or printed material concerning a hazardous substance which is prepared by chemical manufacturers, importers, and employers for hazardous chemicals pursuant to OSHA’s Hazard Communication Standard, 29 CFR 1910.1200. **D 5681, D34**

material specification—proprietary or consensus standards document which defines the material, acceptable chemical limits, and other requirements used in fastener manufacturing. **F 1789, F16**

material test report—written document or electronic record, signed by an authorized party, attesting that the raw material is in accordance with specified requirements, including the actual results of all required chemical analyses, tests, and examinations. **F 1789, F16**

material tests—the quality and property tests of component materials. **C 822, C13**

material transfer—a general term to describe the carry-over of material from one electrical contact to another.

NOTE—When the discussion becomes specific, the term “gain” or “loss” is used with respect to a particular contact (for d-c application, anode or cathode; for a-c application, stationary contact or movable contact). For example, anode gain, anode loss, stationary contact gain. **B 542, B02**

material transfer, bridge—material transfer that occurs without the presence of a gaseous electric discharge. The filament of molten contact material that connects the two separating contacts does not rupture in the middle; thus there is a gain of material on one contact and a loss of material from the other. **B 542, B02**

material transfer, cathode—movement of contact metal from the cathode by means of a cathode arc. **B 542, B02**

material transfer, needle—material transfer that results in a buildup with a smaller diameter and a relatively great length. **B 542, B02**

material transfer, negative—see **material transfer**. **B 542, B02**

material transfer, positive—see **material transfer**. **B 542, B02**

maternity wear, n—clothing worn during pregnancy. **F 1494, F23**

mat finish—smooth dull finish applied to leather for shoe uppers, handbags, belts, etc. **D 1517, D31**

mat finish (matte finish)—a dull finish. **B 374, B08**

mat-formed particleboard—a particleboard in which the coated particles are formed first into a mat having substantially the same length and width as the finished board before being flat-platen pressed. **D 1554, D07**

mat glaze—See *mat glaze* under **glaze**. **C 242, C21**

mathematical/analytical (M/A) technique—a technique of obtaining probability functions for economic measures of project worth without the repeated trials of simulation. **E 631, E06**

mathematical/analytical (M/A) technique, n—a technique of obtaining probability functions for economic measures of project worth without the repeated trials of simulation. **E 833, E06**

mathematical model—the representation of a physical system by mathematical expressions from which the behavior of the system can be deduced with known accuracy. (ISRM) **D 653, D18**

mat reinforcement—see **quadrant mat**. **C 822, C13**

matric potential—the energy required to extract water from a soil against the capillary and adsorptive forces of the soil matrix. **D 653, D18**

matric suction—for isothermal soil systems, matric suction is the

pressure difference across a membrane separating soil solution, in-place, from the same bulk (see **soil-water pressure**).

D 653, D18

matrix—See **mandrel**.

B 374, B08

matrix, *adj*—a descriptive term for a textile fiber in which one or more polymeric fibrous material(s) is dispersed in another.

D 123, D13

matrix—*in grouting*, a material in which particles are embedded, that is, the cement paste in which the fine aggregate particles of a grout are embedded.

D 653, D18

matrix, *n*—the part of an adhesive which surrounds or engulfs embedded filler or reinforcing particles and filaments.

D 907, D14

matrix, *n*—substance in which the analyte or property exists.

D 1129, D19

matrix, *n*—the continuous constituent of a composite material, which surrounds or engulfs embedded filler or reinforcement.

D 3878, D30

matrix, *adj*—a descriptive term for a textile fiber in which one or more polymeric fibrous material(s) is dispersed in another.

D 4466, D13

matrix—the continuous phase.

E 7, E04

matrix, *n*—*in methods of chemical analysis*, all components of a material except the analyte.

E 135, E01

matrix—the essentially homogenous phase in a composite material in which reinforcements such as fibers, filaments, particles, etc., are embedded.

E 631, E06

matrix—the type of material such as dust, paint, or soil, in which lead in a sample is contained.

E 1605, E06

matrix—the essentially homogeneous phase in a composite material in which reinforcements such as fibers, filaments, particles, etc., are embedded.

E 1749, E06

matrix array, *n*—a set of rows and columns of transductive elements able to convert the quantity of light received to a relatively-sized modulated electrical signal. Distinguished from a linear array. (See **photodiode array (matrix)**.)

F 1294, F05

matrix content—the amount of matrix present in a composite expressed either as percent by weight or percent by volume. For polymer matrix composites this is resin content.

D 3878, D30

matrix effect—a change in an instrument reading of an analyte level caused by materials in the matrix other than the analyte.

E 1605, E06

matrix effects:

Auger—any change of an Auger spectrum (for example, shape or signal strength) due to the physical environment (for example, amorphous/crystalline, thin layer/thick layer, or rough/smooth surface) of the emitting element and not due to chemical bonding or changes in concentration.

SIMS—any change in the secondary ion yields which are caused by changes in the chemical composition or structure of a particular specimen.

AES—see **Auger**.

E 673, E42

matrix metal, *n*—the continuous phase of a polyphase alloy or mechanical mixture; the physically continuous metallic constituent in which separate particles of another constituent are embedded.

B 243, B09

matrix spike—an aliquot of the sample spiked with known levels of the target analytes.

D 5681, D34

matrix symbols, *n*—an arrangement of regular polygon shaped cells where the center-to-center distance of adjacent elements is uniform and the arrangement of cells represents data or symbology functions, or both.

F 1294, F05

matte, *n*—lacking luster or gloss. Synonymous with "flat" in paint terminology.

E 284, E12

matte glaze—a glaze which does not exhibit specular reflection.

C 242, C21

matting, *n*—*for pile yarn floor covering*, loss of tuft definition due to entanglement

D 123, D13

matting, *n*—*for pile yarn floor coverings*, loss of tuft definition due to entanglement.

D 5684, D13

mattress, *n*—a mattress is a ticking (outermost layer of fabric or related material) filled with a resilient material, used alone or in combination with other products, intended or promoted for sleeping upon.

E 176, E05

mattress blade—special clinching blade for fastening sisal pads in bedding plants, permitting stapling inside edging wire.

F 592, F16

maturation (latex), *n*—controlled storage of compounded latex before processing, which allows stabilization and escape of air bubbles, optimizes dispersion of ingredients, and allows partial pre-vulcanization of rubber particles.

D 1566, D11

mature fibers, *n*—(cotton fibers treated with sodium hydroxide solution)—fibers that have swollen into unconvoluted and almost rod-like shapes, where total wall width is equal to or greater than the lumen width.

D 123, D13

mature fibers, *n*—(cotton fibers observed under polarized light)—fibers that appear yellow, yellow green, or green and are yellow or light yellow upon rotation to the subtractive position (through 90°) and show little or no parallel extinction on removal of the selenite plate. (Compare **immature fibers**.)

D 123, D13

mature fibers, *n*—*cotton fibers treated with sodium hydroxide solution*—fibers that have swollen into unconvoluted and almost rod-like shapes, where total wall width is equal to or greater than the lumen width.

D 7139, D13

mature fibers, *n*—*cotton fibers observed under polarized light*—fibers that appear yellow, yellow green, or green and are yellow or light yellow upon rotation to the subtractive position (through 90°) and show little or no parallel extinction on removal of the selenite plate. (Compare **immature fibers**.)

D 7139, D13

maturing range—the time-temperature range within which a ceramic body, glaze, or other composition may be fired to yield specified properties.

C 242, C21

maturing temperature—the temperature at which porcelain enamel must be held for a selected time to achieve the desired properties.

C 286, B08

maturing temperature, *n*—the temperature, as a function of time and bonding condition, that produces desired characteristics in bonded components.

D 907, D14

maturity, *n*—the extent of the development of a property of a cementitious mixture.

C 125, C09

maturity function, *n*—a mathematical expression which uses the measured temperature history of a cementitious mixture during the curing period to calculate an index that is indicative of the maturity at the end of that period.

C 125, C09

maturity index, *n*—an indicator of maturity which is calculated from the temperature history of the cementitious mixture by using a maturity function.

C 125, C09

maturity index, *n*—a relative indication of cotton fiber maturity.

D 123, D13

maturity index, *n*—a relative indication of cotton fiber maturity.

D 7139, D13

maximum allowable particle size, *n*—the largest lineal dimension of a sample's individual particles accepted for a given sample mass.

D 5681, D34

maximum amplitude (L , LT^{-1} , LT^{-2})—deviation from mean or zero point.

D 653, D18

maximum bend moment—the greatest moment applied to a needle during a bend test.

F 1840, F04

maximum curve—in a phase diagram, a univariant line, tracing the meetings of a pair of bivariate surfaces at intermediate composition and coinciding with their highest temperature at each pressure level, or their highest pressure at each temperature level; congruent transformation occurs everywhere along a maximum curve.

E 7, E04

maximum density (maximum unit weight)—see **unit weight**.

D 653, D18

maximum draft—maximum vertical dimension of the boom below the water line.

F 818, F20

maximum dynamic load

maximum dynamic load—sum of all instantaneous dynamic loads including those due to acceleration, wave forces, and so forth.

F 818, F20

maximum elongation, El_{max} , n —the elongation at the time of fracture, including both elastic and plastic deformation of the tensile specimen.

E 6, E28

maximum erosion rate, n —in cavitation and liquid impingement erosion, the maximum instantaneous erosion rate in a test that exhibits such a maximum followed by decreasing erosion rates. (See also **erosion rate-time pattern**.)

G 40, G02

maximum force, P_{max} [F]—in fatigue, the highest algebraic value of applied force in a cycle. By convention, tensile forces are positive and compressive forces are negative.

E 1823, E08

maximum hardness—hardness specified in fastener standards above which the fastener is considered nonconforming to the standard.

F 1789, F16

maximum heating temperature, n —the maximum temperature, as recommended by the manufacturer, to which a hot-applied sealant or filler for pavement cracks or joints can be heated while conforming to all specification requirements and result in appropriate application characteristics.

D 5535, D04

maximum image area, n —the portion on a page which can be printed. (See **percent coverage** and **image area**.)

F 1457, F05

maximum inflation pressure, n —for inflatable restraints, the maximum internal cushion pressure occurring after breakout pressure.

D 123, D13

maximum inflation pressure, n —for inflatable restraints, the maximum internal cushion pressure occurring after breakout pressure.

D 6799, D13

maximum joint width, n —the widest opening of an installed joint system.

E 176, E05

maximum life expectancy, LE-1000, n —for paper, a paper is expected to be usable for 1000 years.

D 1968, D06

maximum life expectancy paper, LE-1000, n —for paper, a paper expected to be usable for 1000 years when stored under prescribed conditions.

D 1968, D06

maximum load rating [M], n —of a passenger tire the load rating at the maximum permissible cold inflation pressure for that tire.

F 538, F09

maximum (non-statistical), n —the highest acceptable actual test result; any valid individual test result above the maximum is cause for rejection of the component or material lot being tested.

$$\text{All } x_i \leq \text{Maximum} = USL$$

A 644, A04

maximum operating distance from outlet, n —the maximum operating distance of the vacuum cleaner from the supply outlet is the straight line measured distance from the front of the nozzle to the face of the cord input plug or to the face of the wall outlet (see Discussion) in the case of a central vacuum cleaning system, with the maximum straight line extension from the front of the cleaning system nozzle in the operating position parallel to and touching the floor.

F 395, F11

maximum page length, n —the maximum number of lines of text or graphic equivalent which a printer can output onto a sheet of paper; this value can be set by either the printer or the computer, or both.

F 1457, F05

maximum permissible errors, n —of a thermometer or thermometric system, extreme values permitted by regulation or specification of the difference between the indication of a thermometer or thermometric system and the true value of temperature.

E 344, E20

maximum plunger travel, [L], n —in tire testing, the relative displacement of tread surface by a plunger, measured from the point of initial contact of the plunger with the tread surface to the point of maximum force at rupture or at the bottom-out point.

F 538, F09

maximum point—that composition and temperature, or pressure, at which a heterogeneous equilibrium occurs at its highest temperature, or pressure, when this does not coincide with one of the composition limits of the equilibrium, that is, when it occurs at an

intermediate composition; the equilibrium becomes congruent (univariant) at the maximum point.

E 7, E04

maximum pore diameter, n —in gas diffusion, the diameter of a capillary of circular cross section which is equivalent (with respect to surface tension effects) to the largest pore of the diffuser under consideration.

D 4175, D02

maximum power, n —of a photovoltaic device, the electrical output when operated at a point where the product of current and voltage is maximum.

E 1328, E44

maximum principal tensile stress (MPTS)—a maximum calculated tensile stress based on strain gage measurements.

E 631, E06

maximum print position, n —the rightmost point at which the printer can mark the paper.

F 1457, F05

maximum rate period, n —in cavitation and liquid impingement erosion, a stage following the acceleration period, during which the erosion rate remains constant (or nearly so) at its maximum value. (See also **erosion rate-time pattern**.)

G 40, G02

maximum self-registering clinical thermometer, n —clinical thermometer designed to retain the indication of its maximum measured temperature until reset.

E 344, E20

maximum size (of aggregate), n —in specifications for, or description of aggregate, the smallest sieve opening through which the entire amount of aggregate is required to pass.

C 125, C09

maximum size (of aggregate), n —in specifications for, or descriptions of aggregate, the smallest sieve opening through which the entire amount of aggregate is required to pass.

D 8, D04

maximum sound level, $L_{AFmax}[nd]$, (dB) n —Ten times the common logarithm of the square of the ratio of the largest frequency-weighted and exponential-time-weighted (or other wise time-averaged) sound pressure during the measurement period to the square of the reference-sound-pressure of 20 micro pascals. The subscripts designate the frequency weighting (A or C), and time the weighting or averaging (F for fast, S for slow, I for impulse, or a number with proper units to indicate time interval).

C 634, E33

maximum (statistical), n —the highest acceptable statistical test result; for compliance, the sample mean (\bar{x}) plus M standard deviations(s), where M is a matter of agreement between the supplier and purchaser, must be less than, or equal to, the upper specification limit.

$$\bar{x} + M \times s \leq \text{Maximum} = USL$$

A 644, A04

maximum stress-intensity factor, K_{max} [FL^{-3/2}]—in fatigue, the maximum value of the stress-intensity factor in a cycle. This value corresponds to P_{max} .

E 1823, E08

maximum sublimation point—in a PT phase diagram, the highest pressure and temperature at which a solid species of intermediate composition may exist in equilibrium with vapor of identical composition.

E 7, E04

maximum transit rate—the maximum speed at which the sampler can be lowered and raised in the sampling vertical and still have the sample collected isokinetically.

D 4410, D19

maximum use pressure, n —the greatest pressure to which a material can be subjected as a result of a reasonably foreseeable malfunction, operator error or process disturbance.

G 126, G04

maximum use temperature, n —the greatest temperature to which a material can be subjected as a result of a reasonably foreseeable malfunction, operator error, or process disturbance.

G 126, G04

maxwell, ϕ —the unit of magnetic flux in the cgs-emu system of units. One maxwell equals 10^{-8} weber. See **magnetic flux**.

NOTE—

$$e = -N d\phi/dt \times 10^{-8}$$

where:

e = induced instantaneous emf in volts,

$d\phi/dt$ = time rate of change of flux in maxwells per second, and

N = number of turns surrounding the flux, assuming each turn is linked with all the flux.

A 340, A06

MCL—maximum contaminant level.

D 6161, D19

McQuaid-Ehn grain size—the austenitic grain size developed in steels by carburizing at 1700°F (927°C) followed by slow cooling.

See Test Methods E 112. E 7, E04

MCS, n —see **multiple chemical sensitivity**.

E 2114, E06

MD—State of Maryland.

E 631, E06

MD—State of Maryland.

E 1605, E06

MDSA—see **message data storage area**.

F 1457, F05

mealiness, n —an uneven or grainy solid or halftone dot caused by improperly ground ink or the presence of foreign matter.

D 6488, D01

mean—arithmetical average of a set of numbers.

D 1517, D31

mean annual ground surface temperature—the mean annual temperature of the surface of the ground.

D 7099, D18

mean annual ground temperature—the mean annual temperature of the ground at a particular depth.

D 7099, D18

mean coefficient of thermal expansion, α (mm/mm·°C or in./in.·°C)—from temperature T_1 to temperature $TT_1 < T_2$:

$$\alpha = \frac{0.01P}{T_2 - T_1}$$

where P = percent linear thermal expansion, as defined below.

C 242, C21

mean crossings—in *fatigue loading*, the number of times that the force-time history crosses the mean force level with a positive slope or a negative slope, or both, as specified during a given period.

E 1823, E08

mean depth of erosion, n —in *cavitation and impingement erosion*, the average thickness of material eroded from a specified surface area, usually calculated by dividing the measured mass loss by the density of the material to obtain the volume loss and dividing that by the area of the specified surface. (Also known as *mean depth of penetration* or *MDP*. Since that might be taken to denote the average value of the depths of individual pits, it is a less preferred term.)

G 40, G02

mean depth of penetration, n —See **mean depth of erosion**.

G 40, G02

mean deviation unevenness, U %, n —in *textiles*, the average of the absolute values of the deviations of the linear densities of the integrated lengths between which unevenness is measured and expressed as a percentage of the average linear density for the total length within which unevenness is measured. (See also **unevenness, coefficient of variation unevenness**.)

D 123, D13

mean deviation unevenness, U %, n —in *textiles*, the average of the absolute values of the deviations of the linear densities of the integrated lengths between which unevenness is measured and expressed as a percentage of the average linear density for the total length within which unevenness is measured. (See also **unevenness, coefficient of variation unevenness**.)

D 4849, D13

mean diameter, arithmetic—See **arithmetic mean diameter** under **diameter**.

C 242, C21

mean diameters—the family of diameters, \bar{D}_{pq} , such that:

$$\bar{D}_{pq}^{(p-q)} = (\sum_i D_i^p) / (\sum_i D_i^q)$$

where:

p and q = dissimilar positive integers. (The value of q may also be “zero.”)

E 1620, E29

mean droplet diameter (\bar{D}_{pq})—is represented by the following:

$$\bar{D}_{pq}^{(p-q)} = \frac{\sum D_i^p}{\sum D_i^q}$$

where:

D_i = the diameter of the i^{th} particle,

$\sum D_i^o$ = the total number of drops in the sample. Thus:

\bar{D}_{10} = length mean diameter,

\bar{D}_{20} = area mean diameter,

\bar{D}_{30} = volume mean diameter,

\bar{D}_{31} = volume/length mean diameter (mean evaporative diameter),

\bar{D}_{32} = SAUTER mean diameter, and

\bar{D}_{43} = DeBROUKERE or HERDAN mean diameter.

E 1102, E35

mean escape depth—the average depth normal to the surface from which the specified particles or radiations escape as defined by:

$$\int_0^\infty z\phi(z,\theta)dz / \int_0^\infty \phi(z,\theta)dz$$

where $\phi(z,\theta)$ = the emission depth distribution function for depth z from the surface into the material and for direction of emission θ with respect to the surface normal.

E 673, E42

mean force, P_m (or S_m or ϵ_m) [F or FL²]—in *fatigue loading*, the algebraic average of the maximum and minimum forces in constant amplitude loading, or of individual cycles in spectrum loading,

$$P_m = \frac{P_{\max} + P_{\min}}{2}$$

or the integral average of the instantaneous force values of a spectrum loading history.

E 1823, E08

mean free path—See **electron, inelastic mean free path**. E 673, E42

mean free path—the average distance that a molecule travels between successive collisions with other molecules. E 1316, E07

mean ionic activity coefficient—for a salt that is composed of two monovalent ions, the geometric mean of the individual ionic activity coefficients. (The geometric mean is obtained, in this case, by multiplying the two individual ionic activity coefficients and then taking the square root.) It is important because, unlike individual ionic activity coefficients, it can be measured by a variety of techniques, such as freezing point depression and vapor pressure, as well as by paired sensing electrodes. D 4127, D19

mean length, n —in *testing of cotton fibers*, the average length of all the fibers in the test specimen based on mass-length data.

D 123, D13

mean length, n —in *testing of cotton fibers*, the average length of all the fibers in the test specimen based on mass-length data.

D 7139, D13

mean modulus—the ratio of mean stress to mean strain. (ISO)

D 4092, D20

mean panel rating (MPR), n —the average value, for each quality section of highway pavement, of ride quality ratings assigned by a ride rating panel.

E 867, E17

mean particle diameter—the weighted average particle size, in SI units, of a granular adsorbent computed by a standard procedure.

D 2652, D28

mean profile depth (MPD), n —the average of all of the mean segment depths of all segments of the profile.

E 867, E17

mean roughness index (MRI), n —the average of the international roughness index (IRI) values for the right and left wheel tracks.

E 867, E17

mean segment depth, n —the average value of the profile depth of the two halves of a segment having a given baselength. E 867, E17

mean specific heat, n —the quantity of heat required to change the temperature of a unit mass of a substance one degree, measured as

mean specific heat, *n*

the average quantity over the temperature range specified. (It is distinguished from true specific heat by being an average rather than a point value.) (In SI units: J/kg•K) (In inch-pound units: Btu/lb•F) **C 168, C16**

mean square, *n*—in analysis of variance, a contraction of the expression “mean of the squared deviations from the appropriate average(s)” where the divisor of each sum of squares is the appropriate degrees of freedom. **D 123, D13**

mean square, *n*—in analysis of variance, a contraction of the expression “mean of the squared deviations from the appropriate average(s)” where the divisor of each sum of squares is the appropriate degrees of freedom. **D 4175, D02**

mean strain—the average value of strain during a single complete hysteresis loop of cyclic deformation. (ISO) **D 4092, D20**

mean stress—the average value of the stress during a single complete hysteresis loop of cyclic deformation. (ISO) **D 4092, D20**

mean temperature, *n*—in thermal transmittance of textiles only, the average of the hot plate temperature and the temperature of the calm, cool air that prevailed during the test. **D 123, D13**

mean texture depth (MTD), *n*—the mean depth of the pavement surface macrotexture determined by the volumetric technique of Test Method E 965. **E 867, E17**

mean value—arithmetic average of data values; calculated as the algebraic sum of the data values divided by the number of data values. **E 631, E06**

mean (value)—the arithmetic mean, unless stated to be the geometric mean. **E 1605, E06**

mean-variance criterion—a technique for evaluating the relative risk and return when choosing among competing projects that dictates that the project value with the higher mean (that is, expected value of project worth) and lower standard deviation be chosen. **E 631, E06**

mean-variance criterion, *n*—a technique for evaluating the relative risk and return when choosing among competing projects that dictates that the project value with the higher mean (that is, expected value of project worth) and lower standard deviation be chosen. **E 833, E06**

mean velocity in hydraulics, *n*—the average velocity throughout a channel cross section. Defined as the discharge divided by the cross-sectional area of flow usually expressed in meters per second (m/s) or feet per second (ft/s). **D 653, D18**

mean (\bar{x}), *n*—the sum of the individual data points (x 's) divided by the number of data points (n).

$$\bar{x} = \frac{\sum x_i}{n}$$

A 644, A04

measured energy input rate—peak rate at which the equipment consumes energy, measured during a period when the equipment is operating at full input. **F 1827, F26**

measured heat release of specimen, *n*—the observed heat release under the variable flux field imposed on the specimen and measured. **E 176, E05**

measured inflation pressure, *n*—gauge pressure of a tire measured at a given time under ambient temperature and barometric pressure. **F 538, F09**

measured sediment load—that part of the total sediment discharge that can be measured with available suspended-sediment samplers; does not include bed-load discharge and suspended sediment discharge very near the bed. **D 4410, D19**

measurement, *n*—set of operations having the object of determining a numeric value or non-numeric characteristic. **D 1129, D19**

measurement, *n*—act of quantifying a property or dimension. **meeting rail**—See **windows and doors**. **E 631, E06**

measurement, *n*—act of quantifying a property or dimension. **E 1605, E06**

measurement accuracy—the numerical or percentage deviation of a measured value (or a value computed from one or more measure-

ments) from its true value or from some absolute or standardized value. This deviation may depend upon the procedures used and is caused chiefly by systematic errors in the calibrations of the equipment used, which errors, if known, may be removed from the measured data to enhance the accuracy of the measured or computed value. **A 340, A06**

measurement area—the surface area that is examined for conformance to one or more specified requirements. **B 374, B08**

measurement interval, *n*—the distance travelled, in kilometres (miles), between two successive groove (void) depth measurements. **F 538, F09**

measurement plan, *n*—a document formally describing the specific steps to be taken during a measurement, including any unique requirements. **C 634, E33**

measurement process, *n*—the method and procedure of obtaining and measuring samples or their subsamples to produce sample data. **D 5681, D34**

measurement quality assurance plan—a documented program for the measurement process that ensures, on a continuing basis, that the overall uncertainty meets the requirements of the specific application. This plan requires traceability to, and consistency with, nationally or internationally recognized standards. **E 170, E10**

measurement quality objective, *n*—the precision, accuracy, and detection requirements for measurement data, based on the intended use of that data. **D 1129, D19**

measurement quality objectives (MQOs)—quantitative statements of the acceptable level of selectivity, sensitivity, bias, and precision for measurements of the analyte of interest in the matrix of concern. **D 5681, D34**

measurement set, *n*—the set of acoustical measurements and related data obtained at a single measurement location during a specified time interval. **C 634, E33**

measurement system—all elements of the analytical process including laboratory subsampling, sample preparation and cleanup, and analyte detection and quantitation, including the analysts. **D 5681, D34**

measurement system—the specific combinations of instrumentation, operator, and procedure used to make a particular measurement. **E 170, E10**

measurement time, *n*—that time required from the time of patient contact to display of temperature to within the stated accuracy. **E 344, E20**

measurement time, *n*—the period required from the time of patient contact to the time when the thermometer may be removed or read to within the stated accuracy of the thermometer. **E 344, E20**

measurement traceability, *n*—property of the result of a measurement or the value of a standard whereby it can be related to stated references, usually national or international standards, through an unbroken chain of comparisons all having stated uncertainties.

NOTE—The concept is often expressed by the adjective *traceable*.

NOTE—The unbroken chain of comparisons is called a *traceability-chain*. **D 1129, D19**

measurement traceability—the ability to demonstrate by means of an unbroken chain of comparisons that a measurement is in agreement within acceptable limits of uncertainty with comparable nationally or internationally recognized standards. **E 170, E10**

measurement uncertainty—an estimate of potential inaccuracies in a measured or derived quantity based on explicit evaluation and combination of all sources of errors. Note - Quantitative uncertainty estimates are typically given in the form of variances (or standard deviations) and covariances (or correlations) derived from statistical procedures combining random, systematic, and calculational (modeling) uncertainties. **E 7, E04**

measurement value, *n*—the numerical result of quantifying a particular property or dimension. (See **observation**). **D 123, D13**

measuring junction—the junction of a thermocouple placed at a location where an unknown temperature is to be measured or

- where an established temperature is to be maintained. When the measuring junction is at a higher temperature than the reference junction it is commonly called the hot junction. **E 7, E04**
- measuring junction, *n***—that junction of a thermocouple which is subjected to the temperature to be measured. **E 344, E20**
- mechanical adhesion, *n***—see *mechanical adhesion* under **adhesion**. **D 907, D14**
- mechanical alignment*—See **alignment**. **E 7, E04**
- mechanical analysis*—see **grain-size analysis**. **D 653, D18**
- mechanical analysis**—a determination of the particle-size distribution of a sample by mechanical separation. **D 4410, D19**
- mechanical bonds, *n***—the attachment created when plaster penetrates, into or through, the substrate, or envelops irregularities in the surface of the substrate. **C 11, C11**
- mechanical break-up unit (MBU), *n***—a design structure found in the insert that forces product to flow in a swirling method for producing specific spray characteristics. **D 6655, D10**
- mechanical cell, *n***—a type of flotation cell that uses mechanical agitation of a pulp by means of an immersed impeller (rotor) and stator stirring mechanism. Aeration to the cell can be from an external pressurized air source or self-induced air. **D 121, D05**
- mechanical cleaner*—see **cleaner, mechanical**. **F 412, F17**
- mechanical cleaning**—process for removing dirt, scale, or other deposits from surfaces through the use of mechanical means such as abrasive blasting. **B 374, B08**
- mechanical connection**—a joining of two or more elements by means of mechanical fasteners, such as screws, bolts, or rivets but not by welding or adhesive bonding. **E 631, E06**
- mechanical deposition**—coating process in which particles of the plating metal are impacted against the fastener surface such that cold welding of the plating metal to the fastener surface is accomplished. **F 1789, F16**
- mechanical disk scanner**—a rotating scanning disk that breaks light reflection during the optical reading operation into a series of light points that are directed through the slit of a fixed aperture and onto the surface of a photomultiplier tube. **F 149, F05**
- mechanical dispersion, *n***—a mixture produced by the application of mechanical shearing forces to a multi-phase system, one component of which is water, so as to distribute one or more of the materials uniformly throughout the mass of the water with the water existing as a continuous phase. **D 4175, D02**
- mechanical dispersion, *n***—a low energy aqueous medium produced by continuous stirring of the test solution and containing both dissolved and undissolved components of the test material. **D 4175, D02**
- mechanical dispersion, *n***—a low energy aqueous medium produced by continuous stirring of the test solution and containing both dissolved and undissolved components of the test material. **D 6384, D02**
- mechanical durability**—resistance of the carbon paper or ribbon to cutting after repeated use. **F 221, F05**
- mechanical fastener, *n***—a corrosion-resistant component used to attach the insulation board to the substrate or framing member. **E 2110, E06**
- mechanical fastener**—mechanical device that holds or joins two or more components in definite positions with respect to each other and is often described as a bolt, nut, rivet, screw, washer, or special formed part. **F 1789, F16**
- mechanical freezers**—freezers that operate by a refrigeration system in which cooling is provided by mechanical means such as a compressor. **E 1705, E48**
- mechanical hygrometer*—See **hygrometer**. **D 1356, D22**
- mechanical hysteresis, *n***—the energy absorbed in a complete cycle of loading and unloading. **E 6, E28**
- mechanical joint*—see **joint, mechanical**. **F 412, F17**
- mechanical leather**—a collective term for many types of leather used in connection with textile and other machinery. **D 1517, D31**
- mechanical loss factor**—see **tangent delta**. **E 1142, E37**
- mechanically alloyed powder, *n***—a composite powder produced by mechanically incorporating other constituents which are generally insoluble within the deformable particles of the matrix metal. **B 243, B09**
- mechanically deformed**—nails with rolthreaded or formed shanks to improve holding power.
- roll-threaded*—with helical, annular, or longitudinal deformations rolled on fastener shank.
- formed*—with barbed, angular, serrated, longitudinally or helically fluted, longitudinally or helically roll-grooved or twisted deformations formed on wire from which nail is made. **F 547, F16**
- mechanically foamed plastic, *n***—a cellular plastic in which the cells are formed by the physical incorporation of gases. **D 883, D20**
- mechanically plated, peen-coated, peen-galvanized**—covered with coat of zinc through peen-coating, that is, by tumbling in a container holding powdered zinc and numerous glass beads. **F 547, F16**
- mechanical plating**—the application of a metallic layer by impacting spherical objects (for example glass beads) against the work surface in the presence of powdered coating metal and appropriate chemicals. **B 374, B08**
- mechanical polishing, *n***—of *metallic coatings*, the loosening and detachment of superficial, small particles of coating metal during processing or testing, due to mechanical abrasion. **A 902, A05**
- mechanical properties, *n***—those properties of a material that are associated with elastic and inelastic reaction when force is applied, or that involve the relationship between stress and strain. **E 6, E28**
- mechanical properties**—fastener characteristics which relate to its reaction to applied loads; these properties may be those of the basic raw material or result from the manufacturing process. **F 1789, F16**
- mechanical properties of frozen ground**—these include the static and dynamic properties relating to the strength and deformability of frozen geological materials: the compressive and shearing strengths, with and without confinement; the static and dynamic Young' Modulus and Poisson's ratio; the velocities of compressional and shear waves; seismic velocities. **D 7099, D18**
- mechanical property**—any property of wood that relates to its ability to support load or resist deflection. **D 9, D07**
- mechanical pulp, *n***—fibrous material obtained by treating wood or other plant material with a predominantly mechanical process, such as stone groundwood (SGW), pressurized groundwood (PGW), refiner mechanical pulp (RMP), and thermomechanical pulp (TMP). (See **chemical pulp** and **semichemical pulp**.) **D 1968, D06**
- mechanical pump dispenser, *n***—a small, finger- or hand-actuated, mechanical device used to dispense (spray, stream, or flow) product from a container that may be, generally, held in one's hand. **D 6655, D10**
- mechanical refrigeration**—a refrigeration system in which cooling is provided by mechanical means such as a compressor. **E 1705, E48**
- mechanical stage**—a device provided for adjusting the position of a specimen, usually by translation in two directions at right angles to each other. **E 7, E04**
- mechanical strength**—the failure strength of a material under given loading conditions. **D 7099, D18**
- mechanical testing**—determination of mechanical properties. **B 374, B08**
- mechanical testing, *n***—the determination of mechanical properties. **E 6, E28**
- mechanical transfer papers**—papers that produce a visible image by the transfer of a coating to another sheet which may or may not be specially treated. **F 221, F05**
- mechanical transfer papers**—papers that produce a visible image by the transfer of a coating to another sheet which may or may not be specially treated. (F 221) **F 549, F05**

mechanical twins—See **twin bands**.

E 7, E04

med fiber, *n*—a medullated animal fiber in which the diameter of the medulla is less than 60 % of the diameter of the fiber. **D 123**, D13

med fiber, *n*—a medullated animal fiber in which the diameter of the medulla is less than 60 % of the diameter of the fiber. **D 4845**, D13

medial—toward the inside or center. (Opposite: lateral) **F 869**, F08

median, *n*—for a series of observations, after arranging them in order of magnitude, the value that falls in the middle when the number of observations is odd or the arithmetic mean of the two middle observations when the number of observations is even. **D 123**, D13

median crack—damage produced in glass by the static or translational contact of a hard, sharp object on the surface. (See also **cleavage crack**.) **C 162**, C14

median diameter—See **median diameter** under **diameter**. **C 242**, C21

median diameter—the grain diameter such that half of the sediment by mass is composed of particles of larger size and half by mass is composed of particles of smaller size; commonly denoted by the symbol "D₅₀". **D 4410**, D19

median droplet diameter ($D_{x,f}$)—For cumulative distributions, $D_{x,f}$ where *x* is *V*, *A*, *L*, or *N*, are diameters such that the fraction (*f*) of the total of volume, surface area, length of diameter, or number of drops respectively, is in drops of smaller diameter.

Thus:

$D_{V,5}$ = volume median diameter,

$D_{A,5}$ = area median diameter,

$D_{L,5}$ = length median diameter, and

$D_{N,5}$ = number median diameter.

Also, $D_{V,1}$ and $D_{V,9}$ = diameter of drop such that 10 % and 90 % respectively, of the liquid volume is in drops of smaller diameter.

E 1102, E35

median fatigue life—the middle value of the observed fatigue lives, arranged in order of magnitude, of the individual specimens in a group tested under essentially identical conditions. If the sample size is even, it is the average of the two middlemost values.

E 1823, E08

median fatigue strength at *N* cycles [FL^{-2}]—an estimate of the stress level at which 50 % of the population would survive *N* cycles.

E 1823, E08

median force, *n*—in tensile testing, that force level that is exceeded by half the recorded peaks and which in turn exceeds the other half of the recorded peaks, in a specified distance of cross-head travel.

D 123, D13

median force, *n*—in tensile testing, that force level that is exceeded by half the recorded peaks and which in turn exceeds the other half of the recorded peaks, in a specified distance of cross-head travel.

D 4850, D13

median particle size, *n*—the particle size at which half the distribution (by mass, volume, number, etc.) is larger than and half smaller than the stated size.

E 1638, E29

medical direction—physician responsibility for the development, implementation, and evaluation of the clinical aspects of an EMS system.

F 1177, F30

medical protocol—preestablished physician authorized procedures or guidelines for medical care of a specified clinical situation, based on patient presentation (also known as standing orders).

F 1177, F30

medical removal (of workers)—temporary removal of workers from a job site due to elevated blood-lead levels as defined in HUD interim guidelines. Compare **administrative removal**. **E 631**, E06

medical removal (of workers)—temporary removal of workers from a job site due to elevated blood-lead levels as defined in HUD interim guidelines. Compare **administrative removal**.

E 1605, E06

medical transportation services—the moving of patients from one location to another. Specific services include any or all of the following: emergency and non-emergency medical response and transportation; scheduled and non-scheduled interfacility transfers,

medical standbys, long-distance medical transfers, air medical response and transport (helicopter and fixed wing aircraft); and stretcher and wheelchair transport services. **F 1177**, F30

medical transportation system—a sub-system of the emergency medical services system consisting of an organization or collection of medical transport services which provide transportation, treatment, and observation of patients for a specific geographic area.

F 1177, F30

medium—the material that supports the growth and reproduction of microorganisms.

F 1600, F20

medium barb, *n*—barbs having an average length of $0.4 \pm 5\%$.

F 1379, F14

medium buffs—see **upholstery leather**. Formerly often referred to as "special machine buffs."

D 1517, D31

medium crown—staple crown usually larger than $\frac{5}{16}$ in. (8 mm) and up to and including $\frac{11}{16}$ in. (17 mm) in width.

F 592, F16

medium-density fiberboard (MDF)—a composite panel product composed primarily of cellulosic fibers in which the primary source of physical integrity is provided through addition of a bonding system cured under heat and pressure. Additives may be introduced during the manufacturing process to improve certain properties. MDF density at the time of manufacturing, is typically between 500 kg/m^3 (31 lb/ft^3) and 1000 kg/m^3 (62 lb/ft^3), based on a reported moisture content at the time of weight and volume measurements.

D 1554, D07

medium-density particleboard—a particleboard as previously defined with a density between $640 - 800 \text{ kg/m}^3$ ($40 - 50 \text{ lb/ft}^3$) based on a reported moisture content at the time of weight and volume measurements.

D 1554, D07

medium density polyethylene plastics (MDPE), *n*—those branched polyethylene plastics, having a standard density of 0.926 to 0.940 g/cm^3 . (D20)

F 412, F17

medium density polyethylene plastics, (MDPE) *n*—those branched polyethylene plastics, *q. v.*, having a standard density of 0.926 to 0.940 g/cm^3 .

D 883, D20

medium grain—See **grain**.

D 9, D07

medium-hard drawn wire—as applied to copper wire, having tensile strength less than the minimum for hard-drawn wire, but greater than the maximum for soft wire.

B 354, B01

medium-high carbon—See **steel grades**.

F 547, F16

medium life expectancy, LE-50, *n*—for paper, a paper is expected to be usable for 50 years.

D 1968, D06

medium life expectancy paper, LE-50, *n*—for paper, a paper expected to be usable for 50 years when stored under prescribed conditions.

D 1968, D06

medium-low carbon—See **steel grades**.

F 547, F16

medium (plural, media), *n*—a nutrient system for the cultivation of cells or organisms, and especially bacteria.

F 1494, F23

medium point—point with 28° to 35° included angle for 0.040 to 0.065-in. wire diameter; 32° to 38° included angle for 0.072 to 0.225-in. wire diameter; 37° to 44° included angle for 0.250 to 0.325-in. wire diameter.

F 547, F16

medium sprays—distribution of droplets with $400 \mu\text{m} < D_{V,5} \leq 1200 \mu\text{m}$.

E 1102, E35

medium volatile bituminous coal—See **medium volatile bituminous coal** under **rank**.

D 121, D05

medium weight concrete masonry unit—unit whose oven-dry density is at least 105 lb/ft^3 (1680 kg/m^3) and less than 125 lb/ft^3 (2000 kg/m^3).

C 1209, C15

medulla, *n*—in mammalian hair fibers, the more or less continuous cellular marrow inside the cortical layer in most medium and coarse fibers.

D 123, D13

medulla, *n*—in mammalian hair fibers, the more or less continuous cellular marrow inside the cortical layer in most medium and coarse fibers.

D 4845, D13

medullated fiber, *n*—an animal fiber that in its original state includes a medulla.

D 123, D13

medullated fiber, *n*—an animal fiber that in its original state includes a medulla. **D 4845, D13**

megohm—unit of measurement of water purity by electrical resistance; One million ohms; reciprocal of conductivity. See **microsiemens, ohm**. **D 6161, D19**

melamine plastic, *n*—plastic based on resins made by the condensation or melamine and aldehydes. **F 1251, F04**

melamine plastics, *n*—plastics based on resins made by the condensation of melamine and aldehydes. **D 883, D20**

melamine resin—under **resin, synthetic** see **melamine resin**. **D 16, D01**

melt, *n*—the total molten metal produced in a single heat. **A 644, A04**

melt, *n*—all the metal that, while molten, was held at the same time in the same holding vessel. **B 899, B02**

melt—a specific quantity of glass made at one time. **C 162, C14**

melt—to change a solid into a liquid by the application of heat; or the liquid resulting from such action. **C 242, C21**

melter—(1) a melting unit constructed of refractory materials, with a glass level maintained essentially constant by feeding batch to replace glass continuously withdrawn. Also known as a tank, continuous furnace, and glass melting furnace.

(2) {archaic} person in charge of the melting furnace during the early stages of filling and melting of batch. **C 162, C14**

melter, *n*—a piece of equipment designed specifically to melt and heat hot-applied sealant and filler accurately and controllably. **D 5535, D04**

melter-applicator, *n*—a piece of equipment designed specifically to melt, heat accurately and controllably, and apply hot-applied sealants and fillers to pavement cracks or joints uniformly. **D 5535, D04**

melter tender—{archaic} person who regulates the temperature of a melting furnace in order that the glass will have the proper viscosity for casting. **C 162, C14**

melt index—the flow rate of PE material when measured in accordance with Test Method D 1238. **F 412, F17**

melting—the thermal process by which the charge is completely converted into molten glass free from undissolved batch. **C 162, C14**

melting, *n*—the liquefaction of material under the influence of heat. **D 123, D13**

melting—thermal process by which a material changes from a crystalline to a liquid form. **E 1142, E37**

melting—a response evidenced by softening of the material, resulting in a nonreversible change. **F 1494, F23**

melting area—the area of a melter under fire. Usually the area up to the bridgewall or floater. **C 162, C14**

melting furnace—the complete unit of a glass melting assembly, including the melter, regenerators or recuperators, flues, refiners, forehearth, channels, throats, etc. **C 162, C14**

melting point—in a phase diagram, the temperature at which the liquidus and solidus coincide at an invariant point. **E 7, E04**

melting point, *n*—fixed point of a single component system in which liquid and solid phases are in equilibrium at a specified pressure, usually 101 325 Pa, and the system is gaining heat slowly. (Compare **freezing point**.) **E 344, E20**

melting point—in a phase diagram, the temperature at which the liquidus and solidus coincide at an invariant point, (E 7, E04). **E 1142, E37**

melting point (cooling curve) of petroleum wax, *n*—temperature at which melted petroleum wax first shows a minimum rate of temperature change when allowed to cool under prescribed conditions. **D 4175, D02**

melting point, final—the temperature at which the last crystal disappears into the melt. **E 1547, E15**

melting point, initial—the temperature at which positive evidence of liquefaction is observed. **E 1547, E15**

melting pressure—at a stated temperature, the pressure at which the

solid phases of an element, or congruently melting compound, may coexist at equilibrium with liquid of the same composition.

E 7, E04

melting temperature—an arbitrarily defined reference point used for comparison purposes at which the glass viscosity is 10 Pa-s.

C 162, C14

melting temperature—at a stated pressure, the temperature at which a solid phase of an element, or congruently melting compound, may coexist at equilibrium with liquid of the same composition.

E 7, E04

melting temperature—at a given pressure, the temperature at which a crystalline solid undergoes a phase transition to the isotopic state when heat is added.

E 1142, E37

melt pressure, *n*—the pressure applied to the plastic material in front of the screw driving the injection molding process on a reciprocating screw machine that is calculated based on the hydraulic force acting axially on the screw.

D 883, D20

melt temperature, *n*—the temperature of the molten plastic.

D 883, D20

member—a group of wires stranded together for combination with other stranded groups into a multiple-membered conductor.

B 354, B01

membrane—a flexible or semiflexible roof covering or waterproofing, whose primary function is the exclusion of water.

D 1079, D08

membrane—a thin space of material covering a structure of separating solutions and permitting selection transport of a chemical species between the two solutions.

D 4127, D19

membrane—engineered thin semipermeable film which serves as a barrier permitting the passage of materials only up to a certain size, shape, or electro-chemical character. Membranes are used as the separation agent in reverse osmosis, electro-dialysis, ultrafiltration, nanofiltration, and microfiltration, as disc filters in laboratories, and as pleated filter cartridges, particularly for microfiltration.

D 6161, D19

membrane—any thin sheet or layer.

E 7, E04

membrane—continuous portion of a boom that serves as a barrier to the movement of a substance.

F 818, F20

membrane area—the area available in contact with the feed water.

D 6161, D19

membrane color, *n*—a visual rating of particulates on a filter membrane against ASTM Color Standards.

D 4175, D02

membrane compaction—compression of membrane structure due to a pressure difference across its thickness. See **compaction**.

D 6161, D19

membrane conditioning (pretreatment)—process carried out on a membrane after completion of its preparation and prior to its use in a separation application such as thermal annealing.

D 6161, D19

membrane configuration—the design and shape of a given membrane element (cartridge) such as tubular, spiral wound or hollow fiber.

D 6161, D19

membrane distillation—distillation process in which the fluid and gas phases are separated by a porous membrane.

D 6161, D19

membrane element—a bundle of spiral membrane envelopes or hollow fiber membranes bound together as a discrete entity.

D 6161, D19

membrane filter, *n*—a thin, nonfibrous filtration medium for fluids, with mean pore size larger than 0.01 μm in diameter, with which particles larger than the rated pore size are retained at or near the delivery surface.

D 1129, D19

membrane filter, *n*—a porous article of closely controlled pore size through which a liquid is passed to separate matter in suspension.

D 4175, D02

membrane filter, *n*—a thin medium of closely controlled pore size through which a liquid is passed and on which particulate matter in suspension is retained.

D 4175, D02

membrane filter

membrane filter—geometrically regular porous matrix; removes particles above pore size rating by physical size exclusion.

D 6161, D19

membrane layer—a flexible dynamic layer which carries one or both switch poles the deflection of which is used to short both poles together. The membrane layer is a required component of a membrane switch.

F 2112, F01

membrane module—manifold assembly containing one or more membranes to separate the streams of feed, permeate and retentate (brine).

D 6161, D19

membrane partition (distribution) coefficient—parameter equal to the equilibrium concentration of a component in a membrane divided by the corresponding equilibrium concentration of the component in the external phase in contact with the membrane surface.

D 6161, D19

membrane physical ageing—change in the transport properties of a membrane over a period of time due to physical chemical structural alterations.

D 6161, D19

membrane post-treatment—process carried out on a membrane after its essential structure has been formed but prior to its exposure to an actual feed stream.

D 6161, D19

membrane pressing, *n*—a process in which an adherend is brought in intimate contact with a substrate to form an assembly by application of overpressure to a flexible film.

D 907, D14

membrane reactor—device for simultaneously carrying out a reaction and membrane-based separation in the same physical enclosure.

D 6161, D19

membrane salt passage— SP_m is the concentration of a compound in the permeate related to its average concentration on the feed/concentrate side. (See **B-value**.)

D 6161, D19

membrane softening—use of crossflow membrane to substantially reduce hardness ions in water. See **nanofiltration**.

D 6161, D19

membrane switch—a momentary switching device in which at least one contact is on, or made of, a flexible substrate.

F 2112, F01

membrane switch flex tail—flexible portion of a membrane switch used for input/output connection.

F 2112, F01

memory color, *n*—color of an object that, according to the judgment of the observer, would match the color of another object previously seen by that observer.

E 284, E12

MEMS—microelectromechanical systems.

E 2444, E08

meniscus—See **onion**.

C 162, C14

MEPS—See **rigid cellular polystyrene thermal insulation board**.

E 631, E06

mercerization—the process of subjecting a vegetable fiber to the action of a fairly concentrated aqueous solution of a strong base so as to produce great swelling with resultant changes in fine structure, dimensions, morphology, and mechanical properties.

D 1695, D01

merchant pig iron, *n*—pig iron produced for commercial sale to foundries.

A 644, A04

merino, *adj*—from pure-bred merino sheep.

D 123, D13

merino, *adj*—from pure-bred merino sheep.

D 4845, D13

mesh, *n*—the square opening of a sieve.

D 8, D04

mesh, *n*—in *coatedglass yarn fabrics*, the number of warp yarns or ends per linear 25.4 mm (1 in.) followed by the number of filling yarns or picks per linear 25.4 mm (1 in.).

D 123, D13

mesh—the square opening of a sieve.

D 1079, D08

mesh, *n*—in *coatedglass yarn fabrics*, the number of warp yarns or ends per linear 25 mm (1 in.) followed by the number of filling yarns or picks per linear 25 mm (1 in.).

D 7018, D13

mesh, *n*—in *a piece of woven wire cloth*, the nominal number of apertures or fraction thereof per in.

E 1638, E29

mesh—in *chain link fabric*, the clear distance between parallel wires forming a diamond.

F 552, F14

mesh—an alignment of opposing teeth. The teeth may be in-line or angled.

F 1638, F04

mesh-lapping—process of overlapping one piece of mesh onto another that has been applied to a surface previously.

E 631, E06

mesic peat—see **hemic peat**.

D 653, D18

mesomorphous cellulose—those portions of cellulose in which the segments of the individual molecules have some regularity of arrangement, but not enough to permit strict lattice order to give a distinct X-ray diffraction pattern.

D 1695, D01

mesophile—an organism with an optimum growth temperature range of 20 to 45°C.

F 1600, F20

mesopic, *adj*—pertaining to vision at intermediate levels of illumination, at which both retinal cones and retinal rods are stimulated.

E 284, E12

mesopore—a pore of width between 2 and 50 nanometres (20 and 500 angstrom units).

D 2652, D28

message data storage area, *n*—a RAM in the receiving device where the incoming signal is stored until it is ready to be taken into the device's working memory.

F 1457, F05

messenger wire—a metallic supporting member either solid or stranded which may also perform the function of a conductor.

B 354, B01

meta-anthracite—See **meta-anthracite** under **rank**.

D 121, D05

metabolic pathway—the sequence of biochemical reactions that allows conversion for carbon or energy assimilation.

F 1600, F20

metabolite, *n*—a chemical substance produced by any of the many complex chemical and physical processes involved in the maintenance of life.

D 4175, D02

metadata, *n*—loosely has been defined as data about data but is more tightly defined as the detailed description of instance data, including the format and characteristics of instance data where instance data is defined by Tannenbaum as "that which is input into a receiving tool, application, database, or simple processing engine."

E 867, E17

metal—slang for molten glass in a melter.

C 162, C14

metal blister—bloating of the metal sheet.

C 286, B08

metal cast button, *n*—a button produced by the casting of molten metals and metal alloys into single cavity or multiple cavity molds.

D 123, D13

metal cast button, *n*—a button produced by the casting of molten metals and metal alloys into single-cavity or multiple-cavity molds.

D 5497, D13

metal connector plate—finished (coated or galvanized) steel or bare stainless-steel plate of specified thickness with or without integral multiple plate projections (teeth) or nail holes, or a combination of both, with projections partially sheared from solid sheet during its fabrication and projecting from the plate in a single direction or both directions perpendicular to the plate surface area; plate of specified thickness to which appropriate tolerances apply. Metal connector plates are manufactured from coiled strips of structural quality sheet metal, produced in various lengths and widths, and designed to connect wood members so as to transmit forces from one wood member (or section) to another one or more wood members (or section). Other common terms include *plate, metal plate, metal-plate connector, nail plate, truss plate*, but the preferable term is **metal connector plate**.

E 631, E06

metal connector plate with integral teeth—metal connector plate with integral multiple projections (teeth) partially sheared from solid sheet during its fabrication and projecting from the plate in a single direction or in both directions perpendicular to the plate surface area. See **metal connector plate**.

E 631, E06

metal distribution ratio—the ratio of the thickness of metal upon two specified areas of a cathode. See **throwing power**.

B 374, B08

metal dusting—accelerated deterioration of metals in carbonaceous gases at elevated temperatures to form a dust-like corrosion product.

G 15, G01

metal filter, *n*—a metal structure having controlled interconnected porosity produced to meet filtration or permeability requirements.

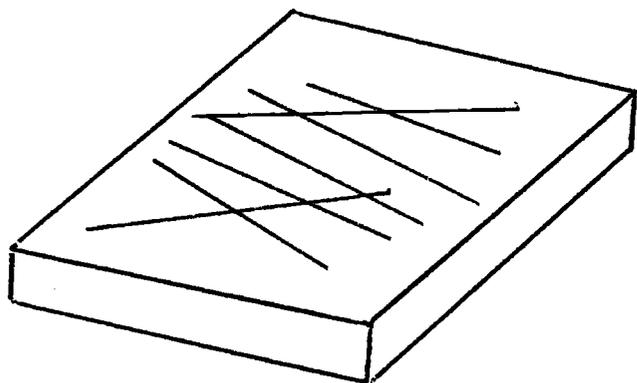

B 243, B09

metal flashing—See **flashing**: frequently used as through-wall, cap-, or counter-flashing.

D 1079, D08

metal injection molding (MIM), *n*—a process in which a mixture of

- metal powders and a binder system is forced under pressure into a mold. See also **powder injection molding**. **B 243, B09**
- metal-lath nail, hook-head metal-lath nail**—bright, blued or galvanized, regular-stock-steel, 1/8 by 0.106-in. nail with thin flat 7/16 or 1/2-in. hook head and medium diamond point. (See **self-furring nail**.) **F 547, F16**
- metallic**—a manufactured fiber composed of metal, plastic-coated metal, metal-coated plastic, or a core completely covered by metal. **D 123, D13**
- metallic**, *adj*—pertaining to the appearance of a gonioparent material containing metal flakes. **E 284, E12**
- metallic resinates**, *n*—rosin in which part or all of the rosin acids have been chemically reacted with those metals that give soaps or salts which are water insoluble. **D 804, D01**
- metallic yield**, *n*—the mass percentage of a ferrous waste stream that is generally recoverable as metal or alloy. **D 5681, D34**
- metallic yield**—the weight percent of the municipal ferrous scrap that is generally recoverable as metal or alloy. **D 5681, D34**
- metal-like**, *adj*—pertaining to the appearance of a bare metal. **E 284, E12**
- metal line**—the line on the refractory of a melting furnace which marks the boundary between the glass and the atmosphere above it. **C 162, C14**
- metallizing**—(1) the application of a metal layer to the surface of non-conducting or non-metallic materials.
(2) the application of metallic coatings by nonelectrolytic procedures such as spraying of molten or heat-softened metal or deposition from the vapor phase. **B 374, B08**
- metallizing**—See **thermal spraying**. **G 15, G01**
- metallography**—that branch of science which relates to the constitution and structure, and their relation to the properties, of metals and alloys. **E 7, E04**
- metallography**—study of the structure of fastener metals using optical or electronic microscopes that produce a magnified image of the material structure of the fastener. **F 1789, F16**
- metallurgical-coke-base carbon refractory**, *n*—see **carbon refractory, metallurgical-coke-base**. **C 71, C08**
- metal marking resistance**, *n*—the ability of a coating to withstand streaking or marking when a metal object is rubbed against or dragged across the surface of the coating. **D 16, D01**
- metal marks**—lines on the surface of a ceramic body or glaze caused by drawing a hard metal, such as a knife, across the surface.

F 109, C21

- metal (or metallic) coating**—generally denotes all metal coatings obtained by any method applied to a basis material. **B 374, B08**
- metal powder**, *n*—particles of elemental metals or alloys, normally less than 1000 μm (1 mm) in size. **B 243, B09**

- metal shadowing**—See **shadowing**. **E 7, E04**
- metal sheathed cable stripper**, *n*—a tool used to remove a selected portion of the metal sheath from an end of sheathed thermocouple material. **E 344, E20**
- metal spraying**—application of a metallic coating by projecting molten or heat-softened metal from a source (gun) onto the workpiece. **B 374, B08**
- metal substrate**—see **base metal**. **C 286, B08**
- metameric**, *adj*—(1) pertaining to spectrally different objects or color stimuli that have the same tristimulus values.
(2) pertaining to objects, having different spectrophotometric curves, that match when illuminated by at least one specific spectral composition and observed by a specific observer. (See also **parameric**.) **E 284, E12**
- metamerism**, *n*—property of two specimens that match under a specified illuminator and to a specified observer and whose spectral reflectances or transmittances differ in the visible wavelengths. See also **illuminant metamerism, observer metamerism, paramerism**. **E 284, E12**
- metamerism indices**, *n*—see **special indices of metamerism, indices of metamerism potential**. **E 284, E12**
- metamers**, *n*—(1) spectrally different objects or color stimuli that have the same tristimulus values.
(2) specimens differing in spectral reflectance but having colors that match in light of one spectral composition, when viewed by one observer, but may not match in light of other spectral compositions, or when viewed by another observer. See also **paramers**. **E 284, E12**
- metastable**—a state of apparent equilibrium which has a higher free energy than has the true equilibrium state; usually applied to a phase existing outside its temperature and pressure span of equilibrium existence, by reason of a greatly delayed transformation. **E 7, E04**
- metatectic equilibrium**—See **peritectoid equilibrium**. **E 7, E04**
- meta-xylene**—1,3-dimethylbenzene (C_8H_{10}) mol weight 106.16; clear, colorless, flammable liquid; freezing point, -47.87°C ; boiling point, 139.3°C . **D 4790, D16**
- meteorological precipitation**—See **precipitation**. **D 1356, D22**
- metering pump**—a mechanical arrangement that permits pumping of the various components of a grout system in any desired proportions or in fixed proportions. (*Syn.* proportioning pump, variable proportion pump.) **D 653, D18**
- metering valve**—a valve that delivers a definite limited amount of aerosol formulation each time the valve mechanism is operated. **D 3064, D10**
- meter leather**—a specialty leather made from sheepskins, treated to make it impermeable and used for the measuring bags of gas meters. **D 1517, D31**
- methanogenic bacteria**—microorganisms capable of producing methane. **E 1705, E48**
- methanol**, *n*—methyl alcohol, the chemical compound CH_3OH . **D 4175, D02**
- methanol (methyl alcohol, wood alcohol)**—an alcohol, CH_3OH , formed by catalytically combining carbon monoxide (CO) with hydrogen (H_2) in a 1:2 ratio, under high temperature and pressure. Commercially, it is often manufactured by steam reforming natural gas. It is also formed in the destructive distillation of wood. **E 1705, E48**
- method**, *n*—instructions used to produce a numerical result, which are detailed in a document referred to as “the method.” **E 135, E01**
- method bias**—See **bias**. **D 1356, D22**
- method blank**—a digestate that reflects the maximum treatment given any one sample within a sample batch except that only the sampling medium (such as a blank wipe) is initially placed into the digestion vessel. (The same reagents and processing conditions that are applied to field samples within a batch are also applied to the method blanks.) Analysis results from method blanks provide information on the level of potential contamination resulting from

method blank

the laboratory and sampling medium sources that are experienced by samples processed within the batch. **E 631, E06**

method blank—a sample, devoid of analyte, that is analyzed to determine its contribution to the total blank (background) reading. **E 631, E06**

method detection limit, *n*—the minimum concentration of an analyte that can be reported with a 99 % confidence that the value is above zero, based on a standard deviation of greater than seven replicate measurements of the analyte in the matrix of concern at a concentration near the low standard. **D 1356, D22**

method of least squares, *n*—a technique of estimation of a parameter which minimizes $\sum e^2$, where *e* is the difference between the observed value and the predicted value derived from the assumed model. **E 456, E11**

method of least squares, *n*—a technique of estimation of a parameter which minimizes $\sum e^2$, where *e* is the difference between the observed value and the predicted value derived from the assumed model. **E 1325, E11**

method of standard additions—the addition of a series of known amounts of the analytes of interest to more than one aliquot of the sample as a means of correcting for interferences. **D 5681, D34**

methoxyl group—the monovalent group $-\text{OCH}_3$, characteristic of methyl alcohol and its esters or ethers. **D 1695, D01**

methylcellulose—any of several methyl ethers of cellulose. Commercially, the water-soluble ether (degree of substitution approximately 1.5 to 2.0). **D 1695, D01**

methylene blue active substances (MBAS)—compounds that react with methylene blue, a cationic dye, causing it to transfer from an aqueous solution to an immiscible organic liquid upon equilibration under conditions such as those described in Test Method D 2330. The reactive compounds are principally surfactants of the sulfonate type $(\text{RSO}_3)^-\text{Na}^+$, the sulfate ester type $(\text{ROSO}_3)^-\text{Na}^+$, and sulfated nonionics $(\text{RE}_n\text{OSO}_3)^-\text{Na}^+$. Soaps are not included among the surfactants reactive to MBAS. **D 459, D12**

methylethylcellulose—a cellulose ether containing both methyl and ethyl groups. **D 1695, D01**

methylglucuronoxylan—the main hemicellulose of hardwood pulps; a polysaccharide containing xylose and 4-O-methylglucuronic acid groups. In the wood it is partially acetylated. **D 1695, D01**

methyl tertiary-butyl ether (MTBE), *n*—the chemical compound $(\text{CH}_3)_3\text{COCH}_2[\text{C}_5\text{H}_{12}\text{O}]$. **D 4175, D02**

metric count, *n*—an indirect yarn numbering system for sliver roving, and yarn, equal to the number of kilometers per kilogram (1000m/kg). **D 123, D13**

metric count, *n*—an indirect yarn numbering system for sliver roving, and yarn, equal to the number of kilometers per kilogram (1000 m/kg). **D 4849, D13**

metric sabin, $[\text{L}^2]$ —the unit of measure of sound absorption in the metre-kilogram-second system of units. **C 634, E33**

MeV (mega or million electron volts)—a unit of energy equal to one million electron volts, used to express the energy of X-rays, gamma rays, electrons, and neutrons. **E 1316, E07**

MFFT, *n*—abbreviation of minimum film forming temperature. **D 16, D01**

M_f*, *M_s—See **transformation temperature**. **A 941, A01**

MGD (MGPD)—millions of gallons per day. **D 6161, D19**

Mho—a measure of water purity by conductance, reciprocal of ohms. See **ohm**. **D 6161, D19**

mica splittings, *n*—trimmed or untrimmed mica split to thickness under 0.003 mm produced from block, thins, and splitting block. **D 1711, D09**

MICR—(1) An abbreviation commonly applied to the character set (E-13B) contained in ANSI X3.2-76 and X9.13-83.

(2) See **magnetic ink character recognition**. **F 149, F05**

micrinite—See **micrinite** under **maceral**. **D 121, D05**

microaerophilic bacteria—aerobic bacteria that require 2-10 % oxygen in order to grow. See **bacteria (microaerophiles)**. **D 6161, D19**

microalloyed steel, *n*—a low-alloy steel that conforms to a specification that requires the presence of one or more carbide-, nitride-, or carbonitride-forming elements, generally in individual concentrations less than 0.15 mass percent, to enhance strength. **A 941, A01**

microbe—bacteria and other organisms that require the aid of a microscope to be seen. **D 6161, D19**

microbes—microscopic organisms, including algae, bacteria, fungi, protozoa, and viruses. **F 1600, F20**

microbial activity test, *n*—any analytical procedure designed to measure the rate or results of one or more microorganism processes. **D 4175, D02**

microbial contamination—See **Terminology F 17**. **F 1327, F02**

microbial corrosion—corrosion that is affected by the action of microorganisms in the environment. **G 15, G01**

microbial degradation, *n*—(Synonym—**biodegradation**.) **D 4175, D02**

microbial degradation, *n*—synonym for **biodegradation**. **D 6384, D02**

microbially induced corrosion (MIC), *n*—corrosion that is enhanced by the action of microorganisms in the local environment. **D 4175, D02**

microbiological aerosol, *n*—an airborne particle partially or exclusively composed of microorganisms including bacteria and fungi. **D 5681, D34**

microbiological contamination (of packaged products)—the entry of viable microorganisms into a finished package due to lack of or loss of package integrity. **F 17, F02**

microbiologically influenced corrosion (MIC)—corrosion inhibited or accelerated by the presence or activity, or both, of microorganisms. **G 15, G01**

microbiological package integrity—the physical condition of a finished package, including, but not limited to, the security of package seals, which ensures the maintenance of the package contents in a commercially sterile condition. **F 17, F02**

microcharacter—See **micro penetration tester**. **E 7, E04**

microclimate, *n*—uniform localized climate conditions within a given area. **E 2114, E06**

microclimatology, *n*—the science that deals with the climate of restricted areas and investigates their phenomena and causes. **D 1356, D22**

microcrack—a crack too small to be seen with the unaided eye (see **crack, fracture, seam**). **C 119, C18**

microcrystalline cellulose—a commercial name for cellulose that has been hydrolyzed to the limiting DP and that consists essentially of microcrystals. **D 1695, D01**

microcrystalline limestone—a limestone that consists largely or wholly of crystals that are so small as to be recognizable only under magnification. If it is capable of taking a polish, it is classified commercially as a marble. **C 119, C18**

microcut—the scratch made by a microcharacter test. **E 7, E04**

microelectromechanical systems, MEMS—in general, this term is used to describe micron-scale structures, sensors, and actuators and/or the technologies used for their manufacture (such as, silicon process technologies). **E 2444, E08**

microfiber batting, *n*—a textile filling material containing fibers, such as polyester or olefin, which have a diameter of less than 10 μm . **D 123, D13**

microfiber batting, *n*—a textile filling material containing fibers, such as polyester or olefin, which have a diameter of less than 10 μm . **D 7022, D13**

microfiltration (MF)—pressure driven membrane based separation process designed to remove particles and dissolved macromolecules in the approximate range of 0.05 to 2 μm . **D 6161, D19**

micro focus X-ray tube—an X-ray tube having an effective focal spot size not greater than 100 μm . **E 1316, E07**

microgram, μg , *n*—one millionth of a gram. **E 631, E06**

micrograph—a graphic reproduction of an object as seen through the

- microscope or equivalent optical instrument, at magnifications greater than ten diameters. (**photomicrograph**). E 7, E04
- microhardness**, *n*—hardness measured with an instrument having a smaller indenter and applying a lower force than the standard instrument, permitting measurements on smaller specimens or thinner sheets that are not amenable to measurement by normal instruments. D 1566, D11
- microinch**—one millionth of an inch, 0.000001 in. = 0.001 mil. B 374, B08
- microindent**—See **indentation**. E 7, E04
- micrometeorology**, *n*—the study of the meteorological characteristics of a local site that is usually small and often is confined to a shallow layer of air next to the ground. D 1356, D22
- micrometer eyepiece**—an eyepiece that has a scale permanently positioned in its focal plane, thus, in effect, superimposing the scale on the image of the field being observed. E 7, E04
- micrometer** (μm)—one millionth of a meter, 0.001 mm. B 374, B08
- micrometre**—a unit of length equal to one millionth of a metre. E 1316, E07
- micron**—obsolete (see **micrometer**). B 374, B08
- micron**—a term for micrometre. E 1316, E07
- micron** (μ), *n*—0.001 mm, also known as a micrometre; measurement of cell diameter. F 2312, F04
- micronaire reading**, *n*—a relative measurement of fiber fineness derived from the porous plug air-flow method. D 123, D13
- micronaire reading**, *n*—a relative measurement of fiber fineness derived from the porous plug air-flow method. D 7139, D13
- micron (micrometre)**—a metric unit of measurement equivalent to 10^{-6} metres, 10^{-4} centimetres. Symbol is μm . D 6161, D19
- micron of mercury**—a unit of pressure equal to that exerted by a column of mercury standing one micrometre high. E 1316, E07
- microorganism**—see **microbe**. D 6161, D19
- microorganism**, *n*—bacteria, fungi, yeast, mold, viruses, and other infectious agents. However, it should be noted that not all microorganisms are infectious or pathogenic. F 2312, F04
- micro penetration hardness**—the hardness number obtained by use of a low load tester whose indentation is usually measured with a high power microscope. E 7, E04
- micro penetration tester**—a testing machine capable of applying low loads, usually in the range from 1 g to 5 kg to form an indentation or a scratch or both, as a basis for measuring hardness. Typical names associated with commercial testers are Bergsman, Eberbach, Knoop, Microcharacter, Tukon, Vickers, etc. E 7, E04
- microphotograph**—a microscopically small photograph. E 7, E04
- microphotometer**, *n*—an instrument for measuring the relative transmittance of small areas on a photographic emulsion such as spectral lines and X-ray diffraction patterns. E 135, E01
- micropore**—intraaggregate capillaries responsible for the retention of water and solutes. D 653, D18
- micropore**—a pore with width not exceeding 2 nanometres (20 angstrom units). D 2652, D28
- microporosity**—intragranular porosity and microscopic intergranular porosity with submicroscopic pore throats. D 653, D18
- microporosity**—extremely fine porosity in castings. E 7, E04
- microporous insulation**, *n*—material in the form of compacted powder or fibers with an average interconnecting pore size comparable to or below the mean free path of air molecules at standard atmospheric pressure. Microporous insulation may contain opacifiers to reduce the amount of radiant heat transmitted. C 168, C16
- microprocessor**, *n*—a central processing chip within the electronic controller section of the apparatus. D 121, D05
- microprocessor unit/image generator**, *n*—a set of components on the printer PWB which convert coded data (ASCII) into video data. F 1457, F05
- micro-scale polygon**—closed, multi-sided, roughly equidimensional, pattern ground usually caused by desiccation cracking of fine-grained soils. The polygons are less than 2 m in diameter. D 7099, D18
- microscope**—an instrument capable of producing a magnified image of a small object. E 7, E04
- microscopy**—the science of the interpretive use, and applications of microscopes. E 175, E41
- microseism**—seismic pulses of short duration and low amplitude, often occurring previous to failure of a material or structure. (ISRM) D 653, D18
- micro separometer rating (MSEP)**, *n*—a numerical value indicating the ease of separating emulsified water from a sample by coalescence. D 4175, D02
- microsiemens**—unit of measurement of water purity by electrical conductivity; one micromho; reciprocal of resistivity. See **megohm**, **ohm**. D 6161, D19
- microstrain**, *n*—the strain over a gage length comparable to interatomic distances. E 6, E28
- microstructure**—the structure of a suitably prepared specimen as revealed by a microscope. E 7, E04
- microstructure**—structure of a given metal revealed by microscopic observation of an etched surface. F 1789, F16
- microtexture**, *n*—in *glossy surface coatings*, small undulations or roughness that introduce perceptible local distortion in images of objects reflected by a surface. E 284, E12
- microtexture**, *n*—in *surface coatings*, undulations that introduce perceptible local distortion in images of objects reflected by a surface. E 284, E12
- microthrowing power**—the ability of a plating solution or a specified set of plating conditions to deposit metal in pores or scratches. B 374, B08
- microtunneling**—trenchless installation of pipe by jacking the pipe behind a remotely controlled, steerable, laser guided, microtunnel boring machine that provides continuous support to the excavated face under various geotechnical conditions including the presence of groundwater. C 896, C04
- microwave extraction cell**—a polytetrafluoroethylene cell used for evaluating microwave active materials. Refer to Test Method F 1349 for schematics of cell construction. F 1479, F02
- microwave only food package**—a container used to heat foods only in a microwave oven. F 1479, F02
- microwave oven**—equipment that uses ultrahigh frequency electromagnetic radiation in the bands of 915 ± 25 and 2450 ± 50 MHz to prepare food. F 1827, F26
- microwave radiation emission**—the microwave energy to which persons might be exposed during operation or servicing of microwave cooking equipment. F 1827, F26
- microwave susceptor**—packaging material that, when placed in a microwave field, is designed to interact with the field and provide substantial heat to the package contents. F 1479, F02
- micrurgy**—the use of a micromanipulator in combination with a microscope. E 175, E41
- middle rail**—See **intermediate rail**. F 552, F14
- midget impinger**—See **impinger**. D 1356, D22
- mid-infrared**—pertaining to the infrared region of the electromagnetic spectrum with wavelength range from approximately 2.5 to 25 μm (wavenumber range 4000 to 400 cm^{-1}). E 131, E13
- mid-neck girth**, *n*—in *body measurements*, the circumference of the neck approximately 25 mm (1 in.) above the neck base (See neck base girth.). D 123, D13
- mid-neck girth**, *n*—the horizontal circumference of the neck, taken approximately 25 mm (1 inch) above the neck base level. D 5219, D13
- mid rail**, *n*—a rail located between top rail and bottom rail or between top rail and floor if there is no bottom rail.
- mid rail**—See **railing systems**. E 631, E06
- mid rail**, *n*—a rail located between top rail and bottom rail or between top rail and floor if there is no bottom rail. E 1481, E06

midsole

midsole—a sole of leather or other material placed between the outsole and the insole. **F 869, F08**

mid-thigh girth, *n*—in *body measurements*, the circumference of the upper leg between the hip and the knee. **D 123, D13**

mid-thigh girth, *n*—the maximum horizontal circumference of the upper leg, taken midway between the hip girth level and the midpoint (or crease) of the knee. **D 5219, D13**

migration, *n*—the movement of contaminant(s) away from a source through permeable subsurface media (such as the movement of a groundwater plume of contamination) or the movement of contaminant(s) by a combination of surficial and subsurface processes. **D 5681, D34**

migration, *n*—ink spreading over a long period of time. See also **feathering**. **F 1857, F05**

migration development—premature color development on the CF side of a CFB sheet caused by free CB oil-dye penetrating through the sheet until it reacts with the CF receptor coating. **F 549, F05**

mil—a unit of length equal to $\frac{1}{1000}$ of an inch [0.0254 mm]. **B 354, B01**

mil—one thousandth of an inch, 0.001 in. = 25.4 μm . **B 374, B08**

mildew (fungus) resistance, *n*—the ability of a coating to resist fungus growth that can cause discoloration and ultimate decomposition of a coating's binding medium. **D 16, D01**

mildewstat, *n*—a chemical agent that inhibits the growth of mildew. **D 16, D01**

milk glass—a translucent or opaque white glass. **C 162, C14**

miliness—a condition of pronounced cloudiness in glass. **C 162, C14**

milking, *n*—a white colored buildup on the non-image areas of the offset blanket that usually occurs when the paper coating or paper filler (in the case of uncoated paper) softens due to inadequate water resistance. **D 6488, D01**

milk of lime—a suspension of hydrated lime (or slaked quicklime) in water in such proportions as to resemble milk in appearance. **C 51, C07**

mill, *n*—a machine used for rubber mastication, mixing, or sheeting, having two counter-rotating rolls with adjustable longitudinal axis separation that usually rotate at different speeds. **D 1566, D11**

mill addition—any of the materials added to the ball mill charge of a frit. **C 286, B08**

mill broke, *n*—any paper generated in a paper mill prior to the completion of a specific paper manufacturing process which is unsuitable for subsequent applications but can be reused in the paper manufacturer process. **D 1968, D06**

mill certification—producing mill certificate or proof of conformance with specified minimum allowable stresses for heat identification number of metal coil(s) from which metal connector plates were fabricated. **E 631, E06**

milled asbestos—all grades of asbestos that are recovered as a result of mechanical comminution and screen classification or air classification of asbestos ore. **D 2946, C17**

Miller-Bravais indices—indices used for the hexagonal system which involve the use of a fourth axis a_3 , coplanar with and at 120° to a_1 and a_2 . **E 7, E04**

Miller indices (for lattice planes)—the reciprocals of the fractional intercepts which a plane makes on the three axes. The symbols are (*hkl*). **E 7, E04**

mill finish, *adj*—having a nonuniform finish which may vary from piece to piece and within a piece, and which may not be entirely free of stains or oil. See also **mill finishsheet**. **B 881, B07**

mill grain, *n*—in *rubber*, grain which is imparted to rubber sheeting while being mixed or conditioned in a rubber mill and which is parallel to the direction the rubber moves in the mill. **D 123, D13**

mill grain, *n*—in *rubber*, grain which is imparted to rubber sheeting while being mixed or conditioned in a rubber mill and which is parallel to the direction the rubber moves in the mill. **D 6477, D13**

milliamperes (mA)—the technical term is **tube current** and is defined as the current passing between the cathode and anode

during the operation of an x-ray tube, measured in milliamperes (mA) and usually taken as a measure of x-ray intensity. **E 1316, E07**

milliequivalent per litre (meq/L)—a weight-volume measurement obtained by dividing the concentration expressed in milligrams per litre by the equivalent weight of the substance or ion. If specific gravity is unity meq/L is the same as epm. **D 6161, D19**

milligram per litre (mg/L)—a weight-volume measurement which expresses the concentration of a solute in milligrams per litre of solution. When specific gravity is unity mg/L = ppm. When specific gravity is not unity, mg/L divided by specific gravity of solution equals ppm. **D 6161, D19**

millimetre of mercury—a unit of pressure corresponding to a column of mercury exactly 1 mm high under standard acceleration of gravity. Sometimes called torr. **E 1316, E07**

millimicron (μm)—a unit of length used in measuring light waves. The peak spectral response of a scanner is expressed in μm . **F 149, F05**

milling, *n*—the mechanical treatment of metal powder, or metal powder mixtures, as in a ball mill, to alter the size or shape of the individual particles or to coat one component of the mixture with another. **B 243, B09**

milling—a process by which asbestos ore is treated mechanically to produce grades of asbestos with specified properties. **D 2946, C17**

milling, *n*—in waste derived fuels, reduction in particle size by shearing, cutting, grinding to a suitable particle size for analysis and characterization. **D 5681, D34**

milling—a reduction in particle size of refuse-derived fuel by shearing, cutting, or grinding to a suitable particle size for analysis and characterization (see **sample reduction**). **E 856, D34**

mill-mixed plaster (ready-mixed plaster), *n*—material formulated and dry-blended by the manufacturer, requiring only the addition of and mixing with water. **C 11, C11**

millrun—the total yield of lumber from a mill or a group of logs without regard to grades. **D 9, D07**

mill scale—the heavy oxide layer that forms during hot fabrication or heat treatment of metals. **B 374, B08**

mill tailings, *n*—finely ground mine waste (commonly passing a 150- μm (100 mesh screen) resulting from the mill processing of ore. **D 5681, D34**

millwork—generally building materials made of finished wood and manufactured in millwork plants and planing mills often assembled for installation upon delivery to the job site. Includes such items as inside and outside doors, window and door frames, molding, and interior trim. **D 9, D07**

mill wrinkle—See **crease**. **D 3990, D13**

MIM—see **metal injectionmolding**. **B 243, B09**

mineral fiber, *n*—insulation composed principally of fibers manufactured from rock, slag, or glass, with or without binders. **C 168, C16**

mineral fiber felt—a felt with rock wool as the principal component. **D 1079, D08**

mineral fiber insulation, *n*—insulation composed principally of fibers manufactured from rock, slag, or glass processed from molten state into fibrous form to comprise flexible batts or blankets, rigid or semi-rigid blocks and boards, or loose fill insulations, with or without binder. **E 176, E05**

mineral granules—opaque, natural, or synthetically colored aggregate commonly used to surface cap sheets, granule-surfaced sheets, and roofing shingles. **D 1079, D08**

mineral insulating oil, *n*—an oil of mineral origin, refined from petroleum crude oil, possessing electrical insulating properties. **D 2864, D27**

mineralization—the microbial-mediated breakdown of organic materials into inorganic materials. **F 1600, F20**

mineralized coal—See **mineralized coal** under **coal**. **D 121, D05**

mineralizer—a processing additive that promotes either the recrystallization or the partial fusion or sintering of certain mineral or

ceramic materials, often facilitating the desired conversion at a lower temperature. **C 242, C21**

mineral matter, n —in coal, historically considered to be the non-organic fraction composed of physically discrete particles of minerals, such as clays, quartz, pyrite, etc., and all elements other than carbon, hydrogen, oxygen, nitrogen and sulfur in the organic fraction. **D 121, D05**

mineral parting, n —discrete layer of mineral or mineral-rich sediment interbedded within lower mineral matter content coal. **D 121, D05**

mineral rubber, n —a compounding material (not a rubber) prepared from petroleum asphalt and used as a tackifier, softener, or extender. **D 1566, D11**

mineral stabilizer—a fine, water-insoluble inorganic material, used in admixture with solid or semisolid bituminous materials. **D 1079, D08**

mineral streak—an olive to greenish-black or brown discoloration of undetermined cause; commonly associated with bird pecks and other injuries. Occurs in streaks usually containing accumulations of mineral matter. **D 9, D07**

mineral-surfaced roofing—built-up roofing whose top ply consists of a granule-surfaced sheet. **D 1079, D08**

mineral-surfaced sheet—a felt that is coated on one or both sides with asphalt and surfaced with mineral granules. **D 1079, D08**

mineral tanned—leathers which have been tanned with chemical compounds of mineral origin without the use of vegetable tanning materials, notably the salts of chromium, aluminum, and zirconium. **D 1517, D31**

mineral wool, n —A synthetic vitreous fiber insulation made by melting predominantly igneous rock, and or furnace slag, and other inorganic materials, and then physically forming the melt into fibers. **C 168, C16**

minerogenic palsa—a palsa in which the core extends below the peat into the underlying material. **D 7099, D18**

mine subsidence, n —the downward displacement of the natural land surface in response to the removal of underlying supporting material by mining. **E 2201, E50**

miniature unmanned air vehicle, mini-UAV, n —UAV with a maximum gross takeoff weight of 55 lbs or less. **F 2395, F38**

minifocus X-ray tube—an X-ray tube having an effective focal spot size between 100 and 400 μm . **E 1316, E07**

minimal purge sampling—the collection of ground water that is representative of the formation by purging only the volume of water contained by the sampling equipment (that is, tubing, pump bladder). **D 5681, D34**

minimum acceptable rate of return—the minimum percentage return required for an investment to be economically acceptable. **E 631, E06**

minimum acceptable rate of return, n —the minimum percentage return required for an investment to be economically acceptable. **E 833, E06**

minimum application temperature, n —the minimum temperature, as recommended by the manufacturer, to which a hot-applied sealant or filler for pavement cracks or joints must be heated while conforming to all specification requirements and result in appropriate application characteristics. **D 5535, D04**

minimum autoignition temperature (MAIT), n —the minimum temperature at which a dust cloud will self ignite under the specified conditions of test. **E 1445, E27**

minimum average roll value (MARV), n —for geosynthetics, a manufacturing quality control tool used to allow manufacturers to establish published values such that the user/purchaser will have a 97.7% confidence that the property in question will meet published values. For normally distributed data, "MARV" is calculated as the typical value minus two (2) standard deviations from documented quality control test results for a defined population from one specific test method associated with one specific property. **D 4439, D35**

minimum curve—in a phase diagram, a univariant line tracing the

meeting of a pair of bivariate surfaces at intermediate composition and coinciding with their lowest temperature at each pressure level, or their lowest pressure at each temperature level; congruent transformation occurs everywhere along a minimum curve. **E 7, E04**

minimum detectable leakage rate—the magnitude of the smallest leakage rate that can be unambiguously detected by a given leak detector in the presence of conditions existing at time of test. **E 1316, E07**

minimum detectable mass permeated, n —the smallest mass of permeant that is detectable with the complete permeation test system. **F 1494, F23**

minimum detectable permeation rate, n —the lowest rate of permeation that is measurable with the complete permeation test system. **F 1494, F23**

minimum detectable temperature difference (MDTD)—a measure of the compound ability of an infrared imaging system and an observer to detect a target of unknown location at one temperature against a large uniform background at another temperature when displayed on a monitor for a limited time.

NOTE—For a given target size, the MDTD is the minimum temperature difference between the target and its background at which the observer can detect the target. The standard target is a circle whose size is given by its angular subtense, and both target and background are isothermal blackbodies. **E 1316, E07**

minimum detection limit—See analyzer. **D 1356, D22**

minimum determinability, n —the lowest value that can be determined within the stated precision of a method expressed quantitatively in the same dimension that is used for reporting results of the test. **D 1129, D19**

minimum edge contrast, E_{Cmin}, n —the smallest edge contrast in a scan reflectance profile. **F 1294, F05**

minimum force, $P_{min} [F]$ —in fatigue, the lowest algebraic value of applied force in a cycle. By convention, tensile forces are positive and compressive forces are negative. **E 1823, E08**

minimum hardness—hardness value of a fastener below which it is not in conformance with the specification. **F 1789, F16**

minimum ignition energy, n —electrical energy discharged from a capacitor, which is just sufficient to effect ignition of the most ignitable mixture of a given fuel-mixture under specific test conditions. **E 1445, E27**

minimum immersion length, n —the depth that a thermometer should be immersed, in a uniform temperature environment, such that further immersion does not produce a change in indicated temperature greater than the specified tolerance. **E 344, E20**

minimum joint width, n —the narrowest opening of an installed joint system. **E 176, E05**

minimum local thickness—lowest local thickness value on the significant surface of a single article. **F 1789, F16**

minimum (non-statistical), n —the lowest acceptable actual test result; any valid individual test result below the minimum is cause for rejection of the component or material lot being tested.

$\text{All } x_i \geq \text{Minimum} = LSL$

A 644, A04

minimum point—that composition and temperature, or pressure, at which a heterogeneous equilibrium occurs at its lowest temperature, or pressure, when this does not coincide with one of the composition limits of the equilibrium, that is, when it occurs at an intermediate composition; the equilibrium becomes congruent (univariant) at the minimum point. **E 7, E04**

minimum process capability index, C_{pk}, n —smaller of the upper process capability index and the lower process capability index. **E 456, E11**

minimum process performance index, P_{pk}, n —smaller of the upper process performance index and the lower process performance index. **E 456, E11**

minimum reflectance, R_{min} , n

minimum reflectance, R_{min} , n —the smallest reflectance value in a scan reflectance profile. **F 1294, F05**

minimum reflectivity difference, n —the difference between the smallest minimum space reflectance value and the largest maximum bar reflectance value as measured across the entire symbol. According to the equation:

$$MAD = \text{Min}(A_s \text{ min}) - \text{Max}(A_b \text{ max})$$

where:

A_s = Minimum Space Reflectance, and

A_b = Maximum Bar Reflectance.

F 1294, F05

minimum required pressure—one of a series of established pressure values for a plastic piping component (multilayer pipe, fitting, valve, and so forth) obtained by categorizing the long-term hydrostatic pressure strength in accordance with ISO 9080.

F 412, F17

minimum required strength—one of a series of established stress values for a plastic compound obtained by categorizing the long-term hydrostatic strength determined by hydrostatic testing in accordance with ISO 9080.

F 412, F17

minimum resolvable temperature difference (MRTD)—a measure of the ability of an infrared imaging system and the human observer to recognize periodic bar targets on a display. The MRTD is the minimum temperature difference between a standard periodic test pattern (7:1 aspect ratio, 4 bars) and its blackbody background at which an observer can resolve the pattern as a four-bar pattern.

E 1316, E07

minimum spacing—minimum anchor spacing measured centerline to centerline, at which base material will not be damaged when multiple anchors are set.

E 2265, E06

minimum standard deviation, S_M , n —the standard deviation of results on a test material obtained under conditions of minimum variability

E 135, E01

minimum (statistical), n —the lowest acceptable statistical test result; for compliance, the sample mean (\bar{x}) minus M standard deviation(s), where M is a matter of agreement between the supplier and purchaser, must be greater than, or equal to, the lower specification limit (LSL).

$$\bar{x} - M \times s \geq \text{Minimum} = LSL$$

A 644, A04

minimum stress-intensity factor coefficient, Y_m^* —the minimum value of the stress intensity factor coefficient, Y^* .

E 1823, E08

minimum stress-intensity factor, K_{min} [$FL^{-3/2}$]—in fatigue, the minimum value of the stress-intensity factor in a cycle. This value corresponds to P_{min} when $R > 0$ and is taken to be zero when $R \leq 0$.

E 1823, E08

minimum test value, n —for geosynthetics, the lowest sample value from documented manufacturing quality control test results for a defined population from one test method associated with one specific property.

D 4439, D35

minimum thickness, n —of steel sheet, an ordering designation which indicates that the applicable tolerance for thickness is all plus from the ordered thickness.

A 902, A05

minor defect, n —a defect that is not likely to materially reduce the usability of the product from its intended purpose, or is a departure from established standards having little bearing on the effective use of operation of a product.

D 123, D13

minor defect, n —a defect that is not likely to materially reduce the usability of the product from its intended purpose, or is a departure from established standards having little bearing on the effective use of operation of a product.

D 4850, D13

minor imperfection, n —in fabric grading, a deviation in a roll of fabric that judgment and experience indicate is likely to have no bearing on subsequent processing of the fabric.

D 123, D13

minor imperfection, n —in fabric grading, a deviation in a roll of fabric that judgment and experience indicate is likely to have no bearing on subsequent use or processing of the fabric.

D 6799, D13

minor modification—any change that does not alter the structural or operational characteristics of the ride or device nor change its performance from that specified in the manufacturer's design criteria.

F 747, F24

minor package defect—a defect that does not significantly reduce the usability of the package for its intended purpose, or that is a departure from established standards having little or no bearing on the effective use of the package.

F 17, F02

minor package defect—See Terminology F 17.

F 1327, F02

minor principal plane—see **principal plane**.

D 653, D18

minor principal stress—see **stress**.

D 653, D18

minor tile facial dimension—the length or width of the tile exclusive of the lugs.

C 242, C21

minor tile thickness—the thickness of tile that does not include maximum protuberances or ridges.

C 242, C21

minus, n —the sieve designating the upper limit or maximum size shall be the sieve of the series with the largest opening upon which is cumulatively retained a total of less than or equal to 1 % of the sample.

D 5681, D34

minus sieve, n —the portion of a powder sample which passes through a standard sieve of specified number. (See **plus sieve**.)

B 243, B09

mirror assembly, n —a mirror, marked and aligned with the viewing rakes, used as an aid in quickly identifying and tracking the flame front progress.

E 176, E05

mirror, first or front surface—an optical mirror on which the reflecting surface is applied to the front surface of the mirror instead of to the back, that is, to the first surface of incidence.

E 175, E41

mirror illuminator—a thin, half-round opaque mirror interposed in a microscope for the purpose of directing an intense oblique beam of light to the object. The light incident on the object passes through one half the aperture of the objective and the light reflected from the object passes through the other half aperture of the objective.

E 7, E04

mirror line, n —a line, part of a pattern piece, that divides two symmetrical parts.

D 6963, D13

miscibility gap—a region of multi-phase equilibrium; commonly applied to the specific case in which an otherwise continuous series of liquid, or solid, solutions is broken, over a limited temperature range, by the intrusion of a two phase field that terminates at a critical point. See **binodal curve**.

E 7, E04

misclip—See **scalloped selvage**.

D 3990, D13

misdraw—See **wrong draw**.

D 3990, D13

mismatch—an uneven fit in worked lumber when adjoining pieces do not meet tightly at all points of contact or when the surfaces of adjoining pieces are not in the same plane.

D 9, D07

mispick, n —in woven fabrics, a pick not properly interlaced which causes a break in the weave pattern. (See **double pick**.)

D 123, D13

mispick, n —in woven fabrics, a pick not properly interlaced which causes a break in the weave pattern. (*Syn.* wrong pick) (See also **double pick**)

D 3990, D13

misprint, n —in printed fabric, colors or patterns, or both, either missed, or partially missed, or incorrectly positioned relative to each other.

D 123, D13

misprint, n —in printed fabric, colors or patterns, or both, either missed, or partially missed, or incorrectly positioned relative to each other.

D 3990, D13

misread, n —a disparity between the data encoded in a symbol and the data output from a code reader. Also known as bad read or mis-scan. Such errors will not be detected by test routines in the decode algorithm. (See also, **non-read**.)

F 1294, F05

misregister, n —in printed fabric, colors or patterns not correctly positioned. (Compare **misprint**.)

D 123, D13

misregister, n —in printed fabric, colors or patterns not correctly positioned. (Compare **misprint**.)

D 3990, D13

missing coating, n —for coated inflatable restraint fabrics, portions of

the coated layer containing exposed base fabric or scrape marks in the coated layer. **D 6799, D13**

missing data, n—one or more fields in a data record that has no valid values due to a variety of reasons such as improper functioning of the data collection device, failed communications, or shortcomings in subsequent processing programs. **E 867, E17**

missing dots, n—a noticeable area void of halftones or an area of the cylinder that has cells that have not transferred ink to the paper. It can be caused by a worn cylinder or rough paper surface, or both. (Also referred to as *skipped dots*). **D 6488, D01**

missing end—See **end out**. **D 3990, D13**

missing pick—See **broken pick**. **D 3990, D13**

missing yarn, n—for *inflatable restraint fabrics*, a yarn discontinuity resulting in a change in weave pattern. **D 6799, D13**

miss-knit, n—*inknitted fabrics*, a deviation from the designated knitting pattern. **D 123, D13**

miss-knit, n—*inknitted fabrics*, a deviation from the designated knitting pattern. **D 3990, D13**

mist—a finely structured fracture marking giving a matte or roughened appearance to a surface; having continuous degrees of coarseness. Mist is variously known as fine hackle, frosted area, matte, and stippled area. **C 162, C14**

mist, n—liquid, usually water in the form of particles suspended in the atmosphere at or near the surface of the earth; small water droplets floating or falling, approaching the form of rain, and sometimes distinguished from fog as being more transparent or as having particles perceptibly moving downward. **D 1356, D22**

mist, n—liquid, usually water, in the form of particles suspended in the atmosphere at or near the surface of the earth; small water droplets floating or falling, approaching the form of rain, and sometimes distinguished from fog as being more transparent or as having particles perceptively moving downward. **E 1620, E29**

misting, n—side effect of ink film splitting within an inking unit, in particular on rapidly-rotating inking rollers. **D 6488, D01**

misting—see **dusting**. **F 335, F05**

mists—distribution of droplets with $50 \mu\text{m} < D_{v,5} \leq 100 \mu\text{m}$. **E 1102, E35**

misweave, n—for *inflatable restraint fabrics*, a change in the weave pattern caused by incorrect interlacing or insertion of a yarn. (Includes *mispick, wrong, draw, jerk-in*.) **D 6799, D13**

mitered fittings—fittings manufactured by using beveled pipe segments. **C 896, C04**

mitered pipe—See **beveled pipe**. **C 896, C04**

miter ending—See **railing systems**. **E 631, E06**

miter ending—an angular or dovetailed member end, designed to fit an adjacent matching member, thereby providing continuity of profile at the connection. **E 631, E06**

miter ending—an angular or dovetailed member end, designed to fit an adjacent matching member, thereby providing continuity of profile at the connection. **E 1481, E06**

mix—See **batch (3)**. **C 162, C14**

mix, n—an adequate mixture of rubber in any form with other material(s). **D 1566, D11**

mixed aniline point, n—the minimum equilibrium solution temperature of a mixture of two volumes of aniline (aminobenzene), one volume of sample, and one volume of *n*-heptane of specified purity. **D 4175, D02**

mixed aniline point, n—the minimum equilibrium solution temperature of a mixture of two volumes of aniline, one volume of sample, and one volume of *n*-heptane of specified purity. **D 4175, D02**

mixed base, adj—in *lubricating grease*, the description of a thickener system composed of soaps of two metals. **D 4175, D02**

mixed bed, n—a physical mixture of anion-exchange and cation-exchange materials. **D 1129, D19**

mixed-bed—a physical mixture of anion-exchange and cation-exchange materials. **D 6161, D19**

mixed end, n—*inwoven fabrics*, a warp yarn differing from that normally being used in the fabric. **D 123, D13**

mixed end, n—*inwoven fabrics*, a warp yarn differing from that normally being used in the fabric. **D 3990, D13**

mixed filling, n—*in woven fabrics*, a filling yarn differing from that normally being used in the fabric. (See also **filling band**. Compare **barré**.) **D 123, D13**

mixed filling, n—*in woven fabrics*, a filling yarn differing from that normally being used in the fabric. (See also **filling band**) (Compare **barré**) **D 3990, D13**

mixed grain size—See **duplex grain size**. **E 7, E04**

mixed-in-place pile—a soil-cement pile, formed in place by forcing a grout mixture through a hollow shaft into the ground where it is mixed with the in-place soil with an auger-like head attached to the hollow shaft. **D 653, D18**

mixed-in-place (road mix), n—a bituminous surface or base course produced by mixing mineral aggregate and cut-back asphalt, bituminous emulsion, or tar at the job-site by means of travel plants, motor graders, drags, or special road-mixing equipment; open or dense-graded aggregates, sand, and sandy soil may be used. **D 8, D04**

mixed liquor, n—*in sewage treatment*, the contents of an aeration tank including the activated sludge mixed with primary effluent or the raw wastewater and return sludge. **D 4175, D02**

mixed liquor, n—*in sewage treatment*, the contents of an aeration tank including the activated sludge mixed with primary effluent or the raw wastewater and return sludge. **D 6384, D02**

mixed potential—the potential of a specimen (or specimens in a galvanic couple) when two or more electrochemical reactions are occurring simultaneously. **G 15, G01**

mixed powder, n—a powder made by mixing two or more powders as uniformly as possible. The constituent powders will differ in chemical composition or in particle size or shape, or a combination thereof. **B 243, B09**

mixed reflection, n—partly specular and partly diffuse reflection. **E 284, E12**

mixed reflection, n—partly regular and partly diffuse reflection.

NOTE—The irradiance or illuminance received from a point source after regular (diffuse) reflection varies inversely as the square of the distance to the source (diffuser). **E 349, E21**

mixed transmission, n—a combination of diffuse and regular transmission. **E 284, E12**

mixed transmission, n—partly regular and partly diffuse transmission.

NOTE—The irradiance or illuminance received from a point source, after regular (diffuse) transmission, varies inversely as the square of the distance to the source (diffuser). **E 349, E21**

mixer—a machine employed for blending the constituents of grout, mortar, or other mixtures. **D 653, D18**

mixer, n—a machine that incorporates and disperses compounding ingredients into rubber to form a mix or a compound, through the action of mechanical work (shear). **D 1566, D11**

mixer, internal, n—a machine with a closed cavity in which a specially shaped rotor(s) masticates the rubber or incorporates and disperses compounding materials, or both, into the rubber. **D 1566, D11**

mixing, n—the thorough intermingling of powders of two or more materials. **B 243, B09**

mixing cycle—the time taken for the loading, mixing, and unloading cycle. **D 653, D18**

mixing ratio (r), n—the ratio of the mass of water vapor m_v to the mass of dry air m_a , present in the moist air;

$$r = \frac{m_v}{m_a}$$

D 4023
D 1356, D22

mixing speed—the rotation rate of a mixer drum or of the paddles in an open-top, pan, or trough mixer, when mixing a batch; expressed in revolutions per minute. **D 653, D18**

mixture design, *n*—a design in which two or more ingredients or components shall be mixed and the response is a property of the resulting mixture that does not depend upon the amount of the mixture. **E 456, E11**

mixture design, *n*—a design in which two or more ingredients or components shall be mixed and the response is a property of the resulting mixture that does not depend upon the amount of the mixture.

NOTE—The proportions of each of the *q* components (X_i) in the mixture shall satisfy the conditions $0 \leq X_i \leq 1$ and $\sum_{i=1}^q X_i = 1$; and each experimental point is defined in terms of these proportions.

NOTE—In some fields of application the experiment mixtures are described by the terms *formulation* or *blend*. The use of mixture designs is appropriate for experimenting with the formulations of manufactured products, such as paints, gasoline, foods, rubber, and textiles.

NOTE—In some applications, the proportions of the components of the mixture may vary between 0 and 100 % of the mixture (*complete domain*). In others, there may be operative restraints, so that at least one component cannot attain 0 or 100 % (*reduced domain*).

E 1325, E11

mobile carrier—distinct species moving freely within a membrane for the purpose of increasing the selective sorption and flux of a specific component in a feed stream relative to all other components. **D 6161, D19**

mobile home—Obsolete term. Use **manufactured home**. (See **building**.) **E 631, E06**

mobius loop—a one-sided surface formed by holding one end of a rectangle fixed, rotating the opposite end through 180° and then applying it to the first end. **F 221, F05**

mocha leather—leather from any variety of hair sheep; after the grain has been removed by a liming process known as frizing, the fine fibers below the grain are sueded. **D 1517, D31**

mocha suede—a washable and durable suede produced from chrome-tanned Arabian blackhead hair sheepskins (commonly called blackhead mochas) mechanically abraded on the flesh side. Tightness of fiber structure found in these skins imparts the characteristic fineness of finish associated with mocha suede. **D 1517, D31**

mock flat-felled seam, *n*—See **double-welt seam**. **D 4965, D13**

mock French seam, *n*—a complex seam formed on the inside of the object with raw edges enclosed and no stitching rows visible on the face side; similar in appearance to the French seam but constructed differently. (Compare **French seam**.) **D 123, D13**

mock French seam, *n*—in *home sewing*, a complex seam formed on the inside of the product with cut edges enclosed and no stitching visible on the face side; similar in appearance to the French seam but constructed differently. (Compare **French seam**.) **D 4965, D13**

mock leno weave, *n*—a weave in which the warp yarns remain parallel but form open warp stripes by programmed interlacing of warp and filling yarns simulating a leno appearance. **D 123, D13**

mock leno weave, *n*—a weave in which the warp yarns remain parallel but form open warp stripes by programmed interlacing of warp and filling yarns simulating a leno appearance. **D 7018, D13**

mockup, *n*—a section or a structure or assembly, built full-size or to scale, for the purpose of studying construction details, testing performance, judging appearance, or any combination thereof. **E 631, E06**

modacrylic—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of less than 85 % but at least 35 % by weight of acrylonitrile units (C₂H₃CH₂C₂H₃CH(C₂H₃)), except fiber qualify-

CN

ing under **rubber**, 2, and **anidex**.

*******novoloid**—a manufactured fiber containing at least 85 % by weight of a cross-linked novolac. **D 123, D13**

modality, *n*—any of the sensory systems (for example, auditory, taste, olfaction, touch, or visual modality). **E 253, E18**

mode, *n*—the value of the variate for which the relative frequency in a series of observations reaches a local maximum. **D 123, D13**

mode, *n*—an output of an *IR thermometer* that gives a representation of a temperature using a disclosed calculation technique with respect to selected reference (for example, *blackbody*, *oral*, *rectal*, etc.). **E 344, E20**

mode—the type of ultrasonic wave propagating in the materials as characterized by the particle motion (for example, longitudinal, transverse, and so forth). **E 1316, E07**

mode—one of the three classes of crack (surface) displacements adjacent to the crack tip. These displacement modes are associated with the stress-strain fields around the crack tip and are designated one, two, and three. Arabic numerals 1, 2, and 3 are used for the general case, and they represent opening, sliding, and tearing displacements, respectively. Roman numerals are used to specialize the mode to plane strain (I and II) or to antiplane-strain (III). **E 1823, E08**

mode conversion—phenomenon by which an ultrasonic wave that is propagating in one mode can reflect or refract at an interface to form ultrasonic wave(s) of other modes. **E 1316, E07**

model code, *n*—a proposed **code** that is established within the procedural framework of a group of knowledgeable people, and is designed for adoption by governmental authority. **E 631, E06**

model code—See **code**. **E 631, E06**

model evaluation, *n*—the process of quantifying the accuracy of chosen results from a model when applied for a specific use. **E 176, E05**

model signature, *n*—a signature that is used as a prototype for a simulation or copy, by manual electronic or other means. **E 2195, E30**

model validation, *n*—the process of determining the correctness of the assumptions and governing equations implemented in a model when applied to the entire class of problems addressed by the model. **E 176, E05**

model verification, *n*—the process of determining the correctness of the solution of a system of governing equations in a model. With this definition, verification does not imply the solution of the correct set of governing equations, only that the given set of equations is solved correctly. **E 176, E05**

MODEM—modulator/demodulator. **F 1457, F05**

mode of control, *n*—means the pilot uses to direct the activity of the UAV. There are three modes of control: fully autonomous, semi-autonomous, and remote control. A UAV may use different modes of control in different phases of flight. **F 2395, F38**

moderately conductive, *adj*—describes a solid material having a volume resistivity between 1 and 10 000 000 Ω-cm. **D 1711, D09**

moderator—a material used to slow fast neutrons. Neutrons are slowed down when they collide with atoms of light elements such as hydrogen, deuterium, beryllium, and carbon. **E 1316, E07**

modernize, *v*—in *building*, to adapt to current needs, tastes, or usage by **remodeling** or **repair**. **E 631, E06**

modernize—See **building modification**. **E 631, E06**

modes, *n*—of *appearance*, various manners in which colors can be perceived (see also **aperture mode**, **illuminant mode**, **object mode**.) **E 284, E12**

modified Auger parameter—the Auger parameter plus the photon energy, which equals the kinetic energy of the sharpest Auger peak plus the binding energy of the most intense photoelectron peak. **E 673, E42**

modified design—a concrete pipe design changed from a standard design. **C 822, C13**

modified general question test (MGQT), *n*—test format patterned after the Reid test and modified by the U.S. Military. It contains relevant, irrelevant, and comparison questions. The MGQT is widely used in the field, and has a body of validity research. **E 2035, E52**

modified grab test, n —in *fabric testing*, a tensile test in which the control part of the width of the specimen is gripped in the clamps and in which lateral slits are made midlength of the specimen severing all yarns bordering that portion of the specimen held between the two clamps. **D 123, D13**

modified grab test, n —in *fabric testing*, a tensile test in which the control part of the width of the specimen is gripped in the clamps and in which lateral slits are made midlength of the specimen severing all yarns bordering that portion of the specimen held between the two clamps. **D 4850, D13**

modified groove—see **femal end of pipe**. **C 822, C13**

modified internal rate of return (MIRR)—See **adjusted internal rate of return (AIRR)**. **E 631, E06**

modified internal rate of return (MIRR), n —See **adjusted internal rate of return (AIRR)**. **E 833, E06**

modified rosin, n —rosin that has been treated with heat or catalysts, or both with or without added chemical substances, so as to cause substantial change in the structure of the rosin acids, as isomerization, hydrogenation, dehydrogenation, or polymerization, without substantial effect on the carboxyl group. **D 804, D01**

modified tongue—see **male end of pipe**. **C 822, C13**

modified vegetable oil—an oil, extracted from seeds, that has been chemically modified (for example, methylated). **E 1519, E35**

modified vegetable oil concentrate—an emulsifiable, chemically modified vegetable oil product containing 5 to 20 % w/w surfactant and the remainder chemically modified vegetable oil. **E 1519, E35**

modified worsted system, n —a worsted system for spinning manufactured fibers which relies on pin control of fibers during sliver weight reduction, but which bypasses the system of combing required with wool to remove noil. **D 123, D13**

modified worsted system, n —a worsted system for spinning man-made fibers which relies on pin control of fibers during sliver weight reduction, but which bypasses the system of combing required with wool to remove noil. **D 4849, D13**

modifier—in *grouting*, an additive used to change the normal chemical reaction or final physical properties of a grout system. **D 653, D18**

modifier, n —ingredient which, when added to an adhesive, changes its properties. **D 907, D14**

modular container—See **container**. **D 996, D10**

modular dwelling—a manufactured home consisting completely or in part of **modules**. **E 631, E06**

modular dwelling—See **dwelling unit**. **E 631, E06**

modulate, v —to vary a characteristic or parameter of an entity in accordance with a characteristic or parameter of another entity. **E 131, E13**

modulated current plating—a method of electroplating in which the cathode current density is changed periodically. See **pulse plating, ripple plating, periodic reverse plating**. **B 374, B08**

modulation—AES, the periodic waveform added to the spectrometer pass energy to obtain the desired Auger spectrum display. The modulation should be given as eV peak-to-peak, thereby including the geometrical factor of the spectrometer, rather than volts peak-to-peak. The frequency and waveform should also be given. **E 673, E42**

modulation analysis—an analytical method used in electromagnetic testing that separates responses due to various factors influencing the total magnetic field by separating and interpreting, individually, frequencies or frequency bands in the modulation envelope of the (carrier frequency) signal. **E 1316, E07**

modulation frequency, f, v —the frequency, in Hz, at which radiant energy of a given wavenumber is modulated by a rapid-scanning interferometer. **E 131, E13**

modulation, MOD, n —the ratio of minimum edge contrast (ECmin) to symbol contrast (SC) expressed as:

$$\text{MOD} = \text{ECmin}/\text{SC}$$

F 1294, F05

modulation transfer function (MTF)—in infrared imaging systems, the modulus of a Fourier transform that describes the spatial distribution of the overall attenuation in amplitude of a thermal imaging system.

NOTE—MTF is a sensitive function of spatial frequency.

E 1316, E07

modulator/demodulator, n —a device that converts electronic signals from the form used in data processing (digital) to the form used in communication (analog), and vice versa. (See **MODEM**.)

F 1457, F05

module, n —for *inflatable restraints*, an assembly composed of an inflator, a cushion, a mounting device, a trigger, and a cover.

D 123, D13

module—a membrane element combined with the element's housing. Pressure vessel containing membrane element(s). **D 6161, D19**

module, n —for *inflatable restraints*, an assembly composed of an inflator, cushion, mounting device, trigger, and cover. **D 6799, D13**

module, n —a unit of structure based on a standard pattern of standard dimensions. (See also **modular dwelling**.) **E 631, E06**

module, n —the narrowest nominal width of bar or space in a symbol. **F 1294, F05**

modulo, n —an arithmetic operation in which the result is the remainder after division. The type of algorithm used to calculate the check digit for certain bar code symbols. **F 1294, F05**

modulus, n —as related to sealants used in building construction, the stress (force/unit area) at a corresponding strain (elongation) expressed as a percent of the original dimension. **C 717, C24**

modulus, n —the property of a material representative of its resistance to deformation. (See also **chord modulus, initial modulus, tangent modulus, Young's modulus**.) **D 123, D13**

modulus, n —the ratio of stress to strain; that property of a material which, together with the geometry of a specimen, determines the stiffness of the specimen; may be static or dynamic, and if dynamic, is mathematically a vector quantity, the phase of which is determined by the phase of the complex force relative to that of deflection. (See also **complex, elastic, damping**.) **D 1566, D11**

modulus, n —the property of a material representative of its resistance to deformation. (See also **chord modulus, initial modulus, tangent modulus, Young's modulus**.) **D 4848, D13**

modulus, complex—see **complex modulus**. **D 4092, D20**

modulus, complex—see **complex modulus**. **E 1142, E37**

modulus, elastic—see **complex modulus and storage modulus**. **D 4092, D20**

modulus, elastic—see **complex modulus and storage modulus**. **E 1142, E37**

modulus, loss—see **complex modulus and loss modulus**. **D 4092, D20**

modulus, loss—see **complex modulus and loss modulus**. **E 1142, E37**

modulus of deformation—see **modulus of elasticity**. **D 653, D18**

modulus of elasticity—see **complex modulus and storage modulus**. **D 4092, D20**

modulus of elasticity—see **complex modulus and storage modulus**. **E 1142, E37**

modulus of elasticity—for a given material, the ratio of unit stress to unit strain within its elastic range which may be used as a measure of stiffness. Sometimes called *Young's Modulus*. **F 1789, F16**

modulus of elasticity [FL^{-2}], n —the ratio of stress to corresponding strain below the proportional limit. **E 6, E28**

modulus of elasticity (modulus of deformation), $E, M (FL^{-2})$ —the ratio of stress to strain for a material under given loading conditions; numerically equal to the slope of the tangent or the secant of a stress-strain curve. The use of the term **modulus of elasticity** is recommended for materials that deform in accordance with Hooke's law; the term **modulus of deformation** for materials that deform otherwise. **D 653, D18**

modulus of elasticity, MPa (FL^{-2}), n —the ratio of stress (nominal)

modulus of elasticity, MPa (FL^{-2}), *n*

to corresponding strain below the proportional limit of a material, expressed in force per unit area, such as megapascals (pounds-force per square inch). **D 4439**, D35

modulus of rupture in bending [FL^{-2}], *n*—the value of maximum tensile or compressive stress (whichever causes failure) in the extreme fiber of a beam loaded to failure in bending computed from the flexure equation:

$$S_b = MclI$$

where:

M = maximum bending moment, computed from the maximum force and the original moment arm,

c = initial distance from the neutral axis to the extreme fiber where failure occurs, and

I = initial moment of inertia of the cross section about the neutral axis.

E 6, E28

modulus of rupture in torsion [FL^{-2}], *n*—the value of maximum shear stress in the extreme fiber of a member of circular cross section loaded to failure in torsion computed from the equation:

$$S_s = Tr/J$$

where:

T = maximum twisting moment,

r = original outer radius, and

J = polar moment of inertia of the original cross section.

E 6, E28

modulus of subgrade reaction—see **coefficient of subgrade reaction**. **D 653**, D18

modulus of volume change—see **coefficient of volume compressibility**. **D 653**, D18

modulus, secant—slope of the line connecting the origin and a given point of the stress-strain curve. **C 717**, C24

modulus, storage—see **complex modulus and storage modulus**. **D 4092**, D20

modulus, storage—see **complex modulus and storage modulus**. **E 1142**, E37

modulus, tangent, *n*—the slope of the line touching (tangent to) the stress-strain curve at a given point on the curve. **C 717**, C24

modulus, tensile, *n*—See **tensile stress at given elongation**, the preferred term. **D 1566**, D11

modulus, Young's, *n*—the ratio of normal stress to corresponding strain for tensile or compressive stresses below the proportional limit of the material. **D 1566**, D11

moellon—synthetic moellon is made by direct oxidation of cod or other fish oils (see also **degras**). **D 1517**, D31

mohair, *n*—the hair of the Angora goat, *Capra* species. **D 123**, D13

mohair, *n*—the hair of the Angora goat, *Capra* species. **D 4845**, D13

mohair paint roller cover, *n*—a cover in which the paint applying material is woven of short-pile velour that contains wool or angora goat hair. **D 16**, D01

Mohr circle—a graphical representation of the stresses acting on the various planes at a given point. **D 653**, D18

Mohr circle of stress (strain)—a graphical representation of the components of stress (strain) acting across the various planes at a given point, drawn with reference to axes of normal stress (strain) and shear stress (strain). (ISRM) **D 653**, D18

Mohr envelope—the envelope of a sequence of Mohr circles representing stress conditions at failure for a given material. (ISRM) **D 653**, D18

Mohr envelope (rupture envelope) (rupture line)—the envelope of a series of Mohr circles representing stress conditions at failure for a given material. **D 653**, D18

moil—(*l*) the glass remaining on a punty or blowpipe after a gob has been cut off or after a piece of ware has been blown and severed.

(2) the glass originally in contact with the blowing mechanism or head, which becomes cullet after the desired article is severed from it. **C 162**, C14

moiré, *n*—an undesirable, unintended interference pattern caused by the out-of-register overlap of two or more regular patterns such as dots or lines. **D 6488**, D01

moire patter—a pattern developed from interference or light blocking, when gratings, screens, or regularly spaced patterns are superimposed on one another. **E 175**, E41

moist room, *n*—an enclosed room for storage and curing of paste, mortar, and concrete specimens in which temperature and high relative humidity can be controlled within specified limits. **C 219**, C01

moisture, *n*—*in coal*, that water in and on coal assayed in accordance with standard test methods in which the final step is the measurement of mass loss from a coal sample heated to 104 to 110°C at specified conditions of residence time, atmosphere, sample mass, and equipment configuration.

equilibrium moisture, *n*—the moisture in a coal sample as determined in accordance with Test Method D 1412.

inherent moisture, *n*—*in coal*, the moisture that exists as an integral part of the coal in its natural state, including water in pores, but not that present in macroscopically visible fractures.

pore moisture, *n*—moisture in the pores of coal, which may be quantitatively equivalent to or less than inherent moisture depending upon the state of dryness of the sample.

residual moisture, *n*—that moisture remaining in the sample after air drying.

surface moisture, *n*—that portion of total moisture in a coal lot or sample collected from a lot, core face channel, or other source that is in excess of inherent moisture.

total moisture, *n*—all of the moisture in and on a consignment or sample of coal. **D 121**, D05

moisture, *n*—*as used with textiles*, water absorbed, adsorbed or resorbed by a material. (See also **water**.) **D 123**, D13

moisture, *n*—*as used with textiles*, water absorbed, adsorbed, or resorbed by a material. (See also **water**.) **D 4920**, D13

moisture—the volatile substances evolved during volatilization and purging of the sample-residue flask and absorbed on the desiccant contained in the absorption tubes under the conditions of the test. **E 1547**, E15

moisture as-is, *n*—deprecated term. See **moisture content**. **D 4920**, D13

moisture as-received, *n*—deprecated term. See **moisture content**. **D 4920**, D13

moisture, atmospheric—ambient humidity that may be absorbed by hygroscopic material during sampling and testing and may lead to erroneous results. **D 4790**, D16

moisture content—amount of water contained within a concrete masonry unit or related unit at a given time expressed as a percentage of the total amount of water in the unit under saturated conditions. **C 1209**, C15

moisture content—the amount of water contained in the wood, usually expressed as a percentage of the mass of the oven-dry wood. **D 9**, D07

moisture content, *n*—that part of the total mass of a material that is absorbed or adsorbed water, compared to the total mass. (Compare **moisture pick-up** and **moisture regain**.) **D 123**, D13

moisture content—see **water content**. **D 653**, D18

moisture content—the moisture present in a cellulosic material, as determined by prescribed methods, conventionally expressed as a percentage of the total mass of the "wet" material. **D 1695**, D01

moisture content—the water content of a substance as measured under specified conditions. **D 2652**, D28

moisture content, *n*—the percentage, by mass, of water absorbed and adsorbed by carbon black. **D 3053**, D24

moisture content, *n*—the amount of moisture in a material determined under prescribed conditions and expressed as a percentage of the mass of the moist material, that is, the original mass comprising the dried substance plus any moisture present. **D 4845, D13**

moisture content, *n*—that part of the total mass of a material that is absorbed or adsorbed water, compared to the total mass. (Compare **moisture pick-up** and **moisture regain**.) **D4920, D13**

moisture content, *n*—*at moisture-equilibrium*, the moisture content of a material in equilibrium with air of known, or specified, temperature and relative humidity. **D4920, D13**

moisture content—the moisture present in a material, as determined by definite prescribed methods, expressed as a percentage of the weight of the sample on either of the following bases:

- (1) Original weight.
- (2) Moisture-free weight.

NOTE—This is variously referred to as moisture content or moisture “as is” or “as received.”

NOTE—This is also referred to as moisture regain (frequently contracted to “regain”) or moisture content on the “oven-dry,” “moisture-free,” or “dry” basis. **E 41, G03**

moisture content, *n*—the percentage by mass of liquid-phase water in a two-phase mixture of vapor-and liquid-phase water. **E 957, E44**

moisture content—the amount of water contained in the biomass, expressed as either a percentage of the mass of the oven-dry biomass or of the wet biomass, moisture content, dry basis. **E 1705, E48**

moisture content (dry-basis), *n*—deprecated term. See **moisture pick-up**. **D4920, D13**

moisture content, *n*—the amount of moisture in a material determined under prescribed conditions and expressed as a percentage of the mass of the moist material, that is, the original mass comprising the oven-dried substance plus any moisture present. **D 123, D13**

moisture-density curve—see **compaction curve**. **D 653, D18**

moisture-density test—see **compaction test**. **D 653, D18**

moisture (dry-basis), *n*—deprecated term. See **moisture pick-up**. **D4920, D13**

moisture equilibrium, *n*—the condition reached by a material when it no longer takes up moisture from, or gives up moisture to, the surrounding atmosphere. (Compare **moisture-free**.) **D 123, D13**

moisture equilibrium—the condition reached by a sample when it no longer takes up moisture from, or gives up moisture to the surrounding air. **D 1695, D01**

moisture equilibrium, *n*—the condition reached by a material when it no longer takes up moisture from, or gives up moisture to, the surrounding atmosphere. (Compare **moisture-free**.) **D4920, D13**

moisture equilibrium, *n*—*for preconditioning*, the moisture condition reached by a material during free exposure to moving air in the standard atmosphere for preconditioning. **D4920, D13**

moisture equilibrium, *n*—*for testing*, the condition reached by a material during free exposure to moving air in a specified atmosphere for testing. **D4920, D13**

moisture equilibrium—the condition reached by a sample when the net difference between the amount of moisture absorbed and the amount desorbed, as shown by a change in weight, shows no trend and becomes insignificant. **E 41, G03**

moisture equilibrium for preconditioning, *n*—the moisture condition reached by a material during free exposure to moving air in the standard atmosphere for preconditioning. **D 123, D13**

moisture equilibrium for preconditioning—the moisture equilibrium condition reached by a sample after free exposure to air controlled at the standard condition for preconditioning. **D 1695, D01**

moisture equilibrium for testing, *n*—the condition reached by a sample or specimen during free exposure to moving air controlled at specified conditions. **D 123, D13**

moisture equilibrium for testing, *n*—*for industrial yarns and tire cords*, the condition reached when, after free exposure to a test atmosphere which is in motion, two successive weighings not less than 4 h apart, show not more than 0.1 % progressive change in mass of the specimen or sample. **D 123, D13**

moisture equilibrium for testing—the equilibrium moisture condition reached by a sample after free exposure to moving air controlled at standard conditions. **D 1695, D01**

moisture equilibrium for testing, *n*—*for industrial yarns and tire cords*, the condition reached when, after free exposure to a test atmosphere which is in motion, two successive weighings not less than 4 h apart, show not more than 0.1 % progressive change in mass of the specimen or sample. **D 6477, D13**

moisture equivalent:

centrifuge moisture equivalent, W_e , CME (D)—the water content of a soil after it has been saturated with water and then subjected for 1 h to a force equal to 1000 times that of gravity.

field moisture equivalent, FME—the minimum water content expressed as a percentage of the weight of the oven-dried soil, at which a drop of water placed on a smoothed surface of the soil will not immediately be absorbed by the soil but will spread out over the surface and give it a shiny appearance. **D 653, D18**

moisture expansion—an increase in dimension or bulk volume of a ceramic article caused by reaction with water or water vapor. **C 242, C21**

moisture-free, *adj*—the condition of a material that has been exposed in an atmosphere of desiccated air until there is no further significant change in its mass. **D 123, D13**

moisture-free, *adj*—*in textiles*, a descriptive term for a material that (1) has been exposed to a flow of desiccated air at a specified temperature until there is no further significant change in mass, or (2) has been treated by a distillation process using a suitable solvent. (Compare **moisture equilibrium**.) **D 123, D13**

moisture-free, *adj*—the condition of a material that has been exposed in an atmosphere of desiccated air until there is no further significant change in its mass. **D 4845, D13**

moisture-free, *adj*—*in textiles*, a descriptive term for a material that (1) has been exposed to a flow of desiccated air at a specified temperature until there is no further significant change in mass, or (2) has been treated by a distillation process using a suitable solvent. (Syn. **zero-moisture**.) (Compare **moisture equilibrium**.) **D4920, D13**

moisture gradient—a condition of graduated moisture content between successive thickness zones of wood that may be losing or absorbing moisture. During seasoning the gradations are between the relatively dry surface zones and the wet zones at the center of the piece. **D 9, D07**

moisture pick-up, *n*—the mass of absorbed and adsorbed water that is held by material, compared to the mass of the dried material. (Compare **moisture content**, and **moisture regain**.) **D 123, D13**

moisture pick-up, *n*—*at moisture-equilibrium*, the moisture pick-up of a material in equilibrium with air of known, or specified, temperature and relative humidity. **D 123, D13**

moisture pick-up, *n*—the mass of absorbed and adsorbed water that is held by a material, compared to the mass of the dried material. (Compare **moisture content** and **moisture regain**.) **D4920, D13**

moisture pick-up, *n*—*at moisture-equilibrium*, the moisture pick-up of a material in equilibrium with air of known, or specified, temperature and relative humidity. **D4920, D13**

moisture regain, *n*—the amount of moisture in a material determined under prescribed conditions and expressed as a percentage of the mass of the moisture-free material. (See **moisture content**.) **D 123, D13**

moisture regain, *n*—the amount of water resorbed by a dried material at specified equilibrium conditions of temperature and humidity, compared to the mass of the dried material. (See **standard**

- moisture regain.** Compare **commercial moisture regain**, **moisture content**, and **moisture pick-up.**) D 123, D13
- moisture regain**—the moisture present in a cellulosic material, as determined by prescribed methods, expressed as a percentage of the oven-dry mass. D 1695, D01
- moisture regain, *n***—the amount of moisture in a material determined under prescribed conditions and expressed as a percentage of the mass of the moisture-free material. D 4845, D13
- moisture regain, *n***—the amount of water resorbed by a dried material at specified equilibrium conditions of temperature and humidity, compared to the mass of the dried material. (See **standard moisture regain.**) (Compare **commercial moisture regain**, **moisture content**, and **moisture pick-up.**) D 4920, D13
- moisture regain**—the moisture in a material determined under prescribed conditions and expressed as a percentage of the weight of the moisture-free specimen.
NOTE—Moisture regain may result from either absorption or desorption, and differs from moisture content only in the basis used for calculation. E 41, G03
- moisture regain, commercial**—an arbitrary figure formally adopted as the regain to be used in calculating the commercial or legal mass of shipments or deliveries of any specific material. D 1695, D01
- moisture regain, standard**—the moisture regain of sample brought from a lower moisture regain into equilibrium with the standard atmosphere. D 1695, D01
- moisture resistant paper**—a category of optical scanning paper developed to meet unusual ambient or climatic conditions, for example, census forms or meter reading forms. F 149, F05
- moisture, wet-basis, *n***—deprecated term. See **moisture content.** D 4920, D13
- molality (m_1)**—moles (gram molecular weight) of solute per 1000 g of solvent. D 6161, D19
- molar absorptivity, ϵ** —see **absorptivity, molar.** E 131, E13
- molarity (M_1)**—moles (gram molecular weight) of solute per litre of total solution. D 6161, D19
- molar linear absorption coefficient (ϵ_m)**—a constant relating the spectrophotometric absorbance, A_λ , of an optically absorbing molecular species at a given wavelength, λ , per unit pathlength, d , to the molar concentration, c , of that species in solution:
$$\epsilon_m = A_\lambda / (d \times c)$$
- SI Unit: $m^2 \text{ mol}^{-1}$ E 170, E10
- mold, *n***—*in metal or powder injection molding*, the member of the tooling into which the powder and binder mixture is forced, and the configuration of which forms the surfaces of the green part. In isostatic compacting, a mold is also the confining form in which powder is isostatically compacted. B 243, B09
- mold**—a form (usually metal) in which glass is shaped. C 162, C14
- mold, *n***—the support structure that holds the laminate or lay-up during the laminate consolidation process. D 3878, D30
- mold, *n***—form of fungal growth, characterized by long strands of filaments (hyphae) and, under appropriate growth conditions, aerial, spore-bearing structures. D 4175, D02
- molded, *v***—formed in a closed die by the application of external pressure. C 709, D02
- molded, *v***—formed in a closed die by the application of external pressure. D 4175, D02
- molded glass**—glass that is formed in a mold as distinct from cast, rolled, drawn, or offhand ware. C 162, C14
- molded pulp**—See **packaging.** D 996, D10
- molded shape**—*in packaging*, a material formed to specific contours for **cushioning**, or **blocking** or **bracing** purposes. D 996, D10
- mold flux, *n***—a mold powder in its liquid state which protects the steel from re-oxidation, lubricates the solidifying steel shell as it passes through the mold, absorbs inclusions, and controls the heat transfer from the steel shell to the mold. C 71, C08
- mold form**—the cavity or shape that uncured composite laminae are placed into or onto and from which they derive their form. E 631, E06
- mold form**—the cavity or shape that uncured composite laminae are placed into or onto and from which they derive their form. E 1749, E06
- molding, *v***—see **compacting.** B 243, B09
- molding, *v***—shaping of brick by dropping, throwing, or vibrating wet clay or shale in a mold cavity shaped to provide the peripheral dimensions of the brick. C 43, C15
- molding, *n***—a piece of trim, typically wood, milled with a decorative shape or profile. E 1605, E06
- molding, bag**—See **bag molding.** D 883, D20
- molding, blow**—See **blow molding.** D 883, D20
- molding, compression**—See **compression molding.** D 883, D20
- molding, compression, *n***—the process of forming a material to a desired shape by flow induced by a force applied after a material is placed in the mold cavity. D 1566, D11
- molding, contact pressure**—a method of molding or laminating in which the pressure is only slightly more than necessary to hold the materials together during the molding operation. This pressure is usually less than 69 kPa (10 psi). (D20) F 412, F17
- molding, contact pressure, *n***—See **contact pressure molding.** D 883, D20
- molding, high-pressure**—molding or laminating in which the pressure used is greater than 1380 kPa (200 psi). (D20) F 412, F17
- molding, high-pressure, *n***—See **high-pressure molding.** D 883, D20
- molding, injection**—See **injection molding.** D 883, D20
- molding, injection, *n***—the process of forming a material by forcing it from an external heated chamber through a sprue (runner, gate) into the cavity of a closed mold by means of a pressure gradient that is independent of the mold clamping force. D 1566, D11
- molding, low-pressure**—molding or laminating in which the pressure used is 1380 kPa (200 psi) or less. (D20) F 412, F17
- molding, low-pressure, *n***—See **low-pressure molding.** D 883, D20
- molding pressure, compression**—the calculated fluid pressure applied to the material in the mold. D 883, D20
- molding pressure, compression**—the calculated fluid pressure applied to the material in the mold. (D20) F 412, F17
- molding pressure, injection**—the pressure applied to the cross-sectional area of the material cylinder. D 883, D20
- molding pressure, injection**—the pressure applied to the cross-sectional area of the material cylinder. (D20) F 412, F17
- molding pressure, transfer**—the pressure applied to the cross-sectional area of the material pot or cylinder. D 883, D20
- molding pressure, transfer**—the pressure applied to the cross-sectional area of the material pot or cylinder. (D20) F 412, F17
- molding shrinkage, *n***—the difference in dimensions between a molded product and the mold cavity in which it was molded, both the mold and product being at normal room temperature when measured. D 1566, D11
- molding, transfer**—See **transfer molding.** D 883, D20
- molding, transfer, *n***—the process of forming a material by forcing it from an auxiliary heated chamber through a sprue hole (runner, gate) into the cavity of a closed mold by means of a pressure gradient that is dependent on the mold clamping force. D 1566, D11
- mold lubricant**—a substance applied on or into molds to reduce friction or prevent adhesion. C 162, C14
- mold lubricant, *n***—synonym for **release agent (mold).** D 1566, D11
- mold mark**—mark or seam on glassware resulting from a mold joint. C 162, C14
- mold marks, *n***—surface imperfection transferred to a molded product from corresponding marks on a mold. D 1566, D11
- mold open time, *n***—the time interval from the instant the mold begins to open until it is closed again. D 883, D20
- mold powder, *n***—a powder or granular material added to the top of

molten steel in the continuous casting mold which melts, forming a mold flux or liquid layer over the molten steel. **C 71, C08**

mold temperature, *n*—the mean temperature of the mold cavity surface measured after the system has obtained thermal equilibrium and immediately after opening the mold. **D 883, D20**

molecular contaminant, *n*—nonparticulate contaminant that may exist in either a gaseous, liquid, or solid state. **G 126, G04**

molecular diffusion, *n*—a process of spontaneous intermixing of different substances, attributable to molecular motion and tending to produce uniformity of concentration. **D 1356, D22**

molecular flow—the flow of gas through a passage under conditions such that the mean-free path is greater than the largest dimension of a transverse section of the passage. **E 1316, E07**

molecular leak—a leak of such geometric configuration that gas flow through it obeys the laws of molecular flow (Knudsen's law). The flow is proportional to the difference of the end pressures and inversely proportional to the square root of the molecular weight of the gas. **E 1316, E07**

molecular mass, *n*—synonym for **molecular weight**. **D 1566, D11**

molecular replica—See **replica**. **E 7, E04**

molecular SIMS—the SIMS technique when applied to molecular or polyatomic secondary ions. **E 673, E42**

molecular weight, *n*—ratio of the mass of a molecule to one-twelfth ($1/12$) of the mass (1.6605×10^{-27} kg) of a carbon-12 atom, or the sum of the atomic weights of the atoms in a molecule. **D 1566, D11**

molecular weight cut off (MWCO)—the rating of a membrane for the size of uncharged solutes it will reject a percent rejection coefficient for a given membrane. Also referred to as nominal molecular weight cut off (NMWCO). **D 6161, D19**

mole fraction, *n*—the ratio of the number of molecules (or moles) of a compound or element to the total number of molecules (or moles) present.

mole fraction of water vapor (x_v), *n*—the ratio of the number of moles of water vapor, n_v , to the total number of moles of water and dry air:

$$x_v = \frac{n_v}{n_v + n_a}$$

where:

$$n_v = \frac{m_v}{M_v}$$

$$n_a = \frac{m_a}{M_a}$$

and where M_v and M_a = molecular weights of water vapor and air, respectively. **D 1356, D22**

mole run—a meandering ridge in a membrane not associated with insulation or deck joints. **D 1079, D08**

moles of substituent combined, MS—in a cellulose derivative, the average number of substituent molecules per glucose unit. For most derivatives, MS = DS, but for a few, such as hydroxyethyl-cellulose, the substituted group may also be reactive and MS may be greater than DS. **D 1695, D01**

molten cast refractory, *n*—a solidified material made by melting refractory ingredients and pouring into molds (see also **fused or fusion cast refractory**). **C 71, C08**

molten state—the liquid phase of a solid substance existing above its melting point temperature. **D 4790, D16**

molten substances—metals in their liquefied, elevated temperature state, as well as related non-metallic substances also handled at elevated temperatures such as slag, dross, and salt. Excluded are liquid hot substances that may be associated with metal processing such as water, oil, and caustic solutions. **F 1494, F23**

MON—in *gasoline knock testing*, abbreviation for Motor octane number. **D 4175, D02**

monitor, *n*—a device that continually measures or intermittently samples and analyzes atmospheres or emissions for the concentra-

tion of a specific constituent or constituents, or for the level of a physical property (such as temperature) to provide either a real-time read-out or an electrical signal.

continuous monitor, *n*—a device for the uninterrupted measurement of atmospheric or emission concentrations or properties in real or near-real time. **D 1356, D22**

monitor, *n*—something that reminds or warns. **D 4175, D02**

monitoring, *v*—the continual sampling, measuring, recording, and/or signaling, of the characteristics of water or waterborne material. **D 1129, D19**

monitoring, *n*—surveillance to determine (1) whether known or suspected leaded paint is deteriorating; (2) that lead hazard control methods remain effective; (3) whether structural problems threaten the integrity of lead hazard controls; and (4) whether dust lead levels will remain below applicable standards. Monitoring includes both visual assessments and **reevaluations**. **E 1605, E06**

monitoring examination, *n*—A clinical polygraph examination specifically intended to uncover whether the offender has committed any illegal sexual act(s) with a child or any other sexual act forbidden by law during a sex offender's period of supervision. The requested test timeframe can be since the imposition of the offender's parole or probation, since his last test, or any other period designated by supervision officers. This is exclusively a single-issue polygraph test. **E 2035, E52**

monitoring path—See **point analyzer**. **D 1356, D22**

monitoring path length—See **point analyzer**. **D 1356, D22**

monitoring well (observation well)—a special well drilled in a selected location for observing parameters such as liquid level or pressure changes or for collecting liquid samples. The well may be cased or uncased, but if cased the casing should have openings to allow flow of borehole liquid into or out of the casing. **D 653, D18**

monochromatic, *adj*—characterized by a single wavelength or, by extension, by a small range of wavelengths that can be described by stating a single wavelength. **E 284, E12**

monochromatic—a property of a beam of electromagnetic radiation in which all waves in the beam have the same wavelength. **E 1316, E07**

monochromatic (homogeneous)—of the same wavelength. **E 7, E04**

monochromatic objective—an objective, usually made of fused quartz, which has been corrected for use only with monochromatic light. **E 7, E04**

monochromatic radiation, *n*—radiation characterized by a single frequency. By extension, radiation of a very small range of frequency or wavelength that can be described by stating a single frequency or wavelength. **E 349, E21**

monochromator—a device or instrument that, with an appropriate energy source, may be used to provide a continuous calibrated series of electromagnetic energy bands of determinable wavelength or frequency range. **E 131, E13**

monochromator, *n*—a device for isolating monochromatic radiation from a beam of polychromatic radiation. **E 135, E01**

monochromator, *n*—a device for isolating a narrow band of wavelengths from a beam of radiation containing a broader range of wavelengths. **E 284, E12**

monochromator—a device for isolating monochromatic radiation from a beam of radiation which includes a broad range of wavelengths. **E 1316, E07**

monochromator (X-rays)—a device for producing monochromatic radiation from heterochromatic radiation. It usually consists of a crystal so arranged as to diffract one wavelength of particularly high intensity, such as the characteristic, out of a beam of mixed white and characteristic radiation. **E 7, E04**

monochrome decoration—a single color decoration. **C 242, C21**

monoclinic—having three axes of any length with two included angles equal to 90° and one included angle not equal to 90° . **E 7, E04**

monocyclic terpenes, *n*—a designation sometimes used in the trade to describe a heterogeneous mixture of monocyclic, bicyclic, and

monocyclic terpenes, *n*

other related terpene C₁₀H₁₆ hydrocarbons recovered or removed in the fractionation of certain terpenes or other essential oils, or as a by-product in the chemical conversion of pinenes generally sold under trade names. **D 804, D01**

monodisperse, *adj*—describing a population of drops of substantially equal diameter. **E 1620, E29**

monofilament, *n*—a single filament which can function as a yarn in commercial textile operations, that is, it must be strong and flexible enough to be knitted, woven, or braided, etc. (See **yarn**.) **D 123, D13**

monofilament—a continuous filament strong enough to function as a yarn in commercial textile operations or as an entity in other operations. **D 3878, D30**

monofilament, *n*—a single filament which can function as a yarn in commercial textile operations, that is, it must be strong and flexible enough to be knitted, woven, or braided, etc. (see **yarn**.) **D 4849, D13**

mono-hydrated lime—dolomitic lime which has been hydrated at atmospheric pressure and contains more than 8% unhydrated oxides. **C 51, C07**

monolithic, *n*—a material of uniform composition applied as a continuous surface or structure. **C 904, C03**

monolithic mass—a mass that has good dimensional stability, to freezing and thawing resistance, low permeability, a high bearing capacity, and resistance to attack by biological agents. The EPA states that an end product such as this could be used as a foundation for buildings or roads, or simply buried and covered over in a landfill (EPA/SW-872). **D 5681, D34**

monolithic refractory, *n*—a refractory which may be installed *in situ*, without joints to form an integral structure. **C 71, C08**

monolithic refractory construction, *n*—a refractory installation utilizing monolithic refractories. **C 71, C08**

monomer, *n*—a low-molecular-weight substance consisting of molecules capable of reacting with like or unlike molecules to form a polymer. **D 883, D20**

monomer, *n*—a relatively simple compound which can react to form a polymer. (Compare **polymer**.) **D 907, D14**

monomer, *n*—a low molecular weight substance consisting of molecules capable of reacting with like or unlike molecules to form a polymer. **D 1566, D11**

monomer, *n*—a relatively simple compound which can react to form a polymer. (See also **polymer**.) (D20) **F 412, F17**

monomer, *n*—a relatively simple compound which can react to form a polymer. (See also **polymer**.) **F 1251, F04**

monomolecular layer—an adsorbed film, one molecule thick. **D 2652, D28**

monopack—See **color film**. **E 7, E04**

monotectic equilibrium—a reversible binary univariant transformation in which a liquid phase, that is stable only at higher temperatures, decomposes, with lowering temperature, into a new liquid phase and a solid phase, for example: $L_1 = L_2 + \alpha$. **E 7, E04**

monotectic point—the composition and temperature in a binary system at which exists a liquid that is capable of univariant decomposition, with lowering temperature, into another liquid phase and a solid phase. **E 7, E04**

monotropic transformation—a nonreversible metastable phase change. **E 7, E04**

montan wax, *n*—a wax-like material comprised primarily of montanic acid and its ester, higher aliphatic alcohols, and resins obtained from the solvent extraction of lignite. **D 4175, D02**

month, *n*—for reporting analyses of outdoor air on a monthly rate, results are calculated to a base of thirty days. **D 1356, D22**

montmorillonite—a group of clay minerals characterized by a weakly bonded sheet-like internal molecular structure; consisting of extremely finely divided hydrous aluminum or magnesium silicates that swell on wetting, shrink on drying, and are subject to ion exchange. **D 653, D18**

monumental stone—rock of adequate quality to be quarried and cut

as dimension stone as it exists in nature, as used in the monument and memorial industry. **C 119, C18**

moonstone glass—a type of opal glass resembling the mineral moonstone. **C 162, C14**

mop-and-flop—a procedure in which roofing elements (insulation boards, felt plies, cap sheets, and so forth) are initially placed upside down adjacent to their ultimate locations, are coated with adhesive, and are then turned over and adhered to the substrate. **D 1079, D08**

mopping—the application of hot bitumen with a mop or mechanical applicator to the substrate or to the plies of a built-up roof. There are four types of mopping: (1) *solid*—a continuous coating; (2) *spot*—bitumen is applied in roughly circular areas, generally about 460 mm (18 in.) in diameter, leaving a grid of unmopped, perpendicular areas; (3) *strip*—bitumen is applied in parallel bands, generally 200 mm (8 in.) wide and 300 mm (12 in.) apart; (4) *sprinkle*—bitumen is shaken onto the substrate from a broom or mop in a random pattern. **D 1079, D08**

Morocco grain—embossed imitation of the natural goat grain on other kinds of leather. **D 1517, D31**

Morocco leather—vegetable-tanned fancy goatskin leather having a distinctive pebbled grain. **D 1517, D31**

morphology—the shape characteristics of a structure; the form and orientation of specific phase or constituent. **E 7, E04**

morphology, *n*—the form and structure of a particular organism. **F 1494, F23**

mortar, *n*—a mixture of gypsum plaster with aggregate or hydrate lime, or both, and water to produce a trowelable fluidity. **C 11, C11**

mortar, *n*—a mixture of finely divided hydraulic cementitious material, fine aggregate, and water in either the unhardened or hardened state; hydraulic mortar. **C 219, C01**

mortar, *n*—a mixture consisting of cementitious materials, fine aggregate, water, with or without admixtures, that is used to construct unit masonry assemblies. **C 1180, C12**

mortar, air-setting, *n*—a composition of finely ground materials, marketed in either a wet or dry condition, which may require tempering with water to attain the desired consistency and which is suitable for laying refractory brick and bonding them strongly upon drying and upon subsequent heating at furnace temperatures. **C 71, C08**

mortar board samples—those obtained from the mortar board after some established time period from the end of mixing, and before retempering. Retempered mortar board samples are those obtained from the mortar board after retempering. Since mortar on a mason's mortar board is disturbed by the activity of the mason, samples from a mason's mortar board shall be so identified to differentiate them from samples taken from a mortar board used exclusively for test purposes. **C 1180, C12**

mortar bond or grout bond, *n*—adhesion between mortar or grout and masonry units, reinforcement, or connectors. **C 1180, C12**

mortar cement, *n*—a hydraulic cement manufactured for use in masonry mortar designed for specific bond and air content criteria. **C 219, C01**

mortar, heat setting, *n*—a refractory mortar of finely ground materials whose potential strength is dependent on use at furnace or process temperatures. **C 71, C08**

mortar, refractory, *n*—a finely ground preparation which becomes plastic and trowelable when tempered with water, and is suitable for laying and bonding refractory brick. **C 71, C08**

mosaic crystal—an imperfect single crystal composed of regions each very slightly disoriented with respect to its neighbor. **E 7, E04**

mosaic structure—the structure of a material containing mosaic crystals. **E 7, E04**

mote, *n*—a whole, immature cotton seed. **D 123, D13**

mote, *n*—a whole, immature cotton seed. **D 7139, D13**

- mote trash*—See **trash**. **D 3990**, D13
- mother liquor**, *n*—the residual liquid that remains after the crystallization or isolation processes. **E 2363**, E55
- motion control**—the restriction of extraneous motion of the foot by the shoe. **F 869**, F08
- motion segment**, *n*—two adjacent vertebrae, the intervening disc, and the associated ligamentous structures. **F 1582**, F04
- motor-generator (MG set)**—a machine that consists of one or more motors mechanically coupled to one or more generators. In plating, such a machine in which the generator delivers dc of appropriate amperage and voltage. **B 374**, B08
- motoring**, *n*—*for the CFR engine*, operation of the CFR engine without fuel and with the ignition shut off. **D 4175**, D02
- motorized nozzle**, *n*—an attachment for a vacuum cleaner containing an electric motor-driven agitator that assists in dirt removal from a floor surface. **F 395**, F11
- motor octane number**, *n*—*for spark-ignition engine fuel*, the numerical rating of knock resistance obtained by comparison of its knock intensity with that of primary reference fuels when both are tested in a standardized CFR engine operating under the conditions specified in this test method. **D 4175**, D02
- motor octane number of primary reference fuels above 100**, *n*—determined in terms of the number of millilitres of tetraethyl lead in *isooctane*. **D 4175**, D02
- motor octane number of primary reference fuels from 0 to 100**, *n*—the volume % of *isooctane* (equals 100.0) in a blend with *n*-heptane (equals 0.0). **D 4175**, D02
- mottle**, *n*—the nonuniform transfer or absorption of the ink into the substrate creating an uneven ink film. **D 6488**, D01
- mottle**, *n*—a spotty nonuniformity of color appearance on a scale that is larger than the colorant particles, typically 1 to 10 mm. **E 284**, E12
- mottle**—a gross random nonuniformity in the visual density of a printed area. **F 335**, F05
- mottle, back trap**, *n*—a nonuniform density variation of a printed ink film due to nonuniform ink absorption into the paper. **D 6488**, D01
- mottled iron**, *n*—a cast iron containing a mixed structure of gray iron and white iron of variable proportions. The fracture has a mottled appearance. **A 644**, A04
- mottle, halftone**, *n*—a nonuniform transfer of halftone dots. **D 6488**, D01
- mottle, print**, *n*—an uneven appearance within the continuous ink film solid areas of a print, with respect to density, gloss or color. Also referred to as “solid area mottle.” **D 6488**, D01
- mottle, trapping**, *n*—nonuniform print due to improper tack sequence of the inks. **D 6488**, D01
- mottle, water interference**, *n*—nonuniform print caused by poor ink transfer due to the printing substrates’ inability to absorb fountain solution. **D 6488**, D01
- mottling**—the presence in the surface of a glaze or body of irregularly shaped, randomly distributed areas that vary in color, gloss, or sheen causing the surface to be nonuniform in appearance. **C 242**, C21
- mottling**, *vt*—the presence in the surface of a film, of irregularly shaped, randomly distributed areas that vary in color, gloss, or sheen, causing the film to be non-uniform in appearance, also known as **blotching**. **D 16**, D01
- mottling**—physical migration of polish film from smooth, even distribution at time of application to small discrete pools of material, resulting in a blotchy or spotty appearance. **D 2825**, D21
- mottling**, *n*—non-uniformity of image density which follows patterns in the substrate or by non-uniform ink-substrate interaction. **F 1857**, F05
- moulding**—a specially worked wood member used mostly for decoration but often serves a useful purpose in other ways; generally worked from lumber of strip size; may be a plane surface but often curved or patterned. **D 9**, D07
- moulding and trim nail**—bright zinc-plated, slim, hardened-steel, 1¼ by 0.054 to 2½ by 0.083-in. nails with blunt point and button head. (See **finishing nail**, **finenail**, **hardboard nail**, **insulation building-board nail**, **tileboard nail**, **wallboard nail**.) **F 547**, F16
- mountain permafrost**—permafrost existing at high altitudes, regardless of latitude. **D 7099**, D18
- mouse teeth**—distal tip teeth that interdigitate. **F 1638**, F04
- mouth**, *n*—*in zippers*, the opening in a slider that receives the chain. **D 123**, D13
- mouth**, *n*—the opening in a slider that receives the chain. **D 2050**, D13
- mouthfeel**, *n*—a mixed experience deriving from sensations in the oral cavity that relate to physical (for example, density, particulate) or chemical (for example, astringency, menthol cooling) properties of a stimulus material. **E 253**, E18
- mouth width**, *n*—*of zippers*, the measurement between the slider flanges at the point where they bear against the shoulders of the interlocked elements or at the outermost edges of the bead if the bead extends beyond the elements. **D 123**, D13
- mouth width**, *n*—the measurement between the slider flanges at the point where they bear against the shoulders of the interlocked elements or at the outermost edges of the bead if the bead extends beyond the elements. **D 2050**, D13
- mouton**—a sheepskin shearling tanned and finished for use as a fur, usually with wool straightened. **D 1517**, D31
- movable bed**—a stream bed made up of materials readily transportable by the stream flow. **D 4410**, D19
- movable by-pass clincher**—clinching mechanism for forming a by-pass clinch. **F 592**, F16
- movable in-line clincher**—clinching mechanism for forming an in-line clinch. **F 592**, F16
- movable retainer**, *n*—*in zippers*, a movable or sliding device performing a similar function to that of the fixed retainer, the purpose being to permit separation of the two stringers from the bottom, without the necessity of opening the zipper from the top. **D 123**, D13
- movable retainer**, *n*—a movable or sliding device performing a similar function to that of the fixed retainer, the purpose being to permit separation of the two stringers from the bottom, without the necessity of opening the zipper from the top. **D 2050**, D13
- moveable property**—tangible property, other than real property or tangible intellectual property, that is transportable and visible. **E 2135**, E53
- movement cycle**, *n*—the change between the minimum and the maximum joint widths of a joint system. **E 176**, E05
- moving beam scanner**, *n*—a scanning device where scanning motion is achieved by mechanically moving the light beam through the bars and spaces of a bar code symbol. **F 1294**, F05
- moving range**, *n*—the difference without regard to sign between two successive observations. **D 123**, D13
- MPP**—see **maximum print position**. **F 1457**, F05
- MPU/IG**—see **microprocessor unit/image generator**. **F 1457**, F05
- MR-8**—the original optical scanning test device that measures the amount of reflected light in millivolts. **F 149**, F05
- 2200 m/s cross section**, $\sigma(v_0)$ —the neutron cross section at $v_0 = 2200$ m/s (E is about 0.0253 eV). **E 170**, E10
- MTBE**—abbreviation for methyl *tert*-butyl ether. **D 4175**, D02
- mucilage**, *n*—an adhesive prepared from a gum and water, and also in a more general sense, a liquid adhesive which has a low order of bonding strength. (See also **adhesive**, **glue**, **paste**, and **sizing**.) **D 907**, D14
- muck**—stone, dirt, debris, or useless material; or an organic soil of very soft consistency. **D 653**, D18
- mucker tire**, *n*—a flotation type of tire specifically designed for use in soft grounds. **D 5681**, D34
- mud**—a mixture of soil and water in a fluid or weakly solid state. **D 653**, D18

mud circle

mud circle—a type of nonsorted circle developed in fine-grained materials. **D 7099**, D18

mud-cracking, *n*—an irregular broken network of cracks in the film, which occurs due to volatile loss while drying or curing. **D 16**, D01

mud cracking—surface cracking resembling a dried mud flat. **D 1079**, D08

mudcracking—in *protective coatings*, a particular pattern of cracking in a coating with the appearance of a dried mud puddle (see cracking and checking). **D 4538**, D33

mudflow—a mass of water-sediment mixture which, because of its high viscosity, moves more slowly than water. **D 4410**, D19

mudguard, *n*—a strip of material applied to a shoe upper just above the sole intended as a protection against dampness or as an ornament. **F 1646**, F13

mudjacking—see **slab jacking**. **D 653**, D18

mud mat, *n*—in construction design: (1) a surfacing layer suitable for the application of membrane waterproofing, installed on a prepared subgrade; (2) an area of fill compacted to no less than 95 % of the maximum dry density of the fill based upon the appropriate laboratory compaction test, such as defined in Test Methods D 698 or D 1557. **D 1079**, D08

mud pit—usually a shallow, rectangular, open, portable container with baffles into which drilling fluid and cuttings are discharged from a borehole and that serves as a reservoir and settling tank during recirculation of the drilling fluids. Under some circumstances, an excavated pit with a lining material may be used. **D 653**, D18

mud slab, *n*—a 2 in. (50 mm) minimum thickness non-reinforced concrete slab suitable as the substrate for membrane waterproofing. **D 1079**, D08

mud-up—to seal a furnace structure with wet clay or castable refractory material. **C 162**, C14

muffle—an enclosure in a furnace to protect the ware from the flame and products of combustion. **C 162**, C14

mukluk leather—leather usually made from deer, elk, or similar skins. It is tanned white with aldehydes, alum, or syntans. It is highly permeable to moisture vapor and retains its flexibility at very low temperatures. **D 1517**, D31

mulch treatment, *n*—a spray application of bituminous material used to temporarily stabilize a recently seeded area; the bituminous material can be applied to the soil or to straw or hay mulch as a tie-down, also. **D 8**, D04

mull—See **windows and doors**. **E 631**, E06

Mullen test—See **package testing**. **D 996**, D10

Mullins Effect, *n*—the softening of a vulcanized rubber (reduction in the stress at a given strain) as a result of previous deformation. **D 1566**, D11

Mullins Effect, *n*—the phenomenon occurring in vulcanized rubber whereby the second and succeeding hysteresis loops exhibit less area than the first, due to breaking of physical cross-links; may be permanent or temporary, depending on the nature of the material. (See also **preflex effect**.) **D 1566**, D11

mullion—See **windows and doors**. **E 631**, E06

mullite—a rare mineral of theoretical composition $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$, a relatively stable phase in ceramics produced by the high temperature reaction of alumina and silica or by the thermal decomposition of alumina-silica minerals such as kyanite, sillimanite, andalusite, and various clay minerals. **C 242**, C21

mullite porcelain—a vitreous ceramic whiteware for technical application in which mullite ($3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$) is the essential crystalline phase. **C 242**, C21

mullite refractories, *n*—refractory products consisting predominantly of mullite ($3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$) crystals formed either by conversion of one or more of the sillimanite group of minerals, or by synthesis from appropriate materials employing either melting or sintering processes. **C 71**, C08

mullite whiteware—any ceramic whiteware in which mullite ($3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$) is the essential crystalline phase. **C 242**, C21

multi-axial tension, *n*—stress in more than one direction.

D 4439, D35

multibench blasting—the blasting of several benches (steps) in quarries and open pits, either simultaneously or with small delays. (ISRM) **D 653**, D18

multi-cased well—a well constructed by using successively smaller diameter casings with depth. **D 653**, D18

multicomponent system—the complete series of compositions produced by mixing, in all proportions, two or more components. **E 7**, E04

multidirectional magnetization—the alternative application of magnetic fields in different directions during the same time frame. **E 1316**, E07

multi-family dwelling, *n*—a structure that contains more than one separate residential unit, which is used or occupied, or is intended to be used or occupied, in whole or in part, as the home or residence of one or more persons. **E 1605**, E06

multifont reader—a reading device that can read forms containing intermixed characters printed in a number of fonts. Multifont reading eliminates the need to prebatch the input data by font prior to submission to the scanner. **F 149**, F05

multigroup cross section—average particle fluence-weighted cross section in an energy interval of a multigroup model. (See also **multigroup model**).

$$\sigma_i = \int_{E_i}^{E_{i+1}} \Phi(E) \sigma(E) dE / \int_{E_i}^{E_{i+1}} \Phi(E) dE$$

E 170, E10

multigroup model—subdivision of an energy spectrum into a number of subintervals: (E_i , E_{i+1}), where: $i = 1, 2, \dots, n$. **E 170**, E10

multigroup particle fluence—particle fluence in the energy intervals of a multigroup model (see also **multigroup model**).

$$\Phi = \int_{E_i}^{E_{i+1}} \Phi(E) dE$$

E 170, E10

multilateral arrangement—recognition arrangement that covers the acceptance of each other's results by more than two parties. (ISO Guide 2) **E 1187**, E36

multilayer deposit—a deposit consisting of two or more layers of metal deposited successively, consisting of either different metals or layers of the same metal with different characteristics. **B 374**, B08

multilayered sample, *n*—a sample consisting of two or more clearly differentiated components. **D 5681**, D34

multilayered structure—in *flexible barrier materials*, a structure that consists of two or more continuous layers or plies of material. **F 17**, F02

multilayered structure—See Terminology F 17. **F 1327**, F02

multilayer pipe, *n*—A pipe constructed of multiple layers that are bonded to each other and in which at least 60% of the wall thickness consists of polymeric material(s).

In the case of multilayer pipes intended for pressure applications two types of pipes are recognized as follows:

Type 1 multilayer pipe—A pressure rated pipe in which at least 60% of its wall thickness is comprised of a polymeric material that has an established HDB (Hydrostatic Design Basis) or MRS (Minimum Required Strength) from which the pressure rating of the pipe is determined.

Type 2 multilayer pipe—A pressure rated pipe in which at least 60% of the wall thickness is comprised of a polymeric material, and for which the pipe pressure rating has been determined for each pipe size and pipe wall construction based on the pipe's experimentally established PDB (Pressure Design Basis) or MRP (Minimum Required Pressure). **F 412**, F17

multilevel pile, *n*—for *pile yarn floor coverings*, pile in which some tuft legs are substantially longer than others, resulting in a sculptured appearance or pattern. **D 123**, D13

- multilevel pile, *n***—for *pile yarn floor covering*, pile in which some tuft legs are substantially longer than others, resulting in a sculptured appearance or pattern. **D 5684, D13**
- multimedia filter**—filter with a bed consisting of three or more separate filter media. The coarsest, lowest density at the top and the finest, highest density at the bottom. **D 6161, D19**
- multimolecular layer**—an adsorbed film more than one molecule thick. **D 2652, D28**
- multiphase coolant, *n***—an engine coolant composed of immiscible liquids or undissolved solids, or both. **D 4725, D15**
- multiple back reflections**—successive reflections from the back surface of the material under examination. **E 1316, E07**
- multiple-cavity mold**—a mold possessing multiple cavities for simultaneous fabrication of multiple articles of glass. **C 162, C14**
- multiple-cavity process**—a glass-molding process that uses multiple charges of glass and forms them simultaneously. **C 162, C14**
- multiple chemical sensitivity, MCS, *n***—a diagnostic label for people who suffer multi-symptom illnesses as a result of contact with, or proximity to, a variety of airborne agents and other substances. **E 2114, E06**
- multiple cloning site**—DNA that contains several contiguous restriction enzyme recognition sites; also called a polylinker. **E 1705, E48**
- multiple correlation coefficient, (*R*)**—the correlation, $r_{y\hat{y}}$, between the accepted reference values, Y_i , and the values determined using the calibration equation, \hat{Y}_i , equal to the square root of the coefficient of multiple determination, R^2 . **E 131, E13**
- multiple-facet polygraph test, *n***—a test in which the relevant questions cover the same event, though the questions may cover different aspects of that event. Because the relevant questions all relate to the same event, in field conditions the examinee would typically be entirely either truthful or deceptive to all questions, though this is not a condition of the multiple-facet polygraph test. One multiple-facet PDD format is the Reid Test. **E 2035, E52**
- multiple font reader**—a reading device that can read more than one type font, but only one font may be read at a time. **F 149, F05**
- multiple-gob process**—See **multiple-cavity process**. **C 162, C14**
- multiple headspace extraction, *n***—a technique to determine the total concentration of a gas trapped in a liquid by analysis of successive gas extractions from the vapor space of a closed vessel containing a known amount of the sample. **D 4175, D02**
- multiple heat, *n***—two or more molten **primary heats**, in whole or in part, combined in a common ladle or in a common non-oscillating mold. **A 941, A01**
- multiple imaging separation**—the angular separation of primary and secondary multiple images as measured from the design eye position. **F 2429, F07**
- multiple-issue polygraph test, *n***—a test in which the relevant questions cover two or more areas that are partially or completely independent from one another. Forms of multiple-issue polygraph testing include Post-Conviction Sex Offender Testing, applicant testing, and counterintelligence screening. **E 2035, E52**
- multiple laboratories operational precision, *n***—the standard deviation of the results of a series of determinations by several laboratories employing the method with its associated sample container preparation, collection, splitting, preservation, transmission, and storage on a homogeneous sample. **D 1129, D19**
- multiple-layer adhesive, *n***—film adhesive, usually supported, with a different adhesive composition on each side. **D 907, D14**
- multiple length staple fibers, *n***—manufactured staple fibers that are two or more times the nominal cut fiber length. **D 123, D13**
- multiple-length staple fibers, *n***—manufactured staple fibers that are two or more times the nominal cut fiber length. **D 4849, D13**
- multiple pressing, *n***—a method of pressing whereby two or more compacts are produced simultaneously in separate die cavities. **B 243, B09**
- multiple reflections**—successive echoes of ultrasonic energy between two surfaces. **E 1316, E07**
- multiple retrogressive slide**—a type of mass movement associated with shear failure in unfrozen sediments underlying permafrost, leading to detachment of blocks of frozen ground that move downslope. This type of slide is not unique to frozen geological materials and may also occur in non-permafrost conditions. **D 7099, D18**
- multiple-row blasting**—the drilling, charging, and firing of several rows of vertical holes along a quarry or opencast face. (ISRM) **D 653, D18**
- multiple scattering event**—ISS, a collision process that may be described as a sequence of binary scattering events which may or may not be elastic. **E 673, E42**
- multiple-screened wells**—two or more monitoring wells situated in the same borehole. These devices can be either individual casing strings and screen set at a specific depth, a well with screens in more than one zone, or can consist of devices with screens with tubing or other collecting devices attached that can collect a discrete sample. **D 653, D18**
- multiple stitch zigzag, *n***—in *home sewing*, a simple machine stitch pattern of alternating diagonal segments with each segment of two or more stitches having equal length and width. **D 5646, D13**
- multiplet or exchange splitting**—XPS, splitting of a photoelectron line caused by the interaction of the unpaired electron created by photoemission with other unpaired electrons in the atom. **E 673, E42**
- multi-plexing**—the sharing of a common set of physical optical and/or electrical components across multiple numbers of sensors. Each sensor is capable of monitoring a unique sample. Each sample is monitored separately and referenced against its unique baseline characteristics. **D 6161, D19**
- multiplicity factor**—a factor used in calculating the intensity of diffraction from a polycrystalline specimen. It is equal to the number of sets of planes of the same family. **E 7, E04**
- multiplicity of infection**—the ratio of infecting phage to host bacteria. **E 1705, E48**
- multi-ribbed**—See **thread, vertical**. **F 547, F16**
- multi-row symbology, *n***—symbologies where a long symbol is broken into sections and “stacked” one upon another similar to sentences in a paragraph. Examples are: Code 16K, Code 49 and PDF417. **F 1294, F05**
- multi-stage sampling, nested sampling**—sampling in which the sample is selected by stages, the sampling units at each stage being from the larger sampling units chosen at the previous stage.
- NOTE—Multi-stage sampling is different from multiple sampling. (see **acceptance sampling**). **E 1402, E11**
- multi-strike film ribbon**—is a ribbon wherein the substrate film such as polyester is coated or impregnated with an ink which allows several different imprints be made from multiple overstrikes on the same location on the ribbon, and still result in full characters being printed. **F 221, F05**
- multivariant**—having two or more degrees of freedom. **E 7, E04**
- multivariate calibration, *n***—a process for creating a calibration model in which multivariate mathematics is applied to correlate the absorbances measured for a set of calibration samples to reference component concentrations or property values for the set of samples. **D 4175, D02**
- municipal ferrous scrap, *n***—ferrous waste that is collected from industrial, commercial, or household sources and destined for disposal facilities. **D 5681, D34**
- municipal ferrous scrap**—ferrous waste that is collected from industrial, commercial, or household sources and destined for disposal facilities. Typically, municipal ferrous scrap consists of a metal or alloy fraction, a combustible fraction, and an inorganic noncombustible fraction that includes metal oxides. **D 5681, D34**
- municipal solid wastes (MSW)**—the refuse materials collected from urban areas in the form of organic matter, glass, plastics, waste paper, etc., not including human wastes. **E 1705, E48**

Munsell Book of Color, *n*—current Munsell Color Company physical exemplification of the Munsell color order system, consisting of about 1600 color chips arranged in a cylindrical coordinate system of planes of constant Munsell hue on which Munsell value is displayed vertically and Munsell chroma horizontally.

E 284, E12

Munsell chroma, *n*—an attribute of color used in the Munsell color-order system to indicate the degree of departure of a color from a gray of the same Munsell value, in steps that are visually approximately equal in magnitude.

E 284, E12

Munsell color-order system, *n*—a system of specifying colors of surfaces illuminated by daylight and viewed by an observer adapted to daylight, in terms of three attributes: hue, value, and chroma, using scales that are perceptually approximately uniform.

E 284, E12

Munsell hue, *n*—an attribute of color used in the Munsell color-order system to indicate the hue of a specimen viewed in daylight.

E 284, E12

Munsell notation, *n*—(1) the Munsell hue (H), value (V), and chroma (C) assigned to the color of a specimen by visually comparing the specimen to the chips in the Munsell Book of Color. The numbers are customarily arranged in the expression H V/C.

(2) a notation in the Munsell color system, derived from luminous reflectance *Y* and Chromaticity Coordinates *x* and *y* in the 1931 CIE system for Standard Illuminant *C*, by the use of scales defined by the Optical Society of America Subcommittee on the Spacing of the Munsell Colors.

E 284, E12

Munsell value, *n*—an attribute of color used in the Munsell color-order system to indicate the lightness of a specimen viewed in daylight, on a scale extending from 0 for ideal black to 10 for ideal white, in steps that are visually approximately equal in magnitude.

E 284, E12

muntin, *n*—a secondary intermediate member subdividing a glazed area.

C 717, C24

muntin—See **windows and doors**.

E 631, E06

Murgatroyd belt—{archaic} that portion of the sidewall of a bottle near the bottom.

C 162, C14

muskeg—level, practically treeless areas supporting dense growth consisting primarily of grasses. The surface of the soil is covered with a layer of partially decayed grass and grass roots which is usually wet and soft when not frozen.

D 653, D18

muslin, *n*—as applied to bed sheeting, a plain weave fabric with not fewer than 128 yarns/in. ²(645 mm²).

D 123, D13

muslin, *n*—as applied to bed sheeting, a plain weave fabric with not fewer than 128 yarns/in. ²(645 mm²).

D 7023, D13

mussiness, *n*—surface distortion in a fabric characterized by undesirable unevenness due to many minor deformations.

D 123, D13

mussiness, *n*—surface distortion in a fabric characterized by objectionable unevenness due to many minor deformations.

D 3990, D13

mutagen—a substance that increases the normal mutation rate.

F 1600, F20

mutual aid—the furnishing of resources, from one individual or agency to another individual or agency, including but not limited to facilities, personnel, equipment, and services, pursuant to an agreement with the individual or agency, for use within the jurisdiction of the individual or agency requesting assistance.

F 1177, F30

m-value—the negative slope of a curve plotting log flow versus log time. A measurement of the degrees of membrane compaction as a result of temperature, pressure and time.

D 6161, D19

MV (mega or million volt)—a unit of electrical potential difference equal to one million volts, used to describe the accelerating potential of an X-ray tube.

E 1316, E07

mycoplasma—the smallest prokaryotes capable of living freely, lacking a cell wall, having a circular double-stranded DNA relatively rich in adenine and thymine, and containing 16s and 23s ribosomal RNAs. They can be found as contaminants in cell cultures.

E 1705, E48

mylonite—a microscopic breccia with flow structure formed in fault zones. (ISRM)

D 653, D18

mythical image—the assumed intersections of the extended sides of a microindentation which is established in order that a true diagonal can be approximated.

E 7, E04

N

NaHMP—sodium hexametaphosphate, an antiscalant. **D 6161, D19**

nail, *n*—straight, slender fastener, usually pointed and headed; designed to be driven through connector plate or plates with or without nail holes; serving as separate supplementary or primary fastener. **E 631, E06**

nail—straight, slender fastener, usually pointed and headed; 6 in. or less in length; designed to be driven; to hold two or more pieces together or to act as support. (See **screw nail; drive screw**.)
F 547, F16

nail-base fiberboard sheathing—a specially manufactured cellulosic fiberboard product, approximately 25 lb/ft³, designed for use in frame construction to permit the direct application of certain exterior siding materials such as wood-based or composite shingles. **D 1554, D07**

nail hole, *n*—an appropriately sized opening such that tile shall not be fractured by the fastener and fixing process used to attach the tile to the roof deck. **C 43, C15**

nail hole—round perforation in metal connector plate through which a nail can be driven to fasten plate to wood members (or section) and to transmit shear loads; providing predetermined location for appropriately locating nails to be driven. See **plate hole**.
E 631, E06

nailing—(1) exposed-nauling of roofing wherein nail heads are bare to the weather;
(2) concealed-nauling of roofing wherein nail heads are concealed from the weather. (See also **blind nailing**). **D 1079, D08**

nail-on plate—solid or prepunched (or predrilled) metal connector plate of specified thickness (gage); manufactured to various sizes, that is, lengths and widths; designed to be fastened with nails (or staples) to wood members and to transmit forces from one wood member (or section) to another one or more wood members (or section).
natural grade—See **grade**. **E 631, E06**

NAK, *n*—a signal from the printer which indicates that the previous data block was in error and that retransmission can begin; also used as a not ready signal. **F 1457, F05**

Nanofiltration (NF)—a crossflow process with pore sizes designed to remove selected salts and most organics above about 300 molecular weight range, sometimes referred to as loose RO. A pressure-driven membrane separation process in which particles and dissolved molecules smaller than about 2nm are rejected.
D 6161, D19

nanopowder, *n*—a powder consisting of particles typically less than 100 nm in size. **B 243, B09**

nap—the wooly or fuzzy surface finish of some fabrics and some leathers such as suede and antelope, reversed calf and side leather. **F 869, F08**

napa leather—chrome, alum, or combination tanned sheepskin glove leather, drum colored. **D 1517, D31**

nap finish—a process in which the natural grain layer of the leather is removed and the outer surface of the leather is then given a napped finish. (See also **suedefinish**.) **D 1517, D31**

naphtha, aromatic solvent—a concentrate of aromatic hydrocarbons including C₈, C₉ and C₁₀ homologs.
D 4790, D16

naphtha-based oil—a petroleum oil containing a majority of the naphtha fraction. **E 1519, E35**

naphthalene (C₁₀H₈)—mol weight 128.16; monoclinic prismatic plates; commercially available as white scales, powder, balls, or cakes; odor of moth balls; solidification point, 80.1°C; sublimes above melting point. **D 4790, D16**

naphthene-aromatics, *n*—a mixture of naphthenic and aromatic hydrocarbons which are adsorbed from a paraffinic solvent on an adsorbent during percolation and then desorbed with an aromatic solvent such as toluene. **D 8, D04**

naphthenic oil, *n*—a hydrocarbon process oil containing more than 30 %, by mass, of naphthenic hydrocarbons. **D 1566, D11**

naphthenic oil—a term applied to mineral insulating oil derived from special crudes having very low, naturally occurring *n*-paraffin (wax) contents. Such an oil has a low natural pour point and does not need to be dewaxed nor does it usually require the use of a pour depressant. **D 2864, D27**

narrow crown—staple crown usually 5/16 in. (8 mm) in width or smaller. **F 592, F16**

narrow elastic fabric, *n*—an elastic fabric that is less than 150 mm, (6 in.), in width. (Compare **wide elastic fabric**.) **D 123, D13**

narrow elastic fabric, *n*—an elastic fabric that is less than 150 mm, (6 in.), in width. (Compare **wide elastic fabric**.) **D 4850, D13**

narrow fabric, *n*—a fabric not exceeding 12 in. (300 mm) in width. **D 123, D13**

narrow fabric, *n*—a fabric not exceeding 300 mm (12 in.) in width. **D 4850, D13**

National Contingency Plan (NCP)—the National Oil and Hazardous substances Pollution Contingency Plan found at 40 CFR § 300, which is the EPA's regulations for how hazardous substances are to be cleaned up pursuant to CERCLA. **D 5681, D34**

National ITS Architecture, *n*—a document prepared through the sponsorship of the U.S. DOT that provides a common structure for the design of intelligent transportation systems giving a framework around which multiple design approaches can be developed by defining: (1) the functions that must be performed to implement a given user service, (2) the physical entities or subsystems where these functions reside, (3) the interfaces/information flows between the physical subsystems, and (4) the communication requirements for the information flows. **E 867, E17**

National Lead Laboratory Accreditation Program (NLLAP)—a program mandated by Title X, Section 405b in which EPA confers recognition of a laboratory's ability to meet strict quality system requirements in a program conducted by accrediting bodies within a memorandum of understanding with EPA. **E 1605, E06**

National Priorities List—list compiled by EPA pursuant to CERCLA 42 USC § 9605(a)(8)(B) of properties with the highest priority for cleanup pursuant to EPA's Hazard Ranking System. See 40 CFR Part 300. **D 5681, D34**

national standard—an artifact, such as a well-characterized instrument or radiation source, that embodies the international definition of primary physical measurement standard for national use. **E 170, E10**

national standards laboratory—the laboratory which maintains a nation's measurement standards, such as the National Institute of Standards and Technology in the United States. **E 170, E10**

native asphalt, *n*—asphalt occurring as such in nature. **D 8, D04**

native hide—a cattlehide without a brand. **D 1517, D31**

native material—in place geologic (or soil) materials encountered at a site. **D 653, D18**

native species, *n*—(1) A species that is indigenous in a specified area for all or part of its life span. (2) Used in reference to plants: a plant whose presence and survival in a specific region is not due to human intervention. **E 2114, E06**

native water—water from a sampled medium; this water has been unaffected by sampling, handling, and preservation. **D 4410, D19**

natural aging, *n*—spontaneous aging of a super-saturated solid solution at room temperature. **A 941, A01**

natural cement, *n*—a hydraulic cement produced by calcining a naturally occurring argillaceous limestone at a temperature below the sintering point and then grinding to a fine powder. **C 219, C01**

natural clay tile—a tile made by either the dust-pressed method or the plastic method, from clays that produce a dense body having a distinctive, slightly textured appearance. **C 242, C21**

natural cleft—an irregularly textured low-relief surface, produced by splitting stone along its bedding plane, stratification, or rift. **C 119, C18**

Natural Color System, *n*—color order system based on resemblances of colors to up to four of six "elementary" colors red, yellow,

Natural Color System, n

- green, blue, black, and white, in which the attributes of the colors are hue, chromaticness, and blackness. **E 284, E12**
- natural convection**—see **convection, natural**. **E 772, E44**
- natural fiber, n**—a class name for various genera of fibers (including filaments) of (1) animal, (2) mineral, or (3) vegetable origin. (Compare **man-made fiber**.) **D 123, D13**
- natural fiber, n**—a class name for various genera of fibers (including filaments) of (1) animal, (2) mineral, or (3) vegetable origin. **D 4845, D13**
- natural frequency**—the frequency at which a body or system vibrates when unconstrained by external forces. (ISRM) **D 653, D18**
- natural frequency (displacement resonance) f_n** —frequency for which phase angle is 90° between the direction of the excited force (or torque) vector and the direction of the excited excursion vector. **D 653, D18**
- natural gas**—a naturally occurring mixture of hydrocarbon and nonhydrocarbon gases found in porous geological formations (reservoirs) beneath the earth's surface, often in association with petroleum. The principal constituent of natural gas is methane. **D 4150, D03**
- natural gas odorant**—an intensively smelling organic chemical or combination of chemicals (for example, sulfur compounds), added to fuel gases to impart a characteristic and distinctive (usually disagreeable) warning odor so gas leaks can be detected. **D 4150, D03**
- natural gas, processed**—a methane-rich commercial gaseous product derived from naturally occurring gas mixtures by processing (also referred to as merchantable natural gas). **D 4150, D03**
- natural grade**—the elevation of the original or undisturbed surface of the ground. **E 631, E06**
- natural grain**—refers to a surface that is not filled with pigments and the haircells are easily viewed with the naked eye. **D 1517, D31**
- natural graphite, n**—*in carbon and graphite technology*, a material consisting predominantly of graphitic carbon, which forms in the earth's crust as the result of igneous or metamorphic processes acting on carbonaceous materials. **C 709, D02**
- natural graphite, n**—*in carbon and graphite technology*, a material consisting predominantly of graphitic carbon, which forms in the earth's crust as the result of igneous or metamorphic processes acting on carbonaceous materials. **D 4175, D02**
- natural levee**—raised berms or crests above the flood-plain surface adjacent to the channel usually containing coarser materials deposited by flood flows. **D 4410, D19**
- natural linewidth**—See **intrinsic linewidth**. **E 673, E42**
- naturally aspirated aircraft engine, n**—aircraft piston engine that breathes without forced means from either turbochargers or superchargers. **D 4175, D02**
- naturally dispersed sample**—a sample having sediment that will not settle in about 4 h due to the character of fineness of particles or due to the nature of the dissolved constituents, or both. **D 4410, D19**
- natural materials, n**—synthesized or produced by living cells. **F 2312, F04**
- natural pH, n**—the measured pH of the pulp before the addition of collector, frother, or any conditioning agents. **D 121, D05**
- natural process limits (NPL), n**—limits which include a stated fraction of the individuals in a population.
- NOTE—*Natural process limits* will not ordinarily be the dimensional limits shown on an engineering drawing. They are mostly used to compare the natural capability of the process to tolerance limits. **E 456, E11**
- natural resin**—see **resin, natural**. **D 16, D01**
- natural resin, n**—a resin of vegetable or animal origin. **D 6440, D01**
- natural rubber, n**—the material processed from the spa (latex) of *Hevea Brasiliensis* (rubber tree). **D 5681, D34**
- natural spreading rate, n**—the spreading rate that occurs when a coating is applied in a manner natural to the operator's technique, perceptions, and expectations, as they relate to coating tools, substrate, and characteristics of the coating itself. **D 16, D01**
- natural state**—condition of woodwork before priming and painting. **E 631, E06**
- natural-type environment**—in solar energy applications, the natural aspects of the outdoor exposure environment elements (or simulation), including changes with time, that may affect the thermal performance of a collector through degradation of collector materials or physical damage to the collector configuration. (Typical aspects include radiant exposure, ambient temperature, and rain impingement.) **E 772, E44**
- natural weathering**—long-term exposure of materials to unconcentrated sunlight on fixed-angle (or seasonally adjusted) racks, the purpose of which is to assess the effects of environmental factors in various functional and decorative parameters of interest. **E 772, E44**
- natural weathering, n**—outdoor exposure of materials to unconcentrated sunlight, the purpose of which is to assess the effects of environmental factors on various functional and decorative parameters of interest. **G 113, G03**
- naval stores, n**—chemically reactive oils, resins, tars, and pitches derived from the oleoresin contained in, exuded by, or extracted from wood chiefly of the pine species (*Genus Pinus*). **D 804, D01**
- navel, n**—a component of an open-end spinning machine located on the axis of the rotor through which the yarn is withdrawn from the rotor and which modifies the twist of the yarn inside the rotor. (See **doffing tube**.) **D 123, D13**
- navel, n**—a component of an open-end spinning machine located on the axis of the rotor through which the yarn is withdrawn from the rotor and which modifies the twist of the yarn inside the rotor. **D 3888, D13**
- NBS color difference, n**—color difference calculated by use of the Judd-Hunter National Bureau of Standards equations, which are unique in including terms taking account of (1) the masking effect of gloss on the detection of color differences and (2) the relative importance of chromaticness and lightness in a particular viewing arrangement, such as variation in the separation between the two specimens compared. **E 284, E12**
- NC**—effective thermal neutron content or neutron radiographic contrast. NC is the percent background film exposure due to unscattered thermal neutrons. **E 1316, E07**
- near-diagonal element, n**—*in bispectral photometry*, off-diagonal elements of an uncorrected bispectral matrix whose values include a significant reflection component, due to reflection overspill. For instruments with irradiation and viewing bandpass functions which approximate the recommended trapezoidal or triangular shape, this should be limited to within two to three bands of the diagonal. **E 284, E12**
- near field**—the region of the ultrasonic beam adjacent to the transducer and having complex beam profiles. Also known as the Fresnel zone. **E 1316, E07**
- near-infrared**—pertaining to the infrared region of the electromagnetic spectrum with wavelength range from approximately 0.78 to 2.5 μm (wavenumber range 12 800 to 4000 cm^{-1}). **E 131, E13**
- near-real-time-data, n**—data that is collected, processed, aggregated very close in time, usually within seconds or just a few minutes, to the actual time period or instance when the phenomenon being measured or observed actually occurred. **E 867, E17**
- near size particle, n**—a particle of a size approximately equal to the aperture size of the sieve. **ISO/DIS 2395 E 1638, E29**
- near-specular, adj**—pertaining to the appearance of a material when viewed from a direction close to the specular angle, typically within 25°. **E 284, E12**
- near-specular angle, n**—the aspecular angle when a material is viewed close to the specular direction, typically within 25°. **E 284, E12**
- near-specular color, n**—color of a material when viewed at a specified near-specular angle. **E 284, E12**

- near surface discontinuity**—a discontinuity not open to, but lying near, the surface of a part undergoing examination which produces broad, fuzzy, lightly held powder patterns. **E 1316, E07**
- neat cement grout**—a mixture of hydraulic cement and water without any added aggregate or filler materials. **D 653, D18**
- neat gypsum plaster**—see **gypsum neat plaster**. **C 11, C11**
- neat petroleum, n**—oil visibly free of contaminants. **D 1129, D19**
- nebulize, v**—to produce droplets. **E 1620, E29**
- nebulizer, n**—a device for converting a sample solution into a gas-liquid aerosol for atomic absorption, emission, fluorescence, or mass analysis. **E 135, E01**
- neck**—(1) the part of a bottle between finish and shoulder.
(2) {archaic} the structure that connects the melting and working chambers of a melting furnace.
(3) the structure connecting the uptake and port in a melting furnace. **C 162, C14**
- neck base girth, n**—*in body measurements*, the circumference of the neck over the cervicale at the back and at the top of the collar bone at the front. **D 123, D13**
- neck base girth, n**—the circumference of the neck, taken over the cervicale at the back and the top of the collarbone at the front. **D 5219, D13**
- neck base girth, n**—*in body measurements*, the circumference of the neck over the cervical at the back and at the top of the collar bone at the front. **F 1494, F23**
- neck formation, n**—during sintering, the development of a neck-like bond between particles. **B 243, B09**
- neck girth, n**—*ingarment construction*, with shirt open in front and collar fully extended and laid out flat, measure from center of collar button to the far end of the button hole. **F 1494, F23**
- necking, n**—*in building construction*, the localized reduction in cross section that may occur in a material under stress. **C 717, C24**
- necking, n**—the localized reduction in cross-section which may occur in a material under tensile stress. **D 883, D20**
- necking, n**—the localized reduction in cross section that may occur in a material under tensile stress. **D 1566, D11**
- necking, n**—the onset of nonuniform or localized plastic deformation, resulting in a localized reduction of cross-sectional area. **E 6, E28**
- necking, n**—the localized reduction in cross section that may occur in a material under tensile stress. (D20) **F 412, F17**
- neck ring**—a metal mold part used to form the finish of a hollow glass article. **C 162, C14**
- necktie, n**—a decorative band of fabric worn around the neck and tied in a knot or a bow. **D 123, D13**
- necktie, n**—a decorative band of fabric worn around the neck and tied in a knot or a bow. **D 7022, D13**
- neck to bust point, n**—the distance from the side of the neck base to the bust apex (contour), taken with the arms down. **D 5219, D13**
- needle**—the vertical, reciprocating, refractory part of a feeder which alternatively forces the glass through the orifice and pulls it up after shearing. **C 162, C14**
- needle damage, n**—*in sewn fabrics*, the partial or complete yarn severance or fiber fusing caused by a needle passing through a fabric during sewing. **D 123, D13**
- needled felt, n**—a textile structure composed entirely of fibers principally interlocked and reoriented through the action of felting needles. **D 123, D13**
- needled felt, n**—a textile structure composed entirely of fibers physically interlocked and reoriented through the action of felting needles. **D 4845, D13**
- needle ductility**—a measure of the amount of plastic bending a needle can withstand. **F 1840, F04**
- needle glazing**—*in building construction*, the application of a small bead of a sealant at the sight line adhering to the sash and glass or panel by means of a nozzle with an orifice not exceeding 3.18 mm [$\frac{1}{8}$ in.] in diameter. **C 717, C24**
- needle gun**—a power tool that removes paint by the impact of a set of thin metal rods. **E 1605, E06**
- needle ice**—thin, elongated, crystals of ice that form perpendicular to the surface of the ground. **D 7099, D18**
- needle length, n**—the distance measured along the needle curvature from end to end. **F 1840, F04**
- needle point**—point forming circular cone. **F 547, F16**
- needle-punched batting, n**—a textile filling material which is stabilized by mechanically entangling the fibers. **D 123, D13**
- needle-punched batting, n**—a textile filling material which is stabilized by mechanically entangling the fibers. **D 7022, D13**
- needle radius, n**—the radius of the uniformly curved portion or portions of the needle measured from the centerline of the needle body. **F 1840, F04**
- needles, n**—elongated rod-like particles. **B 243, B09**
- needles per unit width, n**—*for tufted pile yarn floor covering*, the number of binding sites per unit of floor covering width; needles being the means of inserting the pile yarn into the backing fabric. **D 123, D13**
- needles per unit width, n**—*for tufted pile yarn floor covering*, the number of binding sites per unit of floor covering width; needles being the means of inserting the pile yarn into the backing fabric. **D 5684, D13**
- needle wire diameter, n**—the gage or thickness of the needle wire, measured at a location between the needle body and the attachment area, where either no or minimal work has taken place. **F 1840, F04**
- needs, n**—the functions that the value analysis team determines to be fulfilled by the product/project. **E 833, E06**
- Neel temperature**—the temperature above which an antiferromagnetic material becomes paramagnetic. **E 1142, E37**
- Néel wall**—in a thin magnetic film (less than about 10^{-6} cm thick for iron), a domain wall in which the magnetic moment at any point is substantially parallel to the film surface. See also **domain wall**. **A 340, A06**
- negative**—an image in which the dark tones of the original appear light and the light tones appear dark. **F 335, F05**
- negative air pressure (vacuum) test**—test procedure utilizing air at a pressure less than atmospheric pressure, intended to determine the acceptability of a pipe section or multiple pipe sections, or an installed pipeline or manhole before or after backfill. **C 822, C13**
- negative developer**—see **reversal developer**. **F 335, F05**
- negative development**—see **reversal development**. **F 335, F05**
- negative distortion**—See **distortion**. **E 7, E04**
- negative eyepiece**—an eyepiece in which the real image of the object is formed between the lens elements of the eyepiece. **E 7, E04**
- negative image**—a developed image in which dark areas correspond to light area of the original subject. **F 335, F05**
- negative load**—a load that results in the indoor side of a glass specimen being the high-pressure side. **E 631, E06**
- negative, photographic**—a sensitized plate or film which has been exposed in a camera and which upon development has the lights and shades inverse to those of the original subject. The plate or film does not become a negative until it is exposed, after which it may be an undeveloped or a developed negative. **E 7, E04**
- negative print**—a photograph having approximately the opposite rendition of light and shade as the original subject. **E 7, E04**
- negative replica**—See **replica**. **E 7, E04**
- negative side waterproofing, n**—an application wherein the waterproofing system and the source of hydrostatic pressure are on opposite sides of the structural element. **D 1079, D08**
- negative test**—the absence of the characteristics color change within a specified time limit, usually within a few minutes.
- net assignable area**—See **space categories**. **E 631, E06**
- negative thixotropy**—synonym of **anti-thixotropy**. **E 1142, E37**
- neoprene**—a synthetic rubber (polychloroprene) used in liquid- or sheet-applied elastomeric roofing membranes or flashing. **D 1079, D08**

neoprene

neoprene—an elastomer, polychloroprene, formed by adding hydrogen chloride to monovinylacetylene. **F 869, F08**

neoprene treated, *adj*—*in glass fiber*, a descriptive term for the application of polychloroprene rubber compound to improve the stability, knot holding properties, and abrasion resistance of the cord. **D 123, D13**

neoprene treated, *adj*—*in glass fiber*, a descriptive term for the application of polychloroprene rubber compound to improve the stability, knot holding properties, and abrasion resistance of the cord. **D 7018, D13**

nep, *n*—a tightly tangled knot-like mass of unorganized fibers. **D 123, D13**

nep, *n*—a tightly tangled knot-like mass of unorganized fibers. (Compare **pills**.) **D 3990, D13**

nep, *n*—one or more fibers occurring in a tangled and unorganized mass. **D 4845, D13**

nep, *n*—a tightly tangled knot-like mass of unorganized fibers. Compare **nap** and **pill**. **D 4849, D13**

neper, *n*—a division of the logarithmic scale wherein the number of nepers is equal to the natural logarithm of the scalar ratio of either two voltages or two currents. **D 1711, D09**

nepheline syenite—a mineral aggregate consisting chiefly of albite, microcline, and nephelite, each in significant amount. **C 242, C21**

nephelometer—an instrument that measures the amount of light scattered in a suspension. **D 4410, D19**

nephelometer—a device used to measure mainly the turbidity of water with results expressed in nephelometric turbidity units (NTU). Measures light at 90°. **D 6161, D19**

Nernst equation—a mathematical description of electrode behavior:

$$E = E_x + 2.3 RT/zF \log A$$

where:

E = total potential developed between the sensing and reference electrodes, mV,

E_x = potential dependent on the choice of reference electrodes,

RT/zF = Nernst factor,

R and F = constants,

z = charge on the ion, including sign,

T = temperature, and,

A = activity of the ion to which the electrode is responding. **D 4127, D19**

Nernst factor—the term $2.3RT/nF$ in the Nernst equation, which is equal (at $T = 25^\circ\text{C}$) to 59.16 mV when $n = 1$ and 29.58 mV when $n = 2$, and which includes the sign of the charge on the ion in the term n . The Nernst factor varies with temperature. This factor is often referred to as the *electrode slope*. **D 4127, D19**

Nernstian response—the response of an ion-selective electrode is over a given range of activity (or concentration) in which a plot of the potential of such an electrode in conjunction with a reference electrode versus the logarithm of the ionic activity of a given species (a_A) is linear with a slope of $2.303 \times 10^{-3} RT/z_A F$ mV/decade (59.16/z_A mV per unit of pa_A at 25°C). **D 4127, D19**

nerve, *n*—the elastic resistance of unvulcanized rubber or rubber mixes to permanent deformation. **D 1566, D11**

nest, *n*—a group of articles, **cans**, **baskets**, or **boxes** of various sizes, that fit one within the other. **D 996, D10**

nest, *n*—*for pattern standard def.*, a graded nest. **D 6963, D13**

nested experiment, *n*—an experiment to examine the effect of two or more factors in which the same level (version) of a factor cannot be used with all levels (versions) of other factors. Synonym: hierarchical experiment. **E 456, E11**

nested experiment, *n*—an experiment to examine the effect of two or more factors in which the same level (version) of a factor cannot be used with all levels (versions) of other factors. Synonym: hierarchical experiment. **E 1325, E11**

nestling down, *n*—a down not fully developed with a sheath and with soft barbs emanating from the sheath. **D 123, D13**

nestling feathers, *n*—immature feathers in which the barbs are held together and covered by a sheath. **D 123, D13**

σ_{net} —net stress based on area at minimum diameter of notched round bar **F 2078, F07**

net assignable area—See **space categories**. **E 1480, E06**

net benefits (savings)—the difference between the benefits and the costs—where both are discounted to present or annual value dollars.

net floor area—See **floor area**. **E 631, E06**

net benefits (savings), *n*—the difference between the benefits and the costs—where both are discounted to present or annual value dollars. **E 833, E06**

net boom—special purpose boom in which all or part of the membrane material is netting. **F 818, F20**

net calorific value—a lower value calculated from the gross calorific value. It is equivalent to the heat produced by combustion of a unit quantity of solid fuel at a constant pressure of one atmosphere, under the assumption that all water in the products remains in the form of vapor. **D 5681, D34**

net calorific value—the energy released by combustion of a unit quantity of refuse-derived fuel at constant volume or constant pressure in a suitable calorimeter under specified conditions such that all water in the products remains in the gaseous form. The net calorific value is the lower heating value that can be calculated from the gross calorific value by making a correction for the heat of vaporization of the water. This is the measure of calorific value in Europe but is rarely used in the United States. Synonym: lower heating value. **E 856, D34**

net calorific value (net heat of combustion at constant pressure), *n*—the heat produced by combustion of unit quantity of a solid or liquid fuel when burned, at a constant pressure of 1 atm (0.1 MPa), under conditions such that all the water in the products remains in the forms of vapor. **D 121, D05**

net calorific value (net heat of combustion at constant pressure), Q_p , *n*—the heat produced by combustion of unit quantity of a solid or liquid specimen when burned at a constant pressure of 0.1 MPa (1 atm), under conditions such that all the water in the products remains in the form of vapor. **D 5681, D34**

net calorific value (net heat of combustion at constant pressure), Q_p —the heat produced by combustion of unit quantity of a solid or liquid fuel when burned at a constant pressure of 0.1 MPa (1 atm), under conditions such that all the water in the products remain in the form of vapor. **D 5681, D34**

net count rate—the count rate recorded in a spectrometer after correcting for background and coincidence events. **E 170, E10**

net density—total density less fog and support (film base) density. **E 1316, E07**

net floor area—that part of the **gross floor area** located within **occupiable space**. **E 631, E06**

net floor area—See **floor area**. **E 1480, E06**

net heating value (also called lower heating value)—the amount of energy per volume transferred as heat from the complete, ideal combustion of the gas at standard temperature in which all the water formed by the reaction remains in the vapor state. **D 4150, D03**

net heat of combustion, *n*—the oxygen bomb (see Test Method D 3286) value for the heat of combustion, corrected for gaseous state of product water. **E 176, E05**

net heat of combustion, *n*—the oxygen bomb calorimeter value for the heat of combustion, corrected for the gaseous state of product water. **E 176, E05**

net heat of combustion, Q_n (MJ/kg), *n*—the quantity of energy released when a unit mass of fuel is burned at constant pressure, with all of the products, including water, being gaseous. **D 4175, D02**

net molded edge—an edge, not physically altered after molding, in final form ready for use.

net programmable area—See **space categories**.

newel—See **railing systems**. E 631, E06

net molded edge—an edge, not physically altered after molding, in final form ready for use. E 1749, E06

net positive suction head, NPSH, *n*—the difference between total pressure and vapor pressure in a fluid flow, expressed in terms of equivalent height of fluid, or “head,” by the equation:

$$\text{NPSH} = (P_s/w) + (V^2/2g) - (P_v/w)$$

where:

P_s = static pressure,

P_v = vapor pressure,

V = flow velocity,

w = specific weight of fluid, and

g = gravitational acceleration.

This quantity is used in pump design as a measure of the tendency for cavitation to occur at the pump inlet. It can be related to the cavitation number. G 40, G02

net power—the difference between gross power and freewheeling power; net power is the power required for processing. D 5681, D34

net processing time—the time during which refuse is processed through the size reduction device. D 5681, D34

net programmable area—See **space categories**. E 1480, E06

net pyrgeometer—see **pyranometer, net**. E 772, E44

net pyrradiometer—see **pyranometer, net**. E 772, E44

net-section area, A_N [L^2]—area of the net remaining ligament. E 1823, E08

net thickness, B_N [L]—distance between the roots of the side grooves in side-grooved specimens. E 1823, E08

network, *n*—a three-dimensional reticulate structure formed by interchain or intrachain bonding of polymer molecules in combination with chain entanglements. D 1566, D11

network level analysis, *n*—evaluation of a network of pavement to enable selection of candidate projects, project scheduling, and budget estimates. E 867, E17

network structure—a structure in which one constituent occurs primarily at the grain boundaries, thus partially or completely enveloping the grains of the other constituents; on a two-dimensional section cut through such a structure, the grain boundary constituent will appear as a network. E 7, E04

Neumann bands—See **twin bands**. E 7, E04

neutral, *adj*—achromatic or without hue. E 284, E12

neutral body—a comparison piece used in the differential method of thermal analysis, which has nearly the same thermal properties as the test specimen, and which produces no heat effects within the temperature range through which the specimen is being tested. See Practice E 14. E 7, E04

neutral content, *n*—the total amount of material contained in naval stores, such as rosin, tall oil, and their derivatives that do not contain any acidic functionality. D 804, D01

neutral fat—the unsaponified and unsaponifiable matter that becomes included along with fatty acids in a diethyl ether extract of samples under analysis for soap content, as described in 25.2 of Test Method D 460. D 459, D12

neutral filter—see **filter, neutral**. E 131, E13

neutral filter—see **filter, neutral**. E 135, E01

neutralization value—a number used as a measure of the acidic or basic constituents present in an insulating liquid, usually expressed in terms of equivalent milligrams of potassium hydroxide per gram of sample. D 2864, D27

neutralizer—a dilute alkaline solution with which sheet metal ware is treated as a part of the pickling process subsequent to the acid

treatment. A chemical or mixture of chemicals which, when added to water, produces the dilute alkaline solution. C 286, B08

neutralizing potential (NP), *n*—the potential for a solid material sample to neutralize acidic effluent produced from the oxidation of iron-sulfide minerals, based on the amount of carbonate present in the sample. The NP is also presented in terms of tons of calcium carbonate equivalent per 1000 tons of solid material. It is calculated by digesting the solid material with an excess of standardized acid and back-titrating with a standardized base to measure and convert the acid consumption to calcium carbonate equivalents. D 5681, D34

*neutral refractories, *n**—see **refractories, neutral**. C 71, C08

neutral sized paper, *n*—paper that has been manufactured using a procedure or process at a pH value of 7 (with a normal range of 6.5 to 7.5) that results in paper that has resistance to aqueous liquid penetration. See **sizing**. D 1968, D06

neutral soap—under **soap**, see **neutral soap**. D 459, D12

neutral solution—a fluid environment containing an equal amount of hydrogen and hydroxyl ions, that is, pH = 7. E 1823, E08

neutral stress—see **stress**. D 653, D18

neutral white surface—a highly reflecting surface whose diffuse reflectance makes it a colorimetric match of a nonselective reflecting white surface under specified viewing conditions. (psychophysical definition). D 459, D12

neutron—a neutral elementary particle having an atomic mass close to 1. In the free state outside of the nucleus, the neutron is unstable having a half-life of approximately 10 min. E 1316, E07

neutron activation detector—a neutron fluence sensing device, well-characterized with respect to geometry, mass, composition and cross section which produces activity with a sufficiently long half life to permit its measurement after withdrawal from the neutron field. E 170, E10

neutron fluence—see **particle fluence**. E 170, E10

neutron fluence rate—see **particle fluence rate**. *neutronflux*—see **particle fluence rate**. E 170, E10

neutron radiography—the process of producing a radiograph using neutrons as the penetrating radiation. E 1316, E07

neutron radiography (NRT)—a process of making an image of the internal details of an object by the selective attenuation of a neutron beam by the object. E 1316, E07

neutron spectrum—see **particle fluence spectrum**. E 170, E10

newel, *n*—a decorative or structural post member at the start or end of a stair run, often extending above a handrail; usually square or rectangular in cross section, supporting the end of a stair railing or serving as the common support for two stair railings, often supporting a stair stringer and platform; also, the center post of a spiral stair. E 631, E06

newel, *n*—a decorative or structural post member at the start or end of a stair run, often extending above a handrail; usually square or rectangular in cross section, supporting the end of a stair railing or serving as the common support for two stair railings, often supporting a stair stringer and platform; also, the center post of a spiral stair. E 1481, E06

new tire, *n*—a tire that has never been mounted on a rim. D 5681, D34

Newtonian behavior, *n*—the property of a liquid in which its viscosity is constant over a stated range of strain rates. (Compare **non-Newtonian behavior**.) D 907, D14

Newtonian flow, *n*—a Newtonian liquid is one that flows immediately on application of even the smallest force, and for which the rate of flow is directly proportional to the force applied. D 4175, D02

newtonian fluid—a true fluid that tends to exhibit constant viscosity at all rates of shear. D 653, D18

Newtonian fluid, *n*—a fluid that at a given temperature exhibits a constant viscosity at all shear rates or shear stresses. D 4175, D02

Newtonian oil or fluid, *n*

Newtonian oil or fluid, *n*—an oil or fluid that at a given temperature exhibits a constant viscosity at all shear rates or shear stresses.

D 4175, D02

Newtonian viscosity—see **viscosity, Newtonian**.

newton (N)—the SI unit of force ($\text{kg}\cdot\text{m}/\text{s}^2$).

E 1316, E07

***n*-factor**—the ratio of the surface freezing or thawing index to the air freezing or thawing index.

D 7099, D18

2ⁿ factorial experiment, *n*—a factorial experiment in which *n* factors are studied, each of them in two levels (versions).

E 456, E11

2ⁿ factorial experiment, *n*—a factorial experiment in which *n* factors are studied, each of them in two levels (versions).

E 1325, E11

NFS(B)—notched fracture strength in bending

F 2078, F07

NFS(B)_{F1624}—notched fracture strength in bending of a bare specimen at Test Method F 1624 step-loading rates

F 2078, F07

NFS(T)—notched fracture strength in tension

F 2078, F07

nick—indentation on the surface of a bolt, nut, screw, or stud. Also referred to as a gouge.

F 1789, F16

nickel, *n*—a refined nickel primarily produced from ore or matte or similar raw material containing a minimum of 99.80 percent nickel by weight.

B 899, B02

nickel alloy, *n*—a material that conforms to a specification that requires, by weight percent, more nickel than any other element.

B 899, B02

nickel-base alloy and nickel-based alloy—these terms are not used in ASTM standards under the jurisdiction of Committee B02 and are not preferred. See **nickel alloy**.

B 899, B02

nickel dipping, nickel flashing, or nickel pickling—a process for depositing metallic nickel on steel by galvanic action, reduction, or both.

C 286, B08

Nicol prism—a prism, used for polarizing or analyzing light, made by cementing together, with Canada balsam, two pieces of calcite in such a way that the extraordinary ray from the first piece passes through the second piece while the ordinary ray is reflected to the side into an absorbing layer of black print. When two Nicol prisms are crossed, therefore, no light passes through.

E 7, E04

Nicol prism—a prism, used for polarizing or analyzing light, made by cementing together, with Canada balsam, two pieces of calcite in such a way that the extraordinary ray from the first piece passes through the second piece while the ordinary ray is reflected to the side into an absorbing layer of black paint. When two Nicol prisms are crossed, therefore, no light passes through.

E 175, E41

nineteen-inch selvage—a prepared roofing sheet with a 432-mm (17-in.) granule-surfaced exposure and a 483-mm (19-in.) selvage.

D 1079, D08

ninety-pound—a prepared roll roofing with a granule-surfaced exposure that has a mass of approximately $4400 \text{ g}/\text{m}^2$ ($90 \text{ lb}/108 \text{ ft}^2$).

D 1079, D08

nip, *n*—the radial clearance between rolls of a mill or calendar on a line of centers.

D 1566, D11

NIST, *n*—acronym for National Institute of Standards and Technology.

D 4175, D02

Nitinol—a generic trade name for a Ni-Ti alloy.

F 2005, F04

nitrate pulps—pulp used for the manufacture of cellulose nitrate and subject to various specifications by the manufacturers, including those of alpha-cellulose content and viscosity.

D 1695, D01

nitre—an industrial term for NaNO_3 .

C 162, C14

nitride-carbide inclusion types—a compound with the general formula $M_x(C, N)_y$, observed generally as colored idiomorphic cubic crystals, where *M* includes Ti, Cb, Ta, Zr.

E 7, E04

nitriding, *n*—introducing nitrogen into a solid steel object by holding it at a suitable temperature in contact with a nitrogenous environment.

A 941, A01

nitrocellulose—see **cellulose nitrate**.

D 1695, D01

nitrogen alloying, *n*—the transfer of nitrogen from a furnace atmosphere to powder or a P/M part, in such a way as to increase the nitrogen content of the material within controlled limits.

B 243, B09

nitrogen narcosis, *n*—a distinct anesthetic effect, characterized by

loss of judgment and disorientation, caused from breathing nitrogen at increased partial pressures.

F 1549, F32

nitrogen surface area (NSA), *n*—the total surface area of carbon black that is calculated from nitrogen adsorption data using the B.E.T. theory.

D 3053, D24

nits or nitty enamel—a porcelain enamel blemish in dry process enameling characterized by minute surface pits visible only on close examination.

C 286, B08

(*n, k*) symbology, *n*—a class of bar code symbologies in which each symbol character is *n* modules in width and is composed of *k* bar and space pairs. A subset of these is the *n, k, m*, class of symbologies, where *m* represents the maximum width of an element in modules. (See **module**.)

F 1294, F05

NLGI, *n*—National Lubricating Grease Institute

D 4175, D02

NLGI number, *n*—a numerical scale for classifying the consistency range of lubricating greases and based on the Test Method D 217 worked penetration.

D 4175, D02

NMR absorption band; NMR band—a region of the spectrum in which a detectable signal exists and passes through one or more maxima.

E 131, E13

NMR absorption line—a single transition or a set of degenerate transitions is referred to as a line.

E 131, E13

NMR apparatus; NMR equipment—an instrument comprising a magnet, radio-frequency oscillator, sample holder, and a detector that is capable of producing an electrical signal suitable for display on a recorder or an oscilloscope, or which is suitable for input to a computer.

E 131, E13

noble—the positive (increasingly oxidizing) direction of electrode potential.

G 15, G01

noble metal—a metal that does not readily tend to furnish ions, and therefore does not dissolve readily, nor easily enter into such reactions as oxidations, etc. The opposite of base metal.

NOTE—Since there is no agreement over the sign of electrode potentials, the words noble and base are often preferred because they are unambiguous.

B 374, B08

noble metal—a metal with a standard electrode potential that is more noble (positive) than that of hydrogen.

G 15, G01

noble metal thermocouple, *n*—thermocouple whose thermoelements are composed primarily of noble metals and their alloys. (See also **base metal thermocouple; refractory metal thermocouple**.)

E 344, E20

no conclusion (totally inconclusive, indeterminable)—This is the zero point of the confidence scale. It is used when there are significantly limiting factors, such as disguise in the questioned and/or known writing or a lack of comparable writing, and the examiner does not have even a leaning one way or another.

Examples—No conclusion could be reached as to whether or not the John Doe of the known material wrote the questioned material, or I could not determine whether or not the John Doe of the known material wrote the questioned material.

E 1658, E30

node, *adj*—point, line, or surface of standing wave system at which the amplitude is zero.

D 653, D18

node—the bonded portion of the honeycomb flat sheet material; the honeycomb cell's double wall.

E 631, E06

node—the bonded portion of the honeycomb flat sheet material; the honeycomb cell's double wall.

E 1749, E06

no deception indicated (NDI), *n*—no deception indicated is a conventional term for a PDD outcome. A decision of NDI means that the physiological data are stable and interpretable and that the evaluation criteria used by the examiner concluded that the examinee was being completely truthful to the relevant issue. No deception indicated corresponds to the term "No Significant Physiological Responses," or NSR.

E 2035, E52

nodular fireclay, *n*—see **fireclay, nodular**.

C 71, C08

nodular graphite, *n*—graphite in the form of nodules or spheroids in iron castings.

A 644, A04

nodularity, *n*—the volumetric proportion of spheroidal or nodular

graphite to total graphite in a ductile iron or a compacted graphite iron matrix (see Test Method A 247, for Evaluating the Microstructure of Graphite in Iron Castings, Types I and II). **A 644, A04**

nodularity, degree of, *n*—the volumetric proportion of spheroidal or nodular graphite to total graphite in a ductile iron matrix (see Test Method A 247, Types I and II). **A 644, A04**

nodular powder, *n*—irregular particles having knotted, rounded, or similar shapes. **B 243, B09**

nodule—a rounded projection formed on a cathode during electrodeposition. **B 374, B08**

nodules—small irregularly shaped imperfections in the electrolytic copper foil which do not cause the foil to fail the thickness tolerance. **B 846, B05**

nodulizing alloy, *n*—an alloy added to molten iron for the primary purpose of causing the formation of spheroidal graphite during solidification. **A 644, A04**

no-flow point, *n*—the temperature corresponding to a specified degree of blockage of a screen by separated solids. **D 4175, D02**

no-frost state—the case where the frost point of a sealed insulating glass unit is below the temperature specified by the purchaser or user. **E 631, E06**

no identification—this expression could be understood to mean anything from a strong probability that the suspect wrote the questioned writing; to a complete elimination. It is not only confusing but also grammatically incorrect when used informally in sentences such as. "I no identified the writer" or "I made a no ident in this case." **E 1658, E30**

noil, *n*—the short fibers removed in combing; applied particularly to wool, but also to other fibers as cotton, silk, and rayon. **D 123, D13**

noil, *n*—the short fibers removed in combing; applied particularly to wool, but also to other fibers such as cotton, silk, and rayon. **D 4845, D13**

noise—See **contact noise**. **B 542, B02**

noise, *n*—an extraneous electronic signal that effects baseline stability. **D 1129, D19**

noise—See **analyzer**. **D 1356, D22**

noise—in surface analysis, the random fluctuation of the measured intensity at a particular location in a spectrum, usually expressed as an RMS (root-mean-square), standard deviation, or a peak-to-peak value. **E 673, E42**

noise—in electromagnetic inspection, any nonrelevant signal that tends to interfere with the normal reception or processing of a desired flaw signal. It should be noted that such noise signals may be generated by inhomogeneities in the inspected part that are not detrimental to the end use of the part. **E 1316, E07**

noise—the data present in a radiological measurement which is not directly correlated with the degree of radiation attenuation by the object being examined. **E 1316, E07**

noise—any undesired signal (electrical or acoustic) that tends to interfere with the reception, interpretation, or processing of the desired signal. **E 1316, E07**

noise, *n*—In PDD, it is the random variation in the recorded data that has no diagnostic value, and when excessive, may take the identification of diagnostic patterns more difficult. **E 2035, E52**

noise—the maximum amplitude, peak-to-peak, for all random variations.

noise, short term—is that with a frequency greater than six cycles per min (equivalent to a period of 10 seconds or less).

noise, long term—is that with a frequency between 0.6 and 6 cycles per min (equivalent to periods of 100 and 10 s). **E 2161, E37**

noise—(1) random variations of one or more characteristics of any entity such as voltage, current, or data.

(2) a random signal of known statistical properties of amplitude, distribution, and spectral density.

(3) loosely, any disturbance tending to interfere with the normal operation of a device or system. **F 149, F05**

noise equivalent temperature difference (NETD)—the target-to-background temperature difference between a blackbody target and its blackbody background at which the signal-to-noise ratio of a thermal imaging system or scanner is unity. **E 1316, E07**

noise isolation class, NIC—a single-number rating calculated in accordance with Classification E 413 using measured values of noise reduction. It provides an estimate of the sound isolation between two enclosed spaces that are acoustically connected by one or more paths. **C 634, E33**

noise reduction coefficient, NRC—a single-number rating derived from measured values of sound absorption coefficients in accordance with 11.7 of Test Method C 423. It provides an estimate of the sound absorptive property of an acoustical material. **C 634, E33**

noise reduction, *NR*—in a specified frequency band, the difference between the average sound pressure levels measured in two enclosed spaces or rooms due to one or more sound sources in one of them. **C 634, E33**

no-knock condition, *n*—for octane rating, where the knock intensity in all cylinders is less than light knock. Refer to Annex A1 for description of knock intensity. **D 4175, D02**

NOM—natural organic matter. **D 6161, D19**

nominal, *adj*—name or identifying value of a measurable property by which a conductor or component or property of a conductor is identified, and to which tolerances are applied. **B 354, B01**

nominal, *n*—representative value of a measurable property determined under a set of conditions, by which a product may be described. **D 4439, D35**

nominal, *n*—commonly used to refer to the average size product (chip) that comprises 50 % or more of the throughput in a scrap tire processing operation. It should be noted that any scrap tire processing operation also would generate products (chips) above and below the "nominal" range of the machine. **D 5681, D34**

nominal airflow rate, Q_{nom} , *n*—the flow rate indicated by the blower door using the manufacturer's calibration coefficients (m^3/s , ft^3/min). **E 631, E06**

nominal contact pressure, $[FL^{-2}]$, *n*—in tribology, an average contact pressure between two conforming bodies, calculated by dividing the contact force by the **apparent area of contact**. **G 40, G02**

nominal diameter—references the internal diameter in name only to the nearest unit dimension. **C 896, C04**

nominal diameter—the diameter of a sphere that has the same volume as the sediment particle. Sometimes called *equivalent spherical diameter*. **D 4410, D19**

nominal dimension—dimension that is greater than the specified dimension by the thickness of a mortar joint. It is usually expressed as a whole number. **C 1232, C15**

nominal discount rate—the rate of interest reflecting the time value of money stemming both from inflation and the real earning power of money over time. **E 631, E06**

nominal discount rate, *n*—the rate of interest reflecting the time value of money stemming both from inflation and the real earning power of money over time. **E 833, E06**

nominal filtration rating, *n*—(Deprecated term) an arbitrary micrometer value for a filter medium indicated by a filter manufacturer. **D 4175, D02**

nominal filtration rating, *n*—an arbitrary micrometer value indicated by a filter manufacturer. Due to lack of reproducibility this rating is deprecated. **D 4175, D02**

nominal gage length, *n*—*General* — in tensile testing, the length of a specimen under specified pretension measured from nip-to-nip of the jaws of the holding clamps in their starting position at the beginning of the test, and including any portion of the specimen in contact with bollard or snubbing surfaces.

Specific I, the length of a specimen under specific pre-tension between frets, in instruments where the specimen is not held by clamps, for example, in a vibroscope.

nominal gage length, *n*

Specific 2, the length of a specimen measured between the points of attachment to the tabs while under specified pretension.

D 123, D13

nominal gage length, *n*—in tensile testing, (*General*) the length of a specimen under specified pretension measured from nip-to-nip of the jaws of the holding clamps in their starting position at the beginning of the test, and including any portion of the specimen on contact with bollard or snubbing surfaces. (*Specific 1*), the length of a specimen under specific pre-tension between frets, in instruments where the specimen is not held by clamps, for example, in a vibroscope. (*Specific 2*), the length of a specimen measured between the points of attachment to the tabs while under specified pretension.

D 4849, D13

nominal joint width, *n*—the specified opening of a joint in practice that is selected for test purposes.

E 176, E05

nominal maximum size (of aggregate), *n*—in specifications for, or description of aggregate, the smallest sieve opening through which the entire amount of the aggregate is permitted to pass.

C 125, C09

nominal maximum size (of aggregate), *n*—in specifications for, or descriptions of aggregate, the smallest sieve opening through which the entire amount of the aggregate is permitted to pass.

D 8, D04

nominal mesh size, *n*—the designated dimension of the openings of a sieve.

E 1638, E29

nominal (net-section) stress, σ_N [FL^{-2}]—in fracture testing, a measure of the stress on the net cross section calculated in a simplified manner and without taking into account stress gradients produced by geometric discontinuities such as holes, grooves, fillets, and so forth.

E 1823, E08

nominal plunger energy $\frac{1}{2} [ML^2/T^2]$, *n*—in tire testing, one half of the product of a peak force (required to rupture the tire structure in tread area) and maximum plunger travel into a tire at the time of rupture.

F 538, F09

nominal pressure—the intended operating pressure.

E 631, E06

nominal pressure—the intended operating pressure.

E 1749, E06

nominal product size—the screen size corresponding to 90 % cumulative passing by weight.

D 5681, D34

nominal size—as applied to products such as lumber, traditionally the approximate rough-sawn commercial size by which it is known and sold in the market. Actual rough-sawn sizes may vary from the nominal. Reference to standards or grade rules is required to determine nominal/actual finished size relationships.

D 9, D07

nominal size, *n*—the average size product (chip) that comprises 50 % or more of the through put in a scrap tire processing operation; scrap tire processing operations generate products (chips) above and below the nominal size.

D 5681, D34

nominal stress, *n*—the stress at a point calculated on the net cross section by simple elastic theory without taking into account the effect on the stress produced by discontinuities such as holes, grooves, fillets, or any combination of them. Taken in part from

D 907, D14

nominal stress [FL^{-2}], *n*—the stress at a point calculated on the net cross section by simple elastic theory without taking into account the effect on the stress produced by geometric discontinuities such as holes, grooves, fillets, and so forth.

E 6, E28

nominal temperature—the intended operating temperature.

nondestructive test—See **test, nondestructive**.

nonbearing wall—See **wall**.

E 631, E06

nominal temperature—the intended operating temperature.

E 1749, E06

nominal thickness, *n*—of steel sheet, an ordering designation which indicates that the applicable tolerance for thickness is both plus and minus from the ordered thickness.

A 902, A05

nominal value, *n*—representative value of a measurable property by which a product may be described

D 4439, D35

nominal wall, *n*—specified wall thickness with a published plus and minus tolerance from the specified thickness at any point.

B 899, B02

nominal width, *n*—in reference to bar codes, the intended width of an element.

F 1294, F05

non-alteration distributor—distributor of mechanical fasteners who buys, resells, and may repack the fasteners, but does not change the individual fasteners in any way.

F 1789, F16

nonaromatic hydrocarbons—one or more types of hydrocarbons identified as paraffins, cycloparaffins (naphthenes), and olefins. Generally, the saturated types, paraffins and cycloparaffins, constitute the impurities in the commercial grades of aromatic hydrocarbons.

D 4790, D16

nonassociated gas—natural gas not in contact with, nor dissolved in, reservoir liquids.

D 4150, D03

nonbanded coal—See *nonbanded coal* under **coal**.

D 121, D05

noncanopy—a fixed device located in close proximity over cooking equipment and in some cases having a shelf-like appearance. The purpose of which is to channel air movement to contain and capture the unwanted by-products resulting from cooking activities.

F 1827, F26

noncarbonated mechanically refrigerated visible product, beverage dispenser—counter-top equipment, mechanically refrigerated, with a transparent, impact-resistant container designed to afford a visual display of the beverage.

F 1827, F26

non-carbonate hardness—hardness caused by chlorides, sulfates, and nitrates of calcium and magnesium.

D 6161, D19

non-chlorine bleach, *n*—a bleach that does not release the hypochlorite ion in solution, for example, sodium perborate, sodium percarbonate.

D 123, D13

non-chlorine bleach, *n*—a bleach that does not release the hypochlorite ion in solution, for example, sodium perborate, sodium percarbonate.

D 3136, D13

nonchromatic, adj—see **achromatic**.

E 284, E12

noncohesive sediments—discrete particles, the movement of which for given erosive forces depends only upon the properties of shape, size, and density and upon the relative position of the particle with respect to surrounding particles.

D 4410, D19

non-combustible, *adj*—not capable of undergoing combustion under specified conditions. (Contrast **combustible**.)

E 176, E05

noncombustible—that fraction of a macrosample remaining after moisture and combustibles are driven off by heat and combustion. It is composed of metallic and glass particles in addition to the residue from the combustion of organic substances.

E 856, D34

noncombustible textile, *n*—a textile that will neither ignite nor give off vapors that will ignite when subjected to external sources of ignition. (Compare **combustible textile**)

D 123, D13

noncombustible textile, *n*—a textile that will neither ignite nor give off vapors that will ignite when subjected to external sources of ignition. (Compare **combustible textile**.)

D 4391, D13

noncombustive reaction, *n*—a reaction other than combustion or thermal degradation undergone by certain materials upon exposure to elevated temperatures.

D 4175, D02

non-composite, *n*—as applied to loadbearing elements, structural interaction between contiguous elements is assumed not to exist in the evaluation of load capacity.

E 176, E05

noncompounded engine oil, *n*—a lubricating oil having a viscosity within the range of viscosities of oils normally used in engines, and that may contain anti-foam agents or pour depressants, or both, but not other additives.

D 4175, D02

*non-compression glazing, *n**—see **non-compression glazing system**.

C 717, C24

non-compression glazing, *v*—in building construction, the act of installing components into a non-compression glazing system.

C 717, C24

non-compression glazing system, *n*—in building construction, a sealant or combination of sealant(s) used to provide weather-tightness by way of the adhesive/cohesive characteristics of the components in the joint.

C 717, C24

noncondensable gas—a gas whose temperature is above its critical

temperature, so that it cannot be liquefied by increase of pressure alone. **E 1316, E07**

noncondensable gas content, *n*—the concentration of noncondensable gas in a geothermal fluid. **E 957, E44**

noncondensable gases, *n*—in geothermal, chemical species (such as carbon dioxide or hydrogen sulfide) that are constituents of geothermal fluids, that partition primarily into the vapor phase when geothermal fluids boil, and that do not condense along with geothermal steam when put through a condenser in a geothermal power plant. **E 957, E44**

nonconformance—fastener or fastener component which does not conform to a specification or other inspection standard. **F 1789, F16**

nonconforming, *adj*—a description of a unit or a group of units that does not meet the unit or group tolerance. **D 123, D13**

nonconforming item, *n*—an item that does not satisfy the requirements of the applicable specification. **D 123, D13**

non-conforming item, *n*—an item containing at least one nonconformity. **E 456, E11**

nonconforming unit, *n*—a unit of product containing at least one nonconformity. **D 1711, D09**

nonconformities per hundred units, *n*—a calculated ratio of nonconforming units to the number of units inspected, the quotient being multiplied by 100 (see **percent nonconforming**). **D 1711, D09**

nonconformity, *n*—an occurrence of failing to satisfy the requirements of the applicable specification; a condition that results in a nonconforming item. **D 123, D13**

nonconformity, *n*—a departure of a quality characteristic from its intended level or state that occurs with a severity sufficient to cause a test result not to meet a specification requirement. **D 1711, D09**

nonconformity—the nonfulfillment of specified requirements, (ISO 8402). **E 1187, E36**

nonconformity, *n*—nonfulfillment of a requirement. **E 1605, E06**

non-contact, *n*—a method of bar code reading typified by fixed or moving beam scanners having a greater optical throw and depth of field than contact, or wand scanners. **F 1294, F05**

noncryotic ground—geological materials at temperatures above 0°C. **D 7099, D18**

nondegradable, *adj*—in *erosion control*, not subject to decomposition to the point the material loses its ability to function for its intended purpose for the design life of the project under biological, chemical, and/or ultraviolet processes associated with typical application environments. **D 653, D18**

Nondestructive Evaluation—see **Nondestructive Testing**. **E 1316, E07**

Nondestructive Examination—see **Nondestructive Testing**. **E 1316, E07**

Nondestructive Inspection—see **Nondestructive Testing**. **E 1316, E07**

nondestructive test—See **test, nondestructive**. **E 1749, E06**

Nondestructive Testing (NDT), *n*—the development and application of technical methods to examine materials or components in ways that do not impair future usefulness and serviceability in order to detect, locate, measure and evaluate flaws; to assess integrity, properties and composition; and to measure geometrical characteristics. **E 1316, E07**

nondrying oil, *n*—an oil that does not of itself possess to a perceptible degree the power to take up oxygen from the air and lose its liquid characteristics. **D 16, D01**

non-elastic elongation, (NE), *n*—of *rope*, elongation after cyclic tensioning the rope to a specified force for a specified number of cycles. **D 123, D13**

non-erasable optical data—a non-erasable, non-rewriteable storage medium where the digital data is represented by the degree of reflectivity of the mediums recording layer. The data cannot be altered. **E 1316, E07**

nonferromagnetic material—a material that is not magnetizable and

hence, essentially not affected by magnetic fields. This would include paramagnetic materials and diamagnetic materials.

E 1316, E07

nonferrous alloys—alloys that do not contain iron as their main constituent although iron may be present as an impurity. The most common nonferrous groups are copper, nickel, aluminum, and titanium alloys. **F 1789, F16**

nonfibrous spicules—acicular particles resembling assemblages of asbestos fibers composed of nonfibrous, or semifibrous minerals such as picrolite. **D 2946, C17**

non-fill, *n*—defect resulting from the failure of the rubber to fill out all the mold pattern detail. **D 1566, D11**

nonflaming mode, *n*—the mode of testing that does not use a pilot flame. **E 176, E05**

nonflammable textile, *n*—any combustible textile that burns without a flame. (See also **glow, smoldering**. Compare **flammable textile, combustible textile, and noncombustible textile**.) **D 123, D13**

nonflammable textile, *n*—any combustible textile that burns without a flame. (See also **glow, smoldering**.) (Compare **flammable textile, combustible textile, noncombustible textile**.) **D 4391, D13**

non-frost-susceptible soil—a soil that does not display significant detrimental ice segregation during freezing. **D 7099, D18**

non-graphitizable carbon, *n*—in *carbon and graphite technology*, a carbon which cannot be transformed into graphitic carbon solely by heat treatment up to 3000°C under inert atmosphere or reduced pressure (also known as a hard carbon). **C 709, D02**

non-graphitizable carbon, *n*—in *carbon and graphite technology*, a carbon which cannot be transformed into graphitic carbon solely by heat treatment up to 3000°C under inert atmosphere or reduced pressure (also known as a hard carbon). **D 4175, D02**

non-hygroscopic material, *n*—material which neither absorbs nor retains water vapor. **D 1356, D22**

nonimpact printer—a printer in which image formation is not the result of mechanical impacts. Examples are thermal printers, electrostatic printers, electrophotographic printers, and ink jet printers. **F 909, F05**

non-interlocking tile, *n*—tile without restrictive ribs, grooves, or channels at the side lap or head lap. **C 43, C15**

nonionic cellulose ethers—that class of cellulose ethers which does not contain any ionizable groups. **D 1695, D01**

nonionic detergent—under **detergent**, see **nonionic detergent**. **D 459, D12**

nonionic polyelectrolyte—neutral charged polymers, usually polyacrylamides, used for coagulation/flocculation. See **polyelectrolytes**. **D 6161, D19**

nonionic surfactant—a chemical compound that produces uncharged surface active particles in solution. **D 459, D12**

nonionic surfactant—a surface-active agent having no ionizable polar end groups but comprised of hydrophilic and lipophilic segments. **E 609, E35**

nonionic surfactant—a surface-active agent having no ionizable polar end groups but comprised of hydrophilic and lipophilic segments. **E 1519, E35**

nonlinearity—the maximum deviation of the transducer output(s) (of the wheel force transducer system) from the best-fit linear relation to the applied calibration force, expressed as a percentage of full scale. Proven outliers are excluded. **E 867, E17**

non-lint content, *n*—that portion of a mass of cotton fiber which is essentially foreign matter. **D 123, D13**

non-lint content, *n*—that portion of a mass of cotton fiber which is essentially foreign matter. **D 7139, D13**

nonloadbearing tile, *n*—tile for use in masonry constructions carrying no superimposed loads. See **Specification C 56**. **C 43, C15**

nonmagnetic—a relative term describing a material which, for practical purposes, may be considered to have a relative permeability close to unity.

nonmagnetic

NOTE—Certain materials may be nonmagnetic only under limited conditions. A 340, A06

nonmetal, *n*—any material other than a metal, nonpolymeric alloy, or any composite in which the metallic component is not the most easily ignited component and for which the individual constituents cannot be evaluated independently, including (ceramics, such as glass, synthetic polymers, such as most rubbers, thermoplastics, and thermosets, and natural polymers, such as naturally occurring rubber, wood, and cloth.) **nonmetallic***adj.* G 126, G04

nonmetallic inclusions—particles of impurities (usually oxides, sulfides, silicates and such) that are held mechanically or are formed during solidification or by subsequent reaction within the solid metal (See **exogenous inclusions**). E 7, E04

nonmetallic reinforcing mesh, *n*—a fiberglass component of the EIFS encapsulated in the base coat to strengthen the system.

NOTE—Nonmetallic reinforcing mesh is available in various weights to achieve different levels of impact resistance. E 2110, E06

non-Newtonian behavior, *n*—the property of a liquid in which its viscosity is not constant over a stated range of strain rates. D 907, D14

non-Newtonian flow, *n*—a non-Newtonian liquid is one whose viscosity depends on the rate of shear. Some will not flow until the force applied is greater than a definite value called the yield point. D 4175, D02

non-Newtonian oil or fluid, *n*—an oil or fluid that at a given temperature exhibits a viscosity that varies with changing shear stress or shear rate. D 4175, D02

non-Newtonian viscosity—see **viscosity, non-Newtonian**.

E 1142, E37

nonoperational mode—the condition that exists when a solar collector has been filled, purged of heat transfer fluid (if a liquid), and capped (but not sealed) to prevent contamination by foreign substances prior to exposure. E 772, E44

nonoriented electrical steel—a flat-rolled electrical steel which has approximately the same magnetic properties in all directions. A 340, A06

nonparametric, *adj*—a term referring to a statistical technique that does not assume the nature of the underlying frequency distribution is known. D 123, F03

nonplastic ceramics—nonclay ceramic materials that when mixed with water do not exhibit the rheological property-plasticity. C 242, C21

non-point sources, *n*—diffuse pollution sources (that is, without a single point of origin or not introduced into a receiving stream from a specific outlet). E 2114, E06

non-pressure pipe—pipe designed for gravity-conveyed medium which must resist only intermittent static pressures and does not have a pressure rating. F 412, F17

nonprobability sample, *n*—a sample of which the sampling units have not been selected in a manner that satisfies the minimum requirements for probability sampling. D 121, D05

nonreactive, *adj*—a condition which will not produce a chemical transformation or change. E 344, E20

non-read, *n*—the failure of a bar code scanner to recognize or decode a bar code symbol after a scanning attempt. Such a non-read may be caused by bar code symbol defects, scanner defects, or operator error. F 1294, F05

nonread ink—See **reflective ink**.

F 149, F05

nonreducing end groups—those terminal glucose units of cellulose or its derivatives which contain a free hydroxyl in the 4-position and do not reduce Fehling's solution or similar reagents. D 1695, D01

non-reference oil, *n*—any oil other than a reference oil; such as a research formulation, commercial oil, or candidate oil. D 4175, D02

nonreflective ink—See **scan ink**.

F 149, F05

nonreinforced pipe—concrete pipe designed without reinforcement. C 822, C13

nonrelevant indication, *n*—an NDT indication that is caused by a condition or type of discontinuity that is not rejectable. False indications are non-relevant. E 1316, E07

non-renewable resource, *n*—resource that exists in a fixed amount that cannot be replenished on a human time scale. E 2114, E06

nonresonant forced and vibration technique, *n*—a technique for performing dynamic mechanical measurements, in which the sample is oscillated mechanically at a fixed frequency. D 4092, D20

nonrigid plastic, *n*—for purposes of general classification, a plastic that has a modulus of elasticity either in flexure or in tension of not over 70 MPa (10 000 psi) at 23°C and 50 % relative humidity when tested in accordance with Test Methods D 790, Test Method D 747, Test Method D 638, or Test Methods D 882. D 883, D20

non-sample contacting equipment—related equipment associated with the sampling effort, but that does not directly contact the sample (for example, augers, drilling rods, excavations machinery). D 653, D18

nonscan ink—See **reflective ink**.

F 149, F05

nonscreen-type film (direct-type film)—X-ray film designed for use with or without metal screens, but not intended for use with salt screens. E 1316, E07

nonselective radiator, *n*—thermal radiator whose spectral emissivity is independent of wavelength over the range considered. E 349, E21

nonselective surface—a surface for which the spectral optical properties reflectance, absorptance, transmittance, and emittance are essentially independent of wavelength over a particular wavelength range.

NOTE—For solar absorbers, the absorption of solar energy is largely confined to the wavelength range from 0.3 to 3.0 μm , but there is significant flux emitted at wavelengths out to about 30 μm . E 772, E44

nonselectivity reflecting white surface—a surface that exhibits equal, diffuse and high reflectance at all wavelengths in the visible region [380 to 700 nm.] (physical definition). D 459, D12

nonseparable zipper, *n*—a zipper having two stringers that are permanently attached to each other at either or both ends. (Compare **separable zipper**.) D 123, D13

nonseparable zipper, *n*—a zipper having two stringers that are permanently attached to each other at one or both ends. (Compare **separable zipper**.) D 2050, D13

non-soap thickener (synthetic thickener, inorganic thickener, organic thickener), *n*—*in lubricatinggrease*, any of several specially treated or synthetic materials, excepting metallic soaps, that can be thermally or mechanically dispersed in liquid lubricants to form the lubricating grease structure. D 4175, D02

nonsorted circle—a form of patterned ground that is equi-dimensional in several directions with a dominantly circular outline which lacks a border of stones. D 7099, D18

nonsorted net—a type of patterned ground with cells that are equi-dimensional in several directions, but neither circular nor polygonal, and lacking borders of stones. D 7099, D18

nonsorted polygon—a type of patterned ground that is equi-dimensional in several directions, with a dominant polygonal outline, and lacking a border of stones. D 7099, D18

nonsorted step—a type of patterned ground with a step-like form and a downslope border of vegetation embanking an area of relatively bare ground upslope. D 7099, D18

nonsorted stripe—a type of patterned ground with a striped and nonsorted appearance, which is due to parallel strips of vegetation-covered ground and intervening strips of relatively bare ground, and orientated down the steepest available slope. D 7099, D18

non-spiked sample—a sample, devoid of analyte, that is targeted for addition of analyte but is not fortified with all target analytes prior to sample preparation. E 631, E06

non-spiked sample—a portion of a homogenized sample that is targeted for addition of analyte but that is not fortified (spiked) with all the lead before sample preparation. Analysis results for

this sample are used to correct for background levels in soil that are used for the spiked and spiked duplicate samples. **E 631, E06**

non-spiked sample—a blank wipe sample that was targeted for addition of analyte but was not fortified with all the target analysis before sample preparation. **E 631, E06**

non-spiked sample—a portion of a homogenized sample that was targeted for the addition of analyte but is not fortified with all the target analytes before sample preparation. **E 1605, E06**

non-standard test, n—a test that is not conducted in conformance with the requirements in the standard test method; such as running on an uncalibrated test stand, using different test equipment, applying different equipment assembly procedures, or using modified operating conditions. **D 4175, D02**

non-standard virgin material—a plastic resin or compound in the form of powder or pellets which does not meet the specification requirements for which it was manufactured, and has not been subjected to use or processing other than that required for its initial manufacture. **F 412, F17**

non-sulfur vulcanizing system, n—a vulcanizing system not requiring free or donated sulfur. **D 1566, D11**

non-tactile switch—a switch assembly that has a tactile ratio equal to zero. **F 2112, F01**

nonvitreous (nonvitrified)—that degree of vitrification evidenced by relatively high water absorption. **C 242, C21**

non-volatile—term used to denote the calculated chemical basis of a material in which the volatile fraction of that material is removed, relative to a specific temperature. For example, in lime and limestone, the loss on ignition is considered to be the volatile fraction. **C 51, C07**

nonvolatile content, n—the portion of a coating that does not evaporate during drying or curing under specified conditions, comprising the binder and, if present, the pigment. (The percent volatile content is obtained by subtracting the nonvolatile content from 100.) **D 16, D01**

nonvolatile content, n—the portion of a material that remains after volatile matter has been evaporated under specified ambient or accelerated conditions. (See **solids content**.) **D 907, D14**

nonvolatile extractables—for purposes of the ASTM tests for volatile extractables and nonvolatile extractables, nonvolatiles shall be defined as those compounds that give more than 50 % recovery in studies using the applicable nonvolatile extractables method. **F 17, F02**

nonvolatile extractables—those chemical species which are released from microwave food packaging under simulated use conditions and are detected using an applicable nonvolatile extractables method. **F 1479, F02**

nonvolatile ingredient—component of an aerosol formulation with a vapor pressure less than atmospheric pressure (14.7 psia (101 kPa)) at 105 °F (40.6 °C). **D 3064, D10**

nonvolatile matter, n—in insulating varnish, that portion of a varnish which is not volatilized when exposed to specified conditions. **D 1711, D09**

nonvolatile matter—the oily, gummy, or resinous residue remaining after evaporating volatile hydrocarbon materials. **D 4790, D16**

nonvolatile organic chemical—See **organic chemical**. **D 1356, D22**

nonvolatile residue (NVR), n—molecular or particulate matter remaining following the filtration and controlled evaporation of a liquid containing contaminants. **G 126, G04**

nonvolatiles—materials remaining after the loss of volatile components. **D 2825, D21**

nonvolatile vehicle, n—the liquid portion of a paint excepting its volatile thinner and water. **D 16, D01**

nonwaterfowl feathers, n—feathers derived from chickens, turkeys, or other landfowl. **D 123, D13**

nonwoven blanket, n—a blanket produced by bonding or interlocking of fibers, or both, accomplished by mechanical, chemical, thermal, or solvent means, or combination thereof. **D 123, D13**

nonwoven blanket, n—a blanket produced by bonding or interlocking of fibers, or both, accomplished by mechanical, chemical, thermal, or solvent means, or combination thereof. **D 7023, D13**

nonwoven fabric, n—a textile structure produced by bonding or interlocking of fibers, or both, accomplished by mechanical, chemical, thermal, or solvent means and combinations thereof. **D 123, D13**

nonwoven fabric—See *nonwoven fabric* under **fabric**. **D 3878, D30**

nonwoven fabric, n—a textile structure produced by bonding or interlocking of fibers, or both, accomplished by mechanical, chemical, thermal, or solvent means and combinations thereof. **D 5684, D13**

no-observed-effect concentration (NOEC)—in a toxicity test, the tested concentration of one or more chemicals immediately below the lowest tested concentration that resulted in a statistically significant change in a particular toxicological variable compared to that value in the control (s). **E 943, E47**

normal—an imaginary line forming a right angle with the tangent to a curved surface at a particular point. It is used as a basis for determining angles of incidence, reflection, and refraction. **E 175, E41**

normal, ⊥—directional in a direction normal (perpendicular) to a surface. **E 772, E44**

normal consistency, n—a degree of plasticity of a hydraulic-cement paste that is appropriate for testing as measured by a stipulated method. **C 219, C01**

normal cure—method of setting or hardening asbestos-cement products wherein the hydraulic cement is allowed to hydrate at atmospheric conditions of pressure, preferably under conditions to inhibit water loss. **D 2946, C17**

normal direction, n—for *geotextiles*, the direction perpendicular to the plane of a geotextile. **D 4439, D35**

normal direction—that direction which is perpendicular to the plane of working in a worked material. (See **cross direction**). **E 7, E04**

normal distribution, n—the distribution that has the probability function:

$$f(x) = (1/\sigma)(2\pi)^{-1/2} \exp[-(x-3)^2/2\sigma^2]$$

$$f \sim x! 5 \sim 1/s! \sim 2p! \quad \exp @ 2 \sim x 2\mu! / 2s \#$$

where:

x = random variate,

μ = mean of the distribution, and

s = standard deviation of the distribution.

(Syn. Gaussian distribution, law of error) **D 123, D13**

normal distribution, n—the distribution that has the probability function:

$$f(\chi) = (1/\sigma) (2\pi)^{-1/2} \exp[-(\chi-\mu)^2/2\sigma^2]$$

where:

χ = a random variate,

μ = the mean distribution, and

σ = the standard deviation of the distribution.

(Synonym—*Gaussian distribution, law of error*.)

D 4175, D02

normal distribution—drop size distribution described by the following equation:

$$f_n(D) = \{1/[\sigma\sqrt{(2\pi)}]\} \int_{-\infty}^D \exp\{-[x - \bar{D}, o]^2/(2\sigma^2)\} dx$$

where:

$f_n(D)$ = the (D) fraction of drops of diameter less than D .

E 1620, E29

normal force—that component of the force between contacting bodies perpendicular to their interface. **B 542, B02**

normal force—a force directed normal to the surface element across which it acts. (ISRM) **D 653, D18**

normal force [F], n

normal force [F], n —of a tire, the component of a tire force vector in the Z' direction. **F 538, F09**

normal human temperature—the conventionally accepted average body temperature in healthy human beings (37 °C or 98.6 °F). **E 344, E20**

normal impact velocity, n —See **impact velocity**. **G 40, G02**

normal incidence (see also **straight beam**)—a condition in which the axis of the ultrasonic beam is perpendicular to the entry surface of the part under examination. **E 1316, E07**

normal incidence sound absorption coefficient, α_n ; [dimensionless] — of a surface, at a specified frequency, the fraction of the perpendicularly incident sound power absorbed or otherwise not reflected. **C 634, E33**

normal inspection—inspection that is used when there is no statistically significant evidence that the quality of the product being submitted is better or poorer than the specified quality level. **D 1517, D31**

normalization—converting actual data to a set of reference conditions in order to “standardize” operation to common base. **D 6161, D19**

normalization, n —in *spectrometric analysis*, (1) the process of adjusting instrument output to conform to an established condition using one or more homogeneous specimens or reference materials; (2) the adjustment of the analysis total to 100 %, or some other total. **E 135, E01**

normalize—by calculation, to revert a given thickness (actual) of cured composite to a standard thickness (that is, a specific per ply thickness standard) to yield equivalent fiber stress (based upon the standard). **E 631, E06**

normalize—by calculation, to revert a given thickness (actual) of cured composite to a standard thickness (that is, a specific per ply thickness standard) to yield equivalent fiber stress (based upon the standard). **E 1749, E06**

normalized crack size, a/W —the ratio of crack size, a , to specimen width, W . **E 1823, E08**

normalized erosion resistance, N_e , n —the volume loss rate of a test material, divided into the volume loss rate of a specified reference material similarly tested and similarly analyzed. “Similarly analyzed” means that the two erosion rates must be determined for corresponding portions of the erosion rate-time pattern; for instance, the maximum erosion rate or the terminal erosion rate. **G 40, G02**

normalized incubation resistance, N_o , n —in *cavitation and liquid impingement erosion*, the incubation period of a test material, divided by the incubation period of a specified reference material similarly tested and similarly analyzed. (See also **normalized erosion resistance**.) **G 40, G02**

normalized inflation pressure, n —measured pressure of a tire adjusted, according to the ideal gas law, to the nominal test temperature and one atmosphere barometric pressure. **F 538, F09**

normalized K -gradient, $C = (1/K) \cdot dK/da [L^{-1}]$ —the fractional rate of change of K with increasing crack size. **E 1823, E08**

normalized noise isolation class, NNIC—a single-number rating calculated in accordance with Classification E 413 using measured values of normalized noise reduction. (See **normalized noise reduction**.) **C 634, E33**

normalized noise reduction, NNR—between two rooms, in a specified frequency band, the value that the noise reduction in a given field test would have if the reverberation time in the receiving room were 0.5 s. NNR is calculated as follows:

$$NNR = NR + 10 \log (T/0.5)$$

where:

NR = noise reduction, dB and

T = reverberation time in receiving room, s.

C 634, E33

normalizing, n —heating a steel object to a suitable temperature

above the **transformation range** and then cooling it in air to a temperature substantially below the **transformation range**.

A 941, A01

normalizing—variation of full annealing in which steel is heated above the upper critical temperature and is then air cooled in air, rather than in a furnace. Normalizing relieves the internal stresses caused by previous working, and while it produces sufficient softness and ductility for many purposes, it leaves the steel harder and with a higher tensile strength than full annealing. To remove cooling stresses, normalizing is often followed by tempering.

F 1789, F16

normally consolidated soil deposit—a soil deposit that has never been subjected to an effective pressure greater than the existing overburden pressure. **D 653, D18**

normal mode—of a room, one of the possible ways in which the air in a room, considered as an elastic body, will vibrate naturally when subjected to an acoustical disturbance. With each normal mode is associated a resonance frequency and, in general, a group of wave propagation directions comprising a closed path.

C 634, E33

normal operating conditions—the usual range of physical operating conditions (flow, pressure, temperature, etc.) for component or system. **E 1705, E48**

normal operating conditions—the usual range of physical conditions for which a facility was designed to operate. **E 1705, E48**

normal permeability—the ratio of the induction (when cyclically made to change symmetrically about zero) to the corresponding change in magnetizing force. **E 1316, E07**

normal segregation—a concentration of alloying components or constituents that have lower melting points in those regions which are the last to solidify. **E 7, E04**

normal stress—see **stress**. **D 653, D18**

normal stress, (FL^{-2}) , n —the component of applied stress that is perpendicular to the surface on which the force acts. **D 4439, D35**

normal stress [FL^{-2}], n —the stress component perpendicular to a plane on which the forces act. **E 6, E28**

normal stress, s —the stress component perpendicular to a plane on which the forces act. (E28) **D 4092, D20**

normal temperature, n —as applied to laboratory observations of the physical characteristics of bituminous materials, 25°C (77°F). **D 8, D04**

normal weather conditions—the range of environmental conditions in a local climatic region that occurred during the past 30 years. This excludes extreme conditions that have occurred only once during that period. **E 1705, E48**

normal weight concrete masonry unit—unit whose oven-dry density is 125 lb/ft³ (2000 kg/m³) or greater. **C 1209, C15**

normative, n —information that is part of the standard. **F 1294, F05**

normative terminology, n —a terminology that is standardized or authoritatively prescribed. **E 1992, E02**

nose, n —the lower visible edge of tile as applied on the roof. **C 43, C15**

nose—{archaic} the working end or refining chamber of a tank. **C 162, C14**

nose—guide-body area where fastener is driven from tool. **F 592, F16**

nose extension—See **lip**. **F 592, F16**

nose lugs, n —projections on the underside of the nose of each tile contoured to fit into the main water courses of the tile immediately below, inhibiting the entry of wind-driven rain. **C 43, C15**

no-slump grout—grout with a slump of 1 in. (25 mm) or less according to the standard slump test (Test Method C 143). See also **slump** and **slump test**. **D 653, D18**

notch, n —a shape used to mark a location. **D 6963, D13**

notch, n —a groove smaller in both width and length than a lateral groove that contains one closed end. **F 538, F09**

notched head—nail head with semi-circular rim and “V”-notch, having rounded “V” corners, wide notch part at rim, and narrow

notch part at nail-shank projection, formed during heading, to allow tight collating of nails in strip form. **F 592, F16**

notched tensile strength—the maximum nominal (net section) stress that a notched tensile specimen is capable of sustaining. **F 2078, F07**

notch length, a_n (L)—the distance from a reference plane to the front of the machined notch. The reference plane depends on the specimen form, and normally is taken to be either the boundary, or a plane containing either the forceline or the centerline of a specimen or plate. The reference plane is defined prior to specimen deformation. **E 1823, E08**

notch tensile strength (NTS) [FL⁻²]—the maximum nominal (net-section) stress that a notched tensile specimen is capable of sustaining. **E 1823, E08**

not ready signal, *n*—a signal from a device in a system indicating that it will not be able to receive or send the next data segment. **F 1457, F05**

novolac (or novolak), *n*—a phenolic-aldehyde resin which, unless a source of methylene groups is added, remains permanently thermoplastic. (See also **resinoid** and **thermoplastic**.) **D 883, D20**

novolak, *n*—a phenolic resin containing less than a 1 : 1 ratio of formaldehyde to phenol so that normally it remains thermoplastic until heated with an appropriate amount of a compound (for example, formaldehyde or hexamethylenetetramine) capable of giving additional linkages, thereby producing an infusible material. **D 907, D14**

nozzle, *n*—a part of a vacuum cleaner system that is applied to a surface to be cleaned and may incorporate an agitation device to assist dirt removal. **F 395, F11**

nozzle refractory, *n*—a refractory shape containing an orifice for the purpose of transmitting molten metal from a refractory-lined container. **C 71, C08**

***n*-propylbenzene**—1-phenyl propane (C₉H₁₂) mol weight 120.19; used as a reference standard for identifying and determining C₉ aromatics; melting point, -99.2°C; boiling point, 159.2°C. **D 4790, D16**

NSF (International)—National Sanitation Foundation (international), a U.S.-based organization that provides testing procedures to certify that equipment meets certain minimum standards to produce potable water. **D 6161, D19**

NTU—see **nephelometer**. **D 6161, D19**

nuance, *n*—a two-dimensional attribute that distinguishes among colors having the same hue. **E 284, E12**

nub head—head with protruding knob. (See **washer head**.) **F 547, F16**

nubuck—type of leather where the grain layer is very lightly buffed (snuffed), to create a very fine nap and still called top grain leather. **D 1517, D31**

nuclear activity—the number of disintegrations occurring in a given quantity of material per unit of time. "Curie" is the unit of measurement. One curie is equivalent to 3.7×10^{10} disintegrations per second. **E 1316, E07**

nuclear magnetic resonance (NMR) spectroscopy—that form of spectroscopy concerned with radio-frequency-induced transitions between magnetic energy levels of atomic nuclei. **E 131, E13**

nucleation—the preplating step in which a catalytic material, often a palladium or gold compound, is absorbed on a surface to act as sites for initial stages of deposition. **B 374, B08**

nucleation, *n*—the formation of crystal nuclei in liquid in the supercooled state. **E 344, E20**

nucleocapsid—the outer protein coat or shell (capsid) of a virus plus its inner core of nucleic acid and proteins. **E 1705, E48**

nucleide, *n*—an atomic species characterized by the constitution of its nucleus, specifically by the number of protons and neutrons. **D 1129, D19**

nuclide—a species of an atom characterized by its mass number, atomic number, and its nuclear energy state. **E 170, E10**

Nukiyama-Tanasawa distribution—drop size distribution described by the following equation:

$$dN/dD = a \times D^m \exp(-b \times D^n)$$

where:

N = the number of drops of diameter smaller than D , and a , m , b , and n are parameters (usually $m = 2$ and $n \neq 1$).

E 1620, E29

Nukiyama-Tanasawa nozzle—an internal mixing pneumatic atomizer consisting of two concentric tubes. Liquid emerging from the inner tube is atomized by air flowing through the annulus between the tubes. **E 1620, E29**

NUL—see **null signal**. **F 1457, F05**

null signal, *n*—an electronic signal with no data. **F 1457, F05**

number density—the number of particles contained in a specified volume of space at a given instant. **E 1620, E29**

number of pieces of trash, *n*—*in testing cotton with the Trash Meter*, a number correlated with the total number of pieces of trash on the surface of the sample of cotton over the viewing window. **D 123, D13**

number of pieces of trash, *n*—*in testing cotton with the Trash Meter*, a number correlated with the total number of pieces of trash on the surface of the sample of cotton over the viewing window. **D 7139, D13**

number system character, *n*—the first, or left-hand, digit in a UPC number that identifies a particular numbering system. Similar to AI or DI numbers, but used specifically for retail applications according to UCC rules. **F 1294, F05**

numeral head—head with raised or depressed, identifying number or numbers on top surface of head. **F 547, F16**

numeric—a machine vocabulary that includes only the primary numbers as contrasted to **alphanumeric**, which includes both letters and numerals. **F 149, F05**

numerical aperture—the product of the lowest index of refraction in the object space multiplied by the sine of half the angular aperture of the objective. **E 175, E41**

numerical aperture (NA)—the sine of half the angular aperture of an objective lens multiplied by the refractive index of the medium between the lens and the sample. **E 7, E04**

numerical aperture (NA), *n*—the sine of one half of the vertex angle of the largest cone of meridional rays that can enter or leave an optical system or element, multiplied by the refractive index of the medium in which the cone is located. **E 131, E13**

numerical value of a quantity—magnitude of a quantity expressed by the product of a number and the unit in which the quantity is measured.

"O"—See **windows and doors**. **E 631, E06**

nut—internally threaded product intended for use on external or male screw threads such as a bolt or a stud for the purpose of tightening or assembling two or more components. **F 1789, F16**

nutrient—a substance that supports organismal growth. **F 1600, F20**

nutrient broth, *n*—a liquid medium. **F 1494, F23**

nu-value—see synonymous term **Abbé value**. **C 162, C14**

N (Wide to Narrow Ratio), *n*—*in symbologies with two element widths*, the wide to narrow ratio of elements is calculated by summing the average wide bar width and average wide space width and dividing the sum by 2 times Z . Intercharacter gaps, if applicable, are not included.

$$N = (\text{average wide bar} + \text{average wide space}) (2 * Z)$$

F 1294, F05

******nylon**—a manufactured fiber in which the fiber-forming substance is a long-chain synthetic polyamide in which less than 85 % of the amide (ICzCICzNHICz) linkages are

attached directly to two aromatic rings. **D 123, D13**

nylon plastic, *n*—a plastic based on resins composed principally of a

nylon plastic, n

long-chain synthetic polymeric amide which has recurring amide groups as an integral part of the main polymer chain. **F 1251, F04**

nylon plastics, n—plastics based on resins composed principally of a long-chain synthetic polymeric amide which has recurring amide groups as an integral part of the main polymer chain. **D 883, D20**

nylon plastics—plastics based on resins composed principally of a long-chain synthetic polymer amide which has recurring amide groups as an integral part of the main polymer chain. (D20)

F 412, F17

Nyquist frequency—modulation frequency or wavenumber above which aliasing occurs. **E 131, E13**

nytril—a manufactured fiber containing at least 85 % of a long-chain polymer of vinylidene dinitrile ($(\text{CzCH}_2\text{CzC}(\text{CN}_2)\text{Cz})$) where the vinylidene dinitrile content is no less than every other unit in the polymer chain.

***olefin**—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85 % by weight of ethylene, propylene, or other olefin units, except amorphous (noncrystalline) polyolefins qualifying under **rubber, 1**.

*******PBI**—a manufactured fiber in which the fiber-forming substance is a long chain aromatic polymer having reoccurring imidazole groups as an integral part of the polymer chain.

*****polyester**—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85 % by weight of an ester of a substituted aromatic carboxylic acid, including but not restricted to substituted terephthalate units,

and para substituted hydroxy-benzoate units,

D 123, D13

object beam—the portion of laser radiation which illuminates the test object surface, is scattered, and carries object information to the recording medium. **E 1316, E07**

object beam angle—the angle between a line from the center of the object to the center of the recording medium and the normal to the center of the recording medium. **E 1316, E07**

object evaporation—See **shadowing**. **E 7, E04**

object-film distance—the distance between the surface of the source side object and the plane of the recording medium.

NOTE—In the case where the recording medium is placed directly in contact with the object being examined, the distance is equal to the thickness of the object. **E 1316, E07**

objective—the primary magnifying system of a microscope. A system, generally of lenses, less frequently of mirrors, forming a real, inverted, and magnified image of the object. **E 175, E41**

objective, n—the first part of a performance statement, consisting of a qualitative statement of the performance to be provided by the built element being addressed in order to satisfy a particular user need. **E 2151, E06**

objective aperture—See **aperture**. **E 7, E04**

objective evidence, n—data supporting the existence or verity of something. **E 1605, E06**

objective, fluorite—an objective using the mineral fluorite in its construction. It is usually intermediate between achromatic and apochromatic in correction, but may be more highly corrected. **E 175, E41**

object mode, n—color seen as ascribed to an object. **E 284, E12**

object plane resolution—the dimension in the object plane that corresponds to the product of a system's instantaneous field-of-view and a specified distance from the system to the object. **E 1316, E07**

object scattered neutrons—neutrons scattered by the test objects that contribute to the film exposure. **E 1316, E07**

objects of cultural heritage, n—any items taken from nature, or modified or created by humankind that are significant for cultural interpretation and scientific research. **D 123, D13**

objects of cultural heritage, n—any man-made or modified natural article that reflects the beliefs, social forms, and material traits of racial, social, religious, or other specific groups. **D 5038, D13**

objects of natural heritage, n—any items taken from nature, modified or unmodified, that are significant for the interpretation of the natural environment, or that are significant for cultural and scientific research. **D 123, D13**

objects of natural heritage, n—any items taken from nature, modified or unmodified, that are significant for the interpretation of the natural environment. **D 5038, D13**

obligate aerobe, n—microorganism with an absolute requirement for atmospheric oxygen in order to function. **D 4175, D02**

obligate anaerobe, n—microorganism that cannot function when atmospheric oxygen is present. **D 4175, D02**

oblique illumination—nonspecular illumination under which the light impinges at an oblique angle to the optical axis. (See **conical illumination**; **diffuse illumination**; **darkfield illumination**.) **E 7, E04**

oblique illumination—see **illumination, oblique**. **E 175, E41**

observation, n—the process of determining the presence or absence of attributes or making measurements of a variable. **D 123, D13**

observation, n—a result of the process of determining the presence or absence of an attribute or making a measurement of a variable. (Compare **measurement value**, **determination value**, and **test result**) **D 123, D13**

observation, n—the process of obtaining information regarding the presence or absence of an attribute of a test specimen, or of making a reading on a characteristic or dimension of a test specimen. **E 456, E11**

observation, n—a judgement that is based on what one sees while

conducting lead hazard activities and that is substantiated by **objective evidence**. **E 1605, E06**

observation angle, n—angle between the axes of the incident beam and the observed (reflected) beam, (in **retroreflection**, α , angle between the illumination axis and the observation axis). **E 284, E12**

observation well—typically, a small diameter well used to measure changes in hydraulic head, usually in response to a nearby pumping well. **D 653, D18**

observed dropping point, n—the value noted on the thermometer monitoring the internal temperature of the grease test cup when the first drop of material falls from the test cup and reaches the bottom of the test tube. **D 4175, D02**

observed fluorescence lifetime, τ —the time required for the fluorescence intensity to decay to 1/e of its initial value after the termination of excitation. **E 131, E13**

observed value, n—the value obtained by making an observation. **E 456, E11**

observer, n—(1) an assessor in a visual sensory test. (See also **assessor**.) (2) a person who is watching an individual or group to collect information about behavior, responses to products, test protocols, or processes. **E 253, E18**

observer metamerism, n—the property of specimens having different spectral characteristics and having the same color when viewed by one observer, but different colors when viewed by a different observer under the same conditions. **E 284, E12**

obsidian—a highly siliceous natural glass. **C 162, C14**

obvious ignition, n—pronounced continuous and self-sustaining combustion of the test system accompanied by rapid generation of heat and smoke. It is a matter of operator judgment based upon experience in this type of operation. **E 176, E05**

occluded cell—an electrochemical cell created at a localized site on a metal surface which has been partially obstructed from the bulk environment. **G 15, G01**

occluded vapor phase—condition of contaminant residence in which volatilized contaminants occur in porosity that is ineffective to free and open gaseous flow and exchange, such porosity generally being microporosity; frequently termed dead-end pore space. **D 653, D18**

occlusion—the trapping of undissolved gas in a solid during solidification. **E 1316, E07**

occlusion, n—the physical process of covering a chemical that has been applied to or spilled on the skin, thereby disallowing its evaporation and generally increasing its absorption through the skin. **F 1494, F23**

occupancy instrument (OI) (accord d'occupation(AO))—agreement between a prospective or current occupant and the manager or owner of a facility concerning occupancy in that facility. **E 631, E06**

occupancy instrument (OI) (accord d'occupation(AO))—agreement between a prospective or current occupant and the manager or owner of a facility concerning occupancy in that facility. **E 1480, E06**

occupancy, n (occupation)—discouraged term, to be used only in connection with building codes, where the term refers to the number of occupants in a space, or other specific classification of use. **E 631, E06**

occupancy, n (occupation)—discouraged term, to be used only in connection with building codes, where the term refers to the number of occupants in a space, or other specific classification of use. **E 1480, E06**

occupant, n—of a facility, a group, department, agency or corporation, or other organization, or a part thereof, or an individual or individuals thereof, that is or will be occupying space in a particular facility.

occupiable space—See **building space**.

office—See **building space**.

occupant, n

office, n—a place, such as an open workspace, room, suite, or building, in which business, clerical, or professional activities are conducted.

ogee—See **railing systems**. E 631, E06

occupant (occupant)—(1) Department, agency, corporation, or other organization, or a part thereof, that is or will be occupying space in a particular facility. (2) Individual or family living in a housing dwelling.

building occupant (occupantd'un immeuble)—one who has certain rights to, possession of, or control over the premises occupied, such as **tenant** or owner.

overall serviceability score—See **serviceability score**. E 631, E06

occupant (occupant)—(1) Department, agency, corporation, or other organization, or a part thereof, that is or will be occupying space in a particular facility. (2) Individual or family living in a housing dwelling.

building occupant (occupantd'un immeuble)—one who has certain rights to, possession of, or control over the premises occupied, such as **tenant** or owner. E 1480, E06

occupants—those tenants, subtenants, or other persons or entities using the property or a portion of the property. D 5681, D34

occupational exposure limit to asbestos—the maximum time weighted average (TWA) number of asbestiform fibers to which nearly all workers may be repeatedly subjected over a normal day or a 40-h week and the peak number of asbestiform fibers to which an individual may be subjected during 15 min or less, without known adverse health effects. Lifetime exposure is based on 99 % probability of protecting all workers from acquiring clinically significant disease for a working life of 50 years. E 1542, E34

occupational exposure limit to carbon disulfide—the maximum time weighted average (TWA) of carbon disulfide to which nearly all workers may be repeatedly subjected over a normal 8-h day or a 40-h week, the ceiling concentration of carbon disulfide or the maximum peak above ceiling concentration of carbon disulfide that cannot be exceeded, without known adverse health effects. Lifetime exposure is undefined. E 1542, E34

occupational exposure limit to ozone—the maximum time weighted average (TWA) of ozone to which nearly all workers may be repeatedly subjected over a normal 8-h day or a 40-h week or the ceiling limit of ozone that cannot be exceeded, without known adverse health effects. Lifetime exposure is undefined. E 1542, E34

occupational exposure limit to quartz dust—the maximum time weighted average (TWA) concentration of respirable quartz particles to which nearly all workers may be repeatedly subjected over a normal 10-h day or a 40-h week without known adverse health effects. Ceiling and lifetime exposures are undefined. E 1542, E34

occupational exposure limit to synthetic amorphous silica—the maximum time weighted average (TWA) concentration of respirable synthetic amorphous silica to which nearly all workers may be repeatedly subjected over a normal 8-h day or a 40-h week without known adverse health effects. Ceiling and lifetime exposures are undefined. E 1542, E34

occupational exposure limit to water-insoluble chromates—the maximum time weighted average (TWA) concentration of water-insoluble chromates as chromium to which nearly all workers may be repeatedly subjected over a normal 8-h day or a 40-h week without known adverse health effects. Ceiling and lifetime exposures are undefined. E 1542, E34

occupational exposure limit XXXXX, "generic"—the maximum time weighted average (TWA) concentration to which nearly all workers may be repeatedly subjected for a normal 8- to 10-h workday, 40-h workweek without known adverse health effects. E 1542, E34

occupiable space—space normally used by people. E 631, E06

occurrences spectrum—*in fatigue loading*, representation of spectrum loading contents by the number of times a particular loading

parameter (peak, range, and so forth) occurs within each specified loading interval between lower and upper bound values.

E 1823, E08

OCR—See **optical characterrecognition**. F 149, F05

OCR-A—an abbreviation commonly applied to the character set contained in ANSI X3.17-81. F 149, F05

OCR-B—an abbreviation commonly applied to the character set contained in ANSI X3.49-75 (R-1982). F 149, F05

octane number, n—*for spark ignition engine fuel*, any one of several numerical indicators of resistance to knock obtained by comparison with reference fuels in standardized engine or vehicle tests.

D 4175, D02

octave band, n—a band of sound frequencies for which the highest frequency in the range is (within 2%) twice the lowest frequency. The position of the band is identified by the rounded geometric mean of the highest frequency and the lowest frequency of the band. The nominal mid-band frequencies of "preferred" octave bands as defined in ANSI S1.6 fall in the series 16, 31.5, 63, 125, 250, 500, 1000 Hz etc. C 634, E33

octave band sound pressure level, OBSPL— L_{p1}/f where f indicates the nominal center frequency of a specific band if applicable, [nd], (dB), n —sound pressure level for sound filtered using an octave-band filter meeting the requirements of ANSI S1.11. C 634, E33

ocular—see **eyepiece**. E 175, E41

ocular micrometer—a glass disk, of a diameter which permits introducing it into standard oculars, upon one surface of which a fine scale is engraved accurately. E 7, E04

OD—the outside dimension of a **package** or part, or outside diameter of a cylindrical container or wire or rod. D 996, D10

odor, n—that property of a substance which affects the sense of smell; any smell; scent; perfume.

odor threshold, n—the concentration of an odorous compound at which the physiological effect elicits a response 50 % of the time. D 1356, D22

odor, n—*of a wax*, the numerical rating corresponding to the odor scale description that best fits the sample being tested.

D 4175, D02

odor, n—See **aroma**. E 253, E18

odorant, n—odorous substance. D 1356, D22

odorant, n—a substance that stimulates the olfactory receptors. E 253, E18

odor-intensity index, n—the number of times the concentration of the original sample is halved by addition of odor-free water to obtain the least definitely perceptible odor. D 1129, D19

odor threshold—See **odor**. D 1356, D22

odor threshold number, n—the greatest dilution of the sample with odor-free water to yield the least definitely perceptible odor.

D 1129, D19

OEM—original equipment manufacturer. D 6161, D19

OEM coatings, n—original equipment manufacturers coatings, which include automotive, marine, furniture, appliance, as well as many other miscellaneous consumer and industrial applications.

D 16, D01

oersted, Oe—the unit of magnetic field strength in the cgs-emu system of units. One oersted equals a magnetic field strength of 1 Gb/cm of flux path. One oersted equals $1000/4\pi$ or 79.58 ampere-turns per metre. See **magnetic field strength**. A 340, A06

offal—parts of hides not used for standard grades of leathers, the heads, shoulders, and bellies of heavy leather. D 1517, D31

off-axis laminate—a laminate whose principal axis is oriented at an angle theta other than 0 or 90° with respect to a reference direction, usually related to principal load or stress direction. D 3878, D30

off-axis response ($U/(U_r \cos \theta)$), n—the ratio of the indicated wind speed (U) at various angles of attack θ to the indicated wind speed at zero angle of attack (U_r) multiplied by the cosine of the angle of attack. D 1356, D22

off-diagonal element, n—*in bispectral photometry*, any element of a

- bispectral matrix for which irradiation and viewing wavelengths are not equal. E 284, E12
- offgas*, *v*—see **outgas**. E 2114, E06
- off grade**, *adj*—not meeting predetermined specifications. D 1968, D06
- offhand glass**—glass produced by the offhand process. C 162, C14
- offhand process**—the process of forming glassware by a craftsman working without the aid of molds. C 162, C14
- office**, *n*—a place, such as a room, suite, or building, in which business, clerical, or professional activities are conducted. E 631, E06
- office copies**, *n*—(also *quick copies*, *imaged copies*), reproductions made by direct or indirect electrostatic printing, ink jet printing, thermographic processing or similar processes, as contrasted with conventional printing, such as letterpress or offset. D 1968, D06
- office overhead**, *n*—in *construction design planning and estimating*, the non-permanent portion of construction cost that is attributable to the prime contractor's home office (overhead) cost of doing business. E 833, E06
- official test aerosol**, **OTA**—a standard insecticide dispenser and formulation prepared by the Chemical Specialties Manufacturers Association (CSMA) for use in aerosol test methods for flying insects. D 3064, D10
- off-line**—pertaining to the operation of a functional unit not under the direct control of the computer. F 149, F05
- off-line measurements**, *n*—measurement where the sample is removed, isolated from, and analyzed in an area remote from the manufacturing process. E 2363, E55
- off-line medical director**—a physician responsible for all aspects of an EMS system dealing with the provision of medical care (also known as System Medical Director). F 1177, F30
- off-line testing**—eddy current tests conducted on equipment that includes the test coil and means to propel individual tubes under test through the coil at appropriate speeds and conditions. E 1316, E07
- offset**—an imperfection resulting from mold parts not properly matched, that is, a finish or base offset from the body or neck. C 162, C14
- offset*—see **set-off**. F 335, F05
- offset**, *n*—unintentional transfer of ink (as from a freshly printed substrate). F 1857, F05
- off set barbs**, *n*—angling of the barb cluster from the center line of the tape in opposite directions. F 1379, F14
- offset hinge**—a swing gate hinge that permits the gate to swing 180° from the closed to the open position (see Specification F 900). F 552, F14
- offset modulus**, J_o , (FL^{-1}), Nm^{-1} , *n*—for *geosynthetics*, the ratio of the change in force per unit width to the change in elongation below an arbitrary offset point at which there is a proportional relationship between force and elongation, and above the inflection point on the force-elongation curve. D 4439, D35
- offset paper**, *n*—an uncoated or coated paper designed for use in offset lithography. D 1968, D06
- offset point*—See **side point**. F 547, F16
- off the road tire (OTR)**, *n*—tire designed primarily for use on unpaved roads or where no roads exist, built for ruggedness and traction rather than for speed. D 5681, D34
- ogee**, *n*—a molding with a profile having a double curve formed by a convex line turning into a concave line, resulting in an S-shape. E 631, E06
- ogee**, *n*—a molding with a profile having a double curve formed by a convex line turning into a concave line, resulting in an S-shape. E 1481, E06
- ohm**—unit of electric resistance equal to the resistance of a circuit in which a potential difference of one volt produces a current of one ampere. D 6161, D19
- oil**—See **petroleum**, **vegetable**, **paraffinic**, and so forth. E 1519, E35
- oil absorption number (OAN)**, *n*—the number of cubic centimetres of dibutyl phthalate (DBP) or paraffin oil absorbed by 100 g of carbon black under specified conditions. D 3053, D24
- oil absorption number of compressed sample (COAN)**, *n*—the number of cubic centimetres of dibutyl phthalate (DBP) or paraffin oil absorbed by 100 g of carbon black after being compressed four times in a compression cylinder at 165 MPa (24 000 psi) under specified conditions. D 3053, D24
- oil air filter**—a filter or series of filters placed in the air flow line from an air compressor to reduce the oil content of the air. D 653, D18
- oil canning**—a form of buckling; in *flat sandwich constructions*, a defect occasioned by excessive compressive loads and represented by waviness of the product. E 631, E06
- oil canning**—a form of buckling; in *flat sandwich constructions*, a defect occasioned by excessive compressive loads and represented by waviness of the product. E 1749, E06
- oil color**, *n*—an oil paint containing a high concentration of colored pigment, commonly used for tinting paint. D 16, D01
- oil content**, *n*—the measured amount of oil contained in an oil-impregnated object, for example, a self-lubricating bearing. B 243, B09
- oiled**, *adj*—describing a coating applied to metallic coated steel sheet alone or in addition to chemical treatment for further protection against the onset of storage corrosion; the oil coating is intended as a corrosion inhibitor only and not as a rolling or drawing lubricant. A 902, A05
- oil furnace process**, *n*—a process for producing furnace carbon blacks that uses oil as the source of hydrocarbons for decomposition by injection into a high-velocity stream of combustion gases. D 3053, D24
- oil-gas tar**, *n*—tar produced by cracking oil vapors at high temperatures in the manufacture of oil gas. D 8, D04
- oiling off**—coating the surface of leather with oil. D 1517, D31
- oil of (pine) tar**, *n*—certain heavier fractions of the volatile oil recovered by distilling pine-tar oil to convert it into pine tar. D 804, D01
- oil of turpentine**, *n*—the pharmaceutical name for spirits of turpentine that conforms to the requirements of the National Formulary. D 804, D01
- oil paint*—under **paint**, see *oil paint*. D 16, D01
- oil resistance**, *n*—of *insulating varnish*, a measure of the retention of properties after exposure to a specified oil under specified conditions of test. D 1711, D09
- oil resistance**, *n*—the ability of a substrate to resist oil present on human fingers. F 1857, F05
- oil separation**, *n*—the appearance of a liquid fraction from an otherwise homogeneous lubricating composition. D 4175, D02
- oil spillage**, *n*—a localized deterioration or softening of a bituminous pavement surface caused by the spilling of oil, fuel, or other solvents. E 867, E17
- oil spillage**, *n*—a localized deterioration or softening of the pavement surface caused by the spilling of oil, fuel, or other solvents. E 1778, E17
- oil tannage**—tannage with cod oil or other oxidizable oil, usually of marine origin. D 1517, D31
- oil-tempered**—heated above the critical temperature, quenched in oil, and tempered. F 547, F16
- oil trap**—a device used to remove oil from the compressed air discharged from an air compressor. D 653, D18
- oil varnish*—under **varnish**, see *oil varnish*. D 16, D01
- OL**—abbreviation for **open loop**. F 1457, F05
- old growth**—timber in or from a mature, naturally established forest. If the trees have grown during most of their lives in active competition for sunlight, the bole is usually straight and relatively free of limbs. D 9, D07
- olefin fiber**—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least

olefin fiber

85 % by weight of ethylene, propylene, or other olefin units, except amorphous (noncrystalline) polyolefins qualify under rubber. **D 123, D13**

olefin fiber—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85 % by weight of ethylene, propylene, or other olefin units, except amorphous (noncrystalline) polyolefins qualify under rubber. **D 4849, D13**

olefin plastic, n—a plastic based on polymers made by the polymerization of olefins or copolymerization of olefins with other monomers, the olefins being at least 50 mass %. **F 1251, F04**

olefin plastics—plastics based on polymers made by the polymerization of olefins or copolymerization of olefins with other monomers, the olefins being at least 50 mass %. **D 883, D20**

olefin plastics—plastics based on polymers made by the polymerization of olefins or copolymerization of olefins with other monomers, the olefins being at least 50 mass %. (D20) **F 412, F17**

oleoresin, n—pine gum, the nonaqueous secretion of resin acids dissolved in a terpene hydrocarbon oil that is produced or exuded from the intercellular resin ducts of a living tree, and is present, together with oxidation products, in the dead wood of weathered limbs and stumps. **D 804, D01**

oleoresin, n—a plant product containing chiefly essential oil and resin. **F 141, F06**

oleoresins—nonaqueous secretions of resin acids dissolved in terpenic hydrocarbons that are produced or exuded from the intercellular resin ducts of living trees, especially the conifers, and accumulated, together with oxidation products, in the wood of weathered limbs or stumps. **D 1695, D01**

olfaction, n—(1) the sense of smell. (2) pertaining to the act of smelling. **E 253, E18**

olfactory, adj—of, relating to, or connected with the sense of smell. **D 1356, D22**

olfactory, adj—pertaining to the sense of smell. **E 253, E18**

oligomer, n—a substance composed of only a few nonomeric units repetitively linked to each other, such as a dimer, trimer, tetramer, etc., or their mixtures. **D 883, D20**

oligomer, n—a polymer consisting of only a few monomer units such as a dimer, trimer, tetramer, and the like, or their mixtures. **D 1566, D11**

oligomer, n—a polymer consisting of only a few monomer units such as a dimer, trimer, tetramer, etc., or their mixtures. (D20) **F 412, F17**

oligomer, n—a polymer consisting of only a few monomer units such as a dimer, trimer, tetramer, and so forth, or their mixtures. **F 1251, F04**

oligomerization, n—the process of converting a monomer or mixture of monomers into a oligomer. **D 883, D20**

oligosaccharides—polymeric carbohydrates containing relatively few (compared to the polysaccharides) sugar units connected by glycosidal linkages. Two to nine units has been suggested as a suitable range. For longer chains the polymers cannot be readily separated into individual molecular species. **D 1695, D01**

O&M—operation and maintenance. **D 6161, D19**

omnidirectional, adj—refers to a code format that can be read, regardless of orientation, from a multiplicity of angles. **F 1294, F05**

OMR (optical mark reading)—the process of identification of marks by an optical scanner. **F 149, F05**

one-coat ware, one-coat work—(1) articles finished in a single coat of porcelain enamel.

(2) Sometimes a contraction of one-cover-coat ware, in which the finish consists of a single cover coat applied over ground coat. **C 286, B08**

one-fire finish—a porcelain enamel on the finished product processed in a single firing. **C 286, B08**

one-on-one—the application of a single ply of roofing over the

substrate, followed by the application of a second single ply over the first (phased application). **D 1079, D08**

one-percent length (L1 %N), n—*in fiber testing*, the length exceeded by 1 % of the number of fibers in a test specimen. **D 123, D13**

one-percent length (L1 %N), n—*in fiber testing*, the length exceeded by 1 % of the number of fibers in a test specimen. **D 7139, D13**

one-piece woven, adj—*for inflatable restraints*, a descriptive related to either 1) a tubular woven fabric composed of two-layer inflatable sections, visible lines where the two layers initially interlace, and non-inflatable woven sections, or 2) the cushion cut from such fabric. **D 6799, D13**

on-feet—the desired and optimum uniformity of contact between the type font line and the platen. **F 221, F05**

on-grade—in contact with the ground, *as related to floor location*, in contact with the ground or with less than 18 in. of well-ventilated space between the bottom of the lowest horizontal structural member and any point of the ground. **F 141, F06**

onion—(1) a term sometimes used for the bulklike mass of glass at the origin of the drawn sheet in the Fourcault process.

(2) the spread of molten glass as it flows from a canal onto a tin bath. **C 162, C14**

on-line—pertaining to the operation of a functional unit when under the direct control of the computer. **F 149, F05**

on-line analysis—analytical procedure performed in a process environment using automatic or continuous sampling. **D 4790, D16**

on-line instrument—automated instrument that samples gas directly from the pipeline, but is installed externally. **D 4150, D03**

on-line measurements, n—measurement where the sample is diverted from the manufacturing process, and may be returned to the process stream. **E 2363, E55**

on-line medical physician—a physician immediately available for communication of medical direction to non-physician prehospital care providers in remote location. **F 1177, F30**

on-line testing—eddy current tests conducted on equipment that includes the test coil and means to propel tubes under test through the coil at appropriate speeds and conditions as an integral part of a continuous tube manufacturing sequence. **E 1316, E07**

on-location cleaning, n—*for textile floorcoverings and upholstered furniture*, a cleaning process performed in the location where a product is used. **D 123, D13**

on-location cleaning, n—*for textile floor coverings and upholstered furniture*, a cleaning process performed in the location where a product is used. **D 5253, D13**

onset point (temperature or time), n—the temperature or time at which a deflection is first observed from the established baseline prior to the thermal event. **E 473, E37**

onset temperature, n—the temperature at which a deflection from the established baseline is first observed. **E 1445, E27**

onset temperature, n—in a thermal transfer ribbon, the temperature at which the imaging material begins to change physical form (that is, start to melt). **F 1623, F05**

onshore permafrost—permafrost beneath exposed land surfaces. **D 7099, D18**

onyx marble—translucent, generally layered, cryptocrystalline calcite with colors in pastel shades, particularly yellow, brown, and green. **C 119, C18**

oolitic limestone—a limestone composed largely of the spherical or subspherical particles called oolites or ooliths. **C 119, C18**

ooze—traditionally, vegetable-tanned suede leather. Now also refers to other tannages sueded or napped on the grain side. **D 1517, D31**

opacifier—a material that imparts or increases the diffuse reflectance of porcelain enamel. **C 286, B08**

opacity—the property of reflecting light diffusely and nonselectively; properly defined in Test Method C 347 under the term *contrast ratio*. **C 286, B08**

opacity, n—the degree of obstruction to the transmission of visible light.

In this sense "opacity" is a relative term, it being considered that given a film sufficiently thin, in paint technology at least, there is no absolutely opaque substance.

D 16, D01

opacity, *n*—a measure of the degree to which the intensity of light is reduced as it passes through a gas, due to absorption and scattering.

D 1356, D22

opacity, *n*—of paper, one hundred times the ratio of the light reflected by a paper specimen when the specimen is backed by a black body of 0.5 % reflectance or less to that when the specimen is backed by a thick stack of the same kind of paper.

D 1968, D06

opacity, *n*—(1) *optical*, the ability of a specimen to prevent the transmission of light; the reciprocal of the transmittance factor.

(2) *paper backing*, the ability of a sheet of paper to hide a surface behind and in contact with it, expressed as the ratio of the reflectance factor R_b when the sheet is backed by a black surface to the reflectance factor R_∞ when it is backed by a pile of sheets of the same kind, and of such number that further addition of sheets does not affect the measured opacity.

(3) *white backing*, the ability of a thin film or sheet of material, such as paint or paper, to hide a surface behind and in contact with it, expressed as the ratio of the reflectance factor R_b when the material is backed by a black surface to the reflectance factor R_w when it is backed by a white surface (usually having a reflectance factor of 0.89).

E 284, E12

opacity—the property of paper that minimizes the show-through of printing from the back side or the next sheet. The ratio of the paper reflectance with a black backing to the paper reflectance with a white backing.

F 149, F05

opacity (printing), *n*—See **opacity (2) paper backing**.

E 284, E12

opacity value, *n*—the calculated value of a material by means of two reflectance measurements, R_1 and R_2 . The first measurement, R_1 , is taken on a sample of a blank material using an infinite pad backing. The second measurement, R_2 , is taken of the same blank material with black backing. The reflectance value of the black backing should not exceed 5 %. The opacity value is calculated according to the following equation:

$$\text{Opacity value} = 1.00 - (R_1 - R_2/R_1) = R_2/R_1$$

F 1294, F05

opal glass—glass with fiery translucence; typically a nearly opaque white glass.

C 162, C14

opaque, *adj*—transmitting no optical radiation.

E 284, E12

opaque body, *n*—body that transmits practically no light.

E 349, E21

opaque glaze—See *opaque glaze* under **glaze**.

C 242, C21

opaque wall—all exposed areas of a wall that enclose conditioned space, except openings for windows, doors and building service systems.

open construction—See **building constructions**.

open-plan workstation—See **building space**.

open system—See **building system**.

operable—See **windows and doors**.

E 631, E06

open—the quality of asbestos with a relatively high specific surface area and degree of fiberization, free from an appreciable portion of crudy material.

D 2946, C17

open area, *n*—the ratio of the total area of the apertures to the total functional area of the screening media, expressed as a percentage.

E 1638, E29

open assembly time, *n*—interval between adhesive application to the adherends and assembly of the adhesive joint.

D 907, D14

open bubble—a surface cavity formed by a gaseous inclusion which was vented to ambient atmosphere during processing.

C 162, C14

open-cavity ice—ice formed in an open cavity or crack in the ground by reverse sublimation of water vapor.

D 7099, D18

open cell, *n*—in carbon and graphite technology, a cell that is not totally enclosed in its walls and hence interconnected with other cells. An open-cell foam is a foam consisting predominantly of open or connected cells.

C 709, D02

open cell, *n*—a cell not totally enclosed by its walls and hence interconnecting with other cells.

C 717, C24

open cell, *n*—in carbon and graphite technology, a cell that is not totally enclosed in its walls and hence interconnected with other cells. An open-cell foam is a foam consisting predominantly of open or connected cells.

D 4175, D02

open cell, *n*—a cell not totally enclosed by its walls, and hence interconnecting with other cells. (See **closed cell**.)

F 1251, F04

open-cell cellular plastic, *n*—a cellular plastic in which there is a predominance of interconnected cells.

D 883, D20

open-cell cellular plastic, *n*—a cellular plastic in which there is a predominance of interconnected cells. (D20)

F 412, F17

open cell foam, *n*—a material comprised predominantly of interconnecting cellular voids.

C 168, C16

open cell material, *n*—a cellular material in which substantially all cells in the mass are open cells.

C 717, C24

open cell sealant backing, *n*—in building construction, a flexible and very compressible fabricated shape (usually cylindrical), without a surface skin, that is composed of open cell material.

C 717, C24

open-circuit potential—the potential of an electrode measured with respect to a reference electrode or another electrode when no current flows to or from it.

G 15, G01

open circuit resistance—minimum allowable resistance as measured between two test points that, if lower than, will indicate an electrical short.

F 2112, F01

open-circuit voltage, *n*—of a photovoltaic device, the voltage potential across the positive and the negative terminals under irradiation when zero current flows into or out of these terminals.

E 1328, E44

open construction—a method by which a building, component, assembly or system is manufactured in such a manner that all portions can be readily inspected on site without disassembly or destruction.

E 631, E06

open crate—See **crate**.

D 996, D10

open cut—an excavation through rock or soil made through a hill or other topographic feature to facilitate the passage of a highway, railroad, or waterway along an alignment that varies in topographic relief. An open cut can be comprised of single slopes or multiple slopes, or multiple slopes and horizontal benches, or both. (ISRM)

D 653, D18

open deep fat fryer—equipment with a deep kettle containing oil or fat for cooking food within a perforated container. See **fryer**.

F 1827, F26

open-end spinning machine, *n*—a textile machine for converting staple fiber into spun yarn by a continuous process in which the individual fibers or groups of fibers are caused to assemble at the open end of the forming yarn. (See **rotor-type open-end spinning machine**.)

D 123, D13

open-end spinning machine, *n*—a textile machine for converting staple fiber into spun yarn by a continuous process in which the individual fibers or groups of fibers are caused to assemble at the open end of the forming yarn. (See also **rotor-type open-end spinning machine**.)

D 3888, D13

open-end yarn, *n*—a continuous strand of fibers, produced directly from sliver or roving, in a single continuous operation, by opening and reassembling them in a spinning element to form the yarn.

D 3888, D13

open-face fabric, *n*—a face or shell fabric constructed with specifically designed open areas to show the substrate when joined to another material.

D 123, D13

open flame sunshine carbon arc, *n*—a light source in which an arc is produced across a pair of copper coated carbon rods filled with rare earth elements intended to produce a specific spectral power distribution. The carbons are open to the atmosphere and may be surrounded by a glass lantern arrangement which acts to modify the spectral power distribution received by the specimens.

G 113, G03

open-graded aggregate, *n*—an aggregate that has a particle size distribution such that when it is compacted, the voids between the

open-graded aggregate, *n*

aggregate particles, expressed as a percentage of the total space occupied by the material, remain relatively large. **D 8, D04**

open grain—See **grain**. **D 9, D07**

opening—for the purpose of Test Method D 4749, openings and apertures shall be regarded as synonymous terms. Dimensions for round and square openings shall be determined as follows: for round holes, dimensions shall refer to the opening diameter; for square holes, dimensions shall refer to the distance between parallel wires. **D 121, D05**

opening device, *n*—in *open-end spinning*, either a drafting system or an opening roller which separates the feed stock into individual fibers or very small tufts prior to their reassembly into yarn. (See **feed unit**.) **D 123, D13**

opening device, *n*—in *open-end spinning*, either a drafting system or an opening roller which separates the feed stock into individual fibers or very small tufts prior to their reassembly into yarn. **D 3888, D13**

opening force—the force available to open the contacts. **B 542, B02**

opening roller, *n*—a component of the opening device in *open-end spinning machines*, a roller covered with pins or teeth or similar device used to separate the feed stock into individual fibers or very small tufts by a continuous combing action. **D 123, D13**

opening roller, *n*—a component of the opening device in *open-end spinning machines*, a roller covered with pins or teeth or similar device used to separate the feed stock into individual fibers or very small tufts by a continuous combing action. (*Syn.* combing roll) **D 3888, D13**

open loop, *n*—a way of electronically interconnecting the components of a system. **F 1457, F05**

open loop, *adj*—refers to a testing mode in which fresh collection medium flows continuously through the collection chamber of the test cell. **F 1494, F23**

open place—See **crack mark**. **D 3990, D13**

open-plan workstation—office workspace for one person, not enclosed by full-height walls. **E 631, E06**

open pore, *n*—a pore communicating with an exterior surface. **B 243, B09**

open porosity—See *open porosity* under **porosity**. **C 242, C21**

open pot—a pot open to the flames and gases of combustion. **C 162, C14**

open pot—a pot wherein the glass surface is not protected from the furnace atmosphere. **C 162, C14**

open seams—unfilled fissures or naturally occurring cracks in stone. **C 119, C18**

open system—a building system, designed to have interchangeability of its **subsystems**, subassemblies, **components**, or building elements with like **subsystems**, subassemblies, **components**, or elements of other systems. **E 631, E06**

open-system freezing—freezing that occurs under conditions in which water can be gained or lost by the system. **D 7099, D18**

open-system pingo—a pingo formed by doming of frozen ground due to the freezing of injected water supplied by groundwater moving downslope through taliks to the site of the pingo, where it moves to the surface. **D 7099, D18**

open talik—a body of unfrozen ground that penetrates the permafrost completely. **D 7099, D18**

open time, *n*—length of time a coating remains wet enough to allow for brushing-in at the laps; also called wet edge time. **D 16, D01**

open water boom—boom intended for use in open waters (see Practice F 625 for environmental descriptors). **F 818, F20**

open wound, *n*—a wound that communicates with the atmosphere by direct exposure. **F 2312, F04**

operating characteristic curve (OC-curve), *n*—in *acceptance sampling*, the curve which has as its abscissa a hypothesized lot average, and which has as its ordinate the probability of accepting the lot, when the plan is used. (See also **Type A operating characteristic curve** and **Type B operating characteristic curve**.) **D 123, D13**

operating conditions, extreme—unusual physical conditions to which a component or system may be exposed and for which it is not designed or intended to withstand, nor is it required to withstand by a local regulatory agency. **E 772, E44**

operating conditions, normal—the usual range of physical conditions (for example, temperature, pressure, wear and tear, weather) for which the component or system was designed. **E 772, E44**

operating cost—the expenses incurred during the normal operation of a building or a building system or component, including labor, materials, utilities, and other related costs. **E 631, E06**

operating cost, *n*—the expenses incurred during the normal operation of a building or a building system or component, including labor, materials, utilities, and other related costs. **E 833, E06**

operating cycle, *n*—an ion-exchange process consisting of a backwash, regeneration, rinse, and service run. **D 1129, D19**

operating humidity, *n*—relative humidity of ambient air which allows operation of an *IR thermometer* within a specified *laboratory error range*. **E 344, E20**

operating humidity range of analyzer—See **analyzer**. **D 1356, D22**

operating humidity range of sample—See **sample**. **D 1356, D22**

operating pressure—the gage hydraulic pressure at which feedwater enters a device. **D 6161, D19**

operating pressure, *n*—the pressure expected under normal operating conditions. **G 126, G04**

operating site, *n*—in waste management, a location or facility where waste is treated, stored, or disposed as part of an on-going operation. **D 5681, D34**

operating temperature, *n*—ambient temperature that allows operation of an *IR thermometer* within specified *laboratory error range*. **E 344, E20**

operating temperature, *n*—the temperature expected under normal operating conditions. **G 126, G04**

operating temperature range of analyzer—See **analyzer**. **D 1356, D22**

operating temperature range of sample—See **sample**. **D 1356, D22**

operational control point, *n*—a set point for equilibrium conditions measured at sensor location(s) in an exposure device. **G 113, G03**

operational control point tolerance, *n*—the permissible deviation from the operational control point including permitted random deviation during equilibrium conditions in an exposure device. **G 113, G03**

operational definition, *n*—a definition that describes the procedure or process by which an entity is made or calculated. **E 1992, E02**

operationally valid standard test, *n*—in *automotive lubricant testing*, a standard test that meets operational validity requirements, where specified. **D 4175, D02**

operational period—See **analyzer**. **D 1356, D22**

operational uniformity, *n*—the range around the operational control point for measured parameters within the intended exposure area within the limits of intended operational range. **G 113, G03**

operator, *n*—a person who normally and regularly carries out a particular test. **D 4175, D02**

operator—person having direct control of equipment or operation. **E 631, E06**

operator—the person having direct control of the starting, stopping, or speed of an amusement ride. **F 747, F24**

operator, *n*—means any person who causes or authorizes the operation of an aircraft, such as the owner, lessee, or bailee of an aircraft. Also, the entity responsible for compliance with airworthiness and continuing airworthiness requirements. **F 2395, F38**

operator maintenance—maintenance tasks of a minor nature, including preventative maintenance, performed by equipment operators at the most convenient time, whether it is before, during, or after operations. **E 2135, E53**

ophthalmic glass—glass used in eyeglasses. **C 162, C14**

opponent-color scales, *n*—scales that denote one color by positive scale values, the neutral axis by zero value, and an approximately complementary color by negative scale values. Common examples

include scales that are positive in the red direction and negative in the green direction (CIE a^* , Hunter a) and scales that are positive in the yellow direction and negative in the blue direction (CIE b^* , Hunter b). E 284, E12

opportunity cost of capital—the rate of return available on the next best available investment of comparable risk.

overall rate of return (ORR)—See **adjusted internal rate of return (AIRR)**. E 631, E06

opportunity cost of capital, n —the rate of return available on the next best available investment of comparable risk. E 833, E06

optic, *adj*—having variations in wall thickness, producing refractive effects. C 162, C14

optic, n —a lens or prism in an optical instrument. C 162, C14

optical axis, n —an imaginary line joining the centers of curvature of the surfaces of lenses or mirrors in an optical system. E 135, E01

optical bleach—see **fluorescent whitening agents (FWA)**.

D 459, D12

optical brightener, n —discouraged term for **fluorescent whitening agent**. E 284, E12

optical brightener—a material often added to paper during its manufacture to improve its brightness or whiteness. These materials can cause erratic reflectance values when used with optical scanners that are sensitive to the short wavelength portions of the spectrum. See **fluorescence**. F 149, F05

optical character reader—an information processing device that accepts prepared forms and converts data from them to computer output media via **optical character recognition**. F 149, F05

optical character recognition (OCR)—**character recognition** that uses optical means to identify graphic characters. F 149, F05

optical crown glass—optical glass with a low dispersion relative to its index of refraction, usually forming the converging element of an optical system. Generally, optical glasses possessing an Abbé value greater than 50. C 162, C14

optical density, n —see **reflectance density, reflection density, transmittance density, transmittance density**. E 284, E12

optical density—the degree of opacity of a translucent medium (darkening of film) expressed as follows:

$$OD = \log(I_o/I)$$

where:

OD = optical density,

I_o = light intensity incident on the film, and

I = light intensity transmitted through the film.

E 1316, E07

optical density—the image intensity or density in terms of or measured by a reflectance densitometer. F 221, F05

optical density—a measure of image (density) by reflectance densitometer. F 335, F05

optical density of smoke, D, n —a measure of the attenuation of a light beam passing through smoke, expressed as the common logarithm of the ratio of the incident flux, I_o , to the transmitted flux, I . ($D = \log_{10}(I_o/I)$). E 176, E05

optical fiber—See **fiber, optical**. C 162, C14

optical fiber, n —a filament-shaped dielectric material that guides radiant energy. E 131, E13

optical flint glass—optical glass with a high dispersion relative to its index of refraction, usually forming the diverging element of an optical system. Generally, optical glasses possessing an Abbé value less than 50. C 162, C14

optical glass—glass of high quality having closely specified optical properties, used in the manufacture of optical systems. C 162, C14

optical glass numerical designation—the numerical designation in common usage is based on the index of refraction for the helium line (n_d) and the Abbé value. The unity factor for the index is dropped (that is, 1.496 becomes 496) and the decimal point for the Abbé value is also dropped (Abbé value 64.4 becomes 644). Thus

a glass with an index of refraction of 1.496 and an Abbé value of 64.4 is specified 496-644 without reference to chemical composition. C 162, C14

optical line pair test pattern—see **line pair test pattern**.

E 1316, E07

optical measuring path length, n —the length of the optical beam over which the atmosphere or emission concentration is measured and averaged. D 1356, D22

optical opacity—an expression for the amount of light absorbed and scattered by a suspension reported as: extinction coefficient, or percent of incident light scattered in 90°, or percent of incident light transmitted at 180° over a standard distance, or all three. D 4410, D19

optical path difference—see **retardation**.

E 131, E13

optical pyrometer—an instrument with the temperature of an object is determined by comparing its brightness at some fixed wavelength with that of a standardized source. E 7, E04

optical retardation—see **retardation**.

E 131, E13

optical scanner—(1) a scanner that uses light for examining patterns. (2) a device that scans optically and usually generates an analog or digital signal. F 149, F05

optical throw, n —the distance from the aperture of a bar code reader to the leading vertical plane of the depth of field. Also, the minimum distance a bar code symbol can be away from a scanner and still be successfully read. F 1294, F05

optical whitening agent—see **fluorescent whitening agents (FWA)**.

D 459, D12

optimal colors, n —object colors having the maximum possible luminance factor for each chromaticity. E 284, E12

optimal decision rules, n —those that restrict the types and proportion of error to those that can be tolerated by the consumers of the polygraph results. Because it is not possible to simultaneously reduce errors of one type (that is, false positives) without increasing errors of the other type, optimal decision rules are central to a judicious and rational process by which the payoff to the consumers of the polygraph decision is greatest, and the cost associated with errors is minimized. Optimal decision rules for investigative and evidentiary polygraphy may be different from one another. E 2035, E52

optimum concentration range, n —in analysis of trace metals, a range, defined by limits expressed in concentration, below which scale expansion must be used and above which curve correction should be considered. D 5681, D34

optimum cure, n —the state of vulcanization at which a desired property value or combination of property values is obtained.

D 1566, D11

optimum energy, n —energy (millijoules/square millimetres) which achieves the best optical print density and consistent, well-defined image; dependent on ribbon thickness, coating formulation, ribbon speed in the printer, and print head temperature. F 1623, F05

optimum exposure—the time-light intensity relationship that produces the most satisfactory print. F 335, F05

optimum frequency—in electromagnetic testing, that frequency which provides the largest signal-to-noise ratio obtainable for the detection of an individual material property. Each property of a given material may have its own optimum frequency. E 1316, E07

optimum moisture content (optimum water content), $OMC, w_o (D)$ —the water content at which a soil can be compacted to a maximum dry unit weight by a given compactive effort.

D 653, D18

oral temperature, t_{bm}, n —posterior sublingual temperature as measured by a *contact thermometer*. E 344, E20

orange-box nail—coated, regular-stock-steel, 1¼ by 0.072-in. nail with flat ⅞-in. head and medium diamond point. F 547, F16

orange peel—a finish resembling the dimpled appearance of an orange peel. B 374, B08

orange peel

orange peel—a pattern of roughness or waviness on a vitreous or glassy surface which resembles the skin of an orange in texture.

C 162, C14

orange peel—a pitted texture of a fired glaze resembling the surface of rough orange peel.

C 242, C21

orange peel—a surface condition characterized by an irregular waviness of the porcelain enamel resembling an orange skin in texture; sometimes considered a defect.

C 286, B08

orange peel—*in protective coatings*, the dimpled appearance of a dried coating film resembling the surface of an orange.

D 4538, D33

orange peel, n—a pattern of roughness somewhat like that of the outer surface of an orange, appearing when the film split pattern is not uniform over the printed surface.

D 6488, D01

orange peel, n—the appearance of irregularity of a surface resembling the skin of an orange.

E 284, E12

orange-peel—uneven surface somewhat resembling an orange peel.

F 412, F17

orbicular cryogenic fabric—a distinct soil micromorphology resulting from the effects of freezing and thawing, in which coarser soil particles form circular to ellipsoidal patterns.

D 7099, D18

orbital energy—XPS, Koopmans energy corrected for intra-atomic relaxation.

E 673, E42

order-disorder transformation—a phase change among two solid solutions having the same crystal structure but in which the atoms of one phase, the disordered one, are randomly distributed and in the other, the different kinds of atoms occur in a regular sequence upon the crystal lattice, that is, in an ordered arrangement.

E 7, E04

order distribution—see **lateral order**.

D 1695, D01

ordered structure—that crystal structure of a solid solution in which the atoms of different elements seek preferred lattice positions.

E 7, E04

order (in X-ray reflection)—the factor *n* in the Bragg equation (see **Bragg equation**). In X-ray reflection from a crystal, the order is an integral number which is the path difference measured in wavelengths between reflections from adjacent planes.

E 7, E04

order of a system—the number of components; for example, a system of binary order is made up of two components.

E 7, E04

order strengthening—a thermal treatment of a cold-worked product at a temperature below its recrystallization temperature causing ordering to occur to obtain an increase in yield strength.

B 846, B05

ordinance, n—a rule or law adopted by local governmental authority.

E 631, E06

organic, adj—being or composed of hydrocarbons or their derivatives, or matter of plant or animal origin.

D 1079, D08

organic chemical, n—a carbon-based compound in which the element carbon is attached to other carbon atom(s), hydrogen, oxygen, or other elements in a chain, ring, or three-dimensional structure.

nonvolatile organic chemical, n—an organic compound with a saturation vapor pressure less than 10^{-8} kPa at 25°C.

polar organic chemical, n—an organic compound that may exhibit a relatively high electric dipole moment or may be readily ionized, typically containing heteroatoms, such as oxygen, sulfur, nitrogen, phosphorus, chlorine, and bromine.

semivolatile organic chemical, n—an organic compound with a saturation vapor pressure between 10^{-2} and 10^{-8} kPa at 25°C.

total volatile organic compounds (TVOC), n—the summed concentration of all the individual volatile organic compounds (VOCs) quantifiable in an air sample by both a precisely specified sampling protocol and a precisely defined analytical method.

volatile organic chemical, n—an organic compound with a saturation vapor pressure greater than 10^{-2} kPa at 25°C.

D 1356, D22

organic clay—a clay with a high organic content.

D 653, D18

organic cryosol—an organic soil having a surface layer containing more than 17 % organic carbon by weight, with permafrost within 1 m below the surface.

D 7099, D18

organic fiber—natural or synthetic organic fiber based upon a carbon chain structure, having a length-to-diameter (or to maximum transverse dimension) ratio of at least 100 to 1.

D 2946, C17

organic fiber content, n—*for asbestos-cement*, the percentage of organic matter expressed as the equivalent percentage by mass of wood cellulose in a dried sample.

D 2946, C17

organic (inorganic) SIMS—the SIMS technique when applied to organic (inorganic) specimens or organic (inorganic) molecules placed on a solid.

E 673, E42

organic silt—a silt with a high organic content.

D 653, D18

organic soil—soil with a high organic content.

D 653, D18

organic terrain—see **peatland**.

D 653, D18

organizational component, n—a portion of an organization with specific tasks and activities that constitutes a part of the total effort and accomplishment of the organization.

D 1356, D22

organoleptic, adj—relating to a property of a sample perceived by the sense organs (obsolete, see **sensory**).

E 253, E18

organosol, n—a suspension of a finely divided polymer in a plasticizer, together with a volatile organic liquid.

D 883, D20

organosol, n—a suspension of a finely divided polymer in a plasticizer together with a volatile organic liquid.

D 1566, D11

organosol, n—a suspension of a finely divided plastic in a plasticizer, together with a volatile organic liquid.

F 1251, F04

orientation, n—*in buttons*, the degree of order and spatial alignment of pearlescent pigment crystals internally or in a coating.

D 123, D13

orientation—the angle made by the crystallites of the cellulose with the fiber axis. This is approximately the same angle as that made by the molecules or the fibrils.

D 1695, D01

orientation, n—*in buttons*, the degree of order and spatial alignment of pearlescent pigment crystals internally or in a coating.

D 5497, D13

orientation—the angular position of a crystal described by the angles which certain crystallographic axes make with the frame of reference. In hardness measurements, the relationship between the direction of the axes of the indenter of a hardness tester and the direction of non-homogeneous properties of the specimen.

E 7, E04

orientation, n—the plane in which the exposed face of the specimen is located during testing.

E 176, E05

orientation, n—the plane in which the exposed face of the specimen is located during testing, either vertical or horizontal facing up.

E 176, E05

orientation, n—the plane in which the exposed face of the specimen is located during testing, which is horizontal facing up for this test.

E 176, E05

orientation, n—the plane in which the exposed face of the specimen is located during testing.

E 176, E05

orientation, n—plane in which the exposed face of the specimen is located during testing, either vertical or horizontally face upwards.

E 176, E05

orientation, n—the plane on which the exposed face of the specimen is located during testing, which is horizontal facing up for this test.

E 176, E05

orientation (of a crystal), n—the angular position of a crystal described by the angles which certain crystallographic axes make with the frame of reference.

C 709, D02

orientation (of a crystal), n—the angular position of a crystal described by the angles which certain crystallographic axes make with the frame of reference.

D 4175, D02

orientation (of a grain), n—the angular position of a grain described by the angles which a defined set of axes of the grain make with the stated frame of reference. Generally used to characterize the

axis of the grain that has the largest physical extent, for example, in a grain of needle coke. **C 709, D02**

orientation (of a grain), *n*—the angular position of a grain described by the angles which a defined set of axes of the grain make with the stated frame of reference. Generally used to characterize the axis of the grain that has the largest physical extent, for example, in a grain of needle coke. **D 4175, D02**

orientation (of an object), *n*—the angular position of an object described by the angles which a defined set of axes or surfaces of the object make with the frame of reference. **C 709, D02**

orientation (of an object), *n*—the angular position of an object described by the angles which a defined set of axes or surfaces of the object make with the frame of reference. **D 4175, D02**

oriented lake—one of a group of lakes possessing a common, preferred, long-axis orientation. **D 7099, D18**

orifice—an opening through which glass flows. In a feeder, an opening in the bottom of the spout formed by the orifice ring. **C 162, C14**

orifice atomizer—see **plain jet atomizer**. **E 1620, E29**

orifice blower door, *n*—a blower door in which airflow rate is determined by means of the pressure drop across an orifice or nozzle. **E 631, E06**

orifice meter, *n*—a flowmeter, employing as the measure of flow rate the difference between the pressures measured on the upstream and downstream sides of the orifice (that is, the pressure differential across the orifice) in the conveying pipe or duct. **D 1356, D22**

orifice ring—that ring that forms the hole through which glass flows in the feeder process. (See also **bushing**.) **C 162, C14**

original—the object to be copied. **F 335, F05**

original crack size, a_o , [L]—the physical crack size at the start of testing. **E 1823, E08**

original length, *n*—of yarns, the length of the yarn under a specified tension. **D 4849, D13**

original source data, *n*—data as received by a center that is a source for an archive. **E 867, E17**

original twist, *n*—the twist in a single or plied yarn component of a plied or cabled yarn as the component was before incorporation into the more complex structure. **D 123, D13**

original twist, *n*—the twist in a single or plied yarn component of a plied or cabled yarn as the component was before incorporation into the more complex structure. **D 4849, D13**

original uncracked ligament, b_o , [L]—distance from the original crack front to the back edge of the specimen, that is:

$$b_o = W - a_o$$

E 1823, E08

O-ring, *n*—See **seal, O-ring**. **D 1566, D11**

O-ring gasket—a solid gasket of circular cross section. **C 822, C13**

orthel—a suborder of gelisol that contains neither large quantities of organic matter (as in histels), nor evidence of extensive mixing due to frost action (as in turbels). **D 7099, D18**

orthochromatic—(1) of, pertaining to, or producing tone values (of light or shade) in a photograph, corresponding to the tones of nature.

(2) photographic use; designating a film made sensitive to green and blue, but not red, light. **E 7, E04**

orthogonal array, *n*—a table of coefficients identifying the levels, or some weight associated with the levels, for each factor to be used in the analysis of specified effects, which are arranged in such a manner that each effect will be independent of the other effects. **E 456, E11**

orthogonal array, *n*—a table of coefficients identifying the levels, or some weight associated with the levels, for each factor to be used in the analysis of specified effects, which are arranged in such a manner that each effect will be independent of the other effects. **E 1325, E11**

orthogonal contrasts, *n*—two contrasts are orthogonal if the contrast coefficients of the two sets satisfy the condition that, when

multiplied in corresponding pairs, the sum of the products is equal to zero. See **contrast** and **contrast analysis**. **E 456, E11**

orthogonal contrasts, *n*—two contrasts are orthogonal if the contrast coefficients of the two sets satisfy the condition that, when multiplied in corresponding pairs, the sum of the products is equal to zero. See **contrast** and **contrast analysis**. **E 1325, E11**

orthogonal trajectory deviation, *n*—the perpendicular deviation or distance from the center of the vehicle to the TGL at the end of a stopping test. **F 538, F09**

orthopedic and surgical felt, *n*—a white, soft, low-density, highly resilient felt. **D 123, D13**

orthopedic and surgical felt, *n*—a white, soft, low density, highly resilient felt. **D 4845, D13**

orthopedic devices—any device of leather, metal or other material included in the construction of a shoe or inserted in a shoe to prevent or correct foot defects and deformities. **F 869, F08**

orthopedic leathers—a general term for the types of leather used in the manufacture of artificial limbs, braces, etc., for orthopedic purpose. The leathers may range from chamois and horsehide glove to case and strap leathers. **D 1517, D31**

orthorhombic—having three mutually perpendicular axes of unequal lengths. **E 7, E04**

orthotic—an accessory inserted in a shoe to prevent or correct foot defects and deformities. **F 869, F08**

orthotropic—having three mutually perpendicular planes of elastic symmetry. **E 631, E06**

orthotropic—having three mutually perpendicular planes of elastic symmetry. **E 1749, E06**

orthotropic material—a material in which a property of interest, at a given point, possesses three mutually perpendicular planes of symmetry, which taken together define the principal material coordinate system. **D 3878, D30**

ortho-xylene—1,2-dimethylbenzene (C_8H_{10}) mol weight 106.16; clear, colorless, flammable liquid; freezing point, $-25.18^\circ C$; boiling point, $144^\circ C$. **D 4790, D16**

OSA-UCS color system, *n*—Optical Society of America Uniform Color Scales color order system based on equality of visual spacing, which uses the opponent-color scales $\pm L$ (lightness), $\pm j$ (yellowness-blueness), and $\pm g$ (greenness-redness). **E 284, E12**

OSA-UCS samples, *n*—current Optical Society of America physical exemplification of the OSA-UCS color system, consisting of about 550 samples displayed on a face-centered-cubic lattice such that each interior sample has 12 nearest neighbors at equal intervals from it. **E 284, E12**

oscillating disc cure meter, *n*—a test device for determining vulcanization parameters, in which a rotationally oscillating disc is embedded in a rubber specimen in a closed heated cavity and the resistance of the rubber to disc rotation measured versus time. **D 1566, D11**

oscillating mirror scanner, *n*—a single beam scanner with a mirror that oscillates in a plane at right angles to the scanner beam which causes the field of view to be swept by the beam. **F 1294, F05**

oscillation—the variation, usually with time, of the magnitude of a quantity with respect to a specified reference when the magnitude is alternately greater and smaller than the reference. **D 653, D18**

osmosis—the spontaneous flow of water from a less concentrated solution to a more concentrated solution through a semipermeable membrane until chemical potential equilibrium is achieved. **D 6161, D19**

osmotic pressure—a measurement of the potential energy difference between solutions on either side of a semipermeable membrane. In reverse osmosis and nanofiltration systems, the applied pressure must exceed the osmotic pressure to produce permeate. **D 6161, D19**

Ostwald coefficient, *n*—the solubility of a gas, expressed as the volume of gas dissolved per volume of liquid when both are in equilibrium at the specified partial pressure of gas and at the specified temperature. **D 4175, D02**

Ostwald color system, *n*—color order system in which colors are specified in terms of the attributes hue, blackness, and whiteness, and are spaced according to the results of spinning-disk mixing of specified amounts of ideal black, white, and maximally chromatic samples. **E 284**, E12

other alkali-insoluble impurities, *n*—*in scoured wool*, the oven-dried, ash-free, alcohol-extractives-free, alkali-insoluble substances other than vegetable matter base, such as skin, cotton or other fibers, paper, string, tag (dung) pieces, and paint pieces, etc. **D 123**, D13

other alkali-insoluble impurities, *n*—*in scoured wool*, oven-dried, ash-free, alcohol-extractives-free, alkali-insoluble substances other than vegetable matter base, such as skin, cotton or other fibers, paper, string, tag (dung) pieces, paint pieces, etc. **D 4845**, D13

ounce—an ounce is equivalent in thickness to 1/64 in. (approximately 0.4 mm). **D 1517**, D31

outaging, *n*—practice of removing a portion of liquid contents from a conventional sampling cylinder after filling to provide expansion room. **D 4175**, D02

outcrop—the exposure of the bedrock at the surface of the ground. (ISRM) **D 653**, D18

outdoor exposure—normal weather conditions, that is, the sun's rays, rain, air, temperature changes, and wind. **F 412**, F17

outdoor-indoor transmission loss, *OITL*—*of a building facade, in a specified frequency band*, ten times the common logarithm of the ratio of the airborne sound power incident on the exterior of the facade to the sound power transmitted by the facade and radiated to the interior. The quantity so obtained is expressed in decibels. **C 634**, E33

outgas, *v*—a process of evaporation or chemical decomposition through which vapors are released from materials. **E 2114**, E06

outgassing, *n*—the emission of occluded gasses from a material by vacuum, heat, or pressure. **C 717**, C24

outgassing—the process by which materials expel gases. **E 772**, E44

outgassing—the evolution of gas from a material in a vacuum. **E 1316**, E07

outlet pressure—see **forepressure**. **E 1316**, E07

outlier, *n*—a result far enough in magnitude from other results to be considered not a part of the set. **D 4175**, D02

outlier—see **outlying observation**. **E 456**, E11

outlying observation, *n*—an observation that appears to deviate markedly in value from other members of the sample in which it appears. **E 456**, E11

out-of-plane measurements [L]—measurements taken on structures that are curved out-of-plane in the *z*-direction (that is, perpendicular to the underlying layer). **E 2444**, E08

out-of-roundness—the allowed difference between the maximum measured diameter and the minimum measured diameter (stated as an absolute deviation). **F 412**, F17

out of specification data, *n*—*in data acquisition*, sampled value of a monitored test parameter that has deviated beyond the procedural limits. **D 4175**, D02

output—See **analyzer**. **D 1356**, D22

output per stroke (OPS), *n*—the amount of product dispensed with one complete actuation when measured in terms of weight (grams) or volume (microliter, milliliters, or cc's). **D 6655**, D10

outside bevel divergent point—staple point with two-plane beveled face on staple outside and along thick leg side; designed to lead staple legs into opposite directions and to result at the same time in their crossing during driving. **F 592**, F16

outside bevel point—bevel point with its beveled face on staple outside. **F 592**, F16

outside diameter, *n*—the maximum diameter of a tire when it is mounted and inflated. **F 538**, F09

outside drive—a lock that is gear-driven by a spindle located outside the lock case on either the end, top, or bottom of the lock case. **F 471**, F12

outside-leg length, *n*—*in body measurements*, the distance from the side waist to the soles of the feet, following the curve of the body. **D 123**, D13

outside seam, *n*—a seam formed in which the completed seam allowance is located on the exterior of the object, usually on the face side of the fabric. (Compare **inside seam**.) **D 123**, D13

outside seam, *n*—*in home sewing*, a seam in which the seam allowance of the completed seam is visible from the face side of the sewn product. (Compare **inside seam**.) **D 4965**, D13

outsole—the bottom sole thickness. The surface of which is exposed to wear. **F 869**, F08

outward clinch—clinch with both staple legs flared outwardly during driving. **F 592**, F16

oval head, oval rivet head—circular head having convex top surface, with its height smaller than its radius. **F 547**, F16

ovality—(%),

$$\frac{(\text{maximum measured diameter} - \text{minimum measured diameter})}{\text{average measured diameter}}$$

× 100
F 412, F17

oven—general purpose equipment, operating in dry heat mode, used primarily for baking and roasting food products. **F 1827**, F26

oven-dried, *adj*—the condition of a material that has been heated under prescribed conditions of temperature and humidity until there is no further significant change in its mass. **D 123**, D13

oven-dried, *adj*—the condition of a material that has been heated under prescribed conditions of temperature and humidity until there is no further significant change in its mass. **D 4845**, D13

oven-dried, *adj*—a descriptive term for a material that has been heated under prescribed conditions of temperature and humidity until there is no further significant change in the mass of the material. **D4920**, D13

oven-dried wool, *n*—wool dried to moisture equilibrium under specified conditions. **D 123**, D13

oven drying loss—the reduction in weight resulting when a substance is heated in an oven under specified conditions. **D 2652**, D28

oven glass—(1) glass suitable for manufacture of articles to be used in baking and roasting foods.

(2) glassware made from oven glass. **C 162**, C14

oven ware—ceramic whiteware for culinary oven use. **C 242**, C21

overaging, *n*—**aging** under conditions of time and temperature greater than those required to obtain maximum change in a certain property, so that the property is altered away from the maximum. **A 941**, A01

overall cleaning, *n*—*for upholstered furniture*, the application of an appropriate cleaning agent to the entire fabric covering, accomplished while the upholstery fabric remains attached to the furniture unit. **D 123**, D13

overall cleaning, *n*—*for upholstered furniture*, the application of an appropriate cleaning agent to the entire fabric covering, accomplished while the upholstery fabric remains attached to the furniture unit. **D 7023**, D13

overall coefficient of heat transfer—See **transmittance, thermal**. **C 168**, C16

overall gas penetration resistance, *n*—the integrity of a totally encapsulating chemical protective suit to resist the inward leakage of gases when exposed to a hazardous chemical environment. **F 1494**, F23

overall height—maximum vertical dimension of boom. **F 818**, F20

overall length—the total length of the individual pipeline system, section, or fitting prior to installation. **F 412**, F17

overall liquid penetration resistance, *n*—the integrity of a chemical protective suit to resist the inward leakage of liquids when exposed to a hazardous chemical environment. **F 1494**, F23

overall magnetization—magnetization of an entire part with a single energizing cycle. **E 1316**, E07

overall precision—See **precision**. **D 1356, D22**

overall profile grade, *n*—as defined in *ANSI X3.182*, the lowest grade received by measurement of the following parameters: edge determination, overall profile reflectance grade, decode and decodability; grades may be denoted by letters (*A* to *F*) or numbers (4.0 to 0). **F 1294, F05**

overall rate of return (ORR), *n*—See **adjusted internal rate of return (AIRR)**. **E 833, E06**

overall serviceability score—See **serviceability score**. **E 1480, E06**

overall width, *n*—the maximum cross-sectional width of a tire, including protective or decorative ribs. **F 538, F09**

overbreak—the quantity of rock that is excavated or breaks out beyond the perimeter specified as the finished excavated tunnel outline. (ISRM) **D 653, D18**

overburden—the loose soil, sand, silt, or clay that overlies bedrock. In some usages it refers to all material overlying the point of interest (tunnel crown), that is, the total cover of soil and rock overlying an underground excavation. (ISRM) **D 653, D18**

overburden load—the load on a horizontal surface underground due to the column of material located vertically above it. (ISRM) **D 653, D18**

overcoating—the act of making a developed electrostatic image permanent by spraying or laminating a protective film or similar layer over the surface. **F 335, F05**

overconsolidated soil deposit—a soil deposit that has been subjected to an effective pressure greater than the present overburden pressure. **D 653, D18**

overconsolidation ratio, OCR—the ratio of preconsolidation vertical stress to the current effective overburden stress. **D 653, D18**

overcure, *n*—a state of vulcanization cure beyond the state of optimum cure. **D 1566, D11**

overdamped-well response—characterized by the water level returning to the static level in an approximately exponential manner following a sudden change in water level (see for comparison **underdamped well response**). **D 653, D18**

overdrawn structure—a condition, sometimes found to exist in very heavily cold-worked rods or wires. (cupping). Cupping is overdrawn material, but the converse is not true. **E 7, E04**

overdrilling—the process of drilling out a well casing and any material placed in the annular space. **D 653, D18**

overdry—the state of a cellulosic material that has been dried to constant mass at a temperature of 100 to 105°C. **D 1695, D01**

overemulsification—excessive emulsifier dwell time which results in the removal of penetrants from some discontinuities. **E 1316, E07**

over-flow drain—a drain for eliminating the excess foam and starch created during the cooking process. **F 1827, F26**

overglaze decoration—See **overglaze decoration** under **decoration**. **C 242, C21**

overhang—See **lip**. **F 592, F16**

overhead, *n*—in *abar code system*, the fixed number of symbol characters required for start, stop, and checking in addition to data carrying characters. As an example, a symbol requiring a start, stop and single check character contains three characters of overhead. **F 1294, F05**

overhead slide gate—any horizontal slide gate supported only from above (see Specification F 1184). **F 552, F14**

overheating, *n*—heating a steel object to such a high temperature that excessive grain growth occurs. **A 941, A01**

overheating—(1) in *ferrous alloys*, heating to an excessively high temperature such that the properties/structure undergo modification. The resulting structure is very coarse-grained. Unlike burning, it may be possible to restore the original properties/structure by further heat treatment or mechanical working, or a combination thereof.
(2) in *aluminum alloys*, overheating produces structures that show areas of resolidified eutectic or other evidence that indicates the metal has been heated within the melting range. **E 7, E04**

over-laminate, *n*—in *reference to code printing*, a coating or material added to protect a printed symbol. **F 1294, F05**

overland flow—rainfall runoff from a surface containing concentrated flow no larger than rill flow. **D 4410, D19**

overlength staple fibers, *n*—manufactured staple fibers that are at least 10 % longer than the nominal or average cut length. **D 123, D13**

overlength staple fibers, , *n*—manufactured staple fibers that are at least 10 % longer than nominal or average cut length. **D 4849, D13**

overload recovery time—an interval of nonlinear operation of an instrument caused by a signal with amplitude in excess of the instrument's linear operating range. **E 1316, E07**

overpacking, *n*—(1) **packaging** that exceeds minimum requirements, (2) additional packaging used to increase protection. **D 996, D10**

overpress—an imperfection; projecting excess glass resulting from imperfect closing of mold joints. **C 162, C14**

overpressed metal connector plate—metal connector plate with teeth, fully penetrating wood member, with tooth side of plate pressed more than one half of plate thickness below surface of wood member; in contrast to underpressed metal connector plate, the surface of which is not in contact with the surface of the wood members.
owner—see **property owner**. **E 631, E06**

over-retting, *v*—in *flax*, indicates that decomposition has caused excessive deterioration of bast fibers. (See **retting** and **underretting**) **D 6798, D13**

overrun—the relation between the liquid volume of the cream mix, and that of the dispensed aerated product. **D 3064, D10**

overshoot, *n* (θ_n)—the amplitude of a deflection of a wind vane as it oscillates about θ_B after release from an initial displacement.
*overshoot ratio, *n* (Ω)*—the ratio of two successive overshoots of a wind vane, as expressed by the following equation:

$$\Omega = \frac{\theta_{(n+1)}}{\theta_n}$$

where θ_n and $\theta_{(n+1)}$ = *n* and *n* + 1 overshoots, respectively. **D 1356, D22**

overshot—See **float**. **D 3990, D13**

oversize bulky waste (OBW)—items whose large size precludes or complicates processing or sampling. **D 5681, D34**

oversize powder, *n*—particles coarser than the maximum permitted by a given particle size specification. **B 243, B09**

overspray—the slip from the spray gun not deposited on the ware. Also, spray application of a light coat of slip to an unfired porcelain enamel. **C 286, B08**

overspray—in *protective coatings*, any material not deposited on the surface being coated. **D 4538, D33**

overstriking, *v*—printing characters over each other, in some cases this is desired, in others it is a defect. **F 1457, F05**

over-tone—see **mass color**. **D 16, D01**

overtone, *n*—any of the conditions occurring in the developing unit when the toner concentration is too high. **F 1457, F05**

overturning moment [*FL*], *n*—of a tire, the component of a tire moment vector tending to rotate a tire about the *X'*-axis, positive clockwise when looking in the positive direction of the *X'*-axis. **F 538, F09**

overvoltage—the irreversible excess of potential required for an electrochemical reaction to proceed actively at a specified electrode, over and above the reversible potential characteristics of that reaction. **B 374, B08**

overvoltage—the change in potential of an electrode from its equilibrium or steady state value when current is applied. **G 15, G01**

overwashing—too long or too vigorous washing, or both, which results in removal of penetrants from some discontinuities. **E 1316, E07**

ovulation thermometer—a thermometer specifically designed for obtaining body temperature for the purpose of determining the date of ovulation or the basal body temperature. **E 344, E20**

Owens process

Owens process—{archaic} a bottle-making process in which the blank or parison mold is filled by suction and subsequently blown.

C 162, C14

owner—the public agency or authority, group, corporation, partnership, or individual that specifies products or services for use on a project that it presently or eventually will own or administrate.

C 822, C13

owner, n—*in pipe laying*, the person, firm, corporation, or government agency entering into contract with the contractor for the installation of pipe and accessories.

C 1154, C17

owner, n—*for pipelaying*, the person, firm, corporation, or government agency entering into contract with the contractor for the installation of asbestos-cement pipe and accessories.

D 2946, C17

owner—generally the fee owner of record of the property.

E 5681, D34

owner, n—one who holds the title and is responsible for funding the project.

E 833, E06

owner—one who has the legal or rightful title to property.

E 2135, E53

oxbow lake—a lake formed when a meander bend is cut off and its ends filled in, thus isolating the lake from the main channel of the stream.

D 4410, D19

oxic, adj—an environment with a sufficient partial pressure of oxygen to support aerobic growth.

D 4175, D02

oxidant compatibility, n—the ability of a substance to coexist at an expected pressure and temperature with both an oxidant and a potential source(s) of ignition within a risk parameter acceptable to the user.

G 126, G04

oxidant index, n—the minimum concentration of an oxidant, such as oxygen, nitrous oxide, or fluorine, expressed as a volume percent, in a mixture of the oxidant with a diluent, such as nitrogen, helium, or carbon dioxide, that will just support sustained combustion of a material initially at given conditions of temperature, pressure, flow conditions, and propagation direction (see *oxygen index*).

G 126, G04

oxidation—a reaction in which electrons are removed from a reactant. Sometimes, more specifically the combination of a reactant with oxygen.

B 374, B08

oxidation, n—*of engine oil*, the reaction of the oil with an electron acceptor, generally oxygen, that can produce deleterious acidic or resinous materials often manifested as sludge formation, varnish formation, viscosity increase, or corrosion, or a combination thereof.

D 4175, D02

oxidation—loss of electrons by a constituent of a chemical reaction. (Also refers to the corrosion of a metal that is exposed to an oxidizing gas at elevated temperatures.)

G 15, G01

oxidation grain size—(1) grain size determined by holding a specimen at a suitably elevated temperature in a mildly oxidizing atmosphere. The specimen is polished before oxidation and etched afterwards.

(2) refers to the method involving heating of polished steel specimen to a specified temperature, followed by quenching and repolishing. The grain boundaries are sharply defined by the presence of iron oxide. Grain size is expressed as an ASTM Number.

E 7, E04

oxidation inhibitor—any substance added to an insulating fluid to improve its resistance to deleterious attack in an oxidizing environment. For example, 2,6-ditertiary-butyl paracresol is sometimes added to petroleum insulating oil to improve its oxidation stability.

D 2864, D27

oxidation life—a measure of the ability of an insulating liquid to resist oxidation under a prescribed set of conditions. Often the changes in color, neutralization number, interfacial tension, initial appearance of sludge, or rate of sludge formation are the criteria used to measure this quality.

D 2864, D27

oxidation of carbon, n—the chemical combination of carbon with oxygen or oxygen-containing compounds.

C 709, D02

oxidation of carbon, n—the chemical combination of carbon with oxygen or oxygen-containing compounds.

D 4175, D02

oxidation-reduction potential, n—the electromotive force developed by a noble metal electrode immersed in the water, referred to the standard hydrogen electrode.

D 1129, D19

oxidation-reduction potential—the electromotive force developed by a noble metal electrode immersed in the water, referred to the standard hydrogen electrode.

D 6161, D19

oxidation stability—see **oxidation life**.

D 2864, D27

oxidative induction time, OIT—an accelerated aging index for relative resistance to oxidative decomposition.

E 1142, E37

oxidatively degradable plastic, n—a degradable plastic in which the degradation results from oxidation.

D 883, D20

oxidatively degradable plastic, n—See **degradable plastic**.

D 883, D20

oxide film replica—See **replica**.

E 7, E04

oxide network, n—continuous or discontinuous oxides that follow prior particle boundaries.

B 243, B09

oxide type inclusions—oxide compounds occurring as non-metallic inclusions in metals usually as a result of deoxidizing additions. In wrought products, that is, steel, they may occur as a “stinger” formation composed of distinct granular or crystalline appearing particles.

E 7, E04

oxidized—darkened or dulled by surface treatment or by the natural oxidizing of metal.

F 547, F16

oxidized coal—see **weathered coal**

D 121, D05

oxidizing agent—a compound that causes oxidation, thereby itself becoming reduced.

B 374, B08

oxidizing agent—a batch ingredient that raises the state of oxidation of the melt.

C 162, C14

oxycelluloses—water-insoluble substances formed by the action of oxidizing agents on cellulose. The chemical nature of oxycelluloses varies with the oxidant used, and the type is indicated by attaching the name of the oxidant adjectivally to “oxycelluloses” as in “hypochlorite oxycelluloses.” Any such mixture is “an oxycellulose” and the word should not be used in the singular without either the definite or indefinite article. In many respects, the phrases “oxidized cellulose” or “partially oxidized cellulose” are preferable.

D 1695, D01

oxygenate, n—an oxygen-containing ashless organic compound, such as an alcohol or ether, which may be used as a fuel or fuel supplement.

D 4175, D02

oxygen compatibility (also oxidant compatibility), n—the ability of a substance to coexist with both oxygen and a potential source(s) of ignition at an expected pressure and temperature with a magnitude of risk acceptable to the user.

G 126, G04

oxygen consumption principle, n—the expression of the relationship between the mass of oxygen consumed during combustion and the heat released.

E 176, E05

oxygen consumption principle, n—the expression of the relationship between the mass of oxygen consumed during combustion and the heat released.

E 176, E05

oxygen demand, n—the amount of oxygen required, under the specified test conditions for the oxidation of waterborne organic and inorganic matter.

D 1129, D19

oxygen demand—the amount of oxygen required for the oxidation of waterborne organic and inorganic matter under the specified test conditions.

D 6161, D19

oxygen depletion, n—*in a fire*, reduction of oxygen (O₂) content of an atmosphere as a result of combustion.

E 176, E05

oxygen-enriched, adj—containing more than 25 mole percent oxygen.

G 126, G04

oxygen-free copper, extra-low phosphorus—oxygen-free copper containing 0.001 to 0.005 % phosphorus. The copper is not readily susceptible to hydrogen embrittlement, as determined in Specification B 379. The copper in the annealed condition has a minimum conductivity of 98.16 % IACS.

B 846, B05

oxygen-free copper, low phosphorus—oxygen-free copper containing 0.005 to 0.12 % phosphorus. The copper is not susceptible to

hydrogen embrittlement, as determined in Specification B 379. The copper in the annealed condition has a minimum conductivity of 90 % IACS.

- deoxidized, phosphorus-arsenical copper
- arsenical, tough-pitch copper
- silver-bearing copper
- sulfur-bearing copper
- deoxidized phosphorus-tellurium copper
- zirconium-bearing copper
- tellurium-bearing copper

NOTE—Coppers listed contain the designated element or elements in amounts as agreed upon between the manufacturer or supplier and the purchaser.

B 846, B05

oxygen-free electronic copper—high-purity, high-conductivity oxygen-free copper normally intended for electronic applications. The copper has high resistance to hydrogen embrittlement, as determined in Specification B 170. The copper in the annealed

condition has a minimum electrical conductivity of 101 % IACS.

B 846, B05

oxygen index, *n*—minimum concentration of oxygen in a mixture of oxygen and nitrogen that will just support flaming combustion of a material under specified conditions.

E 176, E05

oxygen index, *n*—the minimum concentration of oxygen, expressed as a volume percent, in a mixture of oxygen and nitrogen that will just support sustained combustion of a material initially at room temperature under the conditions of Test Method D 2863 (see Test Method D 2863).

G 126, G04

oxygen number, *n*—*for plumage*, a measure of the degree of cleanliness; the amount of oxidizable water soluble and fine suspended matter present in a water extract.

D 123, D13

oxygen number, *n*—*for plumage*, a measure of the degree of cleanliness; the amount of oxidizable water soluble and fine suspended matter present in a water extract.

D 7022, D13

ozone—a very active form of oxygen that is produced by corona, arcing, or ultraviolet rays.

F 819, F18

ozone cutting and checking—cracks produced by ozone in a material under mechanical stress.

F 819, F18

P

P—in *electromagnetics*, symbol for radiant power. **D 4175, D02**
“P”—a letter code. See **upholstery cleaning instructions**.
D 5253, D13
“P”—professionally clean only, an alternate to the **“S”** dry cleaning term although not in customary usage. **D 5253, D13**
P—concentrated load, lbf (or N) **E 631, E06**
P—concentrated load applied at the top edge of the wall at the selected reference displacement, in newtons (pound-force).
E 631, E06
P—effective pair production content. *P* is the percent background exposure caused by pair production in 2 mm of lead. **E 1316, E07**
P—applied load **F 2078, F07**
PA—abbreviation for **program attention**. **F 1457, F05**
PAC—powdered activated carbon or poly-aluminum chloride.
D 6161, D19
PACI—poly-aluminum chloride. **D 6161, D19**
pack—(1) the quantity of ware packed.
(2) the ratio of packed ware to theoretical. **C 162, C14**
pack, n—the final configuration of material with necessary protection afforded for the distribution system.
blister pack, n—encapsulation of an item inside a preformed semi-rigid transparent, or opaque plastic bubble that is affixed to a semi-rigid backing.
exterior pack—a **container, bundle**, or assembly that is sufficient by reason of material, design, and construction to protect its contents during shipment or storage.
intermediate pack—in *packaging*, a **wrap, box, or bundle** that contains two or more unit packs of identical items, and that is in turn enclosed by an outer **shipping container**.
D 996, D10
pack, v—to place material into a container for handling, storage, and transportation. **D 996, D10**
packability, n—for *inflatable restraints*, the compressibility of a folded airbag cushion relative to the space available in an airbag module. **D 6799, D13**
package—(1) *n*, a container providing means of protection and handling to a product; (2) *v*, to design, manufacture, or provide protection to a product; (3) *when referring to a fiber container*, a container not necessarily complying with all the requirements for a “box” in accordance with the *Uniform Freight Classification* and *National Motor Freight Classification*; (4) *when referring to a fiber container*, one of the special authorized containers described in detail in the Classifications in the section titled “Authorized Packages or Shipping Containers,” of the above Freight Classifications.
aerosol package—a package that contains in addition to its contents, a gas under pressure. It is fitted with a valve which enables the contents to be dispensed.
consumer package—a primary container (which may be enclosed in a secondary container) designed to contain, store, and protect from the point of manufacture to the point of use, a product intended for household or individual use. (See *unit package* under **package**.)
industrial package, n—a package used for the transportation or storage of commodities, the contents of which are not meant for retail sale without being repackaged.
intermediate package—a wrap, box, or bundle (that is, a container) that contains two or more unit packages of identical items (also called a *secondary package*).
primary package—a container in direct contact with and enclosing the product along with any required protective material(s).
secondary package, n—a container enclosing one or more primary packages along with any required protective material(s).
unit package—the first tie, wrap, or container applied to a single

item, a quantity of the same item, a set, or an item with all its component parts, that constitutes a complete and identifiable package containing the unit of issue of a product for ultimate use (also called a *primary package*).
D 996, D10

package, v—to prepare goods for distribution by enclosing in a container or covering. (See *Terminology D 996*.) **D 1968, D06**
package—a container providing protection to a product during distribution, storage, retailing, and use. **F 1479, F02**
packaged building—Use **manufactured building** or **precutbuilding**.
E 631, E06
package integrity—the physical capability of a given package to protect its contents with the desired level of protection over a defined period of service; for example, as a barrier to physical, microbiological, or chemical challenges. **F 1327, F02**
package material, n—each separate and distinct material which by itself or in combination with other materials, forms a package component. **D 996, D10**
package or outside package—a package plus its contents.
D 5681, D34
package source reduction, n—the reduction of the weight or volume of the packaging materials used in a package containing an equivalent product. **D 996, D10**
package testing:
bursting strength—the strength of a material in pounds-force per square inch (or kilopascals), measured by the Cady or Mullen tester. (See **Cady test**, and **Mullen test**.)
bursting strength test—a test for measuring the resistance of a material to bursting measured in pounds per square inch (or kilopascals). (See **Mullentester**.)
Cady test—a test for **bursting strength** made on a specific type of machine.
caliper—(1) *n*, thickness (as related to **paperboard**) of a sheet measured under specified procedures expressed in thousandths of an inch (or millimetres). Thousandths of an inch are sometimes termed “points”; (2) *n*, the precision instrument used in the paperboard industry to measure thickness; (3) *v*, to measure with a caliper.
compression test—a test for measuring resistance to external compressive forces. (See **loading**.)
drop test—a test for measuring the durability of an article, or the protection, or the retention properties of a container, or all three by subjecting the packaged product to a free fall from predetermined heights onto a surface with prescribed characteristics.
Elmendorf test—a test for measuring the tearing resistance of tape, paperboard, or other materials.
incline impact (Conbur) test—a test for determining principally the resistance of a packaged product to damage from impacts.
Mullen test—a test for bursting strength made on a specific type of machine.
puncture test—(1) a test for measuring the resistance of board to puncture; (2) the strength of a material, primarily involving tear and stiffness, expressed in units as measured by the puncture tester.
revolving drum test—a test for measuring the protection to contents, or the retention properties of a container, or both, by subjecting the packaged products to rough handling in a standard revolving drum.
testing machine compression—in *package testing*, an imposed force in motion applied at a predetermined rate and condition until a predetermined end point is achieved. **D 996, D10**
package unit, n—in *pipe laying*, several units of pipe bound together for the purpose of being transported and, when desired, unloaded at the job site. **C 1154, C17**
package unit, n—for *pipe laying*, several units of asbestos-cement

- pipe bound together for the purpose of being transported and, when desired, unloaded at the job site. **D 2946, C17**
- packaging, *n***—(1) the technique of preparing goods for distribution; (2) the design criteria, processes, and procedures used to protect material from deterioration and damage from the time manufacturing is completed until ultimate use or disposal; (3) the processes and procedures used to protect an item in a unit package.
- bulk packaging**—(1) a method of containing loose or granular materials for shipping or storage, (2) a method of assembling many items into a **container** for shipment or storage.
- child-resistant packaging**—packaging designed or constructed to be significantly difficult for most children under 5 years of age to open, or to obtain a toxic or harmful amount of the contents within a reasonable time; and not difficult for normal adults to use properly.
- commercial packaging**—the methods and materials used by a supplier to satisfy the requirements of the distribution system.
- foam-in-place packaging**—See **cushioning material**.
- industrial packaging**—packaging of partially manufactured or finished goods for distribution from manufacturer to manufacturer, and to users other than retail customers.
- molded pulp**—a type of **packaging** which has been formed from wet paper pulp to predetermined shape to generally fit one or more individual items. Used as apple trays, egg flats, egg carton. (See **molded shape**.)
- skin packaging**—a process whereby a product placed on a backing material is covered by a closely fitting thermoplastic film bonded to the backing material.
- vacuum packaging**—the technique of **packaging in containers** from which substantially all air has been removed prior to sealing. **D 996, D10**
- packaging, *n***—(See Terminology D 996.) **D 1968, D06**
- packaging**—See Terminology D 996. **D 5077, D10**
- packaging**—a receptacle and any other components or materials (drums, boxes, liners, absorbents, etc.) necessary for the receptacle to perform its containment function in conformance with the minimum packing requirements of 40 CFR 171, 172, 173. **D 5681, D34**
- packaging**—See Practices A 700 for Packaging, Marking, and Loading Methods for Steel Products for Domestic Shipment. **F 547, F16**
- packaging material, *n***—any material intended to contain and protect a raw material, intermediate, API, or product during storage and transport. **E 2363, E55**
- pack cementation**—in **diffusion coatings**, a coating process similar to pack carburizing that involves packing the parts to be coated into a retort with a carefully blended mixture of powders and then exposing the pack under hermetically sealed conditions or in an inert atmosphere to elevated temperatures. **B 374, B08**
- packed distillation column**—a column or tube constructed with internals of ceramic, steel, or fiberglass-type materials to separate one or more volatile liquids by distillation. **E 1705, E48**
- packer**—in **grouting**, a device inserted into a hole in which grout or water is to be injected which acts to prevent return of the grout or water around the injection pipe; usually an expandable device actuated mechanically, hydraulically, or pneumatically. **D 653, D18**
- packer hides**—hides from meatpacking houses. **D 1517, D31**
- packer (monitoring wells)**—a transient or dedicated device placed in a well that isolates or seals a portion of the well, well annulus, or borehole at a specific level. **D 653, D18**
- pack-hardened, pack-carburized**—See **case-hardened**. **F 547, F16**
- packing, *n***—the selection or construction of the **shipping container** and assembling of items or **packages** therein, including any necessary **blocking, bracing, or cushioning**, weatherproofing, exterior **strapping**, and **marking** of shipping container for identification of contents. (Compare **packaging**).
- absorbent packing, *n***—a material included within a **package** to soak up liquids resulting from leakage or liquefaction of contents.
- interior (inner) packing**—material or parts used in supporting, positioning, or cushioning an item in its outer shipping container. (See also **buffer, cushioning material, divider, liner, separator**.)
- saddle, *n***—a form of **interior packing** shaped to fit the article in order to increase the area of contact between the **blocking** and the article.
- shell, (when referring to a fiberboard packaging), *n***—a specific form of inner **packing** consisting of a sheet of **corrugated** or **solid fiberboard** scored and folded to form a joined or unjoined **tube** open at both ends. **D 996, D10**
- packing leather**—see **hydraulic leathers**. **D 1517, D31**
- packing material, *n***—any material in which compacts are embedded during the presintering or sintering operation. **B 243, B09**
- packing (mechanical), *n***—a deformable material used to prevent or control the passage of matter between surfaces that move in relation to each other. **D 1566, D11**
- pac leather**—highly water-resistant leather used by lumbermen, hunters, and others for outdoor wear. **D 1517, D31**
- pad, *n***—(when referring to a **fiberboard container**) a **corrugated** or **solid fiberboard** sheet or other authorized material used for extra protection or for separating tiers or layers of articles when packed for shipment. (Compare **buffer, divider, separator**). See **cushioning material**. **D 996, D10**
- pad character, *n***—See **filler character**. **F 1294, F05**
- pad clean, *v***—clean using an absorbent pad. **D 5253, D13**
- paddle mixer**—a mixer consisting essentially of a trough within which mixing paddles revolve about the horizontal axis, or a pan within which mixing blades revolve about the vertical axis. **D 653, D18**
- paddling, puddling**—{archaic} the rough shaping of a piece of glass in a furnace by means of paddles or tools preparatory to the pressing operation for making optical glass blanks. **C 162, C14**
- page**—a form on which many lines of data may be entered for reading by a page reader. Pages are larger in size than **documents**. **F 149, F05**
- page coverage**—a term used to describe the percentage of printed area to non-printed area on a page within a specified area of the page. **F 335, F05**
- page reader**—an electronic machine capable of reading full pages of printed data. **F 149, F05**
- pail, *n***—a **container**, usually cylindrical, with a handle, available in sizes of about 1 to 12 gal (3 to 50 L). **D 996, D10**
- pail**—a small container, usually with a capacity of 5 U.S. gal (19 L). Pails typically have bungs or spouts, or the entire lid can be removed. **D 5681, D34**
- paint, *n***—in **general**, a pigmented coating. **E 631, E06**
- paint brush, *n***—a paint application tool consisting of a flexible brushing part composed of long filamentary material (brushing material) bound to a handle. **D 16, D01**
- paint brush bristle, *n***—hair of the swine (for example: pig, hog, boar), used in brushing material. **D 16, D01**
- paint brush ferrule, *n***—outer band that joins the brushing material to the handle. **D 16, D01**
- paint brush filament, *n***—a synthetic polymer extrusion used in brushing material. **D 16, D01**
- paint brush head, *n***—brush without the handle. **D 16, D01**
- paint brush length clear, *n***—also called “length out,” the exposed length of the brushing material from the ferrule to the tip end. **D 16, D01**
- paint brush thickness, *n***—measurement of the brushing material across the narrow opening of the ferrule. **D 16, D01**

paint chip sample

paint chip sample—a fragment of a dry paint film removed from the substrate. **E 631, E06**

paint collection container—a sealable rigid walled container. **E 631, E06**

paint collection tray—any clean, dry, lead-free container for use in catching paint scrapings. **E 631, E06**

painted—coated with paint or plastic by dipping or barrel-tumbling. **F 547, F16**

painted debris, n—for **clearance examination**, pieces of construction waste completely or partially coated with paint. **E 1605, E06**

painted element—a painted architectural or building component.

pane, n—use **lite**.

pane—See **windows and doors**. **E 631, E06**

painting history, n—A record of all paint layers that have been applied to a building **component** as determined by either documentation or professional judgement. **E 1605, E06**

paint-lead hazard, n—a source of adverse effects on human health due to the presence of lead in deteriorated paint on all building surfaces or lead in paint on chewable surfaces, friction surfaces resulting in dust lead levels of adjacent horizontal surfaces above regulatory dust-lead values, or impacted surfaces. **E 1605, E06**

paint n, general—a pigmented coating. See **coating**. **D 16, D01**

paint n, specific—a classification sometimes employed to distinguish pigmented drying oil coatings (“paints”) from synthetic enamels and lacquers.

emulsion paint—a paint, the vehicle of which is an emulsion of binder in water. The binder may be oil, oleoresinous varnish, resin, or other emulsifiable binder.

latex paint—a paint containing a stable aqueous dispersion of synthetic resin, produced by emulsion polymerization, as the principal constituent of the binder. Modifying resins may also be present.

oil paint—a paint that contains drying oil or oil varnish as the basic vehicle ingredient.

paste paint—a paint in which the pigment is sufficiently concentrated to permit a substantial reduction with vehicle before use.

water paint—a paint, the vehicle of which is a water emulsion, water dispersion, or ingredients that react chemically with water. **D 16, D01**

paint pad, n—a paint application tool consisting of short filamentary material usually bonded to a flat, resilient backing connected to a handle designed to apply paint by a wiping action. **D 16, D01**

paint residue—dry or chemically softened paint that remains on a surface after initial paint removal. **E 631, E06**

paint roller, n—a complete paint application tool consisting of a roller frame and a roller cover designed to apply paint by a rolling action. **D 16, D01**

paint roller core, n—a structural tube that forms the base of the roller cover to which paint applying material is attached. **D 16, D01**

paint roller cover, n—a tubular sleeve consisting of a paint applying material secured to a core. **D 16, D01**

paint roller cover pile height, n—also called “nap length;” the length of the roller cover paint applying material from pile backing to pile face. **D 16, D01**

paint roller frame, n—a frame and handle assembly designed to hold a roller cover. **D 16, D01**

paint scrapings—waste material consisting of paint removed by wet or dry scraping during an abatement process. **E 631, E06**

paint vb—to apply a thin layer of a coating to a substrate by brush, spray, roller, immersion, or any other suitable means. **D 16, D01**

paired comparison, n—a method in which stimuli are presented in pairs for comparison on the basis of some defined criterion. **E 253, E18**

pair production—a process that corresponds to the creation of an electron-positron pair by the interaction of a gamma ray in the field of a nucleus. The energy of the gamma ray must exceed 1.022 MeV (twice the rest mass of an electron). **E 170, E10**

pair production—the process whereby a gamma photon with energy greater than 1.02 MeV is converted directly into matter in the form of an electron-positron pair. Subsequent annihilation of the positron results in the production of two 0.511 MeV gamma photons. **E 1316, E07**

pair production—the process whereby a gamma photon with energy greater than 1.02 MeV is converted directly into matter in the form of an electron-positron pair. Subsequent annihilation of the positron results in the production of two 0.511 MeV gamma photons. **E 1316, E07**

pajamas, n—a two piece ensemble consisting of a top and a bottom generally used for, but not limited to, nightwear. **D 123, D13**

pajamas, n—a two piece ensemble consisting of a top and a bottom generally used for, but not limited to, nightwear. **D 7022, D13**

palatable, adj—sufficiently pleasant to be consumed. **E 253, E18**

paleosol—an ancient soil or soil horizon that formed on the earth’s surface during the geologic past. **D 7099, D18**

palladium barrier leak detector—a leak detector using hydrogen as the tracer gas and using the principle of hydrogen diffusing through a hot palladium barrier into an evacuated vacuum gage. **E 1316, E07**

pallet, n—horizontal platform device used as a base for assembling, storing, handling, and transporting materials and products in a unit load. (Compare **skid, dolly**.)

expendable pallet—a **pallet** intended to be discarded after a single use.

reusable pallet—a **pallet** intended for more than one shipment (reusable for economic life).

stringer, n—a wooden member to which the face or faces of a **pallet** or the deck of a platform are fastened and running at right angles to the members making up the face or the deck. **D 996, D10**

palletized load—See **load**. **D 996, D10**

palletized unit load—See **load**. **D 996, D10**

pallet nail—bright, stiff-stock or hardened-steel, helically threaded (with medium lead angle) or annularly threaded, 1½ by 0.105 to 4 by 0.177-in. nails with smooth or checkered flat ⅜ to ⅞-in. head and medium or blunt diamond or blunt chisel point. **F 547, F16**

palsa—a peaty permafrost mound possessing a core of alternating layers of segregated ice and peat or mineral soil material. **D 7099, D18**

palsa bog—a poorly-drained lowland underlain by organic-rich sediments, which contains perennially frozen peat bodies (peat plateaux) and occasionally palsas. **D 7099, D18**

panchromatic—sensitive, as a film or plate, to light of all hues. **E 7, E04**

pane, n—See **lite**. **C 717, C24**

panel—cut stone with face dimensions large in relation to its thickness, for placement in a building structure or frame assembly. **C 119, C18**

panel—a sheet of plywood of any construction. **D 1038, D07**

panel, n—a group of assessors chosen to participate in a sensory test. **E 253, E18**

panel, n—in a building, (1) a portion of a surface flush with or recessed from, or sunk below the surrounding area, sometimes set off by distinct molding or other decorative measure. (2) a usually flat and rectangular piece of construction material made to form part of a surface (as of a **wall**, ceiling, or **floor**). (See also **railing systems** and **windows and doors**.)

panelized construction—See **building constructions**.

passive solar energy system—See **building subsystem**.

pattern—see **components pattern**. **E 631, E06**

panel, n—a flat infill element between a top rail, bottom rail, and posts. **E 1481, E06**

panel clamp—a two-piece clamp with carriage bolt and nut, designed to secure prefabricated panels on free standing enclosures. **F 552, F14**

panelist, n—See **assessor**. **E 253, E18**

panelized construction—a building method using **panels** as major elements. **E 631, E06**

panel member, *n*—See **assessor**. **E 253, E18**

panel, *n*—(1) a **face** or **side** of a **box** or **crate**, (2) any flat area between folds, or edges of a **box**, **carton**, or interior part. **D 996, D10**

pan head—flat head with rim having rounded upper edge and squared lower edge, usually slotted. **F 547, F16**

pan mixer—a mixer comprised of a horizontal pan or drum in which mixing is accomplished by means of the rotating pan of fixed or rotating paddles, or both; rotation is about a vertical axis. **D 653, D18**

pans—containers used to hold the food product in the oven capacity: (1) a full-size bake pan is nominally 18 by 26 by 1 in. (457 by 660 by 25 mm), (2) a half size bake pan is nominally 18 by 13 by 1 in. (457 by 330 by 25 mm), and (3) a steam pan is nominally 12 by 20 by 2.5 in. (305 by 508 by 64 mm). **F 1827, F26**

paper:

creped duplex paper—a double sheet composed of two layers of **creped paper** united with asphalt, latex, or other adhesives, generally with 20, 25, or 30-lb paper and 20, 25, or 30 lb of laminating material.

creped paper—paper, usually **kraft** (bleached sulfate) in various basis weights, that has been machined to resemble crepe and thus has stretch. It is used for wrapping purposes and for bag and barrel **liners**.

water-resistant paper—paper that is treated by the addition of materials to provide a degree of resistance to damage or deterioration by water in liquid form.

wet-strength paper—paper that has been treated with chemical additives to aid in the retention of resistance to bursting, tearing, or rupturing when wet. **D 996, D10**

paper acidity, *n*—the extent to which water-soluble materials in paper alter the hydrogen-hydroxyl ion equilibrium of reagent water causing an excess of hydrogen ions, as measured by titrating with a standardized solution of alkali under specified conditions. **D 1968, D06**

paper alkalinity, *n*—the extent to which water-soluble materials in paper alter the hydrogen-hydroxyl ion equilibrium of reagent water causing an excess of hydroxyl ions, as measured by titrating with a standardized solution of acid under specified conditions. **D 1968, D06**

paper bleed, *n*—an optical phenomenon that causes bars to appear larger and spaces to appear narrower than actually printed because of the scattering of incident light rays within the media. **F 1294, F05**

paperboard, *n*—one of the two broad subdivisions of paper (general term, the other being paper as specific term). Paperboard is, in general, heavier and thicker than paper and is constructed primarily for strength properties such as stiffness, tearing resistance and the like. Sheets with thickness greater than 0.010 in. (0.25 mm) (with some exceptions) fall in this class. (See also **containerboard**.)

*boxboard, *n**—a general term designating the grades of **paperboard** used for fabrication of folding and set-up **boxes** (**cartons**). Customarily shipped in sheets.

*chipboard, *n**—a **paperboard** generally made from reclaimed paper stock.

*finish, *n**—in packaging, a term descriptive of the surface of **paperboard** depending on the final machining in manufacture:

(1) *dry finish*—not dampened before going through the calender rolls. The surface is not as dense nor as smooth as water-finished board;

(2) *water finish*—dampened on one (or both) sides in the calendering opening to provide a relatively hard and glossy finish.

*kraft, *n**—a term (derived from a German word meaning strength) applied to pulp, paper, or **paperboard** produced

from virgin wood fibers by the sulphate process.

*linerboard, *n**—(1) **paperboard** used for the flat facings in **corrugated fiberboard**; also paperboard used as the outer plies of solid fiberboard, (2) **containerboard** made of blends of reworked paper fibers usually made on cylinder machines but can be made on Fourdrinier or Inverform machines. It is sometimes called **jute**—a misnomer, since jute fibers are no longer used (See **facings**.) **D 996, D10**

paperboard—one of the two broad subdivisions of paper (general term), the other being paper (specific term). The distinction between paperboard and paper is not sharp but, broadly speaking, paperboard is heavier in basis weight, thicker and more rigid than paper. In general, all sheets 12 points (0.012 in., 3.0 mm) or more in thickness are classified as paperboard. There are a number of exceptions based upon traditional nomenclature. For example, blotting paper, felts, and drawing paper in excess of 12 points are classified as paper while corrugating medium, chipboard, and linerboard less than 12 points are classified as paperboard. Paperboard is made from a wide variety of furnishes on a number of types of machines, principally cylinder and fourdrinier. The board classes are: (1) containerboard, which is used for corrugated boxes; (2) boxboard, which is principally used to make cartons; and (3) all other paperboard. **D 1968, D06**

paperboard blank—a flat piece of **paperboard** that has been cut to size, die-cut, corner cut, scored, printed, or otherwise prepared and ready to be formed or folded and joined, or the flat pieces of parts thereof. **D 996, D10**

paperboard step—a term applied to trays, shells, or platforms positioned inside a **container** to raise one portion of contents higher than others. It may be attached to a lid for the purpose of holding certain articles positioned when the lid is in closed position. **D 996, D10**

paperboard stop—pieces of **boxboard** attached to the inside surface of the ends of a set-up paper box lid to hold the base in proper position when the height of the base is less than the height of the lid. **D 996, D10**

paperboard tube—See **tube**. **D 996, D10**

paper grain—the paper machine direction of paper. **F 149, F05**

paper grain direction—see **paper machine direction**. **F 149, F05**

paper linting, *n*—the picking off of loosely bonded paper surface fibers, or dust, or both, that can accumulate on an offset plate or blanket interfering with print quality. **D 6488, D01**

paper machine direction—the direction of paper grain parallel with the direction of movement on the paper machine. It is also called *grain direction*. The direction at right angles to the paper machine direction is called the *cross-machine direction*, or simply, *cross direction*. **F 149, F05**

papermaker's felt, *n*—a fabric, made from wool or man-made fibers or mixtures of both, fabricated as an endless belt for use on a paper making machine. (See also *felt* and *needled felt*.) **D 123, D13**

papermaker's felt, *n*—a fabric, made from wool or man-made fibers or mixtures of both, fabricated as an endless belt for use on a paper making machine. (See also *felt* and *needled felt*.) **D 4845, D13**

paper manifold set—a business form prepared by interleaving one-time carbon paper and a receiving paper to give the number of parts required for comparison. A standard test set is 8 ½ by 11 in. (21.59 by 27.94 cm) and most frequently contains six plies six bond sheets, usually 12 lb (17 by 22-500) (45 g/m²) and five carbons, usually 8 lb (20 by 30-500) (18.75 g/m²). (F 497) **F 221, F05**

paper manufacturing process, *n*—an operation that begins with the pulping of fibrous and nonfibrous raw materials and ends after the first slitter/winder, with the cutting and trimming of the reel into smaller rolls. In an operation in which the finished product is sheeted directly off the machine, the production of rough sheets constitutes the end of the process. In an operation that involves supercalendering, the end of the process is at the slitter/winder

paper manufacturing process, *n*

following the supercalendar. In an operation that involves off-machine coating, the process ends at the slitter/winder following the coater or the supercalendar associated with the coater.

D 1968, D06

paper mill sludge, *n*—a slurry of solid residues from a paper mill's waste water treatment system containing fibers and other material.

D 1968, D06

paper multiwall-sack—See **bag**.

D 996, D10

paper, OCR—paper used in OCR systems; refer to ANSI X3.62-79.

F 149, F05

paper product, *n*—any item manufactured from paper or paperboard.

D 1968, D06

paper smoothness—the degree of irregularity of the surface of paper determined by the measurement of the flow of air between the paper surface and a plain surface under specified clamping and air pressure. The resistance to air flow increases as the paper goes from rough to smooth. With an instrument measuring the rate of flow, as the paper goes from rough to smooth, the number rating goes down. With an instrument measuring the time for a given volume to flow, as the paper goes from rough to smooth, the number rating increases.

F 149, F05

paper wall covering, *n*—a wall covering with a top layer consisting of paper or an alternative cellulosic-based material, but not consisting of a wood product.

E 176, E05

paper weight—see **basis weight**.

F 149, F05

paperwork—all required site documentation, which may include the manifests, waste profiles, material safety data sheets (MSDS), site forms, sample labels, custody seals, and chain of custody forms.

D 5681, D34

paraffinic oil, *n*—a hydrocarbon process oil, most or all of which is composed of alkanes

D 1566, D11

paraffinic oil—a term applied to mineral insulating oil derived from crudes having substantial contents of naturally occurring *n*-paraffins (wax). Such an oil must be dewaxed and may need the addition of a pour depressant in order to exhibit a low pour point.

D 2864, D27

paraffinic oil—a petroleum oil (derived from paraffin crude oil) whose paraffinic carbon type content is typically greater than 60 %.

E 1519, E35

parallax factor (used in electron stereomicroscopy)—parallax factor (*f*) is the rate of change of elevation with respect to parallax:

$$f = dx/dy = \csc \sigma / 2M \times 10^3 \mu\text{m}/\text{mm}$$

x = elevation

y = parallax, the apparent lateral displacement of an image point.

where σ is the stereo angle and *M* is the final magnification of the image.

E 7, E04

parallel communication, *n*—the transmission system where code for a character is sent over a set of channels, all bits at once, one bit per channel. (See **serial communication**.)

F 1457, F05

parallel-core conductor—see **concentric-lay conductor**. **B 354, B01**

parallel laminate—a laminate in which all the layers of material are oriented approximately parallel with respect to the grain or strongest direction in tension. (See also **cross laminate**)

D 883, D20

parallel laminate, *n*—see **parallel laminate** under **laminate, *n***.

D 907, D14

parallel laminate—a laminate in which all the layers of material are oriented approximately parallel with respect to the grain or strongest direction in tension. (See also **cross laminate**.) (D20)

F 412, F17

paramagnetic material—a material having a relative permeability which is slightly greater than unity, and which is practically independent of the magnetizing force.

A 340, A06

paramagnetic material—a material that has a relative permeability

slightly greater than unity and that is practically independent of the magnetizing force.

E 1316, E07

parameric, *adj*—pertaining to specimens having different spectrophotometric curves that produce approximately the same color sensation under the same illuminating and viewing conditions. (See also **metameric**.)

E 284, E12

paramerism, *n*—phenomenon in which specimens having different spectrophotometric curves produce approximately the same color sensation under the same illuminating and viewing conditions. (See also **metamerism**.)

E 284, E12

paramers, *n*—specimens having different spectrophotometric curves that produce approximately the same color sensation under the same illuminating and viewing conditions. (See also **metamers**.)

E 284, E12

parameter, *n*—*in statistics*, a variable that describes a characteristic of a population or mathematical model.

D 123, D13

parameter—*in statistics*, a constant (usually to be estimated) defining some property of the population frequency distribution, such as the population median or the population standard deviation.

E 1823, E08

parameter (in crystals)—See **lattice parameter**.

E 7, E04

parameter quality, *n*—*in construction planning, design, specification, estimating, and cost analysis*, is a measure of the amount (quality) of work included within a **group element, element, or sub-element**, or any combination thereof, which, using standard metrics, ensures consistent **elemental cost analysis** preparation.

E 833, E06

parametric, *adj*—a term referring to a statistical technique that assumes the nature of the underlying frequency distribution is known.

D 123, D13

parametric release, *n*—a system of release that gives assurance that the product is of the intended quality based on the information collected during the manufacturing process.

E 2363, E55

parametric system, *n*—a system that uses the response of a sensor to produce an output that is correlatable with the selected parameter.

D 1129, D19

parasite—an organism living in or on another living organism, obtaining from it part or all of its nutriment.

E 609, E35

para-xylene—1,4-dimethylbenzene (C₈H₁₀) mol weight 106.16; clear, colorless, flammable liquid; freezing point, 13.26°C; boiling point, 137 to 138°C.

D 4790, D16

parchment—tanned sheepskins. Vellum is practically the same as parchment except it is made from calfskins. In addition to its use as "parchment" for diplomas and records, it is also utilized for banjo and drum heads, lampshades, etc.

D 1517, D31

parent coil or plate, *n*—coil of sheet or a plate that has been processed to final temper as a single unit and may subsequently be cut into two or more smaller coils or into individual sheets or smaller plates to provide the required width and length.

B 881, B07

parent material—material from which a soil has been derived.

D 653, D18

parfocal eyepiece—see **eyepiece, parfocal**.

E 175, E41

parison—a preliminary shape or blank from which a glass article is to be formed.

C 162, C14

parison, *n*—the shaped plastic mass, generally in the form of a tube, used in blow molding. (ISO)

D 883, D20

parison, *n*—the shaped plastic mass, generally in the form of a tube, used in blow molding. (D20, ISO)

F 412, F17

parison mold—See **blank mold**.

C 162, C14

parity, *n*—a system for encoding characters as 'odd' (having an odd number of binary ones in their structure) or 'even' (having an even number of binary ones in their structure), used as a self-checking mechanism in bar codes.

F 1294, F05

parity, *n*—an error checking system in which an extra bit may be added to the character data bits to show whether the number of bits in the character transmitted is even or odd.

F 1457, F05

parity error, *n*—a parity error occurs when the receiving device counts the number of bits in the received character, including the

parity bit, and finds that the number does not agree with the predetermined odd/even requirement. **F 1457, F05**

parkerized—chemically treated to provide iron and steel with dark corrosion-resistant protective coating by boiling in solution of manganese dihydrogen phosphate and subsequently applying coating of paraffin oil. **F 547, F16**

parquet flooring nail—hardened-steel, annularly threaded, 1/8 by 0.062 to 1/4 by 0.072-in. nails with deep countersunk 0.080 to 0.113-in. casing head and diamond or needle point. **F 547, F16**

part, *n*—a single item coming from a compact, either prior to or after machining. **B 899, B02**

part, *n*—in upholstered furniture, one component of a furniture unit, such as a seat, back, pillow, or arm cushion. **D 123, D13**

part, *n*—in upholstered furniture, one component of a furniture unit, such as a seat, back, pillow, or arm cushion. **D 7023, D13**

partial cleavage, *n*—in textiles, a transverse gouge, cut or other cross-wise rent in the fiber. Clearly penetrating at least the cuticle of the fiber. **D 123, D13**

partial cleavage, *n*—in textiles, a transverse gouge, cut or other cross-wise rent in the fiber. Clearly penetrating at least the cuticle of the fiber. **D 4845, D13**

partial discharge—an electrical discharge that only partially bridges the insulation between conductors. It may or may not occur adjacent to a conductor. **D 2864, D27**

partial discharge apparent power loss (P_a), *n*—the summation over a period of time of all corona pulse amplitudes multiplied by the rms test voltage.

$$P_a = I_t V_s$$

where:

P_a = apparent power loss in time interval ($t_1 - t_0$), W,

I_t = average corona current, A, and

V_s = applied rms test voltage, V.

D 1711, D09

partial discharge (corona), *n*—an electrical discharge that only partially bridges the insulation between conductors. **D 1711, D09**

partial discharge (corona) energy (W), *n*—the energy drawn from the test voltage source as the result of an individual discharge. **D 1711, D09**

partial discharge (corona) extinction voltage (CEV), *n*—the highest voltage at which partial discharges above some stated magnitude no longer occur as the applied voltage is gradually decreased from above the inception voltage. **D 1711, D09**

partial discharge (corona) inception voltage (CIV), *n*—the lowest voltage at which continuous partial discharges above some stated magnitude (which may define the limit of permissible background noise) occur as the applied voltage is gradually increased. **D 1711, D09**

partial discharge (corona) level, *n*—the magnitude of the greatest recurrent discharge during an observation of continuous discharges. **D 1711, D09**

partial discharge (corona) power loss (P), *n*—the summation of the energies drawn from the test voltage source by individual discharges occurring over a period of time, divided by that time period.

$$P = \frac{1}{T} \sum_{i=1}^{i=m} Q_i V_i$$

where:

P = discharge power, W,

T = time period, s,

m = number of the final pulse during T , and

$Q_i V_i$ = discharge energy of the i th pulse.

D 1711, D09

partial discharge (corona) pulse rate (n), *n*—the average number of

discharge pulses that occur per second or in some other specified time interval. **D 1711, D09**

partial discharge pulse, *n*—a voltage or current pulse that occurs at some designated location in a circuit as a result of a partial discharge. **D 1711, D09**

partial discharge pulse voltage (V_p), *n*—the terminal pulse voltage resulting from a partial discharge represented as a voltage source suddenly applied in series with the capacitance of the insulation system under test, and that would be detected at the terminals of the system under open-circuit conditions. **D 1711, D09**

partial discharge quantity (terminal corona charge) (Q_t), *n*—the magnitude of an individual discharge in an insulation system expressed in terms of the charge transfer measured at the system terminals. **D 1711, D09**

partial immersion thermometer, *n*—a liquid-in-glass thermometer designed to indicate temperatures correctly when the bulb and a specified part of the stem are exposed to the temperatures being measured. (Compare **complete immersion thermometer** and **total immersion thermometer**.) **E 344, E20**

partially alloyed powder, *n*—a powder in which the alloy addition or additions are metallurgically bonded to an elemental or pre-alloyed powder. **B 243, B09**

partially balanced incomplete block design (PBIB), *n*—an incomplete block design in which each block contains the same number k , of different versions from the t versions of the principal factor. **E 456, E11**

partially balanced incomplete block design (PBIB), *n*—an incomplete block design in which each block contains the same number k , of different versions from the t versions of the principal factor.

NOTE—The arrangement is such that not all pairs of versions occur together in the same number of the blocks; some versions can therefore be compared with greater precision than others. **E 1325, E11**

partially-bonded permafrost—ice-bearing permafrost in which some of the soil particles are not bonded together by ice. **D 7099, D18**

partially nested experiment, *n*—a nested experiment in which several factors may be crossed as in factorial experiments and other factors nested within the crossed combinations. **E 456, E11**

partially nested experiment—a nested experiment in which several factors may be crossed as in factorial experiments and other factors nested within the crossed combinations.

NOTE—It is not unusual to find that experiments consist of both factorial and nested segments. See **nested experiment**. **E 1325, E11**

partially oriented yarn, *n*—filament yarn in which polymer molecules are only partially aligned. **D 123, D13**

partially oriented yarn, *n*—filament yarn in which polymer molecules are only partially aligned. **D 4849, D13**

partially preformed—not fully formed prior to driving. **F 592, F16**

partial pressure—the contribution of one component of a system to the total pressure of its vapor at a specified temperature and gross composition. **E 7, E04**

partial pressure—the pressure caused by a gas, either by itself, or in the presence of other gases. When a second gas is not present, the partial pressure is the same as the total pressure. **E 1316, E07**

partial remedy, *n*—an interim or incomplete solution intended to be consistent with the expected permanent remedy for treatment, control, elimination, or management of risk associated with the release of a contaminant to the environment. **D 5681, D34**

partial replacement disc—a structure intended to restore a portion of the support and motion or a portion thereof, between adjacent vertebral bodies. **F 1582, F04**

partial sensory profile, *n*—a profile comprising certain selected attributes with their intensity values. Examples are flavor profile, odor profile, and texture profile. **E 253, E18**

partial thickness skin wound, *n*—a skin wound with the loss of the epidermis and part of the dermis, but retaining a layer of viable dermal tissue that includes the sources of epidermal cells from

partial thickness skin wound, *n*

which the wound can heal spontaneously by epidermal tissue regeneration. **F 2312, F04**

participant, *n*—in wear testing, any individual that uses a test or control textile during a wear test. **D 123, D13**

particle—a minute quantity or fragment of matter whose size and shape depend on the forces of cohesion. It is usually only a single crystal or a unit of matter with a specific gravity approximating that of a single crystal. **C 242, C21**

particle, *n*—a small discrete mass of solid or liquid matter.

*particle concentration, *n**—concentration expressed in terms of number of particles per unit volume of air or other gas.

*particle fall, *n**—a measurement of air contamination consisting of the mass rate at which solid particles deposit from the atmosphere.

*particle size, *n**—an expression for the size of liquid or solid particles expressed as the average or equivalent diameter.

*particle size distribution, *n**—the relative percentage by mass, surface area, volume, number, or other property of each of the different size fractions of particulate matter. **D 1356, D22**

particle—the aggregate component of a particle board manufactured by mechanical means from wood or other lignocellulosic material (comparable to the aggregate in concrete) including all small subdivisions of wood such as chips, curls, flakes, sawdust, shavings, slivers, strands, wood flour, and wood wool. Particle size may be measured by the screen mesh that permits passage of the particles and another screen upon which they are retained, or by the measured dimensions as for flakes and strands. **D 1554, D07**

particle, *n*—a small discrete mass of solid or liquid matter. **E 1620, E29**

particleboard corestock—common name given to particle board manufactured for use as a core for overlaying. **D 1554, D07**

particleboard panel stock—common name given to particle board manufactured primarily for use as panel material, and in which the surfaces may be treated to obtain decorative effects. **D 1554, D07**

particleboards—a generic term for a composite panel primarily composed of cellulosic materials, generally in the form of discrete pieces or particles, as distinguished from fibers, bonded together with a bonding system, and that may contain additives. **D 1554, D07**

particleboard underlayment—an underlayment grade particleboard made or machined to close thickness tolerances for use as a leveling course and to provide a smooth surface under floor covering materials. **D 1554, D07**

particle concentration—See **particle**. **D 1356, D22**

particle concentration, *n*—a measure of the liquid or solid particle content in a mixture of particles and fluid. The following more specific terms are in use:

(I) **rain density**—the mass of liquid per unit volume of mixture in an actual or simulated rainfield. **G 40, G02**

particle drift deposits—the deposition of chemical particles outside the intended target. **E 1102, E35**

particle fall—See **particle**. **D 1356, D22**

particle fluence, Φ —the quotient of dN by da , where dN is the number of particles incident on a sphere of cross-sectional area da (ICRU).

$$\Phi = \frac{dN}{da}$$

Unit: m^{-2} **E 170, E10**

particle fluence rate, ϕ —the quotient of $d\phi$ by dt , where $d\phi$ is the increment of particle fluence in the time interval dt (ICRU).

$$\phi = \frac{d\Phi}{dt} = \frac{d^2N}{da dt}$$

Unit: $m^{-2} \cdot s^{-1}$ **E 170, E10**

particle fluence spectrum, $\phi(E)$ —the quotient of $d\phi$ by dE , where $d\phi$ is the particle fluence of particles in the interval E to $E + dE$.

$$\phi(E) = \frac{d\Phi}{dE}$$

Unit: $m^{-2} \cdot eV^{-1}$ **E 170, E10**

particle number—the number of particles emitted, transferred or received (ICRU). **E 170, E10**

particle (particulate contaminant), *n*—a piece of matter in a solid state with observable length, width, and thickness. **G 126, G04**

particle shape—a characterization of the shape or configuration of a particle fitting it into any one of ten basic classes, as follows:

Class

A	acicular—needle shaped
B	angular—sharp-edged or having roughly polyhedral shape
C	crystalline—of geometric shape freely developed
D	dendritic—having a branched crystalline shape
E	fibrous—regularly or irregularly threadlike
F	flakey—lamellar, plate-like
G	granular—having an approximately equidimensional but irregular shape
H	irregular—lacking any symmetry
I	nodular—having a rounded irregular shape
J	spherical—globule shaped

C 242, C21

particle sieve diameter—a measure of the size of a sediment particle; the smallest standard sieve opening through which the particle will pass. For an elongated particle, it is a measure of its intermediate axis. **D 4410, D19**

particle size, *n*—the controlling lineal dimension of an individual particle as determined by analysis with sieves or other suitable means. **B 243, B09**

particle size—See **average particle size**. **C 242, C21**

particle size—See **particle**. **D 1356, D22**

particle size—the diameter of solid or liquid particles, expressed in micrometres. **D 3064, D10**

particle size—a linear dimension, usually designated as *diameter*, used to characterize the size of a particle; the dimension may be determined by any of several different techniques, including sedimentation, sieving, micrometric measurement, or direct measurement. **D 4410, D19**

particle size, *n*—the controlling lineal dimension of individual particles (see Terminology C 859). **D 5681, D34**

particle-size analysis—see **grain-size analysis**. **D 653, D18**

particle size distribution, *n*—the percentage by weight, or by number, of each fraction into which a powder sample has been classified with respect to sieve number or microns. (Preferred usage: “particle size distribution by frequency.”) **B 243, B09**

particle-size distribution—a profile of the sizes of particles contained in a material in which the quantities must be expressed on some basis which may be total number, total surface, or total weight or volume of the particles in the material. **C 242, C21**

particle size distribution—the percentage by mass or by number of each fraction into which a powder sample has been classified with respect to sieve number or microns. **C 286, B08**

particle-size distribution—see **gradation, grain-size distribution**. **D 653, D18**

particle size distribution—See **particle**. **D 1356, D22**

particle-size distribution—the relative amount of a sediment sample of a range in specific sizes in terms of percentages by mass finer than a given size, D , often shown on a semilog plot. **D 4410, D19**

particle size distribution, *n*—in sieve analysis, the percentages, by mass or number, of all fractions into which various sizes of particles are classified. **E 1638, E29**

particle-size, intermediate axis—the size of a sediment particle

- determined by direct measurement of the axis normal to a plane representing the longest and shortest axes. **D 4410**, D19
- particle sizing, v** —segregation of granular material into specified particle size ranges. **C 709**, D02
- particle sizing, v** —segregation of granular material into specified particle size ranges. **D 4175**, D02
- particle velocity, u** ; [LT^{-1}]; m/s—a fluctuating velocity superimposed by the presence of sound on the other velocities the particles of the medium may have. In analogy with alternating voltage its magnitude can be expressed in several ways, such as instantaneous particle velocity or peak particle velocity, but the unqualified term means root-mean-square particle velocity. In air, the other velocities are those due to thermal agitation and wind currents. **C 634**, E33
- particulate, *adj***—pertaining to or composed of particles.
personalsample—See **sample**.
- pH, n** —the negative logarithm to the base ten of the conventional hydrogen ion activity. **D 1356**, D22
- particulate, *adj***—of or relating to minute separate particles. **D 4175**, D02
- particulate, n** —a general term used to describe a finely divided solid of organic or inorganic matter. **G 126**, G04
- particulate grout**—any grouting material characterized by undissolved (insoluble) particles in the mix. See also **chemical grout**. **D 653**, D18
- particulate matter, n** —see **powder**. **B 243**, B09
- particulate matter, n** —that nonliquid matter, exclusive of gases, which is heterogeneously dispersed in water. **D 1129**, D19
- particulate reinforced ceramic matrix composite, n** —a ceramic matrix composite in which the reinforcing components are particles of equiaxed or platelet geometry (in contrast to whiskers or short fibers). **C 1145**, C28
- particulate rubber, n** —rubber, vulcanized or unvulcanized, that has been transformed into a collection of particles, with or without a coating of a partitioning agent to prevent agglomeration during production, transportation, or storage (see **buffing rubber, granulated rubber, ground rubber, and powdered rubber**). **D 1566**, D11
- particulate rubber, n** —raw, uncured, compounded or vulcanized rubber that has been transformed by means of a mechanical size reduction process into a collection of particles, with or without a coating of a partitioning agent to prevent agglomeration during production, transportation, or storage (also see definition of **buffing rubber, granulated rubber, ground rubber, and powdered rubber**). **D 5681**, D34
- particulate solid**—synonym for **bulk solid**. **D 653**, D18
- particulate wood fuel**—any wood fuel with a maximum particle volume of 16.39 cm³ (1 in.³) such that the largest dimension is 7.62 cm (3 in.). **E 1705**, E48
- part identifying number (PIN)**—alphanumeric sequence used to code B18 fasteners. The system was developed by ASME Standards Committee B18. **F 1789**, F16
- parting, *vt***—*in fire assay*, separating silver from gold by selectively dissolving the silver in acid. **E 135**, E01
- parting**—the selective corrosion of one or more components of a solid solution alloy. **G 15**, G01
- parting agent**—a material applied to one or both surfaces of a sheet to prevent blocking. **D 1079**, D08
- parting limit**—the minimum concentration of a more noble component in an alloy, above which parting does not occur in a specific environment. **G 15**, G01
- parting line**—line or seam on glassware resulting from the joint of two mold parts. **C 162**, C14
- parting line, n** —another name for **spew line**. **D 1566**, D11
- partition**—See **fiberboard partition**. **D 996**, D10
- partition coefficient**—when, to a polyphase mixture there is added a definite quantity of a new component that is insufficient to bring about a phase change, the proportioning of the new component among the several phases at equilibrium may be expressed by means of a ratio known as a partition coefficient; since the ratio often changes very little over small ranges of variation in the amount of the added component, it is customary simply to refer to the partition coefficient of the added component without reference to the quantity of the addition, provided the latter is small. **E 7**, E04
- partitioning**—the act of movement of contaminants from one soil residence phase to another. **D 653**, D18
- partition tile, n** —tile for use in building interior partitions, subdividing areas into rooms, or similar constructions, and carrying no superimposed loads. **C 43**, C15
- parts per billion (ppb)**—a measure of proportion by weight, equivalent to a unit weight of solute per billion unit weights of solution (approximate $\mu\text{g/L}$ or mg/m^3 in dilute solutions). **D 6161**, D19
- parts per million**—mass unit of any substance in a million mass-units of the water-substance mixture. **D 4410**, D19
- parts per million (ppm)**—a measure of proportion by weight, equivalent to a unit weight of solute per million unit weights of solution (approximate mg/L or g/m^3 in dilute solutions). **D 6161**, D19
- parts per trillion (ppt)**—a measure of proportion by weight, equivalent to a unit weight of solute per trillion unit weights of solution (approximate g/L or $\mu\text{g/m}^3$ in dilute solutions). **D 6161**, D19
- part wool felt, n** —a felt composed of any one of or a combination of new and recycled wool fibers mixed with one or more man-made fibers, vegetable fibers, or animal fibers other than wool. **D 123**, D13
- part wool felt, n** —a felt composed of any one of, or a combination of, new and recycled wool fibers mixed with one or more man-made fibers, vegetable fibers, or animal fibers other than wool. **D 4845**, D13
- party in interest, n** —(see the *Compilation of ASTM Standard Definitions*). **E 1732**, E30
- pascal cubic metres per second ($\text{Pa}\cdot\text{m}^3/\text{s}$)**—the preferred unit of gas flow in the SI system. One $\text{Pa}\cdot\text{m}^3/\text{s}$ is approximately equal to 10 atm cm³/s or, more precisely, 1 $\text{Pa}\cdot\text{m}^3/\text{s} = 9.8692 \text{ atm}\cdot\text{cm}^3/\text{s}$. **E 1316**, E07
- pascal (Pa)**—One pascal is approximately equal to 1×10^{-5} atm or, more precisely, 1 Pa = 0.98692×10^{-5} atm. **E 1316**, E07
- pass**—a treatment step or one of multiple treatment steps producing in a membrane system a product stream in a membrane system. **D 6161**, D19
- passenger car tire, n** —a tire with less than a 457-mm rim diameter for use on cars only. **D 5681**, D34
- passenger car tires, n** —a tire with less than an 18 in. (45.7 cm) rim diameter for use on cars only. **D 5681**, D34
- passenger tire equivalent (PTE), n** —a measurement of mixed passenger and truck tires, where five passenger tires are equal to one truck tire. **D 5681**, D34
- passivating**—a process for creating passivity (q.v.). **B 374**, B08
- passivation**—the changing of the chemically active surface of stainless steel to a much less reactive state. **F 921**, F04
- passivation**—a process to render the surface condition of stainless steel chemically inactive. **F 1078**, F04
- passivation**—process of forming an oxide film on the surface of stainless steel fasteners by chemical treatment, usually nitric acid solution, to improve corrosion resistance of stainless steel fasteners. **F 1789**, F16
- passivation**—the process in metal corrosion by which metals become passive. (See **passive**.) **G 15**, G01
- passivator**—a type of inhibitor which appreciably changes the potential of a metal to a more noble (positive) value. **G 15**, G01
- passive**—the state of the metal surface characterized by low corrosion rates in a potential region that is strongly oxidizing for the metal. **G 15**, G01
- passive-active cell**—a corrosion cell in which the anode is a metal in

passive-active cell

- the active state and the cathode is the same metal in the passive state. **G 15, G01**
- passive construction methods in permafrost**—methods of construction through which the foundation materials are maintained in the frozen state. **D 7099, D18**
- passive earth pressure*—see **earth pressure**. **D 653, D18**
- passive fiber optic chemical sensor, n**—a fiber optic sensor that utilizes the intrinsic spectroscopic properties of the analyte to modulate the optical signal. **E 131, E13**
- passive refrigeration**—a refrigeration system in which cooling is provided by a refrigerant such as liquid nitrogen. **E 1705, E48**
- passive sampling**—the collection of ground-water quality data so as to induce no hydraulic stress on the aquifer. **D 5681, D34**
- passive single-phase thermal pile**—a foundation pile provided with a single-phase natural convection cooling system to remove heat from the ground. **D 7099, D18**
- passive solar energy system*—a **building subsystem** in which solar energy is collected and transferred predominantly by natural means, namely, conduction, convection, radiation, or evaporation. **E 631, E06**
- passive state of plastic equilibrium*—see **plastic equilibrium**. **D 653, D18**
- passive two-phase thermal pile**—a foundation pile provided with a two-phase natural convection cooling system to remove heat from the ground. **D 7099, D18**
- passivity**—the condition of a metal that retards its normal reaction in a specified environment and associated with the assumption of a potential more noble than its normal potential. **B 374, B08**
- pass-over style*—used over counter-height equipment when pass-over configuration (from the cooking side to the serving side) is required. **F 1827, F26**
- pasta cooker**—equipment, including a cooking vessel, in which the cooking medium, water or a water-oil mixture, (see **cooking medium**) is placed to such a depth that the cooking of food is essentially supported by displacement of the cooking medium rather than by the bottom of the vessel. Heat is delivered to the cooking medium by means of an immersed electric element or band wrapped vessel (electric pasta cooker), or by heat transfer from gas burners through either the walls of the pasta cooker or through tubes passing through the cooking fluid (gas pasta cooker). **F 1827, F26**
- paste**—a prepared mixture consisting of a suspension of undissolved solid(s) in a liquid medium sufficiently viscous that it cannot achieve a level surface without application of external force; not a slurry. **C 242, C21**
- paste, n**—an adhesive composition having a characteristic plastic-type consistency, that is, a high order of yield value, such as that prepared by heating a mixture of starch and water and subsequently cooling the hydrolyzed product. (Compare **adhesive, glue, mucilage, and sizing**.) **D 907, D14**
- paste mold**—a mold lined with adherent carbon, used wet for blown ware. **C 162, C14**
- paste paint*—under **paint**, see *paste paint*. **D 16, D01**
- patch, n**—a portion of pavement surface that has been replaced or where additional material has been applied to the pavement after original construction. **E 867, E17**
- patch, n**—a portion of pavement surface which has been replaced or where additional material has been applied to the pavement after original construction. **E 1778, E17**
- patches**—insertions of sound wood or synthetic material in veneer or panels from which defective portions have been removed. **D 1038, D07**
- patching, n**—retouching a portion of a written stroke. **E 2195, E30**
- patching compound, n**—compound used to fill or smooth minor depressions or irregularities in a flooring surface. **F 141, F06**
- patch test**—a test to determine whether a proposed liquid encapsulant is suitable for a particular surface or use that is performed by applying a small area of it to the surface, letting it cure, and testing it for adhesion. **E 1605, E06**
- pate dure (hard paste)**—a French term designating ceramic whitewares fired at relatively high temperatures. **C 242, C21**
- patenting, n**—*inwire making*, heating a medium-carbon or high-carbon steel before wire drawing, or between drafts, to a temperature above the **transformation range**, and then cooling it in air, or a bath of molten lead or salt, to a temperature below Ae_1 . **A 941, A01**
- patent leather**—Any leather with a finish system that produces a high gloss with great depth and clarity. Usually obtained by one or more applications of a high solids coating, but is also made by film lamination. **D 1517, D31**
- pate tendre (soft paste)**—a French term designating ceramic whitewares fired at relatively low temperatures. **C 242, C21**
- path length**—the distance traveled by the laser radiation from the beam splitter to the recording medium. **E 1316, E07**
- path length difference**—the difference in path length between the object beam and the reference beam. **E 1316, E07**
- pathogenic**—disease causing. **E 1705, E48**
- pathogens**—organisms that are capable of causing disease. **F 1600, F20**
- path percolation (line of creep)**—the path that water follows along the surface of contact between the foundation soil or rock and the base of a dam or other structure. **D 653, D18**
- patient**—any human whose temperature is being taken. **E 344, E20**
- pattern*—See **diffraction pattern**. **E 7, E04**
- pattern**—metal, fiberboard, wood or paper forms from the outlines of which are cut the various pieces of the shoe. **F 869, F08**
- patternate, v**—to measure the pattern of a spray. **E 1620, E29**
- patternation, n**—the measurement and characterization of spray patterns. **E 1620, E29**
- patternator, n**—a device designed to patternate sprays. **E 1620, E29**
- patterned ground**—a general term for any ground surface exhibiting a discernibly ordered, more or less symmetrical, structural pattern of ground and, where present, vegetation. **D 7099, D18**
- paved road, n**—two or more lanes, all-weather, maintained, hard surface roads with good driving visibility used for heavy and high-density traffic, in accordance with the U.S. Federal Highway Administration. **F 538, F09**
- pavement, bituminous*—see **bituminous pavement**. **E 867, E17**
- pavement characteristic, n**—a physical feature or property of a pavement surface such as type, roughness, texture, and skid resistance. **E 867, E17**
- pavement condition, n**—a quantitative representation of distress in pavement at a given point in time. **E 867, E17**
- pavement, continuously reinforced concrete (CRCP)*—see **continuously reinforced concrete pavement**. **E 867, E17**
- pavement distress, n**—external indications of pavement defects or deterioration. **E 867, E17**
- pavement distress, n**—external indications of pavement defects or deterioration. **E 1778, E17**
- pavement, jointed concrete (JCP)*—see **jointed concrete pavement**. **E 867, E17**
- pavement macrotexture, n**—the deviations of a pavement surface from a true planar surface with the characteristic dimensions of wavelength and amplitude from 0.5 mm (0.2 in.) up to those that no longer affect tire-pavement interaction. **E 867, E17**
- pavement management section/segment, n**—a contiguous pavement area considered to have uniform construction, maintenance, usage history, and condition. **E 867, E17**
- pavement-micro texture (micro-rugosity), n**—the deviations of a pavement surface from a true planar surface with characteristic dimensions of wavelength and amplitude less than 0.5 mm (0.2 in.). **E 867, E17**

pavement performance, *n*—ability of a pavement to fulfill its purpose over time. E 867, E17

pavement, Portland cement concrete—see **Portland cement concrete pavement**. E 867, E17

pavement pumping—ejection of soil and water mixtures from joints, cracks, and edges of rigid pavements, under the action of traffic. D 653, D18

pavers—the glass-contact refractory blocks used in the bottom of a melter. See **tank block**. C 162, C14

pavers—unglazed porcelain or natural clay tile formed by the dust-pressed method and similar to ceramic mosaics in composition and physical properties but relatively thicker with 6 in.² (39 cm²) or more of facial area. C 242, C21

paving—stone used in an interior pedestrian wearing surface as in patios, walkways, driveways, and the like. (See **flooring**) C 119, C18

paving brick, *n*—brick made to provide the wearing surface of highways, streets, driveways, walkways, patios, and similar applications. See Specifications C 902 and C 1272. C 43, C15

payback method—a technique of economic evaluation that determines the time required for the cumulative benefits from an investment to recover the investment cost and other accrued costs (see **discounted payback period**; **simple payback period**). E 631, E06

payback method, *n*—a technique of economic evaluation that determines the time required for the cumulative benefits from an investment to recover the investment cost and other accrued costs (see **discounted payback period**; **simple payback period**). E 833, E06

Pb—chemical symbol for the element, lead.

Pb-positive/negative—see **lead positive/negative**. E 631, E06

P_c—critical load required to rupture a specimen using a continuous loading rate F 2078, F07

PCB—see **printed circuit board**. F 1457, F05

PCS—See **print contrast signal**. F 149, F05

PDD examination, *n*—a process that encompasses all activities that take place between a PDD examiner and an examinee during a specific series of interactions. These interactions may include the pretest interview, the use of the polygraph to collect physiological data from the examinee while presenting a series of tests, the test data analysis phase, which may be supplemented in a post-test interview phase. E 2035, E52

PDD examiner, *n*—someone who has successfully completed formal education and accredited training in conducting PDD examinations and, if appropriate, is certified or licensed by their agency or state to conduct such examinations. E 2035, E52

PDPA, *n*—phase Doppler particle analyzer. E 1620, E29

pea gravel, *n*—in roofing, small, natural aggregate, 6 to 10 mm (¼ to ⅜ in.) in diameter, screened to comply with Specification C 33, size 8. D 1079, D08

peak, *n*—in constant rate of elongation load-strain testing, the point of maximum load. D 1079, D08

peak, *n*—that part of a DTA or DSC curve which is attributable to the occurrence of a single process. It is normally characterized by a deviation from the established base line, a maximum deflection, and a reestablishment of a base line not necessarily identical to that before the peak. E 1445, E27

peak, *n*—that portion of a heating curve which is attributable to the occurrence of a single process. It is normally characterized by a deviation from the established baseline, a maximum deflection, and a reestablishment of a baseline not necessarily identical to that before the peak. E 1445, E27

peak—in *fatigue loading*, the point where the first derivative of the force-time history changes from positive to negative sign; the point of maximum force in constant amplitude loading. E 1823, E08

peak braking coefficient [*nd*], *n*—of a tire, the maximum value of the braking coefficient that occurs prior to wheel lockup as the braking

torque is progressively increased; this measure is influenced by operating conditions. F 538, F09

peak EGT, *n*—*foroctane rating*, as the mixture is manually leaned from a state rich of stoichiometric, the exhaust gas temperature will increase with the removal of excess fuel. As the mixture is continually leaned, a peak temperature will be attained, after which continued leaning will result in lower exhaust gas temperatures. D 4175, D02

peak force, *n*—*forpile floor coverings*, the force required to separate two or more layers and registered on a chart as a peak, that is, a value exceeding the value immediately preceding and following it. D 123, D13

peak force, *n*—*intear testing of fabrics*, the maximum force required to break one or more yarn components in a woven or knitted fabric specimen, or break the fiber, fiber bonds or fiber interlocks in other manufactured forms. D 123, D13

peak force, *n*—*intear testing of fabrics*, the maximum force required to break one or more yarn components in a woven or knitted fabric specimen, or break the fiber, fiber bonds or fiber interlocks in other manufactured forms. D 4850, D13

peak force, *n*—*forpile floor covering*, the force required to separate two or more layers and registered on a chart as a peak, that is, a value exceeding the value immediately preceding and following it. D 5684, D13

peak load, *n*—maximum force recorded during a strength test. D 907, D14

peak melting point, *n*—in a thermal transfer ribbon, the maximum temperature to which the imaging material should be subjected. F 1623, F05

peak of tension (PTO), *n*—a family of testing procedures, including known solution, searching (probing), and acquaintance tests. There is a body of validation research for the known solution POT. E 2035, E52

peak point (temperature or time), *n*—the temperature or time corresponding to the maximum (or minimum) deflection from the baseline of the independent parameter curve. E 473, E37

peaks—extraneous marks extending from the character outward past the COL. F 149, F05

peak shear strength—maximum shear strength along a failure surface. (ISRM) D 653, D18

peak slip friction number, *n*—the maximum value of the slip friction number. E 867, E17

peak sound pressure level, *L_{PK}* [*nd*], (dB), *n*—ten times the common logarithm of the square of the ratio of the largest absolute value of the instantaneous sound pressure in a stated frequency band during a specified time interval to the reference sound pressure of 20 micropascals. C 634, E33

peak temperature, *n*—the temperature corresponding to the maximum deflection of the DTA or DSC curve. E 1445, E27

peak value (of an impulse voltage wave), *n*—the maximum value of voltage. D 1711, D09

peak width, FWHM—full width at half-maximum peak height above background. E 673, E42

peaned point—point formed like that usually found on rivets. F 547, F16

pearl ash—{archaic} commercial potassium carbonate. C 162, C14

pearlescent, *adj*—exhibiting various colors depending on the angles of illumination and viewing, as observed in mother-of-pearl. E 284, E12

pearlite—a metastable microstructure formed, when local austenite areas attain the eutectoid composition, in alloys of iron and carbon containing greater than 0.025 percent but less than 6.67 percent carbon. The structure is an aggregate consisting of alternate lamellae of ferrite and cementite formed on slow cooling during the eutectoid reaction. In an alloy of given composition, pearlite may be formed isothermally at temperatures below the eutectoid temperature by quenching austenite to a desired temperature (generally above 550°C) and holding for a period of time necessary for transformation to occur. The interlamellar spacing varies

pearlite

directly with the transformation temperature; that is, the higher the temperature the greater the spacing. E 7, E04

pearlite colony—a circumscribed aggregate within which lamellae of corresponding phases have the same orientation. E 7, E04

pearlite nodule—cluster of wedge-shaped pearlite colonies. E 7, E04

pearlitic structure—a microstructure resembling that of the pearlite constituent in steel, therefore, a lamellar type of structure of varying degrees of coarseness. E 7, E04

pearlized, *n*—*in buttons*, the addition of synthetic or natural pearlescent pigments to the button resin formulation or to the formulation used for coating. D 5497, D13

peat—a naturally occurring highly organic substance derived primarily from plant materials. D 653, D18

peat—an unconsolidated, compressible soil consisting of partially decomposed semi-carbonized remains of plants, some animals, and soil material. Peat, found in ancient bogs, can be the first stage in the formation of coal. D 7099, D18

peat hummock—a hummock consisting of peat. D 7099, D18

peatland—areas having peat-forming vegetation on which peat has accumulated or is accumulating. D 653, D18

peatland—peat-covered terrain. D 7099, D18

peat plateau—a generally flat-topped, expanses of peat rising one or more meters above the general surface of a peatland (or, peat bog). In a peat plateau, a layer of permafrost exists. This may penetrate into the peat below and farther, into the underlying mineral soil. D 7099, D18

pebbled grain—an embossed or naturally shrunken leather grain finish resembling a pebbled surface, ranging from fine pebbled Morocco goat to heavy Scotch grain upper leather. D 1517, D31

pebble mill—see **ball mill**. C 286, B08

peccary—a wild boar found in Central and South America. The skin is usually chrome-tanned and shaved to light weight for glove leathers. It is distinguishable from pigskin and carpincho leather by the fact that bristle holes occur in straight-line groups of three. D 1517, D31

pectic substrates—complex polysaccharides containing a large proportion of galacturonic acid units. D 1695, D01

pectins—colorless, amorphous, water-soluble polysaccharides occurring in plant tissues that yield pectic acid and methanol on hydrolysis. D 1695, D01

pedestrian, *n*—a person using legs or leg surrogates (for example, prosthetic limbs, crutches, etc.) as the principal mechanism for locomotion. F 1646, F13

pedestrian gate—a gate, usually comprised of a single leaf, which is used to close a gate opening through which pedestrians are intended to pass. While often referring to a swing gate, the gate may be of any single leaf gate intended for pedestrian use (that is, slide gate or others). See Specifications F 654, F 900, and F 1184. F 552, F14

peelable seal—the opening characteristic of forcibly separating two package substrates, which have been joined together by a sealing process, without tearing the substrates. F 1327, F02

peeler log—a log selected as suitable for cutting into rotary veneer. D 1038, D07

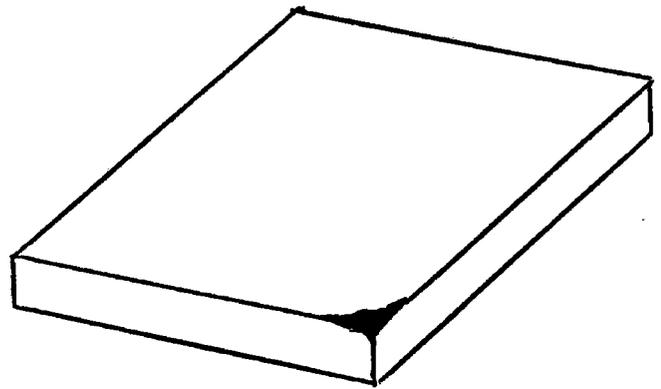

peeling—See **delamination**. A 902, A05

peeling—the detachment or partial detachment of an electrodeposited coating from a basis metal or undercoat. B 374, B08

peeling—See **orange peel**; **shivering**. C 242, C21

peeling—a defect characterized by the spontaneous detachment of pieces of porcelain enamel from cast iron. C 286, B08

peeling—compressive stresses in a fired glaze or other ceramic coating of sufficient magnitude to exceed the strength of adhesion between the glaze and the body.

F 109, C21

peeling resistance of metal connector plate with integral teeth—resistance to consecutive withdrawal of adjacent teeth of metal connector plate from wood member during shear load application starting at the last row of teeth and progressing toward the center of the connection. See **lateral resistance of metal connector plate**. E 631, E06

peel ply—a removable ply molded onto the surface of a laminate to provide a chemically clean surface for bonding or painting after removal. E 631, E06

peel ply—a removable ply molded onto the surface of a laminate to provide a chemically clean surface for bonding or painting after removal. E 1749, E06

peel strength, *n*—the average load per unit width of bondline required to separate progressively a flexible member from a rigid member or another flexible member. D 907, D14

peen-coated, peen-galvanized—See **mechanically plated**. F 547, F16

peening—See **shot peening**. B 374, B08

peen plating—See **mechanical plating**. B 374, B08

peephole—a small opening in a furnace wall for observation purposes. C 162, C14

peerless cut nail—name for small, regular-stock-steel, cut nails with broad flat circular head and sheared long-tapered square point to facilitate clinching. F 547, F16

Pel—picture element. F 1457, F05

pelleted activated carbon—a form of granular activated carbon consisting of cylindrical particles. D 2652, D28

pelletized biomass fuel—see **densified particulate biomass fuels**. E 1705, E48

pellet size distribution, *n*—the percentage, by mass, of carbon black retained on each of a specified series of sieve screens arranged with progressively smaller openings. D 3053, D24

pellicle mirror—a thin transparent membrane used in place of a transparent flat glass disk of a “plane glass illuminator.” E 7, E04

pelt—a raw skin with hair. Usually refers to fur animals. D 1517, D31

Peltier coefficient, *n*—the reversible heat which is absorbed or evolved at a thermocouple junction when unit current passes in unit time. E 344, E20

PEM—abbreviation for **printer emulation module**. F 1457, F05

pencil—rod-like assemblage of asbestos fibers in close-packed parallel orientation, of generally uniform diameter that can be fiberized readily. D 2946, C17

pencil beam—a radiation beam which has little divergence, usually created by collimating an intense source of radiation. E 1316, E07

pencil point—long needle point. F 547, F16

pendulum hardness tester, *n*—a device for measuring the hardness of a dry film, based on the damping time required for a specified decrease in oscillation (swing) amplitude; the shorter the damping time the lower the hardness. D 16, D01

penetrability—a grout property descriptive of its ability to fill a porous mass; primarily a function of lubricity and viscosity.

D 653, D18

penetrameter—alternative term for **image quality indicator**.

E 1316, E07

penetrameter sensitivity—alternative term for **IQI sensitivity**.

E 1316, E07

penetrant—a solution or suspension of dye.

E 1316, E07

penetrant—a material that enhances the ability of an agrichemical to enter a substrate or penetrate a surface.

E 1519, E35

penetrant comparator—an intentionally flawed specimen having separate but adjacent areas for the application of different liquid penetrant materials so that a direct comparison of their relative effectiveness can be obtained.

NOTE—It can also be used to evaluate liquid penetrant techniques, liquid penetrant systems, or test conditions.

E 1316, E07

penetrant, fluorescent—a penetrant that emits visible radiation when excited by black light.

E 1316, E07

penetrant (permeant)—entity from a phase in contact with one of the membrane surfaces that passes through the membrane.

D 6161, D19

penetrant, post emulsifiable—a liquid penetrant that requires the application of a separate emulsifier to render the excess surface penetrant water-washable.

E 1316, E07

penetrant, solvent-removable—a liquid penetrant so formulated that most of the excess surface penetrant can be removed by wiping with a lint-free material, with the remaining surface penetrant traces removable by further wiping with a lint-free material lightly moistened with solvent remover.

E 1316, E07

penetrant, visible—a liquid penetrant that is characterized by an intense color, usually red.

E 1316, E07

penetrant, water-washable—a liquid penetrant with a built-in emulsifier.

E 1316, E07

penetrating agent—a material that increases the penetration of a liquid medium into a porous material.

D 459, D12

penetration, *n*—the depths to which one material extends into or penetrates another.

C 709, D02

penetration, *n*—the consistency of a bituminous material expressed as the distance in tenths of a millimetre (0.1 mm) that a standard needle penetrates vertically a sample of the material under specified conditions of loading, time, and temperature.

D 8, D04

penetration—depth of hole cut in rock by a drill bit. (ISRM)

D 653, D18

penetration, *n*—the entering of an adhesive into an adherend.

D 907, D14

penetration—the consistency of a bituminous material expressed as the distance in tenths of a millimetre (0.1 mm) that a standard needle penetrates vertically a sample of material under specified conditions of loading, time, and temperature. A cone is sometimes used for special purposes instead of a needle.

D 1079, D08

penetration, *n*—of a propellant or of petrolatum, the depth, in tenths of a millimetre, that a standard cone penetrates the sample under prescribed conditions of weight, time, and temperature.

D 4175, D02

penetration, *n*—of petroleum wax, the depth, in tenths of a millimetre, to which a standard needle penetrates into the wax under defined conditions.

D 4175, D02

penetration, *n*—the depths to which one material extends into or penetrates another.

D 4175, D02

penetration depth—the maximum depth in a material from which usable ultrasonic information can be obtained and measured.

E 1316, E07

penetration grouting—filling joints or fractures in rock or pore spaces in soil with a grout without disturbing the formation; this grouting method does not modify the solid formation structure. See also **displacement grouting**.

D 653, D18

penetration macadam, *n*—a pavement layer containing essentially

one-size coarse aggregate, penetrated in place by a heavy application of bituminous material, followed by an application of a smaller size coarse aggregate, and compacted; multiple layers containing still smaller coarse aggregate may be used.

D 8, D04

penetration of petrolatum, *n*—the depth, in tenths of a millimetre, that a standard cone will penetrate the sample under fixed conditions of mass, time, and temperature.

D 4175, D02

penetration resistance curve (Proctor penetration curve)—the curve showing the relationship between: (1) the penetration resistance, and (2) the water content.

D 653, D18

penetration resistance (standard penetration resistance) (Proctor penetration resistance), p_R , N (FL⁻² or Blows L⁻¹)—(a) number of blows of a hammer of specified weight falling a given distance required to produce a given penetration into soil of a pile, casing, or sampling tube.

(b) unit load required to maintain constant rate of penetration into soil of a probe or instrument.

(c) unit load required to produce a specified penetration into soil at a specified rate of a probe or instrument. For a Proctor needle, the specified penetration is 2½ in. (63.5 mm) and the rate is ½ in. (12.7 mm)/s.

D 653, D18

penetration time—same as **dwelt time**.

E 1316, E07

penetrator—See **indenter**.

E 7, E04

penetrometer, *n*—an instrument that measures the consistency or hardness of semiliquid to semisolid materials by measuring the depth to which a specified cone or needle under a given force falls into the material.

D 4175, D02

pen lift, *n*—an interruption in a stroke caused by removing the writing document from the writing surface.

E 2195, E30

Penning gage—see **ionization vacuum gage**.

E 1316, E07

Penn-Vernon process—see synonymous term **Pittsburgh sheet process**.

C 162, C14

penny size, penny weight—denoting length of nail, indicated by “d” (not indication of diameter). Because of standardization of sizes of common nails, sinkers, and cooler nails, penny weight denotes, in addition to length, the head and shank diameter of these nails. For other nail types, sizes are referred to by length and diameter.

F 547, F16

pen position, *n*—the relationship between the writing instrument and the writing surface.

E 2195, E30

pen pressure, *n*—the force with which the writing instrument contacts the paper.

E 2195, E30

pentane insolubles, *n*—in used oil analysis, separated matter resulting when a used oil is dissolved in pentane.

D 4175, D02

penta resin—under **resin, synthetic**, see **penta resin**.

D 16, D01

pentosans—one of the groups of amorphous carbohydrates included under the general term “hemicellulose.” Pentosans yield principally pentoses on acid hydrolysis. The principal pentosan in wood is xylan.

D 1695, D01

peptizer (dry rubber), *n*—a compounding material used in small proportions to accelerate, by chemical action, the softening of rubber under the influence of mechanical action, or heat, or both.

D 1566, D11

percale, *n*—as applied to bed sheeting, a plain weave fabric with not fewer than 180 yarns/in.² (645 mm²).

D 123, D13

percale, *n*—as applied to bed sheeting, a plain weave fabric with not fewer than 180 yarns/in.² (645 mm²).

D 7023, D13

percent active FWA—the absolute concentration of specified FWA in (1) raw materials, or (2) finished product, expressed in terms of specific structure or generic name, when known.

D 459, D12

percentage elongation, *n*—of paper, a mathematical quantity used to express elongation (stretch) as a percentage increase in the length of a paper test specimen at rupture, in comparison to its length at the beginning of a tensile test carried to rupture under specified conditions. See **elongation**.

D 1968, D06

percentage point, *n*

percentage point, *n*—a difference of 1 % of a base quantity.

D 123, D13

percent area, *n*—in testing cotton with the Trash Meter, the ratio of total area of trash on the surface of a sample of cotton to that of the area of the viewing window, expressed in a percentage of the area of the viewing window.

D 123, D13

percent area, *n*—in testing cotton with the Trash Meter, the ratio of total area of trash on the surface of a sample of cotton to that of the area of the viewing window, expressed in a percentage of the area of the viewing window.

D 7139, D13

percent compaction—the ratio, expressed as a percentage, of: (1) dry unit weight of a soil, to (2) maximum unit weight obtained in a laboratory compaction test.

D 653, D18

percent conductivity—the ratio of the resistivity of the International Annealed Copper Standard (IACS) at 20°C to the resistivity of a material at 20°C, expressed in percent. Results are calculated on a weight basis or volume basis and so specified.

B 354, B01

percent consolidation—see **degree of consolidation**.

D 653, D18

percent coverage, *n*—the ratio of the area actually covered by the ink (or print material) to the area of the page times one hundred. (See **image area** and **maximum image area**.)

F 1457, F05

percent elongation, *n*—the increase in length of a specimen expressed as a percentage of the original length.

D 123, D13

percent elongation, *n*—the increase in length of a specimen expressed as a percentage of the original length.

D 6477, D13

percent evaporated, *n*—in batch distillation, the sum of the percent recovered and the percent loss.

D 4175, D02

(2) **percent exhaust (%E)**—the ratio of FWA on the substrate (wt FWA (s)) obtained under specified conditions to the total FWA introduced in the original bath (wt FWA (o)).

D 459, D12

percent fines—amount, expressed as a percentage by weight, of a material in aggregate finer than a given sieve, usually the No. 200 (74 μm) sieve.

D 653, D18

percent hydrolysis-resistant cellulose—the residue after treatment of cellulose with acid under specified conditions, expressed as a percentage of the original.

D 1695, D01

percentile—one of the values in a series dividing the distribution of the variable in the series into 100 groups of equal frequency or size.

C 242, C21

percentile level L_x [*nd*], (dB), *n*—of a time varying level, the level exceeded × percent of the time during the stated measurement period.

C 634, E33

percent linear thermal expansion—the change in length per unit length as temperature is changed from temperature T_1 to temperature T_2 ($T_1 < T_2$), expressed as a percent:

$$P = [(L_2 - L_1)/L_0] \times 100 + A$$

where:

L_0 = sample length at T_0 (between 20 and 30°C),

L_1 = sample length at T_1 ,

L_2 = sample length at T_2 , and

A = instrument correction.

C 242, C21

percent loss, *n*—in batch distillation, 100 minus the percent total recovery.

D 4175, D02

percent nonconforming, *n*—a calculated ratio of nonconforming units to the number of units inspected, the quotient being multiplied by 100.

D 1711, D09

percent nozzle pattern overlap—calculated by subtracting the nozzle spacing from the single nozzle pattern width and then dividing by the nozzle spacing and multiplying the result by one hundred.

E 1102, E35

percent saturation (degree of saturation), $S_r, S_r(D)$ —the ratio, expressed as a percentage, of: (1) the volume of water in a given soil or rock mass, to (2) the total volume of intergranular space (voids).

D 653, D18

percept, *n*—the result of the process of perception.

E 284, E12

perception, *n*—the awareness of a stimulus by way of the senses.

E 253, E18

perception, *n*—See **visual perception**.

E 284, E12

perched ground water—unconfined ground water separated from an underlying body of ground water by an unsaturated zone.

D 653, D18

perched water table—a water table usually of limited area maintained above the normal free water elevation by the presence of an intervening relatively impervious confining stratum.

D 653, D18

perched water table—groundwater separated from an underlying body of groundwater by unsaturated soil or rock. Usually located at a higher elevation than the groundwater table. (ISRM)

D 653, D18

percolation—the movement of gravitational water through soil (see **seepage**).

D 653, D18

percolation—the movement of water through the vadose zone, in contrast to infiltration at the land surface and recharge across a water table.

D 653, D18

percolation—the movement of water downward and radially through subsurface soil layers.

D 7099, D18

percolation layer (drainage course)—a layer of washed gravel or of a manufactured drainage media that allows water to filter through to the drain.

C 717, C24

percussion cone—damage produced by contact stresses generated by mechanical contact of a hard, blunt object with a glass surface.

C 162, C14

percussion drilling—a drilling technique that uses solid or hollow rods for cutting and crushing the rock by repeated blows. (ISRM)

D 653, D18

percussion drilling—a drilling process in which a hole is advanced by using a series of impacts to the drill steel and attached bit; the bit is normally rotated during drilling. See **rotary drilling**.

D 653, D18

pereletok (Russian)—a layer of frozen ground which forms part of the seasonally frozen ground, in areas either free of permafrost or with a lowered permafrost table, which remains frozen through one or several summers, and then thaws.

D 7099, D18

perennially frozen ground—see **permafrost**.

D 7099, D18

perfect gas—see **ideal gas**.

E 1316, E07

perfect reflecting diffuser—ideal reflecting surface that neither absorbs nor transmits light, but reflects diffusely, with the radiance of the reflecting surface being the same for all reflecting angles, regardless of the angular distribution of the incident light.

E 284, E12

perfect transmitting diffuser, *n*—ideal transmitting specimen that neither absorbs nor reflects light, but transmits diffusely, with the radiance of the specimen being the same for all transmitting angles, regardless of the angular distribution of the incident light.

E 284, E12

perforated hardboard—hardboard with closely spaced factory punched or drilled holes.

D 1554, D07

perforated metal connector plate—metal connector plate with prepunched or predrilled holes. Also called *punched metal connector plate*.

performance—See **building performance**. (See also **facility performance**)

performance criterion, of a facility—See **requirement statement**.

E 631, E06

perforation—a slot or hole made in well casing to allow for communication of fluids between the well and the annular space.

D 653, D18

perforations, *n*—in paper, a line of slits scored in a sheet of paper so that it may be easily folded, refolded, and afterwards torn off with ease.

D 1968, D06

performance—See **building performance**. (See also **facility performance**)

E 1480, E06

performance—ability of a boom to contain or deflect oil under a given set of environmental conditions.

F 818, F20

performance check, AE system—see **verification, AE system**.
E 1316, E07

performance criterion, of a facility—See **requirement statement**.
E 1480, E06

performance curve, *n*—for a qualitative chemical spot test kit, this is a plot of the test kit response (positive or negative) versus the lead content in a given sample matrix as determined by quantitative analysis.
E 631, E06

performance parameter—for a particular spot test kit and a particular sample matrix, this is the lead content that yields a known degree of confidence in detecting lead.
E 631, E06

performance properties—design feature(s) manufactured into the fastener to achieve a specific characteristic relative to the fastener application, such as torque-tension.
F 1789, F16

performance property, *n*—*in wear testing*, any chemical or physical property of a fiber, yarn, or fabric that is evaluated during the wear-refurbishing cycles.
D 123, D13

performance property, *n*—a result obtained by conducting a performance test.
D 4439, D35

performance rating, *n*—the rating of a product's performance defined by a standard test method.
F 1773, F08

performance standard, *n*—*in building constructions*, a standard that defines the required **performance** of a building material, element, subsystem, or system.
performance test method of a facility—See **requirement statement**.
E 631, E06

performance statement, *n*—an essential part of a performance standard that addresses a specific attribute in terms of an element in a hierarchy of built elements, and consists of four related parts: objective, criteria, evaluation, and commentary.
E 2151, E06

performance test, *n*—a test which simulates in the laboratory as closely as practicable selected conditions experienced in the field and which can be used in design. (Synonym for **design test**.)
D 4439, D35

performance test, *n*—*in geosynthetics*, a laboratory procedure which simulates selected field conditions which can be used in design.
D 4439, D35

performance test—a test devised to permit observation and measurement of the performance of a system or unit of equipment operating under prescribed load conditions.
D 5681, D34

performance test method of a facility—See **requirement statement**.
E 1480, E06

pergelic soil temperature regime—in United States Department of Agriculture (USDA) classification, these are soils in which the mean annual temperature is less than 0°C (32°F). Ice wedges and lenses are normal in such soils in the United States.
D 7099, D18

periclase grain, *n*—a crystalline magnesium oxide in granular form; this contains at least 85 % magnesia.
C 71, C08

periglacial—the conditions, processes, and landforms associated with cold non-glacial environments.
D 7099, D18

periglacial phenomena—landforms and soil characteristics produced by periglacial processes.
D 7099, D18

periglacial processes—processes associated with frost action in cold, non-glacial environments.
D 7099, D18

period—time interval occupied by one cycle.
D 653, D18

period, *n*—size of the minimum interval of the independent variable after which the same characteristics of a periodic phenomenon recur.
E 349, E21

periodic reverse plating—a method of plating in which the current is reversed periodically. The cycles are usually no longer than a few minutes and may be much less.
B 374, B08

period system efficiency—see **efficiency, period system**.
E 772, E44

peritectic equilibrium—a reversible univariant transformation in which a solid phase, that is stable only at lower temperature,

decomposes into a liquid and a solid phase that are conjugate at higher temperature, or the reverse; for example: $\alpha + L = \beta$, $\alpha + \beta + L = \gamma$, etc.
E 7, E04

peritectoid equilibrium—a reversible univariant transformation in which a solid phase, that is stable only at low temperature, decomposes with rising temperature into two or more conjugate solid phases; for example: $\alpha + \beta = \gamma$, $\alpha + \beta + \gamma = \delta$, etc.
E 7, E04

perlite, *n*—insulation composed of natural perlite ore expanded to form a cellular structure.
C 168, C16

perlite—an aggregate used in lightweight insulating concrete and in preformed perlite insulating board; formed by heating and expanding siliceous volcanic glass.
D 1079, D08

perm, *n*—a unit of measurement of water vapor permeance; a metric perm, or 1 g/24 h·m²·mm Hg. U.S. unit, 1 grain/h·ft²·in. Hg.
C 11, C11

perm, *n*—the mass rate of water vapor flow through one square foot of a material or construction of one grain per hour induced by a vapor pressure gradient between two surfaces of one inch of mercury or in units that equal that flow rate.
C 168, C16

perm, *n*—empirical unit of **water-vapor permeance** (mass flow rate), equal to one grain (avoirdupois) of water vapor per hour flowing through one square foot of a material or construction induced by a vapor-pressure difference of one inch of mercury between the two surfaces.
E 631, E06

permanent set—See **residual deflection**.
E 631, E06

permacrete—an artificial mixture of frozen soil materials cemented by pore ice, which forms a concrete-like construction material for use in cold regions.
D 7099, D18

permafrost—perennially frozen soil.
D 653, D18

permafrost—the thermal condition in which the temperatures in earth materials remain below 0°C (32°F) for at least two consecutive winters and the intervening summer; moisture in the form of water and ground ice may or may not be present.
D 7099, D18

permafrost aggradation—an increase in the thickness and/or area of permafrost through natural or artificial causes as a result of climatic cooling and/or change of terrain conditions such as vegetation succession, filling of lake basins, or human activity.
D 7099, D18

permafrost base—the lower boundary surface of permafrost, above which temperatures are below 0°C (32°F), and below which temperatures are above 0°C (32°F).
D 7099, D18

permafrost boundary—(1) the geographical boundary between the continuous and discontinuous permafrost zones; (2) the margin of a discrete body of permafrost.
D 7099, D18

permafrost degradation—a decrease in thickness and/or areal extent of permafrost because of natural or artificial causes as a result of climatic warming and/or change of terrain conditions such as disturbance or removal of an insulating vegetation layer by fire or human means.
D 7099, D18

permafrost limit—the geographical distal (terminal) boundaries of the circumpolar, or alpine, or altitudinal, continuous and discontinuous permafrost zones.
D 7099, D18

permafrost region—a region in which the temperature of some or all of the ground beneath the layer which freezes and thaws seasonally remains at or below 0°C for at least two consecutive years.
D 7099, D18

permafrost, relict—see **relict permafrost**.
D 7099, D18

permafrost, saline—see **saline permafrost**.
D 7099, D18

permafrost table—the upper boundary surface of permafrost.
D 7099, D18

permafrost thickness—the vertical distance between the permafrost table and the permafrost base.
D 7099, D18

permafrost zone—a major subdivision of a permafrost region.
D 7099, D18

permanence, *n*—resistance to appreciable changes in characteristics with time and environment.
D 907, D14

permanence, *n*—*of paper*, the tendency to resist changes in any or all of its properties with the passage of time.
D 1968, D06

permanent boom

permanent boom—boom intended for long-term or permanent deployment. **F 818, F20**

permanent care label, *n*—as applied to textile products, a care label that remains legible and attached to a textile product throughout its useful life. **D 123, D13**

permanent care label, *n*—as applied to textile products, a care label that remains legible and attached to a textile product throughout its useful life. **D 3136, D13**

permanent deformation, *n*—the net long-term change in a dimension of a specimen after deformation and relaxation under specified conditions. **D 123, D13**

permanent hardness—the total milliequivalents of hardness minus the milliequivalents of bicarbonate alkalinity in a water. See **hardness, alkalinity**. **D 6161, D19**

permanent linear change, *n*—the percent dimensional change in length (based on original length) of a refractory specimen free of externally applied stresses, after being subjected to a prescribed heat treatment. **C 71, C08**

permanent magnet—a magnet that retains a high degree of magnetization virtually unchanged for a long period of time (characteristic of materials with high retentivity). **E 1316, E07**

permanent magnet lens—an electron lens consisting of permanent magnets. **E 7, E04**

permanent mold casting, *n*—a metal object produced by introducing molten metal by gravity or low pressure into a mold constructed of durable material, usually iron or steel, and allowing it to solidify. See also graphite permanent mold casting. **B 899, B02**

permanent plugging—a seal that has a hydraulic conductivity that is equivalent or less than the hydraulic conductivity of the geologic formation. This term is often used with uncased boreholes. **D 653, D18**

permanent set—the amount by which an elastic material fails to return to its original form after deformation. **F 869, F08**

permanent set of test frame—a load-induced permanent displacement from an original position of the test frame. **E 631, E06**

permanent shear stability index (PSSI), *n*—a measure of the irreversible decrease, resulting from shear, in an oil's viscosity contributed by an additive. **D 4175, D02**

permanent strain—the strain remaining in a solid with respect to its initial condition after the application and removal of stress greater than the yield stress (commonly also called "residual" strain). (ISRM) **D 653, D18**

permanganate number—the number of millilitres of 0.1 *N* potassium permanganate solution that is consumed by 1 g of oven-dry pulp under certain specified and carefully controlled conditions. It is an indication of the hardness or bleachability of a pulp. It also is an indirect estimate of lignin content. **D 1695, D01**

permeability, *n*—the rate of passage of a liquid or a gas through a porous material; determined under specified conditions. **B 243, B09**

permeability, *n*—the property of a porous material that permits a fluid (or gas) to pass through it; in construction, commonly refers to water vapor permeability of a sheet material or assembly and is defined as water vapor permeance per unit thickness. Metric unit of measurement, metric perms per centimetre of thickness. See **water vapor transmission, perm, permeance**. **C 11, C11**

permeability—the measure through a material of fluid flow, gas, or liquid. **C 242, C21**

permeability, *n*—a property measured by the rate of passage of a fluid under a pressure gradient through a material. **C 709, D02**

permeability—that property which permits movement of a liquid through the pores and interstices of the concrete. **C 822, C13**

permeability, *n*—the rate of flow of a fluid under a differential pressure through a material. (See also **air permeability, porosity**.) **D 123, D13**

permeability—see **coefficient of permeability**. **D 653, D18**

permeability—the capacity of a rock to conduct liquid or gas. It is measured as the proportionality constant, *k*, between flow velocity, *v*, and hydraulic gradient, *I*; $v = k \cdot I$. (ISRM) **D 653, D18**

permeability, *n*—the permeation rate divided by the pressure gradient of the gas or vapor. For a homogeneous material that obeys Fick's law, the permeability is equal to the product of the diffusion coefficient and the solubility coefficient of the gas or vapor. **D 1566, D11**

permeability, *n*—a property measured by the rate of passage of a fluid under a pressure gradient through a material. **D 4175, D02**

permeability, *n*—in gas diffusion, the flow of gas, through the gas diffuser. **D 4175, D02**

permeability, *n*—in gas diffusion, the rate of a substance that passes through a material (diffuser) under given conditions. **D 4175, D02**

permeability, *n*—the rate of flow of a liquid under a differential pressure through a material. **D 4439, D35**

permeability, *n*—of geotextiles, hydraulic conductivity. **D 4439, D35**

permeability, *n*—the rate of flow of a fluid under a differential pressure through a material **D 4850, D13**

permeability—see **permeance**. **D 6161, D19**

permeability, *n*—the ability of a rock to transmit fluid. **E 957, E44**

permeability—the ratio of flux density produced to magnetizing force (the ease with which a material can become magnetized). **E 1316, E07**

permeability, a-c—a generic term used to express various dynamic relationships between magnetic induction, *B*, and magnetizing force, *H*, for magnetic material subjected to a cyclic excitation by alternating or pulsating current. The values of a-c permeability obtained for a given material depend fundamentally upon the excursion limits of dynamic excitation and induction, the method and conditions of measurement, and also upon such factors as resistivity, thickness of laminations, frequency of excitation, and so forth.

NOTE—The numerical value for any permeability is meaningless unless the corresponding *B* or *H* excitation level is specified. For incremental permeabilities not only must the corresponding d-c *B* or *H* excitation level be specified, but also the dynamic range (ΔB or ΔH).

E 1316, E07

permeability, ac, impedance, incremental, $\mu_{\Delta z}$ —the value of impedance permeability obtained when ac excitation is superimposed on a dc excitation. **A 340, A06**

permeability, ac, inductance, incremental, $\mu_{\Delta L}$ —the value of inductance permeability, μ_L , obtained when the ac excitation is superimposed on a dc excitation. **A 340, A06**

permeability, ac, inductance, μ_L —the value developed from the measured inductive component of the electrical circuit for a material in an *SCM* condition, the permeability is evaluated from the measured inductive component of the electrical circuit representing the magnetic specimen. This circuit is assumed to be composed of paralleled linear inductive and resistive elements, ωL_1 and R_1 . **A 340, A06**

permeability, ac, magnetic—a generic term used to represent a dynamic material property. It is expressed as the ratio of the magnetic induction, *B*, to the magnetic field strength, *H*, that produced the induction. The value of *H* may be calculated from several different component values of the exciting current. (See **magnetic field strength, ac**, and various permeabilities.)

NOTE—The numerical value for any permeability is meaningless unless the corresponding *B* or *H* excitation level is specified. For incremental permeabilities not only the corresponding dc *B* or *H* excitation level must be specified, but also the dynamic excursion limits of dynamic excitation range (ΔB or ΔH).

A 340, A06

permeability, ac, peak, μ_p —the ratio of the measured peak value of magnetic induction to the peak value of the magnetic field strength,

H_p , calculated from the measured peak value of the exciting current. **A 340, A06**

permeability, ac, rms, impedance, μ_z —the ratio of the measured peak value of magnetic induction, B , to the apparent magnetic field strength, H_z , calculated from the rms value of the total exciting current.

NOTE—The value of the current used to compute H_z is obtained by multiplying the measured value of rms exciting current by 1.414. This assumes that the total exciting current is magnetizing current and is sinusoidal. **A 340, A06**

permeability coefficient—parameter defined as a transport flux per unit transmembrane driving force per unit membrane thickness. **D 6161, D19**

permeability coefficient—the steady-state rate of flow of gas through unit area and thickness of a solid barrier per unit pressure differential at a given temperature. **E 1316, E07**

permeability, dc, μ —a generic term used to represent a number of magnetostatic material properties. The value represented is the ratio of the induction, B , to the dc magnetic field strength, H , producing magnetic flux under the specific magnetizing conditions.

NOTE—The magnetic constant Γ_m is a scalar quantity differing in value and uniquely determined by each electromagnetic system of units. In the cgs–emu system of units, Γ_m is 1 gauss/oersted, and in the SI system, $\Gamma_m = 4\pi \times 10^{-7}$ H/m.

NOTE—Relative permeability is a pure number which is the same in all unit systems. The value and dimension of absolute permeability depends on the system of units used.

NOTE—For any ferromagnetic material permeability is a function of the degree of magnetization. However, initial permeability, μ_0 , and maximum permeability, μ_m , are unique values for a given specimen under specified conditions.

NOTE—Except for initial permeability, μ_0 , a numerical value for any of the dc permeabilities is meaningless unless the corresponding B or H excitation level is specified.

NOTE—For the incremental permeabilities, μ_Δ and $\mu_{\Delta i}$, a numerical value is meaningless unless both the corresponding values of mean excitation level (B or H) and the excursion range (ΔB or ΔH) are specified. **A 340, A06**

permeability, d-c—permeability is a general term used to express relationships between magnetic induction, B , and magnetizing force, H , under various conditions of magnetic excitation. These relationships are either (1) absolute permeability, which in general is the quotient of a change in magnetic induction divided by the corresponding change in magnetizing force, or (2) relative permeability, which is the ratio of the absolute permeability to the magnetic constant (γ_m).

NOTE—The magnetic constant γ_m is a scalar quantity differing in value and uniquely determined by each electromagnetic system of units. In the unrationalized cgs system γ_m is 1 gauss/oersted and the mksa rationalized system $\gamma_m = 4\pi \times 10^{-7}$ H/m.

NOTE—Relative permeability is a pure number which is the same in all unit systems. The value and dimension of absolute permeability depends on the system of units employed.

NOTE—For any ferromagnetic material, permeability is a function of the degree of magnetization. However, initial permeability, μ_0 , and maximum permeability, μ_m , are unique values for a given specimen under specified conditions.

NOTE—Except for initial permeability, μ_0 , a numerical value for any of the d-c permeabilities is meaningless unless the corresponding B or H excitation level is specified.

NOTE—For the incremental permeabilities μ_Δ and $\mu_{\Delta i}$, a numerical value is meaningless unless both the corresponding values of mean excitation level (B or H) and the excursion range (ΔB or ΔH) are specified. **E 1316, E07**

permeability, dc, absolute, μ_{abs} —the ratio of the total induction, ΔB , to the dc magnetic field strength, ΔH , which produced it. Also described as:

$$\mu_{\text{abs}} = \Gamma_m + \mu_i = \Gamma_m \mu_r$$

A 340, A06

permeability, dc, reversible, μ_{rev} —the ratio of magnetic induction, ΔB , to the dc magnetic field strength increase, ΔH , when the magnetic field strength is first established at a value, H , then reduced by a small increment H , and then reestablished to the value, H . **A 340, A06**

permeability, differential, μ_d —the ratio of an increment of induction, ΔB , to an increment of magnetic field strength, ΔH , for any point on a dc hysteresis loop. It is also the absolute slope ($\Delta B/\Delta H$) of the curve at any point on the normal magnetizing curve.

NOTE—For a symmetrical series circuit in which each component has the same cross-sectional area, reluctance values add directly giving:

$$\mu_{\text{eff}} = \frac{\ell_1 + \ell_2 + \ell_3 + \dots}{\frac{\ell_1}{\mu_1} + \frac{\ell_2}{\mu_2} + \frac{\ell_3}{\mu_3} + \dots}$$

For a symmetrical parallel circuit in which each component has the same flux path length, permeance values add directly giving:

$$\mu_{\text{eff}} = \frac{\mu_1 A_1 + \mu_2 A_2 + \mu_3 A_3 + \dots}{A_1 + A_2 + A_3 + \dots}$$

A 340, A06

permeability, ideal, μ_α —the ratio of the magnetic induction to the corresponding magnetic field strength after the material has been simultaneously subjected to a value of ac magnetizing field approaching saturation superimposed on a given dc magnetizing field, and the ac magnetizing field has thereafter been gradually reduced to zero. The resulting ideal permeability is thus a function of the incremental field and residual strongly polarized domains that remain after the ac field is reduced to zero.

NOTE—Ideal permeability, sometimes called anhysteretic permeability, is principally significant to feebly magnetic material and to the Rayleigh range of soft magnetic material. **A 340, A06**

permeability, incremental, μ_Δ —the ratio of the change of magnetic induction, B , to the corresponding change in magnetic field strength, H , under dc biasing conditions and when B is not equal to zero. This value is also the slope of a straight line joining the excursion limits of an incremental hysteresis loop.

NOTE—When the change in H is reduced to zero, the incremental permeability, μ_Δ , becomes the reversible permeability, μ_{rev} . **A 340, A06**

permeability, incremental intrinsic, $\mu_{\Delta i}$ —the ratio of the change in the intrinsic induction B_i to the corresponding change in magnetic field strength when the mean induction differs from zero. **A 340, A06**

permeability, initial, μ_0 —the limiting value approached by the normal permeability as the applied magnetic field strength, H , is reduced to zero. The permeability is equal to the slope of the normal induction curve at the origin of linear B and H axes. **A 340, A06**

permeability, initial dynamic, μ_{0d} —the limiting value of each of the various ac permeabilities reached in a magnetic material as the magnetizing current is first raised to a moderate value then is progressively and gradually reduced to a zero value. See **initial inductance**.

NOTE—This same value, μ_{0d} , is also equal to the initial values of both impedance permeability, μ_z , and peak permeability, μ_p . **A 340, A06**

permeability, instantaneous—(Coincident with B_{max}), μ_t —with SCM excitation, the ratio of the maximum induction B_{max} to the instantaneous magnetic field strength, H_t , which is the value of apparent magnetic field strength, H' , determined at the instant when B reaches a maximum. **A 340, A06**

permeability, intrinsic, μ_i —the ratio of the calculated value of intrinsic induction B_i , to the corresponding magnetic field strength, H .

permeability, intrinsic, μ_i

NOTE—See definition of susceptibility.

A 340, A06

permeability intrinsic, n (L^{-3})—a measure of the ease with which a porous medium can transmit a fluid under a potential gradient.

D 653, D18

permeability, maximum, μ_m —the highest value of permeability achieved when the magnetic material is subjected to a symmetrically cyclically magnetized condition.

NOTE—Under dc test conditions the maximum permeability, μ_m , is the highest value of normal permeability μ , developed by the magnetic material.

NOTE—Under ac test conditions, the maximum permeability is the highest value of ac permeability achieved under symmetrically cyclically magnetized conditions and with no biasing magnetic field in the magnetic material.

A 340, A06

permeability, normal, dc, μ —the ratio of any magnetic induction, B , to the corresponding dc magnetic field strength, H , when the magnetic material has been subjected to SCM conditions.

A 340, A06

permeability of refractories, n —the capacity of a refractory for transmitting a fluid (gas or liquid).

C 71, C08

permeability, relative, μ_r —the ratio of the absolute permeability of a material to the magnetic constant Γ_m , giving a pure numeric parameter.

NOTE—In the cgs-em system of units, the relative permeability is numerically the same as the absolute permeability.

A 340, A06

permeability test—a test to determine the movement of a liquid through concrete under a hydraulic or pressure gradient.

C 822, C13

permeability, unoccupied space, μ_u —the permeability of space (vacuum), identical with the magnetic constant, Γ_m .

A 340, A06

permeability, water vapor—See **water vapor permeability**.

C 168, C16

permeable—allowing material to pass through.

D 6161, D19

permeance—the rate of water vapor transmission per unit area at a steady state through a membrane or assembly, expressed in $ng/Pa \cdot s \cdot m^2$ (grain/ft²·h·in. Hg).

D 1079, D08

permeance, n —the permeation rate divided by the pressure differential of a gas or vapor between opposite faces of a solid body.

D 1566, D11

permeance, \mathcal{P} —the reciprocal of the reluctance of a magnetic circuit.

A 340, A06

permeance (pressure normalized flux)—transport flux per unit transmembrane driving force.

D 6161, D19

permeance (water vapor), n —the ratio of the rate of water vapor transmission (WVT) through a material or assembly between its two parallel surfaces to the vapor pressure differential between the surfaces. Metric unit of measurement is the metric perm, 1 g/24 h·m²·mm Hg; U.S. unit, 1 grain/h·ft²·in. Hg. See **water vapor transmission, permeability, perm**.

C 11, C11

permeance, water vapor—See **water vapor permeance**.

C 168, C16

permeate—that portion of the feed stream which passes through a membrane.

D 6161, D19

permeate collector fabric—see **product (permeate) channel spacer**.

D 6161, D19

permeate post-treatment—one or more final conditioning steps to improve permeate quality such as contacting with ion exchange resins to remove trace ions in the permeate.

D 6161, D19

permeation, n —the transmission of a fluid through a porous medium (NEW).

D 4439, D35

permeation grouting—filling joints or fractures in rock or pore spaces in soil with a grout, without disturbing the formation.

D 653, D18

permeation rate, n —the flow rate of a gas or vapor, under specified conditions, through a prescribed area of a solid body, divided by that area.

D 1566, D11

permeator—a reverse osmosis module of the hollow fiber configuration consisting of membrane(s) and pressure vessel.

D 6161, D19

Permissible Exposure Limit—an occupational exposure limit, such as for lead, that is established and enforced by an authority having jurisdiction.

E 1605, E06

permissible exposure limit (PEL), n —an OSHA defined term meaning the limit of OSHA permitted exposure to a specific contaminant as required in the applicable regulation. This limit is an 8-h time weighted average (TWA), determined in the worker's breathing zone, and is expressed in a number of units of measure — see applicable contaminant regulation.

D 1356, D22

permittivity—see **relative permittivity**

D 1711, D09

permittivity, $\kappa(\epsilon)$ —a factor giving the influence of an extensive, isotropic dielectric medium on the forces of attraction or repulsion between two electrified bodies (see Discussion 1 of this definition). It is the product of the "relative permittivity," $\kappa'(\epsilon_r)$, and the "permittivity of free space (vacuum)," $\kappa_0(\epsilon_0)$.

$$\kappa = \kappa' \cdot \kappa_0$$

The SI unit is: farad per metre (F/m);

where:

farad (F) = $s^4 A^2 / m^2 kg$,

s = seconds,

A = amperes,

m = metres, and

kg = kilograms.

D 2864, D27

permittivity, absolute—the same as **permittivity**.

D 2864, D27

permittivity, absolute, ϵ' —the magnitude of the real part of the complex permittivity expressed in F/m.

E 1142, E37

permittivity, complex, ϵ^* —a material property deduced from the ratio of the admittance, Y_p , of a given electrode configuration separated by that material, to the admittance of the identical electrode configuration separated by a vacuum (or air for most practical purposes), Y_v :

$$\epsilon^* = Y_p / Y_v = Y_p / iWC_v = \epsilon' - i\epsilon''$$

where:

ϵ' = absolute permittivity

ϵ'' = loss factor,

C_v = capacitance with vacuum separating the electrodes, and

$i = \sqrt{-1}$.

E 1142, E37

permittivity, high frequency, $\epsilon^{\infty'}$ —the permittivity of a material that is approached asymptotically as the applied frequency is increased to the point at which dipoles can no longer reorient.

E 1142, E37

permittivity, low frequency, $\epsilon^{\infty''}$ —the permittivity of a material that is approached asymptotically as the applied frequency is decreased to the point at which all dipoles can reorient.

E 1142, E37

permittivity of free space (vacuum), $\kappa_0(\epsilon_0)$ —is defined by the following equation derived from wave theory:

$$\kappa_0 = 1/\mu_0 c^2 = 8.854 \times 10^{-12} \text{ farad per metre}$$

where: the magnetic permeability of free space,

$$\mu_0 = 4\pi \times 10^{-7} \text{ henry per metre; 1 henry} = m^2 kg/s^2 A^2$$

and the speed of electromagnetic waves in free space,

$$c = 2.998 \times 10^8 \text{ metres per second.}$$

D 2864, D27

permittivity of free space (vacuum), ϵ_0 —is defined by the following equation derived from wave theory:

$$\epsilon_0 = 1/\mu_0 \cdot c^2 = 8.854 \times 10^{-12} \text{ F/m}$$

where the magnetic permeability of free space, μ_0 , is;

$$\mu_0 = 4\pi \times 10^{-7} \text{ H/m}$$

and the speed of electromagnetic waves in free space, c , is given by;

$$c = 2.998 \times 10^8 \text{ m/s.}$$

E 1142, E37

permittivity, relative, κ' —a material property deduced from the ratio of capacitance of a given configuration of electrodes separated by the material, C_p , to the capacitance of the same electrode configuration separated by a vacuum (or air for most practical purposes), C_v :

$$\kappa' = C_p/C_v = \epsilon'/\epsilon_0$$

$$\kappa'_{vac} = 1$$

Experimentally, the material separating the electrodes must replace the vacuum (or air) at all points where it makes a significant change in capacitance. Relative permittivity is commonly referred to as the dielectric constant. The use of κ' (kappa prime) for relative permittivity, and ϵ' (epsilon prime) for absolute permittivity is recommended and is consistent with the strict definition of terms; however, the scientific literature is not consistent.

E 1142, E37

permittivity, relative complex, $\kappa^*(\epsilon_r^*)$ —the ratio of the admittance, Y , of a given set of electrodes with a material as dielectric to the admittance, Y_v , of the same configuration with vacuum as dielectric:

$$\kappa^* = Y/Y_v = Y/j\omega C_v = \kappa' - j\kappa''$$

where:

κ' = relative permittivity,

κ'' = dielectric loss index, and

C_v = capacitance with vacuum as the dielectric.

D 2864, D27

permittivity, relative, $\kappa'(\epsilon_r)$ —a dimensionless number, dependent upon the nature and condition of the dielectric medium and upon the frequency of the applied electromagnetic field. For a vacuum $\kappa' \equiv 1.0$. For other dielectrics it is the quotient obtained by dividing the equivalent parallel capacitance, C_p , of a given configuration of electrodes with a material as a dielectric by the capacitance, C_v , of the same configuration of electrodes with vacuum (or air for most practical purposes) as the dielectric:

$$\kappa' = C_p/C_v$$

D 2864, D27

permittivity, (Ψ), (T^{-1}), n —of geotextiles, the volumetric flow rate of water per unit cross sectional area per unit head under laminar flow conditions, in the normal direction through a geotextile.

D 4439, D35

peroxide number, n —the milliequivalents of constituents in 1000 g of wax that will oxidize potassium iodide.

D 4175, D02

peroxides—a class of oxygen-containing compounds possessing a peroxy-functional group. Hydrogen peroxide is the lowest member of this series.

D 4790, D16

perpetual resource, n —a resource that is virtually inexhaustible on a human time scale.

E 2114, E06

Persian Morocco—a name given to leather produced with Morocco grain, natural or embossed from hair sheepskin. An ambiguous term, applied in the bag trade to sheepskins and in the book trade mostly to goatskin (as distinguished from "Turkey Morocco"). It should be correctly confined to hair sheepskins.

D 1517, D31

persians—India-tanned hair sheepskins.

D 1517, D31

persistence history, n —documentation of one or more modifications made to a set of data that can be used to trace back the specific

procedures that were applied and when that was done and that becomes part of the processing documentation metadata.

E 867, E17

personal air sample—an air sample that is collected within the personal breathing zone of a worker.

E 1605, E06

personal air samples—air samples that are collected within the personal breathing zone (PBZ) of a person.

E 631, E06

personal air samples—airborne particulates, samples of air collected from within the breathing zone of a person, but outside a respiratory, if worn.

E 631, E06

personal breathing zone (PBZ)—an area within approximately 6 in. of a person's face.

E 631, E06

personal computer, n —an electronic device programmable to carry out a variety of functions and intended primarily for use by one operator at a time.

F 1457, F05

personal protective equipment—equipment for protecting the eyes, face, head, and/or extremities of workers from hazards, including protective clothing, respiratory devices, and protective shields.

NOTE—PPE should be used only where feasible engineering controls, administrative controls, and work practice controls have been applied and have failed to reduce the hazard.

E 1605, E06

pertinent patient information—information obtained from all available resources that relates to the patient's condition and problems. This information must be continuously updated. All information must be recorded and reported.

F 1177, F30

pervaporation—a separation process involving vaporization of one liquid from a mixture of two or more liquids, with the aid of a membrane which functions as a barrier to the liquid phase. The feed and brine streams are both liquid phase and the permeate emerges downstream face of the membrane as a vapor.

D 6161, D19

pest—an organism existing under circumstances that makes it undesirable.

E 609, E35

petalite—a lithium mineral of theoretical composition $\text{Li}_2\text{O} \cdot \text{Al}_2\text{O}_3 \cdot 8\text{SiO}_2$ which transforms on heating to a beta spodumene-silica solid solution product of very low or nil thermal expansion.

C 242, C21

P2 etch—an etchant used for preparing the surface of aluminum alloys for adhesive bonding. (Syn. **sulfoferric etch**.)

packaged building—See **building**.

E 631, E06

P2 etch—an etchant used for preparing the surface of aluminum alloys for adhesive bonding. (Syn. **sulfoferric etch**.)

E 1749, E06

petri plate—a dish designed to contain solid growth medias.

F 1600, F20

petrographic examination—methods of examining nonmetallic matter under suitable microscopes to determine structural relationships and to identify the phases or minerals present. With transparent materials, the determination of the optical properties, such as the indices of refraction and the behavior in transmitted polarized light, serve as means of identification. With opaque materials, the color, hardness, reflectivity, shape and etching behavior in polished sections serve as means of identification. Metallographic applications include examination of particles mechanically or chemically separated from the metal by these methods.

E 7, E04

petroleum coke, n —a solid, carbonaceous residue produced by thermal decomposition of heavy petroleum fractions or cracked stocks, or both.

D 4175, D02

petroleum-coke-base carbon refractory, n —see **carbon refractory, petroleum-coke-base**.

C 71, C08

petroleum color scale, n —a color scale for petroleum products, defined by 16 glass standards of specified luminous transmittance and chromaticity, graduated in steps of 0.5 from 0.5 for the lightest color to 8.0 for the darkest.

E 284, E12

petroleum exclusion—the exclusion from CERCLA liability provided in 42 USC § 9601(14), as interpreted by the courts and EPA: "The term (hazardous substance) does not include petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under

petroleum exclusion

subparagraphs (A) through (F) of this paragraph, and the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas).” **D 5681, D34**

petroleum oil—oil derived from petroleum; contains a mixture of hydrocarbons that are broadly classified as paraffins, naphthenes, aromatics, or other unsaturates, or combination thereof. **E 1519, E35**

petroleum pitch—a dark brown to black, predominantly aromatic, solid cementitious material obtained by the processing of petroleum, petroleum fractions, or petroleum residuals. **D 1079, D08**

petroleum products—those substances included within the meaning of the petroleum exclusion to CERCLA 42 USC § 9601(14) as interpreted by the courts and EPA, that is: “petroleum, including crude oil or any fraction thereof which is not otherwise specifically listed or designated as a hazardous substance under subparagraphs (A) through (F) of this paragraph, and the term does not include natural gas, natural gas liquids, liquefied natural gas, or synthetic gas usable for fuel (or mixtures of natural gas and such synthetic gas).” **D 5681, D34**

P_{ex}, n—the maximum explosion pressure (above the pressure in the vessel at the time of ignition) reached during the course of a single deflagration test. **E 1445, E27**

P_{ex,a}, n—the maximum explosion pressure (absolute) reached during the course of a single deflagration test. **E 1445, E27**

P/F, n—the acronym for powder forging. See **powder forging**. **B 243, B09**

pH—the cologarithm (negative logarithm) of the hydrogen ion activity, less precisely, concentration, of a medium, as determined by inhibitors or electrometric means. **B 374, B08**

pH—the negative logarithm of the hydrogen ion concentration, which can be greatly affected by temperature, particularly under alkaline conditions. It is therefore important to measure alkaline earth solutions (AES) at a specific recommended temperature of 25°C. **C 51, C07**

pH, n—in common usage, a measure of the acidity or alkalinity of a solution, on a logarithmic scale, with neutrality represented by a value of 7, with increasing acidity represented by decreasingly smaller values, and with increasing alkalinity represented by increasingly larger values. **D 123, D13**

pH, n—the negative logarithm of the hydrogen-ion activity in an aqueous solution, or, the logarithm of the reciprocal of the hydrogen-ion activity. **D 1129, D19**

pH, n—in common usage, a measure of acidity or alkalinity of a solution, on a logarithmic scale, with neutrality represented by a value of seven, with increasing acidity represented by decreasingly smaller values, and with increasing alkalinity represented by increasingly larger values. **D 4845, D13**

pH—negative logarithm of the effective hydrogen-ion activity, approximately $-\log_{10} [H^+]$ where $[H^+]$ is equivalents per litre concentration. **D 6161, D19**

pH—chemical symbol meaning the (p)otential of (H)ydrogen ion, indicating a measure of acidity or alkalinity of an aqueous solution. **PHA**—see **public housing agency**. **E 631, E06**

pH—defined formally as the negative logarithm to the base 10 of the conventional hydrogen ion activity. The pH of an aqueous solution is derived from E , the electromotive force (emf) of the cell:

reference || solution | glass electrode

(where the double vertical line represents a liquid junction) when the electrodes are immersed in the solution, and E_s , the electromotive force obtained when the electrodes are immersed in a standard solution (whose assigned pH is designated pH(S)), by the following equation:

$$\text{pH} = \text{pH}(\text{S}) + \frac{(E - E_s)F}{(RT \ln 10)}$$

where:

F = faraday, 96 487 C·mol⁻¹,

R = gas constant, 8.314 33 J·K⁻¹·mol⁻¹, and

T = absolute temperature, (t °C + 273.15). **E 1547, E15**

pH—the measurement of the acid concentration of a solution. Range is 0 to 14 (acid to basic), with pH 7 being neutral. **E 1705, E48**

phase—a state of matter, either solid, liquid, or gaseous. **D 6161, D19**

phase—a physically homogeneous, mechanically separable portion of a material system. **E 7, E04**

phase—homogeneous, distinguishable portion of a material system. **E 1142, E37**

phase analysis—an analytical technique that discriminates between variables in a part undergoing electromagnetic testing part by the different phase angle changes that these conditions produce in the test signal. (See also **phase detection**.) **E 1316, E07**

phase angle, n—in general, the angle by which one sine wave leads another; units are either radians or degrees. **D 1566, D11**

phase angle, θ , n—the angle whose cotangent is the dissipation factor, $\text{arccot } \kappa''/\kappa'$ and is also the angular difference in the phase between the sinusoidal alternating voltage applied to a dielectric and the component of the resulting current having the same frequency as the voltage. **D 1711, D09**

phase angle, θ —(1) the angle whose cotangent is the dissipation factor, $\text{arccot } \kappa''/\kappa'$. (2) The angular difference in the phase between the sinusoidal alternating voltage applied to a dielectric and the component of the resulting current have the same frequency as the voltage. **D 2864, D27**

phase angle, δ —the angle between a sinusoidally applied strain and the resultant sinusoidal stress. **D 4092, D20**

phase angle, δ —angle between a sinusoidally applied strain and the resultant sinusoidal stress, (D 4092, D20). **E 1142, E37**

phase angle, Θ —the angular difference in phase between the sinusoidal alternating voltage applied to a dielectric and the component of the resulting current (to ground) having the same frequency as the voltage. **E 1142, E37**

phase angle—the angular equivalent of the time displacement between corresponding points on two sine waves of the same frequency. **E 1316, E07**

phase angle, dielectric—same as **phase angle**. **D 2864, D27**

phase change-type disposable fever thermometer—one-time use instrument utilizing the melting of compounds to measure and indicate an anatomical site temperature. **E 344, E20**

phase change-type fever thermometer—a reusable instrument utilizing the change of state of chemical compositions to measure and indicate an anatomical site temperature. **E 344, E20**

phase contrast microscopy—a special method of controlled illumination, ideally suited for observing thin, transparent objects whose structural details vary only slightly in thickness or refractive index. This can also be applied to the examination of opaque materials to determine surface elevation changes. **E 7, E04**

phase correction—the operation in which the effects of an asymmetrical or chirped interferogram are corrected to eliminate instrumental phase contributions. **E 131, E13**

phased application—the installation of a roofing or waterproofing system during two or more separate time intervals; a roofing system not installed in a continuous operation. **D 1079, D08**

phase defect angle—same as **loss angle**. **D 2864, D27**

phase detection—the derivation of a signal whose amplitude is a function of the phase angle between two alternating currents, one of which is used as a reference. **E 1316, E07**

phase diagram—See **constitutional diagram**. **E 7, E04**

phase diagram—see **constitutional diagram**. **E 1142, E37**

phase difference—difference between phase angles of two waves of same frequency. **D 653, D18**

phase distribution, n—the partitioning of a semivolatle chemical compound between the gaseous (vapor) and the particle-associated phases in the atmosphere. **D 1356, D22**

phase hologram, n—a recording of the variations in light intensity caused by the interference of the reference beam with the object

beam as variations in the thickness or index of refraction of the recording medium. The variations in thickness or index refract coherent light to produce the reconstruction. **E 1316, E07**

Phase I Environmental Site Assessment—the process described in Practice E 1527. **D 5681, D34**

phase modulation—modulation produced by rapid oscillation of one mirror of a scanning interferometer through an amplitude which is smaller than the shortest wavelength in the spectrum to produce an interferogram which is, to a good approximation, the first derivative of the conventional interferogram. **E 131, E13**

phase of periodic quantity—fractional part of period through which independent variable has advanced, measured from an arbitrary origin. **D 653, D18**

phase rule—the maximum number of phases (P) that may coexist at equilibrium is equal to 2, plus the number of components (C) in the mixture, minus the number of degrees of freedom (F); $P + F = C + 2$. **E 7, E04**

phase rule—see **Gibbs Phase Rule**. **E 1142, E37**

phase-sensitive system—a system whose output signal is dependent on the phase relationship between the voltage returned from a pickup or sensing coil and a reference voltage. **E 1316, E07**

phase separation—the formation of coexisting glassy phases as a result of thermal history within an originally homogeneous glass. **C 162, C14**

phase separation, n —the formation of two layers, a lower aqueous constituent and an upper hydrocarbon constituent, separated by either a common boundary or a layer of emulsion. **D 4175, D02**

phase shift—a change in the phase relationship between two alternating quantities of the same frequency. **E 1316, E07**

phasic response, n —a response, typically of short duration, where the level of physiological arousal returns to its pre-arousal state. **E 2035, E52**

pH electrode—an ion-selective electrode, made of glass, that responds to hydrogen ion activity. Wide-range pH electrodes function over the activity range $1 M H^+$ (pH 0) to $10^{-14} M H^+$ (pH 14). pH electrodes may be subject to “acid error” in strongly acidic solutions and are also subject to “alkaline error” caused by response to sodium or other cations in basic solutions. **D 4127, D19**

phenol—hydroxy benzene, carboic acid (C_6H_5OH) mol weight 94.11; colorless acicular crystals or white crystalline mass; characteristic odor; solidification point, $40.85^\circ C$; boiling point, $182^\circ C$. **D 4790, D16**

phenolic compounds, n —hydroxy derivatives of benzene and its condensed nuclei. **D 1129, D19**

phenolic plastic, n —a plastic based on resins made by the condensation of phenols, such as phenol and cresol, with aldehydes. **F 1251, F04**

phenolic plastics, n —plastics based on resins made by the condensation of phenols, such as phenol or cresol, with aldehydes. **D 883, D20**

phenolic resin—a thermosetting condensation product obtained by reacting phenol with an aldehyde. **C 904, C03**

phenolic resin—under **resin, synthetic**, see *phenolic resin*. **D 16, D01**

phenolic resin compound, single-stage—a phenolic material in which the resin, because of its reactive groups, is capable of further polymerization by application of heat. (See also **phenolic resin compound, two-stage**). **D 883, D20**

phenolic resin compound, two-stage—a phenolic material in which the resin is essentially not reactive at normal storage temperatures, but contains a reactive additive which causes further polymerization upon the application of heat. **D 883, D20**

Phillips (Penning) vacuum gage—a sensitive cold cathode ionization gage in which the electron path length, and therefore the number of ionizing collisions, is increased by means of a magnetic field. Also known as a cold-cathode discharge gage. **E 7, E04**

Phillips ionization gage—see **ionization vacuum gage**. **E 1316, E07**

phloem—inner bark; the principal tissue concerned with the translocation of elaborate foodstuffs. A synonym is “bast.” **D 9, D07**

pH/mV meter—an instrument that measures and displays the voltage developed between a sensing electrode and a reference electrode placed in a solution, and can convert the voltage developed by a pH electrode to a corresponding pH value. **D 4127, D19**

phosphate-coated, phosphatized—chemically treated to provide iron and steel with gray protective ferric-phosphate coating; to provide increased nail holding power by surface roughening. **F 547, F16**

phosphatized, *adj*—pertains to chemical treatment, in a phosphate solution, of uncoated and metallic coated sheet to prepare the surface for painting without further treatment except normal cleaning. (Syn. **phosphated, phosphate coated**) **A 902, A05**

phosphor—any substance that can be stimulated to emit light by incident radiation. **E 1316, E07**

phosphorescence—the emission of radiant energy from an atom, molecule, or ion resulting from absorption of a photon and a subsequent transition to the ground state with a change in total spin quantum number (see also **intersystem crossing**). **E 131, E13**

phosphorescence, n —photoluminescence that continues after excitation ceases. **E 284, E12**

photocell, photodetector, photodiode, phototube, n —See **detector**. **E 284, E12**

photocell/photoelectric cell/photo-sensor, n —a solid-state, photo-sensitive, electronic device in which use is made of the variation of current-voltage characteristics as a function of incident radiation (light). **F 1294, F05**

photochemical reaction, n —any chemical reaction that is initiated as a result of absorption of light. **D 1356, D22**

photochemical smog, n —a type of air pollution resulting from photochemical reactions. **D 1356, D22**

photochromism, n —a reversible change in color of a specimen due to exposure to light (or other radiant flux) without appreciable heating of the specimen. **E 284, E12**

photoconductor—a material that exhibits increased electrical conductivity when exposed to light. **F 335, F05**

photodegradable, *adj*—capable of undergoing a significant loss of properties that can be measured by standardized tests after exposure to representative amounts of sunlight. **D 996, D10**

photodegradable plastic, n —a degradable plastic in which the degradation results from the action of natural daylight. **D 883, D20**

photodegradable plastic, n —See **degradable plastic**. **D 883, D20**

photodegradation, n —photochemically induced changes in the condition of the material. **G 113, G03**

photodiode array (linear) (PDA), n —a group of very small photodiodes, arranged in a line, that detects photon energy (light) from the radiation that strikes a surface and measures the amount of reflected light as electrical pulses. **F 1294, F05**

photodiode array (matrix) (PDA), n —an area photodiode array, having a two-dimensional configuration. **F 1294, F05**

photoelectric colorimeter, n —color-stimulus-measuring instrument using photoelectric detectors in which source-filter-detector response characteristics are adjusted so that the instruments read directly the tristimulus values or related quantities. **D 2946, C17**

photoelectric cross-section—the probability that an incident photon traversing a material will produce a photoelectron from a given subshell, expressed as an area unit per event. **E 673, E42**

photoelectric effect—a dipole interaction involving the interaction of photons with bound electrons in atoms, molecules, and solids, resulting in production of photoelectrons and excited ions. **E 673, E42**

photoelectron satellite peaks—See **photoelectron X-ray satellite peaks**, and **shakeup lines or shakeup satellites**. **E 673, E42**

photoelectron X-ray satellite peaks—photoelectron peaks in a spectrum resulting from photoemission induced by characteristic

photoelectron X-ray satellite peaks

- minor X-ray lines associated with the X-ray spectrum of the anode material. **E 673, E42**
- photoelectron X-ray satellite subtraction**—the removal of photoelectron X-ray satellite peaks from a spectrum. **E 673, E42**
- photoemission**—the emission of electrons from atoms or molecules caused by photoelectric effects. **E 673, E42**
- photo fluorography**—a photograph of the image formed on a fluorescent screen. **E 1316, E07**
- photographic density**—See **density**. **E 7, E04**
- photoluminescence, *n***—luminescence produced by the absorption of radiant flux; distinguished from ordinary reflection by a time delay and, usually, a shift toward longer wavelengths. See **fluorescence** and **phosphorescence**. **E 284, E12**
- photomicrograph**—a micrograph made by photographic means. **E 7, E04**
- photometer**—a device so designed that it furnishes the ratio, or a function of the ratio, of the radiant power of two electromagnetic beams. These two beams may be separated in time, space, or both. **E 131, E13**
- photometer, *n***—an instrument for measuring light. **E 284, E12**
- photometer, *n***—instrument used for measuring photometric quantities. **E 349, E21**
- photometer**—an instrument for measuring photometric quantities, such as luminous intensity or luminous flux. See **Terminology C 859**. **E 772, E44**
- photometer, *n***—a device that measures the intensity and brightness of a light beam. **F 1294, F05**
- photometric, *adj***—pertaining to measurement of quantities in which radiation is evaluated according to the spectral luminous efficiency function $V(\lambda)$. **E 284, E12**
- photometric linearity**—the ability of a photometric system to yield a linear relationship between the radiant power incident on its detector and some measurable quantity provided by the system. **E 131, E13**
- photometry, *n***—the measurement of quantities associated with light, that is, radiation evaluated according to its visual effect, by weighting with the CIE spectral luminous efficiency function $V(\lambda)$. **E 284, E12**
- photometry, *n***—measurement of quantities referring to radiation, evaluated according to the visual effect which it produces, as based on certain conventions. **E 349, E21**
- photomicrograph**—a micrograph made by photographic means. **E 7, E04**
- photopic, *adj***—(1) pertaining to vision at sufficiently high levels of illumination that only the retinal cones are stimulated.
(2) pertaining to detectors with spectral responsivity weighted according to the CIE spectral luminous efficiency function $V(\lambda)$. **E 284, E12**
- photosedimentation**—a technique of fine particle measurement wherein the size and number (or volume) of particles in a sedimenting suspension are determined by the effect of the presence of sedimenting particles on the intensity of a beam of light or X-ray or laser beam transmitted through the suspension as a function of settling time of the particles. **C 242, C21**
- photostimulable luminescence**—the physical phenomenon of phosphors absorbing incident ionizing radiation, storing the energy in quasi-stable states and emitting luminescent radiation proportional to the absorbed energy when stimulated by radiation of a different wavelength. **E 1316, E07**
- photostimulable luminescent phosphor**—a phosphor capable of storing a latent radiological image which upon laser stimulation will generate luminescence proportional to the radiation intensity. **E 1316, E07**
- photovoltaic array, *n***—an assembly of panels or modules, together with support structure and other components (if used), to form a complete dc power-producing unit. **E 1328, E44**
- photovoltaic cell, *n***—the basic device that generates electricity by the photovoltaic effect when exposed to radiant energy such as sunlight. **E 1328, E44**
- photovoltaic cell area, *n***—the total frontal area of the cell including the area covered by the grids and contacts. **E 1328, E44**
- photovoltaic device, *n***—any photovoltaic cell or collection of cells (module, panel, or array) under consideration. **E 1328, E44**
- photovoltaic module, *n***—a single package containing two or more electrically interconnected photovoltaic cells, including a frame or integral mounting points, and means for electrical connection; which make it suitable for field installation without additional modification. **E 1328, E44**
- photovoltaic module area, *n***—the rectangular area that touches the extreme outside edges of the module. **E 1328, E44**
- photovoltaic panel, *n***—a number of modules which are electrically connected and mechanically integrated, and designed to provide a field-installable unit. **E 1328, E44**
- photovoltaic reference cell, *n***—a photovoltaic cell whose short-circuit current is calibrated against the total irradiance of a reference spectral irradiance distribution. See also **reference cell calibration constant**. **E 1328, E44**
- photozone counter**—a stream counter in which the interrogation zone is monitored for changes in a light signal because of the presence of a particle. **C 242, C21**
- pH, *pH* (D)**—an index of the acidity or alkalinity of a soil in terms of the logarithm of the reciprocal of the hydrogen ion concentration. **D 653, D18**
- Phragmen method**—See **focusing camera**. **E 7, E04**
- phreatic eruption, *n***—an explosion of the surface of the earth that results from a sudden increase in the volume of groundwater when it flashes to steam due to contact with hot rocks. **E 957, E44**
- phreatic line**—the trace of the phreatic surface in any selected plane of reference. **D 653, D18**
- phreatic line**—see **line of seepage**. **D 653, D18**
- phreatic surface**—see **free water elevation**. **D 653, D18**
- phreatic water**—see **free water**. **D 653, D18**
- phthalic anhydride**—anhydride of phthalic acid ($C_8H_4O_3$) mol weight 148.11; white lustrous needles; odorless; solidification point, 130.8°C; boiling point, 295°C; sublimes. **D 4790, D16**
- phthalic anhydride-1308, refined**—phthalic anhydride with impurities limited to ultra trace amounts as indicated by a solidification point of 130.8°C minimum refined to improve color characteristics. Refer to Specification D 2403 for complete specifications. **D 4790, D16**
- pH unit**—a tenfold change in hydrogen ion activity, expressed as the negative logarithm of the hydrogen ion activity. Thus a solution of pH 7 is $10^{-7}M$ in hydrogen ion activity, and a pH 8 solution is $10^{-8}M$. The lower the solution pH, the more acid the solution. Occasionally, ion levels are expressed in pX units. Thus $pNa = 3.5$ is equivalent to $10^{-3.5}M Na^+$, or $3.0 \times 10^{-4}M$. **D 4127, D19**
- physical adsorption (van der Waals adsorption)**—the binding of an adsorbate to the surface of a solid at energies approximating those of condensation. **D 2652, D28**
- physical-chemical parameters, *n***—values for physical or chemical properties of a permeant or polymer, or both, such as solubility parameters, molecular weight, vapor pressure, and so forth. **F 1494, F23**
- physical crack extension, Δa_p [L]**—an increase in physical crack size.
$$\Delta a_p = a_p - a_0$$
E 1823, E08
- physical crack size, a_p [L]**—the distance from a reference plane to the observed crack front. This distance may represent an average of several measurements along the crack front. The reference plane depends on the specimen form, and normally is taken to be either the boundary, or a plane containing either the force line or the centerline of a specimen or plate. The reference plane is defined prior to specimen deformation. **E 1823, E08**
- physical inventory**—The verification of the existence, location, and

- quantity of property items. The process may involve verifying additional property information. **E 2135, E53**
- physical objective aperture*—See **aperture, electron**. **E 7, E04**
- physical properties**—those properties inherent in the raw material which remain unchanged or exhibit only slight alteration in the fastener following manufacture. **F 1789, F16**
- physical protection** (protection physique)—barriers that will delay or deter someone attempting unauthorized physical access to assets at a specific location. **E 631, E06**
- physical protection** (protection physique)—barriers that will delay or deter someone attempting unauthorized physical access to assets at a specific location. **E 1480, E06**
- physical stability**—*in asbestos-cement products*, the ability of the product to maintain its physical dimensions and properties when in contact with liquid, gaseous, or solid media normally encountered in its service environment. **D 2946, C17**
- physical standard, n**—stable specimen having a value of a physical quantity assigned by accurate measurements under specified conditions, usually in a standards laboratory. **E 284, E12**
- physiological site offset, μ_p , n**—difference in degrees of measured temperature between two body sites derived from the representative study samples. **E 344, E20**
- physiology, n**—the branch of biology dealing with the functions and vital processes of living organisms or their parts and organs. **E 2035, E52**
- phytobland oil**—a highly refined paraffinic material with a minimum unsulfonated residue of 92 % v/v. **E 1519, E35**
- P_f —crack initiation load for a given loading and environmental condition using an incrementally increasing load under displacement control **F 2078, F07**
- piano leather**—a name covering highly specialized leathers used for various purposes in the manufacture of pianos, both manual and mechanical. The leathers are made of selected skivers, full-grain sheepskins, or deerskins. **D 1517, D31**
- pick, n**—an individual filling yarn. **D 123, D13**
- pick, n**—an individual filling yarn of a fabric. **D 1566, D11**
- pick, n**—*in paper*, a defect that occurs in paper when its surface or the coating on its surface (or both) lifts from the paper's surface. **D 1968, D06**
- pick, n**—*in woven fabric*, an individual filling yarn (single or ply) or cord source. **D 4850, D13**
- pick, n**—an individual filling yarn. **E 631, E06**
- picket*—See **railing systems**.
- pick count, n**—*in woven fabrics*, the number of filling yarns per unit fabric length. **D 123, D13**
- pick count, n**—*in braided rope*, the number of strands rotating in one direction in one cycle length. **D 123, D13**
- pick count, n**—*in woven fabrics*, the number of individual filling yarns per inch of fabric regardless of whether they are comprised of single or plied components. **D 4850, D13**
- picker leather**—leathers used for pickers in textile machinery, and having a wide range of properties. Some are hard rawhide buffalo leathers, others glycerin-treated rawhide and still others belting leather. **D 1517, D31**
- picket, n**—one of a series of closely spaced upright infill members located between top rail or handrail and bottom rail of a railing system. (Syn. *baluster, baluster bar*)
- picket casting*—See **railing systems**. **E 631, E06**
- picket, n**—synonym for **baluster, baluster bar**. **E 1481, E06**
- picket**—a helically formed steel wire interwoven in the manufacture of chain link fabric or used for field splicing rolls of fabric into continuous chain link mesh from terminal post to terminal post. **F 552, F14**
- picket casting**—an ornamental cast element attached to a picket. Also, cast element designed to attach picket to top and bottom rails.
- picket railing system*—See **railing systems**. **E 631, E06**
- picket fence code, n**—a bar code printed so that individual bars are vertical (perpendicular to the horizon); the bars look like pickets in a fence. See the reverse, **verticalbar code** or **ladder code**. **F 1294, F05**
- picket railing system**—a system consisting of posts, pickets, top rail, and bottom rail. **E 631, E06**
- picking, n**—a rolling up in the lap (see *lap*) when the previously applied paint film is in a semisolid (gel-like) state of drying, causing a tacky resistance to the brush or roller and resulting in an unsightly nonuniform appearance in the final dried film. **D 16, D01**
- picking, n**—the removal of material (fiber, filler or coating) from the paper surface or underlying ink film during printing. **D 6488, D01**
- pickle**—an acid solution used to remove oxides or other compounds from the surface of a metal by chemical or electrochemical action. **B 374, B08**
- pickle**—to treat unhaird hides with a solution of salt and acid in order to prepare them for mineral tannage or for temporary preservation until they reach the tannery. **D 1517, D31**
- pickle basket**—a basket fabricated from corrosion-resistant material to hold ware during pickling. **C 286, B08**
- pickle pills**—small gelatin capsules containing chemicals used for testing the strength of pickling solutions. **C 286, B08**
- pickling**—the removal of oxides or other compounds from a metal surface by means of a pickle. **B 374, B08**
- pickling**—the chemical process of preparing the metal surface for porcelain enameling. **C 286, B08**
- pick off, n**—the undesirable removal of a previously printed ink film in subsequent units of the press due to insufficient drying of the ink. **D 6488, D01**
- pick out mark, n**—a fillingwise band or bar characterized by a chafed or fuzzy appearance. **D 123, D13**
- pick-out mark, n**—a fillingwise band or bar characterized by a chafed or fuzzy appearance. **D 3990, D13**
- pick-out place*—See **temple mark**. **D 3990, D13**
- pick-up**—the amount of slip retained per unit area on dipped ware. **C 286, B08**
- pick-up roll, n**—the part of a spreading device that runs in a bath or reservoir of adhesive. **D 907, D14**
- picosiemens per metre, n**—the unit of electrical conductivity is also called a conductivity unit (CU). A siemen is the SI definition of reciprocal ohm sometimes called mho.
- $$1 \text{ pS/m} = 1 \times 10^{-12} \Omega^{-1} \text{ m}^{-1} = 1 \text{ cu} = 1 \text{ picomho/m}$$
- D 4175, D02**
- picture element, n**—in pictures or displays which are made up of tiny dots, each dot is a picture element. **F 1457, F05**
- picture framing, n**—a perimeter thickness or color difference (usually darker) relative to the rest of the painted surface. **D 16, D01**
- picture framing**—a rectangular pattern of ridges in a membrane over insulation or deck joints. **D 1079, D08**
- piece boundary, n**—a collection of lines that define the shape of a piece. **D 6963, D13**
- piece information, n**—information that is piece specific. **D 6963, D13**
- piece system attributes, n**—information provided in the transfer file that is piece specific. **D 6963, D13**
- piece system text, n**—information provided in the transfer file that is piece specific. **D 6963, D13**
- piece, test, n*—see **specimen**, the preferred term. **D 1566, D11**
- piecing, n**—a thick place in a spun yarn caused by poor splicing. **D 123, D13**
- piecing, n**—a thick place in a spun yarn caused by poor splicing. **D 3990, D13**
- pie disk, n**—*in tire X-ray testing*, a circular disk of a specified diameter having six pie-shaped sections, each containing cords of different materials; it is used for demonstrating the discernment capability of an X-ray imaging system. **F 538, F09**
- piezoelectric vibratory atomizer**—a vibratory atomizer in which a

piezoelectric vibratory atomizer

piezoelectric transducer transmits high-frequency oscillations to a liquid, creating relatively uniform drops whose size is a function of the frequency of oscillation. **E 1620, E29**

piezometer—a device used to measure head at a point in the subsurface. **D 653, D18**

piezometric line (equipotential line)—line along which water will rise to the same elevation in piezometric tubes. **D 653, D18**

piezometric surface—the surface at which water will stand in a series of piezometers. **D 653, D18**

piezometric surface—an imaginary surface that everywhere coincides with the static level of the water in the aquifer. (ISRM) **D 653, D18**

pig, n—an oblong or square mass of metal that has been cast while still molten into a mold that gives the metal its particular shape; most commonly used for lead and tin in weights that can be handled manually. **B 899, B02**

pig—a shaped object on which to rest a blowpipe or punty during the gathering operation. **C 162, C14**

pig iron, n—the high carbon iron product obtained by the reduction of iron ores, typically in a blast furnace or an electric furnace, and cast into uniform shapes (pigs) having physical and chemical characteristics suitable for end use as foundry melting stock. **A 644, A04**

pigment, n—the fine solid particles used in the preparation of paint or printing ink and substantially insoluble in the vehicle. Asphaltic materials are not pigments except when they contain substances substantially insoluble in the vehicle in which they are used. **D 16, D01**

pigment, n—an insoluble compounding material used to impart color. **D 1566, D11**

pigment—water-insoluble solid coloring matter pulverized to a fine particle size for asbestos-cement. **D 2946, C17**

pigment—a substance, generally in the form of fine particles, that is substantially insoluble in the matrix and is used because of its color or decorative properties. **D 3878, D30**

pigment bleed, n—a condition in which some of the ink pigment is dispersed in the dampening solution and deposits on the non-image area of the plate and then prints as a light background tint. **D 6488, D01**

pigment-finished leather—leather finished with compounds containing opaque pigments which more or less conceal the grain pattern. Split leathers are often finished with pigments and embossed to simulate a grain. **D 1517, D31**

pigment volume, n—the percent by volume of pigment in the nonvolatile portion of a paint or printing ink, as calculated from bulking value and composition data. The letters PV are commonly used as an abbreviation. **D 16, D01**

P_{ignition}, n—the absolute pressure at the time of ignition. **E 1445, E27**

ΔP_{ignitor}, n—the pressure rise in the chamber due to the ignitor by itself. **E 1445, E27**

pigskin—a surface defect characterized by a texture similar to that of pigskin. **C 286, B08**

pigskin—leather made from the skin of pigs or hogs. In the glove leather trade, the term pigskin includes peccary and carpincho. **D 1517, D31**

pike pole (maritime), n—a long, slender, hooked pole used by boaters to retrieve line, objects, and so forth from water. Also known as a *boat hook*. **F 1490, F32**

pilate, v—a deprecated term. See the preferred term, **pile lift**. **D 5253, D13**

pile—relatively slender structural element that is driven, or otherwise introduced, into the soil, usually for the purpose of providing vertical or lateral support. **D 9, D07**

pile, n—*for pile yarn floor covering*, the texture surfaces composed of many tuft legs bound to a backing fabric in an orderly and repetitive array. **D 123, D13**

pile, n—*in pile fabric*, the raised loops or tufts (cut loops) that form all

or part of the fabric surface. (See also **cut pile floor covering** and **looped pile floor covering**.) **D 123, D13**

pile—relatively slender structural element which is driven, or otherwise introduced, into the soil, usually for the purpose of providing vertical or lateral support. **D 653, D18**

pile, n—*in pile fabric*, the raised loops or tufts (cut loops) that form all or part of the fabric surface. (See also **cut pile floor covering** and **looped pile floor covering**.) **D 4850, D13**

pile, n—*for pile yarn floor covering*, the textured surface composed of many tuft legs bound to a backing fabric in an orderly and repetitive array. **D 5684, D13**

pile floor covering, n—a pile fabric intended for use as a floor covering. The pile may be in the form of cut loops or loops, or both. Both the cut loops and the loops may vary in height. **D 123, D13**

pile height, n—*in determination of tuft height*, a measurement that uses a small graduated ruler inserted until it touches the backing to measure the pile from the top surface of the primary backing to the top of the tuft. **D 123, D13**

pile height, n—*in determination of tuft height*, a measurement that uses a small graduated ruler inserted until it touches the backing to measure the pile from the top surface of the primary backing to the top of the tuft. **D 5684, D13**

pile lay, n—*in floor covering*, the direction in which most of the pile fibers lean in the original, uncrushed carpet. **D 123, D13**

pile lay, n—the direction in which most of the pile fibers lean in the original, uncrushed carpet. **D 5684, D13**

pile lift, v—raise the pile on a textile floor covering. **D 5253, D13**

pile lifting, n—the process of raising the pile on a textile. **D 123, D13**

pile lofting, n—See the preferred term, **pile lift**. **D 5253, D13**

pile retention, n—*in corduroy*, the degree to which cut-pile yarns are held secure and intact during wear. **D 123, D13**

pile retention, n—*in corduroy*, the degree to which cut-pile yarns are held secure and intact during wear. **D 4850, D13**

pile reversal, n—a persistent change in the direction of pile lay in certain areas, resulting in an apparent visual difference of shade. (Syn. **watermarking, pooling, shading**) **D 123, D13**

pile reversal, n—a persistent change in the direction of pile lay in certain areas, resulting in an apparent visual difference of shade. (Syn. **watermarking, pooling, shading**). **D 5684, D13**

pile thickness, n—*in pile yarn floor covering*, the difference in the unextended height of the tuft elements above the backing measured as the difference between two parallel plates exerting a specified compression on the pile and backing and on the backing with the pile removed. **D 123, D13**

pile thickness, n—*in pile yarn floor covering*, the difference in the unextended height of the tuft elements above the backing measured as the difference between two parallel plates exerting a specified compression on the pile and backing and on the backing with the pile removed. **D 5684, D13**

pileup—EIA, counts in a backscattering spectrum arising from two separate events that occur so closely in time that the signals are not resolved by the detection system and cause counts to be recorded in erroneous channels. **E 673, E42**

pile yarn floor covering, n—a textile product in which yarn or yarn segments are attached intermittently to a backing fabric to project above the backing fabric and form pile, in the form of cut loops or loops, or both, with the yarn entering the backing fabric substantially perpendicular to the plane of the backing fabric. (Syn. **cut pile, cut pile floor covering, cut-loop pile, level pile, loop pile, loop pile floor covering, multilevel pile**) **D 123, D13**

pile yarn floor covering, n—a textile product in which yarn or yarn segments are attached intermittently to a backing fabric to project above the backing fabric and form a pile, in the form of cut loops or loops, or both, with the yarn entering the backing fabric substantially perpendicular to the plane of the backing fabric. See **cut pile, cut pile floor covering, cut-loop pile, level pile, loop pile, loop pile floor covering, multilevel pile**. **D 5684, D13**

pile yarn mass, *n*—for *back coated pile yarn floor covering*, the mass per unit area of pile yarn. **D 123**, D13

pile yarn mass, *n*—for *backcoated pile yarn floor covering*, the mass per unit area of pile yarn. **D 5684**, D13

pill, *n*—a buildup of paper, ink or coating on the offset blanket, plate or rollers in such a quantity that it interferes with print quality. **D 6488**, D01

pill, *n*—a build up of paper or ink on the plate. **D 6488**, D01

pill, *n*—the build up of ink or other materials on the gravure cylinder or impression cylinder. **D 6488**, D01

Pilkington process—a process for making flat glass in which the glass continuously pours from a tank onto a spout and thence between forming rolls and is subsequently annealed as one continuous sheet. **C 162**, C14

pillar—in-situ rock between two or more underground openings: crown pillars; barrier pillars; rib pillars; sill pillars; chain pillars; etc. (ISRM) **D 653**, D18

pill, *n*—resistance to the formation of pills on the surface of a textile fabric. **D 123**, D13

pill, *n*—resistance to the formation of pills on the surface of a textile fabric. **D 4850**, D13

pills, *n*—bunches or balls of tangled fibers which are held to the surface of a fabric by one or more fibers. (Compare **fuzz ball**.) **D 123**, D13

pills, *n*—bunches or balls of tangled fibers which are held to the surface of a fabric by one or more fibers. (Compare **fuzz ball**) **D 3990**, D13

pills, *n*—bunches or balls of tangled fibers which are held to the surface of a fabric by one or more fibers. (Compare **fuzz ball**.) **D 4850**, D13

pilot—plain-shank section between point and threaded portion of shank. **F 547**, F16

pilot, *n*—person who has final authority and responsibility for the operation and safety of flight. See also 14 CFR Part 1 for “pilot-in-command.” Sometimes called the UAV controller, ASTM reserves the term controller for air traffic services provider. **F 2395**, F38

pilot drift (pioneer tunnel)—a drift or tunnel first excavated as a smaller section than the dimensions of the main tunnel. A pilot drift or tunnel is usually used to investigate rock conditions in advance of the main tunnel, to permit installation of bracing before the principal mass of rock is removed, or to serve as a drainage tunnel. (ISRM) **D 653**, D18

piloted airblast nozzle—an airblast nozzle combined with a lower capacity pressure nozzle. **E 1620**, E29

piloted ignition, *n*—ignition of combustible gases or vapors by a pilot source of ignition (compare **spontaneous ignition, unpiloted ignition**). **E 176**, E05

pilot energy rate—average rate of energy consumption (Btu/h or kW) by the equipment's continuous, $E_{pilot\ rate}$

$$E_{pilot\ rate} = \frac{E_{pilot} \times 60}{t_{pilot}}$$

where:

$E_{pilot\ rate}$ = pilot energy rate,

E_{pilot} = pilot energy consumption during the test period, Btu, kWu or kJ, and

t_{pilot} = length of pilot of test period, min. **F 1827**, F26

pilot point—point of threaded nail with plain portion of shank between top of point and threaded portion of shank. **F 547**, F16

pilot source of ignition, *n*—a discrete source of energy, such as, for example, a flame, spark, electrical arc, or glowing wire (compare **pilotedignition, unpiloted ignition**). **E 176**, E05

PIM—see **powder injectionmolding**. **B 243**, B09

pimple—a small solid bump or protrusion on the pipe surface. **C 896**, C04

pimple, *n*—an imperfection, a small, protuberance of varied shape on the surface of a plastic product. **D 883**, D20

pimple, *n*—small, sharp, or conical elevation on the surface of a plastic. **F 412**, F17

pin—small headless nail. **F 547**, F16

pin-and-collar specimen, *n*—an assembly of a metal pin bonded inside a metal collar, used to measure the shear strength of an adhesive. **D 907**, D14

pinch, *n*—for *sampling*, as much fiber as can be taken up between the tips of the index finger and thumb. **D 2946**, C17

pin cushion distortion—See **distortion**. **E 7**, E04

pineapple, *n*—a finial in the form of a pineapple. **E 631**, E06

pineapple, *n*—a finial in the form of a pineapple. **E 1481**, E06

pine needle oil, *n*—an essential oil of typical fragrance obtained by steam distillation of the leaves (needles) of certain species of pine. **D 804**, D01

pinenes, *n*—bicyclic terpene hydrocarbons, the principal constituent of all turpentines and existing therein in two isomeric forms, alpha-pinene and beta-pinene. **D 804**, D01

pine oil, *n*—a colorless to amber colored volatile oil with characteristic pinaceous odor, consisting principally of isomeric tertiary and secondary cyclic terpene alcohols, with variable quantities of terpene hydrocarbons, ethers, ketones, phenols, and phenolic ethers, the amount and character of which depend on the source and method of manufacture. **D 804**, D01

pine tar, *n*—A product of the destructive distillation of pine wood. **D 804**, D01

pingo—a perennial frost mound consisting of a core of massive ice, produced primarily by injection of water, and covered with soil and vegetation. **D 7099**, D18

pingo ice—massive ice which forms the core of a pingo. **D 7099**, D18

pingo remnant—a collapsed pingo. **D 7099**, D18

pingo scar—a pingo remnant in a contemporary non-permafrost environment. **D 7099**, D18

pinhole, *n*—in *fabrics*, a very small hole, approximately the size of the cross section of a pin. **D 123**, D13

pinhole—a tiny hole in a film, foil, or laminate comparable in size to one made by a pin. **D 1079**, D08

pin hole, *n*—in *fabrics*, a very small hole, approximately the size of the cross section of a pin. **D 3990**, D13

pinhole—in *protectivecoatings*, minute holes through a coat or coats that expose an underlying coat or the substrate. **D 4538**, D33

pinhole—an opening in the carbon tissue that permits the coating to seep through to the uncoated side. **F 221**, F05

pinhole eyepiece—an eyepiece, or a cap to place over an eyepiece, which has a small central aperture instead of an eye lens. Used in adjusting or aligning microscopes. **E 7**, E04

pinhole ocular—See **pinhole eyepiece**. **E 7**, E04

pinhole, pinholing—a porcelain enamel surface defect caused by gas evolution and characterized by a small hole resembling a pin prick that may extend to the base metal. **C 286**, B08

pinholes—small holes occurring as imperfections which penetrate entirely through the copper foil. **B 846**, B05

pinholes—imperfections in the surface of a ceramic body or glaze resembling pin pricks. **C 242**, C21

pinholes, *n*—small pore-like flaws in a coating that extend entirely through the applied film and have the general appearance of pin pricks when viewed by reflected light. **D 16**, D01

pinholes—small pore-like flaws in a coating that extend entirely through the applied film and have the general appearance of pin pricks when viewed by reflected light (see Terminology D 16). **D 4538**, D33

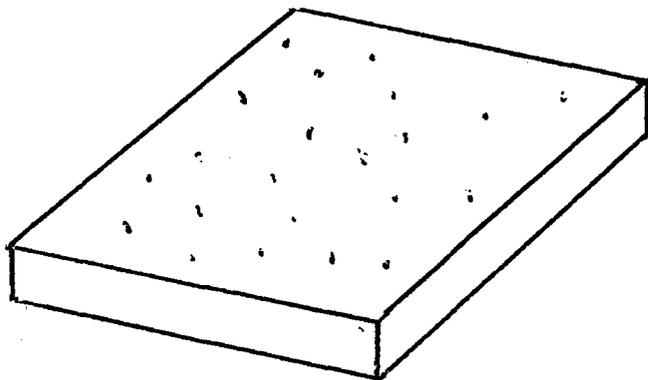

pinholes, *n*—small voids in the printed area caused by the failure of ink to form a continuous ink film. **D 6488**, D01

pinholes—very small holes; sometimes found as a type of porosity in a casting because of microshrinkage or of gas evolution during

pinholes

solidification; or, in wrought products, due to removal of inclusions or microconstituents during macroetching of transverse sections. In photography, a very small circular aperture. E 7, E04

pinholes—imperfections in the surface of a ceramic glaze resembling pin pricks.

F 109, C21

pinhole system—a group of two or more pinholes arranged to define a beam. E 7, E04

pinholing, n—the presence of a series of fine holes or voids in a film. D 16, D01

pinholing, n—the appearance of fine voids in the print area caused by nonuniform wetting of the substrate or some other mechanical problem. D 6488, D01

pinked seam-finish, n—a finish for the raw edges of the seam allowances of a plain seam, which produces a zigzagged cut raw edge. (Compare **stitched and pinked seam-finish**.) D 123, D13

pinked seam finish, n—in home sewing, a seam finish in which a zigzagged or scalloped cut edge is produced. (Compare **stitched and pinked seam finish**.) D 4965, D13

pink noise—noise with a continuous frequency spectrum and with equal power per constant percentage bandwidth. For example, equal power in any one-third octave band. C 634, E33

pin lock slider, n—a slider that incorporates a projection on the pull that fits between adjacent interlocking elements of a zipper when a pin lock slider is in the locked position. D 123, D13

pin lock slider, n—a slider that incorporates a projection on the pull that fits between adjacent interlocking elements of a zipper when a pin lock slider is in the locked position. D 2050, D13

pin mark, n—a series of holes near the edge parallel with the lengthwise direction of a fabric caused by the holding device on a pin tenter frame. (See also **clip mark**.) D 123, D13

pin mark, n—a series of holes near the edge parallel with the lengthwise direction of a fabric caused by the holding device on a pin tenter frame. (See also **clip mark**.) D 3990, D13

pin mark or point mark—a visible imprint on the back of ware left by processing tools; sometimes synonymous with burning tool mark. C 286, B08

pin, retainer—See **retainer pin**. D 2050, D13

pin seal—natural grain sealskin tanned for fancy leather. Imitations on other skins should be described as “pin-grain sheepskin,” “pin-grain goatskin,” etc. D 1517, D31

pin, separable—See **separable pin**. D 2050, D13

pinle atomizer—an impact atomizer in which a liquid jet is directed against a fixed axisymmetric surface. (See also **variable-orifice poppet nozzle**.) E 1620, E29

pipe, n—tube in standardized combination of outside diameter and wall thickness, commonly designated by “Nominal Pipe Sizes” and “ANSI Schedule Numbers.”

drawn pipe, n—pipe brought to final dimensions by drawing through a die.

extruded pipe, n—pipe formed by hot extruding.

seamless pipe, n—extruded or drawn pipe which does not contain any line junctures resulting from the method of manufacture.

structural pipe, n—pipe commonly used for structural purposes. B 881, B07

pipe, n—a tubular metal product, cast or wrought, of dimensions that conform to those referred to commercially as standard pipe sizes. B 899, B02

pipe—a tube or elongated hollow concrete structure intended to transmit flow between locations. C 822, C13

pipe—See **vitrified clay pipe**. C 896, C04

pipe, n—as related to heating, ventilating, or air conditioning systems, a cylindrical conduit for the conveyance of liquids or semi-solids. E 176, E05

pipe, n—a tubular conduit for transport of fluids or finely divided solids; also, a hollow structural member or safety barrier; a hollow product of round cross section.

pipe railing system—See **railing system**. E 631, E06

pipe, n—hollow round section of metal or other material, the size of which is usually designated by nominal size, in inches (millimeters), as influenced by inside diameter and wall thickness.

E 1481, E06

pipe body—the clay material or mixture of clay materials from which vitrified clay pipe is made. C 896, C04

pipe bursting—process by which existing pipelines are broken by mechanical fracturing from either inside or outside with the remains being pushed into the surrounding soil while simultaneously inserting a new pipeline of equal or larger diameter.

C 896, C04

pipe diameter—the inside diameter of a concrete pipe. C 822, C13

pipe insulation, n—insulation in a form suitable for application to cylindrical surfaces. C 168, C16

pipe insulation supplementary materials, n—as related to fire testing, components, including tapes and sealants used for transverse joints as well as fitting covers that are intermittently spaced, as needed, within the pipe insulation system, as well as adhesives used to bond the insulation to the pipe substrate and that do not cover the pipe continuously for an extended length. E 176, E05

pipe insulation system, n—as related to fire testing, system intended to insulate and cover, continuously for an extended length, the outside surface of a pipe; the system shall have an insulation core, with or without a covering or vapor retarder facing which includes longitudinal closure systems (if used) and perhaps other pipe insulation supplementary materials such as adhesives, fasteners, or tapes (if used). E 176, E05

pipeline—pipe sections joined together. C 822, C13

pipeline—pipes joined to provide a conduit through which fluids flow. C 896, C04

pipe nipple—a short length of pipe with male threads at both ends. B 846, B05

pipe railing system—a railing system fabricated of pipe or round tubing. E 631, E06

pipe railing system—a railing system fabricated of pipe or round tubing. E 1481, E06

pipe, seamless—seamless tube conforming to the particular dimensions commercially known as “standard pipe sizes.” B 846, B05

pipe section—a single pipe. C 822, C13

pipe spigot—portion of a pipe or fitting which fits into a bell or socket of a preceding pipe or fitting. F 412, F17

pipe, threadless—a seamless copper tube of standard pipe outside diameters conforming to particular dimensions commercially known as threadless pipe (TP). B 846, B05

pipe zone backfill—backfill in the area of the pipe, may be specified for depth and compaction. F 412, F17

pipng—the progressive removal of soil particles from a mass by percolating water, leading to the development of channels.

D 653, D18

pipng, n—a system of pipes. E 631, E06

pipy—see **flanky**.

Pirani gage—see **thermal conductivity vacuum gage**. E 1316, E07

pirani vacuum gage—a thermal conductivity or hot-wire gage in which the temperature of an electrically heated fine wire varies as the thermal conductivity of the residual gas. The wire has a high temperature coefficient of electrical resistance and the change in resistance is usually measured in a bridge circuit. (See **thermocouple vacuum gage**.) E 7, E04

piscicide—a chemical used to kill, control, or cause other adverse effects on fish. E 609, E35

piston, *n*—a sliding component that helps pressurize the product during actuation along with transfer of the product from the body to the exit orifice in the actuator. D 6655, D10

pit—a small depression or cavity produced in a metal surface during electrodeposition or by corrosion. B 374, B08

pit—a defect similar to a dimple but slightly smaller. C 286, B08

pit—an excavation in the surface of the earth from which ore is obtained as in large open pit mining or as an excavation made for test purposes, that is, a testpit. (ISRM) D 653, D18

pit, *n*—an imperfection, a small crater in the surface of the plastic, with its width of approximately the same order of magnitude as its depth. D 883, D20

pit—tiny depression or hole on the grain surface of leather, due to natural causes or manufacturing. D 1517, D31

pit—a shallow depression or crater in which all surfaces are visible by normal (20/20) vision under 200 fc of illumination.

F 109, C21

pit, *n*—small crater in the surface of the plastic, with its width approximately the same order of magnitude as its depth. (D20)

F 412, F17

pit, *n*—in *plastics*, an imperfection, a small crater in the surface, the depth and width of which are approximately the same order of magnitude. F 1251, F04

pitch, *n*—in *cooling tower fill*, the wave length of corrugated products. C 1154, C17

pitch, *n*—black or dark-brown solid cementitious material which gradually liquefies when heated and which is obtained as residua in the partial evaporation or fractional distillation of tar. D 8, D04

pitch—a term applied to the resin occurring in the wood of certain conifers. D 9, D07

pitch, *n*—for *wovenpile floor covering*, the number of binding sites in 27 in. (686 mm) of width. D 123, D13

pitch—see tall oil pitch. D 804, D01

pitch—See **incline**; **coal-tar pitch**; or **petroleum pitch**. D 1079, D08

pitch—the distance from center point to center point of adjacent crests of an asbestos-cement product of corrugated or grooved cross-section. D 2946, C17

pitch, *n*—for *coolingtower fill*, the wave length of corrugated products. D 2946, C17

pitch, *n*—for *wovenpile floor covering*, the number of binding sites in 686 mm (27 in.) of width. D 5684, D13

pitch, *n*—an inclination or slope measured in degrees, or percent, or by the ratio of rise and run. E 631, E06

pitch—the distance between one character reference point and the corresponding point on the next adjacent character. F 149, F05

pitch angle, (rad or degree), *n*—in *a vehicle*, the angle between its X-axis and the ground plane. F 538, F09

pitch-bonded basic brick, *n*—unburned basic refractory shapes bonded with pitch; if subsequently heat-treated sufficiently to minimize softening of the bond on reheating, they are referred to as *tempered*. C 71, C08

pitch diameter—for all practical purposes, the diameter of the smooth shank prior to threading. F 547, F16

pitch-impregnated basic brick, *n*—burned basic refractory shapes impregnated with pitch after firing. C 71, C08

pitch line—line parallel to nail axis located at distance equal to one-half of pitch diameter from nail axis. F 547, F16

pitch pocket—an opening extending parallel to the annual growth rings containing, or that has contained, pitch, either solid or liquid. D 9, D07

pitch pocket—a flanged, open-bottomed metal container placed around a column or other roof-penetration, and filled with hot bitumen or flashing cement to seal the joint. D 1079, D08

pitch polishing—polishing operation in which pitch rather than felt is the resilient carrier for the polishing agent. C 162, C14

pitch seam—a shake or check filled with pitch. D 9, D07

pitch streak—a well-defined accumulation of pitch in a more or less regular streak in the wood of certain conifers. D 9, D07

pith—the small, soft tissue occurring in the structural center of a tree trunk, branch, twig, or log. D 9, D07

pith fleck—a narrow streak, resembling pith on the surface of a piece; usually brownish, up to several inches in length; resulting from burrowing of larvae in the growing tissues of the tree. D 9, D07

pit, *n*, (PT^s)—as used in *fractography*, a surface-distributed cavity created on the specimen/component due to an interaction/reaction between the material and the testing/service environment, for example, corrosion, oxidation. C 1145, C28

piton, ice, *n*—a device designed to be hammered into ice to provide a belay or protection anchor. F 1773, F08

piton, rock, *n*—a device designed to be driven by a hammer into a crack in rock to provide a belay or protection anchor. F 1773, F08

pits—small holes having jagged edges, occurring as imperfections which do not penetrate entirely through the copper foil. B 846, B05

pits—small depressions, voids or pinholes in stone, especially on a finished surface. C 119, C18

pits, ponds, or lagoons—man-made or natural depressions in a ground surface that are likely to hold liquids or sludge containing hazardous substances or petroleum products. The likelihood of such liquids or sludge being present is determined by evidence of factors associated with the pit, pond, or lagoon, including, but not limited to, discolored water, distressed vegetation, or the presence of an obvious wastewater discharge. D 5681, D34

pitting, *n*—small defects in the surface of the photoreceptor that produce spots or voids on the printout. F 1457, F05

pitting—corrosion of a metal surface, confined to a point or small area, that takes the form of cavities. G 15, G01

pitting, *n*—in *tribology*, a form of wear characterized by the presence of surface cavities the formation of which is attributed to processes such as fatigue, local adhesion, or cavitation. G 40, G02

pitting factor—ratio of the depth of the deepest pit resulting from corrosion divided by the average penetration as calculated from weight loss. G 15, G01

Pittsburgh sheet process—the method of making sheet glass by drawing vertically upward from a free bath surface wherein definition of draw is established by a submerged refractory member. C 162, C14

pixel—The smallest addressable element in an electronic image. E 1316, E07

pixel—picture element. F 1457, F05

pixel, display size—the dimensions of the smallest picture element comprising the displayed image, given in terms of the imaged object's dimensions being represented by the element. E 1316, E07

pixel (picture element)—smallest spatial unit of an image. E 7, E04

pixel size—the length and width of a pixel. E 1316, E07

pizza oven—See *conveyor oven* or *deck oven*. F 1827, F26

placement, *n*—the process of placing and consolidating concrete; a

placement, n

quantity of concrete placed and finished during a continuous operation; also inappropriately called pouring. **C 717, C24**

placket, n—*in garment construction*, a finished garment opening that is usually dependent on mechanical devices called closures to secure the opening. **F 1494, F23**

Plackett-Burman designs, n—a set of screening designs using orthogonal arrays that permit evaluation of the linear effects of up to $n = t - 1$ factors in a study of t , treatment combinations. **E 456, E11**

Plackett-Burman designs, n—a set of screening designs using orthogonal arrays that permit evaluation of the linear effects of up to $n = t - 1$ factors in a study of t , treatment combinations. **E 1325, E11**

plaid reference line(s), n—used for alignment of pattern pieces on plaid material during marker making. **D 6963, D13**

plain—{archaic} relatively free of gaseous inclusions. **C 162, C14**

plain braid, n—*in rope*, a braided construction in which one strand of one direction of rotation about the axis of the rope passes over one strand of the opposite direction. (See **braided rope**.) **D 123, D13**

plain conductor—a conductor made up of one or more plain wires of the same metal. **B 354, B01**

plain jet atomizer—a pressure atomizer comprising a simple orifice designed to produce an unstable liquid jet. **E 1620, E29**

plain orifice atomizer—see **plain jet atomizer**. **E 1620, E29**

plain paper copying—a form of indirect electrophotographic copying in which the electrostatic image of the original is first formed on a photoconductor element, then developed with a toner, and finally transferred onto a plain sheet of paper where it is fixed (see also Terminology F 1156). **F 335, F05**

plainsawn—A synonym for *flat grain*. **D 9, D07**

plain seam, n—a seam formed by a single joining line. (Ant. **complex seam**.) **D 123, D13**

plain seam, n—*inhome sewing*, a seam formed by a single line of stitching. (Ant. **complex seam**.) **D 4965, D13**

plain-shank—term applied to nail without shank deformations, disregarding grip-marks. **F 547, F16**

plain steel—bright steel. **F 547, F16**

plain washer—fastener accessory that accepts a bolt or screw through its center hole and provides a surface to distribute bearing stress. It also serves to provide a surface for head or nut rotation during tightening. **F 1789, F16**

plain weave, n—a fabric pattern in which each yarn of the filling passes alternately over and under a yarn of warp and each yarn of the warp passes alternately over and under a yarn of the filling. **D 123, D13**

plain weave, n—a fabric pattern in which each yarn of the filling passes alternately over and under a yarn of warp and each yarn of the warp passes alternately over and under a yarn of the filling. **D 4850, D13**

plain wire—wire consisting of one metal only. **B 354, B01**

plaited rope, n—rope made from eight strands arranged in four pairs in which one strand is placed adjacent to a second in each pair and in which each strand of each pair has been twisted in one direction while each strand in each alternate pair has been twisted in the opposite direction and the four pairs of strands are intertwined maypole fashion in a manner such that each pair of strands passes over and under adjacent pair of strands. **D 123, D13**

planar grinding—the first step in a preparation procedure used to bring all specimens into the same plane of polish. It is unique to semi or fully automatic preparation equipment that utilize specimen holders. **E 7, E04**

Planckian locus, n—locus in a chromaticity diagram that represents the chromaticities of the radiation of Planckian radiators at different temperatures. **E 284, E12**

Planckian radiator, n—See **full radiator**. **E 284, E12**

plane, adj—having a flat, smooth surface with no significant variations such as elevations or depressions. **E 284, E12**

plane bed—a sedimentary stream bed without elevations or depressions larger than the maximum size of the bed material. **D 4410, D19**

plane (crystal)—an idiomorphic face of a crystal. Any atom-containing plane in a crystal. **E 7, E04**

planed-to-caliper hardboard—hardboard that is machined to a close thickness tolerance. **D 1554, D07**

plane, focal—a plane through the focal point perpendicular to the principal axis of a lens or mirror. **E 175, E41**

plane glass illuminator—a thin transparent flat glass disk interposed in a microscope or a lens imaging system for the purpose of directing light to the object without causing a reduction of the useful aperture of the lens system. **E 7, E04**

plane of weakness—surface or narrow zone with a (shear or tensile) strength lower than that of the surrounding material. (ISRM) **D 653, D18**

plane of working—the plane of maximum area extension. **E 7, E04**

plane-strain (chevron-notch) fracture toughness, K_{IVM} [FL^{-3/2}]—determined similarly to K_{IV} or K_{IVj} using the same specimen, or specimen geometries, but using a simpler analysis based on the maximum test force. Unloading-reloading cycles are not required in a test to determine K_{IVM} . **E 1823, E08**

plane-strain (chevron-notch) fracture toughness, K_{IV} or K_{IVj} [FL^{-3/2}]—under conditions of crack-tip plane strain in a chevron-notched specimen: K_{IV} relates to extension resistance with respect to a slowly advancing steady-state crack. K_{IVj} relates to crack extension resistance with respect to a sporadically advancing crack. **E 1823, E08**

plane-strain crack-arrest fracture toughness, K_{Ia} [FL^{-3/2}]—the value of crack-arrest fracture toughness, K_{Ia} , for a crack that arrests under conditions of crack-front plane-strain. **E 1823, E08**

plane-strain fracture toughness, K_{Ic} [FL^{-3/2}], J_{Ic} [FL⁻¹]—the crack-extension resistance under conditions of crack-tip plane strain. **E 1823, E08**

plane-stress fracture toughness, K_c [FL^{-3/2}]—crack-extension resistance under conditions that do not approach crack-tip plane strain to the degree required by an empirical criterion. **E 1823, E08**

plane stress (strain)—a state of stress (strain) in a solid body in which all stress (strain) components normal to a certain plane are zero. (ISRM) **D 653, D18**

planetary permafrost—permafrost occurring on any of the planetary bodies. **D 7099, D18**

plane wave—wave in which fronts are parallel to plane normal to direction of propagation. **D 653, D18**

planimetric method—See **Jeffries' method**. **E 7, E04**

plank—See **lumber**. **D 996, D10**

plank, n—a form of resilient floor covering having an aspect ratio greater than 2:1. **F 141, F06**

plans and specifications, n—*in pipe laying*, documents prepared by the engineer or owner, or both, stipulating work to be done and materials to be used which, combined with other contract documents and Guide C 966, form the basis for a comprehensive contract between the owner and the contractor. **C 1154, C17**

plans and specifications, n—*for pipe laying*, documents prepared by the engineer or owner, or both, stipulating work to be done and materials to be used which, combined with other contract documents and Guide C 966, form the basis for a comprehensive contract between the owner and the contractor. **D 2946, C17**

plantar—pertaining to the sole of the foot. **F 869, F08**

plant capacity—manufacture of product per unit time, expressed as m³/day, m³/h, GPD, MGD. **D 6161, D19**

plant mix, cold-laid, n—a mixture of cut-back asphalt, bituminous emulsion, or tar and mineral aggregate prepared in a central bituminous mixing plant and spread and compacted at the job-site when the mixture is at or near ambient temperature. **D 8, D04**

plant mix, hot-laid bituminous emulsion mixtures, n—a mixture of emulsion and heated mineral aggregate usually prepared in a

- conventional asphalt plant or drum mixer and spread and compacted at the job site at a temperature above ambient. **D 8**, D04
- plant tests**—the quality assurance tests performed prior to delivery as a basis of acceptance. **C 822**, C13
- plaque**—a round, clear area in a layer of host cells caused by virus growth and resultant killing or lysis of the cells. **E 1705**, E48
- plaque, n —as invirology**, a visible, clear area, which is theoretically the result of the infection and lysis of host cells by a single viable virus. **F 1494**, F23
- plaque forming unit (PFU), n** —a virus particle capable of producing plaques by infecting and lysing bacteria in a lawn in top agar. **F 1494**, F23
- plasma**—a partially or totally ionized gas or vapor. **B 542**, B02
- plasmids**—independently-replicating extrachromosomal genetic material. **F 1600**, F20
- plasmon loss lines**—peaks in an electron spectrum that are due to certain characteristic energy losses of electrons emitted from the specimen. These losses occur as a result of the excitation of collective oscillations among the valence band electrons. **E 673**, E42
- plaster**—see **gypsum plaster, gypsum neat plaster**. **C 11**, C11
- plaster**—{archaic} partially dehydrated gypsum used with water for bedding plates of glass to tables during the grinding and polishing of plate glass. **C 162**, C14
- plaster, n —hydraulic cement**, a mixture of hydraulic cement, fine aggregate and water that hardens; used for coating surfaces, such as ceilings, walls and partitions. **C 219**, C01
- plaster-base finish, n** —the surface texture intended for the direct application of plaster. **C 43**, C15
- plaster-base nail, plasterboard nail, plaster-boardnail**—See **gypsum-lath nail, wood-lathnail**. **F 547**, F16
- plaster bond, n** —the adhesion between plaster coats or between plaster and substrate. **C 11**, C11
- plastic**—a descriptive term applied to a material that exhibits the property of plasticity or stickiness, where plasticity is the ability of a material to undergo substantial deformation without fracturing. **C 242**, C21
- plastic**—(1) capable of being deformed continuously and permanently in any direction without rupture, under a stress exceeding the yield value. (2) made of, consisting of or pertaining to plastics. (3) a material containing as an essential ingredient an organic substance of large molecular mass, which is solid in its finished state and, at some stage in its manufacture or in its processing into finished articles, can be shaped by flow. **D 1695**, D01
- plastic, n** —any of numerous polymeric materials that are usually thermoplastic or thermosetting, of high molecular weight and that can be molded, cast extruded, drawn, laminated, or otherwise fabricated into objects, powders, beads, films, filaments, fibers, or other shapes (*Webster Modified*). **F 1251**, F04
- plastic, n** —a material that contains, as an essential ingredient, one or more organic polymeric substances of large molecular weight, is solid in its finished state, and, at some stage in its manufacture of processing into finished articles, can be shaped by flow. **F 1494**, F23
- plastic cement, n** —a hydraulic cement to which one or more plasticizing agents (but not more than 12 % by volume) have been added during intergrinding or blending to increase the workability and molding qualities of the resultant cement paste, mortar, or plaster. **C 11**, C11
- plastic cement, n** —a hydraulic cement used in plaster or stucco. **C 219**, C01
- plastic cement**—See **flashing cement**. **D 1079**, D08
- plastic coated**—covered fully or partially with polymer to provide ease of driving, increased holding power, or corrosion resistance, or a combination of these. **F 547**, F16
- plastic conduit**—plastic pipe or tubing used as an enclosure for electrical wiring. **F 412**, F17
- plastic deformation**—see **plastic flow**. **D 653**, D18
- plastic deformation**—permanent distortion of a material under the action of applied stresses. **F 1789**, F16
- plastic equilibrium**—state of stress within a soil or rock mass or a portion thereof, which has been deformed to such an extent that its ultimate shearing resistance is mobilized.
- active state of plastic equilibrium**—plastic equilibrium obtained by an expansion of a mass.
- passive state of plastic equilibrium**—plastic equilibrium obtained by a compression of a mass. **D 653**, D18
- plastic flow (plastic deformation)**—the deformation of a plastic material beyond the point of recovery, accompanied by continuing deformation with no further increase in stress. **D 653**, D18
- plastic foam, n** —See **cellular plastic** (the preferred terminology). **D 883**, D20
- plastic frozen ground**—fine-grained soil in which only a portion of the pore water has turned into ice. **D 7099**, D18
- plasticity, n** —the property of freshly mixed cement paste, mortar, or plaster which determines its workability and molding qualities. **C 11**, C11
- plasticity**—a comparative physical property of a standard consistency lime putty to resist the loss of plastic state workability when subjected to pressure against the suction of an absorptive surface as measured by the Emley Plasticimeter. **C 51**, C07
- plasticity**—the property of a soil or rock which allows it to be deformed beyond the point of recovery without cracking or appreciable volume change. **D 653**, D18
- plasticity**—property of a material to continue to deform indefinitely while sustaining a constant stress. (ISRM) **D 653**, D18
- plasticity, n** —a property of a material that allows the material to be deformed continuously and permanently without rupture upon the application of a force that exceeds the yield value of the material. **D 907**, D14
- plasticity, n** —a characteristic of unvulcanized rubber indicated by the degree of retention of deformation after removal of the deforming force. **D 1566**, D11
- plasticity**—a property of a material that allows it to be deformed continuously and permanently without rupture upon the application of a force that exceeds the yield value of the material. (D 907, D14) **F 869**, F08
- plasticity**—ability of the metal to undergo permanent deformation without rupture. **F 1789**, F16
- plasticity index, I_p , PI , I_w (D)**—numerical difference between the liquid limit and the plastic limit. **D 653**, D18
- Plasticity Retention Index (PRI), n** —for natural rubber, the ratio of a “plasticity number” measured after air-oven ageing, under specified conditions, to a “plasticity number” measured before ageing. **D 1566**, D11
- plasticizer, n** —a substance added to paint, varnish, or lacquer to impart flexibility. **D 16**, D01
- plasticizer**—in grouting, a material that increases the plasticity of a grout, cement paste, or mortar. **D 653**, D18
- plasticizer, n** —a substance incorporated in a material to increase its workability, flexibility, or distensibility. **D 883**, D20
- plasticizer, n** —a substance of low or negligible volatility that lowers the softening range and increases workability, flexibility or extensibility. **D 907**, D14
- plasticizer, n** —a compounding material used to enhance the deformability of a polymeric compound. **D 1566**, D11
- plasticizer, n** —a substance incorporated in a material to increase its workability, flexibility, or distensibility. (D20) **F 412**, F17
- plasticizer, n** —a substance incorporated into a material to increase its workability, flexibility, or distensibility of the material. **F 1251**, F04
- plastic limit, w_p , PL , P_w (D)**—(a) the water content corresponding to an arbitrary limit between the plastic and the semisolid states of consistency of a soil. (b) water content at which a soil will just

plastic limit, w_p , PL , P_w (D)

begin to crumble when rolled into a thread approximately $\frac{1}{8}$ in. (3.2 mm) in diameter. **D 653, D18**

plastic or bond fireclay, n—see **fireclay, plastic or bond**. **C 71, C08**

plastic pipe—a hollow cylinder of a plastic material in which the wall thicknesses are usually small when compared to the diameter and in which the inside and outside walls are essentially concentric. **D 883, D20**

plastic pipe—a hollow cylinder of a plastic material in which the wall thicknesses are usually small when compared to the diameter and in which the inside and outside walls are essentially concentric. (D20) **F 412, F17**

plastic pressing—See wet pressing under **pressing**. **C 242, C21**

plastic refractory, n—a refractory material, tempered with water, that can be extruded and that has suitable workability to be pounded into place to form a monolithic structure. **C 71, C08**

plastic replica—See **replica**. **E 7, E04**

plastic(s), n—a material that contains as an essential ingredient one or more organic polymeric substances of large molecular weight, is solid in its finished state, and, at some stage in its manufacture or processing into finished articles, can be shaped by flow. **D 883, D20**

plastic(s), n—a material that contains as an essential ingredient one or more organic polymeric substances of large molecular weight, is solid in its finished state, and, at some stage in its manufacture or processing into finished articles, can be shaped by flow.

NOTE—Rubber, textiles, adhesives, and paint, which may in some cases meet this definition, are not considered plastics. See ASTM definitions of these terms.

NOTE—The above definition may be used as a separate meaning to the definitions contained in the dictionary for the adjective “plastic.”

NOTE—The plural form may be used as an adjective to refer to two or more plastic materials, for example, plastics industry. However, when the intent is to distinguish “plastic products” from “wood products” or “glass products,” the singular form should be used. As a general rule, if the adjective is to restrict the noun modified with respect to the type of material, “plastic” should be used; if the adjective is to indicate that more than one type of plastic material is or may be involved, “plastics” is permissible. (D20) **F 412, F17**

plastic soil—a soil that exhibits plasticity. **D 653, D18**

plastic state (plastic range)—the range of consistency within which a soil or rock exhibits plastic properties. **D 653, D18**

plastic true strain, ϵ_p , n—the inelastic component of true strain. **E 6, E28**

plastic tubing, n—(1) a particular size of plastic pipe in which the outside diameter is essentially the same as the corresponding size of copper tubing.

(2) small diameter flexible pipe. (See **plastic pipe**.) **D 883, D20**

plastic tubing, n—a particular size of smooth wall plastic pipe in which the outside diameter is essentially the same as the corresponding size of copper tubing. **F 412, F17**

plastic-zone adjustment, r_y [L]—an addition to the physical crack size to account for plastic crack-tip deformation enclosed by a linear-elastic stress field. **E 1823, E08**

plastisol—a suspension of a finely divided resin in a plasticizer, that can be converted to a continuous film by the application of heat. Distinct from baking enamels etc., in that substantially all the original mixture becomes a part of the film; there is no significant evaporation of solvent. The films are usually much thicker than obtainable from coatings which depend on the evaporation of a volatile solvent. **B 374, B08**

plastisol, n—a liquid suspension of a finely divided PVC polymer or copolymer in a plasticizer. **D 883, D20**

plastisol, n—a suspension of a finely divided polymer in a plasticizer. **D 1566, D11**

plastisol, n—a liquid suspension of a finely divided PVC polymer or copolymer in a plasticizer. **F 1251, F04**

plastometer, n—an instrument for measuring the plasticity of a material. **D 1566, D11**

plate—as in *inch-pound specifications*, a wrought flat product over 0.188-in. thick and over 12-in. wide, in straight lengths or coils (rolls). **B 846, B05**

plate—as in *SI specifications*, a wrought flat product over 5-mm thick and over 300-mm wide, in straight lengths or coils (rolls). **B 846, B05**

plate:

Alclad plate, n—composite plate product comprised of an aluminum-alloy core having on both surfaces a metallurgically bonded aluminum or aluminum-alloy cladding that is anodic to the core, thus electrolytically protecting the core against corrosion.

mill finish plate, n—plate having a non-uniform finish which may vary from piece to piece and within a piece, and which may not be entirely free of stains or oil.

tread plate, n—plate or sheet having a raised, figured pattern on one surface to provide improved traction. **B 881, B07**

plate, n—a flat-rolled metal product of same minimum thickness and width arbitrarily dependent on the type of metal. **B 899, B02**

plate, n—a flat, rolled sheet having a width and length much greater than thickness. (If of steel, having dimensions of 0.180 in. (4.6 mm) or greater in thickness, and greater than 8.0 in. (203 mm) in width.) **E 631, E06**

plate, n—abbreviated term for **metal connector plate**. **E 631, E06**

plate—an image vehicle, usually permanent and reusable for use on printing presses. **F 335, F05**

plate, n—as in *microbiology*, a Petri dish containing culture medium. **F 1494, F23**

plate, n—a longitudinal element asymmetrical in the transverse plane and designed to resist tension, compression, bending, and torsion. **F 1582, F04**

plate-as-rolled, n—the quantity of plate product rolled at one time, either from an individual slab or directly from an ingot. **A 941, A01**

plateau, vulcanization, n—vulcanization during which the value of a desired property proceeds to a maximum or minimum and then remains essentially constant for a substantial period after the initial change. **D 1566, D11**

plate binding, n—the refusal of part of a lithographic plate to produce an image due to loss of ink receptivity. **D 6488, D01**

plate cassette—See **cassette**. **E 7, E04**

plate chamber—the chamber within the vacuum system of an electron microscope in which is placed the plate cassette. **E 7, E04**

plate-clinched point—pointed end of nail, having been driven through member against anvil plate, bent sideways. **F 547, F16**

plated—See **electroplated**. **F 547, F16**

plate distillation column—column constructed with perforated plates to separate one or more volatile liquids by distillation. **E 1705, E48**

plate glass—flat glass formed by a rolling process, ground and polished on both sides, with surfaces essentially plane and parallel. **C 162, C14**

plate hole—opening in metal connector plate resulting from punching integral plate projection(s) from, or nail hole in, connector plate during its fabrication. See **nail hole**. **E 631, E06**

plate-mark—any imperfection in a pressed plastic sheet resulting from the surface of the pressing plate. **D 883, D20**

platen—a plate of metal, especially one that exerts or receives pressure, as in a press used for gluing plywood. **D 1038, D07**

plates, n—flat particles of metal powder having considerable thickness. **B 243, B09**

plate scumming, n—the deposit of ink on the non-image area of the plate that can be in the form of minute particles or larger continuous solids. **D 6488, D01**

plate shear—a term describing the stresses associated with shear distortion of planes parallel to the edge plane of a sandwich

- construction or core material when loaded in shear parallel to the plane of the facings (see Test Method C 273). **E 631, E06**
- plate shear**—a term describing the stresses associated with shear distortion of planes parallel to the edge plane of a sandwich construction or core material when loaded in shear parallel to the plane of the facings (see Test Method C 273). **E 1749, E06**
- plate swelling**, *n*—an enlargement of rubber or polymer plates due to contact with an incompatible ink, coating, or wash up solvent. **D 6488, D01**
- plate tinting**, *n*—the existence of a weak coloration from the fountain solution onto the non-image area of the plate. **D 6488, D01**
- plate wave**—see **Lamb wave**. **E 1316, E07**
- plate wear**, *n*—a physical abrading away of the non-image or image area, or both, of the plate. **D 6488, D01**
- plate wear blinding**, *n*—the failure of the litho plate to print due to erosion in the image area. **D 6488, D01**
- plating**—pressing leather with a heated metal plate, usually smooth, under high pressure. **D 1517, D31**
- plating**—deposition of an adherent metal onto the surface of the base metal of the fastener. A specific process should be specified; that is, electroplating, hot dip galvanizing, mechanical deposition, etc. **F 1789, F16**
- plating range**—the current density range over which a satisfactory electroplate can be deposited. **B 374, B08**
- platinum-cobalt color**—color measured in reference to color standards prepared with solutions of cobalt chloride and potassium chloroplatinate. Color standards are identical with the description given in APHA publications and is referred to as “**APHA Color**”. **D 4790, D16**
- platinum-cobalt color scale**, *n*—a color scale for clear, light-yellow liquids, defined by specified dilutions of a platinum-cobalt stock solution, ranging from 5 for the lightest color to 500 for the darkest. **E 284, E12**
- platinum 27 (Pt-27)**, *n*—the platinum standard to which the National Bureau of Standards referred thermoelectric measurements prior to 1973. **E 344, E20**
- platinum 67 (Pt-67)**, *n*—the platinum standard used by the National Bureau of Standards after 1972 as the reference to which thermoelectric measurements are referred. **E 344, E20**
- pleat**, *n*—three layers of fabric involving two folds or reversals of direction; the back fold may be replaced by a seam. **D 123, D13**
- pleat**, *n*—three layers of fabric involving two folds or reversals of direction; the back fold may be replaced by a seam. **D 4850, D13**
- plied yarn**—See *plied yarn* under **yarn**. **D 3878, D30**
- plied yarn duck**, *n*—duck fabric with plied yarns in both warp and filling. (See **flat duck**.) **D 123, D13**
- plied yarn duck**, *n*—duck fabric with plied yarns in both warp and filling. (See **flat duck**.) **D 4850, D13**
- plier**—portable stapler with attached clincher for placing staples away from edges of work. **F 592, F16**
- PLOQ**, *n*—pooled limit of quantitation. **D 4175, D02**
- plowing**, *n*—*in tiretesting*, a type of uncontrollability defined by a loss of steering control with no substantial vehicle yaw; the vehicle moves on a trajectory that is dictated by vehicle dynamics as determined by velocity, mass, and the available traction at each tire. **F 538, F09**
- plowing**, *n*—*in tribology*, the formation of grooves by plastic deformation of the softer of two surfaces in relative motion. **G 40, G02**
- plow layer**—the depth typically reached by a plow or other commonly used earth turning device used in agriculture. This depth is commonly one to two feet (0.3 to 0.61 m) below land surface. **D 653, D18**
- plucked**—a machined surface with occasional pits, obtained by rough planing the stone surface, thus breaking or “**plucking**” out small particles. **C 119, C18**
- plug**—See **closure**. **D 996, D10**
- plugging**, *n*—the restriction of a flow path due to the accumulation of material along the flow path boundaries. **D 4175, D02**
- plugging compound**—a putty-like mixture of inorganic materials used to fill holes in iron castings to ensure an even surface for porcelain enameling. **C 286, B08**
- plugging factor**—see **fouling factor** and **SDI**. **D 6161, D19**
- plugging material**—a material that has a hydraulic conductivity equal to or less than that of the geologic formation(s) to be sealed. Typical materials include portland cement and bentonite. **D 653, D18**
- plugs**—straight-sided insertions of sound wood or synthetic material replacing defective portions of veneers. They usually are held in place by friction until veneers are bonded into plywood. **D 1038, D07**
- plumage**, *n*—the outgrowth of fowl, consisting of feathers and down (waterfowl) or feathers only (nonwaterfowl). **D 123, D13**
- plumage**, *n*—the outgrowth of fowl, consisting of feathers and down (waterfowl) or feathers only (nonwaterfowl). **D 7022, D13**
- plumules**, *n*—downy waterfowl plumage with underdeveloped soft and flaccid quill with barbs indistinguishable from those of down. **D 123, D13**
- plumules**, *n*—downy waterfowl plumage with underdeveloped soft and flaccid quill with barbs indistinguishable from those of down. **D 7022, D13**
- plunger**—the reciprocating metal part that forces glass into the contours of a mold, or which, in a blank mold, forms the initial cavity for subsequent blowing. (See also **needle**.) **C 162, C14**
- plunger**, *n*—*in tiretesting*, a cylindrical rod with a hemispherical end. **F 538, F09**
- plunging water jet barrier**—special purpose barrier created by a series of coherent streams of water directed vertically downward into a body of water. **F 818, F20**
- plus sieve**, *n*—the portion of a powder sample retained on a standard sieve of specified number. (See **minus sieve**.) **B 243, B09**
- ply**—a single layer of membrane reinforcement in the bituminous membrane waterproofing system. **C 717, C24**
- ply**, *n*—(1) any of the several layers of solid **fiberboard**; (2) any of the layers in plywood or laminated **paperboard**; (3) any of the walls of a **multiwall bag**. (See also **veneer**.) **D 996, D10**
- ply**—a single sheet of veneer, or several strips laid with adjoining edges, that may or may not be glued, which forms one veneer lamina in a glued plywood panel. (See also **layer**.) **D 1038, D07**
- ply**—a layer of felt in a built-up roofing membrane; a four-ply membrane has at least four plies of felt at any vertical cross section cut through the membrane. **D 1079, D08**
- ply**—(in laminar composites) the constituent single layer as used in fabricating, or occurring within a composite structure. **D 3878, D30**
- ply**, *n*—*in a tire*, a layer of rubber-coated parallel cords. **F 538, F09**
- ply coordinate axes**—a set of Cartesian coordinates two of which lie within the plane of the ply, one axis of which is parallel to the principal fiber direction and the other axis perpendicular to the principal fiber direction (the third axis is through the ply’s thickness). **D 3878, D30**
- ply count**, *n*—*in laminated composite materials*, the number of plies or laminae used to construct the composite. **D 3878, D30**
- plying cement**—any bituminous material used for adhering layers of felts, fabrics, or mats to structural surfaces and to each other. **D 1079, D08**
- ply orientation**—the acute angle (theta) including 90° between a reference direction and the ply principal axis. The ply orientation is positive if measured counterclockwise from the reference direction and negative if measured clockwise. **D 3878, D30**
- plyout**—a single wrap of ribbon extending out of its normal position in relation to the core or the next wrap. **F 221, F05**
- ply principal axis**—the ply coordinate axis that coincides with the

ply principal axis

direction of maximum inplane Young's modulus. For balanced weave fabric either warp or fill direction may be chosen.

D 3878, D30

ply rating, *n*—the term is used to identify a given tire with its maximum recommended load when used in a specific type of service, giving an index of tire strength, not necessarily representing the number of cord plies in the tire.

F 538, F09

plywood, *n*—see *plywood* under **wood laminate**.

D 907, D14

plywood—usually a crossbanded assembly made of layers of veneer or veneer in combination with a lumber core or other wood-based panel material joined with an adhesive. Plywood generally is constructed of an odd number of layers with grain of adjacent layers perpendicular to one another. Outer layers and all odd-numbered layers generally have the grain direction oriented parallel to the long dimension of the panel.

D 1038, D07

plywood box—See **box**.

D 996, D10

P/M, *n*—the acronym representing powder metallurgy. Used as **P/M Part, P/M Product, P/M Process**, and so forth.

B 243, B09

P_{max} , *n*—the maximum pressure (above pressure in the vessel at the time of ignition) reached during the course of a deflagration for the optimum concentration of the dust tested. P_{max} is determined by a series of tests over a large range of concentrations. It is reported in bar.

E 1445, E27

PM cycle—see **preventative maintenance cycle**.

F 1457, F05

P/M forging, *n*—see **powder forging**.

B 243, B09

P/M part, *n*—see **powder metallurgy part**.

B 243, B09

pneumatic atomizer—a device wherein the movement of gas or vapor is the primary source of energy utilized to produce a spray.

E 1620, E29

pneumatic tire, *n*—a hollow tire that becomes load-bearing upon inflation with air, or other gas, to a pressure above atmosphere.

D 123, D13

pneumatic tire, *n*—a hollow tire that becomes load-bearing upon inflation with air, or other gas, to a pressure above atmospheric.

D 6477, D13

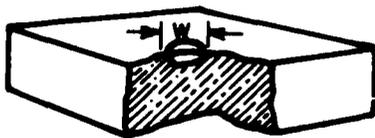

pneumatic tires, *n*—a tire that depends on the compressed air it holds to carry the load. It differs from a solid tire in which the tire itself carries the load.

D 5681, D34

POA—see **printer output area**.

F 1457, F05

pock—a partially closed surface cavity.

where:

w = width.

F 109, C21

pocket, *n*—in *zippers*, the cavity of an element designed to receive the head.

D 123, D13

pocket, *n*—the cavity of an element designed to receive the head.

D 2050, D13

pocket, *n*—an opening in a structure to accept a construction member.

E 631, E06

pocket-shaped—as applied to chamois skins, a skin trimmed in the form of a rectangle with the two corners at one end rounded.

D 1517, D31

point—a thin, flat, triangular or diamond-shaped piece of zinc used to hold glass in wood sash by driving it into the wood.

C 717, C24

point, *n*—a term used to describe the thickness of **paperboard**, a point being one thousandth of an inch. (See **caliper**.)

D 996, D10

point—end of shank opposite head, usually tapered; formed during manufacture of nail to facilitate driving.

F 547, F16

point, *n*—portion of the needle intended to initiate tissue penetration.

F 1840, F04

point analyzer, *n*—See also **analyzer**.

monitoring path, *n*—the actual path over which an atmospheric or an emission compound concentration is measured and averaged.

monitoring path length, *n*—the length of the monitoring path over which the average atmosphere or emission compound concentration is measured and averaged using an open path analyzer.

D 1356, D22

point bar—one or a series of low ridges, usually of coarse sediment, deposited on the inner (convex) side of a river bend.

D 4410, D19

point bars—see **burning bars, points, or tools**.

C 286, B08

point configuration, *n*—the shape of the point. Some common point configurations include, but are not limited to: taper, trocar, blunt, spatulated, conventional cutting edge, reverse cutting edge, cutting taper, and side cutting needle.

F 1840, F04

pointed—provided with sharp point.

F 547, F16

pointed blade—See **pointed clincher**.

F 592, F16

pointed clincher—blade clincher with sharp point to facilitate piercing of corrugated board.

F 592, F16

point estimate—the estimate of a parameter given by a single statistic, for example, sample average (see **sample average**) (**arithmetic average**).

E 1823, E08

point focus collector—see **collector, point focus**.

E 772, E44

point-integrated sample—a sample of water-sediment mixture collected at a relatively fixed point in accordance with the technique of point integration. A point-integrated sample is discharge weighted. However, because the sample is obtained from a single point, the concentration of any component of the mixture that is transported exactly at stream velocity can be considered as either a spatial or a discharge-weighted concentration. Samples collected with instruments that instantaneously capture a quantity of water-sediment mixture are not true point-integrated samples. (See **point sample**.)

D 4410, D19

point-integrating sediment sampler—an instrument capable of collecting a water-sediment mixture isokinetically for a specified period of time by opening and closing under water; an instrument suitable for performing point integration.

D 4410, D19

point integration—a method of sampling at a relatively fixed point whereby the water-sediment mixture is withdrawn isokinetically for a specified period of time.

D 4410, D19

pointless—See **sheared-square point**.

F 547, F16

point projection X-ray microscopy—a method of producing enlarged images by means of X rays. The specimen is placed close to a point source of X rays and the magnification achieved is the ratio of source-image to source-object distance. Resolution depends primarily on the diameter of the source.

E 175, E41

point reflector, *n*—reflector subtending a very small solid angle at the observer's eye, so that the observer cannot readily distinguish its size or shape.

E 284, E12

point sample—sample of water-sediment mixture taken at a single point, either with an instantaneous or a point-integrating sampler.

D 4410, D19

points, conjugate—the pair of points on the principal axis of a mirror or lens so located that light emitted from either point will be focused at the other. Related points in the object and image are located optically so that one is the image of the other.

E 175, E41

point size, *n*—a measurement of the height of a type font, where a point is approximately $\frac{1}{2}$ in. or 0.353 mm.

F 1457, F05

point source—a source whose linear dimensions are very small compared with the distance from the source to the region of observation.

NOTE—The irradiance varies inversely with the square of the distance; a unique property of point sources.

E 1316, E07

point source, *n*—a single, stationary location or fixed facility from which pollutants are discharged; any single identifiable source of pollution.

E 2114, E06

point value, *n*—for *asbestos*, an index of commercial value of asbestos fiber used in asbestos-cement products.

D 2946, C17

point weight—See **felt mill ream**.

D 1079, D08

Poiseuille flow—the particular case of laminar viscous flow through a long pipe of circular cross section.

E 1316, E07

Poisson distribution, n —the distribution which has as its probability function:

$$P(r) = e^{-\mu} \mu^r / r!$$

where:

$P(r)$ = probability of obtaining exactly r occurrences of an event in one unit, such as a unit of time or area,

μ = both mean and variance of distribution, and

e = base of natural logarithms.

D 123, D13

Poisson's ratio, n —the negative of the ratio of transverse strain to the corresponding axial strain resulting from a uniformly distributed axial stress below the proportional limit of the material.

C 1145, C28

Poisson's ratio, ν —the absolute value of the ratio of transverse strain to the corresponding axial strain resulting from uniformly distributed axial stress below the proportional limit of the material.

D 4092, D20

Poisson's ratio—the absolute value of the ratio between linear strain changes, perpendicular to and in the direction of a given uniaxial stress change, respectively.

D 7099, D18

Poisson's ratio, μ , n —the negative of the ratio of transverse strain to the corresponding axial strain resulting from an axial stress below the proportional limit of the material.

E 6, E28

Poisson's ratio, (ν)—ratio between linear strain changes perpendicular to and in the direction of a given uniaxial stress change.

D 653, D18

polar—see **polarizing element**.

E 175, E41

polar-aromatics, n —a polar aromatic hydrocarbon fraction that is adsorbed on an adsorbing medium from a paraffinic solvent during percolation and then desorbed with a chlorinated hydrocarbon solvent such as trichloroethylene.

D 8, D04

polarimeter, Senarmount (Friedel)—See **Senarmount (Friedel) polarimeter**.

C 162, C14

polariscope—an optical device consisting of a light source, mutually perpendicular polarizing elements, and generally equipped with one or more retardation plates for qualitative observations of relative optical retardation by color differentiation.

C 162, C14

polarizability—the inability of an electrode to reproduce a reading after a minute electrical current has been passed through the membrane. Glass pH electrodes are especially prone to polarization errors caused by small currents flowing from the pH meter input circuit and from static electrical charges built up as the electrodes are removed from the sample solution, or when the electrodes are wiped.

D 4127, D19

polarization—the change in the potential of an electrode during electrolysis, such that the potential of an anode always becomes more noble and that of a cathode less noble than their respective static potentials. Equal to the difference between the static potential and the dynamic potential.

B 374, B08

polarization—see **concentrationpolarization**.

D 6161, D19

polarization—for plane polarized beams the plane of polarization is taken as the electric vector. For elliptically or partially polarized beams, polarization must be handled by use of the Stokes parameters, which is rather complex and must be handled in the text. The direction of polarization of a plane polarized beam is taken as the angle between the plane of polarization and the plane of incidence or of reflection or transmission. For other than parallel or perpendicular polarization, the subject is most easily handled in the text.

E 772, E44

polarization—the change from the open-circuit electrode potential as the result of the passage of current.

G 15, G01

polarization admittance—the reciprocal of polarization resistance (di/dE).

G 15, G01

polarization energy—see **screening energy**.

E 673, E42

polarization, parallel, \parallel —with the plane of polarization parallel to the plane of incidence, reflectance, or transmittance.

E 772, E44

polarization, perpendicular, \perp —with the plane of polarization perpendicular to the plane of incidence, reflectance, or transmittance.

E 772, E44

polarization resistance—the slope (dE/di) at the corrosion potential of a potential (E)—current density (i) curve. (It is inversely proportional to the corrosion current density when the polarization resistance technique is applicable.)

G 15, G01

polarized light illumination—a method of illumination in which the incident light is plane polarized before it impinges on the specimen.

E 7, E04

polarizer—a substance or a means that produces or increases polarization.

B 374, B08

polarizer—a Nicol prism, polarizing film, or similar device into which normal light passes and from which polarized light emerges.

E 7, E04

polarizing element—a general term for a device for producing or analyzing plane polarized light. It may be a Nicol prism, some other form of calcite prism, a reflecting surface, or a polarizing

E 175, E41

pole—a timber in the round, often to support power or telephone lines.

D 9, D07

pole—the area on a magnetized part from which the magnetic field is leaving or returning into the part.

E 1316, E07

pole-barn nail—bright or galvanized, stiff-stock or hardened-steel, helically threaded, 2½ to 9-in. nails with flat head and medium diamond point. (See **threaded nail**.)

F 547, F16

pole figure (for crystalline aggregates)—a graphical representation of the crystal orientations present in an aggregate.

E 7, E04

polepiece, n —in reinforced plastics, the supporting part of the mandrel used in filament winding, usually on one of the axes of rotation.

D 883, D20

pole piece—a part of a magnetic electron lens made of a magnetically permeable material for the purpose of concentrating and shaping the magnetic field within the lens.

E 7, E04

pole piece spacer—the central part of a magnetic electron lens pole piece assembly made of nonmagnetic material for the purpose of rigidly defining the separation of the pole pieces of a lens. The length of the spacer affects the strength and shape of the magnetic field in the lens.

E 7, E04

polish—a temporary coating that enhances the appearance and may protect the substrate to which it is applied.

D 2825, D21

polished—a highly-reflective surface, produced by mechanical abrasion and buffing.

C 119, C18

polished—See **tumbled**.

F 547, F16

polished aggregate, n —exposed aggregate worn sufficiently smooth to affect frictional characteristics.

E 867, E17

polished aggregate, n —exposed aggregate worn sufficiently smooth to affect frictional characteristics.

E 1778, E17

polished finish—a surface that has high luster and strong reflection of incident light.

C 119, C18

polished plate glass—See **plate glass**.

C 162, C14

polished wire glass—wire glass, ground and polished on both sides.

C 162, C14

polishing—the smoothing of a metal surface by means of the action of abrasive particles attached by adhesive to the surface of wheels or endless belts usually driven at a high speed.

B 374, B08

polishing—a mechanical, chemical, or electrolytic process or combination thereof used to prepare a smooth reflective surface suitable for microstructure examination, free of artifacts or damage introduced during prior sectioning or grinding.

E 7, E04

poll, n —an electronic method the cluster controller uses to sequentially select each connected device.

F 1457, F05

pollution—the condition caused by the presence of substances of

pollution

such character and in such quantities that the quality of the environment is impaired. **D 4410, D19**

polyaddition—See **addition polymerization**. **D 883, D20**

polyamide plastics—See **nylon plastics**. **D 883, D20**

polyarylate, n—See **aromatic polyester**. **D 883, D20**

polyaryletherketone, n—a polymer in which aryl groups are connected by one or more ether as well as one or more Ketone linkages. **D 883, D20**

polyatomic ion—a charged multi-atom species. **E 673, E42**

polybutene oil—a family of branched-chain polyolefins made by the polymerization of a mixture of iso- and normal butenes. The products are colorless, viscous liquids and are used as cable oils and in capacitors because they are good dielectrics, impermeable to water vapor and gas, and resistant to oxidation. Other synonyms for polybutene are polybutylene, polyisobutylene, and polyisobutene. **D 2864, D27**

polybutylene, n—a polymer prepared by the polymerization of butene as the sole monomer. (See **polybutylene plastics** and **butylene plastics**.) **D 883, D20**

polybutylene, n—a polymer prepared by the polymerization of butene as the sole monomer. (D20) **F 412, F17**

polybutylene, n—a polymer prepared by the polymerization of butene as the sole monomer. (See also **polybutylene plastic** and **butylene plastic**.)

polybutylene plastic, plastic based on polymers made with butene as essentially the sole monomer. **F 1251, F04**

polybutylene plastics, n—plastics based on polymers made with butene as essentially the sole monomer. **D 883, D20**

polybutylene plastics, n—plastics based on polymers with butene as essentially the sole monomer. (D20) **F 412, F17**

polycarbonate, n—a polyester polymer in which the repeating structural unit in the chain is of the carbonate type. **D 883, D20**

polycarbonate, n—a polymer in which the repeating structural unit in the chain is a carbonic acid ester of Bisphenol A. **F 1251, F04**

polycarbonate plastics—polyester plastics based on polymers in which the repeating structural units in the chains are essentially all of the carbonate type. **D 883, D20**

polychlorinated biphenyl (PCB), n—PCB's belong to a broad family of organic chemicals known as chlorinated hydrocarbons and are produced by attaching one or more chlorine atoms to a biphenyl molecule. **D 2864, D27**

polychromator, n—a device for simultaneously isolating several rays of monochromatic radiation from a beam of polychromatic radiation. **E 135, E01**

polychrome decoration—See **polychrome decoration** under **decoration**. **C 242, C21**

polycondensation—See **condensation polymerization**. **D 883, D20**

polycondensation, n—see **condensation**. **D 907, D14**

polycrystalline—characteristic of an aggregate composed of more than one, and usually of a large number, of crystals. **E 7, E04**

polycrystalline fiber, n—a continuous polycrystalline filament of heat insulating material whose composition is alumina, boria, and silica in an approximate ratio of 3:1:2, respectively. **E 344, E20**

polydicyclopentadiene plastic, n—a crosslinked thermoset polymer formed by the ring-opening metathesis polymerization of dicyclopentadiene. **D 883, D20**

polyelectrolyte—synthetic (or natural) molecules, containing multiple ionic groups, used as coagulants and flocculants; available as anionic, cationic and nonionic. **D 6161, D19**

polyester, n—a polymer in which the repeated structural unit in the chain is of the ester type. (ISO) **D 883, D20**

polyester, n—a polymer in which the repeated structural unit in the chain is of the ester type. **F 1251, F04**

polyester plastics—synonymous with **alkyd plastics**. **D 883, D20**

polyester resin—a condensation product resulting from a chemical reaction between a dicarboxylic acid and a dihydroxy alcohol or by the polymerization of a hydroxy carboxylic acid. **C 904, C03**

polyether, n—a polymer in which the repeated structural unit in the chain is of the ether type. **D 883, D20**

polyether, n—a polymer in which the repeated structural unit in the chain is of the ether type. **F 1251, F04**

polyethylene, n—a polymer prepared by the polymerization of ethylene as the sole monomer. (See **polyethylene plastics** and **ethylene plastics**.) **D 883, D20**

polyethylene, n—a polymer prepared by the polymerization of ethylene as the sole monomer. (D20) **F 412, F17**

polyethylene—a polymer prepared by the polymerization of ethylene as the sole monomer. (D 883, D20) **F 869, F08**

polyethylene, n—a polymer prepared by the polymerization of ethylene as the sole monomer. (See also **polyethylene plastic** and **ethylene plastic**.) **F 1251, F04**

polyethylene plastic—a plastic based on polymers made with ethylene as essentially the sole monomer. **F 1251, F04**

polyethylene plastics—plastics based on polymers made with ethylene as essentially the sole monomer. **D 883, D20**

polyethylene plastics—plastics based on polymers made with ethylene as essentially the sole monomer. (D20) **F 412, F17**

polyethylene terephthalate, n—a polymer derived from terephthalic acid and ethylene glycol by condensation polymerization. **F 1251, F04**

polygon—a type of patterned ground consisting of a closed, roughly equi-dimensional, figure bounded by several sides, commonly more-or-less straight, but some, or all, of which may be irregularly curved. A polygon may be either a "low center" or a "high center," depending on whether its center is lower or higher than its margins. **D 7099, D18**

polygonal pattern—a pattern of numerous multi-sided, roughly equi-dimensional figures, bounded by more-or-less straight lines. **D 7099, D18**

polygonal peat plateau—a peat plateau with ice wedge polygons. **D 7099, D18**

polygon trough—the narrow depression surrounding a high-center polygon. **D 7099, D18**

polygraph examiner, n—a term used synonymously with PDD examiner. In the evolution of terminology within this discipline, the term "Polygraph Examiners" replaced the antiquated appellation "Lie Detector Operator" (see definition of **PDD examiner**). **E 2035, E52**

polygraph instrument, n—a diagnostic instrument used during a PDD examination, which is capable of simultaneously monitoring, recording, and measuring at a minimum, respiratory, electrodermal, and cardiovascular activity as a response to auditory or visual stimuli. **E 2035, E52**

polygraphy, n—see definition of **PDD**. **E 2035, E52**

polyisocyanurate foam, n—a cellular thermal insulation produced by the polymerization of polyisocyanates in the presence of polyhydroxyl compounds, catalysts, cell stabilizers, and blowing agents. See Specification C 591. **D 1079, D08**

polyisocyanurate foam board, n—a thermal insulation composed of polyisocyanurate foam with adhered facers. Commonly called *iso* or *isoboard*. See Specification C 1289. **D 1079, D08**

polymer, n—a macromolecular material formed by the chemical combination of monomers having either the same or different chemical composition. **D 123, D13**

polymer, n—a substance consisting of molecules characterized by the repetition (neglecting ends, branch junctions and other minor irregularities) of one or more types of monomeric units. (IUPAC) **D 883, D20**

polymer, n—a compound formed by the reaction of simple molecules having functional groups which permit their combination to proceed to higher molecular weights under suitable conditions. **D 907, D14**

polymer, n—a substance consisting of molecules characterized by the

repetition (neglecting ends, branch junctions, and other minor irregularities) of one or more types of monomeric units.

D 1566, D11

polymer, *n*—a macromolecular material formed by the chemical combination of monomers having either the same or different chemical composition.

D 4466, D13

polymer, *n*—a substance consisting of molecules characterized by the repetition (neglecting ends, branch junctions, and other minor irregularities) of one or more types of monomeric units. (IUPAC, D20)

F 412, F17

polymer, *n*—a substance consisting of molecules characterized by the repetition (neglecting ends, branch junctions, and other minor irregularities) of one or more types of monomeric units. (See **copolymer.**)

F 1251, F04

polymer, *n*—a substance consisting of molecules characterized by repetition (neglecting ends, branches, junctions, and other minor irregularities) of one or more chemically bonded types of monomeric units.

F 1494, F23

polymer coating—a term used to describe color coatings such as PVC (poly(vinyl chloride)), polyester, and clear coatings such as polyurethane and acrylic urethane (see Specifications F 668, F 934, and F 1234).

F 552, F14

polymeric poured (seamless) floors, *n*—a floor surfacing material composed of polymeric materials applied to the substrate in liquid form alone or in combination with mineral or plastic aggregates, desiccants, or fillers.

F 141, F06

polymerization—a chemical reaction in which the molecules of monomers are linked together to form polymers. (See also **polycondensation** and **polyaddition.**)

D 883, D20

polymerization, *n*—a chemical reaction in which the molecules of a monomer(s) are linked together in repeating units to form larger molecules.

D 907, D14

polymerization, *n*—formation of a polymer by the chemical reaction of monomers.

D 1566, D11

polymerization—a chemical reaction in which monomers are linked together to form polymers. (See also **polycondensation** and **polyaddition.**)

F 1251, F04

polymerized rosin, *n*—rosin that has been treated by chemical or physical means, or both, in a manner so as to cause a union of a part of the rosin acids to form dimers to such an extent that the average molecular weight of such rosin will be measurably greater than that of the original rosin. Also known as “dimerized rosin.”

D 804, D01

polymer network, *n*—a three-dimensional reticulate structure formed by chemical or physical linking of polymer chains.

D 1566, D11

polymer(s)—a large molecule formed by the chemical union of reactive units called monomers.

D 4790, D16

polymers—a substance consisting of molecules characterized by the repetition of one or more types of monomeric units.

D 6161, D19

polymer sheet, *n*—a continuous polymeric planar structure.

F 1494, F23

polymer technique—the examination technique in which a polymer is used as the particle suspension vehicle.

E 1316, E07

polymethylmethacrylimide (PMMI), *n*—a thermoplastic polymer formed from a reaction of poly(methyl methacrylate) and monomethyl amine.

D 883, D20

polymorphic substance—an element, or compound, capable of stable existence in different temperature and pressure ranges in two, or more, different crystalline states.

E 7, E04

polymorphic substance—element, or compound, capable of stable existence in different temperature and pressure ranges in two, or more, different crystalline forms.

E 1142, E37

polynary separator, *n*—a device that separates a single input feed stream into three or more output product streams.

D 5681, D34

polynary system—See **multicomponent system.**

E 7, E04

polyol, *n*—an alcohol having many hydroxyl groups, also known as a polyhydric alcohol or polyalcohol.

D 883, D20

polyolefin, *n*—any long-chain synthetic polymer composed of at least

85 % by weight of ethylene, propylene, or other olefin units (monomers), except amorphous (non-crystalline) polyolefin qualifying under Rubber 1, as defined by the Federal Trade Commission. (Compare Olefin)

D 123, D13

polyolefin, *n*—a polymer prepared by the polymerization of an olefin(s) as the sole monomer(s). (See **polyolefin plastics** and **olefinplastics.**)

D 883, D20

polyolefin, *n*—any long-chain synthetic polymer composed of at least 85 % by weight of ethylene, propylene, or other olefin units (monomers), except amorphous (non-crystalline) polyolefin qualifying under Rubber 1, as defined by the Federal Trade Commission. (Compare Olefin)

D 4849, D13

polyolefin, *n*—a polymer prepared by the polymerization of an olefin(s) as essentially the sole monomer(s). (D20)

F 412, F17

polyolefin, *n*—a polymer prepared by the polymerization of an olefin(s) as the sole monomer(s). (See also **polyolefin plastic, olefin plastic.**)

F 1251, F04

polyolefin-material cleanliness, *n*—the degree to which a polymer melt is free of filterable particles which remain insoluble in the melt under the specified test condition.

D 123, D13

polyolefin-material cleanliness, *n*—the degree to which a polymer melt is free of filterable particles which remain insoluble in the melt under the specified test condition.

D 4849, D13

polyolefin monofilament, *n*—as used in this specification D 3218, a flat single filament of the slit-film type, which can function as a yarn in commercial textile operations.

D 123, D13

polyolefin monofilament, *n*—as used in specification D 3218, a flat single filament of the slit-film type, which can function as a yarn in commercial textile operations.

D 4849, D13

polyolefin plastic—a plastic based on polymers made with an olefin(s) as essentially the sole monomer(s).

F 1251, F04

polyolefin plastics, *n*—plastics based on polymers made with an olefin(s) as essentially the sole monomer(s).

D 883, D20

polyolefin plastics, *n*—plastics based on polymers made with an olefin(s) as essentially the sole monomer(s). (D20)

F 412, F17

polyoxymethylene, *n*—a polymer in which the repeated structural unit in the chain is oxymethylene.

D 883, D20

polyoxymethylene, *n*—a polymer in which the repeated structural unit in the chain is oxymethylene.

F 1251, F04

polyoxymethylene plastics, *n*—acetal plastics based on polymers in which oxymethylene is essentially the sole repeated structural unit in the chains. (ISO) (See also **acetal plastics.**)

D 883, D20

polyphthalamide (PPA), *n*—a polyamide in which residues of terephthalic acid or isophthalic acid or a combination of the two comprise at least 60 molar percentage of the dicarboxylic acid part of the repeating structural units in the polymer chain.

D 883, D20

polypropylene, *n*—a polymer prepared by the polymerization of propylene as the sole monomer. (See **polypropylene plastics** and **propylene plastics.**)

D 883, D20

polypropylene, *n*—a polymer prepared by the polymerization of propylene as the sole monomer. (D20)

F 412, F17

polypropylene, *n*—a polymer prepared by the polymerization of propylene as the sole monomer. (See also **polypropylene plastic, propylene plastic.**)

F 1251, F04

polypropylene plastics—plastics based on polymers made with propylene as essentially the sole monomer.

D 883, D20

polypropylene plastics—plastics based on polymers made with polypropylene as essentially the sole monomer. (D20)

F 412, F17

polystyrene, *n*—a polymer prepared by the polymerization of styrene as the sole monomer. (See **styrene plastics.**)

D 883, D20

polystyrene—a plastic based on a resin made by polymerization of styrene as the sole monomer. For use as a standard in colorimetry, the polystyrene shall contain no internal or external additives.

D 4790, D16

polystyrene, *n*—a polymer prepared by the polymerization of styrene as the sole monomer. (D20)

F 412, F17

polystyrene, *n*—a polymer prepared by the polymerization of styrene as the sole monomer. (See also **styrene plastic.**)

F 1251, F04

polyterephthalate, n

polyterephthalate, n—a thermoplastic polyester in which the terephthalate group is one of the repeating structural unit in the polymer chain. **D 883, D20**

polyterephthalate, n—a thermoplastic polyester in which the terephthalate group is a repeated structural unit in the polymer chain. **F 1251, F04**

polyterephthalate plastics—a thermoplastic polyester in which the terephthalate group is a repeated structural unit in the chain, the terephthalate being in greater amount than other dicarboxylates which may be present. **D 883, D20**

polyterpene resin, n—a resin produced by the polymerization of terpene fractions or mixtures of terpenes obtained from naval stores, or paper pulp production, or citrus juice production, or combinations thereof. **D 6440, D01**

polyurethane, n—a polymer prepared by the reaction of an organic diisocyanate with compounds containing hydroxyl groups. **D 883, D20**

polyuronides—polysaccharides containing uronic acid groups. **D 1695, D01**

poly(vinyl acetate), n—a polymer prepared by the polymerization of vinyl acetate as the sole monomer. **D 883, D20**

poly(vinyl acetate)—a polymer prepared by the polymerization of vinyl acetate as the sole monomer. (D20) **F 412, F17**

poly(vinyl acetate), n—a polymer prepared by the polymerization of vinyl acetate as the sole monomer. **F 1251, F04**

polyvinyl acetate emulsion adhesive, n—a latex adhesive in which the polymeric portion comprises polyvinyl acetate, copolymers based mainly on polyvinyl acetate, or a mixture of these, and which may contain modifiers and secondary binders to provide specific properties. **D 907, D14**

poly(vinyl alcohol)—polymers prepared by the essentially complete hydrolysis of polyvinyl esters. **D 883, D20**

poly(vinyl alcohol), n—a polymer prepared by the essentially complete hydrolysis of polyvinyl ester. **F 1251, F04**

poly(vinyl chloride)—a polymer prepared by the polymerization of vinyl chloride as the sole monomer (vinyl chloride content in monomer not less than 99 %). **D 883, D20**

poly(vinyl chloride)—a polymer prepared by the polymerization of vinyl chloride as the sole monomer. (D20) **F 412, F17**

poly(vinyl chloride), n—a polymer prepared by the polymerization of vinyl chloride as the sole monomer. **F 1251, F04**

poly(vinyl chloride) (pvc)—a polymer prepared by the polymerization of vinyl chloride as the sole monomer. (D 883, D20) **F 869, F08**

pond—a surface which is incompletely drained. **D 1079, D08**

ponded ash, n—ash that is in an ash pond or that has been excavated from an ash pond. **E 2201, E50**

pontil—See **punty**. **C 162, C14**

pool—a sharing arrangement for a group of property with a common purpose. **E 2135, E53**

pooled limit of quantitation, n—level of property or concentration of analyte above which quantitative test results can be obtained with a specified degree of confidence. See 3.2.1 for acronym. **D 4175, D02**

pooling—See **pile reversal**. **D 5684, D13**

pooling—the existence of excessive amounts of penetrant, emulsifier or developer in an incompletely drained area. **E 1316, E07**

poorly bonded—a condition in which the soil particles are weakly held together by the ice, so that the frozen soil has poor resistance to chipping and breaking. **D 7099, D18**

poorly-bonded permafrost—ice-bearing permafrost in which few of the soil particles are bonded together by ice. **D 7099, D18**

pop-in—a discontinuity in the force against clip gage displacement record. This discontinuity is characterized by a sudden increase in displacement and, generally, a decrease in force. Subsequently, the displacement and force increase to above their respective values at pop-in. **E 1823, E08**

pop-off—in dry process enameling, a defect appearing as a small

conical piece of porcelain enamel, either partially or entirely separated from the ware. **C 286, B08**

popouts, n—small holes in the pavement surface, normally ranging in diameter from 25 mm (1 in.) to 100 mm (4 in.) and depth from 13 mm (0.5 in.) to 50 mm (2 in.). **E 867, E17**

popouts, n—small holes in the pavement surface, normally ranging in diameter from 25 mm (1 in.) to 100 mm (4 in.) and depth from 13 mm (0.5 in.) to 50 mm (2 in.). **E 1778, E17**

poppers—a defect characterized by randomly occurring, relatively small, circular shaped areas of ground coat appearing in the first cover coat sheet steel porcelain enamel. **C 286, B08**

population, n—the totality of items or units of materials under consideration. **D 5681, D34**

population, n—the totality of items or units of material under consideration. **E 456, E11**

population, n—the totality of items or units of material under consideration. **F 1773, F08**

population (or universe)—*in fatigue testing*, the totality of the set of test specimens, real or conceptual, that could be prepared in the specified way from the material under consideration. **E 1823, E08**

porcelain—a glazed or unglazed vitreous ceramic whiteware made by the porcelain process, and used for technical purposes, designating such products as electrical, chemical, mechanical, structural, and thermal wares when they are vitreous.

alumina porcelain—a vitreous ceramic whiteware for technical application in which alumina (Al_2O_3) is an essential crystalline phase.

chemical porcelain—vitreous ceramic whitewares used for containing, transporting, or reacting of chemicals.

cordierite porcelain—a vitreous ceramic whiteware for technical application in which cordierite ($2\text{MgO}\cdot 2\text{Al}_2\text{O}_3\cdot 5\text{SiO}_2$) is the essential crystalline phase.

forsterite porcelain—a vitreous ceramic whiteware for technical application in which forsterite ($2\text{MgO}\cdot \text{SiO}_2$) is the essential crystalline phase.

steatite porcelain—a vitreous ceramic whiteware for technical application in which magnesium metasilicate ($\text{MgO}\cdot \text{SiO}_2$) is the essential crystalline phase.

titanium porcelain—a vitreous ceramic whiteware for technical application in which titania (TiO_2) is the essential crystalline phase.

zircon porcelain—a vitreous ceramic whiteware for technical application in which zircon ($\text{ZrO}_2\cdot \text{SiO}_2$) is the essential crystalline phase. **C 242, C21**

porcelain enamel—a substantially vitreous or glassy, inorganic coating bonded to metal by fusion at a temperature above 800°F (425°C approximate). **C 286, B08**

porcelain process—the method of producing glazed ware by which a ceramic body and glaze are matured together in the same firing operation. **C 242, C21**

porcelain tile—a ceramic mosaic tile or paver that is generally made by the dust-pressed method of a composition resulting in a tile that is dense, fine-grained, and smooth with sharply formed face, usually impervious and having colors of the porcelain type which are usually of a clear, luminous type or granular blend thereof. **C 242, C21**

pore, n—an inherent or induced cavity within a particle or within an object. **B 243, B09**

pore—a discontinuity, essentially circular in cross section, in a coating extending through to the underlying coating or basis material. **B 374, B08**

pore, n—*in carbon and graphite technology*, in a carbon or graphite foam, a passage that interconnects two cells. **C 709, D02**

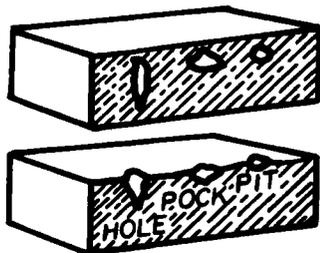

pore—*in catalysis*, a small opening in a material permitting admission, adsorption, or passage of a fluid. **D 3766, D32**

pore, n—*in carbon and graphite technology*, in a carbon or graphite foam, a passage that interconnects two cells. **D 4175, D02**

pore—an opening or void in a membrane or filter matrix.

D 6161, D19

pore—an internal cavity which may be exposed by cutting, grinding, or polishing to become a pit, pock, or hole.

F 109, C21

pore count, *n*—in carbon and graphite technology, in open-cell foams, the number of pores aligned in one plane in one linear inch, as determined by stereoscopic image analysis. C 709, D02

pore count, *n*—in carbon and graphite technology, in open-cell foams, the number of pores aligned in one plane in one linear inch, as determined by stereoscopic image analysis. D 4175, D02

pore diameter—the diameter of a pore in a model in which the pores in a sorbent are assumed to be cylindrical in shape and which is calculated from data obtained by a specified procedure.

D 2652, D28

pore-forming material, *n*—a substance included in a powder mixture that volatilizes during sintering and thereby produces a desired kind and degree of porosity in the finished compact. B 243, B09

pore ice—ice occurring in the pores of earth materials. D 7099, D18

pore-liquid—liquid that occupies an open space between solid soil particles. Within this guide, pore-liquid is limited to aqueous pore-liquid; that includes water and its solutes. D 653, D18

pore-liquid tension—see **matric-suction** or **soil waterpressure**.

D 653, D18

pore, (P), *n*—as used in fractography, a volume-distributed flaw that is a discrete cavity or void in a solid material. C 1145, C28

pore pressure (pore waterpressure)—see **neutral stress** under stress.

D 653, D18

pores—in wood anatomy, a term applied to the cross section of a vessel or of a vascular tracheid. D 9, D07

pores—the complex network of channels in the interior of a particle of a sorbent. D 2652, D28

pores, *n*—an inherent or induced network of channels and open spaces within an otherwise solid structure. F 2312, F04

pore size distribution—in catalysis, the volume of pores of a material expressed or displayed as a function of pore diameters.

D 3766, D32

pore volume—volume of the pores in a unit weight of a sorbent.

D 2652, D28

pore volume distribution—the distribution of pore volumes among pores of different sizes or diameters. D 2652, D28

pore volume distribution—in catalysis, an alternative term for pore size distribution. D 3766, D32

pore volume of flow (V_{pg}), *n*—the cumulative volume of flow through a test specimen divided by the volume of voids within the specimen. D 4439, D35

pore water—water contained in the voids of the soil or rock.

D 653, D18

pore water—water occurring in the pores of earth materials.

D 7099, D18

pore water—water occupying space between sediment or soil particles (syn. **interstitial water**). E 943, E47

poromer, *n*—See **poromeric material**, the preferred term.

D 1566, D11

poromeric material, *n*—a flexible synthetic leather-like material that

is permeable to air and water vapor and usually resistant to water penetration and abrasion. D 1566, D11

porometry, *n*—the determination of the distribution of pore diameters relative to direction of fluid flow by the displacement of a wetting liquid as a function of pressure. F 2312, F04

porosimetry, *n*—the determination of pore volume and pore size distribution through the use of a nonwetting liquid (typically mercury) intrusion into a porous material as a function of pressure. F 2312, F04

porosity, *n*—the amount of pores (voids) expressed as a percentage of the total volume of the powder metallurgy part. B 243, B09

porosity—in metallic coatings, the presence of any discontinuity, crack, or hole in the coating that exposes a different underlying metal. B 542, B02

porosity, *n*—the percentage of the total volume of a material occupied by both open and closed pores. C 71, C08

porosity—the volume fraction of voids contained in a solid, often expressed as a percent.

closed porosity—the volume fraction of all pores within a solid mass that are closed off by surrounding solid and, hence, are inaccessible to each other and to the external surface: they thus are not detectable by gas or liquid penetration.

connected porosity—the volume fraction of all pores, voids, and channels within a solid mass that are interconnected with each other.

open porosity—the volume fraction of all pores, voids, and channels within a solid mass that are interconnected with each other and communicate with the external surface, and thus are measurable by gas or liquid penetration (Syn. **apparent porosity**). C 242, C21

porosity, *n*—the percentage of the total volume of a material occupied by both open and closed pores. C 709, D02

porosity, *n*—the ratio of the volume of air or void contained within the boundaries of a material to the total volume (solid matter plus air or void) expressed as a percentage. (See also **air permeability** and **permeability**.) D 123, D13

porosity—the ratio of the aggregate volume of voids or interstices in a rock or soil to its total volume. (ISRM) D 653, D18

porosity, *n*—the presence of numerous small cavities. D 1566, D11

porosity—the existence in a material of connected air voids. It is frequently expressed as the ratio of void volume to total volume. D 1695, D01

porosity—of particles in catalysis, the ratio of the volumes of the pores in the particles to the volumes enclosed by their envelopes. D 3766, D32

porosity: porosity, internal—the presence of numerous pits or pin holes beneath the pultruded surface; usually observable only in a cut cross section. D 3918, D20

porosity, *n*—the percentage of the total volume of a material occupied by both open and closed pores. D 4175, D02

porosity, *n*—the ratio of the volume of air or void contained within the boundaries of a material to the total volume (solid matter plus air or void) expressed as a percentage. D 4850, D13

porosity—that portion of a membrane filter volume which is open to fluid flow, also known as void volume. D 6161, D19

porosity—holes in a solid, not necessarily connected. E 7, E04

porosity, *n*—the ratio of the aggregate volume of interstices in a rock or soil to its total volume, usually stated as a percent. E 957, E44

porosity—in paper, the property that allows the passage of air through the sheet—an important factor in ink penetration, and also a quality that may affect paper feeding in some readers that have vacuum feeding mechanisms. F 149, F05

porosity, *n*—property of a solid which contains an inherent or induced network of channels and open spaces. F 2312, F04

porosity, apparent—See **open porosity** under **porosity**. C 242, C21

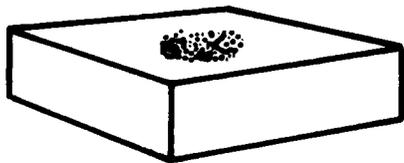

porosity, *n* (D)—the ratio, usually expressed as a percentage, of: (1) the volume of voids of a given soil or rock mass, to (2) the total volume of the soil or rock mass. D 653, D18

porosity, surface

porosity, surface—the presence of numerous visible pits or pin holes at or near the pultruded surface. **D 3918, D20**

porous—substances containing pores for fluids to pass due to an open physical structure. **D 6161, D19**

porous area—an area that will retain dye when tested in accordance with Practice E 165 and, if broken through at the porous area, will show evidence of dye penetration into the body.

F 109, C21

porous ice—ice that contains numerous voids, usually interconnected and usually resulting from melting at air bubbles or along crystal interfaces from presence of salt or other materials in the water, or from the freezing of saturated snow. Though porous, the mass retains its structural unity. **D 7099, D18**

porous packaging material—a material used in medical packaging which is intended to provide an environmental and biological barrier, while allowing sufficient air flow to be used in gaseous sterilization methods (for example, EtO, steam, gas plasma). **F 1327, F02**

porous region, (PR), n—as used in fractography, a volume-distributed flaw that is a 3-dimensional zone of porosity or microporosity. **C 1145, C28**

porous seam, (PS), n—as used in fractography, a volume-distributed flaw that is a 2-dimensional area of porosity or microporosity. **C 1145, C28**

porous woods—another name for hardwoods, which frequently have vessels or pores large enough to be seen readily without magnification. **D 9, D07**

port—an opening in a melting furnace designed for the passage of fuel, air/oxygen, flame, or exhaust gases or combination thereof. **C 162, C14**

port, n—an opening or aperture in an integrating sphere. **E 284, E12**

portable vacuum cleaner operational weight, n—the unit weight of the cleaner, including cord, as usually used to vacuum carpets plus the accessories such as hose, motorized nozzle, tools, and tool caddy if they are normally attached to or stored on the cleaner. Weight is with clean filters and the electric cord. **F 395, F11**

portable vacuum cleaner total weight, n—the weight of the cleaner, electric cord, all hoses, and attachments included with the model, but not including any packaging. Weight is with clean filters. **F 395, F11**

portal—the surface entrance to a tunnel. (ISRM) **D 653, D18**

portfolio analysis—a technique used to seek the combination of assets with the maximum return for any given degree of risk (that is, variance of the return), or the minimum risk for any given rate of return. **E 631, E06**

portfolio analysis, n—a technique used to seek the combination of assets with the maximum return for any given degree of risk (that is, variance of the return), or the minimum risk for any given rate of return. **E 833, E06**

portfolio (portfeuille)—group of securities, buildings, or other properties held by an individual or institutional investor. **E 631, E06**

portfolio (portfeuille)—group of securities, buildings, or other properties held by an individual or institutional investor. **E 1480, E06**

portion size—the number of lengths of pipe to be used for a specific test. **B 846, B05**

portion, test, n—see **sample**, the preferred term. **D 1566, D11**

portland blast-furnace slag cement—essentially an intimately interground mixture of portland cement clinker and granulated blast-

furnace slag or an intimate and uniform blend of portland cement and fine granulated blast-furnace slag in which the amount of the slag constituent is within specified limits conforming to Specification C 150. **D 2946, C17**

portland cement, n—a hydraulic cement produced by pulverizing clinker consisting essentially of hydraulic calcium silicates, and usually containing one or more forms of calcium sulfate as an interground addition. **C 11, C11**

portland cement, n—a hydraulic cement produced by pulverizing portland-cement clinker, and usually containing calcium sulfate. **C 219, C01**

portland cement—hydraulic cement produced by pulverizing clinker consisting essentially of hydraulic calcium silicates, and usually containing one or more of the forms of calcium sulfate as an interground addition and conforming to Specification C 150. **D 2946, C17**

portland-cement clinker, n—a clinker, partially fused by pyroprocessing, consisting predominantly of crystalline hydraulic calcium silicates. **C 219, C01**

Portland cement concrete pavement, n—a pavement having a surface of aggregate mixed with Portland cement paste binder or a mixture of Portland cement and other pozzolans. **E 867, E17**

portland cement concrete pavement, n—a pavement having a surface of aggregate mixed with portland cement paste binder or a mixture of portland cement and other pozzolans. **E 1778, E17**

Portland Cement-Lime Mortar (PCL)—See Cement-Lime Mortar. **C 51, C07**

portland cement plaster, n—a plaster mix in which portland cement or combinations of portland and masonry cements or portland cement and lime are the principal cementitious materials mixed with aggregate. **C 11, C11**

portland pozzolan cement—intimate and uniform blend of portland cement or portland blast-furnace slag cement and fine pozzolan produced by intergrinding portland cement and pozzolan, by blending portland cement or portland blast-furnace slag cement and finely divided pozzolan, or a combination of intergrinding and blending, in which the amount of the pozzolan constituent is within specified limits. **D 2946, C17**

portrait mode, adj—a printer output orientation in which the printed lines run perpendicular to the direction of movement of the paper. (See **landscape mode**.) **F 1457, F05**

POS—an abbreviation for point of sale data entry systems where actual transactions are recorded by terminals operating on-line to a central computer. These systems frequently employ optical scanning as a means of capturing data. **F 149, F05**

positive column—that region of an electric discharge between the cathode and anode falls. **B 542, B02**

positive development, direct development—charged area development by means of toner particles having appropriate charge polarity so that dark areas of the print correspond to dark areas of the original. **F 335, F05**

positive displacement pump—a pump that will continue to build pressure until the power source is stalled if the pump outlet is blocked. **D 653, D18**

positive distortion—See **distortion**. **E 7, E04**

positive eyepiece—an eyepiece in which the focal plane is external to its lenses. **E 7, E04**

positive identification—This phrase is inappropriate because it seems to suggest that some identifications are more positive than others. **E 1658, E30**

positive image—a developed image in which dark areas correspond to dark areas of the original subject. **F 335, F05**

positive load—a load that results in the outdoor side of a glass specimen being the high-pressure side. **E 631, E06**

positive (negative) ion yield—the total number of positive (negative) secondary ions sputtered from the specimen per incident primary particle. **E 673, E42**

- positive, photographic**—a photograph having approximately the same rendition of light and shade as the original subject. E 7, E04
- positive replica**—See **replica**. E 7, E04
- positive side waterproofing, n**—an application wherein the waterproofing system and the source of hydrostatic pressure are on the same side of the structural element. D 1079, D08
- positive test**—the observation of the characteristic color change within a specified time limit, usually within 10 to 30 s.
- post**—See **railing systems**. E 631, E06
- positive transparency**—a photographic print made on a transparent base from a negative. In electron microscopy this is used as an intermediate step to prepare a negative print. E 7, E04
- possible/could have**—these terms have no place in expert opinions on handwriting because the examiner's task is to decide to what degree of certainty it can be said that a handwriting sample is by a specific person. If the evidence is so limited or unclear that no definite or qualified opinion can be expressed, then the proper answer is *no conclusion*. To say that the suspect "could have written the material in question" says nothing about probability and is therefore meaningless to the reader or to the court. The examiner should be clear on the different meanings of "possible" and "probable," although they are often used interchangeably in everyday speech. E 1658, E30
- post**—short timber used in upright position for supporting structures of fencing. It may be round, split, or sawn. D 9, D07
- post, n**—a vertical supporting member. E 631, E06
- post, n**—a vertical supporting member. E 1481, E06
- post**—post holding clincher to facilitate assembly of container bottoms. F 592, F16
- post, n**—a non-threaded anchor component that connects to the bony elements of the spine, pelvis, or ribs by means of a non-threaded hole in the bony element. F 1582, F04
- post cap**—a fitting atop a post usually to exclude water from tubular posts. F 552, F14
- post-cleaning**—the removal of residual liquid penetrant examination materials from the test part after the penetrant examination has been completed. E 1316, E07
- post-consumer, adj**—refers to materials that are reclaimed from products that have already served their intended end-use as consumer item. Waste from industrial processes are not considered post-consumer. Post-consumer materials are a subset of **recovered materials**. E 2114, E06
- post-consumer recycled content, n**—the portion, often expressed as a percent by weight, of material used in the manufacture of a new product, where the material ex. works has been recovered or otherwise diverted from disposal. F 141, F06
- post-conviction sex offender testing (PCSOT), n**—See clinical polygraph examination.
- disclosure examination, n**—a form of Post-Conviction Sex Offender Testing (PCSOT) which involves an in-depth look at the entire life cycle of an offender and his or her sexual behaviors up to the date of criminal conviction. Sometimes referred to as a sexual history examination. E 2035, E52
- postcure, n**—further treatment by time or temperature, or both, of an adhesive to modify specific properties. D 907, D14
- postcure, v**—to further treat an adhesive by time or temperature, or both, to modify specific properties. D 907, D14
- post cure, n**—heat or radiation treatment, or both, to which a cured or partially cured thermosetting plastic or rubber composition is subjected, to enhance the level of one or more properties. D 1566, D11
- post cure**—heat or radiation treatment, or both, to which a cured or partially cured thermosetting plastic or rubber composition is subjected to enhance the level of one or more properties.
- pot-life**—See **working life**.
- prebleeding**—See **debulking**. E 631, E06
- post cure**—heat or radiation treatment, or both, to which a cured or partially cured thermosetting plastic or rubber composition is subjected to enhance the level of one or more properties.
- post dispensing contraction, n**—*in building construction*, the volumetric decrease of a sealant that occurs between dispensing and cure. C 717, C24
- post dispensing expansion, n**—*in building construction*, the volumetric increase of a sealant that occurs between dispensing and cure. C 717, C24
- postemergence herbicide**—a chemical applied after emergence of the specified weed or crop. E 609, E35
- post emulsification**—a penetrant removal technique employing a separate emulsifier. E 1316, E07
- post-fab, n**—fabrication process where close-outs and inserts are attached or put into the panel after the facings are bonded to the core. C 274, D30
- post-flashover, adj**—the stage of a fire at which the average air temperature in the upper half of the room exceeds 600°C. E 176, E05
- postforming, n**—the forming of cured or partially cured thermosetting plastics. D 883, D20
- post hinge**—a fitting that attaches to the gate post, the pintle of which fits the frame hinge permitting the gate to swing. F 552, F14
- post-nucleation**—the step where, if necessary, the catalyst is converted to its final form. This is the final step prior to electroless plating. B 374, B08
- post treatment**—a process of applying chemical(s) to a membrane after formation to improve its performance. D 6161, D19
- post treatment**—the addition of chemicals to the product or concentrate stream to make it suitable for the desired end use application. D 6161, D19
- post treatment**—utilization of equipment such as degasifiers to make the product or concentrate stream, or both, suitable for the desired end use application. D 6161, D19
- post-weld heat treatment, n**—heating weldments immediately after welding, to provide **tempering**, **stress relieving**, or a controlled rate of cooling to prevent formation of a hard or brittle microstructure. A 941, A01
- pot**—a one-piece refractory container for molten glass. Types of pots include: C 162, C14
- potable water**—term used to indicate water having a total dissolved solids content less than 500 mg/L with a sufficiently low level of biological agents, suspended solids, organic odor and color-generating components to be safe and palatable for drinking. D 6161, D19
- potable water**—water that is satisfactory for drinking and culinary purposes, meeting the requirements of the health department having jurisdiction. E 772, E44
- pot arch**—a furnace for firing or preheating a pot. C 162, C14
- potash**—potassium oxide (K₂O). Loosely, a carbonate of potassium. C 162, C14
- potential drop, Δh (L)**—the difference in total head between two equipotential lines. D 653, D18
- potential migration pathway, n**—the route that may be taken by contaminants in the environment as they move or are transported from the source(s), usually in a downgradient direction. D 5681, D34
- potentiodynamic**—refers to a technique wherein the potential of an electrode with respect to a reference electrode is varied at a selected rate by application of a current through the electrolyte. G 15, G01
- potentiometer**—an instrument for the measurement of electromotive force by balancing against it an equal and opposite electromotive force across a calibrated resistance carrying a definite current. Potentiometers can be made manual or with automatic self-balancing features. E 7, E04
- potentiometric surface**—an imaginary surface representing the static

potentiometric surface

- head of ground water. The water table is a particular potentiometric surface. **D 653, D18**
- potentiostaircase**—refers to a potentiostep technique for polarizing an electrode in a series of constant potential steps wherein the time duration and potential increments or decrements are equal for each step. **G 15, G01**
- potentiostat**—an instrument for automatically maintaining an electrode in an electrolyte at a constant potential or controlled potentials with respect to a suitable reference electrode. **G 15, G01**
- potentiostatic**—the technique for maintaining a constant electrode potential. **G 15, G01**
- potentiostep**—refers to a technique in which an electrode is polarized in a series of potential increments or decrements. **G 15, G01**
- pot furnace**—a furnace for melting glass in pots. **C 162, C14**
- pot furnace**—a furnace used to smelt porcelain enamel raw batch contained in a crucible. **C 286, B08**
- potholes, n**—bowl-shaped holes in the pavement surface, grater than 100 mm (4 in.) in diameter, and more than 25 mm (1 in.) in depth. **E 867, E17**
- potholes, n**—bowl-shaped holes in the pavement surface, greater than 0.1 m (4 in.) in diameter, and more than 25 mm (1 in.) in depth. **E 1778, E17**
- pot life**—See **working life**. **C 717, C24**
- pot life**—the period of time during which a reacting thermosetting composition remains suitable for its intended processing after mixing with reaction-initiating agents. **D 883, D20**
- pot life; working life, n**—period of time during which a multi-part adhesive can be used after mixing the components. **D 907, D14**
- pot life, n**—the period of time during which a reacting thermosetting plastic or rubber composition remains suitable for its intended use, after mixing with a reaction-initiating agent. **D 1566, D11**
- pot-life**—See **working life**. **E 1749, E06**
- pot life, n**—the duration of time that the wet-state remains workable after it has been mixed. **E 2110, E06**
- pot life**—the period of time during which a reacting thermosetting plastic or rubber composition remains suitable for its intended processing after mixing with reaction-initiating agents. (D20) **F 412, F17**
- pot, pan, and utensils washing machine, commercial**—machines that uniformly wash, rinse, and heat-sanitize food preparation utensils. The machines are capable of removing physical soil and sanitizing multiple pots, pans, and utensils from properly racked and pre-scraped multiple items. **F 1827, F26**
- pot, pan, and utensil washing machine, commercial**—see **pot, pan, and utensil washing machines, commercial**. **F 1827, F26**
- pottery**—all fired ceramic wares that contain clay when formed, except technical, structural, and refractory products. **C 242, C21**
- potting, n**—an embedding process for parts that are assembled in a container (or “can”) into which the insulating material is poured, and the container remains an integral part of the finished unit as the outer surface. **D 1711, D09**
- pot wagon**—a vehicle used for transferring a pot from a pot arch to a pot furnace. **C 162, C14**
- pouch, n**—a small or moderate-sized bag, sack, or receptacle for carrying or containing parts. **D 996, D10**
- poultry corrosion**—See **deposit corrosion**. **G 15, G01**
- poultry, n**—chickens, turkeys, ducks, geese, and other domesticated fowl. **F 2463, F10**
- Pourbaix diagram (electrode potential-pH diagram)**—a graphical representation showing regions of thermodynamic stability of species in metal-water electrolyte systems. **G 15, G01**
- pour density, n**—the mass per unit volume of pelleted carbon black. **D 3053, D24**
- pouring pit refractory, n**—a refractory associated with the transfer or flow control of molten steel between furnace and mold. **C 71, C08**
- pour-on application**—application by pouring a chemical onto the target. **E 1102, E35**
- pour point**—the lowest temperature at which a liquid can be observed to flow under specified conditions. **D 2864, D27**
- pour point, n**—*in petroleum products*, the lowest temperature at which movement of the test specimen is observed under the prescribed conditions of the test. **D 4175, D02**
- powder, n**—particles that are usually less than 1000 μm (1 mm) in size. **B 243, B09**
- powder, n**—particles of a solid characterized by small size, nominally within the range of from 0.1 to 1000 μm . **B 899, B02**
- powder**—synonym for **bulksolid**, particularly when the particles of the bulk solid are fine. **D 653, D18**
- powder**—see **dry powder**. **E 1316, E07**
- powder adhesion**—the ability of an electrostatically charged powder to remain attached by static attraction to a grounded substrate. **C 286, B08**
- powder blend, n**—a homogeneous mixture of powder from one or more heats; it is limited to the amount that can be mixed in the same blender at one time. **B 899, B02**
- powder blend**—See **dry-blend**. **D 883, D20**
- powder blower**—a compressed air device used to apply magnetic powder over the surface of a part undergoing inspection. **E 1316, E07**
- powder cleaner, n**—a cleaning agent in which an absorbent compound is the principal ingredient. See **absorbent compound**. **D 123, D13**
- powder cleaner, n**—a cleaning agent in which an absorbent compound is the principal ingredient. See **absorbent compound**. **D 5253, D13**
- powder cleaning, n**—See the preferred term, **dry extraction cleaning**. **D 5253, D13**
- powder coating, n**—a coating produced by the use of a heat-fusible coating powder. **D 1711, D09**
- powdered activated carbon**—activated carbon in particle sizes predominantly smaller than 80 mesh. **D 2652, D28**
- powdered iced tea dispenser**—commercial equipment designed to deliver a portion of instant tea, usually mixed with tap water and dispensed into a container with ice. **F 1827, F26**
- powdered rubber, n**—particulate rubber composed of mainly non-spherical particles that have a maximum particle dimension equal to or below 425 μm (40 mesh). See **particulate rubber**. **D 1566, D11**
- powdered rubber, n**—particulate rubber composed of mainly non-spherical particles that have a maximum particle dimension equal to or below 425 μm (40 mesh) (also refer to **particulate rubber**). **D 5681, D34**
- powder flow meter, n**—an instrument for measuring the rate of flow of a powder according to a specified procedure. **B 243, B09**
- powder forging, n**—densification (generally hot) of a P/M preform by forging. **B 243, B09**
- powdering, n**—*as related to metallic coatings*, microcracking and fine particle separation of generally brittle coatings when the coating is severely stressed. **A 902, A05**
- powdering**—partial or total disintegration of the polish film resulting in a fine, light-colored material. **D 2825, D21**
- powdering**—a phenomenon that occurs in the creases of shoes during wear when polish film does not have adequate flexibility and breaks up into small powdery particles. **D 2825, D21**
- powdering, n**—a condition where ink easily rubs off a print after the normal drying period. Also referred to as “chalking.” **D 6488, D01**
- powder injection molding (PIM), n**—a process in which a mixture of powders and a binder system is forced under pressure into a mold. See also **metal injection molding**. **B 243, B09**
- powder lubricant, n**—an agent mixed with or incorporated in a powder to facilitate the pressing and ejecting of the compact. **B 243, B09**
- powder metallurgy, n**—the production and utilization of metal powders. **B 243, B09**
- powder metallurgy part, n**—a shaped object that has been formed

from metal powders and bonded by heating below the melting point of the major constituent. A structural or mechanical component, bearing, or bushing made by the powder metallurgy process. Synonymous with **P/M part**. **B 243, B09**

powder method—any method of X-ray diffraction involving a polycrystalline and preferably randomly oriented powder specimen and a narrow beam of monochromatic radiation. **E 7, E04**

powder porcelain enameling—process by which the application of porcelain enamel is achieved by dry electrostatic spraying. **C 286, B08**

powder porcelain resistivity—the opposition that a porcelain powder offers to the flow of direct current, equal to the voltage drop across the powder, divided by the current through the powder. (Also known as **electrical resistance**) **C 286, B08**

powder retention—Same as **electrostatic retention**. **C 286, B08**

powder rolling, *n*—see **roll compacting**. **B 243, B09**

powder to air ratio—ratio of the mass of powder delivered to the spray gun to the total volume of air used to convey and aspirate it. **C 286, B08**

power, active (real), *P*—the product of the rms current in a circuit, the rms voltage across the circuit and the cosine of the angular phase difference between the current and voltage. **A 340, A06**

power cable insulating paper, *n*—paper used, in conjunction with an insulating liquid, as the primary electrical insulation on conductors for transmission of electric energy. **D 1711, D09**

power capacity—electrical power is defined as current \times voltage = $V \times I$ (watts) **F 2112, F01**

power factor, dielectric—same as **power factor**. **D 2864, D27**

power factor, magnetic, $\cos \gamma$ —(a) the cosine of the angle between vectors representing the rms values of the applied voltage of a circuit and the current in circuit.

(b) the ratio of the active (real) power to the apparent power in an ac circuit. **A 340, A06**

power factor, *PF, n*—the ratio of the power in watts, *W*, dissipated in a material to the product of the effective sinusoidal voltage, *V*, and current, *I*, in volt-amperes. **D 1711, D09**

power factor, *PF*—the ratio of the power in watts, *W*, dissipated in a material, to the product of the effective values of voltage, *V*, and current, *I*, in volt-amperes:

$$PF = W/VI$$

The power factor is related to the **dissipation factor, *D***, as follows:

$$PF = D / \sqrt{1 + D^2}$$

D 2864, D27

power loss—the power, per unit volume, that is transformed into heat through hysteresis. (ISO) **D 4092, D20**

power, reactive (quadrature), *P_q*—the product of the rms current in an electrical circuit, the rms voltage across the circuit, and the sine of the angular phase difference between the current and the voltage.

$$P_q = EI \sin \theta$$

where:

P_q = reactive power in vars,

E = voltage in volts,

I = current in amperes, and

θ = angular phase by which *E* leads *I*.

NOTE—The reactive power supplied to a magnetic core having an *SCM* excitation is the product of the magnetizing current and the voltage induced in the exciting winding. **A 340, A06**

power spectral density—the limiting mean-square value (for example, of acceleration, velocity, displacement, stress, or other random variable) per unit bandwidth, that is the limit of the

mean-square value in a given rectangular bandwidth divided by the bandwidth, as the bandwidth approaches zero. **D 653, D18**

power spectral density—the limiting mean-square value (for example, of acceleration, velocity, displacement, stress, or other random variable) per unit bandwidth of frequency, that is the limit of the mean-square value of a given rectangular bandwidth divided by the bandwidth, as the bandwidth approaches zero. **E 1823, E08**

power unit, *n*—the part of a central vacuum system that contains the suction source and dirt receptacle. **F 395, F11**

pozzolan, *n*—a siliceous or siliceous and aluminous material, which in itself possesses little or no cementitious value but will, in finely divided form and in the presence of moisture, chemically react with calcium hydroxide at ordinary temperatures to form compounds possessing cementitious properties. **C 125, C09**

pozzolan, *n*—a siliceous or siliceous and aluminous material, which in itself possesses little or no cementitious value but which will, in finely divided form and in the presence of moisture, chemically react with calcium hydroxide at ordinary temperatures to form cementitious hydrates. **C 219, C01**

pozzolan—a siliceous or siliceous and aluminous material, which in itself possesses little or no cementitious value but will, in finely divided form and in the presence of moisture, chemically react with calcium hydroxide at ordinary temperatures to form compounds possessing cementitious properties. **D 653, D18**

pozzolan, *n*—primarily siliceous or siliceous and aluminous materials that will, in finely divided form and in the presence of moisture, chemically react with calcium hydroxide at ordinary temperatures to form compounds possessing cementitious properties. **E 2201, E50**

pozzolanic activity, *n*—the phenomenon of strength development that occurs when lime and certain aluminosilicates react at ambient temperatures in the presence of water. **E 2201, E50**

ppb(v)—See **concentration**. **D 1356, D22**

ppm(v)—See **concentration**. **D 1356, D22**

practical response time—the length of time that elapses between the instant at which an ion-selective electrode and a reference electrode are brought into contact with a sample solution (or at which the concentration of the ion of interest in a solution in contact with an ion-selective electrode and a reference electrode is changed) and the first instant at which the potential of the cell becomes equal to its steady-state value within 1 mV. The experimental conditions used should be stated, that is, the stirring rate, the composition of solution of which the response time is measured, the composition of the solution to which the electrode was exposed prior to this measurement, the history and preconditioning of the electrode, and the temperature. **D 4127, D19**

practical skills instructor—an individual who assists with practical skills instruction under the direction of the course instructor/coordinator. **F 1177, F30**

practice, *n*—a definitive procedure for performing one or more specific operations or functions that does not produce a test result. **D 123, D13**

practice, *n*—a definitive procedure for performing one or more specific operations or functions that does not produce a test result. **D 5684, D13**

preadaptation, *n*—the incubation of an inoculum in the presence of the test substance which is done prior to the initiation of the test and under conditions similar to the test conditions. **D 4175, D02**

pre-adaptation, *n*—the pre-incubation of an inoculum in the presence of the test material and under conditions similar to the test conditions. **D 4175, D02**

pre-adaptation, *n*—the incubation of an inoculum in the presence of the test material which is done prior to the initiation of the test and under conditions similar to the test conditions. **D 4175, D02**

pre-adaptation, *n*—the incubation of an inoculum in the presence of the test material which is done prior to the initiation of the test and under conditions similar to the test conditions. **D 6384, D02**

pre-alloyed powder, *n*—powder composed of two or more elements that are alloyed in the powder manufacturing process in which the

pre-alloyed powder, *n*

particles are of the same nominal composition throughout. Synonymous with **completely alloyed powder**. **B 243, B09**

prebake resistance, n—deprecated term, see **precure heat tolerance**. **D 1566, D11**

prebleeding—See **debulking**. **E 1749, E06**

pre-bond treatment, n—Synonym for **surface preparation**. **D 907, D14**

preburn period, n—*in atomic emission spectrometry*, the time interval after the initiation of a discharge during which the emitted radiation energy is not recorded for analytical purposes. **E 135, E01**

preceramic polymer, n—inorganic or organometallic polymers that can be converted (after polymer curing) to a ceramic by a thermal treatment.

Discussion—Such preceramic polymers are commonly used to form non-oxide ceramic, such as silicon carbide, silicone oxycarbide, silicon nitride, and aluminum nitride. **C 1145, C28**

precious metals, n—the eight noble metals: gold, silver, palladium, platinum, rhodium, iridium, osmium, and ruthenium. **B 899, B02**

precipitate—an insoluble product of a chemical reaction of soluble compounds in water. **D 6161, D19**

precipitation, n—separation of a new phase from solid, liquid, or gaseous solutions, usually with changing conditions of temperature or pressure, or both.

electrostatic precipitation, n—a process consisting of the separation of particulate matter from air or other gases under the influence of an electrostatic field.

meteorological precipitation, n—the precipitation of water from the atmosphere in the form of hail, mist, rain, sleet, and snow.

thermal precipitation, n—a process consisting of the separation of particulate matter from air and other gases under the influence of a relatively large temperature gradient extending over a short distance.

ultrasonic precipitation, n—a process consisting of the separation of particulate matter from air and other gases following agglomeration induced by an ultrasonic field. **D 1356, D22**

precipitation—separation of a new phase from solid, liquid, or gaseous solutions, usually with changing conditions of temperature or pressure, or both. **E 7, E04**

precipitation hardening, n—**hardening** caused by the precipitation of a constituent from a supersaturated solid solution. **A 941, A01**

precipitation hardening alloys—group of alloys that can be hardened by participation of second phases or intermetallic compounds by cooling during a thermal or thermal-mechanical aging treatment. **F 1789, F16**

precipitation heat treatment, n—**artificial aging** in which a constituent precipitates from a supersaturated solid solution. **A 941, A01**

precipitation heat treatment—a thermal treatment of a solution heat-treated product to produce property changes such as hardening, strengthening, and conductivity increase by precipitation of constituents from the supersaturated solid solution. This treatment has also been called “age hardened” and “precipitation hardened.” **B 846, B05**

precipitation titration—a titration in which the titrant and the sample species form a precipitate. An electrode can be used to follow the titration if it senses either of the ions involved in the reaction. The success of the titration depends on the lower limit of detection of the electrode, the solubility of the precipitate, the reaction rate, and the possible presence of other species which are also precipitated by the titrant. Examples of precipitation titrations are the determination of halides with silver nitrate and sulfate with lead ion. **D 4127, D19**

precipitator, n—a device or apparatus for the separation of particulate matter from air or other gases.

electrostatic precipitator, n—apparatus employing electrostatic

precipitation for the separation of particles from a gas stream.

thermal precipitator—See **precipitation**. **D 1356, D22**

precision—the agreement of repeated measurements of the same parameter expressed quantitatively as the standard deviation computed from the results of a series of controlled determinations. **C 242, C21**

precision, n—the degree of agreement within a set of observations or test results obtained as directed in a test method. **D 123, D13**

precision, n—*underconditions of single-operator precision*, the single-operator-laboratory-sample-apparatus-day precision of a method; the precision of a set of statistically independent observations all obtained as directed in the method and obtained over the shortest practical time interval in one laboratory by a single operator using one apparatus and randomly drawn specimens from one sample of the material being tested. **D 123, D13**

precision, n—*underconditions of within-laboratory precision with multiple operators*, the multi-operator, single-laboratory-sample, single-apparatus-day (within-operator) precision of a method; the precision of a set of statistically independent test results all obtained in one laboratory using a single sample of material and with each test result obtained by a different operator, with each operator using one apparatus to obtain the same number of observations by testing randomly drawn specimens over the shortest practical time interval. **D 123, D13**

precision, n—*underconditions of between laboratory precision*, the multi-laboratory, single-sample, single-operator-apparatus-day (within-laboratory) precision of a method; the precision of a set of statistically independent test results all of which are obtained by testing the same sample of material and each of which is obtained in a different laboratory by one operator using one apparatus to obtain the same number of observations by testing randomly drawn specimens over the shortest practical time interval. **D 123, D13**

precision—the degree of agreement of repeated measurements of the same property, expressed in terms of dispersion of test results about the arithmetical mean result obtained by repetitive testing of a homogeneous sample under specified conditions. The precision of a method is expressed quantitatively as the standard deviation computed from the results of a series of controlled determinations. **D 459, D12**

precision, n—the degree of agreement of repeated measurements of the same parameter expressed quantitatively as the standard deviation computed from the results of a series of controlled determinations. **D 1129, D19**

precision, n—the degree of agreement of repeated measurements of the same property, expressed in terms of dispersion of test results about the mean result obtained by repetitive testing of a homogeneous sample under specified conditions.

overall precision, n—a value including components of within-laboratory and between-user variability.

single-operator precision, n—a measure of the replication of repeated measurements obtained by a single operator on a given sample. **D 1356, D22**

precision, n—the closeness of agreement between test results obtained under prescribed conditions. **D 4175, D02**

precision, n—the degree of agreement between two or more results on the same property of identical test material. In this practice, precision statements are framed in terms of *repeatability* and *reproducibility* of the test method. **D 4175, D02**

precision, n—the degree of agreement between two or more results on the same property of identical test material. In this practice, precision statements are framed in terms of the *repeatability* and *reproducibility* of the test method. **D 4175, D02**

precision—the degree of agreement of repeated measurement of the same property, expressed in terms of dispersion of test results about the arithmetical mean result obtained by repetitive testing of a homogeneous sample under specified conditions. The precision

of a test method is expressed quantitatively as a standard deviation computed from the results of a series of controlled determinations.

D 4790, D16

precision, *n*—a generic concept used to describe the dispersion of a set of measured values.

D 5681, D34

precision—a term used to indicate the capability of a person, an instrument, or a method to obtain reproducible results; specifically, a measure of the random error as expressed by the variance, the standard error, or a multiple of the standard error.

D 5681, D34

precision—the closeness of agreement between randomly selected individual measurements or test results (see Terminology E 456).

E 131, E13

precision—of methods of chemical analysis, a characteristic manifested by agreement among individual results at a given analyte content.

E 135, E01

precision—the closeness of agreement between measurements obtained under prescribed conditions (see Terminology E 456).

E 170, E10

precision, *n*—the closeness of agreement between test results obtained under prescribed conditions. See also **repeatability, reproducibility**.

E 284, E12

precision, *n*—the scatter between individual values of test data within the subset, normally computed with respect to the mean of the subset. (See **bias**.)

E 344, E20

precision, *n*—the closeness of agreement between independent test results obtained under stipulated conditions.

E 456, E11

precision—degree of mutual agreement between individual measurements, namely repeatability and reproducibility. Compare **accuracy**.

E 631, E06

precision—a term used to indicate the capability of a person, an instrument, or a method to obtain reproducible results; specifically, a measure of the random error as expressed by the variance, the standard error, or a multiple of the standard error.

E 856, D34

precision—the degree of agreement of repeated measurements of the same property. Precision statements in ASTM methods for industrial chemicals will be derived from the estimated standard deviation or coefficient of variation of a series of measurements and will be expressed in terms of the repeatability, the within-laboratory, between days variability, and the reproducibility of the method.

E 1547, E15

precision—the closeness of agreement between repetitive independent test results obtained under prescribed conditions (see Terminology E 456).

E 1605, E06

precision—the closeness of agreement between randomly selected individual measurements or test results for a given set of experimental variables.

E 1823, E08

precision—the degree of agreement among or between repeated measurements of the same property.

E 2161, E37

precision, *n*—a measurement concept that expresses the ability to generate test results that agree with each other in absolute magnitude.

F 538, F09

precision (as distinguished from accuracy)—the degree of mutual agreement between individual measurements, namely repeatability and reproducibility. (E 380)

F 221, F05

precision index of the average, *n*—the sample standard deviation divided by the square root of the number of samples.

precut building—See **building**.

E 631, E06

precleaning—the removal of surface contaminants from the test part so that they will not interfere with the examination process.

E 1316, E07

precoagulum, *n*—coagulum resulting from the partial inadvertent coagulation of a latex.

D 1566, D11

precoat—the initial coating of the septum in a diatomaceous earth filter to provide initial straining medium.

D 6161, D19

precoat—see **basecoat**.

F 1623, F05

precondition, *v*—to bring a sample or specimen of a textile material to a relatively low moisture content (approximate equilibrium in an

atmosphere between 3 and 25 % relative humidity) prior to conditioning in a controlled atmosphere for testing.

D 123, D13

pre-condition, *n*—the pre-incubation of an inoculum under the conditions of the test in the absence of the test material.

D 4175, D02

pre-conditioning—an activity conducted prior to placing plugging material into a borehole in order to stabilize the hole.

D 653, D18

preconditioning—any preliminary exposure of a material to the influence of specified atmospheric conditions for the purpose of favorably approaching equilibrium with a prescribed atmosphere.

E 41, G03

preconsolidation pressure (prestress), p_e (FL⁻²)—the greatest effective pressure to which a soil has been subjected.

D 653, D18

pre-consumer, *adj*—refers to materials that are reclaimed from manufacturing and other industrial processes, and products which have not served their intended end-use as a consumer item. Pre-consumer materials include: culls, trimmed materials, print overruns, overissue publications, and obsolete inventories.

E 2114, E06

pre-consumer recycle content, *n*—material recovered or diverted from industrial waste streams for use in the manufacture of a new product or a product made by a new process, often expressed as a percent by weight. This excludes materials and by-products generated from and commonly reused or reworked within the original manufacturing process.

F 141, F06

precrack, *n*—a crack that is intentionally induced into the test specimen prior to testing the specimen to fracture

C 1145, C28

precrack force, P_M [F]—the allowable precrack force.

E 1823, E08

preure heat tolerance (adhesives), *n*—the amount of exposure (at a certain time and temperature) prior to bonding that a cure-activated adhesive system can tolerate without significant impairment of its adhesion potential.

D 1566, D11

precut building—a **manufactured building** produced largely of elements cut to size in a factory and transported for assembly at the erection site.

E 631, E06

predictive thermometer—any thermometer that indicates the true temperature of a measurement site in a time shorter than that necessary for the thermometer to reach equilibrium temperature of that site.

E 344, E20

predictive thermometer, *n*—one that provides an indication of the final stabilized temperature of the measurement site in advance of the time necessary for the transducer to reach a stabilized temperature.

E 344, E20

prediluted aqueous ethylene glycol coolant, *n*—a commercially prepared uniform solution (50 % by volume minimum) of ethylene-glycol-based engine coolant concentrate and deionized water (described in Specification D 1193, Type IV).

D 4725, D15

predrilled hole—hole drilled through metal connector plate during its fabrication.

prefabricated building—See **building**.

prefabricated panel system—See **building system**.

E 631, E06

preemergence herbicide—a chemical applied before emergence of a specified weed or planted crop.

E 609, E35

pre-exposure—exposure of a photoconductive medium to a light source prior to imaging.

F 335, F05

prefabricated building—Use **manufactured building**.

E 631, E06

prefabricated panel system—building-panel system fabricated away from its ultimate position on a building.

E 631, E06

pre-fabricated vertical drain (PVD), *n*—a geocomposite consisting of geotextile cover and drainage core installed vertically into soil to provide drainage for accelerating consolidation of soils.

D 4439, D35

preference, *n*—choice of one product, treatment, or item over others in a given set based upon hedonics, sensory properties, or other criteria.

E 253, E18

preferential adsorption—adsorption in which one or more components are adsorbed to a much greater extent than others.

D 2652, D28

preferential sputtering—See **sputtering**.

E 673, E42

preferred orientation, *n*—in *manufactured carbon and graphite product technology*, an alignment in the crystal or defect structure of a body leading to variations in physical properties as a function of direction; normally referenced to an orthogonal system where one of the axes is the working direction. C 709, D02

preferred orientation, *n*—in *manufactured carbon and graphite product technology*, an alignment in the crystal or defect structure of a body leading to variations in physical properties as a function of direction; normally referenced to an orthogonal system where one of the axes is the working direction. D 4175, D02

preferred orientation—a condition of polycrystalline aggregate in which the crystal orientations are not distributed at random. E 7, E04

preferred white, *n*—for *color determination*, the white color, usually bluish, that is judged by a given group of observers looking at a given series of specimens to be the whitest color attainable. D 2946, C17

preferred white surface(s)—the particular surface which under specified viewing conditions is considered whitest by a statistically significant majority of representative observers in a series of paired comparisons performed at a specified time and geographical locale (psychological definition). D 459, D12

prefilming airblast nozzle—an airblast nozzle in which solid surfaces are configured to produce a liquid film that subsequently is broken up by adjacent airstreams. E 1620, E29

prefit—a process to check the fit of mating detail parts in an assembly prior to adhesive bonding in order to ensure proper bondlines. E 631, E06

prefit—a process to check the fit of mating detail parts in an assembly prior to adhesive bonding in order to ensure proper bondlines. E 1749, E06

pre-flame reaction, *n*—in *fuel testing*, a slow, nonluminous reaction of the sample or its decomposition products with the atmosphere in the combustion chamber. D 4175, D02

preflex effect, *n*—the phenomenon occurring in vulcanized rubber, related to the Mullins effect, whereby the dynamic moduli at low strain amplitude are less after a history to high strains than before. (See also **Mullins effect**.) (Also called strain history effect.) D 1566, D11

preform, *n*—a P/M compact intended to be changed in shape through deformation and densification. B 243, B09

preform, *n*—a preshaped mat or woven structure formed from fibers of whiskers to the desired configuration and reinforcement architecture. C 1145, C28

preform, *n*—a coherent, shaped mass of powdered, granular or fibrous plastic molding compound, or of fibrous filler material with or without resin. (ISO) D 883, D20

preform, *n*—a preshaped fibrous reinforcement, normally without matrix, but often containing a binder to facilitate manufacture, formed by distribution of fibers to the approximate contour and thickness of the finished part. D 3878, D30

preformed—formed prior to driving. F 592, F16

preformed flexible joint sealant—pliable material, formed into a defined cross section, that is applied to the surface of a pipe, box section, or manhole section joint, intended to control the movement of fluids or solids through the joint. C 822, C13

preformed gasket—an elastomeric compound molded in the form of a continuous strip, channel, or other shape, for use in filling joints and providing weathertight seals in glazing or between building components. C 717, C24

preforming, *v*—the initial pressing of a metal powder to form a compact that is subjected to a subsequent pressing operation other than coining or sizing. Also, the preliminary shaping of a refractory metal compact after presintering and before the final sintering. B 243, B09

preheat—to heat the equipment's cooking medium, cavity, or surface (see **cooking medium**, **cooking cavity**, or **cooking surface**) from

a predetermined ambient temperature to the equipment's thermostatic set point. F 1827, F26

preheat duration—total time required for preheat (see **preheat**), from preheat initiation at controls to when the equipment is ready to cook. F 1827, F26

preheat energy—amount of energy consumed (Btu, kJ or kWh) by the equipment while heating the equipment's cooking medium, cavity, or surface (see **cooking medium**, **cooking cavity**, or **cooking surface**) from an ambient temperature to a thermostat set point, E_p . F 1827, F26

preheating, *n*—*fortool steels*, heating to an intermediate temperature immediately before final **austenitizing**. A 941, A01

preheating, *n*—heating before welding, a mechanical treatment, or some further thermal treatment. A 941, A01

preheating, solar—the use of solar energy to partially heat a substance, such as domestic potable water, prior to heating it to a higher desired temperature with auxiliary fuel. E 772, E44

preheat rate—average rate at which the temperature of the equipment's cooking medium, cavity, or surface (see **cooking medium**, **cooking cavity**, or **cooking surface**) is heated from a predetermined ambient temperature to the equipment's thermostat set point. F 1827, F26

preheat time—time required for the equipment to heat from the ambient room to a specified and calibrated operating temperature, or thermostat set point, T_p . F 1827, F26

preheat zone—that portion of a continuous furnace through which the ware passes before entering the firing zone. C 286, B08

prehospital emergency medical services—a sub-system of the emergency medical services system which provides medical services to patients requiring immediate assistance due to illness or injury, prior to the patients' arrival at an emergency medical facility. F 1177, F30

prehospital provider—all personnel providing emergency medical care in a location which is remote from facilities which are capable of providing definitive medical care. F 1177, F30

preignition, *n*—in a *spark-ignition engine*, ignition of the mixture of fuel and air in the combustion chamber before the passage of the spark. D 4175, D02

pre-launch production plan—written description of the dimensional, mechanical, chemical, and performance testing that will be carried out during initial production, prior to full production. F 1789, F16

preliminary assessment (PA), *n*—a review of existing information and an off-site reconnaissance, if appropriate, to determine whether a release may require additional investigation or action. A preliminary assessment may include an on-site reconnaissance, if appropriate. See ASTM Guidance for Transaction Screen Questionnaire (Practice E 1528). D 5681, D34

premature deterioration, *n*—in *building construction*, significant deleterious change (to a degree that jeopardizes functionality) of an installed sealant, coating or membrane earlier than the product's claimed or reasonably expected service life. C 717, C24

premix, *n*—a uniform mixture of ingredients to a prescribed analysis, prepared by the powder producer, for direct use in compacting powder metallurgy products. B 243, B09

premix, *n*—in reinforced thermosetting plastics, the admixture of resin, reinforcements, fillers, etc., not in web or filamentous form, ready for molding. D 883, D20

premix burner, *n*—in *flame atomic absorption and emission spectrometry*, a burner in which the fuel gas is mixed with the oxidizing gas before reaching the combustion zone. E 135, E01

prepack seal—a preassembly seal installed to fill voids or provide a support seal for subsequent fillet sealing. E 631, E06

prepack seal—a preassembly seal installed to fill voids or provide a support seal for subsequent fillet sealing. E 1749, E06

preparation time—the time from the removal of a cooked load (see **load**) from the equipment until the next load is entered in the equipment. F 1827, F26

preparatory coat—an initial coat of the liquid-applied membrane which is applied at cracks, joints, or terminal points to provide reinforcement to the membrane at these critical areas. **C 717, C24**

prepared coal—*for the purpose of Test Method D 4749*, any coal, regardless of its topsize, that has been manually or mechanically cleaned. This includes coal that has been processed over a picking table or air tables through a breaker, jig, or other device which segregates according to size or density (specific gravity). **D 121, D05**

preplaced aggregate concrete—concrete produced by placing coarse aggregate in a form and later injecting a portland cement-sand or resin grout to fill the interstices. **D 653, D18**

prepolymer, *n*—a polymer of degree of polymerization between that of the monomer or monomers and the final polymer. (ISO) **D 883, D20**

prepolymer, *n*—a polymer of degree of polymerization between that of the monomer or monomers and the final polymer. **F 1251, F04**

prepreg, *n*—in reinforced thermosetting plastics, the admixture of resin, reinforcements, fillers, etc., in web or filamentous form, ready for molding. **D 883, D20**

prepreg—the admixture of fibrous reinforcement and polymeric matrix used to fabricate composite materials. Its form may be sheet, tape, or tow. For thermosetting matrices, it has been partially cured to a controlled viscosity called “B stage.” **D 3878, D30**

prepreg—a combination of mat, fabric, nonwoven material, or roving with resin usually advanced to the B-stage, ready for curing. **E 631, E06**

prepreg—a combination of mat, fabric, nonwoven material, or roving with resin usually advanced to the B-stage, ready for curing. **E 1749, E06**

preprinted symbol, *n*—a symbol printed in advance of application either on a label or on the article to be identified. **F 1294, F05**

preproduction test, *n*—a test or series of tests conducted by (1) an adhesive manufacturer to determine conformity of an adhesive batch to established production standards, (2) a fabricator to determine the quality of an adhesive before parts are produced, or (3) an adhesive specification custodian to determine conformance of an adhesive to the requirements of a specification not requiring qualification tests. (Compare **acceptance test** and **qualification test**.) **D 907, D14**

prepunched hole—hole punched through metal connector plate during its fabrication. **E 631, E06**

present serviceability, *n*—the current condition of a pavement (traveled surface) as perceived by the traveling public. **E 867, E17**

present serviceability rating (PSR), *n*—a mean rating of the serviceability of a pavement (traveled surface) established by a rating panel under controlled conditions. The accepted scale for highways is 0 to 5, with 5 being excellent. **E 867, E17**

present value—the value of a benefit or cost found by discounting future cash flows to the base time (Syn. *present worth*). **E 631, E06**

present value, *n*—the value of a benefit or cost found by discounting future cash flows to the base time (Syn. *present worth*). **E 833, E06**

present value factor—The discount factor used to convert future values (benefits and costs) to present values (Syn. *present worth factor*).
present worth—See **present value**.
present worth factor—See **present value factor**. **E 631, E06**

present value factor, *n*—The discount factor used to convert future values (benefits and costs) to present values (Syn. *present worth factor*). **E 833, E06**

*present worth, *n**—See **present value**. **E 833, E06**

*present worth factor, *n**—See **present value factor**. **E 833, E06**

preservation, *n*—action taken to retard or prevent deterioration or damage to cultural objects. **D 123, D13**

preservation, *n*—*in packaging*, the application of protective measures such as cleaning, drying, and the use of preservatives, barrier materials, cushioning, and containers. **D 996, D10**

preservation, *n*—the protection of cultural property through activities that minimize chemical and physical deterioration and damage and that prevent loss of informational content. The primary goal of preservation is to prolong the existence of cultural property. **D 5038, D13**

preservation, *n*—the act or process of applying measures to sustain the existing form, integrity, or materials of a **building**, structure, or **artifact** and the existing form or vegetative cover of a cite.

*conservation, *n**—management of a natural resource, structure, or **artifact** to prevent misuse, destruction, or neglect. It may include detailed characterization and recording (technical or inventory) or provenance and history and application of measures.

*protection, *n**—the act or process of applying measures designed to affect the physical condition of a **building**, structure, or **artifact** by guarding it from deterioration, loss, or attack; or, to cover or shield it from damage.

*rehabilitation, *n**—*of a structure*, the act or process of returning a structure to a state of utility through **repair** or **alteration** which makes possible an efficient contemporary use.

*restoration, *n**—the act or process of reestablishing accurately the form and details of a structure, site, or **artifact** as it appeared at a particular period of time, by means of removal of later work or by the **reconstruction** of missing earlier work.

pressure sensitive adhesive—See **adhesive, contact pressure**. **E 631, E06**

preservative—a chemical substance which, when suitably applied to wood, makes the wood resistant to attack by fungi, insects, marine borers, or weather conditions. **D 9, D07**

preservative—a material that prolongs the useful life of an agrichemical by inhibiting decomposition by microorganisms. **E 609, E35**

preservative (latex), *n*—substance added to un compounded latex before or after concentration to inhibit putrefaction and accompanying coagulation. **D 1566, D11**

preshadowed replica—See **replica**. **E 7, E04**

presintering, *v*—the heating of a compact at a temperature below the normal final sintering temperature, usually to increase the ease of handling or shaping the compact, or to remove a lubricant or binder before sintering. **B 243, B09**

*prespot, *n**—See **pretreat**. **D 5253, D13**

press, *v*—to apply force to a mass of powder, generally while confined in a die or container, to form a compact. **B 243, B09**

press—an apparatus for applying and maintaining pressure on an assembly of veneers and adhesive in the manufacture of plywood. It may be operated mechanically or hydraulically and the platens may be cold or heated depending on the type of adhesive used. **D 1038, D07**

press—mechanical device that removes liquids from solids by mechanically pressing the solids against a porous surface. **E 1705, E48**

press-and-blow process—a process of glass manufacture in which the finish and parison are pressed and the parison is subsequently blown to form the final shape. **C 162, C14**

pressed bar, *n*—a compact in the form of a bar; a green compact. **B 243, B09**

pressed density, *n*—synonymous with **green density**. **B 243, B09**

pressed glass—glassware formed by pressure between a mold and a plunger. **C 162, C14**

pressed-in crease, *n*—a sharp crease inserted intentionally in a fabric usually by application of pressure, heat, and moisture. **D 123, D13**

pressed-in crease, *n*—a sharp crease inserted intentionally in a fabric usually by application of pressure, heat, and moisture. **D 4850, D13**

pressed product, *n*—*for cooling tower fill*, that which is pressed singly or in stacks interlayered with templates, at a minimum pressure of 12 MPa (1740 psi). **D 2946, C17**

pressed products, *n*

pressed products, *n*—*in cooling tower fill*, includes those that are pressed singly or in stacks interlayered with templates, at a minimum pressure of 12 MPa (1740 psi). **C 1154, C17**

pressing, *v*—shaping of brick by pressing clay or shale into a mold cavity which forms the peripheral dimensions of the brick. **C 43, C15**

pressing:

dry pressing—forming ceramic ware in dies from powdered or granular material by direct pressure.

hot pressing—a jiggering process wherein a heated profile tool or plunger is used.

wet pressing (plastic pressing)—forming ceramic ware in dies from a plastic body by direct pressure. **C 242, C21**

pressing, *n*—*in the care of textiles*, a process of smoothing and shaping by heat and pressure, with or without the presence of steam. **D 123, D13**

pressing, *n*—*in the care of textiles*, a process of smoothing and shaping by heat and pressure, with or without the presence of steam. **D 3136, D13**

pressing and finishing, *n*—this term takes into account all of the industrial pressing and finishing treatments used in garment production. **D 123, D13**

pressing and finishing, *n*—this term takes into account all of the industrial pressing and finishing treatments used in garment production. **D 7022, D13**

pressing crack, *n*—*in a rigid die system*, a defect occurring as a result of the forming operation. **B 243, B09**

pressing (n)—an as-pressed, oversized piece of glass used as the precursor for finishing to an optical element blank. **C 162, C14**

pressing (v)—the operation of forming pressed glass. **C 162, C14**

press-off, *n*—*in knitted fabric*, a condition in which the yarn fails to knit and either the fabric falls off the needles or the design is distorted or incomplete. **D 123, D13**

press-off, *n*—*in knitted fabrics*, a condition in which the yarn fails to knit and either the fabric falls off the needles or the design is distorted or incomplete. **D 3990, D13**

pressure, *n*—the force exerted to a surface per unit area. **D 123, D13**

pressure, *n*—the force or load per unit area.

*gage pressure, *n**—the difference in pressure between that existing within a system and that of the surrounding atmosphere.

*static pressure, *n**—the pressure of a fluid at rest, or in motion, exerted perpendicularly to the direction of flow.

*total pressure, *n**—the pressure representing the sum of static pressure and velocity pressure at the point of measurement.

*velocity pressure, *n**—that pressure caused by and related to the velocity of the flow of fluid; a measure of the kinetic energy of the fluid. **D 1356, D22**

pressure—the internal force per unit area exerted by any material. Since the pressure is directly dependent on the temperature, the latter must be specified. The pressure may be reported in either of two ways:

(1) **absolute pressure**—the total pressure with zero as a reference point, usually expressed as pounds-force per square inch absolute (psia).

(2) **gage pressure**—the pressure in excess of atmospheric pressure. Under standard conditions at sea level, the numerical value of the absolute pressure is 14.7 higher than that of the gage pressure, which is usually expressed in pounds-force per square inch gage (psi). **D 3064, D10**

pressure, *n*—the force exerted to a surface per unit area. **D 4850, D13**

pressure—when expressed with reference to pipe, the force per unit area exerted by the medium in the pipe. **F 412, F17**

pressure atomizer—a device wherein pressurized liquid is the primary source of energy utilized to produce a spray. **E 1620, E29**

pressure atomizing nozzle—see **pressure atomizer**. **E 1620, E29**

pressure-break, *n*—as applied to a defect in a laminated plastic a break apparent in one or more outer sheets of the paper, fabric, or other base visible through the surface layer of resin which covers it. **D 883, D20**

pressure bulb—the zone in a loaded soil or rock mass bounded by an arbitrarily selected isobar of stress. **D 653, D18**

pressure check—an imperfection; a check or crack in a glass article resulting from too much pressure in forming. **C 162, C14**

pressure correction factor—a multiplier that adjusts the measured gas volume to the actual volume at standard gas pressure, P_{cf}

$$= \frac{\text{absolute actual gas pressure psia}}{\text{absolute standard pressure psia}}$$

$$= \frac{\text{gas gage pressure psig} + \text{barometric pressure psia}}{\text{absolute standard pressure psia}}$$

NOTE—Absolute standard gas temperature and pressure used in this calculation should be the same values used for determining the higher heating value. PG&E standard conditions are 519.67°R and 14.73 psia.

F 1827, F26

pressure, design—pressure used in design to determine the required minimum thickness and minimum mechanical properties.

E 1316, E07

pressure design basis—one of a series of established pressure values for a plastic piping component (multilayer pipe, fitting, valve, and so forth) obtained by categorizing the long-term hydrostatic pressure strength determined in accordance with an industry test method that uses linear regression analysis. **F 412, F17**

pressure die-casting, *n*—Same as die casting. **B 899, B02**

pressure difference—in leak testing, the difference between the pressure on the inlet side of the leak and the pressure on the exit side of the leak. **E 1316, E07**

pressure drop—the difference between the pressure measured in the condenser and the pressure measured in the distillation flask.

D 4175, D02

pressure dye test—(1) a form of leak test in which the item or items to be tested are filled with a liquid dye or fluorescent oil which is then pressurized for the purpose of driving the liquid through possible leakage paths with the presence of the leaks being visible when viewed from the exterior; (2) a form of leak test in which the item or items to be tested are immersed in a liquid dye or fluorescent oil which is then pressurized for the purpose of driving liquid into possible leakage paths with their presence being visible when the excess liquid has been removed from the exterior.

E 1316, E07

pressure-evacuation test—a leak test in which one or more devices are placed under gas pressure for a period of time, the objective being to accumulate enough gas in those devices that may leak to permit an indication on a leak detector sensitive to the gas when the devices are placed in an evacuated system joined to the leak detector. **E 1316, E07**

pressure filling—pressurizing a container by injecting a propellant through the valve under high pressure. The operation is usually used where the propellant content is small, and it is carried out under ambient conditions (that is, refrigeration equipment is not needed). **D 3064, D10**

pressure filtration—filtration performed in an enclosed pressurized filter vessel. **D 6161, D19**

pressure fixing—the process of making the image permanent by means of pressure. **F 335, F05**

pressure flow, *n*—flow in a direction parallel to the plane of a geotextile or related product driven predominately by a differential fluid pressure. **D 4439, D35**

pressure fryer—equipment with a deep kettle containing oil or fat covered by a heavy, gasketed lid with a pressure valve. The equipment kettle operates between 10 and 12 psig. See **fryer**.

F 1827, F26

pressure head—the head of water at a point in a porous system; negative for unsaturated systems, positive for saturated systems. Quantitatively, it is the water pressure divided by the specific weight of water. **D 653, D18**

pressure inflated—inflatable boom that requires pressurized gas for its flotation. **F 818, F20**

pressure-less steam cooker—equipment where in the cooking compartment operates between 0 and 2.9 psig. See **steam cooker**. **F 1827, F26**

pressure limit, *n*—the minimum pressure of an oxidant (or oxidant mixture) that will just support sustained combustion of a material initially at given conditions of oxidant concentration, temperature, flow condition, and propagation direction. **G 126, G04**

pressure mark, *n*—See **bruise**. **D 3990, D13**

pressure melting—lowering of the melting point of ice through the application of pressure. **D 7099, D18**

pressure nozzle—see **pressure atomizer**. **E 1620, E29**

pressure, *p* (FL⁻²)—the load divided by the area over which it acts. **D 653, D18**

pressure pipe—pipe designed to resist continuous pressure exerted by the conveyed medium. **F 412, F17**

pressure probe—see **probe**. **E 1316, E07**

pressure rating (PR)—the estimated maximum water pressure the pipe is capable of withstanding continuously with a high degree of certainty that failure of the pipe will not occur. **F 412, F17**

pressure ratio (PR), *n*—defined as $PR = (P_{ex,a} - \Delta P_{ignitor}) / P_{ignitor}$. **E 1445, E27**

pressure relief device—a pressure-activated valve designed to automatically relieve excessive pressure. **E 772, E44**

pressure, saturation—the pressure, for a pure substance at any given temperature, at which vapor and liquid, or vapor and solid, coexist in stable equilibrium. **E 41, G03**

pressure sensitive—a carbon paper, ribbon, or paper capable of producing an image from pressure as with pen or pencil. **F 221, F05**

pressure-sensitive adhesive, *n*—a viscoelastic material which in solvent-free form remains tacky and will adhere instantaneously to most solid surfaces with the application of very slight pressure. **D 907, D14**

pressure sensitive adhesive—See **adhesive, contact pressure**. **E 1749, E06**

pressure-sensitive-adhesive tape—See **tape**. **D 996, D10**

pressure-sensitive article, *n*—a combination of a pressure-sensitive adhesive with a backing or with a backing and release liner. **D 907, D14**

pressure-sensitive copy paper—paper systems that develop a visible image on the application of localized pressure. **F 221, F05**

pressure station, *n*—a specified induced change in the building pressure difference from the initial zero-flow building pressure difference (Pa, in. H₂O).

primary circulation area—See **space categories**.

primary circulation area—See **building space**. **E 631, E06**

pressure tank—a container from which slip is removed by air pressure. **C 286, B08**

pressure testing—a method of permeability testing with water or grout pumped downhole under pressure. **D 653, D18**

pressure testing—a method of leak testing in which the component being tested is filled completely with a gas or liquid which is then pressurized. The outside of the component is examined for the detection of any leaks. **E 1316, E07**

pressure-treated wood—wood treated by applying pressure to force the preservative into it. **D 9, D07**

pressure, vapor—the pressure exerted by a vapor.

NOTE—If a vapor is kept in confinement over its source so that the vapor can accumulate, the temperature being held constant, the vapor pressure approaches a fixed limit called the maximum, or saturated, vapor pressure, dependent only on the temperature and the liquid.

E 41, G03

pressure vessel—the vessel containing one or more individual membrane elements and designed to withstand safely the hydraulic pressure driving the separation mechanism. **D 6161, D19**

pressure-void ratio curve (compression curve)—a curve representing the relationship between effective pressure and void ratio of a soil as obtained from a consolidation test. The curve has a characteristic shape when plotted on semilog paper with pressure on the log scale. The various parts of the curve and extensions to the parts of the curve and extensions to the parts have been designated as recompression, compression, virgin compression, expansion, rebound, and other descriptive names by various authorities. **D 653, D18**

pressure washing—the cleaning of soil or rock surfaces accomplished by injection of water, air, or other liquids, under pressure. **D 653, D18**

pressure, water vapor—the component of atmospheric pressure caused by the presence of water vapor, usually expressed in millimetres, inches of mercury, or pascals. **E 41, G03**

prestressing force—axial force in anchor resulting from setting or torquing of anchor or nut. **E 2265, E06**

pretension, *n*—the specified tension applied to a specimen preparatory to making a test. **D 123, D13**

pretension, *n*—the specified tension applied to a specimen preparatory to making a test. **D 4848, D13**

pretest interview, *n*—the earliest portion of the PDD examination process during which the examinee and examiner discuss the test, test procedure, and the details of the test issues. The pretest interview also serves to prepare the examinee for the testing. **E 2035, E52**

pretreat, *vt*—preapplication of cleaning agent to spots, stains, and areas of high soil concentration to maximize activation time and therefore facilitate soil removal during overall cleaning. **D 123, D13**

pretreat, *v*—*in the cleaning of textile floor coverings and upholstered furniture*, apply a cleaning agent to spots, stains, and areas of high soil concentration prior to overall cleaning to maximize activation time and facilitate soil removal. **D 5253, D13**

pretreatment—processes such as chlorination, filtration, coagulation, clarification, acidification which may be used on feedwater ahead of membrane devices to improve quality, minimize scaling and corrosion potential, control biological activity. **D 6161, D19**

prevailing torque—torque necessary to rotate a fastener relative to its mating component with the torque being measured with the fastener in motion and zero axial load in the assembly. **F 1789, F16**

preventative maintenance cycle—the predetermined interval through which specified servicing events take place. (See **PM cycle**.) **F 1457, F05**

prevention process—future-oriented strategy that, through analysis and action toward correcting the process itself, enriches quality through continuous improvement activities. **F 1789, F16**

prevention system—system which outlines advance quality planning, in-process inspection, process controls, and statistical methods to control the processes and seek continuous improvement. **F 1789, F16**

prevulcanization inhibitor (PVI), *n*—a compounding material that increases the time to incipient vulcanization of a rubber mix. **D 1566, D11**

primary accelerator, *n*—the principal highest concentration accelerator used in a vulcanizing system. **D 1566, D11**

primary atomization, *n*—the initial disintegration of a liquid jet, sheet, or film. **E 1620, E29**

primary backing, *n*—*for tufted pile yarn floor covering*, the fabric through which the pile yarn is carried by needles to form tufts; the backing fabric. **D 123, D13**

primary backing, *n*—*for tufted pile yarn floor covering*, the fabric through which the pile yarn is carried by needles to form tufts; the backing fabric. **D 5684, D13**

primary biodegradation, *n*—degradation of the test material by

primary biodegradation, *n*

microorganisms resulting in a change in the test material's physical or chemical properties, or both. **D 4175, D02**

primary biodegradation, *n*—degradation of the test substance resulting in a change in its physical or chemical properties, or both. **D 4175, D02**

primary biodegradation, *n*—degradation of the test material by microorganisms resulting in a change in the test material's physical or chemical properties, or both. **D 6384, D02**

primary biodegradation test, *n*—a test that monitors the disappearance of a test material by measuring some physical attribute of the material. **D 4175, D02**

primary biodegradation test, *n*—a test which follows the disappearance of a test substance by measuring some attribute of the substance. **D 4175, D02**

primary biodegradation test, *n*—a test that monitors the disappearance of a test material by measuring some physical attribute of the material. **D 6384, D02**

primary boiling—the evolution of gas during the initial firing of porcelain enamel; sometimes a defect. **C 286, B08**

primary breakup, *n*—see **primary atomization**. **E 1620, E29**

primary circulation area—portion of building area dedicated to public corridor, lobby, or atrium; or required for access to stairs, elevators, restroom facilities, or building exits. **E 631, E06**

primary circulation area—See **space categories**. **E 1480, E06**

primary clay (residual clay)—a clay that remains geologically at its site of formation. **C 242, C21**

primary colorants, *n*—a small number of colorants (dyes or pigments) that may be mixed subtractively to produce a large gamut of colors. **E 284, E12**

primary color stimuli, *n*—three selected colored lights used to specify the color of any light presented by the amounts of the three that must be mixed additively to produce light matching the light presented. **E 284, E12**

primary consolidation (primary compression) (primary time effect)—see **consolidation**. **D 653, D18**

primary container—a container which is in contact with the contents. **D 996, D10**

primary crystals—the first type of crystals that separates from a melt on cooling. **E 7, E04**

primary current distribution—the distribution of the current over the surface of an electrode in the absence of polarization. **B 374, B08**

primary extinction—a decrease in intensity of a diffracted X-ray beam caused by perfection of crystal structure extending over such a distance (about 10^{-4} cm or greater) that interference between multiply reflected beams inside the crystal causes a decrease in the intensity of the externally diffracted beam. **E 7, E04**

primary filter pack—a clean silica sand or sand and gravel mixture of selected grain size and gradation that is installed in the annular space between the borehole wall and the well screen, extending an appropriate distance above the screen, for the purpose of retaining and stabilizing the particles from the adjacent strata. The term is used in place of gravel pack. **D 653, D18**

primary flow-rate standard—See **standard**. **D 1356, D22**

primary healing, *n*—healing by first intention. **F 2312, F04**

primary heat, *n*—the product of a single cycle of a batch melting process. **A 941, A01**

primary hole—*in grouting*, the first series of holes to be drilled and grouted, usually at the maximum allowable spacing. **D 653, D18**

primary insulation, *n*—the first layer of two or more layers of insulating materials over a conductor. **D 1711, D09**

primary jacket, *n*—a layer of insulating material applied over the primary insulation for the purpose of providing mechanical protection for the primary insulation. **D 1711, D09**

primary light source, *n*—surface of an object emitting light produced by a transformation of energy. **E 284, E12**

primary lining—the lining first placed inside a tunnel or shaft, usually used to support the excavation. The primary lining may be

of wood or steel sets with steel or wood lagging or rock bolts and shot-crete. (ISRM) **D 653, D18**

primary passive potential (passivation potential)—the potential corresponding to the maximum active current density (critical anodic current density) of an electrode that exhibits active-passive corrosion behavior. **G 15, G01**

primary permeability—internal permeability of intact rock; intergranular permeability (not permeability due to fracturing). **D 653, D18**

primary photovoltaic reference cell, *n*—a photovoltaic reference cell calibrated in sunlight. **E 1328, E44**

primary porosity—the porosity that developed during the final stages of sedimentation or that was present within sedimentary particles at the time of deposition. **D 653, D18**

primary prevention—abatement of accessible lead-based paint and paint residue to prevent the possibility of lead poisoning. **E 631, E06**

primary protective clothing—protective clothing designed to be worn for work activities during which significant exposure to molten substance splash, radiant heat, and flame is likely to occur. **F 1494, F23**

primary radiation—radiation coming directly from the source. **E 1316, E07**

primary reference fuel blends above 100 octane, *n*—the milliliters per U.S. gallon of tetraethyllead in *isooctane* that define octane numbers above 100 in accordance with an empirically determined relationship. **D 4175, D02**

primary reference fuel blends below 100 octane, *n*—the volume % of *isooctane* in a blend with *n*-heptane that defines the octane number of the blend, *isooctane* being assigned as 100 and *n*-heptane as 0 octane number. **D 4175, D02**

primary reference fuels, *n*—*for knock testing*, *isooctane*, *n*-heptane, volumetrically proportioned mixtures of *isooctane* with *n*-heptane, or blends of tetraethyllead in *isooctane* that define the octane number scale. **D 4175, D02**

primary reference fuels, *n*—*for octane rating*, blended fuels of reference grade *isooctane* and *n*-heptane. **D 4175, D02**

primary sampling unit, *n*—the sampling unit containing all of the sources of variability which should be considered in acceptance testing; the sampling unit taken in the first stage of selection in any procedure for sampling a lot or shipment. (See **lot sampling unit**.) **D 123, D13**

primary sampling unit, *n*—the sampling unit containing all the sources of variability which should be considered in acceptance testing; the sampling unit taken in first stage of selection in any procedure for sampling a lot or shipment. **D 4439, D35**

primary sampling unit, *psu*, *n*—the element, increment, segment or cluster selected at the first stage of the selection procedure from a population or universe. **E 1402, E11**

primary seal—a seal that in combination with the structure and optional brush coat or secondary seal forms a continuous, durable, and absolute seal in the sealing plane and requires no additional seals. **E 631, E06**

primary seal—a seal that in combination with the structure and optional brush coat or secondary seal forms a continuous, durable, and absolute seal in the sealing plane and requires no additional seals. **E 1749, E06**

primary standard, *n*—standard that is designated or widely acknowledged as having the highest metrological qualities and whose value is accepted without reference to other standards of the same quantity.

NOTE—The concept of primary standard is equally valid for base quantities and derived quantities. **D 1129, D19**

primary standard—See **standard**. **D 1356, D22**

primary standard, *n*—one whose calibration is determined by measurement according to specified parameters. **D 2946, C17**

primary standard, *n*—a physical standard calibrated by an absolute method. **E 284, E12**

primary-standard dosimeter—a dosimeter of the highest metrological quality, established and maintained as an absorbed-dose standard by a national or international standards organization.

E 170, E10

primary state of stress—the stress in a geological formation before it is disturbed by man-made works. (ISRM)

D 653, D18

primary variable, *n*—the primary characteristic or measurement of interest.

D 5681, D34

primary wound closure, *n*—wound closure for healing by first intention.

F 2312, F04

primary (X-ray)—the beam incident on the sample.

E 7, E04

primary X rays, *n*—in *spectrometry*, the emergent beam from the X-ray source.

E 135, E01

prime coat, *n*—an application of a low-viscosity bituminous material to an absorptive surface, designed to penetrate, bond, and stabilize this existing surface and to promote adhesion between it and the construction course that follows.

D 8, D04

primer—in *building construction*, a compatible coating designed to enhance adhesion.

C 717, C24

primer, *n*—the first of two or more coats of a paint, varnish, or lacquer system.

D 16, D01

primer, *n*—a coating applied to a surface, prior to the application of an adhesive, to improve the performance of the bond.

D 907, D14

primer—a thin liquid bitumen applied to a surface to improve the adhesion of heavier applications of bitumen and to absorb dust.

D 1079, D08

primer—a coating applied to a surface prior to the application of an adhesive, sealant, or paint to improve the adhesive bonding characteristics or corrosion resistance, or both, of the surface.

E 631, E06

primer—a coating applied to a surface prior to the application of an adhesive, sealant, or paint to improve the adhesive bonding characteristics or corrosion resistance, or both, of the surface.

E 1749, E06

primer—an organic solvent, which enhances adhesion, applied to plastic pipe and fittings prior to application of a solvent cement.

F 412, F17

primers, *n*—liquid coatings applied to improve the adhesion of the EIFS to the substrate or of the finish to the base coat

NOTE—Primers are sometimes applied to improve the water resistance of cementitious base coats.

E 2110, E06

priming, *v*—the initial process of evacuating air from the mechanical pump dispenser and replacing it with product so that the dispensing process may begin.

D 6655, D10

principal component analysis—a mathematical procedure for resolving sets of data into orthogonal components whose linear combinations approximate the original data to any desired degree of accuracy.

E 131, E13

principal plane—each of three mutually perpendicular planes through a point in a soil mass on which the shearing stress is zero.

intermediate principal plane—the plane normal to the direction of the intermediate principal stress.

major principal plane—the plane normal to the direction of the major principal stress.

minor principal plane—the plane normal to the direction of the minor principal stress.

D 653, D18

principal point—a point on the axis of symmetry of a lens or lens system from which any ray entering the lens or lens system will emerge in a parallel direction.

E 7, E04

principal stress—see **stress**.

D 653, D18

principal stress (normal) [FL⁻²], *n*—the maximum or minimum value of the normal stress at a point in a plane considered with respect to all possible orientations of the considered plane. On such principal planes the shear stress is zero.

E 6, E28

principal stress (strain)—the stress (strain) normal to one of three mutually perpendicular planes on which the shear stresses (strains) at a point in a body are zero. (ISRM)

D 653, D18

print, *n*—in still photography, printing, and digital imaging, an image, usually on paper, to be viewed by reflected light.

E 284, E12

printability gage, *n*—a printer's tool used to determine the amount of print gain under given printing conditions.

F 1294, F05

printability range, *n*—the range of print gain found under actual working conditions, based on press sheets selected at random during a press run.

F 1294, F05

print contrast, *n*—a differential measurement of light reflectance between image area and background area.

F 1457, F05

print contrast ratio—in *optical character recognition*, the ratio obtained by subtracting the reflectance at an inspection area from the maximum reflectance found within a specified distance from that area, and dividing the result by that maximum reflectance. See **print contrast signal**.

F 149, F05

print contrast signal—the relative value of the contrast of printing in relation to the paper background on which it is printed as defined by the following equation:

$$PCS_p = \frac{R_w - R_p}{R_w}$$

where:

R_w = maximum reflectance found within the area of interest to which the PCS of point *p* is referenced. (In measuring printed images, this area of interest should be a rectangle approximately twice the nominal character height by twice the nominal character width and centered on the character being measured), and

R_p = reflectance from a small measurement area centered on point *p*.

The reflectance R_w and R_p are measured within a circular area of 0.008 in. (0.2 mm) in diameter.

F 149, F05

print contrast signal (PCS), *n*—a comparison between the reflectance of printed bars and intervening spaces. PCS, under a given set of illumination conditions, is defined by the following equation:

$$PCS = \frac{R_s - R_b}{R_s}$$

where:

R_s = Space reflectance, and

R_b = Bar reflectance.

F 1294, F05

printed circuit board—see **printed wiring board and PWB**.

F 1457, F05

printed sheet vinyl flooring, *n*—a floor surfacing material which has a printed pattern and is protected with a wearlayer of transparent or translucent vinyl plastic. The wearlayer may also include a specialty performance top coating.

F 141, F06

printed wiring board, *n*—a circuit board on which the conductors have been set by a print-like process. (See **PWB**.)

F 1457, F05

printer—an output unit that produces durable hard-copy record of data in the form of a sequence of discrete graphic characters belonging to a predetermined character set.

F 909, F05

printer emulation module, *n*—a device used to simulate the presence of a printer in a system. (See **PEM**.)

F 1457, F05

printer output area, *n*—the maximum area on the page to which the printer will print.

F 1457, F05

printer ready—see **data terminal ready**.

F 1457, F05

print gain, *n*—gain in bar width of the printed bar code symbol, compared to the original precision film master; caused in the plate-making process by ink spread during printing.

F 1294, F05

printing—the act of producing an image on a document or other receptor media from a machine or printer designed for that purpose, such as a printing press, thermal printer, or a computer printer, such as a laser or ink jet.

F 335, F05

printing—the act of producing an image on a document or other receptor media from a machine or printer designed for that

printing

- purpose, such as a printing press, thermal printer, or a computer printer such as a laser or ink jet. **F 909, F05**
- printing ink, n**—a colored or pigmented liquid or paste composition that dries to a solid film after application as a thin layer by printing machinery. **D 16, D01**
- printing module, n**—those components in the laser printer that together drive the laser scanner, create the image on the page, and deliver the page to the stacker. **F 1457, F05**
- printout**—information printed on paper. **F 1457, F05**
- printout queuing, n**—a feature which allows a number of documents to be lined up or queued in memory for subsequent printout while other documents are being processed or printed, or both. **F 1457, F05**
- print quality**—the interrelationship of printed material and imprinted material that affects the optimum performance of the scanner. Refer to OCR Print Quality Guideline, ANSI X3.99-83. **F 149, F05**
- print quality, n**—as described in ANSI X3.182, the grade of a printed bar code symbol as rated by measurements and calculations of various parameters. **F 1294, F05**
- print resistance, n (coatings)**—the ability of a coating to resist taking on the imprint due to the pressure of another surface placed against it. **D 16, D01**
- print speed rating, n**—highest speed of image development under fixed operating conditions to obtain optimum print quality. **F 1623, F05**
- print speed response, n**—the response curve of optical density versus print speed with a fixed energy level input. **F 1623, F05**
- print void, n**—a defective spot of unprinted matter in a print solid or halftone that can be caused by a buildup of foreign matter on the plate or blanket. **D 6488, D01**
- prism illuminator**—a 45 to 90° prism interposed in a microscope for the purpose of directing an intense oblique beam of light to the object. The prism illuminator utilizes only one half the aperture of the microscope as does the mirror illuminator with an attending loss of resolution over that obtainable with either a plane glass illuminator or a pellicle mirror. **E 7, E04**
- private label distributor**—distributor who, by prearrangement with a manufacturer, markets fasteners identified with the distributor's unique identification marking and who assumes responsibility for the fasteners. **F 1789, F16**
- probabilistic design**—design that accounts for the uncertainties due to statistical variabilities in physical and mechanical properties of the materials, elements, or structures, and in the applied loads (compare **deterministic design**). **E 631, E06**
- probability function, n**—of a discrete variate, the mathematical expression which gives the probability that a variate will take a particular value. **D 123, D13**
- probability function, n**—of a continuous variate, the mathematical expression whose definite integral gives the probability that a variate will take a value within the two limits of integration. **D 123, D13**
- probability level, n**—a general term that reflects the stated proportion of times an event is likely to occur. (Compare to *confidence level* and *significance level*.) **D 123, D13**
- probability of failure**—the probability that a glass specimen will fail when tested at a given load. General industry practice is to express the probability of failure as lights per 1000 lights. **E 631, E06**
- probability sample, n**—a sample of which the sampling units have been selected by a chance process such that, at each step of selection, a specified probability of selection can be attached to each member available for selection. **D 121, D05**
- probability sample, n**—a sample of which the sampling units have been selected by a chance process. At each step of selection, a specified probability of selection can be attached to each sampling unit available for selection. **E 456, E11**
- probability sample, n**—a sample of which the sampling units have been selected by a chance process such that, at each step of selection, a specified probability of selection can be attached to each sampling unit available for selection.

NOTE—These probabilities of selection need not be equal. If equal, see simple random sample. See the general term—sample. Also, see Practice E 105 in this volume. **E 456, E11**

- probability sample, n**—a sample of which the sampling units have been selected by a chance process such that, at each step of selection, a specified probability of selection can be attached to each sampling unit available for selection. **E 1402, E11**
- probable**—the evidence contained in the handwriting points rather strongly toward the questioned and known writings having been written by the same individual; however, it falls short of the “virtually certain” degree of confidence.
- Examples*—It has been concluded that the John Doe of the known material probably wrote the questioned material, or it is my opinion (or conclusion or determination) that the John Doe of the known material *probably* wrote the questioned material. **E 1658, E30**
- probably did not**—the evidence points rather strongly against the questioned and known writings having been written by the same individual, but, as in the probable range above, the evidence is not quite up to the “virtually certain” range.
- Examples*—It has been concluded that the John Doe of the known material probably did not write the questioned material, or it is my opinion (or conclusion or determination) that the John Doe of the known material probably did not write the questioned material. **E 1658, E30**
- probe, n**—a tube used for sampling or for measuring pressures at a distance from the actual collection or measuring apparatus. **D 1356, D22**
- probe, n**—an assembly, including the transducer, that is used to position the transducer in the specific location at which the temperature is to be determined. **E 344, E20**
- probe, n**—part of an *IR thermometer* that channels net *infrared* radiation between the *subject* and the *sensor* and is intended to be positioned near or inside the *subject*. **E 344, E20**
- probe**—in leak testing, a tube having an opening at one end, used for directing or collecting a stream of tracer gas. **E 1316, E07**
- probe*—see **search unit**. **E 1316, E07**
- probe coil**—in electromagnetic testing, a small coil or coil assembly that is placed on or near the surface of test objects. **E 1316, E07**
- probe coil clearance**—the perpendicular distance between adjacent surfaces of the probe and test part; also lift-off. **E 1316, E07**
- probe cover, n**—disposable or reusable sanitary barrier enveloping that part of the *probe* which otherwise would come in contact with a *subject*. **E 344, E20**
- probe cover and sheath, n**—a device provided for the purpose of preventing biological contact between the patient and the probe or thermometer. **E 344, E20**
- probe cover and sheath, n**—a device provided for the purpose of preventing biological contact between the patient and probe (see Specification E 1104). **E 344, E20**
- probe covers and sheaths, n**—devices provided for the purpose of preventing biological contact between the patient and the probe or clinical thermometer. **E 344, E20**
- probe gas**—in leak testing, a tracer gas which issues from an orifice so as to impinge on a restricted test area. **E 1316, E07**
- probe ion**—an ionic species intentionally produced by an ion source and directed onto the specimen surface at a known incident angle with a known energy. **E 673, E42**
- probe test**—a leak test in which the tracer gas is applied by means of a probe so that the area covered by the tracer gas is localized. This enables the individual leaks to be located. **E 1316, E07**
- procedure, n**—specified way to carry out an activity or process. **E 1605, E06**
- procedure, n**—specified way to perform an activity. **E 1732, E30**
- procedure, n**—a documented description of the operations to be performed, the precautions to be taken, and the measures to be applied directly or indirectly related to the manufacture of an

intermediate, API, or drug product.

E 2363, E55

process:

dry process (dry mix)—the method of preparation of a ceramic body wherein the constituents are blended dry, following which liquid may be added as required for subsequent processing.

wet process (slip process)—the method of preparation of a ceramic body wherein the constituents are blended in sufficient liquid to produce a fluid suspension for use as such or for subsequent processing. C 242, C21

process—a defined event or sequence of events in plating or coating that may include pretreatments and posttreatments. F 2078, F07

processability, *n*—the relative ease with which raw or compounded rubber can be handled in rubber machinery. D 1566, D11

process aids, *n*—materials, excluding solvents, used as an aid in the manufacture of an intermediate or API that do not themselves participate in a chemical or biological reaction (for example, filter aid, activated carbon).

E 2363, E55

process analytical technology (PAT), *n*—system for designing, analyzing, and controlling manufacturing through timely measurements of critical quality and performance attributes of raw and in-process materials and processes with the goal of ensuring final product quality.

E 2363, E55

process anneal—a heat treatment used to soften metal for further cold working; in ferrous sheet and wire industries, heating to a temperature close to but below the lower limit of the transformation range and subsequently cooling for working; in the nonferrous industries, heating above the recrystallization temperatures at a time and temperature sufficient to permit the desired subsequent cold working. E 7, E04

process annealing, *n*—in the sheet and wire industries, heating a steel object to a temperature close to, but below, A_{c1} and then cooling it, in order to soften it for further cold working. A 941, A01

process annealing—sometimes called subcritical annealing or stress relieving, performed at temperatures just below the lower critical temperature. Process annealing neither refines grains nor redissolves cementite, but does improve the ductility and decreases residual stress in work-hardened steel. F 1789, F16

process average, *n*—for the items produced, the true and unknown level of (1) the fraction of nonconforming items or (2) a characteristic of the items as determined by a specific test method.

D 123, D13

process capability index, C_p , *n*—an index describing process capability in relation to specified tolerance. E 456, E11

process capability, **PC**, *n*—statistical estimate of the outcome of a characteristic from a process that has been demonstrated to be in a state of statistical control. E 456, E11

process control, *n*—checks performed during manufacturing to measure critical attributes and, if appropriate, adjust the process to deliver the desired output(s).

E 2363, E55

process control radiograph—a radiograph which images a beam purity indicator and sensitivity indicator under identical exposure and processing procedures as the test object radiograph. A process control radiograph may be used to determine image quality parameters in circumstances of large or unusual test object geometry. E 1316, E07

processed biologics, *n*—cells, tissues, or organs that have undergone manipulation for use in the manufacture of TEMPs; processing here extends beyond the minimal manipulation or processing as it is applied in the field of structural, reproductive and metabolic tissue transplantation. A processed biologic may be used as a component of a TEMP. F 2312, F04

processed tire, *n*—a scrap tire that has been altered, converted, or size reduced. D 5681, D34

process fishscaling—fishscaling that appears during the drying or firing cycle of cover coat application. C 286, B08

process flow—current or anticipated sequential process steps required to produce a fastener. F 1789, F16

processing—the work involved in transforming quarry blocks into dimension stone, including sawing, drilling, grinding, honing, polishing, carving, and all other operations necessary for installation. C 119, C18

processing, *vt*—any activity performed on cells, tissues, and organs other than recovery, such as preparation and preservation for storage and packaging. F 2312, F04

processing aid, *n*—a compounding material that improves processability of a polymeric compound by reducing nerve, providing better dispersion of dry material, increasing the extension rate, reducing power consumption during mixing, producing smoother surfaces on calendered and extruded products, and improving knitting to name a few examples. D 1566, D11

processing capacity—the number of hits that can be processed at the processing speed before the system must interrupt data collection to clear buffers or otherwise prepare for accepting additional data. E 1316, E07

processing documentation metadata, *n*—information that describes the processes applied to data from original source data through to storage in an ADMS. E 867, E17

processing materials, *n*—any item or material that is not a component of the TEMP and is in contact with the cells, tissues, and organs during processing. F 2312, F04

processing speed—the sustained rate (hits/s), as a function of the parameter set and number of active channels, at which AE signals can be continuously processed by a system without interruption for data transport. E 1316, E07

process oil, *n*—a hydrocarbon oil derived from petroleum or other sources, used as an extender or process aid. D 1566, D11

processor, *n*—applies to garment maintenance, the party performing the care and maintenance operation. F 1494, F23

process parameter, *n*—an attribute of the manufacturing system. E 2363, E55

process parameters—combination of conditions originating from people, measurement, materials, method, and environment that contribute to a given output. F 1789, F16

process performance index, P_p , *n*—index describing process performance in relation to specified tolerance. E 456, E11

process performance, **PP**, *n*—statistical measure of the outcome of a characteristic from a process that may not have been demonstrated to be in a state of statistical control. E 456, E11

process waste—inorganic by-product materials such as mine tailings, culm piles, coal processing conversion and combustion wastes, cement and limekiln dust, by-product gypsum, and chemically treated compositions made from these wastes or waste mixtures. D 5681, D34

Proctor compaction curve—see **compaction curve**. D 653, D18

Proctor penetration curve—see **penetration resistance curve**. D 653, D18

Proctor penetration resistance—see **penetration resistance**. D 653, D18

prods—hand-held electrodes. E 1316, E07

producer, *n*—primary manufacturer of the material. B 881, B07

producer, *n*—the primary manufacturer of the material. B 899, B02

producer's risk, *n*—the probability of rejecting a lot when the process average is at the acceptable quality level or AQL. D 123, D13

product, *n*—the upholstered furniture for which information is required. E 176, E05

product, *n*—material, composite or assembly about which information is required. E 176, E05

product, *n*—mattress, or mattress with foundation, for which fire-test-response characteristics are to be measured. E 176, E05

product, n

product, n—material, component, or complete end-use product, in use in fixed guideway transportation vehicles. **E 176, E05**

product, n—any object possessing intrinsic value, capable of delivery either as an assembled whole or as a component part or parts, and produced for introduction into trade or commerce. **E 2201, E50**

product analysis, n—a chemical analysis of the semifinished or finished steel. **A 902, A05**

product analysis, n—a chemical analysis of a specimen taken from the semi-finished product or the finished product. **A 941, A01**

product analysis—chemical analysis performed on the finished fastener to verify that the chemical composition is within specified limits. **F 1789, F16**

product channel spacer (permeate carrier)—the fabric or other material through which permeate water flows after it passes through the flat sheet membrane. **D 6161, D19**

product deterioration—chemical reaction or physical change within or between components considered compatible in the original formulation, that may be due to time or temperature of storage, or other factors. **D 3064, D10**

product formulation—the specific formulation of the completed product, including propellant(s), usually expressed as mass per mass percent. **D 3064, D10**

production capacity—maximum rate (lb/h) at which the equipment can bring the specified food product to a specified “cooked” condition in accordance with the cooking energy efficiency test (see **cooking energy efficiency**), *PC*.

$$PC = \frac{W \times 60}{t}$$

where:

PC = production capacity of the equipment, lb/h (kg/h),

W = total weight of food cooked during cooking test, lb (kg), and

t = total time of cooking test, min.

F 1827, F26

production cycle—the series of operations required to process through the facility a quantity of feedstock mixed with water having a volume equal to the typical volume of the fermentation system and return the facility to the configuration at the start of the cycle. The quantity of water mixed with the feedstock shall be as per specification for normal operation. This volume is equal to the sum of the working volumes of all fermenters in a batch fermentation process. This volume is equal to the sum of the working volumes of each stage of fermentation in a continuous fermentation process. **E 1705, E48**

production lot, n—that part of one manufacturer’s production made from the same nominal raw material under essentially the same conditions and designed to meet the same specifications.

D 123, D13

production plan—complete written plan of fastener and process characteristics, process controls, tests, and acceptance procedures that will occur during full production. **F 1789, F16**

production rate—rate (lb/h) at which the equipment brings the specified food product to a specified “cooked” condition, *PR*.

F 1827, F26

production run—the quantity of BMLs (produced at one time and from the same material lot) that travel together continuously through the same processing steps, that is, assembly, size reduction, annealing, etc. **E 344, E20**

production unit—as referred to in this practice, is a quantity of geotextile agreed upon by the purchaser and seller for the purpose of sampling. **D 4439, D35**

productivity—flow rate of product water. **D 6161, D19**

product staging—a process in which the permeate from one membrane module is used as the feed to another membrane module in order to further improve product quality. **D 6161, D19**

product standard, n—material having a color designated as standard for a specified product. **E 284, E12**

product tube—the tube at the center of the spiral wound cartridge which collects permeate water. **D 6161, D19**

product water—purified water produced by a process. See **permeate**. **D 6161, D19**

proeutectoid carbide—primary crystals of cementite formed directly from the decomposition of austenite exclusive of that cementite which results from the eutectoid reaction. **E 7, E04**

proeutectoid ferrite—primary crystals of ferrite formed directly from the decomposition of austenite exclusive of that ferrite which results from the eutectoid reaction. **E 7, E04**

professional care, n—for consumer textile products, cleaning and maintenance procedures requiring the services of a person specially trained and skilled in their use. **D 123, D13**

professional care, n—for textile products, cleaning and maintenance procedures requiring the services of a person specially trained or skilled in their use. **D 3136, D13**

professional judgement, n—the process of formulating a decision based on evaluating data, information, observations, or a combination of the three, using the professional’s training and experience, and made in light of common industry practice. **E 1605, E06**

professional use, n—intended or implied use of an instrument by individuals that are licensed or certified for collecting information for medical diagnosing purposes. **E 344, E20**

proficiency testing—determination of laboratory testing performance by means of interlaboratory test comparisons, (ISO Guide 2).

E 1187, E36

proficiency testing, n—determination of laboratory testing performance by means of interlaboratory test comparisons. **E 1732, E30**

profile, n—wrought product that is long in relation to its cross sectional dimensions which is of a form other than that of sheet, plate, foil, rod, bar, tube, or wire.

extruded profile, n—profile produced by hot extruding.

structural profile, n—profile, rolled or extruded, commonly used for structural purposes such as angles, channels, H-beams, I-beams, tees, and zeos. **B 881, B07**

profile, n—the contour of the top surface of the tile when viewed from the nose end. **C 43, C15**

profile—see **soil profile**. **D 653, D18**

profile, vt—in atomic emission spectrometry, to scan and set the deflection of the grating, or actual or apparent position of the entrance slit, or actual or apparent location of the exit slits, to produce optimum measurement of intensity. **E 135, E01**

profile depth, n—the difference between the amplitude measurements pavement macrotexture profile and a horizontal line through the top of the highest peak within a given baselength. **E 867, E17**

profile, longitudinal—see **longitudinal profile**. **E 867, E17**

profile record, n—a data record of the surface elevation, slope or acceleration, of arbitrary length. **E 867, E17**

profile segment, n—that part of a profile record for which the profile index will be calculated. **E 867, E17**

profile, transverse—see **transverse profile**. **E 867, E17**

profilometer, n—equipment used to measure profile of traveled surface roughness. **E 867, E17**

program—See facility program. **E 631, E06**

program, n—See facility program. **E 833, E06**

program, n—a documented policy with procedures for selection and use of CPC. **F 1494, F23**

program administrator, n—a person responsible for the formulation and implementation of a CPC program. **F 1494, F23**

program attention, n—an application-dependent signal sent by the operator to the cluster controller from the printer to signify that a task was performed. **F 1457, F05**

program authority, n—a person responsible for enforcing the requirements of a CPC program. **F 1494, F23**

program controller—a device which can automatically execute a pre-determined schedule of control. **E 7, E04**

programmable read only memory, n—an information storage area

that can be recorded on and read by an operator, but modified only through special physical processes. (See **PROM**.) F 1457, F05

programmed temperature gas chromatography, PTGC—utilized changes in column temperature with time. D 2864, D27

progressive aging, *n*—aging by increasing the temperature in steps, or continuously, during the aging cycle. A 941, A01

progressive failure—failure in which the ultimate shearing resistance is progressively mobilized along the failure surface. D 653, D18

progressive failure—formation and development of localized fractures which, after additional stress increase, eventually form a continuous rupture surface and thus lead to failure after steady deterioration of the rock. (ISRM) D 653, D18

project brief—See **facility program**. E 1480, E06

project brief, *n* (exposéé projet)—document describing the required **facility serviceability** in detail sufficient for the project to proceed. E 631, E06

projected length, L_p —length of the projection of the ski, measured between the ski tip and the ski tail parallel to the ski body pressed against a plane surface. F 472, F27

projected length, L_p —the length of the projection of the snowboard, measured between the snowboard tip and the snowboard tail with the snowboard unweighted on a plane surface (unweighted meaning solely under the influence of its own weight). F 1107, F27

projected treadlife [L], *n*—the test distance that gives h as the average tread depth; where h is the height of treadwear indicator above groove (or void) base. F 538, F09

projection—a calculation, usually performed by a software package, which predicts the performance of parts or all of a water plant. D 6161, D19

projection, *n*—a pavement contacting area of the tread band, bounded by void. F 538, F09

projection distance—distance from the eyepiece to the image screen. E 7, E04

projection head—flange or collar spaced at short distance from end of wire, with wire projecting from upper side of flange or collar forming part of head and wire projecting from other side of flange or collar forming the shank. (See **gudgeon**.) F 547, F16

projection lens—the final lens in the electron microscope corresponding to an ocular or projector in a compound light microscope. This lens forms a real image on the viewing screen or photographic film. E 7, E04

project level analysis, *n*—evaluation of a pavement section to select the type and timing of rehabilitation or maintenance corrective actions. E 867, E17

project life, *n*—the time period over which the economic viability of a geothermal facility is evaluated. E 957, E44

project (projet)—resources and activities used to achieve a specific set of objectives within a specified time schedule.
project brief—See **facility program**.
project record—use **as-built**, the preferred term.
protection—See **preservation**. E 631, E06

project (projet)—resources and activities used to achieve a specific set of objectives within a specified time schedule. E 1480, E06

PROM—programmable read only memory. F 1457, F05

promoter, *n*—a material that provides thermal energy which is used to increase the temperature to start combustion of the material being tested. G 126, G04

proof—See **rod proof**. C 162, C14

proof, *n*—*in fire assay*, a synthetic verifier having a precious metal content similar to that expected in the test sample. E 135, E01

proof—measurement term of concentration of ethanol in water solutions. E 1705, E48

proof correction, *n*—*in fire assay*, the adjustment to the final assay obtained by analyzing the proof concurrently with the test sample. E 135, E01

proofing, *n*—process of coating a fabric with raw or compounded rubber to impede penetration by a liquid, usually water. D 1566, D11

proofing (the act of), *n*—process of coating a fabric with rubber. D 1566, D11

proof load—a magnitude of uniform load at which glass specimens shall be tested. E 631, E06

proof load, externally threaded fastener—tension applied load that the fastener must support without evidence of permanent deformation (for most carbon or alloy steel fastener strength grades or property classes, proof loads are established at approximately 90 % to 93 % of the expected minimum yield strength). F 1789, F16

proof load factor, *a*—the constant which, when multiplied by the equivalent design load, determines the proof load. E 631, E06

proof-test current—the current measured during ac proof tests.

NOTE—This current is an indication of the validity of the dielectric constant of the type of material used and the thickness of the total contact area under test. F 819, F18

propagance, *n*—ratio of propagated flux to incident flux; a general term that includes the results of reflection, transmission, and similar effects that modify the flux in a beam. E 284, E12

propagation of flame, *n*—the upward and outward movement of the flame front from the ignition source to the vessel walls, that is determined by visual observation. E 1445, E27

propagation of flames, *n*—a combustion reaction that produces at least a 7 % rise of the initial absolute pressure.

$$\frac{P_2}{P_1} \geq 1.07.$$

E 1445, E27

propellant—liquefied gas with a vapor pressure greater than atmospheric pressure (14.7 psia (101 kPa)) at 105°F (40.6°C). D 3064, D10

propellant—an inert ingredient in pressurized products that provides the force necessary to dispense the formulation from its container. E 609, E35

propene concentrate, *n*—*in liquefied natural gas technology*, concentrate containing more than 50 % propene. (Synonym—*propylene*.) D 4175, D02

property—the real DoD property subject to classification under the classification of environmental condition of property area types. D 5681, D34

property—the real property that is the subject of the EBS described in this practice as well as the real property adjacent to the subject property (which may be privately owned). Real property includes buildings and other fixtures and improvements located on the property and affixed to the land. D 5681, D34

property—something or a number of things in which one has the rights and interests subject to ownership. It includes both tangible property and intangible property. E 2135, E53

property class—system of strength classifications used for bolts, nuts, and screws manufactured to metric standards. F 1789, F16

property class symbols—metric series standardized symbols denoting the combination of the fastener's base material, its strength properties, its performance capabilities, and the engineering standard against which it was produced. F 1789, F16

property control function—a business unit within an organization that is responsible for defining, implementing, and maintaining an infrastructure and related processes that ensure the adequate control, protection, preservation, and maintenance of the organization's property. E 2135, E53

property control system—an entity's international management program for protecting, preserving, accounting for, and controlling property from acquisition through disposition, including both application and compliance. E 2135, E53

property custodian—an individual or organization accountable for property. E 2135, E53

property management—a monitoring and control function, charged with assuring that organizational processes related to the lifecycle management of property support organization objectives, represent

property management

sound business practice, and are compliant with applicable standards, policies, regulations, and contractual requirements.

E 2135, E53

property management system—a subset of existing organizational processes related to the lifecycle management of property. These processes represent sound practice and are compliant with applicable standards, policies, regulations, and contractual requirements.

E 2135, E53

property manager—the individual designated by the organization to provide leadership to the organization in the management and use of assets.

E 2135, E53

property owner—person, firm, corporation, guardian, conservator, receiver, trustee, executor, or other judicial officer who, alone or jointly or severally with others, owns, holds, or controls the whole or any part of the freehold or leasehold title to any property, with or without accompanying actual possession of it, and shall include in addition to the holder of legal title, any vendee in possession of it, but may not include a mortgagee or an owner of a reversionary interest under a ground rent lease.

E 631, E06

property records—information retained for use in managing property.

E 2135, E53

property responsibility—obligations of a person or entity for actions related to property such as maintenance, control, and record-keeping. More general than accountability.

E 2135, E53

property system function—a major portion of a property control system. Examples include property management, acquisition, receiving, identification, records, movement, storage, physical inventories, reports, consumption, utilization, maintenance, subcontractor or alternate location control, and disposition.

E 2135, E53

property system functional segment—a portion of a property system function of property control that may be separately identified and contains similar properties, procedures, and conditions of control that can be isolated for purpose of analysis.

E 2135, E53

property tax files—the files kept for property tax purposes by the local jurisdiction where the property is located and includes records of past ownership, appraisals, maps, sketches, photos, or other information that is reasonably ascertainable and pertaining to the property.

D 5681, D34

proportional limit, *n*—the maximum stress that a material is capable of sustaining without significant deviation from proportionality of stress to strain.

D 907, D14

proportional limit, *n*—the greatest stress which a material is capable of sustaining without any deviation from proportionality of stress to strain (Hooke's law).

D 4439, D35

proportional limit—greatest stress that the material is capable of sustaining without a deviation from the law of proportionality of stress to strain (Hooke's Law). In many cases, the elastic limit is so close to the proportional limit that no distinction is made.

F 1789, F16

proportional limit [FL⁻²], *n*—the greatest stress which a material is capable of sustaining without any deviation from proportionality of stress to strain (Hooke's law).

E 6, E28

proportional limit stress, *n*—the greatest stress that a material is capable of sustaining without any deviation from proportionality of uniaxial stress to strain (uniaxial Hooke's law).

C 1145, C28

proportional sampling, *n*—a method of selection such that the proportion of the sampling units (usually, psu's) selected for the sample from each stratum is the same (except for possible rounding effects).

E 1402, E11

proportional spacing—a system of printing where the character spacing is set in accordance with the character width; this is in contrast to a fixed number of characters per inch such as 10 pitch (10 characters/inch), 12 pitch (12 characters/inch), 15 pitch (15 characters/inch), etc.

F 1457, F05

proportional spacing, *n*—a system of printing wherein the character spacing is set in accordance with the character width. (See **fixed pitch**.)

F 1457, F05

proportioning probe—in leak testing, a probe that can vary sample

to pure air ratios between 100 % sample and 100 % pure air without substantially changing the total flow from the probe.

E 1316, E07

proportioning pump—see **metering pump**.

D 653, D18

proprietary—made and marketed by one having the exclusive right to manufacture and sell; privately owned and managed.

D 653, D18

propylene concentrate—concentrate containing more than 90 % propylene.

D 4175, D02

propylene concentrate, *n*—hydrocarbon product containing more than 50 % propylene.

D 4175, D02

propylene glycol ether of methylcellulose—see (2-hydroxypropyl)methylcellulose.

D 1695, D01

propylene plastic, *n*—a plastic based on polymers of propylene or copolymers of propylene with other monomers, the propylene being in the greatest amount by mass.

F 1251, F04

propylene plastics, *n*—plastics based on polymers of propylene or copolymers of propylene with other monomers, the propylene being in the greatest amount by mass. (ISO)

D 883, D20

propylene plastics, *n*—plastics based on polymers of propylene or copolymers of propylene with other monomers, the propylene being in the greatest amount by mass. (ISO, D20)

F 412, F17

protected water boom—boom intended for use in protected waters with moderate environmental conditions (see Practice F 625 for environmental descriptors).

F 818, F20

protecting tube, *n*—a tube designed to enclose a temperature-sensing device and protect it from the deleterious effects of the environment.

E 344, E20

protection anchors, *n*—anchors used to secure a climbing rope while leading a climb or to lower off one.

F 1773, F08

protection board—See **protection course**.

C 717, C24

protection course—semi-rigid sheet material placed on top of the waterproofing membrane to protect it against damage during subsequent construction and to provide a protective barrier against compressive and shearing forces induced by materials placed above it.

C 717, C24

protection potential—the most noble potential where pitting and crevice corrosion will not propagate.

G 15, G01

protection tube—a tube made of a specially selected material which can be used to protect a thermocouple from adverse effects of the environment.

E 7, E04

protective atmosphere—(1) a gas envelope surrounding the part to be brazed, welded, or thermal sprayed, with the gas composition controlled with respect to chemical composition, dew point, pressure, flow rate; (2) the atmosphere in a heat treating or sintering furnace formulated to protect the parts or compacts from oxidation, nitridation, or other contamination from the environment.

B 374, B08

protective clothing, *n*—an item of clothing that is specifically designed and constructed for the intended purpose of isolating all or part of the body from a potential hazard; or, isolating the external environment from contamination by the wearer of the clothing.

F 1494, F23

protective clothing material, *n*—any element, constituent, or substance from which protective clothing is composed or can be made.

F 1494, F23

protective filter—see **filter**.

D 653, D18

protein—general term used to cover single cell microorganisms, extract of the microorganisms, (bacteria or fungi or algae) that is used for food or feed to animals and humans.

E 1705, E48

protocol, *n*—a formal set of conventions governing a communication process.

F 1457, F05

prototype plan—written description of the dimensional, mechanical, chemical, and performance tests that will be used to facilitate the building of a prototype.

F 1789, F16

protrusion, *n*—*infabrics*, a general term for a visible group of fibers, a yarn, or a yarn segment that extends above the fabric surface.

D 123, D13

protrusion, *n*—*infabrics*, a general term for a visible group of fibers, a yarn, or a yarn segment that extends above the fabric surface.

D 4850, D13

provider, *n*—the individual or organization providing specific dwelling designs, materials, products, components, subsystems, or buildings for acceptance by the specifier.

E 2151, E06

proximal—nearest to the body, or center, or some other point considered as the center of a system.

F 869, F08

proximal end—that portion of the instrument that is closest to the surgeon when in use.

F 921, F04

proximal end—that portion of the instrument that is closest to the surgeon when in use.

F 1078, F04

proximate analysis, *n*—*in the case of coal and coke*, the determination, by prescribed methods, of moisture, volatile matter, fixed carbon (by difference), and ash.

D 121, D05

proximate analysis, *n*—the determination, by prescribed methods, of moisture, volatile matter, fixed carbon (by difference), and ash.

D 5681, D34

proximate analysis—the determination, by prescribed methods, of moisture, volatile matter, fixed carbon (by difference), and ash. Unless otherwise specified, the term proximate analysis does not include determinations of chemical elements or any determinations other than those named.

E 856, D34

proximate analysis—the determination, by prescribed methods, of moisture, volatile matter, fixed carbon (by difference), and ash. The term **proximate analysis** does not include determinations of chemical elements or determinations other than those named.

E 1705, E48

proximate analysis—an assay of the moisture, ash, volatile matter, and fixed carbon as determined by prescribed test methods. Other constituents such as sulfur and phosphorus are not included.

E 1705, E48

PRT design, *n*—a generic term used to differentiate between different PRT construction details, such as element and connecting wire construction, insulation methods, sealing techniques, and mounting methods (for example, spring loaded or direct mounting).

E 344, E20

pseudobinary—a term of indefinite meaning, sometimes used synonymously with “quasibinary,” sometimes used to designate an “isopleth.”

E 7, E04

pseudoelasticity, *n*—See **superelasticity**.

F 2005, F04

pseudoglow discharge, *n*—a type of partial discharge characterized by pulses of relatively small amplitude, and generally, a long rise time.

D 1711, D09

pseudomonotropy—an irreversible solid state transformation which occurs below the melting points of both the stable and metastable solid states.

E 7, E04

pseudoreplica—See **replica**.

E 7, E04

PSSI—*in viscometry*, abbreviation for permanent shear stability index.

D 4175, D02

psychology, *n*—the science dealing with the mind and with the mental and emotional processes.

E 2035, E52

psychometrics, *n*—application of measurement principles to psychological phenomena.

E 253, E18

psychophysical color, *n*—characteristics of a color stimulus (that is, light producing a visible sensation that is a function of its wave length) denoted by three dimension values such as three tristimulus values.

D 2946, C17

psychophysical methods, *n*—procedures for establishing relationships between measurable physical stimuli and resulting sensory responses. Some examples of these methods are the method of limits, method of constant stimuli, and the method of adjustment.

E 253, E18

psychophysical power law, *n*—a power function describing the relationship between physical amounts of stimuli and their respective perceived intensities. The mathematical relationship is:

$$R = kS^n$$

where:

R = perceived intensity of a given stimulus,

S = physical amount of that stimulus,

k = constant reflecting the unit of measurement, and

n = exponent that is an empirical constant characteristic of the given sensory system.

E 253, E18

psychophysics, *n*—the study of the functions relating the physical measurements of stimuli and the sensations and perceptions the stimuli evoke.

E 284, E12

psychophysiological detection of deception (PDD), *n*—the academic discipline that provides the student, the practitioner, and the researcher with the theoretical and applied psychological, physiological, and psychophysiological fundamentals for a thorough understanding of PDD tests and the skills and qualifications for conducting PDD examinations (see **polygraphy**).

E 2035, E52

psychophysiological veracity (PV) examination, *n*—see definition of PDD

E 2035, E52

psychophysiology, *n*—the study of interactions between mental and physiological processes.

E 2035, E52

psychrometer, *n*—a variety of hygrometer comprising a dry bulb temperature indicator and a wet bulb temperature indicator which is cooled to the wet bulb temperature by the spontaneous evaporation of moisture.

D 123, D13

psychrometer, *n*—a variety of hygrometer comprising a dry bulb thermometer and a wet bulb thermometer, which, when suitably aspirated, indicates the thermodynamic wet- and dry bulb temperature of the gas.

aspirated psychrometer, *n*—an hygrometer comprising wet- and dry-bulb thermometers that are mounted in a housing to which is attached a motor-driven fan or blower that draws air over the thermometer bulbs at a rate which produces the minimum wet-bulb reading.

sling (whirling) psychrometer, *n*—an hygrometer comprising wet- and dry-bulb thermometers that are mounted on a frame that can be rotated or whirled.

D 1356, D22

psychrometer, *n*—a variety of hygrometer comprising a dry bulb temperature indicator and a wet bulb temperature indicator which is cooled to the wet bulb temperature by the spontaneous evaporation of moisture.

D4920, D13

P-T diagram—a two-dimensional, graphical representation of phase relationships in a system of any order, by means of the pressure and temperature variables.

E 7, E04

PTFE tape—joint sealing tape composed of polytetrafluoroethylene.

D 653, D18

P_{th} —threshold load in which P_i is invariant with respect to loading rate; P_{th} is the basis for calculating the threshold stress or the threshold stress intensity

F 2078, F07

P-T-X diagram—a three-dimensional, graphical representation of the phase relationships in a binary system, by means of the pressure, temperature and concentration variables.

E 7, E04

P_u —highest load level held long enough to record gage measurements, in newtons (pound-force).

E 631, E06

public housing agency (PHA)—any state, county, municipality, or other government entity or public body (or agency or instrumentality thereof) that is authorized to engage or assist in the development or operation of housing for low-income families.

E 631, E06

puckering, *n*—*inbonded, fused, or laminated fabrics*, a wavy, three-dimensional effect typified by closely spaced wrinkles, on either the face fabric or the backing fabric, or both.

D 123, D13

puddling—soil consolidation by agitating by means of poles, a mixture of soil and sufficient water to leave a puddle on the surface.

C 896, C04

pull—the quantity of glass delivered by a melting furnace in a given time, usually 24 h.

C 162, C14

pull, *n*—a group of fibers grasped by the forceps at one time and drawn from the specimen in the combs.

D 123, D13

pull, n

pull, n—*in zippers*, a part connected to a zipper slider by which the slider is operated. **D 123, D13**

pull, n—a part connected to a zipper slider by which the slider is operated. **D 2050, D13**

pull, n—a group of fibers grasped by the forceps at one time and drawn from the specimen in the combs. **D 7139, D13**

pulled-surface, n—as applied to a defect in a laminated plastic imperfections in the surface ranging from a slight breaking or lifting in spots to pronounced separation of its surface from its body. **D 883, D20**

pulled wool, n—wool taken from the pelt of a slaughtered sheep and which has not been commercially scoured. **D 123, D13**

pulled wool, n—wool taken from the pelt of a slaughtered sheep and which has not been commercially scoured. Syn. *slipe wool* and *skin wool*. **D 4845, D13**

pulley, n—a device containing a grooved wheel over which a rope runs to reduce friction and change the angle of pull. **F 1773, F08**

pull-in—See **jerk-in**. **D 3990, D13**

pulling over—operation in which upper of a shoe is pulled over the last. **F 869, F08**

pull-out, n—void existing on the plane of polish of a metallographic specimen caused by the dislodging of a particle or constituent during the grinding or polishing operation. **E 7, E04**

pull post—a terminal post used in a line of fence to brace a long stretch or to effect a change in elevation along the fence line. **F 552, F14**

pull-through failure—a failure mode in which the anchor body pulls through the expansion mechanism without development of the full concrete breakout capacity. **E 2265, E06**

pulp, n—a fluid mixture of solids and water, also known as slurry. **D 121, D05**

pulper—a water filled tank with a motor driven grinding disk to grind and cut waste material, and mixes this material with water to produce a slurry that is pumped to the waterpress through a sizing screen. **F 1827, F26**

pulping, n—the operation of altering a cellulosic raw material such as pulpwood, rags, straw, reclaimed paper, and so forth, into a form suitable for further processing into paper or paperboard; may vary from simple mechanical action to rather complex, chemical digestive sequences and combinations of the two. (See **chemical pulp**, **semichemical pulp**, and **mechanical pulp**.) **D 1968, D06**

pulps, dissolving—chemical cellulose from wood pulp. **D 1695, D01**

pulps for chemical conversion—chemical cellulose from wood pulp. **D 1695, D01**

pulps for manufacture of cellulose derivatives—chemical cellulose from wood pulp. **D 1695, D01**

pulpwood—any wood cut or prepared primarily for the production of wood pulp. **D 9, D07**

pulse—a short wave train of mechanical vibrations. **E 1316, E07**

pulsed cavitation test, n—a test using a vibratory cavitation device in which the cavitation is generated intermittently, with alternating vibratory periods and quiescent periods of controlled relative duration. **G 40, G02**

pulse discharge, n—a type of partial-discharge phenomenon characterized by a spark-type breakdown. **D 1711, D09**

pulsed simulator—simulator whose irradiance output at the test plane area is in a single short duration pulse of 100 ms or less. **E 772, E44**

pulse echo method—an inspection method in which the presence and position of a reflector are indicated by the echo amplitude and time. **E 1316, E07**

pulse Fourier transform NMR—a form of NMR in which the sample is irradiated with one or more pulse sequences of radio-frequency power spaced at uniform time intervals, and the averaged free induction decay following the pulse sequences is converted to a frequency domain spectrum by a Fourier transformation. **E 131, E13**

pulse length—a measure of the duration of a signal as expressed in time or number of cycles. **E 1316, E07**

pulseless-glow discharge, n—a type of partial-discharge phenomenon characterized by a diffused glow. **D 1711, D09**

pulse plating—a method of electroplating in which the current is frequently interrupted or periodically decreased. **B 374, B08**

pulse repetition rate—see **frequency (pulse repetition)**. **E 1316, E07**

pulse travel time (T_p), n—the total time, measured in seconds, required for the sonic pulse to traverse the specimen being tested, and for the associated electronic signals to reverse the circuits of the pulse-propagation circuitry. **C 709, D02**

pulse travel time (T_p), n—the total time, measured in seconds, required for the sonic pulse to traverse the specimen being tested, and for the associated electronic signals to reverse the circuits of the pulse-propagation circuitry. **D 4175, D02**

pulse tuning—a control used on some ultrasonic examination equipment to optimize the response of the search unit and cable to the transmitter by adjusting the frequency spectrum of the transmitted pulse. **E 1316, E07**

pultruded, adj—made by pultrusion. **D 3918, D20**

pultrude, v—to draw resin-impregnated reinforcement through a die. **D 3918, D20**

pultrusion—(1) a process described as the reversed "extrusion" of resin-impregnated reinforcements in the manufacture of rods, tubes, sheets, and shapes of uniform cross section. The reinforcement, after being wet-out by the resin-application system, is drawn through a die to form the desired cross section. (2) a term that is applied to the product of the above process. (3) a term used to show association with the above process. **D 3918, D20**

pultrusion—a process to continuously fabricate composite structural shapes or flat sheet by drawing prepreg materials through forming dies to produce the desired constant cross-sectional shape and simultaneously curing the resin. **E 631, E06**

pultrusion—a process to continuously fabricate composite structural shapes or flat sheet by drawing prepreg materials through forming dies to produce the desired constant cross-sectional shape and simultaneously curing the resin. **E 1749, E06**

pulverization, n—the reduction in particle size of metal powder by mechanical means, a specific type of disintegration. **B 243, B09**

pumpability—*in grouting*, a measure of the properties of a particular grout mix to be pumped as controlled by the equipment being used, the formation being injected, and the engineering objective limitations. **D 653, D18**

pump-down time—time of evacuation. **E 1316, E07**

pumping, n—ejection of liquid or solid material, or both, from beneath the pavement through a crack or joint. **E 867, E17**

pumping, n—ejection of liquid or solid material or both from beneath the pavement through a crack or joint. **E 1778, E17**

pumping, n—ejection of water, material, or both from beneath the pavement through a crack or joint. **E 1778, E17**

pumping of pavement (pumping)—see **pavement pumping**. **D 653, D18**

pumping sampler—a device that draws the water-sediment mixture through a pipe or hose, the intake of which is placed at the desired sampling point in a stream. **D 4410, D19**

pumping test—a field procedure used to determine in situ permeability or the ability of a formation to accept grout. **D 653, D18**

pump-out tubulation—a tube extending from an evacuated device through which gas is pumped and which is usually permanently sealed off after the device has been evacuated. Sometimes called exhaust tubulation. **E 1316, E07**

punch, n—a member of a compacting tool set used to close the die cavity and transmit the applied pressure to the powder or P/M compact. **B 243, B09**

punchouts, n—a broken area of a concrete slab bounded by closely spaced cracks (usually less than 1 m (3 ft)). **E 867, E17**

- punchouts**, *n*—a broken area of a concrete slab bounded by closely spaced cracks (usually less than 1 m (3 ft)). E 1778, E17
- punch ware**—handmade, thin, blown glassware, especially tumblers. C 162, C14
- puncture resistance**, (F), *n*—the inherent resisting mechanism of the test specimen to the failure by a penetrating or puncturing object. D 4439, D35
- puncture test**—See **package testing**. D 996, D10
- pungency**, *n*—irritating, piercing, or sharp trigeminal sensation, experienced primarily in the nasal cavity, as a result of exposure to ammonia or to the volatiles of such substances as freshly prepared mustard or horseradish. E 253, E18
- punty**—(1) a gathering iron of solid cross-section.
(2) a device to which ware is attached for holding during fire polishing or finishing. C 162, C14
- purchaser**, *n*—*as related to corrugated metal pipe*, the person or agency that purchases the finished pipe. A 902, A05
- purchaser**, *n*—*in pipe laying*, the person, company, or organization that purchases any materials or work to be performed. C 1154, C17
- purchaser**, *n*—*for pipe laying*, the person, company, or organization that purchases any materials or work to be performed. D 2946, C17
- purchaser**, *n*—*of an ASTM test*, a person or organization that pays for the conduct of an ASTM test method on a specified product. D 4175, D02
- pure monomer resin**, *n*—a resin produced by the polymerization of essentially pure compounds such as styrene, one of the methylstyrenes, or controlled mixtures of pure monomers. D 6440, D01
- pure shear**—a state of strain resulting from that stress condition most easily described by a Mohr circle centered at the origin. (ISRM) D 653, D18
- purge time**, *n*—*in an intermittent contact test*, the time immediately following the termination of the contact time when the test chemical is removed from the challenge side chamber and air or nitrogen is blown over the outside surface of the protective clothing material. F 1494, F23
- purified cotton cellulose**—see **cotton cellulose, purified**. D 1695, D01
- purified wood cellulose**—see **wood cellulose, purified**. D 1695, D01
- purity**, *n*—the percentage of $\text{CaSO}_4 \cdot \frac{1}{2} \text{H}_2\text{O}$ in the calcined gypsum portion of a gypsum plaster or gypsum concrete, as defined by Specification C 28/C 28M, for Gypsum Plasters. The percentage of $\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$ in the gypsum or the gypsum portion of fully hydrated, dry, set gypsum plaster. C 11, C11
- purity**—The purity of a stream is defined in terms of one or more identifiable components, *x*, *y*, *z*, etc. The purity for any component such as *x* is the mass of *x* in a stream divided by the total mass of that stream. In some cases, the mass of *x* must be defined in practical terms that relate to the origin of the feed. For example, the purity of a ferrous product magnetically recovered from refuse can be expressed as the purity of ferrous by proximate analysis. Alternatively, it can be expressed as the purity by manual sorting, with all nonferrous materials that cannot readily be removed by hand as the contaminants. In any case, purity must be defined for each application. D 5681, D34
- purity**, *n*—See **colorimetric purity, excitation purity**. E 284, E12
- purity, of a biological drug product**—the measure of the biologically active drug in relation to the total substances (not including additives) present in the drug product, usually expressed on a percentage basis. E 1705, E48
- purlin**—a wood member, commonly rectangular in cross section and comparatively long and slender, used most often in a horizontal position in heavy roof construction to support rafters and decking. D 9, D07
- purlin nail, "straw"**—galvanized, regular-stock-steel, aluminum-alloy or copper, 4 to 16 by $\frac{1}{8}$ -in., 0.135 or 0.148-in. nails of desired length with flat $\frac{1}{32}$ -in., curved or $\frac{15}{32}$ -in. head, $\frac{1}{16}$ -in. cast lead head or plastic washer and sheared-square or diamond point; for securing corrugated roofing to I-beams. F 547, F16
- pusher**—tool mechanism for forcing fastener into driving channel. F 592, F16
- push-off crack**, *n*—*in a rigid die system*, a defect or crushed surface caused by the action of the feed shoe or other mechanism removing the compact from the area above the lower punch. B 243, B09
- push-on joint**—see **joint, push-on**. F 412, F17
- putty**—(archaic) a white polishing compound. C 162, C14
- putty**, *n*—*in building construction*, a knife-grade compound generally used as a glazing compound or to fill cracks or holes. C 717, C24
- putty**, *n*—a dough-like material consisting of pigment and vehicle, used for sealing glass in frames, and for filling imperfections in wood or metal surfaces. See **glazing compound**. D 16, D01
- PVC**—poly(vinyl chloride) coating on fence materials. F 552, F14
- P-V diagram**—a graphical representation of the variation of the specific volume of a substance, with change in pressure. E 7, E04
- PV limit**, *n*—*in tribology*, the upper value of a load-bearing material's PV product above which a material fails to function satisfactorily. (See also **PV product**.) G 40, G02
- PV product**, *n*—*in tribology*, the product of the nominal contact pressure on a load-bearing surface and the relative surface velocity between the load-bearing material and its counterface. (See also **PV limit**.) G 40, G02
- P-V-T diagram**—a three-dimensional, graphical representation of a surface, describing the variation of the specific volume of a substance, with independent change of pressure and temperature. E 7, E04
- PWB**—see **printed wiring board**. F 1457, F05
- P-X diagram**—a two-dimensional, graphical representation of the isothermal phase relationships in a binary system; the coordinates of the graph are pressure and concentration. E 7, E04
- P-X projection**—a two-dimensional, graphical representation of the phase relationships in a binary system produced by making an orthographic projection of the phase boundaries of a P-T-X diagram upon a pressure-concentration plane. E 7, E04
- pyranometer**—an instrument (radiometer) used to measure the total solar radiant energy incident upon a surface per unit time and unit surface area. E 631, E06
- pyranometer**—(1) a radiometer to measure the global solar irradiance in the plane of its aperture; (2) A radiometer used to measure the total solar radiant energy incident upon a surface per unit time per unit area. This energy includes the direct radiant energy, diffuse radiant energy, and reflected radiant energy from the background. E 772, E44
- pyranometer**, *n*—a radiometer used to measure the total solar radiant energy incident upon a surface per unit time per area. This energy includes the direct radiant energy, diffuse radiant energy, and reflected radiant energy from the background. G 113, G03
- pyranometer, field**—a pyranometer essentially meeting the World Meteorological Organization Class II specifications, appropriate to field use and typically exposed continuously. E 772, E44
- pyranometer, net**—an instrument for measuring the difference between the irradiance falling on the top and bottom of a horizontal surface. E 772, E44
- pyranometer, reference**—a pyranometer essentially meeting the World Meteorological Organization Class I specifications and used principally to calibrate other instruments. E 772, E44
- pyranometer, spherical**—instrument for measuring the solar flux falling from a solid angle 4π on a spherical surface. E 772, E44
- pyrgeometer**—an instrument for measuring net atmospheric irradiance on a horizontal upward facing black surface at the ambient air temperature. E 772, E44
- pyrheliometer**—a radiometer used to measure the direct or beam solar irradiance incident on a surface normal to the sun's rays. E 772, E44
- pyrheliometer**, *n*—a radiometer used to measure the direct or beam solar irradiance incident on a surface normal to the sun's rays. G 113, G03

pyrheliometer, compensated

pyrheliometer, compensated—pyrheliometer based on the comparison of the heating of two identical metal strips, one exposed to a solar radiant energy, the other to a joule effect. **E 772, E44**

pyrheliometer, secondary reference—a pyrheliometer essentially meeting the World Meteorological Organization Class I specifications but not having self-calibrating capability. **E 772, E44**

pyridine bases—a mixture of pyridine and substituted pyridines. The pyridine bases in tar acids refer to those that react with 0.02 *N* perchloric acid. **D 4790, D16**

pyridine, refined—pyridine (including its impurities) having a total distillation range of 1.0°C. Refined to improve color characteristics. Refer to Specification D 2323 for complete specifications. **D 4790, D16**

pyro—a common expression for the compound tetrasodium pyrophosphate ($\text{Na}_4\text{P}_2\text{O}_7$), either hydrous or anhydrous. **C 286, B08**

pyrogen, *n*—any substance that produces fever. **F 2312, F04**

pyrogens—any substance capable of producing a fever in mammals. Often a bacterial endotoxin such as lipo polysaccharide generated by gram negative bacteria at destruction. Chemically and physically stable, pyrogens are not necessarily destroyed by conditions that kill bacteria. **D 6161, D19**

pyrolysis, *n*—process of simultaneous phase and chemical species change caused by heat (compare **smoldering**). **E 176, E05**

pyrolysis—the breaking apart of complex molecules by heating (over the range from 392° to 932° (200° to 500°C)) in the absence of oxygen, producing solid, liquid, and gaseous fuels. **E 1705, E48**

pyrolytic coating—a thin coating produced by the decomposition of a volatile compound on a hot surface. **C 162, C14**

pyrolytic graphite, *n*—in *carbon and graphite technology*, an artifact consisting predominantly of graphite which was deposited as a

solid on a hot surface by cracking of gaseous or liquid hydrocarbons. **C 709, D02**

pyrolytic graphite, *n*—in *carbon and graphite technology*, an artifact consisting predominantly of graphite which was deposited as a solid on a hot surface by cracking of gaseous or liquid hydrocarbons. **D 4175, D02**

pyrometer—an instrument for measuring temperatures (see **pyrometry**). An autographic or recording pyrometer automatically measures and records temperatures. **E 7, E04**

pyrometric cone equivalent (PCE), *n*—the number of that Standard Pyrometric Cone whose tip would touch the supporting plaque simultaneously with a cone of the refractory material being investigated when tested in accordance with Test Method C 24. **C 71, C08**

pyrometric cones, *n*—elongated trigonal pyramids of standard size made from specified mixtures of ceramic materials which when heated under stated conditions, may be used as an index of heat treatment. **C 71, C08**

pyrometry—the measurement of temperatures: for example, by measuring the electrical resistance of wire, the thermoelectric force of a couple, the expansion of solids, liquids or gases, the specific heat of solids, or the intensity of radiant energy per unit area. **E 7, E04**

pyrophyllite—a hydrated aluminum silicate mineral of the theoretical composition $\text{Al}_2\text{O}_3 \cdot 4\text{SiO}_2 \cdot \text{H}_2\text{O}$, having physical properties in the raw state resembling mineral talc. **C 242, C21**

pyroxylin finish—a plastic finish based on nitrocellulose used on leather. **D 1517, D31**

pyrradiometer, spherical—instrument for measuring total flux falling from a solid angle 4π on a spherical surface. **E 772, E44**

Q

- QD**—abbreviation for quick disassembly zipper. (See **releasing stop**.)
D 123, D13
- QD**—abbreviation for quick disassembly zipper. (See **releasing stop**.)
D 2050, D13
- QR**—abbreviation for quick release zipper. (See **releasing stop**.)
D 123, D13
- QR**—abbreviation for quick release zipper. (See **releasing stop**.)
D 2050, D13
- quad**—one quadrillion (10^{15}) Btu.
E 1705, E48
- quadrant mat**—additional tension zone circumferential reinforcement secured to a layer of reinforcement in the concrete pipe wall.
C 822, C13
- quadratic integrator**, *n*—*in textile unevenness testing*, an integrator that operates continuously and reports unevenness for the time during which it has been active, giving equal weight consideration to all portions of the input.
D 123, D13
- quadratic integrator**, *n*—*in textile unevenness testing*, an integrator that operates continuously and reports unevenness for the time during which it has been active, giving equal consideration to all portions of the input. (Syn. compensating-memory integrator.)
D 4849, D13
- quadratic rate**, *n*—the sum of the squares of the individual discharge magnitudes during a certain time interval divided by that time interval and expressed as (coulombs) per second.
D 1711, D09
- quadrivariant equilibrium**—a stable state among a number of conjugate phases equal to two less than the number of components, that is, having four degrees of freedom.
E 7, E04
- quadruple curve**—in a P-T diagram, a line representing the sequence of pressure and temperature values along which three conjugate phases occur in univariant equilibrium.
E 7, E04
- quadruple point**—in a P-T diagram the pressure and temperature at which four conjugate phases occur in invariant equilibrium.
E 7, E04
- qualification**—*in protective coatings*: The characteristics or abilities gained through training or experience, or both, that enable an individual to perform a required function.
D 4538, D33
- qualification (personal)**—characteristics or abilities gained through training or experience, or both, that enable an individual to perform a required function.
F 1789, F16
- qualification test**, *n*—a series of tests conducted by the procuring activity, or an agent thereof, to determine conformance of materials, or materials system, to the requirements of a specification which normally results in a qualified products list under the specification. (Compare **acceptance test** and **preproduction test**.)
D 907, D14
- qualification test**, *n*—a series of tests conducted by the procuring agency or an agent thereof to determine conformance of thermistor sensors to the requirements of a specification, normally for the development of a qualified products list under the specification.
E 344, E20
- qualification test**—an evaluation, generally nonrepetitive, conducted on an existing, altered, or new product to determine acceptability.
F 412, F17
- qualification testing**—testing performed on a product to determine whether or not the product conforms to requirements of an applicable specification.
F 412, F17
- qualified identification**—An *identification* is not qualified. However, opinions may be qualified when the evidence falls short of an *identification* or *elimination*.
E 1658, E30
- qualified technical personnel**, *n*—persons such as engineers and chemists who, by virtue of education, training, or experience, know how to apply physical and chemical principles involved in the reactions between oxidants and other materials.
G 126, G04
- qualitative**, *adj*—pertaining to a descriptive measurement, such as (1) taste or (2) presence/absence of a characteristic or component.
D 1129, D19
- qualitative sensory profile**, *n*—a description of a sample consisting of sensory attributes, but without intensity values.
E 253, E18
- quality**, *n*—the totality of features and characteristics of a product or service that bear on its ability to satisfy a given need.
- quality assurance**, *n*—a system of activities whose purpose is to provide assurance that the overall quality control job is in fact being done effectively.
- quality control**, *n*—the overall system of activities whose purpose is to provide a quality of product or service that meets the needs of users; also, the use of such a system.
D 1356, D22
- quality**, *n*—collection of features and characteristics of a product, process, or service that defines its ability to satisfy stated or implied needs or requirements.
E 253, E18
- quality**—totality of characteristics of an entity that bear on its ability to satisfy stated or implied needs.
E 1187, E36
- quality**—the mass of vapor phase per unit mass of a liquid-vapor two-phase single-component fluid.
G 40, G02
- quality**, *n*—See **particle concentration**.
G 40, G02
- quality assurance**—See **quality**.
D 1356, D22
- quality assurance**, *n*—all those planned or systematic actions necessary to provide adequate confidence that a material, product, system, or service will satisfy given needs.
D 4439, D35
- quality assurance**—all systematic actions necessary to provide adequate confidence that a calibration, measurement, or process is performed to a predefined level of quality.
E 170, E10
- quality assurance**—all the planned and systematic activities implemented within the quality system, and demonstrated as needed, to provide adequate confidence that an entity will fulfill requirements for quality.
E 1187, E36
- quality assurance**, *n*—all the planned and systematic activities implemented within the quality system, and demonstrated as needed, to provide adequate confidence that an entity will fulfill requirements for quality.
E 1732, E30
- quality assurance**—all of the planned and systematic activities carried out for the purpose of establishing that a fastener lot is within specified tolerances, limits, and other requirements.
F 1789, F16
- quality assurance program**—specific requirements within a quality system which serves to focus the activities of a fastener organization in pursuit of stated requirements of the quality plan.
F 1789, F16
- quality assurance (QA)**, *n*—an integrated system of management activities involving planning, quality control, quality assessment, reporting, and quality improvement to ensure that a process or service (for example, environmental data) meets defined standards of quality with a stated level of confidence.
D 5681, D34
- quality assurance (QA)**, *n*—the sum total of the organized arrangements made with the object of ensuring that all APIs or drug products are of the quality required for their intended use and that quality systems are maintained.
E 2363, E55
- quality assurance/quality control (QA/QC)**—the efforts completed to evaluate the accuracy and precision of a sampling or testing procedure, or both.
D 653, D18
- quality assurance system**—manufacturing system for assuring quality that incorporates either a written control plan or employs other acceptable methods for controlling quality. This may include provisions for prototype development, initial production, and full production including advanced quality planning, continuous improvement, defect prevention, and in-process controls of dimensional, mechanical, and performance characteristics of the fastener.
F 1789, F16
- quality assurance test**—a test in a program which is conducted to determine the quality level.
F 412, F17
- quality audit**—systematic and independent examination to determine whether quality activities and related results comply with planned

quality audit

arrangements and whether these arrangements are implemented effectively and are suitable to achieve objectives. **E 1187, E36**

quality audit, n—systematic and independent examination to determine whether quality activities and related results comply with planned arrangements and whether these arrangements are implemented effectively and are suitable to achieve objectives. **E 1732, E30**

quality constituents, n—measurable characteristic, such as, but not limited to pH, marbling, tenderness, or color. **F 2463, F10**

quality control—See **quality**. **D 1356, D22**

quality control, n—the operational techniques and the activities which sustain a quality of material, product, system, or service that will satisfy given needs; also the use of such techniques and activities. **D 4439, D35**

quality control, n—a system or process for obtaining, maintaining, and verifying a desired level of quality in a data set, process, or service by careful planning and design, the use of proper equipment, continued inspections, and taking corrective actions where and when required. **E 867, E17**

quality control—operational techniques and activities that are used to fulfill requirements of quality. **E 1187, E36**

quality control (QC), n—the overall system of technical activities whose purpose is to measure and control the quality of a product or service so that it meets the needs of users. The aim is to provide quality that is satisfactory, adequate, dependable, and economical. **D 5681, D34**

quality control test—an in-plant test that is conducted on a given test frequency to determine whether product is in accordance with the appropriate specification(s). **F 412, F17**

quality factor, Q, n—the reciprocal of the dissipation factor. **D 1711, D09**

quality factor, Q—the reciprocal of the dissipation factor (when applied to insulating materials). **D 2864, D27**

quality factor, Q—the ratio of elastic modulus to loss modulus, measured in tension, compression, flexure, or shear. **D 4092, D20**

quality management—all activities of the overall management function that determine the quality policy objectives and responsibilities, and implement them by means such as quality planning, quality control, quality assurance and quality improvement within the quality system. **E 1187, E36**

quality management—all activities of the overall management function that determine the quality policy objectives and responsibilities, and implement them by means such as quality planning, quality control, quality assurance and quality improvement within the quality system.

quality management—The responsibility of all levels of management but must be led by top management. Its implementation involves all members of the organization. In quality management, consideration is given to economic aspects. **E 1732, E30**

quality manual—a document stating the quality policy, quality system and quality practices of an organization, (ISO Guide 25). **E 1187, E36**

quality manual, n—a document stating the quality policy, quality system and quality practices of an organization. **E 1732, E30**

quality plan—a document setting out the specific quality practices, resource and sequence of activities relevant to a particular product, service, contract or project, (ISO 8402). **E 1187, E36**

quality policy—overall intentions and direction of an organization with regards quality, as formally expressed by top management. **E 1187, E36**

quality surveillance—continual monitoring and verification of the status of an entity and analysis of records to ensure that specified requirements are being fulfilled. **E 1187, E36**

quality system—organizational structure, procedures, processes and resources needed to implement quality management. **E 1187, E36**

quality system—the organizational structure, responsibilities, procedures, activities, capabilities, and resources that together aim to

ensure that services satisfy date requirements. (Generalized from E 1187.) **E 1605, E06**

quality unit(s), n—an organizational unit independent of production that fulfills both quality assurance and quality control responsibilities. **E 2363, E55**

quantification, n—the process of performing a quantitative determination. **D 1129, D19**

quantitation limit, n—the lowest result that would be considered quantitative. **D 1129, D19**

quantitation limit—an instrumental measurement value that is used to provide a concentration limit for confidently reporting quantitative analysis data for a give analytical method. **E 1605, E06**

quantitation limit—the minimum amount that can be quantified with acceptable accuracy and precision. **E 2161, E37**

quantitative analysis—an analysis run on sample digestates (or serial dilutions of sample digestates) that includes instrumental QC standards. Data from this run are used to calculate and report final lead analysis results. **E 631, E06**

quantitative analysis—the determination of the concentration and distribution of elements within the Auger analysis volume. **E 673, E42**

quantitative sensory profile, n—description of a sample consisting of both sensory attributes and their intensity values. **E 253, E18**

quantity—measurable attribute of a physical phenomenon. There are base units for seven quantities and supplementary units for two quantities upon which units for *all* other quantities are founded.

queue-rail system—Synonym for **traffic-rail system**. **E 631, E06**

quarantine, n—the status of materials isolated physically or by other effective means pending a decision on their subsequent approval or rejection. **E 2363, E55**

quarry—an excavation in the surface of the earth from which stone is obtained for crushed rock or building stone. (ISRM) **D 653, D18**

quarry tile—glazed or unglazed tile, made by the extrusion process from natural clay or shale usually having 6 in.² (39 cm²) or more of facial area. **C 242, C21**

quarter, n—one side of the upper of a shoe or boot from heel to vamp. **F 1646, F13**

quartersawn—a synonym for **edge grain**. **D 9, D07**

quarter wave plate—a device used with a polarizer and analyzer designed to produce circularly polarized light. **E 7, E04**

quartz glass—See **fused silica**. **C 162, C14**

quartzite (commercial definition) (III)—highly indurated, typically metamorphosed sandstone containing at least 95 % free silica, which has a compressive strength of over 117 MPa (17 000 psi). **C 119, C18**

quartzite, ganister, n—for refractories, a rock consisting predominantly of the mineral quartz suitable for the manufacture of silica brick and characterized by a high silica (SiO₂) content and a low percentage of impurities (see Classification C 416). **C 71, C08**

quartzitic sandstone (commercial definition) (II)—sandstone containing at least 90 % free silica (quartz grains plus siliceous cement), which has a compressive strength over 69 MPa (10 000 psi). **C 119, C18**

quasi-binary system—in a ternary or higher order system, a linear composition series between two congruent substances, wherein all equilibria, at all temperatures or pressures, involve only phases having compositions occurring in the linear series, so that the series may be represented as binary on a phase diagram. **E 7, E04**

quasi-isotropic—See **isotropic**. **E 7, E04**

quasi-isotropic laminate—a balanced and symmetric laminate for which a constitutive property of interest, at a given point, displays isotropic behavior in the plane of the laminate. Common quasi-isotropic laminates are (0/±60)s and (0/±45/90)s. **D 3878, D30**

quasi-steady state—state of the solar collector test when the flow rate and temperature of the fluid entering the collector are constant. The exit fluid temperature changes are small and due only to the normal

- change in irradiance that occurs with time for clear sky conditions. **E 772, E44**
- quasi-ternary system**—in a quaternary or higher order system, a planar composition series among three congruent substances, wherein all equilibria, at all temperatures and pressures, involve only phases having compositions occurring upon the plane, so that they may be represented completely upon a ternary phase diagram. **E 7, E04**
- quaternary system**—the complete series of compositions produced by mixing four components in all proportions. **E 7, E04**
- quebracho**—a tanning material extracted from the wood of a South American tree. **D 1517, D31**
- quench aging, *n*—aging** associated with **quenching** after **solution heat treatment**. **A 941, A01**
- quench cracks**—surface discontinuities which usually transverse an irregular or erratic course on the surface of the fastener which may occur because of excessive high thermal or transformation stresses, or both, during fastener heat treatment. **F 1789, F16**
- quench-hardened**—See **hardened**. **F 547, F16**
- quench hardening, *n*—hardening** a steel object by **austenitizing** it, and then cooling it rapidly enough that some or all of the austenite transforms to martensite. **A 941, A01**
- quench hardening**—a treatment for copper-aluminum alloy products consisting of heating above the betatizing temperature followed by quenching to produce a hard martensitic structure. **B 846, B05**
- quenching, *n*—rapid cooling**. **A 941, A01**
- quenching**—see **fritting**. **C 286, B08**
- quenching, *n*—the reduction of fluorescence by a competing deactivating process** resulting from specific interaction between a fluorophor and another substance present in the system. **E 131, E13**
- quenching crack**—a crack formed as a result of thermal stresses produced by rapid cooling from a high temperature—not to be confused with fire crack. **E 7, E04**
- quenching oil, *n*—oil used for cooling metals during a heat-treating operation**. **D 4175, D02**
- Quer-wave (love wave), *W*—dispersive surface wave with one horizontal component, generally normal to the direction of propagation, which decreases in propagation velocity with increase in frequency**. **D 653, D18**
- questioned, *n*—associated with the matter under investigation about which there is some question, including, but not limited to, whether the questioned and known items have a common origin**. **E 1732, E30**
- queue, *n*—a set of tasks stored in memory for use by a device in a specified order. (See **printout queuing**.)** **F 1457, F05**
- queue-rail system**—Synonym for **traffic-rail system**. **E 1481, E06**
- quick break**—a sudden interruption of the magnetizing current. **E 1316, E07**
- quick breaking emulsion**—an emulsion which separates into water and oil within 3 to 10 min after agitation is removed. **E 609, E35**
- quick burst**—Not a preferred term (see **quick burst test, quick burst pressure, and quick burst strength**). **F 412, F17**
- quick burst pressure**—the internal pressure required to bring a piping component to failure when subjected to a quick burst test. **F 412, F17**
- quick burst strength**—the hoop stress resulting from the quick burst pressure. **F 412, F17**
- quick burst test**—an internal pressure test designed to produce failure of a piping component over a relatively short period of time, usually measured in seconds. **F 412, F17**
- quick condition (quicksand)**—condition in which water is flowing upwards with sufficient velocity to reduce significantly the bearing capacity of the soil through a decrease in intergranular pressure. **D 653, D18**
- quick draw, *n*—a short runner**. **F 1773, F08**
- quicklime**—a calcined limestone, the major part of which is calcium oxide or calcium oxide in association with magnesium oxide, capable of slaking with water. **C 51, C07**
- quicklime**—CaO, calcium oxide. **D 6161, D19**
- quicklime sizes**—the different sizes depending upon the type of limestone, kind of kiln used, or treatment subsequent to calcining. The sizes commonly recognized are as follows:
 (1) *large lump*—8 in. (203 mm) and smaller,
 (2) *pebble or crushed*—2½ in. (64 mm) and smaller,
 (3) *ground, screened or granular*—¼ in. (6.4 mm) and smaller, and
 (4) *pulverized*—substantially all passing a No. 20 (850-µm) sieve. **C 51, C07**
- quick test**—see **unconsolidated undrained test**. **D 653, D18**
- quiet zones, *n*—areas of high reflectance (spaces) immediately preceding the start character and following the stop character of a machine-readable symbol as defined for a particular symbology. (See also **clear area**.)** **F 1294, F05**
- quill, *n*—in feathers, the stem or central shaft**. **D 123, D13**
- quill, *n*—in feathers, the stem or central shaft**. **D 7022, D13**
- quill feathers, *n*—feathers which are over 100 mm (4 in.) in length or which have a quill point exceeding 9.5 mm (¾ in.) in length**. **D 123, D13**
- quill feathers, *n*—feathers which are over 100 mm (4 in.) in length or which have a quill point exceeding 9.5 mm (¾ in.) in length**. **D 7022, D13**
- quill point, *n*—in feathers, the section of quill extending beyond the section of barb attachment**. **D 123, D13**
- quill point, *n*—in feathers, the section of quill extending beyond the section of barb attachment**. **D 7022, D13**
- quill shaft, *n*—in feathers, the section of quill from which the barbs emanate**. **D 123, D13**
- quill shaft, *n*—in feathers, the section of quill from which the barbs emanate**. **D 7022, D13**
- quilt, *n*—a bedcovering assembly used primarily for warmth, consisting of an insulating filler secured between two layers of fabric, but generally lighter in weight and thinner than a comforter**. **D 123, D13**
- quilt, *n*—a bedcovering assembly used primarily for warmth, consisting of an insulating filler secured between two layers of fabric, but generally lighter in weight and thinner than a comforter**. **D 7023, D13**
- quilted, *n*—fused or stitched with thread through the upholstery cover material and one or more layers of upholstery material**. **E 176, E05**
- quinoline**—benzo(b)pyridine (C₉H₇N) mol weight 129.15; colorless, refractive oil which darkens on storage; hygroscopic; penetrating odor not as offensive as pyridine; freezing point, -15°C; boiling point, 237.7°C. **D 4790, D16**

R

R₁₀—the portion of a cellulose pulp that is insoluble in 10 % sodium hydroxide using Test Method D 1696 or its equivalent. **D 1695, D01**

R—in a distillation column, abbreviation for reflux ratio. **D 4175, D02**

r—in statistics, abbreviation for repeatability. **D 4175, D02**

R—in statistics, abbreviation for reproducibility. **D 4175, D02**

RA—recycling agent **D 8, D04**

Ra, *n*—in measuring surface finish, the arithmetic average of the absolute distances of all profile points from the mean line for a given distance. **D 4175, D02**

rabbet, *n*—a two-sided, L-shaped, recess in a sash or frame designed to receive glazing. **C 717, C24**

rack, *n*—in warpknitting, a unit of length measure consisting of 480 courses. **D 123, D13**

rack, *n*—in warpknitting, a unit of length measure consisting of 480 courses. **D 4850, D13**

rack—longitudinal offset between adjacent fasteners within strip of collated fasteners. **F 592, F16**

racked fastener—fastener offset in strip. **F 592, F16**

racking—when applied to shear walls, refers to the tendency for a wall frame to distort from rectangular to rhomboid under the action of an in-plane force applied parallel to the wall length. **E 631, E06**

rack length, *n*—in warp knitting, the length of the fabric produced by knitting one rack, measured on the machine under operating take-up tension. **D 123, D13**

rack length, *n*—in warp knitting, the length of the fabric produced by knitting one rack, measured on the machine under operating take-up tension. **D 4850, D13**

rack, plating—a frame for suspending and carrying current to articles during plating and related operations. **B 374, B08**

rack-plating process—fastener coating process in which individual fasteners are placed on a support called a rack which moves the fasteners together through the process steps while providing ready ingress and egress of processing solutions and rinses. In process steps which utilize an electric current, the rack serves to maintain electrical continuity. **F 1789, F16**

radial—coincident with the radius from the pith to the circumference of the tree or log. A radial section is a longitudinal section in a plane that passes through the pith of the tree. **D 9, D07**

radial crushing strength, *n*—the relative capacity of a plain sleeve specimen of sintered metal to resist fracture induced by a load applied between flat parallel plates in a direction perpendicular to the axis of the specimen. **B 243, B09**

radial sectioning—a method of specimen preparation in which a specimen is polished by a cylinder in order to expose compositional changes below the original surface of a specimen with the intent that the depth of these layers can be related to the position on the surface created by the cylinder. **E 673, E42**

radial surface—a longitudinal surface or plane extending wholly or in part from the pith to the bark. **D 9, D07**

radial tire, *n*—a tire constructed so that the ply cords extend from bead to bead at a 90° angle to the centerline of the road. **D 5681, D34**

radian, *n*—the plane angle between two radii of a circle which intersects the circumference of the circle making an arc equal in length to the radius. **D 123, D13**

radian, *n*—the plane angle between two radii of a circle which intersects the circumference of the circle making an arc equal in length to the radius. **D 4849, D13**

radiance, *n*—the rate of radiant emission per unit solid angle and per unit projected area of a source in a stated angular direction from the surface (usually the normal). **C 168, C16**

radiance factor at a point on the surface of a nonself-radiating body, in a given direction under specified conditions of irradiation, *n*—ratio

of the radiance of the body to that of a perfect reflecting or transmitting diffuser, identically irradiated. Symbol: β . **E 349, E21**

radiance factor, β , β_e , *n*—ratio of the radiance from a point on a specimen, in a given direction, to that from the perfect reflecting or transmitting diffuser, similarly irradiated and viewed. **E 284, E12**

radiance (in a given direction, at a point on the surface of a source or receptor or at a point in the path of a beam), *n*—quotient of the radiant flux leaving, arriving at, or passing through an element of surface at this point and propagated in directions defined by an elementary cone containing the given direction by the product of the solid angle of the cone and the area of the orthogonal projection of the element of surface on a plane perpendicular to the given direction. Symbol: L_e , L ; $L_e = d^2\Phi / (d\omega \, dA \, \cos \Theta)$; Unit: Watt per steradian and per square metre, $W \cdot sr^{-1} \, m^{-2}$.

NOTE—Three special cases may be noted:

Case 1—At a point on the surface of a source, in a given direction, radiance is also the quotient of the radiant intensity in the given direction of an element of the surface at this point, by the area of the orthogonal projection of this element on a plane perpendicular to this direction (radiant intensity per unit projected area). $L_e = dI_e / (dA \, \cos \Theta)$.

Case 2—At a point on the surface of a receptor, in a given direction, radiance is also the quotient of the irradiance that is received at this point on a surface perpendicular to the given direction by the solid angle of the elementary cone containing this direction and surrounding the beam which produces this irradiance (perpendicular irradiance per unit solid angle). $L_e = dE_e / d\omega$.

Case 3—On the path and in the direction of an element of a beam, in a nondiffusing, nonabsorbing medium, the radiance is also the quotient of the radiant flux $d\Phi_e$ which transports the beam, by the geometric extent dG of the beam. The geometric extent, which may be defined by two sections of the beam of areas dA and dA' of separation l , and having angles Θ and Θ' between their normals and the direction of the beam is $dG = dA \, \cos \Theta \, d\omega$ where the numerical value in steradians of $d\omega$ is $dA' \, \cos \Theta' / l^2$. $L_0 = d\Phi_e / dG = d^2\Phi_e / (d\omega \, dA \, \cos \Theta)$. In the absence of diffusion, it can be demonstrated in geometrical optics that the optical extent, product of the geometric extent of an element of a beam and the square of the refractive index of the medium of propagation, is an invariant along the length of the beam whatever the deviations that it undergoes by reflection or refraction ($dG \cdot n^2 = \text{constant}$). In consequence, the basic radiance, quotient of the radiance by the square of the refractive index, is invariant along the length of an element of a beam if losses by absorption or by reflection are taken as zero ($L_e \cdot n^2 = \text{constant}$). **E 349, E21**

radiance, L —the flux per unit projected area per unit solid angle leaving a source or, in general, any reference surface. If $d^2\Phi$ is the flux emitted into a solid angle $d\omega$ by a source element of projected area $dA \, \cos \theta$, the radiance is defined as:

$$L = \frac{d^2\Phi}{d\omega \, dA \, \cos \theta}$$

where θ is the angle between the outward surface normal of the area element dA and the direction of observation (unit = $W / sr \cdot m^2$). **E 1316, E07**

radiance, L , L_e , *n*—radiant flux in a beam, emanating from a surface, or falling on a surface, in a given direction, per unit of projected area of the surface as viewed from that direction, per unit of solid angle. **E 284, E12**

radiant, *adj*—pertaining to electromagnetic radiation, with the contributions at all wavelengths weighted equally. **E 284, E12**

radiant efficiency of a source of radiation, *n*—ratio of the radiant flux emitted to the power consumed. Symbol: η_e , η .

NOTE—The radiant efficiency of a source in a limited region of the spectrum may also be considered, that is, the ratio of the radiant flux emitted in this spectral region to the power consumed. **E 349, E21**

radiant emissive power—see **radiant exitance, emitted**. E 772, E44
radiant energy, *n*—energy transmitted as electromagnetic waves.

D 4175, D02

radiant energy—energy transmitted as electromagnetic waves.

E 131, E13

radiant energy, *n*—energy transmitted as electromagnetic radiation.^A

E 284, E12

radiant energy, *n*—energy emitted, transferred, or received as radiation. Symbol: Q_e, Q ; Unit: joule J (1 J = W·s).

NOTE—In ultraviolet radiation therapy and photobiology, this quantity is called “integral dose” (International Photobiology Committee, 1954).

E 349, E21

radiant energy—energy in the form of photons or electromagnetic waves.

E 772, E44

radiant energy, atmospheric—the part of terrestrial radiation that is emitted by the atmosphere.

E 772, E44

radiant energy, blackbody—radiant energy emitted by a (laboratory) blackbody, or radiant energy having that spectral distribution. (Refer to Planck’s law as defined in standard tests).

E 772, E44

radiant energy, circumsolar—radiation scattered by the atmosphere so that it appears to originate from an area of the sky immediately adjacent to the sun. It causes the solar aureole, and its angular extent is directly related to the atmospheric turbidity, being greater with higher turbidity.

E 772, E44

radiant energy, effective nocturnal—energy transfer required to maintain a horizontal upward-facing blackbody surface at the ambient air temperature, in the absence of solar irradiance.

E 772, E44

radiant energy, infrared—radiant energy with wavelengths longer than 770 nm and less than 1 mm (approximately).

E 772, E44

radiant energy, isotropic—diffuse radiant energy that has the same radiance in all directions. See **radiometric properties and quantities**.

E 772, E44

radiant energy, terrestrial—radiant energy emitted by the earth, including its atmosphere.

E 772, E44

radiant exitance at a point on a surface, *n*—quotient of the radiant flux leaving an element of the surface containing the point, by the area of that element. Symbol: M_e, M ; $M_e = d\Phi_e / dA = \int_2 L_e \cos \theta d\omega$. Unit: Watt per square metre, $W \cdot m^{-2}$.

NOTE—The name radiant emittance previously given to this quantity is abandoned because it has given rise to confusion. Thus, the term “emittance” has been used to designate either the flux per unit area leaving a surface (whatever the origin of the flux), the flux per unit area emitted by a surface (flux originating in the surface), or, principally, in certain circles in the United States of America, a quantity without dimensions similar to “emissivity,” but applicable only to a specimen.

NOTE—The expression “self-radiant exitance” ($M_{e,s}$) indicates that the flux considered does not include reflected or transmitted flux.

The expression “thermal-radiant exitance” ($M_{e,th}$) indicates that the flux considered is produced by thermal radiation. These same adjectives (self, thermal) are equally applicable to other quantities, such as radiance, and so forth.

NOTE—In the case of a full radiator (blackbody), the radiance L_e is uniform in all directions. In consequence, when the solid angle is measured in steradians, the radiant exitance has the numerical value $M_e = \pi L_e$.

E 349, E21

radiant exitance at a point on a surface, $M = d\Phi_e / dA$ —the quotient of the radiant flux leaving an element of the surface containing the point, by the area of that element. The exitance may be emitted, transmitted and/or reflected flux, and is measured in watts per square metre ($W \cdot m^{-2}$).

E 772, E44

radiant exitance, emitted—radiant flux emitted per unit surface area.

E 772, E44

radiant exitance, M —the radiant flux per unit area leaving a surface that is,

$$M = \frac{d\Phi}{dA}$$

where:

$d\Phi$ = flux leaving a surface element dA (unit = W/m^2).

NOTE—In general, exitance includes emitted, transmitted and reflected flux.

E 1316, E07

radiant exposure, *n*—time integral of the irradiance at a given point over a specified time interval.

E 284, E12

radiant exposure, *n*—time integral of irradiance, typically reported in joules per square metre, $J \cdot m^{-2}$

G 113, G03

radiant exposure at a point on a surface, *n*—surface density of the energy received. Symbol: H_e, H ; $H_e = dQ_e / dA = \int E_e dt$; Unit: joule per square metre, $J \cdot m^{-2}$.

NOTE—Formerly “irradiation.”

NOTE—Equivalent definition: Product of an irradiance and its duration.

NOTE—In ultraviolet radiation therapy and photobiology, this quantity is called dose (International Photobiology Committee, 1954).

E 349, E21

radiant exposure, H —time integral of irradiance, measured in joules per square metre.

E 772, E44

radiant flux, Φ, n —the time rate of flow of radiant energy; radiant power.

E 284, E12

radiant flux: radiant power, *n*—power emitted, transferred, or received as radiation: Symbol: Φ_e, Φ, P ; $\Phi_e = dQ_e / dt$; Unit: Watt (W).

E 349, E21

radiant flux, $\Phi = dQ/dt$ [Watt (W)]—power emitted, transferred, or received in the form of electromagnetic waves or photons. See **radiometric properties and quantities**.

E 772, E44

radiant flux; radiant power, Φ_e —radiant energy per unit time (unit = W).

E 1316, E07

radiant flux density, *n*—the rate of radiant energy emitted from unit area of a surface in all radial directions of the overspreading hemisphere.

C 168, C16

radiant flux, net—difference between downward and upward (total solar and terrestrial) radiant flux; net flux of all radiant energy across an imaginary horizontal surface.

E 772, E44

radiant flux, net terrestrial—difference between downward and upward terrestrial radiant fluxes; net flux of terrestrial radiant energy.

E 772, E44

radiant flux profile, *n*—the graph relating incident radiant heat energy on the specimen plane to distance from the point of initiation of flaming ignition, that is, 0 mm.

E 176, E05

radiant flux (surface) density at a point of a surface, *n*—quotient of the radiant flux at an element of the surface containing the point, by the area of that element. (See also **irradiance** and **radiant exitance**.) Unit: Watt per square metre, $W \cdot m^{-2}$.

E 349, E21

radiant heat—heat communicated by energy propagated through space and transmitted by electromagnetic waves.

F 1494, F23

radiant intensity, I, I_e, n —the radiant flux per unit solid angle.

E 284, E12

radiant intensity, J, n —the radiant power emitted per unit solid angle in a specified direction.

E 135, E01

radiant intensity of a point source in a given direction, $I = d\Phi / d\Omega$ —quotient of the radiant flux emitted by a source, or by an element of source, in an infinitesimal cone containing the given direction, by the solid angle of the cone, measured in watts per steradian. (Refer to the inverse square law.)

E 772, E44

radiant intensity of a source, in a given direction, *n*—quotient of the radiant flux leaving the source propagated in an element of solid angle containing the given direction, by the element of solid angle. Symbol: I_e, I ; $I_e = d\Phi_e / d\omega$; Unit: Watt per steradian, $W \cdot sr^{-1}$.

NOTE—For a source that is not a point source: The quotient of the radiant flux received at an elementary surface by the solid angle which this surface subtends at any point of the source, when this quotient is taken to the limit as the distance between the surface and the source is increased.

E 349, E21

radiant power—see **radiant flux**. E 772, E44

radiant power, P, n—the rate at which energy is transported in a beam of radiant energy. D 4175, D02

radiant power, P—the rate at which energy is transported in a beam of radiant energy. E 131, E13

radiant power, P, n—the rate at which energy is transported in a beam of radiant energy, preferably expressed in ergs per second or watts. E 135, E01

radiation, n—(1) emission or transfer of energy in the form of electromagnetic waves or particles.

(2) the electromagnetic waves or particles.

NOTE—In general, nuclear radiations and radio waves are not considered in this vocabulary, only optical radiations, that is, electromagnetic radiations (photons) of wavelengths lying between the region of transition to X-rays (1 nm) and the region of transition to radio waves (1 mm). E 349, E21

radiation—the process by which energy is emitted or transferred in the form of photons or electromagnetic waves. (See also **radiant energy**.) E 772, E44

radiation chemical yield, G(x)—the quotient of n(x) by $\bar{\epsilon}$ where n(x) is the mean amount of a specified entity, x, produced, destroyed, or changed by the mean energy, $\bar{\epsilon}$, imparted to the matter (see ICRU Report 33).

$$G(x) = (n(x) / \bar{\epsilon})$$

SI Unit: mol J⁻¹ E 170, E10

radiation coefficient—the quotient of the net radiant exitance of a blackbody (full radiator), by the temperature difference between the blackbody and the surroundings with which it is exchanging radiation. E 772, E44

radiation induced (or enhanced) diffusion—atom movement in the solid, well beyond the typical penetration depth of an incident particle, due to particle beam damage or bombardment induced defects. E 673, E42

radiation pattern, n—the optical pattern of light that leaves the media surface, as described by the radiated light intensity at various angles. F 1294, F05

radiation pyrometer—an instrument for determining temperatures by measuring the radiance (radiant energy per unit area) from an object. E 7, E04

radiation thermometer, n—a radiometer calibrated to indicate the temperature of a blackbody. E 344, E20

radiation thermometer, n—an electronic device that relies on the emitted radiation from a target to access the target's temperature. E 344, E20

radioactivation—an interaction process in which the product nucleus becomes radioactive. E 170, E10

radioactive daughter, n—the direct radioactive decay product of a radionuclide. D 1129, D19

radioactive waste, n—waste that emits radiation, generally alpha or beta particles, often accompanied by gamma. E 833, E06

radioactivity, n—spontaneous nuclear disintegration with emission of corpuscular or electromagnetic radiation, or both. D 1129, D19

radioactivity half-life, n—the unvarying characteristic period of time in which one half of the radioactive atoms of a given radionuclide decay. D 1129, D19

radio frequency (r-f) display—the display of an unrectified signal on the CRT or recorder. E 1316, E07

radiograph—a permanent, visible image on a recording medium produced by penetrating radiation passing through the material being tested. E 1316, E07

radiograph—a permanent, visible image on a recording medium produced by penetrating radiation passing through the material being tested. E 1316, E07

radiographic contrast—the difference in density between an image and its immediate surroundings on a radiograph. E 1316, E07

radiographic equivalence factor—that factor by which the thickness

of a material must be multiplied in order to determine what thickness of a standard material (often steel) will have the same absorption. E 1316, E07

radiographic exposure—see **exposure**. E 1316, E07

radiographic inspection—the use of X rays or nuclear radiation, or both, to detect discontinuities in material, and to present their images on a recording medium. E 1316, E07

radiographic inspection—the use of X rays or nuclear radiation, or both, to detect discontinuities in material, and to present their images on a recording medium. E 1316, E07

radiographic quality—a qualitative term used to describe the capability of a radiograph to show flaws in the area under examination. E 1316, E07

radiographic sensitivity—a general or qualitative term referring to the size of the smallest detail that can be seen on a radiograph, or the ease with which details can be seen. E 1316, E07

radiography—the art, act, or process of making radiographs. E 1316, E07

radiography—the process of producing a radiograph using penetrating radiation. E 1316, E07

radioisotope leak test system—a leak test system which uses a radioactive tracer gas and a detector for measuring the emission from the tracer. E 1316, E07

radioisotopes, n—radionuclides having the same atomic number. D 1129, D19

radiological examination—the use of penetrating ionizing radiation to display images for the detection of discontinuities or to help ensure integrity of the part. E 1316, E07

radiological examination—the use of penetrating ionizing radiation to display images for the detection of discontinuities or to help ensure integrity of the part. E 1316, E07

radiology—the science and application of X rays, gamma rays, neutrons, and other penetrating radiations. E 1316, E07

radiology—the science and application of X rays, gamma rays, neutrons, and other penetrating radiations. E 1316, E07

radiometer, n—a device for measuring radiant power that has an output proportional to the intensity of the input power. E 344, E20

radiometer, n—instrument for measuring radiation in energy or power units. E 349, E21

radiometer—instrument for measuring irradiance in energy or power units. E 772, E44

radiometer—an instrument for measuring the intensity of radiant energy. In infrared thermography, an apparatus that measures the average apparent temperature of the surface subtended by its field of view. E 1316, E07

radiometer, n—a general class of instruments designed to detect and measure radiant energy. G 113, G03

radiometric, adj—pertaining to measurement of quantities associated with radiant energy. E 284, E12

radiometric properties and quantities modifiers—modifiers that can be used to indicate the geometric, spectral, and polarization conditions under which radiometric properties and quantities are evaluated. Radiometric properties and quantities vary with the direction and geometric extent (solid angle) over which the incident or exitant flux, or both, is evaluated, and with the relative spectral distribution of the incident flux and the spectral response of the detector for exitant flux. For reflectance and transmittance, the direction and geometric extent of both the incident beam and exitant beam must be specified. For emittance, only the exitant beam need be specified, and for absorptance, only the incident beam need be specified. The properties also vary with the polarization of the incident flux and the sensitivity to polarization of the collector-detector system for flux incident or exitant at angles greater than about 15° from normal. See the following modifiers: **conical**; **directional**; **hemispherical**; **normal**; and **spectral**. E 772, E44

radiometry, n—measurement of quantities associated with radiation. E 284, E12

radiometry, n—measurement of the quantities associated with radiation. **E 349, E21**

radioscopic inspection—the use of penetrating radiation and radioscapy to detect discontinuities in material. **E 1316, E07**

radioscopy—the electronic production of a radiological image that follows very closely the changes with time of the object being imaged. **E 1316, E07**

radioscopy—the electronic production of a radiological image that follows very closely the changes with time of the object being imaged. **E 1316, E07**

radiosonde, n—a miniature radio transmitter with instruments that is carried aloft (as by an unmanned balloon) for broadcasting by means of precise tone signals or other suitable method the humidity, temperature, pressure, or other parameter every few seconds. **D 1356, D22**

radius of bend, n—the radius of the cylindrical surface of the pin or mandrel that comes in contact with the inside surface of the bend during bending. In the case of free or semi-guided bends to 180° in which a shim or block is used, the radius of bend is one half the thickness of the shim or block. **E 6, E28**

radius of influence of a well—distance from the center of the well to the closest point at which the piezometric surface is not lowered when pumping has produced the maximum steady rate of flow. **D 653, D18**

raggle—same as reglet. **C 717, C24**

raid end band—See **brace band**. **F 552, F14**

rail, n—a horizontal, inclined, or vertical member of a railing system, such as top, intermediate, or bottom member connecting pickets or posts, or both, at specified intervals. (Compare **handrail**.)

rail—See **railing systems, windows and doors**.

rail cap—See **railing systems**.

railing—See **railing systems**. **E 631, E06**

rail, n—a horizontal, inclined, or vertical member of a railing system, such as top, intermediate, or bottom member connecting balusters or posts, or both, at specified intervals. (Compare **handrail**.) **E 1481, E06**

rail—magazine component required for alignment of fastener and directing it into driving channel. **F 592, F16**

rail cap—Synonym for **cap rail**. **E 1481, E06**

rail end—a cup-shaped fitting used with a brace band to connect the top rail or brace to a post. **F 552, F14**

railing—See **banding**. **D 1038, D07**

railing, n—Use **railing system**. **E 1481, E06**

railing return—a bent at the end of a handrail, turning toward the wall or post to which the handrail is attached. **E 631, E06**

railing system—See **railing systems**.

railing return—a bent at the end of a handrail, turning toward the wall or post to which the handrail is attached. **E 1481, E06**

railing system—a framework of horizontal, inclined, vertical, and infill members, including panels and grillwork, for protection of building occupants against fall or injury and for offering safety and convenience in their movement. (Compare **guardrail**.)

railing systems:

baluster, n—(baluster bar) same as **picket**.

balustrade, n—a **railing system** consisting of a row of **pickets** capped by a **handrail**.

bottom rail—the lowest member of a **railing system**, supporting **pickets** or **panels**.

cap, n—a fitting used to close the end of a **pipe**, tubular **post**, **newel**, or **rail**.

cap rail—a **handrail** fastened to the **top rail** of a **railing system**.

collar, n—Same as **escutcheon**.

cover flange—Same as **escutcheon**.

drop cap—the cover of a railing **post** or **newel** that is exposed to view, usually below stringer or **floor**.

easement, n—the curved portion of a **handrail** forming a

transition in the vertical plane between horizontal and inclined sections of **handrail**.

escutcheon, n—a protective or ornamental cover located at the termination of a **post**, **picket**, or **rail** against a tread, **floor**, or wall. Same as **collar**, **cover flange**.

finial, n—an ornamental piece on the top of a **post**, **newel**, or **railing**; frequently in the form of an **urn** or **pineapple**, and so named.

flange plate—a flat (piece) between the end of a **railing** or rail element and the adjoining construction or supporting member.

grab bar—Same as **grab rail**.

grab rail—a short length of **rail** or similar member located for safety or convenience to assist a person in movement.

guardrail system—a **railing system** located for protection of building users at or near the outer edge of a **stair**, ramp, landing, platform, balcony, or accessible roof; at the perimeter of an opening or accessible surface, such as the opening of a **stair**; or at a location where an operating condition requires access limitation to guard against accidental fall and injury. Compare **railingsystem**.

handgrip, n—the part of a **handrail** designed to provide a secure grasp.

handrail, n—a horizontal or sloping member normally grasped by hand for guidance or support.

handrail bracket—a device attached to a wall, **post**, or other surface to support the **handrail**.

handrail height—the vertical distance from the top surface of the **top rail** to the surface of the finished **floor**, top of a ramp, or the nosing line of stair treads.

kick plate—Same as **toe board**.

lamb's tongue—an ornamental curved or tapered fitting terminating a **handrail**, usually tapered to the tip.

lateral scroll—a fitting that curves in a horizontal plane, used to terminate a **handrail**; often ending as a round plate covering the top of a **post**.

mid rail—a rail located between **top** and **bottomrails**.

miter ending—a square, angular, or dovetailed member end, designed to fit an adjacent matching member, thereby providing continuity of profile at the joint.

newel, n—(1) a decorative or structural **post** member, often extending above a **handrail** at the start or end of a **stair** run; usually square or rectangular in cross section, supporting the end of a stair railing or serving as the common support for two stair railings; often supporting a stair stringer and platform. (2) the center **post** of a spiral **stair**.

ogee, n—a molding with a profile having a double curve formed by a convex line turning into a concave line, and resulting in an S-shape.

panel, n—in a **railing system**, a flat element between a **post**, **top rail** and **bottom rail**.

picket, n—one of a series of closely spaced upright members that support the **handrail** in a **railing system**. Same as **baluster**, **baluster bar**.

picket casting—an ornamental element attached to a **picket**.

picket railing system—a system consisting of **posts**, **pickets**, **top rail** and **bottom rail**.

pineapple, n—a **finial** in the form of a pineapple.

pipe railing system—a **railing system** fabricated from **pipe**.

post, n—in **railing systems**, a vertical supporting member. Compare **column**.

rail, n—a horizontal, inclined, or vertical member of a **railingsystem** connecting **pickets** or **posts**, or both, at specified intervals. Compare **handrail**.

rail cap—Same as **cap rail**.

railing, n—Use **railing system**.

railing system—a framework of horizontal, inclined, or vertical members, **panels**, grillwork, or their combinations that

railing system

- support a **handrail**; located at the edge of a **stair** flight, platform, or **floor** as a safety barrier. Compared **guardrail system**, **stair rail system**.
- railing-system penetration limitation*—an arrangement of railing elements designed to prevent passage of a sphere of specified diameter through a **railing system**.
- ramp-rail system*—a **railing system** located alongside a ramp.
- screen, n*—in a **railing system**, a perforated sheet or **wire mesh** in sheet form serving as a **panel**.
- scroll, n*—in a **railing system**, a cast or forged ornamental spiral of convoluted shape serving, for example, as a decorative **panel** or insert.
- side mount*—a railing support that anchors the **post** of a **railing system** to a vertical surface, such as fascia or stair stringer.
- spindle, n*—in a **railing system**, a tapered, round **picket** having a center portion larger in diameter than its ends.
- stair-rail system*—a **rail** or **railing system** located along a **stair** or landing.
- toe board*—in a **railing system**, a vertical plate forming a low curb at the open edge of a stairwell, platform, or floor; to provide a barrier preventing objects from falling beyond it. Same as **kick plate**, **toeplate**.
- toe plate*—Same as **toe board**.
- top rail*—the uppermost member of a **railing system**.
- traffic-rail system*—a **railing system** designed to control the movement of people and requiring special consideration for given conditions.
- transfer-rail system*—a **railing system** designed to support and to permit transfer of body weight in such locations as toilets, showers, and tub enclosures.
- urn, n*—a **finial** in the form of an urn.
- volute, n*—in a **railing system**, an ornamental spiral or *scroll*-shaped form serving, for example, as **handrail** termination.
- wall clip*—a bracket used for anchoring to a wall. Same as **wall flange**.
- wall flange*—Same as **wall clip**.
- wall handrail*—a **handrail** attached to a wall adjacent to a stair, and paralleling the **pitch** of the stair flight; also used along landings, walkways, ramps, and corridors. Same as **wall rail**.
- wall rail*—Same as **wall handrail**.
- wall railing return*—in a **railing system**, a bend at the end of a **wall handrail**, turning toward the wall to which the **handrail** is attached.
- wire mesh*—Same as **screen**.
- railing-system penetration limitation*—See **railing systems**.
- ramp-rail system*—See **railing systems**. E 631, E06
- railing system**—a framework of horizontal, inclined, vertical, and infill members, including panels and grillwork, for protection of building occupants against fall or injury and for offering safety and convenience in their movement. (Compare **guardrail**.) E 1481, E06
- railing-system penetration limitation**—an arrangement of railing elements designed to prevent passage of a sphere of specified diameter through a railing system. E 1481, E06
- railroading, n**—the printing of a continuous mark or line in the plain area of the design that often results in a definite marking or scratching of the engraved cylinder. D 6488, D01
- railroad tracks, n**—a pattern on the printed sheet extending in the machine direction that is comprised of one or more linear regions. D 6488, D01
- rainbowing**—colored patterns in a transparency produced by the photo-elastic molecular nature of the material and stress gradients in the transparency in which certain angles and light polarizations in relation to some windscreen designs may produce localized bands of color in the transparency, often referred to as birefringence. F 2429, F07
- rain density, n*—See **particle concentration**. G 40, G02
- rainfastness**—The maintenance of biological effectiveness of an agrichemical formulation following a rain or overhead irrigation event. E 609, E35
- rainfastness agent**—a material which improves rainfastness. E 1519, E35
- rainwater harvesting, n**—the practice of collecting, storing, and using precipitation from a catchment area such as a roof. E 2114, E06
- raise**—upwardly constructed shaft; that is, an opening, like a shaft, made in the roof of one level to reach a level above. (ISRM) D 653, D18
- raised fiber surface, n**—in *textile fabrics*, intentionally lifted fibers or yarns such as pile, napped, tufted, flocked, or similar surfaces. D 123, D13
- rake**—the sloped edge of a roof at the first or last rafter. D 1079, D08
- RAM**—random access memory. F 1457, F05
- Raman line (band)**—a line (band) that is part of a Raman spectrum. E 131, E13
- Raman shift**—the displacement in wavenumber of a Raman line (band) from the wavenumber of the incident monochromatic beam. E 131, E13
- Raman spectrum**—the spectrum of the modified frequencies resulting from inelastic scattering when matter is irradiated by a monochromatic beam of radiant energy. E 131, E13
- ramming mix, n**—a refractory material, usually tempered with water, that cannot be extruded but that has suitable properties to permit ramming into place to form a monolithic structure. C 71, C08
- ramp-rail system**—a railing system located along the open sides of a ramp. E 631, E06
- random sample*—see **representative sample**. E 631, E06
- ramp-rail system**—a railing system located along the open sides of a ramp. E 1481, E06
- ranch type, adj**—in *shingles*, pertaining to a type of roofing, rectangular in shape, that is lapped at the top and one side. C 1154, C17
- ranch type**—a type of asbestos-cement roofing shingle, rectangular in shape, which is lapped at the top and one side. D 2946, C17
- random assess memory, n**—an electronic data storage system in which the data can be stored and retrieved directly from any memory location. (See **ROM**.) F 1457, F05
- random cause, n**—one of many factors which contribute to variation but which are not feasible to detect and identify since they are random in origin and usually small in effect. D 123, D13
- random composite sample, n**—for *asbestos*, a composite sample in which each individual bag in the lot that is being sampled has an equal chance of being included in the composite sample. D 2946, C17
- random error, n**—the chance variation encountered in all test work despite the closest control of variables. D 4175, D02
- random error, n**—(1) the chance variation encountered in all measurement work, characterized by the random occurrence of deviations from the mean value; (2) an error that affects each member of a set of data (measurements) in a different manner. D 5681, D34
- random error of result, n**—a component of the error which, in the course of a number of test results for the same characteristic, varies in an unpredictable way. E 456, E11
- random errors, n**—errors introduced by the printer, reader, operator, or other system element; errors that are encountered during one scan that may not be encountered during the next scan. F 1294, F05
- randomization, n**—the procedure used to allot treatments at random to the experimental units so as to provide a high degree of independence in the contributions of experimental error to estimates of treatment effects. E 456, E11
- randomization, n**—the procedure used to allot treatments at random to the experimental units so as to provide a higher degree of

independence in the contributions of experimental error to estimates of treatment effects.

NOTE—An essential element in the design of experiments is to provide estimates of effects free from biases due to undetected assignable causes within the experimental space. Randomization is a process to minimize this risk. The operational procedure for assignment *at random* involves the use of random numbers or some similar method for assuring that each unit has an equal chance of being selected for each treatment. **E 1325, E11**

randomized block design, *n*—a design in which the experiment space is subdivided into blocks of experimental units, the units within each block being more homogeneous than units in different blocks. **E 456, E11**

randomized block design, *n*—a design in which the experiment space is subdivided into blocks of experimental units, the units within each block being more homogeneous than units in different blocks.

NOTE—In each block the treatments are allocated randomly to the experimental units within each block. Replication is obtained by the use of two or more blocks, depending on the precision desired, and a separate randomization is made in each block. **E 1325, E11**

randomized block experiment, *n*—a kind of experiment which compares the averages of *k* different treatments that appear in random order in each of *b* blocks. **D 123, D13**

randomized block factorial design, *n*—a factorial experiment run in a randomized block design in which each block includes a complete set of factorial combinations. **E 456, E11**

randomized block factorial design, *n*—a factorial experiment run in a randomized block design in which each block includes a complete set of factorial combinations. **E 1325, E11**

random loading—in fatigue loading, a spectrum loading (straining) where the peak and valley forces (strains) and their sequence result from a random process; the loading (straining) is usually described in terms of its statistical properties, such as the probability density function, the mean, the root mean square, the irregularity factor, and others as appropriate. **E 1823, E08**

random-ordered loading—in fatigue loading, a spectrum loading that is generated from a distinct set of peak and valley forces into a loading sequence by using a specific random sequencing process; a sequence of finite length is usually repeated identically. **E 1823, E08**

random orientation—a condition of a polycrystalline aggregate in which the constituent crystals have orientations completely random with respect to one another. **E 7, E04**

random sample, *n*—for asbestos, a sample in which each individual bag in the lot examined has an equal chance of being included in the sample. **D 2946, C17**

random sample, *n*—a sample selected from a population using random sampling. **E 1605, E06**

random sampling, *n*—the process of selecting units for a sample of size *n* in such a manner that all combinations of *n* units under consideration have an equal or ascertainable chance of being selected as the sample. **D 123, D13**

random sampling—technique for selecting a sample of *n* elements from a population of elements in such a way that each combination of *n* elements has the same probability of being selected. **E 631, E06**

random sampling—in statistical sampling, the process of selecting sample units in such a way that all units under consideration have the same probability of being selected. **E 631, E06**

random sampling—technique for selecting a sample of *n* elements from a population of elements in such a way that each combination of *n* elements has the same probability of being selected. **E 1605, E06**

random sampling—method of sample selection for fasteners in a lot where each fastener has an equal and independent chance of being selected for the sample. **F 1789, F16**

random variance of increment collection (unitvariance)—See *random variance of increment collection (unit variance)* under **variance**.

D 121, D05

D 1356, D22

range—See **analyzer**.

range, *n*—of a thermometer of thermometric system, a set of temperatures within specified lower and upper temperature limits.

E 344, E20

range, *n*—region between the limits within which a quantity is measured, and is expressed by stating the lower and upper range-values. **E 631, E06**

range—the maximum sound path length that is displayed.

E 1316, E07

range—the absolute value of the algebraic difference between the highest and the lowest values in a set of data. **E 1547, E15**

range, *n*—the region between the limits within which a quantity can be measured, which is expressed by stating the lower and upper limits (adapted from E 344). **E 1605, E06**

range—equipment for cooking food by direct or indirect heat transfer from one or more cooking units, to one or more cooking containers. **F 1827, F26**

range, data, *n*—the absolute value of the difference between the highest and lowest values in a set of data. **A 644, A04**

range, exposure—See **exposure scale**. **E 7, E04**

range (of a deformation-measuring instrument)—the amount between the maximum and minimum quantity an instrument can measure without resetting. In some instances provision can be made for incremental extension of the range. **D 653, D18**

range, *R*, *n*—the largest observation minus the smallest observation in a set of values or observations. **E 456, E11**

range, specification (non-statistical), *n*—the absolute value of the difference between the highest (USL) and lowest (LSL) specified values; for compliance with a non-statistical range, each valid individual test result must lie at, or within, the specification limits.

$$LSL \leq \text{All } x_i \leq USL$$

A 644, A04

range, specification (statistical), *n*—the absolute value of the difference between the highest (USL) and lowest (LSL) specified values; for compliance with a statistical range, all calculated values from the mean (\bar{x}) minus *M* times the standard deviation(s) to the mean plus *M* times the standard deviation, where *M* is a matter of agreement between the supplier and purchaser, must not lie outside of the specification limits.

$$LSL \leq \bar{x} - M \times s \quad \text{and} \quad \bar{x} + M \times s \leq USL$$

A 644, A04

rank, *n*—of coal, a classification designation that indicates the degree of metamorphism, or progressive alteration, from lignite to anthracite.

anthracite, *n*—the rank of coal, within the anthracitic class of Classification D 388, such that on the dry and mineral-matter-free basis, the volatile matter content of the coal is greater than 2 % but equal to or less than 8 % (or the fixed carbon content is equal to or greater than 92 % but less than 98 %), and the coal is nonagglomerating.

anthracitic class, *n*—a class of rank consisting of semianthracite, anthracite, and meta-anthracite.

bituminous class, *n*—a class of rank consisting of high volatile C bituminous coal, high volatile B bituminous coal, high volatile A bituminous coal, medium volatile bituminous coal, and low volatile bituminous coal.

high volatile A bituminous coal, *n*—the rank of coal, within the bituminous class of the Classification D 388, such that on the dry and mineral-matter-free basis, the volatile matter content of the coal is greater than 31 % (or the fixed carbon content is less than 69 %), and its gross calorific value is equal to or greater than 14 000 Btu/lb (32.65 MJ/kg) of coal on the moist, mineral-matter-free basis, and the coal is commonly agglomerating.

high volatile B bituminous coal, *n*—the rank of coal, within the

- bituminous class of Classification D 388, such that, on the moist, mineral-matter-free basis, the gross calorific value of the coal in British thermal units per pound is equal to greater than 13 000 (30.24 Mj/kg) but less than 14 000 (32.54 Mj/kg) and the coal commonly agglomerates.
- high volatile C bituminous coal, *n***—the rank of coal, within the bituminous class of Classification D 388, such that, on the moist, mineral-matter-free basis, the gross calorific value of the coal in British thermal units per pound is equal to or greater than 11 500 (26.75 Mj/kg) but less than 13 000 (30.24 Mj/kg) and the coal commonly agglomerates, or equal to or greater than 10 500 (24.42 Mj/kg) but less than 11 500 (26.75 Mj/kg) and the coal agglomerates.
- lignite A, *n***—the rank of coal, within the lignitic class of Classification D 388, such that, on the moist, mineral-matter-free basis, the gross calorific value of the coal in British thermal units per pound is equal to greater than 6300 (14.65 Mj/kg) but less than 8300 (19.31 Mj/kg), and the coal is nonagglomerating.
- lignite B, *n***—the rank of coal, within the lignitic class of Classification D 388, such that, on the moist, mineral-matter-free basis, the gross calorific value of the coal in British thermal units per pound is less than 6300 (14.65 Mj/kg), and the coal is nonagglomerating.
- lignitic class, *n***—a class of rank consisting of lignite A and lignite B.
- low volatile bituminous coal, *n***—the rank of coal, within the bituminous class of Classification D 388, such that, on the dry and mineral-matter-free basis, the volatile matter content of the coal is greater than 14 % but equal to or less than 22 % (or the fixed carbon content is equal to or greater than 78 % but less than 86 %), and the coal commonly agglomerates.
- medium volatile bituminous coal, *n***—the rank of coal, within the bituminous class of Classification D 388, such that, on the dry and mineral-matter-free basis, the volatile matter content of the coal is greater than 22 % but equal to or less than 31 % (or the fixed carbon content is equal to or greater than 69 % but less than 78 %), and the coal commonly agglomerates.
- meta-anthracite, *n***—the rank of coal, within the anthracite class of Classification D 388, such that, on the dry and mineral-matter-free basis, the volatile matter content of the coal is equal to or less than 2 % (or the fixed carbon is equal to or greater than 98 %), and the coal is nonagglomerating.
- semianthracite, *n***—the rank of coal, within the anthracitic class of Classification D 388, such that, on the dry and mineral-matter-free basis, the volatile matter content of the coal is greater than 8 % but equal to or less than 14 % (or the fixed carbon content is equal to or greater than 86 % but less than 92 %), and the coal is nonagglomerating.
- subbituminous class, *n***—a class of rank consisting of subbituminous C coal, subbituminous B coal, and subbituminous A coal.
- subbituminous C coal, *n***—the rank of coal, within the subbituminous class of Classification D 388, such that, on the moist, mineral-matter-free basis, the gross calorific value of the coal in British thermal units per pound is equal to greater than 8300 (19.31 Mj/kg) but less than 9500 (22.10 Mj/kg), and the coal is nonagglomerating.
- subbituminous B coal, *n***—the rank of coal, within the subbituminous class of Classification D 388, such that, on the moist, mineral-matter-free basis, the gross calorific value of the coal in British thermal units per pound is equal to greater than 9500 (22.10 Mj/kg) but less than 10 500 (24.42 Mj/kg) and the coal is nonagglomerating.
- subbituminous A coal, *n***—the rank of coal, within the subbituminous class of Classification D 388, such that, on the moist, mineral-matter-free basis, the gross calorific value of the coal in British thermal units per pound is equal to greater than 10 500 (24.42 Mj/kg) but less than 11 500 (26.75 Mj/kg) and the coal is nonagglomerating.
- ranked set sampling, *n***—a sampling method in which samples are ranked by the use of auxiliary information on the samples and only a subset of the samples are selected for the measurement of the primary variable. **D 5681, D34**
- ranking, *n***—a method in which an assessor arranges a set of samples in order of a defined criterion. **E 253, E18**
- ranney collector**—an underground water collection system sometimes called ranney wells. **D 6161, D19**
- RAP**—reclaimed asphalt pavement **D 8, D04**
- rappel, *n***—the set up of anchors and equipment used to rappel. **F 1773, F08**
- rappel, *v***—to descend by sliding down a rope using equipment or special technique, or both, which applies friction, thereby controlling the speed of descent. **F 1773, F08**
- rappel device, *n***—a friction device used on a rope to control the speed while rappelling. **F 1773, F08**
- rare earth screens**—see **intensifying screen**. **E 1316, E07**
- raspberry**—See **strawberry**. **D 1079, D08**
- raster**—SIMS, the two-dimensional pattern swept out by the deflection of a primary ion beam. **E 673, E42**
- raster output scanner, *n***—an output peripheral, that converts computer data into a bit mapped image, which is sent to the host for storage or a printer for output. (See **ROS**.) **F 1457, F05**
- ratchet lock slider, *n***—a slider with a locking mechanism that permits the slider to slip along the chain upon application of a predetermined force so as to prevent damage that would impair either the service or use of either the slider or chain. **D 123, D13**
- ratchet lock slider, *n***—a slider with a locking mechanism that permits the slider to slip along the chain upon application of a predetermined force so as to prevent damage that would impair either the service or use of either the slider or chain. **D 2050, D13**
- ratchet nail**—bright, regular-stock-steel, $\frac{3}{4}$ to 2 by 0.120-in. nails with single-crest annular ratchet thread, flat $\frac{3}{8}$ -in. head and medium diamond point. **F 547, F16**
- ratchets**—the portion of both the female and the male members possessing inclined teeth that forms the locking mechanism. **F 921, F04**
- ratchet thread**—type of buttress thread, usually annular for engagement with nailing channels, retaining clips, etc. **F 547, F16**
- ratch-setting by number ($L1 \% N$), *n***—the basis for setting roll spacing in the drafting zone, namely, the length exceeded by 1 % of the number of fibers in a test specimen. **D 123, D13**
- ratch-setting by number ($L1 \% N$), *n***—the basis for setting roll spacing in the drafting zone, namely, the length exceeded by 1 % of the number of fibers in a test specimen. **D 7139, D13**
- rate**—the quantity of pesticide applied per unit treated. **E 609, E35**
- rated power, *n***—See **reported power**. **E 1328, E44**
- rated strength**—the strength in tension of a stranded conductor calculated in accordance with specification requirements. **B 354, B01**
- rate, event count (\dot{N}_e)**—the time rate of the event count. **E 1316, E07**
- rate of creep, *n***—the slope of the creep-time curve at a given time. **D 907, D14**
- rate of creep, *n***—the slope of the creep-time curve at a given time. **D 4439, D35**
- rate of creep, *n***—the slope of the creep-time curve at a given time. **E 6, E28**
- rate of growth**—the rate at which a tree has grown. The unit of measure is the number of annual growth rings per inch, measured radially in the trunk or in lumber cut from the trunk. **D 9, D07**
- rate-of-oil flow, *n***—the rate at which a specified oil will pass through a sintered porous compact under specified test conditions. **B 243, B09**

- rate of return**—the percentage yield on an investment per unit time. **E 631, E06**
- rate of return, n** —the percentage yield on an investment per unit time. **E 833, E06**
- rate of rise**—in leak testing, the time rate of pressure increase at a given time in a vacuum system which is suddenly isolated from the pump by a valve. The volume and temperature of the system are held constant during the rate of rise measurement. (See **isolation test**.) **E 1316, E07**
- rate of roughness**—sum of the roughness divided by longitudinal distance covered by the blanking band. **E 867, E17**
- rater, n** —a person having primary responsibility for organizing and conducting the rating process for a building or building-related facility. **E 631, E06**
- rating, n** —a quantitative or qualitative scale for evaluation of a specific property. **D 123, D13**
- rating, n** —statement that, as part of a certificate, sets forth special conditions, privileges, or limitations. See 14 CFR Part 1. **F 2395, F38**
- rating curve, sediment**—a graph of the relationship between stream discharge and sediment discharge at a stream cross section. The graph is sometimes called a *sediment transport curve*. **D 4410, D19**
- rating process, n** —the process of determining the serviceability of a facility for a specified purpose. **E 631, E06**
- rating process, n** (processus d'évaluation)—the process of determining the serviceability of a facility for a specified purpose. **E 1480, E06**
- rating scale, n** —for a topic of facility serviceability, a set of descriptions of combinations of features, in which each description has been selected to indicate a specific level of serviceability on a scale from the lowest to the highest level likely to be encountered. **E 631, E06**
- rating scale (échelle d'évaluation)**—(for an aspect of facility serviceability) set of descriptions of combinations of features, in which each combination has been selected to indicate a specific level of serviceability on a scale from the lowest to the highest level likely to be encountered. **E 631, E06**
- rating scale (échelle d'évaluation)**—(for an aspect of facility serviceability) set of descriptions of combinations of features, in which each combination has been selected to indicate a specific level of serviceability on a scale from the lowest to the highest level likely to be encountered. **E 1480, E06**
- rating score (résultat d'évaluation)**—result (expressed as a number) of finding the combination of features described in a specified rating scale (for one aspect of serviceability) that matches most closely the attributes present in a facility. **E 631, E06**
- rating score (résultat d'évaluation)**—result (expressed as a number) of finding the combination of features described in a specified rating scale (for one aspect of serviceability) that matches most closely the attributes present in a facility. **E 1480, E06**
- ratioed spectrum, n** —the calculated ratio of two single-beam spectra, one of which is a background spectrum. **E 131, E13**
- rationalized erosion rate, n** —in liquid impingement erosion, an erosion rate for impingement tests expressed in dimensionless form as follows: the volume of material lost per unit volume of (liquid or solid) particles impinging, both determined for the same area. **G 40, G02**
- ratio scaling, n** —scaling method in which values are assigned to the intensity of attributes in proportion to the assessor's perception of the intensity of the attributes with reference to a selected standard. **E 253, E18**
- raveled strip test, n** —in fabric testing, a strip test in which the specimen is cut wider than the specified testing width and an approximately even number of yarns are removed from each side to obtain the required testing width. **D 123, D13**
- raveled strip test, n** —in fabric testing, a strip test in which the specimen is cut wider than the specified testing width and an approximately even number of yarns are removed from each side to obtain the required testing width. **D 4850, D13**
- raveling, n** —loss of pavement surface material involving the dislodging of aggregate particles and degradation of the bituminous binder. **E 867, E17**
- raveling, n** —loss of pavement surface material involving the dislodging of aggregate particles and degradation of the bituminous binder. **E 1778, E17**
- raw batch**—a glass charge without cullet. **C 162, C14**
- raw coal**—for the purpose of Test Method D 4749, any coal, regardless of its topsize, that has not been manually or mechanically cleaned. Crushed coal that has not been mechanically cleaned (including coal that has not been through a breaker which normally rejects oversize) is considered to be raw coal. Coal delivered to the surface from an underground mine is considered to be raw coal even when crushing and grinding is done underground. Coal removed from the pit of a surface mine is considered to be raw coal even when breaking and crushing facilities are provided *in the pit*. **D 121, D05**
- raw cotton, n** —ginned lint that has not been subjected to any textile manufacturing process. (See also **ginned lint**.) **D 123, D13**
- raw cotton, n** —ginned lint that has not been subjected to any textile manufacturing process. (See also **ginned lint**.) **D 7139, D13**
- raw count, n** —the enumeration of the cell population not corrected for coincidence. **F 2312, F04**
- raw cullet**—a glass charge made totally of cullet. **C 162, C14**
- raw glaze**—See **raw glaze** under **glaze**. **C 242, C21**
- rawhide**—cattlehide that has been dehaired, limed, often stuffed with oil or grease, and has sometimes undergone other preparation, but has not been tanned. It is used principally for mechanical purposes, such as belt lacings, loom pickers, gaskets, pinions, gears, and for hand luggage, shoe laces, snowshoes, etc. **D 1517, D31**
- raw material**—material components (tubing, insulators, and wires) as received, prior to any manufacturing procedures. **E 344, E20**
- raw material**—material components (tubing, insulators, and wires) used in fabrication of the sheathed thermocouple material. **E 344, E20**
- raw material, n** —a general term used to denote starting materials, reagents, and solvents intended for use in the production of intermediates, APIs, or products. **E 2363, E55**
- raw material manufacturer**—organization which manufactures rod, wire, or bar, used to produce mechanical fasteners, from raw material it manufactures and controls in terms of chemistry and mechanical properties. **F 1789, F16**
- raw petroleum coke, n** —petroleum coke that has not been calcined. **D 4175, D02**
- raw refractory dolomite, n** —see **dolomite, raw refractory**. **C 71, C08**
- raw streak**—an undertanned center layer of leather, visible in cross section as a light-colored streak, especially as applied to heavy leather. **D 1517, D31**
- raw water**—water which has not been treated. Untreated water from wells, surface sources, the sea or public water supplies. **D 6161, D19**
- raw wool, n** —wool or hair of the sheep in the grease, pulled, or scoured state. **D 123, D13**
- raw wool, n** —wool or hair of the sheep in the grease, pulled, or scoured state. **D 4845, D13**
- Rayleigh wave**—an ultrasonic surface wave in which the particle motion is elliptical and the effective penetration is approximately one wavelength. **E 1316, E07**
- Rayleigh wave, v_R (LT^{-1})**—dispersive surface wave in which element has retrograding elliptic orbit with one major vertical and one minor horizontal component both in plane of propagation velocity:

$$v_R = \alpha v_t \text{ with } 0.910 < \alpha < 0.995 \text{ for } 0.25 < v < 0.5$$

rayon—a manufactured fiber composed of regenerated cellulose, as well as manufactured fibers composed of regenerated cellulose in which substituents have replaced not more than 15 % of the hydrogens of the hydroxyl groups.

***rubber**—a manufactured fiber in which the fiber-forming substance is comprised of natural or synthetic rubber, including the following categories:

1. A manufactured fiber in which the fiber-forming substance is a hydrocarbon such as natural rubber, polyisoprene, polybutadiene, copolymers of dienes and hydrocarbons, or amorphous (noncrystalline) polyolefins.

2. A manufactured fiber in which the fiber-forming substance is a copolymer of acrylonitrile and a diene (such as butadiene) composed of not more than 50 % but at least 10 % by weight of acrylonitrile units ($(\text{CzCH}_2\text{CzCH}(\text{Cz}))_n$).

|
CN

The term "lastrile" may be used as a generic description for fibers falling within this category.

3. A manufactured fiber in which the fiber-forming substance is a polychloroprene or a copolymer of chloroprene in which at least 35 % by weight of the fiber-forming substance is composed of chloroprene units ($(\text{CzCH}_2\text{CzClC}_x\text{CH}(\text{Cz})\text{CH}_2\text{Cz})_n$).

|
Cl

D 123, D13

rayon pulps—pulps used in the manufacture of rayon, and subject to various specifications by the manufacturers, including those of purity, moisture content, sheet properties, and viscosity.

D 1695, D01

RCRA—Resource Conservation and Recovery Act of 1976.

E 631, E06

RCRA generators—those persons or entities that generate hazardous wastes, as defined and regulated by RCRA.

D 5681, D34

RCRA generators list—list kept by EPA of those persons or entities that generate hazardous wastes, as defined and regulated by RCRA.

D 5681, D34

RCRA TSD facilities—those facilities on which treatment, storage, or disposal, or a combination thereof, of hazardous wastes takes place, as defined and regulated by RCRA.

D 5681, D34

RCRA TSD facilities list—list kept by EPA of those facilities on which treatment, storage, or disposal, or a combination thereof, of hazardous wastes takes place, as defined and regulated by RCRA.

D 5681, D34

R-curve, *n*—a plot of crack-extension resistance as a function of stable crack extension.

C 1145, C28

R-curve—a plot of crack-extension resistance as a function of stable crack extension, Δa_p or Δa_e .

E 1823, E08

R_a and b , *n*—for the purpose of this test method for color, the daylight color of opaque cotton specimens represented by points in a space as described by Hunter in terms of three color scales: reflectance, R_d , and the chromaticity coordinates for redness or greenness, $+a$ and yellowness or blueness, $+b$.

D 123, D13

R_d and $+b$, *n*—for the purpose of this test method for color, the daylight color of opaque cotton specimens represented by points in a space as described by Hunter in terms of three color scales: reflectance, R_d , and the chromaticity coordinates for redness or greenness, $\pm a$ and yellowness or blueness, $\pm b$.

D 7139, D13

RDF-5—solid fuel derived from municipal solid waste in which the processed combustible fraction is densified (compressed) into the form of pellets, cubettes or briquettes.

D 5681, D34

reach—the section of a sewer between structures.

C 896, C04

reactant—in grouting, a material that reacts chemically with the base component of grout system.

D 653, D18

reaction—any change in chemical composition accompanied by a change of enthalpy.

E 1142, E37

reaction, *n*—any transformation of material accompanied by a change of enthalpy which may be endothermic or exothermic.

E 1445, E27

reaction effect, *n*—the personnel injury, facility damage, product loss, downtime, or mission loss that could occur as the result of an oxygen fire.

G 126, G04

reaction hydrogen embrittlement (RHE)—hydrogen can react with itself, with the matrix, or with a foreign element in the matrix and form new phases that are usually quite stable, and embrittlement is not reversible.

F 2078, F07

reaction induction time (RIT) value, *n*—the time a chemical compound or mixture may be held under isothermal conditions until it exhibits a specified exothermic reaction.

E 1445, E27

reaction isotherm—in a temperature-concentration phase diagram, a tie-element at constant temperature, representing univariant equilibrium among three or more phases.

E 7, E04

reaction isotherm—a temperature-concentration phase diagram, a tie-element at constant temperature representing univariant equilibrium among three or more phases, (E 7, E04).

E 1142, E37

reaction rate—the number of a given reaction that occur per target nucleus per unit time. When appropriate this term may be interpreted as a probability of reaction per unit time.

E 170, E10

reaction to fire, *n*—response of a material in contributing by its own decomposition to a fire to which it is exposed, under specified conditions.

E 176, E05

reactivation (revivification)—oxidation processes for restoring the adsorptive properties of a spent sorbent.

D 2652, D28

reactive aggregate—an aggregate containing siliceous material (usually in amorphous or crypto-crystalline state) which can react chemically with free alkali in the cement.

D 653, D18

reactive monomer, *n*—in solventless electrical varnish, a substance that, when added to a resin, will combine chemically with that resin under specified conditions.

D 1711, D09

reactive particulates, *n*—a particle or particles present in a clay body, which when near the surface may flake off or cause an eruption (pop-outs) of the surface when exposed to the weather.

C 43, C15

reactivity—reactivity is the reaction between substances, which can be monitored by some measure, either qualitative or quantitative. In the Lime Industry, it is commonly used to refer to the reaction between limestone, quicklime and/or a related material and another substance such as water, acid or SO_x .

C 51, C07

reactivity, *n*—rate at which another material will form compounds with carbon or graphite.

C 709, D02

reactivity—the ability to react. For proper use of the term, the reaction in question and the conditions should be stated and the parameter used in measuring reactivity indicated, such as rate, uniformity, or the like.

D 1695, D01

reactivity, *n*—rate at which another material will form compounds with carbon or graphite.

D 4175, D02

read area—one of several terms used to refer to the scan path or scan area.

F 149, F05

read area, *n*—area covered by a scanner. Bar codes must reliably pass through the read area with the length of the symbol parallel to the scan plane.

F 1294, F05

reader, *n*—a device used for machine reading of bar codes that usually consists of a scanner, a decoder, and a data communications interface.

F 1294, F05

reading, *n*—in dataacquisition, the reduction of data points that represent the operating conditions observed in the time period as defined in the test procedure.

D 4175, D02

reading, *n*—numerical value obtained from a digital display or indicated on a scale or dial of an apparatus or instrument.

E 631, E06

reading, *n*—numerical value obtained from a digital display or indicated on a scale or dial of an apparatus or instrument.

E 1605, E06

- read ink*—See **scan ink**. F 149, F05
- read only memory, *n***—a form of electronic memory from which the system can extract information, but which cannot be altered or added to. F 1457, F05
- readout instrumentation*—See **analyzer**. D 1356, D22
- read-through, *n***—an effect observed on thin surfaces coated with leaded paint on the far side that falsely increases an XRF measurement on the near side. E 1605, E06
- ready-mixed plaster, *n***—a calcined gypsum plaster with aggregate added during manufacture. C 11, C11
- ready temperature**—a predetermined starting temperature point for the washing energy test, which may vary with each dishwasher. F 1827, F26
- reagent**—a chemical used to react with another chemical, often to confirm or deny the presence of the second chemical. E 1605, E06
- reagent blank**—a reference standard or correction factor obtained by subjecting one or more reagents to test conditions. D 4790, D16
- reagent blank**—a digestate that reflects the maximum treatment given any one sample within a sample batch except that it has no sample initially placed into the digestion vessel. (The same reagents and processing conditions that are applied to field samples within a batch are also applied to the reagent blank.) E 631, E06
- real area of contact, *n***—*in tribology*, the sum of the local areas of contact between two solid surfaces, formed by contacting asperities, that transmit the interfacial force between the two surfaces. (Contrast with **apparent area of contact**.) G 40, G02
- real discount rate**—the rate of interest reflecting that portion of the time value of money related to the real earning power of money over time.
- real dollars*—See **constant dollars**.
- rebuild*—See **building modification**. E 631, E06
- real discount rate, *n***—the rate of interest reflecting that portion of the time value of money related to the real earning power of money over time. E 833, E06
- real dollars, *n**—See **constant dollars**. E 833, E06
- real image**—a reproduction of an object by an optical system which gathers light from an object point and transforms it into a beam that converges toward another point. E 1316, E07
- real property**—land and rights in land, ground improvements, utility distribution systems, and buildings and other structures, including any fixtures permanently installed therein. Real property is tangible property other than moveable property or tangible intellectual property. E 2135, E53
- real-time radioscopy**—radioscopy that is capable of following the motion of the object without limitation of time. E 1316, E07
- real-time radioscopy**—radioscopy that is capable of following the motion of the object without limitation of time. E 1316, E07
- ream**—in flat glass, layers of glass that are not homogeneous with the main body of the glass. C 162, C14
- ream of paper (news and wrapping), *n***—500 sheets each 610 by 914 mm (24 by 36 in.). D 4175, D02
- rearfoot stability**—the stability of the heel seat. (See **stability**) F 869, F08
- rearm delay time*—see **time, rearm delay**. E 1316, E07
- reboil**—reappearance of bubbles in molten glass after it previously appeared plain. C 162, C14
- reboiling**—gas evolution occurring and recurring during repeated firing of the ground coat; sometimes a defect. C 286, B08
- rebonded fused grain refractory, *n***—a fired refractory brick or shape made predominantly or entirely from fused grain. C 71, C08
- rebound, *n***—the gunned material not adhering to the gunned or shotcreted surface during the gunning process. C 71, C08
- rebuild, *v**—to return to **building** to its previous state or condition. E 631, E06
- recalcitrant**—a substance that is resistant to microbial degradation. F 1600, F20
- recalescence**—the increase in temperature which occurs after under-
- cooling because the rate of liberation of heat during transformation of a material exceeds the rate of dissipation of heat. E 7, E04
- recalescence, *n***—the sudden increase in temperature of reference material in the supercooled state upon nucleation and crystal growth, due to the release of latent heat of fusion of the reference material. E 344, E20
- receiver, *n***—any individual or organization who receives or accepts the product delivered by the supplier. D 4175, D02
- receiver, *n***—the portion of a photometric instrument that receives the viewing beam from the specimen, including a collector such as an integrating sphere, if used, often the monochromator or spectral filters, the detector, and associated optics and electronics. E 284, E12
- receiver**—in solar energy systems, that part of the solar collector to which the solar irradiance is finally directed or redirected, and includes the absorber and any associated glazings through which the redirected energy must pass. E 772, E44
- receiver plane, *n***—the plane containing the specimen normal and the axis of the receiver. E 284, E12
- receiving room**—*in architectural acoustical measurements*, the room in which the sound transmitted from the source room is measured. C 634, E33
- receptor, *n***—humans or other species potentially at risk from exposure to contaminant(s) at the point(s) of exposure. D 5681, D34
- receptor, *n***—a cellular structure that mediates the physiological response to the presence of physical or chemical agents. E 253, E18
- receptor, *n**—see **receiver**. E 284, E12
- receptor**—the component of the carbonless papers which is chemically coated or treated to develop or receive the colorless dyes or pigments respectively. F 549, F05
- receptor, *n***—the material which receives on its surface an image from a thermal printing process. F 1623, F05
- recessed edge, *n**—see **tapered edge**. C 11, C11
- recipe, *n***—a formula, mixing procedure, and any other instructions needed for the preparation of a product. D 1566, D11
- recipient, *n***—the individual or organism into whom materials are grafted or implanted. F 2312, F04
- reciprocal lattice**—a lattice of points each of which represents a set of planes in the crystal lattice, such that a vector from the origin of the reciprocal lattice to any point is normal to the crystal planes represented by that point and has a length which is the reciprocal of the plane spacing. E 7, E04
- reciprocal linear dispersion, *n***—the derivative $d\lambda/dx$ where λ is the wavelength and x is the distance along the spectrum. E 135, E01
- reciprocity**—bilateral relationship where both parties have the same rights and obligations towards each other, (ISO Guide 2). E 1187, E36
- reciprocity law, *n***—the statement that in a photochemical reaction a constant effect is produced if the product of time and radiant power is a constant. E 135, E01
- recirculating dip tank**—a dip tank provided with a means for keeping the slip in constant circulation. C 286, B08
- recirculating nozzle*—see **by-pass nozzle**. E 1620, E29
- reclaim**—overspray that is removed from the spray booth and reconditioned for use. C 286, B08
- reclaim, *n**—See **reclaimed rubber**, the preferred term. D 1566, D11
- reclaimed asphalt pavement (RAP), *n***—asphalt pavement or paving mixture removed from its original location for use in recycled asphalt paving mixture. D 8, D04
- reclaimed, rosin, *n***—rosin that has been recovered or reclaimed by any means from waste or deteriorated material, provided that the concentration of rosin acids is not below that normal for rosin, and any residual or contaminating component from the waste material itself or from any article used in the recovery process is not in sufficient quantity to cause the physical or chemical properties of the reclaimed product to differ materially from those of rosin. D 804, D01

reclaimed rubber, n

reclaimed rubber, n—vulcanized rubber treated by a combination of heat, chemical agents, and intense kneading to give a material with essentially its pre-vulcanized plasticity, which is useful as a rubber compounding material. **D 1566, D11**

reclaiming—the removal of contaminants and products of degradation such as polar, acidic, or colloidal materials from used electrical insulating liquids by chemical or adsorbent means. **D 2864, D27**

reclaiming, n—the use of cleaning methods during recycling primarily to remove insoluble contaminants, thus making the oil suitable for further use. The methods may include settling, heating, dehydration, filtration, and centrifuging. **D 4175, D02**

reclamation, n—actions taken to restore mined land to a post mining land use approved by the regulatory authority. **E 2201, E50**

recoatability—the application characteristics of a polish and the appearance of the film after successive coatings to a surface. **D 2825, D21**

recognition agreement—agreement that is based on the acceptance by one party of results, presented by another party, from implementation of one or more designated functional elements of a certification system, (ISO Guide 2). **E 1187, E36**

recognition test, n—a family of procedures that are based exclusively on responses that are elicited by the examinee's identification of crime-related stimuli that have been imbedded among irrelevant but similar stimuli. Among the more common recognition tests are: the Peak of Tension, Concealed Information Test, reaction time tests, saccadic eye movement test, and evoked potentials P300 odd-ball paradigm tests. The acquaintance (or stimulus) test could also be considered a recognition test. Recognition tests require that the test developer know the crime-related information so that it can be determined whether the examinee also knows this information. This limitation restricts the usefulness of recognition tests to only those circumstances. In contrast to deception tests, recognition tests are not designed to test for involvement in a crime, but only whether the examinee is familiar with the crime details. **E 2035, E52**

recognized laboratory—a laboratory recognized under an Accreditation Program. **E 1605, E06**

recoil implantation or knock-on—the injection, due to collisions caused by incident particles, of surface or near surface atoms into the bulk along the path of the incident beam. **E 673, E42**

recommendation, n—in building constructions, a written suggestion for policy, practice, conduct, design, or material, implying endorsement but not requiring compliance (see **guideline**). **E 631, E06**

reconciliation—a comparison of two or more estimate values by independent cost professionals for the purpose of reaching consistency in the estimate assumptions, parameters, and scope of work. **reconstruct**—See **building modification**.

reconstruction—See **building modification**. **record set drawing**—See **drawing**. **E 631, E06**

reconciliation, n—a comparison of two or more estimate values by independent cost professionals for the purpose of reaching consistency in the estimate assumptions, parameters, and scope of work. **E 833, E06**

reconditioning—the removal of insoluble contaminants, moisture, and dissolved gases from used electrical insulating liquids by mechanical means. **D 2864, D27**

reconstituted sample—a sample of frozen ground which has been permitted to thaw before being refrozen for the performance of mechanical and other tests. **D 7099, D18**

reconstruct, v—to reproduce in the exact form and detail a **building**, structure, or **artifact** as it appeared at a specific period in time. **E 631, E06**

reconstruction, n—the act or process of reproducing by new construction the exact form and detail of a vanished **building**, other structure, or **artifact** as it appeared at a specific period in time. **E 631, E06**

record, n—a document stating results achieved or providing evidence of activities. **E 1605, E06**

recorded land title records—records to be searched during a chain of title search, including records of fee ownership, leases, land contracts, easements, liens, and other encumbrances on or of the property recorded in the place where land title records are recorded, by law or custom, for the local jurisdiction in which the property is located. (Such records are commonly kept by a municipal or county recorder or clerk.) Such records may be obtained from title companies or from the local government agency directly. **D 5681, D34**

recorded land title records—records of fee ownership, leases, land contracts, easements, liens, and other encumbrances on or of the property recorded in the place where land title records are, by law or custom, recorded for the local jurisdiction in which the property is located. (Commonly, such records are kept by a municipal or county recorder or clerk.) Such records may be obtained from title companies or directly from the local government agency. Information about the title to the property that is recorded in a U.S. district court or any place other than where land title records are, by law or custom, recorded for the local jurisdiction in which the property is located, are not considered part of recorded land title records. **D 5681, D34**

recording media—material capable of capturing or storing, or both, a radiological image in digital or analog form. **E 1316, E07**

recording medium—a film or detector that converts radiation into a visible image. **E 1316, E07**

recording medium—a light-sensitive material which detects the interference between the object beam and the reference beam. Typical recording media used in holography are silver halide film, thermoplastic film and electronic detectors, such as video tubes and CCD arrays. **E 1316, E07**

record set drawing—See **drawing**. **E 1480, E06**

record set drawing (as-built drawing), n (dessin de l'ouvrage fini (dessin d'après exécution))—construction drawing revised to show changes made during the construction process, usually based on marked-up prints, drawings, and other data furnished by the contractor. **E 631, E06**

records of emergency release notifications (SARA § 304)—Section 304 of EPCRA or Title III of SARA requires operators of facilities to notify their local emergency planning committee (as defined in EPCRA) and State emergency response commission (as defined in EPCRA) of any release beyond the facility's boundary of any reportable quantity of any extremely hazardous substance. Often the local fire department is the local emergency planning committee. Records of such notifications are "records of emergency release notifications" (SARA § 304). **D 5681, D34**

recoverable elongation (CE), n—of rope, elongation which may be reclaimed after a period of relaxation after the rope was cyclic tensioned. **D 123, D13**

recovered material, n—materials and byproducts that have been separated, diverted, or removed from the solid waste stream, but not including those materials and byproducts generated from and reused within an original manufacturing process. **D 1968, D06**

recovered materials, n—waste material and by-products which have been recovered or diverted from the waste stream, but such term does not include those materials and by-products generated from, and commonly used within, an original manufacturer process. **E 2114, E06**

recovered paper material, n—paper materials that have been separated, diverted, or removed from the solid waste stream excluding the virgin content of mill broke, for the purpose of use, reuse, or recycling, whether or not such materials require subsequent separation and processing. **D 1968, D06**

recovering—the process of covering an existing roofing system with a new roofing system. **D 1079, D08**

recovery, n—the percent of the valuable component (that is, Btu or combustible) from the feed that reports to the froth concentrate product. **D 121, D05**

recovery, *n*—the degree to which a rubber product returns to its normal dimensions after being distorted. **D 1566, D11**

recovery, *n*—the obtaining of cells or tissues which may be used for the production of TEMPs. **F 2312, F04**

recovery, *delayed elastic*—See **delayed elastic recovery**.
D 4848, D13

recovery *immediate elastic*—See **immediate elastic recovery**.
D 4848, D13

recovery, percent, *n*—the amount of a material actually recovered by an assay using a prescribed procedure, or obtained from a process, as a percentage of the as-received material. **D 5681, D34**

recovery *tensile strain*—See **tensile strain recovery**. **D 4848, D13**

recovery time—the time required for a test system to return to its original state after it has received a signal. **E 1316, E07**

recovery time—the time from the removal of the food product from the cooking equipment until the cooking medium, cavity, or surface (see **cooking medium, cooking cavity, or cooking surface**) is back up to temperature as indicated by thermostat(s) controlling the cooking medium, cavity, or surface cycling at their set point(s), *t_{recovery}*. **F 1827, F26**

recovery—Y (conversion)—the ratio of product quantity (permeate stream flow rate) over the feed quantity (feed stream flow rate), given as fraction or in percent. **D 6161, D19**

recrystallization, *n*—the formation of a new grain structure through a nucleation and growth process. **A 941, A01**

recrystallization—the formation of a new grain structure through nucleation and growth commonly produced by subjecting a metal, that may be strained, to suitable conditions of time and temperature. **E 7, E04**

recrystallization annealing, *n*—**annealing** a cold-worked steel object to produce a new grain structure without a change in phase. **A 941, A01**

recrystallization temperature, *n*—the approximate minimum temperature at which recrystallization of a cold-worked steel object occurs within a specified time. **A 941, A01**

recrystallized grain size—(1) the grain by heating following cold work where the time and temperature are so chosen that, while recrystallization is complete, essentially no grain growth has occurred.

(2) in aluminum and magnesium alloys, the grain size after recrystallization, without regard to grain growth or the recrystallization conditions. **E 7, E04**

recrystallized limestone—a limestone in which a new pattern of crystallinity has pervasively replaced the crystal orientation in the original clastic particles, fossils or fossil fragments, and interstitial cement. The new generation of crystals, encompassing both fragmental and matrix materials, extends across boundaries between former crystals. The new crystals generally are larger than those of the original rock. Evidence of original textures may or may not be retained. See also **marble** (next section). **C 119, C18**

rectal temperature, *t_{br}*, *n*—temperature in the anal canal as measured by a **contact thermometer**. **E 344, E20**

rectification—the conversion of alternating into direct current. **B 374, B08**

rectifier—a device that converts alternating into direct current by virtue of a characteristic permitting appreciable flow of current in only one direction. **B 374, B08**

recuperative furnace—a melting furnace having a recuperator. **C 162, C14**

recuperator—a continuous heat exchanger in which heat from exhaust gases is conducted through flue walls to incoming air. **C 162, C14**

recyclable, *adj*—capable of being removed, separated, or diverted from the solid waste stream in an available program, established by, but not limited to, manufacturers, retailers, or municipalities; processed and returned to use in the form of raw materials or products. **D 996, D10**

recyclable cartridge—a cartridge that is recyclable by its manufac-

turer through an established recycling program that the manufacturer makes available to the majority of its customers. **F 335, F05**

recycle, *v*—a multiphased processing that includes removal, separation, and/or diversion, of materials from the solid waste stream; use of such materials as raw materials for the manufacture of new products; and the use of the new product. **D 1968, D06**

recycle, *v*—recovering or reprocessing materials for use in the form of raw materials in the manufacture of new products other than fuel for producing heat or power by combustion. **E 2114, E06**

recycled, *adj*—diverted, separated, or removed from the solid waste stream, processed and returned to use in the form of raw materials or products. **D 996, D10**

recycled asphalt paving mixture, *n*—a mixture of reclaimed asphalt pavement with the inclusion, if required, of asphalt cement, emulsified asphalt, cut-back asphalt, recycling agent, mineral aggregate, and mineral filler. **D 8, D04**

recycled cartridge—a used cartridge that contains some or all parts that have been reused. **F 335, F05**

recycled content, *n*—the percent of a packaging material that is composed of recycled material. **D 996, D10**

recycled content, *n*—the sum, normally expressed as a percent by weight, of post-industrial or pre-consumer recycled material plus post-consumer recycled material. **F 141, F06**

recycled content paper, *n*—a paper product containing recycled fiber expressed as a percentage of total fiber weight, or a paper product containing recovered material (excluding wood residues and sawdust) expressed as a percentage of total product weight. **D 1968, D06**

recycled content products, *n*—products that contain **pre-consumer** or **post-consumer** materials as all or part of their feedstock. **E 2114, E06**

recycled engine coolant, *n*—engine coolant formulated using other than virgin materials. **D 4725, D15**

recycled fiber, *n*—*in paper*, fiber derived from recovered material, excluding wood residues and sawmilling residues, which has been repulped or reintroduced into the paper manufacturing process and made into a product or form usable in the manufacture of a product. **D 1968, D06**

recycled fiber content, *n*—the percentage of recycled fiber, by total fiber weight, of a paper product. **D 1968, D06**

recycled paper, *n*—a paper product whose fiber content consists totally of recycled fiber. **D 1968, D06**

recycled plastic, *n*—those plastics composed of post-consumer material or recovered material only, or both, that may or may not have been subject to additional processing steps of the types used to make products such as recycled-regrind or reprocessed or reconstituted plastics. **D 883, D20**

recycled wool, *n*—*as defined in the Wool Products Labeling Act as amended in 1980*, “the resulting fiber when wool has been woven or felted into a wool product which, without ever having been utilized in any way by the ultimate consumer, subsequently has been made into a fibrous state, or the resulting fiber when wool or reprocessed wool has been spun, woven, knitted, or felted into a wool product which, after having been used in any way by the ultimate consumer, subsequently has been made into a fibrous state.” **D 123, D13**

recycled wool, *n*—*as defined in the Wool Products Labeling Act as amended in 1980*, “the resulting fiber when wool has been woven or felted into a wool product which, without ever having been utilized in any way by the ultimate consumer, subsequently has been made into a fibrous state, or the resulting fiber when wool or reprocessed wool has been spun, woven, knitted, or felted into a wool product which, after having been used in any way by the ultimate consumer, subsequently has been made into a fibrous state.” **D 4845, D13**

recycling, *n*—*in petroleum technology*, the acquisition of oil that has become unsuitable for its intended use, and processing it to regain useful materials. **D 4175, D02**

recycling agent (RA), *n*—a blend of hydrocarbons with or without

recycling agent (RA), *n*

minor amounts of other materials that is used to alter or improve the properties of the aged asphalt in a recycled asphalt paving mixture. **D 8, D04**

red—that temperature at which the intensity of 650 nm light reflected by the liquid crystal is maximum, symbolized as T^{*650} . **E 344, E20**

red edge—{archaic} numerous rouge pits located around the edges of a large sheet of polished plate glass. **C 162, C14**

redox (ORP) electrode—a metallic electrode, usually platinum, used to follow reversible oxidation-reduction reactions. The potential developed between the redox electrode and reference electrode is a Nernstian function of the ratio of a species in two different oxidation states. Redox (ORP) electrodes are primarily used to determine a species in one oxidation state by titration with a reagent that oxidizes or reduces the species being determined. **D 4127, D19**

redox (ORP) potential—the potential developed by a metallic electrode when placed in a solution containing a species in two different oxidation states. Some sensing electrodes, notably the early silver billet electrodes, act as redox (ORP) electrodes as well as sensing electrodes in certain types of solutions, leading to measurement errors. **D 4127, D19**

redox (ORP) titration—a titration in which the ratio of two different oxidation states of a species is changed by the incremental addition of an oxidizing or reducing agent. A redox (ORP) electrode, which responds to the logarithm of the ratio of the activities of the two oxidation states, is used to follow the titration. Among the many substances that can be determined in this manner are H_2O_2 , I_2 , Fe^{+3} , MnO_4^- , and Sn^{+4} . Differential titrations are possible in some cases. **D 4127, D19**

redox potential—the potential of a reversible oxidation-reduction electrode measured with respect to a reference electrode, corrected to the hydrogen electrode, in a given electrolyte. **G 15, G01**

reduced diameter body—fastener having a body diameter not less than the minimum pitch diameter of its thread nor more than its minimum full body diameter. **F 1789, F16**

reduced metal powder, *n*—metal powder produced, without melting, by the chemical reduction of metal oxides or other compounds. **B 243, B09**

reduced viscosity—see **viscosity, reduced**. **D 1695, D01**

reducible sulfur—any form of sulfur or sulfur compounds in paper or paperboard that can be converted to hydrogen sulfide on treatment with a metal such as aluminum and an acid under the conditions of a specified test; it is a measure of the quantity of sulfur compounds in the paper or paperboard that may react with metals to cause tarnishing. **D 1968, D06**

reducing agent—a compound that causes reduction, thereby itself becoming oxidized. **B 374, B08**

reducing agent—a batch ingredient that lowers the state of oxidation of the melt. **C 162, C14**

reducing end groups—those terminal glucose units in cellulose or its derivatives in which the 1-position is not substituted or involved in a glycosidic linkage. These end groups will reduce Fehling's solution or similar reagents. **D 1695, D01**

reducing substances—impurities in pyridine that decolorize a solution of potassium permanganate of specified composition in Method D 2031. **D 4790, D16**

reduction—a reaction in which electrons are added to a reactant. More specifically, the addition of hydrogen or the abstraction of oxygen. Such a reaction takes place, for example, at the cathode in electrolysis. **B 374, B08**

reduction—the gain of electrons by a constituent of a chemical reaction. **G 15, G01**

reduction of area, *n*—the difference between the original cross-sectional area of a tension test specimen and the area of its smallest cross section. The reduction of area is usually expressed as a percentage of the original cross-sectional area of the specimen. **E 6, E28**

reduction of area—difference, expressed as a percentage, of the

original cross sectional area of a tensile test specimen at its minimum cross section after fracture. **F 1789, F16**

reed mark, *n*—*inwoven fabrics*, a crack between groups of warp ends, either continuous or at intervals. **D 123, D13**

reed mark, *n*—*inwoven fabrics*, a crack between groups of warp ends, either continuous or at intervals. **D 3990, D13**

reedy warp—See **reed mark**. **D 3990, D13**

reel—a cylindrical device that has a rim at each end and an axial hole for a shaft or spindle, and on which the product is wound to facilitate handling and shipping. (Also called a “spool.”) **B 846, B05**

reentrant corner—an inside corner of a surface, producing stress concentrations in the roofing or waterproofing membrane. **D 1079, D08**

reevaluation—a visual evaluation/risk assessment that is performed according to a Standard Reevaluation Schedule. **E 1605, E06**

referee sample, *n*—*for asbestos*, a sample on which acceptability is based. Acceptability shall be based on a composite sample if the lot is 200 bags or less, or on a master composite sample if over 200 bags, but not in excess of 2000 bags. **D 2946, C17**

referee test—a test made to settle a disagreement as to conformance to specified requirements. **F 412, F17**

reference beam—laser radiation impinging directly upon the recording medium through optical components and which typically does not contain information about the test object. In some tests, the reference beam may be reflected or scattered from a portion of the object surface. In this case, any object information contained in the reference beam is cancelled in the object beam by the interference between the object beam and the reference beam. **E 1316, E07**

reference beam angle—the angle formed between the center line of the reference beam and the normal to the recording medium. **E 1316, E07**

reference block—a block that is used both as a measurement scale and as a means of providing an ultrasonic reflection of known characteristics. **E 1316, E07**

reference cell calibration constant, *n*—a number that expresses the calibration of a photovoltaic reference cell in terms of short-circuit current per unit incident irradiance at a given temperature. **E 1328, E44**

reference coil—a coil or probe, which may be used in conjunction with the appropriate material, to electrically balance a comparative system. **E 1316, E07**

reference compound (NMR)—a selected material to whose signal the spectrum of a sample may be referred for the measurement of chemical shift (see also **chemical shift**). **E 131, E13**

referenced standards—those which contain guidelines or nondated requirements germane to one or more elements of the host standard. **F 1789, F16**

reference edge—the edge of the form used to align the form so that the nominal reading line will be parallel to the direction of scanning. Depending on the equipment used, this may be any edge of the form. **F 149, F05**

reference electrode—that half of the electrode pair which provides a constant potential regardless of solution composition. The potential developed by the sensing electrode is measured against this reference potential to give an overall system potential which can be converted to the level of the species sensed. **D 4127, D19**

reference electrode—the electrode (for example, hydrogen electrode, normal calomel electrode, or saturated calomel electrode) against which the electrical potential of a specimen is measured. **E 1823, E08**

reference electrode—electrode having a stable and reproducible potential, which is used in the measurement of other electrode potentials. **G 15, G01**

reference electrode filling solution—a concentrated salt solution contacting the internal reference element and the sample solution. The composition of the filling solution is chosen to maximize stability of the potentials developed at the internal reference element/filling solution interface and the filling solution/sample

- junction. In general, filling solutions for AgCl internal construction reference electrodes should: (1) contain Cl^- and be saturated with AgCl to prevent the reference element from dissolving; (2) be at least ten times higher in total ionic strength than the sample; (3) be equitransferent; (4) not contain the ion being measured or an ion that interferes with the measurement. **D 4127, D19**
- reference facility**, *n*—NIST, or a testing laboratory whose physical standards are traceable to NIST or another national standards laboratory. **E 344, E20**
- reference junction**—that junction of a thermocouple which is held at a known temperature. **E 7, E04**
- reference junction**, *n*—that junction of a thermocouple which is at a known temperature. **E 344, E20**
- reference junction**—that junction of a thermocouple which is maintained at a known temperature. **E 1142, E37**
- reference junction correction**—a correction in terms of electromotive force (millivolts) to be applied to the electromotive force generated by a thermocouple to compensate for the difference between the actual temperature of the reference junction and that used as the basic reference junction temperature in standard conversion tables. **E 7, E04**
- reference junction correction**—correction in the terms of electromotive force to be applied to the electromotive force generated by a thermocouple to compensate for the difference between the actual temperature of the reference junction and that used as the basic reference junction temperature in the standard conversion tables, (E 7, E04). **E 1142, E37**
- reference load [F]**—*forspectrum loading*, used in Practices E 1049 to denote the loading level that represents a steady-state condition upon which load variations are superimposed. The reference load may be identical to the mean force of the history, but this is not required. **E 1823, E08**
- reference material**—a material or substance, one or more properties of which are sufficiently well established to be used for the assessment of a measurement method or for assigning values to materials. **E 7, E04**
- reference material**—a material or substance one or more properties of which are sufficiently well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials (ISO Guide 30–1981 (E)). **E 131, E13**
- reference material**, *n*—the material in a freezing-point cell that melts and freezes during use, the freezing point of which can establish a reference temperature. **E 344, E20**
- reference material**—material of definite composition that closely resembles in chemical and physical nature the material with which the analyst expects to deal, and that is employed for calibration or standardization. **E 631, E06**
- reference material**—material or substance, one or more properties of which are sufficiently well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials, (ISO Guide 2, A). **E 1187, E36**
- reference material**—for lead hazard control, a paint, dust, soil or air particulate material having a known lead level as certified by the material supplier. See **Certified ReferenceMaterial**. **E 1605, E06**
- reference material**, *n*—a material or substance, one or more of whose property values are sufficiently homogeneous and well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials. **E 1732, E30**
- reference material**, *n*—a material with known performance. **G 113, G03**
- reference material (RM)**, *n*—a material or substance of which one or more properties are sufficiently well established to enable the material to be used for the calibration of an apparatus, the assessment of a method, or the assignment of values to similar materials. **D 4175, D02**
- reference material (RM)**—the generic term referring to a certified material. **D 5681, D34**
- reference material (RM)**, *n*—material or substance one or more of whose property values are sufficiently homogeneous and well established to be used for the calibration of an apparatus, the assessment of a measurement method, or for assigning values to materials. **E 135, E01**
- reference materials**—the standard penetrant materials against which candidate materials for qualification are compared. **E 1316, E07**
- reference material (standard reference material) (SRM)**—a material of known composition where the lead level is certified by the manufacturer. **E 631, E06**
- reference mortar**, *n*—mortar of the same composition as an admixed mortar except that the reference mortar does not include the admixture and may contain a different amount of water to obtain an equivalent flow or penetration as the admixed mortar. **C 1180, C12**
- reference neutron field*—see **benchmark neutron field**. **E 170, E10**
- reference oil**, *n*—an oil of known performance characteristics, used as a basis for comparison. **D 4175, D02**
- reference point**, *n*—a temperature at which a thermometer is checked for changes in the bulb volume. **E 344, E20**
- reference sample**, *n*—a matrix whose analytes of interest are of known or accepted concentration or property. **D 1129, D19**
- reference sample**, *n*—a sample designated as the one to which all others are to be compared. **E 253, E18**
- reference sediment**—a whole sediment near an area of concern used to assess sediment conditions exclusive of material(s) of interest. **E 943, E47**
- reference specimen**, *n*—a portion of the reference material that is to be exposed. **G 113, G03**
- reference spectrum**, *n*—an established sample spectrum. **E 131, E13**
- reference standard**, *n*—*in cotton testing*, a homogeneous lot of cotton having a known or accepted value for one or more physical properties. **D 123, D13**
- reference standard**—primary or secondary standards used to calibrate testing apparatus and methods. **D 4790, D16**
- reference standard**, *n*—*in cotton testing*, a homogeneous lot of cotton having a known or accepted value for one or more physical properties. **D 7139, D13**
- reference standard**—a material or device whose properties are determined by comparison to another standard, such as a certified reference material. **E 7, E04**
- reference standard**, *n*—a physical standard used to calibrate a group of laboratory standards. **E 284, E12**
- reference standard**—a tube, plate or part with artificial discontinuities used for establishing the test sensitivity setting and for periodically checking and adjusting sensitivity setting as required. (See also **standard**.) (E 215) **E 1316, E07**
- reference standard**, *n*—a material or object for which all relevant chemical and physical characteristics are known and measurable, used as a comparison for, or standardization of, equipment or instruments used for nondestructive testing. (See also **standardization, instrument**.) **E 1316, E07**
- reference-standard dosimeter**—a dosimeter of high metrological quality, used as a standard to provide measurements traceable to and consistent with measurements made using primary-standard dosimeters. **E 170, E10**
- reference standard, primary**, *n*—a substance that has been shown by an extensive set of analytical tests to be authentic material that should be of high purity. **E 2363, E55**
- reference standard, secondary**, *n*—a substance of established quality and purity, as shown by comparison to a primary reference standard, used as a reference standard for routine laboratory analysis. **E 2363, E55**
- reference temperature**, *n*—a fixed, reproducible temperature, to which a value is assigned, that can be used for the calibration of thermometers or other purposes. **E 344, E20**
- reference temperature**, *n*—a fixed, reproducible temperature, to

reference temperature, n

which a value is assigned, that can be used for the calibration of thermometers or other purposes. E 344, E20

reference temperature, n —the temperature of a phase equilibrium state of a pure substance at a specified pressure, for example, the assigned temperature of a fixed point. E 344, E20

reference temperature source, n —a source of thermal radiant power of known temperature or emissivity, or both, used in the testing of radiation thermometers. E 344, E20

reference tension, n —a low tensile force, generally about 1 % of the rope breaking strength, and used for initial rope tension determination. D 123, D13

reference test fluid, n —a standard glycol-base test fluid, described in Specification D 3585, used by laboratories to evaluate test methods and procedures. D 4725, D15

reference thermometer—a thermometer whose calibration is known within a certain specified accuracy. E 344, E20

reference tire, n —a special tire included in a test program; the test results for this tire have significance as a base value or internal benchmark. F 538, F09

reference viscosity, n —the viscosity of Newtonian standard reference fluids certified at each of several temperatures by the supplier. D 4175, D02

refillable, *adj*—intended to be refilled for its original purpose one or more times in an available program established by, but not limited to, manufacturers, distributors, or retailers. D 996, D10

refilled cartridge—a used cartridge in which the toner has been replaced but none of the other components have been replaced or refurbished. F 335, F05

refined—treated to reduce impurities. D 4790, D16

refined tar, n —tar freed from water by evaporation or distillation which is continued until the residue is of desired consistency; or a product produced by fluxing tar residuum with tar distillate. D 8, D04

refiner—a component of a melting furnace, for the purpose of conditioning the glass. See **nose**. C 162, C14

refiner, n —a two-roll mill with a high friction ratio, used for such operations as processing of reclaimed rubber or slightly scorched mixes and the crushing of impurities. D 1566, D11

refining—See **fining**. C 162, C14

reflectance, n —the fraction of the incident radiation upon a surface that is reflected from the surface. C 168, C16

reflectance—the fraction of incident light that is diffusely reflected, measured relative to magnesium oxide under standard conditions. C 286, B08

reflectance, n —in optical measurement of paper, the ratio of the reflected radiant of luminous flux to the incident flux, measured under specified conditions, expressed as a percentage. D 1968, D06

reflectance, ρ , n —ratio of the reflected radiant or luminous flux to the incident flux in the given conditions. E 284, E12

reflectance, n —ratio of the reflected radiant or luminous flux to the incident flux. Symbol: ρ_e , ρ_v , ρ ; $\pi = \rho_r + \rho_d$.

NOTE—When mixed reflection occurs, the (total) reflectance may be divided into two parts, regular (ρ_r) and diffuse reflectance (ρ_d), corresponding, respectively, to the two modes of reflection referred to above.

In general, the values of the various reflectances depend upon the mode of irradiation, the spectral composition, and state of polarization of the incident radiation. E 349, E21

reflectance—a measurement technique (subset of spectrophotometry; see 3.5) in which light is reflected off of a reflecting surface and measured by a detector. The amount of reflected light may be a function of analyte concentration. E 631, E06

reflectance—the ratio of the radiant flux reflected from a surface to that incident upon it. E 1316, E07

reflectance—the ratio of the response of a light sensor illuminated by diffuse reflection from the paper compared to that when the paper

is replaced by a perfect diffuse reflector. A specially prepared surface of *barium sulfate* is considered to be a perfect diffuse reflector. F 149, F05

reflectance, n —the percentage of incident light reflected from an image area, where zero percent reflectance is black. (See **image density**.) F 1457, F05

reflectance, absolute—the ratio of the total reflectance by a document to the total light incident on the document. F 149, F05

reflectance, absolute, n —the ratio of the total reflectance from a document to the total light incident on that document. F 1294, F05

reflectance density, D_p , n —the negative logarithm to base ten of the reflectance. E 284, E12

reflectance, diffuse—reflected light whose angle of reflection varies from the angle of incidence of the illuminating light, such as reflection from a rough surface. F 149, F05

reflectance, diffuse, n —reflected light whose angle of reflection varies from the angle of incidence of the illuminating light, such as in reflection from a rough surface. F 1294, F05

reflectance, diffuse, or R_d , n —a type of reflectance wherein, on an uneven surface, the angle of reflection is random and independent of the angle of incidence. This is in contrast to directional reflectance where the incident light is reflected in a specific direction that is dependent upon the angle of incidence giving the surface a glossy appearance. E 253, E18

reflectance, directional, n —light energy reflected from a surface at a specified, characteristic angle at greater intensity than at other angles. E 253, E18

reflectance factor, n —ratio of the flux reflected from the specimen to the flux reflected from the perfect reflecting diffuser under the same geometric and spectral conditions of measurement. E 284, E12

reflectance factor at a point on a surface, for the part of the reflected radiation contained in a given cone with apex at the point of the surface, and for incident radiation of given spectral composition and geometric distribution, n —ratio of the radiant flux reflected in the directions delimited by the cone to that reflected in the same directions by a perfect reflecting diffuser identically irradiated.

NOTE—For specularly reflecting surfaces that are irradiated by a source of small solid angle, the reflectance factor may be much larger than unity if the cone includes the mirror image of the source.

NOTE—If the solid angle of the cone approaches zero, or 2π sr, the reflectance factor approaches radiance factor or reflectance, respectively. In instruments called “reflectance spectrophotometers,” the geometrical distribution is, in general, intermediate between these two extreme cases. The readings of these instruments, corrected for photometric-scale errors, wavelength-scale errors, and for deviations of the reflecting standard used from a perfect reflecting diffuser, are spectral reflectance factors. For a given sample, these values depend on the geometrical characteristics of the instrument.

NOTE—The term “directional reflectance” is used currently in the United States in this sense. E 349, E21

reflectance, luminous, n —see **luminous reflectance**. D 2946, C17

reflectance, p —the ratio of the reflected flux to the incident flux. See **radiometric properties and quantities**. E 772, E44

reflectance, R —the ratio of the radiant power reflected by the sample to the radiant power incident on the sample. E 131, E13

reflectance, specular—reflected light whose angle of reflection is equal, or nearly equal, to the angle of incidence of the illuminating light, such as in reflectance from a mirror. F 149, F05

reflectance, specular, n —reflected light whose angle of reflection is equal, or nearly equal, to the angle of incidence of the illuminating light, such as in reflection from a mirror. F 1294, F05

reflected (or refracted) wave—components of wave incident upon second medium and reflected into first medium (or refracted) into second medium. D 653, D18

reflected temperature—the temperature of the energy incident upon and reflected from the measurement surface of a specimen. E 1316, E07

reflecting stem—stem glass containing a colored stripe along its length in a location which, when reflected on the mercury column, allows greater contrast and enables the column to appear tinted.

E 344, E20

reflection, *n*—processes by which incident flux leaves a surface from the incident side.

D 2946, C17

reflection, *n*—of radiant energy, the process by which radiant energy is returned from a material or object. See also **diffuse reflection, mixed reflection, specular reflection.**

E 284, E12

reflection, *n*—return of radiation by a surface without change of frequency of the monochromatic components of which the radiation is composed.

E 349, E21

reflection—the process by which incident flux is returned from the surface of incidence of a stationary sample, without change in frequency.

E 772, E44

reflection—see **echo.**

E 1316, E07

reflection—the process by which the incident flux leaves a surface or medium from incident side, without a change in frequency, but may change polarity. Reflection is usually a combination of specular and diffuse reflection.

E 1316, E07

reflection and refraction loss—that part of transmitted energy lost due to nonuniformity of mediums.

D 653, D18

reflection angle—angle of reflection.

E 772, E44

reflection cracking at joints, *n*—cracks in bituminous overlay surfaces that occur over concrete pavements at joints.

E 867, E17

reflection cracking at joints, *n*—cracks in bituminous overlay surfaces that occur over concrete pavements at joints.

E 1778, E17

reflection density, D_R , *n*—the negative logarithm to base ten of the reflectance factor.

E 284, E12

reflection method—the technique of producing a diffraction pattern by X-rays or electrons which have been reflected from a specimen surface.

E 7, E04

reflection (optical) density, *n*—logarithm to the base 10 of the reciprocal of the reflectance. Symbol: D , $D = -\log_{10} \rho$.

E 349, E21

reflection overspill, *n*—in bispectral photometry, the contribution of reflection to off-diagonal values of the discrete bispectral radiance factor matrix, due to the partial overlap of irradiation and viewing wavebands when nominal irradiation and viewing wavelengths are not equal ($\mu \neq \lambda$).

E 284, E12

reflection (X-ray)—See **diffraction.**

E 7, E04

reflective ink—ink not sensed by the optical scanner, but visible to the human eye. Syn. *blind ink, drop-outcolors, drop-out ink, nonread ink, nonscan ink.*

F 149, F05

reflective insulation, *n*—insulation depending for its performance upon reduction of radiant heat transfer across air spaces by use of one or more surfaces of high reflectance and low emittance.

C 168, C16

reflectivity—the reflectance of a coating so thick that additional thickness does not change the reflectance.

NOTE—See Test Method C 347.

C 286, B08

reflectivity, *n*—reflectance of a layer of material of such a thickness that there is no change of reflectance with increased thickness. Symbol: ρ_∞ .

E 349, E21

reflectivity, ρ_∞ , R_∞ —the reflectance of a material represented by a specimen so thick that further increase in thickness does not significantly change the reflectance.

E 284, E12

reflectivity, R_∞ —the reflectance of a microscopically homogeneous sample with a clean optically smooth surface and of thickness sufficient to be a completely opaque.

NOTE—Reflectivity is a property of a material and reflectance is a property of a sample of the material, with no restriction on thickness or surface topography.

E 772, E44

reflectometer, *n*—instrument for the measurement of quantities pertaining to reflection.

E 284, E12

reflectometer, *n*—instrument for the measurement of quantities pertaining to reflection.

E 349, E21

reflectometer—an instrument for measuring reflectance.

E 772, E44

reflectometry, *n*—technique for measurement of reflectance or reflectance factor.

E 284, E12

reflector, *n*—See **area reflector, line reflector, point reflector.**

E 284, E12

reflector—an interface at which an ultrasonic beam encounters a change in acoustic impedance and at which at least part of the energy is reflected.

E 1316, E07

reflowing—See **flow brightening.**

B 374, B08

reflux, in distillation processes—reflux is the liquid condensate recycle to the top of a distillation column to aid in purification of the overhead product (ethanol).

E 1705, E48

reflux ratio, *R*, *n*—in a distillation column, the ratio of the condensate at the head of the column that is returned to the column (*reflux*) to that withdrawn as product.

D 4175, D02

reflux ratio, *R*, *n*—the ratio of reflux to distillate.

D 4175, D02

refraction, *n*—the deflection from a straight path undergone by a light ray in passing obliquely from one medium (as air) into another (as glass) in which its velocity is different.

D 123, D13

refraction, *n*—change in the direction of propagation of radiation determined by change in the velocity of propagation in passing from one medium to another.

E 284, E12

refraction, *n*—change in the direction of propagation of radiation determined by change in the velocity of propagation in passing from one medium to another.

E 349, E21

refraction angle—see **angle of refraction.**

E 772, E44

refractive dispersion, *n*—the difference between the refractive indexes of a substance for light of two different wavelengths, both indexes being measured at the same temperature. For convenience in calculations, the value of the difference thus obtained is usually multiplied by 10 000.

D 4175, D02

refractive index, *n*—the ratio of the velocity of light (of specified wavelength) in air, to its velocity in the substance under examination. This is the relative index of refraction. If absolute refractive index (that is, referred to vacuum) is desired, this value should be multiplied by the factor 1.00027, the absolute refractive index of air.

D 4175, D02

refractive index, *n*—the ratio of the velocity of light (of specified wavelength) in air, to its velocity in the substance under examination. It may also be defined as the sine of the angle of incidence divided by the sine of the angle of refraction, as light passes from air into the substance. This is the relative index of refraction. If absolute refractive index (that is, referred to vacuum) is desired, this value should be multiplied by the factor 1.00027, the absolute refractive index of air. The numerical value of refractive index of liquids varies inversely with both wavelength and temperature.

D 4175, D02

refractive index, *n*—the phase velocity of radiant power in a vacuum divided by the phase velocity of the same radiant power in a specified medium. When one medium is a vacuum, *n* is the ratio of the sine of the angle of incidence to the sine of the angle of refraction.

E 131, E13

refractive index (electrons)—the ratio of electron wavelength in free space to its wavelength in a material medium.

E 7, E04

refractive index (index of refraction), *n*—the ratio of the velocity of radiation (as light) in the first of two media to its velocity in the second as it passes from one into the other.

D 123, D13

refractometer, *n*—an instrument used to indicate the freezing point of engine coolants by refractive index.

D 4725, D15

refractories, acid, *n*—refractories containing a substantial amount of silica that may react chemically with basic refractories, basic slags, or basic fluxes at high temperatures.

C 71, C08

refractories, basic, *n*—refractories whose major constituent is lime, magnesia, or both, and which may react chemically with acid refractories, acid slags, or acid fluxes at high temperatures.

C 71, C08

refractories, neutral, *n*—refractories that are resistant to chemical attack by both acid and basic slags, refractories, or fluxes at high temperatures.

C 71, C08

refractoriness, *n*

refractoriness, *n*—*in refractories*, the capability of maintaining a desired degree of chemical and physical identity at high temperatures and in the environment and conditions of use. **C 71, C08**

refractory, *adj*—resistant to high temperature. **C 71, C08**

refractory block, *n*—a generally rectangular refractory shape of a size larger than usually can be laid with one hand. All sides may not be plane and parallel. **C 71, C08**

refractory brick, *n*—a generally rectangular refractory shape with one dimension greater than the other two and of a size that usually can be laid with one hand. All sides may not be plane and parallel such as wedges, arches, keys, and circle brick, as shown in Specification C 909. **C 71, C08**

refractory composite coating—a combination of heat-resistant ceramic materials applied to a metallic substrate which may or may not require heat treatment prior to service. This term may also be used for coatings applied to nonmetallic substrates, for example, graphite. **C 286, B08**

refractory fibers, *n*—nonmetallic, inorganic, continuous, or non-continuous filaments having those chemical and physical properties that make them applicable for structures, or as components of systems, that are exposed to environments above 1000°F (538°C). **C 71, C08**

refractory lime—lime (usually of a dolomitic type) that has been extremely hard burned so that it will possess little or no tendency for conversion of the oxides to hydroxides. **C 51, C07**

refractory metal thermocouple, *n*—(1) one whose thermoelements have melting points above 1935 °C (3515 °F), (2) thermocouple whose thermoelements are composed primarily of refractory metals and their alloys. (See also **base metal thermocouple; noble metal thermocouple**.) **E 344, E20**

refractory (pl. -ies), *n*—nonmetallic materials having those chemical and physical properties that make them applicable for structures, or as components of systems, that are exposed to environments above 1000°F (538°C). **C 71, C08**

refractory shape, *n*—any refractory piece forming a stable mass with specific dimensions. **C 71, C08**

refurbish, *v*—*as applied to textile products*, to brighten or freshen up and restore to wearability or use by cleaning such as drycleaning, laundering, or steam cleaning. **D 123, D13**

refurbish, *n*—*as applied to textile products*, to brighten or freshen up and restore to wearability or use by cleaning such as drycleaning, laundering, or steam cleaning. **D 3136, D13**

refurbish—to renovate or return property to, at, or near its original condition. **E 2135, E53**

refurbished component—a used component that has been restored to its original function. **F 335, F05**

refusal—*in grouting*, when the rate of grout take is low, or zero, at a given pressure. **D 653, D18**

refuse-derived fuel (RDF)—RDF-1—Waste used as a fuel in as-discarded form.

RDF-2—Waste processed to coarse particle size with or without ferrous metal separation.

RDF-3—shredded fuel derived from municipal solid waste (MSW) that has been processed to remove metal, glass, and other inorganics. This material has a particle size such that 95 weight % passes through a 2-in. square mesh screen.

RDF-4—Combustible waste processed into powder form—95 weight % passing a 10-mesh screen.

RDF-5—Combustible waste densified (compressed) into the form of pellets, slugs, cubettes or briquettes.

RDF-6—Combustible waste processed into liquid fuel.

RDF-7—Combustible waste processed into gaseous fuel.

D 5681, D34

refuse-derived fuel (RDF-3)—refuse-derived fuel-3 (RDF-3) is defined as a shredded fuel derived from municipal solid waste (MSW) which has been processed to remove metal, glass, and

other inorganic materials. This material has a particle size such that 95 weight % passes through a 2-in. square mesh screen.

NOTE—Other refuse-derived fuel may be classified as follows:

RDF-1—Wastes used in as-discarded form.

RDF-2—Wastes processed to coarse particle size with or without ferrous metal separation.

RDF-4—Combustible waste processed into powder form, 95 weight % passing 10-mesh screening.

RDF-5—Combustible waste densified (compressed) into the form of pellets, slugs, cubettes, or briquettes.

RDF-6—Combustible waste processed into liquid fuels.

RDF-7—Combustible waste processed into gaseous fuel. **E 856, D34**

refuse-derived fuel (RDF)—fuel processed from industrial waste, municipal waste, garbage, or sewage sludge. **E 1705, E48**

refuse derived fuel 3 (RDF-3)—as defined by Committee E38 on Resource Recovery, RDF-3 is a shredded fuel derived from municipal solid waste (MSW) that has been processed to remove metal, glass, and other inorganics. The material has a particle size such that 95 % weight passes through a 2 in. square mesh screen. **E 1705, E48**

regain—see **moisture regain**.

regenerable fiber optic chemical sensor, *n*—an active fiber optic chemical sensor that can be used for repetitive measurements by reviving an otherwise permanently depleted or degraded transduction element by chemical or physical means. **E 131, E13**

regenerated cellulose—cellulose regenerated from a solution of cellulose or from a cellulose derivative. **D 1695, D01**

regeneration, *n*—that part of the operating cycle of an ion-exchange process in which a specific chemical solution is passed through the ion-exchange bed to prepare it for a service run. **D 1129, D19**

regeneration—distillation or elution-type processes for restoring the adsorptive properties of a spent sorbent. **D 2652, D28**

regeneration—in ion exchange systems, the process of using either an acid, alkali, or salt solution to remove the accumulated cations or anions. The cation exchange resins take on hydrogen or sodium ions and the anion exchange resins take on hydroxide ions to restore themselves to the original hydrogen or hydroxide form when using strong acid and strong alkali solutions for the process. **D 6161, D19**

regeneration level, *n*—the total weight of regenerant used per unit quantity of ion-exchange material in a single regeneration. **D 1129, D19**

regenerative biology, *n*—the scientific discipline that endeavors to understand how tissues and organs are replaced naturally. The principles of regenerative biology can be applied in tissue engineering to generate TEMPs. **F 2312, F04**

regenerative furnace—a melting furnace having regenerators. **C 162, C14**

regenerative medicine, *n*—a branch of medical science that applies the principles of regenerative biology to specifically restore or recreate the structure and function of human cells, tissues, and organs that do not adequately regenerate. **F 2312, F04**

regenerator—a cyclic heat interchanger that alternately receives heat from gaseous combustion products and transfers heat to air or gas before combustion. **C 162, C14**

regimen of a stream—characteristics of a stream with respect to flow duration, form of and changes in channel, capacity to transport sediment, and amount of material supplied for transportation. **D 4410, D19**

registered quality assurance system—system that a registration body has found to be in compliance with a designated quality system standard. **F 1789, F16**

registration—procedure by which a body indicates relevant characteristics of a product, process or service, or particulars of a body or person, in an appropriate, publicly available list, (ISO Guide 2). **E 1187, E36**

registration—evaluation of a fastener manufacturing facility's quality assurance system by an accredited registration body resulting in

a certification of full compliance with a designated quality system standard; the registration body shall be accredited by a third party registration accreditation body, for example, ANSI/RAB.

F 1789, F16

reglet, *n*—a continuous groove, slot or recess within a building component surface which receives other components such as flashing, gaskets or anchors; a continuous prefabricated metal or plastic device containing a groove, slot or recess which can be cast into (as a form) or mounted onto a building component surface.

C 717, C24

reglet—a groove in a wall or other surface adjoining a roof surface for the attachment of counterflashing.

D 1079, D08

reglet gasket—See **gasket, lock-strip, reglet type**.

C 717, C24

regression line slope—the slope of a linear regression fit of acceptable *J* and Δ *a* values.

E 1823, E08

regular, *adj*—*for color determination*, used to indicate flux transmitted or reflected in the image-forming state.

D 2946, C17

regular, *adj*—denoting flux reflected or transmitted without diffusion in accordance with the laws of optics.

E 284, E12

regular (direct) transmission, *n*—transmission without diffusion.

E 349, E21

regular point—denoting medium diamond point.

F 547, F16

regular reflection, *n*—see the preferred term, **specular reflection**.

E 284, E12

regular (specular) reflection, *n*—reflection without diffusion in accordance with the laws of optical reflection.

E 349, E21

regular transmission, *n*—transmission without diffusion.

E 284, E12

regular transmittance—ratio of the light flux transmitted without diffusion to the flux incident.

D 883, D20

regular transmittance factor, *T_r*, *n*—the ratio of the flux transmitted by a specimen and evaluated by a receiver to the flux passing through the same optical system and evaluated by the receiver when the specimen is removed from the system.

E 284, E12

regular transmittance, τ_r , *n*—ratio of undiffused transmitted flux to incident flux.

E 284, E12

regular wear, *n*—synonym for *uniform wear*.

F 538, F09

regulation, *n*—a rule prescribing a set of conditions and requirements that have been made mandatory for those under its control, by an executive (administrative) authority.

rehabilitation—See **preservation**.

E 631, E06

regulation, *n* (*règlement*)—rule prescribing a set of conditions and requirements that have been made mandatory for those under its control, by an executive (administrative) authority.

E 1480, E06

reheat behavior, *n*—the changes in length or volume taking place in a fired refractory when subjected to a reheat test.

C 71, C08

reheat test, *n*—the prescribed heat treatment of a fired refractory free of externally applied stresses to determine its linear or volume stability by measurements before and after the heating.

C 71, C08

rehydrated mashed potato dispenser—commercial equipment designed to deliver whipped or mashed potatoes.

F 1827, F26

reinforced base coat, *n*—base coat that has been reinforced with the nonmetallic reinforcing mesh.

E 2110, E06

reinforced concrete pipe—a pipe structure comprised of concrete and steel reinforcement. Such reinforcement is comprised of steel wire, welded wire fabric, or bars, of known strength, formed into a cage and positioned in the concrete wall in a specific location in such a manner that the two materials act together to resist stresses.

C 822, C13

reinforced gummed tape—See **tape**.

D 996, D10

reinforced joint, *n*—a concrete joint bridged by reinforcing steel embedded in both joining parts.

C 717, C24

reinforced membrane—a roofing or waterproofing membrane reinforced with felts, mats, fabrics, or chopped fibers.

D 1079, D08

reinforced plastic—a plastic with high strength fillers imbedded in the composition, resulting in some mechanical properties superior to those of the base resin. (See also **filler**.)

D 883, D20

reinforced plastic—a plastic with high-strength fillers imbedded in

the composition, resulting in some mechanical properties superior to those of the base resin. (See also **filler**.)

F 412, F17

reinforced plastic, *n*—a plastic with high strength fillers imbedded in the composition, resulting in some mechanical properties superior to those of the base resin. (See also **filler**.)

F 1251, F04

reinforced reaction injection molding (RRIM), *n*—the process of using solid reinforcements, such as, glass fiber, mica, or talc in the reaction injection molding process.

D 883, D20

reinforced seam, *n*—*in sewn seams*, a seam that includes an additional layer of material on the face or back side of the seam allowance.

D 123, D13

reinforced seam, *n*—*in sewn seams*, a seam that includes an additional layer of material on the face or back side of the seam allowance.

D 4850, D13

reinforcement—steel in the form of continuous wire, welded wire fabric, or bars embedded in concrete in such a manner that the above referenced concrete and steel act together to resist stresses.

C 822, C13

reinforcement, *n*—the act of increasing the mechanical performance capability of a rubber by the incorporation of materials that do not participate significantly in the vulcanization process.

D 1566, D11

reinforcement, *n*—*in a composite material*, the discrete constituent of a composite material, either fiber or particle, which is contained within the matrix, with a purpose of increasing the strength, or stiffness, or both.

D 3878, D30

reinforcement distortion—knotted, tangled, widely spaced, or otherwise abnormal but local irregularities in reinforcement distribution throughout the pultruded cross section.

NOTE—This condition usually causes noticeable changes in the local reinforcement content with crushing of the reinforcement or resin-richness in isolated areas.

D 3918, D20

reinforcement-rich area—an over-concentration of reinforcement in the pultruded cross section.

NOTE—This usually occurs where mat or other reinforcement is folded, creased, or bunched in a portion of the cross section.

D 3918, D20

reinforcing agent, *n*—a material, not basically involved in the vulcanization process, used in rubber to increase the resistance of the vulcanizate to mechanical forces.

D 1566, D11

reinforcing cord, *n*—a cord made from industrial yarns and used to provide added support to other materials, such as tires, hose, belting, protective coverings, webbing, etc.

D 123, D13

reinforcing cord, *n*—a cord made from industrial yarns and used to provide added support to other materials, such as tires, hose, belting, protective coverings, webbings, and so forth.

D 6477, D13

reinforcing resin, *n*—a resin that associates with the aromatic blocks of block co-polymers and raises the upper service temperature of an adhesive blend.

D 6440, D01

rejection/injection, *n*—the process of conveying geothermal fluids to sub-surface formations through wells.

E 957, E44

reins, *n*—a solid or pseudosolid organic material often of high molecular weight, which exhibits a tendency to flow when subjected to stress, usually has a softening or melting range, and usually fractures conchoidally.

F 1251, F04

reinspection—inspection of a fastener lot that has been sorted, reworked, or reprocessed, or a combination thereof, for the characteristic(s) originally found nonconforming and also those characteristics that would be affected by reworking or reprocessing operations.

F 1789, F16

reject—portion of the feed stream that does not pass through the membrane. Concentrate stream from a desalination device (brine).

D 6161, D19

reject—a character located but not identified by an optical scanner.

F 149, F05

rejection factor, R—parameter equal to one minus the ration of the concentration of a component on the downstream and upstream sides of a membrane. Concentrations may be either in the bulk

rejection factor, R

(Apparent Rejection Factor or at the membrane surface (Intrinsic Rejection Factor). **D 6161**, D19

rejection level—the value established for a test signal above or below which test specimens are rejectable, or otherwise distinguished from the remaining specimens. **E 1316**, E07

rejection number, n—*in acceptance sampling*, the minimum number of nonconforming items in a sample that requires the conclusion that the lot does not conform to specification. **D 123**, D13

rejection number—a number R , such that if the number of defective units in the sample is equal to or greater than R , the lot shall be rejected. **D 1517**, D31

rejection number, n—the minimum number of nonconformities for a given AQL and sample size (lot sample size) which will subject a lot to rejection. **D 1711**, D09

rejection of a lot—the disapproval of a lot as not conforming to contract or specification or both. **D 1517**, D31

reject rate—the number of rejects stated as a percentage of total items. Scanner items can be characters, marks, fields, documents, pages, etc. **F 149**, F05

reject (suppression)—a control for minimizing or eliminating low amplitude signals (electrical or material noise) so that larger signals are emphasized. **E 1316**, E07

related color, n—color perceived to belong to an area seen in relation to other colors. **E 284**, E12

related standards—those standards which possess certain relevance to the host standard in terms of understanding its concepts, but do not of necessity specify any mandated requirements. **F 1789**, F16

relative complex permittivity (relative complex dielectric constant) (relative complex capacitivity), κ^* , ϵ_r^* , n —the ratio of the admittance of a given configuration of the material to the admittance of the same configuration with vacuum as dielectric:

$$\kappa^* = Y/Y_v = Y/j\omega C_v = \kappa' - j\kappa''$$

where Y is the admittance with the material and $j\omega C_v$ is the admittance with vacuum. **D 1711**, D09

relative consistency, I_c , C_r (D)—ratio of: (1) the liquid limit minus the natural water content, to (2) the plasticity index. **D 653**, D18

relative density, n—see **density ratio**. **B 243**, B09

relative density, n—see **specific gravity**. **C 125**, C09

relative density, n—the ratio of the density of a material at a stated temperature to the density of water at a stated temperature. **D 4175**, D02

relative density, n—the ratio of the mass of a given volume of liquid to the mass of an equal volume of pure water at the same temperature. **D 4725**, D15

relative density, D_d , I_D (D)—the ratio of (1) the difference between the void ratio of a cohesionless soil in the loosest state and any given void ratio, to (2) the difference between the void ratios in the loosest and in the densest states. **D 653**, D18

relative density (specific gravity)—the ratio of a mass of a given volume of liquid at a given temperature to the mass of an equal volume of pure water at the same temperature. When reporting results, explicitly state the standard reference temperature, for example, relative density 15/15°C. **D 2864**, D27

relative density (specific gravity)—ratio of the density of the gaseous fuel, under specified conditions of temperature and pressure, to the density of normal dry air, at the same temperature and pressure. **D 4150**, D03

relative density (specific gravity), n—the ratio of the mass (weight in vacuo) of a given volume of material at a temperature, t_1 , to the mass of an equal volume of water at a reference temperature, t_2 ; or it is the ratio of the density of the material at t_1 to the density of water at t_2 . When the reference temperature is 4.00°C, the temperature at which the relative density of water is unity, relative density (specific gravity) and density are numerically equal. **D 4175**, D02

relative density (specific gravity)—the ratio of the mass of a given

volume of liquid at 15.56°C (60°F) to the mass of an equal volume of pure water at the same temperature. **D 4790**, D16

relative efficiency—the rating of the adsorptive capacity of an adsorbent based on a comparison of its performance with that of a reference adsorbent in a defined test. **D 2652**, D28

relative humidity, n—the ratio of actual water vapor pressure to the saturation water vapor pressure at the same temperature, expressed as a percentage. **C 11**, C11

relative humidity, n—of air, the ratio of the pressure of water vapor present to the pressure of saturated water vapor at the same temperature. (See **absolute humidity, humidity**.) **D 123**, D13

relative humidity—the ratio of the mass per unit volume (or partial pressure) of water vapor in an air-vapor mixture to the saturated mass per unit volume (or partial pressure) of the water vapor at the same temperature, expressed as a percentage. **D 1079**, D08

relative humidity, n—of air, the ratio of the pressure of water vapor present to the pressure of saturated water vapor at the same temperature. **D4920**, D13

relative humidity, n—the ratio of the actual pressure of existing water vapor to the maximum possible (saturation) pressure of water vapor in the atmosphere at the same temperature, expressed as a percentage. **G 113**, G03

relative humidity with respect to ice—See **relative humidity**. **D 1356**, D22

relative humidity with respect to ice—See **humidity**. **D 1356**, D22

relative humidity with respect to water—See **relative humidity**. **D 1356**, D22

relative humidity with respect to water—See **humidity**. **D 1356**, D22

relative molar response, n—the measured area of a compound divided by the moles present in the synthetic mixture relative to an arbitrarily chosen component. **D 4175**, D02

relative permittivity—the relative permittivity of a soil is the ratio of the permittivity of the soil to the permittivity of a vacuum. It is also known as the **dielectric constant**. **D 7099**, D18

relative permittivity (relative dielectric constant) (SIC) $\kappa'(\epsilon_r)$, n —the real part of the relative complex permittivity. It is also the ratio of the equivalent parallel capacitance, C_p , of a given configuration of electrodes with a material as a dielectric to the capacitance, C_v , of the same configuration of electrodes with vacuum (or air for most practical purposes) as the dielectric:

$$\kappa' = C_p/C_v$$

D 1711, D09

relative retention ratio, n—in chromatography, the column retention time of a component divided by the column retention time of a standard. **D 1129**, D19

relative retention time (RRT)—See **retention time**. **D 1356**, D22

relative rigidity—indynamic mechanical measurement, ratio of modulus at any temperature, frequency, or time to the modulus at a reference temperature, frequency, or time. **E 1142**, E37

relative rigidity (in dynamic mechanical measurement)—the ratio of modulus at any temperature, frequency, or time to the modulus at a reference temperature, frequency, or time. **D 4092**, D20

relative span—dimensionless parameter indicative of the uniformity of the distribution, and defined as follows:

$$\text{relative span} = (D_{v0.9} - D_{v0.1})/D_{v0.5}$$

E 1620, E29

relative spectral energy (power) distribution, n—description of the spectral character of a radiation (description of an illuminant) by the way in which the relative spectral concentration of radiant energy varies throughout the spectrum. Symbol: $S(\lambda)$. **E 349**, E21

relative spectral response, $R_r(\lambda)$, n—of a photovoltaic device, the absolute spectral response of a photovoltaic device where the irradiance is measured in relative units. **E 1328**, E44

relative standard deviation—the coefficient of variation expressed as a percentage. **E 2161**, E37

relative standard deviation (RSD)—a generic continuous monitoring parameter used to quantify the fluctuation of the particulate light scatter baseline from a laser-based incident light source.
D 6161, D19

relative viscosity—see **viscosity, relative**.
D 1695, D01

relative water content—see **liquidity index**.
D 653, D18

relaxation—reduction in anchor prestress and associated clamping force over time.
E 2265, E06

relaxation energy—XPS, the energy associated with intra-atomic or extra-atomic electronic readjustment to the removal of an atomic electron, so as to minimize the energy of the final state of the system.
E 673, E42

relaxation rate, n —the absolute value of the slope of the relaxation curve at a given time.
E 6, E28

relaxed stress, n —the initial stress minus the remaining stress at a given time during a stress-relaxation test.
E 6, E28

relay steel—soft magnetic iron-based alloy used in the construction of electromechanical relays and solenoid switches. High flux densities, low coercive fields, suitable mechanical hardness, and ease of fabrication are primary concerns.
A 340, A06

release, n —any spilling, leaking, pumping, emitting, emptying, discharging, injecting, escaping, leaching, dumping, and disposing into the environment (including the abandonment or discarding of barrels, containers, and other closed receptacles) of any hazardous chemical, extremely hazardous substance, or CERCLA hazardous substance.
D 5681, D34

release, n —any spilling, leaking, pumping, pouring, emitting, emptying, discharging, injecting, escaping, leaching, dumping, or disposing into the environment (including the abandonment or discarding of barrels, containers, and other closed receptacles) of any hazardous chemical, extremely hazardous substance, or CERCLA hazardous substance.
D 5681, D34

release agent, n —a material added to a compound or applied to the mold cavity, or both, to reduce parts sticking to the mold.
D 883, D20

release agent—See **parting agent**.
D 1079, D08

release agent, n —a material used to keep a molding material from adhering to a mold. (D20)
F 412, F17

release agent (mold), n —a substance applied to the inside surface of a mold or added to a material to be molded, to facilitate removal of the product from the mold.
D 1566, D11

release characteristic—see **sensitivity range**.
F 221, F05

release paper, n —a sheet, serving as a protectant or carrier, or both, for an adhesive film or mass, which is easily removed from the film or mass prior to use.
D 907, D14

releasing slider, n —*in zippers*, a slider with a mechanical means for loosening the slider on the chain.
D 123, D13

releasing slider, n —a slider with a mechanical means for loosening the slider on the chain.
D 2050, D13

releasing stop, n —*in zippers*, a device attached at or near the top of the stringer on the separable pin side which limits the travel of the slider at the open end of the chain under normal closing operations.
D 123, D13

releasing stop, n —a device attached at or near the top of the stringer on the separable pin side which limits the travel of the slider at the open end of the chain under normal closing operations.
D 2050, D13

relevant and appropriate requirements—those cleanup standards, standards of control, and other substantive requirements, criteria, or limitations promulgated under federal environmental or state environmental or facility siting laws that, while not “applicable” to a hazardous substance, pollutant, contaminant, remedial action, location, or other circumstance at a CERCLA site, address problems or situations sufficiently similar to those encountered at the CERCLA site that their use is well suited to the particular site. Only those state standards that are identified in a timely manner and are more stringent than federal requirements may be relevant and appropriate.
D 5681, D34

relevant indication, n —an NDT indication that is caused by a condition or type of discontinuity that requires evaluation.
E 1316, E07

relevant question, n —a question that pertains directly to the matter under investigation or to the issue(s) for which the examinee is being tested.
E 2035, E52

reliability—the probability of performing without failure a specified function under normal conditions for a specified period of time.
E 344, E20

reliability, n (fiabilité)—the probability of performing without failure a specified function under normal conditions for a specified period of time.

remodel—See **building modification**.

repair—See **building modification**.
E 631, E06

reliability, n (fiabilité)—the probability of performing without failure a specified function under normal conditions for a specified period of time.
E 1480, E06

relict active layer—a layer of ground, now perennially frozen, lying immediately below the modern active layer. Its thickness indicates the greater annual depth of thaw that occurred during a previous warmer climatic period.
D 7099, D18

relict ice—ice formed in, and remaining from, the recent geological past.
D 7099, D18

relict permafrost—permafrost that reflects past climatic conditions differing from those of today, and which must have formed when the ground surface temperature was different than it is now, as these are not in thermal equilibrium with the present mean annual ground surface temperature.
D 7099, D18

relieving—the removal of material from selected portions of a colored metal surface by mechanical means, to achieve a multicolored effect.
B 374, B08

relocking device—a mechanism separate from the combination lock designed to block the safe bolt work if the lock is punched. It may also incorporate a thermal or shock-releasing device.
F 471, F12

relocking trigger—a component of the combination lock designed to block the bolt if the spindle is punched.
F 471, F12

reluctance, \mathcal{R} —that quantity which determined the magnetic flux, ϕ , resulting from a given magnetomotive force, \mathcal{F} , around a magnetic circuit.

$$\mathcal{R} = \mathcal{F}/\phi$$

where:

\mathcal{R} = magnetic reluctance,

\mathcal{F} = magnetomotive force, and

ϕ = flux.

The reluctance is measured in gilberts per maxwell (magnetic ohms) in the cgs-emu system and in ampere-turns per weber in the SI system.
A 340, A06

reluctivity, ν —the reciprocal of the permeability of a medium.
A 340, A06

remaining ligament, b [L]—the difference between the width of the specimen (w) and the physical crack size (a_p) that is,

$$b = W - a_p$$

E 1823, E08

remaining stress, n —the stress remaining at a given time during a stress-relaxation test.
E 6, E28

remenance, B_{dm} —the maximum value of the remanent induction for a given geometry of the magnetic circuit.

NOTE—If there are no gaps or other inhomogeneities in the magnetic circuit the remenance, B_{dm} , is equal to the retentivity, B_{rs} ; if air gaps or other inhomogeneities are present, B_{dm} will be less than B_{rs} .

A 340, A06

remanent induction, B_d —See **induction, remanent.** A 340, A06

remanufactured cartridge—a cartridge that has had all parts that materially affect function replaced or refurbished so that its original performance has been restored. F 335, F05

re-mass, v —to form, during storage, massive blocks from particulate forms, such as flakes, pastilles, or powder. D 6440, D01

remedial actions—those actions consistent with a permanent remedy taken instead of, or in addition to, removal action in the event of a release or threatened release of a hazardous substance into the environment, to prevent or minimize the release of hazardous substances so that they do not migrate to cause substantial danger to the present or future public health or welfare or the environment. D 5681, D34

remediation, n —to restore or clean up, or both, sites contaminated with hazardous, toxic, or radioactive substances or wastes, or any combination thereof. E 833, E06

remelted heat, n —the product of the remelting of a **primary heat**, in whole or in part. A 941, A01

remodel, v —to replace or improve a **building** or its parts. E 631, E06

remodel, v —to replace or improve a building or its parts. E 1605, E06

remodeled soil—soil that has had its natural structure modified by manipulation. D 653, D18

remodeling sensitivity (sensitivity ratio), S_r (D)—the ratio of: (1) the unconfined compressive strength of an undisturbed specimen of soil, to (2) the unconfined compressive strength of a specimen of the same soil after remodeling at unaltered water content. D 653, D18

remolding index, I_R (D)—the ratio of: (1) the modulus of deformation of a soil in the undisturbed state, to (2) the modulus of deformation of the soil in the remolded state. D 653, D18

remote fire tool—remotely controlled tool. F 592, F16

remotely operated aircraft, ROA, n —UAV that complies with the applicable parts of 14 CFR (airworthiness type certificate, operated by certified pilot) and is approved for routine, integrated operations similar to a manned aircraft of the same class and category. See R-103-2004. F 2395, F38

removable dial—a dial that is removable from the spindle. F 471, F12

removal, n —the cleanup or removal of released hazardous substances from the environment; such actions as may be necessary to take in the event of the threat of release of hazardous substances into the environment; such actions as may be necessary to monitor, assess, and evaluate the release or threat of release of hazardous substances; the disposal of removed material; or the taking of such other actions as may be necessary to prevent, minimize, or mitigate damage to the public health or welfare or to the environment, which may otherwise result from a release or threat of release. D 5681, D34

removal—the cleanup or removal of released hazardous substances from the environment; such actions as may be necessary to take in the event of the threat of release of hazardous substances into the environment; such actions as may be necessary to monitor, assess, and evaluate the release or threat of release of hazardous substances; the disposal of removed material; or the taking of such other actions as may be necessary to prevent, minimize, or mitigate damage to the public health or welfare or to the environment, which may otherwise result from a release or threat of release. D 5681, D34

removal extractor—a series of horizontal baffles, usually constructed of stainless steel, designed to remove grease and drain it away to a container. They are cleaned by running them through a dishwasher or by soaking and rinsing. See *grease extractors*. F 1827, F26

remove loose soil, v —subject textile to agitation, impact, and suction to remove dust and particulate soil. D 5253, D13

renewable energy, n —energy obtained from renewable resources, including wind, solar, tidal, and forestry and agricultural products and by products. E 2114, E06

renewable energy resources—sources of energy that are regenera-

tive or virtually inexhaustible, such as solar, wind, ocean, biomass, municipal wastes, and hydropower energy. Geothermal energy is sometimes also included in the term. E 1705, E48

renewable resource, n —a resource that is grown, naturally replenished, or cleansed, at a rate which exceeds depletion of the usable supply of that resource. E 2114, E06

repair, v —to replace or correct damaged or faulty **components** or **subsystems** of a **building** to **maintain** operating capability. E 631, E06

repair, v —to replace or correct damaged or faulty components or subsystems of a building to maintain operating capability. E 1605, E06

repair—to restore to a sound or good state after wear, partial destruction, or damage. E 2135, E53

repairable—a state in which normal repair is reasonable from a standpoint of cost, accessibility, and technical involvement. E 2135, E53

repairable item—an item that can be reconditioned or economically repaired for reuse. E 2135, E53

reparative medicine, n —a branch of medical science whereby clinicians use surgical methods to repair or modify the structure and function of patient's cells, tissues, or organs. The principles of reparative medicine can be applied in tissue engineering to generate TEMPs. F 2312, F04

repeatability—the standard deviation of results obtained by the same operator using the same instrument in successive measurements on the same sample. C 242, C21

repeatability, n —a measure of the precision of the analyzer to repeat its results on independent introductions of the same sample at different time intervals. D 1356, D22

repeatability, n —the quantitative expression of the random error associated with a single operator in a given laboratory obtaining repetitive results by applying the same test method with the same apparatus under constant operating conditions on identical test material within a short interval of time on the same day. It is defined as the difference between two such results at the 95 % confidence level. D 4175, D02

repeatability—the precision of a test method expressed in terms of the agreement attainable between measurements made by a single operator using the same apparatus and techniques. D 4790, D16

repeatability, n —see **within-laboratory standard deviation.**

E 135, E01

repeatability, n —the closeness of agreement between the results of successive measurements of the same test specimen, or of test specimens taken at random from a homogeneous supply, carried out on a single laboratory, by the same method of measurement, operator, and measuring instrument, with repetition over a specified period of time. See also **reproducibility.** E 284, E12

repeatability, n —of results of temperature measurements, closeness of agreement between the results of successive measurements of the same temperature carried out under the same conditions of measurement. E 344, E20

repeatability, n —precision under repeatability conditions.

E 456, E11

repeatability—the precision of a method expressed as the agreement attainable between independent determinations performed at essentially the same time (duplicates) by one analyst using the same apparatus and techniques. E 1547, E15

repeatability—a quantitative measure of the precision of the results by a single analyst in a given laboratory using a given apparatus. E 2161, E37

repeatability—variation in the values of measurement obtained when one operator uses the same gage for measuring identical characteristics of the same parts. F 1789, F16

repeatability conditions, n —conditions where mutually independent test results are obtained with the same test method in the same laboratory by the same operator with the same equipment within short intervals of time, using test specimens taken at random from a single sample of material. D 4175, D02

repeatability conditions, *n*—conditions under which test results are obtained with the same test method in the same laboratory by the same operator with the same equipment in the shortest practical period of time using test units or test specimens taken at random from a single quantity of material that is as nearly homogeneous as possible (see 10.3 of Practice E 691). **D 4175, D02**

repeatability conditions, *n*—conditions where independent test results are obtained with the same method on identical test items in the same laboratory by the same operator using the same equipment within short intervals of time. **E 456, E11**

repeatability index, *r, n*—an estimate of the maximum difference expected for results on the same test material on different days in the same laboratory, a difference not expected to be exceeded an average of more than once in 20 comparisons (95 % probability). **E 135, E01**

repeatability limit (*r*)—The value below which the absolute difference between two results from separate and consecutive test determinations, carried out on the same sample in the same laboratory by the same operator using the same apparatus on the samples taken at random from a single quantity of homogeneous material, may be expected to occur with a probability of approximately 95%. **D 121, D05**

repeatability limit (*r*), *n*—the value below which the absolute difference between two individual test results obtained under repeatability conditions may be expected to occur with a probability of approximately 0.95 (95 %). **E 456, E11**

repeatability, *r, n*—an established value, below which the absolute difference between two “within-laboratory” or “within test-site” test results may be expected to lie, with a specified probability. **F 538, F09**

repeatability, relative (*r*), *n*—a repeatability estimate expressed as percentage of the average of the property for which the estimate was obtained. **F 538, F09**

repeatability standard deviation, *n*—see **within-laboratory standard deviation**. **E 135, E01**

repeatability standard deviation, *n*—the standard deviation of test results obtained under repeatability conditions. **E 456, E11**

repertoire—includes all of the characters and graphic shapes in an OCR imaging device system. **F 149, F05**

repetitive diving, *n*—any dive conducted while the decompression model being followed for the dives indicates that inert gases are still present in the tissues from a previous dive. This is within the context of a fixed time period, usually 12 to 24 h, depending on the model being followed. **F 1549, F32**

repetitive group designation, *n*—an assigned letter on a decompression table that relates directly to the amount of residual inert gas in the diver’s tissues following a dive. This group changes with time as the diver’s body off-gases. **F 1549, F32**

repetitive impact erosion test, *n*—in *impingement erosion testing*, an apparatus or method that produces a controlled or countable number of impacts by liquid or solid particles of uniform size, shape, and impact velocity, all on the same location of the test specimen. One example of such a test is the “wheel-and-jet” type of liquid impact apparatus. **G 40, G02**

replacement cost—building component replacement and related costs, included in the capital budget, that are expected to be incurred during the study period. **E 631, E06**

replacement cost, *n*—building component replacement and related costs, included in the capital budget, that are expected to be incurred during the study period. **E 833, E06**

replacement disc, *n*—a structure intended to restore support and motion between adjacent vertebral bodies. **F 1582, F04**

replenisher—a toning material added to the developer mix to replace that which is consumed during the copying process. **F 335, F05**

replica—a reproduction of a surface in a material, for example, a plastic.

(1) *atomic*—a thin replica devoid of structure on the molecular level, prepared by the vacuum or hydrolytic deposition of metals or simple compounds of low molecular weight.

(2) *cast*—a reproduction of a surface in plastic made by the evaporation of the solvent from a solution of the plastic or by polymerization of a monomer on the surface.

(3) *collodion*—a replica of a surface cast in nitro-cellulose.

(4) *Formvar*—a reproduction of a surface in a plastic Formvar film.

(5) *gelatin*—a reproduction of a surface prepared in a film composed of gelatin.

(6) *impression*—a surface replica which is made by impression. The results of making an impression.

(7) *molecular*—the reproduction of a surface in a high polymer such as collodion and other plastics.

(8) *negative*—that replica which is obtained by the direct contact of the replicating material with the specimen. In it, the contour of the replica surface is reversed with respect to that of the original.

(9) *oxide film*—a thin film of an oxide of the specimen to be examined. The replica is prepared by air, oxygen, chemical, or electrochemical oxidation of the parent metal and is subsequently freed either mechanically or chemically for purposes of examination.

(10) *plastic*—a reproduction in plastic of the surface to be studied, prepared by evaporation of the solvent from a solution of plastic, by polymerization of a monomer, or solidification of a plastic on the surface.

(11) *positive*—a replica, the contours of which correspond directly to the surface being replicated; that is, elevations on the surface are elevations on the replica.

(12) *preshadowed*—a replica formed by the application of the shadowing material to a surface to be replicated, before the thin replica film is cast or otherwise deposited on the surface.

(13) *pseudo*—a replica which has portions of the material being replicated embedded in it.

(14) *tape replica method* (faxfilm)—a method of producing a replica by pressing the softened surface of a tape or sheet of a plastic material on the surface to be replicated.

(15) *vapor deposited*—a replica formed of a metal or a salt by the condensation of the vapors of the material onto the surface to be replicated. **E 7, E04**

replicate, *n*—*inexperimenting or testing*, one of two or more runs with the same specified experimental or test conditions and with each experimental or test condition being established independently of all previous runs. (Compare **duplicate**.) **D 123, D13**

replicate, *v*—*inexperimenting or testing*, to repeat a run so as to produce a replicate. (Compare **duplicate**.) **D 123, D13**

replicate—in electron microscopy, to reproduce by means of a replica. **E 7, E04**

replicate, *n*—each of several experimental units that are tested simultaneously using the same experimental conditions. **E 943, E47**

replicate, *n*—either (1) an individual test object from a sample of *n* objects or (2) one of *m* individual test values for a test object. **F 538, F09**

replicate (repeat) tests—nominally identical tests on different randomly selected test specimens conducted at the same nominal value of the independent variable *X*. **E 1823, E08**

replicates—two or more repetitions of a test determination. **E 1547, E15**

replication, *v*—the act of selecting and testing a number of replicates. **F 538, F09**

repoint, *v*—to remove defective mortar and place properly prehydrated plastic mortar into mortar joints. **C 1180, C12**

reported power, *n*—of a *photovoltaic device*, the output power at a selected test voltage. **E 1328, E44**

reporting bases:

as-determined basis, n—analytical data obtained from the analysis sample of coal or coke after conditioning and preparation to No. 60 (250- μ m) sieve in accordance with Practice D 2013. As-determined data represents the numerical

reporting bases:

values obtained at the particular moisture level in the sample at the time of analysis. These are normally converted, according to formulae contained in Practice D 3180, to conventional reporting bases.

as-received basis, n—analytical data calculated to the moisture condition of the sample as it arrived at the laboratory and before any processing or conditioning. If the sample has been maintained in a sealed state so that there has been no gain or loss, the as-received basis is equivalent to the moisture basis as sampled.

dry, ash-free basis, n—data calculated to a theoretical base of no moisture or ash associated with the sample. Numerical values as established by Test Methods D 3173 and D 3174 are used for converting the as-determined data to a moisture- and ash-free basis.

dry basis, n—data calculated to a theoretical base of no moisture associated with the sample. The numerical value as established by Test Method D 3173 is used for converting the as-determined data to a dry basis.

equilibrium moisture basis, n—data calculated to the moisture level established as the equilibrium moisture. Numerical values as established by Test Method D 1412 are used for the calculation. **D 121, D05**

reporting limit, n—the lowest level of an **analyte** in a sample that an individual laboratory can confidently report for a particular **matrix**. **E 1605, E06**

representative quality indicator (RQI)—an actual part or similar part of comparable geometry and attenuation characteristics to that of the test part(s), that has known or measurable features, or both, representing the facets of nonconformance for which the test part is to be examined. **E 1316, E07**

representative sample—See *representative sample* under **sample**. **D 121, D05**

representative sample, n—a part of a homogeneous material, or a part of the composited and mixed portions of a material, which carries all the true properties and physical characteristics of the whole material. **D 4175, D02**

representative sample, n—a sample collected in such a manner that it reflects one or more characteristics of interest (as defined by the project objectives) of a population from which it is collected. **D 5681, D34**

representative sample, n—a sample collected such that it reflects one or more characteristics of interest of the lot or population from which it was collected. **D 5681, D34**

representative sample, n—a sample collected such that it reflects one or more characteristics of interest (as defined by the project objectives) of a population from which it was collected. **D 5681, D34**

representative sample—a sample collected in such a manner that it has characteristics equivalent to the material being sampled. **D 5681, D34**

representative sample—sample of a universe or whole (for example, waste sample pile, lagoon, ground water, or waste stream), selected in a random sampling process, which represents the total properties in the universe or whole. **E 631, E06**

representative sample—a sample collected in such a manner that it has characteristics equivalent to the lot. **E 856, D34**

representative sample—sample of a universe or whole (for example, waste sample pile, lagoon, ground water, or waste stream), selected in a random sampling process, which represents the total properties in the universe or whole. **E 1605, E06**

representative sample—a sample containing enough measured elements that the effect of random fluctuations is acceptably small. **E 1620, E29**

representative sample, n—a sample taken from a quantity of material that exhibits the characteristics of the original material from which it was taken. **E 1638, E29**

representative sampling, n—the process of obtaining a representative sample or a representative set of samples. **D 5681, D34**

representative set of samples, n—a set of samples that collectively reflect one or more characteristics of interest of a population from which they were collected. See *representative sample*. **D 5681, D34**

representative subsample, n—a subsample collected in such a manner that it reflects one or more characteristics of interest (as defined by the project objectives) of the laboratory sample from which it was collected. **D 5681, D34**

repress, v—to apply pressure to a previously pressed and either sintered or presintered compact. It includes **restrike, coin, and size**. **B 243, B09**

reprocess—repeating of a process that has already been conducted on a fastener as part of the standard requirement. **F 1789, F16**

reprocessed plastic—a thermoplastic prepared from usually melt processed scrap or reject parts by a plastics processor, or from non-standard or non-uniform virgin material. **D 883, D20**

reprocessed plastic—a thermoplastic prepared from usually melt processed scrap or reject parts by a plastics processor, or from non-standard virgin material or non-uniform virgin material. **F 412, F17**

reprocessing, vt—the reworking of cells, tissues, and organs of unacceptable quality from a defined stage of processing, so that the quality may be rendered acceptable by one or more additional operations. **F 2312, F04**

reproducibility—the standard deviation of results obtained by different operators using the same or different instruments in different laboratories on the same sample. **C 242, C21**

reproducibility, n—a measure of the precision of different analyzers to repeat results on the same sample. **D 1356, D22**

reproducibility, n—a quantitative expression of the random error associated with different operators from different laboratories, using different apparatus, each obtaining a single result by applying the same method on an identical test sample. It is defined as the 95 % confidence limit for the difference between two such single and independent results. **D 4175, D02**

reproducibility—the precision of a test method expressed in terms of agreement expected between measurements made in different laboratories using similar apparatus and the same procedure. **D 4790, D16**

reproducibility, n—see **between-laboratory standard deviation**. **E 135, E01**

reproducibility, n—the closeness of agreement between the results of successive measurements of the same test specimen, or of test specimens taken at random from a homogeneous supply, but changing conditions such as operator, measuring instrument, laboratory, or time. The changes in conditions must be specified. See also **repeatability**. **E 284, E12**

reproducibility, n—of *results of temperature measurements*, closeness of agreement between the results of measurements of the same temperature carried out under changed conditions of measurement. **E 344, E20**

reproducibility, n—precision under reproducibility conditions. **E 456, E11**

reproducibility—the precision of a method expressed as the agreement attainable between determinations performed in different laboratories. **E 1547, E15**

reproducibility, n—the closeness of agreement between test results obtained under reproducibility conditions (that is, conditions under which test results are obtained with the same test method on identical material in different laboratories). **E 1732, E30**

reproducibility—a quantitative measure of the precision of the results between two laboratories. **E 2161, E37**

reproducibility—variation in average measurements obtained when two or more people measure the same parts or items using the same measuring technique. **F 1789, F16**

reproducibility conditions, n—conditions under which test results are obtained in different laboratories with the same test method, using test specimens taken at random from the same sample of material. **D 4175, D02**

reproducibility conditions, *n*—conditions where test results are obtained with the same method on identical test items in different laboratories with different operators using different equipment.

E 456, E11

reproducibility index, *R*, *n*—an estimate of the maximum difference expected for results on the same material in two laboratories, a difference not expected to be exceeded an average of more than once in 20 comparisons (95 % probability).

E 135, E01

reproducibility limit, *n*—the value below which the absolute difference between two test results obtained under reproducibility conditions may be expected to occur with a probability of approximately 0.95 (95 %).

D 121, D05

reproducibility limit, *n*—(*R*) the value below which the absolute difference between two test results obtained under reproducibility conditions may be expected to occur with a probability of approximately 0.95 (95 %).

E 456, E11

reproducibility, *R*, *n*—quantitative expression of the random error associated with operators working in different laboratories, each obtaining single results on identical test material when applying the same method.

D 4175, D02

reproducibility, *R*, *n*—an established value, below which the absolute difference between two “between-laboratory” or “between test-site” test results may be expected to lie, with a specified probability.

F 538, F09

reproducibility, relative (*R*), *n*—a reproducibility estimate expressed as percentage of the average of the property for which the estimate was obtained.

F 538, F09

reproducibility standard deviation, *n*—the standard deviation of test results obtained under reproducibility conditions.

D 121, D05

reproducibility standard deviation, *n*—see **between-laboratory standard deviation**.

E 135, E01

reproducibility standard deviation (S_R), *n*—the standard deviation of test results obtained under reproducibility conditions.

NOTE—Other measures of the dispersion of test results obtained under reproducibility conditions are the “reproducibility variance” and the “reproducibility coefficient of variation.”

E 456, E11

request to send, *n*—an electronic signal sent by one component to another to determine if the second component is ready to receive a transmission from the first.

F 1457, F05

required remedial actions—remedial actions determined necessary to comply with the requirements of CERCLA § 120(h)(3)(B)(i).

D 5681, D34

required response actions—removal or remedial actions, or both, determined necessary to comply with the requirements of CERCLA § 120(h)(3)(B)(i).

D 5681, D34

requirement—a translation of the needs into a set of individual quantified or descriptive specifications for the characteristics of an entity in order to enable its realization and examination, (ISO Guide 25).

E 1187, E36

requirement, *n*—need or expectation that is generally implied or obligatory.

E 1605, E06

requirement scale, *n*—for a topic of facility serviceability, a set of descriptions of requirements for serviceability in which each description has been selected to indicate a specific level of serviceability on a scale from the lowest to the highest level likely to be encountered.

E 631, E06

requirements determination—identifying needs for assets and materials through the planning process. Also may refer to identifying needs for a property or asset management system to help meet organizational goals and objectives.

E 2135, E53

requirement statement (enoncé de boisons)—for a facility, the serviceability requirements for a facility, together with applicable performance criteria, performance test methods, and optional explanatory comments.

criterion, *n* (critéré)—an established precedent, rule, measure, norm, or code upon which a decision may be based.

performance criterion, *n* (critère de rendement)—a quantitative statement of the level of performance needed to satisfy a

serviceability requirement.

performance test method, *n* (méthode d'essai de rendement)—a method of determining whether the performance of a facility is in accordance with a specified performance criterion.

serviceability requirement, *n* (besoin de fontionalité)—for a facility, a qualitative statement of the serviceability required from a facility.

E 631, E06

requirement statement (enoncé de boisons)—for a facility, the serviceability requirements for a facility, together with applicable performance criteria, performance test methods, and optional explanatory comments.

criterion, *n* (critéré)—an established precedent, rule, measure, norm, or code upon which a decision may be based.

performance criterion, *n* (critère de rendement)—a quantitative statement of the level of performance needed to satisfy a serviceability requirement.

performance test method, *n* (méthode d'essai de rendement)—a method of determining whether the performance of a facility is in accordance with a specified performance criterion.

serviceability requirement, *n* (besoin de fontionalité)—for a facility, a qualitative statement of the serviceability required from a facility.

score, *n*—See **serviceability score**.

E 1480, E06

reradiation—loss of energy by radiation from a surface previously heated by absorption.

E 772, E44

rerefining—the use of primary refining processes on used electrical insulating liquids to produce liquids that are suitable for further use as electrical insulating liquids.

D 2864, D27

re-refining, *n*—the use of refining processes during recycling to produce high quality base stocks for lubricants or other petroleum products. Re-refining may include distillation, hydrotreating, or treatments employing acid, caustic, solvent, clay, or other chemicals, or combination thereof.

D 4175, D02

reroofing—the process of recovering or replacing an existing roofing system. See **recovering**.

D 1079, D08

resale value—the monetary sum expected from the disposal of an asset at the end of its economic life, its useful life, or at the end of the study period.

E 631, E06

resale value, *n*—the monetary sum expected from the disposal of an asset at the end of its economic life, its useful life, or at the end of the study period.

E 833, E06

resawn lumber—See **lumber**.

D 996, D10

Research octane number, *n*—for spark-ignition engine fuel, the numerical rating of knock resistance obtained by comparison of its knock intensity with that of primary reference fuel blends when both are tested in a standardized CFR engine operating under the conditions specified in this test method.

D 4175, D02

reserve, *n*—in construction design planning and estimating, an allocation of money held by management (Client) to be disbursed for changed project requirements.

E 833, E06

reserve alkalinity, *adj*—a term applied to engine coolant concentrates and antirusts to indicate the amount of alkaline inhibitors present in the product.

D 4725, D15

reserve buoyancy—gross buoyancy minus boom weight.

F 818, F20

reserve buoyancy to weight ratio—reserve buoyancy divided by boom weight.

F 818, F20

reservoir—a man-made impounded body of water or controlled lake where water is collected and stored.

D 4410, D19

residential dwelling—(1) a detached single family dwelling unit, including attached structures such as porches and stoops; or (2) a single family dwelling unit in a structure that contains more than one separate residential dwelling unit, which is used or occupied, or intended to be used or occupied, in whole or in part, as the home or residence of one or more persons.

E 1605, E06

resident species—a species that is regularly present at a specified site for some portion of its life span.

E 943, E47

residual—property remaining from a work effort for which no known requirement exists within that work effort.

E 2135, E53

residual contamination, R_c, n

residual contamination, R_c, n —the absolute mass of contaminant remaining after a cleaning process, expressed in milligrams per square centimeter of area or optionally as milligrams per square metre. **G 126, G04**

residual deflection—permanent deformation of a building element, component, or structure after complete or partial removal of applied force. Also called **permanent set** or **residual deformation**.

residual deformation—See **residual deflection**. **E 631, E06**

residual density, n —optical density of image after exposure to light or water. **F 1857, F05**

residual drawdown—the difference between the projected prepumping water-level trend and the water level in a well or piezometer after pumping or injection has stopped. **D 653, D18**

residual element, n —*in steel*, a specified or unspecified element, not intentionally added, originating in the raw materials, refractories, or surrounding atmospheres used in steel making. **A 941, A01**

residual elongation (RE), n —*of rope*, elongation after cyclic tensioning the rope to a specified force for a specified period of time. **D 123, D13**

residual error, n —the difference between the observed result and the predicted value (estimated treatment response); Observed Result minus Predicted Value. **E 456, E11**

residual error, n —the difference between the observed result and the predicted value (estimated treatment response); Observed Result minus Predicted Value. **E 1325, E11**

residual fiber shrinkage, n —*of textured yarns*, the shrinkage that remains in a yarn after texturing; the difference between the original length and the length after developed crimp has been removed. **D 4849, D13**

residual fuel, n —a liquid fuel containing bottoms remaining from crude distillation or thermal cracking; sometimes referred to as heavy fuel oil. **D 4175, D02**

residual fuel oil, n —any liquid or liquefiable petroleum product having a kinematic viscosity at 100°C between 5.0 and 50.0 mm²/s, inclusive, burned for the generation of heat in a furnace or firebox or for the generation of power in an engine. **D 4175, D02**

residual fuel oil, n —a fuel oil comprising a blend of viscous long, short, or cracked residue from a petroleum refining process and lighter distillates blended to a fuel oil viscosity specification. **D 4175, D02**

residual induction, B_r —See **induction, residual**. **A 340, A06**

residual magnetic field—the field that remains in ferromagnetic material after the magnetizing force has been removed. **E 1316, E07**

residual mercury column—the mercury that lies in the bore of the stem above the constriction. **E 344, E20**

residual moisture—See *residual moisture* under **moisture**. **D 121, D05**

residual moisture—the moisture content remaining in an RDF sample after it has been air-dried and milled down to an analysis sample. **E 856, D34**

residual nitrogen, n —nitrogen gas that is still dissolved in a diver's tissues after he has surfaced from a dive using compressed air as a breathing gas. **F 1549, F32**

residual potential—apparent surface voltage remaining in light exposed areas of the photoconductive surface. **F 335, F05**

residuals—measurable elements present in a metal or alloy which were not intentionally added to meet a specification requirement. **F 1789, F16**

residual shear strength, n —value of shear stress at sufficiently large displacement where the stress remains constant with continued shearing. **D 4439, D35**

residual soil—soil derived in place by weathering of the underlying material. **D 653, D18**

residual strain—the strain in a solid associated with a state of residual stress. (ISRM) **D 653, D18**

residual strain, n —strain associated with residual stress. **E 6, E28**

(residual) strain gradient, s_g [L⁻¹]—a through-thickness linear gradient (of residual strain) in the structural layer of interest before it is released that is used to represent the actual strain gradient. It is calculated to be the positive difference in the residual strain between the top and bottom of a cantilever divided by its thickness. Directional information is assigned to the value of 's'. **E 2444, E08**

residual strain, ϵ_r —in a surface-micromachining process, the strain present in the structural layer of interest after fabrication yet before the sacrificial layer is removed. In a bulk-micromachining process, the strain present in the suspended layer after fabrication yet before the substrate is removed at specified locations. **E 2444, E08**

residual strength, σ_r [FL⁻²]—the maximum value of the gross stress, neglecting the area of the crack, that a cracked specimen is capable of sustaining. **E 1823, E08**

residual stress—stresses that remain within a body as the result of plastic deformation or casting. **B 846, B05**

residual stress—stress remaining in a solid under zero external stress after some process that causes the dimensions of the various parts of the solid to be incompatible under zero stress, for example, (1) deformation under the action of external stress when some parts of the body suffer permanent strain; or (2) heating or cooling of a body in which the thermal expansion coefficient is not uniform throughout the body. (ISRM) **D 653, D18**

residual stress—the effective stress generated in a thawing soil if no change of volume is permitted during the thaw. **D 7099, D18**

residual stress—an initial, state of stress on unloaded, unglazed glass resulting from manufacturing process (heat-strengthening, tempering). **E 631, E06**

residual stress [FL⁻²], n —stress in a body which is at rest and in equilibrium and at uniform temperature in the absence of external and mass forces. **E 6, E28**

residual technique—the application of the magnetic particles after the magnetizing force has been discontinued. **E 1316, E07**

residual thaw layer—a layer of thawed or unfrozen ground between seasonally frozen ground and the permafrost table. **D 7099, D18**

residual torsion, n —revolutions made by a specified length of steel tire cord when one end is held in a fixed position and the other is allowed to turn freely. **D 123, D13**

residual torsion, n —revolutions made by a specified length of cord when one end is held in a fixed position and the other allowed to turn freely. **D 6477, D13**

residual value—the proceeds, less removal, and disposal costs, if any, realized upon disposition of an asset. It usually is measured by the net proceeds from the sale or other disposition of the asset, or its fair value if the asset is traded in on another asset. The estimated residual value is a current forecast of the residual value. **E 2135, E53**

residue, n —*for plumage*, quill pith, quill fragments, trash, or foreign matter. **D 123, D13**

residue, n —*for plumage*, quill pith, quill fragments, trash, or foreign matter. **D 7022, D13**

residue—those substances that remain in the sample flask after sample volatilization under the conditions of the test. **E 1547, E15**

residuum, n —a liquid or semi-liquid product obtained as residue from the distillation of petroleum and consisting primarily of asphaltic hydrocarbons. **D 4175, D02**

resilience, n —that property of a material to recover to approximately its original size and shape after deformation. (See also.) **D 123, D13**

resilience, n —the ratio of energy output to energy input in a rapid (or instantaneous) full recovery of a deformed specimen. **D 1566, D11**

resilience, n —that property of a material to recover to approximately its original size and shape after deformation. **D 4850, D13**

resilience—tendency of a material to return to its original shape after the removal of a stress. **F 1789, F16**

resilience, impact, *n*—the ratio of output to input mechanical energy in a rapid deformation and recovery cycle of a rubber specimen.

D 1566, D11

resilient, *adj*—tending or able to recover from strain or deformation caused especially by compressive stress.

F 141, F06

resilient connector—a flexible connection for joining pipe to structures capable of being deformed and deflected without rupture or leakage.

C 822, C13

resilient flooring, *n*—an organic floor surfacing material made in sheet or tile form or formed in place as a seamless material of which the wearing surface is non-textile. The resilient floor covering classification by common usage includes, but is not limited to asphalt, cork, linoleum, rubber, vinyl, vinyl composition, and polymeric poured seamless floors. Resilient in this sense is used as a commonly accepted term, but does not necessarily define a physical property.

F 141, F06

resin—in grouting, a material that usually constitutes the base of an organic grout system.

D 653, D18

resin, *n*—a solid or pseudosolid organic material often of high molecular weight, which exhibits a tendency to flow when subjected to stress, usually has a softening or melting range, and usually fractures conchoidally.

D 883, D20

resin, *n*—solid, semisolid, or liquid, usually organic material that has an indefinite molecular mass and, when solid, usually has a softening or melting range and exhibits a tendency to flow when subjected to stress.

D 907, D14

resin, *n*—an organic material of indefinite and relatively high molecular mass that may be used as a softener, processing aid, vulcanizing agent, or reinforcing agent.

D 1566, D11

resin—a solid or pseudosolid organic material often of high molecular weight, which exhibits a tendency to flow when subjected to stress, usually has a softening or melting range, and usually fractures conchoidally.

D 3878, D30

resin, *n*—a solid or pseudosolid organic material, often of high molecular weight, which exhibits a tendency to flow when subjected to stress, usually has a softening or melting range, and usually fractures conchoidally.

F 412, F17

resinates, metallic—See **metallic resinates**.

D 804, D01

resin batch—the quantity of resin that has been formulated in a single continuous operation and subjected to chemical processing or physical mixing to produce a homogenous material.

E 631, E06

resin batch—the quantity of resin that has been formulated in a single continuous operation and subjected to chemical processing or physical mixing to produce a homogeneous material.

E 1749, E06

resin binder—see **binder**.

F 335, F05

resin bonded batting, *n*—a textile filling material which is stabilized by spraying it with an acrylic, polyvinyl acetate, or other suitable resin emulsion after which the batting is dried and cured.

D 123, D13

resin bonded batting, *n*—a textile filling material which is stabilized by spraying it with an acrylic, polyvinyl acetate, or other suitable resin emulsion after which the batting is dried and cured.

D 7022, D13

resin-coated—covered with natural resin to provide ease of driving, increased holding power, or corrosion resistance, or a combination of these.

F 547, F16

resin content—see **matrixcontent**.

D 3878, D30

resin content—the amount of matrix present in a composite usually expressed in units of weight percent.

resite—See **C-stage**.

resitol—See **B-stage**.

resol—See **A-stage**.

E 631, E06

resin content—the amount of matrix present in a composite usually expressed in units of weight percent.

E 1749, E06

resin grout—a grout system composed of essentially resinous materials such as epoxys, polyesters, and urethanes.

D 653, D18

resinite—See *resinite* under **maceral**.

D 121, D05

resin, natural, *n*—a solid organic substance, originating in the secretion of certain plants or insects, which is thermoplastic, flammable, nonconductive of electricity; breaks with a conchoidal fracture (when hard); and dissolves in certain specific organic solvents but not water.

fossil resin—a natural resin of ancient origin usually found in the earth.

D 16, D01

resinoid, *n*—any of the class of thermosetting synthetic resins, either in their initial temporarily fusible state or in their final infusible state. (See also **novolak** and **thermosetting**.)

D 907, D14

resinous—containing a polymer as a binder that is either hardened by chemical action (thermosetting), by the evaporation of a solvent, or by melting for application (thermoplastic).

C 904, C03

resin particle—specially manufactured polymer beads used in the ion exchange process to remove dissolved salts from water.

D 6161, D19

resin-rich area—an area of the pultrusion that lacks sufficient reinforcement.

NOTE—The fiber pattern may not be visible.

D 3918, D20

resin streak, *n*—a streak of excess resin on the surface of a laminated plastic.

D 883, D20

resin, synthetic, *n*—a synthetic substance physically similar to natural resin.

acrylic resin—a synthetic resin made from derivatives of acrylic acid.

alkyd resin—a synthetic resin made from polyhydric alcohols and polybasic acids; generally modified with resins, fatty oils or fatty acids.

ester gum—a resin made from rosin or rosin acids and a polyhydric alcohol, such as glycerine or pentaerythritol.

maleic resin—a resin made from a natural resin and maleic anhydride or maleic acid.

melamine resin—a synthetic resin made from melamine and aldehyde.

penta resin—ester gum made from rosin and pentaerythritol.

phenolic resin—a synthetic resin made from phenols and aldehydes.

styrene resin—a synthetic resin made from vinyl benzene.

urea resin—a synthetic resin made from urea and an aldehyde.

vinyl resin—a synthetic resin made from vinyl compounds.

D 16, D01

resist, *n*—(1) a material applied to a part of a cathode or plating rack to render the surface nonconductive. (2) A material applied to a part of the surface of an article to prevent reaction of metal from that area during chemical or electrochemical processes.

B 374, B08

resistance—the scalar property of an electric circuit or of any body that may be used as part of an electric circuit which determines for a given current the rate at which electric energy is converted into heat or radiant energy and which has a value such that the product of the resistance and the square of the current gives the rate of conversion of energy.

In a dc circuit:

$$P = I^2 R$$

where:

P = power, W,

I = current, A, and

R = resistance, Ω.

B 354, B01

resistance—the ratio of the potential difference applied to a specimen to the current passed through by the applied potential. It is the reciprocal of **conductance**. The unit is ohm.

D 2864, D27

resistance, abrasion, *n*—the ability to withstand scuffing, scratching, rubbing, or wind-scouring.

C 168, C16

resistance, apparent dc

resistance, apparent dc—the dc resistance measured at the end of a specified electrification time. The “apparent dc resistance” is the reciprocal of the “apparent dc conductance.” The unit is ohm.

D 2864, D27

resistance, core, R_1 —the effective ac resistance of a hypothetical parallel resistor that is considered to carry exclusively the core loss current, I_c , when a voltage is applied to the terminals of a coil encircling a magnetic core.

NOTE—The product, $I_c^2 R_1$, equals the total core loss, P_c . A 340, A06

resistance, dc—the ratio of the dc voltage (in volts) to the total current (in amperes) carried through the material between two electrodes that are in contact with, or immersed in a specimen. The “dc resistance” is the reciprocal of the “dc conductance.” The unit is ohm.

D 2864, D27

resistance, freeze-thaw, n —resistance to cycles of freezing and thawing that could affect application, appearance, or performance.

C 168, C16

resistance, impact (toughness), n —ability to withstand mechanical blows or shock without damage seriously affecting the effectiveness of the material or system.

C 168, C16

resistance, insulation, n —the ratio of the dc voltage applied to two electrodes (on or in a specimen) to the total volume and surface current between them.

D 1711, D09

resistance, surface, n —the ratio of the dc voltage applied to two electrodes (on the surface of a specimen) to the current between them.

D 1711, D09

resistance, thermal—the average temperature difference between two defined surfaces of a particular body or assembly when unit thermal transmission in unit time through unit area is established between the surfaces. $R = K \cdot m^2 / W$ ($R = {}^\circ\text{F} \cdot \text{h} \cdot \text{ft}^2 / \text{Btu}$).

D 1079, D08

resistance, thermal, R , n —the quantity determined by the temperature difference, at steady state, between two defined surfaces of a material or construction that induces a unit heat flow rate through a unit area.

$$R = \Delta T/q$$

A resistance (R) associated with a material shall be specified as a material R . A resistance (R) associated with a system or construction of materials shall be specified as a system R . (R in SI units: $\text{K}/(\text{W}/\text{m}^2) = \text{K} \cdot \text{m}^2/\text{W}$.) (R in inch-pound units: $\text{F}/(\text{Btu}/\text{h}/\text{ft}^2) = \text{F} \cdot \text{ft}^2 \cdot \text{h}/\text{Btu}$.)

C 168, C16

resistance thermometer—an instrument for determining temperature by measuring the electrical resistance of a standardized material exposed to that temperature.

E 7, E04

resistance thermometer, n —a temperature-measuring device comprised of a resistance thermometer element, internal connecting wires, a protective shell with or without means for mounting, a connection head, or connecting wire or other fittings, or both.

E 344, E20

resistance thermometer element, n —the temperature-sensitive portion of the thermometer composed of resistance wire, film or semiconductor material, its supporting structure, and means for attaching connecting wires.

E 344, E20

resistance to bending, n —in paper, the force required to deflect a rectangular test piece of paper, clamped at one end, through a specified angle when the force is applied near the free end of the test piece, normal to the plane which includes the near edge of the test piece, the clamp, and the point or line of application of the force.

D 1968, D06

resistance to breakage—the resistance of the inked ribbon or carbon ribbon to rupture resulting from tension before or after use.

F 221, F05

resistance to delamination, n —for pile yarn floor covering, the force/unit width measured when separating component layers

D 123, D13

resistance to delamination, n —for pile yarn floor covering, the force/unit width measured when separating the secondary backing.

D 5684, D13

resistance (to flow)—the reciprocal of conductance.

E 1316, E07

resistance to slippage, n —the force required to separate the parts of a standard seam by a specified amount.

D 123, D13

resistance to ultraviolet radiation, n —in polyolefin tape yarn, the time-to-failure of yarns exposed to xenon-arc weathering.

D 123, D13

resistance to ultraviolet radiation, n —in polyolefin tape yarn, the time-to-failure of yarns exposed to xenon-arc weathering.

D 4849, D13

resistance to yarn slippage, n —at the seam, the force required to displace one or more yarns in a fabric from the original position, causing differences in alignment, or spacing, or both.

D 123, D13

resistance to yarn slippage, n —at the seam, the force required to displace one or more yarns in a fabric from the original position, causing differences in alignment, or spacing, or both.

D 4850, D13

resistance, volume, n —the ratio of the dc voltage applied to two electrodes (on or in a specimen) to the current in the volume of the specimen between the electrodes.

D 1711, D09

resistance, winding, R_w —the effective ac series resistance of an inductor when no ferromagnetic materials are present.

NOTE—At low frequencies, R_w is only slightly greater than the dc resistance of the winding.

NOTE—The product $I^2 R_w$ equals the sum of the copper, eddy current, and dielectric losses in the winding.

NOTE—The total active power, P , delivered to an inductor having a ferromagnetic core is:

$$P = P_c + I^2 R_w$$

A 340, A06

resistazone counter—the generic name used to describe stream counters in which the interrogation zone is monitored for changes in electrical resistance as a result of the presence of a particle.

C 242, C21

resistivity, ρ —that property of a material which determines its resistance to the flow of an electric current, expressed by:

$$\rho = R \cdot A / \ell$$

where:

R = resistance of the specimen, Ω ;

A = cross sectional area, cm^2 ; and

ℓ = length of specimen, cm.

Units of electrical resistivity are ohm-centimetre (cgs) and ohm-metre (SI).

NOTE—This value is equivalent to the resistance between opposite faces of a cube of unit dimensions, and is designated “specific resistivity” or, by usage, “volume resistivity.”

A 340, A06

resistivity—the electrical resistance of a body of unit length, and unit cross-sectional area or unit weight.

B 354, B01

resistivity—the ratio of the potential gradient paralleling the current passing through the specimen, to the current density. This is numerically equal to the resistance between opposite faces of a unit cube. It is the reciprocal of **conductivity**. The unit commonly used is: ohm-centimetre. The SI unit is ohm-metre.

D 2864, D27

resistivity—the property of a substance (in this case, water) to resist the flow of electricity; the measurement of that resistance; the inverse of conductivity. Measured by a resistivity monitor, and described in ohms-cm.

D 6161, D19

resistivity, ρ —the reciprocal of conductivity.

E 1142, E37

resistivity—see **apparent surface resistivity** and **volumeresistivity**.

F 335, F05

resistivity, apparent dc volume—the “dc volume resistivity” measured at the end of a specified electrification time. It is the

reciprocal of the "apparent dc volume conductivity." The unit most commonly used is ohm-centimetre. The SI unit is ohm-metre.

D 2864, D27

resistivity, dc—the ratio of the dc potential gradient paralleling the current to the current density at a given instant in time and under prescribed conditions. It is the reciprocal of the "dc conductivity." In common practice the "dc resistivity" is numerically equal to the dc resistance between opposite faces of a centimeter cube of liquid. The unit is ohm-centimetre. The SI unit is ohm-metre.

D 2864, D27

resistivity, dc volume—the property of a material that impedes the flow of electricity through its volume. It is numerically equal to the ratio of: the steady direct voltage gradient parallel to the current; to the steady-state current density within the material. It is the reciprocal of the *dc volume conductivity*. In common usage where the voltage gradient is in volts per centimetre and the current density is in amperes per square centimetre, the unit of dc volume resistivity is (ohm-centimetre). The SI unit is ohm-metre.

D 2864, D27

resistivity, surface, n —the surface resistance multiplied by that ratio of specimen surface dimensions (width of electrodes defining the current path divided by the distance between electrodes) which transforms the measured resistance to that obtained if the electrodes had formed the opposite sides of a square. **D 1711, D09**

resistivity, surface insulation (of a single-strip specimen)—the effective resistivity of a single insulative layer tested between applied bare metal contacts and the base metal of the insulated test specimen. **A 340, A06**

resistivity, surface insulation (of multi-strip specimens)—the resistance of a unit area per test strip calculated from a measurement of the electrical resistance of a stack of strips with test current perpendicular to the strip surface. **A 340, A06**

resistivity, thermal, r, n —the quantity determined by the temperature difference, at steady state, between two defined parallel surfaces of a homogeneous material of unit thickness, that induces a unit heat flow rate through a unit area. (r in SI units: m K/W.) (r in inch-pound units: h ft F/Btu or, h ft² F/Btu in.) **C 168, C16**

resistivity, volume ρ —See **resistivity**. **A 340, A06**

resistivity, volume, n —the ratio of the electric potential gradient to the current density when the gradient is parallel to the current in the material. **D 1566, D11**

resistivity, volume, n —the volume resistance multiplied by that ratio of specimen volume dimensions (cross-sectional area of the electrodes divided by the distance between electrodes) which transforms the measured resistance to that resistance obtained if the electrodes had formed the opposite sides of a unit cube. **D 1711, D09**

resistivity, water vapor—See **water vapor resistivity**. **C 168, C16**

resite—See **C-stage**. **E 1749, E06**

resitol—See **B-stage**. **E 1749, E06**

resol—See **A-stage**. **E 1749, E06**

resolution—the fineness of detail in an object which is revealed by an optical device. Resolution is usually specified as the minimum distance by which two lines or points in the object must be separated before they can be revealed as separate lines or points in the image (see **resolving power** and **shape resolution**). The theoretical limit of resolution is determined from the equation:

$$d = 0.61 \lambda / (n \sin A.A./2)$$

where:

d = minimum distance between object points observed as distinct points in the image.

λ = wavelength of the radiation employed.

n = the minimum refractive index of the media between the object and the objective lens.

A.A. = the angular aperture.

E 7, E04

resolution $\Delta\lambda, \Delta \bar{\nu}, n$ —of a dispersive spectrometer; in mole-

cular spectroscopy, the wavelength interval, $\Delta\lambda$, or wavenumber interval, $\Delta \bar{\nu}$, of radiant energy leaving the exit slit of a monochromator measured at half the peak detected radiant power.

E 131, E13

resolution, n —in atomic spectrometry, the minimum distance by which two spectral lines must be separated before they can be distinguished as being separate. **E 135, E01**

resolution, n —minimum temperature increment displayed by an *IR thermometer* in degrees Celsius or Fahrenheit. **E 344, E20**

resolution:

depth—*EIA*, energy resolution translated into an equivalent resolution of depth in the specimen.

energy—*EIA*, the full width at half-maximum (FWHM) of the measured energy distribution when the energy distribution of the backscattered particles is monoenergetic.

lateral—*EIA*, the distance measured on the surface of a specimen over which changes in composition can be established with confidence by BS. This resolution is generally determined by the size of the beam spot.

system—*EIA*, the energy or depth resolution measured in a BS spectrum for a monoenergetic incident beam. **E 673, E42**

resolution, n —the level of spatial or temporal detail or administrative classification at which a particular data element is collected, archived retrieved, or both, from an ADMS; that is, lane-by-lane versus detector station or intersection approach; a 20-s versus a 15-min time period; or a particular named city versus the generic term of city. **E 867, E17**

resolution—the smallest increment that a characteristic measuring process must distinguish and display. **E 867, E17**

resolution—the ability of ultrasonic equipment to give simultaneous, separate indications from discontinuities having nearly the same range and lateral position with respect to the beam axis. **E 1316, E07**

resolution—a quantitative measure of the ability to separate closely spaced transitions at an appropriate analytic level. **E 2161, E37**

resolution, n —in a bar code system, the narrowest element dimension that can be distinguished by a particular reading device or method. **F 1294, F05**

resolution (of a deformation-measuring instrument)—the ratio of the smallest divisional increment of the indicating scale to the sensitivity of the instrument. Interpolation within the increment may be possible, but is not recommended in specifying resolution. **D 653, D18**

resolving power—the ability of a given lens system to reveal fine detail in an object. (See also **Resolution**.) **E 7, E04**

resolving power, R, n —the ratio $\lambda/\Delta\lambda$ where λ is the wavelength of radiant energy and $\Delta\lambda$ is the resolution expressed in wavelength units; or, alternatively, the ratio $\bar{\nu}/\Delta \bar{\nu}$ where $\bar{\nu}$ is the wavenumber of radiant energy being examined and $\Delta \bar{\nu}$ is the resolution expressed in wavenumber units. **E 131, E13**

resonance—the reinforced vibration of a body exposed to the vibration, at about the frequency, of another body. **D 653, D18**

resonance method—a technique in which continuous ultrasonic waves are varied in frequency to identify resonant characteristics in order to discriminate some property of a part such as thickness, stiffness, or bond integrity. **E 1316, E07**

resonance reaction—*EIA*, a nuclear reaction that has a narrow peak in the nuclear reaction cross section, which is so much larger than the nuclear reaction cross sections at adjacent energies both above and below the peak that essentially all the particles detected from the reaction are due to the peak. **E 673, E42**

resonant forced vibration technique (in dynamic mechanical measurement)—a technique for performing dynamic mechanical measurements, in which the sample is oscillated mechanically at the system's natural resonant frequency. **D 4092, D20**

resonant frequency—a frequency at which resonance exists. **D 653, D18**

resorption, n —the process by which a material that has given

resorption, *n*

material by desorption takes up some more of the material given up. **D 123, D13**

resorption, *n*—the process by which a material that has given up another material by **desorption** takes up some more of the material given up. **D4920, D13**

resource application—use of stabilized products in specific areas such as earth liners, foundations, road base, backfills, embankments, earth dams, etc. **D 5681, D34**

Resource Conservation and Recovery Act of 1976—an amendment to the Solid Waste Disposal Act of 1965.

restoration—See **preservation**.

retaining wall—See **wall**. **E 631, E06**

Resource Conservation and Recovery Act (RCRA), *n*—a congressional mandate that requires the management of regulated hazardous waste and requires that permits be obtained for facilities (both private and public) that treat, store, or dispose of hazardous waste. **E 833, E06**

resource structural products—structural products produced by lime, fly ash, and heavy metal waste; examples are block, brick, aggregates, gabions, and miscellaneous structural shapes. **D 5681, D34**

respiration rate, *n*—in an microbial aqueous system, the quantitative consumption of oxygen, generally expressed as mg O₂/L/h. **D 5681, D34**

respiration rate—the quantitative consumption of oxygen by an aqueous microbial system. The consumption is generally expressed as mg O₂/L/h. **D 5681, D34**

respiratory tracing, *n*—a display of physiological patterns of the subject's breathing activity as recorded by the pneumograph component. **E 2035, E52**

respondent, *n*—See **assessor**. **E 253, E18**

response—the motion (or other output) in a device or system resulting from an excitation (stimulus) under specified conditions. **D 653, D18**

response, *n*—a physiological change that occurs following, and is attributable to, the presentation of an applied stimulus (for example, reviewed test question). **E 2035, E52**

response curve for *N* cycles—a curve fitted to observed values of percentage survival at *N* cycles for several stress levels, where *N* is the preassigned number such as 10⁶, 10⁷, and so forth. It is an estimate of the relationship between applied stress and the percentage of the population that would survive *N* cycles. **E 1823, E08**

response factor, *n*—a constant of proportionality that converts area to liquid volume. **D 4175, D02**

response factor—in leak testing, the response of the halogen leak detector 0.3 MPa·m³/s of refrigerant-12 (dichlorodifluoromethane, CCl₂F₂) or less, divided by the response to the same quantity of another halogen test gas. Thus, the actual leak rate of a detected leak will be the indication of the detector multiplied by the response factor. The response of mixture of a tracer and nonhalogen gases will be the response factor of the tracer divided by the fraction of tracer gas in the test gas. **E 1316, E07**

response position—the area designated to mark information on a mark read form. **F 149, F05**

response surface, *n*—the pattern of predicted responses based on the empirical model derived from the experiment observations. **E 456, E11**

response surface, *n*—the pattern of predicted responses based on the empirical model derived from the experiment observations. **E 1325, E11**

response time, *n*—in *tensile testing machines*, the time required by the indicating or recording device to reflect an instantaneous change in force, usually 0 to 90 % of full scale. **D 123, D13**

response time—See **analyzer**. **D 1356, D22**

response time—the length of time necessary to obtain a stable electrode potential when the electrode is removed from one solution and placed in another of different concentration. Response

time depends on the electrode type, the magnitude and direction of the concentration change, temperature, and the presence of electrode interferences, if any. After exposure to a change in concentration, values of apparent concentration asymptotically approach the true concentration. Under most conditions, an electrode will exhibit a value within 1 mV of the final value within 1 min. **D 4127, D19**

response time, *n*—in *tensile testing machines*, the time required by the indicating or recording device to reflect an instantaneous change in force, usually 0 to 90 % of full scale. **D 4849, D13**

response time, *n*—the time required for a sensor to change a specified percentage of the total difference between its initial and final temperatures as determined from zero-power resistances when the sensor is subjected to a step function change in temperature. **E 344, E20**

response time—the time required for a leak detector or leak testing system to yield a signal output equal to 63 % of the maximum signal attained when tracer gas is applied continuously to the system under test. Also called **response**. **E 1316, E07**

response to molten substance pour—in *testing thermal protective material*, the observed effect of molten substance contact on textile properties or deterioration of the material. **F 1494, F23**

response-type system number (RTSN), *n*—the raw measured output from a response-type system. **E 867, E17**

response type system number (RTSN)—the raw measured output from a response type system being calibrated. Units are arbitrary, being whatever the road meter in the response type system measures. (See Terminology E 867, Section 5). **E 867, E17**

response variable, *n*—the variable that shows the observed results of an experimental treatment. Synonym: dependent variable. **E 456, E11**

response variable, *n*—the variable that shows the observed results of an experimental treatment. Synonym: dependent variable. **E 1325, E11**

responsibility for the fastener—party responsible for the fastener shall be the organization that supplies the fastener to the purchaser and certifies that the fastener was manufactured, sampled, tested, and inspected in accordance with the specification and meets all of its requirements. **A 563 F 1789, F16**

responsible party—responsible party for the fastener shall be the organization that supplies the fastener to the purchaser and certifies that the fasteners were manufactured, sampled, tested, and inspected in accordance with applicable specifications and meets all of the requirements. **F 1789, F16**

responsivity, *s*, *n*—quotient of the output of a detector *Y* by its input *X*: $s = Y/X$. (See also **spectral responsivity**.) **E 284, E12**

rest conductivity, *n*—the reciprocal of the resistivity of uncharged fuel in the absence of ionic depletion or polarization. **D 4175, D02**

restoration, *n*—action directed towards returning the condition of an object to its original state. **D 123, D13**

restoration, *n*—treatment procedures intended to return cultural property to a known or assumed state, often through the addition of nonoriginal material. **D 5038, D13**

rest potential—See **open-circuit potential**. **G 15, G01**

restriction endonuclease—a bacterial enzyme that cuts double-stranded DNA at positions consisting of specific short sequences of nucleotides. **E 1705, E48**

restrike, *v*—to repress for the purpose of increasing the density of a sintered compact (not to be confused with **coin** or **size**). **B 243, B09**

result, *n*—the outcome of a measurement. **D 1129, D19**

result, *n*—the value obtained by following the complete set of instructions of a test method. **D 4175, D02**

result, *n*—the value obtained by following the complete set of instructions of a test method. It may be obtained from a single determination or several determinations, depending on the instruction of the test method. **D 4175, D02**

- result**, *n*—value representing the quantity of analyte that is obtained by applying a method one time to a test material. **E 135**, E01
- result**—a value, that is, a single determination, an average of duplicates, or other specified grouping of replicates, obtained by carrying out the test method. **E 1547**, E15
- resultant field**—see **field, resultant**. **E 1316**, E07
- resultant traction force** [*MLT*²], *n*—the vector sum of lateral and longitudinal traction forces. **F 538**, F09
- resultant yarn number**, *n*—the yarn number based on the observed mass per unit length of a plied yarn, a cabled yarn, or a yarn whose number has been changed by processing such as twisting or bulking. **D 123**, D13
- resultant yarn number**, *n*—the yarn number based on the observed mass per unit length of a plied yarn, a cabled yarn, or a yarn whose number has been changed by processing such as twisting or bulking. **D 4849**, D13
- retainer basket**, *n*—in sampling, a one-way gate on a sampling device that minimizes loss of sample when retrieving a sampler; also called a core catcher. **D 5681**, D34
- retainer, fixed**—See **fixed retainer**. **D 2050**, D13
- retainer, movable**—See **movable retainer**. **D 2050**, D13
- retainer pin**, *n*—in *zippers*, a tube-like element, similar to the separable pin, attached over the bead at the bottom end of the stringer opposite to the separable pin and that is designed to hold the fixed retainer in position. **D 123**, D13
- retainer pin**, *n*—a tube-like element, similar to the separable pin, attached over the bead at the bottom end of the stringer opposite to the separable pin and that is designed to hold the fixed retainer in position. **D 2050**, D13
- retaining ring**—a component that holds the tumbler pack on the tumbler post. **F 471**, F12
- retannage**—a modifying second tannage, applied after intermediate operations following the primary tannage. **D 1517**, D31
- retard**—bank-protection structure designed to reduce the riparian velocity and induce silting or accretion. **D 653**, D18
- retardation**—delay in deformation. (ISRM) **D 653**, D18
- retardation**, δ —optical path difference between two beams in an interferometer; also known as “optical path difference” or “optical retardation”. **E 131**, E13
- retardation, maximum**, Δ —the greatest retardation generated by an interferometer in a given scan. **E 131**, E13
- retardation plate**—a plate placed in the path of a beam of polarized light for the purpose of introducing a difference in phase. Usually quarter-wave or half-wave plates are used, but if the light passes through them twice the phase difference is doubled. **E 7**, E04
- retarder**, *n*—a material that extends setting time. **C 11**, C11
- retarder**—a material that slows the rate at which chemical reactions would otherwise occur. **D 653**, D18
- retarder**, *n*—Synonym for **inhibitor**. **D 907**, D14
- retarder**, *n*—a material used to reduce the tendency of a rubber compound to vulcanize prematurely. **D 1566**, D11
- re-temper**, *v*—to add more water to a hydraulic-setting compound after the initial mixing, but before partial set has occurred.
- retrofit**—See **building modification**. **E 631**, E06
- retentate**—see **concentrate**. **D 6161**, D19
- retention of prime**, *n*—ability of a pump to retain its prime and dispense a full dose without re-priming after a period of non-use. **D 6655**, D10
- retention time**, *n*—the time that elapses from the introduction of the sample until the component peak maximum is reached. **D 1129**, D19
- retention time**—the duration of time that the optimal signal for reading persists. **E 344**, E20
- retention time (RT)**, *n*—time to elute a specific chemical from a gas chromatographic column, for a specific carrier gas flow rate, measured from the time the chemical is injected into the gas stream to when it appears in the detector.
- relative retention time (RRT)**, *n*—a ratio of RTs for two chemicals for the same chromatographic column and carrier gas flow rate, where the denominator represents a reference chemical. **D 1356**, D22
- retentivity**—the ability of an adsorbent to resist desorption of an adsorbate. **D 2652**, D28
- retentivity**—the ability of a material to retain a portion of the applied magnetic field after the magnetizing force has been removed. **E 1316**, E07
- retentivity**, B_{rs} —the property of a magnetic material which is measured by its maximum value of the residual induction.
- NOTE—Retentivity is usually associated with saturation induction. **A 340**, A06
- retest**—the tests given after the initial acceptance test, usually performed at regular periodic intervals or as required because of physical inspection. **F 819**, F18
- retest date**, *n*—the date when a material should be re-examined to ensure that it is still suitable for use. **E 2363**, E55
- reticle**—a system of lines, circles, dots, cross hairs or wires, or some other pattern, placed in the eyepiece or at an intermediate plane on the optic axis which is used as a measuring reference, focusing target, or to define a camera field of view (a reticle is different than a graticule, see **graticule**). **E 7**, E04
- reticulate-blocky cryostructure**—the structure of frozen soils in which horizontal and vertical veins of ice form a three-dimensional, irregular rectangular lattice. **D 7099**, D18
- reticulate cryostructure**—the structure of frozen soils in which horizontal and vertical veins of ice form a three-dimensional rectangular or square lattice. **D 7099**, D18
- reticulated foam**, *n*—in *carbon and graphite technology*, a foam with a ligamentous structure rather than a spherical pore structure. **C 709**, D02
- reticulated foam**, *n*—in *carbon and graphite technology*, a foam with a ligamentous structure rather than a spherical pore structure. **D 4175**, D02
- reticulate(d) ice**—a network of horizontal or vertical ice veins forming a three-dimensional rectangular lattice within frozen fine-grained sediments. **D 7099**, D18
- reticulation**, *n*—the cracking of a print (mud cracking) due to poorly plasticized ink, over-thinning of an ink or too little print pressure. **D 6488**, D01
- retortable**—capable of withstanding specified thermal processing in a closed retort at temperatures above 100°C. **F 17**, F02
- retortable**—See **Terminology F 17**. **F 1327**, F02
- retorts**—containers fabricated from various metals in which parts are loaded to be diffusion coated or diffusion heat treated. **B 374**, B08
- retrace**, *n*—a stroke written back over the preceding stroke in the reverse direction. **E 2195**, E30
- retractable anvil**—curved clincher used in stapling from outside of container. **F 592**, F16
- retracted spew**, *n*—deprecated term, see **backrinding**. **D 1566**, D11
- retraction**, *n*—in *yarns and cords*, the reduction in length when previous restraint is removed and relaxation is allowed, thus causing a directionally proportional increase in linear density. **D 123**, D13
- retraction**, *n*—in *yarns and cords*, the reduction in length when previous restraint is removed and relaxation is allowed, thus causing a directionally proportional increase in linear density. **D 6477**, D13
- retreating index thermometer**—a thermometer in which the constriction is not sufficiently small to prevent the passage of mercury back to the bulb (or the mercury index from falling) without shaking when heat is removed from the bulb. **E 344**, E20
- retrieval**—removing a deployed boom from the water. **F 818**, F20
- retrieving**, *v*—extracting from the ADMS one or more data values or information sets of interest to a user where the format of that may be one or more sets of text, tables, charts, graphs, schematic

- diagrams, or maps, using one or more varieties of media such as print, electronic files, electronic mail, or storage media such as CD ROMs or DVDs. **E 867, E17**
- retrofit, v—in building*, to add new materials or equipment not provided at the time of original construction. **E 631, E06**
- retrofit**—the modification of an existing building or facility to include new systems or components. **E 631, E06**
- retrofit, n**—the modification of an existing building or facility to include new systems or components. **E 833, E06**
- retrogradation, n**—gradual and irreversible insolubilization of an aqueous dispersion of starch or its derivatives with the formation of either a precipitate or a gel, depending on the concentration. **D 907, D14**
- retrograde condensation**—where the critical point of multicomponent liquid-vapor equilibrium occurs below the maximum in temperature and pressure of the two-phase region, a sequence of increasing pressure change, at a temperature between the temperature maximum and the critical point, will cause a partial condensation of the vapor to liquid and then a full return to the vapor state, called retrograde condensation. **E 7, E04**
- retrograde vaporization**—the inverse of retrograde condensation. **E 7, E04**
- retrogressive thaw slump**—a slope failure resulting from thawing of ice-rich permafrost. It consists of a steep headwall, containing ice or ice-rich sediment, which retreats in a retrogressive manner through melting, and a debris flow formed from the retrogressive thawed sediment and ice, which slides down from the face of the headwall to its base. **D 7099, D18**
- retroreflection, n**—reflection in which the reflected rays are preferentially returned in directions close to the opposite of the direction of the incident rays, this property being maintained over wide variations of the direction of the incident rays. **E 284, E12**
- retroreflection; reflex reflection, n**—reflection in which light is returned in directions close to the direction from which it came, this property being maintained over wide variations in the direction of incident light. **E 349, E21**
- retro-reflective, adj**—a characteristic of material that reflects light back to its source regardless of the angle of incidence. **F 1294, F05**
- retroreflectivity, n**—property of a material or device in which, when directionally irradiated, the reflected rays are preferentially returned in directions close to the opposite of the direction of the incident rays, this property being maintained over wide variations in the direction of the incident rays. **E 284, E12**
- retroreflector, n**—a reflecting surface or device from which, when directionally irradiated, the reflected rays are preferentially returned in directions close to the opposite of the direction of the incident rays, this property being maintained over wide variations of the direction of the incident rays. **E 284, E12**
- retroreflector axis, n**—a designated line segment from the retroreflector center that is used to describe the angular position of the retroreflector. **E 284, E12**
- retroreflector center, n**—a point on or near a retroreflector that is designated to be the center of the device for the purpose of specifying its performance. **E 284, E12**
- retting, n—in flax**, the process of partial biological or chemical decomposition of pectins and other components which bind the fiber, fiber bundles, and the non-fiber structures, thereby facilitating removal of bast fibers from stems.
- under-retting, n—in flax*, indicates that decomposition is insufficient to allow fiber bundles to be easily removed from the non-fibrous parts of the stem.
- over-retting, n—in flax*, indicates that decomposition has caused excessive deterioration of bast fibers. **D 123, D13**
- retting, v—in flax**, the process of partial biological or chemical decomposition of pectins and other components which bind the fiber, fiber bundles, and the non-fiber structures, thereby facilitating removal of bast fibers from stems. (See under-retting and over-retting) **D 6798, D13**
- returnable, adj**—intended to be returned one or more times in an available program established by, but not limited to manufacturers, distributors or retailers. **D 996, D10**
- returnable container**—See **container**. **D 996, D10**
- return flow nozzle**—see **by-pass nozzle**. **E 1620, E29**
- reusable, adj**—intended to be used for its original purpose one or more times in an available program established by, but not limited to, manufacturers, distributors, or retailers (see also **refillable** and **available program** for further clarification). **D 996, D10**
- reusable, adj**—capable of being used again or repeatedly. **D 1968, D06**
- reusable container**—See **container**. **D 996, D10**
- reusable pallet**—See **pallet**. **D 996, D10**
- reuse, v**—using a material, product or component of the waste stream in its original form more than once. **E 2114, E06**
- reverberant sound field**—the sound in an enclosed or partially enclosed space that has been reflected repeatedly or continuously from the boundaries. **C 634, E33**
- reverberation**—the persistence of sound in an enclosed or partially enclosed space after the source of sound has stopped; *by extension*, in some contexts, the sound that so persists. **C 634, E33**
- reverberation room**—a room so designed that the reverberant sound field closely approximates a diffuse sound field, both in the steady state when the sound source is on, and during decay after the source of sound has stopped. **C 634, E33**
- reverberatory wires, n**—a wire mesh located in front of, but close to, the radiating surface of the panel heat source which serves to enhance the combustion efficiency and increase the radiance of the panel. **E 176, E05**
- reversal developer (negative developer)**—uncharged area development by means of toner particles having appropriate charge polarity so that dark areas of the print correspond to light areas of the original. **F 335, F05**
- reversal development (negative development)**—uncharged area development by means of toner particles having appropriate charge polarity so that dark areas of the print correspond to light areas of the original. **F 335, F05**
- reversal plate, film, or paper**—a photographic material which, after exposure to a subject, is processed to give a positive reproduction without transfer of the image to another sheet material. **E 7, E04**
- reversal (slope reversal)**—*in fatigue loading*, the occurrence where the first derivative of the force-time (strain-time) history changes sign. **E 1823, E08**
- reverse**—to reverse the direction of flow of gas and air in a regenerative furnace. **C 162, C14**
- reverse circulation**—a drilling system in which the circulating medium flows down through the annulus and up through the drill rod, that is, in the reverse of the normal direction of flow. **D 653, D18**
- reversed calf**—a term applied to calf leather of heavier weight, suede finished on the flesh surface, containing oils to increase water-resistance, used for shoes where a nappy leather is required. Originally called “trench calf” in England, the term “hunting calf” is also used in that country. The term “service leather” may also be used though this term is usually reserved for sueded split and side leather. **D 1517, D31**
- reversed print**—a print prepared from a positive transparency. (See also **negative print**.) **E 7, E04**
- reversed transparency**—See **positive transparency**. **E 7, E04**
- reverse image, n**—a symbol in which the dark areas are represented by the material substrate (background) and the light areas are represented by the printed portion of the symbol. **F 1294, F05**
- reverse osmosis (RO)**—the separation process where one component of a solution is removed from another component by flowing the feed stream under pressure across a semipermeable membrane that causes selective movement of solvent against its osmotic pressure difference. RO removes ions based on electro chemical forces, colloids, and organics down to 150 molecular weight. May also be called hyperfiltration. **D 6161, D19**

reverse retan—a term applied to leather tanned first with vegetable tannin and then with chromium compounds. **D 1517, D31**

reversible adsorption—adsorption in which the desorption isotherm approximates the adsorption isotherm. **D 2652, D28**

reversible fiber optic chemical sensor, n—a fiber optic chemical sensor in which the transduction element does not undergo a permanent depletion or degradation as a result of the transduction process. **E 131, E13**

reversion, n—*inbuilding construction in joint sealing*, a loss of elastomeric properties and a decrease in durometer hardness of a seal or cured sealant following environmental exposure. **C 717, C24**

reversion—in general, the tendency of pulp or paper properties to return to those of the material at some other stage. It is frequently specifically applied to the loss of brightness with time, after bleaching has produced a high brightness. **D 1695, D01**

reversion (vulcanization), n—deterioration of vulcanizate properties that may occur when vulcanization time is extended beyond the optimum. **D 1566, D11**

revetment—bank protection by armor, that is, by facing of a bank or embankment with erosion-resistant material. **D 653, D18**

review—deliberately critical examination, including observation of plant operation, evaluation of audit results, procedures, certain contemplated actions, and after-the-fact investigations of abnormal conditions. **F 1789, F16**

revivification—see **reactivation**. **D 2652, D28**

revolving drum test—See **package testing**. **D 996, D10**

revolving pot—{archaic} a rotating circular container from which the Owens machine gathers glass. **C 162, C14**

revolving tube—a hollow cylinder, concentric with the needle of a feeder, revolving in the glass. **C 162, C14**

rework, n—*for inflatable restraints*, the deviation from normal process flow remedially altering finished fabric, coated fabric, or cut pieces for the purpose of minimizing or removing a major imperfection. **D 6799, D13**

reworked plastic, n—a plastic from a processor's own production that has been reground, pelletized, or solvated after having been previously processed by molding, extrusion, etc. See **recycled plastic and reprocessed plastic**. **D 883, D20**

rework plastic (thermoplastic)—a plastic from a manufacturer's own production that has been reground or pelletized for reuse by that same manufacturer. **F 412, F17**

REX hardness—*in sealants*, the hardness of a sealant as measured by a REX hardness gage. **E 631, E06**

REX hardness—*in sealants*, the hardness of a sealant as measured by a REX hardness gage. **E 1749, E06**

reynolds number—a dimensionless number expressing the ratio of inertia forces to viscous forces in a moving fluid. The number is given by VL/μ where "V", is the fluid's velocity, "L" is a characteristic length or distance such as pipe diameter, "r" is the fluid's mass density, and "m" is the fluid's dynamic viscosity. **D 4410, D19**

rhBMP, n—recombinant human bone morphogenetic protein. **F 2312, F04**

rheology—the science of measuring the flow and deformation properties of matter. For porcelain enamel slips, the most important parameter is their yield point. **C 286, B08**

rhodizonate spot test method—*for lead detection*, the use of a dilute solution of rhodizonate ion to test a painted surface or paint chip for the qualitative presence of lead (1). A color change from yellow/orange to pink or red indicates the presence of lead above the level of detection of the test kit. **E 631, E06**

rhomboidal—having three equal axes, with the included angles equal to each other but not equal to 90°. **E 7, E04**

rib, n—a continuous circumferential projection. **F 538, F09**

ribbon—in some slate, narrow bands of contrasting color or appear-

ance differing in some degree in chemical composition from the main body. **C 119, C18**

ribbon—a continuous strip of glass in process. **C 162, C14**

ribbon, n—a fine-textured, narrow fabric which weighs less than 510 g/m² (approximately 2.6 lb/100 yd per inch of width or 15 oz/yd²) and which is used primarily for trimming or decorative purposes. (See also **narrow fabric**.) **D 123, D13**

ribbon, n—a fine-textured, narrow fabric which weighs less than 510 g/m² (approximately 2.6 lb/100 yd per inch of width or 15 oz/yd²) and which is used primarily for trimming or decorative purposes. (See also **narrow fabric**.) **D 4850, D13**

ribbon anisotropic phase, n—*as used in Test Method D 5061*, a group of binder-phase anisotropic carbon textures distinguished by their ribbon-like domains (that is, length (*L*) to width (*W*) ratio of $L > 4W$), and subdivided based on domain width as fine ribbon (2.0- to 12.0- μ m), medium ribbon (12.0- to 25.0- μ m), and coarse ribbon (>25.0- μ m) size categories. **D 121, D05**

ribbon machine—a forming machine for the manufacture of blown glass products from a ribbon of molten glass. **C 162, C14**

ribbon process—a process whereby molten glass is delivered to a forming unit in a ribbon form. **C 162, C14**

ribbon wire—box stay wire of nominal 0.103 in. (2.62 mm) in width. **F 592, F16**

rib or element area [*L*²], n—that area within the outer periphery of a tire footprint that is contacted by ribs or elements. **F 538, F09**

Richard's outflow principle—the principle that states that pore-liquid will not generally flow into an air-filled cavity (at atmospheric pressure) in unsaturated soil. **D 653, D18**

rich gas—natural gas containing commercially recoverable amounts of condensable hydrocarbons. **D 4150, D03**

ride—the edge which acts as a cam. **F 1078, F04**

rideability, n—a subjective judgement of the comparative discomfort induced by traveling over a specific section of highway pavement in a vehicle. **E 867, E17**

rideability index (RI), n—an index derived from controlled measurements of the longitudinal profile in the wheel tracks and correlated with panel ratings of rideability. **E 867, E17**

ride number (RN), n—rideability index of a pavement using a scale of 0 to 5, with 5 being perfect and 0 being impassable. **E 867, E17**

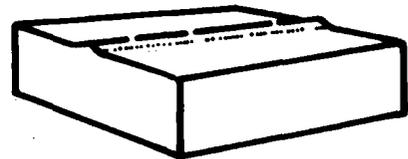

ride quality rating, n—a numerical value subjectively assigned to a section of highway pavement by an individual quantifying his judgement of the level of ride quality for that section based on a psychophysical scale. **E 867, E17**

ride quality rating panel, n—a group of highway users, statistically representative of the total expected highway user population, in rating the ride quality of pavements. **E 867, E17**

rider arch—one of a series of arches that support the checkerwork in a regenerator. **C 162, C14**

ride relief—the contoured area between the shank and ride **F 1078, F04**

ridge—long, narrow protrusion on any surface.

F 109, C21

ridge roll, n—a half-round section applied along the hips and ridge of a roof to conceal and waterproof the apex joint of the roofing material. **C 1154, C17**

ridging—an upward, tenting displacement of a membrane, frequently over an insulation joint. **D 1079, D08**

ridging indentation

ridging indentation—a hardness indentation around which metal has been piled up above the plane of the specimen. E 7, E04

riebeckite asbestos, *n*—a member of the mineral group of monoclinic amphiboles derived from riebeckite (glaucophane) of the alkali amphibole series. D 2946, C17

rifle, *n*—a hand-fed sample divider device that divides the sample into two parts of approximately the same weight. D 121, D05

rift—(1) a consistent direction or trend in a rock body along which the rock is most easily split or broken.

(2) The grain orientation in stone, particularly in sedimentary stones, showing more or less clearly how the stone was originally bedded, and with or without color or grain-size changes, or voids and hollow. C 119, C18

rift sawn—a synonym for *edge grain*. D 9, D07

rigging leather—a strong, flexible, vegetable-tanned leather. D 1517, D31

right-angle chisel point—chisel point with beveled point faces parallel to staple-crown axis. (See **cross-cut chisel point**.) F 592, F16

right side, *n*—See **face side**. D 4965, D13

rigid cellular polystyrene thermal insulation (RCPS)—rigid thermal insulation board formed by expansion of polystyrene resin beads or granules in a closed mold (EPS), or by the expansion of polystyrene resin in an extrusion process (XPS). E 631, E06

rigid grinding disk—a non-fabric support surface, such as a composite of metal/ceramic or metal/polymer, charged during use with an abrasive (usually 6 to 15 micrometer diamond particles) and used for grinding operations in a metallographic preparation. E 7, E04

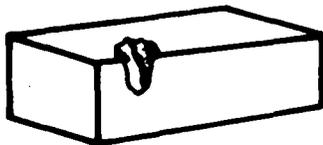

rigid layer—provides mechanical support for the membrane switch. F 2112, F01

rigid plastic, *n*—for purposes of general classification, a plastic that has a modulus of elasticity, either in flexure or in tension, greater than 700 MPa (100 000 psi) at 23°C and 50 % relative humidity when tested in accordance with Test Method D 747, Test Methods D 790, Test Method D 638, or Test Methods D 882. D 883, D20

rigid plastic—for purposes of general classification, a plastic that has a modulus of elasticity either in flexure or in tension greater than 700 MPa (100 000 psi) at 23°C and 50 % relative humidity when tested in accordance with Test Methods D 747, D 790, D 638, or D 882. F 1251, F04

rim, *n*—the metal support for the tire and tube assembly on the wheel. D 5681, D34

rim—a protrusion, usually of base material, bordering either partially or completely a hole, pit, or pocket.

F 109, C21

rim, *n*—the specially shaped circular periphery to which a tire may be mounted with appropriate bead fitment. F 538, F09

rimmed steel, *n*—a steel that contained sufficient oxygen to generate carbon monoxide at the boundary between the solid metal and the remaining molten metal during solidification, resulting in an outer layer low in carbon. A 941, A01

rim strip, *n*—a layer of compound, with or without fabric reinforcement, that is applied at the bead to protect the carcass plies against damage from mounting tools and from rim chafing during service. F 538, F09

rim, test, *n*—a rim having the configuration and dimensions suitable for use with a test tire in accordance with publications of a tire and rim standards organization current at the time of tire manufacture. F 538, F09

rim thickness—thickness of peripheral part of head, measured parallel to nail axis. F 547, F16

ring—(1) a floating refractory body surrounding a glass surface from which gathers are made.

(2) a mold part that forms the rim of a pressed article. C 162, C14

ring, *n*—in buttons, a split ring used to fasten a staple attached button to the substrate. D 123, D13

ring, *n*—in hosiery, a narrow, visually different horizontal band. D 123, D13

ring, *n*—in hosiery, a narrow, visually different horizontal band. D 3990, D13

ring, *n*—in buttons, a split ring used to fasten a staple attached button to the substrate. D 5497, D13

ring buoy (maritime), *n*—a Type 4 personal floatation device, usually made of a hard buoyant material with a line encircling it. F 1490, F32

ring-down count—see **count, acoustic emission, the preferred term**. E 1316, E07

ringhole—an opening in a melter through which glass is gathered. C 162, C14

ring nail, ring-barbed nail, ring-grooved nail, ring-grip nail, ring-shank nail—terms applied to annularly threaded nail. (See **thread, annular**.) F 547, F16

ring or toggle attached staple button, *n*—a button attached to one part of a flexible substrate by means of a ring or toggle rather than a needle or thread. The staple passes through an eyelet in the flexible substrate and is secured by the ring or toggle that passes through the staple eye. D 5497, D13

ring-porous woods—hardwoods in which the pores of the earlywood are large compared to the latewood, thus forming a distinct zone or ring of pores. D 9, D07

ring section—narrow, peripheral section cut from a glass article for optical examination. C 162, C14

ring thread, ring-barb thread, ring-groove thread, ring-grip thread, ring-shank thread—See **annular thread**. F 547, F16

rinse, *n*—that part of the operating cycle of an ion exchange process in which a specified water is passed through a bed of the ion exchange material to remove the residual regenerant solution. D 1129, D19

rinse—the process of removing liquid penetrant examination materials from the surface of a test part by means of washing or flooding with another liquid, usually water. The process is also termed **wash**. E 1316, E07

rinse additive feeder—a device that automatically feeds rinse additives into recirculated or non-recirculated rinse water of spray-type commercial dishwashing and glasswashing machines. F 1827, F26

rinse, *v* or *n*—a process or treatment in an aqueous solution for the purpose of removing extraneous matter. (See Guide D 5548.) D 459, D12

ripening—in the manufacture of viscose rayon, that stage where the cellulose xanthate solution is stored several days under controlled conditions to reach a state from which coagulation is easier. D 1695, D01

ripped selvage—See **cut selvage**. D 3990, D13

ripple—in dry process enameling, a surface defect characterized by pronounced waviness, uniform over a considerable area. C 286, B08

ripple—small, triangular-shaped bed forms that are similar to dunes but smaller. D 4410, D19

ripple (dc)—regular modulations in the dc output wave of a rectifier unit, or a motor-generator set, originating from the harmonics of the ac input system in the case of a rectifier, or from the harmonics of the induced voltage of a motor generator set. B 374, B08

ripple mark—See **Wallner line**. C 162, C14

ripple plating—a method of electroplating in which the current is changed periodically by superimposing surges, ripples, pulses, or alternating current to the d-c electroplating current. B 374, B08

- riprap stone**—material generally less than 2 tons (1814 kg) in mass, specially selected and graded, when properly placed prevent erosion through minor wave action, or strong currents and thereby preserves the shape of a surface, slope, or underlying structure. **D 653, D18**
- rip-shear shredders, n**—a tire shredder designed to reduce a scrap tire to pieces. The size and shape of the rubber particle is dependent on the processing action of the shredder (that is, by cutting blades, rotary shear, or rip shear). **D 5681, D34**
- rise, n**—the maximum dimension of the cross-sectional profile of the tile measured perpendicular to the roof surface as installed. **C 43, C15**
- riser**—the pipe extending from the well screen to or above the ground surface. **D 653, D18**
- rise time, n**—the time required for a free-rise cellular plastic to achieve its ultimate expansion under controlled conditions. **D 883, D20**
- rise time*—See **analyzer**. **D 1356, D22**
- rise time (pulse rise time)**—the interval of time required for the leading edge of a pulse to rise from some specified small fraction to some specified larger fraction of the maximum value. **D 653, D18**
- rising damp, n**—upward-moving moisture in a wall or other structure standing in water or in wet soil. (Compare: **capillary migration, wicking**). **E 631, E06**
- risk, n**—the probability or an expected loss associated with an adverse effect. **D 5681, D34**
- risk, n**—the probability or likelihood that an adverse effect will occur. **D 5681, D34**
- risk**—the probability or likelihood an adverse effect will occur. **E 943, E47**
- risk, n**—combination of the probability of occurrence of harm and the severity of that harm. **E 2363, E55**
- risk, n**—probability of loss or injury from a hazard. **G 126, G04**
- risk-adjusted discount rate (RADR)**—a discount rate that has been adjusted to account for risk. **E 631, E06**
- risk-adjusted discount rate (RADR), n**—a discount rate that has been adjusted to account for risk. **E 833, E06**
- risk analysis**—the body of theory and practice that has evolved to help decision makers assess their risk exposures and risk attitudes so that the investment that is *best for them* is selected. **E 631, E06**
- risk analysis, n**—the body of theory and practice that has evolved to help decision makers assess their risk exposures and risk attitudes so that the investment that is *best for them* is selected. **E 833, E06**
- risk analysis, n**—systematic use of available information to identify hazards and to estimate risk. **E 2363, E55**
- risk assessment**—(1) an on-site investigation to determine the existence, nature, severity, and location of lead-based paint hazards, and (2) the provision of a report by the individual or firm conducting the risk assessment, explaining the results of the investigation and options for reducing lead-based paint hazards. **E 1605, E06**
- risk assessment, n**—overall process comprising a risk analysis and a risk evaluation. **E 2363, E55**
- risk assessment screen (deprecated)**—alternative form of **lead hazard screen**. Use of this term is discouraged in order to minimize confusion. **E 1605, E06**
- risk assessor, certified**—an individual who has been trained by an accredited training program to conduct risk assessments or clearance examinations, or both, and certified under regulations promulgated by authorities having jurisdiction. **E 1605, E06**
- risk attitude**—the willingness of decision makes to take chances or gamble on investments of uncertain outcome.
risk averse (RA)—See **risk attitude**. **E 631, E06**
- risk attitude, n**—the willingness of decision makers to take chances or gamble on investments of uncertain outcome. **E 833, E06**
- risk averse (RA), n*—See **risk attitude**. **E 833, E06**
- risk-based criteria**—cleanup levels intended to meet a predetermined level of acceptable risk to human health or the environment. **D 5681, D34**
- risk exposure**—the probability of investing in a project whose economic outcome is different from what is desired (the target) or what is expected.
risk neutral (RN)—See **risk attitude**.
risk taking (RT)—See **risk attitude**. **E 631, E06**
- risk exposure, n**—the probability of investing in a project whose economic outcome is different from what is desired (the target) or what is expected. **E 833, E06**
- risk neutral (RN), n*—See **risk attitude**. **E 833, E06**
- risk screen (deprecated)**—alternative term for **lead hazard screen**. Use of this term is discouraged in order to minimize confusion. **E 1605, E06**
- risk taking (RT), n*—See **risk attitude**. **E 833, E06**
- river boom (aka fast water boom)**—boom intended for use in currents greater than 1 knot. **F 818, F20**
- river talik**—a layer or body of unfrozen ground occupying a depression in the permafrost table beneath a river. **D 7099, D18**
- rivet head*—See **oval head**. **F 547, F16**
- R_{nsb}**—ratio of specimen notched strength to yield strength in bending **F 2078, F07**
- RNT, n**—residual nitrogen time. **F 1549, F32**
- road meter, n**—equipment that measures the vehicle axle vertical motion relative to the vehicle frame during travel to yield a measure of roughness, for example, Mays, PCA, Soiltest, Cox. **E 867, E17**
- roan**—a sheepskin, not split. **D 1517, D31**
- robber*—See **thief**. **B 374, B08**
- robustness, n**—insensitivity of a statistical test to departures from underlying assumptions. **E 456, E11**
- rock**—a naturally occurring, consolidated aggregation of one or more minerals constituting the crust of the Earth. **C 119, C18**
- rock**—natural solid mineral matter occurring in large masses or fragments. **D 653, D18**
- rock**—any naturally formed aggregate of mineral matter occurring in large masses or fragments. (ISRM) **D 653, D18**
- rock anchor**—a steel rod or cable installed in a hole in rock; in principle the same as rock bolt, but generally used for rods longer than about four metres. (ISRM) **D 653, D18**
- rock asphalt*—see **asphalt rock**. **D 8, D04**
- rock bolt**—a steel rod placed in a hole drilled in rock used to tie the rock together. One end of the rod is firmly anchored in the hole by means of a mechanical device or grout, or both, and the threaded projecting end is equipped with a nut and plate that bears against the rock surface. The rod can be pretensioned. (ISRM) **D 653, D18**
- rock burst**—a sudden and violent expulsion of rock from its surroundings that occurs when a volume of rock is strained beyond the elastic limit and the accompanying failure is of such a nature that accumulated energy is released instantaneously. **D 653, D18**
- rock burst**—sudden explosive-like release of energy due to the failure of a brittle rock of high strength. (ISRM) **D 653, D18**
- rock crystal**—(1) transparent quartz.
(2) highly polished blown glassware, hand-cut or engraved. **C 162, C14**
- rockier**—an imperfection; a bottle with bottom deformed so it wobbles (rocks). **C 162, C14**
- rockier bottom*—See **rockier**. **C 162, C14**
- rock face (or rock-pitched)**—a split surface that has been dressed by machine or by hand to produce a convex bold projection along the face of the stone. This finish provides a bolder, more massive appearance than split face.

NOTE—The above rough finishes and other less-common ones can have a different appearance when separated along the bedding,

rock face (or rock-pitched)

stratification, or rift, or perpendicular to it. This applies in particular to finishes sometimes called natural strata and bed face, among others.

C 119, C18

rock flour—see **silt**.

D 653, D18

rock glacier—a mass of rock fragments and finer material on a slope, that contains either interstitial ice or an ice core, and shows evidence of past or present movement.

D 7099, D18

Rockingham ware—a semivitreous ware or earthenware having a brown or mottled brown bright glaze.

C 242, C21

rock mass—rock as it occurs in situ, including its structural discontinuities. (ISRM)

D 653, D18

rock mechanics—the application of the knowledge of the mechanical behavior of rock to engineering problems dealing with rock. Rock mechanics overlaps with structural geology, geophysics, and soil mechanics.

D 653, D18

rock mechanics—theoretical and applied science of the mechanical behaviour of rock. (ISRM)

D 653, D18

rock protection, n—equipment designed to provide protection and delay anchors in rock.

F 1773, F08

Rockwell hardness number, HR, n—a number derived from the net increase in the depth of indentation as the force on an indenter is increased from a specified preliminary test force to a specified total test force and then returned to the preliminary test force. E 6, E28

Rockwell hardness test, n—an indentation hardness test using a verified machine to force a diamond sphero-conical indenter (diamond indenter) or a hard steel ball indenter, under specified conditions into the surface of the material under test in two operations, and to measure the difference in depth of the indentation under the specified conditions of preliminary and total test forces (minor and major loads, respectively).

E 6, E28

Rockwell superficial hardness test, n—same as the Rockwell hardness test except that smaller preliminary and total test forces are used.

E 6, E28

rod, n—solid wrought product that is long in relation to its circular cross section, which is 0.375 in. or greater [over 10.00 mm] in diameter.

cold-finished rod, n—rod brought to final dimensions by cold working to obtain improved surface finish and dimensional tolerances.

cold-heading rod, n—rod of a quality suitable for use in the manufacture of cold-headed products such as bolts and rivets.

extruded rod, n—rod produced by hot extruding.

rivet rod, n—See *cold-heading rod*.

B 881, B07

rod, n—wrought material of round, solid straight lengths.

NOTE—In the following standards the term “rod” has a similar definition, but is worded differently.

B 899, B02

rod, n—a longitudinal element symmetrical in the transverse plane designed to resist tension, compression, bending, and torsion.

F 1582, F04

rod—produced from hot rolled or cast billets, usually rolled in a multiple strand mill to a round cross section then coiled into one continuous length.

F 1789, F16

rod cast button, n—a button fabricated from a disc sliced or sawed from a cast rod of formulated styrene modified polyester resin.

D 123, D13

rod cast button, n—a button fabricated from a disk sliced or sawed from a cast rod of formulated styrene-modified polyester resin.

D 5497, D13

rod, for staybolts—a round solid section furnished in straight lengths.

B 846, B05

rod, piston finish—a round rod having a special surface produced by turning or grinding to close tolerances for diameter and straightness.

B 846, B05

rod proof—a test specimen taken from the melt on an iron rod.

C 162, C14

rod, shafting—a round rod specially manufactured to the close straightness tolerances required for use in shafting.

B 846, B05

roll—a length of the product 25 ft (7.62 m) to 50 ft (15.24 m) inclusive, spirally wound into a series of connected turns, with successive turns on top of one another.

B 846, B05

roll, v—in a vehicle, the angular motion of a vehicle about its longitudinal axis through the center of gravity.

F 538, F09

roll angle, (rad or degree), n—in a vehicle, the angle between the vehicle y-axis and the ground plane.

F 538, F09

roll compacting, n—the progressive compacting of metal powders by the use of a rolling mill. Synonymous with **powder rolling**.

B 243, B09

rolled clinch—clinch formed by solid clincher against which staple point is driven; obtained normally with desk stapler.

F 592, F16

rolled compact, n—a compact made by passing metal powder continuously through a rolling mill so as to form relatively long sheets of pressed material.

B 243, B09

rolled erosion control product (RECP), n—in erosion control, a material manufactured or fabricated into roll form, and designed to reduce soil erosion and assist in the germination, establishment or protection of vegetation.

D 653, D18

rolled glass—(1) optical glass formed by rolling into plates at time of manufacture, as distinguished from transfer glass.

(2) flat glass formed by rolling.

C 162, C14

rolled seam-finish, n—a finish for the raw edges of the seam allowances of a plain seam, in which both raw edges are enclosed by rolling to one side and hand stitching close to the seam line.

D 123, D13

rolled seam finish, n—in home sewing, a seam finish in which both cut edges are enclosed by rolling them to one side and hand stitching the rolled edge close to the seam line within the seam allowance.

D 4965, D13

rolled selvage—See *curled selvage*.

D 3990, D13

roller—{archaic} a blown cylinder for making window glass by the hand process.

C 162, C14

roller-compacted concrete (RCC), n—concrete compacted while fresh by a roller, often a vibratory roller.

C 125, C09

roller leather—vegetable-tanned sheep or calfskins used for cots or covers on the upper rolls of cotton-spinning machinery.

D 1517, D31

roller spatter resistance, n—the ability of a paint to resist the formation of various size droplets generated during paint roller application, which results in undesirable spots splashing on areas that are not being painted including the person applying the paint.

D 16, D01

roll-grooved nail—bright or plated, helically grooved, round-wire, stiff-stock, 1 by 0.086 to 4 by 0.164-in. drive-screw nails with no clearance between flutes and head, with flat or slightly countersunk head and medium or long diamond point, with crest diameter being referred to as diameter.

F 547, F16

roll-grooved, rolled-grooved—provided with four or more continuous symmetrical, longitudinal or helical flutes; resulting from roll-grooving of round wire prior to heading and pointing of nail. Flutes resulting from this manufacturing process extend all the way from head to point (See **fluted**.)

F 547, F16

rolling—a tannery operation in which the grain surface is compressed and smoothed under pressure by a metal roller.

D 1517, D31

rolling, v—in tribology, motion in a direction parallel to the plane of a revolute body (ball, cylinder, wheel, and so forth) on a surface without relative slip between the surfaces in all or part of the contact area.

G 40, G02

rolling contact fatigue, n—a damage process in a triboelement subjected to repeated rolling contact loads, involving the initiation and propagation of fatigue cracks in or under the contact surface, eventually culminating in surface pits or spalls.

G 40, G02

rolling direction (inrolled metals)—See **longitudinal direction**.

E 7, E04

rolling resistance moment, [FL], *n*—of a tire, the component of a tire moment vector tending to rotate a tire about the Y' -axis, positive clockwise when looking in the positive direction of the Y' -axis.

F 538, F09

rolling shear—in wood, shear in a longitudinal-transverse plane, with stresses perpendicular to the orientation of the fibers lying in the plane. This shearing force tends to roll the fibers.

D 9, D07

rolling wear, *n*—wear due to the relative motion between two non-conforming solid bodies whose surface velocities in the nominal contact location are identical in magnitude, direction, and sense.

G 40, G02

roll response—rotation of the boom from rest due to wave, wind, or current forces.

F 818, F20

roll roofing—coated felts, either smooth or mineral-surfaced.

D 1079, D08

roll straightening—indiffusion coatings, straightening of metal stock of various shapes by passing it through a series of staggered rolls, the rolls usually being in horizontal and vertical planes.

B 374, B08

roll thread—thread produced by action of a form tool which, when pressed into the surface of a blank, displaces material radially.

F 1789, F16

ROM—read only memory.

F 1457, F05

RON—in gasoline knock testing, abbreviation for Research octane number.

D 4175, D02

roof, *n*—the rock material immediately overlying a coal bed.

D 121, D05

roof—top of excavation or underground opening, particularly applicable in bedded rocks where the top surface of the opening is flat rather than arched. (ISRM)

D 653, D18

roof and rock bolts—headed hot-rolled bars with cold-rolled or machine-cut threads at the end to be used with anchorage devices to hold up mine roofs, hold back walls, or hold down equipment or foundations.

F 1789, F16

roof cement—See **flashing cement**.

D 1079, D08

roof-deck nail—galvanized, regular-stock-steel and bright, hardened-steel, plain or annularly threaded, 3 by 0.135 to 4 1/2 by 0.177-in. nails with flat or slightly countersunk 3/32 to 25/64-in. head and medium diamond point.

F 547, F16

roofing fastener—See **purlin nail**.

F 547, F16

roofing nail, asphalt-shingle nail, corrugated-roofing nail, sheet-roofing nail—bright or galvanized, plain-shank, barbed or threaded, regular-stock-steel, 3/4 by 0.092 to 3 by 0.148-in. nails with flat, checkered, large, reinforced, umbrella lead or cast-lead 1/4 to 3/16-in. head and medium or long diamond or needle point, often provided with lead conical neoprene or flat plastic washer. Also, aluminum-alloy, plain-shank or helically threaded, 3/4 by 0.120 to 23/4 by 0.150-in. nails with flat or checkered 3/8 to 3/16-in. head and medium diamond or needle point, often provided with conical neoprene washer. (See **cap nail**.)

F 547, F16

roofing system—an assembly of interacting components designed to weatherproof, and normally to insulate, a building's top surface.

D 1079, D08

roofing system—assembly of interacting components designed to weatherproof, and sometimes to insulate, the roof surface of a building.

E 631, E06

roof insulation board—structural insulating board fabricated for use as above-deck roof insulation.

D 1554, D07

room equivalent, *n*—an identifiable partitioned-interior area of a building that is not usually considered as a room, such as a hallway, stairway, lobby or vestibule.

E 1605, E06

room temperature—a temperature in the range from 20 to 30°C (68 to 86°F).

D 2864, D27

room temperature—a temperature in the range of 20 to 30°C (68 to 85°F).

NOTE—The term “room temperature” is usually applied to an atmosphere of unspecified relative humidity.

E 41, G03

room-temperature-setting adhesive, *n*—an adhesive that sets in the temperature range from 20 to 30°C (68 to 86°F), in accordance with the limits for Standard Room Temperature specified in Practice D 618. (Compare **cold-setting adhesive**, **hot-setting adhesive**, and **intermediate-setting adhesive**.)

D 907, D14

root—innermost part of thread, rounded or flattened; joining flanks of adjacent threads.

F 547, F16

root bend—procedure whereby a loading nose is applied along the weld face such that the weld root is subject to tension.

C 904, C03

root diameter—twice the distance between nail axis and root, measured perpendicular to nail axis.

F 547, F16

root mean square difference, (RMSD)—a measure of accuracy determined by the following equation:

$$RMSD = \left(\frac{1}{n} \sum_{i=1}^n e_i^2 \right)^{1/2}$$

where:

n = the number of observations for which the accuracy is determined, and

e_i = the difference between a measured value of a property and its accepted value.

E 131, E13

root-mean-square strain—the square root of the mean value of the square of the strain, averaged over one cycle of deformation. (ISO)

D 4092, D20

root-mean-square stress—the square root of the mean value of the square of the stress, averaged over one cycle of deformation. (ISO)

D 4092, D20

rope, *n*—a compact and flexible, generally torsionally balanced continuous structure, greater than 4-mm (5/32-in.) diameter capable of applying or transmitting tension between two points.

D 123, D13

rope, *n*—wound or woven length of filaments, provided in various diameters, lengths, and elasticity depending on specific end use.

climbing, *n*—a rope of kernmantle construction, specifically designed to provide support, facilitate movement, and protect a climber by cushioning the impact of a fall. Climbing ropes sometimes are referred to as dynamic ropes.

double, *n*—a half rope.

half, *n*—a climbing rope that must be used with another half rope with one or both ropes being attached to protection anchors.

single, *n*—a climbing rope that may be used alone.

twin, *n*—a special type of half rope in which both rope strands are used as one with both running through the same protection anchors.

F 1773, F08

rope-lay conductor—see **concentric-lay conductor**.

B 354, B01

rope-lay conductor, *n*—a conductor composed of a central core surrounded by one or more layers of helically laid groups of strands.

D 1711, D09

rope mark, *n*—*undyed or finished fabrics*, a long irregularly shifting longitudinal mechanically induced streak.

D 123, D13

rope mark, *n*—*undyed or finished fabrics*, a long irregularly shifting longitudinal mechanically induced streak.

D 3990, D13

roping, *n*—a term used for roving in the woolen system of spinning.

D 123, D13

roping, *n*—a term used for roving in the woolen system of spinning.

D 4845, D13

ROS—abbreviation for **raster output scanner**.

F 1457, F05

rose head—pyramidal head with four triangular faces meeting at common vertex, having a square, rectangular, or circularized flat bearing surface.

F 547, F16

rosin, *n*—a specific kind of natural resin obtained as a vitreous water-insoluble material from pine oleoresin by removal of the

rosin, n

volatile oils, or from tall oil by the removal of the fatty acid components thereof. **D 804, D01**

rosin, n—a resin obtained as a residue in the distillation of crude turpentine from the sap of the pine tree (gum resin) or from an extract of the stumps and other parts of the tree (wood rosin). (Compare **resin**.) **D 907, D14**

rosin, n—a translucent amber to almost black brittle friable resin that is obtained by chemical means from the oleoresin or dead wood of pine trees or from tall oil. **F 141, F06**

rosin acids—acids derived from rosin (colophony) consisting mainly of isomers of abietic acid ($C_{20}H_{30}O_2$) with small amounts of hydroabietic acids ($C_{20}H_{32}O_2$ and $C_{20}H_{28}O_2$). **D 459, D12**

rosin acids or resin acids, n—principally monocarboxylic acids with the empirical formula $C_{19}H_{20}-COOH$. **D 804, D01**

rosin adducts, n—the addition product between rosin and an α , β unsaturated carboxylic acid such as fumaric acid, acrylic acid or maleic anhydride. **D 804, D01**

rosin based resins, n—resinous products derived from rosin or rosin adducts through chemical reaction with raw materials such as alcohols (especially polyhydric alcohols), formaldehyde, α , β unsaturated carboxylic acids, phenols etc., or combinations of these materials. **D 804, D01**

rosin crystallization, n—the formation of rosin acid crystals within rosin. **D 804, D01**

rosin oil, n—the relatively viscous, oily portion of the condensate obtained when rosin is subjected to dry destructive distillation; also used to describe specially compounded oils having a rosin oil base. **D 804, D01**

rosin oil, n—a viscous, oily liquid obtained as a condensate when the residue (rosin) from turpentine production is subjected to dry, destructive distillation. **D 4175, D02**

Rosin-Rammler distribution—drop size distribution described by the following equation:

$$f_v(D) = 1 - \exp[-(D/D_{RR})^n]$$

where:

$f_v(D)$ = the volume fraction of liquid in drops of diameter less than D_{max} ,

D_{RR} = the "Rosin-Rammler" diameter ($D_{V0.632}$ from "Rosin-Rammler" distribution, f_v), and

n = parameter indicating the size span of the distribution.

E 1620, E29

rosin reclaimed—See **reclaimed rosin**. **D 804, D01**

rosin spirits, n—the relatively light, volatile portion of the condensate obtained in the first stages when rosin is subjected to dry destructive distillation. **D 804, D01**

rosin standards, n—the combinations of assembled colored glasses having the colors designated as representative of the established U.S. grades used in classifying rosin. **D 804, D01**

rosin type (sample), n—a sample of rosin, or a mold of thermosetting plastic material, used as an unofficial standard in grading rosin. **D 804, D01**

rot—See **decay**.

D 9, D07

rotameter, n—a device, based on the principle of Stoke's law, for measuring rate of fluid flow, consisting of a tapered vertical tube having a circular cross section, and containing a float that is free to move in a vertical path to a height dependent upon the rate of fluid flow upward through the tube. **D 1356, D22**

rotary atomizer—see **centrifugal atomizer**. **E 1620, E29**

rotary conveyor type—See **pot, pan, and utensils washing machine**. **F 1827, F26**

rotary cup atomizer—a centrifugal atomizer in which liquid is fed to the interior surface of a spinning cup, from which it is flung out to form a spray. **E 1620, E29**

rotary-cut veneer—See under **veneer**.

D 1038, D07

rotary disk atomizer—a centrifugal atomizer in which liquid is introduced near the center of one or more spinning disks, spreads out toward the rim, and is flung out to form a spray. **E 1620, E29**

rotary drilling—a drilling process in which a hole is advanced by rotation of a drill bit under constant pressure without impact. See **percussion drilling**. **D 653, D18**

rotary extraction cleaning, n—a cleaning procedure which uses a rotating brush machine or a series of rotating jets through which shampoo is fed or sprayed into the carpet pile and simultaneously removed by suction. **D 123, D13**

rotary extraction cleaning, n—a cleaning procedure which uses a rotating brush machine or a series of rotating jets through which shampoo is fed or sprayed into the carpet pile and simultaneously removed by suction. **D 5253, D13**

rotary press, n—a machine fitted with a rotating table carrying multiple dies in which a material is pressed. **B 243, B09**

rotary shampoo, n—a cleaning procedure which uses a rotating brush machine through which shampoo is fed into the pile of a textile floor covering. See also **rotary extraction cleaning**. **D 123, D13**

rotary shampoo, v—clean using a brush or bonnet-type machine to impregnate the textile floor covering with a foam. After drying, vacuum loosened soil. See also **rotary extraction cleaning**. **D 5253, D13**

rotary smelter—any of the cylindrical smelters that depend on slow rotation about a horizontal axis for agitation of the molten mass. **C 286, B08**

rotary wheel atomizer—a centrifugal atomizer that consists of a rotating, hollow cylinder in which liquid is introduced to the interior and flows through passages to openings, where it is broken up into drops. **E 1620, E29**

rotation—movement about an axis; such as a body segment about a joint, also used to denote movement about the longitudinal axis of the bone (medial or lateral rotation). **F 869, F08**

rotational capacity test—test in which a zinc-coated bolt is inserted in a steel joint or tension measuring device, assembled with a lubricated zinc coated nut, and initially tightened to not less than 10% of the bolt proof load. After initial tightening, the nut is rotated through specified degrees of rotation. **F 1789, F16**

rotation angle, ϵ , n—angle indicating the orientation of the specimen when it is rotated about a selected axis fixed in it (for plane specimens, usually the specimen normal); *in retroreflection*, angle indicating orientation after rotation about the retroreflector axis. **E 284, E12**

rotation cast button, n—a button fabricated from a disc blanked from a partially polymerized sheet formed in a rotating cylinder. **D 123, D13**

rotation cast button, n—a button fabricated from a disk blanked from a partially polymerized sheet formed in a rotating cylinder (also known as centrifugal casting and wheel casting). **D 5497, D13**

rotation plan, n—*in tire testing*, the scheduled change of wheel positions for all tires on a vehicle, and between vehicles in a convoy, and scheduled change of vehicle position in a convoy during a road test as appropriate. **F 538, F09**

rotisserie—a device fitted with one more mechanically rotated spits that hold the meat or poultry in position near a fixed heat source while the food is slowly being cooked on all sides. **F 1827, F26**

rotisserie broiler—equipment designed for continuous loading and cooking with vertically stacked spits. See **rotisserie**. **F 1827, F26**

rotisserie oven—equipment designed for batch cooking, with the individual spits arranged on a rotating wheel within a closed cavity. See **rotisserie**. **F 1827, F26**

rotor, n—*in open-endspinning machines*, a device resembling a centrifuge, in which the fibers are assembled and in which, by virtue of its rotation, real twist is inserted in the forming yarn. **D 123, D13**

rotor, n—*in open-endspinning machines*, a device resembling a

- centrifuge, in which the fibers are assembled and in which, by virtue of its rotation, real twist is inserted in the forming yarn. **D 3888**, D13
- rotorless cure meter**, *n*—a test device for measuring vulcanization and rheological parameters, in which a rubber specimen is enclosed in a heated die cavity with one surface oscillating and the resistance of the rubber to these oscillations is measured versus time. **D 1566**, D11
- rotor-type open-end spinning machine**, *n*—an open-end spinning machine wherein the assembly of individual fibers and the insertion of real twist are effected by a rotor. (See also **open-end spinning machine**.) **D 123**, D13
- rotor-type open-end spinning machine**, *n*—an open-end spinning machine wherein the assembly of individual fibers and the insertion of real twist are effected by a rotor. (See also **open-end spinning machine**.) **D 3888**, D13
- rotovinyl**, *n*—a vinyl flooring with a pattern produced by rotogravure printing. **F 141**, F06
- RO train**—one of two or more complete RO installations, including membranes and high pressure pump operating in parallel. **D 6161**, D19
- rouge pits**—{archaic} an imperfection; traces of rouge remaining in an incompletely polished glass surface. **C 162**, C14
- rough**, *adj*—a descriptive term for a fabric surface which has the feel of sandpaper. **D 123**, D13
- rough**, *adj*—a descriptive term for a fabric surface which has the feel of sandpaper. **D 3990**, D13
- rough cut**—irregular-shaped areas of uneven corrugations on the veneer surface, occurring as the veneer is cut by the lathe or slicer. **D 1038**, D07
- roughened finish**, *n*—the surface texture resulting when die surfaces are broken by mechanical means, such as wire cutting or wire brushing. **C 43**, C15
- rough glass**—(1) glass pieces obtained by cutting the original sheet of flat glass into workable sizes. **C 162**, C14
(2) rolled or patterned glass.
- roughing**—in leak testing, the initial evacuation of a vacuum system. **E 1316**, E07
- roughing**—the exposure and erection of the fibers of the material on the lasted over margin of the upper and the corresponding edges of the outsole in order to provide a more grippable surface to be cemented for the purpose of sole attaching. **F 869**, F08
- roughing line**—in leak testing, a line running from a mechanical pump to a vacuum chamber through which preliminary pumping is conducted in the rough vacuum range. **E 1316**, E07
- roughing pump**—in leak testing, a vacuum pump used for the initial evacuation of a vacuum system. **E 1316**, E07
- rough lumber**—See **lumber**. **D 996**, D10
- roughness**—height of each continuous scallop rounded to the nearest 0.05 in. (1 mm), except those less than 0.03 in. (0.8 mm) vertically and 2 ft (0.6 m) longitudinally. **E 867**, E17
- roughness index, half-car (HRI)**—see **half-car roughness index**. **E 867**, E17
- roughness index, international (IRI)**—see **international roughness index**. **E 867**, E17
- roughness index, mean (MRI)**—see **mean roughness index**. **E 867**, E17
- roughness traveled surface**—see **traveled surface roughness**. **E 867**, E17
- roughometer**, *n*—a road meter that measures the unidirectional vertical movement of damped, leaf-sprung wheel relative to the road meter's trailer frame during travel to yield a measure of roughness. **E 867**, E17
- rough or burred edge**, *n*—in *mica*, a frayed or serrated edge usually 0.8 mm deep or greater, or an edge turned up or down as caused by trimming with scissors, and so forth, or by rubbing the edge against sandpaper, stone, and so forth. **D 1711**, D09
- rough part**, *n*—the part prior to final machining. **B 899**, B02
- rough, rough-tanned and in-the-rough**—terms applied to cattlehide leathers tanned but not finished. (See also **crust**.) **D 1517**, D31
- rough sawn**—in *plywood*, a decorative treatment produced by scoring across the grain of the panel surface to provide a saw-roughened texture. **D 1038**, D07
- rough selvage**—See **loopy selvage**. **D 3990**, D13
- rough shred**, *n*—a piece of a shredded tire that is larger than 50 mm by 50 mm by 50 mm, but smaller than 762 mm by 50 mm by 100 mm. **D 5681**, D34
- rough shred**, *n*—a piece of a shredded tire that is larger than 2 in. (5.1 cm) by 2 in. (5.1 cm) by 2 in. (5.1 cm), but smaller than 30 in. (76.2 cm) by 2 in. (5.1 cm) by 4 in. (10.2 cm). **D 5681**, D34
- round**—a set of holes drilled and charged in a tunnel or quarry that are fired instantaneously or with short-delay detonators. (ISRM) **D 653**, D18
- round**, *n*—a solid member, circular in cross section.
sag flow test—See **test, sag flow**. **E 631**, E06
- round conductor flat cable**, *n*—a flat cable made with parallel, round conductors in the same plane. **D 1711**, D09
- rounded blade**—a blade having a radius on its outer surface which forms a transition between the outer edge and the cutting edges. **F 1078**, F04
- round edge**, *n*—a rounded, paper-bound edge formation on gypsum board, commonly used for gypsum lath. **C 11**, C11
- rounded thread, round-bottom thread**—thread with rounded root extending to pitch line. Rounded thread also referring to rounded thread crest. **F 547**, F16
- round head**—circular head having convex top surface with height equal to its radius. **F 547**, F16
- roundness**—the ratio of the average radius of curvature of the individual edges of a particle to the radius of the maximum circle that can be inscribed within the particle. **D 4410**, D19
- round or rounded crown**—curved staple crown used in wiring, carding, and encircling operations; also, in spring-up applications in furniture manufacturing. **F 592**, F16
- round-robin test**, *n*—the practice of planning, conducting, analyzing, and interpreting the results of interlaboratory tests on the chemical and physical properties of engine coolants. **D 4725**, D15
- round shank**—term applied to nail with shank of circular cross section, made from round wire. **F 547**, F16
- round table**—{archaic} a type of laying table used for supporting plate glass for grinding and polishing. **C 162**, C14
- route**, *n*—the path chosen by a climber. **F 1773**, F08
- routine dosimeter**—dosimeter calibrated against a primary-, reference-, or transfer-standard dosimeter and used for routine absorbed-dose measurement. **E 170**, E10
- routine hardness locations**—hardness readings made on prescribed fastener surfaces, such as wrench flats, unthreaded shank, bearing face, etc., after removal of oxide, platings, or other coating materials. Used for testing the hardness of a finished fastener. **F 1789**, F16
- routine maintenance**, *n*—in *textile cleaning*, superficial daily or weekly cleaning to remove particulate soil and dust. **D 123**, D13
- routine maintenance**, *n*—in *textile cleaning*, superficial daily or weekly cleaning to remove particulate soil and dust. **D 5253**, D13
- rove**, *n*—in *juteprocessing*, a continuous strand of spun-jute fiber having a spynle number of 50 or greater. **D 123**, D13
- roving**, *n*—in glass textiles, a multiplicity of filaments or yarns gathered together into an approximately parallel arrangement without twist. **C 162**, C14
- roving**, *n*—a loose assemblage of fibers drawn or rubbed into a single strand, with very little twist. In spun yarn systems, the product of the stage, or stages, just prior to spinning. **D 123**, D13
- roving**, *n*—in *glasstextiles*, a multiplicity of filaments or yarns gathered together into an approximately parallel arrangement without twist. **D 123**, D13
- roving**, *n*—in *fibrouscomposites*, large filament count tow. (See also **tow and filament count**.) **D 3878**, D30

roving, *n*

roving, *n*—a loose assemblage of fibers drawn or rubbed into a single strand, with very little twist. In spun yarn systems, the product of the stage, or stages, just prior to spinning. **D 4849**, D13

roving, *n*—*in glasstextiles*, a multiplicity of filaments or yarns gathered together into an approximately parallel arrangement without twist. **D 7018**, D13

roving knot—a knotted or entangled section of roving found in a pultrusion.

NOTE—Such a knot may cause high fiber concentration locally and may or may not be visible as a white or light spot on the surface of the section. **D 3918**, D20

row, *n*—a rib or a continuous collection of elements that lie on a circumferential line parallel to the circumferential centerline of the tread band. **F 538**, F09

row/rib wear, *n*—a type of irregular wear characterized by a greater wear rate in one or more rows/ribs; the increased wear rate may occur at one or more circumferential locations in (on) a given row/rib and is independent of (ie. occurs across) individual projections resulting in a step-off in tread depth between adjacent rows/ribs. **F 538**, F09

R-phase, *n*—the intermediate phase which forms from austenite prior to martensite formation. **F 2005**, F04

R-phase finish temperature (R_f), *n*—the temperature at which the transformation from austenite to R-phase is completed on cooling in a two-stage transformation. **F 2005**, F04

R'-phase finish temperature (R'_f), *n*—the temperature at which the martensite to R-phase transformation is completed on heating in a two-stage transformation. **F 2005**, F04

R-phase peak temperature (R_p), *n*—the temperature of the exothermic peak position on the DSC curve upon cooling for the austenite to R-phase transformation. **F 2005**, F04

R'-phase peak temperature (R'_p), *n*—the temperature of the endothermic peak position on the DSC curve upon heating, for the martensite to R-phase transformation in a two-stage transformation. **F 2005**, F04

R-phase start temperature (R_s), *n*—the temperature at which the transformation from austenite to R-phase begins on cooling in a two-stage transformation. **F 2005**, F04

R'-phase start temperature (R'_s), *n*—temperature at which the martensite to R-phase transformation begins on heating in a two-stage transformation. **F 2005**, F04

RS—abbreviation for raw stock. (see **BP**) **F 549**, F05

RS232, *n*—a serial interface standard to connect elements of a communication system. **F 1457**, F05

R_{sb} —ratio of specimen crack strength to yield strength in bending **F 2078**, F07

RSM—Rapidly Solidified Materials. **B 243**, B09

RSP—Rapid Solidification Processing or Rapidly Solidified Powders. **B 243**, B09

RST—Rapid Solidification Technology. **B 243**, B09

R titration—a titration in which the sensing electrode responds to an ion introduced by a reagent prior to titration. A synonym for *indicator titration*. **D 4127**, D19

RTS—abbreviation for **request to send**. **F 1457**, F05

RTV, *n*—room temperature vulcanization (A) **D 907**, D14

R_u —maximum diaphragm reaction, lbf (or N) **E 631**, E06

rub—abrasion of a glass surface producing a frosted appearance. Also known as a scuff. **C 162**, C14

rubber, *n*—a material that is capable of recovering from large deformations quickly and forcibly, and can be, or already is, modified to a state in which it is essentially insoluble (but can swell) in boiling solvent, such as benzene, methylethyl ketone, and ethanol-toluene azeotrope. **D 123**, D13

rubber, *n*—term not defined by Committee D20. Definition approved by Committee D11 on Rubber and Rubber-Like Materials is as follows:

“**rubber**—a material that is capable of recovering from large

deformations quickly and forcibly, and can be, or already is, modified to a state in which it is essentially insoluble (but can swell) in boiling solvent, such as benzene, methylethylketone, and ethanol-toluene azeotrope.”

“A rubber in its modified state, free of diluents, retracts within 1 min to less than 1.5 times its original length after being stretched at room temperature (18 to 29°C) to twice its length and held for 1 min before release.” **D 883**, D20

rubber—a material that is capable of recovering from large deformations quickly and forcibly, and can be, or already is, modified to a state in which it is essentially insoluble (but can swell) in boiling solvent such as benzene, methyl ethyl ketone, and ethanol-toluene azeotrope. **D 1079**, D08

rubber, *n*—a material that is capable of recovering from large deformations quickly and forcibly, and can be, or already is, modified to a state in which it is essentially insoluble (but can swell) in boiling solvent, such as benzene, methyl ethyl ketone, or ethanol-toluene azeotrope. **D 1566**, D11

rubber, *n*—an elastomer, generally implying natural rubber, but used loosely to mean any elastomer, vulcanized and unvulcanized. By definition, rubber is a material that is capable of recovering from large deformations quickly and forcibly and can be, or already is, modified to a state in which it is essentially insoluble in a boiling solvent. **D 5681**, D34

rubber, *n*—a material that is capable of recovering from large deformations quickly and forcibly, and can be, or already is, modified to a state in which it is essentially insoluble (but can swell) in boiling solvent, such as benzene, methylethyl ketone, and ethanol-toluene azeotrope. **D 6477**, D13

rubber—a material that is capable of recovering from large deformations quickly and forcibly, and can be, or already is, modified to a state in which it is essentially insoluble (but can swell) in boiling solvent, such as benzene, methylethylketone, and ethanol-toluene azeotrope.

A rubber in its modified state, free of diluents, retracts within 1min to less than 1.5 times its original length after being stretched at room temperature (18 to 29°C) to twice its length and held for 1 min before release. (D11) **F 412**, F17

rubber—a generic term that includes elastomers and elastomer compounds, regardless of origin. **F 819**, F18

rubber—a material that is capable of recovering from large deformations quickly and forcibly, and can be, or already is, modified to a state in which it is essentially insoluble (but can swell) in boiling solvent, such as benzene, methyl ethyl ketone, and ethanol-toluene azeotrope. (D 1566, D11) **F 869**, F08

rubber, *n*—an elastic substance derived from various tropical plants, such as the general Hevea and Ficus, essentially a polymer of isoprene; the term is frequently applied to both natural and synthetic elastic substances. (*Webster Modified*) *saran plastic*—see **vinylidene chlorideplastic**. **F 1251**, F04

rubber, bound, *n*—the portion of the rubber in a mix that is so closely associated with the filler as to be unextractable by the usual rubber solvents. **D 1566**, D11

rubber, cellular, closed cell, *n*—a cellular material in which practically all the individual cells are nonconnecting. **D 1566**, D11

rubber compound, *n*—*as used in the manufacture of rubber articles*, an intimate mixture of elastomer(s) with all the materials necessary for the finished article. **D 123**, D13

rubber compound, *n*—*as used in the manufacture of rubber articles*, an intimate mixture of elastomer(s) with all the materials necessary for the finished article. **D 6477**, D13

rubber, crude, *n*—See **rubber, raw**, the preferred term. **D 1566**, D11

rubber, expanded, *n*—cellular rubber having closed cells made from a solid rubber compound. **D 1566**, D11

rubber fines, *n*—small particles of ground rubber that result as a by-product of producing shredded rubber. **D 5681**, D34

rubber flooring, *n*—a floor surfacing material in sheet or tile form

consisting of compounded natural or synthetic rubbers or both in combination with mineral fillers, pigments, and other additives.

F 141, F06

rubber gasket—rubber formed and used as a seal in concrete pipe joints.

C 822, C13

rubber, gel, *n*—the portion of rubber insoluble in a chosen solvent. (See also **rubber, sol.**)

D 1566, D11

rubber, glass transition temperature, *n*—the approximate mid-point of the temperature range over which a reversible change in an amorphous polymer or in amorphous regions of a partially crystalline polymer occur from (or to) a viscous or rubbery condition to (or from) a hard and relatively brittle one.

D 1566, D11

rubber, hard, *n*—See **ebonite**.

D 1566, D11

rubber hardness degree, international, *n*—a measure of hardness, the magnitude of which is derived from the depth of penetration of a specified indenter into a specimen as described in Test Method D 1415.

D 1566, D11

rubber heel marking—the mechanical transfer of coloring matter from rubber heels to surfaces.

D 2825, D21

rubberize, *v*—to impregnate or coat with rubber compound or both.

D 123, D13

rubberize, *n*—to impregnate or coat, or both, a substrate with rubber.

D 1566, D11

rubberize, *v*—to impregnate or coat with rubber compound, or both.

D 6477, D13

rubber latex, centrifuged, *n*—latex, the rubber concentration of which has been increased by the removal of serum by centrifugal force.

D 1566, D11

rubber latex, evaporated, *n*—latex, the rubber concentration of which has been increased by evaporation of some of the water.

D 1566, D11

rubber latex, preserved, *n*—rubber latex treated to inhibit putrefaction and accompanying coagulation.

D 1566, D11

rubber latex, prevulcanized, *n*—a rubber latex in which the particles have been sufficiently vulcanized to produce films and useful articles by drying only.

D 1566, D11

rubber latex, stabilized, *n*—rubber latex treated to inhibit premature coagulation.

D 1566, D11

rubber, natural, *n*—a *cis*-1,4-polyisoprene that is obtained from a botanical source, usually *Hevea brasiliensis*.

D 1566, D11

rubber, oil-extended, *n*—a grade of raw rubber containing a relatively high proportion of processing oil.

D 1566, D11

rubber products, *n*—items of commerce in which the major portion of the filler-bearing material is a rubber.

D 1566, D11

rubber, raw, *n*—natural or synthetic elastomer, usually in bales or packages, that is the starting material for the manufacture of rubber articles.

D 1566, D11

rubber reversion hydroplaning, *n*—hydroplaning of pneumatic tires with separation caused by devulcanized rubber.

E 867, E17

rubber, skim, *n*—rubber obtained by coagulating the rubber in the serum that separates out during the concentration of natural rubber latex.

D 1566, D11

rubber, sol, *n*—the portion of rubber soluble in a chosen solvent. (See also **rubber, gel.**)

D 1566, D11

rubber, sponge, *n*—cellular rubber consisting predominantly of open cells and made from a dry rubber compound.

D 1566, D11

rubber, synthetic, *n*—rubber produced by polymerizing one or more monomers with or without post-polymerization chemical modification.

D 1566, D11

rubber, the vulcanized compound, *n*—a crosslinked elastic material compounded from an elastomer, susceptible to large deformations by a small force and capable of rapid, forceful recovery to approximately its original dimensions and shape upon removal of the deforming force.

D 1566, D11

rubber, virgin(s), *n*—obsolete term. See **wet spots**.

D 1566, D11

rubbing stone—a shaped abrasive used in stoning porcelain enamel.

C 286, B08

rubbing strips—boards nailed to the underside of **skids**, or floor boards of **crates** or **boxes** to provide a surface upon which to slide the containers. (See also **skid.**)

D 996, D10

rubble, *n*—rough stones of irregular shapes and sizes, broken from larger masses either naturally or artificially, as by geological action, in quarrying, or in stone cutting or blasting.

D 8, D04

rug, *n*—a textile floor covering of limited area which is complete in itself and is intended for use as a partial covering of a floor or another floor covering.

D 123, D13

rug, *n*—a textile floor covering of limited area which is complete in itself and is intended for use as a partial covering of a floor or another floor covering.

D 5684, D13

ruggedness, *n*—insensitivity of a test method to departures from specified test or environmental conditions.

E 456, E11

ruggedness, *n*—the degree of reproducibility of the same sample under a variety of normal conditions; for example, different operators.

F 2312, F04

ruggedness test, *n*—an experiment in which environmental or test conditions are deliberately varied to evaluate the effect of such variations.

D 123, D13

ruggedness test, *n*—a factorial test designed to explore the sensitivity of the method to variations in the procedure (See Youden and Steiner, 1975).

D 1356, D22

ruggedness test, *n*—a planned experiment in which environmental factors or test conditions are deliberately varied in order to evaluate the effects of such variation.

E 456, E11

run, *n*—*in experimenting or testing*, a single performance or determination using one of a combination of experimental or test conditions.

D 123, D13

run, *n*—*in knitted fabrics*, a series of dropped stitches. (See **dropped-stitch.**)

D 123, D13

run, *n*—*in the American woolen system*, the number of 1600-yd lengths of yarn per pound; an indirect yarn numbering system generally used for yarns spun on the woolen system.

D 123, D13

run, *n*—*in knitted fabrics*, a series of dropped stitches. (See **dropped-stitch**) (*Syn.* ladder)

D 3990, D13

run, *n*—*in the American woolen system*, the number of 1600-yd lengths of yarn per pound; an indirect yarn numbering system generally used for yarns spun on the woolen system.

D 4849, D13

run, *n*—(1) an uninterrupted sequence of occurrences of the same attribute or event in a series of observations, and (2) a consecutive set of successively increasing run-up or successively decreasing run-down values in a series of variable measurements.

E 456, E11

rundown, *n*—*in building construction*, bloom or fluid migration from a sealant, coating, or membrane that due to natural forces is carried down and accumulates on vertical and sloping surfaces.

C 717, C24

run-in, *n*—*in tribology*, an initial transition process occurring in newly established wearing contacts, often accompanied by transients in coefficient of friction, or wear rate, or both, which are uncharacteristic of the given tribological system's long term behavior. (*Synonym:* **break-in, wear-in.**)

G 40, G02

run in, *v*—*in tribology*, to apply a specified set of initial operating conditions to a tribological system to improve its long term frictional or wear behavior, or both. (*Synonym:* **break in, v.** and **wear in, v.** See also **run-in, *n***.)

G 40, G02

runner, *n*—(1) the secondary feed channel in an injection or transfer mold that runs from the inner end of the sprue or pot to the cavity gate.

(2) the piece formed in a secondary feed channel or runner.

D 883, D20

runner, *n*—(1) the secondary feed channel in an injection or transfer mold that runs from the inner end of the sprue to the cavity gate.

(2) the piece formed in a secondary feed channel or runner. (D20)

F 412, F17

runner, *n*—a sewn or tied loop of webbing or rope designed to support a load.

F 1773, F08

runner bar

runner bar—[archaic] iron casting attached to a circular grinding runner or head for abrasive grinding of plate glass. **C 162, C14**

runner cut—[archaic] an imperfection in plate glass resulting from fracture of the surface by the runner bar. **C 162, C14**

runner (injection or transfer mold), *n*—the secondary feed channel for transferring material under pressure from the inner end of the sprue to the cavity gate. **D 1566, D11**

running batch—the regular batch formulated to produce the desired composition when used with its own cullet. **C 162, C14**

running bond, *n*—pattern used when installing the thermal insulation board, to offset the vertical insulation board joints from joints in previous rows of insulation board. **E 2110, E06**

running ground—*in tunneling*, a granular material that tends to flow or “run” into the excavation. See **flowing ground**. **D 653, D18**

running sample—See **sample**. **D 1356, D22**

running surface—the entire bottom surface of the ski bordered by the side geometry. **F 472, F27**

running surface—the entire bottom surface of the snowboard ordered by the side geometry. **F 1107, F27**

runoff—that part of precipitation appearing in surface streams. **D 4410, D19**

run-off, *n*—water, which, having fallen on a surface, flows across the surface, picking up materials and will, if not collected, continue into a watercourse. Also any rainwater, leachate or other liquid that drains over land from any part of a facility. **E 2201, E50**

run-off application—application of a liquid material using sufficient volume such that it begins to drip from the target. **E 1102, E35**

run-of-kiln quicklime—quicklime as drawn or discharged from a kiln. **C 51, C07**

run-of-mine, *adj*—usage in this test method refers to ore and waste rock produced by excavation (with attendant variable particle sizes) from open pit or underground mining operations. **D 5681, D34**

run-of-mine (ROM) coal—*for the purpose of Test Method D 4749*, (1) *in the case of an underground mine*, it is that coal delivered to the surface by a slope belt, hoist, and so forth.

(2) *in the case of a surface mine*, it is that coal as it exists after it has been removed from the pit and placed into the initial means of transportation whether it be an on-the-road or off-the-road haul truck, dump hopper which feeds a pit-to-plant conveyor, and so forth. For both underground and surface mines, ROM coal is as-mined and has not been exposed to any treatment such as breaking, crushing, or cleaning except for that done by the normal operations used to extract the coal from the ground, that is, blasting, ripping, loading, cutting, and so forth. **D 121, D05**

run-out—no fatigue failure at a specified number of force cycles. **E 1823, E08**

rupture, *n*—the breaking or tearing apart of a material. (Compare **failure**.) **D 123, D13**

rupture—that stage in the development of a fracture where instability occurs. It is not recommended that the term rupture be used in rock mechanics as a synonym for fracture. (ISRM) **D 653, D18**

rupture, *n*—the breaking or tearing apart of a material. (Compare **failure**.) **D 4848, D13**

rupture envelope (ruptureline)—see **Mohr envelope**. **D 653, D18**

russet—a term of varied meaning in the leather trade, since it connotes both color and tannage:

(1) *russet calf*—The natural color of unfinished calf leather resulting from tannage by vegetable extracts.

(2) *russet harness*—A completely finished leather of bright, clean, uniform color, and finish.

(3) *russet sheepskin*—Leather tanned in cold-leached hemlock bark, used for shoe linings, with color resulting from the hemlock.

(4) *russet upholstery*—leather tanned but not finished.

D 1517, D31

Russian leather—originally a Russian calfskin shoe leather, distinguished by its odor of birch oil. Now, in the United States a fancy calfskin stock. **D 1517, D31**

rust, *n* (coatings)—the reddish material, primarily hydrated iron oxide, formed on iron or its alloys resulting from exposure to humid atmosphere or chemical attack. See **white rust**. **D 16, D01**

rust, *n*—of ferrous alloys, a corrosion product consisting primarily of hydrated iron oxides. **D 4175, D02**

rust—a corrosion product consisting primarily of hydrated iron oxide. (A term properly applied only to ferrous alloys.) **G 15, G01**

rust (coatings), *n*—the reddish material, primarily hydrated iron oxide, formed on iron or its alloys resulting from exposure to humid atmosphere or chemical attack. **D 4175, D02**

rustication (or reveal)—a continuous groove cut within the face or along the edge of a dimension stone panel, usually for the purpose of visually imitating or accentuating a joint location. **C 119, C18**

rustproof—made of nonferrous material or protectively coated, plated, galvanized or aluminized. (See **corrosion-resistant, rust-resistant**.) **F 547, F16**

rust resistance, *n* (coatings)—the ability of a coating to protect the substrate of iron or its alloys from rusting. **D 16, D01**

rust-resistant—term used to describe a material or treatment designed to inhibit rusting; not synonymous with rustproof. **F 547, F16**

rut, *n*—a contiguous longitudinal depression deviating from a surface plane defined by transverse cross slope and longitudinal profile. **E 867, E17**

rut, *n*—a contiguous longitudinal depression deviating from a surface plane defined by transverse cross slope and longitudinal profile. **E 1778, E17**

rut-depth—the maximum measured perpendicular distance between the bottom surface of the straightedge and the contact area of the gage with the pavement surface at a specific location. **E 867, E17**

rutile—a mineral form of titanium oxide (TiO₂) (tetragonal crystallization), but usually produced chemically for use in ceramics and other products. **C 242, C21**

R-value—a measure of the resistance to heat flow through a material calculated as $R = t/k$, where t is the thickness of the material and k is the thermal conductivity. **C 162, C14**

Ry, *n*—in measuringsurface finish, the vertical distance between the top of the highest peak and the bottom of the deepest valley in one sampling length. **D 4175, D02**

Ry, *n*—in measuringsurface finish, the vertical distance between the top of the highest peak and the bottom of the deepest valley in one sampling length of the roughness profile. **D 4175, D02**

ryznar stability index (RSI)—an index indicating if a water has a tendency to corrode or precipitate CaCO₃; equals $2 * \text{pH} (\text{CaCO}_3 \text{ saturation}) - \text{pH} (\text{actual})$, $\text{RSI} < 6.0$ scale formation, > 7.0 corrosive. **D 6161, D19**

Rz, *n*—in measuringsurface finish, the average of all Ry values (peak to valley heights) in the assessment length. **D 4175, D02**

Rz (DIN), *n*—in measuringsurface finish, the average of all Ry values (peak to valley heights) in the assessment length. **D 4175, D02**

S

S₁₀—the portion of a cellulose pulp that is soluble in 10 % sodium hydroxide using Test Method D 1696, or its equivalent. **D 1695, D01**

S₁₈—the portion of a cellulose pulp that is soluble in 18 % sodium hydroxide using Test Method D 1696, or its equivalent. **D 1695, D01**

"S"—a letter code. See **upholstery cleaning instructions**. **D 5253, D13**

"S"—clean with dry solvent cleaner only. Do not saturate. Do not use water or solutions containing water. Pile fabrics may require brushing to restore appearance. Cushion covers should not be removed and dry cleaned. **D 5253, D13**

Δ_s—pure shear deformation of diaphragm, in. (or mm) **E 631, E06**

Δ_s'—apparent total shear deformation of the diaphragm based on test (see 8.1.2.2), in. (or mm). This factor includes both the pure shear deformation and that contributed by distortion of the connection system. **E 631, E06**

S—effective scattered neutron content. *S* is the percent background film darkening caused by scattered neutrons. **E 1316, E07**

sabin, [L²]**—**the unit of measure of sound absorption in the inch-pound system. **C 634, E33**

saccharification—the breaking of dextrans (starch) into simple sugars (hydrolysis). **E 1705, E48**

sack—See **bag**. **D 996, D10**

sacrificial layer—a layer that is intentionally deposited (or added) then removed, in whole or in part, during the micromachining process, to allow freestanding microstructures. **E 2444, E08**

sacrificial protection—the form of corrosion protection wherein one metal corrodes in preference to another, thereby protecting the latter from corrosion. **B 374, B08**

saddle—See **packing**. **D 996, D10**

saddle, n—a construction to channel or direct surface water to drains or off the roof. A saddle may be located between drains or in a valley, and is often like a small hip roof or a pyramid with a diamond-shaped base. (See **cricket**). **D 1079, D08**

saddle, n—the bottom support of the enclosed scale. **E 344, E20**

saddle curve—in a phase diagram, the locus of a series of maximum points which itself passes through a minimum value. **E 7, E04**

saddle-fused joint—see **joint, saddle-fused**. **F 412, F17**

saddle leather—vegetable-tanned cattlehide leather for harness and saddlery, usually of a natural tan shade and rather flexible. **D 1517, D31**

saddle point—the minimum point on a saddle curve, which is a univariant point, a composition of congruent melting. **E 7, E04**

saddle stapling—pamphlet or book stapling on a "V"-shaped table, which permits placement of staple in center fold. **F 592, F16**

saddle stitching—Similar to saddle stapling; however, accomplished with wire stitcher. **F 592, F16**

saddle-tie, for furring, n—a single or double strand of wire used to attach furring members to framing members of wall or ceiling assemblies. **C 11, C11**

saddle-tie, for furring, v—to attach furring members to framing members of wall or ceiling assemblies using a single or double strand of wire. **C 11, C11**

saddle-tie, for wire hangers, v—to attach wire hangers to main runners. **C 11, C11**

SAE—abbreviation for Society of Automotive Engineers, Inc. **D 4175, D02**

safety, n—freedom from unacceptable risk. **E 2363, E55**

safety diver, n—diver who is dressed completely in dive gear and who remains on the surface to go to the immediate aid of a distressed diver underwater. **F 1549, F32**

safety factor (rope systems), n—the ratio between the breaking strength and the load; commonly used interchangeably with the term *load ratio*, the term *safety factor* is properly applied only to systems and not to individual components. **F 1490, F32**

safety glass—flat (including bent) glass so constructed, treated, or combined with other materials that, if broken by human contact, the likelihood and/or severity of cutting and piercing injuries that might result from such contact is reduced. See related terms "laminated glass," "fully tempered glass," "tempered glass," and "wired glass." **C 162, C14**

safety mechanism—a device intended to prevent accidental actuation of tool. **F 592, F16**

safety stop, n—additional time spent at shallow depths even though the dive computer or dive table indicates that a direct ascent to the surface is possible. **F 1549, F32**

sag, n—*in building construction*, the gravity-induced downward flow of a sealant or glazing compound, resulting in an uneven thickness, when applied on a vertical surface. **C 717, C24**

sag flow test—See **test, sag flow**. **E 1749, E06**

sagging—process of forming glass by reheating until it conforms to the shape of the mold or form on which it rests. **C 162, C14**

sagging—(1) a defect characterized by a wavy line or lines appearing on those surfaces of porcelain enamel that have been fired in a vertical position.

(2) A defect characterized by irreversible downward bending in an article insufficiently supported during the firing cycle.

NOTE—See the Proposed Method of Test for Sag Resistance of Steel Sheets for Porcelain Enameling, *Proceedings*, ASTM, Vol 55, 1955, p. 431. **C 286, B08**

sagging—usually occurs in sedimentary rock formations as a separation and downward bending of sedimentary beds in the roof of an underground opening. (ISRM) **D 653, D18**

sagittal—pertaining to the anteroposterior median plane of the body (sagittal plane), the median vertical plane of the body dividing it into right and left halves that is the major plane for walking and running. **F 869, F08**

sag or sagging, n—nonuniform downward flow of a wet paint film that occurs between the times of application and setting, resulting in an uneven coating having a thick lower edge. **D 16, D01**

sags—downward movement of a paint film between the time of application and setting, resulting in an uneven coating having a thick lower edge. **D 4538, D33**

saladero hides—Argentinian hides corresponding to small-packer hides in the United States. **D 1517, D31**

salamander—a medium duty broiler, with approximately half the depth of an upright, and generally mounted above a commercial range. See **broiler, overfired**. **F 1827, F26**

sales code diameter—the overall diameter of a tin-plate fabricated aerosol can, taken from the double seam at the bottom of the container. **D 3064, D10**

sales code height—the height of a tin-plate fabricated aerosol can, taken from between the double seams at the top and bottom of the cylinder. **D 3064, D10**

sales square—the quantity of prepared roofing required to cover 9.3 m² (100 ft²) of deck. **D 1079, D08**

saline electrolyte, n—a solution customarily consisting of the chlorides of the alkali metals. **B 899, B02**

saline permafrost—permafrost in which part or all of the total water content is unfrozen because of freezing-point depression caused by the dissolved solids content of the pore water. **D 7099, D18**

salinity, n—the concentration of dissolved matter found in water after bromide and iodide have been replaced by an equivalent quantity of chloride, all carbonate converted to oxide, and all organic matter destroyed. **D 1129, D19**

salinity—the concentration of inorganic salts in water. **D 6161, D19**

salinity—(1) a general property of aqueous solutions caused by the alkali, alkaline, earth, and metal salts that are not hydrolyzed; (2) the ratio of the weight of salt in a soil sample to the total weight of the sample. **D 7099, D18**

salt bath, n—a heat transfer apparatus, utilizing molten salts as the

salt bath, *n*

heating medium, generally used for vulcanization. See **liquid curing medium (LCM)**. **D 1566, D11**

salt cake—an industrial term for sodium sulfate (Na_2SO_4). **C 162, C14**

salt flux—amount of dissolved salt passing through the membrane, moles per day per square unit of membrane area. **D 6161, D19**

salt glaze, *n*—the surface feature resulting when faces have a lustrous glazed finish from the thermochemical reaction of the silicates of the clay body with vapors of salt or chemicals. **C 43, C15**

salt glaze—a glaze produced by the reaction, at elevated temperature, between the ceramic body surface and salt fumes produced in the kiln atmosphere. **C 242, C21**

salt passage, SP—the ratio of product (CP) and feed (CF) salt concentrations expressed as percent

$$SP = \frac{CP \times 100}{CF}$$

the ratio of product (CP) and feed (CF) salt concentrations expressed as percent. **D 6161, D19**

salt rejection, SR—(100 - salt passage) expressed as percent:

$$SR = 100 \left(1 - \frac{CP}{CF} \right)$$

D 6161, D19

salt spray test—corrosion test in which the metallic fastener specimens are exposed to a fine mist of salt water solution, either continuously or intermittently. **F 1789, F16**

salt stain—discoloration on the surface of hides and skins, developed during the curing process. **D 1517, D31**

salt water—See **gall**. **C 162, C14**

salt water, *n*—the aerobic, aqueous compartment, characteristically with a salinity equal to or greater than five parts per thousand. **D 4175, D02**

salt water, *n*—the aerobic, aqueous compartment, characteristically with a salinity equal to or greater than five parts per thousand. **D 6384, D02**

salty, *adj*—taste produced by substances such as sodium chloride when in solution. **E 253, E18**

salvage—property that has no reasonable prospect of sale or use as serviceable property without major repairs, but has some value in excess of its scrap value. **E 2135, E53**

salvage value—the value of an asset, assigned for tax computation purposes, that is expected to remain at the end of the depreciation period. **E 631, E06**

salvage value, *n*—the value of an asset, assigned for tax computation purposes, that is expected to remain at the end of the depreciation period. **E 833, E06**

sample, *n*—one or more portions of a liquid or solid material taken in an unbiased manner from a batch, heat, lot, or process stream to be representative of the whole, for subsequent testing to determine the chemical, physical, mechanical, or other quality characteristics of the material, or combination thereof. **A 644, A04**

sample, *n*—a portion of the material in a lot, selected according to a specific sampling plan, intended to represent the lot. **A 902, A05**

sample—the final form of a material submitted for chemical analysis (drillings, millings, and so forth) or a prepared test specimen to be used for mechanical testing. **B 846, B05**

sample, *n*—a portion of a material or product randomly selected to be representative of the whole. **C 71, C08**

sample—the number of specimens drawn from a lot. **C 822, C13**

sample—each piece or group of pieces selected from a lot and used to determine whether the product complies with the specification criteria. **C 896, C04**

sample, *n*—a quantity of material taken from a larger quantity for the purpose of estimating properties or composition of the larger quantity.

analysis sample, *n*—final subsample prepared from the original

gross sample but reduced to 100 % through No. 60 (250- μm) sieve and divided to not less than 50 g.

divided sample, *n*—See **subsample**.

gross sample, *n*—a sample representing one lot of coal and composed of a number of increments on which neither reduction nor division has been performed.

laboratory sample, *n*—the sample, not less than the permissible weight delivered to the laboratory for further preparation and analysis.

representative sample, *n*—a sample collected in such a manner that every particle in the lot to be sampled is equally represented in the gross or divided sample.

subsample, *n*—a sample taken from another sample.

unbiased sample (representative sample)—a sample free of bias. **D 121, D05**

sample, *n*—(1) a portion of a lot of material which is taken for testing or for record purposes.

(2) a group of specimens used, or observations made, which provide information that can be used for making statistical inferences about the population(s) from which the specimens were drawn. (See also **lot sample, laboratory sample, and specimen**) **D 123, D13**

sample—piece or quantity of bulk material that has been selected by some sampling process. **D 653, D18**

sample, *n*—a small part or portion of a material or product intended to be representative of the whole. **D 883, D20**

sample, *n*—a discreet portion of matrix intended to represent its source. **D 1129, D19**

sample, *n*—a portion of a population intended to be representative of the whole.

cumulative sample, *n*—a sample obtained over a period of time with (1) the collected atmosphere being retained in a single vessel, or (2) with a separated component accumulating into a single whole.

operating humidity range of sample, *n*—the range of ambient relative humidity of air which passes through the analyzer's sensing system, over which the monitor will meet all performance specifications.

operating temperature range of sample, *n*—the range of ambient temperatures of air, which passes through the analyzer's sensing system, over which the analyzer will meet all performance specifications.

personal sample, *n*—a sample representative of air-borne dust that is likely to enter the test subject's respiratory system and which is therefore taken by a collection apparatus (membrane filter) positioned near the nose and mouth of the subject or in the breathing zone.

running sample, *n*—withdrawal of a portion of the atmosphere over a period of time with continuous analysis or with separation of the desired material continuously and in a "linear" form. **D 1356, D22**

sample—a sample consists of one or more units of product drawn from a lot, the units of the sample being selected at random without regard to their quality. **D 1517, D31**

sample, *n*—the portion or unit(s) selected to represent the lot. **D 1566, D11**

sample, *n*—one or more units of product taken from a lot without regard to the quality of the unit. (Also often termed lot sample). **D 1711, D09**

sample, *n*—of paper or paperboard, a specified number of test units selected in accordance with a prescribed procedure to represent the lot. See **lot**. **D 1968, D06**

sample, *n*—a portion of carbon black selected for use in obtaining a test result. **D 3053, D24**

sample, *n*—a part taken as representative of a whole material. **D 4175, D02**

sample, *n*—(1) a portion of material which is taken for testing or for record purposes. (2) a group of specimens used, or of observations

- made, which provide information that can be used for making statistical inferences about the population(s) from which the specimens are drawn. (See also **laboratory sample, lot sample, and specimen.**) **D 4439, D35**
- sample, n**—(1) a portion of a lot of material which is taken for testing or record purposes. (2) the group of specimens used, or observations made, which provide information that can be used for making statistical inferences about the population from which they were drawn. **D 4845, D13**
- sample, n**—a portion of material taken from a larger quantity for the purpose of estimating properties or composition of the larger quantity. **D 5681, D34**
- sample, n**—a portion of material that is taken for testing or for record purposes. **D 5681, D34**
- sample, n**—one or more items or portions collected from a lot or population. **D 5681, D34**
- sample, n**—a portion of material which is collected for testing or for record purposes. **D 5681, D34**
- sample, n**—*in methods of chemical analysis*, a portion of a material selected and processed to render its composition representative of the composition of the whole. (Contrast **specimen**).
- gross, n*—a sample representing one lot of material and composed of a number of increments on which neither reduction nor division has been performed.
- laboratory, n*—a subsample, taken from the prepared sample of a lot, for submission to one or more laboratories for chemical analysis.
- prepared, n*—a subsample, taken from the gross sample, on which comminution, division, blending, or other procedures have been performed.
- test, n*—a subsample selected from the properly prepared laboratory sample which has a suitable sample weight or volume for one or more determinations by chemical analysis.
- umpire, n*—a laboratory sample submitted to a laboratory of recognized capability chosen to resolve a difference. **E 135, E01**
- sample, n**—an amount of the material, product, or assembly, to be tested, which is representative of the item as a whole. **E 176, E05**
- sample, n**—a small part or portion of a material or product intended to be representative of the whole. **E 284, E12**
- sample, n**—a group of items, observations, test results, or portions of material, taken from a large collection of items, observations, test results, or quantities of material, which serves to provide information that may be used as a basis for making a decision concerning the larger collection. **E 456, E11**
- sample, n**—a portion of material taken from a larger quantity for the purpose of estimating properties or composition of the larger quantity. **E 631, E06**
- sample**—a portion of material taken from a larger quantity for the purpose of estimating properties or composition of the larger quantity. See **analysis sample, gross sample, laboratory sample, and representative sample.** **E 856, D34**
- sample, n**—a group of items, observations, test results, or portions of material taken from a large collection of items, observations test results or quantities of material, which serves to provide information that may be used as a basis for making a decision on the larger collection. or quantity. **E 1605, E06**
- sample, n**—a portion, or part, of a quantity of material. **E 1638, E29**
- sample**—a group of items, test results or portions of material, taken from a large collection of items, test results or portions of material, which serves to provide information that may be used as a basis for making a decision concerning the larger collection.
- sample**—One or more sampling units taken from a population and intended to provide information on the population. (ISO 3534-93) **E 1732, E30**
- sample**—the specimens from the population selected for test purposes. **E 1823, E08**
- sample**—a number of items, for example, documents, records, articles, or actions selected from a lot for a review in order to draw inferences regarding to the status of the lot. **E 2135, E53**
- sample, n**—a portion, piece, or segment that is representative of a whole. **E 2363, E55**
- sample**—one or more units of product randomly selected from a lot to represent that lot. **F 412, F17**
- sample, n**—a selected number of n test objects that accurately represent the lot or population of interest. **F 538, F09**
- sample, n**—a group of items, observations, test results, or portions of material, taken from a large collection (population) of items, observations, test results, or quantities of material that serves to provide information that may be used as a basis for making a decision concerning the larger collection. **F 1773, F08**
- sample**—a portion of material taken from a larger quantity and representative of the whole, to be used for test purposes. **G 15, G01**
- sample, n**—a group of units or portion of material, taken from a larger collection of units or quantity of material, which serves to provide information that can be used as a basis for action on the larger quantity. **G 113, G03**
- sample, all-levels (liquid sample)**—one obtained by submerging a closed sampler to a point as near as possible to the draw-off level, then opening the sampler and raising it at a rate such that it is about three-fourths full as it emerges from the liquid. An all-levels sample is not necessarily an average sample because the tank volume may not be proportional to the depth and because the operator may not be able to raise the sampler at the variable rate required for proportionate filling. The rate of filling is proportional to the square root of the depth of immersion. **E 1547, E15**
- sample average (arithmetic average)**—the sum of all the observed values in a sample divided by the sample size. It is a point estimate of the population mean. **E 1823, E08**
- sample, average (liquid sample)**—one that consists of proportionate parts from all sections of the container. **E 1547, E15**
- sample average (\bar{x}), n**—the sum of all the observed values in a sample divided by the sample size. It is a point estimate of the population mean. **F 1773, F08**
- sample, bottom (liquid sample)**—one obtained from the material on the bottom surface of the tank, container, or line at its lowest point. (Bottom samples are usually taken to check for water, sludge, scale, etc.) **E 1547, E15**
- sample, composite, compartment-tank (liquid sample) (ship, barge, etc.)**—a blend of individual all-levels samples from each compartment that contains the product being sampled in proportion to the volume of material in each compartment. **E 1547, E15**
- sample, composite, single-tank (liquid sample)**—a blend of the upper, middle, and lower samples. For a tank of uniform cross section, such as an upright cylindrical tank, the blend consists of equal parts of the three samples. For a horizontal cylindrical tank, the blend consists of the three samples in the proportions shown in **E 1547.** **E 1547, E15**
- sample contacting equipment**—equipment that comes in direct contact with the sample or portion of sample that will undergo chemical analyses or physical testing (for example, ground water well bailer, split-spoon sampler, soil gas sampling probe). **D 653, D18**
- sample, continuous (liquid sample)**—one obtained from a pipeline conveying the product in such a manner as to give a representative average of the stream throughout the period of transit. **E 1547, E15**
- sample division, n**—the process whereby a sample is reduced in weight without change in particle size. **D 121, D05**
- sample division**—the process of extracting a smaller sample from a gross sample wherein the representative properties of the large sample are retained. **D 5681, D34**
- sample division**—the process of extracting a smaller sample from a sample so that the representative properties of the larger sample are retained. During this process it is assumed that no change in particle size or other characteristics occurs. **D 5681, D34**
- sample division**—the process of obtaining a smaller sample from a

sample division

larger sample so that the representative properties of the larger sample are retained. During this process it is assumed that no change in particle size or other characteristics occurs. **E 856, D34**

sample, drain (liquid sample)—one obtained from the draw-off or discharge valve. Occasionally, a drain sample may be the same as a bottom sample, as in the case of a tank car. **E 1547, E15**

sampled zone—that part of a transect presumed to be wholly represented by sediment samples. **D 4410, D19**

sample for examination—a specified number of units taken from a lot for the purpose of visual, dimensional or tactile inspection. **D 1517, D31**

sample for test—a specified number of sample units taken from a lot for the purpose of testing the lot for all physical and chemical properties for which requirements are specified. **D 1517, D31**

sample for test—a specified number of sample units taken from a lot for the purpose of testing the lot for all physical and chemical properties for which requirements are specified. **F 869, F08**

sample, gross (solid sample)—a composite prepared by mixing the increments. **E 1547, E15**

sample integrity—the unimpaired chemical composition of a test sample upon the extraction of said test sample for analysis. **E 176, E05**

sample item—a single document, record, article, or action from the sample. **E 2135, E53**

sample item element—a single element from a sample item subject to evaluation, for example, name or nomenclature, description, national stock number, quantity received, quantity issued, balance on hand, and so forth. **E 2135, E53**

sample, jar (liquid sample)—one obtained by placing a jar into the path of a free-flowing stream so as to collect a definite volume from the full cross section of the stream. **E 1547, E15**

sample, laboratory—See **laboratory sample**. **D 4439, D35**

sample, laboratory (solid sample)—that portion of the subsample that is sent to the laboratory for testing. **E 1547, E15**

sample, lot—See **lot sample**. **D 4439, D35**

sample median—the (1) middle value when all observed values in a sample are arranged in order of magnitude if an odd number of items (units) are tested or (2) the average of the two middle-most values if an even number of items (units) are tested. It is a point estimate of the population median, or 50 % value. **E 1823, E08**

sample, middle (liquid sample)—one obtained from the middle of the tank contents. **E 1547, E15**

sample, mixed (liquid sample)—one obtained after mixing or vigorously stirring the contents of the original container, and then pouring out or drawing off the quantity desired. **E 1547, E15**

sample of the waste, n—for waste sampling of building materials, a collection of the **components of the waste** assembled in proportion to their contribution to the total volume of the waste. **E 1605, E06**

sample, outlet (liquid sample)—one normally obtained at the level of the tank outlet (either fixed or a swing line outlet). **E 1547, E15**

sample pathlength, b—in a *spectrophotometer*, the distance, measured in the direction of propagation of the beam of radiant energy, between the surface of the specimen on which the radiant energy is incident and the surface of the specimen from which it is emergent. **E 131, E13**

sample percentage—the percentage of observed values between two stated values of the variable under consideration. It is a point estimate of the percentage of the population between the same two stated values. (One stated value may be “minus infinity” or “plus infinity.”) **E 1823, E08**

sample preparation, n—the process that may include air drying, crushing, division, and mixing of a gross sample for the purpose of obtaining an unbiased analysis sample. **D 121, D05**

sample preparation—the process that includes drying, size reduction, division, and mixing of a laboratory sample for the purpose of obtaining an unbiased analysis sample. **D 5681, D34**

sample preparation—the process that includes drying, size reduc-

tion, division, and mixing of a laboratory sample for the purpose of obtaining an unbiased analysis sample. **E 856, D34**

sampler, n—a device in which or through which atmospheric or emission samples are collected for analysis.

constant flow high-volume sampler, n—a sampler that is equipped with a constant flow device.

Hi-Vol (high-volume air sampler), n—a device for sampling large volumes of an atmosphere; collecting the contained particulate matter by filtration; and consisting of a high-capacity vacuum pump, a filter to collect suspended particles, and means for measuring or controlling the flow rate, or both. **D 1356, D22**

sampler, n—the device used to obtain a sample. **D 5681, D34**

sample reduction, n—the process whereby a sample is reduced in particle size by crushing or grinding without significant change.

D 121, D05

sample reduction—the process whereby sample particle size is reduced without change in sample weight. **D 5681, D34**

sample reduction—the process whereby sample particle size is reduced without change in sample weight (see milling).

E 856, D34

sample set—a group of samples (one or more). **E 631, E06**

sample size—the number of units of product in the sample.

D 1517, D31

sample size, n—the number of units of product taken to make up the sample. **D 1711, D09**

sample size, n—the base size from which grade rule values are established. **D 6963, D13**

sample size, n—the number of units in a sample or the number of observations in a sample. **E 456, E11**

sample size—the number of units of product in the sample.

F 869, F08

sample skein, n—skein reeled from the package or beam of the laboratory sample, and used in the laboratory as a source of specimens. **D 123, D13**

sample skein, n—skein reeled from the package or beam of the laboratory sample, and used in the laboratory as a Source of specimens. **D 4849, D13**

sample spectrum, n—a spectrum, either single-beam or ratioed, that contains spectral features due to an analyte of interest. **E 131, E13**

sample standard deviation, n—the square root of the sum of the squares of the individual deviations from the sample average divided by one less than the number of results involved.

$$s = \sqrt{\frac{\sum_{j=1}^n (X_j - \bar{X})^2}{n - 1}}$$

where:

S = sample standard deviation,

n = number of results obtained,

X_j = j th individual result, and

\bar{X} = sample average.

D 5681, D34

sample standard deviation, s—the square root of the sample variance. It is a point estimate of the population standard deviation, a measure of the “spread” of the frequency distribution of a population. **E 1823, E08**

sample standard deviation (s), n—the square root of the sample variance. It is a point estimate of the population standard deviation, a measure of the *spread* of the frequency distribution of a population. Sample standard deviation is defined as follows:

$$s = \sqrt{\frac{n\sum x^2 - (\sum x)^2}{n(n - 1)}}$$

where:

s = sample standard deviation,

n = number of units in a sample, and
x = sample property being measured.

F 1773, F08

sample, sub (solid sample)—a smaller sample produced in a specified manner by the reduction in volume or quantity of the gross sample. E 1547, E15

sample system—See analyzer. D 1356, D22

sample, top (liquid sample)—one normally obtained 6 in. (152 mm) below the top surface of the tank contents. E 1547, E15

sample, tube or thief (liquid sample)—one obtained with a sampling tube or special thief, either as a core sample or spot sample from the specified point in the container. E 1547, E15

sample unit (for test purposes)—the total quantity of material necessary to obtain one test result for each of the properties and characteristics specified in the material specification or procurement document. In testing of small package units, the Sample Unit may be a package unit randomly selected from the material representing the lot. In testing commodities in which the units are individually too small to provide sufficient material for evaluating all the properties specified in the material specification, the Sample Unit may be a sufficient amount of the material, taken as an aggregate to provide the quantity of material required. D 1517, D31

sample unit (for test purposes)—the total quantity of material necessary to obtain one test result for each of the properties and characteristics specified in the material specification or procurement document. F 869, F08

sample, upper (liquid sample)—one obtained from the middle of the upper third of the tank contents. E 1547, E15

sample variance, s^2 —the sum of the squares of the differences between each observed value and the sample average divided by the sample size minus one. It is a point estimate of the population variance. E 1823, E08

sample weight, *n*—the amount of test material determined by weighing with a balance. E 135, E01

sampling—process of selecting samples from a lot for use in testing. C 896, C04

sampling, *v*—obtaining a representative portion of the material concerned. D 1129, D19

sampling, *n*—a process consisting of the withdrawal or isolation of a fractional part of the whole.

active sampling, n—a means of collecting an airborne or emission substance that employs a mechanical device such as a pump or vacuum-assisted critical orifice to draw air or emissions into or through the sampling device.

collocated sampling, n—the simultaneous collection of two or more air or emission samples by samplers placed side-by-side (often mistakenly termed *co-located* sampling), placed close enough to each other to ensure that comparable samples are collected, but separated sufficiently to prevent cross-interference.

condensation sampling, n—a process consisting of the collection of one or several components of a gaseous mixture by simple cooling of the gas stream in a device which retains the condensate.

continuous sampling, n—sampling without interruptions throughout an operation or for a predetermined time.

cryogenic sampling, n—the collection of an air or emission substance by condensation in a trap cooled to a temperature sufficient to condense or freeze the substance being collected, usually used in near real-time or sequential monitoring. Also called *freeze-trapping*.

event sampling, n—a special form of intermittent sampling where the duration of a sampling period is defined as a single, discrete occurrence of precipitation, dew, fog, or frost.

grab sampling, n—the collection of an atmospheric or emission substance without regard to variations, whether temporal or spatial.

instantaneous sampling, n—obtaining a sample of an atmosphere in a very short period of time such that this sampling time is insignificant in comparison with the duration of the operation or the period being studied.

intermittent sampling, n—sampling successively for limited periods of time throughout an operation or for a predetermined period of time.

isokinetic sampling, n—sampling in which the linear velocity and direction of the fluid entering the sampling nozzle is equal to the undisturbed fluid stream at the sample point.

reactive sampling, n—the collection of an air or emission substance by reacting it with a chemical reagent (for example, derivatization).

sampling period(s), n—the record length or interval over which data collection occurs.

sampling rate (Hz), n—the rate at which data collection occurs, usually presented in samples per second (Hertz).

sampling train, n—the assemblage of equipment necessary to sample atmospheres.

sequential sampling—See **sample, running**.

source sampling, n—withdrawal, with or without simultaneous isolation of specific components, of a portion of the offgases from a source of pollutants. D 1356, D22

sampling—see **digitization**. E 131, E13

sampling—a process whereby a test sample is extracted from a fire test environment. E 176, E05

sampling—process of drawing or constituting a sample. E 1402, E11

sampling, *n*—(The) process of drawing or constituting a sample. E 1732, E30

sampling, *v*—the act of selecting samples. F 538, F09

sampling density—the number of borings (that is, sampling points) per unit area. D 5681, D34

sampling design, *n*—(1) the sampling schemes specifying the point(s) for sample collection; (2) the sampling schemes and associated components for implementation of a sampling event. D 5681, D34

sampling device—a filter holder and air sampling pump assembly used to collect airborne particulate lead on a filter. The filter holder houses a cellulose ester membrane filter, through which air is drawn by using an air sampling pump; the filter holder is connected to the pump by tubing. E 631, E06

sampling error—the systematic and random deviations of the sample value from that of the population. The systematic error is the *sampling bias*. The random error is the *sampling variance*. D 5681, D34

sampling fraction, *f, n*—the ratio *f* of the number of sampling units selected for the sample to the number of sampling units available.

NOTE—For the simple random sample case, $f = n/N$ where *n* is the sample size and *N* is the number of sampling units available. When $f > 0.10$ estimation of the precision of an estimator should take account of this magnitude of *f*. See finite population correction. E 456, E11

sampling fraction, *f, n*—the ratio *f* of the number of sampling units selected for the sample to the number of sampling units available. E 1402, E11

sampling frequency—number of interferogram data points digitized per second in a single scan. E 131, E13

sampling interval—difference in retardation between successive sample points in an interferogram. E 131, E13

sampling location—a specific area within a sampling site that is subjected to sample collection. Multiple sampling locations are commonly designated for a single sampling site. E 631, E06

sampling location, *n*—a specific area within a **sampling site** that is subjected to sample collection. E 1605, E06

sampling period—See **sampling**. D 1356, D22

sampling plan, *n*—a procedure for obtaining a sample. D 123, D13

sampling plan result, *n*—the number obtained for use in judging the acceptability of a lot when applying a sampling plan. D 123, D13

sampling probe

sampling probe—in leak testing, a device used to collect tracer gas from an area of the test object and feed it to the leak detector at the reduced pressure required. Also called a sniffing probe.

E 1316, E07

sampling process, n—the method and procedure of collecting physical samples from a defined population.

D 5681, D34

sampling rate—See **sampling**.

D 1356, D22

sampling site—a local geographical area that contains the sampling locations. A sampling site is generally limited to an area that is easily covered by walking.

E 631, E06

sampling site, n—a local place that contains the sampling locations.

E 1605, E06

sampling site, n—A sampling site is generally limited to an area that is easily covered by walking, for example, an apartment building or single-family residence.

E 1605, E06

sampling (solid sample)—the process of extracting a small fraction of material from a larger bulk, so that it will be sufficiently representative of the bulk for the intended purpose.

E 1547, E15

sampling template (dust), n—a tool used to isolate a known area of a surface for dust wipe sampling.

E 1605, E06

sampling train—See **sampling**.

D 1356, D22

sampling unit, n—an identifiable, discrete unit or subunit of material that could be taken as part of a sample.

D 123, D13

sampling unit, n—*in wool*, a portion of material that is taken at one time from one physical location and that is combined with similar portions to make up the laboratory sample.

D 123, D13

sampling unit, n—an identifiable, discrete unit or subunit of material that could be taken as part of a sample. (See also **primary sampling unit, laboratory sample, and specimen**.)

D 4439, D35

sampling unit, n—*in wool*, a portion of material that is taken at one time from one physical location and that is combined with similar portions to make up the laboratory sample.

D 4845, D13

sampling unit, primary—See **primary sampling unit**.

D 4439, D35

sampling vertical—an approximately vertical path from the water surface to the bottom along which one or more samples are collected to define various properties of the flow, such as sediment concentration.

D 4410, D19

sampling without replacement, n—a procedure in which a selected sampling unit is set aside for the sample, and a previously unselected unit is selected at each step (or draw) of the sample selection procedure.

E 1402, E11

sampling with replacement, n—a procedure used with some probability sampling plans in which a selected unit is replaced after any step in selection so that this sampling unit is available for selection again at the *next* step of selection, or at any other succeeding step of the sample selection procedure.

E 456, E11

sampling with replacement, n—a procedure used with some probability sampling plans in which a selected unit is replaced after any step in selection so that this sampling unit is available for selection again at the *next* step of selection, or at any other succeeding step of the sample selection procedure.

E 1402, E11

sand, n—fine aggregate resulting from natural disintegration and abrasion of rock or processing of completely friable sandstone.

C 125, C09

sand—particles of rock that will pass the No. 4 (4.75-mm) sieve and be retained on the No. 200 (75- μ m) U.S. standard sieve.

D 653, D18

sandblasted—an irregular, pitted surface produced by impacting sand particles at high velocity against a stone surface.

C 119, C18

sand blasting—abrasive blasting with sand.

B 374, B08

sand boil—the ejection of sand and water resulting from piping.

D 653, D18

sand casting, n—a casting process wherein molten metal is poured by gravity into the cavity of a sand mold and solidified; also, a product of such a process.

B 899, B02

sanded grout—grout in which sand is incorporated into the mixture.

D 653, D18

sand equivalent—a measure of the amount of silt or clay contami-

nation in fine aggregate as determined by test (Test Method D 2419).

D 653, D18

sand finish, n—the surface feature resulting when faces have sand applied either to the clay column in the extrusion process for appearance purposes or as the lubricant to the molds in the molding process.

C 43, C15

sand holes—{archaic} small fractures in the surface of glass, produced by the rough grinding operation, that have not been removed by subsequent fine grinding.

C 162, C14

sand-lightweight concrete, n—concrete made with a combination of expanded clay, shale, slag, or slate or sintered fly ash and natural sand and generally weighing between 1680 and 1920 kg/m³ (105 to 120 pcf).

E 176, E05

sand-lime brick, n—See **calcium-silicate brick**.

C 1209, C15

sand size (fluvial sediment)—0.062 to 2 mm in diameter.

D 4410, D19

sandstone (commercial definition) (I)—sedimentary rock composed mostly of mineral and rock fragments within the sand size range, from 0.06 to 2.0 mm, and having a minimum of 60 % free silica, cemented or bonded to a greater or lesser degree by materials including silica and various carbonates, with iron oxides or clay sometimes present, and which has a compressive strength over 28 MPa (4,000 psi).

C 119, C18

sand wedge—a wedge-shaped body of sand produced by the filling of a thermal contraction crack with sand that has either been blown in or washed in.

D 7099, D18

sand-wedge polygon—a polygon outlined by sand wedges underlying its boundaries.

D 7099, D18

sandwich panel—a structure consisting of relatively dense high-strength facing(s) bonded to a less dense low-strength intermediate material or core.

sash—See **windows and doors**.

E 631, E06

sandwich panel—a structure consisting of relatively dense high-strength facing(s) bonded to a less dense low-strength intermediate material or core.

E 1749, E06

sanforizing mark, n—a crimped, rippled, wavy, pebbled, or cockled place in the cloth showing distortion of the texture.

D 123, D13

sanforizing mark, n—a crimped, rippled, wavy, pebbled, or cockled place showing distortion of the texture. (*Syn.* blanket mark)

D 3990, D13

sanitary ware—See **china sanitary ware**.

C 242, C21

sanitary ware—porcelain enameled ware such as sinks, lavatories, and bathtubs.

C 286, B08

sanitization—reduction in the number of bacterial contaminants to safe levels. See **disinfection**.

D 6161, D19

sanitizing agent feeder—a device that automatically feeds sanitizer into recirculated or non-recirculated rinse water of spray-type commercial dishwashing and glasswashing machines.

F 1827, F26

sap—the moisture in unseasoned wood, containing nutrients and other chemicals in solution.

D 9, D07

saponification—the alkaline hydrolysis of fats whereby a soap is formed; more generally, the hydrolysis of an ester by an alkali with the formation of an alcohol and a salt of the acid portion.

B 374, B08

saponification—alkaline hydrolysis of esters to produce the component soaps and alcohols.

D 459, D12

saponification, n—the interaction of fats, fatty acids, or esters generally with an alkali to form the metallic salt, which is commonly called soap.

D 4175, D02

saponification number, n—*in petroleum technology*, the number of milligrams of potassium hydroxide that is consumed by 1 g of oil under the conditions of the test.

D 4175, D02

saponification number, n—the number of milligrams of potassium hydroxide consumed by 1 g of a sample under the conditions of the test.

D 4175, D02

saponify, v—to hydrolyze a fat with alkali to form an alcohol and the salt of a fatty acid.

D 4175, D02

sapric peat—peat in which the original plant fibers are highly decomposed (less than 33 % fibers). **D 653, D18**

sapwood—the wood containing some living cells and forming the initial wood layer beneath the bark of the log. The thickness of the sapwood layer varies by species and may be lighter in color than heartwood. Under most conditions the sapwood is more susceptible to decay than heartwood. **D 9, D07**

saran—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 80 % by weight of vinylidene chloride units (CzCH₂CzCCl₂Cz). **D 123, D13**

saran plastics—See **vinylidene chloride plastics**. **D 883, D20**

sash, n—single frame in a door or window that holds one or more lites (panes) of glass. See **window sash**. **E 631, E06**

sash, n—single frame in a door or window that holds one or more lites (panes) of glass. See **window sash**. **E 1605, E06**

satellite, n—extraneous or undesirable ink droplets. See also **spatter, spray**. **F 1857, F05**

satellite drops, n—drops formed during atomization that are associated with a much larger drop. **E 1620, E29**

satellite peaks—See **photoelectronX-ray satellite peaks and shake-up lines or shake-up-satellites**. **E 673, E42**

satin, adj—description of a weave pattern in which warp yarns pass unbound (“float”) over several fill yarns before crossing under a single fill yarn. **D 3878, D30**

satin etch—decorative glass surface that scatters light upon reflection, yielding a dull sheen finish. **C 162, C14**

satin finish—a surface finish that behaves as a diffuse reflector and which is lustrous but not mirrorlike. **B 374, B08**

satin glaze—a glaze which exhibits a non-zero specular reflection reduced by at least 50 percent. **C 242, C21**

satin, matte, or black finish—a reduced reflective surface varying from a dull appearance to a blackened surface. **F 1840, F04**

saturated felt—a felt that has been immersed in hot bitumen; the felt adsorbs and absorbs as much bitumen as it can retain under the processing conditions, but remains porous and contains voids. **D 1079, D08**

saturated gun—a self-biased electron gun in which electron emission is limited by space charge rather than filament temperature. **E 7, E04**

saturated-lime water, n—see **lime-saturated water**. **C 219, C01**

saturated unit weight—see **unit weight**. **D 653, D18**

saturates, n—a mixture of paraffinic and naphthenic hydrocarbons that on percolation in a paraffinic solvent are not adsorbed on the adsorbing medium; other compounds such as naphthenic and polar aromatics are adsorbed thus permitting the separation of the saturate fraction. **D 8, D04**

saturation—(1) the attribute by which the a perceived color is judged to depart from a neutral gray of equal lightness toward a pure hue. (2) Attribute of a visual sensation that permits a judgment to be made of the proportion of pure chromatic color in the total sensation. **C 242, C21**

saturation—under **color of an object**, see *saturation*. **D 16, D01**

saturation, n—the condition existing when a vapor is in equilibrium with the plane surface of a condensed phase of the same substance (liquid or solid).

saturation mixing ratio, n—the ratio of the mass of water vapor, m_v, to the mass of dry air, m_a, present in saturated air.

saturation vapor pressure, n—the vapor pressure of a system at a given temperature, wherein the vapor of the substance is in equilibrium with a plane surface of that substance’s pure liquid or solid phase.

saturation vapor pressure of water, n—the pressure of water vapor in equilibrium with plane surface of a condensed phase.

saturation mixing ratio—See **saturation**.

saturation vapor pressure of water—See **saturation**. **D 1356, D22**

saturation—the point at which a solution contains enough of a dissolved solid, liquid, or gas so that no more will dissolve into the solution at a given temperature and pressure. **D 6161, D19**

saturation—the condition of coexistence in stable equilibrium of a vapor and a liquid or a vapor and solid phase of the same substance at the same temperature. **E 41, G03**

saturation—a condition in which an increase in input signal produces no increase in amplitude on the display. **E 1316, E07**

saturation—relative or comparative color characteristic resulting from a hue’s dilution with white light. **E 1316, E07**

saturation activity—the number of disintegrations per unit time for the steady-state condition in which the rate of production of a nuclide is equal to the rate of loss by radioactive decay or nuclear transmutation. **E 170, E10**

saturation charge—the maximum electrostatic charge that can be held on a photoconductive layer without the occurrence of dielectric breakdown. **F 335, F05**

saturation curve—see **zero air voids curve**. **D 653, D18**

saturation, degree of—the ratio of the weight of water vapor associated with a pound of dry air to the weight of water vapor associated with a pound of dry air saturated at the same temperature. **E 41, G03**

saturation density, n—the optical density value at which no additional density increase is seen on the thermal image as the energy delivered to thermal paper is increased. **F 1623, F05**

saturation (in color), n—another term for **chroma**. See **color**. **E 253, E18**

saturation level—see **vertical limit**. **E 1316, E07**

saturation, magnetic—the total magnetization produced in a ferromagnetic material, at which point the incremental permeability has progressively decreased to approach unity. **E 1316, E07**

saturation, s, n—(1) in the CIE 1976 L*, u*, v* system, the quotient of the CIE 1976 u, v, chroma C*_{uv} by the CIE 1976 lightness L*, s = C*_{uv}/L*.

(2) attribute of a visual sensation that permits a judgment to be made of the proportion of pure chromatic color in the total sensation. (See also **chroma (3)**.) **E 284, E12**

saturation temperature, n—the temperature at which a thermal image reaches its maximum optical density. **F 1623, F05**

saucer head—circular, cupped head with concave top surface and convex bearing surface. **F 547, F16**

Saunderson correction, n—mathematical expression relating, in turbid medium theory, the fluxes on opposite sides of a boundary at which there is a change in refractive index. **E 284, E12**

sauter mean diameter, SMD [L], n—the diameter of a drop that has the same ratio of volume to surface area as the ratio of total volume to total surface area in a distribution of drops, as computed from the equation:

$$SMD = \frac{\sum n_i d_i^3}{\sum n_i d_i^2}$$

where:

i = a sampling size interval,

d_i = drop diameter, and

n_i = number of drops in that interval.

G 40, G02

savings-to-investment ratio (SIR)—either the ratio of present value savings to present value investment costs, or the ratio of annual value savings to annual value investment costs.

scaling—see **flaking**.

E 631, E06

savings-to-investment ratio (SIR), n—either the ratio of present value savings to present value investment costs, or the ratio of annual value savings to annual value investment costs. **E 833, E06**

saw burn—blackening or carbonization of a cut surface of a pultruded section.

saw burn

NOTE—This condition is usually caused by cutting with a dull saw blade, cutting too slowly, or cutting a highly reinforced material with a diamond blade without water. **D 3918, D20**

saw chain, n—a closed loop of cutters linked together for use in a portable power-operated tool. **F 1494, F23**

sawdust—wood particles resulting from the cutting and breaking action of saw teeth. **D 1554, D07**

saw kerf—(1) grooves or notches made in cutting with a saw; (2) that portion of a log, timber, or other piece of wood removed by the saw in parting the material into two pieces. **D 9, D07**

saw-log size—a log large enough to produce lumber or other products that can be sawed. Its size and quality vary with the utilization practices of the region. **D 9, D07**

saw milling residue, n—sawdust, chips, slabs, bark, and other debris generated during the processing of logs into finished lumber or lumber products. **D 1968, D06**

sawn veneer—See under **veneer**. **D 1038, D07**

Saybolt color, n—an empirical definition of the color of a clear petroleum liquid. **D 4175, D02**

Saybolt color, n—the name of an empirical scale for expressing of the color of a clear petroleum liquid based on a scale of -16 (darkest) to +30 (lightest) and determined by Test Method D 156. **D 4175, D02**

Saybolt color, n—an empirical definition of the color of a clear petroleum liquid based on a scale of -16 (darkest) to +30 (lightest). **E 284, E12**

SBS—sodium bisulfite, NaHSO₃. **D 6161, D19**

SBS, n—see **sick building syndrome**. **E 2114, E06**

SC—an abbreviation for self-contained. **F 549, F05**

scab—in porcelain enameling metal sheets or castings, a defect having the appearance of a loose piece of metal, tongue, or flap on the surface. **C 286, B08**

scaffold, n—a support, delivery vehicle, or matrix for facilitating the migration, binding, or transport of cells or bioactive molecules used to replace, repair, or regenerate tissues. **F 2312, F04**

scaffold nail—See **double-headed nail**. **F 547, F16**

scale—an adherent oxide coating that is thicker than the superficial film referred to as tarnish. **B 374, B08**

scale—a small particle of foreign material embedded in the surface of molded glass articles. **C 162, C14**

scale—the oxide formed on the surface of the metal during heating. **C 286, B08**

scale, n—a deposit formed from solution directly upon a surface. **D 1129, D19**

scale—a condition wherein resin plates or particles are on the surface of a pultrusion.

NOTE—Scales can often be readily removed, sometimes leaving surface voids or depressions. **D 3918, D20**

scale, n—a defined arrangement of the elements of a set of stimuli or responses. **E 284, E12**

scale, v—to assess the content of one or more appearance attributes in the members of a set of stimuli. **E 284, E12**

scale, n—graduation of temperature display in degrees Celsius or Fahrenheit. **E 344, E20**

scale inhibitor—a chemical which inhibits the growth of microcrystals (inhibits precipitation of sparingly soluble salts). See **antiscalant**. **D 6161, D19**

scale of particle sizes—based on AGU (American Geophysical Union) scale. **D 4410, D19**

scale range—the range of degrees of temperature through which a thermometer is usable. **E 344, E20**

scale suppressant, n—a substance added to engine coolant concentrates, corrosion inhibitor packages, or supplemental coolant additives that helps prevent the formation of hard water mineral scale. **D 4725, D15**

scaling—the process of forming scale with or without acid fumes; sometimes refers to spontaneous detachment of scale. **C 286, B08**

scaling—same as spalling. **C 717, C24**

scaling—the build-up of precipitated salts on a surface, such as membranes, pipes, tanks, or boiler condensate tubes. **D 6161, D19**

scaling, n—the deterioration of the upper concrete slab surface, normally 3 mm (0.125 in.) to 13 mm (0.5 in.) in depth, resulting in the loss of surface mortar. **E 867, E17**

scaling—see **flaking**. **E 1605, E06**

scaling, n—the deterioration of the upper concrete slab surface, normally 3 mm (0.125 in.) to 13 mm (0.5 in.) in depth, resulting in the loss of surface mortar. **E 1778, E17**

scaling resistance, n—See **flaking resistance**. **D 16, D01**

scalloped selvage, n—an abrupt, narrow indentation in the selvage. **D 123, D13**

scalloped selvage, n—an abrupt, narrow indentation in the selvage. (*Syn. misclip*) **D 3990, D13**

scalops—excursions of the surface record above and below the blanking band. **E 867, E17**

scan—a search for information to be recognized by the recognition unit of the optical scanner, and the conversion of the optical signal to an electrical signal. **F 149, F05**

scan, n—the search for a symbol which is to be optically recognized; also, a search for marks to be recognized by the interpretation unit of an optical scanner. **F 1294, F05**

scan area—the area of a form that contains information to be scanned. **F 149, F05**

scan band—a strip across a document that passes directly beneath a scanning head of a reader. **F 149, F05**

scan ink—ink that is sensed by the optical scanner. Synonym for *nonreflective ink, read ink*. **F 149, F05**

scanner—(1) a device that examines a spatial pattern one part after another, and generates analog or digital signals corresponding to the pattern. Scanners are often used to mark reading, pattern recognition, or character recognition.

(2) See **flying spot scanner, optical scanner, mark scanning, optical scanner**. **F 149, F05**

scanner, n—a device that examines a spatial pattern, part by part, and generates analog or digital signals corresponding to the pattern. **F 1294, F05**

scanning—the movement of a search unit relative to the test piece in order to examine a volume of the material. **E 1316, E07**

scanning index—the distance the search unit is moved between scan paths after each traverse of the part. **E 1316, E07**

scanning microscope—an electron microscope in which the image is formed by a beam operating in synchronism with an electron probe scanning the object. The intensity of the image forming beam is proportional to the scattering or secondary emission of the specimen where the probe strikes it. **E 7, E04**

scanning/reading range (also called **Operating Range (OR)**), *n*—the combined distance of optical ability of a lens, a photographic material, or a photographic system to distinguish detail under specific conditions. Also, the narrowest element dimension that can be distinguished by a particular reading device. **F 1294, F05**

scan reflectance profile, n—according to *ANSI X3.182*, a record of the reflectance measured using the reference reflectivity method across the entire bar code symbol. **F 1294, F05**

scar, n—fibrous tissue replacing normal tissues destroyed by injury or disease. **F 2312, F04**

scarfing—the removing of flash or bead by a cutting operation. **B 846, B05**

scarf joint, n—see *scarf joint* under **joint**. **D 907, D14**

SCAS—see **semicontinuous activated sludge, SCAS**. **D 459, D12**

scattered energy—energy that is reflected in a random fashion by small reflectors in the path of a beam of ultrasonic waves. **E 1316, E07**

scattered ion:

energy—ISS, for a binary elastic collision, the kinetic energy of the probe ion following a binary elastic collision, E_s , is given by:

$$E_s = E_0[M_0/(M_0 + M_1)]^2(\cos \theta + [(M_1/M_0)^2 - \sin^2 \theta]^{1/2})^2$$

where:

E_s = kinetic energy for the scattered probe ion,
 E_0 = energy of the incident probe ion prior to collision, determined from the product of ionic charge and accelerating potential,

M_0 = mass of the probe ion,

M_1 = mass of the target atom, and

θ = angle between the initial and final velocity vectors for the probe ion, as determined from a common origin in the laboratory coordinate system, expressed as a value between 0 and 180°.

energy ratio—ISS, the value E_s/E_0 which may be used as the abscissa of an ion-scattering spectrum. For definition of E_s and E_0 , see **scattered ion energy**.

intensity, experimental—ISS, the measured response of the energy filtering and detection system as a consequence of bombarding the specimen material with a beam of probe ions, usually presented as the ordinate of an ion-scattering spectrum.

intensity, theoretical—ISS, defined by an equation of the form:

$$I_i(\theta) = I_0 N P_i \alpha_i (d\sigma/d\Omega) \theta \Delta \Omega T$$

where:

$I_i(\theta)$ = scattered ion intensity from atoms of species, i , at a given scattering angle, θ , ions s^{-1} ,

I_0 = intensity of incident probe ions, ions s^{-1} ,

N_i = number of scattering centers of species i per unit area of surface, or per unit volume accessible to the incident beam, atoms $metre^{-2}$,

P_i = probability that the probe ion remains ionized after interacting with an atom of species i ,

α_i = geometric or shadowing factor for species i in the given environment and geometry,

$(d\sigma/d\Omega)\theta$ = differential scattering cross section per unit solid angle, for species i , taken at the angle for which scattering is measured; that is, the angular distribution of scattered ion intensity per unit flux of incident ions, per atom of species i , $metre^2 atom^{-1} steradian^{-1}$,

$\Delta \Omega$ = solid angle of acceptance determined by the entrance aperture of the filtering and detection system, steradians, and

T = fractional transmission of the analyzing and detection system.

E 673, E42

scattered neutrons—neutrons that have undergone a scattering collision but still contribute to film exposure. **E 1316, E07**

scattering, *n*—the process by which light or other electromagnetic radiant flux passing through matter is redirected over a range of angles. **E 284, E12**

scattering—in leak testing, dispersion or diffusion in various directions due to intermolecular or ionic collisions as applied to the effect of the residual gas in a mass spectrometer tube or an ion beam traversing the tube. **E 1316, E07**

scattering—the dispersion, deflection, or redirection of the energy in an ultrasonic beam caused by small reflectors in the material being examined. **E 1316, E07**

scattering loss—that part of transmitted energy lost due to roughness of reflecting surface. **D 653, D18**

scattering (of radiant energy), *n*—in atomic emission spectrometry, reflection of radiant energy in random directions by matter located between the source and the detector. **E 135, E01**

scattering, 90° (or 180°)—scattering which is observed at an angle of 90° (or 180°) to the direction of the incident beam. **E 131, E13**

scattering tinting strength, *n*—relative change in the scattering properties of a standard black material (with no scattering colorant present) when a specified amount of a white or chromatic scattering colorant is added to it. **E 284, E12**

scattering (X-ray)—a general term which includes both Compton and coherent scattering. **E 7, E04**

scatter rug, *n*—a small rug which is designed to be flexible and is usually cleaned by laundering. **D 123, D13**

scavenger—a chemically active substance which consumes or deactivates an undesirable substance in a system or mixture. **D 2864, D27**

scenario, *n*—a detailed physical description of the process whereby a potential inadvertent combination of materials may occur. **E 1445, E27**

schedule—a pipe size system (outside diameters and wall thicknesses) originated by the iron pipe industry. **F 412, F17**

schematic design—the phase of a project during which the initial solutions to the program are prepared by the design professional through the use of plans and sections and system's descriptions.

*score, *n**—See **serviceability score**.

screen—See **railing systems**.

E 631, E06

schematic design, *n*—the phase of a project during which the initial solutions to the program are prepared by the design professional through the use of plans and sections and system's descriptions.

E 833, E06

schist—a foliated metamorphic quartz-feldspar-containing rock characterized by thin foliae of platy or prismatic minerals such as mica or chlorite. Schists split readily along these planes of foliation. This rock exists in many gradations, some of them progressing into a gneiss. **C 119, C18**

schistosity—the variety of foliation that occurs in the coarser-grained metamorphic rocks and is generally the result of the parallel arrangement of platy and ellipsoidal mineral grains within the rock substance. (ISRM) **D 653, D18**

Schlieren system—an optical system used for visual display of an ultrasonic beam passing through a transparent medium.

E 1316, E07

scintillation, *n*—the multiple discharges or small arcs that originate in the more conductive areas of the insulation surface, and span less conductive areas. **D 1711, D09**

scintillator, *n*—a transparent substance that emits visible or near ultraviolet light when traversed by an ionizing particle.

C 1145, C28

scintillators and scintillating crystals—a detector that converts ionizing radiation to light. **E 1316, E07**

scissoring—lateral misalignment. **F 1638, F04**

Scleroscope hardness number, HSc or HSd, *n*—a number related to the height of rebound of a diamond-tipped hammer dropped on the material being tested. **E 6, E28**

Scleroscope hardness test, *n*—a dynamic indentation hardness test using a calibrated instrument that drops a diamond-tipped hammer from a fixed height onto the surface of the material under test.

E 6, E28

sclerotinite—See *sclerotinite* under **maceral**.

D 121, D05

SCOF—static coefficient of friction.

F 141, F06

SCOF—static coefficient of friction

F 1646, F13

scoop—Deprecated term, see **element**.

D 2050, D13

scorch, *n*—premature vulcanization of a rubber compound.

D 1566, D11

scorch, Mooney, *n*—the time to incipient cure of a compound when

tested in the Mooney shearing disk viscometer under specific conditions (see Test Methods D 1646). **D 1566, D11**

score, *n*—a channel formed for appearance purposes on the face or faces of a manufactured masonry unit. **C 1232, C15**

score, *n*—an impression or crease in **paperboard, corrugated** or **solid fiberboard** to locate and facilitate folding. **D 996, D10**

score, *v*—to form a score. **D 996, D10**

score—a cut made by a flaying knife on the flesh side. **D 1517, D31**

scoring, *n*—*in tribology*, a severe form of wear characterized by the formation of extensive grooves and scratches in the direction of sliding. **D 4175, D02**

scoring, *n*—the formation of severe scratches in the direction of sliding. **D 4175, D02**

scoring, *n*—*in tribology*, a severe form of wear characterized by the formation of extensive grooves and scratches in the direction of sliding. **G 40, G02**

scorotron, *n*—a corotron with a screen. **F 1457, F05**

scotch grain—a pebbled pattern embossed on cattlehide or calf leather. **D 1517, D31**

scotopic, *adj*—pertaining to vision at sufficiently low levels of illumination that only the retinal rods are stimulated. **E 284, E12**

scour—the enlargement of a flow section by the removal of the boundary material by the motion of a fluid. **D 4410, D19**

scoured wool, *n*—wool from which the bulk of impurities has been removed by an aqueous or solvent washing process. **D 123, D13**

scoured wool, *n*—wool from which the bulk of impurities has been removed by an aqueous or solvent washing process. **D 4845, D13**

scouring—a wet process of cleaning by chemical or mechanical means, or both. **D 459, D12**

scrap—excess property that has no value except for its basic material content. **E 2135, E53**

scrape, *n*—the crystallized pine oleoresin collected from the scarified faces of trees being worked for turpentine. **D 804, D01**

scrapings—the overspray that has been recovered from a spray booth. **C 286, B08**

scrap tire, *n*—a tire, which can no longer be used for its original purpose due to wear or damage. **D 5681, D34**

scrap tire processing, *n*—any method of size reducing whole scrap tires to facilitate recycling, energy recovery or disposal. **D 5681, D34**

scratch—damage on a glass surface in the form of a line caused by the relative movement of an object across and in contact with the glass surface. **C 162, C14**
