scratch—damage resulting from the movement of a hard pointed object. **D 2825, D21**

scratch—in micro-indentation hardness testing, a mark or groove cut in the specimen by moving a loaded indenter across the surface. **E 7, E04**

scratch, *n*—a shallow cut or narrow groove in the flooring surface. A line or furrow made in the flooring surface by rasping or rubbing with a pointed or jagged object. **F 141, F06**

scratch—any marking or tearing of the surface in glass or plastic caused by an abrasive material. **F 2429, F07**

scratch coat, *n*—the first layer of plaster applied over lath or other substrate. **C 11, C11**

scratches, *n*—the result of mechanical removal or displacement, or both, of material from a surface by the action of abrasive particles or protuberances sliding across the surfaces. **D 4175, D02**

scratching, *n*—the formation of fine lines in the direction of sliding that may be due to asperities on the harder slider or to hard particles between the surfaces or embedded in one of them. **D 4175, D02**

scratching, *v*—a form of wear, in which a minute groove-like break in a flooring surface is made by a rubbing contact with a tool or particle, the total deformation being confined to the most immediate surface level. **F 141, F06**

scratching, *n*—*in tribology*, the mechanical removal or displacement, or both, of material from a surface by the action of abrasive

particles or protuberances sliding across the surfaces. (See also **plowing**.) **G 40, G02**

scratch-resistant coatings—coatings applied to glass surfaces to reduce the effects of frictive contact. **C 162, C14**

screen, *n*—in laboratory work an apparatus, in which the apertures are circular, for separating sizes of material. **D 8, D04**

screen—an apparatus with circular apertures for separating sizes of material. **D 1079, D08**

screen, *n*—an apparatus for separating sizes of granules. **D 5681, D34**

screen, *n*—a perforated sheet consisting of wire mesh, woven or welded wire fabric, or standard or flattened expanded metal; serving as an infill panel and being an integral part of a panel railing or guardrail system. **E 631, E06**

screen—alternative term for intensifying screen. **E 1316, E07**

screen, *n*—a perforated sheet consisting of wire mesh, woven or welded wire fabric, or standard or flattened expanded metal; serving as an infill panel and being an integral part of a panel railing or guardrail system. **E 1481, E06**

screen, *v*—to review or compare property on hand against a known or anticipated requirement. **E 2135, E53**

screen analysis, *n*—see **sieve analysis**. **B 243, B09**

screen-back hardboard (S1S)—hardboard with a reverse impression of a screen on the back produced when a damp or wet mat is hot-pressed into a board and dried in the press. **D 1554, D07**

screen dump, *n*—a command that causes information showing on a terminal display to be printed just as it appears on the display. **F 1457, F05**

screening, *n*—the appearance of a cross-hatch pattern on the print that can be caused by ink drying too rapidly. **D 6488, D01**

screening, *n*—a pattern of vertical and diagonal lines on the printed substrate where the ink flowout between cells in the cylinder is such that an uneven ink film is formed. **D 6488, D01**

screening, *n*—a preliminary procedure to select assessors, samples, products, or variables. **E 253, E18**

screening design, *n*—a balanced design, requiring relatively minimal amount of experimentation, to evaluate the lower order effects of a relatively large number of factors in terms of contributions to variability or in terms of estimates of parameters for a model. **E 456, E11**

screening design, *n*—a balanced design, requiring relatively minimal amount of experimentation, to evaluate the lower order effects of a relatively large number of factors in terms of contributions to variability or in terms of estimates of parameters for a model.

NOTE—In screening designs, the term lower order effects is sometimes limited to first order terms such as linear components of main effects, but often includes both first order terms and second order terms such as two factor interactions and quadratic curvature components of main effects. **E 1325, E11**

screening energy—the diminished energy of an ion due to coulombic attraction of electrons in the immediate environment. **E 673, E42**

screenings, *n*—a residual product resulting from the artificial crushing of rock, boulders, cobble, gravel, blast-furnace slag or hydraulic cement concrete, all of which pass the smallest screen used with the crushing operation and most of which pass the 2.36-mm (No. 8) sieve. **D 8, D04**

screening test, *n*—*as related to fire*, a fire-response test performed to determine whether a material, product, or assembly (a) exhibits any unusual fire-related characteristics, (b) has certain expected fire-related characteristics, or (c) is capable of being preliminarily categorized according to the fire characteristic in question. **E 176, E05**

screen lens—an electrostatic electron lens consisting of a combination of screens or foils at different potentials. **E 7, E04**

screen marks—a mesh pattern left by a silk screen process in the applied ceramic glass enamel before or after firing. **C 162, C14**

screen mesh, *n*—the average number of openings per linear inch of material. **C 1145, C28**

screen plate or film—See **color film**. E 7, E04

screen test—a standard test for fineness of porcelain enamel slip or powder. C 286, B08

screw—the fastener which joins the scissor halves F 1078, F04

screw, n—an anchor component that connects to the bony elements of the spine, pelvis, or ribs by means of threads. F 1582, F04

screw—mechanical fastener having basic design characteristics which facilitate its assembly into a tapped hole or to form its own threads during installation. F 1789, F16

screw contact—see **contact,screw**. B 542, B02

screw head—See **slotted head**. F 547, F16

screw, ice, n—a device designed to be screwed into ice to provide a belay or protection anchor. F 1773, F08

screw interconnection, n—an interconnection having an implant component sandwiched between the screw head (or screw thread) and bony element or other implant components. F 1582, F04

screw nail, screw nail, screw-grip nail, screw-shank nail, scrushank nail, screw-thread nail—terms applied to helically threaded nail and screw-threaded nail. (See **thread**.) F 547, F16

screw, screw-grip thread, screw-shank thread, scrushank thread, screw thread—See **helical thread, screw thread**. F 547, F16

screw stock—metal in the form of wire or rod, usually a free-machining alloy used for automatic screw machine work. E 7, E04

screw thread—helical thread with small lead angle rolled onto nail shank. F 547, F16

screw thread—helical ridge generally of uniform cross section formed on a cylindrical surface used to facilitate assembly of mechanical components. F 1789, F16

scrim, n—lightweight woven or non-woven fabrics that are manufactured from yarns. D 1079, D08

scrim—a reinforcing fabric woven into an open mesh construction, used in the processing of tape or other B-stage material to facilitate handling and control bondline thicknesses. Also referred to as a *carrier*. E 631, E06

scroll—See **railing systems**. E 631, E06

scrim—a reinforcing fabric woven into an open mesh construction, used in the processing of tape or other B-stage material to facilitate handling and control bondline thicknesses. Also referred to as a *carrier*. E 1749, E06

scroll, n—a cast or forged ornamental spiral of convoluted shape, serving, for example, as a decorative panel or insert. E 631, E06

scroll, n—a cast or forged ornamental spiral of convoluted shape, serving, for example, as a decorative panel or insert. E 1481, E06

scroll—a decorative ornament on top of a gate. F 552, F14

scrubber, n—a type of apparatus used in sampling and in gas cleaning in which the gas is passed through a space containing wetted packing or spray. D 1356, D22

scrubber, n—a pollution control device designed to remove gaseous elements from boiler exhaust gasses. See **flue gas desulfurization**. E 2201, E50

scrubber material, n—see **FGD material**. E 2201, E50

SCS—abbreviation for **system network architecture character string**. F 1457, F05

scud—remnants of epithelial tissue, hair, dirt, etc., left in the hair follicles after unhairing. D 1517, D31

scudding—removal of scud from unhairing hides by scraping with a blade, either by hand or machine. D 1517, D31

scuff—See **rub**. C 162, C14

scuff—disfigurement of polish film resulting from the abrading or scraping action repairable without recoating. D 2825, D21

scuff, v—a form of wear, in which a mark, gall, roughness or other damage is caused by the rubbing of traffic bodies against a flooring surface and may involve deposition of a foreign material onto the flooring surface. F 141, F06

scuff—the color of the CF or CFB sheet caused by capsule damage on the CB sheet when it is pulled under pressure across the mate sheet. F 549, F05

scuffing—long white scrape marks on the surface of the pultrusion. NOTE—This condition usually results from mechanical scraping or scratching of the pultrusion in the machine or in handling it afterwards. D 3918, D20

scuffing, n—in *lubrication*, surface damage resulting from localized welding at the interface of rubbing surfaces with subsequent fracture in the proximity of the weld area. D 4175, D02

scuffing, n—localized damage caused by the occurrence of solid phase welding between sliding surfaces, without local surface melting. D 4175, D02

scuffing—marks on coated surface due to movement between sheets under pressure. F 335, F05

scuffing—*n*, a form of wear occurring in inadequately lubricated tribosystems that is characterized by macroscopically-observable changes in surface texture, with features related to the direction of relative motion. G 40, G02

scuff marks—scratches or other damage to the shoe finish or polish coating. D 2825, D21

scuff, scuffing, n—in *lubrication*, damage caused by instantaneous localized welding between surfaces in relative motion which does not result in immobilization of the parts. D 4175, D02

scum—a floating layer of unmelted material on the molten glass surface. C 162, C14

scum, n—a condition that occurs when a lithographic plate has become sensitized in the nonimage areas and these areas begin to take ink. D 6488, D01

scumming—a defect characterized by areas of poor gloss on the surface of porcelain enamel. C 286, B08

scumming, n—the deposit of ink in the non-imaging area. D 6488, D01

scutching, n—the mechanical beating and scraping of flax straw subsequent to breaking to separate the shives and tow from the long line flax fiber. D 123, D13

scutching, v—the mechanical beating and scraping of flax straw subsequent to breaking to separate the shives and tow from the long line flax fiber. D 6798, D13

scuttle—a hatch that provides access to the roof from the interior of the building. D 1079, D08

scye depth, n—in *body measurements*, the distance from the cervicale to a point level with the armpit. D 123, D13

scye depth, n—the vertical distance from the cervicale to the back break-point level, taken with the arms down. D 5219, D13

SDI—**silt density index**—an index calculated from the rate of plugging of 0.45 μm membrane filter. It is an indication of the amount of particulate matter in water, sometimes called fouling index. D 6161, D19

SDLC—abbreviation for **synchronous data link control**. F 1457, F05

S&DSI—Stiff and Davis saturation index, measure of CaCO₃ solubility in seawater or highly saline water. See Practice D 4582 and **LSI**. D 6161, D19

SDWA—Safe Drinking Water Act of the United States, specifying required purity levels of municipal potable water. D 6161, D19

seal, n—in *building construction*, a barrier against the passage of liquids, solids, or gases. C 717, C24

seal:

heat seal—in *packaging*, a method of bonding mating surfaces under controlled application of heat, pressure, and dwell time.

hermetic seal—in *packaging*, a seal that prevents passage of air and other gases. D 996, D10

seal—the closure of a structure to make it leakproof by the application of sealant to fasteners, seams, and any other possible leak path.

sealing, absolute—See **absolute sealing**. E 631, E06

seal—the closure of a structure to make it leakproof by the application of sealant to fasteners, seams, and any other possible leak path. E 1749, E06

seal

seal—a continuous joint of two or more surfaces of sheet material such as made by fusion or adhesion. **F 17, F02**

seal—See Terminology F 17. **F 1327, F02**

sealant—*in building construction*, a material that has the adhesive and cohesive properties to form a seal. **C 717, C24**

sealant—a mixture of polymers, fillers, and pigments used to fill and seal joints where moderate movement is expected; unlike caulking, it cures to a resilient solid. **D 1079, D08**

sealant, n—a material that has adhesive and cohesive properties to seal joints, cracks, or other narrow openings (generally less than 76-mm (3-in.) wide) in pavements against the entrance or passage of water or other debris. **D 5535, D04**

sealant, aerosol foam, n—*in building construction*, a sealant that expands in volume as it is dispensed from a container, using propellant under pressure, to form a rigid or semi-rigid cellular mass. **C 717, C24**

sealant, aerosol foam, straw-type, n—*in building construction*, an aerosol foam sealant that is extruded through a narrow tube. **C 717, C24**

sealant backing—*in building construction*, a compressible material placed in a joint before applying a sealant. **C 717, C24**

sealant, chemically curing, n—*in building construction*, a compound that cures primarily through chemical reaction. **C 717, C24**

sealant, emulsion—See **sealant, latex**. **C 717, C24**

sealant, hot-applied, n—*in building construction*, a compound that is applied in a molten state and cures primarily by cooling to ambient temperatures. **C 717, C24**

sealant, latex, n—*in building construction*, a compound that cures primarily through water evaporation. **C 717, C24**

sealant, non-sag, n—*in building construction*, a compound that exhibits little or no flow when applied in vertical or inverted joints. **C 717, C24**

sealant, precured, n—*in building construction*, a preformed, factory cured elastomeric material that when adhered to a joint forms a seal. **C 717, C24**

sealant, preshimmied, n—*in building construction*, a sealant having encapsulated therein solids or discrete particles that limit its deformation within a joint under compression. **C 717, C24**

sealant, preshimmied tape, n—*in building construction*, a preshimmied sealant in tape sealant form. **C 717, C24**

sealant-sealed seam finish, n—*in home sewing*, a seam finish in which a clear liquid seam-sealant is used as the treatment to prevent fraying. **D 123, D13**

sealant-sealed seam finish, n—*in home sewing*, a seam finish in which a clear liquid seam-sealant is used as the treatment to prevent fraying. **D 4965, D13**

sealant, self-leveling, n—*in building construction*, a compound that exhibits flow sufficient to seek gravitational leveling. **C 717, C24**

sealant, silicone, n—*in building construction*, a liquid-applied curing compound based on polymer(s) of polysiloxane structures. **C 717, C24**

sealant, solvent-release, n—*in building construction*, a compound that cures primarily through solvent evaporation. **C 717, C24**

sealant, structural, n—*in building construction*, a sealant capable of transferring dynamic or static ("live" or "dead," or both) loads, or both, across joint members exposed to service environments typical for the structure involved. **C 717, C24**

sealant, tape, n—*in building construction*, a sealant having a preformed shape, and intended to be used in a joint initially under compression. **C 717, C24**

seal contamination—foreign matter in the seal area such as, but not limited to, water, grease, or food. **F 17, F02**

seal contamination—See Terminology F 17. **F 1327, F02**

seal creep—the reduction in width of a seal due to a force being exerted on it, such as a bulky product, pouch distortion, or internal air pressure. **F 1327, F02**

seal creep resistance—a measure of the ability of a sealed package or seal to remain intact when subjected to a constant force. **F 1327, F02**

sealed (anodic) coating—*in anodizing aluminum*, an anodic oxide coating on aluminum that has been treated in an aqueous or steam medium resulting in reduced porosity of the coating. **B 374, B08**

sealer, n—a liquid composition to prevent excessive absorption of finish coats into porous surfaces; also a composition to prevent bleeding (see **size**). **D 16, D01**

sealing—permanent joining by heating an interface to reduce the viscosity of glass(es) for geometrical accommodation and bonding. **C 162, C14**

sealing, absolute—See **absolute sealing**. **E 1749, E06**

sealing blade—See **blade clincher**. **F 592, F16**

sealing element—a separate or bonded material between the sleeve and the pipe that forms a seal. **C 896, C04**

sealing glass—a glass with special thermal expansion characteristics intended for sealing to another glass or solid. **C 162, C14**

sealing material, n—See **seal**. **C 717, C24**

sealing of anodic coating—a process which, by absorption, chemical reaction, or other mechanism, increases the resistance of an anodic coating to staining and corrosion, improves the durability of colors produced in the coating, or imparts other desirable properties. **B 374, B08**

sealing surface—that portion of the finish of a glass container which makes contact with the sealing gasket or liner. See **finish**. **C 162, C14**

sealing tape—See **sealant, tape**. **C 717, C24**

seal (mechanical), n—any material or device that prevents or controls the passage of matter across the separable members of a mechanical assembly. **D 1566, D11**

seal, O-ring, n—a product of precise dimensions molded in one piece to the configuration of a torus with circular cross section, suitable for use in a machined groove for static or dynamic service. **D 1566, D11**

seal plane—all surfaces of a shelter that establish seal continuity and are in immediate contact with the environment.

sealed insulating glass—See **windows and doors**.

sealed insulating glass unit—a preassembled unit, comprising sealed panes of glass separated by dehydrated space(s), intended for vision areas of buildings. The unit is normally used for windows, window walls, picture windows, sliding doors, patio doors, or other types of windows or doors. **E 631, E06**

seal plane—all surfaces of a shelter that establish seal continuity and are in immediate contact with the environment. **E 1749, E06**

seal strength—a measure of the mechanical strength of the bond between sealed materials of a package. **F 1327, F02**

seam, n—*in wire*, a longitudinal discontinuity that extends radially into the wire from its surface. **A 902, A05**

seam—a naturally filled or bonded crack which does not adversely affect the strength of a stone (see **crack, fracture, microcrack**). **C 119, C18**

seam, n—a mark on a glass surface resulting from the joint between matching mold parts. **C 162, C14**

seam, v—to slightly grind the sharp edges of a piece of glass. **C 162, C14**

seam, n—a line where two or more fabrics are joined, usually near the edge. (Syn. **joining line**. See also **sewn seam, glued seam, stapled seam, thermallybonded seam**.) **D 123, D13**

seam—See **container**. **D 996, D10**

seam, n—a permanent joining of two or more materials. **D 4439, D35**

seam, n—the connection of two or more pieces of material by mechanical, chemical, or fusion methods to provide the integrity of a single piece of the material. **D 4439, D35**

seam, n—*in homesewing*, a line along which two or more sections of

a product have been joined. (Syn. *joining line*. See also **glued seam, sewn seam, stapled seam, thermally bonded seam.**)
D 4965, D13

seam—an unwelded fold or lap on the surface of a metal which appears as a crack, usually the result of defects in casting or working which have not welded shut.
E 7, E04

seam—a noncontinuous joint of two or more surfaces of sheet material such as made by stitching, spot adhesions, or intermittent fusion.
F 17, F02

seam—See Terminology F 17.
F 1327, F02

seam—straight or smooth curved line surface discontinuity running longitudinally on the fastener thread, shank, and head. **F 1789, F16**

seam allowance, n—*in sewn fabrics*, the distance from the edge of a fabric to the parallel stitch line furthest from that edge.
D 123, D13

seam allowance, n—the width of fabric used in making a seam assembly, bounded by the edge of the fabric and the furthest stitch line.
D 4439, D35

seam allowance, n—*in sewn materials*, the width of material between the cut edge of a fabric section and the line parallel to the cut edge along which that section will be joined to another section during assembly of the finished product.
D 4965, D13

seam assembly, n—the composite structure obtained when fabric(s) are joined by means of a seam.
D 123, D13

seam assembly, n—the unit obtained by joining fabrics with a seam, including details such as fabric direction(s), seam allowance, sewing threads used, and number of stitches per unit length; and sometimes additional details of fabrication such as sewing-machine type and speed, needle type and size, etc. **D 4439, D35**

seam damage, n—*in sewn fabrics*, an adverse change in the physical condition of one or more of the components in a seam which would reduce the seam acceptability such as yarn slippage, needle damage, or fabric rupture.
D 123, D13

seam damage, n—*in sewn fabrics*, any change in the physical condition of one or more of the components in a seam which reduces seam efficiency.
D 123, D13

seam design engineering, n—the procedures used to select a specific thread, a specific stitch type, and a specific seam type to achieve the required seam strength.
D 4439, D35

seam efficiency, n—*in sewn fabrics*, the ratio of seam strength to fabric strength.
D 123, D13

seam efficiency, sewn, n—*in sewn fabrics*, the ratio expressed as a percentage of seam strength to fabric strength.
D 4439, D35

seam engineering, n—*in sewn fabrics*, the procedures used to select a specific combination of sewing thread, stitch type, seam type, and stitch density to achieve the maximum sewn seam strength for a particular fabric type.
D 123, D13

seam failure, n—*in sewn fabrics*, that point at which an external force (1) ruptures the sewing thread, (2) ruptures the fabric, (3) causes excessive yarn slippage adjacent to the stitches, or (4) causes any combination of these unacceptable conditions.
D 123, D13

seam-finish, n—a treatment of the raw fabric edges of the seam allowance in a plain seam.
D 123, D13

seam finish, n—*in home sewing*, a treatment of the fabric cut edges of the seam allowance in a plain seam.
D 4965, D13

seam interaction, n—*in sewn fabrics*, the net effect of the relationship between the combination of fabric, seam type, stitch type, and stitch density on seam efficiency.
D 123, D13

seam interaction, n—the result of combining a specific textile, a specific stitch type, and a specific seam type.
D 4439, D35

seamless pipe, n—a round, hollow product made with a continuous periphery in all stages of manufacture and produced to the particular dimensions commercially known as standard pipe sizes.
B 899, B02

seam mark, n—*in unfinished cloth*, a pressure mark caused by the thickness of the seam being pressed against the cloth. **D 123, D13**

seam mark, n—*in unfinished cloth*, a pressure mark caused by the thickness of the seam being pressed against the cloth. **D 3990, D13**

seam moisture, n—synonym for *inherent moisture*. **D 121, D05**

seam slippage, n—*in sewn fabrics*, the displacement of the fabric yarn parallel and adjacent to the stitch line.
D 123, D13

seam type, n—*in sewn fabrics*, an alphanumeric designation relating to the essential characteristics of fabric positioning and rows of stitching in a specified sewn fabric seam.
D 123, D13

seam type, n—*in sewn fabrics*, an alphanumeric designation relating to the essential characteristics of fabric positioning and rows of stitching in a specific sewn fabric seam (see Federal Standard 751).
D 4439, D35

search-gas—Same as **tracer gas**.
E 1316, E07

search unit—an electro-acoustic device used to transmit or receive ultrasonic energy, or both. The device generally consists of a nameplate, connector, case, backing, piezoelectric element, wearface, or lens, or wedge.
E 1316, E07

seasonal freezing index—the cumulative number of degree-days below 0°C, calculated as the arithmetic sum of all the negative and positive mean daily air temperatures (degrees C) for a specific station during the period between the highest point in the fall and the lowest point the following spring, on the cumulative degree-day time curve.
D 7099, D18

seasonal frost—(1) seasonal temperatures causing frost that affect earth materials and keep these frozen only during the winter; (2) the occurrence of ground temperatures below 0°C for only part of the year.
D 7099, D18

seasonally-active permafrost—the uppermost layer of the permafrost which undergoes seasonal phase changes due to the lowered thawing temperature and freezing-point depression of its pore water.
D 7099, D18

seasonally frozen ground—ground that freezes annually.
D 7099, D18

seasonally frozen layer—the “active layer” in areas without permafrost.
D 7099, D18

seasonally thawed ground—ground that thaws annually.
D 7099, D18

seasonally thawed layer—the “active layer” in areas of permafrost.
D 7099, D18

seasonal thawing index—the cumulative number of degree-days above 0°C, calculated as the arithmetic sum of all the positive and negative mean daily air temperatures (degrees C) for a specific station during the period between the lowest point in the spring and the highest point the following fall, on the cumulative degree-day time curve.
D 7099, D18

season cracking—See **stress-corrosion cracking**.
G 15, G01

seasoning—drying; the term often applied to the process of removing moisture from wood to achieve a moisture content appropriate for the performance expected of the final product.

air-dried—dried by exposure to air, usually in a yard, without artificial heat.

dry—seasoned; in softwood lumber, the abbreviation S-Dry means not in excess of 19 % moisture content at time of surfacing, in accordance with recognized standards.

kiln-dried—dried in a closed chamber in which temperature and relative humidity of the circulated air can be controlled. The drying temperature is usually greater than outside air temperature. In softwood lumber grading rules under the jurisdiction of the Southern Pine Inspection Bureau, the abbreviation KD indicates seasoned in a kiln to a moisture content not in excess of 15 % moisture content.

ovendry—dried in an oven to remove all moisture. The temperature employed usually is 101 to 105°C or 214 to 221°F in accordance with ASTM Methods D 2016 Test for Moisture Content of Wood.

shipping-dry—dried to a moisture content judged low enough to prevent stain, mold, and decay in transit.
D 9, D07

seat—prepared position on the siege where the pot rests. **C 162, C14**

sea water—water with an approximate concentration of total dissolved solids ranging from 30 000 to 60 000 mg/L. See **brackish water**, **high brackish water**. **D 6161**, D19

secant modules, *n*—depreciated term in textile terminology. Use the preferred term *chord modulus*. **D 4848**, D13

secant modulus—See **modulus**, **secant**. **C 717**, C24

secant modulus—the slope of a line drawn from the origin to any specified point on the stress-strain curve. **C 904**, C03

secant modulus—slope of the line connecting the origin and a given point on the stress-strain curve. (ISRM) **D 653**, D18

secant modulus, *n*—the slope of the secant drawn from the origin to any specified point on the stress-strain curve. **D 907**, D14

secant modulus, *n*—the ratio of stress (nominal) to corresponding strain at any specified point on the stress-strain curve. **D 4439**, D35

secant modulus, J_{sec} , (FL^{-1}) , Nm^{-1} , *n*—for *geosynthetics*, the ratio of change in force per unit width to the change in elongation between two points on a force-elongation curve. **D 4439**, D35

secondary accelerator, *n*—accelerator used in smaller concentrations compared to the primary accelerator, to achieve a faster rate of vulcanization. **D 1566**, D11

secondary atomization, *n*—the disintegration of unstable drops or liquid fragments resulting from primary atomization to produce stable drops. **E 1620**, E29

secondary backing, *n*—for *pile yarn floor covering*, a suitable material adhered to or adhered to the underside of the primary backing fabric. **D 123**, D13

secondary backing, *n*—for *pile yarn floor covering*, a suitable material attached to or adhered to the underside of the primary backing fabric. **D 5684**, D13

secondary bonding—the joining together, by the process of adhesive bonding, of two or more cured composite parts, during which the only chemical (or thermal) reaction taking place is the curing of the adhesive itself.

secondary circulation area—See **building space**. **E 631**, E06

secondary bonding—the joining together, by the process of adhesive bonding, of two or more cured composite parts, during which the only chemical (or thermal) reaction taking place is the curing of the adhesive itself. **E 1749**, E06

secondary circulation area—portion of building area not defined as **primary circulation area**, but required for access to some subdivision of space, whether or not bounded by **walls**. **E 631**, E06

secondary circulation area—See **space categories**. **E 631**, E06

secondary circulation area—See **space categories**. **E 1480**, E06

secondary clay (sedimentary clay)—a clay that has been geologically transported from its place of formation. **C 242**, C21

secondary (concerning X-rays)—the X-rays emitted by a specimen irradiated by a primary beam. **E 7**, E04

secondary consolidation (secondary compression) (secondary time effect)—see **consolidation**. **D 653**, D18

secondary container—a container which encloses one or more primary containers. **D 996**, D10

secondary electrons—*AES*, electrons leaving a surface, produced through various mechanisms of energy transfer from the incident beam. By convention, electrons with energies ≤ 50 eV are considered as secondary electrons. **E 673**, E42

secondary extinction—a decrease in the intensity of a diffracted X-ray beam caused by parallelism or near-parallelism of mosaic blocks in a mosaic crystal; the lower blocks are partially screened from the incident radiation by the upper blocks, which have reflected some of it. **E 7**, E04

secondary filter pack—a clean, uniformly graded sand that is placed in the annulus between the primary filter pack and the overlying seal, or between the seal and overlying grout backfill, or both, to prevent movement of seal or grout, of both, into the primary filter pack. **D 653**, D18

secondary flow-rate standard—See **standard**. **D 1356**, D22

secondary hardening, *n*—the hardening phenomenon that occurs during high-temperature **tempering** of certain **steels** containing one or more carbide-forming alloying elements. **A 941**, A01

secondary healing, *n*—healing by second intention. **F 2312**, F04

secondary hole—in *grouting*, the second series of holes to be drilled and grouted usually spaced midway between primary holes. **D 653**, D18

secondary image—the image resulting from internal reflections of light rays at the surfaces of the transparency. **F 2429**, F07

secondary ion—ions ejected from a specimen surface as a result of energy transfer from a primary beam.

angular distribution—*SIMS*, the secondary ion yield as a function of emission angle.

energy distribution—the number of secondary ions as a function of the energy at a specified collection angle.

signal gating—the process of accepting secondary ion signal from only a portion of the sputtered area of the specimen to minimize crater edge effects.

yield—the total number of ions sputtered from the specimen per incident ion of given mass, energy, charge, and angle of incidence. **E 673**, E42

secondary light source, *n*—surface or object that is not self-emitting but receives light and re-directs it, at least in part, by reflection or transmission. **E 284**, E12

secondary lining—the second-placed, or permanent, structural lining of a tunnel, which may be of concrete, steel, or masonry. (ISRM) **D 653**, D18

secondary manufacturer—any entity, including the original manufacturer, that alters the fastener. **F 1789**, F16

secondary material, *n*—fragments or finished products or leftovers from a manufacturing process which converts a primary material into a commodity of economic value. **D 5681**, D34

secondary photovoltaic reference cell, *n*—a photovoltaic reference cell calibrated against a primary reference cell. **E 1328**, E44

secondary processing—process that is performed to a fastener in order to add further value, such as drilling, assembly with other fastener components, lubricating, coating, and machining. This product may already be tested (or certified when applicable, or both) in compliance with a given standard. **F 1789**, F16

secondary protective clothing—protective clothing designed for continuous wear for work activities in designated locations in which intermittent exposure to molten substance splash, radiant heat, and flame sources is possible. **F 1494**, F23

secondary radiation—radiation emitted by any substance as the result of irradiation by the primary source. **E 1316**, E07

secondary road, *n*—two lane, occasionally maintained, hard or loose surface (for example, large rock, paved crush rock, gravel, soil aggregate) intended for medium-weight, low-density traffic, in accordance with the U.S. Federal Highway Administration. **F 538**, F09

secondary seal—a seal that alone cannot provide a dependable absolute seal. **E 631**, E06

secondary seal—a seal that alone cannot provide a dependable absolute seal. **E 1749**, E06

secondary sources (of lead)—sources of lead exposure other than lead-based paint.

SEL—see **substrate equivalent lead concentration**.

semi-detached dwelling—See **dwelling**. **E 631**, E06

secondary standard, *n*—a standard calibrated by reference to another standard, such as a primary standard. Often, a secondary standard is prepared from typical production-type material. **C 1145**, C28

secondary standard—See **standard**. **D 1356**, D22

secondary standard, *n*—standard calibrated by reference to another standard such as a primary, reference, laboratory, or working standard. **D 2946**, C17

secondary standard thermocouple, *n*—a thermocouple that has had

- its temperature-emf relationship determined by reference to a primary standard of temperature. **E 344, E20**
- secondary state of stress**—the resulting state of stress in the rock around man-made excavations or structures. (ISRM) **D 653, D18**
- secondary wound closure, *n***—wound closure for healing by second intention. **F 2312, F04**
- secondary X rays, *n***—the X rays emitted by a specimen irradiated by primary X rays. **E 135, E01**
- second growth**—timber that has grown after the removal, whether by cutting, fire, wind, or other agency, of all or a large part of the previous stand. Often limited to that growth following removal of old-growth timber. **D 9, D07**
- second-hand filling material, *n***—an industry product which contains any filling material which has previously been used should not be offered for sale unless a clear and conspicuous disclosure of that fact is made on the label thereof and in all advertising and invoices relating to such product. **D 123, D13**
- second-hand filling material, *n***—an industry product which contains any filling material which has previously been used should not be offered for sale unless a clear and conspicuous disclosure of that fact is made on the label thereof and in all advertising and invoices relating to such product. **D 7022, D13**
- second side**—{archaic} the final side of plate glass to be ground and polished. **C 162, C14**
- section**—in a phase diagram, a planar cut through a space diagram; sections are commonly isotherms, isobars or isopleths. **E 7, E04**
- sectioned tire, *n***—a tire that has been cut into at least two parts. **D 5681, D34**
- section height [*L*], *n***—the radial height of a tire section, expressed as one half the difference between the outside diameter of the unloaded tire and the nominal rim diameter; the outside diameter is measured on a tire-wheel assembly with the tire inflated to rated inflation pressure. **F 538, F09**
- section mark, *n***—*in woven fabrics*, warp bands of different color, texture, or luster. **D 123, D13**
- section mark, *n***—*in woven fabrics*, warp bands of different color, texture, or luster. **D 3990, D13**
- section width, *n***—the width of a new tire, including 24-h inflation growth and including normal sidewalls, but not including protective side ribs, bars, or decorations. **F 538, F09**
- sedigraph, *n***—an instrument for determining the particle size distribution of a particulate solid, making use of a physical relation between rate of settling (sedimentation) in a liquid and the particle size. **C 1145, C28**
- sediment**—See **fluvial sediment**. **D 4410, D19**
- sediment**—(1) particulate material that usually lies below water, and (2) formulated particulate material that is intended to lie below water in a test. **E 943, E47**
- sedimentation**—(a) consists of five fundamental processes: (1) weathering, (2) erosion, (3) transportation, (4) deposition, and (5) diagenesis, or consolidation into rock; (b) deposition of particles, especially in engineering. **D 4410, D19**
- sedimentation**—the precipitation or settling of insoluble materials from a suspension, either by gravity or artificially. For example, centrifuge, pressure. **D 6161, D19**
- sedimentation, *n***—gravitational settling of solid particles in a liquid system. **E 2201, E50**
- sediment basin**—a structure created by construction of a barrier or small dam-like structure across a waterway or by excavating a basin or a combination of both to trap or restrain sediment. **D 653, D18**
- sediment delivery**—See **sediment yield**. **D 4410, D19**
- sediment delivery ratio**—the ratio of sediment yield to gross erosion expressed in percent. **D 4410, D19**
- sediment discharge**—the mass or volume of sediment passing a stream cross section in a unit of time. (The term may be qualified as suspended-sediment discharge, bedload discharge or total-sediment discharge.) **D 4410, D19**
- sediment load**—a general term that refers to material in suspension or in transport, or both; it is not synonymous with either discharge or concentration. (See **bed-load** and **suspended-sediment load**.) **D 4410, D19**
- sedimentology**—the scientific study of sediment, sedimentary rocks, and the processes by which they were formed. **D 4410, D19**
- sediment particle**—fragment of mineral or organic material in either a singular or aggregate state. **D 4410, D19**
- sediment sample**—a quantity of water-sediment mixture or deposited sediment that is collected to represent some property or properties of the sampled medium. **D 4410, D19**
- sediment sump**—a blank extension beneath the well screen used to collect fine-grained material from the filter pack and adjacent strata. The term is synonymous with rat trap or tail pipe. **D 653, D18**
- sediment transport rate**—See **sediment discharge**. **D 4410, D19**
- Seebeck coefficient, *n***—the rate of change of thermal emf with temperature at a given temperature, normally expressed as emf per unit of temperature. (Same as **thermoelectricpower**). **E 344, E20**
- Seebeck emf, *n***—the net emf set up in a thermocouple under condition of zero current. It represents the algebraic sum of the Peltier and Thomson emf. (Same as **thermal electromotive force**). **E 344, E20**
- seed**—a relatively small gaseous inclusion in glass. **C 162, C14**
- seed coat fragment, *n***—*in cotton*, a portion of a cotton seed, usually black or dark brown in color, broken from a mature or immature seed, and to which fibers and linters may or may not be attached. **D 123, D13**
- seed coat fragment, *n***—*in cotton*, a portion of a cotton seed, usually black or dark brown in color, broken from a mature or immature seed, and to which fibers and linters may or may not be attached. **D 7139, D13**
- seed cotton, *n***—cotton, as harvested and before ginning, consisting of seeds with the fibers attached and usually including measurable amounts of foreign matter. **D 123, D13**
- seed cotton, *n***—cotton, as harvested and before ginning, consisting of seeds with the fibers attached and usually including measurable amounts of foreign matter. **D 7139, D13**
- seep**—a small area where water oozes from the soil or rock. **D 653, D18**
- seepage**—the infiltration or percolation of water through rock or soil to or from the surface. The term seepage is usually restricted to the very slow movement of ground water. (ISRM) **D 653, D18**
- seepage face, *n***—a boundary between the saturated flow field and the atmosphere along which a subsurface liquid discharges, either by evaporation or movement “downhill” along the land surface or in a well as a thin film in response to the force of gravity. **D 653, D18**
- seepage force**—the frictional drag of water flowing through voids or interstices in rock, causing an increase in the intergranular pressure, that is, the hydraulic force per unit volume of rock or soil which results from the flow of water and which acts in the direction of flow. (ISRM) **D 653, D18**
- seepage force, *J* (F)**—the force transmitted to the soil or rock grains by seepage. **D 653, D18**
- seepage line**—see **line of seepage**. **D 653, D18**
- seepage line, *n***—the uppermost level at which a flowing liquid emerges along a seepage face. **D 653, D18**
- seepage (percolation)**—the slow movement of gravitational water through the soil or rock. **D 653, D18**
- seepage velocity, V_e , $V_1(LT^{-1})$** —the rate of discharge of seepage water through a porous medium per unit area of void space perpendicular to the direction of flow. **D 653, D18**
- segmental testing**—a method of isolating and testing portions of an installed pipeline to determine the location of an air loss in excess of the standard. **C 896, C04**
- segment die, *n***—a die fabricated by the assembly of several die sections within a retaining bolster or shrinkage ring. **B 243, B09**

segmented testing

segmented testing—a method of testing vitrified clay pipe using segmented bearings as detailed in Test Method C 301. **C 896, C04**

segregated ice—ice formed by the migration of pore water to the freezing plane where it forms into discreet lenses, layers, or seams, ranging in thickness from hairline to greater than 10 m (32 ft). The ice is formed by **ice segregation**. **D 7099, D18**

segregation, n—the separation of one or more constituents of a powder, for example, by particle size or chemical composition. **B 243, B09**

segregation, n—the unintentional separation of the constituents of concrete or particles of an aggregate, causing a lack of uniformity in their distribution. **C 125, C09**

segregation—*in grouting*, the differential concentration of the components of mixed grout, resulting in nonuniform proportions in the mass. **D 653, D18**

segregation—concentration of alloying elements in specific regions in a metallic object. **E 7, E04**

segregation potential—the ratio of the rate of moisture migration to the temperature gradient in a frozen soil, near the 0°C isotherm. **D 7099, D18**

seismic support—mass (heavy) supported on springs (weak) so that mass remains almost at rest when free end of springs is subjected to sinusoidal motion at operating frequency. **D 653, D18**

seismic test—test that applies load cycles of varying magnitude and frequency to an anchorage system for the purpose of simulating a seismic event (earthquake). **E 2265, E06**

seismic velocity—the velocity of seismic waves in geological formations. (ISRM) **D 653, D18**

seismometer—instrument to pick up linear (vertical, horizontal) or rotational displacement, velocity, or acceleration. **D 653, D18**

seizure, n—*in lubrication*, welding between surfaces in relative motion that results in immobilization of the parts. **D 4175, D02**

seizure or welding, n—localized fusion of rubbing metal, usually indicated by streaks of transferred metal, increased friction and wear, or unusual noise and vibration. **D 4175, D02**

SEL—see **substrate equivalent lead concentration**. **E 1605, E06**

selected area aperture—*SIMS*, the mechanical equivalent of electronic signal gating, commonly used in stigmatic mass spectrometers. **E 673, E42**

selected material—finely divided material free of debris, organic material, and large stones. **C 896, C04**

selective heating, n—intentionally heating only certain portions of a steel object. **A 941, A01**

selective ion meter—an instrument that measures the potential of pH and ion-selective electrodes and displays it directly in concentration or activity units, such as pH, moles per litre, or milligrams per litre, on a logarithmic scale. Millivolt scales are provided for titrations and to verify proper electrode operation. **D 4127, D19**

selective membrane skin—region, often located at the upstream face of an asymmetric membrane that forms a thin distinguishable layer primarily responsible for determining the permeability of the asymmetric membrane. **D 6161, D19**

selective quenching, n—**quenching** only certain portions of a steel object. **A 941, A01**

selective radiator, n—radiator whose spectral emissivity depends on the wavelength over the range considered. **E 349, E21**

selective surface—a surface for which the spectral optical properties reflectance, absorptance, emittance, or transmittance vary significantly with wavelength, which enhances the collection (or rejection) of radiant energy in a restricted portion of the spectrum.

NOTE—An example of a selective surface would be a collector cover glazing that has a high transmittance over the solar spectrum (300 to 2500 nm) and high reflectance over the spectral region of principal thermal infrared emission from the absorber. **E 772, E44**

selectivity—the ability to accurately measure the analyte in the presence of other sample matrix components or analytical process contaminants. **D 5681, D34**

selectivity—the characteristic of a test system that is a measure of the

extent to which an instrument is capable of differentiating between the desired signal and disturbances of other frequencies or phases. **E 1316, E07**

selectivity, n—Qualitative – the extent to which other substances interfere with the determination of a substance according to a given procedure. **E 1732, E30**

selectivity—the ability to accurately and specifically measure the analyte in the presence of components that may be expected to be present in the test specimen. **E 2161, E37**

selectivity constant—a measure of a liquid ion exchange or glass electrode's response to an interfering ion compared to its response to the ion being measured. The smaller the selectivity constant, the greater the electrode's preference for the ion being measured. The principal use of selectivity constants is in determining whether an electrode can be used in a particular application. Since selectivity constants vary somewhat with the ratio of the two ions, they should not be used to correct for errors caused by interferences. The term *selectivity constant* is sometimes mistakenly applied to solid-state electrodes (that are based on solubility product) to indicate the maximum allowable ratio of interference to ion being measured. Unlike liquid and glass electrodes, solid-state electrodes exhibit an *all-or-nothing* response to an interference, with no interference as long as the critical ratio is not exceeded. **D 4127, D19**

selenide-type inclusions—See **sulfide-type inclusions**. **E 7, E04**

self-absorption, n—*in atomic emission spectrometry*, the reduction in relative intensity in the central portion of spectral lines resulting from selective absorption by the cooler outer vapor of the source envelope of radiation emitted by the hot central core. **E 135, E01**

self-balancing potentiometer—See **potentiometer**. **E 7, E04**

self belay, n—a technique of self protection employed by a climber using climbing and mountaineering equipment. **F 1773, F08**

self-biased gun—an electron gun in which the cathode cap is biased with respect to the filament by means of a bias resistor through which the emission current flows between the filament and cap. This type of gun provides high intensity at low angular apertures. (See **biased gun, unbiased gun, saturated gun**.) **E 7, E04**

self-bound seam-finish, n—a finish for the raw edges of the seam allowances of a plain seam, in which one seam allowance encloses both raw edges. **D 123, D13**

self-bound seam finish, n—*in home sewing*, a seam finish in which one seam allowance encloses both cut edges. **D 4965, D13**

self-cementing coal fly ash, n—see **ceementitious ash**. **E 2201, E50**

self-checking bar code, n—a bar code that will not permit a single printing defect to be interpreted as a valid character within the symbology algorithm. **F 1294, F05**

self-clinching—term applied to nail with point or shank designed in such a way that nail clinches automatically while fully driven. **F 547, F16**

self-clocking, n—a bar code symbol designed to be read with a single aperture reader over a range of velocities, with allowances included for change in velocity after reading has commenced. **F 1294, F05**

self-contained chemical paper—a sheet that has two materials added during the paper manufacturing process or coated on the formed sheet, that react under pressure to form a visible image. **F 549, F05**

self-contained mechanical paper—a sheet that has a pigmented substrate that becomes apparent when a surface coating is rendered transparent by application of pressure. **F 549, F05**

self-curing, adj—see **self-vulcanizing**. **D 907, D14**

self-damping conductor—a conductor with internal vibration damping properties which will protect itself from damaging strains caused by aeolian vibration. **B 354, B01**

self-extinguishing, adj—not defined; the Board of Directors of ASTM has ruled that the term "self-extinguishing" shall not be used in ASTM standards. It has no meaning except in association with a specific test method or specific conditions of burning. **D 123, D13**

self-extinguishing, n—not defined. The Board of Directors of ASTM has ruled that the term "self-extinguishing" shall not be used in

- ASTM standards. It has no meaning except in association with a specific test method or specific conditions of burning. **D 4391**, D13
- self-flow**, *n*—the characteristic of a refractory castable to flow readily under its own weight without showing signs of segregation or separation. **C 71**, C08
- self-furring nail**—galvanized, regular-stock-steel, 1¼ to 2 ½ by 0.106-in. nails with ⅜-in. flat head, medium diamond point, and washer or spacer on shank; for fastening reinforcing wire mesh and spacing it from nailing member. **F 547**, F16
- self heating**, *n*—a rise in the temperature of a material, assemblage, or product caused by internal, exothermic chemical reaction. **E 176**, E05
- self-heating**, *n*—the change in temperature of the element caused by the heating effect of the excitation. **E 344**, E20
- self-heating**, *n*—the increase in the temperature of the thermometer element caused by the electric power dissipated in the element, the magnitude depending upon the thermometer current and heat conduction from the thermometer element to the surrounding medium. **E 344**, E20
- self-heating error**, *n*—the error caused by variations from the calibration conditions in the self-heating of the thermometer element at a given current, arising from the variations in the heat conduction from the thermometer to the surrounding medium. **E 344**, E20
- self ignition*, *n*—See **spontaneous ignition**, the preferred term. **E 176**, E05
- self-inflating**—boom that automatically inflates as it is deployed. **F 818**, F20
- self-limiting powder porcelain**—the maximum thickness of electrostatically-charged powder that can be deposited as a surface film. **C 286**, B08
- self-noise**, *n*—extraneous non-acoustical signals, generated or induced in a measurement system. **C 634**, E33
- self-polishing-type floor polish**—a floor polish that dries to a shine. **D 2825**, D21
- self-propagation of flame**, *n*—propagation of a flame front after the removal of any applied energy source. **E 176**, E05
- self-quenching**, *n*—in luminescence, the reduction of luminescence through the depletion of an excited atomic or molecular entity by interaction with another entity of the same species in the ground state. **E 131**, E13
- self-reversal**, *n*—in *atomic emission spectrometry*, the extreme case of self-absorption in which intensity decreases with increasing concentration. **E 135**, E01
- self-sealing fastener**—a fastener that provides a tight seal without the need for sealant material nor the use of a mechanical seal (for example, an interference fit fastener). **E 631**, E06
- self-spreading**—term applied to nail with split shank designed in such a way that two or more legs penetrate material in divergent directions. **F 547**, F16
- self-stressing grout**—expansive-cement grout in which the expansion induces compressive stress in grout if the expansion movement is restrained. **D 653**, D18
- self-supporting specimen**, *n*—a specimen that remains in place by its own structural characteristics both before and during the fire test. **E 176**, E05
- self-sustained combustion**, *n*—combustion that consumes a sample to the point at which the sample holder affects further combustion, assuming sufficient oxidizer. **G 126**, G04
- self-sustaining discharge**—a discharge in which all carriers necessary for the transport of current in the discharge are produced by this discharge itself. **B 542**, B02
- self-vulcanizing**, *adj*—pertaining to an adhesive that undergoes vulcanization without the application of heat. (See also **vulcanization**, *n*.) **D 907**, D14
- self-weighted bottom camber**, H_b —the height of the running surface from a plane surface, measured at the highest point, with only the influence of the snowboard weight. **F 1107**, F27
- selvage**, *n*—the woven edge portion of a fabric parallel to the warp. **D 123**, D13
- selvage**—an edge or edging which differs from the main part of: (1) a fabric; or (2) granule-surfaced roll roofing. **D 1079**, D08
- selvage**, *n*—the woven edge portion of a fabric parallel to the warp. **D 3878**, D30
- selvage**, *n*—the woven edge portion of a fabric parallel to the warp. **D 4439**, D35
- selvage**, *n*—the woven edge portion of a fabric parallel to the warp. **D 4850**, D13
- selvage**—the edge finish on woven chain link fabric joining pairs of pickets. The selvage may be knuckled or twisted. **F 552**, F14
- selvage mark**, *n*—in *finished cloth*, a lengthwise crease mark along the selvage caused by an edge being folded or doubled. **D 123**, D13
- selvage mark**, *n*—in *finished cloth*, a lengthwise crease mark along the selvage caused by an edge being folded or doubled. **D 3990**, D13
- semianthracite*—See *semianthracite* under **rank**. **D 121**, D05
- semiachromatic objective**—a compromise, in the correction for chromatic and spherical aberration, between achromatic and apochromatic objectives; frequently called fluorite objectives. **E 7**, E04
- semiachromatic objective lens**—an objective lens with both longitudinal and spherical chromatic correction for green and blue. Should be used with green or blue filters. **E 7**, E04
- semiautomatic image analyzer**—a device which can detect and measure features of interest in an image but requires the operator to perform feature discrimination. **E 7**, E04
- semi-autonomous**, *adj*—mode of control of a UAV where the pilot executes changes and conducts the mission through a flight management system interface. Without this input, the UAV will perform pre-programmed automatic operations. This can, but might not, include some fully autonomous functions (like takeoff, landing, and collision avoidance). **F 2395**, F38
- semichemical pulp**, *n*—fibrous material obtained by treating wood or other plant material with a combination of chemical and mechanical processes, such as chemimechanical pulp (CMP), chemithermomechanical pulp (CTMP), bleached chemithermomechanical pulp (BCTMP), and neutral sulfite semichemical pulp (NSSC). (See **chemical pulp** and **mechanical pulp**.) **D 1968**, D06
- semicontinuous activated sludge**, SCAS—a term used to designate a test procedure described in Test Method D 2667 that is used to confirm determinations of the degree of biodegradability of alkylbenzene sulfonates. **D 459**, D12
- semicontinuous-conveyance furnace**, *n*—a heating device through which steel objects are intentionally moved in accordance with a predetermined start-stop-start pattern during the thermal processing cycle. **A 941**, A01
- semi-detached dwelling**—one of a group of **dwelling units** joined by a common sidewall and occasionally by a garage, carport, or similar structure. **E 631**, E06
- semidrying oil**, *n*—an oil that possesses the characteristics of a drying oil but to a lesser degree. There is no definite line of demarcation between drying and semidrying oils. **D 16**, D01
- semi-efficient vulcanizing (semi-EV) system**, *n*—as applied to natural rubber and isoprene- and butadiene-based synthetic rubbers, a vulcanizing system having sulfur and accelerator concentrations between those of a conventional sulfur vulcanizing system and an EV system. **D 1566**, D11
- semifusinite*—See *semifusinite* under **maceral**. **D 121**, D05
- semi-guided bend**, *n*—the bend obtained by applying a force directly to the specimen in the portion that is to be bent. **E 6**, E28
- semikilled steel**, *n*—an incompletely deoxidized steel that contained sufficient oxygen to form enough entrapped carbon monoxide during solidification to offset solidification shrinkage. **A 941**, A01
- semi-major axis**, **a**—one-half the length of the long axis of an ellipse. For a circle, this distance is simply the radius. **D 5681**, D34

semi-mat glaze—See *semi-mat glaze* under **glaze**. C 242, C21

semi-minor axis, b—one-half the length of the short axis of an ellipse. D 5681, D34

semi-muffle furnace—a furnace with a partial muffle, in which the products of a combustion come in contact with the ware. C 286, B08

semi-permanent mold casting, n—mold casting that is made with an expendable core such as sand. B 899, B02

semipermeable membrane—a membrane which preferentially allows the passage of specific compounds while rejecting others. D 6161, D19

semi-porcelain—a trade term designating semivitreous dinnerware. C 242, C21

semiquantitative screen—an analysis run that is performed on highly diluted sample digestates for the purpose of determining the approximate analyte level in the digest. This analysis run is generally performed without inserting instrumental QC standards except for calibration standards. Data from this run are used for determining serial dilution requirements for sample digestates to keep them within the linear range of the instrument. E 631, E06

semi-restraint, adj—of or relating to a method of mounting that allows an object a limited degree of movement (for example, contraction or expansion of a fabric). D 123, D13

semirigid plastic, n—for purposes of general classification, a plastic that has a modulus of elasticity either in flexure or in tension of between 70 and 700 MPa (10 000 and 100 000 psi) at 23°C and 50 % relative humidity when tested in accordance with Test Method D 747, Test Methods D 790, Test Method D 638, or Test Methods D 882. D 883, D20

semirigid plastic, n—for the purposes of general classification, a plastic that has a modulus of elasticity either in flexure or in tension of between 70 and 700 MPa (10 000 and 100 000 psi) at 23°C and 50% relative humidity when tested in accordance with Test Methods D 638, D 747, D 790, or D 882. (D20) F 412, F17

semirigid plastic—for purposes of general classification, a plastic that has a modulus of elasticity either in tension of between 70 and 700 MPa (10 000 and 100 000 psi) at 23°C and 50 % relative humidity when tested in accordance with Test Methods D 747, D 790, or D 882. F 1251, F04

semivitreous (semivitrified)—that degree of vitrification evidenced by a moderate or intermediate water absorption. C 242, C21

semivolatile organic chemical—See **organic chemical**. D 1356, D22

Senarmont (Friedel) polarimeter—an optical device for measuring relative optical retardation consisting of a light source, a polarizing filter, a retardation plate exhibiting one-quarter wave retardation with its optical axis perpendicular to the polarizing axis, and a rotatable polarizing element (the analyzer) whose angular position can be read on a scale. C 162, C14

sense-and-avoid system, S&A system, n—appliance which fulfills the requirements of 14 CFR Part 91.113. F 2395, F38

sensing circuit, n—the combination of the thermoelements and extension wires, but excluding active signal conditioning components such as reference junction compensators, amplifiers and transmitters. E 344, E20

sensitive items—items for which, regardless of value, there is a reasonable need for extraordinary security, accountability, and control. E 2135, E53

sensitive tint plate—a gypsum plate (better known as a red I or full wave plate), used with cross polarized light producing circularly polarized light. For anisotropic materials, colors are enhanced, for isotropic materials, a magenta hue is produced. E 7, E04

sensitivity, n—in *electronic systems*, the minimum change in the input signal that produces a change in the output signal that can be reliably measured. D 123, D13

sensitivity, n—in *mechanical systems*, the smallest change that can be induced on a material by the system and be reliably measured. (See also **least count**.) D 123, D13

sensitivity—the effect of remolding on the consistency of a cohesive soil. D 653, D18

sensitivity, n—in *electronic systems*, the minimum change in the input signal that produces a change in the output signal that can be reliably measured. D 4849, D13

sensitivity, n—in *mechanical systems*, the smallest change that can be induced on a material by the system and be reliably measured. (See also **least count**.) D 4849, D13

sensitivity, n—the change of instrument response with change in analyte concentration. E 135, E01

sensitivity, n—ability to perceive, identify, or differentiate one or more stimuli by means of the senses. E 253, E18

sensitivity—see **contrast sensitivity, equivalent IQI sensitivity, equivalent penetrometer sensitivity, IQI sensitivity, radiographic sensitivity**. E 1316, E07

sensitivity—in the case of a leak detector, the response of the detector to tracer gas leakage (that is, scale divisions per unit of leakage rate). E 1316, E07

sensitivity—the degree of capability of a magnetic particle examination technique for indicating surface or near surface discontinuities in ferromagnetic materials. E 1316, E07

sensitivity—a measure of the smallest ultrasonic signal which will produce a discernible indication on the display of an ultrasonic system. E 1316, E07

sensitivity—the capability of methodology or instrumentation to discriminate between samples having differing concentrations or containing differing amounts of an analyte. E 2161, E37

sensitivity analysis—a test of the outcome of an analysis by altering one or more parameters from an initially assumed value(s). E 631, E06

sensitivity analysis, n—a test of the outcome of an analysis by altering one or more parameters from an initially assumed value(s). E 833, E06

sensitivity control—the control in the instrument that adjusts the amplifier gain, and is one of the factors that determines the capacity to detect discontinuities. (E 215) E 1316, E07

sensitivity criterion, n—a quantitative measure of the relative merit of two test methods, that combines the estimated variance of each method with the ability of the method to measure differences in the property of interest. D 123, D13

sensitivity factor:

elemental—XPS, intensities of peaks relative to those of a standard, for example, F1s, for atoms in typical homogeneous environments. Division of peak height or peak area intensities by the appropriate sensitivity factors gives the relative number of atoms detected, on the assumption of sample homogeneity.

relative Auger elemental—AES, the ratio of the Auger signal strength of a specified Auger transition from a single element to that from a selected standard element (for example, silver), as measured under identical conditions.

SIMS—the factor used to convert the net counts per unit time, for a particular species, matrix and experimental conditions, to concentration. E 673, E42

sensitivity level—the descriptive term for identifying the capability of a penetrant system to indicate the presence of a surface-connected discontinuity. Ranging from ½ (ultra low) to 4 (ultra high). E 1316, E07

sensitivity (of an instrument)—the differential quotient dQ_0/dQ_1 , where Q_0 is the scale reading and Q_1 is the quantity to be measured. D 653, D18

sensitivity (of a transducer)—the differential quotient dQ_0/dQ_1 , where Q_0 is the output and Q_1 is the input. D 653, D18

sensitivity of leak test—the smallest leakage rate that an instrument, method, or system is capable of detecting under specified conditions. (See **minimum detectable leakage rate**.) E 1316, E07

sensitivity, photographic—the degree to which a photographic material responds by a change in its chemical or physical state to the action of both light and chemical development. The sensitivity of a given photographic material varies with wavelength of the

- incident radiation. The average degree of response is commonly referred to as speed. **E 7, E04**
- sensitivity range**—the impact pressure range over which a ribbon or carbon will produce an image of specified quality. **F 221, F05**
- sensitivity ratio, SR, *n***—in comparing two test methods, the ratio of the sensitivities of the test methods with the large sensitivity in the numerator. **D 123, D13**
- sensitivity value**—the value determined by the smallest standard discontinuity in any given sensitivity indicator observable in the radiographic image. Values are defined by identification of type of indicator, size of defect, and the absorber thickness on which the discontinuity is observed. **E 1316, E07**
- sensitization**—the absorption of a reducing agent, often a stannous compound, on the surface. **B 374, B08**
- sensitization**—a process resulting in a metallurgical condition which causes susceptibility of an alloy to intergranular corrosion or intergranular environmentally assisted cracking in a specific environment. **G 15, G01**
- sensitizer, *n***—a material which forms an eutectic with the developer to lower the melt point; acting as a solvent with the developer, the leuco dye is solubilized and reacts to form color. **F 1623, F05**
- sensitizing**—see **dye sensitizing**. **F 335, F05**
- sensitometric curve**—See **characteristic curve**. **E 7, E04**
- sensor, *n***—a device designed to respond to a physical stimulus (as temperature, illumination, and motion) and transmit a resulting signal for interpretation or measurement, or for operating a control. **D 1356, D22**
- sensor, *n***—of a thermometer or thermometric system, element of the thermometer or thermometric system that is directly affected by the temperature to be measured. **E 344, E20**
- sensor, *n***—device designed to respond to net IR radiation and convert that response into electrical signals. **E 344, E20**
- sensor, acoustic emission**—a detection device, generally piezoelectric, that transforms the particle motion produced by an elastic wave into an electrical signal. **E 1316, E07**
- sensory, *adj***—pertaining to the senses. **E 253, E18**
- sensory evaluation, *n***—a scientific discipline used to evoke, measure, analyze, and interpret reactions to stimuli perceived through the senses. **E 253, E18**
- sensory panel, *n***—a group of assessors used to obtain information concerning the sensory properties of stimuli. **E 253, E18**
- sensory profile, *n***—a description of the sensory properties of a sample, consisting of the sensory attributes in the order of perception, and with assignment of an intensity value for each attribute. **E 253, E18**
- separable pin, *n***—in zippers, a tube-like element attached over the bead at the bottom end of one stringer. **D 123, D13**
- separable pin, *n***—a tube-like element attached over the bead at the bottom end of one stringer. **D 2050, D13**
- separable zipper, *n***—a zipper fitted with special components at the bottom of the chain, so as to permit complete disengagement and then reengagement of the two stringers. (Compare **nonseparable zipper**.) **D 123, D13**
- separable zipper, *n***—a zipper fitted with special components at the bottom of the chain, so as to permit complete disengagement and then reengagement of the two stringers. (Compare **nonseparable zipper**.) **D 2050, D13**
- separate-application adhesive, *n***—a term used to describe an adhesive consisting of two parts, one part being applied to one adherend and the other part to the other adherend and the two brought together to form a joint. **D 907, D14**
- separate-element zipper, *n***—a zipper consisting of two series of separately formed elements, each attached to one of the opposing edges of two tapes which are engaged and disengaged by the movement of a slider. (Compare **continuous element zipper**.) **D 123, D13**
- separate element zipper, *n***—a zipper consisting of two series of separately formed elements, each attached to one of the opposing edges of two tapes, which are engaged and disengaged by the movement of a slider. (Compare **continuous element zipper**.) **D 2050, D13**
- separator, *n***—a component of some open-end spinning machines located inside the rotor to direct the incoming fibers to the slide surface. **D 123, D13**
- separator, *n***—any material interposed between articles or packing components. (Compare **buffer, divider, insert, liner**.) **D 996, D10**
- separator, *n***—a component of some open-end spinning machines located inside the rotor to direct the incoming fibers to the slide surface. **D 3888, D13**
- separator cloth**—a fabric, coated with TFE-fluorocarbon or similar release agent, placed between the lay-up assembly and the bleeder system to facilitate subsequent bleeder-system removal from the laminate after it has been cured. **E 631, E06**
- separator cloth**—a fabric, coated with TFE-fluorocarbon or similar release agent, placed between the lay-up assembly and the bleeder system to facilitate subsequent bleeder-system removal from the laminate after it has been cured. **E 1749, E06**
- separator paper, *n***—thin paper applied to a stranded conductor to prevent migration of extruded insulation into the strands and, subsequently, to facilitate stripping of the insulating material from the conductor. **D 1711, D09**
- SE probe**—see **dual search unit (twin probe)**. **E 1316, E07**
- sequencing, *n***—a characteristic whereby the thermal profiles of the liquid crystal formulations of a given thermometer follow each other in an orderly predetermined manner. **E 344, E20**
- sequential excitation NMR; continuous wave (CW) NMR**—a form of high-resolution NMR in which nuclei of different field-frequency ratio at resonance are successively excited by sweeping the magnetic field or the radio frequency. **E 131, E13**
- sequential response**—the assignment, according to local protocols, of emergency medical resources with varying levels of care capability to the scene of an illness or injury based on information received from previously arrived, medically trained, on-scene responders. A sequential response differs from a simultaneous response. **F 1177, F30**
- sequential sampling**—See **running sample** under **sample**. **D 1356, D22**
- sequestering agent**—an agent that forms soluble complex compounds with, or sequesters, a simple ion, thereby suppressing the activity of that ion. Thus, in water treatment the effects of hardness can be suppressed by adding agents to sequester calcium and magnesium. See **chelating agent**. **B 374, B08**
- sequestering agent**—any compound that, in aqueous solution, combines with a metallic ion to form a water-soluble combination in which the ion is substantially inactive. **D 459, D12**
- serial communication, *n***—in data communications, refers to sending the code for a character over a single line one bit at a time. (See **parallel communication**.) **F 1457, F05**
- serial dilution**—a method of producing a less-concentrated solution through one or more consecutive dilution steps. A dilution step for a standard or sample is performed by volumetrically placing a small aliquot of higher concentrated solution into a volumetric flask and diluting to volume with water containing the same acid levels as those found in original sample digestates. **E 631, E06**
- serial printer**—a printer where characters are printed one at a time. **F 149, F05**
- series, *n***—a collection of tests in which a common list of questions was used. **E 2035, E52**
- series collection, *n***—an operation involving the use of two or more collectors joined in series. **D 1356, D22**
- series grouting**—similar to stage grouting, except each successively deeper zone is grouted by means of a newly drilled hole, eliminating the need for washing grout out before drilling the hole deeper. **D 653, D18**
- series (in x-ray spectra)**—the group of characteristic X-ray lines which results when a vacancy in one particular electron level is

series (in x-ray spectra)

- filled from outside levels. Thus, the K series lines are emitted when a K level vacancy is filled. **E 7, E04**
- serpentine (commercial definition)**—a rock consisting mostly or entirely of serpentine (hydrated magnesium silicate), commonly greenish but can be black, red, or other colors; commonly veined with calcite, dolomite, or magnesite (magnesium carbonate) or a combination. **C 119, C18**
- serrated**—See **barbed**. **F 547, F16**
- serrations**—corrugations in the cutting edge of the blades. **F 1078, F04**
- serrations or teeth**—the gripping or clamping surfaces of the jaws. **F 921, F04**
- serum, (latex), n**—the dispersion medium of a rubber latex, or the solution remaining, after either coagulation or centrifugation. **D 1566, D11**
- serviceability, n**—the capability of a **building**, assembly, **component**, product, or construction to perform the function(s) for which it is designed and used. **E 631, E06**
- serviceability**—see *facility serviceability*. **E 631, E06**
- serviceability, n**—See **facility serviceability**. (See also **building performance**.)
- serviceability requirement**—See **requirement statement**. **E 631, E06**
- serviceability, n**—See **facility serviceability**. (See also **building performance**.) **E 1480, E06**
- serviceability requirement**—See **requirement statement**. **E 1480, E06**
- serviceability requirements profile (SRP)** (profilte besoins génériques de fonctionnalite (PBGF))—listing of the levels of serviceability (capability to perform, including quality) required in a facility. **E 631, E06**
- serviceability requirements profile (SRP)** (profilte besoins génériques de fonctionnalite (PBGF))—listing of the levels of serviceability (capability to perform, including quality) required in a facility. **E 1480, E06**
- service damage, n**—as used in *fractography*, scratches, chips, cracks, etc., created during use of the component. **C 1145, C28**
- service factor**—a factor which is used to reduce a strength value to obtain an engineering design stress. The factor may vary depending on the service conditions, the hazard, the length of service desired, and the properties of the pipe. **F 412, F17**
- service hardboard**—a hardboard of about 55 lb/ft³ (specific gravity 0.88) density intended for use where standard strength board is not required and better dimensional stability is desired. **D 1554, D07**
- service life, n**—in *building construction*, the period of time an installed sealant, coating, or membrane is reasonably expected to function successfully without replacement or significant repair, assuming reasonable or expected periodic maintenance is performed. **C 717, C24**
- service life**—the period of time required under use conditions to change the appearance of a surface treated with a floor polish sufficiently to require retreatment. **D 2825, D21**
- service life, n**—the interval of time that a connector assembly will be put to use and retain all physical and thermoelectric properties. **E 344, E20**
- service life (service time)**—the elapsed time until the end point is reached in an adsorption process. **D 2652, D28**
- service run, n**—that part of the operating cycle of an ion-exchange process in which a water is passed through a bed of the ion-exchange material in order to remove specific ions from the water or to exchange them for an equivalent amount of a specific ion from the bed material. **D 1129, D19**
- service strength setting time**—the time interval, after the initial mixing of the composition, at a specific temperature, at which time the product has acquired 90 % of its specified strength. **C 904, C03**
- service test**—a test in which the product is used under actual service conditions. **F 869, F08**
- service time**—see **service life**. **D 2652, D28**
- servicing, n**—on *magnet wire or conductor*, a uniform wrapping of insulation around a conductor. **D 1711, D09**
- servo accelerometer, n**—an accelerometer containing servo mechanisms, electronics, and a seismic element to sense inertial reaction. **F 538, F09**
- set, n**—the chemical and physical change in plaster as it goes from a plastic, workable state to a rigid state. See **setting time**. **C 11, C11**
- set**—a flow property of porcelain enamel slip affecting the rate of draining, residual thickness, and uniformity of coating. **C 286, B08**
- set**—in *grouting*, the condition reached by a cement paste, or grout, when it has lost plasticity to an arbitrary degree, usually measured in terms of resistance to penetration or deformation; initial set refers to first stiffening and final set refers to an attainment of significant rigidity. **D 653, D18**
- set, n**—strain remaining after complete release of the force producing the deformation. **D 883, D20**
- set, v**—to convert an adhesive into a fixed or hardened state by physical or chemical action, such as condensation, polymerization, oxidation, vulcanization, gelation, cooling, hydration, or evaporation of volatile constituents. (See also **cure and dry**.) **D 907, D14**
- set, n**—strain remaining after complete release of the force producing the deformation. **D 1566, D11**
- set**—strain remaining after complete release of the force producing the deformation. **E 6, E28**
- set, n**—of *results*, a group of results collected under specified conditions for statistical analysis. **E 135, E01**
- set, n**—strain remaining after complete release of the force producing the deformation. (D11) **F 412, F17**
- set, v**—to convert an adhesive into a fixed or hardened state by chemical or physical action, such as condensation, polymerization, oxidation, vulcanization, gelation, hydration, or evaporation of volatile constituents. (D14) **F 412, F17**
- set, n**—in *tire testing*, a selected number of test or control tires having nominally identical properties. **F 538, F09**
- set**—the positioning of the blade for proper cutting action. **F 1078, F04**
- set**—the at rest position of the instrument halves that will provide the intended closing relationship of fit and force. **F 1638, F04**
- set accelerator, n**—admixture incorporated into a masonry mortar to shorten the time of setting of a mortar. **C 1180, C12**
- set after break, n**—the set of a test piece after stretching it to rupture. **D 1566, D11**
- set mark, n**—a stop mark resulting from a prolonged loom shutdown. **D 123, D13**
- set mark, n**—a stop mark resulting from a prolonged loom shutdown. **D 3990, D13**
- set-off, n**—the unintentional transfer of part of an image or ink from its intended location to another surface. **D 6488, D01**
- set-off**—the unintentional transfer of part of an image or ink from its intended location to another surface. **F 221, F05**
- set-off**—the unintentional transfer of part of an image or ink from its intended location to another surface. **F 335, F05**
- set retarder, n**—admixture incorporated into a masonry mortar to lengthen the time of setting of a mortar. **C 1180, C12**
- set time**—(1) the hardening time of portland cement; or (2) the gel time for a chemical grout. **D 653, D18**
- setting, n**—the process, due to chemical reactions, occurring after the addition of mixing water, that results in a gradual development of rigidity of a cementitious mixture. **C 125, C09**
- setting, n**—process by which, after application, a liquid (wet-state) material changes to a serviceable condition by **curing** or **drying**. **E 631, E06**
- setting agent**—the component of a mixture that catalyzes or reacts with the resin component to cause hardening by polymerization. **C 904, C03**
- setting block, n**—in *building construction in glazing*, a piece of resilient material placed to support, to distribute the load, to

prevent edge contact, and to align a pane of glass or a panel within its supporting frame. **C 717, C24**

setting rate—a comparative term referring to the time required for the glass surface to cool between the limits of the working range. **C 162, C14**

setting shrinkage—*ingrouting*, a reduction in volume of grout prior to the final set of cement caused by bleeding, by the decrease in volume due to the chemical combination of water with cement, and by syneresis. **D 653, D18**

setting temperature, *n*—the temperature to which an adhesive or an assembly is subjected to set the adhesive. (See also **curing temperature** and **drying temperature**.) **D 907, D14**

setting temperature, *n*—the temperature that yields a reading of zero on the main scale for a given adjustment of the amount of mercury in the bulb and main capillary. **E 344, E20**

setting time, *n*—the elapsed time required for a gypsum plaster to attain a specified hardness and strength after mixing with water. **C 11, C11**

setting time, *n*—the elapsed time from the first addition of liquid during the mixing of the refractory castable until the time that the refractory castable has developed enough strength so that forms can be removed without any slumping or deformation. **C 71, C08**

setting time, *n*—the period of time necessary for an adhesive in an assembly to set under specified conditions of temperature or pressure, or both. **D 907, D14**

setting-up agent or **set-up agent**—an electrolyte used to increase the measured pick-up of a slip. **C 286, B08**

settled dust, *n*—particulate matter that has precipitated onto a surface. **E 1605, E06**

settle mark—See **chill mark**. **C 162, C14**

settling—the process of depositing, by gravity, matter suspended in water. **D 4410, D19**

settling velocity, *n*—the terminal rate of fall of a particle through a fluid as induced by gravity or other external force; the rate at which frictional drag balances the accelerating force (or the external force). **D 1356, D22**

sew, *v*—to unite or fasten with stitches. **D 123, D13**

sew, *v*—to unite or fasten with stitches, sewing usually involves a needle and sewing thread. **D 4849, D13**

sewage—waste matter carried off by sewers. **C 896, C04**

sewage (wastewater)—the spent water of a community which is a combination of liquid and water-carried wastes. **C 822, C13**

sewer—a pipeline intended to convey sewage. **C 822, C13**

sewer—generally, an underground conduit usually carrying waste matter in a liquid medium. **C 896, C04**

sewerage—system for collection, treatment, and disposal of sewage. **C 896, C04**

sewer brick, *n*—low absorption, abrasive-resistant brick intended for use in drainage structures. See Specification C 32. **C 43, C15**

sewer line—See **sewer**. **C 896, C04**

sewer pipe—vitrified clay pipe as described in Specification C 700. **C 896, C04**

sewing force, *n*—the force applied to a sewing thread at the needle eye during penetration of a material by the needle. **D 123, D13**

sewing force, *n*—the force applied to a sewing thread at the needle eye during penetration of a material by the needle. **D 4849, D13**

sewing hole, *n*—*in buttons*, a hole in either the flange or shank used to attach the button to the substrate by means of a needle and thread. **D 123, D13**

sewing hole, *n*—a hole in either the flange or shank of a button used to attach the button to the substrate by means of a needle and thread. **D 5497, D13**

sewing machine, *n*—*in home sewing*, a machine that uses needles and bobbin threads in the stitch formation and is primarily for home sewing use rather than industrial use. **D 123, D13**

sewing machine, *n*—*in home sewing*, a machine that uses needles and bobbin threads in the stitch formation and is primarily for home sewing use rather than industrial use. **D 5646, D13**

sewing thread, *n*—a flexible, small-diameter yarn or strand, usually treated with a surface coating, lubricant, or both, intended to be used to stitch one or more pieces of material or an object to a material. **D 123, D13**

sewing thread, *n*—a flexible, small diameter yarn or strand, usually treated with a surface coating, lubricant, or both, intended to be used to stitch one or more pieces of material or an object to a material. **D 4439, D35**

sewing thread, *n*—a flexible, small-diameter yarn or strand, usually treated with a surface coating, lubricant, or both, intended to be used to stitch one or more pieces of material or an object to a material. **D 4849, D13**

sew lines, *n*—lines that indicate where stitching of pattern pieces is to be done. **D 6963, D13**

sewn seam, *n*—*insewn fabrics*, a juncture at which two or more planar structures such as textile fabrics, are joined by sewing, usually near the edge. **D 123, D13**

sewn seam, *n*—*insewn fabrics*, a series of stitches joining two or more separate plies of a material or materials of planar structure such as textile fabric. **D 4439, D35**

sewn seam, *n*—*insewn materials*, a juncture along which two or more planar structures, such as textile material, are joined by sewing. (Compare **glued seam**, **stapled seam**, **thermally bonded seam**. Syn. **stitched seam**.) **D 4965, D13**

sewn seam strength, *n*—*in sewn fabrics*, the maximum resistance to rupture of the junction formed by stitching together two or more planar structures. **D 123, D13**

sewn seam strength, *n*—*for geotextiles*, the maximum resistance, measured in kilonewtons per metre, of the junction formed by stitching together two or more planar structures. **D 4439, D35**

sew-through flange button, *n*—a button that has two or more holes in its flange for passage of a needle and thread so that the button can be attached to a flexible substrate. **D 123, D13**

sew through flange button, *n*—a button attached to one part of a flexible substrate by means of a needle and thread passed through two or more holes in its flange and through the substrate. (Compare **sew-through shank button**.) **D 123, D13**

sew-through flange button, *n*—a button attached to one part of a flexible substrate by means of needle and thread passed through two or more holes in its flange and through the substrate. (Compare **sew-through shank button**.) **D 5497, D13**

sew through shank button, *n*—a button attached to one part of a flexible substrate by means of a needle and thread passed through a hole or loop in the integral shank and through the substrate. (Compare **sew-through flange button**.) **D 123, D13**

sew-through shank button, *n*—a button attached to one part of a flexible substrate by means of needle and thread passed through a hole or loop in the integral shank and through the substrate. (Compare **sew-through flange button**.) **D 5497, D13**

S-glass, *n*—a family of magnesia-alumina-silicate glasses with a higher tensile strength and higher softening temperature than E-glass. **E 344, E20**

shade, *n*—a term descriptive of a lightness difference between surface colors, the other attributes of color being essentially constant. **D 16, D01**

shade, *n*—(1) a color produced by a dye or pigment mixture including black dye or pigment. See also **shade**, *v*; **tint**, *n*; **tint**, *v*.
(2) an expression of color difference from a reference dyeing such that another dye must be added to produce a match.
(3) a color slightly different from a reference color. **E 284, E12**

shade, *v*—to adjust the color of a test specimen to be a closer color match to the standard. See also **shade**, *n*; **tint**, *v*; **tint**, *n*. **E 284, E12**

shade bracket nail—bright, regular-stock-steel, $\frac{3}{4}$ to 1 by 0.080 or 0.092-in. nails with slightly countersunk $\frac{1}{2}$ or $\frac{3}{32}$ -in. head and needle point. **F 547, F16**

shade sorting, *n*—process of grouping together, often by instrumental measurement, similarly colored materials so that the materials

shade sorting, *n*

within each group may be used together in a finished product without perceived color variation. **E 284, E12**

shading coefficient, *n*—the ratio of the solar heat gain through a glazing system under a specific set of conditions to the solar gain through a single light of double-strength sheet glass under the same conditions. **D 123, D13**

shading coefficient, *n*—the ratio of the solar heat gain through a glazing system under a specific set of conditions to the solar gain through a single light of double-strength sheet glass under the same conditions. **D 7018, D13**

shading or shadowing—the act of casting a shadow across any surface. **E 772, E44**

shadow—a region in a body that cannot be reached by ultrasonic energy traveling in a given direction because of the geometry of the body or a discontinuity in it. **E 1316, E07**

shadow angle—the angle between the line of motion of the evaporated atoms and the surface being shadowed. The angle is analogous to the angle of incidence in optics. May be specified as an arc tangent "a" so that "a" is in the ratio between the height of the object casting the shadow over the length of the shadow (see **shadowing**). **E 7, E04**

shadow cast replica—a replica which has been shadowed. (See also **shadowing**.) **E 7, E04**

shadowing—a process by which a metal or salt is deposited on a specimen at an angle (see **shadow angle**) from a heated filament in a vacuum to enhance image contrast by inhibiting the deposition of the shadowing material behind projections.

(1) *metal shadowing*—the enhancement of contrast in a microscopical specimen by the vacuum deposition of a dense metal at an angle generally not perpendicular to the surface of the object.

(2) *oblique evaporation*—the condensation of evaporated material onto a substrate which is inclined to the direct line of the vapor stream in order to produce shadows. **E 7, E04**

shadow microscope—an electron microscope which forms a shadow image of an object using electrons emanating from a point source located close to the object. **E 7, E04**

shadow wall—a structure built on top of the bridgewall or suspended from the crown to limit the flow of heat from the melter to the refiner. **C 162, C14**

shaft—generally a vertical or near vertical excavation driven downward from the surface as access to tunnels, chambers, or other underground workings. (ISRM) **D 653, D18**

shake—(1) a longitudinal separation of the wood. Generally two forms of shake are recognized, although variations and combinations may be used in industrial definitions.

heart shake—a shake that starts out at or near the pith and extends radially. Synonyms are *heart crack*, *rift crack*. A heart shake in which several radial cracks are present is termed a star shake.

ring shake—a shake occurring in the plane of the growth rings in the outer portion of the latewood for partial or entire encirclement of the pith, occasionally moving radially to an adjacent latewood ring. A synonym is "cup shake."

(2) A rectangular, board-like element for roof cover construction, similar to shingles, generally one of three types.

handsplit and resawn shakes—a shake having a split face and a sawn back.

tapersplit shake—a shake having two split faces and a natural, shingle-like taper.

straightsplit shake—a shake having two split faces and with no pronounced taper. **D 9, D07**

shake nail, cedar-shake or shingle nail, wood-shake face nail—enameled (baked-lacquer finished), galvanized, regular-stock-steel, plain-shank or annularly threaded, aluminum-alloy, plain-shank or helically threaded, or stainless-steel, annularly threaded, 1½ by 0.080 to 2½ by 0.092-in. nails with flat ⅛ to ⅝-in. head and medium diamond point. Also, aluminum-alloy 1¼ by 0.086 to 1¾ by 0.092-in. nails with flat ⅜-in. head and blunt diamond point. Also, aluminum-alloy, annularly threaded, 1⅜ and 2 by

0.099-in. nails with special type of thread and with flat slightly countersunk ⅜-in. head and long needle point; for fastening cedar shakes to fiberboard nail-base sheathing. **F 547, F16**

shakeoff process—XPS, a multi-electron photoelectric process in which two or more electrons are emitted, partitioning between them the excess kinetic energy. **E 673, E42**

shakeup lines or shakeup satellites—XPS, photoelectrons originating from photoelectric processes in which the final ion is left in an excited state, so that the photoelectron has a characteristic energy slightly less than that of the normal photoelectron. **E 673, E42**

shaking test—a test used to indicate the presence of significant amounts of rock flour, silt, or very fine sand in a fine-grained soil. It consists of shaking a pat of wet soil, having a consistency of thick paste, in the palm of the hand; observing the surface for a glossy or livery appearance; then squeezing the pat; and observing if a rapid apparent drying and subsequent cracking of the soil occurs. **D 653, D18**

shale, *n*—a thinly stratified, consolidated, sedimentary clay with well-marked cleavage parallel to the bedding. **C 43, C15**

shale—a laminated, indurated rock which is over two-thirds clay-sized minerals. Shales progressively grade into slate. When put to slate-like uses these rocks must meet slate specifications in Specification C 629. **C 119, C18**

shale—a thinly stratified, consolidated, sedimentary clay with well-marked cleavage parallel to the bedding. **C 896, C04**

shall—used to denote a mandatory requirement. **F 1789, F16**

shallow wood failure, *n*—failure that is invariably within the first one or two layers of cells beyond the adhesive layer in which the fracture path is not influenced by the wood-grain angle or growth-ring structure. **D 907, D14**

sham, *n*—a fabric covering for a bed pillow, usually of decorative fabric that matches the bedcovering. **D 123, D13**

sham, *n*—a fabric covering for a bed pillow, usually of decorative fabric that matches the bedcovering. **D 7023, D13**

shampoo, *n*—a solution of detergent in water formulated for specialized cleaning tasks. **D 123, D13**

shampoo, *n*—*in the cleaning of textile floor coverings and upholstered furniture*, a solution of detergent in water formulated for specialized cleaning tasks. **D 5253, D13**

shampoo, *v*—*in the cleaning of textile floor coverings*, use a cleaning machine which applies detergent solution, brushes it in, rinses, and extracts as much water as possible. **D 5253, D13**

shank—refers to leg positions of hide pattern. **D 1517, D31**

shank, *n*—*in buttons*, that part positioned perpendicular to and at the center back of the flange, and having a hole or loop for use in attaching the button to one part of a flexible substrate by means of a needle or thread, a ring, or a toggle. **D 5497, D13**

shank—main body of nail extending from head to point.

shank, formed or deformed—See **barbed, fluted, grooved, knurled, threaded, ortwisted**.

shank diameter—See **diameter**.

shear-resistant—See **threaded shear-resistant nail**.

smooth shank—See **plain shank**.

F 547, F16

shank—that part of the sole of the shoe between the heel and the ball or tread; also, the steel, plastic, or wood piece inserted in the arch of a shoe for reinforcement; also, the leg segment between the thigh and the foot. **F 869, F08**

shank—the part of either the female or the male member that yields configuration, length, and leverage. **F 921, F04**

shank—(1) the part of either scissor half that yields configuration, length, and leverage; (2) the part of the scissor between the finger ring and joint. **F 1078, F04**

shank eye, *n*—*in buttons*, the hole or loop in the shank of a sew-through shank button or the hole in the loop of the staple of a staple button. **D 5497, D13**

shape, *n*—this term is no longer recommended; the term **profile** is preferred. **B 881, B07**

shape calibration—a process of establishing a relationship between

the expected peak shape and energy. The shape calibration may be as simple as the user supplying a few peak full-width at half maximum (FWHM)/energy (or channel) pairs or as complex as using a least squares algorithm to establish several parameters characterizing the peak width and its deviation from a pure Gaussian. Shape calibration may be an explicitly defined function of an analysis program or implicitly done in connection with some other operation (typically the energy calibration). **E 170, E10**

shaped stone—dimension stone processed by carving, grinding, sawing, or other means into specific nonplanar configurations.

C 119, C18

shape factor—a dimensionless ratio of lengths, surface areas, or volumes of the particles, useful for characterizing or comparing particles that otherwise have similar physical properties.

C 242, C21

shape memory alloy, n —a metal which, after an apparent plastic deformation in the martensitic phase, undergoes a thermoelastic change in crystal structure when heated through its transformation temperature range resulting in a recovery of the deformation.

F 2005, F04

shape resolution—an electron image exhibits shape resolution when a polygon can be recognized as such in the image. Roughly, the particle diameter (defined as the diameter of a circle of the same area as the particle) must exceed the resolution by a factor equal to the number of sides on the polygon.

E 7, E04

shapes, n —materials of solid section in such forms as angles, channels, tees, I-beams, and four-fluted bars.

B 899, B02

shark fin—an upward-curved felt sidelap or endlap.

D 1079, D08

sharkskin—leather made from the top grain of the skins of sharks. It has various natural markings. The term should not be applied to leather made from other skins and embossed.

D 1517, D31

sharks teeth—a term relative to the appearance of the cut edge of a glass sheet having dagger-like striations starting at the scored edge and extending toward the opposite surface.

C 162, C14

sharp crease, n —for inflatable restraint fabrics, a sharp ridge that can be felt easily, caused by a hard folding of the fabric over itself not by design.

D 6799, D13

sharpeners—the device for holding the sharpening and truing stones.

The sharpener can be either attached to the slicer or removable from the slicer's sharpener attachment point. If it is removable, a storage location within the machine structure shall be provided.

F 1827, F26

sharp fire—combustion with excess air and short flame.

C 162, C14

sharpness, n —a perceived quality of an image that is associated with the abruptness of change of tone at the edge of an object area or tonal area.

E 284, E12

sharpness—in carbon paper and inked ribbon images, similarity of the geometry of the image to the type face and the rate of change of image density at the edge.

F 221, F05

sharp-notch strength—the maximum nominal (net section) stress that a sharply notched specimen is capable of sustaining.

F 2078, F07

sharp-notch strength, σ_s [FL^{-2}]—the maximum nominal (net-section) stress that a sharply notched specimen is capable of sustaining.

E 1823, E08

sharp point—end of point being keen, instead of being slightly rounded or dull.

F 547, F16

shattering—a phenomenon observed in hardness testing in which fissures or subsurface cracks originate in a hardness indentation and spread to adjacent parts of the specimen.

E 7, E04

shaving—a small wood particle of indefinite dimensions developed incidental to certain woodworking operations involving rotary cutterheads usually turning in the direction of the grain; and because of this cutting action, producing a thin chip of varying thickness, usually feathered along at least one edge and thick at another and usually curled.

D 1554, D07

shavings—the thin slices of wood removed in dressing.

D 9, D07

shear—relative displacement of adjacent planes in a member.

D 9, D07

shear, n —in an adhesively-bonded joint, stress, strain or failure resulting from applied forces that tends to cause adjacent planes of a body to slide parallel in opposite directions.

D 907, D14

shear, adj —descriptive of properties measured using a specimen deformed in shear, for example, shear modulus.

D 1566, D11

shear—an action or stress, resulting from applied forces, which causes (or tends to cause) two contiguous parts of a body to slide, relative to each other, in a direction parallel to their plane of contact.

D 4092, D20

shear, adj —a relative movement of molecules or molecular aggregates that occurs in flowing liquids. A shear flow is one in which the spatial velocity gradient is perpendicular to the direction of flow.

D 4175, D02

shear, v —to subject a liquid to shear flow.

D 4175, D02

shear burst—open break in the fastener metal at approximately 45° to the product axis, usually at the periphery of fasteners having flanged or circular heads or on the side of hex heads.

F 1789, F16

shear-cake—a counterweighted refractory slab used as a gate or door to a small furnace or oven.

C 162, C14

shear coaxial injector—a pneumatic atomizer consisting of a central liquid stream surrounded by a high-velocity co-annular gas stream.

E 1620, E29

shear crimping, n —buckling of the compressive facing due to low core shear modulus. Usually causes the core to fail in shear at the crimp.

C 274, D30

shear degradation, n —the decrease in molecular weight of a polymeric thickener (VI improver) as a result of exposure to high shear stress.

D 4175, D02

sheared-bevel point—one directional point having one flat surface; formed by shearing nail wire off at angle to shank axis, inducing nail to diverge from straight penetration unless countermeasures are introduced.

F 547, F16

sheared point—See sheared-bevel point, sheared-square point.

F 547, F16

sheared-square point—extremity of nail shank opposite head end of nail sheared at right angle to shank axis.

F 547, F16

shear failure (failure by rupture)—failure in which movement caused by shearing stresses in a soil or rock mass is of sufficient magnitude to destroy or seriously endanger a structure.

general shear failure—failure in which the ultimate strength of the soil or rock is mobilized along the entire potential surface of sliding before the structure supported by the soil or rock is impaired by excessive movement.

local shear failure—failure in which the ultimate shearing strength of the soil or rock is mobilized only locally along the potential surface of sliding at the time the structure supported by the soil or rock is impaired by excessive movement.

D 653, D18

shear force—a force directed parallel to the surface element across which it acts. (ISRM)

D 653, D18

shear fracture, n —a mode of fracture in crystalline materials resulting from translation along slip planes which are preferentially oriented in the direction of the shearing stress.

E 6, E28

shearling—leather made from sheepskin that has been sheared shortly before slaughter, the short wool being left on the skin when tanned.

D 1517, D31

shear mark—a mark appearing in glass, caused by the action of the cutting shear.

C 162, C14

shear modulus, n —the ratio of shear stress to corresponding shear strain below the proportional limit. (Compare secant modulus.) (See proportional limit.)

D 907, D14

shear modulus, G [FL^{-2}], n —the ratio of shear stress to corresponding shear strain below the proportional limit of the material.

E 6, E28

shear modulus, G (Pa)—the quotient of shear stress and shear strain. (See ISO 537.)

shear modulus, G (Pa)

$$G = \frac{\sigma}{\gamma}$$

shearogram/hologram, n —the common term for an interferometric image provided by S/H systems. **F 538, F09**

shearographic or holographic (S/H) systems, n —a shearographic or holographic system using interferometric laser imaging to non-destructively inspect tires. **F 538, F09**

shear plane—a plane along which failure of material occurs by shearing. (ISRM) **D 653, D18**

shear rate, $\dot{\gamma}$ —the time rate of change of shear strain. For a one-dimensional shear flow, it is the velocity gradient. **D 4092, D20**

shear rate, n —in fluid flow, the velocity gradient across the fluid. **D 4175, D02**

shear rate, n —the velocity gradient in fluid flow. **D 4175, D02**

shear rate, n —the rate at which a series of adjacent layers of grease move with respect to each other; proportional to the linear velocity of flow divided by the capillary radius, and is thus expressed as reciprocal seconds. **D 4175, D02**

shear resistance—see **internal friction.** **D 653, D18**

shear rigidity, n —the sandwich property which resists shear distortions: synonymous with shear stiffness. $U=hG$; the core thickness (approximate) times the core shear modulus. **C 274, D30**

shear stability, n —the resistance of a polymer-thickened fluid to shear degradation. **D 4175, D02**

shear strain—the change in shape, expressed by the relative change of the right angles at the corner of what was in the undeformed state an infinitesimally small rectangle or cube. (ISRM) **D 653, D18**

shear strain, n —the angular change, expressed in radians, between two lines originally perpendicular to each other, due to shear stress. **D 907, D14**

shear strain, γ —the tangent of the angular change, due to force, between two lines originally perpendicular to each other through a point in a body. (E28) **D 4092, D20**

shear strain, n —the tangent of the angular change, due to force, between two lines originally perpendicular to each other through a point in a body. **E 6, E28**

shear strength, n —the resistance to forces that cause, or tend to cause, two contiguous parts of a body to slide relatively to each other in a direction parallel to their contact. **D 123, D13**

shear strength—(monitoring wells) a measure of the shear or gel properties of a drilling fluid or grout. **D 653, D18**

shear strength, n —in an adhesive joint, the maximum average stress when a force is applied parallel to the joint. (See **bond strength.**) **D 907, D14**

shear strength—the maximum resistance of a soil or rock to shearing stresses. **D 7099, D18**

shear strength—maximum load applied normally to a fastener's axis that can be supported prior to fracture. Single shear is load occurring in one transverse plane, thus cutting the fastener into two pieces; double shear is load applied in two planes so that, at fracture, the fastener would be cut into three pieces. **F 1789, F16**

shear strength [FL⁻²], n —the maximum shear stress which a material is capable of sustaining. Shear strength is calculated from the maximum force during a shear or torsion test and is based on the original dimensions of the cross section of the specimen. **E 6, E28**

shear strength of metal connector plate—resistance to shear force by net plate cross section, expressed as force per unit of length of full cross section of connector plate, when used in connections composed of pairs of plates. **E 631, E06**

shear strength, s, T_f (FL⁻²)—the maximum resistance of a soil or rock to shearing stresses. See **peak shear strength.** **D 653, D18**

shear stress—a state of stress where adjacent planes in a member tend to slip on one another. **D 9, D07**

shear stress, τ —a stress acting parallel to the surface of the plane being considered. **D 653, D18**

shear stress—stress directed parallel to the surface element across which it acts. (ISRM) **D 653, D18**

shear stress, τ —the stress component tangential to the plane on which forces act. (E28) **D 4092, D20**

shear stress, n —the motivating force per unit area for fluid flow. **D 4175, D02**

shear stress area: bolt or screw—area perpendicular to the fastener axis which is based on the root diameter (minor diameter) of an externally threaded bolt or screw. **F 1789, F16**

shear stress [FL⁻²], n —the stress component tangential to the plane on which the forces act. **E 6, E28**

shear stress (shearingstress) (tangential stress)—see **stress.** **D 653, D18**

shear test—an experiment to determine the flow properties of a bulk solid by applying different states of stress and strain to it. **D 653, D18**

shear test—application of load perpendicular to anchor or anchor axis and parallel to and at the surface of the base material. **E 2265, E06**

shear tester—an apparatus for performing shear tests. **D 653, D18**

shear transfer plate—metal connector plate with integral teeth projecting from plate in both directions perpendicular to plate surfaces; designed to be placed between adjacent wood members and to connect and transmit forces from one wood member to another. **E 631, E06**

shear wall—structural subassembly that acts as a cantilever/diaphragm to transfer horizontal building loads to the foundation in the form of horizontal shear and an overturning moment. **E 631, E06**

shear wave—wave motion in which the particle motion is perpendicular to the direction of propagation. **E 1316, E07**

shear wave (rotational, equivolumental)—wave in which medium changes shape without change of volume (shear-plane wave in isotropic medium is transverse wave). **D 653, D18**

shear wave search unit (Y cut quartz search unit)—a straight beam search unit used for generating and detecting shear waves. **E 1316, E07**

sheath, n —in feathers, a covering at the quill point end of nestling feathers or nestling down which holds the barbs together. **D 123, D13**

sheath, n —in feathers, a covering at the quill point end of nestling feathers or nestling down which holds the barbs together. **D 7022, D13**

sheath, n —a cylindrical metal tube with an integral welded closure at the end in which the element is located. **E 344, E20**

sheath-core, adj —a descriptive term for a multicomponent textile fiber consisting of a continuous envelope which encases a continuous, central, internal region. **D 123, D13**

sheath-core, adj —a descriptive term for a multicomponent textile fiber consisting of a continuous envelope which encases a continuous, central, internal region. (See also *component.*) **D 4466, D13**

sheathed crate—See **crate.** **D 996, D10**

sheathed thermocouple, n —a thermocouple having its thermoelements, and sometimes its measuring junction, embedded in ceramic insulation compacted within a metal protecting tube. **E 344, E20**

sheathed-thermocouple assembly, n —the cut-to-length finished assembly consisting of thermoelements having one end joined in a measuring junction, and contained within and electrically isolated from, a protective sheath closed at the measuring end, except the thermoelements of the class G thermocouple join the sheath at the junction. The protective sheath has a moisture seal at the reference junction end of the sheath. The assembly may include a thermocouple connector but does not include a reference junction or extension leads mechanically joined to the thermoelements. **E 344, E20**

sheathed thermocouple material—an assembly of two solid continuous thermoelements embedded in ceramic insulation compacted within a metal protecting sheath. **E 344, E20**

sheathed thermocouple material, *n*—a combination of two or more continuous thermoelements embedded in ceramic insulation compacted within a metal protecting sheath. **E 344**, E20

sheathed thermocouple wire, *n*—one or more pairs of thermoelements (without measuring junction(s)) embedded in ceramic insulation compacted within a metal protecting tube. **E 344**, E20

sheathed thermoelement, *n*—a thermoelement embedded in ceramic insulation compacted within a metal protecting tube. **E 344**, E20

sheath-enclosed-scale thermometer, *n*—the cylindrical glass envelope which encloses the scale and capillary tube. **E 344**, E20

sheathing, *n*—lumber or sheet materials, such as plywood, fiberboard or other suitable panel or sheet material fastened to the frame across the openings of a crate to deter pilferage, or entry of dirt or water or of other articles. **D 996**, D10

sheathing—cellulosic fiberboard for use in housing and other building construction, which may be integrally treated, impregnated or coated to give it additional water resistance. **D 1554**, D07

sheathing nail—See **common nail**, **threaded common nail**, **diaphragm nail**, **fiberboard nail**, **gypsum-sheathing nail**, **hardboard nail**. **F 547**, F16

sheathing/siding nail—stainless-steel, annularly threaded, 1½ by 0.120-in. nail with slightly countersunk ¼-in. head and sharp medium diamond point. **F 547**, F16

sheen, *n*—the specular gloss at a large angle of incidence for an otherwise matte specimen. **E 284**, E12

sheepskin paint roller cover, *n*—a cover in which the paint applying material is wool fleece still attached to its tanned natural skin. **D 16**, D01

sheer, *n*—a fabric that is transparently thin or diaphanous. **D 123**, D13

sheer, *n*—a fabric that is transparently thin or diaphanous. **D 7022**, D13

sheet—as in *inch-pound specifications*, a rolled flat product up to and including 0.188-in. thick and over 24-in. wide, in straight lengths or coils (rolls). **B 846**, B05

sheet—as in *SI specifications*, a rolled flat product up to and including 5-mm thick and over 600-mm wide, in straight lengths or coils (rolls). **B 846**, B05

sheet, *n*—rolled wrought product that is rectangular in cross section, with thickness 0.006 in. and greater [over 0.15 mm] but less than 0.250 in. [up through 6.30 mm], and with sheared, slit, or sawed edges.

Alclad sheet, *n*—composite sheet product comprised of an aluminum-alloy core having on both surfaces (if on one side only, it is *Alclad one-sidesheet*) a metallurgically bonded aluminum or aluminum-alloy coating that is anodic to the core, thus electrolytically protecting the core alloy against corrosion.

Alclad one-side sheet, *n*—alclad sheet with only one side coated.

coiled sheet, *n*—sheet in coils with slit edges.

flat sheet, *n*—sheet with sheared, slit, or sawed edges, which has been flattened or leveled.

mill finish sheet, *n*—sheet having a nonuniform finish which may vary from sheet to sheet and within a piece, and which may not be entirely free of stains or oil.

one-side bright mill finish sheet, *n*—sheet having a moderate degree of brightness on one side, and a mill finish on the other.

standard one-side bright finish sheet, *n*—sheet having a uniform bright finish on one side, and a mill finish on the other.

standard two-side bright finish sheet, *n*—sheet having a uniform bright finish on both sides. **B 881**, B07

sheet, *n*—a flat-rolled metal product of some maximum thickness and minimum width arbitrarily dependent on the type of metal; it is thinner than plate. **B 899**, B02

sheet, *n*—in *textiles*, a large rectangular usually plain woven fabri-

cated product which is used over a mattress on a bed. The product may be carded or combed yarn in a wide range of constructions.

D 123, D13

sheet, *n*—an individual piece of sheeting. (See also **film**, **sheeting**.) **D 883**, D20

sheet, *n*—in *textiles*, a large rectangular usually plain woven fabricated product which is used over a mattress on a bed. The product may be carded or combed yarn in a wide range of constructions. **D 7023**, D13

sheet, *n*—a thin, flat, rolled metal product having mill or cut edges. (If of steel, having dimensions of less than 0.229 in. (5.8 mm) thickness, and greater than 12.0 in. (305 mm) width and length.) **E 631**, E06

sheet—in *honeycomb core material*, a slice of honeycomb cut from a production block.

shelf life—See **storage life**.

shelters:

expandable shelters—those shelters that are expanded from the transport size to a larger size, at expansion ratios of three-to-one or less and perhaps to a different shape. (See Specification PS 27.)

highly expandable shelters—as classified by the U.S. Department of Defense (MIL-STD-907B), those shelters that have expansion ratios greater than three-to-one from their transport size.

knockdown shelters—as classified by the U.S. Department of Defense (MIL-STD-907B), those shelters that are reduced in height and nested with identical items for transportation.

large area shelters—as classified by the U.S. Department of Defense (MIL-STD-907B), those shelters that are disassembled and packed in dedicated or general-purpose containers for shipment.

nonexpandable shelters—as classified by the U.S. Department of Defense (MIL-STD-907B), those shelters that are used in the same size and shape in which they are transported.

E 631, E06

sheet—in *honeycomb core material*, a slice of honeycomb cut from a production block. **E 1749**, E06

sheet blanket, *n*—a thin blanket of cotton or cotton and synthetic blend having a nap on both sides.

D 123, D13

sheet blanket, *n*—a thin blanket of cotton or cotton and synthetic blend having a nap on both sides. **D 7023**, D13

sheet cast button, *n*—a button fabricated from a disc blanked from a cast sheet of formulated styrene-modified polyester resin.

D 123, D13

sheet cast button, *n*—a button fabricated from a disk blanked from a cast sheet of formulated styrene-modified polyester resin.

D 5497, D13

sheet disintegration, *n*—the breakup of an unstable liquid film into particles. **E 1620**, E29

sheet glass—flat glass made by continuous drawing. **C 162**, C14

sheeting, *n*—a form of plastic in which the thickness is very small in proportion to length and width and in which the plastic is present as a continuous phase throughout, with or without filler. (See also **film**.) **D 883**, D20

sheeting, *n*—the process of converting a rubber, rubber mix, rubber dough, or latex into a sheet. **D 1566**, D11

sheeting, *n*—a form of plastic in which the thickness is very small in proportion to length and width and in which the plastic is present as a continuous phase throughout, with or without filler. (See also **film**.) **F 1251**, F04

sheet-metal nail—nail stamped out of sheet metal and formed to desired shape. (See **roofing nail**.) **F 547**, F16

sheet molding compound (SMC), *n*—a fiber-reinforced thermosetting compound, in sheet form. **D 883**, D20

sheet, resilient flooring, *n*—flexible resilient flooring, packaged in roll form, in which the length substantially exceeds the width.

F 141, F06

sheet-roofing fastener nail—See **purlin nail**.

F 547, F16

sheet-roofing nail—See **roofing nail**.

F 547, F16

shelf-life—*in building construction*, the maximum time packaged materials can be stored under specified conditions and still meet the performance requirements specified. C 717, C24

shelf life—maximum time interval during which a material may be stored and remain in a usable condition; usually related to storage conditions. D 653, D18

shelf life, n—Synonym for **storage life**. D 907, D14

shelf life—the length of time packaged materials can be stored under specified conditions and still remain effective in use (C 717, C24).

D 996, D10

shelf life, n—See **storage life, shelf**. D 1566, D11

shelf life, *n*—the period of time, under specified storage conditions, for which the reference material (RM) will possess the same properties or true values, within established acceptance limits.

D 4175, D02

shelf life—See **storage life**. E 1749, E06

shelf roughness—roughness on upward facing surfaces where dissolved solids have settled on parts during a plating operation.

B 374, B08

shell, *n*—the outer walls of a hollow masonry unit. Shell can either be an end shell or a face shell. C 1232, C15

shell—See **packing**. D 996, D10

shell—a portion from the butt end of a horsehide, from which leather of tight, firm, fiber structure and fine grain is made. (See also **cordovan**.) D 1517, D31

shell hardening, *n*—a surface hardening process in which a suitable steel object, when heated through and quench hardened, develops a martensitic layer or shell that closely follows the contour of the piece and surrounds a **core** of essentially pearlitic transformation product. A 941, A01

shelters:

expandable shelters—those shelters that are expanded from the transport size to a larger size, at expansion ratios of three-to-one or less and perhaps to a different shape. (See Specification PS 27.)

highly expandable shelters—as classified by the U.S. Department of Defense (MIL-STD-907B), those shelters that have expansion ratios greater than three-to-one from their transport size.

knockdown shelters—as classified by the U.S. Department of Defense (MIL-STD-907B), those shelters that are reduced in height and nested with identical items for transportation.

large area shelters—as classified by the U.S. Department of Defense (MIL-STD-907B), those shelters that are disassembled and packed in dedicated or general-purpose containers for shipment.

nonexpandable shelters—as classified by the U.S. Department of Defense (MIL-STD-907B), those shelters that are used in the same size and shape in which they are transported.

E 1749, E06

shield, *n*—a nonconducting medium for altering the current distribution on an anode or cathode. B 374, B08

shield, *v*—to alter the normal current distribution on an anode or cathode by the interposition of a nonconductor. B 374, B08

shield, *n*—a conducting layer placed around an insulated conductor or cable to limit the penetration of electric or electromagnetic fields. D 1711, D09

shield—a conductive protective member, partly or wholly enclosing one or more elements of electric equipment or test specimen, for the purpose of reducing or eliminating the electric or magnetic flux, or both, within or beyond that element or elements.

D 2864, D27

shield, electric or magnetic, *n*—a conductive protective component

that encloses, in whole or in part, one or more elements of electric equipment or test specimen in order to reduce or eliminate the electric or magnetic flux, or both, within or beyond that element or elements. D 1711, D09

shielding—in an electron-optical instrument, the protection of the electron beam from distortion due to extraneous electric and magnetic fields. Since the metallic column of the microscope is at ground potential, it provides electrostatic shielding. Magnetic shields may be made of a high permeability material. E 7, E04

shielding effectiveness—the ability of a sandwich panel of suitable thickness and physical characteristics to exclude (protect) sensitive components or units from electromagnetic radiation (interference).

shop drawing—See **drawing**. E 631, E06

shielding effectiveness—the ability of a sandwich panel of suitable thickness and physical characteristics to exclude (protect) sensitive components or units from electromagnetic radiation (interference).

E 1749, E06

shielding glass—a transparent glass containing oxides of heavy elements, such as lead, to absorb ionizing radiation. C 162, C14

shier, *n*—*in wovenfabrics*, fine fillingwise cracks randomly distributed across the fabric width. (Compare **let-off mark** and **crack mark**.) D 123, D13

shier, *n*—*in wovenfabrics*, fine fillingwise cracks randomly distributed across the fabric width. (*Syn.* shire) (Compare **let-offmark** and **crack mark**) D 3990, D13

shim—See **shim spacer; spacer**. C 717, C24

shim—*in plywood*, a long narrow repair in the panel surface not more than $\frac{3}{16}$ in. (4.8 mm) wide made of wood or suitable synthetic compound. D 1038, D07

shim—a material, typically placed under the IQI which is radiologically similar to the object being imaged. E 1316, E07

shim spacer, *n*—*in building construction in glazing*, a spacer designed and placed to position the face surfaces of a pane of glass or a panel between the stops and to prevent glass or panel contact with the stops. C 717, C24

shiner, *n*—a streak, usually short, caused by a lustrous section of a filament yarn. D 123, D13

shiner, *n*—a streak, usually short caused by a lustrous section of filament yarn. D 3990, D13

shiner or shiner-scale—a defect characterized by minute fishscaling occurring in overfired ground coat. C 286, B08

shingle—a thin, oblong piece of wood with one end thinner than the other, lapped lengthwise in covering roofs and outer walls of buildings produced by sawing. D 9, D07

shingle—(1) a small unit of prepared roofing designed for installation with similar units in overlapping rows on inclines normally exceeding 25 %;

(2) to cover with shingles; and

(3) to apply any sheet material in overlapping rows like shingles. D 1079, D08

shingle backer—a specially fabricated sheathing-grade cellulosic fiberboard used as a backer strip in coursed shingle construction. D 1554, D07

shingle-backer nail—See **shake nail**. F 547, F16

shingle nail

wood-shinglenail—bright or galvanized, regular-stock-steel, plain-shank or annularly threaded, $\frac{1}{4}$ by 0.076 to 2 by 0.106-in. nails with flat $\frac{7}{32}$ to $\frac{9}{32}$ -in. head and medium or blunt diamond point. Also, bright or colored (baked-lacquer finished), aluminum-alloy, plain-shank or helically threaded, $\frac{7}{8}$ by 0.080 to $\frac{1}{4}$ by 0.099-in. nails with flat $\frac{5}{32}$ to $\frac{9}{32}$ -in. head and medium or blunt diamond point. Also, aluminum-alloy, annularly threaded, $1\frac{1}{8}$ and 2 by 0.101-in. nails with special type of thread and with flat slightly countersunk $\frac{5}{32}$ -in. head and long needle point for fastening cedar shingles to fiberboard nail-base sheathing.

asbestos-shingle nail—bright or galvanized, regular-stock-steel, annularly threaded, 1 to 2 by 0.113-in. nails with flat $1\frac{1}{32}$ -in. head and long diamond or needle point. Also, aluminum-alloy, helically threaded, $1\frac{1}{8}$ to $2\frac{1}{2}$ by 0.099 to 0.135-in.

nails with smooth or striated flat $\frac{3}{16}$ to $\frac{7}{16}$ -in. head or $\frac{3}{32}$ to $\frac{1}{2}$ -in. casing head and medium diamond or needle point. Also, aluminum-alloy, annularly threaded, $1\frac{1}{8}$ and 2 by 0.101-in. nails with special type of thread and with flat slightly countersunk 0.190-in. striated head and long needle point; for fastening asbestos shingles to fiberboard nail-base sheathing.

asphalt-shingle nail—See **roofing nail**.

siding nail—See **brick-siding nail, hardboard nail, roofing nail, sheathing/siding nail**.

aluminum-siding nail—plain-shank or helically threaded, aluminum-alloy 1 by 0.099 to $2\frac{1}{2}$ by 0.135-in. nails with flat $\frac{1}{4}$ to $\frac{3}{16}$ -in. head and medium diamond point.

asbestos-siding face nail—bright, colored (baked-lacquer finished) or galvanized, regular-stock-steel, hardened-steel, bronze, aluminum or stainless-steel, annularly threaded, file-grip or screw-thread, $1\frac{1}{4}$ by 0.080 to 2 by 0.105-in. nails with smooth or striated flat $\frac{3}{16}$ -in. or button head and medium diamond or needle point.

common siding nail—bright or colored (baked-lacquer finished), galvanized, regular-stock-steel or hardened-steel, plain-shank or threaded, $1\frac{3}{4}$ by 0.080 to 3 by 0.128-in. nails with flat $\frac{3}{32}$ to $\frac{1}{8}$ -in. head and medium diamond point.

corrugated-siding nail—See **roofing nail**.

hardboard-siding nail—See **hardboard nail**.

insulated-siding nail—bright or colored (baked-lacquer finished) aluminum-alloy, $1\frac{1}{2}$ by 0.113 to $2\frac{1}{2}$ by 0.135-in. nails with flat $\frac{7}{32}$ to $\frac{1}{2}$ -in. head and medium diamond point.

insulating-siding nail—See **brick siding nail**.

wood-siding nail—bright and colored (baked-lacquer finished), plain-shank or helically threaded, aluminum-alloy, $1\frac{1}{8}$ by 0.106 to $2\frac{7}{8}$ by 0.148-in. nails with $\frac{3}{16}$ to $\frac{1}{2}$ -in. casing or $\frac{1}{4}$ to $\frac{3}{16}$ -in. sinker head and medium or blunt diamond point. Also, bright or colored (baked-lacquer finished), stainless-steel, annularly threaded, $2\frac{1}{8}$ and $2\frac{3}{8}$ by 0.083 and 0.095-in. nails with slightly countersunk $\frac{3}{16}$ -in. head and medium diamond point. (See **common siding nail**.)

F 547, F16

shingling—(1) the procedure of laying parallel felts so that one longitudinal edge of each felt overlaps, and the other longitudinal edge underlaps, an adjacent felt. (See also **ply**). Normally, felts are shingled on a slope so that the water flows over rather than against each lap;

(2) the application of shingles to a sloped roof. D 1079, D08

ship and galley tile—a special quarry tile having an indented pattern on the face of the tile to produce an antislip effect. C 242, C21

shiplapped lumber—See **lumber**. D 996, D10

shipment, n—goods or commodities which are transported together as a unit; a quantity of product for which a bill of lading has been signed by the carrier. D 123, D13

shipment, n—*forasbestos*, any consignment formed of one or several lots of asbestos fiber. D 2946, C17

shipment, n—goods or commodities which are transported together as a unit; a quantity of product for which a bill of lading has been signed by the carrier. D 4849, D13

shipment (of gypsum panel products), n—the quantity of gypsum panel products shipped by a manufacturer and included on a single invoice. C 11, C11

shipping container—See **container**. D 996, D10

Shipping unit, n—*in textiles*, any type of packaging used to facilitate the handling and shipping of fibers, yarns and fabrics. D 123, D13

Shipping unit, n—*in textiles*, any type of packaging used to facilitate the handling and shipping of fibers, yarns and fabrics. D 4849, D13

shirt, n—a cloth garment for the upper part of the body made of either woven or knitted fabric usually having sleeves, a neck opening, a front opening and a tail long enough to be tucked inside trousers or skirt. F 1494, F23

shirt back length, n—*in garment construction*, a measurement centered below the collar band to bottom edge of shirttail.

F 1494, F23

shirt front length, n—*in garment construction*, a measurement from the placket top, below the collar band to the bottom edge of the shirt's hem in front.

F 1494, F23

shirt sides, n—*in garment construction*, a measurement of length from below armhole to the bottom hem.

F 1494, F23

shivering (peeling)—the splintering that occurs in fired glazes or other ceramic coatings as a result of critical compressive stresses.

C 242, C21

shives, n—the woody parts of the flax plant which are not fibers.

D 123, D13

shives, n—the woody parts of the flax plant which are not fibers.

D 6798, D13

SHMP—sodium hexametaphosphate. (NaHMP) D 6161, D19

shock—the short duration high force initial part of an impact.

F 869, F08

shock absorption—the reduction of peak force by increasing the time over which the force is applied. The reduction of ground reaction forces is of primary importance in athletic footwear. (*Syn.* shock attenuation)

F 869, F08

shock attenuation—see **shock absorption**.

F 869, F08

shock load, n—the sudden application of an external force.

D 1566, D11

shock pulse—a substantial disturbance characterized by a rise of acceleration from a constant value and decay of acceleration to the constant value in a short period of time.

D 653, D18

shock test—test that simulates shock loads applied to an anchorage system using an external load of short duration. E 2265, E06

shock treatment, n—the addition of an antimicrobial agent sufficient to cause rapid and substantial (several orders of magnitude) reductions in number of living microbes in a fluid or system receiving that concentration.

D 4175, D02

shock wave—a wave of finite amplitude characterized by a shock front, a surface across which pressure, density, and internal energy rise almost discontinuously, and which travels with a speed greater than the normal speed of sound. (ISRM)

D 653, D18

shoe finish—coatings applied to leather or other shoe materials at tanneries and shoe manufacturers before retailing to the consumer.

D 2825, D21

shoe fold, n—a fabric folded from both ends into twelve or sixteen folds to the piece, the length of the fold depending upon the length of the piece. (Compare **book fold**.)

D 123, D13

shoe fold, n—a fabric folded from both ends into twelve or sixteen folds to the piece, the length of the fold depending upon the length of the piece. (Compare **book fold**.)

D 4850, D13

shoe leather—this term is self-explanatory and embraces a variety of leathers including:

(1) *sole leather*—made from cattle hides and to a small extent from horsehides and buffalo hides, comprising both the heavier grade, used for outer soles of shoes and the lighter grades and offal (heads, shoulders and bellies) used to a greater or less extent for heels, insoles, toecaps, counters, etc.;

(2) *upper leather*—made principally from calfskins, goat-skins, cattlehides, horsehides, and other classes of animal skins, going into shoe uppers, and

(3) *miscellaneous shoe leathers*, including welting, lining stock, tongue stock, facing stock, etc.

D 1517, D31

shop drawing—a drawing prepared by the fabricator based on a **working drawing** and used in a shop or on a site for assembly.

shoot—see **XRF-shoot**.

E 631, E06

shop drawing—See **drawing**.

E 1480, E06

shop drawings—*when applied to dimension stone*, a highly detailed drawing that shows the net dimensions, joint dimensions, anchor locations and orientations, of the dimension stone and the relationship with the other building materials being used. C 119, C18

Shore A hardness

Shore A hardness—a measurement of hardness for rubbers and plastics using a Shore A hardness gage (durometer). **E 631, E06**

Shore A hardness—a measurement of hardness for rubbers and plastics using a Shore A hardness gage (durometer). **E 1749, E06**

shorelines—a defect characterized by a series of rings or lines in the surface of porcelain enamel similar in appearance to the lines on the shore produced by receding water. **C 286, B08**

shore seal boom—boom that, when grounded, seals against the shoreline. **F 818, F20**

shorn pile, n—pile that is removed when the face pile is sheared. **D 123, D13**

shorn pile, n—pile that is removed when the face pile is sheared. **D 5684, D13**

short—a comparative term signifying a fast-setting glass. **C 162, C14**

short, n—an imperfection in a molded plastic part due to an incompletely filled out condition. **D 883, D20**

short, n—in a molded material, an incompletely filled out condition. **F 412, F17**

short barb, n—barbs having an average length of $0.1875 \pm 5\%$. **F 1379, F14**

short-circuit—see *internal discharge*. **F 1827, F26**

short-circuit current, n—of a photovoltaic device, the current flowing between the positive and negative terminals under illumination when zero voltage appears across these terminals. **E 1328, E44**

short-fiber content (SFC), n—that percentage of fibers (by number or by weight) in a test specimen, that is shorter than 12.5 mm (0.5 in.) in length. **D 123, D13**

short-fiber content (SFC), n—that percentage of fibers (by number or by weight) in a test specimen, that is shorter than 12.7 mm (0.5 in.) in length. **D 7139, D13**

short-finish—an imperfection resulting from incomplete polishing. **C 162, C14**

short float, n—for inflatable restraints fabrics, a warp or filling yarn extending over five or fewer filling or warp yarns with which it should be interlaced. **D 6799, D13**

short knot, n—for inflatable restraints fabrics, a small knob of yarn and associated tails where two yarns are tied together by interlocking loops for the purpose of maintaining yarn continuity. **D 6799, D13**

shortness, n—a qualitative term that describes an adhesive that does not string, cotton, or otherwise form filaments or threads during application. **D 907, D14**

short plumbing (hospital) threads—a special modified form of the tapered pipe thread basically achieved by elimination of the imperfect threads. This thread is normally used only on chromium-plated nipples to ensure that a minimum of thread shall remain exposed after the nipple is threaded into a fitting. **B 846, B05**

short point—point with 40° or greater included angle for 0.040 to 0.065-in. wire diameter; 45° or greater included angle for 0.072 to 0.225-in. wire diameter; 55° or greater included angle for 0.250 to 0.325-in. wire diameter. **F 547, F16**

short range ordering—the reversible short-ranged, order-disorder transformation in which the nickel and chromium atoms occupy specific (ordered) localized sites in the Type EP or Type KP thermoelement alloy crystal structure. **E 344, E20**

short-term exposure limit (STEL), n—the airborne concentration of a substance in a continuous 15-minute time period which should not be exceeded at any time during a workday. **D 1356, D22**

short-term exposure limit (STEL)—the 15-min time-weighted average exposure which shall not be exceeded at any time during a work day, even if the Occupational Exposure Limit is not exceeded. Exposures above the Occupational Exposure Limit up to the STEL should not be longer than 15 min and should not occur more than 4 times per day. The minimum interval between these exposures should be 60 min.

The following specified periods of time must be addressed either by determining a value or by stating the “time” is not addressed:

- workday (number of hours specified)
- workweek (number of hours specified)
- lifetime (that is, cumulative)
- very short term maximum (for example, short-term exposure limit, ceiling, etc.)

Other specified periods of time *may* be addressed. **E 1542, E34**

short-term measure, n—an early action designed to have an authorized duration of less than one year for the effective control or management of a contaminant released to the environment. **D 5681, D34**

short term standard deviation, σ_{ST} , n—the inherent variation present when a process is operating in a state of statistical control, expressed in terms of standard deviation. **E 456, E11**

short-term strength—the failure strength of a material under a short-term loading (that is, up to about 10 min in a uniaxial compression test). **D 7099, D18**

short term weld factor—a dimensionless number that provides a relative measure of the tensile strength of a welded thermoplastic test specimen to the tensile strength of the manufactured sheet. **C 904, C03**

shot, n—small spherically shaped particles of metal. **B 899, B02**

shot—a short energizing cycle in a magnetic particle examination. **E 1316, E07**

shot blasting—blasting with small spherical objects, such as metallic shot, propelled against a metallic surface. See **abrasive blasting**. **B 374, B08**

shotcrete, n—a mortar or concrete that is projected pneumatically at high velocity onto a surface.

dry-mixture shotcrete, n—shotcrete in which most of the mixing water is added at the nozzle.

wet-mix shotcrete, n—shotcrete in which most of the ingredients, including water, are mixed prior to introduction into the delivery hose. **C 125, C09**

shotcrete—mortar or concrete conveyed through a hose and pneumatically projected at high velocity onto a surface. Can be applied by a “wet” or “dry” mix method. (ISRM) **D 653, D18**

shotcreting, n—an installation technique using a pump to convey tempered refractory castable to a nozzle where an admixture and air pressure are injected, spraying the castable stream onto a substrate where the castable becomes sufficiently stiff to withstand the force of gravity. **C 71, C08**

shot peening—a process whereby hard, small spherical objects (such as metallic shot) are propelled against a metallic surface for the purpose of introducing compressive stresses into that surface, hardening it or obtaining decorative effects. **B 374, B08**

shot sawn—a surface with random grooves and markings, produced by gangsawing with chilled steel shot. **C 119, C18**

shot volume, n—the total hollow space of a mold including cavity or cavities, runner(s), and sprue. **D 883, D20**

should—used to denote a recommendation. Not suitable for specification use to denote mandatory requirements. **F 1789, F16**

shoulder, n—in zippers, the bearing surface of an interlocking element by which the chain is contained inside the flanges of the slider. **[D13.54] D 2050**

shoulder circumference, n, in body measurements, with arms down at sides, the maximum distance around the shoulders at the top of the arm. **D 123, D13**

shoulder—half of a double shoulder. **D 1517, D31**

shoulder, n—the bearing surface of an interlocking element by which the chain is contained inside the flanges of the slider. **D 2050, D13**

shoulder, n—of tire, that region of a tire formed by the conjunction of the tread and sidewall. **F 538, F09**

shoulder—edge, when present, at junction of thread crest and flank. If double crested, primary shoulder is nearer head and should be

- equal to or larger in diameter than secondary shoulder, which is closer to point. **F 547, F16**
- shoulder and arm length, n** —the distance from the side of the neck base across the shoulder joint and along the outside of the arm over the elbow to the prominent wrist bone, taken with the arm bent 1.57 rad (90°) and the hand placed on the hip. **D 5219, D13**
- shoulder, b_v** —the widest point, of the ski in the shovel section of the ski. **F 472, F27**
- shoulder contact**—the region on a glass container surface located between the neck and sidewall sections, which normally contacts other similarly shaped and upright containers. **C 162, C14**
- shoulder girth, n** —the horizontal circumference around the shoulders, taken at the front break-point level with the arms down. **D 5219, D13**
- shoulder joint, n** —in anatomy, the junction of the collarbone and the shoulder blade. (See also **acromion**.) **D 123, D13**
- shoulder joint, n** —the juncture of the collarbone and the shoulder blade. **D 5219, D13**
- shoulder length, n** —in body measurements, the distance from the side neck base to the armscye line at the shoulder joint. **D 123, D13**
- shoulder length, n** —the distance from the side of the neck base to the top of the shoulder joint, taken with the arm down. **D 5219, D13**
- shoulder rib, n** —a rib at or near the outer edge or shoulder of the tread band. **F 538, F09**
- shoulder row, n** —a row located at or near the shoulder of the tread band. **F 538, F09**
- shoulder slope, n** —in body measurements, the angle formed when the slant of the shoulder line deviates from the horizontal line that originates at the side neck base. **D 123, D13**
- shoulder slope, n** —the degree of difference between the shoulder slant and the horizontal line that originates at the side neck base, taken with a goniometer positioned on the shoulder and moved until the baseline is parallel to the floor. **D 5219, D13**
- shoulder to elbow length, n** —the distance from the top of the shoulder joint along the outside of the arm to the prominent point of the elbow, taken with the arm bent 1.57 rad (90°) and the hand placed on the hip. **D 5219, D13**
- shoulder wear, n** —a type of irregular wear characterized by an increased wear rate in the outer edge of the shoulder rib or row compared to the inner shoulder edge. **F 538, F09**
- shovel length, l_s** —the projected length of the forward turn-up, measured from the tip to the contact point where a 0.5-mm feeler gage intersects the running surface with the ski body pressed against a plane surface. **F 472, F27**
- shovel length, L_s** —the projected length of the forward turn-up, measured from the tip to the contact point where an 0.1-mm feeler gage intersects the running surface with the snowboard unweighted on a plane surface. **F 1107, F27**
- shovel slicing**—mechanical action of causing bedding material to uniformly contact the pipe haunches. **C 896, C04**
- shovel surface area**—that surface forward of the shovel contact point. The shovel contact point is located at l_s from the tip. **F 472, F27**
- shovel surface area**—that surface forward of the shovel contact point. The shovel contact point is located at L_s from the tip. **F 1107, F27**
- shoving, n** —the horizontal displacement of a localized area of the pavement surface that may also include some vertical displacement. **E 867, E17**
- shoving, n** —the horizontal displacement of a localized area of the pavement surface which may also include some vertical displacement. **E 1778, E17**
- shower curtain, n** —a hanging fabric used to prevent water spillage from a shower area. **D 123, D13**
- shower curtain, n** —a hanging fabric used to prevent water spillage from a shower area. **D 7023, D13**
- showering**—a particular form of corona discharge characterized by strongly ionized streamers or streams of luminous plasma. It generally occurs at a field value just below that which is required for a complete breakdown. **B 542, B02**
- show-through, n** —the printed image can be observed on the opposite side of the sheet under normal lighting conditions. **D 6488, D01**
- show through, n** —optical density of an image on the backside of a printed area. **F 1857, F05**
- shredded rubber, n** —pieces of scrap tires resulting from mechanical processing. **D 5681, D34**
- shredded tire, n** —a size reduced scrap tire where the reduction in size was accomplished by a mechanical processing device, commonly referred to as a shredder. **D 5681, D34**
- shredded tire, n** —a size reduced scrap tire. The reduction in size was accomplished by a mechanical processing device, commonly referred to as a shredder. **D 5681, D34**
- shredder**—a size-reduction machine that tears or grinds materials to a smaller and more uniform particle size. **D 5681, D34**
- shredder, n** —a machine used to reduce whole tires to pieces. **D 5681, D34**
- shred sizing, n** —a term which generally refers to the process of particles passing through a rated screen opening rather than those which are retained on the screen. **D 5681, D34**
- shred sizing, n** —generally refers to the process of particles passing through a rated screen opening rather than those which are retained on the screen. Examples include:
- 1 by 1 in. (2.5 by 2.5 cm), n* —a sized reduced scrap tire, with all dimensions 1 in. (2.5 cm) maximum.
- 2 by 2 in. (5.1 by 5.1 cm), n* —a size reduced scrap tire, with all dimensions 2 in. (5.1 cm) maximum.
- X in. minus, n* —sized reduced scrap tires, the maximum size of any piece has a dimension no larger than X plus 1 in. (X plus 2.5 cm), but 95 % of which is less than X in. (2.54 X cm) in any dimension (that is, 1 in. (2.5 cm) minus; 2 in. (5.1 cm) minus; 3 in. (7.6 cm) minus, and so forth). **D 5681, D34**
- shrend**—{archaic} term for dry gage, v. **C 162, C14**
- shrink, vt**—to cause to contract, to compact cloth by causing to contract when subjected to washing, boiling, steaming or other processes. **F 1494, F23**
- shrinkage, n** —a decrease in dimensions of a compact which may occur during sintering. (Converse of **growth**.) **B 243, B09**
- shrinkage, n** —the decrease in dimension of a refractory material during manufacture or service. **C 71, C08**
- shrinkage**—a decrease in length, area, or volume. **C 717, C24**
- shrinkage**—a reduction in size of a composition which occurs during its hardening process, curing process, or both. **C 904, C03**
- shrinkage, n** —a decrease in volume due to chemical reaction or drying. **C 1180, C12**
- shrinkage**—reduction in dimensions due to lowering the moisture content below the fiber saturation point. **D 9, D07**
- shrinkage, n** —a decrease in one or more dimensions of an object or material. **D 123, D13**
- shrinkage, n** —a decrease in one or more dimensions of an object or material. **D 4391, D13**
- shrinkage, n** —a decrease in dry or more dimensions of an object or material. **D 4845, D13**
- shrinkage, n** —a dimensional change resulting in a decrease in the length of a specimen. **D 4849, D13**
- shrinkage, n** —a decrease in one or more dimensions of an object or material. **D 5684, D13**
- shrinkage, n** —a decrease in one or more dimensions of an object or material. **F 1494, F23**
- shrinkage-compensating**—in grouting, a characteristic of grout made using an expansive cement in which volume increase, if restrained, induces compressive stresses that are intended to offset the tendency of drying shrinkage to induce tensile stresses. See also **self-stressing grout**. **D 653, D18**
- shrinkage index, SI (D)**—the numerical difference between the plastic and shrinkage limits. **D 653, D18**
- shrinkage limit, SL , w_s (D)**—the maximum water content at which a

shrinkage limit, SL , w_s (D)

reduction in water content will not cause a decrease in volume of the soil mass. **D 653, D18**

shrinkage, linear—a reduction in the length of a cast bar of a composition during its hardening process, curing process, or both. **C 904, C03**

shrinkage ratio, R (D)—the ratio of: (1) a given volume change, expressed as a percentage of the dry volume, to (2) the corresponding change in water content above the shrinkage limit, expressed as a percentage of the weight of the oven-dried soil. **D 653, D18**

shrinkage temperature—the temperature at which measurable shrinkage occurs when leather is gradually heated in an aqueous medium. **D 1517, D31**

shrinkage, unrestrained—a reduction in size of a composition which occurs during its hardening process, curing process, or both, with no external forces applied that can inhibit such reduction. **C 904, C03**

shrinkage, volume—a reduction in occupied space of a composition during its hardening process, curing process, or both. **C 904, C03**

shrink mark—an imperfection, a depression in the surface of a molded material where it has retracted from the mold. **D 883, D20**

shrink mark—depression in the surface of a molded material where it has retracted from the mold. (D20) **F 412, F17**

shroud, n —in packaging, a protective cover placed over a load unit, or package to cover the top and four sides. **D 996, D10**

shutter—a mechanical device which permits regulation of the time during which light is allowed to act on a light sensitive medium. **E 7, E04**

shuttle mark, n —in woven fabrics, a fine fillingwise line caused by damage to a group of warp yarns by shuttle abrasion. **D 123, D13**

shuttle mark, n —in woven fabrics, a fine fillingwise line caused by damage to a group of warp yarns by shuttle abrasion. (*Syn.* box mark) **D 3990, D13**

SI—an abbreviation for the International System of Units. **A 340, A06**

SI—abbreviation for Le Système International d'Unités (SI), The International System of Units (SI): The Modern Metric System. **D 4175, D02**

SI—The International System of Units (abbreviation for "le Système International d'Unités) as defined by the General Conference on Weights and Measures (CGPM)—based upon seven base units, two supplementary units, and derived units, which together form a coherent system.

side mount—See **railing systems**. **E 631, E06**

sick building syndrome, SBS, n —condition in which a building's occupants experience health or comfort effects, or both, that appear to be linked to time spent therein, but where no specific illness or cause can be identified. Condition may be localized in a particular room or zone, or may spread throughout the building. **E 2114, E06**

side—a side is half of a hide along the back bone line and with the tail not more than 6 in. (152 mm) long. **D 1517, D31**

side camber, W —the maximum distance from a line drawn between the widest points of the ski and the sidecut of the ski. **F 472, F27**

side centered—equivalent to end centered with a different choice of axes. (See **end centered**.) **E 7, E04**

side-construction tile, n —tile designed to receive its compressive stress at right angles to the axes of the cells. **C 43, C15**

side cut—a board, plank, cant, or timber which does not contain the pith. **D 9, D07**

side cut—that line describing the curved portion of the ski contour limited by the lines at the b_H and b_V dimensions, and defined by the bottom edge. **F 472, F27**

sidecut—that line describing the curved portion of the snowboard contour limited by the lines at the b_H and b_V dimensions and defined by the bottom edge. **F 1107, F27**

sidecut geometry—the configuration of the curve bordering the running surface and defined by the bottom edge. **F 1107, F27**

sidecut magnitude—the maximum distance from a line drawn between the widest points of the snowboard and the edge of the snowboard. **F 1107, F27**

side-fired furnace—a furnace with fuel supplied from the side. **C 162, C14**

side geometry—the configuration of the curve bordering the running surface and defined by the bottom edge. **F 472, F27**

side lap, n —the distance by which the side edge of one tile overlaps the side edge of an adjacent tile in the same course; for interlocking tile this corresponds to the width of that part of the tile that contains the ribs, grooves, or channels which provide for interlocking. (See *Discussion* under **head lap**.) **C 43, C15**

side lap, n —the shortest horizontal distance between the exposed side edge of a course of roofing or siding material and the nearest underlying area of roof deck or side wall not covered by the preceding adjacent course. **C 1154, C17**

side lap—the shortest horizontal distance between the exposed side edge of a course of asbestos-cement roofing or siding material and the most proximate underlying area of roof deck or side wall not covered by the preceding adjacent course. **D 2946, C17**

side leather—shoe upper leather made from the grain side of cattlehides. The name comes from the practice of splitting the hide along the backbone into two sides before tanning. The skins are usually shaved on the flesh side to uniform thickness and the grain is corrected. **D 1517, D31**

side mount—a railing-system support that anchors the post of picket of a railing system to a vertical or inclined surface, such as a fascia or stair stringer.

silent hours—See **hours of operation**.

sill—See **windows and doors**.

E 631, E06

side mount—a railing-system support that anchors the post or baluster of a railing system to a vertical or inclined surface, such as a fascia or stair stringer. **E 1481, E06**

side point—an eccentric nonsymmetrical point. **F 547, F16**

side-port furnace—a furnace with ports on the sides. **C 162, C14**

sideslip angle, (rad or degree), n —in a vehicle, the angle between the projection of a test vehicle's longitudinal axis on the road plane and the velocity vector at some specified point in the test vehicle. **F 538, F09**

sidestrike—activation of stapling head resulting from forcing container resting on table against head. **F 592, F16**

side surface bend—procedure whereby a load is applied on the weld in line with the weld axis. **C 904, C03**

side-tone, n —appearance at the flop angle. **E 284, E12**

side-tone scattering, n —scattering of light in a material resulting in a milky appearance only when the specimen is viewed at the flop angle. **E 284, E12**

side waist length, n —the distance from the mid-underarm point of the armscye to the waist level, taken along the side of the body (contour). **D 5219, D13**

sidewall, n —the side of a tire between the tread shoulder and the rim bead. **D 5681, D34**

sidewall, n —of atire, that portion of a tire between the tread and the bead. **F 538, F09**

sidewall component, n —an individual part of the sidewall construction, either a separate compound or a separately assembled piece. **F 538, F09**

sidewall, glass container—the midsection of a glass container located between the heel and shoulder contact regions; also referred to as barrel. **C 162, C14**

sidewall rubber, n —the exterior rubber layer of a tire that extends over the sidewall part of the carcass. **F 538, F09**

siege—{archaic} floor of a pot furnace, often called "bench." **C 162, C14**

Siemens—a measure of electrical conductance in water, equivalent to a mho. See **Mho, Ohm**. **D 6161, D19**

sieve—a standard wire mesh or screen, especially when used in graded sets to determine the mesh size or particulate size distribution of particulate or granular solids. **C 242, C21**

sieve, n —a standard wire mesh or screen, especially when used in

- graded sets to determine the mesh size or particular size distribution of particulate and granular solids. C 1145, C28
- sieve**, *n*—in laboratory work an apparatus, in which the apertures are square, for separating sizes of material. D 8, D04
- sieve**—an apparatus with square apertures for separating sizes of material. D 1079, D08
- sieve**, *n*—a plate, sheet, or woven wire cloth, or other device, with regularly spaced apertures of uniform size, mounted in a suitable frame or holder, for use in separating material according to size. The terms sieve and screen can be used interchangeably. E 1638, E29
- sieve analysis**, *n*—particle size distribution; usually expressed as the weight percentage retained upon each of a series of standard sieves of decreasing size and the percentage passed by the sieve of finest size. Synonymous with **screen analysis**. B 243, B09
- sieve analysis**—the particle size distribution of a particulate or granular solid or sample thereof, when determined by weight percent passage through, or retention on, a graded set of sieves. C 242, C21
- sieve analysis**, *n*—the particle size distribution of a particulate or granular solid or sample thereof, when determined by passage through and retention on a graded set of sieves. C 1145, C28
- sieve analysis**—determination of the proportions of particles lying within certain size ranges in a granular material by separation on sieves of different size openings. D 653, D18
- sieve analysis**, *n*—the act of obtaining a particle size distribution using sieves. E 1638, E29
- sieve classification**, *n*—the separation of powder into particle size ranges by the use of a series of graded sieves. B 243, B09
- sieve fraction**, *n*—that portion of a powder sample that passes through a standard sieve of specified number and is retained by some finer sieve of specified number. B 243, B09
- sight glass**—the glass window for a viewing port, generally for a pressurized system. C 162, C14
- sight line**—*in building construction in glazing*, the line of intersection of an opaque material with a transparent material. C 717, C24
- sigma** (σ)—solid phase found originally in binary iron-chromium alloys which is in stable equilibrium at temperatures below 820°C. Now used to identify any structure which possesses the same complex body-centered crystal structure. E 7, E04
- signal**—the data present in a radiological measurement which is directly correlated with the degree of radiation attenuation by the object being examined. E 1316, E07
- signal, acoustic emission (emission signal)**—an electrical signal obtained by detection of one or more acoustic emission events. E 1316, E07
- signal amplitude, acoustic emission**—the peak voltage of the largest excursion attained by the signal waveform from an emission event. E 1316, E07
- signal conditioner**, *n*—the component that receives the output from a sensor and processes it for subsequent use. D 1129, D19
- signal gradient**—same as **differential readout**. E 1316, E07
- signal height**—*EIA*, the number of counts in the channels of a backscattering spectrum due to a specific element in the target. E 673, E42
- signal overload level**—that level above which operation ceases to be satisfactory as a result of signal distortion, overheating, or damage. E 1316, E07
- signal overload point**—the maximum input signal amplitude at which the ratio of output to input is observed to remain within a prescribed linear operating range. E 1316, E07
- signal strength**—the measured area of the rectified AE signal with units proportional to volt-sec. E 1316, E07
- signal-to-background ratio**—*AES*, the ratio of signal (above background) to that of the nearby background on the high kinetic energy side of the elastically scattered Auger electrons. E 673, E42
- signal to background ratio**—*SIMS, XPS, for a spectral peak*, the ratio of the maximum counts in the peak above the background to the magnitude of the background. E 673, E42
- signal-to-noise ratio**—the ratio of the signal intensity (above background) to that of noise in determining that signal. E 673, E42
- signal-to-noise ratio**—the ratio of values to signal (response containing relevant information) to that of noise (response containing nonrelevant information). E 1316, E07
- signal-to-noise ratio**—the ratio of the amplitude of an ultrasonic indication to the amplitude of the maximum background noise. E 1316, E07
- signal-to-noise ratio, S/N**—the ratio of the signal, *S*, to the noise, *N*, as indicated by the instrumental read-out indicator. E 131, E13
- signature, acoustic emission (signature)**—a characteristic set of reproducible attributes of acoustic emission signals associated with a specific test article as observed with a particular instrumentation system under specified test conditions. E 1316, E07
- significance level, α , *n***—the stated upper limit for the probability of a decision being made that a hypothesis about the value of a parameter is false when in fact it is true. (See **confidence level, probability level**.) D 123, D13
- significance level**—the decimal probability that a result will exceed the critical value. E 1547, E15
- significance level**—the stated probability (risk) that a given test of significance will reject the null hypothesis (that a specified effect is absent) when the hypothesis is true. E 1823, E08
- significant**—statistically significant. An effect or difference between populations is said to be present if the value of a test statistic is significant, that is, lies outside of selected limits. E 1823, E08
- significant digit**, *n*—any of the figures 0 through 9, except leading zeros and some trailing zeros, which is used with its place value to denote a numerical quantity to some desired approximation. E 456, E11
- significant loss**, *n*—any loss that introduces a bias in final results that is of appreciable economic importance to the concerned parties. D 121, D05
- significant loss**, *n*—any loss that introduces a bias in final results that is of appreciable importance to concerned parties. D 5681, D34
- significantly alter**—any action which would change the mechanical or performance capabilities of the fastener following its original manufacture. F 1789, F16
- significant surface**—surface area where the minimum thickness to be met shall be designated on the applicable drawing or by the provision of a suitably marked sample. However, if not designated, significant surfaces shall be defined as those normally visible, directly or by reflection, which are essential to the appearance or serviceability of the fastener when assembled in normal position, or which can be the source of corrosion products that deface visible surfaces on the assembled fastener. F 1789, F16
- silent hours**—See **hours of operation**. E 1480, E06
- silent hours**—See **hours of operation**. E 1480, E06
- silent hours, *n* (heures d'inactivité)**—period when a facility is essentially unoccupied and only security and building operations staff are present. E 631, E06
- silica**, *n*—pulverized silicon dioxide (SiO_2) used as a filler or a part of the cementitious material. C 1154, C17
- silica**, *n*—*for asbestocement*, pulverized silicon dioxide (SiO_2) used as a filler or a part of the cementitious material. In the latter case, the material shall meet the requirements of Specification C 618. D 2946, C17
- silica glass**—See **fused silica**. C 162, C14
- silica** (SiO_2)—the common oxide of silicon usually found naturally as quartz or in complex combination with other elements as silicates. C 242, C21
- silicate gel**, *n*—a jelly-like substance consisting of polymerized silicate and entrapped coolant. D 4725, D15
- silicate type inclusions**—inclusions composed essentially of silicate glass, normally plastic at forging and hot-rolling temperatures, which appear in steel in the wrought condition as small elongated

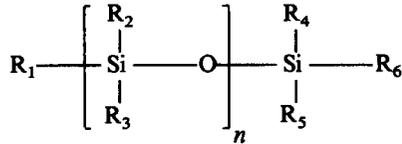

silicate type inclusions

inclusions usually dark in color under reflected light as normally observed. E 7, E04

silicon carbide refractories, *n*—refractory products consisting predominantly of silicon carbide. C 71, C08

silicone elastomer, *n*—an elastomer containing cross-linked silicone polymer and fillers, usually silica. F 1251, F04

silicone fluid—a generic term for a family of relatively inert liquid organosiloxane polymers used as electrical insulation. They have the generic formula:

where the attached R groups may be H, methyl, vinyl, phenyl, alkyl, or substituted phenyl or alkyl radicals. D 2864, D27

silicone plastics—plastics based on polymers in which the main polymer chain consists of alternating silicon and oxygen atoms. D 883, D20

silicone polymer, *n*—a polymer of alternating silicon-oxygen atoms consisting of repeating of diorganosiloxy groups. F 1251, F04

siliconizing—in *diffusion coatings*, diffusion of silicon into solid metal at elevated temperatures. B 374, B08

silk screen process—a decorating process in which a design is printed on glass through a silk mesh, woven wire, or similar screen. C 162, C14

sill—generally a horizontal wood member forming the lowest part of the framework of a construction, from relatively small size as in a window frame to a much larger size as in a railroad bridge; a threshold or door sill. D 9, D07

sill ice—ice in a concordant tabular mass, formed by water intruded or injected under pressure into porous earth material. D 7099, D18

sillimanite—See **andalusite**. C 242, C21

silo—synonym for **bin**. D 653, D18

siltation—See **deposition**. D 4410, D19

silt barrier—boom with very deep skirt used to control the movement of suspended sediments. F 818, F20

silt (inorganic silt) (rock flour)—material passing the No. 200 (75- μ m) U.S. standard sieve that is nonplastic or very slightly plastic and that exhibits little or no strength when air-dried. D 653, D18

silt size—that portion of the soil finer than 0.02 mm and coarser than 0.002 mm (0.05 mm and 0.005 mm in some cases). D 653, D18

silt size (fluvial sediment)—0.004 to 0.062 mm in diameter. D 4410, D19

silver migration—a process by which silver, when in contact with insulating materials under electrical potential, is removed ionically from its original location, and is redeposited as a metal (silver dendrite) at some other location. F 2112, F01

silver/silver chloride reference electrode—a reference electrode with an internal reference element of silver and silver chloride. The filling solution must contain chloride and be saturated with respect to silver chloride. Saturated KCl, 1 M KCl, and equitransferent filling solutions are all commonly used. Ag/AgCl electrodes have better thermal characteristics than calomel electrodes and are therefore preferable for specific ion measurements and precision pH measurements. D 4127, D19

similarities were noted/differences as well as similarities—these expressions are meaningless without an explanation as to the extent and significance of the similarities or differences between the known and questioned material. These terms should never be substituted for gradations of opinions. E 1658, E30

simple (concerning lattices)—having similar atoms or groups of atoms separated by integral translations only. E 7, E04

simple linear regression—a statistical method of estimating the

linear relationship between a dependent variable *y* and an independent variable *x* using the linear model

$$y = b_o + b_z X + \epsilon$$

E 131, E13

simple liquid—a single-phase liquid having a vapor pressure of less than 16 psi Reid vapor pressure at 100°F (830 mm Hg at 37.8°C) and a Saybolt viscosity of less than 10 000 s (2160 cSt) at 25°C. E 1547, E15

simple machine stitch pattern, *n*—in *home sewing*, a repeating segment of machine stitches, with each repeat consisting of one or more stitches long. (Compare **complex machine stitch pattern**.) D 123, D13

simple machine stitch pattern, *n*—in *home sewing*, a repeating segment of machine stitches, with each repeat consisting of one or more stitches long. (Compare **complex machine stitch pattern**.) D 5646, D13

simple payback (SPB) period—the time required for the cumulative benefits from an investment to pay back the investment cost and other accrued costs, not considering the time value of money. E 631, E06

simple payback (SPB) period, *n*—the time required for the cumulative benefits from an investment to pay back the investment cost and other accrued costs, not considering the time value of money. E 833, E06

simple seam, *n*—See **plain seam**. D 4965, D13

simple shear—shear strain in which displacements all lie in one direction and are proportional to the normal distances of the displaced points from a given reference plane. The dilatation is zero. (ISRM) D 653, D18

simplex airblast nozzle—see **piloted airblast nozzle**. E 1620, E29

simplex channel, *n*—a data transmission system capable of transmitting in only one direction. (See **duplex channel**.) F 1457, F05

simplex nozzle—a swirl chamber atomizer comprising a single set of tangential liquid inlets (or slots) combined with a single circular discharge orifice. E 1620, E29

simulated service corrosion test, *n*—evaluation of the effects of a circulating engine coolant on metal test specimens and automotive cooling system components under controlled, essentially isothermal laboratory conditions. D 4725, D15

simultaneous, *adj*—the application of two or more techniques to the same sample at the same time. (ICTAC)

NOTE—A hyphen is used to separate the abbreviations of the techniques; for example, simultaneous thermogravimetric analysis and differential scanning calorimetry would be TGA-DSC. E 473, E37

simultaneous response—the assignment of multiple emergency medical resources to the scene of an illness or injury based on initially available information and local operational policies. These may have varying levels of care capability (for example ALS and BLS, ground and air). Subsequent care or transportation, or both, of the patient is provided by the unit which most closely meets the patient's needs. A simultaneous response differs from a sequential response. F 1177, F30

single-action pressing, *n*—a method by which a powder is pressed in a stationary die between one moving and one fixed punch. B 243, B09

single axle load, [lb (kg)], *n*—the loads transmitted to the road surface by the tires of all wheels lying between two parallel transverse vertical planes 3.3 ft (1 m) apart, extending across the full width of the vehicle; a portion of the gross-vehicle weight. E 867, E17

single base, *adj*—in *lubricating grease*, relating to a thickener comprised of soaps of only one metal. D 4175, D02

single-beam spectrum, *n*—a spectrum determined through one physical path. E 131, E13

single-cased well—a monitoring well constructed with a riser but without an exterior casing. D 653, D18

single coil, *n*—a configuration where there is one coil with one diameter, the coil being either helical or concertina style.

F 1379, F14

single-component developer—see **single-component toner**.

F 335, F05

single-component toner—a dry powder in an electrostatic copying process that does not contain a carrier and is used to form a visible image.

F 335, F05

single fire—See *single fire* under **firing**.

C 242, C21

single-fluid atomizer—see **pressure atomizer**.

E 1620, E29

single-grained structure—see **soil structure**.

D 653, D18

single-impact damage, *n*—See **damage**.

G 40, G02

single input wire construction—a stranded conductor design which varies the number of wires within a range of conductor sizes in order to permit that range of conductor sizes to be constructed from wires of a single diameter.

B 354, B01

single island canopy—used for all types of cooking equipment in a single line island configuration. See *canopy*.

F 1827, F26

single-issue polygraph test, *n*—a PDD test in which the relevant questions cover the exact same issue. To be a single-issue polygraph test, the examinee must be able to answer the relevant questions either all truthfully, or all deceptively. An example would be the single-issue Zone Comparison Test.

E 2035, E52

single jet atomizer—see **plain jet atomizer**.

E 1620, E29

single-junction reference electrode—a reference electrode containing a single electrolyte. The electrolyte (1) provides a constant level of the ion sensed by the reversible reference element and (2) forms a low-junction potential liquid junction with the sample solution.

D 4127, D19

single-level pile, *adj*—*in floor coverings*, having all pile tufts at the same level.

D 123, D13

single-operator operational precision, SOOP, *n*—the standard deviation of the results of a series of determinations by a single operator employing the method with its associated sample container preparation, collection, splitting, preservation, transmission, and storage on a homogeneous sample.

D 1129, D19

single-operator precision—See **precision**.

D 1356, D22

single-pass internal reflection element—in internal reflection spectroscopy, an internal reflection element in which the radiant power transverses the length of the element only once; that is, the radiant power enters at one end of the optical element and leaves via the other end.

E 131, E13

single pass shred, *n*—a shredded tire that has been processed by one pass through a shear type shredder and the resulting pieces have not been classified by size.

D 5681, D34

single-phase thermosiphon—a passive heat transfer device, filled with a liquid or a gas, installed to remove heat from the ground.

D 7099, D18

single sampling, *n*—*in acceptance sampling*, a sampling plan for which the decision to accept or reject a lot is based on a single sample.

D 123, D13

single-sided griddle—See **griddle**.

F 1827, F26

single spread, *n*—see *single spread* under **spread**.

D 907, D14

single-stimulus method, *n*—any psychophysical method in which a judgment follows the presentation of only one stimulus at a time.

E 253, E18

single stitch zigzag, *n*—*in home sewing*, a simple machine stitch pattern made by the needle moving up and down and alternately from one side to the other while the fabric moves through the feed mechanism in either the forward or reverse direction with all segments having equal length.

D 123, D13

single stitch zigzag, *n*—*in home sewing*, a simple machine stitch pattern made by the needle moving up and down and alternately from one side to the other while the fabric moves through the feed mechanism in either the forward or reverse direction with all segments having equal length and equal width. (Compare **multiple stitch zigzag**.)

D 5646, D13

single-strand breaking force, *n*—*in tensile testing*, the breaking

force of one strand that follows a specified path, usually a straight line, between the clamps of a tensile testing machine. D 123, D13

single-strand breaking force, *n*—*in tensile testing*, the breaking force of one strand that follows a specified path, usually a straight line, between the clamps of a tensile testing machine. (Compare **breaking force**.)

D 4848, D13

single-strand strength, *n*—deprecated term. Use **single-strand breaking strength**.

D 4848, D13

single-strike film ribbon—an inked ribbon wherein the substrate is a plastic film material such as polyethylene, where each area of the ribbon is capable of producing only one image.

F 221, F05

single-strike paper ribbon—an inked ribbon wherein the substrate is paper, where each area of the ribbon is capable of producing only one image.

F 221, F05

singlet state—an electronic state with a total spin quantum number of zero.

E 131, E13

single twist, *n*—the amount of twist in each individual single yarn element in a tire cord structure based on the length of the element after twist has been removed from the cord.

D 123, D13

single twist, *n*—the amount of twist in each individual single yarn element in a tire cord structure based on the length of the element after twist has been removed from the cord.

D 6477, D13

single yarn, *n*—the simplest strand of textile material suitable for operations such as weaving, knitting, etc.

D 123, D13

single yarn—See *single yarn* under **yarn**.

D 3878, D30

single yarn, *n*—the simplest strand of textile material suitable for operations such as weaving, knitting, etc.

D 4849, D13

single zone, *n*—a space in which the pressure differences between any two places, as indicated on a manometer, differ by no more than 2.5 Pa (0.01 in. H₂O) during fan pressurization at a building pressure difference of 50 Pa (0.2 in. H₂O) and by no more than 5 % of the highest building pressure difference achieved.

skin—See **facing**.

E 631, E06

sink, *n*—as used in reference to indoor air quality, refers to a surface or material which absorbs, stores and releases energy or matter.

E 2114, E06

sinker—bright or coated, slender, regular-stock-steel, 1 1/8 by 0.067 to 5/8 by 0.244-in. nails with 1/64 to 1/2-in. sinker head and medium diamond point, with diameter of head smaller than that of cooler and common nail of same designation.

F 547, F16

sinker head—flat, slightly countersunk (115° to 130°) head, as found on sinkers and corker nails; smaller in diameter than head on cooler and common nails.

F 547, F16

sinking indentation—a hardness indentation around which the metal has been depressed below the plane of the specimen.

E 7, E04

sinter, *v*—to increase the bonding in a mass of powder or a compact by heating below the melting point of the main constituent.

B 243, B09

sinter—a ceramic material or mixture fired to less than complete fusion, resulting in a coherent mass, or the process involved.

C 242, C21

sinter crack, *n*—*in a rigid die system*, a defect that occurs during the sintering operation.

B 243, B09

sintered glass—glassware made by fusing glass particles.

C 162, C14

sinter forging, *n*—see **powder forging**.

B 243, B09

sintering, *n*—in catalysis, a reduction of the surface area of a catalyst carrier or other solid catalytic material caused by heat.

D 3766, D32

sintering time, *n*—the total elapsed time during which the P/M part/specimen is within (±) a specified percentage of the stated sintering temperature.

B 243, B09

sipe, *n*—a molded or cut rectangular void which is substantially narrower than the major grooves or voids.

F 538, F09

siphon nozzle—a pneumatic atomizer in which an air stream aspirates and atomizes liquid from a reservoir located beneath the nozzle.

E 1620, E29

sisal plier—See **plier**; **mattress blade**.

F 592, F16

site inspection (SI), *n*—an on-site investigation to determine whether a release or potential release exists and the nature of the associated threats. The purpose is to augment the data collected in the preliminary assessment and to generate, if necessary, sampling and other field data to determine whether further action or investigation is appropriate.

D 5681, D34

site remediation, *n*—those actions taken in the event of a release or threatened release of a hazardous substance in to the environment, to prevent or minimize the impact of the release, or to mitigate a substantial hazard to present or future environmental conditions. This early action may or may not lead to ultimate restoration of the site.

D 5681, D34

sitting spread, *n*—*in body measurements*, the circumference of the widest part of the hips with the subject seated.

D 123, D13

sixel encoding, *n*—a method of grouping data, so that each byte resembles a code for an ASCII character.

F 1457, F05

size, *v*—to repress a sintered compact to decrease the dimensional variation (not to be confused with **coin** or **restrike**).

B 243, B09

size—the representative dimension that best describes the extent in space of a particle, agglomerate, or aggregate.

C 242, C21

size, *n*—usually a liquid composition to prevent excessive absorption of all paints into plaster, old wall paint, and similar porous surfaces; also a liquid composition used as a first coat on metal to improve adhesion of succeeding coats (latter usage is limited to the metal decorating industry).

The terms **sealer** and **size** are almost synonymous, but usage has established certain differences. A **sealer** is ordinarily a thin varnish or clear lacquer and is usually applied on wood and metal surfaces. Ordinary painter's **size** is a thin solution of glue, starch or other water-soluble substance and is usually applied on plaster surfaces, but **size** used in metal decorating is a thin varnish.

D 16, D01

size, *n*—one of a series of graduated measurements in manufactured articles of clothing conventionally identified by numbers, letters, or words.

F 1494, F23

size characterization, *n*—the process by which information relating to the nature, extent, potential migration pathways, and receptors of environmental contaminants is gathered, interpreted, and documented. Site characterization efforts to provide a basis for the following: (1) the development of a conceptual site model (CSM), (2) the selection and design of a site remediation plan, or (3) the measuring point against which the effectiveness of a remedy can be evaluated, or some combination thereof.

D 5681, D34

size consist, *n*—the particle size distribution of a coal.

D 121, D05

size effect—influence of specimen size on its strength or other mechanical parameters.

D 653, D18

size factor—the factor included in deriving the allowable bending stress for rectangular members which takes into account the somewhat lower unit strength developed in larger members as compared to smaller members.

D 9, D07

size list, *n*—a list of all size names, in order from smallest to largest, for a particular style.

D 6963, D13

size name, *n*—a user defined name for a graded size.

D 6963, D13

size reduction device or equipment—a device which size reduces (Synonyms: shredder, grinder, pulverizer, and mill).

D 5681, D34

size (sizing), *n*—application of a material (sealer, size) to the surface of an adherend, prior to that of the adhesive, in order to reduce the absorbency of the adherend.

D 907, D14

size thresholds, *n*—the instrument's lower and upper size settings for the particular cell population; adjustable "size gate." Cells or fragments outside the size settings are excluded from the analyses.

F 2312, F04

sizing, *n*—a generic term for compounds which, when applied to yarn or fabric, form a more or less continuous solid film around the yarn and individual fibers. (See also **filler**.)

D 123, D13

sizing, *n*—the process of applying a material on a surface in order to fill pores and thus reduce the absorption of the subsequently applied adhesive or coating or to otherwise modify the surface

properties of the substrate to improve the adhesion, and also, the material used for this purpose. (Synonym *size*.) (See also **primer**.)

D 907, D14

sizing, *n*—the addition of materials to a papermaking furnish, or the application of materials to a surface or board, which results in a paper or board that exhibits some resistance to liquid penetration.

D 1968, D06

sizing, *n*—a generic term for compounds which, when applied to yarn or fabric, form a more or less continuous solid film around the yarn and individual fibers.

D 4850, D13

sizing agent—asphalt, rosin, wax, or other additive introduced to the stock for a fibrous-felted board, prior to forming, or added to the blend of particles and resin for a particle board, to increase water resistance.

D 1554, D07

sizing, **size**—an organic coating applied to glass fibers directly below a bushing to provide some or all of the following: abrasion resistance, lubricity, antistatic characteristics, and chemical bonding to a subsequent matrix.

C 162, C14

sizing system, *n*—*in garment construction*, a method of designating garment sizes.

D 123, D13

sizing system, *n*—a method of designating garment sizes.

D 5219, D13

skater's cracks—curvilinear cracks in a roofing membrane that appear to relate neither to the direction of application of the membrane components nor the substrate components.

D 1079, D08

skein, *n*—a continuous strand of yarn, wound on a hand or motorized reel.

D 123, D13

skein, *n*—a continuous strand of yarn, wound on a hand or motorized reel.

D 4849, D13

skein break factor, *n*—*in yarn testing*, the comparative breaking force of a skein of yarn adjusted for the linear density of the yarn expressed in an indirect system; the product of the breaking force of the skein and the yarn number expressed in an indirect system.

D 123, D13

skein break factor, *n*—the comparative breaking strength of a skein of yarn adjusted for the linear density of the yarn expressed in an indirect system; the product of the breaking strength of the skein and the yarn number expressed in an indirect system.

D 4848, D13

skein break factor, *n*—*in yarn testing*, the comparative breaking force of a skein of yarn adjusted for the linear density of the yarn expressed in an indirect system.

D 4849, D13

skein breaking force, *n*—the force required to rupture a skein of yarn. (See **skein strength**).

D 4849, D13

skein breaking tenacity, *n*—the skein breaking load divided by the product of the yarn number in a direct numbering system and the number of strands placed under tension.

D 123, D13

skein breaking tenacity, *n*—the skein breaking strength divided by the product of the yarn number in direct numbering system and the number of strands placed under tension.

D 4848, D13

skein loop-length, *n*—the inside length of a coil of yarn mounted vertically as measured under a specified force.

D 123, D13

skein loop-length, *n*—the inside length of a coil of yarn mounted vertically as measured under a specified force.

D 4849, D13

skein shrinkage, *n*—a measure of true or intrinsic yarn shrinkage not including crimp contraction.

D 123, D13

skein shrinkage, *n*—a measure of true or intrinsic yarn shrinkage not including crimp contraction.

D 4849, D13

skein strength, *n*—the force required to rupture a skein of yarn, expressed in units of force, as breaking force.

D 123, D13

skein strength, *n*—the ability or capacity of a skein of yarn to withstand the ultimate tensile force required for rupture. (See **skein breaking force**).

D 4849, D13

skew, *n*—a fabric condition resulting when filling yarns or knitted courses are angularly displaced from a line perpendicular to the edge or side of the fabric.

D 123, D13

skew, *n*—a fabric condition resulting when filling yarns or knitted

courses are angularly displaced from a line perpendicular to the edge or side of the fabric. **D 3990**, D13

skew, *n*—a fabric condition resulting when filling yarns or knitted courses are angularly displaced from a line perpendicular to the edge or side of the fabric. **D 4850**, D13

skew—rotational deviation from correct horizontal and vertical orientation; may apply to a single character, line, or entire document. **F 149**, F05

skew, *n*—rotation of a bar code symbol about an axis parallel to the symbol's length. **F 1294**, F05

ski afterbody—that portion of the ski aft of point *O*, a distance of $l_C/2$. **F 472**, F27

ski body—that portion of the ski within the dimensions of l_C . **F 472**, F27

ski body center—point *O*, which is located at a distance of $l_C/2 + l_T$ from the tail of the ski. **F 472**, F27

ski, *n*—one of a pair or series of parallel runners usually wood, affixed to the underside of **boxes**, **crates**, or an item to allow entry of truck forks, or to facilitate sliding. (Compare **rubbing strip**.) **D 996**, D10

skid box—See **box**. **D 996**, D10

skid number (friction number), *n*—the number that is used to report the results of a pavement skid test conducted in accordance with Test Method E 274. **E 867**, E17

skid number-percent normalized gradient, *n*—the speed gradient divided by the skid number, both at the same speed and multiplied by 100. The percent normalized gradient is usually designated by the symbol PNG_v , where *v* is the speed at which the percent normalized gradient is determined.

$$PNG_v = 100(G/SN)_v$$

E 867, E17

skid number (SN), *n*—slide braking coefficient multiplied by 100. **F 538**, F09

skid number-speed gradient, *n*—the slope of skid number versus speed multiplied by -1. The gradient is normally designated by the symbol G_v , where *v* is the speed at which the slope is determined, *SN* is the skid number, and *V* is the speed:

$$G_v = -(dSN/dV), \text{ that may be approximated by:}$$

$$-(SN_1 - SN_2)/(V_1 - V_2)$$

E 867, E17

skid platform—a single platform of wood, metal, plastic, or combination of these materials, elevated a short distance above the floor by runners or legs to facilitate mechanical handling. (Compare **pallet**.) **D 996**, D10

skid resistance (friction number), *n*—the ability of the traveled surface to prevent the loss of tire traction. **E 867**, E17

ski forebody—that portion forward of point *O*, a distance of $l_C/2$. **F 472**, F27

skim coat, calender, *n*—a layer of rubber compound applied to a fabric by pressure normal to the surface. **D 1566**, D11

skim coating (the act of), *n*—the process of applying a thin layer of rubber or rubber mix to a sheet material by means of a calender, without shear forces, between the rubber and the sheet. **D 1566**, D11

skimmer block—a partially submerged object near the exit end of a melting furnace, designed to (1) keep foam, unmelted batch, etc. from exiting the tank; (2) isolate atmospheres on either side; or (3) interrupt surface flow of glass from the melter, or combinations of these. **C 162**, C14

skim rubber, *n*—rubber obtained from the dilute latex that is separated during the concentration of natural rubber latex. **D 1566**, D11

skin, *n*—*in building construction*, a thin layer at the surface of a sealant, cellular rubber gasket, sealant backing, or joint filler that differs in physical properties from the material beneath it. **C 717**, C24

skin, *n*—a relatively dense layer at the surface of a cellular polymeric material. **D 883**, D20

skin—the pelt of a small animal, such as calf, pig, sheep, etc. Also used interchangeably with **hide**. **D 1517**, D31

skin, *n*—a relatively dense layer at the surface of a cellular polymeric material. **D 1566**, D11

skin—See **facing**. **E 1749**, E06

skin, *n*—a relatively dense layer at the surface of a cellular polymeric material. (D20) **F 412**, F17

skin, *n*—the outer integument or covering of the body, consisting of the dermis and the epidermis, and resting upon the subcutaneous tissues. **F 2312**, F04

skin allograft therapy, *n*—the treatment of skin wound or skin ulcer by the temporary topical application of skin allograft(s). **F 2312**, F04

skin, applied, *n*—a thin surface layer of elastomeric material applied to a cellular product. **D 1566**, D11

skin back—See **broken filament**. **D 3990**, D13

skin depth—see **depth of penetration**. **E 1316**, E07

skin effect—the phenomenon wherein the depth of penetration of electric currents into a conductor decreases as the frequency of the current is increased. At very high frequencies, the current flow is restricted to an extremely thin outer layer of the conductor. (See also **depth of penetration**.) **E 1316**, E07

skin effect—the phenomenon that causes the magnetization produced by alternating current to be contained near the surface of a ferromagnetic part. **E 1316**, E07

skin effect, magnetic—the nonuniform magnetodynamic term applies to the nonuniform distribution of induction existing at various points in the cross section of a magnetic core. Skin effect is produced primarily by eddy current phenomena and it increases with the frequency of ac excitation. It can ordinarily be neglected in testing at commercial power frequencies. **A 340**, A06

skin friction, *f* (FL⁻²)—the frictional resistance developed between soil and an element of structure. **D 653**, D18

skinogen, *n*—(Synonym—**biofilm**.) **D 4175**, D02

skin packaging—See **packaging**. **D 996**, D10

skin passed sheet, *n*—Synonym for **extra smooth sheet**. **A 902**, A05

skin replacement surgery, *n*—surgery that permanently replaces lost skin with healthy skin. **F 2312**, F04

skin substitute, *n*—a biomaterial, engineered tissue, or combination of biomaterials and cells or tissues that can be substituted for a skin allograft, a skin autograft, an epidermal autograft, or a dermal autograft in a clinical procedure. **F 2312**, F04

skin temperature, *n*—average temperature of a flat skin surface as measured from the *field of view* of an IR skin type thermometer, with an appropriate adjustments for skin emissivity. **E 344**, E20

skin wool—See **pulled, wool**. **D 4845**, D13

skip—an unsurfaced area on dressed lumber; sometimes designated as skip dressing. **D 9**, D07

skip—See **float**. **D 3990**, D13

skip distance—in angle beam examination, the distance along the test surface, from sound entry point to the point at which the sound returns to the same surface. It can be considered the top surface distance of a complete vee path of sound in the test material. **E 1316**, E07

skirt—continuous portion of the boom below the floats. **F 818**, F20

skirting leather—a specialized vegetable-tanned cattlehide leather used for skirts or hanging portions of saddles that come between the legs of a rider and the horse. **D 1517**, D31

ski size—**F 472**, F27

ski tail, T—the extreme rear edge of the ski. **F 472**, F27

ski tip, S—the extreme forward point or edge of the ski. **F 472**, F27

skiver—the grain split of a sheepskin used for hat sweatbands and small leather goods. **D 1517**, D31

skiving—cutting off a thin layer of leather to bring it to uniform thickness. **D 1517**, D31

skylight

skylight—flat glass installed at an angle greater than 15° from the vertical in a building exterior. **C 162, C14**

slab—a piece of stone produced by shaving or splitting in the first milling or quarrying operation. A slab has two parallel surfaces. **C 119, C18**

slab—in belting leather, the parts of a bend left after the centers are cut out. (See also **split**.) **D 1517, D31**

slabbing—the loosening and breaking away of relatively large flat pieces of rock from the excavated surface, either immediately after or some time after excavation. Often occurring as tensile breaks which can be recognized by the subconchoidal surfaces left on remaining rock surface. (ISRM) **D 653, D18**

slab glass—optical glass obtained by cutting or forming the chunk glass into plates or slabs. **C 162, C14**

slabjacking—in *grouting*, injection of grout under a concrete slab in order to raise it to a specified grade. **D 653, D18**

slack end, n—a warp yarn woven under insufficient tension. **D 123, D13**

slack end, n—a warp yarn woven under insufficient tension. (*Syn.* slack thread, slack warp) **D 3990, D13**

slack filling—See **slack pick**. **D 3990, D13**

slack pick, n—a single filling yarn woven under insufficient tension. **D 123, D13**

slack pick, n—a single filling yarn woven under insufficient tension. (*Syn.* loose pick, slack filling) **D 3990, D13**

slack quenching, n—the incomplete **hardening** of a steel object due to **quenching** from the austenitizing temperature at a rate slower than the **critical cooling rate** for the particular steel composition, resulting in the formation of one or more transformation products in addition to martensite. **A 941, A01**

slack selvage, n—slack ends in the fabric edge. **D 123, D13**

slack selvage, n—slack ends in the fabric edge. (*Syn.* baggy selvage, loose edge, stringy selvage, wavy selvage) **D 3990, D13**

slack tannage—(1) incompletely tanned leather, evidenced by a raw or undertanned streak in the central layer of a piece.

(2) A light tannage, that is, deliberately less than usual.

slack thread—See **slack end**. **D 3990, D13**

slack warp—See **slack end**. **D 3990, D13**

slag—partially fused mixture of spilled batch, overflowed glass, breeze coal, and clay from the sieve. **C 162, C14**

slag—the fused agglomerate which separates in metal melting and floats on the surface of the molten metal. (See also **blast-furnace slag**.) **D 1079, D08**

slag cement, n—a hydraulic cement consisting predominantly of ground, granulated blast-furnace slag. **C 219, C01**

slagging of refractories, n—destructive chemical reaction between refractories and external agencies at high temperatures resulting in the formation of a liquid. **C 71, C08**

slaking—the chemical reaction that produces hydrated lime when quicklime and water are mixed. **C 51, C07**

slaking—deterioration of rock on exposure to air or water. **D 653, D18**

slaking—the process of breaking up or sloughing when an indurated soil is immersed in water. **D 653, D18**

slam-off, n—in *wovenfabrics*, a distortion due to the entrapment of the filling carrier in the shed. **D 123, D13**

slam-off, n—in *wovenfabrics*, a distortion due to the entrapment of the filling carrier in the shed. (Compare **smash**) **D 3990, D13**

slant—a piece of vitrified clay pipe made so that one end has a plane of approximately 45° or 60° to its longitudinal axis. The end may be made with a contoured surface to fit another pipe. **C 896, C04**

slanted magazine—a magazine attached at an angle to tool; used for storing clips of slanted nails or staples. **F 592, F16**

slat, n—a thin flat strip of material used as a member of a **box, crate, pallet, basket**, or other similar structure. A basket **stave**. **D 996, D10**

slate—microcrystalline metamorphic rock most commonly derived from shale and composed mostly of micas, chlorite, and quartz. The micaceous minerals have a subparallel orientation and thus impart strong cleavage to the rock which allows the latter to be split into thin but tough sheets. **C 119, C18**

slater's cement, n—a type of caulking compound, usually gray in color, and used to cover exposed bolt heads or at the side and end laps of corrugated roofing and in other places where water-resistant putty-like material is desired. **C 1154, C17**

slaters' cement—a type of caulking compound, usually gray in color, and used to cover exposed bolt heads or at the side and end laps of corrugated roofing and in other places where water-resistant putty-like material is desired. **D 2946, C17**

slating nail—galvanized, regular-stock-steel, 1 by 0.106 to 2 by 0.148-in. nails with slightly countersunk 5/16 to 7/16-in. flat head and medium diamond point. Also, aluminum-alloy, 7/8 by 0.106 to 1 1/2 by 0.135-in. nails with large flat 5/16 to 3/8-in. head and medium diamond point. Also, solid copper, 7/8 by 0.109 to 3 by 0.148-in. nails with large flat head and medium diamond point. **F 547, F16**

slats—dried, untanned sheepskins, with little or no wool. **D 1517, D31**

sleek—an imperfection; a fine scratchlike mark having smooth boundaries, usually produced by a foreign particle in the polishing operation. **C 162, C14**

sleeve—a coupling which contains or compresses the sealing element and meets the requirements of the standard. The sleeve may be affixed to one end of the pipe at the factory. **C 896, C04**

sleeve, n—in *packaging*, a form, made of various materials and in various shapes, usually open at both ends, that is slipped over an item. **D 996, D10**

sleeve, n—(1) *inconcrete, masonry, or other construction*, a tubular section of sheet metal or other material placed to provide a pocket or opening for the insertion of a railing or other member. (2) an internal or external tubular splice between abutting sections of **pipe, tubing**, or similar members.

sliding glass door—See **windows and doors**.

slip joint—See **joint**.

slope, n—See **pitch**.

slump—See **block flow**.

small quantity—see **hazardous-waste small quantity generator**. **E 631, E06**

sleeved grout pipe—see **tube A manchette**. **D 653, D18**

sleeve interconnection, n—an interconnection in which an implant component passes through any opening that limits motion in one or more planes. **F 1582, F04**

sleeve, post—a specified length of tube or pipe set into a concrete wall, grade beam, or slab, into which fence posts are later placed. **F 552, F14**

sleeve roll-up—a sleeve carrier formed of flat canvas-like material in which a pair of sleeves is rolled lengthwise. **F 819, F18**

sleeves, n—the tubular fireclay shapes that encase an immersed metal rod in the valve assembly of a bottom-pouring ladle. **C 71, C08**

sleeve shoulder roll—the rolled or reinforced edge of an insulating sleeve nearest to the shoulder. **F 819, F18**

sleeve, top rail—a fitting used to join two pieces of top rail when a swedged top rail is not used. **F 552, F14**

sleeve-type reference electrode—a reference electrode in which the filling solution contacts the sample solution by means of a narrow ring-shaped opening between a removable outer sleeve and the inner body of the electrode. The space between the body and sleeve widens above the tip to form a reservoir for the filling solution. Sleeve-type electrodes provide exceptionally stable junction potentials, making them especially suitable for specific ion and precision pH measurements. The junction area, due to its size and the high-leak rate of the internal filling solution, does not easily become clogged. **D 4127, D19**

sleeving, n—braided, knitted, or woven fabric of cylindrical form

- having a width less than 100 mm (4 in.) (circumference less than 200 mm (8 in.)). (See also **tubing**.) **D 123, D13**
- sleeving, n**—braided, knitted, or woven fabric of cylindrical form having a width less than 100 mm (4 in.) (circumference less than 200 mm (8 in.)). **D 7018, D13**
- slenderness ratio, n**—the effective unsupported length of a uniform column divided by the least radius of gyration of the cross-sectional area. **E 6, E28**
- slender, slim nail**—nails with shank diameter usually at least one gage smaller than common nails of same length. **F 547, F16**
- sley, n**—the number of warp ends per 25 mm (1 inch) of fabric width, exclusive of selvage. **D 123, D13**
- sley, n**—the number of warp ends per 25 mm (1 in.) of fabric width, exclusive of selvage. **D 4850, D13**
- sliced veneer**—See under **veneer**. **D 1038, D07**
- slicer**—machine for producing veneer by slicing. **D 1038, D07**
- slide pump sprayer**—a sprayer consisting of a telescoping pump operated by both hands. On the outlet end of the pump is mounted a spray nozzle. On the inlet of the pump is attached a line leading to a container containing the spray solution. **E 1102, E35**
- slider**—that member of a sliding contact pair, normally the smaller, which may be moved through a range of locations on the opposing member. **B 542, B02**
- slider, n—in zippers**, the part that opens a zipper when it is moved in one direction and closes the zipper when it is moved in the opposite direction. **D 123, D13**
- slider, n**—the part that opens a zipper when it is moved in one direction and closes the zipper when it is moved in the opposite direction. **D 2050, D13**
- slider, automatic lock**—See **automatic lock slider**. **D 2050, D13**
- slider, cam lock**—See **cam lock slider**. **D 2050, D13**
- slider, flange lock**—See **flange lock slider**. **D 2050, D13**
- slider, pin lock**—See **pin lock slider**. **D 2050, D13**
- slider, ratchet lock**—See **ratchet lock slider**. **D 2050, D13**
- slider, releasing**—See **releasing slider**. **D 2050, D13**
- slide surface, n—in the rotor of an open-end spinning machine**, that part of the internal surface of the rotor on which the fibers are deposited and are caused to slide to the collecting surface. **D 123, D13**
- slide surface, n—in the rotor of an open-end spinning machine**, that part of the internal surface of the rotor on which the fibers are deposited and are caused to slide to the collecting surface. **D 3888, D13**
- sliding**—a defect in the draining characteristics of slip wherein patches of the coating slide, producing an uneven coating. **C 286, B08**
- sliding**—relative displacement of two bodies along a surface, without loss of contact between the bodies. (ISRM) **D 653, D18**
- sliding braking coefficient, n—of a tire**, the braking coefficient for a non-rotating tire that occurs after wheel lock-up. **F 538, F09**
- sliding electrical contacts**—contacting members that perform their function while undergoing relative tangential motion. **B 542, B02**
- sliding wear, n**—wear due to the relative motion in the tangential plane of contact between two solid bodies. **G 40, G02**
- slightly cloudy pyridine**—quantitative index of turbidity observed with aqueous solution of pyridine, the latter containing trace amounts of oil. **D 4790, D16**
- slime**—biological deposits of gelatinous or filamentous matter. **D 6161, D19**
- sling, n**—a runner. **F 1773, F08**
- slinger**—see **centrifugal atomizer**. **E 1620, E29**
- slinging, n**—see **spraying**. **D 6488, D01**
- sling psychrometer**—See **psychrometer**. **D 1356, D22**
- slip, n**—a suspension of clay and mineral particles in a water medium applied to a ceramic body that, when fired, may function as a glaze or an engobe. **C 43, C15**
- slip**—a slurry containing chemical additives to control rheology. **C 242, C21**
- slip**—translation of a portion of a crystal relative to the adjacent portion. **E 7, E04**
- slip**—displacement of an anchor with respect to the surrounding base material. **E 2265, E06**
- slip angle, n—of a tire**, the angle between the X' -axis and direction of travel of the center of tire contact. **F 538, F09**
- slip angle, critical, n**—the value of the slip angle at the maximum of lateral force coefficient. **F 538, F09**
- slip bands**—See **slip lines**. **E 7, E04**
- slip casting, n**—a method of forming metal or ceramic shapes by pouring a stabilized fluid suspension of powder, usually water based, into the shaped cavity of a fluid-absorbing mold, followed by debinding and sintering. **B 243, B09**
- slip casting**—See **drain casting** and **solid casting** under **casting**. **C 242, C21**
- slip coating**—a ceramic material or mixture other than a glaze, applied to a ceramic body and fired to the maturity required to develop specified characteristics. **C 242, C21**
- slipcover, n**—a removable, fitted protective textile cover, often decorative and specifically made for upholstered furniture. (See **furniture covering**.) **D 123, D13**
- slipcover, n**—a removable, fitted protective textile cover, often decorative and specifically made for upholstered furniture. (See **furniture covering**.) **D 7023, D13**
- slipe wool**—See **pulled, wool**. **D 4845, D13**
- slip-fiber**—asbestos that is located in, or derives from, veins or seams in which the fibers are oriented approximately parallel to each other and inclined at a small angle to the boundaries of the vein or seam and usually not as closely packed as are cross-fibers. **D 2946, C17**
- slip friction number, n**—the quotient of the longitudinal friction force in the road plane over the normal load force at any instant in time and location, multiplied by 100. **E 867, E17**
- slip glaze**—See **slip glaze** under **glaze**. **C 242, C21**
- slip joint**—a joint allowing axial sliding movement of joined parts. **E 631, E06**
- slip lines (slip bands)**—traces of slip planes observed at low magnifications on the polished surface of a crystal which has been deformed after polishing; since no differences in orientation exist, repolishing will remove the traces. With increasing resolving power and magnification, an individual line may be revealed as a series of parallel lines. The "line" which is visible at low magnifications is then described as a slip band. **E 7, E04**
- sliplining**—a method of inserting new pipe into an existing pipeline. **C 896, C04**
- slippage, n**—the movement of adherends with respect to each other during the bonding process. **D 907, D14**
- slippage**—relative lateral movement of adjacent components of a built-up membrane. It occurs mainly in roofing membranes on a slope, sometimes exposing the lower plies or even the base sheet to the weather. **D 1079, D08**
- slippage cracking, n**—cracking associated with the horizontal displacement of a localized area of the pavement surface. **E 867, E17**
- slippage cracking, n**—cracking associated with the horizontal displacement of a localized area of the pavement surface. **E 1778, E17**
- slipping layer, n**—a layer applied to a dye diffusion thermal transfer ribbon which promotes smooth flow of the ribbon through the printer. **F 1623, F05**
- slip planes**—in a given metal, slip occurs most easily along certain crystallographic planes. Hence, these planes are termed slip planes. **E 7, E04**
- slip process**—See **wet process** under **process**. **C 242, C21**
- slip resistance**—the frictional force opposing movement of an object across a surface. **C 242, C21**
- slip resistance**—frictional force opposing movement of an object

slip resistance

across a surface, usually with reference to the sole or heel of a shoe on a floor. **D 2825, D21**

slip resistance, n—the ability to counteract loss of traction. **F 141, F06**

slip resistance—resistance of sheet carbon to slippage when placed between multiple sheets of copy paper. **F 221, F05**

slip ring—a continuous metal ring by means of which electrical current can be conducted to or from brush contacts. One electrical contact member is designed to rotate with respect to the other. **B 542, B02**

slip ring assembly—two or more slip rings with connecting leads or terminals that have been mounted to a common structure. **B 542, B02**

slip ring capsule—an assembly that includes a slip ring assembly, brushes, and bearings for conducting current on multiple circuits from a stationary body to one that may rotate. **B 542, B02**

slip roll ink buildup, n—an undesirable accumulation of ink on the dampening rolls of a continuous type dampening system. **D 6488, D01**

slip (rupture) crack, n—*in a rigid die system*, a defect that occurs typically at the junction between levels of a multilevel part (occurs during the pressing cycle while powder is transferring from one level (area) to another). **B 243, B09**

slip, slurry—a suspension of finely divided ceramic material in liquid. **C 286, B08**

slipsole—a half-sole extending from the toe of the shoe to the shank on the bottom surface. **F 869, F08**

slip speed, n—the difference between the speed of the axis of the measuring wheel, which is equal to the traveling speed of the measuring device, and the tangential velocity measuring wheel with undeflected radius *r*. **E 867, E17**

slip-to-skid friction number, n—the value of the slip friction number at which the test wheel reaches zero rotational speed during a brake test. **E 867, E17**

slit—a narrow aperture, usually rectangular in shape. **E 7, E04**

slit failure—a form of brittle failure which exhibits only a very small crack through the wall of the pipe with no visible (to the naked eye) material deformation in the area of the break. **F 412, F17**

slit system—a group of two or more slits arranged to define a beam. **E 7, E04**

sliver—(slī-ver) a bundle of untwisted, substantially parallel glass fibers. **C 162, C14**

sliver, n—a continuous strand of loosely assembled fibers that is approximately uniform in cross-sectional area and without twist. **D 123, D13**

sliver—a continuous strand of loosely assembled fibers that is approximately uniform in cross-sectional area and without twist. **D 1695, D01**

sliver, n—a continuous strand of loosely assembled fibers that is approximately uniform in cross-sectional area and without twist. **D 4845, D13**

sliver, n—a continuous strand of loosely assembled fibers that is approximately uniform in cross-sectional area and without twist. **D 4849, D13**

sliver knitted fabric, n—a single-jersey fabric in which untwisted staple fibers are knitted in at each loop to form a pile surface on the technical back of the jersey structure. **D 123, D13**

sliver knitted fabric, n—a single-jersey fabric in which untwisted staple fibers are knitted in at each loop to form a pile surface on the technical back of the jersey structure. **D 7022, D13**

slivers—particles of nearly square or rectangular cross-section with a length parallel to the grain of the wood of at least four times the thickness. **D 1554, D07**

slope, n—*in roofing*, the incline of a roof expressed as a ratio of the height in millimetres (inches) of vertical rise per horizontal distance in metres (feet). **C 1154, C17**

slope—the excavated rock surface that is inclined to the vertical or horizontal, or both, as in an open-cut. (ISRM) **D 653, D18**

slope—the tangent of the angle between the roof surface and the horizontal plane, expressed as a percentage, or in inches of rise per foot of horizontal distance. (See also **incline**). **D 1079, D08**

slope—the incline of a roof expressed as a ratio of the height in millimetres (inches) of vertical rise per horizontal distance in metres (feet). **D 2946, C17**

slope—the angle between the horizontal axis and the line formed by plotting electrode potentials against ion level on semilogarithmic graph paper. By analogy, slope has also come to be a measure of electrode response to the ion being detected. Theoretical Nernstian slope, which is temperature-dependent, is 59.16 mV at 25°C for a ten-fold change in the activity of a monovalent ion and 29.58 mV for a divalent ion. Less than theoretical slopes (that is, smaller millivolt changes per decade) are observed if potentials are plotted against concentration, if interferences are present, or if liquid electrodes need renewal. Greater than theoretical slopes are relatively rare and usually indicate that more than one electrode process is occurring. **D 4127, D19**

slope—the ratio of rise (change in Y-axis) to run (change in X-axis) for a linear curve or tangent to a point on a non-linear curve. **E 2161, E37**

slope indicator, n—the rate of change of the slip friction number expressed as an angle near the peak slip friction number. **E 867, E17**

slot scanner, n—the scanning portion of a point-of-sale system embedded within a retail checkout counter. **F 1294, F05**

slot seam, n—a complex seam formed on the inside of the object, having a decorative seam underlay slightly visible from the face side held in place by two visible rows of stitching. **D 123, D13**

slot seam, n—*inhome sewing*, a complex seam formed on the inside of the product, having a decorative seam underlay slightly visible from the face side, and held in place by two visible rows of stitching. **D 4965, D13**

slotted head—head provided with cut or struck slot for insertion of screwdriver or to simulate head of wood screw. **F 547, F16**

slough-off, n—*inwoven fabrics*, a defect caused by several coils of yarn slipping off the filling bobbin simultaneously and being woven into the fabric in a group. **D 123, D13**

slough-off, n—*inwoven fabrics*, a defect caused by several coils of yarn slipping off the filling bobbin simultaneously and being woven into the fabric in a group. **D 3990, D13**

sloughs—a stagnant or sluggish channel of water in a flood plain. **D 4410, D19**

slow crack growth (SCG), n—subcritical crack growth (extension) which may result from, but is not restricted to, such mechanisms as environmentally-assisted stress corrosion or diffusive crack growth. **C 1145, C28**

slow stable crack extension [L]—a displacement controlled crack extension beyond the stretch zone width. The extension stops when the applied displacement is held constant. **E 1823, E08**

slow test—see **consolidated-drain test**. **D 653, D18**

slub, n—an abruptly thickened place in a yarn. (See **lump, piecing, slough-off, slug**. Compare **cockles**) **D 123, D13**

slub, n—an abruptly thickened place in a yarn. (*Syn.* **lump, piecing, slough-off, slug**) (Compare **cockles**) **D 3990, D13**

slub, n—an abruptly thickened place in a yarn. (*Syn.* **lump, piecing, slough-off, slug**. Compare **cockles**) **D 4849, D13**

sludge—a water charged sedimentary deposit. **D 653, D18**

sludge, n—a water-formed sedimentary deposit. **D 1129, D19**

sludge, n—an undesirable residue in rubber latex. **D 1566, D11**

sludge, n—*in internalcombustion engines*, a deposit, principally composed of insoluble resins and oxidation products from fuel combustion and the lubricant, that does not drain from engine parts but can be removed by wiping with a cloth. **D 4175, D02**

sludge, n—a precipitate or sediment from oxidized mineral oil and water. **D 4175, D02**

sludge, n—*in manualtransmissions and final drive axles*, a deposit principally composed of the lubricating oil and oxidation products

that do not drain from parts but can be removed by wiping with a cloth. **D 4175, D02**

sludge—any mixture of solids that settles out of solution. Sludges contain liquids that are not apparent as free liquids. **D 5681, D34**

sludge—a water-formed sedimentary deposit. **D 6161, D19**

sludge blanket—suspended bed of solids in a solids contact or sludge blanket clarifier. **D 6161, D19**

sluffing—a condition wherein scales peel off or become loose, either partially or entirely, from the pultrusion.

NOTE—This term is applied to an occurrence during the pultrusion process and is not to be confused with scraping, prying, or physically removing the scale from the pultrusion. “Sluffing” is sometimes spelled “sloughing”. **D 3918, D20**

slug—any nonfibrous glass in an insulating glass fiber product. **C 162, C14**

slug, *n*—in raw silk, a thickened place several times the diameter of the yarn, 3 mm (1/8 in.) or over in length. **D 123, D13**

slug—a volume of water or solid object used to induce a sudden change of head in a well. **D 653, D18**

slug, *n*—in glass, unattenuated particles of glass of substantially larger diameter than the average filament diameter. (*Syn.* lump, piecing, slough-off, slub) **D 3990, D13**

slug, *n*—in raw silk, a thickened place several times the diameter of the yarn three millimetres (3/8 in.) or over in length. **D 3990, D13**

slug, *n*—See **liquid jet**. **G 40, G02**

slugged bottom—See **heeltap**. **C 162, C14**

slump—a measure of consistency of freshly mixed concrete or grout. See also **slump test**. **D 653, D18**

slump—See **block flow**. **E 1749, E06**

slumping, *n*—the lack of shape retention of a molded part, during subsequent processing, because of the effect of gravity. **B 243, B09**

slumping—See **sagging**. **C 162, C14**

slump test—a test to determine consistency of slip whereby measurement is made of the spreading of a specified volume of slip over a flat plate. **C 286, B08**

slump test—the procedure for measuring slump (Test Method C 143). **D 653, D18**

slunk—the skin of an unborn or prematurely born animal, especially calf. **D 1517, D31**

slurring, *n*—slurring is a printing defect that occurs in offset printing, manifested as changes in the geometry of the halftone dots. **D 6488, D01**

slurry—a suspension of solids in water. **B 374, B08**

slurry—a prepared mixture consisting of a free-flowing suspension of undissolved solid(s) in a liquid medium; not a paste. **C 242, C21**

slurry, *n*—any pourable suspension of a high content of insoluble particulate solids in a liquid medium, most often water. **C 1145, C28**

slurry—a suspension of solid particles in a liquid that can be separated by filtration or sedimentation (does not include emulsions). **E 1547, E15**

slurry, *n*—a suspension of solids in liquid. **E 1620, E29**

slurry, *n*—a mixture of water and any finely divided insoluble material in suspension. **E 2201, E50**

slurry, *n*—a suspension of solid material in liquid (**C 242**) **G 40, G02**

slurry-broadcast resin monolithic surfacing—a flooring system whereby a dry inert filler is added to a catalyzed resin binder to yield a semi-flowable consistency. This mixture is then poured onto the substrate and spread to desired thickness, followed immediately by seeding the fresh surface to excess with a dry inert filler. Upon hardening, any unbonded filler is removed. The application may be repeated once or several times to yield a greater thickness of surfacing. A top coat may be applied. **C 904, C03**

slurry cutoff wall—a vertical barrier constructed by excavating a vertical slot under a bentonite slurry and backfilling it with

materials of low permeability for the purpose of the containment of the lateral flow of water and other fluids. **D 653, D18**

slurry grout—a fluid mixture of solids such as cement, sand, or clays in water. **D 653, D18**

slurry seal, *n*—an application of a fluid mixture of bituminous emulsion, fine aggregate, mineral filler, and water to an existing pavement. **D 8, D04**

slurry trench—a trench that is kept filled with a bentonite slurry during the excavation process to stabilize the walls of the trench. **D 653, D18**

slush grouting—application of cement slurry to surface rock as a means of filling cracks and surface irregularities or to prevent slaking; it is also applied to riprap to form grouted riprap. **D 653, D18**

slushing—the manipulation of dipped ware to distribute the slip uniformly and remove excess material. **C 286, B08**

small quantity—see **hazardous-waste small quantity generator**. **E 1605, E06**

small timbers—a term used mostly to designate square or near-square dimension and timber sizes over 2 and under 9 in. in nominal thickness. **D 9, D07**

smash, *n*—in wovenfabrics, a relatively large hole characterized by broken warp ends and floating picks. (Compare **slam-off**) **D 123, D13**

smash, *n*—in wovenfabrics, a relatively large hole characterized by broken warp ends and floating picks. (*Syn.* break-out) (Compare **slam-off**) **D 3990, D13**

SMBS—sodium metabisulfite, Na₂S₂O₅. **D 6161, D19**

smear fastness, *n*—the ability of an ink and substrate combination to resist ink transfer from a printed area to an unprinted area when swiped by objects or instruments. **F 1857, F05**

smear resistance—the ability of a polished surface to remain uncuffed when touched. **D 2825, D21**

smell, *n*—See **aroma**. **E 253, E18**

smelt—a specific batch or lot of frit. **C 286, B08**

smelter—a furnace in which the raw materials of a frit batch are melted. **C 242, C21**

smelter—a furnace in which the raw materials of the frit batch are melted. **C 286, B08**

smelter drippings—drippings of molten glassy material formed on the crown of the smelter. **C 286, B08**

smelt (*n*)—a specific batch or lot of frit. **C 242, C21**

smelt (*v*)—the act of melting a batch of frit. **C 242, C21**

smog, *n*—a term derived from smoke and fog, applied to extensive atmospheric contamination by aerosols, these aerosols arising partly through natural processes and partly from the activities of human subjects. **D 1356, D22**

smoke—in flat glass, streaked areas appearing as slight discoloration. **C 162, C14**

smoke, *n*—small gas-borne particles resulting from incomplete combustion, consisting predominantly of carbon and other combustible material, and present in sufficient quantity to be observable independently of the presence of other solids. **D 1356, D22**

smoke, *n*—the airborne solid and liquid particulates and gases evolved when a material undergoes pyrolysis or combustion. **E 176, E05**

smoke, *n*—the airborne solid and liquid particulates and gases evolved when a material undergoes pyrolysis or combustion. **E 176, E05**

smoked—(1) a term applied to the discoloring of glass in a reducing flame. **C 162, C14**

(2) glass covered with smoky film from open-fired lehrs. **C 162, C14**

smoke developed index, *n*—a comparative measure expressed as a dimensionless number, derived from measurements of smoke obscuration versus time in Test Method E 84. **E 176, E05**

smoke developed index, *n*—a number or classification indicating a

smoke developed index, *n*

comparative measure derived from smoke obscuration data collected during the test for surface burring characteristics.

E 176, E05

smoke obscuration, *n*—reduction of light transmission by smoke, as measured by light attenuation.

E 176, E05

smoke obscuration, *n*—reduction of light transmission by smoke, as measured by light attenuation.

E 176, E05

smoke obscuration, *n*—the reduction in visibility due to smoke (ISO Guide 52).

E 176, E05

smoke point, *n*—the maximum height of a smokeless flame of fuel burned in a wick-fed lamp.

D 4175, D02

smoke toxicity, *n*—the propensity of smoke to produce adverse biochemical or physiological effects. (See **smoke**.)

E 176, E05

SMOKE unit, *n*—the concentration of smoke particulates in a cubic metre of air that reduces the percent transmission of light through a 1-m path to 10 %. SMOKE = standard metric optical kinetic emission.

E 176, E05

smoldering, *n*—the combustion of a solid material without accompaniment of flame but generally with the production of smoke. (See also **afterglow** and **glow**.)

D 123, D13

smoldering, *n*—the combustion of a solid material without accompaniment of flame but generally with the production of smoke. (See also **afterglow** and **glow**.)

D 4391, D13

smoldering, *n*—combustion of a solid without flame, often evidenced by visible smoke.

E 176, E05

smooth—a non-reflective surface with a barely-visible surface pattern of random markings, produced by mechanical abrasion.

C 119, C18

smooth—{archaic} finely ground surface prior to polishing.

C 162, C14

smooth crack growth behavior—generally, crack extension in chevron-notch specimens which is characterized by slow, continuously advancing crack growth, and a relatively smooth force displacement record. However, any test behavior is automatically characterized as smooth crack-growth behavior unless it satisfies the conditions for crack-jump behavior.

E 1823, E08

smooth-edge carpet plywood strip nail—hardened-steel, $1\frac{1}{16}$ by 0.105-in. nail with countersunk flat $\frac{7}{32}$ -in. head and long diamond point.

F 547, F16

smooth finish, *n*—the surface texture resulting when faces are not altered or marked in the extrusion process, but are left as formed by the die.

C 43, C15

smoothing, *n*—a process in a CAD vendor's system that adds curve interpolation points to a curve. (See **curve interpolation point**.)

D 6963, D13

smoothing—XPS, a mathematical treatment of the data to reduce the noise.

E 673, E42

smoothness, *n*—a measure of the surface roughness or topography of a thermal substrate, critical for optimum printhead contact.

F 1623, F05

smooth-surfaced roof—a built-up roof without mineral aggregate surfacing.

D 1079, D08

smooth-trowel finish, *n*—a uniform finish free of grainy or coarse areas, trowel marks, or other avoidable imperfections.

C 11, C11

smooth - two - side hardboard (S2S)—hardboard produced from a dry mat pressed between two smooth hot platens.

D 1554, D07

smooth (-wall) blasting—a method of accurate perimeter blasting that leaves the remaining rock practically undamaged. Narrowly spaced and lightly charged blastholes, sometimes alternating with empty dummy holes, located along the breakline and fired simultaneously as the last round of the excavation. (ISRM)

D 653, D18

smudge—the tendency of an image to smear or streak onto an adjacent area when rubbed; involves the redeposition of abraded material.

F 221, F05

smudge—a coloration on the CF surface caused by contact with ruptured capsules on the CB surface.

F 549, F05

smudge resistance—the ability of an image to withstand smudging.

F 221, F05

smudging—the tendency of a developed electrostatic image to smear upon rubbing.

F 335, F05

SNA—abbreviation for **system network architecture**.

F 1457, F05

snag, *n*—*in fabrics*, a yarn or part of a yarn pulled or plucked from the surface.

D 123, D13

snag, *n*—*in fabrics*, a yarn or part of a yarn pulled or plucked from the surface.

D 3990, D13

snag, *n*—*in fabrics*, a yarn or part of a yarn pulled or plucked from the surface.

D 4850, D13

snagging resistance, *n*—*in fabrics*, the property of a fabric whereby yarns or parts of yarns are prevented or inhibited from being pulled or plucked from the surface.

D 123, D13

snagging resistance, *n*—*in fabrics*, the property of a fabric whereby yarns or parts of yarns are prevented or inhibited from being pulled or plucked from the surface.

D 4850, D13

snake, snaking—(1) progressive longitudinal cracking in continuous flat glass operation.

(2) *archaic*, variation in the width of the sheet during the sheet glass-drawing process.

(3) movement from side to side of the flat glass ribbon.

C 162, C14

snap—{archaic} a device for gripping a piece of formed glass for fire polishing and finishing.

C 162, C14

snap, *n*—vivid color imagery, high chroma color.

F 1857, F05

snap action, *n*—the force required to disengage a snap fastener resulting from a pull exerted perpendicular to the plane of material to which the snap fastener is attached.

D 123, D13

snap fastener, *n*—a device for attaching one material to another consisting of matching male and female parts, each of which is attached to a separate material so that the parts can be joined by a low compressive force and separated by a low perpendicular tensile force.

D 123, D13

snap temper, *n*—a precautionary interim stress-relieving treatment applied to a high-hardenability steel immediately after **quenching** to prevent cracking because of delay in **tempering** it at the prescribed higher temperature.

A 941, A01

snarl—See **kink**.

D 3990, D13

S-N curve—a plot of stress against the number of cycles to failure. The stress can be maximum stress, S_{max} ; minimum stress, S_{min} ; stress range, ΔS or S_r ; or alternating stress, S_a . The curve indicates the S-N relationship for a specified value of S_m , A , or R and a specified probability of survival. For N , a log scale is commonly used. For S , either a logarithmic or a linear scale is used.

E 1823, E08

S-N curve for *p* % survival—a curve fitted to the fatigue life for p % survival values at each of several stress levels. It is an estimate of the relationship between applied stress and the number of cycles-to-failure that p % of the population would survive where p may be any percent, such as 95, 90, and so forth.

E 1823, E08

S-N curve for 50 % survival—a curve fitted to the median values of fatigue life at each of several stress levels. It is an estimate of the relationship between applied stress and the number of cycles-to-failure that 50 % of the population would survive.

E 1823, E08

S-N diagram, *n*—a plot of stress against the number of cycles to failure. The stress can be maximum stress S_{max} , minimum stress S_{min} , stress range S or S_r , or alternating stress S_a . The diagram indicates the S-N relationship for a specified value of S_m (*mean stress*) A , or R (*load or stress ratio*), and a specified probability of survival. For N , a log scale is almost always used. For S , a linear scale is used most often, but a log scale is sometimes used.

F 1582, F04

Snell's law, *n*—the product of the sine of the angle of refraction by the refractive index of the refracting medium is equal to the product of the sine of the angle of incidence by the index of refraction of the medium containing the incident beam.

E 284, E12

- sniffing probe*—Same as **sampling probe**. E 1316, E07
- snip**—the area of a stone surface from which a chip has been dislodged. C 119, C18
- snipe*—See **machine bite**. D 9, D07
- snow, n**—a solid form of wet deposition composed of white or translucent ice crystals chiefly in complex hexagonal form and often agglomerated into snowflakes. D 1356, D22
- snow**—ice crystals precipitated from the atmosphere, mainly in complex hexagonal form, and often agglomerated into snowflakes. D 7099, D18
- snow anchor, n**—a device driven into or buried in snow to provide a belay or protection anchor. F 1773, F08
- snow ball*—See **fuzz ball**. D 3990, D13
- snowboard**—a single plane device ridden with a sideways stance with the feet somewhat perpendicular to the longitudinal axis of the device. The user slides on snow similar to the way a skier does, except with both feet attached to a single, wide ski. F 1107, F27
- snowboard afterbody**—that portion of the snowboard aft of Point *O*, a distance of $L_c/2$. F 1107, F27
- snowboard bindings (feet retainers)**—apparatuses that attach the rider's feet to the snowboard. The three types of snowboard bindings have been identified as follows:
- hard boot snowboard bindings*—these are designed to be used with hard boots, retaining the boots by means of attaching the boot sole to the binding.
- soft boot snowboard bindings*—these are designed to be used with soft boots, retaining the boots by means of binding straps across the toe and ankle areas.
- step-in snowboard bindings*—these are designed to be used with boots designed specifically for that binding. The boot and binding interlock by mechanical means. F 1107, F27
- snowboard body**—the portion of the snowboard within the dimension of L_c . F 1107, F27
- snowboard body center**—Point *O*, located a distance of $L_c/2 + L_t$ from the tail of the snowboard. F 1107, F27
- snowboard boots**—footwear appropriate for use with snowboard and snowboard bindings. The three types of snowboard boots have been identified as follows:
- hard snowboard boots*—plastic shell alpine ski-type outer boots with the inner boot consisting of an alpine ski boot-type bladder for comfort and warmth. They are designed to be used with hard boot snowboard bindings.
- soft snowboard boots*—outer boots typically consisting of a rubber or plastic lower portion and a leather or nylon upper portion; the inner boot consists of an alpine ski boot-type bladder for warmth and support. They are designed to be used with soft boot snowboard bindings.
- step-in snowboard boots*—these are defined to be used with bindings designed specifically for that boot. The boot and binding interlock by mechanical means. F 1107, F27
- snowboard forebody**—that portion forward of Point *O*, a distance of $L_c/2$. F 1107, F27
- snowboard longitudinal centerline**—(1) *symmetrical snowboard*: the longitudinal axis of symmetry; (2) *asymmetrical snowboard*: the longitudinal line that passes through the center of the insert pattern or through the manufacturer-indicated centers of binding mount areas on snowboard without inserts. F 1107, F27
- snowboard shoulder**—the widest point in the shovel section of the snowboard. F 1107, F27
- snowboard tail**—the extreme rear edge of the snowboard. F 1107, F27
- snowboard tip**—the extreme forward point of the snowboard. F 1107, F27
- snowboard width, W**—the horizontal perpendicular distance between two vertical parallel planes, placed on either edge of the snowboard, parallel to the longitudinal centerline of the snowboard. F 1107, F27
- snowcover**—the accumulation of fallen snow. D 7099, D18
- snowdrift**—an accumulation of wind-blown snow, often much thicker than the surrounding snowcover. D 7099, D18
- snow flaking, n**—the appearance of tiny, white unprinted specks (voids) in type or solids, or both, in offset printing that can be caused by excessive emulsification. D 6488, D01
- snow flaking, n**—small white spots in a printed area caused by the absence of ink. D 6488, D01
- snow, hard pack, n**—*in tire testing*, packed base without loose snow. F 538, F09
- snowline**—the boundary of a highland region in which snow never melts. D 7099, D18
- snow, medium hard pack, n**—*in tire testing*, packed base with some loose snow. F 538, F09
- snow, medium pack, n**—*in tire testing*, groomed packed base with 2.5 to 5.0 cm (1 to 2 in.) loose snow. F 538, F09
- snowmelt**—(1) melting of the snowcover; (2) the period during which the melting of the snowcover occurs at the end of winter. D 7099, D18
- snowpatch**—a relatively small area of snowcover, remaining after the snowmelt period. D 7099, D18
- snow, soft pack, n**—*in tire testing*, freshly fallen or deeply groomed base snow with 5.0 to 7.5 cm (2 to 3 in.) loose snow. F 538, F09
- snuffed top grain, top grain snuffed*—see **corrected grain**. D 1517, D31
- soaking, n**—prolonged holding at a selected temperature. A 941, A01
- soaking heat, n**—a test condition in which the specimen is completely immersed in an atmosphere maintained at a controlled temperature. C 168, C16
- soaking pit**—a conditioning furnace used to bring the glass in open pots to a uniform temperature for casting. C 162, C14
- soap, n**—a cleaning agent usually consisting of sodium or potassium salts of fatty acids. D 123, D13
- soap**—the product formed by the saponification or neutralization of fats, oils, waxes, rosins, or their acids with organic or inorganic bases.
- anhydrous soap*—soap, free of water and all other concomitants.
- blended soap (for example, blended palm oil soap)*—a soap in which more than half but not all of the fatty acid stock is from the source stated.
- built soap*—a mixture of soap and one or more builders containing not less than 50 % of anhydrous soap.
- neutral soap*—an essentially unbuilt soap substantially free from uncombined alkali or fatty matter.
- soap powder*—a mixture in powdered form of soap and one or more alkaline detergents, but composed principally of the latter.
- straight soap (for example, straight palm oil soap)*—a soap in which the fatty acid stock is solely from the source stated.
- superfatted soap*—a toilet soap containing any one or more of the following: unsaponified oils, fats (triglycerides), fatty acids, lanolin and its derivatives, fatty esters or alcohols, and similar agents. See **fatty matter, free**. D 459, D12
- soap, n**—a cleaning agent usually consisting of sodium or potassium salts of fatty acids. D 3136, D13
- soap, n**—*in lubricatinggrease*, a product formed in the saponification (neutralization) of fats, fatty acids, or esters by inorganic bases. D 4175, D02
- soap skimmings (tall oil), n**—the curd, not acidified or otherwise processed, skimmed from the black liquor of the alkaline paper pulp industry, from which tall oil is obtained. D 804, D01
- soapstone (steatite)**—a talc-rich rock with a characteristic slippery feel. Soapstone is quarried for special purposes, such as fireplaces and laboratory counter tops, because of its refractory nature and resistance to acids. C 119, C18
- socket**—the portion of a jointing system that is designed to accept a plain-end pipe or a spigot-end pipe. C 896, C04
- socket**—the portion of a jointing system that is designed to accept a plain-end pipe or spigot-end pipe. F 412, F17

socket end

socket end—the end portion of a piping component which is designed to accept a plain-end piping component or spigot-end piping component. **F 412, F17**

socket-fused joint—see **joint, socket-fused**. **F 412, F17**

socket welding (machine)—a joining technique for thermoplastic pipe whereby the joining surfaces of the pipe and the fitting are inserted into a heating mandrel that is equipped with appropriate sized male and female heater bushings. The surfaces are heated to the melt point, removed, and held together under pressure until fused. **C 904, C03**

sock lining—a piece of material placed over the entire insole on the inside of a shoe to protect the foot from stitches on the inside in certain types of constructions. **F 869, F08**

soda—an industrial term for sodium oxide (Na_2O). Loosely, a carbonate of sodium. **C 162, C14**

soda lime glass—an abbreviated term for soda-lime-silicate glass. **C 162, C14**

soda-lime-silicate glass—glass compositions containing soda (Na_2O), lime (CaO), and silica (SiO_2) as the main ingredients. **C 162, C14**

sodium carboxymethylcellulose—see **carboxymethylcellulose**. **D 1695, D01**

sodium cycle, n—the operation of a cation-exchange unit wherein the removal of specific cations from the influent water is accomplished by exchange with an equivalent amount of sodium ion from the exchange material. **D 1129, D19**

sodium rhodizonate method—for lead detection, use of a dilute solution of sodium rhodizonate to spot test a painted surface qualitatively for the presence of lead. **E 631, E06**

sodium rhodizonate method—for lead detection, use of a dilute solution of sodium rhodizonate to spot test a painted surface qualitatively for the presence of lead. **E 1605, E06**

sodium sulfide method—for lead detection, use of a dilute solution of sodium sulfide to spot test a painted surface qualitatively for the presence of lead. **E 631, E06**

sodium sulfide method—for lead detection, use of a dilute solution of sodium sulfide to spot test a painted surface qualitatively for the presence of lead. **E 1605, E06**

soft (as in soft asbestos)—description of asbestos with relatively high softness. **D 2946, C17**

softcopy, n—non-self-sustaining image. See **hardcopy**. **E 284, E12**

softener, n—a compounding material used to produce a mix of reduced viscosity, which facilitates incorporation of rubber additives. **D 1566, D11**

softener—water treatment equipment that uses a sodium based ion-exchange resin principally to remove cations as calcium and magnesium. **D 6161, D19**

softening—see **membranesoftening**. **D 6161, D19**

softening point—the temperature at which a bitumen becomes soft enough to flow as determined by an arbitrary, closely defined method. **D 1079, D08**

softening point drift—a change in the softening point during storage or application. (See also **fallback**). **D 1079, D08**

softening point (S.P.)—that temperature at which a glass fiber of uniform diameter elongates at a specific rate under its own weight when measured by Test Method C 338. The viscosity at the softening point depends on the density and surface tension. For example, for a glass of density 2.5 g/cm^3 and surface tension 300 dynes/cm, the softening point temperature corresponds to a viscosity of $10^{6.6} \text{ Pa} \cdot \text{s}$. **C 162, C14**

softening temperature—the temperature, under specified conditions, at which porcelain enamel or frit begins to flow. **C 286, B08**

softening temperature (ST), n—in reference to the fusibility of coal and coke ash according to Test Method D 1857, the temperature at which the cone has fused down to a spherical lump in which the height is equal to the width at the base. **D 121, D05**

softening temperature, ST, n—the temperature at which a pyromet-

ric cone has fused down to a spherical lump in which the height is equal to the width at the base. **D 5681, D34**

softening temperature, ST—the temperature at which the cone has fused down to a spherical lump in which the height is equal to the width at the base. **D 5681, D34**

soft fire—a flame with a deficiency of air. **C 162, C14**

soft glass—(1) a glass of relatively low viscosity at elevated temperatures.

(2) a glass with a low softening point.

(3) commonly refers to a glass easy to melt. **C 162, C14**

soft mica, n—mica which when slightly bent shows a tendency to delaminate. **D 1711, D09**

softness, n—in water, the relative absence of dissolved calcium, magnesium, and other salts that react with soluble soaps to form insoluble precipitates. (Compare **hardness**.) **D 123, D13**

softness—inherent property of asbestos implying a high degree of flexibility and low cohesion. **D 2946, C17**

soft window coverings, n—curtains, draperies, or other accessories on wall or window openings that are either lined or unlined and primarily constructed of textile fabrics. **D 123, D13**

soft window coverings, n—curtains, draperies, or other accessories on wall or window openings that are either lined or unlined and primarily constructed of textile fabrics. **D 7023, D13**

soft wire—wire that has been drawn or rolled to final size and then heated to remove the effects of cold working. **B 354, B01**

softwoods—generally, one of the botanical groups of trees that in most cases have needlelike or scalelike leaves; the conifers; also the wood produced by such trees. The term has no reference to the actual hardness of the wood. **D 9, D07**

soft (X-rays)—of long wavelength. **E 7, E04**

soil, n—of coatings, disfiguring foreign materials such as dirt, soot, or stain, other than microorganisms, deposited on or embedded in a dried film of applied coating material; also called *dirt*. **D 16, D01**

soil—solid foreign matter embedded in or adhered on the surface. **D 2825, D21**

soil, n—weathered, unconsolidated mineral or unconsolidated organic materials overlying parent geological substrates characteristic of terrestrial or wetland habitats. **E 943, E47**

soilability—the relative ease with which extraneous matter attaches to or builds up on the surface of a material. **C 286, B08**

soil aggregate, n—natural or prepared mixtures consisting predominantly of stone, gravel, or sand which contain a significant amount of minus 75- μm (No. 200) silt-clay material. **D 8, D04**

soilant, n—a discoloring substance with a dispersed color component that is not in solution, and therefore can cling to the surface of a coating without penetrating into the film. **D 16, D01**

soil application—application of chemical made primarily to the soil rather than to vegetation. **E 609, E35**

soil binder—see **binder**. **D 653, D18**

soil bioengineering, n—in erosion control, the applications of engineering practices and ecological principles to design and construct systems composed of plant materials, frequently in association with inert materials and manufactured products to repair past or prevent future soil erosion and shallow slope failures. **D 653, D18**

soil collection container—a container for holding and transporting the soil sample from the field to the laboratory. A sealable rigid walled container or a resealable plastic bag can be used. The internal volume must be sufficient to hold the entire collected sample. **E 631, E06**

soil compaction—see **compaction, soil**. **F 412, F17**

soil (earth)—sediments or other unconsolidated accumulations of solid particles produced by the physical and chemical disintegration of rocks, and which may or may not contain organic matter. **D 653, D18**

soiled cloth—see **artificially soiled cloth**. **D 459, D12**

soiled end, n—self-descriptive. **D 3990, D13**

soil-forming factors—factors, such as parent material, climate,

vegetation, topography, organisms, and time involved in the transformation of an original geologic deposit into a soil profile. **D 653, D18**

soil gas—vadose zone atmosphere. **D 653, D18**

soil horizon—see **horizon**. **D 653, D18**

soiling, *n*—for *pileym floor covering*, a process by which dirt and other foreign material becomes attached to the surface pile causing a change in appearance. **D 123, D13**

soiling, *n*—for *pileym floor covering*, a process by which dirt and other foreign material becomes attached to the surface pile causing a change in appearance. **D 6584, D13**

soil injection—the mechanical placement of a pesticide beneath the soil surface with a minimum disturbance of the soil. **E 609, E35**

soil injection—the mechanical placement of a pesticide beneath the soil surface with a minimum disturbance of the soil (see Definitions E 609). **E 1102, E35**

soil (in reference to detergency)—matter out of place. **D 459, D12**

soil-lead hazard, *n*—**bare soil** on the property surrounding the building that contains or is presumed to contain lead at a concentration equal to or exceeding limits set in regulations promulgated by authorities having jurisdiction. **E 1605, E06**

soil mechanics—the application of the laws and principles of mechanics and hydraulics to engineering problems dealing with soil as an engineering material. **D 653, D18**

soil modification, *n*—a change to the physical or chemical characteristics of soils. **E 2201, E50**

soil physics—the organized body of knowledge concerned with the physical characteristics of soil and with the methods employed in their determinations. **D 653, D18**

soil profile (profile)—vertical section of a soil, showing the nature and sequence of the various layers, as developed by deposition or weathering, or both. **D 653, D18**

soil-redeposition—deposition of removed soil on a surface during a cleaning process. **D 459, D12**

soil retention—the property of holding foreign matter in or on the surface after a cleaning process. **D 2825, D21**

soil retention agent—a substance that increases the time and agricultural or water remains in the targeted soil zone. **E 1519, E35**

soil stabilization—chemical or mechanical treatment designed to increase or maintain the stability of a mass of soil or otherwise to improve its engineering properties. **D 653, D18**

soil stabilization, *n*—a soil modification that improves the physical characteristics of soils. **E 2201, E50**

soil structure—the arrangement and state of aggregation of soil particles in a soil mass.

flocculent structure—an arrangement composed of flocs of soil particles instead of individual soil particles.

honeycomb structure—an arrangement of soil particles having a comparatively loose, stable structure resembling a honeycomb.

single-grained structure—an arrangement composed of individual soil particles; characteristic structure of coarse-grained soils. **D 653, D18**

soil suspension—highly diffused mixture of soil and water. **D 653, D18**

soil texture—see **gradation**. **D 653, D18**

soil-water pressure—the pressure on the water in a soil-water system, as measured by a piezometer for a saturated soil, or by a tensiometer for an unsaturated soil. **D 653, D18**

soil wedge—a wedge-shaped, downward-tapering, body of soil different in structure from the surrounding soil, which may be an ice wedge cast or produced by repeated frost cracking and filling with soil where no ice wedge was ever present. **D 7099, D18**

sol, *n*—a liquid dispersion of colloidal solid particles, commonly between 5 and 100 nm in size. **C 1145, C28**

solar, *adj*—(1) referring to radiometric quantities, indicates that the radiant flux involved has the sun as its source, or has the relative spectral distribution of solar flux. (2) referring to an optical

property, indicates a weighted average of the spectral property, with a standard solar spectral irradiance distribution as the weighting function. **E 772, E44**

solar azimuth angle, *n*—the angular distance measured clockwise from due north to the projection of the beam radiation on the horizontal plane. **G 113, G03**

solar constant, *n*—the total solar irradiance at normal incidence on a surface in free space at the earth's mean distance from the sun (1 AU). **E 349, E21**

solar constant—the total solar irradiance at normal incidence on a surface in free space at the earth's mean distance from the sun (1 AU = 1.496×10^{11} m).

NOTE—The current accepted value of the solar constant at 1 AU is $1366.1 \text{ W}\cdot\text{m}^{-2}$ and is subject to change. See Tables E 490. **E 772, E44**

solar cooling systems—the complete assembly of subsystems and components necessary to convert solar energy into other forms of energy for space cooling purposes. **E 772, E44**

solar degradation—(1) the process by which exposure to solar energy deteriorates the properties of materials and components; (2) The deterioration produced by exposure to solar energy. **E 772, E44**

solar energy—the radiant energy originating from the sun. Approximately 99 % of solar energy lies between wavelengths of 0.3 to 3.5 μm .

solar energy system—See **building subsystem**. **E 631, E06**

solar energy—the radiant energy originating from the sun. Approximately 99 % of solar energy lies between the wavelengths of 300 to 3500 nm. **E 772, E44**

solar energy system—a **building subsystem** to convert solar energy into thermal energy for space heating or cooling, water heating, or process energy. **E 631, E06**

solar energy system, active—a solar energy system that uses mechanical equipment (pumps, fans) that is not an integral part of a structure to collect and transfer thermal energy, either to the point of use or to be stored for later use. **E 772, E44**

solar energy system, drainback—a solar energy system in which the heat transfer fluid is drained out of the collector and exposed piping, and into a storage tank, a holding tank, or expansion tank in order to protect the collector and piping from damage due to freezing. **E 772, E44**

solar energy system, draindown—a solar energy system in which the heat transfer fluid is drained out of the collector and exposed piping to an external drain in order to protect the collector and piping from damage due to freezing. **E 772, E44**

solar energy system, hybrid—any solar energy system that combines the characteristics of two separate systems. Particularly, a solar energy system supplemented by a conventional energy system may be termed a hybrid system. **E 772, E44**

solar energy system, open—a solar energy system that has its storage tank exposed (open) to atmospheric pressure. **E 772, E44**

solar energy system, passive—a solar energy system that uses natural convection, conduction, or radiation to distribute thermal energy through a structure, or a portion of that structure within the limits of the indoor design temperature conditions. It can include movable components such as dampers, insulation, or blinds, which may be moved periodically either manually or automatically. **E 772, E44**

solar energy system, thermosiphon—a solar energy system in which the heat transfer fluid circulates by convection as the less dense, warm fluid rises and is displaced by the denser, cooler fluid. **E 772, E44**

solar flux—for these measurements, the direct and diffuse radiation from the sun received at ground level over the solar spectrum, expressed in watts per square metre. **E 631, E06**

solar fraction—ratio of the amount of input energy contributed by the solar energy system to the total input energy required for the application. **E 772, E44**

solar heating and cooling systems—the complete assembly of

solar heating and cooling systems

subsystems and components necessary to convert solar energy into thermal energy and use this energy in combination with auxiliary energy, where required, for combined heating and cooling purposes. **E 772, E44**

solar heating system—the complete assembly of subsystems and components necessary to convert solar energy into thermal energy and use this energy in combination with auxiliary energy, where required, for heating purposes. **E 772, E44**

solar irradiance, n —as related to natural weathering of materials, the irradiance of the sun incident on the earth's surface, having wavelengths between about 295 nm and 4050 nm (4.05 microns). **G 113, G03**

solar irradiance at a point of a surface, $E_s = d\Phi_s/dA$ —the quotient of the solar flux incident on an element of a surface containing the point, by the area of that element, measured in watts per square metre. **E 772, E44**

solar irradiance, average, E_s —the time integral of solar irradiance over a specified time period divided by the duration of that time period. **E 772, E44**

solar irradiance, diffuse, $E_s(d)$ —the downward scattered solar flux as received on a horizontal surface from a solid angle of 2π steradian (hemisphere) with the exception of a conical solid angle with a 100 milliradians (approximately 6°) included plane angle centered upon the sun's disk, measured in watts per square metre. **E 772, E44**

solar irradiance, direct, E_s —solar flux coming from the solid angle of the sun's disk incident on a surface perpendicular to the axis of that solid angle. In conventional instruments the acceptance cone includes a plane angle of about 6° . **E 772, E44**

solar irradiance duration—(1) a bright sunshine duration: time interval during which direct solar energy casts distinct shadows; (2) Geographically or topographically possible sunshine duration: maximum interval during which solar energy can reach a given surface. **E 772, E44**

solar irradiance, global $E_s(2\pi)$, n —solar irradiance received on an upward facing horizontal surface directly transmitted from the solid angle of the sun's disk or scattered in traversing the atmosphere, measured in watts per square metre. **G 113, G03**

solar irradiance, global, $E_s(2\pi)$ —solar irradiance received on an upward-facing horizontal surface directly from the solid angle of the sun's disk and scattered or diffusely reflected in traversing the atmosphere, measured in watts per square metre. **E 772, E44**

solar irradiance, infrared—as related to natural weathering of materials, terrestrial solar irradiance for which the wavelengths are longer than those for visible irradiance and shorter than about 4.05 microns. **G 113, G03**

solar irradiance, instantaneous—solar irradiance at a point in time measured in watts per square metre. **E 772, E44**

solar irradiance, ultraviolet, n —as related to natural weathering of materials, terrestrial solar irradiance for which the wavelengths are shorter than those for visible irradiance and longer than about 295 nm. **G 113, G03**

solar irradiance, visible, n —the portion of solar radiation capable of causing a visual sensation. **G 113, G03**

solar irradiation—see **radiant exposure**, the preferred term. **E 772, E44**

solarization—a change in appearance of glass as a result of exposure to sunlight. **C 162, C14**

solarization, v —change in transmittance, reflectance, or absorptance property of a material, such as glass, as a result of exposure to sunlight or other light sources. **G 113, G03**

solar noon—that instant of any day at which the sun reaches its zenith, or crosses the meridian. **E 772, E44**

solar radiation—see **solar energy**. **E 772, E44**

solar reflectance—the fraction of solar flux reflected by a surface. **E 631, E06**

solar rights—the legal right of a person who uses a solar energy device not to have his or her sunlight blocked by another person's new structure or foliage. **E 772, E44**

solar screening, n —of coated fiber glass yarn solar screening, a woven fabric that imparts a shielding or protection from light, heat, wind, and insects without excessive alteration or impairment of visual viewing, and that has a mesh in excess of 12 by 12 in. with a rib pattern in the warp direction formed by the weaving of two or more contiguous yarns with a minimum of space between such yarns followed by space equivalent to the width of one or more of the yarns in the rib. **D 123, D13**

solar screening, n —of coated fiber glass yarn solar screening, a woven fabric that imparts a shielding or protection from light, heat, wind, and insects without excessive alteration or impairment of visual viewing, and that has a mesh in excess of 12 by 12 with a rib pattern in the warp direction formed by the weaving of two or more contiguous yarns with a minimum of space between such yarns followed by space equivalent to the width of one or more of the yarns in the rib. **D 7018, D13**

solar spectrum—spectral distribution of typical terrestrial sunlight at air mass 1.5 as defined in Tables G 173 for direct normal or hemispherical. **E 772, E44**

solar thermal collector—see **collector, solar thermal**. **E 772, E44**

solar water heating system—the complete assembly of subsystems and components necessary to convert energy into thermal energy and use this energy in combination with auxiliary energy, where required, to provide hot water. **E 772, E44**

solar water heating system, direct—a solar water heating system in which the potable water passes directly from the water supply, through the collectors and storage, to the residential hot water supply. **E 772, E44**

solar water heating system, indirect—a solar water heating system in which a closed circulation loop isolates one fluid from contact with others in the system. This closed loop may contain a nonpotable fluid. **E 772, E44**

solderability—the capability of a metal to be wetted by solder. **B 846, B05**

solder embrittlement—reduction in ductility of a metal or alloy associated with local penetration by molten solder long grain boundaries. **E 7, E04**

solder sealing glass—a sealing glass characterized by a low softening point for use as an intermediate bonding material. **C 162, C14**

sole, n —the underside of the boot or rubber that would be in contact with the ground. **F 819, F18**

sole—the bottom of the foot or shoe. **F 869, F08**

sole leather butt bend—a double bend. **D 1517, D31**

solenoid—an electrical conductor formed into a coil. **E 1316, E07**

sol-gel membrane formation—multistep process for making membranes by a reaction between two chemically multifunctional materials, dissolved in a solvent, that results in a network structure with solvent retained in the network followed by heat treatment to achieve a desired pore structure. **D 6161, D19**

sol-gel processing, v —the chemical synthesis of oxides based on the hydrolysis of metal alkoxides to form sols and gels; as liquids, the sols are suitable for casting and infiltration. **C 1145, C28**

solid, n —(flammability regulations) a substance that has a viscosity greater than 1×10^3 St ($1 \times 10^{-1} \text{ m}^2\text{s}^{-1}$) at 104°F (40°C) or an equivalent viscosity at an agreed upon temperature. (This includes powders and granular materials.) **D 16, D01**

solid—a state of matter in which the relative motion of molecules is restricted and in which molecules tend to retain a definite fixed position relative to each other. A solid may be said to have a definite shape and volume. **E 1547, E15**

solid area, A' —the effective solid portion of the cross section of a core (perpendicular to the induction) which is composed of magnetic material. **A 340, A06**

solid bituminous material—one having a viscosity of over 1×10^5 cSt (mm^2/s) at 40°C or an equivalent viscosity at an agreed-upon temperature. This includes powders and granular materials. **D 1079, D08**

solid braid, n —in rope, a braided construction in which each strand alternately passes under and over one or more of the other strands

while all strands are rotating around the axis with the same direction of rotation. **D 123, D13**

solid casting—See *solid casting* under **casting**. **C 242, C21**

solid clincher—non-moving clincher. **F 592, F16**

solid-color, *adj*—not containing flake or gonioapparent pigments. **E 284, E12**

solid conductor—a conductor consisting of one wire. **B 354, B01**

solid conductor, *n*—a conductor consisting of one strand. **D 1711, D09**

solid cone atomizer—a cone atomizer in which a significant quantity of liquid is directed into the center region of the spray pattern. **E 1620, E29**

solid cone pattern, *n*—*Syn.* for **full cone pattern**. **E 1620, E29**

solid fiberboard—See **containerboard**. **D 996, D10**

solid flotation—boom that uses solid buoyant material for the flotation element. **F 818, F20**

solidification—a binding physical and chemical treatment process that transforms materials containing free liquids into a solid, soil-like, or clayey material. This solid material can be a monolithic block with structural integrity. **D 5681, D34**

solidification, *n*—the conversion of liquids, slurries or sludges into a material that can be more easily handled or compacted for disposal or use; a process for converting a liquid to a solidified material; fly ash is often used as a reagent or sorbent in a solidification process. **E 2201, E50**

solidification point, *n*—of *petroleum wax*, that temperature in the cooling curve of the wax where the slope of the curve first changes significantly as the wax sample changes from a liquid to a solid state. **D 4175, D02**

solidification point—an empirical constant defined as the temperature at which the liquid phase of a substance is in approximate equilibrium with a relatively small portion of the solid phase. **D 4790, D16**

solidification point of petroleum wax, *n*—that temperature in the cooling curve of the wax where the slope of the curve first changes significantly as the wax sample changes from a liquid to a solid state. **D 4175, D02**

solidification range—the temperature range between the liquidus and the solidus. **E 7, E04**

solidification shrinkage crack—a crack that forms, usually at elevated temperature because of the shrinkage stresses built up during solidification of a metal casting; a hot crack. **E 7, E04**

solidification temperature of a mold flux, *n*—the temperature at which, on cooling at a defined rate, there is a sudden change in the shape of the viscosity versus temperature curve and at which the mold flux starts to solidify. **C 71, C08**

solid impingement, *n*—impingement by solid particles. **G 40, G02**

solid impingement erosion, *n*—progressive loss of original material from a solid surface due to continued exposure to impacts by solid particles. (*Synonym*: **solid particle erosion, hard particle erosion**.) **G 40, G02**

solid masonry unit—unit whose net cross-sectional area in any plane parallel to the surface containing cores, cells, or deep frogs is 75 % or more of its gross cross-sectional area measured in the same plane. **C 1232, C15**

solid metal connector plate—metal connector plate without any prepunched or predrilled plate holes. **E 631, E06**

solid metal-coupon control specimen—solid metal connector plate sample of same material as metal connector plate under scrutiny of dimensions meeting the requirements of Test Methods E 8 (or other applicable standard or specification) without plate holes or integral plate projections.

space categories, *n* (catégories de locaux) (See also **floor area**):

assignable area, *n* (zoneassignable)—*floor areas* of a facility assigned to or available for assignment to occupant groups of functions, including interior walls, building columns, and building projections, and excluding circulation.

basement (sous-sol)—space partly below average grade having

less than one half of its clear height (measured from floor level to ceiling level) below average grade.

building core and service area, *n* (noyau d'un immeuble et aire de service)—**floor area** of a facility necessary for the general operation of a building that is not available for general occupancy, including: **primary circulation areas**, mechanical, electrical, telephone, and custodial rooms serving individual floors; toilet rooms, building lobbies and atria, stairways, elevators, vertical shafts and chases, loading docks; and also central, mechanical, electrical, telephone, and custodial spaces and penthouses, but excluding interstitial area.

building gross area, *n* (superficie brute d'un immeuble)—sum of the floor areas of a building included within the outside face of outer building wall for all stories.

building service area (aire deservice d'un immeuble)—Used preferred term **building core and service area**.

cellar (cave)—space wholly or partly below average grade have more than one half of its clear height (measured from floor level to ceiling level) below average grade.

circulation space—See **primary circulation; secondary circulation**.

primary circulation area (aire de circulation principale)—portion of a **building** that is a public corridor, lobby, or atrium; or is required for access by all occupants on a floor to stairs, elevators, toilet rooms, or building entrances.

secondary circulation area (aire de circulation secondaire)—portion of a **building** required for access to some subdivision of space, whether bounded by walls or not, that does not serve all **occupants** on a **floor**, and that is not defined as **primary circulation area**.

support space (locauxde soutien)—(*in offices*) part of **usable area** not assigned or dedicated to a specific task or function. Support space includes meeting rooms, waiting areas, storage, lounges, operational equipment (for example, computer rooms), copy areas, libraries, and similar areas.

usable area, *n* (superficieutilisable)—**floor area** of a facility assigned to, or available for assignment to, occupant groups or functions, including interior walls, building columns and projections, and **secondary circulation**.

workplace (poste de travail)—part of a **usable area**, intended for an individual or group to work in.

workspace (aire de travail)—part of **usable area**, intended for a specific function or type of work.

workstation (poste detravail) (aménagement ouvert)—all or part of a **workplace**, suitable for carrying out one function or type of work. **E 631, E06**

solid mopping—See **mopping**. **D 1079, D08**

solid particle erosion, *n*—Synonym for *solid impingement erosion*. **G 40, G02**

solid-phase chemical dosimeter—plastic, dyed plastic, or glass whose optical density, usually in the visible range, changes when exposed to ionizing radiation. Examples that are in use include dyed polymethylmethacrylate (red perspex), undyed poly(vinyl) chloride (PVC), dyed polyamide (blue dye in Nylon matrix), and dyed polychlorostyrene (green dye in chlorostyrene matrix). It is generally considered to be a secondary standard dosimetry system. **E 170, E10**

solids—two types of solids are present in mash. First, insoluble solids are present as solid matter present in the liquid portion of the mash. Secondly, soluble solids are dissolved in the liquid portion of the mash. **E 1705, E48**

solids concentration, *n*—the ratio, expressed as a percent, of the weight (mass) of solids to the sum of the weight of solids plus water. **D 121, D05**

solids contact clarifier—water treating device used in lime softening, waste water treatment and coagulation processes. **D 6161, D19**

solids content, *n*—the percentage by weight of the nonvolatile matter in an adhesive. (See **nonvolatile content**.) **D 907, D14**

solids loading ratio

solids loading ratio—the mass of solid particles per unit volume of mixture in a solid impingement environment. **G 40, G02**

solids loading ratio, *n*—See **particle concentration**. **G 40, G02**

solid solution—a solid phase in which the composition and properties including lattice parameter can vary continuously without changing the crystal structure; a primary or terminal solid solution is limited by and has the crystal structures of a pure metal, a secondary or intermediate solid solution has the basic crystal structure of an intermetallic compound but does not necessarily include its stoichiometric composition. **E 7, E04**

solid-state sintering, *v*—sintering of a powder or compact without formation of a liquid phase. **B 243, B09**

solid state track recorder (SSTR)—a plastic, mineral, or emulsion material that records the passage of energetic ionizing particles as latent tracks that may be chemically enlarged or developed for microscopy or other techniques. **E 170, E10**

solidus, *n*—the highest temperature at which under equilibrium conditions an alloy begins to melt on heating or is completely solid on cooling. **B 899, B02**

solidus—the locus of points in a phase diagram, representing the temperature, under equilibrium conditions, at which each composition in the system begins to melt during heating, or completes freezing during cooling. **E 7, E04**

solidus—locus of points in a phase diagram representing the temperature, under equilibrium conditions, at which each composition in a system begins to melt during heating or completes freezing during cooling. (**E 7, E04**). **E 1142, E37**

solid vinyl flooring, *n*—See **homogeneous vinyl flooring**. **F 141, F06**

solid vinyl tile, *n*—a resilient tile flooring composed of binder, fillers and pigments compounded with suitable stabilizers and processing aids. The tile meets requirements of Specification F 1700. The binder consists of polymers and/or copolymers of vinyl chloride, other modifying resins, and plasticizers which comprise at least 34 % by weight of the finished tile. The polymers and copolymers of vinyl chloride comprise at least 60 % of the weight of the binder. **F 141, F06**

solid waste—discarded solid materials, excluding recovered materials. **D 1968, D06**

solid waste composition or waste composition—the characterization of solid waste as represented by a breakdown of the mixture into specified waste components on the basis of mass fraction or of weight percent. **D 5681, D34**

solid waste disposal site—a place, location, tract of land, area, or premises used for the disposal of solid wastes as defined by state solid waste regulations. The term is synonymous with the term landfill and is also known as a garbage dump, trash dump, or similar term. **D 5681, D34**

solid waste stream, *n*—discarded material moving from the point of discard to ultimate disposition. **D 1968, D06**

solifluction—the process of slow, gravitational, down-slope movement of saturated, non-frozen earth material behaving as a viscous mass over a surface of frozen material. Solifluction features lobes, stripes, sheets, and terraces. **D 7099, D18**

solifluction apron—a fan-like deposit at the base of a slope, produced by solifluction. **D 7099, D18**

solifluction features—geomorphological features, of varying scale, produced by the process of solifluction. These include: aprons, lobes, sheets, and terraces. **D 7099, D18**

solifluction lobe—an isolated tongue-shaped solifluction feature formed by rapid solifluction on certain sections of a slope which exhibit variations in gradient. It is to be noted that the NSDIC definition includes dimensions of up to 25 m wide and 150 m or more long. **D 7099, D18**

solifluction sheet—a broad deposit of non-sorted, water-saturated, locally derived materials that is moving, or has moved, downslope. **D 7099, D18**

solifluction terrace—a low step, or bench, with a straight or lobate

front, the latter reflecting local differences in the rate of solifluction movement. **D 7099, D18**

soller slit—a slit containing a set of thin, closely spaced, parallel metal plates used for the purpose of largely eliminating convergent and divergent rays. **E 7, E04**

soloing, *n*—a technique of climbing where the climber is alone. A belay may or may not be used. **F 1773, F08**

solubility—the extent that one material will dissolve in another, generally expressed as mass percent, or as volume percent or parts per 100 parts of solvent by mass or volume. The temperature should be specified. **D 3064, D10**

solubility, *n*—a measure of the extent to which the material can be dissolved. **F 2312, F04**

solubility, excessive—the tendency of a porcelain enamel frit to dissolve, as a function of time and temperature, in the medium in which it is present in amounts sufficient to adversely affect the rheology of the porcelain enamel slip. **C 286, B08**

solubility parameter, *n*—of liquids, the square root of the heat of vaporization minus work of vaporization (cohesive energy density), per unit volume of liquid, at 298 K. **D 4175, D02**

solubility product— $[M^+]^a[X^-]^b/[MX]$ where the brackets indicate the concentrations of the components of the ionization equilibrium $M_aX_b \rightleftharpoons aM^+ + bX^-$. For sparingly soluble salts [MX] is essentially unity. **D 6161, D19**

soluble iron—the determination of “soluble iron” used in this test method corresponds operationally to the “complexed and dissolved” iron determination described by Vuorinen et al. in their study of the species of iron released from pyrite oxidation by *T. ferrooxidans*. They found that values of complexed and dissolved iron corresponded closely with “total iron” as determined after hot sulfuric acid digestion of samples, particularly at 1 to 2 % pulp density. **E 1705, E48**

soluble oil, *n*—an oil-rich concentrate that will mix with water to form an emulsion imparting such properties as lubrication, cooling, and corrosion inhibition. **D 4175, D02**

soluble oil, *n*—a combination of mineral oil base and one or more polar organic materials, such as petroleum sulfonates, sulfated vegetable oils, and fatty acids or their salts. **D 4725, D15**

solute—chemical species (for example, ion, molecule, etc.) in solution. **D 5681, D34**

solute phase—a condition of contaminant residence in which contaminants are dissolved in ground water in either the saturated or the vadose zone. **D 653, D18**

solutes—matter dissolved in a solvent. **D 6161, D19**

solution, *n*—a homogeneous or single-phase, variable-composition mixture of one substance (solute) in another (solvent), in which the former is dispersed as separated molecules, ions, or atoms. The solvent or the solution may be solid, liquid, or gas. **C 1145, C28**

solution—in a chemical system, a phase existing over a range of composition. **E 7, E04**

solution annealing—heating an austenitic stainless steel to a temperature that puts the carbides into solution. The steel is held at this temperature long enough to achieve grain growth. It is then quenched in a medium for fast cooling, which prevents most of the carbides from reprecipitating. The process achieves optimum creep strength. **F 1789, F16**

solution cavern—openings in rock masses formed by moving water carrying away soluble materials. **D 653, D18**

solution coating—in flexible barrier materials, (1) a process in which a substrate is covered with a homogeneous solution containing the coating material, followed by removal of the (usually organic) solvent(s). (2) Also, the product resulting from such a process. **F 17, F02**

solution coating—See Terminology F 17. **F 1327, F02**

solution-diffusion—molecular-scale process in which penetrant is sorbed into the upstream membrane far from the external phase, moves by molecular diffusion in the membrane to the downstream face and leaves into the external gas, vapor or liquid phase in contact with the membrane. **D 6161, D19**

solution heat treatment, *n*—heating a steel object to a suitable temperature, holding it at that temperature long enough to cause one or more constituents to enter into solid solution, and then cooling it rapidly enough to hold such constituents in solution.

A 941, A01

solution heat treatment—a thermal treatment of a product to put alloying elements into solution in the base metal by heating into the temperature range of solid solubility, followed by cooling at a sufficient rate to retain them in a supersaturated solid solution.

B 846, B05

solution polymerization, *n*—process in which monomers dissolved in a common solvent react to form a polymer.

D 1566, D11

solution treat—see *annealing, solution annealing*.

F 1789, F16

solvent, *n*—any liquid used to dissolve another material.

D 123, D13

solvent—the liquid part of an aerosol formulation used to dissolve solid or other liquid parts.

D 3064, D10

solvent, *n*—any liquid used to dissolve another material.

D 5253, D13

solvent—a chemical compound that is capable of dissolving another substance and a hazardous substance, used in a number of manufacturing/industrial processes including but not limited to the manufacture of paints and coatings for industrial and household purposes, equipment clean-up, and surface degreasing in metal fabricating industries.

D 5681, D34

solvent—here defined as water.

D 6161, D19

solvent—a liquid that can dissolve another substance.

E 609, E35

solvent, *n*—an inorganic or organic liquid used as a vehicle for the preparation of solutions or suspensions in the manufacture of an intermediate, API, or drug product.

E 2363, E55

solvent-activated adhesive, *n*—a dry adhesive on an adherend that is rendered tacky just prior to use by application of a solvent.

D 907, D14

solvent adhesive, *n*—an adhesive having a volatile organic liquid as a vehicle.

D 907, D14

solvent cement—an adhesive made by dissolving a plastic resin or compound in a suitable solvent or mixture of solvents. The solvent cement dissolves the surfaces of the pipe and fittings to form a bond between the mating surfaces provided the proper cement is used for the particular materials and proper techniques are followed.

F 412, F17

solvent-cemented joint—see *joint, solvent-cemented*.

F 412, F17

solvent cementing—making a pipe joint with a solvent cement. (See *solvent cement*.)

F 412, F17

solvent cement joint—a joint made by using a solvent cement to unite the components.

F 412, F17

solvent extraction—a process used in refining some mineral insulating oils in which an unrefined or a partially refined petroleum distillate is contacted countercurrently with an immiscible solvent so as to selectively remove undesirable materials from the mineral oil.

D 2864, D27

solvent holdout—the degree to which a paper base or other substrate can resist penetration of organic liquids either during coating or in the process of liquid development.

F 335, F05

solvent joint—a joint made by using a solvent to unite the components.

F 412, F17

solvent relative humidity, *n*—the humidity of air over a drycleaning bath and in equilibrium with the solvent and its small amount of water.

D 123, D13

solvent relative humidity, *n*—the humidity of air over a drycleaning bath and in equilibrium with the solvent and its small amount of water.

D 3136, D13

solvent remover—a volatile liquid penetrant used to remove excess penetrant from the surface being examined.

E 1316, E07

solvent resistance—a measure of the inertness of base papers and coatings toward the solvent used in the electrostatic coatings and liquid toner systems.

F 335, F05

solvent-soluble material in paper, *n*—the mass of material that can be extracted from a dry specimen by a specified solvent under

prescribed conditions, expressed as a percentage of the original dry mass.

D 1711, D09

solvent tannage—a tanning system utilizing organic solvents, such as acetone, in place of water to carry the tanning agents.

D 1517, D31

solvus—the locus of points in a phase diagram, representing the temperature, under equilibrium conditions, at which each composition of a solid phase becomes capable of coexistence with another solid phase, that is, a solid-solubility limit. Usually applied to the terminal solid solution.

E 7, E04

solvus—locus of points in a phase diagram representing the temperature under equilibrium conditions at which each composition of a solid phase becomes capable of coexistence with another solid phase, that is, a solid-solubility limit usually applied to the terminal solid solution.

E 1142, E37

somatic cell, *n*—is any cell other than a germ or stem cell. Somatic cells may be used as a component of a TEMP.

F 2312, F04

somatic cell therapy, *n*—“is the prevention, treatment, cure, diagnosis, or mitigation of disease or injuries in humans by the administration of autologous, allogeneic, or xenogeneic cells that have been manipulated or altered *ex vivo*. Manufacture of products for somatic cell therapy involves the *ex vivo* propagation, expansion, selection, or pharmacologic treatment of cells, or other alteration of their biological characteristics.” For the purposes of TEMPs somatic cell therapy technologies can be applied in tissue engineering to generate TEMPs, for human and non-human use.

F 2312, F04

somatic cell therapy products, *n*—“are defined as autologous (that is, self), allogeneic (that is, intra-species), or xenogeneic (that is, inter-species) cells that have been propagated, expanded, selected, pharmacologically treated, or otherwise altered in biological characteristics *ex vivo* to be administered to humans and applicable to the prevention, treatment, cure, diagnosis, or mitigation of disease or injuries.” Somatic cell therapy products may be used as a component of a TEMP.

F 2312, F04

sonde, *n*—an elongate cylindrical tool assembly used in a borehole to acquire a geophysical log.

D 121, D05

sonic anemometer/thermometer, *n*—an instrument consisting of a transducer array containing paired sets of acoustic transmitters and receivers, a system clock, and microprocessor circuitry to measure intervals of time between transmission and reception of sound pulses.

D 1356, D22

sonication, *n*—the act of subjecting a material to the shearing forces of high-frequency sound waves.

D 4175, D02

sonication, *n*—the act of subjecting a material to the shearing forces of high-frequency sound waves.

D 6384, D02

sonic nozzle—a pneumatic or vibratory atomizer in which energy is imparted, at frequencies below 20 kHz, to the liquid.

NOTE—For frequencies greater than 20 kHz, see *ultrasonicnozzle*.

NOTE—Alternatively, a pneumatic atomizer in which gas velocities reach or exceed the local speed of sound.

E 1620, E29

sonic temperature—See *temperature*.

D 1356, D22

sonic-whistle atomizer—a pneumatic type of sonic or ultrasonic nozzle.

E 1620, E29

soot, *n*—agglomerations of particles of carbon impregnated with tar, formed in the incomplete combustion of carbonaceous material.

D 1356, D22

soot, *n*—in *internalcombustion engines*, sub-micron size particles, primarily carbon, created in the combustion chamber as products of incomplete combustion.

D 4175, D02

soot fall—See *particle fall*.

D 1356, D22

sorbate—chemical species sorbed by a sorbent.

D 5681, D34

sorbed phase—a condition of contaminant residence in which contaminants are adsorbed into the surface of soil particles or absorbed by soil organic matter.

D 653, D18

sorbent, *n*—a solid or liquid medium in or upon which materials are collected by absorption, adsorption, or chemisorption.

D 1356, D22

sorbent

sorbent—a substance that sorbs the solute from solution (for example, soil, sediment, till, etc.). **D 5681, D34**

sorbent, n—a chemical compound that is added to the gas side of the steam generator to reduce (sorb) emissions; a substance that decreases the concentration or availability of another substance by a sorption mechanism such as absorption and/or adsorption; a material that is used to soak up free liquids by either adsorption or absorption or both. **E 2201, E50**

sorbent boom—sorbent material contained or arranged in the form of a long cylinder. **F 818, F20**

sorbent sampling, n—the collection of chemicals from an air or emission sample by allowing the air or emissions to contact a sorbent. **D 1356, D22**

sorbite—an aggregate of carbide and ferrite produced by tempering martensite at temperatures in the vicinity of 600°C and which may be resolved readily at relatively low magnification (for example, 500×).

(Contemporary) With reference to tool steels, an aggregate of carbide and ferrite produced by cooling at a rate too slow for martensite formation and too fast for pearlite formation. **E 7, E04**

sorption, n—in general, the taking up of some substance (sorbate) into or on the surface of another (sorbent), without specification of the type of process. **C 1145, C28**

sorption, n—the process of taking up or holding a material by adsorption or absorption, or both. **D 123, D13**

sorption, n—a process by which one material (the sorbent) takes up and retains another material (the sorbate) by the processes of absorption, adsorption, or chemisorption. **D 1356, D22**

sorption—a process in which molecules of a fluid are taken up by absorption or adsorption, or both. **D 2652, D28**

sorption, n—the process of taking up or holding a material by adsorption, absorption, or both. **D4920, D13**

sorption—depletion of an amount of solute initially present in solution by a sorbent. **D 5681, D34**

sorption—the taking up of gas by absorption, adsorption, chemisorption, or any combination of these processes. **E 1316, E07**

sorption affinity—the relative degree of sorption that occurs by a geomedia. **D 5681, D34**

sorted circle—a form of patterned ground that is equi-dimensional in several directions, with a dominantly circular outline, and a sorted appearance commonly due to a border of stones surrounding a central area of finer material. **D 7099, D18**

sorted net—a form of patterned ground with cells that are equi-dimensional in several directions, neither dominantly circular nor polygonal, and with a sorted appearance commonly due to borders of stones surrounding central areas of finer material. **D 7099, D18**

sorted polygon—a form of patterned ground that is equi-dimensional in several directions, with a dominantly polygonal outline, and a sorted appearance commonly due to a border of stones surrounding a central area of finer material. **D 7099, D18**

sorted step—a form of patterned ground with a step-like form and a downslope border of stones embanking on an area of relatively fine-grained bare ground upslope. **D 7099, D18**

sorted stripe—a form of patterned ground with a striped and sorted appearance due to parallel strips of stones and intervening strips of finer material, oriented down the steepest available slope. **D 7099, D18**

sorting—the process by which sedimentary particles are selectively separated from associated but dissimilar particles by flowing water. **D 4410, D19**

sorting sample, n—in waste management, a 100 to 150 kg (200 to 300 lb) portion of a vehicle load of municipal solid waste that is deemed to represent the characteristics of that load. **D 5681, D34**

sorting sample—a 200 to 300-lb (91 to 136-kg) portion deemed to represent the characteristics of a vehicle load of MSW. **D 5681, D34**

SOS—abbreviation for **start of scan**. **F 1457, F05**

sound absorption—(1) the process of dissipating sound energy. (2)

the property possessed by materials, objects and structures such as rooms of absorbing sound energy. (3) A ; [L^{-2}]; metric sabin—in a specified frequency band, the measure of the magnitude of the absorptive property of a material, an object, or a structure such as a room. **C 634, E33**

sound absorption coefficient, α ; [dimensionless]; metric sabin/ m^2 —of a surface, in a specified frequency band, the measure of the absorptive property of a material as approximated by the method of Test Method C 423. Ideally, the fraction of the randomly incident sound power absorbed or otherwise not reflected. **C 634, E33**

sound attenuation—the reduction of the intensity of sound as it travels from the source to a receiving location. Sound absorption is often involved as, for instance, in a lined duct. Spherical spreading and scattering are other attenuation mechanisms. **C 634, E33**

sound-deadening board—a specially manufactured cellulosic fiber-board product for use in building construction in wall and floor assemblies to reduce sound transmission. **D 1554, D07**

sound energy density, D ; [$ML^{-1}T^{-2}$]; J/m^3 —the quotient obtained when the sound energy in a region is divided by the volume of the region. The sound energy density at a point is the limit of that quotient as the volume that contains the point approaches zero. **C 634, E33**

sound energy, E ; [ML^2T^{-2}]; J —energy added to an elastic medium by the presence of sound, consisting of potential energy in the form of deviations from static pressure and of kinetic energy in the form of particle velocity. **C 634, E33**

sounding well—in grouting, a vertical conduit in a mass of coarse aggregate for preplaced aggregate concrete which contains closely spaced openings to permit entrance of grout. **D 653, D18**

sound insulation—the capacity of a structure to prevent sound from reaching a receiving location. Sound energy is not necessarily absorbed; impedance mismatch, or reflection back toward the source, is often the principal mechanism. **C 634, E33**

sound intensity, I ; [MT^{-3}]; W/m^2 —the quotient obtained when the average rate of energy flow in a specified direction and sense is divided by the area, perpendicular to that direction, through or toward which it flows. The intensity at a point is the limit of that quotient as the area that includes the point approaches zero. **C 634, E33**

sound isolation—the degree of acoustical separation between two locations, especially adjacent rooms. **C 634, E33**

sound level, L_{AF} —where the A designates the frequency weighting and the F designates fast exponential time weighting (the A is replaced by C to designate C-weighting, and the F by either S or I to designate slow or impulse time weighting), [nd], (dB), *n*—of airborne sound, a sound pressure level obtained using a signal to which a standard frequency-weighting and exponential time weighting has been applied.

NOTE—Standard frequency-weightings designated A and C, and exponential time weightings designated fast, slow, and impulses, are defined in ANSI S1.4, Specification for Sound Level Meters.

NOTE—The frequency-weighting and exponential time weighting must be specified unless made clear from the context.

NOTE—The frequency-weighting modifies the amplitude of the signal as a function of frequency to adjust for differences in perception of sound at different frequencies.

NOTE—In symbols, A-weighted sound level L_{AF} , at running time t is

$$L_{AF}(t) = 10 \log \left\{ \left[(1/0.125) \int_{-\infty}^t P_A^2(\nu)^{-(t-\nu)/0.125} d\nu \right] / P_0^2 \right\}$$

where 0.125 is the time constant in seconds for fast time weighting (1.0 for slow time weighting), ν is a dummy variable of integration, $P_A^2(\nu)$ is the squared, instantaneous, time varying, A-weighted sound pressure in Pascals, and P_0 is the reference sound pressure of 20 μ Pa. **C 634, E33**

sound power level, L_W —of airborne sound, ten times the common logarithm of the ratio of the sound power under consideration to

the standard reference power of 1 pW. The quantity so obtained is expressed in decibels. **C 634, E33**

sound power, W ; [ML²T⁻³]; W —in a specified frequency band, the rate at which acoustic energy is radiated from a source. In general, the rate of flow of sound energy, whether from a source, through an area, or into an absorber. **C 634, E33**

sound pressure level, L_p —of airborne sound, ten times the common logarithm of the ratio of the square of the sound pressure under consideration to the square of the standard reference pressure of 20 μ Pa. The quantity so obtained is expressed in decibels. **C 634, E33**

sound pressure, p ; [ML⁻¹T⁻²]; Pa—a fluctuating pressure superimposed on the static pressure by the presence of sound. In analogy with alternating voltage its magnitude can be expressed in several ways, such as instantaneous sound pressure or peak sound pressure, but the unqualified term means root-mean-square sound pressure. In air, the static pressure is barometric pressure. **C 634, E33**

sound stone—stone which is free of cracks, fissures, or other physical defects. **C 119, C18**

sound transmission class, STC—a single-number rating calculated in accordance with Classification E 413 using values of sound transmission loss. It provides an estimate of the performance of a partition in certain common sound insulation problems. **C 634, E33**

sound transmission coefficient, τ ; [dimensionless]—of a partition, in a specified frequency band, the fraction of the airborne sound power incident on the partition that is transmitted by the partition and radiated on the other side. **C 634, E33**

sound transmission loss, TL —of a partition, in a specified frequency band, ten times the common logarithm of the ratio of the airborne sound power incident on the partition to the sound power transmitted by the partition and radiated on the other side. The quantity so obtained is expressed in decibels. **C 634, E33**

sound wood—wood free of any form of decay, incipient or advanced, and from insect holes. **D 9, D07**

sour, v —in refurbishing textiles, to neutralize the alkalinity of a material after cleaning by using a weak acid such as acetic acid or an acid-forming salt. **D 123, D13**

sour, v —to increase the concentration of hydrogen sulfide. **D 4175, D02**

sour, v —in refurbishing textiles, to neutralize the alkalinity of a material after cleaning by using a weak acid such as acetic acid or an acid-forming salt. **D 5253, D13**

sour, *adj*—taste produced by substances such as citric acid when in solution. **E 253, E18**

source, n —for color determination, that which furnishes light and other radiation; real device by which radiant flux is produced (see **illuminant**). **D 2946, C17**

source, n —the location at which contamination has entered the natural environment. **D 5681, D34**

source, n —an object that produces light or other radiant flux, or the spectral power distribution of that light. (See also **standard source, CIE standard source A, CIE standard source B, CIE standard source C**.) **E 284, E12**

source—a machine or radioactive material that emits penetrating radiation. **E 1316, E07**

source, CIE standard, n —see **standard source**. **D 2946, C17**

source document—a document, paper or electronic, that serves as a basis for posting information to the records of property to provide an auditable record of all transactions, evidencing acquisition, receipt, consumption, utilization, maintenance, physical inventory, and disposition. Examples include purchase or fabrication order, receiving report, stores requisition, record of equipment usage, record of maintenance performed, inventory ticket, and shipping documentation. **E 2135, E53**

source documents—the original materials or facsimiles from which input for a data processing system is derived. **F 149, F05**

source-film distance—the distance between the radiation-producing area of the source and the film. **E 1316, E07**

space categories, n (catégories de locaux) (See also **floor area**):

source marking, n —the bar code marking of a specific item at the point of initial production of the item. **F 1294, F05**

source room—in architectural acoustical measurements, the room that contains the noise source or sources. **C 634, E33**

source sampling—See **sampling**. **D 1356, D22**

source-separated steel cans, n —post-consumer products that are generated as separated can fractions by commercial or household sources.

(a) *all other steel cans, n* —steel containers for food products or liquids, with a maximum capacity of 5 gal, that are not included in one of the other definitions.

(b) *bi-metal beverage cans, n* —steel cans with nonferrous metal convenience ends (normally made of aluminum), originally containing beer or carbonated beverages, but not including other contaminants.

(c) *bi-metal food cans, n* —steel cans with nonferrous metal (usually aluminum) convenience ends, originally containing snack foods, but not including other contaminants. **D 5681, D34**

source (X-rays)—the area emitting primary X-rays in a diffraction experiment. The actual source is always the focal spot of the X-ray tube but the virtual source may be a slit or pinhole, depending on the conditions of the experiment. **E 7, E04**

sour gas—natural gas containing concentrations of sulfur compounds which make it impractical to use without purification because of toxicity or corrosive effects, or both, on piping and equipment. **D 4150, D03**

Soxhlet apparatus, n —an apparatus for use in extracting organic or inorganic material with a suitable solvent in which the solvent is recirculated by evaporation and subsequent condensation. **D 1356, D22**

Soxhlet apparatus, n —a device, usually of glass, used to extract soluble material from a mixture of soluble and insoluble (generally solid) materials, by passing a volatile solvent through the sample and recirculating the solvent by refluxing. **D 4175, D02**

space, n —the element of a bar code symbol whose reflectance is greater than the global threshold (equivalent to a binary 0) as opposed to the bar or dark element. **F 1294, F05**

space application—dispersion of liquid, gas, or dry particles in an air space in such a manner that target pests are exposed to the chemical. **E 1102, E35**

space categories, n (catégories de locaux) (See also **floor area**):

assignable area, n (zone assignable)—**floor areas** of a facility assigned to or available for assignment to occupant groups of functions, including interior walls, building columns, and building projections, and excluding circulation.

basement (sous-sol)—space partly below average grade having less than one half of its clear height (measured from floor level to ceiling level) below average grade.

building core and service area, n (noyau d'un immeuble et aire de service)—**floor area** of a facility necessary for the general operation of a building that is not available for general occupancy, including: **primary circulation areas**, mechanical, electrical, telephone, and custodial rooms serving individual floors; toilet rooms, building lobbies and atria, stairways, elevators, vertical shafts and chases, loading docks; and also central, mechanical, electrical, telephone, and custodial spaces and penthouses, but excluding interstitial area.

building gross area, n (superficie brute d'un immeuble)—sum of the floor areas of a building included within the outside face of outer building walls for all stories.

building service area (aire de service d'un immeuble)—Use preferred term **building core and service area**.

cellar (cave)—space wholly or partly below average grade having more than one half of its clear height (measured from floor level to ceiling level) below average grade.

space categories, n (catégories de locaux) (See also floor area):

circulation space—See **primary circulation; secondary circulation**.

primary circulation area (aire de circulation principale)—portion of a **building** that is a public corridor, lobby, or atrium; or is required for access by all occupants on a floor to stairs, elevators, toilet rooms, or building entrances.

secondary circulation area (aire de circulation secondaire)—portion of a **building** required for access to some subdivision of space, whether bounded by walls or not, that does not serve all **occupants** on a **floor**, and that is not defined as **primary circulation area**.

support space (locaux de soutien)—(in offices) part of **usable area** not assigned or dedicated to a specific task or function. Support space includes meeting rooms, waiting areas, storage, lounges, operational equipment (for example, computer rooms), copy areas, libraries, and similar areas.

usable area, n (superficie utilisable)—**floor area** of a facility assigned to, or available for assignment to, occupant groups or functions, including interior walls, building columns and projections, and **secondary circulation**.

workplace (poste de travail)—part of a **usable area**, intended for an individual or group to work in.

workspace (aire de travail)—part of **usable area**, intended for a specific function or type of work.

workstation (poste de travail) (aménagement ouvert)—all or part of a **workplace**, suitable for carrying out one function or type of work. **E 1480, E06**

space charge aberration—an aberration resulting from the mutual repulsion of the electrons in a beam. This aberration is most noticeable in low-voltage, high-current beams. This repulsion acts as a negative lens causing rays which were originally parallel to diverge. **E 7, E04**

space compression, n—a method of packing a series of space characters into a shorter sequence; to save time for transmission, the receiving device then expands the shorter sequence to its original length. **F 1457, F05**

space lattice—See **lattice**. **E 7, E04**

spacer, n—in *building construction in glazing*, a piece of resilient material placed to maintain space between a pane of glass or a panel and its supporting frame. **C 717, C24**

spacer, n—a device made of any material that serves to maintain a predetermined distance between any two points in a **shipping container**, or between any interior part and articles contained therein. (Compare **divider**.) **D 996, D10**

space reflectance (Rs), n—in reference to bar codes, the highest reflectance value in a space or quiet zone. **F 1294, F05**

spacer layer—a material (usually dielectric) sometimes used to maintain a separation between the membrane layer and static layer of a membrane switch. **F 2112, F01**

spacing—the distance between adjacent blastholes in a direction parallel to the face. (ISRM) **D 653, D18**

spacing—distance between centers of adjacent crests, measured perpendicular to crests. **F 547, F16**

spacing (between latticeplanes)—See **interplanar distance**. **E 7, E04**

spacing of increments, n—pertains to the kind of intervals between increments. Two spacing methods are recognized: systematic and random. Systematic spacing is usually preferable.

systematic spacing 1, n—in which the movements of individual increment collection are spaced evenly in time or in position over the lot.

random spacing 2, n—in which the increments are spaced at random in time or in position over the lot. **D 121, D05**

spacing sleeve—sleeve that encases a portion of the anchor shaft but does not expand. **E 2265, E06**

spading—see **shovel slicing**. **C 896, C04**

spall, n—a fragment or chip as from concrete, brick, stone or other similar materials. **C 717, C24**

spall, v—to break off fragments or chips, as from concrete, brick, stone or other similar materials, by water freezing within the material, corrosion expansion of embedded metal, movement pressures, or other physical or chemical processes. **C 717, C24**

spalling—See **delamination**. **A 902, A05**

spalling, adj—the development of spalls. **C 717, C24**

spalling—(1) longitudinal splitting in uniaxial compression, or (2) breaking-off of plate-like pieces from a free rock surface. (ISRM) **D 653, D18**

spalling, n—in *tribology*, the separation of macroscopic particles from a surface in the form of flakes or chips, usually associated with rolling element bearings and gear teeth, but also resulting from impact events. **G 40, G02**

spalling of refractories, v—the cracking or rupturing of a refractory unit, which usually results in the detachment of a portion of the unit. **C 71, C08**

spalling of refractories, mechanical, n—the spalling of a refractory unit caused by stresses resulting from impact or pressure. **C 71, C08**

spalling of refractories, structural, n—the spalling of a refractory unit caused by stresses resulting from differential changes in the structure of the unit. **C 71, C08**

spalling of refractories, thermal, n—the spalling of a refractory unit caused by stresses resulting from nonuniform changes of the unit produced by a difference in temperature. **C 71, C08**

spalls—(1) fragments or chips from a piece of dimension stone. (2) waste stone usually of small size from the quarrying and milling of dimension limestone. **C 119, C18**

spall, spalling, or spontaneous spalling—a defect characterized by chipping that occurs without apparent external causes. **C 286, B08**

span, n—of a *thermometer or thermometric system*, the absolute value of the difference between the specified lower and upper temperature limits within a range. **E 344, E20**

spandex—a manufactured fiber in which the fiber-forming substance is a long-chain synthetic polymer comprised of at least 85 % of a segmented polyurethane.

*******sulfar**—a manufactured fiber in which the fiber-forming substance is a long chain synthetic polysulfide in which at least 85 % of the sulfide (-S-) linkages are attached directly to two aromatic rings. **D 123, D13**

spandrel glass—architectural glass that is used in a nonvision area or charting of a building. **C 162, C14**

span drift—See **analyzer**. **D 1356, D22**

spangle, n—in *hot-dipcoatings*, the crystalline structure that develops on a metallic-coated surface when the molten coating metal solidifies, especially on steel sheet and articles coated after fabrication. **A 902, A05**

span length, n—in *length testing of cotton with the Fibrograph*, the distance spanned by a specified percentage of the fibers in the test beard, taking the amount reading at the starting point of the scanning as 100 %. **D 123, D13**

span length, n—in *length testing of cotton with the Fibrograph*, the distance spanned by a specified percentage of the fibers in the test beard, taking the amount reading at the starting point of the scanning as 100 %. **D 7139, D13**

spares—pieces of property that duplicate existing items but are designed as replacements, as required, and are normally kept in reserve. **E 2135, E53**

spark, n—in *atomic emission spectrometry*, a high voltage capacitor discharge. **E 135, E01**

spark coil leak detector—a high-frequency discharge coil of the Tesla type which indicates pin holes in glass vacuum systems by a spark jumping between the core of the coil and the pin hole. **E 1316, E07**

spark, discharge—a non-self-sustaining discharge characterized by high luminosity and a ratio of lateral dimension to length that is substantially smaller than unity. **B 542, B02**

spark discharge, n—transient discrete electric discharge, which takes

- place between two conductors, which are at different potentials. The discharge bridges the gap between the conductors in the form of a single ionization channel. **E 1445, E27**
- sparking fuels, *n***—within the context of Test Method D 3175, fuels that do not yield a coherent cake as residue in the volatile matter determination but do evolve gaseous products at a rate sufficient to mechanically carry solid particles out of the crucible when heated at the standard rate. Such coals normally include all low-rank noncaking coals and lignites but may also include those anthracites, semianthracites, bituminous, chars, and cokes that lose solid particles as described above. These are defined as *sparking fuels* because particles escaping at the higher temperatures may become incandescent and spark as they are emitted. **D 121, D05**
- sparkle, *n***—the visual contrast between the appearance of highlights on the particles of a gonioapparent pigment and their immediate surround. **E 284, E12**
- spark line**—not recommended, see **ion line**. **E 135, E01**
- spark plug fouling, *n***—deposition of essentially non-conducting material onto the electrodes of a spark plug that may, but will not necessarily, prevent the plug from operating. **D 4175, D02**
- spark plug whiskering, or spark plug bridging, *n***—a deposit of conductive material on the spark plug electrodes that tends to form a bridge between them, thus shorting out the plug. **D 4175, D02**
- spark test**—an electrical test in which a spark is used to detect discontinuity of coating. **C 286, B08**
- spar varnish**—under **varnish**, see *spar varnish*. **D 16, D01**
- spatial averaging**—the combination of particle size distributions for regions or locations within a liquid dispersion into a distribution representative of a larger sampling region. **E 1620, E29**
- spatial domain filtering, *n***—a filtering operation performed directly on the profile record. **E 867, E17**
- spatial frequency**—a measure of detail in terms of equivalent, uniformly spaced, cyclical patterns. In an object or image plane, it may be expressed in units of cycles per millimetre (cy/mm) or line pairs per millimetre (lp/mm). In an imaging system, it may be expressed in units of cycles per milliradian (cy/mrad) or line pairs per milliradian (lp/mrad). **E 1316, E07**
- spatial grain size**—the average size of the three-dimensional grains, as opposed to the more conventional grain size determined by a simple average of observations made on a cross section of the material. **E 7, E04**
- spatial resolution**—because of ambiguities due to alternative definitions, it is recommended that “spatial resolution” not be used unless a specific definition is provided by the user. **E 1620, E29**
- spatial size distribution**—the size distribution of particles in a given volume of space, wherein there is no significant variation in the distribution during the sampling interval. **E 1620, E29**
- spatter, *n***—a type of extraneous or undesirable ink droplet originating when a portion of an ink droplet strikes the intended area and is deflected to an unintended area. **F 1857, F05**
- spatulate, *n***—to mix or blend by spreading and folding with a flat thin, usually metal, tool. **D 4175, D02**
- SPC—standard (heterotrophic) plate count**—measurement method for enumerating bacteria. **D 6161, D19**
- spear point**—symmetrical point with four bevel faces meeting at point center. **F 592, F16**
- special calibration board, *n***—a specially assembled noncombustible insulating board used for standardizing the operating condition of the equipment which is used only to measure the flux distribution at specified intervals along the specimen surface. It shall be roughly 20 ± 5 mm in thickness with a density of 750 ± 100 kg/m³. **E 176, E05**
- special calibration dummy specimen, *n***—a dummy specimen made of the same material as the dummy specimen, intended only for use in calibration of flux gradient along the specimen. **E 176, E05**
- special cause, *n***—source of intermittent variation in a process. **E 456, E11**
- special cause variation**—special cause variation is intermittent, unpredictable and unstable. In control chart analysis, it is signaled by a point beyond the control limits, a run, or some other nonrandom pattern of points within the control limits. **F 1789, F16**
- special design**—a concrete pipe design for sizes, loads, or service conditions not covered by a standard design. **C 822, C13**
- special indices of metamerism, *n***—indices of degree of metamerism associated with specific changes in illuminating or viewing conditions, such as change of illuminant or change of observer. **E 284, E12**
- specialty-shaped brick, *n***—a brick manufactured to a basic shape of other than a rectangular prism. **C 43, C15**
- special purpose boom**—boom that departs from the general characteristics of “fence type” and “curtain type” booms, either in design or intended use. **F 818, F20**
- special-purpose tile**—a tile, either glazed or unglazed, made to meet or to have specific physical design or appearance characteristics such as size, thickness, shape, color, or decoration; keys or lugs on backs or sides; special resistance to staining, frost, alkalies, acids, thermal shock, physical impact, high coefficient of friction, or electrical properties. **C 242, C21**
- special symbol/character**—in a character set, a character that is neither a numeral, letter, or a blank, for example, virgule, asterisk, dollar sign, comma, period, etc. **F 149, F05**
- special tools**—tools other than common hand tools or those designed specifically for use with a delivered product. **E 631, E06**
- specialty felt, *n***—one of a number of special purpose felt structures available for, but not limited to, a specific end-use application. **D 123, D13**
- specialty felt, *n***—one of a number of special purpose felt structures available for, but not limited to, a specific end-use application. **D 4845, D13**
- specialty fryer**—equipment with a wide and shallow cooking area that allows a layer of food to be lowered into oil on a screen or shallow basket (that is, donut and fish/chicken fryers). See **fryer**. **F 1827, F26**
- specific adhesion, *n***—see *specific adhesion* under **adhesion**. **D 907, D14**
- specific airflow resistance, *r***; [ML⁻²T⁻¹]; mks rayl (Pa·s/m)—the product of the airflow resistance of a specimen and its area. This is equivalent to the quotient of the air pressure difference across the specimen divided by the linear velocity, measured outside the specimen, of airflow through the specimen. **C 634, E33**
- specific area, *n***—of *wool*, the ratio of the fiber surface to fiber volume. **D 123, D13**
- specific area, *n***—of *wool*, the ratio of the fiber surface to fiber volume. **D 4845, D13**
- specification, *n***—a precise statement of a set of requirements to be satisfied by a material, product, system, or service that indicates the procedures for determining whether each of the requirements is satisfied. **D 123, D13**
- specification, *n***—a precise statement of a set of requirements to be satisfied by a material, product, system or service that indicates the procedures for determining whether each of the requirements is satisfied. **D 4439, D35**
- specification, *n*** (caractérisation(caractérisation technique))—precise statement of a set of requirements to be satisfied by a material, product, system, or service. **E 631, E06**
- specification, *n*** (caractérisation(caractérisation technique))—precise statement of a set of requirements to be satisfied by a material, product, system, or service. **E 1480, E06**
- specification limits, *n***—see **tolerance limits**. **E 456, E11**
- specifications, *n***—written requirement for processes, materials or equipment. **D 5681, D34**
- specific capacity**—the rate of discharge from a well divided by the drawdown of the water level within the well at a specific time since pumping started. **D 653, D18**

specific color phenomena, *n* (using instrumental methods of evaluation): E 344, E20

specific criteria, *n*—accreditation criteria related to the ability of a laboratory to conduct specific tests or specific types of tests. E 1187, E36

specific discharge, *n* (LT³)—the rate of flow of water through a porous medium per unit area measured at a right angle to the direction of flow. D 653, D18

specific energy—energy consumption expressed on the basis of unit mass of throughput. D 5681, D34

specific energy for cutting wear [$M L^{-1} T^{-2}$], *n*—*in solid impingement erosion*, the kinetic energy of impinging particles associated with removal of unit volume of target material by cutting wear. G 40, G02

specific energy for deformation wear [$M L^{-1} T^{-2}$], *n*—*in solid impingement erosion*, the kinetic energy of impinging particles associated with removal of unit volume of target material by deformation wear. G 40, G02

specific flux—flux divided by net pressure driving force. See **permeance**. D 6161, D19

specific gravity, *n*—the ratio of mass of a volume of a material at a stated temperature to the mass of the same volume of distilled water at a stated temperature. C 125, C09

specific gravity—as applied to wood, the ratio of the oven-dry weight of a sample to the weight of a volume of water equal to the volume of the sample at some specific moisture content, as green, air-dry, or oven-dry. D 9, D07

specific gravity, *n*—(1) ratio of the weight of a given volume of substance to the weight of an equal volume of water. (2) ratio of the density of a substance at a specified temperature to the density of water. See **density**. D 16, D01

specific gravity, *n*—of felt, the relative mass per unit volume of felt expressed as a percentage of the mass per unit volume of water. D 123, D13

specific gravity:

specific gravity of solids, G, G_v, S_s (D)—ratio of: (1) the weight in air of a given volume of solids at a stated temperature to (2) the weight in air of an equal volume of distilled water at a stated temperature.

apparent specific gravity, G_a, S_a (D)—ratio of: (1) the weight in air of a given volume of the impermeable portion of a permeable material (that is, the solid matter including its impermeable pores or voids) at a stated temperature to (2) the weight in air of an equal volume of distilled water at a stated temperature.

bulk specific gravity (specific mass gravity), G_m, S_m (D)—ratio of: (1) the weight in air of a given volume of a permeable material (including both permeable and impermeable voids normal to the material) at a stated temperature to (2) the weight in air of an equal volume of distilled water at a stated temperature. D 653, D18

specific gravity, *n*—the ratio of the density of the substance in question to the density of a reference substance at specified conditions of temperature and pressure. D 1356, D22

specific gravity—the ratio of the mass of a specimen to the mass of an equal volume of water, both at the same specified temperature. Generally, density is more useful. (see also **density**) D 1695, D01

specific gravity—see **relative density**. D 2864, D27

specific gravity, *n*—*deprecated term*, the ratio of the density of a substance to that of a reference substance such as water (for solids and liquids) or hydrogen (for gases) under specified conditions (see **relative density**). D 4175, D02

specific gravity—ratio of the mass of any volume of a substance to the mass of an equal volume of water at 4°C. D 4410, D19

specific gravity, *n*—the ratio of the density of the substance in question to the density of a reference substance at specified conditions of temperature and pressure. D 4439, D35

specific gravity, *n*—of felt, the relative mass per unit volume of felt expressed as a percentage of the mass per unit volume of water. D 4845, D13

specific gravity—the ratio of the mass (density) of a sample material to the mass (density) of an equal volume of water at the same specified temperature. D 6161, D19

specific gravity, *n*—the ratio of the mass of a given volume of material at a stated temperature to the mass of an equal volume of gas-free distilled water at a stated temperature, expressed by

$$\text{Specific Gravity } x/y = F \text{ (or } y/x \text{ C)}$$

where *x* is usually 60 °F and *y* is usually 15.56 °C. E 344, E20

specific gravity—the ratio of the mass of a unit volume of a material at a stated temperature to the mass of the same volume of gas-free distilled water at a stated temperature. The form of expression shall be the following:

$$\text{Specific gravity } x/y \text{ } ^\circ\text{C} \dots$$

where:

x = temperature of the material, and

y = temperature of the water.

See also **Baumé gravity** and **density**. E 1547, E15

specific gravity, apparent (of solids and liquids)—the ratio of the weight in air of a unit volume of a material at a stated temperature to the weight in air of equal density of an equal volume of gas-free distilled water at a stated temperature. If the material is a solid, the volume shall be that of the impermeable portion. The form of expression shall be the following:

$$\text{Apparent specific gravity } x/y \text{ } ^\circ\text{C}$$

where:

x = temperature of the material, and

y = temperature of the water. E 1547, E15

specific gravity in air—the ratio of the weight in air of a unit volume of a material at a stated temperature to the weight in air of equal density of an equal volume of gas free distilled water at a stated temperature. D 4790, D16

specific gravity (of solids and liquids)—the ratio of the mass of a unit volume of a material at a stated temperature to the mass of the same volume of gas-free distilled water at a stated temperature. If the material is a solid, the volume shall be that of the impermeable portion. The form of expression shall be the following:

$$\text{Specific gravity } x/y \text{ } ^\circ\text{C}$$

where:

x = temperature of the material, and

y = temperature of the water. E 1547, E15

specific heat, *n*—the ratio of the specific heat capacity of a material to the specific heat capacity of a reference material at the same temperature. E 1142, E37

specific heat capacity—the amount of heat required to raise the temperature of a unit mass of a substance by one degree. It is commonly expressed in Joules per kg per degree K. D 7099, D18

specific heat capacity, C—quantity of heat required to provide a unit temperature change to a unit mass of material. E 1142, E37

specific humidity (*q*), *n*—the ratio of the mass of water vapor, m_v , to the total mass, $m_v + m_a$, of the moist air:

$$q = \frac{m_v}{m_v + m_a}$$

D 4023

D 1356, D22

specific inductive capacity—the same as **permittivity, relative**.

D 2864, D27

specific luminance, *n*—see **coefficient of retroreflected luminance**.

E 284, E12

specific normal acoustic admittance, $y \equiv g - jb$; [$M^{-1}L^2T$]; reciprocal mks rayl ($m/Pa \cdot s$)—the reciprocal of the specific normal acoustic

- impedance. The real and imaginary components are called, respectively, **specific normal acoustic conductance** and **specific normal acoustic susceptance**. **C 634, E33**
- specific normal acoustic impedance**, $z \equiv r + jx$; [ML⁻²T⁻¹]; mks rayl (Pa·s/m)—at a surface, the complex quotient obtained when the sound pressure averaged over the surface is divided by the component of the particle velocity normal to the surface. The real and imaginary components of the specific normal acoustic impedance are called, respectively, **specific normal acoustic resistance** and **specific normal acoustic reactance**. **C 634, E33**
- specific packability**, *n*—for inflatable restraints, volumetric index of compressibility for a folded fabric specimen measured at specified levels of compression. **D 6799, D13**
- specific storage**—the volume of water released from or taken into storage per unit volume of the porous medium per unit change in head. **D 653, D18**
- specific storage**, *n* (L⁻¹)—the volume of water released from or taken into storage per unit volume of the porous medium per unit change in head. **D 653, D18**
- specific surface**, *n*—the surface area of one gram of powder, usually expressed in square centimetres. **B 243, B09**
- specific surface**—the surface per unit mass (or less frequently per unit volume) of a moisture-free sample. The specific external surface is used as a measure of the degree of fineness of fibrillation. **D 1695, D01**
- specific surface** (L⁻¹)—the surface area per unit of volume of soil particles. **D 653, D18**
- specific viscosity*—see **viscosity, specific**. **D 1695, D01**
- specific wear rate*, *n*—see **wear factor**. **G 40, G02**
- specific weight (of sediment deposits)**—the dry weight of sediment solids per unit volume of deposit in place. Synonymous with **volume-weight**. **D 4410, D19**
- specific yield**—the ratio of the volume of water that the saturated rock or soil will yield by gravity to the volume of the rock or soil. In the field, specific yield is generally determined by tests of unconfined aquifers and represents the change that occurs in the volume of water in storage per unit area of unconfined aquifer as the result of a unit change in head. Such a change in storage is produced by the draining or filling of pore space and is, therefore, mainly dependent on particle size, rate of change of the water table, and time of drainage. **D 653, D18**
- specified circuit resistance**—maximum allowable circuit resistance as measured between two terminations whose internal contacts, when held closed, complete a circuit. **F 2112, F01**
- specified dimensions**—dimensions to which masonry units or constructions are required to conform. Actual (measured) dimensions may differ from the specified dimensions by permissible variations. **C 1232, C15**
- specified element**, *n*—in steel, an element controlled to a specified minimum, maximum, or range, in accordance with the requirements of the applicable product specification. **A 941, A01**
- specified load**, *n*—as applied to loadbearing elements, the test load applied to the element in a Test Method E 119 test. **E 176, E05**
- specified temperature**—application temperature specified by the sealant manufacturer. **C 717, C24**
- specifying agency**—the individual engineer, firm, or political subdivision charged with and having the responsibility for the design of a facility, product, equipment, or material requirements. **C 896, C04**
- specifying agency**—the individual engineer, firm, or political subdivision charged with and having responsibility for the design of a facility, product, equipment, or material requirements. **F 412, F17**
- specifying authority**—professional(s) responsible for determining and furnishing information required to perform the test.
- specimen*—See **test specimen**. **E 631, E06**
- specimen**, *n*—a portion of a sample on which a specific test is performed. **A 902, A05**
- specimen**, *n*—a piece or portion of a sample selected and prepared for performing a test. **C 71, C08**
- specimen**—an individual unit on which a test can be made. **C 822, C13**
- specimen**—sample, or portion thereof, which is to be tested and the test results to be reported. **C 896, C04**
- specimen**, *n*—a specific portion of a material or laboratory sample upon which a test is performed or which is selected for that purpose. (Syn. *test specimen*). **C 1145, C28**
- specimen**, *n*—a specific portion of a material or a laboratory sample upon which a test is performed or which is selected for that purpose. **D 123, D13**
- specimen**—pieces or quantity taken or prepared from a sample for testing. **D 653, D18**
- specimen**, *n*—a piece or portion of a sample used to make a test. (ISO) **D 883, D20**
- specimen**—that portion of a sample unit required for a single measurement of a given property or characteristic. **D 1517, D31**
- specimen**, *n*—a piece of material appropriately shaped and prepared so that it is ready to use for a test. **D 1566, D11**
- specimen**, *n*—a piece or portion of a sample used to make a test. **D 4175, D02**
- specimen**, *n*—a specific portion of a material or laboratory sample upon which a test is performed or which is taken for that purpose. (Syn. *test specimen*) **D 4439, D35**
- specimen**, *n*—a specific portion of a material or a laboratory sample upon which a test is performed or which is selected for that purpose. **D 4845, D13**
- specimen**, *n*—a specific portion of a material or laboratory sample upon which a test is performed or which is taken for that purpose. **D 5681, D34**
- specimen**, *n*—in methods of chemical analysis, a piece of material selected to be typical of the whole under the assumption that the whole is composed of pieces of similar composition. (Contrast **sample**). **E 135, E01**
- specimen**, *n*—representative piece of the product which is to be tested together with any substrate or treatment. **E 176, E05**
- specimen**, *n*—the actual section of material, product, or assembly, to be placed in the test apparatus. **E 176, E05**
- specimen**, *n*—manufactured item of the product, representative prototype of the product, or mock-up of the product. **E 176, E05**
- specimen**, *n*—the manufactured item of the product, or representative prototype of the product. **E 176, E05**
- specimen**, *n*—a construction consisting of electrical system components and a fire-resistive barrier system. **E 176, E05**
- specimen**, *n*—representative piece of the product which is to be tested together with any substrate or treatment. The specimen may include an air gap. The specimen may also be tested as a stand-alone product without substrates if this is representative of end-use conditions. **E 176, E05**
- specimen**, *n*—a piece or portion of a sample used to make a test. **E 284, E12**
- specimen*—See **test specimen**. **E 1605, E06**
- specimen**, *n*—a piece or portion of a sample used to make a test. (D20, ISO) **F 412, F17**
- specimen**—a prepared portion of a sample upon which a test is intended to be performed **G 15, G01**
- specimen center of pin hole distance**, *H** [L], *n*—the distance between the center of the pin holes on a pin-loaded specimen. **E 1823, E08**
- specimen chamber (electron optics)**—the compartment located in the column of the electron microscope in which the specimen is placed for observation. **E 7, E04**
- specimen charge (electron optics)**—the electrical charge resulting from the impingement of electrons on a nonconducting specimen. **E 7, E04**
- specimen charging**—the accumulation of electrical charge on the specimen caused by particle bombardment. **E 673, E42**

specimen clamp, *n*

specimen clamp, *n*—the device which is used to transport the fiber test beard of cotton through the gathering, combing, brushing, length, length uniformity, strength, and elongation measurement operations. **D 123, D13**

specimen clamp, *n*—the device which is used to transport the fiber test beard of cotton through the gathering, combing, brushing, length, length uniformity, strength, and elongation measurement operations. **D 7139, D13**

specimen contamination (electron optics)—the contamination of the specimen caused by the condensation upon it of residual vapors in the microscope under the influence of electron bombardment. **E 7, E04**

specimen distortion (electron optics)—a physical change in the specimen caused by desiccation or heating by the electron beam. **E 7, E04**

specimen gage length, δd [L], *n*—the distance between the points of displacement measure (for example, clip gage, gage length). **E 1823, E08**

specimen grid—See **specimen screen**. **E 7, E04**

specimen holder (electron optics)—a device which supports the specimen and specimen screen in the correct position in the specimen chamber of the microscope. **E 7, E04**

specimen loader, *n*—an instrument which obtains the test specimen by lowering an open specimen clamp onto the surface of the raw cotton samples, closing the jaws of the specimen clamp and ascending with a portion of the fibers retained in the jaws awaiting the combing and brushing procedure. **D 123, D13**

specimen loader, *n*—an instrument which obtains the test specimen by lowering an open specimen clamp onto the surface of the raw cotton samples, closing the jaws of the specimen clamp and ascending with a portion of the fibers retained in the jaws awaiting the combing and brushing procedure. **D 7139, D13**

specimen normal, *n*—see **surface normal**. **E 284, E12**

specimen pathlength—see **sample pathlength**. **E 131, E13**

specimen screen (electron optics)—a disk of fine screen, usually 200-mesh stainless steel, copper, or nickel, which supports the replica or specimen support film for observation in the microscope. **E 7, E04**

specimen span, *S* [L]—distance between specimen supports. **E 1823, E08**

specimen stage—the part of the microscope which supports the specimen holder and specimen in the microscope, and can be moved in a plane perpendicular to the optic axis from outside the column. **E 7, E04**

specimen stage controls—the external controls by means of which the stage can be moved. **E 7, E04**

specimen strain—a distortion of the specimen resulting from stresses occurring during preparation or observation. In electron metallography, strain may be caused by stretching during removal of a replica or during subsequent washing or drying. Also, electrical and thermal stresses caused by the electron beam may arise during observation. **E 7, E04**

specimen temperature, *T* [θ]—in *fatigue testing*, the average temperature in the specimen test section during isothermal testing, or the temperature in the specimen test section at any instant of time during cyclic-temperature testing. **E 1823, E08**

specimen thermal conductance, C_s —the time rate of heat flow through a unit area of a specimen (window or door), induced by a unit temperature difference between the specimen surfaces. It is calculated as follows:

$$C_s = 1/(1/U_s - 1/h_1 - 1/h_{II})$$

where:

C_s = thermal conductance of specimen (surface to surface), $W/(m^2 \cdot K)$ [Btu/(ft² · h · °F)],

U_s = thermal transmittance of specimen (air to air under test conditions), $W/(m^2 \cdot K)$ [Btu/(ft² · h · °F)],

h_1 = surface conductance, room side, $W/(m^2 \cdot K)$ [Btu/(ft² · h · °F)], and

h_{II} = surface conductance, weather side, $W/(m^2 \cdot K)$ [Btu/(ft² · h · °F)].

E 631, E06

specimen thermal resistance, R_c —the mean temperature difference, at equilibrium, between two defined surfaces of a material or construction that induces a unit heat flow rate through unit area. It is calculated as follows:

$$R_c = 1/U_s - 1/h_1 - 1/h_{II}$$

where:

R_c = surface to surface thermal resistance of specimen, $m^2 \cdot K/W$ (ft² · h · °F/Btu).

E 631, E06

specimen thermal transmittance, U_s (sometimes called overall coefficient of heat transfer)—the heat transmission in unit time through unit area of a specimen and its boundary air films, induced by unit temperature difference between the environments on each side. It is calculated as follows when

$$t_{b2} = t_{II} (\pm 0.5^\circ C) \text{ and } t_{b1} = t_I (\pm 0.5^\circ C)$$

where:

t_{b1} = baffle surface temperature, room side, K or °C (°F),

t_{b2} = baffle surface temperature, weather side, K or °C (°F),

t_I = temperature of room side air, °C (°F), and

t_{II} = temperature of weather side air, °C (°F).

$$U_s = Q_s/A_s \cdot (t_I - t_{II})$$

where:

A_s = projected area of specimen (same as open area in surround panel), m^2 (ft²), and

Q_s = time rate of heat flow through the specimen, W (Btu/h).

The transmittance of the specimen can be calculated from the thermal conductance and the surface conductances as follows:

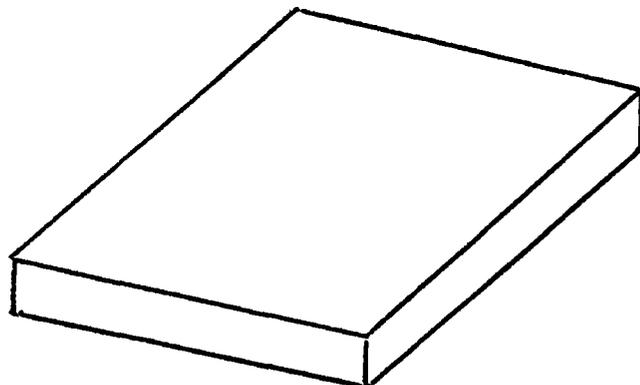

$$1/U_s = 1/h_I + 1/C_s + 1/h_{II}$$

where the values of h_1 and h_{II} are calculated using the appropriate equations in 3.1.4. **E 631, E06**

specimen thickness, *B* [L]—the distance between the parallel sides of a test specimen. **E 1823, E08**

specimen width, *W* [L]—the distance from a reference position (for example, the front edge of a bend specimen or the force line of a compact specimen) to the rear surface of the specimen. **E 1823, E08**

speck—a discrete particle of unreacted or unwanted material in a ceramic body or glaze.

F 109, C21

specking—the discoloration of an enamel surface due to foreign particles in the fired glass. **C 286, B08**

speckle—the random interference pattern which results from the illumination of an optically rough surface with coherent radiation. In laser systems, it results in the granular effect which can be seen in a scattered beam. **E 1316, E07**

speckled ware—a decorative finish with particles of one color appearing in a uniform background of another color or shade. **C 286, B08**

specks, *n*—in *woolenfabrics*, small pieces of undyed vegetable matter which can be removed by carbonizing or can be covered by dyeing or inking. **D 123, D13**

specks, *n*—in *woolenfabrics*, small pieces of undyed vegetable matter which can be removed by carbonizing or can be covered by dyeing or inking. (Compare **trash**) **D 3990, D13**

spectral, *adj*—for *color determination*, indicates either a function of wavelength as in spectral transmittance, or spectral concentration, as in spectral flux. **D 2946, C17**

spectral, *adj*—(1) *modifying a quantity*, descriptor that the quantity is a function of wavelength; (2) *for radiometric quantities*, pertaining to monochromatic radiant energy at a specified wavelength or, by extension, to radiant energy within a narrow wavelength band about a specified wavelength. **E 284, E12**

spectral—(1) for a radiometric quantity, concentration per unit wavelength (or frequency), indicated by the subscript λ following the symbol for the quantity, as $L_\lambda = dL/d\lambda$; at a specific wavelength, indicated by the subscript λ with the wavelength in parentheses, as L_λ (500 nm). (2) For a radiometric property, at a specific wavelength (or frequency), indicated by the wavelength in parentheses, as ρ (750 nm), or as a function of wavelength, indicated by the symbol (λ) following the symbol for the property, as $\epsilon(\lambda)$. See **radiometric properties** and **quantities**. **E 772, E44**

spectral, *adj*—of or relating to, or made by an array of components of an emission or wave separated and arranged in the order of some varying characteristic, such as wavelength, mass, or energy. **F 1294, F05**

spectral background, *n*—non-specific radiation within the spectrum that is not directly related to the observed line or overlapping lines. **E 135, E01**

spectral band, *n*—an arrangement of a specific set of adjacent wavelengths. **F 1294, F05**

spectral bandwidth—see **resolution**. **E 131, E13**

spectral bandwidth, $\Delta\lambda$, *n*—the wavelength interval, $\Delta\lambda$, of radiant energy leaving the exit slit of a monochromator measured at half the peak detected power. **E 284, E12**

spectral characteristic, *n*—the reflectance, reflectance factor, transmittance, or transmittance factor as a function of wavelength, used to characterize a specimen. **E 284, E12**

spectral concentration of a radiometric quantity, *n*—quotient of the quantity, taken over an infinitesimal range on either side of a given wavelength, by the range. $X_e, \lambda = dX_e/d\lambda$.

NOTE—Frequencies, wavenumbers, or their logarithms may also be used; if there is a risk of ambiguity, this should be avoided by means of the wording: “spectral concentration in terms of frequency,” and so forth. (See preliminary remarks at the beginning of “quantities” regarding use of the adjective spectral.) **E 349, E21**

spectral distribution curve, *n*—the curve showing the absolute or relative radiant power emitted or absorbed by a substance as a function of wavelength, frequency, or any other directly related variable. **E 135, E01**

spectral distribution curve of a radiometric quantity (radiant flux, radiant intensity, and so forth), *n*—curve representing the spectral concentration of the quantity as a function of wavelength.

NOTE—Commonly, the relative spectral distribution curve is used, that is, the curve representing the ratio of the spectral concentration of the quantity to a certain value of the same quantity. **E 349, E21**

spectral efficiency factor, $b(\mu)$, *n*—in *bispectral photometry*, the ratio of the total (integrated spectral) radiance from a point on a

specimen when irradiated at wavelength μ to the total radiance of the perfectly reflecting diffuser identically irradiated and viewed.

$$b(\mu) = L(\mu)/L(\mu)_d$$

E 284, E12

spectral emissivity—the ratio of the spectral radiance at a point on a particular specimen and in a particular direction from that point to that emitted by a blackbody at the same temperature. **E 344, E20**

spectral irradiance, $E(\lambda)$, *n*—See **solar irradiance at a point of surface and spectral** in Terminology E 772. **E 1328, E44**

spectral luminous efficiency function, $V(\lambda)$, *n*—the relative effectiveness of radiant power to stimulate the perception of light by the normal human observer, as a function of wavelength: the function adopted as standard by the CIE. **E 284, E12**

spectral position—the effective wavelength or wavenumber of an essentially monochromatic beam of radiant energy. **E 131, E13**

spectral power distribution, *n*—the absolute or relative radiant power emitted by a source, or incident upon a receiver as a function of wavelength. **G 113, G03**

spectral power distribution, SPD, $S(\lambda)$, *n*—specification of an illuminant by the spectral composition of a radiometric quantity, such as radiance or radiant flux, as a function of wavelength. **E 284, E12**

spectral radiance—the power radiated by a specimen in a particular direction per unit time, per unit wavelength, per unit projected area of the specimen, and per unit solid angle. **E 344, E20**

spectral (referring to radiometric quantities), *adj*—for monochromatic radiation at a specified wavelength (or frequency), or, by extension, for radiation within a narrow wavelength band about a specified wavelength.

NOTE—When certain quantities, such as absorbance for transmittance, and so forth, are considered for monochromatic radiation, they are functions of wavelength (or frequency, or wave number, and so forth). They then may be designated by the same term preceded by the adjective “spectral” and by the same symbol followed by λ (or ν , or σ , and so forth) in parentheses, example: spectral transmittance, $\tau(\lambda)$.

Spectral quantities are frequently plotted as a function of wavelength (or frequency) to produce a spectral curve.

If the spectral concentration of a quantity X is considered, it also may be designated by way of abbreviation by the name of the quantity preceded by the adjective “spectral” as before, and by the symbol for the quantity with the subscript λ (or ν , or σ , and so forth), but it must be remembered that X and X_λ are quantities of a different kind because $X_\lambda = dX/d\lambda$. **E 349, E21**

spectral resolution—see **resolving power**. **E 131, E13**

spectral response—the variation in sensitivity of a device to light of different wavelengths. **F 149, F05**

spectral response—the relative light sensitivity of an electrophotographic layer to light of differing wavelengths. **F 335, F05**

spectral response, *n*—the variation in sensitivity of a reading device to light of different wavelengths. **F 1294, F05**

spectral response, $R(\lambda)$, AW^{-1} , *n*—See **absolute spectral response**. **E 1328, E44**

spectral responsivity, $s(\lambda)$, *n*—of a detector, quotient of the detector output by the monochromatic input as a function of wavelength. **E 284, E12**

spectral slit width—the mechanical width of the exit slit, divided by the linear dispersion in the exit slit plane. **E 131, E13**

spectrochemical carrier, *n*—in *dc-arc spectrometry*, a material added to a specimen to facilitate selective vaporization of analytes into the analytical gap. **E 135, E01**

spectrocolorimeter, *n*—spectrometer, one component of which is a dispersive element (such as a prism, grating, or interference filter or wedge or tunable or discrete series of monochromatic sources) that is normally capable of producing as output only colorimetric data (such as tristimulus values and derived coordinates) but not the underlying spectral data from which colorimetric data are derived. See **colorimetric spectrometer**. **E 284, E12**

spectrogoniophotometer, *n*—goniophotometer having the capability of measuring as a function of wavelength; see the preferred term, **goniospectrophotometer**. E 284, E12

spectrograph—an instrument with one slit that uses photography to obtain a record of a spectral range simultaneously. The radiant power passing through the optical system is integrated over time, and the quantity recorded is a function of radiant energy. E 131, E13

spectrograph, *n*—a spectrometer for optical radiation measurements in which the receiver system detects radiant power simultaneously at many points across the spectral region of interest, for example by use of a photographic medium or an array-type photometric detector. E 284, E12

spectrograph (X-ray)—an instrument for recording photographically at predetermined angles the results of diffraction experiments. E 7, E04

spectrometer—an instrument for measuring some function of power, or other physical quantity, with respect to spectral position within a spectral range. E 131, E13

spectrometer, *n*—an instrument for measuring a specified property as a function of a spectral variable. In *optical radiation measurements*, the spectral variable is wavelength or wavenumber and the measured property is (or is related to) absorbed, emitted, reflected, or transmitted radiant power. See **spectrograph**, **spectrophotometer**, **spectroradiometer**. E 284, E12

spectrometer:electron energy analyzer

dispersion—AES, the change in electron image position at the exit of a spectrometer per unit change in electron energy.

energy resolution—AES, XPS, the ratio of the full width at half-maximum intensity of the response curve for monoenergetic electrons at a given energy to the energy of the electrons.

transmission—AES, XPS, the ratio of the number of electrons at a given energy transmitted through the spectrometer to the number entering the entrance aperture of the spectrometer at that energy. E 673, E42

spectrometer tube—the sensing element of a mass spectrometer leak detector. E 1316, E07

spectrometer (X-ray)—(1) an instrument similar to a spectrograph but employing a movable X-ray measuring device, such as a Geiger-Müller counter or ionization chamber, instead of a photographic film. The measuring device moves on a circle centered on the spectrometer axis.

(2) An instrument for recording, similar to the spectrograph, except that a Geiger-Müller counter, scintillation counter, proportional counter, or ionization chamber substitutes for the photographic recording. E 7, E04

spectrometry, *n*—an analytical technique for the quantitative or qualitative characterization of a sample, based on a comparison of the sample's spectrum with the spectrum of a known compound or with a standard(s) of known composition. D 1356, D22

spectrometry, *n*—The branch of physical science treating the theory and practice of the measurement of spectra. E 131, E13

spectrophotometer—a spectrometer with associated equipment, so designed that it furnishes the ratio, or a function of the ratio, of the radiant power of two beams as a function of spectral position. The two beams may be separated in time, space, or both. E 131, E13

spectrophotometer, *n*—a spectrometer for optical radiation measurements in which the receiver system is a photometer. See **photometric**. E 284, E12

spectrophotometer, *n*—instrument for measuring the ratio of two spectral radiometric quantities. E 349, E21

spectrophotometry, *n*—a method for identification of substances and determination of their concentration by measuring light transmittance in different parts of the spectrum. D 1356, D22

spectrophotometry, *n*—quantitative measurement of reflection or transmission properties as a function of wavelength. (See also **abridged spectrophotometry**.) E 284, E12

spectrophotometry—an analytical technique in which a spectrum of analyte species is obtained and used to determine the analyte

concentration in the following manner. Light is directed onto or through analyte species, and the absorption of this light across a range of wavelengths is measured by a detector. The amount of absorbed light is a function of the concentration of analyte species. *spectrum analyzer XRF*—see **XRF spectrum analyzer**. E 631, E06

spectroradiometer, *n*—a spectrometer for measuring emitted optical radiant power. E 284, E12

spectroradiometer, *n*—instrument for measuring the spectral concentration of radiant energy or radiant power. E 349, E21

spectroscopy, *n*—the branch of physical science treating the theory and interpretation of spectra (see Terminology E 135). E 131, E13

spectrum, *n*—an actual or notational arrangement of the component parts of any phenomenon, as electromagnetic waves or particles, ordered in accordance with the magnitude of a common physical property, as wavelength, frequency, or mass. E 131, E13

spectrum, *n*—the spatial arrangement of components of radiant power in order of wavelength. E 284, E12

spectrum:

aligned incidence—EIA, a backscattering spectrum recorded with the analyzing beam aligned with crystallographic axes or planes of the specimen that produce channeling.

random (incidence)—EIA, a backscattering spectrum recorded with the analyzing beam incident on the specimen in a direction such as to produce no channeling. E 673, E42

spectrum averaged cross section, $\bar{\sigma}$ —the cross section averaged over the energy distribution of the neutron fluence, where the energy limits of integration are chosen according to the neutron spectrum and reaction cross section considered. It is defined as:

$$\bar{\sigma} = \int \sigma(E) \Phi(E) dE / \int \Phi(E) dE$$

E 170, E10

spectrum, internal reflection—the spectrum obtained by the technique of internal reflection spectroscopy. E 131, E13

spectrum loading—*in fatigueloading*, a force-time program consisting of some (or all) unequal peak and valley forces. (Also known as *variable amplitude loading* or *irregular loading*.) E 1823, E08

spectrum locus, *n*—the locus of points on a chromaticity diagram representing chromaticities of monochromatic lights of various wavelengths. E 284, E12

spectrum of radiation, *n*—(1) spatial display of a complex radiation produced by separation of its monochromatic components.

(2) composition of a complex radiation. E 349, E21

specular, *adj*—same as regular when applied to reflection. D 2946, C17

specular, *adj*—pertaining to flux reflected from the surface of an object, without diffusion, at the specular angle. E 284, E12

specular angle, *n*—the angle of reflection equal and opposite to the angle of incidence. E 284, E12

specular gloss, *n*—the relative luminous fractional reflectance of a specimen in the specular direction. (See **gloss**.) D 123, D13

specular gloss, *n*—ratio of flux reflected in a specular direction to incident flux for specific source and receptor apertures (usually measured relative to a standard of specified index of refraction). D 2946, C17

specular gloss, *n*—*in waxed paper and paperboard technology*, the degree to which a surface simulates a mirror in its capacity to reflect incident light. D 4175, D02

specular gloss, *n*—the degree to which a surface simulates a mirror in its capacity to reflect incident light. D 4175, D02

specular gloss, *n*—the relative luminous fractional reflectance of a specimen in the specular direction. D 4849, D13

specular gloss, *n*—(1) ratio of flux reflected in specular direction to incident flux for a specified angle of incidence and source and receptor angular apertures.

(2) perceived surface brightness associated with the luminous specular (regular) reflection of a surface. E 284, E12

specular reflection—reflection without diffusion, in accordance with the laws of optical reflection, as in a mirror, (see Terminology E 284). **E 131, E13**

specular reflection, *n*—reflection without diffusion, in accordance with the laws of optical reflection, as in a mirror. **E 284, E12**

specular reflection, *n*—the mirror-like reflection of light from a surface. Also, reflection of light from a surface at an angle equal, but opposite to, the angle of incidence. **F 1294, F05**

specular transmittance, *n*—See **regular transmittance** (the preferred terminology). **D 883, D20**

speed—commonly used term to describe the relative light sensitivity of photoconductive papers. **F 335, F05**

speed effect—the phenomenon in electromagnetic testing of which the evidence is a change in the signal voltage resulting from a change in the relative motion between the specimen and a test coil assembly. **E 1316, E07**

speed (photographic or film) (see sensitivity)—a measure of the response of sensitivity of the material to light, often expressed numerically according to one of several systems, for example, H. and D., D.I.N., Scheiner, and American Standard speed. **E 7, E04**

speed relating to rotary disc floor machines—low speed: up to 800 r/min, high speed: more than 800 but less than 1500 r/min, and ultra high speed: 1500 r/min or more.

NOTE—Effectiveness of the floor machine depends upon machine weight and pad diameter as well as r/min. **D 2825, D21**

spelk—rod-like close packed assemblage, of asbestiform structure, and of generally uniform diameter, that can be fiberized readily. **D 2946, C17**

spew line, *n*—line on the surface of a molded product at the junction of the mold parts. **D 1566, D11**

spew, spue—any constituent of leather that comes to the surface in the form of a white crystallized or dark gummy deposit. **D 1517, D31**

spherical aberration—a lens defect in which image-forming rays passing through the outer zones of the lens focus at a distance from the principal plane different from that of the rays passing through the center of the lens. **E 7, E04**

spherical powder, *n*—globular-shaped particles. **B 243, B09**

spherical projection—a projection in which the orientation of a crystal plane is represented by the point where the plane normal intersects a sphere drawn with the crystal as the center. **E 7, E04**

spherical washers or seats—washers comprised of two mating washer components: one component is a washer having one flat side and a convex spherical surface on the other side. The other component is a washer having one flat side and a concave spherical depression machined into the other side. The two convex and concave spherical portions are mated and fit together to make up one spherical washer unit. **F 1789, F16**

spherical wave—wave in which wave fronts are concentric spheres. **D 653, D18**

sphericity—the ratio of the surface area of a hypothetical sphere of the same volume as the particle to the actual surface area of the particle. (A more convenient expression is the ratio of the diameter of a circle with an area equal to that of the projection of a grain when it rests on its larger face to the diameter of the smallest circle circumscribing this projection). (Shape factor). **D 4410, D19**

spheroidite—a coarse aggregate of carbide and ferrite usually produced by tempering martensite at temperatures slightly below the eutectoid temperature. Generally, any aggregate of ferrite and large spheroidal carbide particles no matter how produced. **E 7, E04**

spheroidize—see **annealing, spheroidize annealing**. **F 1789, F16**

spheroidize annealing—type of subcritical annealing used to soften steel and improve machinability. Heat treating fine pearlite for a long time just below the lower critical temperature of the steel, followed by a very slow cooling, produces a spheroidal or globular form of the pearlite. **F 1789, F16**

spheroidizing, *n*—heating and cooling a steel object to produce a spheroidal or globular form of carbide in its microstructure. **A 941, A01**

spicule (in asbestos)—acicular particle of nonfibrous minerals, superficially resembling a spelk, but which shatters rather than fiberize when subjected to mechanical force. **D 2946, C17**

spider—(1) a wheel-like casting consisting of a rim and radial spokes on which are mounted felt polishing pads.
(2) assembly of radiating tie rods on the top of a furnace. **C 162, C14**

spider—a defect characterized by a starshaped fracture in the porcelain enamel. **C 286, B08**

spigot—see **male end of pipe**. **C 822, C13**

spigot—that portion of a vitrified clay pipe that fits into the bell or socket of the preceding pipe. **C 896, C04**

spiked sample, *n*—a sample portion into which a known amount of analyte has been added. **D 1129, D19**

spiked sample and spiked duplicate sample—a sample portion (split from an original sample) that is spiked with a known amount of analyte. Two portions of a homogenized sample that were targeted for addition of analyte and are fortified with all the target analytes before preparation. Analysis results for these samples are used to provide information on the precision and bias of the overall analysis process. **E 631, E06**

spiked sample and spiked duplicate sample—a spiked sample (or spiked duplicate sample) is a blank wipe that is spiked with a known amount of analyte before preparation. **E 631, E06**

spiked sample and spiked duplicate sample—each is a portion of a single homogenized sample to which the same known amount of analyte is added (spiked) before sample digestion. Analysis results for these samples are used to provide information on accuracy and precision of the overall analysis process.

spindle—See **railing systems**. **E 631, E06**

spiked sample or spiked duplicate sample—a blank medium that contains no purposely added analyte to which a known amount of analyte is added before preparation. **E 631, E06**

spiked sediment—a sediment to which a material has been added for experimental purposes. **E 943, E47**

spill—see **flare**. **F 335, F05**

spillback nozzle—see **by-pass nozzle**. **E 1620, E29**

spill decay—see **flare decay**. **F 335, F05**

spill nozzle—see **by-pass nozzle**. **E 1620, E29**

spill return nozzle—see **by-pass nozzle**. **E 1620, E29**

spin axis, *n*—*of a wheel*, the axis of rotation of a wheel. **F 538, F09**

spindle, *n*—a tapered picket of circular cross-section(s), having a center diameter larger or smaller than the diameter at its ends. **E 631, E06**

spindle, *n*—a tapered baluster of circular cross-section(s), having a center diameter larger or smaller than the diameter at its ends. **E 1481, E06**

spindle—a component or part that connects the dial and drive cam. **F 471, F12**

spinel, *n*—(1) a group of natural or synthetic minerals with the general formula $R''R'''_2O_4$ (or the general oxide formula $R'' \cdot R'''_2O_3$) in which the R'' is one or more bivalent cations such as magnesium or ferrous iron and R''' is one or more trivalent cations such as aluminum, chromium, or ferric iron. *Spinel* in this usage refers mainly to the crystalline structure of the material rather than the specific cations included. (2) specifically the magnesium aluminate spinel, $MgAl_2O_4$ (or $MgO \cdot Al_2O_3$), which is 28.3 % MgO and 71.7 % Al_2O_3 by weight. **C 71, C08**

spinning cup atomizer—see **rotary cup atomizer**. **E 1620, E29**

spinning disk atomizer—see **rotary disk atomizer**. **E 1620, E29**

spinodal curve—a graphical representation of the realizable limit of the super-saturation of a solution. **E 7, E04**

spinodal heat treatment—a thermal treatment of a solution-heat-treated product to produce property changes such as hardening,

spinodal heat treatment

strengthening, and conductivity increase by spinodal decomposition of a solid solution. This treatment has also been called "age hardened," "spinodal hardened," or "spinodally decomposed."

B 846, B05

spin orbit splitting—the splitting of p-, d-, or f-levels arising from coupling of the spin and orbital angular momentum. **E 673, E42**

spinout, *n*—*in tiretesting*, a type of uncontrollability defined by a loss of steering control due to rapid or substantial yaw, or both.

F 538, F09

spin-spin coupling constant (NMR) *J*—a measure, expressed in hertz (Hz), of the indirect spin-spin interaction of different magnetic nuclei in a given molecule. **E 131, E13**

spin velocity, *n*—the angular velocity of the wheel about its spin axis.

F 538, F09

spin welding (machine)—a joining technique used for bonding thermoplastic parts by frictional heat caused by differential rotation of one or both pieces. Rotation is then stopped and pressure held until heat is dissipated. Also known as frictional welding.

C 904, C03

spiral grain—See **grain**.

D 9, D07

spiral thread—misnomer for helical thread. **F 547, F16**

spiral wound cartridge—a crossflow membrane element design consisting of a product tube, flat membrane leaves, feed channel spacers, anti-telescoping devices, and brine (concentrate) seal.

D 6161, D19

spiral wound membrane—a flat sheet membrane with one or more feed channel spacers and barrier layers, all of which are rolled into a spiral configuration. **D 6161, D19**

spirits of turpentine, *n*—the volatile oil consisting primarily of a number of terpene hydrocarbons of the general formula $C_{10}H_{16}$.

D 804, D01

spirit varnish—under **varnish**, see *spirit varnish*. **D 16, D01**

spirometer, *n*—a displacement gasometer consisting of an inverted bell resting upon or sealed by liquid (or other means) and capable of showing the amount of gas added to or withdrawn from the bell by the displacement (rise or fall) of the bell. **D 1356, D22**

spit mark, *n*—*forcoated inflatable restraint fabrics*, an essentially round spot of coating material on the surface of the coated layer.

D 6799, D13

spitout—a glaze defect of the pinhole type developed in the decorating kiln, as a result of the evolution of minute gas bubbles from body or glaze. **C 242, C21**

spitting, *v*—dispensing of a low dose of product when both product and air are dispensed resulting in the pump generating a distinctive spitting noise. **D 6655, D10**

splash cup atomizer—an impact atomizer in which one or more liquid jets are directed against the internal surface of a cup. **E 1620, E29**

splashover—oil splashing over a boom's freeboard. **F 818, F20**

splash plate atomizer—an impact atomizer in which one or more liquid jets are directed against a flat plate. **E 1620, E29**

splay—deposits of flood debris, usually of sand, scattered on the flood plain. **D 4410, D19**

splice—see **joint**. **B 354, B01**

splice, *n*—the connection or junction within the length of a joint system. **E 176, E05**

splice—the joint between two lengths of base film, fabric, or paper. **F 221, F05**

splice, *n*—the joint formed either by overlapping or butting the ends of a given tire component in the course of assembling the tire. **F 538, F09**

splice connections, *n*—joining of consecutive coils. **F 1379, F14**

splice crack, *n*—a crack originating at a splice. **F 538, F09**

splice opening, *n*—a parting of a splice along the interface of the assembled ends of a given component. **F 538, F09**

splice plate—a plate used for fastening and joining members. See also **gusset**.

split-level house—See **building**. **E 631, E06**

splice (reinforcement)—junction of two sections of parallel reinforcement intended to provide continuity and to transfer forces between the two sections. **C 822, C13**

splicing tail, *n*—the barb clusters extending beyond the last attachment at both ends of the coil. **F 1379, F14**

spine key—a part that secures the position of drive cam on a spindle in relation to correct dial calibrations. **F 471, F12**

spine or tongue—that part of a reglet-type lock-strip gasket which is designed to be installed in a reglet in supporting material. **C 717, C24**

split—an imperfection; a crack or check going from surface to surface of a glass article. **C 162, C14**

split—a separation of the wood parallel to the fiber direction, due to the tearing apart of the wood cells. **D 9, D07**

split—a membrane tear resulting from tensile stress. **D 1079, D08**

split—a term used to describe the portion of hide or skin, split into two or more thicknesses, other than the grain or hair side. Splits are usually named according to their sequence of production, such as "main," "second," or "slab" split (in case of upholstery leather), or for the use to which they are to be put, such as "flexible" (for innersoles); "glove," "waxed" (for cheap shoe-uppers); "bag and case" (finished with pyroxylin or pigment finish), sole, etc. **D 1517, D31**

split die, *n*—a die made of parts that can be separated for ready removal of the compact. **B 243, B09**

split ends—See **broken filament**. **D 3990, D13**

split face—a slightly convex or concave surface, produced by hydraulic stone splitters with straight or toothed blades or by driving wedges into a stone without natural cleavage surfaces. **C 119, C18**

split feed—a liquid-phase adsorption process in which a powdered adsorbent is added to the solution to be treated in two or more steps, with or without intermediate separation of the adsorbent. **D 2652, D28**

split filaments—See **broken filament**. **D 3990, D13**

split sample—a single sample separated into two or more individual parts in a manner that each part is representative of the original sample. **D 4410, D19**

split sheet—See **nineteen-inch selvage**. **D 1079, D08**

split spacing grouting—a grouting sequence in which initial (primary) grout holes are relatively widely spaced and subsequent grout holes are placed midway between previous grout holes to "split the spacing."; this process is continued until a specified hole spacing is achieved or a reduction in grout take to a specified value occurs, or both. **D 653, D18**

split-stitch, *n*—*in knitted fabrics*, a stitch in which one part of the yarn is knit and the other part is dropped. **D 123, D13**

split-stitch, *n*—*in knitted fabrics*, a stitch in which one part of the yarn is knit and the other part is dropped. **D 3990, D13**

split- μ test, *n*—a wet traction or stopping distance test conducted on a test course with substantially different wet friction levels for the left and right tire test lanes. **F 538, F09**

split thickness skin autograft, *n*—a skin [auto]graft consisting of the epidermis and a portion of dermis. **F 2312, F04**

splitting—(1) cutting leather into two or more layers. (2) cutting a hide into two sides preparatory to tanning. **D 1517, D31**

splitting failure—a failure mode in which the base material fractures along a plane passing through the axis of the anchor or anchors. **E 2265, E06**

splitting resistance, *n*—*of felt*, the force required to overcome the interfacial strength of a material and specifically to separate a felt into two layers (of approximately equal thickness). **D 123, D13**

splitting resistance, *n*—*of felt*, the force required to overcome the interfacial strength of a material and specifically to separate a felt into two layers (of approximately equal thickness). **D 4845, D13**

spodumene (alpha spodumene)—a lithium mineral of the theoretical composition $Li_2O \cdot Al_2O_3 \cdot 4SiO_2$ (monoclinic crystallization)

- which on heating inverts to beta spodumene, a form having very low or nil thermal expansion. **C 242, C21**
- sponge**, *n*—a form of metal characterized by a porous condition that is the result of decomposition or reduction of a compound without fusion. **B 899, B02**
- sponge iron**, *n*—a coherent, porous mass of substantially pure iron produced by solid-state reduction of iron oxide (for example, iron ore or mill scale). **B 243, B09**
- sponge iron powder**, *n*—ground and sized sponge iron, which may have been purified or annealed or both. **B 243, B09**
- sponge rubber**, *n*—*in building construction*, an elastomeric open-cell material made by incorporating a gas-producing ingredient into a rubber compound, which expands the rubber compound during vulcanization into a material containing cells that are predominately interconnecting. **C 717, C24**
- sponge rubber**, *n*—a porous elastic material with interconnecting cells, generated by gas release in the material prior to vulcanization. **D 1566, D11**
- spongy**, *n*—a porous condition in metal powder particles usually observed in reduced oxides. **B 243, B09**
- spongy enamel**—a defect characterized by masses of bubbles occurring in local areas giving rise to a spongy appearance. **C 286, B08**
- sponsor**, *n*—*of an ASTM test method*, an organization that is responsible for ensuring supply of the apparatus used in the test procedure portion of the test method. **D 4175, D02**
- spontaneous chipping**—see **spall, spalling, or spontaneous spalling**. **C 286, B08**
- spontaneous heating or self heating**, *n*—an exothermic reaction of a material due to slow or incomplete reaction that results in a temperature rise above that of its surroundings. **E 1445, E27**
- spontaneous heating temperature or self-heating temperature**, *n*—the lowest temperature at which spontaneous or self heating occurs under the specified test conditions. This temperature refers to a much earlier stage of reaction than that associated with the autoignition temperature of the material. **E 1445, E27**
- spontaneous ignition**, *n*—unpiloted ignition caused by an internal exothermic reaction (compare **piloted ignition**). **E 176, E05**
- spool**—a cylindrical device that has a rim at each end and an axial hole for a shaft or spindle, and on which the product is wound to facilitate handling and shipping. (Also called a “reel.”) **B 846, B05**
- spoon proof**—test ladle specimen taken during various stages of melting and fining. **C 162, C14**
- sporadic permafrost**—a subzone of the zone of discontinuous permafrost: (1) in North American usage: permafrost underlying <30 % of the exposed land surface; (2) in Russian usage: permafrost underlying from 3 to 20 % of the exposed land surface. **D 7099, D18**
- sporinite**—See **sporinite** under **maceral**. **D 121, D05**
- sport shirt**, *n*—*for boys*, a shirt made in numerical sizes, designed for informal wear and may be worn with or without a jacket. **D 123, D13**
- sport shirt**, *n*—*for men*, a shirt designed for informal wear and made with body sizes such as small, medium, or large; they may be worn with or without a jacket. **D 123, D13**
- sport shirt**, *n*—*for boys*, a shirt made in numerical sizes, designed for informal wear and may be worn with or without a jacket. **D 7022, D13**
- sport shirt**, *n*—*for men*, a shirt designed for informal wear and made with body sizes such as small, medium, or large; they may be worn with or without a jacket. **D 7022, D13**
- spot**, *n*—a small discolored area on, or in, a fabric. **D 123, D13**
- spot**, *n*—a small discolored area on, or in, a fabric. **D 3990, D13**
- spot and stain removal**, *n*—a cleaning procedure for localized areas with cleaning agents and mechanical action specific to the removal of the foreign substances present. **D 123, D13**
- spot and stain removal**, *n*—a cleaning procedure for localized areas with cleaning agents and mechanical action specific to the removal of the foreign substances present. **D 3136, D13**
- spot clean**, *n*—to remove spots and stains by treating them with cleaning agents and mechanical actions specific to the fiber, fabric, product type, and the foreign material present. **D 123, D13**
- spot clean**, *v*—*in the cleaning of textile floor coverings and upholstered furniture*, remove localized spots and stains by treating them with cleaning agents and mechanical actions specific to the fiber, fabric, and product type and the foreign material present. **D 5253, D13**
- spot mopping**—See **mopping**. **D 1079, D08**
- spots**—areas outside the maximum COL, which are contrasting with the background. **F 149, F05**
- spots**, *n*—*in referenceto bar code*, unwanted dark areas in the spaces, quiet zones and intercharacter gaps (if applicable) of a symbol that may be caused by presence of extraneous ink, printing errors, or dirt. **F 1294, F05**
- spot score rule**, *n*—a decision rule in which the sum of scores for an individual relevant question is considered in the formation of the final decision in a polygraph case. **E 2035, E52**
- spot size**, *n*—the diameter of the focused image of the emitter in scanners that use apertured optical systems. **F 1294, F05**
- spot test**—the application of reagent solution to a prepared dry paint film sample, paint chip, paint powder, or painted surface and the subsequent observation for the presence or absence of the characteristic color change. **E 631, E06**
- spot test**, *n*—the application of reagent solution to a dry paint film sample, paint chip, paint powder, or painted surface and the subsequent observation for the presence or absence of the characteristic color change. **E 1605, E06**
- spot test kit**, *n*—equipment (for example, a cutting tool, adsorbent applicators, if necessary) and chemicals (for example, sulfide or rhodizonate spot test reagents and any extraction solutions needed) assembled for use during spot testing for lead. **E 1605, E06**
- spotting out**—the delayed appearance of spots and blemishes on plated or finished surfaces. **B 374, B08**
- spot treatment**—application of a chemical to a small restricted area, usually to control the spread of a pest. **E 1102, E35**
- spot welds**, *n*—means of permanently joining two adjacent coil loops by fusing them through a heat or electrical process. **F 1379, F14**
- spout**—the part of a feeder that carries the orifice, revolving tube, needle, etc. **C 162, C14**
- spray**—the dispersed discharge from an aerosol-type dispenser in the form of small droplets or particles. (This does not include foam-type dispensers.) **D 3064, D10**
- spray**, *n*—a dynamic collection of particles, usually generated by the process of atomization. **E 1620, E29**
- spray**, *v*—to disperse or apply as a spray. **E 1620, E29**
- spray**, *n*—a type of extraneous or undesirable ink dot near the printed zones which originate from the printhead. **F 1857, F05**
- spray angle**, *n*—the plane angle formed by the profile of a spray pattern. **E 1620, E29**
- spray buffing**—the restorative maintenance of a previously polished floor, by the action of a suitable floor polishing machine immediately following the mist-spraying of an appropriate product onto the surface whereby the wet application is buffed to dryness. **D 2825, D21**
- spray characterization**, *n*—the process of describing a spray, based on theory or measurement, in terms of parameters such as liquid flow or flux, patterning, particle size, and velocity. **E 1620, E29**
- spray classification**—classification of sprays by droplet size. **E 1102, E35**
- spray coating**—an aerosol spray product for surface application, that leaves a residual clear or pigmented finish for protective or decorative purposes. **D 3064, D10**
- spray deposit rate**—the amount of spray liquid deposited per unit area. Mean deposit rate is the average amount of deposit over the

entire spray swath. Effective spray deposit rate is the mean deposit from center to center of adjoining swaths. **E 1102, E35**

spray drift—the movement of airborne spray particles from the intended application (target) area. **E 609, E35**

sprayed width per nozzle—the effective width sprayed by a single nozzle. (For broadcast spraying it is the nozzle spacing; for band spraying it is the band width, for row crop spraying it is the number of nozzles per row divided by the row width). **E 1102, E35**

sprayer attachment—an apparatus consisting of the individual components of a sprayer (tank, pressure source, pressure controls, spray liquid lines, pressure nozzles, etc.) in an arrangement to permit its mounting on another implement to permit application of spray at the same time another field operation is performed. **E 1102, E35**

spraying, n—when large ink particles (diameter roughly greater than 80 μm) are thrown off the rollers in the inking unit or the printing plate, particularly with presses that run at high speeds. **D 6488, D01**

spray lime—a hydrated lime of such fineness that at least 95 % of the particles will pass a No. 325 (45-μm) sieve. **C 51, C07**

spray particles/droplets, n—the spherically-shaped liquid objects that are the result of the atomization process created by a dispensing system with the size of these particles or droplets usually expressed in microns. **D 6655, D10**

spray pattern, n—pattern, preferably round, dispensed onto a flat surface when this surface is positioned so that it will intercept a spray at a 90 degree angle at a specific distance. **D 6655, D10**

spray pattern, n—the flux distribution of liquid discharge by an atomizer. **E 1620, E29**

spray probe—in leak testing, a device for directing a small jet of tracer gas on an object under vacuum testing. **E 1316, E07**

spray quenching, n—**quenching** in a spray of liquid. **A 941, A01**

spray rate—the amount of spray liquid emitted by an application unit during treatment, expressed in volume per unit treated. (For area treatment, L/ha, or gal/A; for space treatment, mL/m³, or oz/1000 ft³; for individual units, L/plant, mL/animal, or gal/tree). **E 1102, E35**

spray sagging—a process defect characterized by a wavy line or lines appearing on vertical surfaces of sprayed ware prior to drying. **C 286, B08**

spread, n—the quantity of adhesive per unit of area applied to an adherend.

double spread, n—application of adhesive to both adherends of a joint.

single spread, n—application of adhesive to only one adherend of a joint. **D 907, D14**

spread, n—*in knockmeasurement*, the sensitivity of the detonation meter expressed in knockmeter divisions per octane number. **D 4175, D02**

spread—extent of image expansion in comparison to dimension of imaging device. **F 549, F05**

spreader—See **loading**. **D 996, D10**

spreader—a material which increases the area that a droplet of a given volume of spray mixture will cover on a target. **E 1519, E35**

spreader/sticker—a material that has the properties of both a spreader and a sticker. **E 1519, E35**

spreading—the action of flowing out over a surface during application. **D 2825, D21**

spreading rate, n—the area covered by a unit volume of coating material frequently expressed as square feet per gallon. **D 16, D01**

spread stitches—See **pin hole**. **D 3990, D13**

spready hide—a hide of large area in proportion to the mass. **D 1517, D31**

spring, n—used primarily to return the piston mechanism for filling the body; however, the spring may also control the opening pressure of the upper valve. **D 6655, D10**

springback, n—see **green expansion**. **B 243, B09**

spring characteristics, c (FL⁻¹)—ratio of increase in load to increase in deflection:

$$c = l/C$$

where:

C = compliance.

D 653, D18

spring-clip staple—staple for fastening flat metal clip holding undulated upholstery spring. Also, staple used to attach coiled springs to frame in bedding manufacture where staple serves as clip. **F 592, F16**

spring crown—hip crown; designed to flatten during driving in order to provide optimum lateral guidance in driving channel of stapler. (See **high crown**; “**V**” crown.) **F 592, F16**

spring head—See **cupped oval head, umbrella head**. **F 547, F16**

springline—the points on the internal surface of the transverse cross section of a pipe intersected by the line of maximum horizontal dimension; or in box sections, the mid-height of the internal vertical wall. **C 822, C13**

spring line—the line of maximum horizontal dimension of the transverse cross section. **C 896, C04**

spring line—a line along the length of the pipe at its maximum width along a horizontal plane. **F 412, F17**

spring wire, n—round wire intended especially for the manufacture of springs. **B 899, B02**

springwood—See **earlywood**. **D 9, D07**

spring zone—that location within a melting furnace having the highest temperatures and an up-welling convective flow of molten glass due to density differences. See **hot spot**. **C 162, C14**

sprinkle mopping—See **mopping**. **D 1079, D08**

sprue, n—(1) the primary feed channel that runs from the outer face of an injection or transfer mold to the mold gate in a single cavity mold.

(2) the piece formed in a primary feed channel or sprue.

D 883, D20

sprue, n—material remaining in the sprue hole after molding.

D 1566, D11

sprue, n—(1) the primary feed channel that runs from the outer face of an injection or transfer mold, to the mold gate in a single cavity mold or a runner in multiple-cavity mold; (2) the piece of material formed in the primary feed channel opening. **F 412, F17**

sprue hole, n—the passageway through which a rubber is forced into a mold. **D 1566, D11**

sprung mass—the total mass minus the unsprung mass. **E 867, E17**

spud—to remove the roofing aggregate and most of the bituminous top coating by scraping and chipping. **D 1079, D08**

spun glass—See **fiber**. **C 162, C14**

spun yarn, n—*in a staple system*, a continuous strand of fibers held together by some binding mechanism. **D 123, D13**

spun yarn, n—*in a staple system*, a continuous strand of fibers held together by some binding mechanism. **D 4849, D13**

sputter depth profile—**AES**, the compositional depth profile obtained when material is removed by sputtering as a result of ion bombardment. **E 673, E42**

sputter depth profile—**SIMS**, the compositional depth profile obtained when material is removed by sputtering as a result of primary bombardment. **E 673, E42**

sputtered neutral mass spectrometry—**SNMS** a method in which a mass spectrometer is used to measure the mass-to-charge quotient and abundance of secondary ionised neutral species emitted from a sample as a result of particle bombardment

NOTE—The neutral species may be detected by using plasma, electron, or photon ionization methods. **E 673, E42**

sputtering—the production of specimens in the form of thin films by deposition from a cathode subjected to positive ion bombardment.

E 7, E04

sputtering—the phenomenon which occurs when atoms and ions are ejected from the specimen as a result of particle bombardment.

equilibrium surface composition—the steady-state surface composition produced by sputter-etching a homogeneous specimen under nonvarying conditions for the ambient vacuum and the primary beam.

fractional yield—SIMS, the ratio of the number of atoms and ions of a particular element to the total number of atoms and ions ejected from the specimen.

preferential—the phenomenon which may occur when the sputtering of multicomponent specimens causes a change in the equilibrium surface composition of the specimen.

rate—the amount of specimen material removed per unit time as a result of particle bombardment.

yield—the number of atoms and ions ejected from the specimen per incident ion. **E 673, E42**

spynkle number, *n*—*in jute*, a direct yarn-numbering system for jute rove and jute yarns in which the number of pounds per spynkle, or 14 400-yd (13 167-m) length, is expressed as pounds per spynkle. (See also **direct yarnnumbering system**.) **D 123, D13**

square—a roof area of 9.29 m² (100 ft²), or enough material to cover 9.29 m² of deck. **D 1079, D08**

square, *n*—an equal-sided rectangular **bar** or **tube** having sharp or slightly rounded edges. **E 631, E06**

square-cut glass—optical glass cut in small squares, separated and designated by weight. **C 162, C14**

squareness, *n*—*of paper dimensions*, the variation of the angle of the corner of a sheet of paper from 90°. **D 1968, D06**

square point—sheared square point; also known as no point or square-cut point. **F 547, F16**

square point—point sheared perpendicular to staple-leg axis to form a pointless staple-leg end; known as blunt point. **F 592, F16**

square root normal distribution—drop size distribution described by the following equation in derivative form:

$$df_n/dD = \{1/[2\sqrt{(2 \times \pi \times \sigma_s \times D)}]\} \times \exp\{-[(\sqrt{D}) - (D)_{\text{med}}]^2/[2 \times \sigma^2]\}$$

where:

f_n = the number fraction of drops of diameter less than D , and
 σ_s = the "standard deviation" from $(\sqrt{D})_{\text{med}}$.

E 1620, E29

square shank—term applied to nails with shank of essentially square cross section with or without longitudinal flutes or diagonal barbs; usually found on nails made from square wire. Shank-diameter of nails measured across diagonal (see **diameter**). **F 547, F16**

square spray nozzle—a pressure atomizer with a special orifice outlet configuration designed to create a spray whose cross section approaches a square. **E 1620, E29**

square-wire nail—bright, diagonally barbed, square-wire, regular-stock-steel, 2 by 0.113 to 4 by 0.192-in. common nails with 1/4 to 3/8-in. flat head and medium diamond point; also, 2 by 0.099 and 2 1/2 by 0.113-in. box nails with 1/4 and 1 1/4-in. flat head and medium diamond point; also, 2 by 0.091 and 2 1/2 by 0.099-in. finish nails with 0.124 and 0.131-in. flat head and medium diamond point; also, 1 1/2 by 0.131-in. truss nail with 3/32-in. flat head and medium diamond point. **F 547, F16**

squealer—Same as audible leak indicator. **E 1316, E07**

squeegee oil—a liquid mixture of organic materials used as the vehicle in squeegee paste. **C 286, B08**

squeegee paste, screening ink, screening paste—a mixture of squeegee oil and finely divided inorganic materials such as color oxides and fluxes. **C 286, B08**

squeeze-out, *n*—adhesive pressed out of the joint during the bonding process. **D 907, D14**

squeezing ground, *n*—*in tunneling*, soil or rock that contains a large

amount of clay and that advances slowly into the excavation with no perceptible increase in volume and without fracturing.

D 653, D18

squirrel foot, *n*—exposed, rough pieces of belt or bead wire. (See also *fishhooks*.) **D 5681, D34**

SRV, *n*—Schwingung, Reibung, Verschleiss, (German); oscillating, friction, wear, (English translation). **D 4175, D02**

S₁₀–S₁₈—an estimate of the portion of degraded cellulose in a pulp obtained by subtracting S₁₈ from S₁₀. **D 1695, D01**

stability—(1) resistance to devitrification.

(2) chemical durability, resistance to weathering. **C 162, C14**

stability—the condition of a structure or a mass of material when it is able to support the applied stress for a long time without suffering any significant deformation or movement that is not reversed by the release of stress. (ISRM) **D 653, D18**

stability—resistance to overturning moment. **F 818, F20**

stability factor (stability number), *N_s* (D)—a pure number used in the analysis of the stability of a soil embankment, defined by the following equation:

$$N_s = H_c \gamma_e / c$$

where:

H_c = critical height of the sloped bank,
 γ_e = effective unit of weight of the soil, and
 c = cohesion of the soil

NOTE—Taylor's "stability number" is the reciprocal of Terzaghi's "stability factor." **D 653, D18**

stability testing, *n*—tests required to demonstrate the chemical stability of the ampulized reference material (RM) for the purpose of determining the shelf life of the RM. **D 4175, D02**

stability to thermal oxidation, *n*—*for polyolefin monofilaments*, the time-to-failure, when polyolefin monofilaments exposed to circulating air, at 125°C. **D 123, D13**

stability to thermal oxidation, *n*—*for polyolefin monofilaments*, the time-to-failure, when polyolefin monofilaments are exposed to circulating air, at 125°C. **D 4849, D13**

stabilization—a treatment of magnetic material designed to increase the permanency of its magnetic properties or conditions. **A 340, A06**

stabilization—see **soil stabilization**. **D 653, D18**

stabilization—a treatment process that involves both a physical and chemical reaction for treating heavy metal waste. Heavy metal wastes are considered stabilized when they meet current applicable regulatory requirements. **D 5681, D34**

stabilization, *n*—a process for treating a waste to minimize an undesirable attribute of that waste; the treating of solids from wet scrubbing or other air pollution control processes; fly ash is often used as a reagent or filler. **E 2201, E50**

stabilization annealing—heating an austenitic stainless steel used in severe aqueous corrosion environments by first solution annealing and then reheating to about 1600°F, and holding at that temperature. The treatment causes grain boundary precipitation of carbides, but also the hold time permits the chromium remaining in the austenite solution to redistribute within the grains, restoring corrosion resistance, even adjacent to the grain boundaries. **F 1789, F16**

stabilized borehole liquid level—the borehole liquid level which remains essentially constant with time, that is, liquid does not flow into or out of the borehole. **D 653, D18**

stabilized CCPs, *n*—see **fixated CCPs**. **E 2201, E50**

stabilized stainless steel, *n*—a stainless steel that conforms to a specification that prescribes limits (minimum or range) for niobium (columbium), tantalum, titanium, or a combination thereof. **A 941, A01**

stabilized steel, *n*—a steel which has been treated with one or more carbide- or nitride-forming elements such as titanium, vanadium,

stabilized steel, n

or columbium, to control the level of interstitial solute elements (carbon or nitrogen) in the steel. **A 902, A05**

stabilizer—an ingredient added to a plastic to retard possible degradation. **F 412, F17**

stabilizer, n—materials added to the coating mixture or used in a topcoat to reduce the reversibility and degradation of the color reaction and unreacted background. **F 1623, F05**

stabilizer, dry rubber, n—a substance present in or added to raw rubber to maintain properties at or near their initial values during its production, processing, and storage. **D 1566, D11**

stabilizer, (latex), n—a substance occurring naturally in or added to latex that prevents agglomeration or coagulation of the rubber particles during processing and/or compounding. **D 1566, D11**

stabilizer (rubber), n—a substance present in or added to raw rubber to maintain the properties at or near their initial values during drying, processing, and storage. **D 1566, D11**

stabilizing treatment, n—any treatment intended to stabilize the microstructure or dimensions of a steel object. **A 941, A01**

stable crack extension [L], n—a displacement-controlled crack extension beyond the stretch-zone width. The extension stops when the applied displacement is held constant. **E 1823, E08**

stable engine conditions, n—for *octane rating*, cylinder head temperatures change less than 5°C (9°F) during a 1 min period. Any changes or minor adjustments to throttle, mixture, or engine conditions mandate restarting the clock for determining stable conditions. **D 4175, D02**

stable fabric, n—a fabric, the dimensions of which do not change significantly during processing or use. **D 123, D13**

stable fabric, n—a fabric, the dimensions of which do not change significantly during processing or use. **D 4850, D13**

stable process, n—process in a state of statistical control; process condition when all special causes of variation have been removed. **E 456, E11**

stacker—See **lehr loader**. **C 162, C14**

stacker—a device for accumulating processed documents in optical scanners and card readers. **F 149, F05**

stacking chair, n—chair that is intended to be stacked when not in use. **E 176, E05**

stacking sequence—the arrangement of ply orientations and material components in a laminate specified with respect to some reference direction. **D 3878, D30**

stacking sequence—the order in which each individual ply is layed up, or stacked, on the tool. **E 631, E06**

stacking sequence—the order in which each individual ply is layed up, or stacked, on the tool. **E 1749, E06**

stack vent—a vertical outlet in a built-up roofing system to relieve the pressure exerted by water vapor between the roofing membrane and the vapor retarder or deck. **D 1079, D08**

stage—in *grouting*, the length of hole grouted at one time. See also **stage grouting**. **D 653, D18**

stage—a sequential arrangement of pressure vessels, usually reject staged such as 2:1 array, sometimes permeate staged as in double pass RO. **D 6161, D19**

stage—a device for holding a sample in the desired position in the optical path. **E 7, E04**

stage grouting—sequential grouting of a hole in separate steps or stages in lieu of grouting the entire length at once; holes may be grouted in ascending stages by using packers or in descending stages downward from the collar of the hole. **D 653, D18**

stage micrometer—a graduated scale used on the stage of a microscope for calibration. **E 7, E04**

staggered nested experiment, n—a nested experiment in which the nested factors are run within only a subset of the versions of the first or succeeding factors. **E 456, E11**

staggered nested experiment, n—a nested experiment in which the nested factors are run within only a subset of the versions of the first or succeeding factors. **E 1325, E11**

staging—see **brine staging** and **product staging**. **D 6161, D19**

stagnation conditions—in solar energy systems, the conditions (that is, temperature and pressure) existing when energy system has attained a quasi-steady state after the flow of heat-transfer fluid has stopped, but the absorber continues to receive significant solar irradiance. **E 772, E44**

stain—(1) an imperfection; chemical corrosion on the surface of glass.

(2) transparent coloration achieved by application of metallic ions on glass at an elevated temperature. **C 162, C14**

stain—a discoloration in wood that may be caused by such diverse agencies as microorganisms, metal, or chemicals. The term also applies to materials used to impart color to wood.

blue stain—a bluish or grayish discoloration of the sapwood caused by the growth of certain dark-colored fungi on the surface and in the interior of the wood which is not accompanied by deterioration of the wood. While not caused by a wood-destroying fungi, the presence of blue stain indicates conditions possibly conducive to growth of destructive fungi.

brown stain—a rich brown to deep chocolate-brown discoloration of the sapwood of some pines caused by a fungus that acts much like the blue-stain fungus. See comments on conditions conducive to staining.

chemical brown stain—a brown discoloration of chemical origin that sometimes develops on wood in the course of air seasoning or kiln drying, probably from the oxidation of extractives in the wood. **D 9, D07**

sapstain—See **blue stain**.

stain, n—a discoloration, arising from foreign materials, that penetrates into the coating. **D 16, D01**

stain, n—a penetrating composition that changes the color of a surface, usually transparent and leaving practically no surface film. **D 16, D01**

stain, n—an area of discoloration that penetrates the fabric surface. **D 123, D13**

stain—a local deposit of soil or visible discoloration on a substrate. **D 459, D12**

stain—discoloration by foreign matter. **D 2825, D21**

stain, n—an area of discoloration that penetrates the fabric surface. **D 3990, D13**

stain, n—an area of discoloration that penetrates the fabric surface. **D 4850, D13**

stainability—the relative ease with which a material is penetrated and discolored by a foreign material. **C 286, B08**

stain, contact, n—discoloration of a product by another material or product in the area of direct contact. **D 1566, D11**

stain, diffusion, n—discoloration of a light-colored veneer or coating, caused by the diffusion of staining materials from the rubber through the veneer or coating. **D 1566, D11**

staining—marking the surface of glass by diffusing the colorant into the glass surface. **E 344, E20**

staining—the discoloration of image receptor sheet during contact with a carbon sheet. **F 221, F05**

staining power—the ability of the polish to impart color to leather during normal polishing without hiding the leather grain. **D 2825, D21**

stainless steel, n—a steel that conforms to a specification that requires, by mass percent, a minimum chromium content of 10.5 or more, and a maximum carbon content of less than 1.20. **A 941, A01**

stainless steel—the raw material on the instrument that is in accordance with Specification F 899. **F 921, F04**

stainless steel—the raw material of the instrument that is in accordance with Specification F 899. **F 1078, F04**

stainless steel—steel which has been alloyed with chromium ranging from 10% to less than 30%. Other alloying elements may also be added. **F 1789, F16**

stain, migration, *n*—discoloration, caused by volatile constituents of a rubber, that occurs on any portion of the surface of any object in the proximity of or adjacent to but not in direct contact with the rubber causing the stain. **D 1566, D11**

stains—see **inclusions**. **D 1711, D09**

stair, *n*—an uninterrupted series of level steps, or connecting flights of steps, extending between two or more **floors** or landings.

stair-rail system—See **railing systems**.

*stairway, *n*—See **stair**. **E 631, E06***

stair-rail system—a railing system located along the open sides of a stair or landing. (Compare **guardrail/railing/stair-railsystem**.)

E 631, E06

stair-rail system—a railing system located along the open sides of a stair or landing. (Compare **guardrail/railing/stair-railsystem**.)

E 1481, E06

stakeholder, *n*—a person, party, or private or public agency or organization that is interested in one or more aspects of how ITS-generated data is collected, archived, analyzed, or retrieved from an existing or proposed ADMS. **E 867, E17**

stakeholders, *n*—anyone who affects the project or is affected by the project; other than the owner/user. **E 833, E06**

stalagmometer—an apparatus for determining surface tension. The mass of a drop of a liquid is measured by weighing a known number of drops or by counting the number of drops obtained from a given volume of the liquid. **B 374, B08**

standard—uniform lengths recommended in a simplified practice recommendation or established as a commercial standard.

B 846, B05

standard, *n*—an accepted reference sample or device used for establishing measurement of a physical quantity.

*primary flow-rate standard, *n*—a device or means of measuring flow rate based on direct primary observations, such as time and physical dimensions.*

*primary standard, *n*—a standard directly defined and established by some authority, against which all secondary standards are compared.*

*secondary flow-rate standard, *n*—a flow-rate-measuring device, such as an orifice meter, that has been calibrated against a primary standard.*

*secondary standard, *n*—a standard used as a means of comparison, but checked against a primary standard.*

*transfer standard, *n*—a type of secondary standard.*

*working flow-rate standard, *n*—a flow rate measuring device, such as an orifice meter, that has been calibrated against a secondary flow-rate standard.*

*working standard, *n*—a standard used in the laboratory or field for periodic standardization of a measurement instrument. **D 1356, D22***

standard—1) a physical reference used as a basis for comparison or calibration;

2) a concept that has been established by authority, custom, or agreement to serve as a model or rule in the measurement of quality or establishment of a practice or procedure. **E 7, E04**

*standard, *n**—see **documentary standard, physical standard, primary standard, product standard, reference standard, transfer standard, verification standard, working standard**. **E 284, E12**

standard—(1) a physical reference used as a basis for comparison or calibration; (2) a concept that has been established by authority, custom, or agreement to serve as a model or rule in the measurement of quality or the establishment of a practice or procedure. **E 1316, E07**

standard, *n*—material of established origin with certified properties. **E 1732, E30**

standard addition or known addition—a procedure for the determination of the concentration of a particular species in a sample by adding known amounts of that species to the sample solution and recording the change in potential of an ion-selective electrode versus a suitable reference electrode. **D 4127, D19**

standard air—See **air at normal conditions**. **D 1356, D22**

standard air density, *n*—atmospheric air density of 0.075 lb/ft³ (1.201 kg/m³). **F 395, F11**

standardant, *n*—a material used for standardization. **E 135, E01**

standard atmosphere for preconditioning, *n*—*in textiles*, an atmosphere having a relative humidity of 5 to 25 %, ± 2 % tolerance for the selected relative humidity, and a temperature of not over 50°C (122°F), with ± 1 °C (± 2 °F) tolerance for the selected temperature and used to partially dry the material before further treatment or conditioning. **D 123, D13**

standard atmosphere for preconditioning, *n*—a set of controlled conditions having a temperature not over 50°C (122°F), with respective tolerances of ± 1 °C (± 2 °F), and a relative humidity of 5–25 % ± 2 % for the selected humidity that drying can be achieved prior to conditioning in the standard atmosphere for testing textiles. **D 4920, D13**

standard atmosphere for testing, *n*—an atmosphere for testing in which the conditions for relative humidity and temperature are specified and controlled. (Compare **atmosphere for testing**.) **D 123, D13**

standard atmosphere for testing, *n*—*in textiles*, an atmosphere for testing in which the air is maintained at a relative humidity of 65 ± 2 % and at a temperature of 21 ± 1 °C (70 ± 2 °F). (See **atmosphere for testing**.) **D 123, D13**

standard atmosphere for testing, *n*—an atmosphere for testing in which the conditions for relative humidity and temperature are specified and controlled. (Compare **atmosphere for testing**.) **D 4920, D13**

standard atmosphere for testing, *n*—*in glass textiles*, an atmosphere for testing in which the air is maintained at a relative humidity of at least 45 % and no greater than 67 %, tolerance of ± 2 % for the selected relative humidity, and a temperature of at least 20°C (68°F) and no greater than 25°C (77°F), with a tolerance of ± 1 °C (± 2 °F) at the selected temperature. (Compare **atmosphere for testing**.) **D 4920, D13**

standard atmosphere for testing, *n*—*in textiles*, an atmosphere for testing in which the air is maintained at a relative humidity of 65 ± 2 % and at a temperature of 21 ± 1 °C (70 ± 2 °F). (See **atmosphere for testing**.) **D 4920, D13**

standard atmosphere for testing, *n*—*in tire cord and industrial yarn textiles*, an atmosphere for testing in which the air is maintained at a relative humidity of 55 ± 2 % and at a temperature of 24 ± 1 °C (75 ± 2 °F). (Compare **atmosphere for testing**.) (See **standard atmosphere for testing**.) **D 4920, D13**

standard atmosphere for testing textiles, *n*—laboratory conditions for testing fibers, yarns, and fabrics in which air and relative humidity are maintained at specific levels within established tolerances. **D 123, D13**

standard atmosphere for testing textiles, *n*—laboratory conditions for testing fibers, yarns, and fabrics in which air and relative humidity are maintained at specific levels with established tolerances. **D 6477, D13**

standard atmospheric conditions, *n*—29.92 in. Hg (101 325 Pa), 68°F (20°C), and 30 % relative humidity. **F 395, F11**

standard compaction—see **compaction test**. **D 653, D18**

standard conditions, *n*—*in building construction*, laboratory test conditions consisting of a relative humidity of 50 ± 5 % at an air temperature of 23 of ± 1 °C [73.4 ± 2 °F] at ambient atmospheric pressure. **C 717, C24**

standard depth of penetration—see **depth of penetration**. **E 1316, E07**

standard depth of penetration (SDP)—the depth at which the eddy current density is reduced to approximately 37 % of the density at the surface. Eddy-current testing is most effective when the wall thickness does not exceed the SDP or in heavier tube walls when discontinuities of interest are within one SDP. (E 215) **E 1316, E07**

standard design—a published and proven concrete pipe design. **C 822, C13**

standard deviation, *n*—the most usual measure of the dispersion of

standard deviation, n

observed values or results expressed as the positive square root of the variance. **D 121, D05**

standard deviation, n —the most usual measure of the dispersion of observed values or results expressed as the positive square root of the variance. **D 4175, D02**

standard deviation—a measure of the dispersion of a series of results around their mean, computed as the positive square root of the variance. The standard deviation is the basis for most statements of precision and may be obtained from an analysis of variance of results of an interlaboratory test program. **D 4790, D16**

standard deviation, n —the most usual measure of the dispersion of observed values or results, expressed as the positive square root of the sum of the squared deviations from the sample average, divided by the degrees of freedom, usually $n - 1$, where n is the number of observed values. **E 284, E12**

standard deviation, n —the most usual measure of the dispersion of observed values or results expressed as the positive square root of the variance. **E 456, E11**

standard deviation—the square root of the variance. **E 856, D34**

standard deviation—a measure of the dispersion of a series of results around their average, expressed as the square root of the quantity obtained by summing the squares of the deviations from the average of the results and dividing by the number of observations minus one. It is also the square root of the variance and can be calculated as follows:

$$s = \sqrt{\frac{\sum(X_i - \bar{X})^2}{n - 1}}$$

where:

s = estimated standard deviation of the series of results,

X_i = each individual value,

\bar{X} = average (arithmetic mean) of all values, and

n = number of values. **E 1547, E15**

standard deviation—a measure of variation or scatter around the arithmetic average or mean. **E 2161, E37**

standard deviation, between-laboratory, n —see **between-laboratory standard deviation**. **E 135, E01**

standard deviation (in statistics)—a measure of the precision of the readings, the average deviation of the deviations from the mean value.

standard pipe size—See **iron pipe size**. **E 631, E06**

standard deviation (in statistics)—a measure of the precision of the readings, the average deviation of the deviations from the mean value. **E 1605, E06**

standard deviation, minimum, n —see **minimum standard deviation**. **E 135, E01**

standard deviation (s), n —a measure of the dispersion of a series of results around their average, expressed as the square root of the quantity obtained by summing the squares of the deviations from the average of the results and dividing by the number of observations minus one; it is also the square root of the variance and is calculated as follows:

$$s = \sqrt{\frac{\sum(x_i - \bar{x})^2}{(n - 1)}}$$

where:

s = estimated standard deviation of the series of results,

x_i = each individual value,

\bar{x} = mean (average) of all values, and

n = number of values. **A 644, A04**

standard deviation, s , n —of a sample, a measure of the dispersion of variates observed in a sample expressed as the positive square root of the sample variance. **D 123, D13**

standard deviation, within-laboratory, n —see **within-laboratory standard deviation**. **E 135, E01**

standard dimension ratios (SDR)—a specific ratio of the average specified outside diameter to the minimum specified wall thickness (D_o/t) for outside diameter-controlled plastic pipe, the value of which is derived by adding one to the pertinent number selected from the ANSI Preferred Number Series 10. Some of the values are as follows:

ANSI Preferred Number Series 10	SDR
5.0	6.0
6.3	7.3
8.0	9.0
10.0	11.0
12.5	13.5
16.0	17.0
20.0	21.0
25.0	26.0
31.5	32.5
40.0	41.0
50.0	51.0
63.0	64.0

(See reference: ANSI Preferred Numbers, Z17.1 (Designated as R 10 in ISO 3 and ISO 497).) **F 412, F17**

standard error of calibration, (SEC)—a measure of calibration accuracy determined by the following equation:

$$SEC = \left(\frac{1}{n - p - 1} \sum_{i=1}^n e_i^2 \right)^{1/2}$$

where:

n = the number of observations in the calibration data set,

p = the number of independent variables in the calibration, and

e_i = the difference between a measured value of a property and its accepted value. **E 131, E13**

standard error of performance, (SEP)—a measure of accuracy determined by the following equation:

$$SEP = \left[\frac{1}{n - 1} \sum_{i=1}^n (e_i - \bar{e})^2 \right]^{1/2}$$

where:

n = the number of observations for which the accuracy is determined,

e_i = the difference between a measured value of a property and its accepted reference value, and

\bar{e} = is the mean of all the e_i . **E 131, E13**

standard-fall diameter—the diameter of a sphere with a specific gravity of 2.65 and the same standard-fall velocity as the particle. **D 4410, D19**

standard-fall velocity—the rate of fall that a particle would finally attain if falling alone in quiescent distilled water of infinite extent and a temperature of 24°C. **D 4410, D19**

standard grain-size micrograph—a micrograph taken of a known grain size at a known magnification, which is used to determine grain size by direct comparison with another micrograph or with the image of a specimen. **E 7, E04**

standard gravity, n —as adopted by the International Committee on Weights and Measures, an acceleration of 9.80665 m/s². **D 1356, D22**

standard hardboard—hardboard substantially as manufactured at the end of hot pressing, except for humidification to adjust moisture content, trimming to size, and other subsequent machining, and having the properties associated with hardboard meeting specifications for that quality product. **D 1554, D07**

standard (hardness) block—a carefully prepared metal block used to calibrate hardness test machines. **E 7, E04**

standard hide powder—any lot of hide powder officially approved by the American Leather Chemists Association. **D 1517, D31**

standard illuminant, n —a luminous flux, specified by its spectral

distribution, meeting specifications adopted by a standardizing organization. (See, for example, **CIE standard illuminant A**, **CIE standard illuminant B**, **CIE standard illuminant C**, **CIE standard illuminant D_{65}** .) E 284, E12

standard impinger—See **impinger**. D 1356, D22

standard inside diameter dimension ratio (SIDR)—a specific ratio of the average specified inside diameter to the minimum specified wall thickness (D/t) for inside diameter-controlled plastic pipe, the value of which is derived by subtracting one from the pertinent-number selected from the ANSI Preferred Number Series 10. Some of the values are as follows:

ANSI Preferred Number Series 10	SIDR
5.0	4.0
6.3	5.3
8.0	7.0
10.0	9.0
12.5	11.5
16.0	15.0
20.0	19.0
25.0	24.0
31.5	30.5
40.0	39.0
50.0	49.0
63.0	62.0

(See reference: ANSI Preferred Numbers, Z17.1 (Designated as R 10 in ISO 3 and ISO 497).) F 412, F17

standard instrument—a measuring instrument intended to define, represent physically, maintain, or reproduce the unit of measurement of a quantity (or a multiple or submultiple of that unit) in order that other measuring instruments may be calibrated against it by comparison (see **calibrated instrument**). E 170, E10

standardization, n —(1) the process of adjusting instrument output to a previously established calibration; (2) the experimental establishment of the concentration of a reagent solution. E 135, E01

standardization—correlation of an instrument response to a standard of known accuracy. E 1187, E36

standardization, instrument, n —the adjustment of an NDT instrument using an appropriate reference standard, to obtain or establish a known and reproducible response. (This is usually done prior to an examination, but can be carried out anytime there is concern about the examination or instrument response. (See also **calibration, instrument**.) E 1316, E07

standardize, v —to adjust instrument output to correspond to a previously established calibration using one or more homogeneous specimens or reference materials. (See **calibrate, verify**.) E 284, E12

standard kaolin—kaolin from any lot officially approved by the American Leather Chemists Association. D 1517, D31

standard knock intensity, n —for **knock testing**, that level of knock established when a primary reference fuel blend of specific octane number is used in the knock testing unit at maximum knock intensity fuel-air ratio, with the cylinder height (dial indicator or digital counter reading) set to the prescribed guide table value. The detonation meter is adjusted to produce a knockmeter reading of 50 for these conditions. D 4175, D02

standard laboratory atmosphere—an atmosphere, the temperature and relative humidity of which is specified, with tolerances on each. E 41, G03

standard leak—a device that permits a tracer gas to be introduced into a leak detector or leak testing system at a known rate to facilitate calibration of the leak detector. E 1316, E07

standard leakage rate—the rate of flow of atmospheric air under conditions in which: inlet pressure is 0.1 MPa \pm 5%; outlet pressure is less than 1 kPa; temperature is 25°C \pm 5°C; and dew point is less than -25°C. E 1316, E07

standard match—with a tongue and groove on opposite edges but not centered. D 9, D07

standard moisture regain, n —the moisture regain of a material at

equilibrium with the standard atmosphere for testing textiles. (See **moisture regain**.) D 123, D13

standard moisture regain—see **moisture regain, standard**. D 1695, D01

standard moisture regain, n —the moisture regain of a material at equilibrium with the standard atmosphere for testing textiles. (See **moisture regain**.) D4920, D13

standard neutron field—see **benchmark neutron field**. E 170, E10

standard observer, n —for **color determination**—see **standard observer, CIE 1931**. D 2946, C17

standard observer, n —an ideal observer having visual response described by the CIE color-matching functions. (See also **CIE 1931 standard observer, CIE 1964 supplementary standard observer**.) E 284, E12

standard observer, CIE 1931, n —in **color determination**, hypothetical observer based on color mixture data obtained for a 2° field of view for 17 real observers, adopted by the CIE in 1931. D 2946, C17

standard operating procedure (SOP), n —Written procedures that describe how to perform certain laboratory activities. E 1732, E30

standard penetration resistance—see **penetration resistance**. D 653, D18

standard polyolefin monofilament, n —as used in this specification, a flat polyolefin strand, approximately 0.05 mm (2 mil) thick by 2.5 mm (100 mil) wide and oriented with a draw ratio between 5:1 and 7:1. D 123, D13

standard polyolefin monofilament, n —as used in specification D 3218, a flat polyolefin strand, approximately 0.05 mm (2 mil) thick by 2.5 mm (100 mil) wide and oriented with a draw ratio between 5:1 and 7:1. D 4849, D13

standard, primary, n —one whose calibration is determined by measurement according to specified parameters. C 1154, C17

standard reference material (SRM), n —see **certified reference material**. E 135, E01

standard reference test tire, (SRTT), n —a tire that meets the requirements of Specification E 1136, commonly used as a control tire or surface monitoring tire. F 538, F09

standard reporting conditions, n —for **photovoltaic performance measurements**, a fixed set of conditions that constitute the device temperature, the total irradiance, and the reference spectral irradiance distribution to which electrical performance data are translated. E 1328, E44

standards—rules or bases of comparison used in judging capacity, quantity, content, extent, value, or quality; levels of excellence or attainment regarded as a measure of adequacy. E 2135, E53

standard, secondary, n —standard calibrated by reference to another standard such as a primary, reference, laboratory, or working standard. C 1154, C17

standard-sedimentation diameter—the diameter of a sphere with the same specific gravity and fall velocity as the given particle. D 4410, D19

standard source, n —for **color determination**, light source whose spectral energy distribution is known or defined. D 2946, C17

standard source, n —a source of radiant flux meeting specifications adopted by a standardizing organization. (See also **CIE standard source A**, **CIE standard source B**, **CIE standard source C**.) E 284, E12

standard sprayer, n —generally, a finger-actuated, higher-output (greater than 500 mcl) pump that delivers a coarser spray than a fine mist sprayer. D 6655, D10

standard staple—staple with nominal ½ in. (13 mm)-wide crown, ¼ in. (6 mm)-long legs, made of 0.019 in. (0.48 mm) wire, commonly used in desk-type staplers. F 592, F16

standard subtraction or known subtraction—a variation of the standard addition method. In this procedure, changes in the potential resulting from the addition of a known amount of a

standard subtraction or known subtraction

- species (for example, a complexing agent) that reacts stoichiometrically with the ion of interest are employed to determine the original activity or concentration of the ion. **D 4127, D19**
- standard temperature/time curve (standard time/temperature curve), *n***—in fire testing, a graphical representation derived from prescribed time-temperature relationships and used to control furnace temperature with progressing time. **E 176, E05**
- standard test, *n***—a test on a calibrated test stand, using the prescribed equipment that is assembled according to the requirements in the test method, and conducted according to the specified operating conditions. **D 4175, D02**
- standard test conditions**—the parameters under which a membrane manufacturer tests devices for flow and salt rejection. **D 6161, D19**
- standard thermoelement, *n***—a thermoelement that has been calibrated with reference to platinum 67 (Pt-67). **E 344, E20**
- standard volumetric solution**—a solution of accurately determined concentration used in the quantitative analysis of chemicals and other products. The concentration of such solutions is usually expressed in terms of normality or molarity. **E 1547, E15**
- standard weathering reference material (SWRM), *n***—a Weathering Reference Material (WRM) whose well documented weathering degradation properties have been certified by a recognized standards agency or group and which are identical when exposed to identical test conditions. **G 113, G03**
- standby diver, *n***—a diver at the dive location available to assist a diver in the water. **F 1549, F32**
- standing orders**—a type of medical protocol which provides specific written orders for actions, techniques, or drug administration when communication has not been established for direct medical direction. **F 1177, F30**
- standing wave**—a wave produced by simultaneous transmission in opposite directions of two similar waves resulting in fixed points of zero amplitudes called nodes. **D 653, D18**
- standoff—in abrasiveblasting**, distance from blast nozzle to part when abrasive blasting. **B 374, B08**
- standoff installation**—anchorage assembly in which the attachment is secured at a distance from the surface of the base material. **E 2265, E06**
- staple, *n***—natural fibers or cut lengths from filaments. **D 123, D13**
- staple, *n***—in greasewool, a tuft or lock of fibers which naturally cling together, as found in a fleece. **D 123, D13**
- staple, *n***—a U-shaped round or flat wire fastener that is: (1) used to secure parts together. (It may or may not be clinched); (2) driven over wires and bands to hold parts in position; (3) used to fasten together the flaps of fiberboard boxes. (Compare stitch.) **D 996, D10**
- staple, *v***—to fasten with staples. **D 996, D10**
- staple, *n***—a collection of discontinuous filaments of spinnable length that are natural, manufactured directly in a short length, or cut from continuous filaments. **D 3878, D30**
- staple, *n***—in greasewool, a tuft or lock of fibers which naturally cling together, as found in a fleece. **D 4845, D13**
- staple, *n***—natural fibers or cut lengths from filaments. **D 4849, D13**
- staple, *n***—in buttons, a looped metal shank securely positioned perpendicular to and at center back of the button flange for use in attaching the button to one part of a flexible substrate by means of a needle and thread, a ring, or a toggle. **D 5497, D13**
- staple**—“U”-shaped wire fastener usually with two same-size pointed or pointless legs connected by crown located opposite staple-point ends; designed to be driven by strike, pneumatic, electric, manual or spring tools through or through and into layers of penetrable material and to hold two or more pieces together. **F 592, F16**
- staple, *n***—an anchor component that connects the bony elements of the spine, pelvis, or ribs to each other or to other implant components by using at least two interconnected posts. **F 1582, F04**
- stapled seam, *n***—a seam formed by shaped metal devices such as U-shaped staples. (Compare glued seam, sewn seam.) **D 123, D13**
- stapled seam, *n***—in home sewing, a seam formed by shaped metal devices such as U-shaped staples. (Compare glued seam, sewn seam, thermally bondedseam.) **D 4965, D13**
- staple fiber**—fibers produced in short, random lengths as distinguished from chopped fiber. **C 162, C14**
- staple glass yarn, *n***—yarn made from filaments that are nominally 200 to 380 mm (8 to 15 in.) in length. **D 123, D13**
- staple glass yarn, *n***—yarn made from filaments that are nominally 200 to 300 mm (8 to 15 in.) in length. **D 7018, D13**
- staple length, *n***—in grease wool, the length of a staple obtained by measuring the natural staple without stretching or disturbing the crimp of the fibers. **D 123, D13**
- staple length, *n***—in grease wool, the length of a staple obtained by measuring the natural staple without stretching or disturbing the crimp of the fibers. **D 4845, D13**
- staple length**—distance from top of staple crown to tip of staple point. Also referred to as leg length. In contrast, length of bulk staple, driven by hand-hammer, is measured from bottom of staple crown to tip of staple point. **F 592, F16**
- staple point**—See bevel point, chisel point, clinch point, cross-cut chisel point, divergent point, inside bevel point, outside bevel point, outside bevel divergent point, right-angle chisel point, spear point, step point. **F 592, F16**
- staple spacing**—dimension used to describe the relative location of staple or staples in workpiece; often, the dimension to center or center-to-center of staple. **F 592, F16**
- starch lump**—See hard size. **D 3990, D13**
- stardusting**—an extremely fine form of roughness on the surface of a metal deposit. **B 374, B08**
- star head**—slightly raised pyramidal head with multiple triangular faces meeting at common vertex, having a polygonal or circularized flat bearing surface. **F 547, F16**
- star marks**—a defect sometimes occurring in sheet steel iron cover coats where the dried ware is set down too hard on the firing fixture points and the enamel coating is fractured. **C 286, B08**
- starring**—see back emission and self-limiting. **C 286, B08**
- stars**—a defect similar to star marks appearing in the surface as a series of small hairlines radiating from a common center. They are typical of porcelain enamel powder systems. **C 286, B08**
- start bi, *n***—the first element in a character in asynchronous serial transmission. **F 1457, F05**
- starters, *n***—in shingles, lateral sections of roofing shingles applied beneath the first course of shingles with slight overhang at the eaves. **C 1154, C17**
- starters**—lateral sections of roofing shingles, usually 75 mm (3 in.) wide, and applied beneath the first course of shingles with slight overhang at the eaves. **D 2946, C17**
- starting material, *n***—a raw material, intermediate, or an API that is used in the production of an API or product and that is incorporated as a significant structural fragment into the structure of the API or dosage form. **E 2363, E55**
- starting threshold (U_0 , m/s), *n***—the lowest wind speed at which a rotating anemometer starts and continues to turn and produce a measurable signal when mounted in its normal position. **D 1356, D22**
- start of blue (SB), *n***—that temperature at which the liquid crystal first begins to reflect blue light, which is defined as light having a wavelength of 491 nm. **E 344, E20**
- start of green (SG), *n***—that temperature at which the liquid crystal first begins to reflect green light, which is defined as light having a wavelength of 575 nm. **E 344, E20**
- start of red (SR), *n***—that temperature at which the liquid crystal first begins to reflect red light, which is defined as light having a wavelength of 675 nm. **E 344, E20**
- start of scan, *n***—an electronic signal in a transmission which

indicates to the receiver that the next series of signals are from an image and not text code. **F 1457, F05**

start of text, *n*—an electronic signal in a transmission which indicates to the receiver that the next series of signals are from text and not image code. **F 1457, F05**

start/stop characters or patterns, *n*—distinct characters or patterns used at the beginning and end of bar code symbols that provide timing references and direction-of-read information to the decoding logic. **F 1294, F05**

starved joint, *n*—see *starved joint* under **joint**. **D 907, D14**

starwheel, *n* (also called pick off)—when the feed mechanism of a printer digs into the inked surface. **F 1857, F05**

state of statistical control, *n*—a condition in which a process, including a measurement process, is subject only to random variation. **D 123, D13**

State registered USTs—State lists of underground storage tanks required to be registered under Subtitle I, Section 9002 of RCRA. **D 5681, D34**

static—exhibiting little or no change or movement. **C 717, C24**

static, adj (1)—*in testing*, descriptive of a test in which force or deflection is caused to change at a slow constant rate, within or in imitation of tests performed in screw-operated universal test machines. **D 1566, D11**

static, adj (2)—*in testing*, descriptive of a test in which force or deflection is applied and then is truly unchanging over the duration of the test, often as the mean value of a dynamic test condition. **D 1566, D11**

static, adj (3)—*as a modifier of stiffness or modulus*, descriptive of the property measured in a test performed at a slow constant rate. **D 1566, D11**

static calorimeter, *n*—a calorimeter without a thermostated jacket. **D 5681, D34**

static coefficient of friction—the ratio of the parallel component of force applied to a stationary body that just overcomes the friction or resistance to relative motion of two surfaces in physical contact one with another, but otherwise unconstrained, to the normal component of the force—usually the force caused by gravity—applied to the body under clean, dry conditions. **C 242, C21**

static coefficient of friction—the ratio of the tangential force that is needed to start uniform relative motion between two contacting surfaces to the perpendicular force holding them in contact. **F 141, F06**

static coefficient of friction, *n*—the coefficient of friction corresponding to the maximum friction force that must be overcome to initiate macroscopic motion between two bodies. **G 40, G02**

static cryosol—a mineral soil showing little or no evidence of cryoturbation, with permafrost within 1 m below the surface. **D 7099, D18**

static force, *n*—*in textile testing*, a mass which exerts a force by means of the mass alone without motion. (Syn. dead load) **D 123, D13**

static force, *n*—*in textile testing*, a mass which exerts a force by means of the mass alone without motion. (Syn. dead load.) **D 4850, D13**

static friction, *n*—friction developed between two touching bodies at the time one body starts to move relative to another. (Compare **kinetic friction**.) **D 123, D13**

static friction, *n*—friction developed between two touching bodies at the time one body starts to move relative to another. (Compare **kinetic friction**.) **D 4849, D13**

static hold-up or wettage, *n*—the quantity of liquid retained in the column after draining at the end of a distillation. **D 4175, D02**

static layer—a mechanically supported layer which carries one or both poles of the switch or is used to short both poles together. The static layer is a required component of a membrane switch. **F 2112, F01**

static load—See **load**. **D 996, D10**

static load—a load or series of loads that are supported by or are applied to a structure so gradually that forces caused by change in momentum of the load and structural elements can be neglected and all parts of the system at any instant are essentially in equilibrium. **E 631, E06**

static load, *n*—an imposed stationary force that is constant in magnitude, direction, and sense. **E 631, E06**

static load—load condition not involving significant inertial force. **E 2265, E06**

static pressure—See **pressure**. **D 1356, D22**

static rope (rope systems), *n*—a class of ropes that is used for rescue work and rappelling that has a maximum elongation of 6 % at 10 % of its minimum breaking strength. **F 1490, F32**

static test—a test involving only static loads. **E 2265, E06**

static test, *n*—single cycle loading tests designed to evaluate the mechanical properties of materials, components, interconnections, subconstructs, constructs, subassemblies, or assemblies. **F 1582, F04**

static thermal response curve, *n*—the relationship of the response characteristic of a thermal printing system over a given range of print energies; optical (reflectance) density (*y*-axis) versus temperature (*x*-axis). **F 1623, F05**

static water level—the elevation of the top of a column of water in a monitoring well or piezometer that is not influenced by pumping or conditions related to well installation, hydrologic testing, or nearby pumping. **D 653, D18**

stationary belt method—a method of gross sample collection in which the conveyor belt is stopped and the sample of material is removed manually. **D 5681, D34**

stationary extractor—a series of horizontal baffles that run the full length of the exhaust hood and are not removable for cleaning. It includes one or more water manifolds with spray nozzles that, upon activation, wash the grease extractor with hot, detergent-injected water, removing the accumulation of grease from the extractor. See **grease extractors**. **F 1827, F26**

stationary repeatability precision—the precision of the measurement of a characteristic determined under repeatability condition with the instrumented equipment stationary. **E 867, E17**

station rack type, water-driven rotary spray type—See **pot, pan, and utensils washing machine**. **F 1827, F26**

station/work uniform, *n*—a nonprimary protective clothing ensemble consisting of a shirt and pants that is intended to be worn by members of the fire and rescue services while on duty. **F 1494, F23**

statistic, *n*—a quantity that is calculated from observations on a sample and that estimates a parameter of a population. **D 123, D13**

statistic, *n*—a quantity calculated from a sample of observations, most often to form an estimate of some population parameter. **D 5681, D34**

statistic, *n*—a quantity calculated from a sample of observations, most often to form an estimate of some population parameter. **E 456, E11**

statistic—a summary value calculated from the observed values in a sample. **E 1823, E08**

statistical control—exists when all special causes of variation have been eliminated from a process and only common causes remain. **F 1789, F16**

statistical measure, *n*—statistic or mathematical function of a statistic. **E 456, E11**

statistical noise—XPS, the noise in the spectrum due solely to the statistics of randomly detected single events; the root mean square of the deviations in neighboring channels is equal to the square root of the average counts per channel. **E 673, E42**

statistical procedures, *n*—the organized techniques and methods used to collect, analyze, and interpret data. **E 456, E11**

statistical process control—use of statistical techniques, such as control charts, to analyze a process or its outputs so as to take

statistical process control

appropriate actions to achieve and maintain a state of statistical control and to improve the process capability. **F 1789, F16**

statistical sampling—the process by which a number of items are selected from the population for analysis so that the sample is representative of the entire population from which it was selected.

E 2135, E53

statistical thickness surface area (STSA), *n*—the external surface area of carbon black that is calculated from nitrogen adsorption data using the de Boer theory and a carbon black model.

D 3053, D24

status, *n*—a message sent by a device to the host describing its condition, the condition can be any of several things, such as ready, able to execute the command, etc.

F 1457, F05

status switches, *n*—switches located on the mainframe electronic chassis in the console used to set the number of specimens tested on each laboratory sample and turn off instruments not being used in operating the system.

D 123, D13

status switches, *n*—switches located on the mainframe electronic chassis in the console used to set the number of specimens tested on each laboratory sample and turn off instruments not being used in operating the system.

D 7139, D13

stave, *n*—(1) one of the shaped vertical units of a coopered wooden container which, when placed edge-to-edge and bound with hoops around a circular bottom (sometimes top and bottom), forms a barrel or other staved container; (2) one of the thin, wood or veneer slats forming the body, sides, or cover of a basket or hamper.

D 996, D10

stay—paper or metal material used to join parts of a box together at a corner, or to reinforce a cut-score on solid fiberboard. It is most commonly used for set-up boxes.

D 996, D10

stay log—a device used on a veneer lathe to which is fastened a flitch or segment of a bolt to secure desired grain effects in the veneer.

D 1038, D07

steadite—(1) ternary eutectic found in alloys of iron, carbon and phosphorus. In cast irons it consists of austenite, cementite and iron phosphide or austenite and iron-phosphide. If conditions are such that carbon is deposited as cementite, the three constituents of the eutectic are present. If, however, the carbon is deposited as graphite, that precipitated from the ternary eutectic crystallizes on existing flakes and the eutectic consists of two constituents only, namely, austenite and iron-phosphide.

(2) Binary eutectic found in alloys of iron and phosphorus consisting of ferrite and iron-phosphide.

E 7, E04

steady state, *n*—in heat transfer, condition in which the temperature at any given point in a material or system is independent of time, to a given precision for a specified time period. It follows that the temperature gradient and heat flux at any given point are independent of time.

C 168, C16

steady-state crack—a crack that has advanced slowly until the crack-tip plastic zone size and crack-tip sharpness remain constant with further crack extension. Although crack-tip conditions can be a function of crack velocity, the steady-state crack-tip conditions for metals have appeared to be independent of the crack velocity within the range attained by the loading rates specified in Test Method E 1304.

E 1823, E08

steady-state permeation, *n*—the constant rate of permeation that occurs after breakthrough when the chemical contact is continuous and all forces affecting permeation have reached equilibrium.

F 1494, F23

steady state simulator—simulator whose irradiance output at the test plane area is continuous for periods of a second or greater.

E 772, E44

steady state (thermal), *n*—a condition for which all relevant parameters in a region do not vary over two consecutive steady-state time periods by more than the steady-state tolerance, and no long-term monotonic drifts are present.

Where, the steady-state time period is the time constant of the apparatus-specimen system with additional time necessary if physical phenomena are present, such as moisture transport, which

could cause a long-term monotonic drift.

Steady-state tolerance consists of (possibilities in order of increasing magnitude):

(1) The imprecision of the mean of a set of data points. This can be defined as twice the standard deviation of a set of N independent data points divided by the square root of N , $2\sigma/\sqrt{N}$,

(2) The scatter of the data. This would be 2σ , or,

(3) Some larger value may be chosen resulting in less precision.

C 168, C16

steady-state vibration—vibration in a system where the velocity of each particle is a continuing periodic quantity.

D 653, D18

steam blackening, *n*—the superheated steam treatment of a ferrous P/M component to form a thin, dark, oxide layer, primarily Fe_2O_4 , on the outside surfaces of the component, and extending into the surfaces of the interconnecting porosity.

B 243, B09

steam cleaning, *n*—a deprecated term since no steam is used. Use the preferred term, hot water extraction cleaning.

D 5253, D13

steam cooker—cooking equipment wherein heat is imparted to food in a closed compartment. The compartment can be at or above atmospheric pressure and the steam can be static or circulated. The pressure occurring in the food compartment of these steamers during cooking ranges from zero gage psi pressure to 15 psig.

F 1827, F26

steam extraction cleaning, *n*—a deprecated term since no steam is used. Use the preferred term, hot water extraction cleaning.

D 5253, D13

steam jacketed kettle—cooking equipment comprised of two hemispherical metal shells of different sizes, the smaller shell inserted into the larger shell and fastened in a way that provides a space around its bottom and up its sides to form a pressure vessel with one-half, two-thirds, or full jacketing, wherein heat is imparted to food by steam circulating through the jacket.

F 1827, F26

steam purity, *n*—the proportion by mass of pure vapor-and liquid-phase water in a fluid mixture that consists primarily of steam.

E 957, E44

steam quality, *n*—the percentage by mass of vapor-phase water in a two phase mixture of vapor- and liquid-phase water.

Example — A two-phase geothermal fluid consists of the following mass percentages: 90% vapor-phase water, 6% liquid-phase water, 3% noncondensable gas, 1% total dissolved solids.

The steam quality of this mixture is $[90/(90+6)] \times 100 = 93.75\%$.

E 957, E44

steam treatment, *n*—see steam blackening.

B 243, B09

steatite porcelain—See *steatite porcelain* under porcelain.

C 242, C21

steatite talc—massive talc or the pulverized product thereof having the general formula $3\text{MgO} \cdot 4\text{SiO}_2 \cdot \text{H}_2\text{O}$.

C 242, C21

steatite whiteware—See *steatite whiteware* under ceramic whiteware.

C 242, C21

steel, *n*—a material that conforms to a specification that requires, by mass percent, more iron than any other element and a maximum carbon content of generally less than 2.

A 941, A01

steel belt, *n*—rubber coated steel cords that run diagonally under the tread of steel radial tires and extend across the tire approximately the width of the tread.

D 5681, D34

steel belt, *n*—rubber coated steel cords that run diagonally under the tread of steel radial tires and extend across the tire approximately the width of the tread. The stiffness of the belts provides good handling, tread wear and penetration resistance.

D 5681, D34

steel, cold-rolled—see cold-rolled steel.

C 286, B08

steel cord, *n*—a formed structure made by twisting together two or more steel filaments when used as an end product or a combination of strands or filaments and strands.

D 123, D13

steel cord, *n*—a formed structure made of two or more steel filaments when used as an end product or a combination of strands or filaments and strands.

D 6477, D13

steel cord wrap, *n*—a filament wound helically around a steel cord.

D 123, D13

steel cord wrap, n—a steel filament wound helically around a steel cord. **D 6477, D13**

steel failure—failure mode characterized by fracture of the anchor steel. **E 2265, E06**

steel filament, n—the individual element in a steel strand or cord. **D 123, D13**

steel filament, n—the individual element in a steel strand or cord. **D 6477, D13**

steel grades—steel classified by carbon content. The following grades are generally used for wire or raw material purchase; but do not restrict nails to specific analysis. When the steel grade is referred to in the definition of a nail type, it is intended only as a general indication of the likely material used. Any steel of suitable analysis may be used in nail manufacture unless specified otherwise in the product standard.

low-carbon steel—a grade of steel (see Specification A 510 for General Requirements for Wire Rods and Coarse Round Wire, Carbon Steel) wherein the maximum of the carbon range is up to and including 0.15 %.

medium low-carbon steel—a grade of steel (Specification A 510) wherein the maximum of the carbon range exceeds 0.15 % up to and including 0.23 %.

medium high-carbon steel—a grade of steel (Specification A 510) wherein the maximum of the carbon range exceeds 0.23 % up to and including 0.44 %.

high-carbon steel—a grade of steel (Specification A 510) wherein the maximum of the carbon range exceeds 0.44 %.

F 547, F16

steel scrap, n—discarded steel or steel products, generally segregated by composition and size or "grade," suitable for melting. **A 644, A04**

steel sheet designation, n—a title given to a steel sheet product, associated with unique requirements for chemical composition and with mandatory or nonmandatory (typical) mechanical properties; the specific titles include *commercial steel, drawing steel, deep drawing steel, extra deep drawing steel, forming steel, high strength-lowalloy steel, high temperature steel, structural steel, bake hardenable steel, and solution hardened steel*. **A 902, A05**

steel slag, n—the nonmetallic product consisting essentially of calcium silicates and ferrites combined with fused oxides of iron, aluminum, manganese, calcium and magnesium, that is developed simultaneously with steel in basic oxygen, electric, or open hearth furnaces. **D 8, D04**

steel strand, n—a group of steel filaments combined together to form a unit product. **D 123, D13**

steel strand, n—a group of steel filaments combined to form a unit product to be processed further. **D 6477, D13**

steep asphalt—a roofing asphalt conforming to the requirements of Specification D 312, Type III. **D 1079, D08**

steeple head—See **cone head**. **F 547, F16**

steep slope, adj—in roofing, that which commonly describes an incline of a roof which is greater than 14° (25 % or 3 in./ft). **D 1079, D08**

steer hide—see **hide grades**. **D 1517, D31**

steering wheel angle, (rad or degree), n—in a vehicle, the angular displacement of the steering wheel, measured from its orientation in the vehicle's straight-ahead position. **F 538, F09**

stem—the bole or trunk of a tree. **D 9, D07**

stem, n—for some pump designs, a means to connect the actuator to the piston. **D 6655, D10**

stem, n—of a liquid-in-glass thermometer, capillary tube through which the meniscus of the thermometric liquid moves with change of temperature. **E 344, E20**

stem cells, n—progenitor cells capable of self-replication, proliferation, and differentiation. **F 2312, F04**

stemming—(1) the material (chippings, or sand and clay) used to fill a blasthole after the explosive charge has been inserted. Its purpose

is to prevent the rapid escape of the explosion gases. (2) the act of pushing and tamping the material in the hole. (ISRM) **D 653, D18**

stepdown test—a test involving the preparation of a series of machined steps progressing inward from the surface of a bar for the purpose of detecting by visual inspection internal laminations caused by inclusion segregates. See Practice E 45. **E 7, E04**

step-drawdown test—a test in which a control well is pumped at constant rates in "steps" of increasing discharge. Each step is approximately equal in duration, although the last step may be prolonged. **D 653, D18**

step fracture—See **striation**. **C 162, C14**

stepladder code, n—see **vertical bar code**. **F 1294, F05**

step point—notched point with step faces perpendicular to staple crown; designed to facilitate self-clinching of staple legs when driven against clinching plate. **F 592, F16**

step wear, n—a synonym for *row/rib wear*. **F 538, F09**

step wedge—a device with discrete step thickness increments used to obtain an image with discrete density step values. **E 1316, E07**

step-wedge calibration film—a step-wedge comparison film the densities of which are traceable to a nationally recognized standardizing body. **E 1316, E07**

step-wedge comparison film—a strip of processed film carrying a stepwise array of increasing photographic density. **E 1316, E07**

step wedge comparison film—a radiograph with discrete density steps that have been verified by comparison with a calibrated step wedge film. **E 1316, E07**

stereo angle—one half of the angle through which the specimen is tilted when taking a pair of stereomicrographs. The axis of rotation lies in the plane of the specimen. **E 7, E04**

stereographic projection—the projection to a plane from a spherical projection, customarily using the South Pole as the eye point. **E 7, E04**

stereology—the study of mathematical procedures used to derive three-dimensional parameters describing a structure from two-dimensional measurements. **E 7, E04**

stereomicroscope—a light optical microscope that permits each eye to examine the specimen at a slightly different angle, thereby retaining its three-dimensional relationship. **E 7, E04**

stereoscopic micrographs—a pair of micrographs of the same area but taken from different angles so that the two micrographs when properly mounted and viewed reveal the structures of the objects in their three-dimensional relationships. **E 7, E04**

stereoscopic specimen holder—a specimen holder designed for the purpose of making stereomicrographs. It makes possible the tilting of the specimen through the stereo angle. **E 7, E04**

sterilant—an agent used to achieve commercial sterility. **F 17, F02**

sterilant—See Terminology F 17. **F 1327, F02**

sterile, adj—free from any viable organism, either active or dormant. **D 1129, D19**

sterile—free of any living organism. **E 1705, E48**

sterile—free of any viable microorganisms, either active or dormant (D 1129, D19). **F 17, F02**

sterile—See Terminology F 17. **F 1327, F02**

sterile, adj—free from viable microorganisms. **F 1494, F23**

sterilization—destruction or removal of all viable organisms. **D 6161, D19**

sterilization, n—the destruction or removal of all microorganisms in or about an object, as by, chemical agents, electron beam, gamma irradiation, ultraviolet (UV) exposure, or filtration. **F 2312, F04**

stick, n—extruded form substantially uniform in cross section cut to desired length or weight. **B 881, B07**

stick—See **strip**. **F 592, F16**

sticker—a material that assists the spray deposit to adhere to the target in terms of resistance to wind, water, mechanical action. **E 1519, E35**

stick-fed tool—See **strip-fed tool**.

F 592, F16

stickies, *n*—particulate, generally non-fibrous, contaminants suspended in pulps of the type used in papermaking which adhere to themselves, other components of the paper structure, components of the papermaking machinery, and in the case where the contaminants are incorporated into the finished paper or paper products, cause the unexpected and generally undesirable adherence one to another of units of the finished paper or paper product.

D 1968, D06

sticking—a method of repairing the butt edge of a broken piece of stone, generally done with dowels, cements, or epoxies. The pieces are “stuck” together, thus “sticking”.

C 119, C18

sticking—a response evidenced by softening and adherence of the material to the hot surface or other material.

F 1494, F23

stick-slip, *n*—a phenomenon occurring when boundary lubrication is deficient, manifested by alternate periods of sticking and slipping of the surfaces in contact.

D 123, D13

stick-slip—rapid fluctuations in shear force as one rock mass slides past another, characterized by a sudden slip between the rock masses, a period of no relative displacement between the two masses, a sudden slip, etc. The oscillations may be regular as in a direct shear test, or irregular as in a triaxial test.

D 653, D18

stick-slip, *n*—a phenomenon occurring when boundary lubrication is deficient, manifested by alternate periods of sticking and slipping of the surfaces in contact.

D 4849, D13

stick-slip, *n*—*in tribology*, a cyclic fluctuation in the magnitudes of friction force and relative velocity between two elements in sliding contact, usually associated with a relaxation oscillation dependent on elasticity in the tribosystem and on a decrease of the coefficient of friction with onset of sliding or with increase of sliding velocity.

G 40, G02

stick vacuum cleaner, *n*—a non-self-standing, hand-held, floor-supported, portable vacuum cleaner which has the floor nozzle directly connected to the cleaner. The cleaner is generally designed for light-duty cleaning of household dirt. In use, the cleaner is guided over the floor by means of a handle attached to the cleaner housing. The cleaner may contain a driven agitator to assist in dirt removal on floor surfaces. The cleaner may have attachments or provisions, or both, for both floor and above-the-floor cleaning.

F 395, F11

sticky limit, T_w (D)—the lowest water content at which a soil will stick to a metal blade drawn across the surface of the soil mass.

D 653, D18

stiction—adhesion between the portion of a structural layer that is intended to be freestanding and its underlying layer.

E 2444, E08

stiction, *n*—*in tribology*, a force between two solid bodies in nominal contact, acting without the need for an external normal force pressing them together, which can manifest itself by resistance to tangential motion as well as resistance to being pulled apart.

G 40, G02

Stiff & Davis stability index, S&DSI—an index calculated from total dissolved solids, calcium concentration, total alkalinity, pH and solution temperature that shows the tendency of a water solution to precipitate or dissolve calcium carbonate. S&DSI is used primarily for seawater RO applications. See Practice D 4582, and LSI.

D 6161, D19

stiffener, *n*—a compounding material used to increase the viscosity of an unvulcanized rubber mix.

D 1566, D11

stiffener, *n*—a reinforcing member designed to limit or prevent the deformation of an attaching member.

stile—See **windows and doors**.

storage—see **hazardous-waste storage**.

E 631, E06

stiffener—component that provides support to the membrane.

F 818, F20

stiffness, *n*—resistance to bending.

D 123, D13

stiffness, *n*—*with regard to circular bending of textiles*, resistance to multidirectional bending.

D 123, D13

stiffness—the ratio of change of force (or torque) to the corresponding

change in translational (or rotational) deflection of an elastic element.

D 653, D18

stiffness, *n*—that property of a specimen that determines the force with which it resists deflection, or the deflection with which it responds to an applied force; may be static or dynamic (See also **complex, elastic, damping**.) (Synonym—*spring rate*).

D 1566, D11

stiffness, *n*—resistance to bending.

D 4439, D35

stiffness, *n*—resistance to bending.

D 4850, D13

stiffness, *n*—*with regard to circular bending of textiles*, resistance to multidirectional bending.

D 4850, D13

stiffness (as applied to copper)—the property of a conductor that causes it to resist permanent deformation by bending.

B 354, B01

stiffness, bending, *n*—the force required to produce a bent configuration under specified conditions.

D 1566, D11

stiffness-force—displacement ratio. (ISRM)

D 653, D18

stiffness (or bending stiffness), *n*—*of paper or paperboard*, the degree to which paper or board resists bending when subjected to a bending force in its intended use, or when using a defined testing procedure.

D 1968, D06

stillage—the liquid products or waste remaining after distillation of a beer. The soluble residue are water, proteins, etc.

E 1705, E48

stimulation—the application of a stimulus such as force, pressure, heat, and so forth, to a test article to cause activation of acoustic emission sources.

E 1316, E07

stimulus, *n*—something used to elicit a sensory response.

E 253, E18

stimulus, *n*—any action or condition that has the potential for evoking a response.

E 284, E12

sting-out—the stream of hot air or flame, or both, driven by positive internal pressure, exhausted through openings in melting furnaces.

C 162, C14

stippled area—{archaic} See **hackle**.

C 162, C14

stippled finish—a pebbly textured porcelain enamel, often multicolored.

C 286, B08

stippling—see synonomous term **knurling**.

C 162, C14

stitch, *n*—*in sewing*, the configuration of the interlacing of sewing thread in a specific repeated unit. (See **stitching, stitch type**)

D 123, D13

stitch, *v*—*in making rubberized articles*, to press uncured rubber compound into or around yarns or cords to form a composite of the materials and to remove entrapped air.

D 123, D13

stitch, *n*—*in packaging*, a metal fastener. Stitches are machine-formed using wire drawn from a spool. (Compare **staple**. **Staples** are preformed.)

D 996, D10

stitch, *v*—(1) to unite, by means of **staples** or stitching wire, the joints or parts of containers, or the flaps for **closure**; (2) to unite by sewing with thread, as a **sack**.

D 996, D10

stitch, *n*—the repeated unit formed by the sewing thread in the production of seams in a sewn fabric (see Federal Standard 751a).

D 4439, D35

stitch, *n*—the repeated unit formed by a sewing thread(s) through a material or materials such as a textile fabric.

D 5646, D13

stitch, *v*—*in making rubberized articles*, to press uncured rubber compound into or around yarns or cords to form a composite of the materials and to remove entrapped air.

D 6477, D13

stitch—staple cut and formed from wire immediately prior to driving by same machine.

F 592, F16

stitch, *n*—the image laid down in a single traverse of a printhead across the printer.

F 1857, F05

stitch density, *n*—*in sewn seams*, the number of stitches per unit length in one row of stitching in the seam.

D 123, D13

stitched and pinked seam-finish, *n*—a finish for the raw edges of the seam allowances of a plain seam, in which each raw seam allowance edge is machine stitched and then cut to a zigzag raw edge. (Compare **pinked seam-finish**.)

D 123, D13

stitched and pinked seam finished, *n*—*in home sewing*, a seam finish in which a zigzagged or scalloped cut edge is reinforced by a line of stitching. (Compare **pinked seam finish**.)

D 4965, D13

- stitched seam, *n***—See **seam seam**. **D 4965, D13**
- stitcher**—machine that cuts, forms, and drives wire stitches. **F 592, F16**
- stitches, *n***—in **tuftedpile floor covering**, the number of pile tufts per inch in the lengthwise direction. **D 123, D13**
- stitches, *n***—in **tuftedpile yarn floor covering**, the number of pile tufts per unit length in the lengthwise direction. **D 5684, D13**
- stitch gage, *n***—in **sewn seams**, the perpendicular distance between adjacent parallel rows of stitching. **D 123, D13**
- stitching, *n***—a series of stitches embodied in a material or materials of planar structure such as woven textile fabrics, usually for ornamental purposes or finishing an edge, or both. **D 123, D13**
- stitching, *n***—a series of stitches embodied in a material or materials such as a woven, knitted or textile fabric for ornamental purposes, forming a seam, attaching functional items, or finishing an edge. **D 5646, D13**
- stitching wire**—See **box stay wire**. **F 592, F16**
- stitch lines, *n***—the relationship between consecutive passes of printhead when printing a solid image area. **F 1857, F05**
- stitch type, *n***—a numerical designation relating to the essential characteristics of the interlacing of sewing thread(s) in a specified seam in sewn fabric. **D 123, D13**
- stitch type, *n***—in **sewn seams**, a numerical designation relating to the essential characteristics of the interlacing of sewing thread(s) in a specified stitch. **D 123, D13**
- S titration**—a titration in which the sensing electrode responds to the ion being removed from the sample by the titrant. **D 4127, D19**
- stock, *n***—See **compound**, the preferred term. **D 1566, D11**
- stock in process, *n***—in **textiles**, staple fibers at any stage of manufacture between the opening of the bale and the completion of the spinning process. **D 123, D13**
- stock in process, *n***—in **textiles**, staple fibers at any stage of manufacture between the opening of the bale and the completion of the spinning process. **D 7139, D13**
- stock steel**—standard steel of regular or stiff stock.
- regular**—bright, non-hardened, usually low or medium low-carbon steel.
- stiff**—bright, non-hardened, usually medium low or medium high-carbon steel, having higher hardness, toughness, and stiffness than regular steel. **F 547, F16**
- stoichiometric, *adj***—characterized by or being a proportion of substances or energy in a specific chemical reaction in which there is no excess of any reactant or product. **D 1356, D22**
- Stokes' diameter**—the diameter of a hypothetical sphere having the same density as the actual particle, as computed from the following Stokes' drag force formula:
- $$\text{Drag force} = 3\pi\mu v_p (\text{Stokes' diameter})$$
- where:
- μ = viscosity of fluid medium creating drag on the particle, and
- v_p = velocity of the particle relative to the medium. **E 1620, E29**
- Stokes line (band)**—a Raman line (band) that has a frequency lower than that of the incident monochromatic beam. **E 131, E13**
- stoking, *v***—see **continuous sintering**. **B 243, B09**
- stone**—a naturally-consolidated substance formed from minerals, geologically synonymous with rock (see **rock**, see **dimension stone** if selected or fabricated). **C 119, C18**
- stone**—an imperfection; a crystalline inclusion in glass. **C 162, C14**
- stone**—crushed or naturally angular particles of rock. **D 653, D18**
- stone-banked (solifluction) lobe**—a solifluction lobe with a stony front. **D 7099, D18**
- stone-banked (solifluction) terrace**—a solifluction terrace with a stony front. **D 7099, D18**
- stone chips, *n***—small angular fragments of stone containing no dust. **D 8, D04**
- stone garland**—the downslope border of stones along a sorted step, embanking an area of relatively fine-grained bare ground upslope. **D 7099, D18**
- stoneware**—a vitreous or semivitreous ceramic ware of fine texture, made primarily from nonrefractory fire clay. **C 242, C21**
- stoning**—the operation of removing by abrasion the undesirable portions of porcelain enamel. **C 286, B08**
- stony earth circle**—a type of nonsorted circle developed in gravelly materials. **D 7099, D18**
- stop, *n***—in building construction, in sealants and glazing, a strip of metal, plastic, or wood used around the periphery of a lite of glass or a panel to secure it in place (also referred to improperly as a bead). **C 717, C24**
- stop, *n***—in a zipper, the device at the top and bottom of chain or stringer that prevents the slider from leaving the chain. **D 123, D13**
- stop**—in **grouting**, a packer setting at depth. **D 653, D18**
- stop, *n***—the device at the top and bottom of the chain or stringer that prevents the slider from leaving the chain. **D 2050, D13**
- stop, *n***—any window or diaphragm that restricts the passage of light rays in an optical device. (See also **aperture stop**, **field stop**.) **E 284, E12**
- stop bit, *n***—in asynchronous serial transmission, the last element(s) in a character. **F 1457, F05**
- stop, bottom**—See **bottom stop**. **D 2050, D13**
- stop, bridge top**—See **bridge top stop**. **D 2050, D13**
- stop-drill**—drill bit equipped with a drill stop that ensures attaining a predetermined hole depth. **E 2265, E06**
- stop grouting**—the grouting of a hole beginning at the lowest packer setting (stop) after the hole is drilled to total depth. **D 653, D18**
- stop-leak additives, *n***—a compound containing particulates that is added to the cooling system for the purpose of stopping or minimizing leaks. **D 4725, D15**
- stopless glazing**—See **structural sealant glazing**, the preferred term. **C 717, C24**
- stop mark, *n***—a visible change in the density of the weave across the width of the fabric caused by the tension on the warp not being adjusted properly after the loom has been stopped. (See **set mark**) **D 123, D13**
- stop mark**—a band, either dull or glossy, on the surface, approximately 1/2 to 3 in. (12 to 76 mm) wide and extending around the periphery of a pultruded shape.
- NOTE—This condition is the result of an interruption in the normal continuous pulling operation. **D 3918, D20**
- stop mark, *n***—a visible change in the density of the weave across the width of the fabric caused by the tension on the warp not being adjusted properly after the loom has been stopped. (See **set mark**) **D 3990, D13**
- stop-off**—See **resist**. **B 374, B08**
- stopper head, *n***—a rounded refractory shape, usually made from clay and graphite, providing a valve head seating into a nozzle brick, this assembly forming a metal flow control for bottom-pouring ladles. **C 71, C08**
- stop pin**—a pin of preset length affixed to the inside of one of the tweezer halves designed to limit teeth contact upon closure and prevent their damage. **F 1638, F04**
- stopping:**
- cross section**—EIA, see **cross section**, **stopping**.
- cross section factor**—EIA, the stopping factor expressed per unit volume density of the constituent molecular entity of the specimen at the appropriate depth.
- factor**—EIA, the ratio between a (differential) energy interval in a backscattering spectrum and the corresponding (differential) depth interval in the specimen.
- power**—EIA, same as **stopping**, **cross section**. **E 673, E42**
- stopping distance, *n***—the path distance (rectilinear or curved) needed

stopping distance, *n*

to bring a vehicle to a stop from some selected initial brake application speed. **F 538, F09**

stopping off—the application of a resist to any part of an electrode—cathode, anode, or rack. **B 374, B08**

stop, releasing—See **releasing stop**. **D 2050, D13**

stop, removable—a removable molding or bead used around the periphery of a light of glass or a panel to secure it in place. **C 717, C24**

stop, top—See **top stop**. **D 2050, D13**

storage, adj—as a modifier of energy, descriptive of that component of energy absorbed by a strained elastomer that is not converted to heat and is available for return to the overall mechanical system; by extension, descriptive of that component of modulus or stiffness that is elastic. **D 1566, D11**

storage and warehousing—the activities related to receiving, storing, and shipping materials to and from production or distribution locations. **E 2135, E53**

storage coefficient—the volume of water an aquifer releases from or takes into storage per unit surface area of the aquifer per unit change in head. For a confined aquifer, the storage coefficient is equal to the product of the specific storage and aquifer thickness. For an unconfined aquifer, the storage coefficient is approximately equal to the specific yield. **D 653, D18**

storage component, thermal—a component of a building used for storing thermal energy. Includes all identifiable elements that serve an architectural as well as thermal function. **E 772, E44**

storage device, thermal—the container(s) plus all contents of the container(s) used for storing thermal energy. The transfer fluid and accessories such as heat exchangers, flow switching devices, valves, and baffles which are integral with the thermal storage container(s) are considered a part of the storage device. **E 772, E44**

storage factor—see **quality factor, *Q***. **D 1711, D09**

storage factor—a name formerly used at times for the *quality factor*. **D 2864, D27**

storage factor, magnetic, *Q_m*—the cotangent of the hysteretic angle that is equal to the ratio of the magnetizing current, *I_m*, to the core loss current *I_c*.

$$Q_m = \cot \beta = \tan \gamma = 1/D_m = I_m/I_c = R_l/\omega L_1$$

NOTE—The storage factor is also given by the ratio of 2π times the maximum energy stored in the core to the energy dissipated in the core (hysteresis and eddy current heat loss) per cycle of a periodic *SCM* excitation. **A 340, A06**

storage hardening, *n*—the increase in the viscosity of raw or unvulcanized rubber during storage. **D 1566, D11**

storage life, *n*—the period of time during which a packaged adhesive can be stored under specified temperature conditions and remain suitable for use. (Synonym **shelf life**.) (Compare **working life**.) **D 907, D14**

storage life—the length of time that a packaged adhesive, sealant, or other product can be stored under specified temperature conditions and remain suitable for use (Syn. **shelf-life**.)

story—See **building space**. **E 631, E06**

storage life—the length of time that a packaged adhesive, sealant, or other product can be stored under specified temperature conditions and remain suitable for use (Syn. **shelf-life**.) **E 1749, E06**

storage life, shelf, *n*—the period of time after production during which a material or product, that is stored under specified conditions, retains its intended performance capabilities. **D 1566, D11**

storage media, *n*—the systems upon which the archive or data set, summaries, or displays extracted from it are kept for use by the ADMS or for distribution to various users or stakeholders. **E 867, E17**

storage medium, thermal—the material in the storage device, independent of the containing structure, in which the major portion of the thermal energy is stored. **E 772, E44**

storage modulus—*M'* (Pa), [storage compliance *C* (Pa⁻¹)]—the real part of the complex modulus (complex compliance). **D 4092, D20**

storage modulus—quantitative measure of elastic properties defined as the ratio of the stress, in-phase with strain, to the magnitude of the strain. **E 1142, E37**

storage package—the smallest package intended by the manufacturer for long-term storage at the user's facility. **E 344, E20**

storage phosphor imaging plate—a flexible or rigid reusable detector that stores a radiological image as a result of exposure to penetrating radiation. **E 1316, E07**

storage point, *n*—an indication of the minimum temperature to which an oil should be heated in any part of an oil-handling installation when starting up after a shutdown. It is also an indication of the minimum temperature at which the oil should be stored in a tank fitted with an outflow heater. **D 4175, D02**

storage stability—the ability of a product to maintain its original characteristics over extended storage periods, under normal variations in temperature conditions. **D 3064, D10**

storm anchor (clip), *n*—in shingles, a corrosion-resistant metal fastener with a flat base and a shank that fastens the concealed lower corner of each shingle to the exposed edge of the adjacent shingle. **C 1154, C17**

storm anchor (clip), *n*—for shingles, a corrosion-resistant metal fastener with a flat base and a shank that fastens the concealed lower corner of each shingle to the exposed edge of the adjacent shingle. **D 2946, C17**

storm drain—a pipeline intended to convey storm water. **C 822, C13**

storm sewer—a pipeline intended to convey storm water. **C 822, C13**

storm water—precipitation run-off. **C 822, C13**

story, *n*—a space excluding attics, basements, and cellars, between successive floor levels or between floor and roof. **E 631, E06**

stout nail—nails with shank diameter usually at least one gage larger than common nails of same length. **F 547, F16**

stover—the dried stalks and leaves of a crop remaining after the grain has been harvested. **E 1705, E48**

STP—sodium triphosphate - Na₅P₃O₁₀, a cleaning agent. **D 6161, D19**

STPP—sodium tripolyphosphate. See **STP**. **D 6161, D19**

straight air, adj—the description of a vacuum cleaning system that does not have a mechanically driven agitator (sometimes referred to in the industry as *straight suction*). **F 395, F11**

straight beam—a vibrating pulse wave train traveling normal to the test surface. **E 1316, E07**

straight line drag forces—load on a boom that results from towing it from one end. **F 818, F20**

straight nail—nail not bent or bowed. **F 547, F16**

straightness, *n*—in steel cord, the property of a cord characterized by a lack of deviation from its central axis over short lengths of a cord. **D 123, D13**

straightness, *n*—in steel cord, the property of a cord characterized by a lack of deviation from its central axis over short lengths of cord. **D 6477, D13**

straight-run gases, *n*—hydrocarbon gases that do not contain unsaturates. **D 4175, D02**

straight-run pitch, *n*—a pitch run to the consistency desired in the initial process of distillation and without subsequent fluxing. **D 8, D04**

straight soap—under soap, see *straight soap*. **D 459, D12**

straight stitch, *n*—in home sewing, a simple machine stitch pattern of straight, single stitch segments of equal length. The simple machine stitch pattern is formed by the down and up movement of the needle while the fabric moves through the feed mechanisms in either the forward or reverse direction. **D 123, D13**

straight stitch, *n*—in home sewing, a simple machine stitch pattern of straight, single stitch segments of equal length. The simple machine stitch pattern is formed by the down and up movement of the needle while the fabric moves through the feed mechanisms in either the forward or reverse direction. **D 5646, D13**

straight stream nozzle—see **plain jet atomizer**. E 1620, E29

straight throat—a throat whose floor is at the same level as the floor of the melter. C 162, C14

strain—jargon for optical retardation. C 162, C14

strain, *n*—deformation of a material caused by the application of an external force. (See also **tensile strain**.) D 123, D13

strain, *n*—the unit change due to stress, in the size or shape of a body referred to its original size or shape. D 907, D14

strain, *n*—the unit change, due to force, in the size or shape of a body referred to its original size or shape. D 1566, D11

strain, ϵ —the unit change, due to force, in the size or shape of a body referred to its original size or shape. D 4092, D20

strain, *n*—the change in length per unit of length in a given direction. D 4439, D35

strain, *n*—deformation of a material caused by the application of an external force. D 4848, D13

strain—the change per unit of length in a linear dimension of a body, that accompanies a stress. F 412, F17

strain—deformation produced on a fastener by an outside force. F 1789, F16

strain aging, *n*—aging induced by cold working. A 941, A01

strain amplitude—the ratio of the maximum deformation, measured from the mean deformation, to the free length of the unstrained test specimen. (ISO) D 4092, D20

strain, ϵ (D)—the change in length per unit of length in a given direction. D 653, D18

strain disk—a disk of glass having a calibrated amount of birefringence at a specified location, and used as a comparative measure of the degree of retardation. C 162, C14

strain, *e, n*—the per unit change, due to force, in the size or shape of a body referred to its original size or shape. Strain is a nondimensional quantity, but it is frequently expressed in inches per inch, metres per metre, or percent. E 6, E28

strain ellipsoid—the representation of the strain in the form of an ellipsoid into which a sphere of unit radius deforms and whose axes are the principal axes of strain. (ISRM) D 653, D18

strainer, *n*—a machine designed to force a rubber or rubber mix through a sieve or sieves to remove extraneous material. D 1566, D11

strain gage accelerometer, *n*—an accelerometer using strain gages to sense the motion of the seismic element. F 538, F09

strain gage fatigue life, *n*—the number of fully reversed strain cycles corresponding to the onset of degraded gage performance, whether due to excessive zero shift or other detectable failure mode. E 6, E28

strain hardening, *n*—an increase in hardness and strength of a metal caused by plastic deformation at temperatures below its **recrystallization temperature**. (Syn. *work hardening*) A 941, A01

strain hardening—an increase in hardness and strength caused by plastic deformation at temperatures lower than the recrystallization range. B 354, B01

strain hardening—the increase in strength and hardness and decrease in ductility due to permanent deformation of the structure by cold working. B 846, B05

strain hardening—increase in hardness and strength resulting from plastic deformation by cold working. F 1789, F16

straining block, *n*—a rigid aluminum test block with a rubber surface on one side capable of simulating an anomaly in a tire. F 538, F09

straining block holding fixture, *n*—a device for holding one or more straining blocks in the S/H system during the calibration process. F 538, F09

strain, linear—the change in length of a specimen due to an applied stress relative to the original length of the specimen before the stress was applied. Linear strain is often shown as:

$$\frac{L_2 - L_1}{L_1}$$

where:

L_1 = original length of specimen, and

L_2 = length of the specimen when subjected to an applied stress.

C 904, C03

strain (linear or normal), ϵ (D)—the change in length per unit of length in a given direction. D 653, D18

strainline or strainlining—see **hairline or hairlining**. C 286, B08

strain point (St.P.)—that temperature corresponding to a specific rate of elongation of a glass fiber when measured by Test Method C 336 or a specific rate of midpoint deflection of a glass beam when measured by Test Method C 598. C 162, C14

strain, *r*—the change in length, due to an applied force, per unit length of a specimen. E 1142, E37

strain rate—the rate of relative length deformation with time due to an applied stress. Strain rate is often shown as:

$$\frac{L_2 - L_1}{L_1(T_2 - T_1)}$$

where:

L_1 = original length of specimen,

L_2 = length of the specimen when subjected to an applied stress,

T_1 = time when stress is applied, and

T_2 = time when L_2 is measured.

C 904, C03

strain resolution (strain sensitivity), R_s (D)—the smallest subdivision of the indicating scale of a deformation-measuring device divided by the product of the sensitivity of the device and the gage length. The deformation resolution, R_d , divided by the gage length. D 653, D18

strain (stress) rate—rate of change of strain (stress) with time. (ISRM) D 653, D18

strain (stress) tensor—the second order tensor whose diagonal elements consist of the normal strain (stress) components with respect to a given set of coordinate axes and whose off-diagonal elements consist of the corresponding shear strain (stress) components. (ISRM) D 653, D18

strand—See **wire strand**. A 902, A05

strand, *n*—one of the wires of any stranded conductor. B 354, B01

strand—a multiplicity of continuous glass filaments combined in a single compact unit, without twist. C 162, C14

strand, *n*—(1) a single fiber, filament, or monofilament, (2) an ordered assemblage of textile fibers having a high ratio of length to diameter and normally used as a unit, including slivers, rovings, single yarns, plied yarns, cords, braids, ropes, etc. D 123, D13

strand, *n*—in *fiberope*, an ordered assemblage of textile yarns used to make fiber rope. D 123, D13

strand, *n*—in *braided rope*, one of a number of similar units which are intertwined to produce a braided rope, each unit consisting of one or more yarns which are not twisted together and which follow a prescribed path through the braided rope. D 123, D13

strand—a wood flake having a minimum predetermined length-to-width ratio of 2:1. D 1554, D07

strand—in *fibrous composites*, Synonym for tow. D 3878, D30

strand, *n*—(1) a single fiber, filament, or monofilament. (2) an ordered assemblage of textile fibers having a high ratio of length to diameter and normally used as a unit, including slivers, rovings, single yarns, plied yarns, cords, braids, ropes, etc. D 4849, D13

stranded conductor—a conductor composed of a group of wires, usually twisted, or of any combination of such groups of wires. B 354, B01

stranding factor—the ratio of the mass or electrical resistance of a unit length of stranded conductor to that of a solid conductor of the same cross-sectional area. The stranding factor m for the completed stranded conductor is the numerical average of the stranding factors for each of the individual wires in the conductor, including the straight core wire, if any (for which the stranding factor is

stranding factor

unity). The stranding factor (m_{ind}) for any given wire in a concentric-lay-stranded conductor is:

$$m_{ind} = \sqrt{1 + (9.8696/n^2)}$$

where:

n = length of lay/diameter of helical path of the wire

- B 354**, B01
- strand irregularity**, n —*in textiles*, variation in a property along a strand. **D 123**, D13
- strand irregularity**, n —*in textiles*, variation in a property along a strand. **D 4849**, D13
- strap bellies**—thin, lightweight, vegetable-tanned cattlehide bellies, rather flexible and with a low load, processed for the strap trade. **D 1517**, D31
- strap nail**—bright, regular-stock-steel, 1 ¼ by 0.092 to 2 by 0.113-in. nails with oval 1³/₆₄ to 1⁷/₆₄-in. head and short diamond point. **F 547**, F16
- strapping**, n —a flexible strip material, generally of flat or round cross section, used to: (1) fasten merchandise within a container, (2) hold together a bundle or bale, (3) reinforce a shipping container, (4) secure a shipping container or an article to a pallet. (Compare **bracing**.) **D 996**, D10
- stratified random sample**, n —a sample that is selected independently within each stratum of a universe or population. **E 1402**, E11
- stratum**, n —a subgroup of the population separated in space or time, or both, from the remainder of the population, being internally similar with respect to a target characteristic of interest, and different from adjacent strata of the population. **D 5681**, D34
- straw**, n —*in flax*, refers to dried stems and plant parts such as roots, leaves, and seed holding structures. **D 123**, D13
- straw**, n —*in flax*, refers to dried stems and plant parts such as roots, leaves, and seed holding structures. **D 6798**, D13
- straw**—See **purlin nail**. **F 547**, F16
- strawberry**—a small bubble or blister in the flood coating of a gravel-surfaced membrane. **D 1079**, D08
- stray current**—current through paths other than the intended circuit, such as through heating coils or the tank. **B 374**, B08
- stray current corrosion**—the corrosion caused by electric current from a source external to the intended electrical circuit, for example, extraneous current in the earth. **G 15**, G01
- stray radiant energy**—all radiant energy that reaches the detector at wavelengths that do not correspond to the spectral position under consideration. **E 131**, E13
- stray radiant power**, P_s —the total detected radiant power outside a specified wavelength (wave number) interval each side of the center of the spectral band passed by the monochromator under stated conditions for wavelength (wave number), slit dimensions, light source, and detector. **E 131**, E13
- stray radiant power ratio**, P_s/P_t —the ratio of stray radiant power to the total detected radiant power. **E 131**, E13
- streak**, n —an extended unintentional stripe of narrow width, often a single yarn. **D 123**, D13
- streak**, n —an extended unintentional stripe of narrow width, often a single yarn. **D 3990**, D13
- streaking**—nonuniform deposition of a polish film. **D 2825**, D21
- streaking**, n —undesirable lines in a print caused by damaged rollers, cylinder bounce or bottoming gears. **D 6488**, D01
- streaking**, n —linear deposits of ink that run across both image and non-image areas. **D 6488**, D01
- streaks**, n —a print defect which appears as light bands in the printed area in the direction of the printhead travel. **F 1857**, F05
- streambank erosion**—the removal of bank material by flowing water. **D 4410**, D19
- stream counter**—an instrument in which the particles to be characterized are presented to an interrogation zone as a one-dimensional stream, the size of the particle being deduced from the physical

changes it causes in the interrogation zone. (See also **resistazone** and **photozone**.) **C 242**, C21

stream discharge—the quantity of flow passing through a cross section in a unit of time. **D 4410**, D19

streaming, v —dispensing of a product in the form of a jet or a stream. **D 6655**, D10

streaming potential—a potential that is generated in dilute solutions moving at high velocity through small channels. [Liquid junction potential problems are often wrongly confused with streaming potentials.] **D 4127**, D19

streamline flow—see **laminar flow**. **D 653**, D18

strength—a term to indicate relative thickness in sheet glass. **C 162**, C14

strength—(1) the ability of a member to sustain stress without failure. (2) in a specific mode of test, the maximum stress sustained by a member loaded to failure. **D 9**, D07

strength, n —the property of a material that resists deformation induced by external forces. (Compare **force**.) **D 123**, D13

strength—maximum stress which a material can resist without failing for any given type of loading. (ISRM) **D 653**, D18

strength, n —see **bond strength**. **D 907**, D14

strength, n —*of paper*, the force at which paper ruptures. **D 1968**, D06

strength, n —the property of a material that resists deformation induced by external forces. (Compare **force**.) **D 4848**, D13

strength, n —*dyer's*, the color quality that increases with an increase in the amount of dye present, other conditions remaining constant. (See also **tinting strength**.) **E 284**, E12

strength, n —resistance to external force or load or generation of internal strain, expressed in terms of units of force, lbf, pounds force (N, newtons).

ultimate strength, n —maximum resistance to applied force, load, or stress that a material, member, component, or assembly of a structure can withstand without failure.

strength:

compressive strength—the maximum compressive strength that a material is capable of sustaining. Compressive strength is calculated from the maximum load during a compressive test and the original cross-sectional area of the specimen.

dry strength—the strength of an adhesive joint or composite structure determined immediately after drying under specified conditions or after a period of conditioning in a standard laboratory atmosphere.

wet strength—the strength of an adhesive bond or composite measured after exposing the test specimen to moisture/water vapor until saturated. **E 631**, E06

strength:

compressive strength—the maximum compressive strength that a material is capable of sustaining. Compressive strength is calculated from the maximum load during a compressive test and the original cross-sectional area of the specimen.

dry strength—the strength of an adhesive joint or composite structure determined immediately after drying under specified conditions or after a period of conditioning in a standard laboratory atmosphere.

wet strength—the strength of an adhesive bond or composite measured after exposing the test specimen to moisture/water vapor until saturated. **E 1749**, E06

strength—the stress required to break, rupture, or cause a failure. **F 412**, F17

strength, adfreeze—see **adfreeze strength**. **D 7099**, D18

strength analyzer, n —an instrument which determines tensile strength and elongation at breaking load for a test beard of cotton. **D 123**, D13

strength analyzer, n —an instrument which determines tensile strength and elongation at breaking load for a test beard of cotton. **D 7139**, D13

strength at break, n—See **breaking strength**. D 4848, D13

strength at rupture, n—strength expressed in terms of the force at rupture. (Compare **breaking strength**.) D 123, D13

strength at rupture, n—strength expressed in terms of the force at rupture. (Compare **breaking strength**.) D 4848, D13

strength design basis—one of a series of established stress values (specified in Test Method D 2837) for a plastic molding compound obtained by categorizing the long-term strength determined in accordance with Test Method F2018. F 412, F17

strength, double—sheet glass between 0.115 and 0.134 in. (2.92 and 3.40 mm) thick. C 162, C14

strength grade—system of strength classifications used for bolts, nuts, and screws made to inch standards. F 1789, F16

strength ratio—the hypothetical ratio of the strength of a member to the strength it would have if no weakening defects were present. D 9, D07

strength-reducing defects—imperfections affecting strength, such as checks, compression wood, cross grain, decay, knots, shakes, splits, etc. D 9, D07

strength, single—sheet glass between 0.085 and 0.101 in. (2.16 and 2.57 mm) thick. C 162, C14

strength, transverse (or flexural), n—the breaking load applied normal to the neutral axis of a beam. C 168, C16

strength unit, n—for asbestos, unit of reinforcing potential of asbestos fiber in asbestos-cement products. D 2946, C17

stress—force per unit of area. D 9, D07

stress, n—the resistance to deformation developed within a material subjected to an external force. D 123, D13

stress, n—force exerted per unit area at a point within a plane. D 907, D14

stress, n—the intensity, at a point in a body, of the internal forces (or components of force) that act on a given plane through the point. D 1566, D11

stress, σ —the intensity at a point in a body of the internal forces or components of force that act on a given plane through the point. (E28) D 4092, D20

stress, n—the resistance to deformation developed within a material subjected to an external force. D 4848, D13

stress, n—internal force developed by application of external force or load or generation of internal strain expressed in terms of unit of force per unit of area, megapascals (pound-force per square inch). When the forces are parallel to the plane on which it acts, the stress is called shear stress; when the forces are normal to the plane on which it acts, the stress is called normal stress; when the normal stress is directed toward the plane on which it acts, it is called compressive stress; when the normal stress is directed away from the plane on which it acts, it is called tensile stress. Sometimes referred to as unit stress. E 631, E06

stress—force expressed in units per unit of area, which represents resistance that a fastener offers to deformation. F 1789, F16

stress amplitude—the ratio of the maximum applied force, measured from the mean force, to the cross-sectional area of the unstressed test specimen. (ISO) D 4092, D20

stress concentration factor—See **theoretical stress concentration factor (or stress concentration factor) k_t** . E 1823, E08

stress corrosion, n—environmentally induced degradation that results in the formation and growth of cracks and/or damage in glasses and many ceramics when subjected to the combine action of a corroding agent and stress. C 1145, C28

stress corrosion crack—spontaneous failure of metals by cracking under combined action of corrosion and stress, residual or applied. B 846, B05

stress-corrosion crack—a crack which may be intergranular or transgranular depending on the material, resulting from the combined action of corrosion and stress, either external (applied) or internal (residual). E 7, E04

stress corrosion cracking—cracking phenomena that occurs when an

installed fastener under stress is exposed to a corrosive service environment. F 1789, F16

stress-corrosion cracking—a cracking process that requires the simultaneous action of a corrodent and sustained tensile stress. (This excludes corrosion-reduced sections which fail by fast fracture. It also excludes intercrystalline or transcrystalline corrosion which can disintegrate an alloy without either applied or residual stress.) G 15, G01

stress-corrosion cracking, SCC—a cracking process that requires the simultaneous action of a corrodent and sustained tensile stress. E 1823, E08

stress corrosion cracking (SCC)—a cracking process that requires the simultaneous action of a corrodent and sustained tensile stress. F 2078, F07

stress-crack, n—an external or internal crack in a plastic caused by tensile stresses less than its short-time mechanical strength. D 883, D20

stress crack, n—an external or internal crack in a plastic caused by tensile stresses less than its short-time mechanical strength. D 4439, D35

stress-crack, n—an external or internal crack in a plastic caused by tensile stresses less than its short-time mechanical strength. F 1251, F04

stress crack, environmental, n—a stress crack, the development of which has been accelerated by the environment to which the plastic is exposed. (See **stress-crack**.) F 412, F17

stress cycle—See **cycle**. E 1823, E08

stress decay, n—in *mechanics*, the reduction in force to hold a material at a fixed deformation over a period of time. D 4848, D13

stress ellipsoid—the representation of the state of stress in the form of an ellipsoid whose semi-axes are proportional to the magnitudes of the principal stresses and lie in the principal directions. The coordinates of a point P on this ellipse are proportional to the magnitudes of the respective components of the stress across the plane normal to the direction OP , where O is the center of the ellipsoid. (ISRM) D 653, D18

stress [FL^{-2}], n—the intensity at a point in a body of the forces or components of force that act on a given plane through the point. Stress is expressed in force per unit of area (pounds-force per square inch, megapascals, and so forth). E 6, E28

stress, [FL^{-2}]—force acting over a unit area. Traditionally, the symbol for stress is either S or σ , as a matter of choice. E 1823, E08

stress-intensity factor at crack initiation, K_0 [$FL^{-3/2}$]—the value of K at the onset of rapid fracturing. E 1823, E08

stress-intensity-factor calibration, K calibration—See **applied- K curve** in 1.1.562. E 1823, E08

stress-intensity factor coefficient, Y^* —a dimensionless parameter that relates the applied force and specimen geometry to the resulting crack-tip stress-intensity factor in a chevron-notch specimen test. E 1823, E08

stress-intensity factor, K, K_I, K_{II}, K_{III} —the magnitude of the ideal crack-tip stress field (stress field singularity) for a particular mode in a homogeneous linear-elastic body. F 2078, F07

stress-intensity factor, $K, K_I, K_2, K_3, K_I, K_{II}, K_{III}$ [$FL^{-3/2}$]—the magnitude of the mathematically ideal, crack-tip stress field (stress-field singularity) for a particular mode in a homogeneous, linear-elastic body. E 1823, E08

stress-intensity factor range, ΔK [$FL^{-3/2}$]—in *fatigue*, the variation in the stress-intensity factor in a cycle, that is

$$\Delta K = K_{\max} - K_{\min}$$

E 1823, E08

stress intensity factor threshold for environment assisted cracking, K_{EAC} [$FL^{-3/2}$]—the highest value of the stress intensity factor (K) at which crack growth is not observed for a specified combination of material and environment and where the measured value may depend on specimen thickness. E 1823, E08

stress intensity factor threshold for plane strain environment-assisted cracking, K_{IEAC} [FL^{-3/2}]**—**the highest value of the stress intensity factor (K) at which crack growth is not observed for a specified combination of material and environment and where the specimen size is sufficient to meet requirements for plane strain as described in Test Method E 399. **E 1823, E08**

stress, σ, p, f (FL⁻²)**—**the force per unit area acting within the soil mass.

effective stress (effective pressure) (intergranular pressure), $\bar{\sigma}, f$ (FL⁻²)**—**the average normal force per unit area transmitted from grain to grain of a soil mass. It is the stress that is effective in mobilizing internal friction. **E 1823, E08**

neutral stress (pore pressure) (pore water pressure), u, u_w (FL⁻²)**—**stress transmitted through the pore water (water filling the voids of the soil).

normal stress, σ, p (FL⁻²)**—**the stress component normal to a given plane.

principal stress, $\sigma_1, \sigma_2, \sigma_3$ (FL⁻²)**—**stresses acting normal to three mutually perpendicular planes intersecting at a point in a body, on which the shearing stress is zero.

major principal stress, σ_1 (FL⁻²)**—**the largest (with regard to sign) principal stress.

minor principal stress, σ_3 (FL⁻²)**—**the smallest (with regard to sign) principal stress.

intermediate principal stress, σ_2 (FL⁻²)**—**the principal stress whose value is neither the largest nor the smallest (with regard to sign) of the three.

shear stress (shearing stress) (tangential stress), τ, s (FL⁻²)**—**the stress component tangential to a given plane.

total stress, σ, f (FL⁻²)**—**the total force per unit area acting within a mass of soil. It is the sum of the neutral and effective stresses. **D 653, D18**

stress ratio**—**ratio of ultimate stress of metal connector plate to ultimate stress of matched solid metal-coupon control specimen. Also called *effectiveness ratio* and *efficiency ratio*. **E 631, E06**

stress relaxation**—**stress release due to creep. (ISRM) **D 653, D18**

stress relaxation, n **—**the decrease in stress after a given time at constant strain. **D 1566, D11**

stress relaxation, n **—**the time-dependent decrease in stress in a solid under given constraint conditions. **E 6, E28**

stress relaxation**—**the decrease in stress, at constant strain, with time. **F 412, F17**

stress relief**—**a treatment of a product to reduce residual stresses.

*by mechanical treatment***—**without causing a significant change in size.

*by thermal treatment***—**without causing recrystallization. **B 846, B05**

stress relief annealing**—**heating process applied to fasteners having a geometry with a high degree of upset (round head square neck, for example) to relieve mechanical stresses generated during forming. **F 1789, F16**

stress relieving, n **—**heating a steel object to a suitable temperature, holding it long enough to reduce residual stresses, and then cooling it slowly enough to minimize the development of new residual stresses. **A 941, A01**

stress retention**—**the residual load expressed as a percentage of the original load on a material after the test specimen has been maintained at a constant elongation for a specified time. **D 996, D10**

stress, s **—**force per unit area. **E 1142, E37**

stress, S, n **—**the intensity at a point in a body of the forces or components of force that act on a given plane through the point. **F 1582, F04**

stress-strain curve, n **—**a graphical representation of the stress and strain relationship of a material under conditions of compression, shear, tension, or torsion. (Compare *force-deformation curve*, *force-elongation curve*, and *force-extension curve*.) **D 123, D13**

stress-strain curve, n **—**a graphical representation of the stress and

strain relationship of a material under conditions of compression, shear, tension, or torsion. (Compare *force-deformation curve*, *force-elongation curve*, and *force-extension curve*.) **D 4848, D13**

stress-strain diagram, n **—**a diagram in which corresponding values of stress and strain are plotted against each other. **D 907, D14**

stress-strain diagram, n **—**a diagram in which corresponding values of stress and strain are plotted against each other. Values of stress are usually plotted as ordinates (vertically) and values of strain as abscissas (horizontally). **E 6, E28**

stress (strain) field**—**the ensemble of stress (strain) states defined at all points of an elastic solid. (ISRM) **D 653, D18**

stretch, n **—**of paper, the maximum tensile strain (elongation) developed in a paper test specimen prior to rupture in a tensile test that has been carried to rupture under the conditions specified. **D 1968, D06**

stretch**—**1) an increase or elongation in dimension; 2) mechanically enforcing an elongation of belting during the vulcanization to render it less extensible in service. **F 869, F08**

*stretched filling***—**See *tight pick*. **D 3990, D13**

stretching**—**the process of putting tension on the fabric to make it hang uniformly along the line of fence between terminal posts. **F 552, F14**

stretch stitch, n **—**in home sewing, a complex machine stitch pattern or of various combinations of straight stitch, single stitch zigzag, or multiple stitch zigzag. It is produced by coordinated motions of needle and feed as the fabric moves through the feed mechanism in the forward or reverse direction. **D 123, D13**

stretch stitch, n **—**in home sewing, a complex machine stitch pattern or of various combinations of straight stitch, single stitch zigzag or multiple stitch zigzag. It is produced by coordinated motions of needle and feed as the fabric moves through the feed mechanism in the forward or reverse direction. **D 5646, D13**

stretch woven fabric, n **—**a woven fabric which is capable of at least 20 % stretch in either warp or filling direction, or both, under forces and conditions encountered in use, and of almost complete recovery after removal of the force. **D 123, D13**

stretch woven fabric, n **—**a woven fabric which is capable of at least 20 % stretch in either warp or filling direction, or both, under forces and conditions encountered in use, and almost complete recovery after removal of the force. **D 4850, D13**

stretch yarns, n **—**a generic term for a filament or spun yarn having a high degree of potential elastic stretch. **D 4849, D13**

stretch zone width (SZW) [L]**—**the length of crack extension that occurs during crack-tip blunting, for example, prior to the onset of unstable brittle crack extension, pop-in, or slow stable crack extension. The SZW is co-planar with the original (unloaded) fatigue precrack and refers to an extension of the original crack. **E 1823, E08**

stria**—**a cord of low intensity generally of interest only in optical glass. (See also *cord*.) **C 162, C14**

striated**—**a term used to describe plywood with a face veneer that has been grooved or scored parallel to the grain. **D 1038, D07**

striated head**—**head with parallel ridges and grooves to identify high-density fiberboard nail. **F 547, F16**

striations**—**ridges or steps on the fracture surface parallel to the local direction of the crack front propagation, generally having the appearance of feathers. **C 162, C14**

strike: (1) n **—**a thin film of metal to be followed by other coatings. (2) n **—**a solution used to deposit a strike.

(3) v **—**to plate for a short time, usually at a high initial current density. **B 374, B08**

strike**—**the direction or azimuth of a horizontal line in the plane of an inclined stratum, joint, fault, cleavage plane, or other planar feature within a rock mass. (ISRM) **D 653, D18**

strike tackler**—**stapler activated by striking it with hand or mallet. **F 592, F16**

strike-through, n **—**the penetration of the vehicle of a printing ink

- through the sheet, so that the ink is apparent on the reverse side under normal lighting conditions. **D 6488, D01**
- strike through, n**—ink vehicle penetrates the substrate and is visible on the opposite side. **F 1857, F05**
- striking**—development of color or opacity during cooling or reheating. **C 162, C14**
- striking surface, n**—the hardened, smooth, circular bottom surface of the intermediate tool that is in contact with the test sample. **E 1445, E27**
- string**—an imperfection; a straight or curled line, usually resulting from slow solution of a large grain of sand or foreign material. **C 162, C14**
- stringer, n**—*in zippers*, the tape, bead, and element assembly that constitutes one side of a chain. **D 123, D13**
- stringer**—See **pallet**. **D 996, D10**
- stringer, n**—the tape, bead, and element assembly that constitutes one side of a chain. **D 2050, D13**
- stringer**—a single, high-aspect ratio, elongated inclusion, two or more elongated inclusions, or a number of small non-deformable inclusions aligned in a linear pattern due to deformation. **E 7, E04**
- string fen**—a peatland with roughly parallel narrow ridges of peat dominated by fenlike vegetation interspersed with slight depressions, many of which containing shallow pools. **D 7099, D18**
- stringiness, n**—the property of an adhesive that results in the formation of filaments or threads when adhesive transfer surfaces are separated. (See also **legging** and **webbing**.) (Compare **teeth**.) **D 907, D14**
- stringy selvage**—See **slack selvage**. **D 3990, D13**
- strip, n**—a process or solution used for the removal of a coating from a basis metal or an undercoat. **B 374, B08**
- strip, v**—to remove a coating from the basis metal or undercoat. **B 374, B08**
- strip**—*as in inch-pound specifications*, a rolled flat product, other than flat wire, up to and including 0.188-in. thick, in straight lengths, coils (rolls), or traverse wound on reels or spools having either slit, sheared or slit and rolled edges in widths up to 24-in. inclusive, or having finished drawn or rolled edges, in widths over 1¼-in. to 12-in. inclusive. **B 846, B05**
- strip**—*as in SI specifications*, a rolled flat product other than flat wire up to and including 5-mm thick in straight lengths, coils (rolls), or traverse wound on reels or spools having either slit or sheared edges in widths up to 600-mm inclusive, or having finished drawn or rolled edges, in widths over 30-mm to 300-mm inclusive. **B 846, B05**
- strip, n**—a flat-rolled metal product of some maximum thickness and width arbitrarily dependent on the type of metal, it is narrower than sheet. **B 899, B02**
- strip**—a thin batten or narrow, thin board. Specific descriptions may vary between softwood and hardwood. **D 9, D07**
- strip, n**—a flat, thin member, much longer than wide, having width greater than thickness (if of steel, having dimensions of 0.229 in. (5.8 mm) or less thickness and 12.0 (305 mm) or less width). **E 631, E06**
- strip**—staples, nails, or pins collated and cohered to facilitate automatic driving with appropriate tool. **F 592, F16**
- stripe reference line, n**—line used for alignment of pattern pieces on stripe material during marker making. **D 6963, D13**
- strip-fed tool**—tool using staples or nails that are collated and cohered in strip form. **F 592, F16**
- striping, n**—a printing imperfection observed when the print becomes alternatively more and less intense across the web. **D 6488, D01**
- strip mopping**—See **mopping**. **D 1079, D08**
- strip nail**—steel, 1¼ to 2½-in. nails spot welded to disposable metal strip that feed nails into nailing machine provided with staple-type magazine. During punching of nail from strip, small washer is formed under head. Also, nail stored in special strip to serve as magazine for feeding nailing machine. **F 547, F16**
- stripper, n**—*in textiles*, a product, usually the reducing agent, that changes the coloring material dye, or soil stain to reduced color. (See also **bleach**) **D 123, D13**
- stripper, intextiles, n**—a product, usually a reducing agent, that changes the coloring material, dye, or soil stain to reduced color. **D 3136, D13**
- stripper punch, n**—a punch that, in addition to forming the top or bottom of the die cavity, later moves further into the die to eject the compact. **B 243, B09**
- stripping**—strip flashing:
- (1) the technique of sealing a joint between metal and built-up membrane with one or two plies of felt or fabric and hot- or cold-applied bitumen;
- (2) the technique of taping joints between insulation boards or deck panels. **D 1079, D08**
- stripping, n**—the process whereby volatile fractions are removed from a liquid material. **D 4175, D02**
- stripping yard**—{archaic} the place where glass plates are removed from tables after grinding and polishing. **C 162, C14**
- strip test, n**—*infabric testing*, a tensile test in which the full width of the specimen is gripped in the clamps. **D 123, D13**
- strip test, n**—*infabric testing*, a tensile test in which the full width of the specimen is gripped in the clamps. **D 4850, D13**
- stroke**—*in character recognition*, a straight line or arc used as a segment of a graphic character. Each character is made up of a variable number of the strokes. **F 149, F05**
- stroke, n**—a movement in a single direction, either forward or backwards. **F 395, F11**
- stroke**—*in character recognition*, a straight line or arc used as a segment of a graphic character. **F 909, F05**
- stroke average width**—the average of actual stroke widths taken at points along the length of a stroke. **F 149, F05**
- stroke centerline**—*in character recognition*, a line midway between the two stroke edges. **F 149, F05**
- stroke centerline**—*in character recognition*, a line midway between the two edges of a stroke. **F 909, F05**
- stroke device**—an input device providing a set of coordinates that record the path of the device. **F 909, F05**
- stroke edge**—*in character recognition*, the line of discontinuity between a side of a stroke and the background, obtained by averaging, over the length of the stroke, the irregularities resulting from the printing and detecting processes. **F 149, F05**
- stroke length, n**—the total distance of travel for the mechanical pump dispenser from where the mechanism of a pump sits at rest to where it is fully depressed. **D 6655, D10**
- strokes to prime (STP), n**—the total number of complete actuations needed to obtain a full discharge of product on the initial use of package. **D 6655, D10**
- stroke width**—*in character recognition*, the distance measured perpendicularly to the stroke centerline between the two stroke edges. **F 149, F05**
- strong probability did not**—this carries the same weight as strong probability on the identification side of the scale; that is, the examiner is virtually certain that the questioned and known writings were not written by the same individual.
- Examples*—There is strong probability that the John Doe of the known material did not write the questioned material, or in my opinion (or conclusion or determination) it is highly probable that the John Doe of the known material did not write the questioned material. **E 1658, E30**
- strong probability (highly probable, very probable)**—the evidence is very persuasive, yet some critical feature or quality is missing so that an *identification* is not in order; however, the examiner is virtually certain that the questioned and known writings were written by the same individual.
- Examples*—There is *strong probability* that the John Doe of the known material wrote the questioned material, or it is my opinion (or conclusion or determination) that the John Doe of the known material *very probably* wrote the questioned

strong probability (highly probable, very probable)

- material. **E 1658, E30**
- [strong] reason to believe**—there are too many definitions of *believe* and *belief* that lack certitude. It is more appropriate to testify to our conclusion (or determination or expert opinion) than to our belief, so why use that term in a report? **E 1658, E30**
- struck surface, n**—the surface of a molded brick that is not in contact with the mold and from which the excess clay/shale mixture is removed. **C 43, C15**
- structural adhesive, n**—a bonding agent used for transferring required loads between adherends exposed to service environments typical for the structure involved. **D 907, D14**
- structural boards**—boards graded for structural applications requiring stress grading for assignment of allowable properties. **D 9, D07**
- structural bolt**—heavy hex head bolt having a controlled thread length intended for use in structural connections and assembly of such structures as buildings and bridges. **F 1789, F16**
- structural clay facing tile, n**—tile designed for use in interior and exterior unplastered walls, partitions or columns. See Specification C 212. **C 43, C15**
- structural clay tile, n**—hollow burned-clay masonry building units with parallel cells or cores or both. **C 43, C15**
- structural fill**—man-made deposits of solid materials. Examples include backfills, landfills, embankments, earth dams, linings and blankets, foundations, canals, road base, footings, and trenches. **D 5681, D34**
- structural fill, n**—an engineered fill, typically constructed in layers of uniform thickness and compacted to a desired unit weight in a manner to control compressibility, strength, and hydraulic conductivity. **E 2201, E50**
- structural gasket**—See *lock-strip gasket*, the preferred term. **C 717, C24**
- structural-glued-laminated timber, n**—an engineered, stress-rated product of a timber laminating plant comprising assemblies of specially selected and prepared wood laminations securely bonded together with adhesives, with the following characteristics: (1) The grain of all laminations is approximately parallel longitudinally, and (2) The laminations may be comprised of pieces end-joined to form any length, of pieces placed or glued edge-to-edge to make wider ones, or of pieces bent to curved form during gluing. (Synonym **GLULAM**) ANSI/AITC A190.1—1992, American National Standard for Wood Products—Structural Glued Laminated Timber (Edited to conform with ASTM format.) **D 907, D14**
- structural integrity**—for the purpose of this specification, it is the ability of the AR to maintain air leakage performance after exposure to elevated positive and negative pressure (see 5.1.2 for performance). **E 631, E06**
- structural landfill**—man-made earth work meeting engineered practices and structural requirements. The fill must also be environmentally acceptable and meet EPA requirements. (See 40 CFR 268). **D 5681, D34**
- structural layer**—a layer present in the final MEMS device. **E 2444, E08**
- structural quality sheet coil**—coiled sheet metal used for production of metal connector plates meeting minimum specified grade properties for yield and ultimate stresses and elongation. If Specification A 653/A 653M Grade 40 is specified, the steel properties shall exceed 16 pct for elongation for a 50 mm (2.0 in.) gage length of the 275 MPa (40 ksi) yield point and 380 MPa (55 ksi) ultimate tensile stress, according to Specification A 653/A 653M. **E 631, E06**
- structural sandwich construction, n**—a laminar construction comprising a combination or alternating dissimilar simple or composite materials assembled and intimately fixed in relation to each other so as to use the properties of each to attain specific structural advantages for the whole assembly. **C 274, D30**
- structural sealant glazing, n**—in *building construction*, a glazing system wherein a structural sealant is used to transfer loads between a lite or panel and a supporting framework, without mechanical fasteners or other methods of attachment. **C 717, C24**
- structural slab**—a horizontal, supporting, cast-in-place, concrete building deck. **C 717, C24**
- structural system**—a combination of load supporting and transmitting construction elements or **components** of an assembly or **building** including connections. **E 631, E06**
- structural test, n**—determination of one or more values for load, stress, and deflection characteristics of a material or assembly. **E 631, E06**
- structure**—one of the larger features of a rock mass, like bedding, foliation, jointing, cleavage, or brecciation; also the sum total of such features as contrasted with texture. Also, in a broader sense, it refers to the structural features of an area such as anti-clines or synclines. (ISRM) **D 653, D18**
- structure*—see **soil structure**. **D 653, D18**
- structure**—as applied to a crystal, the shape and size of the unit cell and the location of all atoms within the unit cell. As applied to microstructure, the size, shape and arrangement of phases. **E 7, E04**
- structure, n**—the order of data elements in a message. **F 1294, F05**
- structureborne sound**—sound that arrives at the point of interest, such as the edge of a partition, by propagation through a solid structure. **C 634, E33**
- structure factor**—the ratio of the amplitude of the wave scattered by all the atoms of a unit cell to the amplitude of the wave scattered by a single electron. Symbol = *F*. **E 7, E04**
- strut, n**—a short member of a **crate** or **bracing** used as reinforcement and designed to resist compressive forces in the direction of its length. **D 996, D10**
- stubble, n**—in *shornfloor covering*, the portion of the pile that remains after shearing. **D 123, D13**
- stubble, n**—in *shornfloor covering*, the portion of the pile that remains after shearing. **D 5684, D13**
- stubble height, n**—the distance the stubble extends above the backing fabric. **D 123, D13**
- stubble height, n**—the distance the stubble extends above the backing fabric. **D 5684, D13**
- stucco, n**—a portland cement-aggregate plaster mix designed for use on exterior surfaces. See **portland cement plaster**. **C 11, C11**
- stucco**—an exterior cementitious-lime-finishing system applied to a suitable substrate on the surfaces of buildings and structures. **C 51, C07**
- stucco, n**—a hydraulic cement plaster containing fine aggregate, used for coating exterior surfaces. **C 219, C01**
- stuck lifter, n**—in *internal combustion engines*, a lifter plunger that does not return to its original position by its own force upon removal from the engine. **D 4175, D02**
- stud**—one of a series of slender wood structural members used as supporting elements in walls and partitions. In softwood grading, a stress grade to describe lumber suitable for stud use. **D 9, D07**
- study period**—the length of time over which an investment is analyzed. (Syn. *life cycle, time horizon*). **E 631, E06**
- sub-floor*—See **floor**.
- sub-flooring*—See **floor**.
- sub-grade*—See **grade**. **E 833, E06**
- study period, n**—the length of time over which an investment is analyzed (Syn. *lifecycle, time horizon*). **E 833, E06**
- stuffer yarn, n**—an extra backing yarn running in the warp direction through a woven pile floor covering. **D 123, D13**
- stuffing**—the process of incorporating grease in leather by drumming the wet leather with warm, molten grease and oils. **D 1517, D31**
- stump**—the part of a tree remaining above and below ground after the main stem is cut off. **D 9, D07**
- sturdy pretreatment procedure, n**—in *textile conservation*, the washing, rinsing, drying, and ironing actions followed when backing fabrics are medium to heavy weight. (Compare **delicate pre-treatment procedure**.) **D 123, D13**

- STX**—abbreviation for **start of text**. **F 1457, F05**
- style, *n***—a collection of pattern pieces and related information that defines a sewn product. **D 6963, D13**
- styrene monomer**—ethenylbenzene, vinylbenzene, phenylethylene, (C₆H₅CH = CH₂) mol weight 104.15; clear, colorless, flammable liquid; characteristic odor; solidification point -30.6°C; boiling point 145.2°C. Refer to Specification D 2827 for complete specifications. **D 4790, D16**
- styrene plastic, *n***—a plastic based on polymers of styrene or copolymers of styrene with other monomers, the styrene being greatest amount by mass. **F 1251, F04**
- styrene plastics, *n***—plastics based on polymers of styrene or copolymers of styrene with other monomers, the styrene being in greatest amount by mass. (ISO) **D 883, D20**
- styrene plastics, *n***—plastics based on polymers of styrene or copolymers of styrene with other monomers, the styrene being the greatest amount by mass. (ISO, D20) **F 412, F17**
- styrene resin**—under **resin, synthetic**, see **styrene resin**. **D 16, D01**
- styrene-rubber plastics, *n***—plastics based on styrene polymers and rubbers, the styrene polymers being in the greatest amount by mass. (ISO) **D 883, D20**
- styrene-rubber plastics, *n***—plastics based on styrene polymers and rubbers, the styrene polymers being in the greatest amount by mass. (ISO, D20) **F 412, F17**
- styrene-rubber (SR) pipe and fitting plastics**—plastics containing at least 50% styrene plastics combined with rubbers and other compounding materials, but not more than 15 % acrylonitrile. **F 412, F17**
- styrenic thermoplastic elastomer (TES), *n***—a copolymer material comprising styrenic end-block segments bound to a rubbery segment that may be saturated or unsaturated. **D 883, D20**
- S_u**—ultimate shear strength of the diaphragm, lbf/ft (or N/m) **E 631, E06**
- subassemblies, *n***—any component or structure that is used in the assembly of textile product. **D 2050, D13**
- subassembly, *n***—any portion of an implant assembly that is composed of two or more components. **F 1582, F04**
- subbase**—a layer used in a pavement system between the subgrade and base course, or between the subgrade and portland cement concrete pavement. **D 653, D18**
- subbituminous A coal**—See **subbituminous A coal** under **rank**. **D 121, D05**
- subbituminous B coal**—See **subbituminous B coal** under **rank**. **D 121, D05**
- subbituminous C coal**—See **subbituminous C coal** under **rank**. **D 121, D05**
- subbituminous class**—See **subbituminous class** under **rank**. **D 121, D05**
- subconstruct, *n***—any portion of an implant construct that is composed of two or more components including the spine, pelvis, ribs, or substitute structure. **F 1582, F04**
- subcritical annealing, *n***—annealing at a temperature slightly below A_{c1}. **A 941, A01**
- subcritical flow**—open channel flow that is deeper and at lower velocity than critical flow for the same flow rate; sometimes called tranquil flow. A Froude number less than one exists. **D 4410, D19**
- sub-element, *n***—in **construction planning, design, specification, estimating, and cost analysis**, a sub-element is a component part of an **element** that performs a specific function, of functions, regardless of design, specification, or construction. **E 833, E06**
- sub-face (sub-back)**—the ply adjacent to the exposed face (or back) of a parallel laminated outer layer. **D 1038, D07**
- sub-floor, *n***—a part of a **floor** over which one or more components may be added to complete the **floor**. **E 631, E06**
- subfloor, *n***—that structural layer intended to provide support for design loadings which may receive resilient floor coverings directly if the surface is appropriate or indirectly via an underlayment if its surface is not suitable. **F 141, F06**
- sub-flooring, *n***—the material used in constructing a **sub-floor**. **E 631, E06**
- subflooring nail**—See **threaded sinker (annularly threaded), diaphragm nail**. **F 547, F16**
- subglacial permafrost**—permafrost beneath a glacier. **D 7099, D18**
- subglacial talik**—a layer or body of unfrozen ground beneath a glacier in an area with permafrost. **D 7099, D18**
- subgrade**—the soil prepared and compacted to support a structure or a pavement system. **D 653, D18**
- sub-grade**—the ground elevation established to receive an additional surfacing. **E 631, E06**
- subgrade surface**—the surface of the earth or rock prepared to support a structure or a pavement system. **D 653, D18**
- subgroup, *n***—(1) **object sense, *n***—a set of units or quantity of material obtained by subdividing a larger group of units or quantity of material, and (2) **measurement sense, *n***—a set of groups of observations obtained by subdividing a larger group of observations. See **rational subgroup**. **E 456, E11**
- subgroup**—one or more events or measurements used to analyze the performance of a process. **F 1789, F16**
- subject, *n***—see **assessor**. **E 253, E18**
- subject, *n***—a human whose temperature is measured. **E 344, E20**
- subject contrast**—the ratio (or the logarithm of the ratio) of the radiation intensities transmitted by selected portions of the specimen. **E 1316, E07**
- sublimation, *n***—the volatilization of a solid directly to the vapor state, without passing through the liquid state. **C 1145, C28**
- sublimation**—the process of converting ice in the solid state directly into water vapor (as through the action of wind). **D 7099, D18**
- sublimation ice**—ice formed by reverse sublimation of water vapor onto cold surfaces. **D 7099, D18**
- sublimation pressure**—at a stated temperature, that pressure at which congruent equilibrium between a solid substance and its vapor occurs. **E 7, E04**
- sublimation pressure**—in a binary system, at a stated temperature, that pressure at which congruent equilibrium between a solid substance and its vapor occurs. **E 1142, E37**
- sublimation temperature**—at a stated pressure, that temperature at which congruent equilibrium between a solid substance and its vapor occurs. **E 7, E04**
- sublimation temperature**—in a binary system, at a stated pressure, that temperature at which congruent equilibrium between a solid substance and its vapor occurs. **E 1142, E37**
- submarine (subsea) permafrost**—permafrost occurring beneath the sea or ocean bottom. **D 7099, D18**
- submerged throat**—a throat with its floor below the floor of the melter and its top below the metal line. **C 162, C14**
- submerged unit weight**—see **unit weight**. **D 653, D18**
- submersible boom**—boom that normally resides on the seabed and is positioned by inflating with air, causing it to rise to the water surface. **F 818, F20**
- submicroscopic**—See **ultramicroscopic**. **E 7, E04**
- subnormal thermometer**—a thermometer specifically designed for obtaining body temperatures below the “regular scale” range. **E 344, E20**
- subpermafrost water**—free water in the ground below the permafrost base. **D 7099, D18**
- subsample**—See **subsample** under **sample**. **D 121, D05**
- subsample, *n***—a portion of a material that is collected by subdividing or trimming of a sample. **D 5681, D34**
- subsample, *n***—a portion of the original sample that is taken for testing or for record purposes. **D 5681, D34**
- subsample, *n***—a portion of a sample taken for the purpose of estimating properties or composition of the whole sample. **D 5681, D34**
- subsample, *n***—sample taken from a sample of a population.

subsample, n

NOTE—It may be selected by the same method as was used in selecting the original sample, but need not be so.

NOTE—In sampling from bulk material, subsamples are often prepared by sample division. The subsample thus obtained is also called a “divided sample.” See **sample division**. E 1402, E11

subsealing—*in grouting*, grouting under concrete slabs for the purpose of filling voids without raising the slabs. D 653, D18

subsea talik—a layer or body of unfrozen ground beneath the seabottom and forming part of the subsea permafrost. D 7099, D18

subsidence—the downward displacement of the overburden (rock or soil, or both) lying above an underground excavation or adjoining a surface excavation. Also the sinking of a part of the earth’s crust. (ISRM) D 653, D18

subsieve fraction, n—the portion of powder passing through a 45- μ m (no. 325) sieve. B 243, B09

subsoil—(a) soil below a subgrade of fill. (b) that part of a soil profile occurring below the “A” horizon. D 653, D18

substandard dwelling—dwelling or residence that does not meet minimum local housing codes, or is unsafe because of violation of fire, safety, or health codes. E 631, E06

substandard dwelling—dwelling or residence that does not meet minimum local housing codes, or is unsafe because of violation of fire, safety, or health codes. E 1605, E06

substitution error, n—the replacement of a bar code marked character(s), by an erroneous character(s) usually traceable to poor quality printing, decoding logic error, human input error, or any combination thereof. F 1294, F05

substitution error rate, SER, n—the ratio of the number of invalid or incorrect characters entered into the data base to the number of valid characters entered. F 1294, F05

substrate—*in diffusion coatings*, material on which coating is deposited. B 374, B08

substrate—a body, board, or layer of material on which some other active or useful material or component may be deposited or laid, as for example, an electronic circuitry laid on an alumina ceramic board. C 242, C21

substrate, n—*in building construction*, (1) a material upon which films, treatments, adhesives, sealants, membranes, and coatings are applied; (2) materials that are bonded or sealed together by adhesives or sealants. C 717, C24

substrate, n—a body, board, or layer of material on which some other active or useful material or component may be deposited or laid, as for example, an electronic circuitry laid on an alumina ceramic board. In catalysts, the formed, porous, high-surface-area carrier on which the catalytic agent is widely and thinly distributed for reasons of performance and economy. C 1145, C28

substrate—the soiled surface that is being cleaned. D 459, D12

substrate, n—*as related to adhesives*, a material upon which an adhesive is applied. (Compare **adherend**.) D 907, D14

substrate—the surface upon which the roofing or waterproofing membrane is placed (structural deck or insulation). D 1079, D08

substrate—(substratum) that which lies under; foundation. E 7, E04

substrate, n—a material which is used or is representative of that used, immediately beneath a surface product in end-use, for example, skimmed plasterboard beneath a wall-covering. E 176, E05

substrate—unfinished building-material surface to which finishes are applied. Examples include wood, plaster, drywall, masonry, and metal. E 1605, E06

substrate, n—surface to which the EIFS is applied. E 2110, E06

substrate—the thick, starting material (often single crystal silicon or glass) in a fabrication process that can be used to build MEMS devices. E 2444, E08

substrate, n—the underlying support surface upon which the flooring is installed. F 141, F06

substrate, n—the material (usually paper, plastic or metal) upon which a bar code symbol is printed or reproduced. F 1294, F05

substrate base—unfinished building-material surface to which finishes are applied. Examples include wood, plaster, drywall, masonry, and metal.

substrate effect—see **XRF substrate effect**. E 631, E06

substrate equivalent lead concentration (SEL)—average of at least three XRF analyzer readings on a surface from which the coating has been removed.

subsystem—See **building subsystem**. E 631, E06

substrate equivalent lead concentration (SEL)—average of at least three XRF analyzer readings on a surface from which the coating has been removed. E 1605, E06

substrate failure, n—*in characterizing the locus of an adhesive-joint failure*, the fracture occurring within the substrate. (See **cohesion failure**.) D 907, D14

substrates, n—raw or virgin materials that will ultimately be used in tissue-engineered medical products for growth, support, or delivery of cells or biomolecules. F 2312, F04

subsurface corrosion—See **internal oxidation**. G 15, G01

subsurface discontinuity—any defect that does not open onto the surface of the part in which it exists. E 1316, E07

subsurface layers—layers of material that may exist on a base substrate and which are underneath the outermost layer, or surface, on a base substrate. E 631, E06

subthreshold, adj—pertaining to a stimulus below the specified threshold. E 253, E18

subtractive color mixture, n—mixture of absorbing media or superposition of filters so that the spectral composition of light passing through the combination is determined by simultaneous or successive absorption. E 284, E12

subtractive primaries, n—see **primary colorants**. E 284, E12

successive hurdles approach, n—used in multiple-issue testing, it is a process in which multiple broad areas are covered together in a single PDD test, followed by tests of only those who have positive results with successively focused PDD tests. The benefit of the successive hurdles process is the efficient use of testing resources to deliver accuracy that would normally only be obtainable with several independent single-issue tests. E 2035, E52

suction, n—the absolute difference between ambient and subatmospheric pressure expressed in inches or millimetres of water. F 395, F11

suction power—See **air power**. F 395, F11

suction process—any process in which glass is gathered by vacuum into the mold. C 162, C14

suds—a foam or lather generated on or in a detergent solution. D 459, D12

suede finish—a finish produced by running the surface of leather on a carborundum or emery wheel to separate the fibres in order to give the leather a nap. The grain side of the leather may be suede-finished, but the process is most often applied to the flesh surface. The term “suede” is applied to chrome or alum-tanned leather, while “ooze” is applied to vegetable-tanned suede. The term “suede” when used alone refers to leather only. *The term denotes a finish, not a type of leather.* D 1517, D31

sugars—molecules of carbohydrate, namely monosaccharides and disaccharides such as glucose, galactose, mannose, sucrose or fructose, etc. E 1705, E48

suitable materials—Suitable material is well-graded $\frac{3}{4}$ to $\frac{1}{4}$ in. (19 to 6mm) crushed stone, having a minimum of one fracture face, or other angular, non-consolidating bedding materials not subject to migration. C 896, C04

suitable packaging unit—the unit(s) of packaging to which a specific requirement of marking and labeling is logically applicable. It shall not be less than the smallest unit intended for sale by the manufacturer or distributor to the final user. E 344, E20

sulfate attack—*in grouting*, harmful or deleterious reactions between sulfates in soil or groundwater and the grout. D 653, D18

sulfated ash, n—the residue remaining after the sample has been

- carbonized, and the residue subsequently treated with sulfuric acid and heated to constant weight. **D 4175, D02**
- sulfated oil**—a newer term signifying the same type of material as sulfonated oil. **D 459, D12**
- sulfate pulp**—see **kraft pulp**. **D 1695, D01**
- sulfate reducing bacterial (SRB), pl., *n***—any bacteria with the capability of reducing sulfate to sulfide. **D 4175, D02**
- sulfation**—the introduction into an organic molecule of the sulfuric ester group (or its salts) —O—SO₃H, where the sulfur is linked through an oxygen atom to the parent molecule. **D 459, D12**
- sulfidation**—the reaction of a metal or alloy with a sulfur-containing species to produce a sulfur compound that forms on or beneath the surface of the metal or alloy. **G 15, G01**
- sulfide creep**—in electrical contacts, spontaneous migration of a sulfide based corrosion product that occurs at elevated humidity across a gold rich surface. **B 542, B02**
- sulfide spot test method**—for *lead detection*, the use of a dilute solution of sulfide ion to test a painted surface or paint chip for the qualitative presence of lead (2). A color change from clear to grey or black indicates the presence of lead above the level of detection of the spot test. **E 631, E06**
- sulfide-type inclusions**—in steels, nonmetallic inclusions composed essentially of manganese iron sulfide solid solutions (Fe, Mn) S. They are characterized by plasticity at hot-rolling and forging temperatures and, in the hot worked product, appear as dove gray elongated inclusions varying from a threadlike to oval outline. Selenide type inclusions may behave similarly. **E 7, E04**
- sulfite cellulose**—a by-product of paper mills, produced in sulfiting wood pulp, used as a tanning material; more correctly named lignosulfonate since it does not contain cellulose. **D 1517, D31**
- sulfite pulp**—wood pulp produced by cooking with a sulfite liquor made by dissolving sulfur dioxide in an aqueous base. **D 1695, D01**
- sulfochromate etch**—etchant used for preparing the surface of aluminum alloys for adhesive bonding (sulfuric acid/sodium dichromate). Also known as the *Forest Products Laboratory (FPL) etch*. **E 631, E06**
- sulfochromate etch**—etchant used for preparing the surface of aluminum alloys for adhesive bonding (sulfuric acid/sodium dichromate). Also known as the *Forest Products Laboratory (FPL) etch*. **E 1749, E06**
- sulfoferric etch**—etchant used for preparing the surface of aluminum alloys for adhesive bonding (sulfuric acid/ferric sulfate). Also known as the *P2 etch*. **E 631, E06**
- sulfoferric etch**—etchant used for preparing the surface of aluminum alloys for adhesive bonding (sulfuric acid/ferric sulfate). Also known as the *P2 etch*. **E 1749, E06**
- sulfonated oil**—a water dispersible or soluble surface active material obtained by treating an unsaturated or hydroxylated fatty oil, acid, or ester with an agent capable of sulfating or sulfonating it at least partially. **D 459, D12**
- sulfonation**—the introduction into an organic molecule of the sulfonic acid group (or its salts) —SO₃H where the sulfur atom is joined to a carbon atom of the parent molecule. **D 459, D12**
- sulfur, combined, *n***—the sulfur remaining in a vulcanizate after extraction by a prescribed method. **D 1566, D11**
- sulfur concrete**—see **sulfur polymer cement concrete**. **C 904, C03**
- sulfur dioxide (SO₂)**—mol weight 64.07; colorless, nonflammable gas with strong suffocating odor soluble in water and organic solvents. **D 4790, D16**
- sulfur donor vulcanizing system, *n***—a vulcanizing system in which there is no elemental sulfur present and all of the sulfur available for the crosslinking is provided by the partial decomposition of sulfur-containing materials. **D 1566, D11**
- sulfur, extractable, *n***—all the sulfur removed by a solvent from a rubber mix or vulcanizate. **D 1566, D11**
- sulfur, free, *n***—ideally, the uncombined sulfur in a rubber mix or vulcanizate. **D 1566, D11**
- sulfuric anhydride (organically combined)**—that portion of sulfur, calculated as sulfur trioxide, bound through oxygen to carbon in an organic sulfate, or bound directly to carbon in an organic sulfonate. **D 459, D12**
- sulfur modifier**—the concentrated product produced by reacting sulfur with a hydrocarbon material, used with additional elemental sulfur to produce a binder for sulfur polymer cement concrete. **C 904, C03**
- sulfur mortar**—a product consisting of fillers, such as carbon or silica flour, dispersed in sulfur. Small amounts of modifying additives may be included. **C 904, C03**
- sulfur polymer cement**—the product obtained by reacting sulfur with chemical modifiers to produce a binder for sulfur polymer cement concrete. **C 904, C03**
- sulfur polymer cement concrete**—a thermoplastic chemical-resistant construction material composed of sulfur polymer cement binder composed of elemental sulfur and sulfur modifier, hot-mixed with appropriate types and amounts of aggregate and mineral filler. Commonly referred to as sulfur concrete or sulfur polymer concrete.. **C 904, C03**
- sulfur polymer concrete**—see **sulfur polymer cement concrete**. **C 904, C03**
- sulfur, total, *n***—all the sulfur present in a material, irrespective of its chemical form or origin. **D 1566, D11**
- summerwood**—See **latewood**. **D 9, D07**
- sum of squares, *n***—in *analysis of variance*, a contraction of the expression "sum of the squared deviations from the appropriate average(s)" where the average(s) of interest may be the average(s) of a specific subset(s) of data or of the entire set of data. **D 123, D13**
- sum of squares, *n***—in *analysis of variance*, a contraction of the expression "sum of the squared deviations from the appropriate average(s)" where the average(s) of interest may be the average(s) of specific subset(s) of data or of the entire set of data. **D 4175, D02**
- sump**—a depression around a drain. **D 1079, D08**
- sump**—a pit, cistern, cesspool, or similar receptacle where liquids drain, collect, or are stored. **D 5681, D34**
- sump throat**—{archaic} See **submerged throat**. **C 162, C14**
- sunk cost**—a cost that has already been incurred and which should not be considered in making a new investment decision. **support space**—See **space categories**. **supported file adhesive**—See **adhesive, supported film**. **E 631, E06**
- sunk cost, *n***—a cost that has already been incurred and which should not be considered in making a new investment decision. **E 833, E06**
- sunlight, *n***—as used in weathering, the term equivalent to "daylight". It refers to the full spectrum of solar irradiance, that is, ultraviolet through infrared, and includes both diffuse sky and direct solar irradiance. **G 113, G03**
- supercooled state, *n***—the meta-stable state of reference material in which the temperature of the liquid phase is below the freezing point. **E 344, E20**
- supercooling, *n***—an unstable state in which an engine coolant exists as a liquid below its normal freezing point. **D 4725, D15**
- supercooling**—cooling of a liquid to a temperature below its freezing point, without causing solidification. **D 7099, D18**
- supercooling**—to cool a substance below a transition temperature without the transition occurring, especially to cool below the freezing point without solidification. **E 1142, E37**
- supercritical flow**—open channel flow that is shallower and at higher velocity than critical flow for the same flow rate. A Froude number greater than one exists. **D 4410, D19**
- superelasticity, *n***—nonlinear recoverable deformation behavior of Ni-Ti shape memory alloys at temperatures above the austenite finish temperature (A_f). **F 2005, F04**

superfatted soaps—under **soap**, see *superfatted soap*. **D 459, D12**

superfines, n—the portion of a powder composed of particles that are smaller than a specified size, currently less than 10 μm . **B 243, B09**

superimposed ac—a form of current in which an alternating current component is superimposed on the direct plating current. **B 374, B08**

superimposed load—load imposed by travel over, or by material brought and placed over the trench area, after pipe installation. **C 896, C04**

superimposed load, n—force applied to a specimen or structure other than that associated with its own mass. **E 176, E05**

superior—higher, denoting the upper of two parts, also means towards the head. **F 869, F08**

superlattice—See **ordered structure**. **E 7, E04**

supernatant, n—the liquid above settled solids. **D 4175, D02**

supernatant, n—the liquid above settled solids. **D 6384, D02**

supernatant—that liquid remaining after separation of a liquid/solid mixture. **E 1705, E48**

supernate or supernatant—the liquid above the surface of settled sediment. **D 4410, D19**

supersaturation—a state in which the inorganic salt (s) are in solution at a level higher than the respective solubility product. **D 6161, D19**

super-steep asphalt—a roofing asphalt conforming to the requirements of Specification D 312, Type IV. **D 1079, D08**

superstructure—those parts of a melter above the sidewall tank blocks. **C 162, C14**

supplemental coolant additive (SCA) maintenance dose, n—smaller periodic additions of SCA, subsequent to the precharge dose of SCA, required to maintain protection against general corrosion, cylinder liner pitting, and scaling in heavy-duty engines. **D 4725, D15**

supplemental coolant additive (SCA) precharge dose, n—initial concentration of SCA in engine coolant required to enable the coolant to provide adequate protection against cylinder liner pitting and scaling in heavy-duty engines plus general corrosion protection when water only is used as a coolant. **D 4725, D15**

supplemental fuel, n—a combustible material that displaces a portion of traditional fuel source. It refers to the product being used in conjunction with another conventional fuel but typically not as a sole fuel supply. **D 5681, D34**

supplementary observer, CIE 1964, n—*in color determination*, hypothetical observer based on color mixture data obtained for a 10° field of view for 76 real observers, adopted by the CIE in 1964. **D 2946, C17**

supplier, n—person, company, or organization that furnishes products as a jobber or distributor, as distinct from a producer. **B 881, B07**

supplier, n—*in pipe laying*, the party who supplies material or services. A supplier may or may not be the manufacturer. **C 1154, C17**

supplier, n—*for pipe laying*, the party who supplies material or services. **D 2946, C17**

supplier, n—any individual or organization responsible for the quality of a product just before it is taken over by the receiver. **D 4175, D02**

supplier—the party that is responsible for the product, process or service and is able to ensure that quality assurance is exercised. The definition may apply to manufacturers, distributors, importers, assembles, service organizations, etc. (EN 45020) **E 1187, E36**

supplier declaration—procedure by which a supplier gives written assurance that a product, process or service conforms to specified requirements, (ISO Guide 2). **E 1187, E36**

support—structure or structural feature built into an underground opening for maintaining its stability. (ISRM) **D 653, D18**

supported film adhesive—See **adhesive, supported film**. **E 1749, E06**

supported gasket member—a gasket member held in place by a supporting frame member. **C 717, C24**

supported needled felt, n—a needled felt that is composed entirely of fibers physically interlocked and reoriented in combination with interlay, scrim, or foundation of knitted, stitched, bonded, or extruded structure. **D 123, D13**

supported needled felt, n—a needled felt that is composed entirely of fibers physically interlocked and reoriented in combination with interlay, scrim, or foundation of knitted, stitched, bonded, or extruded structure. **D 4845, D13**

supporter—cam mechanism, especially spring-loaded; designed to provide crown and lateral guidance for staple in driving channel of stapler. **F 592, F16**

support (foot)—the degree to which the shoe upper provides sufficient containment of the motions of the foot. **F 869, F08**

supporting construction, n—the arrangement of building sections forming the fire-separating elements into which the joint systems are installed. **E 176, E05**

support region—in a bulk-micromachining process, the region that marks the end of the suspended structure. **E 2444, E08**

support space—See **space categories**. **E 1480, E06**

suppression—see **reject (suppression)**. **E 1316, E07**

suppressor device, n—an ion-exchange-based device placed between the analytical column and the conductivity detector of an ion chromatography system, that exchanges counter-ions with hydronium or hydroxyl ions. This process enhances the analyte signal by lowering eluant background conductivity, and, for strong acid and strong base ions, forms a more conductive species. **D 1129, D19**

suprapermafrost water—free water in the ground above the permafrost. **D 7099, D18**

supra-threshold, adj—pertaining to a stimulus above the specified threshold. **E 253, E18**

surface—the outermost layer of material on a base substrate facing the inspector or occupants. **E 631, E06**

surface—an interface between a condensed phase and a non-condensed phase (or free space). **E 673, E42**

surface active agent—a substance that affects markedly the interfacial or surface tension of solutions even when present in very low concentrations. **B 374, B08**

surface-active agent—(surfactant) an organic compound that reduces the surface tension of a liquid, or the interfacial tension between two liquids or between a liquid and a solid. It can also modify the properties of the liquid to which it is added, generally water. **D 459, D12**

surface-active agent—a material that when added to a liquid medium modifies the properties of the medium at a surface or interface.

NOTE—**surface-active agent** is the general term which includes soluble detergents in liquid medium, dispersing agents, emulsifying agents, foaming agents, penetrating agents, and wetting agents. **E 1519, E35**

surface area—the total area of the surface of a powder or solid including both external and accessible internal surfaces (from voids, cracks, open porosity, and fissures). **C 242, C21**

surface area—the total area of the surface. As usually used for reactive pulps, this applies not to external surface, but to the internal surface as well, the total surface available to gases or penetrating liquids. It is useful to express this as specific surface, area per gram. **D 1695, D01**

surface area—*in catalysis*, the measure of the total surface of a material per unit mass or volume. **D 3766, D32**

surface area (B.E.T.)—the total surface area of a solid calculated by the B.E.T. (Brunauer, Emmett, Teller) equation, from nitrogen adsorption or desorption data obtained under specified conditions. **D 2652, D28**

surface area distribution—the distribution of surface area according to some parameter such as pores of different size or diameter. **D 2652, D28**

surface area, specific, n—the area, per unit mass of a granular or

powdered or formed porous solid, of all external plus internal surfaces that are accessible to a penetrating gas or liquid.

C 1145, C28

surface bonding mortar—a product containing hydraulic cement, glass fiber reinforcement with or without inorganic fillers, or organic modifiers in a prepackaged form requiring only the addition of water prior to application.

C 1180, C12

surface characteristics—a set of terms considered to be the minimum needed to precisely describe the condition of a surface especially regarding slip resistance (material, contamination, slope, texture, hardness, coating, temperature).

F 1646, F13

surface clay, n—an unconsolidated, unstratified clay, occurring on the surface.

C 43, C15

surface clay—an unconsolidated, unstratified clay, occurring on the surface.

C 896, C04

surface coefficient, n—the ratio of the steady-state heat exchange rate (time rate of heat flow per unit area of a particular surface by the combined effects of radiation, conduction, and convection) between a surface and its external surroundings (air or other fluid and other visible surfaces) to the temperature difference between the surface and its surroundings. (See **conductance, film**.)

C 168, C16

surface color, n—color perceived as belonging to the surface of a specimen, without the specimen appearing to be self-luminous.

E 284, E12

surface conductance, h—(often called surface or film coefficient)—the time rate of heat flow from a unit area of a surface to its surroundings, induced by a unit temperature difference between the surface and the environment. Subscripts are used to differentiate between room-side (I or I) and weather-side (2 or II) surface conductances. Due to radiation effects, the room-side or weather-side temperatures (t_I and t_{II} , respectively), or both, can differ from the respective room-side or weather-side baffle temperatures (t_{bI} and t_{bII} , respectively). If there is a difference of more than ± 0.5 °C, (± 1.0 °F), either on the room side or the weather side, the radiation effects must be accounted for to maintain accuracy in the calculated surface conductances. The room-side and weather-side surface conductances are calculated as follows:

When

$$t_I = t_{bI} (\pm 0.5^\circ\text{C}),$$

$$h_I = q_s / (t_I - t_I)$$

where:

t_I = temperature of specimen room-side surface, K or °C (°F), and

q_s = heat flux through the specimen, W/m^2 [$\text{Btu}/(\text{h}\cdot\text{ft}^2)$].

When

$$t_I \neq t_{bI},$$

$$h_I = (q_{r1} + q_{c1}) / (t_I - t_I)$$

where:

q_{r1} = net radiative heat flux to the room side of the specimen, W/m^2 [$\text{Btu}/(\text{hr}\cdot\text{ft}^2)$], and

q_{c1} = convective heat flux to the room side of the specimen, W/m^2 [$\text{Btu}/(\text{h}\cdot\text{ft}^2)$].

When

$$t_{II} = t_{b2} (\pm 0.5^\circ\text{C}),$$

$$h_{II} = q_s / (t_2 - t_{II})$$

where:

t_2 = temperature of specimen weather-side surface, K or °C (°F).

When

$$t_{II} \neq t_{b2},$$

$$h_{II} = (q_{r2} + q_{c2}) / (t_2 - t_{II})$$

where:

q_{r2} = net radiative heat flux from the weather side of the specimen, W/m^2 [$\text{Btu}/(\text{h}\cdot\text{ft}^2)$], and

q_{c2} = convective heat flux from the weather side of the specimen, W/m^2 [$\text{Btu}/(\text{h}\cdot\text{ft}^2)$].

E 631, E06

surface contour, n—divergence of a surface from planeness rough (high) to smooth (low).

D 123, D13

surface contour, n—divergence of a surface from planeness rough (high) to smooth (low).

D 4850, D13

surface-crack length, 2c [L]—in part-through surface crack (PS) specimens, a distance measured on the specimen surface between the two points at which the crack front intersects the specimen surface. Crack length is less than the specimen width.

E 1823, E08

surface discontinuities—irregularities that occur prior to or during the manufacturing or processing of the fastener. These may include cracks, head bursts, shear bursts, seams, folds, thread laps, voids, tool marks, and nicks or gouges.

F 1789, F16

surfaced lumber—See **lumber**.

D 996, D10

surface dust—See **dust**.

D 1356, D22

surface dust, n—particulate matter on a surface.

E 1605, E06

surface energy approximation—EIA, a simplification of calculations involving the energy of an ion passing through a solid specimen. The energy of the ion at the surface is used in place of a properly averaged energy. This approximation is used to determine the energy at which scattering or stopping cross sections, or both, are evaluated.

E 673, E42

surface feature, n—a quality or condition of the face of a manufactured masonry unit.

C 1232, C15

surface finger oxide, n—the oxide that follows prior particle boundaries into a part from the surface and cannot be removed by physical means, such as rotary tumbling.

B 243, B09

surface finish, n—the geometric irregularities in the surface of a solid material. Measurement of surface finish shall not include inherent structural irregularities unless these are the characteristics being measured.

C 709, D02

surface finish, n—the geometric irregularities in the surface of a solid material. Measurement of surface finish shall not include inherent structural irregularities unless these are the characteristics being measured.

D 4175, D02

surface flame spread, n—the propagation of a flame away from the source of ignition across the surface of a liquid or a solid. Compare: **volumetric flamespread** and **burning velocity**.

E 176, E05

surface flame spread, n—the propagation of a flame away from the source of ignition across the surface of the specimen.

E 176, E05

surface force—any force that acts across an internal or external surface element in a material body, not necessarily in a direction lying in the surface.

D 653, D18

surface freezing index—the cumulative number of degree-days below 0°C for the surface temperature of the ground, or other surface on the ground, during a given period.

D 7099, D18

surface friction, n—resistance to slipping offered by surface harsh (high) to slippery (low).

D 123, D13

surface friction, n—resistance to slipping offered by surface harsh (high) to slippery (low).

D 4850, D13

surface hardening, n—a generic term covering any of several processes that, by **quench hardening** only, produce in a steel object a surface layer that is harder or more wear resistant than the **core**.

A 941, A01

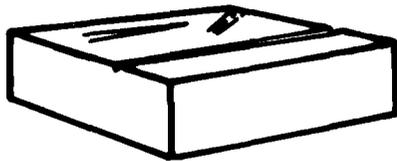

surface impoundment, n—a facility or part of a facility which is a natural topographic depression, man-made excavation, or diked area formed primarily of earthen materials (although it may be lined with man-made materials) which is designed to hold an accumulation of liquid wastes or materials containing free liquids and which is not an injection well.

E 2201, E50

surface marks—relatively long, narrow, shallow grooves or cuts in

surface marks

the surface, such as scratches, score marks, and machining marks. (See also **grinding mark**)

F 109, C21

surface micromachining—a MEMS fabrication process where micron-scale components are formed on a substrate by the deposition (or addition) and removal (in whole or in part) of structural and sacrificial layers. **E 2444, E08**

surface monitoring tire, *n*—a reference tire used to evaluate changes in a test surface over a selected time period. **F 538, F09**

surface normal, *n*—the direction normal or perpendicular to the surface of a plane specimen. **E 284, E12**

surface preparation, *n*—physical or chemical treatments, or both, applied to adherends to render them suitable for bonding. **D 907, D14**

surface preparation—a physical or chemical preparation, or both, of an adherend surface to render it suitable for adhesive joining. **E 631, E06**

surface preparation—a physical or chemical preparation, or both, of an adherend surface to render it suitable for adhesive joining. **E 1749, E06**

surfacers, *n*—a pigmented composition for filling minor irregularities to obtain a smooth uniform surface preparatory to applying finish coats; usually applied over a primer and sandpapered for smoothness. **D 16, D01**

surface reflection—reflection in which radiant energy is returned exclusively at the surface of the specimen. **E 131, E13**

surface resistance—see **resistance, surface**. **D 1711, D09**

surface resistivity, *n*—of paper, the resistance to electric current between electrodes placed on the same paper surface along the current path between the electrodes when a defined dc voltage is applied and the gap between the electrodes is specified. **D 1968, D06**

surface resistivity, ρ_s —the surface resistivity of a material is the ratio of the potential gradient parallel to the current along its surface to the current per unit width of the surface. **D 5077, D10**

surface roughness—AES, the deviation of the topography of an actual surface from an ideal atomically smooth and planar surface. The rms deviation from the center line average is a measure of surface roughness. **E 673, E42**

surface roughness, R_a , *n*—the arithmetic average deviation of the surface profile from the centerline, normally reported in micrometers. **G 126, G04**

surface sealer, *n*—material used to enhance weather resistance. **E 2110, E06**

surface segregation—a diffusion controlled process (as opposed to evaporation, preferential sputtering, or other processes) that causes the surface composition of a homogeneous solid to differ from the bulk composition. **E 673, E42**

surface tension—that property, due to molecular forces, that exists in the surface film of all liquids and tends to prevent the liquid from spreading. **B 374, B08**

surface tension, *n*—the property, due to molecular forces, by which the surface film of all liquids tends to bring the contained volume into a form having the least area. **C 1145, C28**

surface tension—the force existing in a liquid-vapor phase interface that tends to diminish the area of the interface. This force acts at each point on the interface in the plane tangent at that point. **D 459, D12**

surface tension, *n*—a property arising from the molecular forces of the surface film of all liquids which tend to alter the contained

volume of liquid into a form of minimum superficial area, expressed as work in newtons per millimetre. **D 1129, D19**

surface tension (γ), *n*—the specific surface free energy of a liquid gas interface, millinewton per metre (ergs/cm²). **D 4175, D02**

surface thawing index—the cumulative number of degree-days above 0°C for the surface temperature of the ground, or other surface on the ground, during a given period. **D 7099, D18**

surface topography, *n*—the geometrical detail of a solid surface, relating particularly to microscopic variations in height. **G 40, G02**

surface treatment, *n*—an application of bituminous material followed by a layer of mineral aggregate; multiple applications of bituminous material and mineral aggregate may be used. **D 8, D04**

surface void, (SV), *n*—as used in *fractography*, a cavity created at the surface/exterior as a consequence of the reaction/interaction between the material and the processing environment, for example, surface reaction layer or bubble that is trapped during processing. **C 1145, C28**

surface water absorption, *n*—by a fabric, the process of removing liquid water from a surface such as human skin, dishes, or furniture. **D 123, D13**

surface water absorption, *n*—by a fabric, the process of removing liquid water from a surface such as human skin, dishes, or furniture. **D 4850, D13**

surface wave—a wave confined to a thin layer at the surface of a body. (ISR) **D 653, D18**

surface wave—see **Rayleigh wave**. **E 1316, E07**

surface wetting and adhesion—See **wetting and adhesion, surface**. **C 168, C16**

surfacing mat, *n*—a thin mat of fine fibers used primarily to produce a smooth surface on a reinforced plastic. **D 883, D20**

surfactant—a contraction of the term surface-active agent. **D 459, D12**

surfactant—a material that improves the emulsifying, dispersing, spreading, wetting, or other surface-modifying properties of liquids. **E 609, E35**

surfactant—See **surface-active agent**. **E 1519, E35**

surfactants, *n*—surface active molecular species that exhibit both water soluble and oil soluble properties, and affect the physical behavior at the interface between water and oil phases by forming emulsions or changing the wetting characteristics of solid surfaces exposed to water and oil. **D 4175, D02**

surge magnetization—use of a high initial current for a short period (less than a second), then a continuous reduced current while the inspection medium is applied. **E 1316, E07**

surgical scissors with inserts—a stainless steel instrument, available in various sizes and configurations, used in surgical procedures for cutting body tissue, gauze, and suture. An instrument of this type has tungsten carbide, stellite, or other inserts. **F 1078, F04**

surrogate—a substance with properties that mimic the performance of the analyte of interest in the measurement system, but which is not normally found in the sample of concern and is added for quality control purposes. **D 5681, D34**

surrogate microbe, *n*—a microorganism which is used to act as a simulant for other microorganisms which are pathogenic to humans. **F 1494, F23**

surrogate species—a species that is tested to estimate responses of other species, for which direct testing is impractical. **E 943, E47**

surround, *n*—portion of the visual field immediately around the object or light source of interest. See **ambient field**. **E 284, E12**

surveillance, *n*—the act of maintaining supervision or vigilance over a well-specified portion of water so that detailed information is provided concerning the state of that portion. **D 1129, D19**

surveillance and long-term monitoring (SLTM), *n*—activities, conducted after remediation, such as monitoring, repairing and replacing parts, record keeping, maintenance, and other activities that are required to maintain an adequate level of human health and environmental protection from hazardous and radioactive waste residues. **E 833, E06**

surveillance and maintenance, *n*—activities such as monitoring, inspection, maintenance, replacement and repair of components and parts that are required for a site or a facility prior to remediation. **E 833, E06**

susceptibility, κ —a ratio of the intrinsic induction, B_i , as a result of the magnetization of a material to the induction in space because of the influence of the corresponding magnetic field strength, H .

$$\kappa = B_i/\Gamma_m H = \mu_r - 1$$

where:

Γ_m = magnetic constant and

μ_r = relative permeability.

NOTE—The preceding equations apply to an isotropic material if the SI, an abbreviation for the international system of units, are used.

NOTE—In the classical cgs-emu system of units:

$$\kappa = B_i/4\pi\Gamma_m H = (\mu_r - 1)/4\pi$$

A 340, A06

susceptibility, *n*—the ratio of the intrinsic induction due to the magnetization of a material to the induction in space due to the influence of the corresponding magnetizing force. **C 1145, C28**

susceptibility—when not otherwise qualified, the degree of change in viscosity with temperature. **D 1079, D08**

susceptibility, initial, κ_0 —the limiting value of susceptibility when the intrinsic induction approaches zero. **A 340, A06**

susceptibility, mass, χ —the susceptibility divided by the density of a body is called the susceptibility per unit mass, χ , or simply the mass susceptibility.

$$\chi = \kappa/\delta$$

where δ = density.

A 340, A06

susceptibility to hydrogen embrittlement—is a material property that is measured by the threshold stress intensity parameter for hydrogen induced stress cracking, $K_{I_{SCC}}$, $K_{I_{HE}}$, or $K_{E_{HE}}$, which is a function of hardness and microstructure. **F 2078, F07**

susctic cryogenic fabric—a distinct soil micromorphology resulting from the effects of freezing and thawing, in which coarser soil particles have vertical or near-vertical orientation. **D 7099, D18**

suspended sediment—sediment that is carried in suspension by the turbulent components of the fluid or by Brownian movement.

D 4410, D19

suspended-sediment concentration—See **concentration of sediment (by mass)**. **D 4410, D19**

suspended-sediment discharge—the quantity of suspended-sediment passing through a stream cross section per unit of time.

D 4410, D19

suspended-sediment load—that part of the sediment load which is suspended sediment. **D 4410, D19**

suspended-sediment sampler—a device that collects a representative portion of the water with its suspended-sediment load.

D 4410, D19

suspended solids (of activated sludge or other inoculum samples), *n*—solids present in activated sludge or inoculum samples that are not removed by settling under specified conditions. **D 4175, D02**

suspended solids (SS)—solid organic and inorganic particles that are held in suspension in a liquid. **D 6161, D19**

suspension—a mixture of liquid and solid materials. **D 653, D18**

suspension—a two-phase system consisting of a finely divided solid dispersed in a solid, liquid, or gas. **E 609, E35**

suspension—a two-phase system consisting of a finely divided solid dispersed in a liquid. **E 1316, E07**

suspension, *n*—the dispersion of a solid through a liquid with a particle size large enough to be detected by purely optical means.

F 2312, F04

suspension agent—an additive that decreased the settlement rate of particles in liquid. **D 653, D18**

suspension deflection—the change in the vertical distance between the axle at its centerline and a hypothetical reference line directly above the axle centerline on the rigid frame structure. **E 867, E17**

suspension effect—the change in junction potential when a reference electrode is immersed to different depths in a solution containing resins or charged colloids, such as certain clays and soils. The suspension effect, which can be as large as 100 mV, does not occur with sensing electrodes. **D 4127, D19**

suspension, liquid—See **liquid suspension**. **C 242, C21**

suspension stabilizer—a material that reduces the tendency of particles to settle. **E 609, E35**

sustainability, *n*—the maintenance of ecosystem components and functions for future generations. **E 2114, E06**

sustainable building, *n*—see **green building**. **E 2114, E06**

sustainable capacity, *n*—the power which a component of a geothermal facility (such as a reservoir or a power plant) is capable of sustaining for a specified period of time.

Examples of Usage:

This reservoir has a sustainable capacity of 100 MW for at least 30 years.

This reservoir has a capacity of 50 MW, sustainable for at least the first 20 years of a 30-year project life.

With proper maintenance, this power plant has a sustainable capacity of 30 MW for 30 years. **E 957, E44**

sustainable communities, *n*—communities that are founded in sustainable development practices. **E 2114, E06**

sustainable development, *n*—development that meets the needs of the present without compromising the ability of future generations to meet their own needs. **E 2114, E06**

sustained flaming, *n*—the existence of flame on or over the surface of the specimen for periods of 4 s or more. **E 176, E05**

sustained flaming, *n*—existence of flame on or over most of the specimen surface for periods of at least 4 s. **E 176, E05**

sustained flaming, *n*—existence of flame on or over the surface of the specimen for periods of 5 s. **E 176, E05**

sustained flaming, *n*—the existence of flame on or over the majority of the surface of the specimen for a period of 4 s or more. **E 176, E05**

sustained flaming, *n*—existence of flame on or over most of the specimen surface for periods of more than 4 s. **E 176, E05**

sustained pressure test—a constant internal pressure test for an extended period of time. **F 412, F17**

swab test—a low-voltage electrical test used to evaluate continuity of porcelain enamel. **C 286, B08**

swage, *n*—the term used to describe any attachment method that uses mechanical force to crimp the end of the needle and firmly hold the suture in place. **F 1840, F04**

swamp—a forested or shrub covered wetland where standing or gently flowing water persists for long periods on the surface. **D 653, D18**

swath, effective width—the center to center distance between overlapping broadcast applications. **E 1102, E35**

sweating, *n*—see **exudation**. **B 243, B09**

swedge—the formed end of a piece of toprail so that it will fit into and join another piece of toprail. **F 552, F14**

sweep—the uniform and repeated movement of an electron beam across the CRT. **E 1316, E07**

sweep—see **bend**. **F 412, F17**

sweeping mode—movement of a boom relative to the water for the purpose of controlling or collecting a floating substance. **F 818, F20**

sweep width (aka swath)—width intercepted by a boom in collection mode, the projected distance between the ends of a boom deployed in a "U," "V," or "J" configuration. **F 818, F20**

sweet—a term applied to easily workable glass. **C 162, C14**

sweet, *adj*

sweet, *adj*—taste produced by substances such as sucrose when in solution. E 253, E18

sweet gas—natural gas with sulfur compounds low enough that it can be used without further purification. D 4150, D03

swell, *n*—a hump in the pavement surface that may occur over a small area or as a longer, gradual wave; either type of swell can be accompanied by surface cracking. E 867, E17

swell, *n*—a hump in the pavement surface that may occur over a small area or as a longer, gradual wave; either type of swell can be accompanied by surface cracking. E 1778, E17

swelling, *n*—the increase in volume of a specimen immersed in a liquid or exposed to a vapor. D 1566, D11

swelling—increase in volume and dimensions caused by penetration of a liquid. D 1695, D01

swelling ground, *n*—*in tunneling*, soil or rock that contains a large amount of clay and that advances into the excavation principally because the material's volume is increasing. D 653, D18

swept gain—see DAC. E 1316, E07

swimwear, *n*—textile garments intended for wear in fresh, chlorinated, or salt water. D 123, D13

swimwear, *n*—textile garments intended for wear in fresh, chlorinated, or salt water. D 7022, D13

swing gate—a gate leaf attached to one gate post using hinges (frame and post hinges) which allow the gate leaf to open or close by pivoting on the hinges and to the opposite gate post or another gate leaf with a latch or other device. Swing gates may be single swing (one leaf) or double swing (two leaves). See Specifications F 654 and F 900. F 552, F14

swinging field—see **multidirectional magnetization**. E 1316, E07

swirl atomizer—a pressure atomizer in which the liquid is swirled, typically by means of tangential inlets, slotted distributors, vanes, or cores. E 1620, E29

swirl chamber atomizer—a swirl atomizer in which a chamber is located between the swirl generating devices and a discharge orifice. E 1620, E29

swirl coaxial injector—a pneumatic atomizer consisting of a central liquid stream surrounded by a high-velocity co-annular gas stream, wherein swirl is unparted to at least one of the streams. E 1620, E29

sword-point anvil—See **pointed clincher**. F 592, F16

SWRO—seawater reverse osmosis. D 6161, D19

symbol, *n*—a combination of linear bar code or two-dimensional symbol characters including start/stop characters, quiet zones, data characters, special function characters and error detection or correction characters, or both, required by a particular symbology to form a complete, scannable entity. F 1294, F05

symbol character, *n*—a unique bar or space pattern, or both, which is defined for a particular symbology. F 1294, F05

symbol check character, *n*—a symbol character calculated from other characters in a bar code symbol determined by an algorithm defined in the symbology specification and used to verify that the bar code has been correctly composed and read. The symbol check character does not include data encoded in the symbol. F 1294, F05

symbol contrast, SC, *n*—in reference to bar codes, the difference between the largest and smallest reflectances in a scan reflectance profile.

$$SC = R_{\max} - R_{\min}$$

F 1294, F05

symbol density, *n*—*in reference to bar codes*, the number of characters per lineal inch, limited by the width of the narrowest bar or space. F 1294, F05

symbol grade, *n*—*in reference to ANSI X3.182*, the simple average of all profile grades using the standard weighting 4.0 = A, 3.0 = B, 2.0 = C, 1.0 = D, and 0.0 = F. F 1294, F05

symbol length, *n*—the physical length of a bar code symbol, including quiet zones. F 1294, F05

symbology, *n*—*inference to readable codes*, a discrete set of characters used to represent and transmit information by use of a set of rules for encoding information in the symbol by an arrangement of parallel, rectangular, bars and spaces arranged in a predetermined pattern or by two dimensional cells arranged according to unambiguous rules. F 1294, F05

symbology identifier (SI), *n*—an optional three character code that may prefix transmitted data from a bar code reader identifying the symbology read and any options enabled in the reader or special features of a symbology encountered. F 1294, F05

symbology reference decode algorithm, *n*—a decoding algorithm that may be found in a particular application or symbology specification, or both. F 1294, F05

symmetrical—this refers to a snowboard shape that has a longitudinal line of symmetry, thereby allowing a single board to be used for both regular-foot and goofy-foot binding mounting positions. F 1107, F27

symmetrical laminate—See **laminate, symmetrical**.

system—of a building—See **building system**. E 631, E06

symmetrical laminate—See **laminate, symmetrical**. E 1749, E06

symmetrically cyclically magnetized condition, *SCM*—a magnetic material is in a *SCM* condition when, under the influence of a magnetic field strength that varies cyclically between two equal positive and negative limits, its successive hysteresis loops or flux-current loops are both identical and symmetrical with respect to the origin of the axes. A 340, A06

symmetrical thread—thread where following flank is a mirror-image of leading flank about line through crest and perpendicular to nail axis. F 547, F16

symmetrical weld—a fused joint joining two sheets in which the joint and weld configuration on either side of the sheets is identical. C 904, C03

symmetric laminate—a laminate in which the stacking sequence for the plies located on one side of the geometric midplane are the mirror image of the stacking sequence on the other side of the midplane. D 3878, D30

symmetric membrane—membrane and bulk polymer have equivalent characteristic (isotropic). D 6161, D19

symmetry—a property of a crystal in virtue of which equivalent lattice points can be brought into coincidence by operations such as rotation, inversion, or reflection. Such operations, are called symmetry operations or elements. E 7, E04

synchronous, *adj*—data sent together with a time base that allows the sender and receiver to operate locked together. F 1457, F05

synchronous data link control, *n*—the set of electronic signals used in the system network architecture. F 1457, F05

synchrotron radiation—*XPS*, a continuous radiation created by the acceleration of high energy electrons, as in a synchrotron or storage ring. Monochromatized, it is a practical variable energy source of photons for photoelectron spectroscopy. E 673, E42

syndet—a contraction of the term synthetic detergent. Now used to characterize personal washing bars containing surfactants in combination with soap. D 459, D12

syneresis—in grouting, the exudation of liquid (generally water) from a set gel which is not stressed, due to the tightening of the grout material structure. D 653, D18

syneresis, *n*—the contraction of a gel accompanied by the separation of a liquid. D 883, D20

syneresis, *n*—the exudation of small amounts of liquid by gels on standing. D 907, D14

syneresis, *n*—of lubricating greases, the separation of liquid lubricant from a lubricating grease due to shrinkage or rearrangement of the structure. D 4175, D02

syneresis, *n*—the contraction of a gel accompanied by the separation of a liquid. (D20) F 412, F17

synergism, *n*—the combination of two or more stimuli to produce an effect greater than the sum of their individual effects. E 253, E18

synergist—an auxiliary material that has the property of increasing the effect of the active ingredient, even though it may have little specific activity itself.

NOTE—In the case of insecticides, synergists are considered as active ingredients. **D 3064, D10**

syngas—the synthetic gas resulting from incomplete combustion or pyrolysis of organic material to primarily carbon monoxide and hydrogen. (See also **synthesis gas**.) **E 1705, E48**

syngeneic, n—cells, tissues, and organs in which the donor has an unreactive genotype with the recipient. Synonyms: *syngraft, isograft, isogeneic, or isogenic*. **F 2312, F04**

syngenetic ice—(1) ground ice that formed more-or-less simultaneously with the deposition of the ground in which it occurs; (2) ground ice developed during the formation of syngenetic permafrost. **D 7099, D18**

syngenetic ice wedge—an ice wedge formed during the formation of syngenetic permafrost; that is, formed more or less simultaneously with the deposition of the earth materials in which it occurs. **D 7099, D18**

syngenetic permafrost—(1) permafrost that formed more-or-less simultaneously with the deposition of the ground in which it occurs; (2) permafrost that formed through a rise of the permafrost table during the deposition of additional sediment or other earth material on the ground surface. **D 7099, D18**

syntactic cellular plastics—materials consisting of hollow sphere fillers in a resin matrix. **D 883, D20**

syntan—a synthetic organic tanning material. **D 1517, D31**

syntax, n—in reference to codes, the rules governing the use of appropriate identifiers, delimiters, separator character(s), and other non-data characters as well as data positioning within the message. **F 1294, F05**

syntectic equilibrium—a reversible univariant transformation in which a solid phase, that is stable only at lower temperature, decomposes into two conjugate liquid phases that remain stable at higher temperature; for example: $L_1 + L_2 = \alpha$. **E 7, E04**

synthesis gas—mixtures of gas in suitable proportions for the production of synthetic products without adding further reactants, such as carbon monoxide and hydrogen, for synthesis of methanol. **E 1705, E48**

synthesis grade—a quality of aromatic hydrocarbons and related chemicals representing the highest purity available on a commercial scale. It encompasses those materials identified with a quantitative index of purity. **D 4790, D16**

synthetic, adj—*in lubricants*, originating from the chemical synthesis of relatively pure organic compounds from one or more of a wide variety of raw materials. **D 4175, D02**

synthetic atmosphere—See **atmosphere**. **D 1356, D22**

synthetic blood, n—a mixture of a red dye/surfactant, thickening agent, and distilled water having a surface tension and viscosity, and a red color representative of blood and other body fluids, and making it more usable for visible detection. **F 1494, F23**

synthetic detergent—a detergent containing surfactants other than soap. Historically, the term differentiated the first detergents from the earlier soap-based detergents. **D 459, D12**

synthetic detergent—under **detergent**, see *synthetic detergent*. **D 459, D12**

synthetic fillers—generally of the “wood dough” type, limited to the repair of minor defects in panels. **D 1038, D07**

synthetic gypsum, n—a chemical product, consisting primarily of calcium sulfate dihydrate ($\text{CaSO}_4 \cdot 2\text{H}_2\text{O}$) resulting primarily from an industrial process. **C 11, C11**

synthetic hydrocarbon resin, n—a low molecular-weight thermoplastic polymer derived from steam-cracker fractions, coal-tar fractions, synthetic C5 fractions (for example, 1,3-pentadiene), and pure unsaturated monomers. **D 6440, D01**

synthetic insulating fluid—an insulating fluid derived from manufactured materials, whose basestock does not occur in nature, or whose basestock is derived through significant processing of

petroleum basestocks beyond fractionation, distillation, cracking, and hydrotreating. Examples of synthetic fluids are sulfur hexafluoride, silicone fluids, polybutene oils, synthetic isoparaffin fluids, and synthetic ester-based products. **D 2864, D27**

synthetic paint roller cover, n—a cover in which the paint applying material is man-made material. **D 16, D01**

synthetic patches, plugs, and shims—generally composed of two-component formulations of materials which will provide high level performance in terms of bond characteristics, weatherability and durability, used to repair defects in veneer or plywood panels. **D 1038, D07**

synthetic resin—see **resin, synthetic**. **D 16, D01**

syngen, n—the definition of all elements in a computing system. **F 1457, F05**

system—See **roofing system**. **D 1079, D08**
system, n—combination of an *IR thermometer* and an installed *probecover*. **E 344, E20**

system—*of a building*—See **building system**. **E 1480, E06**

systematically selected samples—commonly used technique whereby specimens are chosen for inspection or testing based on stated criteria of a sampling plan, such as occurs during process-control charting, during tooling changes, or at specific timed intervals. **F 1789, F16**

systematic composite sample, n—*for asbestos*, a composite sample that is obtained by taking every *n*th bag in the lot being sampled. **D 2946, C17**

systematic error—an error caused by undetected fundamental flaws in the test equipment by inadequate understanding of the theory underlying the measurement or by repetitious errors on the part of the analyst. **E 856, D34**

systematic error, n—errors introduced by the printer, reader, or other system elements that are consistent for all bars or all spaces. **F 1294, F05**

systematic error of result, n—a component of the error, which in the course of a number of test results for the same characteristic, remains constant or varies in a predictable way.

NOTE—Systematic errors and their causes may be known or unknown. **E 456, E11**

systematic sample, n—*for asbestos*, the sample that is formed from every *n*th bag of the lot to be examined. **D 2946, C17**

systematic sampling, n—the process of selecting units in a sample in accordance with a specific order or location in time or space, or both. **D 123, D13**

systematic sampling, n—sample selection procedure in which every *k*th element is selected from the universe or population; for example, $u, u + k, u + 2k, u + 3k, \text{etc.}$, where *u* is in the interval 1 to *k*. **E 456, E11**

systematic sampling, n—sample selection procedure in which every *k*th element is selected from the universe or population; for example, $u, u + k, u + 2k, u + 3k, \text{etc.}$, where *u* is in the interval 1 to *k*. **E 1402, E11**

system (crystal)—See **crystalsystem**. **E 7, E04**

system examination threshold—the electronic instrument threshold (see **evaluation threshold**) which data will be detected. **E 1316, E07**

systemic disease—a disease in which the pathogen or its products spread throughout the organism. **E 609, E35**

system induced artifacts—anomalies that are created by a system during the acquisition, display processing, or storage of a digital image. **E 1316, E07**

system network architecture, n—a proprietary communication system developed by IBM. (See **SNA**.) **F 1457, F05**

system noise, n—the difference between the maximum and minimum area readings per second for the first 20 area readings in the blank run. **D 4175, D02**

system noise—the noise present in a radiological measurement resulting from the individual elements of the radiological system. **E 1316, E07**

systems integrator, *n*

systems integrator, *n*—the individual or organization within a provider who is responsible for responding to performance statements at the highest level of the hierarchy of built elements and for

assigning the responsibility for responding to performance statements at lower levels to others, such as subcontractors, suppliers, or product manufacturers. **E 2151, E06**

T

- T**—in *electromagnetics*, symbol for transmittance. **D 4175, D02**
- t**—thickness of web material, in. (or mm) **E 631, E06**
- Δ_t —total deflection of diaphragm, in. (or mm) **E 631, E06**
- tab, n**—a piece of material used to hold the laminate specimen in a grip or fixture for testing so that the laminate is not damaged and is adequately supported. **D 3878, D30**
- tabby, n**—a *plainweave fabric*. In the context of tire cord fabric, it refers to sections of closely spaced weft yarns in a special section of fabric woven to provide as sample. **D 6477, D13**
- tabby sample, n**—the section of tire cord fabric between two tabbies that have been woven separately with a distance of 0.5 to 1.0 m (18 to 36 in.) between them. **D 123, D13**
- tabby sample, n**—the section of tire cord fabric between two tabbies that have been woven separately with a distance of 0.5 to 1.0 m (18 to 36 in.) between them. **D 6477, D13**
- Taber stiffness unit, n**—of *paper*, the common unit measure used with Taber instruments. **D 1968, D06**
- table dyeing**—see **brush coloring**. **D 1517, D31**
- table nut**—a hexagon nut used to attach the dial ring to the tube. **F 471, F12**
- table run**—used to describe leather that has not been sorted and graded before selling by the tanner. (Also known as tannery run, or TR). **D 1517, D31**
- tableware**—all utensils and decorative articles used on the table for meal service. **C 242, C21**
- tack, n**—in *building construction*, the sticky condition of the surface of an applied sealant. **C 717, C24**
- tack**—sticky or adhesive quality of the surface of applied sealant. **C 717, C24**
- tack, n**—for *rubber or rubber compounds*, a property that causes two layers of these materials, when pressed together, to adhere at the area of contact. **D 123, D13**
- tack, n**—the property of an adhesive that enables it to form a bond of measurable strength immediately after adhesive and adherend are brought into contact under low pressure. (See also **tack range** and **tacky-dry**.)
- aggressive tack, n*—Synonym for **dry tack**.
- dry tack, n*—the property of certain adhesives, particularly nonvulcanizing rubber adhesives, to adhere on contact to themselves at a stage in the evaporation of volatile constituents, even though they seem dry to the touch. (Synonym *aggressive tack*.) **D 907, D14**
- tack**—sticky, gummy character of a polish film, rendering the surface conducive to dust accumulation, fingerprinting, etc. **D 2825, D21**
- tack**—sticky, gummy character of a polish film, rendering polish surfaces conducive to dust accumulation. **D 2825, D21**
- tack, n**—for *rubber or rubber compounds*, a property that causes two layers of these materials when pressed together to adhere at the area of contact. **D 6477, D13**
- tack coat (bond coat), n**—an application of bituminous material to an existing relatively nonabsorptive surface to provide a thorough bond between old and new surfacing. **D 8, D04**
- tacker**—electric, manual, or pneumatic tool for driving light-wire staples without clinching. **F 592, F16**
- tackifier, n**—a compounding material that enhances the ability of vulcanized rubber to adhere to itself or another material. **D 1566, D11**
- tackifying resin, n**—a resin, which when mixed with certain compatible polymers, imparts tack, under use conditions, to the finished formulation. **D 6440, D01**
- tacking cut, n**—small holes or cuts along the selvage. **D 123, D13**
- tacking cut, n**—small holes or cuts along the selvage. **D 3990, D13**
- tack range, n**—the period of time in which an adhesive will remain in the tacky-dry condition after application to an adherend, under specified conditions of temperature and humidity. **D 907, D14**
- tack, rubber, n**—the property that causes contacting surfaces of unvulcanized rubber to adhere to each other. **D 1566, D11**
- tack tear, n**—the measurement of the resistance of a coated fabric to tearing under conditions simulating an installation that has been tacked in place. **D 123, D13**
- tacky-dry, adj**—pertaining to the condition of an adhesive when the volatile constituents have evaporated or been absorbed sufficiently to leave it in a desired tacky state. **D 907, D14**
- tactile layer**—optional feature incorporated into a membrane switch to alter the tactile response. **F 2112, F01**
- tactile response**—a physical sensation caused by a sudden collapse and/or snapback of a membrane switch. **F 2112, F01**
- tactile switch**—a switch assembly that provides a tactile ratio greater than zero. **F 2112, F01**
- Tafel slope**—the slope of the straight line portion of a polarization curve, usually occurring at more than 50 mV from the open-circuit potential, when presented in a semi-logarithmic plot in terms of volts per logarithmic cycle of current density (commonly referred to as volts per decade). **G 15, G01**
- tag, n**—a paper item, such as ticket or slip, which is marked to provide information to the consumer at the time of purchase, which is permanently affixed to the product. **D 123, D13**
- tag, n**—a **paperboard** card, metal plate, or plastic card on which shipping or identification data are given. (Compare **label**.) **D 996, D10**
- tag, n**—a paper item, such as a ticket or a slip, which is marked to provide information to the consumer at the time of purchase, and which is permanently affixed to the product. **D 3136, D13**
- tag board, n**—a paperboard used for shipping tags, file folders, printed forms, envelopes, etc. **D 1968, D06**
- tagged property**—property identified within an organization's property control system that by its nature (value, sensitivity, special measure of control) qualifies to receive a unique tag, usually a barcode, for identification and tracking. **E 2135, E53**
- tail height, h_T** —the height of the underside of the tail from a plane surface with the center of the ski body pressed against that surface. **F 472, F27**
- tail height, H_T** —the height of the underside of the tail from a plane surface with the snowboard unweighted on a plane surface. **F 1107, F27**
- tailing**—a fringe effect appearing on the trailing edge of the developed electrostatic image, but not directly attached to it. (See also **dragging**.) **F 335, F05**
- tailings**—the (size) residue, coarse or fine, removed from a separation process. **C 242, C21**
- tailings, n**—the underflow product from coal froth flotation. **D 121, D05**
- tail length, L_T** —the projected length of the tail turn-up, measured from the snowboard tail to the contact point where an 0.1-mm feeler gage intersects the running surface of the snowboard ski resting unweighted on a plane surface. **F 1107, F27**
- tail surface area**—that surface from the tail contact point aft. The tail contact point is located l_T from the tail. **F 472, F27**
- tail surface area**—that surface from the tail contact point aft. The tail contact point is located L_T from the tail. **F 1107, F27**
- tail turn-up length, l_T** —the projected length of the tail turn-up, measured from the ski tail to the contact point where a 0.5-mm feeler gage intersects the running surface with the ski body pressed against a plane surface. **F 472, F27**
- taint, n**—a taste or odor foreign to a product, usually the result of spoilage or contamination. **E 253, E18**
- take**—see **grout take**. **D 653, D18**
- takeoff rate, n**—the rate of product takeoff from the reflux divider expressed in millilitres per hour. **D 4175, D02**

takeoff rate, *n*

takeoff rate, *n*—in column distillation, the volume of product withdrawn from the reflux divider over a specified period.

D 4175, D02

take-out—a mechanical device for removing a finished article from any glass-forming unit.

C 162, C14

take-up, *n*—in fabrics, the difference in distance between two points in a yarn as it lies in a fabric and the same two points after the yarn has been removed from the fabric and straightened under a specified tension, expressed as a percentage of the straightened length.

D 123, D13

take-up, *n*—in fabrics, the difference in distance between two points in a yarn as it lies in a fabric and the same two points after the yarn has been removed from the fabric and straightened under a specified tension, expressed as a percentage of the straightened length.

D 4850, D13

take-up rollers, *n*—in open-end spinning machines, a pair of closely set, continuously rotating cylinders which withdraw the spun yarn from the rotor.

D 123, D13

take-up rollers, *n*—in open-end spinning machines, a pair of closely set, continuously rotating cylinders which withdraw the spun yarn from the rotor.

D 3888, D13

talc—a phyllosilicate mineral having the general formula $3MgO \cdot 4SiO_2 \cdot H_2O$ and noted for its extreme softness, low thermal and electrical conductivity, and fire resistance. (See also **steatite talc**.)

C 242, C21

talc—see **industrial talc** and **industrial talc, nonasbestotype**.

D 16, D01

talik—(1) a layer or body of unfrozen ground within the permafrost. It may be either a "closed" or "open" talik, depending on whether it is or is not entirely surrounded by permafrost; (2) a layer or body of unfrozen ground occurring in a permafrost area due to a local anomaly in thermal, hydrological, hydrogeological, or hydrochemical conditions.

D 7099, D18

tall oil, *n*—a generic name for a number of products obtained from the manufacture of wood pulp by the alkali (sulfate) process or more popularly known as the kraft process.

acid refined tall oil, *n*—the product obtained by treating crude tall oil in solvent solution with sulfuric acid under controlled conditions to remove dark color bodies and odoriferous materials. Removal of the solvent yields a product with lighter color and higher viscosity than crude tall oil with approximately the same fatty acids-to-rosin ratio.

crude tall oil, *n*—a dark brown mixture of fatty acids, rosin, and neutral materials liberated by the acidification of soap skimmings. The fatty acids are a mixture of oleic acid and linoleic acid with lesser amounts of saturated and other unsaturated fatty acids. The rosin is composed of resin acids similar to those found in gum and wood rosin. The neutral materials are composed mostly of esters, polycyclic hydrocarbons, sterols, and other high-molecular weight alcohols.

distilled tall oil, *n*—the class of products obtained by distilling crude tall oil in fractionating equipment under reduced pressure under such conditions that the ratio of rosin acids to fatty acids is varied over a wide range. The products that generally contain less than 90 % of fatty acids, are known as distilled tall oils.

D 804, D01

tall oil, distilled—See **distilled tall oil** under **tall oil**.

D 804, D01

tall oil fatty acids, *n*—the class of products containing 90 % or more fatty acids obtained by fractionation of crude tall oil.

D 804, D01

tall oil heads (light ends), *n*—the low-boiling fractions obtained by the fractional distillation of crude tall oil under reduced pressure.

D 804, D01

tall oil pitch, *n*—the residue from the distillation of crude tall oil. It is generally recognized that tall oil pitches contain some high-boiling esters and neutral materials with lesser amounts of rosin and fatty acids.

D 804, D01

tall oil rosin—See **rosin**.

D 804, D01

tall oil soap, *n*—the product formed by the saponification or neutralization of tall oil with organic or inorganic bases.

D 804, D01

talus—rock fragments mixed with soil at the foot of a natural slope from which they have been separated.

D 653, D18

tamped density—see **density, tamped**.

D 2652, D28

tamper—a heavy cylindrical metal section of tubing that is operated on a wire rope or cable. It slips over the riser and fits inside the casing or borehole annulus. It is generally used to tamp annular sealants or filter pack materials into place and prevent bridging.

D 653, D18

tan δ , *n*—is the dimensionless ratio of energy lost to energy returned during one cycle of a periodic process. $\tan \delta$ is normally calculated by dividing the loss component of the property measured by a periodic method by the storage component (for example, $\tan \delta = E''/E'$ as used in DMA).

E 473, E37

tandel, $\tan \delta$, *n*—mathematical tangent of the phase angle delta (δ); pure numeric; often written spaced: tan del; often written using "delta": tandelta, tan delta (Synonym—*loss factor*).

D 1566, D11

tan delta, $\tan \delta$ —the ratio of the loss modulus to the storage modulus, measured in compression, tension, flexure, or shear.

$$\tan \delta = \frac{K''}{K'} = \frac{E''}{E'} = \frac{G''}{G'}$$

D 4092, D20

tandem-axle load, [lb (kg)], *n*—the total load transmitted to the road surface by the tires on all wheels of two consecutive vehicle axles that are more than 3.3 ft (1 m) and not more than 8 ft (2.4 m) apart; a portion of the gross-vehicle weight.

E 867, E17

tangent delta, $\tan \delta$ —in dielectric measurements, the ratio of the loss factor, ϵ'' , to the absolute permittivity, ϵ' ; that is:

$$\tan \delta = \epsilon''/\epsilon'$$

E 1142, E37

tangent erosion rate, *n*—in cavitation or liquid impingement erosion, the slope of a straight line drawn through the origin and tangent to the knee of the cumulative erosion-time curve, when that curve has the characteristic S-shaped pattern that permits this. In such cases, the tangent erosion rate also represents the maximum cumulative erosion rate exhibited during the test.

G 40, G02

tangential—strictly, coincident with a tangent at the circumference of a tree or log, or parallel to such a tangent. In practice, however, it often means roughly coincident with a growth ring. A tangential section is a longitudinal section through a tree or limb perpendicular to a radius. Flat-grained lumber is sawed tangentially.

D 9, D07

tangential force, *n*—a force that acts on a moving body in the direction of a tangent to the curved path of the body.

F 141, F06

tangential stress—see **stress**.

D 653, D18

tangent modulus—See **modulus, tangent**.

C 717, C24

tangent modulus—the slope of a tangent line drawn at the steepest initial portion of the stress-strain curve.

C 904, C03

tangent modulus, *n*—the ratio of change in stress to change in strain derived from the tangent to any point on a stress-strain curve.

D 123, D13

tangent modulus—slope of the tangent to the stress-strain curve at a given stress value (generally taken at a stress equal to half the compressive strength). (ISRM)

D 653, D18

tangent modulus, *n*—in a stress strain curve, the ratio of the change in stress to the change in strain derived from the tangent at any point on the curve.

D 4848, D13

tangent point, *n*—for geotextiles, the first point of the force-elongation curve at which a major decrease in slope occurs.

D 4439, D35

tangible intellectual property—tangible property that is intellectual in nature, including software, technical data, printed information, and legal documents (such as claims, debts, insurance policies, stock certificates, and evidence of indebtedness).

E 2135, E53

tangible property—property having physical existence and hence capable of being valued monetarily. Property other than intangible property. **E 2135, E53**

tangle sheet, *n*—a piece of mica that splits well in places but tears in others, producing a large percentage of partial films. **D 1711, D09**

tank—synonymous with **melter**. **C 162, C14**

tank block—a generic term for large refractory blocks used in the structure of melters. See **pavers**. **C 162, C14**

tank heater—heating system that maintains the dishwasher's wash tank temperature. **F 1827, F26**

tank vacuum cleaner—See **canister vacuum cleaner**. **F 395, F11**

tank voltage—the total voltage between the anode and cathode of a plating bath or electrolytic cell during electrolysis. It is equal to the sum of: (1) the equilibrium reaction potential, (2) the *IR* drop, and (3) the electrode potentials. **B 374, B08**

tannery run—see **table run**. **D 1517, D31**

tan δ (tangent delta)—same as **dissipation factor**. **D 2864, D27**

tap—(1) to drain a furnace.
(2) to remove excess slag from the floor of a pot furnace. **C 162, C14**

tap density, *n*—the apparent density of the powder in a container that has been tapped under specified conditions. **B 243, B09**

tap density—See **tap density** under **density**. **C 242, C21**

tape, *n*—in **textiles**, a narrow fabric with a mass per unit area of less than 0.5 kg/m² (0.1 lb/ft²) for each 25.4 mm (1 in.) of width and which is used primarily for utilitarian purposes. (See also **narrow-fabric** and **textile ribbon**.) **D 123, D13**

tape, *n*—in **zippers**, a strip of material along one edge of which the bead and elements are attached. **D 123, D13**

tape:
gummed paper tape—a **kraft** paper in a wide range of basic weights, usually 35, 60 and 90 lb (24 by 35–500) that is gummed on one side and slit into rolls of various widths.

pressure-sensitive-adhesive tape—in **packaging**, a backing, as tape, coated so as to permit it to adhere instantaneously to most surfaces with the application of slight pressure.

reinforced gummed tape—an adhesive-coated tape that contains glass, rayon, or sisal fibers embedded in latex, resin or asphaltic laminants between two sheets of **kraft**. **D 996, D10**

tape—ribbons, usually of paper or cloth, coated with adhesive that are used to fasten veneers together for convenience in handling during the gluing operation. **D 1038, D07**

tape, *n*—a strip of material along one edge of which the bead and elements are attached. **D 2050, D13**

tape, *n*—in **textiles**, a narrow fabric with a mass per unit area of less than 0.5 kg/m² (0.1 lb/ft²) for each 25.4 mm (1 in.) of width and which is used primarily for utilitarian purposes. **D 7018, D13**

tape—materials in which the reinforcing filaments or fibers are laid in a single direction within a resin matrix in the B-stage.

tap test—See **test, tap**. **E 631, E06**

tape—materials in which the reinforcing filaments or fibers are laid in a single direction within a resin matrix in the B-stage. **E 1749, E06**

tape ends, *n*—in **zippers**, the tape extending beyond the stops at either or both ends of the stringers. **D 123, D13**

tape ends, *n*—the tape extending beyond the stops at either or both ends of the stringers. **D 2050, D13**

tapeless measure—a device which measures length using the number of rotations of a wheel in contact with the surface of the material to be measured. **D 996, D10**

taper—included angle of countersink. **F 547, F16**

taper—half of the difference between b_V and b_H or $(b_V - b_H)/2$. **F 1107, F27**

taper candle, *n*—a slender candle produced to be used with a candle accessory for support. **F 1972, F15**

tapered edge, *n*—an edge formation of gypsum board which provides

a shallow depression at the paper-bound edge to receive joint reinforcement. Also known as a **recessed edge**. **C 11, C11**

tapered edge strip—a tapered insulation strip used to elevate the roofing at the perimeter and at penetrations of the roof. **D 1079, D08**

tapered wedge point—point with two major planes forming “V” and with single minor plane on each flank; forming rectangular cross section. **F 547, F16**

tape replica—See **replica**. **E 7, E04**

taper, *V*—half of the difference between b_V and b_H or $(b_V - b_H)/2$. **F 472, F27**

tape width, exposed—See **exposed tape width**. **D 2050, D13**

tape yarn, *n*—a yarn of a flat, tape-like character produced by slitting an extruded film. **D 123, D13**

tape yarn, *n*—a yarn of a flat, tape-like character produced by slitting an extruded film. **D 4849, D13**

taping compound, *n*—(sometimes called **embedding compound**) a compound specifically formulated and manufactured for use in embedding of joint reinforcing tape at gypsum board joints. **C 11, C11**

tap test—See **test, tap**. **E 1749, E06**

tar, *n*—brown or black bituminous material, liquid or semisolid in consistency, in which the predominating constituents are bitumens obtained as condensates in the destructive distillation of coal, petroleum, oil-shale, wood, or other organic materials, and which yields substantial quantities of pitch when distilled. **D 8, D04**

tar—a brown or black bituminous material, liquid or semisolid in consistency, in which the predominating constituents are bitumens obtained as condensates in the processing of coal, petroleum, oil-shale, wood, or other organic materials. **D 1079, D08**

tar, *n*—a brown or black, bituminous, liquid or semi-solid comprised primarily of bitumens condensed in the processing of coal, petroleum, oil-shale, wood, or other organic materials. **D 4175, D02**

tar concrete, cold-laid, *n*—a plant mix containing a medium-viscosity grade of tar and a graded mineral aggregate, designed to be laid either shortly after mixing or when the mixture is at or near ambient temperature. **D 8, D04**

tar concrete, hot laid, *n*—a plant mix containing a high-viscosity grade of tar and a densely graded mineral aggregate designed to be laid at or near the elevated temperature of mixing. **D 8, D04**

tare, *n*—the mass of all external and internal packing materials (including bobbins, tubes, etc.) of a case, bale, or other type of container. **D 123, D13**

tare, *n*—the mass of all external and internal packing materials (including bobbins, tubes, etc.) of a case, bale, or other type of container. **D 4849, D13**

tare weight, *n*—the weight of a **container** or of packaging materials excluding the contents. **D 996, D10**

target—the object or “hot spot” that is being searched for. **D 5681, D34**

target—specimen under investigation.

thick—EIA, specimen whose thickness produces backscattered particles whose energies, for each constitutive element, vary greatly with respect to the system resolution.

thin—EIA, specimen whose thickness is sufficiently small that the variations in energies of particles backscattered from atoms of each constitutive element is small with respect to the system resolution. **E 673, E42**

target—that part of the anode of an X-ray emitting tube hit by the electron beam. **E 1316, E07**

target cost—the planning expenditure, determined in cooperation with the cost professionals and the design team, for project elements.

task lighting—See **lighting**. **E 631, E06**

target cost, *n*—the planning expenditure, determined in cooperation with the cost professionals and the design team, for project elements. **E 833, E06**

target (in X-ray tubes)

target (in X-ray tubes)—that part of an X-ray tube which the electrons strike and from which X-rays are emitted. E 7, E04

target monitoring zone—the ground water flow path from a particular area or facility in which monitoring wells will be screened. The target monitoring zone should be a stratus (strata) in which there is a reasonable expectation that a vertically placed well will intercept migrating contaminants. D 653, D18

target octane number, n—the research or motor octane number quality desired for a specific product. D 4175, D02

target plane, n—the plane, perpendicular to the line of sight of a radiation thermometer, that is in focus for that instrument. E 344, E20

target size, n—the diameter of a circle in the target plane of a radiation thermometer that is centered on its line of sight and contains 99 % of the input radiant power received by that instrument. E 344, E20

tarnish—corrosion products in the form of thin films or spots that do not protrude significantly from the surface of the metallic coating; for example, reaction products of copper from oxygen or reduced sulfur. B 374, B08

tarnish—the chemical compound on the surface of a contact resulting from the reaction of the contact material and the inorganic constituents of the surrounding atmosphere. B 542, B02

tarnish—a thin film of stain on the surface of glass. C 162, C14

tar or pitch bearing basic ramming mix, n—a tar or pitch bearing refractory that has suitable properties to permit ramming into place to form a monolithic structure. C 71, C08

tar or pitch bearing basic refractories, n—refractories consisting principally of basic grains to which either tar or pitch has been added during manufacture. C 71, C08

task lighting—See **lighting**. E 1480, E06

task lighting (éclairage(de travail) localisé)—localized lighting system consisting of a functional arrangement of luminaires to accommodate the specific visual task or work area needs. E 631, E06

task outline—a general plan of the estimating work to be performed.

technical performance—discouraged term for **performance**—of a building or performance—of a facility. E 631, E06

task outline, n—a general plan of the estimating work to be performed. E 833, E06

taste, n—perception resulting from stimulating the gustatory receptors in the taste buds. E 253, E18

taster, n—an assessor in a taste test. (See also **assessor**.) E 253, E18

tawing—the old English term applied to the process of making leather with alum as distinguished from tanning which was originally confined to vegetable tanning. D 1517, D31

taxa, pl., n—the units of classification of organisms, based on their relative similarities. D 4175, D02

TBC—total bacteria count, the total number of viable microorganisms present in the sample, excluding anaerobic organisms. D 6161, D19

TCC—total colony count. D 6161, D19

TDF, n—See *tire-derived fuel*. D 5681, D34

TDS—total dissolved solids, usually expressed as mg/L or ppm (parts per million). D 6161, D19

tealight candle, n—a cylindrical filled candle produced with a diameter and height of approximately 1.5 in. (38 mm) and 0.75 in. (19 mm) respectively. F 1972, F15

tear—an imperfection; a small surface section of glass torn out by adherence to another hot solid. C 162, C14

tear drop, n—*inwoven fabrics*, short elliptical deviations of one or more adjoining picks. D 123, D13

tear drop, n—*inwoven fabrics*, short elliptical deviations of one or more adjoining picks. (*Syn.* teariness) D 3990, D13

teariness—See **tear drop**. D 3990, D13

tearing—a defect in the surface of porcelain enamel, characterized by short breaks or cracks which have been healed. C 286, B08

tearing energy, n—the work done in tearing a material. D 123, D13

tearing energy, n—the work done in tearing a material. D 4850, D13

tearing force, n—the average force required to continue a tear previously started in a fabric. D 123, D13

tearing force, n—*in fabric*, the force required either (1) to start or (2) to continue or propagate a tear in a fabric under specified conditions. D 123, D13

tearing force, n—*in fabric*, the force required either (1) to start or (2) to continue or propagate a tear in a fabric under specified conditions. D 4850, D13

tearing strength, n—*in fabrics*, the capacity of a material to withstand the ultimate tearing force required to propagate a tear after its initiation. D 123, D13

tearing strength, n—the force required either (1) to start or (2) to continue or propagate a tear in a fabric under specified conditions. D 123, D13

tearing strength, n—*in fabric*, the capacity of a material to withstand the ultimate tearing force required to propagate a tear after its initiation. D 4850, D13

tearing strength, (F, (F), kN), n—the force required either (1) to start or (2) to continue or propagate a tear in a fabric under specified conditions. D 4439, D35

tear off—to remove an existing roofing system down to the structural deck. D 1079, D08

tear offs—small pieces of leather, less than half a skin, that are torn from a skin during the staking or other tanning operations. D 1517, D31

tear resistance, n—*in fabrics*, the resistance to a tearing force. D 123, D13

tear resistance, n—*in fabrics*, the resistance to a tearing force. D 4850, D13

tear (rubber), n—mechanical rupture initiated and propagated at a site of high stress concentration caused by a cut, defect, or localized deformation. D 1566, D11

tear strength, n—the maximum force required to tear a specified specimen, the force acting substantially parallel to the major axis of the test specimen. D 1566, D11

teaser—the worker in direct charge of furnace operations who regulates the charging of batch and adjusts fires. C 162, C14

technical performance—discouraged term for **performance**—of a building or performance—of a facility. E 1480, E06

technician—an employee of the testing laboratory assigned to perform the actual operations of testing. C 717, C24

technique, n—an examination protocol which includes a pretest interview, format, testing requirements, test data analysis, and may include posttest procedures. E 2035, E52

teemer—{archaic} the person who teems or casts the pot of glass. C 162, C14

teeming—See **casting**. C 162, C14

teeth, n—the resultant surface irregularities or projections formed by the breaking of filaments or strings which may form when adhesive-bonded substrates are separated. (Compare **legging**, **stringiness**, and **webbing**.) D 907, D14

teeth—serrations formed on the inside faces of the distal end of the tweezer halves. F 1638, F04

TEL—abbreviation for tetraethyllead (a gasoline antiknock agent). D 4175, D02

telco lines—telecommunication lines, such as telephone and other communication pathways that are used to transmit information from one location to another. F 1457, F05

telecommunication lines, n—any communication pathways such as telephone and others that are used to transmit information from one location to another. F 1457, F05

telegraphing, n—condition in a laminate or other type of composite construction by which irregularities, imperfections, or patterns of an inner layer are visibly transmitted to the surface. D 907, D14

telescoping—the movement of the outer layers of a spiral wound cartridge in the direction of the feed flow caused by excessive pressure drop through the feed channel spacer. D 6161, D19

telomer, *n*—a polymer composed of molecules having terminal groups incapable of reacting with additional monomers, under the conditions of the synthesis, to form larger polymer molecules of the same chemical type. (IUPAC, ISO) **D 883**, D20

telomer, *n*—a polymer composed of molecules having terminal groups incapable of reacting with additional monomers, under the conditions of the synthesis, to form larger polymer molecules of the same chemical type. (D20, IUPAC, ISO) **F 412**, F17

telomer, *n*—a polymer composed of molecules having terminal groups incapable of reacting with additional monomers, under the conditions of the synthesis, to form larger polymer molecules of the same chemical type. **F 1251**, F04

temper, *n*—*as related to metallic-coated steel wire*, stiffness or resistance to bending, typically described by reference to tensile strength. **A 902**, A05

temper—the metallurgical structure and properties of a product resulting from thermal or mechanical processing treatments. **B 846**, B05

temper, *v*—to mix or restore to a workable consistency. **C 11**, C11

temper, *v*—to bring a refractory mixture to a usable state by mixing with a liquid. **C 71**, C08

temper—(1) the degree of residual stress in annealed glass measured polarimetrically or by polariscopic comparison with a standard such as one or more strain disks. (See also **strain disk**.)

(2) term sometimes used in referring to tempered glass. (See also **tempered glass**.) **C 162**, C14

temper, *v*—in hydraulic-setting compounds, to bring to a usable state by mixing in or adding water. **E 631**, E06

temper, *v*—to bring to a workable state by adding water. **E 2110**, E06

temper annealing—a thermal treatment above the eutectoid temperature for copper-aluminum alloy products to minimize the presence of the stable eutectoid structure. **B 846**, B05

temperate bacteriophage—a bacteriophage that can grow lytically, killing the host, or can exist stably in the host. **E 1705**, E48

temperature—

absolute temperature, *n*—(1) temperature measured on the thermodynamic scale, designated as Kelvin (K). (2) temperature measured from absolute zero (−273.15°C or 459.67°F).

dry-bulb temperature (*t*), *n*—the temperature of the ambient air, for example, the temperature that is measured by the dry-bulb thermometer of a psychrometer.

ice-bulb temperature (*t_i*), *n*—the temperature that a thermometer indicates when its bulb is surrounded by a thin film of ice (or a frozen moistened covering), and allowed to cool by sublimation of the ice into the surrounding air.

sonic temperature (*T_s*) (*K*), *n*—an equivalent temperature that accounts for the effects of temperature and moisture on acoustic wavefront propagation through the atmosphere.

thermodynamic dew-point temperature (*T_d*), *n*—the temperature at which moist air with mixing ratio, *r_w*, and total pressure, *p*, when saturated with respect to water at the same pressure, *p*, will have a saturation mixing ratio, *r_w*, equal to the given mixing ratio, *r*.

thermodynamic frost-point temperature (*T_f*), *n*—the temperature at which moist air with mixing ratio, *r*, and total pressure, *p*, when saturated with respect to ice at the same pressure, *p*, will have a saturation mixing ratio, *r_i*, equal to the given mixing ratio, *r*.

thermodynamic ice-bulb temperature (*T_i*), *n*—the temperature that moist air at pressure, *p*, temperature, *t*, and mixing ratio, *r*, will attain when brought adiabatically to saturation at pressure, *p*, by sublimation of pure ice into the moist air.

thermodynamic wet-bulb temperature (*T_w*), *n*—the temperature that moist air at pressure, *p*, temperature, *t*, and mixing ratio, *r*, will attain when brought adiabatically to saturation at pressure, *p*, by the evaporation of pure liquid water into the moist air.

virtual temperature, *n*—the temperature, *T_v*, which dry air must have at the given barometric pressure, *p*, in order to have the same density as moist air at the same pressure, *P*, given temperature, *T*, and mixing ratio, *r*, provided that the dry and moist air behave in accordance with the perfect gas equation of state.

$$T_v = T \frac{(1+r/\epsilon)}{(1+r)}$$

where:

r = mixing ratio (mass of water vapor per mass of dry air, and

ε = ratio of the molecular weight of water vapor to that of dry air.

wet-bulb temperature (*t_w*), *n*—the temperature indicated by the wet-bulb thermometer of a psychrometer. **D 1356**, D22

temperature—the thermal state of matter as measured on a definite scale. **E 41**, G03

temperature coefficient of resistance, *α*, *n*—the ratio of the fractional change in electrical resistance of a substance to the corresponding change in temperature of that substance. **E 344**, E20

temperature correction factor—a multiplier that adjusts the measured gas volume to the actual volume at standard gas temperature, *T_{CF}*

$$\begin{aligned} &= \frac{\text{absolute standard gas temperature } ^\circ R}{\text{absolute actual gas temperature } ^\circ R} \\ &= \frac{\text{absolute standard gas temperature } ^\circ R}{[\text{gas temperature } ^\circ F + 459.67] ^\circ R} \end{aligned}$$

F 1827, F26

temperature correction factor (TCF)—defines the effect of temperature on permeate flow relative to a base temperature (25°C), TCF is mainly a function of fluid characteristics but also membrane polymer. **D 6161**, D19

temperature, dew point—see **dew point**. **E 41**, G03

temperature, dry-bulb—the temperature of the air as indicated by an accurate thermometer, corrected for radiation if significant. **E 41**, G03

temperature effects—changes in potential developed between a sensing and reference electrode due to changes in temperature. The slope of a sensing electrode varies with temperature, as does the potential developed by the internal reference element in the reference electrode. In addition, the solubility of salts such as AgCl or Hg₂Cl₂ changes with temperature. It is therefore advisable to measure all samples and standardizing solutions at the same temperature. **D 4127**, D19

temperature envelope—the temperature range over which a particular penetrant inspection test will operate. **E 1316**, E07

temperature index, *n*—a number which permits comparison of the temperature/time characteristics of an electrical insulating material, or a simple combination of materials, based on the temperature in degrees Celsius which is obtained by extrapolating the Arrhenius plot of life versus temperature to a specified time, usually 20 000 h. **D 1711**, D09

temperature limit, *n*—the minimum temperature of an oxidant (or oxidant mixture) that will just support sustained combustion of a material initially at given conditions of oxidant concentration, temperature, pressure, flow condition, and propagation direction. **G 126**, G04

temperature offset—the designed difference in predictive thermometer readings and water bath test temperatures. **E 344**, E20

temperature profile—the graphical or analytical expression of the variation in ground temperature with depth. **D 7099**, D18

temperature range—those temperatures at which electrode measurements can be made. The lower temperature limit is set by the freezing point of the solution that has the highest freezing point (including the sample as well as all filling solutions). The upper temperature limit is set by the boiling point of the solutions, except for liquid ion exchange electrodes, whose upper temperature limit is determined by the solubility of the ion exchange solution.

temperature range

- Electrode life decreases with exposure to high temperatures. In many cases, the limit of detection also rises with increasing temperature. For these reasons, it is preferable to cool hot solutions before measurement. **D 4127, D19**
- temperature resolution**, *n*—the minimum simulated or actual change in target temperature that gives a usable change in output or indication, or both. **E 344, E20**
- temperature rise**, ΔT , *n*—the difference between T_{\max} and the initial set temperature of the hot plate. **E 1445, E27**
- temperature stability**, *n*—for a *geotextile*, the percent change in tensile strength or in percent elongation as measured at a specified temperature and compared to values obtained at the standard conditions for testing geotextiles. **D 4439, D35**
- temperature uniformity**—the comparison of individual temperatures measured on the surface of a steel plate at the end of the test period in accordance with the heat-up temperature-response (see **heat-up temperature-response**) test. **F 1827, F26**
- temperature, wet-bulb**—wet bulb temperature (without qualification) is the temperature indicated by a wet-bulb psychrometer constructed and used according to specifications. **E 41, G03**
- temper brittleness**, *n*—brittleness that results when certain steels are held within, or are cooled slowly through, a certain range of temperature below the **transformation range**. **A 941, A01**
- temper carbon**, *n*—compact aggregates or nodules of graphite found in malleable iron as a result of heat treatment. **A 644, A04**
- temper carbon**—clusters of finely divided in malleable iron, that are formed as a result of decomposition of cementite, for example, by heating white cast iron to temperatures above the ferrite-austenite transformation temperature and holding at these temperatures for a considerable period of time (**graphite, nodular**). **E 7, E04**
- tempered**—reheated after hardening to some temperature below the critical range and subsequently cooled to increase toughness and ductility. **F 547, F16**
- tempered glass**—a general term for glass that has been subjected to a thermal treatment characterized by rapid cooling to produce a compressively stressed surface layer. See **fully tempered glass and heat-strengthened glass**. **C 162, C14**
- tempered hardboard**—a hardboard subjected to tempering as previously defined or specially manufactured with other variation in usual process so that the resulting product has special properties of stiffness, strength, and water-resistance associated with boards meeting specifications for that quality product. **D 1554, D07**
- tempered martensite**—the decomposition products which result from heating martensite to temperatures below the ferrite austenite (A_{e1}) transformation temper. Under the light microscope, darkening of the martensite needles is observed in the initial stages of tempering. Prolonged tempering at high temperatures produces spheroidized carbides in a matrix of ferrite. At the higher resolution of the electron microscope, the initial stage of tempering is observed to result in a structure containing a precipitate of fine epsilon iron carbide particles. At about 500°F (260°C), there is a transition to a structure of larger and elongated cementite particles in a ferrite matrix. With further tempering at higher temperature, the cementite particles become spheroidal, decreased in number, and increased in size. **E 7, E04**
- tempered refractory castable**, *n*—a refractory castable to which liquid has been added and sufficiently mixed to produce the desired consistency for placement. **C 71, C08**
- tempered service hardboard**—service hardboard, as previously defined, which has been given a tempering treatment to improve such properties as stiffness, strength, and water resistance. **D 1554, D07**
- tempering**, *n*—reheating a quench hardened or normalized steel object to a temperature below A_{c1} , and then cooling it at any desired rate. **A 941, A01**
- tempering**—a thermal treatment of a quench-hardened product to improve ductility. **B 846, B05**
- tempering**—the manufacturing process of adding to a fiber or particle panel material a siccative material such as drying oil blends of oxidizing resin which are stabilized by baking or other heating after introduction. **D 1554, D07**
- tempering-temperature-audit test**—means of checking whether a fastener was tempered at its specified temperature. **F 1789, F16**
- temper number**—a relative evaluation of the annealing process of glassware as determined with strain disks (see **Test Methods C 148**). **C 162, C14**
- tempest**—term used to describe techniques used to reduce emanation of electronic data or intelligence from a tactical shelter. **E 631, E06**
- tempest**—term used to describe techniques used to reduce emanation of electronic data or intelligence from a tactical shelter. **E 1749, E06**
- template**, *n*—(1) a pattern used as a guide in fabricating elements. (2) a precise, detailed pattern or layout to provide essential fabrication details. **E 631, E06**
- temple mark**, *n*—in woven fabrics, small holes or distortions adjacent to the selvage. **D 123, D13**
- temple mark**, *n*—in woven fabrics, small holes or distortions adjacent to the selvage. **D 3990, D13**
- temporal averaging**—the combination of particle size distributions obtained at different points in time into a distribution representative of a longer time interval. **E 1620, E29**
- temporal resolution**—because of ambiguities due to alternative definitions, it is recommended that “temporal resolution” not be used unless a specific definition is provided by the user. **E 1620, E29**
- temporal size distribution**—see **flux size distribution**. In context with particle size distributions, the use of *temporal* is not recommended because of possible confusion with other meanings for this term. **E 1620, E29**
- temporary coating**, *n*—a coating designed to protect or decorate a substrate for a limited time that can be readily removed either by mechanical or chemical means. **D 16, D01**
- temporary decommissioning**—the engineered closure of a well intended to be returned to service at some later date (generally no more than six months). Temporary plugging should not damage the structural integrity of the well. Plugging materials consist of sand, bentonite, or other easily removed materials. **D 653, D18**
- temporary hardness**—usually the bicarbonate salts of calcium and magnesium. **D 6161, D19**
- tenability limit (of humans to fire-generated conditions)**, *n*—limit at which a human being is rendered physically incapacitated or dies as a consequence of exposure to one or more factors (such as toxic gases, temperature, heat flux, or smoke obscuration) generated by a fire. **E 176, E05**
- tenability (of humans to fire-generated conditions)**, *n*—the capability of humans to occupy a room without becoming incapacitated or being killed as a result of a fire. **E 176, E05**
- tenacity**, *n*—in *atensile test*, the force exerted on the specimen based on the linear density of the unstrained material. **D 123, D13**
- tenacity**, *n*—the tensile stress expressed as force per unit linear density of the unstrained specimen. **D 4845, D13**
- tenacity**, *n*—in *atensile test*, the force exerted on the specimen based on the linear density of the unstrained specimen. **D 4845, D13**
- tenacity**, *n*—in *atensile test*, the force exerted on the specimen based on the linear density of the unstrained material. **D 4848, D13**
- tenacity-as-specified-elongation (TASE)**, *n*—the tenacity of a material at its force-at-specified-elongation. (Compare **breaking tenacity**.) **D 4848, D13**
- tenacity at rupture**, *n*—the tenacity at the force-at-rupture. (See also **force-at-rupture, rupture, tenacity**.) **D 123, D13**
- tenacity at rupture**, *n*—the tenacity at the force-at-rupture. (See also **force at rupture, rupture, tenacity**.) **D 4848, D13**
- tenacity-at-specified-elongation, TASE**, *n*—the tenacity of a material at its force-at-specified-elongation. (Compare **breaking tenacity**.) **D 123, D13**
- tenant** (locataire)—organization that has rights and obligations of occupancy in a facility, as specified in a lease or occupancy agreement. **E 631, E06**

tenant (locataire)—organization that has rights and obligations of occupancy in a facility, as specified in a lease or occupancy agreement. **E 1480, E06**

tensile, *adj*—relating to tension in, or on, a material. **D 123, D13**

tensile, *adj*—relating to tension in, or on, a material. **D 4848, D13**

tensile creep rupture strength, $[FL^{-1}]$, *n*—*for geosynthetics*, the force per unit width that will produce failure by rupture in a creep test in a given time, at a specified constant environment **D 4439, D35**

tensile creep strain, *n*—the total strain at any given time. **D 4439, D35**

tensile energy absorption (TEA), *n*—*of paper*, a mathematical quantity used to express the energy absorbed by a paper specimen prior to rupture in a tensile test carried to rupture under conditions specified. **D 1968, D06**

tensile hysteresis, *n*—*in mechanics*, hysteresis resulting from the extension of a material. (See *hysteresis*.) **D 4848, D13**

tensile hysteresis curve, *n*—a complex load-elongation or stress-strain curve obtained under either of two conditions:
 (1) When a specimen is successively subjected to the application of a load or force less than that causing rupture, and the removal of the load or force according to a predetermined procedure. **D 123, D13**
 (2) When a specimen is stretched less than the breaking elongation and allowed to relax by removal of the strain according to a predetermined procedure. **D 123, D13**

tensile index, *n*—a mathematical quantity calculated by dividing the tensile strength of a sample by its mass per unit area, both terms expressed in SI units. See **tensile strength**. **D 1968, D06**

tensile modulus, *n*—see **tensile stress at given elongation**, the preferred term. **D 1566, D11**

tensile modulus, J , (FL^{-1}) , Nm^{-1} , *n*—*for geotextiles*, the ratio of the change in tensile force per unit width to a corresponding change in strain (slope). **D 4439, D35**

tensile set, *n*—the extension remaining after a specimen has been stretched then allowed to retract in a specified manner expressed as a percentage of the original length. **D 1566, D11**

tensile stiffness, *n*—*of paper*, a mathematical quantity expressing the ratio of the tensile force on paper to its tensile strain in the elastic region of the tensile force-elongation behavior of the material **D 1968, D06**

tensile strain, *n*—the strain on a material subjected to tension. **D 123, D13**

tensile strain, *n*—the strain on a material subjected to tension. **D 4848, D13**

tensile strain recovery, *n*—the percent of recoverable extension to the total extension impressed on a fiber under specified conditions. **D 123, D13**

tensile strain recovery, *n*—the percent of recoverable extension to the total extension impressed on a fiber under specified conditions. **D 4848, D13**

tensile strength—the maximum load per unit of original cross-sectional area that a conductor attains when tested in tension to rupture. **B 354, B01**

tensile strength, *n*—a property of solid material that indicates its ability to withstand a uniaxial tensile load. **C 709, D02**

tensile strength, *n*—the strength of a material under tension as distinct from compression, torsion, or shear. **D 123, D13**

tensile strength, *n*—the strength shown by a specimen subjected to tension, as distinct from torsion, compression, or shear. **D 123, D13**

tensile strength, *n*—the breaking load (or force) per unit cross-sectional area of the unstrained specimen. **D 123, D13**

tensile strength, *n*—the strength of a material under tension as distinct from compression, torsion or shear. **D 123, D13**

tensile strength, *n*—*in an adhesive joint*, the maximum tensile stress that a material is capable of sustaining calculated from the

maximum load applied perpendicular to the joint divided by the original cross-sectional area of the joint. **D 907, D14**

tensile strength, *n*—the maximum tensile stress applied during stretching a specimen to rupture. **D 1566, D11**

tensile strength, *n*—*of paper*, the maximum tensile force developed per unit width of a paper test specimen prior to rupture in a tensile test which has been carried to rupture under conditions specified. **D 1968, D06**

tensile strength, *n*—a property of solid material that indicates its ability to withstand a uniaxial tensile load. **D 4175, D02**

tensile strength, *n*—*for geotextiles*, the maximum resistance to deformation developed for a specific material when subjected to tension by an external force. **D 4439, D35**

tensile strength, *n*—the strength of a material under tension as distinct from compression, torsion, or shear. **D 4845, D13**

tensile strength, *n*—the strength of a material under tension as distinct from compression, torsion or shear. **D 4848, D13**

tensile strength, fastener—see **ultimate strength**. **F 1789, F16**

tensile strength of metal connector plate—resistance to tensile force by net plate cross section normal to the direction of load application, expressed as force per unit of width of full cross section of connector plate, when used in pairs of plates.

test:

accelerated test—the testing of materials by exposure to intensified simulation of service conditions, for example, weathering, radiation, etc.

climbing drum peel test—a method of determining the relative peel resistance of adhesive bonds between a relatively flexible adherend and a rigid adherend, and the relatively flexible facing of a sandwich structure and its core (see Test Method D 1781).

destructive test—a test involving the destruction of assemblies or parts in order to evaluate the maximum performance of the assembly or part.

floating roller peel test—a method of determining the relative peel resistance of adhesive bonds between one rigid and one flexible adherend (see Test Method D 3167).

nondestructive test—an inspection test for the evaluation of structural quality without damaging the assembly, for example, ultrasonics, visual inspection, etc.

sag flow test—a method of determining the maximum thickness to which a material can be applied without sagging and that provides a means of measuring the amount of sag flow at a given thickness (for highly viscous resins) (see Test Method D 2730). **E 631, E06**

tensile strength, S_u $[FL^{-2}]$, *n*—the maximum tensile stress which a material is capable of sustaining. Tensile strength is calculated from the maximum force during a tension test carried to rupture and the original cross-sectional area of the specimen. **E 6, E28**

tensile strength, σ_{TS} $[FL^{-2}]$ —the maximum tensile stress that a material is capable of sustaining. Tensile strength is calculated from the maximum force during a tension test carried to rupture and the original cross-sectional area of the specimen. **E 1823, E08**

tensile strength (unconfined or uniaxial tensile strength), T_o (FL^{-2}) —the load per unit area at which an unconfined cylindrical specimen will fail in a simple tension (pull) test. **D 653, D18**

tensile stress, *n*—the stress within a material subjected to tension. **D 123, D13**

tensile stress—normal stress tending to lengthen the body in the direction in which it acts. (ISRM) **D 653, D18**

tensile stress, *n*—a stress applied to stretch a test piece (specimen). **D 1566, D11**

tensile stress, *n*—the stress within a material subjected to tension. **D 4848, D13**

tensile stress at given elongation, *n*—the stress required to stretch the uniform cross section of a test specimen to a given elongation. **D 1566, D11**

tensile stress [FL⁻²], *n*—normal stress due to forces directed away from the plane on which they act. **E 6, E28**

tensile test, *n*—*in textiles*, a test in which a material is extended in one direction to determine one or more of its force-extension, or stress-strain, characteristics; for example, breaking force, elongation at break. **D 123, D13**

tensile test, *n*—*in textiles*, a test in which a textile material is stretched in one direction to determine the force-elongation characteristics, the breaking force, or the breaking elongation. **D 4439, D35**

tensile test, *n*—*in textiles*, a test in which a specimen is extended in one direction to determine one or more of its force-extension, or stress-strain, characteristics; for example, breaking force, elongation-at-break. **D 4848, D13**

tensile test—application of tensile force concentric with the anchor axis. **E 2265, E06**

tensile testing machine, *n*—an apparatus designed to impart, or transmit, force/extension, or stress/strain, to a material and to measure the effect of the action. (See also **constant-rate-of-extension tensile testing machine, constant-rate-of-load tensile testing machine, and constant-rate-of-traverse tensile testing machine.**) **D 123, D13**

tensile testing machine, *n*—an apparatus designed to impart, or transmit, force/extension, or stress/strain, to a material and to measure the effect of the action. (See also **constant-rate-of-extension tensile testing machine, constant-rate-of-load tensile testing machine, and constant-rate-of-traverse tensile testing machine.**) **D 4849, D13**

tensile work, *n*—*of paper*, a term having the same meaning as **tensile energy absorption** when used for paper. **D 1968, D06**

tensiometer—a device for measuring soil-water matric potential (or tension or suction) of water in soil in-situ; a porous, permeable ceramic cup connected through a water filled tube to a pressure measuring device. **D 653, D18**

tension, *n*—a uniaxial force tending to cause the stretching of a material. **D 123, D13**

tension, *n*—a uniaxial force tending to cause the stretching of a material. **D 123, D13**

tension, *n*—a uniaxial force tending to cause the stretching of a material. **D 4848, D13**

tension, *n*—a uniaxial force tending to cause the stretching of a material. **D 4850, D13**

tension band—an offset strip of metal shaped to fit around the terminal post and used with a carriage bolt and nut to attach the tension bar to the post. **F 552, F14**

tension bar—the bar used with tension bands or other post connectors to secure the fabric to a terminal post. **F 552, F14**

tension control structural bolt-nut-washer assembly—assembly that consists of a bolt, nut, and washer capable of developing a minimum predetermined tension that is visually apparent by the separation of the spline end of the bolt from the bolt body during tightening. **F 1789, F16**

tension cracked ice—ice, banded or layered, which forms in cracks produced by tension or mechanical rupture of the ground, resulting mainly from the growth of segregated or intrusive ice. **D 7099, D18**

tension fatigue, *n*—fracture, through crack growth, of a component or test specimen subjected to a repeated tensile deformation. **D 1566, D11**

tension member—any component that carries horizontal (axial) tension loads imposed upon the boom. **F 818, F20**

tension parallel to grain—the imposition of a tensile stress which acts in a direction parallel to the fiber direction of the wood. **D 9, D07**

tension-recovery chart, *n*—*in tension testing*, a continuously plotted graph of tension versus extension resulting from a tension-recovery cycle. (Compare **extension-recovery chart**. See also **extension-recovery cycle and tension-recovery cycle.**) **D 123, D13**

tension-recovery cycle, *n*—*in tension testing*, the continuous application of tension on a specimen with a momentary hold at the maximum tension, followed by return to zero tension at a controlled rate. Compare **extension-recovery cycle**.) (See also **extension-recovery chart load-recovery cycle and tension-recovery chart.**) **D 123, D13**

tension set, *n*—see **tensile set**, the preferred term. **D 1566, D11**

tension-supported roof, *n*—a fabric roof-system, that is properly secured and primarily held in place by tensile forces applied across the system. **[D13.59] D 4851** **D 123, D13**

tension-supported roof, *n*—a fabric roof-system, that is properly secured and primarily held in place by tensile forces applied across the system. **D 4850, D13**

tension test, *n*—*in textiles*, a test designed to measure the tautness of a textile strand or fabric. (See also **tensile test.**) **D 123, D13**

tension test, *n*—*in textiles*, a test designed to measure the tautness in a textile strand or fabric. (See also **tensile test.**) **D 4848, D13**

tension test, *n*—*in textiles*, a test designed to measure the tautness of a textile strand or fabric. **D 4850, D13**

tension wire—a wire, with or without a marcelled pattern (see **marcelling**), typically used along the top of a chain link fence in place of a top rail and along the bottom of a chain link fence for additional security. See Specification A 824 for *marcelled tension wire*. (*Syn.* **coil spring wire.**) **F 552, F14**

tension wood—an abnormal form of wood found in the upper side of the bole and branches of leaning trees of some hardwood species and characterized by the presence of gelatinous fibers and excessive longitudinal shrinkage. Tension wood fibers hold together tenaciously so that sawed surfaces usually have projecting fibers, and planed surfaces often are torn or have raised grain. Tension wood may cause warping. **D 9, D07**

tenter mark, *n*—a visible deformation on the side edge or body of a fabric due to pressure from clips or pins. (See **clip mark, pin mark.**) **D 123, D13**

tenter mark, *n*—a visible deformation on the side edge or body of a fabric due to pressure from clips or pins. (*Syn.* **clip mark, pin mark.**) **D 3990, D13**

tenth-value-layer (TVL)—the thickness of the layer of a specified substance which, when introduced into the path of a given narrow beam of radiation reduces the intensity of this radiation by a factor of ten. **E 1316, E07**

teratogen—a chemical agent that causes congenital malformations in a developing embryo or fetus **E 609, E35**

term, compound, *n*—see **compound term** **E 1992, E02**

term, delimited, *n*—see **delimited term** **E 1992, E02**

terminal block, *n*—a screw terminal device for connection of thermoelements and extension wires or the connection of extension wires to each other or to instruments. **E 344, E20**

terminal erosion rate, *n*—*in cavitation or liquid impingement erosion*, the final steady-state erosion rate that is reached (or appears to be approached asymptotically) after the erosion rate has declined from its maximum value. (See also **terminal period and erosion rate-time pattern.**) **G 40, G02**

terminal period, *n*—*in cavitation or liquid impingement erosion*, a stage following the deceleration period, during which the erosion rate has levelled off and remains approximately constant (sometimes with superimposed fluctuations) at a value substantially lower than the maximum rate attained earlier. This occurs in some, but not all, cavitation and liquid impingement tests. (See also **erosion rate-time pattern.**) **G 40, G02**

terminal post—the basic load-bearing component for a line of fence, to or from which the fabric is stretched; it may be an end, gate, corner or pull post. **F 552, F14**

terminal solid solution—in a multicomponent system, any solid phase, of limited composition range, which includes the composition of one of the components of the system. **E 7, E04**

terminal velocity—the limiting velocity reached by a particle falling under the action of gravity in a still liquid at a specified temperature. **D 4410, D19**

terminator, *n*—a character or sequence of characters, such as a line ending, used to mark the end of a command whose length is variable. **F 1457, F05**

terminators, *n*—functions that basically take place outside of the National ITS Architecture but which interfere with one or more subsystems of the National ITS Architecture by sharing data or information, or both, with them. **E 867, E17**

terminology, *n*—a set of terms representing the concepts of a field. **E 1992, E02**

ternary system—the complete series of compositions produced by mixing three components in all proportions. **E 7, E04**

terne coating, *n*—a lead-based coating, most commonly applied to steel sheet; the coating typically contains from 3 to 20 % tin, and other minor (<1 %) alloying elements may be present. **A 902, A05**

terpene alcohol, *n*—an alcohol directly related to or derived from a terpene hydrocarbon. **D 804, D01**

terpene resins, *n*—the products formed by polymerization of β -pinene, α -pinene, limonene and other terpene hydrocarbons. **D 804, D01**

terpenes, *n*—a class of unsaturated organic compounds having the empirical formula $C_{10}H_{16}$ occurring in most essential oils and oleoresinous plants. **D 804, D01**

terpolymer, *n*—a polymer formed from three monomer species. **D 1566, D11**

terra sigillata—a porous, red clay ware characterized by embossed decorations of the same color and a satin-like unglazed surface. **C 242, C21**

terrazzo, *n*—a form of mosaic flooring made by embedding marble, onyx, granite, or glass chips in portland cement, polyacrylate modified portland cement, or resinous matrices. The terrazzo is poured in place, cured, ground, and then polished. Rustic terrazzo is a variation where, in lieu of grinding and polishing, the surface is washed with water or otherwise treated to expose the chips. Quartz, quartzite, and river bed aggregate can also be used. **F 141, F06**

terrestrial—consisting of land, as distinguished from water. **F 1600, F20**

terrestrial (or soil) environment, *n*—the aerobic environmental compartment which is found in and on natural soils. **D 4175, D02**

terrestrial (or soil) environment, *n*—the aerobic environmental compartment which is found in and on natural soils. **D 6384, D02**

terry fabric, *n*—a fabric with a woven warp pile or a knitted pile, with uncut loops on a single side or uncut loops on both sides, and which is used for such products as toweling, beachwear, and bathrobes. **D 123, D13**

terry fabric, *n*—a fabric with a woven warp pile or a knitted pile, with uncut loops on a single side or uncut loops on both sides, and which is used for such products as toweling, beachwear, and bathrobes. **D 4850, D13**

terry towel, *n*—a textile product with end hems or fringes and side hems or selvages which is made with loop pile on one or both sides generally covering the entire surface or forming strips, checks, or other patterns. **D 123, D13**

terry towel, *n*—a textile product with end hems or fringes and side hems or selvages which is made with loop pile on one or both sides generally covering the entire surface or forming strips, checks, or other patterns. **D 7023, D13**

4-tertiary butyl catechol—*p*-tert-butylcatechol ($C_{10}H_{14}O_2$) mol weight 166.2; colorless crystals; polymerization inhibitor for styrene, butadiene, and other olefins; boiling point, 285°C; melting point, 52°C. **D 4790, D16**

tertiary hole—*in grouting*, the third series of holes to be drilled and grouted usually spaced midway between previously grouted primary and secondary holes. **D 653, D18**

tertiary sampling unit, *n*—in multi-stage sampling, a subsampling unit selected at the 3rd stage of a sampling plan. See **stage**.

NOTE—Such a unit may be further subdivided to obtain a desired measurement. Terminology is not uniform for labeling of units at the 4th stage or beyond. **E 1402, E11**

tervariant equilibrium—a stable state among a number of conjugate phases equal to one less than the number of components, that is, having three degrees of freedom. **E 7, E04**

tesla, **T**—the SI unit of magnetic induction. One tesla is equal to 1.0 Wb/m² or 10⁴ gauss. **A 340, A06**

Tessar—trade name for a photographic objective made by combining a positive lens, a negative lens, and a doublet, which is used for making macrographs. **E 7, E04**

test, *n*—critical examination of the quality, composition, or properties of a material, usually involving standardized test procedures. **E 631, E06**

test—technical operation that consists of the determination of one or more characteristics of a given product, process or service according to a specified procedure, (ISO Guide 2). **E 1187, E36**

test, *n*—see preferred term **examination**. **E 1316, E07**

test, *n*—critical examination of the quality, composition, or properties of a material, usually involving standardized test procedures. **E 1605, E06**

test, *n*—technical operation that consists of the determination of one or more characteristics of a given product, process or service according to a specified procedure. **E 1732, E30**

test:

accelerated test—the testing of materials by exposure to intensified simulation of service conditions, for example, weathering, radiation, etc.

climbing drum peel test—a method of determining the relative peel resistance of adhesive bonds between a relatively flexible adherend and a rigid adherend, and the relatively flexible facing of a sandwich structure and its core (see Test Method D 1781-).

destructive test—a test involving the destruction of assemblies or parts in order to evaluate the maximum performance of the assembly or part.

floating roller peel test—a method of determining the relative peel resistance of adhesive bonds between one rigid and one flexible adherend (see Test Method D 3167).

nondestructive test—an inspection test for the evaluation of structural quality without damaging the assembly, for example, ultrasonics, visual inspection, etc.

sag flow test—a method of determining the maximum thickness to which a material can be applied without sagging and that provides a means of measuring the amount of sag flow at a given thickness (for highly viscous resins) (see Test Method D 2730). **E 1749, E06**

test, *n*—the single running of a list of test questions during physiological recording of the examinee. **E 2035, E52**

test, acceptance—one made at the option of the purchaser to verify that a product meets design criteria. **F 819, F18**

test assembly, *n*—the complete assembly of test specimens together with their supporting construction. **E 176, E05**

test assembly—the wall or floor into which the test sample(s) is (are) mounted or installed. **E 176, E05**

test assembly, *n*—horizontal or vertical construction on which test specimens are to be mounted together with associated instrumentation. **E 176, E05**

test bar, *n*—a bar-shaped coupon that is tested with or without subsequent preparation for the determination of physical or mechanical properties. **A 644, A04**

test beard, *n*—*in length testing of cotton*, the portion of the test specimen that has been combed and brushed into a “beard” which protrudes from the outside of the comb(s) or the clamp(s). **D 123, D13**

test beard, *n*—*in length testing of cotton*, the portion of the test

test beard, n

specimen that has been combed and brushed into a "beard" which protrudes from the outside of the comb(s) or the clamp(s).

D 7139, D13

test chemical, n—the liquid or gas that is used to challenge the protective clothing material specimen. **F 1494, F23**

test coil—the section of the coil assembly that examines the material under test in a comparative system; the coil used to examine the material in an absolute or differential comparative system. (E 566) **E 1316, E07**

test coupon, n—specially designed casting, or portion thereof, that is used to provide a representative sample of the iron from which it was cast. **A 644, A04**

test cycle, n—*intire testing*, one complete circuit of the specified test course. **F 538, F09**

test data analysis, n—the systematic evaluation of the physiological recordings, and for most techniques, entails the assignment of numbers according to patterns of responses to arrive at a decision regarding the examinee's truthfulness or concealed knowledge. **E 2035, E52**

test, design—one made on a sample treated as representative of an industrial product. These tests will not generally be repeated in quantity production. **F 819, F18**

test determination, n—(a) the process of carrying out the series of operations specified in a test method whereby one or more readings (observations) are made on a test specimen and the observations combined to obtain the value of a property of the test specimen, or (b) the value obtained by the process. **D 1968, D06**

test determination, n—the value of a characteristic or dimension of a single test specimen derived from one or more observed values. **E 456, E11**

test difference, n—the apparent thermoelectric difference attributable to mated connectors observed by the test procedure of this specification. **E 344, E20**

test distance, n—distance traveled by a vehicle after tire break-in. **F 538, F09**

test frequency—in electromagnetic testing, the number of complete cycles per unit time of the alternating current applied to the primary test coil. **E 1316, E07**

testing, n—the determination by technical means of properties; performance; or elements of materials, products, services, systems, or environments which involve application of established scientific principles and procedures. **D 1356, D22**

testing—an element of inspection which generally denotes the determination by technical means of the properties or elements of supplies, or components thereof, and involves the application of established scientific principles and procedures. **D 1517, D31**

testing—action of carrying out one or more tests, (ISO Guide 2). **E 1187, E36**

testing agency—see *testinglaboratory*. **E 1187, E36**

testing laboratory—a qualified organization authorized to test building sealants for compliance with specified standards. **C 717, C24**

testing laboratory—laboratory that measures, examines, tests, calibrates, or otherwise determines the characteristics or performance of materials or products, (ISO Guide 2, A). **E 1187, E36**

testing laboratory, n—laboratory that measures, examines, tests or otherwise determines the characteristics or performance of materials or products. **E 1732, E30**

testing programs—programs involving test procedures to determine chemical/protective clothing material interactions or compatibilities. Testing programs include, but are not limited to, testing protective clothing materials for resistance to degradation, penetration, and permeation. **F 1494, F23**

testing, ultrasonic—a nondestructive method of examining materials by introducing ultrasonic waves into, through or onto the surface of the article being examined and determining various attributes of the material from effects on the ultrasonic waves. **E 1316, E07**

test interval—a test interval is equal to one-quarter of the test period. **D 5681, D34**

test kit—equipment (for example, a cutting tool, adsorbent applicators, if necessary) and chemicals (for example, sulfide or rhodizonate spot test reagents and any extraction solutions needed) assembled for use during spot testing for lead. **E 631, E06**

test load, n—the force applied to a tire through the rim; it is normal to the metal loading plate onto which the tire is loaded. **F 538, F09**

test lug, n—a sample produced as an appendage on a casting, that may be removed and tested to qualify the casting or the iron from which it was produced. **A 644, A04**

test matrix, n—a group of candidate tires usually with specified reference tires; all tests are normally conducted in one test program. **F 538, F09**

test measurement, n—a quantitative expression of one value determined for a property of interest by a single application of a specified test procedure. **D 1711, D09**

test method, n—a definitive procedure for the identification, measurement, and evaluation of one or more qualities, characteristics, or properties of a material, product, system, or service that produces a test result. (Compare *practice*.) **D 123, D13**

test method, n—a definitive procedure that produces a test result. **E 456, E11**

test method—defined technical procedure to determine one or more specified characteristics of a material or product, (ISO Guide 2, A). **E 1187, E36**

test method, n—defined technical procedure to determine one or more specified characteristics of a material or product. **E 1732, E30**

test observation, n—see *observation*. **E 456, E11**

test of significance—a statistical test that, by use of a specified test statistic, purports to provide a test of a null hypothesis (under certain assumptions); for example, that an imposed treatment in the experiment is without effect. **E 1823, E08**

test oil, n—any oil subjected to evaluation in an established procedure. **D 4175, D02**

test (or testing), n—a procedure performed on an object (or set of nominally identical objects) using specified equipment that produces data unique to the object (or set). **F 538, F09**

test panel, n—for *in air wicking tests*, the composite structure of a rubber compound and fabric which is used to test the fabric for air wicking. **D 6477, D13**

test (performance test of a facility)—See *requirement statement*. **E 1480, E06**

test period—the test period is two to four continuous h of net-processing time. **D 5681, D34**

test piece—member of test specimen.
test pressure difference—the actual pressure difference across the building envelope, expressed in pascals (inches of water or pounds-force per square foot or inches of mercury). **E 631, E06**

test piece—a specimen containing known artificial or natural defects used for checking the efficiency of magnetic particle flaw detection processes. **E 1316, E07**

test pit—a shallow excavation made to characterize the subsurface. **D 653, D18**

test points—two preselected conductive points in a circuit loop, possibly including a switch. **F 2112, F01**

test portion, n—a quantity of material that is representative of the analysis sample and sufficient to obtain a single test result for the property or properties to be measured. **D 121, D05**

test program, n—an ordered series of tests grouped together using a predefined plane. **F 538, F09**

test quality cartridge—a new or remanufactured cartridge with poor graphic quality. **F 335, F05**

- test quality level*—see **rejection level**. E 1316, E07
- test record**, *n*—a document or electronic record that contains the observations and derived data obtained by applying a given test method. A 941, A01
- test report**, *n*—a document that presents the applicable qualitative or quantitative results obtained by applying one or more given test methods. A 941, A01
- test report**—document that presents test results and other information relevant to a test, (ISO Guide 2, A). E 1187, E36
- test report**—written document or electronic record, signed by an authorized party, which contains sufficient data and information to verify that the tested fastener properties conform to the particular specification requirements. F 1789, F16
- test result**, *n*—a value obtained by applying a given test method, expressed as a single determination or a specified combination of a number of determinations. (See **observation**.) D 123, D13
- test result**, *n*—the value that expresses the level of a property of the test unit. D 1711, D09
- test result**, *n*—the value obtained for a given property from one test unit, which may be a single observation or the combination of multiple observations, as required by a specific test method. See **test unit**. D 1968, D06
- test result**, *n*—a value obtained by applying a given test method, expressed either as a single observation or a specified combination of a number of observations. D 4439, D35
- test result**, *n*—a value obtained by applying a method one time to a test material. E 135, E01
- test result**, *n*—the value of a characteristic obtained by carrying out a specified test method. E 456, E11
- test result**, *n*—the average or median of a specified number of determinations; it is the reported value for a test. F 538, F09
- test ring**—a ring specimen containing artificial subsurface discontinuities which is used to evaluate and compare the overall performance and sensitivity of magnetic particle examination techniques. E 1316, E07
- test, routine**—a type of test made regularly on production material. F 819, F18
- test run**, *n*—a single pass of a loaded tire over a given test surface. F 538, F09
- test sample**, *n*—a portion of the product taken at the place where the product is exchanged, that is, where the responsibility for the product quality passes from the supplier to the receiver. Actually, this is rarely possible and a suitable sampling location should be mutually agreed on. D 4175, D02
- test sample**—a representative part of the experimental environment (gases, liquids, or solids) for purposes of analysis. E 176, E05
- test sample**, *n*—a quantity suitable for use directly in a selected testing device. E 1638, E29
- test section**—the portion of pipeline under test. C 896, C04
- test section**, *n*—a distinct area of construction. D 4439, D35
- test section**—portion(s) of a pipe, fitting, or pipeline under test. F 412, F17
- test sieve**, *n*—a sieve that meets all of the minimum requirements of ASTM Committee E11. E 1638, E29
- test skein**, *n*—a small skein which has a prescribed length of yarn and is used for the determination of linear density or breaking force, or both. D 123, D13
- test skein**, *n*—a small skein which has a prescribed length of yarn and is used for the determination of linear density or breaking force, or both. D 4849, D13
- test specimen**, *n*—a test object, suitably prepared from a sample, for evaluation of the chemical, physical, mechanical, or metallurgical quality of the sample. A 644, A04
- test specimen**—specimen, or portion thereof, which is to be tested and the test results reported, or which is to be prepared for further testing, and the test results reported. C 896, C04
- test specimen**, *n*—the specific portion of a test sample upon which a test is to be performed, and that is obtained by systematically reducing the size of the sample until a representative specimen of the required mass is obtained. C 1154, C17
- test specimen*, *n*—synonym for **test portion**. D 121, D05
- test specimen**, *n*—(*Fibrograph*), the cotton fibers placed randomly on a pair of Fibrograph combs for fiber length measurements. D 123, D13
- test specimen**, *n*—*in cotton length tests with the Length Analyzer*, the cotton fibers protruding randomly from the base of a Motion Control Inc. specimen clamp for fiber length measurement before being combed or brushed. D 123, D13
- test specimen**, *n*—*in cotton maturity tests*, the series of slides observed by one technician as one half of the test. D 123, D13
- test specimen**, *n*—*for wool top*, a length of specified mass taken at random from a length of wool top selected as a laboratory sample. D 123, D13
- test specimen**, *n*—a portion of a test unit upon which one or more test measurements are made. D 1711, D09
- test specimen**, *n*—*of paper*, test unit, or portion of the test unit, upon which single or multiple test determinations are to be made. See **test unit**. D 1968, D06
- test specimen**, *n*—the specific portion of a test sample upon which a test is to be performed, and that is obtained by systematically reducing the size of the sample until a representative specimen of the required mass is obtained. D 2946, C17
- test specimen**, *n*—*for wool top*, a length of specified mass taken at random from a length of wool top selected as a laboratory sample. D 4845, D13
- test specimen**, *n*—(*Fibrograph*), the cotton fibers placed randomly on a pair of Fibrograph combs for fiber length measurements. D 7139, D13
- test specimen**, *n*—*in cotton length tests with the Length Analyzer*, the cotton fibers protruding randomly from the base of a Motion Control Inc. specimen clamp for fiber length measurement before being combed or brushed. D 7139, D13
- test specimen**, *n*—*in cotton maturity tests*, the series of slides observed by one technician as one half of the test. D 7139, D13
- test specimen**, *n*—the specific construction assembly that was tested in accordance with Test Method E 119. E 176, E05
- test specimen**, *n*—a joint system of a specific material(s), design, and width. E 176, E05
- test specimen**, *n*—the fire stop being tested. E 176, E05
- test specimen**, *n*—stack of five identical stacking chairs. E 176, E05
- test specimen**, *n*—a short length, at least 300 mm long, cut from the bulk material length. E 344, E20
- test specimen**, *n*—the portion of a test unit needed to obtain a single test determination. E 456, E11
- test specimen**—portion of a test unit needed to obtain a single test determination. E 631, E06
- test specimen**—sample connections to be tested to determine a particular plate strength characteristic; fabricated by connecting two or more butted wood members with two parallel metal connector plates at each connection, placed symmetrically on opposite sides along the butted ends. E 631, E06
- test specimen**—portion of a test unit needed to obtain a single test determination. E 1605, E06
- test specimen**, *n*—a specific portion of the samples upon which the testing is to be performed. G 113, G03
- test start**, *n*—introduction of test oil into the engine. D 4175, D02
- test statistic**—a function of the observed values in a sample that is used in a test of significance. E 1823, E08
- test structure**—a structure (such as, a fixed-fixed beam or cantilever) that is used to extract information (such as, the residual strain or the strain gradient of a layer) about a fabrication process. E 2444, E08
- test surface**—that surface of a part through which the ultrasonic energy enters or leaves the part. E 1316, E07
- test, tap**—a nondestructive evaluation procedure for detecting areas

test, tap

of panel delamination in sandwich or other composite constructions; outer surface of the panel is tapped with a hammer or coin. Changes in acoustic emissions (sound) resulting from tapping are used to distinguish between delaminated and nondelaminated sections of the panel (see Test Method E 492). **E 631, E06**

test, tap—a nondestructive evaluation procedure for detecting areas of panel delamination in sandwich or other composite constructions; outer surface of the panel is tapped with a hammer or coin. Changes in acoustic emissions (sound) resulting from tapping are used to distinguish between delaminated and nondelaminated sections of the panel (see Test Method E 492). **E 1749, E06**

test target—a printed page design, which has a composition of graphic text elements. **F 335, F05**

test temperature, n—the temperature of the measuring junction. **E 344, E20**

test thermocouple, n—a thermocouple that is to have its temperature-emf relationship determined by reference to a temperature standard. **E 344, E20**

test thermoelement, n—a thermoelement that is to be calibrated with reference to platinum 67 (Pt-67) by comparing its thermal emf with that of a standard thermoelement. **E 344, E20**

test tire, n—a tire used in a test. **F 538, F09**

test tire set, n—one or more test tires as required by the test equipment or procedure, to perform a test thereby producing a single test result. **F 538, F09**

test unit, n—synonym for **analysis sample**. **D 121, D05**

test unit, n—a fraction of a unit of product from which one or more test specimens are taken for each property. **D 1711, D09**

test unit, n—of paper, a unit or portion of the sample sufficient to obtain the test result(s) for the property or properties to be measured. **D 1968, D06**

test unit, n—the total quantity of material (containing one or more test specimens) needed to obtain a test result as specified in the test method. See *test result*. **E 456, E11**

test wheel—a wheel and test tire assembly mounted to a test vehicle by means of a force or torque transducer. **E 867, E17**

tetragonal—having three mutually perpendicular axes, two equal in length and unequal to the third. **E 7, E04**

tex, n—the unit of linear density, equal to the mass in grams of 1000 meters of fiber, yarn, or other textile strand, that is used in a direct yarn numbering system. (See also **linear density** and **direct yarn numbering system**.) **D 123, D13**

tex, n—the unit of linear density, equal to the mass in grams of 1000 meters of fiber, yarn, or other textile strand, that is used in a direct yarn numbering system. (See also **linear density** and **direct yarn numbering system**.) **D 4849, D13**

Texas steers—usually side-branded steer hides of a narrow close compact pattern, plump, and not necessarily from Texas. **D 1517, D31**

textile, n—a general term for fibers, yarn intermediates, yarns, fabrics, and products that retain all the strength, flexibility, and other typical properties of the original fiber or filaments **D 123, D13**

textile, n—originally a woven fabric, now generally applied to: (1) staple fibers and filaments suitable for conversion to or use as yarns, or for the preparation of nonwoven fabrics, (2) yarns made from natural or manufactured fibers, (3) fabrics and other manufactured products made from fibers as defined above, and from yarns, and (4) garments and other articles fabricated wholly from one or more of the above elements, and articles made principally from the above when the products retain the characteristic flexibility and drape of the original fabrics. **D 123, D13**

textile, adj—of or pertaining to textiles. **D 123, D13**

textile, n—a general term applied to fibers and organized assemblies of fibers with sufficient integrity to retain the organization. **D 3878, D30**

textile fiber, n—general, a generic term for the various types of matter that form the basic elements of textile fabrics and other

textile structures.

D 123, D13

textile fiber, n—specific, a unit of matter that is characterized by having a length at least 100 times its diameter or width and which can be spun into a yarn or made into a fabric by interlacing in a variety of methods, including weaving, knitting, braiding, felting, and twisting. **D 123, D13**

textile floor covering, n—a system having a use-surface composed of textile material and generally used for floor covering. **D 123, D13**

textile floor covering, n—a system having a use-surface composed of textile material and generally used for floor covering. **D 5684, D13**

textile modulus, n—deprecated term. Use the preferred term **Young's modulus**. **D 4848, D13**

textural component, n—as used in *Test Method D 5061*, the collective term used to describe carbon forms and recognizable coal- and process-derived components (binder-phase, filler-phase, and miscellaneous material), in coke. **D 121, D05**

texture—(1) a modified appearance of dimension stone resulting from one or several mechanical surface treatments. Untreated stone surfaces have textural characteristics described under (2).

(2) that aspect of the physical appearance of a rock that is determined by size, shape, and mutual relations of the component grains or crystals. Textures related to dimension stone include *equigranular* (grains of approximately the same size); *inequigranular* (grains of markedly unequal sizes); *porphyritic*; *interlocking* (in which grains with irregular boundaries interlock by mutual penetration); interlocking and porphyritic textures are characteristic of granites and marbles; *clastic* (naturally cemented fragmental grains but without mosaic or interlocking relations; this texture is typical of sandstones and some limestones); *mosaic* (closely packed grains with smooth to moderately irregular, noninterlocking mutual boundaries); *granoblastic* (a megascopically granular mosaic texture in which the grains are tightly compacted and the minerals are dominantly equidimensional and present irregular mutual boundaries; mosaic and granoblastic textures are characteristic of metamorphic rocks). **C 119, C18**

texture, n—a surface pattern as compared with a smooth finish. **C 1154, C17**

texture—in wood anatomy, the sizes, distribution, and proportional volumes of the cellular elements of which wood is composed; often used interchangeably with grain. Depending on the relative size and distribution of the cellular elements, texture may be coarse (open grain) or fine, even, or uneven. **D 9, D07**

texture, n—the surface appearance and hand of a textile. **D 123, D13**

texture, n—in *pile yarn floor coverings*, in the case of pile yarn floor coverings, the detailed configuration of loops, cut pile ends, and individual fibers in the pile. **D 123, D13**

texture—of soil and rock, geometrical aspects consisting of size, shape, arrangement, and crystallinity of the component particles and of the related characteristics of voids. **D 653, D18**

texture—the arrangement in space of the components of a rock body and of the boundaries between these components. (ISRM) **D 653, D18**

texture, n—a surface pattern as distinguished from a smooth finish. **D 2946, C17**

texture—the geometric aspects of the component particles of a sediment deposit or rock including size, shape, and arrangement. **D 4410, D19**

texture, n—the surface appearance and hand of a textile. **D 4850, D13**

texture, n—in *pile yarn floor coverings*, in the case of pile yarn floor coverings, the detailed configuration of loops, cut pile ends, and individual fibers in the pile. **D 5684, D13**

texture, n—the rheological and structural (geometric and surface) attributes of a product perceptible by the kinesthetic, tactile, visual, and auditory senses. **E 253, E18**

texture, n—the visible surface structure depending on the size and

- organization of small constituent parts of a material; typically, the surface structure of a woven fabric. **E 284**, E12
- texture, *n***—any surface appearance as contrasted to a smooth surface. **E 2110**, E06
- texture (cube)*—See **preferred orientation**. **E 7**, E04
- textured, *adj***—*inevaluating the color of a surface*, structural quality of a surface determined by the topography of its constituents. **D 2946**, C17
- textured boards**—boards that are factory produced with a nonplanar surface by, for example, molding, embossing, machining, or post-forming or any combination of these processes. **D 1554**, D07
- texture (deformation)*—See **preferred orientation**. **E 7**, E04
- textured glass yarn, *n***—a yarn processed from continuous filament yarn in such a manner to induce bulk to the yarn by disorientation of the filaments. **D 123**, D13
- textured glass yarn, *n***—a yarn processed from continuous filament yarn in such a manner to induce bulk to the yarn by disorientation of the filaments. **D 7018**, D13
- textured product, *n***—*in cooling tower fill*, a product with bas-relief motifs that extend the external surface of a sheet sufficiently to increase its heat transfer capacity by at least 10 % under conditions of turbulent flow. **D 2946**, C17
- textured products, *n***—*in cooling tower fill*, those with bas-relief motifs that extend the external surface of a sheet sufficiently to increase its heat transfer capacity by at least 10 % under conditions of turbulent flow. **C 1154**, C17
- texture finish, *n***—any applied decorative finish other than smooth. **C 11**, C11
- texture shape factor, *n***—average of weighted sum of the ratios of amplitude to wavelength, as determined from an amplitude versus wavenumber (reciprocal of wavelength) spectrum. **E 867**, E17
- thalweg**—the line connecting the lowest or deepest point along a stream bed, valley, or reservoir, whether underwater or not. **D 4410**, D19
- thaw basin**—a depression of the permafrost table created by natural or artificial thawing. **D 7099**, D18
- thaw bulb**—a more-or-less symmetrical area of thaw in permafrost surrounding a man-made structure on or in permafrost and maintained at temperatures above 0°C. **D 7099**, D18
- thaw consolidation**—(1) the process by which a reduction in volume and increase in density of a soil mass occurs, following thaw, in response to the escape of water under the weight of the soil itself and/or an applied load; (2) the process by which settlement due to thaw (settlement) is impeded by flow of water from the soil. Thaw consolidation may proceed for many years. **D 7099**, D18
- thaw consolidation ratio**—a dimensionless ratio describing the relationship between the rate of thaw and the rate of consolidation of a thawing soil, which is considered to be a measure of the relative rates of generation and expulsion of excess water during thaw. **D 7099**, D18
- thawed ground**—previously frozen ground in which all of the ice has melted. **D 7099**, D18
- thawing front**—the advancing boundary between thawed ground and frozen ground. **D 7099**, D18
- thawing index**—the number of degree-days between 0°C (32°F) and the mean temperature each day on the cumulative degree-day time curve for one thawing season. The **air thawing index** is determined from temperatures measured about 1.4 m (4.5 ft) above the ground surface, while that determined from temperatures measured at, or immediately below, a surface is known as the **surfacing thawing index**. **D 7099**, D18
- thawing (of frozen ground)**—the melting of the ice in frozen ground, usually as the result of an increase in temperature. **D 7099**, D18
- thaw penetration**—the downward movement of the thawing front during the thawing of frozen ground. **D 7099**, D18
- thaw-sensitive permafrost**—perennially frozen ground which, upon thawing, will experience significant thaw settlement and suffer loss of strength to a value significantly lower than that for similar material in an unfrozen condition. **D 7099**, D18
- thaw settlement**—the generally differential downward movement of the ground surface resulting from escape of water on melting of excess ice in the soil and the thaw consolidation of the soil mass. **D 7099**, D18
- thaw sink**—a closed thaw basin with subterranean drainage. **D 7099**, D18
- thaw slumping**—a type of mass movement caused by the conversion of ice into water in a soil by ground thaw, creating the kind of landslide that most closely resembles the more temperate climate earth flow with a well-developed breakaway scarp front. **D 7099**, D18
- thaw stable permafrost**—perennially frozen soils that do not, on thawing, show loss of strength below normal long-time thawed values, or result in ground settlement. **D 7099**, D18
- thaw strain**—the amount that frozen ground compresses upon thawing. **D 7099**, D18
- thaw unconformity**—a boundary sometimes identified in perennially frozen ground, which represents the base of a relict active layer as well as the corresponding earlier permafrost table. **D 7099**, D18
- thaw unstable permafrost**—perennially frozen soils that show, on thawing, a significant loss of bearing strength, or below normal, long-time thawed values, and/or significant grounds settlement, as a direct result of the melting of the excess ice in the soil. **D 7099**, D18
- thaw weakening**—the reduction in shear strength due to the decrease in effective stresses resulting from the generation and slow dissipation of excess pore pressures when frozen soils containing ice are thawing. **D 7099**, D18
- the atmosphere*—See **atmosphere**. **D 1356**, D22
- σ_{th-EHE} —threshold stress—test conducted in a specified environment—geometry dependent **F 2078**, F07
- theoretical carbon dioxide (ThCO₂), *n***—the amount of CO₂ which could theoretically be produced from the complete biological oxidation of all of the carbon in a test material. **D 4175**, D02
- theoretical CO₂, *n***—the amount of CO₂ which could in theory be produced from the complete oxidation of all the carbon in a material. **D 4175**, D02
- theoretical CO₂ (carbon dioxide), *n***—the amount of carbon dioxide which could hypothetically be produced from the complete biological oxidation of all the carbon in a material. **D 6384**, D02
- theoretical elastic stress concentration factor (or stress concentration factor) *k_t***—the ratio of the greatest stress in the region of a notch or other stress concentrator as determined by the theory of elasticity (or by experimental procedures that give equivalent values) to the corresponding nominal stress. **E 1823**, E08
- theoretical O₂, *n***—the amount of oxygen which would theoretically be required to completely oxidize a material. **D 4175**, D02
- theoretical O₂(oxygen), *n***—the amount of oxygen that is theoretically required to oxidize a material. **D 4175**, D02
- theoretical O₂(oxygen), *n***—the amount of oxygen that is theoretically required to oxidize a material. **D 6384**, D02
- theoretical plate, *n***—the section of a column required to achieve thermodynamic equilibrium between a liquid and its vapor. **D 4175**, D02
- theoretical time curve*—see **consolidation time curve**. **D 653**, D18
- thermal analysis (TA), *n***—a group of techniques in which a physical property of a substance is measured as a function of temperature or time while the substance is subjected to a controlled-temperature program. (ICTAC) **E 473**, E37
- thermal and oxidative stability, *n***—*in lubricating oils used for manual transmissions and final driveaxles*, a lack of deterioration of the lubricating oil under high-temperature conditions that is observed as viscosity increase of the lubricating oil, insolubles formation in the lubricating oil, or deposit formation on the parts, or a combination thereof. **D 4175**, D02

thermal arrest—See **arrest**.

E 7, E04

thermal blanket, *n*—a blanket woven so that cells or openings are created in the fabric so that air warmed by the body is trapped between the yarns, such as textured or leno weaves; this product can be napped or unnapped. D 123, D13

thermal bonded batting, *n*—a textile filling material which contains low-melting point fibers or polymers which, when heated, fuse the batting materials together. D 123, D13

thermal bonded batting, *n*—a textile filling material which contains low-melting point fibers or polymers which, when heated, fuse the batting materials together. D 7022, D13

thermal bonded batting, *n*—a textile filling material which contains low-melting point fibers or polymers which, when heated, fuse the batting materials together; a textile filling material which contains low-melting point fibers or polymers which, when heated, fuse the batting materials together. D 7023, D13

thermal break, *n*—a solid or cellular material or combination of materials of low thermal transmission placed between components of high thermal transmission in order to reduce the heat flow across the assembly. D 883, D20

thermal capacity, *n*—the quantity of heat required to change the temperature of the body one degree. For a homogeneous body, it is the product of mass and specific heat. For a nonhomogeneous body, it is the sum of the products of mass and specific heat of the individual constituents. (May also be seen as heat capacity.) (In SI units: J/K) (In inch-pound units: Btu/F) C 168, C16

thermal capacity—the amount of thermal energy that can be stored in a storage device during a period of time and for a specific set of values (that is, initial temperature of the storage device, the temperature of the entering fluid, and the mass flow rate of fluid through the storage system). E 772, E44

thermal capacity, theoretical—the amount of energy that can be stored in the storage device if all its components undergo an increase in temperature from the original value to a final value. E 772, E44

thermal character, *n*—apparent difference in temperature of the fabric and the skin of the observer touching it. (See also .) D 123, D13

thermal character, *n*—that property of a fabric that makes it feel warm to the touch. D 123, D13

thermal character, *n*—that property of a fabric that makes it feel warm to the touch. D 4850, D13

thermal conditioning—adjusting the average temperature and reducing the thermal gradients in glass. C 162, C14

thermal conductance, Γ —time rate of heat flow through a unit area of a body induced by a unit temperature difference between the body surfaces. E 1142, E37

thermal conductivity, *n*—time rate of unidirectional heat transfer per unit area, in the steady-state, between parallel planes separated by unit distance, per unit difference of temperature of the planes. D 123, D13

thermal conductivity—the quantity of heat that will flow through a unit area of a substance in unit time under a unit temperature gradient. It is commonly expressed in joules per second per meter per degree K. D 7099, D18

thermal conductivity, λ —time rate of heat flow, under steady conditions, through unit area, per unit temperature gradient in the direction perpendicular to the area. E 1142, E37

thermal conductivity vacuum gage—a vacuum gage containing two surfaces at different temperatures between which heat can be transported by the gas molecules so that changes in the temperature (or in the heating power required to maintain constant temperature) of one of the surfaces can be correlated with the gas pressure. Various types of thermal conductivity gages are distinguished according to the method of indicating the temperature change. The common types are listed below:

(1) *Pirani Gage*—An increase of pressure from the zero point causes a decrease in the temperature of a heated filament of material having a large temperature coefficient of resistance

thus unbalancing a Wheatstone bridge circuit (or the circuit is adjusted to maintain the filament temperature constant).

(2) *Thermocouple Gage*—The decrease in temperature of a heated filament as the pressure rises is indicated by decreased emf in a thermocouple circuit having the junction in thermal contact with the center of the heated filament.

(3) *Thermistor Gage*—A form of Pirani gage employing a thermistor as the heated element.

(4) *Bimetallic Strip Gage*—Deflection of a bimetallic strip with changing temperature indicates the changes in pressure. E 1316, E07

thermal contraction crack—a tensile fracture resulting from thermal stresses in frozen ground. D 7099, D18

thermal-contraction-crack ice—ice formed in thermal contraction cracks in the ground. D 7099, D18

thermal curve—in *thermal analysis*, plot of a dependent variable (such as, heat flow or weight loss) against an independent variable, time or temperature, under defined time-temperature conditions. E 1142, E37

thermal decomposition, *n*—a process of extensive chemical species change caused by heat (different from thermal degradation, *q.v.*; compare **pyrolysis**). E 176, E05

thermal degradation, *n*—irreversible and undesirable change in the properties of a material due to exposure to heat. D 1566, D11

thermal degradation, *n*—a process whereby the action of heat or elevated temperature on a material, product, or assembly causes a loss of physical, mechanical, or electrical properties (different from **thermal decomposition**, *q.v.*). E 176, E05

thermal diffusivity—the ratio of the thermal conductivity to the volumetric heat capacity. D 7099, D18

thermal diffusivity—ratio of thermal conductivity of a substance to the product of its density and specific heat capacity. E 1142, E37

thermal electromotive force—the voltage generated when one junction of two dissimilar metal wires is at a different temperature than the other junction. E 7, E04

thermal electromotive force—voltage generated when one junction of two dissimilar electrical conductors is at a different temperature than the other junction. E 1142, E37

thermal electromotive force (thermal emf), *n*—the net emf set up in a thermocouple under conditions of zero current. (Same as **Seebeck emf**). E 344, E20

thermal end point—in testing of thermal protective materials, the point of where the sensor response on the recorder chart intersects the human tissue burn tolerance criteria overlay. F 1494, F23

thermal endurance—the relative ability of glassware to withstand thermal shock. C 162, C14

thermal endurance, *n*—an expression for the stability of an electrical insulating material, or a simple combination of materials, when maintained at elevated temperatures for extended periods of time. D 1711, D09

thermal endurance—property of a material to resist changes in chemical, physical, mechanical, or electrical properties upon exposure to temperatures for extended periods of time. E 1142, E37

thermal erosion—the erosion of ice-rich permafrost by the combined thermal and mechanical action of moving water or air (sublimation). D 7099, D18

thermal-erosional cirque—the unusually steep horseshoe-shaped headwall of a retrogressive thaw slump. D 7099, D18

thermal-erosional niche—a recess at the base of a river bank or coastal bluff produced by thermal erosion of ice-bonded permafrost. D 7099, D18

thermal expansion, *n*—in refractories, the reversible change in size of materials due to temperature changes. C 71, C08

thermal expansion—See **mean coefficient of thermal expansion; percent linear thermal expansion**. C 242, C21

thermal expansion—the increase in the dimensions or the volume of a body due to a change in temperature. (See **coefficient of thermal expansion**.) E 7, E04

thermal expansion—see **coefficient of linear thermal expansion**.

E 1142, E37

thermal expansion (or contraction) coefficient—the volume change per unit volume of a substance due to a one degree change in its temperature.

D 7099, D18

thermal hazard—relates to the laboratory test methods employed to measure thermal characteristics and to predict burn injury potential.

F 1494, F23

thermal imaging transfer ribbon, *n*—plastic film or other material, upon which a dye or pigmented coating is applied; imaging results when a thermal printhead transfers the coating onto a suitable substrate or receptor media.

F 1623, F05

thermal insulation, *n*—a material or assembly of materials used to provide resistance to heat flow.

C 168, C16

thermal insulation—a material or assembly of materials used primarily to provide resistance to heat flow.

C 634, E33

thermal insulation—a material applied to reduce the flow of heat.

D 1079, D08

thermal insulation, *n*—the resistance to dry heat transfer via conduction, convection, and radiation.

F 1494, F23

thermal insulation board, *n*—a system component of a specific type and density that functions to reduce heat flow through the wall and serves as the surface to receive the base coat.

E 2110, E06

thermal insulation system, *n*—applied or installed thermal insulation complete with any accessories, vapor retarder, and facing required.

C 168, C16

thermalization—the process of slowing neutron velocities by permitting the neutrons to come to thermal equilibrium with a moderating medium.

E 1316, E07

thermalization factor—the inverse ratio of the thermal neutron flux obtained in a moderator, per source neutron.

E 1316, E07

thermal life, *n*—the time necessary for a specific property of a material, or a simple combination of materials, to degrade to a defined end point when aged at a specified temperature.

D 1711, D09

thermal life—the time necessary for a property of a material or system to degrade to a defined end-point at a specified temperature.

E 1142, E37

thermal life curve, *n*—a graphical representation of thermal life at a specified aging temperature in which the value of a property of a material, or a simple combination of materials, is measured at room temperature and the values plotted as a function of time.

D 1711, D09

thermally bonded seam, *n*—a seam formed by heat and pressure. (Compare **glued seam**, **sewn seam**, **stapledseam**.)

D 123, D13

thermally bonded seam, *n*—*in home sewing*, a seam formed by the use of a heat-sensitive material that fuses two material sections together along a seam line when heat and pressure are applied. (Compare **glued seam**, **sewn seam**, **stapledseam**.)

D 4965, D13

thermally foamed plastic—a cellular plastic produced by applying heat to effect gaseous decomposition or volatilization of a constituent.

D 883, D20

thermally foamed plastic—a cellular plastic produced by applying heat to effect gaseous decomposition or volatilization of a constituent. (D20)

F 412, F17

thermally induced phase-separation membrane formation—process in which a dissolved polymer is precipitated or coagulated by controlled cooling to form a membrane structure.

D 6161, D19

thermally stimulated current analysis, *n*—a technique in which the current generated when dipoles change their alignment in a substance is measured as a function of temperature or time while the substance is subjected to a controlled-temperature program in a specified atmosphere. (ICTAC)

NOTE—The technique can be applied in several ways: for example; the substance can be pre-conditioned by heating and cooling in a nonscillating electric field to create aligned, frozen dipoles. The

substance may then generate a thermally stimulated current during subsequent heating with no field applied.

E 473, E37

thermally thick, *n*—the thickness of a medium that is large enough to have the predominate thermal (temperature) effects experienced within that distance, that is, negligible heat is lost from its unexposed side.

E 176, E05

thermal neutrons—neutrons in thermal equilibrium with the medium through which they are traveling or diffusing.

E 170, E10

thermal neutrons—neutrons having energies ranging between 0.005 eV and 0.5 eV; neutrons of these energies are produced by slowing down fast neutrons until they are in equilibrium with the moderating medium at a temperature near 20°C.

E 1316, E07

thermal operating level, *n*—the operating condition at which the radiance of the heat source produces a specified constant heat flux to some specified position at the specimen surface.

E 176, E05

thermal (or flamed)—a roughly textured surface produced by brief exposure to a high-temperature flame resulting in exfoliation of the stone surface.

C 119, C18

thermal pile(s)—structural piling modified to passively remove heat from the ground whenever the ambient air temperature is lower than the ground temperature. See: **thermopiles**, **thermoprobe**, **thermosyphon**, **thermo tube**.

D 7099, D18

thermal precipitation—See **precipitation**.

D 1356, D22

thermal processing—the application of heat to achieve a reduced level of microbiological activity.

F 17, F02

thermal processing—See **Terminology F 17**.

F 1327, F02

thermal profile, *n*—temperatures at which specific color phenomena occur in a liquid crystal thermometer.

E 344, E20

thermal properties of frozen ground—the properties of the ground governing the flow of heat through it, and its freezing and thawing conditions. These include: thermal conductivity, heat capacity (specific heat), and the latent heat of fusion.

D 7099, D18

thermal radiation, *n*—process of emission in which the radiant energy originates in the thermal agitation of the particles of matter (atoms, molecules, ions).

NOTE—The terms “thermal radiation” and, in German “Temperaturstrahlung” apply not only to the process of emission, but also to the radiation itself.

E 349, E21

thermal radiator, *n*—source emitting by thermal radiation. in parentheses indicates the year of last reapproval. A superscript epsilon (ϵ) indicates an editorial change since the last revision or reapproval.

E 349, E21

thermal regime of the ground—a general term encompassing the temperature distribution and heat flows in the ground and their dependence upon time.

D 7099, D18

thermal resistance, *n*—the reciprocal of thermal transmittance.

D 123, D13

thermal resistance, **R**, *n*—the difference in temperature which will develop under a given steady state heat flow between two parallel unit area surfaces for a given material thickness.

C 1154, C17

thermal resistance, **R**, *n*—*for asbestos-cement plastic-foam core insulating panels*, the thermal gradient that will develop under a given steady state heat flow between two parallel unit area surfaces for a given material thickness.

D 2946, C17

thermal resistance, **R**—Under steady-state conditions, the temperature difference required to produce a unit of heat flux through a specimen.

E 1142, E37

thermal resistivity, *n*—the reciprocal of thermal conductivity.

D 123, D13

thermal resistivity, **r**—under steady-state conditions, the temperature gradient, in the direction perpendicular to the isothermal surface, per unit heat flux.

E 1142, E37

thermal resolution—the smallest apparent temperature difference between two blackbodies that can be measured by an infrared sensing device.

E 1316, E07

thermal response, dynamic,, *n*

thermal response, dynamic,, *n*—the relationship between the thermal image optical density (*y*-axis) versus printhead energy (*x*-axis); printhead energy density (millijoules/square millimetres) is a function of printhead power times the pulse width (milliseconds) divided by the area of the printhead dot (square millimetres).

F 1623, F05

thermal shock—a rapid change in temperature imposed on a glass body. **C 162, C14**

thermal shock—a condition of stress brought about by a large temperature difference across a body or glaze. (See also **thermal shock failure; thermal shock resistance testing.**) **C 242, C21**

thermal shock, *n*—a large and rapid temperature change, resulting in large temperature differences within or across a body. **C 1145, C28**

thermal shock—the stress-producing phenomenon resulting from sudden temperature drops in a roof membrane when, for example, a rain shower follows brilliant sunshine. **D 1079, D08**

thermal shock failure—mechanical failure of a glaze or body, as a result of the stress caused by a large temperature difference across the ware. **C 242, C21**

thermal shock resistance testing—the act of exposing ware to a rapid temperature change to determine the temperature difference a glaze or body can withstand without mechanical failure.

$$\Delta T_{\max} = \sigma/T\alpha$$

where:

σ = stress,

E = Young's Modulus, and

α = mean coefficient of thermal expansion.

C 242, C21

thermal shrinkage, *n*—of textile yarns and cords, contraction in length caused by heat **D 123, D13**

thermal shrinkage, *n*—of textile yarn and cords, contraction in length caused by heat. **D 6477, D13**

thermal shrinkage force, *n*—that force induced when a restrained material is restricted from shrinking upon exposure to heat.

D 6477, D13

thermal shrinkage force tester, *n*—an apparatus that measures the force achieved when a yarn or similar specimen, held at a constant (fixed) length, is subjected to a temperature above that at which the specimen was mounted in the apparatus. **D 6477, D13**

thermal spalling—the breaking of rock under stresses induced by extremely high temperature gradients. High-velocity jet flames are used for drilling blast holes with this effect. (ISRM) **D 653, D18**

thermal spraying—a group of processes wherein finely divided metallic or nonmetallic materials are deposited in a molten or semimolten condition to form a coating. (The coating material may be in the form of powder, ceramic rod, wire, or molten materials.) **G 15, G01**

thermal stability, *n*—the resistance to permanent changes in properties caused solely by heat. **D 4175, D02**

thermal stability—resistance to permanent changes in property caused solely by heat, (D 2160, D02). **E 1142, E37**

thermal storage medium—see **storage medium, thermal.**

E 772, E44

thermal stress—the stress produced by a temperature differential within a glass body. **C 162, C14**

thermal talik—a layer or body of unfrozen ground in a permafrost area in which the temperature is above 0°C due to the local thermal regime of the ground. **D 7099, D18**

thermal transmittance, *n*—time rate of unidirectional heat transfer per unit area, in the steady-state, between parallel planes, per unit difference of temperature of the planes. **D 123, D13**

thermal transmittance, *n*—time rate of unidirectional heat transfer per unit area in the steady state, between parallel planes, per unit difference of temperature of the planes. **E 1142, E37**

thermal treatment—a controlled heating; time at maximum temperature-cooling cycle as needed to satisfy the property and grain structure requirements of the temper. **B 846, B05**

thermal vaporizer—an apparatus consisting of a container for chemical and a heater to maintain the vessel at a temperature sufficiently high to accelerate evaporation of the pesticide. The apparatus may contain a blower to disperse the pesticide vapor into a treated area or may rely upon natural turbulent diffusion for dispersion. **E 1102, E35**

thermionic cathode gun—(hot cathode gun). An electron gun which derives its electrons from a heated filament which may also serve as the cathode. **E 7, E04**

thermionic emission—the ejection of a stream of electrons from a hot cathode, usually under the influence of an electrostatic field. **E 7, E04**

thermistor, *n*—a semiconductor, the primary function of which is to exhibit a monotonic decrease in electrical resistance with an increase in sensor temperature, that is, a semiconductor for which the temperature coefficient of resistance is negative and exhibits neither discontinuities nor changes in sign. **E 344, E20**

thermistor, *n*—a temperature sensor employing a semiconductor that exhibits a large continuous change in electrical resistance with a change in sensor temperature, that is, a semiconductor for which the temperature coefficient of resistance is either negative or positive and exhibits no discontinuities. **E 344, E20**

thermoanalytical, *adj*—of, or pertaining to, thermal analysis. (IC-TAC) **E 473, E37**

thermochemical treatment, *n*—a heat treatment carried out in a medium suitably chosen to produce a change in the chemical composition of the steel object by exchange with the medium. **A 941, A01**

thermochromism, *n*—a change in color with temperature change. **E 284, E12**

thermocouple—two dissimilar electrical conductors so joined as to produce a thermal electromotive force when the junctions are at different temperatures. **E 7, E04**

thermocouple, *n*—in thermometry, the sensor of a thermoelectric thermometer, consisting of electrically conducting circuit elements of two different thermoelectric characteristics joined at a junction. **E 344, E20**

thermocouple—Two dissimilar electrical conductors joined as to produce a thermal electromotive force. **E 1142, E37**

thermocouple assembly, *n*—an assembly consisting of two thermocouple elements and one or more associated parts such as terminal block, connection head, and protecting tube. **E 344, E20**

thermocouple assembly—the cut-to-length, finished assembly consisting of thermocouple material with thermoelements having one end joined in a measuring junction. The assembly has the sheath closed at the measuring end and has a moisture seal at the reference junction end of the sheath. The assembly does not include a reference junction but may include a thermocouple connector. **E 344, E20**

thermocouple calibration, *n*—the process of determining the emf developed by a thermocouple with respect to temperature established by a standard. **E 344, E20**

thermocouple calibration point—a temperature, established by a standard, at which the emf developed by a thermocouple is determined. **E 344, E20**

thermocouple connector, *n*—as described in Specification E 1129, a quick-connect plug and jack using matching or compensating materials that have Seebeck coefficients like the extension wires or the thermoelements they connect. The thermocouple connector will match the Seebeck coefficient of the thermoelements over only a limited temperature range. **E 344, E20**

thermocouple gage—see **thermal conductivity vacuum gage.** **E 1316, E07**

thermocouple type, *n*—a nominal thermoelectric class of thermoelement materials that, used as a pair, have a standardized relationship and tolerance between relative Seebeck EMF and temperature, physical characteristics, and an assigned type letter designator and color code. **E 344, E20**

thermocouple vacuum gage—a thermal conductivity or hot-wire

gage in which the temperature of an electrically heated fine wire varies as the thermal conductivity of the residual gas. The thermocouple measures the temperature change. **E 7, E04**

thermodilatometry, *n*—a technique in which a dimension of a substance under negligible load is measured as a function of temperature while the substance is subjected to a controlled-temperature program in a specified atmosphere. (ICTAC)

NOTE—Linear thermodilatometry and volume thermodilatometry are distinguished on the basis of the dimension measured. **E 473, E37**

thermodynamic dew-point temperature—See **temperature**.
D 1356, D22

thermodynamic frost-point temperature—See **temperature**.
D 1356, D22

thermodynamic frost-point temperature—See **temperature**.
D 1356, D22

thermodynamic wet-bulb temperature—See **temperature**.
D 1356, D22

thermoelastic martensitic transformation, *n*—a diffusion-less thermally reversible phase change characterized by a change in crystal structure. **F 2005, F04**

thermoelectric effect error, *n*—the error caused by a thermal emf in the measurement circuit as a result of dissimilar metals and temperature gradients in the circuit. **E 344, E20**

thermoelectric power, *n*—the rate of change of thermal emf with temperature at a given temperature. (Same as **Seebeck coefficient**).
E 344, E20

thermoelectric pyrometer—a device with which temperatures are measured by utilizing the thermoelectric effects. In its simplest form, it consists of a thermocouple of two dissimilar metals which develop an emf when the junctions are at different temperatures and an instrument for measuring the emf developed by the thermocouple. **E 7, E04**

thermoelectric thermometer, *n*—thermometer for which the thermometric quantity is an emf produced by the Seebeck effect.
E 344, E20

thermoelement, *n*—one of the circuit elements comprising a thermocouple. **E 344, E20**

thermoelement, *n*—one of the two dissimilar electrical conductors comprising a thermocouple. **E 344, E20**

thermogalvanic corrosion—the corrosive effect resulting from the galvanic cell caused by a thermal gradient across the metal surface.
G 15, G01

thermogram—see **thermal curve**. **E 1142, E37**

thermogram—a visual image which maps the apparent temperature pattern of an object or scene into a corresponding contrast or color pattern. **E 1316, E07**

thermography, infrared—the process of displaying variations of apparent temperature (variations of temperature or emissivity, or both) over the surface of an object or a scene by measuring variations in infrared radiance.

NOTE—In general, *passive thermography* refers to examination of an object or system during its normal operational mode, without the application of any additional energy source for the express purpose of generating a thermal gradient in the object or system; *active thermography* refers to the examination of an object upon intentional application of an external energy source. The energy source (active or passive) may be a source of heat, mechanical energy (vibration or fatigue testing), electrical current, or any other form of energy. **E 1316, E07**

thermogravimetric analysis, (TGA), *n*—a technique in which the mass of a substance is measured as a function of temperature or time while the substance is subjected to a controlled-temperature program in a specified atmosphere. (ICTAC)

NOTE—The record is the thermogravimetric or TG curve. This definition is similar to the ICTAC definition of the term *thermogravimetry*. **E 473, E37**

thermogravimetry (TG), *n*—see **thermogravimetric analysis**.
E 473, E37

thermo-hydrometer, *n*—a glass hydrometer having a thermometer combined with a hydrometer in one instrument. **E 344, E20**

thermokarst—(1) karst topography (areas of depression and/or subsidence) resulting from the thawing of ice-rich permafrost or massive ice; (2) the process by which characteristic landforms result from the thawing of ice-rich permafrost. **D 7099, D18**

thermokarst lake—a lake occupying a closed depression formed by settlement of the ground following the thawing of ice-rich permafrost or the melting of massive ice. **D 7099, D18**

thermokarst mound—a hummock remaining after melting of the ice wedges surrounding an ice-wedge polygon. **D 7099, D18**

thermokarst terrain—the often irregular topography resulting from the melting of excess ground ice and subsequent thaw settlement. **D 7099, D18**

thermoluminescence dosimeter (TLD)—a dosimeter made of a material that stores energy when irradiated by ionizing radiation and then releases that energy in the form of visible light when heated. The light output of heated TLD is measured photometrically. TLDs are secondary-standard dosimetry systems. Examples of commonly available TLDs include lithium fluoride (LiF), calcium fluoride with various trace activators (such as CaF₂ : Mn and CaF₂ : Dy), calcium sulfate (CaSO₄ : Mn and CaSO₄ : Dy), and lithium borate (Li₂B₄O₇ : Mn). **E 170, E10**

thermomagnetometry, *n*—a family of thermoanalytical techniques in which a magnetic characteristic of a substance is measured as a function of temperature or time while the substance is subjected to a controlled-temperature program in a specified atmosphere. (ICTAC)

NOTE—Thermogravimetric analysis with a magnetic field acting on the specimen is the most common example. **E 473, E37**

thermomechanical analysis, (TMA), *n*—a technique in which the deformation of a substance under nonoscillatory load is measured as a function of temperature or time while the substance is subjected to a controlled-temperature program in a specified atmosphere. (ICTAC)

NOTE—The load on the substance may be compressive, tensile, flexural or torsional. When the applied load is too low to cause deformation, TMA measures a dimension of the substance and in this mode is called **thermodilatometry**. **E 473, E37**

thermomechanical process, *n*—controlled thermal and deformation treatment performed at an elevated temperature. **E 7, E04**

thermometric fixed point, *n*—fixed point useful in the practice of thermometry. **E 344, E20**

thermomicroscopy, *n*—see **thermoptometry**. **E 473, E37**

thermo-osmosis—the process by which water is caused to flow in small openings of a soil mass due to differences in temperature within the mass. **D 653, D18**

thermopile—a trade name for a load-carrying piling that is a thermosyphon. The pile shell is used to contain the thermosyphon working fluid. **D 7099, D18**

thermopile, *n*—a number of similar thermocouples connected in series, arranged so that alternate junctions are at the reference temperature and at the measured temperature, to increase the output for a given temperature difference between reference and measuring junctions. **E 344, E20**

thermopile—a number of temperature sensors connected in series and arranged such that there is an increase in output signal for a given temperature difference between alternate junctions maintained at a reference temperature and the measured temperature. **E 1142, E37**

thermoplastic—any one of a group of materials capable of being repeatedly softened or melted by increases in temperature followed by subsequent solidification on cooling. **C 904, C03**

thermoplastic, *n*—a plastic that repeatedly can be softened by heating and hardened by cooling through a temperature range characteristic of the plastic, and that in the softened state can be shaped by flow into articles by molding or extrusion. **D 883, D20**

thermoplastic, *adj*

thermoplastic, *adj*—capable of being repeatedly softened by heating and hardened by cooling through a temperature range characteristic of the plastic, and that in the softened state can be shaped by flow into articles by molding or extrusion for example.

D 883, D20

thermoplastic, *adj*—capable of being repeatedly softened by heat and hardened by cooling.

D 907, D14

thermoplastic, *n*—polymer or copolymer capable of being softened by heating and hardened by cooling.

D 907, D14

thermoplastic, *n*—a polymer that repeatedly can be softened by heating and hardened by cooling through a temperature range characteristic of the polymer, and in the softened state can be shaped into articles.

D 1566, D11

thermoplastic, *adj*—a property of a polymer that permits it to be repeatedly softened by heating and hardened by cooling through a characteristic temperature range, and in the softened state can be shaped into articles.

D 1566, D11

thermoplastic—a plastic that repeatedly can be softened by heating and hardened by cooling through a temperature range characteristic of the plastic, and that in the softened state can be shaped by flow into articles by molding or extrusion.

D 3878, D30

thermoplastic—a polymer material that will repeatedly soften when heated and harden when cooled.

E 631, E06

thermoplastic—a polymer material that will repeatedly soften when heated and harden when cooled.

E 1749, E06

thermoplastic, *n*—a plastic that can be repeatedly softened by heating and hardened by cooling through a temperature range characteristic of the plastic, and that in the softened state can be shaped by flow into articles by molding or extrusion. (D20)

F 412, F17

thermoplastic, *adj*—capable of being repeatedly softened by heating and hardened by cooling through a temperature range characteristic of the plastic, and that in the softened state can be shaped by flow into articles by molding or extrusion for example. (D20)

F 412, F17

thermoplastic—capable of being repeatedly softened by heating and hardened by cooling through a temperature range characteristic of the plastic, and that in the softened state can be shaped by flow into articles by molding or extrusion.

F 869, F08

thermoplastic, *n*—a plastic that repeatedly can be softened by heating and hardened by cooling through a temperature range characteristic of the plastic, and that in the softened state can be shaped by flow into articles by molding or extrusion.

F 1251, F04

thermoplastic elastomer, *n*—a material having the general properties of an elastomer and capable of being repeatedly softened by heat and hardened to shape by cooling without significant degradation of the polymer system.

C 717, C24

thermoplastic elastomers (TPE)—a diverse family of rubber-like materials that, unlike conventional vulcanized rubbers, can be processed and recycled like thermoplastic materials.

D 883, D20

thermoplastic elastomer (TPE), *n*—a diverse family of rubber-like materials, that, unlike conventional vulcanized rubbers, can be processed and recycled like thermoplastic materials.

D 1566, D11

thermoplastic piping compound—a mixture of a thermoplastic polymer with other ingredients such as fillers, stabilizers, catalysts, processing aids, lubricants, modifiers, pigments, or curing agents, but not plasticizers except in the case of CAB piping compound.

F 412, F17

thermoplastic vulcanizate, *n*—a thermoplastic elastomer with a chemically cross-linked rubbery phase, produced by dynamic vulcanization.

D 1566, D11

thermoplastic weld—the joining together of two plastic surfaces by a combination of heat and pressure, with or without filler material.

C 904, C03

thermoprobe—a trade name for a thermosyphon that is not a load-carrying piling.

D 7099, D18

thermoptometry, *n*—a family of techniques in which an optical characteristic of a substance is measured as a function of temperature or time while the substance is subjected to a controlled-temperature program in a specified atmosphere. (ICTAC)

NOTE—Measurement of total light, light of specific wavelength(s), refractive index, and luminescence leads, respectively, to *thermophotometry*, *thermospectrometry*, *thermorefractometry*, and *thermoluminescence*. Observations under the microscope lead to *thermomicroscopy*.

E 473, E37

thermoset, *n*—a plastic that, after having been cured by heat or other means, is substantially infusible and insoluble.

D 883, D20

thermoset, *adj*—pertaining to the state of a plastic in which it is substantially infusible.

D 883, D20

thermoset, *n*—monomer, polymer or copolymer, which when cured, changes into a substantially infusible and insoluble product.

D 907, D14

thermoset—a class of polymers that, when cured using heat, chemical, or other means, changes into a substantially infusible and insoluble material.

D 3878, D30

thermoset—a polymer material that will undergo or has undergone a chemical reaction by the action of heat, catalysts, ultraviolet light, etc., leading to a relatively infusible state.

E 631, E06

thermoset—a polymer material that will undergo or has undergone a chemical reaction by the action of heat, catalysts, ultraviolet light, etc., leading to a relatively infusible state.

E 1749, E06

thermoset, *n*—a plastic that, when cured by application of heat or chemical means, changes into a substantially infusible and insoluble product. (D20)

F 412, F17

thermoset elastomer, *n*—an elastomeric material that attains its intended properties by an irreversible cross-linking reaction caused by heat alone, heat with a cross-linking agent, chemical interaction, or by radiation; whereby after cross-linking, any reprocessing with heat and pressure will severely degrade the material.

C 717, C24

thermoset plastic, *n*—a plastic that, after having been cured by heat or other means, is substantially infusible and insoluble.

F 1251, F04

thermosetting, *adj*—capable of being changed into a substantially infusible or insoluble product when cured by heat or other means.

D 883, D20

thermosetting, *n*—capable of being changed into a substantially infusible and insoluble product when cured by heat or by other means such as radiation, catalysts, etc.

D 907, D14

thermosetting, *adj*—capable of being changed into a substantially infusible or insoluble product when cured by heat or other means. (D20)

F 412, F17

thermosetting resin, *n*—a polymeric material capable of crosslinking under the influence of heat, pressure, radiation, ultraviolet light, or chemical agents to form a thermoset. (See also **A-stage**, **B-stage**, and **C-stage**.)

D 907, D14

thermosiphon solar energy system—see **solar energy system, thermosiphon**.

E 772, E44

thermosyphon—a two-phase, passive, heat transfer device that removes heat from the ground whenever the ambient air temperature is lower than the ground temperature. Liquid in the lower end of the thermosyphon evaporates by absorbing thermal energy from the ground. Vapor condenses in the upper end of the thermosyphon that is exposed to the air. Condensate return to the lower end is by gravity.

D 7099, D18

thermo tube—a trade name for a convection tube.

D 7099, D18

thermowell, *n*—a closed-end reentrant tube designed for the insertion of a temperature-sensing element, and provided with means for pressure-tight attachment to a vessel. (See also **protecting tube**.)

E 344, E20

thick edge, *n*—a mica splitting with an edge or end thicker than 1½ times the maximum thickness measured at any other point on the splitting or if the thickness of the edge or end exceeds the maximum average thickness allowed for the grade of splittings.

D 1711, D09

thickener, *n*—*inlubricating grease*, a substance composed of finely divided solid particles dispersed in a liquid lubricant to form the product's structure.

D 4175, D02

- thickener**—a vessel designed to concentrate treatment sludges; similar to a clarifier. **D 6161, D19**
- thickener**—a material whose primary function is to increase the viscosity of a fluid. **E 609, E35**
- thickener (latex), n**—a substance used to raise or control the viscosity of latex without making major changes in the total solids content. **D 1566, D11**
- thick filling**—See **coarse pick**. **D 3990, D13**
- thickness, n**—a measurement of the cross section of the tile made perpendicular to its surface. **C 43, C15**
- thickness, n—inbuilding construction in glazing**, the minimum structural sealant dimension between structurally bonded substrates. **C 717, C24**
- thickness**—that dimension designed to lie at right angles to the face of the wall, floor, or other assembly. **C 1232, C15**
- thickness**—the distance between one surface and its opposite. **D 123, D13**
- thickness**—the perpendicular distance between bounding surfaces such as bedding or foliation planes of a rock. (ISRM) **D 653, D18**
- thickness, n—of an electrical insulating material**, the perpendicular distance between the two surfaces of interest, determined in accordance with a standard method. **D 1711, D09**
- thickness, n—of paper or paperboard**, the perpendicular distance between the two principal surfaces of the paper or paperboard as measured under the specified conditions. See **caliper**. **D 1968, D06**
- thickness, n**—the distance between one surface and its opposite. **D 4850, D13**
- thickness, compressed**—See **compressed thickness**. **D 4439, D35**
- thickness, t**—thickness, measured perpendicular to the running surface. X_A indicates the location of thickness measurement from the tail of the ski. **F 472, F27**
- thick place, n**—a yarn defect characterized by a diameter greater than that of the adjoining segments and extending for 6 mm ($\frac{1}{4}$ in.). (See also **thin place**.) **D 123, D13**
- thick place, n—in fabric**, an unintentional change in fabric appearance characterized by a small area of more closely spaced yarns, or by a congregation of thick yarns as compared to the adjacent construction. **D 123, D13**
- thick place, n—in fabric**, an unintentional change in fabric appearance characterized by a small area of more closely spaced yarns, or by a congregation of thick yarns as compared to the adjacent construction. **D 3990, D13**
- thick place, n**—a yarn defect characterized by a diameter greater than that of the adjoining segments and extending for 6 mm ($\frac{1}{4}$ in.). **D 4849, D13**
- thick splitting**—a mica splitting whose thickness in the major portion of its area (or over the entire area) exceeds the following:
 (1) A bookform splitting that exceeds the maximum average thickness allowed for the grade.
 (2) A loose splitting that exceeds 0.03 mm in thickness.
 (3) A loose with powder splitting that exceeds 0.025 mm in thickness. **D 1711, D09**
- thief**—an auxiliary cathode so placed as to divert to itself some current from portions of the work which would otherwise receive too high a current density. **B 374, B08**
- thigh, n—in garment construction**, with trouser leg laid out flat, measure from crotch seam straight across to leg side seam. **F 1494, F23**
- thigh girth, n—in body measurements**, the maximum circumference of the upper leg close to the crotch. (Compare **mid-thigh girth**.) **D 123, D13**
- thigh girth, n**—the maximum horizontal circumference of the upper leg, taken close to the crotch. **D 5219, D13**
- thigh girth, n—in body measurements**, the maximum circumference of the upper leg close to the crotch. **F 1494, F23**
- σ_{th-THE}** —threshold stress—test conducted in air—geometry dependent **F 2078, F07**
- thimble**—a refractory shape used for stirring a pot-made optical glass. **C 162, C14**
- thimble, n—in Soxhlet apparatus**, a closed-end porous cylinder used to hold the material to be extracted, usually made of thick matted filter paper but sometimes made of ceramic. **D 4175, D02**
- thimble element**—an element used in an impact printing device in which the fully formed characters are located on the ends of finger-like devices that are similar to a daisy wheel except that the device is formed to produce a cup-like or thimble structure. **F 909, F05**
- thimble printer**—an impact printing device utilizing a thimble element. The paper on the carriage remains stationary while the element is positioned and caused to strike the paper to produce the characters in their proper positions. **F 909, F05**
- thin end**—See **fine end**. **D 3990, D13**
- thin filling, n—in woven fabrics**, a filling yarn smaller in diameter than normal. **D 123, D13**
- thin filling, n—in woven fabrics**, a filling yarn smaller in diameter than normal. (Syn. fine filling, fine pick, light filling, light pick, thin pick) **D 3990, D13**
- thin film**—a layer of material, typically less than 100 nm in thickness deposited or grown on a substrate. **E 673, E42**
- thin film composite (TFC)**—see **composite membrane**. **D 6161, D19**
- thin film fluid lubricant, n**—fluid lubricants consisting of a primary liquid with or without additives of lubricating powders and without binders or adhesives, which form a film on one or both surfaces to be lubricated and perform their function after application and after excess material has drained from the application area, and without additional material being supplied by either a continuous or intermittent method. **D 4175, D02**
- thinner, n**—the portion of a paint, varnish, lacquer, or printing ink, or related product that volatilizes during the drying process. **D 16, D01**
- thinner, n**—a volatile liquid added to an adhesive to reduce the viscosity or other properties. **D 907, D14**
- thin pick**—See **thin filling**. **D 3990, D13**
- thin place, n**—a yarn defect characterized by a segment that is substantially (at least 25 %) smaller in diameter than the average diameter of the yarn. (See also **thick place**.) **D 123, D13**
- thin place, n—in fabric**, an unintentional change in fabric appearance characterized by a small area of loosely spaced yarns or by a congregation of thin yarns as compared to the adjacent construction. **D 123, D13**
- thin place, n—in fabric**, an unintentional change in fabric appearance characterized by a small area of loosely spaced yarns or by a congregation of thin yarns as compared to the adjacent construction. **D 3990, D13**
- thin place, n**—a yarn defect characterized by a segment that is substantially (at least 25 %) smaller in diameter than the average diameter of the yarn. **D 4849, D13**
- thin splitting, n**—a mica splitting whose thickness in the major section of its area, or over the entire area, is less than the minimum average for the grade. **D 1711, D09**
- thin spot**—See **crack mark**. **D 3990, D13**
- thin stone/thin veneer**—a cladding under 50 mm (2-in.) thick. **C 119, C18**
- thin-wall tube, n**—tube with specified wall thickness 3 % or less of the specified outside diameter. **B 899, B02**
- thiophene**—thiofuran (C_4H_4S) mol weight 84.13; a cyclic organosulfur; colorless, highly reactive liquid; freezing point, $-38.5^\circ C$; boiling point, $84.12^\circ C$. **D 4790, D16**
- third party**—person or body that is recognized as being independent of the parties involved, as concerns the issue in question, (ISO Guide 2). **E 1187, E36**
- third party certification, n**—a certification by an independent testing organization that a particular product meets a referenced standard. **F 1490, F32**

thixotropic, *n*

thixotropic, *n*—the property of a material that enables it to stiffen in a relatively short time on standing but, upon agitation or manipulation, to change to a very soft consistency or to a fluid of high viscosity, the process being completely reversible. **E 2201, E50**

thixotropy—the property of a material to thin upon isothermal agitation and to thicken upon subsequent rest. **C 904, C03**

thixotropy—the property of a material that enables it to stiffen in a relatively short time on standing, but upon agitation or manipulation to change to a very soft consistency or to a fluid of high viscosity, the process being completely reversible. **D 653, D18**

thixotropy, *n*—*in a liquid*, the property of thinning when subjected to strains greater than the yield strain and of rethickening with time upon subsequent rest. (See **yield strain** and **viscosity**.)
D 907, D14

thixotropy—a property of nonsag materials that display a reduction in viscosity when a shearing action is applied but resist seeking their own level when left undisturbed.

time horizon—See **study period**. **E 631, E06**

thixotropy—a decrease of the apparent viscosity under constant shear stress or shear rate, followed by a gradual recovery when the stress or shear rate is reduced to zero. **E 1142, E37**

thixotropy—a property of nonsag materials that display a reduction in viscosity when a shearing action is applied but resist seeking their own level when left undisturbed. **E 1749, E06**

thixotropy, negative—synonym of **anti-thixotropy**. **E 1142, E37**

THM—trihalomethanes; a group of low molecular weight molecules which can result from chlorination of organics typically found in surface water. **D 6161, D19**

THMP—trihalomethane precursors; organic molecules found in water which have the potential of reacting with chlorine to form THMs. **D 6161, D19**

thong hole, *n*—*in zippers*, the opening at the end of a pull.
D 123, D13

thong hole, *n*—the opening at the end of a pull. **D 2050, D13**

thread—annular and helical and, sometimes, longitudinal deformations rolled onto shank; in general, with deformations passing entirely around body; usually resulting in expanded ridges and depressions, larger and smaller, respectively, than wire diameter. (See **knurled**.) **F 547, F16**

thread break, *n*—*in sewn seams*, a mode of failure evidenced by rupture of the sewing thread. **D 123, D13**

thread break, *n*—*in sewn seams*, a mode of failure evidenced by rupture of the sewing thread. **D 4850, D13**

thread count—the total number of warp and filling threads in one square inch of fabric. **F 221, F05**

threaded—annular, helical or longitudinal, symmetrical or nonsymmetrical, flat-bottom or round-bottom deformations with single or double crest shoulders and with rounded or flat flanks; formed onto nail shank after heading by passing through roll-threading dies. (See **mechanically deformed**, **knurled**, **thread**.) **F 547, F16**

threaded deformed bar—steel bar that has a continuous hot-rolled pattern of thread-like deformations along its entire length that allows a nut and coupler to thread onto the bar. **F 1789, F16**

threaded nail

threaded common nail, threaded nail, threaded sinker, *n*—bright or galvanized, regular-stock-steel, stiff-stock or hardened-steel, annularly or helically threaded, 1 by 0.072 to 6 by 0.262-in. nails with flat $\frac{3}{16}$ to $\frac{1}{32}$ -in. head and $\frac{1}{8}$ by 0.072 to $\frac{5}{8}$ by 0.238-in. sinkers with $\frac{1}{64}$ to $\frac{1}{2}$ -in. sinker head and medium diameter point.

threaded shear-resistant nail—stout, short, helically threaded, $\frac{1}{2}$ to $2\frac{1}{2}$ by 0.135 and 0.148-in. nails with $\frac{5}{16}$ -in. sinker head and medium diameter point. **F 547, F16**

thread, element attaching—Deprecated term. **D 2050, D13**

thread galling—displacement of material between mating threads during tightening which causes interface contact points to shear, producing high friction, increased resistance to tightening, and even seizing of the threads. Thread galling is most prevalent with

fasteners made of materials that self-generate an oxide surface film. **F 1789, F16**

thread holder, *n*—the support package on which a sewing yarn is wound. **D 123, D13**

thread holder, *n*—the support package on which a sewing yarn is wound. **D 4849, D13**

thread lap—doubling over of metal on the thread which is created during roll threading operations. **F 1789, F16**

threadless pipe (TP)—seamless tube conforming to the particular dimensions commercially known as “threadless pipe (TP).”
B 846, B05

threatened species, *n*—a species which is likely to become endangered within the foreseeable future throughout all or a significant portion of its habitat as determined by the governmental entity have jurisdiction. **E 2114, E06**

three-body abrasive wear, *n*—a form of abrasive wear in which wear is produced by loose particles introduced or generated between the contacting surfaces. **G 40, G02**

three-coat work, *n*—plaster applied in three successive coats with time between coats for setting or drying, or both. **C 11, C11**

three-edge-bearing method—a method for applying the load to a pipe in an external load-crushing strength test. **C 822, C13**

three-phase system—a vapor phase and two liquid phases, one of which is usually the propellant inside the container. **D 3064, D10**

three-point flexure, *n*—configuration of flexural strength testing where a specimen is loaded at a location midway between two support bearings. **C 1145, C28**

three-quarter-hard wire—as applied to aluminum, wire that has been processed to produce a strength approximately midway between that of half-hard wire and that of hard-drawn wire.
B 354, B01

three (*s*) rating (3*s*), *n*—a statistical method used to derive rated strength, using the formula:

$$\text{Rated Strength} = \bar{x} - 3(s)$$

where:

\bar{x} = tested sample's average ultimate strength, and

s = tested sample's standard deviation.

F 1773, F08

three way sort—an electromagnetic sort based on a signal response from the material under test above or below two levels established by three or more calibration standards. **E 1316, E07**

threshold, absolute, *n*—See **threshold, detection**. **E 253, E18**

threshold concentration—the minimum concentration at which a substance can be detected or recognized by its taste or odor. **D 2652, D28**

threshold concentration—the concentration of a contaminant above which a hot spot is considered to be detected. **D 5681, D34**

threshold, detection, *n*—the lowest physical intensity of a stimulus that is perceived by an assessor a specified percentage of time, usually 50%. **E 253, E18**

threshold, difference, *n*—the minimum difference in physical intensity between a stimulus and a comparison stimulus such that there is a specified probability (most frequently 0.5) that an assessor will perceive the two stimuli as different. The difference threshold is often called the difference limen (DL) or the just noticeable difference (JND). **E 253, E18**

threshold level—the setting of an instrument that causes it to register only those changes in response greater or less than a specified magnitude. **E 1316, E07**

threshold limit value (TLV), *n*—threshold limit value-time weighted average (TLV-TWA) — the time-weighted average concentration for a conventional 8-h workday and 40-h workweek, to which it is believed that nearly all workers may be repeatedly exposed, day after day, without adverse effect. **D 1356, D22**

threshold neutron activation detector—a device containing a particular nuclide that is not significantly activated by neutrons below a certain threshold energy. **E 170, E10**

threshold, population, *n*—the median or other measure of central tendency of the distribution of detection or recognition thresholds for a specified population. **E 253, E18**

threshold potential—the minimum charge level on the surface of an electrostatic copy that is necessary to attract a particular toner by overcoming the attracting force between the toner and the carrier. **F 335, F05**

threshold pressure, *n*—the minimum gas pressure (at a specified oxygen concentration and ambient temperature) that supports self-sustained combustion of the entire standard sample. **G 126, G04**

threshold, recognition, *n*—the lowest physical intensity at which a stimulus is correctly identified by an assessor a specified percentage of the time, usually 50 %. **E 253, E18**

threshold setting—the setting of the instrument that causes it to register only those changes in eddy-current response greater than a specified magnitude. (E 215)

NOTE—Sensitivity and threshold settings usually are indicated by arbitrary numbers on the control panel of the testing instrument. These numerical settings differ among instruments of different types. It is, therefore, not proper to translate a numerical setting on one instrument to that of another type. Even among instruments of the same design and from the same manufacturer, sensitivity and threshold settings may vary slightly when detecting the same discontinuity. Therefore, undue emphasis on the numerical value of sensitivity and threshold settings is not justified. (E 215) **E 1316, E07**

threshold setting, in image analysis—the selected range of gray levels corresponding to a constituent in the field of the view. **E 7, E04**

threshold stopping speed (TSS), *n*—the maximum saw chain speed measured in metres per second (m/s) (feet per minute (f/m)) that does not produce a cut through when the chain saw is dropped onto the test specimen. **F 1494, F23**

threshold strain (ozone testing), *n*—the highest tensile strain at which a rubber specimen can be exposed continually to an ozone-containing environment without development of ozone cracks. **D 1566, D11**

threshold stress intensity (K_{th})—a stress intensity below which no hydrogen stress cracking will occur and above which, time-delayed fracture will occur. **F 2078, F07**

threshold stress (σ_{th})—a stress below which no hydrogen stress cracking will occur and above which time-delayed fracture will occur; in Test Method F 1624, the threshold is identified as the maximum load at the onset of cracking that causes a 5 % drop in load of NSF(B)_{F1624} under displacement control. **F 2078, F07**

threshold temperature, *n*—temperature on the ΔT versus T curve where the slope changes in the direction indicating an exothermic reaction, that is, the sample is beginning to self-heat. **E 1445, E27**

threshold, terminal, *n*—(1) the maximum intensity of a stimulus that will produce a given type of sensory experience without change in modality. (2) the intensity of stimulation above which increase in intensity cannot be detected. **E 253, E18**

threshold (th)—a point separating conditions that will produce a given effect from conditions that will not produce the effect; the lowest load at which subcritical cracking can be detected. **F 2078, F07**

threshold treatment—the process of stopping precipitation at the start of occurrence; usually does not stop the formation of nuclei but does inhibit growth. See **antiscalant**. **D 6161, D19**

throat—a fully or partially submerged, narrow passageway between the melter and refiner of a tank. **C 162, C14**

throat—the central part of a shoe vamp opening where it is seamed to the front of the quarter. **F 869, F08**

throat depth—distance at which a tool may place fastener from edge of the work. **F 592, F16**

throats, *n*—in zippers, the two openings in a slider that receive the stringers. **D 123, D13**

throats, *n*—the two openings in a slider that receive the stringers. **D 2050, D13**

throttling—in leak testing, reducing the net pumping speed of a pumping system by partially closing a valve or installing a section of pipeline with low conductance. **E 1316, E07**

through-body color, *n*—the range of surface color obtained when units without materials added to the surfaces for appearance purposes are fired. **C 43, C15**

through-coil technique—see **coil technique**. **E 1316, E07**

through-opening, *n*—a uninterrupted hole in the test assembly that is seen from the unexposed side when viewing the suspected hole from a position perpendicular to the plane of the test assembly. **E 176, E05**

throughput—the vector product of the area and solid angle of a beam at its focus and the square of the refractive index of the medium in which the beam is focused. **E 131, E13**

throughput—same as **flow rate**. **E 1316, E07**

throughput—the rate at which documents can be processed through an optical scanner. Usually expressed as “documents per minute.” **F 149, F05**

through transmission technique—a test procedure in which the ultrasonic vibrations are emitted by one search unit and received by another at the opposite surface of the material examined. **E 1316, E07**

through-wall flashing—a water-resistant membrane or material assembly extending totally through a wall and its cavities, positioned to direct any water within the wall to the exterior. **D 1079, D08**

throw, *n*—a removable, unfitted protective textile cover, used over upholstered furniture. (See **furniturecovering**.) **D 123, D13**

throw—the projection of broken rock during blasting. (ISRM) **D 653, D18**

throw, *n*—a removable, unfitted protective textile cover, used over upholstered furniture. (See **furniturecovering**.) **D 7023, D13**

throw—a quantity of liquid or powder ingredient that is augured, pumped, or dispensed into a liquid of larger mass and makes up the basic flavoring and/or solid of a finished product. **F 1827, F26**

throwing power—the improvement of the coating (usually metal) distribution over the primary current distribution on an electrode (usually cathode) in a given solution, under specified conditions. The term may also be used for anodic processes for which the definition is analogous. **B 374, B08**

thrust—force applied to a drill in the direction of penetration. (ISRM) **D 653, D18**

thrust collar—a plastic cylinder placed between the last spiral wound cartridge and vessel end plate to support the last cartridge in a pressure vessel against telescoping. **D 6161, D19**

thufur (Icelandic)—perennial hummocks formed in either the active layer of permafrost areas, or in the seasonally frozen ground in non-permafrost areas during freezing of the ground (singular thufa). **D 7099, D18**

ticket number, *n*—in sewing thread, the designator assigned to a sewing thread to designate its approximate linear density. **D 123, D13**

ticket number, *n*—in sewing thread, the designator assigned to a sewing thread to designate its approximate linear density. **D 4849, D13**

ticking—marks caused by the bottom of the upper case character while printing in the lower case, or opposite. **F 149, F05**

tie—wire, clip, or band used to attach the fabric to the top rail and line posts (see Specification F 626). **F 552, F14**

tie line—in a binary or higher order phase diagram, an isothermal, isobaric straight line connecting the compositions of a pair of conjugate phases. **E 7, E04**

tie line—in a binary or higher order phase diagram, an isothermal, isobaric straight line connecting the compositions of a pair of conjugate phases. **E 1142, E37**

tie-off, n

tie-off, n—in waterproofing, the transitional seal used to terminate a waterproofing application at the top or bottom of flashing or by forming a watertight seal with the substrate, membrane, or waterproofing system(s). **D 1079, D08**

tie points, n—the location where ties are placed securing the coils to brackets, wires, or cables including fence fabric, at the specified spacing. **F 1379, F14**

tiered response—a predetermined, protocol driven, level of medical care and vehicle operation mode based on multiple levels of resource response. The two types of tiered response are sequential response (q.v.) and simultaneous response (q.v.). **F 1177, F30**

ties and slits, n—in paper, ties are areas of uncut paper between slits of cut paper within a perforation. **D 1968, D06**

tie stitch—See **lock stitch**. **F 592, F16**

tie tetrahedron—in a quaternary or higher order phase diagram, an isothermal, isobaric four-cornered space figure connecting the compositions of four conjugate phases. **E 7, E04**

tie triangle—in a ternary or higher order phase diagram, an isothermal, isobaric plane three-cornered, straight-sided figure connecting the compositions of three conjugate phases. **E 7, E04**

tight—rock remaining within the minimum excavation lines after completion of a blasting record. (ISRM) **D 653, D18**

tight—in leak testing, free from leaks according to a given specification. **E 1316, E07**

tight end, n—in woven fabrics, a yarn which was woven under excessive tension or has shrunk more than a normal amount. **D 123, D13**

tight end, n—in woven fabrics, a yarn which was woven under excessive tension or has shrunk more than a normal amount. **D 3990, D13**

tightened inspection—inspection under a sampling plan using the same quality level as for normal inspection, but requiring more stringent acceptance criteria. **D 1517, D31**

tight filling—See **tight pick**. **D 3990, D13**

tight pick, n—in woven fabrics, a filling yarn which was woven under excessive tension or has shrunk more than a normal amount, which may cause puckering at the junction with normal picks. (Compare **wavy cloth**.) **D 123, D13**

tight pick, n—in woven fabrics, a filling yarn which was woven under excessive tension or has shrunk more than a normal amount, which may cause puckering at the junction with normal picks. (Compare **wavy cloth**.) **D 3990, D13**

tight piston ring, n—in internal combustion engines, a piston ring that will not fall in its groove under its own weight when the piston, with the ring in a horizontal plane, is turned 90° (putting the ring in a vertical plane); by subsequent application of moderate finger pressure, the ring will be displaced. **D 4175, D02**

tight selvage, n—in woven fabrics, selvage yarns shorter than warp yarn in the body of the fabric. **D 123, D13**

tight selvage, n—in woven fabrics, selvage yarns shorter than warp yarn in the body of the fabric. **D 3990, D13**

tight side—in knife-cut veneer, the side of the sheet that was farthest from the knife as the sheet was being cut and that contains no cutting checks. (See **loose side**.) **D 1038, D07**

tight twist end, n—a single end with higher than normal twist. **D 123, D13**

tight twist end, n—a single end with higher than normal twist. (Syn. hard end, wiry end) **D 3990, D13**

tight yarn, n—in inflatable restraint fabrics, a yarn with less crimp than surrounding fibers that may create puckering, which may appear to be shinier or to lie straighter in the weave pattern, or a combination thereof. **D 6799, D13**

tile—a thin modular stone unit. **C 119, C18**

tile—a ceramic surfacing unit, usually relatively thin in relation to facial area, made from clay or a mixture of clay and other ceramic materials, called the body of the tile, having either a “glazed” or “unglazed” face and fired above red heat in the course of manufacture to a temperature sufficiently high to produce specific

physical properties and characteristics. (See also **ceramic mosaic tile**; **conductive ceramic tile**; **faience tile**; **glazed ceramic mosaic tile**; **glazed interior tile**; **glazed tile**; **glazed tile, extra duty glaze**; **major tile facial dimensions**; **major tile thickness**; **minor tile facial dimension**; **minor tile thickness**; **porcelain tile**; **unglazed tile**; **wedging of tile**.) **C 242, C21**

tile nail

acoustical-tile nail—slender, electroplated, regular-stock-steel or stiff-stock, 1 to 1¾ by 0.062-in. nails with ¼-in. projection head with 0.135-in. collar and sharp, blunt, or medium diamond point.

asbestos-tileboard nail—stainless steel or other nonferrous metal nails with casing or oval head. (See also **asbestosboard nail**.)

roofing-tile nail—galvanized, regular-stock-steel, 5 to 7 by 0.148-in. nails with flat ⅝-in. head and medium diamond point.

tileboard nail—See **asbestosboard nail**, **fiberboard nail**, **insulation building-board nail**. **F 547, F16**

tile, resilient flooring, n—resilient flooring which is packaged in flat pieces which can be installed as individual units. **F 141, F06**

till—see **glacial till**. **D 653, D18**

tilt, n—rotation of a bar code symbol about an axis perpendicular to the substrate. Compare **pitch**, **skew**. **F 1294, F05**

tilt angle—in solar energy applications, the angle between the horizontal and the plane of the detector (collector, photovoltaic array, instrument) surface. **E 772, E44**

tilt angle, v—the angle between the horizontal and the plane of the test fixture, glass frame, or sensory instrumentation. **G 113, G03**

tilting skillet—see **braising pan**. **F 1827, F26**

tilt, of target—same as **angle of incidence**. **E 673, E42**

timbers—See **lumber**. **D 9, D07**

time angle of internal friction, φ_t—inclination of the time yield locus of the tangency - point with the Mohr stress circle passing through the origin. **D 653, D18**

time-averaged throughput method—the method whereby the average throughput is calculated by dividing the total mass size reduced by the net processing time. **D 5681, D34**

time-average sound level, TAV—L_{AT} where T is the time of the interval of measurement, [nd], (dB), n—ten times the logarithm to the base ten of the ratio of mean-square instantaneous A-weighted sound pressure, during a stated time interval T, to the square of the standard reference sound pressure. **C 634, E33**

time constant, n—the time required for the magnitude of change in a signal to reach a value of 63.2 % of its final value in response to a step function input. **D 1711, D09**

time constant, n—in data acquisition, a value which represents a measure of the time response of a system. For a first order system responding to a step change input, it is the time required for the output to reach 63.2 % of its final value. **D 4175, D02**

time constant, n—the 63.2 % response time of a sensor that exhibits a single-exponential response. **E 344, E20**

time constant—AES, the time required for a signal to change by 1 - (1/e) (63.2 %) of its final value in response to a step function input. **E 673, E42**

time constant—of a solar collector, the time required for the fluid leaving a solar collector to attain 63.2 % of the resulting change in equilibrium outlet temperature following a step change in solar irradiance or inlet fluid temperature.

NOTE—The step change involved should be spelled out in the procedure. **E 772, E44**

time constant—a measure of the rapidity of response of a system. **E 2161, E37**

time curve—see **consolidation time curve**. **D 653, D18**

time factor, T_v, T (D)—dimensionless factor, utilized in the theory of consolidation, containing the physical constants of a soil stratum influencing its time-rate of consolidation, expressed as follows:

$$T = k (1 + e) / (a_v \gamma_w H^2) = (c_v t) / H^2$$

where:

- k = coefficient of permeability (LT^{-1}),
 e = void ratio (dimensionless),
 t = elapsed time that the stratum has been consolidated (T),
 α_v = coefficient of compressibility (L^2F^{-1}),
 γ_w = unit weight of water (FL^{-3}),
 H = thickness of stratum drained on one side only. If stratum is drained on both sides, its thickness equals $2H$ (L), and
 c_v = coefficient of consolidation (L^2T^{-1}).

time horizon, n —See **study period**. **D 653, D18**
E 833, E06

time interval, n —the time between weighings of the permeation cup. **F 1494, F23**

time of drying, n —of insulating varnish, the time required for a film of varnish to dry to a tackfree state under specified conditions. **D 1711, D09**

time of flight—the sound path measurement of time for the transmitted, reflected or diffracted energy in a specimen. **E 1316, E07**

time of flight diffraction technique (TOFD)—an ultrasonic examination procedure using a pair of probes in a pitch-catch configuration, the probes being usually arranged symmetrically on the same surface, but opposite sides of a weld. Measurement of travel times for the forward reflected or diffracted energy from a flaw or reference surface is used to determine its depth and vertical extent. **E 1316, E07**

time of integration, n —in yarn evenness testing, the time during which a point-to-point integrator stays switched on. **D 123, D13**

time of integration, n —in yarn evenness testing, the time during which a point-to-point integrator stays switched on. **D 4849, D13**

time of setting, n —the elapsed time from the addition of mixing water to a cementitious mixture until the mixture reaches a specified degree of rigidity as measured by a specific procedure.

time of final setting (of concrete), n —the elapsed time, after initial contact of cement and water, required for the mortar sieved from the concrete to reach a penetration resistance of 4000 psi (27.6 MPa). (C 403/C 403M). **C 125, C09**

time of initial setting (of concrete), n —the elapsed time, after initial contact of cement and water, required for the mortar sieved from the concrete to reach a penetration resistance of 500 psi (3.5 MPa). (C 403/C 403M). **C 125, C09**

time-of-wetness, n —the total amount of time that a surface is wet. This is typically reported in hours. **G 113, G03**

time profile—a plot of the modulus or damping, or both of a material versus time. **D 4092, D20**

time-proportioned sample, n —a sample collected at preselected time intervals. **D 1129, D19**

time quenching, n —interrupted quenching in which the duration of holding in the quenching medium is controlled. **A 941, A01**

time response paper—a special graph paper on which electrode potentials are plotted on the vertical antilogarithmic axis and time is plotted on the horizontal axis as the reciprocal of time. The plot is extrapolated to time-equals-infinity to determine the final electrode potential that would be observed at complete system equilibrium. Time response paper is useful for evaluating electrode performance and for rapidly estimating solution concentration in cases where electrode response is slow, such as close to the lower limit of detection. **D 4127, D19**

time-temperature curve—in thermal analysis, a curve produced by plotting time against the temperature. **E 7, E04**

time-temperature curve—in thermal analysis, a curve produced by plotting time against the temperature (E 7, E04). **E 1142, E37**

time-to-break, n —the time interval during which a specimen is under prescribed conditions of tension and is absorbing the energy required to reach maximum load. **D 123, D13**

time-to-break, n —the time interval during which a specimen is under prescribed conditions of tension and is absorbing the energy required to reach maximum force. **D 4849, D13**

time to delta peak temperature, n —the time from beginning of the

initiation of the arc to the time the delta peak temperature is reached, s. **F 819, F18**

time to ignition, n —time between the start of the test and the presence of a flame on the specimen surface for a period of at least 4s. **E 176, E05**

time to ignition, n —time between the start of the test and the presence of a flame on or over most of the specimen surface for a period of at least 4 s. **E 176, E05**

time to sustained flaming, n —time to ignition. **E 176, E05**

time-to-thermal-runaway, (t_c), n —an estimation of the time required for an exothermic reaction, in an adiabatic container, (that is, no heat gain or loss to the environment), to reach the point of thermal runaway. **E 1445, E27**

time value of money—the time-dependent value of money stemming both from changes in the purchasing power of money (that is, inflation or deflation), and from the real earning potential of alternative investments over time. **E 631, E06**

time value of money, n —the time-dependent value of money stemming both from changes in the purchasing power of money (that is, inflation or deflation), and from the real earning potential of alternative investments over time. **E 833, E06**

time yield locus—the yield locus of a bulk solid which has remained at rest under a given normal stress for a certain time. **D 653, D18**

timing mark—a printed mark that controls the reading of a mark read field. The mark printed in scan ink tells the reader the location of information to be scanned. **F 149, F05**

tinned—See **electroplated, wash-tinned**. **F 547, F16**

tinned wire—see **coated wire**. **B 354, B01**

tin oxide (SnO_2)—in finely ground form used in glazes as an opacifier. **C 242, C21**

tint, n —a color produced by the mixture of white pigment or paint in predominating amount with a colored pigment or paint, not white. The tint of a color is, therefore, much lighter and much less saturated than the color itself. **D 16, D01**

tint, n —a color produced by the mixture of white pigment or paint with a chromatic pigment or paint. (See also **tint, v, shade, n, shade, v.**) **E 284, E12**

tint, v —to adjust the color of a test specimen to be a closer color match to the standard. (See also **tint, n; shade, vt; shade, n.**) **E 284, E12**

tinting, n —see **pigment bleed**. **D 6488, D01**

tinting, n —a background wash of color seen uniformly across the non-image area of a print. See **plate tinting**. **D 6488, D01**

tinting strength, n —the power of coloring a standard paint or pigment. **D 16, D01**

tinting strength, n —measure of the effectiveness with which unit quantity of a colorant alters the color of a material. **E 284, E12**

tint plate—a retardation plate introduced into the polariscope, which adds one wave (565 nm) of retardation to the field which it covers, and which shifts the observed retardation color scale to more easily distinguishable tints. **C 162, C14**

tint strength, n —the ratio, expressed as tint units, of the reflectance of a standard paste to a sample paste, both prepared and tested under specified conditions. **D 3053, D24**

tip height, h_s —the height of the underside of the tip from a plane surface with the center of the ski body pressed against that surface. **F 472, F27**

tip height, H_s —the height of the underside of the tip from a plane surface with the snowboard unweighted. **F 1107, F27**

tire, n —a load-bearing, ground-contacting circumferential attachment to a vehicle wheel. **D 123, D13**

tire, n —a continuous solid or pneumatic rubber covering encircling the wheel of a vehicle. **D 5681, D34**

tire, n —a load-bearing ground-contacting circumferential attachment to a vehicle wheel. **D 6477, D13**

tire, n —a load-bearing ground-contacting circumferential attachment to a vehicle wheel. **F 538, F09**

tire-axis system—the origin of the tire-axis system is the center of the

tire-axis system

- tire contact. The X' axis is the intersection of the wheel plane and the road plane with a positive direction forward. The Z' axis is perpendicular to the road plane with a positive direction downward. The Y' axis is in the road plane, its direction being chosen to make the axis system orthogonal and right-hand. **E 867, E17**
- tire axis system, *n***—the origin of the tire axis system is the center of the tire contact where the X' -axis is the intersection of the wheel plane and the road plane with a positive direction forward, the Z' -axis is perpendicular to the road plane with a positive direction downward, and the Y' -axis is in the road plane, its direction being chosen to make the axis system orthogonal and right-hand. **F 538, F09**
- tire bead, *n***—that part of a tire that comes in contact with the rim and that is shaped to secure the tire to the rim. **D 123, D13**
- tire bead, *n***—the part of a tire that comes in contact with the rim and is shaped to secure the tire to the rim. **D 6477, D13**
- tire bead wire, *n***—a monofilament steel wire with a metallic coating, usually bronze, used in forming a tire bead. **D 123, D13**
- tire bead wire, *n***—a monofilament of steel wire with a metallic coating, usually bronze, used in the forming of a tire bead. **D 6477, D13**
- tire, belted bias, *n***—a bias tire containing a belt. **F 538, F09**
- tire, bias, *n***—a pneumatic tire in which the ply cords that extend to the beads are laid at angles substantially less than 90° to the center line of the tread. **F 538, F09**
- tire chip, *n***—See *chipped tire*. **D 5681, D34**
- tire chips, *n***—Pieces of scrap tires that have a basic geometrical shape and are generally between 12 mm and 50 mm in size and have most of the wire removed (Syn. *chipped tire*). **D 5681, D34**
- tire cord, *n***—a twisted or formed structure composed of two or more single or plied industrial yarn elements having the same nominal twist, direction of twist, length, and tension. **D 123, D13**
- tire cord, *n***—a twisted or formed structure composed of one or more single or plied filaments, strands, or yarns of organic polymer or inorganic material. **D 6477, D13**
- tire cord fabric, *n***—a fabric consisting of tire cord warp with widely spaced (usually 1 to 5 picks/in.) single yarn filling. **D 123, D13**
- tire cord fabric, *n***—a fabric consisting of tire cord warp with widely spaced (usually 40 to 200 picks/m (1 to 5 picks/in.)) single yarn filling. **D 6477, D13**
- tire-derived fuel, *n***—the end product of a process that converts whole scrap tires into a specific chipped form. This specified product then would be capable of being used as fuel. **D 5681, D34**
- tire electrical resistance, *n***—the electrical resistance (in ohms) measured between the wheel of a mounted and inflated tire-wheel assembly and a metallic plate onto which the tire is loaded at a specified load. **F 538, F09**
- tire fabric, *n***—a textile fabric, other than tire cord fabric, which is used as a reinforcement in tires. **D 123, D13**
- tire fabric, *n***—a textile fabric, other than tire cord fabric, which is used as a reinforcement in tires. **D 6477, D13**
- tire forces**—the external forces acting on the tire by the road. **E 867, E17**
- tire forces [*F*], *n***—the external forces acting on a tire by the road. **F 538, F09**
- tire-load [lb (kg)], *n***—the portion of the gross-vehicle weight imposed upon the static tire at the time of weighing, expressed in units of mass, due only to the vertically-downward force of gravity acting on the mass of the static vehicle. **E 867, E17**
- tire longitudinal stiffness indicator, *n***—the rate of change of the slip friction number expressed as an angle near the zero value of the time or location. **E 867, E17**
- tire moments [*FL*], *n***—the external moments acting on the tire by the road. **F 538, F09**
- tire, pneumatic, *n***—a hollow tire that becomes load-bearing upon inflation with air, or other gas, to a pressure above atmospheric. **F 538, F09**
- tire, radial, *n***—a pneumatic tire in which the ply cords that extend to the beads are laid substantially at 90° to the center line of the tread, the tire being stabilized by a belt. **F 538, F09**
- tire shreds, *n***—Pieces of scrap tires that have a basic geometrical shape and are generally between 50 mm and 305 mm in size. **D 5681, D34**
- tire shreds, *n***—See *shredded tire*. **D 5681, D34**
- tire, snow (also mud and snow tire), *n***—a pneumatic tire designed for, or shown to have, good traction on roads covered with mud or snow. **F 538, F09**
- tire weight, *n***—the weight of an unmounted tire without tube or flap. **F 538, F09**
- tire-wet pavement interaction, zone concept, *n***—a division of the load-bearing surface of a moving pneumatic tire into three basic zones; noncontact, partial contact, and contact. **E 867, E17**
- tissue, *n***—an aggregation of similarly specialized cells united in the performance of a particular function. **F 2312, F04**
- tissue engineered medical product (TEMP), *n***—a medical product that repairs, modifies or regenerates the recipient's cells, tissues, and organs or their structure and function, or both. **F 2312, F04**
- tissue engineering, *vivon*, *n***—the application, *in vivo* and *in vitro* of scientific principles and technologies to form tissue engineered medical products (TEMPS) used for medical treatments and diagnoses as diagnostics. **F 2312, F04**
- tissue forceps**—a device formed in two generally symmetrical halves with their proximal ends secured together and set so their distal ends will stay separated unless pressed together. **F 1638, F04**
- tissue regeneration, *n***—healing in which lost tissue is replaced by proliferation of cells, which reconstruct the normal architecture. **F 2312, F04**
- tissue repair, *n***—healing in which lost tissue is replaced by a fibrous scar, which is produced from granulation tissue. **F 2312, F04**
- tit**—an imperfection; a small protrusion on a glass article. **C 162, C14**
- titania porcelain**—See *titania porcelain* under **porcelain**. **C 242, C21**
- titania whiteware**—See *titania whiteware* under **ceramic whiteware**. **C 242, C21**
- titer, *n***—the quantity of a substance required to react with, or to correspond to, a given amount of another substance. **F 1494, F23**
- titer (pronounced tē'ter) (of fatty acids)**—the maximum temperature achieved during the solidification of fatty acids, which have been cooled below the melting point by a standardized procedure. **D 459, D12**
- titration**—a quantitative analytical technique for measuring the concentration of a species by incremental addition of a reagent (titrant) containing a species that reacts with the sample species. Sensing electrodes can be used to follow titrations if they respond to either the species being determined or the titrant ion. Electrode potentials are plotted against millilitres of titrant added, either on standard coordinate graph paper or on Gran's plot paper, and the equivalence point (when equivalent amounts of the two species are present) is determined from the curve. **D 4127, D19**
- t-joint, *n***—the condition created by the overlapping intersection of three or four sheets in the membrane. **D 1079, D08**
- T_{max} , *n***—maximum temperature measured during test. **E 1445, E27**
- T nail**—bright, etched, coated, galvanized, aluminum-coated, plastic-coated, knurled or annularly threaded, stiff-stock or aluminum-alloy, round-wire, 1 by 0.080 to $2\frac{1}{2}$ by 0.131-in. nails of T shape with $\frac{5}{32}$ or $\frac{1}{16}$ -in. round, square or oval-finish head of sinker, with or without heavy fillet, and with diamond or chisel point; driven with special nailing machine provided with staple-type magazine. **F 547, F16**
- TOC**—total organic carbon, a measure of the level of organic constituents in water. **D 6161, D19**
- TOCI**—total organic chlorine. **D 6161, D19**
- toe area cut zone, *n***—in the testing of foot protective devices, that area excluding the sole which extends from the front most part of the footwear to a vertical plane $15 + 0.25$ mm behind the toe box; or in the absence of a toe box, the area which extends to a vertical plane $65 + 6.25$ mm from the front of the footwear. **F 1494, F23**

toe board—a vertical plate at the bottom of a railing system located at the open edge of a stairwell, platform, ramp, or floor; forming a low curb to provide a barrier preventing objects from falling beyond it. (Syns. *kick plate* and *toe plate*.)

toe board—See **railing systems**.

toe plate—See **railing systems**.

toe plate—Synonym for **toe board**. E 631, E06

toe board—a vertical plate at the bottom of a railing system located at the open edge of a stairwell, platform, ramp, or floor; forming a low curb to provide a barrier preventing objects from falling beyond it. (Syns. *kick plate* and *toe plate*.) E 1481, E06

toe box, *n*—in testing of foot protective devices, a component inserted into the toe area of footwear. F 1494, F23

toe-in—a small reduction of the outside diameter at the cut end of a length of thermoplastic pipe. F 412, F17

toe plate—Synonym for **toe board**. E 1481, E06

toggle, *n*—in buttons, a clip used to fasten a staple button to the flexible substrate. D 123, D13

toggle, *n*—in buttons, a clip used to fasten a staple button to the flexible substrate. D 5497, D13

tolerance, *n*—the allowable deviation from a value or standard; especially the total range of variation permitted in maintenance a specified dimension in machining, fabricating, or constructing a member or assembly. E 631, E06

tolerance—the defined limits of allowable (acceptable) departure from the true value of a measured quantity. E 867, E17

tolerance—the defined limit of allowable departure of a value measured or estimated by a WIM system from an accepted reference value. E 867, E17

tolerance—the total range of variation (usually bilateral) permitted for a size, position, or other required quantity; the upper and lower limits between which a dimension must be held. (E 380)

F 221, F05

tolerance interval, *n*—a range constructed from an experimental data sample so as to statistically enclose *P* % or more of the population from which the sample was drawn with a confidence level of 100 (1- α) %.

A 644, A04

tolerance interval, *n*—an interval computed so that it will include at least a stated percentage of the population with a stated probability.

C 1145, C28

tolerance interval—an interval computed so that it will include at least a stated percentage of the population with a stated probability.

E 1823, E08

tolerance level—the stated probability that the tolerance interval includes at least the stated percentage of the population. It is not the same as a confidence level but the term confidence level is frequently associated with tolerance intervals. E 1823, E08

tolerance limits, *n*—bounds of a tolerance interval. C 1145, C28

tolerance limits—the two statistics that define a tolerance interval. (One value may be “minus infinity” or “plus infinity.”)

E 1823, E08

tolerance limits (specification limits), *n*—limits that define the conformance boundaries for an individual unit of a manufacturing or service operation. E 456, E11

tolerance limits, specification or calibration—

(1) The permitted degree of departure of the value of some parameter, *X*, from its nominal value *X_n*.

(2) The guaranteed maximum error in the reading of some instrument scale, or in the calibration of some circuit component, or in the value of any parameter, from its correct value (which may be assumed to be a true value within the resolution of the calibration). Symmetrical tolerance limits, which do not involve the measurement of any parameter, may be quoted in two ways:

(a) **incremental tolerance, ΔX** —this is satisfied by the following limits:

$$X_n + \Delta X \geq X \geq X_n - \Delta X$$

(b) **fractional tolerance, *T_x***—this is defined by the following absolute ratio:

$$T_x = |\Delta X/X_n|$$

which is usually as a percentage, so that the allowed limits of *X* becomes $X_n | 1 \pm T_x |$. For a sum or difference function, the incremental tolerance, ΔF , equals the absolute sum of the component Δ values. For a product or ratio function, the fractional tolerance, *T_F*, equals the absolute sum of the component *T* values. For any other function, using calculus as follows:

$$\Delta F(x, y, x \dots) = \left(\frac{\delta F}{\delta x} \right) \Delta x + \left(\frac{\delta F}{\delta y} \right) \Delta y + \left(\frac{\delta F}{\delta z} \right) \Delta z \dots$$

NOTE—The preceding tolerance limits are symmetrical limits, such as ± 5 %. Occasionally, unsymmetrical limits may be specified such as +5 %, -2 % or 0 %, -5 % or 10 %, -0 %, and so forth. A 340, A06

tolerances, *n*—in mathematics, prescribed limits of variation for specified properties of a particular material based on observed values obtained by specified test methods and on samples that are representative of the material. D 123, D13

tolerances—dimensional limitations established by manufacturers, customers, associations, and government agencies. F 547, F16

tolerance specification, *n*—the total allowable variation around a level or state (upper limit minus lower limit), or the maximum acceptable excursion of a characteristic. E 456, E11

toluene—methyl benzene, toluol (obsolete) (C₇H₈) mol weight 92.13; clear, colorless, highly flammable liquid; odor somewhat like benzene; freezing point, -94.99°C; boiling point, 110.6°C.

D 4790, D16

toluene discoloration, *n*—the transmittance, at 425 nm, of the filtrate obtained from the toluene extract of carbon black, compared with that of pure toluene. D 3053, D24

toluene insolubles, *n*—that portion of the pentane insolubles not soluble in toluene (methylbenzene). D 4175, D02

toluene insolubles, *n*—in used oil analysis, the portion of pentane insolubles not soluble in toluene. D 4175, D02

toluene, nitration grade—toluene with maximum paraffin impurities of 1.5 volume % having a total distillation range of 1°C maximum. Refer to Specification D 841 for complete specifications.

D 4790, D16

toluene standardization fuels, *n*—for knock testing, those volumetrically proportioned blends of two or more of the following: reference fuel grade toluene, *n*-heptane, and *isooctane* that have prescribed rating tolerances for O.N._{ARV} determined by round-robin testing under reproducibility conditions. D 4175, D02

tomography—any radiologic technique that provides an image of a selected plane in an object to the relative exclusion of structures that lie outside the plane of interest (see **tomogram** and **(CT) computed tomography**). E 1316, E07

tonal, *adj*—in reference to audible sound, capable of exciting an auditory sensation having pitch. C 634, E33

toner, *n*—an organic pigment that does not contain inorganic pigment or inorganic carrying base. D 16, D01

toner—a material used to increase the intensity and to control the color of the ink image transferred from ribbon or carbon paper. F 221, F05

toner—the material in a developer system which when deposited by the field of an electrostatic charge pattern, becomes the visible record. F 335, F05

toner, *n*—a dispersion of concentrated pigment or dye used to manufacture, strengthen or modify the color of an ink.

F 1294, F05

toner reservoir

toner reservoir—(also known as toner hopper), an area of a toner cartridge that stores toner for future use in image development.

F 335, F05

toner reservoir shipping seal—(also known as a cartridge seal or seal), a component that covers the toner reservoir to prevent toner from escaping.

F 335, F05

toner throwout—see **dusting**.

F 335, F05

toner usage—the amount of toner (in milligrams per page) removed from the toner reservoir.

F 335, F05

tongue—see **male end of pipe**.

C 822, C13

tongue-and-grooved, *adj*—type of **lumber** joint consisting of a tongue and a groove on opposite edges to provide close fitting into an adjacent grooved or tongued piece.

D 996, D10

tongue tile—*in a port*, the projecting partition between gas and air stream.

C 162, C14

tonic response, *n*—shifting of tonic level, typically in response to changing conditions, as opposed to a sudden stimulus. Tonic responses take several seconds or minutes to occur, unlike phasic responses which tend to be much more rapid. Among the more common PDD methods, the only tests where tonic responses are used as diagnostic information are in the Peak of Tension tests, where a change in the trend of tonic activity can signal that the examinee is aware that the critical item in the series has passed.

E 2035, E52

toning, *n*—the deposit of ink in the non-image area caused by poor wiping of doctor blade.

D 6488, D01

tool—machine for driving fasteners.

F 592, F16

tooled—a linear patterned surface, consisting of parallel concave grooves 3-6 mm on center (or 4, 6, or 8 grooves per in.), produced by hand or pneumatic chisel, or planer tool.

C 119, C18

tooling—*in building construction*, the act of compacting and contouring a sealant in a joint.

C 717, C24

tooling—a term used to describe the shaping of a fillet bead of applied sealant to a feathered edge where it meets the substrate(s).

E 631, E06

tooling—a term used to describe the shaping of a fillet bead of applied sealant to a feathered edge where it meets the substrate(s).

E 1749, E06

tooling time, *n*—*of a sealant*, the time interval after application of a one-component sealant or after mixing and application of multi-component sealant during which tooling is possible.

C 717, C24

tool marks—longitudinal or circumferential grooves of shallow depth produced by the movement of manufacturing tools over the bolt, nut, or screw surface.

F 1789, F16

tooth, *n*—integral projection of metal connector plate formed in direction perpendicular to plate surface(s) during punching process. Also called prong, barb, plug, and nail, yet, preferably called tooth.

E 631, E06

toothed nail—flat, L-shaped, 1/2 to 1 5/16-in. cleats, sheared from 16-gage steel sheet; provided with toothed serrations along narrow sides of long shank and with slightly tapered, dull point; driven with special nailing machine provided with staple-type magazine.

F 547, F16

top, *n*—*in textiles*, (1) *worsted process*—a sliver in which the fibers have been parallelized, and usually combed; (2) *manufactured fibers or tow to top process*, a sliver obtained by drafting, along with breaking or cutting a multifilament tow. (See also wool top.)

D 123, D13

top, *n*—*in wool*, a continuous untwisted strand of wool fibers from which the shorter fibers or noils have been removed by combing.

D 123, D13

top, *n*—*in wool*, a continuous untwisted strand of wool fibers from which the shorter fibers or noils have been removed by combing.

D 4845, D13

top, *n*—*in textiles*, (1) *worsted process*—a sliver in which the fibers have been parallelized, and usually combed; (2) *manufactured*

fibers or tow to top process, a sliver obtained by drafting, along with breaking or cutting a multifilament tow. (see also wool top.)

D 4849, D13

top ash, *n*—another name for fly ash. See **fly ash**.

E 2201, E50

top grain—the first cut taken from the grain side of a split hide from which nothing except the hair and associated epidermis have been removed.

D 1517, D31

topic, *n*—*of serviceability*, a part of the serviceability of a facility for which a paried set of requirements and rating scales can be prepared.

E 631, E06

toplap, *n*—the shortest distance between the lower edge of an overlapping shingle or sheet, and the upper edge of the lapped unit in the first course below.

C 1154, C17

toplap—the shortest distance between the lower edge of an overlapping shingle or sheet, and the upper edge of the lapped unit in the first course below.

D 2946, C17

top loader—a vertically oriented agitation machine which is used for home laundry.

D 459, D12

top of borehole—the surface of the ground surrounding the borehole.

D 653, D18

top of the hydrometer, *n*—the top of the finished instrument.

E 344, E20

top of the thermometer, *n*—the top of the finished instrument.

E 344, E20

topology, *n*—*in a computer network*, the physical layout including the method of connection between nodes.

F 1294, F05

topping compound—see **finishing compound**.

C 11, C11

topping (the act of), *n*—See **skim coating**, the preferred term.

D 1566, D11

top rail—the uppermost member of a railing system.

top rail—See **railing systems**.

top story—See **building space**.

E 631, E06

top rail—the uppermost member of a railing system.

E 1481, E06

top rail—horizontal member of the framework running from terminal post to terminal post on top of the line posts.

F 552, F14

top roller guard—a safety device installed on a Type II, Class 1, cantilever slide gate with external rollers to isolate the upper roller mechanism to reduce the possibility of contact with the roller mechanism by a person. See Specification F 1184.

F 552, F14

top rope climbing, *n*—a technique of climbing where the climber is safeguarded by a roped belay from above.

F 1773, F08

top scissor half—the component which contains the screw head at assembly.

F 1078, F04

topset bed—a layer of sediment deposited on the top surface of an advancing delta that is continuous with the landward alluvial plain.

D 4410, D19

topsize, *n*—the opening of the smallest screen in the series upon which is retained less than 5 % of the sample (see Test Method D 4749).

D 121, D05

topsize, nominal—*for the purpose of Test Method D 4749*, the sieve designating the upper limit or topsize shall be that sieve of the series given in the Standard Series of Sieves section with the smallest openings upon which is cumulatively retained a total of less than 5 % of the sample. This defined topsize is not to be confused with the size of the largest particle in the lot.

D 121, D05

topsoil—surface soil, usually containing organic matter.

D 653, D18

topstitching, *n*—a line of stitching that shows on the face side in the finished article, usually stitched while having the face side of the fabric up.

D 123, D13

topstitching, *n*—*in home sewing*, a line of stitching that is visible on the face side of the finished product, usually stitched while having the face side of the material uppermost.

D 4965, D13

top stop, *n*—*in zippers*, a part affixed between or immediately above the interlocking elements, on either or both stringers, to prevent the slider from leaving the chain.

D 123, D13

top stop, *n*—a part affixed between or immediately above the interlocking elements on either or both stringers, to prevent the slider from leaving the chain.

D 2050, D13

top story—the uppermost **story** of a building. **E 631**, E06

torque, n —a moment (of forces) which produces or tends to produce rotation or torsion. **D 123**, D13

torque, n —a moment (of forces) which produces or tends to produce rotation or torsion. **D 4848**, D13

torque-controlled expansion anchor—a post-installed expansion anchor that derives its holding strength from the expansion of one or more sleeves or other elements against the sides of the drilled hole through the application of torque, which pulls the cone(s) into the expansion sleeve(s). After setting, tensile loading can cause additional expansion (follow-up expansion). **E 2265**, E06

torque [FL], n —a moment (of forces) that produces or tends to produce rotation or torsion. **E 6**, E28

torque [FL], n —of a wheel, the external torque applied to a tire from a vehicle about the wheel spin axis. **F 538**, F09

torque (T), wheel—the external torque applied to a tire from a vehicle about the wheel spin axis. Driving torque is positive wheel torque; braking torque is negative wheel torque. **E 867**, E17

torr—a unit of pressure equal to 1/760th of an atmosphere. **E 1316**, E07

torsional braid analysis, (TBA), n —a particular case of dynamic mechanical analysis in which the material is supported on a braid and the specimen is examined in torsion. (ICTAC) **E 473**, E37

torsional pendulum—a device for performing dynamic mechanical analysis, in which the sample is deformed torsionally and allowed to oscillate in free vibration. **D 4092**, D20

torsional shear test—a shear test in which a relatively thin test specimen of solid circular or annular cross-section, usually confined between rings, is subjected to an axial load and to shear in torsion. In-place torsion shear tests may be performed by pressing a dentated solid circular or annular plate against the soil and measuring its resistance to rotation under a given axial load. **D 653**, D18

torsional strength—load, usually expressed in terms of applied torque, at which the fastener fails by being twisted off about its axis. **F 1789**, F16

torsional stress—the shear stress on a transverse cross section, resulting from a twisting action. (E28) **D 4092**, D20

torsional stress[FL^{-2}], n —the shear stress in a body, in a plane normal to the axis of rotation, resulting from the application of torque. **E 6**, E28

torsion resistance, n —in tire beadwire, the number of turns of twist in a short length of wire that causes rupture **D 123**, D13

torsion resistance, n —in tire bead wire, the number of turns of twist in a short length of wire that causes rupture. **D 6477**, D13

total—see **radiometric properties and quantities**. **E 772**, E44

total annual freezing index—the cumulative number of degree-days, calculated by adding all of the negative mean daily air temperature (in degrees C) for a specific station during a calendar year. **D 7099**, D18

total annual thawing index—the cumulative number of degree-days, calculated by adding all of the positive mean daily air temperature (in degrees C) for a specific station during a calendar year. **D 7099**, D18

total carbon, n —carbon content remaining in the solid products derived from the combustion or reaction of coal, coal by-products, or coke, inclusive of carbonate in any form. **D 121**, D05

total case depth—distance measured perpendicularly from the surface of a hardened case to a point where differences in chemical or physical properties of the case and core no longer can be distinguished. **F 1789**, F16

total cold wall heat flux, n —the heat flux that would be transferred to an object whose temperature is 70°F (21°C). **E 176**, E05

total combustibles, n —combustible materials that include paints, lacquers, coatings, plastics, and so forth, associated with an

original metal product, as well as combustible materials which become associated with the product after it is manufactured.

D 5681, D34

total combustibles—materials that include paints, lacquers, coatings, plastics, etc., associated with the original ferrous product, as well as combustible materials (paper, plastic, textiles, etc.) which become associated with the ferrous product after it is manufactured. **D 5681**, D34

total contraction, n —of textured yarns, the difference between the original length and the length after heat treatment. **D 4849**, D13

total cross section—the sum of the absorption and scattering cross sections. **E 1316**, E07

total crotch length, n —in body measurements, the distance from the waist level at center front through the crotch to the waist level at center back. **D 123**, D13

total crotch length, n —in body measurements, the distance from the waist level at center front through the crotch to the waist level at center back. **F 1494**, F23

total cyanide—the total content of cyanide expressed as the radical CN^- , or alkali cyanide whether present as simple or complex ions. The sum of both the combined and free cyanide content of a solution. **B 374**, B08

total cycle period, τ_t [T]—the time for the completion of one cycle. The parameter τ_t can be separated into hold and non-hold (that is, steady and dynamic) components:

$$\tau_t = \Sigma\tau_h + \Sigma\tau_{nh}$$

where:

$\Sigma\tau_h$ = sum of all the hold portions of the cycle and,

$\Sigma\tau_{nh}$ = sum of all the non-hold portions of the cycle.

τ_t also is equal to the reciprocal of the overall frequency when the frequency is held constant. **E 1823**, E08

total dissolved solids content of steam, n —the concentration by mass of non-volatile, dissolved impurities in geothermal steam. **E 957**, E44

total distillation range—the temperature range, expressed in degrees Celsius, observed in vaporizing a material under specified conditions. **D 4790**, D16

total efficiency—the ratio of the net count rate for all energies in a gamma ray spectrometer system to the gamma ray emission rate of monoenergetic photons from a sample. The value is dependent on the source-detector-shield geometry and the photon energy. If gamma rays of more than one energy are emitted by the source, it may be necessary to determine a separate total efficiency for each such energy. **E 170**, E10

total elongation, El , n —the elongation determined after fracture by realigning and fitting together of the broken ends of the specimen. **E 6**, E28

total elongation (TE), n —of rope, the entire elongation at any given applied force. **D 123**, D13

total fluid constituent, n —in lubricating grease analysis, the n -hexane-soluble material extracted from the lubricating grease sample. **D 4175**, D02

total flux meter, n —the instrument used to measure the level of radiant heat energy incident on the specimen plane at any point. **E 176**, E05

total glycerin, n —is the sum of free and bonded glycerin. **D 4175**, D02

total image unsharpness—the blurring of test object features, in a radiological image resulting from any cause(s). **E 1316**, E07

total immersion thermometer, n —a liquid-in-glass thermometer designed to indicate temperatures correctly when just that portion of the thermometer containing the liquid is exposed to the temperature being measured. (Compare **complete immersion thermometer** and **partial immersion thermometer**.) **E 344**, E20

total insulation (I_T), n —the total resistance to dry heat loss from the manikin, that includes the resistance provided by the clothing and the air layer around the clothed manikin. **F 1494**, F23

total internal surface

total internal surface—the surface of a cellulosic material available for absorption of a given substance. A useful substance for this purpose is water; the value obtained with water is close to the potential maximum surface that can be developed without disruption of the crystalline structure. **D 1695, D01**

total irradiance, n —(1) the integral of the solar spectral irradiance; (2) the solar irradiance measured by a wide bandwidth radiometer. **E 1328, E44**

total Kjeldahl nitrogen, n —the sum of the nitrogen contained in the free ammonia and other nitrogen compounds which are converted to ammonium sulfate under specified digestion conditions. **D 1129, D19**

total length, n —the distance from the bottom of the bulb to the top of the finished thermometer, including any special finish at the top. **E 344, E20**

total length, n —the overall length of the finished hydrometer. **E 344, E20**

total life—the time required for open circuit to occur in the test thermoelement. **E 344, E20**

total mass, n —*in pile yarn floor coverings*, the mass of all matter in the mass per unit area expressed in grams per square metre (ounces per square yard) or in grams per linear metre (ounces per linear yard). **D 123, D13**

total mass, n —*in pile yarn floor covering*, the mass of all matter in the mass per unit area expressed in grams per square metre (ounces per square yard) or in grams per linear metre (ounces per linear yard). **D 5684, D13**

total mass stopping power, S/ρ —of a material for charged particles, the quotient of dE by ρdl , where dE is the energy lost by a charged particle in traversing a distance, dl , in the material of density ρ (ICRU).

$$S/\rho = (1/\rho) dE/dl$$

Unit: $J \cdot m^2 \cdot kg^{-1}$

($eV \cdot m^2 \cdot kg^{-1}$ is also used).

E 170, E10

total matter, n —the sum of the particulate and dissolved matter. **D 1129, D19**

total moisture—See *total moisture* under **moisture**. **D 121, D05**

total moisture—the water contained in a sample. The determination of the total moisture is made by drying a sample under controlled conditions of temperature, time, and air flow. The determination may consist of a single-stage or a two-stage drying process. **E 856, D34**

total n-hexane-insoluble material, n —*in lubricating grease analysis*, that portion of grease (excluding free alkali) that is essentially insoluble in n-hexane. **D 4175, D02**

total or gross-contact area [L^2], n —that area encompassed by the outer periphery of a tire footprint. **F 538, F09**

total pressure—See **pressure**. **D 1356, D22**

total reflectance, ρ, n —the ratio to the incident flux of the radiant or luminous flux reflected at all angles within the hemisphere bounded by the plane of measurement. **E 284, E12**

total reflectance factor, n —the ratio of the radiant or luminous flux, reflected at all angles within the hemisphere bounded by the plane of the specimen, to the flux reflected from the perfect reflecting diffuser under the same geometric and spectral conditions of measurement. **E 284, E12**

total-sediment discharge—the total quantity of sediment passing a section per unit of time. **D 4410, D19**

total-sediment load (total load)—all of the sediment in transport; that part moving as suspended load plus that moving as bedload. **D 4410, D19**

total soil-water potential—the sum of the energy-related components of a soil-water system; for example, the sum of the gravitational, matrix and osmotic potentials. **D 653, D18**

total solar ultraviolet, adj —solar energy above the solar cut on and below the visible, when received after transmittance through the atmosphere. **G 113, G03**

total solvent extractable content (TSEC)—the total concentration by weight (w/w) of organic materials that is extractable from a soil or solid waste by the selected solvent. **D 5681, D34**

total stress—see **stress**. **D 653, D18**

total sum of squares (TSS), n —a statistic used to quantify the information content from the inter-laboratory study in terms of total variation of sample means relative to the standard error of each sample mean. **D 4175, D02**

total transmittance, τ_p, n —the ratio of the flux transmitted at all forward angles to the incidence flux. **E 284, E12**

total variance—See *total variance* under **variance**. **D 121, D05**

total vertical trunk length, n —*in body measurements*, the distance from the right shoulder line midway between the neck base and the shoulder joint, down the back through the crotch and over the projection of the right breast to the starting point. **D 123, D13**

total water content (of frozen ground)—the total amount of water (water and ice) contained in soil or rock. This may be determined: (1) on a dry weight basis, as the ratio of the mass of the water and ice to the dry mass of the sample, expressed as a percentage; (2) on a volume basis, as the ratio of the volume of water and ice to the volume of the entire sample, expressed as a percentage. Using the volumetric method, the ratio cannot exceed unity. In the gravimetric method, however, it can. **D 7099, D18**

total weight basis moisture content—of biomass fuels, the ratio of the weight of the water in a sample to the weight of the wet material. It is expressed as a percent (also called wet basis moisture content). **E 1705, E48**

touch sanding—*in plywood*, a light surface sanding to control thickness; not intended as a full surfacing operation. **D 1038, D07**

touch trip—See **bottom trip**. **F 592, F16**

toughened glass—See **tempered glass**. **C 162, C14**

toughness—See **resistance, impact (toughness)**. **C 168, C16**

toughness, n —the capacity of a material to absorb energy. (Compare **work-to-break, work-to-rupture**.) **D 123, D13**

toughness, n —the capacity of a material to absorb energy (Compare **work to break, work to rupture**). **D 4848, D13**

toughness—ability of a fastener to absorb energy and to deform plastically before fracture. **F 1789, F16**

toughness at rupture, n —toughness of a material to breaking or tearing apart. **D 123, D13**

toughness at rupture, n —toughness of a material to breaking or tearing apart. **D 4848, D13**

toughness index, I_T, T_w —the ratio of: (1) the plasticity index, to (2) the flow index. **D 653, D18**

tough pitch copper—copper of any origin cast in the form of refinery shapes, containing a controlled amount of oxygen in the form of cuprous oxide. By extension the term is also applicable to fabricators' products made therefrom. **B 846, B05**

tow, n —*in flax fibers*, a combination of fiber bundles and ultimate fibers that have a maximum length of 50 cm. **D 123, D13**

tow, n —*in manufactured fibers*, a twistless multifilament strand suitable for conversion into staple fibers or sliver, or for direct spinning into yarn. **D 123, D13**

tow—*in fibrous composites*, a continuous, ordered assembly of essentially parallel, collimated filaments, normally without twist and of continuous filaments (Synonyms: strand and silver). **D 3878, D30**

tow, n —*in manufactured fibers*, a twistless multifilament strand suitable for conversion into staple fibers or sliver, or for direct spinning into yarn. **D 4849, D13**

tow, n —*in flax fibers*, a combination of fiber bundles and ultimate fibers that have a maximum length of 50 cm. **D 6798, D13**

towel, n —an absorbent textile product used for drying or wiping. **D 123, D13**

towel, n —an absorbent textile product used for drying or wiping. **D 7023, D13**

towing—transporting a boom from one place to another by pulling from one end. **F 818, F20**

- TOX**—total organic halides. **D 6161, D19**
- TOXFP**—total organic halide formation potential. **D 6161, D19**
- toxic hazard, *n***—*as related to fire*, the potential for physiological harm from toxic products of combustion. **E 176, E05**
- toxicity, *n***—the propensity of a test material to produce adverse behavioral, biochemical, or physiological effects in a living organism. **D 4175, D02**
- toxicity, *n***—the propensity of a test material to produce adverse behavioral, biochemical, or physiological effects in a living organism. **D 6384, D02**
- toxicity, *n***—the propensity of a substance to produce adverse biochemical or physiological effects. **E 176, E05**
- toxicity**—the property of a chemical, or combination of chemicals, to adversely affect organisms, tissues, or cells. **E 943, E47**
- toxicity, *n***—the property of a material, or combination of materials, to adversely affect organisms. **E 2114, E06**
- toxicity, *n***—the propensity of a substance to produce adverse biochemical or physiological effects. **F 1494, F23**
- toxicity**—the property of a material, or combination of materials, to adversely affect organisms. **F 1600, F20**
- toxicity characteristic leaching procedure (TCLP)**—a mild laboratory extraction procedure designed to determine the mobility of organic and inorganic constituents present in liquid, solid, and multiphasic wastes. **E 631, E06**
- toxicity characteristic leaching procedure (TCLP)**—a mild laboratory extraction procedure designed to determine the mobility of organic and inorganic constituents present in liquid, solid, and multiphasic wastes. **E 1605, E06**
- toxicity test**—an experiment used to study the adverse effect (*s*) of one or more chemicals on whole organisms, tissues, or cells. **E 943, E47**
- toxic potency, *n***—*as applied to inhalation of smoke or its component gases*, a quantitative expression relating concentration and exposure time to a particular degree of adverse physiological response, for example, death, on exposure of humans or animals. **E 176, E05**
- toxic waste, *n***—waste, based on the physical, chemical, radiological, or biological nature of the substance, and when exposed (that is, inhaled, ingested, or absorbed) to the human body, can cause acute or chronic injury or disease. **E 833, E06**
- trace, *n***—a constituent or impurity making up only a small portion of the sample, the upper limit of the trace or microconstituent being about 100 µg/g; this upper boundary is not rigidly fixed. **C 1145, C28**
- traceability**—the ability to demonstrate by means of an unbroken chain of comparisons that a measurement is in agreement within acceptable limits of uncertainty with comparable nationally or internationally recognized standards. **E 7, E04**
- traceability**—the property of a result of a measurement whereby it can be related to appropriate standards, generally international or national standards, through an unbroken chain of comparison, (ISO Guide 2). **E 1187, E36**
- traceability, *n***—the ability to trace the history, application, or location of an item or activity and like items or activities by means of recorded identification. (ANSI/ASQC-1987, A) **E 1187, E36**
- traceability, *n***—ability to trace the history, application, or location of that which is under consideration. **E 1605, E06**
- traceability**—the ability to trace the history, application, or location of an item or activity and like items or activities by means of recorded identification.
- traceability—Property of the result of a measurement or value of a standard whereby it can be related with a stated uncertainty, to stated references, usually national or international standards (i.e. through an unbroken chain of comparisons). **E 1732, E30**
- traceability**—ability to verify the manufacturing history, raw material, heat number, location, or application of an item by means of recorded identification. **F 1789, F16**
- tracer gas**—a gas which, passing through a leak, can then be detected by a specific leak detector and thus disclose the presence of a leak. Also called search gas. **E 1316, E07**
- tracer probe leak location**—Same as **probe test**. **E 1316, E07**
- track, *n***—a partially conducting path of localized deterioration on the surface of an insulating material. **D 1711, D09**
- track**—See **rail**. **F 592, F16**
- track-etch membrane formation**—process for forming membranes with well-defined pores by exposing a dense film to ion bombardment followed by etching of the damaged region. Usually produces pores with a narrow size distribution. **D 6161, D19**
- track etch technique**—a measurement method consisting of a dielectric material that records the passage of energetic heavy ionizing particles as latent tracks that can be developed or enlarged by various chemical methods and observed by microscopy methods or other techniques. **E 170, E10**
- tracking, *n***—the process that produces tracks as a result of the action of electric discharges on or close to the insulation surface. **D 1711, D09**
- tracking, *n***—the undesired appearance of ink on the copy in a repeat pattern. **D 6488, D01**
- tracking collector**—see **collector, tracking**. **E 772, E44**
- tracking, contamination, *n***—tracking caused by scintillations that result from the increased surface conduction due to contamination. **D 1711, D09**
- tracking error**—(1) for a two-axis tracking collector, the angular deviation between the collector-sun line and a line that is normal to the aperture plane. (2) for a single-axis tracking collector, the angular deviation between two planes that intersect along the axis of rotation. One plane contains the optical axis of the collector and the other contains the center of the sun. **E 772, E44**
- tracking resistance, *n***—the quantitative expression of the voltage and the time required to develop a track under specified conditions. **D 1711, D09**
- traction**—transport of debris by running water in which the particles are swept along close to the bed of the stream by rolling, sliding, or saltation. **D 4410, D19**
- traction, *n***—the adhesive friction of a body on a surface on which it moves. **F 141, F06**
- traction**—the coefficient of friction generated between the outsole and typical jogging or running surface. **F 869, F08**
- traction, *n***—*in tribology*, a physical process in which a tangential force is transmitted across the interface between two bodies through dry friction or an intervening fluid film, resulting in motion, reduction in motion, or the transmission of power. **G 40, G02**
- traction coefficient, *n***—*in tribology*, the dimensionless ratio of the traction force transmitted between two bodies to the normal force pressing them together. (See also **traction** and **traction force**.) **G 40, G02**
- traction, $S_1, S_2, S_3(\text{FL}^{-2})$** —applied stress. **D 653, D18**
- traction test, *n***—in tire testing, a series of *n* test runs at a selected operational condition; a traction test is characterized by an average value for the measured performance parameter. **F 538, F09**
- traction test**—method of evaluating the traction characteristics of footwear. **F 869, F08**
- traction vector angle, (rad or degree), *n***—the angle between the resultant traction force vector and the *X'*-axis. **F 538, F09**
- tractive force coefficient, *n***—*of a tire*, the ratio of tractive force to normal force on a tire footprint. **F 538, F09**
- traffic marking**—marring or discoloration, or both, of a floor surface by traffic. **D 2825, D21**
- traffic-rail system**—a railing system designed to control the movement of people and requiring special consideration for given use conditions. Also, *queue-rail system*.
- traffic-rail system—See **railing systems**.
- transfer-rail system—See **railing systems**. **E 631, E06**

traffic-rail system

traffic-rail system—a railing system designed to control the movement of people and requiring special consideration for given use conditions. Also, *queue-rail system*. E 1481, E06

traffic surface—a surface exposed to traffic, either pedestrian or vehicular, also described as finish wearing surface. C 717, C24

trailing—see **dragging**. F 335, F05

train—a grouping of devices (or cassettes immersed in a tank all connected to the same permeate pump). See **array**, **bank**, **block**. D 6161, D19

trained assessor, n—an assessor with a high degree of sensory acuity who has experience with the test procedure and an established ability to make consistent and repeatable sensory assessments. (See also **assessor** and **expert**.) E 253, E18

trajectory, n—the rectilinear or curvilinear path of a vehicle during a stopping maneuver; it is defined by the center of gravity and the transient angular orientation of the vehicle. F 538, F09

trajectory guide line (TGL), n—the centerline marked on the test course pavement that constitutes the intended trajectory; it is used by the driver to guide or steer the vehicle on its intended path. F 538, F09

trammage, n—in *wovencrepes*, a puckered area in which a filling yarn has twist running in the same direction for several picks instead of alternating S and Z twist. D 123, D13

trammage, n—in *wovencrepes*, a puckered area in which a filling yarn has twist running in the same direction for several picks instead of alternating S and Z twist. D 3990, D13

tranquil flow—see **subcritical flow**. D 4410, D19

transcrystalline cracking—cracking or fracturing which occurs through or across a crystal; intracrystalline cracking. E 7, E04

transducer, n—a device that provides a measurable output (for example, resistance, emf, etc.) as a function of temperature. E 344, E20

transducer—an electromagnetic device for converting electrical energy into magnetic or mechanical energy and vice versa. (E 1033) E 1316, E07

transducer—an electroacoustical device for converting electrical energy into acoustical energy and vice versa. See also **crystal**. E 1316, E07

transducers, acoustic emission—see **sensor, acoustic emission**. E 1316, E07

transducer shadow correction, n—the ratio of the *true* along-axis velocity, as measured in a wind tunnel or by another accepted method, to the instrument along-axis wind measurement. D 1356, D22

transfer, n—the process of substituting a loadbearing element from one test specimen for the loadbearing element in another test specimen, or utilizing a loadbearing element from one test specimen for use in another test specimen that does not include a loadbearing element. E 176, E05

transfer—the act of moving a developed image, or a portion thereof, from one surface to another as by electrostatic or adhesive forces. F 335, F05

transfer efficiency—the amount (weight/mass) deposited on a specified target divided by the spray gun output (weight/mass) per unit of time. C 286, B08

transference, n—process by which blocking results. F 1857, F05

transference number (transport number)—the proportion of the total current carried by the ions of a given kind. B 374, B08

transference (or transport, or migration)—the movement of ions through the electrolyte associated with the passage of the electric current. B 374, B08

transference, thermal, n—the steady-state heat flow from (or to) a body through applied thermal insulation and to (or from) the external surroundings by conduction, convection, and radiation. It is expressed as the time rate of heat flow per unit area of the body surface per unit temperature difference between the body surface and the external surroundings. C 168, C16

transfer failure, n—in *characterizing the locus of failure in a*

pressure-sensitive article, separation at the interface of adhesive and backing. D 907, D14

transfer function ($U_r = a + bR$, m/s)—the linear relationship between wind tunnel speed and the rate of rotation of the anemometer throughout the specified working range. D 1356, D22

transfer glass—optical glass cooled in the pot in which it was melted. C 162, C14

transfer molding—a method of forming articles by fusing a plastic material in a chamber and then forcing essentially the whole mass into a hot mold where it solidifies. D 883, D20

transfer molding—a method of forming articles by fusing a plastic material in a chamber and then forcing essentially the whole mass into a hot mold where it solidifies. (D20) F 412, F17

transfer-rail system—a railing system designed to support and to permit the transfer of body weight in such locations as toilets, showers, and tub enclosures.

treatment—see **hazardous-waste treatment**. E 631, E06

transfer-rail system—a railing system designed to support and to permit the transfer of body weight in such locations as toilets, showers, and tub enclosures. E 1481, E06

transfer standard—See **standard**. D 1356, D22

transfer standard, n—a physical standard used to transfer a calibration from one instrument to another, usually from a reference instrument in a standards laboratory to an instrument in the field. E 284, E12

transfer-standard dosimeter—a dosimeter, often a reference-standard dosimeter suitable for transport between different locations, used to compare absorbed-dose measurements. E 170, E10

transflection—an experimental method whereby radiant energy that is transmitted through the specimen is returned through the specimen by means of an external reflector. E 131, E13

transformation, n—the change from one set of variables, x , to another set, x' , by the use of a function, $x' = f(x)$. D 123, D13

transformation ranges, n—those ranges of temperature within which austenite forms during heating and transforms during cooling. A 941, A01

transformation temperature, n—the temperature at which a change in phase occurs, with the limiting temperatures of the **transformation ranges** designated using the following symbols:

Ac_{cm} —the temperature at which the solution of cementite in austenite is completed during heating.

Ac_1 —the temperature at which austenite begins to form during heating.

Ac_3 —the temperature at which transformation of ferrite to austenite is completed during heating.

Ac_4 —the temperature at which austenite transforms to delta ferrite during heating.

$Ae_1, Ae_3, Ae_{cm}, Ae_4$ —the temperatures of phase change at equilibrium.

Ar_{cm} —the temperature at which precipitation of cementite starts during cooling.

Ar_1 —the temperature at which transformation of austenite to ferrite or to ferrite plus cementite is completed during cooling.

Ar_3 —the temperature at which austenite begins to transform to ferrite during cooling.

Ar_4 —the temperature at which delta ferrite transforms to austenite during cooling.

M_r —the temperature at which transformation of austenite to martensite is substantially completed during cooling.

M_s —the temperature at which transformation of austenite to martensite starts during cooling. A 941, A01

transformation temperature—the temperature at which a change in phase occurs. The term is sometimes used to denote the limiting temperature of a transformation range. Sometimes incorrectly and loosely referred to as Critical Point. E 7, E04

transformation temperature—temperature at which a change in phase occurs, (E 7, E04). E 1142, E37

transformation temperature range, n —in a shape memory alloy, the temperature range in which a change of phase occurs.

F 2005, F04

transformed data, n —values created by combining data with other data or subjected to a methodology or mathematical process such as logarithmic transformation, averaging; for example, annual average daily traffic, average speed by segment, congestion indices, or equivalent single-axle loads.

E 867, E17

transformed flow net—a flow net whose boundaries have been properly modified (transformed) so that a net consisting of curvilinear squares can be constructed to represent flow conditions in an anisotropic porous medium.

D 653, D18

transformer oil, oxidation inhibited—a suitably refined mineral insulating oil to which an oxidation inhibitor has been added.

D 2864, D27

transformer oil, uninhibited—a suitable refined mineral insulating oil containing no additives and only such as remain in the oil.

D 2864, D27

transient talik—a layer or body of unfrozen ground in a permafrost area that is being eliminated gradually by freezing.

D 7099, D18

translational edge—an edge of a MEMS structure that is characterized by a distinctive out-of-plane vertical displacement as seen in a 2-D data trace.

E 2444, E08

transitional hours—See **hours of operation**.

E 1480, E06

transitional hours, n (heures de transition)—times in the morning after the first workers normally arrive, until a facility is fully operational, and in the evening from the end of normal work until the occupants have left.

E 631, E06

transition curve—in a P-T diagram, the locus of the temperature and pressure values at which a congruent equilibrium between two solid phases exists.

E 7, E04

transition, first order—a change of state, associated with crystallization or melting in a polymer.

D 883, D20

transition, first order, n —a reversible change in phase of a material; in the case of polymers, usually crystallization or melting.

D 1566, D11

transition, first order—a change of state, associated with crystallization or melting in a polymer. (D20)

F 412, F17

transition flow—in leak testing, the flow of gases under conditions intermediate between laminar viscous flow and molecular flow.

E 1316, E07

transition, glass, n —the reversible physical change in a material from a viscous or rubbery state to a brittle, glassy state.

D 1566, D11

transition phase—a non-equilibrium state that appears in a chemical system in the course of transformation between two equilibrium states.

E 7, E04

transition point—at a stated pressure, the temperature, or at a stated temperature, the pressure, at which two solid phases exist in congruent equilibrium, that is, an allotropic transformation temperature, or pressure.

E 7, E04

transition point, n —in bar code reading, the edge of a space or bar where continued movement to an adjacent and complementary module causes a photodetector to reverse its bias from dark current to saturation and vice versa.

F 1294, F05

transition, second order, n —see **transition, glass**.

D 1566, D11

transition structure—in precipitation from solid solution, a metastable precipitate which is coherent with the matrix.

E 7, E04

transition temperature, n —the test temperature for which the fracture surface of the test specimen shows 50 % ductile and 50 % brittle fracture.

A 644, A04

transition time, t_T [T]—time required for extensive creep conditions to develop in a cracked body. For specimens, this is the time required for the creep deformation zone to spread through a substantial portion of the uncracked ligament.

E 1823, E08

transitory flaming, n —the existence of flame on or over the surface of the specimen for periods of between 1 and 4 s.

E 176, E05

transitory flaming, n —existence of flame on or over most of the specimen surface for periods between 1 and 4 s.

E 176, E05

transit rate—the speed at which the suspended-sediment sampler is lowered and raised in the sampling vertical.

D 4410, D19

transit-rate ratio—the ratio computed by dividing the transit rate by the mean stream velocity in the vertical being sampled.

D 4410, D19

transit time (t , (s)), n —the time required for an acoustic wavefront to travel from the transducer of origin to the receiving transducer.

D 1356, D22

translucency, n —the property of a specimen by which it transmits light diffusely without permitting a clear view of objects beyond the specimen and not in contact with it.

E 284, E12

translucent, *adj*—transmitting light diffusely, but not permitting a clear view of objects beyond the specimen and not in contact with it.

E 284, E12

translucent base media—materials with properties that allow radiological interpretation by transmitted or reflected light.

E 1316, E07

translucent body, n —body that transmits light principally by diffuse transmission. Objects are not seen distinctly through such a body.

E 349, E21

transmembrane pressure (TMP)—the net driving force (pressure or vacuum) across the membrane. The hydraulic pressure differential from the feed side to permeate side less the osmotic pressure differential on each side.

D 6161, D19

transmission, n —of radiant energy, the process whereby radiant energy passes through a material or object. (See also **diffuse transmission**, **mixed transmission**, **regular transmission**.)

E 284, E12

transmission, n —passage of radiation through a medium without change of frequency of the monochromatic components of which the radiation is composed.

E 349, E21

transmission—passage of radiant energy through a material so that it emerges from a surface other than the surface of incidence, without change in frequency.

E 772, E44

transmission coefficient—fraction of monochromatic flux internally transmitted by unit path length of a medium. One minus the absorption coefficient.

NOTE—The transmission coefficient changes with wavelength.

E 772, E44

transmission coefficient—the ratio of the amount of radiant energy leaving the last surface of an optical system to the amount of radiant energy incident on the first surface.

F 2429, F07

transmission densitometer—an instrument that measures the intensity of the transmitted light through a radiographic film and provides a readout of the transmitted film density.

E 1316, E07

transmission density, D_T , n —the negative logarithm to base ten of the transmittance factor.

E 284, E12

transmission, heat, n —the quantity of heat flowing through unit area due to all modes of heat transfer induced by the prevailing conditions.

C 168, C16

transmission method—a method of X-ray or electron diffraction in which the recorded diffracted beams emerge on the same side of the specimen as the transmitted primary beam.

E 7, E04

transmission microscope—a microscope in which the image forming rays pass through (are transmitted by) the specimen being observed.

E 7, E04

transmission (optical) density, n —logarithm to the base 10 of the reciprocal of the transmittance. Symbol: D , $D = -\log_{10} \tau$.

E 349, E21

transmission rate, water vapor—See **water vapor transmission rate**.

C 168, C16

transmission/reflection interaction—see **transflection**.

E 131, E13

transmissivity—the volume of water at the existing kinematic viscosity that will move in a unit time under a unit hydraulic gradient through a unit width of the aquifer.

D 653, D18

transmissivity—the rate at which water of the prevailing kinematic viscosity is transmitted through a unit width of the aquifer under a unit hydraulic gradient.

D 653, D18

transmissivity

transmissivity—the volume of water of the prevailing kinematic viscosity transmitted in a unit time through a unit width of the aquifer under a unit hydraulic gradient. **D 653, D18**

transmissivity of an absorbing material, n —internal transmittance of a layer of the material such that the path of the radiation is of unit length. **E 349, E21**

transmittance, n —the ratio of the radiant power transmitted by a material to the radiant power incident upon it. **E 135, E01**

transmittance, n —of light, that fraction of the incident light of a given wavelength that is not reflected or absorbed, but passes through a substance. **E 253, E18**

transmittance, τ , n —the ratio of transmitted flux to incident flux, under specified geometric and spectral conditions. (See also **diffuse transmittance, internal transmittance, regular transmittance, total transmittance**.) **E 284, E12**

transmittance, n —ratio of the transmitted radiant or luminous flux to the incident flux. Symbol: $\tau_e, \tau_v, \tau; \tau = \tau_r + \tau_d$.

NOTE—Where mixed transmission occurs, the (total) transmittance may be divided into two parts, regular transmittance (τ) and diffuse transmittance (τ_d), corresponding, respectively, to the two modes of transmission referred to above.

In general, the values of the various transmittances depend upon the mode of irradiation, the spectral composition, and the state of polarization of the incident radiation. **E 349, E21**

transmittance, τ —the ratio of the transmitted radiant flux to the incident flux (Practice E 491). See **radiometric properties and quantities**. **E 772, E44**

transmittance, τ —the ratio of the radiant flux transmitted through a body to that incident upon it. **E 1316, E07**

transmittance, n —the ratio of transmitted flux to incident flux under specified geometric and spectral conditions, expressed either as a percentage or a decimal fraction. **G 113, G03**

transmittance density, D_n , n —the negative logarithm to base ten of the transmittance. **E 284, E12**

transmittance factor, T , n —ratio of the flux transmitted by the specimen to the flux transmitted by the perfect transmitting diffuser under the same geometric and spectral conditions of measurement. **E 284, E12**

transmittance, spectral, n —the transmittance as a function of wavelength. **G 113, G03**

transmittance, T , n —the fraction of radiant energy entering a substance that reaches its further boundary. **D 4175, D02**

transmittance, T , n —the molecular property of a substance that determines its transportability of radiant power, expressed by:

$$T = P/P_o$$

where:

P = the radiant power passing through the sample, and

P_o = the radiant power incident upon the sample.

D 4175, D02

transmittance, T —the ratio of radiant power transmitted by the sample to the radiant power incident on the sample. **E 131, E13**

transmittance, thermal, n —the heat transmission in unit time through unit area of a material or construction and the boundary air films, induced by unit temperature difference between the environments on each side. **C 168, C16**

transmitted film density—the density of radiographic film determined by measuring the transmitted light. **E 1316, E07**

transmitted light scanner—an optical scanner that operates by sensing light transmitted through paper instead of reflected from its surface. **F 149, F05**

transparency, n —(I) the degree of regular transmission, thus the property of a material by which objects may be seen clearly through a sheet of it.

(2) an image on a sheet, intended to be viewed or reproduced by light transmitted through it. **E 284, E12**

transparency illuminator, n —a device to permit viewing a transparency by diffusely illuminating it from the back. **E 284, E12**

transparent, adj —transmitting radiant energy without diffusion. **E 284, E12**

transparent body, n —body in which the light transmission is mainly regular and which has a high regular transmittance. Objects are seen distinctly through such a body if its geometrical form is suitable. **E 349, E21**

transpassive region—the region of an anodic polarization curve, noble to and above the passive potential range, in which there is a significant increase in current density (increased metal dissolution) as the potential becomes more positive (noble). **G 15, G01**

transplantation, n —for therapeutic purposes, the process of implanting in one part, cells, tissue(s), or organ(s) taken from another part or from another individual. **F 2312, F04**

transportation—the complex process of moving sediment particles by water. The principal factors affecting transportation are turbulence; ratio of settling velocity to water velocity; shape, size, density, and quantity of particles; and saltation. **D 4410, D19**

transported soil—soil transported from the place of its origin by wind, water, or ice. **D 653, D18**

transport package, n —a package used to protect goods during the process of distribution (handling, storage and transportation). It includes all industrial packaging and the shipping containers used for the distribution of consumer packaged goods. **D 996, D10**

transport packaging, n —methods and materials used to protect goods during the process of distribution (handling, storage and transportation). **D 996, D10**

transverse—directions in wood at right angles to the wood fibers. Includes radial and tangential directions. A transverse section is a section through a tree or timber at right angles to the pitch. **D 9, D07**

transverse—crosswise; at right angles to the longitudinal axis of the body. **F 869, F08**

transverse construction joint deterioration, n —(CRCP only) series of closely spaced transverse cracks or a large number of interconnecting cracks occurring near a construction joint. **E 867, E17**

transverse construction joint deterioration, n —(CRCP only) series of closely spaced transverse cracks or a large number of interconnecting cracks occurring near a construction joint. **E 1778, E17**

transverse cracking, n —cracks in the pavement that are predominantly perpendicular to the direction of traffic. **E 867, E17**

transverse cracking, n —cracks in the pavement that are predominantly perpendicular to the direction of traffic. **E 1778, E17**

transverse direction—See **cross direction**. **E 7, E04**

transverse element, n —a component or subassembly that links longitudinal members together. **F 1582, F04**

transverse loads, n —loads which are perpendicular to the facings: synonymous with flatwise load. **C 274, D30**

transverse profile, n —the vertical deviations of the pavement surface from a horizontal reference perpendicular to the lane direction. **E 867, E17**

transverse rupture strength, n —the stress calculated from the flexure formula, required to break a specimen supported near the ends as a simple beam; the load is applied midway between the center lines of the supports. **B 243, B09**

transverse strain, n —linear strain in a plane perpendicular to the axis of the specimen. **E 6, E28**

transverse wave—see **shear wave**. **E 1316, E07**

transverse wave—wave motion in which the particle displacement at each point in a material is perpendicular to the direction of propagation. (E 494) **E 1316, E07**

transverse wave (shear wave)—a wave in which the displacement at each point of the medium is parallel to the wave front. (ISRM) **D 653, D18**

transverse wave, v_t (LT^{-1})—wave in which direction of displacement of element of medium is parallel to wave front. The propagation velocity, v_p , is calculated as follows:

$$v_i = \sqrt{G/\rho} = \sqrt{\mu/\rho} = \sqrt{(E/\rho)[1/2(1 + \nu)]}$$

where:

- G = shear modulus,
 ρ = mass density,
 ν = Poisson's ratio, and
 E = Young's modulus.

D 653, D18

trap, *n*—a device utilized to selectively retain specific portions (individual or groups of hydrocarbons or oxygenates) of the test sample and to release the retained components by increasing the trap temperature. D 4175, D02

trap efficiency—the percent of the incoming sediment load that is deposited. D 4410, D19

trapezoidal wire—a wire with a keystone-shaped (wedge) cross section with two circular parallel sides. B 354, B01

trash, *n*—*in cotton*, undeveloped seed, motes, small bits of seed coat, or particles of leaf appearing as specks. D 123, D13

trash, *n*—*in flax fiber*, any non-fibrous material. D 123, D13

trash, *n*—*in testing cotton with the Trash Meter*, foreign matter having a distinct difference, as seen by a video camera, between light and dark color from that of cotton. D 123, D13

trash, *n*—*in cotton*, undeveloped seed, motes, small bits of seed coat, or particles of leaf appearing as specks. (*Syn.* mote trash) D 3990, D13

trash, *n*—*in flax fiber*, any non-fibrous material. D 6798, D13

trash, *n*—*in cotton*, undeveloped seed, motes, small bits of seed coat, or particles of leaf appearing as specks. D 7139, D13

trash, *n*—*in testing cotton with the Trash Meter*, foreign matter having a distinct difference, as seen by a video camera, between light and dark color from that of cotton. D 7139, D13

Trash Meter, *n*—an instrument which optically measures the amount of trash on the surface of a raw cotton sample as presented to the viewing window. D 123, D13

Trash Meter, *n*—an instrument which optically measures the amount of trash on the surface of a raw cotton sample as presented to the viewing window. D 7139, D13

trash removal device, *n*—*in open-end spinning machines*, a system for removing impurities from the opened feed stock before the fibers are conveyed to the rotor. D 123, D13

trash removal device, *n*—*in open-end spinning machines*, a system for removing impurities from the opened feed stock before the fibers are conveyed to the rotor. D 3888, D13

trauma care system—a subsystem within the EMS system designed to manage the treatment of the trauma patient. F 1177, F30

travel, *n*—a change in appearance of a material as it is viewed over a wide range of aspect angles. E 284, E12

travel—measured distance of movement when a membrane switch is depressed. F 2112, F01

traveled surface, *n*—any man-made, solid surface for vehicular travel, for example, highways, runways, rails, guideways. E 867, E17

traveled surface roughness, *n*—the deviations of a surface from a true planar surface with characteristic dimensions that affect vehicle dynamics, ride quality, dynamic loads, and drainage, for example, longitudinal profile, transverse profile, and cross slope. E 867, E17

travertine—a porous or cellularly layered partly crystalline calcite rock of chemical origin. C 119, C18

TRC—total residual chlorine. D 6161, D19

tread, *n*—that portion of the tire which contacts the road. D 5681, D34

tread, *n*—*of a tire*, the part of a tire that comes in contact with the ground. F 538, F09

tread arc width, *n*—the length of the arc measured from one extreme of tread design proper to the opposite extreme; that is, from shoulder to shoulder perpendicular to the circumferential center line. F 538, F09

tread band, *n*—an annular volume of rubber that encompasses the outer pavement contacting periphery of a tire; the width is normally much greater than the thickness, and both of these dimensions vary with tire size. F 538, F09

tread depth average, *n*—*in a single tire*, the average of all tire groove (void) depth measurements. F 538, F09

tread depth [L], *n*—synonym for *groove (void)depth*. F 538, F09

tread hardness, *n*—the hardness of an element in the tread design as measured by a designated standard gage. F 538, F09

treadlife, *n*—the distance required to produce wear-out. F 538, F09

tread radius, *n*—the radius of a circle whose arc best fits the tread surface when radius template used is held perpendicular to the circumferential center line of an inflated tire. F 538, F09

tread rubber, *n*—compounded, natural, or synthetic rubber, which is placed on a buffed casing and vulcanized to it to provide a new wearing surface. D 5681, D34

treadwear indicator, *n*—a raised portion of a groove bottom or a void bottom that is molded in a tire at fairly regular intervals around the circumference to provide a visual indication that most of a tread has been worn away. F 538, F09

treated carbon—carbon that is coated or impregnated on the side not carbonized. The treatment is ordinarily applied to improve curl resistance or slip resistance of the sheet or both. F 221, F05

treated iron, *n*—molten cast iron to which all basic alloys and nodulizing alloys have been added but not necessarily all inoculating alloy additions. A 644, A04

treatment—a process that is applied to one or both sides of the copper foil to enhance the adhesion of the foil to the base substrate that shall not degrade the foil or the base substrate. B 846, B05

treatment—the act or manner of treating wood; the quantity of preservative or other substance specified or used to treat wood. D 9, D07

treatment, *n*—a combination of the levels (versions) of each of the factors assigned to an experimental unit, synonym **treatment combination**. E 456, E11

treatment, *n*—a combination of the levels (versions) of each of the factors assigned to an experimental unit, synonym **treatment combination**. E 1325, E11

treatment—see **hazardous-waste treatment**. E 1605, E06

treatment, *n*—any method, technique, or process designed to change the physical, chemical or biological character of a waste to neutralize the waste, render it less hazardous, make it safer to transport or manage, or reduce its volume. E 2201, E50

treatment combination, *n*—*in experimenting*, one set of experimental conditions. D 123, D13

treatment combination, *n*—see **treatment**. E 456, E11

treatment combination, *n*—see **treatment**. E 1325, E11

treatment table, *n*—a recompression schedule used to treat decompression sickness or embolisms. F 1549, F32

tree—a woody plant having one well-defined stem and a more or less definitely formed crown, usually attaining a height of at least 8 ft. D 9, D07

trees—branched or irregular projections formed on a cathode during electrodeposition especially at edges and other high current density areas. B 374, B08

tremie—material placed under water through a tremie pipe in such a manner that it rests on the bottom without mixing with the water. D 653, D18

tremie method—the method whereby materials are emplaced in the bottom of a borehole with a small diameter pipe. D 653, D18

tremolite asbestos, *n*—asbestiform variety of the monoclinic amphibole silicate minerals of the tremolite-actinolite (ferroactinolite) series. D 2946, C17

trench—usually a long, narrow, near vertical sided cut in rock or soil such as is made for utility lines. (ISRM) D 653, D18

trench foundation—The area below the pipe and bedding which supports the pipe bedding structure. C 896, C04

triangle bars

triangle bars—burning bars of triangular cross section (see also **burning bars, points, or tools**). C 286, B08

triangle test, *n*—a method of discrimination testing comprised of three coded samples, two of which are identical. The assessor is asked to select the odd sample. E 253, E18

triangular magnifying lens—thermometer stem glass in which the numerals and graduations lie on surfaces that smoothly merge to form a lens. It is so named for its approximately triangular cross section. E 344, E20

triaxial compression—compression caused by the application of normal stresses in three perpendicular directions. (ISRM) D 653, D18

triaxial shear test (triaxial compression test)—a test in which a cylindrical specimen of soil or rock encased in an impervious membrane is subjected to a confining pressure and then loaded axially to failure. D 653, D18

triaxial state of stress—state of stress in which none of the three principal stresses is zero. (ISRM) D 653, D18

triboelectric effect—the phenomenon of producing an electrostatic voltage differential between dissimilar materials by contact or friction as between the toner and the carrier. F 335, F05

triboelement, *n*—one of two or more solid bodies that comprise a sliding, rolling, or abrasive contact, or a body subjected to impingement or cavitation. (Each triboelement contains one or more **tribosurfaces**.) G 40, G02

tribology, *n*—the science and technology concerned with interacting surfaces in relative motion, including friction, lubrication, wear, and erosion. G 40, G02

tribosurface, *n*—any surface (of a solid body) that is in moving contact with another surface or is subjected to impingement or cavitation. G 40, G02

tribosystem, *n*—any system that contains one or more triboelements, including all mechanical, chemical, and environmental factors relevant to tribological behavior. (See also **triboelement**.) G 40, G02

trichromatic system, *n*—system for specifying color stimuli in terms of tristimulus values based on matching colors by additive mixture of three suitably chosen reference color stimuli. E 284, E12

trickle collector—see **collector, trickle**. E 772, E44

trickling filter—a facility for the waste waters which utilizes a flow of liquid over fixed-media. C 896, C04

triclinic—having three axes of any length, none of the included angles being equal to one another or equal to 90°. E 7, E04

tricomponent fiber, *n*—a fiber consisting of three polymers which are chemically different, physically different, or any combination of such differences. D 123, D13

tricomponent fiber, *n*—a fiber consisting of three polymers which are chemically different, physically different, or any combination of such differences. D 4466, D13

trigger trip—tool activation by trigger operation in conjunction with bottom trip activation. F 592, F16

trim, *v*—**in textiles**, to cut off a portion of a material. D 123, D13

trim—the removal of parts of a raw hide not suitable for making leather, such as portions from the outer edges of heads, shanks and bellies. D 1517, D31

trim, *v*—**in homesewing**, to cut off a narrow strip, width, or portion of a material, usually along a cut edge of a seam allowance. D 4965, D13

trimmed block, *n*—dressed crude mica that has been split into thickness of 0.18 mm and over, and has side trimming done to remove irregularities, imperfections, and residues of dirt and rock. D 1711, D09

trimmers—units of various shapes consisting of such items as bases, caps, corners, mouldings, angles, and so forth, necessary or desirable to make a complete installation and to achieve sanitary purposes as well as architectural design for all types of tile work. C 242, C21

trim nail—See **moulding nail**. F 547, F16

triple-axle load, [lb (kg)], *n*—the total load transmitted to the road surface by the tires on all wheels of three consecutive vehicle axles, with not more than 12 ft (3.7 m) between the two axles furthest apart; a portion of the gross-vehicle weight. E 867, E17

triple-cavity mold—See **multiple-cavity mold**. C 162, C14

triple-cavity process—See **multiple-cavity process**. C 162, C14

triple curve—in a P-T diagram, a line representing the sequence of pressure and temperature values among which two conjugate phases occur in univariant equilibrium. E 7, E04

triple-gob process—See **multiple-cavity process**. C 162, C14

triple point—in a P-T diagram, the temperature and pressure at which three phases occur in invariant equilibrium. E 7, E04

triple point, *n*—fixed point of a system in which three phases are in equilibrium. E 344, E20

triple point of water, *n*—triple point of the liquid, solid, and vapor phases of water. E 344, E20

triplet injector—an impinging jet atomizer in which there are three colliding liquid jets. E 1620, E29

triplet state—an electronic state with a total spin quantum number of one. E 131, E13

tripoli—friable and dustlike silica used as an abrasive. B 374, B08

trisodium phosphate (TSP)— $\text{Na}_3\text{PO}_4 \cdot 12\text{H}_2\text{O}$, a cleaning agent. D 6161, D19

tristimulus colorimeter, *n*—instrument that measures psychophysical color, in terms of tristimulus values, by the use of filters to convert the relative spectral power distribution of the illuminator to that of a standard illuminant, and to convert the relative spectral responsivity of the receiver to the responsivities prescribed for a standard observer. E 284, E12

tristimulus filters, *n*—**in cotton fiber color testing with the Color Meter**, optical filters used in conjunction with specific color lamps to obtain a response function approximating the tristimulus functions of the CIE Standard Observer for Source C. D 123, D13

tristimulus filters, *n*—**in cotton fiber color testing with the Color Meter**, optical filters used in conjunction with specific color lamps to obtain a response function approximating the tristimulus functions of the CIE Standard Observer for Source C. D 7139, D13

Tristimulus Values, *n*—the amounts of three specified stimuli required to match a color. D 4175, D02

tristimulus values—the amounts of three specified stimuli required to match a color. (See also **CIE spectral tristimulus values**.) E 284, E12

tristimulus weighting factors, $S \bar{x}$, $S \bar{y}$, $S \bar{z}$, *n*—factors obtained from products of the spectral power S of an illuminant and the spectral color matching functions \bar{x} , \bar{y} , \bar{z} of an observer, usually tabulated at wavelength intervals of 10 or 20 nm, used to compute tristimulus values by multiplication by the spectral reflectance, transmittance, or radiance (or the corresponding factors) and summation. E 284, E12

trivial name, *n*—a name that is not produced by any systematic procedure of naming. D 1129, D19

trolley wire—a round or shaped, solid bare, hard conductor ordinarily used to supply current to motors through traveling current collectors. B 354, B01

trommel, *n*—a mechanical device that sorts size-reduced scrap tires. D 5681, D34

troostite—a previously unresolvable, fine aggregate of carbide and ferrite produced by tempering martensite at temperatures in the vicinity of 400°C. Term variously and erroneously applied to bainite and nodular fine pearlite. Confusion arose because of similarity in appearance among the three structures before the advent of high-power microscopy.

(Contemporary). With reference to tool steels, synonymous with upper bainite. E 7, E04

tropical—the region lying between the tropics of Cancer and Capricorn. F 1600, F20

- trough*—See **valley**. **E 1823**, E08
- trouser back rise**, *n*—*in garment construction*, a measurement from the crotch seam to bottom edge of waistband at center of the back. **F 1494**, F23
- trouser front rise**, *n*—*in garment construction*, a measurement from the crotch seam to the bottom edge of waistband at center front. **F 1494**, F23
- trouser hips**, *n*—*in garment construction*, the garment's circumference measured at the bottom of pockets or bartack on fly. **F 1494**, F23
- trousers**,—*n, pl*—an outer garment extending from the waist to the ankle covering each leg separately. (Syn. pants). **F 1494**, F23
- trouser waist**, *n*—*in garment construction*, with trousers folded in half by the crease or mating the leg inseams, measure across waist-band's width and double the measurement. **F 1494**, F23
- troweled finish**—a concrete finish provided by smoothing the surface with power driven or hand trowels or both, after the float finishing operation. A troweled finish is smoother than the floated finish. For specifications, see ACI 301-72. **C 717**, C24
- truck tire**, *n*—a tire with a rim diameter of 500 mm or larger. **D 5681**, D34
- truck tire**, *n*—tires with a rim diameter of 20 in. (50.8 cm) or larger. **D 5681**, D34
- true attenuation**—that portion of the observed ultrasound energy loss which is intrinsic to the medium through which the ultrasound propagates. True attenuation losses may be attributed to the basic mechanisms of absorption and scattering. (E 664) **E 1316**, E07
- true continuous technique**—magnetic particle examination in which the magnetizing current is applied prior to the application of the magnetic particles and is maintained without interruption throughout the examination. **E 1316**, E07
- true gage length**, *n*—*in tensile testing*, a precise length between well-defined bench marks located on the specimen while under known tension in the unsupported portion between the holding clamps and free from contact with any snubbing surfaces or other sources which could result in nonuniform strain. **D 123**, D13
- true gage length**, *n*—*in tensile testing*, a precise length between well-defined bench marks located on the specimen while under known tension in the unsupported portion between the holding clamps and free from contact with any snubbing surfaces or other sources which could result in non-uniform strain. **D 4849**, D13
- true international roughness index**, *n*—the value of international roughness index that would be computed for a longitudinal profile measurement with the constant interval approaching zero. **E 867**, E17
- true negative**, *n*—correct classification of a truthful person as truthful. **E 2035**, E52
- trueness**, *n*—the closeness of agreement between the population mean of the measurements or test results and the accepted reference value.
- NOTE—The measure of trueness usually is expressed in terms of bias. Greater bias means less favorable trueness.
- NOTE—"Population mean" is, conceptually, the average value of an indefinitely large number of test results.
- NOTE—Trueness is the systematic component of accuracy. **E 456**, E11
- trueness**—the lack of significant curvature, inclination, note-worthy elevations, or depressions. **E 867**, E17
- true positive**, *n*—correct classification of a deceptive person as deceptive. **E 2035**, E52
- true rise**, *n*—*inbody measurements*, the vertical distance (plumb line) from the waist level at the side to the crotch. **D 123**, D13
- true rise**, *n*—the vertical distance from the waist level at the side of the body to the flat surface, taken with subject sitting on hard, flat surface (crotch depth). **D 5219**, D13
- true solution**—one in which the components are 100 % dissolved in the base solvent. **D 653**, D18
- true strain**, ϵ , *n*—the natural logarithm of the ratio of instantaneous gage length, L , to the original gage length, L_0 ; that is, $\epsilon = \ln(L/L_0)$ or $\epsilon = \ln(1+e)$. **E 6**, E28
- true stress**, σ [FL⁻²], *n*—the instantaneous normal stress, calculated on the basis of the instantaneous cross-sectional area, A ; that is, $\sigma = F/A$; if no necking has occurred, $\sigma = S(1+e)$. **E 6**, E28
- true temperature**, *n*—temperature attributed to a particular site of a *subject* or object of measurement and accepted as having a specified uncertainty. **E 344**, E20
- true value**, μ , *n*—*in statistics*, the value towards which the average of single results obtained by N laboratories tends, when N becomes very large. **D 4175**, D02
- true value**, (μ), *n*—for practical purposes, the value towards which the average of single results obtained by N laboratories tends, when N becomes very large. Consequently, such a true value is associated with the particular test method employed. **D 4175**, D02
- true value**—value of measurand that would be obtained by a perfect measurement. **E 170**, E10
- true value**, *n*—*ofa temperature*, value attributed to a particular temperature and accepted, sometimes by convention, as having an uncertainty appropriate for a given purpose. **E 344**, E20
- truncated point**—needle point with its tip sheared square. **F 547**, F16
- truncation**—*in fatigueloading*, the exclusion of cycles with values above or below a specified level (referred to as truncation level) of a loading parameter (peak, valley, range, and so forth). **E 1823**, E08
- truncation**, *n*—*inbar code printing*, decreasing the length of bars to reduce the height of the symbol below normal specifications. **F 1294**, F05
- trunk**—the main stem or body of a tree. **D 9**, D07
- trunk length (total vertical)**, *n*—the circumference taken from a point on the right shoulder midway between the neck base and the shoulder joint, down the back through the crotch and up over the prominence of the right chest/bust apex to the starting point, avoiding constriction at the crotch. **D 5219**, D13
- trunk nail**—bright, regular-stock-steel, 1/2 to 1 3/4-in. nails with rivet or oval head and extra long "V" point. **F 547**, F16
- trunnions**, *n*—*inzippers*, the two pivots at the end of the pull that fit into the bail. **D 123**, D13
- trunnions**, *n*—the two pivots at the end of the pull that fit into the bail. **D 2050**, D13
- truss**—a coplanar system of structural elements joined together at their ends usually to construct a series of triangles that form a stable beam-like framework. **E 631**, E06
- trussed rafter nail**—See **threaded nail**. **F 547**, F16
- truss plate**—See **metalconnector plate**. **E 631**, E06
- truss rod**—a tensioning rod, used for bracing in gates and at terminal posts. May be threaded at one or both ends or contain a tightener or turnbuckle for adjusting tension. **F 552**, F14
- truss rod tightener**—a tightening device used with an adjusting nut and a truss rod (sometimes incorrectly called *turnbuckle*). **F 552**, F14
- truth-in-data**, *n*—provision of adequate and appropriate metadata that should be given to users of an ADMS that a particular information set they are using is not original source data or information but rather is transformed data; that is, some transportation management centers (TMC) estimate/calculate average traffic speed by detector for each time period based upon algorithms that use volume and lane occupancy as original source data, that could also apply to some of the data being imputed. **E 867**, E17
- TSD facility**—facility for treatment, storage, or disposal of hazardous waste. **E 631**, E06
- TSEC**—total solvent extractable content. The total concentration by weight (w/w) of organic materials that are extractable from a soil or solid waste by the selected solvent. **D 5681**, D34
- TSP**—tri-sodium phosphate. **E 631**, E06
- TSP**—tri-sodium phosphate. **E 1605**, E06

TSS—total suspended solids. Concentration of undissolved solids in a liquid, usually expressed in mg/L or ppm. **D 6161, D19**

t-test, n—a test of statistical significance based on the use of Student's *t*-distribution and used to compare two sample averages or a sample average and a hypothetical value. **D 123, D13**

TTHM—total trihalomethane. **D 6161, D19**

T titration—a titration in which the sensing electrode responds to the titrant ion, not to the sample species being determined. **D 4127, D19**

tube, n—hollow wrought product that is long in relation to its cross section, which is symmetrical and is round, elliptical, a regular hexagon or octagon, or square or rectangular with sharp or rounded corners, and has uniform wall thickness except as affected by corner radii.

Alclad tube, n—a composite tube product comprised of an aluminum-alloy core having on either the inside surface (only) or outside surface (only) a metallurgically bonded aluminum or aluminum-alloy coating that is anodic to the core, thus electrolytically protecting the core against corrosion.

arc-welded tube, n—tube made from sheet or plate formed by positioning two opposite edges of the metal together and butt welded by either the gas-tungsten or gas-metal arc-welding method, with or without the use of filler metal; individually fabricated tube may be welded together to produce the ordered length.

drawn tube, n—tube brought to final dimensions by drawing through a die.

extruded tube, n—tube formed by hot extruding.

finned tube, n—tube which has integral fins or projections protruding from its outside surface.

heat exchanger tube, n—tube used in apparatus in which fluid inside the tube will be heated or cooled by fluid outside the tube, but the term is usually not applied to coiled tube or to tube for use in refrigerators or radiators.

seamless tube, n—a tube that does not contain any junctures (metallurgical welds) resulting from the method of manufacture and may be produced by die and manrel, or by hot piercer processes.

sized tube, n—tube that, after extrusion, has been cold drawn a slight amount to minimize ovality.

structural tube, n—tube commonly used for structural purposes.

welded tube, n—tube produced by forming and seam-welding sheet longitudinally. **B 881, B07**

tube, n—a hollow product of round or any other cross section having a continuous periphery of uniform shape.

NOTE—The following standards use the same definition for "tube," less the words "of uniform shape." **B 899, B02**

tube, n—a cylindrical paperboard **container**, convolutely or spirally wound, having paper, wood, metal, or combination ends.

collapsible tube—in packaging, a flexible **container** having a dispensing tip and cap at one end, and closed at the opposite end, serving as both package and dispenser.

composite tube—in packaging, a **tube** consisting usually of multiple layers of **fiberboard**, film, or foil providing barrier properties, and an outer layer of paper.

fiberboard tube—in packaging, a cylindrical or multisided form.

paperboard (mailing) tube—in packaging, a cylindrical **container** wherein the length does not exceed ten times the girth with a minimum 1/8-in. (3-mm) wall thickness. **D 996, D10**

tube, n—a tubular conduit for transport of fluids or finely divided solids; also, a hollow structural member; a hollow product of round or other cross section. **E 631, E06**

tube—the component that encloses the spindle. It is attached to the lock horn and dial ring (not used in all lock designs). **F 471, F12**

tube, air conditioning—a seamless copper tube conforming to a standard series of sizes, and to specified internal cleanliness

requirements normally furnished in straight lengths, with the ends capped or sealed. **B 846, B05**

tube A manchette—in grouting, a grout pipe perforated with rings of small holes at intervals of about 12 in. (305 mm). **D 653, D18**

tube, automotive and general service—a seamless copper tube of small diameter conforming to a standard series of sizes commercially known as automotive and general service tube. **B 846, B05**

tube, capillary—a tube of small inside diameter with an inside surface of highest quality and conforming to close-diameter tolerances. It is subject to special tests to ensure precision and uniformity of bore and is specially cleaned and packed. **B 846, B05**

tube, condenser—see tube, heat exchanger. **B 846, B05**

tube, copper service—a bendable copper water tube for underground water service. **B 846, B05**

tube, copper water—a seamless copper tube conforming to the particular dimensions commercially known as copper water tube and designated as Types K, L, and M. **B 846, B05**

tube current—the current, measured in milliamperes, passing between the cathode and anode during the operation of an X-ray tube. **E 1316, E07**

tube current—the transfer of electricity, created by the flow of electrons, from the filament to the anode target in an X-ray tube; usually expressed in unit of milliamperes. **E 1316, E07**

tube, ferrule—a tube from which metal rings or collars (ferrules) are made for use in installing condenser tubes. **B 846, B05**

tube furnace—a muffle furnace in which combustion occurs within alloy tubes. **C 286, B08**

tube, heat exchanger—a tube manufactured to special requirements as to dimensional tolerances, finish, and temper for use in condensers and other heat exchangers. **B 846, B05**

tube, heat exchanger with integral enhanced surface—an external or internal surface, or both, modified by a cold forming operation, to produce an enhanced surface for improved heat transfer. The enhancement may take the form of longitudinal or helical fins or ridges, or both, or modifications thereto. **B 846, B05**

tube, heat exchanger with integral fins—a tube having a series of metallic ribs on the outside or inside surface either parallel to the longitudinal axis or circumferentially extended from the tube to increase the effective surface area for heat transfer applications. The fins may be mechanically applied, drawn, or integrally extended from the tube wall. **B 846, B05**

tube horn—an integral part of the case to which the tube is attached (not used in all locks). **F 471, F12**

tuberculation—the formation of localized corrosion products that appear on a surface as knoblike prominences (tubercules). **G 15, G01**

tube, refrigeration service—a seamless copper tube conforming to a standard series of sizes, and to special internal cleanliness and dehydration requirements, normally furnished to soft temper coils and with ends capped or sealed. **B 846, B05**

tube, seamless—a tube produced with a continuous periphery in all stages of the operations. **B 846, B05**

tube, seamless water—a tube conforming to the particular dimensions of tube commercially known as copper water tube and designated as Types K, L, and M in inch-pound units and Types A, B, and C in SI units. **B 846, B05**

tube terminal staple—staple designed for use as a wiring terminal in electronic assembly. **F 592, F16**

tube/tubing—hollow section of metal or other material having a round, square, rectangular, or other cross-sectional form, its size being designated by outside dimension(s) and wall thickness, in inches (millimeters). **E 1481, E06**

tube, waveguide—a tube used as a transmission line to electronic equipment. **B 846, B05**

tube, welded—tube made by processing strip into a tubular shape and welding the edges to make a longitudinal seam. **B 846, B05**

tube, welded water—a tube conforming to the particular dimensions

- of tube commercially known as copper water tube and designated as Types WK, WL, and WM in inch-pound units, and Types WA, WB, and WC in SI units. **B 846, B05**
- tubing, n**—braided, knitted, or woven fabric of cylindrical form having a width of 4 in. or more (circumference of 8 in. or more). (See also **sleeving**.) **D 123, D13**
- tubing, n**—braided, knitted, or woven fabric of cylindrical form having a width of 100 mm (4 in.) or more (circumference of 200 mm (8 in.) or more). **D 7018, D13**
- tubing, n**—a system of tubes. **E 631, E06**
- tubing nail**—See **conduit nail**. **F 547, F16**
- tuck, n**—**in rope**, a free strand of the rope placed between the rope strands during splicing. **D 123, D13**
- tucked seam, n**—a complex seam formed on the inside of the object with neither raw edge enclosed, having one visible line of topstitching on the face side and a visible free folded edge (tuck). (Compare **lapped seam**.) **D 123, D13**
- tucked seam, n**—**in home sewing**, a complex seam formed on the inside of the product with neither cut edge enclosed and having one visible line of topstitching on the face side and a visible free folded edge (tuck). (Compare **lapped seam**.) **D 4965, D13**
- tucking defect, n**—**in knitted fabrics**, one or more unwanted tuck loops. **D 123, D13**
- tucking defect, n**—**in knitted fabrics**, one or more unwanted tuck loops. **D 3990, D13**
- tuck point, v**—(1)(*historical*) to point masonry with a flush mortar joint that approximates the color of the masonry units and then add a mortar strip of contrasting color such that a narrow mortar joint width is simulated. (2) regional term for repoint. **C 1180, C12**
- tuckstone**—blocks placed on top of flux blocks to protect them from flame and gases and as a seal between them and the supported side and end walls. **C 162, C14**
- tuck wall**—the series of tuckstones or a wall serving the same purpose made of courses of brick. **C 162, C14**
- tuft, n**—**in pile yarn floor coverings**, those cut or uncut loops which form part of the fabric face that are attached or bound to the backing fabric at binding sites. **D 123, D13**
- tuft, n**—**in pile yarn floor coverings**, those cut or uncut loops which form part of the fabric face that are attached or bound to the backing fabric at binding sites. **D 5684, D13**
- tuft bind, n**—**in pile fabrics**, the force required to pull a tuft element from a pile yarn floor covering. **D 123, D13**
- tuft bind, n**—**in pile fabrics**, the force required to pull a tuft element from a pile yarn floor covering. **D 5684, D13**
- tufted, n**—buttoned or laced through the upholstery cover material and upholstery material. **E 176, E05**
- tufted fabric, n**—a fabric with a pile consisting of tufts or loops formed by inserting yarn into a previously prepared backing fabric. **D 123, D13**
- tufted fabric, n**—a fabric with a pile consisting of tufts or loops formed by inserting yarn into a previously prepared backing fabric. **D 4850, D13**
- tufted fabric, n**—a fabric with a pile consisting of tufts or loops formed by inserting yarn into a previously prepared backing fabric. **D 5684, D13**
- tuft element, n**—**for pile yarn floor covering**, a segment of yarn bound to a backing fabric at a binding site with two portions (legs) of the yarn projecting above the backing fabric, one portion on each side of the binding site. **D 123, D13**
- tuft element, n**—**for pile yarn floor covering**, a segment of yarn bound to a backing fabric at a binding site with two portions (legs) of the yarn projecting above the backing fabric, one portion on each side of the binding site. **D 5684, D13**
- tuft height, n**—**for pile yarn floor covering**, the length of a tuft leg. **D 123, D13**
- tuft height, n**—**or cut pile yarn floor covering**, the length of a tuft leg. **D 5684, D13**
- tufting, n**—**in upholstered furniture**, localized indentation of upholstered furniture surfaces and cushions, by the use of or appearance of buttons, providing an aesthetic treatment. **D 123, D13**
- tufting, n**—**in upholstered furniture**, localized indentation of upholstered furniture surfaces and cushions, by the use of or appearance of buttons, providing an aesthetic treatment. **D 7023, D13**
- tuft leg, n**—**for pile yarn floor covering**, one of the two portions of a tuft element that projects above the backing fabric on the pile side of the floor covering. **D 123, D13**
- tuft leg, n**—**for pile yarn floor covering**, one of the two portions of a tuft element that projects above the backing fabric on the pile side of the floor covering. **D 5684, D13**
- tuft length, n**—**for pile yarn floor covering**, the length of a tuft element measured while extended in a straight line under zero tension. **D 123, D13**
- tuft length, n**—**for pile yarn floor covering**, the length of a tuft element measured while extended in a straight line under zero tension. **D 5684, D13**
- tumbled**—a worn surface produced by rotating stone objects (like tiles) in a drum, sometimes with sand or aggregate stone, until the faces and edges become eroded. **C 119, C18**
- tumbled**—cleaned and polished by agitation in rotating drum containing polishing compound, such as sawdust or other burnishing media. **F 547, F16**
- tumbler-galvanized**—See **hot-galvanized**. **F 547, F16**
- tumbler, hand change**—an assembly, usually in the form of a circular disk, with a gate designed to accept a fence. When released by hand, the position of the gate may be set in order to change the combination. **F 471, F12**
- tumbler, hole change**—a component, usually in the form of a circular disk, into which a drive pin may be inserted at a selected position, to change the combination. **F 471, F12**
- tumbler, key change**—an assembly, usually in the form of a circular disk, with a gate designed to accept a fence. When released by a key, the position of the gate may be set to change the combination. **F 471, F12**
- tumbler pack**—an assembly of tumblers and components for assembly on a tumbler post. **F 471, F12**
- tumbler post**—a component upon which the tumbler pack is assembled and about which the tumblers rotate. **F 471, F12**
- tumbler, screw change**—an assembly, usually in the form of a circular disk, with threaded perforations into which a screw serving as a drive pin may be inserted at selected positions for change of combination. **F 471, F12**
- tumbler, wheel**—an assembly, usually in the form of a circular disk, with a gate and drive pin, the locations of which may be set to selected positions for changing the combination. **F 471, F12**
- tumbling**—See **barrel finishing**. **B 374, B08**
- tundra**—treeless terrain with a continuous cover of vegetation, found at both high latitudes and high altitudes. **D 7099, D18**
- tundra**—the vast, treeless, nearly level plains of the arctic regions. **F 1600, F20**
- tunnel**—a man-made underground passage constructed without removing the overlying rock or soil. Generally nearly horizontal as opposed to a shaft, which is nearly vertical. (ISRM) **D 653, D18**
- turbel**—a suborder of gelsol that displays evidence of extensive mixing due to the action of frost (cryoturbation). **D 7099, D18**
- turbic cryosol**—a mineral soil showing marked evidence of cryoturbation, as evidenced by broke horizons and displaced material. **D 7099, D18**
- turbidity, n**—reduction of transparency of a sample due to the presence of particulate matter. **D 1129, D19**
- turbidity**—an expression of the optical properties of a sample which causes light rays to be scattered and absorbed rather than transmitted in straight lines through the sample. Turbidity of water is caused by the presence of suspended and dissolved matter such as clay, silt, finely divided organic matter, plankton, other microscopic organisms, organic acids, and dyes. **D 4410, D19**

turbidity

turbidity—reduction of transparency of a sample due to the presence of particulate matter. **D 5681, D34**

turbidity—an expression of the optical properties of a sample that causes light rays to be scattered and absorbed rather than transmitted in straight lines through the sample. Turbidity of water is caused by the presence of matter such as clay, silt, finely divided organic matter, plankton other microscopic organisms, organic acids and dyes. **D 6161, D19**

turbidity, *n*—reduction of transparency of a specimen due to the presence of particulate matter. **E 284, E12**

turbidity, absolute, *n*—the fractional decrease of incident monochromatic light through the sample, integrating both scattering and transmitted light. **D 1129, D19**

turbidity current—See **densitycurrent**. **D 4410, D19**

turbidity, Jackson candle, *n*—an empirical measure of turbidity in special apparatus, based on the measurement of the depth of a column of water sample that is just sufficient to extinguish the image of a burning standard candle observed vertically through the sample. **D 1129, D19**

turbidity, jackson candle (JTU)—an empirical measure of turbidity in special apparatus, based on the measurement of the depth of a column of water sample that is just sufficient to extinguish the image of a burning standard candle observed vertically through the sample. **D 6161, D19**

turbidity, nephelometric, *n*—an empirical measure of turbidity based on a measurement of the light-scattering characteristics (Tyndall effect) of the particulate matter in the sample. **D 1129, D19**

turbidity, nephelometric (NTU)—an empirical measure of turbidity based on a measurement of the light-scattering characteristics (tyndall effect) of the particulate matter in the sample. **D 6161, D19**

turbine power nozzle, *n*—an attachment for a vacuum cleaner containing a turbine driven agitator that assists in dirt removal from a floor surface. **F 395, F11**

turbulence—the irregular motion of a flowing fluid. **D 4410, D19**

turbulent flow—that type of flow in which any water particle may move in any direction with respect to any other particle, and in which the head loss is approximately proportional to the second power of the velocity. **D 653, D18**

turbulent flow, *n*—that type of flow in which any water particle may move in any direction with respect to any other particle, and in which the head loss is approximately proportional to the second power of the velocity. **D 4439, D35**

turf-banked (solifluction) lobe—a solifluction lobe with its front covered by a vegetation mat. **D 7099, D18**

turf-banked (solifluction) terrace—a solifluction terrace with its front covered by a vegetation mat. **D 7099, D18**

turf hummock—a hummock consisting of organic and vegetation matter with or without a core of mineral soil or stones. **D 7099, D18**

turnaround document—a form produced by an electronic data processing system intended for future re-entry, possibly with added data, via an optical scanner. **F 149, F05**

turnbuckle—a tightening device with left hand and right hand threads at opposite ends, used with a truss rod. **F 552, F14**

turned and stitched seam finish, *n*—See **clean finished seam finish**. **D 4965, D13**

turned-over edge—See **curled selvage**. **D 3990, D13**

turn insulating paper, *n*—paper used to insulate conductors that will become coils in a transformer or other inductive apparatus. The conductors are commonly rectangular in cross section. **D 1711, D09**

turn point, *n*—point where a contour makes a sudden change in direction. **D 6963, D13**

turpentine, oil of—See **oil of turpentine**. **D 804, D01**

turpentine, spirits of—See **spirits of turpentine**. **D 804, D01**

turret or collar, *n*—a fitment that secures the body to the closure. **D 6655, D10**

tweak—to make a mechanical adjustment of a spring arm of an electrical contact assembly to adjust the force or position of the contact. **B 542, B02**

tweel, tuille—a counterweighted furnace door, opening vertically. **C 162, C14**

twelve-harness satin, *n*—a weave similar to eight-harness satin except in warp-faced fabrics warp yarns show on the face of the fabric eleven out of twelve adjacent yarns and in filling-faced fabrics filling yarns show on the face eleven out of twelve adjacent yarns. **D 123, D13**

twelve-harness satin, *n*—a weave similar to eight-harness satin except in warp-faced fabrics warp yarns show on the face of the fabric eleven out of twelve adjacent yarns and in filling-faced fabrics filling yarns show on the face of the fabric eleven out of twelve adjacent yarns. **D 7018, D13**

twill braid, *n*—in rope, a braided construction in which one strand of one direction of rotation about the axis passes over two strands of the opposite direction and it in turn passes under the next two strands of opposite direction. **D 123, D13**

twill weave, *n*—a weave characterized by diagonal lines produced by a series of floats staggered in the warp direction, which are normally formed by the filling (a filling-faced twill). (See also **warp-faced twill**.) **D 123, D13**

twill weave, *n*—a weave characterized by diagonal lines produced by a series of floats staggered in the warp or filling direction. (See also **warp-faced twill** and **filling-faced twill**.) **D 123, D13**

twill weave, *n*—a weave characterized by diagonal lines produced by a series of floats staggered in the warp or filling direction. (See also **warp-faced twill** and **filling-faced twill**.) **D 4850, D13**

twin bands—bands across a crystal grain, observed on a polished and etched section, the crystallographic orientations of which have a mirror image relationship to the orientation of the matrix grain across a composition plane which usually is parallel to the sides of the band.

(1) **annealingtwin**—twin bands which are produced during annealing following cold work.

(2) **mechanicaltwins**—twin bands which are produced by cold work.

(3) **Neumann bands**—mechanical twins in ferrite. **E 7, E04**

twine, *n*—(1) a term applied loosely to a variety of textile strands used for tying such articles as parcels, bundles, or bales.

(2) an aggregate of fibers or yarns compacted into a partially or completely balanced twisted structure of indefinite length, generally used for tying or binding. **D 123, D13**

twin-fluid atomizer—see **pneumatic atomizer**. **E 1620, E29**

twist—a distortion caused by the turning or winding of the edges of a board so that the four corners or any face are no longer in the same plane. **D 9, D07**

twist, *n*—in textilestrands, the helical or spiral configurations induced by turning a strand about its longitudinal axis. **D 123, D13**

twist, *n*—in fibrouscomposites, a measure of the number of turns per unit length a fiber bundle makes around its axis. **D 3878, D30**

twist—a condition of longitudinal progressive rotation found in pultruded parts.

NOTE—This term describes a condition that can be easily detected for a noncircular cross section by placing the pultrusion on a plane surface, holding one end flat with the surface, and observing if one edge or side of the other end does not lie parallel with that surface. **D 3918, D20**

twist, *n*—in textile strands, the helical or spiral configurations induced by turning a strand about its longitudinal axis. **D 4849, D13**

twist—the type of selvage obtained by twisting adjacent pairs of wire

ends together in a close helix of 1½ machine turns, which is equivalent to three full twists. **F 552, F14**

twist (amount of), *n*—the number of turns per unit length of yarn or textile strand (or of a product such as cable or hose) around its axis. **D 1566, D11**

twist balance, *n*—in glass fiber cord and sewing thread, the relationship of primary and final twist to each other and to the cord size such that residual torsional effects are nullified. **D 123, D13**

twist balance, *n*—in glass fiber cord and sewing thread, the relationship of primary and final twist to each other and to the cord size such that residual torsional effects are nullified. **D 7018, D13**

twisted—provided with four or more continuous, symmetrical, helical deformations; resulting from twisting of square nail wire about its own longitudinal axis prior to heading and pointing of nail. Helical deformations resulting from this manufacturing process extend all the way from head to point, thus preventing inclusion of clearance between head and thread. **F 547, F16**

twisted nail—helically twisted, squarewire, ½ by 0.072 to 6 by 0.250-in. drivescrew nails, usually of tempered stiff-stock, with flat or countersunk head and medium diamond point, with crest diameter being referred to as diameter. **F 547, F16**

twisted or laid rope, *n*—rope made from three or more strands which are laid or twisted together in a twist direction opposite to the twist direction in the strands. **D 123, D13**

twist factor, *n*—the product obtained when the twist expressed in turns per centimetre is multiplied by the square root of the yarn number expressed in tex.

$$\text{Twist factor (TF)} = \text{tpcm} \times \sqrt{T}$$

where:

T = yarn number expressed in tex.

D 123, D13

twist factor, TF, *n*—the product obtained when the twist expressed in turns per centimetre is multiplied by the square root of the yarn number expressed in tex.

$$\text{Twist factor (TF)} = \text{tpcm} \times \sqrt{T^{1/2}}$$

where:

$\sqrt{L^{1/2}}$ = yarn number expressed in tex.

Twist multiplier and twist factor are a measure of the twist "hardness" of yarn because they are approximately proportional to the tangent of the angle between fibers on the outer yarn surface and the axis of the yarn; the larger this angle, the harder the twist. Furthermore, this angle is a function of both the twist content (turns per unit length) and the number of fibers per yarn cross section (yarn number). Hence, twist content alone cannot provide a measure of the twist hardness of a yarn. Twist multiplier and twist factor are proportional to each other and differ only in the units used. The two are related by the following equations.

$$TF = k \times TM$$

$$k = 277.29/\sqrt{L^{1/2}}$$

Where:

$\sqrt{L^{1/2}}$ = length in yards of the hank used to define the indirect yarn number of the type,

N = hanks/lb. In particular for cotton system,

k = 9.567 and Eq 168 becomes:

$$TF = 9.567 \times TM$$

D 4849, D13

twist multiplier, TM, *n*—the quotient of the twist expressed in turns per inch and the square root of the yarn number in an indirect system.

$$\text{Twist multiplier (TM)} = \text{tpi}/\sqrt{N}$$

where:

N = yarn number in an indirect system, the cotton system unless otherwise specified.

D 123, D13

twist multiplier, (TM), *n*—the quotient of the twist expressed in turns per inch and the square root of the yarn number in an indirect system.

$$\text{Twist multiplier (TM)} = \text{tpi}/\sqrt{N^{1/2}}$$

where:

$\sqrt{N^{1/2}}$ = yarn number in an indirect system, the cotton system, unless otherwise specified.

D 4849, D13

twist nail—slender, copper or aluminum nails with flat head and medium needle point for twist clinching, that is, for having part of nail shank twisted to form a clinched point. **F 547, F16**

twist take-up, *n*—the change in length of a yarn or other textile strand caused by twisting, expressed as a percent of the original untwisted length. **D 123, D13**

twist take-up, *n*—the change in length of a yarn or other textile strand caused by twisting, expressed as a percent of the original untwisted length. **D 4849, D13**

twist, yarn, *n*—the number of turns, about its axis, per unit of length, observed in a yarn or other textile strand. **D 1566, D11**

two-body abrasive wear, *n*—a form of abrasive wear in which the hard particles or protuberances which produce the wear of one body are fixed on the surface of the opposing body. **G 40, G02**

two coat-one fire—the application of two different coats of enamel followed by a single firing step. **C 286, B08**

two-dimensional symbology—see **2D symbol**. **F 1294, F05**

two-fluid atomizer—see **pneumatic atomizer**. **E 1620, E29**

two-front button, *n*—a button in which the face and back shape are identical. **D 5497, D13**

two-layer permafrost—ground in which two layers of permafrost are separated by a layer of unfrozen ground. **D 7099, D18**

two-of-five test, *n*—a method of discrimination testing comprised of five samples: two are identical samples of one product and three are identical samples of a second product. The assessor's task is to determine which two samples are different from the other three. **E 253, E18**

two-phase system—a vapor phase and a single liquid phase, usually containing dissolved propellant, inside the container. **D 3064, D10**

two-phase thermosyphon—a passive heat transfer device, filled with a temperature-dependent liquid/vapor combination, installed to remove heat from the ground. **D 7099, D18**

two-point threshold (touch), *n*—the minimum normal distance between two objects such that they are perceived as two a specified percent of the time. **E 253, E18**

two-side structural sealant glazing, *n*—in building construction, a glazing system wherein two sides of a rectangular-shaped lite or panel, usually opposing, are structural sealant glazed. **C 717, C24**

two-way sort—an electromagnetic sort based on a signal response from the material under test above or below a level established by two or more calibration standards. **E 1316, E07**

T-X diagram—a two-dimensional, graphical representation of the isobaric phase relationships in a binary system; the coordinates of the graph are temperature and concentration. **E 7, E04**

tympanic temperature, *t_{ty}*, *n*—temperature of either tympanic membrane as measured by a contact thermometer. **E 344, E20**

tyndall effect—the path of light through a heterogeneous medium made visible by the solid particles. **D 6161, D19**

type—the designation of plywood as a function of veneer grade and adhesive durability. **D 1038, D07**

type

type—the descriptive term for designating a penetrant as either fluorescent (type 1) or visible (type 2). **E 1316, E07**

Type A operating characteristic curve, *n*—an operating characteristic curve which describes the operation of a sampling plan where the size of the lot being sampled is taken into consideration. **D 123, D13**

type bar—a bar, mounted on an impact printer, that holds type slugs. **F 909, F05**

Type B operating characteristic curve, *n*—an operating characteristic curve which describes the operation of a sampling plan where items are drawn at random from a theoretically infinite process. **D 123, D13**

Type F (flexible) flat sheets—asbestos-cement flat sheet suitable for exterior or interior use, where a board having higher strength and density, smoother surface, greater flexibility, and lower moisture absorption is desired. **D 2946, C17**

type font—type of a given size and style, for example, 10-point Bodoni Modern. **F 909, F05**

Type I—exhaust hood designed for removal of grease and smoke. It includes both listed grease filter, baffles, or extractors for removal of the grease and fire suppression equipment. See **exhaust hood**. **F 1827, F26**

Type I apparel—apparel designed for general heavy work; it may be subjected to breaking and tearing stresses indoors or out. **D 123, D13**

Type I apparel, *n*—apparel designed for general heavy work; it may be subjected to breaking and tearing stresses indoors or out. **D 7022, D13**

Type II—exhaust hood designed for collection and removal of steam, vapor, heat, and odors where grease is not present. It may or may not have filters or baffles and typically does not have a fire suppression system. **F 1827, F26**

Type II apparel—apparel designed for light work or leisure activities; it will not be expected to undergo severe physical stresses. **D 123, D13**

Type II apparel, *n*—apparel designed for light work or leisure activities; it will not be expected to undergo severe physical stresses. **D 7022, D13**

Type II mineral oils, *n*—oils for steam and gas turbine lubricating

systems where the machinery requires enhanced load carrying capacity. These oils are similar to Type I and are typically used in gas turbines with a load carrying gear marine turbines. Such oils contain rust and oxidation inhibitors, plus mild extreme pressure (EP) additives and other additives as needed to meet the specified performance characteristics. Type II oils usually are available in ISO-VG 32, 46, 68, 100, and 150. **D 4175, D02**

Type I mineral oils, *n*—oils for steam and gas turbine lubricating systems where the machinery does *not* require lubricants with enhanced load carrying capacity. Such oils normally contain rust and oxidation inhibitors plus other additives as needed to meet the specified performance characteristics. Type I oils usually are available in ISO-VG 32, 46, 68, and 100 (see Classification D 2422). **D 4175, D02**

type of thermocouple—the type of a thermocouple is represented by a letter designation as defined in accordance with Specification E 230. **E 344, E20**

Type U (utility) flat sheets—asbestos-cement flat sheet suitable for exterior or interior use, having sufficient strength for general utility and construction purposes, and where a board having maximum flexibility, highest density, smoother surface, and lower moisture absorption is not essential. **D 2946, C17**

typewriter—a machine for writing in characters similar to those produced by printers' type by means of keyboard-operated types striking through an inked ribbon. **F 909, F05**

typical metal connector plate—metal connector plate representative of single shipment of plate to be tested; with plate manufacturing procedure simulating actual production conditions anticipated during plate fabrication as well as during member and component assembly. **E 631, E06**

typical serviceability score—See **serviceability score**. **E 1480, E06**

typical value, *n*—for *geosynthetics*, the mean value calculated from documented manufacturing quality control test results for a defined population obtained from one test method associated with on specific property. **D 4439, D35**

typp, *n*—an obsolete indirect yarn numbering system equal to the number of 1000-yd lengths per pound. **D 123, D13**

typp, *n*—an obsolete indirect yarn numbering system equal to the number of 1000-yd lengths per pound. **D 4849, D13**

U

UCC/EAN, *n*—a consortium of UCC and EAN that promulgates international standards. **F 1294**, F05

UCL—a generic term to represent the aggregate quantity of material that causes an incident light beam to be scattered. The value can be correlated to either turbidity or to specific particle count levels of a defined size. **D 6161**, D19

“U” configuration (aka catenary configuration)—boom positioned in a “U” shape. **F 818**, F20

ulcer, *n*—a local defect, or excavation of the surface of an organ or tissue, which is produced by the sloughing of inflammatory necrotic tissue. **F 2312**, F04

ullage, *n*—that volume of a closed system or container which is filled with vapor. **D 4175**, D02

ULPA filter—ultra-low-penetration air filter.
ultimate strength—See **strength**. **E 631**, E06

ultimate analysis, *n*—*in the case of coal and coke*, the determination of carbon and hydrogen in the material, as found in the gaseous products of its complete combustion, the determinations of sulfur, nitrogen, and ash in the material as a whole, and the calculation of oxygen by difference. **D 121**, D05

ultimate analysis, *n*—in analysis of combustible materials, the determination of the percentages of carbon, hydrogen, sulfur, nitrogen, chlorine, ash, and oxygen in a moisture-free sample; the percentage of oxygen is usually determined by difference. **D 5681**, D34

ultimate analysis—the determination of the percentages of carbon, hydrogen, sulfur, nitrogen, chlorine, ash, and oxygen in a dry refuse-derived fuel sample. The percentage of oxygen may be obtained by difference between 100 % and the sum of the other determined elemental analyses. **E 856**, D34

ultimate analysis—the determination of carbon and hydrogen in the material, as found in the gaseous products of its complete combustion, the determination of sulfur, nitrogen, and ash in the material as a whole, and the calculation of oxygen by difference. **E 1705**, E48

ultimate analysis—the determination of the elemental composition of the organic portion of carbonaceous materials as well as the total ash and moisture. Determined by prescribed methods. **E 1705**, E48

ultimate bearing capacity, q_e , q_{ult} (FL^{-2})—the average load per unit of area required to produce failure by rupture of a supporting soil or rock mass. **D 653**, D18

ultimate biodegradation, *n*—degradation achieved when the test substance is totally utilized by microorganisms resulting in the production of CO_2 , (and possibly methane in the case of anaerobic biodegradation), water, inorganic compounds, and new microbial cellular constituents (biomass or secretions, or both). **D 4175**, D02

ultimate biodegradation, *n*—degradation achieved when the test material is totally utilized by microorganisms, resulting in the production of carbon dioxide (and possibly methane, in the case of anaerobic biodegradation), water, inorganic compounds, and new microbial cellular constituents (biomass or secretions, or both). **D 6384**, D02

ultimate biodegradation test, *n*—a test that estimates the extent to which the carbon in a product has been converted to CO_2 or methane, either directly, by measuring the production of CO_2 or methane, or indirectly, by measuring the consumption of O_2 . **D 4175**, D02

ultimate biodegradation test, *n*—a test which estimates the extent to which the carbon in a material is converted to carbon dioxide or methane, either directly by measuring the production of carbon dioxide O_2 or methane, or indirectly by measuring the consumption of oxygen. **D 6384**, D02

ultimate capacity, *n*—as applied to loadbearing elements, the actual maximum load carrying capacity of an element based on properties specific to the material constituting the element. **E 176**, E05

ultimate fiber, *n*—*in flax*, an individual bast fiber. **D 123**, D13

ultimate fiber, *n*—*in flax*, an individual bast fiber. **D 6798**, D13

ultimate resilience, R_u [FL^{-2}], *n*—a material parameter defined by the equation:

$$R_u = S_u^2/2E$$

where:

S_u = ultimate tensile strength, and

E = elastic modulus, as determined from a conventional tension test.

G 40, G02

ultimate strength—the maximum three edge bearing test load supported by a pipe. **C 822**, C13

ultimate strength—maximum resistance to external force, load, or generation of internal strain of a material, member, connection, component, or assembly at which failure occurs; expressed in terms of units of force, newtons (pound-force); as compared to ultimate stress which is expressed in units of force per unit of area. Often referred to as *maximum load*, *ultimate load*, *maximum strength*, or *nominal strength*, and incorrectly referred to as ultimate stress. **E 631**, E06

ultimate strength, *n*—the maximum force sustained as defined by a standard test method. **F 1773**, F08

ultimate tensile load—maximum tensile-applied load or force a fastener can support prior to or coincidental with its fracture, and normally expressed in terms of pounds or Newtons. **F 1789**, F16

ultimate tensile strength, *n*—the highest load attained during a tensile test, converted to unit stress based on the original cross-section area of the tensile test specimen. **C 709**, D02

ultimate tensile strength, *n*—the highest load attained during a tensile test, converted to unit stress based on the original cross-section area of the tensile test specimen. **D 4175**, D02

ultra accelerator, *n*—a highly active accelerator for fast vulcanization and often used for low-temperature vulcanization.

D 1566, D11

ultrafiltration, *n*—a process employing semipermeable membrane under a hydraulic pressure gradient for the separation of components in a solution. The pores of the membrane are of a size which allow passage of the solvent(s) but will retain non-ionic solutes based primarily on physical size, not chemical potential.

D 1129, D19

ultrafiltration (UF)—a pressure driven process employing semipermeable membrane under a hydraulic pressure gradient for the separation of components in a solution. The pores of the membrane are of a size smaller than $0.1\mu m$, which allows passage of the solvent(s) but will retain non-ionic solutes based primarily on physical size, not chemical potential. **D 6161**, D19

ultra-low penetration air (ULPA) filter—filter capable of separating out particles of $0.13\mu m$ or greater from a body of air at 99.9995 % efficiency or greater. See also **HEPA filter**. **E 631**, E06

ultramicroscopic—below the resolution of the microscope. **E 7**, E04

ultra pure water—water generally used in semiconductor industry having specifications (chemical, physical and biological) for extremely low contaminant levels. **D 6161**, D19

ultrasonic—pertaining to mechanical vibrations having a frequency greater than approximately 20 000 Hz. **E 1316**, E07

ultrasonic cavitation test device, *n*—a vibratory cavitation test device whose driving frequency is in the ultrasonic range, about 20 kHz or greater. (For lower frequencies, the term *vibratory cavitation test device* is preferred.) **G 40**, G02

ultrasonic leak detector—an instrument that detects ultrasonic energy produced by molecular turbulence that occurs in the transition from laminar to turbulent flow of a gas through an orifice and that converts this energy to a usable signal. **E 1316**, E07

ultrasonic noise level—the large number of unresolved indications resulting from structure or possibly from numerous small discontinuities, or both. (E 127) **E 1316**, E07

ultrasonic nozzle

ultrasonic nozzle—a pneumatic or vibratory atomizer in which energy is imparted, at high frequency, to the liquid.

NOTE—Common usage refers to frequencies within or above the human auditory range, but recommended practice should be restricted to frequencies above 20 kHz.

NOTE—For frequencies below 20 kHz, see **sonic atomizer**.

E 1620, E29

ultrasonic precipitation—See **precipitation**. D 1356, D22

ultrasonic spectroscopy—analysis of the frequency spectrum of an ultrasonic wave. E 1316, E07

ultraviolet—invisible light radiation, adjacent to the violet end of the visible spectrum, with wavelengths from about 200 to 400 nm (nanometres). E 7, E04

ultraviolet—pertaining to the region of the electromagnetic spectrum from approximately 10 to 380 nm. The term ultraviolet without further qualification usually refers to the region from 200 to 380 nm. E 131, E13

ultraviolet, adj—referring to radiant flux having wavelengths shorter than the visible wavelengths about 10 to 380 nm. E 284, E12

ultraviolet-activated fluorescence, n—fluorescence resulting from the absorption of ultraviolet radiant flux, that is, flux with wavelengths shorter than 380 nm. (See also **visible-activated fluorescence**.) E 284, E12

ultraviolet radiation, n—radiation for which the wavelengths of the monochromatic components are smaller than those for visible radiation and more than about 1 nm.

NOTE—The limits of the spectral range of ultraviolet radiation are not well defined and may vary according to the user. Committee E-2.1.2 of the CIE distinguishes in the spectral range between 100 and 400 nm:

UV-A	315 to 400 nm
UV-B	280 to 315 nm
UV-C	100 to 280 nm

E 349, E21

ultraviolet response—a particular type of optics system used in some optical scanners. As a general rule, nonscan inks for this response will be in the violet portion of the color spectrum. F 149, F05

ultraviolet (UV) radiation—wave lengths between 200 to 300 nm. These wave lengths have a strong germicidal effect. The maximum effect is at 253.7 nm. D 6161, D19

umami, n—a basic taste sensation stimulated by substances such as monosodium glutamate, and nucleotides. E 253, E18

umbilical, n—in surface-supplied diving, diver's gas and a communication and safety line all in one bundle. F 1549, F32

umbrella head—extra-large cupped oval head, provided with slight projection of nail shank above head to provide striking surface during driving. F 547, F16

unadjusted mode, n—an output of *IR thermometer* that displays temperature measured and calculated from a *subject* or object, without any corrections for variations in *operating temperature*, *subject temperature*, *emissivity*, etc. E 344, E20

unaided eye—visual inspection, without the use of special equipment or enhancement excepting the use of corrective lenses. B 846, B05

unaided eye—visual inspection, without the use of special equipment or enhancement excepting the use of corrective lenses. C 896, C04

unary system—composed of one component. E 7, E04

unassigned blankets—blankets that are in storage prior to being issued for use. F 819, F18

unbacked exposure, n—a technique of weathering in which the test specimens are exposed such that the portion of the specimen being evaluated is open to the effects of the weather on all sides. G 113, G03

unbalanced design, n—a statistical study where replication in some or all of the levels of ANOVA is not identical. D 5681, D34

unbiased gun—(zero biased gun) an electron gun in which the cathode cap is at the same potential as the filament (see **self-biased**

gun). This type of gun provides a low-intensity illumination with large angular aperture. E 7, E04

unbiased sample—See **unbiased sample** under **sample**. D 121, D05

unbonded, adj—in describing a test specimen, one in which the elastomer is molded or cut to shape, but that otherwise demands that forces be applied directly to the elastomer. D 1566, D11

unbonded batting, n—a textile filling material which is neither needle-punched, resin bonded, or thermal bonded. (See also **needle-punched batting**, **resin bonded batting**, and **thermal bonded batting**.) D 123, D13

unbonded batting, n—a textile filling material which is neither needle-punched, resin bonded, or thermal bonded. (See also **needle-punched batting**, **resin bonded batting**, and **thermal bonded batting**.) D 7022, D13

unburned brick, n—brick manufactured by processes that do not involve firing of the finished product. C 71, C08

unburned carbon (UBC) in ash, n—the unburned carbon in fly ash includes both carbon carried over as uncombusted “inertinite” and chars or cokes resulting from the incomplete combustion of the thermoplastic, largely vitrinite-derived phases. The latter include “isotropic coke” and “anisotropic coke.” E 2201, E50

uncertainty, n—(of measurement) parameter, associated with the result of a measurement that characterizes the dispersion of values that could reasonably be attributed to the measurand. D 1129, D19

uncertainty—a parameter associated with the result of a measurement, that characterizes the dispersion of the values that could reasonably be attributed to the measurand or derived quantity. E 170, E10

uncertainty, n—of a temperature measurement, parameter, derived from an analysis of a measurement and its result, that characterizes the range in which the true value of temperature is estimated to lie, generally with a given confidence. E 344, E20

uncertainty, n—an indication of the variability associated with a measured value that takes into account two major components of error: (1) bias, and (2) the random error attributed to the imprecision of the measurement process. E 456, E11

uncertainty—lack of certain, deterministic, values for the variable inputs used in an economic analysis of a building or building system. E 631, E06

uncertainty, n—lack of certain, deterministic, values for the variable inputs used in an economic analysis of a building or building system. E 833, E06

uncertainty—measure of the combination of the bias and precision error in specified instrumentation, or the measure of the repeatability of a reported test result. F 1827, F26

uncertainty (of measurement), n—parameter, associated with the result of a measurement, that characterizes the dispersion of the values that could be reasonably attributed to the measurand. G 113, G03

uncombined calcium hydroxide, n—the content of unreacted calcium hydroxide that remains in the sample of cured product when tested. C 1154, C17

uncombined calcium hydroxide, n—for *asbestos-cement*, the content of unreacted calcium hydroxide that remains in the sample of cured product when tested. D 2946, C17

unconditioned space—any space that is not intentionally heated or cooled for human occupancy, including attics, crawlspaces, unfinished basements, attached structures (such as a garage), or any space completely outside the building envelope (for example, rooftop ductwork on small commercial buildings).

underlayment—See **floor**. E 631, E06

unconfined aquifer, n—an aquifer that has a water table. D 653, D18

unconfined compressive strength—the load per unit area at which an unconfined prismatic or cylindrical specimen of material will fail in a simple compression test without lateral support. D 653, D18

unconfined compressive strength—see **compressive strength**.

D 653, D18

unconfined test, *n*—a test in which the test sample is placed directly upon the anvil with no lateral confinement.

E 1445, E27

unconfined yield strength, f_c —the major principal stress of the Mohr stress circle being tangential to the yield locus with the minor principal stress being zero. A synonym for **compressive strength**.

D 653, D18

unconsolidated—for solid material, the characteristic of being uncemented or uncompacted, or both, and separated easily into smaller particles.

D 5681, D34

unconsolidated geologic material (geomedia)—a loosely aggregated solid natural material of geologic origin (for example, soil, sediment, till, etc.).

D 5681, D34

unconsolidated-undrained test (quick test)—a soil test in which the water content of the test specimen remains practically unchanged during the application of the confining pressure and the additional axial (or shearing) force.

D 653, D18

uncontrollability, *n*—any deviation of the vehicle from the intended trajectory (TGL) during or at the end of a test, or both.

F 538, F09

undamped natural frequency—of a mechanical system, the frequency of free vibration resulting from only elastic and inertial forces of the system.

D 653, D18

underarm length, *n*—in body measurements, with the arm down, the distance from the armpit to the inner wrist bone.

D 123, D13

underarm length, *n*—the distance from the mid-underarm point of the armscye to the inner wrist bone, taken with the arm down.

D 5219, D13

under-bust girth (missy special case), *n*—the horizontal circumference around the body under the arms and bust.

D 5219, D13

underconsolidated soil deposit—a deposit that is not fully consolidated under the existing overburden pressure.

D 653, D18

undercool, *n*—the temperature depression below the freezing point of reference material in the supercooled state.

E 344, E20

under-cooling—a decrease in temperature below that at which an equilibrium phase change exists, without the occurrence of the transformation.

E 7, E04

under cooling—see **supercooling**.

E 1142, E37

undercure, *n*—a state of vulcanization between the onset of vulcanization and the state of optimum cure.

D 1566, D11

undercut anchor—a post-installed anchor that derives its holding strength by the mechanical interlock provided by undercutting of the concrete, achieved either by a special tool or by the anchor itself during installation.

E 2265, E06

underdamped-well response—response characterized by the water level oscillating about the static water level following a sudden change in water level. (See for comparison **overdamped wellresponse**.)

D 653, D18

underdrain, *n*—a type of pipe having a multiplicity of perforations along its length, intended for use in surface or below-surface drainage.

C 1154, C17

underdrain—a type of asbestos-cement pipe having a multiplicity of perforations along its length, intended for use in surface or below-surface drainage.

D 2946, C17

underglaze decoration—See *underglaze decoration* under **decoration**.

C 242, C21

underground storage tank (UST)—any tank, including underground piping connected to the tank that is or has been used to contain hazardous substances or petroleum products and the volume of which is 10 % or more beneath the surface of the ground.

D 5681, D34

underlay, *n*—a resilient layer of material placed under rugs or carpets to increase comfort and improve service life of the carpet.

D 123, D13

underlay, *n*—a resilient layer of material placed under rugs or carpets to increase comfort and improve service life of the carpet.

D 5684, D13

underlayment, *n*—in flooring, a layer of material usually placed upon

the sub-floor that provides a smooth, even base for flooring.

floor area:

E 631, E06

underlayment, *n*—a material placed under resilient flooring, or other finished flooring, to provide a suitable installation surface.

F 141, F06

underlay nail, underlayment nail—bright, regular-stock-steel, stiff-stock or hardened-steel, annularly threaded, 1 by 0.080 to 3 by 0.148-in. nails with flat or slightly countersunk $\frac{3}{16}$ to $\frac{5}{16}$ -in. head and medium diamond point.

F 547, F16

underlying layer—in a surface-micromachining process, the layer of material directly beneath the layer of interest. This layer could be the substrate.

E 2444, E08

under-retting, *v*—in flax, indicates that decomposition is insufficient to allow fiber bundles to be easily removed from the non-fibrous parts of the stem. (See **retting** and **over-retting**.)

D 6798, D13

under-the-cap filling—a process for adding the propellant to the container by sealing off the head of the container and injecting the propellant at ambient temperature and high pressure, under the valve cap before crimping. This process is usually used where the propellant content is large and cold filling is not desired.

D 3064, D10

undertone, *n*—the color of a thin layer of pigment-vehicle mixture applied on a white background.

D 16, D01

underwear, *n*—clothing worn next to the skin under outer clothes.

D 123, D13

underwear, *n*—clothing worn next to the skin under outer clothes.

D 7022, D13

undisturbed sample—any plastic mortar test sample molded immediately after mixing and sampling that is allowed to set on a vibration-free surface until tested.

C 1180, C12

undisturbed sample—a soil sample that has been obtained by methods in which every precaution has been taken to minimize disturbance to the sample.

D 653, D18

undisturbed sample—a sample of frozen ground which has been maintained at a constant temperature in the frozen state, as close as possible to that which existed in-situ when the sample was obtained, for purposes of performing mechanical and other tests.

D 7099, D18

undulated staple—staple with curves in crown for better driving stability.

F 592, F16

UN/EDIFACT—abbreviation for United Nations, Electronic Data Interchange for Administration, Commerce and Transport, an international group dedicated to standards for electronic interchange.

F 1294, F05

uneven dyeing, *n*—cloth which shows variations in shade due either to incorrect dyeing methods or faulty materials.

D 123, D13

uneven dyeing, *n*—cloth which shows variations in shade due either to incorrect dyeing methods or faulty materials.

D 3990, D13

unevenness, *n*—in *intextiles*, variation in the linear density of a continuous strand or of a portion of a strand. (See also **coefficient of variationunevenness, mean deviation unevenness**.)

D 123, D13

unevenness, *n*—in *textiles*, variation in the linear density of a continuous strand or of a portion of a strand. (See also **coefficient of variation unevenness, mean deviation unevenness**.)

D 4849, D13

unfading (slate)—a slate that shows no significant color change within the first year of exposure.

C 119, C18

unfrozen ground—ground that does not contain any ice.

D 7099, D18

unfrozen water content—the ratio, expressed as a percentage, of either (1) the weight of unfrozen water to the weight of dry soil, or (2) the volume of the unfrozen water to the total volume of the sample.

D 7099, D18

unglazed tile—a hard, dense tile of homogeneous composition throughout, deriving color and texture from the materials of which the body is made. The colors and characteristics of the tile are determined by the materials used in the body, the method of manufacture, and the thermal treatment.

C 242, C21

uniaxial state of stress

uniaxial state of stress—state of stress in which two of the three principal stresses are zero. (ISRM) **D 653, D18**

uniaxial (unconfined) compression—compression caused by the application of normal stress in a single direction. (ISRM)

D 653, D18

unicellular rubber, n—See **expanded rubber**.

C 717, C24

unidirectional conductor—see **concentric-lay conductor**.

B 354, B01

uniform-chromaticity-scale diagram, n—chromaticity diagram on which all pairs of just-perceptibly different colors of equal luminance are represented by pairs of points separated by nearly equal distances.

E 284, E12

Uniform Code Council, Inc., U.C.C., n—a standard setting organization originally chartered by the National Grocer's Association; it supervises the standards for the Universal Product Code, UPC.

F 1294, F05

uniform color space, n—schematic arrangement of colors in space in which spatial intervals between points correspond to visual differences between colors represented by those points.

E 284, E12

uniform corrosion—corrosion that proceeds at about the same rate over a metal surface.

G 15, G01

uniform diffuser, n—see **Lambertian diffuser**.

E 284, E12

uniform diffuse reflection, n—diffuse reflection in which the spatial distribution of the reflected radiation is such that the radiance or luminance is the same in all directions in which the radiation is reflected.

E 349, E21

uniform diffuse transmission, n—diffuse transmission in which the spatial distribution of the transmitted radiation is such that the radiance or luminance is the same in all directions in which the radiation is transmitted.

E 349, E21

uniform elongation, El_u [%], n—the elongation determined at the maximum force sustained by the test piece just prior to necking, or fracture, or both.

E 6, E28

uniform flow in hydraulics, n—the condition of flow where the rate of energy loss due to frictional and form resistance is equal to the bed slope of the channel.

D 653, D18

uniformity coefficient—the ratio of the particle diameter corresponding to 60 % finer on the cumulative particle size distribution curve to the particle diameter corresponding to 10 % finer on the same distribution curve.

D 2652, D28

uniformity index, n—*in fiber length testing of cotton*, the ratio between the mean length and the upper-half-mean length expressed as a percentage of the upper-half-mean length.

D 123, D13

uniformity index, n—*in fiber length testing of cotton*, the ratio between the mean length and the upper-half-mean length expressed as a percentage of the upper-half-mean length.

D 7139, D13

uniformity ratio, n—*in cotton length testing with the Fibrograph*, the ratio between two span lengths expressed as a percentage of the longer length.

D 123, D13

uniformity ratio, n—*in cotton length testing with the Fibrograph*, the ratio between two span lengths expressed as a percentage of the longer length.

D 7139, D13

uniformly graded—a quantitative definition of the particle size distribution of a soil which consists of a majority of particles being of the same approximate diameter. A granular material is considered uniformly graded when the uniformity coefficient is less than about five (see Test Method D 2487). Comparable to the geologic term well sorted.

D 653, D18

uniform wear, n—a type of treadwear characterized by equal tread loss both from projection to projection and from point to point on a given projection, resulting in a smooth appearance of all parts of the tread pattern.

F 538, F09

unilateral arrangement—recognition arrangement that covers the acceptance of one party's results by another party, (ISO Guide 2).

E 1187, E36

unilaterally punched metal connector plate—metal connector plate

with integral teeth projecting from plate in single direction perpendicular to plate surface area.

unit—see **dwelling unit**.

E 631, E06

unilateral specifications—specifications that have only maximum or minimum values.

F 1789, F16

uniplanar, adj—descriptor for illuminating and viewing geometry in which the axes of the illuminator and the receiver and the normal to the specimen surface are in the same plane; thus directional illumination or viewing is provided by one beam, or by two beams spaced 180° apart in azimuth. The number and angular distribution of the beams should be specified.

E 284, E12

unique hue, n—perceived hue that cannot be described by a hue name other than its own.

E 284, E12

unit—measurement, a precisely specified quantity in terms of which the magnitudes of other quantities of the same kind can be stated.

C 634, E33

unit, n—an object on which a measurement or observation may be made.

E 456, E11

unit—reference value of a given quantity as defined by CGPM Resolution or ISO Standards. There is *only one* unit for each quantity in SI.

E 631, E06

unit—the smallest single portion of material received in any one lot (for example, a single roll of material).

unsupported film adhesive—See **adhesive, unsupported film**.

E 631, E06

unit—see **dwelling unit**.

E 1605, E06

unit—the smallest single portion of material received in any one lot (for example, a single roll of material).

E 1749, E06

unit, n—a single object (for example, a vacuum cleaner) from the total population of like objects on which a measurement or observation may be made.

F 395, F11

unitary hue, n—see **unique hue**.

E 284, E12

unit bed-load discharge—bed-load discharge per unit width of river bed. Units are reported in mass of discharge per unit time per unit width, such as tons per day per foot.

D 4410, D19

unit cell—a parallelepiped element of crystal structure, containing a certain number of atoms, the repetition of which through space will build up the complete crystal.

D 1695, D01

unit cell—the smallest area into which a grid can be divided so that these areas have the same shape, size and orientation. For a triangular grid, the unit cell is a 60°/120° rhombus comprised of two equilateral triangles with a common side.

D 5681, D34

unit cell—a parallelepiped element of crystal structure, containing a certain number of atoms, the repetition of which through space will build up the complete crystal. (See **lattice**.)

E 7, E04

united millimetres (or united inches)—the sum of the dimensions in millimetres (or inches) of the length and width of a light of glass or panel.

C 717, C24

unitization, n—the assembled group of containers or items in a single load that can be handled as a unit throughout the distribution system.

D 996, D10

unitized load—See **load**.

D 996, D10

unit length of instrument, L_c , n—*in textile unevenness testing*, the length of strand being measured between the sensing elements at any moment.

D 123, D13

unit length of instrument, L_c , n—*in textile unevenness testing*, the length of strand being measured between the sensing elements at any moment.

D 4849, D13

unit load—See **load**.

D 996, D10

unit magnetic rating (1 MR), n—a calibrating standard with an MR of one is defined as containing 0.18 g of U.S. Institute of Standards and Technology standard sample No. 29 (a) or iron ore (magnetite) uniformly distributed over the space specified for a 10-g test specimen [14 mm (0.75 in.) diameter by 73 mm (2.875 in.) long], by dispersion in a magnetically inert material.

D 2946, C17

unit of product—a piece of leather in the form in which it is purchased, such as a single hide, side, skin or part thereof; or a

- single fabricated-leather article in the form in which it is purchased, such as a counter, a pair of shoes, gasket, etc. **D 1517**, D31
- unit of product, *n***—an entity of electrical insulating material or product for inspection to determine its classification as conforming or non-conforming. **D 1711**, D09
- unit of structure (in crystals)**—the unit cell, or the group of atoms associated with a unit cell. **E 7**, E04
- unit package**—See **package**. **D 996**, D10
- unit sample, *n***—for *asbestos*, a sample drawn from one bag. **D 2946**, C17
- units placed in usage**—manufactured masonry units that have been installed in masonry. **C 1232**, C15
- unit weight, *n***—of *aggregate*, mass per unit volume. (Deprecated term—use preferred term **bulk density**). **C 125**, C09
- unit weight, *n***—as applied to concrete, weight per unit volume. **E 176**, E05
- unit weight, γ (FL⁻³)**—weight per unit volume (with this, and all subsequent unit-weight definitions, the use of the term weight means force).
- dry unit weight (unitdry weight), γ_d , γ_e (FL⁻³)**—the weight of soil or rock solids per unit of total volume of soil or rock mass.
- effective unit weight, γ_e (FL⁻³)**—that unit weight of a soil or rock which, when multiplied by the height of the overlying column of soil or rock, yields the effective pressure due to the weight of the overburden.
- maximum unit weight, γ_{max} (FL⁻³)**—the dry unit weight defined by the peak of a compaction curve.
- saturated unit weight, γ_G , γ_{sat} (FL⁻³)**—the wet unit weight of a soil mass when saturated.
- submerged unit weight (buoyant unit weight), γ_m , γ' , γ_{sub} (FL⁻³)**—the weight of the solids in air minus the weight of water displaced by the solids per unit of volume of soil or rock mass; the saturated unit weight minus the unit weight of water.
- unit weight of water, γ_w (FL⁻³)**—the weight per unit volume of water; nominally equal to 62.4 lb/ft³ or 1 g/cm³.
- wet unit weight (massunit weight), γ_m , γ_{wet} (FL⁻³)**—the weight (solids plus water) per unit of total volume of soil or rock mass, irrespective of the degree of saturation.
- zero air voids unit weight, γ_z , γ_s (FL⁻³)**—the weight of solids per unit volume of a saturated soil or rock mass. **D 653**, D18
- univariant equilibrium**—a stable state among a number of phases equal to one more than the number of components, that is, having one degree of freedom. **E 7**, E04
- Universal Product Code, UPC, *n***—a bar code symbology specified by the Uniform Code Council. **F 1294**, F05
- universe (population), *n***—the totality of the set of items, units, or measurements, etc., real or conceptual, that is under consideration. **NOTE**—This definition of universe is being revised to incorporate the concept of including one or more populations. *Use with caution.* **E 456**, E11
- unloaded condition**—equipment not doing processing work (for example, moving, changing the characteristics of, or separating materials), but operating in a freewheeling, or idling, condition. **D 5681**, D34
- unloading modulus**—slope of the tangent to the unloading stress-strain curve at a given stress value. (ISRM) **D 653**, D18
- unmanned air vehicle, UAV, *n***—airplane, airship, powered lift, or rotorcraft that operates with the pilot in command off-board, for purposes other than sport or recreation, also known as unmanned aerial vehicle. UAVs are designed to be recovered and reused. A UAV system includes all parts of the system (data-link, control station, and so forth) required to operate the vehicle. See R-103-2004. **F 2395**, F38
- unmated mechanical transfer paper**—a sheet that has a clean pigmented coating that is physically transferred to a second sheet upon the application of pressure. **F 549**, F05
- unmeasured-sediment discharge**—the difference between the total sediment discharge and the measured suspended-sediment discharge. **D 4410**, D19
- unpiloted ignition, *n***—ignition caused by one or more sources of energy without the presence of a pilot source of ignition (compare **piloted ignition, spontaneous ignition**). **E 176**, E05
- unprocessed municipal solid waste, *n***—municipal solid waste in its as-discarded form and that has not been size-reduced, separated, or otherwise processed. **D 5681**, D34
- unprocessed municipal solid waste**—solid waste in its discarded form, that is, waste that has not been size reduced or otherwise processed. **D 5681**, D34
- unrelated color, *n***—color perceived to belong to an area seen in isolation from other colors. **E 284**, E12
- unsampled depth**—the unsampled part of the sampling vertical; usually within 0.8 to 0.15 m of the stream bed, depending on the kind of suspended-sediment sampler used. **D 4410**, D19
- unsampled zone**—the unsampled part of the sampling vertical, usually assumed to be 90 to 150 mm above the stream bed, depending on the kind of sampler used. **D 4410**, D19
- unsaponifiable matter**—see **fatty matter, unsaponifiable**. **D 459**, D12
- unsaponifiable matter, *n***—the total amount of non-acidic organic material, both free and combined, present in naval stores products such as rosin, tall oil, and their derivatives after saponification. Unsaponifiable matter is composed primarily of alcohols, sterols, aldehydes, and hydrocarbons. For example, it is material that will not form a soluble soap when refluxed with alcoholic potassium hydroxide. **D 804**, D01
- unsaponifiable matter, *n***—in *lubricating grease*, organic materials, either added or found with fatty materials, which do not react during saponification. **D 4175**, D02
- unsaponified matter**—see **fatty matter, unsaponified**. **D 459**, D12
- unscheduled cessation**—a rare, unusual, or irregular stopping of an amusement ride operation, intentional or otherwise, that is considered abnormal or potentially hazardous in nature, or both, due to its cause, method, or result. **F 747**, F24
- unsharp, *adj***—characteristic of an image lacking in sharpness. **E 284**, E12
- unspecified element, *n***—in *steel*, an element not controlled to a specified minimum, maximum, or range, in accordance with the requirements of the applicable product specification. **A 941**, A01
- unstable brittle crack extension [L]**—an abrupt crack extension occurring with or without prior stable crack extension in a standard fracture test specimen under crosshead or clip gage displacement control. **E 1823**, E08
- unsulfonated residue, *n***—in *oils*, that portion of an oil remaining unsulfonated after treatment with concentrated sulfuric acid. **D 4175**, D02
- unsupported film adhesive**—See **adhesive, unsupported film**. **E 1749**, E06
- unsupported gasket member**—a gasket member joining infill materials without being held in place by a supporting frame member. **C 717**, C24
- unsupported needled felt, *n***—a needled felt that is composed entirely of fibers physically interlocked and reoriented with, and of themselves without an interlay, scrim, or foundation of knitted, stitched, bonded, or extruded structure. **D 123**, D13
- unsupported needled felt, *n***—a needled felt that is composed entirely of fibers physically interlocked and reoriented with, and of themselves without an interlay, scrim, or foundation of knitted, stitched, bonded, or extruded structure. **D 4845**, D13
- untreated, *n***—a descriptive term for glass fiber yarns having no applied chemicals or coatings, other than the minimal lubricant or binder used to control intra-fiber abrasion. **D 123**, D13

untreated, *adj*

untreated, *adj*—a descriptive term for glass fiber yarns having no applied chemicals or coatings, other than the minimal lubricant or binder used to control intra-fiber abrasion. **D 7018**, D13

updraw—the process of continuously drawing glass of various cross sections, such as cane or tubing, by a method similar to the Fourcault process. **C 162**, C14

upholstered, *adj*—covered with material (as fabric or padding) to provide a soft surface. **E 176**, E05

upholstered, *n*—covered with material (as fabric or padding) to provide a soft surface. **E 176**, E05

upholstered furniture, *n*—furniture covered with such materials as textiles or leather, and generally with padding or cushions, or both. **D 123**, D13

upholstered furniture, *n*—furniture covered with such materials as textiles or leather, and generally with padding or cushions, or both. **D 7023**, D13

upholstered furniture, *n*—a unit of interior furnishing that (1) contains any surface that is covered, in whole or in part, with a fabric or related upholstery cover material, (2) contains upholstery material, and (3) is intended or promoted for sitting or reclining upon. **E 176**, E05

upholstered seating furniture, *n*—a unit of interior furnishing that (1) contains any surface that is covered, in whole or in part, with a fabric or other upholstery cover material, (2) contains upholstery material, and (3) is intended or promoted for sitting upon. **E 176**, E05

upholstery cleaning instructions, *n*—any of the various letter codes supplied by the fabric manufacturer to provide acceptable cleaning methods. **D 123**, D13

upholstery cleaning instructions, *n*—any of the various letter codes supplied by the fabric manufacturer to provide acceptable cleaning methods. **D 5253**, D13

upholstery cover material, *n*—the outermost layer of fabric or related material used to enclose the main support system or upholstery materials, or both, used in the furniture unit. **E 176**, E05

upholstery cover material, *n*—the outermost layer of fabric or related material used to enclose the main support system or upholstery materials, or both, used in the furniture item. **E 176**, E05

upholstery cover material, *n*—the outermost layer of fabric or related material used to enclose the main support system or upholstery materials, or both, used in the furniture item. **E 176**, E05

upholstery fabric, *n*—the exterior fabric covering applied to a furniture unit. **D 123**, D13

upholstery fabric, *n*—the exterior fabric covering applied to a furniture unit. **D 7023**, D13

upholstery leather—a general term for leathers processed for use in furniture, airplanes, buses, and automobiles. The staple raw material in this country consists of spready cattlehides, split at least once and in many cases two or three times. The top or grain cuts go into the higher grades and the splits into the lower grades. **D 1517**, D31

upholstery material, *n*—the padding, stuffing, or filling material used in a furniture item, which may be either loose or attached, enclosed by an upholstery cover material, or located between the upholstery cover material and support system, if present. **E 176**, E05

upholstery nail—bright, regular-stock-steel, two-piece nails with extra-large specially formed head and medium diamond or needle point. **F 547**, F16

uplift—the upward water pressure on a structure.

	Symbol	Unit
unit symbol	<i>u</i>	FL ⁻²
total symbol	<i>U</i>	F or FL ⁻¹

uplift—the hydrostatic force of water exerted on or underneath a structure, tending to cause a displacement of the structure. (ISRM) **D 653**, D18

uplift—*in grouting*, vertical displacement of a formation due to grout injection. **D 653**, D18

uplift—the vertical displacement measured at the loaded end stud with respect to the test apparatus. **E 631**, E06

upper—all of the upper parts of a shoe stitched together and ready for lasting and bottoming. It includes both the outside and lining of the shoe. **F 869**, F08

upper, *n*—that area of the footwear above the sole. **F 1494**, F23

upper, *n*—the parts of a shoe or boot that are above the sole. **F 1646**, F13

upper-arm girth, *n*—*in body measurements*, the maximum circumference of the arm usually midway between the elbow and the shoulder joint. **D 123**, D13

upper-arm girth, *n*—the maximum circumference of the arm, taken midway between the elbow and the shoulder joints with the arm bent 1.57 rad (90°). **D 5219**, D13

upper-arm length, *n*—*in body measurements*, with the arm bent, the distance from the shoulder joint along the outside of the arm to the prominence of the elbow. **D 123**, D13

upper capability index (CPU), *n*—the difference between the upper specification limit and the sample mean divided by three times the sample standard deviation.

$$CPU = \frac{(USL - \bar{x})}{3 \times s}$$

A 644, A04

upper-chest girth, *n*—the horizontal circumference around the body, taken under the arms and above the fullest part of the chest/bust including the lower portion of the shoulder blades. **D 5219**, D13

upper control limit (UCL), *n*—control limit for points above the central line. **E 456**, E11

upper critical point—in a phase diagram, a specific value of composition, temperature and pressure, or combinations thereof, occurring as a maximum in temperature, or pressure, for the coexistence of two or more conjugate phases and at which the conjugate phases become identical. **E 7**, E04

upper cut zone, *n*—*in the testing of foot protective devices*, the area starting at the top of the area of protection on the footwear and extending downward to include the entire upper, excluding the toe area cut zone. **F 1494**, F23

upper-half-mean length, *n*—*in fiber length testing of cotton*, the mean length by number, of the longer one half of the fibers by weight. **D 123**, D13

upper-half-mean length, *n*—*in fiber length testing of cotton*, the mean length by number, of the longer one half of the fibers by weight. **D 7139**, D13

upper leather—the shoe leather that covers the upper part of the foot. It is made principally from calfskins, goatskins, cattlehides, horsehides, and other classes of animal skins. **D 1517**, D31

upper limit log normal distribution (ULLN)—drop size distribution described by the following equation:

$$f_v(D) = \{1/\sqrt{\pi}\} \int_{-\infty}^{del \times \log [A \times D(D_{max} - D)]} \exp(-t^2) dt$$

where:

$f_v(D)$ = the volume fraction of liquid in drops of diameter less than D ,

D_{max} = the upper bound of drop diameters, and

del and A = ULLN parameters determining dispersion and skewness.

E 1620, E29

upper limit of flammability or upper flammable limit (UFL), *n*—the maximum concentration of a combustible substance that is capable of propagating a flame through a homogeneous mixture of

D 653, D18

the combustible and a gaseous oxidizer under the specified conditions of test. **E 1445, E27**

upper process capability index, C_{pk} , *n*—index describing process capability in relation to the upper specification limit. **E 456, E11**

upper process performance index (P_{pk}), *n*—index describing process performance in relation to the upper specification limit. **E 456, E11**

upper quartile length, *n*—in testing of cotton fibers, that length which is exceeded by 25 % of the fibers, by weight, in the test specimen. **D 123, D13**

upper quartile length, *n*—in testing of cotton fibers, that length which is exceeded by 25 % of the fibers, by weight, in the test specimen. **D 7139, D13**

upper range-value, *n*—the highest quantity that an instrument is adjusted to measure. **E 344, E20**

upper specification limit (USL), *n*—the highest specified value. **A 644, A04**

upper tolerance limit (UTL) (upper specification limit), *n*—a tolerance limit applicable to the upper conformance boundary for an individual unit of a manufacturing or service operation. **E 456, E11**

upper valve or poppet, *n*—a valve that controls the flow of product out the exit orifice during the pressurization stage of the liquid and restricts the flow of product so that negative pressure may be created during the filling stage. **D 6655, D10**

upper yield strength, UYS [FL^{-2}], *n*—the first stress maximum (stress at first zero slope) associated with discontinuous yielding. **E 6, E28**

upright broiler—a heavy duty freestanding piece of equipment with a high input rate and production capacity among overfired broilers. See **broiler, overfired**. **F 1827, F26**

upright vacuum cleaner, *n*—a self-standing, floor-supported, portable vacuum cleaner which has the floor nozzle directly connected to the cleaner and is designed for normal-duty cleaning of household dirt. In use, the cleaner is guided over the floor by means of a handle attached to the cleaner housing. The cleaner contains a driven agitator to assist in dirt removal on floor surfaces. The cleaner may have attachments or provisions, or both, for both floor and above-the-floor cleaning. **F 395, F11**

upset head—metal slightly upset, with deformed portion serving as head. **F 547, F16**

upstream—side of a membrane into which penetrants enter from the feed stream. **D 6161, D19**

uptake—acquisition of a substance from the environment by an organism as a result of any active or passive process. **E 943, E47**

upward freezing—the advance of the freezing front upwards from the permafrost table during annual freezing of the active layer. **D 7099, D18**

urban heat island, *n*—an urban area that, due to denuded landscape, impermeable surfaces, surfaces with low albedo, massive buildings, heat-generating cars and machines, and pollutants, is measurably hotter than surrounding rural areas. **E 2114, E06**

urea-formaldehyde adhesive, *n*—(1) an aqueous colloidal dispersion of urea-formaldehyde polymer which may contain modifiers and secondary binders to provide specific adhesive properties, (2) a type of adhesive, based on a dry urea-formaldehyde polymer and water. **D 907, D14**

urea plastics—plastics based on resins made by the condensation of urea and aldehydes. **D 883, D20**

urea resin—under **resin, synthetic**, see **urea resin**. **D 16, D01**

urethane coatings, *n*—coatings based upon vehicles containing a minimum of 10 percent by weight (nonvolatile vehicle basis) of a polyisocyanate monomer reacted in such a manner as to yield polymers containing any ratio, proportion or combination of urethane linkages, active isocyanate groups, or polyisocyanate monomer. The reaction products may contain excess isocyanate

groups available for further reaction at time of application or may contain essentially no free isocyanate as supplied.

Type I, one-package prereacted—urethane coatings characterized by the absence of any significant quantity of free isocyanate groups. They are usually the reaction product of a polyisocyanate and a polyhydric alcohol ester of vegetable oil acids and are hardened with the aid of metallic soap driers.

Type II, one-package moisture cured—urethane coatings characterized by the presence of free isocyanate groups and capable of conversion to useful films by the reaction of these isocyanate groups with ambient moisture.

Type III, one-package heat cured—urethane coatings that dry on cure by thermal release of blocking agents and regeneration of active isocyanate groups that subsequently react with substances containing active hydrogen groups.

Type IV, two-package catalyst—urethane coatings that comprise systems wherein one package contains a prepolymer or adduct having free isocyanate groups capable of forming useful films by combining with a relatively small quantity of catalyst, accelerator, or crosslinking agent such as a monomeric polyol or polyamine contained in a second package. This type has limited pot-life after the two components are mixed.

Type V, two-package polyol—urethane coatings that comprise systems wherein one package contains a prepolymer or adduct or other polyisocyanate capable of forming useful films by combining with a substantial quantity of a second package containing a resin having active hydrogen groups with or without the benefit of catalyst. This type has limited pot-life after the two components are mixed.

Type VI, one-package nonreactive lacquer—urethane solution coatings characterized by the absence of any significant quantity of free isocyanate or other functional groups. Such coatings convert to solid films primarily by solvent evaporation. **D 16, D01**

urethane foam, (flexible), *n*—an open cell, elastomeric material made by the addition reaction of a polyol with a polyisocyanate. **D 1566, D11**

urethane plastic—a plastic based on polymers in which the repeated structural units in the chains are of the urethane type, or on copolymers in which urethane and other types of repeated structural units are present in the chains. **F 1251, F04**

urethane plastics—plastics based on polymers in which the repeated structural units in the chains are of the urethane type, or on copolymers in which urethane and other types of repeated structural units are present in the chains. (ISO) **D 883, D20**

urn, *n*—an ornamental vase used as a finial. **E 631, E06**

urn, *n*—an ornamental vase used as a finial. **E 1481, E06**

uronic acids—oxidation products of the sugars in which a primary alcohol group has been oxidized to a carboxyl without changing the reducing functional group. **D 1695, D01**

usable area—See **space categories**. **E 1480, E06**

use—of a facility—See **facility use**. **E 1480, E06**

use—when applied to material and property, engaging the asset or material into the business process for value. **E 2135, E53**

used oil, *n*—in petroleumproduct recycling, oil whose characteristics have changed since being originally manufactured, and which is suitable for recycling (see also **waste oil**). **D 4175, D02**

used oil, *n*—any oil that has been in a piece of equipment (for example, an engine, gearbox, transformer, or turbine), whether operated or not (see also **used oil, in petroleum product recycling**). **D 4175, D02**

used oil, *n*—in petroleumproduct recycling, oil whose characteristics have changed since being originally manufactured, and that is suitable for recycling. **D 4175, D02**

used oil, *n*—any oil that has been in a piece of equipment (for

used oil, n

- example, an engine, gearbox, transformer or turbine) whether operated or not. **D 4175, D02**
- used tire, n**—a tire removed from a vehicle's rim, which cannot be described legally as new, but which is structurally intact and has a tread depth greater than the legal limit. This tire can be remounted onto another vehicle's rim without repair. **D 5681, D34**
- useful ion yield**—*SIMS*, the ratio of the number of ions of a particular isotope detected to the total number of atoms and ions of the same element sputtered. **E 673, E42**
- useful life**—the period of time over which an investment is considered to meet its original objective.
utility core—Use **core module**. **E 631, E06**
- useful life, n**—the period of time over which an investment is considered to meet its original objective. **E 833, E06**
- USEPA**—U.S. Environmental Protection Agency. **D 6161, D19**
- user, n**—one who actively, physically occupies, conducts business, provides service for uses of the product within facility/project. **E 833, E06**
- user**—see *end user*. **F 1789, F16**
- user service, n**—the National ITS Architecture defines various user services that are groups of ITS related functions that generally meet the need and requirements of a group of stakeholders for a particular type of service—the archived data user service was the thirty-first user service to be defined in the National ITS Architecture following a set process and period of interaction of the architecture team with the stakeholder community and the development and approval of a set of documentation of the need and characteristics of that user service. **E 867, E17**
- use-surface, n**—*for pile yarn floor covering*, that part of a textile floor covering directly exposed to traffic. **D 123, D13**
- use-surface, n**—*for pile yarn floor covering*, that part of a textile floor covering directly exposed to traffic. **D 5684, D13**

- USGS 7.5 Minute Topographic Map**—the map (if any) available from or produced by the United States Geological Survey, entitled "USGS 7.5 Minute Topographic Map" and showing the property. **D 5681, D34**
- utility function**—a function that shows how utility (that is, satisfaction) varies with money or income. **E 631, E06**
- utility function, n**—a function that shows how utility (that is, satisfaction) varies with money or income. **E 833, E06**
- utility vacuum cleaner, n**—a portable, floor-supported vacuum cleaner having a nozzle separated from the cleaner housing by a hose. The cleaner is designed to be used in places other than normal living areas such as utility rooms, basements, workshops, and garages. Besides household dirt, it is designed to pick up various types of larger debris and may be designed for liquid pickup. In use, only the nozzle is guided over the surface area to be cleaned. The cleaner may have detachable nozzles, attachments, and wands for both floor and above-the-floor cleaning. **F 395, F11**
- utilization**—the use of material or an asset in the business process. **E 2135, E53**
- U-type furnace**—a continuous furnace wherein the ware travels in a U-shaped path. **C 286, B08**
- UV absorber, n**—a compounding material that, through its ability to absorb ultraviolet radiation and render it harmless, retards the deterioration caused by sunlight and other UV light sources. **D 1566, D11**
- U-value**—the total heat transfer coefficient of a window at steady state and standardized conditions. **C 162, C14**
- UV fading**—the reduction of brightness of a fluorescent penetrant indication caused by excessive exposure to ultraviolet radiation. **E 1316, E07**
- U.V. protectant**—a material that prevents or reduces degradation due to ultraviolet radiation. **E 609, E35**

V

vacuum, *v*—to clean using an electrically powered machine to create suction in order to remove loose, particulate soil and lint.
D 123, D13

vacuum—a degree of rarefaction below atmospheric pressure: negative pressure.
D 653, D18

vacuum, *n*—pressure below atmospheric pressure. **D 3053**, D24

vacuum, *v*—to clean using an electrically powered machine to create suction in order to remove loose, particulate soil and lint.
D 7023, D13

vacuum—in vacuum technology a given space filled with gas at pressures below atmospheric pressure.
E 1316, E07

vacuum-and-blow process—a bottle manufacturing process whereby glass is gathered by vacuum and subsequently blown. **C 162**, C14

vacuum bag molding—a process in which an adhesive or composite assembly is cured under pressure generated by drawing a vacuum in the space between the lay-up and a flexible sheet placed over it and sealed at the edge. (Compare with **bag molding**.) **E 631**, E06

vacuum bag molding—a process in which an adhesive or composite assembly is cured under pressure generated by drawing a vacuum in the space between the lay-up and a flexible sheet placed over it and sealed at the edge. (Compare with **bag molding**.) **E 1749**, E06

vacuum cassette—a flexible light-tight container that, when operated under a vacuum, holds film and screen in intimate contact during a radiographic exposure.
E 1316, E07

vacuum cassette—a light-tight device having a flexible entrance window, which when operated under a vacuum, holds the film and conversion screen in intimate contact during exposure.
E 1316, E07

vacuum chamber, *n*—a device that allows a vacuum to be applied to a surface.
D 4439, D35

vacuum clean, *vt*—to remove loose particulate soil, lint, and embedded soil by suction using an electrically powered machine.
D 5253, D13

vacuum cleaner, *n*—a system or device that removes foreign material from surfaces by means of the air flow caused by subatmospheric pressure, having an intake intended to be moved in proximity to the surface, a means of separating the material from the air, and a receptacle for collecting the separated material. The inlet may be fixed or attached to other equipment and provision is made for removing collected material.
F 395, F11

vacuum distillation—to affect separation of two or more liquids under reduced pressure operation of a distillation column. Vacuum reduces the boiling points of the liquids being separated.
E 1705, E48

vacuum distillation—the separation of two or more liquids under reduced vapor pressure; reduces the boiling points of liquids being separate.
E 1705, E48

vacuum forming—a forming process in which a heated plastic sheet is drawn against the mold surface by evacuating the air between it and the mold.
D 883, D20

vacuum forming, *n*—a process in which an adherend is brought in intimate contact with a substrate to form an assembly by the evacuation of the surrounding air.
D 907, D14

vacuum level—the potential of the vacuum space at a sufficiently large distance outside the specimen such that electric fields caused by different work functions of different parts of the surface are zero or extremely small.
E 673, E42

vacuum level referencing—*XPS*, a method of establishing the binding energy scale for a particular specimen by assigning the kinetic energy corresponding to the vacuum level as the point of zero binding energy. See also **vacuum level**.
E 673, E42

vacuum lock—See **air lock**.
E 7, E04

vacuum packaging—See **packaging**.
D 996, D10

vacuum plated button, *n*—a button that is flash metal coated in vacuum chambers and subsequently colored to simulate other metal finishes.
D 123, D13

vacuum plated button, *n*—a button that is flash metal coated in

vacuum chambers and subsequently colored to simulate other metal finishes.
D 5497, D13

vacuum testing—(1) a method of testing for leaks in which the object under test is evacuated and the tracer gas applied to the outside surface of the object; (2) a leak-testing procedure in which the enclosure under examination is evacuated, the tracer gas applied to the outside surface of the enclosure, and the gas detected after entering the enclosure.
E 1316, E07

vadose zone—the hydrogeological region extending from the soil surface to the top of the principle water table; commonly referred to as the “unsaturated zone” or “zone of aeration”. These alternate names are inadequate as they do not take into account locally saturated regions above the principle water table (for example, perched water zones).
D 653, D18

vadose zone—the region between the ground surface and underlying groundwater aquifers. It is the region through which pollutants and contaminants travel before entering the groundwater. **D 18**

valence band spectrum—*XPS*, photoelectron energy distribution arising from the less tightly bound electrons involved in the chemical bonds of the specimen material.
E 673, E42

validation, *n*—of an analytical method, the process by which a measurement method is shown to be useful for a specified purpose.
E 135, E01

validation—the quality assurance evaluation of an item of equipment or overall process wherein the equipment or process, or both, is challenged to perform under the “worst case” conditions of process variables and applicable micro-organism contamination to meet preestablished acceptance criteria.
E 1705, E48

validation, *n*—confirmation by examination and provision of objective evidence that the particular requirements for a specific intended use are fulfilled.
E 1732, E30

validation—the process of providing documented evidence that something does what it is intended to do.
E 2161, E37

validation curve, *n*—a set of points that represent the original curve in the exporting CAD system within curve tolerance of the original curve.
D 6963, D13

validation protocol, *n*—a written plan stating how validation will be conducted and defining acceptance criteria.
E 2363, E55

valley—in fatigue loading, the occurrence where the first derivative of the force-time history changes from negative to positive sign; (also known as *trough*); the point of minimum force in constant amplitude loading.
E 1823, E08

valleys—edge irregularities which result in an indentation in the side of a strike.
F 149, F05

valley trenching—gully erosion occurring in flood plains.
D 4410, D19

valuation—the act of estimating the value or worth; assigning a value to an item.
E 2135, E53

value, *n*—see **Munsell value**.
E 284, E12

value analysis team leader (VATL)—the individual who facilitates the value analysis.
E 631, E06

value analysis team leader (VATL), *n*—the individual who facilitates the value analysis.
E 833, E06

value analysis (VA), *n*—the procedure for developing and evaluating alternatives to a proposed economical design that best fulfills the needs and requirements of the user/owner of the building. (Also referred to as *value engineering*.)
E 833, E06

value analysis (VA)—the procedure for developing and evaluating alternatives to a proposed economical design that best fulfills the needs and requirements of the user/owner of the building. (Also referred to as *value engineering*.)
E 631, E06

value, commerce, *n*—measure of economic worth in commerce.
F 2463, F10

valve—a mechanism for discharging products from aerosol-type dispensers.
D 3064, D10

valve leather—see **hydraulic leathers**.

D 1517, D31

vamp—the lower part of a shoe upper which is attached to the sole or welting.

F 869, F08

van der Waals adsorption—see **physical adsorption**.

D 2652, D28

vane, *n*—in feathers, the section that consists of a solid, stiff collection of barbs, as distinguished from the section near the quill point that has soft, fluffy barbs.

D 123, D13

vane, *n*—in feathers, the section that consists of a solid, stiff collection of barbs, as distinguished from the section near the quill point that has soft, fluffy barbs.

D 7022, D13

vane shear test—an in-place shear test in which a rod with thin radial vanes at the end is forced into the soil and the resistance to rotation of the rod is determined.

D 653, D18

Vant Hoff's law—equilibrium shifts with increasing temperature so as to absorb heat, or with decreasing temperature so as to liberate heat.

E 7, E04

vapor, *n*—the gaseous phase of matter that normally exists in a liquid or solid state.

vapor concentration—See **concentration**.

vapor pressure of moist air (e), *n*—the product of the mole fraction of water vapor x_v and the total pressure p at temperature t :

$$e = p x_v$$

D 1356, D22

vapor—the gaseous form of substances that are normally in the solid or liquid state, and that can be changed to these states either by increasing the pressure or decreasing the temperature.

E 41, G03

vapor barrier—See **water vapor retarder (barrier)**.

C 168, C16

vapor barrier—See **vaporretarder**.

D 1079, D08

vapor-deposited replica—See **replica**.

E 7, E04

vapor deposition:

chemical—ion, induced by heat or gaseous reduction of a vapor condensing on the substrate.

physical—a process for depositing a coating by evaporating and subsequently condensing an element or compound, usually in a high vacuum.

B 374, B08

vapor drift—the dispersion of vaporized chemical to the atmosphere and areas surrounding the target area during and following application.

E 1102, E35

vapor fixing—the act of making a developed electrostatic image permanent by submitting the image-forming toner to the vapor of a solvent for the toner.

F 335, F05

vaporization curve—in a P-T diagram the locus of pressure and temperature values at which a congruent liquid is in equilibrium with its vapor.

E 7, E04

vaporization point—at a stated pressure, the temperature at which a congruent liquid is in equilibrium with its vapor, or, at a stated temperature, the pressure at which the same event occurs.

E 7, E04

vaporization point—at a given pressure, the temperature at which the vapor pressure of the liquid is equal to the external pressure or at a stated temperature the external pressure on the liquid that is equal to its vapor pressure.

E 1142, E37

vaporization temperature—at a given pressure, the temperature at which the vapor pressure of the liquid is equal to the external pressure.

E 1142, E37

vapor-liquid ratio, *n*—of a liquid, the ratio, at a specified temperature and pressure, of the volume of vapor in equilibrium with liquid to the volume of liquid sample charged, at 32°F (0°C).

D 4175, D02

vapor migration—the movement of water vapor from a region of high vapor pressure to a region of lower vapor pressure.

D 1079, D08

vapor pressure, *n*—the pressure exerted by the vapor of a liquid when in equilibrium with the liquid.

D 4175, D02

vapor pressure—in a binary system, that pressure at which a liquid and its vapor are in equilibrium at a definite temperature and total pressure.

E 1142, E37

vapor pressure—the pressure exerted by the vapor of a solid or liquid when in equilibrium with the solid or liquid.

E 1316, E07

vapor retarder—a layer of material or a laminate used to appreciably reduce the flow of water vapor into the roofing system.

D 1079, D08

vapor retarder—a material or system that adequately impedes the transmission of water vapor under specified conditions.

E 631, E06

var—the unit of reactive (quadrature) power. One var is the product of one volt and one ampere in phase quadrature.

A 340, A06

variability—also called "variance"; the number of degrees of freedom of a heterogeneous phase equilibrium.

E 7, E04

variable, *n*—a quantity to which any of the values in a given set may be assigned. (See **parameter** and **variate**)

D 123, D13

variable amplitude loading—See **spectrum loading**.

E 1823, E08

variable-angle internal reflection element—an internal reflection element which can be operated over a range of angles of incidence.

E 131, E13

variable-area nozzle—a pressure atomizer in which the open area of one or more liquid flow passages may be varied so as to control the discharge characteristics.

E 1620, E29

variable data, *n*—measurements that vary and may take any of a specified set of numerical values.

F 1773, F08

variable-orifice pintle nozzle—see **variable-orifice poppet nozzle**.

E 1620, E29

variable-orifice poppet nozzle—a variable-area nozzle in which a moveable poppet determines the annular orifice area.

E 1620, E29

variables data, *n*—measurements which vary and may take any of a specified set of numerical values.

D 123, D13

variables data, *n*—measurements which vary and may take any of a specified set of numerical values.

E 456, E11

variables, method of, *n*—measurement of quality by the method of variables consists of measuring and recording the numerical magnitude of a quality characteristic for each of the units in the group under consideration.

NOTE—This involves reference to a continuous scale of some kind.

E 456, E11

variance, *n*—the mean square of deviations (or errors) of a set of observations; the sum of squared deviations (or errors) of individual observations with respect to their arithmetic mean divided by the number of observations less one (degrees of freedom); the square of the standard deviation (or standard error).

random variance of increment collection (unit variance), S_r^2 , *n*—the theoretical variance calculated for a uniformly mixed lot and extrapolated to 0.5-kg (1-lb) increment size.

segregation variance of increment collection, S_s^2 , *n*—the variance caused by nonrandom distribution of ash content or other constituent in the lot. For a method of estimating this variance, see Annex A1 of Test Methods D 2234.

total variance, S_o^2 , *n*—the overall variance resulting from collecting single increments and including division and analysis of the single increments.

variance of analysis, S_a^2 , *n*—the variance caused by chance errors (deviations) of analysis.

variance of division, S_d^2 , *n*—the variance caused by chance errors (deviations) of sample division.

variance of division and analysis, S_{da}^2 , *n*—the variance caused by the combined chance errors of division and analysis.

D 121, D05

variance, σ^2 , *n*—of population, a measure of the dispersion of members of the population expressed as a function of the sum of the squared deviations from the population mean.

D 123, D13

variance, *n*—a measure of the dispersion of a series of accepted results about their average. It is equal to the sum of the squares of the deviation of each result from the average, divided by the number of degrees of freedom.

D 4175, D02

variance—See **variability**.

E 7, E04

variance, *n*—a measure of the squared dispersion of observed values or measurements expressed as a function of the sum of the squared deviations from the population mean or sample average.

NOTE—The sample variance, or variance of a sample of *n* observed values, is computed as $s^2 = [1/(n-1)][\sum(y_i - \bar{y})^2]$. The sample standard deviation *s* is the positive square root of the sample variance. The population variance $\sigma^2 = \int_R (y - \mu)^2 f(y) dy$, where *R* is the region over which the random variable *y* is defined, and where *f*(*y*) is the probability density function and μ is the population mean of *y*. The population standard deviation (σ) is the positive square root of the population variance.

E 456, E11

variance—the mean square of deviations (or errors) of a set of observations; the sum of square deviations (or errors) of individual observations with respect to their arithmetic mean divided by the number of observations less one (degrees of freedom); the square of the standard deviation (or standard error).

E 856, D34

variance—a measure of the dispersion of a series of results around their average. It is the sum of the squares of the individual deviations from the average of the results, divided by the number of results minus one.

E 1547, E15

variance, between-laboratory, *n*—that component of the overall variance due to the difference in the mean values obtained by different laboratories.

D 4175, D02

variance, *s*, *n*—of a sample, a measure of the dispersion of variates observed in a sample expressed as a function of the squared deviations from the sample average.

D 123, D13

variate, *n*—a measured value that includes a random error of measurement; a variable with which a probability distribution is associated. (See also **variable** and **attribute data**.)

D 123, D13

variation in sawing—a deviation from the anticipated line of cut in sawing rough lumber or other rough wood surfaces.

D 9, D07

varistor, *n*—a material having an electrical resistance that is sensitive to changes in applied voltage.

C 1145, C28

varnish, *n*—a liquid composition that is converted to a transparent or translucent solid film after application as a thin layer.

bituminous varnish—a dark-colored varnish containing bituminous ingredients. The varnish may be either of the oil or spirit type.

oil varnish—a varnish that contains resin and drying oil as the basic film-forming ingredients and is converted to a solid film primarily by chemical reaction.

spar varnish—a varnish for exterior surfaces. The name originated from its use on spars of ships.

spirit varnish—a varnish that is converted to a solid film primarily by solvent evaporation.

D 16, D01

varnish, *n*—*in internal combustion engines*, a hard, dry, generally lustrous deposit that can be removed by solvents but not by wiping with a cloth.

D 4175, D02

varnish, *n*—*in manual transmissions and final drive axles*, a hard, dry, generally lustrous deposit that can be removed by solvents but not by wiping with a cloth.

D 4175, D02

varnish, electrical insulating, *n*—a liquid resin system that is applied to and cured on electrical components providing electrical, mechanical, and environmental protection.

D 1711, D09

varved clay—alternating thin layers of silt (or fine sand) and clay formed by variations in sedimentation during the various seasons of the year, often exhibiting contrasting colors when partially dried.

D 653, D18

vat dyeing—see **drum dyeing**.

D 1517, D31

V-board—see **corrugated fiberboard**.

D 996, D10

“V” configuration—boom positioned in a “V” shape.

F 818, F20

“V”-crown—staple crown with inverted “V” cross section on staple; used in spring-up work in furniture and bedding.

F 592, F16

V-cuts, *n*—*in mica*, edge cuts in the form of a “V” with an included angle of 120° or less.

D 1711, D09

1/v detector—a detector made of a nuclide whose cross section for a particular reaction of interest (for example, (*n*, γ), (*n*, *p*), (*n*, α))

varies as the reciprocal of the velocity of the impinging neutrons. The 1/*v* property of the detector is valid only over a restricted energy range and usually below 10 keV (see **2200 m/s cross section**).

E 170, E10

veal—a large calfskin, almost as large as a kip.

D 1517, D31

vector—a fragment of DNA usually containing an origin of replication that is engineered to accept a foreign piece of DNA.

E 1705, E48

vee path—the angle-beam path in materials starting at the search-unit examination surface, through the material to the reflecting surface, continuing to the examination surface in front of the search unit, and reflection back along the same path to the search unit. The path is usually shaped like the letter V.

E 1316, E07

vegetable matter, *n*—*in wool top*, the pieces of burrs, seeds, shive, leaves, twigs, and grasses which have escaped removal in processing, also foreign vegetable fibers such as hemp, sisal, etc., if present.

D 123, D13

vegetable matter, *n*—*in wool top*, the pieces of burrs, seeds, shive, leaves, twigs, and grasses which have escaped removal in processing, also foreign vegetable fibers such as hemp, sisal, etc., if present.

D 4845, D13

vegetable matter base, *n*—*in raw wool*, oven-dried scoured burrs, seeds, twigs, leaves, and grasses, free of mineral matter and alcohol-extractable matter.

D 123, D13

vegetable matter base, *n*—*in raw wool*, oven-dried scoured burrs, seeds, twigs, leaves, and grasses, free of mineral matter and alcohol-extractable matter.

D 4845, D13

vegetable matter present, *n*—*in raw wool*, the weight of vegetable matter base present in the raw wool, adjusted to a moisture content of 12%, an alcohol-extractives content of 1.5%, and a mineral matter content of 0.5%.

D 123, D13

vegetable matter present, *n*—*in raw wool*, the weight of vegetable matter base present in the raw wool, adjusted to a moisture content of 12%, an alcohol-extractives content of 1.5%, and a mineral matter content of 0.5%.

D 4845, D13

vegetable oil—oil extracted from seeds; typically those of corn, cotton, peanut, rapeseed, sunflower, canola, or soybean.

E 1519, E35

vegetable oil concentrate—an emulsifiable vegetable oil product containing 5 to 20% w/w surfactant and a minimum of 80% w/w vegetable oil.

E 1519, E35

vegetable peeling machine, electric—machine consisting of the following: a cylinder having an abrasive or ribbed wall; an abrasive disk with lobes; a peel trap (when waste disposer is not specified); a waste outlet, a water inlet and air-gap type sprayer; and a cylinder cover.

F 1827, F26

vegetable tanning—the conversion of rawhides into leather by treating with water solutions of tannin extracted from materials of vegetable origin.

D 1517, D31

vehicle, *n*—the liquid portion of a paint or printing ink. Anything that is dissolved in the liquid portion of a paint or printing ink is a part of the vehicle.

D 16, D01

vehicle—a liquid medium for the suspension of magnetic particles.

E 1316, E07

vehicle operation mode—the manner of operation of an emergency medical vehicle, involving the use of warning devices and the exercise of driving privileges legally allowed for emergency vehicles.

F 1177, F30

vehicular gate—a structure used to close a gate opening through which vehicles are intended to pass. See Specifications F 654, F 900, and F 1184.

F 552, F14

veiling reflection, *n*—the reflection of light by an image-bearing surface, that reduces the apparent contrast of the image.

E 284, E12

vein ice—(1) a comprehensive term for ice formed along cracks, where it occurs in bodies of various shapes, including tabular

vein ice

forms and wedges; (2) a seam or vein of ice occupying a crack that cuts across rock or soil layers. **D 7099**, D18

veining—the presence in an otherwise homogeneous stone of bands, streaks or irregular bodies of a contrasting color or appearance, and frequently having a different mineralogical composition to the predominant material. “Veining” does not apply to gneiss, commercial granite types, and slate (see *ribbon*). **C 119**, C18

veiny—appearance of leather characterized by many clearly visible blood vessels, either closed or cut open by buffing or shaving operations. **D 1517**, D31

Vello process—a process for continuously drawing glass tubing (or cane) in which glass is fed downward to the draw through an annular orifice. **C 162**, C14

vellum—see **parchment**. **D 1517**, D31

vellum glaze—See *vellum glaze* under **glaze**. **C 242**, C21

velocity, *n*—time rate of linear motion in a given direction. **D 653**, D18

velocity head—the square of the average velocity divided by twice the acceleration due to gravity. **D 4410**, D19

velocity pressure—See **pressure**. **D 1356**, D22

velveteen, *n*—a woven fabric in twill or plain weave made with a short closely packed filling pile in imitation of velvet. **D 123**, D13

velveteen, *n*—a woven fabric in twill or plain weave made with a short closely packed filling pile in imitation of velvet. **D 4850**, D13

vener—a nonload-bearing facing of stone attached to a backing for the purpose of ornamentation, protection, or insulation. **C 119**, C18

vener, *n*—the decorative surface of a shingle or sheet, usually pigmented or granuled for color. **C 1154**, C17

vener, *n*—thin sheets of wood, produced on a rotary lathe, or by slicing, or sawing. **D 996**, D10

vener—thin sheets of wood from which plywood is made; also referred to as plies in the glued panel.

figured veneer—veneer containing irregular grain formations that add to its value for furniture panel faces and other decorative uses. Various figures are referred to as rift-cut, comb-grained, stripe, rope, mottle, fiddle-back, cross-fire, quartered, crossbar, curley, blister, birds’ eye, feather, crotch, ribbon, stump, burl, etc.

half-round veneer—a manner of cutting veneer to bring out a certain beauty of figure. The flitch is mounted on a stay log and is cut on a lathe. It differs from rotary-cut veneer in that the flitch is cut with a wider sweep than when mounted at the lathe center, and the center of the tree is not near the center of rotation.

plain sliced veneer—veneer sliced approximately tangent to the growth rings; also termed “flat cut.”

quartered veneer—veneer produced by slicing or sawing a log on a plane approximately perpendicular to the growth rings. This may bring out a certain figure resulting from the presence of rays which are especially conspicuous in oak.

rift cut veneer—veneer cut at approximately 45 deg to the rays.

rotary-cut veneer—veneer cut in a continuous ribbon by centering the entire log or bolt in a lathe and rotating it against a knife.

sawn veneer—veneer produced by sawing.

sliced veneer—veneer that is sliced off by moving a log, bolt, or flitch laterally against a knife or vice versa. **D 1038**, D07

vener—the decorative surface of an asbestos-cement shingle or sheet, usually pigmented or granuled for enhanced appearance. **D 2946**, C17

vener, *n*—a thin layer of rubber covering the surface of the tire sidewall. **F 538**, F09

vener-box nail—coated, regular-stock-steel, 1½ by 0.080-in. nail with flat 1¼ or ¼-in. head and medium needle point. **F 547**, F16

vener plaster, *n*—a calcined gypsum plaster formulated to be applied in thin coats. **C 11**, C11

venetian blind effect, *n*—the change in appearance of a specimen as it is rotated in its own plane, under fixed conditions of illumination and viewing, resulting from preferential orientation of flake within the specimen. **E 284**, E12

venetian-blind effect, *n*—*in surface coatings*, uniform change in an appearance attribute such as lightness as a directionally-illuminated specimen is rotated in its own plane. **E 284**, E12

vent—an opening designed to convey water vapor or other gas from inside a building or a building component to the atmosphere. **D 1079**, D08

vented cap—a cap with a small hole that is installed on top of the riser. **D 653**, D18

vent hole—*in grouting*, a hole drilled to allow the escape of air and water and also used to monitor the flow of grout. **D 653**, D18

vent hole—an opening for the escape of gases of relief of pressure, often required in fabricated, immersion-coated, or hot-dip galvanized steel members. Compare **drainage hole**, **weephole**.

ventilator—See **windows and doors**.

verification—see **calibrate**. **E 631**, E06

ventilator—see **exhaust hood**. **F 1827**, F26

vent pipe—*in grouting*, a small-diameter pipe used to permit the escape of air, water, or diluted grout from a formation. **D 653**, D18

verification, *n*—the act or process of verifying. **D 123**, D13

verification, *n*—checking or testing to assure conformance with the specification. **E 6**, E28

verification—confirmation by examination and provision of evidence that an instrument, material, reference, or standard is in conformance with a specification. **E 7**, E04

verification, *n*—confirmation that the calibration or standardization of an instrument is acceptable. **E 135**, E01

verification, *n*—the process of testing a thermometer for compliance with specifications. **E 344**, E20

verification—checking or testing to assure conformance with the specification, (Test Method E 384, Committee E04; Test Method E 10, Committee E28; Test method E 18, Committee E28; Test Method E 92, Committee E28). **E 1187**, E36

verification—see **calibrate**. **E 1605**, E06

verification, *n*—a technical process used to evaluate whether or not a specific symbol meets a standard specification. **F 1294**, F05

verification—act of confirming, substantiating, and assuring that an activity or condition has been implemented in conformance with the specified requirements. **F 1789**, F16

verification, AE system (performance check, AE system)—the process of testing an AE system to assure conformance to a specified level of performance or measurement accuracy. (This is usually carried out prior to, during and/or after an AE examination with the AE system connected to the examination object, using a simulated or artificial acoustic emission source.) **E 1316**, E07

verification of conformity—confirmation by examination of evidence, that a product, process or service fulfills specified requirements, (ISO Guide 2). **E 1187**, E36

verification standard, *n*—calibrated physical standard used to verify the accuracy of calibration of measurement scales, operating characteristics, or systems responses of color-measuring instruments. **E 284**, E12

verification temperatures, *n*—the specified temperatures at which thermometers are tested for compliance with scale error limits. **E 344**, E20

verifier, *n*—*in emission spectrometry*, a material used to determine whether standardization is required. **E 135**, E01

verifier, *n*—a device that measures bars, images, spaces, quiet zones, locator points and optical characters of a symbol to determine whether or not a standard specification is met. **F 1294**, F05

verify, *v*—*specific-intextile testing*, to determine whether a previously calibrated instrument, standard solution, or other standard is still properly calibrated. **D 123**, D13

verify, *v*—*general*, to establish that an operation has been completed correctly. **D 123, D13**

verify, *v*—to assess the overall reliability and accuracy of an instrument or method of measurement by use of material standards for which the measurable quantities have accepted values. See **verification standard**. **E 284, E12**

vermiculite, *n*—insulation composed of natural vermiculite ore expanded to form an exfoliated structure. **C 168, C16**

vermiculite—an aggregate used in lightweight insulating concrete, formed by heating and expanding a micaceous mineral. **D 1079, D08**

vernonia oil, *n*—a low-viscosity epoxidized drying oil from the seed of an African plant, *Vernonia galamensis*, containing three reactive epoxy groups and three carbon—carbon double bonds per triglyceride molecule and is characterized by its very low viscosity and melting point. **D 16, D01**

version A, *n*—when applied to *UPC codes*, the standard 12-digit symbol. **F 1294, F05**

version E, *n*—when applied to *UPC codes*, a 6-digit symbol formed by zero suppression. **F 1294, F05**

vertebral body replacement device, *n*—a structure which is designed to restore anatomic position and support to a section of spine lacking one or more vertebral bodies and intervening disc(s). **F 1582, F04**

vertebral span, *n*—the number of vertebra that are spanned by the longitudinal element, including the vertebrae containing anchor components. **F 1582, F04**

vertical—an approximately vertical path from water surface to stream bed along which one or more samples are taken to define sediment concentration or distribution. May also be referred to as *sampling vertical*. **D 4410, D19**

vertical accretion deposits—flood-plain deposits formed by deposition of suspended sediment from overbank flood waters. **D 4410, D19**

vertical bar code, *n*—a symbol oriented so that the bars are parallel to the horizon; also termed ladder or step ladder bar code. **F 1294, F05**

vertical field separators—(1) A vertical line separating data fields.
(2) See **field separator**. **F 149, F05**

vertical grain—See **grain**. **D 9, D07**

vertical illumination—light incident on an object from the objective side such that smooth planes perpendicular to the optical axis of the objective appear bright. **E 7, E04**

vertical ladder gasket—a ladder gasket installed in a vertical plane in such a way that the intermediate cross members (muntins) are horizontal members. **C 717, C24**

vertical limit—the maximum readable level of vertical indications determined either by an electrical or a physical limit of an A-scan presentation. **E 1316, E07**

vertical load, *n*—the normal reaction of the tire on the road which is equal to the negative of normal force. **F 538, F09**

vertical load (F_v)—the downward vertical component of force between the tire and the road. **E 867, E17**

vertical load (load)—force acting in a vertical axis through the wheel transducer; that is, weight. **E 867, E17**

vertically oscillating arm type—See **pot, pan, and utensils washing machine**. **F 1827, F26**

vertical redundancy, *n*—the availability of more than a single scan path through the elements of a bar code symbol. **F 1294, F05**

vertical strip drain, *n*—a geocomposite consisting of a geotextile cover and drainage core installed vertically into soil to provide drainage for accelerating consolidation of soils. **D 4439, D35**

vertical thread—misnomer for longitudinal thread. **F 547, F16**

vessels—wood cells of comparatively large diameter that have open ends and are set one above the other so as to form continuous tubes. The openings of the vessels on the surface of a piece of wood are usually referred to as pores. **D 9, D07**

viability—the ability to grow and reproduce. **F 1600, F20**

viable—ability to live or grow. For example, bacteria, plants. **D 6161, D19**

viable titer, *n*—the number of living microbes present per unit volume, mass, or area. **D 4175, D02**

vial, *n*—a small, usually cylindrical, vessel capable of closure, such as for medications, perfumes, essences, and samples. **D 996, D10**

vibrated beam wall (injection beam wall)—barrier formed by driving an H-beam in an overlapping pattern of prints and filling the print of the beam with cement-bentonite slurry or other materials as it is withdrawn. **D 653, D18**

vibrating needle atomizer—a vibratory atomizer in which liquid under pressure is supplied through a hollow vibrating needle. **E 1620, E29**

vibrating reed atomizer—a vibratory atomizer in which individual drops are produced from a liquid reservoir by an oscillating reed. **E 1620, E29**

vibration—an oscillation wherein the quantity is a parameter that defines the motion of a mechanical system (see **oscillation**). **D 653, D18**

vibration isolation—a reduction, attained by the use of a resilient coupling, in the capacity of a system to vibrate in response to mechanical excitation. **C 634, E33**

vibrative atomizer—see **vibratory atomizer**. **E 1620, E29**

vibratory atomizer—a device wherein an oscillating solid surface is the primary source of energy. **E 1620, E29**

vibratory cavitation, *n*—cavitation caused by the pressure fluctuations within a liquid, induced by the vibration of a solid surface immersed in the liquid. **G 40, G02**

vibratory cavitation test device, *n*—a device used to generate cavitation in a liquid through the vibrations of a solid surface in contact with the liquid. Usually such devices are driven at a frequency roughly in the range from 10 to 30 kHz by a magnetostrictive or a piezo-electric transducer. **G 40, G02**

vibratory finishing—a process for deburring and surface finishing in which the product and an abrasive mixture are placed in a container and vibrated. **B 374, B08**

virothermography—a thermographic technique for examining an object in which temperature differences are produced by excitation. **E 1316, E07**

Vickers—See **micro penetration tester**. In a more restricted sense, the 136° diamond pyramid indenter used in microindentation hardness tests. **E 7, E04**

Vickers Hardness Number (HV), *n*—an expression of hardness obtained by dividing the force applied to a Vickers indenter by the surface area of the permanent impression made by the indenter. **C 1145, C28**

Vickers hardness number, HV, *n*—a number related to the applied force and the surface area of the permanent impression made by a square-based pyramidal diamond indenter having included face angles of 136°, computed from the equation:

$$HV = 2P \sin (\alpha/2)/d^2 = 1.8544P/d^2$$

where:

P = applied force, kgf,
d = mean diagonal of the impression, mm, and
 α = face angle of diamond = 136°.

E 6, E28

Vickers hardness test, *n*—an indentation hardness test using calibrated machines to force a square-based pyramidal diamond indenter having specified face angles, under a predetermined force, into the surface of the material under test and to measure the diagonals of the resulting impression after removal of the force. **E 6, E28**

Vickers hardness test—standard method for measuring the hardness of metals, particularly those with extremely hard surfaces; the surface is subjected to a standard pressure for a standard length of time by means of a pyramid-shaped diamond. The diagonal of the

Vickers hardness test

resulting indentation is measured under a microscope and the Vickers hardness value is then read from a conversion table.

F 1789, F16

Vickers indenter, *n*—a square-based pyramidal-shaped diamond indenter with face angles of $136^{\circ} 00'$.

C 1145, C28

video data, *n*—a signal sent to the image output terminal by the electronic subsystem that turns the laser on and off to create an image on the photoreceptor.

F 1457, F05

video presentation—display of the rectified, and usually filtered, r-f signal.

E 1316, E07

viewing angle, *v*, *n*—*in retroreflection*, the angle between the retroreflector axis and the observation axis.

E 284, E12

viewing conditions, *n*—the conditions under which a visual observation is made, including the angular substance of the specimen at the eye; the geometric relationship of source, specimen and eye; the photometric and spectral character of the field of view surrounding the specimen; and the state of adaptation of the eye.

C 1154, C17

viewing conditions, *n*—the conditions under which a visual observation is made, including the angular substance of the specimen at the eye; the geometric relationship of source, specimen and eye; the photometric and spectral character of the field of view surrounding the specimen; and the state of adaptation of the eye.

D 2946, C17

viewing conditions, *n*—the conditions under which a visual observation is made, including the angular subtense of the specimen at the eye, the geometric relationship of source, specimen, and eye, the photometric and spectral character of the source, the photometric and spectral character of the field of view surrounding the specimen, and the state of adaptation of the eye.

E 284, E12

viewing rakes, *n*—a set of bars with wires spaced at 50-mm intervals for the purpose of increasing the precision of timing the flame front progress along the specimen.

E 176, E05

viewing screen—feature of microwave equipment, usually part of the door assembly, that is opaque to microwave energy, but visually transparent to provide viewing of the oven contents.

F 1827, F26

vignetting, *n*—loss of light rays at stops of an optical instrument, other than the aperture stop.

E 284, E12

vinyl—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 50 % by weight of vinyl alcohol units ($(\text{C}_2\text{H}_4\text{O})_n$), and in which the total of the vinyl alcohol units and any one or more of the various acetal units is at least 85 % by weight of the fiber.

D 123, D13

vinyl acetate plastics—plastics based on polymers of vinyl acetate or copolymers of vinyl acetate with other monomers, the vinyl acetate being in greatest amount by mass. (ISO)

D 883, D20

vinyl asbestos tile (VAT), *n*—an obsolete form of resilient tile composed of vinyl plastic binders, crysotile asbestos fibers, mineral fillers and pigments.

F 141, F06

vinyl chloride copolymer—a polymer prepared by the polymerization of vinyl chloride and other monomers, the vinyl chloride content being a minimum 51 % of the mass of the polymer.

D 883, D20

vinyl chloride plastics—plastics based on polymers of vinyl chloride or copolymers of vinyl chloride with other monomers, the vinyl chloride being in greatest amount by mass. (ISO)

D 883, D20

vinyl chloride plastics—plastics based on polymers of vinyl chloride or copolymers of vinyl chloride with other monomers, the vinyl chloride being in the greatest amount by mass. (ISO, D20)

F 412, F17

vinyl-coated glass yarn, *n*—glass continuous filament yarn, coated with a pigment and plasticized vinyl chloride resin.

D 123, D13

vinyl-coated glass yarn, *n*—glass continuous filament yarn, coated with a pigment and plasticized vinyl chloride resin.

D 7018, D13

vinyl composition tile, *n*—a resilient floor covering composed of binder, fillers, and pigments. The binder consists of one or more resins of poly(vinyl chloride), or vinyl chloride copolymers, or

both, compounded with suitable plasticizers and stabilizers. Other polymeric resins may be incorporated as part of the binder.

E 1605, E06

vinyl composition tile (VCT), *n*—a resilient floor covering composed of binder, fillers, and pigments. The binder shall consist of one or more resins of poly (vinyl chloride), or vinyl chloride copolymers, or both, compounded with suitable plasticizers and stabilizers. Other polymeric resins may be incorporated as part of the binder.

F 141, F06

vinyl ester resin—a thermosetting reaction product of epoxy resin with a polymerizable unsaturated acid usually methacrylic acid, which is then diluted with a reactive monomer—usually styrene.

C 904, C03

vinylidene chloride plastics—plastics based on polymer resins made by the polymerization of vinylidene chloride or copolymerization of vinylidene chloride with other unsaturated compounds, the vinylidene chloride being in the greatest amount by weight.

D 883, D20

vinylidene chloride plastics—plastics based on polymer resins made by the polymerization of vinylidene chloride or copolymerization of vinylidene chloride with other unsaturated compounds, the vinylidene chloride being in the greatest amount by weight. (D20)

F 412, F17

vinyl resin—under **resin, synthetic**, see *vinyl resin*.

D 16, D01

vinyl wall covering, *n*—a wall covering produced by applying a poly(vinyl chloride) (PVC, vinyl) based coating, or laminating a preformed vinyl film, onto a woven or nonwoven fabric substrate or paper.

E 176, E05

vinylon—a manufactured fiber in which the fiber-forming substance is any long-chain synthetic polymer composed of at least 85 % by weight of vinyl chloride units ($(\text{C}_2\text{H}_2\text{Cl})_n$).

D 123, D13

viral penetration, *n*—the penetration of a material by a virus.

F 1494, F23

viral resistant, *adj*—referring to materials which impede viral penetration under specified laboratory test conditions and detection methods.

F 1494, F23

virgin compression curve—see **compression curve**.

D 653, D18

virgin fiber, *n*—*in paper*, fiber that has been derived from sources other than paper or textile materials that have been recovered.

D 1968, D06

virgin glycol, *n*—glycol that has not been used previously.

D 4725, D15

virgin plastic—a plastic material in the form of pellets, granules, powder, floc, or liquid that has not been subjected to use or processing other than that required for its initial manufacture.

D 883, D20

virgin plastic—a plastic material in the form of pellets, granules, powder, floc, or liquid that has not been subjected to use or processing other than that required for its initial manufacture. (D20)

F 412, F17

virgin wool, *n*—*as defined in the Wool Products Labeling Act*, “the terms ‘virgin’ or ‘new’ as descriptive of a wool product, or any fiber or part thereof, shall not be used when the product or part so described is not composed wholly of new or virgin fiber which has never been reclaimed from any spun, woven, knitted, felted, braided, bonded, or otherwise manufactured or used product.”

D 123, D13

virgin wool, *n*—*as defined in the Wool Products Labeling Act*, “the terms ‘virgin’ or ‘new’ as descriptive of a wool product, or any fiber or part thereof, shall not be used when the product or part so described is not composed wholly or new or virgin fiber which has never been reclaimed from any spun, woven, knitted, felted, braided, bonded, or otherwise manufactured or used product.”

D 4845, D13

virtual data warehouse, *n*—a National ITS Architecture market package in which physically distributed ITS archives exchange multiple transportation-related data even though the warehouse is not a center that directly collects its own ITS-related data, and it is

- analogous to a library whose collection is acquired from other libraries or from a central library system. **E 867, E17**
- virtual-front time (of an impulse-voltage wave), n** —a time equal to 1.67 times the interval t_f between the instants when the voltage is 0.3 and 0.9 times the peak value. **D 1711, D09**
- virtual image**—a reproduction of an object by an optical system which gathers light from an object point and transforms it into a beam that appears to diverge from another point. **E 1316, E07**
- virtual leak**—(1) the semblance of a leak in a vacuum system caused by slow release of trapped gas.
(2) during a rate-of-rise test, the semblance of a leak in a vacuum system caused by slow release of sorbed or occluded gas or gases on or in the surfaces and pores of all materials in a system which has been exposed to atmospheric pressure prior to evacuation. **E 1316, E07**
- virtual metamer, n** —set of spectral radiance factors, not based on physical samples, which provide a metameric match for a specific illuminant-observer combination. **E 284, E12**
- virtual origin (of an impulse voltage wave), n** —the point of intersection (o_1) with the line of zero voltage of a line drawn through the points of 0.3 and 0.9 times the peak voltage on the front of an impulse voltage wave. **D 1711, D09**
- virtual-peak value (of an impulse-voltage wave), n** —a value derived from a recording of an impulse wave on which high-frequency oscillations or overshoot of limited magnitude may be present. **D 1711, D09**
- virtual temperature**—See **temperature**. **D 1356, D22**
- virtual time to half-value (of an impulse-voltage wave), n** —the time interval (t_2) between the virtual origin (o_1) and the instant on the tail when the voltage has decreased to half the peak value. **D 1711, D09**
- virus, n** —a *minuteinfectious agent*, which lacks independent metabolism and is only able to replicate within a living host cell. **F 1494, F23**
- viscoelasticity**—property of materials that strain under stress partly elastically and partly viscously, that is, whose strain is partly dependent on time and magnitude of stress. (ISRM) **D 653, D18**
- viscoelasticity**—a combination of viscous and elastic properties in a material, with the relative contribution of each dependent upon time, temperature, stress, and strain rate. **D 1079, D08**
- viscoelasticity, n** —a combination of viscous and elastic properties in a material with the relative contribution of each being dependent on time, temperature, stress, and strain rate. **D 1566, D11**
- viscoelasticity**—the property exhibited by a material which possesses both elastic and viscous properties that vary with strain, strain rate and frequency. **E 1142, E37**
- viscose**—a solution of sodium cellulose xanthate prepared by dissolving the reaction product formed by the interaction of carbon disulfide and alkali cellulose in an aqueous solution of sodium hydroxide. Viscose is used mainly in the manufacture of rayon or cellophane, where it is extruded through fine openings of the proper shape into a coagulating bath. **D 1695, D01**
- viscosity**—the property of fluids that opposes the relative motion of adjacent portions of a given fluid producing a type of internal friction and exhibiting a resistance to flow. **C 242, C21**
- viscosity**—the internal fluid resistance of a substance which makes it resist a tendency to flow. **D 653, D18**
- viscosity**—the property of resistance of flow exhibited within the body of a material. **D 883, D20**
- viscosity, n** —of a liquid, the resistance to flow expressed as the ratio of the applied shear stress to the resulting rate of shearing strain. (See **Newtonian behavior, non-Newtonian behavior, and thixotropy**.) (Compare **consistency**.) **D 907, D14**
- viscosity, n** —the resistance of a material to flow under stress. **D 1566, D11**
- viscosity**—in general, the resistance of a fluid to flow or motion within itself. As applied to cellulose or its derivatives, the viscosity of a solution of the substance. **D 1695, D01**
- viscosity**—same as **viscosity, absolute**. **D 2864, D27**
- viscosity**—the internal resistance to flow of a solid (powder), liquid, or gas at a specified temperature. Viscosity is a definite measurement for the consistency of a material. **D 3064, D10**
- viscosity, η** —the property of resistance to steady flow exhibited within the body of the material. **D 4092, D20**
- viscosity, n** —the ratio between the applied shear stress and rate of shear. It is sometimes called the coefficient of dynamic viscosity. This value is thus a measure of the resistance to flow of the liquid. The SI unit of viscosity is the pascal second (Pa.s). The centipoise (cP) is one millipascal second (mPa.s) and is often used. **D 4175, D02**
- viscosity, η** —the property of resistance to steady flow exhibited within the body of the material, (D4092, D20). **E 1142, E37**
- viscosity**—the property of a fluid that presents a resistance to shearing flow. **E 1316, E07**
- viscosity**—the property of resistance to flow exhibited within the body of a material. **F 412, F17**
- viscosity, n** —the property of resistance of flow exhibited with the body of a material. **F 1251, F04**
- viscosity, absolute, η** —the ratio of shear stress to shear rate. It is the property of internal resistance of a fluid that opposes the relative motion of adjacent layers. The unit most commonly used for insulating fluids is the centipoise. **D 2864, D27**
- viscosity coefficient**—the shearing stress necessary to induce a unit velocity flow gradient in a material. **D 883, D20**
- viscosity coefficient, n** —the shearing stress tangentially applied that will induce a velocity gradient. A material has a viscosity of one poise when a shearing stress of one dyne per square centimetre produces a velocity gradient of (1 cm/s)/cm. (See also **viscosity**.) **D 907, D14**
- viscosity coefficient**—the shearing stress necessary to induce a unit velocity gradient in a material. **D 4092, D20**
- viscosity coefficient**—the shearing stress necessary to induce a unit velocity flow gradient in a material. **F 412, F17**
- viscosity, coefficient of**—same as **viscosity, absolute**. **D 2864, D27**
- viscosity, cuprammonium**—the viscosity of a solution or dispersion of cellulose or pulp in cuprammonium hydroxide under standardized conditions. **D 1695, D01**
- viscosity, cupriethylenediamine**—the viscosity of a solution or dispersion of cellulose or pulp under standard conditions when dissolved in a solution of copper hydroxide in ethylenediamine. **D 1695, D01**
- viscosity, dynamic**—same as **viscosity, absolute**. **D 2864, D27**
- viscosity in absolute units, CGS poises**—the force in dynes required to move, at a velocity of 1 cm/s, one surface having an area of 1 cm² past another parallel-like surface 1 cm away, overcoming the resistance to shear of the material filling the space between. **D 1695, D01**
- viscosity index**—the ratio of the viscosity of a highly concentrated solution to that of a dilute solution. It is a measure of solvent power and, in derivatives, of uniformity of substitution. **D 1695, D01**
- viscosity index (VI), n** —an arbitrary number used to characterize the variation of the kinematic viscosity of a fluid with temperature. **D 4175, D02**
- viscosity, inherent**—the quotient of the natural logarithm of relative viscosity by the concentration, that is, $\ln \eta_{rel}/c$. The concentration should be specified. **D 1695, D01**
- viscosity, intrinsic**—the limiting value of reduced viscosity, η_{sp}/c , as c (concentration) approaches zero. In the cellulosic field the concentration is generally expressed as grams per decilitre. The IUPAC Committee of Nomenclature has recommended the expression "Limiting viscosity number" for this and the concentration is generally expressed as grams per millilitre. **D 1695, D01**
- viscosity, kinematic**—the quotient of the absolute (dynamic) viscosity divided by the density, η/ρ , both at the same temperature. For insulating liquids the unit most commonly used is the centistokes (100 cSt = 1 St). **D 2864, D27**

viscosity loss (VL), n

viscosity loss (VL), n—a measure of the decrease in an oil's viscosity.

D 4175, D02

viscosity, Mooney, n—a measure of the viscosity of a rubber or rubber compound determined in a Mooney shearing disk viscometer (see Test Methods D 1646).

D 1566, D11

viscosity, Newtonian—the property exhibited by a material in which the coefficient of viscosity is independent of strain rate and time (at a given temperature and density).

E 1142, E37

viscosity, non-Newtonian—the property exhibited by a material in which the coefficient of viscosity is dependent on strain rate and/or time (at a given temperature and density).

E 1142, E37

viscosity number—see **viscosity, reduced**.

D 1695, D01

viscosity ratio—see **viscosity, relative**.

D 1695, D01

viscosity, reduced—the specific viscosity divided by the concentration. In the cellulosic field the concentration is generally expressed as grams per decilitre. The IUPAC Committee on Nomenclature has recommended the expression "viscosity number" for this, in which case the preferred expression of concentration is grams per millilitre.

D 1695, D01

viscosity, relative—the ratio of the viscosity of a solution to that of the pure solvent. The IUPAC Committee on Nomenclature has recommended the expression "Viscosity ratio" for this.

D 1695, D01

viscosity, Saybolt Universal—the efflux time in seconds of 60 mL of sample flowing through a calibrated Saybolt Universal orifice under specified conditions.

D 2864, D27

viscosity, specific—the difference between the viscosity of a solution and that of a solvent, divided by the latter.

D 1695, D01

viscosity, xanthate—for a cellulosic pulp, the viscosity of the viscose that will be obtained as a result of a specified series of processes.

D 1695, D01

viscous, adj—as a modifier of *damping*, descriptive of that type of damping in which the damping force is proportional to the velocity of motion across the damping element, so named because of its derivation from an oil-filled dashpot damper.

viscous damping—the dissipation of energy that occurs when a particle in a vibrating system is resisted by a force that has a magnitude proportional to the magnitude of the velocity of the particle and direction opposite to the direction of the particle.

D 653, D18

viscous flow—see **laminar flow**.

D 653, D18

viscous flow—flow, usually at low velocity, in which fluid elements flow in a straight line parallel to the direction of flow of the liquid in the absence of turbulence.

D 1695, D01

viscous flow—the flow of gas through a duct under conditions such that the mean free path is very small in comparison with the smallest dimension of a transverse section of the duct. This flow may be either laminar or turbulent.

E 1316, E07

viscous hydroplaning, n—hydroplaning of pneumatic tires with separation caused by a thin fluid film due principally to the generation of fluid viscous forces.

E 867, E17

viscous leak—a leak of such geometric configuration that gas flow through it is viscous in nature; that is, the flow obeys Poiseuille's Law. The flow rate is proportional to the difference of the squares of the end pressures, and inversely proportional to the gaseous viscosity.

E 1316, E07

visibility, n—the properties and behavior of light waves and objects interacting in the environment to produce light signals capable of evoking visual sensation.

E 284, E12

visibility—the quality or state of being perceived by the eye. In many outdoor applications, visibility is defined in terms of the distance at which an object can be reliably resolved from its surroundings. In outdoor applications it usually is defined in terms of contrast or size of a standard test object, observed under standardized viewing conditions, having the same threshold as the given object.

E 1316, E07

visibility distance, n—the greatest distance at which an object can be seen.

E 284, E12

visible—pertaining to radiant energy in the electromagnetic spectral range visible to the normal human eye (approximately 380 to 780 nm).

E 131, E13

visible, adj—pertaining to that portion of the electromagnetic spectrum to which the eye is sensitive, approximately 380 to 780 nm in wavelength.

E 284, E12

visible-activated fluorescence, n—fluorescence resulting from the absorption of visible radiant flux, that is, flux with wavelengths 380 to 780 nm. (See also **ultra-violet-activated fluorescence**.)

E 284, E12

visible laser diode, VLD, n—a light source operating in the human visible light spectrum.

F 1294, F05

visible light—electromagnetic radiation in the 400–700 (4000–7000 Å) wavelength range.

E 1316, E07

visible light—radiant energy generated in 400 to 700 nm (4000 to 7000 Å) wavelength range.

E 1316, E07

visible radiation, n—any radiation capable of causing a visual sensation.

NOTE—The limits of the spectral range of visible radiation are not well defined and may vary according to the user. The lower limit is generally taken between 380 and 400 nm and the upper limit between 760 and 790 nm (1 nanometer, nm = 10⁻⁹ m).

E 349, E21

visible response—a particular type of optical response system used in some scanners. There are very few reflective inks for this type of system.

F 149, F05

visible start (VS), n—that temperature at which the liquid crystal first begins to reflect visible light.

E 344, E20

visible waste, n—in *cotton testing*, foreign matter deposited in the waste boxes of the machine during the test.

D 123, D13

visible waste, n—in *cotton testing*, foreign matter deposited in the waste boxes of the machine during the test.

D 7139, D13

vision, n—the sense of sight.

E 253, E18

visitor (visitor)—(in a facility) person present who is not an occupant of that facility.

E 1480, E06

visual adaptation—the adjustment of the eyes when one passes from a bright to a darkened place.

E 1316, E07

visual colorimeter, n—an instrument, using the eye as detector, that measures color stimuli produced by mixing one or more of at least three primary colors.

E 284, E12

visual field—point or points in space that can be perceived when the head and eyes are kept fixed. The field may be monocular or binocular.

E 1316, E07

visual inspection—a visual check made to detect constructional defects.

F 819, F18

visual inspection for clearance testing—the visual examination of a residential dwelling or a child-occupied facility following an abatement to determine whether or not the abatement has been successfully completed.

E 1605, E06

visual inspection for risk assessment—the visual examination of a residential dwelling or a child-occupied facility to determine the existence of deteriorated lead-based paint or other potential sources of lead-based paint hazards.

E 1605, E06

visual perception, n—the visual experience resulting from stimulation of the retina and the resulting activity of associated neural systems.

E 284, E12

visual range, n—distance that unaided (except for normal prescription eyewear) human vision can provide deconfliction during a UAV operation, and can effectively monitor the UAV.

F 2395, F38

vitrain—See **vitrain** under **coal**.

D 121, D05

vitreous enamel—see **porcelain enamel**.

C 286, B08

vitreous silica—a generic term for vitreous silicon dioxide. See related terms **fused quartz** and **fused silica**.

C 162, C14

vitreous slip—a slip coating matured on a ceramic body producing a vitrified surface.

C 242, C21

vitreous (vitrified)—that degree of vitrification evidenced by low water absorption. (See also **impervious; nonvitreous; semivitreous**.)

C 242, C21

vitrification—the progressive reduction and elimination of porosity of a ceramic composition, with the formation of a glass phase, as a result of heat treatment. C 242, C21

vitrification—solidification of an aqueous suspension at low temperatures without the formation of ice crystals. E 1705, E48

vitrification range—the maturing range of a vitreous body. C 242, C21

vitrified bond, n—a bond created by the fusion of ceramic materials, principally clays and feldspar. C 1145, C28

vitrified clay pipe—a pipe made from various clays or combinations thereof which are shaped, dried, and fired to a point where the glass-forming components fuse to form a bond between the crystalline grains. C 896, C04

vitrinite—See *vitrinite* under **maceral**. D 121, D05

vitrinite type, n—as used in *Test Method D 5061*, reflectance classes of vitrinite which span 0.1 % reflectance intervals. D 121, D05

VL—in *viscometry*, abbreviation for viscosity loss. D 4175, D02

“V” nail—headless nails with central V-shaped slot at head end. F 547, F16

VOC—an abbreviation for *volatile organic compound*; an organic compound with the tendency to become vapor at specified conditions of temperature and pressure. E 631, E06

VOC—an abbreviation for *volatile organic compound*; an organic compound with the tendency to become vapor at specified conditions of temperature and pressure. E 1749, E06

vocabulary—See **repertoire**. F 149, F05

vocational career apparel, n—career apparel which is generally subject to abusive wear and for which durability is a more important attribute than appearance. (See also **career apparel** and **dress career apparel**) D 123, D13

vocational career apparel, n—career apparel which is generally subject to abusive wear and for which durability is a more important attribute than appearance. (See also **career apparel** and **dress career apparel**.) D 7022, D13

VOC (viable organism count)—a measure of biological activity (living or growing) in water. D 6161, D19

VOC (volatile organic compound)—an organic compound with a vapor pressure higher than water. D 6161, D19

void—a defective area in which a part of the basis material or underlayer is visible after final coating. B 374, B08

void, n—an unfilled space enclosed within an apparently solid carbon or graphite body. C 709, D02

void—space in a soil or rock mass not occupied by solid mineral matter. This space may be occupied by air, water, or other gaseous or liquid material. D 653, D18

void, n—(1) in a solid plastic, an unfilled space of such size that it scatters radiant energy such as light.
(2) a cavity unintentionally formed in a cellular material and substantially larger than the characteristic individual cells. (ISO) D 883, D20

void—any pocket of enclosed gas or air within a composite. D 3878, D30

void—any pocket of gas entrapment within or between the plies of reinforcement (see **blister** and **porosity**). D 3918, D20

void, n—an unfilled space enclosed within an apparently solid carbon or graphite body. D 4175, D02

void—*in structural members*, any opening, small crack, or crevice occurring at the juncture of structural members (such as chambers, reliefs, joggles, butt joints, or fasteners). E 631, E06

void—*in structural members*, any opening, small crack, or crevice occurring at the juncture of structural members (such as chambers, reliefs, joggles, butt joints, or fasteners). E 1749, E06

void—the absence of ink, or an area of significantly lower density of ink, within the confines of a character. F 149, F05

void, n—(1) in a solid plastic, an unfilled space of such size that it scatters radiant energy such as light.

(2) a cavity unintentionally formed in a cellular material and

substantially larger than the characteristic individual cells. (D20, ISO) F 412, F17

void, n—a volume (in the tread band) defined by the lack of rubber; the depth dimension of this volume may vary from point to point in (on) the tread band. F 538, F09

void, n—(1) in a solid plastic, an unfilled space of such size that it scatters radiant energy such as light, (2) a cavity unintentionally formed in a cellular material and substantially larger than the characteristic individual cells. F 1251, F04

void—shallow pocket or hollow on the surface of a fastener because of nonfilling of metal during forging. F 1789, F16

void, cellular material, n—a cavity unintentionally formed in a cellular material and substantially larger than the characteristic individual cells. D 1566, D11

void content, n—the volume percentage of voids in a composite. D 3878, D30

void ratio, e (D)—the ratio of: (1) the volume of void space, to (2) the volume of solid particles in a given soil mass.
critical void ratio, e_c (D)—the void ratio corresponding to the critical density. D 653, D18

void ratio (e, (D)), n—the ratio of the volume of void space to the volume of solids. D 4439, D35

void(s), n—in bar code standards, unwanted light areas contained within the dark elements of a positive bar. F 1294, F05

void space—ratio of the volume of voids in a powder bed to that of the overall volume of the powder bed. C 242, C21

void volume—the volume between the solid particles in a bed of granular material. Also called the interstitial volume. D 5681, D34

volatile, adj—a relative term expressing the tendency to form vapor; that is, at room temperature or in some other temperature domain. C 1145, C28

volatile corrosion inhibitor (VCI)—See **corrosion**. D 996, D10

volatile extractables—for purposes of the *ASTM tests for volatile extractables and nonvolatile extractables*, volatiles shall be defined as those compounds that give more than 50 % recovery in studies using the applicable volatile extractables method. F 17, F02

volatile extractables—those chemical species which are released in the vapor state from microwave food packaging under simulated use conditions and are detected using an applicable volatile extractables method. F 1479, F02

volatile fatty acid (VFA) number (of latex), n—the number of grams of potassium hydroxide equivalent to the volatile fatty acids in a latex sample containing 100 g of total solids. D 1566, D11

volatile fuels—relatively wide boiling range volatile distillate. D 4175, D02

volatile ingredients—the components of an aerosol formulation with a vapor pressure greater than atmospheric pressure (14.7 psia (101 kPa)) at 105°F (40.6°C). D 3064, D10

volatile materials—materials, particularly chemicals such as organic solvents that are readily vaporized at room temperature.
volatile organic compound—See **VOC**. E 631, E06

volatile matter, n—those products, exclusive of moisture, given off by a material such as gas or vapor, determined by definite prescribed methods which may vary according to the nature of the material. D 121, D05

volatile matter, n—that matter that is changed under conditions of the test to the gaseous state. D 1129, D19

volatile matter, n—those products, exclusive of moisture, given off by a material as gas or vapor as determined by definite prescribed methods. D 5681, D34

volatile matter—that matter that is changed under conditions of the test to the gaseous state. D 5681, D34

volatile matter—those products, exclusive of moisture, given off by a material as gas or vapor, determined by definite prescribed methods. E 856, D34

volatile matter—those products, exclusive of moisture, given off by

volatile matter

a material as gas or vapor, determined by definite prescribed methods that may vary according to the nature of the material.

E 1705, E48

volatile organic chemical—See **organic chemical**.

D 1356, D22

volatile organic compound—See **VOC**.

E 1749, E06

volatiles, n—materials readily vaporizable at relatively low temperatures.

D 123, D13

volatiles, n—materials readily vaporizable at relatively low temperatures.

D4920, D13

volatile solvent—a nonaqueous liquid that evaporates readily at room temperature and atmospheric pressure.

D 2825, D21

volatile thinner—see **thinner**.

D 16, D01

volatility—the capability of evaporating into a gas.

volute—See **railing systems**.

E 631, E06

volatility—the tendency of a solid or liquid material to pass into the vapor state at ordinary temperature.

E 1142, E37

volatility—the capability of evaporating into a gas.

E 1749, E06

volcanoes, n—printing imperfection resembling the crater of a volcano with a ring of heavy ink surrounding an area of no or very little ink.

D 6488, D01

voltage alignment—See **alignment**.

E 7, E04

voltage efficiency—the ratio, usually expressed as a percentage, of the equilibrium reaction potential in a given electrochemical process to the bath voltage.

B 374, B08

voltage, induced secondary, E_2 —the rms value of the open

circuit voltage induced in the secondary winding N_2 of an inductor as a result of cyclic variations of the flux linkages with N_1 .

A 340, A06

voltage, maximum retest—voltage, either ac rms or dc average, that is equal to the proof test voltage for new protective equipment.

F 819, F18

voltage, maximum use—the ac voltage (rms) classification of the protective equipment that designates the maximum nominal design voltage of the energized system that may be safely worked. The nominal design voltage is equal to phase-to-phase voltage on multiphase circuits.

NOTE—If there is no multiphase exposure in a system area, and the voltage exposure is limited to phase (polarity on dc systems) to ground potential, the phase (polarity on dc systems) to ground potential shall be considered to be the nominal design voltage.

NOTE—If electrical equipment and devices are insulated, or isolated, or both, such that the multiphase exposure on a grounded wye circuit is removed, then the nominal design voltage may be considered as the phase-to-ground voltage on that circuit.

F 819, F18

voltage, nominal design—a nominal value consistent with the latest revision of ANSI C84.1, assigned to the circuit or system for the purpose of conveniently designating its voltage class.

F 819, F18

voltage, retest—voltage, either ac rms or dc average, that used protective equipment must be capable of withstanding for a specific test period without breakdown.

F 819, F18

voltage threshold—a voltage level on an electronic comparator such that signals with amplitudes larger than this level will be recognized. The voltage threshold may be user adjustable, fixed, or automatic floating. (E 750)

E 1316, E07

volt-ampere, P_a —the unit of apparent power.

A 340, A06

volume concentration—See **concentration**.

D 1356, D22

volume concentration—the volume of the liquid or solid particles per unit volume of mixture.

G 40, G02

volume concentration—See **particle concentration**.

G 40, G02

volume count, n—the product of the area under a peak and a response factor.

D 4175, D02

volume density—See **concentration**.

D 1356, D22

volume percent solids, n—the portion of a coating that remains as part of the dry film expressed as percent by volume.

D 16, D01

volume resistivity—the resistance in ohms of a body of unit length and unit cross-sectional area.

B 354, B01

volume resistivity, n—of paper, the resistance to electric current along a current path between electrodes placed on opposite sides of a sheet of paper when a defined dc voltage is applied and the thickness of the paper between the electrodes is specified.

D 1968, D06

volume resistivity—the volume resistance (in ohm-centimetres) between opposite faces of a centimetre cube of the material. A practical relative value for paper is obtained by the measure of resistance to electrical current electrodes placed in contact with the opposing surfaces of the sample.

F 335, F05

volume resistivity, ρ_v —the volume resistivity of a material is the ratio of the potential gradient parallel to the current in the material to the current density.

D 5077, D10

volumetric flame spread, n—flame propagation through the volume of a gaseous mixture.

E 176, E05

volumetric glassware—See **graduated glassware**.

C 162, C14

volumetric heat capacity—the amount of heat required to raise the temperature of a unit volume of a substance by one degree.

D 7099, D18

volumetric latent heat of fusion—the amount of heat required to melt all of the ice (or to freeze all of the pore water) in a unit volume of soil or rock.

D 7099, D18

volumetric shrinkage (volumetric change), V_s (D)—the decrease in volume, expressed as a percentage of the soil mass when dried, of a soil mass when the water content is reduced from a given percentage to the shrinkage limit.

D 653, D18

volumetric (total) water content—the ratio of the volume of the water and ice in a sample to the volume of the whole sample, expressed either as a fraction or as a percentage.

D 7099, D18

volume-weight—See **specificweight**.

D 4410, D19

volute, n—an ornamental spiral or scroll-shaped form serving, for example, as the handrail termination.

E 631, E06

volute, n—an ornamental spiral or scroll-shaped form serving, for example, as the handrail termination.

E 1481, E06

Von Mises yield theory—stated ratio between shear and tension yield stresses for an isotropic, solid material. Theoretical yielding in shear is assumed to occur at a stress equal to 0.577 of the yield stress in tension.

E 631, E06

von Post humification scale—a scale describing various stages of decomposition of peat ranging from H1, which is completely undecomposed, to H10, which is completely decomposed.

D 653, D18

vortex loss—oil escaping past a boom due to drainage vortices produced at the boom.

F 818, F20

votive candle, n—a candle produced for use fully within a candle accessory, specifically, a votive holder.

F 1972, F15

votive holder, n—a small open vessel designed to hold a votive candle during use; the votive holder shall be capable of containing the melted candle.

F 1972, F15

“V” thread—thread with leading flank of one thread intersecting with following flank of adjacent thread at thread root.

F 547, F16

vulcanizate, n—the product of vulcanization, a crosslinked rubber.

D 1566, D11

vulcanization, n—an irreversible chemical reaction during which a rubber compound's chemical structure is changed to make it less plastic, more resistant to solvents, and have improved physical and mechanical properties.

C 717, C24

vulcanization, n—an irreversible process, usually accomplished through the application of heat, during which a rubber compound through a change in its chemical structure (for example, crosslinking) becomes less plastic and more resistant to swelling by organic liquids while elastic properties are conferred, improved, or extended over a greater range of temperatures.

D 123, D13

vulcanization, n—an irreversible process during which a rubber compound, through a change in its chemical structure (for example, cross-linking), becomes less plastic and more resistant to

swelling by organic liquids and elastic properties are conferred, improved, or extended over a greater range of temperature.

D 883, D20

vulcanization, *n*—an irreversible chemical change (for example, cross-linking) in which a rubber compound becomes less plastic with greater elasticity, strength, stability, and chemical resistance over a greater range of temperatures.

D 907, D14

vulcanization, *n*—an irreversible process during which a rubber compound, through a change in its chemical structure (for example, crosslinking), becomes less plastic and more resistant to swelling by organic liquids, while elastic properties are conferred, improved, or extended over a greater range of temperature.

D 1566, D11

vulcanization, *n*—an irreversible process, usually accomplished through the application of heat, during which a rubber compound, through a change in its chemical structure (for example, cross linking) becomes less plastic and more resistant to swelling by organic liquids while elastic properties are conferred, improved, or extended over a greater range of temperatures.

D 6477, D13

vulcanization, *n*—an irreversible process during which a rubber compound, through a change in its chemical structure (for example, cross-linking), becomes less plastic and more resistant to swelling by organic liquids and elastic properties are conferred, improved, or extended over a greater range of temperature. (D20)

F 412, F17

vulcanize, *v*—to subject to vulcanization.

D 907, D14

vulcanized vegetable oil, *n*—a compounding material made by heating unsaturated vegetable oil with cross-linking agents; it is used as a processing aid or extender.

D 1566, D11

vulcanizing agent, *n*—compounding material that produces crosslinking in rubber.

D 1566, D11

vulcanizing system, *n*—the combination of vulcanizing agent and, as required, accelerators, activators, and retarders used to produce the desired vulcanization characteristics or vulcanizate characteristics.

D 1566, D11

V-X diagram—a graphical representation of the isothermal or isobaric phase relationships in a binary system, the coordinates of the graph being specific volume and concentration.

E 7, E04

W

“W”—clean only with water-based shampoo or foam upholstery cleaner. Do not saturate with the liquid. Do not use dry solvents to spot or clean. Pile fabrics may require brushing to restore appearance. Cushion covers should not be removed and laundered.

D 5253, D13

“W”—a letter code. See **upholstery cleaning instructions**.

D 5253, D13

w—uniform load, lbf/in. (or N/mm)

E 631, E06

WAD—See **worst area difference**.

F 149, F05

wadding—See **cushioning material**.

D 996, D10

wafer—a wood flake having a predetermined length of at least $1\frac{3}{16}$ in. (30 mm).

D 1554, D07

wagon nail—annealed, barbed, regular-stock-steel nails with round, oval, cone, flat countersunk, or steeple head and medium diamond point.

F 547, F16

waist, n—*in anatomy*, the part of the body at the location between the lowest rib and hip identified by bending the body to the side.

D 123, D13

waist, n—the part of the body at the location between the lowest rib and hip identified by bending the body to the side.

D 5219, D13

waist—the smallest part of the foot between the instep and the ball, also the corresponding part of a shoe last.

F 869, F08

waist, n—*in anatomy*, the part of the body at the location between the lowest rib and hip identified by bending the body to the side.

F 1494, F23

waist, b_M —the narrowest point of the ski body between the heel and shoulder.

F 472, F27

waist girth, n—*in body measurements*, the circumference of the waist immediately below the lowest rib.

D 123, D13

waist girth, n—the minimum horizontal circumference around the body at waist height.

D 5219, D13

waist girth, n—*in body measurements*, the circumference of the waist immediately below the lowest rib.

F 1494, F23

waist height, n—the distance from the waist level to the hip girth level along the side of the body (contour) then vertically to the floor, taken with subject standing and without shoes.

waist height (infant special case), n—the straight distance from the waist level to the soles of the feet along the side of the body, taken with subject lying down flat with legs extended and foot positioned at 1.57 rad (90°) to the leg.

D 5219, D13

waist (of the snowboard)—the narrowest point of the snowboard body between the heel and the shoulder.

F 1107, F27

waist to hip height, n—the distance from the waist level to the hip girth level, taken along the side of the body (contour).

waist to hip height (infant special case), n—the straight distance from the waist level to the hip girth level, taken along the side of the body with subject lying down flat with legs extended.

D 5219, D13

waist to knee height, n—the vertical distance from the waist level to a point level with the midpoint of the back of the knee (or crease), taken along the side of the body.

waist to knee height (infant special case), n—the straight distance from the waist level to a point level with the midpoint of the back of the knee (or crease), taken along the side of the body with subject lying down flat with legs extended.

D 5219, D13

wale, n—*in knitted fabrics*, a column of successive loops in the length direction of the fabric.

D 123, D13

wale, n—*in woven fabrics*, one of a series of raised portions or ribs lying warpwise in the fabric.

D 123, D13

wale, n—*in woven fabric*, one of a series of raised portions or ribs lying warpwise in the fabric.

D 4850, D13

wale, n—*in knitted fabrics*, a column of successive loops in the length direction of the fabric.

D 4850, D13

wale, n—*in woven fabrics*, one of a series of raised portions or ribs lying warpwise in the fabric.

D 5684, D13

walk in—to embed insulation panels in hot bitumen or adhesive by walking on them immediately after application.

D 1079, D08

walking off, n—the disappearance or weakening of image parts on the printing plate during the press run.

D 6488, D01

walking stick—long arm attached to tool allowing operator to use it without bending over.

F 592, F16

walkway surface—a structure intended to be used by a person attempting to walk.

F 1646, F13

wall, n—a part of a **building** that divides spaces vertically.

bearing wall—a **wall** supporting a vertical load in addition to its own weight.

curtain wall—a **nonbearing** exterior **wall**, secured to and supported by the structural members of the **building**.

nonbearing wall—a **wall** that does not support a vertical load other than its own weight.

retaining wall—a **wall** not enclosing portions of a **building**, designed to resist the lateral displacement of soil or other material.

E 631, E06

wallaby—leather from skins of the wallaby, small and medium-sized kangaroo.

D 1517, D31

wall and top material, n—any pliable planar structure used as a nonbase surface in camping tentage including roofs, sides, windows, screens, doors, awnings, flies, and canopies.

D 123, D13

wallboard—see **gypsum wallboard**.

C 11, C11

wallboard nail—slender, colored (baked-lacquer finished), regular-stock-steel or hardened-steel, smooth or annularly threaded, $1\frac{1}{8}$ by 0.062 to 2 by 0.083-in. nails with slightly countersunk 0.109 to 0.181-in. head and medium diamond or long needle point.

F 547, F16

wall bracket—a bracket used for anchoring the central portion of a handrail to a wall.

E 631, E06

wall bracket—a bracket used for anchoring the central portion of a handrail to a wall.

E 1481, E06

wall clip—a bracket used for anchoring the end of a handrail to a wall. (Syn. *wall flange*.)

E 631, E06

wall clip—See **railing systems**.

E 631, E06

wall clip—a bracket used for anchoring the end of a handrail to a wall. (Syn. *wall flange*.)

E 1481, E06

wall covering, n—*for purposes of this practice*, a paper- or vinyl-based product designed to be attached to a wall surface for decorative or acoustical purposes.

E 176, E05

wallcovering, n—a fabric, vinyl, or paper-based product designed to be attached to a vertical wall surface for decorative or acoustical purposes.

E 176, E05

wallcovering composite, n—an assembly of a wallcovering, adhesive (if used), and substrate used as a vertical wall treatment for decorative or acoustical purposes.

E 176, E05

wall covering system, n—*for purposes of this practice*, an assembly of a paper wall covering or a vinyl wall covering, adhesive (if used), and substrate (if it is part of the assembly) used as a wall treatment for decorative or acoustical purposes.

E 176, E05

wall flange—Synonym for **wall clip**.

E 631, E06

wall flange—See **railing systems**.

E 631, E06

wall flange—Synonym for **wall clip**.

E 1481, E06

wall friction, f' (FL^{-2})—frictional resistance mobilized between a wall and the soil or rock in contact with the wall.

D 653, D18

wall handrail—See **railing systems**.

E 631, E06

wall handrail—a handrail attached to a wall or other building element adjacent to a stair and along landings, walkways, ramps, and corridors. (Syn. *wall rail*.)

wall rail—Synonym for **wall handrail**.

E 631, E06

wall handrail—a handrail attached to a wall or other building element adjacent to a stair and along landings, walkways, ramps, and corridors. (Syn. *wall rail*.)

E 1481, E06

wall-mounted canopy—used for all types of cooking equipment located against a wall. See *canopy*. F 1827, F26

Wallner line—a fracture surface marking, having a wavelike profile in the fracture surface. Such marks frequently appear as a series of curved lines, indicating the direction of propagation of the fracture from the concave to the convex side of a given wallner line. Also known as ripple mark. C 162, C14

wall (pipe)—the structural element composed of concrete or concrete and steel between the inside and outside surfaces of a concrete pipe. C 822, C13

wall rail—Synonym for **wall handrail**. E 1481, E06

wall railing return—a bend at the end of a wall handrail, turning toward the wall to which the handrail is attached. E 631, E06

wall railing return—a bend at the end of a wall handrail, turning toward the wall to which the handrail is attached. E 1481, E06

walls—exterior vertical sides of vitrified clay filter block. C 896, C04

walls, veneered—See *veneer*. C 119, C18

wall yield locus—a plot of the wall shear stress versus wall normal stress. The angle of wall friction is obtained from the wall yield locus as the arctan of the ratio of the wall shear stress to wall normal stress. D 653, D18

walrus—leather from the hides of walrus. Walrus hide is very thick, and is used for buffing wheels. When split, it is used for bag leather. Split walrus and seal leather are practically indistinguishable, and “walrus leather” in the traveling-goods industry is used to refer to sealskin leather on which a simulated walrus grain is embossed. D 1517, D31

wand scanner—a hand-held optical scanner used in applications where it's impractical to transport data past a fixed read head. F 149, F05

wand scanner, n—a hand-held device used as a contact bar code or OCR reader. F 1294, F05

wane—bark or lack of wood from any cause on edge or corner of a piece. D 9, D07

warm heading or working—forming method in which material is heated to a given temperature to improve formability before heading. The temperature used is below the recrystallization point or transformation temperature of the metal being formed. F 1789, F16

warming-in—reheating glass to permit further working, also for striking. C 162, C14

warm, moist climate—subtropical climate distinguished as warm and humid year round, with frequent rain showers. G 113, G03

warm-setting adhesive, n—Synonym for **intermediate-temperature-setting adhesive**. D 907, D14

warm spring, n—thermal spring whose temperature is appreciably above the local mean annual temperature but below that of the human body. E 957, E44

warm-up (rubber processing), n—the reduction in viscosity of a rubber or rubber mix, by mechanical work and heat to render it suitable for further processing. D 1566, D11

warp—any variation from a true or plane surface. Warp includes **bow, crook, cup,** and **twist,** or any combination thereof. D 9, D07

warp, n—(1) the yarn running lengthwise in a woven fabric (2) a group of yarns in long lengths and approximately parallel, put on beams or warp reels for further textile processing including weaving, knitting, twisting, dyeing, etc. D 123, D13

warp, n—a significant variation from the original true, or plane surface. D 907, D14

warp, n—(1) the yarn running lengthwise in a woven fabric; (2) a group of yarns in long lengths and approximately parallel, put on beams or warp reels for further textile processing including weaving, knitting, twisting, dyeing, and so forth. D 3878, D30

warp, n—the yarn running lengthwise in a woven fabric. D 4439, D35

warp, n—(1) the yarn running lengthwise in a woven fabric; (2) a group of yarns in long lengths and approximately parallel, put on

beams or warp reels for further textile processing including weaving, knitting, twisting, dyeing, and so forth. D 4850, D13

warpage, n—distortion that may occur in a compact during sintering. B 243, B09

warpage—curvature of a flat specimen measured as deviation of the specimen surface from a true plane along the edges or the diagonals and at the mid-length of an edge or diagonal, expressed as a percent of the length of the edge or diagonal, and called convex or concave with respect to the face of the specimen. C 242, C21

warpage, n—distortion caused by nonuniform change of internal stresses. (See also **dome**.) D 883, D20

warp bands—See **section marks**. D 3990, D13

warp elongation and tension, n—stretch or tension measured in the warp direction of the fabric. D 123, D13

warp elongation and tension, n—stretch or tension measured in the warp direction of the fabric. D 4850, D13

warp-faced twill, n—a twill weave in which the warp yarns produce the diagonal effect. (See also **twill weave** and **filling faced twill**.) D 123, D13

warp-faced twill, n—a weave in which warp yarns float over filling yarns, to produce a diagonal effect in the resulting fabric. (See also **twill weave** and **filling-faced twill**.) D 4850, D13

warp-faced twill, n—a weave in which warp yarns float over filling yarns, to produce a diagonal effect in the resulting fabric. (See also **twill weave** and **filling-faced twill**.) D 4850, D13

warping, n—change or deformation in the original flatness of an asbestos-cement product. C 1154, C17

warping—deformation in the original flatness of an asbestos-cement flat product. D 2946, C17

warp nested, adj—laid up so that warp plies alternate in the pattern: warp surface up, warp surface down. D 3878, D30

warp streak, n—*in woven fabric*, a narrow band running lengthwise and characterized by apparent differences in color from adjoining ends. D 123, D13

warp streak, n—*in woven fabric*, a narrow band running lengthwise and characterized by apparent differences in color from adjoining ends. (Compare **barré**.) D 3990, D13

warp surface, n—the ply surface that shows the larger area of warp tows with respect to fill tows. D 3878, D30

warp test—see Test Method C 314. C 286, B08

warp tests, n—*infabric testing*, tests in which the warp yarns are torn. D 123, D13

warp tests, n—*infabric testing*, tests in which the warp yarns are torn. D 4850, D13

warp-to-filling seam, n—a sewn seam in which the warp yarns are perpendicular to the sewn seam on one side of the seam and parallel to the seam on the opposite side of that seam. D 123, D13

warp-to-filling seam, n—a sewn seam in which the warp yarns are perpendicular to the sewn seam on one side of the seam and parallel to the seam on the opposite side of that seam. D 4850, D13

warp-to-warp seam, n—a sewn seam in which the yarns in the warp direction on both sides of the seam are perpendicular to the seam. D 123, D13

warp-to-warp seam, n—a sewn seam in which the yarns in the warp direction on both sides of the seam are perpendicular to the seam. D 4850, D13

wash—same as **rinse**. E 1316, E07

washability analysis of coal, n—the analysis of the specific gravity distribution of chemical and physical characteristics of coal. D 121, D05

washable (as applied to a garment)—a term applied to a garment that will be restored to wearability (Discussion 1) by laundering according to an acceptable (Discussion 2) procedure in the absence of irreparable damage. D 459, D12

wash-and-wear, adj—a generic term applied to fabrics or garments

wash-and-wear, adj

which satisfactorily retain a neat appearance after repeated wearing and suitable home laundering with little or no pressing or ironing. (Compare **durable-press**.) **D 123, D13**

wash-and-wear, adj—a generic term applied to fabrics or garments which satisfactorily retain a neat appearance after repeated wearing and suitable home laundering with little or no pressing or ironing. (Compare **durable-press**.) **D 4850, D13**

washboard—an imperfection; ripples, waves, etc., on the surface of glassware. **C 162, C14**

washboard, n—*inhosiery*, a ridgy effect caused by uneven tension between feeds on the knitting machine. **D 123, D13**

washboard, n—*inhosiery*, a ridgy effect caused by uneven tension between feeds on the knitting machine. **D 3990, D13**

washed out solid, n—a decrease in the density of solids caused by ink taking on an excessive amount of water or by the insufficient transfer of ink. **D 6488, D01**

washer head—head with washer-like flange to serve as bearing surface for head. (See **nub head**.) **F 547, F16**

washer-retainer crack—opening in the lip or hub of metal used to retain a washer on a nut. **F 1789, F16**

washer-spacer—a component located between the tumblers and intended to prevent the transfer of movement by friction between adjacent tumblers. **F 471, F12**

washer-tension—a component used to apply tension to the tumbler pack. **F 471, F12**

washer wrinkles—See **crow'sfeet**. **D 3990, D13**

washing—*in grouting*, the physical act of cleaning the sides of a hole by circulating water, water and air, acid washes, or chemical substances through drill rods or tremie pipe in an open hole. **D 653, D18**

washing period—the period of time from the beginning of the dishwasher's wash cycle until the end of the final rinse. **F 1827, F26**

wash load—the portion of the stream sediment load composed of particles, usually finer than 0.062 mm in diameter which are found only in relatively small quantities in the bed. **D 4410, D19**

wash, v or n—a cleaning process carried out in an aqueous medium. **D 459, D12**

washout nozzle—a tubular extension with a check valve utilized at the end of a string of casing through which water can be injected to displace drilling fluids and cuttings from the annular space of a borehole. **D 653, D18**

waste, n—a material that is unwanted at its present location; that is no longer useful for its original purpose; that has been disposed, or any combination thereof. **D 5681, D34**

waste, n—for waste sampling of building materials, material resulting from a demolition, renovation, or lead hazard control project that is or will be directed for disposal. **E 1605, E06**

waste component—a category of solid waste, composed of materials of similar physical properties and chemical composition, which is used to define the composition of solid waste, for example, ferrous, glass, newsprint, yard waste, aluminum, etc. **D 5681, D34**

waste composition, n—of a solid waste, characterization of multi-constituent waste by a breakdown into specified waste components on the basis of mass or volume fraction or percentage. (*Syn. solid waste composition*.) **D 5681, D34**

waste hopper—(also known as waste toner bin), an area of a cartridge that receives the waste toner removed from the photoreceptor by the cleaner blade. **F 335, F05**

waste oil, n—*in petroleum technology*, oil having characteristics making it unsuitable either for further use or for economic recycling. **D 4175, D02**

waste rock, n—rock produced by excavation from open pit or underground mining operations whose economic mineral content is less than a specified economic cutoff value. **D 5681, D34**

waste stream, n—the total flow of waste from a demolition, renovation, or lead abatement project. **E 1605, E06**

waste tire, n—a tire which is no longer capable of being used for its

original purpose but which has been disposed of in such a manner that it cannot be used for any other purpose. **D 5681, D34**

waste tire, n—a tire that is no longer capable of being used for its original purpose, but has been disposed of in such a manner that it can not be used for any other purpose. **D 5681, D34**

waste toner bin—a compartment or container on the cartridge which receives the waste toner removed by the cleaner blades from the photoreceptor or OPC by the wiper blades. (Test Method F 1531-94) **F 335, F05**

waste water, n—water discharged from a process as a result of its formation or use in that process. **D 1129, D19**

wastewater—water that (1) is or has been used in an industrial or manufacturing process, (2) conveys or has conveyed sewage, or (3) is directly related to manufacturing, processing, or raw materials storage areas at an industrial plant. Wastewater does not include water originating on or passing through or adjacent to a site, such as stormwater flows, that has not been used in industrial or manufacturing processes, has not been combined with sewage, or is not directly related to manufacturing, processing, or raw materials storage areas at an industrial plant. **D 5681, D34**

water, n—the chemical compound H₂O. **D 123, D13**

water, n—the chemical compound, H₂O. (*Syn. moisture*.) **D4920, D13**

water absorption, n—the amount of water absorbed by a material under specified test conditions commonly expressed as weight percent of the test specimen. **C 11, C11**

water absorption, n—the amount of water absorbed by a material under specified test conditions. **D 1566, D11**

water absorption—increase in mass of a product during immersion in water under specified conditions of duration and temperature, expressed as a percent of its dry mass. **D 2946, C17**

water accommodated fraction (WAF), n—the predominately aqueous portion of a mixture of water and a poorly water-soluble material which separates in a specified period of time after the mixture has undergone a specified degree of mixing and includes water, dissolved components, and dispersed droplets of the poorly water soluble material. **D 4175, D02**

water accommodated fraction (WAF), n—the predominantly aqueous portion of a mixture of water and a material poorly soluble in water which separates in a specified period of time after the mixture has undergone a specified degree of mixing and which includes water, dissolved components, and dispersed droplets of the poorly water soluble material. **D 6384, D02**

water-based coating, n—deprecated term. Use the preferred term, waterborne coating. **D 16, D01**

water beading—surface property that causes the formation of discrete water droplets on the polished surface. **D 2825, D21**

waterbody encircling a palsa—a water-filled depression surrounding a palsa. **D 7099, D18**

water boil efficiency—the energy (latent heat of vaporization) required to boil water from the cooking medium (see **cooking medium**), expressed as a percentage of the quantity of energy input to the equipment during the boil-off period, η *water boil*.

$$\eta_{\text{waterboil}}(\%) = \frac{W \times E_{\text{vap}} \times 100}{E_{\text{input}}}$$

where:

W = weight loss of water, lb (g),

E_{vap} = heat of vaporization of water, Btu/lb (J/kg),

= 970 Btu/lb (2256 kJ/kg) at standard pressure (29.921 in. Hg), and

E_{input} = energy consumed by the equipment, Btu.

F 1827, F26

waterborne coating, n—a coating in which the principal volatile constituent is water. See also **water-reducible coating**. **D 16, D01**

water break—the appearance of a discontinuous film of water on a surface signifying nonuniform wetting and usually associated with a surface contamination. **B 374, B08**

water-break—failure of water to maintain a continuous film on metallic, vitreous, or similar surfaces on withdrawing from clean water. **D 459, D12**

water break test—a quality control test of conditioned water. **E 1316, E07**

water-cementitious material ratio, n—the ratio of the mass of water, exclusive only of that absorbed by the aggregates, to the mass of cementitious material (*hydraulic*) in concrete, mortar, or grout, stated as a decimal (see also **water-cement ratio**). **C 125, C09**

water-cement ratio, n—the ratio of the mass of water, exclusive only of that absorbed by the aggregates, to the mass of portland cement in concrete, mortar, or grout, stated as a decimal. **C 125, C09**

water-cement ratio—the ratio of the weight of water to the weights of Portland cement in a cement grout or concrete mix. See also **grout mix**. **D 653, D18**

water conditioning agent—a material the reduces eliminates the antagonism between a pesticide formulation and ions present in the water that is utilized in a pesticide application. **E 1519, E35**

water consumption—the total amount of water consumed by the equipment during an event such as cooling water for condensing, cooking, or preheating. **F 1827, F26**

water content, n—the water content of a substance, as measured under specified conditions. (*Compilation of ASTM Standard Definitions*, 7th Edition.) **D 2864, D27**

water content, unfrozen—see **unfrozen water content**. **D 7099, D18**

water content, w (D)—the ratio of the mass of water contained in the pore spaces of soil or rock material, to the solid mass of particles in that material, expressed as a percentage. **D 653, D18**

water dam—synonymous with **water gate**. **C 162, C14**

water depth-nominal, n—the nominal thickness of the water layer, that is, the volume of water divided by the area of the wetted pavement surface. **E 867, E17**

water depth-positive, n—the distance from the water surface to the reference plane which is the top of the pavement asperities. **E 867, E17**

water dew point—(see **dew point**) **D 4150, D03**

water discharge—the quantity of water passing a stream cross section per unit of time. **D 4410, D19**

water-emulsion floor polish—an emulsion-based floor polish in which water is the continuous or external phase and falling into two categories:

(1) **polymer-emulsion floor polish**—a water-emulsion floor polish containing a predominance of synthetic emulsion polymers.

(2) **wax-emulsion floor polish**—a water-emulsion floor polish containing a predominance of natural or synthetic waxes, or both. **D 2825, D21**

water equivalent, n—Synonym for **energy equivalent**. **D 121, D05**

water-extractable material—substances dissolved from other substances by water under specified conditions. **D 2652, D28**

water filtration vacuum cleaner, n—a system or device that removes foreign material from surfaces by means of the air flow caused by subatmospheric pressure, having an intake intended to be moved in proximity to the surface, and a water reservoir which separates and collects the material from the air. The inlet may be fixed or attached to other equipment. It also may be designed for liquid pick up. **F 395, F11**

water finish, n—compact glossy finish produced on one or both surfaces of a paper or paper-board by wetting with water as the sheet is being calendered. **D 1711, D09**

water-formed deposits, n—any accumulation of insoluble material derived from water or formed by the reaction of water upon the surfaces in contact with the water. **D 1129, D19**

waterfowl feathers, n—feathers from ducks or geese, or both. **D 123, D13**

waterfowl feathers, n—feathers from ducks or geese, or both. **D 7022, D13**

water gain—see **bleeding**. **D 653, D18**

water-gate—See gate. Also known as a water-dam. **C 162, C14**

water glass—sodium silicate glass that is readily soluble in water. **C 162, C14**

water-hardened—quenched in water after heating to critical temperature. **F 547, F16**

water hardness—a term used to describe a quality of water arising from the presence of dissolved mineral salts, usually calcium (Ca) and magnesium (Mg) and sometimes iron and manganese. The degree of hardness is calculated in grains of calcium carbonate (CaCO₃) per gallon (gpg) or parts per million (ppm), sometimes expressed as milligrams per litre (mg/L). One grain per gpg of CaCO₃ equals 17.1 ppm or mg/L. The calcium/magnesium ratio of the hardness minerals is also expressed as calcium carbonate. Water essentially free of calcium and magnesium is described as soft; if appreciable amounts of both minerals are present, it is called hard. In the United States the categories of hardness, as defined by the U.S. Geological Survey, and the Ca/Mg ratio, are:

	Soft	Moderately Hard	Hard	Very Hard
Grains per gallon	0.0–3.5	3.6–7.0	7.1–10.5	10.6*
Parts per million or milligrams per litre	0.0–60	61–120	121–180	over 180
Ca/Mg ratio ^A	4:1	3:1	2:1	

^A Calculated from data in “Public Water Supplies of the 100 Largest Cities in the United States, 1962.”¹

See discussions in Test Method D 2960, Guide D 4265, and Guide D 5548. **D 459, D12**

water-holding capacity (D)—the smallest value to which the water content of a soil or rock can be reduced by gravity drainage. **D 653, D18**

water jet—a roughly textured surface produced by exposure to a high-pressure stream of water. **C 119, C18**

water jet barrier—barrier created by stream of pressurized water spray directed across the water surface. **F 818, F20**

water leakage—penetration of water onto the exterior plane of framing or cavity insulation under specified conditions of air pressure difference across the AR during a test period. **E 631, E06**

water mark, water spot—an appearance defect characterized by a depressed spot. **C 286, B08**

water migration resistance—the ability of either facing or core materials to prevent migration of water in sandwich panels.

wall rail—See **railing systems**.

wall railing return—See **railing systems**. **E 631, E06**

water migration resistance—the ability of either facing or core materials to prevent migration of water in sandwich panels. **E 1749, E06**

water of hydration or combined water—that water in a material that cannot be removed by drying at 110°C, as it is chemically bound, expressed as a percent of the weight of the material. **C 242, C21**

water paint—under **paint**, see **water paint**. **D 16, D01**

water path—the distance from the transducer to the test surface in immersion or water column testing. **E 1316, E07**

water-plasticity ratio (relative water content) (liquidity index)—see **liquidity index**. **D 653, D18**

water pollution—the harmful or objectionable material introduced into water in sufficient quantities to adversely affect its usefulness. **D 4410, D19**

waterpress—a device that de-waters the slurry generated in the pulper by use of a tapered compression cone and perforated screen, then discharges the pulp down a chute to a waste container. Water removed during this process is recirculated to the *pulper* tank in order to conserve fresh water use. **F 1827, F26**

waterproof, adj—deprecated term. **D 996, D10**

waterproof—as applied to plywood, the term is synonymous with **exterior type plywood**. **D 1038, D07**

waterproofing, n—in building construction, treatment of a surface or

waterproofing, *n*

structure to prevent the passage of liquid water under hydrostatic, dynamic, or static pressure. **C 717, C24**

waterproofing—treatment of a surface or structure to prevent the passage of water under hydrostatic pressure. **D 1079, D08**

waterproofness (coated fabric), *n*—the property of impenetrability by liquid water. **D 1566, D11**

water quality indicator parameters—refer to field monitoring parameters that include but are not limited to pH, specific conductance, dissolved oxygen, oxidation-reduction potential, temperature, and turbidity that are used to monitor the completeness of purging. **D 5681, D34**

water-reducible coating, *n*—a coating that can be reduced in viscosity by the addition of water. **D 16, D01**

water-repellant, *n*—a material or treatment for surfaces to provide resistance to penetration by water. **E 631, E06**

water repellent substances—materials such as waxes, soaps, or silicones that render the surface of shingles more water repellent. **D 2946, C17**

water repellent system, *n*—an exterior coating system for above grade concrete or masonry which temporarily repels water but which is not intended to prevent the passage of moisture under hydrostatic pressure.

(1) *film forming type*—latex or oil based paints or similar materials that may require repair or renewal because of climatic action;

(2) *pore penetrating type*—types that fill or coat the interior of the surface pores of concrete or masonry and are temporarily retained in these surface pores thus providing water repelling action; periodic repair or renewal may be required because of climatic action. **D 1079, D08**

water repellency (coated fabric), *n*—the property of being resistant to wetting by liquid water. **D 1566, D11**

water repellent, *n*—admixture incorporated into a masonry mortar to decrease the rate of water absorption of the hardened mortar. **C 1180, C12**

water-repellent leather—a leather that has been treated with any of a variety of chemicals to reduce the ability of water to spread on or wet the surface. Treatments can be for grain or suede leathers. **D 1517, D31**

water-repellent paper, *n*—gypsum board paper surfacing which has been formulated or treated to resist water penetration. **C 11, C11**

water-repellent substances, *n*—*in shingles*, materials such as waxes, soaps, or silicones which render the surface of shingles more water repellent. **C 1154, C17**

water-resistance, *n*—measured ability to retard both penetration and wetting by water in liquid form. **D 996, D10**

water resistance—the capability of a material or system to retard water leakage.

water vapor barrier—Use **water-vapor retarder**, the preferred term. **E 631, E06**

water resistance—ability of the image to resist deformation or change in color with immersion in water. **F 221, F05**

water resistance, *n* (also called water fastness)—ability of an image to resist water damage. **F 1857, F05**

water resistance (coated fabric), *n*—the property of retarding both penetration and wetting by liquid water. **D 1566, D11**

water resistant—a term frequently applied to plywood that is capable of withstanding limited exposure to water or to severe conditions without failure in the glue bonds. **D 1038, D07**

water-resistant barrier—See **barrier material**. **D 996, D10**

water-resistant core, *n*—a gypsum board specially formulated to resist water penetration. **C 11, C11**

water-resistant leather—a term formerly applied to leather heavily stuffed with oils, greases, and waxes, used primarily in work shoes and boots. Currently, the term may also, and more commonly, include upper leathers treated with any of a variety of chemicals to reduce the penetration or absorption of liquid water as measured in D 2098, Test for Dynamic Water Resistance of Shoe Upper Leather

by the Dow Corning Leather Tester, or D 2099, Test for Dynamic Water Resistance of Shoe Upper Leather by the Maeser Water Penetration Tester. **D 1517, D31**

water retained, *n*—*in textiles*, the amount of water absorbed by the fibers, adsorbed on the surface of the fibers, and held within the voids of the fabric after immersion, measured under specified conditions. **D 123, D13**

water retained, *n*—*in textiles*, the amount of water absorbed by the fibers, adsorbed on the surface of the fibers, and held within the voids of the fabric after immersion, measured under specified conditions. **D 4845, D13**

water retention, *n*—the moisture remaining in and on a material after a specified mechanical treatment. **D 123, D13**

water retention, *n*—the moisture remaining in and on a material after a specified mechanical treatment. **D 4849, D13**

water service—the pipe from the water main or other source of water supply to the building or other point of use or distribution. **F 412, F17**

watershed—all lands enclosed by a continuous hydrologic-surface drainage divide and lying upslope from a specified point on a stream. **D 4410, D19**

water softener—a vessel having a cation resin in the sodium form that removes cations such as calcium and magnesium from water and releases another ion such as sodium. The resin is usually regenerated. See **softener**. **D 6161, D19**

water solubility—the amount of material that is miscible or will dissolve in water at a given temperature. **D 4790, D16**

water soluble fraction (WSF), *n*—the filtrate or centrifugate of the water accommodated fraction which includes all parts of the WAF, except the dispersed droplets of the poorly soluble material. **D 4175, D02**

water soluble fraction (WSF), *n*—the filtrate or centrifugate of the water accommodated fraction which includes all parts of the WAF except the dispersed droplets of the poorly soluble material. **D 6384, D02**

water spotting—change in appearance of surface resulting solely from the action of cool water. **D 2825, D21**

water streak—a defect occurring in the bisque characterized by a washed-out pattern in the form of a streak. **C 286, B08**

water table—see **free water elevation**. **D 653, D18**

water table aquifer, *n*—see preferred term **unconfined aquifer**. **D 653, D18**

water table (ground-water table)—the surface of a ground-water body at which the water pressure equals atmospheric pressure. Earth material below the ground-water table is saturated with water. **D 653, D18**

watertight—will restrain the passage of water to not exceed a specified limit. **C 822, C13**

water tolerance—the amount of water that a penetrant or emulsifier can absorb before its effectiveness is impaired. **E 1316, E07**

water vapor diffusion, *n*—the process by which water vapor spreads or moves through permeable materials caused by a difference in water vapor pressure. **C 168, C16**

water vapor diffusion—the process by which water vapor spreads or moves through permeable materials caused by a difference in water vapor pressure. **E 631, E06**

water vapor permeability, *n*—the time rate of water vapor transmission through unit area of flat material of unit thickness induced by unit vapor pressure difference between two specific surfaces, under specified temperature and humidity conditions. **C 168, C16**

water vapor permeability—the rate of water vapor transmission per unit of thickness and per unit of vapor pressure differential. Test conditions must be specified. **D 1695, D01**

water vapor permeance, *n*—the time rate of water vapor transmission through unit area of flat material or construction induced by unit vapor pressure difference between two specific surfaces, under specified temperature and humidity conditions. **C 168, C16**

water-vapor permeance—time rate of water-vapor transmission through unit area of a flat material or construction induced by unit vapor-pressure difference between two specified surfaces, under specified temperature and humidity conditions. See **perm.**

E 631, E06

water vapor permeance (WVP), n —the steady state rate of water vapor movement through a free film induced by a vapor pressure difference (Δp) of one unit between the two surfaces of the film, where Δp is expressed in inches or millimetres of mercury. Thus: $WVP = WVT/\Delta p$. See **WVT**.

D 16, D01

water vapor pressure, n —the pressure of water vapor at a given temperature; also the component of atmospheric pressure contributed by the presence of water vapor.

C 168, C16

water vapor pressure, n —the pressure of water vapor at a given temperature.

C 1145, C28

water vapor resistance, n —the steady vapor pressure difference that induces unit time rate of vapor flow through unit area of a flat material (or construction that acts like a homogeneous body) for specific conditions of temperature and relative humidity at each surface.

C 168, C16

water-vapor-resistance—measured ability to retard penetration and permeation by water-vapor.

D 996, D10

water-vapor-resistant barrier—See **barrier material**.

D 996, D10

water vapor resistivity, n —the steady vapor pressure difference that induces unit time rate of vapor flow through unit area and unit thickness of a flat material (or construction that acts like a homogeneous body), for specific conditions of temperature and relative humidity at each surface.

C 168, C16

water-vapor retarder, n —material or system that impedes the transmission of water vapor under specified conditions.

E 631, E06

water vapor retarder (barrier), n —a material or system that adequately impedes the transmission of water vapor under specified conditions.

C 168, C16

water vapor transmission rate, n —the steady water vapor flow in unit time through unit area of a body, normal to specific parallel surfaces, under specific conditions of temperature and humidity at each surface.

C 168, C16

water vapor transmission (WVT), n —the rate of water vapor flow, under steady specified conditions, through a unit area of a material, between its two parallel surfaces and normal to the surfaces. Metric unit of measurement is 1 g/24 h·m². See **permeability, permeance, perm.**

C 11, C11

water vapor transmission (WVT) rate, n —the steady state rate of water vapor movement through a free film under specific conditions of temperature and humidity at each surface; customarily expressed in grains per square foot per hour (gr/ft²·h) or grams per square metre per day (g/m²·d).

D 16, D01

watt, W—the unit of active power. One watt is energy, work, or quantity of heat expended at a rate of one joule per second.

A 340, A06

wave—an optical effect due to uneven glass distribution or to striae.

C 162, C14

wave—disturbance propagated in medium in such a manner that at any point in medium the amplitude is a function of time, while at any instant the displacement at point is function of position of point.

D 653, D18

wave form—the shape of the peak-to-peak variation of a controlled mechanical test variable (for example, load, strain, displacement) as a function of time.

E 1823, E08

wave front—moving surface in a medium at which a propagated disturbance first occurs.

D 653, D18

wave front—(1) a continuous surface over which the phase of a wave that progresses in three dimensions is constant, or (2) a continuous line along which the phase of a surface wave is constant. (ISRM)

D 653, D18

wave front—a continuous surface drawn through the most forward points in a wave disturbance which have the same phase.

E 1316, E07

waveguide, acoustic emission—a device that couples elastic energy from a structure or other test object to a remotely mounted sensor during AE monitoring. An example of an acoustic emission waveguide would be a solid wire of rod that is coupled at one end to a monitored structure, and to a sensor at the other end.

E 1316, E07

wave length—normal distance between two wave fronts with periodic characteristics in which amplitudes have phase difference of one complete cycle.

D 653, D18

wavelength, λ —the distance, measured along the line of propagation, between two points that are in phase on adjacent waves.

E 131, E13

wavelength, λ, n —of an electromagnetic wave, the distance in the direction of propagation between nearest points at which the electric vector has the same phase. (See also **complementary wavelength, dominant wavelength**.)

E 284, E12

wavelength, n —distance in the direction of propagation of a periodic wave between two successive points at which the phase is the same (at the same time).

NOTE—The wavelength in a medium is equal to the wavelength in vacuo divided by the refractive index of the medium. Unless otherwise stated, values of wavelength are generally those in air. The refractive index of standard air (15°C, 101.325 N·m⁻²) lies between 1.000 27 and 1.000 29 for visible radiations.

VACUUM TERMS

NOTE—Vacuum terms are now being compiled. Test Method E 294, Test Method E 295, Practice E 296, and Method E 297 contain some approved terms. The Glossary of Terms Used in Vacuum Technology, published by The American Vacuum Society, is also being used where applicable.

E 349, E21

wavelength (X-rays)—the minimum distance between points at which the electric vector of an electromagnetic wave has the same value, measured along the direction of propagation of the wave. It is equal to the velocity divided by the frequency. (See also **electron wavelength**.)

E 7, E04

wavenumber, $\bar{\nu}$ —the number of waves per unit length.

E 131, E13

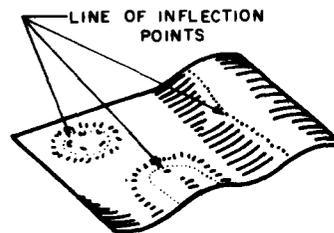

wave number, n —the inverse of wavelength.

E 867, E17

wave train—a succession of ultrasonic waves arising from the same source, having the same characteristics, and propagating along the same path.

E 1316, E07

waviness—a long-order departure from flatness as opposed to sharp discontinuities. Amplitude is in excess of specified surface finish. In general, waviness will exhibit a number of inflection points that, if connected, would form a line whose path may be open or closed (Syn. *warp*).

F 109, C21

wavy cloth, n —a cloth that will not lie flat on a cutting table. (Compare **tight pick**.)

D 123, D13

wavy cloth, n —a cloth that will not lie flat on a cutting table. (Syn. **baggy cloth**) (Compare **tight pick**)

D 3990, D13

wavy dressing—more pronounced imprints or markings made by machine knives in dressing than specified for knife marks.

D 9, D07

wavy edges (waves—edge wave)—a continuous pattern of waves or wrinkles along the edges of the strip, with a relatively flat center portion.

B 846, B05

wavy face, n

wavy face, n—a surface condition characterized by a considerable variation in yarn diameter. **D 123, D13**

wavy face, n—a surface condition characterized by a considerable variation in yarn diameter **D 3990, D13**

wavy selvage—See **slack selvage**. **D 3990, D13**

wax, n—a solid or semi-solid material consisting of a mixture of hydrocarbons or hydrocarbon derivatives, or both. **F 1972, F15**

wax appearance point—the temperature at which wax or other solid substances first begin to separate from the liquid oil when it is cooled under prescribed conditions (Refer to D 3117). **D 2864, D27**

wax blocking point, n—the lowest temperature at which film disruption occurs across 50 % of the waxed paper surface when the test strips are separated. **D 4175, D02**

wax candle, n—a candle that contains animal wax, insect wax, petroleum wax, synthetic wax, or vegetable wax as the primary fuel. **F 1972, F15**

wax content of insulating oil—the amount of solid material that separates from a mixture of liquid oil and a suitable wax antisolvent (methyl ethyl ketone, sec-butyl acetate, etc.) under prescribed test conditions. **D 2864, D27**

waxing—the practice of filling minor surface voids in stone with certain polyester compounds, cabinetmaker's wax, or melted shellac. (It does not refer to the application of paste wax to make the surface shinier.) **C 119, C18**

wax loading, n—the weight of wax present primarily as a surface film but including the minor part embedded in the surface fibers of corrugated board. It is expressed as weight per unit area, usually in grams per square metre or pounds per thousand square feet of board. **D 4175, D02**

wax picking point, n—the temperature at which the first film disruption occurs on the waxed paper when test strips are separated. **D 4175, D02**

W-board—See **corrugated fiberboard**. **D 996, D10**

"W" configuration (aka "3" configuration)—boom positioned in a "W" shape. **F 818, F20**

wear-galvanized—See **hot-galvanized**. **F 547, F16**

wear—the removal of material or impairment of surface finish through friction or impact. **C 119, C18**

wear—attrition of polish film resulting from normal use. **D 2825, D21**

wear, n—damage to a solid surface, generally involving progressive loss of material, due to relative motion between that surface and a contacting substance or substances. **D 4175, D02**

wear, n—the loss of material from, or relocation of material on, a surface. **D 4175, D02**

wear, n—the loss of material from two or more surfaces in relative motion. **D 4175, D02**

wear, n—the removal of metal from a rubbing surface by mechanical action, or by a combination of mechanical and chemical actions. **D 4175, D02**

wear, n—the removal of metal from the test pieces by a mechanical or chemical action, or by a combination of mechanical and chemical actions. **D 4175, D02**

wear, n—the accumulative and integrative action of all the deleterious mechanical influences encountered in use which tend to impair a material's serviceability. Such influences include, but are not limited to abrasion, scratching, gouging and scuffing. **F 141, F06**

wear, n—damage to a solid surface, usually involving progressive loss or displacement of material, due to relative motion between that surface and a contacting substance or substances. **G 40, G02**

wear coefficient, n—*in tribology*, a wear parameter that relates sliding wear measurements to tribosystem parameters. Most commonly, but not invariably, it is defined as the dimensionless coefficient *k* in the equation

$$\text{wear volume} = k \left(\frac{\text{load} \times \text{sliding distance}}{\text{hardness of the softer material}} \right)$$

See also **wear factor**.

G 40, G02

wear factor, n—*in tribology*, a wear parameter that relates sliding wear measurements to operating parameters. Most commonly, but not invariably, it is defined as the total wear volume divided by the normal force or load and also divided by the sliding distance; therefore, this term should always be fully defined in context. **G 40, G02**

wear in, v—See **run in**. **G 40, G02**

wear in, n—See **run in**. **G 40, G02**

wearing surface—See **trafficsurface**. **C 717, C24**

wearlayer, n—the portion of a resilient floor covering that contains or protects the pattern and design exclusive of temporary finishes or maintenance coatings. **F 141, F06**

wear level, n—the number of wear refurbishing cycles to which an item has been subjected. **D 123, D13**

wear map, n—a calculated or experimentally determined diagram that identifies regions within each of which the wear mechanism or wear rate remains substantially the same, the regions being separated by transition lines or bands that are functions of two or more parameters. **G 40, G02**

wear mechanism map, n—see **wear map**. **G 40, G02**

wear-out, n—a tire condition where any point on the tread is reduced to a depth equal to the height of treadwear indicator. **F 538, F09**

wear performance index, n—a calculated value that relates the wear performance of a candidate tire to that of a control tire tested in the same test; it may be calculated on the basis of either percent loss or rate of tread wear. **F 538, F09**

wear rate, n—the rate of material removal or dimensional change due to wear per unit of exposure parameter; for example, quantity of material removed (mass, volume, thickness) in unit distance of sliding or unit time. **D 4175, D02**

wear rate, n—the rate of material removal or dimensional change due to wear per unit of exposure parameter, for example, quantity of material removed (mass, volume, thickness) in unit distance of sliding or unit time. **G 40, G02**

wear rate map, n—see **wear map**. **G 40, G02**

wear-refurbishing cycle, n—*for a specific wear testing program*, one complete series of events that may be terminated by laundering or dry cleaning. **D 123, D13**

wear resistance—ability of the carbon or ribbon to retain its image-producing capacity after repeated use. **F 221, F05**

wear-service conditions, n—the specific conditions under which a textile is used (for example, at school, at work, at leisure, or at home). **D 123, D13**

wear test, n—a test in which textiles are subjected to wear-service conditions and evaluated for performance. **D 123, D13**

weatherability—the ability of a polished surface to resist the effects of exposure. **D 2825, D21**

weather aging—placing materials in known environmental conditions to evaluate changes. **F 869, F08**

weather conditions, normal—the (actual or anticipated) range of environmental conditions (rain, snow, hail, wind, temperature, pollution) that will typically occur in a local climatic region over several years. **E 772, E44**

weather cracking, n—distinct surface cracks induced by action of ozone in those areas of sidewall that are under tension; the cracks usually form perpendicularly to the direction of stress. **F 538, F09**

weathered coal, n—coal that has been exposed to climatic conditions (precipitation, sunlight, wind, temperature variations, etc.) and sometimes ground water, such that its properties are altered compared to those in coal from the same seam that has not been so exposed. **D 121, D05**

weathering—natural alteration by either chemical or mechanical processes due to the action of constituents of the atmosphere, surface water or ground water, or to temperature change. **C 119, C18**

weathering—atmospheric attack on a glass surface. **C 162, C14**

weathering, n—*in building construction*, any change of an installed

- sealant, coating, or membrane due to the action of atmospheric elements. **C 717, C24**
- weathering**, *v*—*inbuilding construction*, the exposure of an installed sealant, coating, or membrane due to atmospheric elements. **C 717, C24**
- weathering**—the mechanical or chemical disintegration and discoloration of the surface of wood that is caused by exposure to light, the action of dust and sand carried by winds, and the alternate shrinking and swelling of the surface fibers with the continual variation in moisture content brought by changes in the weather. Weathering does not include decay. **D 9, D07**
- weathering**—the process of disintegration and decomposition as a consequence of exposure to the atmosphere, to chemical action, and to the action of frost, water, and heat. (ISRM) **D 653, D18**
- weathering**, *n*—the surface deterioration of a rubber article during outdoor exposure. **D 1566, D11**
- weathering behind glass**, *v*—a technique of weathering in which the test specimens are exposed in a glass covered frame constructed of wood, metal, or other satisfactory material which protects the specimen from the effects of rain and weather. The frame shall be open at the back or sides to allow ambient air to circulate over the specimens. **G 113, G03**
- weathering of waterborne oil**, *n*—the combined effects of evaporation, solution, chemical oxidation, and biological decomposition from environmental exposure. **D 1129, D19**
- weathering reference material (WRM)**, *n*—a reference material having well documented and repeatable degradation properties when exposed to identical test conditions. **G 113, G03**
- weathering steels**—steels having added alloying elements to enhance the resistance to atmospheric corrosion. **F 1789, F16**
- weatherproof**—*as applied to plywood*, the term is synonymous with **exterior type plywood**. **D 1038, D07**
- weather-resistance**—measured ability of a material, assembly, or package to maintain designated physical properties and appearance under specified weathering conditions. **D 996, D10**
- weather-resistive barrier**, *n*—a material conforming to Practice E 2112, located behind the EIFS. **E 2110, E06**
- weather sealer**—form of coating applied to the outer surface of a construction to augment its weather resistance. **E 631, E06**
- weathertight**, *adj*—*in building construction*, impermeable to the passage of air or water or both under certain conditions as determined by test. **C 717, C24**
- weathertightness**, *n*—*in building construction*, the degree of permeability to the passage of water or air or both under certain conditions as determined by test. **C 717, C24**
- weave**, *v*—interlaces, in a specific pattern, strands or yarns oriented in two or more directions in a planar textile process. **D 3878, D30**
- weaving wire**, *n*—round wire intended especially for weaving. **B 899, B02**
- web**—that part of an H-type lock-strip gasket which extends between the flanges, forming two channels and that part of a reglet-type lock-strip gasket which extends between the flanges and spline. **C 717, C24**
- webbing**, *n*—*in textiles*, a stout narrow fabric with a mass per unit area of at least 0.5 kg/m² (0.1 lb/ft²) for each 25.4 mm (1 in.) of width. (Compare **narrow fabric**, **ribbon**, and **tape**.) **D 123, D13**
- webbing**, *n*—(1) phenomenon that occurs when an adhesive is ejected from a spray gun as a series of web-like threads, (2) filaments or threads that may form when adhesive transfer surfaces are separated. **D 907, D14**
- webbing**, *n*—*in textiles*, a stout narrow fabric with a mass per unit area of at least 0.5 kg/m² (0.1 lb/ft²) for each 25.4 mm (1 in.) of width. **D 7018, D13**
- webbing**, *n*—a flat or tubular length of woven fabric used for a variety of purposes in climbing and mountaineering. **F 1773, F08**
- Weber's law**, *n*—the just-perceptible increment of a stimulus is an approximately constant fraction of the stimulus magnitude over a wide range. **E 284, E12**
- weber**, **Wb**—the unit of magnetic flux. The weber is the magnetic flux whose decrease to zero when linked with a single turn induces in the turn a voltage whose time integral is one volt-second. One weber equals 10⁸ maxwells. See **magnetic flux**. **A 340, A06**
- webs**, *n*—the partitions dividing tile or hollow brick into cells. **C 43, C15**
- webs**—interior supports separating channels of vitrified clay filter block. **C 896, C04**
- wedge**, *n*—*in the field of adhesive technology*, a tool made from a rigid material, tapering to a thin edge, used to separate adherends by force. **D 907, D14**
- wedge**, *n*—*in mica*, a crystalline structure in a micablock, which upon splitting results in a yield of pieces thicker at one end than the other. **D 1711, D09**
- wedge**—in ultrasonic angle-beam examination by the contact method, a device used to direct ultrasonic energy into the material at an angle. **E 1316, E07**
- wedge ice**—the ice occurring in an ice wedge. **D 7099, D18**
- wedge point**—point with two convergent planes forming “V.” **F 547, F16**
- wedge tensile strength**—ultimate strength determined by testing with the use of a wedge with a prescribed angle. **F 1789, F16**
- wedge tensile test**—tensile test performed on various headed fasteners and studs using a wedge of prescribed dimensions and hardness, and in a prescribed manner for the purpose of verifying good head quality or ductility, or both. **F 1789, F16**
- wedging of tile**—the difference between two spaced measurements of the length or width of a tile, expressed as a percent of the distance between points of measurement. **C 242, C21**
- week**, *n*—(1) The week for workplace use is considered to be five workdays of approximately 8 h, within a period of seven consecutive days. (2) For reporting analysis of outdoor air on a weekly rate, results are calculated to a base of seven consecutive 24-h days. **D 1356, D22**
- weep hole**—a small diameter hole (usually ¼ in.) drilled into the protective casing above the ground surface that serves as a drain hole for water that may enter the protective casing annulus. **D 653, D18**
- weep hole**, *n*—a small hole allowing drainage of fluid. Compare **drainage hole**, **vent hole**.
wet strength—See **strength**, **wet**. **E 631, E06**
- weeping**, *n*—a condition where undesired ink on the faceplate which contaminates other ink colors. **F 1857, F05**
- weft**, *n*—see **filling**. **D 4439, D35**
- weftless fabric**, *n*—*as used in tire building*, a sheet of parallel cords surrounded by uncured rubber compound. **D 123, D13**
- weftless fabric**, *n*—*as used in tire building*, a sheet of parallel cords surrounded by uncured rubber compound. **D 6477, D13**
- weigh**, *vt*—to determine the mass of a material. **D 4848, D13**
- weigh**, *vt*—to measure the tire load on one or more tires by using a vehicle scale, an axle-load scale, a portable axle-load weigher, or a wheel-load weigher. **E 867, E17**
- weigh-in-motion**, *n*—the process of estimating a moving vehicle's gross weight and the portion of that weight that is carried by each wheel, axle, and axle group, or a combination thereof, by measurement and analysis of dynamic vehicle tire forces. **E 867, E17**
- weight**, *v*—to determine the mass of a material. **D 123, D13**
- weight**, *n*—the force exerted on a body by gravity. (See also **mass** and **force**.) **D 123, D13**
- weight**, *n*—*in warpknitting*, the number of tex (yards per pound) of finished fabric. **D 123, D13**
- weight**, *n*—*as used with fabrics*, mass per unit area. **D 123, D13**
- weight**, *n*—*in textile testing*, an object, having a known mass, used in such procedures as weighing, calibrating, and applying a force. **D 4848, D13**
- weight**, *n*—*in warpknitting*, the number of tex (yards per pound) of finished fabric. **D 4850, D13**
- weight**, *n*—*as used with fabrics*, mass per unit area. **D 4850, D13**

weighted bottom camber, h_B

weighted bottom camber, h_B —the maximum height of the running surface measured from a plane horizontal surface, with the ski held in a plane horizontal orientation and thus subject to deflection due to its weight under the influence of the ski weight. X_{hB} is the location of h_B from the tail of the ski. **F 472, F27**

weight, [lb (kg)], n —the external force of gravity vertically downwards upon a body with a magnitude equal to the body's mass multiplied by the local acceleration of free fall. **E 867, E17**

weight of applied coating wax, n —the weight of applied coating per unit area of board, usually grams per square metre or pounds per thousand square feet of board covered. **D 4175, D02**

weight of wax coating, n —the weight of wax present as a surface film on corrugated paperboard, expressed as weight per unit area, usually grams per square metre or pounds of coating per thousand feet of board covered. **D 4175, D02**

weight percent impregnating wax, n —the weight percent of wax in the facing relative to the weight of unwaxed facing measured at 23°C (73°F) and 50 % relative humidity. **D 4175, D02**

weight percent solids, n —the portion of a coating that remains as part of the dry film expressed as weight. **D 16, D01**

weight resistivity—the resistance in ohms at a specified temperature of a body of uniform cross section and of unit weight and unit length. **B 354, B01**

weir—a submerged refractory wall within a melter to direct glass flow. **C 162, C14**

weir boom (aka skimming boom/barrier)—boom that has a weir skimming device(s) built into its face. **F 818, F20**

Weissenberg camera—an X-ray diffraction camera used mainly for the determination of unknown crystal structures. A variation of the rotating crystal camera, it has a shield in front of the film which admits the diffracted beams of only one layer line. The film moves parallel to the camera axis and in synchronism with the rotation of the crystal. Overlapping spots are thus prevented and the film records not only the position of a diffraction spot but also the position of the crystal at the time the spot was produced. **E 7, E04**

weld decay—not a preferred term. Intergranular corrosion, usually of stainless steels or certain nickel-base alloys, that occurs as the result of sensitization in the heat-affected zone during the welding operation. **G 15, G01**

welded pipe—product made from sheet, strip, or plate with a seam made by welding. **B 846, B05**

welded pipe, n —a round hollow product made by forming flat stock and joining the single longitudinal seam by welding; it is produced to the particular dimensions commercially known as standard pipe sizes. **B 899, B02**

welded tube—product made from sheet, strip, or plate with a seam made by welding. **B 846, B05**

welding—joining the ends of two wires, rods, metal whose length is great in comparison with the major axis of its cross section, or groups of wires (I) by fusing, using the application of heat or pressure or both, by means of a flame torch, electric arc, or electric current or (2) by cold pressure. **B 354, B01**

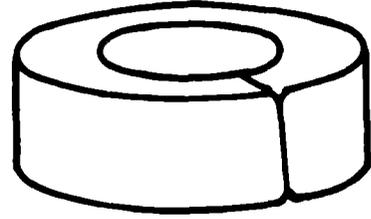

welding, n —in tribology, the bonding between metallic surfaces in direct contact, at any temperature. **G 40, G02**

welding glass—colored glass to protect a welder's eyes from injurious radiation. **C 162, C14**

weld-line, n —a discontinuity in a molded plastic part formed by the merging of two or more streams of plastic flowing together. **D 883, D20**

weld-mark, n —a visible weld-line. **D 883, D20**

weld mark—a deep groove or fissure formed by incomplete union of two or more particles or streams of material flowing together.

F 109, C21

weld-mark, n —a visible weld line. (D20) **F 412, F17**

weld- or knit-line—a mark on, or weakness in, a molded plastic formed by the union of two or more streams of plastic flowing together. **D 883, D20**

weld point—under the conditions of this test, the lowest applied load in kilograms at which the rotating ball welds to the three stationary balls, indicating the extreme-pressure level of the lubricants-force (or newtons) has been exceeded. **D 4175, D02**

weld point, n —the lowest applied load at which sliding surfaces seize and then weld. **D 4175, D02**

weld reinforcement—the portion of the welded joint which extends beyond the inner and outer surface of the base metal of the welded pipe. **B 846, B05**

weld structure—the microstructure of a weld deposit and heat-affected base metal. **E 7, E04**

well, n —in buttons, the recess in the center of a sew through flange button that gives aesthetics and identifies the face side. **D 123, D13**

well, n —in buttons, a recess in center of sew-through flange button that give aesthetics and identifies the face side. **D 5497, D13**

well bonded permafrost—a condition in which the soil particles are strongly held together by the ice, so that the frozen soil possesses relatively high resistance to chipping or breaking. **D 7099, D18**

well completion diagram—a record that illustrates the details of a well installation. **D 653, D18**

well screen—a filtering device used to retain the primary or natural filter pack; usually a cylindrical pipe with openings of a uniform width, orientation, and spacing. **D 653, D18**

well screen jetting (hydraulic jetting)—when jetting is used for development, a jetting tool with nozzles and a high-pressure pump is used to force water outwardly through the screen, the filter pack, and sometimes into the adjacent geologic unit. **D 653, D18**

welt, n —the piping effect produced when welt cord and cover fabrics are sewn together for ornamental purposes to finish the edges between intersecting surfaces of upholstered furniture cushions, pillows, arms, or backs. **E 176, E05**

welt beating—operation of lightly beating the welt into a smooth position around the edge of a shoe. **F 869, F08**

welt cord, n —the continuous small-diameter cylindrical material that is wrapped in fabric and sewn as part of the cover to make a welt edge on upholstered furniture. **E 176, E05**

welted seam, n —in upholstered furniture, seam sewn with a strip of covered cord between the two fabric pieces, joined so that the welting shows on the exterior of the furniture unit. **D 123, D13**

welted seam, n —in upholstered furniture, seam sewn with a strip of covered cord between the two fabric pieces, joined so that the welting shows on the exterior of the furniture unit. **D 7023, D13**

welting, n —in upholstered furniture, a cord covered by strips of exterior fabric, used in welted seams of upholstery covering. **D 123, D13**

welting, n —in upholstered furniture, a cord covered by strips of exterior fabric, used in welted seams of upholstery covering. **D 7023, D13**

welting shoulder—the shoulder portion of the vegetable-tanned cattlehide leather, tanned with a low load to give the flexibility required for a welt. **D 1517, D31**

welt seam, n —a complex seam formed on the inside of the object

- with one trimmed raw edge enclosed and one stitching line visible on the face side. **D 123, D13**
- welt seam**, *n*—*inhome sewing*, a complex seam formed on the inside of the product with one trimmed cut edge enclosed and one stitching line visible on the face side. **D 4965, D13**
- Westlake process**—{archaic} an automatic process using vacuum gather for producing articles in paste molds. **C 162, C14**
- wet**, *adj*—covered or saturated with a liquid, generally water. **D 4538, D33**
- wet adhesion**, *n*—the ability of a coating film to adhere tightly to the substrate directly beneath it under wet conditions such as rain, dew, washing, etc. **D 16, D01**
- wet-basis moisture content**—the moisture content expressed as the ratio of the weight of water in the fuel to the total weight of the fuel. **E 1705, E48**
- wet basis moisture content**—see **total weight basis moisture content**. **E 1705, E48**
- wet blasting**—a process for cleaning or finishing by means of a slurry of abrasive in water directed at high velocity against the work pieces. **B 374, B08**
- wet blue**—hides of skins which have been chromium tanned, but not dyed and/or fat liquored. Commonly referred to as *leather in the Blue*. **D 1517, D31**
- wet-bulb depression** ($t - t_w$), *n*—the difference between the dry-bulb temperature and the wet-bulb temperature.
- wet-bulb temperature**—the equilibrium temperature of a liquid vaporizing into a gas. With water and air, wet-bulb and dry-bulb temperatures give a measure of the relative humidity. **D 9, D07**
- wet-bulb temperature**—See **temperature**. **D 1356, D22**
- wet-bulb temperature**, *n*—the equilibrium temperature of a liquid vaporising into a gas. With water and air, wet-bulb and dry-bulb temperatures can be used to calculate the relative humidity. **G 113, G03**
- wet chop**—fiber glass strand which has been chopped directly after application of sizing. See **chopped fiber** and **dry chop**. **C 162, C14**
- wet cleaning**—under **cleaning**, see **wet cleaning**. **D 459, D12**
- wet cockle**, *n*—the wave pattern on paper substrate, which may be created by the ink solvent during printing caused as paper fibers expand relieving stresses. **F 1857, F05**
- wet crock**—the degree of polish rub-off obtained during rubbing tests using water between a cloth (clothing) and the shoes. **D 2825, D21**
- wet deposition**—See **deposition**. **D 1356, D22**
- wet edge**, *n*—the edge of a wet, painted area that remains workable for continued painting. **D 16, D01**
- wet edge**, *n*—the leading edge of a continuously applied wet-state material. **E 2110, E06**
- wet edge extender**, *n*—high boiling liquids such as propylene glycol added to latex or water-based paints to reduce the evaporation rate and thereby extend the (open) time that they are wet enough to brush into. **D 16, D01**
- wet-felting**—forming of a fibrous-felted board mat from a water suspension of fibers and fiber bundles by means of a deckle box, fourdrinier, or cylinder board machine. **D 1554, D07**
- wet-film gage**—a gage for measuring the thickness of a wet film. **C 717, C24**
- wet-film thickness**—the thickness of a liquid coating as it is applied. **C 717, C24**
- wet gas**—natural gas that contains water vapor in excess of sales or contractual specifications, or both. **D 4150, D03**
- wet impingement**—See **impingement**. **D 1356, D22**
- wet-installed fastener**—a fastener that is coated on the shank and under the head with a curing-type sealant to provide a corrosion barrier and a secondary seal. **E 631, E06**
- wetland**—land which has the water table at, near, or above the land surface, or which is saturated for long enough periods to promote hydrophylic vegetation and various kinds of biological activity which are adapted to the wet environment. **D 653, D18**
- wet layup**, *n*—a method of making a reinforced plastic in which the polymer compound is applied as a liquid and as the reinforcement is put in place. **D 883, D20**
- wet milling**—the grinding of porcelain enamel materials with sufficient liquid to form a slurry. **C 286, B08**
- wet milling**, *n*—the grinding of materials with sufficient liquid to form a slurry. **C 1145, C28**
- wet pressing**—See **wet pressing** under **pressing**. **C 242, C21**
- wet process**—See **wet process** under **process**. **C 242, C21**
- wet process enameling**—a method of porcelain enameling in which slip is applied to a metal article at ambient temperature, dried and fired. **C 286, B08**
- wet scraping**, *n*—removal of leaded paint by hand scraping while keeping the surface wetted to minimize the generation of dust. **E 1605, E06**
- wet sieving**—for the purpose of *Test Method D 4749*, the test method for the sieving of coal that uses water as a medium for facilitating the segregation of the sample into particle size; this is generally used when testing coal particles 600 μm (No. 30 U.S.A. Standard Series) or smaller. **D 121, D05**
- wet slurry technique**—a magnetic particle examination technique in which the magnetic particles are suspended in a high-viscosity vehicle. **E 1316, E07**
- wet spots**, *n*—local patches of high moisture content in raw rubber. **D 1566, D11**
- wet-state materials**, *n*—the adhesive, base coat, and finish coat applied in liquid or semiliquid state. **E 2110, E06**
- wet storage stain (coatings)**—See **whiterust**. **D 16, D01**
- wet strength**, *n*—see **wet strength** under **bond strength**. **D 907, D14**
- wet strength**—See **strength, wet**. **E 1749, E06**
- wet strength paper**—See **paper**. **D 996, D10**
- wettability**—the rate at which particles can be made wet under specified conditions. **D 2652, D28**
- wettage**, *n*—see **static hold-up** or **wettage**. **D 4175, D02**
- wet technique**—the examination technique in which the magnetic particles are suspended in a liquid vehicle. **E 1316, E07**
- wet tensile strength**, *n*—of paper, tensile strength of water-saturated paper or paperboard measured under specified conditions. **D 1968, D06**
- wetting**—the formation of a relatively uniform, smooth, unbroken, and adherent film of solder to a base material. **B 846, B05**
- wetting**—the property of a polish to uniformly and completely contact the solid surface to which it is applied. **D 2825, D21**
- wetting action**—the ability of a liquid to spread over and adhere to solid surfaces. **E 1316, E07**
- wetting agent**—a substance that reduces the surface tension of a liquid, thereby causing it to spread more readily on a solid surface. **B 374, B08**
- wetting agent**—a chemical additive that reduces the surface tension of a fluid, inducing it to spread readily on a surface to which it is applied, thus causing wetting of the surface of the solid with the fluids. **C 242, C21**
- wetting agent**, *n*—a chemical additive which reduces the surface tension of a fluid, inducing it to spread readily on a surface to which it is applied, thus causing wetting of the surface with the fluids. **C 1145, C28**
- wetting agent**—a material that increases the spreading of a liquid medium on a surface. **D 459, D12**
- wetting agent**—a substance capable of lowering the surface tension of liquids, facilitating the wetting of solid surfaces, and facilitating the penetration of liquids into the capillaries. **D 653, D18**
- wetting agent**—wetting agents can be considered synonymous with spreading agents in function. **E 1519, E35**
- wetting agent (latex)**, *n*—a substance used to reduce the surface tension of latex and thereby facilitate spreading or impregnation of a surface by the latex. **D 1566, D11**

wetting and adhesion, surface, n

wetting and adhesion, surface, n—the mutual affinity of and bonding between finish and the surface to which it is applied.

C 168, C16

wet unit weight—see **unit weight**.

D 653, D18

wet winding, n—a method of making filament-wound reinforced plastics in which the fiber reinforcement is coated with a polymer compound as a liquid just prior to wrapping on a mandrel.

D 883, D20

wheel, n—a rigid structure consisting of a rim connected to a central disk that permits rotationally centered attachment to an axle.

F 538, F09

wheelbarrow sprayer—a sprayer apparatus mounted on a frame with wheelbarrow-type handles and one or two wheels.

E 1102, E35

wheel cast button, n—see **rotation cast button**.

D 5497, D13

wheel center, n—the point at which the spin axis of a wheel intersects the wheel plane.

F 538, F09

wheel force transducer system—a force-to-electrical signal converter system including transducer(s), associated signal condition, zeroing, amplifying, recording, and monitoring instrumentation.

E 867, E17

wheel load, (lb (kg)), n—the sum of the tire loads on all tires included in the wheel assembly on one end of an axle; a wheel assembly may have a single tire or dual tires.

E 867, E17

wheel plane, n—the central plane of a tire that is mounted on the wheel, normal to the spin axis.

F 538, F09

wheel search unit—an ultrasonic device incorporating one or more piezoelectric elements mounted inside a liquid-filled flexible tire. The beam is coupled to the test surface through the rolling contact area of the tire.

E 1316, E07

wheel torque, n—the external torque acting about the spin axis.

F 538, F09

wheel track, n—a line or path followed by the tire of a road vehicle on a traveled surface.

E 867, E17

whippers—a mechanical device used to beat air into a beverage so as to change its properties from a liquid drink to a frothy drink.

F 1827, F26

whirling psychrometer—See **psychrometer, sling**.

D 1356, D22

whisker, n—a short, single-crystal fiber.

D 883, D20

whisker—two triangular pieces of metal formed during cutting of nail point.

F 547, F16

whiskering, n—fine hair-like lines that are dragged from solid print areas to non-print areas.

D 6488, D01

whiskers—metallic filamentary growths, often microscopic, sometimes formed during electrodeposition and sometimes spontaneously during storage or service, after finishing.

B 374, B08

whiskers—See **striation**.

C 162, C14

whiskers at trailing edge of solid areas, n—ragged edges around the printed image caused by improper roller setting or by an impression roll that is too hard (improper durometer).

D 6488, D01

white, adj—for **colordetermination**, color description most usually applied to opaque, highly reflecting, highly diffusing, visually hueless specimens.

D 2946, C17

white iron, n—cast iron in which substantially all of the carbon is in solution and in the combined form. The metal has a white fracture.

A 644, A04

white light—see **visible light**.

E 1316, E07

white light—light containing all wave lengths in the visible spectrum (in the range from 380 to 780 nm).

E 1316, E07

whiteness—the degree of approach of the color of a substance to that of the ideal white, commonly represented by a standardized preparation of magnesium oxide.

D 1695, D01

whiteness, n—the degree to which a near-white surface approaches **perfect white** defined as a 100 % reflectance over the whole visible spectrum.

D 2946, C17

whiteness, n—attribute of color perception by which an object color is judged to approach the preferred white.

E 284, E12

whiteness index, n—a number, computed by a given procedure from

colorimetric data, that indicates the degree of departure of an object color from a preferred white.

E 284, E12

whiteness-retention—comparative whiteness of original and cleaned fabric.

D 459, D12

white noise—noise with a continuous frequency spectrum and with equal power per unit bandwidth. For example, equal power in any band of 100-Hz width.

C 634, E33

white rust, n—white corrosion products (zinc hydroxide and zinc oxide) on zinc-coated articles. They form when the parts are stored so close together that condensed moisture is entrapped between them and the air circulation is inadequate to assist drying. Also called wet storage stain. See **rust**.

D 16, D01

white sidewall, n—a sidewall which contains a white (or light colored) compound as a part of the total sidewall.

F 538, F09

white speck—in western softwoods, pockets of decay caused by *Fomes pini*.

D 9, D07

white standard—a substance that reflects 100 % light and is used in calibrating test instruments. See **barium sulfate**.

F 149, F05

whiteware—See **ceramic whiteware**.

C 242, C21

white wash—a combination of hydrated lime (or slaked quicklime), water, and other materials to be used as a paintlike coating.

C 51, C07

white weight—the weight of limed, unwashed stock.

D 1517, D31

white wool, n—wool having shade variations from true white to creamy white but free of pigmented, dyed, or otherwise colored wools.

D 123, D13

white wool, n—wool having shade variations from true white to creamy white but free of pigmented, dyed, or otherwise colored wools.

D 4845, D13

white write—a process in electrostatic printing where the photoconductive element is charged with a charge of the opposite sign as that of the toner. A light beam, acting like a "charge eraser" is used to discharge all areas of the photoconductor that are NOT to receive toner to form the image. The toner is attracted to the remaining charged areas of the photoconductor when the latent electrostatic image is developed.

F 909, F05

white (X-rays)—containing a large number of wavelengths.

E 7, E04

whiting—calcium carbonate powder of high purity.

C 242, C21

whole air sampling, n—the collection of an air sample into a sealable container such as a canister, bottle, or bag for subsequent analysis of its contents.

D 1356, D22

whole sediment—sediment and associated pore water that have had minimal manipulation.

E 943, E47

whole tire, n—a scrap tire that has been removed from a rim but which has not been processed.

D 5681, D34

wick, n—an object that delivers fuel to a flame through the process of capillary action.

F 1972, F15

wicking, n—transmission of a gas or liquid, due to a pressure differential or capillary action, along fibers incorporated in a rubber product.

D 1566, D11

wicking—absorption of film by materials allowed to rest on polished substrate, for example, felt pads on bottoms of decorator pieces.

D 2825, D21

wickproof, adj—in **tire fabric, tire cord fabric, tire cord, or yarn**, a term used to describe a fabric or yarn that shows no air wicking by this prescribed test.

D 6477, D13

wide crown—staple crown usually larger than $1\frac{1}{16}$ in. (17 mm) in width.

F 592, F16

wide elastic fabric, n—an elastic fabric that is at least 150 mm (6 in.) in width. (Compare **narrow elastic fabric**.)

D 123, D13

wide elastic fabric, n—an elastic fabric that is at least 150 mm (6 in.) in width. (Compare **narrow elastic fabric**.)

D 4850, D13

widfield eyepiece—an eyepiece that permits the observation of an extended field of view of the specimen.

E 7, E04

wide ring—a rate of growth of less than four annual rings per inch, that is, a growth rate faster than that described by **medium grain**.

D 9, D07

widespread permafrost—widely distributed, discontinuous permafrost. **D 7099, D18**

wide strip tensile test, n—for geosynthetics, a tensile test in which the entire width of a 200 mm (8.0 in.) wide specimen is gripped in the clamps and the gage length is 100 mm (4.0 in.). **D 4439, D35**

wide-to-narrow-ratio, n—a calculated proportion comparing the width of wide elements to narrow elements in a bar code having two widths. **F 1294, F05**

wide-width strip tensile test, n—for geotextiles, a uniaxial tensile test in which the entire width of a 200-mm (8.0-in.) wide specimen is gripped in the clamps and the gage length is 100 mm (4.0 in.). **D 4439, D35**

Widmannstätten structure—a precipitate structure, resulting from the precipitation of a new phase along certain crystallographic planes of the parent solid solution and characterized by a geometrical pattern appearance in the microstructure, originally observed in meteorites but readily produced in many other alloys with proper heat treatment. **E 7, E04**

width, n—the maximum dimension of the tile measured perpendicular to the length. **C 43, C15**

width, n—of flatknit fabrics, the perpendicular distance between the selvages when the fabric is under zero tension and free of folds or wrinkles. **D 123, D13**

width, n—of circularknit fabrics, twice the perpendicular distance between the enclosed edges of a flattened tube of fabric that is under zero tension and free of folds or wrinkles. **D 123, D13**

width, n—of a raised-surface fabric, the dimension included within the outer limits of the nap or pile, but excluding the selvages, or as otherwise agreed upon by the purchaser and supplier. **D 123, D13**

width, n—of a fabric, the distance from the outer edge of one selvage to the outer edge of the other selvage, measured perpendicular to the selvages while the fabric is held under zero tension and is free of folds and wrinkles. **D 123, D13**

width, n—of a fabricwoven on a shuttleless loom, the distance from the outer warp on one side to the outer warp on the other side, measured perpendicular to the warp yarns while the fabric is held under zero tension and is free of folds and wrinkles. **D 123, D13**

width—in the case of a beam, the cross-sectional dimension perpendicular to the direction in which the load is applied. **D 883, D20**

width, n—of flatknit fabrics, the perpendicular distance between the selvages when the fabric is under zero tension and free of folds or wrinkles. **D 4850, D13**

width, n—of circularknit fabrics, twice the perpendicular distance between the enclosed edges of a flattened tube of fabric that is under zero tension and free of folds or wrinkles. **D 4850, D13**

width, n—of a raised-surface fabric, the dimension included within the outer limits of the nap or pile, but excluding the selvages, or as otherwise agreed upon by the purchaser and supplier. **D 4850, D13**

width, n—of a fabric, the distance from the outer edge of one selvage to the outer edge of the other selvage, measured perpendicular to the selvages while the fabric is held under zero tension and is free of folds and wrinkles. **D 4850, D13**

width, n—of a fabricwoven on a shuttleless loom, the distance from the outer warp on one side to the outer warp on the other side, measured perpendicular to the warp yarns while the fabric is held under zero tension and is free of folds and wrinkles. **D 4850, D13**

width—in the case of a beam, the shorter dimension perpendicular to the direction in which the load is applied. (D20) **F 412, F17**

width—See **spacing**. **F 547, F16**

width—the width measurement is a straight line running across the bottom of the last at the ball or the widest part of the foot. **F 869, F08**

width, b—total distance measured perpendicular to the center line on the running surface. X_b indicates the location of ski width from the tail of the ski. **F 472, F27**

width code, n—in bar code symbology, a binary code that assigns a value of one to the wide element (bar or space) and a value of zero to the narrow element. **F 1294, F05**

width of metal connector plate—dimension of metal connector plate perpendicular to longitudinal axis of coiled metal strip from which plate was sheared during its fabrication.

window—See **windows and doors**.

windows and doors:

back bedding—a bead of sealant, glazing compound, or putty, applied between the face of glass and the frame containing it.

back putty—Use **back bedding**.

balance, n—a mechanism used in hung window assemblies to provide mechanical assistance in raising the operable sash and providing a means of holding the sash in the open position.

bead, n—in glazing, (1) a strip of metal or wood used around the periphery of a pane of glass to secure it in place (also referred to as a “stop”). (2) a strip of sealant, glazing compound, or putty.

bite, n—the distance that the surround member (rail or stile) overlaps the glazing.

fixed, adj—describing a sash, panel, or glazing designed not to be opened (antonym: operable).

frame, n—an assembly of structural members that surrounds and supports the sash, ventilators, doors, panels, or glazing that is installed into an opening in a building envelope or wall.

glaze, v—to install glazing.

glazing, n—a material installed in a sash, ventilator, or panel such as glass, plastic, etc.

glazing bead, n—a glazing material used in a sash, ventilator, panel, window or door assembly that retains the glazing.

glazing material, n—the components used to install glazing into its surrounding edge members, such as gaskets, sealants, glazing retainers, etc.

head, n—an upper horizontal member of a window or door frame.

horizontal sliding window, n—a window assembly in which the operable sash(es) moves horizontally in the plane of the window.

hung window, n—window assembly in which the operable sash(es) moves vertically in the plane of the window and having a balance(s) to aid in the operation of the sash.

Windows may be single, double, or triple hung depending on the number of operable sash(es).

interlock, n—a set of meeting rails or meeting stiles that contains a provision for each of the rails or stiles to physically engage one another over their entire length.

jamb, n—a vertical member of a window or door frame.

light, n—Use **lite**.

lite, n—one piece of glazing (preferred term) (also spelled light) (synonym: pane)

meeting rail, n—a rail that overlaps another rail.

mull, v—to join or connect frame members of windows or doors; or a frame member to a mullion.

mullion, n—a member used between windows or doors as a means of connection, which may or may not be structural.

muntin, n—a member used between lites of glazing within a sash, ventilator, or panel.

“O”—in window and door design, a designation used to indicate a fixed sash, panel, or lite.

operable, adj—describing a sash, ventilator, or panel designed to be opened and closed (antonym: fixed).

pane, n—See **lite**.

panel, n—an assembly of one or more lites of glazing, encompassed by surrounding edge members, which when operable, slides horizontally in the plane of a sliding door.

rail, n—a horizontal surrounding edge member of a sash, ventilator, or panel.

sash, n—an assembly of one or more lites of glazing,

width of metal connector plate

- encompassed by surrounding edge members, which when **operable**, slides in the plane of the **window**.
- sealed insulating glass, n**—an assembly of two or more **lites** separated by a dehydrated gaseous space(s), the entire assembly being sealed to resist passage of water vapor or gas.
- sill, n**—a lower horizontal member of a **window** or sliding door **frame**.
- sliding glass door, n**—a door assembly in which the **operable panel** (s) moves horizontally in the plane of the door.
- stile, n**—a vertical surrounding edge member of a **sash, ventilator, or panel**.
- ventilator, n**—an assembly of one or more **lites** encompassed by surrounding edge members, that operates in a manner other than sliding in the plane of the **window**.
- window, n**—an assembly consisting of a surrounding **frame** and one or more **sashes, ventilators, or fixed lites** of glass, or a combination of these, designed to be installed in a **wall** opening for the purpose of admitting light or air, or both.
- “X”—in window and door design, a designation used to indicate an **operable sash, ventilator, or panel**. **E 631, E06**
- widthwise direction, n**—in *textiles*, the direction in a machine-made fabric perpendicular to the warp. **D 123, D13**
- widthwise direction, n**—in *textiles*, the direction in machine-made fabric perpendicular to the warp. (Syn. *cross-machine direction, weftwise direction, fillingwise direction*). **D 5684, D13**
- wilderness setting**—situations in which the delivery of patient care by EMS providers is adversely affected by logistical complications, such as: an environment that is physically stressful or hazardous to the patient, rescue personnel, or both; remoteness of the patient’s location, such that it causes a delay in the delivery of care to the patient; or lack of adequate medical supplies, equipment, or transportation. **F 1177, F30**
- wildness, n**—an obsolete term previously used to describe a number of cord properties including flare, straightness, and residual torsion. **D 123, D13**
- wildness, n**—obsolete term, previously used to describe a number of steel tire cord properties including flare, straightness, and residual torsion. **D 6477, D13**
- wild type**—the naturally occurring, original isolate. **E 1705, E48**
- willow**—(1) *willow grain*—refers to boarded leather.
- (2) *willow tanned*—In the sporting goods industry, used to indicate flexible, well-oiled, chrome-tanned cattlehide or horsehide used for gloves. **D 1517, D31**
- winding**—a process in which continuous material is applied under controlled tension to a form in a predetermined geometric relationship to make a structure. A matrix material to bind the fibers together may be added before, during or after winding. Filament winding is the most common type. **D 3878, D30**
- winding loss, (copper loss), P_w** —the power expended, as heat, in the conductors of an inductor or resistor, or both, as a result of the electric current in them. **A 340, A06**
- winding system, n**—in *open-end spinning machines*, a device which forms the yarn package. **D 123, D13**
- winding system, n**—in *open-end spinning machines*, a device which forms the yarn package. **D 3888, D13**
- winding wire**—see **magnet wire**. **D 1711, D09**
- window**—in a chamois skin, a thin portion that transmits light when the skin is viewed against a window or light background. **D 1517, D31**
- window assembly, n**—an integrally fabricated unit containing a glazed light(s) placed in an opening in a wall or partition and that is intended primarily for the transmission of light, or light and air, and not primarily as an entrance or exit. **E 176, E05**
- window glass**—See **sheet glass**. **C 162, C14**
- windows, n**—part of *zippers*, the openings in pin-lock and cam-lock sliders through which the locking pin and cams, respectively, may extend. **D 123, D13**
- windows, n**—the openings in pin-lock and cam-lock sliders through which the locking pin and cams, respectively, may extend. **D 2050, D13**
- window sash**—assembly of one or more lites (or panes) of glazing, encompassed by surrounding edge members, which when operable, slides in the plane of the window. **E 1605, E06**
- window stool**—flat, horizontal molding fitted over the sill, on the window interior, between jambs, that comes in contact with the bottom rail of the (lower) operating sash and the window sill. **E 631, E06**
- window stool**—flat, horizontal molding fitted over the sill, on the window interior, between jambs, that comes in contact with the bottom rail of the (lower) operating sash and the window sill. **E 1605, E06**
- wind response**—change in freeboard or draft due to wind force acting to displace the boom from rest. **F 818, F20**
- wipe, v**—in *upholsterycleaning*, to clean coated upholstery fabrics with a sponge or cloth wetted with a mild detergent, soap solution, or coated fabric cleaner formulated for the purpose. **D 123, D13**
- wipe, v**—in *upholsterycleaning*, clean face-coated upholstery fabrics by removing surface soil with a sponge or cloth wetted with a mild detergent, soap solution, or coated fabric cleaner formulated for the purpose. Do not use dry solvent cleaner. **D 5253, D13**
- wipe, n**—sorberent material (e.g. cotton gauze) that is rubbed on a surface to collect a sample for chemical analysis. **D 5681, D34**
- wipe, n**—a disposable, porous paper (cellulosic) towellelette that is moistened with a wetting agent. **E 631, E06**
- wipe**—disposable twoelettes moistened with a wetting agent. These towelettes are used for cleaning sampling equipment. Wipe brands or sources selected for use shall contain insignificant background lead levels. **E 631, E06**
- wipe**—disposable towelettes moistened with a wetting agent (see 2.1.5.1 and 2.1.5.2). These towlettes are used to collect the sample and to clean sampling equipment. Wipe brands or sources selected for use shall not contain significant background lead levels (see 2.1.5.1.) Wipe brands or sources selected for use shall be of adequate width and thickness to perform the collection procedure (see 2.1.5.2). **E 631, E06**
- wipe, n**—a disposable towellelette that is moistened with a wetting agent. **E 1605, E06**
- wiper**—see **slider**. The term “wiper” is sometimes used interchangeably with the more preferred term “slider.” **B 542, B02**
- wipe sampling kit**—a sealable rigid walled container with 50 mL minimum volume (see 2.1.6.1). The kit must also include a separate container of clean uncontaminated wipes for use in collecting samples. One container of bulk packed wipes is typically used for collection of multiple samples.
- wire fabric**—See **screen**.
- wire mesh**—See **screen**.
- wire mesh**—See **railing systems**. **E 631, E06**
- wire, n**—a single continuous length of metal, generally with a circular cross section, that is cold drawn from wire rod or bar. **A 902, A05**
- wire**—a rod or filament of drawn or rolled metal whose length is great in comparison with the major axis of its cross section. **B 354, B01**
- wire, n**—solid wrought product that is long in relation to its cross section, which is square or rectangular with sharp or rounded corners or edges, or is round, hexagonal, or octagonal, and whose diameter or greatest perpendicular distance between parallel faces is less than 0.375 in. [up through 10.00 mm].
- Alclad wire, n**—composite wire product comprised of an aluminum-alloy wire having on its surface a metallurgically bonded aluminum or aluminum-alloy coating that is anodic to the alloy to which it is bonded, thus electrolytically protecting the core against corrosion.
- cold-heading wire, n**—wire of a quality suitable for use in the manufacture of cold-headed products such as bolts and rivets.

- drawn wire, n*—wire brought to final dimension by drawing through a die.
- extruded wire, n*—wire produced by hot extruding.
- flattened wire, n*—wire having two parallel flat surfaces and rounded edges produced by roll-flattening round wire.
- rivet wire, n*—See *cold-heading wire*. **B 881, B07**
- wire, n**—a thin, flexible continuous length of metal, usually of uniform, round cross section. **B 899, B02**
- wire**—a single strand flexible anchor component with a circular cross section that connects the bony elements of the spine, pelvis, or ribs to each other or to other implant components. A series of wire components can be bound together to form a cable (see **cable**). **F 1582, F04**
- wire**—used extensively in fastener manufacturing. It is produced from hot rolled or annealed rods or bars by cold drawing. Steel sizes range from 0.062 to 1.375 in. **F 1789, F16**
- wire bar**—refinery shape used for rolling into rod or flat product for subsequent processing into wire, strip, or shape. Approximately 3½ to 5 in. (89 to 127 mm) square in cross section, usually 54 in. (1.37 m) in length, and ranging in weight from 200 to 420 lb (91 to 191 kg). Usually tapered on both ends. **B 846, B05**
- wirebound box**—See **box**. **D 996, D10**
- wire brush surface**—a roughness due to fibers protruding above the surface of the pultruded part.
- NOTE—This condition usually occurs at the edge of a reinforcing mat strip and is typically located at the edges or corners of the profile. **D 3918, D20**
- wired glass**—flat glass with a layer of wire mesh completely embedded in the glass. **C 162, C14**
- wire fabric**—See **screen**. **E 1481, E06**
- wire gage**—measure used to describe, by system of arbitrary numbers, diameter of shank or wire from which nail is made. Because several systems of gage designations are in use, reference to particular gage system should be indicated. **F 547, F16**
- wire mesh**—See **screen**. **E 1481, E06**
- wire nail**—nail manufactured from metal wire or rod. **F 547, F16**
- wire rings (hog rings), n**—wires formed to make attachments during splicing or under certain conditions to serve as an alternate to the tie wires (see *double loop ties*). **F 1379, F14**
- wire rod, n**—a hot-rolled, single continuous length of metal, generally of circular cross section, hot wound or laid into irregular coils, considered a semifinished product, primarily intended for wire drawing. **A 902, A05**
- wire rope, n**—a number of wire strands laid helically about an axis. **A 902, A05**
- wires, n**—high tensile, brass plated steel wires, coated with a special adhesion-promoting compound, that are used as tire reinforcement. Belts or radial tires plies and beads are common uses. **D 5681, D34**
- wire sawn**—a surface with a pattern of linear and/or curved grooves produced by a wire saw. **C 119, C18**
- wire side, n**—of *paper*, the side of paper that was in contact with the sheet-forming wire on a paper machine that utilized a single wire (versus a twin-wire) forming section (also called the “bottom side”). **D 1968, D06**
- wire side**—in *paper*, the side of a sheet next to the wire in paper manufacturing. **F 149, F05**
- wires per unit length, n**—for *woven pile yarn floor covering*, the number of binding sites per unit of floor covering length; wires in the widthwise direction being the usual means of forming the pile. **D 123, D13**
- wires per unit length, n**—for *woven pile yarn floor covering*, the number of binding sites per unit of floor covering length; wires in the widthwise direction being the usual means of forming the pile. **D 5684, D13**
- wire strand, n**—a number of wires laid helically about an axis; may or may not contain a center wire. **A 902, A05**
- wiry end**—See **tight twist end**. **D 3990, D13**
- withdrawal force**—the force required to separate two mated connector halves. **B 542, B02**
- withdrawal pressing, n**—a powder consolidation method in which the die moves downward in relation to the lower punch(es) during compaction. It further descends over the fixed lower punch(es) for ejection, so that the compact may then be pushed off the tooling at this point. **B 243, B09**
- with grain, n**—the direction in a body with preferred orientation due to forming stresses that has the maximum *a*-axis alignment as measured in an X-ray diffraction test. **C 709, D02**
- with grain, n**—the direction in a body with preferred orientation due to forming stresses that has the maximum *a*-axis alignment as measured in an X-ray diffraction test. **D 4175, D02**
- within-laboratory, between days variability**—the precision of a method expressed as the agreement attainable between independent determinations (each the average of duplicates) performed by one analyst using the same apparatus and techniques on each of two days. **E 1547, E15**
- within-laboratory standard deviation, n**—the standard deviation of test results obtained within a laboratory for a single material under conditions that may include such elements as different operators, equipment, and longer time intervals. **E 456, E11**
- within-laboratory standard deviation, S_p, n** —the standard deviation of results collected on the same material in the same laboratory on different days (synonym: **repeatability**). **E 135, E01**
- witness tire, n**—a reference tire with an extended period of stability for specified characteristic properties. **F 538, F09**
- Wobbe index**—a numerical value that is calculated as the heat value (calorific value/heat) on a volume basis at specified reference conditions, divided by the square root of the relative density at the same specified reference conditions. The Wobbe index is a measure of heat input to gas appliances derived from the orifice flow equation. It indicates the relative amount of energy that would flow through a small burner orifice jet. **D 4150, D03**
- wobble**—in electromagnetic testing, an effect that produces variations in coil spacing (operational lift-off) due to lateral motion of the test specimen in passing through an encircling coil. **E 1316, E07**
- wollastonite**—a calcium metasilicate mineral with the formula CaSiO_3 containing theoretically 48.3 % lime (CaO) and 51.7 % silica (SiO_2), occurring in acicular masses of elongated triclinic crystals, usually white or pale gray. **C 242, C21**
- wood**—the tissues of the stem, branches, and roots of a woody plant lying between the pith and cambium, serving for water conduction, mechanical strength, and food storage, and characterized by the presence of tracheids or vessels. **D 9, D07**
- wood-base fiber and particle panel materials**—a generic term applied to a group of board materials manufactured from wood or other lignocellulosic fibers or particles to which binding agents and other materials may be added during manufacture to obtain or improve certain properties. Composed of two broad types, fibrous-felted and particleboards. **D 1554, D07**
- wood cellulose, purified**—chemical cellulose from wood. **D 1695, D01**
- wood-cement board**—a panel material where wood usually in the form of excelsior is bonded with inorganic cement. **D 1554, D07**
- wood-destroying organisms**—principally the decay-producing fungi, beetles, termites, carpenter ants, marine borers, etc. **D 9, D07**
- wood failure, n**—the rupturing of wood fibers in strength tests on bonded specimens, usually expressed as the percentage of the total area involved which shows such failure. **D 907, D14**
- wood failure**—(1) as applied to *plywood glueline testing*, the area of wood fiber remaining at the glueline following completion of the specified shear test. Determination is by means of visual examination and expressed as a percent of the test area.
- (2) as applied to *failure in plywood not directly associated with*

wood failure

the adhesive, a rupture, shelling, tearing or breaking of the wood itself. (See also **broken grain**.)

D 1038, D07

wood fiber, *n*—insulation composed of wood fibers, with or without binders. **C 168, C16**

wood-fibered plaster, *n*—a calcined gypsum plaster containing shredded or ground wood fiber added during manufacture. **C 11, C11**

wood flour—very fine wood particles generated from wood reduced by a ball or similar mill until it resembles wheat flour in appearance, and of such a size that the particles usually will pass through a 40-mesh screen. **D 1554, D07**

wood fuel—fuel derived from biomass composed of woody trees or shrubs. **E 772, E44**

wood fuel—fuel derived from biomass composed of woody trees or shrubs. **E 1705, E48**

wood-heel attaching nail—bright, regular-stock-steel, annularly threaded or helically threaded, $\frac{3}{8}$ by 0.054 to $\frac{7}{8}$ by 0.072-in. nails with slightly countersunk flat head and medium or long diamond point. **F 547, F16**

wood-heel top-lift nail—bright, regular-stock-steel, $\frac{1}{2}$ by 0.041 to $\frac{3}{4}$ by 0.048-in. nails with flat or brad head and long diamond point. **F 547, F16**

wood laminates, *n*—(see also **laminated**, *n*)

built-up laminated wood, *n*—an assembly made by joining layers of lumber with mechanical fastenings so that the grain of all laminations is essentially parallel.

glue-laminated wood, *n*—an assembly made by bonding layers of veneer or lumber with an adhesive so that the grain of all laminations is essentially parallel.

plywood, *n*—a panel generally flat built up of layers of veneer called plies, united under pressure by an adhesive to create a panel with the bond between the plies as strong as, or stronger than, the wood, and that has the following characteristics: (1) is constructed of an odd number of layers with grain of adjacent layers perpendicular, (2) with a layer consisting of either a single ply or two or more plies laminated with parallel grain direction, and (3) with outer layers and all odd numbered layers generally having the grain direction oriented parallel to the long dimension of the panel. **D 907, D14**

wood-lath nail—blued, regular-stock-steel, 1 and $1\frac{1}{8}$ by 0.054 and 0.072-in. nails with flat $\frac{1}{8}$ to $\frac{1}{64}$ -in. head and medium diamond point. **F 547, F16**

wood residue, *n*—the scrap and waste wood resulting from the harvest of trees. **D 1968, D06**

wood substance—the moisture-free material of which wood is composed.

NOTE—In laboratory tests, wood substance is usually on an extractive-free basis, but in common usage it usually includes all material remaining after oven-drying. There is little variation in the specific gravity of wood substance among temperate-zone species. Variation among species is caused primarily by the proportions of wood substance and air. **D 9, D07**

wood veneer, *n*—a thin sheet of wood, generally within the thickness range from 0.01 to 0.25 in. (0.3 to 6.3 mm) to be used in a laminate. **D 907, D14**

wood wool (excelsior)—long, curly, slender strands of wood used as an aggregate component for some particleboards. **D 1554, D07**

wool—a mass of staple fibers bonded into a three dimensional network, producing a low density material for thermal and/or acoustic insulation. **C 162, C14**

wool, *n*—used in the generic sense in these tolerances, the fiber from the fleece of the sheep or lamb, the hair of the Angora or Cashmere goat, rabbit hair, and the so-called specialty fibers from the hair of the camel, alpaca, llama, and vicuna. **D 123, D13**

wool, *n*—the fibrous covering of the sheep, *Ovis* species. **D 123, D13**

wool, *n*—as defined in the Wool Products Labeling Act of 1939, “the

fiber from the fleece of the sheep or lamb, or hair of the Angora goat or Cashmere goat (and may include the so-called specialty fibers from the hair of the camel, alpaca, llama, and vicuna) which has never been reclaimed from any woven or felted wool product.” **D 123, D13**

wool, *n*—the fibrous covering of the sheep, *Ovis* species. **D 4845, D13**

wool, *n*—as defined in the Wool Products Labeling Act of 1939, “the fiber from the fleece of sheep or lamb, or hair of the Angora goat or Cashmere goat (and may include the so called specialty fibers from the hair of the camel, alpaca, llama, and vicuna) which has never been reclaimed from any woven or felted wool product.” **D 4845, D13**

wool base, *n*—oven-dried scoured wool free of alcohol-extractable matter, mineral matter, vegetable matter, and all impurities. **D 123, D13**

wool base, *n*—oven-dried scoured wool free of alcohol-extractable matter, mineral matter, vegetable matter, and all impurities. **D 4845, D13**

wool content, *n*—the quantity of new and recycled wool, as defined in the Wool Products Labeling Act, which is determined by chemical analysis. **D 123, D13**

wool content, *n*—the quantity of new and recycled wool, as defined in the Wool Products Labeling Act, which is determined by chemical analysis. **D 4845, D13**

woolen run—an indirect yarn numbering system in the woolen system, equal to the number of 1600-yd lengths per pound. (Compare **woolen cut**, **worsted count**.) **D 123, D13**

woolen-spun, *adj*—of, or pertaining to, material produced by the woolen system of yarn spinning as distinct from materials made by the worsted system of spinning. (Compare **worsted-spun**.) **D 123, D13**

woolen-spun, *adj*—of, or pertaining to, material produced by the woolen system of yarn spinning as distinct from materials made by the worsted system of spinning. (Compare **worsted-spun**.) **D 4849, D13**

woolen system, *n*—a spinning system employing a minimum of drafting and producing yarns of low-bulk density. **D 123, D13**

woolen system, *n*—a spinning system employing a minimum of drafting and producing yarns of low-bulk density. **D 4849, D13**

woolen yarn, *n*—yarn spun from wool fibers which have been carded but not combed or gilled. **D 123, D13**

woolen yarn, *n*—yarn spun from wool fibers which have been carded but not combed or gilled. **D 4845, D13**

wool felt, *n*—a felt composed wholly of any one or a combination of new or recycled wool fibers. **D 123, D13**

wool felt, *n*—a felt composed wholly of any one of or a combination of new or recycled wool fibers. **D 4845, D13**

wool, grease—See **grease wool**. **D 4845, D13**

wool, new—See **wool, virgin**. **D 4845, D13**

wool, raw—See **raw wool**. **D 4845, D13**

wool, recycled—See **recycled wool**. **D 4845, D13**

wool, reprocessed—See **recycled wool**. **D 4845, D13**

wool, reused—See **recycled wool**. **D 4845, D13**

woolskin—sheepskin tanned with the wool on. **D 1517, D31**

word processors—a combination of pieces of hardware consisting of keyboard, video display, and printer interfaced with a computer for the purpose of combining operator and computer logic control in preparing printed matter. **F 909, F05**

work, *n*—the energy expended in displacing a body; mathematically, force times distance. **D 123, D13**

work, *n*—the energy expended in displacing a body; mathematically, force times distance. **D 4848, D13**

workability—a subjective term used to describe the ease of fabrication of molten glass. **C 162, C14**

workability, *n*—the ability of mortar to be easily placed and spread. **C 1180, C12**

workability—the degree of ease and smoothness of cut obtainable on wood with hand or machine tools. **D 9, D07**

workability enhancer, *n*—admixture incorporated into a masonry mortar to increase the ease of being worked and used. A workability enhancer will increase the board life and maintain the water retention of a mortar. **C 1180, C12**

workability index, *n*—a measure of the moldability of plastic refractories, determined in accordance with Test Method C 181. **C 71, C08**

workability of concrete, *n*—that property determining the effort required to manipulate a freshly mixed quantity of concrete with minimum loss of homogeneity. **C 125, C09**

work area—assigned space within a building, or at an exterior location, that is designated as the region delineated by the scope of work. **E 631, E06**

work area, *n*—the interior or exterior space where lead hazard control or other building maintenance or modification activities are performed. **E 1605, E06**

work breakdown structure (WBS), *n*—a hierarchically structured list of work packages and activities, that defines the total work scope of a project, identifies and organizes the relationships of the work packages and activities to each other, and provides the basis for effective project planning, management, and control. **E 833, E06**

work function—the potential barrier that must be overcome to remove an electron from the Fermi level of a specimen to the vacuum level. **E 673, E42**

work hardening—a change in the hardness of a material as a result of plastic deformation. **E 7, E04**

working cotton standard, *n*—a reference standard developed primarily for use within a specific laboratory. (See **Precision**.) **D 123, D13**

working cotton standard, *n*—a reference standard developed primarily for use within a specific laboratory. **D 7139, D13**

working direction, *n*—in *manufactured carbon and graphite product technology*, direction of applied force used in forming a solid body; generally the direction of applied molding pressure for a uniaxially molded material and the extrusion direction for an extruded material. **C 709, D02**

working direction, *n*—in *manufactured carbon and graphite product technology*, direction of applied force used in forming a solid body; generally the direction of applied molding pressure for a uniaxially molded material and the extrusion direction for an extruded material. **D 4175, D02**

working distance—the distance between the surface of the specimen being examined and the front surface of the objective lens. **E 7, E04**

working drawing—a detail drawing, usually produced by a draftsman under direction of an architect, engineer, or other designer showing form, quantity, and relationship of construction elements and materials; indicating their location, identification, grades, dimensions, and connections. Compare **shop drawing**.

working life:

adhesive working life—the period of time during which an adhesive, after mixing with catalyst, solvent, or other compounding ingredients, remains suitable for use.

sealant working life—the amount of time faying surfaces can be left open once sealant has been applied and still squeeze out excess sealant on closure to a thickness of 0.005 in. (0.13 mm) or less. **E 631, E06**

working drawing—See **drawing**. **E 1480, E06**

*working drawing, *n** (dessin d'exécution)—detail drawing, usually produced by a draftsman under direction of an architect, engineer, or other designer showing the form, quantity, and relationship of construction elements and materials and indicating their location, identification, grades, dimensions, and connections. **E 631, E06**

working electrode—the test or specimen electrode in an electrochemical cell. **G 15, G01**

working elongation (WE), *n*—of rope, elongation which is immediately recoverable when tension is removed from the rope. **D 123, D13**

working end—the compartment of a melting furnace from which glass is delivered for forming. **C 162, C14**

working flow-rate standard—See **standard**. **D 1356, D22**

working life, *n*—of a sealant, the time interval after opening a container of a single component sealant, or after mixing the components of a multi-component sealant, during which application and tooling is possible. **C 717, C24**

working life, *n*—the period of time during which an adhesive, after mixing with catalyst, solvent, or other compounding ingredients, remains suitable for use. (Synonym **pot life**.) (Compare **storage life**.) **D 907, D14**

working life:

adhesive working life—the period of time during which an adhesive, after mixing with catalyst, solvent, or other compounding ingredients, remains suitable for use.

sealant working life—the amount of time faying surfaces can be left open once sealant has been applied and still squeeze out excess sealant on closure to a thickness of 0.005 in. (0.13 mm) or less. **E 1749, E06**

working pressure—the pressure adjudged best for any particular set of conditions encountered during grouting. **D 653, D18**

working range—the range of surface temperature in which glass is formed into ware in a specific process. The “upper end” refers to the temperature at which the glass is ready for working (generally corresponding to a viscosity of 10^2 to 10^3 Pa · s), while the “lower end” refers to the temperature at which it is sufficiently viscous to hold its formed shape (generally corresponding to a viscosity greater than 10^4 Pa · s). For comparative purposes, when no specific process is considered, the working range of glass is assumed to correspond to a viscosity range from 10^3 to $10^{6.6}$ Pa · s. **C 162, C14**

working standard—See **standard**. **D 1356, D22**

working standard, *n*—an instrument standard or laboratory standard in routine use. **E 284, E12**

working stresses—See **allowable properties**. Archaic. **D 9, D07**

working time, *n*—the elapsed time from the first addition of liquid during mixing of the refractory castable until the first indication that it can no longer be placed by the desired placement method; the total of the mixing time and placement time. **C 71, C08**

working time (chemical-resistant mortars)—the time interval in minutes after initial mixing of the component parts, at a specific temperature and in the absence of direct sunlight, in which the mortar may be applied to a brick or tile surface without curling behind the trowel. **C 904, C03**

work-in-process—material that has been released to manufacturing, engineering, design, or other services under the contract and includes undelivered manufactured parts, assemblies, and products, either complete or incomplete. **E 2135, E53**

workmanship—expected absence of imperfections affecting serviceability of a fastener. Often used to describe a finish free from injurious burrs, seams, laps, or irregular surfaces. **F 1789, F16**

workplace—See **space categories**. **E 1480, E06**

work plan—a plan, specific to a particular site, for conducting activities specified in the plan. **D 5681, D34**

work plans, *n*—plans that are specific to sampling at a particular site; examples are Health and Safety Plans and Sampling and Analysis Plans. **D 5681, D34**

work (plating)—the material being plated or otherwise finished. **B 374, B08**

work-practice control—see **engineered control**. **E 631, E06**

work recovery, *n*—the percent of recoverable work to the total work required to strain a fiber a specified amount under specified conditions. **D 123, D13**

work recovery, *n*—the percent of recoverable work to the total work

work recovery, *n*

- required to strain a fiber a specified amount under specified conditions. **D 4848, D13**
- workshop effort**—the exclusive, intense concentration of the VA team on the project during the workshop period.
workstation—See **building space**. **E 631, E06**
- workshop effort, *n***—the exclusive, intense concentration of the VA team on the project during the workshop period. **E 833, E06**
- workspace**—See **space categories**. **E 1480, E06**
- workstation**—See **space categories**. **E 1480, E06**
- work-to-break, *n***—the total energy required to rupture a specimen to the breaking force during a tensile test. **D 123, D13**
- work to break, *n***—the energy expended up to the breaking force. (See **work-to-rupture**. Compare **toughness**.) **D 4848, D13**
- work-to-break, *n***—the total energy required to rupture a specimen to the breaking force during a tensile test. **D 6477, D13**
- work-to-break (W, LF), *n***—*in tensile testing*, the total energy required to rupture a specimen. **D 4439, D35**
- work-to-rupture, *n***—the energy expended to tear apart a material. (See **work-to-break**. Compare **toughness**.) **D 123, D13**
- work to rupture, *n***—the energy expended to tear apart a material. (See **work to break**. Compare **toughness**.) **D 4848, D13**
- worst area difference**—one of the measures of how easily an interpreter can identify the characters of a font set, it is the range of the surface areas enclosed by the nominal COL's of the characters; the greater this range, the more easily the characters can be identified. **F 149, F05**
- worsted count, *n***—an indirect yarn numbering system in the worsted system equal to the number of 560-yd lengths per pound. (*Syn.* English worsted count. Compare **woolen run**.) **D 123, D13**
- worsted count, *n***—an indirect yarn numbering system in the worsted system equal to the number of 560-yd lengths per pound. (*Syn.* English worsted count. Compare **woolen run**.) **D 4849, D13**
- worsted-spun, *adj***—of, or pertaining to, materials produced by the worsted system of yarn spinning as distinct from materials made by the woolen system of spinning. **D 123, D13**
- worsted-spun, *adj***—of, or pertaining to, materials produced by the worsted system of yarn spinning as distinct from materials made by the woolen system of spinning. **D 4845, D13**
- worsted system, *n***—a spinning system adapted to fibers 50 to 225 mm (2 to 9 in.) in length. **D 123, D13**
- worsted system, *n***—a spinning system adapted to fibers 50 to 225 mm (2 to 9 in.) in length. **D 4849, D13**
- worsted yarn, *n***—yarn spun from wool fibers which have been carded, and either gilled or combed, or both. **D 123, D13**
- worsted yarn, *n***—yarn spun from wool fibers which have been carded, and either gilled or combed, or both. **D 4845, D13**
- worth**—the value as defined in monetary terms of a specific function identified.
XEPS—see **rigid cellular polystyrene thermal insulation board**. **E 631, E06**
- worth, *n***—the value as defined in monetary terms of a specific function identified. **E 833, E06**
- wound, *n***—an injury or damage, usually restricted to those caused by physical means with disruption of the normal continuity of structures. Called also injury and trauma. **F 2312, F04**
- wound closure, *n***—the provision of an epithelial cover over a wound; it can be accomplished by approximating wound edges, performing a skin [auto]graft, or allowing spontaneous healing from the edges. **F 2312, F04**
- wound contraction, *n***—the shrinkage and spontaneous closure of open skin wounds. **F 2312, F04**
- wound contracture, *n***—a condition of fixed high resistance to passive stretch of muscle, skin or joints resulting from fibrosis and scarring of the skin or the tissues supporting the muscles or the joints, or both. (This definition is a modification of Dorland's definition of contracture, "a condition of fixed high resistance to passive stretch of muscle, resulting from fibrosis of the tissues supporting the muscles or the joints, or disorders of the muscle

- fibers," because that definition does not address fibrosis and scarring in skin.) **F 2312, F04**
- wound inflammation, *n***—a localized protective response elicited by injury or destruction of tissues, which serves to destroy, dilute, or wall off (sequester) both the injurious agent and the injured tissue. **F 2312, F04**
- woven fabric, *n***—a structure produced when at least two sets of strands are interlaced, usually at right angles to each other, according to a predetermined pattern of interlacing, and such that at least one set is parallel to the axis along the lengthwise direction of the fabric. **D 123, D13**
- woven fabric**—See **woven fabric** under **fabric**. **D 3878, D30**
- woven fabric, *n***—a structure produced when at least two sets of strands are interlaced, usually at right angles to each other, according to a predetermined pattern of interlacing, and such that at least one set is parallel to the axis along the lengthwise direction of the fabric. **D 4850, D13**
- wppm, *abbr***—an abbreviation for part per million by weight. **D 4175, D02**
- wppm, *abbr***—an abbreviation for part per million by weight. **D 6384, D02**
- WQA**—water quality association. **D 6161, D19**
- wrap, *n***—a flexible sheet material used to protect items in **packaging**. **D 996, D10**
- wrap, *v***—to protect the exposed edges of thermal insulation board. **E 2110, E06**
- wrap angle, *n***—*in yarn friction testing*, the cumulative angular contact of the test specimen against the friction-inducing device, expressed in radians. **D 123, D13**
- wrap angle, *n***—*in yarn friction testing*, the cumulative angular contact of the test specimen against the friction-inducing device, expressed in radians. **D 4849, D13**
- wrap around**—the display of misleading reflections from a previously transmitted pulse, caused by an excessively high pulse-repetition frequency. **E 1316, E07**
- wrap-around bend, *n***—the bend obtained when a specimen is wrapped in a closed helix around a cylindrical mandrel. **E 6, E28**
- wrap-in, *n***—*in vinyl-coated glass yarns*, a method of completing a package after a break by wrapping the two ends together on the package without splicing or tying a knot. **D 123, D13**
- wrap-in, *n***—*in vinyl-coated glass yarns*, a method of completing a package after a break by wrapping the two ends together on the package without splicing or tying a knot. **D 7018, D13**
- wrap seam**—a depression or step in the surface finish caused by the lap of the flexible mold or carrier strip after it is removed from the cured pultrusion. **D 3918, D20**
- Wratten filter**—the trade name for a specific type of color filter. **E 7, E04**
- wrinkle, *n***—an objectionable crease, generally short and irregular in shape. **D 123, D13**
- wrinkle, *n***—an imperfection in reinforced plastics that has the appearance of a wave molded into one or more plies of fabric or other reinforcing material. **D 883, D20**
- wrinkle**—a permanent crease or furrow in the grain surface of a hide or leather, incapable of removal by rolling or plating. **D 1517, D31**
- wrinkle, *n***—an objectionable crease, generally short and irregular in shape. **D 3990, D13**
- wrinkle depression**—an undulation or series of undulations or waves on the surface of the pultruded part.
NOTE—This condition can occur in either the lengthwise or crosswise direction of the pultrusion and is caused by reinforcement shifting and crowding (see **folded reinforcement**). Wrinkles affect the flatness of the surface. **D 3918, D20**
- wrinkle recovery, *n***—that property of a fabric which enables it to recover from folding deformations. **D 123, D13**
- wrinkle recovery, *n***—that property of a fabric which enables it to recover from folding deformations. **D 4850, D13**
- wrinkle resistance, *n***—that property of a fabric which enables it to

resist the formation of wrinkles when subjected to a folding deformation. **D 123, D13**

wrinkle resistance, n—that property of a fabric which enables it to resist the formation of wrinkles when subjected to a folding deformation. **D 4850, D13**

wrinkles, n—a condition where ink being absorbed into a substrate coating causes it to swell and stretch to the point where it cannot recede back to its former dimensions, forming folds in the image area. **F 1857, F05**

wrinkling—*in protective coatings*, the formation of a surface appearance in a coating film resembling the skin of a prune. **D 4538, D33**

wrist, n—*in anatomy*, the joint which articulates between the end of the lower arm and the hand. **D 123, D13**

wrist, n—the joint that articulates between the end of the lower arm and the hand. **D 5219, D13**

wrist, n—*in anatomy*, the joint which articulates between the end of the lower arm and the hand. **F 1494, F23**

wrist girth, n—*in body measurements*, the circumference over the prominence of the inner and the outer forearm bones. **D 123, D13**

wrist girth, n—the maximum circumference of the wrist, taken over the inner and outer prominence of the wrist bones. **D 5219, D13**

wrist girth, n—*in body measurements*, the circumference over the prominence of the inner and outer forearm bones. **F 1494, F23**

write—the images produced by a ribbon or first carbon. **F 221, F05**

writing—the act of producing an image on a document, or other receptor media, one character or stroke at a time, such as by hand with a pen or pencil or by means of a typewriter or pen plotter. **F 335, F05**

writing—the act of producing an image on a document or other receptor media, one character or stroke at a time, such as by hand with a pen or pencil or by means of a typewriter or pen plotter. **F 909, F05**

wrong draft—See **wrong draw**. **D 3990, D13**

wrong draw, n—*in woven fabric*, one or more incorrectly drawn warp ends in the harness or reed. **D 123, D13**

wrong draw, n—*in woven fabric*, one or more incorrectly drawn warp ends in the harness or reed. (*Syn.* wrong draft, misdraw) **D 3990, D13**

wrong pick—See **mispick**. **D 3990, D13**

wrong side, n—See **back side**. **D 4965, D13**

"WS"—clean with shampoo, foam, or dry cleaning solvents as desired. Do not saturate with any the liquid. Pile fabrics may require brushing to restore appearance. Cushion covers should not be removed and laundered or dry cleaned. **D 5253, D13**

"WS"—a letter code. See **upholstery cleaning instructions**. **D 5253, D13**

WSF—*in aquatic toxicity testing*, abbreviation for water soluble fraction. **D 4175, D02**

X

“X”—do not clean with either water cleaner or solvent-based cleaner. Use a vacuum cleaner or light brush only. **D 5253, D13**

“X”—a letter code. See **upholstery cleaning instructions**. **D 5253, D13**

xanthate viscosity—see **viscosity, xanthate**. **D 1695, D01**

X_{bH} , X_{bM} , and X_{bV} —the X coordinates of the locations of these respective widths of the snowboard measured from the tail of the snowboard.

X_{bH} , X_{bM} , X_{bV} —the x coordinates for the location of these respective widths of the ski measured from the tail of the ski. **F 472, F27**

X dimension, n—in *bar code symbology*, the intended width of the narrow elements as set by the application or specification, or both. **F 1294, F05**

xenogeneic or xenogenic, n—cells, tissues, and organs in which the donor and recipient belong to different species. Synonyms: *xenogenous, heterogeneic, or heterologous*. **F 2312, F04**

xenograft, n—a graft of tissue transplanted between animals of different species. Called also heterograft, heterologous graft and heteroplastic graft. **F 2312, F04**

xenon arc, n—an excited state xenon-plasma that emits UV, visible, and IR radiation and is produced by passing a high intensity electric current through a quartz tube containing xenon gas. **G 113, G03**

xenotransplantation, n—any procedure that involves the transplantation or infusion into a human recipient of either (1) live cells, tissues, or organs from a nonhuman animal source or (2) human body fluids, cells, tissues, or organs that have had *ex vivo* contact with live nonhuman cells, tissues, or organs. **F 2312, F04**

Xeriscape, n—a term that refers to water-efficient choices in planting and irrigation design. It refers to seven basic principles to conserve water and protect the environment, including: planning and designing; use of well-adapted plants; soil analysis; practical turf areas; use of mulches; appropriate maintenance; and efficient irrigation. **E 2114, E06**

xerographic copying—a form of plain paper copying which uses a dry toner. Synonym for *xerography*. **F 335, F05**

xerographic paper, n—a grade of paper suitable for copying by the electrostatic process. **D 1968, D06**

xerography—See **xerographic copying**. **F 335, F05**

x-mm minus, n—pieces of classified, size reduced scrap tires where the maximum size of 95 % of the pieces is less than x-mm in any dimension (that is, 25-mm minus; 50-mm minus; 75-mm minus, etc). **D 5681, D34**

X-radiation—electromagnetic radiation of the same nature as visible light but having a wavelength approximately 1/1000 that of visible light. **E 7, E04**

X-ray fluorescence instrument, n—a measurement device that determines metal contents of materials using the physics of the interaction of gamma rays (from the excitation source) with electrons in target metals (for example, lead) in the material and the resulting fluorescence. **E 1605, E06**

X-ray ghost line—XPS, lines in a spectrum due to presence of contaminating X-ray photons from an impurity in the X-ray anode, from the X-ray window, or from certain elements present in the specimen. **E 673, E42**

X-ray image plane, n—in *tire testing*, a surface located at a specified distance from the X-ray tube “focal spot.” **F 538, F09**

X-ray imaging system, n—in *tire testing*, a collection of the components and subsystems needed to produce a fluoroscopic or radiographic image of the tire. **F 538, F09**

X-ray linewidth—the energy width of the principal characteristic X-ray; in XPS it usually refers to that of the X-ray source. The X-ray linewidth contributes to the photo-electron peak widths. **E 673, E42**

X-ray monochromator—a device used to eliminate photons of energies other than those in a narrow band. **E 673, E42**

X-ray radiograph, n—an X-ray film, plate, or paper that is placed at the image plane and is used for recording an X-ray image of the object being examined. **F 538, F09**

X-rays—See **X-radiation**. **E 7, E04**

X-ray screen, n—a fluorescent screen, placed at the image plane, that produces an X-ray image of the object being examined. **F 538, F09**

X-ray standard field—an X-ray field that is well characterized as to the exposure rate, or absorbed dose rate produced in a specified material, at a specified location within the field for a given tube voltage, current, and filtration. **E 170, E10**

X-ray tube—a device for the production of X-rays by the impact of high-speed electrons on a metal target. **E 7, E04**

XRF analyzer—instrument that determines lead concentration, using the principle of X-ray fluorescence. **E 631, E06**

XRF direct-reading analyzer—an analyzer that provides the operator with a display of a lead concentration calculated from the lead “K” x-ray intensity. Compare **XRF spectrum analyzer**. **E 631, E06**

XRF reading cycle-XRF direct-reading analyzers—calculate the lead “K” x-ray intensity in a specific time interval (10 to 30 s) that is fixed by the manufacturer and related to the age of the source. The calculated result in this time interval is a *reading cycle*. **E 631, E06**

XRF sample site—specific spot on a surface being tested for lead concentration by portable or laboratory XRF equipment. **E 631, E06**

XRF-shoot, v—to obtain the results of an XRF single reading cycle. **E 631, E06**

XRF spectrum analyzer—type of XRF analyzer that provides the operator with a plot of the energy and intensity of both “k” and “L” x-rays, as well as a calculated concentration of lead. Compare **XRF direct-reading analyzer**. **E 631, E06**

XRF substrate effect—return of backscattered radiation from paint, substrate, or underlying material to the XRF analyzer. **E 631, E06**

X/R ratio, n—the ratio of system inductive reactance to resistance. **F 819, F18**

xylan—a pentosan giving almost exclusively xylose on hydrolysis. **D 1695, D01**

xylem—the portion of the tree trunk, branches, and roots that lies between the pith and the cambium. **D 9, D07**

xylene—a mixture of C₈ aromatic hydrocarbons. **D 4790, D16**

xylene, 10°C—xylene having a total distillation range of no more than 10°C. This range brackets the boiling points of the three individual isomers and ethylbenzene. Refer to Specification D 846 for complete specifications. **D 4790, D16**

xylene, nitration grade—xylene consisting principally of the meta isomer and having a total distillation range of no more than 5°C. Nonaromatic impurities is limited to a maximum of 4 volume %. Refer to Specification D 843 for complete specifications. **D 4790, D16**

xylol(s)—dimethyl phenol(s), hydroxydimethylbenzene (C₈H₁₀O) mol weight 122.16; colorless crystalline powders. Five isomeric xylenols exist. **D 4790, D16**

Y

- Y**—conversion, recovery. **D 6161, D19**
- yarn**, *n*—a generic term for a continuous strand of textile fibers, filaments, or material in a form suitable for knitting, weaving, or otherwise intertwining to form a textile fabric. **D 123, D13**
- yarn**—*in fibrous composites*, a continuous, ordered assembly of essentially parallel, collimated filaments, normally with twist, and of either discontinuous or continuous filaments.
- single yarn*, *n*—an end in which each filament follows the same twist. **D 3878, D30**
- yarn**, *n*—a generic term for a continuous strand of textile fibers, filaments, or material in a form suitable for knitting, weaving, or otherwise intertwining to form a textile fabric. **D 4849, D13**
- yarn appearance**, *n*—the visual effect obtained by viewing a sample of yarn wound with a designated traverse on a black board of designated size. **D 123, D13**
- yarn appearance**, *n*—the visual effect obtained by viewing a sample of yarn wound with a designated traverse on a black board of designated size. **D 4849, D13**
- yarn break**, *n*—*in sewn seams*, a mode of failure evidenced by yarns rupturing at the seam or at any other area in the test specimen. (Syn. yarn burst and yarn tear) **D 123, D13**
- yarn break**, *n*—*in sewn seams*, a mode of failure evidenced by yarns rupturing at the seam or at any other area in the test specimen. (Syn. yarn burst and yarn tear.) **D 4850, D13**
- yarn crimp**, *n*—*in fabric*, the undulations or waviness in a yarn due to interactions with other yarns. **D 123, D13**
- yarn crimp**, *n*—*in fabric*, the undulations or waviness in a yarn due to interactions with other yarns. **D 4850, D13**
- yarn distortion**, *n*—*in woven fabrics*, a condition in which the symmetrical surface appearance of a fabric is altered by the shifting or sliding of warp or filling yarns. **D 123, D13**
- yarn distortion**, *n*—*in woven fabrics*, a condition in which the symmetrical surface appearance of a fabric is altered by the shifting or sliding of warp or filling yarns. **D 4850, D13**
- yarn fault**, *n*—*in textile strands*, a change in thickness sufficient without magnification. **D 123, D13**
- yarn fault**, *n*—*in textile strands*, a change in thickness sufficient to be visible without magnification. **D 4849, D13**
- yarn fault count**, *n*—the number of yarn faults per specified length of product. **D 123, D13**
- yarn fault count**, *n*—the number of yarn faults per specified length of product. **D 4849, D13**
- yarn number**, *n*—a measure of the linear density of a yarn, expressed as “mass per unit length,” or “length per unit mass,” depending upon the yarn numbering system used. (Syn. **yarn count**.) (See **yarn numbering system**.) **D 123, D13**
- yarn number**, *n*—a measure of the linear density of a yarn expressed as “mass per unit length,” or “length per unit mass,” depending upon the yarn numbering system used. (Syn. **yarn count**.) (See **yarn numbering system**.) **D 4849, D13**
- yarn numbering system**, *n*—a system expresses the size of a yarn as a relationship between its length and associated mass. (See also **direct yarn numbering system** and **indirect yarn numbering system**.) **D 123, D13**
- yarn numbering system**, *n*—a system that expresses the size of a yarn as a relationship between its length and associated mass. (See **direct yarn numbering system** and **indirect yarn numbering system**.) **D 4849, D13**
- yarn number jute**, *n*—mass per unit length of a yarn measured as the number of pounds per 13 167 m (14 400 yd), and expressed as pounds per spynle. **D 123, D13**
- yarn package**, *n*—a length or parallel lengths of yarn in a form suitable for handling, storing, or shipping. **D 123, D13**
- yarn package**, *n*—a length or parallel lengths of yarn in a form suitable for handling, storing, or shipping. **D 4849, D13**
- yarn severance**, *n*—a numerical value expressed on a percentage basis from this test that is used as an index of the degree of cutting of fabric yarns by the sewing machine needle in making sewn seams. **D 123, D13**
- yarn slippage**, *n*—*at the seam in sewn fabrics*, the displacement of one or more yarns from the original position, causing differences in alignment, spacing, or both. **D 123, D13**
- yarn slippage**, *n*—*at the seam in sewn fabrics*, the displacement of one or more yarns from the original position, causing differences in alignment, spacing, or both. **D 4850, D13**
- yarn streak**, *n*—*for inflatable restraint fabrics*, discoloration of an individual yarn that does not affect adjacent yarns. **D 6799, D13**
- yarn take-up**, *n*—*in fabric*, the additional length of yarn used to make a given length of fabric. **D 123, D13**
- yarn take-up**, *n*—*in fabric*, the additional length of yarn used to make a given length of fabric. **D 4850, D13**
- yaw**, *n*—*in a vehicle*, the angular motion of a vehicle about its vertical axis through the center of gravity. **F 538, F09**
- yaw velocity**, *n*—the magnitude of the yaw (rotation or angular displacement); it may be measured by fore and aft, vehicle versus pavement, velocity sensors. **F 538, F09**
- Y dimension**, *n*—*in a bar code symbology*, the specified height of elements. **F 1294, F05**
- yeast**—single cell microorganisms (fungi) that produce alcohol and CO₂ under normal fermentation conditions. **E 1705, E48**
- yellow**, *adj*—hue description applied to light of wavelengths from 572 to 783 nm and to visually similar stimuli. **D 2946, C17**
- yellowness**, *n*—*in asbestos fiber and products*, the degree to which asbestos deviates from colorlessness or neutral grey toward yellowish or tan as determined by the yellowness index. **D 2946, C17**
- yellowness**, *n*—attribute of color perception by which an object color is judged to depart from colorless or a preferred white toward yellow. **E 284, E12**
- yellowness index**, *n*—*in asbestos fiber and products*, an index calculated arbitrarily from reflectance measurements using tristimulus filters. Use the following relationship for asbestos:
- $$\text{yellowness index} = (A - B)/G$$
- where:
- A = reflectance with the amber tristimulus filter,
 B = reflectance with the blue tristimulus filter, and
 G = reflectance with the green tristimulus filter.
- NOTE—Additional definitions are presented in Specification C 296, Specification C 428, Test Method C 458, Test Methods C 500, Specification C 508, Specification C 541, Specification C 663, Specification C 668, Specification C 875, Guide C 966, Terminology D 123, Test Method D 1918, Test Method D 2985, Test Method D 2590, Test Method D 3879, and STP 834. **D 2946, C17**
- yellowness index**, *n*—a number, computed by a given procedure from colorimetric or spectrophotometric data, that indicates the degree of departure of an object color from colorless, or from a preferred white, toward yellow. **E 284, E12**
- yellow ware**—a yellow semivitreous ware or an earthenware with a colorless, clear glaze. **C 242, C21**
- yield**, *n*—the weight percent of the feed that reports to the concentrate. **D 121, D05**
- yield**, *n*—*in knitted fabrics*, the number of finished square meters per kilogram (square yards per pound) of greige fabric. **D 123, D13**
- yield**, *n*—*of wool*, the percentage of a designated commercial composition obtained by processing a lot of raw wool. **D 123, D13**
- yield**, *n*—*in raw wool*, the combined weight of clean wool fiber present and vegetable matter present, as a percentage of the raw wool weight. **D 123, D13**
- yield**—*in grouting*, the volume of freshly mixed grout produced from a known quantity of ingredients. **D 653, D18**
- yield**, *n*—*in raw wool*, the combined weight (mass) of clean wool

yield, *n*

- fiber present and vegetable matter present, as a percentage of the raw wool weight. **D 4845**, D13
- yield**, *n*—of wool, the percentage of a designated commercial composition obtained by processing a lot of raw wool. **D 4845**, D13
- yield**, *n*—in *knitted fabrics*, the number of finished square metres per kilogram (square yards per pound) of greige fabric. **D 4850**, D13
- yield**—an estimate of the number of pages that can be produced with a particular toner cartridge under specified conditions. **F 335**, F05
- yield, aerosol foam sealant**, *n*—in *building construction*, the cured volume of a compound after it is dispensed from a container. **C 717**, C24
- yield bend angle**—the angle at which the yield bend moment occurs. **F 1840**, F04
- yield bend moment**—the amount of moment required to initiate plastic deformation during a bend test. **F 1840**, F04
- yield, expected**, *n*—the quantity of material or the percentage of theoretical yield anticipated at any appropriate phase of production based on previous laboratory, pilot scale, or manufacturing data. **E 2363**, E55
- yield factor**, *n*—in *papermaking*, either a proportion or percentage representing that portion of the input material that is retained after paper stock preparation for inclusion in the paper manufacturing process. **D 1968**, D06
- yielding arch**—type of support of arch shape, the joints of which deform plastically beyond a certain critical load, that is, continue to deform without increasing their resistance. (ISRM) **D 653**, D18
- yield locus**—plot of shear stress versus normal stress at failure. The yield locus (YL) is sometimes called the instantaneous yield locus to differentiate it from the time yield locus. **D 653**, D18
- yield point**, *n*—in a *stress strain curve*, the point beyond which work is not completely recoverable and permanent deformation takes place. **D 123**, D13
- yield point**, *n*—that point on the stress-strain curve, short of ultimate failure, where the rate of stress with respect to strain goes through a zero value and may become negative. **D 1566**, D11
- yield point**, *n*—in *geosynthetics*, the point on the force-elongation curve at which the first derivative equals zero (the first maximum). **D 4439**, D35
- yield point**, *n*—in a *stress-strain curve*, the point beyond which work is not completely recoverable and permanent deformation takes place. (Compare **elastic limit**) **D 4848**, D13
- yield point elongation**, *YPE*, *n*—the strain (expressed in percent) separating the stress-strain curve's first point of zero slope from the point of transition from discontinuous yielding to uniform strain hardening. **E 6**, E28
- yield point**, *YP* [FL^{-2}], *n*—term previously used, by E 8 and E 8M, for the property which is now referred to as **upper yield strength**. **E 6**, E28
- yield strain**, *n*—the strain below which a material acts in an elastic manner, and above which it begins to exhibit permanent deformation or flow. **D 907**, D14
- yield strain**, *n*—the level of strain at the yield point. **D 1566**, D11
- yield strength**, *n*—the stress at which a material exhibits a specified limiting deviation from the proportionality of a stress-strain relationship. **D 123**, D13
- yield strength**, *n*—the stress at which a material exhibits a specified limiting deviation from the proportionality of stress to strain. **D 6477**, D13
- yield strength**—tension-applied load at which the fastener experiences a specific amount of permanent deformation, that is, the bolt has been stressed beyond its elastic limit and is in the plastic zone. It is very difficult to test full size bolts for yield strength. Because of different strain rates in the threaded section, thread runout and unthreaded shank which together comprise the stressed length, a "proof load" concept was introduced. **F 1789**, F16
- yield strength**, σ_{YS} [FL^{-2}]*n*—the stress at which a material exhibits a specific limiting deviation from the proportionality of stress to strain. This deviation is expressed in terms of strain. **E 1823**, E08
- yield strength**, *YS* or *S_y* [FL^{-2}], *n*—the engineering stress at which, by convention, it is considered that plastic elongation of the material has commenced. This stress may be specified in terms of (a) a specified deviation from a linear stress-strain relationship, (b) a specified total extension attained, or (c) maximum or minimum engineering stresses measured during discontinuous yielding. **E 6**, E28
- yield stress**—the stress beyond which the induced deformation is not fully annulled after complete destressing. (ISRM) **D 653**, D18
- yield stress**, *n*—the stress (either normal or shear) at which a marked increase in deformation occurs without an increase in load. (Synonym *yield value*) **D 907**, D14
- yield stress**, *n*—the level of stress at the yield point. **D 1566**, D11
- yield stress**, *n*—in *solids*, the maximum stress that can be applied without causing permanent deformation. **D 4175**, D02
- yield stress**, *n*—in *fluids*, the shear stress required to initiate flow. **D 4175**, D02
- yield stress**, *n*—limit to internal force developed by application of external force or load or generation of internal strain to a material, member, connection component, or assembly beyond which a marked increase in the rate of deformation occurs without an increase in load; expressed in terms of units of force per unit area, psi, pounds force per square inch (Mpa, megapascals). **E 631**, E06
- yield, theoretical**, *n*—the quantity that would be produced at any appropriate phase of production based upon the quantity of material to be used, in the absence of any loss or error in actual production. **E 2363**, E55
- yield value*, *n*—Synonym **yield stress**. **D 907**, D14
- yoke**—a magnet that induces a magnetic field in the area of a part that lies between its poles. Yokes may be permanent magnets or either alternating-current or direct-current electromagnets. **E 1316**, E07
- yoke magnetization**—a longitudinal magnetic field induced in a part, or in an area of a part, by means of an external electromagnet shaped like a yoke. **E 1316**, E07
- Youden square**, *n*—a type of block design derived from certain Latin squares by deleting, or adding, rows (or columns) so that one block factor remains complete blocks and the second block factor constitutes balanced incomplete blocks. **E 456**, E11
- Youden square**, *n*—A type of block design derived from certain Latin squares by deleting, or adding, rows (or columns) so that one block factor remains complete blocks and the second block factor constitutes balanced incomplete blocks. **E 1325**, E11
- Young's modulus**, *n*—in a *stress-strain curve for an elastic material*, the ratio of change in stress to change in strain within the elastic region of the material. **D 123**, D13
- Young's modulus**—the ratio of the increase in stress on a test specimen to the resulting increase in strain under constant transverse stress limited to materials having a linear stress-strain relationship over the range of loading. Also called **elastic modulus**. **D 653**, D18
- Young's modulus**, *n*—in a *stress-strain curve for an elastic material*, the ratio of change in stress to change in strain within the elastic region of the material. **D 4848**, D13
- Young's modulus**—the ratio of the increase of stress acting on a test sample to the resulting increase in strain, under constant transverse stress. **D 7099**, D18
- Young's modulus**—see *modulus of elasticity*. **F 1789**, F16
- Young's modulus**, *E* [FL^{-2}], *n*—modulus of elasticity in tension or compression. **E 6**, E28

Z

Zahn cup—an apparatus for the measurement of liquid or slurry viscosity expressed as the number of seconds required for the liquid or slurry to drain from the cup through a hole of definite diameter. **C 242, C21**

Z-Axis, *n*—in *barcode reading*, a coordinate related to the orientation and movement of a symbol on a transport system. **F 1294, F05**

Z dimension, *n*—in *bar code reading*, a calculation of element width achieved by adding the average element width of bar and space and dividing by two. **F 1294, F05**

zeolite—any of various natural or synthetic hydrated aluminum silicates used as ion exchange substrates in water softening. **D 6161, D19**

zephyr yarn, *n*—a variety of soft worsted yarn characterized by a low twist and spun from wool which is as fine or finer in average diameter than U.S. Standard 64's grade tops. **D 123, D13**

zephyr yarn, *n*—a variety of soft worsted yarn characterized by a low twist and spun from wool which is as fine or finer in average diameter with U.S. Standard 64's grade tops. **D 4845, D13**

zero air voids curve (saturation curve)—the curve showing the zero air voids unit weight as a function of water content. **D 653, D18**

zero air voids density (zero air voids unit weight)—see **unit weight**. **D 653, D18**

zero carbon steel—see **decarburized enameling steel**. **C 286, B08**

zero crossings—in *fatigueloading*, the number of times that the force-time history crosses zero force level with a positive slope or negative slope, or both, as specified, during a given period. **E 1823, E08**

zero curtain—the period during which a nearly constant temperature, very close to the freezing point, exists during annual freezing and, occasionally, thawing, of the active layer. The zone immediately above the permafrost table where zero temperature (°C) exists for a considerable period during freezing and thawing of the overlying ground. **D 7099, D18**

zero defects—term which indicates that no deviation from the requirements of a specification are present within a statistically valid sample drawn from a given fastener lot. **F 1789, F16**

zero discharge—a condition whereby a facility discharges no process effluent. **D 6161, D19**

zero drift—See **analyzer**. **D 1356, D22**

zero-filling—addition of zero-valued points to the end of a measured interferogram. **E 131, E13**

zero-moisture, *adj*—See **moisture-free**, the preferred term. **D4920, D13**

zero path difference point—see **centerburst**. **E 131, E13**

zero-power resistance, *n*—the dc resistance of a device, at a specified temperature, calculated for zero-power. **E 344, E20**

zero retardation point—see **centerburst**. **E 131, E13**

zero-span, *adj*—in *tensile testing*, having a grip separation of 0.00 mm (0.000 in.). **D 1968, D06**

zero-span tensile strength, *n*—of *paper*, the tensile strength of a sheet of fibrous material, measured with special jaws, at an apparent initial span of zero. **D 1968, D06**

zero suppression, *n*—in *bar code reading*, the technique used to shorten UPC codes by omitting zeros from the symbol. **F 1294, F05**

zero time, *n*—the time when the given loading or constraint conditions are initially obtained in creep and stress-relaxation tests, respectively. **E 6, E28**

zero time (T₀), *n*—the travel time (correction factor), measured in seconds, associated with the electronic circuits in the pulse propagation system. **C 709, D02**

zero time (T₀), *n*—the travel time (correction factor), measured in seconds, associated with the electronic circuits in the pulse propagation system. **D 4175, D02**

zeta potential—colloidal stability measured in millivolts. High negative value (−10 to −30 mv) results in particulate stability. **D 6161, D19**

zigzagged seam-finish, *n*—a finish for the raw edges of the seam allowances of a plain seam, in which machine zigzag stitching is placed 3 to 6 mm (1/8 to 1/4 in.) from the raw edge. (Compare **edge-stitched seam-finish**.) **D 123, D13**

zigzagged seam finish, *n*—in *home sewing*, a seam finish in which machine zigzag stitching is placed 3 to 6 mm (1/8 to 1/4 in.) from each of the cut edges of the seam allowances. (Compare **edge-stitched seam finish**.) **D 4965, D13**

zinc coated, galvanized—generic terms covering barrel-galvanized, dipped, electro-galvanized, electro-zinc-plated, flake-galvanized, hot-dipped, hot-dip galvanized, hot-dipped zinc coated, hot-galvanized, mechanically plated, peen-coated, peen galvanized, tumbler-galvanized, and wean-galvanized. **F 547, F16**

zinc phosphate—coating that serves as a vehicle to retain various lubricants on the surface of wire or rod and protects the surfaces of the tool and workpiece against damage during various steps in the cold forming and extrusion process. It is also a coating used for corrosion protection of finished fasteners. **F 1789, F16**

zinc-plated—surface provided with usually thin electrochemical deposit of zinc as a result of immersion in electrolytic bath or with mechanical deposit of zinc as a result of peen coating. **F 547, F16**

zinc-rich primer, *n*—a primer for ferrous metals, incorporating zinc dust at a concentration sufficient to make the dried film electrically conductive thus providing cathodic protection to the ferrous substrate. **D 16, D01**

zipper, *n*—a slide fastener consisting of interlockable elements each attached to one of the opposing edges of two tapes and a movable part called a "slider" that spans the interlockable elements, which when moved in one direction causes the elements on one tape to interlock with the elements on the other tape, and when moved in the opposite direction causes the elements to disengage. (Compare **continuouselement zipper** and **separate-element zipper**.) **D 123, D13**

zipper, *n*—a slide fastener consisting of interlockable elements each attached to one of the opposing edges of two tapes and a movable part called a "slider" that spans the interlockable elements, which when moved in one direction causes the elements on one tape to interlock with the elements on the other tape, and when moved in the opposite direction causes the elements to disengage. (Compare **continuouselement zipper** and **separate element zipper**.) **D 2050, D13**

zipper gasket—See **lock-stripgasket**, the preferred term. **C 717, C24**

zirconium oxide refractory, *n*—refractory products consisting substantially of zirconium dioxide. **C 71, C08**

zircon porcelain—See **zircon porcelain** under **porcelain**. **C 242, C21**

zircon refractory, *n*—refractory products consisting substantially or entirely of crystalline zirconium orthosilicate (ZrSiO₄). **C 71, C08**

zircon whiteware—See **zircon whiteware** under **ceramic whiteware**. **C 242, C21**

Zn-5Al-MM—an abbreviation describing an alloy of zinc, 5% aluminum, and mischmetal, employed as a metallic coating over steel wire or steel sheet used in the manufacture of chain link fabric, fence framework materials, and other products (see Specifications F 1234 and F 1345). **F 552, F14**

zone—any group of crystal planes which are all parallel to one line, called the zone axis. **E 7, E04**

zone of gas-hydrate stability—that portion of the subsurface where the conditions of temperature and pressure are suitable for the formation and preservation of gas hydrates. **D 7099, D18**

zone of mixing

zone of mixing—the layer of the specimen surface within which the primary beam causes atomic mixing. E 673, E42

zone of saturation—a hydrologic zone in which all the interstices between particles of geologic material or all of the joints, fractures,

or solution channels in a consolidated rock unit are filled with water under pressure greater than that of the atmosphere.

D 653, D18
