VII. *Part of a Letter of Mr. Dale from Braintree, Feb. 1. 1699. to Dr. Martin Lifter, Fellow of the College of Physicians and R. S. concerning feveral Insects.*

HERewith you will receive a *Cervus volans* or two, which I take to be different from thofe described by *Moufet* in his *Theat. Insect.* p. 148, 149. thefe are plentifully found about *Colcheſter*, eſpecially towards the Sea-Coaſt. Beſides theſe I have happened upon divers ſorts of Scarabs, which I cannot find figured in your curious *Tabulæ Mutæ* in the Appendix *Hift. Animal. Angl.* as the *Bæneæ* *Moufet.* p. 152. a Species or two of *Cantharides*, three or four ſorts of *Lady-Bugs*, and others; which, although of moſt of them I have at preſent but ſingle *Specimens*, yet if you deſire the ſight of them to deſign and fill up the Vacancies of your Plates with, they ſhall be ſent up to you. Laſt Summer being on our Sea-Coaſt at *Harwich*, I obſerved no leſs than five or ſix Species of *Cochleæ Marine* two of which I have ſince found to be already noted by you in your excellent *Hift. Conchyl.* as of *English Production*, viz. *ſect.* 5. n. 19. and 43. A third I have which is by you figured, viz. n. 13. but is not marked as found in *England*. The fourth agrees with your n. 8. in Figure, but having no Name, I cannot be poſitive, I therefore deſire your Name of it :
 This
